FEDERAL REGISTER

Vol. 80 Monday,
No. 133 July 13, 2015

Book 1 of 3 Books

Pages 39941–40136

OFFICE OF THE FEDERAL REGISTER

The **FEDERAL REGISTER** (ISSN 0097–6326) is published daily, Monday through Friday, except official holidays, by the Office of the Federal Register, National Archives and Records Administration, Washington, DC 20408, under the Federal Register Act (44 U.S.C. Ch. 15) and the regulations of the Administrative Committee of the Federal Register (1 CFR Ch. I). The Superintendent of Documents, U.S. Government Publishing Office, Washington, DC 20402 is the exclusive distributor of the official edition. Periodicals postage is paid at Washington, DC.

The **FEDERAL REGISTER** provides a uniform system for making available to the public regulations and legal notices issued by Federal agencies. These include Presidential proclamations and Executive Orders, Federal agency documents having general applicability and legal effect, documents required to be published by act of Congress, and other Federal agency documents of public interest.

Documents are on file for public inspection in the Office of the Federal Register the day before they are published, unless the issuing agency requests earlier filing. For a list of documents currently on file for public inspection, see *www.ofr.gov.*

The seal of the National Archives and Records Administration authenticates the Federal Register as the official serial publication established under the Federal Register Act. Under 44 U.S.C. 1507, the contents of the **Federal Register** shall be judicially noticed.

The **Federal Register** is published in paper and on 24x microfiche. It is also available online at no charge at *www.fdsys.gov*, a service of the U.S. Government Publishing Office.

The online edition of the **Federal Register** is issued under the authority of the Administrative Committee of the Federal Register as the official legal equivalent of the paper and microfiche editions (44 U.S.C. 4101 and 1 CFR 5.10). It is updated by 6:00 a.m. each day the **Federal Register** is published and includes both text and graphics from Volume 59, 1 (January 2, 1994) forward. For more information, contact the GPO Customer Contact Center, U.S. Government Publishing Office. Phone 202-512-1800 or 866-512-1800 (toll free). E-mail, *gpocusthelp.com.*

The annual subscription price for the **Federal Register** paper edition is $749 plus postage, or $808, plus postage, for a combined **Federal Register, Federal Register** Index and List of CFR Sections Affected (LSA) subscription; the microfiche edition of the **Federal Register** including the **Federal Register** Index and LSA is $165, plus postage. Six month subscriptions are available for one-half the annual rate. The prevailing postal rates will be applied to orders according to the delivery method requested. The price of a single copy of the daily **Federal Register,** including postage, is based on the number of pages: $11 for an issue containing less than 200 pages; $22 for an issue containing 200 to 400 pages; and $33 for an issue containing more than 400 pages. Single issues of the microfiche edition may be purchased for $3 per copy, including postage. Remit check or money order, made payable to the Superintendent of Documents, or charge to your GPO Deposit Account, VISA, MasterCard, American Express, or Discover. Mail to: U.S. Government Publishing Office—New Orders, P.O. Box 979050, St. Louis, MO 63197-9000; or call toll free 1-866-512-1800, DC area 202-512-1800; or go to the U.S. Government Online Bookstore site, see *bookstore.gpo.gov.*

There are no restrictions on the republication of material appearing in the **Federal Register.**

How To Cite This Publication: Use the volume number and the page number. Example: 80 FR 12345.

Postmaster: Send address changes to the Superintendent of Documents, Federal Register, U.S. Government Publishing Office, Washington, DC 20402, along with the entire mailing label from the last issue received.

DEPARTMENT OF TRANSPORTATION

Federal Aviation Administration

14 CFR Part 39

[Docket No. FAA–2014–0758; Directorate Identifier 2013–SW–062–AD; Amendment 39–18202; AD 2015–14–04]

RIN 2120–AA64

Airworthiness Directives; Kaman Aerospace Corporation (Kaman) Helicopters

AGENCY: Federal Aviation Administration (FAA), DOT.

ACTION: Final rule.

SUMMARY: We are adopting a new airworthiness directive (AD) for Kaman Model K–1200 helicopters with certain main rotor blades (MRB) installed. This AD requires inspecting each MRB for a crack or damage. This AD was prompted by a report that a crack was found on an MRB during a tear-down inspection. The actions are intended to detect a crack in the MRB, which could lead to failure of the MRB and subsequent loss of control of the helicopter.

DATES: This AD is effective August 17, 2015.

ADDRESSES: For service information identified in this AD, contact Kaman Aerospace Corporation, Old Windsor Rd., P.O. Box 2, Bloomfield, Connecticut 06002–0002; telephone (860) 242–4461; fax (860) 243–7047; or at *http://www.kamanaero.com.* You may review a copy of the referenced service information at the FAA, Office of the Regional Counsel, Southwest Region, 2601 Meacham Blvd., Room 663, Fort Worth, Texas 76137.

Examining the AD Docket

You may examine the AD docket on the Internet at *http://www.regulations.gov* or in person at the Docket Operations Office between 9 a.m. and 5 p.m., Monday through Friday, except Federal holidays. The AD docket contains this AD, the economic evaluation, any comments received, and other information. The street address for the Docket Operations Office (phone: 800–647–5527) is U.S. Department of Transportation, Docket Operations Office, M–30, West Building Ground Floor, Room W12–140, 1200 New Jersey Avenue SE., Washington, DC 20590.

FOR FURTHER INFORMATION CONTACT: Nicholas Faust, Aviation Safety Engineer, Boston Aircraft Certification Office, Engine & Propeller Directorate, 12 New England Executive Park, Burlington, Massachusetts 01803; telephone (781) 238–7763; email *nicholas.faust@faa.gov.*

SUPPLEMENTARY INFORMATION:

Discussion

On October 3, 2014, at 79 FR 59697, the **Federal Register** published our notice of proposed rulemaking (NPRM), which proposed to amend 14 CFR part 39 by adding an AD that would apply to Kaman Model K–1200 helicopters with certain part-numbered MRBs installed. The NPRM proposed to require performing repetitive X-Ray and visual inspections of each wooden MRB for a crack, wood split, void, or delamination at intervals not exceeding 1,000 hours time-in-service (TIS). If there is a crack, wood split, void, or delamination, the NPRM proposed to require repairing or replacing the MRB before further flight. The NPRM also proposed accomplishing the required inspections and repairs by a method approved by the Manager of the Boston Aircraft Certification Office.

The NPRM was prompted by reports of cracks found in the MRB spar during X-ray and teardown inspections with the MRB removed from the helicopter. The proposed requirements were intended to detect a crack in the MRB, which could lead to failure of the MRB and subsequent loss of control of the helicopter.

Since we issued the NPRM, we discovered a typographical error in paragraph (a) of this AD, where we incorrectly stated the design approval holder's name as Kaman Aerospace Incorporated instead of Kaman Aerospace Corporation, as specified by the current FAA type certificate. We have corrected this error.

Comments

After our NPRM (79 FR 59697, October 3, 2014), was published, we received comments from one commenter.

Request

Kaman suggested, without explanation, clarifying the description of the cost to replace an MRB set in the Cost of Compliance section by adding the word ''non-repairable'' before ''MRB set.''

We disagree. Operators may elect to replace a repairable MRB set instead of having the MRBs repaired. The ability to repair a MRB set does not change the cost of replacement.

Kaman also suggested, without explanation, changing the compliance time in paragraph (e)(1) of this AD to state, ''When the MRB reaches 3,000 hours TIS and before it reaches 3,050 hours TIS . . .''

We disagree. This AD requires an initial inspection before 3,000 hours TIS but allows an additional 50 hours TIS for any MRBs that have already accumulated 3,000 hours TIS as of the effective date of this AD. The suggested language would change two requirements. First, it would allow the additional 50 hours TIS for all affected helicopters and is inconsistent with Kaman's service information. Second, it would prohibit blades to be inspected before they accumulate 3,000 hours.

FAA's Determination

We have reviewed the relevant information, considered the comments received, and determined that an unsafe condition exists and is likely to exist or develop on other products of these same type designs and that air safety and the public interest require adopting the AD requirements as proposed with minor editorial change described previously. This change is consistent with the intent of the proposals in the NPRM (79 FR 59697, October 3, 2014) and will not increase the economic burden on any operator nor increase the scope of the AD.

Related Service Information

We reviewed Kaman Maintenance Manual 04–00–00, Continued Airworthiness, Revision 31, dated August 1, 2013, which establishes the airworthiness limitations for the Model K–1200 helicopter. The airworthiness limitations establish an MRB life limit of 8,000 hours TIS and also establish a recurring 1,000 hour Rotor Blade Spar Inspection for each MRB with 3,000 or more hours TIS.

We also reviewed Kaman Maintenance Manual 05–20–06, 1,000 Hour Rotor Blade Spar Inspection, Revision 31, dated August 1, 2013, which specifies returning each MRB to Kaman every 1,000 hours for inspection after the MRB accumulates 3,000 hours TIS.

Costs of Compliance

We estimate that this AD will affect 11 helicopters of U.S. Registry. We estimate that operators may incur the following costs in order to comply with this AD. At an average labor cost of $85 per work-hour, inspecting each matched pair of main rotor blades requires about 160 work-hours and required parts cost about $2,000, for a cost per MRB set of $15,600 and a cost per helicopter of $31,200 per inspection cycle. If required, repairing a cracked MRB requires about 335 work-hours and required parts cost about $15,000, for a cost per MRB of $43,475. Replacing an MRB set requires about 4 work-hours, and required parts cost about $495,000, for a cost per helicopter of $495,340.

Authority for This Rulemaking

Title 49 of the United States Code specifies the FAA's authority to issue rules on aviation safety. Subtitle I, section 106, describes the authority of the FAA Administrator. Subtitle VII: Aviation Programs, describes in more detail the scope of the Agency's authority.

We are issuing this rulemaking under the authority described in Subtitle VII, Part A, Subpart III, Section 44701: ''General requirements.'' Under that section, Congress charges the FAA with promoting safe flight of civil aircraft in air commerce by prescribing regulations for practices, methods, and procedures the Administrator finds necessary for safety in air commerce. This regulation is within the scope of that authority because it addresses an unsafe condition that is likely to exist or develop on products identified in this rulemaking action.

Regulatory Findings

This AD will not have federalism implications under Executive Order 13132. This AD will not have a substantial direct effect on the States, on the relationship between the national government and the States, or on the distribution of power and responsibilities among the various levels of government.

For the reasons discussed above, I certify that this AD:

(1) Is not a ''significant regulatory action'' under Executive Order 12866;

(2) Is not a ''significant rule'' under DOT Regulatory Policies and Procedures (44 FR 11034, February 26, 1979);

(3) Will not affect intrastate aviation in Alaska to the extent that it justifies making a regulatory distinction; and

(4) Will not have a significant economic impact, positive or negative, on a substantial number of small entities under the criteria of the Regulatory Flexibility Act.

We prepared an economic evaluation of the estimated costs to comply with this AD and placed it in the AD docket.

List of Subjects in 14 CFR Part 39

Air transportation, Aircraft, Aviation safety, Incorporation by reference, Safety.

Adoption of the Amendment

Accordingly, under the authority delegated to me by the Administrator, the FAA amends 14 CFR part 39 as follows:

PART 39—AIRWORTHINESS DIRECTIVES

■ 1. The authority citation for part 39 continues to read as follows:

Authority: 49 U.S.C. 106(g), 40113, 44701.

§ 39.13 [Amended]

■ 2. The FAA amends § 39.13 by adding the following new airworthiness directive (AD):

2015–14–04 Kaman Aerospace Corporation: Amendment 39–18202; Docket No. FAA–2014–0758; Directorate Identifier 2013–SW–062–AD.

(a) Applicability

This AD applies to Kaman Aerospace Corporation (Kaman) Model K–1200 helicopters with a main rotor blade (MRB) part number K911001–009, K911001–010, K911001–109, or K911001–110 installed, certificated in any category.

(b) Unsafe Condition

This AD defines the unsafe condition as a crack in an MRB, which could lead to failure of the MRB and subsequent loss of control of the helicopter.

(c) Effective Date

This AD becomes effective August 17, 2015.

(d) Compliance

You are responsible for performing each action required by this AD within the specified compliance time unless it has already been accomplished prior to that time.

(e) Required Actions

(1) Before the MRB reaches 3,000 hours time-in-service (TIS) or within 50 hours TIS, whichever occurs later, and thereafter at intervals not exceeding 1,000 hours TIS:

(i) X-Ray inspect each MRB between station (STA) 30 and 289 for a crack, a wood split, a void, and delamination.

(ii) Using a 10X or higher power magnifying glass, inspect each spar plank between STA 33 and STA 78 for a wood split or a crack, and inspect each spar plank to plank glueline for a void or delamination.

(2) If there is a crack, wood split, void, or delamination within maximum repair damage limits in an MRB, before further flight, repair the MRB. If there is a crack, wood split, void, or delamination exceeding maximum repair damage limits in an MRB, before further flight, replace the MRB with an airworthy MRB.

(3) Each inspection and repair procedure required for compliance with Paragraphs (e)(1) and (e)(2) of this AD must be accomplished by a method approved by the Manager, Boston Aircraft Certification Office (ACO). For a repair method to be approved by the Manager, Boston ACO, as required by this AD, the Manager's approval letter must specifically refer to this AD.

(f) Alternative Methods of Compliance (AMOCs)

(1) The Manager, Boston Aircraft Certification Office, FAA, may approve AMOCs for this AD. Send your proposal to: Nicholas Faust, Aviation Safety Engineer, Boston Aircraft Certification Office, Engine & Propeller Directorate, 12 New England Executive Park, Burlington, Massachusetts 01803; telephone (781) 238–7763; email *nicholas.faust@faa.gov.*

(2) For operations conducted under a 14 CFR part 119 operating certificate or under 14 CFR part 91, subpart K, we suggest that you notify your principal inspector, or lacking a principal inspector, the manager of the local flight standards district office or certificate holding district office before operating any aircraft complying with this AD through an AMOC.

(g) Additional Information

Kaman Aerospace Corporation Maintenance Manual 04–00–00, Continued Airworthiness, Revision 31, dated August 1, 2013, and Kaman Aerospace Corporation Maintenance Manual 05–20–06, 1,000 Hour Rotor Blade Spar Inspection, Revision 31, dated August 1, 2013, which are not incorporated by reference, contain additional information about the subject of this AD. For service information identified in this AD, contact Kaman Aerospace Corporation, Old Windsor Rd., P.O. Box 2, Bloomfield, Connecticut 06002–0002; telephone (860) 242–4461; fax (860) 243–7047; or at *http://www.kamanaero.com.* You may review a copy of this service information at the FAA, Office of the Regional Counsel, Southwest Region, 2601 Meacham Blvd., Room 663, Fort Worth, Texas 76137.

(h) Subject

Joint Aircraft Service Component (JASC) Code: 6210, Main Rotor MRB.

Issued in Fort Worth, Texas, on June 29, 2015.

Lance T. Gant,

Acting Directorate Manager, Rotorcraft Directorate, Aircraft Certification Service.

Airworthiness Directives; The Boeing Company Airplanes

AGENCY: Federal Aviation Administration (FAA), DOT.

ACTION: Final rule.

SUMMARY: We are adopting a new airworthiness directive (AD) for The Boeing Company Model 747 airplanes equipped with a main deck side cargo door (MDSCD). This AD was prompted by recent testing that indicates that intermodal containers, when loaded as cargo, under certain flight-load conditions, can shift and impact the adjacent fuselage frames. This AD requires revising the airplane flight manual (AFM) to incorporate limitations for carrying certain payloads. We are issuing this AD to prevent intermodal containers loaded in the offset method from shifting during flight gust loads and damaging fuselage frames, which could lead to the structural failure of the aft fuselage in flight and subsequent in-flight breakup of the airplane.

DATES: This AD is effective August 17, 2015.

Examining the AD Docket

You may examine the AD docket on the Internet at *http://www.regulations.gov* by searching for and locating Docket No. FAA–2014–0780; or in person at the Docket Management Facility between 9 a.m. and 5 p.m., Monday through Friday, except Federal holidays. The AD docket contains this AD, the regulatory evaluation, any comments received, and other information. The address for the Docket Office (phone: 800–647–5527) is Docket Management Facility, U.S. Department of Transportation, Docket Operations, M–30, West Building Ground Floor, Room W12–140, 1200 New Jersey Avenue SE., Washington, DC 20590.

FOR FURTHER INFORMATION CONTACT:
Steven C. Fox, Senior Aerospace Engineer, Airframe Branch, ANM–120S, FAA, Seattle Aircraft Certification Office (ACO), 1601 Lind Avenue SW., Renton, WA 98057–3356; phone: 425–917–6425; fax: 425–917–6590; email: *steven.fox@faa.gov.*

SUPPLEMENTARY INFORMATION:

Discussion

The FAA issued a notice of proposed rulemaking (NPRM) to amend 14 CFR part 39 by adding an AD that would apply to The Boeing Company Model 747 airplanes equipped with an MDSCD. The NPRM published in the **Federal Register** on December 1, 2014 (79 FR 71037). The NPRM was prompted by recent testing, which indicates that intermodal containers, when loaded as cargo, under certain flight-load conditions, can shift and impact the adjacent fuselage frames. The NPRM proposed to require revising the AFM to incorporate limitations for carrying certain payloads. We are issuing this AD to prevent intermodal containers loaded in the offset method from shifting during flight gust loads and damaging fuselage frames, which could lead to the structural failure of the aft fuselage in flight and subsequent in-flight breakup of the airplane.

Background

Intermodal containers are common in the cargo shipping industry and transported by ships, trains, and trucks. The focus of this final rule is an intermodal container that is nominally 20 feet long, 8 feet wide, and 8.5 feet tall. This nominally sized intermodal container includes the dimensions of an International Organization for Standardization (ISO) container ISO 668–1CC. Because the intermodal containers themselves do not meet the requirements of FAA Technical Standard Order TSO–C90D, ‘‘Cargo Pallets, Nets and Containers (Unit Load Devices),’’ the lower surface on these intermodal containers is incompatible with most airplane cargo-loading systems (CLSs). These intermodal containers, however, can be concentrically loaded on an FAA-approved TSO–C90D pallet with a certified net combination and loaded in the center of the airplane, restrained by the CLS or a series of straps connected to the aircraft structure in accordance with the airplane's FAA-approved Weight and Balance Manual (WBM) procedures for cargo that is not a Unit Load Device (ULD).

The WBM is part of the Operating Limitations section of the Airplane Flight Manual (AFM). In accordance with 14 CFR 21.41, the Operating Limitations are part of the airplane type certificate and, therefore, can be modified only by changing that certificate; that is, by obtaining an amended or supplemental type certificate. Revisions to the AFM are approved as AFM supplements, and the approval is based on a finding that, with the AFM revisions, the airplane continues to meet the applicable airworthiness standards. Operators are required to comply with the Operating Limitations by 14 CFR 91.9(a).

The FAA has become aware that some operators, both domestic and foreign, are not loading these containers in the center of the airplane, but rather in the standard left and right pallet positions. When loaded in this manner, the 8-foot, 6-inch, height of the intermodal container interferes with the fuselage, so some operators have been transporting these intermodal containers shifted inboard, off of the FAA-approved TSO pallets, and attached to the pallet only with a net and/or straps. This method of transport is referred to as the ‘‘offset method.’’ The practice of offsetting the intermodal containers results in the certified pallet-net combination having slack in the net by the amount of the offset. FAA observations have found the offset for intermodal containers is as much as 9 inches, with the corresponding 9 inches of slack in the TSO pallet net.

Although additional cargo straps have been used to restrain the intermodal containers to the pallets, the FAA determined that these straps are not effective, and the intermodal container can shift in flight. In 2013, a U.S. cargo operator requested permission from the FAA to carry intermodal containers on Boeing Model 747 airplanes using the offset method—similar to procedures used by other U.S. and non-U.S. air carriers. Based on the FAA's review of the offset method, it denied the operator's request.

Industry Testing of the Offset Method

In March 2014, some U.S. cargo operators and Boeing conducted a series of full-scale tests, witnessed by the FAA, to demonstrate that carrying intermodal containers by the offset method could be shown safe and compliant to the applicable regulations. The test procedures were developed by engineers from Boeing and some U.S. cargo operators, and were intended to show compliance for flight loads on Model 747 airplanes only. The results produced CLS failures and excessive deflections. The preliminary test results confirmed the FAA's safety concerns.

U.S. operators and Boeing conducted additional testing to demonstrate that carrying intermodal containers by the offset method could be shown to be safe and compliant with applicable regulations. This testing used methods from National Aerospace Standard (NAS) 3610, with maximum payloads that were reduced from those tested previously. The intent was for Boeing to use the test data to develop an appropriate loading method that could be incorporated into the Boeing Model 747 WBMs. The certified pallet net was not used because previous testing showed it ineffective in restraining the ISO container as the offset of the container on the pallet introduces slack in the net, with the container essentially free to move laterally in the airplane by the amount of the offset.

Significant engineering resources were applied, and a complex method of strapping installation and procedures and sequence for tightening the straps was developed to preclude the excessive deflections experienced during earlier tests. While a few load cases were successful, some had very small margins (precluding any reduction of the complexity of the nearly 100 straps required). The testing was halted after attempts to substantiate vertical loading repetitively overloaded the forward and aft CLS restraint locks, and the proposed cargo restraining method was deemed unviable.

FAA engineering from the Transport Airplane Directorate has been extensively involved in the testing of offset loading methods for intermodal containers with the objective to determine and document a safe and compliant methodology that could be the basis for a Boeing Model 747 Weight and Balance Supplement for airline use worldwide. Testing to date indicates this objective has not been met.

When positioned in accordance with the WBMs, an intermodal container is secured to the CLS pallet along its entire length by straps and netting. Offsetting the container has the effect of creating slack in the net and straps, except at the ends of the container. As a result, when gust loads are encountered, most of the loads are transferred to the locks at the ends of the container and are not shared with the locks in the middle. This uneven loading has the effect of exceeding the structural capability of the locks at the ends of the container. This phenomenon quickly failed the forward and aft CLS locks during vertical testing, as confirmed by both sets of industry testing.

At this time, there is no offset method for restraining intermodal containers that has been demonstrated to be safe and compliant.

Safety Issue

The current practice of carrying an intermodal container by the offset method is not currently permitted by the Boeing Model 747 WBMs. A series of tests has verified that an intermodal container, under certain flight-load conditions, can shift in both the outboard and vertical directions. This shift by the intermodal container can damage as many as ten fuselage frames per container position during flight, leading to the structural failure of the aft fuselage in flight, and subsequent in-flight breakup of the airplane.

Normally, the FAA does not issue ADs to address non-compliance with existing regulations. But because of the widespread nature of these practices, the FAA has determined that issuing an AD is the most effective means of addressing this unsafe condition.

This final rule, therefore, revises the Operating Limitations section of the FAA-approved AFM to incorporate limitations on carrying certain payloads. As revised, the AFM expressly states the pre-existing prohibition on carriage of either (1) intermodal containers nominally sized at 20 feet long, 8 feet wide, and 8.5 feet tall, or (2) ISO 668–1CC containers, if those containers are not concentrically loaded on a pallet and restrained to the aircraft in accordance with the FAA-approved WBMs or WBM supplement.

Explanation of Changes to the Final Rule

Since issuing the NPRM (79 FR 71037, December 1, 2014), the FAA has learned that some operators might regard changes that they make to the Boeing Weight and Balance Manual to be ''FAA approved,'' even though the operators have not sought FAA approval through the supplemental type certificate process, as described in the NPRM. To clarify that only changes made through the type certificate process are considered ''FAA approved,'' we have revised the language of the final rule to specifically reference the FAA-approved Boeing type certificate Weight and Balance Manual or a Supplemental Weight and Balance Manual approved through the supplemental type certificate process. Given the comments opposing the proposed AD discussed below, it is apparent that the commenters were not confused on this point. Nevertheless, this clarification will prevent confusion for any operator in the future.

Comments

We gave the public the opportunity to participate in developing this AD. The following presents the comments received on the NPRM (79 FR 71037, December 1, 2014) and the FAA's response to each comment.

Support for the NPRM (79 FR 71037, December 1, 2014)

The Air Line Pilots Association, International (ALPA), stated that they fully support the intent of the NPRM (79 FR 71037, December 1, 2014).

Request To Withdraw NPRM (79 FR 71037, December 1, 2014): Intermodal Containers Are Permitted by WBMs

The Cargo Airline Association, Atlas Air, International Air Transport Association (IATA), National Air Carrier Association (NACA), Kalitta Air, LLC (Kalitta), and the Michigan Senate requested that we withdraw the NPRM (79 FR 71037, December 1, 2014). The commenters asserted that offset intermodal containers are permitted by the Boeing Model 747 WBMs. The commenters also asserted that the Boeing Model 747 WBMs permit the restraint of an intermodal container and pallet assembly with cargo restraint straps only to the pallet (and not the airplane itself), whether or not the container is offset. The commenters concluded that the NPRM statement indicating that ''the current practice of carrying an intermodal container by the offset method is not permitted by the Boeing Model 747 Weight and Balance Manual'' is incorrect and completely at odds with Boeing's WBMs. The commenters limited their views to only those Model 747 WBMs created by Boeing.

We disagree with the request. Since the commenters did not address any supplemental WBMs produced by holders of supplemental type certificates (STCs), our response is limited to a discussion of the Boeing Model 747 WBMs. As explained below, contrary to the commenters' assertions, the Boeing Model 747 WBMs do not permit loading of either offset intermodal containers or intermodal containers strapped only to the pallet.

As discussed in the NPRM, in accordance with section 21.41 of the Federal Aviation Regulations (14 CFR 21.41), the operating limitations are part of the airplane's type certificate (TC). The operating limitations specified in the Boeing Model 747 WBMs are established by the TC holder at the time of type certification as necessary to demonstrate that the airplane, when properly loaded, will comply with all applicable airworthiness requirements. One of these requirements is to demonstrate the capability of the airplane to continue safe operation when subjected to a range of structural loads that may be encountered during operations (14 CFR 25.1519). The Boeing Model 747 WBMs provide operators with detailed instructions, including restrictions, on how the airplane may be loaded such that after loading and during flight the airplane still is in compliance with the operating limitations.

The Boeing Model 747 cargo airplanes are equipped with a cargo loading system, which is part of the airplane's type design and consists of roller trays, guides, latches, and locks that restrain the cargo to the airplane for flight loads. A Unit Load Device (ULD) is a device for grouping and retaining cargo for transit. The Boeing Model 747 WBMs include, as part of the operating limitations, instructions that identify which ULDs may be loaded into the airplane's cargo loading system on the main cargo deck of the airplane without additional restraint to the airplane's structure.

Although the actual wording in these manuals varies slightly, all Boeing Model 747 WBMs require that, to be carried on the main deck without additional restraints, ''certified'' ULDs must conform to FAA Technical Standard Order (TSO) TSO–C90, ''Cargo Pallets, Nets, and Containers,'' or to National Aerospace Standard (NAS) 3610 (''Cargo Unit Load Devices—Specification For''), the document the TSO references as a requirement. NAS 3610 is an industry standard used to define the required configuration and certification testing for various ULDs.

The types of certified ULDs identified in the Boeing Model 747 WBMs are NAS 3610-compliant containers) and pallet-net combinations. Containers identified in NAS 3610 are attached directly to the airplane's cargo loading system. Intermodal containers, which are the subject of this AD, do not meet the standard for NAS 3610 containers. For the pallet-net combinations, the cargo is restrained to the pallet by a net that attaches to the pallet on all four sides and covers the cargo. Under the Boeing Model 747 WBMs, an intermodal container may be loaded into a certified pallet-net combination ULD as long as the intermodal container is located within the perimeter of the pallet. However, as explained in the NRPM, an intermodal container offset from its pallet introduces slack in the corresponding net and, therefore, does not meet the requirements of NAS 3610 and is not allowed as a certified ULD under the Boeing Model 747 WBMs.

The Boeing Model 747 WBMs require that all cargo other than the identified ULDs be restrained to the airplane by straps in accordance with instructions specified in the WBMs. The Boeing Model 747 WBMs provide detailed instructions that define the specific locations where straps must be attached to the airplane structure, as well as other information such as maximum weights to be restrained at each location. With one recently approved exception,[1] nothing in the Boeing Model 747 WBMs or in NAS 3610 allows for the use of straps to restrain cargo to the ULD pallet itself.

Therefore, contrary to the commenters' assertions, the Boeing Model 747 WBMs do not permit loading of either offset intermodal containers or intermodal containers strapped only to the pallet. Furthermore, neither Boeing nor any of the commenters have shown that the airplane, when loaded with offset containers, complies with the applicable airworthiness standards of part 25. As discussed in the NPRM, any such showing would have to be done by a change to the type certificate in accordance with FAA Order 8110.4C.

We have not changed this final rule regarding this issue.

Opposition to NPRM (79 FR 71037, December 1, 2014): History of Safety

IATA, Kalitta, and the Michigan Senate opposed the NPRM (79 FR 71037, December 1, 2014), stating that it does not refer to any incident or accident. The commenters reported that for more than 40 years, intermodal containers loaded as offset cargo have been carried with no damage to frames.

We disagree with the commenters' conclusion. As discussed in the NRPM, industry and Boeing testing have shown that offset loading of intermodal containers can allow the cargo to shift, which would be unsafe under certain flight load conditions. (The AD docket contains a Boeing presentation summarizing these test results.) The purpose of this AD, and all ADs, is to correct an unsafe condition regardless of whether that condition has caused accidents in the past.

Furthermore, in general, the shifting of cargo in flight has resulted in numerous incidents and accidents. For example, on August 7, 1997, Fine Air Flight 101 crashed shortly after takeoff from Miami because cargo shifted. Similarly, all evidence indicates that on April 29, 2013, National Airlines Flight 102 crashed shortly after takeoff from Bagram, Afghanistan, because cargo shifted. We have not changed this final rule regarding this issue.

Request To Withdraw NPRM (79 FR 71037, December 1, 2014): Proposal Based on Unfounded Principles

Atlas Air, the Cargo Airline Association, Kalitta, NACA, and United Parcel Service (UPS) requested that we withdraw the NPRM (79 FR 71037, December 1, 2014) because it misstates an important principle. The commenters noted that the NPRM stated that ''the Weight and Balance Manual is part of the Operating Limitations section of the Airplane Flight Manual (AFM).'' The commenters asserted that a reader could infer from this that all content in an airplane manufacturer's WBMs is part of the Operating Limitations section of the AFM. The commenters contended that since Boeing's Model 747 WBMs contain operating procedures in addition to operating limitations, only portions of the WBMs are part of the Operating Limitations section of the AFM. The commenters also noted that Boeing frequently revises the WBMs, and when Boeing does so, Boeing does not amend the type certificate, which the commenters assert would be ''a laborious process.''

We agree with the commenters' proposition that not all of a manufacturer's WBM is necessarily part of the AFM operating limitations, but we disagree with their assertion that FAA-approved loading instructions are not operating limitations. We also disagree with the commenters' request to change the rule as originally proposed. As provided in 14 CFR 25.1583(c), the WBM is referenced in the AFM and contains operating limitations approved under that section. Section 25.1583(c)(2) requires that the AFM include loading instructions that are necessary to ensure loading of the airplane within the weight and center of gravity limits, and to maintain the loading within these limits in flight. While the Boeing Model 747 WBMs may include information other than limitations, the loading instructions discussed previously are limitations, and the FAA approved the Boeing Model 747 WBMs based on a determination that, as operating limitations, these instructions were adequate to meet the requirements of 14 CFR 25.1583.

For many years the FAA has recognized that both the weight and balance information and the loading instructions are operating limitations.

[1] The FAA recently approved a supplement to the Boeing Model 747 WBMs that allows strapping of cargo to a pallet under limited circumstances that are not relevant to this rulemaking.

For example, in FAA Advisory Circular (AC) 25.1581–1, dated July 14, 1997 (*http://rgl.faa.gov/Regulatory_and_Guidance_Library/rgAdvisoryCircular.nsf/0/cb7efbdd420bd265862569b3005479d7/$FILE/AC25-1581-1.pdf*), the FAA stated, in Section 2b(1), ''Any limitations on airplane loading associated with the stated weight limitations must be included in the AFM or addressed in a separate weight and balance document.''

These loading instructions are the procedures that Boeing determined were necessary to load and restrain cargo for flight loads; these instructions are used to show compliance with the design requirements for the airplane, including the structural capabilities of the cargo loading system, airplane floors, and fuselage, and are therefore operating limitations. The types of ULDs and methods to restrain cargo are limitations provided in the Boeing Model 747 WBMs that ensure the airplane structure is not overloaded throughout the airplane's defined flight envelope. For this reason, additions to the approved list of ULDs or deviations to the structural tie-down locations that are not approved through the type certification process result in noncompliant and unknown conditions that could result in the structural overload to the airplane under certain flight loads.

Adopting the commenters' argument that these loading instructions are not limitations and, therefore, not mandatory would lead to the anomalous result that, while the weight and balance limitations are mandatory, the means to ensure they are complied with are not.

Regarding the commenter's statement that Boeing frequently changes the WBMs, those changes are in fact changes to the type certificate, which are approved by the FAA or its designees. We have not changed this final rule regarding this issue.

Opposition to NPRM (79 FR 71037, December 1, 2014): AD Approach Is Overly Broad and Burdensome

Kalitta asserted that the NPRM (79 FR 71037, December 1, 2014) appears to assume that the offset configuration is already forbidden because it is not explicitly provided for in the Boeing Model 747 WBMs—*i.e.,* unless the loading of a specific ULD or type of cargo and configuration is specifically defined in the Boeing Model 747 WBMs, it is prohibited. The commenter asserted that this is a novel interpretation and is unduly restrictive, contrary to accepted and normal air carrier operations and contrary to the FAA's own guidance material, and will have a significant and far-reaching operational and economic impact on all U.S. air carriers in the future, no matter what kind of aircraft they operate. The commenter stated that the FAA should carefully consider the ramifications of adopting a policy of ''what is not explicitly allowed is forbidden.'' The commenter stated that this approach reaches well beyond the particular matter at hand, and can create a regulatory environment that stifles innovation, and requires a manufacturer or the FAA to think in advance of every kind of operation that may possibly arise, and provide for it in the regulatory documents. According to the commenter, this would create an impossible burden on government and industry both.

We disagree with the commenter's assertions. As discussed previously, the Boeing Model 747 WBMs define safe and compliant methods for loading the airplane. The Boeing Model 747 WBMs provide the instructions required by 14 CFR 25.1583, enabling the operators to load and restrain cargo in a manner that does not permit the shifting of cargo during flight, which could cause damage to the airplane or result in a configuration leading to the loss of control of the airplane. As discussed previously, these instructions are considered operating limitations. Operation of the airplane beyond those limits is not permitted by the Boeing Model 747 WBMs. Section 121.135(b)(21) requires operators to include in their manuals methods and procedures for maintaining the aircraft weight and center of gravity within approved limits. The unsafe condition addressed in this AD is a result of operators having adopted methods and procedures that are contrary to the WBM instructions and, as a result, not within the approved limits.

Innovations are acceptable provided they meet the limits specified in the WBMs. Innovations that exceed those limits must be approved as changes to the WBM, as required by subparts D and E of 14 CFR part 21, and as provided in FAA Order 8110.4C, dated March 28, 2007 (*http://rgl.faa.gov/Regulatory_and_Guidance_Library/rgOrders.nsf/0/d21193af2d37a8ba862570ab0054c104/$FILE/8110.4C_CHG5_Incorporated.pdf*), which describes the process for obtaining FAA approval for changes to the airplane's type certificate. We have not changed this final rule regarding this issue.

Opposition to NPRM (79 FR 71037, December 1, 2014): Unrealistic Cost Estimate

Cargo Airline Association, Atlas Air, IATA, NACA, and Kalitta alleged that the FAA's determination of the estimated costs to comply with the NPRM (79 FR 71037, December 1, 2014) is fundamentally flawed because it is based on an unreasonably narrow view of the AD's costs and, as a result, the FAA's cost estimate is unrealistically low. The commenters concluded that the AD, if issued as proposed, would have significant, multi-million dollar cost consequences and competitiveness implications for all U.S. Model 747 freighter operators, with no appreciable countervailing safety benefits. In particular, the commenters stated that when intermodal containers are carried in the offset manner, additional cargo can be carried in the adjacent cargo pallet positions. The commenters further asserted that if the intermodal containers are required to be restrained to the airplane, the necessary restraint configuration would preclude the carriage of the adjacent positions and that revenue from the adjacent positions would be lost.

We do not agree with the commenters' allegations. As discussed previously and in the NPRM, carriage of offset containers is contrary to the limitations in the Boeing Model 747 WBMs and, therefore, contrary to 14 CFR 91.9(a). The intent of this AD is to require operators to revise their AFMs in a manner that eliminates this already-noncompliant practice, which we have determined creates an unsafe condition. Based on the FAA's determination that this conduct is noncompliant, the FAA has already directed individual operators not to carry intermodal containers using the offset method.[2] Issuance of this AD fulfills the FAA's international obligations of informing foreign airworthiness authorities of the existence of this unsafe condition and of the appropriate means for addressing it, as well as reinforces the determination discussed previously.

Moreover, the cost associated with ceasing noncompliant conduct is not attributable to this AD, regardless of how profitable that conduct may be. The cost information in AD actions describes only the direct costs of the specific action required by the AD—in this case, revising the AFM. We recognize that, in doing the actions required by an AD, operators might incur operational costs in addition to the direct costs. The cost

[2] For example, a letter dated May 2, 2014, directing Kalitta to discontinue this practice is included in the docket.

analysis in AD rulemaking actions, however, typically does not include incidental or operational costs such as the time required for planning or other administrative actions. Our analysis also would not include possible revenue lost as a result of ending noncompliant operations. The FAA recognizes that the reason operators carry intermodal containers in violation of the Boeing Model 747 WBM limitations is that it is more profitable. The amount of revenue that could be generated when cargo is carried in a noncompliant manner is almost impossible to calculate.

We have not changed this final rule regarding this issue.

Opposition to NPRM (79 FR 71037, December 1, 2014): Economic Impact on Small Entities

Kalitta and the Michigan Senate stated that the NPRM (79 FR 71037, December 1, 2014) fails to account for impact on small entities because most airlines that would be affected by the NPRM have fewer than 1,500 employees. The commenters stated that this is a significant economic impact by loss of revenue.

As discussed previously, we have determined that there is no significant impact on air carriers in the United States because loading offset intermodal containers is contrary to the limitations of the Boeing Model 747 WBMs, and is therefore already prohibited. That is, whether or not this final rule is issued, the practice of carrying intermodal containers in the offset method is not permitted for U.S. air carriers as it is a noncompliant and unsafe practice.

Opposition to NPRM (79 FR 71037, December 1, 2014): Inadequate Testing

Cargo Airline Association, Atlas Air, NACA, IATA, Kalitta, and the Michigan Senate criticized the tests discussed in the NPRM (79 FR 71037, December 1, 2014) that confirmed the FAA's determination that loading containers in the offset position is an unsafe condition, arguing they were unrealistic or inconclusive. In general, the commenters claimed that the tests used configurations of intermodal containers and their restraints that are different from those used in service and applied pass-fail criteria that were unnecessarily stringent.

We do not agree that the tests were unrealistic or inadequate. A detailed discussion of the commenters' technical concerns regarding the tests is included in the AD docket.

In short, the tests of offset intermodal containers discussed in the NPRM included a range of configurations, including those that the participants, including Boeing and cargo operators, considered necessary to show compliance to the regulations, and even a scenario using empty containers. The tests demonstrated that offset intermodal containers would not be restrained securely for flight loads such as heavy turbulence. As discussed previously, loading offset intermodal containers is already contrary to the limitations of the Boeing Model 747 WBMs. If commenters believe that they can show compliance with the applicable part 25 airworthiness standards using offset containers, they may apply for supplemental type certificates (STCs). Any such STCs, if granted, would also be considered as a possible alternative method of compliance (AMOC) to this AD.

Request To Delay Issuance of AD Pending Acceptance of New Testing

Kalitta, NACA, and the Michigan Senate requested that we delay issuing a final AD because new testing by Kalitta shows that the offset configuration can be used without posing a threat to safety.

We disagree with the request. The test process and results have not been submitted to the FAA for approval. However, if the testing is completed and approved, it may serve as the basis for a new STC, which we would then consider as a possible AMOC to this AD. We have not changed this final rule regarding this issue.

Request To Withdraw NPRM (79 FR 71037, December 1, 2014): Unnecessary Based on New Operating Specifications

Cargo Airline Association, IATA, Kalitta, NACA, and the Michigan Senate requested that we withdraw the NPRM (79 FR 71037, December 1, 2014). IATA recently issued Operating Specification (OS) 6/13 (ULD: Operating Specifications). According to the commenters, IATA OS 6/13 provides guidance for safely handling multiple configurations of offset sea-land (intermodal) containers and ensuring the effectiveness and ultimate load strength of tie-down arrangements. The commenters asserted that offset methods for intermodal containers developed in the 1970s by some airlines had received Boeing support and approval.

We disagree with the request. The commenters did not submit data to show how IATA OS 6/13 complies with the applicable regulations. Further, IATA OS 6/13 documents procedures similar to those found to have failed early on in the testing described in the preamble to the NPRM. For example, these procedures include strapping the intermodal container to the pallet, and not directly to the airplane. In fact, the procedures described in IATA OS 6/13 are contrary to the Boeing Model 747 WBMs for the reasons discussed previously.

The commenters provided no evidence of Boeing support and approval regarding use of offset methods. Boeing's comments did not include any statement that offset carriage of intermodal containers without restraint directly to the airplane complies with the Boeing Model 747 WBMs. Neither the FAA nor Boeing has found any evidence that Boeing was involved in or aware of the carriage of intermodal containers in the 1970s.

We have not changed this final rule regarding this issue, although any operator may request approval of an AMOC for use of an STC WBM supplement. However, in this case, because IATA OS 6/13 is so similar to the documented tested failures, new test data would be required to show that the IATA method meets the applicable airworthiness requirements to support approval of an STC.

Request To Allow Offset Containers, If Strapped to Airplane

Atlas Air, Boeing, AirbridgeCargo Airlines LLC (AirbridgeCargo), NACA, and UPS requested that the intermodal containers be allowed to be loaded offset on the pallet, provided that the containers are restrained directly to the airplane by retention straps. A number of the commenters stated that this practice is already allowed by the WBMs and that they currently use this method.

We disagree with the request. None of the commenters provided any actual data demonstrating a compliant restraint method to the airplane for an offset intermodal container. Further, none have demonstrated that they currently use a method complying with the Boeing WBMS. The Boeing Model 747 WBMs describe how to restrain cargo, offset or not, as special cargo restrained to the airplane; however, when the cargo is restrained correctly to the airplane, so many straps would be attached to so many locations on the aircraft that no cargo could be carried adjacent to the offset intermodal container. Thus, the benefit of increased capacity gained by installing an offset container would be lost. Therefore, the FAA finds it unlikely that operators are actually using compliant methods to restrain offset intermodal containers.

We have not changed this final rule regarding this issue. However, under the provisions of paragraph (i) of this AD, we will consider requests for approval of an AMOC if sufficient data are submitted to substantiate that the alternative method would provide an acceptable level of safety. These data would need to include the compliant restraint methodology.

Request To Withdraw NPRM (79 FR 71037, December 1, 2014): Unlevel Playing Field With International Carriers

Kalitta and the Michigan Senate requested that we withdraw the NPRM (79 FR 71037, December 1, 2014). They asserted that by issuing this AD we provide their foreign competitors with a significant competitive advantage. Kalitta stated that while the FAA may believe that incorporation of these restrictions into an AD will solve the competition problem by ''leveling the playing field,'' as they will apply to all U.S. carriers, and will be adopted by many foreign governments, the agency needs to reconsider this position. The commenters added that foreign authorities may or may not adopt the AD as written, but they have wide latitude in what sort of AMOCs they will permit their carriers to use. The commenters also stated that foreign authorities will very likely look to the IATA standards to provide an acceptable AMOC, enabling their carriers to continue to operate in the very manner that will be foreclosed to U.S. air carriers.

Kalitta asserted that this ''unexpected gift to foreign airlines'' is not necessitated by safety of flight, and is contrary to the policy considerations mandated by Congress in the International Air Transportation Competition Act (49 U.S.C. 40101), which requires the Secretary of Transportation to strengthen the competitive position of air carriers to ensure at least equality with foreign air carriers, including the attainment of the opportunity for air carriers to maintain and increase their profitability in air foreign transportation. According to the commenters, this obviously does not mean that the FAA should ignore serious safety issues out of concern for U.S. carriers' competitive position, but that the agency must take account of U.S. carriers' financial health and competitive standing, and avoid adopting measures and policies that harm carriers unless they are absolutely necessary.

We disagree with the request. Section 44701 of 49 U.S.C. requires the FAA to promote the safe flight of civil aircraft by, among other things, prescribing regulations and minimum standards for aircraft. In addition, the International Civil Aviation Organization (ICAO) Annex 8, Airworthiness of Aircraft (*http://www.icao.int/safety/airnavigation/NationalityMarks/annexes_booklet_en.pdf*) requires that civil aviation authorities of other countries take appropriate action in response to FAA ADs. Based on the FAA's determination of the unsafe condition addressed by this AD, we expect foreign authorities to adopt similar requirements. Regarding the potential for other civil aviation authorities to adopt IATA's procedures as an AMOC for their ADs, as discussed previously, the IATA procedures are similar to those that have been tested previously and that the FAA considers to be unsafe. We have no reason to believe other authorities would reach a different conclusion.

We have not changed this final rule regarding this issue.

Request To Withdraw NPRM (79 FR 71037, December 1, 2014) or Delay Issuance of AD Pending WBM Revision

NACA and AirbridgeCargo requested that we delay issuance of the AD until all new testing is completed. Based on its understanding of the current round of testing, NACA stated that there is a strong likelihood the Boeing Model 747 WBMs will be revised. AirbridgeCargo proposed that further research be done to establish a weight limit for intermodal containers. The commenters therefore preferred a revised WBM to an AD, which would also allow U.S. cargo carriers to fully compete with foreign carriers on a level playing field.

We disagree with the request. To date, all testing to support a revision to the Boeing Model 747 WBMs has been unsuccessful. Although there is a current plan for more testing by a U.S. air carrier to support an STC application, it is unclear if the testing will be successful and when it will be completed. If the testing resumes and provides a successful conclusion, and if sufficient data are submitted to substantiate that the products or alternative methods would provide an acceptable level of safety, the FAA could consider new methods or products as acceptable for compliance with the requirements of this AD. We have not changed this final rule regarding this issue.

Request To Change Requirement To Revise AFM

Boeing requested that we revise paragraph (g) of the proposed AD (79 FR 71037, December 1, 2014), which proposed to require revising the Operating Limitations section of the AFM. Boeing stated that airlines are not able to revise a Boeing AFM. Boeing requested that we change the requirement to ''insert a copy of this AD into the Limitations section of the AFM.''

We disagree with the request. Paragraph (g) of the proposed AD (79 FR 71037, December 1, 2014) would allow operators to insert a copy of this AD into the Limitations section of the AFM. However, operators may also comply with this AD by revising the operating limitations. Operating limitations are a part of the type certificate for an airplane. For many years, we have imposed operating restrictions that are necessary to address identified unsafe conditions by requiring revisions to the Operating Limitations section of the AFM. For this reason, as stated in the NPRM (79 FR 71037, December 1, 2014), we must engage in rulemaking (*i.e.,* issuance of an AD) in order to make the revisions mandatory for previously type-certificated airplanes. While the Boeing Model WBMs are contained in a ''Boeing document'' in the sense that Boeing originally produced it, the document, nevertheless, is a part of the airplane flight manual that operators must use to operate the airplane properly. Of course, those operators that have previously revised the required AFM limitations are given credit for having previously accomplished the requirements of this AD, as allowed by paragraph (f) of this AD. The legal effect is the same: The operator is required to comply with the limitations referenced in 14 CFR 91.9(a). We have not changed this final rule regarding this issue.

Request To Revise Description of Issue Prompting Rulemaking

Boeing requested that we revise the description of the issue that prompted the NPRM (79 FR 71037, December 1, 2014). The NPRM stated that recent testing indicates that intermodal containers, when loaded as cargo, can shift. While implicitly agreeing that loading offset containers is unsafe unless they are restrained directly to the airplane, Boeing requested that we change the wording to explain that the condition is limited to ''cargo using a TSO–C90 certified ULD.''

We disagree with the requested change. The **SUMMARY** section of this final rule and paragraph (e) of this AD go on to explain that intermodal containers loaded in the offset method are the subject of this AD, and the type of ULD does not change the unsafe condition. Further, not all Boeing Model 747 WBMs refer to TSO–C90; several refer directly to the TSO–C90-required document NAS 3610. We have therefore not revised this final rule regarding this issue.

Request To Delete Reference to TSO Revision Level

Boeing and UPS stated that the SUPPLEMENTARY INFORMATION section of the NPRM (79 FR 71037, December 1, 2014) referred to a ''TSO–C90D'' pallet. Revision D is the latest issue of TSO–C90, and per the WBMs applicable to Boeing Model 747 airplanes, approved ULDs for carriage may conform to the TSO–C90 revision to which they were certified. UPS recommends revising the Discussion section of the NPRM to remove the revision level when TSO–C90 is referenced.

We agree that the revision level of TSO–C90 does not matter; an intermodal container conforms to none of the revision levels. However, the Discussion section of the NPRM (79 FR 71037, December 1, 2014) is not repeated in this final rule. No change to this final rule is necessary.

Conclusion

We reviewed the relevant data, considered the comments received, and determined that air safety and the public interest require adopting this AD as proposed—except for minor editorial changes. We have determined that these minor changes:

- Are consistent with the intent that was proposed in the NPRM (79 FR 71037, December 1, 2014) for correcting the unsafe condition; and
- Do not add any additional burden upon the public than was already proposed in the NPRM (79 FR 71037, December 1, 2014).

Costs of Compliance

We estimate that this AD affects 98 airplanes of U.S. registry. We estimate the following costs to comply with this AD:

ESTIMATED COSTS

Action	Labor cost	Parts cost	Cost per product	Cost on U.S. operators
AFM revision	1 work-hour × $85 per hour = $85	$0	$85	$8,330

Authority for This Rulemaking

Title 49 of the United States Code specifies the FAA's authority to issue rules on aviation safety. Subtitle I, section 106, describes the authority of the FAA Administrator. Subtitle VII: Aviation Programs, describes in more detail the scope of the Agency's authority.

We are issuing this rulemaking under the authority described in Subtitle VII, Part A, Subpart III, Section 44701: ''General requirements.'' Under that section, Congress charges the FAA with promoting safe flight of civil aircraft in air commerce by prescribing regulations for practices, methods, and procedures the Administrator finds necessary for safety in air commerce. This regulation is within the scope of that authority because it addresses an unsafe condition that is likely to exist or develop on products identified in this rulemaking action.

Regulatory Findings

This AD will not have federalism implications under Executive Order 13132. This AD will not have a substantial direct effect on the States, on the relationship between the national government and the States, or on the distribution of power and responsibilities among the various levels of government.

For the reasons discussed above, I certify that this AD:

(1) Is not a ''significant regulatory action'' under Executive Order 12866,

(2) Is not a ''significant rule'' under DOT Regulatory Policies and Procedures (44 FR 11034, February 26, 1979),

(3) Will not affect intrastate aviation in Alaska, and

(4) Will not have a significant economic impact, positive or negative, on a substantial number of small entities under the criteria of the Regulatory Flexibility Act.

List of Subjects in 14 CFR Part 39

Air transportation, Aircraft, Aviation safety, Incorporation by reference, Safety.

Adoption of the Amendment

Accordingly, under the authority delegated to me by the Administrator, the FAA amends 14 CFR part 39 as follows:

PART 39—AIRWORTHINESS DIRECTIVES

■ 1. The authority citation for part 39 continues to read as follows:

Authority: 49 U.S.C. 106(g), 40113, 44701.

§ 39.13 [Amended]

■ 2. The FAA amends § 39.13 by adding the following new airworthiness directive (AD):

2015–14–09 The Boeing Company: Amendment 39–18207; Docket No. FAA–2014–0780; Directorate Identifier 2014–NM–168–AD.

(a) Effective Date

This AD is effective August 17, 2015.

(b) Affected ADs

None.

(c) Applicability

This AD applies to The Boeing Company Model 747–100, 747–100B, 747–100B SUD, 747–200B, 747–200C, 747–200F, 747–300, 747–400, 747–400D, 747–400F, 747SR, 747SP, 747–8F, and 747–8 series airplanes, certificated in any category, equipped with a main deck side cargo door (MDSCD).

(d) Subject

Air Transport Association (ATA) of America Code 53, Fuselage.

(e) Unsafe Condition

This AD was prompted by recent testing that indicates that intermodal containers, when loaded as cargo, under certain flight-load conditions, can shift and impact the adjacent fuselage frames. We are issuing this AD to prevent intermodal containers loaded in the offset method from shifting during flight gust loads and damaging fuselage frames, which could lead to the structural failure of the aft fuselage in flight, and subsequent in-flight breakup of the airplane.

(f) Compliance

Comply with this AD within the compliance times specified, unless already done.

(g) Revision of Airplane Flight Manual (AFM)

Within 14 days after the effective date of this AD, revise the Operating Limitations section of the FAA-approved AFM to include the information in figure 1 to paragraph (g) of this AD. This may be accomplished by inserting a copy of this AD into the Limitations section of the AFM.

FIGURE 1 TO PARAGRAPH (g) OF THIS AD—AFM REVISION

Unless approved by the Manager of the Seattle Aircraft Certification Office, the carriage of the following payloads is prohibited:

FIGURE 1 TO PARAGRAPH (g) OF THIS AD—AFM REVISION—Continued

(1) Intermodal containers nominally sized at 20 feet long, 8 feet wide, and 8.5 feet tall that are not concentrically loaded on a pallet and restrained to the aircraft in accordance with the FAA-approved Boeing type certificate Weight and Balance Manual or a supplemental type certificate Weight and Balance Supplement.

(2) ISO 668-1CC containers that are not concentrically loaded on a pallet and restrained to the aircraft in accordance with the FAA-approved Boeing type certificate Weight and Balance Manual or a supplemental type certificate Weight and Balance Supplement.

Note: Both payloads 1 and 2 may be concentrically loaded on a pallet and netted in accordance with the FAA-approved Weight and Balance Manual and then loaded in the center of the airplane and restrained to the airplane by the approved center loaded cargo restraint system or restrained directly to the airplane, both as defined in the FAA-approved Weight and Balance Manual.

(h) Special Flight Permits

Special flight permits, as described in Section 21.197 and Section 21.199 of the Federal Aviation Regulations (14 CFR 21.197 and 21.199), are not allowed if any intermodal container prohibited as specified in figure 1 to paragraph (g) of this AD is on board. For special flight permits, carriage of freight is not allowed.

(i) Alternative Methods of Compliance (AMOCs)

(1) The Manager, Seattle Aircraft Certification Office (ACO), FAA, has the authority to approve AMOCs for this AD, if requested using the procedures found in 14 CFR 39.19. In accordance with 14 CFR 39.19, send your request to your principal inspector or local Flight Standards District Office, as appropriate. If sending information directly to the manager of the ACO, send it to the attention of the person identified in paragraph (j) of this AD. Information may be emailed to: *9-ANM-Seattle-ACO-AMOC-Requests@faa.gov.*

(2) Before using any approved AMOC, notify your appropriate principal inspector, or lacking a principal inspector, the manager of the local flight standards district office/certificate holding district office.

(j) Related Information

For more information about this AD, contact Steven C. Fox, Senior Aerospace Engineer, Airframe Branch, ANM–120S, FAA, Seattle Aircraft Certification Office (ACO), 1601 Lind Avenue SW., Renton, WA 98057–3356; phone: 425–917–6425; fax: 425–917–6590; email: *steven.fox@faa.gov.*

(k) Material Incorporated by Reference

None.

Issued in Renton, Washington, on July 7, 2015.

[Docket No. 150325297–5297–01]

RIN 0694–AG59

Clarifications and Corrections to the Export Administration Regulations (EAR): Control of Spacecraft Systems and Related Items the President Determines No Longer Warrant Control Under the United States Munitions List (USML)

AGENCY: Bureau of Industry and Security, Department of Commerce.

ACTION: Final rule.

SUMMARY: This final rule makes additional clarifications and corrections to the interim final rule that was published on May 13, 2014. The May 13 rule added controls to the Export Administration Regulations (EAR) for spacecraft and related items that the President has determined no longer warrant control under United States Munitions List (USML) Category XV—spacecraft and related items.

The changes included in this final rule are limited to corrections and clarifications to what was included in the interim final rule. This is the second corrections and clarifications rule BIS has published for the May 13 rule. These corrections and clarifications were also informed by comments received in response to the May 13 rule that included a request for comments.

The corrections and clarifications to the May 13 rule are also part of Commerce's retrospective regulatory review plan under Executive Order (EO) 13563 (see the **SUPPLEMENTARY INFORMATION** section of this rule for information on the availability of the plan).

DATES: This rule is effective July 13, 2015.

FOR FURTHER INFORMATION CONTACT: For questions about the ECCNs included in this rule, contact Dennis Krepp, Office of National Security and Technology Transfer Controls, Bureau of Industry and Security, U.S. Department of Commerce, Telephone: 202–482–1309, email: *Dennis.Krepp@bis.doc.gov.* For general questions about the regulatory changes pertaining to satellites, spacecraft, and related items, contact the Regulatory Policy Division, Office of Exporter Services, Bureau of Industry and Security, at 202–482–2440 or email: *rpd2@bis.doc.gov.*

SUPPLEMENTARY INFORMATION:

Background

This final rule makes corrections and clarifications to the interim final rule, *Revisions to the Export Administration Regulations (EAR): Control of Spacecraft Systems and Related Items the President Determines No Longer Warrant Control Under the United States Munitions List (USML),* that was published on May 13, 2014 (79 FR 27417) (May 13 rule). The May 13 rule added controls to the Export Administration Regulations (EAR) for spacecraft and related items that the President has determined no longer warrant control under United States Munitions List (USML) Category XV—spacecraft and related items. The vast majority of the changes included in the May 13 rule have been implemented as published in the interim final rule and are not republished in this final rule. A full description of those changes can be found in the Background section and the regulatory text of the May 13 rule. BIS also published corrections and clarifications to the May 13 rule in a final rule published on November 12, 2014 (79 FR 67055).

The changes included in this final rule are limited to corrections and clarifications to what was included in the May 13 rule but are also informed by comments received in response to the May 13 rule. These corrections and clarifications to the May 13 rule are described below.

In § 736.2 (General Prohibitions), this final rule revises the heading of paragraph (b)(3)(iii) (Additional country scope of prohibition for 9x515 or ''600 series'' items) to remove the term ''additional.'' The country scope of prohibition of paragraph (b)(3)(iii) for the 9x515 and ''600 series'' items is specified in this paragraph for purposes of General Prohibition Three. The country scope of prohibition of paragraph (b)(3)(iii) for the 9x515 items applies to destinations in Country Groups D:5 and E:1 (see Supplement No. 1 to part 740 of the EAR). However, because of the use of the term ''additional'' in the heading of paragraph (b)(3)(iii), BIS has received questions from the public whether the country scope of prohibition specified in paragraph (b)(3)(i) also needs to be considered for purposes of the 9x515 items. The country scope of paragraph (b)(3)(i) does not apply to 9x515 items, so this final rule revises the heading of paragraph (b)(3)(iii) to clarify this point by removing the term ''additional.'' This rule does not change the country scope of prohibition for the 9x515 or ''600 series'' items. Reexporters are reminded that the country scope of prohibition for the ''600 series'' items, which includes Country Groups D:1, D:3, D:4, D:5 or E:1, is broader than that for 9x515 items.

In § 740.20 under paragraph (d) (Prior Consignee Statement), this final rule revises the introductory text of paragraph (d)(2) to remove two sentences that were intended to be removed in a December 29, 2014 (79 FR 77866) final rule, but were not removed as intended because of ambiguity in the amendatory instruction. This rule removes the two outdated sentences. This final rule sets out the full text of paragraph (d)(2) to ensure the text of this paragraph accurately reflects past revisions of the EAR.

In addition, this final rule makes three minor clarifications to the text of paragraph (d)(2) to make the intent of the paragraph clearer. First, this rule removes the term ''and'' in the phrase ''exporter, reexporter and transferor'' and replaces it with ''or'' in two places in paragraph (d)(2). This clarification is made because the party making the export, reexport or transfer (in-country) authorized under License Exception STA is the person responsible for obtaining the prior consignee statement and maintaining a log or other record consistent with the requirements of paragraph (d)(2). The use of the term ''and'' may have given the misimpression that the exporter receiving the prior consignee statement would also need to obtain a prior consignee statement for subsequent transfers (in-country) or reexports authorized under License Exception STA, which is not required under paragraph (d)(2). Second, this final rule adds the parenthetical phrase ''(such as documents created in the ordinary course of business)'' to provide an example of an ''other record'' in paragraph (d)(2). Third, this final rule adds an ''(S)'' at the end of the terms ''NAME'' and ''CONSIGNEE'' in the bracketed text at the end of paragraph (d)(2). Making these two terms plural clarifies that multiple consignees may be included on the same prior consignee statement, provided all of the applicable requirements of paragraph (d)(2) are met. This is an existing BIS interpretation of paragraph (d)(2) that this edit clarifies.

In § 744.21 (Restrictions on certain 'military end uses' in the People's Republic of China (PRC) or for a 'military end use' or 'military end user' in Russia or Venezuela), this final rule revises the general prohibition in paragraph (a)(2) in § 744.21 for the 9x515 and ''600 series'' ECCNs to clarify that the use in, with, or for the International Space Station (ISS) for exports, reexports, or transfers within Russia of these 9x515 and ''600 series'' items is not within the scope of the general prohibition, including launch to the ISS. Exports, reexports, and transfers (in-country) to China and Venezuela are not eligible for the ISS exclusion from the § 744.21 license requirements in paragraph (a)(2) because China and Venezuela are not ISS partner countries, unlike Russia, which is an ISS partner country.

In Supplement No. 2 to part 748 (Unique application and submission requirements), this final rule revises the introductory text of paragraphs (y)(1) and (y)(2) to clarify that for purposes of the license applications for satellite exports, the requirements specified in paragraphs (y)(1)(i) and (ii) and (y)(2)(i) and (ii), respectively, can be met either at the time of application or prior to export or reexport.

ECCN 3A611. This final rule makes a clarification to the Related Controls paragraph (6) in ECCN 3A611 by adding two references to the 9x515 ECCNs. These references added in this rule clarify that electronic items ''specially designed'' for military application that are not controlled in any USML category but are within the scope of a 9x515 ECCN are controlled by that 9x515 ECCN. This Related Controls paragraph (6) already established this relationship between 3A611 and other ''600 series'' ECCNs, but references to the 9x515 ECCNs also need to be added to clarify the relationship between 3A611 and the 9x515 ECCNs. This clarification will help exporters determine when they should review ECCN 3A611 or a 9x515 ECCN when classifying electronic items. Lastly, this final rule corrects the last sentence of the Related Controls paragraph (6) to replace ECCN 0A604 that is referenced at the end of the paragraph with the correct ECCN 9A604. This change corrects a mistake in the cross reference for the ECCN referenced in this Related Controls paragraph (6).

ECCN 9A515. This final rule makes six corrections and clarifications to ECCN 9A515. Specifically, these corrections and clarifications are made to the MT Control in the License Requirement table, to the Related Definitions paragraph and to ''items'' paragraphs (d), (e), (x) and (y) in the List of Items Controlled section, as described below.

ECCN 9A515—MT Control. This final rule revises the MT Control paragraph in the License Requirements section to add the phrase ''microcircuits in'' before the reference to 9A515.d and adds the new 9A515.e.2 to the MT controls. This final rule makes this change to add greater specificity regarding what parts of ECCN 9A515.d and 9A515.e.2 are controlled for MT reasons. This clarification also addresses questions BIS has received from the public and will align the ECCN's text more closely with the MTCR Annex.

ECCN 9A515—Related Definitions. This final rule adds a definition of 'microcircuit' to clarify how the term is understood in the context of ECCN 9A515. This rule clarifies that for purposes of ECCN 9A515 a 'microcircuit' means a device in which a number of passive or active elements are considered as indivisibly associated on or within a continuous structure to perform the function of a circuit. The addition of the Related Definition will make the intent of this ECCN clearer. This ECCN 9A515 specific definition of 'microcircuit' does not change the meaning or interpretation of microcircuit under the EAR. The definition of 'microcircuit' this final rule adds to ECCN 9A515 is the same definition as found in ECCN 3A001 and also as defined by the Missile Technology Control Regime (MTCR) Annex. The ECCN 9A515 definition is limited to providing guidance on the application of the definition based on current BIS practice and past interpretive guidance BIS has provided, including how the term is defined in that ECCN on the CCL and by the MTCR.

ECCN 9A515.d. This final rule also revises items paragraph (d) in the List of Items Controlled section of ECCN 9A515 to conform to the intended commodities classified under this paragraph. In the introductory text of paragraph (d), this final rule adds MOSFETS to the parenthetical phrase that provides examples for microelectronic circuits classified under paragraph (d). Importantly, such MOSFETS are already classified under 9A515.d. In response to the public's questions, however, this addition provides clarity without changing the scope of the ECCN. This final rule also adds the phrase ''and discrete electronic components'' to ECCN 9A515.d to help the public self-classify such items and avoid the need to submit classification requests. Lastly, this final rule removes the hyphen in the term ''micro-circuits'' in the introductory text of paragraph (d) in the List of Items Controlled section of ECCN 9A515 to conform to the other uses of ''microcircuits'' in 9A515, including the clarifications being made in this rule where the term ''microcircuits'' is used in 9A515.

ECCN 9A515.e. This final rule also revises items paragraph (e) in the List of Items Controlled section of ECCN 9A515 to conform to the intended commodities classified under this paragraph. Because of an oversight in the control parameter added in the May 13 rule, certain commodities that were intended to be classified under this paragraph (e) were not classified under this ECCN 9A515. In order to address this oversight and provide additional clarity regarding the scope of this control parameter, this final rule makes the following changes to paragraph (e). In the introductory text of paragraph (e), this final rule adds MOSFETS to the parenthetical phrase that provides examples for microelectronic circuits classified under paragraph (e). Importantly, such MOSFETS are already classified under 9A515.e, so the impact of the addition of MOSFETS to the parenthetical phrase is limited to providing additional specificity to the phrase, in order to make it easier for the public to determine that such MOSFETS are classified under 9A515.e. BIS had received questions from the public on why BIS had not included MOSFETS in the illustrative parenthetical phrase and so, to assist the public and add greater specificity, BIS adds MOSFETS to the illustrative list. This final rule also adds the phrase ''and discrete electronic components'' to ECCN 9A515.e. Although BIS already classifies discrete electronic components under 9A515.e, the agency has received questions on this issue. The additional text will assist the public with self-classifying such items and avoid the submission of unneeded classification requests. This final rule also adds to ECCN 9A515 a definition of 'microcircuit' in the Related Definition as described above. Lastly, in the introductory text of paragraph (e), this final rule removes the term ''all'' before ''characteristics'' and adds in its place the phrase ''meeting or exceeding the characteristics in either paragraph e.1 or e.2'' to clarify that the control parameters specified in paragraph (e)(1) and (e)(2) are applied in the disjunctive. As a conforming change to the introductory text of paragraph (e), this final rule consolidates the control parameter of (e)(2) with paragraph (e)(1), removes the term ''and'' at the end of paragraph (e)(1) and adds in its place the term ''or''. This final rule removes the ''AND'', but because of the consolidation of the control parameters of (e)(2) with paragraph (e)(1) and the use of ''or'' between the two control parameters in the revised paragraph (e)(1), this aspect of the clarification does not substantively change what is classified under paragraph (e).

Lastly, for the changes to paragraph (e), this final rule adds a new paragraph (e)(2) to clarify that microelectronic circuits and discrete components that meet the scope of the introductory text of paragraph (e), have a total dose $\geq 5 \times 10^5$ Rads (Si) (5×10^3 Gy (Si)), and are not described in 9A515.d are also within the scope of ECCN 9A515.e. This is a correction to the control parameter of paragraph (e) that addresses questions BIS has received from the public regarding the classification of the commodities described under this revised paragraph (e)(2). Specifically, the commodities that meet the new control parameter under paragraph (e)(2) that this final rule adds to ECCN 9A515 are commodities that would have been classified under the United States Munitions List (USML) prior to the effective date of the May 13 rule. The Summary of the May 13 rule states that ''New Export Control Classification Numbers (ECCNs) 9A515, 9B515, 9D515, and 9E515 created by this rule and existing ECCNs on the Commerce Control List (CCL) will control such items.'' In other words, any item that was formerly classified under USML Category XV that was moved to the CCL would be classified under a 9x515 ECCN or in another ECCN on the CCL (such as one of the ECCNs that use space qualified). However, because of a mistake in the control parameter under paragraph (e) of ECCN 9A515, certain commodities that were intended to be classified in this ECCN inadvertently dropped to an EAR99 designation, which was contrary to the May 13 rule's description of where the commodities formerly classified under USML Category XV would be classified on the CCL. As noted above, BIS has received inquiries from the public questioning the odd result and asking for clarification whether such commodities are intended to be EAR99, or if, as specified in the May 13 rule, the intent is for such items to be classified in 9A515.e. The questioners are correct that the intent was for such commodities to be classified under 9A515, and this final rule adds a control parameter to 9A515.e.2 to ensure consistency with the stated intent of the May 13 rule.

ECCN 9A515.x. This final rule revises paragraph (x) in the List of Items Controlled section. This final rule revises the existing exclusions under paragraphs (1), (2) and (4) to clarify what commodities are not within the scope of paragraph (x). Specifically, under paragraph (1) this final rule adds a reference to ECCN 9A004 to clarify that commodities enumerated or controlled in 9A004 are not within the scope of 9A515.x. This final rule revises the existing exclusion under paragraph (2) by adding the phrase ''discrete electronic components'' to clarify that, in addition to microelectronic circuits, discrete electronic components are not within the scope of ECCN 9A515.x, a change that also conforms with the clarification being made to 9A515.e.2 described above. This final rule revises the existing exclusion under paragraph (4) to add ECCN 7A003.d.2 to the list of ECCNs containing ''space-qualified'' as a control criterion that are not within the scope of 9A515.x and deletes 3A002.a.3 because it is no longer needed. This final rule also revises the list of items excluded from paragraph (x) by adding paragraphs (5), (6), and (7). These additional exclusions clarify that the following commodities are also not within the scope of 9A515.x: microwave solid state amplifiers and microwave assemblies (refer to ECCN 3A001.b.4 for controls on these items); traveling wave tube amplifiers (refer to ECCN 3A001.b.8 for controls on these items); and commodities elsewhere specified in ECCN 9A515.y. These clarifications to the exclusions from paragraph (x) will address questions BIS has received from the public that asked whether certain commodities that were excluded from USML Category XV (on the basis of the former Note to USML Category XV) were classified in ECCN 9A515.x. General Order No. 5 in Supplement No. 1 to part 736 of the EAR under paragraph (e)(3) (Prior commodity jurisdiction determinations) already provides guidance that such commodities would not be classified under a 9A515 entry, but this final rule makes this reading explicit in the context of 9A515.x. This clarification makes no change to the scope of items classified under 9A515.x and merely provides additional guidance to assist the public in understanding the scope of 9A515, in particular as it relates to commodities that previously were determined to not be subject to the ITAR on the basis of the former Note to USML Category XV(e).

ECCN 9A515.y. This final rule adds a paragraph 9A515.y.1 as the first commodity specified under paragraph (y) in this ECCN. As noted in the introductory text of paragraph (y), the U.S. Government through the section

748.3(e) process will identify the items that warrant being classified under 9x515.y items, such as the commodities being specified under 9A515.y.1 in this final rule. Specifically, discrete electronic ''components'' not specified in 9A515.e have been identified in an interagency-cleared commodity classification (CCATS) pursuant to § 748.3(e) as warranting control in 9A515.y.1. This final rule also reserves paragraph (y.2) to conform to **Federal Register** drafting requirements.

The addition described above for ECCN 9A515.y.1 is the first approved population of a .y control being added to 9A515. As stated in the May 13 rule, BIS (along with State and Defense) will continue to populate the 9A515.y with additional entries as additional classification determinations are made in response to requests from the public under § 748.3(e).

ECCN 9D001. This final rule revises the NS Controls paragraph in the License Requirements section of ECCN 9D001 to add 9A004. ECCN 9A004 is included in the heading of 9D001, but is not included in the range of ECCNs identified in the NS Controls paragraph. ECCN 9A004 should have been added to the NS Controls paragraph in 9D001 to conform to the changes made to 9A004 in the May 13 rule. This final rule corrects this by adding ECCN 9A004 to the NS Controls paragraph for 9D001. In addition, for the purposes of clarification, this final rule revises the heading of ECCN 9D001 to remove the parenthetical phrase that follows 9A004 and revises the Related Controls paragraph of ECCN 9D001 to remove the reference to 9A004. These clarifications are made because there are no longer commodities that are subject to the ITAR in ECCN 9A004, so there is no need for the parenthetical phrase when referencing 9A004 in the heading of 9D001 and there is no need to reference 9A004 in the Related Controls paragraph of 9D001. Lastly, this final rule removes the parenthetical phrase ''(see 22 CFR parts 120 through 130)'' after the defined term ''Subject to the ITAR'' in the Related Controls paragraph of ECCN 9D002 because the text is redundant. The citation information is already included in the definition of ''subject to the ITAR'' in § 772.1 of the EAR and therefore does not need to be restated on the CCL.

ECCN 9D002. This final rule revises the NS Controls paragraph in the License Requirements section of ECCN 9D002 to add 9A004. ECCN 9A004 is included in the heading of 9D002, but is not included in the range of ECCNs identified in the NS Controls paragraph. ECCN 9A004 should have been added to the NS Controls paragraph in 9D002 to conform to the changes made to 9A004 in the interim final rule. In addition, for the purposes of clarification, this final rule revises the heading of ECCN 9D002 to remove the parenthetical phrase that follows 9A004 and revises the Related Controls paragraph of ECCN 9D002 to remove the reference to 9A004. These clarifications are made because there are no longer commodities that are subject to the ITAR in ECCN 9A004, so there is no need for the parenthetical phrase when referencing 9A004 in the heading of 9D002 and there is no need to reference 9A004 in the Related Controls paragraph of 9D002. Lastly, this final rule removes the parenthetical phrase ''(see 22 CFR parts 120 through 130)'' after the defined term ''Subject to the ITAR'' in the Related Controls paragraph of ECCN 9D002 because the text is redundant as already noted above.

ECCN 9D515. This final rule reserves the ''items'' paragraphs (f) through (x) in the List of Items Controlled section and adds a new ''items'' paragraph (y) in ECCN 9D515. This change is made to conform to the changes made to 9A515.y. In addition, this final rule revises the NS and RS Controls paragraph in the License Requirements section to exclude software classified under 9D515.y from these controls. Similar to the ''600 series'' ECCNs, the (y) software and technology entries for the 9x515 items will be controlled at the same level as the related (y) commodities.

ECCN 9E001. This final rule revises the NS Controls paragraph in the License Requirements section of ECCN 9E001 to add 9A004. ECCN 9A004 is included in the heading of 9E001, but is not included in the range of ECCNs identified in the NS controls paragraph. ECCN 9A004 should have been added to the NS Controls paragraph in 9E001 to conform to the changes made to 9A004 in the interim final rule. This final rule corrects this by adding ECCN 9A004 to the NS Controls paragraph for 9E001. In addition, for the purposes of clarification, this final rule revises the heading of ECCN 9E001 to remove the parenthetical phrase that follows 9A004 and revises Related Controls paragraph (2) to remove the reference to 9A004. These clarifications are made because there are no longer commodities that are subject to the ITAR in ECCN 9A004, so there is no need for the parenthetical phrase when referencing 9A004 in the heading of 9E001 and there is no need to reference 9A004 in the Related Controls paragraph of 9E001. Lastly, this final rule removes the parenthetical phrase ''(see 22 CFR parts 120 through 130)'' after the defined term ''Subject to the ITAR'' in the Related Controls paragraph of ECCN 9E001 because the text is redundant as already noted above.

ECCN 9E002. Similar to the changes described above for ECCN 9E001, this final rule for clarification revises the heading of 9E002 to remove the parenthetical phrase that follows 9A004. In addition, for the purposes of clarification revises Related Controls paragraph (3) to remove the reference to 9A004. These clarifications are made because there are no longer commodities that are subject to the ITAR in ECCN 9A004, so there is no need for the parenthetical phrase when referencing 9A004 in the heading of 9E002 and there is no need to reference 9A004 in the Related Controls paragraph of 9E002. Lastly, this final rule removes the parenthetical phrase ''(see 22 CFR parts 120 through 130)'' after the defined term ''Subject to the ITAR'' in the Related Controls paragraph of ECCN 9E002 because the text is redundant as already noted above.

ECCN 9E515. This final rule reserves ''items'' paragraphs (f) through (x) in the List of Items Controlled section and adds a new ''items'' paragraph (y) to ECCN 9E515. This change is made to conform to the changes made to 9A515.y. In addition, this final rule revises the NS and RS Controls paragraph in the License Requirements section to exclude technology classified under 9E515.y from the controls in ECCN 9E515. Similar to the ''600 series'' ECCNs, the (y) software and technology entries for the 9x515 items will be controlled at the same level as the related (y) commodities. Lastly, this final rule revises the MT Control paragraph in the License Requirements section to add 9A515.e.2 to the MT controls. This final rule makes this change to conform to the changes described above for the MT controls in ECCN 9A515.e.2 and to conform to the MTCR Annex. The rule specifies that the control applies to technology for items in 9A515.d and 9A515.e.2 controlled for MT reasons.

Addressing Public Comments Received

The May 13 rule requested public comment by November 10, 2014. BIS is still in the process of reviewing the comments received at that time and will address them through a subsequent rulemaking.

As required by Executive Order (EO) 13563, BIS intends to review this rule's impact on the licensing burden on exporters. Commerce's full plan is available at: *http://open.commerce.gov/*

news/2011/08/23/commerce-plan-retrospective-analysis-existing-rules. Data are routinely collected on an ongoing basis, including through the comments to be submitted and as a result of new information and results from AES data. These results and data have been, and will continue to form, the basis for ongoing reviews of the rule and assessments of various aspects of the rule. As part of its plan for retrospective analysis under EO 13563, BIS intends to conduct periodic reviews of this rule and to modify, or repeal, aspects of this rule, as appropriate, and after public notice and comment. With regard to a number of aspects of this rule, assessments and refinements will be made on an ongoing basis. This is particularly the case with regard to possible modifications that will be considered based on public comments described above.

Export Administration Act

Although the Export Administration Act expired on August 20, 2001, the President, through Executive Order 13222 of August 17, 2001, 3 CFR, 2001 Comp., p. 783 (2002), as amended by Executive Order 13637 of March 8, 2013, 78 FR 16129 (March 13, 2013) and as extended by the Notice of August 7, 2014, 79 FR 46959 (August 11, 2014), has continued the Export Administration Regulations in effect under the International Emergency Economic Powers Act. BIS continues to carry out the provisions of the Export Administration Act, as appropriate and to the extent permitted by law, pursuant to Executive Order 13222 as amended by Executive Order 13637.

Rulemaking Requirements

1. Executive Orders 13563 and 12866 direct agencies to assess all costs and benefits of available regulatory alternatives and, if regulation is necessary, to select regulatory approaches that maximize net benefits (including potential economic, environmental, public health and safety effects, distribute impacts, and equity). Executive Order 13563 emphasizes the importance of quantifying both costs and benefits, of reducing costs, of harmonizing rules, and of promoting flexibility. This final rule has been determined to be not significant for purposes of Executive Order 12866.

2. Notwithstanding any other provision of law, no person is required to respond to, nor is subject to a penalty for failure to comply with, a collection of information, subject to the requirements of the Paperwork Reduction Act of 1995 (44 U.S.C. 3501 *et seq.*) (PRA), unless that collection of information displays a currently valid OMB control number. This regulation involves collections previously approved by the OMB under control numbers 0694–0088, ''Multi-Purpose Application,'' which carries a burden hour estimate of 43.8 minutes for a manual or electronic submission. This rule does not alter any information collection requirements; therefore, total burden hours associated with the PRA and OMB control number 0694–0088 are not expected to increase as a result of this rule. You may send comments regarding the collection of information associated with this rule, including suggestions for reducing the burden, to Jasmeet K. Seehra, Office of Management and Budget (OMB), by email to *Jasmeet_K._Seehra@omb.eop.gov,* or by fax to (202) 395–7285.

3. This rule does not contain policies with Federalism implications as that term is defined under E.O. 13132.

4. The Department finds that there is good cause under 5 U.S.C. 553(b)(B) to waive the provisions of the Administrative Procedure Act (APA) requiring prior notice and the opportunity for public comment because they are either unnecessary or contrary to the public interest. The following revisions are non-substantive or are limited to ensure consistency with the intent of the May 13, 2014 interim final rule, and thus prior notice and the opportunity for public comment is unnecessary. Sections 736.2 and 740.20 and ECCNs 9D001, 9D002, 9E001, 9E002 were revised to make corrections to the EAR that resulted from mistakes or other ambiguity in amendatory instructions in past rulemakings. In addition to the revisions above, BIS revises § 744.21, ECCNs 3A611, 9A515, 9D515 and 9E515 to provide guidance on existing interpretations of current EAR provisions and necessary conforming changes, and thus prior notice and the opportunity for public comment is contrary to the public interest. Finally, as contemplated in the May 13 rule, BIS has added an entry to the .y paragraph of ECCN 9A515, which was added as a result of the § 748.3(e) process. For purposes of the APA, there is good cause and it is in the public interest to incorporate this change so the public can benefit from understanding the classification of the item. These revisions are important to get in place as soon as possible so the public will be aware of the correct text and meaning of current EAR provisions.

BIS finds good cause to waive the 30-day delay in effectiveness under 5 U.S.C. 553(d)(3). As mentioned previously, the revisions made by this rule consist of both technical corrections and clarifications that need to be in place as soon as possible to avoid confusion by the public regarding the intent and meaning of changes to the EAR.

Because a notice of proposed rulemaking and an opportunity for public comment are not required to be given for these amendments by 5 U.S.C. 553, or by any other law, the analytical requirements of the Regulatory Flexibility Act, 5 U.S.C. 601 *et seq.,* are not applicable.

List of Subjects

15 CFR Part 736

Exports.

15 CFR Parts 740 and 748

Administrative practice and procedure, Exports, Reporting and recordkeeping requirements.

15 CFR Part 744

Exports, Reporting and recordkeeping requirements, Terrorism.

15 CFR Part 774

Exports, Reporting and recordkeeping requirements.

Accordingly, the Export Administration Regulations (15 CFR parts 730–774) are amended as follows:

PART 736—[AMENDED]

■ 1. The authority citation for 15 CFR part 736 continues to read as follows:

Authority: 50 U.S.C. app. 2401 *et seq.;* 50 U.S.C. 1701 *et seq.;* 22 U.S.C. 2151 note; E.O. 12938, 59 FR 59099, 3 CFR, 1994 Comp., p. 950; E.O. 13020, 61 FR 54079, 3 CFR, 1996 Comp., p. 219; E.O. 13026, 61 FR 58767, 3 CFR, 1996 Comp., p. 228; E.O. 13222, 66 FR 44025, 3 CFR, 2001 Comp., p. 783; E.O. 13338, 69 FR 26751, 3 CFR, 2004 Comp., p. 168; Notice of August 7, 2014, 79 FR 46959 (August 11, 2014); Notice of November 7, 2014, 79 FR 67035 (November 12, 2014); Notice of May 6, 2015, 80 FR 26815 (May 8, 2015).

■ 2. Section 736.2 is amended by revising the heading of paragraph (b)(3)(iii) to read as follows:

§ 736.2 General prohibitions and determination of applicability.

* * * * *

(b) * * *

(3) * * *

(iii) *Country scope of prohibition for 9x515 or ''600 series'' items.* * * *

* * * * *

PART 740—[AMENDED]

■ 3. The authority citation for 15 CFR part 740 continues to read as follows:

Authority: 50 U.S.C. app. 2401 *et seq.;* 50 U.S.C. 1701 *et seq.;* 22 U.S.C. 7201 *et seq.;* E.O. 13026, 61 FR 58767, 3 CFR, 1996 Comp., p. 228; E.O. 13222, 66 FR 44025, 3 CFR, 2001 Comp., p. 783; Notice of August 7, 2014, 79 FR 46959 (August 11, 2014).

■ 4. Section 740.20 is amended by revising the introductory text of paragraph (d)(2) and the bracketed text at the end of the introductory text of paragraph (d)(2) to read as follows:

§ 740.20 License Exception Strategic Trade Authorization (STA).

* * * * *

(d) * * *

(2) *Prior Consignee Statement.* The requirements in this paragraph (d)(2) apply to each party using License Exception STA to export, reexport or transfer (in-country), including reexporters and transferors of items previously received under License Exception STA. The exporter, reexporter, or transferor must obtain the following statement in writing from its consignee prior to shipping the item and must retain the statement in accordance with part 762 of the EAR. One statement may be used for multiple shipments of the same items between the same parties so long as the party names, the description(s) of the item(s) and the ECCNs are correct. The exporter, reexporter, or transferor must maintain a log or other record (such as documents created in the ordinary course of business) that identifies each shipment made pursuant to this section and the specific consignee statement that is associated with each shipment. Paragraphs (d)(2)(i) through (vi) of this section are required for all transactions. In addition, paragraph (d)(2)(vii) is required for all transactions in ''600 series'' items and paragraph (viii) of this section is required for transactions in ''600 series'' items if the consignee is not the government of a country listed in Country Group A:5 (See Supplement No. 1 to part 740 of the EAR). Paragraph (d)(2)(viii) is also required for transactions including 9x515 items.

[INSERT NAME(S) OF CONSIGNEE(S)]:

* * * * *

PART 744—[AMENDED]

■ 5. The authority citation for 15 CFR part 744 continues to read as follows:

Authority: 50 U.S.C. app. 2401 *et seq.;* 50 U.S.C. 1701 *et seq.;* 22 U.S.C. 3201 *et seq.;* 42 U.S.C. 2139a; 22 U.S.C. 7201 *et seq.;* 22 U.S.C. 7210; E.O. 12058, 43 FR 20947, 3 CFR, 1978 Comp., p. 179; E.O. 12851, 58 FR 33181, 3 CFR, 1993 Comp., p. 608; E.O. 12938, 59 FR 59099, 3 CFR, 1994 Comp., p. 950; E.O. 12947, 60 FR 5079, 3 CFR, 1995 Comp., p. 356; E.O. 13026, 61 FR 58767, 3 CFR, 1996 Comp., p. 228; E.O. 13099, 63 FR 45167, 3 CFR, 1998 Comp., p. 208; E.O. 13222, 66 FR 44025, 3 CFR, 2001 Comp., p. 783; E.O. 13224, 66 FR 49079, 3 CFR, 2001 Comp., p. 786; Notice of August 7, 2014, 79 FR 46959 (August 11, 2014); Notice of September 17, 2014, 79 FR 56475 (September 19, 2014); Notice of November 7, 2014, 79 FR 67035 (November 12, 2014); Notice of January 21, 2015, 80 FR 3461 (January 22, 2015).

■ 6. Section 744.21 is amended by revising paragraph (a)(2) to read as follows:

§ 744.21 Restrictions on certain 'Military end uses' in the People's Republic of China (PRC) or for a 'Military end use' or 'Military end user' in Russia or Venezuela.

(a) * * *

(2) *General prohibition.* In addition to the license requirements for 9x515 and ''600 series'' items specified on the Commerce Control List (CCL), you may not export, reexport, or transfer (in-country) any 9x515 or ''600 series'' item, including items described in a .y paragraph of a 9x515 or ''600 series'' ECCN, to the PRC, Russia or Venezuela without a license. The use in, with, or for the International Space Station (ISS) for exports, reexports or transfers within Russia is not within the scope of this paragraph's general prohibition, including launch to the ISS. (*See* § 740.11(e)(1) of the EAR for a definition of the ISS).

* * * * *

PART 748—[AMENDED]

■ 7. The authority citation for 15 CFR part 748 continues to read as follows:

Authority: 50 U.S.C. app. 2401 *et seq.;* 50 U.S.C. 1701 *et seq.;* E.O. 13026, 61 FR 58767, 3 CFR, 1996 Comp., p. 228; E.O. 13222, 66 FR 44025, 3 CFR, 2001 Comp., p. 783; Notice of August 7, 2014, 79 FR 46959 (August 11, 2014).

■ 8. Supplement No. 2 to part 748 (Unique Application and Submission Requirements) is amended by revising the introductory text of paragraph (y)(1) and the introductory text of paragraph (y)(2) to read as follows:

Supplement No. 2 to Part 748—Unique Application and Submission Requirements

* * * * *

(y) * * *

(1) A license application to export a satellite controlled by ECCN 9A515.a for launch in or by a country that is not a member of the North Atlantic Treaty Organization (NATO) or a major non-NATO ally of the United States (as defined in 22 CFR 120.31 and 120.32), must include a statement affirming that at the time of application or prior to export or reexport the following will be in place:

* * * * *

(2) A license application to export a satellite controlled by ECCN 9A515.a for launch in or by a country that is a member of the North Atlantic Treaty Organization (NATO) or that is a major non-NATO ally of the United States (as defined in 22 CFR 120.31 and 120.32), must include a statement affirming that at the time of application or prior to export or reexport the following will be in place:

* * * * *

PART 774—[AMENDED]

■ 9. The authority citation for 15 CFR part 774 continues to read as follows:

Authority: 50 U.S.C. app. 2401 *et seq.;* 50 U.S.C. 1701 *et seq.;* 10 U.S.C. 7420; 10 U.S.C. 7430(e); 22 U.S.C. 287c, 22 U.S.C. 3201 *et seq.;* 22 U.S.C. 6004; 30 U.S.C. 185(s), 185(u); 42 U.S.C. 2139a; 42 U.S.C. 6212; 43 U.S.C. 1354; 15 U.S.C. 1824a; 50 U.S.C. app. 5; 22 U.S.C. 7201 *et seq.;* 22 U.S.C. 7210; E.O. 13026, 61 FR 58767, 3 CFR, 1996 Comp., p. 228; E.O. 13222, 66 FR 44025, 3 CFR, 2001 Comp., p. 783; Notice of August 7, 2014, 79 FR 46959 (August 11, 2014).

■ 10. In Supplement No. 1 to Part 774, Category 3—Electronics, Export Control Classification Number (ECCN) 3A611 is amended by revising Related Controls paragraph (6) in the List of Items Controlled section to read as follows:

Supplement No. 1 to Part 774—The Commerce Control List

* * * * *

3A611 Military electronics, as follows (see List of Items Controlled).

* * * * *

List of Items Controlled

Related Controls: * * * (6) Electronic items ''specially designed'' for military application that are not controlled in any USML category but are within the scope of another ''600 series'' ECCN or a 9x515 ECCN are controlled by that ''600 series'' ECCN or 9x515 ECCN. For example, electronic components not enumerated on the USML or a ''600 series'' other than 3A611 that are ''specially designed'' for a military aircraft controlled by USML Category VIII or ECCN 9A610 are controlled by the catch-all control in ECCN 9A610.x. Electronic components not enumerated on the USML or another ''600 series'' entry that are ''specially designed'' for a military vehicle controlled by USML Category VII or ECCN 0A606 are controlled by ECCN 0A606.x. Electronic components not enumerated on the USML that are ''specially designed'' for a missile controlled by USML Category IV are controlled by ECCN 9A604. * * *

* * * * *

■ 11. In Supplement No. 1 to Part 774, Category 9—Aerospace and Propulsion, Export Control Classification Number (ECCN) 9A515 is amended:

■ a. By revising the fourth entry in the License Requirements table;

■ b. By revising the Related Definitions paragraph in the List of Items Controlled section;

■ c. By revising the introductory text of paragraph d. in the Items section;

■ d. By revising paragraphs e. introductory text, e.1, and e.2 in the Items section; and

■ e. By revising paragraphs x. and y. in the Items section to read as follows.

9A515 ''Spacecraft'' and related commodities, as follows (see List of Items Controlled).

License Requirements

* * * * *

Control(s)	Country Chart (see Supp. No. 1 to part 738)
* * * * *	
MT applies to microcircuits in 9A515.d and 9A515.e.2 when ''usable in'' ''missiles'' for protecting ''missiles'' against nuclear effects (e.g. Electromagnetic Pulse (EMP), X-rays, combined blast and thermal effects).	MT Column 1
* * * * *	

* * * * *

List of Items Controlled

* * * * *

Related Definitions: 'Microcircuit' means a device in which a number of passive or active elements are considered as indivisibly associated on or within a continuous structure to perform the function of a circuit.

Items:

* * * * *

d. Microelectronic circuits (*e.g.,* integrated circuits, microcircuits, MOSFETs) and discrete electronic components rated, certified, or otherwise specified or described as meeting or exceeding all the following characteristics and that are ''specially designed'' for defense articles, ''600 series'' items, or items controlled by 9A515:

* * * * *

e. Microelectronic circuits (*e.g.,* integrated circuits, microcircuits, MOSFETs) and discrete electronic components that are rated, certified, or otherwise specified or described as meeting or exceeding the characteristics in either paragraph e.1 or e.2, AND ''specially designed'' for defense articles controlled by USML Category XV or items controlled by 9A515:

e.1. A total dose $\geq 1 \times 10^5$ Rads (Si) (1×10^3 Gy(Si)) and $< 5 \times 10^5$ Rads (Si) (5×10^3 Gy(Si)); and a single event effect (SEE) (*i.e.,* single event latchup (SEL), single event burnout (SEB), or single event gate rupture (SEGR)) immunity to a linear energy transfer (LET) ≥80 MeV-cm2/mg; or

e.2. A total dose $\geq 5 \times 10^5$ Rads (Si) (5×10^3 Gy (Si)) and not described in 9A515.d.

* * * * *

x. ''Parts,'' ''components,'' ''accessories'' and ''attachments'' that are ''specially designed'' for defense articles controlled by USML Category XV or items controlled by 9A515, and that are NOT:

1. Enumerated or controlled in the USML or elsewhere within ECCNs 9A515 or 9A004;

2. Microelectronic circuits and discrete electronic components;

3. Described in ECCNs 7A004 or 7A104;

4. Described in an ECCN containing ''space-qualified'' as a control criterion (*i.e.,* 3A001.b.1, 3A001.e.4, 3A002.g.1, 3A991.o, 3A992.b.3, 6A002.a.1, 6A002.b.2, 6A002.d.1, 6A004.c and .d, 6A008.j.1, 6A998.b, or 7A003.d.2);

5. Microwave solid state amplifiers and microwave assemblies (refer to ECCN 3A001.b.4 for controls on these items);

6. Travelling wave tube amplifiers (refer to ECCN 3A001.b.8 for controls on these items); or

7. Elsewhere specified in ECCN 9A515.y.

Note to 9A515.x: ''Parts,'' ''components,'' ''accessories,'' and ''attachments'' specified in USML subcategory XV(e) or enumerated in other USML categories are subject to the controls of that paragraph or category.

y. Items that would otherwise be within the scope of ECCN 9A515.x but that have been identified in an interagency-cleared commodity classification (CCATS) pursuant to § 748.3(e) as warranting control in 9A515.y.

y.1. Discrete electronic components not specified in 9A515.e; and

y.2. [RESERVED]

■ 12. In Supplement No. 1 to Part 774, Category 9—Aerospace and Propulsion, Export Control Classification Number (ECCN) 9D001 is amended:

■ a. By revising the heading;

■ b. By revising the first entry in the License Requirements table; and

■ b. By revising the Related Controls paragraph in the List of Items Controlled section to read as follows:

9D001 ''Software'' ''specially designed'' or modified for the ''development'' of equipment or ''technology'' controlled by ECCN 9A001 to 9A004, 9A012, 9A101 (except for items in 9A101.b that are ''subject to the ITAR,'' see 22 CFR part 121), 9A106.d. or .e, 9A110, or 9A120, 9B (except for ECCNs 9B604, 9B610, 9B619, 9B990, and 9B991), or ECCN 9E003.

DEPARTMENT OF HOMELAND SECURITY

Coast Guard

33 CFR Part 165

[Docket Number USCG–2015–0188]

RIN 1625–AA00

Safety Zones; Misery Challenge, Manchester Bay, Manchester, MA

AGENCY: Coast Guard, DHS.

ACTION: Temporary final rule.

SUMMARY: The Coast Guard is establishing a temporary safety zone in Manchester Bay to be enforced during the Misery Challenge marine event, which will involve swimmers, kayakers, and stand-up paddlers. This safety zone will ensure the protection of the event participants, support vessels, and maritime public from the hazards associated with the event. Vessels will be prohibited from entering into, transiting through, mooring, or anchoring within this safety zone during periods of enforcement unless authorized by the Coast Guard Sector Boston Captain of the Port (COTP) or the COTP's designated representative.

DATES: This temporary final rule is effective from 7:30 a.m. on August 1, 2015 to 11:30 a.m. on August 1, 2015.

ADDRESSES: Documents mentioned in this preamble are part of docket [USCG–

2015–0188]. To view documents mentioned in this preamble as being available in the docket, go to *http://www.regulations.gov*, type the docket number in the ''SEARCH'' box and click ''SEARCH.'' Click on Open Docket Folder on the line associated with this rulemaking. You may also visit the Docket Management Facility in Room W12–140 on the ground floor of the Department of Transportation West Building, 1200 New Jersey Avenue SE., Washington, DC 20590, between 9 a.m. and 5 p.m., Monday through Friday, except Federal holidays.

FOR FURTHER INFORMATION CONTACT: If you have questions on this rule, contact Mr. Mark Cutter, Coast Guard Sector Boston Waterways Management Division, telephone (617) 223–4000, email *Mark.E.Cutter@uscg.mil.* If you have questions on viewing or submitting material to the docket, call Ms. Cheryl Collins, Program Manager, Docket Operations, telephone (202) 366–9826.

SUPPLEMENTARY INFORMATION:

Table of Acronyms

DHS Department of Homeland Security
CFR Code of Federal Regulation
FR **Federal Register**
NPRM Notice of Proposed Rulemaking
NAD 83 North American Datum of 1983

A. Regulatory History and Information

On May 8, 2015 we published a notice of proposed rulemaking (NPRM) entitled Safety Zones; Misery Challenge, Manchester Bay, Manchester, MA in the **Federal Register** (80 FR 26514). We received no comments on the proposed rule. No public meeting was requested, and none was held.

B. Basis and Purpose

The legal basis for the proposed rule is 33 U.S.C. 1231; 50 U.S.C. 191; 33 CFR 1.05–1, 6.04–1, 6.04–6, and *160.5*; Department of Homeland Security Delegation No. 0170.1, which collectively authorize the Coast Guard to establish regulatory safety zones.

By establishing a temporary safety zone, the Coast Guard will ensure the protection of the event participants, support vessels, and maritime public from the hazards associated with the event.

C. Discussion of Comments, Changes and the Temporary Final Rule

The Coast Guard provided a comment period of 30 days and no comments were received. There are no changes to the regulatory text.

D. Regulatory Analyses

We developed this rule after considering numerous statutes and executive orders related to rulemaking. Below we summarize our analyses based on these statutes and executive orders.

1. Regulatory Planning and Review

This rule is not a significant regulatory action under section 3(f) of Executive Order 12866, Regulatory Planning and Review, as supplemented by Executive Order 13563, Improving Regulation and Regulatory Review, and does not require an assessment of potential costs and benefits under section 6(a)(3) of Executive Order 12866 or under section 1 of Executive Order 13563. The Office of Management and Budget has not reviewed it under those Orders.

We expect the economic impact of this rule to be minimal. This regulation may have some impact on the public, but that potential impact will likely be minimal for several reasons. First, this safety zone will be in effect for only 4 hours in the morning when vessel traffic is expected to be light. Second, vessels may enter or pass through the safety zone during an enforcement period with the permission of the COTP or the designated representative. Finally, the Coast Guard will provide notification to the public through Broadcast Notice to Mariners well in advance of the event.

2. Impact on Small Entities

The Regulatory Flexibility Act of 1980 (RFA), 5 U.S.C. 601–612, as amended, requires federal agencies to consider the potential impact of regulations on small entities during rulemaking. The term ''small entities'' comprises small businesses, not-for-profit organizations that are independently owned and operated and are not dominant in their fields, and governmental jurisdictions with populations of less than 50,000. The Coast Guard received no comments from the Small Business Administration on this rule. The Coast Guard certifies under 5 U.S.C. 605(b) that this rule will not have a significant economic impact on a substantial number of small entities.

For all of the reasons discussed in the Regulatory Planning and Review section, the Coast Guard certifies under 5 U.S.C. 605(b) that this rule would not have a significant economic impact on a substantial number of small entities.

If you think that your business, organization, or governmental jurisdiction qualifies as a small entity and that this rule would have a significant economic impact on it, please submit a comment (see **ADDRESSES**) explaining why you think it qualifies and how and to what degree this rule would economically affect it.

3. Assistance for Small Entities

Under section 213(a) of the Small Business Regulatory Enforcement Fairness Act of 1996 (Pub. L. 104–121), we want to assist small entities in understanding this rule. If the rule would affect your small business, organization, or governmental jurisdiction and you have questions concerning its provisions or options for compliance, please contact the person listed in the **FOR FURTHER INFORMATION CONTACT**, above.

Small businesses may send comments on the actions of Federal employees who enforce, or otherwise determine compliance with, Federal regulations to the Small Business and Agriculture Regulatory Enforcement Ombudsman and the Regional Small Business Regulatory Fairness Boards. The Ombudsman evaluates these actions annually and rates each agency's responsiveness to small business. If you wish to comment on actions by employees of the Coast Guard, call 1–888–REG–FAIR (1–888–734–3247). The Coast Guard will not retaliate against small entities that question or complain about this rule or any policy or action of the Coast Guard.

4. Collection of Information

This rule will not call for a new collection of information under the Paperwork Reduction Act of 1995 (44 U.S.C. 3501–3520).

5. Federalism

A rule has implications for federalism under Executive Order 13132, Federalism, if it has a substantial direct effect on the States, on the relationship between the national government and the States, or on the distribution of power and responsibilities among the various levels of government. We have analyzed this rule under that Order and determined that this rule does not have implications for federalism.

6. Protest Activities

The Coast Guard respects the First Amendment rights of protesters. Protesters are asked to contact the person listed in the **FOR FURTHER INFORMATION CONTACT** section to coordinate protest activities so that your message can be received without jeopardizing the safety or security of people, places or vessels.

7. Unfunded Mandates Reform Act

The Unfunded Mandates Reform Act of 1995 (2 U.S.C. 1531–1538) requires Federal agencies to assess the effects of their discretionary regulatory actions. In particular, the Act addresses actions that may result in the expenditure by a

State, local, or tribal government, in the aggregate, or by the private sector of $100,000,000 (adjusted for inflation) or more in any one year. Though this rule will not result in such an expenditure, we do discuss the effects of this rule elsewhere in this preamble.

8. Taking of Private Property

This rule will not cause a taking of private property or otherwise have taking implications under Executive Order 12630, Governmental Actions and Interference with Constitutionally Protected Property Rights.

9. Civil Justice Reform

This rule meets applicable standards in sections 3(a) and 3(b)(2) of Executive Order 12988, Civil Justice Reform, to minimize litigation, eliminate ambiguity, and reduce burden.

10. Protection of Children From Environmental Health Risks

We have analyzed this rule under Executive Order 13045, Protection of Children from Environmental Health Risks and Safety Risks. This rule is not an economically significant rule and does not create an environmental risk to health or risk to safety that may disproportionately affect children.

11. Indian Tribal Governments

This rule does not have tribal implications under Executive Order 13175, Consultation and Coordination with Indian Tribal Governments, because it does not have a substantial direct effect on one or more Indian tribes, on the relationship between the Federal Government and Indian tribes, or on the distribution of power and responsibilities between the Federal Government and Indian tribes.

12. Energy Effects

This action is not a ''significant energy action'' under Executive Order 13211, Actions Concerning Regulations That Significantly Affect Energy Supply, Distribution, or Use.

13. Technical Standards

This rule does not use technical standards. Therefore, we did not consider the use of voluntary consensus standards.

14. Environment

We have analyzed this rule under Department of Homeland Security Management Directive 023–01 and Commandant Instruction M16475.lD, which guide the Coast Guard in complying with the National Environmental Policy Act of 1969 (NEPA) (42 U.S.C. 4321–4370f), and have made a determination that this action is one of a category of actions that do not individually or cumulatively have a significant effect on the human environment. This rule involves the establishment of a temporary safety zone. This rule is categorically excluded from further review under paragraph 34(g) of Figure 2–1 of the Commandant Instruction. A written environmental analysis (EA) checklist and categorical exclusion determination (CED) are available in the docket where indicated under **ADDRESSES**. We seek any comments or information that may lead to the discovery of a significant environmental impact from this rule.

List of Subjects in 33 CFR Part 165

Harbors, Marine safety, Navigation (water), Reporting and recordkeeping requirements, Security measures, Waterways.

For the reasons discussed in the preamble, the Coast Guard amends 33 CFR part 165 as follows:

PART 165—REGULATED NAVIGATION AREAS AND LIMITED ACCESS AREAS

■ 1. The authority citation for part 165 continues to read as follows:

Authority: 33 U.S.C., 1231; 50 U.S.C. 191; 33 CFR 1.05–1, 6.04–1, 6.04–6, and 160.5; Department of Homeland Security Delegation No. 0170.1.

■ 2. Add a new § 165.T01–0188 to read as follows:

§ 165.T01–0188 Safety Zone—Misery Challenge—Manchester Bay, Manchester, Massachusetts.

(a) *General.* Establish a temporary safety zone:

(1) *Location.* The following area is a safety zone: All navigable waters, from surface to bottom, within one hundred (100) yards from the participants and vessels in support of events in Manchester Bay, Manchester, MA, and enclosed by a line connecting the following points (NAD 83):

Latitude	Longitude
42°34′03″ N.	70°46′42″ W.; thence to.
42°33′58″ N.	70°46′33″ W.; thence to
42°32′32″ N.	70°47′45″ W.; thence to
42°32′58″ N.	70°48′40″ W.; thence to point of origin.

(2) *Effective and enforcement period.* This rule will be effective on August 1, 2015, from 7:30 a.m. to 11:30 a.m.

(b) *Regulations.* While this safety zone is being enforced, the following regulations, along with those contained in 33 CFR 165.23, apply:

(1) No person or vessel may enter or remain in this safety zone without the permission of the Captain of the Port (COTP), Coast Guard Sector Boston or the COTP's representative. However, any vessel that is granted permission by the COTP or the COTP's representative must proceed through the area with caution and operate at a speed no faster than that speed necessary to maintain a safe course, unless otherwise required by the Navigation Rules.

(2) Any person or vessel permitted to enter the safety zone shall comply with the directions and orders of the COTP or the COTP's representative. Upon being hailed by a U.S. Coast Guard vessel by siren, radio, flashing lights, or other means, the operator of a vessel within the zone shall proceed as directed. Any person or vessel within the safety zone shall exit the

(3) To obtain permissions required by this regulation, individuals may reach the COTP or a COTP representative via VHF channel 16 or 617–223–5757 (Sector Boston Command Center).

(c) *Penalties.* Those who violate this section are subject to the penalties set forth in 33 U.S.C. 1232 and 50 U.S.C. 1226.

(d) *Notification.* Coast Guard Sector Boston will give notice through the Local Notice to Mariners, Broadcast Notice to Mariners, and to mariners for the purpose of enforcement of this temporary safety zone. Also, Sector Boston will notify the public to the greatest extent possible of any period in which the Coast Guard will suspend enforcement of this safety zone.

(e) *COTP representative.* The COTP's representative may be any Coast Guard commissioned, warrant, or petty officer or any Federal, state, or local law enforcement officer who has been designated by the COTP to act on the COTP's behalf. The COTP's representative may be on a Coast Guard vessel, a Coast Guard Auxiliary vessel, a state or local law enforcement vessel, or a location on shore.

Dated: June 25, 2015.

C.C. Gelzer,

Captain, U.S. Coast Guard, Captain of the Port Boston.

DEPARTMENT OF HOMELAND SECURITY

Coast Guard

33 CFR Part 165

[Docket No. USCG–2015–0616]

Safety Zones; Annual Events in the Captain of the Port Detroit Zone

AGENCY: Coast Guard, DHS.

ACTION: Notice of enforcement of regulation.

SUMMARY: The Coast Guard will enforce various safety zones for annual marine events in the Captain of the Port Detroit zone from 8 p.m. on July 2, 2015, through 11 p.m. on August 1, 2015. Enforcement of these zones is necessary and intended to ensure safety of life on the navigable waters immediately prior to, during, and immediately after these fireworks events. During the aforementioned period, the Coast Guard will enforce restrictions upon, and control movement of, vessels in a specified area immediately prior to, during, and immediately after fireworks events. During each enforcement period, no person or vessel may enter the respective safety zone without permission of the Captain of the Port.

DATES: The regulations in 33 CFR 165.941 will be enforced at various dates and times between 8 p.m. on July 2, 2015, through 11 p.m. on August 1, 2015.

FOR FURTHER INFORMATION CONTACT: If you have questions on this document, call or email PO1 Todd Manow, Prevention, U.S. Coast Guard Sector Detroit, 110 Mount Elliot Ave., Detroit MI, 48207; telephone (313)568–9580; email *Todd.M.Manow@uscg.mil.*

SUPPLEMENTARY INFORMATION: The Coast Guard will enforce the safety zones listed in 33 CFR 165.941, Safety Zones; Annual Events in the Captain of the Port Detroit Zone, at the following dates and times for the following events, which are listed in chronological order by date and time of the event:

(1) *Bay City Fireworks Festival, Bay City, MI.* The safety zone listed in 33 CFR 165.941(a)(53), all waters of the Saginaw River near Bay City, MI, from the Veteran's Memorial Bridge south approximately 1000-yds to the River Walk Pier, will be enforced from 8 p.m. to 10:30 p.m. on July 2, 3, and 4, 2015. In the case of inclement weather on any scheduled day, this safety zone will be enforced from 8 p.m. to 10:30 p.m. on July 5, 2015.

(2) *Caseville Fireworks, Caseville, MI.* The safety zone listed in 33 CFR 165.941(a)(36), all waters of Saginaw Bay, within a 300-yard radius of the fireworks launch site located at position 43°56.9′ N, 083°17.2′ W (NAD 83), located off the Caseville break wall, will be enforced from 9:45 p.m. to 10:15 p.m. on July 3, 2015. In the case of inclement weather on July 3, 2015, this safety zone will be enforced from 9:45 p.m. to 10:15 p.m. on July 5, 2015.

(3) *Algonac Pickerel Tournament Fireworks, Algonac, MI.* The safety zone listed in 33 CFR 165.941(a)(37), all waters of the St. Clair River, within a 300-yd radius of the fireworks barge located at position 42°37′ N, 082°32′ W, North of Russell Island, will be enforced from 10 p.m. to 10:30 p.m. on July 3, 2015. In the case of inclement weather on July 3, 2015, this safety zone will be enforced from 10 p.m. to 10:30 p.m. on July 4, 2015.

(4) *Lexington Independence Festival Fireworks, Lexington, MI.* The safety zone listed in 33 CFR 165.941(a)(42), all waters of Lake Huron within a 300-yd radius of the fireworks barge located 300 yards east of the Lexington break wall, will be enforced from 10 p.m. to 10:30 p.m. on July 3, 2015. In the case of inclement weather on July 3, 2015, this safety zone will be enforced from 10 p.m. to 10:30 p.m. on July 5, 2015.

(5) *Grosse Ile Yacht Club Fireworks, Grosse Ile, MI.* The safety zone listed in 33 CFR 165.941(a)(44), all waters of the Detroit River within a 300-yd radius of the fireworks launch site located at the Grosse Ile Yacht Club at position 42°06′ N, 083°09′ W (NAD 83), will be enforced from 9:45 p.m. to 10:30 p.m. on July 4, 2015.

(6) *Roostertail Fireworks, Detroit, MI.* The safety zone listed in 33 CFR 165.941(a)(1), all waters of the Detroit River within a 300-ft radius of the fireworks launch site between Detroit and Belle Isle near the Roostertail Restaurant, will be enforced from 10 p.m. to 10:10 p.m. on July 4, 2015.

(7) *Harrisville Fireworks, Harrisville, MI.* The safety zone listed in 33 CFR 165.941(a)(7), a 450-ft radius of the fireworks launch site located at the end of the break wall at the Harrisville harbor, will be enforced from 10 p.m. to 11 p.m. on July 5, 2014.

(8) *City of St. Clair Fireworks, St. Clair, MI.* The safety zone listed in 33 CFR 165.941(a)(31) will be enforced from 10 p.m. to 10:45 p.m. on July 4, 2015. In the case of inclement weather on July 4, 2015, this safety zone will be enforced from 10 p.m. to 10:45 p.m. on July 5, 2015. A regulated area is established to include all waters off the St. Clair River near St. Clair City Park, within a 300-yard radius of the fireworks launch site located at position 42°49′ N, 082°29′ W (NAD 83).

(9) *Oscoda Township Fireworks, Oscoda, MI.* The safety zone listed in 33 CFR 165.941(a)(32) will be enforced from 10 p.m. to 10:30 p.m. on July 4, 2015. In the case of inclement weather on July 4, 2015, this safety zone will be enforced from 10 p.m. to 10:30 p.m. on July 5, 2015. A regulated area is established to include all waters of Lake Huron, off the DNR Boat Launch near the mouth of the Au Sable River within a 300-yard radius of the fireworks launch site located at position 44°25′ N, 083°19′ W (NAD 83).

(10) *Port Austin Fireworks, Port Austin, MI.* The safety zone listed in 33 CFR 165.941(a)(33), all waters of Lake Huron within a 300-yd radius of the fireworks launch site, at position 42°03′ N, 082°59′ W, off of the Port Austin break wall, will be enforced from 10 p.m. to 10:30 p.m. on July 4, 2015. In the case of inclement weather on July 4, 2015, this safety zone will be enforced from 10 p.m. to 10:30 p.m. on July 5, 2015.

(11) *Grosse Pointe Farms Fireworks, Grosse Pointe Farms, MI.* The safety zone listed in 33 CFR 165.941(a)(35), all waters of Lake St. Clair, within a 300-yd radius of the fireworks launch site at position 42°23.85 N, 082°53.25 W, at a private park at Harbor Hill and Lake Shore Rd, will be enforced from 10 p.m. to 10:30 p.m. on July 4, 2015.

(12) *Grosse Pointe Yacht Club 4th of July Fireworks, Grosse Pointe Shores, MI.* The safety zone listed in 33 CFR 165.941(a)(41), all U.S. waters of the Lake St. Clair, within a 300 yard radius of position 42°26′ N, 082°52′ W, approximately 500 ft east of the Grosse Point Yacht Club, will be enforced from 10 p.m. to 10:30 p.m. on July 4, 2015. In the case of inclement weather on July 4, 2015, this safety zone will be enforced from 10 p.m. to 10:30 p.m. on July 5, 2015.

(13) *Trenton Fireworks, Trenton, MI.* The safety zone listed in 33 CFR 165.941(a)(45), all U.S. waters of the Detroit River, Trenton Channel, within a 300 yard radius of position 42°09′ N, 083°10′ W, will be enforced from 10 p.m. to 10:30 p.m. on July 4, 2015. In the case of inclement weather on July 4, 2015, this safety zone will be enforced from 10 p.m. to 10:30 p.m. on July 5, 2015.

(14) *Belle Maer Harbor 4th of July Fireworks, Harrison Township, MI.* The safety zone listed in 33 CFR 165.941(a)(46), all U.S. waters of Lake St. Clair, within a 400 yard radius of position 42°36′ 30″ N, 082°47′40″ W, will be enforced from 10 p.m. to 10:30 p.m. on July 4, 2015. In the case of inclement weather on July 4, 2015, this

safety zone will be enforced from 10 p.m. to 10:30 p.m. on July 5, 2015.

(15) *Tawas City 4th of July Fireworks, Tawas City, MI.* The safety zone listed in 33 CFR 165.941(a)(47), all U.S. waters of Lake Huron, within a 300 yard radius of position 44°16′ N, 083°30′ W, 2000 feet west of the State Dock in East Tawas, will be enforced from 10 p.m. to 11 p.m. on July 4, 2015. In the case of inclement weather on July 4 2015, this safety zone will be enforced from 10 p.m. to 11 p.m. on July 5, 2015.

(16) *Marine City Maritime Festival Fireworks, Marine City, MI.* The safety zone listed in 33 CFR 165.941(a)(13), all waters of the St. Clair River within a 500 foot radius of the fireworks launch site located at position 42°43.15 N, 082°29.2 W, approximately 500 feet offshore from the intersection of Pearl St. and N. Water St, will be enforced from 10 p.m. to 10:30 p.m. on July 31, 2015. In the case of inclement weather on July 31, 2015, this safety zone will be enforced from 10 p.m. to 10:30 p.m. on August 1, 2015.

Under the provisions of 33 CFR 165.23, entry into, transiting, or anchoring within these safety zones during the enforcement period is prohibited unless authorized by the Captain of the Port Detroit or his designated representative. Vessels that wish to transit through the safety zones may request permission from the Captain of the Port Detroit or his designated representative. Requests must be made in advance and approved by the Captain of Port before transits will be authorized. Approvals will be granted on a case by case basis. The Captain of the Port may be contacted via U.S. Coast Guard Sector Detroit on channel 16, VHF–FM. The Coast Guard will give notice to the public via Local Notice to Mariners and VHF radio broadcasts that the regulation is being enforced.

This document is issued under authority of 33 CFR 165.941 and 5 U.S.C. 552 (a). If the Captain of the Port determines that any of these safety zones need not be enforced for the full duration stated in this document, he may suspend such enforcement and notify the public of the suspension via a Broadcast Notice to Mariners.

Dated: June 29, 2015.

Scott B. Lemasters,

Captain, U. S. Coast Guard, Captain of the Port Detroit.

[Docket No. USCG–2015–0530]

RIN 1625–AA00

Safety Zone; Annual Events Requiring Safety Zones in the Captain of the Port Lake Michigan Zone-Sturgeon Bay Yacht Club Evening on the Bay Fireworks

AGENCY: Coast Guard, DHS.

ACTION: Notice of enforcement of regulation.

SUMMARY: The Coast Guard will enforce the safety zone on the waters of Sturgeon Bay in Sturgeon Bay, WI for the Evening on the Bay Fireworks. This zone will be enforced from 8:30 p.m. until 10:30 p.m. on August 8, 2015. This action is necessary and intended to ensure safety of life on navigable waters immediately prior to, during, and immediately after the fireworks display. During the aforementioned period, the Coast Guard will enforce restrictions upon, and control movement of, vessels in the safety zone. No person or vessel may enter the safety zone while it is being enforced without permission of the Captain of the Port Lake Michigan or a designated representative.

DATES: The regulations in 33 CFR 165.929 will be enforced for safety zone (f)(5), Table 165.929, from 8:30 p.m. until 10:30 p.m. on August 8, 2015.

FOR FURTHER INFORMATION CONTACT: If you have questions on this document, call or email MST1 Joseph McCollum, Prevention Department, Coast Guard Sector Lake Michigan, Milwaukee, WI at (414) 747–7148, email *joseph.p.mccollum@uscg.mil.*

SUPPLEMENTARY INFORMATION:

The Coast Guard will enforce the Sturgeon Bay Yacht Club Evening on the Bay Fireworks safety zone listed as item (f)(5) in Table 165.929 of 33 CFR 165.929. Section 165.929 lists many annual events requiring safety zones in the Captain of the Port Lake Michigan zone. This safety zone will encompass all waters of Sturgeon Bay within the arc of a circle with a 280-foot radius from the fireworks launch site located on a barge in approximate position 44°49.310′ N., 087°21.370′ W. (NAD 83). This zone will be enforced from 8:30 p.m. until 10:30 p.m. on August 8, 2015.

All vessels must obtain permission from the Captain of the Port Lake Michigan or the on-scene representative to enter, move within, or exit the safety zone. Requests must be made in advance and approved by the Captain of the Port before transits will be authorized. Approvals will be granted on a case by case basis. Vessels and persons granted permission to enter the safety zone must obey all lawful orders or directions of the Captain of the Port Lake Michigan or a designated representative.

This document is issued under authority of 33 CFR 165.929, Safety Zones; Annual events requiring safety zones in the Captain of the Port Lake Michigan zone, and 5 U.S.C. 552(a). In addition to this publication in the **Federal Register**, the Coast Guard will provide the maritime community with advance notification for the enforcement of this zone via Broadcast Notice to Mariners or Local Notice to Mariners. The Captain of the Port Lake Michigan or an on-scene representative may be contacted via Channel 16, VHF–FM.

Dated: June 16, 2015.

A.B. Cocanour,

Captain, U.S. Coast Guard, Captain of the Port Lake Michigan.

BILLING CODE 9110–04–P

ENVIRONMENTAL PROTECTION AGENCY

40 CFR Part 52

[EPA–HQ–OAR–2012–0943, FRL–9930–25–OAR]

Findings of Failure To Submit a Section 110 State Implementation Plan for Interstate Transport for the 2008 National Ambient Air Quality Standards for Ozone

AGENCY: Environmental Protection Agency (EPA).

ACTION: Final rule.

SUMMARY: The Environmental Protection Agency (EPA) is taking final action finding that 24 states have failed to submit infrastructure State Implementation Plans (SIPs) to satisfy certain interstate transport requirements of the Clean Air Act (CAA) with respect to the 2008 8-hour ozone national ambient air quality standard (NAAQS). Specifically, these requirements pertain to significant contribution to nonattainment, or interference with maintenance, of the 2008 8-hour ozone NAAQS in other states. These findings of failure to submit establish a 2-year deadline for the EPA to promulgate a Federal Implementation Plan (FIP) to address the interstate transport SIP requirements pertaining to significant

contribution to nonattainment and interference with maintenance unless, prior to the EPA promulgating a FIP, the state submits, and the EPA approves, a SIP that meets these requirements.

DATES: Effective date of this action is August 12, 2015.

FOR FURTHER INFORMATION CONTACT:
General questions concerning this document should be addressed to Mrs. Gobeail McKinley, Office of Air Quality Planning and Standards, Air Quality Policy Division, Mail Code C539–04, 109 TW Alexander Drive, Research Triangle Park, NC 27711; telephone (919) 541–5246; email: *mckinley.gobeail@epa.gov.*

SUPPLEMENTARY INFORMATION:

I. General Information

A. Notice and Comment Under the Administrative Procedures Act (APA)

Section 553 of the APA, 5 U.S.C. 553(b)(3)(B), provides that, when an agency for good cause finds that notice and public procedure are impracticable, unnecessary or contrary to the public interest, the agency may issue a rule without providing notice and an opportunity for public comment. The EPA has determined that there is good cause for making this rule final without prior proposal and opportunity for comment because no significant EPA judgment is involved in making a finding of failure to submit SIPs, or elements of SIPs, required by the CAA, where states have made no submissions or incomplete submissions, to meet the requirement. Thus, notice and public procedure are unnecessary. The EPA finds that this constitutes good cause under 5 U.S.C. 553(b)(3)(B).

B. How can I get copies of this document and other related information?

The EPA has established a docket for this action under Docket ID No. EPA–HQ–OAR–2012–0943. Publicly available docket materials are available either electronically through *https://www.regulations.gov* or in hard copy at the EPA Docket Center, EPA/DC, William Jefferson Clinton West Building, Room 3334, 1301 Constitution Avenue NW., Washington, DC. The Public Reading Room is open from 8:30 a.m. to 4:30 p.m., Monday through Friday, excluding legal holidays. The telephone number for the Public Reading Room is (202) 566–1744 and the telephone number for the Office of Air and Radiation Docket and Information Center is (202) 566–1742.

C. How is the preamble organized?

Table of Contents

D. Where do I go if I have specific state questions?

The table below lists the states that failed to make an interstate transport SIP submittal addressing CAA section 110(a)(2)(D)(i)(I) requirements for the 2008 ozone NAAQS. For questions related to specific states mentioned in this document, please contact the appropriate EPA Regional Office:

Regional offices	States
EPA Region 1: Anne Arnold, Manager, Air Quality Planning Unit (OEP05–02), EPA Region I, 5 Post Office Square, Suite 100, Boston, MA 02109–3912. (617) 918–1047.	Maine, Massachusetts, New Hampshire, Vermont
EPA Region 3: Cristina Fernandez, Associate Director, Office of Air Program Planning (3AP30), Air Protection Division, EPA Region III, 1650 Arch Street, Philadelphia, PA 19103–2187. (215) 814–2178.	Pennsylvania, Virginia, West Virginia
EPA Region 4: R. Scott Davis, Chief, Air Planning & Implementation Branch, EPA Region IV, Sam Nunn Atlanta Federal Center, 61 Forsyth Street SW, 12th Floor, Atlanta, GA 30303. (404) 562–9127.	Alabama, Florida, Georgia, Mississippi, North Carolina, South Carolina, Tennessee
EPA Region 5: John Mooney, Air Program Branch Manager, Air Programs Branch, EPA Region 5, 77 West Jackson Street, Chicago, IL 60604–3590. (312) 886–6043.	Illinois, Michigan, Minnesota
EPA Region 6: Guy Donaldson, Chief, Air Planning Section, EPA Region VI, 1445 Ross Avenue, Dallas, TX 75202–2733. (214) 665–7242.	Arkansas, New Mexico, Oklahoma
EPA Region 7: Joshua A. Tapp, Branch Chief, Air Planning and Development Branch, EPA Region VII, 11201 Renner Blvd., Lenexa, KS 66219. (913) 551–7606.	Iowa, Kansas, Missouri
EPA Region 9: Matt Lakin, Air Program Manager, Air Planning Office, EPA Region 9, 75 Hawthorne Street, San Francisco, CA 94105. (415) 972–3851.	California

II. Background and Overview

A. Interstate Transport SIPs

The CAA section 110(a) imposes an obligation upon states to submit SIPs that provide for the implementation, maintenance and enforcement of a new or revised NAAQS within 3 years following the promulgation of that NAAQS. Section 110(a)(2) lists specific requirements that states must meet in these SIP submissions, as applicable. The EPA refers to this type of SIP submission as the ''infrastructure'' SIP because it ensures that states can implement, maintain and enforce the air standards. Within these requirements, section 110(a)(2)(D)(i) contains requirements to address interstate transport of NAAQS pollutants. A SIP revision submitted for this sub-section is referred to as an ''interstate transport SIP.'' In turn, section 110(a)(2)(D)(i)(I) requires that such a plan contain adequate provisions to prohibit emissions from the state that will contribute significantly to nonattainment of the NAAQS in any other state (''prong 1'') or interfere with maintenance of the NAAQS in any other state (''prong 2''). Interstate transport prongs 1 and 2, also called the ''good neighbor'' provisions, are the requirements relevant to this findings document.

Pursuant to CAA section 110(k)(1)(B), the EPA must determine no later than 6 months after the date by which a state is required to submit a SIP whether a state has made a submission that meets the minimum completeness criteria established per section 110(k)(1)(A). The EPA refers to the determination that a state has not submitted a SIP submission that meets the minimum completeness criteria as a ''finding of failure to submit.'' If the EPA finds a state has failed to submit a SIP to meet its statutory obligation to address 110(a)(2)(D)(i)(I), pursuant to section 110(c)(1) the EPA has not only the authority, but the obligation, to promulgate a FIP within 2 years to address the CAA requirement. This finding therefore starts a 2-year clock for promulgation by the EPA of a FIP, in accordance with CAA section 110(c)(1), unless prior to such promulgation the state submits, and the EPA approves, a submittal from the state to meet the requirements of CAA section 110(a)(2)(D)(i)(I) for the 2008 8-hour ozone NAAQS. The EPA will work with states subject to these findings of failure to submit and provide assistance as necessary to help them develop approvable submittals in a timely manner. The EPA notes this action does not start a mandatory sanctions clock pursuant to CAA section 179 because this finding of failure to submit does not pertain to a part D plan for nonattainment areas required under CAA section 110(a)(2)(I) or a SIP call pursuant to CAA section 110(k)(5).

B. Background on 2008 Ozone NAAQS and Related Rulemakings

On March 12, 2008, the EPA strengthened the NAAQS for ozone.[1] The EPA revised the previous 8-hour primary ozone standard of 0.08 parts per millions (ppm) to 0.075 ppm. The EPA also revised the secondary 8-hour standard to the level of 0.075 ppm making it identical to the revised primary standard. Infrastructure SIPs addressing the revised standard were due March 12, 2011. In September 2009, the EPA announced it would reconsider the 2008 8-hour ozone NAAQS.[2] To reduce the workload for states during the interim period of reconsideration, the EPA also announced its intention to propose staying implementation of the 2008 ozone NAAQS for a number of the requirements. Then, on January 6, 2010, as part of its voluntary rulemaking on reconsideration, the EPA proposed to revise the 2008 NAAQS for ozone from 75 ppb to a level within the range of 60 to 70 ppb. *See* 75 FR 2938 (January 19, 2010). The EPA indicated its intent to issue final standards, based upon the reconsideration, by summer 2011.

On July 6, 2011, the EPA finalized the Cross-State Air Pollution Rule (CSAPR), 76 FR 48208, in response to the remand by the United States Court of Appeals for the District of Columbia Circuit (DC Circuit) of the EPA's earlier rule, the Clean Air Interstate Rule (CAIR).[3] *See North Carolina* v. *EPA,* 531 F.3d 896 (D.C. Cir. 2008), *modified by* 550 F.3d 1176 (remanding CAIR). CSAPR addresses ozone transport with respect to the 1997 ozone NAAQS, but does not address the 2008 ozone standard, because the 2008 ozone NAAQS was under reconsideration by the EPA during the analytical work for CSAPR.

On September 2, 2011, consistent with the direction of the President, the Administrator of the Office of Information and Regulatory Affairs of the Office of Management and Budget returned the draft final 2008 ozone NAAQS rule to the EPA for further consideration.[4] In view of this direction and the timing of the EPA's ongoing periodic review of the ozone NAAQS required under CAA section 109 (as announced on September 29, 2008), the EPA decided to coordinate further proceedings on its voluntary rulemaking on reconsideration of the 2008 ozone NAAQS with that ongoing periodic review, by deferring the completion of its voluntary rulemaking on reconsideration until it completed its statutorily-required periodic review.[5] During this time period for renewed implementation of the 2008 ozone standard, however, a number of legal developments pertaining to the EPA's promulgation of CSAPR created uncertainty over the EPA's statutory interpretation and implementation of the ''good neighbor'' requirement as to that standard.

On August 21, 2012, the DC Circuit issued a decision in *EME Homer City Generation, L.P.* v. *EPA* addressing several legal challenges to CSAPR and holding, among other things, that states had no obligation to submit good neighbor SIPs until the EPA had first quantified each state's good neighbor obligation.[6] Accordingly, under that decision the submission deadline for good neighbor SIPs under the CAA would not necessarily be tied to the promulgation of a new or revised NAAQS. While the EPA disagreed with this interpretation of the statute and sought review first with the DC Circuit *en banc* and then with the United States Supreme Court, the EPA complied with the DC Circuit's ruling during the pendency of its appeal. In particular, the EPA indicated that consistent with the DC Circuit's opinion, it would not at that time issue findings that states had failed to submit SIPs addressing the good neighbor requirements in CAA section 110(a)(2)(D)(i)(I).[7] Moreover, when the EPA made findings that states had failed to submit infrastructure SIPs

[5] *Id.*

[6] *EME Homer City Generation, L.P.* v. *EPA,* 696 F.3d 7, 31 (D.C. Cir. 2012).

[7] *See, e.g.,* Memorandum from the Office of Air and Radiation former Assistant Administrator Gina McCarthy to the EPA Regions, ''Next Steps for Pending Redesignation Requests and State Implementation Plan Actions Affected by the Recent Court Decision Vacating the 2011 Cross-State Air Pollution Rule,'' November 19, 2012; 78 FR 65559 (November 1, 2013) (final action on Florida infrastructure SIP submission for 2008 8-hour ozone NAAQS); and 78 FR 14450 (March 6, 2013) (final action on Tennessee infrastructure SIP submissions for 2008 8-hour ozone NAAQS).

addressing the 2008 ozone NAAQS, the EPA explained that it was not issuing findings as to the good neighbor requirements in accordance with the court's holding in *EME Homer City Generation.* 78 FR 2882, 2884 (January 15, 2013) (Findings of Failure To Submit a Complete State Implementation Plan for Section 110(a) Pertaining to the 2008 Ozone National Ambient Air Quality Standard).

While the DC Circuit declined to consider the EPA's appeal *en banc,*[8] on January 23, 2013, the Supreme Court granted the EPA's petition for certiorari.[9] During 2013 and early 2014, as the EPA awaited a decision from the Supreme Court, the EPA initiated efforts and technical analyses aimed at identifying and quantifying state good neighbor obligations for the 2008 ozone NAAQS. As part of this effort, the EPA solicited stakeholder input and also provided states with, and requested input on, emissions inventories for 2011 and emissions inventory projections for 2018.

On April 29, 2014, the Supreme Court issued a decision reversing the DC Circuit's *EME Homer City* opinion on CSAPR and held, among other things, that under the plain language of the CAA, states must submit SIPs addressing the good neighbor requirement in CAA section 110(a)(2)(D)(i)(I) within 3 years of promulgation of a new or revised NAAQS, regardless of whether the EPA first provides guidance, technical data or rulemaking to quantify the state's obligation. Thus, the Supreme Court affirmed that states have an obligation in the first instance to address the good neighbor provision after promulgation of a new or revised NAAQS, a holding that also applies to states' obligation to address interstate transport for CAA section 110(a)(2)(D)(i)(I) for the 2008 ozone NAAQS.

C. Mandatory Duty Suit for the EPA's Failure to Make Findings of Failure To Submit for States That Did Not Submit SIPs

On March 15, 2013, several states and the District of Columbia filed a complaint challenging the EPA's assertion in the January 15, 2013 findings of failure to submit for the 2008 ozone NAAQS infrastructure SIPs that it did not have the authority to issue findings as to the good neighbor provision.[10] After the Supreme Court issued its decision reversing the DC Circuit's vacatur of CSAPR, the EPA requested partial vacatur and remand of the January 15, 2013 portion of the findings that pertained to the good neighbor provision. On August 1, 2014, the court granted the EPA's request, vacating the EPA's decision not to make findings of failure to submit with respect to the good neighbor provision and remanding the findings to the EPA for further consideration.

Shortly thereafter, Sierra Club and WildEarth Guardians filed two separate cases alleging that the EPA had not fulfilled its mandatory duty to make findings of failure to submit good neighbor SIPs addressing interstate transport in CAA section 110(a)(2)(D)(i)(I) with respect to the 2008 ozone NAAQS. In the first case, Sierra Club filed a complaint in the U.S. District Court for the Northern District of California (Northern District of California) on July 15, 2014, seeking an order to compel the EPA to make findings of failure to submit with respect to the 2008 ozone NAAQS good neighbor SIP for the state of Tennessee.[11] On November 18, 2014, Sierra Club and WildEarth Guardians filed another complaint in the same court seeking an order to compel the EPA to make findings of failure to submit with respect to the 2008 ozone NAAQS good neighbor SIPs for the following states: Arkansas, California, Connecticut, Georgia, Iowa, Illinois, Kansas, Massachusetts, Maine, Michigan, Minnesota, Missouri, New Hampshire, New Mexico, Oklahoma, Pennsylvania, Rhode Island, South Carolina, Virginia, Washington and West Virginia.[12] On January 15, 2015, the plaintiffs amended their complaint in the second case to add Alabama, Florida, North Carolina and Mississippi. On May 15, 2015, the court entered judgment ordering the EPA to, by June 30, 2015, sign a notice issuing its findings of failure to submit with respect to the 2008 ozone NAAQS interstate transport SIPs for the 26 states addressed in both cases.[13]

The EPA recognizes the practical and legal uncertainty that has surrounded the 2008 ozone NAAQS and the proper interpretation of the good neighbor provision. States were given the impression that if the NAAQS were revised as a result of the reconsideration, the 3-year SIP deadline would reset. The EPA also recognizes that this uncertainty may have influenced states' efforts to develop SIPs to address CAA section 110(a)(2)(D)(i)(I) requirements for the 2008 ozone NAAQS. Given that the NAAQS have not been revised and the United States Supreme Court overturned the DC Circuit opinion on CSAPR, March 12, 2011, remains the legally applicable deadline for good neighbor SIPs for the 2008 8-hour ozone NAAQS.

In response to the orders from the DC Circuit and the Northern District of California, the EPA is taking this action for all states that have failed to submit complete SIPs addressing CAA section 110(a)(2)(D)(i)(I) for the 2008 ozone NAAQS. To date, 26 states, the District of Columbia and Puerto Rico have submitted complete SIPs addressing CAA section 110(a)(2)(D)(i)(I) for the 2008 ozone NAAQS. Three states specifically identified in the Northern District of California's order have made complete submissions as of the date of this document. Therefore, the EPA is issuing national findings of failure to submit good neighbor SIPs addressing the requirements of CAA sections 110(a)(2)(D)(i)(I) as to the 2008 ozone NAAQS, addressing all states that have not made complete submissions as to the date of this document.

D. Further Background Specific to North Carolina SIP Status

On November 12, 2012, the state of North Carolina submitted a SIP revision to the EPA addressing, among other things, the good neighbor provision of CAA section 110(a)(2)(D)(i)(I) for the 2008 ozone NAAQS. The submission was determined to be complete by a letter dated November 15, 2012. On July 15, 2014, Sierra Club filed a complaint in the Northern District of California alleging that the EPA had failed to take final action on the North Carolina SIP submission, including the interstate transport provisions, by the statutory deadline and asked the court to order the EPA to take such final action by a date certain.[14] Subsequently, on September 3, 2014, the state of North Carolina submitted a letter withdrawing the good neighbor provision of the November 12, 2012, infrastructure SIP submission addressing CAA section

[8] *EME Homer City Generation, L.P.* v. *EPA,* No. 11–1302 (D.C. Cir. January 24, 2013), ECF No. 1417012 (denying the EPA's motion for rehearing *en banc*).

[9] *EPA* v. *EME Homer City Generation, L.P.,* 133 S. Ct. 2857 (2013) (granting the EPA's and other parties' petitions for certiorari).

[10] *Maryland* v. *EPA,* Case No. 13–1070 (D.C. Cir., filed March 15, 2013).

[11] Complaint, *Sierra Club* vs. *McCarthy,* Case 4:14–cv–3198–JSW (N.D. Cal. July 15, 2014). The complaint also included a separate claim regarding the EPA's alleged failure to take final action to approve or disapprove infrastructure SIPs as to a number of states.

[12] Complaint, *Sierra Club* vs. *McCarthy,* Case 4:14–cv–05091–YGR (N.D. Cal. November. 18, 2014).

[13] *See* Judgment, *Sierra Club* v. *McCarthy,* Case 4:14–cv–05091–YGR (N.D. Cal. May 15, 2015).

[14] Complaint, *Sierra Club* v. *McCarthy,* Case 4:14–cv–03198–JSW, (N.D. Cal. July 15, 2014).

110(a)(2)(D)(i)(I).[15] In reliance on the withdrawal, Sierra Club filed an amended complaint on December 12, 2014, that revised its claim to remove the allegation that the EPA had failed to act the good neighbor provision of North Carolina's SIP.[16] The parties to the litigation subsequently entered into a consent decree that settled the remaining claim as to North Carolina.[17] In further reliance on the withdrawal, Sierra Club and WildEarth Guardians also filed an amended complaint in case number 4:14–cv–05091, discussed above, alleging that the EPA had failed to make a finding of failure to submit as to North Carolina's good neighbor SIP for the 2008 ozone NAAQS.[18]

On June 26, 2015, North Carolina submitted a letter indicating that it wished to ''rescind'' its September 3, 2014 withdrawal of its good neighbor SIP to address the 2008 ozone NAAQS.[19] The letter explained that the November 12, 2012 submittal did not include modeling and that preliminary air quality modeling released by the EPA on January 22, 2015, supported its interstate transport SIP. The letter also explained that, based on this modeling, the state concluded ''it has met its obligations under CAA section 110(a)(1) and (2)(D) related to interstate transport . . . and therefore, does not expect'' to be subject to this document finding certain states' failure to submit interstate transport SIPs for the 2008 ozone NAAQS.

On June 30, 2015, the EPA responded to North Carolina's June 26, 2015 letter.[20] Because the EPA determined that it was not appropriate to rescind North Carolina's prior withdrawal of its November 12, 2012 SIP submission, and because the June 25, 2015, letter relies on new information and analysis to support the state's conclusion regarding its statutory interstate transport obligations that was not contained in its November 12, 2012, SIP submission (*i.e.,* the preliminary air quality modeling released by the EPA on January 22, 2015), the EPA views the June 26, 2015 letter as a new SIP submission. Accordingly, the EPA has evaluated the June 26, 2015 letter for completeness as a SIP revision pursuant to the criteria in 40 CFR part 51, appendix V, and concluded that the June 26, 2015, letter is an incomplete SIP submission. The incompleteness letter notes that North Carolina's June 26, 2015, letter contains new information and analysis upon which North Carolina now relies to support its conclusions regarding the state's statutory obligations to address interstate transport, in particular the EPA's air quality modeling, and that neither the new information nor North Carolina's conclusions relying upon that information were subject to public notice and comment per criteria 2.1(f)–(h) of appendix V. Accordingly, the EPA is finding in this document that North Carolina has failed to submit a complete SIP revision addressing CAA section 110(a)(2)(D)(i)(I) as to the 2008 ozone NAAQS.

[15] *See,* Letter from Sheila Holman, Director, Division of Air Quality, NCDENR, to Heather McTeer Toney, Regional Administrator, USEPA Region 4, ''Withdrawal of Section 110(a)(2)(D)(i)(I) from North Carolina's 2008 Ozone Infrastructure State Implementation Plan Submittal'' (September 3, 2014).

[18] *See* Amended Complaint, *Sierra Club* v. *McCarthy,* Case No. 4:14–cv–05091 (N.D. Cal. Jan. 15, 2015).

[19] *See* Letter from Sheila C. Holman, NCDENR, to Heather McTeer Toney, USEPA Region 4, ''Recession [sic] of North Carolina's September 3, 2014, Withdrawal of 2008 Ozone Infrastructure State Implementation Plan Certification Pertaining to Interstate Transport (Section 110(a)(2)(D)(i)(I))'' (June 26, 2015).

[20] *See* Letter from Beverly H. Banister, USEPA Region 4, to Sheila Holman, NCDENR, ''Response to North Carolina's June 26, 2015 Letter Seeking to Rescind the September 3, 2014 Withdrawal of the 2008 Ozone Infrastructure State Implementation Plan Certification Regarding Interstate Transport'' (June 30, 2015).

III. Findings of Failure To Submit for States That Failed To Make a Good Neighbor SIP Submission for the 2008 Ozone NAAQS

Three states (*i.e.,* Connecticut, Rhode Island and Washington) addressed by the Northern District of California's order have made complete SIP submittals addressing the good neighbor provision for the 2008 ozone NAAQS. Hawaii was not addressed by the Northern District of California's order and the state has submitted a complete SIP submittal addressing the good neighbor provision for the 2008 ozone NAAQS. The EPA is making findings of failure to submit for 24 states. The EPA is finding that the following states have not made a complete good neighbor SIP submittal to meet the requirements of CAA section 110(a)(2)(D)(i)(I): Alabama, Arkansas, California, Florida, Georgia, Iowa, Illinois, Kansas, Massachusetts, Maine, Michigan, Minnesota, Mississippi, Missouri, New Hampshire, New Mexico, North Carolina, Oklahoma, Pennsylvania, South Carolina, Tennessee, Vermont,[21] Virginia and West Virginia.

[21] We are making a finding for the state of Vermont even though the state was not addressed by the Northern District of California's order. In fairness and to fulfill its statutory obligations, the EPA is addressing all states that have not made a submittal in this findings document.

IV. Environmental Justice Considerations

This document is making a procedural finding that certain states have failed to submit a SIP to address CAA section 110(a)(2)(D)(i)(I) for the 2008 ozone NAAQS. The EPA did not conduct an environmental analysis for this rule because this rule would not directly affect the air emissions of particular sources. Because this rule will not directly affect the air emissions of particular sources, it does not affect the level of protection provided to human health or the environment. Therefore, this action will not have potential disproportionately high and adverse human health or environmental effects on minority, low-income or indigenous populations.

V. Statutory and Executive Order Reviews

A. Executive Order 12866: Regulatory Planning and Review and Executive Order 13563: Improving Regulation and Regulatory Review

This action is not a significant regulatory action and was therefore not submitted to the Office of Management and Budget (OMB) for review.

B. Paperwork Reduction Act (PRA)

This action does not impose an information collection burden under the provisions of the Paperwork Reduction Act, 44 U.S.C. 3501 *et seq.* This final rule does not establish any new information collection requirement apart from what is already required by law.

C. Regulatory Flexibility Act (RFA)

This action is not subject to the RFA. The RFA applies only to rules subject to notice and comment rulemaking requirements under the Administrative Procedure Act (APA), 5 U.S.C. 553, or any other statute. This rule is not subject to notice and comment requirements because the agency has invoked the APA ''good cause'' exemption under 5 U.S.C. 553(b).

D. Unfunded Mandates Reform Act of 1995 (UMRA)

This action does not contain any unfunded mandate as described in UMRA, 2 U.S.C. 1531–1538, and does not significantly or uniquely affect small governments. The action implements mandates specifically and explicitly set forth in the CAA under section 110(a) without the exercise of any policy discretion by the EPA.

E. Executive Order 13132: Federalism

This action does not have federalism implications. It will not have substantial direct effects on the states, on the relationship between the national government and the states, or on the distribution of power and responsibilities among the various levels of government.

F. Executive Order 13175: Consultation and Coordination With Indian Tribal Governments

This action does not have tribal implications as specified in Executive Order 13175. This rule responds to the requirement in the CAA for states to submit SIPs under section 110(a) to address CAA section 110(a)(2)(D)(i)(I) for the 2008 ozone NAAQS. No tribe is subject to the requirement to submit an implementation plan under section 110(a) within 3 years of promulgation of a new or revised NAAQS. Thus, Executive Order 13175 does not apply to this action.

G. Executive Order 13045: Protection of Children From Environmental Health and Safety Risks

The EPA interprets Executive Order 13045 as applying only to those regulatory actions that concern environmental health or safety risks that the EPA has reason to believe may disproportionately affect children, per the definition of ''covered regulatory action'' in section 2–202 of the Executive Order. This action is not subject to Executive Order 13045 because it does not concern an environmental health risk or safety risk.

H. Executive Order 13211: Actions That Significantly Affect Energy Supply, Distribution or Use

This action is not subject to Executive Order 13211, because it is not a significant regulatory action under Executive Order 12866.

I. National Technology Transfer and Advancement Act

This rulemaking does not involve technical standards.

J. Executive Order 12898: Federal Actions to Address Environmental Justice in Minority Populations and Low-Income Populations

The EPA believes the human health or environmental risk addressed by this action will not have potential disproportionately high and adverse human health or environmental effects on minority, low-income or indigenous populations because it does not affect the level of protection provided to human health or the environment. The EPA's evaluation of environmental justice considerations is contained in section IV of this document.

K. Congressional Review Act (CRA)

This action is subject to the CRA, and the EPA will submit a rule report to each House of the Congress and to the Comptroller General of the United States. This action is not a ''major rule'' as defined by 5 U.S.C. 804(2).

L. Judicial Review

Section 307(b)(l) of the CAA indicates which federal Courts of Appeal have venue for petitions of review of final agency actions by the EPA under the CAA. This section provides, in part, that petitions for review must be filed in the Court of Appeals for the District of Columbia Circuit (i) when the agency action consists of ''nationally applicable regulations promulgated, or final actions taken, by the Administrator,'' or (ii) when such action is locally or regionally applicable, if ''such action is based on a determination of nationwide scope or effect and if in taking such action the Administrator finds and publishes that such action is based on such a determination.''

The EPA has determined that this final rule consisting of findings of failure to submit certain of the required good neighbor SIP provisions is ''nationally applicable'' within the meaning of section 307(b)(1). This rule affects 24 states across the country that are located in seven of the ten EPA Regions, 10 different federal circuits, and multiple time zones.

This determination is appropriate because, in the 1977 CAA Amendments that revised CAA section 307(b)(l), Congress noted that the Administrator's determination that an action is of ''nationwide scope or effect'' would be appropriate for any action that has ''scope or effect beyond a single judicial circuit.'' H.R. Rep. No. 95–294 at 323–324, reprinted in 1977 U.S.C.C.A.N. 1402–03. Here, the scope and effect of this action extends to the 10 judicial circuits that include the states across the country affected by this action. In these circumstances, section 307(b)(1) and its legislative history authorize the Administrator to find the rule to be of ''nationwide scope or effect'' and thus to indicate that venue for challenges lies in the DC Circuit. Accordingly, the EPA is determining that this is a rule of nationwide scope or effect. Under section 307(b)(1) of the CAA, petitions for judicial review of this action must be filed in the United States Court of Appeals for the District of Columbia within 60 days from the date this final action is published in the **Federal Register**. Filing a petition for review by the Administrator of this final action does not affect the finality of the action for the purposes of judicial review nor does it extend the time within which a petition for judicial review must be filed, and shall not postpone the effectiveness of such rule or action.

List of Subjects in 40 CFR Part 52

Environmental protection, Air pollution control, Incorporation by reference, Intergovernmental relations, Ozone, Reporting and recordkeeping requirements.

Dated: June 30, 2015.

Janet G. McCabe,

Acting Assistant Administrator.

BILLING CODE 6560–50–P

ENVIRONMENTAL PROTECTION AGENCY

40 CFR Part 52

[EPA–R09–OAR–2014–0841; FRL–9929–60–Region 9]

Revisions to the California State Implementation Plan, South Coast Air Quality Management District

AGENCY: Environmental Protection Agency (EPA).

ACTION: Final rule.

SUMMARY: The Environmental Protection Agency (EPA) is taking action to approve a revision to the South Coast Air Quality Management District (SCAQMD) portion of the California State Implementation Plan (SIP). This revision concerns volatile organic compound (VOC) emissions from Large Confined Animal Facilities. We are approving a local rule to regulate these emission sources under the Clean Air Act (CAA or the Act).

DATES: This rule will be effective on August 12, 2015.

ADDRESSES: The EPA has established docket number EPA–R09–OAR–2014–0841 for this action. Generally, documents in the docket for this action are available electronically at *http://www.regulations.gov* or in hard copy at EPA Region IX, 75 Hawthorne Street, San Francisco, California 94105–3901. While all documents in the docket are listed at *http://www.regulations.gov,* some information may be publicly available only at the hard copy location (*e.g.,* copyrighted material, large maps, multi-volume reports), and some may not be available in either location (*e.g.,* confidential business information (CBI)). To inspect the hard copy materials, please schedule an appointment during normal business hours with the contact listed in the **FOR FURTHER INFORMATION CONTACT** section.

FOR FURTHER INFORMATION CONTACT: Nancy Levin, EPA Region IX, (415) 972–3848, *Levin.Nancy@epa.gov.*

SUPPLEMENTARY INFORMATION: Throughout this document, ''we,'' ''us,'' and ''our'' refer to EPA.

Table of Contents

I. Proposed Action

On April 14, 2015, in 80 FR 19931, the EPA proposed approval of the following rule that was submitted for incorporation into the California SIP.

TABLE 1—SUBMITTED RULE

Local agency	Rule No.	Rule title	Adopted	Submitted
SCAQMD	223	Emission Reduction Permits for Large Confined Animal Facilities.	06/02/06	03/17/09

Our proposed action contains more information on the basis for this rulemaking and on our evaluation of the submittal.

II. Public Comments and EPA Responses

The EPA's proposed action provided a 30-day public comment period. During this period, we received no comments.

III. EPA Action

No comments were submitted. Therefore, as authorized in section 110(k)(3) of the Act, EPA is fully approving this rule into the California SIP.

IV. Incorporation by Reference

In this rule, the EPA is finalizing regulatory text that includes incorporation by reference. In accordance with requirements of 1 CFR 51.5, the EPA is finalizing the incorporation by reference of the SCAQMD rules described in the amendments to 40 CFR part 52 set forth below. The EPA has made, and will continue to make, these documents available electronically through *www.regulations.gov* and in hard copy at the appropriate EPA office (see the **ADDRESSES** section of this preamble for more information).

V. Statutory and Executive Order Reviews

Under the Clean Air Act, the Administrator is required to approve a SIP submission that complies with the provisions of the Act and applicable Federal regulations. 42 U.S.C. 7410(k); 40 CFR 52.02(a). Thus, in reviewing SIP submissions, EPA's role is to approve state choices, provided that they meet the criteria of the Clean Air Act. Accordingly, this action merely approves state law as meeting Federal requirements and does not impose additional requirements beyond those imposed by state law. For that reason, this action:

- Is not a significant regulatory action subject to review by the Office of Management and Budget under Executive Orders 12866 (58 FR 51735, October 4, 1993) and 13563 (76 FR 3821, January 21, 2011);
- does not impose an information collection burden under the provisions of the Paperwork Reduction Act (44 U.S.C. 3501 *et seq.*);
- is certified as not having a significant economic impact on a substantial number of small entities under the Regulatory Flexibility Act (5 U.S.C. 601 *et seq.*);
- does not contain any unfunded mandate or significantly or uniquely affect small governments, as described in the Unfunded Mandates Reform Act of 1995 (Pub. L. 104–4);
- does not have Federalism implications as specified in Executive Order 13132 (64 FR 43255, August 10, 1999);
- is not an economically significant regulatory action based on health or safety risks subject to Executive Order 13045 (62 FR 19885, April 23, 1997);
- is not a significant regulatory action subject to Executive Order 13211 (66 FR 28355, May 22, 2001);
- is not subject to requirements of Section 12(d) of the National Technology Transfer and Advancement Act of 1995 (15 U.S.C. 272 note) because application of those requirements would be inconsistent with the Clean Air Act; and
- does not provide EPA with the discretionary authority to address, as appropriate, disproportionate human health or environmental effects, using practicable and legally permissible methods, under Executive Order 12898 (59 FR 7629, February 16, 1994).

In addition, the SIP is not approved to apply on any Indian reservation land or in any other area where EPA or an Indian tribe has demonstrated that a tribe has jurisdiction. In those areas of Indian country, the rule does not have tribal implications and will not impose substantial direct costs on tribal governments or preempt tribal law as specified by Executive Order 13175 (65 FR 67249, November 9, 2000).

The Congressional Review Act, 5 U.S.C. 801 *et seq.,* as added by the Small Business Regulatory Enforcement Fairness Act of 1996, generally provides that before a rule may take effect, the agency promulgating the rule must submit a rule report, which includes a copy of the rule, to each House of the Congress and to the Comptroller General of the United States. EPA will submit a report containing this action and other required information to the U.S. Senate, the U.S. House of Representatives, and the Comptroller General of the United States prior to publication of the rule in the **Federal Register**. A major rule cannot take effect until 60 days after it is published in the **Federal Register**. This action is not a ''major rule'' as defined by 5 U.S.C. 804(2).

Under section 307(b)(1) of the Clean Air Act, petitions for judicial review of this action must be filed in the United States Court of Appeals for the appropriate circuit by September 11, 2015. Filing a petition for reconsideration by the Administrator of this final rule does not affect the finality of this action for the purposes of judicial review nor does it extend the time within which a petition for judicial review may be filed, and shall not postpone the effectiveness of such rule or action. This action may not be challenged later in proceedings to enforce its requirements (see section 307(b)(2)).

List of Subjects in 40 CFR Part 52

Environmental protection, Air pollution control, Incorporation by reference, Intergovernmental relations, Reporting and recordkeeping requirements, Volatile organic compounds.

Dated: June 9, 2015.

Jared Blumenfeld,

Regional Administrator, Region IX.

Part 52, chapter I, title 40 of the Code of Federal Regulations is amended as follows:

PART 52 [AMENDED]

■ 1. The authority citation for part 52 continues to read as follows:

Authority: 42 U.S.C. 7401 *et seq.*

Subpart F—California

■ 2. Section 52.220 is amended by adding paragraph (c)(363)(i)(F) to read as follows:

§ 52.220 Identification of plan.

* * * * *

(c) * * *

(363) * * *

(i) * * *

(F) South Coast Air Quality Management District.

(*1*) Rule 223, ''Emission Reduction Permits for Large Confined Animal Facilities,'' adopted on June 2, 2006.

[EPA–R03–OAR–2014–0833; FRL–9930–31–Region 3]

Approval and Promulgation of Air Quality Implementation Plans; Maryland; Preconstruction Requirements—Nonattainment New Source Review

AGENCY: Environmental Protection Agency (EPA).

ACTION: Final rule.

SUMMARY: The Environmental Protection Agency (EPA) is approving a State Implementation Plan (SIP) revision submitted on August 22, 2013 by the Maryland Department of the Environment (MDE) on behalf of the State of Maryland. This revision pertains to Maryland's major nonattainment New Source Review (NSR) program, notably preconstruction permitting requirements for sources of fine particulate matter ($PM_{2.5}$). This action is being taken under the Clean Air Act (CAA).

DATES: This final rule is effective on August 12, 2015.

ADDRESSES: EPA has established a docket for this action under Docket ID Number EPA–R03–OAR–2014–0833. All documents in the docket are listed in the *www.regulations.gov* Web site. Although listed in the electronic docket, some information is not publicly available, *i.e.,* confidential business information (CBI) or other information whose disclosure is restricted by statute. Certain other material, such as copyrighted material, is not placed on the Internet and will be publicly available only in hard copy form. Publicly available docket materials are available either electronically through *www.regulations.gov* or in hard copy for public inspection during normal business hours at the Air Protection Division, U.S. Environmental Protection Agency, Region III, 1650 Arch Street, Philadelphia, Pennsylvania 19103. Copies of the State submittal are available at the Maryland Department of the Environment, 1800 Washington Boulevard, Suite 705, Baltimore, Maryland 21230.

FOR FURTHER INFORMATION CONTACT: David Talley, (215) 814–2117, or by email at *talley.david@epa.gov.*

SUPPLEMENTARY INFORMATION:

I. Background

On March 25, 2015 (80 FR 15713), EPA published a notice of proposed rulemaking (NPR) for the State of Maryland. In the NPR, EPA proposed approval of revisions to Maryland's major nonattainment NSR program, notably preconstruction permitting requirements for sources of fine particulate matter ($PM_{2.5}$). The formal SIP revision (#13–06) was submitted by MDE on August 22, 2013.

Generally, the revisions incorporate provisions related to the 2008 ''Implementation of the New Source Review (NSR) Program for Particulate Matter Less than 2.5 Micrometers ($PM_{2.5}$)'' (2008 NSR $PM_{2.5}$ Rule). 73 FR 28321 (May 16, 2008). As discussed in the NPR, the 2008 NSR $PM_{2.5}$ Rule (as well as the 2007 ''Final Clean Air Fine Particle Implementation Rule'' (2007 $PM_{2.5}$ Implementation Rule) [1]), was the subject of litigation before the United States Court of Appeals for the District of Columbia Circuit (D.C. Circuit) in *Natural Resources Defense Council* v. *EPA* (hereafter, *NRDC* v. *EPA*).[2] On January 4, 2013, the D.C. Circuit remanded to EPA both the 2007 $PM_{2.5}$ Implementation Rule and the 2008 NSR $PM_{2.5}$ Rule. The court found that in both rules EPA erred in implementing the 1997 $PM_{2.5}$ National Ambient Air Quality Standard (NAAQS) solely pursuant to the general implementation provisions of subpart 1 of part D of title I of the CAA (subpart 1), rather than pursuant to the additional implementation provisions specific to particulate matter in subpart 4 of part D of title I (subpart 4).[3] However, as was also discussed in the NPR, EPA's final actions redesignating all of the areas in Maryland which were nonattainment for the 1997 $PM_{2.5}$ NAAQS to attainment obviated the need for MDE to submit a nonattainment NSR SIP addressing $PM_{2.5}$ requirements, including those under subpart 4. *See* 80 FR 15714. EPA, therefore, did not evaluate MDE's August 22, 2013 SIP revision submittal for compliance with subpart 4. To the extent that any area in Maryland is designated as nonattainment for $PM_{2.5}$ in the future, MDE will have to make a submittal under CAA section 189 addressing how its nonattainment NSR permitting program satisfies all of the statutory requirements pertaining to $PM_{2.5}$, including subpart 4.

II. Summary of SIP Revision

The 2008 NSR $PM_{2.5}$ Rule: (1) Required NSR permits to address directly emitted $PM_{2.5}$ and precursor pollutants; (2) established significant emission rates for direct $PM_{2.5}$ and precursor pollutants (including sulfur dioxide (SO_2) and oxides of nitrogen (NO_X)); (3) established $PM_{2.5}$ emission offsets; and (4) required states to account for gases that condense to form particles (condensables) in $PM_{2.5}$ emission limits.

To implement these provisions, Maryland amended Regulation .01 under COMAR 26.11.01 (General Administrative Provisions) and Regulations .01 and .02 under COMAR 26.11.17 (Nonattainment Provisions for Major New Sources and Major Modifications). The general definitions at COMAR 26.11.01.01 were amended to add definitions of ''$PM_{2.5}$'' and ''$PM_{2.5}$ emissions.'' COMAR 26.11.17 contains the preconstruction requirements for new major stationary sources and major modifications locating in nonattainment areas. The definitions of ''regulated NSR pollutant'' and ''significant'' under COMAR 26.11.17.01 were amended. The amended definitions require that sources account for the condensable fraction of PM_{10} and $PM_{2.5}$, require that NO_X and SO_2 be regulated as precursors to PM_{10} and $PM_{2.5}$, and establish

[1] 72 FR 20586 (April 25, 2007).

[2] 706 F.3d 428 (D.C. Cir. 2013).

[3] The court's opinion did not specifically address the point that implementation under subpart 4 requirements would still require consideration of subpart 1 requirements, to the extent that subpart 4 did not override subpart 1. EPA assumes that the court presumed that EPA would address this issue of potential overlap between subpart 1 and subpart 4 requirements in subsequent actions.

significant emission rates (SERs) for $PM_{2.5}$ and its precursors. COMAR 26.11.17.02 was revised to specify that all of the major nonattainment NSR preconstruction requirements of the chapter are applicable to new major stationary sources and major modifications that are major for $PM_{2.5}$ or its precursors. COMAR 26.11.17.02 was also revised to clarify that in addition to the requirements of that chapter, the Prevention of Significant Deterioration (PSD) requirements of COMAR 26.11.04.16 may also apply to sources locating in nonattainment areas.

Other specific requirements of MDE's August 22, 2013 SIP revision submittal and the rationale for EPA's proposed action are explained in the NPR and will not be restated here. No public comments were received on the NPR.

III. Final Action

EPA is approving MDE's August 22, 2013 submittal as a revision to the Maryland SIP.

IV. Incorporation by Reference

In this rulemaking action, the EPA is finalizing regulatory text that includes incorporation by reference. In accordance with requirements of 1 CFR 51.5, the EPA is finalizing the incorporation by reference of the MDE rules regarding definitions and permitting requirements discussed in section II of this preamble. The EPA has made, and will continue to make, these documents generally available electronically through *www.regulations.gov* and/or in hard copy at the appropriate EPA office (see the **ADDRESSES** section of this preamble for more information).

V. Statutory and Executive Order Reviews

A. General Requirements

Under the CAA, the Administrator is required to approve a SIP submission that complies with the provisions of the CAA and applicable Federal regulations. 42 U.S.C. 7410(k); 40 CFR 52.02(a). Thus, in reviewing SIP submissions, EPA's role is to approve state choices, provided that they meet the criteria of the CAA. Accordingly, this action merely approves state law as meeting Federal requirements and does not impose additional requirements beyond those imposed by state law. For that reason, this action:

- Is not a ''significant regulatory action'' subject to review by the Office of Management and Budget under Executive Order 12866 (58 FR 51735, October 4, 1993);
- does not impose an information collection burden under the provisions of the Paperwork Reduction Act (44 U.S.C. 3501 *et seq.*);
- is certified as not having a significant economic impact on a substantial number of small entities under the Regulatory Flexibility Act (5 U.S.C. 601 *et seq.*);
- does not contain any unfunded mandate or significantly or uniquely affect small governments, as described in the Unfunded Mandates Reform Act of 1995 (Pub. L. 104–4);
- does not have Federalism implications as specified in Executive Order 13132 (64 FR 43255, August 10, 1999);
- is not an economically significant regulatory action based on health or safety risks subject to Executive Order 13045 (62 FR 19885, April 23, 1997);
- is not a significant regulatory action subject to Executive Order 13211 (66 FR 28355, May 22, 2001);
- is not subject to requirements of Section 12(d) of the National Technology Transfer and Advancement Act of 1995 (15 U.S.C. 272 note) because application of those requirements would be inconsistent with the CAA; and
- does not provide EPA with the discretionary authority to address, as appropriate, disproportionate human health or environmental effects, using practicable and legally permissible methods, under Executive Order 12898 (59 FR 7629, February 16, 1994).

In addition, this rule does not have tribal implications as specified by Executive Order 13175 (65 FR 67249, November 9, 2000), because the SIP is not approved to apply in Indian country located in the state, and EPA notes that it will not impose substantial direct costs on tribal governments or preempt tribal law.

B. Submission to Congress and the Comptroller General

The Congressional Review Act, 5 U.S.C. 801 *et seq.,* as added by the Small Business Regulatory Enforcement Fairness Act of 1996, generally provides that before a rule may take effect, the agency promulgating the rule must submit a rule report, which includes a copy of the rule, to each House of the Congress and to the Comptroller General of the United States. EPA will submit a report containing this action and other required information to the U.S. Senate, the U.S. House of Representatives, and the Comptroller General of the United States prior to publication of the rule in the **Federal Register**. A major rule cannot take effect until 60 days after it is published in the **Federal Register**. This action is not a ''major rule'' as defined by 5 U.S.C. 804(2).

C. Petitions for Judicial Review

Under section 307(b)(1) of the CAA, petitions for judicial review of this action must be filed in the United States Court of Appeals for the appropriate circuit by September 11, 2015. Filing a petition for reconsideration by the Administrator of this final rule does not affect the finality of this action for the purposes of judicial review nor does it extend the time within which a petition for judicial review may be filed, and shall not postpone the effectiveness of such rule or action. This action pertaining to Maryland's nonattainment NSR program may not be challenged later in proceedings to enforce its requirements. (See section 307(b)(2).)

List of Subjects in 40 CFR Part 52

Environmental protection, Air pollution control, Carbon monoxide, Incorporation by reference, Intergovernmental relations, Nitrogen dioxide, Ozone, Particulate matter, Reporting and recordkeeping requirements, Sulfur oxides, Volatile organic compounds.

Dated: June 26, 2015.

William C. Early,

Acting Regional Administrator, Region III.

For the reasons stated in the preamble, title 40, chapter I, of the Code of Federal Regulations is amended as follows:

PART 52—APPROVAL AND PROMULGATION OF IMPLEMENTATION PLANS

■ 1. The authority citation for part 52 continues to read as follows:

Authority: 42 U.S.C. 7401 *et seq.*

Subpart V—Maryland

■ 2. In § 52.1070, the table in paragraph (c) is amended by revising the entries for COMAR 26.11.01.01, 26.11.17.01, and 26.11.17.02 to read as follows:

§ 52.1070 Identification of plan.

BILLING CODE 6560–50–P

ENVIRONMENTAL PROTECTION AGENCY

40 CFR Parts 52 and 81

[EPA–R04–OAR–2014–0870; FRL–9930–49-Region 4]

Approval and Promulgation of Implementation Plans and Designation of Areas for Air Quality Planning Purposes; Tennessee; Redesignation of the Knoxville 2008 8-Hour Ozone Nonattainment Area to Attainment

AGENCY: Environmental Protection Agency (EPA).

ACTION: Final rule.

SUMMARY: The Environmental Protection Agency (EPA) is taking four separate final actions related to a state implementation plan (SIP) revision submitted by the State of Tennessee, through the Tennessee Department of Environment and Conservation (TDEC), Division of Air Pollution Control, on November 14, 2014, for the Knoxville, Tennessee 8-hour ozone nonattainment area (hereinafter referred to as the ''Knoxville Area'' or ''Area''). The Knoxville Area includes a portion of Anderson County as well as Blount and Knox Counties in their entireties. EPA is approving the base year emissions inventory for the 2008 8-hour ozone national ambient air quality standards (NAAQS) for the Knoxville Area; determining that the Knoxville Area is attaining the 2008 8-hour ozone NAAQS; approving into the SIP the State's plan for maintaining attainment of the 2008 8-hour ozone NAAQS in the Area, including the 2011 and 2026 motor vehicle emission budgets (MVEBs) for nitrogen oxides (NO_X) and volatile organic compounds (VOC); and redesignating the Area to attainment for the 2008 8-hour ozone NAAQS. EPA is also finding the 2011 and 2026 MVEBs for NO_X and VOC for the Knoxville Area adequate for the purposes of transportation conformity.

DATES: This rule is effective August 12, 2015.

ADDRESSES: EPA has established a docket for this action under Docket Identification No. EPA–R04–OAR–2014–0870. All documents in the docket are listed on the *www.regulations.gov* Web site. Although listed in the index, some information may not be publicly available, i.e., Confidential Business Information or other information whose disclosure is restricted by statute. Certain other material, such as copyrighted material, is not placed on the Internet and will be publicly available only in hard copy form. Publicly available docket materials are available either electronically through *www.regulations.gov* or in hard copy at the Air Regulatory Management Section (formerly the Regulatory Development Section), Air Planning and Implementation Branch (formerly the Air Planning Branch), Air, Pesticides and Toxics Management Division, U.S. Environmental Protection Agency, Region 4, 61 Forsyth Street SW., Atlanta, Georgia 30303–8960. EPA requests that if at all possible, you contact the person listed in the **FOR FURTHER INFORMATION CONTACT** section to schedule your inspection. The Regional Office's official hours of business are Monday through Friday, 8:30 a.m. to 4:30 p.m., excluding Federal holidays.

FOR FURTHER INFORMATION CONTACT: Jane Spann or Tiereny Bell of the Air Regulatory Management Section, in the Air Planning and Implementation Branch, Air, Pesticides and Toxics Management Division, U.S. Environmental Protection Agency, Region 4, 61 Forsyth Street SW., Atlanta, Georgia 30303–8960. Ms. Spann may be reached by phone at (404) 562–9029 or via electronic mail at *spann.jane@epa.gov.* Ms. Bell may be reached by phone at (404) 562–9088 or via electronic mail at *bell.tiereny@epa.gov.*

SUPPLEMENTARY INFORMATION:

I. Background for Final Actions

On May 21, 2012, EPA designated areas as unclassifiable/attainment or nonattainment for the 2008 8-hour ozone NAAQS that was promulgated on March 27, 2008. *See* 77 FR 30088. The Knoxville Area was designated as nonattainment for the 2008 8-hour ozone NAAQS and classified as a marginal nonattainment area. On November 14, 2014, TDEC requested that EPA redesignate the Area to attainment for the 2008 8-hour ozone NAAQS and submitted a SIP revision containing a base year emissions inventory for the Area to address the requirements of Clean Air Act (CAA or Act) section 182(a)(1) and the State's plan for maintaining attainment of the 2008 8-hour ozone standard in the Area, including the 2011 and 2026 MVEBs for NO_X and VOC. In a notice of proposed rulemaking (NPR) published on May 21, 2015, EPA proposed to approve the base year emissions inventory for the 2008 8-hour ozone NAAQS for the Knoxville Area; to determine that the Knoxville Area is attaining the 2008 8-hour ozone NAAQS; to approve into the SIP the

State's plan for maintaining attainment of the 2008 8-hour ozone standard in the Area, including the 2011 and 2026 MVEBs for NO_X and VOC; and to redesignate the Area to attainment for the 2008 8-hour ozone NAAQS. *See* 80 FR 29237. In that notice, EPA also notified the public of the status of the Agency's adequacy determination for the Knoxville Area NO_X and VOC MVEBs.[1] The details of Tennessee's submittal and the rationale for EPA's actions are explained in the NPR. EPA received one comment on the May 21, 2015, NPR. This comment is provided in the docket for today's final actions and supports those actions. EPA's response to the comment is provided below.

II. EPA's Response to Comment

The Commenter ''support[s] this docket as written'' and states that ''it is clear the metro area [Knoxville] is in attainment of the 2008 8-hour ozone standard.'' Although supportive of the actions, the Commenter is ''somewhat suspicious of the large projected decreases in NO_X from [on] road sources, given that vehicle traffic will almost certainly be increasing throughout the modeled time period.'' The Commenter believes that it ''seems likely that smaller. . .reductions in NO_X from [on] road sources. . . will still result in continued attainment of the ozone standard given that current NO_X emissions are resulting in ozone attainment.''

EPA does not view this comment as adverse. Regarding the magnitude of the projected on-road mobile source NO_X emissions reductions given increased vehicle traffic, EPA notes that Tennessee used the interagency consultation process required by 40 CFR part 93 (known as the Transportation Conformity Rule) which requires EPA, the United States Department of Transportation, metropolitan planning organizations (MPOs), state departments of transportation, and State and local air quality agencies to work together to develop applicable implementation plans. The planning assumptions used to develop on-road NO_X emissions estimates for the Knoxville Area maintenance plan applied emissions factors developed from the latest EPA-approved mobile emissions model (known as the Motor Vehicle Emissions Simulator or MOVES2014) and did consider increased vehicle traffic by incorporating the increased vehicle miles travelled from the MPO's travel demand model. MOVES2014 is the state-of-the-science emissions model that incorporates the newest emissions control regulatory programs.

III. What are the effects of these actions?

Approval of Tennessee's redesignation request changes the legal designation of Blount and Knox Counties and the portion of Anderson County included in the Knoxville Area, found at 40 CFR 81.343, from nonattainment to attainment for the 2008 8-hour ozone NAAQS. Approval of Tennessee's associated SIP revision also incorporates a plan for maintaining the 2008 8-hour ozone NAAQS in the Knoxville Area through 2026 and a section 182(a)(1) base year emissions inventory into the Tennessee SIP. The maintenance plan establishes NO_X and VOC MVEBs for 2011 and 2026 for the Knoxville Area and includes contingency measures to remedy any future violations of the 2008 8-hour ozone NAAQS and procedures for evaluation of potential violations. The NO_X MVEBs for 2011 and 2026 are 41.62 tons per day (tpd) and 17.69 tpd, respectively. The VOC MVEBs for 2011 and 2026 are 19.71 tpd and 10.49 tpd, respectively. Additionally, EPA is finding the newly-established NO_X and VOC MVEBs for the Knoxville Area adequate for the purpose of transportation conformity. Within 24 months from this final rule, the transportation partners will need to demonstrate conformity to the new NO_X and VOC MVEBs pursuant to 40 CFR 93.104(e).

IV. Final Actions

EPA is taking four separate but related actions regarding the Knoxville Area's redesignation to attainment and maintenance of the 2008 8-hour ozone NAAQS. First, EPA is approving Tennessee's section 182(a)(1) base year emissions inventory for the 2008 8-hour ozone standard for the Knoxville Area into the SIP. Approval of the base year inventory is a prerequisite for EPA to redesignate the Area from nonattainment to attainment.

Second, EPA is determining that the Knoxville Area is attaining the 2008 8-hour ozone NAAQS based on complete, quality-assured and certified monitoring data for the 2011–2013 monitoring period. The 2012–2014 data in the Air Quality System indicates that the Area is continuing to attain the 2008 8-hour ozone NAAQS.

Third, EPA is approving the maintenance plan for the Knoxville Area, including the NO_X and VOC MVEBs for 2011 and 2026, into the Tennessee SIP (under CAA section 175A). The maintenance plan demonstrates that the Area will continue to maintain the 2008 8-hour ozone NAAQS, and the budgets meet all of the adequacy criteria contained in 40 CFR 93.118(e)(4) and (5).

Fourth, EPA is determining that Tennessee has met the criteria under CAA section 107(d)(3)(E) for the Knoxville Area for redesignation from nonattainment to attainment for the 2008 8-hour ozone NAAQS. On this basis, EPA is approving Tennessee's redesignation request for the 2008 8-hour ozone NAAQS for the Knoxville Area. As mentioned above, approval of the redesignation request changes the official designation of Blount and Knox Counties and the portion of Anderson County in the Knoxville Area for the 2008 8-hour ozone NAAQS from nonattainment to attainment, as found at 40 CFR part 81.

EPA is also finding the newly-established NO_X and VOC MVEBs for the Knoxville Area adequate for the purpose of transportation conformity. Within 24 months from this final rule, the transportation partners will need to demonstrate conformity to the new NO_X and VOC MVEBs pursuant to 40 CFR 93.104(e).

V. Statutory and Executive Order Reviews

Under the CAA, redesignation of an area to attainment and the accompanying approval of the maintenance plan under CAA section 107(d)(3)(E) are actions that affect the status of geographical area and do not impose any additional regulatory requirements on sources beyond those required by state law. A redesignation to attainment does not in and of itself impose any new requirements, but rather results in the application of requirements contained in the CAA for areas that have been redesignated to attainment. Moreover, the Administrator is required to approve a SIP submission that complies with the provisions of the Act and applicable Federal regulations. *See* 42 U.S.C. 7410(k); 40 CFR 52.02(a). Thus, in reviewing SIP submissions, EPA's role is to approve state choices, provided that they meet the criteria of the CAA. Accordingly, these actions merely approve state law as meeting Federal requirements and do not impose additional requirements beyond those

[1] Tennessee's November 14, 2015, SIP submission, including the Knoxville Area NO_X and VOC MVEBs, was open for public comment on EPA's adequacy Web site on December 4, 2014, found at: *http://www.epa.gov/otaq/stateresources/transconf/currsips.htm#knx-tn.* The EPA public comment period on adequacy for the MVEBs for 2011 and 2026 for the Knoxville Area closed on January 5, 2015. No comments, adverse or otherwise, were received during EPA's adequacy process for the MVEBs associated with Tennessee's maintenance plan.

imposed by state or federal law. For these reasons, these actions:

• Are not a significant regulatory actions subject to review by the Office of Management and Budget under Executive Orders 12866 (58 FR 51735, October 4, 1993) and 13563 (76 FR 3821, January 21, 2011);

• do not impose an information collection burden under the provisions of the Paperwork Reduction Act (44 U.S.C. 3501 *et seq.*);

• are certified as not having a significant economic impact on a substantial number of small entities under the Regulatory Flexibility Act (5 U.S.C. 601 *et seq.*);

• do not contain any unfunded mandate or significantly or uniquely affect small governments, as described in the Unfunded Mandates Reform Act of 1995 (Pub. L. 104–4);

• do not have Federalism implications as specified in Executive Order 13132 (64 FR 43255, August 10, 1999);

• are not economically significant regulatory actions based on health or safety risks subject to Executive Order 13045 (62 FR 19885, April 23, 1997);

• are not a significant regulatory action subject to Executive Order 13211 (66 FR 28355, May 22, 2001);

• are not subject to requirements of Section 12(d) of the National Technology Transfer and Advancement Act of 1995 (15 U.S.C. 272 note) because application of those requirements would be inconsistent with the CAA; and

• do not provide EPA with the discretionary authority to address, as appropriate, disproportionate human health or environmental effects, using practicable and legally permissible methods, under Executive Order 12898 (59 FR 7629, February 16, 1994).

The SIP is not approved to apply on any Indian reservation land or in any other area where EPA or an Indian tribe has demonstrated that a tribe has jurisdiction. In those areas of Indian country, the rule does not have tribal implications as specified by Executive Order 13175 (65 FR 67249, November 9, 2000), nor will it impose substantial direct costs on tribal governments or preempt tribal law.

The Congressional Review Act, 5 U.S.C. 801 *et seq.,* as added by the Small Business Regulatory Enforcement Fairness Act of 1996, generally provides that before a rule may take effect, the agency promulgating the rule must submit a rule report, which includes a copy of the rule, to each House of the Congress and to the Comptroller General of the United States. EPA will submit a report containing this action and other required information to the U.S. Senate, the U.S. House of Representatives, and the Comptroller General of the United States prior to publication of the rule in the **Federal Register**. A major rule cannot take effect until 60 days after it is published in the **Federal Register**. This action is not a ''major rule'' as defined by 5 U.S.C. 804(2).

Under section 307(b)(1) of the CAA, petitions for judicial review of this action must be filed in the United States Court of Appeals for the appropriate circuit by September 11, 2015. Filing a petition for reconsideration by the Administrator of this final rule does not affect the finality of this action for the purposes of judicial review nor does it extend the time within which a petition for judicial review may be filed, and shall not postpone the effectiveness of such rule or action. This action may not be challenged later in proceedings to enforce its requirements. *See* section 307(b)(2).

List of Subjects

40 CFR Part 52

Environmental protection, Air pollution control, Incorporation by reference, Intergovernmental relations, Nitrogen dioxide, Ozone, Reporting and recordkeeping requirements, Volatile organic compounds.

40 CFR Part 81

Environmental protection, Air pollution control.

Dated: July 6, 2015.

Heather McTeer Toney,

Regional Administrator, Region 4.

40 CFR parts 52 and 81 are amended as follows:

PART 52—APPROVAL AND PROMULGATION OF IMPLEMENTATION PLANS

■ 1. The authority citation for part 52 continues to read as follows:

Authority: 42 U.S.C. 7401 *et seq.*

Subpart RR—Tennessee

■ 2. Section 52.2220(e) is amended by adding two new entries for ''2008 8-hour Ozone Maintenance Plan for the Knoxville Area'' and ''2008 8-hour Ozone Emissions Inventory for the Knoxville Area'' at the end of the table to read as follows:

§ 52.2220 Identification of plan.

* * * * *

(e) * * *

Monday, July 13, 2015

FEDERAL RETIREMENT THRIFT INVESTMENT BOARD

5 CFR Parts 1600, 1601, and 1651

Default Investment Fund

AGENCY: Federal Retirement Thrift Investment Board

ACTION: Proposed rule with request for comments.

SUMMARY: The Federal Retirement Thrift Investment Board (Agency) proposes to amend its regulations to change the default investment fund for certain participants in the Thrift Savings Plan (TSP).

DATES: Submit comments on or before August 12, 2015.

ADDRESSES: You may submit comments using one of the following methods:

- *Federal Rulemaking Portal: http://www.regulations.gov* at Docket ID number FRTIB–2015–0002. Follow the instructions for submitting comments.
- *Mail:* Office of General Counsel, Attn: James Petrick, Federal Retirement Thrift Investment Board, 77 K Street NE., Suite 1000, Washington, DC 20002.
- *Hand Delivery/Courier:* The address for sending comments by hand delivery or courier is the same as that for submitting comments by mail.
- *Facsimile:* Comments may be submitted by facsimile at (202) 942–1676.

The most helpful comments explain the reason for any recommended change and include data, information, and the authority that supports the recommended change.

FOR FURTHER INFORMATION CONTACT: Austen Townsend at (202) 864–8647.

SUPPLEMENTARY INFORMATION: The Agency administers the TSP, which was established by the Federal Employees' Retirement System Act of 1986 (FERSA), Public Law 99–335, 100 Stat. 514. The TSP provisions of FERSA are codified, as amended, largely at 5 U.S.C. 8351 and 8401–79. The TSP is a tax-deferred retirement savings plan for Federal civilian employees, members of the uniformed services, and spouse beneficiaries. The TSP is similar to cash or deferred arrangements established for private-sector employees under section 401(k) of the Internal Revenue Code (26 U.S.C. 401(k)).

On December 18, 2014, the President signed the Smart Savings Act (''the Act''), Public Law 113–255 (128 Stat. 2920). The Act directed the Agency to invest any sums available for investment in the TSP for which an election has not been made in an age-appropriate target date asset allocation investment fund. The Act excluded contributions made by members of the uniformed services for which an election has not been made. This proposed rule would conform the Agency's regulations to the requirements of the Act.

New Default Investment Fund for Certain Participants

This proposed regulation would change the TSP's default investment fund from the TSP's Government Securities Investment Fund (G Fund) to the age-appropriate TSP Lifecycle Fund (L Fund) for the following persons: (1) A civilian employee with a newly established TSP account; (2) a rehired civilian employee who has a zero account balance; and (3) the surviving spouse beneficiary of a deceased TSP participant for whom a beneficiary participant account is established. The default investment fund for uniformed services participants will remain the G Fund as required by the Act. In the case of a rehired civilian participant who has a positive account balance and a contribution allocation in effect, the participant's contribution allocation will remain in effect. In the case of a rehired participant who has a positive account balance and no contribution allocation in effect, the participant's new contribution will continue to be invested in the G Fund. Participants whose default investment fund is the age-appropriate L Fund will receive a notification concerning investment risk before enrollment or as soon as practicable thereafter.

Regulatory Flexibility Act

I certify that this proposed regulation will not have a significant economic impact on a substantial number of small entities. This proposed regulation will affect Federal civilian employees and spouse beneficiaries who participate in the Thrift Savings Plan, which is a Federal defined contribution retirement savings plan created under the Federal Employees' Retirement System Act of 1986 (FERSA), Public Law 99–335, 100 Stat. 514, and which is administered- by the Agency.

Paperwork Reduction Act

I certify that these proposed regulations do not require additional reporting under the criteria of the Paperwork Reduction Act.

Unfunded Mandates Reform Act of 1995

Pursuant to the Unfunded Mandates Reform Act of 1995, 2 U.S.C. 602, 632, 653, 1501–1571, the effects of this proposed regulation on state, local, and tribal governments and the private sector have been assessed. This proposed regulation will not compel the expenditure in any one year of $100 million or more by state, local, and tribal governments, in the aggregate, or by the private sector. Therefore, a statement under section 1532 is not required.

List of Subjects in 5 CFR Parts 1600, 1601, and 1651

Government employees, Pensions, Retirement.

Gregory T. Long,

Executive Director, Federal Retirement Thrift Investment Board.

For the reasons stated in the preamble, the Agency proposes to amend 5 CFR chapter VI as follows:

PART 1600—EMPLOYEE CONTRIBUTION ELECTIONS, CONTRIBUTION ALLOCATIONS, AND AUTOMATIC ENROLLMENT PROGRAM

■ 1. The authority citation for part 1600 continues to read as follows:

Authority: 5 U.S.C. 8351, 8432(a), 8432(b), 8432(c), 8432(j), 8432d, 8474(b)(5) and (c)(1).

■ 2. Amend § 1600.37 by revising the heading, the introductory text, and paragraphs (c) and (d), and by adding paragraph (e) to read as follows:

§ 1600.37 Notice.

The Board shall furnish all new employees and all rehired employees covered by the automatic enrollment program a notice that accurately describes:

* * * * *

(c) The fund in which the default employee and agency contributions will be invested unless the employee makes a contribution allocation;

(d) The employee's ability to request a refund of any default employee contributions (adjusted for allocable gains and losses) and the procedure to request such a refund; and

(e) That an investment in any fund other than the G Fund is made at the employee's risk, that the employee is not protected by the United States Government or the Board against any loss on the investment, and that neither the United States Government nor the Board guarantees any return on the investment.

PART 1601—PARTICIPANTS' CHOICES OF TSP FUNDS

■ 3. The authority citation for part 1601 continues to read as follows:

Authority: 5 U.S.C. 8351, 8432d, 8438, 8474(b)(5) and (c)(1).

■ 4. Amend § 1601.13, by revising paragraphs (a)(3) and (4), redesignating paragraph (a)(5) as (a)(6) and revising it, and adding a new paragraph (a)(5) to read as follows:

§ 1601.13 Elections.

(a) * * *

(3) A uniformed services participant or a participant enrolled prior to [EFFECTIVE DATE OF FINAL REGULATION] who elects for the first time to invest in a TSP Fund other than the G Fund must execute an acknowledgement of risk in accordance with § 1601.33;

(4) All deposits made on behalf of a participant enrolled prior to [EFFECTIVE DATE OF FINAL REGULATION] or a uniformed services participant who does not have a contribution allocation in effect will be invested in the G Fund. A participant who is enrolled prior to [EFFECTIVE DATE OF FINAL REGULATION] and subsequently rehired after [EFFECTIVE DATE OF FINAL REGULATION] and has a positive account balance will be considered enrolled prior to [EFFECTIVE DATE OF FINAL REGULATION] for purposes of this paragraph;

(5) All deposits made on behalf of a participant first enrolled on or after [EFFECTIVE DATE OF FINAL REGULATION] who does not have a contribution allocation in effect will be invested in the age-appropriate TSP Lifecycle Fund; and

(6) Once a contribution allocation becomes effective, it remains in effect until it is superseded by a subsequent contribution allocation or the participant's account balance is reduced to zero. If a rehired participant has a positive account balance and a contribution allocation in effect, then the participant's contribution allocation will remain in effect until a new allocation is made. If, however, the participant has a zero account balance, then the participant's contributions will be allocated to the age-appropriate TSP Lifecycle Fund until a new allocation is made.

* * * * *

§ 1601.22 [Amended]

■ 5. Amend § 1601.22 by removing paragraph (a)(3).

■ 6. Amend § 1601.33 by revising the first sentence of paragraph (a), to read as follows:

§ 1601.33 Acknowledgement of risk.

(a) A uniformed services participant or a participant enrolled prior to [EFFECTIVE DATE OF FINAL REGULATION] who wants to invest in a TSP Fund other than the G Fund must execute an acknowledgement of risk for that fund. * * *

* * * * *

PART 1651—DEATH BENEFITS

■ 7. The authority citation for part 1651 continues to read as follows:

Authority: 5 U.S.C. 8424(d), 8432d, 8432(j), 8433(e), 8435(c)(2), 8474(b)(5) and 8474(c)(1).

■ 8. Amend § 1651.2, by revising the last sentence of paragraph (d) to read as follows:

§ 1651.2 Entitlement to funds in a deceased participant's account.

* * * * *

(d) * * * The account will accrue earnings at the G Fund rate in accordance with 5 CFR part 1645 until it is paid out or a beneficiary participant account is established under this part.

■ 3. Amend § 1651.19, by revising the first sentence of paragraph (a) to read as follows:

§ 1651.19 Beneficiary participant accounts.

