
[a] For fuels that are not listed, you must ask us to approve a reference fuel and its properties.

(c) Your official CO_2 emission result equals your calculated brake-specific emission rate multiplied by all applicable adjustment factors, other than the deterioration factor.

§ 1036.535 Determining engine fuel maps and fuel consumption at idle.

This section describes procedures for determining an engine's fuel-consumption rate for model year 2021 and later vehicles. Note that vehicle manufacturers will generally use these values to demonstrate compliance with vehicle-based Phase 2 emission standards that rely on emission modeling using the GEM simulation tool, as described in 40 CFR 1037.510.

(a) *General test provisions.* Perform fuel mapping using the procedure described in paragraph (b) of this section to establish measured fuel-consumption rates at a range of engine speed and load settings. Measure fuel consumption at idle using the procedure described in paragraph (c) of this section. Use these measured fuel-consumption values to declare fuel-consumption rates for certification as described in paragraph (d) of this section. Also measure NO_X emissions (in g/s) during each of the specified sampling periods consistent with the data requirements 40 CFR part 86, subpart T. Perform emission measurements as described in 40 CFR 1065.530 for discrete-mode steady-state testing. Control engine speed and torque to within ±20 rpm and ±20 N·m, or 20 percent of the speed and torque setpoint, whichever is greater. This section uses engine parameters and variables that are consistent with 40 CFR part 1065. For molar mass values, see 40 CFR 1065.1005.

(b) *Steady-state fuel mapping.* Determine fuel-consumption rates for each engine configuration over a series of steady-state engine operating points as described in this paragraph (b). You may use shared data across an engine platform to the extent that the fuel-consumption rates remain valid. For example, if you test a high-output configuration and create a different configuration that uses the same fueling strategy but limits the engine operation to be a subset of that from the high-output configuration, you may use the fuel-consumption rates for the reduced number of mapped points for the low-output configuration, as long as the narrower map includes at least 100 points. Perform fuel mapping as follows:

(1) Select 13 speed points that include warm idle speed, $f_{\text{nidle,}}$ the highest speed above maximum power at which 70% of

maximum power occurs, n_{hi}, and 11 equally spaced points between f_{nidle} and n_{hi}. If operating the engine at the specified speeds causes unstable engine operation due to operating on the low or high speed governor you may adjust the speed setpoint for those points as needed. Typically this would only happen at f_{nidle} above zero torque and n_{hi} at 100% torque. f_{nidle} and zero torque must be one of the test points.

(2) Select 11 normalized torque values at each of the speed points determined in paragraph (b)(1) of this section, including $T = 0$, maximum mapped torque, $T_{max\ mapped}$, and 9 equally spaced points between $T = 0$ and $T_{max\ mapped}$. Normalized torque values are expressed as a percentage of $T_{max\ mapped}$ at a given engine speed.

(3) Warm up the engine as described in 40 CFR 1065.510(b)(2).

(4) Within 60 seconds after concluding the warm-up procedure, operate the engine at f_{ntest} and the highest torque value, T_{max}, at that speed.

(5) After the engine operates at the set speed and torque for 60 seconds, start recording measurements using one of the following methods:

(i) *Carbon mass balance.* Record speed and torque and measure emissions of CO_2, CO, NMHC, and CH_4 for (29 to 31) seconds and determine the corresponding mean values for the sampling period.

(ii) *Direct measurement of fuel flow.* Record speed and torque and measure fuel consumption with a fuel flow meter for (29 to 31) seconds and determine the corresponding mean values for the sampling period.

(6) Within 15 seconds after completing the sampling period described in paragraph (b)(5) of this section, set the engine to operate at the next lowest torque value while holding speed constant. Perform the measurements described at the new torque setting and repeat this sequence for all remaining torque values down to $T = 0$.

(7) Continue testing to complete fuel mapping as follows:

(i) Within 15 seconds after sampling at $T = 0$, set the engine to operate at the next lowest speed value and increase torque to T_{max}. Perform measurements for all the torque values at the selected speed as described in paragraphs (b)(5) and (6) of this section. Repeat this sequence for all remaining speed values down to f_{nidle} to complete the fuel-mapping procedure. You may interrupt the mapping sequence to calibrate emission-measurement instrumentation only during stabilization at T_{max} for a given speed.

(ii) If an infrequent regeneration event occurs during fuel mapping, invalidate all the measurements made at that engine speed. Allow the regeneration event to finish, then restart engine stabilization at T_{max} at the same engine speed and continue with measurements from that point in the fuel-mapping sequence.

(8) If you determine fuel-consumption rates using emission measurements from the raw or diluted exhaust, calculate the mean fuel mass flow rate,, for each point in the fuel map using the following equation:

$$\bar{\dot{m}}_{fuel} = \frac{M_C}{w_{Cmeas}} \cdot \left(\bar{\dot{n}}_{exh} \cdot \frac{\bar{x}_{Ccombdry}}{1 + \bar{x}_{H2Oexhdry}} - \frac{\bar{\dot{m}}_{CO2urea}}{M_{CO2}} \right) \quad \text{Eq. 1036.535-1}$$

Where:

m_{fuel} = mean fuel mass flow rate for a given fuel map setpoint, expressed to at least the nearest 0.001 g/s.

M_C = molar mass of carbon.

w_{Cmeas} = carbon mass fraction of fuel as determined by 40 CFR 1065.655(d), except that you may not use the default properties in Table 1 of 40 CFR 1065.655 to determine α, β, and w_C for liquid fuels.

n_{exh} = the mean raw exhaust molar flow rate from which you measured emissions according to 40 CFR 1065.655.

$x_{Ccombdry}$ = the mean concentration of carbon from fuel in the exhaust per mole of dry exhaust.

$\bar{x}_{H2Oexhdry}$ = the mean concentration of H_2O in exhaust per mole of dry exhaust.

$\bar{\dot{m}}_{CO2urea}$ = the mean CO_2 mass emission rate from urea decomposition as described in paragraph (b)(9) of this section. If your engine does not utilize urea SCR for emission control, or if you choose not to perform this correction, set $\bar{\dot{m}}_{CO2urea}$ equal to 0.

M_{CO2} = molar mass of carbon dioxide.

Example:

$$\bar{\dot{m}}_{fuel} = \frac{12.0107}{0.869} \cdot \left(25.534 \cdot \frac{0.002805}{1 + 0.0353} - \frac{0.0726}{44.0095} \right) = 0.933 \text{ g/s}$$

(9) If you determine fuel-consumption rates using emission measurements with engines that have urea SCR for NO_X control, you may correct for the mean CO_2 emissions coming from urea decomposition, $\bar{\dot{m}}_{CO2urea}$, at each fuel map setpoint using the following equation:

$$\bar{\dot{m}}_{CO2urea} = \bar{\dot{m}}_{urea} \cdot \frac{M_{CO2} \cdot MF_{CH4N2O}}{M_{CH4N2O}} \quad \text{Eq. 1036.535-2}$$

Where:

$\bar{\dot{m}}_{urea}$ = the mean mass flow rate of injected urea solution for a given sampling period.

M_{CO2} = molar mass of carbon dioxide.

MF_{CH4N2O} = mass fraction of urea in aqueous solution. Note that the subscript "CH_4N_2O" refers to urea as a pure compound and the subscript "urea" refers to the aqueous urea solution.

M_{CH4N2O} = molar mass of urea.

Example:

$\bar{\dot{m}}_{urea}$= 0. 304 g/s

M_{CO2} = 44.0095 g/mol

MF_{CH4N2O} = 32.5% = 0.325

M_{CH4N2O} = 60.05526 g/mol

$$\bar{\dot{m}}_{\mathrm{CO2urea}} = 0.304 \cdot \frac{44.0095 \cdot 0.325}{60.05526} = 0.0726\ \mathrm{g/s}$$

(10) For all fuels except those that have at least 75% pure alcohol, correct the measured or calculated mean fuel mass flow rate, $\bar{\dot{m}}_{\mathrm{fuel}}$ at each engine operating condition to a mass-specific net energy content of a reference fuel using the following equation and the values specified in Table 1 of § 1036.530:

$$\bar{\dot{m}}_{\mathrm{fuelcor}} = \bar{\dot{m}}_{\mathrm{fuel}} \cdot \frac{E_{\mathrm{mfuelmeas}} \cdot w_{\mathrm{Cref}}}{E_{\mathrm{mfuelCref}}} \qquad \text{Eq. 1036.535-3}$$

Example:

$\bar{\dot{m}}_{\mathrm{fuel}}$ = 0.933 g/s

$E_{\mathrm{mfuelmeas}}$ = 42.7984 MJ/kgC

w_{Cref} = 0.874

$E_{\mathrm{mfuelCref}}$ = 49.3112 MJ/kgC

$$\bar{\dot{m}}_{\mathrm{fuel}} = 0.933 \cdot \frac{42.7984 \cdot 0.874}{49.3112} = 0.708\ \mathrm{g/s}$$

(c) *Fuel consumption at idle.* Determine values for fuel-consumption rate at idle for each engine configuration as described in this paragraph (c). You may use shared data across engine configurations, consistent with good engineering judgment. Perform measurements as follows:

(1) Warm up the engine as described in 40 CFR 1065.510(b)(2).

(2) Within 60 seconds after concluding the warm-up procedure, operate the engine at its minimum declared warm idle speed, f_{nidlemin}, as described in 40 CFR 1065.510(b)(3), set zero torque, and start the sampling period. Continue sampling for (595 to 605) seconds. Perform measurements using one of the following methods during the sampling period:

(i) *Carbon mass balance.* Record speed and torque and measure emissions of CO_2, CO, NMHC, and CH_4 and determine the corresponding mean values for the sampling period. Calculate the mean fuel mass flow rate, $\bar{\dot{m}}_{\mathrm{fuel}}$, during the sampling period as described in paragraph (b)(8) of this section.

(ii) *Direct measurement of fuel flow.* Record speed and torque and measure fuel consumption with a fuel flow meter and determine the corresponding mean values for the sampling period.

(3) Repeat the steps in paragraphs (c)(1) and (2) of this section with the engine set to operate at idle torque, T_{idle}. Determine T_{idle} using the following equation:

$$T_{\mathrm{idle}} = \frac{T_{\mathrm{fnstall}} \cdot f_{\mathrm{fnidle}}^{2}}{f_{\mathrm{fnstall}}^{2}} + \frac{P_{\mathrm{acc}}}{f_{\mathrm{nidle}}} \qquad \text{Eq. 1036.535-2}$$

Where:

T_{fnstall} = the maximum engine torque at f_{nstall}.

f_{nidle} = the applicable engine idle speed as described in this paragraph (c).

f_{nstall} = the stall speed of the torque converter; use f_{ntest} or 2250 rpm, whichever is lower.

P_{acc} = accessory power for the vehicle class; use 1300 W.

Example:

f_{ntest} = 1740.8 rpm = 182.30 rad/s

f_{nstall} = 1740.8 rpm = 182.30 rad/s

T_{fnstall} = 1870 N·m

P_{acc} = 1300 W

f_{nidle} = 600 rpm = 62.83 rad/s

$$T_{\mathrm{idle}} = \frac{1870 \cdot 62.83^2}{182.30^2} + \frac{1300}{62.83} = 242.84\ \mathrm{N \cdot m}$$

(4) Repeat the steps in paragraphs (c)(1) through (3) of this section with the engine operated at its declared maximum warm idle speed, f_{nidlemax}.

(5) If an infrequent regeneration event occurs during this procedure, invalidate any measurements made at that idle condition. Allow the regeneration event to finish, then repeat the measurement and continue with the test sequence.

(6) Correct the measured or calculated mean fuel mass flow rate, $\bar{\dot{m}}_{\mathrm{fuel}}$ at each of the four idle settings to account for mass-specific net energy content as described in paragraph (b)(10) of this section.

(d) *Measured vs. declared fuel-consumption rates.* Select fuel-consumption rates (g/s) to characterize the engine's fuel map and fuel-consumption rate at idle. These declared values may not be lower than any corresponding measured values determined in paragraphs (b) and (c) of this section. You may select any value that is at or above the corresponding measured value. Use good engineering judgment to select values that will be at or below the fuel-consumption rates for your production engines. These declared fuel-consumption rates are the values that vehicle manufacturers will use for certification. Note that production engines are subject to GEM cycle-weighted limits as described in § 1036.301.

Subpart G—Special Compliance Provisions

§ 1036.601 What compliance provisions apply?

(a) Engine and vehicle manufacturers, as well as owners, operators, and rebuilders of engines subject to the requirements of this part, and all other persons, must observe the provisions of this part, the provisions of 40 CFR part 1068, and the provisions of the Clean Air Act. The provisions of 40 CFR part 1068 apply for heavy-duty highway engines as specified in that part, subject to the following provisions:

(1) The hardship exemption provisions of 40 CFR 1068.245, 1068.250, and 1068.255 do not apply for motor vehicle engines.

(2) The provisions of 40 CFR 1068.235 that allow for modifying certified engines for competition do not apply for heavy-duty vehicles or heavy-duty engines. Certified motor vehicles and motor vehicle engines and their emission control devices must remain in their certified configuration even if they are used solely for competition or if they become nonroad vehicles or engines; anyone modifying a certified motor vehicle or motor vehicle engine for any reason is subject to the tampering and defeat device prohibitions of 40 CFR 1068.101(b) and 42 U.S.C. 7522(a)(3). Note that a new engine that will be installed in a vehicle that will be used solely for competition may be excluded from the requirements of this part based on a determination that the vehicle is not a motor vehicle under 40 CFR 85.1703.

(3) The tampering prohibition in 40 CFR 1068.101(b)(1) applies for alternative fuel conversions as specified in 40 CFR part 85, subpart F.

(4) The warranty-related prohibitions in section 203(a)(4) of the Act (42 U.S.C. 7522(a)(4)) apply to manufacturers of new heavy-duty highway engines in addition to the prohibitions described in 40 CFR 1068.101(b)(6). We may assess a civil penalty up to $37,500 for each engine or vehicle in violation.

(b) Engines exempted from the applicable standards of 40 CFR part 86 are exempt from the standards of this part without request.

(c) The emergency vehicle field modification provisions of 40 CFR 85.1716 apply with respect to the standards of this part.

(d) Subpart C of this part describes how to test and certify dual-fuel and flexible-fuel engines. Some multi-fuel engines may not fit either of those defined terms. For such engines, we will determine whether it is most appropriate to treat them as single-fuel engines, dual-fuel engines, or flexible-fuel engines based on the range of possible and expected fuel mixtures. For example, an engine might burn natural gas but initiate combustion with a pilot injection of diesel fuel. If the engine is designed to operate with a single fueling algorithm (*i.e.,* fueling rates are fixed at a given engine speed and load condition), we would generally treat it as a single-fuel engine. In this context, the combination of diesel fuel and natural gas would be its own fuel type. If the engine is designed to also operate on diesel fuel alone, we would generally treat it as a dual-fueled engine. If the engine is designed to operate on varying mixtures of the two fuels, we would generally treat it as a flexible-fueled engine. To the extent that requirements vary for the different fuels or fuel mixtures, we may apply the more stringent requirements.

§ 1036.610 Off-cycle technology credits and adjustments for reducing greenhouse gas emissions.

(a) You may ask us to apply the provisions of this section for CO_2 emission reductions resulting from powertrain technologies that were not in common use with heavy-duty vehicles before model year 2010 that are not reflected in the specified test procedure. We will apply these provisions only for technologies that will result in a measurable, demonstrable, and verifiable real-world CO_2 reduction. Note that prior to MY 2016, these technologies were referred to as ''innovative technologies''.

(b) The provisions of this section may be applied as either an improvement factor (used to adjust emission results) or as a separate credit within the engine family, consistent with good engineering judgment. Note that the term ''credit'' in this section describes an additive adjustment to emission rates and is not equivalent to an emission credit in the ABT program of subpart H of this part. We recommend that you base your credit/adjustment on A to B testing of pairs of engines/vehicles differing only with respect to the technology in question.

(1) Calculate improvement factors as the ratio of in-use emissions with the technology divided by the in-use emissions without the technology. Adjust the emission results by multiplying by the improvement factor. Use the improvement-factor approach where good engineering judgment indicates that the actual benefit will be proportional to emissions measured over the test procedures specified in this part. For example, the benefits from technologies that reduce engine operation would generally be proportional to the engine's emission rate.

(2) Calculate separate credits based on the difference between the in-use emission rate (g/ton-mile) with the technology and the in-use emission rate without the technology. Subtract this value from your measured emission result and use this adjusted value to determine your FEL. We may also allow you to calculate the credits based on g/hp-hr emission rates. Use the separate-credit approach where good engineering judgment indicates that the actual benefit will not be proportional to emissions measured over the test procedures specified in this part.

(3) We may require you to discount or otherwise adjust your improvement factor or credit to account for uncertainty or other relevant factors.

(c) Send your request to the Designated Compliance Officer. We recommend that you do not begin collecting test data (for submission to EPA) before contacting us. For technologies for which the vehicle manufacturer could also claim credits (such as transmissions in certain circumstances), we may require you to include a letter from the vehicle manufacturer stating that it will not seek credits for the same technology. Your request must contain the following items:

(1) A detailed description of the off-cycle technology and how it functions to reduce CO_2 emissions under conditions not represented on the duty cycles required for certification.

(2) A list of the engine configurations that will be equipped with the technology.

(3) A detailed description and justification of the selected test engines.

(4) All testing and simulation data required under this section, plus any other data you have considered in your analysis. You may ask for our preliminary approval of your test plan under § 1036.210.

(5) A complete description of the methodology used to estimate the off-cycle benefit of the technology and all supporting data, including engine testing and in-use activity data. Also include a statement regarding your recommendation for applying the provisions of this section for the given technology as an improvement factor or a credit.

(6) An estimate of the off-cycle benefit by engine model, and the fleetwide benefit based on projected sales of engine models equipped with the technology.

(7) A demonstration of the in-use durability of the off-cycle technology,

based on any available engineering analysis or durability testing data (either by testing components or whole engines).

(d) We may seek public comment on your request, consistent with the provisions of 40 CFR 86.1869–12(d). However, we will generally not seek public comment on credits/adjustments based on A to B engine dynamometer testing, chassis testing, or in-use testing.

(e) We may approve an improvement factor or credit for any engine family that is properly represented by your testing. You may similarly continue to use an approved improvement factor or credit for any appropriate engine families in future model years through 2020. Starting in model year 2021, you must request our approval before applying an improvement factor or credit under this section for any kind of technology, even if we approved an improvement factor or credit for similar engine models before model year 2021.

§ 1036.615 Engines with Rankine cycle waste heat recovery and hybrid powertrains.

This section specifies how to generate advanced technology-specific emission credits for hybrid powertrains that include energy storage systems and regenerative braking (including regenerative engine braking) and for engines that include Rankine-cycle (or other bottoming cycle) exhaust energy recovery systems. This section applies only for model year 2020 and earlier engines.

(a) *Pre-transmission hybrid powertrains.* Test pre-transmission hybrid powertrains with the hybrid engine test procedures of 40 CFR part 1065 or with the post-transmission test procedures in 40 CFR 1037.550. Pre-transmission hybrid powertrains are those engine systems that include features to recover and store energy during engine motoring operation but not from the vehicle's wheels.

(b) *Rankine engines.* Test engines that include Rankine-cycle exhaust energy recovery systems according to the test procedures specified in subpart F of this part unless we approve alternate procedures.

(c) *Calculating credits.* Calculate credits as specified in subpart H of this part. Credits generated from engines and powertrains certified under this section may be used in other averaging sets as described in § 1036.740(c).

(d) *Off-cycle technologies.* You may certify using both the provisions of this section and the off-cycle technology provisions of § 1036.610, provided you do not double-count emission benefits.

§ 1036.620 Alternate CO_2 standards based on model year 2011 compression-ignition engines.

For model years 2014 through 2016, you may certify your compression-ignition engines to the CO_2 standards of this section instead of the CO_2 standards in § 1036.108. However, you may not certify engines to these alternate standards if they are part of an averaging set in which you carry a balance of banked credits. You may submit applications for certifications before using up banked credits in the averaging set, but such certificates will not become effective until you have used up (or retired) your banked credits in the averaging set. For purposes of this section, you are deemed to carry credits in an averaging set if you carry credits from advanced technology that are allowed to be used in that averaging set.

(a) The standards of this section are determined from the measured emission rate of the test engine of the applicable baseline 2011 engine family(ies) as described in paragraphs (b) and (c) of this section. Calculate the CO_2 emission rate of the baseline test engine using the same equations used for showing compliance with the otherwise applicable standard. The alternate CO_2 standard for light and medium heavy-duty vocational-certified engines (certified for CO_2 using the transient cycle) is equal to the baseline emission rate multiplied by 0.975. The alternate CO_2 standard for tractor-certified engines (certified for CO_2 using the ramped-modal cycle) and all other heavy heavy-duty engines is equal to the baseline emission rate multiplied by 0.970. The in-use FEL for these engines is equal to the alternate standard multiplied by 1.03.

(b) This paragraph (b) applies if you do not certify all your engine families in the averaging set to the alternate standards of this section. Identify separate baseline engine families for each engine family that you are certifying to the alternate standards of this section. For an engine family to be considered the baseline engine family, it must meet the following criteria:

(1) It must have been certified to all applicable emission standards in model year 2011. If the baseline engine was certified to a NO_X FEL above the standard and incorporated the same emission control technologies as the new engine family, you may adjust the baseline CO_2 emission rate to be equivalent to an engine meeting the 0.20 g/hp-hr NO_X standard (or your higher FEL as specified in this paragraph (b)(1)), using certification results from model years 2009 through 2011, consistent with good engineering judgment.

(i) Use the following equation to relate model year 2009–2011 NO_X and CO_2 emission rates (g/hp-hr): $CO_2 = a \times \log(NO_X)+b$.

(ii) For model year 2014–2016 engines certified to NO_X FELs above 0.20 g/hp-hr, correct the baseline CO_2 emissions to the actual NO_X FELs of the 2014–2016 engines.

(iii) Calculate separate adjustments for emissions over the ramped-modal cycle and the transient cycle.

(2) The baseline configuration tested for certification must have the same engine displacement as the engines in the engine family being certified to the alternate standards, and its rated power must be within five percent of the highest rated power in the engine family being certified to the alternate standards.

(3) The model year 2011 U.S.-directed production volume of the configuration tested must be at least one percent of the total 2011 U.S.-directed production volume for the engine family.

(4) The tested configuration must have cycle-weighted BSFC equivalent to or better than all other configurations in the engine family.

(c) This paragraph (c) applies if you certify all your engine families in the primary intended service class to the alternate standards of this section. For purposes of this section, you may combine light heavy-duty and medium heavy-duty engines into a single averaging set. Determine your baseline CO_2 emission rate as the production-weighted emission rate of the certified engine families you produced in the 2011 model year. If you produce engines for both tractors and vocational vehicles, treat them as separate averaging sets. Adjust the CO_2 emission rates to be equivalent to an engine meeting the average NO_X FEL of new engines (assuming engines certified to the 0.20 g/hp-hr NO_X standard have a NO_X FEL equal to 0.20 g/hp-hr), as described in paragraph (b)(1) of this section.

(d) Include the following statement on the emission control information label: ''THIS ENGINE WAS CERTIFIED TO AN ALTERNATE CO_2 STANDARD UNDER § 1036.620.''

(e) You may not bank CO_2 emission credits for any engine family in the same averaging set and model year in which you certify engines to the standards of this section. You may not bank any advanced technology credits in any averaging set for the model year you certify under this section (since such credits would be available for use in this averaging set). Note that the provisions of § 1036.745 apply for deficits generated with respect to the standards of this section.

(f) You need our approval before you may certify engines under this section, especially with respect to the numerical value of the alternate standards. We will not approve your request if we determine that you manipulated your engine families or test engine configurations to certify to less stringent standards, or that you otherwise have not acted in good faith. You must keep and provide to us any information we need to determine that your engine families meet the requirements of this section. Keep these records for at least five years after you stop producing engines certified under this section.

§ 1036.625 In-use compliance with family emission limits (FELs).

Section 1036.225 describes how to change the FEL for an engine family during the model year. This section, which describes how you may ask us to increase an engine family's FEL after the end of the model year, is intended to address circumstances in which it is in the public interest to apply a higher in-use FEL based on forfeiting an appropriate number of emission credits.

(a) You may ask us to increase an engine family's FEL after the end of the model year if you believe some of your in-use engines exceed the CO_2 FEL that applied during the model year (or the CO_2 emission standard if the family did not generate or use emission credits). We may consider any available information in making our decision to approve or deny your request.

(b) If we approve your request under this section, you must apply emission credits to cover the increased FEL for all affected engines. Apply the emission credits as part of your credit demonstration for the current production year. Include the appropriate calculations in your final report under § 1036.730.

(c) Submit your request to the Designated Compliance Officer. Include the following in your request:

(1) Identify the names of each engine family that is the subject of your request. Include separate family names for different model years

(2) Describe why your request does not apply for similar engine models or additional model years, as applicable.

(3) Identify the FEL(s) that applied during the model year and recommend a replacement FEL for in-use engines; include a supporting rationale to describe how you determined the recommended replacement FEL.

(4) Describe whether the needed emission credits will come from averaging, banking, or trading.

(d) If we approve your request, we will identify the replacement FEL. The value we select will reflect our best judgment to accurately reflect the actual in-use performance of your engines, consistent with the testing provisions specified in this part. We may apply the higher FELs to other engine families from the same or different model years to the extent they used equivalent emission controls. We may include any appropriate conditions with our approval.

(e) If we order a recall for an engine family under 40 CFR 1068.505, we will no longer approve a replacement FEL under this section for any of your engines from that engine family, or from any other engine family that relies on equivalent emission controls.

§ 1036.630 Certification of engine GHG emissions for powertrain testing.

For engines included in powertrain families under 40 CFR part 1037, you may choose to include the corresponding engine emissions in your engine families under this part 1036.

(a) If you choose to include engine emissions in an engine family, the declared powertrain emission levels become standards that apply for selective enforcement audits and in-use testing. We may require that you provide the engine test cycle (not normalized) corresponding to a given powertrain for each of the specified duty cycles.

(b) If you choose to certify only fuel map emissions for an engine family and to not certify emissions over powertrain test cycles under 40 CFR 1037.550, we will not presume you are responsible for emissions over the powertrain cycles. However, where we determine that you are responsible in whole or in part for the emission exceedance in such cases, we may require that you participate in any recall of the affected vehicles. Note that this provision does not apply if you also hold the certificate of conformity for the vehicle.

Subpart H—Averaging, Banking, and Trading for Certification

§ 1036.701 General provisions.

(a) You may average, bank, and trade (ABT) emission credits for purposes of certification as described in this subpart and in subpart B of this part to show compliance with the standards of § 1036.108. Participation in this program is voluntary. (**Note:** As described in subpart B of this part, you must assign an FCL to all engine families, whether or not they participate in the ABT provisions of this subpart.)

(b) The definitions of subpart I of this part apply to this subpart. The following definitions also apply:

(1) *Actual emission credits* means emission credits you have generated that we have verified by reviewing your final report.

(2) *Averaging set* means a set of engines in which emission credits may be exchanged. Credits generated by one engine may only be used by other engines in the same averaging set. See § 1036.740.

(3) *Broker* means any entity that facilitates a trade of emission credits between a buyer and seller.

(4) *Buyer* means the entity that receives emission credits as a result of a trade.

(5) *Reserved emission credits* means emission credits you have generated that we have not yet verified by reviewing your final report.

(6) *Seller* means the entity that provides emission credits during a trade.

(7) *Standard* means the emission standard that applies under subpart B of this part for engines not participating in the ABT program of this subpart.

(8) *Trade* means to exchange emission credits, either as a buyer or seller.

(c) Emission credits may be exchanged only within an averaging set as specified in § 1036.740.

(d) You may not use emission credits generated under this subpart to offset any emissions that exceed an FCL or standard. This applies for all testing, including certification testing, in-use testing, selective enforcement audits, and other production-line testing. However, if emissions from an engine exceed an FCL or standard (for example, during a selective enforcement audit), you may use emission credits to recertify the engine family with a higher FCL that applies only to future production.

(e) You may use either of the following approaches to retire or forego emission credits:

(1) You may retire emission credits generated from any number of your engines. This may be considered donating emission credits to the environment. Identify any such credits in the reports described in § 1036.730. Engines must comply with the applicable FELs even if you donate or sell the corresponding emission credits under this paragraph (h). Those credits may no longer be used by anyone to demonstrate compliance with any EPA emission standards.

(2) You may certify an engine family using an FEL (FCL for CO_2) below the

emission standard as described in this part and choose not to generate emission credits for that family. If you do this, you do not need to calculate emission credits for those engine families and you do not need to submit or keep the associated records described in this subpart for that family.

(f) Emission credits may be used in the model year they are generated. Surplus emission credits may be banked for future model years. Surplus emission credits may sometimes be used for past model years, as described in § 1036.745.

(g) You may increase or decrease an FCL during the model year by amending your application for certification under § 1036.225. The new FCL may apply only to engines you have not already introduced into commerce.

(h) See § 1036.740 for special credit provisions that apply for greenhouse gas credits generated under 40 CFR 86.1819–14(k)(7) or § 1036.615 or 40 CFR 1037.615.

(i) Unless the regulations explicitly allow it, you may not calculate credits more than once for any emission reduction. For example, if you generate CO_2 emission credits for a hybrid engine under this part for a given vehicle, no one may generate CO_2 emission credits for that same hybrid engine and vehicle under 40 CFR part 1037. However, credits could be generated for identical vehicles using engines that did not generate credits under this part.

(j) You may use emission credits generated in one model year without adjustment for certifying vehicles in a later model year, even if emission standards are different.

(k) Engine families you certify with a nonconformance penalty under 40 CFR part 86, subpart L, may not generate emission credits.

§ 1036.705 Generating and calculating emission credits.

(a) The provisions of this section apply separately for calculating emission credits for each pollutant.

(b) For each participating family, calculate positive or negative emission credits relative to the otherwise applicable emission standard based on the engine family's FCL for greenhouse gases. If your engine family is certified to both the vocational and tractor engine standards, calculate credits separately for the vocational engines and the tractor engines (as specified in paragraph (b)(3) of this section). Calculate positive emission credits for a family that has an FCL below the standard. Calculate negative emission credits for a family that has an FCL above the standard. Sum your positive and negative credits for the model year before rounding. Round the sum of emission credits to the nearest megagram (Mg), using consistent units throughout the following equations:

(1) For vocational engines:

$$\text{Emission credits (Mg)} = (\text{Std}-\text{FCL}) \cdot (\text{CF}) \cdot (\text{Volume}) \cdot (\text{UL}) \cdot (10^{-6})$$

Where:

Std = the emission standard, in g/hp-hr, that applies under subpart B of this part for engines not participating in the ABT program of this subpart (the "otherwise applicable standard").

FCL = the Family Certification Level for the engine family, in g/hp-hr, measured over the transient duty cycle, rounded to the same number of decimal places as the emission standard.

CF = a transient cycle conversion factor (hp-hr/mile), calculated by dividing the total (integrated) horsepower-hour over the duty cycle (average of vocational engine configurations weighted by their production volumes) by 6.3 miles for spark-ignition engines and 6.5 miles for compression-ignition engines. This represents the average work performed by vocational engines in the family over the mileage represented by operation over the duty cycle.

Volume = the number of vocational engines eligible to participate in the averaging, banking, and trading program within the given engine family during the model year, as described in paragraph (c) of this section.

UL = the useful life for the given engine family, in miles.

(2) For tractor engines:

$$\text{Emission credits (Mg)} = (\text{Std}-\text{FCL}) \cdot (\text{CF}) \cdot (\text{Volume}) \cdot (\text{UL}) \cdot (10^{-6})$$

Where:

Std = the emission standard, in g/hp-hr, that applies under subpart B of this part for engines not participating in the ABT program of this subpart (the "otherwise applicable standard").

FCL = the Family Certification Level for the engine family, in g/hp-hr, measured over the ramped-modal cycle rounded to the same number of decimal places as the emission standard.

CF = a transient cycle conversion factor (hp-hr/mile), calculated by dividing the total (integrated) horsepower-hour over the duty cycle (average of tractor-engine configurations weighted by their production volumes) by 6.3 miles for spark-ignition engines and 6.5 miles for compression-ignition engines. This represents the average work performed by tractor engines in the family over the mileage represented by operation over the duty cycle. Note that this calculation requires you to use the transient cycle conversion factor even for engines certified to standards based on the ramped-modal cycle.

Volume = the number of tractor engines eligible to participate in the averaging, banking, and trading program within the given engine family during the model year, as described in paragraph (c) of this section.

UL = the useful life for the given engine family, in miles.

(3) For engine families certified to both the vocational and tractor engine standards, we may allow you to use statistical methods to estimate the total production volumes where a small fraction of the engines cannot be tracked precisely.

(4) You may not generate emission credits for tractor engines (*i.e.,* engines not certified to the transient cycle for CO_2) installed in vocational vehicles (including vocational tractors certified pursuant to 40 CFR 1037.630 or exempted pursuant to 40 CFR 1037.631). We will waive this requirement where you demonstrate that less than five percent of the engines in your tractor family were installed in vocational vehicles. For example, if you know that 96 percent of your tractor engines were installed in non-vocational tractors, but cannot determine the vehicle type for the remaining four percent, you may generate credits for all the engines in the family.

(c) As described in § 1036.730, compliance with the requirements of this subpart is determined at the end of the model year based on actual U.S.-directed production volumes. Keep appropriate records to document these production volumes. Do not include any of the following engines to calculate emission credits:

(1) Engines that you do not certify to the CO_2 standards of this part because they are permanently exempted under subpart G of this part or under 40 CFR part 1068.

(2) Exported engines.

(3) Engines not subject to the requirements of this part, such as those excluded under § 1036.5. For example, do not include engines used in vehicles certified to the greenhouse gas standards of 40 CFR 86.1819.

(4) Any other engines if we indicate elsewhere in this part 1036 that they are not to be included in the calculations of this subpart.

(d) You may use CO_2 emission credits to show compliance with CH_4 and/or N_2O FELs instead of the otherwise applicable emission standards. To do this, calculate the CH_4 and/or N_2O emission credits needed (negative credits) using the equation in paragraph (b) of this section, using the FEL(s) you specify for your engines during certification instead of the FCL. You must use 25 Mg of positive CO_2 credits to offset 1 Mg of negative CH_4 credits. You must use 298 Mg of positive CO_2 credits to offset 1 Mg of negative N_2O credits.

§ 1036.710 Averaging.

(a) Averaging is the exchange of emission credits among your engine families. You may average emission credits only within the same averaging set.

(b) You may certify one or more engine families to an FCL above the applicable standard, subject to any applicable FEL caps and other the provisions in subpart B of this part, if you show in your application for certification that your projected balance of all emission-credit transactions in that model year is greater than or equal to zero, or that a negative balance is allowed under § 1036.745.

(c) If you certify an engine family to an FCL that exceeds the otherwise applicable standard, you must obtain enough emission credits to offset the engine family's deficit by the due date for the final report required in § 1036.730. The emission credits used to address the deficit may come from your other engine families that generate emission credits in the same model year (or from later model years as specified in § 1036.745), from emission credits you have banked, or from emission credits you obtain through trading.

§ 1036.715 Banking.

(a) Banking is the retention of surplus emission credits by the manufacturer generating the emission credits for use in future model years for averaging or trading.

(b) You may designate any emission credits you plan to bank in the reports you submit under § 1036.730 as reserved credits. During the model year and before the due date for the final report, you may designate your reserved emission credits for averaging or trading.

(c) Reserved credits become actual emission credits when you submit your final report. However, we may revoke these emission credits if we are unable to verify them after reviewing your reports or auditing your records.

(d) Banked credits retain the designation of the averaging set in which they were generated.

§ 1036.720 Trading.

(a) Trading is the exchange of emission credits between manufacturers. You may use traded emission credits for averaging, banking, or further trading transactions. Traded emission credits remain subject to the averaging-set restrictions based on the averaging set in which they were generated.

(b) You may trade actual emission credits as described in this subpart. You may also trade reserved emission credits, but we may revoke these emission credits based on our review of your records or reports or those of the company with which you traded emission credits. You may trade banked credits within an averaging set to any certifying manufacturer.

