

studies of delta smelt and other fishes. The results of these studies are expected to provide net benefits to listed species by improving our understanding of their ecology and habitat use, and by informing the development of new research tools that can guide management decisions and habitat restoration actions. Sampling would be conducted in Suisun Bay, and would take multiple life stages of CVSR Chinook salmon, SRWR Chinook salmon, CCV steelhead, and sDPS green sturgeon. Capture methods would include beach seine, fyke trap, larval net, otter trawl, midwater trawl, boat electrofishing, set line, and gill net. All sampling would follow methods and protocols designed to minimize take of listed species while conducting research and monitoring. For example, sampling gear such as gill nets would be watched closely to monitor the status of any fishes entangled in the net. Set times would be short (approximately one hour), and nets would be set in habitats that listed fish are unlikely to inhabit. Listed salmonids captured in the course of sampling would be identified, carefully measured for length and released. Green sturgeon would be anesthetized using MS-222, scanned for a presence of a PIT tag, PIT tagged if no PIT tag is present, tissue sampled, and allowed to recover prior to release. All fishes collected in any sampling gear would be handled as gently as possible to facilitate safe release back to the water. The researchers are not proposing to kill any of the fish they capture, but a small number may die as an unintended result of the activities.

Permit 19400

ICF consulting has requested a five year permit to take juvenile CVSR Chinook salmon and SRWR Chinook salmon while conducting a study to investigate if longfin smelt in San Pablo Bay shift their vertical distribution under different environmental and biological conditions. Although this study principally targets longfin smelt, ESA listed Chinook salmon would be encountered during sampling. ICF proposes to collect data that would be useful to local researchers on captured and/or photographed listed Chinook salmon, including abundance, length, and potentially tissue samples. Fish would be sampled using a midwater trawl, however the majority of tows would be conducted with only a video device (*i.e.*, SmeltCam) acting as the codend. Therefore, the majority of take would be observe/harass. The fish camera image program would be able to determine the length, and thereby an estimate of the race/run/listing status, of

salmon that pass through the net. In order to verify the results of the SmeltCam, some tows would be conducted with both the video device and a traditional codend. Physically captured juvenile salmonids would be placed in a bucket with aerated water, handled (*i.e.*, measured to fork length and possibly fin tissue sampled for genetic analysis), and released. The researchers are not proposing to kill any of the fish they capture.

This notice is provided pursuant to section 10(c) of the ESA. NMFS will evaluate the applications, associated documents, and comments submitted to determine whether the applications meet the requirements of section 10(a) of the ESA and Federal regulations. The final permit decisions will not be made until after the end of the 30-day comment period. NMFS will publish notice of its final action in the **Federal Register**.

Dated: July 22, 2015.

Angela Somma,

Chief, Endangered Species Division, Office of Protected Resources, National Marine Fisheries Service.

BILLING CODE 3510-22-P

DEPARTMENT OF COMMERCE

National Oceanic and Atmospheric Administration

RIN 0648-XE042

Endangered Species; File No. 18238

AGENCY: National Marine Fisheries Service (NMFS), National Oceanic and Atmospheric Administration (NOAA), Commerce.

ACTION: Notice; receipt of application.

SUMMARY: Notice is hereby given that NMFS Southwest Fisheries Science Center (SWFSC), 8901 La Jolla Shore Dr., La Jolla, CA 92037, [Responsible Party: Lisa Ballance, Ph.D.], has applied in due form for a permit to take green (*Chelonia mydas*), loggerhead (*Caretta caretta*), and olive ridley (*Lepidochelys olivacea*) sea turtles for purposes of scientific research.

DATES: Written, telefaxed, or email comments must be received on or before August 28, 2015.

ADDRESSES: The application and related documents are available for review by selecting "Records Open for Public Comment" from the *Features* box on the Applications and Permits for Protected Species (APPS) home page, <https://apps.nmfs.noaa.gov>, and then selecting File No. 18238 from the list of available applications.

These documents are also available upon written request or by appointment in the Permits and Conservation Division, Office of Protected Resources, NMFS, 1315 East-West Highway, Room 13705, Silver Spring, MD 20910; phone (301) 427-8401; fax (301) 713-0376.

Written comments on this application should be submitted to the Chief, Permits and Conservation Division, at the address listed above. Comments may also be submitted by facsimile to (301) 713-0376, or by email to NMFS.Pr1Comments@noaa.gov. Please include the File No. in the subject line of the email comment.

Those individuals requesting a public hearing should submit a written request to the Chief, Permits and Conservation Division at the address listed above. The request should set forth the specific reasons why a hearing on this application would be appropriate.

FOR FURTHER INFORMATION CONTACT:

Amy Hapeman or Brendan Hurley, (301) 427-8401.

SUPPLEMENTARY INFORMATION:

The subject permit is requested under the authority of the Endangered Species Act of 1973, as amended (ESA; 16 U.S.C. 1531 *et seq.*) and the regulations governing the taking, importing, and exporting of endangered and threatened species (50 CFR parts 222-226).

The SWFSC requests a five-year research permit proposes to continue long-term monitoring of resident green sea turtles in southern California to characterize population structure, foraging ecology, and migration patterns. Up to 60 green, five olive ridley, and five loggerhead sea turtles would be captured annually using entanglement, seine, or dip net and have the following procedures performed before release: photography/video; temporary marking the carapace; flipper tagging and passive integrated transponder tagging; ultrasound; morphometrics; tetracycline injection; biological sampling; cloacal and oral swabbing; lavage; and up to two transmitter attachments. Animals with transmitters may be surveyed and tracked by vessel after release. The permit would be valid for five years from the date of issuance.

Dated: July 23, 2015.

Julia Harrison,

Chief, Permits and Conservation Division, Office of Protected Resources, National Marine Fisheries Service.