* * * * *

(a) * * * Regardless of the allocation of the deceased participant's account balance at the time of his or her death, each beneficiary participant account, once established, will be allocated 100 percent to the age-appropriate TSP Lifecycle Fund based on the beneficiary participant's date of birth. * * *

* * * * *

[FR Doc. 2015–16867 Filed 7–10–15; 8:45 am]

BILLING CODE 6760–01–P

FEDERAL RETIREMENT THRIFT INVESTMENT BOARD

5 CFR Part 1653

Criminal Restitution Orders

AGENCY: Federal Retirement Thrift Investment Board.

ACTION: Proposed rule with request for comments.

SUMMARY: The Federal Retirement Thrift Investment Board (Agency) proposes to amend its procedures for processing criminal restitution orders to: (1) Require an enforcement letter from the Department of Justice stating that restitution has been ordered under the Mandatory Victims Restitution Act; and (2) provide that the Agency will treat a judgment ordering restitution under the Mandatory Victims Restitution Act as a final judgment. The Agency also proposes to make two technical corrections.

DATES: Submit comments on or before August 12, 2015.

ADDRESSES: You may submit comments using one of the following methods:

- *Federal Rulemaking Portal: http://www.regulations.gov* at Docket ID number FRTIB–2015–0001. Follow the instructions for submitting comments.
- *Mail:* Office of General Counsel, Attn: James Petrick, Federal Retirement Thrift Investment Board, 77 K Street NE., Suite 1000, Washington, DC 20002.
- *Hand Delivery/Courier*: The address for sending comments by hand delivery or courier is the same as that for submitting comments by mail.
- *Facsimile:* Comments may be submitted by facsimile at (202) 942–1676.

The most helpful comments explain the reason for any recommended change and include data, information, and the authority that supports the recommended change.

FOR FURTHER INFORMATION CONTACT: Laurissa Stokes at (202) 942–1645.

SUPPLEMENTARY INFORMATION: The Agency administers the Thrift Savings Plan (TSP), which was established by the Federal Employees' Retirement System Act of 1986 (FERSA), Public Law 99–335, 100 Stat. 514. The TSP provisions of FERSA are codified, as amended, largely at 5 U.S.C. 8351 and 8401–79. The TSP is a tax-deferred retirement savings plan for Federal civilian employees and members of the uniformed services. The TSP is similar to cash or deferred arrangements established for private-sector employees under section 401(k) of the Internal Revenue Code (26 U.S.C. 401(k)).

The Agency's governing statute includes an anti-alienation provision that generally protects TSP funds from execution, levy, attachment, garnishment, or other legal process. 5 U.S.C. 8437(c)(2). However, there are exceptions for certain court orders such as criminal restitution orders under the Mandatory Victims Restitution Act (MVRA) of 1996. The Department of Justice (DOJ) may request a payment from a participant's TSP account to enforce a judgment that orders restitution under the MVRA.

On September 10, 2014, the Agency published regulations explaining the Agency's procedures for processing payments for the enforcement of criminal restitution orders. 79 FR 53603 (September 10, 2014).

Requirement To Provide an Enforcement Letter

Various statutes grant courts the authority to order, or compel them to order, convicted offenders to pay restitution to victims as part of their sentences. Only orders for restitution under 18 U.S.C. 3663A can be enforced against a TSP account.

Judgments ordering restitution often do not reference the statutory authority or statutory mandate under which the court ordered restitution. This leaves the Agency to determine the authority or mandate under which the court ordered restitution. The Agency believes the DOJ is better positioned to determine the authority or mandate under which the court ordered restitution. Therefore, the Agency proposes to amend 5 CFR part 1653 to require an enforcement letter from the DOJ stating that the court ordered restitution under 18 U.S.C. 3663A. The Agency will rely on the DOJ's assertion that the court ordered restitution under 18 U.S.C. 3663A.

Treatment of a Judgment Ordering Restitution Under 18 U.S.C. 3663A as a Final Judgment

The Agency has received requests from several participants to stay payment from their TSP accounts pending the outcome of an appeal of a judgment ordering restitution under 18 U.S.C. 3663A or the underlying conviction. The Agency's policy is to deny such requests and treat the judgment as a final judgment. This policy is consistent with 18 U.S.C. 3664(o), which says that a sentence that imposes an order of restitution is a final judgment notwithstanding the fact that it may be corrected, amended, or appealed. The Agency proposes to amend 5 CFR part 1653 to codify this policy.

Technical Corrections

Paragraph (c)(5) of § 1653.33 provides that the TSP will not honor a criminal restitution order that requires a series of payments. The Agency proposes to amend paragraph (c)(5) to provide that the TSP will not honor a criminal restitution order that requires ''the TSP to make'' a series of payments. The Agency also proposes to replace certain references to a ''restitution order'' in 5 CFR part 1653, subpart D with the defined term ''criminal restitution order'' to avoid any ambiguity with respect to whether the regulations refer to the underlying judgment itself or the documents necessary to enforce the judgment against a TSP account. For consistency, the Agency also proposes to replace certain references to a ''levy'' with the defined term ''tax levy.''

Regulatory Flexibility Act

I certify that this regulation will not have a significant economic impact on a substantial number of small entities. This regulation will affect Federal employees and members of the uniformed services who participate in the Thrift Savings Plan, which is a Federal defined contribution retirement savings plan created under the Federal Employees' Retirement System Act of 1986 (FERSA), Public Law 99–335, 100 Stat. 514, and which is administered by the Agency.

Paperwork Reduction Act

I certify that these proposed regulations do not require additional reporting under the criteria of the Paperwork Reduction Act.

Unfunded Mandates Reform Act of 1995

Pursuant to the Unfunded Mandates Reform Act of 1995, 2 U.S.C. 602, 632, 653, 1501–1571, the effects of this regulation on state, local, and tribal governments and the private sector have been assessed. This proposed regulation will not compel the expenditure in any one year of $100 million or more by state, local, and tribal governments, in the aggregate, or by the private sector. Therefore, a statement under section 1532 is not required.

List of Subjects in 5 CFR Part 1653

Claims, Government employees, Pensions, Retirement, Taxes.

Gregory T. Long,

Executive Director, Federal Retirement Thrift Investment Board.

For the reasons stated in the preamble, the Agency proposes to amend 5 CFR chapter VI as follows:

PART 1653—COURT ORDERS AND LEGAL PROCESSES AFFECTING THRIFT SAVINGS PLAN ACCOUNTS

■ 1. The authority citation for part 1653 continues to read as follows:

Authority: 5 U.S.C. 8432d, 8435, 8436(b), 8437(e), 8439(a)(3), 8467, 8474(b)(5), and 8474(c)(1).

■ 2. Amend § 1653.31(b), by revising the definition for ''criminal restitution order'' and adding a definition for ''enforcement letter'' in alphabetical order to read as follows:

§ 1653.31 Definitions.

* * * * *

(b) * * *

Criminal restitution order means a complete copy of a judgment in a criminal case issued by a federal court ordering restitution for a crime under 18 U.S.C. 3663A.

Enforcement letter means a letter received from the Department of Justice requesting a payment from a participant's TSP account to enforce a criminal restitution order.

* * * * *

■ 3. Amend § 1653.33 by:

■ a. Revising paragraph (b)(2) and adding paragraph (b)(3),

■ b. Replacing the words ''restitution order'' wherever they appear not preceded by the word ''criminal'' with the words ''criminal restitution order'' in paragraphs (c)(1) and (2); and

■ c. Revising paragraphs (c)(3), (c)(5), and (c)(6).

The revisions read as follows:

§ 1653.33 Qualifying criminal restitution order.

* * * * *

(b) * * *

(2) The criminal restitution order must require the participant to pay a stated dollar amount as restitution.

(3) The criminal restitution order must be accompanied by an enforcement letter that states the restitution is ordered under 18 U.S.C. 3663A. The enforcement letter must expressly refer to the ''Thrift Savings Plan'' or describe the TSP in such a way that it cannot be confused with other Federal Government retirement benefits or non-Federal retirement benefits.

(c) * * *

(3) A criminal restitution order accompanied by an enforcement letter that requires the TSP to make a payment in the future;

* * * * *

(5) A criminal restitution order accompanied by an enforcement letter that requires TSP to make a series of payments;

(6) A criminal restitution order accompanied by an enforcement letter that designates the specific TSP Fund, source of contributions, or balance from which the payment or portions of the payment shall be made.

■ 4. Amend § 1653.34 by revising the last sentence of paragraph (b) introductory text to read as follows:

§ 1653.34 Processing Federal tax levies and criminal restitution orders.

* * * * *

(b) * * * To be complete, a tax levy or criminal restitution order must meet all the requirements of § 1653.32 or § 1653.33; it must also provide (or be accompanied by a document or enforcement letter that provides):

* * * * *

■ 5. Amend § 1653.35, by revising the first sentence of the introductory text and revising paragraph (a) to read as follows:

§ 1653.35 Calculating entitlement.

A tax levy or criminal restitution order can only require the payment of a stated dollar amount from the TSP. The payee's entitlement will be the lesser of:

(a) The dollar amount stated in the tax levy or enforcement letter; or

* * * * *

■ 6. Amend § 1653.36 by:

■ a. Replacing the word ''levy'' wherever it appears not preceded by the word ''tax'' with the words ''tax levy'' in paragraph (a);

■ b. Replacing the words ''restitution order'' wherever they appear not preceded by the word ''criminal'' with the words ''criminal restitution order'' and by replacing the word ''levy'' wherever it appears not preceded by the word ''tax'' with the words ''tax levy'' in paragraph (c);

■ c. Revising paragraph (d) introductory text;

■ d. Replacing the word ''levy'' wherever it appears not preceded by the word ''tax'' with the words ''tax levy'' in paragraph (g); and

■ e. Adding paragraph (h).

The revisions and additions read as follows:

§ 1653.36 Payment.

* * * * *

(d) If a participant has funds in more than one type of account, payment will be made from each account in the following order, until the amount required by the tax levy or stated in the enforcement letter is reached:

* * * * *

(h) The TSP will not hold a payment pending appeal of a criminal restitution order or the underlying conviction. The TSP will treat the criminal restitution order as a final judgment pursuant to 18 U.S.C. 3664(o) and process payment as provided by this subpart.

BILLING CODE 6760–01–P

DEPARTMENT OF THE TREASURY

31 CFR Part 22

RIN 1505–AC45

Nondiscrimination on the Basis of Race, Color, or National Origin in Programs or Activities Receiving Federal Financial Assistance

AGENCY: Department of the Treasury.

ACTION: Notice of proposed rulemaking.

SUMMARY: This proposed regulation provides for the enforcement of Title VI of the Civil Rights Act of 1964, as amended (''Title VI'') to the end that no person in the United States shall on the grounds of race, color, or national origin be denied participation in, be denied the benefits of, or be otherwise subjected to discrimination under any program or activity that receives federal financial assistance from the Department of the Treasury. The promulgation of this proposed regulation will provide guidance to the Department's recipients of federal financial assistance in complying with the provisions of Title VI and will also promote consistent and appropriate enforcement of Title VI by the Department's components.

DATES: Written comments must be received on or before September 11, 2015.

ADDRESSES: Interested persons are invited to submit comments regarding this notice of proposed rulemaking according to the instructions below. All submissions must refer to the document title. The Department encourages the early submission of comments.

Electronic Submission of Comments: Interested persons may submit comments electronically through the Federal eRulemaking Portal at *http://www.regulations.gov*. Electronic submission of comments allows the commenter maximum time to prepare and submit a comment, ensures timely receipt, and enables the Department to make them available to the public. Comments submitted electronically through the *http://www.regulations.gov* Web site can be viewed by other commenters and interested members of the public. Commenters should follow the instructions provided on that site to submit comments electronically.

Mail: Send comments to Mariam G. Harvey, Director, Office of Civil Rights and Diversity, 1500 Pennsylvania Avenue NW., Washington, DC 20220; facsimile (202) 622–0367.

Note: To receive consideration as public comments, comments must be submitted through a method specified.

Public Inspection of Public Comments: All properly submitted comments will be available for inspection and downloading at *http://www.regulations.gov*.

Additional Instructions: In general comments received, including attachments and other supporting materials, are part of the public record and are available to the public. Do not submit any information in your comment or supporting materials that you consider confidential or inappropriate for public disclosure.

FOR FURTHER INFORMATION CONTACT: Mariam G. Harvey, Director, Office of Civil Rights and Diversity, Department of the Treasury, (202) 622–0316 (voice), and (202) 622–7104 (TTY). All responses to this notice should be submitted via *http://www.regulations.gov* or by mail to ensure consideration.

SUPPLEMENTARY INFORMATION:

I. Background

The purpose of this proposed rule is to provide for the enforcement of Title VI of the Civil Rights Act of 1964, as amended (42 U.S.C. 2000d, *et seq.*), as it applies to programs or activities receiving assistance from the Department of the Treasury. Specifically, the statute states that ''[n]o person in the United States shall, on the grounds of race, color, or national origin be denied participation in, be denied the benefits of, or be otherwise subjected to discrimination under any program or activity that receives federal financial assistance.'' 42 U.S.C. 2000d. Each federal agency subject to Title VI is required to issue regulations implementing Title VI. 28 CFR 42.403. The Department of the Treasury will be issuing Title VI regulations for the first time. The Department proposes regulations as Title VI of the Civil Rights Act of 1964, as amended, 42 U.S.C. 2000d to 2000d-7 (''Title VI''), requires.

Title VI prohibits discrimination on the basis of race, color, and national origin in all programs or activities that receive federal financial assistance. Under Treasury's proposed Title VI implementing regulations, Treasury-funded programs are prohibited from taking acts, including permitting actions, that discriminate based on the statutorily protected classes. These proposed regulations further provide for Treasury procedures to ensure compliance, including a hearing procedure.

II. Applicable Executive Orders and Regulatory Certifications

Executive Order 12866

Executive Orders 13563 and 12866 direct agencies to assess costs and benefits of available regulatory alternatives and, if regulation is necessary, to select regulatory approaches that maximize net benefits (including potential economic, environmental, public health and safety effects, distributive impacts, and equity). Executive Order 13563 emphasizes the importance of quantifying both costs and benefits, of reducing costs, of harmonizing rules, and of promoting flexibility. This proposed rule has been designated a ''significant regulatory action'' although not economically significant, under section 3(f) of Executive Order 12866. Accordingly, this proposed rule has been reviewed by the Office of Management and Budget.

Unfunded Mandates Reform Act of 1995

The Department certifies that no actions were deemed necessary under the Unfunded Mandates Reform Act of 1995. Furthermore, these proposed regulations will not result in the expenditure by State, local, and tribal governments, in the aggregate, or by the private sector, of $100,000,000 or more in any one year, and they will not significantly or uniquely affect small governments.

The Regulatory Flexibility Act

The Department, in accordance with the Regulatory Flexibility Act, 5 U.S.C. 605(b), has reviewed these Title VI regulations and by approving, certifies that these regulations will not have a significant economic impact on a substantial number of small entities because all of the entities that are subject to these regulations are already subject to Title VI, and some entities already are subject to the Title VI regulations of other agencies.

This proposed rule, if adopted, is not a ''major rule,'' nor will it have a significant economic impact on a substantial number of small entities, in large part because these regulations do not impose any new substantive obligations on federal funding recipients. All recipients of federal funding have been bound by Title VI's antidiscrimination provision since 1964. Individual participants in the recipients' programs have thus long had the right to be free from discrimination on the basis of race, color, and national origin. This rule merely ensures that the Department and its components have regulations implementing this statute.

Executive Order 13132

These Title VI regulations will not have substantial direct effects on the states, on the relationship between the national government and the States, or on the distribution of power and responsibilities among the various levels of government. These Title VI regulations do not subject recipients of federal funding to any new substantive obligations because all recipients of federal funding have been bound by Title VI's antidiscrimination provision since 1964. Moreover, these Title VI regulations are required by statute; Congress specifically directed federal agencies to adopt implementing regulations when Title VI was enacted. Therefore, in accordance with section 6 of Executive Order 13132, the Department has determined that this rule does not have sufficient federalism implications to warrant the preparation of a federalism summary impact statement. No further action is required.

Executive Order 12250

The Attorney General has reviewed and approved this proposed rule pursuant to Executive Order 12250.

Paperwork Reduction Act

Under the Paperwork Reduction Act (44 U.S.C. chapter 35), an agency may not conduct or sponsor and a person is not required to respond to a collection of information unless it displays a valid control number issued by the Office of Management and Budget (OMB). The information collections contained in this proposed rule will be submitted and approved by OMB in connection with information collections for the applicable programs listed in appendix A to the regulations.

The information collections contained in this proposed rule are found in §§ 22.5 (reporting), 22.6 (reporting and recordkeeping), 22.7 (reporting), and 22.10 (reporting).

The OMB control numbers that will be revised include the following:

Bureau/Office	Program or activity	OMB Control Nos.
Departmental Offices, Office of Domestic Finance, Office of Financial Institutions.	Community Development Financial Institutions (CDFI) Fund—Financial Component.	1559–0021
Departmental Offices, Office of Domestic Finance, Office of Financial Institutions.	Community Development Financial Institutions (CDFI) Fund—Technical Assistance Component.	1559–0021

Departmental Offices, Office of the Fiscal Assistant Secretary.	Grants under the RESTORE Act's Direct Component and Centers of Excellence program.	1505–0250

Comments on the collection of information should be sent to the Office of Management and Budget, Attention: Desk Officer for the Department of Treasury, Office of Information and Regulatory Affairs, Washington, DC 20503, or email to *OIRA_Submission@OMB.EOP.gov* with copies to the Department of Treasury at the addresses specified in the **ADDRESSES** section. Comments on the information collection should be submitted no later than September 11, 2015. Comments are specifically requested concerning:

1. Whether the proposed information collection is necessary for the proper performance of agency functions, including whether the information will have practical utility;

2. The accuracy of the estimated burden associated with the proposed collection of information, including the validity of the methodology and assumptions used (see below);

3. How to enhance the quality, utility, and clarity of the information required to be maintained; and

4. How to minimize the burden of complying with the proposed information collection, including the application of automated collection techniques or other forms of information technology.

List of Subjects in 31 CFR Part 22

Civil rights, Reporting and recordkeeping requirements.

For the reasons discussed in the preamble, the Department proposes to amend 31 CFR by adding part 22 to read as follows:

PART 22—NONDISCRIMINATION ON THE BASIS OF RACE, COLOR, OR NATIONAL ORIGIN IN PROGRAMS OR ACTIVITIES RECEIVING FEDERAL FINANCIAL ASSISTANCE FROM THE DEPARTMENT OF THE TREASURY

Sec.

Authority: 42 U.S.C. 2000d-2000d-7.

§ 22.1 Purpose.

The purpose of this part is to effectuate the provisions of Title VI of the Civil Rights Act of 1964 (Title VI) to the end that no person in the United States shall, on the grounds of race, color, or national origin, be excluded from participation in, be denied the benefits of, or be otherwise subjected to discrimination under any program or activity receiving federal financial assistance from the Department of the Treasury.

§ 22.2 Application.

(a) This part applies to any program for which federal financial assistance is authorized under a law administered by the Department, including the types of federal financial assistance listed in Appendix A to this part. It also applies to money paid, property transferred, or other federal financial assistance extended after the effective date of this part pursuant to an application approved before that effective date. This part does not apply to:

(1) Any federal financial assistance by way of insurance or guaranty contracts;

(2) Any assistance to any individual who is the ultimate beneficiary; or

(3) Any employment practice, under any such program, of any employer, employment agency, or labor organization, except to the extent described in § 22.4(c). The fact that a type of federal financial assistance is not listed in Appendix A to this part shall not mean, if Title VI is otherwise applicable, that a program is not covered. Other types of federal financial assistance under statutes now in force or hereinafter enacted may be added to appendix A to this part.

(b) In any program receiving federal financial assistance in the form, or for the acquisition, of real property or an interest in real property, to the extent that rights to space on, over, or under any such property are included as part of the program receiving that assistance, the nondiscrimination requirement of this part shall extend to any facility located wholly or in part in that space.

§ 22.3 Definitions.

As used in this part:

Applicant means a person who submits an application, request, or plan required to be approved by an official of the Department of the Treasury, or designee thereof, or by a primary recipient, as a condition to eligibility for federal financial assistance, and *application* means such an application, request, or plan.

Designated agency official means the Assistant Secretary for Management and his or her designee.

Facility includes all or any part of structures, equipment, or other real or personal property or interests therein, and the provision of facilities includes the construction, expansion, renovation, remodeling, alteration, or acquisition of facilities.

Federal financial assistance includes:

(1) Grants and loans of federal funds;
(2) The grant or donation of federal property and interests in property;

(3) The detail of federal personnel;

(4) The sale and lease of, and the permission to use (on other than a casual or transient basis), federal property or any interest in such property without consideration or at a nominal consideration, or at a consideration which is reduced for the purpose of assisting the recipient, or in recognition of the public interest to be served by such sale or lease to the recipient; and

(5) Any federal agreement, arrangement, or other contract which has as one of its purposes the provision of assistance.

Primary recipient means any recipient that is authorized or required to extend federal financial assistance to another recipient.

Program or activity and *program* mean all of the operations of any entity described in the following paragraphs (1) through (4) of this definition, any part of which is extended federal financial assistance:

(1)(i) A department, agency, special purpose district, or other instrumentality of a State or of a local government; or

(ii) The entity of such state or local government that distributes such assistance and each such department or agency to which the assistance is extended, in the case of assistance to a State or local government;

(2)(i) A college, university, or other postsecondary institution, or a public system of higher education; or

(ii) A local educational agency (as defined in 20 U.S.C. 7801), system of vocational education, or other school system;

(3)(i) An entire corporation, partnership, or other private organization, or an entire sole proprietorship—

(A) If assistance is extended to such corporation, partnership, private organization, or sole proprietorship as a whole; or

(B) Which is principally engaged in the business of providing education, health care, housing, social services, or parks and recreation; or

(ii) The entire plant or other comparable, geographically separate facility to which federal financial assistance is extended, in the case of any other corporation, partnership, private organization or sole proprietorship; or

(4) Any other entity which is established by two or more of the entities described in the preceding paragraphs (1), (2), or (3) of this definition.

Recipient may mean any State, territory, possession, the District of Columbia, or Puerto Rico, or any political subdivision thereof, or instrumentality thereof, any public or private agency, institution, or organization, or other entity, or any individual, in any State, territory, possession, the District of Columbia, or Puerto Rico, to whom federal financial assistance is extended, directly or through another recipient, including any successor, assignee, or transferee thereof, but such term does not include any ultimate beneficiary.

§ 22.4 Discrimination prohibited.

(a) *General.* No person in the United States shall, on the grounds of race, color, or national origin be excluded from participation in, be denied the benefits of, or be otherwise subjected to discrimination under, any program to which this part applies.

(b) *Specific discriminatory actions prohibited.* (1) A recipient to which this part applies may not, directly or through contractual or other arrangements, on the grounds of race, color, or national origin:

(i) Deny a person any service, financial aid, or other benefit provided under the program;

(ii) Provide any service, financial aid, or other benefit to a person which is different, or is provided in a different manner, from that provided to others under the program;

(iii) Subject a person to segregation or separate treatment in any matter related to his receipt of any service, financial aid, or other benefit under the program;

(iv) Restrict a person in any way in the enjoyment of any advantage or privilege enjoyed by others receiving any service, financial aid, or other benefit under the program;

(v) Treat a person differently from others in determining whether he satisfies any admission, enrollment, quota, eligibility, membership, or other requirement or condition which persons must meet in order to be provided any service, financial aid, or other benefit provided under the program;

(vi) Deny a person an opportunity to participate in the program through the provision of services or otherwise to afford him an opportunity to do so which is different from that afforded others under the program (including the opportunity to participate in the program as a volunteer or as an employee, but only to the extent set forth in paragraph (c) of this section); or

(vii) Deny a person the opportunity to participate as a member of a planning, advisory, or similar body which is an integral part of the program.

(2) A recipient, in determining the types of services, financial aid, or other benefits, or facilities which will be provided under any such program, or the class of persons to whom, or the situations in which, such services, financial aid, other benefits, or facilities will be provided under any such program, or the class of persons to be afforded an opportunity to participate in any such program, may not, directly or through contractual or other arrangements, use criteria or methods of administration which have the effect of subjecting persons to discrimination because of their race, color, or national origin or have the effect of defeating or substantially impairing accomplishment of the objectives of the program with respect to individuals of a particular race, color, or national origin.

(3) In determining the site or location of facilities, a recipient or applicant may not make selections with the purpose or effect of excluding persons from, denying them the benefits of, or subjecting them to discrimination under any program to which this regulation applies, on the grounds of race, color, or national origin; or with the purpose or effect of defeating or substantially impairing the accomplishment of the objectives of Title VI or this part.

(4) As used in this section the services, financial aid, or other benefits provided under a program receiving federal financial assistance include any service, financial aid, or other benefit provided in or through a facility provided with the aid of federal financial assistance.

(5) The enumeration of specific forms of prohibited discrimination in this paragraph does not limit the generality of the prohibition in paragraph (a) of this section.

(6) This part does not prohibit the consideration of race, color, or national origin if the purpose and effect are to remove or overcome the consequences of practices or impediments which have restricted the availability of, or participation in, the program or activity receiving federal financial assistance, on the grounds of race, color, or national origin. Where prior discriminatory practice or usage tends, on the grounds of race, color, or national origin to exclude individuals from participation in, to deny them the benefits of, or to subject them to discrimination under any program or activity to which this part applies, the applicant or recipient must take affirmative action to remove or overcome the effects of the prior discriminatory practice or usage. Even in the absence of prior discriminatory practice or usage, a recipient in administering a program or activity to which this part applies, may take affirmative action to assure that no person is excluded from participation in or denied the benefits of the program or activity on the grounds of race, color, or national origin.

(c) *Employment practices.* (1) Where a primary objective of the federal financial assistance to a program to which this part applies is to provide employment, a recipient subject to this part shall not, directly or through contractual or other arrangements, subject a person to discrimination on the ground of race, color, or national origin in its employment practices under such program (including recruitment or recruitment advertising, hiring, firing, upgrading, promotion, demotion, transfer, layoff, termination, rates of pay or other forms of compensation or benefits, selection for training or apprenticeship, and use of facilities). Such recipient shall take affirmative action to insure that applicants are employed, and employees are treated during employment, without regard to their race, color, or national origin. The requirements applicable to construction employment under any such program shall be those specified in or pursuant to Part III of Executive Order 11246 or any Executive Order which supersedes it.

(2) Where a primary objective of the federal financial assistance is not to provide employment, but

discrimination on the grounds of race, color, or national origin in the employment practices of the recipient or other persons subject to the regulation tends, on the grounds of race, color, or national origin, to exclude individuals from participation in, deny them the benefits of, or subject them to discrimination under any program to which this regulation applies, the provisions of paragraph (c)(1) of this section shall apply to the employment practices of the recipient or other persons subject to the regulation, to the extent necessary to assure equality of opportunity to, and nondiscriminatory treatment of, beneficiaries.

§ 22.5 Assurances required.

(a) *General.* Either at the application stage or the award stage, federal agencies must ensure that applications for federal financial assistance or awards of federal financial assistance contain, be accompanied by, or be covered by a specifically identified assurance from the applicant or recipient, satisfactory to the designated agency official, that each program or activity operated by the applicant or recipient and to which these Title VI regulations apply will be operated in compliance with these Title VI regulations.

(b) *Duration of obligation.* (1) In the case where the federal financial assistance is to provide or is in the form of personal property, or real property or interest therein or structures thereon, the assurance shall obligate the recipient, or, in the case of a subsequent transfer, the transferee, for the period during which the property is used for a purpose for which the federal financial assistance is extended or for another purpose involving the provision of similar services or benefits, or for as long as the recipient retains ownership or possession of the property, whichever is longer. In all other cases the assurance shall obligate the recipient for the period during which federal financial assistance is extended to the program.

(2) In the case where federal financial assistance is provided in the form of a transfer of real property, structures, or improvements thereon, or interest therein, from the federal Government, the instrument effecting or recording the transfer shall contain a covenant running with the land assuring nondiscrimination for the period during which the real property is used for a purpose for which the federal financial assistance is extended or for another purpose involving the provision of similar services or benefits. Where no transfer of property or interest therein from the federal government is involved, but property is acquired or improved with federal financial assistance, the recipient shall agree to include such covenant in any subsequent transfer of such property. When the property is obtained from the federal government, such covenant may also include a condition coupled with a right to be reserved by the Department to revert title to the property in the event of a breach of the covenant where, in the discretion of the designated agency official, such a condition and right of reverter is appropriate to the statute under which the real property is obtained and to the nature of the grant and the grantee. In such event if a transferee of real property proposes to mortgage or otherwise encumber the real property as security for financing construction of new, or improvement of existing, facilities on such property for the purposes for which the property was transferred, the designated agency official may agree, upon request of the transferee and if necessary to accomplish such financing, and upon such conditions as the designated agency official deems appropriate, to subordinate such right of reversion to the lien of such mortgage or other encumbrance.

(c) *Continuing federal financial assistance.* Every application by a State or a State agency for continuing federal financial assistance to which this part applies (including the types of federal financial assistance listed in appendix A to this part) shall as a condition to its approval and the extension of any federal financial assistance pursuant to the application:

(1) Contain, be accompanied by, or be covered by a statement that the program is (or, in the case of a new program, will be) conducted in compliance with all requirements imposed by or pursuant to this part; and

(2) Provide, be accompanied by, or be covered by provision for such methods of administration for the program as are found by the designated agency official to give reasonable guarantee that the applicant and all recipients of federal financial assistance under such program will comply with all requirements imposed by or pursuant to this part.

(d) *Assurance from institutions.* (1) In the case of any application for federal financial assistance to an institution of higher education (including assistance for construction, for research, for special training projects, for student loans or for any other purpose), the assurance required by this section shall extend to admission practices and to all other practices relating to the treatment of students.

(2) The assurance required with respect to an institution of higher education, hospital, or any other institution, insofar as the assurance relates to the institution's practices with respect to admission or other treatment of individuals as students, patients, or clients of the institution or to the opportunity to participate in the provision of services or other benefits to such individuals, shall be applicable to the entire institution.

(e) *Form.* (1) The assurances required by paragraph (a) of this section, which may be included as part of a document that addresses other assurances or obligations, shall include that the applicant or recipient will comply with all applicable federal statutes relating to nondiscrimination. This includes but is not limited to Title VI of the Civil Rights Act of 1964, as amended, 42 U.S.C. 2000d, *et seq.*

(2) The designated agency official will specify the extent to which such assurances will be required of the applicant's or recipient's subgrantees, contractors, subcontractors, transferees, or successors in interest. Any such assurance shall include provisions which give the United States a right to seek its judicial enforcement.

§ 22.6 Compliance information.

(a) *Cooperation and assistance.* The designated Agency official shall to the fullest extent practicable seek the cooperation of recipients in obtaining compliance with this part and shall provide assistance and guidance to recipients to help them comply voluntarily with this part.

(b) *Compliance reports.* Each recipient shall keep such records and submit to the designated Agency official timely, complete, and accurate compliance reports at such times, and in such form and containing such information, as the designated Agency official may determine to be necessary to enable the designated Agency official to ascertain whether the recipient has complied or is complying with this part. In the case in which a primary recipient extends federal financial assistance to any other recipient, such other recipient shall also submit such compliance reports to the primary recipient as may be necessary to enable the primary recipient to carry out its obligations under this part. In general recipients should have available for the designated Agency official racial and ethnic data showing the extent to which members of minority groups are beneficiaries of programs receiving federal financial assistance.

(c) *Access to sources of information.* Each recipient shall permit access by the designated Agency official during normal business hours to such of its books, records, accounts, and other sources of information, and its facilities as may be pertinent to ascertain compliance with this part. Where any information required of a recipient is in the exclusive possession of any other agency, institution, or person and this agency, institution, or person fails or refuses to furnish this information, the recipient shall so certify in its report and shall set forth what efforts it has made to obtain the information.

(d) *Information to beneficiaries and participants.* Each recipient shall make available to participants, beneficiaries, and other interested persons such information regarding the provisions of this part and its applicability to the program for which the recipient receives federal financial assistance, and make such information available to them in such manner, as the designated Agency official finds necessary to apprise such persons of the protections against discrimination assured them by Title VI and this part.

§ 22.7 Conduct of investigations.

(a) *Periodic compliance reviews.* The designated Agency official shall from time to time review the practices of recipients to determine whether they are complying with this part.

(b) *Complaints.* Any person who believes that he or she, or any specific class of persons, has been subjected to discrimination prohibited by this part may by himself or herself, or by a representative, file with the designated Agency official a written complaint. A complaint must be filed not later than 180 days after the date of the alleged discrimination, unless the time for filing is extended by the designated Agency official.

(c) *Investigations.* The designated Agency official will make a prompt investigation whenever a compliance review, report, complaint, or any other information indicates a possible failure to comply with this part. The investigation will include, where appropriate, a review of the pertinent practices and policies of the recipient, the circumstances under which the possible noncompliance with this part occurred, and other factors relevant to a determination as to whether the recipient has failed to comply with this part.

(d) *Resolution of matters.* (1) If an investigation pursuant to paragraph (c) of this section indicates a failure to comply with this part, the designated Agency official will so inform the recipient and the matter will be resolved by informal means whenever possible. If it has been determined that the matter cannot be resolved by informal means, action will be taken as provided for in § 22.8.

(2) If an investigation does not warrant action pursuant to paragraph (d)(1) of this section the designated Agency official will so inform the recipient and the complainant, if any, in writing.

(e) *Intimidatory or retaliatory acts prohibited.* No recipient or other person shall intimidate, threaten, coerce, or discriminate against any individual for the purpose of interfering with any right or privilege secured by section 601 of Title VI or this part, or because the individual has made a complaint, testified, assisted, or participated in any manner in an investigation, proceeding, or hearing under this part. The identity of complainants shall be kept confidential except to the extent necessary to carry out the purposes of this part, including the conduct of any investigation, hearing, or judicial proceeding arising thereunder.

§ 22.8 Procedure for effecting compliance.

(a) *General.* If there appears to be a failure or threatened failure to comply with this part, and if the noncompliance or threatened noncompliance cannot be corrected by informal means, compliance with this part may be effected by the suspension or termination of or refusal to grant or to continue federal financial assistance or by any other means authorized by law. Such other means may include, but are not limited to:

(1) A referral to the Department of Justice with a recommendation that appropriate proceedings be brought to enforce any rights of the United States under any law of the United States (including other titles of the Civil Rights Act of 1964), or any assurance or other contractual undertaking; and

(2) Any applicable proceeding under State or local law.

(b) *Noncompliance with § 22.5.* If an applicant fails or refuses to furnish an assurance required under § 22.5 or otherwise fails or refuses to comply with a requirement imposed by or pursuant to that section, federal financial assistance may be suspended, terminated, or refused in accordance with the procedures of paragraph (c) of this section. The Agency shall not be required to provide assistance in such a case during the pendency of the administrative proceedings under such paragraph. However, subject to § 22.12, the Agency shall continue assistance during the pendency of such proceedings where such assistance is due and payable pursuant to an application approved prior to the effective date of this part.

(c) *Termination of or refusal to grant or to continue federal financial assistance.* (1) No order suspending, terminating, or refusing to grant or continue federal financial assistance shall become effective until:

(i) The designated Agency official has advised the applicant or recipient of the applicant's or recipient's failure to comply and has determined that compliance cannot be secured by voluntary means;

(ii) There has been an express finding on the record, after opportunity for hearing, of a failure by the applicant or recipient to comply with a requirement imposed by or pursuant to this part;

(iii) The action has been approved by the designated Agency official pursuant to § 22.10(e); and

(iv) The expiration of 30 days after the designated Agency official has filed with the committee of the House and the committee of the Senate having legislative jurisdiction over the program involved, a full written report of the circumstances and the grounds for such action.

(2) Any action to suspend or terminate or to refuse to grant or to continue federal financial assistance shall be limited to the particular political entity, or part thereof, or other applicant or recipient as to whom such a finding has been made and shall be limited in its effect to the particular program, or part thereof, in which such noncompliance has been so found.

(d) *Other means authorized by law.* No action to effect compliance with Title VI by any other means authorized by law shall be taken by the Department of the Treasury until:

(1) The designated Agency official has determined that compliance cannot be secured by voluntary means;

(2) The recipient or other person has been notified of its failure to comply and of the action to be taken to effect compliance; and

(3) The expiration of at least 10 days from the mailing of such notice to the recipient or other person. During this period of at least 10 days, additional efforts shall be made to persuade the recipient or other person to comply with the regulation and to take such corrective action as may be appropriate.

§ 22.9 Hearings.

(a) *Opportunity for hearing.* Whenever an opportunity for a hearing is required by § 22.8(c), reasonable notice shall be given by registered or certified mail, return receipt requested, to the affected applicant or recipient. This notice shall advise the applicant or recipient of the action proposed to be taken, the specific provision under which the proposed action against it is to be taken, and the matters of fact or law asserted as the basis for this action, and either:

(1) Fix a date not less than 20 days after the date of such notice within which the applicant or recipient may request of the designated agency official that the matter be scheduled for hearing; or

(2) Advise the applicant or recipient that the matter in question has been set for hearing at a stated place and time. The time and place so fixed shall be reasonable and shall be subject to change for cause. The complainant, if any, shall be advised of the time and place of the hearing. An applicant or recipient may waive a hearing and submit written information and argument for the record. The failure of an applicant or recipient to request a hearing under this paragraph or to appear at a hearing for which a date has been set shall be deemed to be a waiver of the right to a hearing under section 602 of Title VI and § 22.8(c) and consent to the making of a decision on the basis of such information as is available.

(b) *Time and place of hearing.* Hearings shall be held at the offices of the Department of the Treasury component administering the program, at a time fixed by the designated Agency official unless the designated Agency official determines that the convenience of the applicant or recipient or of the Agency requires that another place be selected. Hearings shall be held before the designated Agency official, or at designated Agency official's discretion, before a hearing examiner appointed in accordance with section 3105 of title 5, United States Code, or detailed under section 3344 of title 5, United States Code.

(c) *Right to counsel.* In all proceedings under this section, the applicant or recipient and the Agency shall have the right to be represented by counsel.

(d) *Procedures, evidence, and record.* (1) The hearing, decision, and any administrative review thereof shall be conducted in conformity with sections 554 through 557 of title 5, United States Code, and in accordance with such rules of procedure as are proper (and not inconsistent with this section) relating to the conduct of the hearing, giving of notices subsequent to those provided for in paragraph (a) of this section, taking of testimony, exhibits, arguments and briefs, requests for findings, and other related matters. Both the designated Agency official and the applicant or recipient shall be entitled to introduce all relevant evidence on the issues as stated in the notice for hearing or as determined by the officer conducting the hearing at the outset of or during the hearing.

(2) Technical rules of evidence do not apply to hearings conducted pursuant to this part, but rules or principles designed to assure production of the most credible evidence available and to subject testimony to test by cross-examination shall be applied where determined reasonably necessary by the officer conducting the hearing. The hearing officer may exclude irrelevant, immaterial, or unduly repetitious evidence. All documents and other evidence offered or taken for the record shall be open to examination by the parties and opportunity shall be given to refute facts and arguments advanced on either side of the issues. A transcript shall be made of the oral evidence except to the extent the substance thereof is stipulated for the record. All decisions shall be based upon the hearing record and written findings shall be made.

(e) *Consolidated or joint hearings.* In cases in which the same or related facts are asserted to constitute noncompliance with this part with respect to two or more federal statutes, authorities, or other means by which federal financial assistance is extended and to which this part applies, or noncompliance with this part and the regulations of one or more other federal departments or agencies issued under Title VI, the designated Agency official may, by agreement with such other departments or agencies, where applicable, provide for the conduct of consolidated or joint hearings, and for the application to such hearings of rules or procedures not inconsistent with this part. Final decisions in such cases, insofar as this regulation is concerned, shall be made in accordance with § 22.10.

§ 22.10 Decisions and notices.

(a) *Procedure on decisions by hearing examiner.* If the hearing is held by a hearing examiner, the hearing examiner shall either make an initial decision, if so authorized, or certify the entire record including his recommended findings and proposed decision to the designated agency official for a final decision, and a copy of such initial decision or certification shall be mailed to the applicant or recipient. Where the initial decision is made by the hearing examiner the applicant or recipient may, within 30 days after the mailing of such notice of initial decision, file with the designated Agency official the applicant's or recipient's exceptions to the initial decision, with the reasons therefor. In the absence of exceptions, the designated Agency official may, on his or her own motion, within 45 days after the initial decision, serve on the applicant or recipient a notice that the designated Agency official will review the decision. Upon the filing of such exceptions or of notice of review, the designated Agency official shall review the initial decision and issue his or her own decision thereon including the reasons therefor. In the absence of either exceptions or a notice of review the initial decision shall, subject to paragraph (e) of this section, constitute the final decision of the designated Agency official.

(b) *Decisions on record or review by the designated Agency official.* Whenever a record is certified to the designated Agency official for decision or he or she reviews the decision of a hearing examiner pursuant to paragraph (a) of this section, or whenever the designated Agency official conducts the hearing, the applicant or recipient shall be given reasonable opportunity to file with the designated Agency official briefs or other written statements of its contentions, and a written copy of the final decision of the designated Agency official shall be sent to the applicant or recipient and to the complainant, if any.

(c) *Decisions on record where a hearing is waived.* Whenever a hearing is waived pursuant to § 22.9, a decision shall be made by the designated Agency official on the record and a written copy of such decision shall be sent to the applicant or recipient, and to the complainant, if any.

(d) *Rulings required.* Each decision of a hearing examiner or the designated Agency official shall set forth his or her ruling on each finding, conclusion, or exception presented, and shall identify the requirement or requirements imposed by or pursuant to this part with which it is found that the applicant or recipient has failed to comply.

(e) *Approval by designated Agency official.* Any final decision by an official of the Agency, other than the designated Agency official personally, which provides for the suspension or termination of, or the refusal to grant or continue federal financial assistance, or the imposition of any other sanction available under this part or Title VI, shall promptly be transmitted to the designated Agency official personally, who may approve such decision, may vacate it, or remit or mitigate any sanction imposed.

(f) *Content of orders.* The final decision may provide for suspension or termination of, or refusal to grant or continue federal financial assistance, in whole or in part, to which this regulation applies, and may contain such terms, conditions, and other provisions as are consistent with and will effectuate the purposes of Title VI and this part, including provisions designed to assure that no federal financial assistance to which this regulation applies will thereafter be extended to the applicant or recipient determined by such decision to be in default in its performance of an assurance given by it pursuant to this part, or to have otherwise failed to comply with this part, unless and until it corrects its noncompliance and satisfies the designated Agency official that it will fully comply with this part.

(g) *Post termination proceedings.* (1) An applicant or recipient adversely affected by an order issued under paragraph (f) of this section shall be restored to full eligibility to receive federal financial assistance if it satisfies the terms and conditions of that order for such eligibility or if it brings itself into compliance with this part and provides reasonable assurance that it will fully comply with this part.

(2) Any applicant or recipient adversely affected by an order entered pursuant to paragraph (f) of this section may at any time request the designated Agency official to restore fully its eligibility to receive federal financial assistance. Any such request shall be supported by information showing that the applicant or recipient has met the requirements of paragraph (g)(1) of this section. If the designated Agency official determines that those requirements have been satisfied, he or she shall restore such eligibility.

(3) If the designated Agency official denies any such request, the applicant or recipient may submit a request for a hearing in writing, specifying why it believes such official to have been in error. It shall thereupon be given an expeditious hearing, with a decision on the record in accordance with rules or procedures issued by the designated Agency official. The applicant or recipient will be restored to such eligibility if it proves at such a hearing that it satisfied the requirements of paragraph (g)(1) of this section. While proceedings under this paragraph are pending, the sanctions imposed by the order issued under paragraph (f) of this section shall remain in effect.

§ 22.11 Judicial review.

Action taken pursuant to section 602 of the Title VI is subject to judicial review as provided in section 603 of the Title VI.

§ 22.12 Effect on other regulations, forms, and instructions.

(a) *Effect on other regulations.* All regulations, orders, or like directions issued before the effective date of this part by any officer of the Department of the Treasury which impose requirements designed to prohibit any discrimination against individuals on the grounds of race, color, or national origin under any program to which this part applies, and which authorize the suspension or termination of or refusal to grant or to continue federal financial assistance to any applicant for a recipient of such assistance for failure to comply with such requirements, are hereby superseded to the extent that such discrimination is prohibited by this part, except that nothing in this part may be considered to relieve any person of any obligation assumed or imposed under any such superseded regulation, order, instruction, or like direction before the effective date of this part. Nothing in this part, however, supersedes any of the following (including future amendments thereof):

(1) Executive Order 11246 (3 CFR, 1965 Supp., p. 167) and regulations issued thereunder; or

(2) Any other orders, regulations, or instructions, insofar as such orders, regulations, or instructions prohibit discrimination on the ground of race, color, or national origin in any program or situation to which this part is inapplicable, or prohibit discrimination on any other ground.

(b) *Forms and instructions.* The designated Agency official shall issue and promptly make available to all interested persons forms and detailed instructions and procedures for effectuating this part as applied to programs to which this part applies and for which the designated Agency official is responsible.

(c) *Supervision and coordination.* The designated Agency official may from time to time assign to officials of the Agency, or to officials of other departments or agencies of the Government with the consent of such departments or agencies, responsibilities in connection with the effectuation of the purposes of Title VI and this part (other than responsibility for final decision as provided in § 22.10), including the achievement of effective coordination and maximum uniformity within the Agency and within the Executive Branch of the Government in the application of Title VI and this part to similar programs and in similar situations. Any action taken, determination made or requirement imposed by an official of another department or agency acting pursuant to an assignment of responsibility under this paragraph shall have the same effect as though such action had been taken by the designated Agency official of the Department.

Appendix A to Part 22—Activities to Which This Part Applies

Note: Failure to list a type of federal assistance in this appendix A shall not mean, if Title VI is otherwise applicable, that a program is not covered.

Component	Program or activity	Authority

RIN 1024–AE09

Special Regulations, Areas of the National Park System, Lake Chelan National Recreation Area, Solid Waste Disposal

AGENCY: National Park Service, Interior.

ACTION: Proposed rule.

SUMMARY: The National Park Service proposes to authorize a solid waste transfer station near Stehekin, Washington, within the boundary of Lake Chelan National Recreation Area, that does not meet all regulatory siting criteria and accepts solid waste generated within the boundary of the recreation area from non-NPS activities. The proposed rule would authorize this transfer station, notwithstanding certain restrictions found in the general regulations governing solid waste disposal sites in units of the National Park System.

DATES: Comments must be received by 11:59 p.m. EST on October 13, 2015.

ADDRESSES: You may submit comments, identified by Regulation Identifier Number (RIN) 1024–AE09, by any of the following methods:

- *Federal eRulemaking Portal: http://www.regulations.gov.* Follow the instructions for submitting comments.
- *Mail or hand deliver to:* National Park Service, North Cascades National Park Complex, 810 State Route 20, Sedro-Woolley, WA 98284, Attn: Kerri L. Cook, Facility Operations Specialist.

Instructions: All submissions received must include the words ''National Park Service'' or ''NPS'' and the docket number or RIN (1024–AE09) for this rulemaking. Comments received will be posted without change to *http://www.regulations.gov,* including any personal information provided. The NPS need not consider comments that it receives after the end of the comment period (see **DATES**) or comments delivered using a method that is not listed above (see **ADDRESSES**).

FOR FURTHER INFORMATION CONTACT: Kerri L. Cook, Facility Operations Specialist, National Park Service, North Cascades National Park Complex, 810 State Route 20, Sedro-Woolley, WA 98284; (360) 854–7280. Email: *Kerri_Cook@nps.gov.*

SUPPLEMENTARY INFORMATION:

Background

On December 22, 1994, the National Park Service (NPS) adopted the regulations codified at 36 CFR part 6 to implement a statutory requirement of Public Law 98–506 (54 U.S.C. 100903) (Act), which was enacted in 1984. The Act prohibits the operation of a solid waste disposal site within the boundary of any unit of the National Park System except for those operating as of September 1, 1984, or those ''used only for disposal of wastes generated within that unit of the park system so long as such site will not degrade any of the natural or cultural resources of such park unit.'' The Act directed the Secretary of the Interior to promulgate regulations ''to carry out the provisions of this subsection, including reasonable regulations to mitigate the adverse effects of solid waste disposal sites in operation as of September 1, 1984, upon property of the United States.''

36 CFR part 6 regulates both existing and new solid waste disposal sites within the boundaries of any unit of the National Park System to ensure that operation of such sites will not degrade the natural or cultural resources of the park unit. Transfer stations are included in the definition of ''solid waste disposal site'' in § 6.3 and are therefore subject to 36 CFR part 6.

Section 6.4(a) prohibits any person (including NPS) from operating a new solid waste disposal site within the boundaries of a park unit unless the criteria in § 6.4(a) are met. Section 6.4(a)(1) requires that the solid waste handled by the site is generated solely from ''National Park Service activities,'' defined in § 6.3 as ''operations conducted by the National Park Service or a National Park Service contractor, concessionaire or commercial use licensee.'' Section 6.4(a)(9) requires that ''the site is not located within one mile of a National Park Service visitor center, campground, ranger station, entrance station, or similar public use facility, or a residential area.'' Section 6.4(a)(10) requires that the site is not detectable by public sight, sound, or odor from a scenic vista, a public use facility, a designated or proposed wilderness area, a site listed on (or eligible for listing on) the National Register of Historic Places, or a public road. Section 6.8(a) prohibits the NPS from accepting waste at an NPS operated solid waste disposal site, except for waste generated by NPS activities.

Proposed Rule

The NPS proposes a park-specific regulation in 36 CFR 7.62 to authorize a limited exception to the part 6 requirements described above. The proposed rule would authorize an NPS transfer station on federal lands near Stehekin, Washington, within the boundary of Lake Chelan National Recreation Area (LACH or park), that does not satisfy all of the siting requirements in part 6 and that accepts non-NPS waste generated by the Stehekin community. The need for this proposed regulation is explained below.

Stehekin is a remote community of approximately 75 year-round plus 80 seasonal residents, located on privately owned land within the statutory boundary of LACH. Stehekin is located at the head of 55-mile-long Lake Chelan and is accessible only by boat, float plane, or foot trail. Non-NPS services and facilities in Stehekin include seasonal lodging, food operations, and other small businesses that help support 35,000–45,000 park visitors annually. NPS operates the only facility in the Stehekin Valley for the management of solid waste. Waste consolidated at the NPS transfer station is shipped by barge 55 miles down the lake for ultimate disposal. Geographically isolated private residents and businesses in Stehekin have no feasible method of properly disposing solid waste other than the NPS transfer station. Consequently, NPS has for many years accepted Stehekin community waste in its transfer station to deter small dumps on private lands and illegal dumping on public lands. Although the Act does not prohibit NPS from receiving Stehekin waste, this waste does not qualify as waste generated from ''National Park Service activities'' under the existing regulations, so the current practice of accepting waste from Stehekin at the existing NPS transfer station conflicts with §§ 6.4(a)(1) and 6.8(a) of 36 CFR part 6.

The existing NPS transfer station is located within the 100-year floodplain and is part of a larger maintenance facility that is being relocated outside of the Stehekin River floodplain due to frequent flooding.[1] The NPS seeks to build a new transfer station at the site of the new maintenance facility in a more environmentally suitable location within LACH but outside the 100-year floodplain. The NPS has determined that there is no available or suitable nonfederal land, and a limited amount of buildable federal land, outside the floodplain in the lower Stehekin River valley.[2] The NPS has also determined that, due to geographic constraints, there are no suitable locations for the new transfer station that comply with the site location requirements in § 6.4(a)(9) and (10). Specifically, like the existing maintenance facility and transfer station, the proposed site of the new transfer station: (i) Is located within one mile of a campground (Harlequin Campground) and residential housing; (ii) will likely be visible from scenic vistas and off-trail areas in designated wilderness areas; (iii) may be heard from a campground (Harlequin Campground); and (iv) may be detectable by sight, sound, or odor from a road open to public travel.

The NPS has determined that in these unique circumstances, it would best protect park resources to allow the NPS transfer station, whether at the existing or proposed location, to accept waste generated by the community of Stehekin, notwithstanding the prohibition on accepting non-NPS waste in §§ 6.4(a)(1) and 6.8(a) and the siting criteria in § 6.4(a)(9) and (10). Due to its geographic isolation, the community of Stehekin has no environmentally responsible or practicable alternative for the disposal of its waste, much of which is generated by the provision of essential services to thousands of park visitors each year. Prohibiting this community from using the existing or proposed NPS transfer station could result in the illegal disposal of waste on park lands, or other disposal practices which would degrade the natural resources of LACH. In this exceptional situation, accepting non-NPS-generated waste for transfer and ultimate disposal outside the park boundary would pose significantly fewer environmental land use concerns than other alternatives. This determination is supported by the analysis contained in the November 2014 Replacement of Administrative Facilities at Stehekin Environmental Assessment (EA), which examined the environmental impacts of the continued operation of the existing NPS transfer station and the construction and operation of the new transfer station, which will employ contemporary environmental methods for handling waste.

The NPS promulgates a special regulation to authorize an exception to a prohibition found in a general regulation only in limited circumstances. The only other exceptions to the part 6 requirements have been granted by special regulation for Alaskan parks under similar circumstances, where geographically isolated communities have no feasible alternative for solid waste disposal that complies with the part 6 requirements. The proposed rule would accommodate the exceptional circumstances of the Stehekin community, which is located in a remote area within the boundary of LACH and which has no other practicable options for environmentally responsible solid-waste disposal. It is designed only to authorize the operation of the existing transfer station and the proposed transfer station at the

[1] For more information about flooding in the Stehekin River Channel Migration Zone and plans to move the existing maintenance facility, see the Stehekin River Corridor Implementation Plan and Final Environmental Impact Statement (FEIS) which can be viewed at the park's planning Web site, *http://www.nps.gov/noca/parkmgmt/planning.htm,* then click on the link entitled ''Stehekin River Corridor Implementation Plan/Environmental Impact Statement (2012).''

[2] See the Replacement of Administrative Facilities at Stehekin Environmental Assessment that tiers off the 2012 FEIS and specifically evaluates what facilities would be constructed and precisely where they would be located. This document can be viewed at *http://parkplanning.nps.gov/SMFRP* by clicking on ''Document List.''

locations identified in the EA, which the NPS believes would best protect park resources based upon the analysis contained in the EA. All other requirements in part 6 would remain in effect and apply to the existing and new NPS transfer station, including the requirement in § 6.4(a)(3) that the site of the existing and new facility ''will not degrade any of the natural or cultural resources'' of LACH. The proposed rule is consistent with the Act, which does not prohibit solid waste disposal sites from handling waste generated by non-NPS activities provided the waste is generated within a park unit and will not degrade any of the park unit's natural or cultural resources. The proposed rule does not supersede or replace other requirements applicable to solid waste disposal sites, including the requirement (unless there is an approved waiver) in Director's Order #35B (Sale of National Park Service Produced Utilities) that NPS recover the cost of utilities (including the collection and disposal of solid waste) provided to non-NPS users.

Under these circumstances, the NPS has determined that the exceptions to part 6 in the proposed rule are necessary and would protect park resources by authorizing the NPS to accept solid waste generated by the community of Stehekin in the existing and proposed transfer stations.

Compliance With Other Laws, Executive Orders, and Departmental Policy

Regulatory Planning and Review (Executive Orders 12866 and 13563)

Executive Order 12866 provides that the Office of Information and Regulatory Affairs (OIRA) in the Office of Management and Budget will review all significant rules. OIRA has determined that this proposed rule is not significant.

Executive Order 13563 reaffirms the principles of Executive Order 12866 while calling for improvements in the nation's regulatory system to promote predictability, to reduce uncertainty, and to use the best, most innovative, and least burdensome tools for achieving regulatory ends. The executive order directs agencies to consider regulatory approaches that reduce burdens and maintain flexibility and freedom of choice for the public where these approaches are relevant, feasible, and consistent with regulatory objectives. It emphasizes further that regulations must be based on the best available science and that the rulemaking process must allow for public participation and an open exchange of ideas. We have developed this proposed rule in a manner consistent with these requirements.

Regulatory Flexibility Act

This rulemaking will not have a significant economic effect on a substantial number of small entities under the Regulatory Flexibility Act (5 U.S.C. 601 *et seq.*). This certification is based on the benefit-cost and regulatory flexibility analyses found in the report entitled ''Benefit-Cost and Regulatory Flexibility Analyses: Solid Waste Management at Lake Chelan National Recreation Area'' which can be viewed online at *http://parkplanning.nps.gov/SMFRP* by clicking the link entitled ''Document List.''

Small Business Regulatory Enforcement Fairness Act (SBREFA)

This proposed rule is not a major rule under 5 U.S.C. 804(2), the SBREFA. This proposed rule:

a. Does not have an annual effect on the economy of $100 million or more.

b. Will not cause a major increase in costs or prices for consumers, individual industries, Federal, State, or local government agencies, or geographic regions.

c. Does not have significant adverse effects on competition, employment, investment, productivity, innovation, or the ability of U.S.-based enterprises to compete with foreign-based enterprises.

Unfunded Mandates Reform Act

This proposed rule does not impose an unfunded mandate on State, local, or tribal governments, or the private sector of more than $100 million per year. The proposed rule does not have a significant or unique effect on State, local, or tribal governments or the private sector. A statement containing the information required by the Unfunded Mandates Reform Act (2 U.S.C. 1531 *et seq.*) is not required.

Takings (Executive Order 12630)

This proposed rule does not affect a taking of private property or otherwise have taking implications under Executive Order 12630. A takings implication assessment is not required.

Federalism (Executive Order 13132)

Under the criteria in section 1 of Executive Order 13132, this proposed rule does not have sufficient federalism implications to warrant the preparation of a Federalism summary impact statement. A Federalism summary impact statement is not required.

Civil Justice Reform (Executive Order 12988)

This proposed rule complies with the requirements of Executive Order 12988. Specifically, this rule:

a. Meets the criteria of section 3(a) requiring that all regulations be reviewed to eliminate errors and ambiguity and be written to minimize litigation; and

b. Meets the criteria of section 3(b)(2) requiring that all regulations be written in clear language and contain clear legal standards.

Consultation With Indian Tribes (E.O. 13175 and Department Policy)

The Department of the Interior strives to strengthen its government-to-government relationship with Indian Tribes through a commitment to consultation with Indian Tribes and recognition of their right to self-governance and tribal sovereignty. We have evaluated this proposed rule under the criteria in Executive Order 13175 and under the Department's tribal consultation policy and have determined that tribal consultation is not required because the proposed rule will have no substantial direct effect on federally recognized Indian tribes.

In May and July 2014, the NPS sent letters to the Tribal Historic Preservation Officers for the Colville Confederated Tribes and the Confederated Tribes and Bands of the Yakama Nation inviting comment regarding the inventory, evaluation, and finding of no effect on cultural resources within the project area. This encompasses the relocation of all maintenance facilities, including the transfer station, as proposed in the preferred alternative (Alternative 2) in the EA. These tribes did not identify any significant concerns related to the project.

Paperwork Reduction Act of 1995 (44 U.S.C. 3501 et seq.)

This proposed rule does not contain information collection requirements, and a submission to the Office of Management and Budget under the Paperwork Reduction Act is not required. We may not conduct or sponsor and you are not required to respond to a collection of information unless it displays a currently valid OMB control number.

National Environmental Policy Act of 1969 (NEPA)

We have prepared an environmental assessment to determine whether this rulemaking will have a significant impact on the quality of the human environment under NEPA. This proposed rule would implement part of the preferred alternative (Alternative 2) in the EA that is referenced above and available online at *http://parkplanning.nps.gov/SMFRP* by clicking on "Document List."

Effects on the Energy Supply (Executive Order 13211)

This proposed rule is not a significant energy action under the definition in Executive Order 13211. A Statement of Energy Effects is not required.

Clarity of This Regulation

The NPS is required by Executive Orders 12866 (section 1(b)(12)), 12988 (section 3(b)(1)(B)), and 13563 (section 1(a)), and by the Presidential Memorandum of June 1, 1998, to write all rules in plain language. This means that each rule we publish must:

a. Be logically organized;

b. Use the active voice to address readers directly;

c. Use common, everyday words and clear language rather than jargon;

d. Be divided into short sections and sentences; and

e. Use lists and tables wherever possible.

If you feel that we have not met these requirements, send us comments by one of the methods listed in ADDRESSES section above. To better help us revise this proposed rule, your comments should be as specific as possible. For example, you should tell us the numbers of the sections or paragraphs that you find unclear, which sections or sentences are too long, the sections where you feel lists or tables would be useful, etc.

Drafting Information

The primary author of this proposed regulation is Jay Calhoun, Regulations Program Specialist, Division of Regulations, Jurisdiction, and Special Park Uses, National Park Service, 1849 C Street NW., Washington, DC 20240.

Public Participation

It is the policy of the Department of the Interior, whenever practicable, to afford the public an opportunity to participate in the rulemaking process. Accordingly, interested persons may submit written comments regarding this proposed rule by one of the methods listed in the ADDRESSES section above.

Public Availability of Comments

Before including your address, phone number, email address, or other personal identifying information in your comment, you should be aware that your entire comment—including your personal identifying information—may be made publicly available at any time. While you can ask us in your comment to withhold your personal identifying information from public review, we cannot guarantee that we will be able to do so.

List of Subjects in 36 CFR Part 7

National parks, Reporting and recordkeeping requirements.

In consideration of the foregoing, NPS proposes to amend 36 CFR part 7 as follows:

PART 7—SPECIAL REGULATIONS, AREAS OF THE NATIONAL PARK SYSTEM

■ 1. The authority citation for part 7 continues to read as follows:

Authority: 54 U.S.C. 100101, 100751, 320102; Sec. 7.96 also issued under DC Code 10–137 and DC Code 50–2201.07.

■ 2. In § 7.62, add paragraph (d) as follows:

§ 7.62 Lake Chelan National Recreation Area.

* * * * *

(d) *Solid waste disposal.* A solid waste transfer station located near Stehekin within the boundary of Lake Chelan National Recreation Area must comply with all provisions in 36 CFR part 6, except it may:

(1) Accept solid waste generated within the boundary of the park unit that was not generated by National Park Service activities;

(2) Be located within one mile of a campground or a residential area;

(3) Be visible by the public from scenic vistas or off-trail areas in designated wilderness areas;

(4) Be detectable by the public by sound from a campground; and

(5) Be detectable by the public by sight, sound, or odor from a road open to public travel.

Dated: July 1, 2015.

Michael Bean,

Principal Deputy Assistant Secretary for Fish and Wildlife and Parks.

36 CFR Part 13

[NPS–KLGO–18480; PPAKKLGOL0, PPMPRLE1Z.L00000]

RIN 1024–AE27

Special Regulations, Areas of the National Park System, Klondike Gold Rush National Historical Park, Horse Management

AGENCY: National Park Service, Interior.

ACTION: Proposed rule.

SUMMARY: The National Park Service proposes to revise the special regulations for Klondike Gold Rush National Historical Park to close the core Dyea Historic Townsite to the use of horses except by special use permit issued by the superintendent.

DATES: Comments must be received by 11:59 p.m. EST on September 11, 2015.

ADDRESSES: You may submit comments, identified by Regulation Identifier Number (RIN) 1024–AE27, by either of the following methods:

• *Federal eRulemaking Portal: http://www.regulations.gov.* Follow the instructions for submitting comments.

• *Mail or hand deliver to:* National Park Service, Regional Director, Alaska Regional Office, 240 West 5th Ave., Anchorage, AK 99501.

• *Mail or hand deliver to:* National Park Service, Superintendent, Klondike Gold Rush National Historical Park, P.O. Box 517, Skagway, AK 99840. Comments can be hand-delivered to the NPS office on 2nd and Broadway in Skagway.

Instructions: Comments will not be accepted by fax, email, or in any way other than those specified above. All submissions received must include the words "National Park Service" or "NPS" and must include the docket number or RIN (1024–AE27) for this rulemaking. Comments received will be posted without change to *http://www.regulations.gov,* including any personal information provided.

Docket: For access to the docket to read background documents or comments received, go to *http://www.regulations.gov.*

FOR FURTHER INFORMATION CONTACT: Andee Sears, Regional Law Enforcement Specialist, Alaska Regional Office, 240 West 5th Ave., Anchorage, AK 99501. Phone (907) 644–3410. Email: *AKR_Regulations@nps.gov*

SUPPLEMENTARY INFORMATION:

Background and Significance of Klondike Gold Rush National Historic Site

Klondike Gold Rush National Historic Site (KLGO or park) was established in 1980. The park includes 13,191 acres and is the only NPS area authorized and established solely to commemorate an American gold rush. The purpose of the park is to preserve for the benefit and inspiration of the people of the United States, the historic structures, trails, artifacts and landscapes and stories associated with the Klondike Gold Rush of 1898.

Part of the park is the Dyea Historic Townsite, which served as the gateway community to the Chilkoot Trail. At the time of the Gold Rush, approximately 10,000 people lived in Dyea. Dyea is rich in surface artifacts and other remnants from the Klondike Gold Rush of 1898. Horses were a very important and visible component of the 1898 Klondike Gold Rush and the Dyea Historic Townsite from 1897 and for several decades afterward. Thousands of unique and irreplaceable cultural landscape features and artifacts remain within and above the top layers of soil, and as such are highly susceptible to damage from ground disturbance, including disturbance caused by unregulated horseback traffic.

Authority To Promulgate Regulations

The National Park Service (NPS) manages KLGO under a statute commonly known as the NPS Organic Act of 1916 (Organic Act) (54 U.S.C. 100101 *et seq.*), which gives the NPS broad authority to regulate the use of the park areas under its jurisdiction. The Organic Act authorizes the Secretary of the Interior, acting through NPS, to ''prescribe such regulations as the Secretary considers necessary or proper for the use and management of [National Park] System units.'' 54 U.S.C. 100751(a).

Management of the park is also governed by the Alaska National Interest Lands Conservation Act (ANILCA). Horses at KLGO are a form of non-motorized surface transportation for traditional activities which is subject to Section 1110(a) of ANILCA. Under this section of ANILCA and implementing regulations at 43 CFR 36.11(h), such use is subject to reasonable regulations to protect the natural and other values of KLGO and the NPS may close an area to this form of transportation by regulation upon a finding by the NPS that the activity would be detrimental to the resources or values of the area. The NPS believes, based upon the analysis in the Dyea Area Plan and Environmental Assessment (EA) and the associated Finding of No Significant Impact (FONSI), that unregulated horse traffic in the Dyea Historic Townsite would be detrimental to the thousands of unique and irreplaceable cultural landscape features and artifacts that remain within and above the top layers of soil in the area.

Dyea Area Plan and Environmental Assessment and Proposed Rule

In January 2014, the NPS completed the EA after providing an opportunity for public comment. The proposed action in the EA calls for eliminating horse traffic from the Dyea Historic Townsite except for limited and infrequent use on an established route by private, non-commercial parties pursuant to a special use permit issued by the superintendent. In March 2014, the NPS held a public hearing in Skagway, AK for the proposed restrictions on horse use in the Dyea Historic Townsite in compliance with regulations at 43 CFR 36.11(h)(3). In September 2014, the Regional Director for the Alaska Region signed the FONSI identifying the proposed action in the EA as the selected action. The proposed rule would implement the selected action by closing the Dyea Historic Townsite to the use of horses except under a special use permit issued by the superintendent. If, after observation, the superintendent determines that the desired condition, as defined in the EA, has deteriorated, the superintendent may include permit conditions to protect natural and cultural resources and, if necessary, the NPS may cease issuing permits until impacts from prior uses of horses are mitigated. The NPS may also adopt permit conditions to limit impacts from the use of horses on other user experiences.

The closure area is a small 80 acre parcel encompassing the core Dyea Historic Townsite. Alternate routes have already been designated for commercial horse use outside the core Dyea Historic Townsite and noncommercial horse use will continue to be unrestricted outside the Historic Townsite.

Compliance With Other Laws, Executive Orders, and Department Policy

Regulatory Planning and Review (Executive Order 12866)

Executive Order 12866 provides that the Office of Information and Regulatory Affairs (OIRA) in the Office of Management and Budget will review all significant rules. OIRA has determined that this proposed rule is not significant.

Executive Order 13563 reaffirms the principles of Executive Order 12866 while calling for improvements in the nation's regulatory system to promote predictability, to reduce uncertainty, and to use the best, most innovative, and least burdensome tools for achieving regulatory ends. The executive order directs agencies to consider regulatory approaches that reduce burdens and maintain flexibility and freedom of choice for the public where these approaches are relevant, feasible, and consistent with regulatory objectives. Executive Order 13563 emphasizes further that regulations must be based on the best available science and that the rulemaking process must allow for public participation and an open exchange of ideas. We have developed this proposed rule in a manner consistent with these requirements.

Regulatory Flexibility Act

This proposed rule will not have a significant economic effect on a substantial number of small entities under the Regulatory Flexibility Act (5 U.S.C. 601 *et seq.*). This certification is based on the cost-benefit and regulatory flexibility analyses found in the reports entitled ''Regulatory Flexibility Threshold Analysis: Special Regulations for Klondike Gold Rush National Historical Park'' and ''Preliminary Cost/Benefit Analysis: Special Regulations for Klondike Gold Rush National Historical Park in Alaska'' which can be viewed online at *http://www.nps.gov/klgo/learn/management/documents.htm.*

Small Business Regulatory Enforcement Fairness Act

This proposed rule is not a major rule under 5 U.S.C. 804(2), the Small Business Regulatory Enforcement Fairness Act. This rule:

a. Does not have an annual effect on the economy of $100 million or more.

b. Will not cause a major increase in costs or prices for consumers, individual industries, federal, state, or local government agencies, or geographic regions

c. Does not have significant adverse effects on competition, employment, investment, productivity, innovation, or the ability of U.S. based enterprises to compete with foreign-based enterprises.

Unfunded Mandates Reform Act

This proposed rule does not impose an unfunded mandate on State, local, or tribal governments or the private sector of more than $100 million per year. The proposed rule does not have a significant or unique effect on State, local or tribal governments or the private sector. A statement containing the information required by the Unfunded Mandates Reform Act (2 U.S.C. 1531 *et seq.*) is therefore not required.

Takings (Executive Order 12630)

This proposed rule does not affect a taking of private property or otherwise have taking implications under Executive Order 12630. A takings implication assessment is not required.

Federalism (Executive Order 13132)

Under the criteria in section 1 of Executive Order 13132, this proposed rule does not have sufficient federalism implications to warrant the preparation of a Federalism summary impact statement. The proposed rule is limited in effect to federal lands managed by the NPS in Alaska and would not have a substantial direct effect on state and local government in Alaska. A federalism summary impact statement is not required.

Civil Justice Reform (Executive Order 12988)

This proposed rule complies with the requirements of Executive Order 12988. Specifically, this proposed rule:

1. Meets the criteria of section 3(a) requiring that all regulations be reviewed to eliminate errors and ambiguity and be written to minimize litigation; and
2. Meets the criteria of section 3(b)(2) requiring that all regulations be written in clear language and contain clear legal standards.

Consultation With Indian Tribes (E.O. 13175 and Department Policy) and ANCSA Corporations

The Department of the Interior strives to strengthen its government-to-government relationship with Indian Tribes through a commitment to consultation with Indian tribes and recognition of their right to self-governance and tribal sovereignty. We have evaluated this rule under the criteria in Executive Order 13175 and under the Department's tribal consultation policy and Alaska Native Claims Settlement Act (ANCSA) Native Corporation policies and have determined that tribal consultation is not required because the rulemaking will have no substantial direct effect on federally recognized Indian tribes or ANCSA Native Corporation lands, water areas, or resources. Although the NPS has made this determination, the NPS sent copies of the draft plan and letters requesting government-to-government consultation to four affected Native tribal governments, one of whom is the Carcross/Tagish First Nations tribe in Carcross, Canada. Several meetings were held between 2012 and 2013 with tribal governments in Skagway and Haines to discuss key components of the Dyea Area Plan and EA that were of interest to the local federally recognized tribes.

Paperwork Reduction Act (44 U.S.C. 3501 et seq.)

This proposed rule does not contain any new collections of information that require approval by the Office of Management and Budget (OMB) under the Paperwork Reduction Act. OMB has approved the information collection requirements associated with NPS Special Park Use Permits and has assigned OMB Control Number 1024–0026 (expires 08/31/16). An agency may not conduct or sponsor and a person is not required to respond to a collection of information unless it displays a currently valid OMB control number.

National Environmental Policy Act

This proposed rule does not constitute a major Federal action significantly affecting the quality of the human environment. A detailed statement under the National Environmental Policy Act of 1969 is not required because we reached a Finding of No Significant Impact. The EA and FONSI are available online at *http://www.nps.gov/klgo/learn/management/documents.htm.*

Effects on the Energy Supply (Executive Order 13211)

This proposed rule is not a significant energy action under the definition in Executive Order 13211. A Statement of Energy Effects is not required.

Clarity of This Regulation

We are required by Executive Orders 12866 (section 1(b)(12)), 12988 (section 3(b)(1)(B)), and 13563 (section 1(a)), and by the Presidential Memorandum of June 1, 1998, to write all rules in plain language. This means that each rule we publish must:

1. Be logically organized;
2. Use the active voice to address readers directly;
3. Use common, everyday words and clear language rather than jargon;
4. Be divided into short sections and sentences; and
5. Use lists and tables wherever possible.

If you feel that we have not met these requirements, send us comments by one of the methods listed in the **ADDRESSES** section above. To better help us revise the proposed rule, your comments should be as specific as possible. For example, you should tell us the numbers of the sections or paragraphs that you find unclear, which sections or sentences are too long, the sections where you feel lists or tables would be useful, etc.

Drafting Information

The primary authors of this proposed regulation are Jay Calhoun, Regulations Program Specialist, National Park Service, Jenna Giddens of Kenai Fjords National Park, Andee Sears of the Alaska Regional Office, National Park Service, and Tim Steidel of Klondike Gold Rush National Historical Park.

Public Availability of Comments

Before including your address, phone number, email address, or other personal identifying information in your comment, you should be aware that your entire comment—including your personal identifying information—may be made publicly available at any time. While you can ask us in your comment to withhold your personal identifying information from public review, we cannot guarantee that we will be able to do so.

List of Subjects in 36 CFR Part 13

Alaska, National parks, Reporting and recordkeeping requirements.

In consideration of the foregoing, the National Park Service proposes to amend 36 CFR part 13 as set forth below:

PART 13—NATIONAL PARK SYSTEM UNITS IN ALASKA

■ 1. The authority citation for part 13 continues to read as follows:

Authority: 16 U.S.C. 3124; 54 U.S.C. 100101, 100751, 320102; Sec. 13.1204 also issued under Sec. 1035, Pub. L. 104–333, 110 Stat. 4240.

■ 2. Add § 13.1408 to subpart Q to read as follows:

§ 13.1408 Dyea.

The Dyea Historic Townsite is closed to the use of horses by members of the public except by special use permit issued by the Superintendent. A map showing the boundaries of the Dyea Historic Townsite is available on the park Web site and at the park visitor center.

Dated: July 1, 2015.

Michael Bean,

Principal Deputy Assistant Secretary for Fish and Wildlife and Parks.

Land Exchange Procedures and Procedures To Amend the Hawaiian Homes Commission Act, 1920

AGENCY: Office of the Secretary, Interior.

ACTION: Proposed rule; extension of comment period.

SUMMARY: The Department of the Interior (Department) is extending the comment period for the proposed rule governing land exchanges involving Hawaiian home lands and amendments to the Hawaiian Homes Commission Act proposed by the State of Hawaii until August 12, 2015. The proposed rule would clarify under current Federal law what Departmental procedures would apply.

DATES: The comment period for the proposed rule published on May 12, 2015 (80 FR 27134) is extended. Comments must be received by August 12, 2015.

ADDRESSES: You may submit comments on the rulemaking by either of the methods listed below. Please use Regulation Identifier Number 1090–AA98 in your message.

1. *Federal eRulemaking Portal: http://www.regulations.gov.* Follow the instructions on the Web site for submitting comments.

2. *U.S. mail, courier, or hand delivery:* Office of Native Hawaiian Relations, Department of the Interior, 1849 C Street NW., Washington, DC 20240.

FOR FURTHER INFORMATION CONTACT: Ka'i'ini Kimo Kaloi, Director, Office of Native Hawaiian Relations, telephone (202) 208–7462.

SUPPLEMENTARY INFORMATION: On May 12, 2015, we published a proposed rule to clarify how under current law the Department of the Interior shall review proposed land exchanges involving Hawaiian home lands and amendments to the Hawaiian Homes Commission Act proposed by the State of Hawaii. See 80 FR 27134. Today we are publishing an extension of the comment period, establishing a new comment deadline of August 12, 2015, to allow additional time for the State of Hawaii, Native Hawaiian Community, beneficiaries, and public comment. We will accept all comments received between May 12, 2015, and August 12, 2015. The proposed rule, frequently asked questions, and other information are online at: *http://www.doi.gov/ohr.*

Dated: July 8, 2015.

Kristen J. Sarri,

Principal Deputy Assistant Secretary for Policy, Management and Budget.

AGENCY FOR INTERNATIONAL DEVELOPMENT

Notice of July 9 Advisory Committee on Voluntary Foreign Aid Meeting

AGENCY: United States Agency for International Development.

ACTION: Notice of meeting.

SUMMARY: Pursuant to the Federal Advisory Committee Act, notice is hereby given of a meeting of the Advisory Committee on Voluntary Foreign Aid (ACVFA).

Date: Thursday, July 9, 2015

Time: 2:00–4:00 p.m.

Location: Horizon Ballroom, The Ronald Reagan Building, 1300 Pennsylvania Ave, NW., Washington, DC 20004.

Purpose

The Advisory Committee on Voluntary Foreign Aid (ACVFA) brings together USAID and private voluntary organization officials, representatives from universities, international nongovernment organizations, U.S. businesses, and government, multilateral, and private organizations to foster understanding, communication, and cooperation in the area of foreign aid.

Agenda

USAID Acting Administrator Ambassador Alfonso E. Lenhardt will make opening remarks, followed by panel discussions among ACVFA members and USAID leadership on USAID Forward and Local Solutions. The full meeting agenda will be forthcoming on the ACVFA Web site at*http://www.usaid.gov/who-we-are/organization/advisory-committee.*

Stakeholders

The meeting is free and open to the public. Registration information will be forthcoming on the ACVFA Web site at *http://www.usaid.gov/who-we-are/organization/advisory-committee.*

FOR FURTHER INFORMATION CONTACT: Jayne Thomisee, *acvfa@usaid.gov.*

Dated: June 8, 2015.

Jayne Thomisee,

Executive Director & Policy Advisor, U.S. Agency for International Development.

BILLING CODE P

DEPARTMENT OF AGRICULTURE

Submission for OMB Review; Comment Request

July 8, 2015.

The Department of Agriculture has submitted the following information collection requirement(s) to OMB for review and clearance under the Paperwork Reduction Act of 1995, Pub. L. 104–13. Comments regarding (a) whether the collection of information is necessary for the proper performance of the functions of the agency, including whether the information will have practical utility; (b) the accuracy of the agency's estimate of burden including the validity of the methodology and assumptions used; (c) ways to enhance the quality, utility and clarity of the information to be collected; (d) ways to minimize the burden of the collection of information on those who are to respond, including through the use of appropriate automated, electronic, mechanical, or other technological collection techniques or other forms of information technology should be addressed to: Desk Officer for Agriculture, Office of Information and Regulatory Affairs, Office of Management and Budget (OMB), *OIRA_Submission@OMB.EOP.GOV* or fax (202) 395–5806 and to Departmental Clearance Office, USDA, OCIO, Mail Stop 7602, Washington, DC 20250–7602. Comments regarding these information collections are best assured of having their full effect if received within 30 days of this notification. Copies of the submission(s) may be obtained by calling (202) 720–8958.

An agency may not conduct or sponsor a collection of information unless the collection of information displays a currently valid OMB control number and the agency informs potential persons who are to respond to the collection of information that such persons are not required to respond to the collection of information unless it displays a currently valid OMB control number.

Food Safety and Inspection Service

Title: Animal Disease Reporting System.

OMB Control Number: 0583–0139.

Summary of Collection: The Food Safety and Inspection Service (FSIS) has been delegated the authority to exercise the functions of the Secretary as provided in the Federal Meat Inspection Act (FMIA) (21 U.S.C. 601 *et seq.*), the Poultry Products Inspection Act (PPIA) (21 U.S.C. 451 *et seq.*). These statutes mandate that FSIS protect the public by ensuring that meat and poultry products are safe, wholesome, unadulterated, and properly labeled and packaged. In accordance with 9 CFR 320.6, 381.180, 352.15, and 354.91, establishments that slaughter meat, poultry, exotic animals, and rabbits are required to maintain certain records regarding their business operations and to report this information to the Agency as required.

Need and Use of the Information: FSIS will collect information from establishments using FSIS Form 6510–7, Poultry Lot Information. FSIS uses this information to plan inspection activities, to develop sampling plans, to target establishments for testing, to develop Agency budget, and to develop reports to Congress.

Description of Respondents: Business or other for-profit.

Number of Respondents: 1,159.

Frequency of Responses: Reporting: Other (daily).

Total Burden Hours: 23.180.

Ruth Brown,

Departmental Information Collection Clearance Officer.

DEPARTMENT OF COMMERCE

Bureau of the Census

[Docket Number: 150630568–5568–01]

2020 Census Tribal Consultation Meetings

AGENCY: Bureau of the Census, Commerce.

ACTION: Notice of 2020 Census tribal consultation meetings.

SUMMARY: Pursuant to Executive Order 13175, the Bureau of the Census (Census Bureau) plans to conduct eight tribal consultation meetings and one national webinar with federally recognized tribes across the country between October 2015 and April 2016. These meetings will provide a forum for tribes to share insights, make recommendations and discuss concerns related to the 2020 Census. The Census Bureau's procedures for outreach, notice and consultation will ensure involvement of tribes, to the extent practicable and permitted by law, before making decisions or implementing policies, rules or programs that affect federally recognized tribal governments. The Census Bureau requests that interested members of the public comment with any questions or topics they would like to see considered in these meetings. For a list of dates, locations and times please check *http://webdev.ssd.census.gov/aian/census_2020/.* These meetings are open to members of federally recognized tribes by invitation.

DATES: Any questions or topics to be considered in the tribal consultation meetings must be received in writing by September 30, 2015.

ADDRESSES: Please direct all comments on this notice to Angel L. Petty, Program Assistant, 2020 Partnership and Outreach Staff, Decennial Communications and Budget Office (DCBO), U.S. Census Bureau Washington, DC 20233; telephone (301) 763–2231 or fax (301) 763–2231 or by email *Angel.L.Petty@census.gov.*

FOR FURTHER INFORMATION CONTACT: Angel L. Petty, Program Assistant, 2020 Partnership and Outreach Staff, Decennial Communications and Budget Office, U.S. Census Bureau, at the above listed address and telephone number.

SUPPLEMENTARY INFORMATION:

Background

The Census Bureau's Decennial Directorate and the Intergovernmental Affairs Office is responsible for the development and implementation of outreach and promotion activities to assist in obtaining a complete and accurate census count in 2020 among all residents including the American Indian and Alaska Native (AIAN) populations. This program is one part of the overall outreach and promotion efforts directed at building awareness about the importance of the census and motivating response to the census in communities all across the country.

In accordance with Executive Order 13175, Consultation and Coordination with Indian Tribal Governments, issued November 6, 2000, the Census Bureau will be adhering to its tribal consultation policy by seeking the input of tribal governments in the planning and implementation of the 2020 Census with the goal of ensuring the most accurate counts and data for the American Indian and Alaska Native population. In that regard, we are seeking comments with regard to the following operational topics:

Enumeration—Enumeration is the process of collecting data, and is the central focus of the decennial census operation. Most successful enumeration occurs at the respondent's domicile either through self-response, or through some method of non-response follow-up. The Census Bureau is exploring ways to increase its self-response rates, and is developing tools to ease the burden of responding by leveraging technology, and exploring new modalities to promote Internet response.

Demographic Statistics—Demographic statistics provide information that is used to develop an understanding of the age, sex, and racial composition of a population and how it has changed over time through the basic demographic processes of birth, death, and migration.

Geography—Geography is a determinative part of the decennial census operation because it provides meaning and context to decennial census counts. Geographic planning provides the framework for census design, data collection, tabulation, and data dissemination. The Census Bureau seeks to use the latest and best geographic methodologies available to support the decennial census.

2020 Census Field Partnerships and Recruitment—Partnership efforts focus on maximizing public engagement in the decennial census process in an effort to keep the public informed, encourage self-response, and assist with recruiting the workforce necessary to complete the decennial census. Partnership efforts are directed at individuals from all walks of life, as well as the widest variety of public, private and governmental organizations.

2020 Census Communications and Planning—Communications planning seeks to motivate the entire population of the 50 states and its territories, to participate in the decennial census and its partnership activities. Communications planning will culminate in a communications campaign that will focus on, increasing participation in self-response options, improving accuracy, reducing the differential undercount and improving cooperation with enumerators and field operations.

For additional information on the tribal consultation sessions please visit: *http://webdev.ssd.census.gov/aian/census_2020/.*

Dated: July 7, 2015.

John H. Thompson,

Director, Bureau of the Census.

DEPARTMENT OF COMMERCE

Economic Development Administration

Notice of Petitions by Firms for Determination of Eligibility To Apply for Trade Adjustment Assistance

AGENCY: Economic Development Administration, Commerce.

ACTION: Notice and opportunity for public comment.

Pursuant to Section 251 of the Trade Act 1974, as amended (19 U.S.C. 2341 *et seq.*), the Economic Development Administration (EDA) has received petitions for certification of eligibility to apply for Trade Adjustment Assistance from the firms listed below. Accordingly, EDA has initiated investigations to determine whether increased imports into the United States of articles like or directly competitive with those produced by each of these firms contributed importantly to the total or partial separation of the firm's workers, or threat thereof, and to a decrease in sales or production of each petitioning firm.

LIST OF PETITIONS RECEIVED BY EDA FOR CERTIFICATION ELIGIBILITY TO APPLY FOR TRADE ADJUSTMENT ASSISTANCE
[7/3/2015 Through 7/7/2015]

Firm name	Firm address	Date accepted for investigation	Product(s)
NicVape, Inc.	107 Corporate Drive, Spartanburg, SC 29303.	7/6/2015	The firm manufactures liquids and concentrates for the electronic cigarette industry.
Alpha Products, Inc.	5570 West 70th Place, Chicago, IL 60638.	7/6/2015	The firm manufactures stamped and fabricated metal parts including steel and aluminum railcar parts, speaker baskets, cluster mailboxes, and high capacity magazines.
Modular Sound Systems, Inc. d/b/a Bag End Loudspeakers.	1201 Armstrong Street, Algonquin, IL 60102.	7/6/2015	The firm manufactures loudspeakers and electronic components.
Diversified Plastics Corporation.	120 West Mount Vernon Street, Nixa, MO 65714.	7/7/2015	The firm manufactures plastics including expandable polypropylene & polystyrene for packaging, injection molding, beaded press molding, concrete foam blocks and automotive components.
Georgia Chair Company, Inc.	456 Industrial Boulevard, Gainesville, GA 30501.	7/7/2015	The firm manufactures chairs, tables, desks, and bookcases; the manufacturing material is red oak wood.

Any party having a substantial interest in these proceedings may request a public hearing on the matter. A written request for a hearing must be submitted to the Trade Adjustment Assistance for Firms Division, Room 71030, Economic Development Administration, U.S. Department of Commerce, Washington, DC 20230, no later than ten (10) calendar days following publication of this notice.

Please follow the requirements set forth in EDA's regulations at 13 CFR 315.9 for procedures to request a public hearing. The Catalog of Federal Domestic Assistance official number and title for the program under which these petitions are submitted is 11.313, Trade Adjustment Assistance for Firms.

Dated: July 7, 2015.

Certain Steel Nails From the Republic of Korea, Malaysia, the Sultanate of Oman, Taiwan, and the Socialist Republic of Vietnam: Antidumping Duty Orders

AGENCY: Enforcement and Compliance, International Trade Administration, Department of Commerce.

SUMMARY: Based on affirmative final determinations by the Department of Commerce (''the Department'') and the International Trade Commission (''ITC''), the Department is issuing antidumping duty orders on certain steel nails (''steel nails'') from the Republic of Korea (''Korea''), Malaysia, the Sultanate of Oman (''Oman''), Taiwan, and the Socialist Republic of Vietnam (''Vietnam'').

DATES: *Effective Date:* July 13, 2015.

FOR FURTHER INFORMATION CONTACT: Krisha Hill (Korea), Edythe Artman (Malaysia and Vietnam), Lilit Astvatsatrian (Oman), or Victoria Cho (Taiwan) AD/CVD Operations, Office IV, Enforcement and Compliance, International Trade Administration, U.S. Department of Commerce, 14th Street and Constitution Avenue NW., Washington, DC 20230; telephone: (202) 482–4037, (202) 482–3931, (202) 482–6412, or (202) 482–5075, respectively.

SUPPLEMENTARY INFORMATION:

Background

In accordance with sections 735(d) and 777(i)(1) of the Tariff Act of 1930, as amended (the Act), and 19 CFR 351.210(c), on May 20 and 22, 2015, the Department published its affirmative final determinations of sales in the less-than-fair-value investigations of steel nails from Korea, Malaysia, Oman, Taiwan, and Vietnam, respectively.[1]

[1] *See Certain Steel Nails from the Republic of Korea: Final Determination of Sales at Less Than Fair Value,* 80 FR 28955 (May 20, 2015) (''*Final Determination of Steel Nails from Korea*''); *Certain Steel Nails From Malaysia; Final Determination of Sales at Less Than Fair Value,* 80 FR 28969 (May 20, 2015); *Certain Steel Nails From the Sultanate of Oman: Final Determination of Sales at Less Than Fair Value,* 80 FR 28972 (May 20, 2015); *Certain Steel Nails From Taiwan: Final Determination of Sales at Less Than Fair Value,* 80 FR 28959 (May 20, 2015) (''*Final Determination of Steel Nails from Taiwan*''); and *Certain Steel Nails From the Socialist Republic of Vietnam: Final Determination*

Pursuant to 735(e) of the Act and 19 CFR 351.224(f), the Department published its amended final determination of sales in the less-than-fair-value investigation of steel nails from Malaysia on June 16, 2015.[2] On July 6, 2015, the ITC notified the Department of its affirmative determinations that an industry in the United States is materially injured within the meaning of section 735(b)(1)(A)(i) of the Act, by reason of the less-than-fair-value imports of steel nails from Korea, Malaysia, Oman, Taiwan, and Vietnam.[3]

Scope of the Orders

The merchandise covered by these orders is certain steel nails having a nominal shaft length not exceeding 12 inches.[4] Certain steel nails include, but are not limited to, nails made from round wire and nails that are cut from flat-rolled steel. Certain steel nails may be of one piece construction or constructed of two or more pieces. Certain steel nails may be produced from any type of steel, and may have any type of surface finish, head type, shank, point type and shaft diameter. Finishes include, but are not limited to, coating in vinyl, zinc (galvanized, including but not limited to electroplating or hot dipping one or more times), phosphate, cement, and paint. Certain steel nails may have one or more surface finishes. Head styles include, but are not limited to, flat, projection, cupped, oval, brad, headless, double, countersunk, and sinker. Shank styles include, but are not limited to, smooth, barbed, screw threaded, ring shank and fluted. Screw-threaded nails subject to this proceeding are driven using direct force and not by turning the nail using a tool that engages with the head. Point styles include, but are not limited to, diamond, needle, chisel and blunt or no point. Certain steel nails may be sold in bulk, or they may be collated in any manner using any material.

Excluded from the scope of these orders are certain steel nails packaged in combination with one or more non-subject articles, if the total number of nails of all types, in aggregate regardless of size, is less than 25. If packaged in combination with one or more non-subject articles, certain steel nails remain subject merchandise if the total number of nails of all types, in aggregate regardless of size, is equal to or greater than 25, unless otherwise excluded based on the other exclusions below.

Also excluded from the scope are certain steel nails with a nominal shaft length of one inch or less that are (a) a component of an unassembled article, (b) the total number of nails is sixty (60) or less, and (c) the imported unassembled article falls into one of the following eight groupings: (1) Builders' joinery and carpentry of wood that are classifiable as windows, French-windows and their frames; (2) builders' joinery and carpentry of wood that are classifiable as doors and their frames and thresholds; (3) swivel seats with variable height adjustment; (4) seats that are convertible into beds (with the exception of those classifiable as garden seats or camping equipment); (5) seats of cane, osier, bamboo or similar materials; (6) other seats with wooden frames (with the exception of seats of a kind used for aircraft or motor vehicles); (7) furniture (other than seats) of wood (with the exception of (i) medical, surgical, dental or veterinary furniture; and (ii) barbers' chairs and similar chairs, having rotating as well as both reclining and elevating movements); or (8) furniture (other than seats) of materials other than wood, metal, or plastics (*e.g.,* furniture of cane, osier, bamboo or similar materials). The aforementioned imported unassembled articles are currently classified under the following Harmonized Tariff Schedule of the United States (HTSUS) subheadings: 4418.10, 4418.20, 9401.30, 9401.40, 9401.51, 9401.59, 9401.61, 9401.69, 9403.30, 9403.40, 9403.50, 9403.60, 9403.81 or 9403.89.

Also excluded from the scope of these orders are steel nails that meet the specifications of Type I, Style 20 nails as identified in Tables 29 through 33 of ASTM Standard F1667 (2013 revision).

Also excluded from the scope of these orders are nails suitable for use in powder-actuated hand tools, whether or not threaded, which are currently classified under HTSUS subheadings 7317.00.20.00 and 7317.00.30.00.

Also excluded from the scope of these orders are nails having a case hardness greater than or equal to 50 on the Rockwell Hardness C scale (HRC), a carbon content greater than or equal to 0.5 percent, a round head, a secondary reduced-diameter raised head section, a centered shank, and a smooth symmetrical point, suitable for use in gas-actuated hand tools.

Also excluded from the scope of these orders are corrugated nails. A corrugated nail is made up of a small strip of corrugated steel with sharp points on one side.

Also excluded from the scope of these orders are thumb tacks, which are currently classified under HTSUS subheading 7317.00.10.00.

Certain steel nails subject to these orders are currently classified under HTSUS subheadings 7317.00.55.02, 7317.00.55.03, 7317.00.55.05, 7317.00.55.07, 7317.00.55.08, 7317.00.55.11, 7317.00.55.18, 7317.00.55.19, 7317.00.55.20, 7317.00.55.30, 7317.00.55.40, 7317.00.55.50, 7317.00.55.60, 7317.00.55.70, 7317.00.55.80, 7317.00.55.90, 7317.00.65.30, 7317.00.65.60 and 7317.00.75.00. Certain steel nails subject to these orders also may be classified under HTSUS subheadings 7907.00.60.00, 8206.00.00.00 or other HTSUS subheadings.

While the HTSUS subheadings are provided for convenience and customs purposes, the written description of the scope of these orders is dispositive.

Antidumping Duty Orders

As stated above, on July 6, 2015, in accordance with section 735(d) of the Act, the ITC notified the Department of its final determinations in these investigations, in which it found material injury with respect to steel nails from Korea, Malaysia, Oman, Taiwan, and Vietnam.[5] Because the ITC determined that imports of steel nails from Korea, Malaysia, Oman, Taiwan, and Vietnam are materially injuring a U.S. industry, unliquidated entries of such merchandise from Korea, Malaysia, Oman, Taiwan, and Vietnam, entered or withdrawn from warehouse for consumption are subject to the assessment of antidumping duties.

Therefore, in accordance with section 736(a)(1) of the Act, the Department will direct U.S. Customs and Border Protection (CBP) to assess, upon further instruction by the Department, antidumping duties equal to the amount by which the normal value of the merchandise exceeds the export price (or constructed export price) of the merchandise, for all relevant entries of steel nails from Korea, Malaysia, Oman, Taiwan, and Vietnam. Antidumping duties will be assessed on unliquidated entries of steel nails from Malaysia, Oman, and Vietnam entered, or withdrawn from warehouse, for

of Sales at Less Than Fair Value, 80 FR 29622 (May 22, 2015) ("*Final Determination for Vietnam*").

[2] *See Certain Steel Nails From Malaysia: Amended Final Determination of Sales at Less Than Fair Value,* 80 FR 34370 (June 16, 2015).

[3] *See* Certain Steel Nails from Korea, Malaysia, Oman, Taiwan, and Vietnam, USITC Investigation Nos. 701–TA–521 and 731–TA–1252–1255 (Final), USITC Publication 4541 (July 2015).

[4] The shaft length of certain steel nails with flat heads or parallel shoulders under the head shall be measured from under the head or shoulder to the tip of the point. The shaft length of all other certain steel nails shall be measured overall.

[5] *Id.*

consumption on or after December 29, 2014, the date of publication of the preliminary determinations,[6] but will not include entries occurring after the expiration of the provisional measures period and before publication of the ITC's final injury determination as further described below.

Antidumping duties will be assessed on relevant unliquidated entries of steel nails from Korea entered, or withdrawn from warehouse, for consumption on or after December 29, 2014, the date of publication of the preliminary determinations.[7] Antidumping duties will not include entries occurring after the expiration of the provisional measures period and before publication of the ITC's final injury determination as further described below. Because the preliminary determination in the less-than-fair-value investigation involving Taiwan was negative, antidumping duties will be assessed on relevant unliquidated entries of steel nails from Taiwan, entered, or withdrawn from warehouse, for consumption on or after May 20, 2015, the date of publication of the final determination.[8]

Suspension of Liquidation

In accordance with section 735(c)(1)(B) of the Act, we will instruct CBP to continue to suspend liquidation on all relevant entries of steel nails from Korea,[9] Malaysia, Oman, and Vietnam. We will also instruct CBP to begin suspension of liquidation on all relevant entries of steel nails from Taiwan.[10] These instructions suspending liquidation will remain in effect until further notice.

We will also instruct CBP to require cash deposits equal to the amounts as indicated below. Accordingly, effective on the date of publication of the ITC's final affirmative injury determinations, CBP will require, at the same time as importers would normally deposit estimated duties on this subject merchandise, a cash deposit equal to the estimated weighted-average antidumping duty margins listed below.[11] The relevant all-others rate (for Korea, Malaysia, Oman, and Taiwan) or the rate for the Vietnam-wide entity (for Vietnam), as applicable, apply to all producers or exporters not specifically listed. For the purpose of determining cash deposit rates, the estimated weighted-average dumping margins for imports of subject merchandise from Vietnam will be adjusted, as appropriate, for export subsidies found in the final determination of the companion countervailing duty investigation of this merchandise imported from Vietnam.[12]

Provisional Measures

Section 733(d) of the Act states that instructions issued pursuant to an affirmative preliminary determination may not remain in effect for more than four months except where exporters representing a significant proportion of exports of the subject merchandise, request the Department to extend that four-month period to no more than six months. At the request of exporters that account for a significant proportion of steel nails from Korea, Malaysia, Oman, and Vietnam, we extended the four-month period by additional 42 days in each case.[13] In the underlying investigations, the Department published the preliminary determinations on December 29, 2014. Therefore, the extended period, beginning on the date of publication of the preliminary determinations, ended on June 26, 2015. Furthermore, section 737(b) of the Act states that definitive duties are to begin on the date of publication of the ITC's final injury determination.

Therefore, in accordance with section 733(d) of the Act and our practice, we will instruct CBP to terminate the suspension of liquidation and to liquidate, without regard to antidumping duties, unliquidated entries of steel nails from Korea, Malaysia, Oman, and Vietnam entered, or withdrawn from warehouse, for consumption after June 26, 2015, the date on which the provisional measures expired, until and through the day preceding the date of publication of the ITC's final injury determinations in the **Federal Register**. Suspension of liquidation will resume on the date of publication of the ITC's final determination in the **Federal Register**.

The weighted-average dumping margins are as follows:

Exporter/producer	Dumping margins (%)
Korea:	
Daejin Steel	11.80
Jinheung Steel Corporation, Jinsco International Corporation, and Duo-Fast Korea Co., Ltd.[14]	0.00
All Others	11.80
Malaysia:	
Inmax Sdn. Bhd.	39.35
Region International Co. Ltd. and Region System Sdn. Bhd.	2.66
Tag Fasteners Sdn. Bhd.	39.35
All Others	2.66
Oman:	
Oman Fasteners, LLC	9.10
All Others	9.10
Taiwan:	
PT Enterprises	2.24

[6] *See Certain Steel Nails From Malaysia: Preliminary Determination of Sales at Less Than Fair Value and Postponement of Final Determination and Extension of Provisional Measures,* 79 FR 78055 (December 29, 2014); *Certain Steel Nails From the Sultanate of Oman: Affirmative Preliminary Determination of Sales at Less Than Fair Value and Postponement of Final Determination,* 79 FR 78034 (December 29, 2014); *Certain Steel Nails From the Socialist Republic of Vietnam: Preliminary Determination of Sales at Less Than Fair Value and Postponement of Final Determination and Extension of Provisional Measures,* 79 FR 78058 (December 29, 2014).

[7] *See Certain Steel Nails From the Republic of Korea: Affirmative Preliminary Determination of Sales at Less Than Fair Value and Postponement of Final Determination,* 79 FR 78051 (December 29, 2014). For the single entity consisting of Jinheung Steel, Duo-Fast Korea Co., Ltd., and Jinsco International Corporation (''Jinheung Steel Single Entity''), because this entity's estimated weighted-average final dumping margin is zero, we directed CBP to terminate suspension of liquidation of entries of certain steel nails produced and exported by this entity and have not imposed any cash deposit requirement on those entries. *See Final Determination of Steel Nails from Korea,* 80 FR at 28957.

[8] *See Final Determination of Steel Nails from Taiwan.* No suspension of liquidation has been required for entries exported by Quick Advance, Inc. and produced by Ko Nails, Inc. because its estimated weighted-average final dumping margin is zero. The Department calculated its dumping margin during its investigation based on sales of Quick Advance, Inc. that were produced by Ko Nails, Inc. Therefore, Quick Advance Inc.'s exclusion from antidumping duty liability and any cash deposit requirement pertains only to the channel(s) of sales that were examined by the Department in the investigation. *See* the Memorandum to the File, entitled, ''Clarification of Quick Advance, Inc.'s Sales Channels,'' dated concurrently with this notice.

[9] Except for those entries produced and exported by the Jinheung Steel Single Entity, as stated above.

[10] Except for those entries produced by Ko Nails, Inc. and exported by the Quick Advance Inc., as stated above.

[11] *See* section 736(a)(3) of the Act.

[13] *See Certain Steel Nails From the Republic of Korea, Malaysia, the Sultanate of Oman, Taiwan, and the Socialist Republic of Vietnam: Postponement of Preliminary Determination of Antidumping Duty Investigations,* 79 FR 63082 (October 22, 2014). Provisional measures were not effect for entries of subject merchandise from Taiwan because the Department's preliminary determination was negative. *See Certain Steel Nails From Taiwan: Negative Preliminary Determination of Sales at Less Than Fair Value and Postponement of Final Determination,* 79 FR 78053, 78054 (December 29, 2014) (Preliminary Determination).

[14] No suspension of liquidation will be required for entries of these firms because their estimated weighted-average dumping margin is zero. *See Final Determination of Steel Nails from Korea.*

Exporter/producer	Dumping margins (%)
Quick Advance Inc.[15]	0.00
All Others	2.24
Vietnam [16]:	
Kosteel Vina Limited Company	323.99
Vietnam-Wide Entity *	323.99%

* The Vietnam-wide entity includes the following exporters/producers: Region Industries Co., Ltd., United Nail Products Co., Ltd., Cong Ty Tnhh Cong Nghe Nhua A Chau, Kim Tin Group, Megastar Co., Ltd. and Simone Accessories Collection.

This notice constitutes the antidumping duty orders with respect to steel nails from Korea, Malaysia, Oman, Taiwan, and Vietnam pursuant to section 736(a) of the Act. Interested parties can find a list of antidumping duty orders currently in effect at *http://enforcement.trade.gov/stats/iastats1.html.*

These orders are published in accordance with section 736(a) of the Act and 19 CFR 351.211.

Dated: July 7, 2015.

Paul Piquado,

Assistant Secretary for Enforcement and Compliance.

[FR Doc. 2015–17239 Filed 7–10–15; 8:45 am]

BILLING CODE 3510–DS–P

[15] As stated above, no suspension of liquidation will be required for entries exported by Quick Advance Inc., which were produced by Ko Nails, Inc. because its estimated weighted-average dumping margin is zero. *See Final Determination of Steel Nails from Taiwan.*

[16] As explained in the *Final Determination for Vietnam,* 80 at 29623, the estimated weighted-average dumping margins for the separate-rate company and the Vietnam-wide entity will be adjusted for export subsidies. As a result of these adjustments, the cash deposit rate for both the separate-rate company and the Vietnam-wide entity will be 290.40 percent.

Polyethylene Retail Carrier Bags From Indonesia, Malaysia, the People's Republic of China, Taiwan, Thailand, and the Socialist Republic of Vietnam: Final Results of the Expedited Sunset Reviews of the Antidumping Duty Orders

AGENCY: Enforcement and Compliance, International Trade Administration, Department of Commerce.

SUMMARY: The Department of Commerce (the Department) finds that revocation of the antidumping duty orders on polyethylene retail carrier bags from Indonesia, Malaysia, the People's Republic of China, Taiwan, Thailand, and the Socialist Republic of Vietnam would be likely to lead to continuation or recurrence of dumping as indicated in the ''Final Results of Sunset Review'' section of this notice.

DATES: *Effective Date:* July 13, 2015.

FOR FURTHER INFORMATION CONTACT: Thomas Schauer or Minoo Hatten, AD/CVD Operations, Office I, Enforcement and Compliance, International Trade Administration, U.S. Department of Commerce, 14th Street and Constitution Avenue NW., Washington, DC 20230; telephone: (202) 482–0410 or (202) 482–1690, respectively.

SUPPLEMENTARY INFORMATION:

Background

On April 1, 2015, the Department published the notice of initiation of the sunset reviews of the antidumping duty orders on polyethylene retail carrier bags (PRCBs) from Indonesia, Malaysia, the People's Republic of China (PRC), Taiwan, Thailand, and the Socialist Republic of Vietnam (Vietnam) pursuant to section 751(c) of the Tariff Act of 1930, as amended (the Act).[1]

In accordance with 19 CFR 351.218(d)(1)(i), the Department received notices of intent to participate in these sunset reviews from the Polyethylene Retail Carrier Bag Committee (the domestic interested party) within 15 days after the date of publication of the *Initiation Notice* and the effective date of the initiation of this sunset review.[2] The domestic interested party claimed interested party status under section 771(9)(C) of the Act.

The Department received complete substantive responses to the *Initiation Notice* from the domestic interested party within the 30-day period specified in 19 CFR 351.218(d)(3)(i).[3] The Department received no substantive responses from any respondent interested party. In accordance with section 751(c)(3)(B) of the Act and 19 CFR 351.218(e)(1)(ii)(C)(2), the Department conducted expedited (120-day) sunset reviews of the antidumping duty orders on PRCBs from Indonesia, Malaysia, the PRC, Taiwan, Thailand, and Vietnam.

Scope of the Orders

The merchandise subject to the antidumping duty orders is PRCBs which are currently classified under subheading 3923.21.0085 of the Harmonized Tariff Schedule of the United States (HTSUS). The HTSUS number is provided for convenience and customs purposes. A full description of the scope of the order is contained in the Preliminary Decision Memorandum.[4] The written description is dispositive.

Analysis of Comments Received

A complete discussion of all issues raised in these reviews are addressed in the accompanying Issues and DecisionMemorandum, which is hereby adopted by this notice, including the likelihood of continuation or recurrence of dumping in the event of revocation

[1] *See Initiation of Five-year (''Sunset'') Review,* 80 FR 17388 (April 1, 2015) (*Initiation Notice*).

The Polyethylene Retail Carrier Bag Committee is comprised of five domestic producers of PRCBs: Hilex Poly Co., LLC, Superbag Corporation, Unistar Plastics, LLC, Command Packaging, and Roplast Industries, Inc. *Id.*

[3] *See* letters from domestic interested party: ''Five-Year ('Sunset') Review Of Antidumping Duty Order On Polyethylene Retail Carrier Bags From Indonesia: Domestic Industry's Substantive Response'' (May 1, 2015) (Indonesia Substantive Response); 2) ''Second Five-Year ('Sunset') Review Of Antidumping Duty Order On Polyethylene Retail Carrier Bags From Malaysia: Domestic Industry's Substantive Response'' (May 1, 2015) (Malaysia Substantive Response); 3) ''Second Five-Year ('Sunset') Review Of Antidumping Duty Order On Polyethylene Retail Carrier Bags From The People's Republic Of China: Domestic Industry's Substantive Response'' (May 1, 2015) (PRC Substantive Response); 4) ''Five-Year ('Sunset') Review Of Antidumping Duty Order On Polyethylene Retail Carrier Bags From Taiwan: Domestic Industry's Substantive Response'' (May 1, 2015) (Taiwan Substantive Response); 5) ''Second Five-Year ('Sunset') Review Of Antidumping Duty Order On Polyethylene Retail Carrier Bags From Thailand: Domestic Industry's Substantive Response'' (May 1, 2015) (Thailand Substantive Response); and 6) ''Five-Year ('Sunset') Review Of Antidumping Duty Order On Polyethylene Retail Carrier Bags From The Socialist Republic Of Vietnam: Domestic Industry's Substantive Response'' (May 1, 2015) (Vietnam Substantive Response).

[4] *See* Memorandum from Christian Marsh, Deputy Assistant Secretary for Antidumping and Countervailing Duty Operations, to Paul Piquado, Assistant Secretary for Enforcement and Compliance, entitled, ''Issues and Decision Memorandum for the Expedited Sunset Reviews of the Antidumping Duty Orders on Polyethylene Retail Carrier Bags from Indonesia, Malaysia, the People's Republic of China, Taiwan, Thailand, and the Socialist Republic of Vietnam'' dated concurrently with this notice (Issues and Decision Memorandum).

and the magnitude of dumping margins likely to prevail if the orders were revoked.[5] The Issues and Decision Memorandum is a public document and is on file electronically *via* Enforcement and Compliance's Antidumping and Countervailing Duty Centralized Electronic Service System (ACCESS). ACCESS is available to registered users at *http://access.trade.gov* and to all parties in the Central Records Unit in Room B8024 of the main Department of Commerce building. In addition, a complete version of the Issues and Decision Memorandum can be accessed directly on the Internet at *http://enforcement.trade.gov/frn/index.html.*

Final Results of Reviews

Pursuant to sections 751(c)(1) and 752(c) of the Act, we determine that revocation of the antidumping duty orders on PRCBs from Indonesia, Malaysia, the PRC, Taiwan, Thailand, and Vietnam would be likely to lead to continuation or recurrence of dumping up to the following weighted-average margin percentages:

Country	Weighted-Average Margin (Percent)
Indonesia	85.17
Malaysia	101.74
PRC	77.57
Taiwan	95.81
Thailand	122.88
Vietnam	76.11

Notification to Interested Parties

This notice serves as the only reminder to parties subject to administrative protective orders (APO) of their responsibility concerning the disposition of proprietary information disclosed under APO in accordance with 19 CFR 351.305(a). Timely written notification of the destruction of APO materials or conversion to judicial protective order is hereby requested. Failure to comply with the regulations and terms of an APO is a violation which is subject to sanction.

The Department is issuing and publishing these final results and notice in accordance with sections 751(c), 752(c), and 777(i)(1) of the Act and 19 CFR 351.218.

Dated: July 6, 2015.

Multilayered Wood Flooring From the People's Republic of China: Final Results of Changed Circumstances Review

AGENCY: Enforcement and Compliance, International Trade Administration, Department of Commerce.

SUMMARY: On February 12, 2015, the Department of Commerce (the ''Department'') published its initiation and preliminary results of a changed circumstances review [1] of the antidumping duty (''AD'') order on multilayered wood flooring (''MLWF'') from the People's Republic of China (''PRC'').[2] The Department preliminarily determined that Zhejiang Fuma Warm Technology Co., Ltd. (''Zhejiang Fuma'') is the successor-in-interest to Huzhou Fuma Wood Bus. Co., Ltd. (''Huzhou Fuma'') for purposes of the AD order on MLWF from the PRC and, as such, is entitled to Huzhou Fuma's cash deposit rate with respect to entries of subject merchandise. We invited interested parties to comment on the *Preliminary Results.* As no parties submitted comments, and there is no other information or evidence on the record calling into question our *Preliminary Results,* the Department is making no changes to the *Preliminary Results.*

DATES: *Effective Date:* July 13, 2015.

FOR FURTHER INFORMATION CONTACT: Krisha Hill, AD/CVD Operations, Office IV, Enforcement and Compliance, International Trade Administration, U.S. Department of Commerce, 14th Street and Constitution Avenue NW., Washington, DC 20230; telephone: (202) 482–4037.

SUPPLEMENTARY INFORMATION:

Background

On February 12, 2015, the Department initiated a changed circumstances review and made a preliminary finding that Zhejiang Fuma is the successor-in-interest to Huzhou Fuma, and is entitled to Huzhou Fuma's cash deposit rate with respect to entries of merchandise subject to the AD order on MLWF from the PRC.[3] We also provided interested parties 14 days from the date of publication of the *Preliminary Results* to submit case briefs in accordance with 19 CFR 351.309(c)(1)(ii). No interested parties submitted case briefs or requested a hearing. On June 24, 2015, the Department issued to interested parties draft customs instructions and solicited comment. None were received.

Scope of the Order

Multilayered wood flooring is composed of an assembly of two or more layers or plies of wood veneer(s) in combination with a core. Imports of the subject merchandise are provided for under the following subheadings of the Harmonized Tariff Schedule of the United States (''HTSUS''): 4412.31.0520; 4412.31.0540; 4412.31.0560; 4412.31.2510; 4412.31.2520; 4412.31.4040; 4412.31.4050; 4412.31.4060; 4412.31.4070; 4412.31.5125; 4412.31.5135; 4412.31.5155; 4412.31.5165; 4412.31.3175; 4412.31.6000; 4412.31.9100; 4412.32.0520; 4412.32.0540; 4412.32.0560; 4412.32.2510; 4412.32.2520; 4412.32.3125; 4412.32.3135; 4412.32.3155; 4412.32.3165; 4412.32.3175; 4412.32.3185; 4412.32.5600; 4412.39.1000; 4412.39.3000; 4412.39.4011; 4412.39.4012; 4412.39.4019; 4412.39.4031; 4412.39.4032; 4412.39.4039; 4412.39.4051; 4412.39.4052; 4412.39.4059; 4412.39.4061; 4412.39.4062; 4412.39.4069; 4412.39.5010; 4412.39.5030; 4412.39.5050; 4412.94.1030; 4412.94.1050; 4412.94.3105; 4412.94.3111; 4412.94.3121; 4412.94.3131; 4412.94.3141; 4412.94.3160; 4412.94.3171; 4412.94.4100; 4412.94.5100; 4412.94.6000; 4412.94.7000; 4412.94.8000; 4412.94.9000; 4412.94.9500; 4412.99.0600; 4412.99.1020; 4412.99.1030; 4412.99.1040; 4412.99.3110; 4412.99.3120; 4412.99.3130; 4412.99.3140; 4412.99.3150; 4412.99.3160; 4412.99.3170; 4412.99.4100; 4412.99.5100; 4412.99.5710; 4412.99.6000; 4412.99.7000; 4412.99.8000; 4412.99.9000; 4412.99.9500; 4418.71.2000; 4418.71.9000; 4418.72.2000; 4418.72.9500; and 9801.00.2500.[4] While HTSUS subheadings are provided for convenience and customs purposes, the

written description of the subject merchandise is dispositive.

Final Results of Changed Circumstances Review

Because no party submitted a case brief in response to the Department's *Preliminary Results,* and because the record contains no other information or evidence that calls into question the *Preliminary Results,* the Department continues to find that Zhejiang Fuma is the successor-in-interest to Huzhou Fuma, and is entitled to Huzhou Fuma's cash deposit rate with respect to entries of merchandise subject to the AD order on MLWF from the PRC.[5]

Instructions to U.S. Customs and Border Protection

Based on these final results, we will instruct U.S. Customs and Border Protection to collect estimated ADs for all shipments of subject merchandise exported by Zhejiang Fuma and entered, or withdrawn from warehouse, for consumption on or after the publication date of this notice in the **Federal Register** at the current AD cash deposit rate for Huzhou Fuma (*i.e.,* 58.84 percent). This cash deposit requirement shall remain in effect until further notice.

Notification to Interested Parties

This notice serves as a final reminder to parties subject to administrative protective order (''APO'') of their responsibility concerning the disposition of proprietary information disclosed under APO in accordance with 19 CFR 351.305(a)(3). Timely written notification of the return/destruction of APO materials or conversion to judicial protective order is hereby requested. Failure to comply with the regulations and terms of an APO is a sanctionable violation.

We are issuing and publishing this final results notice in accordance with sections 751(b) and 777(i) of the Tariff Act of 1930, as amended, and 19 CFR 351.216.

Dated: July 7, 2015.

Paul Piquado,

Assistant Secretary for Enforcement and Compliance.

DEPARTMENT OF COMMERCE

National Oceanic and Atmospheric Administration

RIN 0648–XD807

Takes of Marine Mammals Incidental to Specified Activities; Construction Activities at the Children's Pool Lifeguard Station at La Jolla, California

AGENCY: National Marine Fisheries Service (NMFS), National Oceanic and Atmospheric Administration (NOAA), Commerce.

ACTION: Notice; issuance of an Incidental Harassment Authorization (IHA).

SUMMARY: In accordance with the Marine Mammal Protection Act (MMPA), notification is hereby given that NMFS has issued an IHA to the City of San Diego for an IHA to take small numbers of marine mammals, by Level B harassment, incidental to construction activities at the Children's Pool Lifeguard Station in La Jolla, California.

DATES: Effective June 28, 2015 to June 27, 2016.

ADDRESSES: A copy of the IHA and the IHA application are available by writing to Jolie Harrison, Chief, Permits and Conservation Division, Office of Protected Resources, National Marine Fisheries Service, 1315 East-West Highway, Silver Spring, MD 20910 or by telephone to the contacts listed below (see **FOR FURTHER INFORMATION CONTACT**).

An electronic copy of the IHA application containing a list of the references used in this document may be obtained by writing to the address specified above, telephoning the contact listed below (see **FOR FURTHER INFORMATION CONTACT**), or visiting the Internet at: *http://www.nmfs.noaa.gov/pr/permits/incidental/construction.htm.* Documents cited in this notice, including the IHA application, may also be viewed, by appointment, during regular business hours, at the aforementioned address.

FOR FURTHER INFORMATION CONTACT: Howard Goldstein or Jolie Harrison, Office of Protected Resources, NMFS, 301–427–8401.

SUPPLEMENTARY INFORMATION:

Background

Sections 101(a)(5)(A) and (D) of the MMPA (16 U.S.C. 1361 *et seq.*) direct the Secretary of Commerce (Secretary) to allow, upon request, the incidental, but not intentional, taking of small numbers of marine mammals by United States citizens who engage in a specified activity (other than commercial fishing) within a specified geographical region if certain findings are made and either regulations are issued or, if the taking is limited to harassment, a notice of a proposed authorization is provided to the public for review.

An authorization for the incidental takings shall be granted if NMFS finds that the taking will have a negligible impact on the species or stock(s), will not have an unmitigable adverse impact on the availability of the species or stock(s) for subsistence uses (where relevant), and if the permissible methods of taking and requirements pertaining to the mitigation, monitoring, and reporting of such takings are set forth. NMFS has defined ''negligible impact'' in 50 CFR 216.103 as ''. . . an impact resulting from the specified activity that cannot be reasonably expected to, and is not reasonably likely to, adversely affect the species or stock through effects on annual rates of recruitment or survival.''

Section 101(a)(5)(D) of the MMPA established an expedited process by which citizens of the United States can apply for an authorization to incidentally take small numbers of marine mammals by harassment. Section 101(a)(5)(D) of the MMPA establishes a 45-day time limit for NMFS's review of an application followed by a 30-day public notice and comment period on any proposed authorizations for the incidental harassment of small numbers of marine mammals. Within 45 days of the close of the public comment period, NMFS must either issue or deny the authorization.

Except with respect to certain activities not pertinent here, the MMPA defines ''harassment'' as: Any act of pursuit, torment, or annoyance which (i) has the potential to injure a marine mammal or marine mammal stock in the wild [Level A harassment]; or (ii) has the potential to disturb a marine mammal or marine mammal stock in the wild by causing disruption of behavioral patterns, including, but not limited to, migration, breathing, nursing, breeding, feeding, or sheltering [Level B harassment].

Summary of Request

On February 25, 2015, NMFS received an application from the City of San Diego, Engineering and Capital Projects Department, requesting an IHA for the taking of marine mammals incidental to construction activities. NMFS determined that the IHA application was adequate and complete on April 9, 2015. NMFS published a notice making preliminary determinations and proposing to issue an IHA on May 19, 2015 (80 FR 28588). The notice initiated a 30-day public comment period.

The City of San Diego will undertake the construction activities between June 2015 and June 2016 at the Children's Pool Lifeguard Station in La Jolla, California. In-air noise generated from equipment used during the construction activities is likely to result in the take of marine mammals. The requested IHA will authorize the take, by Level B (behavioral) harassment, of small numbers of Pacific harbor seals (*Phoca vitulina richardii*), California sea lions (*Zalophus californianus*), and northern elephant seals (*Mirounga angustirostris*) incidental to construction activities of the Children's Pool Lifeguard Station at La Jolla, CA. Because the construction activities were subject to delays and cannot be completed by June 27, 2015, the City of San Diego has requested a renewal of the 2014 to 2015 IHA for an additional year. The construction activities are planned to take place during June 2015 to June 2016 in La Jolla, CA. Regarding the previous IHA, NMFS published a notice in the **Federal Register** (79 FR 8160) on February 11, 2014, making preliminary determinations and proposing to issue an IHA. The notice initiated a 30-day public comment period. On June 6, 2014, NMFS published a notice in the **Federal Register** (79 FR 32699) announcing the issuance of an IHA. Additional information on the construction activities at the Children's Pool Lifeguard Station is contained in the IHA application, which is available upon request (see **ADDRESSES**).

Also, NMFS issued the City of San Diego an IHA in 2013 (78 FR 40705, July 8, 2013) for demolition and construction activities at the Children's Pool Lifeguard Station that were scheduled to be completed in 2013. Because the construction activities were subject to delays (*e.g.,* nesting migratory birds, unexpected drainage pipes, unexpected demolition and construction planning, etc.) and could not be completed by December 15, 2013, the City of San Diego requested a renewal of the 2013 IHA for an additional year. Additional information on the construction activities at the Children's Pool Lifeguard Station is contained in the IHA application, which is available upon request (see **ADDRESSES**).

Description of the Specified Activity

Overview

The City of San Diego plans to conduct construction activities at the Children's Pool Lifeguard Station in La Jolla, CA in order to meet the needs of the lifeguards at Children's Pool and the demand for lifeguard services. The overall project includes the demolition of the existing lifeguard station and construction of a new, three-story, lifeguard station on the same site. Demolition of the existing lifeguard station was completed in 2013 to 2014 and construction of the new lifeguard station is expected to be completed in 2015 to 2016. Because the previously existing lifeguard station was demolished and closed to entry, a temporary lifeguard tower was moved onto the bluff near the previous lifeguard station.

Dates and Duration

The City of San Diego is planning to begin/resume the project at the Children's Pool in La Jolla, CA on June 1, 2015, (see page 30 to 31 of the Negative Declaration in the IHA application) with completion of the new lifeguard station to be completed by December 15, 2015. The City of San Diego and NMFS are requiring a moratorium on all construction activities during harbor seal pupping and weaning (*i.e.,* December 15th to May 30th; see page 5 of the Mitigated Negative Declaration in the IHA application). Therefore, work on this project can only be performed between June 1st and December 14th of any year.

Planned construction activities will generally occur Monday through Friday (no work will occur on holidays) during daylight hours only, as stipulated in the ''Mitigated Negative Declaration'' included in the IHA application and local ordinances. As a modification to the original IHA, the City of San Diego has requested that planned construction activities be allowed on weekends (*i.e.,* Saturday and Sunday to ensure completion of the project during 2015. The exact dates of the planned activities depend on logistics and scheduling. The IHA is valid through June 2016 to allow for construction delays.

Specific Geographic Region

The La Jolla Children's Pool Lifeguard Station is located at 827 ½ Coast Boulevard, La Jolla, CA 92037 (32° 50′ 50.02″ North, 117° 16′ 42.8″ West). The locations and distances (in ft) from the construction site to the Children's Pool haul-out area, breakwater ledge/rocks haul-out area, reef haul-out area, and Casa Beach haul-out area can be found in the City of San Diego's IHA application.

Detailed Description of the Specified Activities

The Children's Pool was created in 1931 by building a breakwater wall which created a protected pool for swimming. Although partially filled with sand, the Children's Pool still has open water for swimming and a beach for sunbathing and beachcombing. The Children's Pool and nearby shore areas (*i.e.,* shoreline, beaches, and reefs of La Jolla) are used by swimmers, sunbathers, SCUBA divers and snorkelers, shore/surf fishermen, school classes, tide pool explorers, kayakers, surfers, boogie and skim boarders, seal, sea lion, bird and nature watchers, and for other activities by the general public. Over the last three years (2010 through 2012), an average of 1,556,184 people have visited the Children's Pool annually, and lifeguards have taken an average of 8,147 preventive actions and 86 water rescues annually (CASA, 2010; 2011; 2012).

The previous lifeguard facility at Children's Pool, built in 1967, was old, deteriorating from saltwater intrusion, and no longer served the needs of the lifeguard staff or the beach-going public. The structure was condemned on February 22, 2008 due to its deteriorated condition and lack of structural integrity. Because the existing building was no longer viable, a temporary lifeguard tower was moved in. However, a new lifeguard station is required to meet the needs of the lifeguards and the demand for lifeguard services.

The overall project includes the demolition of the existing lifeguard station and construction of a new, three-story, lifeguard station on the same site. Demolition and removal of the existing lifeguard station was completed in 2013 to 2014 and construction of the new lifeguard station is expected to be completed in 2015 to 2016. The building contractor utilized excavators, backhoes, concrete saws, and jackhammers for demolishing the previous structure and has hauled the waste materials to an offsite landfill where it was separated into recycled content and waste. During the second year of construction (2014 to 2015) and in the same footprint as the old lifeguard station, the new lifeguard station is being constructed within and adjacent to the previous facility. Rough plumbing and electrical have been laid; the foundation has been poured and some of the steel structure has been erected. The new lifeguard facility is in an optimal location to provide lifeguard service to the community. The new, three-story, building will contain a lower level with beach access level public restrooms and showers, lifeguard lockers, and sewage pump room; a second level with two work stations, ready/observation room, kitchenette, restroom, and first aid station; and a third ''observation'' level (with a 270°

view of the beach and nearby reef areas) with a single occupancy observation space, radio storage closet, and exterior catwalk. Interior stairs will link the floors. The existing below grade retaining walls will remain in place and new retaining walls will be constructed for a ramp from street level to the lower level for emergency vehicle beach access and pedestrian access to the lower level restrooms and showers. A 5.6 m (18. 5 ft) wall will be located along the north end of the lower level. The walls will be designed for a minimum design life of 50 years and will not be undermined from ongoing coastal erosion. The walls will not be readily viewed from Coast Boulevard, the public sidewalks or the surrounding community. Enhanced paving, seating and viewing space, drinking fountains, adapted landscaping, and water efficient irrigation will also be included.

The City of San Diego has divided the demolition and construction activities are divided into phases:

(1.) Mobilization and temporary facilities;

(2.) Demolition and site clearing;

(3.) Site preparation and utilities;

(4.) Building foundation;

(5.) Building shell;

(6.) Building exterior;

(7.) Building interior;

(8.) Site improvements; and

(9.) Final inspection and demobilization.

Demolition and construction of the new lifeguard station was initially estimated to take approximately 7 months (148 actual demolition and construction days) and be completed by December 15, 2013; however, demolition and construction did not start until later than previously planned in June 2013 and June 2014 due to the presence of nesting migratory birds (*i.e.,* Western seagulls [*Larus occidentalis*] and eggs/chicks). There were additional unexpected delays in the demolition due to unforeseen underground structures at the site making it impossible to finish the project by December 15, 2013 or 2014. The City of San Diego completed phases 1 to 4 during 2013 and 2014. During the 2013 to 2014 construction window, the temporary on-site tower was removed and two temporary towers were installed nearby (one about 500 m [1,640.4 ft] south of the construction site and another about 1,000 m [3,280.8 ft] east of the construction site to serve citizens utilizing the beaches and ocean waters nearby. Construction of phases 5 to 9 will commence in June 2015, thereby necessitating a renewal of the previous IHA.

The notice of the final IHA for the City of San Diego's demolition and construction activities that was published in the **Federal Register** on July 8, 2013 (78 FR 40705) provides a detailed summary on phases 1 to 4 (*i.e.,* mobilization and temporary facilities, demolition and site clearing, site preparation and utilities, and building foundation). Phases 5 to 9 include (phases overlap in time):

(5.) *Building shell:*

Pre-cast concrete panel walls, panel walls, rough carpentry and roof framing, wall board, cable railing, metal flashing, and roofing.

Equipment—crane, truck, fork lift, and hand/power tools.

Timeframe—Approximately 35 days.

This phase will be completed in 2015 and has a maximum source level of 100 dB.

(6.) *Building exterior:*

Doors and windows, siding paint, light fixtures, and plumbing fixtures.

Equipment—truck, hand/power tools, and chop saw.

Timeframe—Approximately 4 weeks.

This phase will be completed in 2015 and has a maximum source level of 100 dB.

(7.) *Building interiors:*

Walls, sewage lift station, rough and finish mechanical electrical plumbing structural (MEPS), wall board, door frames, doors and paint.

Equipment—truck, hand/power tools, and chop saw.

Timeframe—Approximately 37 days.

This phase will be completed in 2015 and has a maximum source level of 100 dB.

(8.) *Site improvements:*

Modify storm drain, concrete seat walls, curbs, and planters, fine grade, irrigation, hardscape, landscape, hand rails, plaques, and benches.

Equipment—backhoe, truck, hand/ power tools, concrete pump/truck, and fork lift.

Timeframe—Approximately 37 days.

This phase will be completed in 2015 and has a maximum source level of 110 dB.

(9.) *Final inspection and demobilization:*

System testing, remove construction equipment, inspection, and corrections.

Equipment—truck, and hand/power tools.

Timeframe—Approximately 41 days.

This phase will be completed in 2015 and has a maximum source level of 100 dB.

The exact dates of the planned activities depend on logistics and scheduling.

Sound levels during all phases of the project will not exceed 110 dB re 20 μPa at five feet from the sound sources. The 110 dB estimate is based on equipment manufacturers' estimates obtained by the construction contractor. The City of San Diego utilized published or manufacturers' measurement data based on the planned equipment (*i.e.,* a backhoe, dump truck, cement pump, air compressor, electric screw guns, jackhammers, concrete saw, chop saw, and hand tools) to be utilized on the project site. Operation of the equipment is the primary activity within the range of construction activities that is likely to affect marine mammals by potentially exposing them to in-air (*i.e.,* airborne or sub-aerial) noise. During the working day, the City of San Diego estimates there will be sound source levels above 90 dB re 20 μPa, including 65 days of 100 to 110 dB re 20 μPa at the construction site.

On average, pinnipeds will be about 30.5 meters (m) (100 feet [ft]) or more from the construction site with a potential minimum of about 15.2 m (50 ft). During 2013 and 2014, measured sound levels from the demolition equipment reaching the pinnipeds did not exceed approximately 90 dB re 20 μPa at the haul-out area closest to the demolition and construction and a peak of about 83 dB re 20 μPa at the mean hauling-out distance (30.5 m). The City of San Diego used the formula and online calculator on the Web site: *http://sengpielaudio.com/calculator-distance.htm* and measured distances from the sound source to determine the area of potential impacts from in-air sound. Table 1 of the City of San Diego's monitoring report provides mean sound and mean distance from sound sources by the type of equipment and monitoring location. The City of San Diego intends to continue to measure in-air background noise levels in the days immediately prior to, during, and after the construction activities.

Additional details regarding the construction activities of the Children's Pool Lifeguard Station can be found in the City of San Diego's IHA application. The IHA application can also be found online at: *http://www.nmfs.noaa.gov/pr/permits/incidental/construction.htm.*

Comments and Responses

A notice of preliminary determinations and proposed IHA for the City of San Diego's construction activities as published in the **Federal Register** on May 19, 2015 (80 FR 28588). During the 30-day public comment period, NMFS received comments from the Marine Mammal Commission (Commission) and one private citizen. The comments are posted online at: *http://www.nmfs.noaa.gov/pr/permits/*

incidental/construction.htm. Following are the substantive comments and NMFS's responses:

Comment 1: The Commission concurs with NMFS's preliminary findings and recommends that NMFS issue the requested IHA, subject to inclusion of the proposed mitigation, monitoring, and reporting measures.

Response: NMFS concurs with the Commission's recommendation and has issued the IHA to the City of San Diego.

Comment 2: One private citizen did not oppose the issuance of an IHA by NMFS and the conduct of the construction activities at the Children's Pool Lifeguard Station at La Jolla, CA. The commenter provided many descriptions and photographs of the public viewing and interacting with Pacific harbor seals on the beach and in the water at the Children's Pool. Also, the commenter provided behavioral descriptions of harbor seals and how they may be acclimated to human presence and noise at this site. Many of the commenter's statements were not germane to the proposed IHA or have not identified or provided scientific publications supporting their statement which limits our ability to respond to commenter's statements.

Response: As described in detail in the notice of the proposed IHA (80 FR 28588, May 19, 2015), as well as in this document, NMFS does not believe the City of San Diego's construction activities will cause injury, serious injury, or mortality to marine mammals, and no take by injury, serious injury, or mortality is authorized. The required monitoring and mitigation measures that the City of San Diego will implement during the construction activities will further reduce the potential impacts on marine mammals to the lowest level practicable. NMFS anticipates only behavioral disturbance to occur during the conduct of the construction activities at the Children's Pool Lifeguard Station in La Jolla, CA.

Description of Marine Mammals in the Specified Geographic Area of the Specified Activity

Three species of pinnipeds are known to or could occur in the Children's Pool planned action area and off the Pacific coastline (see Table 1 below). Pacific harbor seals, California sea lions, and northern elephant seals are the three species of marine mammals that occur and are likely to be found within the immediate vicinity of the activity area. Therefore, these three species are likely to be exposed to effects of the specified activities. A variety of other marine mammals have on occasion been reported in the coastal waters off southern California. These include gray whales, killer whales, bottlenose dolphins, Steller sea lions, northern fur seals, and Guadalupe fur seals. However, none of these species have been reported to occur in the immediate action area of the Children's Pool beach. Therefore, NMFS does not expect, and is not authorizing, incidental take of other marine mammal species from the specified activities. Table 1 below identifies the cetacean and pinnipeds species, their habitat, occurrence, range, abundance, and conservation status in the nearshore area of the general region of the project area.

TABLE 1—THE HABITAT, OCCURRENCE, RANGE, ABUNDANCE, AND CONSERVATION STATUS OF MARINE MAMMALS INHABITING THE GENERAL REGION OF THE ACTION AREA IN THE PACIFIC OCEAN OFF THE SOUTHERN COAST OF CALIFORNIA

Species	Habitat	Occurrence	Range	Best population estimate (minimum) [1]	ESA [2]	MMPA [3]
Mysticetes:						
Gray whale (*Eschrichtius robustus*).	Coastal and shelf.	Transient during season migrations.	North Pacific Ocean, Gulf of California to Arctic—Eastern North Pacific stock.	20,990 (20,125)	DL—Eastern Pacific stock. EN—Western Pacific stock.	NC—Eastern North Pacific stock D—Western North Pacific stock.
Odontocetes:						
Killer whale (*Orcinus orca*).	Widely distributed.	Varies on inter-annual basis.	Cosmopolitan	354 (354)—West Coast Transient stock.	NL EN—Southern resident population.	NC D—Southern Resident and AT1 Transient populations.
Bottlenose dolphin (*Tursiops truncatus*).	Offshore, inshore, coastal, estuaries.	Limited, small population within 1 km of shore.	Tropical and temperate waters between 45° North and South.	323 (290)—California Coastal stock.	NL	NC.
Long-beaked common dolphin (*Delphinus capensis*).	Inshore	Common, more inshore distribution, year-round presence.	Nearshore and tropical waters.	107,016 (76,224)—California stock.	NL	NC.
Pinnipeds:						
Pacific harbor seal (*Phoca vitulina richardii*).	Coastal	Common	Coastal temperate to polar regions in Northern Hemisphere.	30,968 (27,348)—California stock.	NL	NC.
Northern elephant seal (*Mirounga angustirostris*).	Coastal, pelagic when not migrating.	Common	Eastern and Central North Pacific—Alaska to Mexico.	179,000 (81,368)—California breeding stock.	NL	NC.

TABLE 1—THE HABITAT, OCCURRENCE, RANGE, ABUNDANCE, AND CONSERVATION STATUS OF MARINE MAMMALS INHABITING THE GENERAL REGION OF THE ACTION AREA IN THE PACIFIC OCEAN OFF THE SOUTHERN COAST OF CALIFORNIA—Continued

Species	Habitat	Occurrence	Range	Best population estimate (minimum) [1]	ESA [2]	MMPA [3]
California sea lion (*Zalophus californianus*).	Coastal, shelf	Common	Eastern North Pacific Ocean—Alaska to Mexico.	296,750 (153,337)—U.S. stock.	NL	NC.
Steller sea lion (*Eumetopias jubatus*).	Coastal, shelf	Rare	North Pacific Ocean—Central California to Korea.	72,223 (52,847)—Eastern U.S. stock.	DL—Eastern U.S. stock. EN—Western U.S. stock.	D.
Northern fur seal (*Callorhinus ursinus*).	Pelagic, offshore.	Rare	North Pacific Ocean—Mexico to Japan.	12,844 (6,722)—California stock.	NL	NC—California stock.
Guadalupe fur seal (*Arctocephalus townsendi*).	Coastal, shelf	Rare	California to Baja California, Mexico.	7,408 (3,028)—Mexico to California.	T	D.

NA = Not available or not assessed.

[3] U.S. Marine Mammal Protection Act: D = Depleted, S = Strategic, and NC = Not classified.

The rocks and beaches at or near the Children's Pool in La Jolla, CA, are almost exclusively Pacific harbor seal hauling-out sites. On infrequent occasions, one or two California sea lions or a single juvenile northern elephant seal have been observed on the sand or rocks at or near the Children's Pool (*i.e.,* breakwater ledge/rocks haul-out area, reef haul-out area, and Casa Beach haul-out area). These sites are not usual haul-out locations for California sea lions and/or northern elephant seals. The City of San Diego commissioned two studies of harbor seal abundance trends at the Children's Pool. Both studies reported that appearances of California sea lions and northern elephant seals are infrequent, but not rare at Children's Pool (Yochem and Stewart, 1998; Hanan, 2004; Hanan & Associates, 2011). During 2013, the City of San Diego observed one juvenile and three adult California sea lions and two juvenile northern elephant seals at the Children's Pool. During 2014, the City of San Diego observed 22 California sea lions (during 19 days) and 30 juvenile elephant seals (during 29 days) at the Children's Pool. Adult sea lions were also observed hauling out on rocks and cliffs near the Children's Pool.

Pacific Harbor Seal

Harbor seals are widely distributed in the North Atlantic and North Pacific. Two subspecies exist in the Pacific Ocean: *P.* v. *stejnegeri* in the western North Pacific near Japan, and *P.* v. *richardii* in the eastern North Pacific. The subspecies in the eastern North Pacific Ocean inhabits near-shore coastal and estuarine areas from Baja California, Mexico, to the Pribilof Islands in Alaska. These seals do not make extensive pelagic migrations, but do travel 300 to 500 kilometers (km) (162 to 270 nautical miles [nmi]) on occasion to find food or suitable breeding areas (Herder, 1986; Harvey and Goley, 2011). Previous assessments of the status of harbor seals have recognized three stocks along the west coast of the continental U.S.: (1) California, (2) Oregon and Washington outer coast waters, and (3) inland waters of Washington. An unknown number of harbor seals also occur along the west coast of Baja California, at least as far south as Isla Asuncion, which is about 100 miles south of Punta Eugenia. Animals along Baja California are not considered to be a part of the California stock because it is not known if there is any demographically significant movement of harbor seals between California and Mexico and there is no international agreement for joint management of harbor seals. Harbor seal presence at haul-out sites is seasonal with peaks in abundance during their pupping and molting periods. Pupping and molting periods are first observed to the south and progress northward up the coast with time (*e.g.,* January to May near San Diego, April to June in Oregon and Washington) (Jeffries, 1984; Jeffries, 1985; Huber *et al.,* 2001; Hanan, 2004; Hanan & Associates, 2011).

In California, approximately 400 to 600 harbor seal haul-out sites are distributed along the mainland coast and on offshore islands, including intertidal sandbars and ledges, rocky shores and islets, and beaches (Harvey *et al.,* 1995; Hanan, 1996; Lowry *et al.,* 2008). Preferred haul-out sites are those that are protected from the wind and waves, and allow access to deep water for foraging (Perrin *et al.,* 2008). Of the known haul-out sites, 14 locations are rookeries (2 locations have multiple sites, for a total of 17 sites) on or near the mainland of California. The population of harbor seals has grown off the U.S. west coast and has led to new haul-out sites being used in California (Hanan, 1996). Harbor seals are one of the most common and frequently observed marine mammals along the coastal environment.

Harbor seals have been observed hauling-out and documented giving birth at the Children's Pool since the 1990's (Yochem and Stewart, 1998; Hanan & Associates, 2004). Pacific harbor seals haul-out year-round on beaches and rocks (*i.e.,* breakwater ledge/rocks haul-out area, reef haul-out area, and Casa Beach haul-out area) below the lifeguard tower at Children's Pool. According to Yochem (2005), the Children's Pool beach site is used by harbor seals at all hours of the day and at all tides with the exception of occasional high tide/high swell events in which the entire beach is awash. It is one of the three known haul-out sites for this species in San Diego County. These animals have been observed in this area moving to/from the Children's Pool, exchanging with the rocky reef directly west of and adjacent to the breakwater and with Seal Rock, which is about 150 m (492 ft) west of the Children's Pool. Harbor seals have also been reported on the sandy beach just southwest of the Children's Pool. At low tide, additional space for hauling-out is available on the rocky reef areas outside the retaining wall and on beaches immediately southward. Haul-out times vary by time of year, from less than an hour to many hours. There have been no foraging studies at this site, but harbor seals have been observed in nearshore waters and kelp beds nearby, including La Jolla Cove.

The Children's Pool area is the only rookery in San Diego County and the only mainland rookery on the U.S. west coast between the border of Mexico and Point Mugu in Ventura County, CA (321.9 km [200 miles]). The number of harbor seals in this area has increased since 1979, and seals are documented to give birth on these beaches during December through May (Hanan, 2004; Hanan & Associates, 2011). The official start to pupping season is December 15. Females in an advanced stage of pregnancy begin to show up on the Children's Pool beach by late October to early November. Several studies have identified harbor seal behavior and estimated harbor seal numbers including patterns of daily and seasonal area use (Yochem and Stewart, 1998; Hanan & Associates, 2011; Linder, 2011). Males, females, and pups (in season) of all ages and stages of development are observed at the Children's Pool and adjacent areas.

In southern California, a considerable amount of information is known about the movements and ecology of harbor seals, but population structure in the region is not as well known (Stewart and Yochem, 1994, 2000; Keper *et al.,* 2005; Hanan & Associates, 2011). Linder (2011) suggests that this population moves along the California coast and the beach at Children's Pool is part of a ''regional network of interconnected'' haul-out and pupping sites. Harbor seals often haul-out in protected bays, inlets, and beaches (Reeves *et al.,* 1992). At and near the Children's Pool, harbor seals haul-out on the sand, rocks, and breakwater base in numbers of 0 to 15 harbor seals to a maximum of about 150 to 250 harbor seals depending on the time of day, season, and weather conditions (Hanan, 2004, Hanan & Associates, 2011; Linder, 2011). Because space is limited behind the breakwater at the Children's Pool, Linder (2011) predicted that it is unlikely that numbers will exceed 250 harbor seals. Based on monitoring from a camera, Western Alliance for Nature (WAN) reported that during the month of May 2013 up to 302 harbor seals were documented resting on the Children's Pool beach at any given time, with additional harbor seals on the rocks and in the water (Wan, personal communication). Almost every day, except for weekends, over 250 individual harbor seals were present on the beach. During the months of September 2012 to January 2013, the average number of harbor seals on the beach varied from 83 to 120 animals before people entered the beach or when people were behind the rope. During this same period, when people were on the beach and/or across the rope, the average number of harbor seals varied from 7 to 27. The City of San Diego observed 12 counts totaling more than 200 and a maximum of 238 animals during the 2014 to 2015 construction window. The weather (*i.e.,* wind and/or rain) and the proximity of humans to the beach likely affect the presence of harbor seals on the beach.

Radio-tagging and photographic studies have revealed that only a portion of seals utilizing a hauling-out site are present at any specific moment or day (Hanan, 1996, 2005; Gilbert *et al.,* 2005; Harvey and Goley, 2011; and Linder, 2011). These radio-tagging studies indicate that harbor seals in Santa Barbara County haul-out about 70 to 90% of the days annually (Hanan, 1996). The City of San Diego expects harbor seals to behave similarly at the Children's Pool. Tagged and branded harbor seals from other haul-out sites have been observed by Dr. Hanan at the Children's Pool. For example, harbor seals with red-stained heads and coats, which are typical of some harbor seals in San Francisco Bay have been observed at Children's Pool, indicating that seals tagged at other locations and haul-out sites visit the site. A few seals have been tagged at the Children's Pool and there are no reports of these tagged animals at other sites (probably because of very low re-sighting efforts and a small sample size [10 individuals radio-tagged]), which may indicate a degree of site-fidelity (Yochem and Stewart, 1998). These studies further indicate that seals are constantly moving along the coast including to/from the offshore islands and that there may be as many as 600 individual harbor seals using Children's Pool during a year, but certainly not all at one time.

The City of San Diego has fitted a polynomial curve to the number of expected harbor seals hauling-out at the Children's Pool by month (see Figure 1 of the IHA application and Figure 2 below) based on counts at the Children's Pool by Hanan (2004), Hanan & Associates (2011), Yochem and Stewart (1998), and the Children's Pool docents (Hanan, 2004). A three percent annual growth rate of the population was applied to Yochem and Stewart (1998) counts to normalize them to Hanan & Associates and docent counts in 2003 to 2004. Based on monitoring during 2013 to 2014, Dr. Hanan estimates that similar numbers of harbor seals hauling-out at Children's Pool during 2011 and will expect similar numbers in 2015 to 2016.

A complete count of all harbor seals in California is impossible because some are always away from the haul-out sites. A complete pup count (as is done for other pinnipeds in California) is also not possible because harbor seals are precocial, with pups entering the water almost immediately after birth. Population size is estimated by counting the number of seals ashore during the peak haul-out period (May to July) and by multiplying this count by a correction factor equal to the inverse of the estimated fraction of seals on land. Based on the most recent harbor seal counts (2009) and including a revised correction factor, the estimated population of harbor seals in California is 30,196 individuals (NMFS, 2011), with an estimated minimum population of 26,667 for the California stock of harbor seals. Counts of harbor seals in California increased from 1981 to 2004. The harbor seal is not listed under the ESA and the California stock is not considered depleted or strategic under the MMPA (Carretta *et al.,* 2010).

California Sea Lion

The California sea lion is a full species, separate from the Galapagos sea lion (*Zalophus wollebaeki*) and the extinct Japanese sea lion (*Zalophus japonicus*) (Brunner, 2003; Wolf *et al.,* 2007; Schramm *et al.,* 2009). This species of sea lion is found from southern Mexico to southwestern Canada. The breeding areas of the California sea lion are on islands located in southern California, western Baja California, and the Gulf of California. A genetic analysis of California sea lions identified five genetically distinct geographic populations: (1) Pacific Temperate, (2) Pacific Subtropical, (3) Southern Gulf of California, (4) Central Gulf of California, and (5) Northern Gulf of California (Schramm *et al.,* 2009). In that study, the Pacific Temperate population included rookeries within U.S. waters and the Coronados Islands just south of U.S./Mexico border. Animals from the Pacific Temperate population range north into Canadian waters, and movement of animals between U.S. waters and Baja California waters has been documented, though the distance between the major U.S. and Baja California rookeries is at least 740.8 km (400 nmi). Males from western Baja California rookeries may spend most of the year in the United States.

The entire California sea lion population cannot be counted because all age and sex classes are never ashore at the same time. In lieu of counting all sea lions, pups are counted during the breeding season (because this is the only age class that is ashore in its entirety), and the numbers of births is estimated from the pup count. The size of the population is then estimated from the number of births and the proportion of pups in the population. Censuses are conducted in July after all pups have been born. There are no rookeries at or near the Children's Pool, although in the past two years births have been reported at La Jolla Cove (about 0.75 km [0.47 miles] east of Children's Pool). Population estimates for the U.S. stock of California sea lions range from a minimum of 153,337 to an average estimate of 296,750 animals. They are considered to be at carrying capacity of the environment. The California sea lion is not listed under the ESA and the U.S. stock is not considered depleted or strategic under the MMPA.

Northern Elephant Seal

Northern elephant seals breed and give birth in California (U.S.) and Baja California (Mexico), primarily on offshore islands (Stewart *et al.,* 1994) from December to March (Stewart and Huber, 1993). Spatial segregation in foraging areas between males and females is evident from satellite tag data (Le Beouf *et al.,* 2000). Males migrate to the Gulf of Alaska and western Aleutian Islands along the continental shelf to feed on benthic prey, while females migrate to pelagic areas in the Gulf of Alaska and the central North Pacific to feed on pelagic prey (Le Beouf *et al.,* 2000). Adults return to land between March and August to molt, with males returning later than females. Adults return to their feeding areas again between their spring/summer molting and their winter breeding seasons.

Populations of northern elephant seals in the U.S. and Mexico have recovered after being nearly hunted to extinction (Stewart *et al.,* 1994). Northern elephant seals underwent a severe population bottleneck and loss of genetic diversity when the population was reduced to an estimated 10 to 30 individuals (Hoelzel *et al.,* 2002). However, movement and genetic exchange continues between rookeries when they start breeding (Huber *et al.,* 1991). The California breeding population is now demographically isolated from the Baja California population. The California breeding population is considered in NMFS's stock assessment report to be a separate stock.

A complete population count of elephant seals is not possible because all age classes are not ashore simultaneously. Elephant seal population size is typically estimated by counting the number of pups produced and multiplying by the inverse of the expected ratio of pups to total animals (McCann, 1985). Based on counts of elephant seals at U.S. rookeries in 2010, Lowry *et al.* (2014) reported that 40,684 pups were born. Lowry *et al.* (2014) applied a multiplier of 4.4 to extrapolate from total pup counts to a population estimate of approximately 179,000 elephant seals. This multiplier is derived from life tables based on published elephant seal fecundity and survival rates, and reflects a population with approximately 23% pups (Cooper and Stewart, 1983; Le Boeuf and Reiter, 1988; Hindell 1991; Huber *et al.,* 1991; Reiter and Le Boeuf, 1991; Clinton and Le Boeuf, 1993; Le Boeuf *et al.,* 1994; Pistorius and Bester, 2002; McMahon et al., 2003; Pistorius *et al.,* 2004; Condit *et al.,* 2014). The minimum population size for northern elephant seals in 2010 can be estimated very conservatively as 81,368, which is equal to twice the observed pup count (to account for the pups and their mothers). The population is reported to have grown at 3.8% annually since 1988 (Lowry *et al.,* 2014). Northern elephant seals are not listed under the ESA and are not considered as depleted or a strategic stock under the MMPA.

Further information on the biology and local distribution of these marine mammal species and others in the region can be found in the City of San Diego's IHA application, which is available upon request (see **ADDRESSES**), and the NMFS Marine Mammal Stock Assessment Reports, which are available online at: *http://www.nmfs.noaa.gov/pr/sars/*.

Potential Effects of the Specified Activity on Marine Mammals

This section includes a summary and discussion of the ways that the types of stressors associated with the planned specified activity (*e.g.,* construction equipment and activities) have been observed to impact marine mammals. This discussion may also include reactions that we consider to rise to the level of a take and those that we do not consider to rise to the level of take (for example, with acoustics), we may include a discussion of studies that showed animals not reacting at all to sound or exhibiting barely measureable avoidance). This section is intended as a background of potential effects and does not consider either the specific manner in which this activity will be carried out or the mitigation that will be implemented, or how either of those will shape the anticipated impacts from this specific activity. The ''Estimated Take by Incidental Harassment'' section later in this document will include a quantitative analysis of the number of individuals that are expected to be taken by this activity. The ''Negligible Impact Analysis'' section will include the analysis of how this specific activity will impact marine mammals and will consider the content of this section, the ''Estimated Take by Incidental Harassment'' section, the ''Mitigation'' section, and the ''Anticipated Effects on Marine Mammal Habitat'' section to draw conclusions regarding the likely impacts of this activity on the reproductive success or survivorship of individuals and from that on the affected marine mammal populations or stocks.

When considering the influence of various kinds of sound on the marine environment, it is necessary to understand that different kinds of marine life are sensitive to different frequencies of sound. Based on available behavioral data, audiograms have been derived using auditory evoked potentials, anatomical modeling, and other data, Southall *et al.* (2007) designate ''functional hearing groups'' for marine mammals and estimate the lower and upper frequencies of functional hearing of the groups. The functional groups and the associated frequencies are indicated below (though animals are less sensitive to sounds at the outer edge of their functional range and most sensitive to sounds of frequencies within a smaller range somewhere in the middle of their functional hearing range):

- Low-frequency cetaceans (13 species of mysticetes): functional hearing is estimated to occur between approximately 7 Hz and 30 kHz;
- Mid-frequency cetaceans (32 species of dolphins, six species of larger toothed whales, and 19 species of beaked and bottlenose whales): functional hearing is estimated to occur between approximately 150 Hz and 160 kHz;
- High-frequency cetaceans (eight species of true porpoises, six species of river dolphins, *Kogia* spp., the franciscana (*Pontoporia blainvillei*), and four species of cephalorhynchids): functional hearing is estimated to occur between approximately 200 Hz and 180 kHz; and
- Phocid pinnipeds in water: functional hearing is estimated to occur between approximately 75 Hz and 100 kHz;

• Otariid pinnipeds in water: functional hearing is estimated to occur between approximately 100 Hz and 40 kHz.

As mentioned previously in this document, 3 marine mammal species (0 cetacean and 3 pinniped species) are likely to occur in the planned action area. Of the 3 pinniped species likely to occur in the City of San Diego's planned action area, 2 are classified as phocid pinnipeds (*i.e.,* Pacific harbor seal and northern elephant seal) and, 1 is classified as an otariid pinniped (*i.e.,* California sea lion) (Southall *et al.,* 2007). The City of San Diego requests authorization for Level B harassment of these 3 species of marine mammals (*i.e.,* Pacific harbor seals, California sea lions, and northern elephant seals) incidental to the use of equipment and its propagation of in-air noise from various acoustic mechanisms associated with the construction activities of the Children's Pool Lifeguard Station at La Jolla, CA discussed above. NMFS considers a species' functional hearing group when we analyze the effects of exposure to sound on marine mammals.

The notice of the proposed IHA (79 FR 8160, February 11, 2014) included a discussion of the effects of in-air sounds from construction activities on pinnipeds, which included tolerance, behavioral disturbance, and hearing impairment. NMFS refers readers to the City of San Diego's IHA application and NMFS's EA for additional information on the behavioral reactions (or lack thereof) by all types of marine mammals to high levels of in-air sounds.

The potential effects to marine mammals described in this section of the document generally do not take into consideration the monitoring and mitigation measures described later in this document (see the ''Mitigation'' and ''Monitoring and Reporting'' sections), which are designed to effect the least practicable impact on affected marine mammal species or stocks.

Anticipated Effects on Marine Mammal Habitat

The rocks and beaches at or near the Children's Pool in La Jolla, CA, are almost exclusively Pacific harbor seal hauling-out sites. Harbor seals have been observed hauling-out and documented giving birth at the Children's Pool since the 1990's (Yochem and Stewart, 1998; Hanan & Associates, 2004). It is one of the three known haul-out sites for this species in San Diego County and is the only rookery in San Diego County and the only mainland rookery on the U.S. west coast between the border of Mexico and Point Mugu in Ventura County, CA. More information on this population of Pacific harbor seals can be found in the ''Description of Marine Mammals in the Specified Geographic Area of the Specified Activity.''

The primary anticipated adverse impacts upon habitat consist of temporary changes to the in-air acoustic environment, as detailed in the notice of the proposed IHA (79 FR 8160, February 11, 2014). These changes are minor, temporary, and limited in duration to the period of the construction activities. The temporary impacts on the acoustic environment are not expected to have any permanent effects on the species or stock populations of marine mammals occurring at the Children's Pool.

All construction activities are beyond or outside the habitat areas where harbor seals and other pinnipeds are found. Visual barriers will be erected to shield construction activities from the visual perception and potentially dampen acoustic effects on pinnipeds. Because the public occasionally harasses the harbor seals with various activities, the NMFS-qualified PSO monitoring the site will make observations and attempt to distinguish and attribute any observed harassment to the public or to the construction activities and give all details in the observation report. If any short-term, temporary impacts to habitat due to sounds or visual presence of equipment and workers did occur, the City of San Diego will expect pinniped behavior to return to pre-construction conditions soon after the activities are completed, which is anticipated to occur before the next pupping season (Hanan & Associates, 2011).

The area of habitat affected is small and the effects are localized and temporary; thus there is no reason to expect any significant reduction in habitat available for foraging and other habitat uses. No aspect of the project is anticipated to have any permanent effect on the location or use of pinniped haul-outs or related habitat features in the area (Hanan & Associates, 2011). Further, the site is already very disturbed by member of the public who come to the area during the day and night to view the pinnipeds. The City of San Diego and NMFS do not project any loss or modification of physical habitat for these species. Any potential temporary loss or modification of habitat due to in-air noise or visual presence of equipment and workers during the construction activities is expected by the City of San Diego and NMFS to be quickly restored after construction activities end and all equipment and barriers are removed.

For these reasons, NMFS anticipates that the action will result in no impacts to marine mammal habitat beyond rendering the areas immediately around the Children's Pool less desirable during construction activities.

Mitigation

In order to issue an Incidental Take Authorization (ITA) under section 101(a)(5)(D) of the MMPA, NMFS must prescribe, where applicable, the permissible methods of taking pursuant to such activity, and other means of effecting the least practicable impact on such species or stock and its habitat, paying particular attention to rookeries, mating grounds, and areas of similar significance, and on the availability of such species or stock for taking for certain subsistence uses (where relevant).

The City of San Diego has established the Children's Pool as a shared beach for pinnipeds and people (except during pupping season when the beach has been closed to the public). In the past, during the pupping season, a rope was placed along the upper part of the beach with signage to inform and designate how close people can come to the haul-out area and the pinnipeds. The timeframe for the rope has been extended so that it is now present year-round. The construction activities are planned to occur outside the harbor seal pupping and weaning periods.

The City of San Diego will implement the following mitigation measures to help ensure the least practicable impact on marine mammals:

(1) Prohibition of construction during pupping season;

(2) Daily construction timing;

(3) Construction of visual and acoustic barriers;

(4) Use of Protected Species Observers;

(5) Establishment of buffer zones; and

(6) Potential abandonment survey.

Visual and acoustic barriers were constructed in 2013 to mitigate the effects of the construction activities. The visual and acoustic barriers were constructed of plywood, 1.2 to 2.4 m (4 to 8 ft) tall stood on end and held up by wood posts. The sheets of plywood were stood upright and held up with two wooden two by fours hinged to the top of the frame, so they could be collapsed and moved depending on the location and need for access by demolition and construction equipment. The barriers were placed at the site with input from NMFS Southwest Regional Office (SWRO) personnel so that they will hide as advantageously as possible the construction activities that may be seen by pinnipeds. The barriers appear to dampen the acoustic sound sources, but do not prevent sound from permeating the environment. The barriers also appear to hide and reduce visual cues that may stimulate behavioral reactions from the pinnipeds on the beach below. As the site is a beach with construction along the cliff and on flat areas above the cliff, a complete barrier cannot be constructed to hide all construction activities for the project. Once the walls of the lifeguard station's building are in place, much of the construction activities will take place above the Children's Pool beach (*i.e.,* out of sight) as well as inside the building (*i.e.,* a visual and partial sound barrier). There will be no activities in the ocean or closer to the water's edge and since harbor seals mate underwater in the ocean, there will be no impacts on mating activities. California sea lions and northern elephant seals are such infrequent users of this area and their rookeries are so far away (at least 104.6 km [65 miles] at offshore islands) that there will be no adverse impact on these species.

As part of the public comment process for the issuance of the previous 2013 IHA, NMFS modified several of the monitoring and mitigation measures included in the proposed IHA (78 FR 25958, May 3, 2013) for practicability reasons, and also included several additional measures in the final IHA (78 FR 40705, July 8, 2013). These included changing the pupping season from December 15th to May 15th and prohibiting construction activities during this time; extending construction activities from 7:00 a.m. to 7:00 p.m. to help assure that more work will be completed during the 2013 construction window; continuing monitoring for 60 days following the end of construction activities; and triggering a shut-down of construction activities in the unexpected event of abandonment of the Children's Pool site. The mitigation measure on scheduling the heaviest construction activities (with the highest sound levels) during the annual period of lowest haul-out occurrence (October to November) was originally included in the City of San Diego's Mitigated Negative Declaration when it was anticipated that the City of San Diego would obtain an IHA in the summer of 2012 and begin demolition and construction activities in the fall of 2012. This requirement has been removed because it is no longer practicable due to logistics, scheduling and to allow the planned activities to be completed before the next pupping season.

The activities planned by the applicant includes a variety of measures calculated to minimize potential impacts on marine mammals, including:

Prohibition of Construction During Pupping Season

Construction shall be prohibited during the Pacific harbor seal pupping season (December 15th to May 15th) and for an additional two weeks thereafter to accommodate lactation and weaning of late season pups. Thus, construction shall be prohibited from December 15th to June 1st.

Daily Construction Timing

Construction activities shall be scheduled, to the maximum extent practicable, during the daily period of lowest haul-out occurrence, from approximately 8:30 a.m. to 3:30 p.m. However, construction activities may be extended from 7 a.m. to 7 p.m. to help assure that the project can be completed during the 2015 construction window. Harbor seals typically have the highest daily or hourly haul-out period during the afternoon from 3 p.m. to 6 p.m.

Construction of Visual and Acoustic Barriers

A visual and acoustic barrier will be erected and maintained for the duration of the project to shield construction activities from beach view. The temporary barrier shall consist of 1/2 to 3/4 inch (1.3 to 1.9 centimeters [cm]) plywood constructed 1.8 to 2.4 m (6 to 8 ft) high depending on the location. The City of San Diego does not believe that a complete barrier can be constructed to hide all of the construction activities. Once the walls of the lifeguard station building are in place, much of the construction activities will take place on the bluff above the beach (thus out of sight) and inside the building, which will provide a visual and partial sound barrier.

Protected Species Observers

Trained PSOs will be used to detect, document, and minimize impacts (*i.e.,* possible shut-down of noise-generating operations [turning off the equipment so that in-air sounds associated with construction no longer exceed levels that are potentially harmful to marine mammals]) to marine mammals. More information about this measure is contained in the ''Monitoring'' section (below).

Establishment of Buffer Zones

The City of San Diego shall establish buffer zones (*i.e.,* where sound pressure levels are at or above 90 dB re 20 μPa for harbor seals and/or at or above 100 dB re 20 μPa for all pinniped species except harbor seals [for in-air noise]) around the construction activities so that in-air sounds associated with the construction activities no longer exceed levels that are potentially harmful to marine mammals.

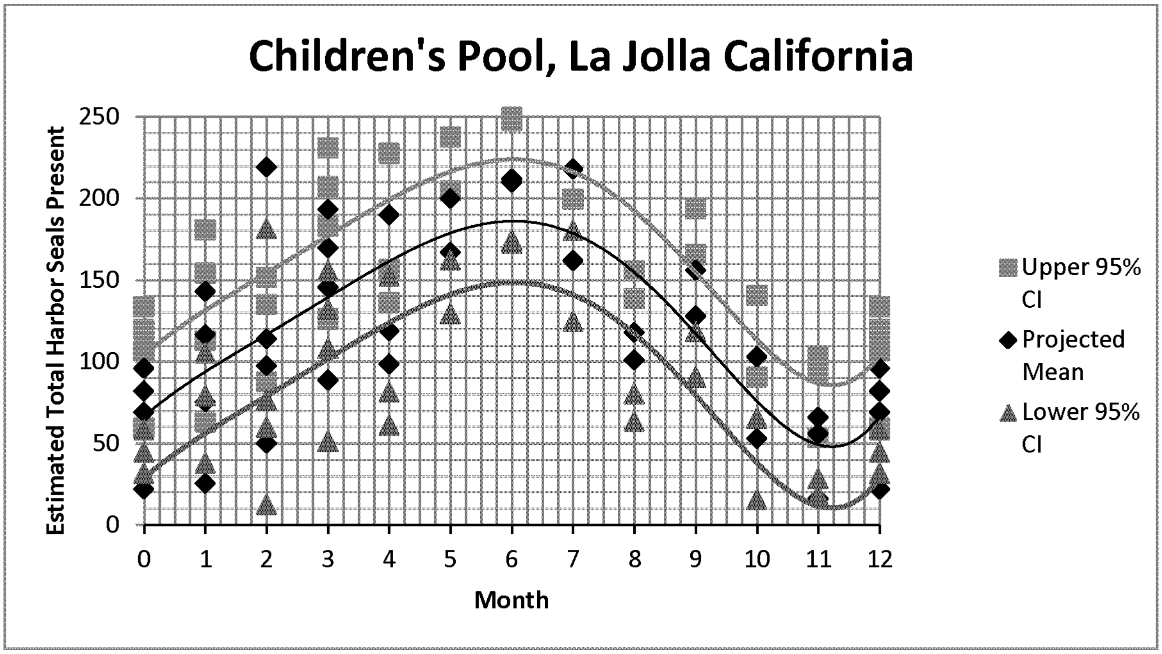
Timing Constraints for In-Air Noise

To minimize in-air noise impacts on marine mammals, construction activities shall be limited to the period when the species of concern will be least likely to be in the project area. The construction window for construction activities shall be from June 1 to December 15, 2015. The IHA may extend to June 1 through June 27, 2016 to finish the construction activities if needed. Avoiding periods when the highest number of marine mammal individuals are in the action area is another mitigation measure to protect marine mammals from the construction activities.

Potential Abandonment Survey

After the first two months of monitoring during construction activities, the City of San Diego will take the mean number of observed harbor seals at the Children's Pool in a 24-hour period across that two months and compare it to the mean of the lower 95 percent confidence interval in Figure 1 (see below). If the observed mean is lower, the City of San Diego will shut-down construction activities and work with NMFS and other harbor seal experts (*e.g.,* Mark Lowry, Dr. Sarah Allen, Dr. Pamela Yochem, and/or Dr. Brent Stewart) to develop and implement a revised mitigation plan to further reduce the number of takes and potential impacts. Once a week every week thereafter, the City of San Diego will take the same mean of observed harbor seals across the previous three tide cycles (a tide cycle is approximately 2 weeks) and compare it to the 95% lower confidence interval in Figure 1 for the same time period. If the observed mean is lower, the City of San Diego will shut-down and take the action described above. If abandonment of the site is likely, monitoring will be expanded away from the Children's Pool to determine if animals have been temporarily displaced to known haul-out sites in the southern California area (*e.g.,* north end of Torrey Pines, cave on the exposed ocean side of Point Loma, etc.). For the purpose of this action, NMFS will consider the Children's Pool site to possibly be abandoned if zero harbor seals are present each day during the daytime and nighttime hours for at least three tide cycles (a tide cycle is approximately 2 weeks), but this cannot be confirmed until observations continue to be zero during a full pupping and molting season.

Figure 1. Estimated total harbor seals by month based on counts at the site by Hanan & Associates, Yochem and Stewart, and Children's Pool docents. The polynomial curve fits to counts by months, which includes the projected mean as well as the upper 95% and lower 95% confidence intervals, was used to estimate harbor seals expected to be hauled-out by day.



More information regarding the City of San Diego's monitoring and mitigation measures for the planned construction activities at the Children's Pool Lifeguard Station can be found in the IHA application.

Mitigation Conclusions

NMFS has carefully evaluated the applicant's mitigation measures and considered a range of other measures in the context of ensuring that NMFS prescribes the means of effecting the least practicable impact on the affected marine mammal species and stocks and their habitat. NMFS's evaluation of potential measures included consideration of the following factors in relation to one another:

- The manner in which, and the degree to which, the successful implementation of the measure is expected to minimize adverse impacts to marine mammals;
- The proven or likely efficacy of the specific measure to minimize adverse impacts as planned; and
- The practicability of the measure for applicant implementation, including consideration of personnel safety, practicality of implementation, and impact on the effectiveness of the activity.

Any mitigation measure(s) prescribed by NMFS should be able to accomplish, have a reasonable likelihood of accomplishing (based on current science), or contribute to the accomplishment of one or more of the general goals listed below:

(1) Avoidance or minimization of injury or death of marine mammals wherever possible (goals 2, 3, and 4 may contribute to this goal).

(2) A reduction in the numbers of marine mammals (total number or number at biologically important time or location) exposed to received levels from construction equipment, or other activities expected to result in the take of marine mammals (this goal may contribute to 1, above, or to reducing harassment takes only).

(3) A reduction in the number of times (total number or number at biologically important time or location) individuals would be exposed to received levels from construction equipment, or other activities expected to result in the take of marine mammals (this goal may contribute to 1, above, or to reducing harassment takes only).

(4) A reduction in the intensity of exposures (either total number or number at biologically important time or location) to received levels from construction equipment, or other activities expected to result in the take of marine mammals (this goal may contribute to a, above, or to reducing the severity of harassment takes only).

(5) Avoidance of minimization of adverse effects to marine mammal habitat, paying special attention to the food base, activities that block or limit passage to or from biologically important areas, permanent destruction of habitat, or temporary destruction/ disturbance of habitat during a biologically important time.

(6) For monitoring directly related to mitigation—an increase in the probability of detecting marine mammals, thus allowing for more effective implementation of the mitigation.

Based on NMFS's evaluation of the applicant's measures, as well as other measures considered by NMFS or recommended by the public, NMFS has determined that the mitigation measures provide the means of effecting the least practicable impact on marine mammal species or stocks and their habitat, paying particular attention to rookeries, mating grounds, and areas of similar significance.

Monitoring and Reporting

In order to issue an ITA for an activity, section 101(a)(5)(D) of the MMPA states that NMFS must, where applicable, set forth ''requirements pertaining to the monitoring and reporting of such taking.'' The MMPA implementing regulations at 50 CFR 216.104 (a)(13) require that requests for ITAs include the suggested means of accomplishing the necessary monitoring and reporting that will result in increased knowledge of the species and of the level of taking or impacts on populations of marine mammals that are expected to be present in the action area.

Monitoring measures prescribed by NMFS should accomplish one or more of the following general goals:

(1) An increase in the probability of detecting marine mammals, both within the mitigation zone (thus allowing for more effective implementation of the mitigation) and in general to generate more data to contribute to the analyses mentioned below;

(2) An increase in our understanding of how many marine mammals are likely to be exposed to levels from construction equipment that we associate with specific adverse effects, such as behavioral harassment, TTS or PTS;

(3) An increase in our understanding of how marine mammals respond to stimuli expected to result in take and how anticipated adverse effects on individuals (in different ways and to varying degrees) may impact the population, species, or stock (specifically through effects on annual rates of recruitment or survival) through any of the following methods:

• Behavioral observations in the presence of stimuli compared to observations in the absence of stimuli (need to be able to accurately predict received level, distance from source, and other pertinent information);

• Physiological measurements in the presence of stimuli compared to observations in the absence of stimuli (need to be able to accurately predict receive level, distance from the source, and other pertinent information);

• Distribution and/or abundance comparisons in times or areas with concentrated stimuli versus times or areas without stimuli;

(4) An increased knowledge of the affected species; and

(5) An increase in our understanding of the effectiveness of certain mitigation and monitoring measures.

Monitoring

The City of San Diego has developed a monitoring plan (see Appendix I, Mitigated Negative Declaration in the IHA application) based on discussions between the project biologist, Dr. Doyle Hanan, and NMFS biologists. The plan has been vetted by City of San Diego planners and reviewers. The plan has been formally presented to the public for review and comment. The City of San Diego has responded in writing and in public testimony (see City of San Diego Council Hearing, December 14, 2011) to all public concerns.

The monitoring plan involves surveying prior to construction activities, monitoring during construction activities by NMFS-approved PSOs with high-resolution binoculars and handheld digital sound level meters (measuring devices in the 30 to 130 dB re 20 μPa range), and post-construction monitoring. The City of San Diego would include sound measurements at and near the construction site in their initial survey prior to the activities as a background and baseline for the project. While no specific acoustic study is planned, the City of San Diego's Mitigated Negative Declaration states that marine mammal monitoring shall be conducted for three to five days prior to construction and shall include hourly systematic counts of pinnipeds using the beach, Seal Rock, and associated reef areas. Monitoring three to five days prior to construction will provide baseline data regarding recent haul-out behavior and patterns as well as background noise levels near the time of the construction activities.

During the construction activities, monitoring shall assess behavior and potential behavioral responses to construction noise and activities. PSOs would observe the construction activities from a station along the breakwater wall and from the base of the cliff below the construction area. PSOs would be on site approximately 30 minutes before the start of construction activities and would remain on site until 30 minutes after activities have ceased. Visual digital recordings and photographs shall be used to document individuals and behavioral responses to construction. The City of San Diego (*i.e.,* PSOs) plans to make hourly counts of the number of pinnipeds present and record sound or visual events that result in behavioral responses and changes, whether during construction or from public stimuli. During these events, pictures and video will also be taken when possible. The ''Mitigated Negative Declaration'' states ''monitoring shall assess behavior and potential behavioral responses to construction noise and activities. Visual digital recordings and photographs shall be used to document individuals and behavioral responses to construction.''

Monitors will have authority to stop construction as necessary depending on sound levels, pinniped presence, and distance from sound sources. Daily monitoring reports would be maintained for periodic summary reports to the City of San Diego and to NMFS. Observations would be entered into and maintained on Hanan & Associates computers. The City of San Diego plans to follow the reporting requirements in the Mitigated Negative Declaration, which states that ''the biologist shall document field activity via the Consultant Site Visit Record. The Consultant Site Visit Record shall be either emailed or faxed to the City of San Diego's Mitigation Monitoring Coordination process (MMC) on the 1st day of monitoring, the 1st week of each month, the last day of monitoring, and immediately in the case of any undocumented discovery. The project biologist shall submit a final construction monitoring report to MMC within 30 days of construction completion.'' The MMC ''coordinates the monitoring of development projects and requires that changes are approved and implemented to be in conformance with the permit requirements and to minimize any damage to the environment.'' These documents will also be sent to NMFS. Finally, the City of San Diego has modified its monitoring program to include 60 days of monitoring post-construction activities. Following construction, the City of San Diego would have a program of onsite PSOs that would randomly select a day per week to monitor.

NMFS notes that the WAN's La Jolla Harbor Seal Webcam was attached to the old (now demolished) lifeguard station and is no longer available online (*http://www.wanconservancy.org/la_jolla_harbor_seal_earthcam.htm*). The City of San Diego has stated that there is no suitable place to mount the camera at the construction site. Therefore, the City of San Diego cannot do periodic checks using the webcam for monitoring purposes as required by the 2013 IHA. However, the camera was not expected to replace NMFS-qualified PSOs at the site making accurate counts, measuring sound levels and observing the public and the construction, as well as the harbor seals. In the old camera view, a person may have been able to see visual evidence of Level B harassment but probably would not have been able to distinguish between harassment from construction activities and harassment from the public since the camera had a limited scope and only showed the Children's Pool beach and pinnipeds (usually a specific portion of the beach, but not the reef nor nearby beaches).

Consistent with NMFS procedures, the following marine mammal monitoring and reporting shall be performed for the action:

(1) The PSO shall be approved by NMFS prior to construction activities.

(2) The NMFS-approved PSO shall attend the project site prior to, during, and after construction activities cease each day throughout the construction window.

(3) The PSO shall search for marine mammals within the Children's Pool area.

(4) The PSO shall be present during construction activities to observe for the presence of marine mammals in the vicinity of the specified activity. All such activity would occur during daylight hours (*i.e.,* 30 minutes after sunrise and 30 minutes before sunset). If inclement weather limits visibility within the area of effect, the PSO would perform visual scans to the extent conditions allow.

(5) If marine mammals are sighted by the PSO within the acoustic threshold areas, the PSO shall record the number of marine mammals within the area of effect and the duration of their presence while the noise-generating activity is occurring. The PSO would also note whether the marine mammals appeared to respond to the noise and, if so, the nature of that response. The PSO shall record the following information: date and time of initial sighting, tidal stage, weather conditions, Beaufort sea state, species, behavior (activity, group cohesiveness, direction and speed of travel, etc.), number, group composition, distance to sound source, number of animals impacted, construction activities occurring at time of sighting, and monitoring and mitigation measures implemented (or not implemented). The observations would be reported to NMFS.

(6) A final report will be submitted summarizing all in-air acoustic effects from construction activities and marine mammal monitoring during the time of the authorization, and any long term impacts from the project.

A written log of dates and times of monitoring activity will be kept. The log shall report the following information:

- Time of observer arrival on site;
- Time of the commencement of in-air noise generating activities, and description of the activities;
- Distances to all marine mammals relative to the sound source;
- Distances from the sound meter to each sound-producing activity when conducting sound measurements;
- For harbor seal observations, notes on seal behavior during noise-generating activity, as described above, and on the number and distribution of seals observed in the project vicinity;
- For observations of all marine mammals other than harbor seals, the time and duration of each animal's presence in the project vicinity; the number of animals observed; the behavior of each animal, including any response to noise-generating activities;
- Time of the cessation of in-air noise generating activities; and
- Time of observer departure from site.

All monitoring data collected during construction would be included in the biological monitoring notes to be submitted. A final report summarizing the construction monitoring and any general trends observed will also be submitted to NMFS within 90 days after monitoring has ended during the period of the lifeguard station construction.

Reporting

The City of San Diego will notify NMFS Headquarters and the NMFS Southwest Regional Office prior to initiation of the construction activities. A draft final report must be submitted to NMFS within 90 days after the conclusion of the construction activities of the Children's Pool Lifeguard Station. The report would include a summary of the information gathered pursuant to the monitoring requirements set forth in the IHA, including dates and times of operations and all marine mammal sightings (dates, times, locations, species, behavioral observations [activity, group cohesiveness, direction and speed of travel, etc.], tidal stage, weather conditions, Beaufort sea state and wind force, associated construction activities). A final report must be submitted to the Regional Administrator within 30 days after receiving comments from NMFS on the draft final report. If no comments are received from NMFS, the draft final report would be considered to be the final report.

While the IHA does not authorize injury (*i.e.,* Level A harassment), serious injury, or mortality, should the applicant, contractor, monitor or any other individual associated with the construction project observe an injured or dead marine mammal, the incident (regardless of cause) will be reported to NMFS as soon as practicable. The report should include species or description of animal, condition of animal, location, time first found, observed behaviors (if alive) and photo or video, if available.

In the unanticipated event that the City of San Diego discovers a live stranded marine mammal (sick and/or injured) at Children's Pool, they shall immediately contact Sea World's stranded animal hotline at 1–800–541–7235. Sea World shall also be notified if a dead stranded pinniped is found so that a necropsy can be performed. In all cases, NMFS shall be notified as well, but for immediate response purposes, Sea World shall be contacted first.

Reporting Prohibited Take—In the unanticipated event that the specified activity clearly causes the take of a marine mammal in a manner prohibited by this IHA, such as an injury (Level A harassment), serious injury, or mortality, the City of San Diego shall immediately cease the specified activities and immediately report the incident to the Chief of the Permits and Conservation Division, Office of Protected Resources, NMFS, at 301–427–8401 and/or by email to *Jolie.Harrison@noaa.gov, Howard.Goldstein@noaa.gov,* and the West Coast Regional Stranding Coordinator (562–980–3230). The report must include the following information:

- Time, date, and location (latitude/longitude) of the incident;
- The type of activity involved;
- Description of the circumstances during and leading up to the incident;
- Status of all sound source use in the 24 hours preceding the incident; water depth; environmental conditions (*e.g.,* wind speed and direction, Beaufort sea state, cloud cover, and visibility);
- Description of marine mammal observations in the 24 hours preceding the incident; species identification or description of the animal(s) involved;
- The fate of the animal(s); and photographs or video footage of the animal (if equipment is available).

Activities shall not resume until NMFS is able to review the circumstances of the prohibited take. NMFS shall work with the City of San Diego to determine the action necessary to minimize the likelihood of further prohibited take and ensure MMPA compliance. The City of San Diego may not resume its activities until notified by NMFS via letter, email, or telephone.

Reporting an Injured or Dead Marine Mammal With an Unknown Cause of Death—In the event that the City of San Diego discovers an injured or dead marine mammal, and the lead PSO determines that the cause of the injury or death is unknown and the death is relatively recent (*i.e.,* in less than a moderate state of decomposition as described in the next paragraph), the City of San Diego will immediately report the incident to the Chief of the Permits and Conservation Division, Office of Protected Resources, NMFS, at 301–427–8401, and/or by email to *Jolie.Harrison@noaa.gov, Howard.Goldstein@noaa.gov,* and the NMFS West Coast Regional Office (1–866–767–6114), and/or to the West Coast Regional Stranding Coordinator (562–980–3230). The report must include the same information identified above. Activities may continue while NMFS reviews the circumstances of the incident. NMFS will work with the City of San Diego to determine whether modification of the activities is appropriate.

Reporting an Injured or Dead Marine Mammal Not Related to the Activities—In the event that the City of San Diego discovers an injured or dead marine mammal, and the lead PSO determines that the injury or death is not associated with or related to the activities authorized (*e.g.,* previously wounded animal, carcass with moderate to advanced decomposition, or scavenger damage), the City of San Diego shall report the incident to the Chief of the Permits and Conservation Division, Office of Protected Resources, NMFS, at 301–427–8401, and/or by email to *Jolie.Harrison@noaa.gov, Howard.Goldstein@noaa.gov,* and the NMFS West Coast Regional Office (1–866–767–6114) and/or to the West Coast Regional Stranding Coordinator (562–980–3230) within 24 hours of the discovery. The City of San Diego shall provide photographs or video footage (if available) or other documentation of the stranded animal sighting to NMFS and the Marine Mammal Stranding Network. Activities may continue while NMFS reviews the circumstances of the incident.

Monitoring Results From Previously Authorized Activities

2013 to 2014

Hanan & Associates, Inc., on behalf of the City of San Diego, conducted marine mammal and in-air sound monitoring at six locations during demolition and construction activities at the Children's Pool Lifeguard Station in La Jolla, California from June 3, 2013 to February 12, 2014. Demolition and construction activities began on July 10, 2013 and were halted for the Pacific harbor seal pupping season (December 15, 2013 to June 1, 2014). During 115 days of visual and acoustic observations, Hanan & Associates counted a total of 61,631 Pacific harbor seals and 26,037 people. During the 2013 demolition and construction activities, Hanan & Associates observed a total of 15,673 takes by Level B harassment (*i.e.,* alerts, movements, and flushes) that could be attributed to demolition and construction activities (5,095 takes), the general public (8,639 takes), and other sources (1,939 takes). As of April 15, 2014, at least 60 harbor seal pups (including 2 still births) have been born at the Children's Pool and there has been no indication of abandonment. In addition to the Pacific harbor seal sightings, PSOs recorded 11 sightings of cetaceans (gray whales and bottlenose dolphins), 4 sightings of California sea lions (1 juvenile, 3 adult), and 2 northern elephant seals (both juveniles) at the Children's Pool.

Hanan & Associates recorded mean in-air sound levels of 69.2 dB re 20 μPa (range of 55.6 to 93.7 dB re 20 μPa) during non-demolition and construction activities and 70.3 dB re 20 μPa (range of 50.7 to 103.1 dB re 20 μPa) during demolition and construction activities. During 2013, measured sound levels from the demolition equipment reaching the pinnipeds did not exceed approximately 90 dB re 20 μPa at the haul-out area closest to the demolition and construction activities, nor did they exceed a peak of about 83 dB re 20 μPa at the mean hauling-out distance (30.5 m).

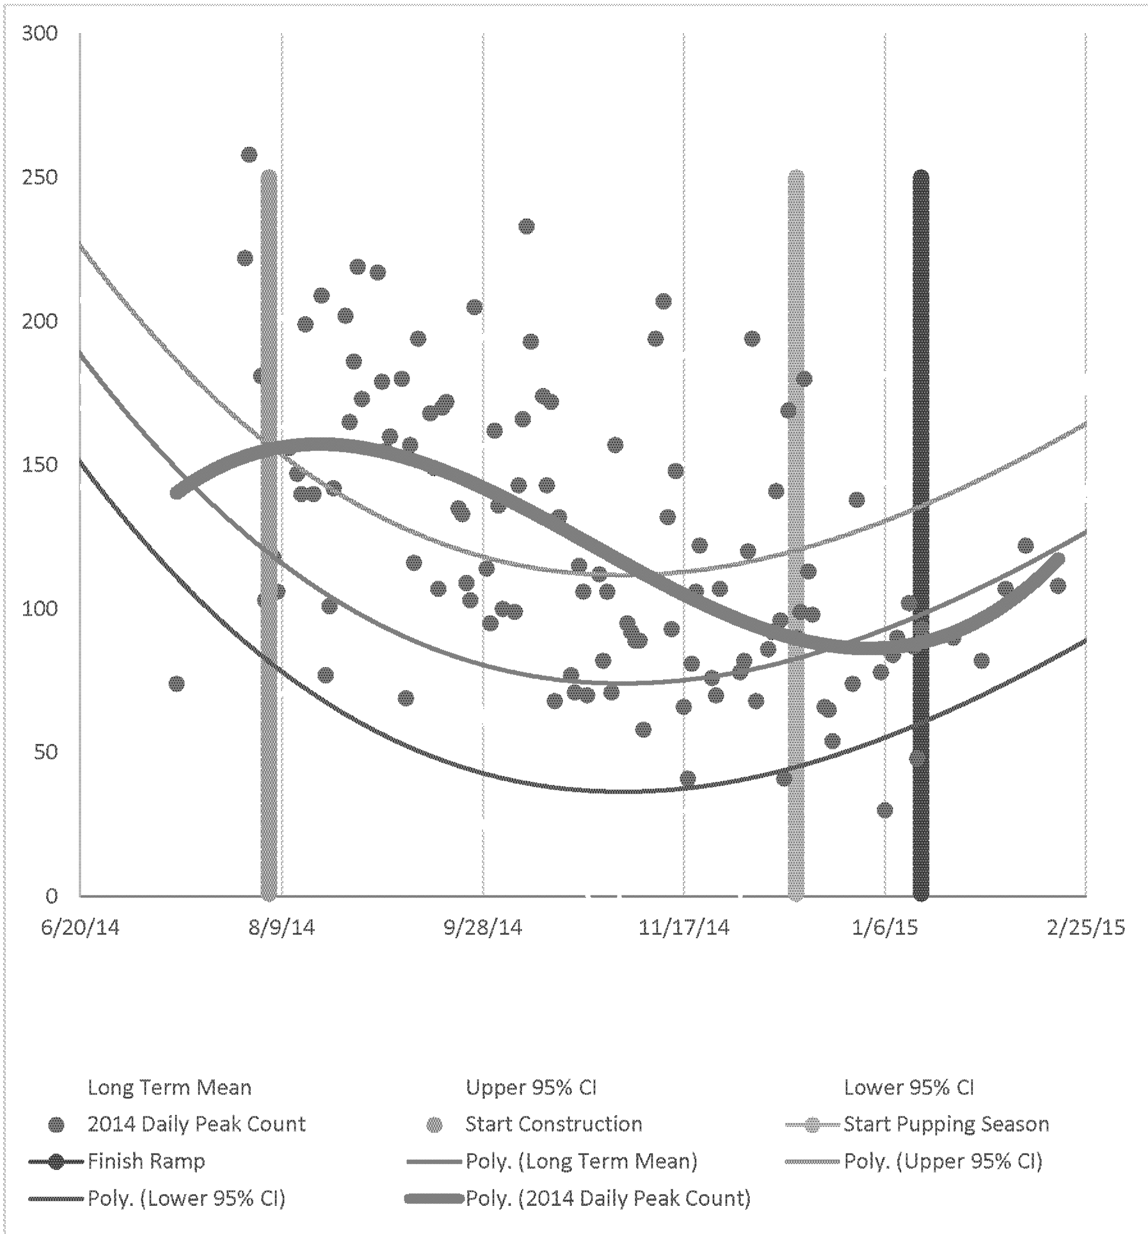
2014 to 2015

Hanan & Associates, Inc., on behalf of the City of San Diego, conducted marine mammal and in-air sound monitoring at seven locations during demolition and construction activities at the Children's Pool Lifeguard Station in La Jolla, California from August 6, 2014 to March 15, 2015. Construction activities began on August 6, 2014 and were halted for the Pacific harbor seal pupping season (December 15, 2014 to June 1, 2015). During 127 days of visual and acoustic observations, Hanan & Associates counted a total of 63,598 Pacific harbor seals and 27,844 people. During the 2014 demolition and construction activities, Hanan & Associates observed a total of 20,259 takes by Level B harassment (*i.e.,* alerts, movements, and flushes) that could be attributed to demolition and construction activities (7,424 takes), the general public (10,000 takes), and other sources (2,835 takes). As of March 13, 2015, at least 60 harbor seal pups (including 6 still or premature births) have been born at the Children's Pool and there has been no indication of abandonment. In addition to the Pacific harbor seal sightings, PSOs recorded 24 sightings of cetaceans (gray whales, common and bottlenose dolphins), 366 sightings of California sea lions (at Seal Rock, Children's Pool beach, South Casa Beach, and on the reef), and 1 northern elephant seals (1 juvenile on Children's Pool beach) at the Children's Pool. One dead adult and one dead juvenile California sea lion were sighted on the Children's Pool beach after the start of the beach closure and after the construction activities stopped for the pupping season. These strandings were reported to NMFS.