(c) If a negative emission credit balance results from a transaction, both the buyer and seller are liable, except in cases we deem to involve fraud. See § 1036.255(e) for cases involving fraud. We may void the certificates of all engine families participating in a trade that results in a manufacturer having a negative balance of emission credits. See § 1036.745.

§ 1036.725 What must I include in my application for certification?

(a) You must declare in your application for certification your intent to use the provisions of this subpart for each engine family that will be certified using the ABT program. You must also declare the FELs/FCL you select for the engine family for each pollutant for which you are using the ABT program. Your FELs must comply with the specifications of subpart B of this part, including the FEL caps. FELs/FCLs must be expressed to the same number of decimal places as the applicable standards.

(b) Include the following in your application for certification:

(1) A statement that, to the best of your belief, you will not have a negative balance of emission credits for any averaging set when all emission credits are calculated at the end of the year; or a statement that you will have a negative balance of emission credits for one or more averaging sets, but that it is allowed under § 1036.745.

(2) Detailed calculations of projected emission credits (positive or negative) based on projected U.S.-directed production volumes. We may require you to include similar calculations from your other engine families to project your net credit balances for the model year. If you project negative emission credits for a family, state the source of positive emission credits you expect to use to offset the negative emission credits.

§ 1036.730 ABT reports.

(a) If any of your engine families are certified using the ABT provisions of this subpart, you must send a final report by March 31 following the end of the model year. You may ask us to extend the deadline for the final report to April 30.

(b) Your final report must include the following information for each engine family participating in the ABT program:

(1) Engine-family designation and averaging set.

(2) The emission standards that would otherwise apply to the engine family.

(3) The FCL for each pollutant. If you change the FCL after the start of production, identify the date that you started using the new FCL and/or give the engine identification number for the first engine covered by the new FCL. In this case, identify each applicable FCL and calculate the positive or negative emission credits as specified in § 1036.225.

(4) The projected and actual U.S.-directed production volumes for the model year. If you changed an FCL during the model year, identify the actual production volume associated with each FCL.

(5) The transient cycle conversion factor for each engine configuration as described in § 1036.705.

(6) Useful life.

(7) Calculated positive or negative emission credits for the whole engine family. Identify any emission credits that you traded, as described in paragraph (d)(1) of this section.

(c) Your final report must include the following additional information:

(1) Show that your net balance of emission credits from all your participating engine families in each averaging set in the applicable model year is not negative, except as allowed under § 1036.745. Your credit tracking must account for the limitation on credit life under § 1036.740(d).

(2) State whether you will reserve any emission credits for banking.

(3) State that the report's contents are accurate.

(d) If you trade emission credits, you must send us a report within 90 days after the transaction, as follows:

(1) As the seller, you must include the following information in your report:

(i) The corporate names of the buyer and any brokers.

(ii) A copy of any contracts related to the trade.

(iii) The engine families that generated emission credits for the trade, including the number of emission credits from each family.

(2) As the buyer, you must include the following information in your report:

(i) The corporate names of the seller and any brokers.

(ii) A copy of any contracts related to the trade.

(iii) How you intend to use the emission credits, including the number of emission credits you intend to apply to each engine family (if known).

(e) Send your reports electronically to the Designated Compliance Officer using an approved information format. If you want to use a different format, send us a written request with justification for a waiver.

(f) Correct errors in your final report as follows:

(1) If you or we determine before the due date for the final report that errors mistakenly decreased your balance of emission credits, you may correct the errors and recalculate the balance of emission credits. You may not make these corrections for errors that are determined after the due date for the final report. If you report a negative balance of emission credits, we may disallow corrections under this paragraph (f)(1).

(2) If you or we determine anytime that errors mistakenly increased your balance of emission credits, you must correct the errors and recalculate the balance of emission credits.

§ 1036.735 Recordkeeping.

(a) You must organize and maintain your records as described in this section. We may review your records at any time.

(b) Keep the records required by this section for at least eight years after the due date for the final report. You may not use emission credits for any engines if you do not keep all the records required under this section. You must therefore keep these records to continue to bank valid credits. Store these records in any format and on any media, as long as you can promptly send us organized, written records in English if we ask for them. You must keep these records readily available. We may review them at any time.

(c) Keep a copy of the reports we require in §§ 1036.725 and 1036.730.

(d) Keep records of the engine identification number (usually the serial number) for each engine you produce that generates or uses emission credits under the ABT program. You may identify these numbers as a range. If you change the FEL after the start of production, identify the date you started using each FCL and the range of engine identification numbers associated with each FCL. You must also identify the purchaser and destination for each engine you produce to the extent this information is available.

(e) We may require you to keep additional records or to send us relevant information not required by this section in accordance with the Clean Air Act.

§ 1036.740 Restrictions for using emission credits.

The following restrictions apply for using emission credits:

(a) *Averaging sets.* Except as specified in paragraph (c) of this section, emission credits may be exchanged only within the following averaging sets:

(1) Spark-ignition engines.

(2) Compression-ignition light heavy-duty engines.

(3) Compression-ignition medium heavy-duty engines.

(4) Compression-ignition heavy heavy-duty engines.

(b) *Applying credits to prior year deficits.* Where your credit balance for the previous year is negative, you may apply credits to that credit deficit only after meeting your credit obligations for the current year.

(c) *Credits from hybrid engines and other advanced technologies.* Credits you generate under § 1036.615 may be used for any of the averaging sets identified in paragraph (a) of this section; you may also use those credits to demonstrate compliance with the CO_2 emission standards in 40 CFR 86.1819 and 40 CFR part 1037. Similarly, you may use advanced-technology credits generated under 40 CFR 86.1819–14(k)(7) or 40 CFR 1037.615 to demonstrate compliance with the CO_2 standards in this part. In the case of spark-ignition engines and compression-ignition light heavy-duty engines, you may not use more than 60,000 Mg of credits from other averaging sets in any model year.

(1) The maximum amount of CO_2 credits you may bring into the following service class groups is 60,000 Mg per model year:

(i) Spark-ignition engines, light heavy-duty compression-ignition engines, and light heavy-duty vehicles. This group comprises the averaging sets listed in paragraphs (a)(1) and (2) of this section and the averaging set listed in 40 CFR 1037.740(a)(1).

(ii) Medium heavy-duty compression-ignition engines and medium heavy-duty vehicles. This group comprises the averaging sets listed in paragraph (a)(3) of this section and 40 CFR 1037.740(a)(2).

(iii) Heavy heavy-duty compression-ignition engines and heavy heavy-duty vehicles. This group comprises the averaging sets listed in paragraph (a)(4) of this section and 40 CFR 1037.740(a)(3).

(2) The limit specified in paragraph (c)(1) of this section does not limit the amount of advanced technology credits that can be used within a service class group if they were generated in that same service class group.

(d) *Credit life.* Credits may be used only for five model years after the year in which they are generated. For example, credits you generate in model year 2018 may be used to demonstrate compliance with emission standards only through model year 2023.

(e) *Other restrictions.* Other sections of this part specify additional restrictions for using emission credits under certain special provisions.

§ 1036.745 End-of-year CO_2 credit deficits.

Except as allowed by this section, we may void the certificate of any engine family certified to an FCL above the applicable standard for which you do not have sufficient credits by the deadline for submitting the final report.

(a) Your certificate for an engine family for which you do not have sufficient CO_2 credits will not be void if you remedy the deficit with surplus credits within three model years. For example, if you have a credit deficit of 500 Mg for an engine family at the end of model year 2015, you must generate (or otherwise obtain) a surplus of at least 500 Mg in that same averaging set by the end of model year 2018.

(b) You may not bank or trade away CO_2 credits in the averaging set in any model year in which you have a deficit.

(c) You may apply only surplus credits to your deficit. You may not apply credits to a deficit from an earlier model year if they were generated in a model year for which any of your engine families for that averaging set had an end-of-year credit deficit.

(d) If you do not remedy the deficit with surplus credits within three model years, we may void your certificate for that engine family. Note that voiding a certificate applies *ab initio.* Where the net deficit is less than the total amount of negative credits originally generated by the family, we will void the certificate only with respect to the number of engines needed to reach the amount of the net deficit. For example, if the original engine family generated 500 Mg of negative credits, and the manufacturer's net deficit after three years was 250 Mg, we would void the certificate with respect to half of the engines in the family.

(e) For purposes of calculating the statute of limitations, the following actions are all considered to occur at the expiration of the deadline for offsetting a deficit as specified in paragraph (a) of this section:

(1) Failing to meet the requirements of paragraph (a) of this section.

(2) Failing to satisfy the conditions upon which a certificate was issued relative to offsetting a deficit.

(3) Selling, offering for sale, introducing or delivering into U.S. commerce, or importing vehicles that are found not to be covered by a certificate as a result of failing to offset a deficit.

§ 1036.750 What can happen if I do not comply with the provisions of this subpart?

(a) For each engine family participating in the ABT program, the certificate of conformity is conditioned upon full compliance with the provisions of this subpart during and after the model year. You are responsible to establish to our satisfaction that you fully comply with applicable requirements. We may void the certificate of conformity for an engine family if you fail to comply with any provisions of this subpart.

(b) You may certify your engine family to an FCL above an applicable standard based on a projection that you will have enough emission credits to offset the deficit for the engine family. See § 1036.745 for provisions specifying what happens if you cannot show in your final report that you have enough actual emission credits to offset a deficit for any pollutant in an engine family.

(c) We may void the certificate of conformity for an engine family if you fail to keep records, send reports, or give us information we request. Note that failing to keep records, send reports, or give us information we request is also a violation of 42 U.S.C. 7522(a)(2).

(d) You may ask for a hearing if we void your certificate under this section (see § 1036.820).

§ 1036.755 Information provided to the Department of Transportation.

After receipt of each manufacturer's final report as specified in § 1036.730 and completion of any verification testing required to validate the manufacturer's submitted final data, we will issue a report to the Department of Transportation with CO_2 emission information and will verify the accuracy of each manufacturer's equivalent fuel consumption data that required by NHTSA under 49 CFR 535.8. We will send a report to DOT for each engine manufacturer based on each regulatory category and subcategory, including sufficient information for NHTSA to determine fuel consumption and associated credit values. See 49 CFR 535.8 to determine if NHTSA deems submission of this information to EPA to also be a submission to NHTSA.

Subpart I—Definitions and Other Reference Information

§ 1036.801 Definitions.

The following definitions apply to this part. The definitions apply to all subparts unless we note otherwise. All undefined terms have the meaning the Act gives to them. The definitions follow:

Act means the Clean Air Act, as amended, 42 U.S.C. 7401–7671q.

Adjustable parameter has the meaning given in 40 CFR part 86.

Advanced technology means technology certified under 40 CFR 86.1819–14(k)(7), § 1036.615, or 40 CFR 1037.615.

Aftertreatment means relating to a catalytic converter, particulate filter, or any other system, component, or technology mounted downstream of the exhaust valve (or exhaust port) whose design function is to decrease emissions in the engine exhaust before it is exhausted to the environment. Exhaust-gas recirculation (EGR) and turbochargers are not aftertreatment.

Aircraft means any vehicle capable of sustained air travel more than 100 feet above the ground.

Alcohol-fueled engine mean an engine that is designed to run using an alcohol fuel. For purposes of this definition, alcohol fuels do not include fuels with a nominal alcohol content below 25 percent by volume.

Auxiliary emission control device means any element of design that senses temperature, motive speed, engine rpm, transmission gear, or any other parameter for the purpose of activating, modulating, delaying, or deactivating the operation of any part of the emission control system.

Averaging set has the meaning given in § 1036.740.

Calibration means the set of specifications and tolerances specific to a particular design, version, or application of a component or assembly capable of functionally describing its operation over its working range.

Carryover means relating to certification based on emission data generated from an earlier model year as described in § 1036.235(d).

Certification means relating to the process of obtaining a certificate of conformity for an engine family that complies with the emission standards and requirements in this part.

Certified emission level means the highest deteriorated emission level in an engine family for a given pollutant from the applicable transient and/or steady-state testing, rounded to the same number of decimal places as the applicable standard. Note that you may have two certified emission levels for CO_2 if you certify a family for both vocational and tractor use.

Complete vehicle means a vehicle meeting the definition of complete vehicle in 40 CFR 1037.801 when it is first sold as a vehicle. For example, where a vehicle manufacturer sells an incomplete vehicle to a secondary manufacturer, the vehicle is not a complete vehicle under this part, even after its final assembly.

Compression-ignition means relating to a type of reciprocating, internal-combustion engine that is not a spark-ignition engine. Note that § 1036.1 also deems gas turbine engines and other engines to be compression-ignition engines. Note also that certain spark-ignition engines are subject to the requirements for compression-ignition engines.

Crankcase emissions means airborne substances emitted to the atmosphere from any part of the engine crankcase's ventilation or lubrication systems. The crankcase is the housing for the crankshaft and other related internal parts.

Criteria pollutants means emissions of NO_X, HC, PM, and CO. Note that these pollutants are also sometimes described collectively as ''non-greenhouse gas pollutants'', although they do not necessarily have negligible global warming potentials.

Designated Compliance Officer means one of the following:

(1) For compression-ignition engines, *Designated Compliance Officer* means Director, Diesel Engine Compliance Center, U.S. Environmental Protection Agency, 2000 Traverwood Drive, Ann Arbor, MI 48105; *complianceinfo@epa.gov; epa.gov/otaq/verify/*

(2) For spark-ignition engines, *Designated Compliance Officer* means Director, Gasoline Engine Compliance Center, U.S. Environmental Protection Agency, 2000 Traverwood Drive, Ann Arbor, MI 48105; *nonroad-si-cert@epa.gov; epa.gov/otaq/verify.*

Deteriorated emission level means the emission level that results from applying the appropriate deterioration factor to the official emission result of the emission-data engine. Note that where no deterioration factor applies, references in this part to the *deteriorated emission level* mean the official emission result.

Deterioration factor means the relationship between emissions at the end of useful life (or point of highest emissions if it occurs before the end of useful life) and emissions at the low-hour/low-mileage test point, expressed in one of the following ways:

(1) For multiplicative deterioration factors, the ratio of emissions at the end of useful life (or point of highest emissions) to emissions at the low-hour test point.

(2) For additive deterioration factors, the difference between emissions at the end of useful life (or point of highest emissions) and emissions at the low-hour test point.

Dual-fuel means relating to an engine designed for operation on two different types of fuel but not on a continuous mixture of those fuels (see § 1036.601(d). For purposes of this part, such an engine remains a dual-fuel engine even if it is designed for operation on three or more different fuels.

Emission control system means any device, system, or element of design that controls or reduces the emissions of regulated pollutants from an engine.

Emission-data engine means an engine that is tested for certification. This includes engines tested to establish deterioration factors.

Emission-related maintenance means maintenance that substantially affects emissions or is likely to substantially affect emission deterioration.

Engine configuration means a unique combination of engine hardware and calibration (related to the emission standards) within an engine family. Engines within a single engine configuration differ only with respect to normal production variability or factors unrelated to compliance with emission standards.

Engine family has the meaning given in § 1036.230.

Excluded means relating to engines that are not subject to some or all of the requirements of this part as follows:

(1) An engine that has been determined not to be a heavy-duty engine is excluded from this part.

(2) Certain heavy-duty engines are excluded from the requirements of this part under § 1036.5.

(3) Specific regulatory provisions of this part may exclude a heavy-duty engine generally subject to this part from one or more specific standards or requirements of this part.

Exempted has the meaning given in 40 CFR 1068.30.

Exhaust-gas recirculation means a technology that reduces emissions by routing exhaust gases that had been exhausted from the combustion chamber(s) back into the engine to be mixed with incoming air before or during combustion. The use of valve timing to increase the amount of residual exhaust gas in the combustion chamber(s) that is mixed with incoming air before or during combustion is not considered exhaust-gas recirculation for the purposes of this part.

Family certification level (FCL) means a CO_2 emission level declared by the manufacturer that is at or above emission test results for all emission-data engines. The FCL serves as the emission standard for the engine family with respect to certification testing if it is different than the otherwise applicable standard. The FCL must be expressed to the same number of decimal places as the emission standard it replaces.

Family emission limit (FEL) means an emission level declared by the manufacturer to serve in place of an otherwise applicable emission standard (other than CO_2 standards) under the ABT program in subpart H of this part. The FEL must be expressed to the same number of decimal places as the emission standard it replaces. The FEL serves as the emission standard for the engine family with respect to all required testing except certification testing for CO_2. The CO_2 FEL is equal to the CO_2 FCL multiplied by 1.03 and rounded to the same number of decimal places as the standard (*e.g.,* the nearest whole g/hp-hr for the 2016 CO_2 standards).

Flexible-fuel means relating to an engine designed for operation on any mixture of two or more different types of fuels (see § 1036.601(d).

Fuel type means a general category of fuels such as diesel fuel, gasoline, or natural gas. There can be multiple grades within a single fuel type, such as premium gasoline, regular gasoline, or gasoline with 10 percent ethanol.

Good engineering judgment has the meaning given in 40 CFR 1068.30. See 40 CFR 1068.5 for the administrative process we use to evaluate good engineering judgment.

Greenhouse gas means one or more compounds regulated under this part based primarily on their impact on the climate. This generally includes CO_2, CH_4, and N_2O.

Greenhouse gas emissions model (GEM) means the GEM simulation tool described in 40 CFR 1037.520. Note that an updated version of GEM applies starting in model year 2021 (see 40 CFR 1037.810).

Gross vehicle weight rating (GVWR) means the value specified by the vehicle manufacturer as the maximum design loaded weight of a single vehicle, consistent with good engineering judgment.

Heavy-duty engine means any engine which the engine manufacturer could reasonably expect to be used for motive power in a heavy-duty vehicle. For purposes of this definition in this part, the term ''engine'' includes internal combustion engines and other devices that convert chemical fuel into motive power. For example, a fuel cell or a gas turbine used in a heavy-duty vehicle is a heavy-duty engine.

Heavy-duty vehicle means any motor vehicle above 8,500 pounds GVWR or that has a vehicle curb weight above 6,000 pounds or that has a basic vehicle frontal area greater than 45 square feet. *Curb weight* has the meaning given in 40 CFR 86.1803. *Basic vehicle frontal area* has the meaning given in 40 CFR 86.1803.

Hybrid means relating to an engine or powertrain that includes energy storage features other than a conventional battery system or conventional flywheel. Supplemental electrical batteries and hydraulic accumulators are examples of hybrid energy storage systems. Note that certain provisions in this part treat hybrid engines and powertrains intended for vehicles that include regenerative braking different than those intended for vehicles that do not include regenerative braking.

Hydrocarbon (HC) means the hydrocarbon group on which the emission standards are based for each fuel type. For alcohol-fueled engines, HC means nonmethane hydrocarbon equivalent (NMHCE). For all other engines, HC means nonmethane hydrocarbon (NMHC).

Identification number means a unique specification (for example, a model number/serial number combination) that allows someone to distinguish a particular engine from other similar engines.

Incomplete vehicle means a vehicle meeting the definition of incomplete vehicle in 40 CFR 1037.801 when it is first sold as a vehicle.

Innovative technology means technology certified under § 1036.610.

Liquefied petroleum gas (LPG) means a liquid hydrocarbon fuel that is stored under pressure and is composed primarily of nonmethane compounds that are gases at atmospheric conditions. Note that, although this commercial term includes the word ''petroleum'', LPG is not considered to be a petroleum fuel under the definitions of this section.

Low-hour means relating to an engine that has stabilized emissions and represents the undeteriorated emission level. This would generally involve less than 125 hours of operation.

Manufacture means the physical and engineering process of designing, constructing, and/or assembling a heavy-duty engine or a heavy-duty vehicle.

Manufacturer has the meaning given in section 216(1) of the Act. In general, this term includes any person who manufactures or assembles an engine, vehicle, or piece of equipment for sale in the United States or otherwise introduces a new engine into commerce in the United States. This includes importers who import engines or vehicles for resale.

Medium-duty passenger vehicle has the meaning given in 40 CFR 86.1803.

Model year means the manufacturer's annual new model production period, except as restricted under this definition. It must include January 1 of the calendar year for which the model year is named, may not begin before January 2 of the previous calendar year, and it must end by December 31 of the named calendar year. Manufacturers may not adjust model years to circumvent or delay compliance with emission standards or to avoid the obligation to certify annually.

Motor vehicle has the meaning given in 40 CFR 85.1703.

Natural gas means a fuel whose primary constituent is methane.

New motor vehicle engine has the meaning given in the Act. This generally means a motor vehicle engine meeting the criteria of either paragraph (1), (2), or (3) of this definition.

(1) A motor vehicle engine for which the ultimate purchaser has never received the equitable or legal title is a n*ew motor vehicle engine*. This kind of engine might commonly be thought of as ''brand new'' although a *new motor vehicle engine* may include previously used parts. Under this definition, the engine is new from the time it is produced until the ultimate purchaser receives the title or places it into service, whichever comes first.

(2) An imported motor vehicle engine is a *new motor vehicle engine* if it was originally built on or after January 1, 1970.

(3) Any motor vehicle engine installed in a new motor vehicle.

Noncompliant engine means an engine that was originally covered by a certificate of conformity, but is not in the certified configuration or otherwise does not comply with the conditions of the certificate.

Nonconforming engine means an engine not covered by a certificate of conformity that would otherwise be subject to emission standards.

Nonmethane hydrocarbon (NMHC) means the sum of all hydrocarbon species except methane, as measured according to 40 CFR part 1065.

Nonmethane hydrocarbon equivalent has the meaning given in 40 CFR 1065.1001.

Off-cycle technology means technology certified under § 1036.610.

Official emission result means the measured emission rate for an emission-data engine on a given duty cycle before the application of any deterioration factor, but after the applicability of any required regeneration or other adjustment factors.

Owners manual means a document or collection of documents prepared by the engine or vehicle manufacturer for the owner or operator to describe appropriate engine maintenance, applicable warranties, and any other information related to operating or keeping the engine. The owners manual is typically provided to the ultimate purchaser at the time of sale.

Oxides of nitrogen has the meaning given in 40 CFR 1065.1001.

Percent has the meaning given in 40 CFR 1065.1001. Note that this means percentages identified in this part are assumed to be infinitely precise without regard to the number of significant figures. For example, one percent of 1,493 is 14.93.

Petroleum means gasoline or diesel fuel or other fuels normally derived from crude oil. This does not include methane or LPG.

Placed into service means put into initial use for its intended purpose, excluding incidental use by the manufacturer or a dealer.

Preliminary approval means approval granted by an authorized EPA representative prior to submission of an application for certification, consistent with the provisions of § 1036.210.

Primary intended service class has the meaning given in § 1036.140.

Rechargeable Energy Storage System (RESS) means the component(s) of a hybrid engine or vehicle that store recovered energy for later use, such as the battery system in an electric hybrid vehicle.

Revoke has the meaning given in 40 CFR 1068.30.

Round has the meaning given in 40 CFR 1065.1001.

Scheduled maintenance means adjusting, repairing, removing, disassembling, cleaning, or replacing components or systems periodically to keep a part or system from failing, malfunctioning, or wearing prematurely. It also may mean actions you expect are necessary to correct an overt indication of failure or malfunction for which periodic maintenance is not appropriate.

Small manufacturer means a manufacturer meeting the criteria specified in 13 CFR 121.201. The employee and revenue limits apply to the total number of employees and total revenue together for affiliated companies. Note that manufacturers with low production volumes may or may not be ''small manufacturers''.

Spark-ignition means relating to a gasoline-fueled engine or any other type of engine with a spark plug (or other sparking device) and with operating characteristics significantly similar to the theoretical Otto combustion cycle. Spark-ignition engines usually use a throttle to regulate intake air flow to control power during normal operation. Note that some spark-ignition engines are subject to requirements that apply for compression-ignition engines as described in § 1036.140.

Steady-state has the meaning given in 40 CFR 1065.1001.

Suspend has the meaning given in 40 CFR 1068.30.

Test engine means an engine in a test sample.

Test sample means the collection of engines selected from the population of an engine family for emission testing. This may include testing for certification, production-line testing, or in-use testing.

Tractor means a vehicle meeting the definition of ''tractor'' in 40 CFR 1037.801, but not classified as a ''vocational tractor'' under 40 CFR 1037.630, or relating to such a vehicle.

Tractor engine means an engine certified for use in tractors. Where an engine family is certified for use in both tractors and vocational vehicles, ''tractor engine'' means an engine that the engine manufacturer reasonably believes will be (or has been) installed in a tractor. Note that the provisions of this part may require a manufacturer to document how it determines that an engine is a tractor engine.

Ultimate purchaser means, with respect to any new engine or vehicle, the first person who in good faith purchases such new engine or vehicle for purposes other than resale.

United States has the meaning given in 40 CFR 1068.30.

Upcoming model year means for an engine family the model year after the one currently in production.

U.S.-directed production volume means the number of engines, subject to the requirements of this part, produced by a manufacturer for which the manufacturer has a reasonable assurance that sale was or will be made to ultimate purchasers in the United States. This does not include engines certified to state emission standards that are different than the emission standards in this part.

Vehicle has the meaning given in 40 CFR 1037.801.

Vocational engine means an engine certified for use in vocational vehicles. Where an engine family is certified for use in both tractors and vocational vehicles, ''vocational engine'' means an engine that the engine manufacturer reasonably believes will be (or has been) installed in a vocational vehicle. Note that the provisions of this part may require a manufacturer to document how it determines that an engine is a vocational engine.

Vocational vehicle means a vehicle meeting the definition of ''vocational'' vehicle in 40 CFR 1037.801.

Void has the meaning given in 40 CFR 1068.30.

We (us, our) means the Administrator of the Environmental Protection Agency and any authorized representatives.

§ 1036.805 Symbols, abbreviations, and acronyms.

The procedures in this part generally follow either the International System of Units (SI) or the United States customary units, as detailed in NIST Special Publication 811, which we incorporate by reference in § 1036.810. See 40 CFR 1065.20 for specific provisions related to these conventions. This section summarizes the way we use symbols, units of measure, and other abbreviations.

(a) *Symbols for chemical species.* This part uses the following symbols for chemical species and exhaust constituents:

Symbol	Species
C	carbon.
CH_4	methane.
CH_4N_2O	urea.
CO	carbon monoxide.
CO_2	carbon dioxide.
H_2O	water.
HC	hydrocarbon.
NMHC	nonmethane hydrocarbon.
NMHCE	nonmethane hydrocarbon equivalent.
NO	nitric oxide.
NO_2	nitrogen dioxide.
NO_X	oxides of nitrogen.
N_2O	nitrous oxide.
PM	particulate matter.
THC	total hydrocarbon.
THCE	total hydrocarbon equivalent.

(b) *Symbols for quantities.* This part uses the following symbols and units of measure for various quantities:

Symbol	Quantity	Unit	Unit symbol	Unit in terms of SI base units
α	atomic hydrogen-to-carbon ratio	mole per mole	mol/mol	1
β	atomic oxygen-to-carbon ratio	mole per mole	mol/mol	1
e	mass weighted emission result	grams/ton-mile	g/ton-mi	g/kg-km
E_m	mass-specific net energy content	megajoules/kilogram	MJ/kg	$m^2 \cdot s^{-2}$
f_n	angular speed (shaft)	revolutions per minute	r/min	$\pi \cdot 30 \cdot s^{-1}$
m	mass	pound mass or kilogram	lbm or kg	kg
M	molar mass	gram per mole	g/mol	$10^{-3} \cdot kg \cdot mol^{-1}$
MF	mass fraction			
P	power	kilowatt	kW	$10^3 \cdot m^2 \cdot kg \cdot s^{-3}$
T	torque (moment of force)	newton meter	N·m	$m^2 \cdot kg \cdot s^{-2}$
W	work	kilowatt-hour	kW·hr	$3.6 \cdot m^2 \cdot kg \cdot s^{-1}$
w_C	carbon mass fraction	gram/gram	g/g	1
x	amount of substance mole fraction	mole per mole	mol/mol	1
x_b	brake energy fraction			
x_{bl}	brake energy limit			

(c) *Superscripts.* This part uses the following superscripts to define a quantity:

Superscript	Quantity
overbar (such as $\bar{y}$)	arithmetic mean.
overdot (such as $\dot{y}$)	quantity per unit time.

(d) *Subscripts.* This part uses the following subscripts to define a quantity:

Subscript	Quantity
acc	accessory.
Ccombdry	carbon from fuel per mole of dry exhaust.
CO2urea	CO_2 from urea decomposition.
cor	corrected.
cycle	test cycle.
exh	raw exhaust.
fuel	fuel.
H2Oexhaustdry	H_2O in exhaust per mole of exhaust.
idle	idle.
max	maximum.
mapped	mapped.
meas	measured quantity.
neg	negative.
mapped	mapped.
pos	positive.
ref	reference quantity.
stall	stall.
test	test.

(e) *Other acronyms and abbreviations.* This part uses the following additional abbreviations and acronyms:

ABT	averaging, banking, and trading.
AECD	auxiliary emission control device.
ASTM	American Society for Testing and Materials.
BTU	British thermal units.
CFR	Code of Federal Regulations.
DF	deterioration factor.
DOT	Department of Transportation.
E85	gasoline blend including nominally 85 percent denatured ethanol.
EPA	Environmental Protection Agency.
FCL	Family Certification Level.
FEL	Family Emission Limit.
GEM	Greenhouse gas Emissions Model.
g/hp-hr	grams per brake horsepower-hour.
GVWR	gross vehicle weight rating.
LPG	liquefied petroleum gas.
NARA	National Archives and Records Administration.
NHTSA	National Highway Traffic Safety Administration.
NTE	not-to-exceed.
RESS	rechargeable energy storage system.
RMC	ramped-modal cycle.
rpm	revolutions per minute.
SCR	Selective catalytic reduction.
U.S	United States.
U.S.C	United States Code.

(f) *Prefixes.* This part uses the following prefixes to define a quantity:

Symbol	Quantity	Value
µ	micro	10^{6}
m	milli	10^{-3}
c	centi	10^{-2}
k	kilo	10^3
M	mega	10^6

§ 1036.810 Incorporation by reference.

(a) Certain material is incorporated by reference into this part with the approval of the Director of the Federal Register under 5 U.S.C. 552(a) and 1 CFR part 51. To enforce any edition other than that specified in this section, the Environmental Protection Agency must publish a notice of the change in the **Federal Register** and the material must be available to the public. All approved material is available for inspection at U.S. EPA, Air and Radiation Docket and Information Center, 1301 Constitution Ave. NW., Room B102, EPA West Building, Washington, DC 20460, (202) 202–1744, and is available from the sources listed below. It is also available for inspection at the National Archives and Records Administration (NARA). For information on the availability of this material at NARA, call 202–741–6030, or go to *http://www.archives.gov/federal_register/code_of_federal_regulations/ibr_locations.html.*

(b) American Society for Testing and Materials, 100 Barr Harbor Drive, P.O. Box C700, West Conshohocken, PA 19428–2959, (610) 832–9585, *http://www.astm.org/.*

(1) ASTM D240–14 Standard Test Method for Heat of Combustion of Liquid Hydrocarbon Fuels by Bomb Calorimeter, approved October 1, 2014, (''ASTM D240''), IBR approved for § 1036.530(b).

(2) ASTM D4809–13 Standard Test Method for Heat of Combustion of Liquid Hydrocarbon Fuels by Bomb Calorimeter (Precision Method), approved May 1, 2013, (''ASTM D4809''), IBR approved for § 1036.530(b).

(c) National Institute of Standards and Technology, 100 Bureau Drive, Stop 1070, Gaithersburg, MD 20899–1070, (301) 975–6478, or *www.nist.gov.*

(1) NIST Special Publication 811, 2008 Edition, Guide for the Use of the International System of Units (SI), March 2008, IBR approved for § 1036.805.

(2) [Reserved]

§ 1036.815 Confidential information.

The provisions of 40 CFR 1068.10 apply for information you consider confidential.

§ 1036.820 Requesting a hearing.

(a) You may request a hearing under certain circumstances, as described elsewhere in this part. To do this, you must file a written request, including a description of your objection and any supporting data, within 30 days after we make a decision.

(b) For a hearing you request under the provisions of this part, we will approve your request if we find that your request raises a substantial factual issue.

(c) If we agree to hold a hearing, we will use the procedures specified in 40 CFR part 1068, subpart G.

§ 1036.825 Reporting and recordkeeping requirements.

(a) This part includes various requirements to submit and record data or other information. Unless we specify otherwise, store required records in any format and on any media and keep them readily available for eight years after you send an associated application for certification, or eight years after you generate the data if they do not support an application for certification. You are expected to keep your own copy of required records rather than relying on someone else to keep records on your behalf. We may review these records at any time. You must promptly send us organized, written records in English if we ask for them. We may require you to submit written records in an electronic format.

(b) The regulations in § 1036.255 and 40 CFR 1068.25 and 1068.101 describe your obligation to report truthful and complete information. This includes information not related to certification. Failing to properly report information and keep the records we specify violates 40 CFR 1068.101(a)(2), which may involve civil or criminal penalties.

(c) Send all reports and requests for approval to the Designated Compliance Officer (see § 1036.801).

(d) Any written information we require you to send to or receive from another company is deemed to be a required record under this section. Such records are also deemed to be submissions to EPA. Keep these records for eight years unless the regulations specify a different period. We may require you to send us these records whether or not you are a certificate holder.

(e) Under the Paperwork Reduction Act (44 U.S.C. 3501 *et seq.*), the Office of Management and Budget approves the reporting and recordkeeping specified in the applicable regulations. The following items illustrate the kind of reporting and recordkeeping we require for engines and vehicles regulated under this part:

(1) We specify the following requirements related to engine certification in this part 1036:

(i) In § 1036.135 we require engine manufacturers to keep certain records related to duplicate labels sent to vehicle manufacturers.

(ii) In subpart C of this part we identify a wide range of information required to certify engines.

(iii) In subpart G of this part we identify several reporting and recordkeeping items for making demonstrations and getting approval related to various special compliance provisions.

(iv) In §§ 1036.725, 1036.730, and 1036.735 we specify certain records related to averaging, banking, and trading.

(2) We specify the following requirements related to testing in 40 CFR part 1065:

(i) In 40 CFR 1065.2 we give an overview of principles for reporting information.

(ii) In 40 CFR 1065.10 and 1065.12 we specify information needs for establishing various changes to published test procedures.

(iii) In 40 CFR 1065.25 we establish basic guidelines for storing test information.

(iv) In 40 CFR 1065.695 we identify the specific information and data items to record when measuring emissions.

(3) We specify the following requirements related to the general compliance provisions in 40 CFR part 1068:

(i) In 40 CFR 1068.5 we establish a process for evaluating good engineering judgment related to testing and certification.

(ii) In 40 CFR 1068.25 we describe general provisions related to sending and keeping information.

(iii) In 40 CFR 1068.27 we require manufacturers to make engines available for our testing or inspection if we make such a request.

(iv) In 40 CFR 1068.105 we require vehicle manufacturers to keep certain records related to duplicate labels from engine manufacturers.

(v) In 40 CFR 1068.120 we specify recordkeeping related to rebuilding engines.

(vi) In 40 CFR part 1068, subpart C, we identify several reporting and recordkeeping items for making demonstrations and getting approval related to various exemptions.

(vii) In 40 CFR part 1068, subpart D, we identify several reporting and recordkeeping items for making demonstrations and getting approval related to importing engines.

(viii) In 40 CFR 1068.450 and 1068.455 we specify certain records related to testing production-line engines in a selective enforcement audit.

(ix) In 40 CFR 1068.501 we specify certain records related to investigating and reporting emission-related defects.

(x) In 40 CFR 1068.525 and 1068.530 we specify certain records related to recalling nonconforming engines.

■ 116. Part 1037 is revised to read as follows:

PART 1037—CONTROL OF EMISSIONS FROM NEW HEAVY–DUTY MOTOR VEHICLES

Authority: 42 U.S.C. 7401–7671q.

Subpart A—Overview and Applicability

§ 1037.1 Applicability.

(a) This part contains standards and other regulations applicable to the emission of the air pollutant defined as the aggregate group of six greenhouse gases: Carbon dioxide, nitrous oxide, methane, hydrofluorocarbons, perflurocarbons, and sulfur hexafluoride. The regulations in this part 1037 apply for all new heavy-duty vehicles, except as provided in §§ 1037.5 and 1037.104. This includes electric vehicles and vehicles fueled by conventional and alternative fuels. This also includes certain trailers as described in §§ 1037.5, 1037.150, and 1037.801.

(b) The provisions of this part apply for alternative fuel conversions as specified in 40 CFR part 85, subpart F.

§ 1037.2 Who is responsible for compliance?

The regulations in this part 1037 contain provisions that affect both vehicle manufacturers and others. However, the requirements of this part are generally addressed to the vehicle manufacturer(s). The term ''you'' generally means the vehicle manufacturer(s), especially for issues related to certification. Additional requirements and prohibitions apply to other persons as specified in § 1037.601 and 40 CFR part 1068.

§ 1037.5 Excluded vehicles.

Except for the definitions specified in § 1037.801, this part does not apply to the following vehicles:

(a) Vehicles not meeting the definition of ''motor vehicle'' in § 1037.801.

(b) Vehicles excluded from the definition of ''heavy-duty vehicle'' in § 1037.801 because of vehicle weight, weight rating, and frontal area (such as light-duty vehicles and light-duty trucks).

(c) Vehicles produced in model years before 2014, unless they are certified under § 1037.150.

(d) Medium-duty passenger vehicles and other vehicles subject to the light-duty greenhouse gas standards of 40 CFR part 86. See 40 CFR 86.1818 for greenhouse gas standards that apply for these vehicles. An example of such a vehicle would be a vehicle meeting the definition of ''heavy-duty vehicle'' in § 1037.801 and 40 CFR 86.1803, but also meeting the definition of ''light truck'' in 40 CFR 86.1818–12(b)(2).

(e) Vehicles subject to the heavy-duty greenhouse gas standards of 40 CFR part 86. See 40 CFR 86.1819 for greenhouse gas standards that apply for these vehicles. This generally applies for complete heavy-duty vehicles at or below 14,000 pounds GVWR.

(f) Aircraft meeting the definition of ''motor vehicle''. For example, this would include certain convertible aircraft that can be adjusted to operate on public roads. Standards apply separately to certain aircraft engines, as described in 40 CFR part 87.

(g) Trailers meeting one or more of the following characteristics:

(1) Trailers designed specifically for in-field operations in logging or mining.

(2) Trailers designed to operate at low speeds such that they are unsuitable for normal highway operation.

(3) Trailers with permanently affixed components designed for heavy construction that allow the trailer to perform its primary function while stationary. This would include crane trailers and concrete trailers. Trailers would not qualify under this paragraph (g)(3) based on welding equipment or other components that are commonly used separate from trailers.

(4) Trailers less than 35 feet long with three axles, and all trailers with four or more axles.

(5) Trailers intended for temporary or permanent residence, office space, or other work space, such as campers, mobile homes, and carnival trailers.

(6) Trailers designed specifically to transport livestock.

(7) Trailers built before January 1, 2018.

(8) Note that the definition of trailer in § 1037.801 excludes equipment that serves similar purposes but are not intended to be pulled by a tractor. For example, car-hauling equipment does not qualify as a trailer under this part if it is designed to be pulled by a heavy-duty vehicle with a pintle hook or hitch instead of a fifth wheel.

(h) Where it is unclear, you may ask us to make a determination regarding the exclusions identified in this section. We recommend that you make your request before you produce the vehicle.

§ 1037.10 How is this part organized?

This part 1037 is divided into the following subparts:

(a) Subpart A of this part defines the applicability of part 1037 and gives an overview of regulatory requirements.

(b) Subpart B of this part describes the emission standards and other requirements that must be met to certify vehicles under this part. Note that § 1037.150 discusses certain interim requirements and compliance provisions that apply only for a limited time.

(c) Subpart C of this part describes how to apply for a certificate of conformity for vehicles subject to the standards of § 1037.105 or § 1037.106.

(d) [Reserved]

(e) Subpart E of this part addresses testing of in-use vehicles.

(f) Subpart F of this part describes how to test your vehicles and perform emission modeling (including references to other parts of the Code of Federal Regulations) for vehicles subject to the standards of § 1037.105 or § 1037.106.

(g) Subpart G of this part and 40 CFR part 1068 describe requirements, prohibitions, and other provisions that apply to manufacturers, owners, operators, rebuilders, and all others. Section 1037.601 describes how 40 CFR part 1068 applies for heavy-duty vehicles.

(h) Subpart H of this part describes how you may generate and use emission credits to certify vehicles that are subject to the standards of § 1037.105 or § 1037.106.

(i) Subpart I of this part contains definitions and other reference information.

§ 1037.15 Do any other regulation parts apply to me?

(a) Parts 1065 and 1066 of this chapter describe procedures and equipment specifications for testing engines and vehicles to measure exhaust emissions. Subpart F of this part 1037 describes how to apply the provisions of part 1065 and part 1066 of this chapter to determine whether vehicles meet the exhaust emission standards in this part.

(b) As described in § 1037.601, certain requirements and prohibitions of part 1068 of this chapter apply to everyone, including anyone who manufactures, imports, installs, owns, operates, or rebuilds any of the vehicles subject to this part 1037. Part 1068 of this chapter describes general provisions that apply broadly, but do not necessarily apply for all vehicles or all persons. The issues addressed by these provisions include these seven areas:

(1) Prohibited acts and penalties for manufacturers and others.

(2) Rebuilding and other aftermarket changes.

(3) Exclusions and exemptions for certain vehicles.

(4) Importing vehicles.

(5) Selective enforcement audits of your production.

(6) Recall.

(7) Procedures for hearings.

(c) [Reserved]

(d) Other parts of this chapter apply if referenced in this part.

§ 1037.30 Submission of information.

Unless we specify otherwise, send all reports and requests for approval to the Designated Compliance Officer (see § 1037.801). See § 1037.825 for additional reporting and recordkeeping provisions.

Subpart B—Emission Standards and Related Requirements

§ 1037.101 Overview of emission standards for heavy-duty vehicles.

(a) This part specifies emission standards for certain vehicles and for certain pollutants. This part contains standards and other regulations applicable to the emission of the air pollutant defined as the aggregate group of six greenhouse gases: Carbon dioxide, nitrous oxide, methane, hydrofluorocarbons, perflurocarbons, and sulfur hexafluoride.

(b) The regulated emissions are addressed in four groups:

(1) *Exhaust emissions of NO_X, HC, PM, and CO.* These pollutants are sometimes described collectively as ''criteria pollutants'' because they are either criteria pollutants under the Clean Air Act or precursors to the criteria pollutant ozone. These pollutants are also sometimes described collectively as ''non-greenhouse gas pollutants'', although they do not necessarily have negligible global warming potential. As described in § 1037.102, standards for these pollutants are provided in 40 CFR part 86.

(2) *Exhaust emissions of CO_2, CH_4, and N_2O.* These pollutants are described collectively in this part as ''greenhouse gas pollutants'' because they are regulated primarily based on their impact on the climate. These standards are provided in §§ 1037.105 through 1037.107.

(3) *Hydrofluorocarbons.* These pollutants are also ''greenhouse gas pollutants'' but are treated separately from exhaust greenhouse gas pollutants

listed in paragraph (b)(2) of this section. These standards are provided in § 1037.115.

(4) *Fuel evaporative emissions.* These requirements are described in § 1037.103.

(c) The regulated heavy-duty vehicles are addressed in different groups as follows:

(1) For criteria pollutants, vocational vehicles and tractors are regulated based on gross vehicle weight rating (GVWR), whether they are considered ''spark-ignition'' or ''compression-ignition,'' and whether they are first sold as complete or incomplete vehicles.

(2) For greenhouse gas pollutants, vehicles are regulated in the following groups:

(i) Tractors above 26,000 pounds GVWR.

(ii) Trailers are subject to standards as specified in § 1037.107.

(iii) All other motor vehicles subject to standards under this part. These other vehicles are referred to as ''vocational'' vehicles.

(iv) The greenhouse gas emission standards in some cases apply differently for ''spark-ignition'' and ''compression-ignition'' engines or vehicles. Engine requirements are similarly differentiated, as described in 40 CFR 1036.140. References in this part 1037 to ''spark-ignition'' or ''compression-ignition'' defer to the application of standards under 40 CFR 1036.140. For example, any vehicle with an engine certified to spark-ignition standards under 40 CFR part 1036 is subject to requirements under this part 1037 that apply for spark-ignition vehicles.

(3) For evaporative and refueling emissions, vehicles are regulated based on the type of fuel they use. Vehicles fueled with volatile liquid fuels or gaseous fuels are subject to evaporative emission standards. Vehicles up to a certain size that are fueled with gasoline, diesel fuel, ethanol, methanol, or LPG are subject to refueling emission standards.

§ 1037.102 Exhaust emission standards for NO_X, HC, PM, and CO.

See 40 CFR part 86 for the exhaust emission standards for NO_X, HC, PM, and CO that apply for heavy-duty vehicles.

§ 1037.103 Evaporative and refueling emission standards.

(a) *Applicability.* Evaporative and refueling emission standards apply to heavy-duty vehicles as follows:

(1) Complete and incomplete heavy-duty vehicles at or below 14,000 pounds GVWR must meet evaporative and refueling emission standards as specified in 40 CFR part 86, subpart S, instead of the requirements specified in this section.

(2) Heavy-duty vehicles above 14,000 pounds GVWR that run on volatile liquid fuel (such as gasoline or ethanol) or gaseous fuel (such as natural gas or LPG) must meet evaporative and refueling emission standards as specified in this section.

(b) *Emission standards.* The evaporative and refueling emission standards and measurement procedures specified in 40 CFR 86.1813 apply for vehicles above 14,000 pounds GVWR, except as described in this section. The evaporative emission standards phase in over model years 2018 through 2022, with provisions allowing for voluntary compliance with the standards as early as model year 2015. Count vehicles subject to standards under this section the same as heavy-duty vehicles at or below 14,000 pounds GVWR to comply with the phase-in requirements specified in 40 CFR 86.1813. These vehicles may generate and use emission credits as described in 40 CFR part 86, subpart S, but only for vehicles that are tested for certification instead of relying on the provisions of paragraph (c) of this section. The following provisions apply instead of what is specified in 40 CFR 86.1813:

(1) The refueling standards in 40 CFR 86.1813–17(b) apply to complete vehicles starting in model year 2022; they are optional for incomplete vehicles.

(2) The leak standard in 40 CFR 86.1813–17(a)(4) does not apply.

(3) The FEL cap relative to the diurnal plus hot soak standard for low-altitude testing is 1.9 grams per test.

(4) The diurnal plus hot soak standard for high-altitude testing is 2.3 grams per test.

(5) Testing does not require measurement of exhaust emissions. Disregard references in subpart B of this part to procedures, equipment specifications, and recordkeeping related to measuring exhaust emissions. All references to the exhaust test under 40 CFR part 86, subpart B, are considered the ''dynamometer run'' as part of the evaporative testing sequence under this subpart.

(6) Vehicles not yet subject to the Tier 3 standards in 40 CFR 86.1813 must meet evaporative emission standards as specified in 40 CFR 86.008–10(b)(1) and (2) for Otto-cycle applications and 40 CFR 86.007–11(b)(3)(ii) and (b)(4)(ii) for diesel-cycle applications.

(c) *Compliance demonstration.* You may provide a statement in the application for certification that vehicles above 14,000 pounds GVWR comply with evaporative and refueling emission standards instead of submitting test data if you include an engineering analysis describing how vehicles include design parameters, equipment, operating controls, or other elements of design that adequately demonstrate that vehicles comply with the standards. We would expect emission control components and systems to exhibit a comparable degree of control relative to vehicles that comply based on testing. For example, vehicles that comply under this paragraph (c) should rely on comparable material specifications to limit fuel permeation, and components should be sized and calibrated to correspond with the appropriate fuel capacities, fuel flow rates, purge strategies, and other vehicle operating characteristics. You may alternatively show that design parameters are comparable to those for vehicles at or below 14,000 pounds GVWR certified under 40 CFR part 86, subpart S.

(d) *CNG refueling requirement.* Compressed natural gas vehicles must meet the requirements for fueling connection devices as specified in 40 CFR 86.1813–17(f)(1). Vehicles meeting these requirements are deemed to comply with evaporative and refueling emission standards.

(e) *LNG refueling requirement.* Liquefied natural gas vehicles must meet the requirements in Section 4.2 of SAE J2343 (incorporated by reference in § 1037.810), which specifies that vehicles meet a five-day hold time after a refueling event before the fuel reaches the point of venting to relieve pressure. This hold time starts immediately after a conventional refueling event corresponding to the vehicle's refueling fittings and other hardware, without any stabilization period to reach a different starting condition for the fuel in the tank. The vehicle must remain parked away from direct sun with ambient temperatures between (20 and 30) °C throughout the measurement procedure. This standard and procedure are consistent with Section 9.3.5 of NFPA 52, except that NFPA specifies a three-day hold time. Vehicles meeting these requirements are deemed to comply with evaporative and refueling emission standards. The provisions of this paragraph (e) are optional for vehicles produced before January 1, 2020.

(f) *Incomplete vehicles.* If you sell incomplete vehicles, you must identify the maximum fuel tank capacity for which you designed the vehicle's evaporative emission control system.

(g) *Useful life.* The evaporative emission standards of this section apply for the full useful life, expressed in service miles or calendar years, whichever comes first. The useful life values for the standards of this section are described in 40 CFR 86.1805.

(h) *Auxiliary engines and separate fuel systems.* The provisions of this paragraph (g) apply for vehicles with auxiliary engines. This includes any engines installed in the final vehicle configuration that contribute no motive power through the vehicle's transmission.

(1) Auxiliary engines and associated fuel-system components must be installed when testing complete vehicles. If the auxiliary engine draws fuel from a separate fuel tank, you must fill the extra fuel tank before the start of diurnal testing as described for the vehicle's main fuel tank. Use good engineering judgment to ensure that any nonmetal portions of the fuel system related to the auxiliary engine have reached stabilized levels of permeation emissions. The auxiliary engine must not operate during the running loss test or any other portion of testing under this section.

(2) For testing with incomplete vehicles, you may omit installation of auxiliary engines and associated fuel-system components as long as those components installed in the final configuration are certified to meet the applicable emission standards for Small SI equipment described in 40 CFR 1054.112 or for Large SI engines in 40 CFR 1048.105. For any fuel-system components that you do not install, your installation instructions must describe this certification requirement.

§ 1037.104 Exhaust emission standards for CO_2, CH_4, and N_2O for heavy-duty vehicles at or below 14,000 pounds GVWR.

Heavy-duty vehicles at or below 14,000 pounds GVWR are not subject to the provisions of this part 1037 if they are subject to 40 CFR part 86, subpart S, including all vehicles certified under 40 CFR part 86, subpart S. See 40 CFR 86.1819 and 86.1865 for detailed provisions that apply for these vehicles.

§ 1037.105 Exhaust emission standards for CO_2 for vocational vehicles.

(a) The standards of this section apply for the following vehicles:

(1) Vehicles above 14,000 pounds GVWR and at or below 26,000 pounds GVWR, but not certified to the vehicle standards in 40 CFR 86.1819.

(2) Vehicles above 26,000 pounds GVWR that are not tractors.

(3) Vocational tractors.

(4) Heavy-duty vehicles at or below 14,000 pounds GVWR that are excluded from the standards in 40 CFR 86.1819 or that use engines certified under § 1037.150(m).

(b) CO_2 standards apply as described in this paragraph (b). The provisions of § 1037.241 specify how to comply with these standards. Standards differ based on engine cycle, vehicle weight class, and intended vehicle duty cycle. See § 1037.510(c) to determine which duty cycle applies.

(1) Model year 2027 and later vehicles are subject to CO_2 standards corresponding to the selected subcategories as shown in the following table:

TABLE 1 OF § 1037.105—PHASE 2 CO_2 STANDARDS FOR MODEL YEAR 2027 AND LATER VOCATIONAL VEHICLES

[g/ton-mile]

Engine type	Vehicle size	Multi-purpose	Regional	Urban
Compression-ignition	Class 2b–5	280	292	272
Compression-ignition	Class 6–7	174	170	172
Compression-ignition	Class 8	183	174	182
Spark-ignition	Class 2b–5	308	321	299
Spark-ignition	Class 6–7	191	187	189
Spark-ignition	Class 8	198	188	196

(2) Model year 2024 through 2026 vehicles are subject to CO_2 standards corresponding to the selected subcategories as shown in the following table:

TABLE 2 OF § 1037.105—PHASE 2 CO_2 STANDARDS FOR MODEL YEAR 2024 AND LATER VOCATIONAL VEHICLES

[g/ton-mile]

Engine type	Vehicle size	Multi-purpose	Regional	Urban
Compression-ignition	Class 2b–5	292	304	284
Compression-ignition	Class 6–7	181	178	179
Compression-ignition	Class 8	192	182	190
Spark-ignition	Class 2b–5	321	334	312
Spark-ignition	Class 6–7	199	196	197
Spark-ignition	Class 8	210	199	208

(3) Model year 2021 through 2023 vehicles are subject to CO_2 standards corresponding to the selected subcategories as shown in the following table:

TABLE 3 OF § 1037.105—PHASE 2 CO_2 STANDARDS FOR MODEL YEAR 2021 THROUGH 2023 VOCATIONAL VEHICLES

[g/ton-mile]

Engine type	Vehicle size	Multi-purpose	Regional	Urban
Compression-ignition	Class 2b–5	305	318	296
Compression-ignition	Class 6–7	190	186	188
Compression-ignition	Class 8	200	189	198
Spark-ignition	Class 2b–5	329	343	320
Spark-ignition	Class 6–7	205	201	203
Spark-ignition	Class 8	216	204	214

(4) You may certify model year 2021 and later emergency vehicles to the CO_2 standards specified in Table 5 of this section instead of the standards specified in paragraphs (b)(1) through (3) of this section. Vehicles certified to these alternative standards may not generate emission credits.

TABLE 5 OF § 1037.105—ALTERNATIVE PHASE 2 CO_2 STANDARDS FOR EMERGENCY VEHICLES

[g/ton-mile]

Vehicle size	CO_2 standard
Class 2b–5	321
Class 6–7	201
Class 8	213

(5) Model year 2014 through 2020 vehicles are subject to Phase 1 CO_2 standards as shown in the following table:

TABLE 4 OF § 1037.105—PHASE 1 CO_2 STANDARDS FOR MODEL YEAR 2014 THROUGH 2020 VOCATIONAL VEHICLES

[g/ton-mile]

Vehicle size	CO_2 standard for model years 2014–2016	CO_2 standard for model year 2017 and later
Class 2b–5	388	373
Class 6–7	234	225
Class 8	226	222

(c) No CH_4 or N_2O standards apply under this section. See 40 CFR part 1036 for CH_4 or N_2O standards that apply to engines used in these vehicles.

(d) You may generate or use emission credits for averaging, banking, and trading as described in subpart H of this part. This requires that you specify a Family Emission Limit (FEL) for CO_2 for each vehicle subfamily. The FEL may not be less than the result of emission modeling from § 1037.520. These FELs serve as the emission standards for the vehicle subfamily instead of the standards specified in paragraph (b) of this section.

(e) The exhaust emission standards of this section apply for the full useful life, expressed in service miles or calendar years, whichever comes first. The following useful life values apply for the standards of this section:

(1) 150,000 miles or 15 years, whichever comes first, for Class 2b through Class 5 vehicles.

(2) 185,000 miles or 10 years, whichever comes first, for Class 6 and Class 7 vehicles.

(3) 435,000 miles or 10 years, whichever comes first, for Class 8 vehicles.

(f) See § 1037.631 for provisions that exempt certain vehicles used in off-road operation from the standards of this section.

(g) You may optionally certify a vocational vehicle to the standards and useful life applicable to a heavier vehicle service class (such as medium heavy-duty instead of light heavy-duty), provided you do not generate credits with the vehicle. If you include lighter vehicles in a credit-generating subfamily (with an FEL below the standard), exclude their production volume from the credit calculation. Conversely, if you include lighter vehicles in a credit-using subfamily, you must include their production volume in the credit calculation.

§ 1037.106 Exhaust emission standards for CO_2 for tractors above 26,000 pounds GVWR.

(a) The CO_2 standards of this section apply for tractors above 26,000 pounds GVWR. Note that the standards of this section do not apply for vehicles classified as ''vocational tractors'' under § 1037.630,

(b) The CO_2 standards for tractors above 26,000 pounds GVWR are given in Table 1 of this section. The provisions of § 1037.241 specify how to comply with these standards.

TABLE 1 OF § 1037.106—CO_2 STANDARDS FOR CLASS 7 AND CLASS 8 TRACTORS BY MODEL YEAR

[g/ton-mile]

Subcategory [1]	Phase 1 standards for model years 2014–2016	Phase 1 standards for model years 2017–2020	Phase 2 standards for model years 2021–2023	Phase 2 standards for model years 2024–2026	Phase 2 standards for model year 2027 and later
Class 7 Low-Roof (all cab styles)	107	104	97	90	87
Class 7 Mid-Roof (all cab styles)	119	115	107	100	96
Class 7 High-Roof (all cab styles)	124	120	109	101	96
Class 8 Low-Roof Day Cab	81	80	78	72	70

TABLE 1 OF § 1037.106—CO_2 STANDARDS FOR CLASS 7 AND CLASS 8 TRACTORS BY MODEL YEAR—Continued

[g/ton-mile]

Subcategory[1]	Phase 1 standards for model years 2014–2016	Phase 1 standards for model years 2017–2020	Phase 2 standards for model years 2021–2023	Phase 2 standards for model years 2024–2026	Phase 2 standards for model year 2027 and later
Class 8 Low-Roof Sleeper Cab	68	66	70	64	62
Class 8 Mid-Roof Day Cab	88	86	84	78	76
Class 8 Mid-Roof Sleeper Cab	76	73	78	71	69
Class 8 High-Roof Day Cab	92	89	86	79	76
Class 8 High-Roof Sleeper Cab	75	72	77	70	67
Heavy-Haul Tractors	....	....	54	52	51

[1] Sub-category terms are defined in § 1037.801.

(c) No CH_4 or N_2O standards apply under this section. See 40 CFR part 1036 for CH_4 or N_2O standards that apply to engines used in these vehicles.

(d) You may generate or use emission credits for averaging, banking, and trading as described in subpart H of this part. This requires that you calculate a credit quantity if you specify a Family Emission Limit (FEL) that is different than the standard specified in this section for a given pollutant. The FEL may not be less than the result of emission modeling from § 1037.520. These FELs serve as the emission standards for the specific vehicle subfamily instead of the standards specified in paragraph (a) of this section.

(e) The exhaust emission standards of this section apply for the full useful life, expressed in service miles or calendar years, whichever comes first. The following useful life values apply for the standards of this section:

(1) 185,000 miles or 10 years, whichever comes first, for vehicles at or below 33,000 pounds GVWR.

(2) 435,000 miles or 10 years, whichever comes first, for vehicles above 33,000 pounds GVWR.

(f) You may optionally certify a tractor to the standards and useful life applicable to a heavier vehicle service class (such as heavy heavy-duty instead of medium heavy-duty), provided you do not generate credits with the vehicle. If you include lighter vehicles in a credit-generating subfamily (with an FEL below the standard), exclude its production volume from the credit calculation. Conversely, if you include lighter vehicles in a credit-using subfamily, you must include their production volume in the credit calculation.

§ 1037.107 Emission standards for trailers.

The exhaust emission standards specified in this section apply to trailers based on the effect of trailer designs on the performance of the trailer in conjunction with a tractor; this accounts for the effect of the trailer on the tractor's exhaust emissions, even though trailers themselves have no exhaust emissions.

(a) Standards apply for trailers as follows:

(1) Different levels of stringency apply for box vans depending on features that may affect aerodynamic performance. You may optionally meet less stringent standards for different trailer types, which we characterize as follows:

(i) For trailers 35 feet or longer, ''non-aero trailers'' are box vans that have a rear lift gate or rear hinged ramp, and at least one of the following side features: side lift gate, belly box, side-mounted pull-out platform, steps for side-door access, or a drop-deck design. For trailers less than 35 feet long, ''non-aero trailers'' are refrigerated box vans with at least one of the side features identified for longer trailers.

(ii) ''Partial-aero trailers'' are box vans that have at least one of the side features identified in paragraph (a)(1)(i) of this section. Long box vans also qualify as partial-aero trailers if they have a rear lift gate or rear hinged ramp. Note that this paragraph (a)(1)(ii) does not apply for box vans designated as ''non-aero trailers'' under paragraph (a)(1)(i) of this section.

(iii) ''Full-aero trailers'' are box vans that do not meet the specifications of either paragraph (a)(1)(i) or (ii) of this section.

(2) CO_2 standards apply for full-aero trailers as specified in the following table:

TABLE 1 OF § 1037.107—PHASE 2 CO_2 STANDARDS FOR TRAILERS

[g/ton-mile]

Model year	Dry van		Refrigerated van	
	Short	Long	Short	Long
2018–2020	144	83	147	84
2021–2023	143	81	146	82
2024–2026	141	79	144	79
2027+	140	77	144	77

(3) Partial-aero trailers may continue to meet the 2024 standards in 2027 and later model years.

(4) Non-box trailers and non-aero trailers must meet standards as follows:

(i) Trailers must use qualified automatic tire inflation systems with wheels on all axles.

(ii) Trailers must use tires with a TRRL at or below 4.7 kg/ton. Through model year 2023, trailers may instead use tires with a TRRL at or below 5.1 kg/ton.

(5) You may generate or use emission credits for averaging to demonstrate compliance with the standards specified in paragraph (a)(2) of this section as described in subpart H of this part. This requires that you specify a Family Emission Limit (FEL) for CO_2 for each vehicle subfamily. The FEL may not be less than the result of the emission calculation in § 1037.515. These FELs serve as the emission standards for the

specific vehicle subfamily instead of the standards specified in paragraph (a) of this section. You may not use averaging for non-box trailers, partial-aero trailers, or non-aero trailers that meet standards under paragraph (a)(3) or (a)(4) of this section, and you may not use emission credits for banking or trading for any trailers.

(6) The provisions of § 1037.241 specify how to comply with the standards of this section.

(b) No CH_4, N_2O, or HFC standards apply under this section.

(c) The emission standards of this section apply for a useful life of 10 years.

§ 1037.115 Other requirements.

Vehicles required to meet the emission standards of this part must meet the following additional requirements, except as noted elsewhere in this part:

(a) *Adjustable parameters.* Vehicles that have adjustable parameters must meet all the requirements of this part for any adjustment in the physically adjustable range. We may require that you set adjustable parameters to any specification within the adjustable range during any testing. See 40 CFR 86.094–22 for information related to determining whether or not an operating parameter is considered adjustable. You must ensure safe vehicle operation throughout the physically adjustable range of each adjustable parameter, including consideration of production tolerances. Note that adjustable roof fairings and trailer rear fairings are deemed not to be adjustable parameters.

(b) *Prohibited controls.* You may not design your vehicles with emission control devices, systems, or elements of design that cause or contribute to an unreasonable risk to public health, welfare, or safety while operating. For example, this would apply if the vehicle emits a noxious or toxic substance it would otherwise not emit that contributes to such an unreasonable risk.

(c) [Reserved]

(d) *Defeat devices.* 40 CFR 1068.101 prohibits the use of defeat devices.

(e) *Air conditioning leakage.* Loss of refrigerant from your air conditioning systems may not exceed a total leakage rate of 11.0 grams per year or a percent leakage rate of 1.50 percent per year, whichever is greater. Calculate the total leakage rate in g/year as specified in 40 CFR 86.1867–12(a). Calculate the percent leakage rate as: [total leakage rate (g/yr)] ÷ [total refrigerant capacity (g)] × 100. Round your percent leakage rate to the nearest one-hundredth of a percent. This paragraph (e) does not apply for refrigeration units installed on trailers or for refrigeration units on vocational vehicles that are limited to cooling cargo.

(1) For purposes of this requirement, ''refrigerant capacity'' is the total mass of refrigerant recommended by the vehicle manufacturer as representing a full charge. Where full charge is specified as a pressure, use good engineering judgment to convert the pressure and system volume to a mass.

(2) If your system uses a refrigerant other than HFC–134a that is listed as an acceptable substitute refrigerant for heavy-duty vehicles under 40 CFR part 82, subpart G, and the substitute refrigerant is identified in 40 CFR 86.1867–12(e), your system is deemed to meet the leakage standard in this paragraph (e), consistent with good engineering judgment, and the leakage rate reporting requirement of § 1037.205(c)(1) does not apply. If your system uses any other refrigerant that is listed as an acceptable substitute refrigerant for heavy-duty vehicles under 40 CFR part 82, subpart G, contact us for procedures for calculating the leakage rate in a way that appropriately accounts for the refrigerant's properties.

§ 1037.120 Emission-related warranty requirements.

(a) *General requirements.* You must warrant to the ultimate purchaser and each subsequent purchaser that the new vehicle, including all parts of its emission control system, meets two conditions:

(1) It is designed, built, and equipped so it conforms at the time of sale to the ultimate purchaser with the requirements of this part.

(2) It is free from defects in materials and workmanship that cause the vehicle to fail to conform to the requirements of this part during the applicable warranty period.

(b) *Warranty period.* (1) Your emission-related warranty must be valid for at least:

(i) 5 years or 50,000 miles for spark-ignition vehicles and Class 5 and lighter heavy-duty vehicles (except tires).

(ii) 5 years or 100,000 miles for Class 6 through Class 8 heavy-duty vehicles (except tires).

(iii) 5 years for trailers (except tires).

(iv) 1 year for tires installed on trailers, and 2 years or 24,000 miles for all other tires.

(2) You may offer an emission-related warranty more generous than we require. The emission-related warranty for the vehicle may not be shorter than any basic mechanical warranty you provide to that owner without charge for the vehicle. Similarly, the emission-related warranty for any component may not be shorter than any warranty you provide to that owner without charge for that component. This means that your warranty for a given vehicle may not treat emission-related and nonemission-related defects differently for any component. The warranty period begins when the vehicle is placed into service.

(c) *Components covered.* The emission-related warranty covers tires, automatic tire inflation systems, vehicle speed limiters, idle shutdown systems, hybrid system components, and devices added to the vehicle to improve aerodynamic performance (not including standard components such as hoods or mirrors even if they have been optimized for aerodynamics), to the extent such emission-related components are included in your application for certification. The emission-related warranty also covers other added emission-related components to the extent they are included in your application for certification. The emission-related warranty covers all components whose failure would increase a vehicle's emissions of air conditioning refrigerants (for vehicles subject to air conditioning leakage standards), and it covers all components whose failure would increase a vehicle's evaporative emissions (for vehicles subject to evaporative emission standards). The emission-related warranty covers these components even if another company produces the component. Your emission-related warranty does not need to cover components whose failure would not increase a vehicle's emissions of any regulated pollutant.

(d) *Limited applicability.* You may deny warranty claims under this section if the operator caused the problem through improper maintenance or use, as described in 40 CFR 1068.115.

(e) *Owners manual.* Describe in the owners manual the emission-related warranty provisions from this section that apply to the vehicle.

§ 1037.125 Maintenance instructions and allowable maintenance.

Give the ultimate purchaser of each new vehicle written instructions for properly maintaining and using the vehicle, including the emission control system. The maintenance instructions also apply to service accumulation on any of your emission-data vehicles. See paragraph (i) of this section for requirements related to tire replacement. Only the provisions of paragraph (h) of this section apply for trailers.

(a) *Critical emission-related maintenance.* Critical emission-related maintenance includes any adjustment, cleaning, repair, or replacement of critical emission-related components. This may also include additional emission-related maintenance that you determine is critical if we approve it in advance. You may schedule critical emission-related maintenance on these components if you demonstrate that the maintenance is reasonably likely to be done at the recommended intervals on in-use vehicles. We will accept scheduled maintenance as reasonably likely to occur if you satisfy any of the following conditions:

(1) You present data showing that, if a lack of maintenance increases emissions, it also unacceptably degrades the vehicle's performance.

(2) You present survey data showing that at least 80 percent of vehicles in the field get the maintenance you specify at the recommended intervals.

(3) You provide the maintenance free of charge and clearly say so in your maintenance instructions.

(4) You otherwise show us that the maintenance is reasonably likely to be done at the recommended intervals.

(b) *Recommended additional maintenance.* You may recommend any additional amount of maintenance on the components listed in paragraph (a) of this section, as long as you state clearly that these maintenance steps are not necessary to keep the emission-related warranty valid. If operators do the maintenance specified in paragraph (a) of this section, but not the recommended additional maintenance, this does not allow you to disqualify those vehicles from in-use testing or deny a warranty claim. Do not take these maintenance steps during service accumulation on your emission-data vehicles.

(c) *Special maintenance.* You may specify more frequent maintenance to address problems related to special situations, such as atypical vehicle operation. You must clearly state that this additional maintenance is associated with the special situation you are addressing. We may disapprove your maintenance instructions if we determine that you have specified special maintenance steps to address vehicle operation that is not atypical, or that the maintenance is unlikely to occur in use. If we determine that certain maintenance items do not qualify as special maintenance under this paragraph (c), you may identify this as recommended additional maintenance under paragraph (b) of this section.

(d) *Noncritical emission-related maintenance.* Subject to the provisions of this paragraph (d), you may schedule any amount of emission-related inspection or maintenance that is not covered by paragraph (a) of this section (that is, maintenance that is neither explicitly identified as critical emission-related maintenance, nor that we approve as critical emission-related maintenance). Noncritical emission-related maintenance generally includes maintenance on the components we specify in 40 CFR part 1068, Appendix I, that is not covered in paragraph (a) of this section. You must state in the owners manual that these steps are not necessary to keep the emission-related warranty valid. If operators fail to do this maintenance, this does not allow you to disqualify those vehicles from in-use testing or deny a warranty claim. Do not take these inspection or maintenance steps during service accumulation on your emission-data vehicles.

(e) *Maintenance that is not emission-related.* For maintenance unrelated to emission controls, you may schedule any amount of inspection or maintenance. You may also take these inspection or maintenance steps during service accumulation on your emission-data vehicles, as long as they are reasonable and technologically necessary. You may perform this nonemission-related maintenance on emission-data vehicles at the least frequent intervals that you recommend to the ultimate purchaser (but not the intervals recommended for severe service).

(f) *Source of parts and repairs.* State clearly on the first page of your written maintenance instructions that a repair shop or person of the owner's choosing may maintain, replace, or repair emission control devices and systems. Your instructions may not require components or service identified by brand, trade, or corporate name. Also, do not directly or indirectly condition your warranty on a requirement that the vehicle be serviced by your franchised dealers or any other service establishments with which you have a commercial relationship. You may disregard the requirements in this paragraph (f) if you do one of two things:

(1) Provide a component or service without charge under the purchase agreement.

(2) Get us to waive this prohibition in the public's interest by convincing us the vehicle will work properly only with the identified component or service.

(g) [Reserved]

(h) *Owners manual.* Explain the owner's responsibility for proper maintenance in the owners manual.

(i) *Tire maintenance and replacement.* Include instructions that will enable the owner to replace tires so that the vehicle conforms to the original certified vehicle configuration.

§ 1037.130 Assembly instructions for secondary vehicle manufacturers.

(a) If you sell a certified incomplete vehicle to a secondary vehicle manufacturer, give the secondary vehicle manufacturer instructions for completing vehicle assembly consistent with the requirements of this part. Include all information necessary to ensure that the final vehicle assembly an engine will be in its certified configuration.

(b) Make sure these instructions have the following information:

(1) Include the heading: ''Emission-related installation instructions''.

(2) State: ''Failing to follow these instructions when completing assembly of a heavy-duty motor vehicle violates federal law, subject to fines or other penalties as described in the Clean Air Act.''

(3) Describe the necessary steps for installing any diagnostic system required under 40 CFR part 86.

(4) Describe how your certification is limited for any type of application, as illustrated in the following examples:

(i) If the incomplete vehicle is at or below 8,500 pounds GVWR, state that the vehicle's certification is valid under this part 1037 only if the final configuration has a vehicle curb weight above 6,000 pounds or basic vehicle frontal area above 45 square feet.

(ii) If your engine will be installed in a vehicle that you certify to meet diurnal emission standards using an evaporative canister, but you do not install the fuel tank, identify the maximum permissible fuel tank capacity if tank size affects compliance.

(5) Describe any other instructions to make sure the vehicle will operate according to design specifications in your application for certification.

(c) Provide instructions in writing or in an equivalent format. You may include this information with the incomplete vehicle document required by DOT. If you do not provide the instructions in writing, explain in your application for certification how you will ensure that each installer is informed of the installation requirements.