Hanan & Associates recorded mean in-air sound levels of 68.9 dB re 20 μPa (range of 51.5 to 97.2 dB re 20 μPa) during non-construction activities and 71.3 dB re 20 μPa (range of 49.4 to 102.7 dB re 20 μPa) during construction activities. During 2014, measured sound levels from the construction equipment reaching the pinnipeds did not exceed approximately 90 dB re 20 μPa at the haul-out area closest to the construction activities.

More information on the monitoring results from the City of San Diego's previous demolition and construction activities at the La Jolla Children's Pool Lifeguard Station can be found in the final monitoring reports. The 2013 to 2014 and 2014 to 2015 monitoring reports can be found online at: *http://www.nmfs.noaa.gov/pr/permits/incidental/construction.htm#childrenspool.*

Figure 2. Daily peak counts and long-term trends with a 95% confidence interval of Pacific harbor seals at Children's Pool from June 2014 to February 2015 based on monitoring at the site by Hanan & Associates.



Estimated Take by Incidental Harassment

Except with respect to certain activities not pertinent here, the MMPA defines ''harassment'' as: any act of pursuit, torment, or annoyance which (i) has the potential to injure a marine mammal or marine mammal stock in the wild [Level A harassment]; or (ii) has the potential to disturb a marine mammal or marine mammal stock in the wild by causing disruption of behavioral patterns, including, but not limited to, migration, breathing, nursing, breeding, feeding, or sheltering [Level B harassment].

TABLE 2—NMFS'S CURRENT UNDERWATER AND IN-AIR ACOUSTIC EXPOSURE CRITERIA

Criterion	Criterion definition	Threshold
Underwater Impulsive (Non-Explosive) Sound		
Level A harassment (injury)	Permanent threshold shift (PTS) (Any level above that which is known to cause TTS).	180 dB re 1 μPa-m (root means square [rms]) (cetaceans) 190 dB re 1 μPa-m (rms) (pinnipeds).
Level B harassment	Behavioral disruption (for impulsive noise)	160 dB re 1 μPa-m (rms).
Level B harassment	Behavioral disruption (for continuous noise)	120 dB re 1 μPa-m (rms).
In-Air Sound		
Level A harassment	NA	NA

TABLE 2—NMFS'S CURRENT UNDERWATER AND IN-AIR ACOUSTIC EXPOSURE CRITERIA—Continued

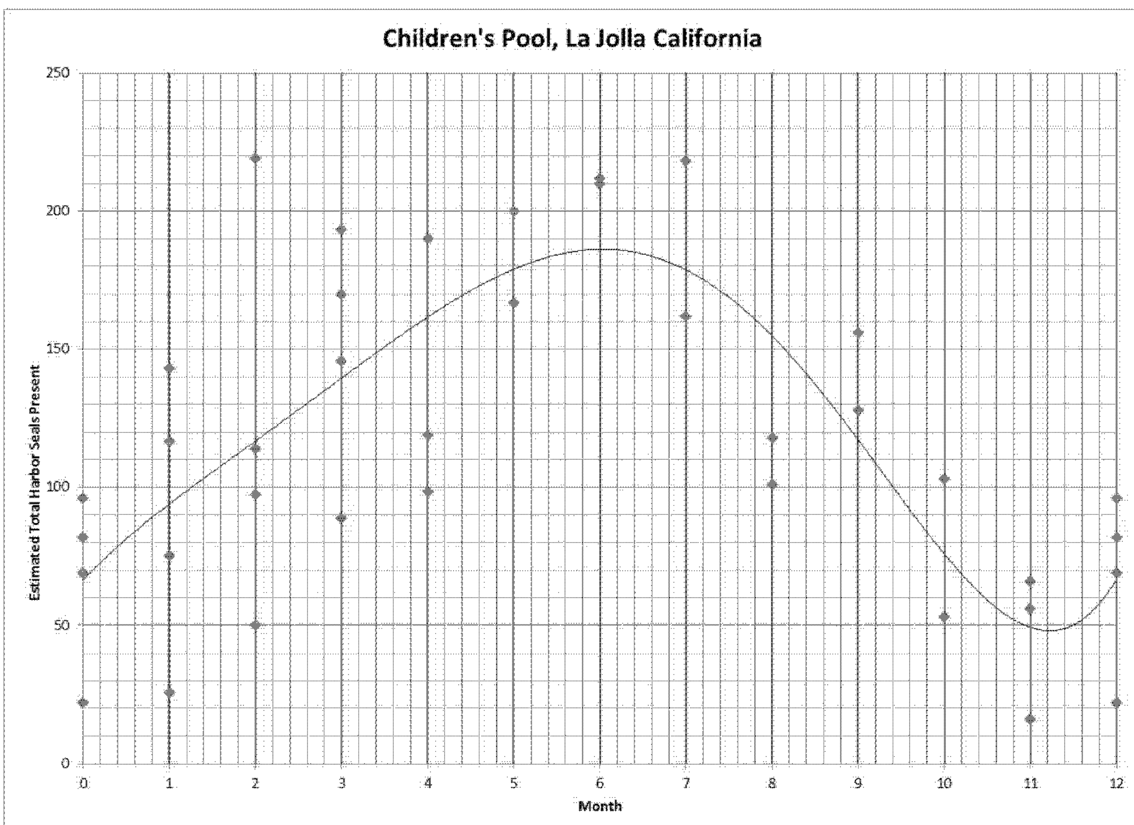
Criterion	Criterion definition	Threshold
Level B harassment	Behavioral disruption	90 dB re 20 μPa (harbor seals) 100 dB re 20 μPa (all other pinniped species) NA (cetaceans).

NA = Not available or not assessed.

The City of San Diego and NMFS anticipate takes of Pacific harbor seals, California sea lions, and northern elephant seals by Level B (behavioral) harassment only incidental to the construction project at the Children's Pool. No takes by injury (Level A harassment), serious injury, or mortality are expected. NMFS will consider pinnipeds behaviorally reacting to the construction activities by flushing into the water, moving more than 1 m (3.3 ft), but not into the water; becoming alert and moving, but not moving more than 1 m; and changing direction of current movements by individuals as behavioral criteria for take by Level B harassment.

With planned construction activities scheduled to begin in June 2015, the City of San Diego expects a range of 0 to 190 harbor seals to be present daily during June and a seasonal decline through November to about 0 to 50 harbor seals present daily. If all of the estimated harbor seals present are taken by incidental harassment each day, there could be a maximum of 10,000 takes (*i.e.,* approximately 2,947 adult males and 2,211 juvenile males, 2,842 adult females and 2,000 juvenile females based on age and sex ratios presented in Harkonen *et al.,* 1999) over the entire duration of the activities. An unknown portion of the incidental takes will be from repeated exposures as harbor seals leave and return to the Children's Pool area. A polynomial curve fit to counts by month was used by the City of San Diego to estimate the number of harbor seals expected to be hauled-out by day (see below and Figure 2 of the IHA application).

Figure 3. Estimated total harbor seals by month based on counts at the site by Hanan & Associates, Yochem and Stewart, and Children's Pool docents. The polynomial curve fits to counts by months was used to estimate harbor seals expected to be hauled-out by day.



Assuming the total seals predicted to haul-out daily at the Children's Pool are exposed to sound levels that are considered Level B harassment during days where sound is predicted to exceed 90 dB at the construction site (65 days), there could be a maximum of approximately 10,000 incidental takes (*i.e.,* exposures) of approximately up to 600 individual Pacific harbor seals over the duration of the activities. The estimated 600 individual Pacific harbor seals will be taken by Level B harassment multiple times during the construction activities.

Very few California sea lions and/or northern elephant seals are ever observed at the Children's Pool (*i.e.,* one or two individuals). The City of San Diego requests the authority to incidentally take (*i.e.,* exposures) 10,000 Pacific harbor seals, 100 California sea lions, and 25 northern elephant seals, which will equate to 600, 2, and 1 individuals, respectively, being exposed multiple times. More information on the number of takes authorized, and the approximate percentage of the stock for the three species in the action area can be found in Table 3.

TABLE 3—SUMMARY OF THE AUTHORIZED INCIDENTAL TAKE BY LEVEL B HARASSMENT OF PINNIPEDS FOR THE CITY OF SAN DIEGO'S CONSTRUCTION ACTIVITIES GENERATING IN-AIR NOISE AT THE CHILDREN'S POOL LIFEGUARD STATION IN LA JOLLA, CA

Species	Take authorization (number of exposures)	Estimated number of individuals taken	Abundance	Approximate percentage of estimated stock (individuals)	Population trend
Pacific harbor seal	10,000	600	30,968—California stock	1.93	Increased in California 1981 to 2004
California sea lion	100	2	296,750—U.S. stock	<0.01	Increasing
Northern elephant seal	25	1	179,000—California breeding stock.	<0.01	Increasing 3.8% annually since 1988

Encouraging and Coordinating Research

Each construction phase and potential harassment activity will be evaluated as to observed sound levels and any pinniped reaction by type of sound source. Flushing would be documented by sex and age class. These data will provide information for IHA permitting in future projects. Potential additional mitigation (other than what is already required) will be discussed and suggested in the final report. NMFS has encouraged the City of San Diego to review and analyze any available data to determine baseline information as well as evaluate the impacts from the construction activities on the pinnipeds at the Children's Pool.

Impact on Availability of Affected Species or Stock for Taking for Subsistence Uses

Section 101(a)(5)(D) of the MMPA requires NMFS to determine that the authorization will not have an unmitigable adverse effect on the availability of marine mammal species or stocks for subsistence use. There are not relevant subsistence uses of marine mammals implicated by this action. Therefore, NMFS has determined that the total taking of affected species or stocks will not have an unmitigable adverse impact on the availability of such species or stocks for subsistence purposes.

Analysis and Determinations

Negligible Impact

Negligible impact is ''an impact resulting from the specified activity that cannot be reasonably expected to, and is not reasonably likely to, adversely affect the species or stock through effects on annual rates of recruitment or survival'' (50 CFR 216.103). A negligible impact finding is based on the lack of likely adverse effects on annual rates of recruitment or survival (*i.e.,* population-level effects). An estimate of the number of Level B harassment takes, alone, is not enough information on which to base an impact determination. In addition to considering estimates of the number of marine mammals that might be ''taken'' through behavioral harassment, NMFS must consider other factors, such as the likely nature of any responses (their intensity, duration, etc.), the context of any responses (critical reproductive time or location, migration, etc.), as well as the number and nature of estimated Level A harassment takes, the number of estimated mortalities, effects on habitat, and the status of the species.

In making a negligible impact determination, NMFS evaluated factors such as:

(1) The number of anticipated serious injuries or mortalities;

(2) The number and nature of anticipated injuries;

(3) The number, nature, intensity, and duration of Level B harassment; and

(4) The context in which the takes occur (*i.e.,* impacts to areas of significance, impacts to local populations, and cumulative impacts when taking into account successive/contemporaneous actions when added to baseline data);

(5) The status of the stock or species of marine mammals (*e.g.,* depleted, ESA-listed, decreasing, increasing, stable, impact relative to the size of the population);

(6) Impacts on habitat affecting rates of recruitment/survival; and

(7) The effectiveness of monitoring and mitigation measures.

To avoid repetition, the discussion of NMFS's analyses applies to all the species or stocks for which take is being authorized (listed in Table 3), given that the anticipated effects of these construction activities on marine mammals are expected to be relatively similar in nature in this case. Additionally, there is no information about the nature or severity of the impacts, or the size, status, or structure of any species or stock that would lead to a different analysis for this activity, else species-specific factors would be identified and analyzed. NMFS had determined that the specified activities associated with the construction activities are not likely to cause long-term behavioral disturbance, PTS, or other (non-auditory) injury, serious injury, or death, based on the analysis contained in the notice of the proposed IHA (80 FR 28588, May 19, 2015). NMFS also considered the following factors:

No injuries (Level A harassment), serious injuries, or mortalities are anticipated to occur as a result of the City of San Diego's construction activities, and none are authorized by NMFS. The planned activities are not expected to result in the alteration of reproductive behaviors, and the potentially affected species would be subjected to only temporary and minor behavioral impacts.

Behavioral disturbance may potentially occur incidental to the visual presence of humans and construction activities; however, pinnipeds at this site have likely adapted or become acclimated to human presence at this site. These ''urbanized'' harbor seals do not exhibit sensitivity at a level similar to that noted in harbor seals in some other regions affected by human disturbance (Allen *et al.,* 1984; Suryan and Harvey, 1999; Henry and Hammil, 2001; Johnson and Acevedo-Gutierrez, 2007; Jansen *et al.,* 2006; Hanan & Associates, 2011). Therefore, there is a high likelihood that many of the harbor seals present during the construction activities would not be flushed off of the beach or rocks, as pinnipeds at this site are conditioned to human presence and loud noises (Hanan, 2004; Hanan & Associates, 2011) (see *http://www.youtube.com/watch?v=4IRUYVTULsg*).

As discussed in detail above, the project scheduling avoids sensitive life stages for Pacific harbor seals. Construction activities producing in-air noise will commence in June and end by December 15. The commencement date occurs after the end of the pupping season, affords additional time to accommodate lactation and weaning of season pups, and takes into account periods of lowest haul-out occurrence. The end date falls approximately two weeks prior to January 1, the time after which most births occur, providing protection for pregnant and nursing harbor seals that may give birth before January 1.

Table 3 of this document outlines the number of Level B harassment takes that are anticipated as a result of these activities. Due to the nature, degree, and context of Level B (behavioral) harassment anticipated and described (see ''Potential Effects on Marine Mammals'' section above) in this notice, this activity is not expected to impact rates of annual recruitment or survival for the affected species or stock (*i.e.,* California stock of Pacific harbor seals, U.S. stock of California sea lions, and California breeding stock of northern elephant seals), particularly given the required mitigation, monitoring, and reporting measures that would be implemented to minimize impacts to marine mammals.

The Children's Pool is one of the three known haul-out sites for Pacific harbor seal in San Diego County and the only rookery in San Diego County and the only mainland rookery on the U.S. west coast for this species between the border of Mexico and Point Mugu in Ventura County, CA. For the other marine mammal species that may occur within the action area (*i.e.,* California sea lions and northern elephant seals), there are no known designated or important feeding and/or reproductive areas. Many animals perform vital functions, such as feeding, resting, traveling, and socializing, on a diel cycle (*i.e.,* 24 hour cycle). Behavioral reactions to noise exposure (such as disruption of critical life functions, displacement, or avoidance of important habitat) are more likely to be significant if they last more than one diel cycle or recur on subsequent days (Southall *et al.,* 2007). However, Pacific harbor seals have been hauling-out at Children's Pool during the year for many years (including during pupping season and while females are pregnant) while being exposed to anthropogenic sound sources such as vehicle traffic, human voices, etc. and other stimuli from human presence. While studies have shown the types of sound sources used during the construction activities have the potential to displace marine mammals from breeding areas for a prolonged period (*e.g.,* Lusseau and Bejder, 2007; Weilgart, 2007), based on the best available information, this does not seem to be the case for the Pacific harbor seals at the Children's Pool. The Pacific harbor seals have repeatedly hauled-out to pup over many years and the NMFS Stock Assessment Reports (NMFS, 2011) for this stock have shown that the population is increasing and is considered stable. Additionally, the construction activities would increase sound levels in the environment in a relatively small area surrounding the lifeguard station (compared to the range of the animals), and some animals may only be exposed to and harassed by sound for less than a day.

NMFS's practice has been to apply the 90 dB re 20 μPa and 100 dB re 20 μPa received level threshold for in-air sound levels to determine whether take by Level B harassment occurs. Southall *et al.* (2007) provide a severity scale for ranking observed behavioral responses of both free-ranging marine mammals and laboratory subjects to various types of anthropogenic sound (see Table 4 in Southall *et al.* [2007]). NMFS has not established a threshold for Level A harassment (injury) for marine mammals exposed to in-air noise, however, Southall *et al.* (2007) recommends 149 dB re 20 μPa (peak flat) as the potential threshold for injury from in-air noise for all pinnipeds. No in-air sounds from construction activities would exceed 110 dB at the source and no measured sounds approached that sound level in 2013.

Of the 3 marine mammal species under NMFS jurisdiction that may or are known to likely occur in the action area, none are listed as threatened or endangered under the ESA. No incidental take has been requested to be authorized for ESA-listed species as none are expected to be within the action area. To protect these animals (and other marine mammals in the action area), the City of San Diego shall schedule construction activities with highest sound levels during the daily period of lowest haul-out occurrence; limit activities to the hours of daylight; erect a temporary visual and acoustic barrier; use PSOs and prohibit construction activities during harbor seal pupping season. No injury, serious injury, or mortality is expected to occur and due to the nature, degree, and context of the Level B harassment anticipated, the activity is not expected to impact rates of recruitment or survival.

Although behavioral modifications, including temporarily vacating the area during the construction activities, may be made by these species to avoid the resultant acoustic disturbance, the availability of alternate areas within these areas for species and the short and sporadic duration of the activities, have led NMFS to determine that the taking by Level B harassment from the specified activity would have a negligible impact on the affected species in the specified geographic region. NMFS believes that the time period of the construction activities, the requirement to implement mitigation measures (*e.g.,* prohibiting construction activities during pupping season, scheduling operations to periods of the lowest haul-out occurrence, visual and acoustic barriers, and the addition of a new measure that helps protect against unexpected abandonment of the site), and the inclusion of the monitoring and reporting measures, will reduce the amount and severity of the potential impacts from the activity to the degree that will have a negligible impact on the species or stocks in the action area.

Based on the analysis contained herein of the likely effects of the specified activity on marine mammals and their habitat, and taking into consideration the implementation of the monitoring and mitigation measures, NMFS finds that the total marine mammal take from the City of San Diego's activities will have a negligible impact on the affected marine mammal species or stocks.

Small Numbers

As mentioned previously, NMFS estimates that 3 species of marine mammals under its jurisdiction could be potentially affected by Level B harassment over the course of the IHA. NMFS makes its small numbers determination based on the numbers or proportion of marine mammals that will be taken relative to the populations of the affected species or stocks. It is estimated that up to 600 individual Pacific harbor seals, 2 individual California sea lions, and 1 northern elephant seal would be taken (multiple times) by Level B harassment, which would be approximately 1.93, less than 0.01, and less than 0.01% of the respective California, U.S., and California breeding stocks. The population estimates for the marine mammal species that may be taken by Level B harassment were provided in Table 2 of this document.

NMFS has determined, provided that the aforementioned mitigation and monitoring measures are implemented, that the impact of the construction activities at the Children's Pool Lifeguard Station in La Jolla, CA, June 2015 to June 2016, may result, at worst, in a temporary modification in behavior and/or low-level physiological effects (Level B harassment) of small numbers of certain species of marine mammals. Based on the analysis contained herein of the likely effects of the specified activity on marine mammals and their habitat, and taking into consideration the implementation of the mitigation and monitoring measures, NMFS finds that small numbers of marine mammals will be taken relative to the populations of the affected species or stocks. See Table 2 for the authorized take numbers of marine mammals.

Endangered Species Act

NMFS (Permits and Conservation Division) has determined that an ESA section 7 consultation for the issuance of an IHA under section 101(a)(5)(D) of the MMPA for this activity is not necessary for any ESA-listed marine mammal species under its jurisdiction, as the planned action will not affect ESA-listed species.

National Environmental Policy Act

To meet NMFS's National Environmental Policy Act (NEPA; 42 U.S.C. 4321 *et seq.*) requirements for the issuance of an IHA to the City of San Diego, NMFS prepared an Environmental Assessment (EA) in 2013 for a similar activity titled *Environmental Assessment on the Issuance of an Incidental Harassment Authorization to the City of San Diego to Take Marine Mammals by Harassment Incidental to Demolition and Construction Activities at the Children's Pool Lifeguard Station in La Jolla, California* to comply with the Council of Environmental Quality (CEQ) regulations and NOAA Administrative Order (NAO) 216–6. NMFS prepared and signed a Finding of No Significant Impact (FONSI) determining that preparation of an Environmental Impact Statement was not required. The FONSI was signed on June 28, 2013 prior to the issuance of the IHA for the City of San Diego's construction activities from June 2013 to June 2014. The currently planned construction activities that will be covered by the IHA from June 2015 to June 2016 are similar to the demolition and construction activities described in the 2013 EA. NMFS has reviewed CEQ's regulations and has determined that it is not necessary to supplement the 2013 EA because the effects of this IHA fall within the scope of those documents and do not require further supplementation. Based on the public comments received in response to the publication in the **Federal Register** notice and proposed IHA, NMFS has reaffirmed its FONSI.

Authorization

NMFS has issued an IHA to the City of San Diego for construction activities at the Children's Pool Lifeguard Station at La Jolla, CA, incorporating the previously mentioned mitigation, monitoring, and reporting requirements.

Dated: June 30, 2015.

Perry F. Gayaldo,

Deputy Director, Office of Protected Resources, National Marine Fisheries Service.

RIN 0648–XD782

Takes of Marine Mammals Incidental to Specified Activities; Taking Marine Mammals Incidental to Marine Seismic Survey in the Beaufort Sea, Alaska

AGENCY: National Marine Fisheries Service (NMFS), National Oceanic and Atmospheric Administration (NOAA), Commerce.

ACTION: Notice; issuance of an incidental take authorization.

SUMMARY: In accordance with the Marine Mammal Protection Act (MMPA) regulations, notification is hereby given that NMFS has issued an Incidental Harassment Authorization (IHA) to SAExploration, Inc. (SAE) to take, by harassment, small numbers of marine mammals incidental to a marine 3-dimensional (3D) ocean bottom node (OBN) seismic survey program in the Beaufort Sea, Alaska, during the 2015 Arctic open-water season.

DATES: Effective July 1, 2015, through October 15, 2015.

ADDRESSES: Inquiry for information on the incidental take authorization should be addressed to Jolie Harrison, Chief, Permits and Conservation Division, Office of Protected Resources, National Marine Fisheries Service, 1315 East West Highway, Silver Spring, MD 20910. A copy of the application containing a list of the references used in this document, NMFS' Environmental Assessment (EA) and Finding of No Significant Impact (FONSI), and the IHA may be obtained by writing to the address specified above, telephoning the contact listed below (see **FOR FURTHER INFORMATION CONTACT**), or visiting the Internet at: *http://www.nmfs.noaa.gov/pr/permits/incidental.htm#applications.*

Documents cited in this notice may be viewed, by appointment, during regular business hours, at the aforementioned address.

FOR FURTHER INFORMATION CONTACT: Shane Guan, Office of Protected Resources, NMFS, (301) 427–8401.

SUPPLEMENTARY INFORMATION:

Background

Sections 101(a)(5)(A) and (D) of the MMPA (16 U.S.C. 1361 *et seq.*) direct the Secretary of Commerce to allow, upon request, the incidental, but not intentional, taking of small numbers of marine mammals by U.S. citizens who engage in a specified activity (other than commercial fishing) within a specified geographical region if certain findings are made and either regulations are issued or, if the taking is limited to harassment, a notice of a proposed authorization is provided to the public for review.

An authorization for incidental takings shall be granted if NMFS finds that the taking will have a negligible impact on the species or stock(s), will not have an unmitigable adverse impact on the availability of the species or stock(s) for subsistence uses (where relevant), and if the permissible methods of taking and requirements pertaining to the mitigation, monitoring and reporting of such takings are set forth. NMFS has defined ''negligible impact'' in 50 CFR 216.103 as ''an impact resulting from the specified activity that cannot be reasonably expected to, and is not reasonably likely to, adversely affect the species or stock through effects on annual rates of recruitment or survival.''

Except with respect to certain activities not pertinent here, the MMPA defines ''harassment'' as: Any act of pursuit, torment, or annoyance which (i) has the potential to injure a marine mammal or marine mammal stock in the wild [Level A harassment]; or (ii) has the potential to disturb a marine mammal or marine mammal stock in the wild by causing disruption of behavioral patterns, including, but not limited to, migration, breathing, nursing, breeding, feeding, or sheltering [Level B harassment].

Summary of Request

On December 2, 2014, NMFS received an application from SAE for the taking of marine mammals incidental to a 3D ocean bottom node (OBN) seismic survey program in the Beaufort Sea. After receiving NMFS comments, SAE made revisions and updated its IHA application on December 5, 2014, January 21, 2015, January 29, 2015, and again on February 16, 2015. In addition, NMFS received the marine mammal mitigation and monitoring plan (4MP) from SAE on December 2, 2014, with an updated version on January 29, 2015. NMFS determined that the application and the 4MP were adequate and complete on February 17, 2015.

SAE proposes to conduct 3D OBN seismic surveys in the state and federal waters of the U.S. Beaufort Sea during the 2015 Arctic open-water season. The proposed activity would occur between July 1 and October 15, 2015. The actual seismic survey is expected to take approximately 70 days, dependent on weather. The following specific aspects of the proposed activities are likely to result in the take of marine mammals: Seismic airgun operations and associated navigation sonar and vessel movements. Takes, by Level A and/or Level B Harassments, of individuals of six species of marine mammals are anticipated to result from the specified activity.

SAE also conducted OBN seismic surveys in the Beaufort Sea in the 2014 Arctic open-water season (79 FR 51963; September 2, 2014).

Detailed descriptions of SAE's 3D OBN seismic survey program are provided in the **Federal Register** notice for the proposed IHA (80 FR 20084; April 14, 2015). No change has been made in the action described in the **Federal Register** notice. Please refer to that document for detailed information about the activities involved in the seismic survey program.

Comments and Responses

A notice of NMFS' proposal to issue an IHA to SAE was published in the **Federal Register** on April 14, 2015 (80 FR 20084). That notice described in detail SAE's activity, the marine mammal species that may be affected by the activity, and the anticipated effects on marine mammals and the availability of marine mammals for subsistence uses. During the 30-day public comment period, NMFS received only one comment letter from the Marine Mammal Commission (Commission). All comments are addressed in this section of the **Federal Register** notice.

Comment 1: The Commission points out that information regarding the specific areas that would be surveyed by SAE, or specific times of year for the survey, was not available as part of the proposed incidental harassment authorization. The Commission recommends that, prior to issuing the IHA, NMFS require SAE to determine what areas it will survey and when, in order to ensure that the proposed survey area and associated numbers of takes are consistent with what NMFS plans to authorize and, if they are not, amend the numbers of takes accordingly.

Response: Although a specific survey area for SAE's proposed 3D OBN seismic survey has not been determined, and probably will be remain confidential until the beginning of the survey, the potential area is known and all scenarios of the proposed survey have been considered and evaluated for impact assessment. As described in the **Federal Register** notice (80 FR 20084; April 14, 2015) for the proposed IHA, the worst-case scenario related to location (with the highest animal density) is taken into consideration for the analysis of the marine mammal impacts.

Comment 2: The Commission points out that the total survey area for the project, 777 km², appears low since it equates to roughly four times the size of each recording patch (192 km²). The Commission further notes that SAE has indicated that each patch would take about four days to shoot, which means that if the proposed total survey are of 777 km² is indeed accurate, SAE would be able to shoot that area within 16 days instead of 49 days.

Response: The Commission has confused shot patch size (192 km²) and recording patch size (19.4 km²). The shot patches greatly overlap with one another, while the recorder patches do not. Considering the tremendous overlap in shot area between adjacent patches, no more than 777 km² will be shot under this authorization, although many areas will be shot more than once. It actually would take much longer than 49 days if SAE wanted to completely survey the entire777 km².

Comment 3: The Commission states that it is concerned that the method used by SAE and NMFS to estimate numbers of takes is based on the total ensonified area rather than the area expected to be ensonified on a daily basis, as is standard for a moving sound source. The Commission recommends that NMFS use the method of area times density times the number of survey days to estimate the total number of Level A and B harassment takes for each of the marine mammal species expected to be in the project area.

Response: Despite that in most cases monitoring reports from 3D seismic surveys showed that take numbers, based on observation with adjustment to count for animals missed, are usually under or closely reflect the take estimates using a simple method of multiplying the total ensonified area by animal density, NMFS recognizes that such method has its limitation of not considering animal movement into the area on different days. The Commission's recommended method of area times density times the number of survey days provides an appropriate estimated of the *instances* of take, but often overestimates the number of individuals taken, because in many circumstances individual animals would be repeatedly taken. Except in rare cases when animals are migrating through the ensonified area, the ''instances'' of take generated by this method are higher than the individuals taken, given that in many cases marine mammals are using local habitat for multiple days and will be taken multiple times—and therefore, additional work may be needed to identify the likely numbers individuals taken to compare to the population size. NMFS is exploring new methodologies to calculate take estimates by accounting for daily ensonified area, days of the project, as well as the averaged rates of animal moving in/out of the survey area, prior monitoring report data, and other applicable information, if available. In the case of SAE's 3D OBN seismic survey, NMFS recalculated take numbers using daily ensonified area multiplied by project days multiplied by animal density and then adjusted the turnover rates based on species movement patterns and home ranges. A detailed description of the take estimates and the methodology are provided in section ''Estimated Take by Incidental Harassment'' below.

Comment 4: The Commission notes that NMFS is proposing to authorize the incidental taking of marine mammals by Level A harassment under section 101(a)(5)(D) of the MMPA, instead of through regulations under section 101(a)(5)(A) of the MMPA. The Commission states that authorizing Level A harassment under section 101(a)(5)(D) of the MMPA would be inconsistent with the intent of the MMPA. The Commission recommends that NMFS (1) develop criteria for determining when taking by Level A harassment should be authorized (*i.e.,* types of sound sources, project locations, species, effectiveness of mitigation measures) and (2) authorize any such takes through regulation under

101(a)(5)(A) of the MMPA and a letter of authorization rather than through an incidental harassment authorization. The Commission further states that it would welcome an opportunity to discuss the development of such criteria with NMFS.

Response: NMFS does not agree with the Commission's statement that Level A harassment cannot be authorized under section 101(a)(5)(D) of the MMPA. The legal requirements and underlying analysis for the issuance of a take authorization (*i.e.,* an IHA) in this particular case do not require the issuance of regulations and a letter of authorization. In order to issue an authorization pursuant to section 101(a)(5)(D) of the MMPA, NMFS must determine that the taking by harassment (Level A and Level B) of small numbers of marine mammal species or stocks will have a negligible impact on affected species or stocks, and will not have an unmitigable adverse impact on the availability of affected species or stocks for taking for subsistence uses. Potential impact on marine mammals incidental to SAE's 3D seismic survey would be limited to harassments only. Therefore, the issuance of an IHA to SAE under section 101(a)(5)(D) of the MMPA meets the legal requirements stated above. However, if there were a potential for serious injury or mortality, NMFS could not issue an IHA. Instead, any incidental take authorization would need to be processed under section 101(a)(5)(A) of the MMPA.

As described here and in the **Federal Register** notice (80 FR 20084; April 14, 2015) for the proposed IHA, permanent hearing threshold shift (PTS) is considered to be injury (Level A Harassment), not serious injury or mortality. Therefore, it is appropriate to issue an incidental take authorization under 101(a)(5)(D), as we have made the necessary findings (described elsewhere in this document) under that section of the MMPA.

NMFS agrees with the Commission that criteria for determining when taking by Level A harassment should be authorized (*i.e.,* types of sound sources, project locations, species, effectiveness of mitigation measures) will enhance the analysis of marine mammal incidental takes under MMPA, and appreciates the Commission's willingness to be involved in such a process.

Comment 5: The Commission notes that NMFS has proposed that SAE conduct in-situ sound source measurements for the 1,240-in^3 airgun array to ensure accurate characterization of the Level A and B harassment zones for that sound source. The Commission recommends that NMFS verify that any adjustments to the size of the Level A and/or B harassment zones, based on in-situ measurements, are accurate before such adjustments are made.

Response: SAE is required to conduct in-situ sound source measurements for the 1,240-in^3 airgun array before the commencement of its 3D seismic surveys. The Commission did not specify a method for how the in-situ measurements should be verified. Nevertheless, NMFS will evaluate the empirically measured exclusion zone and zone of influence based on comparable measurements of similar airguns in similar environment before agreeing that SAE should adopt the measured zones for monitoring and mitigation measures.

Comment 6: The Commission recommends that NMFS require that SAE refrain from initiating or cease seismic activities if an aggregation of bowhead or gray whales (*i.e.,* 12 or more whales of any age/sex class that appear to be engaged in a non-migratory, significant biological behavior (*e.g.,* feeding, socializing)) is observed within the Level B harassment Zone.

Response: NMFS discussed the Commission's recommendation with SAE and SAE agrees to refrain from initiating or to cease seismic activities if an aggregation of bowhead or gray whales (*i.e.,* 12 or more whales of any age/sex class that appear to be engaged in a non-migratory, significant biological behavior (*e.g.,* feeding, socializing)) is observed within the Level B harassment Zone.

Comment 7: The Commission recommends that NMFS encourage SAE to coordinate with other operators and researchers who may be conducting aerial surveys with the goal that information collected during those surveys will assist SAE in monitoring pinnipeds use of haul-out sites before, during, and after SAE's planned seismic survey.

Response: NMFS discussed the Commission's recommendation with SAE and encouraged SAE to coordinate with other operations and researchers who may be conducting aerial surveys. SAE responded that they attempted to coordinate with other companies last year for spotted seal monitoring, but none agreed to cooperate. In addition, at this point it is unclear whether any other companies in the Beaufort Sea may be conducting pinnipeds haul-out aerial surveys in the 2015 open-water season. Nevertheless, NMFS encourages SAE again to seek cooperation with other companies who may be conducting aerial surveys with the goal that information collected during those surveys will assist SAE in monitoring pinnipeds use of haul-out sites before, during, and after SAE's planned seismic survey.

Comment 8: The Commission recommends that NMFS incorporate the peer-review panel's recommendations into the final authorization and, if necessary, consult with personnel directly associated with implementing passive acoustic monitoring to ensure that the monitoring objectives are able to be met.

Response: NMFS conducted a peer review process to evaluate SAE's monitoring plan in early March 2015 in Anchorage, AK. The peer review panel submitted its report to NMFS in early April and provided recommendations to SAE. NMFS worked with SAE extensively on these recommendations. As a result, NMFS requires and SAE agrees to implement the following recommendations from the peer-review panel: (1) Conducting sound source verification (SSV) if SAE plans to use the 1,240 in^3 airgun array for seismic survey; (2) including an additional mitigation vessel for marine mammal monitoring if SAE plans to use the 1,240 in^3 airgun array; (3) deploying more acoustic sensors than the 2014 season for passive acoustic monitoring; (4) testing a new mooring design with NMFS National Marine Mammal Laboratory for micro Marine Autonomous Recording System (microMARS) to be deployed in shallow water; (5) including sightability curves in the 90-day report; and (6) making monitoring data available for valid scientific reasons and request.

In addition, though not solicited as part of the independent peer review of the monitoring, the peer-review panel also provided a number of mitigation measures which, upon discussion with SAE, the company agreed to limit the mitigation airgun shot interval to 1 shot per minute. However, SAE could not agree to the ramp up of 1 airgun per 5 minutes, as opposed to standard protocol of doubling the number of airguns every five minutes. SAE states that the recommended ramp up protocol is cost prohibitive.

A detailed description of peer-review process, peer-review recommendations, and NMFS' discussion with SAE regarding implementation of the recommendations is provided in ''*Monitoring Plan Peer Review*'' section below.

Description of Marine Mammals in the Area of the Specified Activity

The Beaufort Sea supports a diverse assemblage of marine mammals. Table 1 lists the 12 marine mammal species under NMFS jurisdiction with confirmed or possible occurrence in the proposed project area.

TABLE 1—MARINE MAMMAL SPECIES WITH CONFIRMED OR POSSIBLE OCCURRENCE IN THE SEISMIC SURVEY AREA

Common name	Scientific name	Status	Occurrence	Seasonality	Range	Abundance
Odontocetes						
Beluga whale (Beaufort Sea stock).	*Delphinapterus leucas*	–	Common	Mostly spring and fall with some in summer.	Mostly Beaufort Sea.	39,258
Beluga whale (eastern Chukchi Sea stock).	—	–	Common	Mostly spring and fall with some in summer.	Mostly Chukchi Sea.	3,710
Killer whale **	*Orcinus orca*	–	Occasional/Extralimital.	Mostly summer and early fall.	California to Alaska.	552
Harbor porpoise **	*Phocoena phocoena*	–	Occasional/Extralimital.	Mostly summer and early fall.	California to Alaska.	48,215
Narwhal **	*Monodon monoceros*	–				45,358
Mysticetes						
Bowhead whale *	*Balaena mysticetus*	Endangered; Depleted.	Common	Mostly spring and fall with some in summer.	Russia to Canada.	19,534
Gray whale	*Eschrichtius robustus*	–	Somewhat common.	Mostly summer	Mexico to the U.S. Arctic Ocean.	19,126
Minke whale **	*Balaenoptera acutorostrata.*	–				810–1,003
Humpback whale * ** (Central North Pacific stock).	*Megaptera novaeangliae*	Endangered; Depleted.				21,063
Pinnipeds						
Bearded seal (Beringia distinct population segment).	*Erigathus barbatus*	Candidate	Common	Spring and summer.	Bering, Chukchi, and Beaufort Seas.	155,000
Ringed seal * (Arctic stock).	*Phoca hispida*	Threatened; Depleted.	Common	Year round	Bering, Chukchi, and Beaufort Seas.	300,000
Spotted seal	*Phoca largha*	–	Common	Summer	Japan to U.S. Arctic Ocean.	141,479
Ribbon seal **	*Histriophoca fasciata*	Species of concern.	Occasional	Summer	Russia to U.S. Arctic Ocean.	49,000

* Species or stocks listed under the Endangered Species Act.
** Species are so rarely sighted in the proposed project area that take is unlikely.

Minke whales are relatively common in the Bering and southern Chukchi Seas and have recently also been sighted in the northeastern Chukchi Sea (Aerts *et al.,* 2013; Clarke *et al.,* 2013). Minke whales are rare in the Beaufort Sea. They have not been reported in the Beaufort Sea during the Bowhead Whale Aerial Survey Project/Aerial Surveys of Arctic Marine Mammals (BWASP/ASAMM) surveys (Clarke *et al.,* 2011, 2012; 2013; Monnet and Treacy, 2005), and there was only one observation in 2007 during vessel-based surveys in the region (Funk *et al.,* 2010). Humpback whales have not generally been found in the Arctic Ocean. However, subsistence hunters have spotted humpback whales in low numbers around Barrow, and there have been several confirmed sightings of humpback whales in the northeastern Chukchi Sea in recent years (Aerts *et al.,* 2013; Clarke *et al.,* 2013). The first confirmed sighting of a humpback whale in the Beaufort Sea was recorded in August 2007 (Hashagen *et al.,* 2009), when a cow and calf were observed 54 mi east of Point Barrow. No additional sightings have been documented in the Beaufort Sea. Narwhal are common in the waters of northern Canada, west Greenland, and in the European Arctic, but rarely occur in the Beaufort Sea (COSEWIC, 2004). Only a handful of sightings have occurred in Alaskan waters (Allen and Angliss, 2013). These three species are not considered further in this proposed IHA notice. Both the walrus and the polar bear could occur in the U.S. Beaufort Sea; however, these species are managed by the U.S. Fish and Wildlife Service (USFWS) and are not considered further in this Notice of Proposed IHA.

The Beaufort Sea is a main corridor of the bowhead whale migration route. The main migration periods occur in spring from April to June and in fall from late August/early September through October to early November. During the fall migration, several locations in the U.S. Beaufort Sea serve as feeding grounds for bowhead whales. Small numbers of bowhead whales that remain in the U.S. Arctic Ocean during summer also feed in these areas. The U.S. Beaufort Sea is not a main feeding or calving area for any other cetacean species. Ringed seals breed and pup in the Beaufort Sea; however, this does not occur during the summer or early fall. Further information on the biology and local distribution of these species can be found in SAE's application (see **ADDRESSES**) and the NMFS Marine Mammal Stock Assessment Reports, which are available online at: *http://www.nmfs.noaa.gov/pr/species/.*

Potential Effects of the Specified Activity on Marine Mammals

Operating active acoustic sources such as airgun arrays, navigational sonars, and vessel activities have the potential for adverse effects on marine mammals. Potential effects from SAE's 3D OBN seismic surveys on marine mammals in the U.S. Beaufort Sea are discussed in the ''Potential Effects of the Specified Activity on Marine Mammals'' section of the **Federal Register** notice for the proposed IHA (80 FR 20084; April 14, 2015). No changes have been made to the discussion contained in this section of the **Federal Register** notice for the proposed IHA.

Anticipated Effects on Habitat

The primary potential impacts to marine mammal habitat are associated with elevated sound levels produced by airguns and vessels and their effects on marine mammal prey species. These potential effects from SAE's 3D OBN seismic survey are discussed in the ''Anticipated Effects on Marine Mammal Habitat'' section of the **Federal Register** notice for the proposed IHA (80 FR 20084; April 14, 2015). No changes have been made to the discussion contained in this section of the **Federal Register** notice for the proposed IHA.

Mitigation Measures

In order to issue an incidental take authorization under section 101(a)(5)(D) of the MMPA, NMFS must set forth the permissible methods of taking pursuant to such activity, and other means of effecting the least practicable adverse impact on such species or stock and its habitat, paying particular attention to rookeries, mating grounds, and areas of similar significance, and on the availability of such species or stock for taking for certain subsistence uses.

For the SAE open-water 3D OBN seismic surveys in the Beaufort Sea, NMFS is requiring SAE to implement the following mitigation measures to minimize the potential impacts to marine mammals in the project vicinity as a result of its survey activities. The primary purpose of these mitigation measures is to detect marine mammals within or about to enter designated exclusion zones and to initiate immediate shutdown or power down of the airgun(s).

Besides the mitigation measures that were proposed in the **Federal Register** notice (80 FR 20084; March 14, 2015), NMFS included two additional measures that require SAE (1) refrain from initiating or cease seismic activities if an aggregation of bowhead or gray whales (*i.e.,* 12 or more whales of any age/sex class that appear to be engaged in a non-migratory, significant biological behavior (*e.g.,* feeding, socializing)) is observed within the Level B harassment zone; and (2) operate a mitigation airgun at a rate of 1 shot per minute. A detailed discussion of the mitigation measures are provided below.

(1) Establishing Exclusion and Disturbance Zones

Under current NMFS guidelines, the ''exclusion zone'' for marine mammal exposure to impulse sources is customarily defined as the area within which received sound levels are ≥180 dB (rms) re 1 μPa for cetaceans and ≥190 dB (rms) re 1 μPa for pinnipeds. These safety criteria are based on an assumption that SPL received at levels lower than these will not injure these animals or impair their hearing abilities, but at higher levels might have some such effects. Disturbance or behavioral effects to marine mammals from underwater sound may occur after exposure to sound at distances greater than the exclusion zones (Richardson *et al.* 1995). Currently, NMFS uses 160 dB (rms) re 1 μPa as the threshold for Level B behavioral harassment from impulse noise.

In 2014, Heath *et al.* (2014) conducted a sound source verification (SSV) of the very same 620-in^3 array SAE plans to use in 2015. The SSV was conducted in generally the same survey area of SAE's planned 2015 work. They empirically determined that the distances to the 190, 180, and 160 dB isopleths for sound pressure levels emanating from the 620-in^3 array was 195, 635, and 1,820 m, respectively (Table 3). Heath *et al.* (2014) also measured sound pressure levels from an active 10-in^3 gun during SAE's 2014 Beaufort operations and found noise levels exceeding 190 dB extended out 54 m, exceeding 180 dB out to 188 m, and exceeding 160 dB out to 1,050 m (Table 2).

Sound source studies have not been done for the 1,240-in^3 array; however, Austin and Warner (2013) conducted a sound source verification of a 1,200-in^3 array operated by SAE in Cook Inlet found the radius to the 190 dB isopleth to be 250 m, to the 180 dB isopleth to be 910 m, and to the 160 dB isopleth to be 5,200 m. These are the distance values SAE intends to use before the SSV for the 1,240 in^3 airgun arrays are obtained before the survey. If SAE plans to use the 1,240 in^3 airgun arrays, SSV of these zones will be empirically measured before the 2015 open-water seismic survey for monitoring and mitigation measures.

TABLE 2—SUMMARY OF AIRGUN ARRAY SOURCE LEVELS AND PROPOSED EXCLUSION ZONE AND ZONES OF INFLUENCE RADII

Array size (in^3)	Source level (dB)	190 dB radius (m)	180 dB radius (m)	160 dB radius (m)
10	195	54	188	1,050
620	218	195	635	1,820
1,240 *	224	250	910	5,200

* Denotes modelled source level that need to be empirically measured before the seismic survey.

(2) Vessel Related Mitigation Measures

These mitigation measures apply to all vessels that are part of SAE's Beaufort Sea seismic survey activities, including supporting vessels.

• Avoid concentrations or groups of whales. Operators of vessels should, at all times, conduct their activities at the maximum distance possible from such concentrations or groups of whales.

• If any vessel approaches within 1.6 km (1 mi) of observed whales, except when providing emergency assistance to whalers or in other emergency situations, the vessel operator will take reasonable precautions to avoid potential interaction with the whales by taking one or more of the following actions, as appropriate:

○ Reducing vessel speed to less than 5 knots within 300 yards (900 feet or 274 m) of the whale(s);

○ Steering around the whale(s) if possible;

○ Operating the vessel(s) in such a way as to avoid separating members of a group of whales from other members of the group;

○ Operating the vessel(s) to avoid causing a whale to make multiple changes in direction; and

○ Checking the waters immediately adjacent to the vessel(s) to ensure that no whales will be injured when the propellers are engaged.

• Reduce vessel speed, not to exceed 5 knots, when weather conditions require, such as when visibility drops, to avoid the likelihood of injury to whales.

(3) Mitigation Measures for Airgun Operations

The primary requirements for airgun mitigation during the seismic surveys are to monitor marine mammals near the airgun array during all daylight airgun operations and during any nighttime start-up of the airguns and, if any marine mammals are observed, to adjust airgun operations, as necessary, according to the mitigation measures described below. During the seismic surveys, Protected Species Observers (PSOs) will monitor the pre-established exclusion zones for the presence of marine mammals. When marine mammals are observed within, or about to enter, designated safety zones, PSOs have the authority to call for immediate power down (or shutdown) of airgun operations, as required by the situation. A summary of the procedures associated with each mitigation measure is provided below.

Ramp Up Procedure

A ramp up of an airgun array provides a gradual increase in sound levels, and involves a step-wise increase in the number and total volume of airguns firing until the full volume is achieved. The purpose of a ramp up (or ''soft start'') is to ''warn'' cetaceans and pinnipeds in the vicinity of the airguns and to provide time for them to leave the area and thus avoid any potential injury or impairment of their hearing abilities.

During the open-water survey program, the seismic operator will ramp up the airgun arrays slowly. Full ramp ups (*i.e.,* from a cold start after a shutdown, when no airguns have been firing) will begin by firing a single airgun in the array (*i.e.,* the mitigation airgun). A full ramp up, after a shutdown, will not begin until there has been a minimum of 30 minutes of observation of the safety zone by PSOs to assure that no marine mammals are present. The entire exclusion zone must be visible during the 30-minute lead-in to a full ramp up. If the entire exclusion zone is not visible, then ramp up from a cold start cannot begin. If a marine mammal is sighted within the exclusion zone during the 30-minute watch prior to ramp up, ramp up will be delayed until the marine mammal is sighted outside of the exclusion zone or the animal is not sighted for at least 15 minutes, for small odontocetes (harbor porpoise) and pinnipeds, or 30 minutes, for baleen whales and large odontocetes (including beluga and killer whales and narwhal).

Use of a Small-Volume Airgun During Turns and Transits

Throughout the seismic survey, during turning movements and short transits, SAE will employ the use of the smallest-volume airgun (*i.e.,* ''mitigation airgun'') to deter marine mammals from being within the immediate area of the seismic operations. The mitigation airgun will be operated at approximately one shot per minute and will not be operated for longer than three hours in duration (turns may last two to three hours for the project).

During turns or brief transits (*i.e.,* less than three hours) between seismic tracklines, one mitigation airgun will continue operating. The ramp up procedures described above will be followed when increasing the source levels from the one mitigation airgun to the full airgun array. However, keeping one airgun firing during turns and brief transits will allow SAE to resume seismic surveys using the full array without having to ramp up from a ''cold start,'' which requires a 30-minute observation period of the full exclusion zone and is prohibited during darkness or other periods of poor visibility. PSOs will be on duty whenever the airguns are firing during daylight and during the 30-minute periods prior to ramp-ups from a ''cold start.''

Power Down and Shutdown Procedures

A power down is the immediate reduction in the number of operating energy sources from all firing to some smaller number (*e.g.,* a single mitigation airgun). A shutdown is the immediate cessation of firing of all energy sources. The array will be immediately powered down whenever a marine mammal is sighted approaching close to or within the applicable exclusion zone of the full array, but is outside the applicable exclusion zone of the single mitigation airgun. If a marine mammal is sighted within or about to enter the applicable exclusion zone of the single mitigation airgun, the entire array will be shut down (*i.e.,* no sources firing). In addition, SAE will implement shutdown measures when aggregations of bowhead whales or gray whales that appear to be engaged in non-migratory significant biological behavior (*e.g.,* feeding, socializing) are observed within the 160-dB harassment zone around the seismic operations.

No Seismic Survey With Presence of Aggregation of Whales

SAE shall refrain from initiating or cease seismic activities if an aggregation of bowhead or gray whales (*i.e.,* 12 or more whales of any age/sex class that appear to be engaged in a non-migratory, significant biological behavior (*e.g.,* feeding, socializing)) is observed within the Level B harassment Zone.

Poor Visibility Conditions

SAE plans to conduct 24-hour operations. PSOs will not be on duty during ongoing seismic operations during darkness, given the very limited effectiveness of visual observation at night (there will be no periods of darkness in the survey area until mid-August). The provisions associated with operations at night or in periods of poor visibility include the following:

• If during foggy conditions, heavy snow or rain, or darkness (which may be encountered starting in late August), the full 180 dB exclusion zone is not visible, the airguns cannot commence a ramp-up procedure from a full shut-down.

• If one or more airguns have been operational before nightfall or before the onset of poor visibility conditions, they can remain operational throughout the night or poor visibility conditions. In this case ramp-up procedures can be initiated, even though the exclusion zone may not be visible, on the assumption that marine mammals will be alerted by the sounds from the single airgun and have moved away.

Mitigation Conclusions

NMFS has carefully evaluated SAE's mitigation measures and considered a range of other measures in the context of ensuring that NMFS prescribes the means of effecting the least practicable impact on the affected marine mammal species and stocks and their habitat. Our evaluation of potential measures included consideration of the following factors in relation to one another:

- The manner in which, and the degree to which, the successful implementation of the measures are expected to minimize adverse impacts to marine mammals;
- The proven or likely efficacy of the specific measure to minimize adverse impacts as planned; and
- The practicability of the measure for applicant implementation.

Any mitigation measure(s) prescribed by NMFS should be able to accomplish, have a reasonable likelihood of accomplishing (based on current science), or contribute to the accomplishment of one or more of the general goals listed below:

1. Avoidance or minimization of injury or death of marine mammals wherever possible (goals 2, 3, and 4 may contribute to this goal).

2. A reduction in the numbers of marine mammals (total number or number at biologically important time or location) exposed to received levels of seismic airguns, or other activities expected to result in the take of marine mammals (this goal may contribute to 1, above, or to reducing harassment takes only).

3. A reduction in the number of times (total number or number at biologically important time or location) individuals would be exposed to received levels of seismic airguns or other activities expected to result in the take of marine mammals (this goal may contribute to 1, above, or to reducing harassment takes only).

4. A reduction in the intensity of exposures (either total number or number at biologically important time or location) to received levels of seismic airguns or other activities expected to result in the take of marine mammals (this goal may contribute to 1, above, or to reducing the severity of harassment takes only).

5. Avoidance or minimization of adverse effects to marine mammal habitat, paying special attention to the food base, activities that block or limit passage to or from biologically important areas, permanent destruction of habitat, or temporary destruction/disturbance of habitat during a biologically important time.

6. For monitoring directly related to mitigation—an increase in the probability of detecting marine mammals, thus allowing for more effective implementation of the mitigation.

Based on our evaluation of these mitigation measures, NMFS has determined that the proposed mitigation measures provide the means of effecting the least practicable impact on marine mammals species or stocks and their habitat, paying particular attention to rookeries, mating grounds, and areas of similar significance. Mitigation measures to ensure availability of such species or stock for taking for certain subsistence uses are discussed later in this document (see ''Impact on Availability of Affected Species or Stock for Taking for Subsistence Uses'' section).

Monitoring and Reporting

In order to issue an ITA for an activity, section 101(a)(5)(D) of the MMPA states that NMFS must set forth, ''requirements pertaining to the monitoring and reporting of such taking.'' The MMPA implementing regulations at 50 CFR 216.104(a)(13) indicate that requests for ITAs must include the suggested means of accomplishing the necessary monitoring and reporting that will result in increased knowledge of the species and of the level of taking or impacts on populations of marine mammals that are expected to be present in the action area. SAE submitted a marine mammal monitoring plan as part of the IHA application.

Monitoring measures prescribed by NMFS should accomplish one or more of the following general goals:

1. An increase in our understanding of the likely occurrence of marine mammal species in the vicinity of the action, *i.e.,* presence, abundance, distribution, and/or density of species.

2. An increase in our understanding of the nature, scope, or context of the likely exposure of marine mammal species to any of the potential stressor(s) associated with the action (*e.g.,* sound or visual stimuli), through better understanding of one or more of the following: The action itself and its environment (*e.g.,* sound source characterization, propagation, and ambient noise levels); the affected species (*e.g.,* life history or dive pattern); the likely co-occurrence of marine mammal species with the action (in whole or part) associated with specific adverse effects; and/or the likely biological or behavioral context of exposure to the stressor for the marine mammal (*e.g.,* age class of exposed animals or known pupping, calving or feeding areas).

3. An increase in our understanding of how individual marine mammals respond (behaviorally or physiologically) to the specific stressors associated with the action (in specific contexts, where possible, *e.g.,* at what distance or received level).

4. An increase in our understanding of how anticipated individual responses, to individual stressors or anticipated combinations of stressors, may impact either: The long-term fitness and survival of an individual; or the population, species, or stock (*e.g.,* through effects on annual rates of recruitment or survival).

5. An increase in our understanding of how the activity affects marine mammal habitat, such as through effects on prey sources or acoustic habitat (*e.g.,* through characterization of longer-term contributions of multiple sound sources to rising ambient noise levels and assessment of the potential chronic effects on marine mammals).

6. An increase in understanding of the impacts of the activity on marine mammals in combination with the impacts of other anthropogenic activities or natural factors occurring in the region.

7. An increase in our understanding of the effectiveness of mitigation and monitoring measures.

8. An increase in the probability of detecting marine mammals (through improved technology or methodology), both specifically within the safety zone (thus allowing for more effective implementation of the mitigation) and in general, to better achieve the above goals.

Monitoring Measures

Monitoring will provide information on the numbers of marine mammals potentially affected by the exploration operations and facilitate real-time mitigation to prevent injury of marine mammals by industrial sounds or activities. These goals will be accomplished in the Beaufort Sea during 2015 by conducting vessel-based monitoring and passive acoustic monitoring to document marine mammal presence and distribution in the vicinity of the survey area.

Visual monitoring by PSOs during seismic survey operations, and periods when these surveys are not occurring, will provide information on the numbers of marine mammals potentially affected by these activities and facilitate real-time mitigation to prevent impacts to marine mammals by industrial sounds or operations. Vessel-based PSOs onboard the survey vessels and mitigation vessel will record the numbers and species of marine mammals observed in the area and any observable reaction of marine mammals to the survey activities in the Beaufort Sea.

Besides the monitoring measures that were proposed in the **Federal Register** notice (80 FR 20084; March 14, 2015), NMFS included several additional measures based on the Commission and peer-review recommendations. These additional monitoring measures include: (1) NMFS evaluation of empirically measured exclusion zones and zone of influence before they are adopted; (2) conducting SSV if SAE plans to use the 1,240 in^3 airgun array for seismic survey; (3) including an additional mitigation vessel for marine mammal monitoring if SAE plans to use the 1,240 in^3 airgun array; (4) deploying more acoustic sensors than the 2014 season for passive acoustic monitoring; and (5) testing a new mooring design with NMFS National Marine Mammal Laboratory for microMARS to be deployed in shallow water.

Details of the monitoring measures are described below.

Visual-Based PSOs

The visual-based marine mammal monitoring will be implemented by a team of experienced PSOs, including both biologists and Inupiat personnel. PSOs will be stationed aboard both survey vessels through the duration of the project. The vessel-based marine mammal monitoring will provide the basis for real-time mitigation measures as discussed in the Mitigation Measures section. In addition, monitoring results of the vessel-based monitoring program will include the estimation of the number of ‘‘takes’’ as stipulated in the IHA.

(1) PSOs

Vessel-based monitoring for marine mammals will be done by trained PSOs throughout the period of survey activities. The observers will monitor the occurrence of marine mammals near the survey vessel during all daylight periods during operation, and during most daylight periods when operations are not occurring. PSO duties will include watching for and identifying marine mammals; recording their numbers, distances, and reactions to the survey operations; and documenting ‘‘take by harassment.’’

A total of 2 PSOs will be required onboard each survey vessel to meet the following criteria:

- 100% monitoring coverage during all periods of survey operations in daylight;
- At least two PSOs conducting vessel-based visual monitoring from both vessels during all time;
- Maximum of 4 consecutive hours on watch per PSO; and
- Maximum of 12 hours of watch time per day per PSO.

PSO teams will consist of Inupiat observers and experienced field biologists. Each vessel will have an experienced field crew leader to supervise the PSO team. The total number of PSOs may decrease later in the season as the duration of daylight decreases.

(2) PSO Role and Responsibilities

When onboard the seismic and support vessels, there are three major parts to the PSO position:

- Observe and record sensitive wildlife species;
- Ensure mitigation procedures are followed accordingly; and
- Follow monitoring and data collection procedures.

The main roles of the PSO and the monitoring program are to ensure compliance with requirements set in place by NMFS to ensure that disturbance of marine mammals is minimized, and potential effects on marine mammals are documented. The PSOs will implement the monitoring and mitigation measures specified in the IHA. The primary purposes of the PSOs on board of the vessels are:

- Mitigation: Implement mitigation clearing and ramp up measures, observe for and detect marine mammals within, or about to enter the applicable safety zone and implement necessary shut down, power down and speed/course alteration mitigation procedures when applicable. Advise marine crew of mitigation procedures.
- Monitoring: Observe for marine mammals and determine numbers of marine mammals exposed to sound pulses and their reactions (where applicable) and document those as required.

(3) Observer Qualifications and Training

Crew leaders and most PSOs will be individuals with experience as observers during recent seismic, site clearance and shallow hazards, and other monitoring projects in Alaska or other offshore areas in recent years. New or inexperienced PSOs will be paired with an experienced PSO or experienced field biologist so that the quality of marine mammal observations and data recording is kept consistent.

Biologist-observers will have previous marine mammal observation experience, and field crew leaders will be highly experienced with previous vessel-based marine mammal monitoring and mitigation projects. Resumes for those individuals will be provided to NMFS for review and acceptance of their qualifications. Inupiat observers will be experienced in the region and familiar with the marine mammals of the area. All observers will complete a NMFS-approved observer training course designed to familiarize individuals with monitoring and data collection procedures.

PSOs will complete a 2- or 3-day training and refresher session on marine mammal monitoring, to be conducted shortly before the anticipated start of the 2015 open-water season. Any exceptions will have or receive equivalent experience or training. The training session(s) will be conducted by qualified marine mammalogists with extensive crew-leader experience during previous vessel-based seismic monitoring programs.

(4) Marine Mammal Observer Protocol

Source vessels will employ PSOs to identify marine mammals during all hours of airgun operations. To better observe the exclusion zone, a lead PSO, one or two PSOs, and an Inupiaq communicator will be on the primary source vessel and two PSOs will be stationed aboard the secondary source vessel. (The total number of observers is limited by available berthing space aboard the vessels.) The three to four total observers aboard the primary source vessel will allow two observers simultaneously on watch during daylight hours.

The PSOs will watch for marine mammals during all periods of source operations and for a minimum of 30 minutes prior to the planned start of airgun or pinger operations after an extended shutdown. Marine mammal monitoring shall continue throughout airgun operations and last for 30 minutes after the finish of airgun firing. SAE vessel crew and operations personnel will also watch for marine mammals, as practical, to assist and alert the PSOs for the airgun(s) to be shut down if marine mammals are observed in or about to enter the exclusion zone.

The PSOs will watch for marine mammals from the best available vantage point on the survey vessels, typically the bridge. The PSOs will scan the area around the vessel systematically with reticle binoculars (*e.g.,* 7 × 50 and 16–40 × 80) and with the naked eye. Laser range finders (Leica LRF 1200 laser rangefinder or equivalent) will be available to assist with distance estimation.

The observers will give particular attention to the areas within the marine mammal exclusion zones around the source vessels. These zones are the maximum distances within which received levels may exceed 180 dB (rms) re 1 μPa (rms) for cetaceans, or 190 dB (rms) re 1 μPa for pinnipeds.

When a marine mammal is seen approaching or within the exclusion zone applicable to that species, the seismic survey crew will be notified immediately so that mitigation measures called for in the applicable authorization(s) can be implemented.

Night-vision equipment (Generation 3 binocular image intensifiers or equivalent units) will be available for use if and when needed. Past experience with night-vision devices (NVDs) in the Beaufort Sea and elsewhere has indicated that NVDs are not nearly as effective as visual observation during daylight hours (*e.g.,* Harris *et al.* 1997, 1998; Moulton and Lawson 2002).

(5) Dedicated Monitoring Vessel

If SAE decides to use the 1,240 in³ airgun array, an additional dedicated visual monitoring vessel will be employed to assist marine mammal monitoring due to the larger exclusion zones and zone of influence from this larger airgun array. A minimum of 2 PSOs will be positioned on this dedicated monitoring vessel.

(6) Field Data-Recording

The PSOs will record field observation data and information about marine mammal sightings that include:

- Species, group size, age/size/sex categories (if determinable);
- Physical description of features that were observed or determined not to be present in the case of unknown or unidentified animals;
- Behavior when first sighted and after initial sighting, heading (if consistent);
- Bearing and distance from observer, apparent reaction to activities (*e.g.,* none, avoidance, approach, paralleling, etc.), closest point of approach, and behavioral pace;
- Time, location, speed, and activity of the source and mitigation vessels, sea state, ice cover, visibility, and sun glare; and
- Positions of other vessel(s) in the vicinity.

Acoustic Monitoring

(1) Sound Source Measurements

Since the same airgun array of 620 in³ and a single mitigation airgun of 10 in³ to be used were empirically measured in the generally same seismic survey vicinity in 2014 (Heath 2014), NMFS does not think additional SSV tests for this array and a single airgun are necessary for the 2015 seismic survey. However, if SAE decides to use the 1,240 in³ airgun arrays for deeper water, SSV on these arrays is required before the commencement of the surveys. Results of the acoustic characterization and SSV will be used to establish the 190 dB, 180 dB, 170 dB, and 160 dB isopleths for the 1,240 in³ airgun arrays.

The results of the SSV will be submitted to NMFS within five days after completing the measurements, followed by a report to be submitted within 14 days after completion of the measurements. A more detailed report will be provided to NMFS as part of the required 90-day report following completion of the acoustic program.

NMFS will evaluate the empirically measured exclusion zones and zone of influence from the 1,240 in³ before they are formally established for mitigation and monitoring measures.

(2) Passive Acoustic Monitoring

SAE will conduct Passive Acoustical Monitoring (PAM) using microMARS. These sensors will be deployed on the seabed and will record continuously at 64 kHz sample rate and 16-bit samples. The recorders will be calibrated and their mooring designs tested prior to deployment.

PAM Deployment

Passive acoustic monitoring package will be deployed at the four corners of SAE's survey site. Each PAM package will include two microMARS units coupled with an ARC–1 release device, a float and a retrievable mooring. Deploying two microMARS at each monitoring location will allow redundancy in the system to reduce the likelihood of failures and/or data loss.

PAM will be deployed before the SAE's proposed 3D seismic survey and remain at the study site during the entire survey period.

Data Analysis

Acoustic data will be analyzed for two frequency bands, low (below 2 kHz for baleen whales and low-frequency noise) and high (2 kHz–32 kHz for beluga whales and high-frequency noise). This will allow sounds produced by different species and anthropogenic sources to be reviewed and analyzed in greater detail. Specialized acoustic review and analysis software, Trition will be used to create long-term spectral averages (LTSAs) for all acoustic files downloaded from the recorders.

Once LTSAs of all the acoustic data have been created and preliminarily reviewed, experienced bioacoustic data analysts will perform a detailed review of the data. Analysts will log the time of occurrence of all biological sounds, seismic source events (if audible), and other relevant acoustic signals (*e.g.* ships, small boats, and other noise events). Combined event log data will then be organized into tables to provide summaries including (1) the number and type of acoustic events; (2) the number of days each event occurred at each site; and (3) event durations for each deployment and site. Graphs of daily event occurrence will be made for each identified marine mammal species that have sufficient data to plot. Graphs of the percentage of time for which signals from each species were detected with respect to total recording time at each site will be plotted by species.

Noise analysis will be performed on all recorded acoustic data. Sound levels will be measured for full and octave frequency bands. This analysis will be conducted using automated algorithms that measure root-mean-square (RMS) sound pressure level (SPL) each octave bands. These results will be averaged both hourly and daily to provide a synoptic representation of the ambient noise levels present at each location for each of the different frequency bands measured.

Monitoring Plan Peer Review

The MMPA requires that monitoring plans be independently peer reviewed ''where the proposed activity may affect the availability of a species or stock for taking for subsistence uses'' (16 U.S.C. 1371(a)(5)(D)(ii)(III)). Regarding this requirement, NMFS' implementing regulations state, ''Upon receipt of a complete monitoring plan, and at its discretion, [NMFS] will either submit the plan to members of a peer review panel for review or within 60 days of receipt of the proposed monitoring plan, schedule a workshop to review the plan'' (50 CFR 216.108(d)).

NMFS established an independent peer review panel to review SAE's 4MP for the proposed 3D seismic survey in the Beaufort Sea. The panel met in early March 2015, and provided comments and recommendations to NMFS in April 2015. The full panel report can be viewed on the Internet at: *http://www.nmfs.noaa.gov/pr/permits/incidental.htm.*

NMFS provided the panel with SAE's IHA application and monitoring plan and asked the panel to answer the following questions:

1. Will the applicant's stated objectives effectively further the understanding of the impacts of their activities on marine mammals and otherwise accomplish the goals stated above? If not, how should the objectives be modified to better accomplish the goals above?

2. Can the applicant achieve the stated objectives based on the methods described in the plan?

3. Are there technical modifications to the proposed monitoring techniques and methodologies proposed by the applicant that should be considered to better accomplish their stated objectives?

4. Are there techniques not proposed by the applicant (*i.e.,* additional monitoring techniques or methodologies) that should be considered for inclusion in the applicant's monitoring program to better accomplish their stated objectives?

5. What is the best way for an applicant to present their data and results (formatting, metrics, graphics, etc.) in the required reports that are to be submitted to NMFS (*i.e.,* 90-day report and comprehensive report)?

The peer-review panel report contains recommendations that the panel members felt were applicable to the SAE' monitoring plans. The peer-review panel believed that the objectives for both vessel-based and passive acoustic monitoring were appropriate. The panel also agreed that the objectives of real-time mitigation of potential disturbance of marine mammals would be mostly met through visual monitoring. However, there are some limitations associated with PSOs' ability to monitor the entire safety radii at all times. Specific panel recommendations are provided below.

(1) If SAE decides to use the larger airgun array (*i.e.,* the 1,240 in^3 array), SAE should conduct sound source verification;

(2) SAE should have an additional observer on the secondary source vessel such that at least two observers are on watch during all daylight hours;

(3) If SAE uses the 1,240 in^3 airgun array and the measured safety radii (exclusion zones) in the Beaufort Sea are similar to the measurement done in Cook Inlet (250 m for 190 dB and 910 m for 180 dB), SAE should have a dedicated scout (monitoring) vessel with at least 2 PSOs to monitor the 180 dB exclusion zone (910 m);

(4) If the seismic surveys are offshore, more acoustic sensors are needed at more locations than what is presented by SAE at the peer-review meeting (one sensor at each of the four corners);

(5) microMARS used for PAM should be deployed well before the seismic surveys begin in order to collect baseline data before all the vessels are operative in the area and the airgun arrays begin operating;

(6) SAE should develop a more compact mooring design for microMARS that are deployed in shallow waters, particularly because of the compact size of these recorders;

(7) Additional testing to be conducted to verify PAM recorders' performance due to the limited or non-existent field experience in long term deployments and cold Arctic waters;

(8) Improve the effectiveness of monitoring by using Unmanned Aerial Systems for monitoring of marine mammals in the Beaufort Sea;

(9) Provide information in the reports about how the detections obtained by the microMARS are ground-truthed;

(10) Acoustic characteristics of the identified noise sources be included in the reports to provide a better understanding of source levels and the robustness of SSV results, and other acoustic characteristics of the seismic survey equipment, such as spectral content, and received levels in different metrics such as RMS dB, cSEL 24h, dB peak to peak, and 1/3 octave bands;

(11) Sightability curves be included in the reports as much as possible;

(12) Coordinate and collaborate with other companies (such as Caelus and Repsol) for monitoring the aggregated effects of all their activities on spotted seals, especially animals that may be haulted out; and

(13) Continue to make all environmental data (including PSO observations, acoustic monitoring, vessel track lines and timing of operations) available to the general public.

In addition, though not solicited as part of the independent peer review of the monitoring, the peer review panel also recommended the following mitigation measures:

(1) SAE should limit seismic operations at night or during periods of low visibility because PSOs' ability to detect marine mammals entering the safety zone is limited;

(2) If a bowhead whale mother/calf pair or an aggregation of three or more bowhead whales are sighted within the Level B harassment zone prior to the onset of night or during that day, SAE could be more cautious during darkness based on the potential risk to marine mammals. If the risk is relatively high, it might be decided that airguns should be shut down for the night;

(3) SAE should not use a mitigation gun for longer than one hour, which is the equivalent amount of time for surveying the safety radii plus ramp up; and

(4) Mitigation gun should be shot only once every minute instead of every few seconds.

NMFS discussed the peer review panel report and the list of recommendations with SAE. For the aforementioned monitoring measures, NMFS requires and SAE agrees to implement the following:

(1) Conducting sound source verification if the 1,240 in^3 airgun array is used in the proposed 3D seismic survey;

(2) Mobilizing a dedicated scout (monitoring) vessel with at least 2 PSOs onboard to monitor the 180 dB exclusion zone (910 m) if the SSV test show that the 180 dB radius of the exclusion zone from the 1,240 in^3 airgun array is 910 m or larger;

(3) Deploying microMARS used for PAM at least three days before the seismic surveys till three days after the seismic survey in order to collect data for comparing the sound field before, during, and after the seismic survey;

(4) Deploying two microMARS units at each of the four corners (total of 8 microMARS units);

(5) Developing a more compact mooring design for microMARS that are deployed in shallow waters, particularly because of the compact size of these recorders;

(6) Conducting tests and calibration to verify PAM recorders' performance prior to deployment;

(7) Including sightability curves in the 90-day report;

(8) Making all environmental data (including PSO observations, acoustic monitoring, vessel track lines and timing of operations) available for valid scientific research.

In addition, NMFS worked with SAE on the following 5 of the panel recommendations and determined that these will also be required in the IHA issued to SAE with clarification and certain modifications to make them practicable for implementation. These measures are listed below:

(1) Regarding the number of PSOs onboard the secondary source vessel, this is to clarify that SAE plans to have two PSOs on both source vessels, and they will be working on a shift described earlier in the ''Monitoring Measure'' section of this document. Therefore, at any given time, there will be 2 PSOs monitoring from both source vessels. NMFS notes that the number of

PSOs is limited by the available berth on the seismic vessel. The source vessels SAE plan to use are small, and therefore, could only afford maximum of 2 PSOs onboard each vessel.

(2) Regarding ground-truth information in the reports about microMARS detection, SAE states that it should be able to identify bowhead and beluga calls from acoustic recordings. However, SAE states that it will be difficult to identify pinniped calls for species identification at distances, especially at the locations where the microMARS are deployed there will be no PSOs on watch to verify the calling animals. Therefore, ground-truth of acoustic data to specific species calls would not be possible. Nevertheless, as stated earlier, SAE will make the acoustic data available to researchers who are interested in studies that will shed light on marine mammal call identification.

(3) Regarding acoustic characteristics of the identified noise sources, and other acoustic characteristics of the seismic survey equipment, such as spectral content, and received levels in different metrics such as RMS dB, cSEL 24h, dB peak to peak, and 1/3 octave bands, SAE will work with its contractor to characterize the identified noise sources as much as possible within the limits of the microMARS. However, SAE states that some of the requested data analysis would require knowing not only the real-time distance of each noise sources, but the aspect (*e.g.,* forward, endfire) of the array as well. SAE states that for cost reasons, SAE cannot afford extended acoustic analysis beyond identified source characterization. Nevertheless, SAE will make the acoustic data available to researchers who are interested in additional studies of the noise field from data collected by SAE. In the IHA issued to SAE, NMFS requires that SAE at least perform basic acoustic characteristics of the identified noise sources that include spectral content and received levels in different metrics such as RMS dB, cSEL 24h, dB peak to peak, and 1/3 octave bands.

(4) Regarding coordinating and collaborating with other companies (such as Caelus and Repsol) for monitoring the aggregated effects of all their activities on spotted seals, especially animals that may be haulted out, SAE responded that they attempted to coordinate with other companies last year for spotted seal monitoring, but none agreed to cooperate. In addition, at this point it is unclear whether any other companies in the Beaufort Sea may be conducting pinnipeds haul-out aerial surveys in the 2015 open-water season. Nevertheless, NMFS encourages SAE again to seek cooperation with other companies who may be conducting aerial surveys with the goal that information collected during those surveys will assist SAE in monitoring pinnipeds use of haul-out sites before, during, and after SAE's planned seismic survey.

The only recommendation from the peer-review panel SAE is not able to implement is the utilization of Unmanned Aerial Systems (UAS) for monitoring of marine mammals in the Beaufort Sea for marine mammal monitoring. The major reason for this is that using UAS for marine mammal monitoring is still not a proven technology to provide an effective monitoring modality. The resolution from the UAS video camera does not have high resolution, especially for pinniped survey due to the small size of the animals. In addition, SAE states that the expense of flying a UAS is cost-prohibitive for the company. NMFS agrees with SAE's reasoning. Therefore, this recommendation is not included in the IHA issued to SAE.

With regards to the panel's mitigation recommendations, NMFS agrees with the panel that mitigation airgun should be fired at a rate of 1 shot per minute instead of every few seconds. This condition is required in the IHA issued to SAE.

Regarding the remaining three mitigation measures provided by the peer-review panel, SAE and NMFS discussed and decided that it is important to be consistent with existing mitigation practices for typical 3D seismic surveys unless new scientific information is available that warrant a change. These mitigation measures are described in the ''Mitigation'' section above. These three mitigation recommendations from the panel are addressed and clarified below:

(1) *Limiting seismic operations at night or during periods of low visibility:* This recommendation is not consistent with existing mitigation practices for a typical marine seismic survey, which require no airgun ramping up when the entire exclusion zone cannot be cleared due to low visibility. However, if the entire exclusion zone can be visually cleared by PSOs, a ramp up can be commenced and, as long as no shutdown occurs during the course of the survey, airgun firing can continue into night or during periods of low visibility. By limiting seismic operations at night or during periods of low visibility, SAE would not be able to complete its 3D seismic survey during the project period and would have to come back the following year to continue their work. This can be cost-prohibitive for the company and will also extend the season when the marine environment is affected.

(2) *Be more cautious during darkness based on the potential risk to marine mammals if a bowhead whale mother/calf pair or an aggregation of three or more bowhead whales are sighted within the Level B harassment zone prior to the onset of night or during that day. If the risk is relatively high, airguns should be shut down for the night:* The panel did not define what constitutes ''the risk is relatively high'', and without a clear definition, NMFS considers that this recommendation cannot be made into a requirement. Additionally, as discussed in (1) above, ceasing seismic activities at night because bowhead whale mother/calf pair or an aggregation of three or more bowhead whales are sighted within the Level B harassment zone during the day would be cost-prohibitive, especially consider that the potential risk is not identified.

(3) *Mitigation gun not to be operated for more than one hour:* NMFS does not allow extended use of ''mitigation airgun'' when the seismic survey is not ongoing, just so that the applicant can ramp up at night or without the 30-minute clearance before ramping up airgun arrays. However, NMFS allows a single airgun (so called ''mitigation gun'') to be kept on for turning from one track to the next and for short transiting purposes. SAE, as well as other seismic surveyors (*e.g.,* BP), state that for 3D seismic surveys, an approximately 3-hour time frame is needed to complete a turn or short transit, and NMFS has been requiring the applicants to use the smallest single airgun for a maximum of 3 hours for turning and short transiting purposes (*e.g.,* IHA to SAE's 3D seismic survey in 2014 open-water season in Beaufort Sea). Further, the panel did not provide a justification for its recommendation of maximum of one-hour use of ''mitigation airgun''. Therefore, to be consistent with the existing mitigation measures, NMFS again requires that SAE use the ''mitigation airgun'' for turning and short line transiting only, with a maximum operation time of 3 hours.

Reporting Measures

(1) Sound Source Verification Report

As discussed earlier, if SAE plans to use the 1,240 in^3 airgun arrays, SSV tests on these arrays will be required. A report on the preliminary results of the sound source verification measurements, including the measured 190, 180, 170, and 160 dB (rms) radii of the 1,240 in^3 airgun array, would be submitted within 14 days after collection of those measurements at the start of the field season.

(2) Weekly Reports

SAE will submit weekly reports to NMFS no later than the close of business (Alaska Time) each Thursday during the weeks when seismic surveys take place. The field reports will summarize species detected, in-water activity occurring at the time of the sighting, behavioral reactions to in-water activities, and the number of marine mammals exposed to harassment level noise.

(3) Monthly Reports

SAE will submit monthly reports to NMFS for all months during which seismic surveys take place. The monthly reports will contain and summarize the following information:

• Dates, times, locations, heading, speed, weather, sea conditions (including Beaufort Sea state and wind force), and associated activities during the seismic survey and marine mammal sightings.

• Species, number, location, distance from the vessel, and behavior of any sighted marine mammals, as well as associated surveys (number of shutdowns), observed throughout all monitoring activities.

• An estimate of the number (by species) of: (i) Pinnipeds that have been exposed to the seismic surveys (based on visual observation) at received levels greater than or equal to 160 dB re 1 μPa (rms) and/or 190 dB re 1 μPa (rms) with a discussion of any specific behaviors those individuals exhibited; and (ii) cetaceans that have been exposed to the geophysical activity (based on visual observation) at received levels greater than or equal to 160 dB re 1 μPa (rms) and/or 180 dB re 1 μPa (rms) with a discussion of any specific behaviors those individuals exhibited.

(4) Technical Report

The results of SAE's 2015 vessel-based monitoring, including estimates of ''take'' by harassment, will be presented first in a ''90-day'' draft Technical Report, to be submitted to NMFS within 90 days after the end of the seismic survey, and then in a final Technical Report, which will address any comments NMFS had on the draft. The Technical Report will include:

(a) Summaries of monitoring effort (*e.g.,* total hours, total distances, and marine mammal distribution through the study period, accounting for sea state and other factors affecting visibility and detectability of marine mammals);

(b) Analyses of the effects of various factors influencing detectability of marine mammals (*e.g.,* sea state, number of observers, and fog/glare);

(c) Species composition, occurrence, and distribution of marine mammal sightings, including date, water depth, numbers, age/size/gender categories (if determinable), group sizes, and ice cover;

(d) Data analysis separated into periods when a seismic airgun array (or a single mitigation airgun) is operating and when it is not, to better assess impacts to marine mammals—the final and comprehensive report to NMFS should summarize and plot:

• Data for periods when a seismic array is active and when it is not; and

• The respective predicted received sound conditions over fairly large areas (tens of km) around operations;

(e) Sighting rates of marine mammals during periods with and without airgun activities (and other variables that could affect detectability), such as:

• Initial sighting distances versus airgun activity state;

• Closest point of approach versus airgun activity state;

• Observed behaviors and types of movements versus airgun activity state;

• Numbers of sightings/individuals seen versus airgun activity state;

• Distribution around the survey vessel versus airgun activity state; and

• Estimates of take by harassment;

(f) Results from all hypothesis tests, including estimates of the associated statistical power, when practicable;

(g) Estimates of uncertainty in all take estimates, with uncertainty expressed by the presentation of confidence limits, a minimum-maximum, posterior probability distribution, or another applicable method, with the exact approach to be selected based on the sampling method and data available;

(h) A clear comparison of authorized takes and the level of actual estimated takes;

(i) Acoustic characteristics of the identified noise sources. These should include the acoustic characteristics of the seismic survey equipment, such as spectral content, and received levels in different metrics such as RMS dB, cSEL 24h, dB peak to peak, and 1/3 octave bands; and

(j) Provide sightability curves in the 90-day report.

(5) Data Sharing and Research Collaboration

(a) Make all environmental data (including PSO observation, acoustic monitoring, vessel track lines and timing of operations) available for valid scientific research purposes; and

(b) Make a best effort to coordinate and collaborate with other companies for monitoring the aggregated effects of all their activities on spotted seals, especially animals that many be hauled out.

(6) Notification of Injured or Dead Marine Mammals

In the unanticipated event that the specified activity clearly causes the take of a marine mammal in a manner prohibited by the IHA, such as a serious injury, or mortality (*e.g.,* ship-strike, gear interaction, and/or entanglement), SAE would immediately cease the specified activities and immediately report the incident to the Chief of the Permits and Conservation Division, Office of Protected Resources, NMFS, and the Alaska Regional Stranding Coordinators. The report would include the following information:

• Time, date, and location (latitude/longitude) of the incident;

• Name and type of vessel involved;

• Vessel's speed during and leading up to the incident;

• Description of the incident;

• Status of all sound source use in the 24 hours preceding the incident;

• Water depth;

• Environmental conditions (*e.g.,* wind speed and direction, Beaufort sea state, cloud cover, and visibility);

• Description of all marine mammal observations in the 24 hours preceding the incident;

• Species identification or description of the animal(s) involved;

• Fate of the animal(s); and

• Photographs or video footage of the animal(s) (if equipment is available).

Activities would not resume until NMFS is able to review the circumstances of the prohibited take. NMFS would work with SAE to determine what is necessary to minimize the likelihood of further prohibited take and ensure MMPA compliance. SAE would not be able to resume its activities until notified by NMFS via letter, email, or telephone.

In the event that SAE discovers a dead marine mammal, and the lead PSO determines that the cause of the death is unknown and the death is relatively recent (*i.e.,* in less than a moderate state of decomposition as described in the next paragraph), SAE would immediately report the incident to the Chief of the Permits and Conservation Division, Office of Protected Resources, NMFS, and the NMFS Alaska Stranding Hotline and/or by email to the Alaska Regional Stranding Coordinators. The report would include the same information identified in the paragraph above. Activities would be able to continue while NMFS reviews the circumstances of the incident. NMFS would work with SAE to determine whether modifications in the activities are appropriate.

In the event that SAE discovers a dead marine mammal, and the lead PSO determines that the death is not associated with or related to the activities authorized in the IHA (*e.g.,* previously wounded animal, carcass with moderate to advanced decomposition, or scavenger damage), SAE would report the incident to the Chief of the Permits and Conservation Division, Office of Protected Resources, NMFS, and the NMFS Alaska Stranding Hotline and/or by email to the Alaska Regional Stranding Coordinators, within 24 hours of the discovery. SAE would provide photographs or video footage (if available) or other documentation of the stranded animal sighting to NMFS and the Marine Mammal Stranding Network. SAE can continue its operations under such a case.

Monitoring Results From Previously Authorized Activities

SAE was issued an IHA for a 3D OBN seismic survey in the same area of the proposed 2015 seismic survey in the Beaufort Sea during the 2014 Arctic open-water season. SAE conducted the seismic survey between August 25 and September 30, 2014. The technical report (90-day report) submitted by SAE indicates that one beluga whale and 2 spotted seals were observed within the 180–dB exclusion zones during the survey that prompted immediate shutdown. Two additional spotted seals were detected within the zone of influence when the airgun arrays were firing. Post-activity analysis based on total sighting data concluded that up to approximately 5 beluga whales and 264 pinnipeds (likely all spotted seals due to their large numbers) could be exposed to received levels above 160-dB re 1 μPa. Some of these could be exposed to levels that may have Level A harassment which was not authorized under the previous IHA. Nevertheless, take of Level B harassment were under the take limits allowed by the IHA issued to SAE.

Based on the monitoring results from SAE's 2014 seismic survey, NMFS is re-evaluating the potential effects on marine mammals and requested SAE to conduct analysis on potential Level A takes (see ''Estimated Take by Incidental Harassment'' section below).

Estimated Take by Incidental Harassment

Except with respect to certain activities not pertinent here, the MMPA defines ''harassment'' as: any act of pursuit, torment, or annoyance which (i) has the potential to injure a marine mammal or marine mammal stock in the wild [Level A harassment]; or (ii) has the potential to disturb a marine mammal or marine mammal stock in the wild by causing disruption of behavioral patterns, including, but not limited to, migration, breathing, nursing, breeding, feeding, or sheltering [Level B harassment].

Takes by Level A and Level B harassments of some species are anticipated as a result of SAE's proposed 3D seismic survey. NMFS expects marine mammal takes could result from noise propagation from operation of seismic airguns. NMFS does not expect marine mammals would be taken by collision with seismic and support vessels, because the vessels will be moving at low speeds, and PSOs on the survey vessels and the mitigation vessel will be monitoring for marine mammals and will be able to alert the vessels to avoid any marine mammals in the area.

For impulse sounds, such as those produced by the airguns proposed to be used in SAE's 3D OBN seismic surveys, NMFS uses the 180 and 190 dB (rms) re 1 μPa isopleth to indicate the onset of Level A harassment for cetaceans and pinnipeds, respectively; and the 160 dB (rms) re 1 μPa isopleth for Level B harassment of all marine mammals. SAE provided calculations of the 190-, 180-, and 160-dB isopleths expected to be produced by the proposed seismic surveys and then used those isopleths to estimate takes by harassment. NMFS used those calculations to make the necessary MMPA findings. SAE provided a full description of the methodology used to estimate takes by harassment in its IHA application, which is also provided in the following sections.

Acoustic Footprint

The acoustical footprint that could cause harassment (Levels A and B) was determined by placing a 160-dB isopleth buffer around the area that would be surveyed (shot) during the 2015 open water season (777 km^2). SAE stated that for the majority of its proposed 2015 seismic survey, a 620 in^3 airgun array would be used. However, to make conservative impact analysis, SAE uses the acoustic footprint of a large 1,240 in^3 array for this analysis.

There are no precise estimates for the 1,240-in^3 array. The estimated distances to the 160 dB isopleth for the 1,240-in^3 array are based on the sound source measurements from Austin and Warner (2012) for a 1,200-in^3 array in Cook Inlet. The results showed a measured distance of 5.2 km to the 160 dB isopleths (Table 2). Placing a 5.2-km buffer around the 777 km^2 maximum shot area results in an estimated annual ZOI of 1,463 km^2 (565 mi^2), which is the ZOI value used in the exposure estimate calculations.

Because the exact location of the 2015 shoot area is currently unknown, the distribution of marine mammal habitat within the shoot area is unknown. However, within the 4,562 km^2 potential survey box, 19% (860 km^2) falls within the 0 to 1.5 m water depth range, 16% (753 km^2) falls within the 1.5 to 5 m range, 36% (1,635 km^2) within the 5 to 15 m range, and 29 percent% (1,348 km^2) within waters greater than 15 m deep (bowhead migration corridor). Thus, not all the area that could be surveyed in 2015 constitutes bowhead summer (≤5 m depth) or fall migrating (≤15 m depth) habitat. Further, few of the lease areas that could be shot in 2015 extend into the deeper waters of the potential survey box. The distribution of these depth ranges is found in Figure 6–1 of SAE's IHA application.

Marine Mammal Densities

In the **Federal Register** notice (80 FR 20084; April 14, 2015) for the proposed IHA, NMFS used the aerial survey data (Ferguson and Clarke 2013) collected in the Beaufort Sea during the Aerial Surveys of Arctic Marine Mammals (ASAMM) program in 2012 and 2013 for bowhead whale density calculation. At the time of the proposed IHA stage, 2014 density data had not been vetted. Subsequently, the 2014 aerial survey data for bowhead whale became available, and NMFS was advised by the National Marine Mammal Laboratory (NMML) and NMFS Alaska Regional Office (AKRO) to use the 2008—2014 bowhead and beluga whale survey data and a g(0) of 0.8696 and f(0) of 0.07 for density estimates. Both g(0) and f(0) are factors used to correct the potential presence of animals not detected and potential missed sighting from the survey. The results showed much higher density for bowhead whale within the SAE's proposed 3D seismic survey area. The revised bowhead whale density, along with densities of other marine mammals that could be affected by SAE's 3D seismic survey, are provided in Table 3.

TABLE 3. MARINE MAMMAL DENSITIES (#/km²) IN THE BEAUFORT SEA

Species	Summer	Fall
Bowhead whale	0.1674	0.4828
Beluga whale	0.0020	0.0057
Ringed seal	0.3547	0.2510
Spotted seal	0.0177	0.0125
Bearded seal	0.0177	0.0125

Level B Exposure Calculations

In the **Federal Register** notice (80 FR 20084; April 14, 2015) for the proposed IHA, NMFS performed marine mammal take estimates by multiplying animal density and the total ensonified area of the entire survey without incorporating a time vector. However, the Commission pointed out in its comment that such method does not take into account the potential of new animals moving into the ensonified area during the course of the survey. NMFS also realized that although such method provides take estimates that closely matched the actual estimated takes provided in the 90-day reports (with corrections to count for animals missed due to avoidance of seismic exposure and missed detection), the potential of not counting new animals moving into the area could underestimate the actual take. Therefore, in response to the Commission's response, NMFS is incorporating a time vector, survey days, into take estimates by multiplying animal density and daily ensonified area and the number of survey days. However, this method provides the number of instances of take without accounting for the fact that some individuals may be taken more than once during the survey. Since the same animal is very likely to be taken multiple times on different days, this method presents a serious issue when analyzing the number of unique animals from a given population that are harassed. To address this issue, NMFS applied a correction factor, the daily turnover rate, to provide take estimates that are more realistic.

1. Daily Ensonified Area

SAE states that regardless the size of the airgun array, the daily survey area is 18.75 mi². However, the daily ensonified areas, which are the daily survey areas in additional to areas that would be ensonified to 160 dB re 1 μPa, would vary with the size of the airgun array used. The specific daily ensonified areas depend on the ensonified radii from different airgun arrays shown in Table 2. For the 620 in³ airgun array, the daily ensonified area out to the 160 dB re 1 μPa is 43.6 mi², or 113 km². For the 1,240 in³ airgun array, the daily ensonified area out the 160 dB re 1 μPa is 117 mi², or 303 km².

Assuming that the survey areas of different bathymetry are proportionally represented by the bathymetry of the entire survey box, then 19% of the survey area will be less than 1.5 m deep, 16% survey area is 1.5–5 m deep, 36% survey area 5–15 m deep, and the remaining 29% survey area is deeper than 15 m. As stated earlier, waters below 5 m deep are not bowhead whale habitat, therefore, bowhead takes are excluded from these waters. In addition, waters below 15 m deep are not bowheads habitat during the fall, therefore, they are also excluded for take calculation for SAE's 3D survey in the fall.

No adjustments were made for beluga whales, and ringed, spotted, and bearded seals, as they could appear in much shallower waters.

2. Number of Survey Days

As discussed in the **Federal Register** notice (80 FR 20084; April 14, 2015) and in this document, within the total of 107 days of this IHA (from July 1 to October 15, 2015), SAE states that survey is anticipated to last 70 days, of which approximately 70% of the time, or a total of 49 days, when the actual seismic survey using airgun arrays will be occurring, depending on weather and ice conditions. Though it cannot be predicted the exact days when incremental weather and ice conditions would present the surveys, for the purpose of this analysis, NMFS prorated survey days in summer (July 1 to August 31) and in fall (September 1 to October 15) with the total days in summer (62 days) and fall (45 days), which yielded 28 survey days in summer and 21 survey days in fall.

3. Turnover Rate of Marine Mammals

For bowhead whales, during the summer period into early fall (August to October), they are often observed feeding from Smith Bay to Point Barrow (Clarke & Ferguson, 2010a, 2010b; Clarke *et al.* 2011a, 2011b, 2012, 2013). In other areas of the western Beaufort Sea (including the SAE's proposed seismic survey area), bowhead whales may feed on the continental shelf, out to approximately the 50-m isobath, in September and October (Clarke *et al.* 2015). In the fall period (September and October), bowhead whales are observed migrating through the western Beaufort Sea primarily on the shelf (including the SAE's proposed seismic survey area), at depths less than 50 m, with some whales migrating across the outer shelf (Clarkes *et al.,* 2015).

It is difficult to determine an average turnover time for individual bowhead whales in a particular area of the Beaufort Sea. Reasons for this include differences in residency time between migratory and non-migratory periods, changes in distribution of food and other factors such as behavior that influence animal movement, variation among individuals, etc.

Complete turnover of individual bowhead whales in the project area each 24-hour period is possible during distinct periods within the fall migration when bowheads are traveling through the area, however, bowheads often move in pulses with one to several days between major pulses of whales (Miller *et al.* 2002). Gaps between groups of traveling whales during fall migration result in days when no bowhead whales would be expected to be present in the activity area. The absence of bowhead whales during periods of the fall migration can likely be attributed to individuals stopping to feed opportunistically when food is encountered, which is known to occur annually in an area north of Barrow (Citta *et al.* 2014). The extent of feeding by bowhead whales during fall migration varies greatly from year to year based on the location and abundance of prey (Shelden and Mocklin 2013). For these reasons, NMFS believes a daily 100% turnover period for bowhead whales is unnecessarily conservative and has selected a daily turnover rate of 50% to account for both feeding (where animals stay relatively within an area) and migration (where animals are moving across an area) in both fall and winter.

For beluga whales, two stocks are potentially present in the SAE 3D seismic survey areas: the East Chukchi Sea and Beaufort Sea stocks. Since they cannot be visually distinguished in the field, the proportion of take form each stock in the seismic survey area in Beaufort Sea cannot be determined (Allen and Angliss 2014). Thus it would be difficult to assess the turnover rate of beluga whales because each different stock has its own migratory pattern and time. Therefore, NMFS used the most conservative measure of assuming complete turnover of the animals every 24 hours, making a daily turnover rate of 100% for a more conservative take calculation.

For ringed seals, satellite tagging data from tagging studies fromthe State of Alaska Department of Fish and Game's Marine Mammals Program, the Ice Seal Committee, and interested seal hunters from villages along the west and north coasts of Alaska were used to derive a turnover rate for this species. Data from these tagged animals showed that in addition to a long distance seasonal migration, there are many instances from July through September when individual ringed seals stayed in a relatively small area (compared to their migration route) up to multiple weeks, including on and around the offshore continental shelf leased blocks. In addition, Patterson *et al.* (2014) indicate a turnover period of a week or more for individual seals in the vicinity of the seismic survey in the Alaskan Arctic may be more appropriate, based on the 6–24 day area occupancy. These results suggest that assuming a 100% turnover of all individual seals around SAE's seismic survey box on a daily basis is unreasonable, and a period closer to a week may be more appropriate and yet still conservative for other individuals that remained in the area for longer periods. Therefore, for the purpose of this IHA, NMFS used a slightly higher turnover rate than the weekly rate, *i.e.,* a 48-hour (or 50%) turnover rate, to be more conservative.

Few data are available on the home range and movement patterns of the other two ice seals, the bearded seal and spotted seals. Therefore, we used the most conservative daily turnover rate for take estimates of these species.

4. Use of Different Size of Airgun Arrays

As discussed in the **Federal Register** notice (80 FR 20084; April 14, 2015) for the proposed IHA and early in this document, two types of airgun arrays will be used during SAE's 3D seismic survey in the Beaufort Sea: 620 in^3 and 1,240 in^3 airgun arrays. Upon inquiry from NMFS regarding the frequency of different airgun arrays being used, SAE expects that approximately 80% of the survey would be done using the 620 in^3 array, with the remaining by the 1,240 in^3 array. Therefore, the take number estimates reflect the combination of takes from each of these two airgun arrays in a 4:1 ration for the 620 in^3 vs. 1,240 in^3 arrays.

Based on the above described take estimate calculation by multiplying ensonified area by animal density by survey days in specific marine mammal habitat and season, adjusted by turnover rates and different airgun usage, the estimated number of bowhead and beluga whales, and ringed, spotted, and bearded seals can be calculated. A summary of the calculation is provided in Table 4 below.

TABLE 4—SUMMARY OF CALCULATION OF MARINE MAMMAL EXPOSED TO RECEIVED LEVELS HIGHER THAN 160 dB RE 1 μPa FOR SAE'S PROPOSED 3D SEISMIC SURVEY

Species (habitat)	Summer				Fall				All seasons		
	ZOI (km^2)	Days	Density (km^{-1})	Summer exposure	ZOI (km^2)	Days	Density (km^{-1})	Fall exposure	Turnover	Airgun usage	Total adjusted exposure
Airgun array volume: 620 in^3											
Bowhead whale	113	....	....	344	113	....	....	332.2	50	80	271

The potential takes of spotted seals are adjusted based on observations during SAE's 2014 seismic operations immediately east of the Colville River Delta (Lomac-MacNair *et al.,* 2014). The 90-day report (Lomac-MacNair *et al.,* 2014) reported only 5 confirmed sightings of ringed seals, none of which were observed during active seismic activity. But a total of 40 spotted seals (4 during seismic surveys) and an additional 28 seals (could be either ringed or spotted seals, with 4 during seismic surveys) were observed. Given only 88 km^2 were shot in 2014, this would extrapolate to about 353 spotted seals observed during the planned 777 km2 of operations planned in 2015. If 80% of the ringed/spotted seal sightings were actually spotted seals, then an additional 200 spotted seals would be observed during the seismic survey. Given the nearshore location of the planned seismic activities and proximity to Colville River Delta spotted seal haulout sites, and likelihood that a number of seals that were exposed to seismic noise exceeding 160 dB were not observed, NMFS corrected the spotted seal takes to 500.

No density data for gray whale is available in the SAE's proposed survey area, because gray whale occurrence in the Beaufort Sea is not frequent, especially in nearshore water where SAE's survey area is. Based on sighting data, only a few gray where have been documented in the nearshore Beaufort Sea (Green and Negri, 2005, Green *et al.,* 2007). Therefore, it is estimated up to 2 gray whales could be taken by Level B harassment as a result of SAE's 3D seismic survey during the 2015 open-water season in the Beaufort Sea.

A summary of estimated number of marine mammal potentially exposed to received sound levels greater than 160 dB re 1 μPa is provided in Table 6.

Level A Exposure Calculations

As discussed earlier in this section, NMFS considers that exposures to pinnipeds at noise levels above 190 dB and cetaceans at noise levels above 180 dB constitute Level A takes under the MMPA. Although brief exposure of marine mammals at these levels are not likely to cause TTS or PTS (Southall *et al.* 2007), this consideration is a precaution NMFS takes for its effect analysis.

The methods used in estimate Level A exposure is the same for Level B estimates, *i.e.,* multiplying the total amount of area available to the species that could be seasonally ensonified by noise levels exceeding 190 and 180 dB by density of each species by the number of survey days in each season, then corrected by the animals turnover rates and different airgun array usage. The results of potential Level A exposure are shown in Table 5, assuming that animals will not avoid being exposed to received levels that could cause hearing threshold shifts or even injury, which is highly unlikely, and that no mitigation and monitoring measures would be implemented to avoid Level A takes.

TABLE 5—SUMMARY OF CALCULATION OF CETACEANS EXPOSED TO RECEIVED LEVELS HIGHER THAN 180 Db AND PINNIPEDS EXPOSURE TO RECEIVED LEVELS HIGHER THAN 190 dB RE 1 μPa, WITH NO CONSIDERATION OF ANIMALS AVOIDING LEVEL A EXCLUSION ZONE AND NO MONITORING AND MITIGATION MEASURES ARE IN PLACE TO AVOID SUCH EXPOSURES

It is important to note that the numbers presented in Table 5 are not the Level A take numbers. These numbers represent an unlikely scenario of exposure incidences if an animal did not avoid the intense noise field that could cause hearing impairment or injury and no monitoring or mitigation measures were implemented to avoid such consequences. Literature (*e.g.,* Richardson *et al.* 1995, 1999; Southall *et al.* 2007) shows that marine mammals often avoid areas with intense noises, especially bowhead whales, even when the received noise levels are way below the levels that could elicit Level B harassment. Although this avoidance of an area by the marine mammals does not preclude the animals being taken by Level B harassment, it lessens the likelihood that they will be exposed above 180 dB for cetaceans and 190 dB for pinnipeds and incur hearing impairment or injury.

Most importantly, monitoring and mitigation measures prescribed in the IHA require SAE to shut down or power down airgun arrays when a marine mammal is detected approaching, therefore, potential Level A harassment can be further avoided. Especially for non-deep diving large cetaceans such as bowhead whales (and to some extent beluga whales), vessel-based visual monitoring is effective to detect the whales before they enter the exclusion zone, as shown in previous 90-day reports from SAE and other open-water seismic survey activities. Nevertheless, in the unlikely case if a marine mammal is not detected by the PSO and did not avoid the 180 or 190 dB established for cetaceans and pinnipeds, respectively, a Level A take could occur. To derive more realistic Level A take estimates and in discussion with the Commission, NMFS consulted with the ESA biologists at NMFS Alaska Region. In addition, NMFS reviewed the monitoring results from SAE's 90-day report of its 2014 3D seismic survey in the same area with similar airgun arrays and vessel types, and also reviewed monitoring results from other monitoring reports in nearby waters in Beaufort Sea using similar sizes of airgun arrays (*e.g.,* BP's 2012 Simpson Lagoon 3D seismic survey and BP's 2014 North Prudhoe Bay 3D seismic survey). Based on the review of these monitoring plans (including consideration of missed detections), the likely effectiveness of the mitigation and the likely avoidance of high levels of sound, NMFS modified the authorized Level A take as follows: 1 bowhead whale, 4 beluga whale, 20 ringed seals, 20 spotted seals, and 10 bearded seals.

A summary of authorized Level A and Level B harassments for SAE's 3D seismic surveys in the Colville Delta of the Beaufort Sea is provided in Table 6.

TABLE 6—THE AUTHORIZED LEVEL A AND LEVEL B HARASSMENTS OF MARINE MAMMALS FOR SAE'S 2015 OPEN-WATER 3D SEISMIC SURVEY IN THE BEAUFORT SEA

Species	Stock abundance	Authorized Level B harassment	Authorized Level A harassment	% of take by stock
Bowhead whale	19,534	452	1	2.31
Beluga whale (Beaufort Sea stock)	39,258	27	4	0.07
Beluga whale (E. Chukchi Sea stock)	3,710	27	4	0.73
Gray whale	19,126	2	0	0.01
Ringed seal	300,000	1,148	20	0.39
Spotted seal	141,479	500	20	0.35
Bearded seal	155,000	115	10	0.07

The estimated Level A and Level B takes as a percentage of the marine mammal stock are 2.31% or less in all cases (Table 6). The highest percent of population estimated to be taken is 0.005% for Level A and 2.31% for Level B harassments for bowhead whale. For beluga whales, since there are two stocks in the proposed action, the percentage of the takes represent the worst case scenario when all takes occur in Beaufort Sea stock (0.07%) or East Chukchi Sea stock (0.73%). However, most likely the percentage of takes for each stock would not be this worst case scenario.

Analysis and Determinations

Negligible Impact

Negligible impact is ''an impact resulting from the specified activity that cannot be reasonably expected to, and is not reasonably likely to, adversely affect the species or stock through effects on annual rates of recruitment or survival'' (50 CFR 216.103). A negligible impact finding is based on the lack of likely adverse effects on annual rates of recruitment or survival (*i.e.,* population-level effects). An estimate of the number of Level B harassment takes, alone, is not enough information on which to base an impact determination. In addition to considering estimates of the number of marine mammals that might be ''taken'' through behavioral harassment, NMFS must consider other factors, such as the likely nature of any responses (their intensity, duration, etc.), the context of any responses (critical reproductive time or location, migration, etc.), as well as the number and nature of estimated Level A harassment takes, the number of estimated mortalities, effects on habitat, and the status of the species.

To avoid repetition, this introductory discussion of our analyses applies to all the species listed in Table 6, given that the anticipated effects of SAE's 3D seismic survey project on marine mammals are expected to be relatively similar in nature. Where there are meaningful differences between species or stocks, or groups of species, in anticipated individual responses to activities, impact of expected take on the population due to differences in population status, or impacts on habitat, they are described independently in the analysis below.

No serious injuries or mortalities are anticipated to occur as a result of SAE's proposed 3D seismic survey, and none are proposed to be authorized. The takes that are anticipated and authorized are expected to be limited to short-term Level B behavioral harassment, and Level A harassment in the form of permanent hearing threshold shifts. While the airguns are expected to be operated for approximately 49 days within a 70-day period, the project timeframe will occur when cetacean species are typically not found in the project area or are found only in low numbers. While pinnipeds are likely to be found in the proposed project area more frequently, their distribution is dispersed enough that they likely will not be in the Level A or Level B harassment zone continuously. As mentioned previously in this document, pinnipeds appear to be more tolerant of anthropogenic sound than mysticetes.

Bowhead Whales

The bowhead whale is listed as endangered species under the ESA and depleted under the MMPA. However, despite these designations, the Bering-Chukchi-Beaufort stock of bowheads has been increasing at a rate of 3.4% annually for nearly a decade (Allen and Angliss, 2011), even in the face of ongoing industrial activity. Additionally, during the 2001 census, 121 calves were counted, which was the highest yet recorded. The calf count provides corroborating evidence for a healthy and increasing population (Allen and Angliss, 2011).

Most of the bowhead whales encountered will likely show overt disturbance (avoidance) only if they receive airgun sounds with levels ≥ 160 dB re 1 μPa. In addition, elevated background noise level from the seismic airgun reverberant field could cause acoustic masking to bowhead whales and reduce their communication space. However, even though the decay of the signal is extended, the fact that pulses are separated by approximately 8 to 10 seconds for each individual source vessel (or 4 to 5 seconds when taking into account the two separate source vessels stationed 300 to 335 m apart) means that overall received levels at distance are expected to be much lower, thus resulting in less acoustic masking.

Bowhead whales are less likely to occur in the proposed project area in July and early August, as they are found mostly in the Canadian Beaufort Sea at this time. The animals are more likely to occur later in the season (late-August through October), as they head west towards Chukchi Sea.

It is estimated that a maximum of 452 bowhead whales (2.31%) could be taken by Level B harassment. Potential impacts to bowhead whales from SAE's 3D seismic surveys would be limited to brief behavioral disturbances and temporary avoidance of the ensonified areas.

In their westward migration route, bowhead whales have been observed to feed in the vicinity of the survey area in the Beaufort Sea. Most of the feedings are observed in the September to October period as more bowhead whales are moving through the migratory corridor in the Beaufort Sea. Therefore, the areas in offshore Beaufort Sea are considered as biologically important areas for bowhead whales in September and October (Clarke *et al.* 2015). However, their habitat is in relatively deeper water > 15 m, which accounts for only 29% of SAE's proposed seismic survey area.

The proposed activity also partially overlaps with BIAs where bowhead whale mother/calf pairs are sighted in the summer and fall and BIAs of bowhead whale fall migration (Clarke *et al.,* 2015). However, as discussed previously, the majority of the survey areas (71%) are in shallow waters < 15 m, and are not considered bowhead habitat in the fall. In the summer, bowhead whale habitat extends to much shallower area of < 5 m, which counts for about 65% of the proposed 3D seismic survey areas.

Due to the relatively small airgun arrays to be used in the SAE's 3D seismic survey, noise exposure to bowhead whales is expected to be low and would in almost all cases cause Level B harassment in the form of mild and temporary behavioral modification and/or avoidance. Moreover, the majority of the ensonified areas (67%) would fall between 160 and 166 dB re 1 μPa for impulse noise, which at the low-end of the range for Level B behavioral harassment by noise exposure.

It is estimated that up to 1 bowhead whale could be exposed to received noise levels above 180 dB re 1 μPa (rms) for durations long enough to cause PTS, if the animal does not avoid the area for some reason and is not detected in time to have mitigation measures implemented. Marine mammals that are taken by TTS (which is a form of Level B harassment) are expected to receive minor (in the order of several dBs) and brief (minutes to hours) temporary hearing impairment because (1) animals are not likely to remain for prolonged periods within high intensity sound fields, and (2) both the seismic vessel and the animals are constantly moving, and it is unlikely that the animal will be moving along with the vessel during the survey. Although repeated experience to TTS (Level B harassment) could result in PTS (Level A harassment), for the same reasons discussed above, even if marine mammals experience PTS, the degree of PTS is expected to be mild, resulting in a few dB elevation of hearing threshold, and are not expected to be biologically significant for the population or species.

Beluga Whale

Odontocete reactions to seismic airgun pulses are generally assumed to be limited to shorter distances from the airgun than are those of mysticetes (*e.g.,* bowhead whales), in part because odontocete low-frequency hearing is assumed to be less sensitive than that of mysticetes. However, at least when in the Canadian Beaufort Sea in summer, belugas appear to be fairly responsive to seismic energy, with few being sighted within 6–12 mi (10–20 km) of seismic vessels during aerial surveys (Miller *et al.* 2005). Belugas will likely occur in small numbers in the Beaufort Sea during the survey period and few will likely be affected by the survey activity.

Beluga whales are less likely to occur in the proposed project area in July and early August, as they are found mostly in the Canadian Beaufort Sea at this time. The animals are more likely to occur later in the season (late-August through October), as they head west towards Chukchi Sea. However, most beluga whales are expected to occur in much deeper water offshore in the Beaufort Sea during its migration. The beluga whale fall migration BIAs are approximately 75 km offshore from the SAE's proposed seismic survey area (Clarke *et al.,* 2015). No other beluga whale BIAs overlap with SAE's proposed survey area.

It is estimated that a maximum of 27 beluga whales (0.07% from the Beaufort Sea stock if all animals taken are from the Beaufort Sea stock, or 0.73% from the East Chukchi Sea stock if all animals taken are from the East Chukchi Sea stock) could be taken by Level B harassment. Potential impacts to beluga whales from SAE's 3D seismic survey activity include brief behavioral disturbances and temporary avoidance of the ensonified areas.

It is estimated that up to 4 beluga whales could be exposed to received noise levels above 180 dB re 1 μPa (rms) for durations long enough to cause PTS, if the animals do not avoid are area for some reason and are not detected in time to have mitigation measures implemented. Marine mammals that are taken by TTS (which is a form of Level B harassment) are expected to receive minor (in the order of several dBs) and brief (minutes to hours) temporary hearing impairment because (1) animals are not likely to remain for prolonged periods within high intensity sound fields, and (2) both the seismic vessel and the animals are constantly moving, and it is unlikely that the animal will be moving along with the vessel during the survey. Although repeated experience to TTS (Level B harassment) could result in PTS (Level A harassment), for the same reasons discussed above, even if marine mammals experience PTS, the degree of PTS is expected to be mild, resulting in a few dB elevation of hearing threshold, and are not expected to be biologically significant for the population or species.

Gray Whales

Gray whales are not commonly encountered in the Beaufort Sea coast, though occasional sightings have occurred in the past. It is estimated that a maximum of 2 gray whales (0.01%) could be taken by Level B harassment. Potential impacts to gray whales from SAE's 3D seismic survey will be limited to brief behavioral disturbances and temporary avoidance of the ensonified areas. No Level A takes of gray whale is expected, and none is authorized.

No BIA for gray whales overlaps with SAE's 3D seismic survey in the Beaufort Sea (the gray whale reproduction and feeding BIAs during the summer and fall are in the Chukchi Sea (Clarke *et al.* 2015)).

Pinnipeds

Ringed, spotted, and bearded are regularly encountered in the proposed SAE's seismic survey area, with the first two species being most common. Ringed seals were recently listed under the ESA as threatened species, and are considered depleted under the MMPA. On July 25, 2014, the U.S. District Court for the District of Alaska vacated NMFS' rule listing the Beringia bearded seal DPS as threatened and remanded the rule to NMFS to correct the deficiencies identified in the opinion.

As stated in the **Federal Register** notice (80 FR 20084; April 14, 2015) for the proposed IHA, they appear to be more tolerant of anthropogenic sound, especially at lower received levels, than other marine mammals, such as mysticetes. SAE's proposed activities would occur at a time of year when these seal species found in the region are not molting, breeding, or pupping. Therefore, these important life functions would not be impacted by SAE's proposed activities. The exposure of pinnipeds to sounds produced by SAE's proposed 3D seismic survey operations in the Beaufort Sea is not expected to result in more than Level B harassment of individuals from pinnipeds in most cases, with a few by Level A harassment in the form of TTS (Level B harassment) and PTS (Level A harassment).

It is estimated that maxima of 459 ringed seals (0.15%), 500 spotted seals (0.35%), and 115 bearded seals (0.07%) could be taken by Level B harassment. Level B behavioral harassment to these species from SAE's 3D seismic survey activity include brief behavioral disturbances and temporary avoidance of the ensonified areas.

In addition, it is estimated that up to 20 ringed and spotted seals and 10 bearded seals could be exposed to received noise levels above 190 dB re 1 μPa (rms) for durations long enough to cause TTS, if the animals do not avoid are area for some reason and are not detected in time to have mitigation measures implemented (or even PTS if such exposures occurred repeatedly). Marine mammals that are taken by TTS are expected to receive minor (in the order of several dBs) and brief (minutes to hours) temporary hearing impairment because (1) animals are not likely to remain for prolonged periods within high intensity sound fields, and (2) both the seismic vessel and the animals are constantly moving, and it is unlikely that the animal will be moving along with the vessel during the survey. Although repeated experience to TTS could result in PTS (Level A harassment), for the same reasons discussed above, even if marine mammals experience PTS, the degree of PTS is expected to be mild, resulting in a few dB elevation of hearing threshold. Therefore, even if a few marine mammals receive TTS or PTS, the degree of these effects are expected to be minor and, in the case of TTS, brief, and are not expected to be biologically significant for the population or species.

No biologically important area exists for seals in the vicinity of SAE's 3D seismic survey activities.

Taking into account the mitigation measures that are planned, effects on marine mammals are generally expected to be restricted to avoidance of a limited area around SAE's proposed open-water activities and short-term changes in behavior, falling within the MMPA definition of ''Level B harassments.'' The many reported cases of apparent tolerance by marine mammals to seismic exploration, vessel traffic, and some other human activities show that co-existence is possible. Mitigation measures, such as controlled vessel speed, dedicated marine mammal observers, non-pursuit, ramp up procedures, and shut downs or power downs when marine mammals are seen within defined ranges, will further reduce short-term reactions and minimize any effects on hearing sensitivity. In all cases, the effects are expected to be short-term, with no lasting biological consequence.

Potential impacts to marine mammal habitat were discussed previously in the **Federal Register** notice (80 FR 20084; April 14, 2015) for the proposed IHA (see the ''Anticipated Effects on Habitat'' section of that document). Although some disturbance of food sources of marine mammals is possible, any impacts are anticipated to be minor enough as to not affect rates of recruitment or survival of marine mammals in the area. The marine survey activities would occur in a localized area, and given the vast area of the Arctic Ocean where feeding by marine mammals occurs, any missed feeding opportunities in the direct project area could be offset by feeding opportunities in other available feeding areas.

In addition, no critical habitat of ESA-listed marine mammal species occurs in the Beaufort Sea.

Based on the analysis contained herein of the likely effects of the specified activity on marine mammals and their habitat, and taking into consideration the implementation of the proposed monitoring and mitigation measures, NMFS finds that the total marine mammal take from SAE's proposed 3D seismic survey in the Beaufort Sea, Alaska, will have a negligible impact on the affected marine mammal species or stocks.

Small Numbers

The requested takes proposed to be authorized represent less than 2.31% for all populations or stocks potentially impacted (see Table 6 in this document). These take estimates represent the maximum percentage of each species or stock that could be taken by Level B behavioral harassment and Level A harassment if each animal is taken only once, and each take represents a different individual animal. However, it is likely that many, if not most, individual animals could be taken multiple times due to their short term movement patter and home range. Therefore, the percentages of takes of marine mammals among their populations are likely to be much lower. The numbers of marine mammals estimated to be taken are small proportions of the total populations of the affected species or stocks. In addition, the mitigation and monitoring measures (described previously in this document) prescribed in the IHA are expected to reduce even further any potential disturbance and injuries to marine mammals.

Based on the analysis contained herein of the likely effects of the specified activity on marine mammals and their habitat, and taking into consideration the implementation of the mitigation and monitoring measures, NMFS finds that small numbers of marine mammals will be taken relative to the populations of the affected species or stocks.

Impact on Availability of Affected Species or Stock for Taking for Subsistence Uses

Relevant Subsistence Uses

The proposed seismic activities will occur within the marine subsistence area used by the village of Nuiqsut. Nuiqsut was established in 1973 at a traditional location on the Colville River providing equal access to upland (*e.g.,* caribou, Dall sheep) and marine (*e.g.,* whales, seals, and eiders) resources (Brown 1979). Although Nuiqsut is located 40 km (25 mi) inland, bowhead whales are still a major fall subsistence resource. Although bowhead whales have been harvested in the past all along the barrier islands, Cross Island is the site currently used as the fall whaling base, as it includes cabins and equipment for butchering whales. However, whalers must travel about 160 km (100 mi) to annually reach the Cross Island whaling camp, which is located in a direct line over 110 km (70 mi) from Nuiqsut. Whaling activity usually begins in late August with the arrival whales migrating from the Canadian Beaufort Sea, and may occur as late as early October, depending on ice conditions and quota fulfillment. Most whaling occurs relatively near (<16 km or <10 mi) the island, largely to prevent meat spoilage that can occur with a longer tow back to Cross Island. Since 1993, Cross Island hunters have harvested one to four whales annually, averaging three.

Cross Island is located 70 km (44 mi) east of the eastern boundary of the seismic survey box. (Point Barrow is over 180 km [110 mi] outside the potential survey box.) Seismic activities are unlikely to affect Barrow or Cross Island based whaling, especially if the seismic operations temporarily cease during the fall bowhead whale hunt.

Although Nuiqsut whalers may incidentally harvest beluga whales while hunting bowheads, these whales are rarely seen and are not actively pursued. Any harvest that would occur would most likely be in association with Cross Island.

The potential seismic survey area is also used by Nuiqsut villagers for hunting seals. All three seal species that are likely to be taken—ringed, spotted, and bearded—are hunted. Sealing begins in April and May when villagers hunt seals at breathing holes in Harrison Bay. In early June, hunting is concentrated at the mouth of the Colville River, where ice breakup flooding results in the ice thinning and seals becoming more visible.

Once the ice is clear of the Delta (late June), hunters will hunt in open boats along the ice edge from Harrison Bay to Thetis Island in a route called ''round the world.'' Thetis Island is important as it provides a weather refuge and a base for hunting bearded seals. During July and August, ringed and spotted seals are hunted in the lower 65 km (40 mi) of the Colville River proper.

In terms of pounds, approximately one-third of the village of Nuiqsut's annual subsistence harvest is marine mammals (fish and caribou dominate the rest), of which bowhead whales contribute by far the most (Fuller and George 1999). Seals contribute only 2 to 3% of annual subsistence harvest (Brower and Opie 1997, Brower and Hepa 1998, Fuller and George 1999). Fuller and George (1999) estimated that 46 seals were harvested in 1992. The more common ringed seals appear to dominate the harvest, although the larger and thicker-skinned bearded seals are probably preferred. Spotted seals occur in the Colville River Delta in small numbers, which is reflected in the harvest.

Available harvest records suggest that most seal harvest occurs in the months preceding the proposed August start of the seismic survey, when waning ice conditions provide the best opportunity to approach and kill hauled out seals. Much of the late summer seal harvest occurs in the Colville River as the seals follow fish runs upstream. Still, open-water seal hunting could occur coincident with the seismic surveys, especially bearded seal hunts based from Thetis Island. In general, however, given the relatively low contribution of seals to the Nuiqsut subsistence, and the greater opportunity to hunt seals earlier in the season, any potential impact by the seismic survey on seal hunting is likely remote.

Potential Impacts to Subsistence Uses

NMFS has defined ''unmitigable adverse impact'' in 50 CFR 216.103 as: ''an impact resulting from the specified activity: (1) That is likely to reduce the availability of the species to a level insufficient for a harvest to meet subsistence needs by: (i) Causing the marine mammals to abandon or avoid hunting areas; (ii) Directly displacing subsistence users; or (iii) Placing physical barriers between the marine mammals and the subsistence hunters; and (2) That cannot be sufficiently mitigated by other measures to increase the availability of marine mammals to allow subsistence needs to be met.

Noise and general activity during SAE's proposed 3D OBN seismic survey have the potential to impact marine mammals hunted by Native Alaskans. In the case of cetaceans, the most common reaction to anthropogenic sounds (as noted previously) is avoidance of the ensonified area. In the case of bowhead whales, this often means that the animals divert from their normal migratory path by several kilometers. Additionally, general vessel presence in the vicinity of traditional hunting areas could negatively impact a hunt. Native knowledge indicates that bowhead whales become increasingly ''skittish'' in the presence of seismic noise. Whales are more wary around the hunters and tend to expose a much smaller portion of their back when surfacing, which makes harvesting more difficult. Additionally, natives report that bowheads exhibit angry behaviors, such as tail-slapping, in the presence of seismic activity, which translate to danger for nearby subsistence harvesters.

Responses of seals to seismic airguns are expected to be negligible. Bain and Williams (2006) studied the responses of harbor seals, California sea lions, and Steller sea lions to seismic airguns and found that seals at exposure levels above 170 dB re 1 μPa (peak-peak) often showed avoidance behavior, including generally staying at the surface and keeping their heads out of the water, but that the responses were not overt, and there were no detectable responses at low exposure levels.

Plan of Cooperation or Measures To Minimize Impacts to Subsistence Hunts

Regulations at 50 CFR 216.104(a)(12) require IHA applicants for activities that take place in Arctic waters to provide a Plan of Cooperation (POC) or information that identifies what measures have been taken and/or will be taken to minimize adverse effects on the availability of marine mammals for subsistence purposes.

SAE has prepared a POC, which was developed by identifying and evaluating any potential effects the proposed seismic survey might have on seasonal abundance that is relied upon for subsistence use. For the proposed project, SAE worked closely with the North Slope Borough (NSB) and its partner Kuukpik Corporation, to identify subsistence communities and activities that may take place within or near the project area.

As a joint venture partner with Kuukpik, SAE is working closely with them and the communities on the North Slope to plan operations that will include measures that are environmentally suitable and that do not impact local subsistence use. In addition, SAE signed a Conflict Avoidance Agreement (CAA) with the AEWC and other subsistence whaling communities.

SAE adopted a three-stage process to develop its POC:

Stage 1: To open communications SAE attended and presented the program description to the Alaska Eskimo Whaling Commission (AEWC) during their mini-convention in December, 2014, in Anchorage. Collaboration meetings were held in March and April 2015 with Kuukpik Corporation leaders. Kuukpik Corporation is SAE's joint venture partners in the project and on the North Slope of Alaska.

Prior to offshore activities, SAE met and consulted with nearby communities, the North Slope Borough (NSB) planning department and the Fish and Wildlife division. SAE has also presented its project during a community meeting in the village of Nuiqsut, to discuss the planned activities. The discussions included SAE's project description, the POC, resolution of potential conflicts, and proposed operational window. These meetings helped to identify any subsistence conflicts. The following meetings were conducted:

- Nuiqsut: November, 2014 (Job Fair)
- Nuiqsut: January, 2015 (Project Presentation)
- AEWC: December, 2014 (2015 planned projects)
- Barrow (NSB): March, 2015 (Pre Application Meeting)
- Barrow: March, 2015 (Planning Commission Meeting)
- AEWC: February, 2015 (Project Presentation)

In addition, SAE scheduled the following meeting in the near future:

- Nuqsut: July, 2015 (update Meeting)
- KSOP: July 2015 (Presentation)

Stage 2: SAE incorporated meaningful requests to mitigate concerns into operations, including signing a CAA and providing weekly updates to the Kuukpikmiut Subsistence Oversight Panel (KSOP). SAE plans to have a review of permit stipulations and a permit matrix developed for the crews. The means of communications and contacts list have been developed and implemented into operations. Communications will be handled within the CAA and directly with Nuiqsut Whalers. The use of scientific and Inupiat PSOs/Communicators on board the vessels will ensure that appropriate precautions are taken to avoid harassment of marine mammals, including whales, seals, walruses or polar bears. SAE will coordinate the timing and location of operations with the Com-Centers in Deadhorse and Kaktovik to minimize impact to the subsistence activities or the Nuiqsut/Kaktovik Bowhead Whale Hunt.

Stage 3: If a conflict does occur with project activities and subsistence hunting, the SAs will immediately contact the project manager and the Com Center. If avoidance is not possible, the project manager will initiate communication with a representative from the impacted subsistence hunter group(s) to resolve the issue and to plan an alternative course of action (which may include ceasing operations during the whale hunt).

In addition, the following mitigation measures will be imposed in order to effect the least practicable adverse impact on the availability of marine mammal species for subsistence uses:

(i) Establishment and operations of Communication and Call Centers (Com-Center) Program

• For the purposes of reducing or eliminating conflicts between subsistence whaling activities and SAE's survey program, SAE will participate with other operators in the Com-Center Program. Com-Centers will be operated to facilitate communication of information between SAE and subsistence whalers. The Com-Centers will be operated 24 hours/day during the 2015 fall subsistence bowhead whale hunt.

• All vessels shall report to the appropriate Com-Center at least once every six hours, commencing each day with a call at approximately 06:00 hours.

• The appropriate Com-Center shall be notified if there is any significant change in plans, such as an unannounced start-up of operations or significant deviations from announced course, and that Com-Center shall notify all whalers of such changes. The appropriate Com-Center also shall be called regarding any unsafe or unanticipated ice conditions.

(ii) SAE shall monitor the positions of all of its vessels and exercise due care in avoiding any areas where subsistence activity is active.

(iii) Routing barge and transit vessels:

• Vessels transiting in the Beaufort Sea east of Bullen Point to the Canadian border shall remain at least 5 miles offshore during transit along the coast, provided ice and sea conditions allow. During transit in the Chukchi Sea, vessels shall remain as far offshore as weather and ice conditions allow, and at all times at least 5 miles offshore.

• From August 31 to October 31, vessels in the Chukchi Sea or Beaufort Sea shall remain at least 20 miles offshore of the coast of Alaska from Icy Cape in the Chukchi Sea to Pitt Point on the east side of Smith Bay in the Beaufort Sea, unless ice conditions or an emergency that threatens the safety of the vessel or crew prevents compliance with this requirement. This condition shall not apply to vessels actively engaged in transit to or from a coastal community to conduct crew changes or logistical support operations.

• Vessels shall be operated at speeds necessary to ensure no physical contact with whales occurs, and to make any other potential conflicts with bowheads or whalers unlikely. Vessel speeds shall be less than 10 knots in the proximity of feeding whales or whale aggregations.

• If any vessel inadvertently approaches within 1.6 kilometers (1 mile) of observed bowhead whales, except when providing emergency assistance to whalers or in other emergency situations, the vessel operator will take reasonable precautions to avoid potential interaction with the bowhead whales by taking one or more of the following actions, as appropriate:

○ Reducing vessel speed to less than 5 knots within 900 feet of the whale(s);

○ Steering around the whale(s) if possible;

○ Operating the vessel(s) in such a way as to avoid separating members of a group of whales from other members of the group;

○ Operating the vessel(s) to avoid causing a whale to make multiple changes in direction; and

○ Checking the waters immediately adjacent to the vessel(s) to ensure that no whales will be injured when the propellers are engaged.

(iv) Limitation on seismic surveys in the Beaufort Sea

• Kaktovik: No seismic survey from the Canadian Border to the Canning River from around August 25 to close of the fall bowhead whale hunt in Kaktovik and Nuiqsut, based on the actual hunt dates. From around August 10 to August 25, based on the actual hunt dates, SAE will communicate and collaborate with the Alaska Eskimo Whaling Commission (AEWC) on any planned vessel movement in and around Kaktovik and Cross Island to avoid impacts to whale hunting.

• Nuiqsut:

○Pt. Storkerson to Thetis Island: No seismic survey prior to July 25 inside the Barrier Islands. No seismic survey from around August 25 to close of fall bowhead whale hunting outside the Barrier Island in Nuiqsut, based on the actual hunt dates.

○ Canning River to Pt. Storkerson: No seismic survey from around August 25 to the close of bowhead whale subsistence hunting in Nuiqsut, based on the actual hunt dates.

• Barrow: No seismic survey from Pitt Point on the east side of Smith Bay to a location about half way between Barrow and Peard Bay from September 15 to the close of the fall bowhead whale hunt in Barrow.

(v) SAE shall complete operations in time to allow such vessels to complete transit through the Bering Strait to a point south of 59 degrees North latitude no later than November 15, 2015. Any vessel that encounters weather or ice that will prevent compliance with this date shall coordinate its transit through the Bering Strait to a point south of 59 degrees North latitude with the appropriate Com-Centers. SAE vessels shall, weather and ice permitting, transit east of St. Lawrence Island and no closer than 10 miles from the shore of St. Lawrence Island.

Unmitigable Adverse Impact Analysis and Preliminary Determination

SAE has adopted a spatial and temporal strategy for its 3D OBN seismic survey that should minimize impacts to subsistence hunters and ensure the sufficient availability of species for hunters to meet subsistence needs. SAE will temporarily cease seismic activities during the fall bowhead whale hunt, which will allow the hunt to occur without any adverse impact from SAE's activities. Although some seal hunting co-occurs temporally with SAE's proposed seismic survey, the locations do not overlap, so SAE's activities will not impact the hunting areas and will not directly displace sealers or place physical barriers between the sealers and the seals. In addition, SAE is conducting the seismic surveys in a joint partnership agreement with Kuukpik Corporation, which allows SAE to work closely with the native communities on the North Slope to plan operations that include measures that are environmentally suitable and that do not impact local subsistence use, and to adjust the operations, if necessary, to minimize any potential impacts that might arise. Based on the description of the specified activity, the measures described to minimize adverse effects on the availability of marine mammals for subsistence purposes, and the proposed mitigation and monitoring measures, NMFS has determined that there will not be an unmitigable adverse impact on subsistence uses from SAE's proposed activities.

Endangered Species Act (ESA)

Within the project area, the bowhead whale is listed as endangered and the ringed seal is listed as threatened under the ESA. NMFS' Permits and Conservation Division initiated consultation with staff in NMFS' Alaska Region Protected Resources Division under section 7 of the ESA on the issuance of an IHA to SAE under section 101(a)(5)(D) of the MMPA for this activity. In June 2015, NMFS issued a Biological Opinion, and concluded that the issuance of the IHA associated with SAE's 2015 3D seismic survey in the Beaufort Sea is not likely to jeopardize the continued existence of the endangered bowhead, humpback and the threatened Arctic sub-species of ringed seal. No critical habitat has been designated for these species, therefore none will be affected.

National Environmental Policy Act (NEPA)

NMFS prepared an EA that includes an analysis of potential environmental effects associated with NMFS' issuance of an IHA to SAE to take marine mammals incidental to conducting a 3D seismic survey in the Beaufort Sea, Alaska. NMFS has finalized the EA and prepared a Finding of No Significant Impact for this action. Therefore, preparation of an Environmental Impact Statement is not necessary. NMFS' draft EA was available to the public for a 30-day comment period before it was finalized.

Authorization

As a result of these determinations, NMFS has issued an IHA to SAE for the take of marine mammals, by Level B and Level A harassments, incidental to conducting a 3D OBN seismic survey in the Beaufort Sea during the 2015 open-water season, provided the previously mentioned mitigation, monitoring, and reporting requirements are incorporated.

Dated: July 6, 2015.

Perry Gayaldo,

Deputy Director, Office of Protected Resources, National Marine Fisheries Service.

BILLING CODE 3510–22–P

DEPARTMENT OF COMMERCE

Patent and Trademark Office

Submission for OMB Review; Comment Request; ''Post Patent Public Submissions''

The Department of Commerce will submit to the Office of Management and Budget (OMB) for clearance the following proposal for collection of information under the provisions of the Paperwork Reduction Act (44 U.S.C. chapter 35).

Agency: United States Patent and Trademark Office, Commerce.

Title: Post Patent Public Submissions.

OMB Control Number: 0651–0067.

Form Number(s):

• PTO/SB/42.

Type of Request: Regular.

Number of Respondents: 240.

Average Time per Response: 10 hours.

Burden Hours: 2,400.

Cost Burden: $57.50.

Needs and Uses: The United States Patent and Trademark Office (USPTO) is required by 35 U.S.C. 131 *et seq.* to examine an application for patent and, when appropriate, issue a patent. The provisions of 35 U.S.C. 301 and 37 CFR 1.501 govern the ability of a person to submit into the file of an issued patent (i) prior art consisting of patents or printed publications which the person making the submission believes to have a bearing on the patentability of any claim of the patent, and (ii) statements of the patent owner filed by the patent owner in a proceeding before a Federal court or the USPTO in which the patent owner took a position on the scope of any claim of the patent.

Affected Public: Individuals and housholds; businesses or other for-profits; not-for-profit institutions.

Frequency: On occasion.

Respondent's Obligation: Required to obtain or retain benefits.

OMB Desk Officer: Nicholas A. Fraser, email: *Nicholas_A._Fraser@omb.eop.gov.*

Once submitted, the request will be publicly available in electronic format through reginfo.gov. Follow the instructions to view Department of Commerce collections currently under review by OMB.

Further information can be obtained by:

• Email: *InformationCollection@uspto.gov.* Include ''0651–0067 copy request'' in the subject line of the message.

• Mail: Marcie Lovett, Records Management Division Director, Office of the Chief Information Officer, United States Patent and Trademark Office, P.O. Box 1450, Alexandria, VA 22313–1450.

Written comments and recommendations for the proposed information collection should be sent on or before August 12, 2015 to Nicholas A. Fraser, OMB Desk Officer, via email to *Nicholas_A._Fraser@omb.eop.gov,* or by fax to 202–395–5167, marked to the attention of Nicholas A. Fraser.

Dated: July 1, 2015.

Marcie Lovett,

Records Management Division Director, USPTO, Office of the Chief Information Officer.

BILLING CODE 3510–16–P

DEPARTMENT OF DEFENSE

Office of the Secretary

[Docket ID DoD–2015–OS–0068]

Privacy Act of 1974; System of Records

AGENCY: National Guard Bureau, DoD.

ACTION: Notice to add a new System of Records.

SUMMARY: The National Guard Bureau proposes to add a new system of records INGB 004, entitled ''Joint Services Support System (JSS).'' JSS will be a centralized, web-based portal that manages, for the Yellow Ribbon Reintegration Program (YRRP), the entire event life cycle—to include, planning, conducting and reporting, for events held nationwide, for Service members and their families. In addition to YRRP, JSS also aims to support program management activities/events for other currently participating programs, such as the Family Program, Employer Support Program, Financial Management Awareness Program, Sexual Assault Response and Prevention Program, Psychological Health Program and Warrior Support program, as well as future Guard and Reserve programs supporting the National Guard Bureau (NGB), Manpower and Personnel Directorate. JSS will also support the collection and storage of Civilian Employer Information (CE) from Service members to fulfill the Uniformed Services Employment and Reemployment Rights Act (USERRA) mandate.

DATES: Comments will be accepted on or before August 12, 2015. This proposed action will be effective the day following the end of the comment period unless comments are received which result in a contrary determination.

ADDRESSES: You may submit comments, identified by docket number and title, by any of the following methods:

* *Federal Rulemaking Portal: http://www.regulations.gov.* Follow the instructions for submitting comments.

* *Mail:* Department of Defense, Office of the Deputy Chief Management Officer, Directorate of Oversight and Compliance, Regulatory and Audit Matters Office, 9010 Defense Pentagon, Washington, DC 20301–9010.

Instructions: All submissions received must include the agency name and docket number for this **Federal Register** document. The general policy for comments and other submissions from members of the public is to make these submissions available for public viewing on the Internet at *http://www.regulations.gov* as they are received without change, including any personal identifiers or contact information.

FOR FURTHER INFORMATION CONTACT: Ms. Jennifer Nikolaisen, 111 South George Mason Drive, AH2, Arlington, VA

22204–1373 or telephone: (703) 601–6884.

SUPPLEMENTARY INFORMATION: The National Guard Bureau notices for systems of records subject to the Privacy Act of 1974 (5 U.S.C. 552a), as amended, have been published in the **Federal Register** and are available from the address in **FOR FURTHER INFORMATION CONTACT** or from the Defense Privacy and Civil Liberties Division Web site at *http://dpcld.defense.gov/.*

The proposed system report, as required by 5 U.S.C. 552a(r) of the Privacy Act of 1974, as amended, was submitted on May 15, 2015, to the House Committee on Oversight and Government Reform, the Senate Committee on Governmental Affairs, and the Office of Management and Budget (OMB) pursuant to paragraph 4c of Appendix I to OMB Circular No. A–130, ''Federal Agency Responsibilities for Maintaining Records About Individuals,'' dated February 8, 1996 (February 20, 1996, 61 FR 6427).

Dated: July 7, 2015.

Aaron Siegel,

Alternate OSD Federal Register Liaison Officer, Department of Defense.

INGB 004

System name:

Joint Services Support System (JSS)

SYSTEM LOCATION:

Datacenter located at 801 Industrial Boulevard, Suite #200, Grapevine, Texas 76051–8635.

CATEGORIES OF INDIVIDUALS COVERED BY THE SYSTEM:

Current and former members of the Federally Recognized Air and Army National Guards of the United States, current and former members of the United States Armed Forces, current and former members of the Reserve Components of the United States Armed Forces, family members of current and former members of the National Guard, Armed Forces, and Armed Forces Reserve, Department of Defense civilian employees and contractors, and volunteers.

CATEGORIES OF RECORDS IN THE SYSTEM:

Service affiliation, name, DoD ID Number, date of birth, personal and business phone number, business email address, entitlement and eligibility information, activation and mobilization dates, unit name and address, employment information (type of employment, dates of employment), employer information (past and current employer name address and phone number).

AUTHORITY FOR MAINTENANCE OF THE SYSTEM:

10 U.S.C. 10502, Chief, National Guard Bureau; 38 U.S.C. 4301–4335, Employment and Reemployment Rights of Members of the Uniformed Services; 10 U.S.C. 10145, Ready Reserve: placement in; 10 U.S.C. 12302, Ready Reserve; Public Law 110–181, Section 582, Yellow Ribbon Integration; 20 CFR part 1002, Regulations Under the Uniformed Services Employment and Reemployment Rights Act of 1994; DoD Instruction 1342.28, DoD Yellow Ribbon Reintegration Program (YRRP); DoD Manual 7730.54–M, Vol.2, Reserve Components Common Personnel Data System (RCCPDS): Personnel Reports, and DoD Manual 7730.54 Vol. 1, and Reserve Components Common Personnel Data System (RCCPDS): Reporting Procedures.

PURPOSE(S):

The National Guard Bureau is proposing to add a new system of records that will be a centralized, web-based portal that manages, for the Yellow Ribbon Reintegration Program (YRRP), the entire event life cycle—to include, planning, conducting and reporting, for events held nationwide, for Service members and their families. In addition to YRRP, JSS also aims to support program management activities/events for other currently participating programs, such as the Family Program, Employer Support Program, Financial Management Awareness Program, Sexual Assault Response and Prevention Program, Psychological Health Program and Warrior Support program, as well as future Guard and Reserve programs supporting the National Guard Bureau (NGB), Manpower and Personnel Directorate. JSS will also support the collection and storage of Civilian Employer Information (CE) from Service members to fulfill the Uniformed Services Employment and Reemployment Rights Act (USERRA) mandate.

Routine uses of records maintained in the system including categories of users and the purpose of such uses:

In addition to those disclosures generally permitted under 5 U.S.C. 552a(b) of the Privacy Act of 1974, as amended, the records contained therein may specifically be disclosed outside the DoD as a routine use pursuant to 5 U.S.C. 552a(b)(3) as follows:

The DoD Blanket Routine Uses set forth at the beginning of the National Guard Bureau compilation of system of records notices may apply to this system. The complete list of DoD blanket routine uses can be found online at: *http://dpcld.defense.gov/Privacy/SORNsIndex/BlanketRoutineUses.aspx.*

POLICIES AND PRACTICES FOR STORING, RETRIEVING, ACCESSING, RETAINING, AND DISPOSING OF RECORDS IN THE SYSTEM:

STORAGE:

Electronic storage media.

RETRIEVABILITY:

By DoD ID Number, date of birth and last name, or by name only, depending on the category of individual.

SAFEGUARDS:

Data center access is limited to only data center technicians and the center uses biometric scanning for controlled data center access. The data center also has security camera monitoring and 24-hour onsite staff providing additional protection against unauthorized entry. All employees are trained on documented information security and privacy procedures. Access to confidential information is restricted to authorized personnel only according to documented processes.

Systems access is logged and tracked for auditing purposes. Secure document-destruction policies are in place for all sensitive information and change-management procedures are fully documented. In addition, there is an independently audited disaster recovery and business continuity of operations plan in place.

RETENTION AND DISPOSAL:

Disposition pending (until the National Archives and Records Administration approves retention and disposal schedule for the National Guard Bureau all records will be treated as permanent).

SYSTEM MANAGER(S) AND ADDRESS:

National Guard Bureau (NGB), Manpower and Personnel Directorate (J1), 111 South George Mason Drive, Arlington Hall 2, Arlington, VA 22204–1373.

NOTIFICATION PROCEDURE:

Individuals who wish to inquire whether this system of records contains information about themselves should address written inquiries to National Guard Bureau (NGB), Manpower and Personnel Directorate (J1), Joint Support Personnel System; 111 South George Mason Drive, Arlington Hall 2, Arlington, VA 22204–1373.

Written requests must include the individual's DoD ID number or their name and date of birth, and full mailing address to receive a response.

In addition, the requester must provide a notarized statement or an unsworn declaration made in accordance with 28 U.S.C. 1746, in the following format:

If executed outside the United States: 'I declare (or certify, verify, or state) under penalty of perjury under the laws of the United States of America that the foregoing is true and correct. Executed on (date). (Signature)'.

If executed within the United States, its territories, possessions, or commonwealths: 'I declare (or certify, verify, or state) under penalty of perjury that the foregoing is true and correct. Executed on (date). (Signature)'.

RECORD ACCESS PROCEDURES:

Individuals seeking to access information about themselves in this system should address written inquiries to National Guard Bureau (NGB), Manpower and Personnel Directorate (J1), 111 South George Mason Drive, Arlington Hall 2, Arlington, VA 22204–1373

Written requests must include the individual's DoD ID number or their name and date of birth, as well as full mailing address to receive a response.

In addition, the requester must provide a notarized statement or an unsworn declaration made in accordance with 28 U.S.C. 1746, in the following format:

If executed outside the United States: 'I declare (or certify, verify, or state) under penalty of perjury under the laws of the United States of America that the foregoing is true and correct. Executed on (date). (Signature)'.

If executed within the United States, its territories, possessions, or commonwealths: 'I declare (or certify, verify, or state) under penalty of perjury that the foregoing is true and correct. Executed on (date). (Signature)'.

CONTESTING RECORDS PROCEDURES:

The National Guard Bureau rules for accessing records and for contesting contents and appealing initial agency determinations are published at 32 CFR part 329 or may be obtained from the system manager.

RECORD SOURCE CATEGORIES:

Information is collected directly from the individual when registering as a user or registering to attend an event or reporting their civilian employer information. Defense Manpower Data Center (DMDC) also provides additional information about Service members (only), to validate the information collected directly from the Defense Eligibility and Enrollment Reporting System (DEERS) and provide eligibility information to the programs providing the services.

EXEMPTIONS CLAIMED FOR THE SYSTEM:

None.

[FR Doc. 2015–16970 Filed 7–10–15; 8:45 am]

BILLING CODE 5001–06–P

DEPARTMENT OF EDUCATION

[Docket No. ED–2015–ICCD–0086]

Agency Information Collection Activities; Submission to the Office of Management and Budget for Review and Approval; Comment Request; Professional Development Grants for Indian Children Application Package

AGENCY: Office of Elementary and Secondary Education (OESE), Department of Education (ED).

ACTION: Notice.

SUMMARY: In accordance with the Paperwork Reduction Act of 1995 (44 U.S.C. chapter 3501 *et seq.*), ED is proposing an extension of an existing information collection.

DATES: Interested persons are invited to submit comments on or before August 12, 2015.

ADDRESSES: Comments submitted in response to this notice should be submitted electronically through the Federal eRulemaking Portal at *http://www.regulations.gov* by selecting Docket ID number ED–2015–ICCD–0086 or via postal mail, commercial delivery, or hand delivery. If the regulations.gov site is not available to the public for any reason, ED will temporarily accept comments at *ICDocketMgr@ed.gov. Please note that comments submitted by fax or email and those submitted after the comment period will not be accepted; ED will ONLY accept comments during the comment period in this mailbox when the regulations.gov site is not available.* Written requests for information or comments submitted by postal mail or delivery should be addressed to the Director of the Information Collection Clearance Division, U.S. Department of Education, 400 Maryland Avenue SW., LBJ, Mailstop L–OM–2–2E319, Room 2E115, Washington, DC 20202.

FOR FURTHER INFORMATION CONTACT: For specific questions related to collection activities, please contact John Cheek, 202–401–0274.

SUPPLEMENTARY INFORMATION: The Department of Education (ED), in accordance with the Paperwork Reduction Act of 1995 (PRA) (44 U.S.C. 3506(c)(2)(A)), provides the general public and Federal agencies with an opportunity to comment on proposed, revised, and continuing collections of information. This helps the Department assess the impact of its information collection requirements and minimize the public's reporting burden. It also helps the public understand the Department's information collection requirements and provide the requested data in the desired format. ED is soliciting comments on the proposed information collection request (ICR) that is described below. The Department of Education is especially interested in public comment addressing the following issues: (1) Is this collection necessary to the proper functions of the Department; (2) will this information be processed and used in a timely manner; (3) is the estimate of burden accurate; (4) how might the Department enhance the quality, utility, and clarity of the information to be collected; and (5) how might the Department minimize the burden of this collection on the respondents, including through the use of information technology. Please note that written comments received in response to this notice will be considered public records.

Title of Collection: Professional Development Grants for Indian Children Application Package.

OMB Control Number: 1810–0580.

Type of Review: An extension of an existing information collection.

Respondents/Affected Public: State, Local and Tribal Governments.

Total Estimated Number of Annual Responses: 50.

Total Estimated Number of Annual Burden Hours: 1,500.

Abstract: The Office of Indian Education (OIE) of the Department of Education (ED) requests an extension of this previously approved information collection, for the Indian Education Discretionary Grant Applications authorized under Title VII, Part A, of the Elementary and Secondary Education Act, as amended. The Professional Development (PD) (CFDA 84.299B) program is a competitive discretionary grant program. The grant applications submitted for this program are evaluated on the basis of how well an applicant addresses the selection criteria, and are used to determine applicant eligibility and amount of award for projects selected for funding.

The selection criteria used for the Professional Development Grant program are included in 34 CFR 263.6. Sections 263.7, 263.8, 263.9, and 263.10 also have information collection requirements addressed in this clearance request relating to statutory or regulatory requirements.

Dated: July 7, 2015.

Tomakie Washington,

Acting Director, Information Collection Clearance Division, Office of the Chief Privacy Officer, Office of Management.

[FR Doc. 2015–16962 Filed 7–10–15; 8:45 am]

Applications Available: July 13, 2015.

Date of Pre-Application Meeting: July 20, 2015.

Deadline for Transmittal of Applications: August 12, 2015.

Deadline for Intergovernmental Review: September 11, 2015.

Full Text of Announcement

I. Funding Opportunity Description

Purpose of Program: The purpose of the IRE program is to support demonstration projects in prisoner reentry education that develop evidence of reentry education's effectiveness. IRE seeks to demonstrate that high-quality, appropriately designed, integrated, and well-implemented educational and related services provided in institutional and community settings are critical in supporting educational attainment and reentry success for individuals who have been incarcerated.

Background: The economic and civic importance of the programs authorized by the Workforce Innovation and Opportunity Act, 29 U.S.C. 3101 *et. seq.* (WIOA),[1] including the Adult Education and Family Literacy Act (Title II of WIOA) (AEFLA), is amplified by three recent policy documents that highlight the challenges faced by low-skilled adults: (1) ''Time for the U.S. to Reskill? What the Survey of Adult Skills Says'',[2] released by the Organisation for Economic Co-operation and Development (OECD); (2) ''Ready to Work: Job-Driven Training and American Opportunity'',[3] published by the Office of the Vice President; and (3) ''Making Skills Everyone's Business'',[4] published by the Department.

These reports focus on the large numbers of low-skilled adults in the U.S. and underscore the urgent need to improve services and learning outcomes for adults in federally-funded programs by implementing innovative approaches to teaching and learning.

More than 700,000 incarcerated individuals leave Federal and State prisons each year.[5] Too many of these individuals do not reintegrate successfully into society; within 3 years of release, 4 out of 10 prisoners will be reincarcerated.[6]

This cycle of recidivism contributes significantly to the overall expenditures for corrections, which costs States more than $50 billion annually.[7] Moreover, the number of individuals cycling in and out of our Nation's prisons jeopardizes public safety and negatively affects those individuals' families and their communities. Approximately 2.7 million children have an incarcerated parent, and these children are more likely to be expelled or suspended from school than children without an incarcerated parent.[8]

Among the male U.S. population aged 20 to 34 years without a high school credential, 1 in 3 black men, 1 in 8 white men, and 1 in 14 Hispanic men are incarcerated.[9] Formerly incarcerated men earn significantly less per year than those who have never been incarcerated.[10] Unfortunately, many offenders are ill-equipped to break this cycle of reincarceration because they lack the education and workforce skills they need to succeed in the labor market and the cognitive skills (*e.g.*, the ability to solve problems) that are essential to successfully addressing the challenges of reentry.[11] Approximately 41 percent of Federal and State prisoners lack a high school credential, compared to 18 percent of the general population. Fewer than 15 percent have attained a postsecondary credential.[12]

Although most State and Federal prisons offer adult education and career and technical education programs, and some offer postsecondary education, participation in these programs has not kept pace with the growing prison population.[13] Similarly, those under community supervision (parole or probation) often do not participate in education and training programs.[14] Possible reasons for these low participation rates include lack of, or limited access to, programs, limited awareness of program opportunities, reductions in services because of State budget constraints, insufficient personal motivation, and competing demands (*e.g.*, employment) that may take precedence over pursuing education.[15]

[15] Crayton, Anna, and Suzanne Rebecca Neusteter. 2008. *The Current State of Correctional Education.* Paper prepared for the Reentry Roundtable on Education. New York: John Jay

It is not surprising, therefore, that formerly incarcerated individuals cited education, job training, and employment as vital needs not generally met during incarceration or after release.[16]

Low-skilled individuals who move in and out of prison may not be able to access well-integrated and sequenced educational programs. Coordination and communication among educational programs and their partner-related service providers, both inside and outside of correctional institutions, are essential to facilitating educational participation and progress. A lack of coordination and communication can result in barriers such as differing standardized assessments and curricula and lack of articulation agreements, making student transfers from one program to another difficult. Other barriers to accessing well-integrated related services and educational programs in institutional and community settings include:

- Misinterpretation of Federal and State privacy laws and insufficient links among data systems, making it difficult for programs to get a comprehensive picture of their students' backgrounds, avoid duplication of effort, and track outcomes.
- A perception among correctional officials (*e.g.*, wardens, parole and probation officers, and court officials) and policymakers that individuals in correctional institutions should not receive educational services; this, in turn, can make it difficult to begin or expand student participation and establish supportive education and reentry policies.
- Inadequate staff training, resulting in ineffective educational services.
- Limited funds, leading to long waiting lists for programs.

Programs based in jails present additional challenges. Because individuals in jails are typically serving a sentence of a year or less, they may not have time to complete a program while incarcerated. The connection between the jail and community-based programs, therefore, is particularly important. On the other hand, individuals incarcerated in prisons may not be released to a nearby community. This can create challenges for prisons trying to develop an education continuum for students because they may need to develop partnerships with community-based providers across the State.[17]

The Department previously recognized the need for the development of a correctional education reentry model illustrating an education continuum to bridge the gap between prison and community-based education and training programs (Reentry Education Model).[18] Through a grant competition in 2012, Promoting Reentry Success Through Continuity of Educational Opportunities (PRSCEO), the Department funded three grant projects specifically to assess the Reentry Education Model in existing correctional and reentry education settings. Recognizing the need for other models to address the reentry education challenge, the Secretary will, through this new competition, support the establishment and operation of projects through partnerships that will implement models for correctional and reentry education based on strong theory (as defined in this notice). Eligible applicants will apply on behalf of a partnership that includes required and optional partners as described in the *Eligible Applicants* section of this notice.

Note: Applicants are not required to include the Reentry Education Model in their applications and will not receive any competitive preference as a result of incorporating the Reentry Education Model in their applications.

Priorities: This competition contains two absolute priorities. Absolute Priority 1 is from the notice of the Secretary's Final Supplemental Priorities and Definitions for Discretionary Grant Programs published in the **Federal Register** on December 10, 2014, (79 FR 73426) (Secretary's priorities). We are establishing Absolute Priority 2 for this grant competition only and any subsequent year in which we make awards from the list of unfunded applicants from this competition, in accordance with section 437(d)(1) of the General Education Provisions Act (GEPA), 20 U.S.C. 1232(d)(1).

Absolute Priorities: For the FY 2015 grant competition and any subsequent year in which we make awards from the list of unfunded applications from this competition, these priorities are absolute priorities. Under 34 CFR 75.105(c)(3), we consider only applications that meet both of these absolute priorities.

Absolute Priority 1—Supporting High-Need Students.[19]

To meet this priority, an applicant must propose a project designed to improve academic outcomes or learning environments for low-skilled adults (as defined in this notice).

Absolute Priority 2—Improving Supports and Correctional Education.

To meet this priority, an applicant must propose a project that:

(1) Improves the quality of education programs in adult correctional facilities and community settings, and

(2) Links correctional education students to education or job training programs post-release.

Requirements

Application Requirements

The project plan submitted within the application must include:

(a) An approach that demonstrates strong theory (as defined in this notice), which includes a logic model (as defined in this notice) and supporting practice.

(b) A description of how the applicant will implement, or already has implemented, specified and described elements of a system designed to coordinate education and related services provided in a correctional facility or facilities and in community settings. This description must include the following:

(1) The elements of the proposed project, including:

(i) A correctional institution student intake protocol that includes assessment, individual educational plan development, and the recording of information in a centralized, electronic data system;

(ii) The process the applicant will use for developing individual education plans that address individual student needs;

(iii) Educational services with appropriate alignment and content, including basic educational services for low-skilled adults, within correctional facilities and within community-based educational programs for reentering formerly incarcerated persons or other justice-involved individuals such as probationers;

(iv) Strategies based on strong theory (as defined in this notice) for:

College of Criminal Justice, Prisoner Reentry Institute. Accessed May 20, 2015, from *www.prisonlegalnews.org/news/publications/pri-crayton-state-of-correctional-education/*.

[17] ''Reentry Education Model Implementation Study, Promoting Reentry Success Through Continuity of Educational Opportunities,'' U.S. Department of Education, 2015.

[18] ''A Reentry Education Model, Supporting Education and Career Advancement for Low Skill Individuals in Corrections,'' U.S. Department of Education, 2012.

[19] See *http://www.gpo.gov/fdsys/pkg/FR-2014-12-10/pdf/2014-28911.pdf*, 79 FR 73426, Priority 4. Also see the *Definition* section of this notice inviting applications for the definitions of ''high-need students'' and ''low-skilled adults.''

(A) Improving student outcomes in the attainment of established measures for the AEFLA program,

(B) Increasing the number of students completing their educational programs, and

(C) Increasing the number of students attaining their educational goals;

(v) Pre-release procedures and protocols to support the transition of students, including low-skilled adults, from correctional institution educational programs to community-based educational programs; and

(vi) Intake processes and procedures for the community-based educational services that include—

(A) Connecting incarcerated individuals with community-based services by supporting orientation to, and pre-enrollment in, those services prior to release from the correctional institution,

(B) Timely transfer of student data and educational plans, which are updated as necessary and appropriate, and

(C) A process of communication among all project partners and with the individual students, including a point person for tracking individual progress to the extent practicable and for tracking students transferring to other adult basic education or adult secondary education programs, postsecondary education, training programs, or occupational training programs.

(2) Fundamental program elements, which must include:

(i) A description of the non-Federal funds and in-kind contributions that would be used in the project, if applicable;

(ii) A description of the partnership that will implement the proposed project, including required and optional partners as described under *Eligible Applicants*;

(iii) Electronic data system;

(iv) Staff training;

(v) Reentry policies; and

(vi) Evaluation processes.

(3) Implementation components, including—

(i) The methodology that the applicant used to select the partner(s);

(ii) For each proposed partner, descriptions of—

(A) The populations served by the partner; and

(B) The expected contributions of the partner to the proposed project and the extent to which each partner has committed to the implementation and sustainability of the project.

(iii) Strategies for identifying and allocating human resources among the partners as needed to implement the proposed project;

(iv) The applicant's approach to initial and ongoing personnel development or training for personnel involved in implementing the proposed project; and

(4) Sustainability components, including a plan for:

(i) Assessing the responsibilities for project maintenance and support among the partners at the participating project sites by the end of the project period in order to continue services after the project period ends; and

(ii) Continuing personnel training among the partners in order to build capacity to implement reentry education during the grant project period and to ensure that the project is sustained after the grant project period ends.

(c) A detailed timeline for implementing the proposed project.

(d) A plan for collecting data that will be submitted to the Department, which, at a minimum, must include:

(1) The numbers of individuals who maintain educational participation while transitioning from and among correctional institutions, including to community correctional settings and other community-based educational programs; and

(2) The numbers of adults who acquire basic skills (including English language acquisition), complete secondary education, and transition to further education, training, or to work as indicated by attainment of educational functioning levels, attainment of high school credentials, enrollment in postsecondary education or training programs, and attainment of employment.

(e) A description of the project's strong theory (as defined in this notice), including the logic model and supporting practice and a plan to collect data on the following system outputs:

(1) Changes to policies, procedures, or data collection systems, and

(2) Changes related to student information or record sharing, referrals for services, educational services, assessments, and transition planning.

(f) A proposed budget that includes estimates of the costs of:

(1) Implementing the proposed project, including but not limited to—

(i) Personnel, and

(ii) The various components of the proposed project; and

(2) Attendance of up to two attendees at a required one-and-one-half-day meeting in Washington, DC.

(g) A description of the applicant's formative evaluation plan, consistent with the proposed project's strong theory (as defined in this notice), that:

(1) Includes information on how the data described in paragraph (d) of these *Application Requirements* will be reviewed by the project staff prior to finalizing data collection plans and again prior to submitting those data to the Department (consistent with the timeline in paragraph (c) of these *Application Requirements*) and how they will be used during the course of the project to adjust the project or its implementation in order to enhance the project's outcomes, generalizability, and potential for sustainability; and

(2) Includes, as appropriate, periodic collection of student and system data in addition to other data relating to fidelity of implementation, stakeholder acceptability, and the types of facilities in which the services are provided (*e.g.*, correctional institution, community center, library).

General Requirements

To meet the general requirements of this competition, each applicant must propose to conduct the following activities:

(a) Participate in program activities and collaborative efforts among grantees, Department staff, and the Department-identified technical assistance provider, if applicable, to disseminate information to entities such as adult education providers, correctional institutions, community-based organizations, community colleges, professional organizations, and other entities identified by the Department.

(b) Communicate and collaborate on an ongoing basis with Department-funded or other Department-designated projects in order to share information on successful strategies and challenges for implementing reentry education across correctional and community settings.

(c) Maintain ongoing telephone and email communication with the Department project officer and the administrators of other projects funded under this competition.

(d) Submit data, when and as specified by the Department, in order to evaluate the applicant's success in implementing the project's objectives with reference to the reentry education challenge.

Definitions

The definition of ''Adult education and literacy activities'' is from section 203(2) of the Workforce Innovation and Opportunity Act of 2014, 29 U.S.C. 3272(2) (WIOA). The definitions of ''high-minority school,'' ''high need students,'' and ''low-skilled adult'' are from the notice of the Secretary's Final Supplemental Priorities and Definitions for Discretionary Grant Programs published in the **Federal Register** on

December 10, 2014, (79 FR 73426). The definitions of ''logic model'', ''relevant outcome'', and ''strong theory'' are from the Education Department General Administrative Regulations at 34 CFR 77.1(c).

Adult education and literacy activities means programs, activities, and services that include adult education, literacy, workplace adult education and literacy activities, family literacy activities, English language acquisition activities, integrated English literacy and civics education, workforce preparation activities, or integrated education and training.

Note: The programs, activities, and services listed in the definition of ''adult education and literacy activities'' are each defined in section 203 of WIOA, 29 U.S.C. 3272.

High-minority school means a school as that term is defined by a local educational agency (LEA), which must define the term in a manner consistent with its State's Teacher Equity Plan, as required by section 1111(b)(8)(C) of the Elementary and Secondary Education Act of 1965, as amended (ESEA). The applicant must provide the definition(s) of High-minority schools used in its application.

High-need students means students who are at risk of educational failure or otherwise in need of special assistance and support, such as students who are living in poverty, who attend high-minority schools (as defined in this notice), who are far below grade level, who have left school before receiving a regular high school diploma, who are at risk of not graduating with a diploma on time, who are homeless, who are in foster care, who have been incarcerated, who have disabilities, or who are English learners.

Logic model (also referred to as theory of action) means a well-specified conceptual framework that identifies key components of the proposed process, product, strategy, or practice (*i.e.*, the active ''ingredients'' that are hypothesized to be critical to achieving the relevant outcomes) and describes the relationships among the key components and outcomes, theoretically and operationally.

Low-skilled adult means an adult with low literacy and numeracy skills.

Relevant outcome means the student outcome(s) (or the ultimate outcome if not related to students) the proposed process, product, strategy, or practice is designed to improve; consistent with the specific goals of a program.

Strong theory means a rationale for the proposed process, product, strategy, or practice that includes a logic model.

Waiver of Proposed Rulemaking: Under the Administrative Procedure Act (5 U.S.C. 553), the Department generally offers interested parties the opportunity to comment on proposed priorities and other requirements. Section 437(d)(1) of the General Education Provisions Act (GEPA), however, allows the Secretary to exempt from rulemaking requirements regulations governing the first grant competition under a new or substantially revised program authority. This is the first grant competition for this program under AEFLA, Title II of WIOA, section 242, National Leadership Activities, 29 U.S.C. 3332, and therefore qualifies for this exemption. In order to ensure timely grant awards, the Secretary has decided to forgo public comment on the priorities and other requirements under section 437(d)(1) of GEPA. These priorities and other requirements will apply to the FY 2015 grant competition and any subsequent year in which we make awards from the list of unfunded applicants from this competition.

Program Authority: 29 U.S.C. 3332.

Applicable Regulations: (a) The Education Department General Administrative Regulations (EDGAR) in 34 CFR parts 75, 77, 79, 81, 82, 84, 86, 97, 98, and 99. (b) The OMB Guidelines to Agencies on Governmentwide Debarment and Suspension (Nonprocurement) in 2 CFR part 180, as adopted and amended as regulations of the Department in 2 CFR part 3485, and the Uniform Administrative Requirements, Cost Principles, and Audit Requirements for Federal Awards in 2 CFR part 200, as adopted and amended in 2 CFR part 3474.

Note: The regulations in 34 CFR part 79 apply to all applicants except federally-recognized Indian tribes.

Note: The regulations in 34 CFR part 86 apply only to institutions of higher education.

II. Award Information

Type of Award: Discretionary grants.

Estimated Available Funds: $2,700,000 for the first 12 months of this project period. Funding for program years two and three is subject to the availability of funds and to a grantee meeting the requirements of 34 CFR 75.253. Contingent upon the availability of funds and the quality of applications, we may make additional awards in FY 2016 and future years from the list of unfunded applications from this competition.

Estimated Range of Awards: $200,000–$350,000.

Estimated Average Size of Award: $300,000.

Estimated Number of Awards: 9.

Note: The Department is not bound by any estimates in this notice.

Project Period: Up to 36 months. Applicants under this competition are required to provide detailed budget information for each of the three years of this project and for the total grant.

III. Eligibility Information

1. *Eligible Applicants:*

(a) An application must be submitted by an eligible applicant, as described in paragraph (b) of this section, on behalf of a partnership that involves the required partners in subparagraph (c)(i) of this section, and any optional partners in subparagraph (c)(ii) of this section.

(b) Eligible applicant means one of the following organizations that currently provide adult education and literacy activities:

(i) correctional institutions;

(ii) community correction facilities or organizations;

(iii) intermediary prisoner reentry service providers;

(iv) community-based educational service providers;

(v) other community-based or faith-based organizations;

(vi) volunteer literacy organizations;

(vii) institutions of higher education, including community college or technical colleges;

(viii) public or private nonprofit agencies;

(ix) libraries;

(x) occupational training providers;

(xi) public housing authorities; or

(xii) nonprofit institutions not described above that provide adult education and literacy activities in correctional institutions or community settings.

(c) The partnership on whose behalf the application is submitted—

(i) Must include—

(A) The eligible applicant submitting the application, and

(B) One or more correctional institutions, as identified in the list of eligible applicants in paragraph (b)(i) of this section, at least one of which must currently offer adult basic education services or English literacy programs; and

(ii) May also include one or more of the other eligible applicants identified above in paragraph (b) of this section.

2. *Cost Sharing or Matching:* This program does not require cost sharing or matching.

IV. Application and Submission Information

1. *Address to Request Application Package:* You can obtain an application package via the Internet or from the

Education Publications Center (ED Pubs), or from the program office.

To obtain a copy via the Internet, use the following address: *www.ed.gov/fund/grant/apply/grantapps/index.html.* To obtain a copy from ED Pubs, write, fax, or call the following: ED Pubs, U.S. Department of Education, P.O. Box 22207, Alexandria, VA 22304. Telephone, toll free: 1–877–433–7827. FAX: (703) 605–6794. If you use a telecommunications device for the deaf (TDD) or a text telephone (TTY), call, toll free: 1–877–576–7734.

You can contact ED Pubs at its Web site, also: *www.EDPubs.gov* or at its email address: *edpubs@inet.ed.gov.*

If you request an application package from ED Pubs, be sure to identify this program or competition as follows: CFDA number 84.191D

To obtain a copy from the program office, contact the persons listed under **FOR FURTHER INFORMATION CONTACT** in section VII of this notice.

Individuals with disabilities can obtain a copy of the application package in an accessible format (*e.g.,* braille, large print, audiotape, or compact disc) by contacting the person or team listed under Accessible Format in section VIII of this notice.

2. a. *Content and Form of Application Submission:* Requirements concerning the content of an application, together with the forms you must submit, are in the application package for this competition.

Page Limit: The application narrative (Part III of the application) is where you, the applicant, address the selection criteria that reviewers use to evaluate your application. You must limit the application narrative [Part III] to no more than 30 pages, using the following standards:

• A ''page'' is 8.5″ x 11″, on one side only, with 1″ margins at the top, bottom, and both sides.

• Double space (no more than three lines per vertical inch) all text in the application narrative, including titles, headings, footnotes, quotations, references, and captions, as well as all text in charts, tables, figures, and graphs.

• Use a font that is either 12 point or larger or no smaller than 10 pitch (characters per inch).

• Use one of the following fonts: Times New Roman, Courier, Courier New, or Arial. An application submitted in any other font (including Times Roman or Arial Narrow) will not be accepted.

The page limit does not apply to Part I, the cover sheet; Part II, the budget section, including the narrative budget justification; Part IV, the assurances and certifications; or the one-page abstract, the resumes, the bibliography, or the letters of support. However, the page limit does apply to all of the application narrative section [Part III].

Our reviewers will not read any pages of your application that exceed the page limit.

2. b. *Content and Form of Application Submission:*

Given the types of projects that may be proposed in applications for the IRE program, your application may include business information that the applicant considers proprietary. The Department's regulations define ''business information'' in 34 CFR 5.11.

Because we plan to make successful applications available to the public upon request, you may wish to request confidentiality of business information. Consistent with Executive Order 12600, please designate in your application any information that you feel is exempt from disclosure under Exemption 4 of the Freedom of Information Act. In the appropriate Appendix section of your application, under ''Other Attachments Form,'' please list the page number or numbers on which we can find this information. For additional information please see 34 CFR 5.11(c).

3. *Submission Dates and Times:*

Applications Available: July 13, 2015.

Deadline for Transmittal of Applications: August 12, 2015.

Applications for grants under this competition must be submitted electronically using the Grants.gov Apply site. For information (including dates and times) about how to submit your application electronically, or in paper format by mail or hand delivery if you qualify for an exception to the electronic submission requirement, please refer to section IV.7. *Other Submission Requirements* of this notice.

We do not consider an application that does not comply with the deadline requirements.

Individuals with disabilities who need an accommodation or auxiliary aid in connection with the application process should contact the person listed under **FOR FURTHER INFORMATION CONTACT** in section VII of this notice. If the Department provides an accommodation or auxiliary aid to an individual with a disability in connection with the application process, the individual's application remains subject to all other requirements and limitations in this notice.

Deadline for Intergovernmental Review: September 11, 2015.

4. *Intergovernmental Review:* This program is subject to Executive Order 12372 and the regulations in 34 CFR part 79. Information about Intergovernmental Review of Federal Programs under Executive Order 12372 is in the application package for this program.

5. *Funding Restrictions:* We reference regulations outlining funding restrictions in the *Applicable Regulations* section of this notice.

6. *Data Universal Numbering System Number, Taxpayer Identification Number, and System for Award Management:* To do business with the Department of Education, you must—

a. Have a Data Universal Numbering System (DUNS) number and a Taxpayer Identification Number (TIN);

b. Register both your DUNS number and TIN with the System for Award Management (SAM) (formerly the Central Contractor Registry (CCR)), the Government's primary registrant database;

c. Provide your DUNS number and TIN on your application; and

d. Maintain an active SAM registration with current information while your application is under review by the Department and, if you are awarded a grant, during the project period.

You can obtain a DUNS number from Dun and Bradstreet. A DUNS number can be created within one-to-two business days.

If you are a corporate entity, agency, institution, or organization, you can obtain a TIN from the Internal Revenue Service. If you are an individual, you can obtain a TIN from the Internal Revenue Service or the Social Security Administration. If you need a new TIN, please allow 2–5 weeks for your TIN to become active.

The SAM registration process can take approximately seven business days, but may take upwards of several weeks, depending on the completeness and accuracy of the data entered into the SAM database by an entity. Thus, if you think you might want to apply for Federal financial assistance under a program administered by the Department, please allow sufficient time to obtain and register your DUNS number and TIN. We strongly recommend that you register early.

Note: Once your SAM registration is active, you will need to allow 24 to 48 hours for the information to be available in Grants.gov and before you can submit an application through Grants.gov.

If you are currently registered with SAM, you may not need to make any changes. However, please make certain that the TIN associated with your DUNS number is correct. Also note that you will need to update your registration annually. This may take three or more business days.

Information about SAM is available at *www.SAM.gov.* To further assist you with obtaining and registering your DUNS number and TIN in SAM or updating your existing SAM account, we have prepared a SAM.gov Tip Sheet, which you can find at: *www2.ed.gov/fund/grant/apply/sam-faqs.html.*

In addition, if you are submitting your application via Grants.gov, you must (1) be designated by your organization as an Authorized Organization Representative (AOR); and (2) register yourself with Grants.gov as an AOR. Details on these steps are outlined at the following Grants.gov Web page: *www.grants.gov/web/grants/register.html.*

7. *Other Submission Requirements:* Applications for grants under this program must be submitted electronically unless you qualify for an exception to this requirement in accordance with the instructions in this section.

a. Electronic Submission of Applications

Applications for grants under this competition must be submitted electronically using the Governmentwide Grants.gov Apply site at *www.Grants.gov.* Through this site, you will be able to download a copy of the application package, complete it offline, and then upload and submit your application. You may not email an electronic copy of a grant application to us.

We will reject your application if you submit it in paper format unless, as described elsewhere in this section, you qualify for one of the exceptions to the electronic submission requirement *and* submit, no later than two weeks before the application deadline date, a written statement to the Department that you qualify for one of these exceptions. Further information regarding calculation of the date that is two weeks before the application deadline date is provided later in this section under *Exception to Electronic Submission Requirement.*

You may access the electronic grant application for IRE at *www.Grants.gov.* You must search for the downloadable application package for this program by the CFDA number. Do not include the CFDA number's alpha suffix in your search (*e.g.,* search for 84.191, not 84.191D).

Please note the following:

• When you enter the Grants.gov site, you will find information about submitting an application electronically through the site, as well as the hours of operation.

• Applications received by Grants.gov are date and time stamped. Your application must be fully uploaded and submitted and must be date and time stamped by the Grants.gov system no later than 4:30:00 p.m., Washington, DC time, on the application deadline date.

Except as otherwise noted in this section, we will not accept your application if it is received—that is, date and time stamped by the Grants.gov system—after 4:30:00 p.m., Washington, DC time, on the application deadline date. We do not consider an application that does not comply with the deadline requirements. When we retrieve your application from Grants.gov, we will notify you if we are rejecting your application because it was date and time stamped by the Grants.gov system after 4:30:00 p.m., Washington, DC time, on the application deadline date.

• The amount of time it can take to upload an application will vary depending on a variety of factors, including the size of the application and the speed of your Internet connection. Therefore, we strongly recommend that you do not wait until the application deadline date to begin the submission process through Grants.gov.

• You should review and follow the Education Submission Procedures for submitting an application through Grants.gov that are included in the application package for this competition to ensure that you submit your application in a timely manner to the Grants.gov system. You can also find the Education Submission Procedures pertaining to Grants.gov under News and Events on the Department's G5 system home page at *www.G5.gov.*

• You will not receive additional point value because you submit your application in electronic format, nor will we penalize you if you qualify for an exception to the electronic submission requirement, as described elsewhere in this section, and submit your application in paper format.

• You must submit all documents electronically, including all information you typically provide on the following forms: The Application for Federal Assistance (SF 424), the Department of Education Supplemental Information for SF 424, Budget Information—Non-Construction Programs (ED 524), and all necessary assurances and certifications.

• You must upload any narrative sections and all other attachments to your application as files in a PDF (Portable Document) read-only, non-modifiable format. Do not upload an interactive or fillable PDF file. If you upload a file type other than a read-only, non-modifiable PDF or submit a password-protected file, we will not review that material.

• Your electronic application must comply with any page-limit requirements described in this notice.

• After you electronically submit your application, you will receive from Grants.gov an automatic notification of receipt that contains a Grants.gov tracking number. (This notification indicates receipt by Grants.gov only, not receipt by the Department.) The Department then will retrieve your application from Grants.gov and send a second notification to you by email. This second notification indicates that the Department has received your application and has assigned your application a PR/Award number (an ED specified identifying number unique to your application).

• We may request that you provide us original signatures on forms at a later date.

Application Deadline Date Extension in Case of Technical Issues with the Grants.gov System: If you are experiencing problems submitting your application through Grants.gov, please contact the Grants.gov Support Desk, toll free, at 1–800–518–4726. You must obtain a Grants.gov Support Desk Case Number and must keep a record of it.

If you are prevented from electronically submitting your application on the application deadline date because of technical problems with the Grants.gov system, we will grant you an extension until 4:30:00 p.m., Washington, DC time, the following business day to enable you to transmit your application electronically or by hand delivery. You also may mail your application by following the mailing instructions described elsewhere in this notice.

If you submit an application after 4:30:00 p.m., Washington, DC time, on the application deadline date, please contact the person listed under **FOR FURTHER INFORMATION CONTACT** in section VII of this notice and provide an explanation of the technical problem you experienced with Grants.gov, along with the Grants.gov Support Desk Case Number. We will accept your application if we can confirm that a technical problem occurred with the Grants.gov system and that that problem affected your ability to submit your application by 4:30:00 p.m., Washington, DC time, on the application deadline date. The Department will contact you after a determination is made on whether your application will be accepted.

Note: The extensions to which we refer in this section apply only to the unavailability of, or technical problems with, the Grants.gov system. We will not grant you an extension if you failed to fully register to submit your application to Grants.gov before the application deadline date and time or if the technical problem you experienced is unrelated to the Grants.gov system.

Exception to Electronic Submission Requirement: You qualify for an exception to the electronic submission requirement, and may submit your application in paper format, if you are unable to submit an application through the Grants.gov system because—

- You do not have access to the Internet; or
- You do not have the capacity to upload large documents to the Grants.gov system; and
- No later than two weeks before the application deadline date (14 calendar days or, if the fourteenth calendar day before the application deadline date falls on a Federal holiday, the next business day following the Federal holiday), you mail or fax a written statement to the Department, explaining which of the two grounds for an exception prevent you from using the Internet to submit your application.

If you mail your written statement to the Department, it must be postmarked no later than two weeks before the application deadline date. If you fax your written statement to the Department, we must receive the faxed statement no later than two weeks before the application deadline date. Address and mail or fax your statement to: Tammi Fergusson, U.S. Department of Education, 400 Maryland Avenue SW., Room 11009, PCP, Washington, DC 20202–7240. FAX: (202) 245–7839.

Your paper application must be submitted in accordance with the mail or hand delivery instructions described in this notice.

b. Submission of Paper Applications by Mail

If you qualify for an exception to the electronic submission requirement, you may mail (through the U.S. Postal Service or a commercial carrier) your application to the Department. You must mail the original and two copies of your application, on or before the application deadline date, to the Department at the following address: U.S. Department of Education, Application Control Center, Attention: (CFDA Number 84.191D), LBJ Basement Level 1, 400 Maryland Avenue SW., Washington, DC 20202–4260.

You must show proof of mailing consisting of one of the following:

(1) A legibly dated U.S. Postal Service postmark.

(2) A legible mail receipt with the date of mailing stamped by the U.S. Postal Service.

(3) A dated shipping label, invoice, or receipt from a commercial carrier.

(4) Any other proof of mailing acceptable to the Secretary of the U.S. Department of Education.

If you mail your application through the U.S. Postal Service, we do not accept either of the following as proof of mailing:

(1) A private metered postmark.

(2) A mail receipt that is not dated by the U.S. Postal Service. If your application is postmarked after the application deadline date, we will not consider your application.

Note: The U.S. Postal Service does not uniformly provide a dated postmark. Before relying on this method, you should check with your local post office.

c. Submission of Paper Applications by Hand Delivery

If you qualify for an exception to the electronic submission requirement, you (or a courier service) may deliver your paper application to the Department by hand. You must deliver the original and two copies of your application by hand, on or before the application deadline date, to the Department at the following address: U.S. Department of Education, Application Control Center, Attention: (CFDA Number 84.191D), 550 12th Street SW., Room 7041, Potomac Center Plaza, Washington, DC 20202–4260.

The Application Control Center accepts hand deliveries daily between 8:00 a.m. and 4:30:00 p.m., Washington, DC time, except Saturdays, Sundays, and Federal holidays.

Note for Mail or Hand Delivery of Paper Applications: If you mail or hand deliver your application to the Department:

(1) You must indicate on the envelope and—if not provided by the Department—in Item 11 of the SF 424 the CFDA number, including suffix letter, if any, of the competition under which you are submitting your application; and

(2) The Application Control Center will mail to you a notification of receipt of your grant application. If you do not receive this notification within 15 business days from the application deadline date, you should call the U.S. Department of Education Application Control Center at (202) 245–6288.

V. Application Review Information

1. *Selection Criteria:* The selection criteria for this program are from 34 CFR 75.210 of EDGAR and are listed in the following paragraphs. The maximum score for all the selection criteria is 100 points.

In addressing each criterion, applicants are encouraged to make explicit connections to relevant aspects of responses to other selection criteria. The selection criteria are as follows:

(1) *Need for project* (up to 10 points).

(a) The Secretary considers the need for the proposed project.

(b) In determining the need for the proposed project, the Secretary considers one or more of the following factors:

(i) The magnitude of the need for the services to be provided or the activities to be carried out by the proposed project; and

(ii) The extent to which specific gaps or weaknesses in services, infrastructure, or opportunities have been identified and will be addressed by the proposed project, including the nature and magnitude of those gaps or weaknesses.

(2) *Significance* (up to 20 points).

(a) The Secretary considers the significance of the proposed project.

(b) In determining the significance of the proposed project, the Secretary considers—

(i) The extent to which the proposed project is likely to build local capacity to provide, improve, or expand services that address the needs of the target population; and

(ii) The importance or magnitude of the results or outcomes likely to be attained by the proposed project.

(3) *Quality of the project design* (up to 30 points).

(a) The Secretary considers the quality of the design of the proposed project.

(b) In determining the quality of the design of the proposed project, the Secretary considers—

(i) The extent to which the goals, objectives, and outcomes to be achieved by the proposed project are clearly specified and measurable;

(ii) The extent to which there is a conceptual framework underlying the proposed research or demonstration activities and the quality of that framework;

(iii) The extent to which the proposed project is designed to build capacity and yield results that will extend beyond the period of Federal financial assistance;

(iv) The extent to which the proposed project will integrate with or build on similar or related efforts to improve relevant outcomes (as defined in 34 CFR 77.1(c)), using existing funding streams from other programs or policies supported by community, State, and Federal resources; and

(v) The extent to which the proposed project is supported by strong theory (as defined in 34 CFR 77.1(c)).

(4) *Adequacy of resources* (up to 15 points).

(a) The Secretary considers the adequacy of resources for the proposed project.

(b) In determining the adequacy of resources for the proposed project, the Secretary considers—

(i) The relevance and demonstrated commitment of each partner in the proposed project to the implementation and success of the project;

(ii) The extent to which the costs are reasonable in relation to the objectives, design, and potential significance of the proposed project; and

(iii) The potential for continued support of the project after Federal funding ends, including, as appropriate, the demonstrated commitment of appropriate entities to such support.

(5) *Quality of the management plan* (up to 10 points).

(a) The Secretary considers the quality of the management plan for the proposed project.

(b) In determining the quality of the management plan for the proposed project, the Secretary considers—

(i) The adequacy of the management plan to achieve the objectives of the proposed project on time and within budget, including clearly defined responsibilities, timelines, and milestones for accomplishing project tasks;

(ii) The extent to which the time commitments of the project director and principal investigator and other key project personnel are appropriate and adequate to meet the objectives of the proposed project.

(6) *Quality of the project evaluation* (up to 15 points).

(a) The Secretary considers the quality of the evaluation to be conducted of the proposed project.

(b) In determining the quality of the evaluation, the Secretary considers—

(i) The extent to which the methods of evaluation include the use of objective performance measures that are clearly related to the intended outcomes of the project and will produce quantitative and qualitative data to the extent possible; and

(ii) The extent to which the methods of evaluation will, if well-implemented, produce strong evidence (as defined in 34 CFR 77.1(c)).

(ii) The extent to which the methods of evaluation will provide valid and reliable performance data on relevant outcomes (as defined in this notice).

2. *Review and Selection Process:* We remind potential applicants that in reviewing applications in any discretionary grant competition, the Secretary may consider, under 34 CFR 75.217(d)(3), the past performance of the applicant in carrying out a previous award, such as the applicant's use of funds, achievement of project objectives, and compliance with grant conditions. The Secretary may also consider whether the applicant failed to submit a timely performance report or submitted a report of unacceptable quality.

In addition, in making a competitive grant award, the Secretary also requires various assurances including those applicable to Federal civil rights laws that prohibit discrimination in programs or activities receiving Federal financial assistance from the Department of Education (34 CFR 100.4, 104.5, 106.4, 108.8, and 110.23).

3. *Special Conditions:* Under 2 CFR 3474.10, the Secretary may impose special conditions and, in appropriate circumstances, high-risk conditions on a grant if the applicant or grantee is not financially stable; has a history of unsatisfactory performance; has a financial or other management system that does not meet the standards in 2 CFR part 200, subpart D, as applicable; has not fulfilled the conditions of a prior grant; or is otherwise not responsible.

VI. Award Administration Information

1. *Award Notices:* If your application is successful, we notify your U.S. Representative and U.S. Senators and send you a Grant Award Notification (GAN); or we may send you an email containing a link to access an electronic version of your GAN. We may notify you informally, also. If your application is not evaluated or not selected for funding, we notify you.

2. *Administrative and National Policy Requirements:* We identify administrative and national policy requirements in the application package and reference these and other requirements in the Applicable Regulations section of this notice.

We reference the regulations outlining the terms and conditions of an award in the Applicable Regulations section of this notice and include these and other specific conditions in the GAN. The GAN also incorporates your approved application as part of your binding commitments under the grant.

3. *Reporting:* (a) If you apply for a grant under this competition, you must ensure that you have in place the necessary processes and systems to comply with the reporting requirements in 2 CFR part 170 should you receive funding under the competition. This does not apply if you have an exception under 2 CFR 170.110(b).

(b) At the end of your project period, you must submit a final performance report, including financial information, as directed by the Secretary. If you receive a multi-year award, you must submit an annual performance report that provides the most current performance and financial expenditure information as directed by the Secretary under 34 CFR 75.118. The Secretary may also require more frequent performance reports under 34 CFR 75.720(c). For specific requirements on reporting, please go to *www.ed.gov/fund/grant/apply/appforms/appforms.html.*

4. *Performance Measures:* Under the Government Performance and Results Act, the Department has established goals and measures for the Adult Education and Family Literacy Act program.

One of the established goals of AEFLA is to support adult education systems that result in increased adult achievement in order to prepare adults, including individuals in correctional settings, for family, work, citizenship, and future learning. The AEFLA program provides adults with opportunities to acquire basic foundation skills (including English language acquisition), complete secondary education, and transition to further education and training and to work. There are four established measures for the AEFLA program that are applicable for adults in the IRE program. These measures are—

(1) The percentage of adults enrolled in English literacy programs served by the program who acquire the level of English language skills needed to complete the levels of instruction in which they enrolled.

(2) The percentage of adults enrolled in adult basic education programs served by the program who acquire the level of basic skills needed to complete the level of instruction in which they enrolled.

(3) The percentage of all enrolled adults in the applicable population served by the program who obtain certification of attaining passing scores on a State-recognized high school equivalency test or obtain a diploma or State-recognized equivalent, documenting satisfactory completion of secondary studies (high school or adult high school)[20]

(4) The percentage of adults in the applicable population served by the

[20] The applicable population consists of all enrolled learners who take all GED tests, are enrolled in adult high school at the high ASE level, or are enrolled in the assessment phase of the External Diploma Program who exit during the program years.

program that enter postsecondary education or a training program.[21]

Under the Government Performance and Results Act, the Department has established goals and measures for the recidivism of individuals who have been in correctional institutions. The measure related to recidivism is—

(5) The percentage of adults served by the program who, within one year of release, have criminal justice system involvement (arrest, re-conviction, violation of parole conditions, or return to incarceration).

Grantees will be responsible for providing data to support evaluation of these objectives.

5. *Continuation Awards:* In making a continuation award under 34 CFR 75.253, the Secretary considers, among other things: whether a grantee has made substantial progress in achieving the goals and objectives of the project; whether the grantee has expended funds in a manner that is consistent with its approved application and budget; and, if the Secretary has established performance measurement requirements, the performance targets in the grantee's approved application. In making a continuation grant, the Secretary also considers whether the grantee is operating in compliance with the assurances in its approved application, including those applicable to Federal civil rights laws that prohibit discrimination in programs or activities receiving Federal financial assistance from the Department (34 CFR 100.4, 104.5, 106.4, 108.8, and 110.23).

VII. Agency Contact

FOR FURTHER INFORMATION CONTACT: Tammi Fergusson, U.S. Department of Education, 400 Maryland Avenue SW., Room 11009, Potomac Center Plaza (PCP), Washington, DC 20202. Telephone: (202) 245–7706 or by email: *Tammi.Fergusson@ed.gov.*

If you use a TDD or TTY, call the FRS, toll free, at 1–800–877–8339.

VIII. Other Information

Accessible Format: Individuals with disabilities can obtain this document and a copy of the application package in an accessible format (*e.g.,* braille, large print, audiotape, or compact disc) on request to the program contact person listed under **FOR FURTHER INFORMATION CONTACT** in section VII of this notice.

Electronic Access to This Document: The official version of this document is the document published in the **Federal Register**. Free Internet access to the official edition of the **Federal Register** and the Code of Federal Regulations is available via the Federal Digital System at: *www.gpo.gov/fdsys.* At this site you can view this document, as well as all other documents of this Department published in the **Federal Register**, in text or Adobe Portable Document Format (PDF). To use PDF you must have Adobe Acrobat Reader, which is available free at the site. You may also access documents of the Department published in the **Federal Register** by using the article search feature at: *www.federalregister.gov.* Specifically, through the advanced search feature at this site, you can limit your search to documents published by the Department.

Dated: July 7, 2015.

Johan E. Uvin,

Acting Assistant Secretary for Career, Technical, and Adult Education.