§ 1037.135 Labeling.

(a) Assign each vehicle a unique identification number and permanently affix, engrave, or stamp it on the vehicle in a legible way. The vehicle identification number (VIN) serves this purpose.

(b) At the time of manufacture, affix a permanent and legible label identifying each vehicle. The label must be—

(1) Attached in one piece so it is not removable without being destroyed or defaced.

(2) Secured to a part of the vehicle needed for normal operation and not normally requiring replacement.

(3) Durable and readable for the vehicle's entire life.

(4) Written in English.

(c) The label must—

(1) Include the heading ''VEHICLE EMISSION CONTROL INFORMATION''.

(2) Include your full corporate name and trademark. You may identify another company and use its trademark instead of yours if you comply with the branding provisions of 40 CFR 1068.45.

(3) Include EPA's standardized designation for the vehicle family.

(4) State the regulatory subcategory that determines the applicable emission standards for the vehicle family (see definition in § 1037.801).

(5) State the date of manufacture [DAY (optional), MONTH, and YEAR]. You may omit this from the label if you stamp, engrave, or otherwise permanently identify it elsewhere on the vehicle, in which case you must also describe in your application for certification where you will identify the date on the vehicle.

(6) Identify the emission control system. Use terms and abbreviations as described in Appendix III to this part or other applicable conventions. Phase 2 tractors and Phase 2 vocational vehicles (other than those certified to standards for emergency vehicles) may omit this information.

(7) Identify any requirements for fuel and lubricants that do not involve fuel-sulfur levels.

(8) State: ''THIS VEHICLE COMPLIES WITH U.S. EPA REGULATIONS FOR [MODEL YEAR] HEAVY-DUTY VEHICLES.''

(9) If you rely on another company to design and install fuel tanks in incomplete vehicles that use an evaporative canister for controlling diurnal emissions, include the following statement: ''THIS VEHICLE IS DESIGNED TO COMPLY WITH EVAPORATIVE EMISSION STANDARDS WITH UP TO × GALLONS OF FUEL TANK CAPACITY.'' Complete this statement by identifying the maximum specified fuel tank capacity associated with your certification.

(d) You may add information to the emission control information label to identify other emission standards that the vehicle meets or does not meet (such as European standards). You may also add other information to ensure that the vehicle will be properly maintained and used.

(e) You may ask us to approve modified labeling requirements in this part 1037 if you show that it is necessary or appropriate. We will approve your request if your alternate label is consistent with the requirements of this part.

§ 1037.140 Determining vehicle parameters.

(a) Where applicable, a vehicle's roof height and a trailer's length are determined from nominal design specifications, as provided in this section. Specify design values for roof height and trailer length to the nearest inch.

(b) Base roof height on fully inflated tires having a static loaded radius equal to the arithmetic mean of the largest and smallest static loaded radius of tires you offer or a standard tire we approve.

(c) Base trailer length on the outer dimensions of the load-carrying structure. Do not include aerodynamic devices or HVAC units.

(d) The nominal design specifications must be within the range of the actual values from production vehicles considering normal production variability. In the case of roof height, use the mean tire radius specified in paragraph (b) of this section. If after production begins it is determined that your nominal design specifications do not represent production vehicles, we may require you to amend your application for certification under § 1037.225.

(e) If your vehicle is equipped with an adjustable roof fairing, measure the roof height with the fairing in its lowest setting.

(f) For any provisions in this part that depend on the number of axles on a vehicle, include lift axles or any other installed axles that can be used to carry the vehicle's weight while in motion.

§ 1037.150 Interim provisions.

The provisions in this section apply instead of other provisions in this part.

(a) *Incentives for early introduction.* The provisions of this paragraph (a) apply with respect to vehicles produced in model years before 2014 Manufacturers may voluntarily certify in model year 2013 (or earlier model years for electric vehicles) to the greenhouse gas standards of this part.

(1) This paragraph (a)(1) applies for regulatory subcategories subject to the standards of § 1037.105 or § 1037.106. Except as specified in paragraph (a)(3) of this section, to generate early credits under this paragraph for any vehicles other than electric vehicles, you must certify your entire U.S.-directed production volume within the regulatory subcategory to these standards. Except as specified in paragraph (a)(4) of this section, if some vehicle families within a regulatory subcategory are certified after the start of the model year, you may generate credits only for production that occurs after all families are certified. For example, if you produce three vehicle families in an averaging set and you receive your certificates for those families on January 4, 2013, March 15, 2013, and April 24, 2013, you may not generate credits for model year 2013 production in any of the families that occurs before April 24, 2013. Calculate credits relative to the standard that would apply in model year 2014 using the equations in subpart H of this part. You may bank credits equal to the surplus credits you generate under this paragraph (a) multiplied by 1.50. For example, if you have 1.0 Mg of surplus credits for model year 2013, you may bank 1.5 Mg of credits. Credit deficits for an averaging set prior to model year 2014 do not carry over to model year 2014. These credits may be used to show compliance with the standards of this part for 2014 and later model years. We recommend that you notify EPA of your intent to use this provision before submitting your applications.

(2) [Reserved]

(3) You may generate emission credits for the number of additional SmartWay designated tractors (relative to your 2012 production), provided you do not generate credits for those vehicles under paragraph (a)(1) of this section. Calculate credits for each regulatory subcategory relative to the standard that would apply in model year 2014 using the equations in subpart H of this part. Use a production volume equal to the number of designated model year 2013 SmartWay tractors minus the number of designated model year 2012 SmartWay tractors. You may bank credits equal to the surplus credits you generate under this paragraph (a)(3) multiplied by 1.50. Your 2012 and 2013 model years must be equivalent in length.

(4) This paragraph (a)(4) applies where you do not receive your final certificate in a regulatory subcategory within 30 days of submitting your final application for that subcategory. Calculate your credits for all production that occurs 30 days or more after you

submit your final application for the subcategory.

(b) *Interim standards for pickups and vans.* See 40 CFR part 86, subpart S, for interim standards that apply for certain heavy-duty pickups and vans.

(c) *Provisions for small manufacturers.* Standards apply on a delayed schedule for manufacturers meeting the small business criteria specified in 13 CFR 121.201. Apply the small business criteria for NAICS code 336120 for vocational vehicles and tractors and 336212 for trailers. Qualifying manufacturers are not subject to the greenhouse gas standards of §§ 1037.105 and 1037.106 for vehicles built before January 1, 2022, Similarly, qualifying manufacturers are not subject to the greenhouse gas standards of § 1037.107 for trailers built before January 1, 2019. In addition, qualifying manufacturers producing vehicles that run on any fuel other than gasoline, E85, or diesel fuel may delay complying with every new standard under this part by one model year. Qualifying manufacturers must notify the Designated Compliance Officer each model year before introducing these excluded vehicles into U.S. commerce. This notification must include a description of the manufacturer's qualification as a small business under 13 CFR 121.201. You must label your excluded vehicles with the following statement: ''THIS VEHICLE IS EXCLUDED UNDER 40 CFR 1037.150(c).'' Small businesses may certify their vehicles under this part 1037 before standards start to apply; however, they may generate emission credits only if they certify their entire U.S.-directed production volume within the applicable averaging set for that model year.

(d) *Air conditioning leakage for vocational vehicles.* The air conditioning leakage standard of § 1037.115 does not apply for model year 2020 and earlier vocational vehicles.

(e) [Reserved]

(f) *Electric vehicles.* All electric vehicles are deemed to have zero emissions of CO_2, CH_4, and N_2O. No emission testing is required for electric vehicles. Use good engineering judgment to apply other requirements of this part to electric vehicles.

(g) *Compliance date.* Compliance with the standards of this part was optional prior to January 1, 2014. This means that if your 2014 model year begins before January 1, 2014, you may certify for a partial model year that begins on January 1, 2014 and ends on the day your model year would normally end. You must label model year 2014 vehicles excluded under this paragraph (g) with the following statement: ''THIS VEHICLE IS EXCLUDED UNDER 40 CFR 1037.150(g).''

(h) *Off-road vehicle exemption.* In unusual circumstances, vehicle manufacturers may ask us to exempt vehicles under § 1037.631 based on other criteria that are equivalent to those specified in § 1037.631(a). For example, we would normally not grant relief in cases where the vehicle manufacturer had credits or could otherwise comply with applicable standards. Request approval for the exemption before you produce the subject vehicles. Send your request with supporting information to the Designated Compliance Officer; we will coordinate with NHTSA in making a determination under § 1037.210. If you introduce into U.S. commerce vehicles that depend on our approval under this paragraph (h) before we inform you of our approval, those vehicles violate 40 CFR 1068.101(a)(1).

(i) *Credit multiplier for advanced technology.* If you generate credits from model year 2020 and earlier vehicles certified with advanced technology, you may multiply these credits by 1.50, except that you may not apply this multiplier in addition to the early-credit multiplier of paragraph (a) of this section.

(j) *Limited prohibition related to early model year engines.* The provisions of this paragraph (j) apply only for vehicles that have a date of manufacture before January 1, 2018. See § 1037.635 for related provisions that apply in later model years. The prohibition in § 1037.601 against introducing into U.S. commerce a vehicle containing an engine not certified to the standards applicable for the calendar year of installation does not apply for vehicles using model year 2014 or 2015 spark-ignition engines, or any model year 2013 or earlier engines.

(k) *Verifying drag areas from in-use vehicles.* This paragraph (k) applies instead of § 1037.401(b) through model year 2020. We may measure the drag area of your vehicles after they have been placed into service. To account for measurement variability, your vehicle is deemed to conform to the regulations of this part with respect to aerodynamic performance if we measure its drag area to be at or below the maximum drag area allowed for the bin above the bin to which you certified (for example, Bin II if you certified the vehicle to Bin III), unless we determine that you knowingly produced the vehicle to have a higher drag area than is allowed for the bin to which it was certified.

(l) *Optional sister-vehicle certification under 40 CFR part 86.* You may certify certain complete or cab-complete vehicles to the GHG standards of 40 CFR 86.1819 instead of the standards of § 1037.105 as specified in 40 CFR 86.1819–14(j).

(m) *Loose engine sales.* Manufacturers may certify certain model year 2020 and earlier spark-ignition engines to emission standards under 40 CFR 1036.108 where they are identical to engines used in vehicles certified to the standards of 40 CFR 86.1819. Vehicles in which those engines are installed are subject to standards under this part as specified in § 1037.105. See 40 CFR 86.1819–14(k)(8).

(n) *Streamlined preliminary approval for trailer devices.* Before January 1, 2018, manufacturers of aerodynamic devices for trailers may ask for preliminary EPA approval of compliance data for their devices based on qualifying for designation under the SmartWay program based on measured C_DA values, whether or not that involves testing or other methods specified in § 1037.525. Trailer manufacturers may certify based on delta C_DA values established under this paragraph (n) through model year 2020. Manufacturers must perform testing as specified in subpart F of this part for any vehicles or aerodynamic devices not qualifying for approval under this paragraph (n).

(o) *Phase 1 coastdown procedures.* For tractors subject to Phase 1 standards under § 1037.106, the default method for measuring drag area (C_DA) is the coastdown procedure specified in 40 CFR part 1066, subpart D. This includes preparing the tractor and the standard trailer with wheels meeting specifications of § 1037.527(b) and submitting information related to your coastdown testing under § 1037.527(h).

(p) *ABT reports.* Through model year 2017, you may submit a final report under § 1037.730 up to 270 days after the end of the model year, as long as you send a draft report with the same information within 90 days after the end of the model year.

(q) *Vehicle families for advanced and off-cycle technologies.* For vocational vehicles and tractors subject to Phase 1 standards, create separate vehicle families for vehicles that contain advanced or off-cycle technologies; group those vehicles together in a vehicle family if they use the same advanced or off-cycle technologies.

(r) *Limited carryover from Phase 1 to Phase 2.* The provisions for carryover data in § 1037.235(d) do not allow you to use aerodynamic test results from Phase 1 to support a compliance demonstration for Phase 2 certification.

(s) *Interim useful life for light heavy-duty vocational vehicles.* Class 2b through Class 5 vocational vehicles certified to Phase 1 standards are subject to a useful life of 110,000 miles or 10 years, whichever comes first, instead of the useful life specified in § 1037.105. For emission credits generated from these Phase 1 vehicles, multiply any banked credits that you carry forward to demonstrate compliance with Phase 2 standards by 1.36.

Subpart C—Certifying Vehicle Families

§ 1037.201 General requirements for obtaining a certificate of conformity.

(a) You must send us a separate application for a certificate of conformity for each vehicle family. A certificate of conformity is valid from the indicated effective date until the end of the model year for which it is issued, which may not extend beyond December 31 of that year. You must renew your certification annually for any vehicles you continue to produce.

(b) The application must contain all the information required by this part and must not include false or incomplete statements or information (see § 1037.255).

(c) We may ask you to include less information than we specify in this subpart, as long as you maintain all the information required by § 1037.250.

(d) You must use good engineering judgment for all decisions related to your application (see 40 CFR 1068.5).

(e) An authorized representative of your company must approve and sign the application.

(f) See § 1037.255 for provisions describing how we will process your application.

(g) We may perform confirmatory testing on your vehicles; for example, we may test vehicles to verify drag areas or other GEM inputs. This includes tractors used to determine $F_{\text{alt-aero}}$ under § 1037.525. We may require you to deliver your test vehicles or components to a facility we designate for our testing. Alternatively, you may choose to deliver another vehicle or component that is identical in all material respects to the test vehicle or component, or a different vehicle or component that we determine can appropriately serve as an emission-data vehicle for the family. We may perform confirmatory testing on engines under 40 CFR part 1036 and may require you to apply modified fuel maps from that testing for certification under this part.

(h) The certification and testing provisions of 40 CFR part 86, subpart S, apply instead of the provisions of this subpart relative to the evaporative and refueling emission standards specified in § 1037.103, except that § 1037.245 describes how to demonstrate compliance with evaporative emission standards.

(i) Vehicles and installed engines must meet exhaust, evaporative, and refueling emission standards and certification requirements in 40 CFR part 86 or 40 CFR part 1036, as applicable. Include the information described in 40 CFR part 86, subpart S, or 40 CFR 1036.205 in your application for certification in addition to what we specify in § 1037.205 so we can issue a single certificate of conformity for all the requirements that apply for your vehicle and the installed engine.

§ 1037.205 What must I include in my application?

This section specifies the information that must be in your application, unless we ask you to include less information under § 1037.201(c). We may require you to provide additional information to evaluate your application. References to testing and emission-data vehicles refer to testing vehicles or components to measure any quantity that serves as an input value for modeling emission rates under § 1037.515 or 1037.520.

(a) Describe the vehicle family's specifications and other basic parameters of the vehicle's design and emission controls. List the fuel type on which your vocational vehicles and tractors are designed to operate (for example, ultra low-sulfur diesel fuel).

(b) Explain how the emission control system operates. As applicable, describe in detail all system components for controlling greenhouse gas emissions, including all auxiliary emission control devices (AECDs) and all fuel-system components you will install on any production vehicle. Identify the part number of each component you describe. For this paragraph (b), treat as separate AECDs any devices that modulate or activate differently from each other. Also describe your modeling inputs as described in §§ 1037.515 and 1037.520, with the following additional information if it applies for your vehicles:

(1) Describe your design for vehicle speed limiters, consistent with § 1037.640.

(2) Describe your design for predictive cruise control.

(3) Describe your design for automatic engine shutdown systems, consistent with § 1037.660.

(4) Describe your engineering analysis demonstrating that your air conditioning compressor qualifies as a high-efficiency model as described in 40 CFR 86.1868–12(h)(5).

(5) Describe your design for stop-start technology, including the logic for engine shutdown and the maximum duration of engine operation after the onset of any vehicle conditions described in § 1037.520(f)(8)(iii).

(6) If you perform powertrain testing under § 1037.550, report both CO_2 and NO_X emission levels corresponding to each test run.

(7) Include measurements for vehicles with hybrid power take-off systems.

(c) For vehicles subject to air conditioning standards, include:

(1) The refrigerant leakage rates (leak scores).

(2) The type of refrigerant and the refrigerant capacity of the air conditioning systems.

(3) The corporate name of the final installer of the air conditioning system.

(d) Describe any vehicles you selected for testing and the reasons for selecting them.

(e) Describe any test equipment and procedures that you used, including any special or alternate test procedures you used (see § 1037.501). Include information describing the procedures you used to determine C_DA values for tractors and trailers as specified in § 1037.525.

(f) Describe how you operated any emission-data vehicle before testing, including the duty cycle and the number of vehicle operating miles used to stabilize emission-related performance. Explain why you selected the method of service accumulation. Describe any scheduled maintenance you did.

(g) Where applicable, list the specifications of any test fuel to show that it falls within the required ranges we specify in 40 CFR part 1065.

(h) Identify the vehicle family's useful life.

(i) Include the maintenance instructions and warranty statement you will give to the ultimate purchaser of each new vehicle (see §§ 1037.120 and 1037.125).

(j) Describe your emission control information label (see § 1037.135).

(k) Identify the emission standards or FELs to which you are certifying vehicles in the vehicle family. For families containing multiple subfamilies, this means that you must identify multiple CO_2 FELs. For example, you may identify the highest and lowest FELs to which any of your subfamilies will be certified and also list all possible FELs in between (which will be in 1 g/ton-mile increments).

(l) Where applicable, identify the vehicle family's deterioration factors and describe how you developed them.

Present any emission test data you used for this (see § 1037.241(c)).

(m) Where applicable, state that you operated your emission-data vehicles as described in the application (including the test procedures, test parameters, and test fuels) to show you meet the requirements of this part.

(n) [Reserved]

(o) Report calculated and modeled emission results as follows:

(1) For vocational vehicles and tractors, report modeling results for ten configurations. Include modeling inputs and detailed descriptions of how they were derived. Unless we specify otherwise, include the configuration with the highest modeling result, the lowest modeling result, and the configurations with the highest projected sales.

(2) For trailers that demonstrate compliance with g/ton-mile emission standards as described in § 1037.515, report CO_2 emission results for the configurations with the highest and lowest calculated values, and for the configuration with the highest projected sales.

(p) Where applicable, describe all adjustable operating parameters (see § 1037.115), including production tolerances. You do not need to include parameters that do not affect emissions covered by your application. Include the following in your description of each parameter:

(1) The nominal or recommended setting.

(2) The intended physically adjustable range.

(3) The limits or stops used to establish adjustable ranges.

(4) Information showing why the limits, stops, or other means of inhibiting adjustment are effective in preventing adjustment of parameters on in-use vehicles to settings outside your intended physically adjustable ranges.

(q) [Reserved]

(r) Unconditionally certify that all the vehicles in the vehicle family comply with the requirements of this part, other referenced parts of the CFR, and the Clean Air Act.

(s) Include good-faith estimates of U.S.-directed production volumes by subfamily. We may require you to describe the basis of your estimates.

(t) Include the information required by other subparts of this part. For example, include the information required by § 1037.725 if you plan to generate or use emission credits.

(u) Include other applicable information, such as information specified in this part or 40 CFR part 1068 related to requests for exemptions.

(v) Name an agent for service located in the United States. Service on this agent constitutes service on you or any of your officers or employees for any action by EPA or otherwise by the United States related to the requirements of this part.

§ 1037.210 Preliminary approval before certification.

If you send us information before you finish the application, we may review it and make any appropriate determinations. Decisions made under this section are considered to be preliminary approval, subject to final review and approval. We will generally not reverse a decision where we have given you preliminary approval, unless we find new information supporting a different decision. If you request preliminary approval related to the upcoming model year or the model year after that, we will make best-efforts to make the appropriate determinations as soon as practicable. We will generally not provide preliminary approval related to a future model year more than two years ahead of time.

§ 1037.211 Preliminary approval for manufacturers of aerodynamic devices.

(a) If you design or manufacture aerodynamic devices for trailers, you may ask us to provide preliminary approval for the measured performance of your devices. While decisions made under this section are considered to be preliminary approval, we will not reverse a decision where we have given you preliminary approval, unless we find new information supporting a different decision. For example, where we measure the performance of your device after giving you preliminary approval and its measured performance is less than your data indicated, we may rescind the preliminary approval of your test results.

(b) To request this, you must provide test data for delta C_DA values as specified in § 1037.150(n) or § 1037.525. Trailer manufacturers may use approved delta C_DA values as inputs under § 1037.515 to support their application for certification.

(c) The following provisions apply for combining multiple devices under this section for the purpose of certifying trailers:

(1) If the device manufacturer establishes a delta C_DA value in a single test with multiple aerodynamic devices installed, trailer manufacturers may use that delta C_DA value directly for the same combination of aerodynamic devices installed on production trailers.

(2) Trailer manufacturers may combine delta C_DA values for aerodynamic devices that are not tested together, as long as each device does not significantly impair the effectiveness of another, consistent with good engineering judgment. To approximate the overall benefit of multiple devices, calculate a composite delta C_DA value for multiple aerodynamic devices by applying the full delta C_DA value for the device with the greatest aerodynamic improvement, adding the second-highest delta C_DA value multiplied by 0.9, and adding any other delta C_DA values multiplied by 0.8.

§ 1037.220 Amending maintenance instructions.

You may amend your emission-related maintenance instructions after you submit your application for certification as long as the amended instructions remain consistent with the provisions of § 1037.125. You must send the Designated Compliance Officer a written request to amend your application for certification for a vehicle family if you want to change the emission-related maintenance instructions in a way that could affect emissions. In your request, describe the proposed changes to the maintenance instructions. If operators follow the original maintenance instructions rather than the newly specified maintenance, this does not allow you to disqualify those vehicles from in-use testing or deny a warranty claim.

(a) If you are decreasing or eliminating any specified maintenance, you may distribute the new maintenance instructions to your customers 30 days after we receive your request, unless we disapprove your request. This would generally include replacing one maintenance step with another. We may approve a shorter time or waive this requirement.

(b) If your requested change would not decrease the specified maintenance, you may distribute the new maintenance instructions anytime after you send your request. For example, this paragraph (b) would cover adding instructions to increase the frequency of filter changes for vehicles in severe-duty applications.

(c) You need not request approval if you are making only minor corrections (such as correcting typographical mistakes), clarifying your maintenance instructions, or changing instructions for maintenance unrelated to emission control. We may ask you to send us copies of maintenance instructions revised under this paragraph (c).

§ 1037.225 Amending applications for certification.

Before we issue you a certificate of conformity, you may amend your application to include new or modified vehicle configurations, subject to the provisions of this section. After we have issued your certificate of conformity, but before the end of the model year, you may send us an amended application requesting that we include new or modified vehicle configurations within the scope of the certificate, subject to the provisions of this section. Before the end of the model year, you must amend your application if any changes occur with respect to any information that is included or should be included in your application. After the end of the model year, you may amend your application only to update maintenance instructions as described in § 1037.220 or to modify an FEL as described in paragraph (f) of this section.

(a) You must amend your application before you take any of the following actions:

(1) Add a vehicle configuration to a vehicle family. In this case, the vehicle configuration added must be consistent with other vehicle configurations in the vehicle family with respect to the criteria listed in § 1037.230.

(2) Change a vehicle configuration already included in a vehicle family in a way that may affect emissions, or change any of the components you described in your application for certification. This includes production and design changes that may affect emissions any time during the vehicle's lifetime.

(3) Modify an FEL for a vehicle family as described in paragraph (f) of this section.

(b) To amend your application for certification, send the relevant information to the Designated Compliance Officer.

(1) Describe in detail the addition or change in the vehicle model or configuration you intend to make.

(2) Include engineering evaluations or data showing that the amended vehicle family complies with all applicable requirements. You may do this by showing that the original emission-data vehicle is still appropriate for showing that the amended family complies with all applicable requirements.

(3) If the original emission-data vehicle or emission modeling for the vehicle family is not appropriate to show compliance for the new or modified vehicle configuration, include new test data or emission modeling showing that the new or modified vehicle configuration meets the requirements of this part.

(4) Include any other information needed to make your application correct and complete.

(c) We may ask for more test data or engineering evaluations. You must give us these within 30 days after we request them.

(d) For vehicle families already covered by a certificate of conformity, we will determine whether the existing certificate of conformity covers your newly added or modified vehicle. You may ask for a hearing if we deny your request (see § 1037.820).

(e) For vehicle families already covered by a certificate of conformity, you may start producing the new or modified vehicle configuration anytime after you send us your amended application and before we make a decision under paragraph (d) of this section. However, if we determine that the affected vehicles do not meet applicable requirements, we will notify you to cease production of the vehicles and may require you to recall the vehicles at no expense to the owner. Choosing to produce vehicles under this paragraph (e) is deemed to be consent to recall all vehicles that we determine do not meet applicable emission standards or other requirements and to remedy the nonconformity at no expense to the owner. If you do not provide information required under paragraph (c) of this section within 30 days after we request it, you must stop producing the new or modified vehicles.

(f) You may ask us to approve a change to your FEL in certain cases after the start of production. The changed FEL may not apply to vehicles you have already introduced into U.S. commerce, except as described in this paragraph (f). You may ask us to approve a change to your FEL in the following cases:

(1) You may ask to raise your FEL for your vehicle subfamily at any time. In your request, you must show that you will still be able to meet the emission standards as specified in subparts B and H of this part. Use the appropriate FELs with corresponding production volumes to calculate emission credits for the model year, as described in subpart H of this part.

(2) Where testing applies, you may ask to lower the FEL for your vehicle subfamily only if you have test data from production vehicles showing that emissions are below the proposed lower FEL. Otherwise, you may ask to lower your FEL for your vehicle subfamily at any time. The lower FEL applies only to vehicles you produce after we approve the new FEL. Use the appropriate FELs with corresponding production volumes to calculate emission credits for the model year, as described in subpart H of this part.

(3) You may ask to add an FEL for your vehicle family at any time.

§ 1037.230 Vehicle families, sub-families, and configurations.

(a) For purposes of certifying your vehicles to greenhouse gas standards, divide your product line into families of vehicles based on regulatory subcategories as specified in this section. Subcategories are specified using terms defined in § 1037.801. Your vehicle family is limited to a single model year.

(1) Apply subcategories for vocational vehicles and vocational tractors as shown in Table 1 of this section. This involves 21 separate subcategories for Phase 2 vehicles to account for engine type, GVWR, and the vehicle characteristics corresponding to the duty cycles for vocational vehicles as specified in § 1037.510; three separate subcategories apply for emergency vehicles as described in § 1037.105(b)(4). Divide Phase 1 vehicles into three GVWR-based vehicle classes as shown in Table 1 of this section, disregarding additional specified characteristics. Table 1 follows:

TABLE 1 OF § 1037.230—VOCATIONAL VEHICLE SUBCATEGORIES

Engine type	Class 2b–5	Class 6–7	Class 8
Compression-ignition	Urban	Urban	Urban.
	Multi-Purpose	Multi-Purpose	Multi-Purpose.
	Regional	Regional	Regional.
Spark-ignition	Urban	Urban	Urban.
	Multi-Purpose	Multi-Purpose	Multi-Purpose.
	Regional	Regional	Regional.
All	Emergency	Emergency	Emergency.

(2) Apply subcategories for tractors (other than vocational tractors) as shown in the following table:

TABLE 2 OF § 1037.230—TRACTOR SUBCATEGORIES

Class 7	Class 8	
Low-roof tractors	Low-roof day cabs	Low-roof sleeper cabs.
Mid-roof tractors	Mid-roof day cabs	Mid-roof sleeper cabs.
High-roof tractors	High-roof day cabs	High-roof sleeper cabs.
	Heavy-haul tractors (starting with Phase 2)	

(3) Apply subcategories for trailers as shown in the following table:

TABLE 3 OF § 1037.230— TRAILER SUBCATEGORIES

Full-aero trailers	Partial-aero trailers [a]	Other trailers
Long dry box vans	Long dry box vans	Non-aero trailers.
Short dry box vans	Short dry box vans	Non-box trailers.
Long refrigerated box vans	Long refrigerated box vans	
Short refrigerated box vans	Short refrigerated box vans	

[a] The partial-aero subcategories do not apply before model year 2027.

(b) If the vehicles in your family are being certified to more than one FEL, subdivide your greenhouse gas vehicle families into subfamilies that include vehicles with identical FELs. Note that you may add subfamilies at any time during the model year.

(c) Group vehicles into configurations consistent with the definition of "vehicle configuration" in § 1037.801. Note that vehicles with hardware or software differences that are related to measured or modeled emissions are considered to be different vehicle configurations even if they have the same modeling inputs and FEL. Note also, that you are not required to separately identify all configurations for certification. See paragraph (g) of this section for provisions allowing you to group certain hardware differences into the same configuration. Note that you are not required to identify all possible configurations for certification; also, you are required to include in your final report only those configurations you produced.

(d) You may combine dissimilar vehicles into a single vehicle family in special circumstances as follows:

(1) For a vehicle model that includes a range of GVWR values that straddle weight classes, you may include all the vehicles in the same vehicle family if you certify the vehicle family to the numerically lower CO_2 emission standard from the affected weight classes. Vehicles that are optionally certified to a more stringent under this paragraph (d)(1) are subject to useful-life and all other provisions corresponding to the weight class with the numerically lower CO_2 emission standard.

(2) You may include refrigerated box vans in a vehicle family with dry box vans; if you do this, all the trailers in the family are subject to the standards that apply for dry box vans. Similarly, you may include short trailers in a vehicle family with long trailers; if you do this, all the trailers in the family are subject to the standards that apply for long vans. You may also include short refrigerated box vans in a vehicle family with long dry box vans; if you do this, all the trailers in the family are subject to the standards that apply for long dry box vans.

(e) You may divide your families into more families than specified in this section.

(f) You may ask us to allow you to group into the same configuration vehicles that have very small body hardware differences that do not significantly affect drag areas. Note that this allowance does not apply for substantial differences, even if the vehicles have the same measured drag areas.

§ 1037.231 Powertrain families.

(a) If you choose to perform powertrain testing as specified in § 1037.550, use good engineering judgment to divide your product line into powertrain families that are expected to have similar fuel consumptions and CO_2 emission characteristics throughout the useful life. Your powertrain family is limited to a single model year.

(b) Except as specified in paragraph (c) of this section, group powertrains in the same powertrain family if they share all the following attributes:

(1) Engine family.

(2) The applicable simulated test vehicle category according to § 1037.550(f): Either Class 2b through 7, heavy-haul or Class 8 other than heavy-haul.

(3) Number of clutches.

(4) Type of clutch (*e.g.,* wet or dry).

(5) Presence and location of a fluid coupling such as a torque converter.

(6) Gear configuration, as follows:

(i) Planetary (*e.g.,* simple, compound, meshed-planet, stepped-planet, multi-stage).

(ii) Countershaft (*e.g.,* single, double, triple).

(iii) Continuously variable (*e.g.,* pulley, magnetic, torroidal).

(7) Number of available forward gears, and transmission gear ratio for each available forward gear, if applicable.

(8) Transmission oil sump configuration (*e.g.,* conventional or dry).

(9) The power transfer configuration of any hybrid technology (*e.g.,* series or parallel).

(10) The energy storage device and capacity of any hybrid technology (*e.g.,* 10 MJ hydraulic accumulator, 10 kW·hr Lithium-ion battery pack, 10 MJ ultracapacitor bank).

(11) The rated output of any hybrid mechanical power technology (*e.g.,* 50 kW electric motor).

(c) For powertrains that share all the attributes described in paragraph (b) of this section, divide them further into separate powertrain families based on common calibration attributes. Group powertrains in the same powertrain family to the extent that powertrain test results and corresponding emission levels are expected to be similar throughout the useful life.

(d) You may subdivide a group of powertrains with shared attributes under paragraph (b) of this section into different powertrain families.

(e) In unusual circumstances, you may group powertrains into the same powertrain family even if they do not have shared attributes under in paragraph (b) of this section if you show that their emission characteristics throughout the useful life will be similar.

(f) If you include the axle when performing powertrain testing for the family, you must limit the family to include only those axles represented by the test results. You may include multiple axle ratios in the family if you test with the axle expected to produce the highest emission results.

§ 1037.235 Testing requirements for certification.

This section describes the emission testing you must perform to show compliance with respect to the greenhouse gas emission standards in subpart B of this part, and to determine any input values from §§ 1037.515 and 1037.520 that involve measured quantities.

(a) Select emission-data vehicles that represent production vehicles and components for the vehicle family consistent with the specifications in §§ 1037.205(o), 1037.515, and 1037.520. Where the test results will represent multiple vehicles or components with different emission performance, use good engineering judgment to select worst-case emission data vehicles. In the case of powertrain testing under § 1037.550, select a test engine and test transmission by considering the whole range of vehicle models covered by the powertrain family and the mix of duty cycles specified in § 1037.510.

(b) Test your emission-data vehicles (including emission-data components) using the procedures and equipment specified in subpart F of this part. Measure emissions (or other parameters, as applicable) using the specified procedures.

(c) We may measure emissions (or other parameters, as applicable) from any of your emission-data vehicles.

(1) We may decide to do the testing at your plant or any other facility. If we do this, you must deliver the vehicle or component to a test facility we designate. The vehicle or component you provide must be in a configuration that is suitable for testing. If we do the testing at your plant, you must schedule it as soon as possible and make available the instruments, personnel, and equipment we need.

(2) If we measure emissions (or other parameters, as applicable) from your vehicle or component, the results of that testing become the official emission results for the vehicle or component. Note that changing the official emission result does not necessarily require a change in the declared modeling input value. Unless we later invalidate these data, we may decide not to consider your data in determining if your vehicle family meets applicable requirements. This applies equally to individual data points from powertrain testing under § 1037.550 or § 1037.551, except that the results of our testing do not become the official emission result if our results are lower than your reported test results.

(3) Before we test one of your vehicles or components, we may set its adjustable parameters to any point within the physically adjustable ranges, if applicable.

(4) Before we test one of your vehicles or components, we may calibrate it within normal production tolerances for anything we do not consider an adjustable parameter. For example, this would apply for a vehicle parameter that is subject to production variability because it is adjustable during production, but is not considered an adjustable parameter (as defined in § 1037.801) because it is permanently sealed. For parameters that relate to a level of performance that is itself subject to a specified range (such as maximum power output), we will generally perform any calibration under this paragraph (c)(4) in a way that keeps performance within the specified range.

(d) You may ask to use carryover data for a vehicle or component from a previous model year instead of doing new tests if the applicable emission-data vehicle from the previous model year remains the appropriate emission-data vehicle under paragraph (b) of this section.

(e) We may require you to test a second vehicle or component of the same configuration in addition to the vehicle or component tested under paragraph (a) of this section.

(f) If you use an alternate test procedure under 40 CFR 1065.10 and later testing shows that such testing does not produce results that are equivalent to the procedures specified in subpart F of this part, we may reject data you generated using the alternate procedure.

§ 1037.241 Demonstrating compliance with exhaust emission standards for greenhouse gas pollutants.

(a) For purposes of certification, your vehicle family is considered in compliance with the CO_2 emission standards in §§ 1037.105 through 1037.107 if all vehicle configurations in that family have calculated or modeled CO_2 emission rates from § 1037.515 or § 1037.520 that are at or below the applicable standards. Note that FELs are considered to be the applicable emission standards with which you must comply if you participate in the ABT program in subpart H of this part. Your vehicle family is deemed not to comply if any vehicle configuration in that family has a calculated or modeled CO_2 emission rate that is above the applicable standard.

(b) In the case of trailer certification that does not rely on calculated CO_2 emission rates, your vehicle family is considered in compliance with the emission standards if all vehicle configurations in that family meet specified design standards and have TRRL values at or below the specified standard. Your family is deemed not to comply for certification if any trailer does not meet specified design standards or if any vehicle configuration in that family has a measured TRRL value above the specified standard.

(c) We may require you to provide an engineering analysis showing that the performance of your emission controls will not deteriorate during the useful life with proper maintenance. If we determine that your emission controls are likely to deteriorate during the useful life, we may require you to develop and apply deterioration factors consistent with good engineering judgment. For example, you may need to apply a deterioration factor to address deterioration of battery performance for a hybrid electric vehicle. Where the highest useful life emissions occur between the end of useful life and at the low-hour test point, base deterioration factors for the vehicles on the difference between (or ratio of) the point at which the highest emissions occur and the low-hour test point.

§ 1037.243 Demonstrating compliance with evaporative emission standards.

(a) For purposes of certification, your vehicle family is considered in compliance with the evaporative emission standards in subpart B of this part if you prepare an engineering analysis showing that your vehicles in the family will comply with applicable standards throughout the useful life, and there are no test results from an emission-data vehicle representing the family that exceed an emission standard.

(b) Your evaporative emission family is deemed not to comply if your engineering analysis is not adequate to show that all the vehicles in the family will comply with applicable emission standards throughout the useful life, or if a test result from an emission-data vehicle representing the family exceeds an emission standard.

(c) To compare emission levels with emission standards, apply deterioration factors to the measured emission levels. Establish an additive deterioration factor based on an engineering analysis that takes into account the expected aging from in-use vehicles.

(d) Apply the deterioration factor to the official emission result, as described in paragraph (c) of this section, then round the adjusted figure to the same number of decimal places as the emission standard. Compare the rounded emission levels to the emission standard for each emission-data vehicle.

(e) Your analysis to demonstrate compliance with emission standards must take into account your design strategy for vehicles that require testing. Specifically, vehicles above 14,000 pounds GVWR are presumed to need the same technologies that are required for heavy-duty vehicles at or below 14,000 pounds GVWR. Similarly, your analysis to establish a deterioration factor must take into account your testing to establish deterioration factors for smaller vehicles.

§ 1037.250 Reporting and recordkeeping.

(a) Within 90 days after the end of the model year, send the Designated Compliance Officer a report including the total U.S.-directed production volume of vehicles you produced in each vehicle family during the model year (based on information available at the time of the report). Report by vehicle identification number and vehicle configuration and identify the subfamily identifier. Report uncertified vehicles sold to secondary vehicle manufacturers. Small manufacturers may omit the reporting requirements of this paragraph (a).

(b) Organize and maintain the following records:

(1) A copy of all applications and any summary information you send us.

(2) Any of the information we specify in § 1037.205 that you were not required to include in your application.

(3) A detailed history of each emission-data vehicle (including emission-related components), if applicable.

(4) Production figures for each vehicle family divided by assembly plant.

(5) Keep a list of vehicle identification numbers for all the vehicles you produce under each certificate of conformity. Also identify the technologies that make up the certified configuration for each vehicle your produce.

(c) Keep required data from emission tests and all other information specified in this section for eight years after we issue your certificate. If you use the same emission data or other information for a later model year, the eight-year period restarts with each year that you continue to rely on the information.

(d) Store these records in any format and on any media, as long as you can promptly send us organized, written records in English if we ask for them. You must keep these records readily available. We may review them at any time.

(e) If you fail to properly keep records or to promptly send us information as required under this part, we may require that you submit the information specified in this section after each calendar quarter, and we may require that you routinely send us information that the regulation requires you to submit only if we request it. If we find that you are fraudulent or grossly negligent or otherwise act in bad faith regarding information reporting and recordkeeping, we may require that you send us a detailed description of the certified configuration for each vehicle before you produce it.

§ 1037.255 What decisions may EPA make regarding my certificate of conformity?

(a) If we determine your application is complete and shows that the vehicle family meets all the requirements of this part and the Act, we will issue a certificate of conformity for your vehicle family for that model year. We may make the approval subject to additional conditions.

(b) We may deny your application for certification if we determine that your vehicle family fails to comply with emission standards or other requirements of this part or the Clean Air Act. We will base our decision on all available information. If we deny your application, we will explain why in writing.

(c) In addition, we may deny your application or suspend or revoke your certificate if you do any of the following:

(1) Refuse to comply with any testing or reporting requirements.

(2) Submit false or incomplete information (paragraph (e) of this section applies if this is fraudulent). This includes doing anything after submission of your application to render any of the submitted information false or incomplete.

(3) Render any test data inaccurate.

(4) Deny us from completing authorized activities (see 40 CFR 1068.20). This includes a failure to provide reasonable assistance.

(5) Produce vehicles for importation into the United States at a location where local law prohibits us from carrying out authorized activities.

(6) Fail to supply requested information or amend your application to include all vehicles being produced.

(7) Take any action that otherwise circumvents the intent of the Act or this part, with respect to your vehicle family.

(d) We may void the certificate of conformity for a vehicle family if you fail to keep records, send reports, or give us information as required under this part or the Act. Note that these are also violations of 40 CFR 1068.101(a)(2).

(e) We may void your certificate if we find that you intentionally submitted false or incomplete information. This includes rendering submitted information false or incomplete after submission.

(f) If we deny your application or suspend, revoke, or void your certificate, you may ask for a hearing (see § 1037.820).

Subpart D—Testing Production Vehicles and Engines

§ 1037.301 Measurements related to GEM inputs in a selective enforcement audit.

(a) We may require you to perform selective enforcement audits under 40 CFR part 1068, subpart E, with respect to any GEM inputs in your application for certification. This section describes how this applies uniquely in certain circumstances.

(b) A selective enforcement audit consist of performing measurements with production vehicles relative to one or more declared values for GEM inputs, and using those measured values in place of your declared values to run GEM. The vehicle is considered passing if the new modeled emission result is at or below the modeled emission result corresponding to the declared GEM inputs. If you have reported an FEL for the vehicle configuration prior to the start of the audit, we will instead consider the vehicle passing if the new cycle-weighted emission result is at or below the FEL.

(c) For vehicles certified based on powertrain testing as specified in § 1037.550, we may apply the selective enforcement audit requirements to the powertrain. If engine manufacturers perform the powertrain testing and include those results in their certification under 40 CFR part 1036, they are responsible for selective enforcement audits related to those results. Otherwise, the certificate holder for the vehicle is responsible for the selective enforcement audit.

(1) A selective enforcement audit for powertrains would generally consist of performing a test with the complete powertrain (engine and transmission together). We may alternatively allow you to test the engine on a dynamometer with no installed transmission as described in § 1037.551.

(2) Recreate a set of test results for each of three separate powertrains. Generate weighted GEM results for each of ten separate configurations for each of the three selected powertrains. Each unique test run for a given configuration with a particular powertrain constitutes a separate test for purposes of evaluating whether the vehicle family meets the pass-fail criteria under 40 CFR 1068.420. The test result for a single test run in the audit is considered passing if it is at or below the value selected as an input for GEM. Perform testing with up to ten separate configurations for additional powertrains as needed to reach a pass-fail decision under 40 CFR 1068.240. For example, testing three powertrains over each of ten separate test runs would represent 30 tests; the family would have a pass result if 13 or fewer of the 30 tests are failing, and the family would have a fail result if 19 or more of the 30 tests are failing, and testing with an additional powertrain would be required if 14–18 of the 30 tests are failing. In the case of testing engines to simulate powertrain testing, apply the provisions of this paragraph (c)(2) based on separately simulated powertrains and vehicle configurations.

(d) To perform a selective enforcement audit with respect to drag area, use the same method you used for certification; we may instead require you to use the reference method specified in § 1037.525. For this paragraph (d), all measurements for tractors must include $F_{\text{alt-aero}}$ and adjustments to account for wind-averaged drag as applicable under § 1037.525. The following provisions apply instead of 40 CFR 1068.420 for a selective enforcement audit with respect to drag area:

(1) Determine whether or not a vehicle fails to meet standards as follows:

(i) For tractors, a failed vehicle is one whose measured drag area exceeds the maximum drag area corresponding to the bin you identified in your application for certification.

(ii) For trailers, a failed vehicle is a failed vehicle is one whose delta C_{DA} based on measured values is less than the minimum drag area corresponding to the bin you identified in your application for certification.

(2) Measure drag area for a minimum of two vehicles. If one of those vehicles fails, measure drag area for two additional vehicles from the vehicle family. If both of those vehicles fail, measure drag area for four additional vehicles from the vehicle family. You may perform testing on additional vehicles.

(3) Determine whether a vehicle family passes or fails the audit as follows:

(i) For tractors, you reach a pass decision for the audit if the arithmetic average value of the drag area for all tested vehicles is at or below the maximum value corresponding to the bin you identified in your application for certification. You reach a fail decision for the audit if this average value is above the maximum value corresponding to the bin you identified in your application for certification.

(ii) For trailers, you reach a pass decision for the audit if the arithmetic average value of delta C_DA is at or above the minimum value corresponding to the bin you identified in your application for certification. You reach a fail decision for the audit if this average value is below the minimum value corresponding to the bin you identified in your application for certification.

(4) In the case of trailer certification that relies on data from a device manufacturer under § 1037.211, we may require the device manufacturer to perform a selective enforcement audit as described in this paragraph (d). Our test order will establish the equivalent of a vehicle family for performing tests for the audit. If the audit leads to a fail result for the family, we may revoke our approval under § 1037.211 as that relates to any future application for certification.

(5) If we test some of your vehicles in addition to your testing, we may decide not to include your test results as official data for those vehicles if there is substantial disagreement between your testing and our testing. We will reinstate your data as valid if you show us that we made an error and your data are correct. If we perform testing, we may choose to stop testing after any number of tests.

(6) If we rely on our test data instead of yours, we will notify you in writing of our decision and the reasons we believe your facility is not appropriate for doing the tests we require under this paragraph (c). You may request in writing that we consider your test results from the same facility for future testing if you show us that you have made changes to resolve the problem.

(7) We may allow you to perform additional replicate tests with a given vehicle to reduce measurement variability, consistent with good engineering judgment.

(e) Selective enforcement audit provisions for fuel maps apply to engine manufacturers as specified in 40 CFR 1036.301.

(f) We may suspend or revoke certificates, based on the outcome of a selective enforcement audit, for any appropriate configurations within one or more vehicle families.

(g) We may apply selective enforcement audit provisions with respect to off-cycle technologies, with any necessary modifications, consistent with good engineering judgment.

Subpart E—In-Use Testing

§ 1037.401 General provisions.

(a) We may perform in-use testing of any vehicle subject to the standards of this part. For example, we may test vehicles to verify drag areas or other GEM inputs as specified in paragraph (b) of this section.

(b) We may measure the drag area of a vehicle you produced after it has been placed into service. We may use any of the procedures specified in § 1037.525 for measuring drag area. Your vehicle conforms to the regulations of this part with respect to aerodynamic performance if we measure its drag area to be at or below the maximum drag area allowed for the bin to which that configuration was certified.

Subpart F—Test and Modeling Procedures

§ 1037.501 General testing and modeling provisions.

This subpart specifies how to perform emission testing and emission modeling required elsewhere in this part.

(a) You must demonstrate that you meet emission standards using emission modeling as described in §§ 1037.515 and 1037.520. This modeling depends on several measured values as described in this subpart F. You may rely on fuel maps from the engine manufacturer as described in 40 CFR 1036.535, or you may instead use powertrain testing as described in § 1037.550.

(b) Where exhaust emission testing is required, use the equipment and procedures in 40 CFR part 1065 and/or part 1066, as applicable. Measure the emissions of all the exhaust constituents subject to emission standards as specified in 40 CFR part 1065 and/or part 1066, as applicable. Use the applicable duty cycles specified in § 1037.510.

(c) See 40 CFR 86.101 and 86.1813 for measurement procedures that apply for evaporative and refueling emissions.

(d) Use the applicable fuels specified 40 CFR part 1065 to perform valid tests.

(1) For service accumulation, use the test fuel or any commercially available fuel that is representative of the fuel that in-use vehicles will use.

(2) For diesel-fueled vehicles, use the appropriate diesel fuel specified for emission testing. Unless we specify otherwise, the appropriate diesel test fuel is ultra low-sulfur diesel fuel.

(3) For gasoline-fueled vehicles, use the gasoline specified for ''General Testing''.

(e) You may use special or alternate procedures as specified in 40 CFR 1065.10.

(f) This subpart is addressed to you as a manufacturer, but it applies equally to anyone who does testing for you, and to us when we perform testing to determine if your vehicles meet emission standards.

(g) Apply this paragraph (g) whenever we specify the use of standard trailers. Unless otherwise specified, a tolerance of ±2 inches applies for all nominal trailer dimensions.

(1) The standard trailer for high-roof tractors must meet the following criteria:

(i) It is an unloaded two-axle dry van box trailer 53.0 feet long, 102 inches wide, and 162 inches high (measured from the ground with the trailer level).

(ii) It has a king pin located with its center 36±0.5 inches from the front of the trailer and a minimized trailer gap (no greater than 45 inches).

(iii) It has a simple orthogonal shape with smooth surfaces and nominally flush rivets. Except as specified in paragraph (g)(1)(v) of this section, the standard trailer does not include any aerodynamic features such as side fairings, rear fairings, or gap reducers. It may have a scuff band no more than 0.13 inches thick.

(iv) It includes dual 22.5 inch wheels, standard tandem axle, standard mudflaps, and standard landing gear. The centerline of the tandem axle assembly must be 146±4 inches from the rear of the trailer. The landing gear must be installed in a conventional configuration.

(v) For the Phase 2 standards, include side skirts meeting the specifications of this paragraph (g)(1)(v). The side skirts must be mounted flush with the sides of the trailer and may extend as far forward as the centerline of the landing gear and as far rearward as the leading edge of the front wheel, with a height of 36±2 inches. We may approve your request to use a skirt with different dimensions if these specified values are impractical or inappropriate for your test trailer, and you propose alternative dimensions that provide an equivalent or comparable degree of aerodynamic drag for your test configuration.

(2) The standard trailer for mid-roof tractors is an empty two-axle tanker trailer 42±1 feet long by 140 inches high.

(i) It has a 40±1 feet long cylindrical tank with a 7000±7 gallon capacity, smooth surface, and rounded ends.

(ii) The standard tanker trailer does not include any aerodynamic features such as side fairings, but does include a centered 20 inch manhole, side-centered ladder, and lengthwise walkway. It includes dual 24.5 inch wheels.

(3) The standard trailer for low-roof tractors is an unloaded two-axle flat bed trailer 53±1 feet long and 102 inches wide.

(i) The deck height is 60.0±0.5 inches in the front and 55.0±0.5 inches in the rear. The standard trailer does not include any aerodynamic features such as side fairings.

(ii) It includes an air suspension and dual 22.5 inch wheels on tandem axles spread up to 122 inches apart between axle centerlines, measured along the length of the trailer.

(h) Use a standard tractor for measuring aerodynamic drag of trailers. Standard tractors must be certified at Bin III or better for Phase 1 or Phase 2 under § 1037.520(b)(1) or (3). The standard tractor for long trailers is a Class 8 high-roof sleeper cab. The standard tractor for short trailers is a Class 8 high-roof day cab.

§ 1037.510 Duty-cycle exhaust testing.

This section applies for Phase 2 powertrain testing, certain off-cycle testing under § 1037.610, and the Phase 1 advanced-technology provisions of § 1037.615.

(a) Measure emissions by testing the vehicle on a chassis dynamometer or the powertrain on a powertrain dynamometer with the applicable duty cycles. Each duty cycle consists of a series of speed commands over time—variable speeds for the transient test and constant speeds for the cruise tests. None of these cycles include vehicle starting or warmup.

(1) Perform testing for Phase 1 vehicles as follows to generate credits or adjustment factors for off-cycle or advanced technologies:

(i) *Transient cycle.* The transient cycle is specified in Appendix I of this part. Warm up the vehicle. Start the duty cycle within 30 seconds after concluding the warm-up procedure. Start sampling emissions at the start of the duty cycle.

(ii) *Cruise cycle.* For the 55 mph and 65 mph cruise cycles, warm up the vehicle at the test speed, then sample emissions for 300 seconds while maintaining vehicle speed within ±1.0 mph of the speed setpoint; this speed tolerance applies instead of the approach specified in 40 CFR 1066.425(b)(1) and (2).

(2) If you rely on powertrain testing under § 1037.550 for demonstrating compliance with Phase 2 vehicle standards, perform testing as described in this paragraph (a)(2) to generate GEM inputs for each of the eight or nine test runs representing different vehicle configurations, and for each of the four test runs representing different idle speed settings. You may perform any number of these test runs directly in succession once the vehicle is warmed up. For these tests and other powertrain tests, perform testing as follows:

(i) *Transient cycle.* The transient cycle is specified in Appendix I of this part. Warm up the vehicle by operating over one transient cycle. Within 60 seconds after concluding the warm up cycle, start emission sampling while the vehicle operates over the duty cycle.

(ii) *Cruise cycle.* The grade portion of the route corresponding to the 55 mph and 65 mph cruise cycles is specified in Appendix IV of this part. Warm up the vehicle by operating it at the appropriate speed setpoint over the duty cycle. Within 60 seconds after concluding the warm-up cycle, start emission sampling while the vehicle operates over the duty cycle, maintaining vehicle speed within ±1.0 mph of the speed setpoint; this speed tolerance applies instead of the approach specified in 40 CFR 1066.425(b)(1) and (2).

(iii) *Idle cycle.* Perform testing with the idle cycle for Phase 2 vocational vehicles. Warm up the vehicle by operating it at 65 mph for 600 seconds. Within 60 seconds after concluding the warm-up cycle, set the engine to operate at idle speed for 600 seconds, with the brake applied and the transmission in drive (or clutch depressed for manual transmission).

(3) For other testing of Phase 2 and later vehicles, perform testing on a chassis dynamometer as follows:

(i) *Transient cycle.* The transient cycle is specified in Appendix I of this part. Warm up the vehicle by operating over one transient cycle. Within 60 seconds after concluding the warm up cycle, start emission sampling while the vehicle operates over the duty cycle.

(ii) *Cruise cycle.* The grade portion of the route corresponding to the 55 mph and 65 mph cruise cycles is specified in Appendix IV of this part. Warm up the vehicle by operating it at the appropriate speed setpoint over the duty cycle. Within 60 seconds after concluding the warm-up cycle, start emission sampling while the vehicle operates over the duty cycle, maintaining vehicle speed within ±1.0 mph of the speed setpoint; this speed tolerance applies instead of the approach specified in 40 CFR 1066.425(b)(1) and (2).

(b) Calculate the official emission result from the following equation:

$$e_{\mathrm{CO2comp}} = \frac{1}{PL \cdot \bar{v}_{\mathrm{moving}}} \cdot \left((1 - w_{\mathrm{idle}}) \cdot \left(\frac{w_{transient} \cdot m_{transient}}{D_{transient}} + \frac{w_{55} \cdot m_{55}}{D_{55}} + \frac{w_{65} \cdot m_{65}}{D_{65}} \right) \cdot \bar{v}_{\mathrm{moving}} + w_{\mathrm{idle}} \cdot \bar{\dot{m}}_{\mathrm{idle}} \right) \quad \text{Eq. 1037.510-1}$$

Where:

e_{CO2comp} = total composite mass of CO_2 emissions in g/ton-mile, rounded to the nearest whole number.

PL = the standard payload, in tons, as specified in § 1037.705.

v_{moving} = mean composite weighted driven vehicle speed, excluding idle operation, as shown in Table 1 of this section for Phase 2 vocational vehicles. For other vehicles, let v_{moving} = 1.

$w_{[\mathrm{cycle}]}$ = weighting factor for the appropriate test cycle, as shown in Table 1 of this section.

$m_{[\mathrm{cycle}]}$ = CO_2 mass emissions over each test cycle (other than idle), in g/test.

$D_{[\mathrm{cycle}]}$ = the total driving distance for the indicated drive cycle. Use 2.84 miles for the transient cycle, and use 12.5 miles for both of the cruise cycles.

$\bar{\dot{m}}_{\mathrm{idle}}$= CO_2 emission rate at idle, in g/hr.

Example: Class 8 vocational vehicle meeting the Phase 2 standards based on the Regional duty cycle.

PL = 7.5 tons

$\bar{v}_{\mathrm{moving}}$ = 28.1 mph

$w_{\mathrm{transient}}$ = 50% = 0.50

w_{55} = 28% = 0.28

w_{65} = 22% = 0.22

w_{idle} = 10% = 0.10

$m_{\mathrm{transient}}$ = 6184.7 g

m_{55} = 5260.0 g

m_{65} = 7452.5 g

$D_{\mathrm{transient}}$ = 2.84

D_{55} = 12.5

D_{65} = 12.5

$\bar{\dot{m}}_{\mathrm{idle}}$= 11707 g/hr

$$e_{\mathrm{CO2}} = \frac{1}{7.5 \cdot 28.1} \cdot \left((1 - 0.10) \cdot \left(\frac{0.50 \cdot 6184.7}{2.84} + \frac{0.28 \cdot 5260.0}{12.5} + \frac{0.22 \cdot 7452.5}{12.5} \right) \cdot 28.1 + 0.10 \cdot 11707 \right) = 166.1 \text{ g/ton-mile}$$

(c) Apply weighting factors specific to each type of vehicle and for each duty cycle as follows:

(1) Apply weighting factors for tractors as shown in Table 1 of this section. Note that the weighting factors specified here are equivalent to weighting factors in GEM.

(2) Apply weighting factors for vocational vehicles as shown in Table 1 of this section. For Phase 2 vocational vehicles, select the most appropriate duty cycle for modeling emission results with each vehicle configuration. The default is the Multi-Purpose Duty Cycle. You may need to instead select the Regional Duty Cycle or the Urban Duty Cycle as follows:

(i) Except as specified in paragraph (c)(2)(iii) of this section, use the Regional Duty Cycle for each configuration meeting any of the following characteristics:

(A) The vehicle configuration as modeled in GEM reaches a speed of 65 miles per hour at less than 75% of maximum test speed for compression-ignition engines, and at less than 45% maximum test speed for spark-ignition engines, when operating in the highest available transmission gear. Maximum test speed is the highest speed from the engine's fuel map.

(B) The vehicle is intended to be used as an intercity bus.

(C) The vehicle is intended to be used for temporary housing, such as for camping.

(D) The engine was certified based on testing only with the ramped-modal cycle.

(ii) Except as specified in paragraph (c)(2)(iii) of this section, use the Urban Duty Cycle for each configuration meeting any of the following characteristics:

(A) The vehicle configuration as modeled in GEM does not reach a speed of 55 miles per hour before the engine is at or above 90% of maximum test speed for compression-ignition engines, and at or above 50% maximum test speed for spark-ignition engines, when operating in the highest available transmission gear.

(B) The vehicle has a hybrid powertrain.

(iii) You may ask us to make a different determination with respect to the duty cycle than we specify in this paragraph (c)(2) if you can demonstrate that a different duty cycle is more appropriate for a certain vehicle configuration.

(3) Use the values for weighting factors and average speed in the following table to properly simulate the appropriate duty cycle:

TABLE 1 OF § 1037.510—WEIGHTING FACTORS FOR DUTY CYCLES

	Distance-weighted			Time-weighted		Average speed while moving, (mph)
	Transient (percent)	55 mph cruise (percent)	65 mph cruise (percent)	Idle (percent)	Non-idle (percent)	
Day Cabs	19	17	64			
Sleeper Cabs	5	9	86			
Heavy-haul tractors	19	17	64			
Vocational—Multi-Purpose	82	15	3	15	85	20.9
Vocational—Regional	50	28	22	10	90	28.1
Vocational—Urban	94	6	0	20	80	19.2

TABLE 1 OF § 1037.510—WEIGHTING FACTORS FOR DUTY CYCLES—Continued

	Distance-weighted			Time-weighted		Average speed while moving, (mph)
	Transient (percent)	55 mph cruise (percent)	65 mph cruise (percent)	Idle (percent)	Non-idle (percent)	
Vocational with conventional powertrain (Phase 1 only)	42	21	37			
Vocational Hybrid Vehicles (Phase 1 only)	75	9	16			

(d) For transient testing, compare actual second-by-second vehicle speed with the speed specified in the test cycle and ensure any differences are consistent with the criteria as specified in 40 CFR 1066.425. If the speeds do not conform to these criteria, the test is not valid and must be repeated.

(e) Run test cycles as specified in 40 CFR part 1066. For cruise cycle testing of vehicles equipped with cruise control, use the vehicle's cruise control to control the vehicle speed. For vehicles equipped with adjustable vehicle speed limiters, test the vehicle with the vehicle speed limiter at its highest setting.

(f) For Phase 1, test the vehicle using its adjusted loaded vehicle weight, unless we determine this would be unrepresentative of in-use operation as specified in 40 CFR 1065.10(c)(1).

(g) For hybrid vehicles, correct for the net energy change of the energy storage device as described in 40 CFR 1066.501.

§ 1037.515 Determining CO_2 emissions to show compliance for trailers.

This section describes a compliance approach for trailers that is consistent with the modeling for vocational vehicles and tractors described in § 1037.520, but is simplified consistent with the smaller number of trailer parameters that affect CO_2 emissions. Note that the calculated CO_2 emission rate, e_{CO2}, is equivalent to the value that would result from running GEM with the same input values.

(a) *Compliance equation.* Calculate CO_2 emissions for demonstrating compliance with emission standards for each trailer configuration using the following equation:

$$e_{CO2} = \left(C_1 + C_2 \cdot TRRL + C_3 \cdot \Delta C_D A + C_4 \cdot WR\right) \cdot C_5 \qquad \text{Eq. 1037.515-1}$$

Where:

C_i = constant values for calculating CO_2 emissions from this regression equation derived from GEM, as shown in Table 1 of this section. Let C_5 = 0.985 for trailers that have automatic tire inflation systems with all wheels; otherwise, let C_5 = 1.

$TRRL$ = tire rolling resistance level, in kg per metric ton, as specified in paragraph (b) of this section.

$\Delta C_D A$ = the delta $C_D A$ value for the trailer, in m^2, as specified in paragraph (c) of this section.

WR = weight reduction, in pounds, as specified in paragraph (d) of this section.

TABLE 1 OF § 1037.515—REGRESSION COEFFICIENTS FOR CALCULATING CO_2 EMISSIONS

Trailer category	C_1	C_2	C_3	C_4
Long dry box ban	77.4	1.7	−6.1	−0.001
Long refrigerated box van	78.3	1.8	−6.0	−0.001
Short dry box van	134.0	2.2	−10.5	−0.003
Short refrigerated box van	136.3	2.4	−10.3	−0.003

(b) *Tire rolling resistance.* Use the procedure specified in § 1037.520(c) to determine the tire rolling resistance level for your tires. Note that you may base tire rolling resistance levels on measurements performed by tire manufacturers, as long as those measurements meet this part's specifications.

(c) *Drag area.* You may use delta $C_D A$ values approved under § 1037.211 for device manufacturers if your trailers are properly equipped with those devices. Determine delta $C_D A$ values for other trailers based on testing. Measure $C_D A$ and determine delta $C_D A$ values as described in § 1037.525(a). You may use delta $C_D A$ values from one trailer configuration to represent any number of additional trailers based on worst-case testing. This means that you may apply delta $C_D A$ values from your measurements to any trailer models of the same category with drag area at or below that of the tested configuration. For trailers in the ''short trailer'' subcategory that are not 28 feet long, apply the delta $C_D A$ value established for a comparable 28-foot trailer model; you may use the same devices designed for 28-foot trailers or you may adapt those devices as appropriate for the different trailer length, consistent with good engineering judgment. For example, 48-foot trailers may use longer side skirts than the skirts that were tested with a 28-foot trailer. Trailer and device manufacturers may seek preliminary approval for these adaptations. Determine bin levels based on delta $C_D A$ test results as described in the following table:

TABLE 2 OF § 1037.515—BIN DETERMINATIONS FOR TRAILERS BASED ON AERODYNAMIC TEST RESULTS

[delta C_DA in m²]

If a trailer's measured delta C_DA is . . .	designated the trailer as . . .	and use the following values for delta C_DA
≤ 0.09	Bin I	0.0
0.10–0.19	Bin II	0.1
0.20–0.39	Bin III	0.3
0.40–0.59	Bin IV	0.5
0.60–0.79	Bin V	0.7
0.80–1.19	Bin VI	1.0
1.20–1.59	Bin VII	1.4
≥1.60	Bin VIII	1.8

(d) *Weight reduction.* Determine weight reduction for a trailer configuration by summing all applicable values, as follows:

(1) Determine weight reduction for using lightweight materials for wheels as described in § 1037.520(e).

(2) Apply weight reductions for other components made with light-weight materials as shown in the following table:

TABLE 3 OF § 1037.515—WEIGHT REDUCTIONS FOR TRAILERS

[pounds]

Component	Material	Weight reduction (pounds)
Structure for Suspension Assembly [1]	Aluminum	280
Hub and Drum (per axle)	Aluminum	80
Floor	Aluminum	375
Floor	Composite (wood and plastic)	245
Floor Crossmembers	Aluminum	203
Landing Gear	Aluminum	50
Rear Door	Aluminum	187
Rear Door Surround	Aluminum	150
Roof Bows	Aluminum	100
Side Posts	Aluminum	300
Slider Box	Aluminum	150
Upper Coupler Assembly	Aluminum	430

[1] For tandem-axle suspension sub-frames made of aluminum, apply a weight reduction of 280 pounds. Use good engineering judgment to estimate a weight reduction for using aluminum sub-frames with other axle configurations.

§ 1037.520 Modeling CO_2 emissions to show compliance for vocational vehicles and tractors.

This section describes how to use the Greenhouse gas Emissions Model (GEM) simulation tool (incorporated by reference in § 1037.810) to show compliance with the CO_2 standards of §§ 1037.105 and 1037.106 for vocational vehicles and tractors. Use GEM version 2.0.1 to demonstrate compliance with Phase 1 standards; use GEM Phase 2 version 1.0 (''GEM_P2v1.0'') to demonstrate compliance with Phase 2 standards. Use good engineering judgment when demonstrating compliance using GEM. See § 1037.515 for calculation procedures for demonstrating compliance with trailer standards.

(a) *General modeling provisions.* To run GEM, enter all applicable inputs as specified by the model.

(1) GEM inputs apply for Phase 1 and Phase 2 standards as follows:

(i) Regulatory subcategory (see § 1037.230).

(ii) Coefficient of aerodynamic drag or drag area, as described in paragraph (b) of this section (tractors only).

(iii) Steer tire rolling resistance, as described in paragraph (c) of this section.

(iv) Drive tire rolling resistance, as described in paragraph (c) of this section.

(v) Vehicle speed limit, as described in paragraph (d) of this section (tractors only).

(vi) Vehicle weight reduction, as described in paragraph (e) of this section (tractors only for Phase 1).

(vii) Credit for idle-reduction strategies, as described in paragraph (f) of this section (only for Class 8 sleeper cabs and Phase 2 vocational vehicles).

(2) Additional GEM inputs apply for Phase 2 standards as follows:

(i) Transmission make, model, and type. Also identify the gear ratio for every available forward gear to two decimal places.

(ii) Engine make, model, fuel type, engine family name, calibration identification. Also identify whether the engine is subject to spark-ignition or compression-ignition standards under 40 CFR part 1036.

(iii) Drive axle ratio, k_a. If a vehicle is designed with two or more user-selectable axle ratios, use the drive axle ratio that is expected to be engaged for the greatest driving distance. If the vehicle does not have a drive axle, such as a hybrid vehicle with direct electric drive, let k_a = 1.

(iv) Various engine and vehicle operational characteristics, as described in paragraph (f) of this section.

(v) Engine fuel map, as described in paragraph (g) of this section. Include fuel consumption at idle for vocational vehicles.

(vi) Engine full-load torque curve and motoring torque curve, as described in paragraph (h) of this section.

(vii) Loaded tire radius for drive tires, expressed to the nearest 0.01 m, as described in paragraph (c) of this section.

(viii) Vehicles with hybrid power take-off, as described in paragraph (j) of this section (vocational vehicles only).

(ix) Declared engine idle speed at CITT. This is the engine's idle speed when the vehicle is in drive.

(3) You may certify your vehicles based on powertrain testing as described in § 1037.550, rather than fuel maps, to characterize fuel consumption rates at different speed and torque values as follows:

(i) Compliance based on powertrain testing is required for hybrid electric vehicles and all vehicles with a transmission that is not automatic, automated manual, manual, or dual-clutch. Compliance based on powertrain testing is optional for all other vehicles.

(ii) GEM inputs associated with powertrain testing include powertrain family, transmission calibration, test data from § 1037.550, and the powertrain test configuration (dynamometer connected to transmission output or wheel hub). You do not need to identify or provide inputs for transmission gear ratios, fuel map data, or engine torque curves, which would otherwise be required under paragraph (a)(2) of this section.

(iii) Fuel consumption at idle is still required for vocational vehicles.

(4) If you certify emergency vehicles to the alternative standards specified in § 1037.105(b)(4), run GEM by identifying the vehicle as an emergency vehicle and enter values for tire rolling resistance as specified in paragraph (c) of this section. GEM requires no additional data entry for qualifying emergency vehicles.

(5) You may use a default fuel map for specialty vehicles using engines certified to alternate standards under § 1037.605.

(b) *Coefficient of aerodynamic drag and drag area.* Determine the appropriate drag area, C_DA, for tractors as described in this paragraph (b). Use the recommended method or an alternate method to establish a value for C_DA, expressed in m² to one decimal place, as specified in § 1037.525. Where we allow you to group multiple configurations together, measure C_DA of the worst-case configuration.

(1) Except as specified in paragraph (b)(2) of this section, determine the Phase 1 bin level for your vehicle based on measured C_DA values as shown in the following tables:

TABLE 1 OF § 1037.520—C_D INPUTS FOR PHASE 1 HIGH-ROOF TRACTORS

Tractor type	Bin level	If your measured C_{DA} (m²) is . . .	Then your C_D input is . . .
High-Roof Day Cabs	Bin I	≥ 8.0	0.79
	Bin II	7.1–7.9	0.72
	Bin III	6.2–7.0	0.63
	Bin IV	5.6–6.1	0.56
	Bin V	≤ 5.5	0.51
High-Roof Sleeper Cabs	Bin I	≥ 7.6	0.75
	Bin II	6.8–7.5	0.68
	Bin III	6.3–6.7	0.60
	Bin IV	5.6–6.2	0.52
	Bin V	≤5.5	0.47

TABLE 2 OF § 1037.520—C_D INPUTS FOR PHASE 1 LOW-ROOF AND MID-ROOF TRACTORS

Tractor type	Bin level	If your measured C_DA (m²) is . . .	Then your C_D input is . . .
Low-Roof Day and Sleeper Cabs	Bin I	≥ 5.1	0.77
	Bin II	≤ 5.0	0.71
Mid-Roof Day and Sleeper Cabs	Bin I	≥ 5.6	0.87
	Bin II	≤ 5.5	0.82

(2) For Phase 1 low- and mid-roof tractors, you may instead determine your drag area bin based on the drag area bin of an equivalent high-roof tractor. If the high-roof tractor is in Bin I or Bin II, then you may assume your equivalent low- and mid-roof tractors are in Bin I. If the high-roof tractor is in Bin III, Bin IV, or Bin V, then you may assume your equivalent low- and mid-roof tractors are in Bin II.

(3) For Phase 2 tractors other than heavy-haul tractors, determine bin levels and C_{DA} inputs as follows:

(i) Determine bin levels for high-roof tractors based on aerodynamic test results as described in the following table:

TABLE 3 OF § 1037.520—BIN DETERMINATIONS FOR PHASE 2 HIGH-ROOF TRACTORS BASED ON AERODYNAMIC TEST RESULTS

[C_{DA} in m²]

Tractor type	Bin I	Bin II	Bin III	Bin IV	Bin V	Bin VI	Bin VII
Day Cabs	≥7.5	6.8–7.4	6.2–6.7	5.6–6.1	5.1–5.5	4.7–5.0	≤4.6
Sleeper Cabs	≥7.3	6.6–7.2	6.0–6.5	5.4–5.9	4.9–5.3	4.5–4.8	≤4.4

(ii) For low- and mid-roof tractors, you may determine your bin level based on aerodynamic test results as described in Table 4 of this section, or based on the bin level of an equivalent high-roof tractor as shown in Table 5 of this section.

TABLE 4 OF § 1037.520—BIN DETERMINATIONS FOR PHASE 2 LOW-ROOF AND MID-ROOF TRACTORS BASED ON AERODYNAMIC TEST RESULTS

[C_{DA} in m²]

Tractor type	Bin I	Bin II	Bin III	Bin IV
Low-Roof Cabs	≥5.1	4.6–5.0	4.2–4.5	≤4.1
Mid-Roof Cabs	≥6.5	6.0–6.4	5.6–5.9	≤5.5

TABLE 5 OF § 1037.520—BIN DETERMINATIONS FOR PHASE 2 LOW- AND MID-ROOF TRACTORS BASED ON EQIVALENT HIGH-ROOF TRACTORS

If your equivalent high-roof tractor is . . .	then the corresponding low- and mid-roof tractors is . . .
Bin I	Bin I.
Bin II	Bin I.
Bin III	Bin II.
Bin IV	Bin II.