[FR Doc. 2015–17046 Filed 7–10–15; 8:45 am]

BILLING CODE 4000–01–P

[21] The applicable population consists of all adults who passed the state approved high school equivalency test or earned a secondary credential while enrolled in adult education, have a secondary credential at entry, or are enrolled in a class specifically designed for transitioning to postsecondary education who exit during the program year. Entry into postsecondary education or training can occur any time from the time of exit through the end of the following program year. A transition class is a class that has a specific purpose to prepare students for entry into postsecondary education, training, or an apprenticeship program.

DEPARTMENT OF ENERGY

[Certification Notice—236]

Notice of Filing of Self-Certification of Coal Capability Under the Powerplant and Industrial Fuel Use Act

AGENCY: Office of Electricity Delivery and Energy Reliability, DOE.

ACTION: Notice of filing.

SUMMARY: On June 5, 2015, Panda Stonewall LLC, as owner and operator of a new base load electric powerplant, submitted a coal capability self-certification to the Department of Energy (DOE) pursuant to § 201(d) of the Powerplant and Industrial Fuel Use Act of 1978 (FUA), as amended, and DOE regulations in 10 CFR 501.60, 61. FUA and regulations thereunder require DOE to publish a notice of filing of self-certification in the **Federal Register**. 42 U.S.C. 8311(d) and 10 CFR 501.61(c).

ADDRESSES: Copies of coal capability self-certification filings are available for public inspection, upon request, in the Office of Electricity Delivery and Energy Reliability, Mail Code OE–20, Room 8G–024, Forrestal Building, 1000 Independence Avenue SW., Washington, DC 20585.

FOR FURTHER INFORMATION CONTACT: Christopher Lawrence at (202) 586–5260.

SUPPLEMENTARY INFORMATION: Title II of FUA, as amended (42 U.S.C. 8301 *et seq.*), provides that no new base load electric powerplant may be constructed or operated without the capability to use coal or another alternate fuel as a primary energy source. Pursuant to FUA in order to meet the requirement of coal capability, the owner or operator of such a facility proposing to use natural gas or petroleum as its primary energy source shall certify to the Secretary of Energy (Secretary) prior to construction, or prior to operation as a base load electric powerplant, that such powerplant has the capability to use coal or another alternate fuel. Such certification establishes compliance with FUA section 201(a) as of the date it is filed with the Secretary. 42 U.S.C. 8311.

The following owner of a proposed new base load electric powerplant has filed a self-certification of coal-capability with DOE pursuant to FUA section 201(d) and in accordance with DOE regulations in 10 CFR 501.60, 61:

Owner: Panda Stonewall LLC.

Capacity: 778 megawatts (MW).

Plant Location: 20260 Energy Park Drive, Leesburg, VA 20175.

In-Service Date: May 2017.

Issued in Washington, DC, on July 7, 2015.

Christopher Lawrence,

Electricity Policy Analyst, Office of Electricity Delivery and Energy Reliability.

[FR Doc. 2015–17072 Filed 7–10–15; 8:45 am]

BILLING CODE 6450–01–P

DEPARTMENT OF ENERGY

Public Availability of Department of Energy FY 2014 Service Contract Inventory

AGENCY: Department of Energy.

ACTION: Notice of public availability of FY 2014 Service Contract Inventories.

SUMMARY: In accordance with Section 743 of Division C of the Consolidated Appropriations Act of 2010 (Pub. L. 111–117), the Department of Energy (DOE) is publishing this notice to advise the public on the availability of the FY 2014 Service Contract inventory. This inventory provides information on service contract actions over $25,000 that DOE completed in FY 2014. The information is organized by function to show how contracted resources are distributed throughout the agency. The inventory has been developed in accordance with guidance issued on November 5, 2010, by the Office of Management and Budget's Office of

Federal Procurement Policy (OFPP). OFPP's guidance is available at *http://www.whitehouse.gov/sites/default/files/omb/procurement/memo/service-contract-inventories-guidance-11052010.pdf.* On December 19, 2011, OFPP issued additional guidance available at *http://www.whitehouse.gov/sites/default/files/omb/procurement/memo/service-contract-inventory-guidance.pdf.*

Except for minor changes to reporting deadlines, the guidance for preparing and analyzing FY 2014 inventories is essentially unchanged from OFPP's November 5, 2010, guidance for preparing the FY 2010 inventory. DOE has posted its inventory and a summary of the inventory at: *http://energy.gov/management/downloads/service-contract-inventory.*

FOR FURTHER INFORMATION CONTACT: Questions regarding the service contract inventory should be directed to Jeff Davis in the Strategic Programs Division at 202–287–1877 or *jeff.davis@hq.doe.gov.*

Dated: July 6, 2015.

Patrick M. Ferraro,

Director, Office of Acquisition Management.

[FR Doc. 2015–17038 Filed 7–10–15; 8:45 am]

BILLING CODE 6450–01–P

DEPARTMENT OF ENERGY

[OE Docket No. EA–182–D]

Application to Export Electric Energy; H.Q. Energy Services (U.S.) Inc.

AGENCY: Office of Electricity Delivery and Energy Reliability, DOE.

ACTION: Notice of application.

SUMMARY: H.Q. Energy Services (U.S.) Inc. (Applicant or HQUS)) has applied to renew its authority to transmit electric energy from the United States to Canada pursuant to section 202(e) of the Federal Power Act.

DATES: Comments, protests, or motions to intervene must be submitted on or before August 12, 2015.

ADDRESSES: Comments, protests, motions to intervene, or requests for more information should be addressed to: Office of Electricity Delivery and Energy Reliability, Mail Code: OE–20, U.S. Department of Energy, 1000 Independence Avenue SW., Washington, DC 20585–0350. Because of delays in handling conventional mail, it is recommended that documents be transmitted by overnight mail, by electronic mail to *Electricity.Exports@hq.doe.gov,* or by facsimile to 202–586–8008.

SUPPLEMENTARY INFORMATION: Exports of electricity from the United States to a foreign country are regulated by the Department of Energy (DOE) pursuant to sections 301(b) and 402(f) of the Department of Energy Organization Act (42 U.S.C. 7151(b), 7172(f)) and require authorization under section 202(e) of the Federal Power Act (16 U.S.C. 824a(e)).

On July 19, 2010, DOE issued Order No. EA–182–C to HQUS, which authorized the Applicant to transmit electric energy from the United States to Canada as a power marketer for a five-year term using existing international transmission facilities. That authority expires on August 21, 2015. On June 10, 2015, HQUS filed an application with DOE for renewal of the export authority contained in Order No. EA–182 for an additional five-year term.

In its application, HQUS states that it does not own or operate any electric generation or transmission facilities, and it does not have a franchised service area. The electric energy that HQUS proposes to export to Canada would be surplus energy purchased from third parties such as electric utilities and Federal power marketing agencies pursuant to voluntary agreements. The existing international transmission facilities to be utilized by HQUS have previously been authorized by Presidential permits issued pursuant to Executive Order 10485, as amended, and are appropriate for open access transmission by third parties.

Procedural Matters: Any person desiring to be heard in this proceeding should file a comment or protest to the application at the address provided above. Protests should be filed in accordance with Rule 211 of the Federal Energy Regulatory Commission's (FERC) Rules of Practice and Procedures (18 CFR 385.211). Any person desiring to become a party to these proceedings should file a motion to intervene at the above address in accordance with FERC Rule 214 (18 CFR 385.214). Five copies of such comments, protests, or motions to intervene should be sent to the address provided above on or before the date listed above.

Comments and other filings concerning HQUS's application to export electric energy to Canada should be clearly marked with OE Docket No. EA–182–D. An additional copy is to be provided directly to Jerry L. Pfeffer, Skadden, Arps, Slate, Meagher & Flom LLP, 1440 New York Avenue NW., Washington, DC 20005.

A final decision will be made on this application after the environmental impacts have been evaluated pursuant to DOE's National Environmental Policy Act Implementing Procedures (10 CFR part 1021) and after a determination is made by DOE that the proposed action will not have an adverse impact on the sufficiency of supply or reliability of the U.S. electric power supply system.

Copies of this application will be made available, upon request, for public inspection and copying at the address provided above, by accessing the program Web site at *http://energy.gov/node/11845,* or by emailing Angela Troy at *Angela.Troy@hq.doe.gov.*

Issued in Washington, DC, on July 7, 2015.

Christopher Lawrence,

Electricity Policy Analyst, Office of Electricity Delivery and Energy Reliability.

[FR Doc. 2015–17069 Filed 7–10–15; 8:45 am]

BILLING CODE 6450–01–P

DEPARTMENT OF ENERGY

Federal Energy Regulatory Commission

[Project No. 2851–024]

Cellu Tissue Corporation; Dunn Paper; Notice of Application for Transfer of License and Soliciting Comments, Motions to Intervene, and Protests

On June 18, 2015, Cellu Tissue Corporation (transferor) and Dunn Paper (transferee) filed an application for transfer of license of the Natural Dam Hydroelectric Project, FERC No. 2851. The project is located on the Oswegatchie River in St. Lawrence County, New York.

The applicants seek Commission approval to transfer the license for the Natural Dam Hydroelectric Project from the transferor to the transferee.

Applicant Contact: For Transferor: Mr. Jeremy Bartholomew, Cellu Tissue Corporation, 4921 Route 58N, Gouverneur, NY 13642, telephone: 315–287–7177. For Transferee: Mr. Greg Howe, Dunn Paper, 4921 Route 58N, Gouverneur, NY 13642, telephone: 315–287–7177.

FERC Contact: Patricia W. Gillis, (202) 502–8735.

Deadline for filing comments, motions to intervene, and protests: 15 days from the date that the Commission issues this notice. The Commission strongly encourages electronic filing. Please file motions to intervene, comments, and protests using the Commission's eFiling system at *http://www.ferc.gov/docs-filing/efiling.asp.* Commenters can submit brief comments up to 6,000 characters, without prior registration, using the eComment system at *http://www.ferc.gov/docs-filing/ecomment.asp.* You must include your name and contact information at the end of your comments. For assistance, please contact FERC Online Support at *FERCOnlineSupport@ferc.gov,* (866) 208–3676 (toll free), or (202) 502–8659 (TTY). In lieu of electronic filing, please send a paper copy to: Secretary, Federal Energy Regulatory Commission, 888 First Street NE., Washington, DC 20426. The first page of any filing should include docket number P–2851–024.

Dated: July 1, 2015..

Kimberly D. Bose,

Secretary.

BILLING CODE 6717–01–P

DEPARTMENT OF ENERGY

Federal Energy Regulatory Commission

[Docket No. AD15–2–000]

Billing Procedures for Annual Charges For the Costs of Other Federal Agencies for Administering Part I of the Federal Power Act; Notice Reporting Costs for Other Federal Agencies' Administrative Annual Charges for Fiscal Year 2014

1. The Federal Energy Regulatory Commission (Commission) is required to determine the reasonableness of costs incurred by other Federal agencies (OFAs) [1] in connection with their participation in the Commission's proceedings under the Federal Power Act (FPA) Part I [2] when those agencies seek to include such costs in the administrative charges licensees must pay to reimburse the United States for the cost of administering Part I.[3] The Commission's *Order on Remand and Acting on Appeals of Annual Charge Bills* [4] determined which costs are eligible to be included in the administrative annual charges and it established a process for Commission review of future OFA cost submittals. This order established a process whereby the Commission would annually request each OFA to submit cost data, using a form [5] specifically designed for this purpose. In addition, the order established requirements for detailed cost accounting reports and other documented analyses, which explain the cost assumptions contained in the OFAs' submissions.

2. The Commission has completed its review of the forms and supporting documentation submitted by the U.S. Department of the Interior (Interior), the U.S. Department of Agriculture (Agriculture), and the U.S. Department of Commerce (Commerce) for fiscal year 2014. This notice reports the costs the Commission included in its administrative annual charges for fiscal year 2015.

Scope of Eligible Costs

3. The basis for eligible costs that should be included in the OFAs' administrative annual charges is prescribed by the Office of Management and Budget's (OMB) Circular A–25—*User Charges* and the Federal Accounting Standards Advisory Board's Statement of Federal Financial Accounting Standards (SFFAS) Number 4—*Managerial Cost Accounting Concepts and Standards for the Federal Government.* Circular A–25 establishes Federal policy regarding fees assessed for government services and provides specific information on the scope and type of activities subject to user charges. SSFAS Number 4 provides a conceptual framework for federal agencies to determine the full costs of government goods and services.

4. Circular A–25 provides for user charges to be assessed against recipients of special benefits derived from federal activities beyond those received by the general public.[6] With regard to licensees, the special benefit derived from federal activities is the license to operate a hydropower project. The guidance provides for the assessment of sufficient user charges to recover the *full* costs of services associated with these special benefits.[7] SFFAS Number 4 defines full costs as the costs of resources consumed by a specific governmental unit that contribute directly or indirectly to a provided service.[8] Thus, pursuant to OMB requirements and authoritative accounting guidance, the Commission must base its OFA administrative annual charge on all direct and indirect costs incurred by agencies in administering Part I of the FPA. The special form the Commission designed for this purpose, the ''Other Federal Agency Cost Submission Form,'' captures the full range of costs recoverable under the FPA and the referenced accounting guidance.[9]

Commission Review of OFA Cost Submittals

5. The Commission received cost forms and other supporting documentation from the Departments of the Interior, Agriculture, and Commerce (OFAs). The Commission completed a review of each OFA's cost submission forms and supporting reports. In its examination of the OFAs' cost data, the Commission considered each agency's ability to demonstrate a system or process which effectively captured, isolated, and reported Part I costs as required by the ''Other Federal Agency Cost Submission Form.''

6. The Commission held a Technical Conference on March 26, 2015 to report its initial findings to licensees and OFAs. No OFA representatives attended the conference. Following the technical conference, licensees had the opportunity to submit comments [10] to the Commission regarding its initial review.

7. Written comments were filed by Idaho Falls Group (Idaho Falls). Idaho Falls generally supported the Commission's analysis but raised questions regarding certain various individual cost submissions. The Commission will address the issues in the Appendix to this notice.

8. After additional reviews, full consideration of the comments presented, and in accordance with the previously cited guidance, the Commission accepted as reasonable any costs reported via the cost submission forms that were clearly documented in the OFAs' accompanying reports and/or analyses. These documented costs will be included in the administrative annual charges for fiscal year 2015.

Summary of Reported & Accepted Costs for Fiscal Year 2014

---

[1] The OFAs include: The U.S. Department of the Interior (Bureau of Indian Affairs, Bureau of Land Management, Bureau of Reclamation, National Park Service, U.S. Fish and Wildlife Service, Office of the Solicitor, Office of Environmental Policy & Compliance, Office of Hearings and Appeals and Office of Policy Analysis); the U.S. Department of Agriculture (U.S. Forest Service); the U.S. Department of Commerce (National Marine Fisheries Service); and the U.S. Army Corps of Engineers.

[2] 16 U.S.C. 794–823d (2006).

[3] *See id.* § 803(e)(1) and 42 U.S.C. 7178.

[4] 107 FERC ¶ 61,277, *order on reh'g,* 109 FERC ¶ 61,040 (2004).

[5] Other Federal Agency Cost Submission Form, *available at https://www.ferc.gov/docs-filing/forms.asp#ofa.*

[6] OMB Circular A–25 § 6.

[7] OMB Circular A–25 § 6. a. 2.

[8] SFFAS Number 4 ¶ 7.

[9] To avoid the possibility of confusion that has occurred in prior years as to whether costs were being entered twice as ''Other Direct Costs'' and ''Overhead,'' the form excluded ''Other Direct Costs.''

Figure 1

9. Figure 1 summarizes the total reported costs incurred by Interior, Agriculture, and Commerce with respect to each OFA's participation in administering Part I of the FPA. Additionally, Figure 1 summarizes the reported costs that the Commission determined were clearly documented and accepted for inclusion in its FY 2015 administrative annual charges.

Summary Findings of Commission's Costs Review

10. As presented in the preceding table, the Commission determined that $6,400,174 of the $7,459,258 in total reported costs were determined to be reasonable and clearly documented in the OFAs' accompanying reports and/or analyses. Based on these findings, 14% of the total reported cost was determined to be unreasonable. The Commission noted the most significant issues with regard to the insufficiency of documentation provided by the OFAs was the lack of supporting documentation to substantiate costs reported on the ''Other Federal Agency Cost Submission Form'' as well as the inability to segregate Municipal and Non-Municipal costs.

11. The cost reports that the Commission determined were clearly documented and supported could be traced to detailed cost-accounting reports, which reconciled to data provided from agency financial systems or other pertinent source documentation. A further breakdown of these costs is included in the Appendix to this notice, along with an explanation of how the Commission determined their reasonableness.

Points of Contact

12. If you have any questions regarding this notice, please contact Norman Richardson at (202) 502–6219 or Raven Rodriquez at (202) 502–6276.

Dated: July 7, 2015.

BILLING CODE 6717–01–P

DEPARTMENT OF ENERGY

Federal Energy Regulatory Commission

[Docket No. EL15–82–000]

Illinois Industrial Energy Consumers v. Midcontinent Independent System Operator, Inc.; Notice of Complaint

Take notice that on June 30, 2015, pursuant to Rule 206 of the Federal Energy Regulatory Commission's (Commission) Rules of Practice and Procedure, 18 CFR 385.206 and sections 206, 222, and 306 of the Federal Power Act (FPA), 16 U.S.C. 824(e), 824(v), and 825(e), Illinois Industrial Energy Consumers (Complainant) filed a formal complaint against Midcontinent Independent System Operator, Inc. (Respondent) asserting that Respondent's Open Access Transmission, Energy and Operating Reserves Market Tariff is unjust, unreasonable, and unduly discriminatory, in violation of the FPA, as more fully explained in the complaint.

Any person desiring to intervene or to protest this filing must file in accordance with Rules 211 and 214 of the Commission's Rules of Practice and Procedure (18 CFR 385.211, 385.214). Protests will be considered by the Commission in determining the appropriate action to be taken, but will not serve to make protestants parties to the proceeding. Any person wishing to become a party must file a notice of intervention or motion to intervene, as appropriate. The Respondent's answer and all interventions, or protests must be filed on or before the comment date. The Respondent's answer, motions to intervene, and protests must be served on the Complainants.

The Commission encourages electronic submission of protests and interventions in lieu of paper using the ''eFiling'' link at *http://www.ferc.gov.* Persons unable to file electronically should submit an original and 5 copies of the protest or intervention to the Federal Energy Regulatory Commission, 888 First Street NE, Washington, DC 20426.

This filing is accessible on-line at *http://www.ferc.gov,* using the ''eLibrary'' link and is available for electronic review in the Commission's Public Reference Room in Washington, DC There is an ''eSubscription'' link on the Web site that enables subscribers to receive email notification when a document is added to a subscribed docket(s). [Docket No. EL15–81–000]

Bloom Energy Corporation; Notice of Petition for Declaratory Order

Take notice that on June 30, 2015, pursuant to rule 207(a) of the Federal Energy Regulatory Commission's (Commission) Rules of Practice and Procedure and sections 366.3(d) and 366.4(b)(3) of the Commission's regulations, 18 CFR 385.207(a), 366.3(d), and 366.4(b)(3), Bloom Energy Corporation (Bloom), filed a petition for declaratory order seeking a ruling that Bloom and certain of its subsidiaries are exempt from Commission regulation under the Public Utility Holding Company Act of 2005 as a result of their generation and sales to non-captive customers of electric energy generated from fuel cells using natural gas or renewable energy biogas as a fuel, all as more fully explained in the petition.

Any person desiring to intervene or to protest this filing must file in accordance with Rules 211 and 214 of the Commission's Rules of Practice and Procedure (18 CFR 385.211, 385.214). Protests will be considered by the Commission in determining the appropriate action to be taken, but will not serve to make protestants parties to the proceeding. Any person wishing to become a party must file a notice of intervention or motion to intervene, as appropriate. Such notices, motions, or protests must be filed on or before the comment date. Anyone filing a motion to intervene or protest must serve a copy of that document on the Petitioner.

The Commission encourages electronic submission of protests and interventions in lieu of paper using the ''eFiling'' link at *http://www.ferc.gov.* Persons unable to file electronically should submit an original and 5 copies of the protest or intervention to the Federal Energy Regulatory Commission, 888 First Street NE., Washington, DC 20426

BILLING CODE 6717–01–P

DEPARTMENT OF ENERGY

Federal Energy Regulatory Commission

[Docket No. ER15–2101–000]

Golden West Power Partners, LLC; Supplemental Notice That Initial Market-Based Rate Filing Includes Request for Blanket Section 204 Authorization

This is a supplemental notice in the above-referenced proceeding of Golden West Power Partners, LLC's application for market-based rate authority, with an accompanying rate tariff, noting that such application includes a request for blanket authorization, under 18 CFR part 34, of future issuances of securities and assumptions of liability.

Any person desiring to intervene or to protest should file with the Federal Energy Regulatory Commission, 888 First Street, NE., Washington, DC 20426, in accordance with Rules 211 and 214 of the Commission's Rules of Practice and Procedure (18 CFR 385.211 and 385.214). Anyone filing a motion to intervene or protest must serve a copy of that document on the Applicant.

Notice is hereby given that the deadline for filing protests with regard to the applicant's request for blanket authorization, under 18 CFR part 34, of future issuances of securities and assumptions of liability, is July 27, 2015.

The Commission encourages electronic submission of protests and interventions in lieu of paper, using the FERC Online links at *http://www.ferc.gov.* To facilitate electronic service, persons with Internet access who will eFile a document and/or be listed as a contact for an intervenor must create and validate an eRegistration account using the eRegistration link. Select the eFiling link to log on and submit the intervention or protests.

Persons unable to file electronically should submit an original and 5 copies of the intervention or protest to the Federal Energy Regulatory Commission, 888 First Street NE., Washington, DC 20426.

The filings in the above-referenced proceeding are accessible in the Commission's eLibrary system by clicking on the appropriate link in the above list. They are also available for electronic review in the Commission's Public Reference Room in Washington, DC. BILLING CODE 6717–01–P

DEPARTMENT OF ENERGY

Federal Energy Regulatory Commission

[Project No. 4285–046]

City of Logan, Utah; Notice of Application Accepted for Filing, Ready for Environmental Analysis, Soliciting Comments, Motions to Intervene, Protests, Recommendations, Terms and Conditions, and Fishway Prescriptions

Take notice that the following hydroelectric application has been filed with the Commission and is available for public inspection:

a. *Type of Proceeding:* Amendment of License.

b. *Project No.:* 4285–046.

c. *Date Filed:* May 8, 2015.

d. *Licensee:* City of Logan, Utah.

e. *Name of Project:* Logan No. 2 Hydroelectric Project.

f. *Location:* The project is located on the Logan River, near the City of Logan, in Cache County, Utah. The project occupies federal lands administered by the Logan Ranger District, USDA Forest Service (USFS).

g. *Filed Pursuant to:* Federal Power Act, 16 U.S.C. 791a–825r.

h. *Licensee Contact:* City of Logan, Utah, Logan City Light and Power Department, 233 North Main Street, Logan, Utah 84321, Mark Montgomery at 435–716–9744 or Greg Clark at 208–906–7612.

i. *FERC Contact:* Mr. M Joseph Fayyad, (202) 502–8759, *mo.fayyad@ferc.gov.*

j. *Deadline for filing comments, motions to intervene, protests, recommendations, terms and conditions, and prescriptions:* 60 days from the issuance date of this notice; reply comments are due 105 days from the issuance date of this notice. The Commission strongly encourages electronic filing. Please file motions to intervene, protests and comments using the Commission's eFiling system at *http://www.ferc.gov/docs-filing/efiling.asp.* Commenters can submit brief comments up to 6,000 characters, without prior registration, using the eComment system at *http://www.ferc.gov/docs-filing/ecomment.asp.* You must include your name and contact information at the end of your comments. For assistance, please contact FERC Online Support at *FERCOnlineSupport@ferc.gov,* (866) 208–3676 (toll free), or (202) 502–8659 (TTY). In lieu of electronic filing, please send a paper copy to: Secretary, Federal Energy Regulatory Commission, 888 First Street NE., Washington, DC 20426. The first page of any filing should include docket number P–4285–046.

k. *Description of Request:* Based upon an inspection of the dam and intake structure, the licensee proposes to replace or rehabilitate several portions of these structures. The proposed work will include: (1) Replacement of spillway crest gates with Obermeyer weirs; (2) Replacement of spillway abutment walls; (3) Armoring the abutments of the dam, which may consist of a combination of riprap and/or roller compacted concrete. (4) Replacement of the penstock isolation gate (Radial Gate) with an Obermeyer weir gate; (5) Replacement of trash rack at intake structure; (6) Replacement of the low level sluice gatehouse; (7) Rehabilitating the upstream face of dam; (8) Dredging of about 100,000 cubic yards of sediment from the reservoir; (9) refurbishment of the electrical generating equipment, which includes replacement of the existing runners, wicket gates, and associated parts which are damaged; and (10) recoating the interior and exterior of the steel portion of the penstock to reduce corrosion potential.

l. This filing may be viewed on the Commission's Web site at *http://www.ferc.gov/docs-filing/elibrary.asp.* Enter the docket number excluding the last three digits in the docket number field to access the document. You may also register online at *http://www.ferc.gov/docs-filing/esubscription.asp* to be notified via email of new filings and issuances related to this or other pending projects. For assistance, call 1–866–208–3676 or email *FERCOnlineSupport@ferc.gov,* for TTY, call (202) 502–8659. A copy is also available for inspection and reproduction in the Commission's Public Reference Room located at 888 First Street NE., Room 2A, Washington, DC 20426, or by calling (202) 502–8371.

m. Individuals desiring to be included on the Commission's mailing list should so indicate by writing to the Secretary of the Commission.

n. *Comments, Protests, or Motions to Intervene:* Anyone may submit comments, a protest, or a motion to intervene in accordance with the requirements of Rules of Practice and Procedure, 18 CFR 385.210, .211, and .214. In determining the appropriate action to take, the Commission will consider all protests or other comments filed, but only those who file a motion to intervene in accordance with the Commission's Rules may become a party to the proceeding. Any comments, protests, or motions to intervene must be received on or before the specified comment date for the particular application.

o. *Filing and Service of Responsive Documents:* Any filing must (1) bear in all capital letters the title ''COMMENTS'', ''PROTEST'', ''MOTION TO INTERVENE'', ''REPLY COMMENTS'', ''RECOMMENDATIONS'', ''TERMS AND CONDITIONS'', or ''PRESCRIPTIONS'', as applicable; (2) set forth in the heading the name of the applicant and the project number of the application to which the filing responds; (3) furnish the name, address, and telephone number of the person protesting or intervening; and (4) otherwise comply with the requirements of 18 CFR 385.2001 through 385.2005. All comments, motions to intervene, recommendations, terms and conditions, or prescriptions must set forth their evidentiary basis and otherwise comply with the requirements of 18 CFR 4.34(b), and should relate to project works which are the subject of the license amendment. Agencies may obtain copies of the application directly from the applicant. A copy of any protest or motion to intervene must be served upon each representative of the applicant specified in the particular application. If an intervener files comments or documents with the Commission relating to the merits of an issue that may affect the responsibilities of a particular resource agency, they must also serve a copy of the document on that resource agency. A copy of all other filings in reference to this application must be accompanied by proof of service on all persons listed in the service list prepared by the

Commission in this proceeding, in accordance with 18 CFR 4.34(b) and 385.2010.

Dated: July 7, 2015.

DEPARTMENT OF ENERGY

Federal Energy Regulatory Commission

[Project No. 2548–046]

Northbrook Lyons Falls, LLC; Notice of Application Accepted for Filing, Soliciting Comments, Motions To Intervene, Protests, Recommendations, Terms and Conditions, and Prescriptions

Take notice that the following hydroelectric application has been filed with the Commission and is available for public inspection:

a. *Type of Proceeding:* Amendment of License.

b. *Project No.:* 2548–046.

c. *Date Filed:* May 15, 2015.

d. *Licensee:* Northbrook Lyons Falls, LLC.

e. *Name of Project:* Lyons Falls Project.

f. *Location:* The 8.63-Megawatt (MW) Lyons Falls Project is located on the Moose and Black Rivers in Lewis County, New York.

g. *Filed Pursuant to:* Federal Power Act, 16 U.S.C. 791a–825r.

h. *Licensee Contact:* Mr. Dan Parker, Northbrook Lyons Falls, LLC, 37 Alfred A. Plourde Parkway, Suite 2, Lewiston, ME 04240, Telephone: (315) 261–2158, email: *daniel.parker@kniger.com*

i. *FERC Contact:* Mr. M. Joseph Fayyad, (202) 502–8759, *mo.fayyad@ferc.gov.*

j. *Deadline for filing comments, motions to intervene, protests, recommendations, terms and conditions, and prescriptions:* 60 days from the issuance date of this notice; reply comments are due 105 days from the issuance date of this notice. The Commission strongly encourages electronic filing. Please file motions to intervene, protests and comments using the Commission's eFiling system at *http://www.ferc.gov/docs-filing/efiling.asp.* Commenters can submit brief comments up to 6,000 characters, without prior registration, using the eComment system at *http://www.ferc.gov/docs-filing/ecomment.asp.* You must include your name and contact information at the end of your comments. For assistance, please contact FERC Online Support at *FERCOnlineSupport@ferc.gov,* (866) 208–3676 (toll free), or (202) 502–8659 (TTY). In lieu of electronic filing, please send a paper copy to: Secretary, Federal Energy Regulatory Commission, 888 First Street NE., Washington, DC 20426. The first page of any filing should include docket number P–2548–046.

k. *Description of Request:* The licensee proposes to increase the installed capacity at one of the project's developments, the existing 5.6 megawatt (MW) Lyons Falls Mill Development. The proposed work would consist of: (1) Demolishing the existing four-unit primary powerhouse and mothball the secondary single-unit powerhouse; (2) constructing a new 60 feet long, 45 feet wide, and 40 feet high, combined intake and trashrack structure adjacent to the river left dam abutment; (3) constructing two 11.5-foot-diameter, 75- foot-long steel penstocks; (4) constructing a new concrete and masonry powerhouse located along river left, largely in the footprint of the existing primary powerhouse, with two generating units. The proposed work at the Lyons Falls development would increase its installed capacity from 5.6 MW to 11.2 MW and its hydraulic capacity from 1170 cubic feet per second (cfs) to 2684 cfs.

The licensee provided documentation that on June 1, 2015, it has submitted a Joint Application for Permit to the New York State Department of Conservation (NYSDEC) in support of amending the Project's existing Section 401 Water Quality Certificate or issuing a new Water Quality Certificate for the Project.

BILLING CODE 6717–01–P

DEPARTMENT OF ENERGY

Federal Energy Regulatory Commission

[Docket Nos. CP15–521–000; PF13–4–000]

Gulf LNG Liquefaction Company, LLC, Gulf LNG Energy, LLC, Gulf LNG Pipeline LLC; Notice of Application

Take notice that on June 19, 2015, Gulf LNG Liquefaction Company, LLC (Gulf Liquefaction), Gulf LNG Energy, LLC (Gulf Energy), and Gulf LNG Pipeline LLC (Gulf Pipeline) (collectively, Applicants) 569 Brookwood Village, Suite 749, Birmingham, Alabama 35209, filed an application pursuant to section 3(a) of the Natural Gas Act (NGA) and Part 153 of the Commission's Regulations, requesting authorization to construct and operate the Gulf LNG Liquefaction Project (Project) at Gulf Energy's liquefied natural gas terminal located near Pascagoula, Jackson County, Mississippi. The Project consists of new natural gas liquefaction and export facilities. Additionally, within the same application, Gulf Pipeline filed pursuant to section 7(c) of the NGA and Part 157 of the Commission's Regulations to make modifications to the terminal's sendout pipeline to allow for bi-directional flow. The filing may be viewed on the web at *http://www.ferc.gov* using the ''eLibrary'' link. Enter the docket number excluding the last three digits in the docket number field to access the document. For assistance, contact FERC at *FERCOnlineSupport@ferc.gov* or call toll-free (886) 208–3676 or TYY (202) 502–8659.

Any questions regarding this application should be directed to Glenn A. Sheffield, Director of Rates and Regulatory Affairs, Gulf LNG Liquefaction Company, LLC, 569 Brookwood Village, Suite 749, Birmingham, Alabama 35209, telephone (205) 325–3813, or email *glenn_sheffield@kindermorgan.com;* or Tina S. Hardy, Manager IC-Regulatory, telephone (205) 325–3668, or email *tina_hardy@kindermorgan.com.*

Specifically, Gulf Liquefaction proposes under section 3 to construct two 5 million ton per annum liquefaction trains, pretreatment, ancillary and support facilities, two marine off loading facilities, and an extension of the storm surge protection facilities. These facilities will enable Gulf Liquefaction to liquefy and export up to 1.5 billion cubic feet of natural gas per day. Gulf Energy proposes under section 3 to make modifications to their terminal to accommodate Gulf Liquefaction's operations and Gulf Pipeline proposes interconnect modifications under section 7 to allow bi-directional flow of natural gas to the terminal.

On May 21, 2014, the Commission staff granted the Applicants' request to use the National Environmental Policy Act (NEPA) Pre-Filing Process and assigned Docket No. PF13–4–000 to staff activities involving the proposed facilities. Now, as of the filing of this application on June 19, 2015, the NEPA Pre-Filing Process for this project has ended. From this time forward, this proceeding will be conducted in Docket No. CP15–521–000, as noted in the caption of this Notice.

Pursuant to section 157.9 of the Commission's rules, 18 CFR 157.9, within 90 days of this Notice the Commission staff will either: complete its environmental assessment (EA) and place it into the Commission's public record (eLibrary) for this proceeding, or issue a Notice of Schedule for Environmental Review. If a Notice of Schedule for Environmental Review is issued, it will indicate, among other milestones, the anticipated date for the Commission staff's issuance of the final environmental impact statement (FEIS) or EA for this proposal. The filing of the EA in the Commission's public record for this proceeding or the issuance of a Notice of Schedule will serve to notify federal and state agencies of the timing for the completion of all necessary reviews, and the subsequent need to complete all federal authorizations within 90 days of the date of issuance of the Commission staff's FEIS or EA.

There are two ways to become involved in the Commission's review of this project. First, any person wishing to obtain legal status by becoming a party to the proceedings for this project should, on or before the comment date stated below, file with the Federal Energy Regulatory Commission, 888 First Street NE., Washington, DC 20426, a motion to intervene in accordance with the requirements of the Commission's Rules of Practice and Procedure (18 CFR 385.214 or 385.211) and the Regulations under the NGA (18 CFR 157.10). A person obtaining party status will be placed on the service list maintained by the Secretary of the Commission and will receive copies of all documents filed by the applicant and by all other parties. A party must submit 5 copies of filings made with the Commission and must mail a copy to the applicant and to every other party in the proceeding. Only parties to the proceeding can ask for court review of Commission orders in the proceeding.

However, a person does not have to intervene in order to have comments considered. The second way to participate is by filing with the Secretary of the Commission, as soon as possible, an original and two copies of comments in support of or in opposition to this project. The Commission will consider these comments in determining the appropriate action to be taken, but the filing of a comment alone will not serve to make the filer a party to the proceeding. The Commission's rules require that persons filing comments in opposition to the project provide copies of their protests only to the party or parties directly involved in the protest.

Persons who wish to comment only on the environmental review of this project should submit an original and two copies of their comments to the Secretary of the Commission. Environmental commenters will be placed on the Commission's environmental mailing list, will receive copies of the environmental documents, and will be notified of meetings associated with the Commission's environmental review process. Environmental commenters will not be required to serve copies of filed documents on all other parties. However, the non-party commenters will not receive copies of all documents filed by other parties or issued by the Commission (except for the mailing of environmental documents issued by the Commission) and will not have the right to seek court review of the Commission's final order.

Motions to intervene, protests and comments may be filed electronically via the internet in lieu of paper; see, 18 CFR 385.2001(a) (1) (iii) and the instructions on the Commission's Web site under the ''e-Filing'' link. The Commission strongly encourages electronic filings.

Comment Date: July 22, 2015.

Dated: July 1, 2015.

[Docket No. PF15–23–000]

Millennium Pipeline Company, LLC; Notice of Intent To Prepare an Environmental Assessment for the Planned Valley Lateral Project, and Request for Comments on Environmental Issues

The staff of the Federal Energy Regulatory Commission (FERC or Commission) will prepare an environmental assessment (EA) that will discuss the environmental impacts of the Valley Lateral Project involving construction and operation of facilities by Millennium Pipeline Company, LLC (Millennium) in Orange County, New York. The Commission will use this EA in its decision-making process to determine whether the project is in the public convenience and necessity.

This notice announces the opening of the scoping process the Commission will use to gather input from the public and interested agencies on the project. You can make a difference by providing us with your specific comments or concerns about the project. Your comments should focus on the potential environmental effects, reasonable alternatives, and measures to avoid or lessen environmental impacts. Your input will help the Commission staff determine what issues they need to evaluate in the EA. To ensure that your comments are timely and properly recorded, please send your comments so that the Commission receives them in Washington, DC on or before August 5, 2015.

If you sent comments on this project to the Commission before the opening of this docket on April 30, 2015, you will need to file those comments in Docket No. PF15–23–000 to ensure they are considered as part of this proceeding.

This notice is being sent to the Commission's current environmental mailing list for this project. State and local government representatives should notify their constituents of this planned project and encourage them to comment on their areas of concern.

If you are a landowner receiving this notice, a pipeline company representative may contact you about the acquisition of an easement to construct, operate, and maintain the planned facilities. The company would seek to negotiate a mutually acceptable agreement. However, if the Commission approves the project, that approval conveys with it the right of eminent domain. Therefore, if easement negotiations fail to produce an agreement, the pipeline company could initiate condemnation proceedings where compensation would be determined in accordance with state law.

A fact sheet prepared by the FERC entitled ''An Interstate Natural Gas Facility On My Land? What Do I Need To Know?'' is available for viewing on the FERC Web site (*www.ferc.gov*). This fact sheet addresses a number of typically asked questions, including the use of eminent domain and how to participate in the Commission's proceedings.

Public Participation

For your convenience, there are three methods you can use to submit your comments to the Commission. The Commission encourages electronic filing of comments and has expert staff available to assist you at (202) 502–8258 or *efiling@ferc.gov.* Please carefully follow these instructions so that your comments are properly recorded.

(1) You can file your comments electronically using the *eComment* feature on the Commission's Web site (*www.ferc.gov*) under the link to *Documents and Filings.* This is an easy method for submitting brief, text-only comments on a project;

(2) You can file your comments electronically by using the *eFiling* feature on the Commission's Web site (*www.ferc.gov*) under the link to *Documents and Filings.* With eFiling, you can provide comments in a variety of formats by attaching them as a file with your submission. New eFiling users must first create an account by clicking on ''*eRegister.''* If you are filing a comment on a particular project, please select ''Comment on a Filing'' as the filing type; or

(3) You can file a paper copy of your comments by mailing them to the following address. Be sure to reference the project docket number (PF15–23–000) with your submission: Kimberly D. Bose, Secretary, Federal Energy Regulatory Commission, 888 First Street NE., Room 1A, Washington, DC 20426.

Summary of the Planned Project

Millennium plans to construct and operate approximately 7.8 miles of new pipeline lateral in Orange County, New York. The planned pipeline lateral would provide about 130 million cubic feet per day of natural gas per day to the Competitive Power Ventures (CPV) Valley Energy Center in the Town of Wawayanda, New York from Millennium's existing mainline pipeline. According to Millennium, the Valley Lateral Project would supply natural gas for generation of up to 650 megawatts of power at the CPV Valley Energy Center (in development).

The planned Valley Lateral Project would consist of the following facilities:

- 7.8 miles of pipeline lateral originating at Millennium's existing mainline that would deliver gas to the CPV Valley Energy Center;
- a pig[1] launcher at the pipeline origin located wholly within the permanent pipeline right-of-way; and
- a pig receiver and metering facilities at the pipeline terminus and located entirely within the area to be developed for the CPV Valley Energy Center.

The general location of the project facilities is shown in appendix 1.[2]

Land Requirements for Construction

Construction of the planned pipeline lateral facilities would occur within a 75- to 135-foot right-of-way. Following construction, Millennium would maintain a 50-foot right-of-way for permanent operation of the project's facilities; the remaining acreage would be restored and revert to former uses. About 24 percent of the planned pipeline route parallels existing pipeline, utility, or road rights-of-way.

The EA Process

The National Environmental Policy Act (NEPA) requires the Commission to take into account the environmental impacts that could result from an action whenever it considers the issuance of a Certificate of Public Convenience and Necessity. NEPA also requires us[3] to discover and address concerns the public may have about proposals. This process is referred to as scoping. The main goal of the scoping process is to focus the analysis in the EA on the important environmental issues. By this notice, the Commission requests public comments on the scope of the issues to address in the EA. We will consider all filed comments during the preparation of the EA.

In the EA we will discuss impacts that could occur as a result of the construction and operation of the planned project under these general headings:

- geology and soils;
- land use;
- water resources, fisheries, and wetlands;
- cultural resources;
- vegetation and wildlife;
- air quality and noise;
- endangered and threatened species;
- public safety; and
- cumulative impacts.

We will also evaluate possible alternatives to the planned project or portions of the project, and make recommendations on how to lessen or avoid impacts on the various resource areas.

Although no formal application has been filed, we have already initiated our NEPA review under the Commission's pre-filing process. The purpose of the pre-filing process is to encourage early involvement of interested stakeholders and to identify and resolve issues before the FERC receives an application. As part of our pre-filing review, we have begun to contact some federal and state agencies to discuss their involvement in the scoping process and the preparation of the EA.

The EA will present our independent analysis of the issues. The EA will be available in the public record through eLibrary. We will also publish and distribute the EA to the public for an allotted comment period. We will consider all comments on the EA before we make our recommendations to the Commission. To ensure we have the opportunity to consider and address your comments, please carefully follow the instructions in the Public Participation section, beginning on page 2.

With this notice, we are asking agencies with jurisdiction by law and/or special expertise with respect to the environmental issues related to this project to formally cooperate with us in the preparation of the EA.[4] Agencies that would like to request cooperating agency status should follow the instructions for filing comments provided under the Public Participation section of this notice.

Consultations Under Section 106 of the National Historic Preservation Act

In accordance with the Advisory Council on Historic Preservation's implementing regulations for section 106 of the National Historic Preservation Act, we are using this notice to initiate consultation with the applicable State Historic Preservation Office, and to solicit their views and those of other government agencies, interested Indian tribes, and the public on the project's potential effects on historic properties.[5] We will define the project-specific Area of Potential Effects (APE) in consultation with the SHPO as the project develops. On natural gas facility projects, the APE at a minimum encompasses all areas subject to ground disturbance (examples include construction right-of-way, contractor/pipe storage yards, compressor stations, and access roads). Our EA for this project will document our findings on the impacts on historic properties and summarize the status of consultations under section 106.

Environmental Mailing List

The environmental mailing list includes federal, state, and local government representatives and agencies; elected officials; environmental and public interest groups; Native American Tribes; other interested parties; and local libraries and newspapers. This list also includes all affected landowners (as defined in the Commission's regulations) who are potential right-of-way grantors, whose property may be used temporarily for project purposes, or who own homes within certain distances of aboveground facilities, and anyone who submits comments on the project. We will update the environmental mailing list as the analysis proceeds to ensure that we send the information related to this environmental review to all individuals, organizations, and government entities interested in and/or potentially affected by the planned project.

Copies of the EA will be sent to the environmental mailing list for public review and comment. If you would prefer to receive a paper copy of the document instead of the CD version or would like to remove your name from the mailing list, please return the attached Information Request (appendix 2).

Becoming an Intervenor

Once Millennium files its application with the Commission, you may want to become an ''intervenor'' which is an official party to the Commission's proceeding. Intervenors play a more formal role in the process and are able

[1] A ''pig'' is a tool that the pipeline company inserts into and pushes through the pipeline for cleaning the pipeline, conducting internal inspections, or other purposes.

[2] The appendices referenced in this notice will not appear in the **Federal Register**. Copies of the appendices were sent to all those receiving this notice in the mail and are available at *www.ferc.gov* using the link called ''eLibrary'' or from the Commission's Public Reference Room, 888 First Street NE., Washington, DC 20426, or call (202) 502–8371. For instructions on connecting to eLibrary, refer to the last page of this notice.

[3] ''We,'' ''us,'' and ''our'' refer to the environmental staff of the Commission's Office of Energy Projects.

[4] The Council on Environmental Quality regulations addressing cooperating agency responsibilities are at Title 40, Code of Federal Regulations, Part 1501.6.

[5] The Advisory Council on Historic Preservation regulations are at Title 36, Code of Federal Regulations, Part 800. Those regulations define historic properties as any prehistoric or historic district, site, building, structure, or object included in or eligible for inclusion in the National Register of Historic Places.

to file briefs, appear at hearings, and be heard by the courts if they choose to appeal the Commission's final ruling. An intervenor formally participates in the proceeding by filing a request to intervene. Instructions for becoming an intervenor are in the User's Guide under the ''e-filing'' link on the Commission's Web site. Please note that the Commission will not accept requests for intervenor status at this time. You must wait until the Commission receives a formal application for the project.

Additional Information

Additional information about the project is available from the Commission's Office of External Affairs, at (866) 208–FERC, or on the FERC Web site (*www.ferc.gov*) using the eLibrary link. Click on the eLibrary link, click on ''General Search'' and enter the docket number, excluding the last three digits in the Docket Number field (*i.e.,* PF15–23). Be sure you have selected an appropriate date range. For assistance, please contact FERC Online Support at *FercOnlineSupport@ferc.gov* or toll free at (866) 208–3676, or for TTY, contact (202) 502–8659. The eLibrary link also provides access to the texts of formal documents issued by the Commission, such as orders, notices, and rulemakings.

In addition, the Commission offers a free service called eSubscription which allows you to keep track of all formal issuances and submittals in specific dockets. This can reduce the amount of time you spend researching proceedings by automatically providing you with notification of these filings, document summaries, and direct links to the documents. Go to *www.ferc.gov/docs-filing/esubscription.asp.*

Finally, public meetings or site visits will be posted on the Commission's calendar located at *www.ferc.gov/EventCalendar/EventsList.aspx* along with other related information.

Dated: July 6, 2015.

Combined Notice Of Filings

Take notice that the Commission has received the following Natural Gas Pipeline Rate and Refund Report filings:

Docket Numbers: RP15–1077–000.
Applicants: Texas Gas Transmission, LLC.
Description: § 4(d) rate filing per 154.204: Remove References to Expired Operating Lease to be effective 4/1/2015.
Filed Date: 6/24/15.
Accession Number: 20150624–5059.
Comments Due: 5 p.m. ET 7/6/15.

Docket Numbers: RP15–1078–000.
Applicants: Barclays Bank PLC.
Description: Petition for Temporary Waiver of Commission Capacity Release Regulations and Related Tariff Provisions and Request for Expedited Action of Barclays Bank PLC under RP15–1078.
Filed Date: 6/24/15.
Accession Number: 20150624–5160.
Comments Due: 5 p.m. ET 7/1/15.

Docket Numbers: RP15–1079–000.
Applicants: Algonquin Gas Transmission, LLC.
Description: § 4(d) rate filing per 154.204: BBPC 2015–07–01 Releases to EDF Trading to be effective 7/1/2015.
Filed Date: 6/25/15.
Accession Number: 20150625–5022.
Comments Due: 5 p.m. ET 7/7/15.

Docket Numbers: RP15–1080–000.
Applicants: Northern Natural Gas Company.
Description: § 4(d) rate filing per 154.204: 20150625 Negotiated Rate to be effective 7/1/2015.
Filed Date: 6/25/15.
Accession Number: 20150625–5025.
Comments Due: 5 p.m. ET 7/7/15.

Docket Numbers: RP15–1081–000.
Applicants: Kern River Gas Transmission Company.
Description: § 4(d) rate filing per 154.204: 2015 Enserco to Twin Eagle to be effective 7/1/2015.
Filed Date: 6/25/15.
Accession Number: 20150625–5034.
Comments Due: 5 p.m. ET 7/7/15.

The filings are accessible in the Commission's eLibrary system by clicking on the links or querying the docket number.

Any person desiring to intervene or protest in any of the above proceedings must file in accordance with Rules 211 and 214 of the Commission's Regulations (18 CFR 385.211 and § 385.214) on or before 5:00 p.m. Eastern time on the specified comment date. Protests may be considered, but intervention is necessary to become a party to the proceeding.

eFiling is encouraged. More detailed information relating to filing requirements, interventions, protests, service, and qualifying facilities filings can be found at: *http://www.ferc.gov/docs-filing/efiling/filing-req.pdf.* For other information, call (866) 208–3676 (toll free). For TTY, call (202) 502–8659.

Dated: June 25, 2015.

BILLING CODE 6717–01–P

DEPARTMENT OF ENERGY

Federal Energy Regulatory Commission

[Docket No. CP15–499–000]

Texas Eastern Transmission, LP; Notice of Intent to Prepare An Environmental Assessment for the Proposed South Texas Expansion Project, And Request for Comments on Environmental Issues

The staff of the Federal Energy Regulatory Commission (FERC or Commission) will prepare an environmental assessment (EA) that will discuss the environmental impacts of the South Texas Expansion Project (Project) involving construction and operation of facilities by Texas Eastern Transmission, LP (Texas Eastern) in Nueces, Matagorda, Brazoria, Chambers, and Orange Counties, Texas. The Commission will use this EA in its decision-making process to determine whether the project is in the public convenience and necessity.

This notice announces the opening of the scoping process the Commission will use to gather input from the public and interested agencies on the Project. You can make a difference by providing us with your specific comments or concerns about the Project. Your comments should focus on the potential environmental effects, reasonable alternatives, and measures to avoid or lessen environmental impacts. Your input will help the Commission staff determine what issues they need to evaluate in the EA. To ensure that your comments are timely and properly recorded, please send your comments so that the Commission receives them in Washington, DC on or before July 30, 2015.

If you sent comments on this project to the Commission before the opening of this docket on May 22, 2015, you will need to file those comments in Docket No. CP15–499–000 to ensure they are considered as part of this proceeding.

This notice is being sent to the Commission's current environmental mailing list for this Project. State and local government representatives should notify their constituents of this proposed project and encourage them to comment on their areas of concern.

If you are a landowner receiving this notice, a Texas Eastern representative may contact you about the acquisition of an easement to construct, operate, and maintain the proposed facilities. The company would seek to negotiate a mutually acceptable agreement. However, if the Commission approves the Project, that approval conveys with it the right of eminent domain. Therefore, if easement negotiations fail to produce an agreement, the pipeline company could initiate condemnation proceedings where compensation would be determined in accordance with state law.

Texas Eastern provided landowners with a fact sheet prepared by the FERC entitled ''An Interstate Natural Gas Facility On My Land? What Do I Need To Know?'' This fact sheet addresses a number of typically asked questions, including the use of eminent domain and how to participate in the Commission's proceedings. It is also available for viewing on the FERC Web site (*www.ferc.gov*).

Public Participation

For your convenience, there are three methods you can use to submit your comments to the Commission. The Commission encourages electronic filing of comments and has expert staff available to assist you at (202) 502–8258 or *efiling@ferc.gov.* Please carefully follow these instructions so that your comments are properly recorded.

(1) You can file your comments electronically using the eComment feature on the Commission's Web site (*www.ferc.gov*) under the link to Documents and Filings. This is an easy method for submitting brief, text-only comments on a project;

(2) You can file your comments electronically by using the eFiling feature on the Commission's Web site (*www.ferc.gov*) under the link to Documents and Filings. With eFiling, you can provide comments in a variety of formats by attaching them as a file with your submission. New eFiling users must first create an account by clicking on ''eRegister.'' If you are filing a comment on a particular project, please select ''Comment on a Filing'' as the filing type; or

(3) You can file a paper copy of your comments by mailing them to the following address. Be sure to reference the Project docket number (CP15–499–000) with your submission: Kimberly D. Bose, Secretary, Federal Energy Regulatory Commission, 888 First Street NE., Room 1A, Washington, DC 20426.

Summary of the Proposed Project

Texas Eastern proposes to construct and operate pipeline and compression facilities in Nueces, Matagorda, Brazoria, Chambers, and Orange Counties, Texas. The Project would provide about 400,000 dekatherms of natural gas per day. According to Texas Eastern, its Project would provide service to a customer by increasing flow in its system to South Texas.

The Project would consist of the following facilities:

• installation of an 8,400 horsepower (hp) compressor and a meter and regulating station at the existing Petronila Station in Nueces County, Texas;

• installation of an 8,400 hp compressor unit and piping modifications at the existing Blessing Compressor Station in Matagorda County, Texas;

• modification to piping and other compression facilities at the Mont Belvieu Compressor Station in Chambers County, Texas, Vidor Compressor Station in Orange County, Texas, and Angleton Compressor Station in Brazoria County, Texas; and

• modification to piping at existing launcher and receiver sites along Texas Eastern's Line 16 in Brazoria, Chambers, and Orange Counties, Texas.

The general location of the Project facilities is shown in appendix 1.[1]

Land Requirements for Construction

Construction of the proposed facilities would disturb about 122 acres of land for the aboveground facilities and the pipeline. Following construction Texas Eastern would maintain 31 acres for permanent operation of the Project's facilities; the remaining acreage would be restored and revert to former uses. Changes to existing facilities would be accomplished within the existing facilities' fence lines.

The EA Process

The National Environmental Policy Act (NEPA) requires the Commission to take into account the environmental impacts that could result from an action whenever it considers the issuance of a Certificate of Public Convenience and Necessity. The NEPA also requires us[2] to discover and address concerns the public may have about proposals. This process is referred to as ''scoping.'' The main goal of the scoping process is to focus the analysis in the EA on the important environmental issues. By this notice, the Commission requests public comments on the scope of the issues to address in the EA. We will consider all filed comments during the preparation of the EA.

In the EA we will discuss impacts that could occur as a result of the construction and operation of the proposed project under these general headings:

• geology and soils;
• land use;
• water resources, fisheries, and wetlands;
• cultural resources;
• vegetation and wildlife;
• air quality and noise;
• endangered and threatened species;
• public safety; and
• cumulative impacts

We will also evaluate reasonable alternatives to the proposed Project or portions of the Project, and make recommendations on how to lessen or avoid impacts on the various resource areas.

The EA will present our independent analysis of the issues. The EA will be available in the public record through eLibrary. We will consider all comments on the EA before making our recommendations to the Commission. To ensure we have the opportunity to consider and address your comments, please carefully follow the instructions in the Public Participation section of this notice.

With this notice, we are asking agencies with jurisdiction by law and/or special expertise with respect to the environmental issues of this project to formally cooperate with us in the preparation of the EA.[3] Agencies that would like to request cooperating agency status should follow the instructions for filing comments provided under the Public Participation section of this notice.

Consultations Under Section 106 of the National Historic Preservation Act

In accordance with the Advisory Council on Historic Preservation's implementing regulations for section 106 of the National Historic Preservation Act, we are using this notice to initiate consultations with the Texas State Historic Preservation Office (SHPO), and to solicit its views and those of other government agencies, interested Indian tribes, and the public

[1] The appendices referenced in this notice will not appear in the **Federal Register**. Copies of appendices were sent to all those receiving this notice in the mail and are available at *www.ferc.gov* using the link called ''eLibrary'' or from the Commission's Public Reference Room, 888 First Street NE., Washington, DC 20426, or call (202) 502–8371. For instructions on connecting to eLibrary, refer to the last page of this notice.

[2] ''We,'' ''us,'' and ''our'' refer to the environmental staff of the Commission's Office of Energy Projects.

[3] The Council on Environmental Quality regulations addressing cooperating agency responsibilities are at Title 40, Code of Federal Regulations, Part 1501.6.

on the Project's potential effects on historic properties.[4] We will define the Project-specific Area of Potential Effects (APE) in consultation with the SHPO as the Project develops. On natural gas facility projects, the APE at a minimum encompasses all areas subject to ground disturbance (examples include construction right-of-way, contractor/pipe storage yards, compressor stations, and access roads). Our EA for this Project will document our findings on the impacts on historic properties and summarize the status of consultations under section 106.

Environmental Mailing List

The environmental mailing list includes federal, state, and local government representatives and agencies; elected officials; environmental and public interest groups; Indian tribes; other interested parties; and local libraries and newspapers. This list also includes all affected landowners (as defined in the Commission's regulations) who are potential right-of-way grantors, whose property may be used temporarily for project purposes, or who own homes within certain distances of aboveground facilities, and anyone who submits comments on the project. We will update the environmental mailing list as the analysis proceeds to ensure that we send the information related to this environmental review to all individuals, organizations, and government entities interested in and/or potentially affected by the proposed Project.

If we publish and distribute the EA, copies of the EA will be sent to the environmental mailing list for public review and comment. If you would prefer to receive a paper copy of the document instead of the CD version or would like to remove your name from the mailing list, please return the attached Information Request (appendix 2).

Becoming an Intervenor

In addition to involvement in the EA scoping process, you may want to become an ''intervenor'' which is an official party to the Commission's proceeding. Intervenors play a more formal role in the process and are able to file briefs, appear at hearings, and be heard by the courts if they choose to appeal the Commission's final ruling. An intervenor formally participates in the proceeding by filing a request to intervene. Instructions for becoming an intervenor are in the User's Guide under the ''e-filing'' link on the Commission's Web site.

Additional Information

Additional information about the project is available from the Commission's Office of External Affairs, at (866) 208–FERC, or on the FERC Web site at *www.ferc.gov* using the ''Documents & Filings'' link. Click on the eLibrary link, click on General Search and enter the docket number, excluding the last three digits in the Docket Number field (*i.e.,* CP15–499). Be sure you have selected an appropriate date range. For assistance, please contact FERC Online Support at *FercOnlineSupport@ferc.gov* or toll free at (866) 208–3676, or for TTY, contact (202) 502–8659. The eLibrary link also provides access to the texts of formal documents issued by the Commission, such as orders, notices, and rulemakings.

In addition, the Commission offers a free service called eSubscription which allows you to keep track of all formal issuances and submittals in specific dockets. This can reduce the amount of time you spend researching proceedings by automatically providing you with notification of these filings, document summaries, and direct links to the documents. Go to *www.ferc.gov/docs-filing/esubscription.asp.*

Finally, public meetings or site visits will be posted on the Commission's calendar located at *www.ferc.gov/EventCalendar/EventsList.aspx* along with other related information.

Federal Energy Regulatory Commission

[Docket No. CP15–520–000]

Tennessee Gas Pipeline Company, L.L.C.; Notice of Application

Take notice that on June 19, 2015, Tennessee Gas Pipeline Company, L.L.C. (''Tennessee''), filed an application pursuant to section 7(c) of the Natural Gas Act (NGA) and Part 157 of the Commission's Regulations, to construct, install, modify, operate, and maintain certain pipeline and compression facilities located in Pennsylvania. Tennessee's proposed Triad Expansion Project (Project) is designed to add an additional 180,000 Dth/d of new West to East transportation capacity on Tennessee's 300 Line in Susquehanna County, Pennsylvania. The Project would require the construction of approximately 7 miles of 36-inch-diameter pipeline loop (Line 300–3) immediately west of Compressor Station 321 as well as various piping modifications to tie the new Line 300–3 to existing Line 300 and a pig launcher/receiver at each end of the new loop. The estimated cost of the Triad Expansion Project is $87,420,002. The filing may be viewed on the web at *http://www.ferc.gov* using the ''eLibrary'' link. Enter the docket number excluding the last three digits in the docket number field to access the document. For assistance, contact FERC at *FERCOnlineSupport@ferc.gov* or call toll-free, (886) 208–3676 or TYY, (202) 502–8659.

Any questions concerning this application should be directed to Jacquelyne M. Rocan, Assistant General Counsel, Tennessee Gas Pipeline Company, L.L.C., 1001 Louisiana Street, Houston, Texas 77002, phone: (713) 420–4544, facsimile: (713) 420–1601, email: *Jacquelyne_Rocan@kindermorgan.com,* or Shannon M. Miller, Regulatory Affairs, Tennessee Gas Pipeline Company, L.L.C., 1001 Louisiana Street, Houston, Texas 77002, phone: (713) 420–4038, facsimile: (713) 420–1605, email: *shannon_miller@kindermorgan.com.*

Pursuant to section 157.9 of the Commission's rules, 18 CFR 157.9, within 90 days of this Notice the Commission staff will either: complete its environmental assessment (EA) and place it into the Commission's public record (eLibrary) for this proceeding, or issue a Notice of Schedule for Environmental Review. If a Notice of Schedule for Environmental Review is issued, it will indicate, among other milestones, the anticipated date for the Commission staff's issuance of the final environmental impact statement (FEIS) or EA for this proposal. The filing of the EA in the Commission's public record for this proceeding or the issuance of a Notice of Schedule will serve to notify federal and state agencies of the timing for the completion of all necessary reviews, and the subsequent need to complete all federal authorizations within 90 days of the date of issuance of the Commission staff's FEIS or EA.

There are two ways to become involved in the Commission's review of this project. First, any person wishing to obtain legal status by becoming a party to the proceedings for this project should, on or before the comment date stated below, file with the Federal Energy Regulatory Commission, 888 First Street, NE., Washington, DC 20426, a motion to intervene in accordance with the requirements of the Commission's Rules of Practice and Procedure (18 CFR 385.214 or 385.211) and the Regulations under the NGA (18 CFR 157.10). A person obtaining party status will be placed on the service list maintained by the Secretary of the Commission and will receive copies of all documents filed by the applicant and by all other parties. A party must submit 5 copies of filings made with the Commission and must mail a copy to the applicant and to every other party in the proceeding. Only parties to the proceeding can ask for court review of Commission orders in the proceeding.

However, a person does not have to intervene in order to have comments considered. The second way to participate is by filing with the Secretary of the Commission, as soon as possible, an original and two copies of comments in support of or in opposition to this project. The Commission will consider these comments in determining the appropriate action to be taken, but the filing of a comment alone will not serve to make the filer a party to the proceeding. The Commission's rules require that persons filing comments in opposition to the project provide copies of their protests only to the party or parties directly involved in the protest.

Persons who wish to comment only on the environmental review of this project should submit an original and two copies of their comments to the Secretary of the Commission. Environmental commenters will be placed on the Commission's environmental mailing list, will receive copies of the environmental documents, and will be notified of meetings associated with the Commission's environmental review process. Environmental commenters will not be required to serve copies of filed documents on all other parties. However, the non-party commenters will not receive copies of all documents filed by other parties or issued by the Commission (except for the mailing of environmental documents issued by the Commission) and will not have the right to seek court review of the Commission's final order.

Motions to intervene, protests and comments may be filed electronically via the internet in lieu of paper; see, 18 CFR 385.2001(a) (1) (iii) and the instructions on the Commission's Web site under the ''e-Filing'' link. The Commission strongly encourages electronic filings.

Comment Date: July 27, 2015.

Dated: July 6, 2015.

Kimberly D. Bose,

Secretary.

DEPARTMENT OF ENERGY

Federal Energy Regulatory Commission

[Docket No. CP15–522–000]

Southwest Gas Storage Company; Notice of Request Under Blanket Authorization

Take notice that on June 26, 2015, Southwest Gas Storage Company (Southwest), filed in Docket No. CP15–522–000, a prior notice request pursuant to sections 157.205, 157.208, 157.213, and 157.216 of the Commission's regulations under the Natural Gas Act (NGA) and Southwest's blanket authorization issued in Docket No. CP99–230–000. Southwest seeks authorization to convert, modify, replace, and abandon certain natural gas storage facilities at its Howell Storage Field located in Livingston County, Michigan, all as more fully set forth in the application which is on file with the Commission and open for public inspection. Specifically, Southwest is converting 15 injection/withdrawal wells to observation wells as part of Southwest's multi-year Howell Storage Field Well Re-Entries and Integrity Work Project. The filing may also be viewed on the web at *http://www.ferc.gov* using the ''eLibrary'' link. Enter the docket number excluding the last three digits in the docket number field to access the document. For assistance, contact FERC at *FERCOnlineSupport@ferc.gov* or call toll-free, (866) 208–3676 or TTY, (202) 502–8659.

Any questions concerning this application may be directed to: Stephen T. Veatch, Sr., Director, Certificates & Tariffs, Southwest Gas Storage Company, 1300 Main Street, P.O. Box 4967, Houston TX 77210–4967, by phone at (713) 989–2024, fax at (713) 989–1205 or email at *Stephen.Veatch@energytransfer.com.*

Any person may, within 60 days after the issuance of the instant notice by the Commission, file pursuant to Rule 214 of the Commission's Procedural Rules (18 CFR 385.214) a motion to intervene or notice of intervention. Any person filing to intervene or the Commission's staff may, pursuant to section 157.205 of the Commission's Regulations under the NGA (18 CFR 157.205) file a protest to the request. If no protest is filed within the time allowed therefore, the proposed activity shall be deemed to be authorized effective the day after the time allowed for protest. If a protest is filed and not withdrawn within 30 days after the time allowed for filing a protest, the instant request shall be treated as an application for authorization pursuant to section 7 of the NGA.

Pursuant to section 157.9 of the Commission's rules, 18 CFR 157.9, within 90 days of this Notice the Commission staff will either: complete its environmental assessment (EA) and place it into the Commission's public record (eLibrary) for this proceeding; or issue a Notice of Schedule for Environmental Review. If a Notice of Schedule for Environmental Review is issued, it will indicate, among other milestones, the anticipated date for the Commission staff's issuance of the final environmental impact statement (FEIS) or EA for this proposal. The filing of the EA in the Commission's public record for this proceeding or the issuance of a Notice of Schedule for Environmental Review will serve to notify federal and state agencies of the timing for the completion of all necessary reviews, and the subsequent need to complete all federal authorizations within 90 days of the date of issuance of the Commission staff's FEIS or EA.

Persons who wish to comment only on the environmental review of this project should submit an original and two copies of their comments to the Secretary of the Commission. Environmental commenters will be placed on the Commission's environmental mailing list, will receive copies of the environmental documents, and will be notified of meetings associated with the Commission's environmental review process. Environmental commenters will not be required to serve copies of filed documents on all other parties. However, the non-party commenters will not receive copies of all documents filed by other parties or issued by the Commission (except for the mailing of environmental documents issued by the Commission) and will not have the right to seek court review of the Commission's final order.

The Commission strongly encourages electronic filings of comments, protests, and interventions via the internet in lieu of paper. See 18 CFR 385.2001(a)(1)(iii) and the instructions on the Commission's Web site (*www.ferc.gov*) under the ''e-Filing'' link. Persons unable to file electronically should submit an original and 5 copies of the protest or intervention to the Federal Energy regulatory Commission, 888 First Street NE., Washington, DC 20426.

Dated: July 7, 2015.

BILLING CODE 6717–01–P

ENVIRONMENTAL PROTECTION AGENCY

[EPA–HQ–OPP–2015–0317; FRL–9930–03]

Notice of Receipt of Requests for Amendments To Terminate Uses in Certain Pesticide Registrations; Correction

AGENCY: Environmental Protection Agency (EPA).

ACTION: Notice; correction.

SUMMARY: EPA issued a notice in the **Federal Register** of June 10, 2015, concerning amendments to terminate uses in certain pesticide registrations. This document corrects errors in the sections titled ''DATES'' and ''What action is the agency taking?''.

FOR FURTHER INFORMATION CONTACT: Ricardo Jones, Pesticide Re-evaluation Division (7508P), Office of Pesticide Programs, Environmental Protection Agency, 1200 Pennsylvania Ave. NW., Washington, DC 20460–0001; telephone number: (703) 347–0493; email address: *jones.ricardo@epa.gov.*

SUPPLEMENTARY INFORMATION:

I. General Information

A. Does this action apply to me?

The Agency included in the June 10, 2015, notice a list of those who may be potentially affected by this action.

B. How can I get copies of this document and other related information?

The docket for this action, identified by docket identification (ID) number EPA–HQ–OPP–2015–0317, is available at *http://www.regulations.gov* or at the Office of Pesticide Programs Regulatory Public Docket (OPP Docket) in the Environmental Protection Agency Docket Center (EPA/DC), West William Jefferson Clinton Bldg., Rm. 3334, 1301 Constitution Ave. NW., Washington, DC 20460–0001. The Public Reading Room is open from 8:30 a.m. to 4:30 p.m., Monday through Friday, excluding legal holidays. The telephone number for the Public Reading Room is (202) 566–1744, and the telephone number for the OPP Docket is (703) 305–5805. Please review the visitor instructions and additional information about the docket available at *http://www.epa.gov/dockets.*

II. What does this correction do?

The notice (FR Doc. 2015–14092) published in the **Federal Register** of June 10, 2015 (80 FR 32947) (FRL–9928–01) is corrected as follows:

1. On page 32947, second column, under the heading ''Dates'', correct paragraph one to add: ''chloroxylenol'' before the word ''registrations'' wherever it appears.

2. On page 32947, second column, under the heading ''Dates'', after paragraph one, correct to add a new paragraph that reads as follows: ''Unless a request is withdrawn by January 6, 2016, for clothianidin registrations for which the registrant has not requested a waiver of the 180–day comment period, EPA expects to issue orders terminating these uses. The Agency will consider withdrawal requests postmarked no later than January 6, 2016. Comments must be received on or before January 6, 2016, for those clothianidin registrations where the 180–day comment period has not been waived.''

3. On page 32948, first column, paragraph two of Unit II is corrected to read as follows:

''Unless a request is withdrawn by the chloroxylenol registrant by July 10, 2015, EPA expects to issue orders terminating the uses described in Table 1 of the June 10, 2015, document for the active ingredient chloroxylenol. Users of these pesticides or anyone else desiring the retention of a use should contact the applicable registrant directly during this 30–day period. Unless a request is withdrawn by the clothianidin registrant by January 6, 2016, EPA expects to issue orders terminating the uses described in Table 1 of the June 10, 2015, document for the active ingredient clothianidin. Users of these pesticides or anyone else desiring the retention of a use should contact the applicable registrant directly during this 180–day period.''

Authority: 7 U.S.C. 136 *et seq.*

Dated: July 6, 2015.

Michael Goodis,

Acting Director, Pesticide Re-Evaluation Division, Office of Pesticide Programs.

FEDERAL ELECTION COMMISSION

Sunshine Act Meetings

AGENCY: Federal Election Commission.

DATE & TIME: Thursday, July 16, 2015 at 10:00 a.m.

PLACE: 999 E Street NW., Washington, DC (Ninth Floor).

STATUS: This meeting will be open to the public.

ITEMS TO BE DISCUSSED:

Correction and Approval of Minutes for June 18, 2015
Draft Advisory Opinion 2015–02: Grand Trunk Western Railroad Company—Illinois Central Railroad Company PAC
Draft Advisory Opinion 2015–03: Democracy Rules, Inc.
Draft Advisory Opinion 2015–04: Collective Actions PAC
Proposed Directive 74 on the Timely Resolution of Enforcement Matters
Notice to Respondents of Information Sharing by the Commission
Proposed Statement of Policy Regarding the Public Disclosure of Closed Enforcement Files
Policy on Third-Party Appearances Before the Commission to Discuss Advisory Opinions
Draft Notice of Disposition on REG 2014–06: Candidate Debates
Draft Notice of Availability on REG 2015–03: Contributions from Corporations and Other Organizations to Political Committees
Draft Notice of Availability on REG 2015–04: Independent Spending by Corporations, Labor Organizations, Foreign Nationals, and Certain Political Committees
Revised Meeting Dates for September—December 2015
Management and Administrative Matters

Individuals who plan to attend and require special assistance, such as sign language interpretation or other reasonable accommodations, should contact Shawn Woodhead Werth, Secretary and Clerk, at (202) 694–1040, at least 72 hours prior to the meeting date.

PERSON TO CONTACT FOR INFORMATION: Judith Ingram, Press Officer, Telephone: (202) 694–1220.

Shawn Woodhead Werth,

Secretary and Clerk of the Commission.

DEPARTMENT OF HEALTH AND HUMAN SERVICES

Agency for Toxic Substances and Disease Registry

[30Day–15–15TG]

Agency Forms Undergoing Paperwork Reduction Act Review

The Agency for Toxic Substances and Disease Registry (ATSDR) has submitted the following information collection request to the Office of Management and Budget (OMB) for review and approval in accordance with the Paperwork Reduction Act of 1995. The notice for the proposed information collection is published to obtain comments from the public and affected agencies.

Written comments and suggestions from the public and affected agencies concerning the proposed collection of information are encouraged. Your comments should address any of the following: (a) Evaluate whether the proposed collection of information is necessary for the proper performance of the functions of the agency, including whether the information will have practical utility; (b) Evaluate the accuracy of the agencies estimate of the burden of the proposed collection of information, including the validity of the methodology and assumptions used; (c) Enhance the quality, utility, and clarity of the information to be collected; (d) Minimize the burden of the collection of information on those who are to respond, including through the use of appropriate automated, electronic, mechanical, or other technological collection techniques or other forms of information technology, *e.g.,* permitting electronic submission of responses; and (e) Assess information collection costs.

To request additional information on the proposed project or to obtain a copy of the information collection plan and instruments, call (404) 639–7570 or send an email to *omb@cdc.gov.* Written comments and/or suggestions regarding the items contained in this notice should be directed to the Attention: CDC Desk Officer, Office of Management and Budget, Washington, DC 20503 or by fax to (202) 395–5806. Written comments should be received within 30 days of this notice.

Proposed Project

Promotion of the National ALS Registry to Non-referral Centers—New—Agency for Toxic Substances and Disease Registry (ATSDR).

Background and Brief Description

ATSDR is requesting a two-year OMB approval for the information collection project entitled ''Promotion of the National ALS Registry to Non-referral Centers''. ATSDR is authorized by the Public Health Law No: 110–373, ALS Registry Act to (1) develop a system to collect data on amyotrophic lateral sclerosis (ALS) and other motor neuron disorders that can be confused with ALS, misdiagnosed as ALS, or progress to ALS; and (2) establish a national registry for the collection and storage of such data to develop a population-based registry of cases.

ATSDR implemented the National ALS Registry (Registry) in 2009 using an algorithm applied to national administrative databases. A self-registration component was launched in October 2010.

The primary goal of the Registry is to obtain more complete information on the likely prevalence of ALS and to better describe the demographic characteristics (age, race, sex, and geographic location) of those with ALS. The secondary goal of the registry is to collect additional information on potential risk factors for ALS including, but not limited to, family history of ALS, smoking history, and military service.

The Registry's case ascertainment methodology required validation; therefore, ATSDR established State and Metropolitan ALS Surveillance Projects (Surveillance Projects). In order to avoid biasing results from the Surveillance Projects' evaluation of the Registry's completeness, staff were instructed to not promote the Registry during the surveillance period.

The proposed project is a new component to be added to the existing Registry and ALS Surveillance Projects to increase self-enrollment rates of those with ALS. According to the Morbidity and Mortality Weekly Report (MMWR) published in 2014, the proportion of cases identified via self-registration was lower than those identified in the administrative data for the period October 2010–December 2011. On-going self-registration is critical because not all persons with ALS can be identified through the algorithm, and only self-registering persons with ALS can complete the risk-factor surveys. Therefore, efforts to increase Registry awareness among non-referral center neurology practices/neurologists is needed to increase self-enrollment of persons with ALS.

This new information collection aims to evaluate educational and promotional outreach activities among select non-referral/non-specialty center neurology practices and is a result of the need to promote the Registry among neurologists who do not work at major ALS referral centers. The following objectives are set for this project:

(1) To implement a pilot project to conduct educational and promotional outreach activities at non-referral center neurology practices in the U.S., to inform neurologists and their staff about the Registry;

(2) To encourage neurologists to inform their patients about the Registry, and to increase persons with ALS self-enrollment in the Registry through the web portal via the use of existing Registry brochures, pamphlets, and factsheets; and

(3) To examine the effectiveness of educational and promotional outreach activities by reviewing persons with ALS self-enrollment rates before, during, and after the project period.

By increasing self-enrollment rates, ATSDR will be able to produce more accurate estimates of prevalence of ALS, and collect risk-factor survey data from a more representative sample of persons with ALS nationwide which will allow ATSDR to fulfill its congressional mandate under the ALS Registry Act.

To achieve these objectives, a four group educational and promotional outreach project respondents has been designed.

Data for the study will be gathered by means of initial eligibility phone calls and follow-up phone calls and mailings, for neurologists who do or would diagnose/care for patients with ALS. Train-the trainer sessions will be conducted to educate neurologists about the Registry and key informant interviews with neurologists will be done to better understand their knowledge, attitudes, and beliefs about the Registry, and to gather additional information about the currently deployed Registry materials.

Participation is voluntary. The total annual burden hours for the proposed project is 344. There is no cost to the respondents other than their time.

ESTIMATED ANNUALIZED BURDEN HOURS

Type of respondents	Form name	Number of respondents	Number of responses per respondent	Avg. burden per response (in hrs.)
Neurologist Support Staff	Initial Phone Call	1,900	1	6/60
Neurologist Support Staff	Fax to Determine Provider Status	380	1	1/60
Neurologist Support Staff	Follow-up Phone Call 1 (One-Week Post Mailing).	950	1	3/60
Neurologist Support Staff	Follow-up Phone Call 2 (Three Months Post Mailing).	950	1	3/60
Neurologist Support Staff	Fax to Determine if Mailing was Received	190	1	1/60
Neurologist/Neurologist Support Staff	Train-the-trainer Invitation Phone Call	60	1	6/60
Neurologist/Neurologist Support Staff	Key Informant Interview Invitation Phone Call	64	1	6/60
Neurologist/Neurologist Support Staff	Train-the-trainer	21	1	1

ESTIMATED ANNUALIZED BURDEN HOURS—Continued

Type of respondents	Form name	Number of respondents	Number of responses per respondent	Avg. burden per response (in hrs.)
Neurologist	Key Informant Interview	16	1	1

Leroy A. Richardson,

Chief, Information Collection Review Office, Office of Scientific Integrity, Office of the Associate Director for Science, Office of the Director, Centers for Disease Control and Prevention.

BILLING CODE 4163–18–P

DEPARTMENT OF HEALTH AND HUMAN SERVICES

Centers for Disease Control and Prevention

[60Day–15–0920–0573; Docket No. CDC–2015–0054]

Proposed Data Collection Submitted for Public Comment and Recommendations

AGENCY: Centers for Disease Control and Prevention (CDC), Department of Health and Human Services (HHS).

ACTION: Notice with comment period.

SUMMARY: The Centers for Disease Control and Prevention (CDC), as part of its continuing efforts to reduce public burden and maximize the utility of government information, invites the general public and other Federal agencies to take this opportunity to comment on proposed and/or continuing information collections, as required by the Paperwork Reduction Act of 1995. This notice invites comment on a proposed revisions of the National HIV Surveillance System (NHSS) information collection. This data collection provides the primary population-based data used to describe the epidemiology of HIV in the United States.

DATES: Written comments must be received on or before September 11, 2015.

ADDRESSES: You may submit comments, identified by Docket No. CDC–2015–0054 by any of the following methods:

- *Federal eRulemaking Portal:* Regulation.gov. Follow the instructions for submitting comments.
- *Mail:* Leroy A. Richardson, Information Collection Review Office, Centers for Disease Control and Prevention, 1600 Clifton Road NE., MS–D74, Atlanta, Georgia 30329.

Instructions: All submissions received must include the agency name and Docket Number. All relevant comments received will be posted without change to *Regulations.gov,* including any personal information provided. For access to the docket to read background documents or comments received, go to *Regulations.gov.*

Please note: All public comment should be submitted through the Federal eRulemaking portal (Regulations.gov) or by U.S. mail to the address listed above.

FOR FURTHER INFORMATION CONTACT: To request more information on the proposed project or to obtain a copy of the information collection plan and instruments, contact the Information Collection Review Office, Centers for Disease Control and Prevention, 1600 Clifton Road NE., MS–D74, Atlanta, Georgia 30329; phone: 404–639–7570; Email: *omb@cdc.gov.*

SUPPLEMENTARY INFORMATION: Under the Paperwork Reduction Act of 1995 (PRA) (44 U.S.C. 3501–3520), Federal agencies must obtain approval from the Office of Management and Budget (OMB) for each collection of information they conduct or sponsor. In addition, the PRA also requires Federal agencies to provide a 60-day notice in the **Federal Register** concerning each proposed collection of information, including each new proposed collection, each proposed extension of existing collection of information, and each reinstatement of previously approved information collection before submitting the collection to OMB for approval. To comply with this requirement, we are publishing this notice of a proposed data collection as described below.

Comments are invited on: (a) Whether the proposed collection of information is necessary for the proper performance of the functions of the agency, including whether the information shall have practical utility; (b) the accuracy of the agency's estimate of the burden of the proposed collection of information; (c) ways to enhance the quality, utility, and clarity of the information to be collected; (d) ways to minimize the burden of the collection of information on respondents, including through the use of automated collection techniques or other forms of information technology; and (e) estimates of capital or start-up costs and costs of operation, maintenance, and purchase of services to provide information. Burden means the total time, effort, or financial resources expended by persons to generate, maintain, retain, disclose or provide information to or for a Federal agency. This includes the time needed to review instructions; to develop, acquire, install and utilize technology and systems for the purpose of collecting, validating and verifying information, processing and maintaining information, and disclosing and providing information; to train personnel and to be able to respond to a collection of information, to search data sources, to complete and review the collection of information; and to transmit or otherwise disclose the information.

Proposed Project

National HIV Surveillance System (NHSS) (OMB Control No. 0920–0573, Expiration 02/29/2016)—Revision—National Center for HIV/AIDS, Viral Hepatitis, STD, and TB Prevention (NCHHSTP), Centers for Disease Control and Prevention (CDC).

Background and Brief Description

CDC is authorized under Sections 304 and 306 of the Public Health Service Act (42 U.S.C. 242b and 242k) to collect information on cases of human immunodeficiency virus (HIV) and indicators of HIV disease and HIV disease progression including AIDS. Data collected as part of the National HIV Surveillance System (NHSS) are the primary data used to monitor the extent and characteristics of the HIV burden in the United States. HIV surveillance data are used to describe trends in HIV incidence and prevalence and characteristics of infected persons. HIV surveillance data are used widely at the federal, state, and local levels for planning and evaluating prevention programs and health-care services, and allocate funding for prevention and care.

As science, technology, and our understanding of HIV have evolved, the NHSS has been updated periodically. CDC, in collaboration with health departments in the 50 states, the District of Columbia, and U.S. dependent areas, conducts national surveillance for cases of HIV infection that includes critical data across the spectrum of HIV disease from HIV diagnosis, to AIDS, the end-stage disease caused by infection with HIV, and death. In addition, this national system provides essential data to estimate HIV incidence and monitor patterns in HIV drug resistance and genetic diversity, as well as provide information on perinatal exposures in the United States.

The CDC surveillance case definition has been modified periodically to accurately monitor disease in adults, adolescents and children and reflect use of new testing technologies and changes in HIV treatment. Information is then updated in the case report forms and reporting software as needed.

In 2014, following extensive consultation and peer review, CDC and the Council of State and Territorial Epidemiologists (CSTE) revised and combined the surveillance case definitions for human immunodeficiency virus (HIV) infection into a single case definition for persons of all ages. Laboratory criteria for defining a confirmed case now accommodate new multitest algorithms, including criteria for differentiating between HIV–1 and HIV–2 infection and for recognizing early HIV infection. Clinical (nonlaboratory) criteria for defining a case for surveillance purposes have been made more practical by eliminating the requirement for information about laboratory tests. The surveillance case definition is intended primarily for monitoring the HIV infection burden and planning for prevention and care on a population level, not as a basis for clinical decisions for individual patients. CDC and CSTE recommend that all states and territories conduct case surveillance of HIV infection using this revised surveillance case definition.

Modifications to data elements to accommodate the 2014 HIV Case Surveillance definition were approved in the last renewal of this information collection. The updates requested in this revision request include modifications to currently collected data elements and forms to accommodate new testing technologies as well as clinical practice guidelines. Specifically, the *HIV Testing and Antiretroviral Use History* section will be revised on the adult/adolescent and pediatric case report forms to include new laboratory tests, additional information on use of antiretrioviral (ARV) medications for pre-exposure prophylaxis (PrEP), post-exposure prophylaxis (PEP), prevention of mother-to-child-transmission among HIV infected women during pregnancy, and hepatitis B virus (HBV) treatment. Other changes include addition of dates to the address and patient identification fields to better track residence information and minor formatting changes to the form used for Perinatal HIV Exposure Reporting (PHER).

CDC provides funding for 59 jurisdictions to provide adult and pediatric HIV case reports. Health department staff compile information from laboratories, physicians, hospitals, clinics and other health care providers to complete the HIV and pediatric case reports. CDC estimates that, annually, approximately 1,061 adult HIV case reports and 5 pediatric case reports are processed by each health department.

These data are recorded using standard case report forms either on paper or electronically and entered into the electronic reporting system. Updates to case reports are also entered into the reporting system by health departments as additional information may be received from laboratories, vital statistics, or additional providers. Evaluations are also conducted by health departments on a subset of case reports (*e.g.* re-abstraction, validation, de-duplication). CDC estimates that on average approximately 107 evaluations of case reports, 1,576 updates to case reports and 6,303 updates of laboratory test data will be processed by each of the 59 health departments annually. Case report information compiled over time by health departments is then de-identified and forwarded to CDC on a monthly basis to become part of the national HIV surveillance database.

Supplemental surveillance data are collected in a subset of areas to provide additional information necessary to estimate HIV incidence, the extent of HIV drug resistance and HIV genetic diversity among persons infected with HIV and to monitor and evaluate perinatal HIV prevention efforts. Health departments funded for these supplemental data collections obtain this information from laboratories, health providers, and medical records. CDC estimates that on average 2,288 reports containing incidence data elements will be processed annually by each of the 25 health departments funded to collect incidence data; 829 reports containing additional data elements on HIV nucleotide sequences from genotype test results will be processed on average by each of the 53 health departments conducting Molecular HIV Surveillance (MHS) and an estimated 114 reports containing perinatal exposure data elements will be processed on average annually by each of the 35 health departments reporting data collected as part of Perinatal HIV Exposure Reporting (PHER). These supplemental data are also reported monthly to CDC.

The total estimated time burden is 52,204 hours. There is no cost to respondents other than their time.

ESTIMATED ANNUALIZED BURDEN HOURS

Type of respondent	Form name	Number of respondents	Number of responses per respondent	Average burden per response (in hours)	Total annual burden hours)
Health Departments	Adult HIV Case Report	59	1,061	20/60	20,866
Health Departments	Pediatric HIV Case Report	59	5	20/60	98
Health Departments	Case Report Evaluations	59	107	20/60	2,104
Health Departments	Case Report Updates	59	1,576	5/60	7,749
Health Departments	Laboratory Updates	59	6,303	1/60	6,198
Health Departments	HIV Incidence Surveillance	25	2,288	10/60	9,533
Health Departments	Molecular HIV Surveillance (MHS)	53	829	5/60	3,661
Health Departments	Perinatal HIV Exposure Reporting (PHER).	35	114	30/60	1,995
Total					52,204

Leroy A. Richardson,

Chief, Information Collection Review Office, Office of Scientific Integrity, Office of the Associate Director for Science, Office of the Director, Centers for Disease Control and Prevention.

Centers for Medicare & Medicaid Services

[Document Identifier: CMS–10464]

Agency Information Collection Activities: Submission for OMB Review; Comment Request

ACTION: Notice.

SUMMARY: The Centers for Medicare & Medicaid Services (CMS) is announcing an opportunity for the public to comment on CMS' intention to collect information from the public. Under the Paperwork Reduction Act of 1995 (PRA), federal agencies are required to publish notice in the **Federal Register** concerning each proposed collection of information, including each proposed extension or reinstatement of an existing collection of information, and to allow a second opportunity for public comment on the notice. Interested persons are invited to send comments regarding the burden estimate or any other aspect of this collection of information, including any of the following subjects: (1) The necessity and utility of the proposed information collection for the proper performance of the agency's functions; (2) the accuracy of the estimated burden; (3) ways to enhance the quality, utility, and clarity of the information to be collected; and (4) the use of automated collection techniques or other forms of information technology to minimize the information collection burden.

DATES: Comments on the collection(s) of information must be received by the OMB desk officer by August 12, 2015.

ADDRESSES: When commenting on the proposed information collections, please reference the document identifier or OMB control number. To be assured consideration, comments and recommendations must be received by the OMB desk officer via one of the following transmissions: OMB, Office of Information and Regulatory Affairs, Attention: CMS Desk Officer, Fax Number: (202) 395–5806 *or* Email: *OIRA_submission@omb.eop.gov*.

To obtain copies of a supporting statement and any related forms for the proposed collection(s) summarized in this notice, you may make your request using one of following:

1. Access CMS' Web site address at *http://www.cms.hhs.gov/PaperworkReductionActof1995*.

2. Email your request, including your address, phone number, OMB number, and CMS document identifier, to *Paperwork@cms.hhs.gov*.

3. Call the Reports Clearance Office at (410) 786–1326.

FOR FURTHER INFORMATION CONTACT: Reports Clearance Office at (410) 786–1326.

SUPPLEMENTARY INFORMATION: Under the Paperwork Reduction Act of 1995 (PRA) (44 U.S.C. 3501–3520), federal agencies must obtain approval from the Office of Management and Budget (OMB) for each collection of information they conduct or sponsor. The term ''collection of information'' is defined in 44 U.S.C. 3502(3) and 5 CFR 1320.3(c) and includes agency requests or requirements that members of the public submit reports, keep records, or provide information to a third party. Section 3506(c)(2)(A) of the PRA (44 U.S.C. 3506(c)(2)(A)) requires federal agencies to publish a 30-day notice in the **Federal Register** concerning each proposed collection of information, including each proposed extension or reinstatement of an existing collection of information, before submitting the collection to OMB for approval. To comply with this requirement, CMS is publishing this notice that summarizes the following proposed collection(s) of information for public comment:

1. *Type of Information Collection Request:* Revision of a currently approved information collection; *Title of Information Collection:* Agent/Broker Data Collection in Federally-Facilitated Health Insurance Exchanges; *Use:* The CMS collects personally identifiable information from agents/brokers to register them with the FFM and permit them to assist individuals and employers in enrolling in the FFM. We use this collection of information to ensure agents/brokers possess the basic knowledge required to enroll individuals and SHOP employers/employees through the Marketplaces. Agents/brokers will use CMS or third-party systems to enter identifying information and register with the FFM. As a component of registration, agents/brokers are required to complete online training courses through a CMS or third-party Learning Management System (LMS). Upon completion of their applications and training requirements, agents/brokers will be required to attest to their agreement to adhere to FFM standards and requirements through a CMS or third-party LMS. *Form Number:* CMS–10464 (OMB control number: 0938–1204); *Frequency:* Annually; *Affected Public:* Private sector (Business or other for-profits and Not-for-profit institutions); *Number of Respondents:* 19,474; *Total Annual Responses:* 32,929,239; *Total Annual Hours:* 2,786,198. (For policy questions regarding this collection contact Daniel Brown at 301–492–5146.)

Dated: July 8, 2015.

William N. Parham, III,

Director, Paperwork Reduction Staff, Office of Strategic Operations and Regulatory Affairs.

DEPARTMENT OF HEALTH AND HUMAN SERVICES

Administration for Children and Families

Submission for OMB Review; Comment Request

Title: LIHEAP Quarterly Allocation Estimates, Form ACF–535.

OMB No.: 0970–0037.

Description: The LIHEAP Quarterly Allocation Estimates, ACF Form-535 is a one-page form that is sent to 50 State grantees and to the District of Columbia. It is also sent to Tribal Government grantees that receive over $1 million annually for the Low Income Home Energy Assistance Program (LIHEAP). Grantees are asked to complete and submit the form in the 4th quarter of each year. The data collected on the form are grantees' estimates of obligations they expect to make each quarter for the upcoming fiscal year for the LIHEAP program. This is the only method used to request anticipated distributions of the grantees' LIHEAP funds. The information is used to develop apportionment requests to OMB and to make grant awards based on grantees' anticipated needs. Information collected on this form is not available through any other Federal source. Submission of the form is voluntary.

Respondents: State Governments, and Tribal Governments that receive over $1 million annually, and the District of Columbia.

ANNUAL BURDEN ESTIMATES

Instrument	Number of respondents	Number of responses per respondent	Average burden hours per response	Total burden hours
LIHEAP Quarterly Allocation Estimates, Form ACF–535	52	1	.25	13

Estimated Total Annual Burden Hours: 13.

Additional Information:

Copies of the proposed collection may be obtained by writing to the Administration for Children and Families, Office of Planning, Research and Evaluation, 370 L'Enfant Promenade SW., Washington, DC 20447, Attn: ACF Reports Clearance Officer. All requests should be identified by the title of the information collection. Email address: *infocollection@acf.hhs.gov.*

OMB Comment:

OMB is required to make a decision concerning the collection of information between 30 and 60 days after publication of this document in the **Federal Register**. Therefore, a comment is best assured of having its full effect if OMB receives it within 30 days of publication. Written comments and recommendations for the proposed information collection should be sent directly to the following: Office of Management and Budget, Paperwork Reduction Project, Email: *OIRA_SUBMISSION@OMB.EOP.GOV*, Attn: Desk Officer for the Administration for Children and Families.

Robert Sargis,

Reports Clearance Officer.

DEPARTMENT OF HEALTH AND HUMAN SERVICES

Food and Drug Administration

[Docket No. FDA–2015–N–0001]

Science Board to the Food and Drug Administration; Notice of Meeting

AGENCY: Food and Drug Administration, HHS.

ACTION: Notice.

This notice announces a forthcoming meeting of a public advisory committee of the Food and Drug Administration (FDA). The meeting will be open to the public.

Name of Committee: Science Board to the Food and Drug Administration (Science Board).

General Function of the Committee: The Science Board provides advice to the Commissioner of Food and Drugs and other appropriate officials on specific, complex scientific and technical issues important to FDA and its mission, including emerging issues within the scientific community. Additionally, the Science Board provides advice to the Agency on keeping pace with technical and scientific developments including in regulatory science, input into the Agency's research agenda, and on upgrading its scientific and research facilities and training opportunities. It will also provide, where requested, expert review of Agency sponsored intramural and extramural scientific research programs.

Date and Time: The meeting will be held on July 29, 2015, from 8:30 a.m. to 4 p.m.

Location: FDA White Oak Campus, 10903 New Hampshire Ave., Bldg. 31 Conference Center, the Great Room (Rm. 1503 B and C), Silver Spring, MD 20993–0002. For those unable to attend in person, the meeting will also be Webcast. The link for the Webcast is available at: *https://collaboration.fda.gov/scienceboard2015/.* Answers to commonly asked questions including information regarding special accommodations due to a disability, visitor parking, and transportation may be accessed at: *http://www.fda.gov/AdvisoryCommittees/AboutAdvisoryCommittees/ucm408555.htm.*

Contact Person: Rakesh Raghuwanshi, Office of the Chief Scientist, Food and Drug Administration, Bldg. 1, Rm. 3309, 10903 New Hampshire Ave., Silver Spring, MD 20993, 301–796–4769, *rakesh.raghuwanshi@fda.hhs.gov,* or FDA Advisory Committee Information Line, 1–800–741–8138 (301–443–0572 in the Washington, DC area). A notice in the **Federal Register** about last minute modifications that impact a previously announced advisory committee meeting cannot always be published quickly enough to provide timely notice. Therefore, you should always check the Agency's Web site at *http://www.fda.gov/AdvisoryCommittees/default.htm* and scroll down to the appropriate advisory committee meeting link, or call the advisory committee information line to learn about possible modifications before coming to the meeting.

Agenda: The Science Board will be provided with a report from the Commissioner's Fellowship Program Evaluation subcommittee and will be provided with a progress report from the Science Looking Forward subcommittee. The Board will hear an overview of two scientific activities from the Center for Veterinary Medicine and will be asked to provide input on strategies to implement targeted directives contained in the National Strategy for Combating Antibiotic-Resistant Bacteria, designed to guide action by public health, health care, and veterinary partners in a common effort to address urgent and serious drug-resistant threats that affect people in the United States and around the world. A recipient of one of the Fiscal Year 2014 Scientific Achievement Awards (selected by the Board) will provide an overview of the activities for which the award was given. A status update on the 21st Century Cures Act will be presented, and the Deputy Commissioner for Medical Products and Tobacco will discuss his vision for the Office of Medical Products and Tobacco.

FDA intends to make background material available to the public no later than 2 business days before the meeting. If FDA is unable to post the background material on its Web site prior to the meeting, the background material will be made publicly available at the location of the advisory committee meeting, and the background material will be posted on FDA's Web site after the meeting. Background material is available at *http://www.fda.gov/AdvisoryCommittees/Calendar/default.htm.* Scroll down to the appropriate advisory committee meeting link.

Procedure: Interested persons may present data, information, or views, orally or in writing, on issues pending before the committee. Written submissions may be made to the contact person on or before July 22, 2015. Oral presentations from the public will be scheduled between approximately 2:45 and 3:45 p.m. Those individuals interested in making formal oral presentations should notify the contact person and submit a brief statement of the general nature of the evidence or arguments they wish to present, the names and addresses of proposed participants, and an indication of the approximate time requested to make their presentation on or before July 14, 2015. Time allotted for each presentation may be limited. If the number of registrants requesting to speak is greater than can be reasonably accommodated during the scheduled open public hearing session, FDA may conduct a lottery to determine the speakers for the scheduled open public hearing session. The contact person will notify interested persons regarding their request to speak by July 15, 2015.

Persons attending FDA's advisory committee meetings are advised that the Agency is not responsible for providing access to electrical outlets.

FDA welcomes the attendance of the public at its advisory committee meetings and will make every effort to accommodate persons with physical disabilities or special needs. If you require special accommodations due to a disability, please contact Mr. Rakesh Raghuwanshi at least 7 days in advance of the meeting.

FDA is committed to the orderly conduct of its advisory committee meetings. Please visit our Web site at *http://www.fda.gov/AdvisoryCommittees/AboutAdvisoryCommittees/ucm111462.htm* for procedures on public conduct during advisory committee meetings.

Notice of this meeting is given under the Federal Advisory Committee Act (5 U.S.C. app. 2).

Dated: July 7, 2015.

Leslie Kux,

Associate Commissioner for Policy.

DEPARTMENT OF HEALTH AND HUMAN SERVICES

Food and Drug Administration

[Docket No. FDA–2011–D–0147]

Agency Information Collection Activities; Submission for Office of Management and Budget Review; Comment Request; Guidance for Industry and Food and Drug Administration Staff; Section 905(j) Reports: Demonstrating Substantial Equivalence for Tobacco Products and Demonstrating the Substantial Equivalence of a New Tobacco Product: Responses to Frequently Asked Questions

AGENCY: Food and Drug Administration, HHS.

ACTION: Notice.

SUMMARY: The Food and Drug Administration (FDA) is announcing that a proposed collection of information has been submitted to the Office of Management and Budget (OMB) for review and clearance under the Paperwork Reduction Act of 1995.

DATES: Fax written comments on the collection of information by August 12, 2015.

ADDRESSES: To ensure that comments on the information collection are received, OMB recommends that written comments be faxed to the Office of Information and Regulatory Affairs, OMB, Attn: FDA Desk Officer, FAX: 202–395–7285, or emailed to *oira_submission@omb.eop.gov.* All comments should be identified with the OMB control number 0910–0673. Also include the FDA docket number found in brackets in the heading of this document.

FOR FURTHER INFORMATION CONTACT: FDA PRA Staff, Office of Operations, Food and Drug Administration, 8455 Colesville Rd., COLE–14526, Silver Spring, MD 20993–0002, *PRAStaff@fda.hhs.gov.*

SUPPLEMENTARY INFORMATION: In compliance with 44 U.S.C. 3507, FDA has submitted the following proposed collection of information to OMB for review and clearance.

Guidance for Industry and Food and Drug Administration Staff; Section 905(j) Reports: Demonstrating Substantial Equivalence for Tobacco Products OMB Control Number 0910–0673—Extension

On June 22, 2009, the President signed the Family Smoking Prevention and Tobacco Control Act (the Tobacco Control Act) (*Pub. L. 111–31*) into law. The Tobacco Control Act amended the Federal Food, Drug, and Cosmetic Act (the FD&C Act) by adding a new chapter granting FDA authority to regulate the manufacture, marketing, and distribution of tobacco products to protect the public health generally and to reduce tobacco use by minors. Section 905(j) of the FD&C Act (*21 U.S.C. 387e(j)*) authorizes FDA to establish the manner and form for the submission of information related to substantial equivalence (SE). In guidance documents issued under the Good Guidances Practices regulation (*21 CFR 10.115*), FDA provides recommendations intended to assist persons submitting reports under section 905(j) of the FD&C Act and explains, among other things, FDA's interpretation of the statutory sections related to substantial equivalence.

In the **Federal Register** of March 5, 2015 (80 FR 11989), FDA published a 60-day notice requesting public comment on the proposed collection of information. FDA received one comment. The commenter expressed a concern that small manufacturers have the burden of conducting testing without a definitive guide on what will constitute substantial equivalence. FDA has carefully considered the burden associated with the submission of an SE report. The information needed to demonstrate substantial equivalence is dependent on the new product and the predicate product that the manufacturer identifies. Nevertheless, to assist manufacturers in preparing SE reports, FDA has issued guidance documents and participated in outreach such as webinars to provide manufacturers with information. Moreover, manufacturers seeking to demonstrate substantial equivalence may also contact FDA to seek the Agency's input on the specific types of information that the Agency believes will be necessary to support the manufacturer's section 905(j) report. The commenter also supported FDA's development of more streamlined SE Reports but challenged ''new requirements on label changes,'' and requested that FDA promulgate a rule on categorical exclusions (environmental assessments). Although these comments are outside of the scope of this PRA collection, FDA intends to consider them as part of the Agency's other regulatory efforts as appropriate.

FDA estimates the burden of this collection of information as follows:

TABLE 1—ESTIMATED ANNUAL REPORTING BURDEN [1]

Activity	No. of respondents	No. of responses per respondent	Total annual responses	Average burden per response	Total hours
Full SE 905(j)(1)(A)(i) and 910(a)	75	1	75	300	22,500
Product Quantity Change SE Report	125	1	125	87	10,875
Same Characteristics SE Report	100	1	100	47	4,700
Totals					38,075

[1] There are no capital costs or operating and maintenance costs associated with this collection of information.

FDA has based these estimates on information it now has available from interactions with the industry, information related to other regulated products, and FDA's expectations regarding the tobacco industry's use of the section 905(j) pathway to market their products. Table 1 describes the annual reporting burden as a result of the implementation of the SE requirements of sections 905(j) and 910(a) of the FDC Act (*21 U.S.C. 387j(a)*). Based on current information, FDA now estimates that it will receive 300 section 905(j) reports each year. Of these 300 reports, FDA estimates that 75 of these reports will be ''full'' SE reports that take a manufacturer approximately 300 hours to prepare. Under the newly issued guidance entitled, ''Demonstrating the Substantial Equivalence of a New Tobacco Product: Responses to Frequently Asked Questions,'' FDA is recommending that certain modifications might be addressed in either a ''Same Characteristics SE Report'' or ''Product Quantity Change Report.'' FDA estimates that it will receive 100 Same Characteristics SE Reports and that it will take a manufacturer approximately 47 hours to prepare this report. FDA estimates that it will receive 125 Product Quantity Change SE Reports and that it will take a manufacturer approximately 87 hours to prepare this report. Therefore, FDA estimates the burden for submission of SE information will be 38,075 hours.

Dated: July 7, 2015.

Leslie Kux,

Associate Commissioner for Policy.

BILLING CODE 4164–01–P

DEPARTMENT OF HEALTH AND HUMAN SERVICES

Extension of Comment Period for the Office of the Assistant Secretary for Preparedness and Response Public Access Plan to Federally Funded Research: Publications and Data

AGENCY: Department of Health and Human Services.

ACTION: Notice of extension of public comment period until July 13.

SUMMARY: The Department of Health and Human Services (HHS) is extending the comment period on the Assistant Secretary for Preparedness and Response (ASPR) Public Access Plan for Federally Funded Research: Publications and Data. The document is available to the public via *http://www.phe.gov/Preparedness/planning/science/Pages/AccessPlan.aspx.* The comment period was previously scheduled to end June 25, 2015. The public comment period is extended until July 13, 2015.

FOR FURTHER INFORMATION CONTACT: Please submit comments via email to *Harvey.ball@hhs.gov*

SUPPLEMENTARY INFORMATION: Pursuant to Section 103 of the America COMPETES Reauthorization Act of 2010 (Pub. L. 111–358), the Executive Office of the President, Office of Science and Technology Policy (OSTP) issued a memorandum on February 22, 2013 to the heads of federal agencies directing them to develop plans to enhance access to the results of federally-funded scientific research. ASPR is voluntarily developing a public access plan in order to maximize availability of digitally-formatted scientific data resulting from research supported wholly or in part by federal funding that will improve the public's ability to locate and access this data.

Background: This plan considers the interests and needs of various stakeholders, including, but not limited to, federally funded researchers, universities, libraries, publishers, data users and civil society groups.

Availability of Materials: The draft copy of the ASPR Public Access Plan will be posted on the phe.gov Web site: *http://www.phe.gov/Preparedness/planning/science/Documents/AccessPlan.pdf.*

Procedures for Providing Public Input: All comments must be received by July 13, 2015. Please submit comments to Harvey Ball via email *harvey.ball@hhs.gov.*

Dated: July 2, 2015.

Nicole Lurie,

Assistant Secretary for Preparedness and Response.

Indian Health Service

Office of Direct Service and Contracting Tribes; National Indian Health Outreach and Education—Health Reform Cooperative Agreement; Correction

AGENCY: Indian Health Service, HHS.

ACTION: Notice; correction.

SUMMARY: The Indian Health Service published a document in the **Federal Register** on June 19, 2015, for the FY 2015 National Indian Health Outreach and Education, Health Reform Cooperative Agreement Program. The notice contained two incorrect dates.

FOR FURTHER INFORMATION CONTACT: Mr. Paul Gettys, Grant Systems Coordinator, Division of Grants Management (DGM), Indian Health Service, 801 Thompson Avenue, Suite TMP 360, Rockville, MD 20852, Telephone direct (301) 443–2114, or the DGM main number (301) 443–5204. (This is not a toll-free number.)

Corrections

In the **Federal Register** of June 19, 2015, in FR Doc. 2015–15157, on page 35373, in the third column, under the heading Key Dates, the correct Application Deadline Date and Proof of Non-Profit Status Due Date should read as follows:

Application Deadline Date: August 19, 2015.

Proof of Non-Profit Status Due Date: August 19, 2015.

Dated: July 1, 2015.

Robert G. McSwain,

Acting Director, Indian Health Service.

BILLING CODE 4140–01–P

DEPARTMENT OF HEALTH AND HUMAN SERVICES

Substance Abuse and Mental Health Services Administration

Agency Information Collection Activities: Proposed Collection; Comment Request

In compliance with Section 3506(c)(2)(A) of the Paperwork Reduction Act of 1995 concerning opportunity for public comment on proposed collections of information, the Substance Abuse and Mental Health Services Administration (SAMHSA) will publish periodic summaries of proposed projects. To request more information on the proposed projects or to obtain a copy of the information collection plans, call the SAMHSA Reports Clearance Officer on (240) 276–1243.

Comments are invited on: (a) Whether the proposed collections of information are necessary for the proper performance of the functions of the agency, including whether the information shall have practical utility; (b) the accuracy of the agency's estimate of the burden of the proposed collection of information; (c) ways to enhance the quality, utility, and clarity of the information to be collected; and (d) ways to minimize the burden of the collection of information on respondents, including through the use of automated collection techniques or other forms of information technology.

Proposed Project: Hospital Data Abstraction, Formerly Entitled Evaluation of Emergency Department Crisis Center Follow-Up—(OMB No. 0930–0337)

The Substance Abuse and Mental Health Services Administration's (SAMHSA), Center for Mental Health Services (CMHS) will conduct an evaluation to assess the impact of crisis center follow-up with patients admitted to emergency departments following a suicide attempt.

The overarching purpose of the Hospital Data Abstraction, formerly entitled Evaluation of Emergency Department Crisis Center Follow-up, is to examine the impact of crisis center follow-up with patients admitted to emergency departments or inpatient behavioral health units following a suicide attempt or serious suicidal ideation on subsequent readmissions for suicidal behavior. This effort assesses the capacity of follow-up to save both lives and critical hospital resources. This evaluation effort includes one data collection activity. Clearance is being requested for the continuation and expansion of the already-approved abstraction of hospital data on patients admitted to emergency departments or inpatient behavioral health units following a suicide attempt or serious ideation. This effort will continue to examine the impact of crisis center follow-up on readmissions for suicidal behavior. The data collected through this project will ultimately help SAMHSA to understand and direct crisis center follow-up lifesaving initiatives. The data collection activity is described below.

Hospitals collaborating with two cohorts (cohorts IV and V) of Lifeline crisis centers will participate in this expanded initiative. Fifteen hospitals per cohort will participate for a total of 30. Patient data will be collected for patients admitted for a suicide attempt in the two years prior to collaboration between the hospital and crisis center and for patients admitted for a suicide attempt for the two-year period after collaboration.

The Hospital Data Abstraction Form will be utilized to collect systematic patient data for patients seen in the 30 participating hospitals' emergency departments or inpatient behavioral health units. Information to be abstracted from patient data include: Demographic data, historical data, and subsequent suicidal behavioral and admission data. Data will be de-identified. Hospital staff will review patient data for qualifying (*i.e.,* admission to the emergency department for suicide attempt) records. Records to be reviewed will include emergency department or inpatient behavioral health unit admissions for the two years prior to crisis center and hospital collaboration and for two years following collaboration. It is expected that a total of 30,000 records will be abstracted by hospital staff and provided to the evaluation team.

This revision involves an increase in the number of participating hospital respondents and burden associated with the continuation/expansion of the already-approved Hospital Data Abstraction Form (OMB No. 0930–0337; Expiration 09/30/2016), as well as the discontinuation of data collection and burden associated with the Crisis Center Data Abstraction Form.

The estimated response burden to collect this information is as follows annualized over the requested three-year clearance period is presented below:

TOTAL AND ANNUALIZED AVERAGES: RESPONDENTS, RESPONSES, AND HOURS

Instrument	Number of respondents	Responses per respondent *	Total number of responses	Burden per response	Annual burden *
Hospital Data Abstraction Form	30	334	10,020	.04	401

* Rounded to the nearest whole number.

Send comments to Summer King, SAMHSA Reports Clearance Officer, Room 2–1057, 1 Choke Cherry Road, Rockville, MD 20857 or email her a copy at *summer.king@samhsa.hhs.gov.* Written comments should be received by September 11, 2015.

Summer King,

Statistician.

BILLING CODE 4162–20–P

DEPARTMENT OF HOMELAND SECURITY

Coast Guard

[USCG–2014–0941]

Port Access Route Study: In the Chukchi Sea, Bering Strait and Bering Sea

AGENCY: Coast Guard, DHS.

ACTION: Notice; extension of comment period.

SUMMARY: The Coast Guard is extending the comment period for the Port Access Route Study (PARS) in the Chukchi Sea, Bering Strait and Bering Sea until August 18, 2015. This extension is necessary to allow all interested parties to submit comments to the docket for Coast Guard consideration.

DATES: Comments and related material must either be submitted to our online docket via *http://www.regulations.gov* or reach the Docket Management Facility on or before August 18, 2015.

ADDRESSES:

Comment submission: You may submit comments identified by docket number USCG–2014–0941 using any one of the following methods:

(1) Federal eRulemaking Portal: *http://www.regulations.gov.*

(2) Fax: 202–493–2251.

(3) Mail: Docket Management Facility (M–30), U.S. Department of Transportation, West Building Ground Floor, Room W12–140, 1200 New Jersey Avenue SE., Washington, DC 20590–0001.

(4) Hand delivery: Same as mail address above, between 9 a.m. and 5 p.m., Monday through Friday, except Federal holidays. The telephone number is 202–366–9329.

To avoid duplication, please use only one of these four methods. See the ''Public Participation and Request for Comments'' portion of the **SUPPLEMENTARY INFORMATION** section below for instructions on submitting comments.

FOR FURTHER INFORMATION CONTACT: If you have questions on this notice of study or extension of comment period, call or email LT Kody Stitz, Seventeenth Coast Guard District (dpw); telephone (907) 463–2270; email *Kody.J.Stitz@uscg.mil* or Mr. David Seris, Seventeenth Coast Guard District (dpw); telephone (907) 463–2267; email *David.M.Seris@uscg.mil.*

SUPPLEMENTARY INFORMATION:

Public Participation and Request for Comments

We encourage you to participate in this study by submitting comments and related materials. All comments received will be posted without change to *http://www.regulations.gov* and will include any personal information you have provided.

Submitting Comments

If you submit a comment, please include the docket number for this notice of study (USCG–2014–0941), indicate the specific section of this document to which each comment applies, and provide a reason for each suggestion or recommendation. You may submit your comments and material online (via *http://www.regulations.gov*) or by fax, mail, or hand delivery, but please use only one of these means. If you submit a comment online via *www.regulations.gov,* it will be considered received by the Coast Guard when you successfully transmit the comment. If you fax, hand deliver, or mail your comment, it will be considered as having been received by the Coast Guard when it is received at the Docket Management Facility. We recommend that you include your name and a mailing address, an email address, or a telephone number in the body of your document so that we can contact you if we have questions regarding your submission.

To submit your comment online, go to *http://www.regulations.gov,* type ''USCG–2014–0941'' into the search bar and click search, next to the displayed search results click ''Comment Now'', which will open the comment page for this study. If you submit your comments by mail or hand delivery, submit them in an unbound format, no larger than 8.5 by 11 inches, suitable for copying and electronic filing. If you submit comments by mail and would like to know that they reached the Facility, please enclose a stamped, self-addressed postcard or envelope. We will consider all comments and material received during the comment period.

Viewing Comments and Documents

To view comments, as well as documents mentioned in this preamble as being available in the docket, go to *http://www.regulations.gov,* type ''USCG–2014–0941'' into the search bar and click search, next to the displayed search results click ''Open Docket Folder'', which will display all comments and documents associated with this docket. You may also visit the Docket Management Facility in Room W12–140 on the ground floor of the Department of Transportation West Building, 1200 New Jersey Avenue SE., Washington, DC 20590, between 9 a.m. and 5 p.m., Monday through Friday, except Federal holidays. We have an agreement with the Department of Transportation to use the Docket Management Facility.

Privacy Act

Anyone can search the electronic form of comments received into any of our dockets by the name of the individual submitting the comment (or signing the comment, if submitted on behalf of an association, business, labor union, etc.). You may review a Privacy Act notice regarding our public dockets in the January 17, 2008, issue of the **Federal Register** (73 FR 3316).

Background and Purpose

The Coast Guard published a Notice of Study in the **Federal Register** of December 05, 2014 entitled, ''Port Access Route Study (PARS) in the Chukchi Sea, Bering Strait and Bering Sea''. This original notice of study announcement stated the comment period would end on June 3, 2015; however, on February 19, 2015 the Coast Guard issued a notice in the **Federal Register** which errantly stated the comment period would end on August 18, 2015. The Coast Guard placed a correction notice in the **Federal Register** informing the public of the error but because this error was caused by the Coast Guard we are extending the public comment period through August 18, 2015 to ensure all interested members of the public are able to submit their comments to the docket.

Dated: July 2, 2015.

D.B. Abel,

Rear Admiral, U.S. Coast Guard Commander, Seventeenth Coast Guard District.

DEPARTMENT OF HOMELAND SECURITY

Coast Guard

[Docket No. USCG–2015–0633]

Great Lakes Pilotage Advisory Committee; Meeting

AGENCY: Coast Guard, Department of Homeland Security.

ACTION: Committee Management; Notice of Federal Advisory Committee Meeting.

SUMMARY: The Great Lakes Pilotage Advisory Committee will meet on August 5, 2015, in Washington, DC to discuss matters relating to Great Lakes pilotage, including review of proposed Great Lakes pilotage regulations and policies. This meeting will be open to the public.

DATES: The Great Lakes Pilotage Advisory Committee will meet on Wednesday, August 5, 2015 from 8:30 a.m. to 5:30 p.m. Please note that this meeting may close early if the committee completes its business. Pre-registration, all submitted written materials, comments, and requests to make oral presentations at the meeting should reach Ms. Michelle Birchfield, Great Lakes Pilotage Advisory Committee Alternate Designated Federal Officer on or before July 28, 2015. Any written material submitted by the public will be distributed to the committee and become part of the public record.

ADDRESSES: The meeting will be held at U.S. Coast Guard Headquarters located at 2703 Martin Luther King Jr. Avenue SE., Washington, DC 20593 in Building 33, lower level conference room. All visitors to Coast Guard Headquarters will have to pre-register to be admitted to the facility. Please provide your full name, date of birth, and Social Security number by close of business on July 28, 2015, to the contact person listed in **FOR FURTHER INFORMATION CONTACT** below. Additionally, all visitors to Coast Guard Headquarters must provide identification in the form of government-issued picture identification card for access to the facility. Please allow at least 30 minutes before the planned start of the meeting in order to pass through security.

For information on facilities or services for individuals with disabilities or to request special assistance at the meeting, contact the person listed in **FOR FURTHER INFORMATION CONTACT** below as soon as possible.

To facilitate public participation, we are inviting public comment on the issues to be considered by the committee as listed in the ''Agenda'' section below. Comments must be submitted in writing no later than July 28, 2015, and must be identified by [USCG–2015–0633] and may be submitted by *one* of the following methods:

- *Federal eRulemaking Portal: http://www.regulations.gov.* Follow the instructions for submitting comments.
- *Fax:* 202–493–2251.
- *Mail:* Docket Management Facility (M–30), U.S. Department of Transportation, West Building Ground Floor, Room W12–140, 1200 New Jersey Avenue SE., Washington DC 20590–0001.
- *Hand Delivery:* Same as mail address above between 9 a.m. and 5 p.m., Monday through Friday, except Federal holidays. The telephone number is 202–366–9329.

To avoid duplication, please use only one of these four methods.

Instructions: All submissions received must include the words ''Department of Homeland Security'' and the docket number for this action. Comments received will be posted without alteration at *http://www.regulations.gov*, including any personal information provided. You may review a Privacy Act notice regarding our public dockets in the January 17, 2008, issue of the **Federal Register** (73 FR 3316).

Docket: For access to the docket to read documents or comments related to this notice, go to *http://www.regulations.gov*, and use ''USCG–2015–0633'' in the ''Search'' box, press Enter, and then click on the item you wish to view.

Public comments will be heard during the meeting on August 5, 2015. Speakers are requested to limit their comments to 5 minutes. Please note that the public comment period may end before the period allotted, following the last call for comments. Contact the individual listed in the **FOR FURTHER INFORMATION CONTACT** section below to register as a speaker.

FOR FURTHER INFORMATION CONTACT: Commandant (CG–WWM–2), ATTN: Ms. Michelle Birchfield, Great Lakes Pilotage Advisory Committee Alternate Designated Federal Officer, U.S. Coast Guard Stop 7509, 2703 Martin Luther King Jr. Avenue SE., Washington, DC 20593–7509; telephone 202–372–1537, fax 202–372–8387, or email at *Michelle.R.Birchfield@uscg.mil.* If you have questions on viewing or submitting material to the docket, call Cheryl Collins, Program Manager, Docket Operations, telephone 202–366–9826 or 1–800–647–5527.

SUPPLEMENTARY INFORMATION: Notice of this meeting is given under the Federal Advisory Committee Act, (Title 5 U.S.C. Appendix). The Great Lakes Pilotage Advisory Committee was established under the authority of 46 U.S.C. 9307, and makes recommendations to the Secretary of Homeland Security and the Coast Guard on matters relating to Great Lakes pilotage, including review of proposed Great Lakes pilotage regulations and policies.

Further information about the Great Lakes Pilotage Advisory Committee is available by going to the Web site: *https://www.facadatabase.gov.* Click on the search tab and type ''Great Lakes'' into the search form. Then select ''Great Lakes Pilotage Advisory Committee'' from the list. A copy of all meeting documentation will also be available at *https://www.uscg.mil/hq/cg5/cg552/pilotage.asp* by July 30, 2015. Alternatively, you may contact Ms. Michelle Birchfield as noted in the **FOR FURTHER INFORMATION CONTACT** section above.

Agenda

The Great Lakes Pilotage Advisory Committee will meet on Wednesday, August 5, 2015 to review, discus, deliberate and formulate recommendations as appropriate on topics contained in the below agenda:

(1) Status Report of action taken on Committee recommendations.

(2) Ice Operations: Closing 2014/Opening 2015.

(3) State of U.S. Great Lakes Pilotage.

(4) Status of current rulemakings and audits.

(5) Great Lakes Pilotage Management System (also known as Klein System) upgrade.

(6) Pilot development.

Public comments or questions will be taken throughout the meeting as the committee discusses the issues and prior to deliberations and voting. There will also be a public comment period at the end of the meeting.

Minutes: Minutes from the meeting will be available for public view and copying within 90 days following the meeting at *https://www.uscg.mil/hq/cg5/cg552/pilotage.asp.*

G.C. Rasicot,

Director, Marine Transportation Systems, U.S. Coast Guard.

BILLING CODE 9110–04–P

DEPARTMENT OF HOMELAND SECURITY

U.S. Customs And Border Protection

[CBP Dec. 15–09]

Western Hemisphere Travel Initiative: Designation of an Approved Native American Tribal Card Issued by the Seneca Nation of Indians as an Acceptable Document To Denote Identity and Citizenship for Entry in the United States at Land and Sea Ports of Entry

AGENCY: U.S. Customs and Border Protection, DHS.

ACTION: Notice.

SUMMARY: This notice announces that the Commissioner of U.S. Customs and Border Protection is designating an approved Native American Tribal Card issued by the Seneca Nation of Indians to U.S. and Canadian citizens as an acceptable travel document for purposes of the Western Hemisphere Travel Initiative. The approved card may be used to denote identity and citizenship of Seneca Nation of Indians members entering the United States from contiguous territory or adjacent islands at land and sea ports of entry.

DATES: This designation will become effective on July 13, 2015.

FOR FURTHER INFORMATION CONTACT: Arthur A. E. Pitts, Director, Traveler Policies Division, Admissibility and Passenger Programs, Office of Field Operations, U.S. Customs and Border Protection, via email at *arthur.a.pitts@cbp.dhs.gov.*

SUPPLEMENTARY INFORMATION:

Background

The Western Hemisphere Travel Initiative

Section 7209 of the Intelligence Reform and Terrorism Prevention Act of 2004 (IRTPA), Public Law 108–458, as amended, required the Secretary of Homeland Security (Secretary), in consultation with the Secretary of State, to develop and implement a plan to require U.S. citizens and individuals for whom documentation requirements have previously been waived under section 212(d)(4)(B) of the Immigration and Nationality Act (8 U.S.C. 1182(d)(4)(B)) to present a passport or other document or combination of documents as the Secretary deems sufficient to denote identity and citizenship for all travel into the United States. *See* 8 U.S.C. 1185 note. On April 3, 2008, the Department of Homeland Security (DHS) and the Department of State promulgated a joint final rule, effective on June 1, 2009, that implemented the plan known as the Western Hemisphere Travel Initiative (WHTI) at U.S. land and sea ports of entry. *See* 73 FR 18384 (the WHTI land and sea final rule). It amended, among other sections of the Code of Federal Regulations (CFR), 8 CFR 212.0, 212.1, and 235.1. The WHTI land and sea final rule specifies the documents that U.S. citizens and nonimmigrant aliens from Canada, Bermuda, and Mexico are required to present when entering the United States at land and sea ports of entry.

Under the WHTI land and sea final rule, one type of citizenship and identity document that may be presented upon entry to the United States at land and sea ports of entry from contiguous territory or adjacent islands [1] is a Native American Tribal Card that has been designated as an acceptable document to denote identity and citizenship by the Secretary, pursuant to section 7209 of IRTPA. Specifically, 8 CFR 235.1(e), as amended by the WHTI land and sea final rule, states:

> Upon designation by the Secretary of Homeland Security of a United States qualifying tribal entity document as an acceptable document to denote identity and citizenship for the purposes of entering the United States, Native Americans may be permitted to present tribal cards upon entering or seeking admission to the United States according to the terms of the voluntary

[1] ''Adjacent islands'' is defined in 8 CFR 212.0 as ''Bermuda and the islands located in the Caribbean Sea, except Cuba.'' This definition applies to 8 CFR 212.1 and 235.1.

agreement entered between the Secretary of Homeland Security and the tribe. The Secretary of Homeland Security will announce, by publication of a notice in the **Federal Register,** documents designated under this paragraph. A list of the documents designated under this paragraph will also be made available to the public.

A ''United States qualifying tribal entity'' is defined as a ''tribe, band, or other group of Native Americans formally recognized by the United States Government which agrees to meet WHTI document standards.'' [2] Native American tribal cards are also referenced in 8 CFR 235.1(b) which lists the documents U.S. citizens may use to establish identity and citizenship when entering the United States. *See* 8 CFR 235.1(b)(7).

The Secretary has delegated to the Commissioner of U.S. Customs and Border Protection (CBP) the authority to designate certain documents as acceptable border crossing documents for persons arriving in the United States by land or sea from within the Western Hemisphere, including certain United States Native American tribal cards. *See* DHS Delegation Number 7105 (Revision 00), dated January 16, 2009.

Tribal Card Program

The WHTI land and sea final rule allowed U.S. federally recognized Native American tribes to work with CBP to enter into agreements to develop tribal ID cards that can be designated as acceptable to establish identity and citizenship when entering the United States at land and sea ports of entry from contiguous territory or adjacent islands. CBP has been working with various U.S. federally recognized Native American tribes to facilitate the development of such cards.[3] As part of the process, CBP will enter into one or more agreements with a U.S. federally recognized tribe that specify the requirements for developing and issuing WHTI-compliant tribal cards, including a testing and auditing process to ensure that the cards are produced and issued in accordance with the terms of the agreements.

After production of the cards in accordance with the specified requirements, and successful testing and auditing by CBP of the cards and program, the Secretary of Homeland Security or the Commissioner of CBP may designate the tribal card as an acceptable WHTI-compliant document for the purpose of establishing identity and citizenship when entering the United States by land or sea from contiguous territory or adjacent islands. Such designation will be announced by publication of a notice in the **Federal Register**. More information about WHTI-compliant documents is available at *www.cbp.gov/travel.*

Seneca Nation of Indians WHTI-Compliant Tribal Card Program

The Seneca Nation of Indians (Seneca Nation) has voluntarily established a program to develop a WHTI-compliant tribal card that denotes identity and U.S. or Canadian citizenship. On November 10, 2009, CBP and the Seneca Nation signed a Memorandum of Agreement (MOA) to develop, issue, test, and evaluate tribal cards to be used for border crossing purposes. Pursuant to this MOA, the cards are issued to members of the Seneca Nation who can establish identity, tribal membership, and U.S. or Canadian citizenship. The cards incorporate physical security features acceptable to CBP as well as facilitative technology allowing for electronic validation of identity, citizenship, and tribal membership by CBP. In 2013, CBP and the Seneca Nation entered into two related agreements, a January 15, 2013 service level agreement and an April 15, 2013 security agreement. The former memorializes the technical specifications for the production, issuance and use of the card, and the latter addresses confidentiality and information sharing.

CBP has tested the cards developed by the Seneca Nation pursuant to the above agreements and has performed an audit of the tribe's card program. On the basis of these tests and audit, CBP has determined that the cards meet the requirements of section 7209 of the IRTPA and are acceptable documents to denote identity and citizenship for purposes of entering the United States at land and sea ports of entry from contiguous territory or adjacent islands. CBP's continued acceptance of the tribal card as a WHTI-compliant document is conditional on compliance with the MOA and all related agreements.

Acceptance and use of the WHTI-compliant tribal card is voluntary for tribe members. If an individual is denied a WHTI-compliant tribal card, he or she may still apply for a passport or other WHTI-compliant document.

Designation

This notice announces that the Commissioner of CBP designates the tribal card issued by the Seneca Nation in accordance with the MOA and all related agreements between the tribe and CBP as an acceptable WHTI-compliant document pursuant to section 7209 of the IRTPA and 8 CFR 235.1(e). In accordance with these provisions, the approved card, if valid and lawfully obtained, may be used to denote identity and U.S. or Canadian citizenship of Seneca Nation members for the purposes of entering the United States from contiguous territory or adjacent islands at land and sea ports of entry.[4]

Dated: July 7, 2015.

R. Gil Kerlikowske,

Commissioner.

[FR Doc. 2015–17039 Filed 7–10–15; 8:45 am]

BILLING CODE 9111–14–P

[2] *See* 8 CFR 212.0. This definition applies to 8 CFR 212.1 and 235.1.

[3] The Native American tribal cards qualifying to be a WHTI-compliant document for border crossing purposes are commonly referred to as ''Enhanced Tribal Cards'' or ''ETCs.''

[4] The Native American Tribal Card issued by the Seneca Nation of Indians may not, by itself, be used by Canadian citizen tribal members to establish that they meet the requirements of section 289 of the Immigration and Nationality Act (INA) [8 U.S.C. 1359]. INA § 289 provides that nothing in this title shall be construed to affect the right of American Indians born in Canada to pass the borders of the United States, but such right shall extend only to persons who possess at least 50 per centum of blood of the American Indian race. While the tribal card may be used to establish a card holder's identity for purposes of INA § 289, it cannot, by itself, serve as evidence of the card holder's Canadian birth or that he or she possesses at least 50% American Indian blood, as required by INA § 289.

DEPARTMENT OF HOMELAND SECURITY

U.S. Customs and Border Protection

[CBP Dec. 15–10]

Designation of an Enhanced Driver's License and Identity Document Issued by the State of Minnesota as a Travel Document Under the Western Hemisphere Travel Initiative

AGENCY: U.S. Customs and Border Protection, DHS.

ACTION: Notice.

SUMMARY: This notice announces that the Commissioner of U.S. Customs and Border Protection is designating enhanced driver's licenses and identity documents issued by the State of Minnesota as acceptable documents for purposes of the Western Hemisphere Travel Initiative. These documents may be used to denote identity and citizenship of U.S. citizens entering the United States from within the Western Hemisphere at land and sea ports of entry.

DATES: This designation is effective July 13, 2015.

FOR FURTHER INFORMATION CONTACT: Arthur A. E. Pitts, Director, Traveler Policies Division, Admissibility and

Passenger Programs, Office of Field Operations, U.S. Customs and Border Protection, via email at *arthur.a.pitts@cbp.dhs.gov.*

SUPPLEMENTARY INFORMATION:

Background

The Western Hemisphere Travel Initiative

Section 7209 of the Intelligence Reform and Terrorism Prevention Act of 2004 (IRTPA), Public Law 108–458, as amended, required the Secretary of Homeland Security (Secretary), in consultation with the Secretary of State, to develop and implement a plan to require U.S. citizens and individuals for whom documentation requirements have previously been waived under section 212(d)(4)(B) of the Immigration and Nationality Act (8 U.S.C. 1182(d)(4)(B)) to present a passport or other document or combination of documents as the Secretary deems sufficient to denote identity and citizenship for all travel into the United States. *See* 8 U.S.C. 1185 note. On April 3, 2008, the Department of Homeland Security (DHS) and the Department of State promulgated a joint final rule, effective on June 1, 2009, that implemented the plan known as the Western Hemisphere Travel Initiative (WHTI) at U.S. land and sea ports of entry. *See* 73 FR 18384 (the WHTI land and sea final rule). It amended various sections of title 8 of the Code of Federal Regulations (CFR), including 8 CFR 212.0, 212.1, and 235.1. The WHTI land and sea final rule specifies the documents that U.S. citizens and nonimmigrant aliens from Canada, Bermuda, and Mexico are required to present when entering the United States at land and sea ports of entry from within the Western Hemisphere (which includes contiguous territories and adjacent islands of the United States).

Under the WHTI land and sea final rule, one type of citizenship and identity document that U.S. citizens may present upon entry to the United States is an enhanced driver's license or identification document[1] (EDL) designated as an acceptable document to denote identity and citizenship by the Secretary pursuant to section 7209 of IRTPA, as amended. Section 235.1(d) of title 8 of the Code of Federal Regulations, as amended by the WHTI land and sea final rule, states:

> Upon designation by the Secretary of Homeland Security of an enhanced driver's license as an acceptable document to denote identity and citizenship for purposes of entering the United States, U.S. citizens and Canadians may be permitted to present these documents in lieu of a passport upon entering or seeking admission to the United States according to the terms of the agreements entered between the Secretary of Homeland Security and the entity. The Secretary of Homeland Security will announce, by publication of a notice in the **Federal Register**, documents designated under this paragraph. A list of designated documents will also be made available to the public.

The Secretary has delegated to the Commissioner of U.S. Customs and Border Protection (CBP) the authority to designate certain documents as acceptable border crossing documents for persons arriving in the United States by land or sea from within the Western Hemisphere, including state-specific EDLs. *See* DHS Delegation Number 7105 (Revision 00), dated January 16, 2009.

EDL Programs

DHS is committed to working with the various States of the Union and the Government of Canada to facilitate the development of State and province-issued EDLs as travel documents that denote identity and citizenship as required under section 7209 of IRTPA, as amended. As part of the process, CBP will enter into one or more agreements with a State that specifies the requirements for developing and issuing WHTI-compliant EDLs, including a testing and auditing process to ensure that the cards are produced and issued in accordance with the terms of the agreements.

After production of the cards in accordance with the specified requirements, and successful testing and auditing by CBP of the cards and program, the Secretary of DHS or the Commissioner of CBP may designate the EDL as an acceptable WHTI-compliant document for the purpose of establishing identity and citizenship when entering the United States by land or sea from contiguous territory or adjacent islands. Such designation will be announced by publication of a notice in the **Federal Register**. More information about WHTI-compliant documents is available at *www.cbp.gov/travel.*

Minnesota EDLs

The State of Minnesota (Minnesota) has established a voluntary program to develop EDLs that would denote identity and citizenship. On October 1, 2012, CBP and Minnesota entered into a Memorandum of Agreement (MOA) to develop, issue, test, and evaluate an enhanced driver's license and identification card with facilitative technology to be used for border crossing purposes. On November 21, 2012, CBP approved the plan outlining the business process for the implementation of the Minnesota EDL program. Under the terms of the MOA and business plan, Minnesota will only issue EDLs to U.S. citizens. EDLs also may be issued as photo identification cards to non-drivers. The cards are to incorporate physical security features acceptable to CBP as well as facilitative technology allowing for electronic validation of identity and citizenship.

Subsequently, CBP and Minnesota entered into two related agreements, a December 11, 2012 service level agreement and an April 15, 2013 security agreement. The former memorializes the technical specifications for the production, issuance and use of the card, and the latter addresses confidentiality and information sharing.

CBP has tested the cards developed by Minnesota pursuant to the above agreements and has performed an audit of Minnesota's EDL program. On the basis of these tests and audit, CBP has determined that the cards meet the requirements of section 7209 of IRTPA and are acceptable documents to denote identity and citizenship for purposes of entering the United States at land and sea ports of entry from contiguous territory or adjacent islands. CBP's continued acceptance of the Minnesota EDL as a WHTI-compliant document is conditional on compliance with the MOA and all related agreements.

Acceptance and use of the WHTI-compliant EDL is voluntary. If an individual is denied a WHTI-compliant EDL, he or she may still apply for a passport or other WHTI-compliant document.

Designation

This notice announces that the Commissioner of CBP designates the EDL issued by Minnesota in accordance with the MOA and all related agreements between Minnesota and CBP as an acceptable document to denote identity and citizenship pursuant to section 7209 of IRTPA and 8 CFR 235.1(d). Therefore, pursuant to 8 CFR 235.1(d), U.S. citizen holders of Minnesota EDLs may present these EDLs as an alternative to a passport upon entering the United States at all land and sea ports of entry when coming from contiguous territory and

[1] The enhanced driver's license or identification document may be in one of two forms, as decided by the issuing authority, provided that the document (card) denotes identity and citizenship and meets technical requirements: (1) An enhanced driver's license or (2) an enhanced identity card. The designation ''EDL'' covers both documents.

adjacent islands from within the Western Hemisphere.

Dated: July 7, 2015.

R. Gil Kerlikowske,

Commissioner.

DEPARTMENT OF HOMELAND SECURITY

U.S. Customs and Border Protection

National Customs Automation Program (NCAP) Concerning Remote Location Filing Entry Procedures in the Automated Commercial Environment (ACE) and the Use of the Document Image System for the Submission of Invoices and the Use of eBonds for the Transmission of Single Transaction Bonds

AGENCY: U.S. Customs and Border Protection, Department of Homeland Security.

ACTION: General notice.

SUMMARY: This document announces U.S. Customs and Border Protection's (CBP's) plan to conduct a National Customs Automation Program (NCAP) test concerning entries filed using remote location (RLF) filing procedures. The test expands the entry types eligible for RLF procedures and the port locations where RLF entries may be filed; requires the electronic transmission of invoices using the Document Image System (DIS); and requires that single transaction bonds be transmitted using eBond for RLF entries requiring a single transaction bond. This test applies only to entries ''certified for cargo release from summary'' filed through the Automated Commercial Environment (ACE). Remote location filing is a special entry procedure which allows importers of record and brokers with a national permit to file an entry electronically from a remote location other than where the goods are being entered.

This test is in furtherance of key CBP modernization initiatives and the development of ACE. CBP is transitioning all entry types to ACE from the legacy Automated Commercial System (ACS). This test checks the viability, reliability and functionality associated with filing invoices using DIS; submitting single transaction bonds using eBond for RLF entries submitted in ACE; and expanding the entry types eligible for RLF procedures and port locations.

This notice invites public comment concerning the test program; provides legal authority for the test; explains the purpose of the test; provides test participant responsibilities; identifies the regulations that will be waived under the test; provides eligibility criteria for participation in the test; explains the application process; and establishes the duration of the test. This notice also explains the repercussions and appeals process for misconduct under the test.

DATES: The initial phase of the RLF test will begin on August 12, 2015. This test will continue until concluded by way of an announcement in the **Federal Register**. Comments will be accepted through the duration of the test.

ADDRESSES: Comments concerning this notice and any aspect of this test may be submitted at any time during the test via email to Josephine Baiamonte, ACE Business Office (ABO), Office of International Trade at *josephine.baiamonte@cbp.dhs.gov.* In the subject line of your email, please indicate, ''*Comment on RLF Test FRN''.*

FOR FURTHER INFORMATION CONTACT: For technical questions related to the Automated Commercial Environment (ACE) or Automated Broker Interface (ABI) transmissions, contact your assigned client representative. Interested parties without an assigned client representative should direct their questions to Steven Zaccaro at *steven.j.zaccaro@cbp.dhs.gov.*

SUPPLEMENTARY INFORMATION:

I. Background

The National Customs Automation Program (NCAP) was established in Subtitle B of Title VI—Customs Modernization (Customs Modernization Act), in the North American Free Trade Agreement Implementation Act, Pub. L. 103–182, 107 Stat. 2057 (19 U.S.C. 1411). Through NCAP, the initial thrust of customs modernization was on trade compliance and the development of the Automated Commercial Environment (ACE), the planned successor to the Automated Commercial System (ACS). The ability to meet these objectives depends on successfully modernizing CBP's business functions and the information technology that supports those functions. CBP's modernization efforts are accomplished through phased releases of ACE component functionality designed to introduce a new capacity or to replace a specific legacy ACS function. Each release will begin with a test and will end with mandatory compliance with the new ACE feature, thus retiring the legacy ACS function. Each release builds on previous releases and sets the foundation for subsequent releases.

For the convenience of the public, a chronological listing of **Federal Register** publications detailing ACE test developments is set forth below in Section XII, entitled, ''Development of ACE Prototypes.'' The procedures and criteria related to participation in the prior ACE tests remain in effect unless otherwise explicitly changed by this or subsequent notices published in the **Federal Register**.

II. Authorization for the Test

The Customs Modernization provisions provide the Commissioner of CBP with authority to conduct limited test programs or procedures designed to evaluate planned components of the NCAP. The test described in this notice is authorized pursuant to § 101.9(b) of title 19 of the Code of Federal Regulations (19 CFR 101.9(b)), which provides for the testing of NCAP programs or procedures. *See* Treasury Decision (T.D.) 95–21.

III. Remote Location Filing (RLF)

Remote location filing is a planned component of the NCAP, authorized by section 411 of the Tariff Act of 1930, as amended by section 631 of the Customs Modernization Act. *See* 19 U.S.C. 1411(a)(2)(B). After years of testing RLF entry procedures, CBP published a final rule in the **Federal Register** that implemented RLF as a special entry procedure. *See* 74 FR 69015 (December 30, 2009). These regulations, codified at 19 CFR part 143, subpart E, authorize importers of record and brokers with a national permit to file an entry electronically from a remote location other than where the goods are being entered. Under CBP regulations, only certain entry types may be filed using RLF procedures and these entries must be filed at a RLF-operational CBP location. A current listing of RLF eligible entry types may be found at the following link: *http://www.cbp.gov/trade/entry-summary/remote-location-filing/eligibility.* A current list of RLF-operational CBP locations may be found at the following link: *http://www.cbp.gov/document/guidance/rlf-operational-location-points-contact.*

At this time, the entry types that may be filed using RLF procedures for parties not participating in this test are 01 entries (formal consumption entries), 03 entries (formal consumption entries subject to antidumping or countervailing duties), and 11 entries (informal entries). Interested parties should check the CBP links referenced above for changes to the entry types authorized for RLF procedures and changes to the RLF operational CBP locations.

Under the CBP regulations (19 CFR part 143, subpart E), importers and licensed customs brokers with a national permit must be operational on (1) the Automated Broker Interface (ABI); an interface that allows participants to electronically file required import data with CBP and transfers that data into ACE; (2) the Electronic Invoice Program (EIP), a module of ABI which allows entry filers to transmit detailed invoice data through the Automated Invoice Interface (AII); and (3) the Automated Clearing House (ACH) which is a CBP- approved method for the electronic payment of duties, fees and taxes. RLF entry filers must be operational on ACH at least 30 days prior to filing a RLF entry. Additionally, all entries filed using RLF procedures must be secured by a continuous bond. The CBP regulations also require that any invoice data required or requested by CBP be transmitted electronically using EIP, and any payment of duties, fees and taxes be submitted through ACH. The CBP regulations prohibit combining the use of RLF procedures with the use of line release or immediate entry procedures. RLF filers may certify release from summary, *i.e.,* file an entry summary that serves as both an entry and an entry summary. RLF filers must file electronically (including by facsimile transmissions) all additional information required to be presented with an entry and entry summary that CBP can accept electronically. If CBP cannot accept the additional information electronically, the additional information must be presented in paper form at the port of entry.

IV. Request for Participation and Test Participation Criteria

Any party who wishes to participate in this test should contact their assigned client representative and request to participate. Interested parties without an assigned client representative should direct their questions to Steven Zaccaro at *steven.j.zaccaro@cbp.dhs.gov,* request the assignment of a client representative and submit a request to participate in this test to the newly assigned client representative. Any party seeking to participate in this test must provide CBP, as part of its request to participate, its filer code and the port(s) at which it is interested in filing RLF entries.

In order to participate in this test, an interested party must be a participant in the DIS test. Moreover, any party who participates in this test and wishes to, or is required to, submit a single transaction bond must also participate in the eBond test or use a surety or surety agent participating in the eBond test for the submission of the single transaction bond. For eligibility requirements for participation in the DIS test, *see* 77 FR 20835 (April 6, 2012); 78 FR 44142 (July 23, 2013); 78 FR 53466 (August 29, 2013); and 79 FR 36083 (June 23, 2014). For eligibility requirements for participation in the eBond test, *see* 79 FR 70881 (November 28, 2014) and 80 FR 516 (January 6, 2015).

V. Test Procedures and Participant Responsibilities

Only entries filed through ACE that are certified for ACE cargo release from summary may be submitted under this test. For such ACE entries, this test seeks to determine the viability, reliability and functionality of: (1) Expanding the entry types eligible for RLF procedures and the port locations where RLF entries may be filed; (2) submitting invoices using the DIS, instead of EIP, for entries filed using RLF entry procedures; and (3) submitting single transaction bonds using eBond procedures for entries filed using RLF entry procedures that require such a bond.

Under the RLF ACE test, participants will be allowed to file entry types 01, 03, 11, and 52. Test participants should check *the following link* to determine, for purposes of this test, which entry types are eligible for RLF procedures and the port locations where RLF entries may be filed: *http://www.cbp.gov/trade/entry-summary/remote-location-filing.* Test participants should also check the link regularly for any changes to the list of eligible entry types and port locations. Please note that the list of entry types and operational ports eligible for RLF procedures under this test is larger than the list of entry types and port locations eligible for RLF procedures under the current CBP regulations (19 CFR part 143, subpart E). Test participants are required to submit invoices, including pro forma invoices, required or requested by CBP using the DIS. Test participants may not submit invoice data using EIP. Test participants who file a RLF entry that requires the filing of a single transaction bond must submit it using eBond. The use of eBond for submitting single transaction bonds is mandatory and exclusive, and participants may not submit a single transaction bond through any other manner for RLF entries filed under this test. Test participants are required to follow and abide by all terms, conditions and requirements of the DIS and eBond tests.

VI. Waiver of Regulations Under the Test

For purposes of this test, 19 CFR part 143, subpart E is waived to the extent it is inconsistent with the provisions of this test notice.

VII. Test Duration

The initial phase of the test will begin August 12, 2015 and will continue until concluded by way of an announcement in the **Federal Register**. At the conclusion of the test, an evaluation will be conducted to assess the viability, reliability and utility of receiving invoices and invoice data through DIS and single transaction bonds through eBond for entries filed using RLF procedures. The final results of the evaluation will be published in the **Federal Register** and the *Customs Bulletin* as required in 19 CFR 101.9(b)(2). Any modification, change or expansion of this test or the DIS or eBond tests will be announced via a separate **Federal Register** notice.

VIII. Comments

All interested parties are invited to comment on any aspect of this test at any time. CBP requests comments and feedback on all aspects of this test, including the design, conduct and implementation of the test, in order to determine whether to modify, alter, expand, limit, continue, end, or fully implement this program.

IX. Paperwork Reduction Act

The collection of information contained in this test has been approved by the Office of Management and Budget (OMB) in accordance with the requirements of the Paperwork Reduction Act (44 U.S.C. 3507) and assigned OMB number 1651–0024. An agency may not conduct or sponsor, and a person is not required to respond to, a collection of information unless it displays a valid control number assigned by OMB.

X. Confidentiality

All data submitted and entered into ACE is subject to the Trade Secrets Act (18 U.S.C. 1905) and is considered confidential, except to the extent as otherwise provided by law. As stated in previous notices, participation in this or any of the previous ACE tests is not confidential and upon a written Freedom of Information Act (FOIA) request, a name(s) of an approved participant(s) will be disclosed by CBP in accordance with 5 U.S.C. 552.

XI. Misconduct Under the Test

A test participant may be subject to civil and criminal penalties, administrative sanctions, liquidated damages, or discontinuance from participation in this test for any of the following:

(1) Failure to follow the terms and conditions of this test, or the DIS and eBond tests;

(2) Failure to exercise reasonable care in the execution of participant obligations;

(3) Failure to abide by applicable laws and regulations that have not been waived; or

(4) Failure to deposit duties, taxes or fees in a timely manner.

If the Director, Business Transformation Division, ACE Business Office (ABO), Office of International Trade finds that there is a basis for discontinuance of test participation privileges, the test participant will be provided a written notice proposing the discontinuance with a description of the facts or conduct warranting the action. The test participant will be offered the opportunity to appeal the Director's decision in writing within 10 calendar days of receipt of the written notice. The appeal must be submitted to the Executive Director, ABO, Office of International Trade by emailing *Deborah.Augustin@cbp.dhs.gov*.

The Executive Director will issue a decision in writing on the proposed action within 30 working days after receiving a timely filed appeal from the test participant. If no timely appeal is received, the proposed notice becomes the final decision of the Agency as of the date that the appeal period expires. A proposed discontinuance of a test participant's privileges will not take effect unless the appeal process under this paragraph has been concluded with a written decision adverse to the test participant.

In the case of willfulness or those in which public health, interest, or safety so requires, the Director, Business Transformation Division, ABO, Office of International Trade, may immediately discontinue the test participant's privileges upon written notice to the test participant. The notice will contain a description of the facts or conduct warranting the immediate action. The test participant will be offered the opportunity to appeal the Director's decision within 10 calendar days of receipt of the written notice providing for immediate discontinuance. The appeal must be submitted to the Executive Director, ABO, Office of International Trade by emailing *Deborah.Augustin@cbp.dhs.gov*. The immediate discontinuance will remain in effect during the appeal period. The Executive Director will issue a decision in writing on the discontinuance within 15 working days after receiving a timely filed appeal from the test participant. If no timely appeal is received, the notice becomes the final decision of the Agency as of the date that the appeal period expires.

XII. Developments of ACE Prototypes

A chronological listing of **Federal Register** publications detailing ACE test developments is set forth below.

- ACE Portal Accounts and Subsequent Revision Notices: 67 FR 21800 (May 1, 2002); 69 FR 5360 and 69 FR 5362 (February 4, 2004); 69 FR 54302 (September 8, 2004); 70 FR 5199 (February 1, 2005).
- ACE System of Records Notice: 71 FR 3109 (January 19, 2006).
- Terms/Conditions for Access to the ACE Portal and Subsequent Revisions: 72 FR 27632 (May 16, 2007); 73 FR 38464 (July 7, 2008).
- ACE Non-Portal Accounts and Related Notice: 70 FR 61466 (October 24, 2005); 71 FR 15756 (March 29, 2006).
- ACE Entry Summary, Accounts and Revenue (ESAR I) Capabilities: 72 FR 59105 (October 18, 2007).
- ACE Entry Summary, Accounts and Revenue (ESAR II) Capabilities: 73 FR 50337 (August 26, 2008); 74 FR 9826 (March 6, 2009).
- ACE Entry Summary, Accounts and Revenue (ESAR III) Capabilities: 74 FR 69129 (December 30, 2009).
- ACE Entry Summary, Accounts and Revenue (ESAR IV) Capabilities: 76 FR 37136 (June 24, 2011).
- Post-Entry Amendment (PEA) Processing Test: 76 FR 37136 (June 24, 2011).
- ACE Announcement of a New Start Date for the National Customs Automation Program Test of Automated Manifest Capabilities for Ocean and Rail Carriers: 76 FR 42721 (July 19, 2011).
- ACE Simplified Entry: 76 FR 69755 (November 9, 2011).
- National Customs Automation Program (NCAP) Tests Concerning Automated Commercial Environment (ACE) Document Image System (DIS): 77 FR 20835 (April 6, 2012).
- National Customs Automation Program (NCAP) Tests Concerning Automated Commercial Environment (ACE) Simplified Entry: Modification of Participant Selection Criteria and Application Process: 77 FR 48527 (August 14, 2012).
- Modification of NCAP Test Regarding Reconciliation for Filing Certain Post-Importation Preferential Tariff Treatment Claims under Certain FTAs: 78 FR 27984 (May 13, 2013).
- Modification of Two National Customs Automation Program (NCAP) Tests Concerning Automated Commercial Environment (ACE) Document Image System (DIS) and Simplified Entry (SE): 78 FR 44142 (July 23, 2013).
- Modification of Two National Customs Automation Program (NCAP) Tests Concerning Automated Commercial Environment (ACE) Document Image System (DIS) and Simplified Entry (SE); Correction: 78 FR 53466 (August 29, 2013).
- Modification of NCAP Test Concerning Automated Commercial Environment (ACE) Cargo Release (formerly known as Simplified Entry): 78 FR 66039 (November 4, 2013).
- Post-Summary Corrections to Entry Summaries Filed in ACE Pursuant to the ESAR IV Test: Modifications and Clarifications: 78 FR 69434 (November 19, 2013).
- National Customs Automation Program (NCAP) Test Concerning the Submission of Certain Data Required by the Environmental Protection Agency and the Food Safety and Inspection Service Using the Partner Government Agency Message Set Through the Automated Commercial Environment (ACE): 78 FR 75931 (December 13, 2013).
- Modification of National Customs Automation Program (NCAP) Test Concerning Automated Commercial Environment (ACE) Cargo Release for Ocean and Rail Carriers: 79 FR 6210 (February 3, 2014).
- Modification of National Customs Automation Program (NCAP) Test Concerning Automated Commercial Environment (ACE) Cargo Release to Allow Importers and Brokers to Certify From ACE Entry Summary: 79 FR 24744 (May 1, 2014).
- Modification of National Customs Automation Program (NCAP) Test Concerning Automated Commercial Environment (ACE) Cargo Release for Truck Carriers: 79 FR 25142 (May 2, 2014).
- Modification of National Customs Automation Program (NCAP) Test Concerning Automated Commercial Environment (ACE) Document Image System: 79 FR 36083 (June 25, 2014).
- Announcement of eBond Test: 79 FR 70881 (November 28, 2014).
- eBond Test Modifications and Clarifications: Continuous Bond Executed Prior to or Outside the eBond Test May Be Converted to an eBond by the Surety and Principal, Termination of an eBond by Filing Identification Number, and Email Address Correction: 80 FR 899 (January 7, 2015).
- Modification of National Customs Automation Program (NCAP) Test Concerning Automated Commercial

Environment (ACE) Document Image System Relating to Animal and Plant Health Inspection Service (APHIS) Document Submissions: 80 FR 5126 (January 30, 2015).

• Modification of National Customs Automation Program (NCAP) Test Concerning the use of Partner Government Agency Message Set through the Automated Commercial Environment (ACE) for the Submission of Certain Data Required by the Environmental Protection Agency (EPA): 80 FR 6098 (February 4, 2015).

• Announcement of Modification of ACE Cargo Release Test to Permit the Combined Filing of Cargo Release and Importer Security Filing (ISF) Data: 80 FR 7487 (February 10, 2015).

• Modification of NCAP Test Concerning ACE Cargo Release for Type 03 Entries and Advanced Capabilities for Truck Carriers: 80 FR 16414 (March 27, 2015).

Dated: July 8, 2015.

Brenda Smith,

Assistant Commissioner, Office of International Trade.

[FR Doc. 2015–17041 Filed 7–10–15; 8:45 am]

BILLING CODE 9111–14–P

DEPARTMENT OF HOMELAND SECURITY

U.S. Citizenship and Immigration Services

[OMB Control Number 1615–0050]

Agency Information Collection Activities: Request for Hearing on a Decision in Naturalization Proceedings (Under Section 336 of the INA), Form N–336; Revision of a Currently Approved Collection; Extension.

AGENCY: U.S. Citizenship and Immigration Services, Department of Homeland Security.

ACTION: 60-Day notice.

SUMMARY: The Department of Homeland Security (DHS), U.S. Citizenship and Immigration (USCIS) invites the general public and other Federal agencies to comment upon this proposed revision of a currently approved collection of information. In accordance with the Paperwork Reduction Act (PRA) of 1995, the information collection notice is published in the **Federal Register** to obtain comments regarding the nature of the information collection, the categories of respondents, the estimated burden (*i.e.* the time, effort, and resources used by the respondents to respond), the estimated cost to the respondent, and the actual information collection instruments.

DATES: Comments are encouraged and will be accepted for 60 days until September 11, 2015.

ADDRESSES: All submissions received must include the OMB Control Number 1615–0050 in the subject box, the agency name and Docket ID USCIS–2007–0020. To avoid duplicate submissions, please use only *one* of the following methods to submit comments:

(1) *Online.* Submit comments via the Federal eRulemaking Portal Web site at *http://www.regulations.gov* under e-Docket ID number USCIS–2007–0020;

(2) *Email.* Submit comments to *USCISFRComment@uscis.dhs.gov;*

(3) *Mail.* Submit written comments to DHS, USCIS, Office of Policy and Strategy, Chief, Regulatory Coordination Division, 20 Massachusetts Avenue NW., Washington, DC 20529–2140.

FOR FURTHER INFORMATION CONTACT: USCIS, Office of Policy and Strategy, Regulatory Coordination Division, Laura Dawkins, Chief, 20 Massachusetts Avenue NW., Washington, DC 20529–2140, telephone number 202–272–8377 (This is not a toll-free number. Comments are not accepted via telephone message). Please note contact information provided here is solely for questions regarding this notice. It is not for individual case status inquiries. Applicants seeking information about the status of their individual cases can check Case Status Online, available at the USCIS Web site at *http://www.uscis.gov,* or call the USCIS National Customer Service Center at 800–375–5283 (TTY 800–767–1833).

SUPPLEMENTARY INFORMATION:

Comments:

You may access the information collection instrument with instructions, or additional information by visiting the Federal eRulemaking Portal site at: *http://www.regulations.gov* and enter USCIS–2007–0020 in the search box. Regardless of the method used for submitting comments or material, all submissions will be posted, without change, to the Federal eRulemaking Portal at *http://www.regulations.gov,* and will include any personal information you provide. Therefore, submitting this information makes it public. You may wish to consider limiting the amount of personal information that you provide in any voluntary submission you make to DHS. DHS may withhold information provided in comments from public viewing that it determines may impact the privacy of an individual or is offensive. For additional information, please read the Privacy Act notice that is available via the link in the footer of *http://www.regulations.gov.*

Written comments and suggestions from the public and affected agencies should address one or more of the following four points:

(1) Evaluate whether the proposed collection of information is necessary for the proper performance of the functions of the agency, including whether the information will have practical utility;

(2) Evaluate the accuracy of the agency's estimate of the burden of the proposed collection of information, including the validity of the methodology and assumptions used;

(3) Enhance the quality, utility, and clarity of the information to be collected; and

(4) Minimize the burden of the collection of information on those who are to respond, including through the use of appropriate automated, electronic, mechanical, or other technological collection techniques or other forms of information technology, *e.g.,* permitting electronic submission of responses.

Overview of This Information Collection

(1) *Type of Information Collection:* Revision of a Currently Approved Collection.

(2) *Title of the Form/Collection:* Request for Hearing on a Decision in Naturalization Proceedings (Under Section 336 of the INA).

(3) *Agency form number, if any, and the applicable component of the DHS sponsoring the collection:* N–336; USCIS.

(4) *Affected public who will be asked or required to respond, as well as a brief abstract: Primary:* Individuals or households. Form N–336 provides a method for applicants, whose applications for naturalization are denied, to request a new hearing by an Immigration Officer of the same or higher rank as the denying officer, within 30 days of the original decision.

(5) *An estimate of the total number of respondents and the amount of time estimated for an average respondent to respond:* The estimated total number of respondents for the information collection N–336 is 5,253 and the estimated hour burden per response is 2.75 hours for paper submissions and 2.4 hours for MyUSCIS submissions.

(6) *An estimate of the total public burden (in hours) associated with the collection:* The total estimated annual hour burden associated with this collection is 12,706 hours.

(7) *An estimate of the total public burden (in cost) associated with the*

collection: The estimated total annual cost burden associated with this collection of information is $1,313,250.

Dated: July 1, 2015.

Laura Dawkins,

Chief, Regulatory Coordination Division, Office of Policy and Strategy, U.S. Citizenship and Immigration Services, Department of Homeland Security.

Comments

You may access the information collection instrument with instructions, or additional information by visiting the Federal eRulemaking Portal site at: *http://www.regulations.gov* and enter USCIS–2006–0030 in the search box. Regardless of the method used for submitting comments or material, all submissions will be posted, without change, to the Federal eRulemaking Portal at *http://www.regulations.gov,* and will include any personal information you provide. Therefore, submitting this information makes it public. You may wish to consider limiting the amount of personal information that you provide in any voluntary submission you make to DHS. DHS may withhold information provided in comments from public viewing that it determines may impact the privacy of an individual or is offensive. For additional information, please read the Privacy Act notice that is available via the link in the footer of *http://www.regulations.gov.*

Written comments and suggestions from the public and affected agencies should address one or more of the following four points:

(1) Evaluate whether the proposed collection of information is necessary for the proper performance of the functions of the agency, including whether the information will have practical utility;

(2) Evaluate the accuracy of the agency's estimate of the burden of the proposed collection of information, including the validity of the methodology and assumptions used;

(3) Enhance the quality, utility, and clarity of the information to be collected; and

(4) Minimize the burden of the collection of information on those who are to respond, including through the use of appropriate automated, electronic, mechanical, or other technological collection techniques or other forms of information technology, *e.g.,* permitting electronic submission of responses.

Overview of This Information Collection

(1) *Type of Information Collection:* Revision of a Currently Approved Collection.

(2) *Title of the Form/Collection:* Application to Preserve Residence for Naturalization.

(3) *Agency form number, if any, and the applicable component of the DHS sponsoring the collection:* N–470; USCIS.

(4) *Affected public who will be asked or required to respond, as well as a brief abstract: Primary:* Individuals or households. The information collected on Form N–470 will be used to determine whether an alien who intends to be absent from the United States for a period of one year or more is eligible to preserve residence for naturalization purposes.

(5) *An estimate of the total number of respondents and the amount of time estimated for an average respondent to respond:* The estimated total number of respondents for the information collection N–470 is 625 and the estimated hour burden per response is .6 hour for respondents via paper and .4 hour for respondents via MyUSCIS.

(6) *An estimate of the total public burden (in hours) associated with the collection:* The total estimated annual hour burden associated with this collection is 263 hours.

(7) *An estimate of the total public burden (in cost) associated with the collection:* The estimated total annual cost burden associated with this collection of information is 76,563.

Dated: July 1, 2015.

Laura Dawkins,

Chief, Regulatory Coordination Division, Office of Policy and Strategy, U.S. Citizenship and Immigration Services, Department of Homeland Security.

BILLING CODE 9111–97–P

DEPARTMENT OF THE INTERIOR

Bureau of Land Management

[LLWO600000.L18200000.XP0000]

Renewal of Approved Information Collection; OMB Control No. 1004–0204

AGENCY: Bureau of Land Management, Interior.

ACTION: 60-Day notice and request for comments.

SUMMARY: In compliance with the Paperwork Reduction Act, the Bureau of Land Management (BLM) invites public comments on, and plans to request approval to continue, the collection of information from applicants for Resource Advisory Councils. The Office of Management and Budget (OMB) has assigned control number 1004–0204 to this information collection.

DATES: Please submit comments on the proposed information collection by September 11, 2015.

ADDRESSES: Comments may be submitted by mail, fax, or electronic mail.

Mail: U.S. Department of the Interior, Bureau of Land Management, 1849 C Street NW., Room 2134LM, Attention: Jean Sonneman, Washington, DC 20240.

Fax: to Jean Sonneman at 202–245–0050.

Electronic mail: *Jean_Sonneman@blm.gov.*

Please indicate ''Attn: 1004–0204'' regardless of the form of your comments.

FOR FURTHER INFORMATION CONTACT: Mark Purdy at 202–912–7635. Persons who use a telecommunication device for the deaf may call the Federal Information Relay Service at 1–800–877–8339, to leave a message for Mr. Purdy.

SUPPLEMENTARY INFORMATION: OMB regulations at 5 CFR part 1320, which implement provisions of the Paperwork Reduction Act, 44 U.S.C. 3501–3521, require that interested members of the public and affected agencies be given an opportunity to comment on information collection and recordkeeping activities (see 5 CFR 1320.8 (d) and 1320.12(a)). This notice identifies an information collection that the BLM plans to submit to OMB for approval. The Paperwork Reduction Act provides that an agency may not conduct or sponsor a collection of information unless it displays a currently valid OMB control number. Until OMB approves a collection of information, you are not obligated to respond.

The BLM will request a 3-year term of approval for this information collection activity. Comments are invited on: (1) The need for the collection of information for the performance of the functions of the agency; (2) the accuracy of the agency's burden estimates; (3) ways to enhance the quality, utility and clarity of the information collection; and (4) ways to minimize the information collection burden on respondents, such as use of automated means of collection of the information. A summary of the public comments will accompany our submission of the information collection requests to OMB.

Before including your address, phone number, email address, or other personal identifying information in your comment, you should be aware that your entire comment—including your personal identifying information—may be made publicly available at any time. While you can ask us in your comment to withhold your personal identifying information from public review, we cannot guarantee that we will be able to do so.

The following information pertains to this request:

Title: Bureau of Land Management Resource Advisory Council Application (43 CFR Subpart 1784).

OMB Control Number: 1004–0204.

Summary: This control number consists of one information collection activity. In an application form, the BLM seeks to collect information to determine education, training, and experience related to possible service on advisory committees established under the authority of Section 309 of the Federal Land Policy and Management Act (43 U.S.C. 1739), the Federal Advisory Committee Act, 5 U.S.C. App. 2, and 43 CFR Subpart 1784. The BLM refers to such advisory committees as Resource Advisory Councils (RACs). The information that the BLM collects is necessary to ensure that each RAC is structured to provide fair membership balance, as prescribed by each RAC's charter.

Frequency of Collection: On occasion.

Forms: Form 1120–19, Bureau of Land Management Resource Advisory Council Application.

Estimated Number and Description of Respondents: 245 applicants annually for possible service on RACs.

Estimated Annual Burden Hours: 980.

Estimated Annual Non-Hour Costs: None.

Anna Atkinson,

Information Collection Clearance Officer (Acting), Bureau of Land Management.

Bureau of Land Management

[LLNVC00000.L71220000.FR0000. LVTFF1503840.15X; NVN093739; MO# 4500078799]

Notice of Realty Action; Segregation of Public Land Located in Lyon County and Mineral County, Nevada

AGENCY: Bureau of Land Management, Interior.

ACTION: Notice.

SUMMARY: This notice serves to segregate the identified public lands located in Lyon County and Mineral County, Nevada for up to two years from appropriation pursuant to the public land laws, including location pursuant to the General Mining Act, subject to valid existing rights. The purpose of such segregation is to promote the orderly administration of the public lands identified in section 3009(a) of the National Defense Authorization Act, Public Law 113–291 (December 19, 2014).

DATES: Interested parties may submit written comments regarding the segregation to the Bureau of Land Management (BLM) on or before August 27, 2015.

ADDRESSES: Mail written comments to the BLM District Manager, Carson City District Office, 5665 Morgan Mill Road, Carson City, NV 89701.

FOR FURTHER INFORMATION CONTACT: Perry Wickham, Realty Specialist, BLM Sierra Front Field Office at email: *pwickham@blm.gov* or phone: 775–885–6017. Persons who use a telecommunications device for the deaf (TDD) may call the Federal Information Relay Service (FIRS) at 1–800–877–8339 to contact the above individual during normal business hours. The FIRS is available 24 hours a day, 7 days a week, to leave a message or question with the above individual. You will receive a reply during normal business hours.

SUPPLEMENTARY INFORMATION: The following described public land in Lyon County and Mineral County, Nevada, has been identified for conveyance to the city of Yerington (City) under the authority of section 3009 of the National Defense Authorization Act, Public Law 113–291, titled Land Conveyance to Yerington, Nevada.

Mount Diablo Meridian, Nevada.

Those public lands, located in Lyon County and Mineral County, Nevada, are identified on the map as ''City of Yerington Sustainable Development Conveyance Lands.''

The area described contains approximately 10,359 acres.

The conveyance of the public land will be subject to valid existing rights and encumbrances of record, including but not limited to, rights-of-way for roads and public utilities.

On July 13, 2015, the above described land will be segregated from appropriation under the public land laws, including the mining laws, for up to two years from the date of the publication of the notice, subject to valid existing rights, but would remain subject to the sale provisions of the Federal Land Policy and Management Act. Until completion of the sale, the BLM is no longer accepting land use applications affecting the identified public land, except applications for the amendment of previously-filed right-of-way applications or existing authorizations to increase the term of the grants in accordance with 43 CFR 2807.15 and 2886.15. The segregative effect will terminate upon issuance of a patent, publication in the **Federal Register** of a termination of the segregation, or on Thursday, July 13, 2017, whichever occurs first, unless extended by the BLM State Director in accordance with 43 CFR 2711.1–2(d) prior to the termination date.

Public Comments: For a period until August 27, 2015 interested parties and the general public may submit comments concerning segregation of lands to be conveyed to the City, including notification of any encumbrances or other claims relating to the conveyed lands, to District Manager, Carson City District Office, at the above address. Comments transmitted via email will not be accepted. Comments will be available for public review at the BLM Carson City District Office, during regular business hours, except holidays.

Before including your address, phone number, email address, or other personal identifying information in your comment, be advised that your entire comment-including your personal identifying information-may be made publicly available at any time. While you can ask us in your comment to withhold from public review your personal identifying information, we cannot guarantee that we will be able to do so.

Authority: 43 CFR 2711.1–2.

Ralph Thomas,

District Manager, Carson City District Office.

BILLING CODE 4310–HC–P

LEGAL SERVICES CORPORATION

Sunshine Act Meeting

DATE AND TIME: The Legal Services Corporation's Board of Directors and its six committees will meet July 16–18, 2015. On Thursday, July 16, the first meeting will commence at 12:45 p.m., Central Daylight Time (CDT), with the meeting thereafter commencing promptly upon adjournment of the immediately preceding meeting. On Friday, July 17, the first meeting will commence at 3:00 p.m., CDT, with the next meeting commencing at 4:15 p.m., CDT, and the meeting thereafter commencing promptly upon adjournment of the immediately preceding meeting. On Saturday, July 18, the first meeting will commence at 8:30 a.m., CDT, with the next meeting commencing at 9:00 a.m., CDT, and it will be followed by the closed session meeting of the Board of Directors which will commence promptly upon adjournment of the prior meeting.

LOCATION: Radisson Blu Norway Room, 35 South Seventh Street, Minneapolis, Minnesota 55402.

PUBLIC OBSERVATION: Unless otherwise noted herein, the Board and all committee meetings will be open to public observation. Members of the public who are unable to attend in person but wish to listen to the public proceedings may do so by following the telephone call-in directions provided below.

CALL-IN DIRECTIONS FOR OPEN SESSIONS:

- Call toll-free number: 1–866–451–4981;
- When prompted, enter the following numeric pass code: 5907707348.
- When connected to the call, please immediately ''MUTE'' your telephone.

Members of the public are asked to keep their telephones muted to eliminate background noises. To avoid disrupting the meeting, please refrain from placing the call on hold if doing so will trigger recorded music or other sound. From time to time, the presiding Chair may solicit comments from the public.

MEETING SCHEDULE

	Time *
Thursday, July 16, 2015	
1. Operations & Regulations Committee. 2. Audit Committee. 3. Finance Committee. 4. Governance & Performance Review Committee.	12:45 p.m.
Friday, July 17, 2015	
1. Delivery of Legal Services Committee. 2. Institutional Advancement Committee.	3:00 p.m.
Saturday, July 18, 2015	
1. Institutional Advancement Committee Communication Subcommittee. 2. Board of Directors.	8:30 a.m.

STATUS OF MEETING: Open, except as noted below.

Board of Directors—Open, except that, upon a vote of the Board of Directors, a portion of the meeting may be closed to the public to hear briefings by management and LSC's Inspector General, and to consider and act on the General Counsel's report on potential and pending litigation involving LSC, and on a list of prospective funders.**

Institutional Advancement Committee—Open, except that, upon a vote of the Board of Directors, the meeting may be closed to the public to consider and act on recommendation of new prospective donors and to receive a briefing on the development report.**

Audit Committee—Open, except that the meeting may be closed to the public to hear a briefing on the Office of Compliance and Enforcement's active enforcement matters.**

Governance and Performance Review Committee—Open, except that the meeting may be closed to the public to consider and act on recommendation of new prospective funders, and to receive a briefing on the development report.**

A verbatim written transcript will be made of the closed session of the Board, Institutional Advancement Committee, Audit Committee, and Governance and Performance Review Committee meetings. The transcript of any portions of the closed sessions falling within the relevant provisions of the Government in the Sunshine Act, 5 U.S.C. 552b(c)(6) and (10), will not be available for public inspection. A copy of the General Counsel's Certification that, in his opinion, the closing is authorized by law will be available upon request.

MATTERS TO BE CONSIDERED:

* Please note that all times in this notice are in the *Central Daylight Time.*

** Any portion of the closed session consisting solely of briefings does not fall within the Sunshine Act's definition of the term ≥meeting≥ and, therefore, the requirements of the Sunshine Act do not apply to such portion of the closed session. 5 U.S.C. 552b (a)(2) and (b). See also 45 CFR 1622.2 & 1622.3.

July 16, 2015

OPERATIONS & REGULATIONS COMMITTEE

1. Approval of agenda
2. Approval of minutes of the Committee's meeting of April 12, 2015
3. Update on changes to 45 CFR part 1610—Transfers of LSC Funds and 45 CFR part 1627—Subgrants and Membership Fees or Dues
   - Ron Flagg, General Counsel
   - Stefanie Davis, Assistant General Counsel
   - Mark Freedman, Senior Assistant General Counsel
4. Consider and act on Final Rule for 45 CFR part 1628—Recipient Fund Balances
   - Ron Flagg, General Counsel
   - Stefanie Davis, Assistant General Counsel
5. Consider and act on Proposed Rulemaking Agenda 2015—2016
   - Ron Flagg, General Counsel
   - Stefanie Davis, Assistant General Counsel
   - Mark Freedman, Senior Assistant General Counsel
   - Tom Hester, Associate Counsel to the Inspector General
6. Consider and act on updating the LSC Rulemaking Protocol
   - Ron Flagg, Vice President & General Counsel
   - Stefanie Davis, Assistant General Counsel
   - Mark Freedman, Senior Assistant General Counsel
7. Consider and act on initiating rulemaking for 45 CFR part 1630—Cost Standards and the Property Acquisition and Management Manual
   - Ron Flagg, General Counsel
   - Stefanie Davis, Assistant General Counsel
   - Mark Freedman, Senior Assistant General Counsel
8. Report on 2015 Grant Assurances
   - Jim Sandman, President
   - Public Comment
9. Consider and act on comments on population data for grants to serve agricultural workers
   - Ron Flagg, General Counsel
   - Bristow Hardin, Program Analyst
   - Mark Freedman, Senior Assistant General Counsel
   - Public Comment
10. Other public comment
11. Consider and act on other business
12. Consider and act on adjournment of meeting

July 16, 2015

AUDIT COMMITTEE

1. Approval of agenda
2. Approval of minutes of the Committee's meeting on April 13, 2015
3. Review of the Audit Committee Charter
4. Briefing by Office of Inspector General
   - Jeffrey Schanz, Inspector General
5. Management update regarding risk management
   - Ron Flagg, Vice President of Legal Affairs
6. Briefing about follow-up by Office of Compliance and Enforcement on referrals by the Office of Inspector General regarding audit reports and annual Independent Public audits of grantees
   - Lora Rath, Director of Compliance and Enforcement
   - John Seeba, Assistant Inspector General for Audits
7. Public comment
8. Consider and act on other business

Closed Session

9. Approval of minutes of the Committee's meeting on April 13, 2015
10. Briefing by Office of Compliance and Enforcement on active enforcement matter(s) and follow-up on open investigation referrals from the Office of Inspector General
    - Lora Rath, Director of Compliance and Enforcement
11. Consider and act on adjournment of meeting

July 16, 2015

FINANCE COMMITTEE

1. Approval of agenda
2. Approval of minutes of the Committee's telephonic meeting on June 15, 2015
3. Presentation of the LSC's Financial Report for the first eight months of FY 2015
   - David Richardson, Treasurer/Comptroller
4. Review of Internal Budgetary Adjustments for the FY 2015 Consolidated Operating Budget
   - David Richardson, Treasurer/Comptroller
5. Report on the FY 2016 appropriations process
   - Carol Bergman, Director of Government Relations & Public Affairs
6. Consider and act Temporary Operating Authority for FY 2016, *Resolution 2015–XXX*
   - David Richardson, Treasurer/Comptroller
7. Consider and act on FY 2017 Budget Request, *Resolution 2015–XXX*
   - Jim Sandman, President
   - Carol Bergman, Director of Government Relations & Public affairs
   - Jeffrey Schanz, Inspector General
8. Public comment
9. Consider and act on other business
10. Consider and act on adjournment of meeting

July 16, 2015

GOVERNANCE AND PERFORMANCE REVIEW COMMITTEE

1. Approval of agenda
2. Approval of minutes of the Committee's meeting on April 13, 2015
3. Report on GAO inquiry
   - Carol Bergman, Director of Government Relations & Public Affairs
4. Report on foundation grants and LSC's research agenda
   - Jim Sandman, President
5. Public comment
6. Consider and act on other business
7. Consider and act on adjournment of meeting

Closed Session

8. Approval of minutes of the Committee's meeting on April 13, 2015
9. Development Report
10. Consider and act on prospective funders
    - Jim Sandman, President
11. Consider and act on motion to adjourn meeting

July 17, 2015

DELIVERY OF LEGAL SERVICES COMMITTEE

1. Approval of Agenda
2. Approval of minutes of the Committee's meeting on April 13, 2015
3. Panel presentation and Committee discussion on Providing legal services to Native American communities
   - Chris Allery, Supervising Attorney, Anishinabe Legal Services
   - Dorothy Alther, Executive Director, California Indian Legal Services
   - Ed Reinhardt, Senior Attorney, Legal Services of North Dakota
   - Sylvia Struss, Administrative Director, DNA—People's Legal Services
   - Colline Wahkinney-Keely, Executive Director, Oklahoma Indian Legal Services
   - Janet LaBella, Director, Office of Program Performance, Legal Services Corporation, (Moderator)
4. Public comment
5. Consider and act on other business
6. Consider and act on motion to adjourn the meeting

July 17, 2015

INSTITUTIONAL ADVANCEMENT COMMITTEE

Open Session

1. Approval of agenda
2. Approval of minutes of the Committee's meeting of April 14, 2015
3. Development activities update
4. Discussion of Protocol for the Allocation of Private Funds
5. Public comment
6. Consider and act on other business
7. Adjourn open session

Closed Session

1. Consider and act on agenda
2. Approval of minutes of the Committee's Closed Session meeting of April 14, 2015
3. Development report
4. Consider and act on prospective donors
5. Consider and act on adjournment of meeting

July 18, 2015

COMMUNICATIONS SUBCOMMITTEE OF THE INSTITUTIONAL ADVANCEMENT COMMITTEE

Open Session

1. Approval of agenda
2. LSC communications updates
3. Public comment
4. Consider and act on other business

July 18, 2015

BOARD OF DIRECTORS

Open Session

1. Pledge of Allegiance
2. Approval of agenda
3. Approval of minutes of the Board's Open Session meeting of April 15, 2015
4. Approval of minutes of the Board's Open Session telephonic meeting of May 22, 2015
5. Chairman's Report
6. Members' Report
7. President's Report
8. Inspector General's Report
9. Consider and act on the report of the Finance Committee

BILLING CODE 7555–01–P

NUCLEAR REGULATORY COMMISSION

[NRC–2014–0212]

Oversight of Counterfeit, Fraudulent, and Suspect Items in the Nuclear Industry

AGENCY: Nuclear Regulatory Commission.

ACTION: Regulatory issue summary; issuance.

SUMMARY: The U.S. Nuclear Regulatory Commission (NRC) is issuing Regulatory

Issue Summary (RIS) 2015–08, ''Oversight of Counterfeit, Fraudulent, and Suspect Items in the Nuclear Industry.'' This RIS is intended to heighten awareness of existing NRC regulations and how they apply to the nuclear industry stakeholders' oversight of counterfeit, fraudulent, and suspect items (CFSI). This RIS is addressed to all NRC's licensees and certificate holders, Agreement State radiation control program directors, and state liaison officers, as well as addressees' contractors and vendors.

DATES: The RIS is available as of July 13, 2015.

ADDRESSES: Please refer to Docket ID NRC–2014–0212 when contacting the NRC about the availability of information regarding this document. You may obtain publicly-available information related to this document using any of the following methods:

- *Federal Rulemaking Web site:* Go to *http://www.regulations.gov* and search for Docket ID NRC–2014–0212. Address questions about NRC dockets to Carol Gallagher; telephone: 301–415–3463; email: *Carol.Gallagher@nrc.gov.* For technical questions, contact the individual listed in the **FOR FURTHER INFORMATION CONTACT** section of this document.
- *NRC's Agencywide Documents Access and Management System (ADAMS):* You may obtain publicly available documents online in the ADAMS Public Documents collection at *http://www.nrc.gov/reading-rm/adams.html.* To begin the search, select ''*ADAMS Public Documents''* and then select ''*Begin Web-based ADAMS Search.''* For problems with ADAMS, please contact the NRC's Public Document Room (PDR) reference staff at 1–800–397–4209, 301–415–4737, or by email to *pdr.resource@nrc.gov.* The ADAMS accession number for each document referenced in this document (if that document is available in ADAMS) is provided the first time that a document is referenced.
- *NRC's PDR:* You may examine and purchase copies of public documents at the NRC's PDR, Room O1–F21, One White Flint North, 11555 Rockville Pike, Rockville, Maryland 20852.
- This RIS is also available on the NRC's public Web site at *http://www.nrc.gov/reading-rm/doc-collections/gen-comm/reg-issues/* (select ''2015'' and then select ''RIS 2015–08'').

FOR FURTHER INFORMATION CONTACT: James Gaslevic, Office of New Reactors, U.S. Nuclear Regulatory Commission, Washington, DC 20555–0001; telephone: 301–415–2776, email: *James.Gaslevic@nrc.gov.*

SUPPLEMENTARY INFORMATION: The NRC published a notice of opportunity for public comment on this RIS in the **Federal Register** (79 FR 59521) on October 2, 2014. The agency received comments from eight commenters. The staff considered all comments, which resulted in minor clarifications to the RIS. The evaluation of these comments and the resulting changes to the RIS are discussed in a publicly available memorandum that is in ADAMS under Accession No. ML15008A192.

Dated at Rockville, Maryland, this 7thh day of July 2015.

For the Nuclear Regulatory Commission.

Sheldon D. Stuchell,

Chief, Generic Communications Branch, Division of Policy and Rulemaking, Office of Nuclear Reactor Regulation.

NUCLEAR REGULATORY COMMISSION

[NRC–2014–0210]

Regulatory Guide 8.11, Revision 1, Applications of Bioassay for Uranium

AGENCY: Nuclear Regulatory Commission.

ACTION: Regulatory guide; issuance.

SUMMARY: The U.S. Nuclear Regulatory Commission (NRC) is issuing Revision 1 to Regulatory Guide (RG) 8.11, ''Applications of Bioassay for Uranium.'' This guide provides methods that the NRC staff considers acceptable for the development and

implementation of a bioassay program for monitoring the intake of mixtures of uranium isotopes by occupationally exposed workers. This guide applies to licenses issued under ''Domestic Licensing of Special Nuclear Material.''

ADDRESSES: Please refer to Docket ID NRC–2014–0210 when contacting the NRC about the availability of information regarding this document. You may access information related to this document, which the NRC possesses and is publicly available, using any of the following methods:

- *Federal Rulemaking Web site:* Go to *http://www.regulations.gov* and search for Docket ID NRC–2014–0210. Address questions about NRC dockets to Carol Gallagher; telephone: 301–415–3463; email: *Carol.Gallagher@nrc.gov.*
- *NRC's Agencywide Documents Access and Management System (ADAMS):* You may obtain publicly-available documents online in the ADAMS Public Document collection at *http://www.nrc.gov/reading-rm/adams.html.* To begin the search, select ''ADAMS Public Documents'' and then select ''*Begin Web-based ADAMS Search.''* For problems with ADAMS, please contact the NRC's Public Document Room (PDR) reference staff at 1–800–397–4209, 301–415–4737, or by email to *pdr.resource@nrc.gov.* The ADAMS accession number for each document referenced in this notice (if that document is available in ADAMS) is provided the first time that a document is referenced. Revision 1 of RG 8.11 is available in ADAMS under Accession No. ML15054A618. The regulatory analysis may be found in ADAMS under Accession No. ML14133A612.
- *NRC's PDR:* You may examine and purchase copies of public documents at the NRC's PDR, Room O1–F21, One White Flint North, 11555 Rockville Pike, Rockville, Maryland 20852.

Regulatory guides are not copyrighted, and NRC approval is not required to reproduce them.

FOR FURTHER INFORMATION CONTACT: Harriet Karagiannis, telephone: 301–251–7477; email: *Harriet.Karagiannis@nrc.gov* or Casper Sun, telephone: 301–251–7912; email: *Casper.Sun@nrc.gov.* Both are staff of the Office of Nuclear Regulatory Research, U.S. Nuclear Regulatory Commission, Washington, DC 20555–0001.

SUPPLEMENTARY INFORMATION:

I. Introduction

The NRC is issuing a revision to an existing guide in the NRC's ''Regulatory Guide'' series. This series was developed to describe and make available to the public information regarding methods that are acceptable to the NRC staff for implementing specific parts of the agency's regulations, techniques that the staff uses in evaluating specific issues or postulated events, and data that the staff needs in its review of applications for permits and licenses, or for amendments to such permits and licenses. The draft Revision 1 of RG 8.11 was issued with a temporary identification as Draft Regulatory Guide, DG–8054 and published in the **Federal Register** to obtain public comments (79 FR 60190; October 6, 2014).

The NRC issued the initial version of RG 8.11 in June 1974 to provide guidance to NRC licensees on methods the staff found acceptable to demonstrate compliance with the then current version of NRC's radiation protection regulations in 10 CFR part 20. In 1991 the NRC promulgated amendments to its 10 CFR part 20 regulations (56 FR 23360; May 21, 1991). The 1991 rulemaking included substantive amendments to the 10 CFR part 20 regulations as well as a renumbering of those regulations. As such, this revision (Revision 1) to the guide updates the guide's cross-references to the current 10 CFR part 20 regulations.

In addition, the guide endorses for use certain sections of a voluntary consensus standard, namely, the American National Standards Institute/Health Physics Society N13.22–2013 standard, ''Bioassay Programs for Uranium,'' as a means for licensees to demonstrate compliance with the NRC regulations, 10 CFR 20.1201, ''Occupational Dose Limits for Adults,'' and 10 CFR 20.1204, ''Determination of Internal Exposure.'' Specifically, 10 CFR 20.1201(e) requires NRC licensees to limit the soluble uranium intake to an occupational worker to 10 milligrams in a week, in addition to annual occupational dose limits, and 10 CFR 20.1204(a) requires NRC licensees to take suitable and timely measurements of the concentrations of radioactive materials in air in work areas and the quantities of radionuclides in the bodies of occupational workers. Finally, this guide identifies the bioassay interpretation methods in the NRC document NUREG/CR–4884, ''Interpretation of Bioassay Measurement,'' as an acceptable method to comply with NRC requirements.

II. Additional Information

DG–8054 was published in the *Federal Registe*r (79 FR 60190; October 6, 2014) for a 60-day public comment period. The public comment period closed on December 5, 2014. The NRC received one comment submission. This comment submission and the staff responses to the comments set forth in that comment submission are available under ADAMS Accession Number ML15014A269.

III. Congressional Review Act

This regulatory guide is a rule as defined in the Congressional Review Act (5 U.S.C. 801–808). However, the Office of Management and Budget has not found it to be a major rule as defined in the Congressional Review Act.

IV. Backfitting

Licensees may voluntarily use the guidance in this regulatory guide (Revision 1 of RG 8.11) to demonstrate compliance with the underlying NRC regulations. Methods or solutions that differ from those described in this regulatory guide may be deemed acceptable if they provide sufficient basis and information for the NRC staff to verify that the proposed alternative demonstrates compliance with the appropriate NRC regulations. Current licensees (*i.e.,* persons holding a NRC issued license as of the date of issuance of this regulatory guide) may continue to use guidance the NRC found acceptable for complying with the identified regulations as long as their current licensing basis remains unchanged. The acceptable guidance may be from the previous version of this regulatory guide. Licensees may use the information in this regulatory guide for actions which do not require NRC review and approval. Licensees may also use the information in this regulatory guide to resolve regulatory or inspection issues.

The NRC staff does not intend or approve any imposition or backfitting of the guidance in this regulatory guide (see 10 CFR 70.76, ''Backfitting''). The NRC staff does not expect any current licensee to use or commit to using the guidance in this regulatory guide, unless such licensee makes a change to its licensing basis. The NRC staff does not expect or plan to initiate NRC regulatory action that would require the use of this regulatory guide. Examples of such regulatory actions include the issuance of an order or generic communication, or the promulgation of a rule, requiring the use of this regulatory guide without further backfit consideration.

During regulatory discussions on licensee-specific operational issues, the NRC staff may discuss with licensees various actions consistent with staff positions in this regulatory guide, as one acceptable means of meeting the underlying NRC regulatory requirements. Such discussions would not ordinarily be considered backfitting, even if prior versions of this regulatory guide are part of the licensee's licensing basis. However, unless this regulatory guide is part of the licensee's licensing basis, the staff may not represent to the licensee that the licensee's failure to comply with the positions in this regulatory guide constitutes a violation.

If a current licensee voluntarily seeks a license amendment or change and (1) the NRC staff's consideration of the request involves a regulatory issue directly relevant to this regulatory guide and (2) the specific subject matter of this regulatory guide is an essential consideration in the staff's determination of the acceptability of the licensee's request, then the staff may request that the licensee either follow the guidance in this regulatory guide or provide an equivalent alternative process that demonstrates compliance with the underlying NRC regulatory requirements. Such a request by the NRC staff is not considered backfitting as defined in 10 CFR 70.76(a)(1).

If a licensee believes that the NRC is either using this regulatory guide or requesting or requiring the licensee to implement the methods or processes in this regulatory guide in a manner inconsistent with the discussion in the Implementation section of this regulatory guide, then the licensee may file a backfit appeal with the NRC in accordance with the guidance in NRC Management Directive 8.4, ''Management of Facility-Specific Backfitting and Information Collection'' and NUREG–1409, ''Backfitting Guidelines.''

Dated at Rockville, Maryland, this 8th day of July, 2015.

For the Nuclear Regulatory Commission.

Carol Moyer,

Acting Branch Chief, Regulatory Guidance and Generic Issues Branch, Division of Engineering, Office of Nuclear Regulatory Research.

BILLING CODE 7590–01–P

SECURITIES AND EXCHANGE COMMISSION

[Release No. 34–75373; File No. SR–CBOE–2015–063]

Self-Regulatory Organizations; Chicago Board Options Exchange, Incorporated; Notice of Filing and Immediate Effectiveness of a Proposed Rule Change Relating to Rule 6.49A

July 7, 2015.