TABLE 5 OF § 1037.520—BIN DETERMINATIONS FOR PHASE 2 LOW- AND MID-ROOF TRACTORS BASED ON EQIVALENT HIGH-ROOF TRACTORS—Continued

If your equivalent high-roof tractor is . . .	then the corresponding low- and mid-roof tractors is . . .
Bin V	Bin III.
Bin VI	Bin III.
Bin VII	Bin IV.

(iii) Determine the C_{DA} input according to the tractor's bin level as described in the following table:

TABLE 6 OF § 1037.520—PHASE 2 C_{DA} TRACTOR INPUTS BASED ON BIN LEVEL

Tractor type	Bin I	Bin II	Bin III	Bin IV	Bin V	Bin VI	Bin VII
High-Roof Day Cabs	7.6	7.1	6.5	5.8	5.3	4.9	4.5
High-Roof Sleeper Cabs	7.4	6.9	6.3	5.6	5.1	4.7	4.3
Low-Roof Cabs	5.3	4.8	4.3	4.0			
Mid-Roof Cabs	6.7	6.2	5.7	5.4			

(c) *Tire radius and rolling resistance.* You must have a loaded radius and a tire rolling resistance level (TRRL) for each tire configuration. For purposes of this section, you may consider tires with the same SKU number to be the same configuration. Determine TRRL input values separately for drive and steer tires; determine tire radius only for drive tires.

(1) Determine a tire's loaded radius as specified in ISO 28580 (incorporated by reference in § 1037.810).

(2) Measure tire rolling resistance in kg per metric ton as specified in ISO 28580 (incorporated by reference in § 1037.810), except as specified in this paragraph (c). Use good engineering judgment to ensure that your test results are not biased low. You may ask us to identify a reference test laboratory to which you may correlate your test results. Prior to beginning the test procedure in Section 7 of ISO 28580 for a new bias-ply tire, perform a break-in procedure by running the tire at the specified test speed, load, and pressure for 60±2 minutes.

(3) For each tire design tested, measure rolling resistance of at least three different tires of that specific design and size. Perform the test at least once for each tire. Use the arithmetic mean of these results as your test result. You may use this value or any higher value as your GEM input for TRRL. You must test at least one tire size for each tire model, and may use engineering analysis to determine the rolling resistance of other tire sizes of that model. Note that for tire sizes that you do not test, we will treat your analytically derived rolling resistances the same as test results, and we may perform our own testing to verify your values. We may require you to test a small sub-sample of untested tire sizes that we select.

(4) If you obtain your test results from the tire manufacturer or another third party, you must obtain a signed statement from the party supplying those test results to verify that tests were conducted according to the requirements of this part. Such statements are deemed to be submissions to EPA.

(5) For tires marketed as light truck tires and that have load ranges C, D, or E, use as the GEM input TRRL multiplied by 0.87.

(d) *Vehicle speed limit.* If the vehicles will be equipped with a vehicle speed limiter, input the maximum vehicle speed to which the vehicle will be limited (in miles per hour rounded to the nearest 0.1 mile per hour) as specified in § 1037.640. Otherwise leave this field blank. Use good engineering judgment to ensure the limiter is tamper resistant. We may require you to obtain preliminary approval for your designs.

(e) *Vehicle weight reduction.* Develop a weight-reduction as a GEM input as described in this paragraph (e). For purposes of this paragraph (e), high-strength steel is steel with tensile strength at or above 350 MPa.

(1) Vehicle weight reduction inputs for wheels are specified relative to dual-

wide tires with conventional steel wheels. For purposes of this paragraph (e)(1), an aluminum alloy qualifies as light-weight if a dual-wide drive wheel made from this material weighs at least 21 pounds less than a comparable conventional steel wheel. The inputs are listed in Table 7 of this section. For example, a tractor or vocational vehicle with aluminum steer wheels and eight (4×2) dual-wide aluminum drive wheels would have an input of 210 pounds (2×21 + 8×21).

TABLE 7 OF § 1037.520—WHEEL-RELATED WEIGHT REDUCTIONS

Weight-Reduction Technology		Weight Reduction (lb per tire or wheel)
Wide-Based Single Drive Tire or Wide-Based Single Trailer Tire with . . .	Steel Wheel	84
	Aluminum Wheel	139
	Light-Weight Aluminum Alloy Wheel	147
Steer Tire, Dual-wide Drive Tire, or Dual-wide Trailer Tire with . . .	High-Strength Steel Wheel	8
	Aluminum Wheel	21
	Light-Weight Aluminum Alloy Wheel	30

(2) Weight reduction inputs for tractor components other than wheels are specified in the following table:

TABLE 8 OF § 1037.520—NONWHEEL-RELATED WEIGHT REDUCTIONS FROM ALTERNATIVE MATERIALS FOR TRACTORS

[pounds]

Weight reduction technologies	Aluminum	High-strength steel	Thermoplastic
Door	20	6	
Roof	60	18

<tr><td>Frame Rails</td><td>High Strength Steel</td><td>24</td><td>40</td><td>87</td></tr>
</table>

(4) Apply vehicle weight inputs for changing technology configurations as follows:

(i) For Class 8 tractors or Class 8 vocational vehicles with a permanent 6×2 axle configuration, apply a weight reduction input of 300 pounds.

(ii) For Class 8 tractors with 4×2 axle configuration, apply a weight reduction input of 400 pounds.

(iii) For tractors with installed engines with displacement below 14.0 liters, apply a weight reduction of 300 pounds.

(iv) GEM accounts for increased vehicle weight for vehicles that use natural gas. For vehicles that use a fuel other than diesel fuel, gasoline, or natural gas, use good engineering judgment to determine an appropriate weight adjustment relative to a comparable vehicle fueled by gasoline or diesel fuel. This may require a negative value.

(5) You may ask to apply the off-cycle technology provisions of § 1037.610 for weight reductions not covered by this paragraph (e).

(f) *Additional vehicle characteristics.* GEM accounts for CO_2 emission reductions for certain technologies and vehicle configurations as noted in this paragraph (f) for Phase 2 vehicles. Because these adjustments are made internal to GEM, you need to identify the features as GEM inputs rather than separately applying these adjustments to GEM results. These adjustments (as applicable for GEM 3.0) are summarized for informational purposes only.

(1) GEM applies a 2.5% emission reduction for single drive axles with the following Class 8 vehicles:

(i) Tractors in a 4×2 configuration.

(ii) Vocational vehicles and tractors with a permanent 6×2 configuration. The same emission reduction applies for part-time 6×2 configurations, but only for the cruise cycles specified in § 1037.510.

(2) GEM applies a 0.5% emission reduction for vehicles that use a low-friction drive axle lubricant, as follows:

(i) A lubricant qualifies if it meets the specifications for BASF Emgard FE 2986 as described in ''Emgard® FE 75W–90 Fuel Efficient Synthetic Gear Lubricant'' (incorporated by reference in § 1037.810).

(ii) You may use A to B testing using the procedures in § 1037.560 to show that a lubricant performs at an equivalent or superior level relative to a lubricant specified in paragraph (f)(2)(i) of this section. Testing must show equivalent or superior performance at every specified speed and torque value.

(3) GEM applies a 2% emission reduction for tractors if they have an automatic transmission, an automated manual transmission, or a dual-clutch transmission. Similarly, GEM applies a 2.3% emission reduction for Class 8 vocational vehicles certified with the Regional duty cycle if they have an automated manual transmission or a dual-clutch transmission.

(4) GEM applies a 2% emission reduction for tractors with predictive cruise control. This includes any cruise control system that incorporates satellite-based global-positioning data for controlling operator demand.

(5) GEM applies a 0.5% emission reduction for tractors with a high-efficiency air conditioning compressor. This includes mechanically powered compressors meeting the specifications described in 40 CFR 86.1868–12(h)(5), and all electrically powered compressors.

(6) GEM applies a 1% emission reduction for tractors with electrically powered pumps for steering and engine cooling.

(7) GEM applies a 1% emission reduction for tractors with automatic tire inflation systems.

(8) GEM accounts for emission reductions for reduced idle for the following technologies:

(i) *Stop-start technology for vocational vehicles.* Phase 2 vocational vehicles qualify for reduced emissions in GEM modeling if the engine shuts down no more than 30 seconds after the onset of any of the following conditions:

(A) The vehicle's brake is depressed at a zero-speed condition.

(B) A vehicle with automatic transmission goes into ''Park''.

(ii) *Neutral-idle technology for vocational vehicles.* A Phase 2 vocational vehicle with an automatic transmission qualifies for reduced emissions in GEM modeling if the vehicle goes into neutral (or reduces torque equivalent to being in neutral) at a zero-speed condition.

(iii) *Extended-idle reduction.* If your sleeper cab is equipped with idle reduction technology meeting the requirements of § 1037.660 that will automatically shut off the main engine after 300 seconds or less, GEM applies a 5 percent emission reduction for Phase 2 vehicles. For Phase 1, enter 5.0 g/ton-mile as the input (or a lesser value specified in § 1037.660); otherwise leave this field blank.

(g) *Engine fuel mapping and fuel consumption at idle.* Use the fuel map and fuel consumption at idle from the engine manufacturer to characterize the engine's specific fuel consumption, or create a new fuel map and determine fuel consumption at idle as described in 40 CFR 1036.535.

(h) *Engine full-load torque curve and motoring torque curve.* Use the full-load torque curve and the motoring torque map from the engine manufacturer or create new maps as described in 40 CFR 1065.510(b) and (c)(2).

(i) *Vehicles with hybrid power take-off.* Determine the delta PTO emission result of your engine and hybrid power take-off system as described in § 1037.540.

(j) *Alternate fuels.* For fuels other than those identified in GEM, perform the simulation by identifying the vehicle as being diesel-fueled, but use a fuel map based on the mass flow rates of the alternate fuel.

§ 1037.525 Aerodynamic measurements.

This section describes a methodology for determining aerodynamic drag area, C_DA for use in determining input values for §§ 1037.515 and 1037.520.

(a) *General provisions for trailers.* A trailer's aerodynamic performance for demonstrating compliance with standards is based on a delta C_DA value relative to a baseline trailer. Determine these delta C_DA values by performing A to B testing, as follows:

(1) The default method for measuring C_DA is a coastdown procedure as specified in § 1037.527. If we approve it in advance, you may instead use one of the alternative methods specified in §§ 1037.529 through 1037.533, consistent with good engineering judgment. If you request our approval to determine drag area using an alternative method, you must submit additional information as described in paragraph (c) of this section.

(2) Determine a baseline C_DA value for a standard tractor pulling a test trailer representing a production configuration; use a 53-foot test trailer to represent long trailers and a 28-foot test trailer to represent short trailers. Repeat this testing with the same tractor and a baseline trailer. For testing long trailers, the baseline trailer is a trailer meeting the specifications for a Phase 1 standard trailer in § 1037.501(g)(1); for testing refrigerated box vans, install an HVAC unit on the baseline trailer that properly represents a baseline configuration. For testing short trailers, use a 28-foot baseline trailer with a single axle that meets the same specifications as the Phase 1 standard trailer, except as needed to accommodate the reduced trailer length. Use good engineering judgment to perform paired tests that accurately demonstrate the reduction in aerodynamic drag associated with the improved design. Measure C_DA in m² to two decimal places. Calculate delta C_DA by subtracting the drag area for the test trailer from the drag area for the baseline trailer.

(b) *General provisions for tractors.* The GEM input for a tractor's aerodynamic performance is an absolute C_DA value that is measured or calculated for a tractor in a test configuration. Test high-roof tractors with a standard box trailer. Note that the standard box trailer for Phase 1 tractors is different from that of later model years. Test low-roof and mid-roof tractors without a trailer; however, you may test low-roof and mid-roof tractors with a trailer to evaluate off-cycle technologies. The default method for determining C_DA values is a coastdown procedure as specified in § 1037.527. If we approve it in advance, you may instead use one of the alternative methods specified in §§ 1037.529 through 1037.533, or some other method, based on a correlation to coastdown testing, consistent with good engineering judgment. Submit information describing how you determined C_DA values from coastdown testing whether or not you use an alternative method. If you request our approval to determine drag area using an alternative method, C_DA_{alt}, you must submit additional information as described in paragraph (c) of this section and adjust the C_DA values to be equivalent to the corresponding values from coastdown measurements as follows:

(1) Unless good engineering judgment requires otherwise, assume that coastdown drag areas are proportional to drag areas measured using alternative methods. This means you may apply a single constant adjustment factor, $F_{alt\text{-}aero}$, for a given alternate drag area method using the following equation:

$$C_DA = C_DA_{alt} \cdot F_{alt\text{-}aero} \qquad \text{Eq. 1037.525-1}$$

(2) Determine $F_{alt\text{-}aero}$ by performing coastdown testing and applying your alternate method on the same vehicle. Unless we approve another vehicle, the vehicle must be a Class 8, high-roof, sleeper cab with a full aerodynamics package, pulling a standard trailer. Where you have more than one tractor model meeting these criteria, use the tractor model with the highest projected sales. If you do not have such a tractor model, you may use your most comparable tractor model with our prior approval. In the case of alternate methods other than those specified in this subpart, good engineering judgment may require you to determine your adjustment factor based on results from more than one vehicle.

(3) For Phase 2 testing, determine separate values of $F_{alt\text{-}aero}$ for a high-roof day cab and a high-roof sleeper cab corresponding to each major tractor model based on testing as described in paragraph (b)(2) of this section. Perform this testing on each major tractor model. You may ask us to approve aggregating separate product lines into a single major tractor model if you show that the product lines are different only in ways that are unrelated to aerodynamic characteristics. If you have more than six major tractor models, you may limit

your testing in a given year to a maximum of six major tractor models until you have performed testing for your whole product line. For any untested tractor models, apply the value of $F_{\text{alt-aero}}$ from the tested tractor model that best represents the aerodynamic characteristics of the untested tractor model, consistent with good engineering judgment. Testing under this paragraph (b)(3) continues to be valid for later model years until you change the tractor model in a way that causes the test results to no longer represent production vehicles. You must also determine unique values of $F_{\text{alt-aero}}$ for low-roof and mid-roof tractors if you determine C_DA values based on low or mid-roof tractor testing as shown in Table 4 of § 1037.520. For Phase 1 testing, if good engineering judgment allows it, you may calculate a single, constant value of $F_{\text{alt-aero}}$ for your whole product line by dividing the coastdown drag area, C_DA_{coast}, by C_DA_{alt}.

(4) Calculate $F_{\text{alt-aero}}$ to at least three decimal places. For example, if your coastdown testing results in a drag area of 6.430, but your wind tunnel method results in a drag area of 6.200, $F_{\text{alt-aero}}$ would be 1.037.

(c) *Approval of alternative methods.* You must obtain preliminary approval before using any method other than coastdown testing to determine drag coefficients. We will approve your request if you show that your procedures produce data that are the same as or better than coastdown testing with respect to repeatability and unbiased correlation. Note that the correlation is not considered to be biased if there a bias before correction, but you remove the bias using $F_{\text{alt-aero}}$. Send your request for approval to the Designated Compliance Officer. Keep records of the information specified in this paragraph (c). Unless we specify otherwise, include this information with your request. You must provide any information we require to evaluate whether you may apply the provisions of this section, consistent with good engineering judgment. Include additional information related to your alternative method as described in §§ 1037.529 through 1037.533. If you use a method other than those specified in this subpart, include all the following information, as applicable:

(1) Official name/title of the procedure.

(2) Description of the procedure.

(3) Cited sources for any standardized procedures that the method is based on.

(4) Description and rationale for any modifications/deviations from the standardized procedures.

(5) Data comparing the procedure to the coastdown reference procedure.

(6) Additional information specified for the alternative methods described in §§ 1037.529 through 1037.533 as applicable to this method (*e.g.,* source location/address, background/history).

(d) *Yaw sweep corrections.* Aerodynamic features can be more effective at reducing wind-averaged drag than is predicted by zero-yaw drag. The following procedures describe how to adjust a tractor's C_DA values to account for wind-averaged drag:

(1) For Phase 2 testing, apply the following method based on SAE J1252 (incorporated by reference in § 1037.810):

(i) Determine the zero-yaw drag area, $C_DA_{\text{zero-yaw}}$, and the yaw-sweep drag area for your vehicle using the same alternate method. For the yaw sweep drag area, measure the drag area, at a minimum, at yaw angles of 0°, ±1°, ±3°, ±6°, and ±9°, where 0° represents the direction of travel. Alternatively, using good engineering judgment with demonstration of equivalency and our prior approval, you may measure the drag area using different or fewer yaw angles than those specified above, provided they satisfy the requirements for SAE J1252, unless otherwise demonstrated.

(ii) Calculate the wind-averaged coefficient of drag according to SAE J1252 based on a vehicle speed of 55 mph and a wind speed of 7 mph.

(iii) For the tractor used to determine $F_{\text{alt-aero}}$, determine your wind-averaged drag area, C_DA_{wa}, using the following equation:

$$C_DA_{\text{wa}} = C_DA_{\text{zero-coastdown}} + (C_DA_{\text{wa-alt}} - C_DA_{\text{zero-alt}}) \cdot F_{\text{alt-aero}} \qquad \text{Eq. 1037.525-2}$$

(iv) For additional tractors using an alternative method and predetermined $F_{\text{alt-aero}}$, use the following equation to determine C_DA_{wa}:

$$C_DA_{\text{wa}} = C_DA_{\text{wa-alt}} \cdot F_{\text{alt-aero}} \qquad \text{Eq. 1037.525-3}$$

(v) You may calculate C_DA_{wa} without additional testing by adding 0.80 m² to $C_DA_{\text{zero-coastdown}}$ or using the following equation if you use an alternative method:

$$C_DA_{\text{wa}} = (C_DA_{\text{zero-alt}} \cdot F_{\text{alt-aero}}) + 0.80 \qquad \text{Eq. 1037.525-4}$$

(2) For Phase 1 testing, you may correct your zero-yaw drag area as follows if the ratio of the zero-yaw drag area divided by yaw-sweep drag area for your vehicle is greater than 0.8065 for ±6° yaw angle or 0.8330 for wind-averaged drag (which represents the ratios expected for a typical Class 8 high-roof sleeper cab):

(i) Determine the zero-yaw drag area, $C_DA_{\text{zero-yaw}}$, and the yaw-sweep drag area, $C_DA_{\text{full-ys}}$, for your vehicle using the same alternate method as specified in this subpart. Measure the drag area for 0°, –6°, and +6°. Use the arithmetic mean of the –6° and +6° drag areas as the ±6° drag area, $\overline{C_DA_{\pm 6}}$.

(ii) Calculate your yaw-sweep correction factor, CF_{ys}, using the following equation:

$$CF_{ys} = \frac{\overline{C_DA_{\pm 6}} \cdot 0.8065}{C_DA_{\text{zero-yaw}}} \qquad \text{Eq. 1037.525-5}$$

(iii) You may instead calculate the wind-averaged drag area according to SAE J1252 (incorporated by reference in § 1037.810) and substitute this value into Equation 1037.525–4 for the ±6° yaw-averaged drag area. If you choose to calculate the wind-averaged drag area according to SAE J1252, you may calculate your yaw-sweep correction factor, CF_{ys}, using Equation 1037.525–5 through model year 2017; otherwise use the following equation:

$$CF_{ys} = \frac{C_DA_{\text{full-ys}} \cdot 0.8330}{C_DA_{\text{zero-yaw}}} \qquad \text{Eq. 1037.525-6}$$

(iv) Calculate your corrected drag area for determining the aerodynamic bin by multiplying the measured zero-yaw drag area by CF_{ys} as determined using Equation 1037.525–5 or 1037.525–6, as applicable. You may apply the correction factor to drag areas measured using other procedures. For example, apply CF_{ys} to drag areas measured using the coastdown method. If you use an alternative method, apply an alternative correction, $F_{\text{alt-aero}}$, and calculate the final drag area using the following equation:

$$C_DA = F_{\text{alt-aero}} \cdot CF_{ys} \cdot C_DA_{\text{zero-alt}} \qquad \text{Eq. 1037.525-7}$$

(v) You may ask us to apply CF_{ys} to similar vehicles incorporating the same design features.

§ 1037.527 Coastdown procedures for calculating drag area (C_DA).

The coastdown procedures in this section describe how to calculate drag area, C_DA, for Phase 2 tractors and trailers, subject to the provisions of § 1037.525. Follow the provisions of Sections 1 through 9 of SAE J2263 (incorporated by reference in § 1037.810), with the following clarifications and exceptions:

(a) The terms and variables identified in this section have the meaning given in SAE J1263 (incorporated by reference in § 1037.810) and J2263 unless specified otherwise.

(b) To determine C_DA values for a tractor, perform coastdown testing with a tractor-trailer combination using the manufacturer's tractor and a standard trailer. To determine C_DA values for a trailer, perform coastdown testing with a tractor-trailer combination using a standard tractor. Prepare tractors and trailers for testing as follows:

(1) Install instrumentation for peforming the specified measurements.

(2) After adding vehicle instrumentation, verify that there is no brake drag or other condition that prevents the wheels from rotating freely. Do not apply the parking brake at any point between this inspection and the end of the measurement procedure.

(3) Install tires mounted on steel rims in a dual configuration (except for steer tires). The tires must—

(i) Be SmartWay-Verified or have a coefficient of rolling resistance at or below 5.1 kg/metric ton.

(ii) Have accumulated at least 2,175 miles but have no less than 50 percent of their original tread depth, as specified for truck cabs in SAE J1263 (incorporated by reference in § 1037.810).

(iii) Not be retreads or have any apparent signs of chunking or uneven wear.

(iv) Be size 295/75R22.5 or 275/80R22.5.

(v) Be inflated to the proper tire pressure as specified in Sections 6.6 and 8.1 of SAE J2263.

(4) Perform an inspection or wheel alignment for both the tractor and the trailer to ensure that wheel position is within the manufacturer's specifications.

(c) The test condition specifications described in Sections 7.1 through 7.4 of SAE J1263 apply, with the following exceptions and additional provisions:

(1) We recommend that you not perform coastdown testing if winds are expected to exceed 6.0 mph.

(2) Road grade may exceed 0.5%; however, the road grade for testing must not be excessive, considering factors such as coastdown effects and road safety standards.

(3) If road grade is greater than 0.02% over the length of the test surface, you must determine road grade as a function of distance along the length of the test surface and incorporate this into the

analysis. Use Section 11.5 of SAE J2263 to calculate the force due to grade.

(4) The road surface temperature must be at or below 50 °C. Use good engineering judgment to measure road surface temperature.

(d) C_DA calculations are based on measured speed values while the vehicles coasts down through a high-speed range from 70 down to 60 mph, and through a low-speed range from 25 down to 15 mph. Disable any vehicle speed limiters that prevent travel above 72 mph. If a vehicle cannot exceed 72 mph, adjust the high-speed range to include the highest achievable speed range as described in paragraph (g)(2) of this section. Measure vehicle speed at a minimum recording frequency of 10 Hz, in conjunction with time-of-day data. Determine vehicle speed using either of the following methods:

(1) *Complete coastdown runs.* Operate the vehicle at a top speed above 72 mph and allow the vehicle to coast down to 13 mph or lower. Collect data for the high-speed range over a test segment that includes speeds from 72 down to 58 mph, and collect data for the low-speed range over a test segment that includes speeds from 27 down to 13 mph. Perform a minimum of sixteen valid coastdown runs, eight in each direction.

(2) *Split coastdown runs.* Collect data during a high-speed coastdown while the vehicle coasts through a test segment that includes speeds from 72 mph down to 58 mph. Similarly, collect data during a low-speed coastdown while the vehicle coasts through a test segment that includes speeds from 27 mph down to 13 mph. Perform two to four high-speed coastdowns consecutively in one direction followed by the same number of low-speed coastdowns in the same direction, then perform that same number of measurements in the opposite direction. Repeat this process until you have performed twelve valid high-speed coastdowns and twelve valid low-speed coastdowns in each direction. You may not split runs as described in Section 9.3.1 of SAE J2263 except as allowed under this paragraph (d)(2).

(e) Measure wind speed, wind direction, air temperature, and air pressure at a minimum recording frequency of 1 Hz, in conjunction with time-of-day data. Use at least one stationary electro-mechanical anemometer and suitable data loggers meeting SAE J1263 specifications, subject to the following additional specifications for the anemometer placed along the test surface:

(1) You must start a coastdown measurement within 24 hours after running zero-wind and zero-angle calibrations.

(2) Place the anemometer at least 50 feet from the nearest tree and at least 25 feet from the nearest bush (or equivalent features). Position the anemometer adjacent to the test surface, near the midpoint of the length of the track, between 2.5 and 3.0 body widths from the expected location of the test vehicle's centerline as it passes the anemometer. Record the location of the anemometer along the test track, to the nearest 10 feet.

(3) Mount the anemometer at a height that is within 6 inches of half the test vehicle's body height.

(4) The height of vegetation surrounding the anemometer may not exceed 10% of the anemometer's mounted height, within a radius equal to the anemometer's mounted height.

(f) Measure air speed and air direction onboard the vehicle at a minimum recording frequency of 10 Hz, in conjunction with time-of-day data, using an anemometer and suitable data loggers that meet the requirements of Sections 5.4 and 5.5 of SAE J2263. Mount the anemometer 1 meter above the top of the leading edge of the trailer. Correct anemometer measurements using the wind speed and wind direction measurements described in paragraph (e) of this section as follows:

(1) Calculate arithmetic mean values for vehicle speed, air speed, wind speed, and wind direction in 5-mph vehicle speed increments for each coastdown. Include data from vehicle speeds between 60 and 25 mph if you collect data from complete coastdown runs. You may disregard data from an increment at the start or end of the coastdown run if it is less than 5 minutes.

(2) Calculate the theoretical air speed, $v_{air,th,}$ for each 5-mph increment using the following equation:

$$\overline{v}_{\mathrm{air,th}} = \sqrt{\overline{w}^2 + \overline{v}^2 - \overline{v}\,\overline{w}\cos(\overline{\theta}_{\mathrm{w}} + \theta_{\mathrm{veh}})} \qquad \text{Eq. 1037.527-1}$$

Where:

$\overline{w}$ = the mean wind speed over each 5-mph increment.

$\overline{v}$ = the mean vehicle speed over each 5-mph increment.

$\overline{\theta}_w$ = the mean wind direction over each 5-mph increment. Let $\overline{\theta}_w = 0$ for air flow in the first travel direction, with values increasing counterclockwise. For example, if the vehicle starts by traveling eastbound, then $\overline{\theta}_w = 270°$ means a wind from the south.

$\overline{\theta}_{veh}$ = the vehicle direction. Use $\overline{\theta}_{veh} = 0°$ for travel in the first direction, and use $\overline{\theta}_{veh} = 180°$ for travel in the opposite direction.

(3) Perform a linear regression using paired values of $\overline{v}_{air,th}$ and measured air speed, $\overline{v}_{air,mess}$, from all 5-mph increments to determine the air-speed correction coefficients, α_0 and $\alpha_{1,}$ based on the following equation:

$$\overline{v}_{\mathrm{air,th}} = \alpha_0 + \alpha_1 \cdot \overline{v}_{\mathrm{air,meas}} \qquad \text{Eq. 1037.527-2}$$

(4) Correct each measured value of air speed using the following equation:

$$v_{\mathrm{air}} = \alpha_0 + \alpha_1 \cdot v_{\mathrm{air,meas}} \qquad \text{Eq. 1037.527-3}$$

(g) Determine drag area, C_DA, using the following procedure instead of what is specified in Section 10 of SAE J1263:

(1) Calculate the vehicle's effective mass, M_e, to account for rotational inertia by adding 56.7 kg to the measured vehicle mass, *M,* (in kg) for each tire making road contact.

(2) Operate the vehicle and collect data over the high-speed range and low-speed range as specified in paragraph (d)(1) or (d)(2) of this section. If a vehicle cannot exceed a maximum speed of 72 mph, establish an alternate high-speed range by fixing the high end of the high-speed range at 2 mph less than the vehicle's maximum speed, and fixing the low end of the high-speed range such that the high-speed range spans 10 mph; adjust the testing and calculation instructions in this paragraph (g) as needed to account for this alternate high-speed range.

(3) Calculate mean vehicle speed at each speed endpoint (70, 60, 25, and 15 mph) as follows:

(i) Calculate the mean vehicle speed (in m/s) to represent the starting point of each speed range as the arithmetic average of measured speeds throughout the speed interval defined as 2.00 mph above the nominal starting speed point to 2.00 mph below the nominal starting speed point, expressed to at least two decimal places. Determine the timestamp corresponding to the starting point of each speed range as the time midpoint of the ±2.00 mph speed interval.

(ii) Repeat the calculations described in paragraph (g)(3)(i) of this section corresponding to the endpoint speed (60 or 15 mph) to determine the time at which the vehicle reaches the ending speed, and the mean vehicle speed representing the endpoint of each speed range.

(iii) If you incorporate grade into your calculations, use the average values for the elevation and distance traveled over each interval.

(4) Calculate the road-load force, *F,* for each speed range using the following equation:

$$F = -M_e \cdot \frac{\bar{v}_{\text{start}} - \bar{v}_{\text{end}}}{\bar{t}_{\text{start}} - \bar{t}_{\text{end}}} + M \cdot a_g \cdot \frac{\bar{h}_{\text{start}} - \bar{h}_{\text{end}}}{\bar{D}_{\text{start}} - \bar{D}_{\text{end}}} - F_{\text{axle}} \qquad \text{Eq. 1037.527-4}$$

Where:

M_e = the vehicle's effective mass, in kg, expressed to at least one decimal place.

$\bar{v}$ = average vehicle speed, in m/s, at the start or end of each speed range, as described in paragraph (g)(3) of this section.

$\bar{t}$ = timestamp at which the vehicle reaches the starting or ending speed, in seconds, expressed to at least one decimal place.

M = the vehicle's measured mass, in kg, expressed to at least one decimal place.

$\bar{h}$ = average elevation at the start or end of each speed range, in m, expressed to at least two decimal places.

$\bar{D}$ = distance traveled on the road surface from a fixed reference location along the road to the start or end of each speed range, in m, expressed to at least one decimal place.

F_{axle} = an estimate of rear-axle losses. Use 200 N for the high-speed range and 100 N for the low-speed range.

a_g = acceleration of Earth's gravity, as described in 40 CFR 1065.630.

(5) If you perform high-speed and low-speed coastdowns as described in paragraph (d)(2) of this section, average the F values for each set of consecutive low-speed runs. Use this value as F_{lo} in the calculations in this paragraph (g) to apply to each of the high-speed runs in a set of consecutive high-speed runs that immediately precede a set of consecutive low-speed runs. Otherwise, determine the F_{lo} and F_{hi} values in the calculations in this paragraph (g) from the same run.

(6) Calculate average air temperature $\bar{T}$ and air pressure $\bar{p}_{\text{act}}$ during each high-speed run.

(7) Calculate average air speed during each speed range for each run, $\bar{v}_{\text{air,hi}}$ and $\bar{v}_{\text{air,lo}}$.

(8) Perform an iterative calculation to determine aerodynamic and mechanical forces as follows:

(i) Assume initially that aerodynamic forces for the low-speed range are zero: $F_{\text{aero,lo}} = 0$.

(ii) Estimate high-speed aerodynamic forces by subtracting mechanical forces from the road-load force corresponding to the high-speed coastdown, F_{hi}, as follows:

$$F_{\text{aero,hi}} = F_{\text{hi}} - (F_{\text{lo}} - F_{\text{aero,lo}}) \qquad \text{Eq. 1037.523-5}$$

(iii) Calculate a new value for $F_{\text{aero,lo}}$ by adjusting the high-speed aerodynamic forces to account for speed, as follows:

$$F_{\text{aero,lo}} = F_{\text{aero,hi}} \cdot \frac{\bar{v}^2_{\text{air,lo}}}{\bar{v}^2_{\text{air,hi}}} \qquad \text{Eq. 1037.527-6}$$

(iv) Repeat the steps in paragraphs (g)(8)(ii) and (iii) of this section until $F_{\text{aero,hi}}$ changes less than 1.0%.

(9) Calculate drag area, C_DA, in m² for each high-speed segment using the following equation:

$$C_DA = \frac{2 \cdot F_{\text{aero,hi}}}{\bar{v}^2_{\text{air,hi}}} \cdot \frac{R \cdot \bar{T}}{\bar{p}_{\text{act}}} \qquad \text{Eq. 1037.527-7}$$

Where:

R = specific gas constant = 287.058 J/(kg·K).
$\overline{T}$ = mean air temperature in K, expressed to at least one decimal place.
$\overline{P}_{act}$ = mean absolute air pressure in Pa, expressed to at least one decimal place.

(10) Calculate an arithmetic mean C_DA value from all the high-speed segments to determine the drag area for the test.

(h) Include the following information in your application for certification:

(1) The name, location, and description of your test facilities, including background/history, equipment and capability, and track and facility elevation, along with the grade and size/length of the track.

(2) Test conditions for each test result, including date and time, wind speed and direction, ambient temperature and humidity, vehicle speed, driving distance, manufacturer name, test vehicle/model type, model year, applicable family, tire type and rolling resistance, weight of tractor-trailer (as tested), and driver identifier(s).

(3) Average C_DA result and all the individual run results (including voided or invalid runs).

§ 1037.529 Wind-tunnel procedures for calculating drag area (C_DA).

(a) You may measure drag areas consistent with published SAE procedures as described in this section using any wind tunnel recognized by the Subsonic Aerodynamic Testing Association, subject to the provisions of § 1037.525. If your wind tunnel does not meet the specifications described in this section, you may ask us to approve it as an alternative method under § 1037.525(b). All wind tunnels must meet the specifications described in SAE J1252 (incorporated by reference in § 1037.810), with the following exceptions and additional provisions:

(1) The minimum Reynold's number, $Re^{\#}_{\min}$, is $1.0 \cdot 10^6$ instead of the value specified in section 5.2 of SAE J1252. Also, the projected frontal area of the vehicle at zero yaw angle may exceed the recommended 5 percent of the active test section area, but it may not exceed 25 percent.

(2) For full-scale wind tunnel testing, use good engineering judgment to select a tractor and trailer that is a reasonable representation of the tractor and trailer used for eference coastdown testing. For example, where your wind tunnel is not long enough to test the tractor with a standard 53 foot trailer, it may be appropriate to use a shorter box trailer. In such a case, the correlation developed using the shorter trailer would only be valid for testing with the shorter trailer.

(3) For reduced-scale wind tunnel testing, use a one-eighth or larger scale model of a tractor and trailer that is sufficient to simulate airflow through the radiator inlet grill and across an engine geometry that represents engines commonly used in your test vehicle.

(b) Open-throat wind tunnels must also meet the specifications of SAE J2071 (incorporated by reference in § 1037.810).

(c) To determine C_DA values for a tractor, perform wind-tunnel testing with a tractor-trailer combination using the manufacturer's tractor and a standard trailer. To determine C_DA values for a trailer, perform wind-tunnel testing with a tractor-trailer combination using a standard tractor. The wind tunnel tests performed under this section must simulate a vehicle speed of 55 mph. For Phase 1 vehicles, conduct the wind tunnel tests at a zero yaw angle and, if so equipped, utilizing the moving/rolling floor to simulate driving the vehicle for comparison to the coastdown procedure, which corrects to a zero yaw angle for the oncoming wind. For Phase 2 vehicles, conduct the wind tunnel tests by measuring the drag area according to § 1037.525(d)(1) and, if so equipped, utilizing the moving/rolling floor for comparison to the coastdown procedure.

(d) In your request to use wind-tunnel testing, describe how you meet all the specifications that apply under this section, using terminology consistent with SAE J1594 (incorporated by reference in § 1037.810). If you request our approval to use wind-tunnel testing even though you do not meet all the specifications of this section, describe how your method nevertheless qualifies as an alternative method under § 1037.525(c) and include all the following information:

(1) Identify the name and location of the test facilities for your wind tunnel method.

(2) Background and history of the wind tunnel.

(3) The wind tunnel's layout (with diagram), type, and construction (structural and material).

(4) The wind tunnel's design details: The type and material for corner turning vanes, air settling specification, mesh screen specification, air straightening method, tunnel volume, surface area, average duct area, and circuit length.

(5) Specifications related to the wind tunnel's flow quality: Temperature control and uniformity, airflow quality, minimum airflow velocity, flow uniformity, angularity and stability, static pressure variation, turbulence intensity, airflow acceleration and deceleration times, test duration flow quality, and overall airflow quality achievement.

(6) Test/working section information: Test section type (*e.g.,* open, closed, adaptive wall) and shape (*e.g.,* circular, square, oval), length, contraction ratio, maximum air velocity, maximum dynamic pressure, nozzle width and height, plenum dimensions and net volume, maximum allowed model scale, maximum model height above road, strut movement rate (if applicable), model support, primary boundary layer slot, boundary layer elimination method, and photos and diagrams of the test section.

(7) Fan section description: Fan type, diameter, power, maximum rotational speed, maximum speed, support type, mechanical drive, and sectional total weight.

(8) Data acquisition and control (where applicable): Acquisition type, motor control, tunnel control, model balance, model pressure measurement, wheel drag balances, wing/body panel balances, and model exhaust simulation.

(9) Moving ground plane or rolling road (if applicable): Construction and material, yaw table and range, moving ground length and width, belt type,

maximum belt speed, belt suction mechanism, platen instrumentation, temperature control, and steering.

(10) Facility correction factors and purpose.

§ 1037.531 Using computational fluid dynamics to calculate drag area (C_DA).

This section describes how to use commercially available computational fluid dynamics (CFD) software to determine C_DA values, subject to the provisions of § 1037.525.

(a) To determine C_DA values for a tractor, perform CFD modeling based on a tractor-trailer combination using the manufacturer's tractor and a standard trailer. To determine C_DA values for a trailer, perform CFD modeling based on a tractor-trailer combination using a standard tractor. Perform all CFD modeling as follows:

(1) Except as described in paragraph (a)(9) of this section, specify a blockage ratio at or below 0.2 percent to simulate open-road conditions.

(2) Specify yaw angles according to § 1037.525(d)(1) for Phase 2 vehicles; assume zero yaw angle for Phase 1 vehicles.

(4) Model the tractor with an open grill and representative back pressures based on available data describing the tractor's pressure characteristics.

(5) Enable the turbulence model and mesh deformation.

(6) Model tires and ground plane in motion to simulate a vehicle moving forward in the direction of travel.

(7) Apply the smallest cell size to local regions on the tractor and trailer in areas of high flow gradients and smaller-geometry features (*e.g.,* the A-pillar, mirror, visor, grille and accessories, trailer-leading edge, trailer-trailing edge, rear bogey, tires, and tractor-trailer gap).

(8) Simulate a vehicle speed of 55 mph.

(b) Take the following steps for CFD code with a Navier-Stokes formula solver:

(1) Perform an unstructured, time-accurate analysis using a mesh grid size with a total volume element count of at least 50 million cells of hexahedral and/or polyhedral mesh cell shape, surface elements representing the geometry consisting of no less than 6 million elements, and a near-wall cell size corresponding to a y+ value of less than 300.

(2) Perform the analysis with a turbulence model and mesh deformation enabled (if applicable) with boundary layer resolution of ±95 percent. Once the results reach this resolution, demonstrate the convergence by supplying multiple, successive convergence values for the analysis. The turbulence model may use k-epsilon (k-ε), shear stress transport k-omega (SST k-ω), or other commercially accepted methods.

(c) For Lattice-Boltzman based CFD code, perform an unstructured, time-accurate analysis using a mesh grid size with total surface elements of at least 50 million cells using cubic volume elements and triangular and/or quadrilateral surface elements with a near-wall cell size of no greater than 6 mm on local regions of the tractor and trailer in areas of high flow gradients and smaller geometry features, with cell sizes in other areas of the mesh grid starting at twelve millimeters and increasing in size from this value as the distance from the tractor and trailer increases.

(d) You may ask us to allow you to perform CFD analysis using parameters and criteria other than those specified in this section, consistent with good engineering judgment. In your request, you must demonstrate that you are unable to perform modeling based on the specified conditions (for example, you may have insufficient computing power, or the computations may require inordinate time), or you must demonstrate that different criteria (such as a different mesh cell shape and size) will yield better results. In your request, you must also describe your recommended alternative parameters and criteria, and describe how this approach will produce results that adequately represent a vehicle's in-use performance. We may require that you supply data demonstrating that your selected parameters and criteria will provide a sufficient level of detail to yield an accurate analysis. If you request an alternative approach because it will yield better results, we may require that you perform CFD analysis using both your recommended criteria and parameters and the criteria and parameters specified in this section to compare the resulting key aerodynamic characteristics, such as pressure profiles, drag build-up, and turbulent/laminar flow at key points around the tractor-trailer combination.

(e) Include the following information in your request to determine C_DA values using CFD for tractors:

(1) The name of the software.

(2) The date and version number of the software.

(3) The name of the company producing the software and the corresponding address, phone number, and Web site.

(4) Identify whether the software uses Navier-Stokes or Lattice-Boltzmann equations.

(5) Describe the input values you will use to simulate the vehicle's aerodynamic performance for comparing to coastdown results.

§ 1037.533 Constant-speed procedure for calculating drag area (C_DA).

This section describes how to use constant-speed aerodynamic drag testing to determine C_DA values, subject to the provisions of § 1037.525.

(a) *Test track.* Select a test track that meets the specifications described in § 1037.527(c)(2).

(b) *Ambient conditions.* Ambient conditions must remain within the specifications described in § 1037.527(c) throughout the preconditioning and measurement procedure.

(c) *Vehicle preparation.* To determine C_DA values for a tractor, perform coastdown testing with a tractor-trailer combination using the manufacturer's tractor and a standard trailer. To determine C_DA values for a trailer, perform coastdown testing with a tractor-trailer combination using a standard tractor. Prepare tractors and trailers for testing as described in § 1037.527(b). Install measurement instruments meeting the requirements of 40 CFR part 1065, subpart C, that have been calibrated as described in 40 CFR part 1065, subpart D, as follows:

(1) Install a torque meter to measure torque at the vehicle's driveshaft, or measure torque from both sides of each drive axle using a half-shaft torque meter, a hub torque meter, or a rim torque meter. Set up instruments to read engine rpm for calculating rotational speed at the point of the torque measurements, or install instruments for measuring the rotational speed of the driveshaft, axles, or wheels directly.

(2) Install instrumentation to measure vehicle speed at 10 Hz, with an accuracy and resolution of 0.2 kph. Also install instrumentation for reading engine rpm from the engine's onboard computer.

(3) Mount an anemometer on the trailer as described in § 1037.527(f). For air speeds in the range of 65–130 kps and yaw angles in the range of 0±7°, the anemometer must have an accuracy that is ±1.5% of measured air speed and is ±0.5° of measured yaw angle.

(4) Fill the vehicle's fuel tanks to be at maximum capacity at the start of the measurement procedure.

(5) Measure total vehicle mass to the nearest 20 kg, with a full fuel tank, including the driver and any passengers that will be in the vehicle during the measurement procedure.

(d) *Measurement procedure.* The measurement sequence consists of vehicle preconditioning followed by stabilization and measurement over five consecutive constant-speed test segments with three different speed setpoints (16, 80, and 113 kph). Each test segment is divided into smaller increments for data analysis.

(1) Precondition the vehicle and zero the torque meters as follows:

(i) If you are using rim torque meters, zero the torque meters by lifting each instrumented axle and recording torque signals for at least 30 seconds, and then drive the vehicle at 80 kph for at least 30 minutes.

(ii) If you are using any other kind of torque meter, drive the vehicle at 80 kph for at least 30 minutes, and then allow the vehicle to coast down from full speed to a complete standstill while the clutch is disengaged or the transmission is in neutral, without braking. Zero the torque meters within 60 seconds after the vehicle stops moving by recording the torque signals for at least 30 seconds, and directly resume vehicle preconditioning at 80 kph for at least 2 km.

(iii) You may calibrate instruments during the preconditioning drive.

(2) Perform testing as described in paragraph (d)(3) of this section over a sequence of test segments at constant vehicle speed as follows:

(i) 300±30 seconds in each direction at 16 kph.

(ii) 450±30 seconds in each direction at 80 kph.

(iii) 900±30 seconds in each direction at 113 kph.

(iv) 450±30 seconds in each direction at 80 kph.

(v) 300±30 seconds in each direction at 16 kph.

(3) When the vehicle preconditioning described in paragraph (d)(1) of this section is complete, stabilize the vehicle at the specified speed for at least 200 meters and start taking measurements. The test segment starts when you start taking measurements for all parameters.

(4) During the test segment, continue to operate the vehicle at the speed setpoint, maintaining constant speed and torque within the ranges specified in paragraph (e) of this section. Drive the vehicle straight with minimal steering; do not change gears. Perform measurements as follows during the test segment:

(i) Measure the rotational speed of the driveshaft, axle, or wheel where the torque is measured, or calculate it from engine rpm in conjunction with gear and axle ratios, as applicable.

(ii) Measure vehicle speed in conjunction with time-of-day data.

(iii) Measure ambient conditions, air speed, and air direction as described in § 1037.527(e) and (f). Correct air speed and air direction as described in paragraphs (f)(1) and (2) of this section.

(5) You may divide a test segment into multiple passes by suspending and resuming measurements. Stabilize vehicle speed before resuming measurements for each pass as described in paragraph (d)(3) of this section. Analyze the data from multiple passes by combining them into a single sequence of measurements for each test segment.

(6) Divide measured values into even 10-second increments. If the last increment for each test segment is less than 10 seconds, disregard measured values from that increment for all calculations under this section.

(e) *Validation criteria.* Analyze measurements to confirm that the test is valid. Analyze vehicle speed and drive torque by calculating the mean speed and torque values for each successive 1-second increment, for each successive 10-second increment, and for each test segment. The test is valid if the data conform to all the following specifications:

(1) *Vehicle speed.* The mean vehicle speed for the test segment must be within 2.0 kph of the speed setpoint. In addition, for testing at 80 kph and 113 kph, all ten of the 1-second mean vehicle speeds used to calculate a corresponding 10-second mean vehicle speed must be within ± 0.3 kph of that 10-second mean vehicle speed. Perform the same data analysis for testing at 16 kph, but apply a validation threshold of ±0.15 kph.

(2) *Drive torque.* All ten of the 1-second mean torque values used to calculate a corresponding 10-second mean torque value must be within ±10% of that 10-second mean torque value.

(3) *Torque drift.* Torque meter drift may not exceed ±1%. Determine torque meter drift by repeating the procedure described in paragraph (d)(1) of this section after testing is complete, except that driving the vehicle is necessary only to get the vehicle up to 80 kph as part of coasting to standstill.

(f) *Calculations.* Analyze measured data for each time segment after time-aligning all the data. Use the following calculations to determine C_DA:

(1) *Onboard air speed.* Correct onboard anemometer measurements for air speed using onboard measurements and measured ambient conditions as described in § 1037.527(f), except that you must divide the test segment into consecutive 10-second increments rather than 5-mph increments. Disregard data from the final increment of the test segment if it is less than 10 seconds. This analysis results in the following equation for correcting air speed measurements:

$$v_{\mathrm{air}} = \alpha_0 + \alpha_1 \cdot v_{\mathrm{air,meas}} \qquad \text{Eq. 1037.533-1}$$

(2) *Yaw angle.* Correct the onboard anemometer measurements for air direction for each test segment as follows:

(i) Calculate arithmetic mean values for air speed, $\bar{v}_{\mathrm{air}}$, wind speed, $\bar{\theta}_{\mathrm{w}} = 0$, and wind direction, $\bar{w}$, over each 10-second increment for each test segment. Disregard data from the final increment of the test segment if it is less than 10 seconds.

(ii) Calculate the theoretical air direction, $\theta_{\mathrm{air,th}}$, for each 10-second increment using the following equation:

$$\bar{\theta}_{\mathrm{air,th}} = -\operatorname{asin}\left(\frac{\bar{w}}{\bar{v}_{\mathrm{air}}} \cdot \sin\left(\bar{\theta}_{\mathrm{w}} + \theta_{\mathrm{veh}}\right)\right) \qquad \text{Eq. 1037.533-2}$$

Where:

θ_{veh} = the vehicle direction, as described in § 1037.527(f)(2).

(iii) Perform a linear regression using paired values of $\theta_{\mathrm{air,th}}$ and measured air direction, $\theta_{\mathrm{air,meas}}$, from each 10-second increment for all 80 kph and 113 kph test segments to determine the air-direction correction coefficients, β_0 and β_1, based on the following equation:

$$\overline{\theta}_{\text{air,th}} = \beta_0 + \beta_1 \cdot \overline{\theta}_{\text{air,meas}} \qquad \text{Eq. 1037.533-3}$$

(iv) For all 80 kph and 113 kph test segments, correct each measured value of air direction using the following equation:

$$\theta_{\text{air}} = \beta_0 + \beta_1 \cdot \theta_{\text{air,meas}} \qquad \text{Eq. 1037.533-4}$$

(3) *Traction force.* (i) Calculate a traction force in N for each measurement using the following equation:

$$F_{\text{trac}} = \frac{T_{\text{total}}}{v_{\text{veh}}} \cdot \frac{n_{\text{eng}} \cdot \pi}{k_{\text{g}} \cdot k_{\text{a}} \cdot 30} - M \cdot a_{\text{g}} \cdot \frac{G}{100}$$

Where:

T_{total} = the sum of all corrected torques at a point in time, in N·m.
v_{veh} = vehicle speed in m/s (full precision).
n_{eng} = mean engine speed in rpm (full precision).
k_{g} = transmission gear ratio of the engaged gear.
k_{a} = drive axle ratio.
M = the measured vehicle mass, in kg
a_{g} = acceleration of Earth's gravity, as described in 40 CFR 1065.630.
G = instantaneous road grade, in percent (increase in elevation per 100 units horizontal length).

(ii) Calculate a mean traction force, $\overline{F}_{\text{trac}}$, in N for each 10-second increment by averaging all the calculated traction forces in each 10-second increment.

(4) *Determination of drag area.* Calculate a vehicle's drag area as follows:

(i) Use Equation 1037.533–5 to calculate a single mean traction force for the two 16-kph test segments, $\overline{F}_{\text{trac16}}$. This value represents the mechanical drag force acting on the vehicle.

(ii) Calculate the mean aerodynamic force for each 10-second increment, $\overline{F}_{\text{aero}}$, from the 80 kph and 113 kph test segments by subtracting $\overline{F}_{\text{trac16}}$ from $\overline{F}_{\text{trac}}$.

(iii) Average the corrected air speed and corrected yaw angle over every 10-second segment from the 80 kph and 113 kph test segments to determine $\overline{v}_{\text{air}}$ and θ_{air}.

(iv) Calculate C_DA for each 10-second increment from the 80 kph and 113 kph test segments using the following equation:

$$C_DA_i = \left[\frac{2 \cdot \overline{F}_{\text{aero}}}{\overline{v}^2_{\text{air}}} \cdot \frac{R \cdot \overline{T}}{\overline{p}_{\text{act}}}\right]_i \qquad \text{Eq. 1037.533-6}$$

Where:

C_DA_i = the mean drag area for each 10-second increment, *i*.
$\overline{F}_{\text{aero}}$ = mean aerodynamic force over a given 10-second increment.
$\overline{V}^2_{\text{air[speed]}}$ = mean aerodynamic force over a given 10-second increment
R = specific gas constant = 287.058 J/(kg·K).
$\overline{T}$ = mean air temperature in K.
$\overline{P}_{\text{act}}$ = mean absolute air pressure in Pa.

(v) Determine whether at least 75 percent of the 10-second increments from the 80 kph and 113 kph test segments have a corrected yaw angle, θ_{air}, that is within the range of $|\theta_{\text{air}}| \leq 2°$. If so, this is considered a low-yaw test. If not, this is considered a high-yaw test.

(vi) For low-yaw tests, calculate a vehicle's characteristic zero-yaw drag area as the arithmetic mean of the drag areas representing all the 10-second increments for both 80 kph and 113 kph test segments that had.

(vii) For high-yaw tests, calculate a vehicle's characteristic zero-yaw drag area as follows:

(A) Plot all the C_DA values from the 80 kph and 113 kph test segments against the corresponding values for corrected yaw angle for each 10-second increment. Create a regression based on a fourth-order polynomial regression equation of the following form:

$$C_DA = C_DA_{\text{ZeroYaw}} + a_1\,\overline{\theta}_{\text{air}} + a_2\,\overline{\theta}^2_{\text{air}} + a_3\,\overline{\theta}^3_{\text{air}} + a_4\,\overline{\theta}^4_{\text{air}} \qquad \text{Eq. 1037.533-7}$$

(B) Determine $C_DA_{\text{zero-yaw}}$ as the y-intercept from the regression equation.

(g) *Documentation.* Keep the following records related to the constant-speed procedure for calculating drag area:

(1) The measurement data for calculating C_DA as described in this section.

(2) A general description and pictures of the vehicle tested.

(3) The vehicle's maximum height and width.

(4) The measured vehicle mass.

(5) Mileage at the start of the first test segment and at the end of the last test segment.

(6) The date of the test, the starting time for the first test segment, and the ending time for the last test segment.

(7) The transmission gear used for each test segment.

(8) The data describing how the test was valid relative to the specifications and criteria described in paragraphs (b) and (e) of this section.

(9) A description of any unusual events, such as a vehicle passing the test vehicle, or any technical or human errors that may have affected the C_DA determination without invalidating the test.

§ 1037.540 Special procedures for testing vehicles with hybrid power take-off.

This section describes the procedure for quantifying the reduction in greenhouse gas emissions for vehicles as a result of running power take-off (PTO) devices with a hybrid energy delivery system. The procedures are written to test the PTO by ensuring that the engine produces all of the energy with no net change in stored energy. The full test for the hybrid vehicle is from a fully charged renewable energy storage system (RESS) to a depleted RESS and then back to a fully charged RESS. The procedures in paragraphs (a) though (e) of this section may be used for Phase 1 testing of any hybrid PTO architecture for which you are requesting a vehicle certificate using either chassis testing or powertrain testing. You must include all hardware for the PTO system. You may ask us to modify the provisions of this section to allow testing hybrid vehicles other than electric-battery hybrids, consistent with good engineering judgment. Phase 2 PTO greenhouse gas emission reductions are quantified using GEM and are described in paragraph (f) of this section.

(a) Select two vehicles for testing as follows:

(1) Select a vehicle with a hybrid energy delivery system to represent the vehicle family. If your vehicle family includes more than one vehicle model, use good engineering judgment to select the vehicle type with the maximum number of PTO circuits that has the smallest potential reduction in greenhouse gas emissions.

(2) Select an equivalent conventional vehicle as specified in § 1037.615.

(b) Measure PTO emissions from the fully warmed-up conventional vehicle as follows:

(1) Without adding a restriction, instrument the vehicle with pressure transducers at the outlet of the hydraulic pump for each circuit. Perform pressure measurements with a frequency of at least 1 Hz.

(2) Operate the PTO system with no load for at least 15 seconds. Measure gauge pressure and record the average value over the last 10 seconds ($\overline{P}_{min}$). Apply maximum operator demand to the PTO system until the pressure relief valve opens and pressure stabilizes; measure gauge pressure and record the average value over the last 10 seconds ($\overline{P}_{max}$).

(3) Denormalize the PTO duty cycle in Appendix II of this part using the following equation:

$$p_{refi} = p_i \cdot \left(\overline{p}_{max} - \overline{p}_{min}\right) + \overline{p}_{min} \qquad \text{Eq. 1037.540-1}$$

Where:

p_{refi} = the reference pressure at each point i in the PTO cycle.

p_i = the normalized pressure at each point i in the PTO cycle (relative to $\overline{p}_{max}$).

$\overline{p}_{max}$ = the mean maximum pressure measured in paragraph (b)(2) of this section.

$\overline{p}_{min}$ = the mean minimum pressure measured in paragraph (b)(2) of this section.

(4) If the PTO system has two circuits, repeat paragraph (b)(2) and (3) of this section for the second PTO circuit.

(5) Install a system to control pressures in the PTO system during the cycle.

(6) Start the engine.

(7) Operate the vehicle over one or both of the denormalized PTO duty cycles in Appendix II of this part, as applicable. Measure emissions during operation over each duty cycle using the provisions of 40 CFR part 1066.

(8) Measured pressures must meet the cycle-validation specifications in the following table for each test run over the duty cycle:

TABLE 1 OF § 1037.540—STATISTICAL CRITERIA FOR VALIDATING EACH TEST RUN OVER THE DUTY CYCLE

Parameter[a]	Pressure
Slope, a_1	$0.950 \leq a_1 \leq 1.030$
Absolute value of intercept, $\lvert a_0 \rvert$.	≤2.0% of maximum mapped pressure
Standard error of estimate, *SEE*.	≤10% of maximum mapped pressure
Coefficient of determination, r^2.	≥ 0.970

[a] Determine values for specified parameters as described in 40 CFR 1065.514(e) by comparing measured values to denormalized pressure values from the duty cycle in Appendix II of this part.

(c) Measure PTO emissions from the fully warmed-up hybrid vehicle as follows:

(1) Perform the steps in paragraphs (b)(1) through (5) of this section.

(2) Prepare the vehicle for testing by operating it as needed to stabilize the battery at a full state of charge. For electric hybrid vehicles, we recommend running back-to-back PTO tests until engine operation is initiated to charge the battery. The battery should be fully charged once engine operation stops. The ignition should remain in the ‘‘on’’ position.

(3) Turn the vehicle and PTO system off while the sampling system is being prepared.

(4) Turn the vehicle and PTO system on such that the PTO system is functional, whether it draws power from the engine or a battery.

(5) Operate the vehicle over one or both of the denormalized PTO duty cycles without turning the vehicle off, until the engine starts and then shuts down. The test cycle is completed once the engine shuts down. Measure emissions as described in paragraph (b)(7) of this section. Use good engineering judgment to minimize the variability in testing between the two types of vehicles.

(6) Apply cycle-validation criteria as described in paragraph (b)(8) of this section.

(d) Calculate the equivalent distance driven based on operating time for the PTO portion of the test by determining the time of the test and applying the conversion factor in paragraph (d)(4) of this section. For testing where fractions of a cycle were run (for example, where three cycles are completed and the halfway point of a fourth PTO cycle is reached before the engine starts and shuts down again), calculate the time of the test, $t_{test,}$ as follows:

(1) Add up the time run for all complete tests.

(2) For fractions of a test, use the following equation to calculate the time:

$$t_{\text{test-partial}} = \frac{\sum_{i=1}^{N}\left(p_{\text{circuit-1,i}} + p_{\text{circuit-2,i}}\right)\cdot \Delta t}{\overline{p}_{\text{circuit-1}} + \overline{p}_{\text{circuit-2}}} \quad \text{Eq. 1037.540-2}$$

Where:

i = an indexing variable that represents one recorded value.

N = number of measurement intervals.

$p_{\text{circuit-1}}$ = normalized pressure command from circuit 1 of the PTO cycle for each point, i, starting from $i = 1$.

$p_{\text{circuit-2}}$ = normalized pressure command from circuit 2 of the PTO cycle for each point, i, starting from $i = 1$. Let $p_{\text{circuit-2}}$ = 0 if there is only one circuit.

$\overline{P}_{\text{circuit-1}}$ = the mean normalized pressure command from circuit 1 over the entire PTO cycle.

$\overline{P}_{\text{circuit-2}}$ = the mean normalized pressure command from circuit 2 over the entire PTO cycle. Let $\overline{P}_{\text{circuit-2}}$ = 0 if there is only one circuit.

Δt = the time interval between measurements. For example, at 100 Hz, Δt = 0.0100 seconds.

(3) Sum the time from the complete cycles and from the partial cycle.

(4) Divide the total PTO operating time from paragraph (d)(3) of this section by a conversion factor of 0.0144 hr/mi to determine the equivalent distance driven. This is based on an assumed fraction of engine operating time during which the PTO is operating of 28 percent, and an assumed average vehicle speed while driving of 27.1 mph, as follows:

$$Factor = \frac{28\%}{(100\% - 28\%)\cdot 27.1} = 0.0144 \text{ hr/mi}$$

(e) For Phase 1, calculate combined cycle-weighted emissions of the four duty cycles for vocational vehicles, for both the conventional and hybrid PTO vehicle tests, as follows:

(1) Calculate the CO_2 emission rates in grams per test without rounding.

(2) Divide the CO_2 mass from the PTO cycle by the distance determined in paragraph (d)(4) of this section and the standard payload to get the CO_2 emission rate in g/ton-mile.

(3) Calculate the g/ton-mile emission rate for the driving portion of the test specified in § 1037.510 and add this to the CO_2 g/ton-mile emission rate for the PTO portion of the test.

(4) Follow the provisions of § 1037.615 to calculate improvement factors and benefits for advanced technologies.

(f) For Phase 2, calculate the delta PTO fuel results for input into GEM during vehicle certification as follows:

(1) Calculate fuel consumption in grams per test, m_{fuelPTO}, without rounding, as described in § 1037.550(k)(1).

(2) Divide the fuel mass by the distance determined in paragraph (d)(4) of this section and the standard payload to determine the fuel rate in g/ton-mile.

(3) Calculate the difference between the conventional PTO emissions result and the hybrid PTO emissions result for input into GEM.

(g) If the PTO system has more than two circuits, apply to provisions of this section using good engineering judgment.

§ 1037.550 Powertrain testing.

This section describes the procedure for simulating a chassis test for both conventional and hybrid powertrains. This testing is an optional approach that replaces the fuel map in GEM for certifying Phase 2 vehicles. It applies for vehicle manufacturers, but engine manufacturers may perform testing under this section as specified in 40 CFR 1036.630 and § 1037.551. While this section includes the detailed equations, you need to develop your own driver model and vehicle model; we recommend that you use the MATLAB/Simulink code provided at *www.epa.gov/otaq/climate/gem.htm*.

(a) Perform the powertrain test to establish measured fuel-consumption rates at a range of engine speed and load settings. Also measure NO_X emissions during each of the specified sampling periods consistent with the data requirements 40 CFR part 86, subpart T. You may use emission-measurement systems meeting the specifications of 40 CFR part 1065, subpart J, to measure NOx emissions. This section uses engine parameters and variables that are consistent with 40 CFR part 1065. For molar mass values, see 40 CFR 1065.1005(f)(2).

(b) Select fuel-consumption rates (g/cycle) to characterize the powertrain emissions at each setting. These declared values may not be lower than any corresponding measured values determined in this section. You may select any value that is at or above the corresponding measured value. These declared fuel-consumption rates serve as worst-case values for certification.

(c) Select a test engine and powertrain as described in § 1037.235.

(d) Set up the engine according to 40 CFR 1065.110. The default test configuration involves connecting the powertrain's transmission output shaft directly to the dynamometer. You may instead set up the dynamometer to connect at the wheel hubs if your powertrain configuration requires it, such as for hybrid powertrains, or if you want to represent the axle performance with powertrain test results. If you connect at the wheel hubs, input your test results into GEM to reflect this.

(e) Cool the powertrain during testing so temperatures for intake-air, oil, coolant, block, head, transmission, battery, and power electronics are within their expected ranges for normal operation. You may use auxiliary coolers and fans.

(f) Set the dynamometer to operate in speed control. Record data as described in 40 CFR 1065.202. Design a vehicle model to measure torque and calculate the dynamometer speed setpoint at a rate of at least 100 Hz, as follows:

(1) Calculate the dynamometer's angular speed target, $f_{\text{nref,dyno}}$, based on the simulated linear speed of the tires:

$$f_{\text{nrefi,dyno}} = \frac{k_{\text{a}}}{2 \cdot \pi \cdot r} \cdot v_{\text{refi}} \qquad \text{Eq. 1037.550-1}$$

Where:

$$r_{\text{[speed]}} = \text{tire radius} = \frac{k_{\text{a}} \cdot k_{\text{topgear}} \cdot v_{65}}{2 \cdot \pi \cdot f_{\text{n[speed]}}} \qquad \text{Eq. 1037.550-2}$$

k_a = drive axle ratio. Set k_a = 4.0 for all calculations in this paragraph (f).

$k_{topgear}$ = transmission gear ratio in the highest available gear.

v_{65} = reference speed. Use 65 mph = 29.05 m/s.

$f_{n[speed]}$ = engine's angular speed determined in paragraph (h) of this section.

$$v_{\text{refi}} = \left(\begin{array}{l} \dfrac{k_{\text{d}} \cdot T_{\text{i-1}}}{r} \cdot \left(Eff_{\text{axle}} \right) - \\ \left(M \cdot g \cdot C_{\text{rr}} \cdot \cos\left(\text{atan}\left(G_{\text{i-1}} \right) \right) + \dfrac{\rho \cdot C_{\text{D}} A}{2} \cdot v_{\text{ref,i-1}}^2 \right) - F_{\text{brake,i-1}} - F_{\text{grade,i-1}} \end{array} \right) \cdot \frac{\Delta t_{\text{i-1}}}{M + M_{\text{rotating}}} + v_{\text{ref,i-1}} \qquad \text{Eq. 1037.550-3}$$

Where:

v_{refi} = simulated vehicle reference speed. Use the unrounded result for calculating $f_{nrefi,dyno}$.

i = a time-based counter corresponding to each measurement during the sampling period. Let v_{ref1} = 0; start calculations at i = 2. A 10-minute sampling period will generally involve 60,000 measurements.

T = instantaneous measured torque.

Eff_{axle} = axle efficiency. Use Eff_{axle} = 0.955 for $T > 0$, and use Eff_{axle} = 1/0.955 for $T < 0$. To calculate $f_{nrefi,dyno}$ for a dynamometer connected at the wheel hubs, as described in paragraph (f)(2) of this section, use Eff_{axle} = 1.0.

M = vehicle mass for a vehicle class as determined in paragraph (h) of this section.

g = gravitational constant = 9.81 m/s².

C_{rr} = coefficient of rolling resistance for a vehicle class as determined in paragraph (h) of this section.

G_{i-1} = the percent grade interpolated at distance, D_{i-1} from the duty cycle in Appendix IV corresponding to measurement (i-1).

$$D_{\text{i-1}} = \sum_{i=1}^{N} \left(v_{\text{ref,i-1}} \cdot \Delta t_{\text{i-1}} \right) \qquad \text{Eq. 1037.550-4}$$

ρ = air density at reference conditions. Use ρ = 1.17 kg/m³.

C_DA = drag area for a vehicle class as determined in paragraph (h) of this section.

F_{brake} = instantaneous braking force applied by the driver model.

$$F_{\text{grade,i-1}} = M \cdot g \cdot \sin\left(\text{atan}\left(G_{\text{i-1}} \right) \right) \qquad \text{Eq. 1037.550-5}$$

Δt = the time interval between measurements. For example, at 100 Hz, Δt = 0.0100 seconds.

$M_{rotating}$ = inertial mass of rotating components as determined in paragraph (h) of this section.

Example: Example is for Class 2b to 7 vocational vehicles with 6 speed automatic transmission at B speed (Test 4 in Table 1 of § 1037.550).

k_a = 4.0

$k_{topgear}$ = 0.6716

f_{nrefB} = 1870 rpm = 31.16 r/s

v_{65} = 65 mph = 29.05 m/s

T_{1000-1} = 500.0 N·m

C_{rr} = 6.9 kg/ton = $6.9 \cdot 10^{\text{minus;3}}$ kg/kg

M = 11408 kg

C_DA = 5.4 m²

G_{1000-1} = 1.0% = 0.018

$$D_{1000\text{-}1} = \sum_{i=1}^{1000} \left(19.99 \cdot 0.01 + 20.0 \cdot 0.01 + \ldots + v_{\text{ref},1000-1} \cdot \Delta t_{1000-1} \right) = 1367\,\text{m}$$

$F_{brake_{10001}}$ = 0 N

$V_{ref10001}$ = 20.0 m/s

$F_{grade_{10001}}$ = 11408·9.81·sin (atan (0.018)) = 2014. N

ρ Δt = 0.0100 s

$M_{rotating}$ = 454 kg

$$r_B = \frac{4.0 \cdot 0.6716 \cdot 29.05}{2 \cdot \pi \cdot 31.16} = 0.399\,\text{m}$$

$$v_{\text{ref}_{1000}} = \left(\begin{array}{l} \frac{4.0 \cdot 500.0}{0.399} \cdot (0.955) - \\ \left(11408 \cdot 9.81 \cdot 6.9 \cdot \cos\left(\text{atan}\left(0.018\right)\right) + \frac{1.17 \cdot 5.4}{2} \cdot 20.0^2\right) - 0 - 2014.1 \end{array} \right) \cdot \frac{0.0100}{11408 + 454} + 20.0$$

$$v_{\text{ref1000}} = 20.00128 \text{ m/s}$$

$$f_{\text{nref1000,dyno}} = \frac{20.00128 \cdot 4.28}{2 \cdot 3.14 \cdot 0.462} = 31.9515 \text{ r/s} = 1917.09 \text{ rpm}$$

(2) For testing with the dynamometer connected at the wheel hubs, calculate $f_{\text{nref,dyno}}$ using the following equation:

$$f_{\text{nrefi,dyno}} = \frac{v_{\text{refi}}}{2 \cdot \pi \cdot r} \qquad \text{Eq. 1037.550-6}$$

(g) Design a driver model to mimic a human driver modulating the throttle and brake pedals to follow the test cycle as closely as possible. The driver model must meet the speed requirements for operation over the cruise cycles as described in § 1037.510 and for operation over the transient cycle as described in 40 CFR 1066.425(b). Design the driver model to meet the following specifications:

(1) Send a brake signal when throttle position is zero and vehicle speed is greater than the reference vehicle speed from the test cycle. Include a delay before changing the brake signal to prevent dithering, consistent with good engineering judgment.

(2) Allow braking only if throttle position is zero.

(3) Compensate for the distance driven over the duty cycle over the course of the test. Use the following equation to perform the compensation in real time to determine your time in the cycle:

$$t_{\text{cycle}_i} = \sum_{i=1}^{N} \left(\left(\frac{v_{\text{vehicle,i-1}}}{v_{\text{cycle,i-1}}} \right) \cdot \Delta t_{\text{i-1}} \right) \qquad \text{Eq. 1037.550-7}$$

Where:

v_{vehicle} = measured vehicle speed.

v_{cycle} = reference speed from the test cycle. If $v_{\text{cycle,i-1}} < 1.0$ m/s, set $v_{\text{cycle,i-1}} = v_{\text{vehicle,i-1}}$.

(h) Set up the driver model and the vehicle model in the test cell to test the powertrain, as follows:

(1) For Class 2b through Class 7 vocational vehicles, test the powertrain over eight different test runs. For all test runs, set M_{rotating} to 454 kg, C_DA to 5.4, k_a to 4.0, and Eff_{axle} to 0.955. Set the tire radius, *r,* for each test run based on the vehicle configuration corresponding to the designated engine speed (A, B, C, or f_{ntest}, all from 40 CFR part 1065) at 65 mph. These engine speeds apply equally for spark-ignition engines. Use the following settings specific to each test run:

TABLE 1 OF § 1037.550—VEHICLE SETTINGS FOR POWERTRAIN TESTING OF CLASS 2b THROUGH CLASS 7 VOCATIONAL VEHICLES

	Test 1	Test 2	Test 3	Test 4	Test 5	Test 6	Test 7	Test 8
M (kg)	7,257	11,408	7,257	11,408	7,257	11,408	7,257	11,408.
C_{rr} (kg/metric ton)	6.7	6.9	6.7	6.9	6.7	6.9	6.7	6.9.
r at engine speed	A	A	B	B	C	C	Maximum test speed	Maximum test speed.

(2) For tractors and Class 8 vocational vehicles, test the powertrain over nine different test runs. For all test runs, set C_{rr} to 6.9, k_a to 4.0, and Eff_{axle} to 0.955. Set the tire radius, *r,* for each test run based on the vehicle configuration corresponding to the designated engine speed (the minimum NTE exclusion speed as determined in 40 CFR 86.1370(b)(1), B, or f_{ntest} from 40 CFR part 1065) at 65 mph. Use the settings specific to each test run from Table 2 of this section for general purpose vehicles, and from Table 3 of this section for heavy-haul tractors. Tables 2 and 3 follow:

TABLE 2 OF § 1037.550—VEHICLE SETTINGS FOR POWERTRAIN TESTING OF TRACTORS AND CLASS 8 VOCATIONAL VEHICLES—GENERAL PURPOSE VEHICLES

	Test 1	Test 2	Test 3	Test 4	Test 5	Test 6	Test 7	Test 8	Test 9
M (kg)	31,978	22,679	19,051	31,978	22,679	19,051	31,978	22,679	19,051.
C_DA	5.4	4.7	4.0	5.4	4.7	4.0	5.4	4.7	4.0.
$M_{rotating}$ (kg)	1,134	907	680	1,134	907	680	1,134	907	680.
r at engine speed.	Minimum NTE exclusion speed.	Minimum NTE exclusion speed.	Minimum NTE exclusion speed.	B	B	B	Maximum test speed.	Maximum test speed.	Maximum test speed.