Pursuant to Section 19(b)(1) of the Securities Exchange Act of 1934 (the ''Act''),[1] and Rule 19b–4 thereunder,[2] notice is hereby given that on June 24, 2015, Chicago Board Options Exchange, Incorporated (the ''Exchange'' or ''CBOE'') filed with the Securities and Exchange Commission (the ''Commission'') the proposed rule change as described in Items I, II, and III below, which Items have been prepared by the Exchange. The Exchange filed the proposal as a ''non-controversial'' proposed rule change pursuant to Section 19(b)(3)(A)(iii) of the Act[3] and Rule 19b–4(f)(6) thereunder.[4] The Commission is publishing this notice to solicit comments on the proposed rule change from interested persons.

I. Self-Regulatory Organization's Statement of the Terms of the Substance of the Proposed Rule Change

The Exchange p [sic] proposes to amend its Rule 6.49A relating to the transfer of positions. The text of the proposed rule change is provided below.

(additions are *italicized;* deletions are [bracketed])

* * * * *

Chicago Board Options Exchange, Incorporated Rules

* * * * *

Rule 6.49A. Transfer of Positions

(a)–(b) No change.

(c) *Transfer Procedure.*

(1)–(8) No change.

(9) Any Request for Quotes that is to be submitted later than 1*2:3*0[0] p.m. *(or two and one half hours prior to an early scheduled close)* must have the approval of the President of the Exchange to have a Request Response Time of less than two hours. In no event may a Request for Quotes be submitted to the floor later than 2:30 p.m. *(or thirty minutes prior to an early scheduled close).*

(10)–(13) No change.

(d) No change.

. . . *Interpretations and Policies:*

.01–.03 No change.

* * * * *

The text of the proposed rule change is also available on the Exchange's Web site (*http://www.cboe.com/AboutCBOE/CBOELegalRegulatoryHome.aspx*), at the Exchange's Office of the Secretary, and at the Commission's Public Reference Room.

II. Self-Regulatory Organization's Statement of the Purpose of, and Statutory Basis for, the Proposed Rule Change

In its filing with the Commission, the Exchange included statements concerning the purpose of and basis for the proposed rule change and discussed any comments it received on the proposed rule change. The text of these statements may be examined at the places specified in Item IV below. The Exchange has prepared summaries, set forth in sections A, B, and C below, of the most significant aspects of such statements.

A. Self-Regulatory Organization's Statement of the Purpose of, and Statutory Basis for, the Proposed Rule Change

1. Purpose

Rule 6.49A describes the circumstances under which Trading Permit Holders may transfer positions and the on- and off-floor procedures for a transfer of positions. Pursuant to subparagraph (c), an on-floor transfer of positions must be represented to the trading crowd pursuant to a request for quotes and can be completed after a two-hour response time (or different time if approved by the Exchange President pursuant to subparagraph (c)(8)). Subparagraph (c)(6) indicates that transfer packages offered on the floor are subject to FLEX trading procedures in Rule 24A.5(a) through (c) or Rule 24B.5(a)(2)(i) through (iii). Pursuant to Rule 24A.5(a) or Rule 24B.5(a)(2), the submission of a request for quotes must use the forms, formats, procedures and time frames established by the Exchange. On receipt of a request for quotes in proper form, the Exchange official will initiate the request for quotes by communicating the terms and specifications on and off the floor.

Rule 6.49A(c)(9) currently provides that a submission of a request for quotes for a transfer package later than 1:00 p.m. require the approval of the President of the Exchange (as that would result in a response time of less than two hours). Additionally, Rule

[1] 15 U.S.C. 78s(b)(1).

[2] 17 CFR 240.19b–4.

[3] 15 U.S.C. 78s(b)(3)(A)(iii).

[4] 17 CFR 240.19b–4(f)(6).

6.49A(c)(9) provides that no requests for quotes for transfer packages may be submitted to the floor later than 2:30 p.m. Because the request for quotes procedures described above provide that a request for quotes must be in proper form before the Exchange initiates it, the Exchange needs time to review the materials submitted to determine that the request is in proper form. However, if a request for quotes is submitted near the 1:00 p.m. cut-off time, the Exchange may not have sufficient time to conduct this review and complete its procedures to initiate the request for quotes by 1:00 p.m. to allow the full two-hour response time in accordance with Rule 6.49A. If the review cannot be completed by 1:00 p.m., then the Exchange President would need to approve initiation of the request for quotes that trading day, which could further delay the process. To ensure the Exchange has sufficient time to determine that a request for quotes submission is in proper form and to initiate the request for quotes, the Exchange proposes to amend Rule 6.49A(c)(9) to require that requests for quotes be submitted by 12:30 p.m.[5] (or two and one half hours prior to an early scheduled close). This proposed rule change provides the Exchange with sufficient time to complete its review and initiate requests for quotes to allow the full two-hour response time for the trading crowd to submit quotes in accordance with Rule 6.49A (without the potential delay of obtaining approval of the Exchange President)

2. Statutory Basis

The Exchange believes the proposed rule change is consistent with the Act and the rules and regulations thereunder applicable to the Exchange and, in particular, the requirements of Section 6(b) of the Act.[6] Specifically, the Exchange believes the proposed rule change is consistent with the Section 6(b)(5) [7] requirements that the rules of an exchange be designed to prevent fraudulent and manipulative acts and practices, to promote just and equitable principles of trade, to foster cooperation and coordination with persons engaged in regulating, clearing, settling, processing information with respect to, and facilitating transactions in securities, to remove impediments to and perfect the mechanism of a free and open market and a national market system, and, in general, to protect investors and the public interest. Additionally, the Exchange believes the proposed rule change is consistent with the Section 6(b)(5) [8] requirement that the rules of an exchange not be designed to permit unfair discrimination between customers, issuers, brokers, or dealers.

In particular, the Exchange believes that the proposed rule change will promote just and equitable principles of trade by ensuring that the Exchange has sufficient time to review submissions of requests for quotes to determine whether they are in proper form and complete its procedures to initiate a request for quotes. Additionally, the proposed rule change will protect investors because it will ensure this review is completed in time to provide the trading crowd with the full two-hour period during which it can submit quotes in accordance with Rule 6.49A (without the potential delay of obtaining approval of the Exchange President).

B. Self-Regulatory Organization's Statement on Burden on Competition

CBOE does not believe that the proposed rule change will impose any burden on competition that is not necessary or appropriate in furtherance of the purposes of the Act. The proposed rule change slightly modifies the cut-off time for submission of requests for quotes for on-floor position transfers to provide the Exchange with sufficient time to review the request for quotes and determine whether it is in proper form prior to the initiation of the request for response time. All submissions of requests for quotes will be subject to the same revised cut-off time. While the proposed rule change requires requests for quotes to be submitted to the Exchange earlier, any potential burden imposed by this earlier cut-off time is offset by the benefits of ensuring that requests for quotes are submitted in proper form and that the trading crowd receives the full two hour response time to submit quotes for the transfer package. To the extent the Exchange receives a submission after the revised cut-off time, the rule still permits the Exchange to accept it and begin the shortened request for quotes with approval of the President.

C. Self-Regulatory Organization's Statement on Comments on the Proposed Rule Change Received From Members, Participants, or Others

The Exchange neither solicited nor received comments on the proposed rule change.

III. Date of Effectiveness of the Proposed Rule Change and Timing for Commission Action

Because the foregoing proposed rule change does not:

A. Significantly affect the protection of investors or the public interest;

B. impose any significant burden on competition; and

C. become operative for 30 days from the date on which it was filed, or such shorter time as the Commission may designate, it has become effective pursuant to Section 19(b)(3)(A) of the Act [9] and Rule 19b–4(f)(6) [10] thereunder. At any time within 60 days of the filing of the proposed rule change, the Commission summarily may temporarily suspend such rule change if it appears to the Commission that such action is necessary or appropriate in the public interest, for the protection of investors, or otherwise in furtherance of the purposes of the Act. If the Commission takes such action, the Commission will institute proceedings to determine whether the proposed rule change should be approved or disapproved.

IV. Solicitation of Comments

Interested persons are invited to submit written data, views, and arguments concerning the foregoing, including whether the proposed rule change is consistent with the Act. Comments may be submitted by any of the following methods:

Electronic Comments

- Use the Commission's Internet comment form (*http://www.sec.gov/rules/sro.shtml*); or
- Send an email to *rule-comments@sec.gov.* Please include File Number SR–CBOE–2015–063 on the subject line.

Paper Comments

- Send paper comments in triplicate to Secretary, Securities and Exchange Commission, 100 F Street NE., Washington, DC 20549–1090.

All submissions should refer to File Number SR–CBOE–2015–063. This file number should be included on the subject line if email is used. To help the Commission process and review your comments more efficiently, please use only one method. The Commission will post all comments on the Commission's Internet Web site (*http://www.sec.gov/rules/sro.shtml*). Copies of the submission, all subsequent amendments, all written statements with respect to the proposed rule change that are filed with the

[5] The proposed rule change also adds corresponding cut-off times for submissions of requests for quotes to the Exchange for review, as well as the latest a request for quotes may be submitted to the floor, when the Exchange is scheduled to close early (such as trading days immediately preceding certain holidays).

[6] 15 U.S.C. 78f(b).

[7] 15 U.S.C. 78f(b)(5).

[8] *Id.*

[9] 15 U.S.C. 78s(b)(3)(A).

[10] 17 CFR 240.19b–4(f)(6).

Commission, and all written communications relating to the proposed rule change between the Commission and any person, other than those that may be withheld from the public in accordance with the provisions of 5 U.S.C. 552, will be available for Web site viewing and printing in the Commission's Public Reference Room, 100 F Street NE., Washington, DC 20549 on official business days between the hours of 10:00 a.m. and 3:00 p.m. Copies of such filing also will be available for inspection and copying at the principal office of the Exchange. All comments received will be posted without change; the Commission does not edit personal identifying information from submissions. You should submit only information that you wish to make available publicly. All submissions should refer to File Number SR–CBOE–2015–063, and should be submitted on or before August 3, 2015.

For the Commission, by the Division of Trading and Markets, pursuant to delegated authority.[11]

Brent J. Fields,

Secretary.

BILLING CODE 8011–01–P

SECURITIES AND EXCHANGE COMMISSION

[Release No. 34–75377; File No. SR–FINRA–2015–022]

Self-Regulatory Organizations; Financial Industry Regulatory Authority, Inc.; Notice of Filing of a Proposed Rule Change to Amend FINRA Rule 2210 (Communications with the Public)

July 7, 2015.

Pursuant to Section 19(b)(1) of the Securities Exchange Act of 1934 (''Act'')[1] and Rule 19b–4 thereunder,[2] notice is hereby given that on June 29, 2015, Financial Industry Regulatory Authority, Inc. (''FINRA'') filed with the Securities and Exchange Commission (''SEC'' or ''Commission'') the proposed rule change as described in Items I and II below, which Items have been prepared by FINRA. The Commission is publishing this notice to solicit comments on the proposed rule change from interested persons.

[11] 17 CFR 200.30–3(a)(12).

[1] 15 U.S.C. 78s(b)(1).

[2] 17 CFR 240.19b–4.

I. Self-Regulatory Organization's Statement of the Terms of Substance of the Proposed Rule Change

FINRA is proposing to amend FINRA Rule 2210 to require each of a member's Web sites to include a readily apparent reference and hyperlink to BrokerCheck on: (i) The initial Web page that the member intends to be viewed by retail investors; and (ii) any other Web page that includes a professional profile of one or more registered persons who conduct [sic] business with retail investors. These requirements would not apply to a member that does not provide products or services to retail investors, or to a directory or list of registered persons limited to names and contact information.

The text of the proposed rule change is available on FINRA's Web site at *http://www.finra.org,* at the principal office of FINRA and at the Commission's Public Reference Room.

II. Self-Regulatory Organization's Statement of the Purpose of, and Statutory Basis for, the Proposed Rule Change

In its filing with the Commission, FINRA included statements concerning the purpose of and basis for the proposed rule change and discussed any comments it received on the proposed rule change. The text of these statements may be examined at the places specified in Item IV below. FINRA has prepared summaries, set forth in sections A, B, and C below, of the most significant aspects of such statements.

A. Self-Regulatory Organization's Statement of the Purpose of, and Statutory Basis for, the Proposed Rule Change

1. Purpose

FINRA established BrokerCheck in 1988 (then known as the Public Disclosure Program) to provide the public with information on the professional background, business practices, and conduct of FINRA members and their associated persons. The information that FINRA releases to the public through BrokerCheck is derived from the Central Registration Depository (''CRD®''), the securities industry online registration and licensing database. FINRA members, their associated persons and regulators report information to the CRD system via the uniform registration forms. By making most of this information publicly available, BrokerCheck, among other things, helps investors make informed choices about the individuals and firms with which they conduct business.

In January 2013, FINRA filed with the SEC a proposed rule change to amend FINRA Rule 2267 (Investor Education and Protection)[3] to require all members to include a prominent description of and link to BrokerCheck on their Web sites, social media pages and any comparable Internet presence, as well as on the Web sites, social media pages and any comparable Internet presence relating to a member's investment banking or securities business maintained by or on behalf of any person associated with a member.[4] The proposed rule change was intended to increase investor awareness and use of BrokerCheck. The Commission received 24 comment letters in response to the proposed rule change. FINRA withdrew the filing to better understand commenters' concerns regarding the challenges of implementing the proposed rule change.

Many of the comments received on the 2013 proposed rule change expressed concern with the challenges of implementing the proposal with respect to social media pages, the lack of guidance with respect to terms and phrases in the proposed amendments, and the disadvantages of using a ''deep'' link to BrokerCheck summary reports that would bypass the BrokerCheck homepage.[5] Commenters suggested that the link to BrokerCheck be required initially for member Web sites, where its implementation would be relatively straightforward, and that the value of the link be assessed first in that context before expanding to third party sites.

In light of commenters' concerns, FINRA has developed a revised proposal that addresses member Web sites. Specifically, the revised proposal would amend FINRA Rule 2210 (Communications with the Public) to require each of a member's Web sites to include a readily apparent reference and hyperlink to BrokerCheck on: (i) The initial Web page that the member intends to be viewed by retail investors; and (ii) any other Web page that includes a professional profile of one or more registered persons who conduct

[3] Subject to limited exceptions, FINRA Rule 2267(a) requires members to provide annually in writing to each of their customers the BrokerCheck hotline number, the FINRA Web site address, and a notification of the availability of an investor brochure that describes BrokerCheck.

[4] *See* Securities Exchange Act Release No. 68700 (January 18, 2013), 78 FR 5542 (January 25, 2013) (Notice of Filing of SR–FINRA–2013–002). *See also infra* Item II.C. of the filing for further discussion of the 2013 filing and prior proposals.

[5] The SEC also received numerous comment letters that raised issues outside the scope of the proposed rule change to FINRA Rule 2267. These comment letters focused generally on concerns regarding the current operation and display of BrokerCheck reports.

[sic] business with retail investors. The proposal would not apply to a member that does not provide products or services to retail investors, or a directory or list of registered persons limited to names and contact information.

FINRA believes that the revised proposal addresses many of the commenters' concerns on the original proposal to amend Rule 2267. By incorporating the proposed rule change into the regulatory framework for communications with the public, the revised proposal would group the proposed requirement with other related standards that apply to member Web sites. By excluding those members that do not provide products and services to retail investors, the revised proposal is more aligned with its goal of increasing retail investor awareness and usage of BrokerCheck. FINRA also believes that the revised proposal should reduce the potential burden on members by clarifying that the requirement would not apply to directory pages limited to registered persons' names and contact information, since firms would not need to include as many links to BrokerCheck on their Web sites.

The revised proposal also responds to commenters' concerns with respect to communications on third-party sites that are not controlled by the member, such as social media sites, by limiting its application to Web sites of the member, rather than applying its requirements to third-party sites, such as social media sites, which the member does not control. The revised proposal also no longer requires a deep link to the BrokerCheck report of a member or registered person; instead, it would require a link to the BrokerCheck homepage.

FINRA will announce the implementation date of the proposed rule change in a *Regulatory Notice* to be published no later than 60 days following Commission approval. The effective date will be no later than 180 days following publication of the *Regulatory Notice* announcing Commission approval.

2. Statutory Basis

FINRA believes that the proposed rule change is consistent with the provisions of Section 15A(b)(6) of the Act,[6] which requires, among other things, that FINRA rules must be designed to prevent fraudulent and manipulative acts and practices, to promote just and equitable principles of trade, and, in general, to protect investors and the public interest. FINRA believes that the proposed rule change will help protect investors by making them aware of information available on BrokerCheck by requiring links to BrokerCheck on member Web sites.

B. Self-Regulatory Organization's Statement on Burden on Competition

FINRA does not believe that the proposed rule change will result in any burden on competition that is not necessary or appropriate in furtherance of the purposes of the Act. FINRA recognizes that the proposed rule change would impose burdens on members associated with implementing references and hyperlinks to BrokerCheck on their Web sites and to keep those references and hyperlinks current. However, FINRA believes that by limiting the application of the proposal only to a member's own Web sites, the revised proposal significantly reduces these implementation costs for members, while maintaining the proposal's investor protection goals.

FINRA has undertaken an economic impact assessment, as set forth below, to analyze the regulatory need for the proposed rulemaking, its potential economic impacts, including anticipated costs and benefits, and the alternatives FINRA considered in assessing how to best meet its regulatory objectives.

Economic Impact Assessment

A. Regulatory Need

BrokerCheck provides investors with information on the professional background, business practices, regulatory history, and conduct of members and their associated persons. Among other things, BrokerCheck helps investors make well-informed choices about the individuals and firms with which they conduct business. FINRA believes that the need for greater investor awareness and access to BrokerCheck continues to be important to protect investors. The proposed rule change will help increase investor awareness and make it easier for investors to find BrokerCheck by requiring references and hyperlinks to BrokerCheck on member Web sites.

B. Economic Impacts

(i) Anticipated Benefits

FINRA believes that BrokerCheck serves as a critical source of information for investors and considers BrokerCheck to be among the first resources they should turn to when choosing whether to do business with a particular firm or registered person. BrokerCheck enables investors to search for and download information on professional background and regulatory history of members and their registered persons, thereby reducing the direct and indirect costs associated with acquiring valuable information about the members and their registered persons (''search costs'').[7] As discussed above, the proposed rule will increase investor awareness and the likely usage of BrokerCheck. By making more investors aware of the information available on BrokerCheck, the proposed rule will make investors' searches for information about firms and registered persons more efficient and will help them make more informed decisions about whether to do business with a particular firm or registered person, thereby enhancing investor protection.

(ii) Anticipated Costs

The proposed rule change will impose costs on members that provide products and services to retail investors, which FINRA estimates to be approximately 3,800 members.[8] These members would incur costs associated with identifying the Web pages that would need to be updated based upon this proposed rule and determining where to place the references and hyperlinks within these Web pages, updating the required Web pages, as well as testing and deploying the updated Web site. In addition, these members would incur costs associated with maintaining the links on their Web pages and updating their policies and procedures to ensure ongoing compliance as their Web sites are updated or new Web pages are added over time. Members would have flexibility on how best to link to BrokerCheck, which is intended to

---

[6] 15 U.S.C. 78*o*–3(b)(6).

[7] Search costs encompass the time, energy and money expended by a consumer who is researching a product or service for purchase. *See, e.g.,* Meir G. Kohn & Steven Shavell, The Theory of Search, 9 Journal of Economic Theory 93 (1974); Simon P. Anderson & Regis Renault, Pricing, Product Diversity, and Search Costs: A Bertrand-Chamberlin-Diamond Model, 30, No. 4 The RAND Journal of Economics 719 (1999).

[8] FINRA's estimate is based on the types of business in which members are engaged (based on information provided in response to Question 12 on Form BD). FINRA identified businesses that are generally associated with products and services for retail investors and estimates that approximately 3,800 members are engaged in such retail-oriented businesses. FINRA notes that this estimate includes members engaged in private placements of securities. Form BD information identifies members engaged in private placements but does not distinguish between those who conduct private placement of securities with retail versus institutional investors as those terms are defined in Rule 2210. However, based on staff experience, FINRA believes that a significant portion of the members engaged in private placements provide products and services to retail investors. Nonetheless, FINRA notes that the estimates in this proposal could be overstated and serve as an upper-bound for the number of impacted members and the corresponding aggregate cost estimates, discussed below.

reduce costs by allowing members to choose the most cost-effective option.

Based on staff experience, FINRA estimates that on average the initial implementation costs for large members would be approximately $2,400 per member, and for mid-size and small members [9] the costs are estimated to be approximately $128 per member.

These estimates are based on FINRA's assumption that large members typically have full-featured Web sites that dynamically generate Web pages based on data and logic. The technology personnel at these members would be required to update the underlying information in order to automate the implementation of references and hyperlinks to BrokerCheck across all applicable Web pages. FINRA estimates that on average it would take large members approximately 60 hours of technology staffs' time to make the required updates, which at a $40 hourly rate would cost approximately $2,400 per firm.[10] FINRA assumes that mid-size and small members typically have less complex Web sites, which they manage and maintain with non-technical staff. These members would use personnel in non-technical roles to accomplish the required updates to their Web sites. FINRA estimates that on average it would take mid-size or small members approximately eight hours of non-technical staffs' time to make the required updates, which at a $16 hourly rate would cost approximately $128 per member.[11]

FINRA notes that costs associated with updating existing Web sites to include the required information will likely vary significantly across members depending on the scope and design of their Web sites, the extent to which the Web sites are automated (*e.g.,* include content management systems that dynamically generate Web pages) and the number of Web pages that include professional profiles of the applicable registered representatives. FINRA further estimates that there are approximately 175 large members and 3,625 mid-size and small members that provide products and services to retail investors and would be required to implement references and hyperlinks to BrokerCheck on their Web sites. Based on its average cost estimates for large, mid-size and small members, FINRA estimates that the total implementation costs associated with this rule proposal to the membership would be approximately $884,000.[12]

In addition to the initial implementation costs, members would also incur ongoing costs associated with maintaining the links on their Web pages and creating and maintaining procedures and internal controls to ensure that they remain compliant with the proposed rule. However, FINRA believes that the ongoing compliance costs associated with this rule proposal would likely be minimal because, apart from standard Web site upkeep, ''static'' BrokerCheck hyperlinks and references would require minimal (if any) additional maintenance on an ongoing basis.[13] FINRA will read with interest comments from members on the anticipated costs of compliance with the proposal.

C. Alternatives

In considering how to best meet its regulatory objectives, FINRA considered several alternatives to particular features of this proposal. For example, some commenters suggested that the goals of the rule could be attained more cost effectively if FINRA were to advertise BrokerCheck and its benefits to investors more aggressively. FINRA agrees that better recognition of the benefits of BrokerCheck will serve the investing public well and is considering additional ways in which to enhance awareness. FINRA believes that the proposed rule change serves as a well-calibrated effort to reduce investor search costs and to provide investors access to critical information as they make their decision regarding whether to engage in business with a particular firm or individual.

In developing this proposal, FINRA considered requiring members to include links to BrokerCheck on third-party Web sites, including social media sites. Several commenters expressed concerns about this requirement. As discussed in more detail below, commenters pointed out the limitations in their ability to control the content and features of third-party Web sites, and the significant costs associated with complying with such a requirement. FINRA recognizes the difficulties and costs associated with including links on third-party Web sites, and as a result FINRA has determined at this time to exclude the third-party Web site requirement and limit the application of the rule proposal to members' Web sites.

Finally, FINRA initially proposed that members would be required to include a deep link to BrokerCheck summary reports. These links would direct investors to the specific BrokerCheck page representing the collected information for an individual broker. Commenters noted the disadvantages of using a deep link that would bypass the BrokerCheck homepage, and speculated that there would be significant costs and operational challenges associated with including and tracking deep links. Based on these comments, FINRA has determined not to require the deep link in the proposed rule at this time.

C. Self-Regulatory Organization's Statement on Comments on the Proposed Rule Change Received from Members, Participants or Others

Background

In February 2012, FINRA published *Regulatory Notice* 12–10 seeking comment on a proposal regarding ways to facilitate and increase investor use of BrokerCheck information. A copy of the *Regulatory Notice* is attached as Exhibit 2a.[14] FINRA received 71 comment letters in response to *Regulatory Notice* 12–10. In January 2013, FINRA filed with the SEC SR–FINRA–2013–002, a proposed rule change to amend FINRA Rule 2267 to require that members include a prominent description of and link to BrokerCheck on their Web sites, social media pages and any comparable Internet presence and on Web sites, social media pages and any comparable Internet presence relating to a member's investment banking or securities

[9] Based on FINRA By-Laws, Article I (Definitions), members with 150 or fewer registered representatives are classified as small, members with 151 to 499 registered representatives are classified as mid-size, and members with 500 or more registered representatives are classified as large.

[10] The $40 per hour estimate is based on the high end of the compensation range for web application developers, reported on publicly available sources. For example, the total compensation, including salary, bonus and other benefits, reported for web applications developer on payscale.com ranges from $33,122 to $84,271, which on an hourly basis is approximately $16-$41 per hour. *See http://www.payscale.com/research/US/Job=Web_Developer/Salary* (accessed May 20, 2015).

[11] For the purpose of estimating costs for mid-size or small members, FINRA uses a $16 hourly rate, which corresponds to the low end of the compensation range for a web application developer, as discussed above.

[12] As discussed above, FINRA estimates that there are 175 large members that would be required to implement references and hyperlinks to BrokerCheck on their Web sites, and the implementation costs for these large firms would be approximately $2,400 per firm. Thus, the total implementation costs for these large members would be approximately $420,000 ($2,400 × 175). Similarly, the total implementation cost for the 3,625 mid-size and small members, based on a $128 per firm estimate, would be approximately $464,000 ($128 × 3,625). Hence, the total implementation cost across all members is anticipated to be about $884,000.

[13] Ongoing costs associated with maintaining hyperlinks could be significant if the underlying hyperlinks change regularly over time. However, considering that FINRA does not anticipate changing the BrokerCheck hyperlink, costs associated with maintaining such a link are anticipated to be minimal.

[14] The Commission notes that the Exhibits referred to herein (Exhibits 2a—2e) are attached to the filing, not to this Notice.

business maintained by or on behalf of any person associated with a member. A copy of the 2013 Notice of Filing is attached as Exhibit 2b. On January 25, 2013, the 2013 filing was published for comment in the **Federal Register**, and the SEC received 24 comment letters in response to the proposal. FINRA withdrew the filing on April 18, 2013 to assess and respond to commenters' concerns.

In light of concerns raised on the earlier proposals, in April 2014, FINRA published *Regulatory Notice* 14–19 (''*Notice* 14–19''), requesting comment on the rules as proposed therein (the ''*Notice* 14–19 proposal''). A copy of *Notice* 14–19 is attached as Exhibit 2c. The comment period expired on June 16, 2014. FINRA received 22 comments in response to *Notice* 14–19. A list of the commenters in response to *Notice* 14–19 is attached as Exhibit 2d, and copies of the comment letters received in response to *Notice* 14–19 are attached as Exhibit 2e.[15] A summary of the comments and FINRA's response is provided below.

The *Notice* 14–19 proposal would have required a member to include a readily apparent reference and hyperlink to BrokerCheck on each firm Web site that is available to retail investors. It also would have required a member to include a readily apparent reference and hyperlink to BrokerCheck in online retail communications with the public that include a professional profile of, or contact information for, an associated person.

The requirement to include a link to BrokerCheck where there is contact information or a professional profile of an associated person would have been subject to the following conditions:

- If the retail communication appeared on the member's Web site or any site that it hosted, the link would have had to appear in close proximity to the profile or contact information.
- If the retail communication appeared on a third-party Web site (such as a social media page) that permitted a hyperlink to another Web site, the member would have been required to either:
  - Post a hyperlink to BrokerCheck in close proximity to the profile or contact information; or
  - Post a hyperlink to the member's Web site, which included a readily apparent reference and hyperlink to BrokerCheck, in close proximity to the profile or contact information. The third-party Web site would have had to disclose that a hyperlink to BrokerCheck is available through the linked Web site.
- If the retail communication appeared on a third-party Web site that did not permit a hyperlink to another Web site, the member would have been required to provide the BrokerCheck web address (URL) in close proximity to the profile or contact information and, to the extent feasible, disclose that information concerning the associated person is available through BrokerCheck.

The proposal would have excepted from these requirements:

- Electronic mail and text messages;
- A retail communication that is posted on an online interactive forum (such as a message board, Twitter feed or chat room);
- A member that does not provide products or services to retail investors; and
- A directory or list of associated persons limited to names and contact information.

Seven commenters supported the proposal.[16] Six commenters opposed the proposal.[17] Eight commenters did not expressly support or oppose the proposal, but recommended changes to, or sought clarification of, the proposal.[18] One commenter expressed overall opposition to FINRA and to BrokerCheck in particular.[19]

Comments Supporting Proposal

Commenters supporting the proposal stated that the benefits of the proposal outweigh its potential costs, and that the proposal would increase investors' awareness of BrokerCheck. Four commenters[20] supported the proposal overall, but opposed the omission of the 2013 version's requirement to include a deep link to an associated person's BrokerCheck report. These commenters stated that investors would have difficulty searching for a particular broker's BrokerCheck report on the FINRA Web site without a deep link, particularly where a broker has a common name, such as John Smith. One commenter recognized the difficulty of including deep links on third-party sites, but suggested that FINRA at least require deep links from pages on a member's Web site that include a broker's contact or profile information.[21] One commenter suggested that FINRA inquire of its examination staff or, alternatively, poll members firms to ascertain and compare utilization rates of the different types of online communications occurring between a financial advisor and their clients and gear the requirements toward embedding links to BrokerCheck and deep links to individual financial advisors in those communications.[22]

Two commenters[23] opposed the exception for electronic mail. PIABA noted that including a link to BrokerCheck in an associated person's email signature block would not be burdensome. PIABA also recommended that the proposal require a BrokerCheck description and hyperlink be placed in printed customer account statements. PIABA further recommended changes to BrokerCheck itself to increase the information available to investors.

Comments Opposing the Proposal

Six commenters opposed the proposal. All cited the potential compliance burdens associated with this proposed rule change as a principal reason not to adopt it, particularly the burdens it would impose on small members. Two commenters strongly opposed the proposal because they believe BrokerCheck presents a biased and unfavorable view of securities firms and their personnel.[24]

Many questioned the potential benefits the proposal would offer to investors, noting that investors may already search for information about members and their representatives, such as through Google or the FINRA Web site.[25] One commenter also noted that the proposal will require a small firm compliance officer to divert resources from servicing client accounts and instead use them to achieve compliance with a rule that offers little public benefits.[26]

Comments Recommending Changes to or Clarifications of the Proposal

A number of commenters expressed concerns with requirements to include links and disclosures on third-party Web sites not controlled by a member.[27] Commenters noted that members do not control the content, appearance, or features of third-party sites, and thus are dependent on these sites in terms of complying with the rule proposal.

Commenters pointed out that the proposal appears to be based on technology and social media site rules as they appear today, without taking into account future changes. For example, commenters stated the rules fail to explain a member's responsibilities if a third-party site revised its rules and no longer allowed links to other Web sites. These commenters also argued that the proposal inadequately addressed limits imposed by third-party sites. For example, although Twitter allows a single link to another site, its Profile section limits the user to 160 characters, hardly enough to include either a link to BrokerCheck, or a link to a member's Web site plus the additional disclosure required by the rule proposal. In addition, the requirement would preclude a member from including any other content in the Profile section.

SIFMA recommended that FINRA alter its proposal to make it more principles-based with respect to requirements applicable to third-party sites. SIFMA suggested that the rule be revised to use ''should, to the extent reasonable'' or similar language regarding third-party site linking and disclosure obligations instead of ''must.'' Wells Fargo recommended that the proposal should relieve members of its requirements if a third-party site cannot accommodate a firm's request to include the required link or disclosures.

Commenters requested that FINRA clarify that the rule proposal does not apply to either: (i) Search-engine based, text-only advertising (such as advertisements generated by Google or Bing); or (ii) other ''static'' web-based advertising that contains general references to the services provided by an associated person and includes a link to the person's profile page.[28] One commenter also requested that the proposal expressly exclude certain types of online retail communications, such as interviews, articles, reprints, award listings, biographies, sponsorships, press releases, radio replays, and advertisements that include associated persons' profiles or contact information.[29]

Commenters also urged FINRA to clarify when a member would be deemed to have ''adopted'' or become ''entangled'' with a third-party Web site, thus making it responsible for including a link to BrokerCheck on the site.[30] One commenter recommended that FINRA make clear in the rule language that it does not apply to a third-party site that a member has not adopted or become entangled with.[31]

Commenters requested that FINRA clarify the extent to which a member must include a BrokerCheck link on its own Web site.[32] For example, does a member have to include a link on each Web page of the firm's Web site, or only once on its homepage? Also, what if a member has contact information or profiles of multiple representatives on a single Web page? Does the member have to include multiple links to BrokerCheck, or may it only include one such link?

The ICI recommended that FINRA provide members with flexibility as to where on a firm's Web site a link to BrokerCheck must appear. For example, a member should be allowed to include the link on a Web page that the member reasonably determines will draw the attention of retail investors. SIFMA and the ICI also requested that FINRA clarify that members may use ''buffer'' screens that inform a user that they are leaving the firm's Web site before the user lands on the BrokerCheck Web site.

Given that FINRA includes a link to BrokerCheck on its own Web site, one member asked whether a link to the FINRA Web site would meet the rule's requirements.[33] This commenter noted that, if so, the rule proposal appears to be redundant, given that FINRA Rule 2210(e)(3) already requires members that indicate FINRA membership to include a link to FINRA's Web site.

Two commenters recommended that the proposal only apply to Web pages that provide contact or profile information for registered representatives, rather than all associated persons.[34]

SIFMA and Wells Fargo requested that the exception for directories be clarified. First, SIFMA sought clarification that including a link to an associated person's profile page in a directory would not trigger the requirements to include a link to and description of BrokerCheck. Second, they urged FINRA to allow more information in directories without requiring a BrokerCheck link, such as general biographical information and areas of expertise.

The ICI and SIFMA recommended that FINRA expand the exception for email and text messages to include other similar forms of messaging. This expansion would take into account future technological changes to electronic messaging.

SIFMA requested clarification that the rule proposal would not apply to mobile device ''apps'' or other web-based applications (such as trading platforms or OES) that provide customers with access to their accounts and other member-provided information and capabilities. SIFMA also requested that FINRA include a safe harbor for broken links that allow members time to correct any links that subsequently fail.

Commenters agreed with the revision to the prior proposal that eliminated the requirement to include a deep link to a member's or associated person's BrokerCheck report.[35] Commenters noted that the costs of including and tracking deep links in member and third-party Web sites would have been significant and operationally unfeasible.

Commenters reiterated opponents' views that the proposal would impose significant costs and burdens on members.[36] These costs include requiring members to create and implement new written policies and procedures, and performing ongoing surveillance of firm and associated persons' Web sites to ensure compliance with the rule proposal. One member noted that it has approved roughly 1,000 LinkedIn profiles, and that in order to achieve compliance with the rule, the firm would have to incur 700 employee hours (or nearly 17 weeks of a full-time employee's time).[37]

Commenters recommended that the Chief Economist's office perform a cost-benefit analysis of the rule proposal to ensure that its benefits will exceed its costs before FINRA proceeds with the proposal. Other commenters urged that, if FINRA adopts the rule proposal, members be given at least six months to implement any required changes.[38]

Commenters also recommended that FINRA explore alternatives to requiring links to BrokerCheck as a means to increase investor knowledge and usage of the site.[39] For example, FINRA could pursue its own investor outreach program, or encourage state securities regulators to include links to BrokerCheck on their Web sites. FINRA could make the references to BrokerCheck on its own Web site more prominent and user-friendly, and improve the visual quality and clarity of BrokerCheck summary reports. FINRA could also target focus groups in order to identify possible alternative means of

facilitating and increasing investor use of BrokerCheck.

General Comments

One commenter strongly criticized FINRA's commitment to protect investors. The commenter noted that the proposal would do little good because, in this commenter's view, it would merely present ''expunged backgrounds and brokercheck historys [sic] that are, too often, fairytales.'' [40]

Response to Comments

As discussed above, many of the comments either opposing the proposal in full, or recommending changes to the proposal, concerned requirements in the *Notice* 14–19 proposal that would have required members to include links to BrokerCheck on third-party Web sites, such as social media sites. FINRA believes it has addressed these concerns by revising the current proposal to limit its applicability to a member's own Web site. FINRA however will further consider the commenters' concerns regarding links on third-party Web sites and determine whether to pursue separate rulemaking addressing such links.

Under the current version, each of a member's Web sites must include a readily apparent reference and link to BrokerCheck on: (i) The initial Web page that the member intends to be viewed by retail investors; and (ii) any other Web page that includes a professional profile of one or more registered persons who conduct [sic] business with retail investors. The current version provides exceptions from these requirements for: (i) A member that does not provide products or services to retail investors; and (ii) a directory or list of registered persons limited to names and contact information. The current version would not require a member to include a link to BrokerCheck from any third-party Web site, such as a social media site.

FINRA does not agree that it is necessary at this time to reinstate a requirement to include a deep link to a member's or a registered person's BrokerCheck report. A deep link requirement could potentially increase Web site maintenance costs, and FINRA is not proposing to require such links at this time. Most investors should be able to find information concerning particular members or registered representatives without difficulty given the ease of operation of the BrokerCheck search feature.

FINRA also does not believe it is necessary or appropriate to require links to BrokerCheck on each email sent by a member or registered person. FINRA believes that such a requirement would be overly burdensome and require significant system changes, without commensurate benefit. However, FINRA has removed the express exception for emails and text messages as unnecessary, since the proposal by its terms only applies to a member's own Web site. For the same reason, FINRA has removed the prior exception for retail communications posted on online interactive forums.

FINRA does not agree with comments that BrokerCheck presents a biased and unfavorable view of securities firms and their personnel, or that it omits important information to which investors should have access. FINRA has carefully considered the need to provide investors with information necessary to make informed choices about the individuals and members with which they conduct business. Moreover, FINRA is required by statute to establish and maintain a system for collecting and retaining registration information, including disciplinary actions, regulatory, judicial and arbitration proceedings, and other information required by law, or exchange or association rule, and the source and status of such information.[41] FINRA believes that it is important that investors have access to this information to help them make informed decisions when selecting a broker-dealer or registered person with whom to do business. FINRA regularly assesses the BrokerCheck program and may consider the inclusion of additional information in BrokerCheck at a later time.

FINRA does not agree that the proposal should allow more information in directories of registered persons without requiring a BrokerCheck link, such as biographical information or areas of expertise. This kind of information is precisely the content that should trigger a link to BrokerCheck, since its intent is to generate investor interest in a particular registered representative.

FINRA believes it has answered commenters' questions concerning the scope of the proposed link requirements. In this regard, a member is required to include a link to BrokerCheck only on Web pages that are either the initial page that the member intends to be viewed by retail investors, or pages that include profile information about registered persons that conduct business with retail investors. Links are not required on every Web page of a member's Web site. If a Web page includes profile information about multiple registered persons, only one link to BrokerCheck is required. In response to comments received to the *Notice* 14–19 proposal, FINRA has revised the rule as proposed in *Notice* 14–19 to require a link to BrokerCheck on Web pages that provide profile information about registered persons, rather than Web pages that provide profile information about any associated person. Members also may use ''buffer'' screens or interstitial exiting site pages to inform investors that they are leaving the member Web site prior to connecting to BrokerCheck, although there is no requirement to do so.

In addition, members have flexibility on how best to link to BrokerCheck, as long as the reference and link to BrokerCheck are readily apparent. For example, members have expressed interest in using ''widgets'' as a way to link to BrokerCheck. Use of widgets would meet to [sic] the proposal's requirements, as long as the link and reference to BrokerCheck are readily apparent.

FINRA does not agree that the proposal is redundant given that FINRA includes a link to BrokerCheck on the FINRA Web site. FINRA believes that the proposal will increase awareness of BrokerCheck and believes that more investors will use BrokerCheck after it is implemented.

FINRA also does not believe it is necessary or appropriate to create an exception from the proposal for mobile device applications. To the extent that a web-based application merely provides access to a customer's account information and does not contain profile information about a registered representative that conducts business with retail investors, the proposed requirements would not apply. However, if a customer uses his or her mobile device to access a Web page that contains profile information about a registered representative that conducts business with retail investors, FINRA believes it is important for the customer to be made aware of BrokerCheck, irrespective of whether the investor used a mobile device or a desktop or laptop computer to view such a Web page.

FINRA has considered the potential costs and benefits of the *Notice* 14–19 proposal and, accordingly, revised the proposal to reduce its potential costs while maintaining the proposal's investor protection goals. FINRA also has proposed to allow members at least six months to comply with the proposed rule change. FINRA appreciates the suggestions to explore alternatives to increase investor knowledge and usage

[40] *See* Carrie Devorah.

[41] *See* 15 U.S.C. 78*o*–3(i).

of BrokerCheck. While such suggestions are beyond the scope of this proposal, FINRA intends to continue to consider ways to increase investor knowledge and usage of BrokerCheck.

III. Date of Effectiveness of the Proposed Rule Change and Timing for Commission Action

Within 45 days of the date of publication of this notice in the **Federal Register** or within such longer period up to 90 days (i) as the Commission may designate if it finds such longer period to be appropriate and publishes its reasons for so finding or (ii) as to which the self-regulatory organization consents, the Commission will:

A. by order approve or disapprove such proposed rule change, or

B. institute proceedings to determine whether the proposed rule change should be disapproved.

IV. Solicitation of Comments

Interested persons are invited to submit written data, views, and arguments concerning the foregoing, including whether the proposed rule change is consistent with the Act. Comments may be submitted by any of the following methods:

Electronic Comments

• Use the Commission's Internet comment form (*http://www.sec.gov/rules/sro.shtml);* or

• Send an email to *rule-comments@sec.gov. Please include File Number SR–FINRA–2015–022 on the subject line.*

Paper Comments

• Send paper comments in triplicate to Secretary, Securities and Exchange Commission, 100 F Street, NE., Washington, DC 20549–1090.

All submissions should refer to File Number *SR–FINRA–2015–022.* This file number should be included on the subject line if email is used. To help the Commission process and review your comments more efficiently, please use only one method. The Commission will post all comments on the Commission's Internet Web site (*http://www.sec.gov/rules/sro.shtml).* Copies of the submission, all subsequent amendments, all written statements with respect to the proposed rule change that are filed with the Commission, and all written communications relating to the proposed rule change between the Commission and any person, other than those that may be withheld from the public in accordance with the provisions of 5 U.S.C. 552, will be available for Web site viewing and printing in the Commission's Public Reference Room, 100 F Street, NE., Washington, DC 20549, on official business days between the hours of 10:00 a.m. and 3:00 p.m. Copies of the filing also will be available for inspection and copying at the principal office of FINRA. All comments received will be posted without change; the Commission does not edit personal identifying information from submissions. You should submit only information that you wish to make available publicly. All submissions should refer to File Number SR–FINRA–2015–022 and should be submitted on or before August 3, 2015.

For the Commission, by the Division of Trading and Markets, pursuant to delegated authority.[42]

Brent J. Fields,

Secretary.

SECURITIES AND EXCHANGE COMMISSION

[Release No. 34–75375; File No. SR–NASDAQ–2015–066]

Self-Regulatory Organizations; The NASDAQ Stock Market LLC; Notice of Filing and Immediate Effectiveness of Proposed Rule Change to Amend the Definition of Designated Retail Order in Nasdaq Rule 7018

July 7, 2015.

Pursuant to Section 19(b)(1) of the Securities Exchange Act of 1934 (''Act''),[1] and Rule 19b–4 thereunder,[2] notice is hereby given that on June 24, 2015, The NASDAQ Stock Market LLC (''Nasdaq'' or the ''Exchange'') filed with the Securities and Exchange Commission (''Commission'') the proposed rule change as described in in Items I and II below, which Items have been prepared by Nasdaq. The Commission is publishing this notice to solicit comments on the proposed rule change from interested persons.

I. Self-Regulatory Organization's Statement of the Terms of Substance of the Proposed Rule Change

Nasdaq proposes to amend the definition of ''Designated Retail Order'' in Nasdaq Rule 7018.

The text of the proposed rule change is available at *http://nasdaq.cchwallstreet.com/,* at Nasdaq's principal office, and at the Commission's Public Reference Room.

[1] 15 U.S.C. 78s(b)(1).

[2] 17 CFR 240.19b–4.

II. Self-Regulatory Organization's Statement of the Purpose of, and Statutory Basis for, the Proposed Rule Change

In its filing with the Commission, Nasdaq included statements concerning the purpose of, and basis for, the proposed rule change. The text of these statements may be examined at the places specified in Item IV below, and is set forth in Sections A, B, and C below.

A. Self-Regulatory Organization's Statement of the Purpose of, and Statutory Basis for, the Proposed Rule Change

1. Purpose

The Exchange proposes to amend the definition of ''Designated Retail Order'' (''DRO'') in Nasdaq Rule 7018 in order to clarify it and make it more consistent with the definition of ''Retail Order'' as previously set forth in Nasdaq Rule 4780(a)(2) (eliminated by the recently approved SR–NASDAQ–2015–024), BATS Y-Exchange, Inc. (''BATS'') Rule 11.24(a)(2) [3] and NYSE Arca, Inc. (''NYSE Arca'') Rule 7.44(a)(3) [4], as well as how it is defined in within the BATS Retail Member Organization Application Form (''BATS Form'').[5] The Exchange will also update its Designated Retail Order Attestation form [6] (''Attestation Form'') to be consistent with the proposed rule change. Pursuant to previous approvals, any and all members are required to submit a retail order attestation form to the specific exchange before submitting a retail order to that exchange.[7]

As mentioned above, the proposed changes to the DRO definition in Nasdaq Rule 7018, as well as the corresponding changes to Nasdaq's Attestation Form, will be consistent with the recently eliminated Nasdaq Rule 4780 and in line with the revisions made by BATS to the BATS Form. Specifically, BATS updated its BATS Form to include three key elements: [8] (1) To ensure that the order is a riskless principal order that meets the criteria of

[8] *Supra* note 5.

FINRA Rule 5320.03;[9] (2) to state that an order from a ''natural person'' can include orders on behalf of accounts that are held in a corporate legal form, such as an Individual Retirement Account (''IRA''), Corporation, or a Limited Liability Company (''LLC'') that has been established for the benefit of an individual or group of related family members, provided that the order is submitted by an individual; and (3) to include the standard that members have implemented policies and procedures that are reasonably designed to ensure that ''substantially all'' orders (rather than the previous standard that ''every order'') that are designated by the member as retail orders comply with these requirements. Nasdaq believes that inclusion in the DRO definition of an individual making the decision even if the account is held in corporate legal form qualifies as a ''non-controversial'' rule change under Rule 19b–4(f)(6) and is not a significant change from existing rules on other exchanges.

Consequently, Nasdaq will amend Nasdaq Rule 7018 to reflect the changes to the definition of DRO discussed above and amend its Attestation Form accordingly.

2. Statutory Basis

Nasdaq believes that its proposal is consistent with the requirements of the Act and the rules and regulations thereunder that are applicable to a national securities exchange, and, in particular, with the requirements of Section 6(b) of the Act.[10] In particular, the Exchange believes the proposed change furthers the objectives of Section 6(b)(5) of the Act,[11] in that it is designed to prevent fraudulent and manipulative acts and practices, to promote just and equitable principles of trade, to foster cooperation and coordination with persons engaged in facilitating transactions in securities, and to remove impediments to and perfect the mechanism of a free and open market and a national market system.

The Exchange also believes that the proposed rule change to amend and clarify the definition of DRO in Nasdaq Rule 7018 is consistent with these principles because it would remove impediments to and perfects the mechanism of a free and open market and a national market system, as well as increases competition among execution venues and encourages additional liquidity. Specifically, the amended DRO definition is consistent with Nasdaq Rule 4780(a)(2) (eliminated by the recently approved SR–NASDAQ–2015–024), NYSE Arca Rule 7.44(a)(3) and BATS Rule 11.24(a)(2), and as defined in the BATS Form.[12] As BATS has done with its BATS Form, the Exchange's proposed rule change amending the DRO definition will be more inclusive and benefits the individual investor who places his or her money into accounts that are held in a corporate legal form (*e.g.,* an IRA, Corporation, or an LLC that has been established for the benefit of an individual or group of related family members), provided that the order has been submitted by an individual. As a result, the price discovery is enhanced as more retail investors will have the opportunity to avail themselves of DROs. Under the current rule and attestation, only a small segment of the retail market is included. The proposed rule change widens the net and affords more retail investors and their broker-dealers that route these orders greater opportunities.

Further, although the change from ''every order'' to ''substantially all orders'' slightly reduces the monitoring risk placed on broker-dealers, the Exchange believes that this slightly lower burden will encourage and provide reasonable incentives for retail-focused broker-dealers to route retail orders to the Exchange for the benefit of the price discovery process and for all market participants with enhanced retail liquidity and trading opportunities.

The Exchange believes that the amended DRO definition increases competition among execution venues and encourages additional liquidity by incentivizing more DROs to be routed to the Exchange, which will bring additional liquidity onto the Exchange. Additionally, the proposed rule change will improve the markets and create a more competitive environment, as well as bring more order flow, which, in turn, enhances the price discovery process on the Exchange. The Exchange believes that the transparency and competitiveness of the proposed rule change will result in better prices for retail investors.

The Exchange also believes that the proposed rule change is consistent with these principles in that it creates a financial incentive to bring more than just retail order flow from individual or joint ownership accounts to the public market. The proposed rule change also encourages retail order flow that is in other forms of account registration employed by retail investors (as is the case with an IRA), which broadens it beyond just basic retail order flow. It also includes order flow from members that use other forms of account registration for tax reasons, retirement or pension savings, for families and other related retail investors.

Nasdaq also believes that the proposed rule change to the definition of DRO in Nasdaq Rule 7018 qualifies as a ''non-controversial'' rule change under Rule 19b-4(f)(6) because it is not novel and serves to put the Exchange on equal footing with BATS. It simply recognizes that an order from a ''natural person'' may include orders based on an individual making the decision (rather than an algorithm), even if the account is held in an IRA, Corporation, or an LLC that has been established for the benefit of an individual or group of related family members. Nasdaq further believes that inclusion in the DRO definition of an individual making the decision even if the account is held in corporate legal form qualifies as a ''non-controversial'' rule change under Rule 19b–4(f)(6) and is not a significant change from existing rules on other exchanges. The Exchange believes that this proposed rule change and the proposed rule change to modify the standard that members have implemented policies and procedures that are reasonably designed to ensure that ''substantially all'' rather than ''every'' order are minor enough changes to qualify the filing as non-controversial, which is consistent with previous approvals.

For the above reasons, Nasdaq believes the proposed rule change is consistent with the requirements of Section 6(b)(5) of the Act.[13]

B. Self-Regulatory Organization's Statement on Burden on Competition

The Exchange does not believe that the proposed rule change will result in any burden on competition that is not necessary or appropriate in furtherance of the purposes of the Act. The Exchange believes that competition improves by incentivizing more DROs to be routed to the Exchange, which will bring additional liquidity onto the Exchange as well. The definition of DRO, as amended, will improve the markets and create a more competitive environment, as well as bring more order flow and, therefore, more market makers onto the Exchange to provide liquidity and compete with robust competitive markets.

C. Self-Regulatory Organization's Statement on Comments on the Proposed Rule Change Received from Members, Participants, or Others

Written comments were neither solicited nor received.

III. Date of Effectiveness of the Proposed Rule Change and Timing for Commission Action

Because the foregoing proposed rule change does not: (i) significantly affect the protection of investors or the public interest; (ii) impose any significant burden on competition; and (iii) become operative for 30 days from the date on which it was filed, or such shorter time as the Commission may designate, it has become effective pursuant to Section 19(b)(3)(A)(ii) of the Act [14] and subparagraph (f)(6) of Rule 19b–4 thereunder.[15]

At any time within 60 days of the filing of the proposed rule change, the Commission summarily may temporarily suspend such rule change if it appears to the Commission that such action is: (i) necessary or appropriate in the public interest; (ii) for the protection of investors; or (iii) otherwise in furtherance of the purposes of the Act. If the Commission takes such action, the Commission shall institute proceedings to determine whether the proposed rule should be approved or disapproved. The Exchange has provided the Commission written notice of its intent to file the proposed rule change, along with a brief description and text of the proposed rule change, at least five business days prior to the date of filing of the proposed rule change.

IV. Solicitation of Comments

Interested persons are invited to submit written data, views, and arguments concerning the foregoing, including whether the proposed rule change is consistent with the Act. Comments may be submitted by any of the following methods:

Electronic Comments

- Use the Commission's Internet comment form (*http://www.sec.gov/rules/sro.shtml*); or
- Send an email to *rule-comments@sec.gov.* Please include File Number SR–NASDAQ–2015–066 on the subject line.

Paper Comments

- Send paper comments in triplicate to Secretary, Securities and Exchange Commission, Station Place, 100 F Street NE., Washington, DC 20549–1090.

All submissions should refer to File Number SR–NASDAQ–2015–066. This file number should be included on the subject line if email is used. To help the Commission process and review your comments more efficiently, please use only one method. The Commission will post all comments on the Commission's Internet Web site *http://www.sec.gov/rules/sro.shtml.*

Copies of the submission, all subsequent amendments, all written statements with respect to the proposed rule change that are filed with the Commission, and all written communications relating to the proposed rule change between the Commission and any person, other than those that may be withheld from the public in accordance with the provisions of 5 U.S.C. 552, will be available for Web site viewing and printing in the Commission's Public Reference Room, 100 F Street, NE., Washington, DC 20549, on official business days between the hours of 10:00 a.m. and 3:00 p.m. Copies of the filing also will be available for inspection and copying at the principal office of Nasdaq. All comments received will be posted without change; the Commission does not edit personal identifying information from submissions. You should submit only information that you wish to make available publicly.

All submissions should refer to File Number SR–NASDAQ–2015–066 and should be submitted on or before August 3, 2015.

For the Commission, by the Division of Trading and Markets, pursuant to delegated authority.[16]

Brent J. Fields,

Secretary.

SECURITIES AND EXCHANGE COMMISSION

[Release No. 34–75374; File No. SR–BOX–2015–22]

Self-Regulatory Organizations; BOX Options Exchange LLC; Notice of Filing of Proposed Rule Change to Implement the Governance Provisions of an Equity Rights Program

July 7, 2015.

Pursuant to Section 19(b)(1) of the Securities Exchange Act of 1934 (the ''Act'') [1] and Rule 19b-4 thereunder,[2] notice is hereby given that, on June 25, 2015, BOX Options Exchange LLC (the ''Exchange'') filed with the Securities and Exchange Commission (the ''Commission'') the proposed rule change as described in Items I, II, and III below, which Items have been prepared by the self-regulatory organization. The Commission is publishing this notice to solicit comments on the proposed rule change from interested persons.

I. Self-Regulatory Organization's Statement of the Terms of the Substance of the Proposed Rule Change

The Exchange proposes to implement the governance provisions of an equity rights program (the ''VPR Program''). Upon Commission approval of the proposed rule change, BOX Holdings Group LLC (''Holdings''), an affiliate of the Exchange and direct parent entity of BOX Market LLC, a facility of the Exchange (''BOX''), proposes to amend the existing Limited Liability Company Agreement of Holdings (the ''Holdings LLC Agreement'') by adopting an Amended and Restated Limited Liability Company Agreement of Holdings (the ''Restated Holdings LLC Agreement''). There are no other proposed changes to any rule text. The text of the proposed rule change is available from the principal office of the Exchange, at the Commission's Public Reference Room and also on the Exchange's Internet Web site at *http://boxexchange.com.*

II. Self-Regulatory Organization's Statement of the Purpose of, and Statutory Basis for, the Proposed Rule Change

In its filing with the Commission, the self-regulatory organization included statements concerning the purpose of, and basis for, the proposed rule change and discussed any comments it received on the proposed rule change. The text of these statements may be examined at

[1] 15 U.S.C. 78s(b)(1).

[2] 17 CFR 240.19b–4.

the places specified in Item IV below. The self-regulatory organization has prepared summaries, set forth in Sections A, B, and C below, of the most significant aspects of such statements.

A. Self-Regulatory Organization's Statement of the Purpose of, and Statutory Basis for, the Proposed Rule Change

1. Purpose

The Exchange proposes to implement the governance provisions of the VPR Program, in which certain BOX Options Participants (each, a ''Participant'') elected to participate. The Exchange notified all of its Participants of the opportunity to participate in the VPR Program by Regulatory Circular published on October 1, 2014. All Participants that indicated interest in participating in the VPR Program by October 31, 2014 and that subscribed to the VPR Program by January 14, 2015 were permitted to participate in the VPR Program.

The purpose of this rule filing is, subject to Commission approval, to fulfill a condition to providing Subscribers the full benefits intended through the VPR Program by permitting Holdings to amend the Holdings LLC Agreement by adopting the Restated Holdings LLC Agreement.

Background

In order to implement the VPR Program, the Exchange has already submitted a proposed rule change under Section 19(b)(3)(A)(ii) of the Securities Exchange Act of 1934 (the ''Act'') [3] and Rule 19b–4(f)(2) thereunder,[4] for immediate effectiveness, inasmuch as it establishes or changes a due, fee, or other charge imposed by the Exchange.[5] In addition, the Exchange is submitting this proposed rule change under Section 19(b)(1) of the Act [6] and Rule 19b–4 thereunder,[7] subject to Commission approval, to make changes to its company governance documents to accommodate aspects of the VPR Program that involve or affect the Restated Holdings LLC Agreement of Holdings.

Participants that elected to participate in the VPR Program have the right to acquire equity in and receive distributions from Holdings, in exchange for the achievement of certain order flow volume commitment thresholds on the Exchange over a period of five (5) years and a nominal initial cash payment. The purpose of the VPR Program is to promote the long-term interests of the Exchange by incentivizing Participants to contribute to the growth and success of BOX by providing enhanced levels of trading volume to BOX.

Upon initiation of the VPR Program by Holdings, Participants that elected to participate in the VPR Program, met the eligibility criteria and made the initial cash payment (''Subscribers''), were issued Volume Performance Rights (''VPRs'') in tranches of twenty (20) VPRs (each, a ''Tranche'') with a minimum subscription of two (2)Tranches per Subscriber. Twenty-seven (27) Tranches have been issued in connection with the VPR Program.

Each VPR is comprised of the right to receive 8.5 unvested new Class C Membership Units of Holdings (''Class C Units''), upon effectiveness of this rule filing, and an average daily transaction volume commitment (''VPR Volume Commitment'') equal to 0.0055% of Industry ADV, as measured in Qualifying Contract Equivalents, for a total of five (5) years (twenty (20) consecutive measurement quarters).[8] The VPR Volume Commitment, in terms of total contracts, will change based on the movement of the Industry ADV. One VPR per Tranche will be eligible to vest each quarter of the five (5) year Program period, subject to the Subscriber meeting its volume commitment for that quarter. In addition, VPRs may be reallocated among Subscribers based upon exceeding or failing to meet Subscribers' volume commitments during the VPR Program period.

Ownership Units

As discussed above, each VPR held by a Subscriber includes the right to receive 8.5 Class C Units of Holdings within ten (10) business days after effectiveness of this rule filing and the completion or waiver of the conditions to closing. Currently, Holdings has issued and outstanding Class A and Class B membership units. Class C Units will be created by the adoption of the Restated Holdings LLC Agreement and, at such time, Holdings will admit the Subscribers as Class C Members. Class C Units may be held in fractional numbers equal to one half Unit. Units may, but need not be, represented by physical certificates. The Restated Holdings LLC Agreement provides for the maintenance of capital accounts and other accounting and tax provisions relating to the Class C Units.

The existing limitations on the percentage ownership of Holdings by Participants will continue to apply. In the event that a Member, or any Related Person [9] of a Member, is a Participant pursuant to the Exchange Rules, and the Member owns more than 20% of the Units, alone or together with any

[6] 15 U.S.C. 78s(b)(1).

[7] 17 CFR 240.19b–4.

[8] The measurement of order flow for purposes of the VPR Program first began on January 12, 2015, the first trading day after the first Subscribers subscribed to the VPR Program. However, BOX extended the deadline to accommodate Subscribers; therefore, the first measurement date began later for a Subscriber that submitted the required documents and payment during the extension period. *See* Securities Exchange Act Release No. 74171 (January 29, 2015), 80 FR 6153 (February 4, 2015) (Notice of Filing and Immediate Effectiveness of a Proposed Rule Change To Extend the Deadline for the VPR Program to January 14, 2015).

[9] ''Related Person'' means with respect to any Person: (A) any Affiliate of the Person; (B) any other Person with which the first Person has any agreement, arrangement or understanding (whether or not in writing) to act together for the purpose of acquiring, voting, holding or disposing of Units; (C) in the case of a Person that is a company, corporation or similar entity, any executive officer (as defined under Rule 3b-7 under the Exchange Act) or director of the Person and, in the case of a Person that is a partnership or limited liability company, any general partner, managing member or manager of the Person, as applicable; (D) in the case of any BOX Options Participant who is at the same time a broker-dealer, any Person that is associated with the BOX Options Participant (as determined using the definition of ''person associated with a member'' as defined under Section 3(a)(21) of the Exchange Act); (E) in the case of a Person that is a natural person and a BOX Options Participant, any broker or dealer that is also a BOX Options Participant with which the Person is associated; (F) in the case of a Person that is a natural person, any relative or spouse of the Person, or any relative of the spouse who has the same home as the Person or who is a director or officer of the Exchange or any of its parents or subsidiaries; (G) in the case of a Person that is an executive officer (as defined under Rule 3b-7 under the Exchange Act) or a director of a company, corporation or similar entity, the company, corporation or entity, as applicable; and (H) in the case of a Person that is a general partner, managing member or manager of a partnership or limited liability company, the partnership or limited liability company, as applicable. ''Affiliate'' means, with respect to any Person, any other Person controlling, controlled by or under common control with, the Person. As used in this definition, the term ''control'' means the possession, directly or indirectly, of the power to direct or cause the direction of the management and policies of a Person, whether through the ownership of voting securities, by contract or otherwise with respect to the Person. A Person is presumed to control any other Person, if that Person: (i) is a director, general partner, or officer exercising executive responsibility (or having similar status or performing similar functions); (ii) directly or indirectly has the right to vote 25 percent or more of a class of voting security or has the power to sell or direct the sale of 25 percent or more of a class of voting securities of the Person; or (iii) in the case of a partnership, has contributed, or has the right to receive upon dissolution, 25 percent or more of the capital of the partnership. See proposed Restated Holdings LLC Agreement Section 1.1.

Related Person of the Member (Units owned in excess of 20% being referred to as ''Excess Units''), the Member and its designated Directors will have no voting rights with respect to the Excess Units on any action relating to BOX Holdings nor will the Member or its designated Directors, if any, be entitled to give any proxy with respect to the Excess Units in relation to a vote of the Members; provided, however, that whether or not the Member or its designated Directors, if any, otherwise participates in a meeting in person or by proxy, the Member's Excess Units will be counted for quorum purposes and will be voted by the person presiding over quorum and vote matters in the same proportion as the Units held by the other Members are voted (including any abstentions from voting).[10]

Upon completion of the VPR Program, all outstanding Class C Units associated with vested VPRs will be automatically converted into an equal number of Class A Units and all outstanding Class C Units associated with unvested VPRs will be automatically cancelled and be of no further effect. All rights related to Class C Units will terminate automatically upon cancellation or conversion and rights related to the converted Class A Units will remain, subject to the terms of the Restated Holdings LLC Agreement.[11]

Voting

Each Class C Member will have the right to vote its Class C Units that are associated with vested VPRs (''Voting Class C Units'') on matters submitted to a vote of all holders of Units. VPRs will vest in accordance with the vesting provisions of the VPR Program.[12] Members holding Voting Class C Units will vote with Members holding all other classes of Units. Members holding Voting Units [13] will be entitled to vote together, as a single class, each with one vote per Voting Unit so held.[14] Issued and outstanding Class C Units that are not Voting Class C Units will not have voting rights. Accordingly, as a Subscriber meets or exceeds volume commitments, voting powers as Class C Member of Holdings will increase. Similarly, if Subscribers do not meet volume commitments, voting powers will decrease.

The Holdings LLC Agreement currently provides, and the Restated Holdings LLC Agreement will continue to provide, that any Director designated by either MX US 2, Inc. or IB Exchange Corp may effectively block certain actions of Holdings (the ''Major Action Veto''). The Restated Holdings LLC Agreement provides that, upon vesting of VPRs associated with Class C Units equal to at least 25% of the total outstanding Units, the Major Action Veto will automatically expire and be of no further effect. Also, when the 25% threshold is met, the Restated Holdings LLC Agreement also provides that Holdings and its Members will take all necessary action to amend the Limited Liability Company Agreement of BOX to eliminate the major action veto provisions therein that are applicable to BOX and inure to the benefit of MX US 2, Inc. and IB Exchange Corp and to provide that the executive committee of BOX will be constituted in the same manner as the Executive Committee of Holdings.[15]

The Restated Holdings LLC Agreement includes a new supermajority voting requirement that Members holding at least 67% of all outstanding Voting Units must vote to approve certain actions (the ''Supermajority Actions'') by Holdings.[16] The new supermajority voting requirement will be in addition to all other existing voting requirements applicable to Holdings and any actions Holdings may take, including the Major Action Veto. This new requirement provides additional protections to Subscribers and Members that Supermajority Actions will not be undertaken without broad support among holders of Voting Units.

Supermajority Actions include the following: (i) Merger or consolidation of Holdings or BOX with any other entity, a sale of Holdings or BOX, or the sale, lease or transfer, by Holdings or BOX, of any material portion of its assets; (ii) entry by Holdings or BOX into any line of business other than the business described in Article 3 of the Restated Holdings LLC Agreement or in Article 3 of the Limited Liability Company Agreement of BOX; (iii) conversion of Holdings or BOX from a Delaware limited liability company into any other type of entity; (iv) except as expressly contemplated by a members agreement among the Members (the ''Members Agreement''), Holdings or BOX entering into any agreement, commitment, or transaction with any Member or any of its Affiliates other than transactions or agreements upon commercially reasonable terms that are no less favorable to Holdings or BOX, respectively, than Holdings or BOX would obtain in a comparable arms-length transaction or agreement with a third party; (v) to the fullest extent permitted by law, taking any action to effect the voluntary, or which would precipitate an involuntary, dissolution or winding-up of Holdings or BOX; (vi) except as otherwise provided in the facility agreement between the Exchange and BOX (the ''Facility Agreement'') or to the extent otherwise required by the Exchange to fulfill its regulatory functions or responsibilities or to oversee the BOX Market as determined by the board of the Exchange, the issuance, by Holdings, of any additional equity interests in, or any securities exchangeable for or convertible into equity securities of, Holdings other than the following, as approved by the Holdings Board and in the aggregate not to exceed ten percent (10%) of the outstanding equity interests of Holdings: (A) Equity interests, options or convertible securities issued as a dividend, Unit split or distribution on existing Units, (B) equity interests issued to employees or Directors of, or consultants or advisors to, Holdings or one or more subsidiaries thereof pursuant to a plan, agreement or arrangement, (C) equity interests issued upon the exercise of options or convertible securities issued by Holdings, provided each such exercise or conversion is in accordance with the terms of each such option or security, and (D) equity interests issued by Holdings in the acquisition of any business; (vii) the issuance, by BOX, of any additional equity interests in, or any securities exchangeable for or convertible into equity securities of, BOX, except as otherwise provided in the Facility Agreement or to the extent otherwise required by the Exchange to fulfill its regulatory functions or responsibilities or to oversee the BOX Market as determined by the board of the Exchange; (viii) permitting BOX to operate the BOX Market utilizing any other regulatory services provider other than the Exchange, except as otherwise provided in the Facility Agreement or to the extent otherwise required by the Exchange to fulfill its regulatory functions or responsibilities or to oversee the BOX Market as determined by the Exchange Board; (ix) except as otherwise provided in the Facility Agreement, entering into, or permitting any subsidiary of Holdings to enter into,

[10] *See* proposed Restated Holdings LLC Agreement Section 7.4(h).

[11] *See* proposed Restated Holdings LLC Agreement Section 2.5(e).

[12] *See supra,* note 5.

[13] ''Voting Unit'' means any Class A Unit, Class B Unit, or Voting Class C Unit.

[14] *See* proposed Restated Holdings LLC Agreement Section 4.13(a).

[15] *See* proposed Restated Holdings LLC Agreement Section 16.4.

[16] *See* proposed Restated Holdings LLC Agreement Section 4.13(b).

any partnership, joint venture or other similar joint business undertaking; (x) making a fundamental change to the business model of BOX to be other than a for-profit business, except to the extent otherwise required by the Exchange to fulfill its regulatory functions or responsibilities or to oversee the BOX Market as determined by the Exchange Board; (xi) subject to the transfer provisions of the Restated Holdings LLC Agreement, the acquisition of any Units by any person that results in the person, alone or together with any Affiliate of the person, newly holding an aggregate percentage interest equal to or greater than twenty percent (20%); (xii) altering the provisions relating to the designation of Directors set forth in Section 4.1(a), except to the extent otherwise required by the Exchange to fulfill its regulatory functions or responsibilities or to oversee the BOX Market as determined by the Exchange Board; and (xiii) altering or amending any of the Supermajority Actions provisions, except to the extent otherwise required by the Exchange to fulfill its regulatory functions or responsibilities or to oversee the BOX Market as determined by the Exchange Board.

Amendments to the Restated Holdings LLC Agreement that alter the terms of one or more classes of Units in a manner that would materially, adversely and disproportionately (as compared with other classes of Units) affect the rights associated with the Class C Units as a class will require the written consent of holders of Class C Units (''Class C Members'') holding at least seventy-five percent (75%) of the then outstanding Class C Units and any amendment to the Restated Holdings LLC Agreement that would have a disproportionate (with respect to the same class), material and adverse effect on the rights associated with any Units, or impose any additional, disproportionate (with respect to the same Class) and material liability or obligation upon the holder of any Units, will not be effective without the consent of the holders of those Units.[17]

Directors

The Restated Holdings LLC Agreement will amend the provisions governing composition of the Holdings Board. Currently, MX US 2, Inc. has the right to designate up to five (5) Directors, IB Exchange Corp has the right to designate up to two (2) Directors and each other Member has the right to designate one (1) Director to the Holdings Board and the Holdings Board has the power to increase the size of the Holdings Board and to authorize new Members to designate Directors.

Under the Restated Holdings LLC Agreement, no Member may designate more than three (3) Directors and each Member may designate the maximum number of Directors permitted under any one (1) (but not more than one) of the following criteria: (i) Each Member, so long as it (together with its respective Affiliates) holds a combined total of Class A Units and Class B Units greater than two and one-half percent (2.5%) of all outstanding Voting Units, will be entitled to designate one (1) Director, (ii) each Member, so long as it (together with its respective Affiliates) holds a combined total of Voting Class C Units greater than four percent (4%) of all outstanding Voting Units, will be entitled to designate one (1) Director, (iii) each Member, so long as it (together with its respective Affiliates) holds a combined total of Voting Units greater than fourteen percent (14%) of all outstanding Voting Units, will be entitled to designate two (2) Directors, (iv) each Member, so long as it (together with its respective Affiliates) holds a combined total of Voting Units greater than twenty-eight percent (28%) of all outstanding Voting Units, will be entitled to designate three (3) Directors, and (v) each other existing Member may designate one (1) Director.[18] Directors serving on the Holdings Board may also serve on the board of directors of any subsidiary of Holdings. If a Member ceases to qualify for the right to designate a Director then serving, that Director will then automatically be removed from the Holdings Board.

The Restated Holdings LLC Agreement will also amend the provisions governing the right of Members to designate members of the Executive Committee of Holdings (the ''Executive Committee''), if any. Currently, MX US 2, Inc. has the right to designate up to two (2) members of the Executive Committee (''EC Members'') and IB Exchange Corp has the right to designate one (1) EC Member. Under the Restated Holdings LLC Agreement, any Member with the right to designate three (3) Directors to the Holdings Board will have the right to designate up to two (2) EC Members and any Member with the right to designate two (2) Directors to the Holdings Board will have the right to designate one (1) EC Member. Other provisions relating to the composition of the Executive Committee will be unchanged.[19]

Subscribers will also have the right to designate one individual to a new Advisory Committee organized by Holdings, the purpose of which will be to advise and make recommendations to Holdings with respect to the Exchange's competitiveness in the marketplace. Only Subscribers will have the right to designate individuals to serve on the Advisory Committee.[20] The Advisory Committee will be advisory only and will not have any powers, votes or fiduciary duties to Holdings.

Distributions

Once per year, Holdings will make a distribution (an ''Annual Distribution'') to its Members to the extent funds are available for distribution.[21] In determining the amount of each Annual Distribution, the Holdings Board will first provide for any regulatory needs of BOX and the Exchange, as determined by the Exchange Board, and any Annual Distribution amounts will be calculated after taking into account all financial and regulatory needs of the Exchange, as determined by the Exchange.[22] The Annual Distribution will be equal to 80% of Free Cash Flow,[23] except as limited by applicable law, including for regulatory and compliance purposes. In addition, another 15% of Free Cash Flow will be included in the distribution, except to the extent the Holdings Board determines that any portion thereof is (i) required for the operations of Holdings and its subsidiaries, which will be reflected on the annual budget for the next year, (ii) required for payment of liabilities or

[17] *See* proposed Restated Holdings LLC Agreement Section 18.1(b)(ii).

[18] *See* proposed Restated Holdings LLC Agreement Section 4.1.

[19] *See* proposed Restated Holdings LLC Agreement Section 4.2(c).

[20] *See* Securities Exchange Act Release No. 74114 (January 22, 2015), 80 FR 4611 at 4613 (January 28, 2015) (Notice of Filing and Immediate Effectiveness of a Proposed Rule Change to Implement an Equity Rights Program).

[21] Distributions on Class C Units will not be paid until this rule change is effective. Distributions payable on Class C Units that accrue before such effectiveness will be held in a segregated account until such effectiveness. If this rule filing does not become effective by July 1, 2016, a Subscriber may terminate its involvement in the VPR Program and any and all distributions with respect to Class C Units payable to that Subscriber held in the segregated account will be released back to Holdings and distributed to existing Members in accordance with the terms of the Holdings LLC Agreement. *Id* at 4612.

[22] *See* proposed Restated Holdings LLC Agreement Section 8.1.

[23] ''Free Cash Flow'' means consolidated net income, plus depreciation, less capital expenditures (in each case calculated in accordance with generally accepted accounting principles in the United States, as in effect from time to time) of Holdings and BOX, for the calendar year. See proposed Restated Holdings LLC Agreement Section 1.1.

expenses of Holdings, or (iii) required as a reserve to make reasonable provision to pay other claims and obligations then known to, or reasonably anticipated by, BOX or Holdings. When, as and if declared by the Holdings Board, Holdings will make the cash distribution to each Member pro rata in accordance with the number of Units held by each Member, which will be determined by multiplying the aggregate Annual Distribution amount by each Member's Percentage Interest [24] on the record date. Distributions to Class C Members may be adjusted as provided in the Members Agreement.[25]

Transfers

Class C Units are not expected to be registered for resale by Holdings and may not be transferred without complying with, or qualifying for an exemption from, the registration requirements of the Securities Act. Any Transferee of Class C Units must become a party to the Members Agreement and the Restated Holdings LLC Agreement as a condition to the transfer.

Transfers of Class C Units will be subject to certain rights of first refusal. Before a Class C Member may transfer Class C Units to a transferee that is not an Affiliate, the Class C Member must first offer to sell the Class C Units to Holdings on the same terms[26] and, to the extent Holdings does not exercise its primary right of first refusal, the Class C Units must then be offered to the other Class C Members on the same terms.[27]

Class C Units will include pre-emptive rights. In the event Holdings proposes to issue and sell new equity securities of Holdings, other than for certain customary exceptions, a Class C Member will have the right to maintain its percentage ownership in Holdings represented by the Class C Units it holds, by electing to purchase from Holdings, on the same terms, a percentage of the new securities equal to the percentage of all outstanding securities of Holdings represented by the outstanding Class C Units held by the Class C Member.[28]

Class C Units will be subject to co-sale rights. In the event a Class C Member proposes to Transfer Voting Class C Units (a ''Transferring Member'') to a transferee that is not an Affiliate, each other Class C Member will have the right to sell a portion of its Voting Class C Units to the transferee on the same terms. All Class C Members that elect to exercise this right of co-sale may, collectively, sell a number of Voting Class C Units equal to one-half (1/2) of the total number of Voting Class C Units proposed to be sold by the Transferring Member. If more than one Class C Member elects to exercise this co-sale right, the number of Voting Class C Units each may sell will be divided pro rata among them based upon their relative ownership of Voting Class C Units.[29]

Class C Units will be subject to drag-along rights. In the event that holders of at least seventy-five percent (75%) of the then outstanding Voting Units, including at least seventy-five percent (75%) of the then outstanding Voting Class C Units (collectively, the ''Selling Members'') approve a sale of Holdings in writing, specifying that the drag-along rights will apply to the transaction, then each Class C Member will be required to approve, cooperate and participate as a seller of Class C Units in the transaction, subject to certain customary exceptions.[30]

Miscellaneous

The Holdings LLC Agreement currently requires, and the Restated Holdings LLC Agreement will continue to require, that, so long as MX US 2, Inc. and its Affiliates own 4% or more of Holdings, it shall not invest in more than 5%, or participate in the creation and/or operation of, a competing business (the ''Non-compete Covenant''). The proposed Restated Holdings LLC Agreement provides that, upon vesting of VPRs associated with Class C Units equal to at least 10% of the total outstanding Units, the Non-compete Covenant will automatically expire and be of no further effect.

Additional structural, technical and non-substantive changes to the Holdings LLC Agreement are proposed to accommodate the substantive changes described above.

2. *Statutory Basis*

The Exchange believes the proposed rule change is consistent with the Act and the rules and regulations thereunder applicable to the Exchange and, in particular, the requirements of Section 6(b) of the Act.[31] Specifically, the Exchange believes that its proposed rule change is consistent with Section 6(b)(5) of the Act[32] in that it is designed to prevent fraudulent and manipulative acts and practices, to promote just and equitable principles of trade, to foster cooperation and coordination with persons engaged in facilitating transactions in securities, to remove impediments to and perfect the mechanisms of a free and open market and a national market system and, in general, to protect investors and the public interest. Additionally, the Exchange believes the proposed rule change is consistent with the requirement in Section 6(b)(5) of the Act[33] that the rules of an exchange not be designed to permit unfair discrimination between customers, issuers, brokers, or dealers. The Exchange also believes the proposed rule change is consistent with Section 6(b)(1) of the Act,[34] which requires that the Exchange be so organized and have the capacity to be able to carry out the purposes of the Act and to comply, and to enforce compliance by its members and persons associated with its members, with the provisions of the Act, the rules and regulations thereunder, and the rules of the Exchange.

Ownership

The Exchange believes that continuing to apply the existing limitations on the percentage ownership of Holdings by Participants is just and equitable and not unfairly discriminatory because it will protect all Members, including Participants, by ensuring that no Participant will be permitted to vote more than a 20% ownership interest in Holdings. Therefore, no Participant will be able to assert excessive influence over Holdings. The diverse ownership of Holdings will enhance the Exchange's ability to enforce compliance by Holdings with the provisions of the Act, the rules and regulations thereunder, and the rules of the Exchange. Further, the diverse ownership of Holdings will promote just and equitable principles of trade, foster cooperation and coordination with persons engaged in

[24] ''Percentage Interest'' with respect to a Member means the ratio of the number of Units held by the Member to the total of all of the issued Units, expressed as a percentage and determined with respect to each class of Units, whenever applicable. ''Units'' means Class A Membership Units, Class B Membership Units and Class C Membership Units of Holdings, whether or not associated with vested VPRs. See proposed Restated Holdings LLC Agreement Section 1.1.

[34] 15 U.S.C. 78f(b)(1).

facilitating transactions in securities, remove impediments to and perfect the mechanisms of a free and open market and a national market system and, in general, protect investors and the public interest. The Exchange believes that the limit is reasonable and not unfairly discriminatory because each Participant Member may vote up to 20% so there is no risk that the limit will prevent a Participant with substantial ownership from being adequately represented.

The Exchange believes that the conversion of Class C Units associated with vested VPRs into Class A Units at the end of the VPR Program is just and equitable and not unfairly discriminatory. Class A Units are the primary ownership unit of Holdings. The conversion is just and equitable and not unfairly discriminatory because, at the end of the VPR Program, each Subscriber will be rewarded with Class A Units to the extent it has met its obligations under the VPR Program.

Voting

Limiting voting on matters submitted to a vote of all holders of Units to Class C Units that are associated with vested VPRs is just and equitable and not unfairly discriminatory because the Exchange does not believe it would be fair to treat Class C Units associated with unvested VPRs in the same manner as Class C Units associated with vested VPRs when it comes to matters of voting since vested VPRs in the VPR Program have satisfied certain requirements that provide value to Holdings in return for establishing a voting interest in Holdings. Additionally, the Exchange believes it is reasonable to exclude Class C Units associated with unvested VPRs from voting because Subscribers holding unvested VPRs are still able to provide input and make recommendations to Holdings through the VPR Program.[35]

The Exchange believes that allowing the expiration of the Major Action Veto upon vesting of VPRs associated with Class C Units equal to at least 25% of the total outstanding Units is reasonable and not unfairly discriminatory because it will allow all Members to exert influence over the affairs and direction of Holdings in percentages more closely aligned with their respective ownership percentages. Eliminating the Major Action Veto from both the Restated Holdings LLC Agreement and the Limited Liability Company Agreement of BOX is just and equitable and not unfairly discriminatory because it will allow Holdings and BOX to undertake a broader range of actions without allowing a single Member to block such actions.

The new supermajority voting requirement that Members holding at least 67% of all outstanding Voting Units must vote to approve Supermajority Actions is fair and reasonable because it will ensure sufficient oversight of the commercial affairs of Holdings and that any Supermajority Action undertaken is necessary, appropriate and in the best interest of Holdings and the Members. Additionally, supermajority voting will provide adequate safeguards and affirmative approval of significant changes to Holdings and will serve to protect the interest of the Members. The Exchange further believes that the supermajority voting provision is important given the new, more diverse ownership structure of Holdings. Specifically, requiring supermajority voting will ensure any substantial change in BOX will have to be approved by more than a simple majority.

The proposed rule change will foster key changes to the governance of Holdings. Equity issued pursuant to the proposed rule change and in connection with the VPR Program is intended to reduce the ownership percentage of the existing majority owner of Holdings, MX US 2, Inc., below fifty percent (50%). If Subscribers meet expected order flow commitments pursuant to the VPR Program, the ownership of Holdings by current Members, including MX US 2, Inc., will be diluted such that no single Member will have a majority ownership.

The elimination of the Major Action Veto, the addition of supermajority voting provisions, and the dilution of MX US 2, Inc.'s ownership below fifty percent (50%) will give Members other than MX US 2, Inc. increased voting power and enhance the Exchange's ability to enforce compliance by Holdings with the Act and the rules of the Exchange. Further, such voting provisions will promote just and equitable principles of trade, foster cooperation and coordination with persons engaged in facilitating transactions in securities, remove impediments to and perfect the mechanisms of a free and open market and a national market system and, in general, protect investors and the public interest.

Requiring the written consent of Class C Members holding at least seventy-five percent (75%) of then outstanding Class C Units for any amendment to the Restated Holdings LLC Agreement that alters the terms of one or more classes of Units in a manner that would materially, adversely and disproportionately (as compared with other classes of Units) affect the rights associated with the Class C Units as a class is fair, reasonable and not unfairly discriminatory because it will protect Class C Units from being unfairly disadvantaged relative to the other classes of Units and will prevent the other classes of Units from unfairly discriminating against the Class C Units.

Directors

The Exchange believes that setting the number of Directors that a Member can designate is fair, reasonable and not unfairly discriminatory because it will ensure that the Holdings Board has broad representation and that no single Member will be able to exert undue control and influence over the Holdings Board. The diverse makeup of the Holdings Board will enhance the Exchange's ability to enforce compliance by Holdings with the provisions of the Act, the rules and regulations thereunder, and the rules of the Exchange. Further, the Exchange believes that broad representation will be beneficial because it will foster cooperation and coordination, will contribute to the identification of opportunities for innovation and will enhance competition. The Exchange further believes that the various percentage thresholds for determining the number of Directors a Member can designate fosters cooperation and coordination with persons engaged in facilitating transactions in securities, removes impediments to and perfect the mechanisms of a free and open market and a national market system, protects investors and the public interest, and are just and equitable and not unfairly discriminatory because such thresholds generally align Members' economic interests with their respective representation on the Holdings Board. Further, the purpose of the VPR Program is to reward Subscribers that execute orders on the Exchange; the percentage thresholds for determining the number of Directors a Member is permitted to designate will reward those Members that contribute to the success of the Exchange by allowing them to designate additional Directors to the Holdings Board. The limitations on designated members of the Executive Committee of Holdings is fair, reasonable and not unfairly discriminatory because the Executive Committee has oversight responsibility over the affairs of Holdings and the Exchange believes it is reasonable to limit the membership of the Executive Committee to those Members that have a greater economic interest in Holdings.

[35] *See supra,* note 20.

Distributions

The Exchange believes that the proposed distribution provisions are consistent with the Act and protects investors and the public interest because all financial and regulatory needs of the Exchange and BOX will be provided for in determining the amount each distribution. This rule change ensures that no funds necessary for the regulation of the Exchange or BOX will be distributed to the Members of Holdings and will provide the Exchange with the financial ability to carry out the purposes of the Act, to comply and to enforce compliance with the provisions of the Act and the rules and regulations thereunder, including the rules of the Exchange, to prevent fraudulent and manipulative acts and practices, to promote just and equitable principles of trade and to foster cooperation and coordination with persons engaged in regulating, clearing, settling, processing information with respect to, and facilitating transaction in securities.

Transfers

The Exchange believes that the limitations on transferring Class C Units are fair, reasonable and not unfairly discriminatory. Specifically, requiring any such Transferee to become a party to the Members Agreement and the Restated Holdings LLC Agreement as a condition of a transfer fosters cooperation and coordination with persons engaged in facilitating transactions in securities, removes impediments to and perfect the mechanisms of a free and open market and a national market system, protects investors and the public interest, is just and equitable and not unfairly discriminatory because all Members are required to be parties to the Members Agreement and the Restated Holdings LLC Agreement, which ensures that the rule change will apply to all Members. The limitation on transferring Class C Units to a transferee that is not an Affiliate is just and equitable and not unfairly discriminatory because it preserves the rights of the other Members by protecting their ownership stake in Holdings. Further, the proposed rights of first refusal, pre-emptive rights, co-sale rights and drag-along rights are reasonable and not unfairly discriminatory as these rights provide stability among the ownership group, allow Members to participate in opportunities for third party transactions and protect the nature of the investment made by each Member. All of the proposed limitations on equity transfers enhance the Exchange's capacity and ability to carry out the purposes of the Act and to comply, and to enforce compliance by its members and persons associated with its members, with the provisions of the Act, the rules and regulations thereunder, and the rules of the Exchange.

Miscellaneous

The Exchange believes that the proposed rule change to permit the potential future expiration of the non-compete obligation of MX US 2, Inc. fosters cooperation and coordination with persons engaged in facilitating transactions in securities, removes impediments to and perfect the mechanisms of a free and open market and a national market system, protects investors and the public interest, and is just and equitable and not unfairly discriminatory. Currently, this restriction applies only to MX US 2, Inc. and not to other Members of Holdings. The expiration of this non-compete obligation was approved by the existing Members and will only take effect if MX US 2, Inc. becomes a minority Member of Holdings by reducing its ownership to less than fifty percent (50%) of the outstanding equity of Holdings. The expiration of this existing restriction will place all Members of Holdings on equal footing with respect to other investments they wish to make.

B. Self-Regulatory Organization's Statement on Burden on Competition

The Exchange does not believe that the proposed rule change will impose any burden on competition that is not necessary or appropriate in furtherance of the purposes of the Act. The Exchange believes that the proposed rule change will improve competition by providing market participants with an incentive to consider and utilize another market, BOX, when determining where to execute options contracts and post liquidity.

The Exchange believes that the proposed rule change will help the Exchange achieve the goals of the VPR Program to increase both intermarket and intramarket competition by incenting Subscribers to direct their orders to the Exchange, which will enhance the quality of quoting and increase the volume of contracts traded there. Notwithstanding these incentives, Subscribers will still be free to send orders to other markets, even if they have not met their volume commitment for that measurement period; thus the proposed change will not impose a burden on competition among exchanges. To the extent an additional competitive burden on non-Subscribers is imposed by the proposed rule change, the Exchange believes that this is appropriate because the VPR Program should incent Participants to direct additional order flow to the Exchange and thus provide additional liquidity, which enhances the quality of BOX and increases the volume of options traded on BOX. To the extent that this purpose is achieved, all of the Exchange's Participants, even non-Subscribers, should benefit from the improved market liquidity. Enhanced market quality and increased transaction volume that results from the anticipated increase in order flow directed to the Exchange will benefit all market participants and improve competition on the Exchange.

Given the robust competition for volume among options markets, many of which offer the same products, implementing rule changes to help achieve the goals of a program to attract order flow like the VPR Program is consistent with the above-mentioned goals of the Act. This is especially true for a smaller options exchange, such as BOX, which is competing for volume with much larger exchanges that dominate the options trading industry. BOX captures a relatively modest percentage of the average daily trading volume in options, so it is unlikely that the rule change could cause any competitive harm to the options market generally or to market participants. Rather, the proposed rule change, which will allow BOX to fully implement the governance provisions of the VPR Program, is an attempt by a small options market to attract order volume away from larger competitors by adopting an innovative pricing strategy.

Finally, the proposed rule change will permit an increase in the diversity of ownership of Holdings such that no one entity will have a majority ownership of Holdings. Upon the issuance of Class C Units to Subscribers, the ownership of Holdings will be distributed among more holders and distributed more evenly among existing holders. If there is full participation in the VPR Program, then the ownership of Holdings by its majority owner will be diluted and no single Member will have a majority ownership of Holdings.

C. Self-Regulatory Organization's Statement on Comments on the Proposed Rule Change Received from Members, Participants, or Others

The Exchange has neither solicited nor received comments on the proposed rule change.

III. Date of Effectiveness of the Proposed Rule Change and Timing for Commission Action

Within 45 days of the date of publication of this notice in the **Federal Register** or within such longer period (i) as the Commission may designate up to 90 days of such date if it finds such longer period to be appropriate and publishes its reasons for so finding or (ii) as to which the self-regulatory organization consents, the Commission will:

(A) by order approve or disapprove the proposed rule change, or

(B) institute proceedings to determine whether the proposed rule change should be disapproved.

IV. Solicitation of Comments

Interested persons are invited to submit written data, views, and arguments concerning the foregoing, including whether the proposed rule change is consistent with the Act. Comments may be submitted by any of the following methods:

Electronic Comments

- Use the Commission's Internet comment form (*http://www.sec.gov/rules/sro.shtml*); or
- Send an email to *rule-comments@sec.gov.* Please include File Number SR–BOX–2015–22 on the subject line.

Paper Comments

- Send paper comments in triplicate to Secretary, Securities and Exchange Commission, 100 F Street, NE., Washington, DC 20549–1090.

All submissions should refer to File Number SR–BOX–2015–22. This file number should be included on the subject line if email is used. To help the Commission process and review your comments more efficiently, please use only one method. The Commission will post all comments on the Commission's Internet Web site (*http://www.sec.gov/rules/sro.shtml*). Copies of the submission, all subsequent amendments, all written statements with respect to the proposed rule change that are filed with the Commission, and all written communications relating to the proposed rule change between the Commission and any person, other than those that may be withheld from the public in accordance with the provisions of 5 U.S.C. 552, will be available for Web site viewing and printing in the Commission's Public Reference Room, 100 F Street, NE., Washington, DC 20549, on official business days between the hours of 10:00 a.m. and 3:00 p.m. Copies of such filing also will be available for inspection and copying at the principal office of the Exchange. All comments received will be posted without change; the Commission does not edit personal identifying information from submissions. You should submit only information that you wish to make available publicly. All submissions should refer to File Number SR–BOX–2015–22, and should be submitted on or before August 3, 2015.

For the Commission, by the Division of Trading and Markets, pursuant to delegated authority.[36]

Brent J. Fields,

Secretary.

[FR Doc. 2015–16975 Filed 7–10–15; 8:45 am]

SECURITIES AND EXCHANGE COMMISSION

[Release No. 34–75372; File No. SR-Phlx-2015–52]

Self-Regulatory Organizations; NASDAQ OMX PHLX LLC; Notice of Filing and Immediate Effectiveness of Proposed Rule Change Relating to the Volume-Based and Multi-Trigger Threshold

July 7, 2015.

Pursuant to Section 19(b)(1) of the Securities Exchange Act of 1934 (''Act'') [1], and Rule 19b–4 thereunder,[2] notice is hereby given that on June 22, 2015, NASDAQ OMX PHLX LLC (''Phlx'' or ''Exchange'') filed with the Securities and Exchange Commission (''SEC'' or ''Commission'') the proposed rule change as described in Items I and II, below, which Items have been prepared by the Exchange. The Commission is publishing this notice to solicit comments on the proposed rule change from interested persons.

I. Self-Regulatory Organization's Statement of the Terms of Substance of the Proposed Rule Change

The Exchange proposes to adopt a new Rule 1095 entitled ''Automated Removal of Market Maker Quotes'' of the rules governing Phlx. The Exchange proposes to adopt two new Phlx Market Maker [3] risk protections, a volume-based threshold and a multi-trigger threshold.[4]

The text of the proposed rule change is available on the Exchange's Web site at *http://nasdaqomxphlx.cchwallstreet.com/,* at the principal office of the Exchange, and at the Commission's Public Reference Room.

II. Self-Regulatory Organization's Statement of the Purpose of, and Statutory Basis for, the Proposed Rule Change

In its filing with the Commission, the Exchange included statements concerning the purpose of and basis for the proposed rule change and discussed any comments it received on the proposed rule change. The text of these statements may be examined at the places specified in Item IV below. The Exchange has prepared summaries, set forth in sections A, B, and C below, of the most significant aspects of such statements.

A. Self-Regulatory Organization's Statement of the Purpose of, and Statutory Basis for, the Proposed Rule Change

1. Purpose

The purpose of the filing is to adopt two new risk protections for Phlx specialists, SQTs and RSQTs (collectively ''Market Makers'') to monitor marketplace risk. These protections are intended to assist Market Makers to control their trading risks.[5] Quoting across many series in an option creates the possibility of ''rapid fire'' executions that can create large, unintended principal positions that expose Market Makers, who are required to continuously quote in assigned options, to potentially significant

[1] 15 U.S.C. 78s(b)(1).

[2] 17 CFR 240.19b–4.

[3] A ''Market Maker'' includes Registered Options Traders (''ROTs'') (Rule 1014(b)(i) and (ii)), which includes Streaming Quote Traders (''SQTs'') (*see* Rule 1014(b)(ii)(A)) and Remote Streaming Quote Traders (''RSQTs'') (*see* Rule 1014(b)(ii)(B)). An SQT is defined in Exchange Rule 1014(b)(ii)(A) as an ROT who has received permission from the Exchange to generate and submit option quotations electronically in options to which such SQT is assigned. An RSQT is defined in Exchange Rule 1014(b)(ii)(B) as an ROT that is a member or member organization with no physical trading floor presence who has received permission from the Exchange to generate and submit option quotations electronically in options to which such RSQT has been assigned. An RSQT may only submit such quotations electronically from off the floor of the Exchange. A Market Maker also includes a specialist, an Exchange member who is registered as an options specialist pursuant to Rule 1020(a).

[4] Market Makers will be required to continue to utilize the Risk Monitor Mechanism in Rule 1093, as is the case today.

[5] *See* Rule 1014 entitled ''Obligations and Restrictions Applicable to Specialists and Registered Options Traders.''

market risk. Today, the Exchange's rules permit Market Makers to monitor risk arising from multiple executions across multiple options series of a single underlying security.[6]

The Exchange is proposing to offer a new volume-based and multi-trigger threshold protection to Market Makers. The Exchange proposes to adopt a new Rule 1095, entitled, ''Automated Removal of Market Maker Quotes,'' to establish: (1) a threshold used to calculates each Market Maker's total volume executed in all series of an underlying security within a specified time period and compares that to a pre-determined threshold (''Volume-Based Threshold''), and (2) a threshold used to measure the number of times the Phlx XL system (''System'') has triggered[7] based on the Risk Monitor Mechanism (''Percentage-Based Threshold'') pursuant to Rule 1093 and Volume-Based Thresholds within a specified time period and compares that total to a pre-determined threshold (''Multi-Trigger Threshold'').

Volume-Based Threshold

In connection with offering these two new threshold protections, a Market Maker would provide a specified time period and volume threshold by which the Exchange's System would automatically remove the Market Maker's quotes in *all series of an underlying security,* depending on the threshold utilized, submitted through designated Phlx protocols, as specified by the Exchange. The Exchange counts Specialized Quote Feed (''SQF'')[8] quotes only in determining the number of contracts traded and removed by the System.

The Volume-Based Threshold will determine, during a specified time period established by the Market Maker not to exceeds 15 seconds (''Volume-Based Specified Time Period''), whether a Marker Maker executed a number of contracts which equals or exceeds the designated number of contracts specified by the Market Maker in all series of an underlying security to determine whether to remove the Market Maker's quotes in all series of the underlying security.[9] The Volume-Based Threshold will be based on the total number of contracts executed in the market in the same options series in in an underlying security and will not offset the number of contracts executed on the opposite side of the market.. Once the System determines that the number of contracts executed equals or exceeds a number established by the Market Maker during the Volume-Based Specified Time Period, the System will remove Market Maker's quotes. The Volume-Based Specified Time Period designated by the Market Maker must be the same length of time as designated for purposes of the Percentage-Based Threshold in Rule 1093.

A Volume-Based Specified Time Period will commence for an option every time an execution occurs in any series in such option and will continue until the System automatically removes quotes as described in newly proposed sections (iv) or (v) or the Volume-Based Specified Time Period expires. The Volume-Based Specified Time Period operates on a rolling basis among all series in an option in that there may be multiple Volume-Based Specified Time Periods occurring simultaneously and such Volume-Based Specified Time Periods may overlap.[10]

Multi-Trigger Threshold

A Market Maker or Market Maker Group, which is defined as multiple affiliated Market Makers,[11] may provide the specified time period and number of allowable triggers by which the Exchange will automatically remove quotes in all options series in all underlying issues submitted through designated Phlx protocols, as specified by the Exchange (''Multi-Trigger Threshold''). During a specified time period established by the Market Maker not to exceed 15 seconds (''Multi-Trigger Specified Time Period''), the number of times the System automatically removes the Market Maker's or Group's quotes in all options series will be based on the number of triggers of the Percentage-Based Threshold, described in proposed section (ii) [sic], as well as the Volume-Based Threshold described in proposed (ii).[12] For purposes of this rule, a trigger shall be defined as the event which causes the System to automatically remove quotes in all options series in all underlying issues. Once the System determines that the number of triggers equals or exceeds a number established by either the Market Maker or Group, during a Multi-Trigger Specified Time Period, the System will automatically remove all quotes in all options series in all underlying issues for that Market Maker or Group. A Multi-Trigger Specified Time Period will commence after every trigger of either the Percentage-Based Threshold or the Volume-Based Threshold and will continue until the System removes quotes as described in section (iv) of the proposed rule or the Multi-Trigger Specified Time Period expires. Members may configure the Multi-Trigger Threshold at the badge level (by Market Maker) or by Group (multiple affiliated Market Makers), but not both. This is different as compared to the Percentage-Based Threshold in Rule 1093 or the newly proposed Volume-Based Thresholds that are configured only on the badge level (by Market Maker).[13] The System counts triggers within a Multi-Trigger Specified Time Period across all options for the Market Maker or Group. A Multi-Trigger Specified Time Period operates on a rolling basis in that there may be multiple Multi-Trigger Specified Time Periods occurring simultaneously and such Multi-Trigger Specified Time Periods may overlap.

The System will automatically remove quotes in all options in an underlying security when the Volume-Based Threshold has been reached. The System will automatically remove quotes in all options in all underlying securities when the Multi-Trigger Threshold has been reached.[14] The

[6] *See* Phlx Rule 1093, entitled ''Phlx XL Risk Monitor Mechanism.'' The Percentage Based Threshold compares each Market Maker's executed volume to the total volume disseminated in that series or underlying, and then triggers a protective response when that percentage exceeds the percentage the Market Maker has determined to be acceptable.

[7] A trigger is defined as the event which causes the System to automatically remove all quotes in all options series in an underlying issue.

[8] SQF permits the receipt of quotes.

[9] The System's count of the number of contracts executed is based on trading interest resting on the Exchange book.

[10] *Id.*

[11] This would be more than one Market Maker, but does not require the aggregation of all the member's Market Makers. A Group would be comprised of Market Makers affiliated with one member or member organization. The member or member organization would be required to define a Group by providing a list of such affiliated Market Makers to the Exchange.

[12] Today, ISE's functionality permits market maker quotes to be removed from the ISE trading system if a specified number of curtailment events occur across both ISE and ISE Gemini, LLC (''ISE Gemini''). ISE and ISE Gemini's trading systems will count the number of times a market maker's pre-set curtailment events occur on each exchange and aggregate them. Once a market maker's specified number of curtailment events across both markets is reached, the trading systems will remove the market maker's quotes in all classes on both ISE and ISE Gemini. ISE will then reject any quotes sent by the market maker after the parameters across both exchanges have been triggered until the market maker notifies the market operations staff of ISE that it is ready to come out of its curtailment. *See* Securities Exchange Release No. 73147 (September 19, 2014), 79 FR 57639 (September 25, 2014) (SR–ISE–2014–09) (Order approving proposed rule change related to market maker risk parameters).

[13] *See* proposed new Rule 1095(iii).

[14] The specified time period for the Volume-Based Threshold and the Multi-Trigger Threshold may differ. The specified time period for the

System will send a Purge Notification Message [15] to the Market Maker for all affected options when the above thresholds have been reached.

The two thresholds, Volume-Based Threshold and Multi-Trigger Threshold operate independently of each other. The triggering of the Volume-Based Threshold would occur independently of that of the Multi-Trigger Threshold. The Multi-Trigger Threshold is somewhat dependent on the Volume-Based Threshold to the extent that the Volume-Based Threshold serves as a trigger for the Multi-Trigger Threshold. Quotes will be automatically executed up to the Market Maker's size regardless of whether the quote exceeds the Volume-Based Threshold.[16]

If a Market Maker requests the System to remove quotes in all options series in all underlying issues, the System will automatically reset the Volume-Based Specified Time Period(s). The Multi-Trigger Specified Time Period(s) will not automatically reset for the Multi-Trigger Threshold.[17]

When the System removes quotes as a result of the Volume-Based Threshold, the Market Maker must send a re-entry indicator to re-enter the System. When the System removes quotes as a result of the Multi-Trigger Threshold, the System will not accept quotes through designated protocols until the Market Maker manually requests re-entry.[18] After quotes are removed as a result of the Multi-Trigger Threshold, Exchange staff must set a re-entry indicator in this case to enable re-entry, which will cause the System to send a Reentry Notification Message to the Market Maker for all options series in all underlying issues.[19] The Market Maker's Clearing Firm will be notified regarding the trigger and re-entry into the System after quotes are removed as a result of the Multi-Trigger Threshold, provided the Market Maker's Clearing Firm has requested to receive such notification.[20] The System will then reset all counters to zero and re-entry and continued trading will be permitted. A Market Maker is subject to continuous quoting obligations[21] despite the removal of quotes from the System and approval process for re-entry.

Today, the Exchange provides Market Makers with the Percentage-Based Threshold in Rule 1093 to monitor risk.[22] The Exchange will continue to require Market Makers to utilize the Percentage-Based Threshold. The Volume-Based Threshold and the Multi-Trigger Threshold will be optional.

The Exchange reserved subsection (i) for future modifications to this rule.

The Exchange proposes to implement this rule within thirty (30) days of the operative date.

Example #1 of the Volume-Based Threshold is displayed below. Presume the following order book:

Series of underlying XYZ	Size on bid x offer for MM1
100 Strike Call	300x300
100 Strike Put	50x50
110 Strike Call	200x200
110 Strike Put	150x150

In this example, assume the Specified Time Period designated by the Market Maker # 1 is 10 seconds and the designated number of contracts permitted for the Volume-Based Threshold is 250 contracts. Assume at 12:00:00, the Market Maker # 1 executes all of his offer size, 200 contracts, in the 110 Strike Calls. The System will initiate the Specified Time Period and for 10 seconds the System will count all volume executed in series of underlying XYZ. If at any point during that 10 second period, the Market Maker # 1 executes additional contracts in any series of underlying XYZ, those contracts will be added to the initial execution of 200 contracts. To illustrate, assume at 12:00:05 the Market Maker # 1 executes 60 contracts of his offer in the 100 Strike Calls. The total volume executed is now 260 contracts. Since that volume exceeds the Market Maker #1's designated number of contracts for the Volume-Based Threshold (250 contracts), all of his quotes in all series of underlying XYZ over the designated protocols will be removed from the System; no quotes will be executed in series XYZ until the Market Maker enters new quotes in series XYZ. The Volume-Based Specified Time Period will be reset for Market Maker #1 in underlying XYZ and Market Maker #1 will need to send a re-entry indicator in order to re-enter quotes in options series for underlying XYZ into the System.

Example #2 of the Volume-Based Threshold: Similar to the example above, assume the Specified Time Period is 10 seconds and the designated number of contracts permitted for the Volume-Based Threshold is 250 contracts. Assume at 12:00:00, Market Maker #1 executes all of his offer size, 200 contracts, in the 110 Strike Calls. The System will initiate the Specified Time Period and for 10 seconds the System will count all volume executed in series of underlying XYZ. If at any point during that 10 second period, Market Maker #1 executes additional contracts in any series of underlying XYZ, those contracts will be added to the initial execution of 200 contracts. Then assume at 12:00:05 Market Maker #1 executes 20 contracts of his offer in the 100 Strike Calls. The total volume executed is 220 contracts which does not exceed the Volume-Based Threshold. This second execution initiates another Specified Time Period so there are two open time periods, the first with 5 seconds remaining and a new 10 second time period. At 12:00:10, the first timer period expires and the initial execution of 200 contracts is no longer counted toward the designated number of contracts permitted for the Volume-Based Threshold. Further assume at 12:00:12, which is outside of the initial time period but still within 10 seconds of the second execution of 20 contracts, another execution occurs with Market Maker #1 executing 230 contracts of his bid in the 100 Strike Calls. This total volume executed toward the Volume-Based Threshold within the Specified Time Period is now 250 contracts which equals the designated number of contracts permitted causing the System to remove all quotes in all series of underlying XYZ over the designated protocols for Market Maker #1 to be removed from the System; no quotes will be executed in series XYZ until the Market Maker enters new quotes in series XYZ. The Volume-Based Specified Time Period will be reset for Market Maker #1 in underlying XYZ and Market Maker #1 will need to send a re-entry indicator in order to re-enter quotes in options series for underlying XYZ into the System. This example displays the rolling basis in which the Specified Time Period operates.

Example #3: In order to illustrate the Multi-Trigger Threshold, assume Example #1 and Example #2 provided above occurred in options series of two different underlyings rather than all in options series of underlying XYZ and for two separate Market Makers (MM#1

Volume-Based Threshold must be the same as the Percentage-Based Threshold in Rule 1093.

[15] A message entitled ''Purge Notification Message'' is systemically sent to the Marker Maker upon the removal of quotes due to Volume-Based Threshold or Multi-Trigger Threshold.

[16] *See* proposed new Rule 1095(iii).

[17] *See* proposed new Rule 1095(iv).

[18] In the interest of maintaining fair and orderly markets, the Exchange believes it is important that Market Makers communicate their readiness to Exchange staff in a non-automated manner, such as by email or telephone.

[19] *See* proposed new Rule 1095(v).

[20] Phlx Rule 1016 permits the Exchange to share Marker Maker designated risk settings in the System with the Clearing Firm.

[21] *See* note 3.

[22] An initial default value is set for each Market Maker.

for Example #1 and MM#2 for Example #2) of the same member organization. Assume a Group is defined by the member organization and is comprised of the MM #1 and MM #2. Further assume the member organization has defined the Multi-Trigger Specified Time Period as 10 seconds and the number of allowable triggers as two. Based on the aforementioned examples, a Multi-Trigger Specified Time Period commences at 12:00:05 when MM#1 triggers the Volume-Based Threshold. This Volume-Based Threshold triggers counts as the first trigger toward the Multi-Trigger Threshold for the Group. Another Multi-Trigger Specified Time Period is initiated at 12:00:12 when MM#2 triggers the Volume-Based Threshold (per Example #2). This Volume-Based Threshold trigger counts as the second trigger toward the Multi-Trigger Threshold for the Group since it is within the Multi-Trigger Specified Time Period of the first trigger. Since the member organization designated two triggers for the number of allowable triggers, the Group, both MM#1 and MM#2, quotes in all option series in all underlying issues for the Group are automatically removed from the System and Purge Notification Messages are sent to the Group; no quotes will be executed in series XYZ until the Market Maker enters new quotes in series XYZ. The member organization will need to contact the Exchange to request Exchange staff to enable re-entry into the System. The Exchange proposes to implement this rule within thirty (30) days of the operative date. The Exchange will issue an Options Trader Alert in advance to inform market participants of such date.

2. *Statutory Basis*

The Exchange believes that its proposal is consistent with Section 6(b) of the Act [23] in general, and furthers the objectives of Section 6(b)(5) of the Act [24] in particular, in that it is designed to promote just and equitable principles of trade, to remove impediments to and perfect the mechanism of a free and open market and a national market system, and, in general to protect investors and the public interest, by enhancing the risk protections available to Exchange members. The proposal promotes policy goals of the Commission which has encouraged execution venues, exchange and non-exchange alike, to enhance risk protection tools and other mechanisms to decrease risk and increase stability.

The individual firm benefits of enhanced risk protections flow downstream to counter-parties both within and without the Exchange, thereby increasing systemic protections as well. Additionally, because the Exchange offers the these risk tools to Market Makers, in order to encourage them to provide as much liquidity as possible and encourage market making generally, the proposal removes impediments to and perfects the mechanism of a free and open market and a national market system and protect investors and the public interest.

With respect to permitting the Multi-Trigger Threshold to be set either to one Market Maker or to a number of specified Market Makers affiliated with a member, it is important to note that the risk to Market Makers is not limited to a single series in an option but to all series in an option. Market Makers that quote in multiple series of multiple options have significant exposure, requiring them to offset or hedge their overall positions. The proposed functionality will be useful for Market Makers, who are required to continuously quote in assigned options classes on the Exchange. Quoting across many series in an option or multiple options creates the possibility of executions that can create large, unintended principal positions that could expose market makers to unnecessary risk. The Multi-Trigger Threshold functionality is intended to assist Market Makers manage that risk at the Group level so that Market Makers may provide deep and liquid markets to the benefit of all investors.

The Exchange further represents that its proposal will operate consistently with the firm quote obligations of a broker-dealer pursuant to Rule 602 of Regulation NMS and that the functionality is not mandatory. Specifically, any interest that is executable against a Market Maker's quotes that are received [25] by the Exchange prior to the time either of these functionalities are engaged will be automatically executed at the price up to the Market Maker's size, regardless of whether such execution results in executions in excess of the Market Maker's pre-set parameters.

With respect to providing risk settings to the Market Maker's Clearing Member, each Member that transacts through a Clearing Member on the Exchange executes a Letter of Guarantee wherein the Clearing Member accepts financial responsibility for all Exchange transactions made by the Member on whose behalf the Clearing Member submits the letter of guarantee. The Exchange believes that because Clearing Members guarantee all transactions on behalf of a Member, and therefore, bear the risk associated with those transactions, it is appropriate for Clearing Members to have knowledge of what risk settings a Market Maker may utilize within the System and should be provided and receive notice of re-entry into the System after triggering the Multi-Trigger Threshold.

B. Self-Regulatory Organization's Statement on Burden on Competition

The Exchange does not believe that the proposed rule change will impose any burden on competition not necessary or appropriate in furtherance of the purposes of the Act. Specifically, the proposal will not impose a burden on intra-market or inter-market competition, rather it provides Market Makers with the opportunity to avail themselves of similar risk tools which are currently available on other exchanges.[26] The proposal does not impose a burden on inter-market competition, because members may choose to become market makers on a number of other options exchanges, which may have similar but not identical features.[27] The proposed rule change is meant to protect Market Makers from inadvertent exposure to excessive risk. Accordingly, the proposed rule change will have no impact on competition.

Further, the Exchange is proposing this rule change at the request of its Market Makers to further reduce their risk in the event the Market Maker is suffering from a systems issue or due to the occurrence of unusual or unexpected market activity. The proposed Group parameter for the Multi-Trigger threshold will protect Market Makers from inadvertent exposure to excessive risk at the Group level. Reducing such risk will enable Market Makers to enter quotations without any fear of inadvertent exposure to excessive risk, which in turn will benefit investors through increased liquidity for the execution of their orders. Such increased liquidity benefits investors because they receive better prices and because it lowers volatility in the options market.

The Exchange believes that requiring Market Makers to enter values for the Percentage-Based Threshold is not

[23] 15 U.S.C. 78f(b).

[24] 15 U.S.C. 78f(b)(5).

[25] The time of receipt for an order or quote is the time such message is processed by the Exchange book.

[26] *See* Section 8 of the 19b4.

[27] *See* BATS Rule 21.16, BOX Rules 8100 and 8110, C2 Rule 8.12, CBOE Rule 8.18, ISE Rule 804(g), MIAX Rule 612, NYSE MKT Rule 928NY and NYSE Arca Rule 6.40.

unreasonably burdensome because Market Makers can enter an out-of-range value so that the Exchange-provided risk protections will not be triggered. Reducing risk by utilizing the proposed risk protections will enable Market Makers to enter quotations with larger size, which in turn will benefit investors through increased liquidity for the execution of their orders. Such increased liquidity benefits investors because they receive better prices and because it lowers volatility in the options market.

C. Self-Regulatory Organization's Statement on Comments on the Proposed Rule Change Received From Members, Participants, or Others

No written comments were either solicited or received.

III. Date of Effectiveness of the Proposed Rule Change and Timing for Commission Action

Because the foregoing proposed rule change does not: (i) Significantly affect the protection of investors or the public interest; (ii) impose any significant burden on competition; and (iii) become operative for 30 days from the date on which it was filed, or such shorter time as the Commission may designate, it has become effective pursuant to Section 19(b)(3)(A)(ii) of the Act [28] and subparagraph (f)(6) of Rule 19b–4 thereunder.[29] The Exchange has requested that the Commission waive the thirty-day operative delay so that the proposal may become operative immediately. The Exchange states that waiving the thirty-day operative delay will enable Market Makers to enhance their risk controls and risk management processes without additional delay. The Commission believes that waiving the thirty day delay is consistent with the protection of investors and the public interest. Therefore, the Commission hereby waives the thirty-day operative delay and designates the proposal effective upon filing.[30]

At any time within 60 days of the filing of the proposed rule change, the Commission summarily may temporarily suspend such rule change if it appears to the Commission that such action is: (i) Necessary or appropriate in the public interest; (ii) for the protection of investors; or (iii) otherwise in furtherance of the purposes of the Act. If the Commission takes such action, the Commission shall institute proceedings to determine whether the proposed rule should be approved or disapproved.

[28] 15 U.S.C. 78s(b)(3)(a)(ii).

[29] 17 CFR 240.19b–4(f)(6). In addition, Rule 19b–4(f)(6) requires a self-regulatory organization to give the Commission written notice of its intent to file the proposed rule change at least five business days prior to the date of filing of the proposed rule change, or such shorter time as designated by the Commission. The Exchange has satisfied this requirement.

[30] For purposes of waiving the 30-day operative delay, the Commission has considered the proposed rule's impact on efficiency, competition, and capital formation. *See* 15 U.S.C. 78c(f).

IV. Solicitation of Comments

Interested persons are invited to submit written data, views, and arguments concerning the foregoing, including whether the proposed rule change is consistent with the Act. Comments may be submitted by any of the following methods:

Electronic Comments

- Use the Commission's Internet comment form (*http://www.sec.gov/rules/sro.shtml*); or
- Send an email to *rule-comments@sec.gov. Please include File Number SR–Phlx–2015–52 on the subject line.*

Paper Comments

- Send paper comments in triplicate to Secretary, Securities and Exchange Commission, 100 F Street NE., Washington, DC 20549–1090.

All submissions should refer to File Number *SR–Phlx–2015–52.* This file number should be included on the subject line if email is used. To help the Commission process and review your comments more efficiently, please use only one method. The Commission will post all comments on the Commission's Internet Web site (*http://www.sec.gov/rules/sro.shtml*).

Copies of the submission, all subsequent amendments, all written statements with respect to the proposed rule change that are filed with the Commission, and all written communications relating to the proposed rule change between the Commission and any person, other than those that may be withheld from the public in accordance with the provisions of 5 U.S.C. 552, will be available for Web site viewing and printing in the Commission's Public Reference Room, 100 F Street NE., Washington, DC 20549, on official business days between the hours of 10:00 a.m. and 3:00 p.m. Copies of the filing also will be available for inspection and copying at the principal office of the Exchange. All comments received will be posted without change; the Commission does not edit personal identifying information from submissions. You should submit only information that you wish to make available publicly.

All submissions should refer to File Number *SR–Phlx–2015–52* and should be submitted on or before August 3, 2015.

For the Commission, by the Division of Trading and Markets, pursuant to delegated authority.[31]

Brent J. Fields,

Secretary.

BILLING CODE 8011–01–P

SECURITIES AND EXCHANGE COMMISSION

[Release No. 34–75381; File No. SR–CBOE–2015–065]

Self-Regulatory Organizations; Chicago Board Options Exchange, Incorporated; Notice of Filing and Immediate Effectiveness of a Proposed Rule Change to Extend a Pilot Program that Eliminates Position and Exercise Limits for Physically-Settled SPDR S&P 500 ETF Trust (''SPY'') Options

July 7, 2015.

Pursuant to Section 19(b)(1) of the Securities Exchange Act of 1934 (the ''Act''),[1] and Rule 19b–4 thereunder,[2] notice is hereby given that on July 1, 2015, Chicago Board Options Exchange, Incorporated (the ''Exchange'' or ''CBOE'') filed with the Securities and Exchange Commission (''Commission'') the proposed rule change as described in Items I and II below, which Items have been prepared by the Exchange. The Commission is publishing this notice to solicit comments on the proposed rule change from interested persons.

I. Self-Regulatory Organization's Statement of the Terms of the Substance of the Proposed Rule Change

The text of the proposed rule change is available on the Exchange's Web site (*http://www.cboe.com/AboutCBOE/CBOELegalRegulatoryHome.aspx*), at the Exchange's Office of the Secretary, and at the Commission's Public Reference Room.

II. Self-Regulatory Organization's Statement of the Purpose of, and Statutory Basis for, the Proposed Rule Change

In its filing with the Commission, the Exchange included statements concerning the purpose of and basis for the proposed rule change and discussed any comments it received on the proposed rule change. The text of these statements may be examined at the places specified in Item IV below. The

[31] 17 CFR 200.30–3(a)(12).

[1] 15 U.S.C. 78s(b)(1).

[2] 17 CFR 240.19b–4.

Exchange has prepared summaries, set forth in sections A, B, and C below, of the most significant aspects of such statements.

A. Self-Regulatory Organization's Statement of the Purpose of, and Statutory Basis for, the Proposed Rule Change

1. Purpose

The Exchange proposes to amend Interpretation and Policy .07 to Rule 4.11 (Position Limits) to extend the duration of the SPY Pilot Program.[3] The SPY Pilot Program is currently scheduled to expire on July 12, 2015 and this proposal would extend the SPY Pilot Program through July 12, 2016. There are no substantive changes being proposed to the SPY Pilot Program.

In proposing to extend the SPY Pilot Program, the Exchange reaffirms its consideration of several factors that supported its original proposal to establish the SPY Pilot Program, which include: (1) the liquidity of the option and the underlying security; (2) the market capitalization of the underlying security and the securities that make up the S&P 500 Index; (3) options reporting requirements; and (4) financial requirements imposed by CBOE and the Commission.

When the SPY Pilot Program was most recently renewed in January 2015, CBOE submitted a report providing an analysis of the SPY Pilot Program covering the first twelve months during which the SPY Pilot Program was in effect (the ''Pilot Report''). In the January extension, the Exchange stated that if it were to submit a proposal to either extend the SPY Pilot Program, adopt the SPY Pilot Program on a permanent basis, or terminate the SPY Pilot Program, it would submit another Pilot Report covering the period since the previous extension. [4] Accordingly, the Exchange is submitting another Pilot Report that details CBOE's experience with the SPY Pilot Program. The Pilot Report now includes the period of January 2015 through May 2015. The Pilot Report is attached as Exhibit 3. CBOE notes that it is unaware of any problems created by the SPY Pilot Program and does not foresee any as a result of the proposed extension. In extending the SPY Pilot Program, the Exchange states that if CBOE were to propose another extension, permanent approval or termination of the SPY Pilot Program, the Exchange will submit another Pilot Report covering the period since the previous extension, which will be submitted at least 30 days before the end of the proposed extension. If the SPY Pilot Program is not extended or adopted on a permanent basis by July 12, 2016, position limits in SPY will revert to their Pre-Pilot levels.

2. Statutory Basis

The Exchange believes the proposed rule change is consistent with the Securities Exchange Act of 1934 (the ''Act'') and the rules and regulations thereunder applicable to the Exchange and, in particular, the requirements of Section 6(b) of the Act.[5] Specifically, the Exchange believes the proposed rule change is consistent with the Section 6(b)(5) [6] requirements that the rules of an exchange be designed to prevent fraudulent and manipulative acts and practices, to promote just and equitable principles of trade, to remove impediments to and perfect the mechanism of a free and open market and a national market system, and, in general, to protect investors and the public interest. Specifically, the Exchange believes that extending the SPY Pilot Program promotes just and equitable principles of trade by permitting market participants, including market makers, institutional investors and retail investors, to establish greater positions when pursuing their investment goals and needs. Extending the SPY Pilot Program will give the Exchange and the Commission additional time to evaluate the pilot and its effect on the market.

B. Self-Regulatory Organization's Statement on Burden on Competition

The Exchange does not believe that the proposed rule change will impose any burden on competition that is not necessary or appropriate in furtherance of the purposes of the Act. The proposed rule change is not designed to address any aspect of competition, whether between the Exchange and its competitors, or among market participants. Instead, the proposed rule change is designed to allow the SPY Pilot Program to continue as the Exchange expects other SROs will propose similar extensions.

C. Self-Regulatory Organization's Statement on Comments on the Proposed Rule Change Received from Members, Participants, or Others

The Exchange neither solicited nor received comments on the proposed rule change.

III. Date of Effectiveness of the Proposed Rule Change and Timing for Commission Action

Because the foregoing proposed rule change does not: (i) significantly affect the protection of investors or the public interest; (ii) impose any significant burden on competition; and (iii) become operative for 30 days from the date on which it was filed, or such shorter time as the Commission may designate, it has become effective pursuant to Section 19(b)(3)(A) of the Act and Rule 19b–4(f)(6) thereunder.[7]

A proposed rule change filed pursuant to Rule 19b–4(f)(6) under the Act [8] normally does not become operative for 30 days after the date of its filing. However, Rule 19b–4(f)(6)(iii) [9] permits the Commission to designate a shorter time if such action is consistent with the protection of investors and the public interest. The Exchange has asked the Commission to waive the 30-day operative delay, noting that such waiver will allow the Exchange to extend the pilot program prior to its expiration on July 12, 2015. In addition, the Exchange believes that waiver of the operative delay is consistent with the protection of investors and the public interest because it will allow for the least amount of market disruption as the pilot will continue as it currently does maintaining the status quo. The Commission believes that waiving the 30-day operative delay is consistent with the protection of investors and the public interest. Therefore, the Commission hereby waives the operative delay and designates the proposed rule change operative upon filing.[10]

At any time within 60 days of the filing of the proposed rule change, the Commission summarily may temporarily suspend such rule change if it appears to the Commission that such

action is necessary or appropriate in the public interest, for the protection of investors, or otherwise in furtherance of the purposes of the Act. If the Commission takes such action, the Commission shall institute proceedings to determine whether the proposed rule should be approved or disapproved.

IV. Solicitation of Comments

Interested persons are invited to submit written data, views, and arguments concerning the foregoing, including whether the proposed rule change is consistent with the Act. Comments may be submitted by any of the following methods:

Electronic Comments

- Use the Commission's Internet comment form (*http://www.sec.gov/rules/sro.shtml*); or
- Send an email to *rule-comments@sec.gov.* Please include File Number SR–CBOE–2015–065 on the subject line.

Paper Comments

- Send paper comments in triplicate to Brent J. Fields, Secretary, Securities and Exchange Commission, 100 F Street NE., Washington, DC 20549–1090.

All submissions should refer to File Number SR–CBOE–2015–065. This file number should be included on the subject line if email is used. To help the Commission process and review your comments more efficiently, please use only one method. The Commission will post all comments on the Commission's Internet Web site (*http://www.sec.gov/rules/sro.shtml*). Copies of the submission, all subsequent amendments, all written statements with respect to the proposed rule change that are filed with the Commission, and all written communications relating to the proposed rule change between the Commission and any person, other than those that may be withheld from the public in accordance with the provisions of 5 U.S.C. 552, will be available for Web site viewing and printing in the Commission's Public Reference Room, 100 F Street, NE., Washington, DC 20549 on official business days between the hours of 10:00 a.m. and 3:00 p.m. Copies of such filing also will be available for inspection and copying at the principal office of the Exchange. All comments received will be posted without change; the Commission does not edit personal identifying information from submissions. You should submit only information that you wish to make available publicly. All submissions should refer to File Number SR–CBOE–2015–065, and should be submitted on or before August 3,2015.

BILLING CODE 8011–01–P

SECURITIES AND EXCHANGE COMMISSION

[Release No. 34–75376; File No. SR–NYSEArca–2015–18]

Self-Regulatory Organizations; NYSE Arca, Inc.; Order Granting Approval of Proposed Rule Change Relating to Listing and Trading Under NYSE Arca Equities Rule 5.2(j)(3), Commentary .02 of Shares of the Vanguard Tax-Exempt Bond Index Fund

July 7, 2015.

I. Introduction

On April 6, 2015, NYSE Arca, Inc. (''Exchange'' or ''NYSE Arca'') filed with the Securities and Exchange Commission (''Commission''), pursuant to Section 19(b)(1) of the Securities Exchange Act of 1934 (''Act'')[1] and Rule 19b–4 thereunder,[2] a proposed rule change to list and trade under NYSE Arca Equities Rule 5.2(j)(3), Commentary .02, the shares (''Shares'') of the Vanguard Tax-Exempt Bond Index Fund (''Fund''). The proposed rule change was published for comment in the **Federal Register** on April 16, 2015.[3] On May 26, 2015, the Commission extended the time period in which to approve the proposed rule change, disapprove the proposed rule change, or institute proceedings to determine whether the proposed rule change should be disapproved.[4] The Commission received no comments on the proposed rule change. This order grants approval of the proposed rule change.

II. Description of the Proposed Rule Change

The Exchange proposes to list and trade Shares of the Fund under NYSE Arca Equities Rule 5.2(j)(3), Commentary .02, which governs the listing and trading of Investment Company Units (''Units'') based on fixed income securities indexes. The Fund is a series of the Vanguard Municipal Bond Funds Trust (''Trust'').[5] The Vanguard Group, Inc. will be the investment adviser to the Fund (''Adviser''). State Street Bank and Trust Company will serve as custodian for the Fund. Vanguard Marketing Corporation will be the distributor for the Shares.

A. Principal Investments of the Fund

According to the Exchange, the Fund will seek to track the performance of a benchmark index that measures the investment-grade segment of the U.S. municipal bond market, as described below. The Fund will invest by sampling its benchmark index, meaning that it will hold a range of securities that, in the aggregate, approximates the full index in terms of key risk factors and other characteristics. All of the Fund's investments will be selected through the sampling process, and, under normal circumstances,[6] at least 80% of the Fund's assets will be invested in securities held in its benchmark index. Under normal circumstances, at least 80% of the Fund's income will be exempt from federal income taxes.

According to the Exchange, the Fund has proposed to use the Standard & Poor's National AMT-Free Municipal Bond Index (''Index'') as its benchmark index.[7] The Index includes municipal bonds from issuers that are primarily state or local governments or agencies whose interest is exempt from U.S. federal income taxes and the federal alternative minimum tax (''AMT''). To be eligible for inclusion in the Index, each bond must have a rating of at least investment-grade, as determined by a nationally recognized statistical rating organization (*e.g.*, at least BBB–by Fitch Ratings, Inc.); be denominated in U.S.

---

[11] 17 CFR 200.30–3(a)(12).

[1] 15 U.S.C. 78s(b)(1).

[2] 17 CFR 240.19b–4.

[3] *See* Securities Exchange Act Release No. 74701 (April 10, 2015), 80 FR 20529 (''Notice'').

[4] *See* Securities Exchange Act Release No. 75042, 80 FR 31090 (June 1, 2015).

[5] The Exchange represents that, on January 6, 2015, the Trust filed a registration statement (''Registration Statement'') on Form N–1A under the Securities Act of 1933 and the Investment Company Act of 1940 *(''1940 Act'')* (File *Nos.* 2–57689 and 811–02687). According to the Exchange, the Trust has obtained certain exemptive relief from the Commission under the 1940 Act. *See* Investment Company Act Release No. 27773 (April 2, 2007) (File No. 812–13336).

[6] According to the Exchange, term ''under normal circumstances'' includes, but is not limited to, the absence of extreme volatility or trading halts in the fixed income markets or the financial markets generally; operational issues causing dissemination of inaccurate market information; or force majeure type events such as systems failure, natural or man-made disaster, act of God, armed conflict, act of terrorism, riot or labor disruption, or any similar intervening circumstance.

[7] S&P Dow Jones Indices (''S&P'') is the ''Index Provider'' with respect to the Index. According to the Exchange, the Index Provider is not a broker-dealer or affiliated with a broker-dealer and has implemented procedures designed to prevent the use and dissemination of material, non-public information regarding the Index.

dollars; and have a minimum par amount of $25 million. In addition, to be included in the Index, each bond must have a minimum term to maturity and/or pre-refunded or call date greater than or equal to one calendar month. The following bond types are specifically excluded from the Index: bonds subject to the AMT; commercial paper; derivative securities (inverse floaters, forwards, swaps); housing bonds; insured conduit bonds where the obligor is a for-profit institution; non-insured conduit bonds; non-rated bonds; notes; taxable municipals; tobacco bonds; and variable rate debt. Each bond in the Index must be a constituent of a deal where the deal's original offering amount was at least $100 million. Index constituents normally undergo a review and rebalancing once a month. At each monthly rebalancing, no one issuer can represent more than 25% of the weight of the Index, and individual issuers that represent at least 5% of the weight of the Index cannot account for more than 50% of the weight of the Index in the aggregate.

B. Other Investments

According to the Exchange, while under normal circumstances, at least 80% of the Fund's assets will be invested in securities held in its benchmark index, as described above, the Fund may invest up to 20% of its assets in other securities and financial instruments. According to the Exchange, examples of these other securities and financial instruments are nonpublic, investment-grade securities, generally referred to as 144A securities, as well as smaller public issues or medium-term notes not included in its benchmark index because of the small size of the issue. The Fund may invest in non-investment-grade securities, variable and floating rate securities, exchange-traded funds, hybrid instruments, Build America Bonds, variable-rate demand-preferred securities issued by closed-end municipal bond funds, and tender option bond programs. Other investments subject to the 20% limit also include U.S. Treasury futures contracts, exchange-traded and over-the-counter (''OTC'') options on such futures contracts, exchange-traded and OTC fixed income options, centrally cleared and non-centrally cleared interest rate swaps, centrally cleared and non-centrally cleared total return swaps, and centrally cleared and non-centrally cleared credit default swaps.

C. Investment Restrictions

According to the Exchange, the Fund may invest in other investment companies to the extent permitted by applicable law or Commission exemption and consistent with Section 12(d)(1) of the 1940 Act. The Fund may hold up to an aggregate amount of 15% of its net assets in illiquid assets (calculated at the time of investment), including Rule 144A securities deemed illiquid by the Adviser, in accordance with Commission guidance. The Fund will monitor its portfolio liquidity on an ongoing basis to determine whether, in light of current circumstances, an adequate level of liquidity is being maintained, and will consider taking appropriate steps in order to maintain adequate liquidity if, through a change in values, net assets, or other circumstances, more than 15% of the Fund's net assets are held in illiquid securities.

The Exchange states that the Fund is classified as diversified within the meaning of the 1940 Act [8] and that the Fund intends to maintain the required level of diversification and otherwise conduct its operations so as to qualify as a ''regulated investment company'' for purposes of the Internal Revenue Code of 1986.[9]

D. NYSE Arca Equities Rule 5.2(j)(3)

The Exchange submitted this proposed rule change because the Index for the Fund does not meet all of the ''generic'' listing requirements of Commentary .02 to NYSE Arca Equities Rule 5.2(j)(3) applicable to the listing of Units based on fixed income securities indexes. The Exchange represented that the Index meets all such requirements except for those set forth in Commentary .02(a)(2).[10] Specifically, as of February 7, 2015, 33.69% of the weight of the Index components have a minimum original principal amount outstanding of $100 million or more.

Additional information regarding the Trust, the Fund, and the Shares, including investment strategies, risks, creation and redemption procedures, fees, portfolio holdings, distributions, and taxes, among other things, is included in the Notice and Registration Statement, as applicable.[11]

[8] The diversification standard is set forth in Section 5(b)(1) of the 1940 Act.

[9] 26 U.S.C. 851.

[10] Commentary .02(a)(2) to NYSE Arca Equities Rule 5.2(j)(3) provides that components that in the aggregate account for at least 75% of the weight of the index or portfolio each shall have a minimum original principal amount outstanding of $100 million or more.

[11] *See* Notice and Registration Statement, *supra* notes 3 and 5, respectively.

III. Discussion and Commission's Findings

After careful review, the Commission finds that the proposed rule change is consistent with the requirements of Section 6 of the Act [12] and the rules and regulations thereunder applicable to a national securities exchange.[13] In particular, the Commission finds that the proposal is consistent with Section 6(b)(5) of the Act,[14] which requires, among other things, that the Exchange's rules be designed to promote just and equitable principles of trade, to remove impediments to, and perfect the mechanism of, a free and open market and a national market system, and, in general, to protect investors and the public interest.

The Commission finds that the proposal to list and trade the Shares on the Exchange is consistent with Section 11A(a)(1)(C)(iii) of the Act,[15] which sets forth Congress' finding that it is in the public interest and appropriate for the protection of investors and the maintenance of fair and orderly markets to assure the availability to brokers, dealers, and investors of information with respect to quotations for, and transactions in, securities. Quotation and last-sale information for the Shares will be available via the Consolidated Tape Association (''CTA'') high-speed line. The current value of the Index will be widely disseminated by one or more major market data vendors [16] at least once per day, as required by NYSE Arca Equities Rule 5.2(j)(3), Commentary .02(b)(ii). In addition, an Intraday Indicative Value (''IIV'') for the Shares of the Fund will be disseminated by one or more major market data vendors and updated at least every 15 seconds during the Core Trading Session (9:30 a.m. to 4:00 p.m. Eastern Time).[17] Information regarding market price and trading volume of the Shares will be continually available on a real-time basis throughout the day on brokers' computer screens and other electronic services. The Web site for the Fund will include the prospectus for the Fund and additional data relating to net asset

[12] 15 U.S.C. 78f.

[13] In approving this proposed rule change, the Commission has considered the proposed rule's impact on efficiency, competition, and capital formation. *See* 15 U.S.C. 78c(f).

[14] 17 U.S.C. 78f(b)(5).

[15] 15 U.S.C. 78k–1(a)(1)(C)(iii).

[16] The Exchange further states that the components of the Index and their percentage weighting will be available from major market data vendors.

[17] *See* NYSE Arca Equities Rule 5.2(j)(3), Commentary .02(c). According to the Exchange, several major market data vendors display and/or make widely available IIVs taken from the CTA or other data feeds. *See* Notice, *supra* note 3, at n.17.

value (''NAV'') and other applicable quantitative information. The portfolio of securities held by the Fund will also be disclosed monthly on the Fund's Web site.

The Commission believes that the proposal to list and trade the Shares is reasonably designed to promote fair disclosure of information that may be necessary to price the Shares appropriately and to prevent trading when a reasonable degree of transparency cannot be assured. The Exchange states that the Index Provider is not a broker-dealer or affiliated with a broker-dealer, and has implemented procedures designed to prevent the use and dissemination of material, non-public information regarding the Index.[18] Prior to the commencement of trading, the Exchange will inform its Equity Trading Permit Holders (''ETP Holders'') in an Information Bulletin of the special characteristics and risks associated with trading the Shares. With respect to trading halts, if the Exchange becomes aware that the NAV is not being disseminated to all market participants at the same time, it will halt trading in the Shares until such time as the NAV is available to all market participants. In addition, the Exchange may consider all relevant factors in exercising its discretion to halt or suspend trading in the Shares of the Fund. Trading may be halted because of market conditions or for reasons that, in the view of the Exchange, make trading in the Shares inadvisable. The Exchange represents that, if the IIV or the Index value is not being disseminated as required, the Exchange may halt trading during the day in which the interruption to the dissemination of the IIV or Index value occurs. If the interruption to the dissemination of the IIV or Index value persists past the trading day in which it occurred, the Exchange will halt trading. Moreover, trading in Shares of the Fund will be halted if the circuit breaker parameters in NYSE Arca Equities Rule 7.12 have been reached or because of market conditions or for reasons that, in the view of the Exchange, make trading in the Shares inadvisable. Further, trading in the Shares will be subject to NYSE Arca Equities Rule 7.34, which sets forth additional circumstances under which Shares of the Fund may be halted.

Based on the Exchange's representations, the Commission believes that the Index is sufficiently broad-based to deter potential manipulation. As of February 7, 2015, 98.72% of the weight of the Index components was composed of individual maturities that were part of an entire municipal bond offering with a minimum original principal amount outstanding of $100 million or more for all maturities of the offering. In addition, the total dollar amount outstanding of issues in the Index was approximately $2.424 billion and the average dollar amount outstanding of issues in the Index was approximately $60 million. Further, the Index is composed of approximately 10,015 component issues and 969 unique issuers, and the most heavily weighted component represents 0.27% of the weight of the Index and the five most heavily weighted components represent 0.96% of the weight of the Index. In addition, the average daily notional trading volume for Index components for the period from January 2, 2014 to December 31, 2014 was $1,272,356,609 and the sum of the notional trading volumes for the same period was $318,089,152,147.

In support of this proposal, the Exchange has made representations, including:

(1) Except for Commentary .02(a)(2) to NYSE Arca Equities Rule 5.2(j)(3), the Shares of the Fund currently satisfy all of the generic listing standards under NYSE Arca Equities Rule 5.2(j)(3).

(2) The initial and continued listing standards under NYSE Arca Equities Rules 5.2(j)(3) and 5.5(g)(2) applicable to Units shall apply to the Shares.

(3) The Shares will comply with all other requirements applicable to Units including, but not limited to, requirements relating to the dissemination of key information, such as the value of the Index and IIV, rules governing the trading of equity securities, trading hours, trading halts, surveillance, and the Information Bulletin to ETP Holders (each as described in more detail in the Notice and Registration Statement, as applicable), as set forth in Exchange rules applicable to Units and prior Commission orders approving the generic listing rules applicable to the listing and trading of Units.

(4) The Exchange represents that trading in the Shares will be subject to the existing trading surveillances, administered by the Financial Industry Regulatory Authority (''FINRA'') on behalf of the Exchange, which are designed to detect violations of Exchange rules and applicable federal securities laws.[19] The Exchange represents that these procedures are adequate to properly monitor Exchange trading of the Shares in all trading sessions and to deter and detect violations of Exchange rules and federal securities laws applicable to trading on the Exchange.

(5) FINRA, on behalf of the Exchange, will communicate as needed regarding trading in the Shares with other markets or other entities that are members of the Intermarket Surveillance Group (''ISG''), and FINRA may obtain trading information regarding trading in the Shares from such markets or entities. FINRA also can access data obtained from the Municipal Securities Rulemaking Board relating to municipal bond trading activity for surveillance purposes in connection with trading in the Shares. The Exchange also may obtain information regarding trading in the Shares from markets or other entities that are members of ISG or with which the Exchange has in place a comprehensive surveillance sharing agreement.

(6) For initial and continued listing of the Shares, the Trust is required to comply with Rule 10A–3 under the Act.[20]

(7) The Fund generally will invest at least 80% of its assets in the securities of the Index.

(8) The Fund may at times invest up to 20% of its assets in other securities and financial instruments as described in further detail in the Notice.

This approval order is based on all of the Exchange's representations, including those set forth above and in the Notice, and the Exchange's description of the Fund.

For the foregoing reasons, the Commission finds that the proposed rule change is consistent with Section 6(b)(5) of the Act[21] and the rules and regulations thereunder applicable to a national securities exchange.

IV. Conclusion

It is therefore ordered, pursuant to Section 19(b)(2) of the Act,[22] that the proposed rule change (SR–NYSEArca–2015–18) be, and it hereby is, approved.

For the Commission, by the Division of Trading and Markets, pursuant to delegated authority.[23]

Brent J. Fields,

Secretary.

SECURITIES AND EXCHANGE COMMISSION

[Release No. 34–75378; File No. SR–CBOE–2015–067]

Self-Regulatory Organizations; Chicago Board Options Exchange, Incorporated; Notice of Filing and Immediate Effectiveness of a Proposed Rule Change to Delay Implementation of Tied to Stock Marking Requirement for Certain Orders

July 7, 2015.

Pursuant to Section 19(b)(1) of the Securities Exchange Act of 1934 (the ''Act''),[1] and Rule 19b–4 thereunder,[2] notice is hereby given that on July 1, 2015, Chicago Board Options Exchange, Incorporated (the ''Exchange'' or ''CBOE'') filed with the Securities and Exchange Commission (the ''Commission'') the proposed rule change as described in Items I and II below, which Items have been prepared by the Exchange. The Exchange filed the proposal as a ''non-controversial'' proposed rule change pursuant to Section 19(b)(3)(A)(iii) of the Act[3] and Rule 19b–4(f)(6) thereunder.[4] The Commission is publishing this notice to solicit comments on the proposed rule change from interested persons.

I. Self-Regulatory Organization's Statement of the Terms of Substance of the Proposed Rule Change

The Exchange proposes to delay the implementation of the marking requirement set forth in Rule 6.53(y) with respect to certain orders. There is no proposed change to the rule text.

II. Self-Regulatory Organization's Statement of the Purpose of, and Statutory Basis for, the Proposed Rule Change

In its filing with the Commission, the Exchange included statements concerning the purpose of and basis for the proposed rule change and discussed any comments it received on the proposed rule change. The text of these statements may be examined at the places specified in Item IV below. The Exchange has prepared summaries, set forth in sections A, B, and C below, of the most significant aspects of such statements.

A. Self-Regulatory Organization's Statement of the Purpose of, and Statutory Basis for, the Proposed Rule Change

1. Purpose

On August 13, 2014, the Securities and Exchange Commission (the ''Commission'') approved CBOE Rules 6.53(y) and 15.2A.[5] Rule 6.53(y) defines a tied to stock order[6] and requires the representing Trading Permit Holder to include an indicator on each tied to stock order upon systemization, subject to certain exceptions. Rule 15.2A requires, in a manner and form prescribed by the Exchange, each Trading Permit Holder (''TPH''), on the business day following the order execution date, to report to the Exchange certain information regarding the executed stock or convertible security legs of qualified contingent cross (''QCC'') orders,[7] stock-option orders and other tied to stock orders that the TPH executed on the Exchange that trading day. The Exchange stated in rule filing SR–CBOE–2014–040 that it would issue a circular announcing the implementation date for these rules within 90 days of the date of filing, which implementation date would be within 180 days of the date of filing.

On January 7, 2015, CBOE submitted a rule filing to delay the implementation of these rules based on feedback it received from TPHs.[8] The Exchange stated in that rule filing that it would issue a circular announcing the implementation date for the rules within 90 days of the date of the rule

[1] 15 U.S.C. 78s(b)(1).

[2] 17 CFR 240.19b–4.

[3] 15 U.S.C. 78s(b)(3)(A)(iii).

[4] 17 CFR 240.19b–4(f)(6).

[5] Securities Exchange Act Release No. 72839 (August 13, 2014), 79 FR 49123 (August 19, 2014) (SR–CBOE–2014–040) (order approving Rules 6.53(y) and 15.2A).

[6] Rule 6.53(y) provides that an order is ''tied to stock'' if, at the time the Trading Permit Holder representing the order on the Exchange receives the order (if the order is a customer order) or initiates the order (if the order is a is a proprietary order), has knowledge that the order is coupled with an order(s) for the underlying stock or a security convertible into the underlying stock (''convertible security'' and, together with underlying stock, ''non-option'').

[7] A QCC order is an order to buy (sell) at least 1,000 standard option contracts or 10,000 mini-option contracts that is identified as being part of a qualified contingent trade coupled with a contra-side order to sell (buy) an equal number of contracts. These orders may only be entered in the standard increments applicable to simple orders in the options class under Rule 6.42. For purposes of this order type, a ''qualified contingent trade'' is a transaction consisting of two or more component orders, executed as agent or principal, where: (a) at least one component is an NMS stock, as defined in Rule 600 of Regulation NMS under the Act; (b) all components are effected with a product or price contingency that either has been agreed to by all the respective counterparties or arranged for by a broker-dealer as principal or agent; (c) the execution of one component is contingent upon the execution of all other components at or near the same time; (d) the specific relationship between the component orders (*e.g.,* the spread between the prices of the component orders) is determined by the time the contingent order is placed; (e) the component orders bear a derivative relationship to one another, represent different classes of shares of the same issuer, or involve the securities of participants in mergers or with intentions to merge that have been announced or cancelled; and (f) the transaction is fully hedged (without regard to any prior existing position) as a result of other components of the contingent trade. QCC orders may execute without exposure provided the execution is not at the same price as a public customer order resting in the electronic book and is at or between the national best bid or offer. A QCC order will be cancelled if it cannot be executed. *See* Rule 6.53(u). The Exchange notes that it deactivated the QCC functionality effective August 11, 2014 and will announce any reactivation of QCC functionality by Regulatory Circular. *See* Regulatory Circular RG14–121.

[8] Securities Exchange Act Release No. 34–74067 (January 15, 2015), 80 FR 3267 (January 22, 2015) (SR–CBOE–2015–004) (notice of immediate effectiveness of rule filing).

filing, which implementation date would be within 180 days of the date of filing. In accordance with that filing, the Exchange recently issued a regulatory circular on April 7, 2015, which announced a July 1, 2015 implementation date for the tied to stock marking and reporting requirements.[9] On May 20, 2015, CBOE submitted a rule filing to further delay the implementation of the reporting requirement set forth in Rule 15.2A in order to evaluate the format of the reports in light of its entry into a Regulatory Services Agreement with the Financial Industry Regulatory Authority, Inc. (''FINRA'').[10] In that filing, CBOE announced its intention to proceed with the implementation of the marking requirement set forth in Rule 6.53(y) on July 1, 2015.

The Exchange believes it is appropriate to implement on a limited basis the marking requirement on July 1, 2015 with respect to orders sent to the Exchange for nonelectronic processing (*i.e.,* orders received and systematized by floor brokers handling orders on the CBOE trading floor), but proposes to delay the implementation of the marking requirement with respect to all other orders (*i.e.,* orders submitted to the Exchange for electronic processing). While the Exchange continues to believe that there has been sufficient notice, training and circulars provided to Trading Permit Holders on the marking requirement with respect to electronic orders, based on recent feedback from Trading Permit Holders regarding their development efforts related to the marking requirement, CBOE believes it is appropriate to provide Trading Permit Holders with additional time to complete their necessary systems development work to comply with this new marking requirement. However, since CBOE has completed development work to allow floor brokers to mark orders as tied to stock on devices approved by the Exchange that may be used on the trading floor for the systemization of orders represented in open outcry,[11] CBOE believes it is appropriate to move forward with implementing the tied to stock marking requirement with respect to those orders.

CBOE delayed the implementation of Rule 15.2A for 12 to 18 months from the date of the filing that proposed that delay.[12] CBOE proposes to similarly delay implementation of the tied to stock marking requirement in Rule 6.53(y) with respect to orders submitted for electronic processing for 6 to 18 months from the date of this filing.[13] This will provide Trading Permit Holders with sufficient time to complete their systems development work to comply with the tied to stock marking requirement. During the delay, as part of CBOE's evaluation it is conducting in connection with the delay of the implementation of the reporting requirement, CBOE will evaluate the number of orders represented in open outcry that are marked as tied to stock, which will permit CBOE to evaluate the number of reports it can expect to receive with respect to those orders and the potential impact of the reports on CBOE's surveillances. The Exchange will issue a regulatory circular announcing the new implementation date for the reporting requirement as least 180 days prior to that date.

2. Statutory Basis

The Exchange believes the proposed rule change is consistent with the Act and the rules and regulations thereunder applicable to the Exchange and, in particular, the requirements of Section 6(b) of the Act.[14] Specifically, the Exchange believes the proposed rule change is consistent with the Section 6(b)(5) [15] requirements that the rules of an exchange be designed to prevent fraudulent and manipulative acts and practices, to promote just and equitable principles of trade, to foster cooperation and coordination with persons engaged in regulating, clearing, settling, processing information with respect to, and facilitating transactions in securities, to remove impediments to and perfect the mechanism of a free and open market and a national market system, and, in general, to protect investors and the public interest. Additionally, the Exchange believes the proposed rule change is consistent with the Section 6(b)(5) [16] requirement that the rules of an exchange not be designed to permit unfair discrimination between customers, issuers, brokers, or dealers.

In particular, the Exchange believes the delayed implementation of Rule 6.53(y) with respect to orders submitted to the Exchange for electronic processing will provide Trading Permit Holders with sufficient time to perform systems development work that will allow them to comply with the marking requirement for those orders, which will prevent fraudulent and manipulative acts and practices and promote just and equitable principles of trade. Additionally, the proposed delay will provide the Exchange with sufficient time to evaluate the information obtained through the marking requirement with respect to orders submitted for nonelectronic processing, as part of its ongoing evaluation of the related reporting requirement format. The Exchange believes the ability to tie executed non-option legs to the applicable option legs that were separately submitted for execution will assist in the Exchange's efforts to prevent fraudulent and manipulative acts and practices with respect to tied to stock orders, but only if Trading Permit Holders are able to apply the marking in accordance with the rule.

B. Self-Regulatory Organization's Statement on Burden on Competition

CBOE does not believe that the proposed rule change will impose any burden on competition that is not necessary or appropriate in furtherance of the purposes of the Act. The proposed change does not impose any burden on competition, as it is simply seeking to delay the implementation of the tied to stock marking requirement with respect to certain orders. The implementation on July 1, 2015 of the marking requirement with respect to orders sent to the Exchange for nonelectronic processing is consistent with previous rule filings and was announced to Trading Permit Holders in regulatory circulars.

---

[9] CBOE Regulatory Circular RG15–056 (April 7, 2015).

[10] Securities Exchange Act Release No. 34–75029 (May 21, 2015), 80 FR 30506 (May 28, 2015) (SR–CBOE–2015–051) (notice of immediate effectiveness of rule filing).

[11] Currently, the only Exchange-approved devices are the PULSe workstation, the Floor Broker Workstation (''FBW'') and FBW 2, which CBOE makes available to floor brokers. Pursuant to Rule 6.53(y), Trading Permit Holders representing tied to stock orders on the Exchange must apply the marking at the time of systemization of the order.

[12] *See supra* note 10. In that filing, CBOE indicated that it planned to evaluate the format of the reports with FINRA to ensure that the information to be provided in the reports can be incorporated into surveillances in an efficient and effective manner. During the delay, CBOE intends to review the number of tied to stock orders for which information regarding the stock or convertible security leg is not available from CBOE's internal data (which will permit CBOE to evaluate the number of reports it can expect to receive and the potential impact of the reports on CBOE's surveillances) and determine whether this additional information is necessary in order to enhance its ability to effectively monitor and conduct surveillance of the CBOE markets with respect to tied to stock orders whose execution information is not electronically captured by the audit trail.

[13] The Exchange may still implement the reporting requirement and the marking requirement for electronic orders at separate times.

[14] 15 U.S.C. 78f(b).

[15] 15 U.S.C. 78f(b)(5).

[16] *Id.*

C. Self-Regulatory Organization's Statement on Comments on the Proposed Rule Change Received from Members, Participants, or Others

The Exchange neither solicited nor received comments on the proposed rule change.

III. Date of Effectiveness of the Proposed Rule Change and Timing for Commission Action

Because the foregoing proposed rule change does not: (i) significantly affect the protection of investors or the public interest; (ii) impose any significant burden on competition; and (iii) become operative for 30 days from the date on which it was filed, or such shorter time as the Commission may designate, it has become effective pursuant to Section 19(b)(3)(A)(ii) of the Act [17] and subparagraph (f)(6) of Rule 19b–4 thereunder.[18]

A proposed rule change filed under Rule 19b–4(f)(6) [19] normally does not become operative for 30 days after the date of filing. However, pursuant to Rule 19b–4(f)(6)(iii) [20] the Commission may designate a shorter time if such action is consistent with the protection of investors and the public interest. The Exchange requested that the Commission waive the 30-day operative delay. The Exchange noted this proposed rule change merely further delays implementation of a marking requirement with respect to certain orders. The Exchange also previously indicated it would implement the marking requirement by July 6, 2015, which date is less than 30 days from the date of the filing. According to the Exchange, Trading Permit Holders have provided feedback that they will not be in a position to comply the marking requirement for electronic orders by that date. The Exchange believes the Commission should waive the operative delay to ensure that the Exchange will not be required to implement the marking requirement with respect to those orders prior to Trading Permit Holders having compliant systems ready to apply the marking.

The Commission believes that waiving the 30-day operative delay is consistent with the protection of investors and the public interest. Delaying the July 1, 2015 implementation date will allow more time for the Exchange and Trading Permit Holders to work together to ensure that Trading Permit Holder have compliant systems. For this reason, the Commission designates the proposed rule change to be operative on July 1, 2015.[21]

At any time within 60 days of the filing of the proposed rule change, the Commission summarily may temporarily suspend such rule change if it appears to the Commission that such action is necessary or appropriate in the public interest, for the protection of investors, or otherwise in furtherance of the purposes of the Act.

IV. Solicitation of Comments

Interested persons are invited to submit written data, views, and arguments concerning the foregoing, including whether the proposed rule change is consistent with the Act. Comments may be submitted by any of the following methods:

Electronic Comments

- Use the Commission's Internet comment form (*http://www.sec.gov/rules/sro.shtml);* or
- Send an email to *rule-comments@sec.gov. Please include File Number SR–CBOE–2015–067 on the subject line.*

Paper Comments

- Send paper comments in triplicate to Secretary, Securities and Exchange Commission, 100 F Street, NE., Washington, DC 20549–1090.

All submissions should refer to File Number SR–CBOE–2015–067. This file number should be included on the subject line if email is used. To help the Commission process and review your comments more efficiently, please use only one method. The Commission will post all comments on the Commission's Internet Web site (*http://www.sec.gov/rules/sro.shtml).* Copies of the submission, all subsequent amendments, all written statements with respect to the proposed rule change that are filed with the Commission, and all written communications relating to the proposed rule change between the Commission and any person, other than those that may be withheld from the public in accordance with the provisions of 5 U.S.C. 552, will be available for Web site viewing and printing in the Commission's Public Reference Room, 100 F Street, NE., Washington, DC 20549 on official business days between the hours of 10:00 a.m. and 3:00 p.m. Copies of the filing also will be available for inspection and copying at the principal office of the Exchange. All comments received will be posted without change; the Commission does not edit personal identifying information from submissions. You should submit only information that you wish to make available publicly. All submissions should refer to File Number SR–CBOE–2015–067 and should be submitted on or before August 3, 2015.

For the Commission, by the Division of Trading and Markets, pursuant to delegated authority.[22]

Brent J. Fields,

Secretary.

DEPARTMENT OF STATE

[Public Notice: 9186]

Overseas Security Advisory Council (OSAC) Meeting Notice; Closed Meeting

The Department of State announces a meeting of the U.S. State Department—Overseas Security Advisory Council on August 25–26, 2015. Pursuant to section 10(d) of the Federal Advisory Committee Act (5 U.S.C. Appendix), 5 U.S.C. 552b(c)(4), and 5 U.S.C. 552b(c)(7)(E), it has been determined that the meeting will be closed to the public. The meeting will focus on an examination of corporate security policies and procedures and will involve extensive discussion of trade secrets and proprietary commercial information that is privileged and confidential, and will discuss law enforcement investigative techniques and procedures. The agenda will include updated committee reports, a strategic planning session, and other matters relating to private sector security policies and protective programs and the protection of U.S. business information overseas.

For more information, contact Marsha Thurman, Overseas Security Advisory Council, U.S. Department of State, Washington, DC 20522–2008, phone: 571–345–2214.

Dated: June 30, 2015.

Bill A. Miller,

Director of the Diplomatic, Security Service, U.S. Department of State.

Federal Aviation Administration

Notice of Public Workshops for the Draft Re-Evaluation of the O'Hare Modernization Environmental Impact Statement

AGENCY: Federal Aviation Administration, DOT.

ACTION: Notice of Public Workshops for the Draft Re-Evaluation of the O'Hare Modernization Environmental Impact Statement.

SUMMARY: The Federal Aviation Administration (FAA) announces its intent to host Public Workshops for the Draft Written Re-Evaluation of the O'Hare Modernization Environmental Impact Statement (Draft Re-Evaluation) for Chicago O'Hare International Airport, Chicago, Illinois.

The Draft Re-Evaluation will identify the potential environmental impacts associated with the construction schedule modification that alters the timing for commissioning new Runway 10R/28L, new Runway 9C/27C, and the extension of Runway 9R/27L at O'Hare International Airport pursuant to the National Environmental Policy Act.

The FAA will host Public Workshops on the Draft Re-Evaluation. The Public Workshops on the Draft Re-Evaluation will be held on the following dates: Monday, August 10, 2015, at White Eagle Banquets, 6839 North Milwaukee Avenue, Niles, Illinois 60714; Tuesday, August 11, 2015, at Taft High School, 6530 West Bryn Mawr Avenue, Chicago, Illinois 60631; Wednesday, August 12, 2015, at Monty's Elegant Banquets, 703 South York Road, Bensenville, Illinois 60106; Thursday, August 13, 2015, at Belvedere Events and Banquets, 1170 West Devon Avenue, Elk Grove Village, Illinois 60007. Each Public Workshop will start at 1 p.m. (Central Standard Time), and registration to participate in the Public Workshops will conclude by 9 p.m. (Central Standard Time). Representatives of FAA and its consultants will be available to provide information about the Draft Re-Evaluation. Spanish language translators will be available at the Public Workshops. If you need the assistance of a translator, other than Spanish, please call Ms. Amy Hanson at (847) 294–7354 by August 3, 2015.

The Draft Re-Evaluation will be available for review on line at (*http://www.faa.gov/airports/airport_development/omp/eis_re-eval/*) and at libraries around O'Hare International Airport. The FAA will issue a separate notice at the time the Draft Re-Evaluation is available.

Issued in Des Plaines, IL, July 7, 2015.

James G. Keefer,

Manager, Chicago Airports District Office.

DEPARTMENT OF TRANSPORTATION

Federal Aviation Administration

[Summary Notice No. 2015–43]

Petition for Exemption; Summary of Petition Received; Matthew Gerlitzki

AGENCY: Federal Aviation Administration (FAA), DOT.

ACTION: Notice.

SUMMARY: This notice contains a summary of a petition seeking relief from specified requirements of Title 14 of the Code of Federal Regulations. The purpose of this notice is to improve the public's awareness of, and participation in, the FAA's exemption process. Neither publication of this notice nor the inclusion or omission of information in the summary is intended to affect the legal status of the petition or its final disposition.

DATES: Comments on this petition must identify the petition docket number and must be received on or before August 3, 2015.

ADDRESSES: Send comments identified by docket number FAA–2015–0945 using any of the following methods:

- *Federal eRulemaking Portal:* Go to *http://www.regulations.gov* and follow the online instructions for sending your comments electronically.
- *Mail:* Send comments to Docket Operations, M–30; U.S. Department of Transportation (DOT), 1200 New Jersey Avenue SE., Room W12–140, West Building Ground Floor, Washington, DC 20590–0001.
- *Hand Delivery or Courier:* Take comments to Docket Operations in Room W12–140 of the West Building Ground Floor at 1200 New Jersey Avenue SE., Washington, DC, between 9 a.m. and 5 p.m., Monday through Friday, except Federal holidays.
- *Fax:* Fax comments to Docket Operations at 202–493–2251.

Privacy: In accordance with 5 U.S.C. 553(c), DOT solicits comments from the public to better inform its rulemaking process. DOT posts these comments, without edit, including any personal information the commenter provides, to *http://www.regulations.gov,* as described in the system of records notice (DOT/ALL–14 FDMS), which can be reviewed at *http://www.dot.gov/privacy.*

Docket: Background documents or comments received may be read at *http://www.regulations.gov* at any time. Follow the online instructions for accessing the docket or go to the Docket Operations in Room W12–140 of the West Building Ground Floor at 1200 New Jersey Avenue SE., Washington, DC, between 9 a.m. and 5 p.m., Monday through Friday, except Federal holidays.

FOR FURTHER INFORMATION CONTACT: Keira Jones (202) 267–4024, Office of Rulemaking, Federal Aviation Administration, 800 Independence Avenue SW., Washington, DC 20591.

This notice is published pursuant to 14 CFR 11.85.

Issued in Washington, DC, on July 7, 2015.

Lirio Liu,

Director, Office of Rulemaking.

Petition for Exemption

Docket No.: FAA–2015–0945.

Petitioner: Matthew Gerlitzki.

Section(s) of 14 CFR Affected: § 121.436 (a)(3) and (c).

Description of Relief Sought: Mr. Matthew Gerlitzki seeks relief from § 121.436 (a)(3) and (c) to allow his military pilot in command flight time in rotary turbine-powered aircraft to be credited toward the 1000 hours of experience required by § 121.436 (a)(3). Section § 121.436 (c) states that a pilot may credit 500 hours of military flight time obtained as pilot in command of a multiengine turbine-powered, fixed wing airplane in an operation requiring more than one pilot.

BILLING CODE 4910–13–P

DEPARTMENT OF TRANSPORTATION

Federal Highway Administration

Notice of Final Federal Agency Actions on Proposed SR–126 (Memorial Boulevard) Improvement Project in Tennessee

AGENCY: Federal Highway Administration (FHWA), DOT.

ACTION: Notice of limitation on claims for Judicial Review of actions by FHWA and other Federal agencies.

SUMMARY: This notice announces actions taken by FHWA and other Federal agencies that are final within the meaning of 23 U.S.C. 139(l)(1). The actions relate to a proposed highway project, State Route (SR) 126 (Memorial Boulevard) Improvements, from East Center Street to Interstate 81 (I–81) in Sullivan County, Tennessee. Those actions grant licenses, permits, and approvals for the project.

DATES: By this notice, FHWA is advising the public of final agency actions subject to 23 U.S.C. 139(l)(1). A claim seeking judicial review of the Federal agency actions on the highway project will be barred unless the claim is filed on or before December 10, 2015. If the Federal law that authorizes judicial review of a claim provides a time period of less than 150 days for filing such claim, then that shorter time period still applies.

FOR FURTHER INFORMATION CONTACT: For FHWA: Ms. Theresa Claxton; Planning and Program Management Team Leader; Federal Highway Administration; Tennessee Division Office; 404 BNA Drive, Building 200, Suite 508; Nashville, Tennessee 37217; Telephone (615) 781–5770; email: *Theresa.Claxton@dot.gov.* FHWA Tennessee Division Office's normal business hours are 7:30 a.m. to 4 p.m. (Central Time). You may also contact Mr. Jim Ozment, Environmental Division Director; Tennessee Department of Transportation (TDOT); James K. Polk Building, Suite 900; 505 Deaderick Street; Nashville, Tennessee 37243–0334; Telephone (615) 741–3655, *Jim.Ozment@tn.gov.* TDOT Environmental Division's normal business hours are 8 a.m. to 5 p.m. (Central Time).

SUPPLEMENTARY INFORMATION: Notice is hereby given that FHWA and other Federal agencies have taken final agency actions by issuing licenses, permits, and approvals for the following highway project in the State of Tennessee: SR 126 (Memorial Boulevard) Improvements, Project Number STP–126(10), Sullivan County, Tennessee. The proposed action will improve 8.4 miles of SR 126 (Memorial Boulevard), from East Center Street, within the City of Kingsport's city limits, east to I–81 in Sullivan County, Tennessee. The Selected Alternative (Alternative B Modified) proposes four travel lanes from East Center Street to Harbor Chapel Road, three travel lanes from Harbor Chapel Road to Old Stage Road, and two travel lanes from Old Stage Road to I–81. Portions of the corridor include (1) an additional eastbound travel lane to accommodate trucks ascending the steep grade; (2) a continuous, left-turn lane; and (3) a compressed roadway cross-section width to minimize impacts to a National Register of Historic Places (NRHP) listed resource. The actions by the Federal agencies, and the laws under which such actions were taken, are described in the Final Environmental Impact Statement (FEIS) for the project, approved on November 19, 2014; in the FHWA Record of Decision (ROD) issued on April 8, 2015, and in other documents in the FHWA administrative record. The FEIS, ROD, and other documents in the FHWA administrative record file are available by contacting the FHWA or TDOT at the addresses provided above. The FHWA FEIS and ROD can be viewed and downloaded from the project Web site at *http://www.tdot.state.tn.us/sr126/,* or viewed at the TDOT—Environmental Division; James K. Polk Building, Suite 900; 505 Deaderick Street; Nashville, Tennessee 37243–0334.

This notice does not apply to the Tennessee Valley Authority (TVA), or the U.S. Army Corps of Engineering (USACE) permitting processes for this project, because no TVA or USACE permits have been issued for the project to date. This notice applies to all Federal agency decisions as of the issuance date of this notice and all laws under which such actions were taken, including but not limited to:

1. General: National Environmental Policy Act (NEPA) [42 U.S.C. 4321–4351]; Federal-Aid Highway Act [23 U.S.C. 109, 23 U.S.C. 128, and 23 U.S.C. 139].
2. Air: Clean Air Act [42 U.S.C. 7401–7671(q) and 23 U.S.C. 109(j)].
3. Land: Section 4(f) of the Department of Transportation Act of 1966 [23 U.S.C. 138 and 49 U.S.C. 303].
4. Wildlife: Endangered Species Act [16 U.S.C. 1531–1544 and Section 1536]; Fish and Wildlife Coordination Act [16 U.S.C. 661–667(d)]; Migratory Bird Treaty Act [16 U.S.C. 703–712].
5. Historic and Cultural Resources: Section 106 of the National Historic Preservation Act of 1966, as amended [16 U.S.C. 470(f) *et seq.*].
6. Social and Economic: Civil Rights Act of 1964 [42 U.S.C. 2000(d)–2000(d)(1)]; Uniform Relocation and Real Property Acquisition Policies Act of 1970 [42 U.S.C. 4601–4655]; Farmland Protection Policy Act (FPPA) [7 U.S.C. 4201–4209].
7. Wetlands and Water Resources: Clean Water Act (Section 404, Section 401, and Section 319) [33 U.S.C. 1251–1376].
8. Hazardous Materials: Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA) [42 U.S.C. 9601–9675].
9. Executive Orders: E.O. 11990 Protection of Wetlands; E.O. 11988 Floodplain Management; E.O. 13112 Invasive Species; E.O. 12898 Federal Actions to Address Environmental Justice in Minority Populations and Low Income Populations; E.O. 13175 Consultation and Coordination with Indian Tribal Governments; E.O. 13166 Improving Access to Services for Persons with Limited English Proficiency (LEP); E.O. 11514 Protection and Enhancement of Environmental Quality.

(Catalog of Federal Domestic Assistance Program Number 20.205, Highway Planning and Construction. The regulations implementing Executive Order 12372 regarding intergovernmental consultation on Federal programs and activities apply to this program.)

Authority: 23 U.S.C. 139(l)(1)

Issued on: July 6, 2015.

Sabrina David,

Assistant Division Administrator, Nashville, Tennessee.

[FR Doc. 2015–17028 Filed 7–10–15; 8:45 am]

BILLING CODE 4910–RY–P

DEPARTMENT OF TRANSPORTATION

Federal Motor Carrier Safety Administration

[Docket No. FMCSA–2015–0197]

Hours of Service of Drivers: R&R Transportation Group; Application for Exemption

AGENCY: Federal Motor Carrier Safety Administration (FMCSA), DOT.

ACTION: Notice of application for exemption; request for comments.

SUMMARY: FMCSA announces that it has received an application from the R&R Transportation Group (R&R) for an exemption from the minimum 30-minute rest break requirement of the Agency's hours-of-service (HOS) regulations for commercial motor vehicle (CMV) drivers. The exemption would be available to R&R's drivers engaged in the transportation of materials that by their nature must be attended, such as radioactive materials, pharmaceuticals, and ammunition. The exemption would provide qualified drivers the same regulatory flexibility that the HOS regulations allow drivers transporting explosives, *i.e.* to use 30 minutes or more of attendance time to meet the HOS rest break requirements, provided they do not perform any other work during the break. FMCSA requests

public comment on R&R's application for exemption.

DATES: Comments must be received on or before August 12, 2015.

ADDRESSES: You may submit comments bearing the Federal Docket Management System (FDMS) Docket ID FMCSA–2015–0197 using any of the following methods:

- *Federal eRulemaking Portal:* Go to *www.regulations.gov.* Follow the on-line instructions for submitting comments.
- *Mail:* Docket Management Facility; U.S. Department of Transportation, 1200 New Jersey Avenue SE., West Building Ground Floor, Room W12–140, Washington, DC 20590–0001.
- *Hand Delivery or Courier:* West Building Ground Floor, Room W12–140, 1200 New Jersey Avenue SE., Washington, DC, between 9 a.m. and 5 p.m., ET, Monday through Friday, except Federal Holidays.
- *Fax:* 1–202–493–2251.

Each submission must include the Agency name and the docket number for this notice. Note that DOT posts all comments received without change to *www.regulations.gov,* including any personal information included in a comment. Please see the *Privacy Act* heading below.

Docket: For access to the docket to read background documents or comments, go to *www.regulations.gov* at any time or visit Room W12–140 on the ground level of the West Building, 1200 New Jersey Avenue SE, Washington, DC, between 9 a.m. and 5 p.m., ET, Monday through Friday, except Federal holidays. The online FDMS is available 24 hours each day, 365 days each year. If you want acknowledgment that we received your comments, please include a self-addressed, stamped envelope or postcard or print the acknowledgment page that appears after submitting comments on-line.

Privacy Act: In accordance with 5 U.S.C. 553(c), DOT solicits comments from the public to better inform its rulemaking process. DOT posts these comments, without edit, including any personal information the commenter provides, to *www.regulations.gov,* as described in the system of records notice (DOT/ALL–14 FDMS), which can be reviewed at *www.dot.gov/privacy.*

FOR FURTHER INFORMATION CONTACT: Mr. Robert Schultz, Driver and Carrier Operations Division; Office of Carrier, Driver and Vehicle Safety Standards, FMCSA; Telephone: 202–366–4325. Email: *MCPSD@dot.gov.* If you have questions on viewing or submitting material to the docket, contact Docket Services, telephone (202) 366–9826.

SUPPLEMENTARY INFORMATION:

Background

FMCSA has authority under 49 U.S.C. 31136(e) and 31315 to grant exemptions from certain parts of the Federal Motor Carrier Safety Regulations. FMCSA must publish a notice of each exemption request in the **Federal Register** (49 CFR 381.315(a)). The Agency must provide the public an opportunity to inspect the information relevant to the application, including any safety analyses that have been conducted. The Agency must also provide an opportunity for public comment on the request.

The Agency reviews safety analyses and public comments submitted, and determines whether granting the exemption would likely achieve a level of safety equivalent to, or greater than, the level that would be achieved by the current regulation (49 CFR 381.305). The decision of the Agency must be published in the **Federal Register** (49 CFR 381.315(b)) with the reasons for denying or granting the application and, if granted, the name of the person or class of persons receiving the exemption, and the regulatory provision from which the exemption is granted. The notice must also specify the effective period and explain the terms and conditions of the exemption. The exemption may be renewed (49 CFR 381.300(b)), but only after the public is provided the opportunity to comment on the renewal.

On December 27, 2011 (76 FR 81133), FMCSA published a final rule amending the HOS regulations (49 CFR part 395) for drivers of CMVs. The final rule included a new provision requiring certain drivers to take a rest break during their duty day. Specifically, the rule states that ''driving is not permitted if more than 8 hours have passed since the end of the driver's last off-duty or sleeper-berth period of at least 30 minutes'' [49 CFR 395.3(a)(3)(ii)]. This provision took effect on July 1, 2013.

Under the HOS rules, a driver is on duty if he or she is ''performing any other work in the capacity, employ, or service of a motor carrier'' (§ 395.2). A driver is off duty when relieved of all duty and responsibility for the care and custody of the vehicle, its accessories, and any cargo it may be carrying. However, the Agency has recognized that under certain circumstances it is unsafe for CMVs to be left unattended so that the driver can take 30 minutes off duty. By regulation, FMCSA allows operators of CMVs transporting certain explosives to satisfy the rest-break requirement by using 30 minutes or more of attendance time providing they perform no other work during the break [49 CFR 395.1(q)]. Drivers employing this provision are required to annotate their duty-status record to indicate that they have used the exception.

The Agency has granted requests for exemption from the 30-minute break requirement to drivers transporting security-sensitive radioactive materials (78 FR 32700, May 31, 2013) and weapons, munitions, and sensitive/classified cargo (80 FR 20556, April 16, 2015). FMCSA has extended § 49 CFR 395.1(q) to these drivers under certain terms and conditions.

Request for Exemption

R&R operates three for-hire motor carriers that transport property in interstate commerce: R & R Trucking, Inc., USDOT 382936; TNI USA Inc. NC dba AATCO, USDOT 513601, and NEI Transport, LLC, USDOT 676270 . R&R's application for exemption states that the goods it transports are of such a nature or value that its drivers must keep the CMV under constant observation to prevent theft or an adverse security incident. The application provides examples of the goods transported by R&R CMVs: weapons, ammunition, night-vision goggles, pharmaceuticals, and radioactive material. R&R maintains constant attendance of such loads in order to protect the public from a major security or hazardous material event. R&R states that Federal contracts often require CMV drivers to maintain constant surveillance of the vehicle, and may require the driver of an escort CMV to maintain constant surveillance as well. In addition, R&R states that the U.S. Department of Homeland Security may require surveillance as part of a security alert posted in the National Terrorism Advisory System, and that some Federal agencies, in response to a threat, establish a security threat zone, or geo-fence, restricting or barring further movement of an R&R CMV.

R&R requests an exemption from the HOS regulation pertaining to rest breaks [49 CFR 395.3(a)(3)(ii)] to allow R&R drivers providing surveillance services to be treated the same as CMV drivers attending explosives under § 395.1(q). R&R believes that transportation under the requested exemption would achieve a level of safety and security that is at least equivalent to what would be obtained by following the normal break requirements in § 395.3(a)(3)(ii). R&R states that if the exemption were granted, it would restrict its drivers of such CMVs from performing any other on-duty functions while satisfying the 30-minute break requirement. R&R states that it will require its drivers to record their rest breaks as on-duty time in accordance with § 395.1(q), and to annotate such entries to indicate the specific on-duty periods used to satisfy the rest-break requirement. R&R states that the Department of Defense provides documentation to CMV drivers to alert roadside inspectors of surveillance requirements.

R&R indicates that its three entities operate 255 power units and that 290 drivers would be covered by the exemption. The proposed exemption would be effective for 2 years, the maximum period allowed by § 381.300.

The processing of R&R's exemption request had been held in abeyance until it could be determined whether another exemption request [American Trucking Associations, Inc. (ATA), announced May 1, 2015 (80 FR 25004)] would make the R&R exemption unnecessary if approved. As requested, the ATA exemption was limited to transporters of certain hazardous materials and did not include some of the materials that R&R has requested to be covered by the exemption. Thus, R&R's request is now being considered independent of other requests.

Request for Comments

In accordance with 49 U.S.C. 31136(e) and 31315(b)(4), FMCSA requests public comment on R&R's application for an exemption from certain provisions of 49 CFR part 395. The Agency will consider all comments received by close of businesson August 12, 2015. Comments will be available for examination in the docket at the location listed under the **ADDRESSES** section of this notice. The Agency will consider to the extent practicable comments received in the public docket after the closing date of the comment period.

Issued on: July 7, 2015.

BILLING CODE 4910–EX–P

DEPARTMENT OF TRANSPORTATION

Federal Motor Carrier Safety Administration

[Docket No. FMCSA–2015–0053]

Qualification of Drivers; Exemption Applications; Vision

AGENCY: Federal Motor Carrier Safety Administration (FMCSA), DOT.

ACTION: Notice of applications for exemptions; request for comments.

SUMMARY: FMCSA announces receipt of applications from 27 individuals for exemption from the vision requirement in the Federal Motor Carrier Safety Regulations. They are unable to meet the vision requirement in one eye for various reasons. The exemptions will enable these individuals to operate commercial motor vehicles (CMVs) in interstate commerce without meeting the prescribed vision requirement in one eye. If granted, the exemptions would enable these individuals to qualify as drivers of commercial motor vehicles (CMVs) in interstate commerce.

DATES: Comments must be received on or before August 12, 2015. All comments will be investigated by FMCSA. The exemptions will be issued the day after the comment period closes.

ADDRESSES: You may submit comments bearing the Federal Docket Management System (FDMS) Docket No. FMCSA–2015–0053 using any of the following methods:

- *Federal eRulemaking Portal:* Go to *http://www.regulations.gov.* Follow the on-line instructions for submitting comments.
- *Mail:* Docket Management Facility; U.S. Department of Transportation, 1200 New Jersey Avenue SE., West Building Ground Floor, Room W12–140, Washington, DC 20590–0001.
- *Hand Delivery:* West Building Ground Floor, Room W12–140, 1200 New Jersey Avenue SE., Washington, DC, between 9 a.m. and 5 p.m., Monday through Friday, except Federal Holidays.
- *Fax:* 1–202–493–2251.

Instructions: Each submission must include the Agency name and the docket numbers for this notice. Note that all comments received will be posted without change to *http://www.regulations.gov*, including any personal information provided. Please see the Privacy Act heading below for further information.

Docket: For access to the docket to read background documents or comments, go to *http://www.regulations.gov* at any time or Room W12–140 on the ground level of the West Building, 1200 New Jersey Avenue SE., Washington, DC, between 9 a.m. and 5 p.m., Monday through Friday, except Federal holidays. The FDMS is available 24 hours each day, 365 days each year. If you want acknowledgment that we received your comments, please include a self-addressed, stamped envelope or postcard or print the acknowledgement page that appears after submitting comments on-line.

Privacy Act: In accordance with 5 U.S.C. 553(c), DOT solicits comments from the public to better inform its rulemaking process. DOT posts these comments, without edit, including any personal information the commenter provides, to *www.regulations.gov*, as described in the system of records notice (DOT/ALL–14 FDMS), which can be reviewed at *www.dot.gov/privacy.*

FOR FURTHER INFORMATION CONTACT: Charles A. Horan, III, Director, Carrier, Driver and Vehicle Safety Standards, (202) 366–4001, *fmcsamedical@dot.gov*, FMCSA, Department of Transportation, 1200 New Jersey Avenue SE., Room W64–224, Washington, DC 20590–0001. Office hours are from 8:30 a.m. to 5 p.m., Monday through Friday, except Federal holidays. If you have questions regarding viewing or submitting material to the docket, contact Docket Services, telephone (202) 366–9826.

SUPPLEMENTARY INFORMATION:

I. Background

Under 49 U.S.C. 31136(e) and 31315, FMCSA may grant an exemption from the Federal Motor Carrier Safety Regulations for a 2-year period if it finds ''such exemption would likely achieve a level of safety that is equivalent to or greater than the level that would be achieved absent such exemption.'' FMCSA can renew exemptions at the end of each 2-year period. The 27 individuals listed in this notice have each requested such an exemption from the vision requirement in 49 CFR 391.41(b)(10), which applies to drivers of CMVs in interstate commerce. Accordingly, the Agency will evaluate the qualifications of each applicant to determine whether granting an exemption will achieve the required level of safety mandated by statute.

II. Qualifications of Applicants

Joel D. Barchard

Mr. Barchard, 48, has had esotropia with amblyopia in his right eye since birth. The visual acuity in his right eye is 20/150, and in his left eye, 20/20. Following an examination in 2015, his optometrist stated, ''I believe that he has sufficient vision to perform the driving tasks required to operate a commercial vehicle at this time.''

Mr. Barchard reported that he has driven tractor-trailer combinations for 13 years, accumulating 650,000 miles. He holds a Class A CDL from Massachusetts. His driving record for the last 3 years shows no crashes and no convictions for moving violations in a CMV.

Homer L. Butler

Mr. Butler, 65, has had strabismic amblyopia in his left eye since childhood. The visual acuity in his right eye is 20/20, and in his left eye, 20/400. Following an examination in 2014, his optometrist stated, ''With his glasses, his vision is sufficient to drive and to operate a commercial vehicle.'' Mr. Butler reported that he has driven straight trucks for 40 years, accumulating 80,000 miles, tractor-trailer combinations for 49 years, accumulating 735,000 miles, and buses for 48 years, accumulating 48,000 miles. He holds a Class AM CDL from Pennsylvania. His driving record for the last 3 years shows no crashes and no convictions for moving violations in a CMV.

William D. Cherry

Mr. Cherry, 51, has had amblyopia in his left eye since childhood. The visual acuity in his right eye is 20/20, and in his left eye, 20/200. Following an examination in 2015, his optometrist stated, ''In my opinion, provided that Mr. Cherry wears proper spectacle correction, he has sufficient vision to perform the driving tasks required to operate commercial vehicles.'' Mr. Cherry reported that he has driven straight trucks for nine years, accumulating 342,000 miles. He holds a Class B CDL from Massachusetts. His driving record for the last 3 years shows no crashes and no convictions for moving violations in a CMV.

Thomas W. Chism

Mr. Chism, 53, has aphakia and a torn iris in his right eye due to a traumatic incident in childhood. The visual acuity in his right eye is 20/70, and in his left eye, 20/20. Following an examination in 2014, his optometrist stated, ''In my medical opinion, Thomas W. Chism has sufficient vision to perform the driving tasks required to operate a commercial vehicle.'' Mr. Chism reported that he has driven straight trucks for 34 years, accumulating 51,000 miles, tractor-trailer combinations for 34 years, accumulating 17,000 miles, and buses for 10 years, accumulating 7,500 miles. He holds a Class A CDL from Kansas. His driving record for the last 3 years shows no crashes and no convictions for moving violations in a CMV.

Pedro Del Bosque

Mr. Del Bosque, 61, has been farsighted in his left eye since birth. The visual acuity in his right eye is 20/25, and in his left eye, 20/80. Following an examination in 2015, his optometrist stated, ''In my opinion thee [*sic*] are no restrictions on his vision on either eye which would impair his ability to drive a commercial vehicle safely.'' Mr. Del Bosque reported that he has driven tractor-trailer combinations for 35 years, accumulating 4.2 million miles. He holds a Class AM CDL from Texas. His driving record for the last 3 years shows one crash, for which he was not cited and to which he did not contribute, and no convictions for moving violations in a CMV.

Anthony C. DeNaples

Mr. DeNaples, 34, has complete loss of vision in his right eye due to a traumatic incident in 2004. The visual acuity in his right eye is no light perception, and in his left eye, 20/20. Following an examination in 2015, his optometrist stated, ''In my opinion, this field of vision and the visual acuity Anthony possess in the left eye would give him no reason not to be able to operate a commercial vehicle.'' Mr. DeNaples reported that he has driven straight trucks for 17 years, accumulating 170,000 miles, and tractor-trailer combinations for 17 years, accumulating 170,000 miles. He holds a Class A CDL from Pennsylvania. His driving record for the last 3 years shows no crashes and no convictions for moving violations in a CMV.

Michael R. Doerr

Mr. Doerr, 33, has had keratoconnus in his left eye since 2003. The visual acuity in his right eye is 20/20, and in his left eye, 20/50. Following an examination in 2015, his optometrist stated, ''It is my medical opinion that Mr. Doerr has the vision sufficient to safely operate a commercial vehicle.'' Mr. Doerr reported that he has driven straight trucks for 10 years, accumulating 200,000 miles. He holds a Class B CDL from Idaho. His driving record for the last 3 years shows no crashes and no convictions for moving violations in a CMV.

Mark J. Dufresne

Mr. Dufresne, 58, has complete loss of vision in his left eye due to a traumatic incident in 1982. The visual acuity in his right eye is 20/20, and in his left eye, no light perception. Following an examination in 2015, his optometrist stated, ''In my opinion, he has sufficient vision in the right eye to perform the driving tasks to operate a commercial vehicle.'' Mr. Dufresne reported that he has driven straight trucks for 29 years, accumulating 45,240 miles, and tractor-trailer combinations for five years, accumulating 500 miles. He holds a Class A MC CDL from New Hampshire. His driving record for the last 3 years shows no crashes and no convictions for moving violations in a CMV.

Edward Dugue III

Mr. Dugue, 49, has a prosthetic right eye since 2007 due to central retinal vein occlusion with resulting neovascular glaucoma. The visual acuity in his right eye is no light perception, and in his left eye, 20/20. Following an examination in 2014, his optometrist stated, ''Based on my evaluation, patient has sufficient vision to perform the driving tasks required to operate a commercial vehicle.'' Mr. Dugue reported that he has driven straight trucks for 10 years, accumulating 265,000 miles. He holds a Class C CDL from North Carolina. His driving record for the last 3 years shows no crashes and no convictions for moving violations in a CMV.

Adoum H. Fadoul

Mr. Fadoul, 27, has complete loss of vision in his left eye due to a traumatic incident in 2006. The visual acuity in his right eye is 20/20, and in his left eye, no light perception. Following an examination in 2015, his ophthalmologist stated, ''Based on vision in right eye, ability to drive commercial vehicle should be good.''

Mr. Fadoul reported that he has driven straight trucks for three years, accumulating 75,000 miles. He holds a chauffeur's license from Indiana. His driving record for the last 3 years shows no crashes and no convictions for moving violations in a CMV.

Larry R. Hayes, Jr.

Mr. Hayes, 44, has no light perception in his left eye due to a traumatic incident in childhood. The visual acuity in his right eye is 20/20, and in his left eye, no light perception. Following an examination in 2014, his optometrist stated, ''I believe Larry has sufficient vision to safely drive commercial vehicles.'' Mr. Hayes reported that he has driven tractor-trailer combinations for 26 years, accumulating 2.6 million miles. He holds a Class A CDL from Kansas. His driving record for the last 3 years shows no crashes and no convictions for moving violations in a CMV.

Bradley A. Hetrick

Mr. Hetrick, 57, has had amblyopia in his left eye since birth. The visual acuity in his right eye is 20/20, and in his left eye, 20/400. Following an examination in 2014, his optometrist stated, ''Bradley Hetrick has a history of having a CDL liscense [*sic*] for over 20 years. Visual acuity corrected is 20/20 OD and J20/400 OS. Color vision with Ischihara 14 plates out of 14. 120 degree visual field testing shows no defects on the horizontal meridian . . . I believe he should be granted a vision waver [*sic*].''

Mr. Hetrick reported that he has driven straight trucks for 17 years, accumulating 340,000 miles. He holds a Class AM CDL from Pennsylvania. His driving record for the last 3 years shows no crashes and no convictions for moving violations in a CMV.

Wayne E. Jakob

Mr. Jakob, 56, has had exudative retinopathy in his right eye since 2011 due to Coats' disease. The visual acuity in his right eye is hand motion, and in his left eye, 20/20. Following an examination in 2015, his optometrist stated, ''It is my medical opinion that Mr. Wayne E. Jakob has sufficient vision to perform the driving tasks required to operate a commercial vehicle.'' Mr. Jakob reported that he has driven tractor-trailer combinations for 25 years, accumulating 687,500 miles. He holds a Class A CDL from Illinois. His driving record for the last 3 years shows noo crashes and no convictions for moving violations in a CMV.

Michael A. Kimbler

Mr. Kimbler, 59, has had central vein occlusion in his right eye since 2009. The visual acuity in his right eye is hand motion, and in his left eye, 20/20. Following an examination in 2015, his optometrist stated, ''In my medical opinion,

Michael Kimbler has sufficient vision to perform the driving tasks required to operate a commercial vehicle.'' Mr. Kimbler reported that he has driven straight trucks for 29 years, accumulating 1.11 million miles. He holds a Class C CDL from Texas. His driving record for the last 3 years shows no crashes and no convictions for moving violations in a CMV.

Colon W. King

Mr. King, 47, has had a corneal scar in his right eye since childhood. The visual acuity in his right eye is 20/100, and in his left eye, 20/20. Following an examination in 2014, his optometrist stated, ''Therefore, it is my medical opinion that Mr. King has sufficient vision to perform the driving tasks required to operate a commercial vehicle.'' Mr. King reported that he has driven straight trucks for 12 years, accumulating 576,000 miles, tractor-trailer combinations for 10 years, accumulating 1.14 million miles. He holds a Class A CDL from Maine. His driving record for the last 3 years shows no crashes and no convictions for moving violations in a CMV.

Earney J. Knox

Mr. Knox, 48, has complete loss of vision in his right eye due to a traumatic incident in 1995. The visual acuity in his right eye is no light perception, and in his left eye, 20/20. Following an examination in 2015, his optometrist stated, ''In my opinion, Mr. Knox has exhibited the ability to drive accident free since 1995. His left eye vision is stable without disease process. I see no limitations for Mr. Knox to drive safely in a CMV.'' Mr. Knox reported that he has driven straight trucks for seven years, accumulating 140,000 miles, and tractor-trailer combinations for seven years, accumulating 70,000 miles. He holds a Class A CDL from Missouri. His driving record for the last 3 years shows no crashes and no convictions for moving violations in a CMV.

James R. Leoffler, Jr.

Mr. Leoffler, 67, has had amblyopia in his left eye since childhood. The visual acuity in his right eye is 20/30, and in his left eye, 20/200. Following an examination in 2015, his ophthalmologist stated, ''The patient apparently does not qualify for a commercial driver's license because of his longstanding amblyopia on the left, but I feel he should be considered for an exemption since he has a longstanding history of driving commercial vehicles without any problems.'' Mr. Leoffler reported that he has driven straight trucks for 50 years, accumulating four million miles, and tractor-trailer combinations for 20 years, accumulating 20,000 miles. He holds a Class A CDL from Colorado. His driving record for the last 3 years shows no crashes and no convictions for moving violations in a CMV.

Jimmy D. Mannis

Mr. Mannis, 49, has had amblyopia in his left eye since birth. The visual acuity in his right eye is 20/20, and in his left eye, 20/200. Following an examination in 2015, his optometrist stated, ''It is my opinion especially since Mr. Mannis has proven this in the past, he has sufficient vision to operate a commercial vehicle.'' Mr. Mannis reported that he has driven straight trucks for 11 years, accumulating 1,100 miles, and tractor-trailer combinations for 11 years, accumulating 11,000 miles. He holds a Class A CDL from Arkansas. His driving record for the last 3 years shows no crashes and no convictions for moving violations in a CMV.

George A. McCue

Mr. McCue, 64, has had a prosthetic right eye since childhood due to a benign tumor. The visual acuity in his right eye is no light perception, and in his left eye, 20/20. Following an examination in 2015, his optometrist stated, ''In my opinion the patient meets all the vision guidelines set forth by the DMV to operate a commercial vehicle.'' Mr. McCue reported that he has driven straight trucks for 20 years, accumulating 5.2 million miles. He holds an operator's license from Nevada. His driving record for the last 3 years shows no crashes and no convictions for moving violations in a CMV.

Kevin D. Mendoza

Mr. Mendoza, 58, has complete loss of vision in his left eye due to a traumatic incident in childhood. The visual acuity in his right eye is 20/20, and in his left eye, no light perception. Following an examination in 2015, his optometrist stated, ''Visual perception stable and excellent and new specs mainly for near tasks only and no reason to believe affects CDL driving.'' Mr. Mendoza reported that he has driven straight trucks for 36 years, accumulating 630,000 miles. He holds a Class A CDL from Washington. His driving record for the last 3 years shows no crashes and no convictions for moving violations in a CMV.

James Smentkowski

Mr. Smentkowski, 42, has phthisis bulbi secondary to trauma in his right eye due to a traumatic incident in 1995. The visual acuity in his right eye is no light perception, and in his left eye, 20/15. Following an examination in 2015, his optometrist stated, ''His left eye has 20/15 vision with out [*sic*] the need for correction at distance and has demonstrated no restrictions on his commercial vehicle driving ability.''

Mr. Smentkowski reported that he has driven straight trucks for 24 years, accumulating 840,000 miles, and tractor-trailer combinations for 24 years, accumulating 1.2 million miles. He holds a Class A CDL from New Jersey. His driving record for the last 3 years shows one crash, for which he was not cited and to which he did not contribute, and no convictions for moving violations in a CMV.

Neil G. Sturges

Mr. Sturges, 67, has optic nerve damage in his right eye due to a traumatic incident in 1970. The visual acuity in his right eye is light perception, and in his left eye, 20/20. Following an examination in 2015, his optometrist stated,

''Dr. Craig P. Hartnagel, O.D. P.C. fully certifies that Mr. Sturges has sufficient vision in his left eye to perform his duties as an operator of commercial vehicles.'' Mr. Sturges reported that he has driven straight trucks for 32 years, accumulating 720,000 miles. He holds an operator's license from New York. His driving record for the last 3 years shows no crashes and no convictions for moving violations in a CMV.

Travis L. Watson

Mr. Watson, 68, has had refractive amblyopia in his right eye since childhood. The visual acuity in his right eye is 20/70, and in his left eye, 20/20. Following an examination in 2015, his optometrist stated, ''Mr. Watson has sufficient vision to perform the driving tasks to operate a commercial vehicle.'' Mr. Watson reported that he has driven straight trucks for 45 years, accumulating 675,000 miles, and tractor-trailer combinations for 40 years, accumulating 600,000 miles. He holds a Class A CDL from Tennessee. His driving record for the last 3 years shows no crashes and no convictions for moving violations in a CMV.

Bruce W. Williams

Mr. Williams, 49, has had amblyopia and a retinal detachment in his right eye since childhood. The visual acuity in his right eye is 20/200, and in his left eye, 20/20. Following an examination in 2015, his ophthalmologist stated, ''Also in my opinion, he does have sufficient vision to perform the driving tasks required to operate a commercial vehicle.'' Mr. Williams reported that he has driven tractor-trailer combinations for 20 years, accumulating 200,000 miles. He holds a Class AM CDL from Illinois. His driving record for the last 3 years shows no crashes and no convictions for moving violations in a CMV.

Norman G. Wooten

Mr. Wooten, 51, has had complete loss of vision in his right eye since 2007 due to cancer. The visual acuity in his right eye is no light perception, and in his left eye, 20/25. Following an examination in 2015, his optometrist stated, ''There is no reason Mr. Wooten should not be able to perform any visual tasks to include operation of commercial vehicles.'' Mr. Wooten reported that he has driven straight trucks for seven years, accumulating 665,000 miles, and tractor-trailer combinations for 18 years, accumulating 1.97 million miles. He holds a Class A CDL from Texas. His driving record for the last 3 years shows no crashes and no convictions for moving violations in a CMV.

Kurt A. Yoder

Mr. Yoder, 40, has had amblyopia in his right eye since childhood. The visual acuity in his right eye is 20/100, and in his left eye, 20/20. Following an examination in 2015, his optometrist stated, ''Mr. Yoder should have no problems with continuing with his CDL at this time. They amblyopia is longstanding and he has adjusted to it extremely well.'' Mr. Yoder reported that he has driven straight trucks for 13 years, accumulating 494,000 miles, and tractor-trailer combinations for two years, accumulating 156,000 miles. He holds a Class A CDL from Ohio. His driving record for the last 3 years shows no crashes and no convictions for moving violations in a CMV.

III. Public Participation and Request for Comments

FMCSA encourages you to participate by submitting comments and related materials.

Submitting Comments

If you submit a comment, please include the docket number for this notice, indicate the specific section of this document to which each comment applies, and provide a reason for each suggestion or recommendation. You may submit your comments and material online or by fax, mail, or hand delivery, but please use only one of these means. FMCSA recommends that you include your name and a mailing address, an email address, or a phone number in the body of your document so the Agency can contact you if it has questions regarding your submission.

To submit your comment online, go to *http://www.regulations.gov* and put the docket number FMCSA–2015–0053 in the ''Keyword'' box, and click ''Search. When the new screen appears, click on ''Comment Now!'' button and type your comment into the text box in the following screen. Choose whether you are submitting your comment as an individual or on behalf of a third party and then submit. . If you submit your comments by mail or hand delivery, submit them in an unbound format, no larger than 8½ by 11 inches, suitable for copying and electronic filing. If you submit comments by mail and would like to know that they reached the facility, please enclose a stamped, self-addressed postcard or envelope.

FMCSA will consider all comments and material received during the comment period and may change this notice based on your comments.

Viewing Comments and Documents

To view comments, as well as documents mentioned in this preamble as being available in the docket, go to *http://www.regulations.gov* and insert the docket number FMCSA–2015–0053 in the ''Keyword'' box and click ''Search.'' Next, click ''Open Docket Folder'' button and choose the document listed to review. If you do not have access to the Internet, you may view the docket online by visiting the Docket Management Facility in Room W12–140 on the ground floor of the DOT West Building, 1200 New Jersey Avenue SE., Washington, DC 20590, between 9 a.m. and 5 p.m., e.t., Monday through Friday, except Federal holidays.

Issued on: June 24, 2015.

BILLING CODE 4910–EX–P

DEPARTMENT OF TRANSPORTATION

Federal Motor Carrier Safety Administration

[Docket No. FMCSA–2014–0385]

Qualification of Drivers; Application for Exemptions; Hearing

AGENCY: Federal Motor Carrier Safety Administration (FMCSA), DOT.

ACTION: Notice of applications for exemptions; request for comments.

SUMMARY: FMCSA announces that 15 individuals have applied for a medical exemption from the hearing requirement in the Federal Motor Carrier Safety Regulations (FMCSRs). In accordance with the statutory requirements concerning applications for exemptions, FMCSA requests public comments on these requests. The statute and implementing regulations concerning exemptions require that exemptions must provide an equivalent or greater level of safety than if they were not granted. If the Agency determines the exemptions would satisfy the statutory requirements and decides to grant theses requests after reviewing the public comments submitted in response to this notice, the exemptions would enable these 15 individuals to operate CMVs in interstate commerce.

DATES: Comments must be received on or before August 12, 2015.

ADDRESSES: You may submit comments bearing the Federal Docket Management System (FDMS) Docket No. FMCSA-2014–0385 using any of the following methods:

- *Federal eRulemaking Portal:* Go to *www.regulations.gov.* Follow the on-line instructions for submitting comments.
- *Mail:* Docket Management Facility; U.S. Department of Transportation, 1200 New Jersey Avenue SE., West Building Ground Floor, Room W12–140, Washington, DC 20590–0001.
- *Hand Delivery or Courier:* West Building Ground Floor, Room W12–140, 1200 New Jersey Avenue SE.,

Washington, DC, between 9 a.m. and 5 p.m., ET, Monday through Friday, except Federal Holidays.

- *Fax:* 1–202–493–2251.

Each submission must include the Agency name and the docket numbers for this notice. Note that all comments received will be posted without change to *www.regulations.gov*, including any personal information provided. Please see the Privacy Act heading below for further information.

Docket: For access to the docket to read background documents or comments, go to *www.regulations.gov* at any time or Room W12–140 on the ground level of the West Building, 1200 New Jersey Avenue SE, Washington, DC, between 9 a.m. and 5 p.m., ET, Monday through Friday, except Federal holidays. The FDMS is available 24 hours each day, 365 days each year. If you want acknowledgment that we received your comments, please include a self-addressed, stamped envelope or postcard or print the acknowledgement page that appears after submitting comments on-line.

Privacy Act: In accordance with 5 U.S.C. 553(c), DOT solicits comments from the public to better inform its rulemaking process. DOT posts these comments, without edit, including any personal information the commenter provides, to *www.regulations.gov*, as described in the system records notice (DOT/ALL–14 FDMS), which can be reviewed at *www.dot.gov/privacy.*

FOR FURTHER INFORMATION CONTACT: Charles A. Horan, III, Director, Office of Carrier, Driver and Vehicle Safety, (202) 366–4001, *fmcsamedical@dot.gov*, FMCSA, Department of Transportation, 1200 New Jersey Avenue, SE., Room W64–224, Washington, DC 20590–0001. Office hours are from 8:30 a.m. to 5 p.m., Monday through Friday, except Federal holidays.

SUPPLEMENTARY INFORMATION:

Background

The Federal Motor Carrier Safety Administration has authority to grant exemptions from many of the Federal Motor Carrier Safety Regulations (FMCSRs) under 49 U.S.C. 31315 and 31136(e), as amended by Section 4007 of the Transportation Equity Act for the 21st Century (TEA- 21) (Pub. L. 105–178, June 9, 1998, 112 Stat. 107, 401). FMCSA has published in 49 CFR part 381, subpart C final rules implementing the statutory changes in its exemption procedures made by section 4007, 69 FR 51589 (August 20, 2004).[1] Under the rules in part 381, subpart C, FMCSA must publish a notice of each exemption request in the **Federal Register**. The Agency must provide the public with an opportunity to inspect the information relevant to the application, including any safety analyses that have been conducted and any research reports, technical papers and other publications referenced in the application. The Agency must also provide an opportunity to submit public comment on the applications for exemption.

The Agency reviews the safety analyses and the public comments and determines whether granting the exemption would likely achieve a level of safety equivalent to or greater than the level that would be achieved without the exemption. The decision of the Agency must be published in the **Federal Register**. If the Agency denies the request, it must state the reason for doing so. If the decision is to grant the exemption, the notice must specify the person or class of persons receiving the exemption and the regulatory provision or provisions from which an exemption is granted. The notice must also specify the effective period of the exemption (up to 2 years) and explain the terms and conditions of the exemption. The exemption may be renewed.

The current provisions of the FMCSRs concerning hearing state that a person is physically qualified to drive a CMV if that person

> First perceives a forced whispered voice in the better ear at not less than 5 feet with or without the use of a hearing aid or, if tested by use of an audiometric device, does not have an average hearing loss in the better ear greater than 40 decibels at 500 Hz, 1,000 Hz, and 2,000 Hz with or without a hearing aid when the audiometric device is calibrated to American National Standard (formerly ASA Standard) Z24.5—1951.

49 CFR 391.41(b)(11). This standard was adopted in 1970, with a revision in 1971 to allow drivers to be qualified under this standard while wearing a hearing aid, 35 FR 6458, 6463 (April 22, 1970) and 36 FR 12857 (July 3, 1971).

FMCSA also issues instructions for completing the medical examination report and includes advisory criteria on the report itself to provide guidance for medical examiners in applying the hearing standard. See 49 CFR 391.43(f). The current advisory criteria for the hearing standard include a reference to a report entitled ''Hearing Disorders and Commercial Motor Vehicle Drivers'' prepared for the Federal Highway Administration, FMCSA's predecessor, in 1993.[2]

FMCSA Requests Comments on the Exemption Applications

FMCSA requests comments from all interested parties on whether a driver who cannot meet the hearing standard should be permitted to operate a CMV in interstate commerce. Further, the Agency asks for comments on whether a driver who cannot meet the hearing standard should be limited to operating only certain types of vehicles in interstate commerce, for example, vehicles without air brakes. The statute and implementing regulations concerning exemptions require that the Agency request public comments on all applications for exemptions. The Agency is also required to make a determination that an exemption would likely achieve a level of safety that is equivalent to, or greater than, the level that would be *achieved absent such exemption before granting any such requests.*

Submitting Comments

You may submit your comments and material online or by fax, mail, or hand delivery, but please use only one of these means. FMCSA recommends that you include your name and a mailing address, an email address, or a phone number in the body of your document so that FMCSA can contact you if there are questions regarding your submission.

To submit your comment online, go to *www.regulations.gov* and in the search box insert the docket number ''FMCSA–2014–0385'' and click the search button. When the new screen appears, click on the blue ''Comment Now!'' button on the right hand side of the page. On the new page, enter information required including the specific section of this document to which each comment applies, and provide a reason for each suggestion or recommendation. If you submit your comments by mail or hand delivery, submit them in an unbound format, no larger than 8½ by 11 inches, suitable for copying and electronic filing. If you submit comments by mail and would like to know that they reached the facility, please enclose a stamped, self-addressed postcard or envelope.

We will consider all comments and material received during the comment period and may change this proposed rule based on your comments. FMCSA

[1] This action adopted as final rules the interim final rules issued by FMCSA's predecessor in 1998 (63 FR 67600 (Dec. 8, 2008)), and adopted by FMCSA in 2001 [66 FR 49867 (Oct. 1, 2001)].

[2] This report is available on the FMCSA Web site at *http://www.fmcsa.dot.gov/facts-research/research-technology/publications/medreport_archives.htm.*

may issue a final rule at any time after the close of the comment period.

Viewing Comments and Documents

To view comments, go to *www.regulations.gov* and in the search box insert the docket number ''FMCSA–2014–0385'' and click ''Search.'' Next, click ''Open Docket Folder'' and you will find all documents and comments related to the proposed rulemaking.

Information on Individual Applicants

Dean J. Bobis

Mr. Bobis, 38, holds an operator's license in Arizona.

Keith A. Byrd

Mr. Byrd, 52, holds an operator's license in New Jersey.

Jeffrey D. Cottom

Mr. Cottom, 24, holds a class A CDL in Ohio.

Harold Richard Deavers

Mr. Deavers, 56, holds a class B CDL in West Virginia.

Charles James Heikkinen

Mr. Heikkinen, 34, holds a Chauffeur's license Michigan.

Emil Atanassov Iontchev

Mr. Iontchev, 34, holds an operator's license in Illinois.

Amy Marie Ivins

Ms. Ivins, 37, holds an operator's license in Nebraska.

William Kevin Jones

Mr. Jones, 67, holds an operator's license in Minnesota.

Anthony Michael Maginity

Mr. Maginity, 24, holds an operator's license in Iowa.

Jerrell M. McCrary

Mr. McCrary, 50, holds an operator's license in North Carolina.

Frank P. Oakley, II

Mr. Oakley, 46, holds an operator's license in Georgia.

David Antrez Presley

Mr. Presley, 34, holds an operator's license in Georgia.

Patricia L. Stephens

Ms. Stephens, 44, holds an operator's license in Nebraska.

Jason D. Swearington

Mr. Swearington, 28, holds an operator's license in Texas.

Roderick B. Thomas

Mr. Thomas, 50, holds a class A CDL in Georgia.

Request for Comments

In accordance with 49 U.S.C. 31136(e) and 31315(b)(4), FMCSA requests public comment from all interested persons on the exemption petitions described in this notice. The Agency will consider all comments received before the close of business August 12, 2015. Comments will be available for examination in the docket at the location listed under the **ADDRESSES** section of this notice. The Agency will file comments received after the comment closing date in the public docket, and will consider them to the extent practicable. In addition to late comments, FMCSA will also continue to file, in the public docket, relevant information that becomes available after the comment closing date. Interested persons should monitor the public docket for new material.

Issued on: July 1, 2015.

Larry W. Minor,

Associate Administrator for Policy.

BILLING CODE 4910–EX–P

DEPARTMENT OF TRANSPORTATION

Federal Motor Carrier Safety Administration

[Docket No. FMCSA–2015–0116]

Qualification of Drivers; Exemption Applications; Epilepsy and Seizure Disorders

AGENCY: Federal Motor Carrier Safety Administration (FMCSA), DOT.

ACTION: Notice of applications for exemptions; request for comments.

SUMMARY: FMCSA announces receipt of applications from 21 individuals for an exemption from the prohibition against persons with a clinical diagnosis of epilepsy or any other condition that is likely to cause a loss of consciousness or any loss of ability to operate a commercial motor vehicle (CMV) in interstate commerce. The regulation and the associated advisory criteria published in the Code of Federal Regulations as the ''Instructions for Performing and Recording Physical Examinations'' have resulted in numerous drivers being prohibited from operating CMVs in interstate commerce based on the fact that they have had one or more seizures and are taking anti-seizure medication, rather than an individual analysis of their circumstances by a qualified medical examiner. If granted, the exemptions would enable these individuals who have had one or more seizures and are taking anti-seizure medication to operate CMVs for up to 2 years in interstate commerce.

DATES: Comments must be received on or before August 12, 2015.

ADDRESSES: You may submit comments bearing the Federal Docket Management System (FDMS) Docket ID FMCSA–2015–0116 using any of the following methods:

- *Federal eRulemaking Portal:* Go to *www.regulations.gov.* Follow the on-line instructions for submitting comments.
- *Mail:* Docket Management Facility; U.S. Department of Transportation, 1200 New Jersey Avenue SE., West Building Ground Floor, Room W12–140, Washington, DC 20590–0001.
- *Hand Delivery or Courier:* West Building Ground Floor, Room W12–140, 1200 New Jersey Avenue SE., Washington, DC, between 9 a.m. and 5 p.m., Monday through Friday, except Federal Holidays.
- *Fax:* 1–202–493–2251.

Each submission must include the Agency name and the docket ID for this Notice. Note that DOT posts all comments received without change to *www.regulations.gov,* including any personal information included in a comment. Please see the Privacy Act heading below.

Docket: For access to the docket to read background documents or comments, go to *www.regulations.gov,* at any time or Room W12–140 on the ground level of the West Building, 1200 New Jersey Avenue SE., Washington, DC, between 9 a.m. and 5 p.m., Monday through Friday, except Federal holidays. The FDMS is available 24 hours each day, 365 days each year. If you want acknowledgment that we received your comments, please include a self-addressed, stamped envelope or postcard or print the acknowledgement page that appears after submitting comments on-line.

Privacy Act: In accordance with 5 U.S.C. 553(c), DOT solicits comments from the public to better inform its rulemaking process. DOT posts these comments, without edit, including any personal information the commenter provides, to *www.regulations.gov,* as described in the system records notice (DOT/ALL–14 FDMS), which can be reviewed at *www.dot.gov/privacy.*

FOR FURTHER INFORMATION CONTACT: Charles A. Horan, III, Director, Office of Carrier, Driver and Vehicle Safety, (202) 366–4001, or via email at *fmcsamedical@dot.gov,* or by letter to FMCSA, Room W64–113, Department of

Transportation, 1200 New Jersey Avenue SE., Washington, DC 20590–0001. Office hours are from 8:30 a.m. to 5 p.m., Monday through Friday, except Federal holidays.

SUPPLEMENTARY INFORMATION:

Background

Under 49 U.S.C. 31315 and 31136(e), FMCSA may grant an exemption for up to a 2-year period if it finds ''such exemption would likely achieve a level of safety that is equivalent to or greater than the level that would be achieved absent such exemption.'' The statutes allow the Agency to renew exemptions at the end of the 2-year period. The 21 individuals listed in this notice have requested an exemption from the epilepsy prohibition in 49 CFR 391.41(b)(8), which applies to drivers who operate CMVs as defined in 49 CFR 390.5, in interstate commerce. Section 391.41(b)(8) states that a person is physically qualified to drive a CMV if that person has no established medical history or clinical diagnosis of epilepsy or any other condition which is likely to cause the loss of consciousness or any loss of ability to control a CMV.

FMCSA provides medical advisory criteria for use by medical examiners in determining whether drivers with certain medical conditions should be certified to operate CMVs in intrastate commerce. The advisory criteria indicate that if an individual has had a sudden episode of a non-epileptic seizure or loss of consciousness of unknown cause that did not require anti-seizure medication, the decision whether that person's condition is likely to cause the loss of consciousness or loss of ability to control a CMV should be made on an individual basis by the medical examiner in consultation with the treating physician. Before certification is considered, it is suggested that a 6-month waiting period elapse from the time of the episode. Following the waiting period, it is suggested that the individual have a complete neurological examination. If the results of the examination are negative and anti-seizure medication is not required, then the driver may be qualified.

In those individual cases where a driver had a seizure or an episode of loss of consciousness that resulted from a known medical condition (*e.g.,* drug reaction, high temperature, acute infectious disease, dehydration, or acute metabolic disturbance), certification should be deferred until the driver has recovered fully from that condition, has no existing residual complications, and is not taking anti-seizure medication.

Drivers who have a history of epilepsy/seizures, off anti-seizure medication and seizure-free for 10 years, may be qualified to operate a CMV in interstate commerce. Interstate drivers with a history of a single unprovoked seizure may be qualified to drive a CMV in interstate commerce if seizure-free and off anti-seizure medication for a 5-year period or more.

Submitting Comments

You may submit your comments and material online or by fax, mail, or hand delivery, but please use only one of these means. FMCSA recommends that you include your name and a mailing address, an email address, or a phone number in the body of your document so that FMCSA can contact you if there are questions regarding your submission. To submit your comment online, go to *http://www.regulations.gov* and in the search box insert the docket number ''FMCSA–2015–0116'' and click the search button. When the new screen appears, click on the blue ''Comment Now!'' button on the right hand side of the page. On the new page, enter information required including the specific section of this document to which each comment applies, and provide a reason for each suggestion or recommendation. If you submit your comments by mail or hand delivery, submit them in an unbound format, no larger than 8½ by 11 inches, suitable for copying and electronic filing. If you submit comments by mail and would like to know that they reached the facility, please enclose a stamped, self-addressed postcard or envelope.

We will consider all comments and material received during the comment period and may change this proposed rule based on your comments. FMCSA may issue a final rule at any time after the close of the comment period.

Viewing Comments and Documents

To view comments, as well as any documents mentioned in this preamble, To submit your comment online, go to *http://www.regulations.gov* and in the search box insert the docket number ''FMCSA–2015–0116'' and click ''Search.'' Next, click ''Open Docket Folder'' and you will find all documents and comments related to the proposed rulemaking.

Summary of Applications

William Howard Brown

Mr. Brown is a 58 year-old class A CDL holder in North Carolina. He has a history of epilepsy and has remained seizure free since 1999. He takes anti-seizure medication with the dosage and frequency remaining the same since that time. If granted the exemption, he would like to drive a CMV. His physician states that he is supportive of Mr. Brown receiving an exemption.

Leo Arnold Burns

Mr. Burns is a 59 year-old driver in Nevada. He has a history of a seizure disorder and has remained seizure free since 2010. He takes anti-seizure medication with the dosage and frequency remaining the same since March 2015. If granted the exemption, he would like to drive a CMV. His physician states that he is supportive of Mr. Burns receiving an exemption.

Daniel Dellaserra

Mr. Dellaserra is a 54 year-old class A CDL holder in California. He has a history of seizures and has remained seizure free since 1998. He takes anti-seizure medication with the dosage and frequency remaining the same since that time. If granted the exemption, he would like to drive a CMV. His physician states that he is supportive of Mr. Dellaserra receiving an exemption.

Rodney Lee Ericson

Mr. Ericson is a 51 year-old class A CDL holder in Iowa. He has a history of epilepsy and has remained seizure free since 2010. He takes anti-seizure medication with the dosage and frequency remaining the same since that time. If granted the exemption, he would like to drive a CMV. His physician states that he is supportive of Mr. Ericson receiving an exemption.

Kristopher Alan Fraser

Mr. Fraser is a 31 year-old driver in Washington. He has a history of epilepsy and has remained seizure free since 2007. He takes anti-seizure medication with a change in dosage in October 2014. If granted the exemption, he would like to drive a CMV. His physician states that he is not supportive of Mr. Fraser receiving an exemption.

Todd A. Fuller

Mr. Fuller is a 45 year-old driver in Pennsylvania. He has a history of a seizure in January 2014. He takes anti-seizure medication with the dosage and frequency remaining the same since that time. If granted the exemption, he would like to drive a CMV. His physician states that he is supportive of Mr. Fuller receiving an exemption.

Thomas A. Granese

Mr. Granese is a 70 year-old class A CDL holder in Massachusetts. He has a history of seizure disorder and has remained seizure free since 2003. He takes anti-seizure medication with the dosage and frequency remaining the same since 2010. If granted the exemption, he would like to drive a CMV. His physician states that he is supportive of Mr. Granese receiving an exemption.

Paul E. Granger

Mr. Granger is a 50 year-old chauffeur license holder in Michigan. He has a history of a seizure disorder and has remained seizure free since 1987. He takes anti-seizure medication with the dosage and frequency remaining the same since that time. If granted the exemption, she would like to drive a CMV. His physician states that he is supportive of Mr. Granger receiving an exemption.

Charles Terrell Gray

Mr. Gray is a 69 year-old driver in Oklahoma. He has a history of a single unprovoked seizure and has remained seizure free since 1993. He takes anti-seizure medication with the dosage and frequency remaining the same since that time. If granted the exemption, he would like to drive a CMV. His physician states that he is supportive of Mr. Gray receiving an exemption.

David Allen Griggs

Mr. Griggs is a 55 year-old class A CDL holder in Minnesota. He has a history of a seizure disorder and has remained seizure free since 1987. He takes anti-seizure medication with the dosage and frequency remaining the same since April 2013. If granted the exemption, he would like to drive a CMV. His physician states that he is supportive of Mr. Griggs receiving an exemption.

Howard Pearce Hill

Mr. Hill is a 67 year-old class A CDL holder in Georgia. He has a history of a seizure disorder and has remained seizure free since 1990. He takes anti-seizure medication with the dosage and frequency remaining the same since January 2015. If granted the exemption, he would like to drive a CMV. His physician states that he is supportive of Mr. Hill receiving an exemption.

Eric A. Hilmer

Mr. Hilmer is a 39 year-old class A CDL holder in Wisconsin. He has a history of epilepsy and has remained seizure free since 2007. He takes anti-seizure medication with the dosage and frequency remaining the same since that time. If granted the exemption, he would like to drive a CMV. His physician states that he is supportive of Mr. Hilmer receiving an exemption.

Dennis Edward Klamm

Mr. Klamm is a 52 year-old class C CDL holder in Minnesota. He has a history of a seizure disorder and has remained seizure free since 1987. He takes anti-seizure medication with the dosage and frequency remaining the same since that time. If granted the exemption, he would like to drive a CMV. His physician states that he is supportive of Mr. Klamm receiving an exemption.

Victor John Martinez

Mr. Martinez is a 26 year-old driver in California. He has a history of epilepsy and suffered a seizure in December 2013. He underwent a left temporal craniotomy and lobectomy in 2013. He takes anti-seizure medication with the dosage and frequency remaining the same since that time. If granted the exemption, he would like to drive a CMV.

Sean Michael Monroe

Mr. Monroe is a 42 year-old driver in Virginia. He has a history of epilepsy and has remained seizure free since 2011. He takes anti-seizure medication with the dosage and frequency remaining the same since that time. If granted the exemption, he would like to drive a CMV. His physician states that he is supportive of Mr. Monroe receiving an exemption.

Christina L. Petti

Ms. Petti is a 45 year-old class B CDL holder in New Jersey. She has a history of a seizure disorder and has remained seizure free since 1985. She takes anti-seizure medication with the dosage and frequency remaining the same since that time. If granted the exemption, she would like to drive a CMV. Her physician states that he is supportive of Ms. Petti receiving an exemption.

Robert H. Philley

Mr. Philley is a 47 year-old driver in California. He has a history of a seizure disorder and has remained seizure free since 2013. He takes anti-seizure medication with the dosage and frequency remaining the same since that time. If granted the exemption, he would like to drive a CMV. His physician states that he is supportive of Mr. Philley receiving an exemption.

Christopher L. Phillips

Mr. Phillips is a 46 year-old class A CDL holder in Pennsylvania. He has a history of a seizure disorder and has remained seizure free since 1989. He takes anti-seizure medication with the dosage and frequency remaining the same since that time. If granted the exemption, he would like to drive a CMV. His physician states that he is supportive of Mr. Phillips receiving an exemption.

David T. Pomianek, Jr.

Mr. Pomianek is a 37 year-old class A CDL holder in New Jersey. He has a history of epilepsy and has remained seizure free since 2011. He takes anti-seizure medication with the dosage and frequency remaining the same since that time. If granted the exemption, he would like to drive a CMV. His physician states that he is supportive of Mr. Pomianek receiving an exemption.

Gregory Roy Schaefer

Mr. Schaefer is a 46 year-old driver in Texas. He has a history of a single seizure in June 2014. He takes anti-seizure medication with the dosage and frequency remaining the same since that time. If granted the exemption, he would like to drive a CMV. His physician states that he is supportive of Mr. Schaefer receiving an exemption.

Maciej Skrzyniarz

Mr. Skrzyniarz is a 28 year-old class A CDL holder in Illinois. He has a history of a single seizure in February 2014 associated with alcohol consumption. He takes anti-seizure medication with the dosage and frequency remaining the same since that time. If granted the exemption, he would like to drive a CMV. His physician states that he is supportive of Mr. Skrzyniarz receiving an exemption.

Request for Comments

In accordance with 49 U.S.C. 31315 and 31136(e), FMCSA requests public comment from all interested persons on the exemption applications described in this notice. We will consider all comments received before the close of business on the closing date indicated earlier in the notice.

BILLING CODE 4910–EX–P

DEPARTMENT OF TRANSPORTATION

Federal Railroad Administration

[Docket Number FRA–2015–0059]

Petition for Waiver of Compliance

In accordance with Part 211 of Title 49 of the Code of Federal Regulations

(CFR), this provides the public notice that by a document dated June 15, 2015, the Chicago, Fort Wayne & Eastern Railroad (CFER) has petitioned the Federal Railroad Administration (FRA) for a waiver of compliance from certain provisions of the Federal railroad safety regulations contained at Title 49 Code of Federal Regulations (CFR) part 213. FRA assigned the petition docket number FRA–2015–0059.

Pursuant to 49 CFR 213.119(h), CFER requests a waiver from the accepted practice to conduct walking joint bar inspections to detect cracks and other indications of potential joint failures in Continuous Welded Rail (CWR). The inspection will be conducted utilizing a Joint Bar Inspection System (JBIS). The JBIS system will conduct two tests in fiscal year 2015 with the target dates of July 20, 2015 and November 2, 2015. Accordingly, CFER is seeking approval from the FRA to use the JBIS to fulfill the requirements of the walking joint bar inspection required by 49 CFR213.119(h).

A copy of the petition, as well as any written communications concerning the petition, is available for review online at *www.regulations.gov* and in person at the Department of Transportation's Docket Operations Facility, 1200 New Jersey Ave. SE., W12–140, Washington, DC 20590. The Docket Operations Facility is open from 9 a.m. to 5 p.m., Monday through Friday, except Federal Holidays.

Interested parties are invited to participate in these proceedings by submitting written views, data, or comments. FRA does not anticipate scheduling a public hearing in connection with these proceedings since the facts do not appear to warrant a hearing. If any interested party desires an opportunity for oral comment, they should notify FRA, in writing, before the end of the comment period and specify the basis for their request.

All communications concerning these proceedings should identify the appropriate docket number (*e.g.,* Waiver Petition Docket Number FRA–2015–0059) and may be submitted by any of the following methods:

Web site: http://www.regulations.gov. Follow the online instructions for submitting comments.

Fax: 202–493–2251.

Mail: Docket Operations Facility, U.S. Department of Transportation, 1200 New Jersey Avenue SE., W12–140, Washington, DC 20590.

Hand Delivery: 1200 New Jersey Avenue SE., Room W12–140, Washington, DC 20590, between 9 a.m. and 5 p.m., Monday through Friday, except Federal holidays.

Communications received by August 27, 2015 will be considered by FRA before final action is taken. Comments received after that date will be considered as far as practicable.

Anyone is able to search the electronic form of any written communications and comments received into any of our dockets by the name of the individual submitting the comment (or signing the document, if submitted on behalf of an association, business, labor union, etc.). In accordance with 5 U.S.C. 553(c), DOT solicits comments from the public to better inform its processes. DOT posts these comments, without edit, including any personal information the commenter provides, to *www.regulations.gov,* as described in the system of records notice (DOT/ALL–14 FDMS), which can be reviewed at *www.dot.gov/privacy.* See also *http://www.regulations.gov/#!privacyNotice* for the privacy notice of regulations.gov.

Issued in Washington, DC, on July 6, 2015.

BILLING CODE 4910–06–P

DEPARTMENT OF TRANSPORTATION

Federal Railroad Administration

[Docket Number FRA–2015–0058]

Notice of Application for Approval of Discontinuance or Modification of a Railroad Signal System

In accordance with Part 235 of Title 49 of the Code of Federal Regulations (CFR) and 49 U.S.C. 20502(a), this document provides the public notice that by a document received June 19, 2015, the Canadian National Railroad (CN) petitioned the Federal Railroad Administration (FRA) seeking approval for the discontinuance or modification of a signal system. FRA assigned the petition Docket Number FRA–2015–0058.

Applicant: Canadian National Railroad, Mr. Corey Turner, S&C Supervisor, 297 Rivergate Drive, Memphis, TN 38109.

The CN seeks approval of the discontinuance of the Automatic Block Signal (ABS) system from milepost (MP) 398.2 to MP 403, on the Memphis Subdivision, in Memphis, TN. The reason for the discontinuance is that the ABS system is no longer needed for operations.

A copy of the petition, as well as any written communications concerning the petition, is available for review online at *www.regulatons.gov* and in person at the U. S. Department of Transportation's Docket Operations Facility, 1200 New Jersey Avenue SE., W12–140, Washington, DC 20590. The Docket Operations Facility is open from 9 a.m. to 5 p.m., Monday through Friday, except Federal Holidays.

Interested parties are invited to participate in these proceedings by submitting written views, data, or comments. FRA does not anticipate scheduling a public hearing in connection with these proceedings since the facts do not appear to warrant a hearing. If any interested party desires an opportunity for oral comment, they should notify FRA, in writing, before the end of the comment period and specify the basis for their request.

All communications concerning these proceedings should identify the appropriate docket number and may be submitted by any of the following methods:

- *Web site: http://www.regulations.gov.* Follow the online instructions for submitting comments.
- *Fax:* 202–493–2251.

Submission for OMB Review; Comment Request

AGENCY: Department of the Treasury.

Notice: Notice.

The Department of the Treasury will submit the following information collection request to the Office of Management and Budget (OMB) for review and clearance in accordance with the Paperwork Reduction Act of 1995, Public Law 104–13, on or after the date of publication of this notice.

DATES: Comments should be received on or before August 12, 2015 to be assured of consideration.

ADDRESSES: Send comments regarding the burden estimate, or any other aspect of the information collection, including suggestions for reducing the burden, to (1) Office of Information and Regulatory Affairs, Office of Management and Budget, Attention: Desk Officer for Treasury, New Executive Office Building, Room 10235, Washington, DC 20503, or email at *OIRA_Submission@OMB.EOP.gov* and (2) Treasury PRA Clearance Officer, 1750 Pennsylvania Ave. NW., Suite 8140, Washington, DC 20220, or email at *PRA@treasury.gov.*

FOR FURTHER INFORMATION CONTACT: Copies of the submission(s) may be obtained by emailing *PRA@treasury.gov* or viewing the entire information collection request at *www.reginfo.gov.*

Departmental Offices, Treasury Inspector General for Tax Administration (TIGTA)

OMB Number: 1505–0217.

Type of Review: Extension without change of a currently approved collection.

Title: Treasury Inspector General for Tax Administration (TIGTA) Generic Survey.

Abstract: The TIGTA's Office of Audit's mission is to provide independent oversight of IRS activities. Through its audit programs TIGTA promotes efficiency and effectiveness in the administration of internal revenue laws, including the prevention and detection of fraud, waste, and abuse affecting tax administration. To accomplish this, TIGTA Office of Audit at times finds it necessary to contact a limited number of taxpayers (including businesses) for various reasons.

Affected Public: Individuals or Households; Private Sector: Businesses or other for-profits.

Estimated Burden Hours: 2,500.

Dated: July 7, 2015.

Dawn D. Wolfgang,

Treasury PRA Clearance Officer.

BILLING CODE P

DEPARTMENT OF VETERANS AFFAIRS

[OMB Control No. 2900–NEW]

Agency Information Collection (Veterans Transportation Service Data Collection) Activities: under OMB Review

AGENCY: Veterans Health Administration, Department of Veterans Affairs

ACTION: Notice

SUMMARY: In compliance with the Paperwork Reduction Act (PRA) of 1995 (44 U.S.C. 3501–3521), this notice announces that the Veterans Health Administration (VHA), Department of Veterans Affairs, will submit the collection of information abstracted below to the Office of Management and Budget (OMB) for review and comment. The PRA submission describes the nature of the information collection and its expected cost and burden and includes the actual data collection instrument.

DATES: Written comments and recommendations on the proposed collection of information should be received on or before August 12, 2015.

ADDRESSES: Submit written comments on the collection of information through *www.Regulations.gov,* or to Office of Information and Regulatory Affairs, Office of Management and Budget, Attn: VA Desk Officer; 725 17th St. NW., Washington, DC 20503 or sent through electronic mail to *oira_submission@omb.eop.gov.* Please refer to ''OMB Control No. 2900–NEW (Veterans Transportation Service Data Collection)'' in any correspondence. During the comment period, comments may be viewed online through the FDMS.

FOR FURTHER INFORMATION CONTACT: Crystal Rennie, Enterprise Records Service (005R1B), Department of Veterans Affairs, 810 Vermont Avenue

NW., Washington, DC 20420, (202) 632–7492 or email *crystal.rennie@va.gov.* Please refer to ‘‘OMB Control No. 2900–NEW (Veterans Transportation Service Data Collection)’’ in any correspondence.

SUPPLEMENTARY INFORMATION: Under the PRA of 1995 (Pub. L. 104–13; 44 U.S.C. 3501—3521), Federal agencies must obtain approval from the Office of Management and Budget (OMB) for each collection of information they conduct or sponsor. This request for comment is being made pursuant to Section 3506(c)(2)(A) of the PRA.

With respect to the following collection of information, VHA invites comments on: (1) whether the proposed collection of information is necessary for the proper performance of VHA's functions, including whether the information will have practical utility; (2) the accuracy of VHA's estimate of the burden of the proposed collection of information; (3) ways to enhance the quality, utility, and clarity of the information to be collected; and (4) ways to minimize the burden of the collection of information on respondents, including through the use of automated collection techniques or the use of other forms of information technology.

Titles: Veterans Transportation Service (VTS) Data Collection.

OMB Control Number: 2900–NEW (Veterans Transportation Service Data Collection).

Type of Review: New collection.

Abstract: The information collection is to ensure Veterans, Servicemembers, beneficiaries, caregivers and other persons receive timely and reliable transportation for the purpose of examination, treatment and care. VHA must identify the beneficiary, the dates and location required to plan a trip for scheduled or unscheduled appointments, and ensure reimbursement of beneficiary travel mileage is not paid for transportation provided through VTS. Information is also collected to facilitate overall evaluation of the effectiveness of the allocation of resources for VTS.

An agency may not conduct or sponsor, and a person is not required to respond to a collection of information unless it displays a currently valid OMB control number. The **Federal Register** Notice with a 60-day comment period soliciting comments on this collection of information was published at 79 FR 74814, December 16, 2014.

Affected Public: Individuals or households.

Estimated Annual Burden: 334,895 burden hours.

Estimated Average Burden Per Respondent: 5 minutes.

Frequency of Response: 3.32 (On Occasion).

Estimated Number of Respondents: 100,872.

By direction of the Secretary.

Kathleen M. Manwell,

VA Privacy Service, Office of Privacy and Records Management, Department of Veterans Affairs.

[OMB Control No. 2900–NEW]

Proposed Information Collection (VHA Homeless Programs Project CHALENG (Community Homelessess Assessment, Local Education and Networking Groups) for Veterans)

Activity: Comment Request.

AGENCY: Veterans Health Administration, Department of Veterans Affairs.

ACTION: Notice.

SUMMARY: The Veterans Health Administration (VHA), Department of Veterans Affairs (VA), is announcing an opportunity for public comment on the proposed collection of certain information by the agency. Under the Paperwork Reduction Act (PRA) of 1995, Federal agencies are required to publish notice in the **Federal Register** concerning each proposed collection of information, including each new collection, and allow 60 days for public comment in response to the notice. This notice solicits comments on the information needed for Veterans, Veteran Representatives and health care providers to request reimbursement from the federal government for emergency services at a private institution.

DATES: Written comments and recommendations on the proposed collection of information should be received on or before September 11, 2015.

ADDRESSES: Submit written comments on the collection of information through Federal Docket Management System (FDMS) at *www.Regulations.gov;* or Audrey Revere, Office of Regulatory and Administrative Affairs, Veterans Health Administration (10B4), Department of Veterans Affairs, 810 Vermont Avenue NW., Washington, DC 20420 or email: *Audrey.revere@va.gov.* Please refer to ‘‘VHA Homeless Programs Project CHALENG, OMB Control No. 2900–NEW’’ in any correspondence. During the comment period, comments may be viewed online through the FDMS.

FOR FURTHER INFORMATION CONTACT: Audrey Revere at (202) 461–5694.

SUPPLEMENTARY INFORMATION: Under the PRA of 1995 (Pub. L. 104–13; 44 U.S.C. 3501—3521), Federal agencies must obtain approval from the Office of Management and Budget (OMB) for each collection of information they conduct or sponsor. This request for comment is being made pursuant to Section 3506(c)(2)(A) of the PRA.

With respect to the following collection of information, VHA invites comments on: (1) Whether the proposed collection of information is necessary for the proper performance of VHA's functions, including whether the information will have practical utility; (2) the accuracy of VHA's estimate of the burden of the proposed collection of information; (3) ways to enhance the quality, utility, and clarity of the information to be collected; and (4) ways to minimize the burden of the collection of information on respondents, including through the use of automated collection techniques or the use of other forms of information technology.

Titles: VHA Homeless Programs, Project CHALENG (Community Homelessness Assessment, Local Education and Networking Groups) for Veterans.

OMB Control Number: 2900–NEW.

Type of Review: New Collection Request.

Abstract: In 1993 the Department of Veterans Affairs (VA) launched Project CHALENG (Community Homelessness Assessment, Local Education and Networking Groups) for Veterans in response to Public Law 102–405 which required VA to make an assessment of the needs of homeless Veterans in coordination with other Federal departments, state and local government agencies, and nongovernmental agencies with experience working with homeless persons. Since 1993, VA has administered a needs assessment in accordance with guidance in Public Law 103–446 and Public Law 105–114.

This collection of information is necessary to ensure that VA and community partners are developing services that are responsive to the needs of local homeless Veterans, in order to end homelessness and prevent new Veterans from experiencing homelessness. Over the years data from CHALENG has assisted VA in developing new services for Veterans such as the Homeless Veteran Dental Program (HVDP), the expansion of the

Department of Housing and Urban Development-VA Supportive Housing (HUD–VASH) Program, the Veterans Justice Programs and Supportive Services for Veteran Families (SSVF). In addition community organizations use CHALENG data in grant applications to support services for homeless Veterans; grant applications are for VA, other Federal, local government, and community foundation dollars, which maximizes community participation in serving homeless Veterans.

Affected Public: Individuals or Households.

Estimated Annual Burden: 1,650 burden hours.

Estimated Average Burden Per Respondent: 5 minutes.

Frequency of Response: Annually.

Estimated Number of Respondents: 15,000.

By direction of the Secretary.

Kathleen M. Manwell,

VA Privacy Service, Office of Privacy and Records Management, Department of Veterans Affairs.

BILLING CODE 8320–01–P

DEPARTMENT OF VETERANS AFFAIRS

[OMB Control No. 2900–0740]

Proposed Information Collection (VA Forms 21P–0847) Activity: Comment Request

AGENCY: Veterans Benefits Administration, Department of Veterans Affairs.

ACTION: Notice.

SUMMARY: The Veterans Benefits Administration (VBA), Department of Veterans Affairs (VA), is announcing an opportunity for public comment on the proposed collection of certain information by the agency. Under the Paperwork Reduction Act (PRA) of 1995, Federal agencies are required to publish notice in the **Federal Register** concerning each proposed collection of information, including each proposed revision of a currently approved collection, and allow 60 days for public comment in response to the notice. This notice solicits comments on information needed to determine a claimant's entitlement to possible accrued benefits.

DATES: Written comments and recommendations on the proposed collection of information should be received on or before September 11, 2015.

ADDRESSES: Submit written comments on the collection of information through Federal Docket Management System (FDMS) at *www.Regulations.gov* or to Nancy J. Kessinger, Veterans Benefits Administration (20M33), Department of Veterans Affairs, 810 Vermont Avenue NW, Washington, DC 20420 or email to *nancy.kessinger@va.gov.* Please refer to ''OMB Control No. 2900–0740'' in any correspondence. During the comment period, comments may be viewed online through the FDMS.

FOR FURTHER INFORMATION CONTACT: Nancy J. Kessinger at (202) 632–8924 or FAX (202) 632–8925.

SUPPLEMENTARY INFORMATION: Under the PRA of 1995 (Pub. L. 104–13; 44 U.S.C. 3501—21), Federal agencies must obtain approval from the Office of Management and Budget (OMB) for each collection of information they conduct or sponsor. This request for comment is being made pursuant to Section 3506(c)(2)(A) of the PRA.

With respect to the following collection of information, VBA invites comments on: (1) whether the proposed collection of information is necessary for the proper performance of VBA's functions, including whether the information will have practical utility; (2) the accuracy of VBA's estimate of the burden of the proposed collection of information; (3) ways to enhance the quality, utility, and clarity of the information to be collected; and (4) ways to minimize the burden of the collection of information on respondents, including through the use of automated collection techniques or the use of other forms of information technology.

Title: Request for Substitution of Claimant Upon Death of Claimant (VA Form 21P–0847),

OMB Control Number: 2900–0740.

Type of Review: Revision of a currently approved collection.

Abstract: The Department of Veterans Affairs (VA), through its Veterans Benefits Administration (VBA), administers an integrated program of benefits and services established by law for veterans, service personnel, and their dependents and/or beneficiaries. Information requested by this form is authorized under the authority of 38 U.S.C. 5121A, Payment of Certain Accrued Benefits Upon Death of a Beneficiary.

Affected Public: Individuals or households.

Estimated Annual Burden: 1,667 hours

Estimated Average Burden Per Respondent: 5 minutes

Frequency of Response: Once.

Estimated Number of Respondents: 20,000.

By direction of the Secretary.

Kathleen M. Manwell,

VA Privacy Service, Office of Privacy and Records Management, Department of Veterans Affairs.

The PRA submission describes the nature of the information collection and its expected cost and burden; it includes the actual data collection instrument.

DATES: Comments must be submitted on or before August 12, 2015.

ADDRESSES: Submit written comments on the collection of information through *www.Regulations.gov,* or to Office of Information and Regulatory Affairs, Office of Management and Budget, Attn: VA Desk Officer; 725 17th St. NW., Washington, DC 20503 or sent through electronic mail to *oira_submission@omb.eop.gov.* Please refer to ''OMB Control No. 2900–0681'' in any correspondence.

FOR FURTHER INFORMATION CONTACT: Crystal Rennie, Enterprise Records Service (005R1B), Department of Veterans Affairs, 810 Vermont Avenue NW, Washington, DC 20420, (202) 632–7492 or email *crystal.rennie@va.gov.* Please refer to ''OMB Control No. 2900–0681.''

SUPPLEMENTARY INFORMATION: *Title:* Preliminary Independent Living (IL) Assessment.

OMB Control Number: 2900–0681.

Type of Review: Revision of a currently approved collection.

Abstract: VA case managers use VA Form 28–0791 while evaluating the independent living needs of veterans with severe disabilities. The data is used to determine the scope of the veteran's independent living under the Vocational Rehabilitation and Employment program.

An agency may not conduct or sponsor, and a person is not required to respond to a collection of information unless it displays a currently valid OMB control number. The **Federal Register** Notice with a 60-day comment period soliciting comments on this collection of information was published at 80 FR 03446 on February 19, 2015.

Affected Public: Individuals or households.

Estimated Annual Burden: 2,500 hours.

Estimated Average Burden per Respondent: 1 hour.

Frequency of Response: One-time.

Estimated Number of Respondents: 2,500.

By direction of the Secretary.

Kathleen M. Manwell,

VA Privacy Service, Office of Privacy and Records Management,

Department of Veterans Affairs.

BILLING CODE 8320–01–P

DEPARTMENT OF VETERANS AFFAIRS

[OMB Control No. 2900–0128]

Proposed Information Collection (Notice of Lapse & Application for Reinstatement) Activity: Withdrawal

AGENCY: Veterans Benefits Administration, Department of Veterans Affairs.

ACTION: Notice; withdrawal.

SUMMARY: On Friday, May 15, 2015, The Veterans Benefits Administration (VBA), Department of Veterans Affairs (VA), published a notice in the **Federal Register** announcing an opportunity for public comment on the proposed collection Notice of Lapse & Application for Reinstatement. This notice (FR Vol. 80, Number 94, May 15, 2015) was published in error; therefore this document corrects that error by withdrawing this FR notice, document number 2015–28050–28051.

DATES: Withdraw FR notice published on Friday, May 15, 2015.

FOR FURTHER INFORMATION CONTACT: Crystal Rennie, Enterprise Records Service (005R1B), Department of Veterans Affairs, 810 Vermont Avenue NW., Washington, DC 20420, at (202) 632–7492.

FR Doc. 2015, published on May 15, 2015 (FR Vol 80, Number 94), is withdrawn by this notice.

By direction of the Secretary.

Kathleen M. Manwell,

VA Privacy Service, Office of Privacy and Records Management, Department of Veterans Affairs.

Greenhouse Gas Emissions and Fuel Efficiency Standards for Medium- and Heavy-Duty Engines and Vehicles—Phase 2

AGENCY: Environmental Protection Agency (EPA) and Department of Transportation (DOT) National Highway Traffic Safety Administration (NHTSA)

ACTION: Proposed rule.

SUMMARY: EPA and NHTSA, on behalf of the Department of Transportation, are each proposing rules to establish a comprehensive Phase 2 Heavy-Duty (HD) National Program that will reduce greenhouse gas (GHG) emissions and fuel consumption for new on-road heavy-duty vehicles. This technology-advancing program would phase in over the long-term, beginning in the 2018 model year and culminating in standards for model year 2027, responding to the President's directive on February 18, 2014, to develop new standards that will take us well into the next decade. NHTSA's proposed fuel consumption standards and EPA's proposed carbon dioxide (CO_2) emission standards are tailored to each of four regulatory categories of heavy-duty vehicles: Combination tractors; trailers used in combination with those tractors; heavy-duty pickup trucks and vans; and vocational vehicles. The proposal also includes separate standards for the engines that power combination tractors and vocational vehicles. Certain proposed requirements for control of GHG emissions are exclusive to EPA programs. These include EPA's proposed hydrofluorocarbon standards to control leakage from air conditioning systems in vocational vehicles, and EPA's proposed nitrous oxide (N_2O) and methane (CH_4) standards for heavy-duty engines. Additionally, NHTSA is addressing misalignment in the Phase 1 standards between EPA and NHTSA to ensure there are no differences in compliance standards between the agencies. In an effort to promote efficiency, the agencies are also proposing to amend their rules to modify reporting requirements, such as the method by which manufacturers submit pre-model, mid-model, and supplemental reports. EPA's proposed HD Phase 2 GHG emission standards are authorized under the Clean Air Act and NHTSA's proposed HD Phase 2 fuel consumption standards authorized under the Energy Independence and Security Act of 2007. These standards would begin with model year 2018 for trailers under EPA standards and 2021 for all of the other heavy-duty vehicle and engine categories. The agencies estimate that the combined standards would reduce CO_2 emissions by approximately 1 billion metric tons and save 1.8 billion barrels of oil over the life of vehicles and engines sold during the Phase 2 program, providing over $200 billion in net societal benefits. As noted, the proposal also includes certain EPA-specific provisions relating to control of emissions of pollutants other than GHGs. EPA is seeking comment on non-GHG emission standards relating to the use of auxiliary power units installed in tractors. In addition, EPA is proposing to clarify the classification of natural gas engines and other gaseous-fueled heavy-duty engines, and is proposing closed crankcase standards for emissions of all pollutants from natural gas heavy-duty engines. EPA is also proposing technical amendments to EPA rules that apply to emissions of non-GHG pollutants from light-duty motor vehicles, marine diesel engines, and other nonroad engines and equipment. Finally, EPA is proposing to require that rebuilt engines installed in new incomplete vehicles meet the emission standards applicable in the year of assembly, including all applicable standards for criteria pollutants.

DATES: Comments on all aspects of this proposal must be received on or before September 11, 2015. Under the Paperwork Reduction Act (PRA), comments on the information collection provisions are best assured of consideration if the Office of Management and Budget (OMB) receives a copy of your comments on or before August 12, 2015.

EPA and NHTSA will announce the public hearing dates and locations for this proposal in a supplemental **Federal Register** document.

ADDRESSES: Submit your comments, identified by Docket ID No. EPA–HQ–OAR–2014–0827 (for EPA's docket) and NHTSA–2014–0132 (for NHTSA's docket) by one of the following methods:

- *Online: www.regulations.gov:* Follow the on-line instructions for submitting comments.
- *Email: a-and-r-docket@epa.gov.*
- *Mail:*

EPA: Air and Radiation Docket and Information Center, Environmental Protection Agency, Mail code: 28221T, 1200 Pennsylvania Ave. NW., Washington, DC 20460.

NHTSA: Docket Management Facility, M–30, U.S. Department of Transportation, West Building, Ground Floor, Rm. W12–140, 1200 New Jersey Avenue SE., Washington, DC 20590.

- *Hand Delivery:*

EPA: EPA Docket Center, EPA WJC West Building, Room 3334, 1301 Constitution Ave. NW., Washington, DC 20460. Such deliveries are only accepted during the Docket's normal hours of operation, and special arrangements should be made for deliveries of boxed information.

NHTSA: West Building, Ground Floor, Rm. W12–140, 1200 New Jersey Avenue SE., Washington, DC 20590, between 9 a.m. and 4 p.m. Eastern Time, Monday through Friday, except Federal holidays.

Instructions: EPA and NHTSA have established dockets for this action under Direct your comments to Docket ID No. EPA–HQ–OAR–2014–0827 and/or NHTSA–2014–0132, respectively. See the **SUPPLEMENTARY INFORMATION** section on ''Public Participation'' for more information about submitting written comments.

Docket: All documents in the docket are listed on the *www.regulations.gov* Web site. Although listed in the index, some information is not publicly available, *e.g.,* confidential business information or other information whose disclosure is restricted by statute. Certain other material, such as copyrighted material, is not placed on the Internet and will be publicly available only in hard copy form. Publicly available docket materials are available either electronically through *www.regulations.gov* or in hard copy at the following locations:

EPA: Air and Radiation Docket and Information Center, EPA Docket Center, EPA/DC, EPA WJC West Building, 1301 Constitution Ave. NW., Room 3334, Washington, DC. The Public Reading Room is open from 8:30 a.m. to 4:30 p.m., Monday through Friday, excluding legal holidays. The telephone number for the Public Reading Room is (202) 566–1744, and the telephone number for the Air Docket is (202) 566–1742.

NHTSA: Docket Management Facility, M–30, U.S. Department of

Transportation, West Building, Ground Floor, Rm. W12–140, 1200 New Jersey Avenue SE., Washington, DC 20590. The telephone number for the docket management facility is (202) 366–9324. The docket management facility is open between 9 a.m. and 5 p.m. Eastern Time, Monday through Friday, except Federal holidays.

FOR FURTHER INFORMATION CONTACT: *EPA:* For hearing information or to register, please contact: JoNell Iffland, Office of Transportation and Air Quality, Assessment and Standards Division (ASD), Environmental Protection Agency, 2000 Traverwood Drive, Ann Arbor, MI 48105; Telephone number: (734) 214–4454; Fax number: (734) 214–4816; Email address: *iffland.jonell@epa.gov*. For all other information related to the rule, please contact: Tad Wysor, Office of Transportation and Air Quality, Assessment and Standards Division (ASD), Environmental Protection Agency, 2000 Traverwood Drive, Ann Arbor, MI 48105; telephone number: (734) 214–4332; email address: *wysor.tad@epa.gov*.

NHTSA: Ryan Hagen or Analiese Marchesseault, Office of Chief Counsel, National Highway Traffic Safety Administration, 1200 New Jersey Avenue SE., Washington, DC 20590. Telephone: (202) 366–2992; *ryan.hagen@dot.gov* or *analiese.marchesseault@dot.gov*.

SUPPLEMENTARY INFORMATION:

A. Does this action apply to me?

This proposed action would affect companies that manufacture, sell, or import into the United States new heavy-duty engines and new Class 2b through 8 trucks, including combination tractors, all types of buses, vocational vehicles including municipal, commercial, recreational vehicles, and commercial trailers as well as ¾-ton and 1-ton pickup trucks and vans. The heavy-duty category incorporates all motor vehicles with a gross vehicle weight rating of 8,500 lbs or greater, and the engines that power them, except for medium-duty passenger vehicles already covered by the greenhouse gas standards and corporate average fuel economy standards issued for light-duty model year 2017–2025 vehicles. Proposed regulated categories and entities include the following:

Category	NAICS code [a]	Examples of potentially affected entities
Industry	336111	Motor Vehicle Manufacturers, Engine Manufacturers, Truck Manufacturers, Truck Trailer Manufacturers.
	336112	
	333618	
	336120	
	336212	
Industry	541514	Commercial Importers of Vehicles and Vehicle Components.
	811112	
	811198	
Industry	336111	Alternative Fuel Vehicle Converters.
	336112	
	422720	
	454312	
	541514	
	541690	
	811198	

Note: [a] North American Industry Classification System (NAICS).

This table is not intended to be exhaustive, but rather provides a guide for readers regarding entities likely covered by these rules. This table lists the types of entities that the agencies are aware may be regulated by this action. Other types of entities not listed in the table could also be regulated. To determine whether your activities are regulated by this action, you should carefully examine the applicability criteria in the referenced regulations. You may direct questions regarding the applicability of this action to the persons listed in the preceding **FOR FURTHER INFORMATION CONTACT** section.

B. Public Participation

EPA and NHTSA request comment on all aspects of this joint proposed rule. This section describes how you can participate in this process.

(1) How do I prepare and submit comments?

In this joint proposal, there are many issues common to both EPA's and NHTSA's proposals. For the convenience of all parties, comments submitted to the EPA docket will be considered comments submitted to the NHTSA docket, and vice versa. An exception is that comments submitted to the NHTSA docket on NHTSA's Draft Environmental Impact Statement (EIS) will not be considered submitted to the EPA docket. Therefore, the public only needs to submit comments to either one of the two agency dockets, although they may submit comments to both if they so choose. Comments that are submitted for consideration by one agency should be identified as such, and comments that are submitted for consideration by both agencies should be identified as such. Absent such identification, each agency will exercise its best judgment to determine whether a comment is submitted on its proposal.

Further instructions for submitting comments to either EPA or NHTSA docket are described below.

EPA: Direct your comments to Docket ID No. EPA–HQ–OAR–2014–0827. EPA's policy is that all comments received will be included in the public docket without change and may be made available online at *www.regulations.gov*, including any personal information provided, unless the comment includes information claimed to be Confidential Business Information (CBI) or other information whose disclosure is restricted by statute. Do not submit information that you consider to be CBI or otherwise protected through *www.regulations.gov* or email. The *www.regulations.gov* Web site is an ''anonymous access'' system, which means EPA will not know your identity or contact information unless you provide it in the body of your comment. If you send an email comment directly to EPA without going through *www.regulations.gov* your email address will be automatically captured and included as part of the comment that is placed in the public docket and made available on the Internet. If you submit an electronic comment, EPA recommends that you include your name and other contact information in the body of your comment and with any disk or CD–ROM you submit. If EPA cannot read your comment due to technical difficulties and cannot contact you for clarification, EPA may not be able to consider your comment. Electronic files should avoid the use of special characters, any form of encryption, and be free of any defects or viruses. For additional information about EPA's public docket visit the EPA Docket Center homepage at *http://www.epa.gov/epahome/dockets.htm.*

NHTSA: Your comments must be written and in English. To ensure that your comments are correctly filed in the Docket, please include the Docket number NHTSA–2014–0132 in your comments. Your comments must not be more than 15 pages long.[1] NHTSA established this limit to encourage you to write your primary comments in a concise fashion. However, you may attach necessary additional documents to your comments, and there is no limit on the length of the attachments. If you are submitting comments electronically as a PDF (Adobe) file, we ask that the documents submitted be scanned using the Optical Character Recognition (OCR) process, thus allowing the agencies to search and copy certain portions of your submissions.[2] Please note that pursuant to the Data Quality Act, in order for the substantive data to be relied upon and used by the agency, it must meet the information quality standards set forth in the OMB and Department of Transportation (DOT) Data Quality Act guidelines. Accordingly, we encourage you to consult the guidelines in preparing your comments. OMB's guidelines may be accessed at *http://www.whitehouse.gov/omb/fedreg/reproducible.html.* DOT's guidelines may be accessed at *http://www.dot.gov/dataquality.htm.*

(2) Tips for Preparing Your Comments

When submitting comments, please remember to:

- Identify the rulemaking by docket number and other identifying information (subject heading, **Federal Register** date and page number).
- Explain why you agree or disagree, suggest alternatives, and substitute language for your requested changes.
- Describe any assumptions and provide any technical information and/or data that you used.
- If you estimate potential costs or burdens, explain how you arrived at your estimate in sufficient detail to allow for it to be reproduced.
- Provide specific examples to illustrate your concerns, and suggest alternatives.
- Explain your views as clearly as possible, avoiding the use of profanity or personal threats.
- Make sure to submit your comments by the comment period deadline identified in the DATES section above.

(3) How can I be sure that my comments were received?

NHTSA: If you submit your comments by mail and wish Docket Management to notify you upon its receipt of your comments, enclose a self-addressed, stamped postcard in the envelope containing your comments. Upon receiving your comments, Docket Management will return the postcard by mail.

(4) How do I submit confidential business information?

Any confidential business information (CBI) submitted to one of the agencies will also be available to the other agency. However, as with all public comments, any CBI information only needs to be submitted to either one of the agencies' dockets and it will be available to the other. Following are specific instructions for submitting CBI to either agency. If you have any questions about CBI or the procedures for claiming CBI, please consult the persons identified in the FOR FURTHER INFORMATION CONTACT section.

EPA: Do not submit CBI to EPA through *www.regulations.gov* or email. Clearly mark the part or all of the information that you claim to be CBI. For CBI information in a disk or CD ROM that you mail to EPA, mark the outside of the disk or CD ROM as CBI and then identify electronically within the disk or CD ROM the specific information that is claimed as CBI. Information not marked as CBI will be included in the public docket without prior notice. In addition to one complete version of the comment that includes information claimed as CBI, a copy of the comment that does not contain the information claimed as CBI must be submitted for inclusion in the public docket. Information so marked will not be disclosed except in accordance with procedures set forth in 40 CFR part 2.

NHTSA: If you wish to submit any information under a claim of confidentiality, you should submit three copies of your complete submission, including the information you claim to be confidential business information, to the Chief Counsel, NHTSA, at the address given above under FOR FURTHER INFORMATION CONTACT. When you send a comment containing confidential business information, you should include a cover letter setting forth the information specified in our confidential business information regulation.[3]

In addition, you should submit a copy from which you have deleted the claimed confidential business information to the Docket by one of the methods set forth above.

(5) How can I read the comments submitted by other people?

You may read the materials placed in the docket for this document (*e.g.,* the comments submitted in response to this document by other interested persons) at any time by going to *http://www.regulations.gov.* Follow the online instructions for accessing the dockets. You may also read the materials at the EPA Docket Center or NHTSA Docket Management Facility by going to the street addresses given above under ADDRESSES.

(6) How do I participate in the public hearings?

EPA and NHTSA will announce the public hearing dates and locations for this proposal in a supplemental **Federal Register** document. At all hearings, both agencies will accept comments on the rulemaking, and NHTSA will also accept comments on the EIS.

If you would like to present testimony at the public hearings, we ask that you notify EPA and NHTSA contact persons listed in the FOR FURTHER INFORMATION CONTACT section at least ten days before the hearing. Once EPA and NHTSA learn how many people have registered to speak at the public hearing, we will allocate an appropriate amount of time to each participant. For planning purposes, each speaker should anticipate speaking for approximately ten minutes, although we may need to adjust the time for each speaker if there is a large turnout. We suggest that you bring copies of your statement or other material for EPA and NHTSA panels. It would also be helpful if you send us a copy of your statement or other materials before the hearing. To accommodate as many speakers as possible, we prefer that speakers not use technological aids (*e.g.,* audio-visuals, computer slideshows). However, if you plan to do so, you must notify the contact persons in the FOR FURTHER INFORMATION CONTACT section above. You also must make arrangements to provide your presentation or any other

[1] See 49 CFR 553.21.

[2] Optical character recognition (OCR) is the process of converting an image of text, such as a scanned paper document or electronic fax file, into computer-editable text.

[3] See 49 CFR part 512.

aids to EPA and NHTSA in advance of the hearing in order to facilitate set-up. In addition, we will reserve a block of time for anyone else in the audience who wants to give testimony. The agencies will assume that comments made at the hearings are directed to the proposed rule unless commenters specifically reference NHTSA's EIS in oral or written testimony.

The hearing will be held at a site accessible to individuals with disabilities. Individuals who require accommodations such as sign language interpreters should contact the persons listed under **FOR FURTHER INFORMATION CONTACT** section above no later than ten days before the date of the hearing.

EPA and NHTSA will conduct the hearing informally, and technical rules of evidence will not apply. We will arrange for a written transcript of the hearing and keep the official record of the hearing open for 30 days to allow you to submit supplementary information. You may make arrangements for copies of the transcript directly with the court reporter.

C. Did EPA conduct a peer review before issuing this notice?

This regulatory action is supported by influential scientific information. Therefore, EPA conducted a peer review consistent with OMB's Final Information Quality Bulletin for Peer Review. As described in Section II.C.3, a peer review of updates to the vehicle simulation model (GEM) for the proposed Phase 2 standards has been completed. This version of GEM is based on the model used for the Phase 1 rule, which was peer-reviewed by a panel of four independent subject matter experts (from academia and a national laboratory). The peer review report and the agency's response to the peer review comments are available in Docket ID No. EPA–HQ–OAR–2014–0827.

D. Executive Summary

(1) Commitment to Greenhouse Gas Emission Reductions and Vehicle Fuel Efficiency

As part of the Climate Action Plan announced in June 2013,[4] the President directed the Environmental Protection Agency (EPA) and the Department of Transportation's (DOT) National Highway Traffic Safety Administration (NHTSA) to set the next round of standards to reduce greenhouse gas (GHG) emissions and improve fuel efficiency for medium- and heavy-duty vehicles. More than 70 percent of the oil used in the United States and 28 percent of GHG emissions come from the transportation sector, and since 2009 EPA and NHTSA have worked with industry and states to develop ambitious, flexible standards for both the fuel economy and GHG emissions of light-duty vehicles and the fuel efficiency and GHG emissions of heavy-duty vehicles.[5] [6] The standards proposed here (referred to as Phase 2) would build on the light-duty vehicle standards spanning model years 2011 to 2025 and on the initial phase of standards (referred to as Phase 1) for new medium and heavy-duty vehicles (MDVs and HDVs) and engines in model years 2014 to 2018. Throughout every stage of development for these programs, EPA and NHTSA (collectively, the agencies, or ''we'') have worked in close partnership not only with one another, but with the vehicle manufacturing industry, environmental community leaders, and the State of California among other entities to create a single, effective set of national standards.

Through two previous rulemakings, EPA and NHTSA have worked with the auto industry to develop new fuel economy and GHG emission standards for light-duty vehicles. Taken together, the light-duty vehicle standards span model years 2011 to 2025 and are the first significant improvement in fuel economy in approximately two decades. Under the final program, average new car and light truck fuel economy is expected to double by 2025.[7] This is projected to save consumers $1.7 trillion at the pump—roughly $8,200 per vehicle for a MY2025 vehicle—reducing oil consumption by 2.2 million barrels a day in 2025 and slashing GHG emissions by 6 billion metric tons over the lifetime of the vehicles sold during this period.[8] These fuel economy standards are already delivering savings for American drivers. Between model years 2008 and 2013, the unadjusted average test fuel economy of new passenger cars and light trucks sold in the United States has increased by about four miles per gallon. Altogether, light-duty vehicle fuel economy standards finalized after 2008 have already saved nearly one billion gallons of fuel and avoided more than 10 million tons of carbon dioxide emissions.[9]

Similarly, EPA and NHTSA have previously developed joint GHG emission and fuel efficiency standards for MDVs and HDVs. Prior to these Phase 1 standards, heavy-duty trucks and buses—from delivery vans to the largest tractor-trailers—were required to meet pollution standards for soot and smog-causing air pollutants, but no requirements existed for the fuel efficiency or carbon pollution from these vehicles.[10] By 2010, total fuel consumption and GHG emissions from MDVs and HDVs had been growing, and these vehicles accounted for 23 percent of total U.S. transportation-related GHG emissions.[11] In August 2011, the agencies finalized the groundbreaking Phase 1 standards for new MDVs and HDVs in model years 2014 through 2018. This program, developed with support from the trucking and engine industries, the State of California, Environment Canada, and leaders from the environmental community, set standards that are expected to save a projected 530 million barrels of oil and reduce carbon emissions by about 270 million metric tons, representing one of the most significant programs available to reduce domestic emissions of GHGs.[12] The Phase 1 program, as well as the many additional actions called for in the President's 2013 Climate Action Plan [13] including this Phase 2 rulemaking, not only result in meaningful decreases in GHG emissions, but support—indeed are critical for—United States leadership to encourage other countries to also achieve meaningful GHG reductions.

This proposal builds on our commitment to robust collaboration with stakeholders and the public. It follows an expansive and thorough outreach effort in which the agencies gathered input, data and views from many interested stakeholders, involving over 200 meetings with heavy-duty vehicle and engine manufacturers, technology suppliers, trucking fleets, truck drivers, dealerships, environmental organizations, and state agencies. As with the previous light-duty rules and the heavy-duty Phase 1 rule, the agencies have consulted

frequently with the California Air Resources Board staff during the development of this Phase 2 proposal, given California's unique ability among the states to adopt their own GHG standards for on-highway engines and vehicles. The agencies look forward to feedback and ongoing conversation following the release of this proposed rule from all stakeholders—including through planned public hearings, written comments, and other opportunities for input.

(2) Overview of Phase 1 Medium- and Heavy-Duty Vehicle Standards

The President's direction to EPA and NHTSA to develop GHG emission and fuel efficiency standards for MDVs and HDVs resulted in the agencies' promulgation of the Phase 1 program in 2011, which covers new trucks and heavy vehicles in model years 2014 to 2018. The Phase 1 program includes specific standards for combination tractors, heavy-duty pickup trucks and vans, and vocational vehicles, and includes separate standards for both vehicles and engines. The program offers extensive flexibility, allowing manufacturers to reach standards through average fleet calculations, a mix of technologies, and the use of various credit and banking programs.

The Phase 1 program was developed through close consultation with industry and other stakeholders, resulting in standards tailored to the specifics of each different class of vehicles and engines.

- Heavy-duty combination tractors. Combination tractors—semi trucks that typically pull trailers—are regulated under nine subcategories based on weight class, cab type, and roof height. These vehicles represent approximately two-thirds of all fuel consumption and GHG emissions from MDVs and HDVs.
- Heavy-duty pickup trucks and vans. Heavy-duty pickup and van standards are based on a ''work factor'' attribute that combines a vehicle's payload, towing capabilities, and the presence of 4-wheel drive. These vehicles represent about 15 percent of the fuel consumption and GHG emissions from MDVs and HDVs.
- Vocational vehicles. Specialized vocational vehicles, which consist of a very wide variety of truck and bus types (*e.g.,* delivery, refuse, utility, dump, cement, transit bus, shuttle bus, school bus, emergency vehicles, and recreational vehicles) are regulated in three subcategories based on engine classification. These vehicles represent approximately 20 percent of the fuel consumption and GHG emissions from MDVs and HDVs. The Phase 1 program includes EPA GHG standards for recreational vehicles, but not NHTSA fuel efficiency standards.[14]
- Heavy-duty engines. In addition to vehicle types, the Phase 1 rule has separate standards for heavy-duty engines, to assure they contribute to the overall vehicle reductions in fuel consumption and GHG emissions.

The Phase 1 standards are premised on utilization of immediately available technologies. The Phase 1 program provides flexibilities that facilitate compliance. These flexibilities help provide sufficient lead time for manufacturers to make necessary technological improvements and reduce the overall cost of the program, without compromising overall environmental and fuel consumption objectives. The primary flexibility provisions are an engine averaging, banking, and trading (ABT) program and a vehicle ABT program. These ABT programs allow for emission and/or fuel consumption credits to be averaged, banked, or traded within each of the regulatory subcategories. However, credits are not allowed to be transferred across subcategories.

The Phase 1 program is projected to save 530 million barrels of oil and avoid 270 million metric tons of GHG emissions.[15] At the same time, the program is projected to produce $50 billion in fuel savings, and net societal benefits of $49 billion. Today, the Phase 1 fuel efficiency and GHG reduction standards are already reducing GHG emissions and U.S. oil consumption, and producing fuel savings for America's trucking industry. The market appears to be very accepting of the new technology, and the agencies have seen no evidence of ''pre-buy'' effects in response to the standards.

(3) Overview of Proposed Phase 2 Medium- and Heavy-Duty Vehicle Standards

The Phase 2 GHG and fuel efficiency standards for MDVs and HDVs are a critical next step in improving fuel efficiency and reducing GHG. The proposed Phase 2 standards carry forward our commitment to meaningful collaboration with stakeholders and the public, as they build on more than 200 meetings with manufacturers, suppliers, trucking fleets, dealerships, state air quality agencies, non-governmental organizations (NGOs), and other stakeholders to identify and understand the opportunities and challenges involved with this next level of fuel saving technology. These meetings have been invaluable to the agencies, enabling the development of a proposal that appropriately balances all potential impacts and effectively minimizes the possibility of unintended consequences.

Phase 2 would include technology-advancing standards that would phase in over the long-term (through model year 2027) to result in an ambitious, yet achievable program that would allow manufacturers to meet standards through a mix of different technologies at reasonable cost. The Phase 2 standards would maintain the underlying regulatory structure developed in the Phase 1 program, such as the general categorization of MDVs and HDVs and the separate standards for vehicles and engines. However, the Phase 2 program would build on and advance Phase 1 in a number of important ways including: Basing standards not only on currently available technologies but also on utilization of technologies now under development or not yet widely deployed while providing significant lead time to assure adequate time to develop, test, and phase in these controls; developing standards for trailers; further encouraging innovation and providing flexibility; including vehicles produced by small business manufacturers; incorporating enhanced test procedures that (among other things) allow individual drivetrain and powertrain performance to be reflected in the vehicle certification process; and using an expanded and improved compliance simulation model.

- Strengthening standards to account for ongoing technological advancements. Relative to the baseline as of the end of Phase 1, the proposed standards (labeled Alternative 3 or the ''preferred alternative'' throughout this proposal) would achieve vehicle fuel savings of up to 8 percent and 24 percent, depending on the vehicle category. While costs are higher than for Phase 1, benefits greatly exceed costs, and payback periods are short, meaning that consumers will see substantial net savings over the vehicle lifetime. Payback is estimated at about two years for tractors and trailers, about five years for vocational vehicles, and about three years for heavy-duty pickups and vans. The agencies are further proposing to phase in these MY 2027 standards with interim standards for model years 2021 and 2024 (and for certain types of trailers, EPA is proposing model year 2018 phase-in standards as well).

[14] The proposed Phase 2 program would also include NHTSA recreational vehicle fuel efficiency standards.

[15] The White House, Improving the Fuel Efficiency of American Trucks—Bolstering Energy Security, Cutting Carbon Pollution, Saving Money and Supporting Manufacturing Innovation (Feb. 2014), 4.

In addition to the proposed standards, the agencies are considering another alternative (Alternative 4), which would achieve the same performance as the proposed standards 2–3 years earlier, leading to overall reductions in fuel use and greenhouse gas emissions. The agencies believe Alternative 4 has the potential to be the maximum feasible and appropriate alternative; however, based on the evidence currently before us, EPA and NHTSA have outstanding questions regarding relative risks and benefits of Alternative 4 due to the timeframe envisioned by that alternative. The agencies are proposing Alternative 3 based on their analyses and projections, and taking into account the agencies' respective statutory considerations. The comments that the agencies receive on this proposal will be instrumental in helping us determine standards that are appropriate (for EPA) and maximum feasible (for NHTSA), given the discretion that both agencies have under our respective statutes. Therefore, the agencies have presented different options and raised specific questions throughout the proposed rule, focusing in particular on better understanding the perspectives on the feasible adoption rates of different technologies, considering associated costs and necessary lead time.

- Setting standards for trailers for the first time. In addition to retaining the vehicle and engine categories covered in the Phase 1 program, which include semi tractors, heavy-duty pickup trucks and work vans, vocational vehicles, and separate standards for heavy-duty engines, the Phase 2 standards propose fuel efficiency and GHG emission standards for trailers used in combination with tractors. Although the agencies are not proposing standards for all trailer types, the majority of new trailers would be covered.
- Encouraging technological innovation while providing flexibility and options for manufacturers. For each category of HDVs, the standards would set performance targets that allow manufacturers to achieve reductions through a mix of different technologies and leave manufacturers free to choose any means of compliance. For tractors and vocational vehicles, enhanced test procedures and an expanded and improved compliance simulation model enable the proposed vehicle standards to encompass more of the complete vehicle and to account for engine, transmission and driveline improvements than the Phase 1 program. With the addition of the powertrain and driveline to the compliance model, representative drive cycles and vehicle baseline configurations become critically important to assure the standards promote technologies that improve real world fuel efficiency and GHG emissions. This proposal updates drive cycles and vehicle configurations to better reflect real world operation. For tractor standards, for example, different combinations of improvements like advanced aerodynamics, engine improvements and waste-heat recovery, automated transmission, and lower rolling resistance tires and automatic tire inflation can be used to meet standards. Additionally, the agencies' analyses indicate that this proposal should have no adverse impact on vehicle or engine safety.
- Providing flexibilities to help minimize effect on small businesses. All small businesses are exempt from the Phase 1 standards. The agencies are proposing to regulate small business entities under Phase 2 (notably certain trailer manufacturers), but have conducted extensive proceedings pursuant to Section 609 of the Regulatory Flexibility Act, and otherwise have engaged in extensive consultation with stakeholders, and developed a proposed approach to provide targeted flexibilities geared toward helping small businesses comply with the Phase 2 standards. Specifically, the agencies are proposing to delay all new requirements by one year and simplify certification requirements for small businesses, and are further proposing additional specific flexibilities adapted to particular types of trailers.

SUMMARY OF THE PROPOSED PHASE 2 MEDIUM- AND HEAVY-DUTY VEHICLE RULE IMPACTS TO FUEL CONSUMPTION, GHG EMISSIONS, BENEFITS AND COSTS OVER THE LIFETIME OF MODEL YEARS 2018–2029, BASED ON ANALYSIS METHOD A [a b c]

	3%	7%
Fuel Reductions (billion gallons)	72–77	
GHG Reductions (MMT, CO_2eq)	974–1034	
Pre-Tax Fuel Savings ($billion)	165–175	89–94
Discounted Technology Costs ($billion)	25–25.4	16.8 -17.1
Value of reduced emissions ($billion)	70.1–73.7	52.9–55.6
Total Costs ($billion)	30.5–31.1	20.0–20.5
Total Benefits ($billion)	261–276	156–165
Net Benefits ($billion)	231–245	136–144

Notes:

[a] For an explanation of analytical Methods A and B, please see Section I.D; for an explanation of the less dynamic baseline, 1a, and more dynamic baseline, 1b, please see Section X.A.1.

[b] Range reflects two reference case assumptions, one that projects very little improvement in new vehicle fuel efficiency absent new standards, and the second that projects more significant improvements in vehicle fuel efficiency absent new standards.

[c] Benefits and net benefits (including those in the 7% discount rate column) use the 3 percent average SCC–CO_2 value applied only to CO_2 emissions; GHG reductions include CO_2, CH_4, N_2O and HFC reductions.

SUMMARY OF THE PROPOSED PHASE 2 MEDIUM- AND HEAVY-DUTY VEHICLE ANNUAL FUEL AND GHG REDUCTIONS, PROGRAM COSTS, BENEFITS AND NET BENEFITS IN CALENDAR YEARS 2035 AND 2050, BASED ON ANALYSIS METHOD B [a]

	2035	2050
Fuel Reductions (Billion Gallons)	9.3	13.4
GHG Reduction (MMT, CO_2eq)	127.1	183.4
Vehicle Program Costs (including Maintenance; Billions of 2012$)	−$6.0	−$7.1
Fuel Savings (Pre-Tax; Billions of 2012$)	$37.2	$57.5
Benefits (Billions of 2012$)	$20.5	$32.9

SUMMARY OF THE PROPOSED PHASE 2 MEDIUM- AND HEAVY-DUTY VEHICLE ANNUAL FUEL AND GHG REDUCTIONS, PROGRAM COSTS, BENEFITS AND NET BENEFITS IN CALENDAR YEARS 2035 AND 2050, BASED ON ANALYSIS METHOD B [a]—Continued

	2035	2050
Net Benefits (Billions of 2012$)	$51.7	$83.2

Note:

[a] Benefits and net benefits use the 3 percent average SCC-CO_2 value applied only to CO_2 emissions; GHG reductions include CO_2, CH_4, N_2O and HFC reductions; values reflect the preferred alternative relative to the less dynamic baseline (a reference case that projects very little improvement in new vehicle fuel economy absent new standards.

SUMMARY OF THE PROPOSED PHASE 2 MEDIUM- AND HEAVY-DUTY VEHICLE PROGRAM EXPECTED PER-VEHICLE FUEL SAVINGS, GHG EMISSION REDUCTIONS, AND COST FOR KEY VEHICLE CATEGORIES, BASED ON ANALYSIS METHOD B [a]

	MY 2021	MY 2024	MY 2027
Maximum Vehicle Fuel Savings and Tailpipe GHG Reduction (%)			
Tractors	13	20	24
Trailers [b]	4	6	8
Vocational Vehicles	7	11	16
Pickups/Vans	2.5	10	16
Per Vehicle Cost ($) [c] (% Increase in Typical Vehicle Price) [d]			
Tractors	$6,710 (7%)	$9,940 (10%)	$11,680 (12%)
Trailers	$900 (4%)	$1,010 (4%)	$1,170 (5%)
Vocational Vehicles	$1,150 (2%)	$1,770 (3%)	$3,380 (5%)
Pickups/Vans	$520 (1%)	$950 (2%)	$1,340 (3%)

Notes:

[a] Note that the proposed EPA standards for some categories of box trailers begin in model year 2018; values reflect the preferred alternative relative to the less dynamic baseline (a reference case that projects very little improvement in new vehicle fuel economy absent new standards.

[b] All engine costs are included.

[c] For this table, we use a minimum vehicle price today of $100,000 for tractors, $25,000 for trailers, $70,000 for vocational vehicles and $40,000 for HD pickups/vans.

PAYBACK PERIODS FOR MY2027 VEHICLES UNDER THE PROPOSED STANDARDS, BASED ON ANALYSIS METHOD B

[Payback occurs in the year shown; using 7% discounting]

	Proposed standards
Tractors/Trailers	2nd
Vocational Vehicles	6th
Pickups/Vans	3rd

(4) Issues Addressed in This Proposed Rule

This proposed rule contains extensive discussion of the background, elements, and implications of the proposed Phase 2 program. Section I includes information on the MDV and HDV industry, related regulatory and non-regulatory programs, summaries of Phase 1 and Phase 2 programs, costs and benefits of the proposed standards, and relevant statutory authority for EPA and NHTSA. Section II discusses vehicle simulation, engine standards, and test procedures. Sections III, IV, V, and VI detail the proposed standards for combination tractors, trailers, vocational vehicles, and heavy-duty pickup trucks and vans. Sections VII and VIII discuss aggregate GHG impacts, fuel consumption impacts, climate impacts, and impacts on non-GHG emissions. Section IX evaluates the economic impacts of the proposed standards. Sections X, XI, and XII present the alternatives analyses, consideration of natural gas vehicles, and the agencies' initial response to recommendations from the Academy of Sciences. Finally, Sections XIII and XIV discuss the changes that the proposed Phase 2 rules would have on Phase 1 standards and other regulatory provisions. In addition to this preamble, the agencies have also prepared a joint Draft Regulatory Impact Analysis (DRIA) which is available on our respective Web sites and in the public docket for this rulemaking which provides additional data, analysis and discussion of the proposed standards and the alternatives analyzed by the agencies. We request comment on all aspects of this proposed rulemaking, including the DRIA.

Table of Contents

I. Overview

A. Background

This background and summary of the proposed Phase 2 GHG emissions and fuel efficiency standards includes an overview of the heavy-duty truck industry and related regulatory and non-regulatory programs, a summary of the Phase 1 GHG emissions and fuel efficiency program, a summary of the proposed Phase 2 standards and requirements, a summary of the costs and benefits of the proposed Phase 2 standards, discussion of EPA and NHTSA statutory authorities, and other issues.

For purposes of this preamble, the terms ''heavy-duty'' or ''HD'' are used to apply to all highway vehicles and engines that are not within the range of light-duty passenger cars, light-duty trucks, and medium-duty passenger vehicles (MDPV) covered by separate GHG and Corporate Average Fuel Economy (CAFE) standards.[16] They do not include motorcycles. Thus, in this rulemaking, unless specified otherwise, the heavy-duty category incorporates all vehicles with a gross vehicle weight rating above 8,500 lbs, and the engines that power them, except for MDPVs.[17 18]

Consistent with the President's direction, over the past two years as we have developed this proposal, the agencies have met on an on-going basis with a very large number of diverse stakeholders. This includes meetings, and in many cases site visits, with truck, trailer, and engine manufacturers; technology supplier companies and their trade associations (*e.g.,* transmissions, drive lines, fuel systems, turbochargers, tires, catalysts, and many others); line haul and vocational trucking firms and trucking associations; the trucking industries owner-operator association; truck dealerships and dealers associations; trailer manufacturers and their trade association; non-governmental organizations (NGOs, including environmental NGOs, national security NGOs, and consumer advocacy NGOs); state air quality agencies; manufacturing labor unions; and many other stakeholders. In particular, NHTSA and EPA have consulted on an on-going basis with the California Air Resources Board (CARB) over the past two years as we have developed the Phase 2 proposal. In addition, CARB staff and managers have also participated with EPA and NHTSA in meetings with

[16] 2017 and Later Model Year Light-Duty Vehicle Greenhouse Gas Emissions and Corporate Average Fuel Economy Standards; Final Rule, 77 FR 62623, October 15, 2012.

[17] The CAA defines heavy-duty as a truck, bus or other motor vehicles with a gross vehicle weight rating exceeding 6,000 lbs (CAA section 202(b)(3)). The term HD as used in this action refers to a subset of these vehicles and engines.

[18] The Energy Independence and Security Act of 2007 requires NHTSA to set standards for commercial medium- and heavy-duty on-highway vehicles, defined as on-highway vehicles with a GVWR of 10,000 lbs or more, and work trucks, defined as vehicles with a GVWR between 8,500 and 10,000 lbs and excluding medium duty passenger vehicles.

many external stakeholders, in particular with vehicle OEMs and technology suppliers.[19]

NHTSA and EPA staff also participated in a large number of technical and policy conferences over the past two years related to the technological, economic, and environmental aspects of the heavy-duty trucking industry. The agencies also met with regulatory counterparts from several other nations who either have already or are considering establishing fuel consumption or GHG requirements, including outreach with representatives from the governments of Canada, the European Commission, Japan, and China.

These comprehensive outreach actions by the agencies provided us with information to assist in our identification of potential technologies that can be used to reduce heavy-duty GHG emissions and improve fuel efficiency. The outreach has also helped the agencies to identify and understand the opportunities and challenges involved with the proposed standards for the heavy-duty trucks, trailers, and engines detailed in this preamble, including time needed for implementation of various technologies and potential costs and fuel savings. The scope of this outreach effort to gather input for the proposal included well over 200 meetings with stakeholders. These meetings and conferences have been invaluable to the agencies. We believe they have enabled us to develop this proposal in such a way as to appropriately balance all of the potential impacts, to minimize the possibility of unintended consequences, and to ensure that we are requesting comment on a wide range of issues that can inform the final rule.

(1) Brief Overview of the Heavy-Duty Truck Industry

The heavy-duty sector is diverse in several respects, including the types of manufacturing companies involved, the range of sizes of trucks and engines they produce, the types of work for which the trucks are designed, and the regulatory history of different subcategories of vehicles and engines. The current heavy-duty fleet encompasses vehicles from the ''18-wheeler'' combination tractors one sees on the highway to the largest pickup trucks and vans, as well as vocational vehicles covering a range between these extremes. Together, the HD sector spans a wide range of vehicles with often specialized form and function. A primary indicator of the diversity among heavy-duty trucks is the range of load-carrying capability across the industry. The heavy-duty truck sector is often subdivided by vehicle weight classifications, as defined by the vehicle's gross vehicle weight rating (GVWR), which is a measure of the combined curb (empty) weight and cargo carrying capacity of the truck.[20] Table I–1 below outlines the vehicle weight classifications commonly used for many years for a variety of purposes by businesses and by several Federal agencies, including the Department of Transportation, the Environmental Protection Agency, the Department of Commerce, and the Internal Revenue Service.

TABLE I–1—VEHICLE WEIGHT CLASSIFICATION

Class	2b	3	4	5	6	7	8
GVWR (lb)	8,501–10,000	10,001–14,000	14,001–16,000	16,001–19,500	19,501–26,000	26,001–33,000	>33,000

In the framework of these vehicle weight classifications, the heavy-duty truck sector refers to ''Class 2b'' through ''Class 8'' vehicles and the engines that power those vehicles.[21]

Unlike light-duty vehicles, which are primarily used for transporting passengers for personal travel, heavy-duty vehicles fill much more diverse operator needs. Heavy-duty pickup trucks and vans (Classes 2b and 3) are used chiefly as work trucks and vans, and as shuttle vans, as well as for personal transportation, with an average annual mileage in the range of 15,000 miles. The rest of the heavy-duty sector is used for carrying cargo and/or performing specialized tasks. ''Vocational'' vehicles, which may span Classes 2b through 8, vary widely in size, including smaller and larger van trucks, utility ''bucket'' trucks, tank trucks, refuse trucks, urban and over-the-road buses, fire trucks, flat-bed trucks, and dump trucks, among others. The annual mileage of these vehicles is as varied as their uses, but for the most part tends to fall in between heavy-duty pickups/vans and the large combination tractors, typically from 15,000 to 150,000 miles per year.

Class 7 and 8 combination tractor-trailers—some equipped with sleeper cabs and some not—are primarily used for freight transportation. They are sold as tractors and operate with one or more trailers that can carry up to 50,000 lbs or more of payload, consuming significant quantities of fuel and producing significant amounts of GHG emissions. Together, Class 7 and 8 tractors and trailers account for approximately two-thirds of the heavy-duty sector's total CO_2 emissions and fuel consumption. Trailer designs vary significantly, reflecting the wide variety of cargo types. However, the most common types of trailers are box vans (dry and refrigerated), which are a focus of this Phase 2 rulemaking. The tractor-trailers used in combination applications can and frequently do travel more than 150,000 miles per year and can operate for 20–30 years.

EPA and NHTSA have designed our respective proposed standards in careful consideration of the diversity and complexity of the heavy-duty truck industry, as discussed in Section I.B.

(2) Related Regulatory and Non-Regulatory Programs

(a) History of EPA's Heavy-Duty Regulatory Program and Impacts of Greenhouse Gases on Climate Change

This subsection provides an overview of the history of EPA's heavy-duty regulatory program and impacts of greenhouse gases on climate change.

(i) History of EPA's Heavy-Duty Regulatory Program

Since the 1980s, EPA has acted several times to address tailpipe emissions of criteria pollutants and air toxics from heavy-duty vehicles and engines. During the last two decades these programs have primarily

[19] Vehicle chassis manufacturers are known in this industry as original equipment manufacturers or OEMs.

[20] GVWR describes the maximum load that can be carried by a vehicle, including the weight of the vehicle itself. Heavy-duty vehicles (including those designed for primary purposes other than towing) also have a gross combined weight rating (GCWR), which describes the maximum load that the vehicle can haul, including the weight of a loaded trailer and the vehicle itself.

[21] Class 2b vehicles manufactured as passenger vehicles (Medium Duty Passenger Vehicles, MDPVs) are covered by the light-duty GHG and fuel economy standards and therefore are not addressed in this rulemaking.

addressed emissions of particulate matter (PM) and the primary ozone precursors, hydrocarbons (HC) and oxides of nitrogen (NO_X). These programs, which have successfully achieved significant and cost-effective reductions in emissions and associated health and welfare benefits to the nation, were an important basis of the Phase 1 program. See *e.g.* 66 FR 5002, 5008, and 5011–5012 (January 18, 2001) (detailing substantial public health benefits of controls of criteria pollutants from heavy-duty diesel engines, including bringing areas into attainment with primary (public health) PM NAAQS, or contributing substantially to such attainment); *National Petrochemical Refiners Association* v. *EPA,* 287 F.3d 1130, 1134 (D.C. Cir. 2002) (referring to the ''dramatic reductions'' in criteria pollutant emissions resulting from those on-highway heavy-duty engine standards, and upholding all of the standards).

As required by the Clean Air Act (CAA), the emission standards implemented by these programs include standards that apply at the time that the vehicle or engine is sold and continue to apply in actual use. EPA's overall program goal has always been to achieve emissions reductions from the complete vehicles that operate on our roads. The agency has often accomplished this goal for many heavy-duty truck categories by regulating heavy-duty engine emissions. A key part of this success has been the development over many years of a well-established, representative, and robust set of engine test procedures that industry and EPA now use routinely to measure emissions and determine compliance with emission standards. These test procedures in turn serve the overall compliance program that EPA implements to help ensure that emissions reductions are being achieved. By isolating the engine from the many variables involved when the engine is installed and operated in a HD vehicle, EPA has been able to accurately address the contribution of the engine alone to overall emissions.

(ii) Impacts of Greenhouse Gases on Climate Change

In 2009, the EPA Administrator issued the document known as the Endangerment Finding under CAA Section 202(a)(1).[22] In the Endangerment Finding, which focused on public health and public welfare impacts within the United States, the Administrator found that elevated concentrations of GHG emissions in the atmosphere may reasonably be anticipated to endanger public health and welfare of current and future generations. See also *Coalition for Responsible Regulation* v. *EPA,* 684 F.3d 102, 117–123 (D.C. Cir. 2012) (upholding the endangerment finding in all respects). The following sections summarize the key information included in the Endangerment Finding.

Climate change caused by human emissions of GHGs threatens public health in multiple ways. By raising average temperatures, climate change increases the likelihood of heat waves, which are associated with increased deaths and illnesses. While climate change also increases the likelihood of reductions in cold-related mortality, evidence indicates that the increases in heat mortality will be larger than the decreases in cold mortality in the United States. Compared to a future without climate change, climate change is expected to increase ozone pollution over broad areas of the U.S., including in the largest metropolitan areas with the worst ozone problems, and thereby increase the risk of morbidity and mortality. Other public health threats also stem from projected increases in intensity or frequency of extreme weather associated with climate change, such as increased hurricane intensity, increased frequency of intense storms and heavy precipitation. Increased coastal storms and storm surges due to rising sea levels are expected to cause increased drownings and other adverse health impacts. Children, the elderly, and the poor are among the most vulnerable to these climate-related health effects. See also 79 FR 75242 (December 17, 2014) (climate change, and temperature increases in particular, likely to increase O3 (Ozone) pollution ''over broad areas of the U.S., including the largest metropolitan areas with the worst O3 problems, increas[ing] the risk of morbidity and mortality'').

Climate change caused by human emissions of GHGs also threatens public welfare in multiple ways. Climate changes are expected to place large areas of the country at serious risk of reduced water supplies, increased water pollution, and increased occurrence of extreme events such as floods and droughts. Coastal areas are expected to face increased risks from storm and flooding damage to property, as well as adverse impacts from rising sea level, such as land loss due to inundation, erosion, wetland submergence and habitat loss. Climate change is expected to result in an increase in peak electricity demand, and extreme weather from climate change threatens energy, transportation, and water resource infrastructure. Climate change may exacerbate ongoing environmental pressures in certain settlements, particularly in Alaskan indigenous communities. Climate change also is very likely to fundamentally rearrange U.S. ecosystems over the 21st century. Though some benefits may balance adverse effects on agriculture and forestry in the next few decades, the body of evidence points towards increasing risks of net adverse impacts on U.S. food production, agriculture and forest productivity as temperature continues to rise. These impacts are global and may exacerbate problems outside the U.S. that raise humanitarian, trade, and national security issues for the U.S. See also 79 FR 75382 (December 17, 2014) (welfare effects of O3 increases due to climate change, with emphasis on increased wildfires).

As outlined in Section VIII.A. of the 2009 Endangerment Finding, EPA's approach to providing the technical and scientific information to inform the Administrator's judgment regarding the question of whether GHGs endanger public health and welfare was to rely primarily upon the recent, major assessments by the U.S. Global Change Research Program (USGCRP), the Intergovernmental Panel on Climate Change (IPCC), and the National Research Council (NRC) of the National Academies. These assessments addressed the scientific issues that EPA was required to examine, were comprehensive in their coverage of the GHG and climate change issues, and underwent rigorous and exacting peer review by the expert community, as well as rigorous levels of U.S. government review. Since the administrative record concerning the Endangerment Finding closed following EPA's 2010 Reconsideration Denial, a number of such assessments have been released. These assessments include the IPCC's 2012 ''Special Report on Managing the Risks of Extreme Events and Disasters to Advance Climate Change Adaptation'' (SREX) and the 2013–2014 Fifth Assessment Report (AR5), the USGCRP's 2014 ''Climate Change Impacts in the United States'' (Climate Change Impacts), and the NRC's 2010 ''Ocean Acidification: A National Strategy to Meet the Challenges of a Changing Ocean'' (Ocean Acidification), 2011 ''Report on Climate Stabilization Targets: Emissions, Concentrations, and Impacts over Decades to Millennia'' (Climate Stabilization Targets), 2011 ''National Security Implications for U.S. Naval

[22] ''Endangerment and Cause or Contribute Findings for Greenhouse Gases Under Section 202(a) of the Clean Air Act,'' *74 FR 66496* (December 15, 2009) (''Endangerment Finding'').

Forces'' (National Security Implications), 2011 ''Understanding Earth's Deep Past: Lessons for Our Climate Future'' (Understanding Earth's Deep Past), 2012 ''Sea Level Rise for the Coasts of California, Oregon, and Washington: Past, Present, and Future'', 2012 ''Climate and Social Stress: Implications for Security Analysis'' (Climate and Social Stress), and 2013 ''Abrupt Impacts of Climate Change'' (Abrupt Impacts) assessments.

EPA has reviewed these new assessments and finds that the improved understanding of the climate system they present strengthens the case that GHG emissions endanger public health and welfare.

In addition, these assessments highlight the urgency of the situation as the concentration of CO_2 in the atmosphere continues to rise. Absent a reduction in emissions, a recent National Research Council of the National Academies assessment projected that concentrations by the end of the century would increase to levels that the Earth has not experienced for millions of years.[23] In fact, that assessment stated that ''the magnitude and rate of the present greenhouse gas increase place the climate system in what could be one of the most severe increases in radiative forcing of the global climate system in Earth history.'' [24] What this means, as stated in another NRC assessment, is that:

> Emissions of carbon dioxide from the burning of fossil fuels have ushered in a new epoch where human activities will largely determine the evolution of Earth's climate. Because carbon dioxide in the atmosphere is long lived, it can effectively lock Earth and future generations into a range of impacts, some of which could become very severe. Therefore, emission reductions choices made today matter in determining impacts experienced not just over the next few decades, but in the coming centuries and millennia.[25]

Moreover, due to the time-lags inherent in the Earth's climate, the Climate Stabilization Targets assessment notes that the full warming from any given concentration of CO_2 reached will not be realized for several centuries.

The recently released USGCRP ''National Climate Assessment'' [26] emphasizes that climate change is already happening now and it is happening in the United States. The assessment documents the increases in some extreme weather and climate events in recent decades, the damage and disruption to infrastructure and agriculture, and projects continued increases in impacts across a wide range of peoples, sectors, and ecosystems.

These assessments underscore the urgency of reducing emissions now: Today's emissions will otherwise lead to raised atmospheric concentrations for thousands of years, and raised Earth system temperatures for even longer. Emission reductions today will benefit the public health and public welfare of current and future generations.

Finally, it should be noted that the concentration of carbon dioxide in the atmosphere continues to rise dramatically. In 2009, the year of the Endangerment Finding, the average concentration of carbon dioxide as measured on top of Mauna Loa was 387 parts per million.[27] The average concentration in 2013 was 396 parts per million. And the monthly concentration in April of 2014 was 401 parts per million, the first time a monthly average has exceeded 400 parts per million since record keeping began at Mauna Loa in 1958, and for at least the past 800,000 years according to ice core records.[28]

(b) The NHTSA and EPA Light-Duty National GHG and Fuel Economy Program

On May 7, 2010, EPA and NHTSA finalized the first-ever National Program for light-duty cars and trucks, which set GHG emissions and fuel economy standards for model years 2012–2016 (see 75 FR 25324). More recently, the agencies adopted even stricter standards for model years 2017 and later (77 FR 62624, October 15, 2012). The agencies have used the light-duty National Program as a model for the HD National Program in several respects. This is most apparent in the case of heavy-duty pickups and vans, which are similar to the light-duty trucks addressed in the light-duty National Program both technologically as well as in terms of how they are manufactured (*i.e.,* the same company often makes both the vehicle and the engine, and several light-duty manufacturers also manufacture HD pickups and vans).[29] For HD pickups and vans, there are close parallels to the light-duty program in how the agencies have developed our respective heavy-duty standards and compliance structures. However, HD pickups and vans are true work vehicles that are designed for much higher towing and payload capabilities than are light-duty pickups and vans. The technologies applied to light-duty trucks are not all applicable to heavy-duty pickups and vans at the same adoption rates, and the technologies often produce a lower percent reduction in CO_2 emissions and fuel consumption when used in heavy-duty vehicles. Another difference between the light-duty and the heavy-duty standards is that each agency adopts heavy-duty standards based on attributes other than vehicle footprint, as discussed below.

Due to the diversity of the remaining HD vehicles, there are fewer parallels with the structure of the light-duty program. However, the agencies have maintained the same collaboration and coordination that characterized the development of the light-duty program throughout the Phase 1 rulemaking and the continued efforts for Phase 2. Most notably, as with the light-duty program, manufacturers would continue to be able to design and build vehicles to meet a closely coordinated, harmonized national program, and to avoid unnecessarily duplicative testing and compliance burdens. In addition, the averaging, banking, and trading provisions in the HD program, although structurally different from those of the light-duty program, serve the same purpose, which is to allow manufacturers to achieve large reductions in fuel consumption and emissions while providing a broad mix of products to their customers. The agencies have also worked closely with CARB to provide harmonized national standards.

(c) EPA's SmartWay Program

EPA's voluntary SmartWay Transport Partnership program encourages businesses to take actions that reduce fuel consumption and CO_2 emissions while cutting costs by working with the shipping, logistics, and carrier communities to identify low carbon strategies and technologies across their transportation supply chains. SmartWay provides technical information, benchmarking and tracking tools, market incentives, and partner recognition to facilitate and accelerate the adoption of these strategies. Through the SmartWay program and its related technology assessment center, EPA has worked closely with truck and trailer manufacturers and truck fleets over the last ten years to develop test

[29] This is more broadly true for heavy-duty pickup trucks than vans because every manufacturer of heavy-duty pickup trucks also makes light-duty pickup trucks, while only some heavy-duty van manufacturers also make light-duty vans.

procedures to evaluate vehicle and component performance in reducing fuel consumption and has conducted testing and has established test programs to verify technologies that can achieve these reductions. SmartWay partners have demonstrated these new and emerging technologies in their business operations, adding to the body of technical data and information that EPA can disseminate to industry, researchers and other stakeholders. Over the last several years, EPA has developed hands-on experience testing the largest heavy-duty trucks and trailers and evaluating improvements in tire and vehicle aerodynamic performance. In developing the Phase 1 program, the agencies drew from this testing and from the SmartWay experience. In the same way, the agencies benefitted from SmartWay in developing the proposed Phase 2 trailer program.

(d) The State of California

California has established ambitious goals for reducing GHG emissions from heavy-duty vehicles and engines as part of an overall plan to reduce GHG emissions from the transportation sector in California.[30] Heavy-duty vehicles are responsible for one-fifth of the total GHG emissions from transportation sources in California. In the past several years the California Air Resources Board (CARB) has taken a number of actions to reduce GHG emissions from heavy-duty vehicles and engines. For example, in 2008, the CARB adopted regulations to reduce GHG emissions from heavy-duty tractors that pull box-type trailers through improvements in tractor and trailer aerodynamics and the use of low rolling resistance tires.[31] The tractors and trailers subject to the CARB regulation are required to use SmartWay certified tractors and trailers, or retrofit their existing fleet with SmartWay verified technologies, consistent with California's state authority to regulate both new and in-use vehicles. Recently, in December 2013, CARB adopted regulations that establish its own parallel Phase 1 program with standards consistent with EPA Phase 1 standards. On December 5, 2014, California's Office of Administrative Law approved CARB's adoption of the Phase 1 standards, with an effective date of December 5, 2014.[32] Complementary to its regulatory efforts, CARB and other California agencies are investing significant public capital through various incentive programs to accelerate fleet turnover and stimulate technology innovation within the heavy-duty vehicle market (*e.g.,* Air Quality Improvement, Carl Moyer, Loan Incentives, Lower-Emission School Bus and Goods Movement Emission Reduction Programs).[33] And, recently, California Governor Jerry Brown established a target of up to 50 percent petroleum reduction by 2030.

In addition to California's efforts to reduce GHG emissions that contribute to climate change, California also faces unique air quality challenges as compared to many other regions of the United States. Many areas of the state are classified as non-attainment for both the ozone and particulate matter National Ambient Air Quality Standards (NAAQS) with California having the nation's only two ''Extreme'' ozone non-attainment airsheds (the San Joaquin Valley and South Coast Air Basins).[34] By 2016, California must submit to EPA its Clean Air Act State Implementation Plans (SIPs) that demonstrate how the 2008 ozone and 2006 $PM_{2.5}$ NAAQS will be met by Clean Air Act deadlines. Extreme ozone areas must attain the 2008 ozone NAAQS by no later than 2032 and $PM_{2.5}$ moderate areas must attain the 2006 $PM_{2.5}$ standard by 2021 or, if reclassified to serious, by 2025.

Heavy-duty vehicles are responsible today for one-third of the state's oxides of nitrogen (NO_X) emissions. California has estimated that the state's South Coast Air Basin will need nearly a 90 percent reduction in heavy-duty vehicle NO_X emissions by 2032 from 2010 levels to attain the 2008 NAAQS for ozone. Additionally, on November 25, 2014, EPA issued a proposal to strengthen the ozone NAAQS. If a change to the ozone NAAQS is finalized, California and other areas of the country will need to identify and implement measures to reduce NO_X as needed to complement Federal emission reduction measures. While this section is focused on California's regulatory programs and air quality needs, EPA recognizes that other states and local areas are concerned about the challenges of reducing NO_X and attaining, as well as maintaining, the ozone NAAQS (further discussed in Section VIII.D.1 below).

In order to encourage the use of lower NO_X emitting new heavy-duty vehicles in California, in 2013 CARB adopted a voluntary low NO_X emission standard for heavy-duty engines.[35] In addition, in 2013 CARB awarded a major new research contract to Southwest Research Institute to investigate advanced technologies that could reduce heavy-duty vehicle NO_X emissions well below the current EPA and CARB standards.

California has long had the unique ability among states to adopt its own separate new motor vehicle standards per Section 209 of the Clean Air Act (CAA). Although section 209(a) of the CAA expressly preempts states from adopting and enforcing standards relating to the control of emissions from new motor vehicles or new motor vehicle engines (such as state controls for new heavy-duty engines and vehicles) CAA section 209(b) directs EPA to waive this preemption under certain conditions. Under the waiver process set out in CAA Section 209(b), EPA has granted CARB a waiver for its initial heavy-duty vehicle GHG regulation.[36] Even with California's ability under the CAA to establish its own emission standards, EPA and CARB have worked closely together over the past several decades to largely harmonize new vehicle criteria pollutant standard programs for heavy-duty engines and heavy-duty vehicles. In the past several years EPA and NHTSA also consulted with CARB in the development of the Federal light-duty vehicle GHG and CAFE rulemakings for the 2012–2016 and 2017–2025 model years.

As discussed above, California operates under state authority to establish its own new heavy-duty vehicle and engine emission standards, including standards for CO_2, methane, N_2O, and hydrofluorocarbons. EPA recognizes this independent authority, and we also recognize the potential

[35] See *http://www.arb.ca.gov/regact/2013/hdghg2013/hdghg2013.htm* for a description of the CARB optional reduced NO_X emission standards for on-road heavy-duty engines.

[36] *See* EPA's waiver of CARB's heavy-duty tractor-trailer greenhouse gas regulation applicable to new 2011 through 2013 model year Class 8 tractors equipped with integrated sleeper berths (sleeper-cab tractors) and 2011 and subsequent model year dry-can and refrigerated-van trailers that are pulled by such tractors on California highways at 79 FR 46256 (August 7, 2014).

benefits for the regulated industry if the Federal Phase 2 standards could result in a single, National Program that would meet the NHTSA and EPA's statutory requirements to set appropriate and maximum feasible standards, and also be equivalent to potential future new heavy-duty vehicle and engine GHG standards established by CARB (addressing the same model years as addressed by the final Federal Phase 2 program and requiring the same technologies).

Similarly, CARB has expressed support in the past for a Federal heavy-duty Phase 2 program that would produce significant GHG reductions both at the Federal level and in California that could enable CARB to adopt the same standards at the state level. This is similar to CARB's approach for the Federal heavy-duty Phase 1 program, and with past EPA criteria pollutant standards for heavy-duty vehicles and engines. In order to further the opportunity for maintaining coordinated Federal and California standards in the Phase 2 timeframe (as well as to benefit from different technical expertise and perspective), NHTSA and EPA have consulted on an on-going basis with CARB over the past two years as we have developed the Phase 2 proposal. The agencies' technical staff have shared information on technology cost, technology effectiveness, and feasibility with the CARB staff. We have also received information from CARB on these same topics. EPA and NHTSA have also shared preliminary results from several of our modeling exercises with CARB as we examined different potential levels of stringency for the Phase 2 program. In addition, CARB staff and managers have also participated with EPA and NHTSA in meetings with many external stakeholders, in particular with vehicle OEMs and technology suppliers.

In addition to information on GHG emissions, CARB has also kept EPA and NHTSA informed of the state's need to consider opportunities for additional NO_X emission reductions from heavy-duty vehicles. CARB has asked the agencies to consider opportunities in the Heavy-Duty Phase 2 rulemaking to encourage or incentivize further NO_X emission reductions, in addition to the petroleum and GHG reductions which would come from the Phase 2 standards. When combined with the Phase 1 standards, the technologies the agencies are projecting to be used to meet the proposed GHG emission and fuel efficiency standards would be expected to reduce NO_X emissions by over 450,000 tons in 2050 (see Section VIII).

EPA and NHTSA believe that through this information sharing and dialog we will enhance the potential for the Phase 2 program to result in a National Program that can be adopted not only by the Federal agencies, but also by the State of California, given the strong interest from the regulated industry for a harmonized State and Federal program.

The agencies will continue to seek input from CARB, and from all stakeholders, throughout this rulemaking.

(e) Environment Canada

On March 13, 2013, Environment Canada (EPA's Canadian counterpart) published its own regulations to control GHG emissions from heavy-duty vehicles and engines, beginning with MY 2014. These regulations are closely aligned with EPA's Phase 1 program to achieve a common set of North American standards. Environment Canada has expressed its intention to amend these regulations to further limit emissions of greenhouse gases from new on-road heavy-duty vehicles and their engines for post-2018 MYs. As with the development of the current regulations, Environment Canada is committed to continuing to work closely with EPA to maintain a common Canada-United States approach to regulating GHG emissions for post-2018 MY vehicles and engines. This approach will build on the long history of regulatory alignment between the two countries on vehicle emissions pursuant to the Canada-United States Air Quality Agreement.[37] Environment Canada has also been of great assistance during the development of this Phase 2 proposal. In particular, Environment Canada supported aerodynamic testing, and conducted chassis dynamometer emissions testing.

(f) Recommendations of the National Academy of Sciences

In April 2010 as mandated by Congress in the Energy Independence and Security Act of 2007 (EISA), the National Research Council (NRC) under the National Academy of Sciences (NAS) issued a report to NHTSA and to Congress evaluating medium- and heavy-duty truck fuel efficiency improvement opportunities, titled ''Technologies and Approaches to Reducing the Fuel Consumption of Medium- and Heavy-duty Vehicles.'' That NAS report was far reaching in its review of the technologies that were available and that might become available in the future to reduce fuel consumption from medium- and heavy-duty vehicles. In presenting the full range of technical opportunities, the report included technologies that may not be available until 2020 or even further into the future. The report provided not only a valuable list of off the shelf technologies from which the agencies drew in developing the Phase 1 program, but also provided useful information the agencies have considered when developing this second phase of regulations.

In April 2014, the NAS issued another report: ''Reducing the Fuel Consumption and Greenhouse Gas Emissions of Medium and Heavy-Duty Vehicles, Phase Two, First Report.'' This study outlines a number of recommendations to the U.S. Department of Transportation and NHTSA on technical and policy matters to consider when addressing the fuel efficiency of our nation's medium- and heavy-duty vehicles. In particular, this report provided recommendations with respect to:

- The Greenhouse Gas Emission Model (GEM) simulation tool used by the agencies to assess compliance with vehicle standards
- Regulation of trailers
- Natural gas-fueled engines and vehicles
- Data collection on in-use operation

As described in Sections II, IV, and XII, the agencies are proposing to incorporate many of these recommendations into this proposed Phase 2 program, especially those recommendations relating to the GEM simulation tool and to trailers.

B. Summary of Phase 1 Program

(1) EPA Phase 1 GHG Emission Standards and NHTSA Phase 1 Fuel Consumption Standards

The EPA Phase 1 GHG mandatory standards commenced in MY 2014 and include increased stringency for standards applicable to MY 2017 and later MY vehicles and engines. NHTSA's fuel consumption standards are voluntary for MYs 2014 and 2015, due to lead time requirements in EISA, and apply on a mandatory basis thereafter. They also increase in stringency for MY 2017. Both agencies have allowed voluntary early compliance starting in MY 2013 and encouraged manufacturers' participation through credit incentives.

Given the complexity of the heavy-duty industry, the agencies divided the industry into three discrete categories for purposes of setting our respective Phase 1 standards—combination

[37] *http://www.ijc.org/en_/Air_Quality__Agreement.*

tractors, heavy-duty pickups and vans, and vocational vehicles—based on the relative degree of homogeneity among trucks within each category. The Phase 1 rule also include separate standards for the engines that power combination tractors and vocational vehicles. For each regulatory category, the agencies adopted related but distinct program approaches reflecting the specific challenges in these segments. In the following paragraphs, we summarize briefly EPA's final GHG emission standards and NHTSA's final fuel consumption standards for the three regulatory categories of heavy-duty vehicles and for the engines powering vocational vehicles and tractors. See Sections III, V, and VI for additional details on the Phase 1 standards. To respect differences in design and typical uses that drive different technology solutions, the agencies segmented each regulatory class into subcategories. The category-specific structure enabled the agencies to set standards that appropriately reflect the technology available for each regulatory subcategory of vehicles and the engines for use in each type of vehicle. The Phase 1 program also provided several flexibilities, as summarized in Section I.B(3).

The agencies are proposing to base the Phase 2 standards on test procedures that differ from those used for Phase 1, including the revised GEM simulation tool. Significant revisions to GEM are discussed in Section II and the draft RIA Chapter 4, and other test procedures are discussed further in the draft RIA Chapter 3. It is important to note that due to these test procedure changes, the Phase 1 standards and the proposed Phase 2 standards are not directly comparable in an absolute sense. In particular, the proposed revisions to the 55 mph and 65 mph highway cruise cycles for tractors and vocational vehicles have the effect of making the cycles more challenging (albeit more representative of actual driving conditions). We are not proposing to apply these revisions to the Phase 1 program because doing so would significantly change the stringency of the Phase 1 standards, for which manufacturers have already developed engineering plans and are now producing products to meet. Moreover, the agencies intend such changes to address a broader range of technologies not part of the projected compliance path for use in Phase 1.

(a) Class 7 and 8 Combination Tractors

Class 7 and 8 combination tractors and their engines contribute the largest portion of the total GHG emissions and fuel consumption of the heavy-duty sector, approximately two-thirds, due to their large payloads, their high annual miles traveled, and their major role in national freight transport. These vehicles consist of a cab and engine (tractor or combination tractor) and a detachable trailer. The primary manufacturers of combination tractors in the United States are Daimler Trucks North America, Navistar, Volvo/Mack, and PACCAR. Each of the tractor manufacturers and Cummins (an independent engine manufacturer) also produce heavy-duty engines used in tractors. The Phase 1 standards require manufacturers to reduce GHG emissions and fuel consumption for these vehicles and engines, which we expect them to do through improvements in aerodynamics and tires, reductions in tractor weight, reduction in idle operation, as well as engine-based efficiency improvements.[38]

The Phase 1 tractor standards differ depending on gross vehicle weight rating (GVWR) (*i.e.,* whether the truck is Class 7 or Class 8), the height of the roof of the cab, and whether it is a ''day cab'' or a ''sleeper cab.'' The agencies created nine subcategories within the Class 7 and 8 combination tractor category reflecting combinations of these attributes. The agencies set Phase 1 standards for each of these subcategories beginning in MY 2014, with more stringent standards following in MY 2017. The standards represent an overall fuel consumption and CO_2 emissions reduction up to 23 percent from the tractors and the engines installed in them when compared to a baseline MY 2010 tractor and engine.

For Phase 1, manufacturers demonstrate compliance with the tractor CO_2 and fuel consumption standards using a vehicle simulation tool described in Section II. The tractor inputs to the simulation tool in Phase 1 are the aerodynamic performance, tire rolling resistance, vehicle speed limiter, automatic engine shutdown, and weight reduction. The agencies have verified, through our own confirmatory testing, that the values inputs into the model by manufacturers are generally correct. Prior to and after adopting the Phase 1 standards, the agencies worked with manufacturers to minimize impacts of this process on their normal business practices.

In addition to the final Phase 1 tractor-based standards for CO_2, EPA adopted a separate standard to reduce leakage of hydrofluorocarbon (HFC) refrigerant from cabin air conditioning (A/C) systems from combination tractors, to apply to the tractor manufacturer. This HFC leakage standard is independent of the CO_2 tractor standard. Manufacturers can choose technologies from a menu of leak-reducing technologies sufficient to comply with the standard, as opposed to using a test to measure performance. Given that HFC leakage does not relate to fuel efficiency, NHTSA did not adopt corresponding HFC standards.

(b) Heavy-Duty Pickup Trucks and Vans (Class 2b and 3)

Heavy-duty vehicles with a GVWR between 8,501 and 10,000 lb are classified as Class 2b motor vehicles. Heavy-duty vehicles with a GVWR between 10,001 and 14,000 lb are classified as Class 3 motor vehicles. Class 2b and Class 3 heavy-duty vehicles (referred to in these rules as ''HD pickups and vans'') together emit about 15 percent of today's GHG emissions from the heavy-duty vehicle sector.[39]

The majority of HD pickups and vans are ¾-ton and 1-ton pickup trucks, 12- and 15-passenger vans,[40] and large work vans that are sold by vehicle manufacturers as complete vehicles, with no secondary manufacturer making substantial modifications prior to registration and use. These vehicles can also be sold as cab-complete vehicles (*i.e.,* incomplete vehicles that include complete or nearly complete cabs that are sold to secondary manufacturers). The majority of heavy-duty pickups and vans are produced by companies with major light-duty markets in the United States. Furthermore, the technologies available to reduce fuel consumption and GHG emissions from this segment are similar to the technologies used on light-duty pickup trucks, including both engine efficiency improvements (for gasoline and diesel engines) and vehicle efficiency improvements. For these reasons, EPA and NHTSA concluded that it was appropriate to adopt GHG standards, expressed as grams per mile, and fuel consumption standards, expressed as gallons per 100 miles, for HD pickups and vans based on the whole vehicle (including the engine), consistent with the way these vehicles

[38] We note although the standards' stringency is predicated on use of certain technologies, and the agencies' assessed the cost of the rule based on the cost of use of those technologies, the standards can be met by any means. Put another way, the rules create a performance standard, and do not mandate any particular means of achieving that level of performance.

[39] EPA MOVES Model, *http://www.epa.gov/otaq/models/moves/index.htm.*

[40] Note that 12-passenger vans are subject to the light-duty standards as medium-duty passenger vehicles (MDPVs) and are not subject to this proposal.

have been regulated by EPA for criteria pollutants and also consistent with the way their light-duty counterpart vehicles are regulated by NHTSA and EPA. This complete vehicle approach adopted by both agencies for HD pickups and vans was consistent with the recommendations of the NAS Committee in its 2010 Report.

For the light-duty GHG and fuel economy standards, the agencies based the emissions and fuel economy targets on vehicle footprint (the wheelbase times the average track width). For those standards, passenger cars and light trucks with larger footprints are assigned higher GHG and lower fuel economy target levels reflecting their inherent tendency to consume more fuel and emit more GHGs per mile. For HD pickups and vans, the agencies believe that setting standards based on vehicle attributes is appropriate, but have found that a work-based metric would be a more appropriate attribute than the footprint attribute utilized in the light-duty vehicle rulemaking, given that work-based measures such as towing and payload capacities are critical elements of these vehicles' functionality. EPA and NHTSA therefore adopted standards for HD pickups and vans based on a ''work factor'' attribute that combines their payload and towing capabilities, with an added adjustment for 4-wheel drive vehicles.

Each manufacturer's fleet average Phase 1 standard is based on production volume-weighting of target standards for all vehicles, which in turn are based on each vehicle's work factor. These target standards are taken from a set of curves (mathematical functions), with separate curves for gasoline and diesel.[41] However, both gasoline and diesel vehicles in this category are included in a single averaging set. EPA phased in the CO_2 standards gradually starting in the 2014 MY, at 15–20–40–60–100 percent of the MY 2018 standards stringency level in MYs 2014–2015–2016–2017–2018, respectively. The phase-in takes the form of a set of target curves, with increasing stringency in each MY.

NHTSA allowed manufacturers to select one of two fuel consumption standard alternatives for MYs 2016 and later. The first alternative defined individual gasoline vehicle and diesel vehicle fuel consumption target curves that will not change for MYs 2016–2018, and are equivalent to EPA's 67–67–67–100 percent target curves in MYs 2016–2017–2018–2019, respectively. The second alternative defined target curves that are equivalent to EPA's 40–60–100 percent target curves in MYs 2016–2017–2018, respectively. NHTSA allowed manufacturers to opt voluntarily into the NHTSA HD pickup and van program in MYs 2014 or 2015 at target curves equivalent to EPA's target curves. If a manufacturer chose to opt in for one category, they would be required to opt in for all categories. In other words a manufacturer would be unable to opt in for Class 2b vehicles, but opt out for Class 3 vehicles.

EPA also adopted an alternative phase-in schedule for manufacturers wanting to have stable standards for model years 2016–2018. The standards for heavy-duty pickups and vans, like those for light-duty vehicles, are expressed as set of target standard curves, with increasing stringency in each model year. The final EPA standards for 2018 (including a separate standard to control air conditioning system leakage) represent an average per-vehicle reduction in GHG emissions of 17 percent for diesel vehicles and 12 percent for gasoline vehicles (relative to pre-control baseline vehicles). The NHTSA standard will require these vehicles to achieve up to about 15 percent reduction in fuel consumption and greenhouse gas emissions by MY 2018 (relative to pre-control baseline vehicles). Manufacturers demonstrate compliance based on entire vehicle chassis certification using the same duty cycles used to demonstrate compliance with criteria pollutant standards.

(c) Class 2b–8 Vocational Vehicles

Class 2b–8 vocational vehicles include a wide variety of vehicle types, and serve a vast range of functions. Some examples include service for urban delivery, refuse hauling, utility service, dump, concrete mixing, transit service, shuttle service, school bus, emergency, motor homes, and tow trucks. In Phase 1, we defined Class 2b–8 vocational vehicles as all heavy-duty vehicles that are not included in either the heavy-duty pickup and van category or the Class 7 and 8 tractor category. EPA's and NHTSA's Phase 1 standards for this vocational vehicle category generally apply at the chassis manufacturer level. Class 2b–8 vocational vehicles and their engines emit approximately 20 percent of the GHG emissions and burn approximately 21 percent of the fuel consumed by today's heavy-duty truck sector.[42]

The Phase 1 program for vocational vehicles has vehicle standards and separate engine standards, both of which differ based on the weight class of the vehicle into which the engine will be installed. The vehicle weight class groups mirror those used for the engine standards—Classes 2b–5 (light heavy-duty or LHD in EPA regulations), Classes 6 & 7 (medium heavy-duty or MHD in EPA regulations) and Class 8 (heavy heavy-duty or HHD in EPA regulations). Manufacturers demonstrate compliance with the Phase 1 vocational vehicle CO_2 and fuel consumption standards using a vehicle simulation tool described in Section II. The Phase 1 program for vocational vehicles limited the simulation tool inputs to tire rolling resistance. The model assumes the use of a typical representative, compliant engine in the simulation, resulting in one overall value for CO_2 emissions and one for fuel consumption.

Engines used in vocational vehicles are subject to separate Phase 1 engine-based standards. Optional certification paths, for EPA and NHTSA, are also provided to enhance the flexibilities for vocational vehicles. Manufacturers producing spark-ignition (or gasoline) cab-complete or incomplete vehicles weighing over 14,000 lbs GVWR and below 26,001 lbs GVWR have the option to certify to the complete vehicle standards for heavy-duty pickup trucks and vans rather than using the separate engine and chassis standards for vocational vehicles.

(d) Engine Standards

The agencies established separate Phase 1 performance standards for the engines manufactured for use in vocational vehicles and Class 7 and 8 tractors.[43] These engine standards vary depending on engine size linked to intended vehicle service class. EPA's engine-based CO_2 standards and NHTSA's engine-based fuel consumption standards are being implemented using EPA's existing test procedures and regulatory structure for criteria pollutant emissions from heavy-duty engines.

The agencies also finalized a regulatory alternative whereby a manufacturer, for an interim period of the 2014–2016 MYs, would have the option to comply with a unique standard based on a three percent reduction from an individual engine model's own 2011 MY baseline level.[44]

[41] As explained in Section XII, EPA is proposing to recodify the Phase 1 requirements for pickups and vans from 40 CFR 1037.104 into 40 CFR part 86, which is also the regulatory part that applies for light-duty vehicles.

[42] EPA MOVES model, *http://www.epa.gov/otaq/models/moves/index.htm*.

[43] See 76 FR 57114 explaining why NHTSA's authority under the Energy Independence and Safety Act includes authority to establish separate engine standards.

[44] See 76 FR 57144.

(e) Manufacturers Excluded From the Phase 1 Standards

Phase 1 temporarily deferred greenhouse gas emissions and fuel consumption standards for any manufacturers of heavy-duty engines, manufacturers of combination tractors, and chassis manufacturers for vocational vehicles that meet the ''small business'' size criteria set by the Small Business Administration (SBA). 13 CFR 121.201 defines a small business by the maximum number of employees; for example, this is currently 1,000 for heavy-duty vehicle manufacturing and 750 for engine manufacturing. In order to utilize this exemption, qualifying small businesses must submit a declaration to the agencies. See Section I.F.(1)(b) for a summary of how Phase 2 would apply for small businesses.

The agencies stated that they would consider appropriate GHG and fuel consumption standards for these entities as part of a future regulatory action. This includes both U.S.-based and foreign small-volume heavy-duty manufacturers.

(2) Costs and Benefits of the Phase 1 Program

Overall, EPA and NHTSA estimated that the Phase 1 HD National Program will cost the affected industry about $8 billion, while saving vehicle owners fuel costs of nearly $50 billion over the lifetimes of MY 2014–2018 vehicles. The agencies also estimated that the combined standards will reduce CO_2 emissions by about 270 million metric tons and save about 530 million barrels of oil over the life of MY 2014 to 2018 vehicles. The agencies estimated additional monetized benefits from CO_2 reductions, improved energy security, reduced time spent refueling, as well as possible disbenefits from increased driving accidents, traffic congestion, and noise. When considering all these factors, we estimated that Phase 1 of the HD National Program will yield $49 billion in net benefits to society over the lifetimes of MY 2014–2018 vehicles.

EPA estimated the benefits of reduced ambient concentrations of particulate matter and ozone resulting from the Phase 1 program to range from $1.3 to $4.2 billion in 2030.[45]

In total, we estimated the combined Phase 1 standards will reduce GHG emissions from the U.S. heavy-duty fleet by approximately 76 million metric tons of CO_2-equivalent annually by 2030. In its Environmental Impact Statement for the Phase 1 rule, NHTSA also quantified and/or discussed other potential impacts of the program, such as the health and environmental impacts associated with changes in ambient exposures to toxic air pollutants and the benefits associated with avoided non-CO_2 GHGs (methane, nitrous oxide, and HFCs).

(3) Phase 1 Program Flexibilities

As noted above, the agencies adopted numerous provisions designed to give manufacturers a degree of flexibility in complying with the Phase 1 standards. These provisions, which are essentially identical in structure and function in NHTSA's and EPA's regulations, enabled the agencies to consider overall standards that are more stringent and that will become effective sooner than we could consider with a more rigid program, one in which all of a manufacturer's similar vehicles or engines would be required to achieve the same emissions or fuel consumption levels, and at the same time.[46]

Phase 1 included four primary types of flexibility: Averaging, banking, and trading (ABT) provisions; early credits; advanced technology credits (including hybrid powertrains); and innovative technology credit provisions. The ABT provisions were patterned on existing EPA and NHTSA ABT programs (including the light-duty GHG and fuel economy standards) and will allow a vehicle manufacturer to reduce CO_2 emission and fuel consumption levels further than the level of the standard for one or more vehicles to generate ABT credits. The manufacturer can use those credits to offset higher emission or fuel consumption levels in the same averaging set, ''bank'' the credits for later use, or ''trade'' the credits to another manufacturer. As also noted above, for HD pickups and vans, we adopted a fleet averaging system very similar to the light-duty GHG and CAFE fleet averaging system. In both programs, manufacturers are allowed to carry-forward deficits for up to three years without penalty.

The agencies provided in the ABT programs flexibility for situations in which a manufacturer is unable to avoid a negative credit balance at the end of the year. In such cases, manufacturers are not considered to be out of compliance unless they are unable to make up the difference in credits by the end of the third subsequent model year.

In total, the Phase 1 program divides the heavy-duty sector into 19 subcategories of vehicles. These subcategories are grouped into 9 averaging sets to provide greater opportunities in leveraging compliance. For tractors and vocational vehicles, the fleet averaging sets are Classes 2b through 5, Classes 6 and 7, and Class 8 weight classes. For engines, the fleet averaging sets are gasoline engines, light heavy-duty diesel engines, medium heavy-duty diesel engines, and heavy heavy-duty diesel engines. Complete HD pickups and vans (both spark-ignition and compression-ignition) are the final fleet averaging set.

As noted above, the agencies included a restriction on averaging, banking, and trading of credits between the various regulatory subcategories by defining three HD vehicle averaging sets: Light heavy-duty (Classes 2b–5); medium heavy-duty (Class 6–7); and heavy heavy-duty (Class 8). This allows the use of credits between vehicles within the same weight class. This means that a Class 8 day cab tractor can exchange credits with a Class 8 high roof sleeper tractor but not with a smaller Class 7 tractor. Also, a Class 8 vocational vehicle can exchange credits with a Class 8 tractor. However, we did not allow trading between engines and chassis. We similarly allowed for trading among engine categories only within an averaging set, of which there are four: Spark-ignition engines, compression-ignition light heavy-duty engines, compression-ignition medium heavy-duty engines, and compression-ignition heavy heavy-duty engines.

In addition to ABT, the other primary flexibility provisions in the Phase 1 program involve opportunities to generate early credits, advanced technology credits (including for use of hybrid powertrains), and innovative technology credits.[47] For the early credits and advanced technology credits, the agencies adopted a 1.5 × multiplier, meaning that manufacturers would get 1.5 credits for each early credit and each advanced technology credit. In addition, advanced technology credits for Phase 1 can be used anywhere within the heavy-duty sector (including both vehicles and engines). Put another way, as a means of promoting this promising technology,

[45] **Note:** These calendar year benefits do not represent the same time frame as the model year lifetime benefits described above, so they are not additive.

[46] NHTSA explained that it has greater flexibility in the HD program to include consideration of credits and other flexibilities in determining appropriate and feasible levels of stringency than it does in the light-duty CAFE program. *Cf.* 49 U.S.C. 32902(h), which applies to light-duty CAFE but not heavy-duty fuel efficiency under 49 U.S.C. 32902(k).

[47] Early credits are for engines and vehicles certified before EPA standards became mandatory, advanced technology credits are for hybrids and/or Rankine cycle engines, and innovative technology credits are for other technologies not in the 2010 fleet whose benefits are not reflected using the Phase 1 test procedures.

the Phase 1 rule does not restrict averaging or trading by averaging set in this instance.

For other vehicle or engine technologies that can reduce CO_2 and fuel consumption, but for which there do not yet exist established methods for quantifying reductions, the agencies wanted to encourage the development of such innovative technologies, and therefore adopted special ''innovative technology'' credits. These innovative technology credits apply to technologies that are shown to produce emission and fuel consumption reductions that are not adequately recognized on the Phase 1 test procedures and that were not yet in widespread use in the heavy-duty sector before MY 2010. Manufacturers need to quantify the reductions in fuel consumption and CO_2 emissions that the technology is expected to achieve, above and beyond those achieved on the existing test procedures. As with ABT, the use of innovative technology credits is allowed only among vehicles and engines of the same defined averaging set generating the credit, as described above. The credit multiplier likewise does not apply for innovative technology credits.

(4) Implementation of Phase 1

Manufacturers have already begun complying with the Phase 1 standards. In some cases manufacturers voluntarily chose to comply early, before compliance was mandatory. The Phase 1 rule allows manufacturers to generate credits for such early compliance. The market appears to be very accepting of the new technology, and the agencies have seen no evidence of ''pre-buy'' effects in response to the standards. In fact sales have been higher in recent years than they were before Phase 1 began. Moreover, manufacturers' compliance plans are taking advantage of the Phase 1 flexibilities, and we have yet to see significant non-compliance with the standards.

(5) Litigation on Phase 1 Rule

The D.C. Circuit recently rejected all challenges to the agencies' Phase 1 regulations. The court did not reach the merits of the challenges, holding that none of the petitioners had standing to bring their actions, and that a challenge to NHTSA's denial of a rulemaking petition could only be brought in District Court. See *Delta Construction Co.* v. *EPA,* 783 F. 3d 1291 (D.C. Cir. 2015), U.S. App. LEXIS 6780, F.3d (D.C. Cir. April 24, 2015).

C. Summary of the Proposed Phase 2 Standards and Requirements

The agencies are proposing new standards that build on and enhance existing Phase 1 standards, as well as proposing the first ever standards for certain trailers used in combination with heavy-duty tractors. Taken together, the proposed Phase 2 program would comprise a set of largely technology-advancing standards that would achieve greater GHG and fuel consumption savings than the Phase 1 program. As described in more detail in the following sections, the agencies are proposing these standards because, based on the information available at this time, we believe they would best match our respective statutory authorities when considered in the context of available technology, feasible reductions of emissions and fuel consumption, costs, lead time, safety, and other relevant factors. The agencies request comment on all aspects of our feasibility analysis including projections of feasible market adoption rates and technological effectiveness for each technology.

The proposed Phase 2 standards would represent a more technology-forcing [48] approach than the Phase 1 approach, predicated on use of both off-the-shelf technologies and emerging technologies that are not yet in widespread use. The agencies are proposing standards for MY 2027 that would likely require manufacturers to make extensive use of these technologies. For existing technologies and technologies in the final stages of development, we project that manufacturers would likely apply them to nearly all vehicles, excluding those specific vehicles with applications or uses that would prevent the technology from functioning properly. We also project as one possible compliance pathway that manufacturers could apply other more advanced technologies such as hybrids and waste engine heat recovery systems, although at lower application rates.

Under Alternative 3, the preferred alternative, the agencies propose to provide ten years of lead time for manufacturers to meet these 2027 standards, which the agencies believe is adequate to implement the technologies industry could use to meet the proposed standards. For some of the more advanced technologies production prototype parts are not yet available, though they are in the research stage with some demonstrations in actual vehicles.[49] Additionally, even for the more developed technologies, phasing in more stringent standards over a longer timeframe may help manufacturers to ensure better reliability of the technology and to develop packages to work in a wide range of applications. Moving more quickly, however, as in Alternative 4, would lead to earlier and greater cumulative fuel savings and greenhouse gas reductions.

As discussed later, the agencies are also proposing new standards in MYs 2018 (trailers only), 2021, and 2024 to ensure manufacturers make steady progress toward the 2027 standards, thereby achieving steady and feasible reductions in GHG emissions and fuel consumption in the years leading up to the MY 2027 standards. Moving more quickly, however, as in Alternative 4, would lead to earlier and greater cumulative fuel and greenhouse gas savings.

Providing additional lead time can often enable manufacturers to resolve technological challenges or to find lower cost means of meeting new regulatory standards, effectively making them more feasible in either case. See generally *NRDC* v. *EPA,* 655 F. 2d 318, 329 (D.C. Cir. 1981). On the other hand, manufacturers and/or operators may incur additional costs if regulations require them to make changes to their products with less lead time than manufacturers would normally have when bringing a new technology to the market or expanding the application of existing technologies. After developing a new technology, manufacturers typically conduct extensive field tests to ensure its durability and reliability in actual use. Standards that accelerate technology deployment can lead to manufacturers incurring additional costs to accelerate this development work, or can lead to manufacturers beginning production before such testing can be completed. Some industry stakeholders have informed EPA that when manufacturers introduced new emission control technologies (primarily diesel particulate filters) in response to the 2007 heavy-duty engine standards

[48] In this context, the term ''technology-forcing'' is used to distinguish standards that will effectively require manufacturers to develop new technologies (or to significantly improve technologies) from standards that can be met using off-the-shelf technology alone. Technology-forcing standards do not require manufacturers to use any specific technologies.

[49] ''Prototype'' as it is used here refers to technologies that have a potentially production-feasible design that is expected to meet all performance, functional, reliability, safety, manufacturing, cost and other requirements and objectives that is being tested in laboratories and on highways under a full range of operating conditions, but is not yet available in production vehicles already for sale in the market.

they did not perform sufficient product development validation, which led to additional costs for operators when the technologies required repairs or other resulted in other operational issues in use. Thus, the issues of costs, lead time, and reliability are intertwined for the agencies' determination of whether standards are reasonable.

Another important consideration is the possibility of disrupting the market, such as might happen if we were to adopt standards that manufacturers respond to by applying a new technology too suddenly. Several of the heavy-duty vehicle manufacturers, fleets, and commercial truck dealerships informed the agencies that for fleet purchases that are planned more than a year in advance, *expectations* of reduced reliability, increased operating costs, reduced residual value, or of large increases in purchase prices can lead the fleets to pull-ahead by several months planned future vehicle purchases by pre-buying vehicles without the newer technology. In the context of the Class 8 tractor market, where a relatively small number of large fleets typically purchase very large volumes of tractors, such actions by a small number of firms can result in large swings in sales volumes. Such market impacts would be followed by some period of reduced purchases that can lead to temporary layoffs at the factories producing the engines and vehicles, as well as at supplier factories, and disruptions at dealerships. Such market impacts also can reduce the overall environmental and fuel consumption benefits of the standards by delaying the rate at which the fleet turns over. See *International Harvester* v. *EPA,* 478 F. 2d 615, 634 (D.C. Cir. 1973). A number of industry stakeholders have informed EPA that the 2007 EPA heavy-duty engine criteria pollutant standard resulted in this pull-ahead phenomenon for the Class 8 tractor market. The agencies understand the potential impact that a pull-ahead can have on American manufacturing and labor, dealerships, truck purchasers, and on the program's environmental and fuel savings goals, and have taken steps in the design of the proposed program to avoid such disruption. These steps include the following:

- Providing considerable lead time, including two to three additional years for the preferred alternative compared to Alternative 4
- The standards will result in significantly lower operating costs for vehicle owners (unlike the 2007 standard, which increased operating costs)
- Phasing in the standards
- Structuring the program so the industry will have a significant range of technology choices to be considered for compliance, rather than the one or two new technologies the OEMs pursued in 2007
- Allowing manufacturers to use emissions averaging, banking and trading to phase in the technology even further

We request comment on the sufficiency of the proposed Phase 2 structure, lead time, and stringency to avoid market disruptions. We note an important difference, however, between standards for criteria pollutants, with generally no attendant fuel savings, and the fuel consumption/GHG emission standards proposed today, which provide immediate and direct financial benefits to vehicle purchasers, who will begin saving money on fuel costs as soon as they begin operating the vehicles. It would seem logical, therefore, that vehicle purchasers (and manufacturers) would weigh those significant fuel savings against the potential for increased costs that could result from applying fuel-saving technologies sooner than they might otherwise choose in the absence of the standards.

As discussed in the Phase 1 final rule, NHTSA has certain statutory considerations to take into account when determining feasibility of the preferred alternative.[50] The Energy Independence and Security Act (EISA) states that NHTSA (in consultation with EPA and the Secretary of Energy) shall develop a commercial medium- and heavy-duty fuel efficiency program designed ''to achieve the maximum feasible improvement.'' [51] Although there is no definition of maximum feasible standards in EISA, NHTSA is directed to consider three factors when determining what the maximum feasible standards are. Those factors are, appropriateness, cost-effectiveness, and technological feasibility,[52] which modify ''feasible'' beyond its plain meaning.

NHTSA has the broad discretion to weigh and balance the aforementioned factors in order to accomplish EISA's mandate of determining maximum feasible standards. The fact that the factors may often be at odds gives NHTSA significant discretion to decide what weight to give each of the competing factors, policies and concerns and then determine how to balance them—as long as NHTSA's balancing does not undermine the fundamental purpose of the EISA: Energy conservation, and as long as that balancing reasonably accommodates ''conflicting policies that were committed to the agency's care by the statute.'' [53]

EPA also has significant discretion in assessing, weighing, and balancing the relevant statutory criteria. Section 202(a)(2) of the Clean Air Act requires that the standards ''take effect after such period as the Administrator finds necessary to permit the development and application of the requisite technology, giving appropriate consideration to the cost of compliance within such period.'' This language affords EPA considerable discretion in how to weight the critical statutory factors of emission reductions, cost, and lead time (76 FR 57129–57130). Section 202(a) also allows (although it does not compel) EPA to adopt technology-forcing standards. Id. at 57130.

Giving due consideration to the agencies' respective statutory criteria discussed above, the agencies are proposing these technology-forcing standards for MY 2027. The agencies nevertheless recognize that there is some uncertainty in projecting costs and effectiveness, especially for those technologies not yet widely available, but believe that the thresholds proposed for consideration account for realistic projections of technological development discussed throughout this notice and in the draft RIA. The agencies are requesting comment on the alternatives described in Section X below. These alternatives range from Alternative 1 (which is a no-action alternative that serves as the baseline for our cost and benefit analyses) to Alternative 5 (which includes the most stringent of the alternative standards analyzed by the agencies). The assessment of these different alternatives considers the importance of allowing manufacturers sufficient flexibility and discretion while achieving meaningful fuel consumption and GHG emissions reductions across vehicle types. The agencies look forward to receiving comments on questions of feasibility and long-term projections of costs and effectiveness.

As discussed throughout this document, the agencies believe Alternative 4 has potential to be the maximum feasible alternative, however, based on the evidence currently before us, the agencies have outstanding questions regarding relative risks and

[50] 75 FR 57198.

[51] 49 U.S.C. 32902(k).

[52] *Id.*

[53] Center for Biological Diversity v. National Highway Traffic Safety Admin., *538 F.3d 1172, 1195 (9th Cir. 2008).*

benefits of that option in the timeframe envisioned. We are seeking comment on these relative risks and benefits. Alternative 3 is generally designed to achieve the vehicle levels of fuel consumption and GHG reduction that Alternative 4 would achieve, but with two to three years of additional lead-time—*i.e.,* the Alternative 3 standards would end up in the same place as the Alternative 4 standards, but two to three years later, meaning that manufacturers could, in theory, apply new technology at a more gradual pace and with greater flexibility as discussed above. However, Alternative 4 would lead to earlier and greater cumulative fuel savings and greenhouse gas reductions.

In the sections that follow, the agencies have closely examined the potential feasibility of Alternative 4 for each subcategory. The agencies may consider establishing final fuel efficiency and GHG standards in whole or in part in the Alternative 4 timeframe if we deem them to be maximum feasible and reasonable for NHTSA and EPA, respectively. The agencies seek comment on the feasibility of Alternative 4, whether for some or for all segments, including empirical data on its appropriateness, cost-effectiveness, and technological feasibility. The agencies also note the possibility of adoption in MY 2024 of a standard reflecting deployment of some, rather than all, of the technologies on which Alternative 4 is predicated. It is also possible that the agencies could adopt some or all of the proposal (Alternative 3) earlier than MY 2027, but later than MY 2024, based especially on lead time considerations. Any such choices would involve a considered weighing of the issues of feasibility of projected technology penetration rates, associated costs, and necessary lead time, and would consider the information on available technologies, their level of performance and costs set out in the administrative record to this proposal.

Sections II through VI of this notice explain the consideration that the agencies took into account in considering options and proposing a preferred alternative based on balancing of the statutory factors under 42 U.S.C. 7521(a)(1) and (2), and under 49 U.S.C. 32902(k).

(1) Carryover From Phase 1 Program and Proposed Compliance Changes

Phase 2 will carry over many of the compliance approaches developed for Phase 1, with certain changes as described below. Readers are referred to the proposed regulatory text for much more detail. Note that some of these provisions are being carried over with revisions or additions (such as those needed to address trailers).

(a) Certification

EPA and NHTSA are proposing to apply the same general certification procedures for Phase 2 as are currently being used for certifying to the Phase 1 standards. The agencies, however, are proposing changes to the simulation tool used for the vocational vehicle, tractor and trailer standards that would allow the simulation tool to more specifically reflect improvements to transmissions and drivetrains.[54] Rather than the model using default values for transmissions and drivetrains, manufacturers would enter measured or tested values as inputs reflecting performance of their actual transmission and drivetrain technologies.

The agencies apply essentially the same process for certifying tractors and vocational vehicles, and propose largely to apply it to trailers as well. The Phase 1 certification process for engines used in tractors and vocational vehicles was based on EPA's process for showing compliance with the heavy-duty engine criteria pollutant standards, and the agencies propose to continue it for Phase 2. Finally, we also propose to continue certifying HD pickups and vans using the Phase 1 vehicle certification process, which is very similar to the light-duty vehicle certification process.

EPA and NHTSA are also proposing to clarify provisions related to confirming a manufacturer's test data during certification (*i.e.,* confirmatory testing) and verifying a manufacturer's vehicles are being produced to perform as described in the application for certification (*i.e.,* selective enforcement audits or SEAs). The EPA confirmatory testing provisions for engines and vehicles are in 40 CFR 1036.235 and 1037.235. The SEA provisions are in 40 CFR 1036.301 and 1037.301. The NHTSA provisions are in 49 CFR 535.9(a). Note that these clarifications would also apply for Phase 1 engines and vehicles. The agencies welcome suggestions for alternative approaches that would offer the same degree of compliance assurance for GHGs and fuel consumption as these programs offer with respect to EPA's criteria pollutants.

[54] As described in Section IV, although the proposed trailer standards were developed using the simulation tool, the agencies are proposing a compliance structure that does not require trailer manufacturers to actually use the compliance tool.

(b) Averaging, Banking and Trading (ABT)

The Phase 1 ABT provisions were patterned on established EPA ABT programs that have proven to work well. In Phase 1, the agencies determined this flexibility would provide an opportunity for manufacturers to make necessary technological improvements and reduce the overall cost of the program without compromising overall environmental and fuel economy objectives. We propose to generally continue this Phase 1 approach with few revisions for vehicles regulated in Phase 1. As described in Section IV, we are proposing a more limited averaging program for trailers. The agencies see the ABT program as playing an important role in making the proposed technology-advancing standards feasible, by helping to address many issues of technological challenges in the context of lead time and costs. It provides manufacturers flexibilities that assist the efficient development and implementation of new technologies and therefore enable new technologies to be implemented at a more aggressive pace than without ABT.

ABT programs are more than just add-on provisions included to help reduce costs, and can be, as in EPA's Title II programs generally, an integral part of the standard setting itself. A well-designed ABT program can also provide important environmental and energy security benefits by increasing the speed at which new technologies can be implemented (which means that more benefits accrue over time than with later-commencing standards) and at the same time increase flexibility for, and reduce costs to, the regulated industry and ultimately consumers. Without ABT provisions (and other related flexibilities), standards would typically have to be numerically less stringent since the numerical standard would have to be adjusted to accommodate issues of feasibility and available lead time. See 75 FR 25412–25413. By offering ABT credits and additional flexibilities the agencies can offer progressively more stringent standards that help meet our fuel consumption reduction and GHG emission goals at a faster and more cost-effective pace.[55]

(i) Carryover of Phase 1 Credits and Credit Life

The agencies propose to continue the five-year credit life provisions from Phase 1, and are not proposing any

[55] See NRDC v. Thomas, 805 F. 2d 410, 425 (D.C. Cir. 1986) (upholding averaging as a reasonable and permissible means of implementing a statutory provision requiring technology-forcing standards).

additional restriction on the use of banked Phase 1 credits in Phase 2. In other words, Phase 1 credits in MY2019 could be used in Phase 1 or in Phase 2 in MYs 2021–2024. Although, as we have already noted, the numerical values of proposed Phase 2 standards are not directly comparable in an absolute sense to the existing Phase 1 standards (in other words, a given vehicle would have a different g/ton-mile emission rate when evaluated using Phase 1 GEM than it would when evaluated using Phase 2 GEM), we believe that the Phase 1 and Phase 2 credits are largely equivalent. Because the standards and emission levels are included in a relative sense (as a difference), it is not necessary for the Phase 1 and Phase 2 standards to be directly equivalent in an absolute sense in order for the credits to be equivalent.

This is best understood by examining the way in which credits are calculated. For example, the credit equations in 40 CFR 1037.705 and 49 CFR 535.7 calculate credits as the product of the difference between the standard and the vehicle's emission level (g/ton-mile or gallon/1,000 ton-mile), the regulatory payload (tons), production volume, and regulatory useful life (miles). Phase 2 would not change payloads, production volumes, or useful lives for tractors, medium and heavy heavy-duty engines, or medium and heavy heavy-duty vocational vehicles. However, EPA is proposing to change the regulatory useful lives of HD pickups and vans, light heavy-duty vocational vehicles, spark-ignited engines, and light heavy-duty compression-ignition engines. Because useful life is a factor in determining the value of a credit, the agencies are proposing interim adjustment factors to ensure banked credits maintain their value in the transition from Phase 1 to Phase 2.

For Phase 1, EPA aligned the useful life for GHG emissions with the useful life already in place for criteria pollutants. After the Phase 1 rules were finalized, EPA updated the useful life for criteria pollutants as part of the Tier 3 rulemaking.[56] The new useful life implemented for Tier 3 is 150,000 miles or 15 years, whichever occurs first. This is the same useful life proposed in Phase 2 for HD pickups and vans, light heavy-duty vocational vehicles, spark-ignited engines, and light heavy-duty compression-ignition engines.[57] The numerical value of the adjustment factor for each of these regulatory categories depends on the Phase 1 useful life. These are described in detail below in this preamble in Sections II, V, and VI. Without these adjustment factors the proposed changes in useful life would effectively result in a discount of banked credits that are carried forward from Phase 1 to Phase 2, which is not the intent of the changes in the useful life. With the relatively flat deterioration generally associated with CO_2, EPA does not believe the proposed changes in useful life would significantly affect the feasibility of the proposed Phase 2 standards. EPA requests comments on the proposed changes to useful life. We note that the primary purpose of allowing manufacturers to bank credits is to provide flexibility in managing transitions to new standards. The five-year credit life is substantial, and would allow credits generated in either Phase 1 or early in Phase 2 to be used for the intended purpose. The agencies believe longer credit life is not necessary to accomplish this transition. Restrictions on credit life serve to reduce the likelihood that any manufacturer would be able to use banked credits to disrupt the heavy-duty vehicle market in any given year by effectively limiting the amount of credits that can be held. Without this limit, one manufacturer that saved enough credits over many years could achieve a significant cost advantage by using all the credits in a single year. The agencies believe, subject to consideration of public comment, that allowing a five year credit life for all credits, and as a consequence allowing use of Phase 1 credits in Phase 2, creates appropriate flexibility and appropriately facilitates a smooth transition to each new level of standards.

Although we are not proposing any additional restrictions on the use of Phase 1 credits, we are requesting comment on this issue. Early indications suggest that positive market reception to the Phase 1 technologies could lead to manufacturers accumulating credit surpluses that could be quite large at the beginning of the proposed Phase 2 program. This appears especially likely for tractors. The agencies are specifically requesting comment on the likelihood of this happening, and whether any regulatory changes would be appropriate in response. For example, should the agencies limit the amount of credits that could be carried over from Phase1 or limit them to the first year or two of the Phase 2 program? Also, if we determine that large surpluses are likely, how should that factor into our decision on the feasibility of more stringent standards in MY 2021?

(ii) Averaging Sets

EPA has historically restricted averaging to some extent for its HD emission standards to avoid creating unfair competitive advantages or environmental risks due to credits being inconsistent. Under Phase 1, averaging, banking and trading can only occur within and between specified ''averaging sets'' (with the exception of credits generated through use of specified advanced technologies). We propose to continue this regime in Phase 2, to retain the existing vehicle and engine averaging sets, and create new trailer averaging sets. We also propose to continue the averaging set restrictions from Phase 1 in Phase 2. These averaging sets for vehicles are:

- Complete pickups and vans
- Other light heavy-duty vehicles (Classes 2b–5)
- Medium heavy-duty vehicles (Class 6–7)
- Heavy heavy-duty vehicles (Class 8)
- Long dry van trailers
- Short dry van trailers
- Long refrigerated trailers
- Short refrigerated trailers

We also propose not to allow trading between engines and chassis, even within the same vehicle class. Such trading would essentially result in double counting of emission credits, because the same engine technology would likely generate credits relative to both standards. We similarly would limit trading among engine categories to trades within the designated averaging sets:

- Spark-ignition engines
- Compression-ignition light heavy-duty engines
- Compression-ignition medium heavy-duty engines
- Compression-ignition heavy heavy-duty engines

The agencies continue to believe that restricting trading to within the same eight classes would provide adequate opportunities for manufacturers to make necessary technological improvements and to reduce the overall cost of the program without compromising overall environmental and fuel efficiency objectives, and is therefore appropriate and reasonable under EPA's authority and maximum feasible under NHTSA's authority, respectively. We do not expect emissions from engines and vehicles—when restricted by weight class—to be dissimilar. We therefore expect that the lifetime vehicle performance and emissions levels will be very similar across these defined

[56] 79 FR 23492, April 28, 2014 and 40 CFR 86.1805–17.

[57] NHTSA's useful life is based on mileage and years of duration.

categories, and the estimated credit calculations will fairly ensure the expected fuel consumption and GHG emission reductions.

We continue to believe, subject to consideration of public comment, that the Phase 1 averaging sets create the most flexibility that is appropriate without creating an unfair advantage for manufacturers with erratically integrated portfolios, including engines and vehicles. See 76 FR 57240. The agencies committed in Phase 1 to seek public comment after credit trading begins with manufacturers certifying in 2014 on whether broader credit trading is more appropriate in developing the next phase of HD regulations (76 FR 57128, September 15, 2011). The 2014 model year end of year reports will become available to the agencies in mid-2015. Therefore, the agencies will provide information at that point. We welcome comment on averaging set restrictions. The agencies propose to continue this carry forward provision for phase 2 for the same reasons.

(iii) Credit Deficits

The Phase 1 regulations allow manufacturers to carry-forward deficits for up to three years without penalty. This is an important flexibility because the program is designed to address the diversity of the heavy-duty industry by allowing manufacturers to sell a mix of engines or vehicles that have very different emission levels and fuel efficiencies. Under this construct, manufacturers can offset sales of engines or vehicles not meeting the standards by selling others (within the same averaging set) that are much better than required. However, in any given year it is possible that the actual sales mix will not balance out and the manufacturer may be short of credits for that model year. The three year provision allows for this possibility and creates additional compliance flexibility to accommodate it.

(iv) Advanced Technology Credits

At this time, the agencies believe it is no longer appropriate to provide extra credit for the technologies identified as advanced technologies for Phase 1, although we are requesting comment on this issue. The Phase 1 advanced technology credits were adopted to promote the implementation of advanced technologies, such as hybrid powertrains, Rankine cycle engines, all-electric vehicles, and fuel cell vehicles (see 40 CFR 1037.150(i)). As the agencies stated in the Phase 1 final rule, the Phase 1 standards were not premised on the use of advanced technologies but we expected these advanced technologies to be an important part of the Phase 2 rulemaking (76 FR 57133, September 15, 2011). The proposed Phase 2 heavy-duty engine and vehicles standards are premised on the use of some advanced technologies, making them equivalent to other fuel-saving technologies in this context. We believe the Phase 2 standards themselves would provide sufficient incentive to develop them.

We request comment on this issue, especially with respect to electric vehicle, plug-in hybrid, and fuel cell technologies. Although the proposed standards are premised on some use of Rankine cycle engines and hybrid powertrains, none of the proposed standards are based on projected utilization of the use of the other advanced technologies. (Note that the most stringent alternative is based on some use of these technologies). Commenters are encouraged to consider the recently adopted light-duty program, which includes temporary incentives for these technologies.

(c) Innovative Technology and Off-Cycle Credits

The agencies propose to largely continue the Phase 1 innovative technology program but to redesignate it as an off-cycle program for Phase 2. In other words, beginning in MY 2021 technologies that are not fully accounted for in the GEM simulation tool, or by compliance dynamometer testing would be considered "off-cycle", including those technologies that may no longer be considered innovative technologies. However, we are not proposing to apply this flexibility to trailers (which were not part of Phase 1) in order to simplify the program for trailer manufacturers.

The agencies propose to maintain that, in order for a manufacturer to receive credits for Phase 2, the off-cycle technology would still need to meet the requirement that it was not in common use prior to MY 2010. Although, we have not identified specific off-cycle technologies at this time that should be excluded, we believe it may be prudent to continue this requirement to avoid the potential for manufacturers to receive windfall credits for technologies that they were already using before MY 2010. Nevertheless, the agencies seek comment on whether off-cycle technologies in the Phase 2 program should be limited in this way. In particular, the agencies are concerned that because the proposed Phase 2 program would be implemented MY 2021 and may extend beyond 2027, the agencies and manufacturers may have difficulty in the future determining whether an off-cycle technology was in common use prior to MY 2010. Moreover, because we have not identified a single off-cycle technology that should be excluded by this provision at this time, we are concerned that this approach may create an unnecessary hindrance to the off-cycle program.

Manufacturers would be able to carry over an innovative technology credits from Phase 1 into Phase 2, subject to the same restrictions as other credits. Manufacturers would also be able to carry over the improvement factor (not the credit value) of a technology, if certain criteria were met. The agencies would require documentation for all off-cycle requests similar to those required by EPA for its light-duty GHG program.

Additionally, NHTSA would not grant any off-cycle credits for crash avoidance technologies. NHTSA would also require manufacturers to consider the safety of off-cycle technologies and would request a safety assessment from the manufacturer for all off-cycle technologies.

The agencies seek comment on these proposed changes, as well as the possibility of adopting aspects of the light-duty off-cycle program.

(d) Alternative Fuels

The agencies are proposing to largely continue the Phase 1 approach for engines and vehicles fueled by fuels other than gasoline and diesel.[58] Phase 1 engine emission standards applied uniquely for gasoline-fueled and diesel-fueled engines. The regulations in 40 CFR part 86 implement these distinctions for alternative fuels by dividing engines into Otto-cycle and Diesel-cycle technologies based on the combustion cycle of the engine. The agencies are, however, proposing a small change that is described in Section II. Under the proposed change, we would require manufacturers to divide their natural gas engines into primary intended service classes, like the current requirement for compression-ignition engines. Any alternative fuel-engine qualifying as a medium heavy-duty engine or a heavy heavy-duty engine would be subject to all the emission standards and other requirements that apply to compression-ignition engines. Note that this small change in approach would also apply with respect to EPA's criteria pollutant program.

We are also proposing that the Phase 2 standards apply exclusively at the

[58] See Section I. F. (1) (a) for a summary of certain specific changes we are proposing or considering for natural gas-fueled engines and vehicles.

vehicle tailpipe. That is, compliance is based on vehicle fuel consumption and GHG emission reductions, and does not reflect any so-called lifecycle emission properties. The agencies have explained why it is reasonable that the heavy duty standards be fuel neutral in this manner. See 76 FR 57123; see also 77 FR 51705 (August 24, 2012) and 77 FR 51500 (August 27, 2012). In particular, EPA notes that there is a separate, statutorily-mandated program under the Clean Air Act which encourages use of renewable fuels in transportation fuels, including renewable fuel used in heavy-duty diesel engines. This program considers lifecycle greenhouse gas emissions compared to petroleum fuel. NHTSA notes that the fuel efficiency standards are necessarily tailpipe-based, and that a lifecycle approach would likely render it impossible to harmonize the fuel efficiency and GHG emission standards, to the great detriment of our goal of achieving a coordinated program. 77 FR 51500–51501; see also 77 FR 51705 (similar finding by EPA); see also section I.F. (1) (a) below.

One consequence of the tailpipe-based approach is that the agencies are proposing to treat vehicles powered by electricity the same as in Phase 1. In Phase 1, EPA treated all electric vehicles as having zero emissions of CO_2, CH_4, and N_2O (see 40 CFR 1037.150(f)). Similarly, NHTSA adopted regulations in Phase 1 that set the fuel consumption standards based on the fuel consumed by the vehicle. The agencies also did not require emission testing for electric vehicles in Phase 1. The agencies considered the potential unintended consequence of not accounting for upstream emissions from the charging of heavy-duty electric vehicles. In our reassessment for Phase 2, we have not found any all-electric heavy-duty vehicles that have certified by 2014. As we look to the future, we project very limited adoption of all-electric vehicles into the market. Therefore, we believe that this provision is still appropriate. Unlike the 2017–2025 light-duty rule, which included a cap whereby upstream emissions would be counted after a certain volume of sales (see 77 FR 62816–62822), we believe there is no need to propose a cap for heavy-duty vehicles because of the small likelihood of significant production of EV technologies in the Phase 2 timeframe. We welcome comments on this approach.[59] Note that we also request comment on upstream emissions for natural gas in Section XI.

(e) Phase 1 Interim Provisions

EPA adopted several flexibilities for the Phase 1 program (40 CFR 1036.150 and 1037.150) as interim provisions. Because the existing regulations do not have an end date for Phase 1, most of these provisions did not have an explicit end date. NHTSA adopted similar provisions. With few exceptions, the agencies are proposing not to apply these provisions to Phase 2. These will generally remain in effect for the Phase 1 program. In particular, the agencies note that we do not propose to continue the blanket exemption for small manufacturers. Instead, the agencies propose to adopt narrower and more targeted relief.

(f) In-Use Standards

Section 202(a)(1) of the CAA specifies that EPA is to adopt emissions standards that are applicable for the useful life of the vehicle and for the engine. EPA finalized in-use standards for the Phase 1 program whereas NHTSA adopted an approach which does not include these standards. For the Phase 2 program, EPA will carry-over its in-use provisions and NHTSA proposes to adopt EPA's useful life requirements for its vehicle and engine fuel consumption standards to ensure manufacturers consider in the design process the need for fuel efficiency standards to apply for the same duration and mileage as EPA standards. If EPA determines a manufacturer fails to meet its in-use standards, civil penalties may be assessed. NHTSA seeks comment on the appropriateness of seeking civil penalties for failure to comply with its fuel efficiency standards in these instances. NHTSA would limit such penalties to situations in which it determined that the vehicle or engine manufacturer failed to comply with the standards.

(2) Proposed Phase 2 Standards

This section briefly summarizes the proposed Phase 2 standards for each category and identifies the technologies that the agencies project would be needed to meet the standards. Given the large number of different regulatory categories and model years for which separate standards are being proposed, the actual numerical standards are not listed. Readers are referred to Sections II through IV for the tables of proposed standards.

(a) Summary of the Proposed Engine Standards

The agencies are proposing to continue the basic Phase 1 structure for the Phase 2 engine standards. There would be separate standards and test cycles for tractor engines, vocational diesel engines, and vocational gasoline engines. However, as described in Section II, we are proposing a revised test cycle for tractor engines to better reflect actual in-use operation.

For diesel engines, the agencies are proposing standards for MY 2027 requiring reduction in CO_2 emissions and fuel consumption of 4.2 percent better than the 2017 baseline.[60] We are also proposing standards for MY 2021 and MY 2024, requiring reductions in CO_2 emissions and fuel consumption of 1.5 to 3.7 percent better than the 2017 baseline. The agencies project that these reductions would be feasible based on technological changes that would improve combustion and reduce energy losses. For most of these improvements, the agencies project manufacturers will begin applying them to about 50 percent of their heavy-duty engines by 2021, and ultimately apply them to about 90 percent of their heavy-duty engines by 2024. However, for some of these improvements we project more limited application rates. In particular, we project a more limited use of waste exhaust heat recovery systems in 2027, projecting that about 10 percent of tractor engines will have turbo-compounding systems, and an additional 15 percent of tractor engines would employ Rankine-cycle waste heat recovery. We do not project that turbo-compounding or Rankine-cycle waste heat recovery technology will be utilized in vocational engines. Although we see great potential for waste heat recovery systems to achieve significant fuel savings and CO_2 emission reductions, we are not projecting that the technology could be available for more wide-spread use in this time frame.

For gasoline vocational engines, we are not proposing new more stringent *engine* standards. Gasoline engines used in vocational vehicles are generally the same engines as are used in the complete HD pickups and vans in the Class 2b and 3 weight categories. Given the relatively small sales volumes for gasoline-fueled vocational vehicles, manufacturers typically cannot afford to invest significantly in developing separate technology for these vocational vehicle engines. Thus, we project that vocational gasoline engines would

[59] See also Section I. C. (1) (b)(iv) above (soliciting comment on need for advanced technology incentive credits for heavy duty EVs).

[60] Phase 1 standards for diesel engines will be fully phased-in by MY 2017.

include the same technology as would be used to meet the pickup and van chassis standards, and this would result in some real world reductions in CO_2 emissions and fuel consumption. Although it is difficult at this time to project how much improvement would be observed during certification testing, it seems likely that these improvements would reduce measured CO_2 emissions and fuel consumption by about one percent. Therefore, we are requesting comment on finalizing a Phase 2 standard of 621 g/hp-hr for gasoline engines (*i.e.,* one percent more stringent than the 2016 Phase 1 standard of 627 g/hp-hr) in MY 2027. We note that the proposed MY 2027 vehicle standards for gasoline-fueled vocational vehicles are predicated in part on the use of advanced friction reduction technology with effectiveness over the GEM cycles of about one percent. We also request comment on whether not proposing more stringent standards for gasoline engines would create an incentive for purchasers who would have otherwise chosen a diesel vehicle to instead choose a gasoline vehicle.

TABLE I–2—SUMMARY OF PHASE 1 AND PROPOSED PHASE 2 REQUIREMENTS FOR ENGINES IN COMBINATION TRACTORS AND VOCATIONAL VEHICLES

	Phase 1 program	Alternative 3–2027 (proposed standard)	Alternative 4–2024 (also under consideration)
Covered in this category	Engines installed in tractors and vocational chassis.		
Share of HDV fuel consumption and GHG emissions.	Combination tractors and vocational vehicles account for approximately 85 percent of fuel use and GHG emissions in the medium and heavy duty truck sector.		
Per vehicle fuel consumption and CO_2 improvement.	5%–9% improvement over MY 2010 baseline, depending vehicle application. Improvements are in addition to improvements from tractor and vocational vehicle standards.	4% improvement over MY 2017 for diesel engines. Note that improvements are captured in complete vehicle tractor and vocational vehicle standards, so that engine improvements and the vehicle improvement shown below are not additive.	
Form of the standard	EPA: CO_2 grams/horsepower-hour and NHTSA: Gallons of fuel/horsepower-hour.		
Example technology options available to help manufacturers meet standards.	Combustion, air handling, friction and emissions after-treatment technology improvements.	Further technology improvements and increased use of all Phase 1 technologies, plus waste heat recovery systems for tractor engines (e.g., turbo-compound and Rankine-cycle).	
Flexibilities	ABT program which allows emissions and fuel consumption credits to be averaged, banked, or traded (five year credit life). Manufacturers allowed to carry-forward credit deficits for up to three model years. Interim incentives for advanced technologies, recognition of innovative (off-cycle) technologies not accounted for by the HD Phase 1 test procedures, and credits for certifying early.	Same as Phase 1, except no advanced technology incentives. Adjustment factor of 1.36 proposed for credits carried forward from Phase 1 to Phase 2 for SI and LHD CI engines due to proposed change in useful life.	

(b) Summary of the Proposed Tractor Standards

As explained in Section III, the agencies are proposing to largely continue the Phase 1 tractor program but to propose new standards. The tractor standards proposed for MY 2027 would achieve up to 24 percent lower CO_2 emissions and fuel consumption than a 2017 model year Phase 1 tractor. The agencies project that the proposed 2027 tractor standards could be met through improvements in the:

- Engine [61] (including some use of waste heat recovery systems)
- Transmission
- Driveline
- Aerodynamic design
- Tire rolling resistance
- Idle performance
- Other accessories of the tractor.

The agencies' evaluation shows that some of these technologies are available today, but have very low adoption rates on current vehicles, while others will require some lead time for development. The agencies are proposing to enhance the GEM vehicle simulation tool to recognize these technologies, as described in Section II.C.

We have also determined that there is sufficient lead time to introduce many of these tractor and engine technologies into the fleet at a reasonable cost starting in the 2021 model year. The proposed 2021 model year standards for combination tractors and engines would achieve up to 13 percent lower CO_2 emissions and fuel consumption than a 2017 model year Phase 1 tractor, and the 2024 model year standards would achieve up to 20 percent lower CO_2 emissions and fuel consumption.

[61] Although the agencies are proposing separate engine standards and separate engine certification, engine improvements would also be reflected in the vehicle certification process. Thus, it is appropriate to also consider engine improvements in the context of the vehicle standards.

TABLE I–3—SUMMARY OF PHASE 1 AND PROPOSED PHASE 2 REQUIREMENTS FOR CLASS 7 AND CLASS 8 COMBINATION TRACTORS

	Phase 1 program	Alternative 3—2027 (proposed standard)	Alternative 4—2024 (also under consideration)
Covered in this category	Tractors that are designed to pull trailers and move freight.		
Share of HDV fuel consumption and GHG emissions.	Combination tractors and their engines account for approximately two thirds of fuel use and GHG emissions in the medium and heavy duty truck sector.		
Per vehicle fuel consumption and CO_2 improvement.	10%–23% improvement over MY 2010 baseline, depending on tractor category. Improvements are in addition to improvements from engine standards.	18%–24% improvement over MY 2017 standards.	
Form of the standard	EPA: CO_2 grams/ton payload mile and NHTSA: Gallons of fuel/1,000 ton payload mile.		
Example technology options available to help manufacturers meet standards.	Aerodynamic drag improvements; low rolling resistance tires; high strength steel and aluminum weight reduction; extended idle reduction; and speed limiters.	Further technology improvements and increased use of all Phase 1 technologies, plus engine improvements, improved and automated transmissions and axles, powertrain optimization, tire inflation systems, and predictive cruise control (depending on tractor type).	
Flexibilities	ABT program which allows emissions and fuel consumption credits to be averaged, banked, or traded (five year credit life). Manufacturers allowed to carry-forward credit deficits for up to three model years. Interim incentives for advanced technologies, recognition of innovative (off-cycle) technologies not accounted for by the HD Phase 1 test procedures, and credits for certifying early.	Same as Phase 1, except no extra credits for advanced technologies or early certification.	

(c) Summary of the Proposed Trailer Standards

This proposed rule is a set of GHG emission and fuel consumption standards for manufacturers of new trailers that are used in combination with tractors that would significantly reduce CO_2 and fuel consumption from combination tractor-trailers nationwide over a period of several years. As described in Section IV, there are numerous aerodynamic and tire technologies available to manufacturers to accomplish these proposed standards. For the most part, these technologies have already been introduced into the market to some extent through EPA's voluntary SmartWay program. However, adoption is still somewhat limited.

The agencies are proposing incremental levels of Phase 2 standards that would apply beginning in MY 2018 and be fully phased-in by 2027. These standards are predicated on use of aerodynamic and tire improvements, with trailer OEMs making incrementally greater improvements in MYs 2021 and 2024 as standard stringency increases in each of those model years. EPA's GHG emission standards would be mandatory beginning in MY 2018, while NHTSA's fuel consumption standards would be voluntary beginning in MY 2018, and be mandatory beginning in MY 2021.

As described in Section XV.D and Chapter 12 of the draft RIA, the agencies are proposing special provisions to minimize the impacts on small trailer manufacturers. These provisions have been informed by and are largely consistent with recommendations coming from the SBAR Panel that EPA conducted pursuant to Section 609(b) of the Regulatory Flexibility Act (RFA). Broadly, these provisions provide additional lead time for small manufacturers, as well as simplified testing and compliance requirements. The agencies are also requesting comment on whether there is a need for additional provisions to address small business issues.

TABLE I–4—SUMMARY OF PROPOSED PHASE 2 REQUIREMENTS FOR TRAILERS

	Phase 1 program	Alternative 3—2027 (proposed standard)	Alternative 4—2024 (also under consideration)
Covered in this category	Trailers hauled by low, mid, and high roof day and sleeper cab tractors, except those qualified as logging, mining, stationary or heavy-haul.		
Share of HDV fuel consumption and GHG emissions.	Trailers are modeled together with combination tractors and their engines. Together, they account for approximately two thirds of fuel use and GHG emissions in the medium and heavy duty truck sector.		
Per vehicle fuel consumption and CO_2 improvement.	N/A	Between 3% and 8% improvement over MY 2017 baseline, depending on the trailer type.	

TABLE I–4—SUMMARY OF PROPOSED PHASE 2 REQUIREMENTS FOR TRAILERS—Continued

	Phase 1 program	Alternative 3—2027 (proposed standard)	Alternative 4—2024 (also under consideration)
Form of the standard	N/A	EPA: CO_2 grams/ton payload mile and NHTSA: Gallons/1,000 ton payload mile.	
Example technology options available to help manufacturers meet standards.	N/A	Low rolling resistance tires, automatic tire inflation systems, weight reduction for most trailers, aerodynamic improvements such as side and rear fairings, gap closing devices, and undercarriage treatment for box-type trailers (*e.g.,* dry and refrigerated vans).	
Flexibilities	N/A	One year delay in implementation for small businesses, trailer manufacturers may use pre-approved devices to avoid testing, averaging program for manufacturers of dry and refrigerated box trailers.	

(d) Summary of the Proposed Vocational Vehicle Standards

As explained in Section V, the agencies are proposing to revise the Phase 1 vocational vehicle program and to propose new standards. These proposed standards also reflect further sub-categorization from Phase 1, with separate proposed standards based on mode of operation: Urban, regional, and multi-purpose. The agencies are also proposing alternative standards for emergency vehicles.

The agencies project that the proposed vocational vehicle standards could be met through improvements in the engine, transmission, driveline, lower rolling resistance tires, workday idle reduction technologies, and weight reduction, plus some application of hybrid technology. These are described in Section V of this preamble and in Chapter 2.9 of the draft RIA. These MY 2027 standards would achieve up to 16 percent lower CO_2 emissions and fuel consumption than MY 2017 Phase 1 standards. The agencies are also proposing revisions to the compliance regime for vocational vehicles. These include: The addition of an idle cycle that would be weighted along with the other drive cycles; and revisions to the vehicle simulation tool to reflect specific improvements to the engine, transmission, and driveline.

Similar to the tractor program, we have determined that there is sufficient lead time to introduce many of these new technologies into the fleet starting in MY 2021. Therefore, we are proposing new standards for MY 2021 and 2024. Based on our analysis, the MY 2021 standards for vocational vehicles would achieve up to 7 percent lower CO_2 emissions and fuel consumption than a MY 2017 Phase 1 vehicle, on average, and the MY 2024 standards would achieve up to 11 percent lower CO_2 emissions and fuel consumption.

In Phase 1, EPA adopted air conditioning (A/C) refrigerant leakage standards for tractors, as well as for heavy-duty pickups and vans, but not for vocational vehicles. For Phase 2, EPA believes that it would be feasible to apply similar A/C refrigerant leakage standards for vocational vehicles, beginning with the 2021 model year. The process for certifying that low leakage components are used would follow the system currently in place for comparable systems in tractors.

TABLE I–5—SUMMARY OF PHASE 1 AND PROPOSED PHASE 2 REQUIREMENTS FOR VOCATIONAL VEHICLE CHASSIS

	Phase 1 program	Alternative 3—2027 (proposed standard)	Alternative 4—2024 (also under consideration)
Covered in this category	Class 2b–8 chassis that are intended for vocational services such as delivery vehicles, emergency vehicles, dump truck, tow trucks, cement mixer, refuse trucks, etc., except those qualified as off-highway vehicles.		
	Because of sector diversity, vocational vehicle chassis are segmented into Light, Medium and Heavy Duty vehicle categories and for Phase 2 each of these segments are further subdivided using three duty cycles: Regional, Multi-purpose, and Urban.		
Share of HDV fuel consumption and GHG emissions.	Vocational vehicles account for approximately 20 percent of fuel use and GHG emissions in the medium and heavy duty truck sector categories.		
Per vehicle fuel consumption and CO_2 improvement.	2% improvement over MY 2010 baseline. Improvements are in addition to improvements from engine standards.	Up to 16% improvement over MY 2017 standards.	
Form of the standard	EPA: CO_2 grams/ton payload mile and NHTSA: Gallons of fuel/1,000 ton payload mile.		
Example technology options available to help manufacturers meet standards.	Low rolling resistance tires	Further technology improvements and increased use of Phase 1 technologies, plus improved engines, transmissions and axles, powertrain optimization, weight reduction, hybrids, and workday idle reduction systems.	

TABLE I–5—SUMMARY OF PHASE 1 AND PROPOSED PHASE 2 REQUIREMENTS FOR VOCATIONAL VEHICLE CHASSIS—Continued

	Phase 1 program	Alternative 3—2027 (proposed standard)	Alternative 4—2024 (also under consideration)
Flexibilities	ABT program which allows emissions and fuel consumption credits to be averaged, banked, or traded (five year credit life). Manufacturers allowed to carry-forward credit deficits for up to three model years. Interim incentives for advanced technologies, recognition of innovative (off-cycle) technologies not accounted for by the HD Phase 1 test procedures, and credits for certifying early.	Same as Phase 1, except no advanced technology incentives.	
		Chassis intended for emergency vehicles have proposed Phase 2 standards based only on Phase 1 technologies, and may continue to certify using a simplified Phase 1-style GEM tool. Adjustment factor of 1.36 proposed for credits carried forward from Phase 1 to Phase 2 due to proposed change in useful life.	

(e) Summary of the Proposed Heavy-Duty Pickup and Van Standards

The agencies are proposing to adopt new Phase 2 GHG emission and fuel consumption standards for heavy-duty pickups and vans that would be applied in largely the same manner as the Phase 1 standards. These standards are based on the extensive use of most known and proven technologies, and could result in some use of strong hybrid powertrain technology. These proposed standards would commence in MY 2021. Overall, the proposed standards are 16 percent more stringent by 2027.

TABLE I–6—SUMMARY OF PHASE 1 AND PROPOSED PHASE 2 REQUIREMENTS FOR HD PICKUPS AND VANS

	Phase 1 program	Alternative 3—2027 (proposed standard)	Alternative 4—2025 (also under consideration)
Covered in this category	Class 2b and 3 complete pickup trucks and vans, including all work vans and 15-passenger vans but excluding 12-passenger vans which are subject to light-duty standards.		
Share of HDV fuel consumption and GHG emissions.	HD pickups and vans account for approximately 15% of fuel use and GHG emissions in the medium and heavy duty truck sector.		
Per vehicle fuel consumption and CO_2 improvement.	15% improvement over MY 2010 baseline for diesel vehicles, and 10% improvement for gasoline vehicles.	16% improvement over MY 2018–2020 standards.	
Form of the standard	Phase 1 standards are based upon a "work factor" attribute that combines truck payload and towing capabilities, with an added adjustment for 4-wheel drive vehicles. There are separate target curves for diesel-powered and gasoline-powered vehicles. As proposed, the Phase 2 standards would be based on the same approach.		
Example technology options available to help manufacturers meet standards.	Engine improvements, transmission improvements, aerodynamic drag improvements, low rolling resistance tires, weight reduction, and improved accessories.	Further technology improvements and increased use of all Phase 1 technologies, plus engine stop-start, and powertrain hybridization (mild and strong).	

TABLE I–6—SUMMARY OF PHASE 1 AND PROPOSED PHASE 2 REQUIREMENTS FOR HD PICKUPS AND VANS—Continued

	Phase 1 program	Alternative 3—2027 (proposed standard)	Alternative 4—2025 (also under consideration)
Flexibilities	Two optional phase-in schedules; ABT program which allows emissions and fuel consumption credits to be averaged, banked, or traded (five year credit life). Manufacturers allowed to carry-forward credit deficits for up to three model years. Interim incentives for advanced technologies, recognition of innovative (off-cycle) technologies not accounted for by the HD Phase 1 test procedures, and credits for certifying early.	Proposed to be same as Phase 1, with phase-in schedule based on year-over-year increase in stringency. Adjustment factor of 1.25 proposed for credits carried forward from Phase 1 to Phase 2 due to proposed change in useful life. Proposed cessation of advanced technology incentives in 2021 and continuation of off-cycle credits.	

(f) Summary of the Proposed Final Numeric Standards by Regulatory Subcategory

Table I–7 lists the proposed final (*i.e.,* MY 2027) numeric standards by regulatory subcategory for tractors, trailers, vocational vehicles and engines. Note that these are the same final numeric standards for Alternative 4, but for Alternative 4 these would be implemented in MY 2024 instead of MY 2027.

TABLE I–7—PROPOSED FINAL (MY 2027) NUMERIC STANDARDS BY REGULATORY SUBCATEGORY

Regulatory subcategory	CO_2 grams per ton-mile (for engines CO_2 grams per brake horsepower-hour)	Fuel consumption gallon per 1,000 ton-mile (for engines gallons per 100 brake horsepower-hour)
Tractors:.		
Class 7 Low Roof Day Cab	87	8.5462
Class 7 Mid Roof Day Cab	96	9.4303
Class 7 High Roof Day Cab	96	9.4303
Class 8 Low Roof Day Cab	70	6.8762
Class 8 Mid Roof Day Cab	76	7.4656
Class 8 High Roof Day Cab	76	7.4656
Class 8 Low Roof Sleeper Cab	62	6.0904
Class 8 Mid Roof Sleeper Cab	69	6.7780
Class 8 High Roof Sleeper Cab	67	6.5815
Trailers:		
Long Dry Box Trailer	77	7.5639
Short Dry Box Trailer	140	13.7525
Long Refrigerated Box Trailer	80	7.8585
Short Refrigerated Box Trailer	144	14.1454
Vocational Diesel:		
LHD Urban	272	26.7191
LHD Multi-Purpose	280	27.5049
LHD Regional	292	28.6837
MHD Urban	172	16.8959
MHD Multi-Purpose	174	17.0923
MHD Regional	170	16.6994
HHD Urban	182	17.8782
HHD Multi-Purpose	183	17.9764
HHD Regional	174	17.0923
Vocational Gasoline:		
LHD Urban	299	33.6446
LHD Multi-Purpose	308	34.6574
LHD Regional	321	36.1202
MHD Urban	189	21.2670
MHD Multi-Purpose	191	21.4921
MHD Regional	187	21.0420
HHD Urban	196	22.0547
HHD Multi-Purpose	198	22.2797
HHD Regional	188	21.1545
Diesel Engines:		
LHD Vocational	553	5.4322
MHD Vocational	553	5.4322
HHD Vocational	533	5.2358
MHD Tractor	466	4.5776

TABLE I–7—PROPOSED FINAL (MY 2027) NUMERIC STANDARDS BY REGULATORY SUBCATEGORY—Continued

Regulatory subcategory	CO_2 grams per ton-mile (for engines CO_2 grams per brake horsepower-hour)	Fuel consumption gallon per 1,000 ton-mile (for engines gallons per 100 brake horsepower-hour)
HHD Tractor	441	4.3320

Similar to Phase 1 the agencies are proposing for Phase 2 a set of continuous equation-based standards for HD pickups and vans. Please refer to Section 6, subsection B.1, for a description of these standards, including associated tables and figures.

D. Summary of the Costs and Benefits of the Proposed Rule

This section summarizes the projected costs and benefits of the proposed NHTSA fuel consumption and EPA GHG emission standards, along with those of Alternative 4. These projections helped to inform the agencies' choices among the alternatives considered, along with other relevant factors, and NHTSA's Draft Environmental Impact Statement (DEIS). See Sections VII through IX and the Draft RIA for additional details about these projections.

For this rule, the agencies conducted coordinated and complementary analyses using two analytical methods for the heavy-duty pickup and van segment by employing both DOT's CAFE model and EPA's MOVES model. The agencies used EPA's MOVES model to estimate fuel consumption and emissions impacts for tractor-trailers (including the engine that powers the tractor), and vocational vehicles (including the engine that powers the vehicle). Additional calculations were performed to determine corresponding monetized program costs and benefits. For heavy-duty pickups and vans, the agencies performed complementary analyses, which we refer to as ''Method A'' and ''Method B.'' In Method A, the CAFE model was used to project a pathway the industry could use to comply with each regulatory alternative and the estimated effects on fuel consumption, emissions, benefits and costs. In Method B, the CAFE model was used to project a pathway the industry could use to comply with each regulatory alternative, along with resultant impacts on per vehicle costs, and the MOVES model was used to calculate corresponding changes in total fuel consumption and annual emissions. Additional calculations were performed to determine corresponding monetized program costs and benefits. NHTSA considered Method A as its central analysis and Method B as a supplemental analysis. EPA considered the results of both methods. The agencies concluded that both methods led the agencies to the same conclusions and the same selection of the proposed standards. See Section VII for additional discussion of these two methods.

(1) Reference Case Against Which Costs and Benefits Are Calculated

The No Action Alternative for today's analysis, alternatively referred to as the ''baseline'' or ''reference case,'' assumes that the agencies would not issue new rules regarding MD/HD fuel efficiency and GHG emissions. This is the baseline against which costs and benefits for the proposed standards are calculated. The reference case assumes that model year 2018 standards would be extended indefinitely and without change.

The agencies recognize that if the proposed rule is not adopted, manufacturers will continue to introduce new heavy-duty vehicles in a competitive market that responds to a range of factors. Thus manufacturers might have continued to improve technologies to reduce heavy-duty vehicle fuel consumption. Thus, as described in Section VII, both agencies fully analyzed the proposed standards and the regulatory alternatives against two reference cases. The first case uses a baseline that projects very little improvement in new vehicles in the absence of new Phase 2 standards, and the second uses a more dynamic baseline that projects more significant improvements in vehicle fuel efficiency. NHTSA considered its primary analysis to be based on the more dynamic baseline, where certain cost-effective technologies are assumed to be applied by manufacturers to improve fuel efficiency beyond the Phase 1 requirements in the absence of new Phase 2 standards. EPA considered both reference cases. The results for all of the regulatory alternatives relative to both reference cases, derived via the same methodologies discussed in this section, are presented in Section X of the preamble.

The agencies chose to analyze these two different baselines because the agencies recognize that there are a number of factors that create uncertainty in projecting a baseline against which to compare the future effects of the proposed action and the remaining alternatives. The composition of the future fleet—such as the relative position of individual manufacturers and the mix of products they each offer—cannot be predicted with certainty at this time. Additionally, the heavy-duty vehicle market is diverse, as is the range of vehicle purchasers. Heavy-duty vehicle manufacturers have reported that their customers' purchasing decisions are influenced by their customers' own determinations of minimum total cost of ownership, which can be unique to a particular customer's circumstances. For example, some customers (*e.g.,* less-than-truckload or package delivery operators) operate their vehicles within a limited geographic region and typically own their own vehicle maintenance and repair centers within that region. These operators tend to own their vehicles for long time periods, and sometimes for the entire service life of the vehicle. Their total cost of ownership is influenced by their ability to better control their own maintenance costs, and thus they can afford to consider fuel efficiency technologies that have longer payback periods, outside of the vehicle manufacturer's warranty period. Other customers (*e.g.* truckload or long-haul operators) tend to operate cross-country, and thus must depend upon truck dealer service centers for repair and maintenance. Some of these customers tend to own their vehicles for about four to seven years, so that they typically do not have to pay for repair and maintenance costs outside of either the manufacturer's warranty period or some other extended warranty period. Many of these customers tend to require seeing evidence of fuel efficiency technology payback periods on the order of 18 to 24 months before seriously considering evaluating a new technology for potential adoption within their fleet (NAS 2010, Roeth et al. 2013, Klemick et al. 2014). Purchasers of HD pickups and vans wanting better fuel efficiency tend to demand that fuel consumption improvements pay back within approximately one to three years, but some HD pickup and van owners accrue relatively few vehicle miles traveled per year, such that they may be less likely to adopt new fuel efficiency technologies, while other owners who use their vehicle(s) with greater intensity may be even more willing to pay for fuel efficiency improvements. Regardless of the type of customer, their determination of minimum total cost of ownership involves the customer balancing their own unique circumstances with a heavy-duty vehicle's initial purchase price, availability of credit and lease options, expectations of vehicle reliability, resale value and fuel efficiency technology payback periods. The degree of the incentive to adopt additional fuel efficiency technologies also depends on customer expectations of future fuel prices, which directly impacts customer payback periods. Purchasing decisions are not based exclusively on payback period, but also include the considerations discussed above and in Section X.A.1. For the baseline analysis, the agencies use payback period as a proxy for all of these considerations, and therefore the payback period for the baseline analysis is shorter than the payback period industry uses as a threshold for the further consideration of a technology. The agencies request comment on which alternative baseline scenarios would be most appropriate for analysis in the final rule. Specifically, the agencies request empirical evidence to support whether the agencies should use for the final rule the central cases used in this proposal, alternative sensitivity cases such as those mentioned below, or some other scenarios. See Section X.A.1of this Preamble and Chapter 11 of the draft RIA for a more detailed discussion of baselines.

As part of a sensitivity analysis, additional baseline scenarios were also evaluated for HD pickups and vans, including baseline payback periods of 12, 18 and 24 months. See Section VI of this Preamble and Chapter 10 of the draft RIA for a detailed discussion of these additional scenarios.

(2) Costs and Benefits Projected for the Standards Being Proposed and Alternative 4

The tables below summarize the benefits and costs for the program in two ways: First, from the perspective of a program designed to improve the Nation's energy security and to conserve energy by improving fuel efficiency and then from the perspective of a program designed to reduce GHG emissions. The individual categories of benefits and costs presented in the tables below are defined more fully and presented in more detail in Chapter 8 of the draft RIA.

Table I–8 shows benefits and costs for the proposed standards and Alternative 4 from the perspective of a program designed to improve the Nation's energy security and conserve energy by improving fuel efficiency. From this viewpoint, technology costs occur when the vehicle is purchased. Fuel savings are counted as benefits that occur over the lifetimes of the vehicles produced during the model years subject to the Phase 2 standards as they consume less fuel.

TABLE I–8—LIFETIME FUEL SAVINGS, GHG REDUCTIONS, BENEFITS, COSTS AND NET BENEFITS FOR MODEL YEARS 2018–2029 VEHICLES USING ANALYSIS METHOD A

[Billions of 2012$] [a b]

TABLE I–11—PER VEHICLE COSTS RELATIVE TO BASELINE 1a

	3 Proposed standards			4	
	MY 2021	MY 2024	MY 2027	MY 2021	MY 2024
Per Vehicle Cost ($) [a]					
Tractors	$6,710	$9,940	$11,700	$10,200	$12,400
Trailers	900	1,010	1,170	1,080	1,230
Vocational Vehicles	1,150	1,770	3,380	1,990	3,590
Pickups/Vans	520	950	1,340	1,050	1,730

Note:
[a] Per vehicle costs include new engine and vehicle technology only; costs associated with increased insurance, taxes and maintenance are included in the payback period values.

An important metric to vehicle purchasers is the payback period that can be expected on any new purchase. In other words, there is greater willingness to pay for new technology if that new technology ‘‘pays back’’ within an acceptable period of time. The agencies make no effort to define the acceptable period of time, but seek to estimate the payback period for others to make the decision themselves. The payback period is the point at which reduced fuel expenditures outpace increased vehicle costs, including increased maintenance, insurance premiums and taxes. The payback periods for vehicles meeting the standards considered for the final year of implementation (MY2024 for alternative 4 and MY2027 for the proposed standards) are shown in Table I–12, and are similar for both Method A and Method B.

TABLE I–12—PAYBACK PERIODS FOR MY2027 VEHICLES UNDER THE PROPOSED STANDARDS AND FOR MY2024 VEHICLES UNDER ALTERNATIVE 4 RELATIVE TO BASELINE 1a

[Payback occurs in the year shown; using 7% discounting]

	Proposed standards	Alternative 4
Tractors/Trailers	2nd	2nd
Vocational Vehicles	6th	6th
Pickups/Vans	3rd	4th

(3) Cost Effectiveness

These proposed regulations implement Section 32902(k) of EISA and Section 202(a)(1) and (2) of the Clean Air Act. Through the 2007 EISA, Congress directed NHTSA to create a medium- and heavy-duty vehicle fuel efficiency program designed to achieve the maximum feasible improvement by considering appropriateness, cost-effectiveness, and technological feasibility to determine maximum feasible standards.[62] The Clean Air Act requires that any air pollutant emission standards for heavy-duty vehicles and engines take into account the costs of any requisite technology and the lead time necessary to implement such technology. Both agencies considered overall costs, overall benefits and cost effectiveness in developing the Phase 1 standards. Although there are different ways to evaluate cost effectiveness, the essence is to consider some measure of costs relative to some measure of impacts.

Considering that Congress enacted EPCA and EISA to, among other things, address the need to conserve energy, the agencies have evaluated the proposed standards in terms of costs per gallon of fuel conserved. As described in the draft RIA, the agencies also evaluated the

[62] This EISA requirement applies to regulation of medium- and heavy-duty vehicles. For many years, and as reaffirmed by Congress in 2007, ‘‘economic practicability’’ has been among the factors EPCA requires NHTSA to consider when setting light-duty fuel economy standards at the (required) maximum feasible levels. NHTSA interprets ‘‘economic practicability’’ as a factor involving considerations broader than those likely to be involved in ‘‘cost effectiveness’’.

proposed standards using the same approaches employed in HD Phase 1. Together, the agencies have considered the following three ratios of cost effectiveness:

1. Total costs per gallon of fuel conserved.

2. Technology costs per ton of GHG emissions reduced.

3. Technology costs minus fuel savings per ton of GHG emissions reduced.

By all three of these measures, the proposed standards would be highly cost effective.

As discussed below, the agencies estimate that over the lifetime of heavy-duty vehicles produced for sale in the U.S. during model years 2018–2029, the proposed standards would cost about $30 billion and conserve about 75 billion gallons of fuel, such that the first measure of cost effectiveness would be about 40 cents per gallon. Relative to fuel prices underlying the agencies' analysis, the agencies have concluded that today's proposed standards would be cost effective.

With respect to the second measure, which is useful for comparisons to other GHG rules, the proposed standards would have overall $/ton costs similar to the HD Phase 1 rule. As Chapter 7 of the draft RIA shows, technology costs by themselves would amount to less than $50 per metric ton of GHG (CO_2 eq) for the entire HD Phase 2 program. This compares well to both the HD Phase 1 rule, which was estimated to cost about $30 per metric ton of GHG (without fuel savings), and to the agencies' estimates of the social cost of carbon. Thus, even without accounting for fuel savings, the proposed standards would be cost-effective.

The third measure deducts fuel savings from technology costs, which also is useful for comparisons to other GHG rules. On this basis, net costs per ton of GHG emissions reduced would be negative under the proposed standards. This means that the value of the fuel savings would be greater than the technology costs, and there would be a net cost saving for vehicle owners. In other words, the technologies would pay for themselves (indeed, more than pay for themselves) in fuel savings.

In addition, while the net economic benefits (*i.e.,* total benefits minus total costs) of the proposed standards is not a traditional measure of their cost-effectiveness, the agencies have concluded that the total costs of the proposed standards are justified in part by their significant economic benefits. As discussed in the previous subsection and in Section IX, this rule would provide benefits beyond the fuel conserved and GHG emissions avoided. The rule's net benefits is a measure that quantifies each of its various benefits in economic terms, including the economic value of the fuel it saves and the climate-related damages it avoids, and compares their sum to the rule's estimated costs. The agencies estimate that the proposed standards would result in net economic benefits exceeding $100 billion, making this a highly beneficial rule.

Our current analysis of Alternative 4 also shows that, if technologically feasible, it would have similar cost-effectiveness but with greater net benefits (see Chapter 11 of the draft RIA). For example, the agencies estimate costs under Alternative 4 could be about $40 billion and about 85 billion gallons of fuel could be conserved, such that the first measure of cost effectiveness would be about 47 cents per gallon. However, the agencies considered all of the relevant factors, not just relative cost-effectiveness, when selecting the proposed standards from among the alternatives considered. Relative cost-effectiveness was not a limiting factor for the agencies in selecting the proposed standards. It is also worth noting that the proposed standards and the Alternative 4 standards appear very cost effective, regardless of which reference case is used for the baseline, such that all of the analyses reinforced the agencies' findings.

E. EPA and NHTSA Statutory Authorities

This section briefly summarizes the respective statutory authority for EPA and NHTSA to promulgate the Phase 1 and proposed Phase 2 programs. For additional details of the agencies' authority, see Section XV of this notice as well as the Phase 1 rule.[63]

(1) EPA Authority

Statutory authority for the vehicle controls in this proposal is found in CAA section 202(a)(1) and (2) (which requires EPA to establish standards for emissions of pollutants from new motor vehicles and engines which emissions cause or contribute to air pollution which may reasonably be anticipated to endanger public health or welfare), and in CAA sections 202(d), 203–209, 216, and 301 (42 U.S.C. 7521 (a)(1) and (2), 7521(d), 7522–7543, 7550, and 7601).

Title II of the CAA provides for comprehensive regulation of mobile sources, authorizing EPA to regulate emissions of air pollutants from all mobile source categories. When acting under Title II of the CAA, EPA considers such issues as technology effectiveness, its cost (both per vehicle, per manufacturer, and per consumer), the lead time necessary to implement the technology, and based on this the feasibility and practicability of potential standards; the impacts of potential standards on emissions reductions of both GHGs and non-GHG emissions; the impacts of standards on oil conservation and energy security; the impacts of standards on fuel savings by customers; the impacts of standards on the truck industry; other energy impacts; as well as other relevant factors such as impacts on safety.

This proposed action implements a specific provision from Title II, Section 202(a). Section 202(a)(1) of the CAA states that ''the Administrator shall by regulation prescribe (and from time to time revise) . . . standards applicable to the emission of any air pollutant from any class or classes of new motor vehicles . . ., which in his judgment cause, or contribute to, air pollution which may reasonably be anticipated to endanger public health or welfare.'' With EPA's December 2009 final findings that certain greenhouse gases may reasonably be anticipated to endanger public health and welfare and that emissions of GHGs from Section 202(a) sources cause or contribute to that endangerment, Section 202(a) requires EPA to issue standards applicable to emissions of those pollutants from new motor vehicles. See *Coalition for Responsible Regulation* v. *EPA,* 684 F. 3d at 116–125, 126–27 cert. granted by, in part Util. Air Regulatory Group v. EPA, 134 S. Ct. 418, 187 L. Ed. 2d 278, 2013 U.S. LEXIS 7380 (U.S., 2013), affirmed in part and reversed in part on unrelated grounds by Util. Air Regulatory Group v. EPA, 134 S. Ct. 2427, 189 L. Ed. 2d 372, 2014 U.S. LEXIS 4377 (U.S., 2014) (upholding EPA's endangerment and cause and contribute findings, and further affirming EPA's conclusion that it is legally compelled to issue standards under Section 202 (a) to address emission of the pollutant which endangers after making the endangerment and cause of contribute findings); see also id. at 127–29 (upholding EPA's light-duty GHG emission standards for MYs 2012–2016 in their entirety).

Other aspects of EPA's legal authority, including it authority under Section 202(a), its testing authority under Section 203 of the Act, and its enforcement authorities under Section 207 of the Act are discussed fully in the Phase 1 rule, and need not be repeated here. See 76 FR 57129–57130.

[63] 76 FR 57106—57129, September 15, 2011.

The proposed rule includes GHG emission and fuel efficiency standards applicable to trailers—an essential part of the tractor-trailer motor vehicle. Class 7/8 heavy-duty vehicles are composed of three major components:—The engine, the cab-chassis (*i.e.* the tractor), and the trailer. The fact that the vehicle consists of two detachable parts does not mean that either of the parts is not a motor vehicle. The trailer's sole purpose is to serve as the cargo-hauling part of the vehicle. Without the tractor, the trailer cannot transport property. The tractor is likewise incomplete without the trailer. The motor vehicle needs both parts, plus the engine, to accomplish its intended use. Connected together, a tractor and trailer constitute ''a self-propelled vehicle designed for transporting . . . property on a street or highway,'' and thus meet the definition of ''motor vehicle'' under Section 216(2) of the CAA. Thus, as EPA has previously explained, we interpret our authority to regulate motor vehicles to include authority to regulate such trailers. See 79 FR 46259 (August 7, 2014).[64]

This analysis is consistent with definitions in the Federal regulations issued under the CAA at 40 CFR 86.1803–01, where a heavy-duty vehicle ''that has the primary load carrying device or container attached'' is referred to as a ''[c]omplete heavy-duty vehicle,'' while a heavy-duty vehicle or truck ''which does not have the primary load carrying device or container attached'' is referred to as an ''[i]ncomplete heavy-duty vehicle'' or ''[i]ncomplete truck.'' The trailers that would be covered by this proposal are properly considered ''the primary load carrying device or container'' for the heavy-duty vehicles to which they become attached for use. Therefore, under these definitions, such trailers are implicitly part of a ''complete heavy-duty vehicle,'' and thus part of a ''motor vehicle.''[65 66 67]

The argument that trailers do not themselves emit pollutants and so are not subject to emission standards is also unfounded. First, the argument lacks a factual predicate. Trailers indisputably contribute to the motor vehicle's CO_2 emissions by increasing engine load, and these emissions can be reduced through various means such as trailer aerodynamic and tire rolling resistance improvements. See Section IV below. The argument also lacks a legal predicate. Section 202(a)(1) authorizes standards applicable to emissions of air pollutants ''from'' either the motor vehicle or the engine. There is no requirement that pollutants be emitted from a specified part of the motor vehicle or engine. And indeed, the argument proves too much, since tractors and vocational vehicle chassis likewise contribute to emissions (including contributing by the same mechanisms that trailers do) but do not themselves directly emit pollutants. The fact that Section 202(a)(1) applies explicitly to both motor vehicles and engines likewise indicates that EPA has unquestionable authority to interpret pollutant emission caused by the vehicle component to be ''from'' the motor vehicle and so within its regulatory authority under Section 202(a)(1).[68]

(2) NHTSA Authority

The Energy Policy and Conservation Act (EPCA) of 1975 mandates a regulatory program for motor vehicle fuel economy to meet the various facets of the need to conserve energy. In December 2007, Congress enacted the Energy Independence and Security Act (EISA), amending EPCA to require, among other things, the creation of a medium- and heavy-duty fuel efficiency program for the first time.

Statutory authority for the fuel consumption standards in this proposed rule is found in EISA section 103, 49 U.S.C. 32902(k). This section authorizes a fuel efficiency improvement program, designed to achieve the maximum feasible improvement to be created for commercial medium- and heavy-duty on-highway vehicles and work trucks, to include appropriate test methods, measurement metrics, standards, and compliance and enforcement protocols that are appropriate, cost-effective and technologically feasible.

NHTSA has responsibility for fuel economy and consumption standards, and assures compliance with EISA through rulemaking, including standard-setting; technical reviews, audits and studies; investigations; and enforcement of implementing regulations including penalty actions. This proposed rule would continue to fulfill the requirements of Section 103 of EISA, which instructs NHTSA to create a fuel efficiency improvement program for ''commercial medium- and heavy-duty on-highway vehicles and work trucks'' by rulemaking, which is to include standards, test methods, measurement metrics, and enforcement protocols. *See* 49 U.S.C. 32902(k)(2).

Congress directed that the standards, test methods, measurement metrics, and compliance and enforcement protocols be ''appropriate, cost-effective, and technologically feasible'' for the vehicles to be regulated, while achieving the ''maximum feasible improvement'' in fuel efficiency. NHTSA has broad discretion to balance the statutory factors in Section 103 in developing fuel consumption standards to achieve the maximum feasible improvement.

As discussed in the Phase 1 final rule notice, NHTSA has determined that the five year statutory limit on average fuel economy standards that applies to passengers and light trucks is not applicable to the HD vehicle and engine standards. As a result, the Phase 1 HD engine and vehicle standards remain in effect indefinitely at their 2018 or 2019 MY levels until amended by a future rulemaking action. As was contemplated in that notice, NHTSA is currently engaging in this Phase 2 rulemaking action. Therefore, the Phase 1 standards would not remain in effect at their 2018 or 2019 MY levels indefinitely; they would remain in effect until the MY Phase 2 standards apply. In accordance with Section 103 of EISA, NHTSA will ensure that not less than four full MYs of regulatory lead-time and three full MYs of regulatory stability are provided for in the Phase 2 standards.

(a) Authority To Regulate Trailers

As contemplated in the Phase 1 proposed and final rules, the agencies are proposing standards for trailers in this rulemaking. Because Phase 1 did not include standards for trailers, NHTSA did not discuss its authority for regulating them in the proposed or final rules; that authority is described here.

[64] Indeed, an argument that a trailer is not a motor vehicle because, considered (artificially) as a separate piece of equipment it is not self-propelled, applies equally to the cab-chassis—the tractor. No entity has suggested that tractors are not motor vehicles; nor is such an argument plausible.

[65] We note further, however, that certain hauled items, for example a boat, would not be considered to be a trailer under the proposal. See proposed section 1037.801, proposing to define ''trailer' as being ''designed for cargo and for being drawn by a tractor.''

[66] This concept is likewise reflected in the definition of ''tractor'' in the parallel Department of Transportation regulations: ''a truck designed primarily for drawing other motor vehicles and not so constructed as to carry a load other than a part of the weight of the vehicle and the load so drawn.'' See 49 CFR 571.3.

[67] EPA's proposed definition of ''vehicle'' in 40 CFR 1037.801 makes clear that an incomplete trailer becomes a vehicle (and thus subject to the prohibition against introduction into commerce without a certificate) when it has a frame with axles attached. Complete trailers are also vehicles.

[68] This argument applies equally to emissions of criteria pollutants, whose rate of emission is likewise affected by vehicle characteristics. It is for this reason that EPA's implementing rules for criteria pollutants from heavy duty vehicles and engines specify a test weight for certification testing, since that weight influences the amount of pollution emission.

EISA directs NHTSA to ''determine in a rulemaking proceeding how to implement a commercial medium- and heavy-duty on-highway vehicle and work truck fuel efficiency improvement program designed to achieve the maximum feasible improvement. . . .'' EISA defines a commercial medium- and heavy-duty on-highway vehicle to mean ''an on-highway vehicle with a GVWR of 10,000 lbs or more.'' A ''work truck'' is defined as a vehicle between 8,500 and 10,000 lbs GVWR that is not an MDPV. These definitions do not explicitly exclude trailers, in contrast to MDPVs. Because Congress did not act to exclude trailers when defining GVWRs, despite demonstrating the ability to exclude MDPVs, it is reasonable to interpret the provision to include them.

Both commercial medium- and heavy-duty on-highway vehicles and work trucks, though, must be vehicles in order to be regulated under this program. Although EISA does not define the term ''vehicle,'' NHTSA's authority to regulate motor vehicles under its organic statute, the Motor Vehicle Safety Act (''Safety Act''), does. The Safety Act defines a motor vehicle as ''a vehicle driven or drawn by mechanical power and manufactured primarily for use on public streets, roads, and highways. . . .'' NHTSA clearly has authority to regulate trailers under this Act as vehicles that are drawn and has exercised that authority numerous times. Given the absence of any apparent contrary intent on the part of Congress in EISA, NHTSA believes it is reasonable to interpret the term ''vehicle'' as used in the EISA definitions to have a similar meaning that includes trailers.

Furthermore, the general definition of a vehicle is something used to transport goods or persons from one location to another. A tractor-trailer is designed for the purpose of transporting goods. Therefore it is reasonable to consider all of its parts—the engine, the cab-chassis, and the trailer—as parts of a whole. As such they are all parts of a vehicle, and are captured within the definition of vehicle. As EPA describes above, the tractor and trailer are both incomplete without the other. Neither can fulfill the function of the vehicle without the other. For this reason, and the other reasons stated above, NHTSA interprets its authority to regulate commercial medium- and heavy-duty on-highway vehicles, including tractor-trailers, as encompassing both tractors and trailers.

(b) Authority To Regulate Recreational Vehicles

NHTSA did not regulate recreational vehicles as part of the Phase 1 medium- and heavy-duty fuel consumption standards, although EPA did regulate them as vocational vehicles for GHG emissions.[69] In the Phase 1 proposed rule, NHTSA interpreted ''commercial medium- and heavy duty'' to mean that recreational vehicles, such as motor homes, were not to be included within the program because recreational vehicles are not commercial. Oshkosh Corporation submitted a comment on the agency's interpretation stating that it did not match the statutory definition of ''commercial medium- and heavy-duty on-highway vehicle,'' which defines the phrase by GVWR and on-highway use. In the Phase 1 final rule NHTSA agreed with Oshkosh Corporation that the agency had effectively read words into the statutory definition. However, because recreational vehicles were not proposed in the Phase 1 proposed rule, they were not within the scope of the rulemaking and were excluded from NHTSA's standards.[70] NHTSA expressed that it would address recreational vehicles in its next rulemaking.

NHTSA is proposing that recreational vehicles be included in the Phase 2 fuel consumption standards. As discussed above, EISA prescribes that NHTSA shall set average fuel economy standards for work trucks and commercial medium-duty or heavy-duty on-highway vehicles. ''Work truck'' means a vehicle that is rated between 8,500 and 10,000 lbs GVWR and is not an MDPV. ''Commercial medium- and heavy-duty on-road highway vehicle'' means an on-highway vehicle with a gross vehicle weight rating of 10,000 lbs or more.[71] Based on the definitions in EISA, recreational vehicles would be regulated as class 2b-8 vocational vehicles. Excluding recreational vehicles from the NHTSA standards in Phase 2 could create illogical results, including treating similar vehicles differently. Moreover, including recreational vehicles under NHTSA regulations furthers the agencies' goal of one national program, as EPA regulations already cover recreational vehicles.

NHTSA is proposing that recreational vehicles be included in the Phase 2 fuel consumption standards and that early compliance be allowed for manufacturers who want to certify during the Phase 1 period.[72]

F. Other Issues

In addition to the standards being proposed, this notice discusses several other issues related to those standards. It also proposes some regulatory provisions related to the Phase 1 program, as well as amendments related to other EPA and NHTSA regulations. These other issues are summarized briefly here and discussed in greater detail in later sections.

(1) Issues Related to Phase 2

(a) Natural Gas Engines and Vehicles

This combined rulemaking by EPA and NHTSA is designed to regulate two separate characteristics of heavy duty vehicles: GHGs and fuel consumption. In the case of diesel or gasoline powered vehicles, there is a one-to-one relationship between these two characteristics. For alternatively fueled vehicles, which use no petroleum, the situation is different. For example, a natural gas vehicle that achieves approximately the same fuel efficiency as a diesel powered vehicle would emit 20 percent less CO_2; and a natural gas vehicle with the same fuel efficiency as a gasoline vehicle would emit 30 percent less CO_2. Yet natural gas vehicles consume no petroleum. In Phase 1, the agencies balanced these facts by applying the gasoline and diesel CO_2 standards to natural gas engines based on the engine type of the natural gas engine. Fuel consumption for these vehicles is then calculated according to their tailpipe CO_2 emissions. In essence, this applies a one-to-one relationship between fuel efficiency and tailpipe CO_2 emissions for all vehicles, including natural gas vehicles. The agencies determined that this approach would likely create a small balanced incentive for natural gas use. In other words, it created a small incentive for the use of natural gas engines that appropriately balanced concerns about the climate impact methane emissions against other factors such as the energy security benefits of using domestic natural gas. See 76 FR 57123. We propose to maintain this approach for Phase 2. Note that EPA is also considering natural gas in a broader context of life cycle emissions, as described in Section XI.

(b) Alternative Refrigerants

In addition to use of leak-tight components in air conditioning system

[69] EPA did not give special consideration to recreational vehicles because the CAA applies to heavy-duty motor vehicle generally.

[70] Motor homes are still subject to EPA's Phase 1 CO_2 standards for vocational vehicles.

[71] 49 U.S.C. 32901(a)(7).

[72] NHTSA did not allow early compliance for one RV manufacturer in MY 2014 that is currently complying EPA's GHG standards.

design, manufacturers could also decrease the global warming impact of refrigerant leakage emissions by adopting systems that use alternative, lower global warming potential (GWP) refrigerants, to replace the refrigerant most commonly used today, HFC–134a (R–134a). HFC–134a is a potent greenhouse gas with a GWP 1,430 times greater than that of CO_2.

Under EPA's Significant New Alternatives Policy (SNAP) Program,[73] EPA has found acceptable, subject to use conditions, three alternative refrigerants that have significantly lower GWPs than HFC–134a for use in A/C systems in newly manufactured light-duty vehicles: HFC–152a, CO_2 (R–744), and HFO–1234yf.[74] HFC–152a has a GWP of 124, HFO–1234yf has a GWP of 4, and CO_2 (by definition) has a GWP of 1, as compared to HFC–134a which has a GWP of 1,430.[75] CO_2 is nonflammable, while HFO–1234yf and HFC–152a are flammable. All three are subject to use conditions requiring labeling and the use of unique fittings, and where appropriate, mitigating flammability and toxicity. Currently, the SNAP listing for HFO–1234yf is limited to newly manufactured A/C systems in LD vehicles, whereas HFC–152a and CO_2 have been found acceptable for all motor vehicle air conditioning applications, including heavy-duty vehicles.

None of these alternative refrigerants can simply be ''dropped'' into existing HFC–134a air conditioning systems. In order to account for the unique properties of each refrigerant and address use conditions required under SNAP, changes to the systems will be necessary. Typically these changes will need to occur during a vehicle redesign cycle but could also occur during a refresh. For example, because CO_2, when used as a refrigerant, is physically and thermodynamically very different from HFC–134a and operates at much higher pressures, a transition to this refrigerant would require significant hardware changes. A transition to A/C systems designed for HFO–1234yf, which is more thermodynamically similar to HFC–134a than is CO_2, requires less significant hardware changes that typically include installation of a thermal expansion valve and could potentially require resized condensers and evaporators, as well as changes in other components. In addition, vehicle assembly plants require re-tooling in order to handle new refrigerants safely. Thus a change in A/C refrigerants requires significant engineering, planning, and manufacturing investments.

EPA is not aware of any significant development of A/C systems designed to use alternative refrigerants in heavy-duty vehicles;[76] however, all three lower GWP alternatives are in use or under various stages of development for use in LD vehicles. Of these three refrigerants, most manufacturers of LD vehicles have identified HFO–1234yf as the most likely refrigerant to be used in that application. For that reason, EPA would anticipate that HFO–1234yf could be a primary candidate for refrigerant substitution in the HD market in the future if it is listed as an acceptable substitute under SNAP for HD A/C applications. EPA has begun, but has not yet completed, our evaluation of the use of HFO–1234yf in HD vehicles. After EPA has conducted a full evaluation based on the SNAP program's comparative risk framework, EPA will list this alternative as either a) acceptable subject to use conditions or b) unacceptable if the risk of use in HD A/C systems is determined to be greater than that of the other currently or potentially available alternatives. EPA is also considering and evaluating additional refrigerant substitutes for use in motor vehicle A/C systems under the SNAP program. EPA welcomes comments related to industry development of HD A/C systems using lower-GWP refrigerants.

LD vehicle manufacturers are currently making investments in systems designed for lower-GWP refrigerants, both domestically and on a global basis. In support of the LD GHG rule, EPA projected a full transition of LD vehicles to lower-GWP alternatives in the United States by MY 2021. We expect the investment required to transition to ease over time as alternative refrigerants are adopted across all LD vehicles and trucks. This may occur in part due to increased availability of components and the continuing increases in refrigerant production capacity, as well as knowledge gained through experience. As lower-GWP alternatives become widely used in LD vehicles, some manufacturers may wish to also transition their HD vehicles. Transitioning could be advantageous for a variety of reasons including platform standardization and company environmental stewardship policies.

Although manufacturers of HD vehicles may begin to transition to alternative refrigerants in the future, there is great uncertainty about when significant adoption of alternative refrigerants for HD vehicles might begin, on what timeline adoption might become widespread, and which refrigerants might be involved. Another factor is that the most likely candidate, HFO–1234yf, remains under evaluation and has not yet been listed under SNAP. For these reasons, EPA has not attempted to project any specific hypothetical scenarios of transition for analytical purposes in this proposed rule.

Because future introduction of and transition to lower-GWP alternative refrigerants for HD vehicles may occur, EPA is proposing regulatory provisions that would be in place if and when such alternatives become available and manufacturers of HD vehicles choose to use them. These proposed provisions would also have the effect of easing the burden associated with complying with the lower-leakage requirements when a lower-GWP refrigerant is used instead of HFC–134a. These provisions would recognize that leakage of refrigerants would be relatively less damaging from a climate perspective if one of the lower-GWP alternatives is used. Specifically, EPA is proposing to allow a manufacturer to be ''deemed to comply'' with the leakage standard by using a lower-GWP alternative refrigerant. In order to be ''deemed to comply'' the vehicle manufacturer would need to use a refrigerant other than HFC–134a that is listed as an acceptable substitute refrigerant for heavy-duty A/C systems under SNAP, and defined under the LD GHG regulations at 40 CFR 86.1867–12(e). The refrigerants currently defined at 40 CFR 86.1867–12(e), besides HFC–134a, are HFC–152a, HFO–1234yf, and CO_2. If a manufacturer chooses to use a lower-GWP refrigerant that is listed in the future as acceptable in 40 CFR part 82, subpart G, but that is not identified in 40 CFR 86.1867–12(e), then the manufacturer could contact EPA about how to appropriately determine compliance with the leakage standard.

EPA encourages comment on all aspects of our proposed approach to HD

[73] Section 612(c) of the Clean Air Act requires EPA to review substitutes for class I and class II ozone-depleting substances and to determine whether such substitutes pose lower risk than other available alternatives. EPA is also required to publish lists of substitutes that it determines are acceptable and those it determines are unacceptable. See *http://www.epa.gov/ozone/snap/refrigerants/lists/index.html*, last accessed on March 5, 2015.

[74] Listed at 40 CFR part 82, subpart G.

[75] GWP values cited in this proposal are from the IPCC Fourth Assessment Report (AR4) unless stated otherwise. Where no GWP is listed in AR4, GWP values shall be determined consistent with the calculations and analysis presented in AR4 and referenced materials.

[76] To the extent that some manufacturers produce HD pickups and vans on the same production lines or in the same facilities as LD vehicles, some A/C system technology commonality between the two vehicle classes may be developing.

vehicle refrigerant leakage and the potential future use of alternative refrigerants for HD applications. We specifically request comment on whether there should be additional provisions that could prevent or discourage manufacturers that transition to an alternative refrigerant from discontinuing existing, low-leak A/C system components and instead reverting to higher-leakage components.

Recently, EPA proposed to change the SNAP listing for the refrigerant HFC–134a from acceptable (subject to use conditions) to unacceptable for use in A/C systems in new LD vehicles.[77] EPA expects to take final action on this proposed change in listing status for HFC–134a for use in new, light-duty vehicles in 2015. If the final action changes the status of HFC–134a to unacceptable, it would establish a future compliance date by which HFC–134a could no longer be used in A/C systems in newly manufactured LD vehicles; instead, all A/C systems in new LD vehicles would be required to use HFC–152a, HFO–1234yf, CO_2, or any other alternative listed as acceptable for this use in the future. The current proposed rule does not address the use of HFC–134a in heavy-duty vehicles; however, EPA could consider a change of listing status for HFC–134a use in HD vehicles in the future if EPA determines that other alternatives are currently or potentially available that pose lower overall risk to human health and the environment.

(c) Small Business Issues

The Regulatory Flexibility Act (RFA) generally requires an agency to prepare a regulatory flexibility analysis of any rule subject to notice and comment rulemaking requirements under the Administrative Procedure Act or any other statute unless the agency certifies that the rule will not have a significant economic impact on a substantial number of small entities. See generally 5 U.S.C. Sections 601–612. The RFA analysis is discussed in Section XIV.

Pursuant to Section 609(b) of the RFA, as amended by the Small Business Regulatory Enforcement Fairness Act (SBREFA), EPA also conducted outreach to small entities and convened a Small Business Advocacy Review Panel to obtain advice and recommendations of representatives of the small entities that potentially would be subject to the rule's requirements. Consistent with the RFA/SBREFA requirements, the Panel evaluated the assembled materials and small-entity comments on issues related to elements of the IRFA. A copy of the Panel Report is included in the docket for this proposed rule.

The agencies determined that the proposed Phase 2 regulations could have a significant economic impact on small entities. Specifically, the agencies identified four categories of directly regulated small businesses that could be impacted:

- Trailer Manufacturers
- Alternative Fuel Converters
- Vocational Chassis Manufacturers
- Glider Vehicle[78] Assemblers

To minimize these impacts the agencies are proposing certain regulatory flexibilities—both general and category-specific. In general, we are proposing to delay new requirements for EPA GHG emission standards by one year and simplify certification requirements for small businesses. For the proposed trailers standards, small businesses would be required to comply with EPA's standards before NHTSA's fuel efficiency standards would begin. NHTSA does not believe that providing small businesses trailer manufacturers with an additional year of delay to comply with those fuel efficiency standards would provide beneficial flexibility. The agencies are also proposing the following specific relief:

- Trailers: Proposing simpler requirements for non-box trailers, which are more likely to be manufactured by small businesses; and making third-party testing easier for certification.
- Alternative Fuel Converters: Omitting recertification of a converted vehicle when the engine is converted and certified; reduced N_2O testing; and simplified onboard diagnostics and delaying required compliance with each new standard by one model year.
- Vocational Chassis: Less stringent standards for certain vehicle categories.
- Glider Vehicle Assemblers:[79] Exempt existing small businesses, but limit the small business exemption to a capped level of annual production (production in excess of the capped amount would be allowed, but subject to all otherwise applicable requirements including the Phase 2 standards).

These flexibilities are described in more detail in Section XIV and in the Panel Report. The agencies look forward to comments and to feedback from the small business community before finalizing the rule and associated flexibilities to protect small businesses.

(d) Confidentiality of Test Results and GEM Inputs

In accordance with Federal statutes, EPA does not release information from certification applications (or other compliance reports) that we determine to be confidential business information (CBI) under 40 CFR part 2. Consistent with the CAA, EPA does not consider emission test results to be CBI after introduction into commerce of the certified engine or vehicle. (However, we have generally treated test results as protected before the introduction into commerce date). For Phase 2, we expect to continue this policy and thus would not treat any test results or other GEM inputs as CBI after the introduction into commerce date as identified by the manufacturer. We request comment on this approach.

We consider this issue to be especially relevant for tire rolling resistance measurements. Our understanding is that tire manufacturers typically consider such results as proprietary. However, under EPA's policy, tire rolling resistance measurements are not considered to be CBI and can be released to the public after the introduction into commerce date identified by the manufacturer. We request comment on whether EPA should release such data on a regular basis to make it easier for operators to find proper replacement tires for their vehicles.

With regard to NHTSA's treatment of confidential business information, manufacturers must submit a request for confidentiality with each electronic submission specifying any part of the information or data in a report that it believes should be withheld from public disclosure as trade secret or other confidential business information. A form will be available through the NHTSA Web site to request confidentiality. NHTSA does not consider manufacturers to continue to have a business case for protecting pre-model report data after the vehicles contained within that report have been introduced into commerce.

(e) Delegated Assembly

In EPA's existing regulations (40 CFR 1068.261), we allow engine manufacturers to sell or ship engines that are missing certain emission-related components if those components will be installed by the vehicle manufacturer. EPA has found this provision to work well for engine manufacturers and is proposing a new provision in 40 CFR

[77] See 79 FR 46126, August 6, 2014.

[78] Vehicles produced by installing a used engine into a new chassis are commonly referred to as ''gliders,'' ''glider kits,'' or ''glider vehicles,''

[79] EPA is proposing to amend its rules applicable to engines installed in glider kits, a proposal which would affect emission standards not only for GHGs but for criteria pollutants as well. EPA is also proposing to clarify its requirements for certification and revise its definitions for glider manufacturers. NHTSA is also considering including gliders under its Phase 2 standards.

1037.621 that would provide a similar allowance for *vehicle* manufacturers to sell or ship *vehicles* that are missing certain emission-related components if those components will be installed by a *secondary* vehicle manufacturer. As conditions of this allowance manufacturers would be required to:

- Have a contractual obligation with the secondary manufacturer to complete the assembly properly and provide instructions about how to do so.
- Keep records to demonstrate compliance.
- Apply a temporary label to the incomplete vehicles.
- Take other reasonable steps to ensure the assembly is completed properly.
- Describe in its application for certification how it will use this allowance.

We request comment on this allowance.

(2) Proposed Amendments to Phase 1 Program

The agencies are proposing revisions to test procedures and compliance provisions used for Phase 1. These changes are described in Section XII. As a drafting matter, EPA notes that we are proposing to migrate the GHG standards for Class 2b and 3 pickups and vans from 40 CFR 1037.104 to 40 CFR 86.1819–14. NHTSA is also proposing to amend 49 CFR part 535 to make technical corrections to its Phase 1 program to better align with EPA's compliance approach, standards and CO_2 performance results. In general, these changes are intended to improve the regulatory experience for regulated parties and also reduce agency administrative burden. More specifically, NHTSA proposes to change the rounding of its standards and performance values to have more significant digits. Increasing the number of significant digits for values used for compliance with NHTSA standards reduces differences in credits generated and overall credit balances for the NHTSA and EPA programs. NHTSA is also proposing to remove the petitioning process for off-road vehicles, clarify requirements for the documentation needed for submitting innovative technology requests in accordance with 40 CFR 1037.610 and 49 CFR 535.7, and add further detail to requirements for submitting credit allocation plans as specified in 49 CFR 535.9. Finally, NHTSA is adding the same record requirements that EPA currently requires to facilitate in-use compliance inspections. These changes are intended to improve the regulatory experience for regulated parties and also reduce agency administrative burden.

(3) Other Proposed Amendments to EPA Regulations

EPA is proposing several amendments to regulations not directly related to the HD Phase 1 or Phase 2 programs, as detailed in Section XIII. For these amendments, there would not be corresponding changes in NHTSA regulations (since there are no such regulations relevant to those programs). Some of these relate directly to heavy-duty highway engines, but not to the GHG programs. Others relate to nonroad engines. This latter category reflects the regulatory structure EPA uses for its mobile source regulations, in which regulatory provisions applying broadly to different types of mobile sources are codified in common regulatory parts such as 40 CFR part 1068. This approach creates a broad regulatory structure that regulates highway and nonroad engines, vehicles, and equipment collectively in a common program. Thus, it is appropriate to include some proposed amendments to nonroad regulations in addition to the changes proposed only for highway engines and vehicles.

(a) Standards for Engines Used In Glider Kits

EPA regulations currently allow used pre-2013 engines to be installed into new glider kits without meeting currently applicable standards. As described in Section XIV, EPA is proposing to amend our regulations to allow only engines that have been certified to meet current standards to be installed in new glider kits, with two exceptions. First, engines certified to earlier MY standards that were identical to the current model year standards may be used. Second, the small manufacturer allowance described in Section I.F.(1)(c) for glider vehicles would also apply for the engines used in the exempted glider kits.

(b) Re-Proposal of Nonconformance Penalty Process Changes

Nonconformance penalties (NCPs) are monetary penalties established by regulation that allow a vehicle or engine manufacturer to sell engines that do not meet the emission standards. Manufacturers unable to comply with the applicable standard pay penalties, which are assessed on a per-engine basis.

On September 5, 2012, EPA adopted final NCPs for heavy heavy-duty diesel engines that could be used by manufacturers of heavy-duty diesel engines unable to meet the current oxides of nitrogen (NO_X) emission standard. On December 11, 2013 the U.S. Court of Appeals for the District of Columbia Circuit issued an opinion vacating that Final Rule. It issued its mandate for this decision on April 16, 2014, ending the availability of the NCPs for the current NO_X standard, as well as vacating certain amendments to the NCP regulations due to concerns about inadequate notice. In particular, the amendments revise the text explaining how EPA determines when NCP should be made available. In this action, EPA is re-proposing most of these amendments to provide fuller notice and additional opportunity for public comment. They are discussed in Section XIV.

(c) Updates to Heavy-Duty Engine Manufacturer In-Use Testing Requirements

EPA and manufacturers have gained substantial experience with in-use testing over the last four or five years. This has led to important insights in ways that the test protocol can be adjusted to be more effective. We are accordingly proposing to make changes to the regulations in 40 CFR part 86, subparts N and T.

(d) Extension of Certain 40 CFR Part 1068 Provisions to Highway Vehicles and Engines

As part of the Phase 1 GHG standards, we applied the exemption and importation provisions from 40 CFR part 1068, subparts C and D, to heavy-duty highway engines and vehicles. We also specified that the defect reporting provisions of 40 CFR 1068.501 were optional. In an earlier rulemaking, we applied the selective enforcement auditing under 40 CFR part 1068, subpart E (75 FR 22896, April 30, 2010). We are proposing in this rule to adopt the rest of 40 CFR part 1068 for heavy-duty highway engines and vehicles, with certain exceptions and special provisions.

As described above, we are proposing to apply all the general compliance provisions of 40 CFR part 1068 to heavy-duty engines and vehicles. We propose to also apply the recall provisions and the hearing procedures from 40 CFR part 1068 for highway motorcycles and for all vehicles subject to standards under 40 CFR part 86, subpart S. We also request comment on applying the rest of the provisions from 40 CFR part 1068 to highway motorcycles and to all vehicles subject to standards under 40 CFR part 86, subpart S.

EPA is proposing to update and consolidate the regulations related to formal and informal hearings in 40 CFR part 1068, subpart G. This would allow us to rely on a single set of regulations for all the different categories of vehicles, engines, and equipment that are subject to emission standards. We also made an effort to write these regulations for improved readability.

We are also proposing to make a number of changes to part 1068 to correct errors, to add clarification, and to make adjustments based on lessons learned from implementing these regulatory provisions.

(e) Amendments to Engine and Vehicle Test Procedures in 40 CFR Parts 1065 and 1066

EPA is proposing several changes to our engine testing procedures specified in 40 CFR part 1065. None of these changes would significantly impact the stringency of any standards.

(f) Amendments Related to Marine Diesel Engines in 40 CFR Parts 1042 and 1043

EPA's emission standards and certification requirements for marine diesel engines under the Clean Air Act and the act to Prevent Pollution from Ships are identified in 40 CFR parts 1042 and 1043, respectively. EPA is proposing to amend these regulations with respect to continuous NO_X monitoring and auxiliary engines, as well as making several other minor revisions.

(g) Amendments Related to Locomotives in 40 CFR Part 1033

EPA's emission standards and certification requirements for locomotives under the Clean Air Act are identified in 40 CFR part 1033. EPA is proposing to make several minor revisions to these regulations.

(4) Other Proposed Amendments to NHTSA Regulations

NHTSA is proposing to amend 49 CFR parts 512 and 537 to allow manufacturers to submit required compliance data for the Corporate Average Fuel Economy program electronically, rather than submitting some reports to NHTSA via paper and CDs and some reports to EPA through its VERIFY database system. The agencies are coordinating on an information technology project which will allow manufacturers to submit pre-model, mid-model and final model year reports through a single electronic entry point. The agencies anticipate that this would reduce the reporting burden on manufacturers by up to fifty percent. The amendments to 49 CFR part 537 would allow reporting to an electronic database (*i.e.* EPA's VERIFY system), and the amendments to 49 CFR part 512 would ensure that manufacturer's confidential business information would be protected through that process. This proposal is discussed further in Section XIII.

II. Vehicle Simulation, Engine Standards and Test Procedures

A. Introduction and Summary of Phase 1 and Phase 2 Regulatory Structures

This Section II. A. gives an overview of our vehicle simulation approach in Phase 1 and our proposed approach for Phase 2; our separate engine standards for tractor and vocational chassis in Phase 1 and our proposed separate engine standards in Phase 2; and it describes our engine and vehicle test procedures that are common among the tractor and vocational chassis standards. Section II. B. discusses in more detail how the Phase 2 proposed regulatory structure would approach vehicle simulation, separate engine standards, and test procedures. Section II. C. discusses the proposed vehicle simulation computer program, GEM, in further detail and Section II. D. discusses the proposed separate engine standards and engine test procedure. See Sections III through VI for discussions of the proposed test procedures that are unique for tractors, trailers, vocational chassis, and HD pickup trucks and vans.

In Phase 1 the agencies adopted a regulatory structure that included a vehicle simulation procedure for certifying tractors and the chassis of vocational vehicles. In contrast, the agencies adopted a full vehicle chassis dynamometer test procedure for certifying complete heavy-duty pickups and vans. The Phase 1 vehicle simulation procedure for tractors and vocational chassis requires regulated entities to use GEM to simulate and certify tractors and vocational vehicle chassis. This program is provided free of charge for unlimited use and may be downloaded by anyone from EPA's Web site: *http://www.epa.gov/otaq/climate/gem.htm.* This computer program mathematically combines vehicle component test results with other pre-determined vehicle attributes to determine a vehicle's levels of fuel consumption and CO_2 emissions for certification purposes. For Phase 1, the required inputs to this computer program include, for tractors, vehicle aerodynamics information, tire rolling resistance, and whether or not a vehicle is equipped with certain lightweight high-strength steel or aluminum components, a tamper-proof speed limiter, or tamper-proof idle reduction technologies. The sole input for vocational vehicles, was tire rolling resistance. For Phase 1 the computer program's inputs did not include engine test results or attributes related to a vehicle's powertrain, namely, its transmission, drive axle(s), or tire revolutions per mile. Instead, for Phase 1 the agencies specified a generic engine and powertrain within the computer program, and for Phase 1 these cannot be changed by a program user.[80]

The full vehicle chassis dynamometer test procedure for heavy-duty pickups and vans substantially mirrors EPA's existing light-duty vehicle test procedure. EPA also set separate engine so-called cap standards for methane (CH_4) and nitrous oxide (N_2O) (essentially capping current emission levels). Compliance with the CH_4 and N_2O standards is measured by an engine dynamometer test procedure, which EPA based on our existing heavy-duty engine emissions test procedure with small adaptations. EPA also set hydro-fluorocarbon refrigerant leakage design standards for cabin air conditioning systems in tractors, pickups, and vans, which are evaluated by design rather than a test procedure.

In this action the agencies are proposing a similar regulatory structure for Phase 2, along with a number of revisions that are intended to more accurately evaluate vehicle and engine technologies' impact on real-world fuel efficiency and GHG emissions. Thus, we are proposing to continue the same certification test regime for heavy duty pickups and vans, and for the CH_4 and N_2O) standards, as well as tractor and pickup and van air conditioning leakage standards. EPA is also proposing to control vocational vehicle air conditioning leakage and to use that same certification procedure.

We are proposing to continue the vehicle simulation procedure for certifying tractors and vocational chassis, and we are proposing a new regulatory program to regulate some of the trailers hauled by tractors. The agencies are proposing the use of an equation based on the vehicle simulation procedure for trailer certification. In addition, we are proposing a simplified option for trailer certification that would not require testing to be undertaken by manufacturers to generate inputs for the equation. We are also proposing to continue separate fuel consumption and CO_2 standards for the engines installed

[80] These attributes are recognized in Phase 1 innovative technology provisions at 40 CFR 1037.610.

in tractors and vocational chassis, and we are proposing to continue to require a full vehicle chassis dynamometer test procedure for certifying complete heavy-duty pickups and vans. As described in Section II.B.(2)(b), the agencies see important advantages to maintaining separate engines standards, such as improved compliance assurance and better control during transient engine operation.

The vehicle simulation procedure necessitates some testing of engines and vehicle components to generate the inputs for the simulation tool; that is, to generate the inputs to the model which is used to certify tractors and vocational chassis. For trailers, some testing may be performed in order to generate values that are input into the simulation-based compliance equations. In addition to the testing needed for this purpose for the inputs used in the Phase 1 standards, the agencies are proposing in Phase 2 that manufacturers conduct additional required and optional engine and vehicle component tests, and proposing the additional procedures for conducting these input tests. These include a new required engine test procedure that provides steady-state engine fuel consumption and CO_2 inputs to represent the actual engine in a vehicle. In addition, we are seeking comment on a newly developed engine test procedure that captures transient engine performance for use in the vehicle simulation computer program. As described in detail in the draft RIA Chapter 4, we are proposing to require entering attributes that describe the vehicle's transmission type, and its number of gears and gear ratios. We are proposing an optional powertrain test procedure that would provide inputs to override the agencies' simulated engine and transmission in the vehicle simulation computer program. We are proposing to require entering attributes that describe the vehicle's drive axle(s) type and axle ratio. We are also seeking comment on an optional axle efficiency test procedure that would override the agencies' simulated axle in the vehicle simulation computer program. To improve the measurement of aerodynamic components performance, we are proposing a number of improvements to the aerodynamic coast-down test procedure and data analysis, and we are seeking comment on a newly developed constant speed aerodynamic test procedure. We are proposing that the aerodynamic test procedures for tractors be applicable to trailers when a regulated entity opts to use the GEM-based compliance equation. Additional details about all these test procedures are found in the draft RIA Chapter 3.

We are further proposing to significantly expand the number of technologies that are recognized in the vehicle simulation computer program. These include recognizing lightweight thermoplastic materials, automatic tire inflation systems, advanced cruise control systems, workday idle reduction systems, and axle configurations that decrease the number of drive axles. We are seeking comment on recognizing additional technologies such as high efficiency glass and low global warming potential air conditioning refrigerants as post-process adjustments to the simulation results.

To better reflect real-world operation, we are also proposing to revise the vehicle simulation computer program's urban (55 mph) and rural (65 mph) highway duty cycles to include changes in road grade. We are seeking comment on whether or not these duty cycles should also simulate driver behavior in response to varying traffic patterns. We are proposing a new duty cycle to capture the performance of technologies that reduce the amount of time a vehicle's engine is at idle during a workday when the vehicle is not moving. And to better recognize that vocational vehicle powertrains are configured for particular applications, we are proposing to further subdivide the vocational chassis category into three different vehicle speed categories. This is in addition to the Phase 1 subdivision by three weight categories. The result is nine proposed vocational vehicle subcategories for Phase 2. The agencies are also proposing to subdivide the highest weight class of tractors into two separate categories to recognize the unique configurations and technology applicability to ''heavy-haul'' tractors.

Even though we are proposing to include engine test results as inputs into the vehicle simulation computer model, we are also proposing to continue the Phase 1 separate engine standard regulatory structure by proposing separate engine fuel consumption and CO_2 standards for engines installed in tractors and vocational chassis. For these separate engine standards, we are proposing to continue to use the Phase 1 engine dynamometer test procedure, which was adapted substantially from EPA's existing heavy-duty engine emissions test procedure. However, we are proposing to modify the weighting factors of the tractor engine's 13-point steady-state duty cycle to better reflect real-world engine operation and to reflect the trend toward operating engines at lower engine speeds during tractor cruise speed operation. Further details on the proposed Phase 2 separate engine standards are provided below in Section II. D. In today's action EPA is proposing to continue the separate engine cap standards for methane (CH_4) and nitrous oxide (N_2O) emissions.

(1) Phase 1 Vehicle Simulation Computer Program (GEM)

For Phase 1 EPA developed a vehicle simulation computer program called, ''Greenhouse gas Emissions Model'' or ''GEM.'' GEM was created for Phase 1 for the exclusive purpose of certifying tractors and vocational vehicle chassis. GEM is similar in concept to a number of other commercially available vehicle simulation computer programs. See 76 FR 57116, 57146, and 57156–57157. However, GEM is also unique in a number of ways.

Similar to other vehicle simulation computer programs, GEM combines various vehicle inputs with known physical laws and justified assumptions to predict vehicle performance for a given period of vehicle operation. For Phase 1 GEM's vehicle inputs include vehicle aerodynamics information (for tractors), tire rolling resistance, and whether or not a vehicle is equipped with lightweight materials, a tamper-proof speed limiter, or tamper-proof idle reduction technologies. Other vehicle and engine characteristics were fixed as defaults that cannot be altered by the user. These defaults included tabulated data of engine fuel rate as a function of engine speed and torque (*i.e.* ''engine fuel maps''), transmissions, axle ratios, and vehicle payloads. For tractors, Phase 1 GEM models the vehicle pulling a standard trailer. For vocational vehicles, Phase 1 GEM includes a fixed aerodynamic drag coefficient and vehicle frontal area.

GEM uses the same physical principles as many other existing vehicle simulation models to derive governing equations which describe driveline components, engine, and vehicle. These equations are then integrated in time to calculate transient speed and torque. Some of the justified assumptions in GEM include average energy losses due to friction between moving parts of a vehicle's powertrain; the logical behavior of an average driver shifting from one transmission gear to the next; ad speed limit assumptions such as 55 miles per hour for urban highway driving and 65 miles per hour for rural interstate highway driving. The sequence of the GEM vehicle simulation can be visualized by imagining a human driver initially sitting in a parked running tractor or vocational vehicle. The driver then proceeds to drive the vehicle over a prescribed route that includes three distinct patterns of driving: Stop-and-go city driving, urban highway driving, and rural interstate highway driving. The driver then exits the highway and brings the vehicle to a stop. This concludes the vehicle simulation.

Over each of the three driving patterns or ''duty cycles,'' GEM simulates the driver's behavior of pressing the accelerator, coasting, or applying the brakes. GEM also simulates how the engine operates as the gears in the vehicle's transmission are shifted and how the vehicle's weight, aerodynamics, and tires resist the forward motion of the vehicle. GEM combines the driver behavior over the duty cycles with the various vehicle inputs and other assumptions to determine how much fuel must be consumed to move the vehicle forward at each point during the simulation. For each of the three duty cycles, GEM totals the amount of fuel consumed and then divides that amount by the product of the miles travelled and tons of payload carried. The tons of payload carried are specified by the agencies for each vehicle type and weight class. For each regulatory subcategory of tractor and vocational vehicle (*e.g.,* sleeper cab tractor, day cab tractor, small vocational vehicle, large vocational vehicle, etc.), GEM applies prescribed weighting factors to each of the three duty cycles to represent the fraction of city, urban highway, and rural highway driving that would be typical of each subcategory. After completing all the cycles, GEM outputs a single composite result for the vehicle, expressed as both fuel consumed in gallon per 1,000 ton-miles (for NHTSA standards) and an equivalent amount of CO_2 emitted in grams per ton-mile (for EPA standards). These are the vehicle's GEM results that are used along with other information to demonstrate the vehicle complies with the applicable standards. This other information includes the annual sales volume of the vehicle (family) simulated in GEM, plus information on emissions credits that may be generated or used as part of that vehicle family's certification.

While GEM is similar to other vehicle simulation computer programs, GEM is also unique in a number of ways. First, GEM was designed exclusively for regulated entities to certify tractor and vocational vehicle chassis to the agencies' respective fuel consumption and CO_2 emissions standards. For GEM to be effective for this purpose, the inputs to GEM include only information related to vehicle components and attributes that significantly impact vehicle fuel efficiency and CO_2 emissions. For example, these include vehicle aerodynamics, tire rolling resistance, and whether or not a vehicle is equipped with lightweight materials, a tamper-proof speed limiter, or tamper-proof idle reduction technologies. On the other hand, other attributes such as those related to a vehicle's suspension, frame strength, or interior features are not included, where these might be included in other commercially available vehicle simulation programs for other purposes. Furthermore, the simulated driver behavior and the duty cycles cannot be changed in the GEM executable program. This helps to ensure that all vehicles are simulated and certified in the same way, but this does preclude GEM from being of much use as a research tool for exploring the effects of driver behavior and of different duty cycles.

To allow for public comment, GEM is available free of charge for unlimited use, and the GEM source code is open source. That is, the programming source code of GEM is freely available upon request for anyone to examine, manipulate, and generally use without restriction. In contrast commercially available vehicle simulation programs are generally not free and open source. Additional details of GEM are included in Chapter 4 of the RIA.

As part of Phase 1, the agencies conducted a peer review of GEM version 1.0, which was the version released for the Phase 1 proposal.[81] [82] In response to this peer review and comments from stakeholders, EPA has made changes to GEM. The current version of GEM is v2.0.1, which is the version applicable for the Phase 1 standards.[83]

(2) Phase 1 Engine Standards and Engine Test Procedure

For Phase 1 the agencies set separate engine fuel consumption and CO_2 standards for engines installed in tractors and vocational vehicle chassis. EPA also set separate engine cap standards for methane (CH_4) and nitrous oxide (N_2O) emissions. These Phase 1 engine standards are specified in terms of brake-specific (g/hp-hr) fuel, CO_2, CH_4 and N_2O emissions limits. For these separate engine standards, the agencies adopted an engine dynamometer test procedure, which was built substantially from EPA's existing heavy-duty engine emissions test procedure. Since the test procedure already specified how to measure fuel consumption, CO_2 and CH_4, few changes were needed to employ the test procedure for purposes of the Phase 1 standards. For Phase 1 the test procedure was modified to specify how to measure N_2O.

The duty cycles from EPA's existing heavy-duty emissions test procedure were used in a somewhat unique way for Phase 1. In EPA's non-GHG engine emissions standards, heavy-duty engines must meet brake-specific standards for emissions of total oxides of nitrogen (NO_X), particulate mass (PM), non-methane hydrocarbon (NMHC), and carbon monoxide (CO). These standards must be met by all engines both over a 13-mode steady-state duty cycle called the ''Supplemental Emissions Test'' (SET) and over a composite of a cold-start and a hot-start transient duty cycle called the ''Federal Test Procedure'' (FTP). In contrast, for Phase 1 the agencies require that engines specifically installed in tractors meet fuel efficiency and CO_2 standards over only the SET but not the FTP. This requirement was intended to reflect that tractor engines typically operate near steady-state conditions versus transient conditions. See 76 FR 57159. The agencies adopted the converse for engines installed in vocational vehicles. That is, these engines must meet fuel efficiency and CO_2 standards over only the hot-start FTP but not the SET. This requirement was intended to reflect that vocational vehicle engines typically operate under transient conditions versus steady-state conditions (76 FR 57178). For both tractor and vocational vehicle engines in Phase 1, EPA set CH_4 and N_2O emissions cap standards over the cold-start and hot-start FTP only and not over the SET duty cycle. See Section II. D. for details on how we propose to modify the engine test procedure for Phase 2.

B. Phase 2 Proposed Regulatory Structure

For Phase 2, the agencies are proposing to modify the regulatory structure used for Phase 1. Note that we are not proposing to apply the new Phase 2 regulatory structure for compliance with the Phase 1 standards. The structure used to demonstrate compliance with the Phase 1 standards will remain as finalized in the Phase 1 regulation. The modifications we are proposing are consistent with the agencies' Phase 1 commitments to consider a range of regulatory approaches during the development of

[83] See EPA's Web site at *http://www.epa.gov/otaq/climate/gem.htm* for the Phase 1 GEM revision dated May 2013, made to accommodate a revision to 49 CFR 535.6(b)(3).

future regulatory efforts (76 FR 57133), especially for vehicles not already subject to full vehicle chassis dynamometer testing. For example, we committed to consider a more sophisticated approach to vehicle testing to more completely capture the complex interactions within the total vehicle, including the engine and powertrain performance. We also intended to consider the potential for full vehicle certification of complete tractors and vocational chassis using a chassis dynamometer test procedure. We also considered chassis dynamometer testing of complete tractors and vocational chassis as a complementary approach for validating a more complex vehicle simulation approach. We also committed to consider the potential for a regulatory program for some of the trailers hauled by tractors. After considering these various approaches, the agencies are proposing a structure in which regulated tractor and vocational chassis manufacturers would additionally enter engine and powertrain-related inputs into GEM, which was not allowed in Phase 1.

For trailer manufacturers, which would be subject to first-time standards under the proposal, we are also proposing GEM-based certification. However, we are proposing a simplified structure that would allow certification without the manufacturers actually running GEM. More specifically, the agencies have developed a simple equation that uses the same trailer inputs as GEM to represent the emission impacts of aerodynamic improvements, tire improvements, and weight reduction. As described in Chapter 2.10.6 of the draft RIA, these equations have nearly perfect correlation with GEM so that they can be used instead of GEM without impacting stringency.

We are proposing both required and optional test procedures to provide these additional GEM inputs. We are also proposing to significantly expand the number of technologies recognized in GEM. Further, we are proposing to modify the GEM duty cycles and to further subdivide the vocational vehicle subcategory to better represent real-world vehicle operation. In contrast to these changes, we are proposing to maintain essentially the same chassis dynamometer test procedure for certifying complete heavy-duty pickups and vans.

(1) Other Structures Considered

To follow-up on the commitment to consider other approaches, the agencies spent significant time and resources in evaluating six different options for demonstrating compliance with the proposed Phase 2 standards. These six options include full vehicle chassis dynamometer testing, full vehicle simulation, and vehicle simulation in combination with powertrain testing, engine testing, engine electronic controller and/or transmission electronic controller testing. The agencies evaluated these options in terms of the capital investment required of regulated manufacturers to conduct the testing and/or simulation, the cost per test, the accuracy of the simulation, and the challenges of validating the results. Other considerations included the representativeness to the real world behavior, maintaining existing Phase 1 certification approaches that are known to work well, enhancing the Phase 1 approaches that could use improvements, the alignment of test procedures for determining GHG and non-GHG emissions compliance, and the potential to circumvent the intent of the test procedures.

Chassis dynamometer testing is used extensively in the development and certification of light-duty vehicles. It also is used in Phase 1 for complete Class 2b/3 pickups and vans, as well as for certain incomplete vehicles (at the manufacturer's option). The agencies considered chassis dynamometer testing more broadly as a heavy-duty fuel efficiency and GHG certification option because chassis dynamometer testing has the ability to evaluate a vehicle's performance in a manner that most closely resembles the vehicle's in-use performance. Nearly all of the fuel efficiency technologies can be evaluated on a chassis dynamometer, including the vehicle systems' interactions that depend on the behavior of the engine, transmission, and other vehicle electronic controllers. One challenge associated with application of wide-spread heavy-duty chassis testing is the small number of heavy-duty chassis test sites that are available in North America. As discussed in draft RIA Chapter 3, the agencies were only able to locate 11 heavy-duty chassis test sites. However, we have seen an increased interest in building new sites since issuing the Phase 1 Final Rule. For example, EPA is currently building a heavy-duty chassis dynamometer with the ability to test up to 80,000 pound vehicles at the National Vehicle and Fuel Emissions Laboratory in Ann Arbor, Michigan.

Nevertheless, the agencies continue to be concerned about proposing a chassis test procedure for certifying tractors or vocational chassis due to the initial cost of a new test facility and the large number of heavy duty tractor and vocational chassis variants that could require testing. We have also concluded that for heavy-duty tractors and vocational chassis, there can be increased test-to-test variability under chassis dynamometer test conditions. First, the agencies recognize that such testing requires expensive, specialized equipment that is not widely available. The agencies estimate that it would vary from about $1.3 to $4.0 million per new test site depending on existing facilities.[84] In addition, the large number of heavy-duty vehicle configurations would require significant amounts of testing to cover the sector. For example, for Phase 1 tractor manufacturers typically certified several thousand variants of one single tractor model. Finally, EPA's evaluation of heavy-duty chassis dynamometer testing has shown that the variation of chassis test results is greater than light-duty testing, up to 3 percent worse, based on our sponsored testing at Southwest Research Institute.[85] Although the agencies are not proposing chassis dynamometer certification of tractors and vocational chassis, we believe such an approach could be appropriate in the future for some heavy duty vehicles if more test facilities become available and if the agencies are able to address the large number of vehicle variants that might require testing. We request comment on whether or not a chassis dynamometer test procedure should be required in lieu of the vehicle simulation approach we are proposing. Note, as discussed in Section II. C. (4) (b) that we are also proposing a modest complete tractor heavy-duty chassis dynamometer test program only for monitoring complete tractor fuel efficiency trends over the implementation timeframe of the Phase 1 and proposed Phase 2 standards.

Another option considered for certification involves testing a vehicle's powertrain in a modified engine dynamometer test facility. In this case the engine and transmission are installed in a laboratory test facility and a dynamometer is connected to the output shaft of the transmission. GEM or an equivalent vehicle simulation computer program is then used to control the dynamometer to simulate vehicle speeds and loads. The step-by-step test procedure considered for this option was initially developed as an option for hybrid powertrain testing for Phase 1. A key advantage of the powertrain test approach is that it

[84] 03–19034 TASK 2 Report-Paper 03-Class8_hil_DRAFT, September 30, 2013.

[85] GEM Validation, Technical Research Workshop, San Antonio, December 10–11, 2014.

directly measures the effectiveness of the engine, the transmission, and the integration of the two. Engines and transmissions are particularly challenging to simulate within a computer program like GEM because engines and transmissions installed in vehicles today are actively and interactively controlled by their own sophisticated electronic controls. These controls already contain essentially their own vehicle simulation programs that GEM would then have to otherwise simulate.

We believe that the capital investment impact for powertrain testing on manufacturers could be manageable for those that already have heavy-duty engine dynamometer test cells. We have found that in general medium-duty powertrains can be tested in heavy-duty engine test cells. EPA has successfully completed such a test facility conversion at the National Vehicle and Fuel Emissions Laboratory in Ann Arbor, Michigan. Southwest Research Institute (SwRI) in San Antonio, Texas has completed a similar test cell conversion. Oak Ridge National Laboratory in Oak Ridge, Tennessee recently completed construction of a new and specialized heavy heavy-duty powertrain dynamometer facility. EPA also contracted SwRI to evaluate North America's current capabilities for powertrain testing in the heavy-duty sector and the cost of installing a new powertrain cell that would meet agency requirements.[86] Results indicated that one supplier currently has this capability. We estimate that the upgrade costs to an existing engine test facility are on the order of $1.2 million, and a new test facility in an existing building are on the order of $1.9 million. We also estimate that current powertrain test cells that could be upgraded to measure CO_2 emissions would cost approximately $600,000. For manufacturers or suppliers wishing to contract out such testing, SwRI estimated that a cost of $150,000 would provide about one month of powertrain testing services. Once a powertrain test cell is fully operational, we estimate that for a nominal powertrain family (*i.e.* one engine family tested with one transmission family), the cost for powertrain installation, testing, and data analysis would be $68,972.

Since the Phase 1 Final Rule, the agencies and other stakeholders have completed significant new work toward refining the powertrain test procedure itself. The proposed regulations provide details of the refined powertrain test procedure. See 40 CFR 1037.550.

Furthermore, the agencies have worked with key transmission suppliers to develop an approach to define transmission families. Coupled with the agencies existing definitions of engine families (40 CFR 1036.230 and 1037.230), we are proposing an approach to define a powertrain family in 40 CFR 1037.231. We request comment on what key attributes should be considered when defining a transmission family.

We believe that a combination of a robust powertrain family definition, a refined powertrain test procedure and a refined GEM could become an optimal certification path that leverages the accuracy of powertrain testing along with the versatility of GEM, which alleviates the need to test a large number of vehicle or powertrain variants. To balance the potential advantages of this approach with the fact that it has never been used for vehicle certification in the past, we are proposing to allow this approach as an optional certification path, as described in Section II.B.(2)(b). To be clear, we are not proposing to require powertrain testing at this time, but because this testing would recognize additional technologies that are not recognized directly in GEM (even as proposed to be amended), we are factoring its use into our stringency considerations for vocational chassis. We request comment on whether the agencies should consider requiring powertrain testing more broadly.

Another regulatory structure option considered was engine-only testing over the GEM duty cycles over a range of simulated vehicle configurations. This approach would use GEM to generate engine duty cycles by simulating a range of transmissions and other vehicle variations. These engine duty cycles then would be programmed into a separate controller of a dynamometer connected to an engine's output shaft. Unlike the chassis dynamometer or powertrain dynamometer approaches, which could have significant test facility construction or modification costs, this approach has little capital investment impact on manufacturers because the majority already have engine test facilities to both develop engines and to certify engines to meet both the non-GHG standards and the Phase 1 fuel efficiency and GHG standards. The agencies also have been investigating this approach as an alternative way to generate data that could be used to represent an engine in GEM. Because this approach captures engine performance under transient conditions, this approach could be an improvement over our proposed Phase 2 approach of representing an engine in GEM with only steady-state operating data. Details of this alternative are described in draft RIA. Because this approach is new and has never been used for vehicle development or certification, we are not proposing requiring its use as part of the Phase 2 certification process. However, we encourage others to investigate this new approach in detail, and we request comment on whether or not the agencies should replace our proposed steady-state operation representation of the engine in GEM with this alternative approach.

Additional certification options considered included simulating the engine, transmission, and vehicle using a computer program while having the actual transmission electronic controller connected to the computer running the vehicle simulation program. The output of the simulation would be an engine cycle that would be used to test the engine in an engine test facility. Just as in the engine-only test procedure, this procedure would not require significant capital investment in new test facilities. An additional benefit of this approach would be that the actual transmission controller would be determining the transmission gear shift points during the test, without a transmission manufacturer having to reveal their proprietary transmission control logic. This approach comes with some technical challenges, however. The model would have to become more complex and tailored to each transmission and controller to make sure that the controller would operate properly when it is connected to a computer instead of a transmission. Some examples of the transmission specific requirements would be simulating all the Controller Area Network (CAN) communication to and from the transmission controller and the specific sensor responses both through simulation and hardware. The vehicle manufacturer would have to be responsible for connecting the transmission controller to the computer, which would require a detailed verification process to ensure it is operating properly. Determining full compliance with this test procedure would be a significant challenge for the regulatory agencies because the agencies would have to be able to replicate each of the manufacturer's unique interfaces between the transmission controller and computer running GEM.

Finally, the agencies considered full vehicle simulation plus separate engine standards, which is the proposed

[86] 03–19034 TASK 2 Report-Paper 03-Class8_hil_DRAFT, September 30, 2013.

approach for Phase 2. These are discussed in more detail in the following sections.

(2) Proposed Regulatory Structure

Under the proposed structure, tractor and vocational chassis manufacturers would be required to provide engine, transmission, drive axle(s) and tire radius inputs into GEM. For Phase 1, GEM used default values for all of these, which limited the types of technologies that could be recognized by GEM to show compliance with the standards. We are proposing to significantly expand GEM to account for a wider range of technological improvements that would otherwise need to be recognized through some off-cycle crediting approach. These include improvements to the driver controller (*i.e.,* the simulation of the driver), engines, transmissions, and axles. Additional technologies that would now be recognized in GEM also include lightweight thermoplastic materials, automatic tire inflation systems, advanced cruise control systems, engine stop-start idle reduction systems, and axle configurations that decrease the number of drive axles. The agencies are also proposing to maintain separate engine standards. As described below, we see advantages to having both engine-based and vehicle-based standards. Moreover, the advantages described here for full vehicle simulation do not necessarily correspond to disadvantages for engine testing or vice versa.

(a) Advantages of Full Vehicle Simulation

The agencies' primary purpose in developing fuel efficiency and GHG emissions standards is to increase the use of vehicle technologies that improve fuel efficiency and decrease GHG emissions. Under the Phase 1 tractor and vocational chassis standards, there is no regulatory incentive for manufacturers to adopt new engine, transmission or axle technologies because GEM was not configured to recognize these technologies uniquely. By recognizing such technologies in GEM under Phase 2, the agencies would be creating a regulatory incentive to improve engine, transmission, and axle technologies to improve fuel efficiency and decrease GHG emissions. In its 2014 report, NAS also recognized the benefits of full vehicle simulation and recommended that Phase 2 incorporate such an approach.

We anticipate that the proposed Phase 2 approach would create three new specific regulatory incentives. First, vehicle manufacturers would have an incentive to use the most efficient engines. Since GEM would no longer use the agency default engine in simulation manufacturers would have their own more efficient engines recognized in GEM. Under Phase 1, engine manufacturers have a regulatory incentive to design efficient engines, but vehicle manufacturers do not have a similar regulatory incentive to use efficient engines in their vehicles. Second, the proposed approach would create incentives for both engine and vehicle manufacturers to design engines and vehicles to work together to ensure that engines actually operate as much as possible near their most efficient points. This is because Phase 2 GEM would allow the vehicle manufactures to use specific transmission, axle, and tire characteristics as inputs, thus having the ability to directly recognize many powertrain integration benefits, such as downspeeding, and different transmission architectures and technologies, such as automated manual transmissions, automatic transmissions,, and different numbers of transmission gears, transmission gear ratios, axle ratios and tire revolutions per mile. No matter how well designed, all engines have speed and load operation points with differing fuel efficiency and GHG emissions. The speed and load point with the best fuel efficiency (*i.e.,* peak thermal efficiency) is commonly known as the engine's ''sweet spot''. The more frequently an engine operates near its sweet spot, the better the vehicle's fuel efficiency will be. In Phase 1, a vehicle manufacturer receives no regulatory credit for designing its vehicle to operate closer to the sweet spot because Phase 1 GEM does not model the actual engine, transmission, axle, or tire revolutions per mile. Third, the proposed approach would recognize improvements to the overall efficiency of the drivetrain including the axle. The proposed version of GEM would recognize the benefits of different axle technologies including axle lubricants, and reducing axle losses such as by enabling three-axle vehicles to deliver power to only one rear axle through the proposed post-simulation adjustment approach (see Chapter 4.5 of the Draft RIA).

In addition to providing regulatory incentives to use more fuel efficient technologies, expanding GEM to recognize engine and other powertrain component improvements would also provide important flexibility to vehicle manufacturers. The flexibility to effectively trade engine and other component improvements against other vehicle improvements would allow vehicle manufacturers to better optimize their vehicles to achieve the lowest cost for specific customers. Vehicle manufacturers could use this flexibility to reduce overall compliance costs and/or address special applications where certain vehicle technologies are not practical. The agencies considered in Phase 1 allowing the exchange of emission certification credits generated relative to the separate brake-specific (g/hp-hr) engine standards and credits generated relative to the vehicle standards (g/ton-mile). However, we did not allow this in Phase 1 due in part to concerns about the equivalency of credits generated relative to different standards, with different units of measure and different test procedures. The proposed approach for Phase 2 would eliminate these concerns because engine and other vehicle component improvements would be evaluated relative to the same vehicle standard in GEM. This also means that under the proposed Phase 2 approach there is no need to consider allowing emissions credit trading between engine-generated and vehicle-generated credits because vehicle manufacturers are directly credited by the combination of engine and vehicle technologies they choose to install in each vehicle. Therefore, this approach eliminates one of the concerns about continuing separate engine standards, which was that a separate engine standard and a full vehicle standard were somehow mutually exclusive. That is not the case. In fact, in the next section we describe how we propose to continue the separate engine standard along with recognizing engine performance at the vehicle level. The agencies acknowledge that maintaining a separate engine standard would limit flexibility in cases where a vehicle manufacturer wanted to use less efficient engines and make up for them using more efficient vehicle technologies. However, as described below, we see important advantages to maintaining a separate engine standard, and we believe they more than justify the reduced flexibility.

There could be disadvantages to the proposed approach, however. As is discussed in Section II.B.(2)(b), some of the disadvantages can be addressed by maintaining separate engine standards, which we are proposing to do. We request comment on other disadvantages such as those discussed below.

One disadvantage of the proposed approach is that it would increase complexity for the vehicle standards. For example, vehicle manufacturers would be required to conduct additional engine tests and track additional GEM inputs for compliance purposes. However, we believe that most of the burden associated with this increased complexity would be an infrequent burden of engine testing and updating information systems to track these inputs.

Because GEM measures performance over specific duty cycles intended to represent average operation of vehicles in-use, the proposed approach might also create an incentive to optimize powertrains and drivetrains for the best GEM performance rather than the best in-use performance for a particular application. This is always a concern when selecting duty cycles for certification. There will always be instances, however infrequent, where specific vehicle applications will operate differently than the duty cycles used for certification. The question is would these differences force manufacturers to optimize vehicles to the certification duty cycles in a way that decreases fuel efficiency and increases GHG emissions in-use? We believe that the certification duty cycles would not prevent manufacturers from properly optimizing vehicles for customer fuel efficiency. First, the impact of the certification duty cycles would be relatively small because they affect only a small fraction of all vehicle technologies. Second, the emission averaging and fleet average provisions mean that the proposed regulations would not require all vehicles to meet the standards. Vehicles exceeding a standard over the duty cycles because they are optimized for different in-use operation can be offset by other vehicles that perform better over the certification duty cycles. Third, vehicle manufacturers would also have the ability to lower such a vehicle's measured GHG emissions by adding technology that would improve fuel efficiency both over the certification duty cycles and in-use. The proposed standards are not intended to be at a stringency where manufacturers would be expected to apply all technologies to all vehicles. Thus, there should be technologies available to add to vehicle configurations that initially fail to meet the Phase 2 proposed standards. Fourth, we are proposing further sub-categorization of the vocational vehicle segment, tripling the number of subcategories within this segment from 3 to 9. These 9 subcategories would divide each of the 3 Phase 1 weight categories into 3 additional vehicle speed categories. Each of the 3 speed categories would have unique duty cycle weighting factors to recognize that different vocational chassis are configured for different vehicle speed applications. Furthermore, we are proposing 9 unique standards for each of the subcategories. This further subdivision better recognizes technologies' performance under the conditions for which the vocational chassis was configured to operate. This further decreases the potential of the certification duty cycles to encourage manufacturers to configure vocational chassis differently than the optimum configuration for specific customers' applications. Finally, as required by Section 202 (a) (1) and 202 (d) of the CAA, EPA is proposing specific GHG standards which would have to be met in-use.

One disadvantage of our proposed full vehicle simulation approach is the potential requirement for engine manufacturers to disclose otherwise proprietary information to vehicle manufacturers who install their engines. Under the proposed approach, vehicle manufacturers would need to know details about engine performance long before production, both for compliance planning purposes, as well as for the actual submission of applications for certification. Moreover, vehicle manufacturers would need to know details about the engine's performance that are generally not publicly available—specifically the detailed fuel consumption of an engine over many steady-state operating points. We request comment on whether or not such information could be used to ''reverse engineer'' intellectual property related to the proprietary design of engines, and what steps the agencies could take to address this.

The agencies also generally request comment on the advantages and disadvantages of the proposed structure that would require vehicle manufacturers to provide additional inputs into GEM to represent the engine, transmission, drive axle(s), and loaded tire radius.

(b) Advantages of Separate Engine Standards

For engines installed in tractors and vocational vehicle chassis, we are proposing to maintain separate engine standards for fuel consumption and GHG emissions in Phase 2 for both SI and CI engines. Moreover, we are proposing new more stringent engine standards for CI engines. While the vehicle standards alone are intended to provide sufficient incentive for improvements in engine efficiency, we continue to see important advantages to maintaining separate engine standards for both SI and CI engines. The agencies believe the advantages described below are critical to fully achieve the goals of the NHTSA and EPA standards.

First, EPA has a robust compliance program based on engine testing. For the Phase 1 standards, we applied the existing criteria pollutant compliance program to ensure that engine efficiency in actual use reflected the improvements manufacturers claimed during certification. With engine-based standards, it is straightforward to hold engine manufacturers accountable by testing in-use engines. If the engines exceed the standards, they can be required to correct the problem or perform other remedial actions. Without separate engine standards in Phase 2, addressing in-use compliance becomes more subjective. Having clearly defined compliance responsibilities is important to both the agencies and to the market.

Second, engine standards for CO_2 and fuel efficiency force engine manufacturers to optimize engines for both fuel efficiency and control of non-CO_2 emissions at the same engine operating points. This is of special concern for NO_X emissions, given the strong counter-dependency between engine-out NO_X emissions and fuel consumption. By requiring engine manufacturers to comply with both NO_X and CO_2 standards using the same test procedures, the agencies ensure that manufacturers include technologies that can be optimized for both rather than alternate calibrations that would trade NO_X emissions against fuel consumption depending how the engine or vehicle is tested. In the past, when there was no CO_2 engine standard and no steady-state NO_X standard, some manufacturers chose this dual calibration approach instead of investing in technology that would allow them to simultaneously reduce both CO_2 and NO_X.

Third, engine fuel consumption can vary significantly between transient operation and steady-state operation, and we are proposing only steady-state engine operating data as the required engine input into GEM for both tractor and vocational chassis certification. Because vocational vehicles can spend significant operation under transient engine operation, the separate engine standard for engines installed in vocational vehicles is a transient test. Therefore, the separate engine standard for vocational engines provides the only measure of engine fuel consumption and CO_2 emissions under transient conditions. Without a transient engine test we would not be able to ensure control of fuel consumption and CO_2 emissions under transient engine conditions.

It is worth noting that these first three advantages are also beneficial for the marketplace. In these respects, the separate engine standards allow each manufacturer to be confident that its competitors are playing by the same rules. The agencies believe that the absence of a separate engine standard would leave open the possibility that a manufacturer might choose to cut corners with respect to in-use compliance margins, the NO_X-CO_2 tradeoff, or transient controls. Concerns that competitors might take advantage of this can put a manufacturer in a difficult situation. On the other hand knowing that the agencies are ensuring all manufacturers are complying fully can eliminate these concerns.

Finally, the existence of meaningful separate engine standards allows the agencies to exempt certain vehicles from some or all of the vehicle standards and requirements without forgoing the engine improvements. A good example of this is the off-road vehicle exemption in 40 CFR 1037.631 and 49 CFR 535.3, which exempts vehicles ''intended to be used extensively in off-road environments'' from the vehicle requirements. The engines used in such vehicles must still meet the engine standards of 40 CFR 1036.108 and 49 CFR 535.5(d). The agencies see no reason why efficient engines cannot be used in such vehicles. However, without separate engine standards, there would be no way to require them to be efficient.

In the past there has been some confusion about the Phase 1 separate engine standards somehow preventing the recognition of engine-vehicle optimization that vehicle manufacturers perform to minimize a vehicle's overall fuel consumption. It was not the existence of separate engine standards that prevented recognition of this optimization. Rather it was that the agencies did not allow manufacturers to enter inputs into GEM that characterized unique engine performance. For Phase 2 we are proposing to require that manufacturers input such data because we intend for GEM to recognize this engine-vehicle optimization. The continuation of separate engine standards in Phase 2 does not undermine in any way the recognition of this optimization in GEM.

The agencies request comment on the advantages and disadvantages of the proposal to maintain separate engine standards and to increase the stringency of the CI engine standards. We would also welcome suggested alternative approaches that would achieve the same goals. It is important to emphasize that the agencies see the advantages of separate engine standards as fundamental to the success of the program and do not expect to adopt alternative approaches that fall short of these goals.

Note that commenters opposing separate engine standards should also be careful distinguish between concerns related to the stringency of the proposed engine standards, from concerns inherent to any separate engine standards whatsoever. When meeting with manufacturers prior to this proposal, the agencies heard many concerns about the potential problems with separate engines standards that were actually concerns about separate engine standards that are too stringent. However, we see these as two different issues. The agencies do recognize that setting engine standards at a high stringency could increase the cost to comply with the vehicle standard, if lower-cost vehicle technologies are available. Additionally, the agencies recognize that setting engine standards at a high stringency may promote the use of large-displacement engines, which have inherent heat transfer and efficiency advantages over smaller displacement engines over the engine test cycles, though a smaller engine may be more efficient for a given vehicle application. Thus we encourage commenters supporting the separate engine standards to address the possibility of unintended consequences such as these.

C. Proposed Vehicle Simulation Model—Phase 2 GEM[87]

For tractors and vocational vehicle chassis, the agencies propose that manufacturers would be required to meet vehicle-based standards, and certification to these standards would be facilitated by the required use of the vehicle simulation computer program called, ''Greenhouse gas Emissions Model'' or ''GEM.'' GEM was created for Phase 1 for the exclusive purpose of certifying tractors and vocational chassis. The agencies are proposing to modify GEM and to require vehicle manufacturers to provide additional inputs into GEM to represent the engine, transmission, drive axle(s), and loaded tire radius. For Phase 1, GEM used agency default values for all of these parameters. Under the proposed approach for Phase 2, vehicle manufacturers would be able to use these technologies, plus additional technologies to demonstrate compliance with the applicable standards. The additional technologies include lightweight thermoplastic materials, automatic tire inflation systems, advanced cruise control systems, engine stop-start idle reduction systems, and axle configurations that decrease the number of drive axles to comply with the standards.

(1) Description of the Proposed Modifications to GEM

As explained above, GEM is a computer program that was originally developed by EPA specifically for manufacturers to use to certify to the Phase 1 tractor and vocational chassis standards. GEM mathematically combines the results of vehicle component test procedures with other vehicle attributes to determine a vehicle's certified levels of fuel consumption and CO_2 emissions. For Phase 1 the required inputs to GEM include vehicle aerodynamics information, tire rolling resistance, and whether or not a vehicle is equipped with certain lightweight high-strength steel or aluminum components, a tamper-proof speed limiter, or tamper-proof idle reduction technologies for tractors. The vocational vehicle inputs to GEM for Phase 1 only included tire rolling resistance. For Phase 1 the GEM's inputs did not include engine test results or attributes related to a vehicle's powertrain; namely, its transmission, drive axle(s), or loaded tire radius. Instead, for Phase 1 the agencies specified a generic engine and powertrain within GEM, and for Phase 1 these cannot be changed in GEM.

For this proposal GEM has been modified and validated against a set of experimental data that represents over 130 unique vehicle variants. EPA believes this new version of GEM is an accurate and cost-effective alternative to measuring fuel consumption and CO_2 over a chassis dynamometer test procedure. Some of the key proposed modifications would necessitate required and optional vehicle component test procedures to generate additional GEM inputs. The results of which would provide additional inputs into GEM. These include a new required engine test procedure to provide steady-state engine fuel consumption and CO_2 inputs into GEM. We are also seeking comment on a newly developed engine test procedure that also captures transient engine performance for use in GEM. We are proposing to require inputs that describe the vehicle's transmission type, and its number of gears and gear ratios. We are proposing an optional powertrain test procedure that would provide inputs to override

[87] The specific version of GEM used to develop the proposed standards, and which we propose to use for compliance purposes is also known as GEM 3.0.

the agencies' simulated engine and transmission in GEM. We are proposing to require inputs that describe the vehicle's drive axle(s) type (*e.g.,* 6x4 or 6x2) and axle ratio. We are also seeking comment on an optional axle efficiency test procedure to override the agencies' simulated axle in GEM. We are proposing to significantly expand the number of technologies that are recognized in GEM. These include recognizing lightweight thermoplastic materials, automatic tire inflation systems, advanced cruise control systems, engine stop-start idle reduction systems, and axle configurations that decrease the number of drive axles. We are seeking comment on recognizing (outside of the GEM simulation) additional technologies such as high efficiency glass and low global warming potential air conditioning refrigerants. To better reflect real-world operation, we are also proposing to revise the vehicle simulation computer program's urban and rural highway duty cycles to include changes in road grade. We are seeking comment on whether or not these duty cycles should also simulate driver behavior in response to varying traffic patterns. We are proposing a new duty cycle to capture the performance of technologies that reduce the amount of time a vehicle's engine is at idle during a workday when the vehicle is not moving. And to better recognize that vocational vehicle powertrains are configured for particular applications, we are proposing to further subdivide the vocational chassis category into three different vehicle speed categories, where GEM weights the individual duty cycles' results of each of the speed categories differently. Section 4.2 of the RIA details all these modifications. This section briefly describes some of the key proposed modifications to GEM.

(a) Simulating Engines for Vehicle Certification

Before describing the proposed approach for Phase 2, this section first reviews how engines are simulated for vehicle certification in Phase 1. GEM for Phase 1 simulates the same generic engine for any vehicle in a given regulatory subcategory with a data table of steady-state engine fuel consumption mass rates (g/s) versus a series of steady-state engine output shaft speeds (revolutions per minute, rpm) and loads (torque, N-m). This data table is also sometimes called a ''fuel map'' or an ''engine map'', although the term ''engine map'' can mean other kinds of data in different contexts. The engine speeds in this map range from idle to maximum governed speed and the loads range from engine motoring (negative load) to the maximum load of an engine. When GEM runs over a vehicle duty cycle, this data table is linearly interpolated to find a corresponding fuel consumption mass rate at each engine speed and load that is demanded by the simulated vehicle operating over the duty cycle. The fuel consumption mass rate of the engine is then integrated over each duty cycle in GEM to arrive at the total mass of fuel consumed for the specific vehicle and duty cycle. Under Phase 1, manufacturers were not allowed to input their own engine fuel maps to represent their specific engines in the vehicle being simulated in GEM. Because GEM was programmed with fixed engine fuel maps for Phase 1 that all manufacturers had to use, interpolation of the tables themselves over each of the three different GEM duty cycles did not have to closely represent how an actual engine might operate over these three different duty cycles.

In contrast, for Phase 2 we are proposing a new and required steady-state engine dynamometer test procedure for manufacturers to use to generate their own engine fuel maps to represent each of their engine families in GEM. The proposed Phase 2 approach is consistent with the 2014 NAS Phase 2 First Report recommendation.[88] To validate this approach we compared the results from 28 individual engine dynamometer tests. Three different engines were used to generate this data, and these engines were produced by two different engine manufacturers. One engine was tested at three different power ratings (13 liters at 410, 450 & 475 hp) and one engine was tested at two ratings (6.7 liters at 240 and 300 hp), and other engine with one rating (15 liters 455 hp) service classes. For each engine and rating our proposed steady-state engine dynamometer test procedure was conducted to generate an engine fuel map to represent that particular engine in GEM. Next, with GEM we simulated various vehicles in which the engine could be installed. For each of the GEM duty cycles we are proposing, namely the urban local (ARB Transient), urban highway with road grade (55 mph), and rural highway with road grade (65 mph) duty cycles, we determined the GEM result for each vehicle configuration, and we saved the engine output shaft speed and torque information that GEM created to interpolate the steady-state engine map for each vehicle configuration. We then had this same engine output shaft speed and torque information programmed into an engine dynamometer controller, and we had each engine perform the same duty cycles that GEM demanded of the simulated version of the engine. We then compared the GEM results based on GEM's linear interpolation of the engine maps to the measured engine dynamometer results. We concluded that for the 55 mph and 65 mph duty cycles, GEM's interpolation of the steady-state data tables was sufficiently accurate versus the measured results. This is an outcome one would reasonably expect because even with changes in road grade, the 55 mph and 65 mph duty cycles do not demand rapid changes in engine speed or load. The 55 mph and 65 mph duty cycles are nearly steady-state, as far as engine operation is concerned, just like the engine maps themselves. However, for the ARB Transient cycle, we observed a consistent bias, where GEM consistently under-predicted fuel consumption and CO_2 emissions. This low bias over the 28 engine tests ranged from 4.2 percent low to 7.8 percent low. The mean was 5.9 percent low and the 90th percentile value was 7.1 percent low. These observations are consistent with the fact that engines generally operate less efficiently under transient conditions than under steady-state conditions.

A number of reasons explain this consistent trend. For example, under rapidly changing engine conditions, it is generally more challenging to program an engine electronic controller to respond with optimum fuel injection rate and timing, exhaust gas recirculation valve position, variable nozzle turbo-charger vane position and other set points than it is to do so under steady-state conditions. Transient heat and mass transfer within the intake, exhaust, and combustion chambers also tend to increase turbulence and enhance energy loss to engine coolant during transient operation. Furthermore, because exhaust emissions control is more challenging under transient engine operation, engineering tradeoffs sometimes need to be made between fuel efficiency and transient emissions control. Special calibrations are typically also required to control smoke and manage exhaust temperatures during transient operation for a transient cycle. We are confident that this low bias in GEM would continue to exist well into the future if we were to test additional engines. However, with the range of the results that we have generated so far we are somewhat less confident in proposing a single numerical value to correct for this effect

[88] National Academy of Science. ''Reducing the Fuel Consumption and GHG Emissions of Medium- and Heavy-Duty Vehicles, Phase Two, First Report.'' 2014. Recommendation 3.8.

over the ARB Transient duty cycle. Based on the data we have collected so far, we are conservatively proposing to apply a 5.0 percent correction factor to GEM's ARB Transient results. Note that adjustment would be applied internal to GEM, and no manufacturer input or action would be needed. This means that for GEM fuel consumption and CO_2 emissions results that were generated using the steady-state engine map representation of an engine in GEM, a 1.05 multiplier would be applied to only the ARB Transient result. If a manufacturer chooses to perform the optional powertrain test procedure we are proposing, then this 1.05 multiplier to the ARB Transient would not apply (since we know of no bias in that optional powertrain test). For the same reason, if we were to replace the proposed steady-state engine map in GEM with the alternative approach detailed in draft RIA, then this 1.05 multiplier would not apply. We request comment on whether or not this single value multiplier is an appropriate way to correct between steady-state and transient engine fuel consumption and CO_2 emissions, specifically over the ARB Transient duty cycle. We also request comment on the magnitude of the multiplier itself. For example, for the proposal we have chosen a 1.05 multiplier correction value because it is conservative but still near the mean bias we observed. However, for the tests we have conducted on current technology engines, a 1.05 multiplier would mean that about one half of these engines would be penalized by powertrain testing (or if we utilized the alternative engine approach) because the actual measured transient impact would be slightly higher than 5 percent. While these tests were performed on current technology powertrains rather than the kind of optimized powertrains we project for Phase 2, these results raise still some concerns for us. Because we intend to incentivize powertrain testing and not penalize it, and because we also encourage constructive comments on the alternative approach, we also request comment on increasing the magnitude of this ARB Transient multiplier toward the higher end of the biases we observed. For example, we request comment on increasing the proposed multiplier from 1.05 to 1.07, which is close to the 90th percentile of the results we have collected so far. Using this higher multiplier would imply that only about 10 percent of engines powertrain tested or tested under the alternative approach would show worse fuel consumption over the ARB Transient than its respective representation in a steady-state data table in GEM. This would mean that the remaining 90 percent of engines powertrain tested would receive additional credit in GEM. Using 1.07 would essentially guarantee that any powertrain that was significantly more efficient than current powertrains would receive meaningful credit for the improvement. However, this value would also provide credits for many current powertrain designs.

We also request comment as to whether or not there might be certain vehicle sub-categories or certain small volume vocational chassis, where using the Phase 1 approach of using a generic engine table might be more appropriate. We also request comment as to whether or not the agencies should provide default generic engine maps in GEM for Phase 2 and allow manufacturers to optionally override these generic maps with their own maps, which would be generated according to our proposed engine dynamometer steady-state test procedure.

(b) Simulating Human Driver Behavior and Transmissions for Vehicle Certification

GEM for Phase 1 simulates the same generic human driver behavior and manual transmission for all vehicles. The simulated driver responds to changes in the target vehicle speed of the duty cycles by changing the simulated positions of the vehicle's accelerator pedal, brake pedal, clutch pedal, and gear shift lever. For simplicity in Phase 1 the GEM driver shifted at ideal points for maximum fuel efficiency and the manual transmission was simulated as an ideal transmission that did not have any delay time (*i.e.,* torque interruption) between gear shifts and did not have any energy losses associated with clutch slip during gear shifts.

In GEM for Phase 2 we are proposing to allow manufacturers to select one of three types of transmissions to represent the transmission in the vehicle they are certifying: manual transmission, automated manual transmission, and automatic transmission. We are currently in the process of developing a dual-clutch transmission type in GEM, but we are not proposing to allow its use in Phase 2 at this time. Because production of heavy-duty dual clutch transmissions has only begun in the past few months, we do not yet have any experimental data to validate our GEM simulation of this transmission type. Therefore, we are requesting comment on whether or not there is additional data available for such validation. Should such data be provided in comments, we may finalize GEM for Phase 2 with a fourth transmission types for dual clutch transmissions. We are also considering an option to address dual clutch transmissions through a post-simulation adjustment as discussed in Chapter 4 of the draft RIA.

In the proposed modifications to GEM, the driver behavior and the three different transmission types are simulated in the same basic manner as in Phase 1, but each transmission type features a unique combination of driver behavior and transmission responses that match both the driver behavior and the transmission responses we measured during vehicle testing of these three transmission types. In general the transmission gear shifting strategy for all of the transmissions is designed to shift the transmission so that it is always in the most efficient gear for the current vehicle demand, while staying within certain limits to prevent unrealistically high frequency shifting. Some examples of these limits are torque reserve limits (which vary as function of engine speed), minimum time-in-gear and minimum fuel efficiency benefit to shift to the next gear. Some of the differences between the three transmission types include a driver ''double-clutching'' during gear shifts of the manual transmission only, and ''power shifts'' and torque converter torque multiplication, slip, and lock-up in automatic transmissions only. Refer to Chapter 4 of the draft RIA for a more detailed description of these different simulated driver behaviors and transmission types.

We considered an alternative approach where transmission manufacturers would provide vehicle manufacturers with detailed information about their automated transmissions' proprietary shift strategies for representation in GEM. NAS also recommended this approach.[89] The advantages of this approach include a more realistic representation of a transmission in GEM and potentially the recognition of additional fuel efficiency improving strategies to achieve additional fuel consumption and CO_2 emissions reductions. However, there are a number of technical and policy disadvantages of this approach. One disadvantage is that it would require the

[89] Transportation Research Board 2014. ''Reducing the Fuel Consumption and Greenhouse Gas Emissions of Medium- and Heavy-Duty Vehicles, Phase Two.'' (''Phase 2 First Report'') Washington, DC, The National Academies Press. Cooperative Agreement DTNH22–12–00389. Available electronically from the National Academy Press Web site at *http://www.nap.edu/catalog.php?record_id=12845* (last accessed December 2, 2014). Recommendation 3.7.

disclosure of proprietary information between competing companies because some vehicle manufacturers produce their own transmissions and also use other suppliers' transmissions. There are technical challenges too. For example, some transmission manufacturers have upwards of 40 different shift strategies programmed into their transmission controllers. Depending on in-use driving conditions, some of which are not simulated in GEM (*e.g.,* changing payloads, changing tire traction) a transmission controller can change its shift strategy. Representing dynamic switching between multiple proprietary shift strategies would be extremely complex to simulate in GEM. Furthermore, if the agencies were to propose requiring transmission manufacturers to provide shift strategy inputs for use in GEM, then the agencies would have to devise a compliance strategy to monitor in-use shift strategies, including a driver behavior model that could be implemented as part of an in-use shift strategy test. This too would be very complex. If manufacturers were subject to in-use compliance requirements of their transmission shift strategies, this could lead to restricting the use of certain shift strategies in the heavy-duty sector, which would in turn potentially lead to sub-optimal vehicle configurations that do not improve fuel efficiency or adequately serve the wide range of customer needs; especially in the vocational vehicle segment. For example, if the agencies were to restrict the use of more aggressive and less fuel efficient in-use shift strategies that are used only under heavy loads and steep grades, then certain vehicle applications would need to compensate for this loss of capability through the installation of over-sized and over-powered engines that are subsequently poorly matched and less efficient under lighter load conditions. Therefore, as a policy consideration to preserve vehicle configuration choice and to preserve the full capability of heavy-duty vehicles today, the agencies are intentionally not requiring transmission manufacturers to submit detailed proprietary shift strategy information to vehicle manufacturers to input into GEM. This is not unlike Phase 1, where unique transmission and axle attributes were not recognized at all in GEM. Instead, the agencies are proposing that vehicle manufacturers choose from among the three transmission types that the agencies have already developed, validated, and programmed into GEM. The vehicle manufacturers would then enter into GEM their particular transmission's number of gears and gear ratios. The agencies recognize that designing GEM like this would exclude a potentially significant reduction from the GEM simulation. However, if a manufacturer chooses to use the optional powertrain test procedure, then the agencies' transmission types in GEM would be overridden by the actual data collected during the powertrain test, which would recognize the actual benefit of the transmission. Note that the optional powertrain test procedure is only advantageous to a vehicle manufacturer if an actual transmission is more efficient and has a superior shift strategy compared to its respective transmission type simulated in GEM.

(c) Simulating Axles for Vehicle Certification

In GEM for Phase 1 the axle ratio of the primary drive axle and the energy losses assumed in the simulated axle itself were the same for all vehicles. For Phase 2 we are proposing that the vehicle manufacturer input into GEM the axle ratio of the primary drive axle. This input would recognize the intent to operate the engine at a particular engine speed when the transmission is operating in its highest transmission gear; especially for the 55 mph and 65 mph duty cycles in GEM. This input facilitates GEM's recognition of vehicle designs that take advantage of operating the engine at the lowest possible engine speeds. This is commonly known as ''engine down-speeding'', and the general rule-of-thumb for heavy-duty engines is that for every 100 rpm decrease in engine speed, there can be about a 1 percent decrease in fuel consumption and CO_2 emissions. Therefore, it is important that GEM allow this value to be input by the vehicle manufacturer. Axle ratio is also straightforward to verify during any in-use compliance audit.

We are proposing a fixed axle ratio energy efficiency of 95.5 percent at all speeds and loads, but are requesting comment on whether this pre-specified efficiency is reasonable. However, we know that this efficiency actually varies as a function of axle speed and axle input torque. Therefore, as an exploratory test we have created a modified version of GEM that has as an input a data table of axle efficiency as a function of axle speed and axle torque. The modified version of GEM subsequently interpolates this table over each of the duty cycles to represent a more realistic axle efficiency at each point of each duty cycle. We have also created a draft axle ratio efficiency test procedure that requires the use of a dynamometer test facility. This procedure includes the use of a baseline fuel-efficient synthetic gear lubricant manufactured by BASF.[90] This baseline will be used to gauge improvements in axle design and lubricants. The draft test procedure includes initial feedback that we have received from axle manufacturers and our own engineering judgment. Refer to 40 CFR 1037.560 of the Phase 2 proposed regulations, which contain this draft test procedure. This test procedure could be used to generate the results needed to create the axle efficiency data table for input into GEM. However, the agencies have not yet conducted experimental tests of axles using this draft test procedure so we are reluctant to propose this test procedure as either mandatory or even optional at this time. Rather we request comment as to whether or not we should finalize this test procedure and either require its use or allow its use optionally to determine an axle efficiency data table as an input to GEM, which would override the fixed axle efficiency we are proposing at this time. We also request comment on improving or otherwise refining the test procedure itself. Note that the agencies believe that allowing the GEM default axle efficiency to be replaced by manufacturer inputs only makes sense if the manufacturer inputs is are the results of a specified test procedure that we could verify by our own independent testing of the axle.

In addition to proposing to require the primary drive axle ratio input into GEM (and potentially an option to input an actual axle efficiency data table), we are also proposing that the vehicle manufacturer input into GEM whether or not one or two drive axles are driven by the engine. When a heavy-duty vehicle is equipped with two rear axles where both are driven by the engine, this is called a ''6x4'' configuration. ''6'' refers to the total number of wheel hubs on the vehicle. In the 6x4 configuration there are two front wheel hubs for the two steer wheels and tires plus four rear wheel hubs for the four rear wheels and tires (or more commonly four *sets* of rear dual wheels and tires). ''4'' refers to the number of wheel hubs driven by the engine. These are the two rear axles that have two wheel hubs each. Compared to a 6x4 configuration a 6x2 configuration decreases axle energy loss due to friction and oil pumping in two driven axles, by driving only one axle. The decrease in fuel consumption and CO_2 emissions associated with a 6x2 versus 6x4 axle configuration is estimated to be

[90] BASF TI/EVO 0137 e, Emgard® FE 75W–90 Fuel Efficient Synthetic Gear Lubricant.

2.5 percent.[91] Therefore, in the proposed Phase 2 version of GEM, if a manufacturer simulates a 6x2 axle configuration, GEM decreases the overall GEM result by 2.5 percent. Note that GEM will similarly decrease the overall GEM result by 2.5 percent for a 4x2 tractor or Class 8 vocational chassis configuration if it has only two wheel hubs driven. Note that we are not proposing that GEM have an option to increase the overall GEM result by some percentage by selecting, say, a 6x6 or 8x8 option if the front axle(s) are driven. Because these configurations are only manufactured for specialized vehicles that require extra traction for off-road applications, they are very low volume sales and their increased fuel consumption and CO_2 emissions are not significant in comparison to the overall reductions of the proposed Phase 2 program. Note that 40 CFR 1037.631 (for off-road vocational vehicles), which is being continued from the Phase 1 program, would likely exempt many of these vehicles from the vehicle standards.

Instead of directly modeling 6x4 or 6x2 axle configuration, we are proposing use of a post-simulation adjustment approach discussed in Chapter 4 of the drat RIA to model benefits of different axle configuration.

(d) Simulating Accessories for Vehicle Certification

Phase 1 GEM uses a fixed power consumption value to simulate the fuel consumed for powering accessories such as power steering pumps and alternators. While the agencies are not proposing any changes to this approach for Phase 2, we are requesting comment on whether or not we should allow some manufacturer input to reflect the installation of accessory components that result in lower accessory loads. For example, we could consider an accessory load reduction GEM input based on installing a number of qualifying advanced accessory components that could be in production during Phase 2. We request comment on identifying such advanced accessory components, and we request comment on defining these components in such a way that they can be unambiguously distinguished from other similar components that do not decrease accessory loads. We also request comment on how much of a decrease in accessory load should be programmed into GEM if qualifying advanced accessory components are installed.

(e) Aerodynamics for Tractor, Vocational Vehicle, and Trailer Certification

For GEM in Phase 2 the agencies propose to simulate aerodynamic drag in largely the same manner as in Phase 1. For vocational chassis we propose to continue to use the same prescribed products of drag coefficient times vehicle frontal area (Cd*A) that were predefined for each of the vocational subcategories in Phase 1. For tractors we propose to continue to use an aerodynamic bin approach similar to the one that exists in Phase 1 today. This approach requires tractor manufacturers to conduct a certain amount of coast-down vehicle testing, although manufacturers have the option to conduct scaled wind tunnel testing and/or computational fluid dynamics modeling. The results of these tests determine into which bin a vehicle is assigned. Then in GEM the aerodynamic drag coefficient for each vehicle in the same bin is the same. This approach helps to account for limits in the repeatability of aerodynamic testing and it creates a compliance margin since any test result which keeps the vehicle in the same aerodynamic bin is considered compliant. However, for Phase 2 we are proposing new boundary values for the bins themselves and we are adding two additional bins in order to recognize further advances in aerodynamic drag reduction beyond what was recognized in Phase 1. Furthermore, while Phase 1 GEM used predefined frontal areas for tractors while the manufacturers input a Cd value, the agencies propose that manufacturers would use a measured drag area (CdA) value for each tractor configuration for Phase 2. See 40 CFR 1037.525.

In addition to these proposed changes we are proposing a number of aerodynamic drag test procedure improvements. One proposed improvement is to update the so-called standard trailer that is prescribed for use during aerodynamic drag testing of a tractor—that is, the hypothetical trailer modeled in GEM to represent a trailer paired with the tractor in actual use. In Phase 1 a non-aerodynamic 53-foot long box-shaped dry van trailer was specified as the standard trailer for tractor aerodynamic testing (see 40 CFR 1037.501(g)). For Phase 2 we are proposing to modify this standard trailer for tractor testing to make it more similar to the trailers we would require to be produced during the Phase 2 timeframe. More specifically, we would prescribe the installation of aerodynamic trailer skirts (and low rolling resistance tires as applied in Phase 1) on the reference trailer, as discussed in further in Section III.E.2. As explained more fully in Sections III and IV below, the agencies believe that tractor-trailer pairings will be optimized aerodynamically to a significant extent in-use (such as using high-roof cabs when pulling box trailers), and that this real-world optimization should be reflected in the certification testing. We also request comment on whether or not the Phase 2 standard trailer should include the installation of other aerodynamic devices such as a nose fairing, an under tray, or a boat tail or trailer tail. Would a standard trailer including these additional components make the tractor program better?

Another proposed aerodynamic test procedure improvement is intended to better account for average wind yaw angle to better reflect the true impact of aerodynamic features on the in-use fuel consumption and CO_2 emissions of tractors. Refer to the proposed test procedures in 40 CFR 1037.525 for further details of these aerodynamic test procedures.

For trailer certification, the agencies are proposing to use GEM in a different way than GEM is used for tractor certification in Phase 1 and Phase 2. As described in Section IV, the proposed trailer standards are based on GEM simulation, but trailer manufacturers would not run GEM for certification. Instead, manufacturers would use a simple equation to replicate GEM performance from the inputs. As with GEM, the only technologies recognized by this GEM-based equation for trailer certification are aerodynamic technologies, tire technologies (including tire rolling resistance and automatic tire inflation systems), and some weight reduction technologies. Note that since the purpose of this equation is to measure GEM performance, it can be considered as simply another form of the model using a different input interface. Thus, for simplicity, the remainder of this Section II. C. sometimes discusses GEM as being used for trailers, without regard to how manufacturers will actually input GEM variables.

Similar to tractor certification, we propose that trailer manufacturers may at their option conduct some amount of aerodynamic testing (*e.g.,* coast-down testing, scale wind tunnel testing, computational fluid dynamics modeling, or possibly aerodynamic component testing) and use this information with the equation.[92] In this

[91] NACFE. Executive Report—6x2 (Dead Axle) Tractors. November 2010. See Docket EPA–HQ–OAR–2014–0827.

[92] The agencies project that more than enough aerodynamic component vendors would take advantage of proposed optional pre-approval

case the agencies propose the configuration of a reference tractor for conducting trailer testing. Refer to Section IV of this preamble and to 40 CFR 1037.501 of the proposed regulations for details on the proposed reference tractor configuration for trailer test procedures.

(f) Tires and Tire Inflation Systems for Truck and Trailer Certification

For GEM in Phase 1 vehicle manufacturers input the tire rolling resistance of steer and drive tires directly into GEM. The agencies prescribed an internationally recognized tire rolling resistance test procedure, ISO 28580, for determining the tire rolling resistance value that is input into GEM, as described in 40 CFR 1037.520(c). For Phase 2 we are proposing to continue this same approach and the use of ISO 28580, and we propose to expand these requirements to trailer tires as well. We request comment on whether specific modifications to this test procedure would improve its accuracy, repeatability or its test lab to test lab variability.

In addition to tire rolling resistance, we are proposing that for Phase 2 vehicle manufacturers enter into GEM the tire manufacturer's specified tire loaded radius for the vehicle's drive tires. This value is commonly reported by tire manufacturers already so that vehicle speedometers can be adjusted appropriately. This input value is needed so that GEM can accurately convert simulated vehicle speed into axle speed, transmission speed, and ultimately engine speed. We request comment on whether the proposed test procedure should be modified to measure the tire's revolutions per distance directly, as opposed to using the loaded radius to calculate the drive axle rotational speed from vehicle speed.

For tractors and trailers, we propose to allow manufacturers to specify whether or not an automatic tire inflation system is installed. If one is installed, GEM, or in the case of trailers, the equations based on GEM, would assign a 1 percent decrease in the overall fuel consumption and CO_2 emissions simulation results for tractors, and a 1.5 percent decrease for trailers. This would be done through post-simulation adjustments discussed in Chapter 4 of the draft RIA. In contrast, we are not proposing to assign any decrease in fuel consumption and CO_2 emissions for tire pressure monitoring systems. We do recognize that some drivers would respond to a warning indication from a tire pressure monitoring system, but we are unsure how to assign a fixed decrease in fuel consumption and CO_2 emissions for tire pressure monitoring systems. We would estimate that the value would be less than any value we would assign for an automatic tire inflation system. We request comment on whether or not we should assign a fixed decrease in fuel consumption and CO_2 emissions for tire pressure monitoring systems, and if so, we request comment on what would be an appropriate assigned fixed value.

(g) Weight Reduction for Tractor, Vocational Chassis and Trailer Certification

We propose for Phase 2 that GEM continues the weight reduction recognition approach in Phase 1, where the agencies prescribe fixed weight reductions, or ''deltas'', for using certain lightweight materials for certain vehicle components. In Phase 1 the agencies published a list of weight reductions for using high-strength steel and aluminum materials on a part by part basis. For Phase 2 we propose to use these same values for high-strength steel and aluminum parts for tractors and for trailers and we have scaled these values for use in certifying the different weight classes of vocational chassis. In addition we are proposing a similar part by part weight reduction list for tractor parts made from thermoplastic material. We are also proposing to assign a fixed weight increase to natural gas fueled vehicles to reflect the weight increase of natural gas fuel tanks versus gasoline or diesel tanks. This increase would be allocated partly to the chassis and from the payload using the same allocation as weight reductions for the given vehicle type. For tractors we are proposing to continue the same mathematical approach in GEM to assign 1/3 of a total weight decrease to a payload increase and 2/3 of the total weight decrease to a vehicle mass decrease. For Phase 1 these ratios were based on the average frequency that a tractor operates at its gross combined weight rating. Therefore, we propose to use these ratios for trailers in Phase 2. However, as with the other fuel consumption and GHG reducing technologies manufacturers use for compliance, reductions associated with weight reduction would be calculated using the trailer compliance equation rather than GEM. For vocational chassis, for which Phase 1 did not address weight reduction, we propose a 50/50 ratio. In other words, for vocational chassis in GEM we propose to assign 1/2 of a total weight decrease to a payload increase and 1/2 of the total weight decrease to a vehicle mass decrease. We request comment on all aspects of applying weight reductions in GEM, including proposed weight increases for alternate fuel vehicles and whether a 50/50 ratio is appropriate for vocational chassis.

(h) GEM Duty Cycles for Tractor, Vocational Chassis and Trailer Certification

In Phase 1, there are three GEM vehicle duty cycles that represented stop-and-go city driving (ARB Transient), urban highway driving (55 mph), and rural interstate highway driving (65 mph). In Phase 1 these cycles were time-based. That is, they were specified as a function of simulated time and the duty cycles ended once the specified time elapsed in simulation. The agencies propose to use these three drive cycles in Phase 2, but with some revisions. First the agencies propose that GEM would simulate these cycles on a distance-based specification, rather than on a time-based specification. A distance-based specification ensures that even if a vehicle in simulation does not always achieve the target vehicle speed, the vehicle will have to continue in simulation for a longer period of time to complete the duty cycle. This ensures that vehicles are evaluated over the complete distance of the duty cycle and not just the portion of the duty cycle that a vehicle completes in a given time period. A distance-based duty cycle specification also facilitates a straightforward specification of road grade as a function of distance along the duty cycle. For Phase 2 the agencies are proposing to enhance the 55 mph and 65 mph duty cycles by adding representative road grade to exercise the simulated vehicle's engine, transmission, axle, and tires in a more realistic way. A flat road grade profile over a constant speed test does not present many opportunities for a transmission to shift gears, and may have the unintended consequence of enabling underpowered vehicles or excessively downsped drivetrains to generate credits. The road grade profile proposed is the same for both the 55 mph and 65 mph duty cycles, and the profile was based on real over-the-road testing the agencies directed under an agency-funded contract with Southwest Research Institute.[93] See Section III.E for more details on development of the proposed road grade profile. The agencies are continuing to evaluate

process to make trailer manufacturer testing optional.

[93] SwRI road grade testing and GEM validation report, 2014.

alternate road grade profiles including actual sections of restricted access highway with road grades that are statistically similar to the national road grade profile as well as purely synthetic road grade profiles.[94] We request comments on the proposed road grade profile, and would welcome additional statistical evaluations of this road grade profile and other road grade profiles for comparison. We believe that the enhancement of the 55 mph and 65 mph duty cycles with road grade is consistent with the NAS recommendation regarding road grade.[95]

We recognize that even with the proposed road grade profile, GEM may continue to under predict the number of transmission shifts of vehicles on restricted access highways if the model simulates constant speeds. We request comment on other ways in which the proposed 55 mph and 65 mph duty cycles could be enhanced. For example, we request comment on whether a more aggressive road grade profile would induce a more realistic and representative number of transmission gear shifts. We also request comment on whether we should consider varying the vehicle target speed over the 55 mph and/or 65 mph duty cycles to simulate human driver behavior reacting to traffic congestion. This would increase the number of shifts during the 55 mph and 65 mph duty cycles, though it may be possible for an equivalent effect to be achieved by assigning a greater weighting to the transient cycle in the GEM composite test score.

(i) Workday Idle Operation for Vocational Vehicle Certification

In the Phase 1 program, reduction in idle emissions was recognized only for sleeper cab tractors, and only with respect to hotelling idle, where a driver needs power to operate heating, ventilation, air conditioning and other electrical equipment in order to use the sleeper cab to eat, rest, or conduct other business. As described in Section V, the agencies are now proposing to recognize in GEM technologies that reduce workday idle emissions, such as automatic stop-start systems and automatic transmissions that shift to neutral at idle. Many vocational vehicle applications operate on patterns implicating workday idle cycles, and the agencies are proposing test procedures in GEM to account specifically for these cycles and potential controls. GEM would recognize these idle controls in two ways. For technologies like neutral-idle that address idle that occurs during the transient cycle (representing the type of operation that would occur when the vehicle is stopped at a stop light), GEM would interpolate lower fuel rates from the engine map. For technologies like start-stop and auto-shutdown that eliminate some of the idle that occurs when a vehicle is stopped or parked, GEM would assign a value of zero fuel rate for what we are proposing as an ''idle cycle''. This idle cycle would be weighted along with the 65 mph, 55 mph, and ARB Transient duty cycles according to the vocational chassis duty cycle weighting factors that we are proposing for Phase 2. These weighting factors are different for each of the three vocational chassis speed categories that we are proposing for Phase 2. While we are not proposing to apply this idle cycle for tractors, we do request comment on whether or not we should consider a applying this idle cycle to certain tractor types, like day cabs that could experience more significant amounts of time stopped or parked as part of an urban delivery route. We also request comment on whether or not start-stop or auto-shutdown technologies are being developed for tractors; especially for Class 7 and 8 day cabs that could experience more frequent stops and more time parked for deliveries.

(2) Validation of the Proposed GEM

After making the proposed changes to GEM, the agencies validated the model in comparison to over 130 vehicle variants, consistent with the recommendation made by the NAS in their Phase 2-First Report.[96] As is described in Chapter 4 of the Draft RIA, good agreement was observed between GEM simulations and test data over a wide range of vehicles. In general, the model simulations agreed with the test results within ±5 percent on an absolute basis. As pointed out in Chapter 4.3.2 of the RIA, relative accuracy is more relevant to this rulemaking. This is because all of the numeric standards proposed for tractors, trailers and vocational chassis are derived from running GEM first with Phase 1 ''baseline'' technology packages and then with various candidate Phase 2 technology packages. The differences between these GEM results are examined to select stringencies. In other words, the agencies used the same version of GEM to establish the standards as was used to evaluate baseline performance for this rulemaking. Therefore, it is most important that GEM accurately reflects relative changes in emissions for each added technology. For vehicle certification purposes it is less important that GEM's absolute value of the fuel consumption or CO_2 emissions are accurate compared to laboratory testing of the same vehicle. The ultimate purpose of this new version of GEM will be to evaluate *changes* or *additions* in technology, and compliance is demonstrated on a relative basis to the numerically standards that were also derived from GEM. Nevertheless, the agencies concluded that the absolute accuracy of GEM is generally within ±5 percent, as shown in Figure II–1. Chapter 4.3.2 of the draft RIA shows that relative accuracy is even better, ±2–3 percent.

---

[94] See National Renewable Energy Laboratory report ''EPA GHG Certification of Medium- and Heavy-Duty Vehicles: Development of Road Grade Profiles Representative of US Controlled Access Highways'' dated May 2015 and EPA memorandum ''Development of an Alternative, Nationally Representative, Activity Weighted Road Grade Profile for Use in EPA GHG Certification of Medium- and Heavy-Duty Vehicles'' dated May 13, 2015, both available in Docket EPA–HQ–OAR–2014–0827. This docket also includes file NREL_SyntheticAndLocalGradeProfiles.xlsx which contains numerical representations of all road grade profiles described in the NREL report.

[95] NAS 2010 Report. Page 189. ''A fundamental concern raised by the committee and those who testified during our public sessions was the tension between the need to set a uniform test cycle for regulatory purposes, and existing industry practices of seeking to minimize the fuel consumption of medium and heavy-duty vehicles designed for specific routes that may include grades, loads, work tasks or speeds inconsistent with the regulatory test cycle. This highlights the critical importance of achieving fidelity between certification values and real-world results to avoid decisions that hurt rather than help real-world fuel consumption.''

[96] National Academy of Science. ''Reducing the Fuel Consumption and GHG Emissions of Medium- and Heavy-Duty Vehicles, Phase Two, First Report.'' 2014. Recommendation1.2.

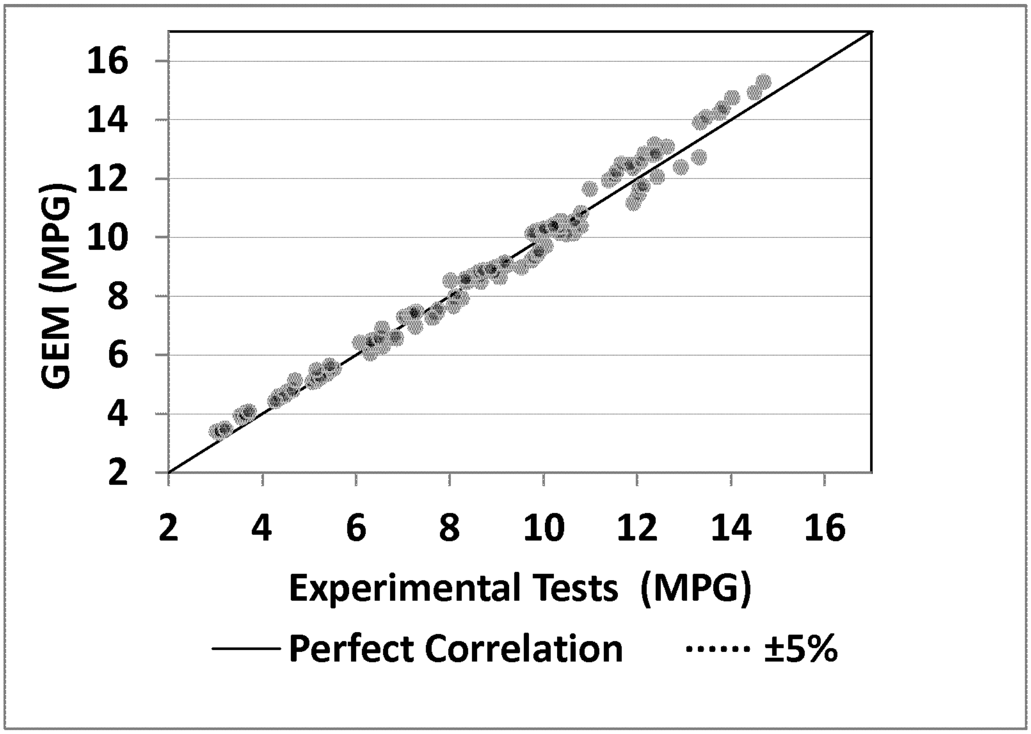

Figure II-1 GEM Validation Data

In addition to this successful validation against experimental results, the agencies have also initiated a peer review of the proposed GEM source code. This peer review has been submitted to Docket # EPA–HQ–OAR–2014–0827.

(3) Supplements to GEM Simulation

As in Phase 1, for most tractors and vocational vehicles, compliance with the Phase 2 g/ton-mile vehicle standards could be evaluated by directly comparing the GEM result to the standard. However, in Phase 1, manufacturers incorporating innovative or advanced technologies could apply improvement factors to lower the GEM result slightly before comparing to the standard.[97] For example, a manufacturer incorporating a launch-assist mild hybrid that was approved for a 5 percent benefit would apply a 0.95 improvement factor to its GEM results for such vehicles. In this example, a GEM result of 300 g/ton-mile would be reduced to 285 g/ton-mile.

For Phase 2, the agencies are proposing to largely continue the existing Phase 1 innovative technology approach. We are also proposing to create a parallel option specifically related to innovative powertrain designs. These proposals are discussed below.

(a) Innovative/Off-Cycle Technology Procedures

In Phase 1 the agencies adopted an emissions credit generating opportunity that applied to new and innovative technologies that reduce fuel consumption and CO_2 emissions, that were not in common use with heavy-duty vehicles before model year 2010 and are not reflected over the test procedures or GEM (*i.e.,* the benefits are ''off-cycle''). See 76 FR 57253. As was the case in the development of Phase 1, the agencies are proposing to continue this approach for technologies and concepts with CO_2 emissions and fuel consumption reduction potential that might not be adequately captured over the proposed Phase 2 duty cycles or are not proposed inputs to GEM. Note, however, that the agencies are proposing to refer to these technologies as off-cycle rather than innovative. See Section I for more discussion of innovative and off-cycle technologies.

We recognize that the Phase 1 testing burden associated with the innovative technology credit provisions discouraged some manufacturers from applying. To streamline recognition of many technologies, default values have been integrated directly into GEM. For example, automatic tire inflation systems and 6x2 axles both have fixed default values, recognized through a post-simulation adjustment approach discussed in Chapter 4 of the draft RIA. This is similar to the technology ''pick list'' from our light-duty programs. See 77 FR 62833–62835 (October 15, 2012). If manufacturers wish to receive additional credit beyond these fixed values, then the innovative/off-cycle technology credit provisions would provide the regulatory path toward that additional recognition.

Beyond the additional technologies that the agencies have added to GEM, the agencies also believe there are several emerging technologies that are being developed today, but would not be accounted for in GEM as we are proposing it because we do not have enough information about these technologies to assign fixed values to them in GEM. Any credits for these technologies would need to be based on the off-cycle technology credit generation provisions. These require the assessment of real-world fuel consumption and GHG reductions that can be measured with verifiable test methods using representative operating conditions typical of the engine or vehicle application.

As in Phase 1, the agencies are proposing to continue to provide two

[97] 40 CFR 1036.610, 1036.615, 1037.610, and 1037.615

paths for approval of the test procedure to measure the CO_2 emissions and fuel consumption reductions of an off-cycle technology used in the HD tractor. See 40 CFR 1037.610 and 49 CFR 535.7. The first path would not require a public approval process of the test method. A manufacturer can use ''pre-approved'' test methods for HD vehicles including the A-to-B chassis testing, powerpack testing or on-road testing. A manufacturer may also use any developed test procedure which has known quantifiable benefits. A test plan detailing the testing methodology is required to be approved prior to collecting any test data. The agencies are also proposing to continue the second path which includes a public approval process of any testing method which could have questionable benefits (*i.e.,* an unknown usage rate for a technology). Furthermore, the agencies are proposing to modify its provisions to better clarify the documentation required to be submitted for approval aligning them with provisions in 40 CFR 86.1869–12, and NHTSA is separately proposing to prohibit credits from technologies addressed by any of its crash avoidance safety rulemakings (*i.e.,* congestion management systems). We welcome recommendations on how to improve or streamline the off-cycle technology approval process.

Sections III and V describe tractor and vocational vehicle technologies, respectively, that the agencies anticipate may qualify for these off-cycle credit provisions.

(b) Powertrain Testing

The agencies are proposing a powertrain test option to allow for a robust way to quantify the benefits of CO_2 reducing technologies that are a part of the powertrain (conventional or hybrid) that are not captured in the GEM simulation. Powertrain testing and certification was included as one of the NAS recommendations in the Phase 2 –First Report.[98] Some of these improvements are transient fuel control, engine and transmission control integration and hybrid systems. To limit the amount of testing, the powertrain would be divided into families and powertrains would be tested in a limited number of simulated vehicles that cover the range of vehicles in which the powertrain would be installed. The powertrain test results would then be used to override the engine and transmission simulation portion of GEM.

The largest proposed change from the Phase 1 powertrain procedure is that only the advanced powertrain would need to be tested (as opposed to the Phase 1 requirement where both the advanced powertrain and the conventional powertrain had to be tested). This change is possible because the proposed GEM simulation uses the engine fuel map and torque curve from the actual engine in the vehicle to be certified. For the powertrain results to be used broadly across all the vehicles that the powertrain would go into, a matrix of 8 to 9 tests would be needed per vehicle cycle. These tests would cover the range of coefficient of drag, coefficient of rolling resistance, vehicle mass and axle ratio of the vehicles that the powertrain will be installed in. The main output of this matrix of tests would be fuel mass as a function of positive work and average transmission output speed over average vehicle speed. This matrix of test results would then be used to calculate the vehicle's CO_2 emissions by taking the work per ton-mile from the GEM simulation and multiplying it by the interpolated work specific fuel mass from the powertrain test and mass of CO_2 to mass of fuel ratio.

Along with proposing changes to how the powertrain results are used, the agencies are also proposing changes to the procedures that describe how to carry out a powertrain test. The changes are to give additional guidance on controlling the temperature of the powertrains intake-air, oil, coolant, block, head, transmission, battery, and power electronics so that they are within their expected ranges for normal operation. The equations that describe the vehicle model are proposed to be changed to allow for input of the axle's efficiency, driveline rotational inertia, as well as the mechanical and electrical accessory loads.

The determine the positive work and average transmission output speed over average vehicle speed in GEM for the vehicle that will be certified, the agencies have defined a generic powertrain for each vehicle category. The agencies are requesting comment on if the generic powertrains should be modified according to specific aspects of the actual powertrain. For example using the engine's rated power to scale the generic engine's torque curve. Similarly, the transmission gear ratios could be scaled by the axle ratio of the drive axle, to make sure the generic engine is operated in GEM at the correct engine speed.

(4) Production Vehicle Testing for Comparison to GEM

The agencies are is proposing to require tractor and vocational vehicle manufacturers to annually chassis test 5 production vehicles over the GEM cycles to verify that relative reductions simulated in GEM are being achieved in actual production. See 40 CFR 1037.665. We would not expect absolute correlation between GEM results and chassis testing. GEM makes many simplifying assumptions that do not compromise its usefulness for certification, but do cause it to produce emission rates different from what would be measured during a chassis dynamometer test. Given the limits of correlation possible between GEM and chassis testing, we would not expect such testing to accurately reflect whether a vehicle was compliant with the GEM standards. Therefore, we are proposing to not apply compliance liability to such testing. Rather, this testing would be for informational purposes only. However, we do expect there to be correlation in a relative sense. Vehicle to vehicle differences showing a 10 percent improvement in GEM should show a similar percent improvement with chassis dynamometer testing. Nevertheless, manufacturers would not be subject to recall or other compliance actions if chassis testing did not agree with the GEM results on a relative basis. Rather, the agencies would continue evaluate in-use compliance by verifying GEM inputs and testing in-use engines.

EPA believes this chassis test program is necessary because of our experience implementing regulations for heavy-duty engines. In the past, manufacturers have designed engines that have much lower emissions on the duty cycles than occur during actual use. By proposing this simple test program, we hope to be able to identify such issues earlier and to dissuade any attempts to design solely to the certification test. We also expect the results of this testing to help inform the need for any further changes to GEM.

As already noted in Section II.B.(1), it can be expensive to build chassis test cells for certification. However, EPA is proposing to structure this pilot-scale program to minimize the costs. First, we are proposing that this chassis testing would not need to comply with the same requirements as would apply for official certification testing. This would allow testing to be performed in developmental test cells with simple portable analyzers. Second, since the proposed program would require only 5 tests per year, manufacturers without

[98] National Academy of Science. ''Reducing the Fuel Consumption and GHG Emissions of Medium- and Heavy-Duty Vehicles, Phase Two, First Report.'' 2014. Recommendation 1.6. However, the agencies are not proposing to allow for the use of manufacturer derived and verified models of the powertrain within GEM.

their own chassis testing facility would be able to contract with a third party to perform the testing. Finally, EPA proposes to apply this testing to only those manufacturers with annual production in excess of 20,000 vehicles.

We request comment on this proposed testing requirement. Commenters are encouraged to suggest alternate approaches that could achieve the assurance that the projected emissions reductions would occur in actual use.

(5) Use of GEM in Establishing Proposed Numerical Standards

Just like in Phase 1, the agencies are proposing specific numerical standards against which tractors and vocational vehicles would be evaluated using GEM (We propose that trailers use a simplified equation-based approach that was derived from GEM). Although the proposed standards are performance-based standards, which do not specifically require the use of any particular technologies, the agencies established the proposed standards by evaluating specific vehicle technology packages using a prepublication version of the Phase 2 GEM. This prepublication version was an intermediate version of the GEM source code, rather than the executable file version of GEM, which is being docketed for this proposal and is available on EPA's GEM Web page. Both the GEM source code and the GEM executable file are generally functionally equivalent.

The agencies determined the proposed numerical standards essentially by evaluating certain specific technology packages representing the packages we are projecting to be feasible in the Phase 2 time frame. For each technology package, GEM was used determine a cycle-weighted g/ton-mile emission rate and a gal/1,000 ton-mile fuel consumption rate. These GEM results were then essentially averaged together, weighted by the adoption rates the agencies are projecting for each technology package and for each model year of standards. Consider as an oversimplified example of two technology packages for Class 8 low-roof sleepers cabs: one package that resulted in 60 g/ton-mile and a second that resulted in 80 g/ton-mile. If we project that the first package could be applied to 50 percent of the Class 8 low-roof sleeper cab fleet in MY 2027, and that the rest of the fleet could do no better than the second technology package, then we would set the fleet average standard at 70 g/ton-mile ($0.5 \cdot 60 + 0.5 \cdot 80 = 70$).

Formal external peer review and expert external user review was then conducted on the version of the GEM source code that was used to calculate the numerical values of the proposed standards. It was discovered via these external review processes that the GEM source code contained some minor software "bugs." These bugs were then corrected by EPA and the Phase 2 proposed GEM executable file was derived from this corrected version of the GEM source code. Moreover, we expect to also receive technical comments during the comment period that could potentially identify additional GEM software bugs, which would lead EPA to make additional changes to GEM before the Final Rule. Nevertheless, EPA has repeated the analysis described above using the corrected version of the GEM source code that was used to create the proposed GEM executable file. The results of this analysis are available in the docket to this proposal.[99]

Thus, even without the agencies making any changes in our projections of technology effectiveness or market adoption rates, it is likely that further revisions to GEM could result in us finalizing different numerical values for the standards. It is important to note that the agencies would not necessarily consider such GEM-based numerical changes by themselves to be changes in the stringency of the standards. Rather, we believe that stringency is more appropriately evaluated in technological terms; namely, by evaluating technology effectiveness and the market adoption rates of technologies. Nevertheless, the agencies will docket any updates and supporting information in a timely manner.

D. Proposed Engine Test Procedures and Engine Standards

For the most part, the proposed Phase 2 engine standards are a continuation of the Phase 1 program, but with more stringent standards for compression-ignition engines. Nevertheless, the agencies are proposing important changes related to the test procedures and compliance provisions. These changes are described below.

As already discussed in Section II.B. the agencies are proposing a regulatory structure in which engine technologies are evaluated using engine-specific test procedures as well using GEM, which is vehicle-based. We are proposing separate standards for each procedure. The proposed engine standards described in Section II.D.(2) and the proposed vehicle standards described in Sections III and V are based on the same engine technology, which is described in Section II.D.(2). We request comment on whether the engine and vehicle standards should be based on the same projected technology. As described below, while the agencies projected the same engine technology for engine standards and for vehicle standards, we separately projected the technology that would be appropriate for:

- Gasoline vocational engines and vehicles
- Diesel vocational engines and vehicles
- Tractor engines and vehicles

Before addressing the engine standards and engine technology in Section II.D.(2), the agencies describe the test procedures that would be used to evaluate these technologies in Section II.D.(1) below. We believe that without first understanding the test procedures, the numerical engine standards would not have the proper context.

(1) Engine Test Procedures

The Phase 1 engine standards relied on the engine test procedures specified in 40 CFR part 1065. These procedures were previously used by EPA to regulate criteria pollutants such as NO_X and PM, and few changes were needed to employ them for purposes of the Phase 1 standards. The agencies are proposing significant changes to two areas for Phase 2: (1) cycle weighting; and (2) GEM inputs. (Note that EPA is also proposing some minor changes to the basic part 1065 test procedures, as described in Section XIII).

The diesel (*i.e.,* compression-ignition) engine test procedure relies on two separate engine test cycles. The first is the Heavy-duty Federal Test Procedure (Heavy-duty FTP) that includes transient operation typified by frequent accelerations and decelerations, similar to urban or suburban driving. The second is the Supplemental Engine Test (SET) which includes 13 steady-state test points. The SET was adopted by EPA to address highway cruise operation and other nominally steady-state operation. However, it is important to note that it was intended as a supplemental test cycle and not necessarily to replicate precisely any specific in-use operation.

The gasoline (*i.e.,* spark-ignition) engine test procedure relies on a single engine test cycle: a gasoline version of Heavy-duty FTP. The agencies are not proposing changes to the gasoline engine test procedures.

It is worth noting that EPA sees great value in using the same test procedures for measuring GHG emissions as is used

[99] *See* Memorandum to the Docket "Numerical Standards for Tractors, Trailers, and Vocational Vehicles Based on the June 2015 GEM Executable Code.

for measuring criteria pollutants. From the manufacturers' perspective, using the same procedures minimizes their test burden. However, EPA sees additional benefits. First, as already noted in Section(b), requiring engine manufacturers to comply with both NO_X and CO_2 standards using the same test procedures discourages alternate calibrations that would trade NO_X emissions against fuel consumption depending how the engine or vehicle is tested. Second, this approach leverages the work that went into developing the criteria pollutant cycles. Taken together, these factors support our decision to continue to rely on the 40 CFR part 1065 test procedures with only minor adjustments, such as those described in Section II.D.(1)(a). Nevertheless, EPA would consider more substantial changes if they were necessary to incentivize meaningful technology changes, similar to the changes being made to GEM for Phase 2 to address additional technologies.

(a) SET Cycle Weighting

The SET cycle was adopted by EPA in 2000 and modified in 2005 from a discrete-mode test to a ramped-modal cycle to broadly cover the most significant part of the speed and torque map for heavy-duty engines, defined by three non-idle speeds and three relative torques. The low speed is often called the ''A speed'', the intermediate speed is often called the ''B speed'', and the high speed is often called the ''C speed.'' As is shown in Table II–1, the SET weights these three speeds at 23 percent, 39 percent, and 23 percent.

TABLE II–1—SET MODES WEIGHTING FACTOR IN PHASE 1

Speed, % load	Weighting factor in Phase 1 (%)
Idle	15
A, 100	8
B, 50	10
B, 75	10
A, 50	5
A, 75	5
A, 25	5
B, 100	9
B, 25	10
C, 100	8
C, 25	5
C, 75	5
C, 50	5
Total	100
Total A Speed	23
Total B Speed	39
Total C Speed	23

The C speed is typically in the range of 1800 rpm for current HHD engine designs. However, it is becoming less common for engines to operate often in such a high speed in real world driving condition, and especially not during cruise vehicle speed between 55 and 65 mph. The agencies receive confidential business information from a few vehicle manufacturers that support this observation. Thus, although the current SET represents highway operation better than the FTP cycle, it is not an ideal cycle to represent future highway operation. Furthermore, given the recent trend configure drivetrains to operate engines at speeds down to a range of 1150–1200 rpm at vehicle speed of 65mph. This trend would make the typical highway engine speeds even further away from C speed.

To address this issue, the agencies are proposing new weighting factors for the Phase 2 GHG and fuel consumption standards. The proposed new SET mode weightings move most of C weighting to ''A'' speed, as shown in Table II–2. It would also slightly reduce the weighting factor on the idle speed.

The agencies request comment on the proposed reweighting.

TABLE II–2—PROPOSED SET MODES WEIGHTING FACTOR IN PHASE 2

Speed, % load	Proposed weighting factor in Phase 2 (%)
Idle	12
A, 100	9
B, 50	10

C, 75	1
C, 50	1
Total	100
Total A Speed	45
Total B Speed	38
Total C Speed	5

(b) Measuring GEM Engine Inputs

Although GEM does not apply directly to engine certification, implementing the Phase 2 GEM would impact engine manufacturers. To recognize the contribution of the engine in GEM the engine fuel map, full load torque curve and motoring torque curve have to be input into GEM. To insure the robustness of each of those inputs, a standard procedure has to be followed. Both the full load and motoring torque curve procedures are already defined in 40 CFR part 1065 for engine testing. However, the fuel mapping procedure being proposed would be new. The agencies have compared the proposed procedure against other accepted engine mapping procedures with a number of engines at various labs including EPA's NVFEL, Southwest Research Institute sponsored by the agencies, and Environment Canada's laboratory.[100] The proposed procedure was selected because it proved to be accurate and repeatable, while limiting the test burden to create the fuel map. This proposed provision is consistent with NAS's recommendation (3.8).

One important consideration is the need to correct measured fuel consumption rates for the carbon and energy content of the test fuel. For engine tests, we propose to continue the Phase 1 approach, which is specified in 40 CFR 1036.530. We propose a similar approach to GEM fuel maps in Phase 2.

The agencies are proposing that engine manufacturers must certify fuel maps as part of their certification to the engine standards, and that they be required to provide those maps to vehicle manufacturers beginning with MY 2020.[101] The one exception to this requirement would be for cases in which the engine manufacturer certifies based on powertrain testing, as described in Section (c). In such cases, engine manufacturers would not be required to also certify the otherwise applicable fuel maps. We are not proposing that vehicle manufacturers be allowed to develop their own fuel maps for engines they do not manufacture.

The current engine test procedures also require the development of regeneration emission rate and frequency factors to account for the emission changes for criteria pollutants during a regeneration event. In Phase 1, the agencies adopted provisions to exclude CO_2 emissions and fuel consumption due to regeneration. However, for Phase 2, we propose to include CO_2 emissions and fuel consumption due to regeneration over the FTP and RMC cycles as determined using the infrequently regenerating aftertreatment devices (IRAF) provisions in 40 CFR 1065.680. We do not believe this would significantly impact the stringency of the proposed standards

[100] US EPA, ''Technical Research Workshop supporting EPA and NHTSA Phase 2 Standards for MD/HD Greenhouse Gas and Fuel Efficiency—December 10 and 11, 2014,'' *http://www.epa.gov/otaq/climate/regs-heavy-duty.htm.*

[101] Current normal vehicle manufacturing processes generally result in many vehicles being produced with prior model year engines. For example, we expect that some MY 2021 vehicles will be produced with MY 2020 engines. Thus, we are proposing to require engine manufacturers to begin providing fuel maps in 2020 so that vehicle manufacturers could run GEM to certify MY 2021 vehicles with MY 2020 engines.

because manufacturers have already made great progress in reducing the impact of regeneration emissions since 2007. Nevertheless, we believe it would be prudent to begin accounting for regeneration emissions to discourage manufacturers from adopting compliance strategies that would reverse this trend. We request comment on this requirement.

We are not proposing, however, to include fuel consumption due to regeneration in the creation of the fuel map used in GEM for vehicle compliance. We believe that the proposed requirements for the duty-cycle standards, along with market forces that already exist, would create sufficient incentives to reduce fuel consumption during regeneration over the entire fuel map.

(c) Engine Test Procedures for Replicating Powertrain Tests

As described in Section II.B.(2)(b), the agencies are proposing a powertrain test option to quantify the benefits of CO_2 reducing powertrain technologies. These powertrain test results would then be used to override the engine and transmission simulation portion of GEM. The agencies are proposing to require that any manufacturer choosing to use this option also measure engine speed and engine torque during the powertrain test so that the engine's performance during the powertrain test could be replicated in a non-powertrain engine test cell. Subsequent engine testing would be conducted using the normal part 1065 engine test procedures, and g/hp-hr CO_2 results would be compared to the levels the manufacturer reported during certification. Such testing would apply for both confirmatory and selective enforcement audit testing.

Under the proposed regulations, engine manufacturers certifying powertrain performance (instead of or in addition to the multi-point fuel maps) would be held responsible for powertrain test results. If the engine manufacturer does not certify powertrain performance and instead certifies only the multi-point fuel maps, it would held responsible for fuel map performance rather than the powertrain test results. Engine manufacturers certifying both would be responsible for both.

(d) CO_2 From Urea SCR Systems

For diesel engines utilizing urea SCR emission control systems for NO_X reduction, the agencies are proposing to allow correction of the final engine fuel map and powertrain duty cycle CO_2 emission results to account for the contribution of CO_2 from the urea injected into the exhaust. This urea could contribute up to 1 percent of the total CO_2 emissions from the engine. Since current urea production methods use gaseous CO_2 captured from the atmosphere (along with NH_3), CO_2 from urea consumption does not represent a net carbon emission. This adjustment is necessary so that fuel maps developed from CO_2 measurements would be consistent with fuel maps from direct measurements of fuel flow rates. Thus, we are only proposing to allow this correction for emission tests where CO_2 emissions are determined from direct measurement of CO_2 and not from fuel flow measurement, which would not be impacted by CO_2 from urea.

We note that this correction would be voluntary for manufacturers, and expect that some manufacturers may determine that the correction is too small to be of concern. The agencies will use this correction with any engines for which the engine manufacturer applied the correction for its fuel maps during certification.

We are not proposing this correction for engine test results with respect to the engine CO_2 standards. Both the Phase 1 standards and the proposed standards for CO_2 from diesel engines are based on test results that included CO_2 from urea. In other words, these standards are consistent with using a test procedure that does not correct for CO_2 from urea. We request comment on whether it would be appropriate to allow this correction for the Phase 2 engine CO_2 standards, but also adjust the standards to reflect the correction. At this time, we believe that reducing the numerical value of the CO_2 standards by 1 g/hp-hr would make the standards consistent with measurement that are corrected for CO_2 from urea. However, we also request comment on the appropriateness of applying a 2 g/hp-hr adjustment should we determine it would better reflect the urea contribution for current engines.

(e) Potential Alternative Certification Approach

In Section II.B.(2)(b), we explained that although GEM does not apply directly to engine certification, implementing the Phase 2 GEM would impact engine manufacturers by requiring that they measure engine fuel maps. In Section II.B.(2), the agencies noted that some stakeholders may have concerns about the proposed regulatory structure that would require engine manufacturers to provide detailed fuel consumption maps for GEM. Given such concerns, the agencies are requesting comment on an approach that could mitigate the concerns by allowing both vehicle and engine to use the same driving cycles for certification. The detailed description of this alternative certification approach can be seen in the draft RIA. We are requesting comment on allowing this approach as an option, or as a replacement to the proposed approach. Commenters supporting this approach should address possible impacts on the stringency of the proposed standards.

This approach utilizes GEM with a default engine fuel map pre-defined by the agency to run a number of pre-defined vehicle configurations over three certification cycles. Engine torque and speed profile would be obtained from the simulations, and would be used to specify engine dynamometer commands for engine testing. The results of this testing would be a CO_2 map as function of the integrated work and the ratio of averaged engine speed (N) to averaged vehicle speed (V) defined as (N/V) over each certification cycle. In vehicle certification, vehicle manufacturers would run GEM with the to-be-certified vehicle configuration and the agency default engine fuel map separately for each GEM cycle. Applying the total work and N/V resulted from the GEM simulations to the CO_2 map obtained from engine tests would determine CO_2 consumption for vehicle certification. For engine certification, we are considering allowing the engine to be certified based on one of the points conducted during engine alternative CO_2 map tests mentioned above rather than based on the FTP and SET cycle testing.

(2) Proposed Engine Standards for CO_2 and Fuel Consumption

We are proposing to maintain the existing Phase 1 regulatory structure for engine standards, which had separate standards for spark-ignition engines (such as gasoline engines) and compression-ignition engines (such as diesel engines), but we are proposing changes to how these standards would apply to natural gas fueled engines. As discussed in Section II.B.(2)(b), the agencies see important advantages to maintaining separate engines standards, such as improved compliance assurance and better control during transient engine operation.

Phase 1 also applied different test cycles depending on whether the engine is used for tractors, vocational vehicles, or both, and we propose to continue this as well.[102] We assume that CO_2 at the

[102] Engine classification is set forth in 40 CFR 1036.801. Spark-ignition means relating to a

Continued

end of Phase 1 is the baseline of Phase 2. Table II–3 shows the Phase 1 CO_2 standards for diesel engines, which serve as the baseline for our analysis of the proposed Phase 2 standards.

TABLE II–3—PHASE 2 BASELINE CO_2 PERFORMANCE

(g/bhp-hr)

LHDD–FTP	MHDD–FTP	HHDD–FTP	MHDD–SET	HHDD–SET
576	576	555	487	460

The gasoline engine baseline CO_2 is 627 (g/bhp-hr). The agencies used the baseline engine to assess the potential of the technologies described in the following sections. As described below, the agencies are proposing new compression-ignition engine standards for Phase 2 that would require additional reductions in CO_2 emissions and fuel consumption beyond the baseline. However, as also described below in Section II.B.(2)(b), we are not proposing more stringent CO_2 or fuel consumption standards for new heavy-duty gasoline engines. Note, however, that we are projecting some small improvement in gasoline engine performance that would be recognized over the vehicle cycles.

For heavy-heavy-duty diesel engines to be installed in Class 7 and 8 combination tractors, the agencies are proposing the standards shown in Table II–4.[103] The proposed MY 2027 standards for engines installed in tractors would require engine manufacturers to achieve, on average, a 4.2 percent reduction in fuel consumption and CO_2 emissions beyond the Phase 1 standard. We propose to adopt interim engine standards in MY 2021 and MY 2024 that would require diesel engine manufacturers to achieve, on average, 1.5 percent and 3.7 percent reductions in fuel consumption and CO_2 emissions, respectively.

TABLE II–4—PROPOSED PHASE 2 HEAVY-DUTY TRACTOR ENGINE STANDARDS FOR ENGINES[104] OVER THE SET CYCLE

Model year	Standard	Medium heavy-duty diesel	Heavy heavy-duty diesel
2021–2023	CO_2 (g/bhp-hr)	479	453
	Fuel Consumption (gallon/100 bhp-hr)	4.7053	4.4499
2024–2026	CO_2 (g/bhp-hr)	469	443
	Fuel Consumption (gallon/100 bhp-hr)	4.6071	4.3517
2027 and Later	CO_2 (g/bhp-hr)	466	441
	Fuel Consumption (gallon/100 bhp-hr)	4.5776	4.3320

Forcompression-ignition engines fitted into vocational vehicles, the agencies are proposing MY 2027 standards that would require engine manufacturers to achieve, on average, a 4.0 percent reduction in fuel consumption and CO_2 emissions beyond the Phase 1 standard. We propose to adopt interim engine standards in MY 2021 and MY 2024 that would require diesel engine manufacturers to achieve, on average, 2.0 percent and 3.5 percent reductions in fuel consumption and CO_2 emissions, respectively.

Table II–5 presents the CO_2 and fuel consumption standards the agencies propose for compression-ignition engines to be installed in vocational vehicles. The first set of standards would take effect with MY 2021, and the second set would take effect with MY 2024.

TABLE II–5—PROPOSED VOCATIONAL DIESEL ENGINE STANDARDS OVER THE HEAVY-DUTY FTP CYCLE

Model year	Standard	Light heavy-duty diesel	Medium heavy-duty diesel	Heavy heavy-duty diesel
2021–2023	CO_2 Standard (g/bhp-hr)	565	565	544
	Fuel Consumption Standard (gallon/100 bhp-hr)	5.5501	5.5501	5.3438
2024–2026	CO_2 Standard (g/bhp-hr)	556	556	536
	Fuel Consumption (gallon/100 bhp-hr)	5.4617	5.4617	5.2652
2027 and Later	CO_2 Standard (g/bhp-hr)	553	553	533
	Fuel Consumption (gallon/100 bhp-hr)	5.4322	5.4322	5.2358

Although both EPA and NHTSA are proposing to begin the Phase 2 engine standards, EPA considered proposing Phase 2 standards that would begin before MY 2021—that is with less lead time. NHTSA is required by statute to

gasoline-fueled engine or any other type of engine with a spark plug (or other sparking device) and with operating characteristics similar to the Otto combustion cycle. However, engines that meet the definition of spark-ignition per 1036.801, but are regulated as diesel engines under 40 CFR part 86 (for criteria pollutants) are treated as compression-ignition engines for GHG standards. Compression-ignition means relating to a type of reciprocating, internal-combustion engine that is not a spark-ignition engine, however, engines that meet the definition of compression-ignition per 1036.801, but are regulated as Otto-cycle engines under 40 CFR part 86 are treated as spark-ignition engines for GHG standards.

[103] The agencies note that the CO_2 and fuel consumption standards for Class 7 and 8 combination tractors do not cover gasoline or LHDD engines, as those are not used in Class 7 and 8 combination tractors.

[104] Tractor engine standards apply to all engines, without regard to the engine-cycle classification.

provide four models years of lead time, while EPA is required only to provide lead time ''necessary to permit the development and application of the requisite technology'' (CAA Section 202(a)(2)). However, as noted in Section I, lead time cannot be separated for other relevant factors such as costs, reliability, and stringency. Proposing these standards before 2021 could increase the risk of reliability issues in the early years. Given the limited number of engine models that each manufacturer produces, managing that many new standards would be problematic (*i.e.,* new Phase 1 standards in 2017, new Phase 2 EPA standards in 2018, 2019, or 2020, new standards in 2021, 2024, and again in 2027). Considering these challenges, EPA determined that earlier model year standards would not be appropriate, especially given the value of harmonizing the NHTSA and EPA standards.

(a) Feasibility of the Diesel (Compression-Ignition) Engine Standards

In this section, the agencies discuss our assessment of the feasibility of the proposed engine standards and the extent to which they would conform to our respective statutory authority and responsibilities. More details on the technologies discussed here can be found in the Draft RIA Chapter 2.3. The feasibility of these technologies is further discussed in draft RIA Chapter 2.7 for tractor and vocational vehicle engines. Note also, that the agencies are considering adopting engine standards with less lead time, and may do so in the Final Rules. These standards are discussed in Section (e).

Based on the technology analysis described below, the agencies can project a technology path exists to allow manufacturers to meet the proposed final Phase 2 standards by 2027, as well as meeting the intermediate 2021 and 2024 standards. The agencies also project that manufacturers would be able to meet these standards at a reasonable cost and without adverse impacts on in-use reliability. Note that the agencies are still evaluating whether these same standards could be met sooner, as was analyzed in Alternative 4.

In general, engine performance for CO_2 emissions and fuel consumption can be improved by improving combustion and reducing energy losses. More specifically, the agencies have identified the following key areas where fuel efficiency can be improved:

- Combustion optimization
- Turbocharging system
- Engine friction and other parasitic losses
- Exhaust aftertreatment
- Engine breathing system
- Engine downsizing
- Waste heat recovery
- Transient control for vocational engines only

The agencies are proposing to phase-in the standards from 2021 through 2027 so that manufacturers could gradually introduce these technologies. For most of these improvements, the agencies project manufacturers could begin applying them to about 45–50 percent of their heavy-duty engines by 2021, 90–95 percent by 2024, and ultimately apply them to 100 percent of their heavy-duty engines by 2027. However, for some of these improvements (such as waste heat recovery and engine downsizing) we project lower application rates in the Phase 2 time frame. This phase-in structure is consistent with the normal manner in which manufacturers introduce new technology to manage limited R&D budgets and well as to allow them to work with fleets to fully evaluate in-use reliability before a technology is applied fleet-wide. The agencies believe the proposed phase-in schedule would allow manufacturers to complete these normal processes. As described in Section (e), the agencies are also requesting comment on whether manufacturers could complete these development steps more quickly so that they could meet these standards sooner.

Based on our technology assessment described below, the proposed engine standards appear to be consistent with the agencies' respective statutory authorities. All of the technologies with high penetration rates above 50 percent have already been demonstrated to some extent in the field or in research laboratories, although some development work remains to be completed. We note that our feasibility analysis for these engine standards is not based on projecting 100 percent application for any technology until 2027. We believe that projecting less than 100 percent application is appropriate and gives us additional confidence that the interim standards would be feasible.

Because this analysis considers reductions from engines meeting the Phase 1 standards, it assumes manufacturers would continue to include the same compliance margins as Phase 1. In other words, a manufacturer currently declaring FCLs 10 g/hp-hr above its measured emission rates (in order to account for production and test-to-test variability) would continue to do the same in Phase 2. We request comment on this assumption.

The agencies have carefully considered the costs of applying these technologies, which are summarized in Section II.D.(2) (d). These costs appear to be reasonable on both a per engine basis, and when considering payback periods.[105] The engine technologies are discussed in more detail below. Readers are encouraged to see the draft RIA Chapter 2 for additional details (and underlying references) about our feasibility analysis.

(i) Combustion Optimization

Although manufacturers are making significant improvements in combustion to meet the Phase 1 engine standards, the agencies project that even more improvement would be possible after 2018. For example, improvements to fuel injection systems would allow more flexible fuel injection capability with higher injection pressure, which can provide more opportunities to improve engine fuel efficiency. Further optimization of piston bowls and injector tips would also improve engine performance and fuel efficiency. We project that a reduction of up to 1.0 percent is feasible in the 2024 model year through the use of these technologies, although it would likely apply to only 95 percent of engines until 2027.

Another important area of potential improvement is advanced engine control incorporating model based calibration to reduce losses of control during transient operation. Improvements in computing power and speed would make it possible to use much more sophisticated algorithms that are more predictive than today's controls. Because such controls are only beneficial during transient operation, they would reduce emission over the FTP cycle, and during in-use operation, they would not reduce emissions over the SET cycle. Thus the agencies are projecting model based control reductions only for vocational engines. Although this control concept is not currently available, we project model based controls achieving a 2 percent improvement in transient emissions could be in production for some engine models by 2021. By 2027, we project over one-third of all vocational diesel engines would incorporate model-based controls.

(ii) Turbocharging System

Many advanced turbocharger technologies can be potentially added

[105] See Section IX.M for additional information about payback periods.

into production in the time frame between 2021 and 2027, and some of them are already in production, such as mechanical or electric turbo-compound, more efficient variable geometry turbine, and Detroit Diesel's patented asymmetric turbocharger. A turbo compound system extracts energy from the exhaust to provide additional power. Mechanical turbo-compounding includes a power turbine located downstream of the turbine which in turn is connected to the crankshaft to supply additional power. On-highway demonstrations of this technology began in the early 1980s. It was used first in heavy duty production by Detroit Diesel for their DD15 and DD16 engines and reportedly provided a 3 to 5 percent fuel consumption reduction. Results are duty cycle dependent, and require significant time at high load to see a fuel efficiency improvement. Light load factor vehicles can expect little or no benefit. Volvo reports two to four percent fuel consumption improvement in line haul applications, which could be in production even by 2020.

(iii) Engine Friction and Parasitic Losses

The friction associated with each moving part in an engine results in a small loss of engine power. For example, frictional losses occur at bearings, in the valvetrain, and at the piston-cylinder interface. Taken together such losses represent a large fraction of all energy lost in an engine. For Phase 1, the agencies projected a 1–2 percent reduction in fuel consumption due to friction reduction. However, new information leads us to project that an additional 1.4 percent reduction would be possible for some engines by 2021 and all engines by 2027. These reductions would be possible due to improvements in bearing materials, lubricants, and new accessory designs such as variable-speed pumps.

(iv) Aftertreatment Optimization

All diesel engines manufacturers are already using diesel particulate filter (DPF) to reduce particulate matter (PM) and selective catalytic reduction (SCR) to reduce NO_X emissions. The agencies see two areas in which improved aftertreatment systems can also result in lower fuel consumption. First, increased SCR efficiency could allow re-optimization of combustion for better fuel consumption because the SCR would be capable of reducing higher engine-out NO_X emissions. Second, improved designs could reduce backpressure on the engine to lower pumping losses. The agencies project the combined impact of such improvements could be 0.6 percent or more.

(v) Engine Breathing System

Various high efficiency air handling (for both intake air and exhaust) processes could be produced in the 2020 and 2024 time frame. To maximize the efficiency of such processes, induction systems may be improved by manufacturing more efficiently designed flow paths (including those associated with air cleaners, chambers, conduit, mass air flow sensors and intake manifolds) and by designing such systems for improved thermal control. Improved turbocharging and air handling systems would likely include higher efficiency EGR systems and intercoolers that reduce frictional pressure loss while maximizing the ability to thermally control induction air and EGR. EGR systems that often rely upon an adverse pressure gradient (exhaust manifold pressures greater than intake manifold pressures) must be reconsidered and their adverse pressure gradients minimized. Other components that offer opportunities for improved flow efficiency include cylinder heads, ports and exhaust manifolds to further reduce pumping losses by about 1 percent.

(vi) Engine Downsizing

Proper sizing of an engine is an important component of optimizing a vehicle for best fuel consumption. This Phase 2 rule would improve overall vehicle efficiency, which would result in a drop in the vehicle power demand for most operation. This drop moves the vehicle operating points down to a lower load zone, which can move the engine away from the sweet spot. Engine downsizing combined with engine downspeeding can allow the engine to move back to higher loads and lower speed zone, thus achieving slightly better fuel economy in the real world. However, because of the way engines are tested, little of the benefit of engine downsizing would be detected during engine testing (if power density remains the same) because the engine test cycles are normalized based on the full torque curve. Thus the current engine test is not the best way to measure the true effectiveness of engine downsizing. Nevertheless, we project that some small benefit would be measured over the engine test cycles—perhaps up to a one-quarter percent improvement in fuel consumption. Note that a bigger benefit would be observed during GEM simulation, better reflecting real world improvements. This is factored into the vehicle standards. Thus, the agencies see no reason to fundamentally revise the engine test procedure at this time.

(vii) Waste Heat Recovery

More than 40 percent of all energy loss in an engine is lost as heat to the exhaust and engine coolant. For many years, manufacturers have been using turbochargers to convert some of the waste heat in the exhaust into usable mechanical power than is used to compress the intake air. Manufacturers have also been working to use a Rankine cycle-based system to extract additional heat energy from the engine. Such systems are often called waste heat recovery (WHR) systems. The possible sources of energy include the exhaust, recirculated exhaust gases, compressed charge air, and engine coolant. The basic approach with WHR is to use waste heat from one or more of these sources to evaporate a working fluid, which is passed through a turbine or equivalent expander to create mechanical or electrical power, then re-condensed.

Prior to the Phase 1 Final Rule, the NAS estimated the potential for WHR to reduce fuel consumption by up to 10 percent.[106] However, the agencies do not believe such levels would be achievable within the Phase 2 time frame. There currently are no commercially available WHR systems for diesel engines, although research prototype systems are being tested by some manufacturers. The agencies believe it is likely a commercially-viable WHR capable of reducing fuel consumption by over three percent would be available in the 2021 to 2024 time frame. Cost and complexity may remain high enough to limit the use of such systems in this time frame. Moreover, packaging constraints and transient response challenges would limit the application of WHR systems to line-haul tractors. Refer to RIA Chapter 2 for a detailed description of these systems and their applicability. The agencies project that WHR recovery could be used on 1 percent of all tractor engines by 2021, on 5 percent by 2024, and 15 percent by 2027.

The net cost and effectiveness of future WHR systems would depend on the sources of waste heat. Systems that extract heat from EGR gases may provide the side benefit of reducing the size of EGR coolers or eliminating them altogether. To the extent that WHR systems use exhaust heat, they would increase the overall cooling system heat rejection requirement and likely require larger radiators. This could have negative impacts on cooling fan power

[106] *See* 2010 NAS Report, page 57.

needs and vehicle aerodynamics. Limited engine compartment space under hood could leave insufficient room for additional radiator size increasing. On the other hand, WHR systems that extract heat from the engine coolant, could actually improve overall cooling.

(viii) Technology Packages for Diesel Engines Installed in Tractors

Typical technology packaged for diesel engines installed in tractors basically includes most technologies mentioned above, which includes combustion optimization, turbocharging system, engine friction and other parasitic losses, exhaust aftertreatment, engine breathing system, and engine downsizing. Depending on the technology maturity of WHR and market demands, a small number of tractors could install waste heat recovery device with Rankine cycle technology. During the stringency development, the agencies received strong support from various stakeholders, where they graciously provided many confidential business information (CBI) including both technology reduction potentials and estimated market penetrations. Combining those CBI data with the agencies' engineering judgment, Table II–4 lists those potential technologies together with the agencies' estimated market penetration for tractor engine. Those reduction values shown as ''SET reduction'' are relative to Phase 1 engine, which is shown in Table II–6. It should be pointed out that the stringency in Table II–6 are developed based on the proposed SET reweighting factors l shown in Table II–2. The agencies welcome comment on the market penetration rates listed below.

TABLE II–6—PROJECTED TRACTOR ENGINE TECHNOLOGIES AND REDUCTION

SET mode	SET weighted reduction (%) 2020–2027	Market penetration (2021) %	Market penetration (2024) %	Market penetration (2027) %
Turbo compound with clutch	1.8	5	10	10
WHR (Rankine cycle)	3.6	1	5	15
Parasitic/Friction (Cyl Kits, pumps, FIE), lubrication	1.4	45	95	100
Aftertreatment (lower dP)	0.6	45	95	100
EGR/Intake & exhaust manifolds/Turbo/VVT/Ports	1.1	45	95	100
Combustion/FI/Control	1.1	45	95	100
Downsizing	0.3	10	20	30
Weighted reduction (%)	....	1.5	3.7	4.2

(ix) Technology Packages for Diesel Engines Installed in Vocational Vehicles

For compression-ignition engines fitted into vocational vehicles, the agencies are proposing MY 2021 standards that would require engine manufacturers to achieve, on average, a 2.0 percent reduction in fuel consumption and CO_2 emissions beyond the baseline that is the Phase 1 standard. Beginning in MY 2024, the agencies are proposing engine standards that would require diesel engine manufacturers to achieve, on average, a 3.5 percent reduction in fuel consumption and CO_2 emissions beyond the Phase 1 baseline standards for all diesel engines including LHD, MHD, and HHD. The agencies are proposing these standards based on the performance of reduced parasitics and friction, improved aftertreatment, combustion optimization, superchargers with VGT and bypass, model-based controls, improved EGR cooling/transport, and variable valve timing (only in LHD and MHD engines). The percent reduction for the MY2021, MY2024, and MY2027 standards is based on the combination of technology effectiveness and market adoption rate projected.

Most of the potential engine related technologies discussed previously can be applied here. However, neither the waste heat technologies with the Rankine cycle concept nor turbo-compound would be applied into vocational sector due to the inefficient use of waste heat energy with duty cycles and applications with more transient operation than highway operation. Given the projected cost and complexity of such systems, we believe that for the Phase 2 time frame manufacturers will focus their development work on tractor applications (which would have better payback for operators) rather than vocational applications. In addition, the benefits due to engine downsizing, which can be seen in tractor engines, may not be clearly seen in vocational sector, again because this control technology produces few benefits in transient operation.

One of the most effective technologies for vocational engines is the optimization of transient control. It would be expected that more advanced transient control including different levels of model based control and neural network control package could provide substantial benefits in vocational engines due to the extensive transient operation of these vehicles. For this technology, the use of the FTP cycle would drive engine manufacturers to invest more in transient control to improve engine efficiency. Other effective technologies would be parasitic/friction reduction, as well as improvements to combustion, air handling systems, turbochargers, and aftertreatment systems. Table II–7 below lists those potential technologies together with the agencies' projected market penetration for vocational engines. Again, similar to tractor engine, the technology reduction and market penetration are estimated by combining the CBI data together with the agencies' engineering judgment. Those reduction values shown as ''FTP reduction'' are relative to a Phase 2 baseline engine, which is shown in Table II–3. The weighted reductions combine the emission reduction values weighted by the market penetration of each technology).

TABLE II–7—PROJECTED VOCATIONAL ENGINE TECHNOLOGIES AND REDUCTION

Technology	GHG emissions reduction 2020–2027 %	Market penetration 2021 %	Market penetration 2024 %	Market penetration 2027 %
Model based control	2.0	25	30	40
Parasitic/Friction	1.5	60	90	100
EGR/Air/VVT/Turbo	1.0	50	90	100
Improved AT	0.5	50	90	100
Combustion Optimization	1.0	50	90	100
Weighted reduction (%)–L/M/HHD		2.0	3.5	4.0

(x) Summary of the Agencies' Analysis of the Feasibility of the Proposed Diesel Engine Standards

The proposed HD Phase 2 standards are based on adoption rates for technologies that the agencies regard, subject to consideration of public comment, as the maximum feasible for purposes of EISA Section 32902(k) and appropriate under CAA Section 202(a) for the reasons given above. The agencies believe these technologies can be adopted at the estimated rates for these standards within the lead time provided, as discussed in draft RIA Chapter 2. The 2021 and 2024 MY standards are phase-in standards on the path to the 2027 MY standards and were developed using less aggressive application rates and therefore have lower technology package costs than the 2027 MY standards.

As described in Section II.D.(2)(d) below, the cost of the proposed standards is estimated to range from $270 to $1,698 per engine. This is slightly higher than the costs for Phase 1, which were estimated to be $234 to $1,091 per engine. Although the agencies did not separately determine fuel savings or emission reductions due to the engine standards apart from the vehicle program, it is expected that the fuel savings would be significantly larger than these costs, and the emission reductions would be roughly proportional to the technology costs when compared to the corresponding vehicle program reductions and costs. Thus, we regard these standards as cost-effective. This is true even without considering payback period. The proposed phase-in 2021 and 2024 MY standards are less stringent and less costly than the proposed 2027 MY standards. Given that the agencies believe the proposed standards are technologically feasible, are highly cost effective, and highly cost effective when accounting for the fuel savings, and have no apparent adverse potential impacts (*e.g.,* there are no projected negative impacts on safety or vehicle utility), the proposed standards appear to represent a reasonable choice under Section 202(a) of the CAA and the maximum feasible under NHTSA's EISA authority at 49 U.S.C. 32902(k)(2).

(b) Basis for Continuing the Phase 1 Spark-Ignited Engine Standard

Today most SI-powered vocational vehicles are sold as incomplete vehicles by a vertically integrated chassis manufacturer, where the incomplete chassis shares most of the same technology as equivalent complete pickups or vans, including the powertrain. The number of such incomplete SI-powered vehicles is small compared to the number of completes. Another, even less common way that SI-powered vocational vehicles are built is by a non-integrated chassis manufacturer purchasing an engine from a company that also produces complete and/or incomplete HD pickup trucks and vans. The resulting market structure leads manufacturers of heavy-duty SI engines to have little market incentive to develop separate technology for vocational engines that are engine-certified. Moreover, the agencies have not identified a single SI engine technology that we believe belongs on engine-certified vocational engines that we do not also project to be used on complete heavy-duty pickups and vans.

In light of this market structure, when the agencies considered the feasibility of more stringent Phase 2 standards for SI vocational engines, we identified the following key questions:

1. Will there be technologies available that could reduce in-use emissions from vocational SI engines?

2. Would these technologies be applied to complete vehicles and carried-over to engine certified engines without a new standard?

3. Would these technologies be applied to meet the vehicle-based standards described in Section V?

4. What are the drawbacks associated with setting a technology-forcing Phase 2 standard for SI engines?

With respect to the first and second questions, as noted in Chapter 2.6 of the draft RIA, the agencies have identified improved lubricants, friction reduction, and cylinder deactivation as technologies that could potentially reduce in-use emissions from vocational engines; and the agencies have further determined that to the extent these technologies would be viable for complete vehicles, they would also be applied to engine-certified engines. Nevertheless, significant uncertainty remains about how much benefit would be provided by these technologies. It is possible that the combined impact of these technologies would be one percent or less. With respect to the third question, we believe that to the extent these technologies are viable and effective, they would be applied to meet the vehicle-based standards for vocational vehicles.

At this time, it appears the fourth question regarding drawbacks is the most important. The agencies could propose a technology forcing standard for vocational SI engines based on a projection of each of these technologies being effective for these engines. However, as already noted in Section I, the agencies see value in setting the standards at levels that would not require every projected technology to work as projected. Effectively requiring technologies to match our current projections would create the risk that the standards would not be feasible if even a single one of technologies failed to match our projections. This risk is amplified for SI engines because of the very limited product offerings, which provide far fewer opportunities for averaging than exist for CI engines. Given the relatively small improvement projected, and the likelihood that most or all of this improvement would result anyway from the complete pickup and van standards and the vocational vehicle-based standards, we do not believe such risk is justified or needed. The approach the agencies are proposing accomplishes the same objective without the attendant potential risk. With this approach, the Phase 1 SI engine standard for these engines would remain in place, and engine improvements would be reflected in the stringency of the vehicle standard for the vehicle in which the engine would be installed. Nevertheless, we request comment on the merits of adopting a more stringent SI engine standard in the 2024 to 2027 time frame, including comment on technologies, adoption rates, and effectiveness over the engine cycle that could support adoption of a more stringent standard. Please see Section V.C of this preamble for a description of the SI engine technologies that have been considered in developing the proposed vocational vehicle standards. Please see Section VI.C of this preamble for a description of the SI engine technologies that have been considered in developing the proposed HD pickup truck and van standards.

(c) Engine Improvements Projected for Vehicles over the GEM Duty Cycles

Because we are proposing that tractor and vocational vehicle manufacturers represent their vehicles' actual engines in GEM for vehicle certification, the agencies aligned our *engine* technology effectiveness assessments for both the separate engine standards and the tractor and vocational vehicle standards for each of the regulatory alternatives considered. This was an important step because we are proposing to recognize the same engine technologies in both the separate engine standards and the vehicle standards, which each have different test procedures for demonstrating compliance. As explained earlier in Section II. D. (1), compliance with the tractor separate engine standards is determined from a composite of the Supplemental Engine Test (SET) procedure's 13 steady-state operating points. Compliance with the vocational vehicle separate engine standards is determined over the Federal Test Procedure's (FTP) transient engine duty cycle. In contrast, compliance with the vehicle standards is determined using GEM, which calculates composite results over a combination of 55 mph and 65 mph steady-state vehicle cycles and the ARB Transient vehicle cycle. Note that we are also proposing a new workday idle cycle for vocational vehicles. Each of these duty cycles emphasizes different engine operating points; therefore, they can each recognize certain technologies differently.

Our first step in aligning our engine technology assessment at both the engine and vehicle levels was to start with an analysis of how we project each technology to impact performance at each of the 13 individual test points of the SET steady-state engine duty cycle. For example, engine friction reduction technology would be expected to have the greatest impact at the highest engine speeds, where frictional energy losses are the greatest. As another example, turbocharger technology is generally optimized for best efficiency at steady-state cruise vehicle speed. For an engine this is near its lower peak-torque speed and at a moderately high load that still offers sufficient torque reserve to climb modest road grades without frequent transmission gear shifting. The agencies also considered the combination of certain technologies causing synergies and dis-synergies with respect to engine efficiency at each of these test points. See RIA Chapter 2 for further details.

Next we estimated unique brake-specific fuel consumption values for each of the 13 SET test points for two hypothetical MY2018 tractor engines that would be compliant with the Phase 1 standards. These were a 15 liter displacement 455 horsepower engine and an 11 liter 350 horsepower engine. We then added technologies to these engines that we determined were feasible for MY2021, MY2024, and MY 2027, and we determined unique improvements at each of the 13 SET points. We then calculated composite SET values for these hypothetical engines and determined the SET improvements that we could use to propose more stringent separate tractor engine standards for MY2021, MY2024, and MY 2027.

To align our engine technology analysis for vehicles to the SET engine analysis described above, we then fit a surface equation through each engine's SET points versus engine speed and load to approximate their analogous fuel maps that would represent these same engines in GEM. Because the 13 SET test points do not fully cover an engine's wide range of possible operation, we also determined improvements for an additional 6 points of engine operation to improve the creation of GEM fuel maps for these engines. Then for each of these 8 tractor engines (two each for MY2018, MY2021, MY2024, and MY2027) we ran GEM simulations to represent low-, mid-, and high-roof sleeper cabs and low-, mid-, and high-roof day cabs. Class 8 tractors were assumed for the 455 horsepower engine and Class 7 tractors (day cabs only) were assumed for the 350 horsepower engine. Each GEM simulation calculated results for the 55 mph, 65 mph, and ARB Transient cycles, as well as the composite GEM value associated with each of the tractor types. After factoring in our Alternative 3 projected market penetrations of the engine technologies, we then compared the percent improvements that the same sets of engine technology caused over the separate engines' SET composites and the various vehicles' GEM composites. Compared to their respective MY2018 baseline engines, the two engines of different horsepower showed the same percent improvements. All of the tractor cab types showed nearly the same relative improvements too. For example, for the MY2021 Alternative 3 engine technology package in a high roof sleeper tractor, the SET engine composites showed a 1.5 percent improvement and the GEM composites a 1.6 percent improvement. For the MY2024 Alternative 3 engine technology packages, the SET engine composites showed a 3.7 percent improvement and the GEM composites a 3.7 percent improvement. For MY2027 Alternative 3 engine technology packages, the SET engine composites showed a 4.2 percent improvement and the GEM composites a 4.2 percent improvement. We therefore concluded that tractor engine technologies will improve engines and tractors proportionally, even though the separate engine and vehicle certification test procedures have different duty cycles.

We then repeated this same process for the FTP engine transient cycle and the GEM vocational vehicle types. For the vocational engine analysis we investigated four engines: 15 liter displacement engine at 455 horsepower rating, 11 liter displacement engine at 345 horsepower rating, a 7 liter displacement engine at a 200 horsepower rating and a 270 horsepower rating. These engines were then used in GEM over the light-heavy, medium-heavy, and heavy-heavy vocational vehicle configurations. Because the technologies were assumed to impact each point of the FTP in the same way, the results for all engines and vehicles were 2.0 percent improvement in MY2021, 3.5 percent improvement in MY2024, and 4.0 percent improvement in MY2027. Therefore, we arrived at the same conclusion that vocational vehicle engine technologies are recognized at the same percent improvement over the FTP as the GEM cycles. We request comment on our approach to arrive at this conclusion.

(d) Engine Technology Package Costs for Tractor and Vocational Engines (and Vehicles)

As described in Chapters 2 and 7 of the draft RIA, the agencies estimated costs for each of the engines technologies discussed here. All costs are presented relative to engines projected to comply with the model year 2017 standards—*i.e.,* relative to our baseline engines. Note that we are not presenting any costs for gasoline engines (SI engines) because we are not proposing to change the standards.

Our engine cost estimates include a separate analysis of the incremental part costs, research and development activities, and additional equipment. Our general approach used elsewhere in this action (for HD pickup trucks, gasoline engines, Class 7 and 8 tractors, and Class 2b-8 vocational vehicles) estimates a direct manufacturing cost for a part and marks it up based on a factor to account for indirect costs. *See also* 75 FR 25376. We believe that approach is appropriate when compliance with proposed standards is achieved generally by installing new parts and systems purchased from a supplier. In such a case, the supplier is conducting the bulk of the research and development on the new parts and systems and including those costs in the purchase price paid by the original equipment manufacturer. The indirect costs incurred by the original equipment manufacturer need not include much cost to cover research and development since the bulk of that effort is already done. For the MHD and HHD diesel engine segment, however, the agencies believe that OEMs will incur costs not associated with the purchase of parts or systems from suppliers or even the production of the parts and systems, but rather the development of the new technology by the original equipment manufacturer itself. Therefore, the agencies have directly estimated additional indirect costs to account for these development costs. The agencies used the same approach in the Phase 1 HD rule. EPA commonly uses this approach in cases where significant investments in research and development can lead to an emission control approach that requires no new hardware. For example, combustion optimization may significantly reduce emissions and cost a manufacturer millions of dollars to develop but would lead to an engine that is no more expensive to produce. Using a bill of materials approach would suggest that the cost of the emissions control was zero reflecting no new hardware and ignoring the millions of dollars spent to develop the improved combustion system. Details of the cost analysis are included in the draft RIA Chapter 2. To reiterate, we have used this different approach because the MHD and HHD diesel engines are expected to comply in part via technology changes that are not reflected in new hardware but rather reflect knowledge gained through laboratory and real world testing that allows for improvements in control system calibrations—changes that are more difficult to reflect through direct costs with indirect cost multipliers. Note that these engines are also expected to incur new hardware costs as shown in Table II–8 through Table II–11. EPA also developed the incremental piece cost for the components to meet each of the 2021 and 2024 standards. The costs shown in Table II–12 include a low complexity ICM of 1.15 and assume the flat-portion of the learning curve is applicable to each technology.

(i) Tractor Engine Package Costs

TABLE II–8—PROPOSED MY2021 TRACTOR DIESEL ENGINE COMPONENT COSTS INCLUSIVE OF INDIRECT COST MARKUPS AND ADOPTION RATES (2012$)

	Medium HD	Heavy HD
Aftertreatment system (improved effectiveness SCR, dosing, DPF)	$7	$7
Valve Actuation	82	82
Cylinder Head (flow optimized, increased firing pressure, improved thermal management)	3	3
Turbocharger (improved efficiency)	9	9
Turbo Compounding	50	50
EGR Cooler (improved efficiency)	2	2
Water Pump (optimized, variable vane, variable speed)	43	43
Oil Pump (optimized)	2	2
Fuel Pump (higher working pressure, increased efficiency, improved pressure regulation)	2	2

Total	471	437	437

(e) Feasibility of Phasing In the CO_2 and Fuel Consumption Standards Sooner

The agencies are requesting comment on accelerated standards for diesel engines that would achieve the same reductions as the proposed standards, but with less lead time. Table II–14 and Table II–15 below show a technology path that the agencies project could be used to achieve the reductions that would be required within the lead time allowed by the alternative standards. As discussed in Sections I and X, the agencies are proposing to fully phase in these standards through 2027. The agencies believe that standards that fully phase in through 2024 have the potential to be the maximum feasible and appropriate option. However, based on the evidence currently before the agencies, we have outstanding questions (for which we are seeking comment) regarding relative risks and benefits of that option in the timeframe envisioned. Commenters are encouraged to address how technologies could develop if a shorter lead time is selected. In particular, we request comment on the likelihood that WHR systems would be available for tractor engines in this time frame, and that WHR systems would achieve the projected level of reduction and the necessary reliability. We also request comment on whether it would be possible to apply the model based controls described in Section II.D.(2)(a)(i) to this many vocational engines in this time frame.

TABLE II–14—PROJECTED TRACTOR ENGINE TECHNOLOGIES AND REDUCTION FOR ALTERNATIVE 4 STANDARDS

%-Improvements beyond Phase 1, 2018 engine as baseline	SET reduction (%)	Market penetration MY 2021 (%)	Market penetration MY 2024 (%)
Turbo compound	1.82	5	10
WHR (Rankine cycle)	3.58	4	15
Parasitics/Friction (Cyl Kits, pumps, FIE), lubrication	1.41	60	100
Aftertreatment	0.61	60	100
Exhaust Manifold Turbo Efficiency EGR Cooler VVT	1.14	60	100

Downsizing	0.29	20	30
Market Penetration Weighted Package		2.1	4.2

TABLE II–15—PROJECTED VOCATIONAL ENGINE TECHNOLOGIES AND REDUCTION FOR MORE STRINGENT ALTERNATIVE STANDARDS

%-Improvements beyond Phase 1, 2018 engine as baseline	FTP reduction (%)	Market penetration MY 2021 (%)	Market penetration MY 2024 (%)
Model based control	2	30	40
Parasitics/Friction	1.5	70	100
EGR/Air/VVT/Turbo	1	70	100
Improved AT	0.5	70	100
Combustion Optimization	1	70	100
Weighted reduction (%)-L/MHD/HHD	....	2.5	4.0

The projected HDD engine package costs for both tractors and vocational engines in MYs 2021 and 2024 under Alternative 4 are shown in Table II–16. Note that, while the technology application rates in MY2024 under Alternative 4 are essentially identical to those for MY2027 under the proposal, the costs are about 5 to 11 percent higher under Alternative 4 due to learning effects and markup changes that are estimated to have occurred by MY2027 under Alternative 3. Note also that the agencies did not include any additional costs for accelerating technology development or to address potential in-use durability issues. We request comment on whether such costs would occur if we finalized this alternative. We also request comment on what steps could be taken to mitigate such costs.

TABLE II–16—EXPECTED PACKAGE COSTS FOR HD DIESEL ENGINES UNDER ALTERNATIVE 4 (2012$) [a]

Model year	MHDD tractor	HHDD tractor	LHDD vocational	MHDD vocational	HHDD vocational
2021	$656	$656	$372	$345	$345
2024	1,885	1,885	493	457	457

Note:
[a] Costs presented here include application rates.

The agencies' analysis shows that, in the absence of additional costs for accelerating technology development or to address potential in-use durability issues, the costs associated with Alternative 4 would be very similar to those we project for the proposed standards. Alternative 4 would also have similar payback times and cost-effectiveness. In other words, Alternative 4 would achieve some additional reductions for model years 2021 through 2026, with roughly proportional additional costs unless there were additional costs for accelerating development or for in-use durability issues. (Note that reductions and costs for MY 2027 and later would be equivalent for Alternative 4 and the proposed standards). In order to help make this assessment, we request comment on the following issues: whether manufacturers could meet these standards with three years less lead time, what additional expenses would be incurred to meet these standards with less lead time, and how reliable would the engines be if the manufacturers had to bring them to market three years earlier.

(3) Proposed EPA Engine Standards for N_2O

EPA is proposing to adopt the MY 2021 N_2O engine standards that were originally proposed for Phase 1. The proposed level for Phase 2 would be 0.05 g/hp-hr with a default deterioration factor of 0.01 g/hp-hr, which we believe is technologically feasible because a number of engines meet this level today. This level of stringency is consistent with the agency's Phase 1 approach to set ''cap'' standards for N_2O. EPA finalized Phase 1 standards for N_2O as engine-based standards at 0.10 g/hp-hr and a 0.02 g/hp-hr default deterioration factor because the agency believes that emissions of this GHG are technologically related solely to the engine, fuel, and emissions aftertreatment systems, and the agency is not aware of any influence of vehicle-based technologies on these emissions. We continue to believe this approach is appropriate, but we believe that more stringent standards are appropriate to ensure that N_2O emissions do not increase in the future. Note that NHTSA did not adopt standards for N_2O because these emissions do not impact fuel consumption in a significant way, and is not proposing such standards for Phase 2 for the same reason.

We are proposing this change at no additional cost and no additional benefit because manufacturers are generally meeting the proposed standard today. The purpose of this standard is to prevent increases in N_2O emissions absent this proposed increase in stringency. We request comment on whether or not we should be considering additional costs for compliance. Similarly, we request comment on whether or not we should assume N_2O increases in our ''No Action'' regulatory Alternatives 1a and 1b described in Section X.

Although N_2O is emitted in very small amounts, it can have a very significant impact on the climate. The global warming potential (GWP) of one molecule of N_2O is 298 times that of one molecule CO_2. Because N_2O and CO_2 coincidentally have the same molar mass, this means that one gram of N_2O would have the same impact on the climate as 298 grams of CO_2. To further put this into perspective, the difference between the proposed N_2O standard (and deterioration factor) and the current Phase 1 standard is 0.40 g/hp-hr of N_2O emissions. This is equivalent to 11.92 g/hp-hr CO_2. Over the same certification test cycle (*i.e.* EPA's HD FTP) the Phase 1 engine CO_2 emissions standard ranges from 460 to 576 g/hp-hr, depending on the service class of the engine. Therefore, absent today's proposed action, engine N_2O increases equivalent to 2.1 to 2.6 percent of the Phase 1 CO_2 standard could occur.

We are proposing this lower cap because we have determined that manufacturers generally are meeting this level today but in the future could increase N_2O emissions up to the current Phase 1 cap standard. Because we do not believe any manufacturer would need to do anything more than recalibrate their SCR systems to comply, the lead time being provided would be sufficient. This section later describes why manufacturers may increase N_2O emissions from SCR-equipped compression-ignition engines in the absence of a lower N_2O cap standard. We request comment on this. We also note that, as described in Section XI, EPA does not believe there is a similar opportunity to lower the pickup and van N_2O standard because it was set at a more stringent level in Phase 1.

(a) N_2O Formation

N_2O formation in modern diesel engines is a by-product of the SCR process. It is dependent on the SCR catalyst type, the NO_2 to NO_X ratio, the level of NO_X reduction required, and the concentration of the reactants in the system (NH_3 to NO_X ratio).

Two current engine/aftertreatment designs are driving N_2O emission higher. The first is an increase in engine out NO_X, which puts a higher NO_X reduction burden on the SCR NO_X emission control system. The second is an increase in NO_2 formation from the diesel oxidation catalyst (DOC) located upstream of the passive catalyzed diesel particulate filter (CDPF). This increase in NO_2 serves two functions: Improving passive CDPF regeneration and optimization of faster SCR reaction.[107]

There are multiple mechanisms through which N_2O can form in an SCR system:

1. Low temperature formation of N_2O over the DOC prior to the SCR catalyst.
2. Low temperature formation of NH_4NO_3 with subsequent decomposition as exhaust temperatures increase, leading to conversion to N_2O over the SCR catalyst.
3. Formation of N_2O from NO_2 over the SCR catalyst at NO_2 to NO ratios greater than 1:1. N_2O formation increases significantly at 300 to 350 °C.
4. Formation of N_2O from NH_3 via partial oxidation over the ammonia slip catalyst.
5. High-temperature N_2O formation over the SCR catalyst due to NH_3 oxidation facilitated by high SCR catalyst surface coverage of NH_3.

Thus, as discussed below, control of N_2O formation requires precise optimization of SCR controls including thermal management and dosing rates, as well as catalyst composition.

(b) N_2O Emission Reduction

Through on-engine and reactor bench experiments, this same work showed that the key to reducing N_2O emissions lies in intelligent emission control system design and operation, namely:

1. Selecting the appropriate DOC and/or CDPF catalyst loadings to maintain NO_2 to NO ratios at or below 1:1.
2. Avoiding high catalyst surface coverage of NH_3 though urea dosing management when the system is in the ideal N_2O formation window.
3. Utilizing thermal management to push the SCR inlet temperature outside of the N_2O low-temperature formation window.

EPA believes that reducing the standard from 0.1 g/hp-hr to 0.05 g/hp-hr is feasible because most engines have emission rates that would meet this standard today and the others could meet it with minor calibration changes at no additional cost. Numerous studies have shown that diesel engine technologies can be fine-tuned to meet the current NO_X and proposed N_2O standards while still providing passive CDPF regeneration even with earlier generations of SCR systems. Currently model year 2014 systems have already moved on to newer generation systems in which the combined CDPF and SCR functions have been further optimized. The result of this is 18 of 24 engines in the EPA 2014 certification database emitting N_2O at less than half of the 2014 standard, and thus below the proposed standard.[108] Given the discussions in the literature, there are still additional calibration steps that can be taken to further reduce N_2O emissions for the higher emitters to afford an adequate compliance margin and room to account for deterioration, without having an adverse effect on criteria pollutant emissions.

[107] Hallstrom, K., Voss, K., and Shah, S., ''The Formation of N_2O on the SCR Catalyst in a Heavy Duty US 2010 Emission Control System'', SAE Technical Paper 2013–01–2463.

[108] *http://www.epa.gov/otaq/crttst.htm.*

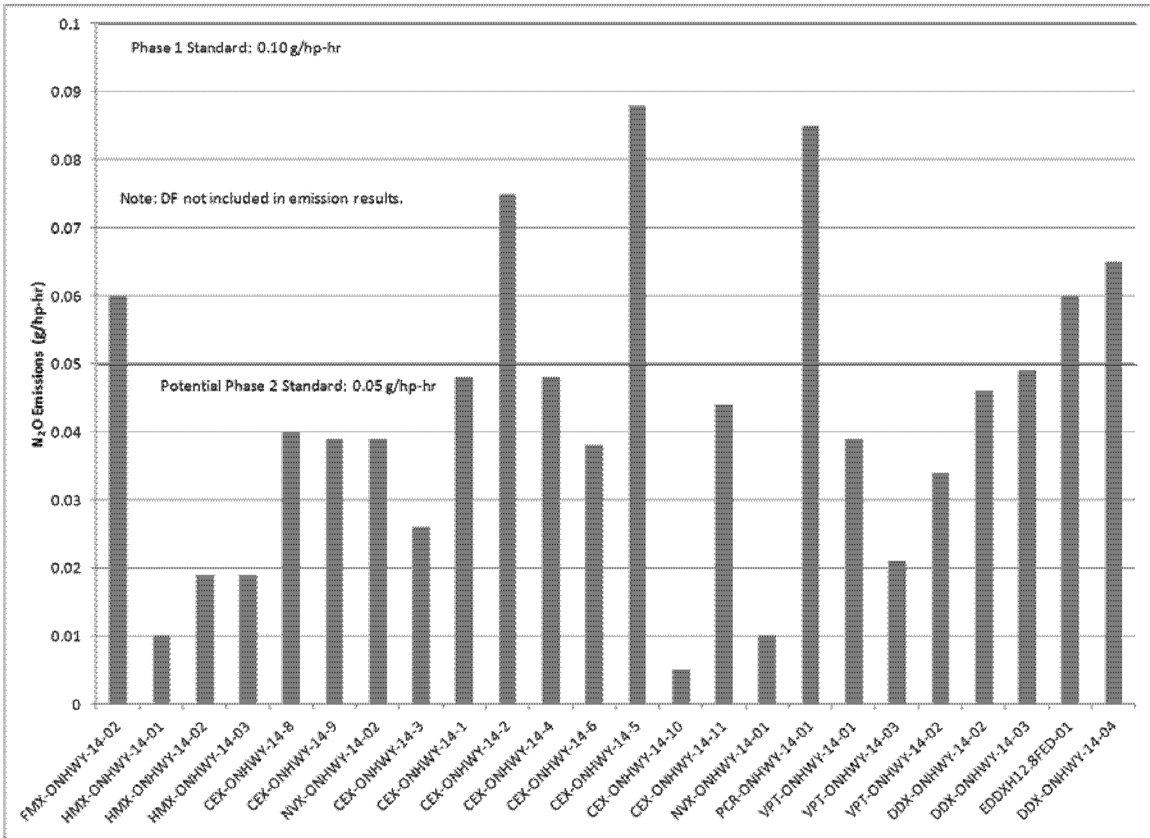

Figure II-2 EPA 2014 Certification Database N_2O Emission Results for 24 Engines

It is important to note, however, that there is a trade off when trying to optimize SCR systems to achieve peak NO_X reduction efficiencies. When transitioning from a <93 percent efficient MY 2011 system to a 98 percent efficient system of the future, lowering the N_2O cap to 0.05 g/hp-hr would put constraints on the techniques that can be applied to improve efficiency. If system designers push the NH_3 to NO_X ratio higher to try and achieve the maximum possible NO_X reduction, it could increase N_2O emissions. If EPA were to adopt a very low NO_X standard (*e.g.,* 0.02 g/hp-hr) over existing test cycles, some reductions would be needed throughout the hot portion of the cycle (although most of the reductions would have to come from the cold start portion of the test cycle). Thermal management would need to play a key role, and reducing catalyst light-off time would move the SCR catalyst through the ammonium nitrate formation and decomposition thermal range quicker, thus lowering N_2O emissions. An increase in the NH_3 to NO_X ratio could also further reduce NO_X emissions; however this would also adversely affect NH_3 slip and N_2O formation. The inability of NH_3 slip catalysts to handle the increased NH_3 load and the EPA NH_3 slip limit of 10 ppm would guard against this NH_3 to NO_X ratio increase, and thus subsequent N_2O increase.

In summary, EPA believes that engine manufacturers would be able to respond with highly efficient NO_X reducing systems that can meet the proposed lower N_2O cap of 0.05 g/hp-hr with no additional cost or lead time. When optimizing SCR systems for better NO_X reduction efficiency, that optimization includes lowering the emissions of undesirable side reactions, including those that form N_2O.

(4) EPA Engine Standards for Methane

EPA is proposing to apply the Phase 1 methane engine standards to the Phase 2 program. EPA adopted the cap standards for CH_4 (along with N_2O standards) as engine-based standards because the agency believes that emissions of this GHG are technologically related solely to the engine, fuel, and emissions aftertreatment systems, and the agency is not aware of any influence of vehicle-based technologies on these emissions. Note that NHTSA did not adopt standards for CH_4 (or N_2O) because these emissions do not impact fuel consumption in a significant way, and is not proposing CH_4 standards for Phase 2 either.

EPA continues to believe that manufacturers of most engine technologies will be able to comply with the Phase 1 CH_4 standard with no technological improvements. We note that we are not aware of any new technologies that would allow us to adopt more stringent standards at this time. We request comment on this.

(5) Compliance Provisions and Flexibilities for Engine Standards

The agencies are proposing to continue most of the Phase 1 compliance provisions and flexibilities for the Phase 2 engine standards.

(a) Averaging, Banking, and Trading

The agencies' general approach to averaging is discussed in Section I. We are not proposing to offer any special credits to engine manufacturers. Except for early credits and advanced technology credits, the agencies propose to retain all Phase 1 credit flexibilities and limitations to continue for use in the Phase 2 program.

As discussed below, EPA is proposing to change the useful life for LHD engines for GHG emissions from the current 10 years/110,000 miles to 15 years/150,000 miles to be consistent with the useful life of criteria pollutants recently updated in EPA's Tier 3 rule. In order to ensure that banked credits would maintain their value in the transition from Phase 1 to Phase 2, NHTSA and EPA propose an adjustment factor of 1.36 (*i.e.,* 150,000 mile ÷ 110,000 miles) for credits that are carried forward from Phase 1 to the MY 2021 and later Phase 2 standards. Without this adjustment factor the proposed change in useful life would effectively result in a discount of banked credits that are carried forward from Phase 1 to Phase 2, which is not the intent of the change in the useful life. See Sections V and VI for additional discussion of similar adjustments of vehicle-based credits.

(b) Request for Comment on Changing Global Warming Potential Values in the Credit Program for CH_4 and N_2O

The Phase 1 rule included a compliance alternative allowing heavy-duty manufacturers and conversion companies to comply with the respective methane or nitrous oxide standards by means of over-complying with CO_2 standards (40 CFR 1036.705(d)). The heavy-duty rules allow averaging only between vehicles or engines of the same designated type (referred to as an ''averaging set'' in the rules). Specifically, the phase 1 heavy-duty rulemaking added a CO_2 credits program which allowed heavy-duty manufacturers to average and bank pollutant emissions to comply with the methane and nitrous oxide requirements after adjusting the CO_2 emission credits based on the relative GHG equivalents. To establish the GHG equivalents used by the CO_2 credits program, the Phase 1 rule incorporated the IPCC Fourth Assessment Report global warming potential (GWP) values of 25 for CH_4 and 298 for N_2O, which are assessed over a 100 year lifetime.

Since the Phase 1 rule was finalized, a new IPCC report has been released (the Fifth Assessment Report), with new GWP estimates. This is prompting us to look again at the relative CO_2 equivalency of methane and nitrous oxide and to seek comment on whether the methane and nitrous oxide GWPs used to establish the GHG equivalency value for the CO_2 Credit program should be updated to those established by IPCC in its Fifth Assessment Report. The Fifth Assessment Report provides four 100 year GWPs for methane ranging from 28 to 36 and two 100 year GWPs for nitrous oxide, either 265 or 298. Therefore, we not only request comment on whether to update the GWP for methane and nitrous oxide to that of the Fifth Assessment Report, but also on which value to use from this report.

(c) In-Use Compliance and Useful Life

Consistent with Section 202(a)(1) and 202 (d) of the CAA, for Phase 1, EPA established in-use standards for heavy-duty engines. Based on our assessment of testing variability and other relevant factors, we established in-use standards by adding a 3 percent adjustment factor to the full useful life emissions and fuel consumption results measured in the EPA certification process to address measurement variability inherent in comparing results among different laboratories and different engines. See 40 CFR part 1036. The agencies are not proposing to change this for Phase 2, but request comment on whether this allowance is still necessary.

We note that in Phase 1, we applied these standards to only certain engine configurations in each engine family (often called the parent rating). We welcome comment on whether the agencies should set Phase 2 CO_2 and fuel consumption standards for the other ratings (often called the child ratings) within an engine family. We are not proposing specific engine standards for child ratings in Phase 2 because we are proposing to include the actual engine's fuel map in the vehicle certification. We believe this approach appropriately addresses our concern that manufacturers control CO_2 emissions and fuel consumption from all in-use engine configurations within an engine family.

In Phase 1, EPA set the useful life for engines and vehicles with respect to GHG emissions equal to the respective useful life periods for criteria pollutants. In April 2014, as part of the Tier 3 light-duty vehicle final rule, EPA extended the regulatory useful life period for criteria pollutants to 150,000 miles or 15 years, whichever comes first, for Class 2b and 3 pickup trucks and vans and some light-duty trucks (79 FR 23414, April 28, 2014). As described in Section V, EPA is proposing that the Phase 2 GHG standards for vocational vehicles at or below 19,500 lbs GVWR apply over the same useful life of 150,000 miles or 15 years. To be consistent with that proposed change, we are also proposing that the Phase 2 GHG standards for engines used in vocational vehicles at or below 19,500 lbs GVWR apply over the same useful life of 150,000 miles or 15 years. NHTSA proposes to use the same useful life values as EPA for all vocational vehicles.

We are proposing to continue regulatory allowance in 40 CFR 1036.150(g) that allows engine manufacturers to use assigned deterioration factors (DFs) for most engines without performing their own durability emission tests or engineering analysis. However, the engines would still be required to meet the standards in actual use without regard to whether the manufacturer used the assigned DFs. This allowance is being continued as an interim provision and may be discontinued for later phases of standards as more information becomes known. Manufacturers are allowed to use an assigned additive DF of 0.0 g/bhp-hr for CO_2 emissions from any conventional engine (*i.e.,* an engine not including advance or off-cycle technologies). Upon request, we could allow the assigned DF for CO_2 emissions from engines including advance or off-cycle technologies, but only if we determine that it would be consistent with good engineering judgment. We believe that we have enough information about in-use CO_2 emissions from conventional engines to conclude that they will not increase as the engines age. However, we lack such information about the more advanced technologies.

We are also requesting comment on how to apply DFs to low level measurements where test-to-test variability may be larger than the actual deterioration rates being measured, such as might occur with N_2O. Should we allow statistical analysis to be used to identifying trends rather than basing the DF on the highest measured value? How would we allow this where emission deterioration is not linear, such as saw-tooth deterioration related to maintenance or other offsetting emission effects causing emissions to peak before the end of the useful life? Finally, EPA requests comment on whether a similar allowance would be appropriate for criteria pollutants as well.

(d) Alternate CO_2 Standards

In the Phase 1 rulemaking, the agencies proposed provisions to allow certification to alternate CO_2 engine standards in model years 2014 through 2016. This flexibility was intended to address the special case of needed lead time to implement new standards for a previously unregulated pollutant. Since that special case does not apply for Phase 2, we are not proposing a similar flexibility in this rulemaking. We also request comment on whether this allowance should be eliminated for Phase 1 engines.

(e) Proposed Approach to Standards and Compliance Provisions for Natural Gas Engines

EPA is also proposing certain clarifying changes to its rules regarding classification of natural gas engines. This proposal relates to standards for all emissions, both greenhouse gases and criteria pollutants. These clarifying changes are intended to reflect the status quo, and therefore should not have any associated costs.

EPA emission standards have always applied differently for gasoline-fueled and diesel-fueled engines. The regulations in 40 CFR part 86 implement these distinctions by dividing engines into Otto-cycle and Diesel-cycle technologies. This approach led EPA to categorize natural gas engines according to their design history. A diesel engine converted to run on natural gas was classified as a diesel-cycle engine; a gasoline engine converted to run on natural gas was classified as an Otto-cycle engine.

The Phase 1 rule described our plan to transition to a different approach, consistent with our nonroad programs, in which we divide engines into compression-ignition and spark-ignition technologies based only on the operating characteristics of the engines.[109] However, the Phase 1 rule included a provision allowing us to continue with the historic approach on an interim basis.

Under the existing EPA regulatory definitions of ''compression-ignition'' and ''spark-ignition'', a natural gas engine would generally be considered compression-ignition if it operates with lean air-fuel mixtures and uses a pilot injection of diesel fuel to initiate combustion, and would generally be considered spark-ignition if it operates with stoichiometric air-fuel mixtures and uses a spark plug to initiate combustion.

EPA's basic premise here is that natural gas engines performing similar in-use functions should be subject to similar regulatory requirements. The compression-ignition emission standards and testing requirements reflect the operating characteristics for the full range of heavy-duty vehicles, including substantial operation in long-haul service characteristic of tractors. The spark-ignition emission standards and testing requirements do not include some of those provisions related to use in long-haul service or other applications where diesel engines predominate, such as steady-state testing, Not-to-Exceed standards, and extended useful life. We believe it would be inappropriate to apply the spark-ignition standards and requirements to natural gas engines that would be used in applications mostly served by diesel engines today. We are therefore proposing to replace the interim provision described above with a differentiated approach to certification of natural gas engines across all of the EPA standards—for both GHGs and criteria pollutants. Under the proposed clarifying amendment, we would require manufacturers to divide all their natural gas engines into primary intended service classes, as we already require for compression-ignition engines, whether or not the engine has features that otherwise could (in theory) result in classification as SI under the current rules. Any natural gas engine qualifying as a medium heavy-duty engine (19,500 to 33,000 lbs GVWR) or a heavy heavy-duty engine (over 33,000 lbs GVWR) would be subject to all the emission standards and other requirements that apply to compression-ignition engines.

Table II–17 describes the provisions that would apply differently for compression-ignition and spark-ignition engines:

TABLE II–17—REGULATORY PROVISIONS THAT ARE DIFFERENT FOR COMPRESSION-IGNITION AND SPARK-IGNITION ENGINES

Provision	Compression-ignition	Spark-ignition
Transient duty cycle	40 CFR part 86, Appendix I, paragraph (f)(2) cycle; divide by 1.12 to de-normalize.	40 CFR part 86, Appendix I, paragraph (f)(1) cycle.
Ramped-modal test (SET)	yes	no.
NTE standards	yes	no.
Smoke standard	yes	no.
Manufacturer-run in-use testing	yes	no.
ABT—pollutants	NO_X, PM	NO_X, NMHC.
ABT— transient conversion factor	6.5	6.3.
ABT—averaging set	Separate averaging sets for light, medium, and heavy HDDE	One averaging set for all SI engines.
Useful life	110,000 miles for light HDDE 185,000 miles for medium HDDE. 435,000 miles for heavy HDDE.	110,000 miles
Warranty	50,000 miles for light HDDE 100,000 miles for medium HDDE. 100,000 miles for heavy HDDE.	50,000 miles.
Detailed AECD description	yes	no.
Test engine selection	highest injected fuel volume	most likely to exceed emission standards.

The onboard diagnostic requirements already differentiate requirements by fuel type, so there is no need for those provisions to change based on the considerations of this section.

We are not aware of any currently certified engines that would change from compression-ignition to spark-ignition under the proposed clarified approach. Nonetheless, because these proposed standards implicate rules for criteria pollutants (as well as GHGs), the provisions of CAA section 202(a)(3)(C) apply (for the criteria pollutants), notably the requirement of four years lead time. We are therefore proposing to continue to apply the existing interim provision through model year 2020.[110]

[109] See 40 CFR 1036.108.

[110] Section 202(a)(2), applicable to emissions of greenhouse gases, does not mandate a specific period of lead time, but EPA sees no reason for a different compliance date here for GHGs and

Continued

Starting in model year 2021, all the provisions would apply as described above. Manufacturers would not be permitted to certify any engine families using carryover emission data if a particular engine model switched from compression-ignition to spark-ignition, or vice versa. However, as noted above, in practice these vehicles are already being certified as CI engines, so we view these changes as clarifications ratifying the current status quo.

We are also proposing that these provisions would apply equally to engines fueled by any fuel other than gasoline or ethanol, should such engines be produced in the future. Given the current and historic market for vehicles above 19,500 lbs GVWR, EPA believes any alternative-fueled vehicles in this weight range would be competing primarily with diesel vehicles and should be subject to the same requirements as them. We request comment on all aspects of classifying natural-gas and other engines for purposes of applying emission standards. See Sections XI and XII for additional discussion of natural gas fueled engines.

(f) Crankcase Emissions From Natural Gas Engines

EPA is proposing one fuel-specific provision for natural gas engines, likewise applicable to all pollutant emissions, both GHGs and criteria pollutant emissions. Note that we are also proposing other vehicle-level emissions controls for the natural gas storage tanks and refueling connections. These are presented in Section XIII.

EPA is proposing to require that all natural gas-fueled engines have closed crankcases, rather than continuing the provision that allows venting to the atmosphere all crankcase emissions from all compression-ignition engines. This has been allowed as long as these vented crankcase emissions are measured and accounted for as part of an engine's tailpipe emissions. This allowance has historically been in place to address the technical limitations related to recirculating diesel-fueled engines' crankcase emissions, which have high PM emissions, back into the engine's air intake. High PM emissions vented into the intake of an engine can foul turbocharger compressors and aftercooler heat exchangers. In contrast, historically EPA has mandated closed crankcase technology on all gasoline fueled engines and all natural gas spark-ignition engines.[111] The inherently low PM emissions from these engines posed no technical barrier to a closed crankcase mandate. Because natural gas-fueled compression ignition engines also have inherently low PM emissions, there is no technological limitation that would prevent manufacturers from closing the crankcase and recirculating all crankcase gases into a natural gas-fueled compression ignition engine's air intake. We are requesting comment on the costs and effectiveness of technologies that we have identified to comply with these provisions. In addition, EPA is proposing that this revised standard not take effect until the 2021 model year, consistent with the requirement of section 202(a)(3)(C) to provide four years lead time.

criteria pollutants. This is also true with respect to the closed crankcase emission discussed in the following subsection.

III. Class 7 and 8 Combination Tractors

Class 7 and 8 combination tractors-trailers contribute the largest portion of the total GHG emissions and fuel consumption of the heavy-duty sector, approximately two-thirds, due to their large payloads, their high annual miles traveled, and their major role in national freight transport.[112] These vehicles consist of a cab and engine (tractor or combination tractor) and a trailer.[113] In general, reducing GHG emissions and fuel consumption for these vehicles would involve improvements to all aspects of the vehicle.

As we found during the development in Phase 1 and as continues to be true in the industry today, the heavy-duty combination tractor-trailer industry consists of separate tractor manufacturers and trailer manufacturers. We are not aware of any manufacturer that typically assembles both the finished truck and the trailer and introduces the combination into commerce for sale to a buyer. There are also large differences in the kinds of manufacturers involved with producing tractors and trailers. For HD highway tractors and their engines, a relatively limited number of manufacturers produce the vast majority of these products. The trailer manufacturing industry is quite different, and includes a large number of companies, many of which are relatively small in size and production volume. Setting standards for the products involved—tractors and trailers—requires recognition of the large differences between these manufacturing industries, which can then warrant consideration of different regulatory approaches. Thus, although tractor-trailers operate essentially as a unit from both a commercial standpoint and for purposes of fuel efficiency and CO_2 emissions, the agencies have developed separate proposed standards for each.

[111] See 40 CFR 86.008–10(c).

[112] The on-highway Class 7 and 8 combination tractor-trailers constitute the vast majority of this regulatory category. A small fraction of combination tractors are used in off-road applications and are regulated differently, as described in Section III.C.

[113] "Tractor" is defined in 49 CFR 571.3 to mean "a truck designed primarily for drawing other motor vehicles and not so constructed as to carry a load other than a part of the weight of the vehicle and the load so drawn."

Based on these industry characteristics, EPA and NHTSA believe that the most appropriate regulatory approach for combination tractors and trailers is to establish standards for tractors separately from trailers. As discussed below in Section IV, the agencies are also proposing standards for certain types of trailers.

A. Summary of the Phase 1 Tractor Program

The design of each tractor's cab and drivetrain determines the amount of power that the engine must produce in moving the truck and its payload down the road. As illustrated in Figure III–1, the loads that require additional power from the engine include air resistance (aerodynamics), tire rolling resistance, and parasitic losses (including accessory loads and friction in the drivetrain). The importance of the engine design is that it determines the basic GHG emissions and fuel consumption performance for the variety of demands placed on the vehicle, regardless of the characteristics of the cab in which it is installed.

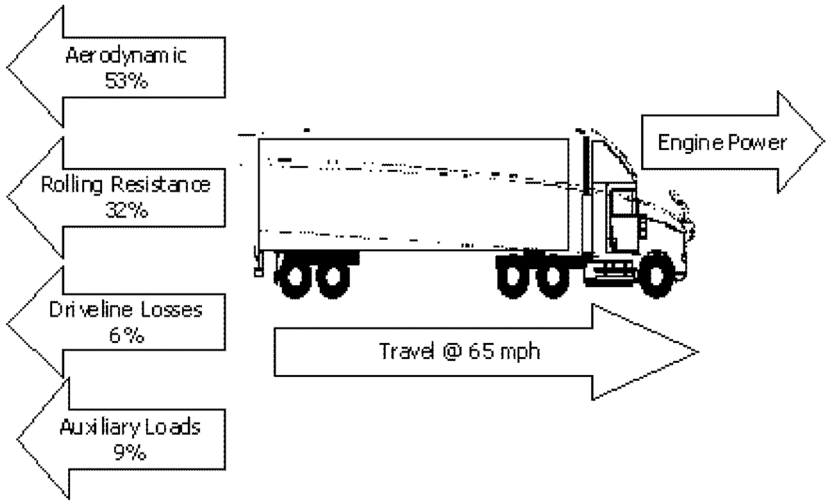

Figure III-1 Combination Tractor and Trailer Loads[114]

Accordingly, for Class 7 and 8 combination tractors, the agencies adopted two sets of Phase 1 tractor standards for fuel consumption and CO_2 emissions. The CO_2 emission and fuel consumption reductions related to engine technologies are recognized in the engine standards. For vehicle-related emissions and fuel consumption, tractor manufacturers are required to meet vehicle-based standards. Compliance with the vehicle standard must be determined using the GEM vehicle simulation tool.

The Phase 1 tractor standards were based on several key attributes related to GHG emissions and fuel consumption that reasonably represent the many differences in utility and performance among these vehicles. Attribute-based standards in general recognize the variety of functions performed by vehicles and engines, which in turn can affect the kind of technology that is available to control emissions and reduce fuel consumption, or its effectiveness. Attributes that characterize differences in the design of vehicles, as well as differences in how the vehicles will be employed in-use, can be key factors in evaluating technological improvements for reducing CO_2 emissions and fuel consumption. Developing an appropriate attribute-based standard can also avoid interfering with the ability of the market to offer a variety of products to meet the customer's demand. The Phase 1 tractor standards differ depending on GVWR (*i.e.,* whether the truck is Class 7 or Class 8), the height of the roof of the cab, and whether it is a ''day cab'' or a ''sleeper cab.'' These later two attributes are important because the height of the roof, designed to correspond to the height of the trailer, significantly affects air resistance, and a sleeper cab generally corresponds to the opportunity for extended duration idle emission and fuel consumption improvements. Based on these attributes, the agencies created nine subcategories within the Class 7 and 8 combination tractor category. The Phase 1 rules set standards for each of them. Phase 1 standards began with the 2014 model year and were followed with more stringent standards following in model year 2017.[115] The standards represent an overall fuel consumption and CO_2 emissions reduction up to 23 percent from the tractors and the engines installed in them when compared to a baseline 2010 model year tractor and engine without idle shutdown technology. Although the EPA and NHTSA standards are expressed differently (grams of CO_2 per ton-mile and gallons per 1,000 ton-mile respectively), the standards are equivalent.

In Phase 1, the agencies allowed manufacturers to certify certain types of combination tractors as vocational vehicles. These are tractors that do not typically operate at highway speeds, or would otherwise not benefit from efficiency improvements designed for line-haul tractors (although standards would still apply to the engines installed in these vehicles). The agencies created a subcategory of ''vocational tractors,'' or referred to as ''special purpose tractors'' in 40 CFR part 1037, because real world operation of these tractors is better represented by our Phase 1 vocational vehicle duty cycle than the tractor duty cycles. Vocational tractors are subject to the standards for vocational vehicles rather than the combination tractor standards. In addition, specific vocational tractors and heavy-duty vocational vehicles primarily designed to perform work off-road or having tires installed with a maximum speed rating at or below 55 mph are exempted from the Phase 1 standards.

In Phase 1, the agencies also established separate performance standards for the engines manufactured for use in these tractors. EPA's engine-based CO_2 standards and NHTSA's engine-based fuel consumption standards are being implemented using EPA's existing test procedures and regulatory structure for criteria pollutant emissions from medium- and heavy-duty engines. These engine standards vary depending on engine size linked to intended vehicle service class (which are the same service classes used for many years for EPA's criteria pollutant standards).

Manufacturers demonstrate compliance with the Phase 1 tractor standards using the GEM simulation tool. As explained in Section II above, GEM is a customized vehicle simulation model which is the preferred approach to demonstrating compliance testing for combination tractors rather than chassis dynamometer testing used in light-duty vehicle compliance. As discussed in the development of HD Phase 1 and recommended by the NAS 2010 study,

[114] Adapted from Figure 4.1. Class 8 Truck Energy Audit, Technology Roadmap for the 21st Century Truck Program: A Government-Industry Research Partnership, 21CT–001, December 2000.

[115] Manufacturers may voluntarily opt-in to the NHTSA fuel consumption standards in model years 2014 or 2015. Once a manufacturer opts into the NHTSA program it must stay in the program for all optional MYs.

a simulation tool is the preferred approach for HD tractor compliance because of the extremely large number of vehicle configurations.[116] The GEM compliance tool was developed by EPA and is an accurate and cost-effective alternative to measuring emissions and fuel consumption while operating the vehicle on a chassis dynamometer. Instead of using a chassis dynamometer as an indirect way to evaluate real world operation and performance, various characteristics of the vehicle are measured and these measurements are used as inputs to the model. For HD Phase 1, these characteristics relate to key technologies appropriate for this category of truck including aerodynamic features, weight reductions, tire rolling resistance, the presence of idle-reducing technology, and vehicle speed limiters. The model also assumes the use of a representative typical engine in compliance with the separate, applicable Phase 1 engine standard. Using these inputs, the model is used to quantify the overall performance of the vehicle in terms of CO_2 emissions and fuel consumption. CO_2 emission reduction and fuel consumption technologies not measured by the model must be evaluated separately, and the HD Phase 1 rules establish mechanisms allowing credit for such ''off-cycle'' technologies.

In addition to the final Phase 1 tractor-based standards for CO_2, EPA adopted a separate standard to reduce leakage of HFC refrigerant from cabin air conditioning (A/C) systems from combination tractors, to apply to the tractor manufacturer. This HFC leakage standard is independent of the CO_2 tractor standard. Manufacturers can choose technologies from a menu of leak-reducing technologies sufficient to comply with the standard, as opposed to using a test to measure performance.

The Phase 1 program also provided several flexibilities to advance the goals of the overall program while providing alternative pathways to achieve compliance. The primary flexibility is the averaging, banking, and trading program which allows emissions and fuel consumption credits to be averaged within an averaging set, banked for up to five years, or traded among manufacturers. Manufacturers with credit deficits were allowed to carry-forward credit deficits for up to three model years, similar to the LD GHG and CAFE carry-back credits. Phase 1 also included several interim provisions, such as incentives for advanced technologies and provisions to obtain credits for innovative technologies (called off-cycle in the Phase 2 program) not accounted for by the HD Phase 1 version of GEM or for certifying early.

B. Overview of the Proposed Phase 2 Tractor Program

The proposed HD Phase 2 program is similar in many respects to the Phase 1 approach. The agencies are proposing to maintain the Phase 1 attribute-based regulatory structure in terms of dividing the tractor category into the same nine subcategories based on the tractor's GVWR, cab configuration, and roof height. This structure is working well in the implementation of Phase 1. The one area where the agencies are proposing to change the regulatory structure is related to heavy-haul tractors. As noted above, the Phase 1 regulations include a set of provisions that allow vocational tractors to be treated as vocational vehicles. However, because the agencies propose to include the powertrain as part of the technology basis for the tractor and vocational vehicle standards in Phase 2, we are proposing to classify a certain set of these vocational tractors as heavy-haul tractors and subject them to a separate tractor standard that reflects their unique powertrain requirements and limitations in application of technologies to reduce fuel consumption and CO_2 emissions.[117]

The agencies propose to also retain much of the certification and compliance structure developed in Phase 1 but to simplify end of the year reporting. The agencies propose that the Phase 2 tractor CO_2 emissions and fuel consumption standards, as in Phase 1, be aligned.[118] The agencies also propose to continue to have separate engine and vehicle standards to drive technology improvements in both areas. The reasoning behind the proposal to maintain separate standards is discussed above in Section II.B.2. As in Phase 1, the agencies propose to certify tractors using the GEM simulation tool and to require manufacturers to evaluate the performance of subsystems through testing (the results of this testing to be used as inputs to the GEM simulation tool). Other aspects of the proposed HD Phase 2 certification and compliance program also mirror the Phase 1 program, such as maintaining a single reporting structure to satisfy both agencies, requiring limited data at the beginning of the model year for certification, and determining compliance based on end of year reports. In the Phase 1 program, manufacturers participating in the ABT program provided 90 day and 270 day reports after the end of the model year. The agencies required two reports for the initial program to help manufacturers become familiar with the reporting process. For the Phase 2 program, the agencies propose that manufacturers would only be required to submit one end of the year report, which would simplify reporting.

Even though many aspects of the proposed HD Phase 2 program are similar to Phase 1, there are some key differences. While Phase 1 focused on reducing CO_2 emissions and fuel consumption in tractors through the application of existing (''off-the-shelf'') technologies, the proposed HD Phase 2 standards seek additional reductions through increased use of existing technologies and the development and deployment of more advanced technologies. To evaluate the effectiveness of a more comprehensive set of technologies, the agencies propose several additional inputs to GEM. The proposed set of inputs includes the Phase 1 inputs plus parameters to assess the performance of the engine, transmission, and driveline. Specific inputs for, among others, predictive cruise control, automatic tire inflation systems, and 6x2 axles would now be required. Manufacturers would conduct component testing to obtain the values for these technologies (should they choose to use them), which testing values would then be input into the GEM simulation tool. See Section III.D.2 below. To effectively assess performance of the technologies, the agencies also propose to change some aspects of the drive cycle used in certification through the addition of road grade. To reflect the existing trailer market, the agencies are proposing to refine the aerodynamic test procedure for high roof cabs by adding some aerodynamic improving devices to the reference trailer (used for determining the relative aerodynamic performance of the tractor). The agencies also propose to change the aerodynamic certification test procedure to capture aerodynamic improvement of trailers and the impact of wind on tractor aerodynamic performance. The agencies are also proposing to change some of the interim provisions developed in Phase 1 to reflect the maturity of the program and

[116] National Academy of Science. ''Technologies and Approaches to Reducing the Fuel Consumption of Medium- and Heavy-Duty Vehicles.'' 2010. Recommendation 8–4 stated ''Simulation modeling should be used with component test data and additional tested inputs from powertrain tests, which could lower the cost and administrative burden yet achieve the needed accuracy of results.''

[117] See 76 FR 57138 for Phase 1 discussion. See 40 CFR 1037.801 for proposed Phase 2 heavy-haul tractor regulatory definition.

[118] Fuel consumption is calculated from CO_2 using the conversion factor of 10,180 grams of CO_2 per gallon for diesel fuel.

reduced need and justification for some of the Phase 1 flexibilities. Further discussions on all of these matters are covered in the following sections.

C. Proposed Phase 2 Tractor Standards

EPA is proposing CO_2 standards and NHTSA is proposing fuel consumption standards for new Class 7 and 8 combination tractors. In addition, EPA is proposing to maintain the HFC standards for the air conditioning systems that were adopted in Phase 1. EPA is also seeking comment on new standards to further control emissions of particulate matter (PM) from auxiliary power units (APU) installed in tractors that would prevent an unintended consequence of increasing PM emissions from tractors during long duration idling.

This section describes in detail the proposed standards. In addition to describing the proposed alternative (''Alternative 3''), in Section III.D.2.f we also detail another alternative (''Alternative 4''). Alternative 4 provides less lead time than the proposed set of standards but may provide more net benefits in the form of greater emission and fuel consumption reductions (with somewhat higher costs) in the early years of the program. The agencies believe Alternative 4 has the potential to be maximum feasible and appropriate as discussed later in this section.

The agencies welcome comment on all aspects of the proposed standards and the alternative standards described in Section III.D.2.f. Commenters are encouraged to address all aspects of feasibility analysis, including costs, the likelihood of developing the technology to achieve sufficient relaibility within the proposed and alternative lead-times, and the extent to which the market could utilize the technology. It would be helpful if comments addressed these issues separately for each type of technology.

(1) Proposed Fuel Consumption and CO_2 Standards

The proposed fuel consumption and CO_2 standards for the tractor cab are shown below in Table III–1. These proposed standards would achieve reductions of up to 24 percent compared to the 2017 model year baseline level when fully phased in beginning in the 2027 MY.[119] The proposed standards for Class 7 are described as ''Day Cabs'' because we are not aware of any Class 7 sleeper cabs in the market today; however, the agencies propose to require any Class 7 tractor, regardless of cab configuration, meet the standards described as ''Class 7 Day Cab.'' We welcome comment on this proposed approach.

The agencies' analyses, as discussed briefly below and in more detail later in this preamble and in the draft RIA Chapter 2, indicate that these proposed standards, if finalized, would be maximum feasible (within the meaning of 49 U.S.C. Section 32902 (k)) and would be appropriate under each agency's respective statutory authorities. The agencies solicit comment on all aspects of these analyses.

TABLE III–1—PROPOSED PHASE 2 HEAVY-DUTY COMBINATION TRACTOR EPA EMISSIONS STANDARDS (g CO_2/ton-mile) AND NHTSA FUEL CONSUMPTION STANDARDS (gal/1,000 ton-mile)

	Day cab		Sleeper cab
	Class 7	Class 8	Class 8
2021 Model Year CO_2 Grams per Ton-Mile			
Low Roof	97	78	70
Mid Roof	107	84	78
High Roof	109	86	77
2021 Model Year Gallons of Fuel per 1,000 Ton-Mile			
Low Roof	9.5285	7.6621	6.8762
Mid Roof	10.5108	8.2515	7.6621
High Roof	10.7073	8.4479	7.5639
2024 Model Year CO_2 Grams per Ton-Mile			
Low Roof	90	72	64
Mid Roof	100	78	71
High Roof	101	79	70
2024 Model Year and Later Gallons of Fuel per 1,000 Ton-Mile

2027 Model Year and Later Gallons of Fuel per 1,000 Ton-Mile			
Low Roof	8.5462	6.8762	6.0904
Mid Roof	9.4303	7.4656	6.7780

[119] Since the HD Phase 1 tractor standards fully phase-in by the MY 2017, this is the logical baseline year.

TABLE III–1—PROPOSED PHASE 2 HEAVY-DUTY COMBINATION TRACTOR EPA EMISSIONS STANDARDS (g CO_2/ton-mile) AND NHTSA FUEL CONSUMPTION STANDARDS (gal/1,000 ton-mile)—Continued

	Day cab		Sleeper cab
	Class 7	Class 8	Class 8
High Roof	9.4303	7.4656	6.5815

It should be noted that the proposed HD Phase 2 CO_2 and fuel consumptions standards are not directly comparable to the Phase 1 standards. This is because the agencies are proposing several test procedure changes to more accurately reflect real world operation of tractors. These changes will result in the following differences. First, the same vehicle evaluated using the proposed HD Phase 2 version of GEM will obtain higher (*i.e.* less favorable) CO_2 and fuel consumption values because the Phase 2 drive cycles include road grade. Road grade, which (of course) exists in the real-world, requires the engine to operate at higher horsepower levels to maintain speed while climbing a hill. Even though the engine saves fuel on a downhill section, the overall impact increases CO_2 emissions and fuel consumption. The second of the key differences between the CO_2 and fuel consumption values in Phase 1 and Phase 2 is due to proposed changes in the evaluation of aerodynamics. In the real world, vehicles are exposed to wind which increases the drag of the vehicle and in turn increases the power required to move the vehicle down the road. To more appropriately reflect the in-use aerodynamic performance of tractor-trailers, the agencies are proposing to input into Phase 2 GEM the wind averaged coefficient of drag instead of the no-wind (zero yaw) value used in Phase 1. The final key difference between Phase 1 and the proposed Phase 2 program includes a more realistic and improved simulation of the transmission in GEM, which could increase CO_2 and fuel consumption relative to Phase 1.

The agencies are proposing Phase 2 CO_2 emissions and fuel consumption standards for the combination tractors that reflect reductions that can be achieved through improvements in the tractor's powertrain, aerodynamics, tires, and other vehicle systems. The agencies have analyzed the feasibility of achieving the proposed CO_2 and fuel consumption standards, and have identified means of achieving the proposed standards that are technically feasible in the lead time afforded, economically practicable and cost-effective. EPA and NHTSA present the estimated costs and benefits of the proposed standards in Section III.D.2. In developing the proposed standards for Class 7 and 8 tractors, the agencies have evaluated the following:

- the current levels of emissions and fuel consumption
- the kinds of technologies that could be utilized by tractor and engine manufacturers to reduce emissions and fuel consumption from tractors and associated engines
- the necessary lead time
- the associated costs for the industry
- fuel savings for the consumer
- the magnitude of the CO_2 and fuel savings that may be achieved

The technologies on whose performance the proposed tractor standards are predicated include: Improvements in the engine, transmission, driveline, aerodynamic design, tire rolling resistance, other accessories of the tractor, and extended idle reduction technologies. These technologies, and other accessories of the tractor, are described in draft RIA Chapter 2.4. The agencies' evaluation shows that some of these technologies are available today, but have very low adoption rates on current vehicles, while others will require some lead time for development. EPA and NHTSA also present the estimated costs and benefits of the proposed Class 7 and 8 combination tractor standards in draft RIA Chapter 2.8 and 2.12, explaining as well the basis for the agencies' proposed stringency level.

As explained below in Section III.D, EPA and NHTSA have determined that there would be sufficient lead time to introduce various tractor and engine technologies into the fleet starting in the 2021 model year and fully phasing in by the 2027 model year. This is consistent with NHTSA's statutory requirement to provide four full model years of regulatory lead time for standards. As was adopted in Phase 1, the agencies are proposing for Phase 2 that manufacturers may generate and use credits from Class 7 and 8 combination tractors to show compliance with the standards. This is discussed further in Section III.F.

Based on our analysis, the 2027 model year standards for combination tractors and engines represent up to a 24 percent reduction in CO_2 emissions and fuel consumption over a 2017 model year baseline tractor, as detailed in Section III.D.2. In considering the feasibility of vehicles to comply with the proposed standards over their useful lives, EPA also considered the potential for CO_2 emissions to increase during the regulatory useful life of the product. As we discuss in Phase 1 and separately in the context of deterioration factor (DF) testing, we have concluded that CO_2 emissions are likely to stay the same or actually decrease in-use compared to new certified configurations. In general, engine and vehicle friction decreases as products wear, leading to reduced parasitic losses and consequent lower CO_2 emissions. Similarly, tire rolling resistance falls as tires wear due to the reduction in tread height. In the case of aerodynamic components, we project no change in performance through the regulatory life of the vehicle since there is essentially no change in their physical form as vehicles age. Similarly, weight reduction elements such as aluminum wheels are (evidently) not projected to increase in mass through time, and hence, we can conclude will not deteriorate with regard to CO_2 performance in-use. Given all of these considerations, the agencies are confident in projecting that the tractor standards being proposed today would be technically feasible throughout the regulatory useful life of the program.

(2) Proposed Non-CO_2 GHG Standards for Tractors

EPA is also proposing standards to control non-CO_2 GHG emissions from Class 7 and 8 combination tractors.

(a) N_2O and CH_4 Emissions

The proposed heavy-duty engine standards for both N_2O and CH_4 as well as details of the proposed standards are included in the discussion in Section II.D.3 and II.D.4. No additional controls for N_2O or CH_4 emissions beyond those in the proposed HD Phase 2 engine standards are being considered for the tractor category.

(b) HFC Emissions

Manufacturers can reduce hydrofluorocarbon (HFC) emissions from air conditioning (A/C) leakage emissions in two ways. First, they can utilize leak-tight A/C system components. Second, manufacturers can largely eliminate the global warming impact of leakage emissions by adopting systems that use an alternative, low-Global Warming Potential (GWP) refrigerant, to replace the commonly used R–134a refrigerant. EPA proposes to address HFC emissions by maintaining the A/C leakage standards adopted in HD Phase 1 (see 40 CFR 1037.115). EPA believes the Phase 1 use of leak-tight components is at an appropriate level of stringency while maintaining the flexibility to produce the wide variety of A/C system configurations required in the tractor category. In addition, there currently are not any low GWP refrigerants approved for the heavy-duty vehicle sector. Without an alternative refrigerant approved for this sector, it is challenging to demonstrate feasibility to reduce the amount of leakage allowed under the HFC leakage standard. Please see Section I.F(1)(b) for a discussion related to alternative refrigerants.

(3) PM Emissions From APUs

Auxiliary power units (APUs) can be used in lieu of operating the main engine during extended idle operations to provide climate control and power to the driver. APUs can reduce fuel consumption, NO_X, HC, CH_4, and CO_2 emissions when compared to main engine idling.[120] However, a potential unintended consequence of reducing CO_2 emissions from combination tractors through the use of APUs during extended idle operation is an increase in PM emissions. Therefore, EPA is seeking comment on the need and appropriateness to further reduce PM emissions from APUs.

EPA conducted an analysis evaluating the potential impact on PM emissions due to an increase in APU adoption rates using MOVES. In this analysis, EPA assumed that these APUs emit criteria pollutants at the level of the EPA standard for this type of non-road diesel engines. Under this assumption, an APU would emit 1.8 grams PM per hour, assuming an extended idle load demand of 4.5 kW (6 hp).[121] However, a 2010 model year or newer tractor that uses its main engine to idle emits approximately 0.35 grams PM per hour.[122] The results from these MOVES runs are shown below in Table III–2. These results show that an increase in use of APUs could lead to an overall increase in PM emissions if left uncontrolled. Column three labeled ''Proposed Program $PM_{2.5}$ Emission Impact without Further PM Control (tons)'' shows the incremental increase in $PM_{2.5}$ without further regulation of APU $PM_{2.5}$ emissions.

TABLE III–2—PROJECTED IMPACT OF INCREASED ADOPTION OF APUS IN PHASE 2

CY	Baseline HD vehicle $PM_{2.5}$ emissions (tons)	Proposed program $PM_{2.5}$[a] emission impact without further PM control (tons)
2035	21,452	1,631
2050	24,675	2,257

Note:
[a] Positive numbers mean emissions would increase from baseline to control case. $PM_{2.5}$ from tire wear and brake wear are included.

Since January 1, 2008, California ARB has prohibited the idling of sleeper cab tractors during periods of sleep and rest.[123] The regulations apply additional requirements to diesel-fueled APUs on tractors equipped with 2007 model year or newer engines. Truck owners in California must either: (1) Fit the APU with an ARB verified Level 3 particulate control device that achieves 85 percent reduction in particulate matter; or (2) have the APU exhaust plumbed into the vehicle's exhaust system upstream of the particulate matter aftertreatment device.[124] Currently ARB includes four control devices that have been verified to meet the Level 3 p.m. requirements. These devices include HUSS Umwelttechnik GmbH's FS–MK Series Diesel Particulate filters, Impco Ecotrans Technologies' ClearSky Diesel Particulate Filter, Thermo King's Electric Regenerative Diesel Particulate Filter, and Proventia's Electronically Heated Diesel Particulate Filter. In addition, ARB has approved a Cummins integrated diesel-fueled APU and several fuel-fired heaters produced by Espar and Webasto.

EPA conducted an evaluation of the impact of potentially requiring further PM control from APUs nationwide. As shown in Table III–2, EPA projects that the HD Phase 2 program as proposed (without additional PM controls) would increase $PM_{2.5}$ emissions by 1,631 tons in 2035 and 2,257 tons in 2050. The annual impact of a program to further control PM could lead to a reduction of $PM_{2.5}$ emissions nationwide by 3,084 tons in 2035 and by 4,344 tons in 2050, as shown in Table III–3 the column labeled ''Net Impact on National $PM_{2.5}$ Emission with Further PM Control of APUs (tons).''

Note:
[a] $PM_{2.5}$ from tire wear and brake wear are included.

EPA developed long-term cost projections for catalyzed diesel particulate filters (DPF) as part of the Nonroad Diesel Tier 4 rulemaking. In that rulemaking, EPA estimated the DPF costs would add $580 to the cost of 150 horsepower engines (69 FR 39126, June 29, 2004). On the other hand, ARB estimated the cost of retrofitting a diesel powered APU with a PM trap to be $2,000 in 2005.[125] The costs of a DPF for an APU that provides less than 25 horsepower would be less than the projected cost of a 150 HP engine because the filter volume is in general proportional to the engine-out emissions and exhaust flow rate. Proventia is charging customers $2,240 for electronically heated DPF.[126] EPA welcomes comments on cost estimates associated with DPF systems for APUs.

EPA requests comments on the technical feasibility of diesel particulate filters ability to reduce PM emissions by 85 percent from non-road engines used to power APUs. EPA also requests comments on whether the technology costs outlined above are accurate, and if so, if projected reductions are appropriate taking into account cost, noise, safety, and energy factors. See CAA section 213(a)(4).

(4) Proposed Exclusions From the Phase 2 Tractor Standards

As noted above, in Phase 1, the agencies adopted provisions to allow tractor manufacturers to reclassify certain tractors as vocational vehicles.[127] The agencies propose in Phase 2 to continue to allow manufacturers to exclude certain vocational-types of tractors from the combination tractor standards and instead be subject to the vocational vehicle standards. However, the agencies propose to set unique standards for tractors used in heavy haul applications in Phase 2. Details regarding the proposed heavy-haul standards are included below in Section II.D.3.

During the development of Phase 1, the agencies received multiple comments from several stakeholders supporting an approach for an alternative treatment of a subset of tractors because they were designed to operate at lower speeds, in stop and go traffic, and sometimes operate at higher weights than the typical line-haul tractor. These types of applications have limited potential for improvements in aerodynamic performance to reduce CO_2 emissions and fuel consumption. Consistent with the agencies' approach in Phase 1, the agencies agree that these vocational tractors are operated differently than line-haul tractors and therefore fit more appropriately into the vocational vehicle category. However, we need to continue to ensure that only tractors that are *truly* vocational tractors are classified as such.[128] A vehicle determined by the manufacturer to be a HHD vocational tractor would fall into one of the HHD vocational vehicle subcategories and be regulated as a vocational vehicle. Similarly, MHD tractors which the manufacturer chooses to reclassify as vocational tractors would be regulated as a MHD vocational vehicle. Specifically, the agencies are proposing to change the provisions in EPA's 40 CFR 1037.630 and NHTSA's regulation at 49 CFR 523.2 and only allow the following two types of vocational tractors to be eligible for reclassification by the manufacturer:

(1) Low-roof tractors intended for intra-city pickup and delivery, such as those that deliver bottled beverages to retail stores.

(2) Tractors intended for off-road operation (including mixed service operation), such as those with reinforced frames and increased ground clearance.[129]

Because the difference between some vocational tractors and line-haul tractors is potentially somewhat subjective, we are also proposing to continue to limit the use of this provision to a rolling three year sales limit of 21,000 vocational tractors per manufacturer consistent with past production volumes of such vehicles. We propose to carry-over the existing three year sales limit with the recognition that heavy-haul tractors would no longer be permitted to be treated as vocational vehicles (suggesting a lower volumetric cap could be appropriate) but that the heavy-duty market has improved since the development of the HD Phase 1 rule (suggesting the need for a higher sales cap). The agencies welcome comment on whether the proposed sales volume limit is set at an appropriate level looking into the future.

Also in Phase 1, EPA determined that manufacturers that met the small business criteria specified in 13 CFR 121.201 for ''Heavy Duty Truck Manufacturing'' were not subject to the greenhouse gas emissions standards of 40 CFR 1037.106.[130] The regulations required that qualifying manufacturers must notify the Designated Compliance Officer each model year before introducing the vehicles into commerce. The manufacturers are also required to label the vehicles to identify them as excluded vehicles. EPA and NHTSA are seeking comments on eliminating this provision for tractor manufacturers in the Phase 2 program. The agencies are aware of two second stage manufacturers building custom sleeper cab tractors. We could treat these vehicles in one of two ways. First, the vehicles may be considered as dromedary vehicles and therefore treated as vocational vehicles.[131] Or the

[127] See 40 CFR 1037.630.

[128] As a part of the end of the year compliance process, EPA and NHTSA verify manufacturer's production reports to avoid any abuse of the vocational tractor allowance.

[129] See existing 40 CFR 1037.630(a)(1)(i) through (iii).

[130] See 40 CFR 1037.150(c).

[131] A dromedary is a box, deck, or plate mounted behind the tractor cab and forward of the fifth wheel on the frame of the power unit of a tractor-trailer combination to carry freight.

agencies could provide provisions that stated if a manufacturer changed the cab, but not the frontal area of the vehicle, then it could retain the aerodynamic bin of the original tractor. We welcome comments on these considerations.

EPA is proposing to not exempt glider kits from the Phase 2 GHG emission standards.[132] Gliders and glider kits are exempt from NHTSA's Phase 1 fuel consumption standards. For EPA purposes, the CO_2 provisions of Phase 1 exempted gliders and glider kits produced by small businesses but did not include such a blanket exemption for other glider kits.[133] Thus, some gliders and glider kits are already subject to the requirement to obtain a vehicle certificate prior to introduction into commerce as a new vehicle. However, the agencies believe glider manufacturers may not understand how these regulations apply to them, resulting in a number of uncertified vehicles.

EPA is concerned about adverse economic impacts on small businesses that assemble glider kits and glider vehicles. Therefore, EPA is proposing an option that would grandfather existing small businesses, but cap annual production based on their recent sales. EPA requests comment on whether any special provisions would be needed to accommodate glider kits. See Section XIV for additional discussion of the proposed requirements for glider vehicles.

Similarly, NHTSA is considering including glider vehicles under its Phase 2 program. The agencies request comment on their respective considerations.

We believe that the agencies potentially having different policies for glider kits and glider vehicles under the Phase 2 program would not result in problematic disharmony between the NHTSA and EPA programs, because of the small number of vehicles that would be involved. EPA believes that its proposed changes would result in the glider market returning to the pre-2007 levels, in which fewer than 1,000 glider vehicles would be produced in most years. Only non-exempt glider vehicles would be subject to different requirements under the NHTSA and EPA regulations. However, we believe that this is unlikely to exceed a few hundred vehicles in any year, which would be few enough not to result in any meaningful disharmony between the two agencies.

With regard to NHTSA's safety authority over gliders, the agency notes that it has become increasingly aware of potential noncompliance with its regulations applicable to gliders. NHTSA has learned of manufacturers who are creating glider vehicles that are new vehicles under 49 CFR 571.7(e); however, the manufacturers are not certifying them and obtaining a new VIN as required. NHTSA plans to pursue enforcement actions as applicable against noncompliant manufacturers. In addition to enforcement actions, NHTSA may consider amending 49 CFR 571.7(e) and related regulations as necessary. NHTSA believes manufacturers may not be using this regulation as originally intended.

(5) In-Use Standards

Section 202(a)(1) of the CAA specifies that EPA is to propose emissions standards that are applicable for the useful life of the vehicle. The in-use Phase 2 standards that EPA is proposing would apply to individual vehicles and engines, just as EPA adopted for Phase 1. NHTSA is also proposing to use the same useful life mileage and years as EPA for Phase 2.

EPA is also not proposing any changes to provisions requiring that the useful life for tractors with respect to CO_2 emissions be equal to the respective useful life periods for criteria pollutants, as shown below in Table III–4. See 40 CFR 1037.106(e). EPA does not expect degradation of the technologies evaluated for Phase 2 in terms of CO_2 emissions, therefore we propose no changes to the regulations describing compliance with GHG pollutants with regards to deterioration. See 40 CFR 1037.241. We welcome comments that highlight a need to change this approach.

TABLE III–4—TRACTOR USEFUL LIFE PERIODS

	Years	Miles
Class 7 Tractors	10	185,000
Class 8 Tractors	10	435,000

D. Feasibility of the Proposed Tractor Standards

This section describes the agencies' technical feasibility and cost analysis in greater detail. Further detail on all of these technologies can be found in the draft RIA Chapter 2.

Class 7 and 8 tractors are used in combination with trailers to transport freight. The variation in the design of these tractors and their typical uses drive different technology solutions for each regulatory subcategory. As noted above, the agencies are proposing to continue the Phase 1 provisions that treat vocational tractors as vocational vehicles instead of as combination tractors, as noted in Section III.C. The focus of this section is on the feasibility of the proposed standards for combination tractors including the heavy-haul tractors, but not the vocational tractors.

EPA and NHTSA collected information on the cost and effectiveness of fuel consumption and CO_2 emission reducing technologies from several sources. The primary sources of information were the Southwest Research Institute evaluation of heavy-duty vehicle fuel efficiency and costs for NHTSA,[134] the Department of Energy's SuperTruck Program,[135] 2010 National Academy of Sciences report of Technologies and Approaches to Reducing the Fuel Consumption of Medium- and Heavy-Duty Vehicles,[136] TIAX's assessment of technologies to support the NAS panel report,[137] the analysis conducted by the Northeast States Center for a Clean Air Future, International Council on Clean Transportation, Southwest Research Institute and TIAX for reducing fuel consumption of heavy-duty long haul combination tractors (the NESCCAF/ICCT study),[138] and the technology cost analysis conducted by ICF for EPA.[139]

[132] Glider vehicles are new vehicles produced to accept rebuilt engines (or other used engines) along with used axles and/or transmissions. The common commercial term ''glider kit'' is used here primarily to refer to an assemblage of parts into which the used/rebuilt engine is installed.

[133] Rebuilt engines used in glider vehicles are subject to EPA criteria pollutant emission standards applicable for the model year of the engine. See 40 CFR 86.004–40 for requirements that apply for engine rebuilding. Under existing regulations, engines that remain in their certified configuration after rebuilding may continue to be used.

Continued

(1) What technologies did the agencies consider to reduce the CO_2 emissions and fuel consumption of combination tractors?

Manufacturers can reduce CO_2 emissions and fuel consumption of combination tractors through use of many technologies, including engine, drivetrain, aerodynamic, tire, extended idle, and weight reduction technologies. The agencies' determination of the feasibility of the proposed HD Phase 2 standards is based on our projection of the use of these technologies and an assessment of their effectiveness. We will also discuss other technologies that could potentially be used, such as vehicle speed limiters, although we are not basing the proposed standards on their use for the model years covered by this proposal, for various reasons discussed below.

In this section we discuss generally the tractor and engine technologies that the agencies considered to improve performance of heavy-duty tractors, while Section III.D.2 discusses the baseline tractor definition and technology packages the agencies used to determine the proposed standard levels.

Engine technologies: As discussed in Section II.D above, there are several engine technologies that can reduce fuel consumption of heavy-duty tractors. These technologies include friction reduction, combustion system optimization, and Rankine cycle. These engine technologies would impact the Phase 2 vehicle results because the agencies propose that the manufacturers enter a fuel map into GEM.

Aerodynamic technologies: There are opportunities to reduce aerodynamic drag from the tractor, but it is sometimes difficult to assess the benefit of individual aerodynamic features. Therefore, reducing aerodynamic drag requires optimizing of the entire system. The potential areas to reduce drag include all sides of the truck—front, sides, top, rear and bottom. The grill, bumper, and hood can be designed to minimize the pressure created by the front of the truck. Technologies such as aerodynamic mirrors and fuel tank fairings can reduce the surface area perpendicular to the wind and provide a smooth surface to minimize disruptions of the air flow. Roof fairings provide a transition to move the air smoothly over the tractor and trailer. Side extenders can minimize the air entrapped in the gap between the tractor and trailer. Lastly, underbelly treatments can manage the flow of air underneath the tractor. DOE has partnered with the heavy-duty industry to demonstrate vehicles that achieve a 50 percent improvement in freight efficiency. This SuperTruck program has led to significant advancements in the aerodynamics of combination tractor-trailers. The manufacturers' SuperTruck demonstration vehicles are achieving approximately 7 percent freight efficiency improvements over a 2010 MY baseline vehicle due to improvements in tractor aerodynamics.[140] The 2010 NAS Report on heavy-duty trucks found that aerodynamic improvements which yield 3 to 4 percent fuel consumption reduction or 6 to 8 percent reduction in Cd values, beyond technologies used in today's SmartWay trucks are achievable.[141]

Lower Rolling Resistance Tires: A tire's rolling resistance results from the tread compound material, the architecture and materials of the casing, tread design, the tire manufacturing process, and its operating conditions (surface, inflation pressure, speed, temperature, etc.). Differences in rolling resistance of up to 50 percent have been identified for tires designed to equip the same vehicle. Since 2007, SmartWay designated tractors have had steer tires with rolling resistance coefficients of less than 6.6 kg/metric ton for the steer tire and less than 7.0 kg/metric ton for the drive tire.[142] Low rolling resistance (LRR) drive tires are currently offered in both dual assembly and wide-based single configurations. Wide based single tires can offer rolling resistance reduction along with improved aerodynamics and weight reduction. The lowest rolling resistance value submitted for 2014MY GHG and fuel efficiency certification was 4.3 and 5.0 kg/metric ton for the steer and drive tires respectively.[143]

Weight Reduction: Reductions in vehicle mass lower fuel consumption and GHG emissions by decreasing the overall vehicle mass that is moved down the road. Weight reductions also increase vehicle payload capability which can allow additional tons to be carried by fewer trucks consuming less fuel and producing lower emissions on a ton-mile basis. We treated such weight reduction in two ways in Phase 1 to account for the fact that combination tractor-trailers weigh-out approximately one-third of the time and cube-out approximately two-thirds of the time. Therefore in Phase 1 and also as proposed for Phase 2, one-third of the weight reduction would be added payload in the denominator while two-thirds of the weight reduction is subtracted from the overall weight of the vehicle in GEM. See 76 FR 57153.

In Phase 1, we reflected mass reductions for specific technology substitutions (*e.g.,* installing aluminum wheels instead of steel wheels). These substitutions were included where we could with confidence verify the mass reduction information provided by the manufacturer. The agencies propose to expand the list of weight reduction components which can be input into GEM in order to provide the manufacturers with additional means to comply via GEM with the combination tractor standards and to further encourage reductions in vehicle weight. As in Phase 1, we recognize that there may be additional potential for weight reduction in new high strength steel components which combine the reduction due to the material substitution along with improvements in redesign, as evidenced by the studies done for light-duty vehicles.[144] In the development of the high strength steel component weights, we are only assuming a reduction from material substitution and no weight reduction from redesign, since we do not have any data specific to redesign of heavy-duty components nor do we have a regulatory mechanism to differentiate between material substitution and improved design. Additional weight reduction would be evaluated as a potential off-cycle credit.

Extended Idle Reduction: Auxiliary power units (APU), fuel operated heaters, battery supplied air conditioning, and thermal storage systems are among the technologies available today to reduce main engine extended idling from sleeper cabs. Each of these technologies reduces fuel consumption during idling from a truck without this equipment (the baseline) from approximately 0.8 gallons per hour (main engine idling fuel consumption rate) to approximately 0.2 gallons per hour for an APU.[145] EPA and NHTSA agree with the TIAX assessment that a 5 percent reduction in overall fuel consumption reduction is achievable.[146]

[145] *See* the draft RIA Chapter 2.4.8 for details.

[146] *See* the 2010 NAS Report, Note 136, above, at 128.

Idle Reduction: Day cab tractors often idle while cargo is loaded or unloaded, as well as during the frequent stops that are inherent with driving in urban traffic conditions near cargo destinations. To recognize idle reduction technologies that reduce workday idling, the agencies have developed a new idle-only duty cycle that is proposed to be used in GEM. As discussed above in Section II.D, this new proposed certification test cycle would measure the amount of fuel saved and CO_2 emissions reduced by two primary types of technologies: Neutral idle and stop-start. The proposed rules apply this test cycle only to vocational vehicles because these types of vehicles spend more time at idle than tractors. However, the agencies request comment on whether we should extend this vocational vehicle idle reduction approach to day cab tractors. Neutral idle would only be available for tractors using torque-converter automatic transmissions, and stop-start would be available for any tractor. Unlike the fixed numerical value in GEM for automatic engine shutdown systems to reduce overnight idling of combination tractors, this new idle reduction approach would result in different numerical values depending on user inputs. The required inputs and other details about this cycle, as it would apply to vocational vehicles, are described in the draft RIA Chapter 3. If we extended this approach to day cab tractors, we could set a fixed GEM composite cycle weighting factor at a value representative of the time spent at idle for a typical day cab tractor, possibly five percent. Under this approach, tractor manufacturers would be able to select GEM inputs that identify the presence of workday idle reduction technologies, and GEM would calculate the associated benefit due to these technologies, using this new idle-only cycle as described in the draft RIA Chapter 3.

The agencies have also received a letter from the California Air Resources Board requesting consideration of credits for reducing solar loads. Solar reflective paints and solar control glazing technologies are briefly discussed in draft RIA Chapter 2.4.9.3. The agencies request comment on the Air Resources Board's letter and recommendations.[147]

Vehicle Speed Limiters: Fuel consumption and GHG emissions increase proportional to the square of vehicle speed. Therefore, lowering vehicle speeds can significantly reduce fuel consumption and GHG emissions. A vehicle speed limiter (VSL), which limits the vehicle's maximum speed, is another technology option for compliance that is already utilized today by some fleets (though the typical maximum speed setting is often higher than 65 mph).

Downsized Engines and Downspeeding: As tractor manufacturers continue to reduce the losses due to vehicle loads, such as aerodynamic drag and rolling resistance, the amount of power required to move the vehicle decreases. In addition, engine manufacturers continue to improve the power density of heavy-duty engines through means such as reducing the engine friction due to smaller surface area. These two changes lead to the ability for truck purchasers to select lower displacement engines while maintaining the previous level of performance. Engine downsizing could be more effective if it is combined with the downspeeding assuming increased BMEP does not affect durability. The increased efficiency of the vehicle moves the operating points down to a lower load zone on a fuel map, which often moves the engine away from its sweet spot to a less efficient zone. In order to compensate for this loss, downspeeding allows the engine to run at a lower engine speed and move back to higher load zones, thus can slightly improve fuel efficiency. Reducing the engine size allows the vehicle operating points to move back to the sweet spot, thus further improving fuel efficiency. Engine downsizing can be accounted for as a vehicle technology through the use of the engine's fuel map in GEM.

Transmission: As discussed in the 2010 NAS report, automatic (AT) and automated manual transmissions (AMT) may offer the ability to improve vehicle fuel consumption by optimizing gear selection compared to an average driver.[148] However, as also noted in the report and in the supporting TIAX report, the improvement is very dependent on the driver of the truck, such that reductions ranged from 0 to 8 percent.[149] Well-trained drivers would be expected to perform as well or even better than an automatic transmission since the driver can see the road ahead and anticipate a changing stoplight or other road condition that neither an automatic nor automated manual transmission can anticipate. However, poorly-trained drivers that shift too frequently or not frequently enough to maintain optimum engine operating conditions could be expected to realize improved in-use fuel consumption by switching from a manual transmission to an automatic or automated manual transmission. As transmissions continue to evolve, we are now seeing in the European heavy-duty vehicle market the addition of dual clutch transmissions (DCT). DCTs operate similar to AMTs, but with two clutches so that the transmission can maintain engine speed during a shift which improves fuel efficiency. We believe there may be real benefits in reduced fuel consumption and GHG emissions through the adoption of dual clutch, automatic or automated manual transmission technology.

Low Friction Transmission, Axle, and Wheel Bearing Lubricants: The 2010 NAS report assessed low friction lubricants for the drivetrain as providing a 1 percent improvement in fuel consumption based on fleet testing.[150] A field trial of European medium-duty trucks found an average fuel consumption improvement of 1.8 percent using SAE 5W–30 engine oil, SAE 75W90 axle oil and SAE 75W80 transmission oil when compared to SAE 15W40 engine oil and SAE 90W axle oil, and SAE 80W transmission oil.[151] The light-duty 2012–16 MY vehicle rule and the pickup truck portion of this program estimate that low friction lubricants can have an effectiveness value between 0 and 1 percent compared to traditional lubricants.

Drivetrain: Most tractors today have three axles—a steer axle and two rear drive axles, and are commonly referred to as 6x4 tractors. Manufacturers offer 6x2 tractors that include one rear drive axle and one rear non-driving axle. The 6x2 tractors offer three distinct benefits. First, the non-driving rear axle does not have internal friction and therefore reduces the overall parasitic losses in the drivetrain. In addition, the 6x2 configuration typically weighs approximately 300 to 400 lbs less than

[147] California Air Resources Board. Letter from Michael Carter to Matthew Spears dated December 3, 2014. Solar Control: Heavy-Duty Vehicles White Paper. Docket EPA–HA–OAR–2014–0827.

[148] Manual transmissions require the driver to shift the gears and manually engage and disengage the clutch. Automatic transmissions shift gears through computer controls and typically include a torque converter. An AMT operates similar to a manual transmission, except that an automated clutch actuator disengages and engages the drivetrain instead of a human driver. An AMT does not include a clutch pedal controllable by the driver or a torque converter.

a 6x4 configuration.[152] Finally, the 6x2 typically costs less or is cost neutral when compared to a 6x4 tractor. Sources cite the effectiveness of 6x2 axles at between 1 and 3 percent.[153] Similarly, with the increased use of double and triple trailers, which reduce the weight on the tractor axles when compared to a single trailer, manufacturers offer 4x2 axle configurations. The 4x2 axle configuration would have as good as or better fuel efficiency performance than a 6x2.

Accessory Improvements: Parasitic losses from the engine come from many systems, including the water pump, oil pump, and power steering pump. Reductions in parasitic losses are one of the areas being developed under the DOE SuperTruck program. As presented in the DOE Merit reviews, Navistar stated that they demonstrated a 0.45 percent reduction in fuel consumption through water pump improvements and 0.3 percent through oil pump improvements compared to a current engine. In addition, Navistar showed a 0.9 percent benefit for a variable speed water pump and variable displacement oil pump. Detroit Diesel reports a 0.5 percent coming from improved water pump efficiency.[154] It should be noted that water pump improvements include both pump efficiency improvement and variable speed or on/off controls. Lube pump improvements are primarily achieved using variable displacement pumps and may also include efficiency improvement. All of these results shown in this paragraph are demonstrated through the DOE SuperTruck program at single operating point on the engine map, and therefore the overall expected reduction of these technologies is less than the single point result.

Intelligent Controls: Skilled drivers know how to control a vehicle to obtain maximum fuel efficiency by, among other things, considering road terrain. For example, the driver may allow the vehicle to slow down below the target speed on an uphill and allow it to go over the target speed when going downhill, to essentially smooth out the engine demand. Electronic controls can be developed to essentially mimic this activity. The agencies propose to provide a 2 percent reduction in fuel consumption and CO_2 emissions for vehicles configured with intelligent controls, such as predictive cruise control.

Automatic Tire Inflation Systems: Proper tire inflation is critical to maintaining proper stress distribution in the tire, which reduces heat loss and rolling resistance. Tires with reduced inflation pressure exhibit a larger footprint on the road, more sidewall flexing and tread shearing, and therefore, have greater rolling resistance than a tire operating at its optimal inflation pressure. Bridgestone tested the effect of inflation pressure and found a 2 percent variation in fuel consumption over a 40 psi range.[155] Generally, a 10 psi reduction in overall tire inflation results in about a 1 percent reduction in fuel economy.[156] To achieve the intended fuel efficiency benefits of low rolling resistance tires, it is critical that tires are maintained at the proper inflation pressure.

Proper tire inflation pressure can be maintained with a rigorous tire inspection and maintenance program or with the use of tire pressure and inflation systems. According to a study conducted by FMCSA in 2003, about 1 in 5 tractors/trucks is operating with 1 or more tires underinflated by at least 20 psi.[157] A 2011 FMCSA study estimated underinflation accounts for one service call per year and increases tire procurement costs 10 to 13 percent. The study found that total operating costs can increase by $600 to $800 per year due to underinflation.[158] A recent study by The North American Council on Freight Efficiency, found that adoption of tire pressure monitoring systems is increasing. It also found that reliability and durability of commercially available tire pressure systems are good and early issues with the systems have been addressed.[159] These automatic tire inflation systems monitor tire pressure and also automatically keep tires inflated to a specific level. The agencies propose to provide a 1 percent CO_2 and fuel consumption reduction value for tractors with automatic tire inflation systems installed.

Tire pressure monitoring systems notify the operator of tire pressure, but require the operator to manually inflate the tires to the optimum pressure. Because of the dependence on the operator's action, the agencies are not proposing to provide a reduction value for tire pressure monitoring systems. We request comment on this approach and seek data from those that support a reduction value be assigned to tire pressure monitoring systems.

Hybrid: Hybrid powertrain development in Class 7 and 8 tractors has been limited to a few manufacturer demonstration vehicles to date. One of the key benefit opportunities for fuel consumption reduction with hybrids is less fuel consumption when a vehicle is idling, but the standard is already premised on use of extended idle reduction so use of hybrid technology would duplicate many of the same emission reductions attributable to extended idle reduction. NAS estimated that hybrid systems would cost approximately $25,000 per tractor in the 2015 through the 2020 time frame and provide a potential fuel consumption reduction of 10 percent, of which 6 percent is idle reduction which can be achieved (less expensively) through the use of other idle reduction technologies.[160] The limited reduction potential outside of idle reduction for Class 8 sleeper cab tractors is due to the mostly highway operation and limited start-stop operation. Due to the high cost and limited benefit during the model years at issue in this action (as well as issues regarding sufficiency of lead time (see Section III.D.2 below), the agencies are not including hybrids in assessing standard stringency (or as an input to GEM).

Management: The 2010 NAS report noted many operational opportunities to reduce fuel consumption, such as driver training and route optimization. The agencies have included discussion of several of these strategies in draft RIA Chapter 2, but are not using these approaches or technologies in the standard setting process. The agencies are looking to other resources, such as EPA's SmartWay Transport Partnership and regulations that could potentially be promulgated by the Federal Highway Administration and the Federal Motor Carrier Safety Administration, to continue to encourage the development and utilization of these approaches.

(2) Projected Technology Effectiveness and Cost

EPA and NHTSA project that CO_2 emissions and fuel consumption reductions can be feasibly and cost-effectively met through technological improvements in several areas. The agencies evaluated each technology and estimated the most appropriate adoption rate of technology into each tractor subcategory. The next sections describe the baseline vehicle configuration, the effectiveness of the individual technologies, the costs of the technologies, the projected adoption rates of the technologies into the regulatory subcategories, and finally the derivation of the proposed standards.

The agencies propose Phase 2 standards that project by 2027, all high-roof tractors would have aerodynamic performance equal to or better today's SmartWay performance—which represents the best of today's technology. This would equate to having 40 percent of new high roof sleeper cabs in 2027 complying with the current best practices and 60 percent of the new high-roof sleeper cab tractors sold in 2027 having better aerodynamic performance than the best tractors available today. For tire rolling resistance, we premised the proposed standards on the assumption that nearly all tires in 2027 would have rolling resistance equal to or superior to tires meeting today's SmartWay designation. As discussed in Section II.D, the agencies assume the proposed 2027 MY engines would achieve an additional 4 percent improvement over Phase 1 engines and we project would include 15 percent of waste heat recovery (WHR) and many other advanced engine technologies. In addition, we are proposing standards that project improvements to nearly all of today's transmissions, incorporation of extended idle reduction technologies on 90 percent of sleeper cabs, and significant adoption of other types of technologies such as predictive cruise control and automatic tire inflation systems.

In addition to the high cost and limited utility of hybrids for many tractor drive cycles noted above, the agencies believe that hybrid powertrains systems for tractors may not be sufficiently developed and the necessary manufacturing capacity put in place to base a standard on any significant volume of hybrid tractors. Unlike hybrids for vocational vehicles and light-duty vehicles, the agencies are not aware of any full hybrid systems currently developed for long haul tractor applications. To date, hybrid systems for tractors have been primarily focused on idle shutdown technologies and not on the broader energy storage and recovery systems necessary to achieve reductions over typical vehicle drive cycles. The proposed standards reflect the potential for idle shutdown technologies through GEM. Further as highlighted by the 2010 NAS report, the agencies do believe that full hybrid powertrains may have the potential in the longer term to provide significant improvements in tractor fuel efficiency and to greenhouse gas emission reductions. However, due to the high cost, limited benefit during highway driving, and lacking any existing systems or manufacturing base, we cannot conclude with certainty, absent additional information, that such technology would be available for tractors in the 2021–2027 timeframe. However the agencies welcome comment from industry and others on their projected timeline for deployment of hybrid powertrains for tractor applications.

(a) Tractor Baselines for Costs and Effectiveness

The fuel efficiency and CO_2 emissions of combination tractors vary depending on the configuration of the tractor. Many aspects of the tractor impact its performance, including the engine, transmission, drive axle, aerodynamics, and rolling resistance. For each subcategory, the agencies selected a theoretical tractor to represent the average 2017 model year tractor that meets the Phase 1 standards (see 76 FR 57212, September 15, 2011). These tractors are used as baselines from which to evaluate costs and effectiveness of additional technologies and standards. The specific attributes of each tractor subcategory are listed below in Table III–5. Using these values, the agencies assessed the CO_2 emissions and fuel consumption performance of the proposed baseline tractors using the proposed version of Phase 2 GEM. The results of these simulations are shown below in Table III–6.

As noted earlier, the Phase 1 2017 model year tractor standards and the baseline 2017 model year tractor results are not directly comparable. The same set of aerodynamic and tire rolling resistance technologies were used in both setting the Phase 1 standards and determining the baseline of the Phase 2 tractors. However, there are several aspects that differ. First, a new version of GEM was developed and validated to provide additional capabilities, including more refined modeling of transmissions and engines. Second, the determination of the proposed HD Phase 2 CdA value takes into account a revised test procedure, a new standard reference trailer, and wind averaged drag as discussed below in Section III.E. In addition, the proposed HD Phase 2 version of GEM includes road grade in the 55 mph and 65 mph highway cycles, as discussed below in Section III.E. Finally, the agencies assessed the current level of automatic engine shutdown and idle reduction technologies used by the tractor manufacturers to comply with the 2014 model year CO_2 and fuel consumption standards. To date, the manufacturers are meeting the 2014 model year standards without the use of this technology. Therefore, in this proposal the agencies reverted back to the baseline APU adoption rate of 30 percent, the value used in the Phase 1 baseline.

TABLE III–5—GEM INPUTS FOR THE BASELINE CLASS 7 AND 8 TRACTOR

TABLE III–6—CLASS 7 AND 8 TRACTOR BASELINE CO_2 EMISSIONS AND FUEL CONSUMPTION

	Class 7			Class 8					
	Day cab			Day cab			Sleeper cab		
	Low roof	Mid roof	High roof	Low roof	Mid roof	High roof	Low roof	Mid roof	High roof
CO_2 (grams CO_2/ton-mile)	107	118	121	86	93	95	79	87	88
Fuel Consumption (gal/1,000 ton-mile)	10.5	11.6	11.9	8.4	9.1	9.3	7.8	8.5	8.6

The fuel consumption and CO_2 emissions in the baseline described above remains the same over time with no assumed improvements after 2017, absent a Phase 2 regulation. An alternative baseline was also evaluated by the agencies in which there is a continuing uptake of technologies in the tractor market that reduce fuel consumption and CO_2 emissions absent a Phase 2 regulation. This alternative baseline, referred to as the more dynamic baseline, was developed to estimate the effect of market pressures and non-regulatory government initiatives to improve tractor fuel consumption. The more dynamic baseline assumes that the significant level of research funded and conducted by the Federal government, industry, academia and other organizations will, in the future, result the adoption of some technologies beyond the levels required to comply with Phase 1 standards. One example of such research is the Department of Energy Super Truck program [161] which has a goal of demonstrating cost-effective measures to improve the efficiency of Class 8 long-haul freight trucks by 50 percent by 2015. The more dynamic baseline also assumes that manufacturers will not cease offering fuel efficiency improving technologies that currently have significant market penetration, such as automated manual transmissions. The baselines (one for each of the nine tractor types) are characterized by fuel consumption and CO_2 emissions that gradually decrease between 2019 and 2028. In 2028, the fuel consumption for the alternative tractor baselines is approximately 4.0 percent lower than those shown in Table III–6. This results from the assumed introduction of aerodynamic technologies such as down exhaust, underbody airflow treatment in addition to tires with lower rolling resistance. The assumed introduction of these technologies reduces the CdA of the baseline tractors and CRR of the tractor tires. To take one example, the CdA for baseline high roof sleeper cabs in Table III–5 is 6.22 (m²) in 2018. In 2028, the CdA of a high roof sleeper cab would be assumed to still be 6.22 m² in the baseline case outlined above. Alternatively, in the dynamic baseline, the CdA for high roof sleeper cabs is 5.61 (m²) in 2028 due to assumed market penetration of technologies absent the Phase 2 regulation. The dynamic baseline analysis is discussed in more detail in draft RIA Chapter 11.

[161] U.S. Department of Energy. ''SuperTruck Making Leaps in Fuel Efficiency.'' 2014. Last accessed on May 10, 2015 at *http://energy.gov/eere/articles/supertruck-making-leaps-fuel-efficiency.*

(b) Tractor Technology Packages

The agencies' assessment of the proposed technology effectiveness was developed through the use of the GEM in coordination with modeling conducted by Southwest Research Institute. The agencies developed the proposed standards through a three-step process, similar to the approach used in Phase 1. First, the agencies developed technology performance characteristics for each technology, as described below. Each technology is associated with an input parameter which in turn would be used as an input to the Phase 2 GEM simulation tool and its effectiveness thereby modeled. The performance levels for the range of Class 7 and 8 tractor aerodynamic packages and vehicle technologies are described below in Table III–7. Second, the agencies combined the technology performance levels with a projected technology adoption rate to determine the GEM inputs used to set the stringency of the proposed standards. Third, the agencies input these parameters into Phase 2 GEM and used the output to determine the proposed CO_2 emissions and fuel consumption levels. All percentage improvements noted below are over the 2017 baseline tractor.

(i) Engine Improvements

There are several technologies that could be used to improve the efficiency of diesel engines used in tractors. Details of the engine technologies, adoption rates, and overall fuel consumption and CO_2 emission reductions are included in Section II.D. The proposed heavy-duty tractor engine standards would lead to a 1.5 percent reduction in 2021MY, a 3.5 percent reduction in 2024MY, and a 4 percent reduction in 2027MY. These reductions would show up in the fuel map used in GEM.

(ii) Aerodynamics

The aerodynamic packages are categorized as Bin I, Bin II, Bin III, Bin IV, Bin V, Bin VI, or Bin VII based on the wind averaged drag aerodynamic performance determined through testing conducted by the manufacturer. A more complete description of these aerodynamic packages is included in Chapter 2 of the draft RIA. In general, the proposed CdA values for each package and tractor subcategory were developed through EPA's coastdown testing of tractor-trailer combinations, the 2010 NAS report, and SAE papers.

(iii) Tire Rolling Resistance

The proposed rolling resistance coefficient target for Phase 2 was developed from SmartWay's tire testing to develop the SmartWay certification, testing a selection of tractor tires as part of the Phase 1 and Phase 2 programs, and from 2014 MY certification data. Even though the coefficient of tire rolling resistance comes in a range of values, to analyze this range, the tire performance was evaluated at four levels for both steer and drive tires, as determined by the agencies. The four levels are the baseline (average) from 2010, Level I and Level 2 from Phase 1, and Level 3 that achieves an additional 25 percent improvement over Level 2. The Level 1 rolling resistance performance represents the threshold used to develop SmartWay designated tires for long haul tractors. The Level 2 threshold represents an incremental step for improvements beyond today's SmartWay level and represents the best in class rolling resistance of the tires we tested. The Level 3 values represent the long-term rolling resistance value that the agencies predicts could be achieved in the 2025 timeframe. Given the multiple year phase-in of the standards, the agencies expect that tire manufacturers will continue to respond to demand for more efficient tires and will offer increasing numbers of tire models with rolling resistance values significantly better than today's typical low rolling resistance tires. The tire rolling resistance level assumed to meet the 2017 MY Phase 1 standard high roof sleeper cab is considered to be a weighted average of 10 percent baseline rolling resistance, 70 percent Level 1, and 20 percent Level 2. The tire rolling resistance to meet the 2017MY Phase 1 standards for the high roof day cab, low roof sleeper cab, and mid roof sleeper cab includes 30 percent baseline, 60 percent Level 1 and 10 percent Level 2. Finally, the low roof day cab 2017MY standard can be met with a weighted average rolling resistance consisting of 40 percent baseline, 50 percent Level 1, and 10 percent Level 2.

(iv) Idle Reduction

The benefits for the extended idle reductions were developed from literature, SmartWay work, and the 2010 NAS report. Additional details regarding the comments and calculations are included in draft RIA Section 2.4.

(v) Transmission

The benefits for automated manual, automatic, and dual clutch transmissions were developed from literature and from simulation modeling conducted by Southwest Research Institute. The benefit of these transmissions is proposed to be set to a two percent improvement over a manual transmission due to the automation of the gear shifting.

(vi) Drivetrain

The reduction in friction due to low viscosity axle lubricants is set to 0.5 percent. 6x4 and 4x2 axle configurations lead to a 2.5 percent improvement in vehicle efficiency. Downspeeding would be as demonstrated through the Phase 2 GEM inputs of transmission gear ratio, drive axle ratio, and tire diameter. Downspeeding is projected to improve the fuel consumption by 1.8 percent.

(vii) Accessories and Other Technologies

Compared to 2017MY air conditioners, air conditioners with improved efficiency compressors will reduce CO_2 emissions by 0.5 percent. Improvements in accessories, such as power steering, can lead to an efficiency improvement of 1 percent over the 2017MY baseline. Based on literature information, intelligent controls such as predictive cruise control will reduce CO_2 emissions by 2 percent while automatic tire inflation systems improve fuel consumption by 1 percent by keeping tire rolling resistance to its optimum based on inflation pressure.

(viii) Weight Reduction

The weight reductions were developed from tire manufacturer information, the Aluminum Association, the Department of Energy, SABIC and TIAX, as discussed above in Section II.B.3.e.

(ix) Vehicle Speed Limiter

The agencies did not consider the availability of vehicle speed limiter technology in setting the Phase 1 stringency levels, and again did not consider the availability of the technology in developing regulatory alternatives for Phase 2. However, as described in more detail above, speed limiters could be an effective means for achieving compliance, if employed on a voluntary basis.

(x) Summary of Technology Performance

Table III–7 describes the performance levels for the range of Class 7 and 8 tractor vehicle technologies.

(c) Tractor Technology Adoption Rates

As explained above, tractor manufacturers often introduce major product changes together, as a package. In this manner the manufacturers can optimize their available resources, including engineering, development, manufacturing and marketing activities to create a product with multiple new features. In addition, manufacturers recognize that a truck design will need to remain competitive over the intended life of the design and meet future regulatory requirements. In some limited cases, manufacturers may implement an individual technology outside of a vehicle's redesign cycle.

With respect to the levels of technology adoption used to develop the proposed HD Phase 2 standards, NHTSA and EPA established technology adoption constraints. The first type of constraint was established based on the application of fuel consumption and CO_2 emission reduction technologies into the different types of tractors. For example, extended idle reduction technologies are limited to Class 8 sleeper cabs using the reasonable assumption that day cabs are not used for overnight hoteling. A second type of constraint was applied to most other technologies and limited their adoption based on factors reflecting the real world operating conditions that some combination tractors encounter. This second type of constraint was applied to the aerodynamic, tire, powertrain, and vehicle speed limiter technologies.

Table III–8 and Table III–10, specify the adoption rates that EPA and NHTSA used to develop the proposed standards. The agencies welcome comments on these adoption rates.

NHTSA and EPA believe that within each of these individual vehicle categories there are particular applications where the use of the identified technologies would be either ineffective or not technically feasible. For example, the agencies are not predicating the proposed standards on the use of full aerodynamic vehicle treatments on 100 percent of tractors because we know that in many applications (for example gravel truck engaged in local aggregate delivery) the added weight of the aerodynamic technologies will increase fuel consumption and hence CO_2 emissions to a greater degree than the reduction that would be accomplished from the more aerodynamic nature of the tractor.

(i) Aerodynamics Adoption Rate

The impact of aerodynamics on a tractor-trailer's efficiency increases with vehicle speed. Therefore, the usage pattern of the vehicle will determine the benefit of various aerodynamic technologies. Sleeper cabs are often used in line haul applications and drive the majority of their miles on the highway travelling at speeds greater than 55 mph. The industry has focused aerodynamic technology development, including SmartWay tractors, on these types of trucks. Therefore the agencies are proposing the most aggressive aerodynamic technology application to this regulatory subcategory. All of the major manufacturers today offer at least one SmartWay sleeper cab tractor model, which is represented as Bin III aerodynamic performance. The proposed aerodynamic adoption rate for Class 8 high roof sleeper cabs in 2027 (*i.e.,* the degree of technology adoption on which the stringency of the proposed standard is premised) consists of 20 percent of Bin IV, 35 percent Bin V, 20 percent Bin VI, and 5 percent Bin VII reflecting our assessment of the fraction of tractors in this segment that could successfully apply these aerodynamic packages with this amount of lead time. We believe that there is sufficient lead time to develop aerodynamic tractors that can move the entire high roof sleeper cab aerodynamic performance to be as good as or better than today's SmartWay designated tractors. The changes required for Bin IV and better performance reflect the kinds of improvements projected in the Department of Energy's SuperTruck program. That program assumes that such systems can be demonstrated on vehicles by 2017. In this case, the agencies are projecting that truck manufacturers would be able to begin implementing these aerodynamic technologies as early as 2021 MY on a limited scale. Importantly, our averaging, banking and trading provisions provide manufacturers with the flexibility (and incentive) to implement these technologies over time even though the standard changes in a single step.

The aerodynamic adoption rates used to develop the proposed standards for the other tractor regulatory categories are less aggressive than for the Class 8 sleeper cab high roof. Aerodynamic improvements through new tractor designs and the development of new aerodynamic components is an inherently slow and iterative process. The agencies recognize that there are tractor applications which require on/off-road capability and other truck functions which restrict the type of aerodynamic equipment applicable. We also recognize that these types of trucks spend less time at highway speeds where aerodynamic technologies have the greatest benefit. The 2002 VIUS data ranks trucks by major use.[162] The heavy trucks usage indicates that up to 35 percent of the trucks may be used in on/off-road applications or heavier applications. The uses include construction (16 percent), agriculture (12 percent), waste management (5 percent), and mining (2 percent). Therefore, the agencies analyzed the technologies to evaluate the potential restrictions that would prevent 100 percent adoption of more advanced aerodynamic technologies for all of the tractor regulatory subcategories.

As discussed in Section III.C.2, the agencies propose to increase the number of aerodynamic bins for low and mid roof tractors from the two levels adopted in Phase 1 to four levels in Phase 2. The agencies propose to increase the number of bins for these tractors to reflect the actual range of aerodynamic technologies effective in low and mid roof tractor applications. The aerodynamic improvements to the bumper, hood, windshield, mirrors, and doors are developed for the high roof tractor application and then carried over into the low and mid roof applications.

(ii) Low Rolling Resistance Tire Adoption Rate

For the tire manufacturers to further reduce tire rolling resistance, the manufacturers must consider several performance criteria that affect tire selection. The characteristics of a tire also influence durability, traction control, vehicle handling, comfort, and retreadability. A single performance parameter can easily be enhanced, but an optimal balance of all the criteria will require improvements in materials and tread design at a higher cost, as estimated by the agencies. Tire design requires balancing performance, since changes in design may change different performance characteristics in opposing directions. Similar to the discussion regarding lesser aerodynamic technology application in tractor segments other than sleeper cab high roof, the agencies believe that the proposed standards should not be premised on 100 percent application of Level 3 tires in all tractor segments given the potential interference with vehicle utility that could result.

(iii) Weight Reduction Technology Adoption Rate

Unlike in HD Phase 1, the agencies propose setting the 2021 through 2027 model year tractor standards without using weight reduction as a technology to demonstrate the feasibility. However, as described in Section III.C.2 below, the agencies are proposing an expanded list of weight reduction options which could be input into the GEM by the manufacturers to reduce their certified CO_2 emission and fuel consumption levels. The agencies view weight reduction as a technology with a high cost that offers a small benefit in the tractor sector. For example, our estimate of a 400 pound weight reduction would cost $2,050 (2012$) in 2021MY, but offers a 0.3 percent reduction in fuel consumption and CO_2 emissions.

(iv) Idle Reduction Technology Adoption Rate

Idle reduction technologies provide significant reductions in fuel consumption and CO_2 emissions for Class 8 sleeper cabs and are available on

[162] U.S. Department of Energy. *Transportation Energy Data Book,* Edition 28–2009. Table 5.7.

the market today. There are several different technologies available to reduce idling. These include APUs, diesel fired heaters, and battery powered units. Our discussions with manufacturers indicate that idle technologies are sometimes installed in the factory, but it is also a common practice to have the units installed after the sale of the truck. We would like to continue to incentivize this practice and to do so in a manner that the emission reductions associated with idle reduction technology occur in use. Therefore, as adopted in Phase 1, we are allowing only idle emission reduction technologies which include an automatic engine shutoff (AES) with some override provisions.[163] However, we welcome comment on other approaches that would appropriately quantify the reductions that would be experienced in the real world.

We propose an overall 90 percent adoption rate for this technology for Class 8 sleeper cabs. The agencies are unaware of reasons why AES with extended idle reduction technologies could not be applied to this high fraction of tractors with a sleeper cab, except those deemed a vocational tractor, in the available lead time.

The agencies are interested in extending the idle reduction benefits beyond Class 8 sleepers, to day cabs. The agencies reviewed literature to quantify the amount of idling which is conducted outside of hoteling operations. One study, conducted by Argonne National Laboratory, identified several different types of trucks which might idle for extended amounts of time during the work day.[164] Idling may occur during the delivery process, queuing at loading docks or border crossings, during power take off operations, or to provide comfort during the work day. However, the study provided only ''rough estimates'' of the idle time and energy use for these vehicles. The agencies are not able to appropriately develop a baseline of workday idling for day cabs and identify the percent of this idling which could be reduced through the use of AES. We welcome comment and data on quantifying the effectiveness of AES on day cabs.

(v) Vehicle Speed Limiter Adoption Rate

As adopted in Phase 1, we propose to continue the approach where vehicle speed limiters may be used as a technology to meet the proposed standard. In setting the proposed standard, however, we assumed a zero percent adoption rate of vehicle speed limiters. Although we believe vehicle speed limiters are a simple, easy to implement, and inexpensive technology, we want to leave the use of vehicles speed limiters to the truck purchaser. Since truck fleets purchase tractors today with owner-set vehicle speed limiters, we considered not including VSLs in our compliance model. However, we have concluded that we should allow the use of VSLs that cannot be overridden by the operator as a means of compliance for vehicle manufacturers that wish to offer it and truck purchasers that wish to purchase the technology. In doing so, we are providing another means of meeting that standard that can lower compliance cost and provide a more optimal vehicle solution for some truck fleets or owners. For example, a local beverage distributor may operate trucks in a distribution network of primarily local roads. Under those conditions, aerodynamic fairings used to reduce aerodynamic drag provide little benefit due to the low vehicle speed while adding additional mass to the vehicle. A vehicle manufacturer could choose to install a VSL set at 55 mph for this vehicle at the request of the customer. The resulting tractor would be optimized for its intended application and would be fully compliant with our program all at a lower cost to the ultimate tractor purchaser.[165]

As in Phase 1, we have chosen not to base the proposed standards on performance of VSLs because of concerns about how to set a realistic adoption rate that avoids unintended adverse impacts. Although we expect there would be some use of VSL, currently it is used when the fleet involved decides it is feasible and practicable and increases the overall efficiency of the freight system for that fleet operator. To date, the compliance data provided by manufacturers indicate that none of the tractor configurations include a tamper-proof VSL setting less than 65 mph. At this point the agencies are not in a position to determine in how many additional situations use of a VSL would result in similar benefits to overall efficiency or how many customers would be willing to accept a tamper-proof VSL setting. As discussed in Section III.E.2.f below, we welcome comment on suggestions to modify the tamper-proof requirement while maintaining assurance that the speed limiter is used in-use throughout the life of the vehicle. We are not able at this time to quantify the potential loss in utility due to the use of VSLs, but we welcome comment on whether the use of a VSL would require a fleet to deploy additional tractors. Absent this information, we cannot make a determination regarding the reasonableness of setting a standard based on a particular VSL level. Therefore, the agencies are not premising the proposed standards on use of VSL, and instead would continue to rely on the industry to select VSL when circumstances are appropriate for its use. The agencies have not included either the cost or benefit due to VSLs in analysis of the proposed program's costs and benefits, therefore it remains a significant flexibility for manufacturers to choose.

(vi) Summary of the Adoption Rates Used To Determine the Proposed Standards

Table III–8 through Table III–10 provide the adoption rates of each technology broken down by weight class, cab configuration, and roof height.

[163] The agencies are proposing to continue the HD Phase 1 AES override provisions included in 40 CFR 1037.660(b) for driver safety.

[164] Gaines, L., A. Vyas, J. Anderson. Estimation of Fuel Use by Idling Commercial Trucks. January 2006.

[165] Ibid.

The agencies note that because a VSL value can be input into GEM, its benefits can be directly assessed with the model and off cycle credit applications therefore are not necessary even though the proposed standard is not based on performance of VSLs (*i.e.* VSL is an on-cycle technology).

(d) Derivation of the Proposed Tractor Standards

The agencies used the technology effectiveness inputs and technology adoption rates to develop GEM inputs to derive the proposed HD Phase 2 fuel consumption and CO_2 emissions standards for each subcategory of Class 7 and 8 combination tractors. Note that we have analyzed *one* technology pathway for each proposed level of stringency, but manufacturers would be free to use any combination of technology to meet the standards, and with the flexibility of averaging, banking and trading, to meet the standard on average. The agencies derived a scenario tractor for each subcategory by weighting the individual GEM input parameters included in Table III–7 with the adoption rates in Table III–8 through Table III–10. For example, the proposed CdA value for a 2021MY Class 8 Sleeper Cab High Roof scenario case was derived as 40 percent times 6.3 plus 35 percent times 5.6 plus 20 percent times 5.1 plus 5 percent times 4.7, which is equal to a CdA of 5.74 m². Similar calculations were made for tire rolling resistance, transmission types, idle reduction, and other technologies. To account for the proposed engine standards and engine technologies, the agencies assumed a compliant engine fuel map in GEM.[166] The agencies then ran GEM with a single set of vehicle inputs, as shown in Table III–11, to derive the proposed standards for each subcategory. Additional detail is provided in the draft RIA Chapter 2.

2027 Model Year and Later Gallons of Fuel per 1,000 Ton-Mile			
Low Roof	8.5462	6.8762	6.0904
Mid Roof	9.4303	7.4656	6.7780
High Roof	9.4303	7.4656	6.5815

A summary of the draft technology package costs is included in Table III–15 through Table III–17 for MYs 2021, 2024, and 2027, respectively, with additional details available in the draft RIA Chapter 2.12. We welcome comments on the technology costs.

TABLE III–15—CLASS 7 AND 8 TRACTOR TECHNOLOGY INCREMENTAL COSTS IN THE 2021 MODEL YEAR [a] [b] PREFERRED ALTERNATIVE VS. THE LESS DYNAMIC BASELINE

[2012$ per vehicle]

	Class 7		Class 8				
	Day cab		Day cab		Sleeper cab		
	Low/mid roof	High roof	Low/mid roof	High roof	Low roof	Mid roof	High roof
Engine [c]	$314	$314	$314	$314	$314	$314	$314
Aerodynamics	687	511	687	511	656	656	535
Tires	49	9	81	15	59	59	15
Tire inflation system	180	180	180	180	180	180	180
Transmission	3,969	3,969	3,969	3,969	3,969	3,969	3,969
Axle & axle lubes	50	50	70	90	70	70	90
Idle reduction with APU	0	0	0	0	2,449	2,449	2,449
Air conditioning	45	45	45	45	45	45	45
Other vehicle technologies	174	174	174	174	174	174	174
Total	5,468	5,252	5,520	5,298	7,916	7,916	7,771

Notes:

[a] Costs shown are for the 2021 model year and are incremental to the costs of a tractor meeting the Phase 1 standards. These costs include indirect costs via markups along with learning impacts. For a description of the markups and learning impacts considered in this analysis and how it impacts technology costs for other years, refer to Chapter 2 of the draft RIA (see draft RIA 2.12).

[b] Note that values in this table include adoption rates. Therefore, the technology costs shown reflect the average cost expected for each of the indicated tractor classes. To see the actual estimated technology costs exclusive of adoption rates, refer to Chapter 2 of the draft RIA (see draft RIA 2.12 in particular).

[c] Engine costs are for a heavy HD diesel engine meant for a combination tractor. The engine costs in this table are equal to the engine costs associated with the separate engine standard because both include the same set of engine technologies (see Section II.D.2.d.i).

TABLE III–16—CLASS 7 AND 8 TRACTOR TECHNOLOGY INCREMENTAL COSTS IN THE 2024 MODEL YEAR [a] [b] PREFERRED ALTERNATIVE VS. THE LESS DYNAMIC BASELINE

Notes:

[a] Costs shown are for the 2027 model year and are incremental to the costs of a tractor meeting the Phase 1 standards. These costs include indirect costs via markups along with learning impacts. For a description of the markups and learning impacts considered in this analysis and how it impacts technology costs for other years, refer to Chapter 2 of the draft RIA (see draft RIA 2.12).

[b] Note that values in this table include adoption rates. Therefore, the technology costs shown reflect the average cost expected for each of the indicated tractor classes. To see the actual estimated technology costs exclusive of adoption rates, refer to Chapter 2 of the draft RIA (see draft RIA 2.12 in particular).

[c] Engine costs are for a heavy HD diesel engine meant for a combination tractor. The engine costs in this table are equal to the engine costs associated with the separate engine standard because both include the same set of engine technologies (see Section II.D.2.d.i).

(i) Proposed Heavy-Haul Tractor Standards

For Phase 2, the agencies propose to add a tenth subcategory to the tractor category for heavy-haul tractors. The agencies recognize the need for manufacturers to build these types of vehicles for specific applications and believe the appropriate way to prevent penalizing these vehicles is to set separate standards recognizing a heavy-haul vehicle's unique needs, such as requiring a higher horsepower engine or different transmissions. The agencies are proposing this change in Phase 2 because unlike in Phase 1 the engine, transmission, and drivetrain technologies are included in the technology packages used to determine the stringency of the proposed tractor standards and are included as manufacturer inputs in GEM. This means that the agencies can adopt a standard reflecting individualized performance of these technologies in particular applications, in this case, heavy-haul tractors, and further, have a means of reliably assessing individualized performance of these technology at certification.

The typical tractor is designed with a Gross Combined Weight Rating (GCWR) of approximately 80,000 lbs due to the effective weight limit on the federal highway system, except in states with preexisting higher weight limits. The agencies propose to consider tractors with a GCWR over 120,000 lbs as heavy-haul tractors. Based on comments received during the development of HD Phase 1 (76 FR 57136–57138) and because we are not proposing a sales limit for heavy-haul like we have for the vocational tractors, the agencies also believe it would be appropriate to further define the heavy-haul vehicle characteristics to differentiate these vehicles from the vehicles in the other nine tractor subcategories. The two additional requirements would include a total gear reduction greater than or equal to 57:1 and a frame Resisting Bending Moment (RBM) greater than or equal to 2,000,000 in-lbs per rail or rail and liner combination. Heavy-haul tractors typically require the large gear reduction to provide the torque necessary to start the vehicle moving. These vehicles also typically require frame rails with extra strength to ensure the ability to haul heavy loads. We welcome comment on the proposed heavy-haul tractor specifications, including whether Gross Vehicle Weight Rating (GVWR) or Gross Axle Weight Rating (GAWR) would be a more appropriate metric to differentiate between a heavy-haul tractor and a typical tractor.

The agencies propose that heavy-haul tractors demonstrate compliance with the proposed standards using the day cab drive cycle weightings of 19 percent transient cycle, 17 percent 55 mph cycle, and 64 percent 65 mph cycle. We also propose that GEM simulates the heavy-haul tractors with a payload of 43 tons and a total tractor, trailer, and payload weight of 118,500 lbs. In addition, we propose that the engines installed in heavy-haul tractors meet the proposed tractor engine standards included in 40 CFR 1036.108. We welcome comments on these proposed specifications.

The agencies recognize that certain technologies used to determine the stringency of the proposed Phase 2 tractor standards are less applicable to heavy-haul tractors. Heavy-haul tractors are not typically used in the same manner as long-haul tractors with extended highway driving, and therefore would experience less benefit from aerodynamics. Aerodynamic technologies are very effective at reducing the fuel consumption and GHG emissions of tractors, but only when traveling at highway speeds. At lower speeds, the aerodynamic technologies may have a detrimental impact due to the potential of added weight. The agencies therefore are not considering the use of aerodynamic technologies in the development of the proposed Phase 2 heavy-haul tractor standards. Moreover, because aerodynamics would not play a role in the heavy-haul standards, the agencies propose to combine all of the heavy-haul tractor cab configurations (day and sleeper) and roof heights (low, mid, and high) into a single heavy-haul tractor subcategory.[167] We welcome comment on this approach.

Certain powertrain and drivetrain components are also impacted during the design of a heavy-haul tractor, including the transmission, axles, and the engine. Heavy-haul tractors typically require transmissions with 13 or 18 speeds to provide the ratio spread to ensure that the tractor is able to start pulling the load from a stop. Downsped powertrains are typically not an option for heavy-haul operations because these vehicles require more torque to move the vehicle because of the heavier load. Finally, due to the loading requirements of the vehicle, it is not likely that a 6x2 axle configuration can be used in heavy-haul applications.

The agencies used the following heavy-haul tractor inputs for developing the proposed 2021, 2024, and 2027 MY standards, as shown in Table III–18 and Table III–19.

TABLE III–18—APPLICATION RATES FOR PROPOSED HEAVY-HAUL TRACTOR STANDARDS

Heavy-Haul Tractor Application Rates			
	2021MY	2024MY	2027MY

The baseline 2017 MY heavy-haul tractor would emit 57 grams of CO_2 per ton-mile and consume 5.6 gallons of fuel per 1,000 ton-mile. The agencies propose the heavy-haul standards shown in Table III–20. We welcome comment on the heavy-haul tractor technology path and standards proposed by the agencies.

TABLE III–20—PROPOSED HEAVY-HAUL TRACTOR STANDARDS

	Heavy-haul tractor		
	2021 MY	2024 MY	2027 MY
Grams of CO_2 per Ton-Mile Standard	54	52	51
Gallons of Fuel per 1,000 Ton-Mile	5.3045	5.1081	5.010

The technology costs associated with the proposed heavy-haul tractor standards are shown below in Table III–21. We welcome comment on the technology costs.

TABLE III–21—HEAVY-HAUL TRACTOR TECHNOLOGY INCREMENTAL COSTS IN THE 2021, 2024, AND 2027 MODEL YEAR [a b] PREFERRED ALTERNATIVE VS. THE LESS DYNAMIC BASELINE

[2012$ per vehicle]

Total	4,833	7,723	9,503

Notes:

[a] Costs shown are for the specified model year and are incremental to the costs of a tractor meeting the phase 1 standards. These costs include indirect costs via markups along with learning impacts. For a description of the markups and learning impacts considered in this analysis and how it impacts technology costs for other years, refer to Chapter 2 of the draft RIA (see draft RIA 2.12).

[b] Note that values in this table include adoption rates. Therefore, the technology costs shown reflect the average cost expected for each of the indicated tractor classes. To see the actual estimated technology costs exclusive of adoption rates, refer to Chapter 2 of the draft RIA (see draft RIA 2.12 in particular).

[c] Engine costs are for a heavy HD diesel engine meant for a combination tractor.

(e) Consistency of the Proposed Tractor Standards With the Agencies' Legal Authority

The proposed HD Phase 2 standards are based on adoption rates for technologies that the agencies regard, subject to consideration of public comment, as the maximum feasible for purposes of EISA Section 32902 (k) and appropriate under CAA Section 202 (a) for the reasons given in Section III.D.2(b) through (d) above; see also draft RIA Chapter 2.4. The agencies believe these technologies can be adopted at the estimated rates for these standards within the lead time provided, as discussed in draft RIA Chapter 2. The 2021 and 2024 MY standards are phase-in standards on the path to the 2027 MY standards and were developed using less aggressive application rates and therefore have lower technology package costs than the 2027 MY standards. Moreover, we project the cost of these technologies would be rapidly recovered by operators due to the associated fuel savings, as shown in the payback analysis included in Section IX below. The cost per tractor to meet the proposed 2027 MY standards is projected to range between $10,000 and $13,000 (much or all of this would be mitigated by the fuel savings during the first two years of ownership). The agencies note that while the projected costs are significantly greater than the costs projected for Phase 1, we still consider that cost to be reasonable, especially given the relatively short payback period. In this regard the agencies note that the estimated payback period for tractors of less than two years [168] is itself shorter than the estimated payback period for light duty trucks in the 2017–2025 light duty greenhouse gas standards. That period was slightly over three years, see 77 FR 62926–62927, which EPA found to be a highly reasonable given the usual period of ownership of light trucks is typically five years.[169] The same is true here. Ownership of new tractors is customarily four to six years, meaning that the greenhouse gas and fuel consumption technologies pay for themselves early on and the purchaser sees overall savings in succeeding years—while still owning the vehicle.[170] The agencies note further that the costs for each subcategory are relatively proportionate; that is, costs of any single tractor subcategory are not disproportionately higher (or lower) than any other. Although the proposal is technology-forcing (especially with respect to aerodynamic and tire rolling resistance improvements), the agencies believe that manufacturers retain leeway to develop alternative compliance paths, increasing the likelihood of the standards' successful implementation. The agencies also regard these reductions as cost-effective, even without considering payback period. The agencies estimate the cost per metric ton of CO_2eq reduction without considering fuel savings to be $20 in 2030, and we estimate the cost per gallon of avoided fuel consumption to be about $0.25 per gallon, which compares favorably with the levels of cost effectiveness the agencies found to be reasonable for light duty trucks.[171 172] See 77 FR 62922. The proposed phase-in 2021 and 2024 MY standards are less stringent and less costly than the proposed 2027 MY standards. For these reasons, and because the agencies have carefully considered lead time, EPA believes they are also reasonable under Section 202(a) of the CAA. Given that the agencies believe the proposed standards are technically feasible, are highly cost effective, and highly cost effective when accounting for the fuel savings, and have no apparent adverse potential impacts (*e.g.,* there are no projected negative impacts on safety or vehicle utility), the proposed standards appear to represent a reasonable choice under Section 202(a) of the CAA and the maximum feasible under NHTSA's EISA authority at 49 U.S.C. 32902(k)(2).

Based on the information before the agencies, we currently believe that Alternative 3 would be maximum feasible and reasonable for the tractor segment for the model years in question. The agencies believe Alternative 4 has potential to be the maximum feasible and reasonable alternative; however, based on the evidence currently before us, EPA and NHTSA have outstanding questions regarding relative risks and benefits of Alternative 4 due to the timeframe envisioned by the alternative. Alternative 3 is generally designed to achieve the levels of fuel consumption and GHG reduction that Alternative 4 would achieve, but with several years of

[168] See Draft RIA Chapter 7.1.3.

[169] Auto Remarketing. Length of Ownership Returning to More Normal Levels; New Registrations Continue Slow Climb. April 1, 2013. Last accessed on February 26, 2015 at *http://www.autoremarketing.com/trends/length-ownership-returning-more-normal-levels-new-registrations-continue-slow-climb.*

[170] North American Council for Freight Efficiency. Barriers to Increased Adoption of Fuel Efficiency Technologies in Freight Trucking. July 2013. Page 24.

[171] See Draft RIA Chapter 7.1.4.

[172] If using a cost effectiveness metric that treats fuel savings as a negative cost, net costs per ton of GHG emissions reduced or per gallon of avoided fuel consumption would be negative under the proposed standards.

additional lead-time—*i.e.,* the Alternative 3 standards would end up in the same place as the Alternative 4 standards, but several years later, meaning that manufacturers could, in theory, apply new technology at a more gradual pace and with greater flexibility. However, Alternative 4 would provide earlier GHG benefits compared to Alternative 3.

(f) Alternative Tractor Standards Considered

The agencies developed and considered other alternative levels of stringency for the Phase 2 program. The results of the analysis of these alternatives are discussed below in Section X of the preamble. For tractors, the agencies developed the following alternatives as shown in Table III–22.

TABLE III–22—SUMMARY OF ALTERNATIVES CONSIDERED FOR THE PROPOSED RULEMAKING

Alternative 1	No action alternative
Alternative 2	Less Stringent than the Proposed Alternative applying off-the-shelf technologies.
Alternative 3 (Proposed Alternative)	Proposed Alternative fully phased-in by 2027 MY.
Alternative 4	Alternative that pulls ahead the proposed 2027 MY standards to 2024 MY.
Alternative 5	Alternative based on very high market adoption of advanced technologies.

When evaluating the alternatives, it is necessary to evaluate the impact of a proposed regulation in terms of CO_2 emission reductions, fuel consumption reductions, and technology costs. However, it is also necessary to consider other aspects, such as manufacturers' research and development resources, the impact on purchase price, and the impact on purchasers. Manufacturers are limited in their ability to develop and implement new technologies due to their human resources and budget constraints. This has a direct impact on the amount of lead time that is required to meet any new standards. From the owner/operator perspective, heavy-duty vehicles are a capital investment for firms and individuals so large increases in the upfront cost could impact buying patterns. Though the dollar value of the lifetime fuel savings will far exceed the upfront technology costs, purchasers often discount future fuel savings for a number of reasons. The purchaser often has uncertainty in the amount of fuel savings that can be expected for their specific operation due to the diversity of the heavy-duty tractor market. Although a nationwide perspective that averages out this uncertainty is appropriate for rulemaking analysis, individual operators must consider their potentially narrow operation. In addition, purchasers often put a premium on reliability (because downtime is costly in terms of towing, repair, late deliveries, and lost revenue) and may perceive any new technology as a potential risk with respect to reliability. Another factor that purchasers consider is the impact of a new technology on the resale market, which can also be impacted by uncertainty.

The agencies selected the proposed standards over the more stringent alternatives based on considering the relevant statutory factors. In 2027, the proposed standards achieve up to a 24 percent reduction in CO_2 emissions and fuel consumption compared to a Phase 1 tractor at a per vehicle cost of approximately $13,000. Alternative 4 achieves the same percent reduction in CO_2 emissions and fuel consumption compared to a Phase 1 tractor, but three years earlier, at a per vehicle cost of approximately $14,000. The alternative standards are projected to result in more emission and fuel consumption reductions from the heavy-duty tractors built in model years 2021 through 2026.[173] We project the proposed standards to be achievable within known design cycles, and we believe these standards would allow different paths to compliance in addition to the one we outline and cost here.

The agencies solicit comment on all of these issues and again note the possibility of adopting, in a final action, standards that are more accelerated than those proposed in Alternative 3. The agencies are also assuming that both the proposed standards and Alternative 4 could be accomplished with all changes being made during manufacturers' normal product design cycles. However, we note that doing so would be more challenging for Alternative 4 and may require accelerated research and development outside of design cycles with attendant increased costs.

The agencies are especially interested in seeking detailed comments on Alternative 4. Therefore, we are including the details of the Alternative 4 analysis below. The adoption rates considered for the 2021 and 2024 MY standards developed for Alternative 4 are shown below in Table III–23 and Table III–24. The inputs to GEM used to develop the Alternative 4 CO_2 and fuel consumption standards are shown below in Table III–25 and Table III–26. The standards associated with Alternative 4 are shown below in Table III–27. Commenters are encouraged to address all aspects of feasibility analysis, including costs, the likelihood of developing the technology to achieve sufficient relaibility within the proposed lead time, and the extent to which the market could utilize the technology.

(g) Derivation of Alternative 4 Tractor Standards

The adoption rates considered for the 2021 and 2024 MY standards developed for Alternative 4 are shown below in Table III–23 and Table III–24. The inputs to GEM used to develop the Alternative 4 CO_2 and fuel consumption standards are shown below in Table III–25 and Table III–26. The standards associated with Alternative 4 are shown below in Table III–27. Commenters are encouraged to address all aspects of feasibility analysis, including costs, the likelihood of developing the technology to achieve sufficient relaibility within the lead time.

[173] See Tables III–14 and III–27.

E. Proposed Compliance Provisions for Tractors

In HD Phase 1, the agencies developed an entirely new program to assess the CO_2 emissions and fuel consumption of tractors. The agencies propose to carry over many aspects of the Phase 1 compliance approach, but are proposing to enhance several aspects of the compliance program. The sections below highlight the key areas that are the same and those that are different.

(1) HD Phase 2 Compliance Provisions That Remain the Same

The regulatory structure considerations for Phase 2 are discussed in more detail above in Section II. We welcome comment on all aspects of the compliance program including where we are not proposing any changes.

(a) Application and Certification Process

For the Phase 2 proposed rule, the agencies are proposing to keep many aspects of the HD Phase 1 tractor compliance program. For example, the agencies propose to continue to use GEM (as revised for Phase 2), in coordination with additional component testing by manufacturers to determine the inputs, to determine compliance with the proposed fuel efficiency and CO_2 standards. Another aspect that we propose to carry over is the overall compliance approach.

In Phase 1 and as proposed in Phase 2, the general compliance process in terms of the pre-model year, during the model year, and post model year activities remain unchanged. The manufacturers would continue to be required to apply for certification through a single source, EPA, with limited sets of data and GEM results (see 40 CFR 1037.205). EPA would issue certificates upon approval based on information submitted through the VERIFY database (see 40 CFR 1037.255). In Phase 1, EPA and NHTSA jointly review and approve innovative technology requests, *i.e.* performance of any technology whose performance is not measured by the GEM simulation tool and is not in widespread use in the 2010 MY. For Phase 2, the agencies are proposing a similar process for allowing credits for off-cycle technologies that are not measured by the GEM simulation tool (see Section I.B.v. for a more detailed discussion of off-cycle requests). During the model year, the manufacturers would continue to generate certification data and conduct GEM runs on each of the vehicle configurations it builds. After the model year ends, the manufacturers would submit end of year reports to EPA that include the GEM results for all of the configurations it builds, along with credit/deficit balances if applicable (see 40 CFR 1037.250 and 1037.730). EPA and NHTSA would jointly coordinate on any enforcement action required.

(b) Compliance Requirements

The agencies are also proposing not to change the following provisions:

- Useful life of tractors (40 CFR 1037.105(e) and 1037.106(e)) although added for NHTSA in Phase 2 (40 CFR 535.5)
- Emission-related warranty requirements (40 CFR 1037.120)
- Maintenance instructions, allowable maintenance, and amending maintenance instructions (40 CFR 1037.125 and 137.220)
- Deterioration factors (40 CFR 1037.205(l) and 1037.241(c))
- Vehicle family, subfamily, and configurations (40 CFR 1037.230)

(c) Drive Cycles and Weightings

In Phase 1, the agencies adopted three drive cycles used in GEM to evaluate the fuel consumption and CO_2 emissions from various vehicle configurations. One of the cycles is the Transient mode of the California ARB Heavy Heavy-Duty Truck 5 Mode cycle. It is intended to broadly cover urban driving. The other two cycles represent highway driving at 55 mph and 65 mph.

The agencies propose to maintain the existing drive cycles and weighting. For sleeper cabs, the weightings would remain 5 percent of the Transient cycle, 9 percent of the 55 mph cycle, and 86 percent of the 65 mph cycle. The day cab results would be weighted based on 19 percent of the transient cycle, 17 percent of the 55 mph cycle, and 64 percent of the 65 mph cycle (see 40 CFR 1037.510(c)). One key difference in the proposed drive cycles is the addition of grade, discussed below in Section III.E.2.

The 55 mph and 65 mph drive cycles used in GEM assume constant speed operation at nominal vehicle speeds with downshifting occurring if road incline causes a predetermined drop in vehicle speed. In real-world vehicle operation, traffic conditions and other factors may cause periodic operation at lower (*e.g.* creep) or variable vehicle speeds. The agencies therefore request comment on the need to include segments of lower or variable speed operation in the nominally 55 mph and 65 mph drive cycles used in GEM and how this may or may not impact the strategies manufacturers would develop. We also request data from fleet operators or others that may track vehicle speed operation of heavy-duty tractors.

(d) Empty Weight and Payload

The total weight of the tractor-trailer combination is the sum of the tractor curb weight, the trailer curb weight, and the payload. The total weight of a vehicle is important because it in part determines the impact of technologies, such as rolling resistance, on GHG emissions and fuel consumption. In Phase 2, we are proposing to carry over the total weight of the tractor-trailer combination used in GEM for Phase 1. The agencies developed the proposed tractor curb weight inputs for Phase 2 from actual tractor weights measured in two of EPA's Phase 1 test programs. The proposed trailer curb weight inputs were derived from actual trailer weight measurements conducted by EPA and from weight data provided to ICF International by the trailer manufacturers.[174]

There is a further issue of what payload weight to assign during compliance testing. In use, trucks operate at different weights at different times during their operations. The greatest freight transport efficiency (the amount of fuel required to move a ton of payload) would be achieved by operating trucks at the maximum load for which they are designed all of the time. However, this may not always be practicable. Delivery logistics may dictate partial loading. Some payloads, such as potato chips, may fill the trailer before it reaches the vehicle's maximum weight limit. Or full loads simply may not be available commercially. M.J. Bradley analyzed the Truck Inventory and Use Survey and found that approximately 9 percent of combination tractor miles travelled empty, 61 percent are ''cubed-out'' (the trailer is full before the weight limit is reached), and 30 percent are ''weighed out'' (operating weight equal 80,000 lbs which is the gross vehicle weight limit on the Federal Interstate Highway System or greater than 80,000 lbs for vehicles traveling on roads outside of the interstate system).[175]

The amount of payload that a tractor can carry depends on the category (or GVWR and GCWR) of the vehicle. For example, a typical Class 7 tractor can carry less payload than a Class 8 tractor. For Phase 1, the agencies used the Federal Highway Administration Truck Payload Equivalent Factors using Vehicle Inventory and Use Survey (VIUS) and Vehicle Travel Information System data to determine the payloads. FHWA's results indicated that the average payload of a Class 8 vehicle ranged from 36,247 to 40,089 lbs, depending on the average distance travelled per day.[176] The same study shows that Class 7 vehicles carried between 18,674 and 34,210 lbs of payload also depending on average distance travelled per day. Based on

[174] ICF International. Investigation of Costs for Strategies to Reduce Greenhouse Gas Emissions for Heavy-Duty On-road Vehicles. July 2010. Pages 4–15. Docket Number EPA–HQ–OAR–2010–0162–0044.

[175] M.J. Bradley & Associates. Setting the Stage for Regulation of Heavy-Duty Vehicle Fuel Economy and GHG Emissions: Issues and Opportunities. February 2009. Page 35. Analysis based on 1992 Truck Inventory and Use Survey data, where the survey data allowed developing the distribution of loads instead of merely the average loads.

[176] The U.S. Federal Highway Administration. Development of Truck Payload Equivalent Factor. Table 11. Last viewed on March 9, 2010 at *http://ops.fhwa.dot.gov/freight/freight_analysis/faf/faf2_reports/reports9/s510_11_12_tables.htm.*

these data, the agencies are proposing to continue to prescribe a fixed payload of 25,000 lbs for Class 7 tractors and 38,000 lbs for Class 8 tractors for certification testing. The agencies propose to continue to use a common payload for Class 8 day cabs and sleeper cabs as a predefined GEM input because the data available do not distinguish among Class 8 tractor types. These proposed payload values represent a heavily loaded trailer, but not maximum GVWR, since as described above the majority of tractors ''cube-out'' rather than ''weigh-out.''

Details of the proposed individual weight inputs by regulatory category, as shown in Table III–30, are included in draft RIA Chapter 3. We welcome comment or new data to support changes to the tractor weights, or refinements to the heavy-haul tractor, trailer, and payload weights.

TABLE III–30—PROPOSED COMBINATION TRACTOR WEIGHT INPUTS

Model type	Regulatory subcategory	Tractor tare weight (lbs)	Trailer weight (lbs)	Payload (lbs)	Total weight (lbs)
Class 8	Sleeper Cab High Roof	19,000	13,500	38,000	70,500
Class 8	Sleeper Cab Mid Roof	18,750	10,000	38,000	66,750
Class 8	Sleeper Cab Low Roof	18,500	10,500	38,000	67,000

Class 7	Day Cab Low Roof	11,000	10,500	25,000	46,500
Class 8	Heavy-Haul	19,000	13,500	86,000	118,500

(e) Tire Testing

In Phase 1, the manufacturers are required to input their tire rolling resistance coefficient into GEM. Also in Phase 1, the agencies adopted the provisions in ISO 28580 to determine the rolling resistance of tires. As described in 40 CFR 1037.520(c), the agencies require that at least three tires for each tire design are to be tested at least one time. Our assessment of the Phase 1 program to date indicates that these requirements reasonably balance the need for precision, repeatability, and testing burden. Therefore we propose to carry over the Phase 1 testing provisions for tire rolling resistance into Phase 2. We welcome comments regarding the proposed tire testing provisions.

In Phase 1, the agencies received comments from stakeholders highlighting a need to develop a reference lab and alignment tires for the HD sector. The agencies discussed the lab-to-lab comparison conducted in the Phase 1 EPA tire test program (76 FR 57184). The agencies reviewed the rolling resistance data from the tires that were tested at both the STL and Smithers laboratories to assess inter-laboratory and test machine variability. The agencies conducted statistical analysis of the data to gain better understanding of lab-to-lab correlation and developed an adjustment factor for data measured at each of the test labs. Based on these results, the agencies believe the lab-to-lab variation for the STL and Smithers laboratories would have very small effect on measured rolling resistance values. Based on the test data, the agencies judge for the HD Phase 2 program to continue to use the current levels of variability, and the agencies therefore propose to allow the use of either Smithers or STL laboratories for determining the tire rolling resistance value. However, we welcome comment on the need to establish a reference machine for the HD sector and whether tire testing facilities are interested in and willing to commit to developing a reference machine.

(2) Key Differences in HD Phase 2 Compliance Provisions

We welcome comment on all aspects of the compliance program for which we are proposing changes.

(a) Aerodynamic Assessment

In Phase 1, the manufacturers conduct aerodynamic testing to establish the appropriate bin and GEM input for determining compliance with the CO_2 and fuel consumption standards. The agencies propose to continue this general approach in HD Phase 2, but make several enhancements to the aerodynamic assessment of tractors. As discussed below in this section, we propose some modifications to the aerodynamic test procedures—the addition of wind averaged yaw in the aerodynamic assessment, the addition of trailer skirts to the standard trailer used to determine aerodynamic performance of tractors and revisions to the aerodynamic bins.

(i) Aerodynamic Test Procedures

The aerodynamic drag of a vehicle is determined by the vehicle's coefficient of drag (Cd), frontal area, air density and speed. Quantifying tractor aerodynamics as an input to the GEM presents technical challenges because of the proliferation of tractor configurations, and subtle variations in measured aerodynamic values among various test procedures. In Phase 1, Class 7 and 8 tractor aerodynamic results are developed by manufacturers using a range of techniques, including wind tunnel testing, computational fluid dynamics, and constant speed tests.

We continue to believe a broad approach allowing manufacturers to use these multiple test procedures to demonstrate aerodynamic performance of its tractor fleet is appropriate given that no single test procedure is superior in all aspects to other approaches. However, we also recognize the need for consistency and a level playing field in evaluating aerodynamic performance. To address the consistency and level playing field concerns, NHTSA and EPA adopted in Phase 1, while working with industry, an approach that identified a reference aerodynamic test method and a procedure to align results from other aerodynamic test procedures with the reference method.

The agencies adopted in Phase 1 an enhanced coastdown procedure as the reference method (see 40 CFR 1066.310) and defined a process for manufacturers to align drag results from each of their own test methods to the reference method results using Falt-aero (see 40 CFR 1037.525). Manufacturers are able to use any aerodynamic evaluation method in demonstrating a vehicle's aerodynamic performance as long as the method is aligned to the reference method. The agencies propose to continue to use this alignment method approach to maintain the testing flexibility that manufacturers have today. However, the agencies propose to increase the rigor in determining the Falt-aero for Phase 2. Beginning in 2021 MY, we propose that the manufacturers would be required to determine a new Falt-aero for each of their tractor models for each aerodynamic test method. In Phase 1, manufacturers are required to determine their Falt-aero using only a high roof sleeper cab with a full aerodynamics package (see 40 CFR 1037.521(a)(2) and proposed 40 CFR 1037.525(b)(2)). In Phase 2, we propose that manufacturers would be required to determine a unique Falt-aero value for each major model of their high roof day cabs and high roof sleeper cabs. In Phase 2, we propose that manufacturers may carry over the Falt-aero value until a model changeover or based on the agencies' discretion to require up to six new Falt-aero determinations each year. We welcome comment on the burden associated with this proposed change to conduct up to six coastdown tests per year per manufacturer.

Based on feedback received during the development of Phase 1, we understand that there is interest from some manufacturers to change the reference method in Phase 2 from coastdown to constant speed testing. EPA has conducted an aerodynamic test program at Southwest Research Institute to evaluate both methods in terms of cost of testing, testing time, testing facility requirements, and repeatability of results. Details of the analysis and results are included in draft RIA Chapter 3.2. The results showed that the enhanced coastdown test procedures and analysis produced results with acceptable repeatability and at a lower cost than the constant speed testing. Based on the results of this testing, the agencies propose to continue to use the enhanced coastdown procedure for the reference method in Phase 2.[177] However, we welcome comment on the need to change the reference method for the Phase 2 final rule to constant speed testing, including comparisons of aerodynamic test results using both the coastdown and constant speed test procedures. In addition, we welcome comments on and suggested revisions to the constant speed test procedure specifications set forth in Chapter 3.2.2.2 of the draft RIA and 40 CFR 1037.533. If we determine that it is appropriate to make the change, then the aerodynamic bins in the final rule would be adjusted to take into account the difference in absolute CdA values due to the change in method.

The agencies are also considering refinements to the computational fluid dynamics modeling method to determine the aerodynamic performance of tractors. Specifically, we are considering whether the conditions for performing the analysis require greater specificity (*e.g.,* wind speed and direction inclusion, turbulence intensity criteria value) or if turbulence model and mesh deformation should be required, rather than ''if applicable,'' for all CFD analysis.[178] The agencies welcome comment on the proposed revisions.

In Phase 1, we adopted interim provisions in 40 CFR 1037.150(k) that accounted for coastdown measurement variability by allowing a compliance demonstration based on in-use test results if the drag area was at or below the maximum drag area allowed for the bin above the bin to which the vehicle was certified. Since adoption of Phase 1, EPA has conducted in-use aerodynamic testing and found that uncertainty associated with coastdown testing is less than anticipated.[179] In addition, we are proposing additional enhancements in the Phase 2 coastdown procedures to continue to reduce the variability of coastdown results, including the impact of environmental conditions. Therefore, we are proposing to sunset the provision in 40 CFR 1037.150(k) at the end of the Phase 1 program (after the 2020 model year). We request comment on whether or not we should factor in a test variability compliance margin into the aerodynamic test procedure, and therefore request data on aerodynamic test variability.

(ii) Wind Averaged Drag

In Phase 1, EPA and NHTSA recognized that wind conditions, most notably wind direction, have a greater impact on real world CO_2 emissions and fuel consumption of heavy-duty trucks than of light-duty vehicles.[180] As noted in the NAS report, the wind average drag coefficient is about 15 percent higher than the zero degree coefficient of drag.[181] In addition, the agencies received comments in Phase 1 that supported the use of wind averaged drag results for the aerodynamic determination. The agencies considered adopting the use of a wind averaged drag coefficient in the Phase 1 regulatory program, but ultimately decided to finalize drag values which represent zero yaw (*i.e.,* representing wind from directly in front of the vehicle, not from the side) instead. We took this approach recognizing that the reference method is coastdown testing and it is not capable of determining wind averaged yaw.[182] Wind tunnels and CFD are currently the only tools to accurately assess the influence of wind speed and direction on a truck's aerodynamic performance. The agencies recognized, as NAS did, that the results of using the zero yaw approach may result in fuel consumption predictions that are offset slightly from real world performance levels, not unlike the offset we see today between fuel economy test results in the CAFE program and actual fuel economy performance observed in-use.

As the tractor manufacturers continue to refine the aerodynamics of tractors, we believe that continuing the zero yaw approach into Phase 2 could potentially impact the overall technology effectiveness or change the kinds of technology decisions made by the tractor manufacturers in developing equipment to meet our proposed HD Phase 2 standards. Therefore, we are proposing aerodynamic test procedures that take into account the wind averaged drag performance of tractors. The agencies propose to account for this change in aerodynamic test procedure by appropriately adjusting the aerodynamic bins to reflect a wind averaged drag result instead of a zero yaw result.

The agencies propose that beginning in 2021 MY, the manufacturers would be required to adjust their CdA values to represent a zero yaw value from coastdown and add the CdA impact of the wind averaged drag. The impact of wind averaged drag relative to a zero yaw condition can only be measured in a wind tunnel or with CFD. We welcome data evaluating the consistency of wind averaged drag measurements between wind tunnel, CFD, and other potential methods such as constant speed or coastdown. The agencies propose that manufacturers would use the following equation to make the necessary adjustments to a coastdown result to obtain the CdA_{wad} value:

$$CdA_{wad} = CdA_{zero,coastdown} + (CdA_{wad,wind\ tunnel} - CdA_{zero,wind\ tunnel}) * F_{alt\text{-}aero}$$

If the manufacturer has a wind averaged CdA value from either a wind tunnel or CFD, then we propose they

[181] *See* 2010 NAS Report, Finding 2–4 on page 39. Also see 2014 NAS Report, Recommendation 3.5.

[182] See 2010 NAS Report. Page 95.

would use the following equation to obtain the CdAwad value:

$$CdA_{wad} = CdA_{wad,wind\ tunnel\ or\ CFD} * F_{alt\text{-}aero}$$

We welcome comment on whether the wind averaged drag should be determined using a full yaw sweep as specified in Appendix A of the Society of Automotive Engineers (SAE) recommended practice number J1252 ''SAE Wind Tunnel Test Procedure for Trucks and Buses'' (*e.g.,* zero degree yaw and a six other yaw angles at increments of 3 degrees or greater) or a subset of specific angles as currently allowed in the Phase 1 regulations.[183]

To reduce the testing burden the agencies propose that manufacturers have the option of determining the offset between zero yaw and wind averaged yaw either through testing or by using the EPA-defined default offset. Details regarding the determination of the offset are included in the draft RIA Chapter 3.2. We propose the manufacturers would use the following equation if they had a zero yaw coastdown value and choose not to conduct wind averaged measurements.

$$CdA_{wad} = CdA_{zero,coastdown} + 0.80$$

In addition, we propose the manufacturers would use the following equation if they had a zero yaw wind tunnel or CFD value and choose not to conduct wind averaged measurements.

$$CdA_{wad} = (CdA_{zero,wind\ tunnel\ or\ CFD} * F_{alt\text{-}aero})+0.80$$

We welcome comments on all aspects of the proposed wind averaged drag provisions.

(iii) Standard Trailer Definition

Similar to the approach the agencies adopted in Phase 1, NHTSA and EPA are proposing provisions such that the tractor performance in GEM is judged assuming the tractor is pulling a standardized trailer.[184] The agencies believe that an assessment of the tractor fuel consumption and CO_2 emissions should be conducted using a tractor-trailer combination, as tractors are invariably used in combination with trailers and this is their essential commercial purpose. Trailers, of course, also influence the extent of carbon emissions from the tractor (and vice-versa). We believe that using a standardized trailer best reflects the impact of the overall weight of the tractor-trailer and the aerodynamic technologies in actual use, and consequent real-world performance, where tractors are designed and used with a trailer. EPA research confirms what one would intuit: tractor-trailer pairings are almost always optimized. EPA conducted an evaluation of over 4,000 tractor-trailer combinations using live traffic cameras in 2010.[185] The results showed that approximately 95 percent of the tractors were matched with the standard trailer specified (high roof tractor with box trailer, mid roof tractor with tanker trailer, and low roof with flatbed trailer). Therefore, the agencies propose that Phase 2 GEM continue to use a predefined typical trailer defined in Phase 1 in assessing overall performance for test purposes. As such, the high roof tractors would be paired with a standard box trailer; the mid roof tractors would be paired with a tanker trailer; and the low roof tractors would be paired with a flatbed trailer.

However, the agencies are proposing to change the definition of the standard box trailer used by tractor manufacturers to determine the aerodynamic performance of high roof tractors in Phase 2. We believe this is necessary to reflect the aerodynamic improvements experienced by the trailer fleet over the last several years due to influences from the California Air Resources Board mandate [186] and EPA's SmartWay Transport Partnership. The standard box trailer used in Phase 1 to assess the aerodynamic performance of high roof tractors is a 53 foot box trailer without any aerodynamic devices. In the development of Phase 2, the agencies evaluated the increase in adoption rates of trailer side skirts and boat tails in the market over the last several years and have seen a marked increase. We estimate that approximately 50 percent of the new trailers sold in 2018 will have trailer side skirts.[187] [188] As the agencies look towards the proposed standards in the 2021 and beyond timeframe, we believe that it is appropriate to update the standard box trailer definition. In 2021–2027, we believe the trailer fleet will be a mix of trailers with no aerodynamics, trailers with skirts, and trailers with advanced aero; with the advanced aero being a very limited subset of the new trailers sold each year. Consequently, overall, we believe a trailer with a skirt will be the most representative of the trailer fleet for the duration of the regulation timeframe, and plausibly beyond. Therefore, we are proposing that the standard box trailer in Phase 2—the trailer assumed during the certification process to be paired with a high roof tractor—be updated to include a trailer skirt starting in 2021 model year. Even though the agencies are proposing new box trailer standards beginning in 2018 MY, we are not proposing to update the standard trailer in the tractor certification process until 2021 MY, to align with the new tractor standards. If we were to revise the standardized trailer definition for Phase 1, then we would need to revise the Phase 1 tractor standards. The details of the trailer skirt definition are included in 40 CFR 1037.501(g)(1).

EPA has conducted extensive aerodynamic testing to quantify the impact on the coefficient of drag of a high roof tractor due to the addition of a trailer skirt. Details of the test program and the results can be found in the draft RIA Chapter 3.2. The results of the test program indicate that on average, the impact of a trailer skirt matching the definition of the skirt specified in 40 CFR 1037.501(g)(1) is approximately 8 percent improvement in coefficient of drag area. This off-set was used during the development of the Phase 2 aerodynamic bins.

We seek comment on our proposed HD Phase 2 standard trailer configuration. We also welcome comments on suggestions on alternative ways to define the standard trailer, such as developing a certified computer aided drawing (CAD) model.

(iv) Aerodynamic Bins

The agencies are proposing to continue the approach where the manufacturer would determine a tractor's aerodynamic drag force through testing, determine the appropriate predefined aerodynamic bin, and then input the predefined CdA value for that bin into the GEM. The agencies proposed Phase 2 aerodynamic bins reflect three changes to the Phase 1 bins—the incorporation of wind averaged drag, the addition of trailer skirts to the standard box trailer used to determine the aerodynamic performance of high roof tractors, and the addition of bins to reflect the continued improvement of tractor aerodynamics in the future. Because of each of these changes, the aerodynamic bins proposed for Phase 2 are not directly comparable to the Phase 1 bins.

HD Phase 1 included five aerodynamic bins to cover the spectrum of aerodynamic performance of high

roof tractors. Since the development of the Phase 1 rules, the manufacturers have continued to invest in aerodynamic improvements for tractors. This continued evolution of aerodynamic performance, both in production and in the research stage as part of the SuperTruck program, has consequently led the agencies to propose two additional aerodynamic technology bins (Bins VI and VII) for high roof tractors. These two new bins would further segment the Phase 1 aerodynamic Bin V to recognize the difference in advanced aerodynamic technologies and designs.

In both HD Phase 1 and as proposed by the agencies in Phase 2, aerodynamic Bin I through Bin V represent tractors sharing similar levels of technology. The first high roof aerodynamic category, Bin I, is designed to represent tractor bodies which prioritize appearance or special duty capabilities over aerodynamics. These Bin I tractors incorporate few, if any, aerodynamic features and may have several features that detract from aerodynamics, such as bug deflectors, custom sunshades, B-pillar exhaust stacks, and others. The second high roof aerodynamics category is Bin II which roughly represents the aerodynamic performance of the average new tractor sold in 2010. The agencies developed this bin to incorporate conventional tractors which capitalize on a generally aerodynamic shape and avoid classic features which increase drag. High roof tractors within Bin III build on the basic aerodynamics of Bin II tractors with added components to reduce drag in the most significant areas on the tractor, such as integral roof fairings, side extending gap reducers, fuel tank fairings, and streamlined grill/hood/mirrors/bumpers, similar to 2013 model year SmartWay tractors. The Bin IV aerodynamic category for high roof tractors builds upon the Bin III tractor body with additional aerodynamic treatments such as underbody airflow treatment, down exhaust, and lowered ride height, among other technologies. HD Phase 1 Bin V tractors incorporate advanced technologies which are currently in the prototype stage of development, such as advanced gap reduction, rearview cameras to replace mirrors, wheel system streamlining, and advanced body designs. For HD Phase 2, the agencies propose to segment the aerodynamic performance of these advanced technologies into Bins V through VII.

In Phase 1, the agencies adopted only two aerodynamic bins for low and mid roof tractors. The agencies limited the number of bins to reflect the actual range of aerodynamic technologies effective in low and mid roof tractor applications. High roof tractors are consistently paired with box trailer designs, and therefore manufacturers can design the tractor aerodynamics as a tractor-trailer unit and target specific areas like the gap between the tractor and trailer. In addition, the high roof tractors tend to spend more time at high speed operation which increases the impact of aerodynamics on fuel consumption and GHG emissions. On the other hand, low and mid roof tractors are designed to pull variable trailer loads and shapes. They may pull trailers such as flat bed, low boy, tankers, or bulk carriers. The loads on flat bed trailers can range from rectangular cartons with tarps, to a single roll of steel, to a front loader. Due to these variables, manufacturers do not design unique low and mid roof tractor aerodynamics but instead use derivatives from their high roof tractor designs. The aerodynamic improvements to the bumper, hood, windshield, mirrors, and doors are developed for the high roof tractor application and then carried over into the low and mid roof applications. As mentioned above, the types of designs that would move high roof tractors from a Bin III to Bins IV through VII include features such as gap reducers and integral roof fairings which would not be appropriate on low and mid roof tractors.

As Phase 2 looks to further improve the aerodynamics for high roof sleeper cabs, we believe it is also appropriate to expand the number of bins for low and mid roof tractors too. For Phase 2, the agencies are proposing to differentiate the aerodynamic performance for low and mid roof applications with four bins, instead of two, in response to feedback received from manufacturers of low and mid roof tractors related to the limited opportunity to incorporate aerodynamic technologies in their compliance plan. We propose that low and mid roof tractors may determine the aerodynamic bin based on the aerodynamic bin of an equivalent high roof tractor, as shown below in Table III–31.

TABLE III–31—PROPOSED PHASE 2 REVISIONS TO 40 CFR 1037.520(b)(3)

High roof bin	Low and mid roof bin
Bin I	Bin I
Bin II	Bin I
Bin III	Bin II
Bin IV	Bin II
Bin V	Bin III
Bin VI	Bin III
Bin VII	Bin IV

The agencies developed new high roof tractor aerodynamic bins for Phase 2 that reflect the change from zero yaw to wind averaged drag, the more aerodynamic reference trailer, and the addition of two bins. Details regarding the derivation of the proposed high roof bins are included in Draft RIA Chapter 3.2.8. The proposed high roof tractor bins are defined in Table III–32. The proposed revisions to the low and mid roof tractor bins reflect the addition of two new aerodynamic bins and are listed in Table III–33.

(b) Road Grade in the Drive Cycles

Road grade can have a significant impact on the overall fuel economy of a heavy-duty vehicle. Table III–34 shows the results from a real world evaluation of heavy-duty tractor-trailers conducted by Oak Ridge National Lab.[189] The study found that the impact of a mild upslope of one to four percent led to a decrease in average fuel economy from 7.33 mpg to 4.35 mpg. These results are as expected because vehicles consume more fuel while driving on an upslope than driving on a flat road because the vehicle needs to exert additional power to overcome the grade resistance force.[190] The amount of extra fuel increases with increases in road gradient. On downgrades, vehicles consume less fuel than on a flat road. However, as shown in the fuel consumption results in Table III–34, the amount of increase in fuel consumption on an upslope is greater than the amount of decrease in fuel consumption on a downslope which leads to a net increase in fuel consumption. As an example, the data shows that a vehicle would use 0.3 gallons per mile more fuel in a severe upslope than on flat terrain, but only save 0.1 gallons of fuel per mile on a severe downslope. In another study, Southwest Research Institute modeling found that the addition of road grade to a drive cycle has an 8 to 10 percent negative impact on fuel economy.[191]

TABLE III–34—FUEL CONSUMPTION RELATIVE TO ROAD GRADE

Type of terrain	Average fuel economy (miles per gallon)	Average fuel consumption (gallons per mile)
Severe upslope (>4%)	2.90	0.34
Mild upslope (1% to 4%)	4.35	0.23
Flat terrain (1% to 1%)	7.33	0.14
Mild downslope (−4% to −1%)	15.11	0.07
Severe downslope (<−4%)	23.50	0.04

[189] Oakridge National Laboratory. Transportation Energy Book, Edition 33. Table 5.10 Effect of Terrain on Class 8 Truck Fuel Economy. 2014. Last accessed on September 19, 2014 at *http://cta.ornl.gov/data/Chapter5.shtml.*

[190] Ibid.

[191] Reinhart, T. (2015). *Commercial Medium- and Heavy-Duty (MD/HD) Truck Fuel Efficiency Technology Study—Report #2.* Washington, DC: National Highway Traffic Safety Administration.

In Phase 1, the agencies did not include road grade. However, we believe it is important to propose including road grade in Phase 2 to properly assess the value of technologies, such as downspeeding and the integration of the engine and transmission, which were not technologies included in the technology basis for Phase 1 and are not directly assessed by GEM in its Phase 1 iteration. The addition of road grade to the drive cycles would be consistent with the NAS recommendation in the 2014 Phase 2 First Report.[192]

The U.S. Department of Energy and EPA have partnered to support a project aimed at evaluating, refining and/or developing the appropriate road grade profiles for the 55 mph and 65 mph highway cruise duty cycles that would be used in the certification of heavy-duty vehicles to the Phase 2 GHG emission and fuel efficiency standards. The National Renewable Energy Laboratory (NREL) was contracted to do this work and has since developed two pairs of candidate, activity-weighted road grade profiles representative of U.S. limited-access highways. To this end, NREL used high-accuracy road grade data and county-specific vehicle miles traveled data. One pair of the profiles is representative of the nation's limited-access highways with 55 and 60 mph speed limits, and another is representative of such highways with speed limits of 65 to 75 mph. The profiles are distance-based and cover a maximum distance of 12 and 15 miles, respectively. A report documenting this NREL work is in the public docket for these proposed rules, and comments are requested on the recommendations therein.[193] In addition to NREL work, the agencies have independently developed yet another candidate road grade profile for use in the 55 mph and 65 mph highway cruise duty cycles. While based on the same road grade database generated by NREL for U.S. restricted-access highways, its design is predicated on a different approach. The development of this profile is documented in the memorandum to the docket.[194] The agencies have evaluated all of the candidate road grade profiles and have prepared possible alternative tractor standards based on these profiles. The agencies request comment on this analysis, which is available in a memorandum to the docket.[195]

For the proposal, the agencies developed an interim road grade profile for development of the proposed standards. The agencies are proposing the inclusion of an interim road grade profile, as shown below in Figure III–2, in both the 55 mph and 65 mph cycles. The grade profile was developed by Southwest Research Institute on a 12.5 mile stretch of restricted-access highway during on-road tests conducted for EPA's validation of the Phase 2 version of GEM.[196] The minimum grade in the interim cycle is −2.1 percent and the maximum grade is 2.4 percent. The cycle spends 30 percent of the distance in grades of +/− 0.5 percent. Overall, the cycle spends approximately 50 percent of the time in relatively flat terrain with road gradients of less than 1 percent.

The agencies believe the interim cycle has sufficient representativeness based on a comparison to data from the Department of Transportation used in the development of the light-duty Federal Test Procedure cycle (FTP), which found approximately 55 percent of the vehicle miles traveled were on road gradients of less than 1 percent.[197] Consequently, we expect that road grade profiles developed by NREL and by the agencies will not differ significantly from the interim profile proposed here. The agencies request data from fleet operators or others that have real world grade profile data.

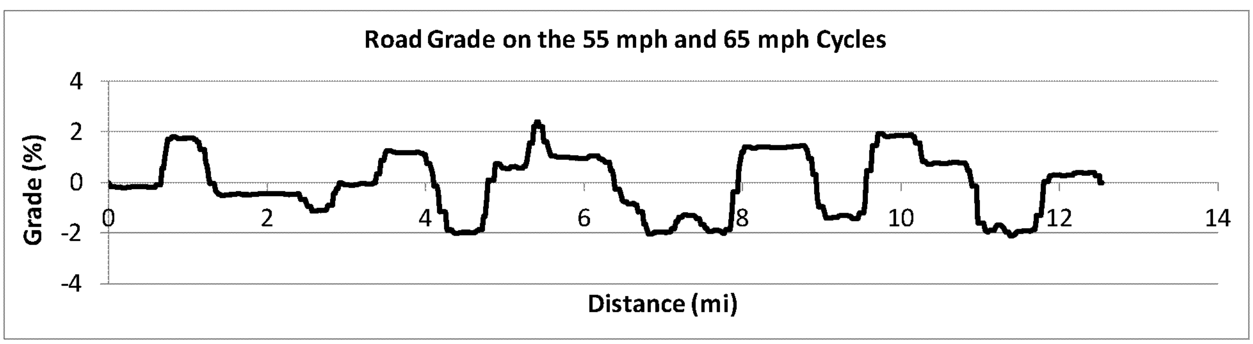

Figure III-2 Proposed Road Grade Profile for 55 mph and 65 mph Drive Cycles

(c) Weight Reduction

In Phase 1, the agencies adopted regulations that provided manufacturers with the ability to use GEM to measure emission reduction and reductions in fuel consumption resulting from use of high strength steel and aluminum components for weight reduction,, and to do so without the burden of entering the curb weight of every tractor produced. We treated such weight reduction in two ways in Phase 1 to account for the fact that combination tractor-trailers weigh-out approximately one-third of the time and cube-out approximately two-thirds of the time. Therefore, one-third of the weight reduction is added payload in the denominator while two-thirds of the weight reduction is subtracted from the overall weight of the vehicle in GEM. See 76 FR 57153. The agencies also allowed manufacturers to petition for off-cycle credits for components not measured in GEM.

NHTSA and EPA propose carrying the Phase 1 treatment of weight reduction into Phase 2. That is, these types of weight reduction, although not part of the agencies' technology packages for

the proposed (or alternative) standards, can still be recognized in GEM up to a point. In addition, the agencies propose to add additional thermoplastic components to the weight reduction table, as shown below in Table III–35. The thermoplastic component weight reduction values were developed in coordination with SABIC, a thermoplastic component supplier. Also, in Phase 2, we are proposing to recognize the potential weight reduction opportunities in the powertrain and drivetrain systems as part of the vehicle inputs into GEM. Therefore, we believe it is appropriate to also recognize the weight reduction associated with both smaller engines and 6x2 axles.[198] We propose including the values listed in Table III–36 and make them available upon promulgation of the final Phase 2 rules (*i.e.*, available even under Phase 1). We welcome comments on all aspects of weight reduction.

(d) GEM Inputs

The agencies propose to continue to require the Phase 1 GEM inputs for tractors in Phase 2. These inputs include the following:

• Steer tire rolling resistance,
• Drive tire rolling resistance,
• Coefficient of Drag Area,
• Idle Reduction, and
• Vehicle Speed Limiter.

As discussed above in Section II.C and III.D, there are several additional inputs that are proposed for Phase 2. The new GEM inputs proposed for Phase 2 include the following:

• Engine information including manufacturer, model, combustion type, fuel type, family name, and calibration identification
• Engine fuel map,
• Engine full-load torque curve,
• Engine motoring curve,
• Transmission information including manufacturer and model
• Transmission type,
• Transmission gear ratios,
• Drive axle ratio,
• Loaded tire radius for drive tires, and
• Other technology inputs.

The agencies welcome comments on the inclusion of these proposed technologies into GEM in Phase 2.

(e) Vehicle Speed Limiters and Extended Idle Provisions

The agencies received comments during the development of Phase 1 that the Clean Air Act provisions to prevent tampering (CAA section 203(a)(3)(A); 42 U.S.C. 7522(a)(3)(A)) of vehicle speed limiters and extended idle reduction technologies would prohibit their use for demonstrating compliance with the Phase 1 standards. In Phase 1, the agencies adopted provisions to allow for discounted credits for idle reduction technologies that allowed for override conditions and expiring engine shutdown systems (see 40 CFR 1037.660). Similarly, the agencies adopted provisions to allow for ''soft top'' speeds and expiring vehicle speed limiters, and we are not proposing to change those provisions (see 40 CFR 1037.640). However, as we develop Phase 2, we understand that the concerns still exist that the ability for a tractor manufacturer to reflect the use of a VSL in its compliance determination may be constrained by the demand for flexibility in the use of VSLs by the customers. . The agencies welcome suggestions on how to close the gap between the provisions that would be acceptable to the industry while maintaining our need to ensure that modifications do not violate 42 U.S.C. 7522(a)(3)(A). We request comment on potential approaches which would enable feedback mechanism between the vehicle owner/fleet that would provide the agencies the assurance that the benefits of the VSLs will be seen in use but which also provides the vehicle owner/fleet the flexibility they many need during in-use operation. More generally in our discussions with several trucking fleets and with the American Trucking Associations an interest was expressed by the fleets if there was a means by which they could participate in the emissions credit transactions which is currently limited to the directly regulated truck manufacturers. VSLs and extended idle systems were two example technologies that fleets and individual owners can order for a new build truck, and that from the fleet's perspective the truck manufacturers receive emission credits for. The agencies do not have a specific proposal or a position on the request from the American Trucking Association and its members, but we request comment on whether or not it is appropriate to allow owners to participate in the overall compliance process for the directly regulated parties, if such a thing is allowed under the two agencies' respective statutes, and what regulatory provisions would be needed to incorporate such an approach.

(f) Emission Control Labels

The agencies consider it crucial that authorized compliance inspectors are able to identify whether a vehicle is certified, and if so whether it is in its certified condition. To facilitate this identification in Phase 1, EPA adopted labeling provisions for tractors that included several items. The Phase 1 tractor label must include the manufacturer, vehicle identifier such as the Vehicle Identification Number (VIN), vehicle family, regulatory subcategory, date of manufacture, compliance statements, and emission control system identifiers (see 40 CFR 1037.135). In Phase 1, the emission control system identifiers are limited to vehicle speed limiters, idle reduction technology, tire rolling resistance, some aerodynamic components, and other innovative and advanced technologies.

The number of proposed emission control systems for greenhouse gas emissions in Phase 2 has increased significantly. For example, the engine, transmission, drive axle ratio, accessories, tire radius, wind averaged drag, predictive cruise control, and automatic tire inflation system are controls which can be evaluated on-cycle in Phase 2 (*i.e.* these technologies' performance can now be input to GEM), but could not be in Phase 1. Due to the complexity in determining greenhouse gas emissions as proposed in Phase 2, the agencies do not believe that we can unambiguously determine whether or not a vehicle is in a certified condition through simply comparing information that could be made available on an emission control label with the components installed on a vehicle. Therefore, EPA proposes to remove the requirement to include the emission control system identifiers required in 40 CFR 1037.135(c)(6) and in Appendix III to 40 CFR part 1037 from the emission control labels for vehicles certified to the Phase 2 standards. However, the agencies may finalize requirements to maintain some label content to facilitate a limited visual inspection of key vehicle parameters that can be readily observed. Such requirements may be very similar to the labeling requirements from the Phase 1 rulemaking, though we would want to more carefully consider the list of technologies that would allow for the most effective inspection. We request comment on an appropriate list of candidate technologies that would properly balance the need to limit label content with the interest in providing the most useful information for inspectors to confirm that vehicles have been properly built. We are not proposing to modify the existing emission control labels for tractors certified for MYs 2014–2020 (Phase 1) CO_2 standards.

Under the agencies' existing authorities, manufacturers must provide detailed build information for a specific vehicle upon our request. Our expectation is that this information should be available to us via email or other similar electronic communication

on a same-day basis, or within 24 hours of a request at most. We request comment on any practical limitations in promptly providing this information. We also request comment on approaches that would minimize burden for manufacturers to respond to requests for vehicle build information and would expedite an authorized compliance inspector's visual inspection. For example, the agencies have started to explore ideas that would provide inspectors with an electronic method to identify vehicles and access on-line databases that would list all of the engine-specific and vehicle-specific emissions control system information. We believe that electronic and Internet technology exists today for using scan tools to read a bar code or radio frequency identification tag affixed to a vehicle that would then lead to secure on-line access to a database of manufacturers' detailed vehicle and engine build information. Our exploratory work on these ideas has raised questions about the level of effort that would be required to develop, implement and maintain an information technology system to provide inspectors real-time access to this information. We have also considered questions about privacy and data security. We request comment on the concept of electronic labels and database access, including any available information on similar systems that exist today and on burden estimates and approaches that could address concerns about privacy and data security. Based on new information that we receive, we may consider initiating a separate rulemaking effort to propose and request comment on implementing such an approach.

(g) End of Year Reports

In the Phase 1 program, manufacturers participating in the ABT program provided 90 day and 270 day reports to EPA and NHTSA after the end of the model year. The agencies adopted two reports for the initial program to help manufacturers become familiar with the reporting process. For the HD Phase 2 program, the agencies propose to simplify reporting such that manufacturers would only be required to submit the final report 90 days after the end of the model year with the potential to obtain approval for a delay up to 30 days. We are accordingly proposing to eliminate the end of year report, which represents a preliminary set of ABT figures for the preceding year. We welcome comment on this proposed revision.

(h) Special Compliance Provisions

In Phase 2, the agencies propose to consider the performance of the engine, transmission, and drivetrain in determining compliance with the Phase 2 tractor standards. With the inclusion of the engine's performance in the vehicle compliance, EPA proposes to modify the prohibition to introducing into U.S. commerce a tractor containing an engine not certified for use in tractor (see proposed 40 CFR 1037.601(a)(1)). In Phase 2, we no longer see the need to prohibit the use of vocational engines in tractors because the performance of the engine would be appropriately reflected in GEM. We welcome comment on removing this prohibition.

The agencies also propose to change the compliance process for manufacturers seeking to use the off-road exclusion. During the Phase 1 program, manufacturers realized that contacting the agencies in advance of the model year was necessary to determine whether vehicles would qualify for exemption and need approved certificates of conformity. The agencies found that the petition process allowed at the end of the model year was not necessary and that an informal approval during the precertification period was more effective. Therefore, NHTSA is proposing to remove its off-road petitioning process in 49 CFR 535.8 and EPA is proposing to add requirements for informal approvals in 40 CFR 1037.610.

(i) Chassis Dynamometer Testing Requirement

The agencies foresee the need to continue to track the progress of the Phase 2 program throughout its implementation. As discussed in Section II, the agencies expect to evaluate the overall performance of tractors with the GEM results provided by manufacturers through the end of year reports. However, we also need to continue to have confidence in our simulation tool, GEM, as the vehicle technologies continue to evolve. Therefore, EPA proposes that the manufacturers conduct annual chassis dynamometer testing of three sleeper cabs tractor and two day cab tractor and provide the data and the GEM result from each of these two tractor configurations to EPA (see 40 CFR 1037.665). We request comment on the costs and efficacy of this data submission requirement. We emphasize that this program would not be used for compliance or enforcement purposes.

F. Flexibility Provisions

EPA and NHTSA are proposing two flexibility provisions specifically for heavy-duty tractor manufacturers in Phase 2. These are an averaging, banking and trading program for CO_2 emissions and fuel consumption credits, as well as provisions for credits for off-cycle technologies which are not included as inputs to the GEM. Credits generated under these provisions can only be used within the same averaging set which generated the credit.

The agencies are also proposing to remove or modify several Phase 1 interim provisions, as described below.

(1) Averaging, Banking, and Trading (ABT) Program

Averaging, banking, and trading of emission credits have been an important part of many EPA mobile source programs under CAA Title II, and the NHTSA light-duty CAFE program. The agencies also included this flexibility in the HD Phase 1 program. ABT provisions are useful because they can help to address many potential issues of technological feasibility and lead-time, as well as considerations of cost. They provide manufacturers flexibilities that assist in the efficient development and implementation of new technologies and therefore enable new technologies to be implemented at a more aggressive pace than without ABT. A well-designed ABT program can also provide important environmental and energy security benefits by increasing the speed at which new technologies can be implemented. Between MYs 2013 and 2014 all four tractor manufacturers are taking advantage of the ABT provisions in the Phase 1 program. NHTSA and EPA propose to carry-over the Phase 1 ABT provisions for tractors into Phase 2.

The agencies propose to continue the five year credit life and three year deficit carry-over provisions from Phase 1 (40 CFR 1037.740(c) and 1037.745). Please see additional discussion in Section I.C.1.b. Although we are not proposing any additional restrictions on the use of Phase 1 credits, we are requesting comment on this issue. Early indications suggest that positive market reception to the Phase 1 technologies could lead to manufacturers accumulating credits surpluses that could be quite large at the beginning of the proposed Phase 2 program. This appears especially likely for tractors. The agencies are specifically requesting comment on the likelihood of this happening, and whether any regulatory changes would be appropriate. For example, should the agencies limit the amount of credits than could be carried over from Phase 1 or limit them to the first year or two of the Phase 2 program? Also, if we determine that large surpluses are likely, how should that factor into our decision on the feasibility of more stringent standards in MY 2021?

We welcome comments on these proposed flexibilities and are interested in information that may indicate doing as proposed could distort the heavy-duty vehicle market.

(2) Off-Cycle Technology Credits

In Phase 1, the agencies adopted an emissions and fuel consumption credit generating opportunity that applied to innovative technologies that reduce fuel consumption and CO_2 emissions. These technologies were required to not be in common use with heavy-duty vehicles before the 2010MY and not reflected in the GEM simulation tool (*i.e.,* the benefits are ''off-cycle''). See 76 FR 57253. The agencies propose to largely continue, but redesignate the Phase 1 innovative technology program as part of the off-cycle program for Phase 2. In other words, beginning in 2021 MY all technologies that are not fully accounted for in the GEM simulation tool, or by compliance dynamometer testing could be considered off-cycle, including those technologies that may have been considered innovative technologies in Phase 1 of the program. The agencies propose to maintain the requirement that, in order for a manufacturer to receive credits for Phase 2, the off-cycle technology would still need to meet the requirement that it was not in common use prior to MY 2010. For additional information on the treatment of off-cycle technologies see Section I.C.1.c.

The agencies are proposing a split process for handling off-cycle technologies in Phase 2. First, there is a set of predefined off-cycle technologies that are entering the market today, but could be fully-recognized in our proposed HD Phase 2 certification procedures. Examples of such technologies include predictive cruise control, 6x2 axles, axle lubricants, automated tire inflation systems, and air conditioning efficiency improvements. For these technologies, the agencies propose to define the effectiveness value of these technologies similar to the approach taken in the MY2017–2025 light-duty rule (see 77 FR 62832–62840 (October 15, 2012)). These default effectiveness values could be used as valid inputs to Phase 2 GEM. The proposed effectiveness value of each technology is discussed above in Section III.D.2.

The agencies also recognize that there are emerging technologies today that are being developed, but would not be accounted for in the GEM inputs, therefore would be considered off-cycle. These technologies could include systems such as efficient steering systems, cooling fan optimization, and further tractor-trailer integration. These off-cycle technologies could include known, commercialized technologies if they are not yet widely utilized in a particular heavy-duty sector subcategory. Any credits for these technologies would need to be based on real-world fuel consumption and GHG reductions that can be measured with verifiable test methods using representative driving conditions typical of the engine or vehicle application.

The agencies propose that the approval for Phase 1 innovative technology credits (approved prior to 2021 MY) would be carried into the Phase 2 program on a limited basis for those technologies where the benefit is not accounted for in the Phase 2 test procedure. Therefore, the manufacturers would not be required to request new approval for any innovative credits carried into the off-cycle program, but would have to demonstrate the new cycle does not account for these improvements beginning in the 2021 MY. The agencies believe this is appropriate because technologies, such as those related to the transmission or driveline, may no longer be ''off-cycle'' because of the addition of these technologies into the Phase 2 version of GEM. The agencies also seek comments on whether off-cycle technologies in the Phase 2 program should be limited by infrequent common use and by what model years, if any. We also seek comments on an appropriate penetration rate for a technology not to be considered in common use.

As in Phase 1, the agencies are proposing to continue to provide two paths for approval of the test procedure to measure the CO_2 emissions and fuel consumption reductions of an off-cycle technology used in the HD tractor. See proposed 40 CFR 1037.610 and 49 CFR 535.7. The first path would not require a public approval process of the test method. A manufacturer could use ''pre-approved'' test methods for HD vehicles including the A-to-B chassis testing, powerpack testing or on-road testing. A manufacturer may also use any developed test procedure that has known quantifiable benefits. A test plan detailing the testing methodology would be required to be approved prior to collecting any test data. The agencies are also proposing to continue the second path, which includes a public approval process of any testing method that could have questionable benefits (*i.e.,* an unknown usage rate for a technology). Furthermore, the agencies are proposing to modify their provisions to clarify what documentation must be submitted for approval, which would align them with provisions in 40 CFR 86.1869–12. NHTSA and EPA are also proposing to prohibit credits from technologies addressed by any of NHTSA's crash avoidance safety rulemakings (*i.e.,* congestion management systems). See 77 FR 62733 (discussing similar issues in the context of the light-duty fuel economy and greenhouse gas reduction standards). We welcome recommendations on how to improve or streamline the off-cycle technology approval process.

(3) Post Useful Life Modifications

Under 40 CFR part 1037, it is generally prohibited for any person to remove or render inoperative any emission control device installed to comply with the requirements of part 1037. However, in 40 CFR 1037.655 EPA clarifies that certain vehicle modifications are allowed after a vehicle reaches the end of its regulatory useful life. This section applies for all vehicles subject to 40 CFR part 1037 and would thus apply for trailers regulated in Phase 2. EPA is proposing to continue this provision and requests comment on it.

This section states (as examples) that it is generally allowable to remove tractor roof fairings after the end of the vehicle's useful life if the vehicle will no longer be used primarily to pull box trailers, or to remove other fairings if the vehicle will no longer be used significantly on highways with vehicle speed of 55 miles per hour or higher. More generally, this section clarifies that owners may modify a vehicle for the purpose of reducing emissions, provided they have a reasonable technical basis for knowing that such modification will not increase emissions of any other pollutant. This essentially requires the owner to have information that would lead an engineer or other person familiar with engine and vehicle design and function to reasonably believe that the modifications will not increase emissions of any regulated pollutant. Thus, this provision does not provide a blanket allowance for modifications after the useful life.

This section also makes clear that no person may ever disable a vehicle speed limiter prior to its expiration point, or remove aerodynamic fairings from tractors that are used primarily to pull box trailers on highways. It is also clear that this allowance does not apply with respect to engine modifications or recalibrations.

This section does not apply with respect to modifications that occur within the useful life period, other than to note that many such modifications to the vehicle during the useful life and to the engine at any time are presumed to violate 42 U.S.C. 7522(a)(3)(A). EPA notes, however, that this is merely a presumption, and would not prohibit modifications during the useful life where the owner clearly has a reasonable technical basis for knowing that the modifications would not cause the vehicle to exceed any applicable standard.

(4) Other Interim Provisions

In HD Phase 1, EPA adopted provisions to delay the onboard diagnostics (OBD) requirements for heavy-duty hybrid powertrains (see 40 CFR 86.010–18(q)). This provision delayed full OBD requirements for hybrids until 2016 and 2017 model years. In discussion with manufacturers during the development of Phase 2, the agencies have learned that meeting the on-board diagnostic requirements for criteria pollutant engine certification continues to be a potential impediment to adoption of hybrid systems. See Section XIV.A.1 for a discussion of regulatory changes proposed to reduce the non-GHG certification burden for engines paired with hybrid powertrain systems.

(5) Phase 1 Flexibilities Not Proposed for Phase 2

The Phase 1 advanced technology credits were adopted to promote the implementation of advanced technologies, such as hybrid powertrains, Rankine cycle engines, all-electric vehicles, and fuel cell vehicles (see 40 CFR 1037.150(i)). As the agencies stated in the Phase 1 final rule, the Phase 1 standards were not premised on the use of advanced technologies but we expected these advanced technologies to be an important part of the Phase 2 rulemaking (76 FR 57133, September 15, 2011). The proposed HD Phase 2 heavy-duty engine and tractor standards are premised on the use of Rankine-cycle engines, therefore the agencies believe it is no longer appropriate to provide extra credit for this technology. While the agencies have not premised the proposed HD Phase 2 tractor standards on hybrid powertrains, fuel cells, or electric vehicles, we also foresee some limited use of these technologies in 2021 and beyond. Therefore, we propose to not provide advanced technology credits in Phase 2 for any technology, but we welcome comments on the need for such incentive.

Also in Phase 1, the agencies adopted early credits to create incentives for manufacturers to introduce more efficient engines and vehicles earlier than they otherwise would have planned to do (see 40 CFR 1037.150(a)). The agencies are not proposing to extend this flexibility to Phase 2 because the ABT program from Phase 1 will be available to manufacturers in 2020 model year and this would displace the need for early credits.

IV. Trailers

As mentioned in Section III, trailers pulled by Class 7 and 8 tractors (together considered ''tractor-trailers'') account for approximately two-thirds of the heavy-duty sector's total CO_2 emissions and fuel consumption. Because neither trailers nor the tractors that pull them are useful by themselves, it is the combination of the tractor and the trailer that forms the useful vehicle. Although trailers do not directly generate exhaust emissions or consume fuels (except for the refrigeration units on refrigerated trailers), their designs and operation nevertheless contribute substantially to the CO_2 emissions and diesel fuel consumption of the tractors pulling them. See also Section I.E (1) and (2) above.

The agencies are proposing standards for trailers specifically designed to be drawn by Class 7 and 8 tractors when coupled to the tractor's fifth wheel. The agencies are not proposing standards for trailers designed to be drawn by vehicles other than tractors, and those that are coupled to vehicles with pintle hooks or hitches instead of a fifth wheel. These proposed standards are expressed as CO_2 and fuel consumption standards, and would apply to each trailer with respect to the emissions and fuel consumption that would be expected for a specific standard type of tractor pulling such a trailer. Note that this approach is discussed in more detail later. Nevertheless, EPA and NHTSA believe it is appropriate to establish standards for trailers separately from tractors because they are separately manufactured by distinct companies; the agencies are not aware of any manufacturers that currently assemble both the finished tractor and the trailer.

A. Summary of Trailer Consideration in Phase 1

In the Phase 1 program, the agencies did not regulate trailers, but discussed how we might do so in the future (see 76 FR 57362). We chose not to regulate trailers at that time, primarily because of the lack of a proposed test procedure, as well as the technical and policy issues at that time. The agencies also noted the large number of small businesses in this industry, the possibility that regulations would substantially impact these small businesses, and the agencies' consequent obligations under the Small Business Regulatory Enforcement Fairness Act.[202] However, the agencies did indicate the potential CO_2 and fuel consumption benefits of including trailers in the program and we committed to consider establishing standards for trailers in future rulemakings.

In the Phase 1 proposal, the agencies solicited general comments on controlling CO_2 emissions and fuel consumption through future trailer regulations (see 75 FR 74345–74351). Although we neither proposed nor finalized trailer regulations at that time, the agencies have considered those comments in developing this proposal. This notice proposes the first EPA regulations covering trailer manufacturers for CO_2 emissions (or any other emissions), and the first fuel consumption regulations by NHTSA for these manufacturers. The agencies intend for this program to be a unified national program so that when a trailer model complies with EPA's standards it will also comply with NHTSA's standards.

B. The Trailer Industry

(1) Industry Characterization

The trailer industry encompasses a wide variety of trailer applications and designs. Among these are box trailers (dry vans and refrigerated vans of all sizes) and ''non-box'' trailers, including platform (sometimes called ''flatbed''), tanker, container chassis, bulk, dump, grain, and many specialized types of trailers, such as car carriers, pole trailers, and logging trailers. Most trailers are designed for predominant use on paved streets, roads, and highways (called ''highway trailers'' for purposes of this proposed rule). A relatively small number of trailers are designed for dedicated use in logging and mining operations or for use in

[202] The Regulatory Flexibility Act (RFA), as amended by the Small Business Regulatory Enforcement Fairness Act (SBREFA), requires agencies to account for economic impacts of all rules that may have a significant impact on a substantial number of small businesses and in addition contains provisions specially applicable to EPA requiring a multi-agency pre-proposal process involving outreach and consultation with representatives of potentially affected small businesses. See *http://www.epa.gov/rfa/* for more information. Note that for this Phase 2 proposal, EPA has completed a Small Business Advocacy Review panel process that included small trailer manufacturers, as discussed in XIV.C below.

applications that we expect would involve little or no time on paved roadways. A more detailed description of the characteristics that distinguish these trailers is included in Section IV.C.(5).

The trailer manufacturing industry is very competitive, and manufacturers are highly responsive to their customers' diverse demands. The wide range of trailer designs and features reflects the broad variety of customer needs, chief among them typically being the ability to maximize the amount of freight the trailer can transport. Other design goals reflect the numerous, more specialized customer needs.

Box trailers are the most common type of trailer and are made in many different lengths, generally ranging from 28 feet to 53 feet. While all have a rectangular shape, they can vary widely in basic construction design (internal volume and weight), materials (steel, fiberglass composites, aluminum, and wood) and the number and configuration of axles (usually two axles closely spaced, but number and spacing of axles can be greater). Box trailer designs may also include additional features, such as one or more side doors, out-swinging or roll-up rear doors, side or rear lift gates, and numerous types of undercarriage accessories.

Non-box trailers are uniquely designed to transport a specific type of freight. Platform trailers carry cargo that may not be easily contained within or loaded and unloaded into a box trailer, such as large, nonuniform equipment or machine components. Tank trailers are often pressure-tight enclosures designed to carry liquids, gases or bulk, dry solids and semi-solids. There are also a number of other specialized trailers such as grain, dump, automobile hauler, livestock trailers, construction and heavy-hauling trailers.

Chapter 1 of the Draft RIA includes a more thorough characterization of the trailer industry. The agencies have considered the variety of trailer designs and applications in developing the proposed CO_2 emissions and fuel consumption standards for trailers.

(2) Historical Context for Proposed Trailer Provisions

(a) SmartWay Program

EPA's voluntary SmartWay Transport Partnership program encourages businesses to take actions that reduce fuel consumption and CO_2 emissions while cutting costs. See Section I.A.2.f above. SmartWay staff work with the shipping, logistics, and carrier communities to identify low carbon strategies and technologies across their transportation supply chains. It is a voluntary, fleet-targeted program that provides an objective ranking of a fleet's freight efficiency relative to its competitors. SmartWay Partners commit to adopting fuel-saving practices and technologies relative to a baseline year as well as tracking their progress.

EPA's SmartWay program has accelerated the availability and market penetration of advanced, fuel efficient technologies and operational practices. In conjunction with the SmartWay Partners Program, EPA established a testing, verification, and designation program, the SmartWay Technology Program, to help freight companies identify the equipment, technologies, and strategies that save fuel and lower emissions. SmartWay verifies the performance of aerodynamic equipment and low rolling resistance tires and maintains a list of verified technologies on its Web site. The trailer aerodynamic technologies verified are grouped in bins that represent one percent, four percent, or five percent fuel savings relative to a typical long-haul tractor-trailer at 65-mph cruise conditions. Historically, use of verified aerodynamic devices totaling at least five percent fuel savings, along with verified tires, qualifies a 53-foot dry van trailer for the ''SmartWay Trailer'' designation. In 2014, EPA expanded the program to qualify trailers as ''SmartWay Elite'' if they use verified tires and aerodynamic equipment providing nine percent or greater fuel savings. The 2014 updates also expanded the SmartWay-designated trailer eligibility to include 53-foot refrigerated van trailers in addition to 53-foot dry van trailers.

The SmartWay Technology Program continues to improve the technical quality of data that EPA and stakeholders need for verification. EPA bases its SmartWay verifications on common industry test methods using SmartWay-specified testing protocols. Historically, SmartWay's aerodynamic equipment verification was performed using the SAE J1321 test procedure, which measures fuel consumption as the test vehicle drives laps around a test track. Under SmartWay's 2014 updates, EPA expanded its trailer designation and equipment verification programs to allow additional testing options. The updates included a new, more stringent 2014 track test protocol based on SAE's 2012 update to its SAE J1321 test method,[203] as well as protocols for wind tunnel, coastdown, and possibly computational fluid dynamics (CFD) approaches. These new protocols are based on stakeholder input, the latest industry standards (*i.e.,* 2012 versions of the SAE fuel consumption and wind tunnel test[204] methods), EPA's own testing and research, and lessons learned from years of implementing technology verification programs. Wind tunnel, coastdown, and CFD testing produce values for aerodynamic drag improvements in terms of coefficient of drag (C_D), which is then related to projected fuel savings using a mathematical curve.[205]

SmartWay verifies tires based on test data submitted by tire manufacturers demonstrating the coefficient of rolling resistance (C_{RR}) of their tires using either the SAE J1269 or ISO 28580 test methods. These verified tires have rolling resistance targets for each axle position on the tractor-trailer. SmartWay-verified trailer tires achieve a C_{RR} of 5.1 kg/metric ton or less on the ISO28580 test method. An operator who replaces the trailer tires with SmartWay-verified tires can expect fuel consumption savings of one percent or more at a 65-mph cruise. Operators who apply SmartWay-verified tires on both the trailer *and* tractor can achieve three percent fuel consumption savings at 65-mph.

Over the last decade, SmartWay partners have demonstrated measureable fuel consumption benefits by adding aerodynamic features and low rolling resistance tires to their 53-foot dry van trailers. To date, SmartWay has verified over 70 technologies, including nine packages from five manufacturers that have received the Elite designation. The SmartWay Transport program has worked with over 3,000 partners, the majority of which are trucking fleets, and broadly throughout the supply-chain industry, since 2004. These relationships, combined with the Technology Program's extensive involvement in the HD vehicle technology industry, have provided EPA with significant experience in freight fuel efficiency. Furthermore, the more than 10-year duration of the voluntary SmartWay Transport Partnership has resulted in significant fleet and manufacturer experience with innovating and deploying technologies

that reduce CO_2 emissions and fuel consumption.

(b) California Tractor-Trailer Greenhouse Gas Regulation

The state of California passed the Global Warming Solutions Act of 2006 (Assembly Bill 32, or AB32), enacting the state's 2020 greenhouse gas emissions reduction goal into law. Pursuant to this Act, the California Air Resource Board (CARB) was required to begin developing early actions to reduce GHG emissions. As a part of a larger effort to comply with AB32, the California Air Resource Board issued a regulation entitled ''Heavy-Duty Greenhouse Gas Emission Reduction Regulation'' in December 2008.

This regulation reduces GHG emissions by requiring improvement in the efficiency of heavy-duty tractors and 53 foot or longer dry and refrigerated box trailers that operate in California.[206] The program is being phased in between 2010 and 2020. Small fleets have been allowed special compliance opportunities to phase in the retrofits of their existing trailer fleets through 2017. The regulation requires affected trailer fleet owners to either use SmartWay-verified trailers or to retrofit trailers with SmartWay-verified technologies. The efficiency improvements are achieved through the use of aerodynamic equipment and low rolling resistance tires on both the tractor and trailer. EPA has granted a waiver for this California program.[207]

(c) NHTSA Safety-Related Regulations for Trailers and Tires

NHTSA regulates new trailer safety through regulations. Table IV–1 lists the current regulations in place related to trailers. Trailer manufacturers will continue to be required to meet current safety regulations for the trailers they produce. We welcome any comments on additional regulations that are not included and particularly those that may be incompatible with the regulations outlined in this proposal.

FMVSS Nos. 223 and 224[208] require installation of rear guard protection on trailers. The definition of rear extremity of the trailer in 223 limits installation of rear fairings to a specified zone behind the trailer. The agencies request comment on any issues associated with installing potential boat tails or other rear aerodynamic fairings that would be more effective than current designs, given the current definition of trailer rear extremity in FMVSS 223.

(d) Additional DOT Regulations Related to Trailers

In addition to NHTSA's regulations, DOT's Federal Highway Administration (FHWA) regulates the weight and dimensions of motor vehicles on the National Network.[209] FHWA's regulations limit states from setting truck size and weight limits beyond certain ranges for vehicles used on the National Network. Specifically, vehicle weight and truck tractor-semitrailer length and width are limited by FHWA.[210] EPA and NHTSA do not anticipate any conflicts between FHWA's regulations and those proposed in this rulemaking.

(3) Agencies' Outreach in Developing This Proposal

In developing this proposed rule, EPA and NHTSA staff met and consulted with a wide range of organizations that have an interest in trailer regulations. Staff from both agencies met representatives of the Truck Trailer Manufacturers Association, the National Trailer Dealers Association, and the American Trucking Association, including their Fuel Efficiency Advisory Committee and their Technology and Maintenance Council. We also met with and visited the facilities of several individual trailer manufacturers, trailer aerodynamic device manufacturing companies, and trailer tire manufacturers, as well as visited an aerodynamic wind tunnel test facility and two independent tire testing facilities. The agencies consulted with representatives from California Air Resources Board, the International Council on Clean Transportation, the North American Council for Freight Efficiency, and several environmental NGOs.

In addition to these informal meetings, and as noted above, EPA also conducted several outreach meetings with representatives from small business trailer manufacturers as required under section 609(b) of the Regulatory Flexibility Act (RFA) and amended by the Small Business Regulatory Enforcement Fairness Act of 1996 (SBREFA). EPA convened a Small Business Advocacy Review (SBAR) Panel, and additional information regarding the findings and recommendations of the Panel are available in Section XIV below and in the Panel's final report.[211] EPA worked with NHTSA to propose flexibilities in response to EPA's SBAR Panel (as outlined in Section IV. F(6)(f) with more detail provided in Chapter 12 of the draft RIA). We welcome comments from all entities and the public to all aspects of this proposal.

C. Proposed Phase 2 Trailer Standards

This proposed rule proposes, for the first time, a set of CO_2 emission and fuel consumption standards for manufacturers of new trailers that would phase in over a period of nine years and continue to reduce CO_2 emissions and fuel consumption in the years to follow. The proposed standards are expressed as overall CO_2 emissions and fuel consumption performance standards considering the trailer as an integral part of the tractor-trailer vehicle.

The agencies are proposing trailer standards that we believe well implement our respective statutory obligations. The agencies believe that a proposed set of standards with similar stringencies, but less lead-time (referred to as ''Alternative 4'' and discussed in more detail later) has the potential to be the maximum feasible alternative within the meaning of section 32902 (k) of EISA, and appropriate under EPA's CAA authority (sections 202 (a)(1) and (2)). However, based on the evidence

[206] Recently, in December 2013, ARB adopted regulations that establish its own parallel Phase 1 program with standards consistent with the EPA Phase 1 tractor standards. On December 5, 2014 California's Office of Administrative Law approved ARB's adoption of the Phase 1 standards, with an effective date of December 5, 2014.

[207] See EPA's waiver of CARB's heavy-duty tractor-trailer greenhouse gas regulation applicable to new 2011 through 2013 model year Class 8 tractors equipped with integrated sleeper berths (sleeper-cab tractors) and 2011 and subsequent model year dry-can and refrigerated-van trailers that are pulled by such tractors on California highways at 79 FR 46256 (August 7, 2014).

[211] Final Report of the Small Business Advocacy Review Panel on EPA's Planned Proposed Rule: Greenhouse Gas Emissions and Fuel Efficiency Standards for Medium- and Heavy-Duty Engines and Vehicles: Phase 2, January 15, 2015.

currently before us, EPA and NHTSA have outstanding questions regarding relative risks and benefits of Alternative 4 due to the timeframe envisioned by that alternative. The proposed alternative (referred to as ''Alternative 3'' and discussed in more detail later) is generally designed to achieve the levels of fuel consumption and GHG reduction that Alternative 4 would achieve, but with several years of additional lead-time. Put another way, the Alternative 3 standards would result in the same stringency as the Alternative 4 standards, but several years later, meaning that manufacturers could, in theory apply new technology at a more gradual pace and with greater flexibility. Additional lead-time will also provide for a more gradual implementation of full compliance program, which could be especially helpful for this newly-regulated trailer industry. It is possible that the agencies could adopt, in full or in part, stringencies from Alternative 4 in the final rule. The agencies seek comment on the lead-time and market penetration in these alternatives.

The agencies are not proposing standards for CO_2 emissions and fuel consumption from the transport refrigeration units (TRUs) used on refrigerated box trailers. Additionally, EPA is not proposing standards for hydrofluorocarbon (HFC) emissions from TRUs. See Section IV.C.(4)

It is worth noting that the proposed standards for box trailers are based in part on the expectation that the proposed program would allow emissions averaging. However, as discussed in Section IV.F. below, given the specific structure and competitive nature of the trailer industry, we request comment on the advantages and disadvantages of implementing the proposed standards without an averaging program. Commenters addressing the stringency of the proposed standards are encouraged to address stringency in the context of compliance programs with and without averaging.

(1) Trailer Designs Covered by This Proposed Rule

As described previously, the trailer industry produces many different trailer designs for many different applications. The agencies are proposing standards for a majority of these trailers. Note that these proposed regulations apply to trailers designed for being drawn by a tractor when coupled to the tractor's fifth wheel. As described in detail in Section IV.C below, the agencies are proposing standards that would phase in between MY 2018 and 2027; the NHTSA standards would be voluntary until MY 2021. The proposed standards would apply to most types of trailers. For most box trailers, these standards would be based on the use of various technologies to improve aerodynamic performance, and on improved tire efficiency through low rolling resistance tires and use of automatic tire inflation (ATI) systems. As discussed below, the agencies have identified some trailers with characteristics that limit the aerodynamics that can be applied, and are proposing reduced the stringencies for those trailer types. As described in Sections IV.D.(1)(d) and (2)(d) below, although manufacturers can reduce trailer weight to reduce fuel costs by reducing trailer weight, these standards are not predicated on weight reduction for the industry.

The most comprehensive set of proposed requirements would apply to long box trailers, which include refrigerated and non-refrigerated (dry) vans. Long box trailers are the largest trailer category and are typically paired with high roof cab tractors that have high annual vehicle miles traveled (VMT) and high average speeds, and therefore offer the greatest potential for CO_2 and fuel consumption reductions. Many of the aerodynamic and tire technologies considered for long box trailers in this proposal are similar to those used in EPA's SmartWay program and required by California's Heavy-Duty Greenhouse Gas Emission Reduction Regulation. Many manufacturers and operators of box trailers have experience with these CO_2- and fuel consumption-reducing technologies. In addition to SmartWay partners and those fleets affected by the California regulation, many operators also seek such technologies in response to high fuel prices and the prospect of improved fuel efficiency. As a result, more data about the performance of these technologies exist for long box trailers than for other trailer types. Short box vans do not have the benefit of programs such as SmartWay to provide an incentive for development of and a reliable evaluation and promotion of CO_2- and fuel consumption-reducing technologies for their trailers. In addition, short box trailers are more frequently used in short-haul and urban operations, which may limit the potential effectiveness of these technologies. As such, EPA is proposing less stringent requirements for manufacturers of short box trailers.

Some trailer designs include features that can affect the practicality or the effectiveness of devices that manufacturers may consider to lower their CO_2 emissions and fuel consumption. We are proposing to recognize box trailers that are restricted from using aerodynamic devices in one location on the trailer as ''partial-aero'' box trailers.[212] The proposed standards for these trailers are based on the proposed standards for full-aero box-trailers, but would be less stringent than when the program is fully phased in.

We propose that box trailers that have work-performing devices in two locations such that they inhibit the use of *all* practical aerodynamic devices be considered ''non-aero'' box trailers in this proposal. The proposed standards for non-aero box trailers are predicated on the use of tire technologies—lower rolling resistance tires and ATI. We are proposing similar standards for non-box trailers (including applications such as dump trailers and agricultural trailers that are designed to be used both on and off the highway).

We are proposing to completely exclude several types of trailers from this trailer program. These excluded trailers would include those designed for dedicated in-field operations related to logging and mining. In addition, we are proposing to exclude heavy-haul trailers and trailers the primary function of which is performed while they are stationary. For all of these excluded trailers, manufacturers would not have any regulatory requirements under this program, and would not be subject to the proposed trailer compliance requirements. We seek comment on the appropriateness of excluding these types of trailers from the proposed trailer program and whether other trailer designs should be excluded. Section IV. C. (5) discusses these trailer types we propose to exclude and the physical characteristics that would define these trailers.

In summary, the agencies are proposing separate standards for ten trailer subcategories:

—Long box (longer than 50 feet[213]) dry vans
—Long box (longer than 50 feet) refrigerated vans
—Short box (50 feet and shorter) dry vans
—Short box (50 feet and shorter) refrigerated vans
—Partial-aero long box dry vans
—Partial-aero long box refrigerated vans
—Partial-aero short box dry vans

[212] Examples of types of work-performing components, equipment, or designs that the agencies might consider as warranting recognition as partial-aero or non-aero trailers include side or end lift gates, belly boxes, pull-out platforms or steps for side door access, and drop-deck designs. See 40 CFR 1037.107 and 49 CFR 535.5(e).

[213] Most long trailers are 53 feet in length; we are proposing a cut-point of 50 feet to avoid an unintended incentive for an OEM to slightly shorten a trailer design in order to avoid the new regulatory requirements.

—Partial-aero short box refrigerated vans
—Non-aero box vans (all lengths of dry and refrigerated vans)
—Non-box trailers (tanker, platform, container chassis, and all other types of highway trailers that are not box trailers)