TABLE 3 OF § 1037.550—VEHICLE SETTINGS FOR POWERTRAIN TESTING OF HEAVY-HAUL TRACTORS

	Test 1	Test 2	Test 3	Test 4	Test 5	Test 6	Test 7	Test 8	Test 9
M (kg)	40,895	31,978	22,679	40,895	31,978	22,679	40,895	31,978	22,679.
C_DA	6.1	5.4	4.7	6.1	5.4	4.7	6.1	5.4	4.7.
$M_{rotating}$ (kg)	1,134	907	680	1,134	907	680	1,134	907	680.
r at engine speed	Minimum NTE exclusion speed.	Minimum NTE exclusion speed.	Minimum NTE exclusion speed.	B	B	B	Maximum test speed.	Maximum test speed.	Maximum test speed.

(i) Operate the powertrain over each of the duty cycles specified in § 1037.510(a)(2).

(j) Collect and measure emissions as described in 40 CFR part 1065. For hybrid powertrains, correct for the net energy change of the energy storage device as described in 40 CFR 1066.501.

(k) For each test point, validate the measured output speed with the corresponding reference values. You may delete points when the vehicle is stopped. Apply cycle-validation criteria for each separate transient or cruise cycle based on the following parameters:

TABLE 4 OF § 1037.550—STATISTICAL CRITERIA FOR VALIDATING DUTY CYCLES

Parameter [a]	Speed control
Slope, a_1	$0.990 \le a_1 \le 1.010$.
Absolute value of intercept, $\lvert a_0 \rvert$.	≤2.0% of maximum test speed.
Standard error of estimate, *SEE*.	≤2.0% of maximum test speed.
Coefficient of determination, r^2.	≥ 0.990.

[a] Determine values for specified parameters as described in 40 CFR 1065.514(e) by comparing measured and reference values for $f_{nref,dyno}$.

(l) [Reserved]

(m) Calculate mass of fuel consumed for all duty cycles except idle as follows:

(1) For measurements involving measured fuel mass flow rate, calculate the mass of fuel for each duty cycle, $m_{fuel[cycle]}$, as follows:

$$m_{fuel} = \sum_{i=1}^{N} \dot{m}_{fueli} \cdot \Delta t \qquad \text{Eq. 1037.550-8}$$

Where:

N = total number of measurements over the duty cycle. For batch fuel mass measurements, set N = 1.

i = an indexing variable that represents one recorded value.

$\dot{m}_{fuel_i}$ = the fuel mass flow rate, for each point, i, starting from i = 1.

$\Delta t = 1/f_{record}$

f_{record} = the data recording frequency.

Example:

N = 6680

$\dot{m}_{fuel_1}$ = 1.856 g/s

$\dot{m}_{fuel_2}$ = 1.962 g/s

f_{record} = 10 Hz

Δt = 1/10 = 0.1 s

$m_{fueltransient} = (1.856 + 1.962 + \ldots + \dot{m}_{fuel6680}) \cdot 0.1$

$m_{fueltransient}$ = 111.95 g

(2) For tests using emission measurements (CO_2, CO, and THC) rather than measured fuel mass flow rate, calculate the mass of fuel for each duty cycle, $m_{fuel[cycle]}$, as follows:

(i) For calculations that use continuous measurement of emissions, calculate $m_{fuel[cycle]}$ using the following equation:

$$m_{fuel[cycle]} = \frac{M_C}{w_{Cmeas}} \cdot \left(\sum_{i=1}^{N_{[event]}} \left(\dot{n}_{exh_i} \cdot \frac{x_{Ccombdry_i}}{1 + x_{H2Oexhdry_i}} \cdot \Delta t_{[event]} \right) - \frac{1}{M_{CO2}} \sum_{j=1}^{N_{[event]}} \left(\dot{m}_{CO2urea_j} \cdot \Delta t_{[event]} \right) \right) \qquad \text{Eq. 1037.550-9}$$

Where:

$N_{[event]}$ = total number of measurements over the duty cycle.

i = an indexing variable that represents one recorded emission value.

w_{Cmeas} = carbon mass fraction of fuel as determined by 40 CFR 1065.655(d), except that you may not use the default properties in Table 1 of 40 CFR 1065.655 to determine α, β, and w_C for liquid fuels.

$\dot{n}_{exh}$ = exhaust molar flow rate from which you measured emissions.

$\chi_{Ccombdry}$ = amount of carbon from fuel in the exhaust per mole of dry exhaust.

$\chi_{H2Oexhdry}$ = amount of H_2O in exhaust per mole of exhaust.

j = an indexing variable that represents one recorded mass emission rate of CO_2 from urea value.

$\dot{m}_{CO2urea_j}$ = mass emission rate of CO_2 from the contribution of urea decomposition over the duty cycle as determined from 40 CFR 1036.535(a)(8). If your engine does not utilize urea SCR for emission control, or if you choose not to perform this correction, set this value equal to 0.

Example:

M_C = 12.0107 g/mol

w_{Cmeas} = 0.867

$N_{emission}$ = 6680

$N_{CO2urea}$ = 668

$\dot{n}_{exh1}$ = 2.876 mol/s

$\dot{n}_{exh2}$ = 2.224 mol/s

$\chi_{Ccombdry_1} = 2.61 \cdot 10^{-3}$ mol/mol

$\chi_{Ccombdry_2} = 1.91 \cdot 10^{-3}$ mol/mol

$\chi_{H2Oexh_1} = 3.53 \cdot 10^{-2}$ mol/mol

$\chi_{H2Oexh_2} = 3.13 \cdot 10^{-2}$ mol/mol

$f_{record\text{-}emission}$ = 10 Hz

$\Delta t_{emission}$ = 1/10 = 0.1 s

M_{CO2} = 44.0095 g/mol

$f_{record\text{-}CO2urea}$ = 1 Hz

$\Delta t_{CO2urea}$ = 1/1 = 1.0 s

$\dot{m}_{CO2urea_1}$ = 0.0726 g/s

$\dot{m}_{CO2urea_2}$ = 0.0751 g/s

$$m_{\text{fueltransient}} = \frac{12.0107}{0.867} \cdot \left(\left(\begin{array}{l} 2.876 \cdot \dfrac{2.61 \cdot 10^{-3}}{1+3.53 \cdot 10^{-2}} \cdot 0.1 + \\ 2.224 \cdot \dfrac{1.91 \cdot 10^{-3}}{1+3.13 \cdot 10^{-2}} \cdot 0.1 + \\ \ldots + \dot{n}_{\text{exh}_{6680}} \cdot \dfrac{x_{\text{Ccombdry}_{6680}}}{1+x_{\text{H2Oexhdry}_{6680}}} \cdot \Delta t_{6680} \end{array} \right) - \frac{1}{44.0095} \cdot \left(0.0726 \cdot 1.0 + 0.0751 \cdot 1.0 + \ldots + \dot{m}_{\text{CO2urea}_{668}} \cdot \Delta t_{668} \right) \right)$$

$m_{CO2transient}$ = 1619.6 g

(ii) If you measure batch emissions, calculate $m_{fuel[cycle]}$ using the following equation:

$$m_{\text{fuel[cycle]}} = \frac{M_{\text{C}}}{w_{\text{Cmeas}}} \cdot \left(\frac{\bar{x}_{\text{Ccombdry}}}{1+\bar{x}_{\text{H2Oexhdry}}} \cdot \sum_{i=1}^{N_{\text{[event]}}} \left(\dot{n}_{\text{exh}_i} \cdot \Delta t_{\text{[event]}} \right) - \frac{1}{M_{\text{CO2}}} \sum_{j=1}^{N_{\text{[event]}}} \left(\dot{m}_{\text{CO2urea}_j} \cdot \Delta t_{\text{[event]}} \right) \right) \quad \text{Eq. 1037.550-10}$$

(iii) If you measure continuous emissions and batch CO_2 from urea, calculate $m_{fuel[cycle]}$ using the following equation:

$$m_{\text{fuel[cycle]}} = \frac{M_{\text{C}}}{w_{\text{Cmeas}}} \cdot \left(\sum_{i=1}^{N_{\text{[event]}}} \left(\dot{n}_{\text{exh}_i} \cdot \frac{x_{\text{Ccombdry}_i}}{1+x_{\text{H2Oexhdry}_i}} \cdot \Delta t_{\text{[event]}} \right) - \frac{m_{\text{CO2urea}}}{M_{\text{CO2}}} \right) \quad \text{Eq. 1037.550-11}$$

(iv) If you measure batch emissions and batch CO_2 from urea, calculate $m_{fuel[cycle]}$ using the following equation:

$$m_{\text{fuel[cycle]}} = \frac{M_{\text{C}}}{w_{\text{Cmeas}}} \cdot \left(\frac{\bar{x}_{\text{Ccombdry}}}{1+\bar{x}_{\text{H2Oexhdry}}} \cdot \sum_{i=1}^{N_{\text{[event]}}} \left(\dot{n}_{\text{exh}_i} \cdot \Delta t_{\text{[event]}} \right) - \frac{m_{\text{CO2urea}}}{M_{\text{CO2}}} \right) \quad \text{Eq. 1037.550-12}$$

(n) Determine the mass of fuel consumed at idle as follows:

(1) Measure fuel consumption with a fuel flow meter and report the mean fuel mass flow rate for each duty cycle, $\bar{\dot{m}}_{fuelidle}$.

(2) For measurements that do not involve measured fuel mass flow rate, calculate the fuel mass flow rate for each duty cycle, $\bar{\dot{m}}_{fuelidle}$, for each set of vehicle settings, as follows:

$$\bar{\dot{m}}_{\text{fuelidle}} = \frac{M_{\text{C}}}{w_{\text{Cmeas}}} \cdot \left(\bar{\dot{n}}_{\text{exh}} \cdot \frac{\bar{x}_{\text{Ccombdry}}}{1+\bar{x}_{\text{H2Oexhdry}}} - \frac{\bar{\dot{m}}_{\text{CO2urea}}}{M_{\text{CO2}}} \right) \quad \text{Eq. 1037.550-13}$$

Where:

$\bar{\dot{n}}_{exh}$ = the mean raw exhaust molar flow rate from which you measured emissions.

$\dot{m}_{CO2urea}$ = mass emission rate of CO_2 from the contribution of urea decomposition over the duty cycle as determined from 40 CFR 1036.535(a)(8), for each point, i, starting from i = 1. If your engine does not utilize urea SCR for emission control, or if you choose not to perform this correction, set this value equal to 0.

M_C = molar mass of carbon.

w_{Cmeas} = carbon mass fraction of fuel as determined by 40 CFR 1065.655(d), except that you may not use the default properties in Table 1 of 40 CFR 1065.655 to determine α, β, and w_C for liquid fuels.

$\bar{\dot{n}}_{exh}$ = the mean raw exhaust molar flow rate from which you measured emissions according to 40 CFR 1065.655.

$\bar{\chi}_{Ccombdry}$ = the mean concentration of carbon from fuel in the exhaust per mole of dry exhaust.

$\bar{\chi}_{H2Oexhdry}$ = the mean concentration of H_2O in exhaust per mole of dry exhaust.

$\bar{\dot{m}}_{CO2urea}$ = the mean CO_2 mass emission rate from urea decomposition as described in paragraph (c)(9) of this section. If your engine does not utilize urea SCR for emission control, or if you choose not to perform this correction, set $\bar{\dot{m}}_{CO2urea}$ equal to 0.

M_{CO2} = molar mass of carbon dioxide.

Example:

$$M_C = 12.0107 \text{ g/mol}$$

$$w_{Cmeas} = 0.867$$

$$\bar{\dot{n}}_{exh} = 25.534 \text{ mol/s}$$

$$x_{Ccombdry} = 2.805 \cdot 10^{-3} \text{ mol/mol}$$

$$x_{H2Oexhdry} = 3.53 \cdot 10^{-2} \text{ mol/mol}$$

$$\bar{\dot{m}}_{CO2urea} = 0.0726 \text{ g/s}$$

$$M_{CO2} = 44.0095$$

$$\bar{\dot{m}}_{fuelidle} = \frac{12.0107}{0.867} \cdot \left(25.534 \cdot \frac{2.805 \cdot 10^{-3}}{1 + 3.53 \cdot 10^{-2}} - \frac{0.0726}{44.0095}\right)$$

$$\bar{\dot{m}}_{fuelidle} = 0.405 \text{ g/s} = 1458.6 \text{ g/hr}$$

(o) Use the results of powertrain testing to determine GEM inputs as described in this paragraph (o). Declare a fuel mass consumption rate at idle $\bar{\dot{m}}_{fuelidle}$, as described in paragraph (b) of this section. Include additional parameters for each of the eight or nine simulated vehicle configurations as follows:

(1) Your declared fuel mass consumption for both cruise cycles and for the transient cycle, $m_{fuel[cycle]}$, as described in paragraph (b) of this section.

(2) Powertrain output speed per unit of vehicle speed. If the test is done with the dynamometer connected at the wheel hubs set k_a to the axle ratio of the rear axle that was used in the test. If the vehicle does not have a drive axle, such as hybrid vehicles with direct electric drive, let k_a = 1.

$$\frac{f_{npowertrain}}{v_{powertrain}} = \frac{k_a}{2 \cdot \pi \cdot r_{[speed]}}$$

(3) Positive work, $W_{[cycle]powertrain}$, over the duty cycle at the transmission output or wheel hubs from the powertrain test.

(4) The following table illustrates the GEM data inputs corresponding to the different vehicle configurations:

Table 5 of § 1037.550 – Example test result output matrix for Class 8 vehicles.

	Test 1	Test 2	Test 3	Test 4	Test 5	Test 6	Test 7	Test 8	Test 9
$m_{\text{fuel[cycle]powertrain}}$									
$\dfrac{f_{\text{npowertrain}}}{v_{\text{powertrain}}}$									
$W_{\text{[cycle]powertrain}}$									

(p) Correct each fuel-consumption result from paragraph (o) of this section for the test fuel's mass-specific net energy content as described in 40 CFR 1036.530.

(q) For each test run, record the engine speed and torque as defined in 40 CFR 1065.915(d)(5) with a minimum sampling frequency of 1 Hz. These engine speed and torque values represent a duty cycle that can be used for separate testing with an engine mounted on an engine dynamometer, such as for a selective enforcement audit as described in § 1037.301.

§ 1037.551 Engine-based simulation of powertrain testing.

Section 1037.550 describes how to measure fuel consumption over specific duty cycles with an engine coupled to a transmission; § 1037.550(q) describes how to create equivalent duty cycles for repeating those same measurements with just the engine. This § 1037.551 describes how to perform this engine testing to simulate the powertrain test. These engine-based measurements may be used for confirmatory testing as described in § 1037.235, or for selective enforcement audits as described in § 1037.301, as long as the test engine's operation represents the engine operation observed in the powertrain test.

(a) Use the procedures of 40 CFR part 1065 to set up the engine, measure emissions, and record data. Measure individual parameters and emission constituents as described in this section. Measure NO_X emissions during each of the specified sampling periods consistent with the data requirements 40 CFR part 86, subpart T. You may use emission-measurement systems meeting the specifications of 40 CFR part 1065, subpart J, to measure NO_X emissions. For hybrid powertrains, correct for the net energy change of the energy storage device as described in 40 CFR 1066.501.

(b) Operate the engine over the applicable engine duty cycles corresponding to the vehicle cycles specified in § 1037.510(a)(2) for powertrain testing over the applicable vehicle simulations described in § 1037.550(h). Warm up the engine to prepare for the transient test or one of the cruise cycles by operating it one time over one of the simulations of the corresponding duty cycle. Warm up the engine to prepare for the idle test by operating it over a simulation of the 65-mph cruise cycle for 600 seconds. Within 60 seconds after concluding the warm up cycle, start emission sampling while the engine operates over the duty cycle. You may perform any number of test runs directly in succession once the engine is warmed up. Perform cycle validation as described in 40 CFR 1065.514 for engine speed, torque, and power.

(c) Calculate the mass of fuel consumed as described in § 1037.550(m) and (n). Correct each measured value for the test fuel's mass-specific net energy content as described in 40 CFR 1036.530. Use these corrected values to determine whether the engine's emission levels conform to the declared fuel-consumption rates from the powertrain test.

§ 1037.555 Special procedures for testing Phase 1 post-transmission hybrid systems.

This section describes the procedure for simulating a chassis test with a pre-transmission or post-transmission hybrid system for A to B testing of Phase 1 vehicles. These procedures may also be used to perform A to B testing with non-hybrid systems. See § 1037.550 for Phase 2 hybrid systems.

(a) Set up the engine according to 40 CFR 1065.110 to account for work inputs and outputs and accessory work.

(b) Collect CO_2 emissions while operating the system over the test cycles specified in § 1037.510(a)(1).

(c) Collect and measure emissions as described in 40 CFR part 1066. Calculate emission rates in grams per ton-mile without rounding. Determine values for *A, B, C,* and *M* for the vehicle being simulated as specified in 40 CFR part 1066. If you will apply an improvement factor or test results to multiple vehicle configurations, use values of *A, B, C, M,* k_a, and *r* that represent the vehicle configuration with the smallest potential reduction in greenhouse gas emissions as a result of the hybrid capability.

(d) Calculate the transmission output shaft's angular speed target for the driver model, $f_{\text{nref,driver}}$, from the linear speed associated with the vehicle cycle using the following equation:

$$f_{\text{nref}_{\text{i,driver}}} = \frac{v_{\text{cycle}_i} \cdot k_a}{2 \cdot \pi \cdot r} \qquad \text{Eq. 1037.555-1}$$

Where:

v_{cyclei} = vehicle speed of the test cycle for each point, *i*, starting from *i*=1.

k_a = drive axle ratio, as declared by the manufacturer.

r = radius of the loaded tires, as declared by the manufacturer.

(e) Use speed control with a loop rate of at least 100 Hz to program the dynamometer to follow the test cycle, as follows:

(1) Calculate the transmission output shaft's angular speed target for the dynamometer, $f_{\text{nref,dyno}}$, from the measured linear speed at the dynamometer rolls using the following equation:

$$f_{\mathrm{nref}_{\mathrm{i,dyno}}} = \frac{v_{\mathrm{ref}_{\mathrm{i}}} \cdot k_{\mathrm{a}}}{2 \cdot \pi \cdot r} \qquad \text{Eq. 1037.555-2}$$

Where:

$$v_{\mathrm{ref}_{\mathrm{i}}} = \left(\frac{k_{\mathrm{a}} \cdot T_{\mathrm{i-1}}}{r} - \left(A + B \cdot v_{\mathrm{ref}_{\mathrm{i-1}}} + C \cdot v_{\mathrm{ref}_{\mathrm{i-1}}}^{2} \right) - F_{\mathrm{brake}_{\mathrm{i-1}}} \right) \cdot \frac{t_{\mathrm{i}} - t_{\mathrm{i-1}}}{M} + v_{\mathrm{ref}_{\mathrm{i-1}}} \qquad \text{Eq. 1037.555-3}$$

T = instantaneous measured torque at the transmission output shaft.
F_{brake} = instantaneous brake force applied by the driver model to add force to slow down the vehicle.
t = elapsed time in the driving schedule as measured by the dynamometer, in seconds.

(2) For each test, validate the measured transmission output shaft's speed with the corresponding reference values according to 40 CFR 1065.514(e). You may delete points when the vehicle is stopped. Perform the validation based on speed values at the transmission output shaft. For steady-state tests (55 mph and 65 mph cruise), apply cycle-validation criteria by treating the sampling periods from the two tests as a continuous sampling period. Perform this validation based on the following parameters:

TABLE 1 OF § 1037.555—STATISTICAL CRITERIA FOR VALIDATING DUTY CYCLES

Parameter	Speed control
Slope, a_1	0.950 ≤$_{a1}$ ≤ 1.030.
Absolute value of intercept, √a_0√.	≤2.0% of maximum test speed.
Standard error of estimate, *SEE*.	≤5% of maximum test speed.
Coefficient of determination, r^2.	≥0.970.

(f) Send a brake signal when throttle position is equal to zero and vehicle speed is greater than the reference vehicle speed from the test cycle. Set a delay before changing the brake state to prevent the brake signal from dithering, consistent with good engineering judgment.

(g) The driver model should be designed to follow the cycle as closely as possible and must meet the requirements of § 1037.510 for steady-state testing and 40 CFR 1066.430(e) for transient testing. The driver model should be designed so that the brake and throttle are not applied at the same time.

(h) Correct for the net energy change of the energy storage device as described in 40 CFR 1066.501.

(i) Follow the provisions of § 1037.510 to weight the cycle results and § 1037.615 to calculate improvement factors and benefits for advanced technologies for Phase 1 vehicles.

§ 1037.560 Rear-axle efficiency test.

This section describes a procedure for mapping rear-axle efficiency.

(a) Prepare an axle assembly for testing as follows:

(1) Select a newly manufactured axle assembly housing.

(2) If you have a family of axle assemblies with different axle ratios, you may test multiple configurations using a common axle housing.

(3) Install the axle with an input shaft angle perpendicular to the axle.

(i) If the axle assembly has a locking differential, lock the main differential and test it with one electric motor on the input shaft and a second electric motor on the output side of the output shaft that has the speed-reduction gear attached to it.

(ii) If an axle assembly has an open differential, use an alternate method to lock the differential for testing.

(iii) For drive-through tandem-axle setups, lock the longitudinal and inter-wheel differentials.

(4) Add gear lubricant according to the axle manufacturer's instructions. Use gear lubricant meeting the specification for BASF Emgard FE 2986 as described in ''Emgard® FE 75W–90 Fuel Efficient Synthetic Gear Lubricant'' (incorporated by reference in § 1037.810). Use this gear lubricant for all axle operation under this section.

(5) Install equipment for measuring the bulk temperature of the gear lubricant in the oil sump or a similar location.

(6) Break in the axle assembly by warming it up until the gear lubricant is as least 85 °C, and then operating it for 77 minutes at an angular wheel speed of 246 rpm at each of three differential torque settings, 25%, 50%, and 75%, in sequence, where differential torque is expressed as a percentage of the axle manufacturer's torque rating. Maintain gear lubricant temperature at 90±5 °C throughout the warm-up period.

(7) Drain and refill the gear lubricant following the break-in procedure.

(b) Measure input and output speeds and torques as described in 40 CFR 1065.210(b). Calibrate and verify measurement instruments according to 40 CFR part 1065, subpart C. Record all data, including bulk oil temperature, at a minimum of 256 Hz.

(c) The test matrix consists of torque and wheel speed values meeting the following specifications:

(1) Input torque values range from 1,000 to 4,000 N·m in 1,000 N·m increments; also include a test point with an output torque of 0 N·m.

(2) Determine maximum wheel speed corresponding to a vehicle speed of 65 mph based on the smallest tire that will be used with the axle. Use wheel speeds for testing that include maximum wheel speed, 50 rpm, and intermediate speeds in 100-rpm increments up to maximum wheel speed (150, 250, etc.). You may omit the last 100-rpm increment if it is within 10 rpm of the maximum wheel speed, and instead test at maximum wheel speed for the last test point.

(3) The average of measured values corresponding to each separate torque-measurement point must be within ±1 N·m of the setpoint for input torque, and within ±1 rpm of the setpoint for output speed.

(d) Determine rear-axle efficiency using the following procedure:

(1) Maintain ambient temperature between (20 and 30) °C throughout testing. Measure ambient temperature within 1.0 m of the axle assembly.

(2) Maintain gear lubricant temperature at 82±1 °C. You may use external heating and cooling as needed.

(3) Warm up the axle by operating it at maximum wheel speed and at zero output torque until the gear lubricant is within the specified temperature range.

(4) Continue operating at maximum wheel speed and zero output torque for at least 300 seconds, then measure the input torque, output torque, and wheel speed for at least 300 seconds, recording the average values for all three parameters. Repeat this stabilization and measurement sequence sequentially for higher torque setpoints from the test

matrix while holding wheel speed constant. Repeat the stabilization and measurement sequence at the same wheel speed from highest to lowest torque. This results in two measurements at each torque setting. Perform the stabilization and measurement sequence again in a sequence from low to high torque values, then from high to low torque values, all at the same wheel speed, resulting in four measurements at each torque setting. Calculate an arithmetic average value for input torque, output torque, and wheel speed at each torque setting.

(5) Decrease wheel speed to the next lower speed setting and repeat the torque sweep described in paragraph (d)(4) of this section to determine input torque, output torque, and wheel speed results for all the torque settings at the new wheel speed. Repeat this process in order of decreasing wheel speed until the mapping is complete for all points in the test matrix. If the test is aborted before completing the map, invalidate all the measurements made at that wheel speed. Once the problem has been resolved, warm up the axle as described in paragraph (d)(3) of this section and continue with measurements from the wheel speed where you stopped testing.

(e) Calculate the torque loss, T_{loss}, at each point from the test matrix using the following equation:

$$T_{\text{loss}} = T_{\text{in}} \cdot k_{\text{a}} - T_{\text{out}} \qquad \text{Eq. 1037.560-1}$$

Where:

T_{in} = input torque.

k_{a} = drive axle ratio, expressed to at least the nearest 0.001.

T_{out} = the output torque.

Example:

T_{in} = 1000.0 N·m

k_{a} = 3.731

T_{out} = 3695.1 N·m

T_{loss} = 1000.0 · 3.731 − 3695.1 = 35.9 N·m

Subpart G—Special Compliance Provisions

§ 1037.601 General compliance provisions.

(a) Engine and vehicle manufacturers, as well as owners and operators of vehicles subject to the requirements of this part, and all other persons, must observe the provisions of this part, the provisions of 40 CFR part 1068, and the provisions of the Clean Air Act. The provisions of 40 CFR part 1068 apply for heavy-duty vehicles as specified in that part, subject to the following provisions:

(1) Except as specifically allowed by this part or 40 CFR part 1068, it is a violation of § 1068.101(a)(1) to introduce into U.S. commerce a tractor or vocational vehicle containing an engine not certified to the requirements of this part and 40 CFR part 86 corresponding to the calendar year for date of manufacture of the tractor or vocational vehicle. Similarly, it is a violation to introduce into U.S. commerce a Phase 1 tractor containing an engine not certified for use in tractors; or to introduce into U.S. commerce a vocational vehicle containing a light heavy-duty or medium heavy-duty engine not certified for use in vocational vehicles. These prohibitions apply especially to the vehicle manufacturer. Note that this paragraph (a)(1) allows the use of Class 8 tractor engines in vocational vehicles.

(2) The provisions of 40 CFR 1068.105(a) apply for vehicle manufacturers installing engines certified under 40 CFR part 1036 as further limited by this paragraph (a)(2). If new engine emission standards apply in a given model year, you may install engines built before the date of the new or changed standards under the provisions of 40 CFR 1068.105(a) through March 31 of that year without our approval; you may not install such engines after March 31 of that year unless we approve it in advance. Installing such engines after March 31 without our prior approval is considered to be prohibited stockpiling of engines. In a written request for our approval, you must describe how your circumstances led you and your engine supplier to have normal inventories of engines that were not used up in the specified time frame. We will approve your request for up to three additional months to install up to 50 engines under this paragraph (a)(2) if we determine that the excess inventory is a result of unforeseeable circumstances and should not be considered circumvention of emission standards.

(3) The provisions of 40 CFR 1068.235 that allow for modifying certified vehicles and engines for competition do not apply for heavy-duty vehicles or heavy-duty engines. Certified motor vehicles and motor vehicle engines and their emission control devices must remain in their certified configuration even if they are used solely for competition or if they become nonroad vehicles or engines; anyone modifying a certified motor vehicle or motor vehicle engine for any reason is subject to the tampering and defeat device prohibitions of 40 CFR 1068.101(b) and 42 U.S.C. 7522(a)(3). Note that a new vehicle that will be used solely for competition may be excluded from the requirements of this part based on a determination that the vehicle is not a motor vehicle under 40 CFR 85.1703.

(4) The tampering prohibition in 40 CFR 1068.101(b)(1) applies for alternative fuel conversions as specified in 40 CFR part 85, subpart F.

(5) The warranty-related prohibitions in section 203(a)(4) of the Act (42 U.S.C. 7522(a)(4)) apply to manufacturers of new heavy-duty highway vehicles in addition to the prohibitions described in 40 CFR 1068.101(b)(6). We may assess a civil penalty up to $37,500 for each engine or vehicle in violation.

(6) The hardship exemption provisions of 40 CFR 1068.245, 1068.250, and 1068.255 do not apply for heavy-duty vehicles.

(7) A vehicle manufacturer that completes assembly of a vehicle at two or more facilities may ask to use as the date of manufacture for that vehicle the date on which manufacturing is completed at the place of main assembly, consistent with provisions of 49 CFR 567.4. Note that such staged assembly is subject to the corresponding provisions of 40 CFR 1068.260. Include your request in your application for certification, along with a summary of your staged-assembly process. You may ask to apply this allowance to some or all of the vehicles in your vehicle family. Our approval is effective when we grant your certificate. We will not approve your request if we determine that you intend to use this allowance to circumvent the intent of this part.

(8) The provisions for selective enforcement audits apply as described in 40 CFR part 1068, subpart E, and § 1037.301.

(b) Vehicles exempted from the applicable standards of 40 CFR part 86 are exempt from the standards of this part without request. Similarly, vehicles are exempt without request if the installed engine is exempted from the applicable standards in 40 CFR part 86.

(c) The prohibitions of 40 CFR 1068.101 apply for vehicles subject to the requirements of this part. The actions prohibited under this provision include the introduction into U.S.

commerce of a complete or incomplete vehicle subject to the standards of this part where the vehicle is not covered by a valid certificate of conformity or exemption.

(d) The emergency vehicle field modification provisions of 40 CFR 85.1716 apply with respect to the standards of this part.

(e) Under § 1037.801, certain vehicles are considered to be new vehicles when they are imported into the United States, even if they have previously been used outside the country. Independent Commercial Importers may use the provisions of 40 CFR part 85, subpart P, and 40 CFR 85.1706(b) to receive a certificate of conformity for engines and vehicles meeting all the requirements of 40 CFR part 1036 and this part 1037.

(f) Standards apply to multi-fuel vehicles as described for engines in 40 CFR 1036.601(d).

§ 1037.605 Installing engines certified to alternate standards for specialty vehicles.

(a) *General provisions.* This section allows vehicle manufacturers to introduce into U.S. commerce certain new motor vehicles if the engines are certified to alternate emission standards that are equivalent to standards that apply for nonroad engines under 40 CFR part 1039 or 1048. See 40 CFR 86.007–11(g) and 40 CFR 86.008–10(g). The provisions of this section apply for the following types of vehicles:

(1) Vehicles with a hybrid powertrain in which the engine provides energy for the Rechargeable Energy Storage System.

(2) Amphibious vehicles.

(3) Vehicles with maximum speed at or below 45 miles per hour. If your vehicle is speed-limited to meet this specification by reducing maximum speed below what is otherwise possible, this speed limitation must be programmed into the engine or vehicle's electronic control module in a way that is tamper-proof. If your vehicles are not inherently limited to a maximum speed at or below 45 miles per hour, they may qualify under this paragraph (a)(3) only if we approve your design to limit maximum speed as being tamper-proof in advance.

(b) *Notification and reporting requirements.* Send the Designated Compliance Officer written notification describing your plans before using the provisions of this section. In addition, by February 28 of each calendar year (or less often if we tell you), send the Designated Compliance Officer a report with all the following information:

(1) Identify your full corporate name, address, and telephone number.

(2) List the vehicle and engine models for which you used this exemption in the previous year and identify the total number of vehicles.

(c) *Production limits.* You may produce up to 1,000 hybrid vehicles, up to 200 amphibious vehicles, and up to 200 speed-limited vehicles under this section in a given model year. This includes vehicles produced by affiliated companies. If you exceed this limit, the exemption is void for the number of vehicles that exceed the limit for the model year. For the purpose of this paragraph (c), we will include all vehicles labeled or otherwise identified as exempt under this section.

(d) *Vehicle standards.* Hybrid vehicles using the provisions of this section remain subject to all other requirements of this part 1037. For example, you must use GEM in conjunction with powertrain testing to demonstrate compliance with emission standards under subpart B of this part. Vehicles qualifying under paragraph (a)(2) or (a)(3) of this section are exempt from the requirements of this part, except as specified in this section; these vehicles must include a label as specified in § 1037.135(a) with the information from § 1037.135(c)(1) and (2) and the following statement: ''THIS [amphibious vehicle or speed-limited vehicle] IS EXEMPT FROM GREENHOUSE GAS STANDARDS UNDER 40 CFR 1037.605.''

§ 1037.610 Vehicles with off-cycle technologies.

(a) You may ask us to apply the provisions of this section for CO_2 emission reductions resulting from vehicle technologies that were not in common use with heavy-duty vehicles before model year 2010 that are not reflected in GEM. These may be described as off-cycle or innovative technologies. These provisions may be applied for CO_2 emission reductions reflected using the specified test procedures, provided they are not reflected in GEM. We will apply these provisions only for technologies that will result in measurable, demonstrable, and verifiable real-world CO_2 emission reductions. This section does not apply for trailers.

(b) The provisions of this section may be applied as either an improvement factor or as a separate credit within the vehicle family, consistent with good engineering judgment. Note that the term ''credit'' in this section describes an additive adjustment to emission rates and is not equivalent to an emission credit in the ABT program of subpart H of this part. We recommend that you base your credit/adjustment on A to B testing of pairs of vehicles differing only with respect to the technology in question.

(1) Calculate improvement factors as the ratio of in-use emissions with the technology divided by the in-use emissions without the technology. Use the improvement-factor approach where good engineering judgment indicates that the actual benefit will be proportional to emissions measured over the test procedures specified in this part.

(2) Calculate separate credits (g/ton-mile) based on the difference between the in-use emission rate with the technology and the in-use emission rate without the technology. Subtract this value from your GEM result and use this adjusted value to determine your FEL. Use the separate-credit approach where good engineering judgment indicates that the actual benefit will be not be proportional to emissions measured over the test procedures specified in this part.

(3) We may require you to discount or otherwise adjust your improvement factor or credit to account for uncertainty or other relevant factors.

(c) You may perform A to B testing by measuring emissions from the vehicles during chassis testing or from in-use on-road testing. We recommend that you perform on-road testing according to SAE J1321, Fuel Consumption Test Procedure—Type II, revised February 2012, or SAE J1526, Joint TMC/SAE Fuel Consumption In-Service Test Procedure Type III, Issued June 1987 (see § 1037.810 for information on availability of SAE standards), subject to the following provisions:

(1) The minimum route distance is 100 miles.

(2) The route selected must be representative in terms of grade. We will take into account published and relevant research in determining whether the grade is representative.

(3) Control vehicle speed over the route to be representative of the drive-cycle weighting adopted for each regulatory subcategory, as specified in § 1037.510(c), or apply a correction to account for the appropriate weighting. For example, if the route selected for an evaluation of a combination tractor with a sleeper cab contains only interstate driving at 65 mph, the improvement factor would apply only to 86 percent of the weighted result.

(4) The ambient air temperature must be between (5 and 35) °C, unless the technology requires other temperatures for demonstration.

(5) We may allow you to use a Portable Emissions Measurement System (PEMS) device for measuring

CO_2 emissions during the on-road testing.

(d) Send your request to the Designated Compliance Officer. We recommend that you do not begin collecting test data (for submission to EPA) before contacting us. For technologies for which the engine manufacturer could also claim credits (such as transmissions in certain circumstances), we may require you to include a letter from the engine manufacturer stating that it will not seek credits for the same technology. Your request must contain the following items:

(1) A detailed description of the off-cycle technology and how it functions to reduce CO_2 emissions under conditions not represented on the duty cycles required for certification.

(2) A list of the vehicle configurations that will be equipped with the technology.

(3) A detailed description and justification of the selected test vehicles.

(4) All testing and simulation data required under this section, plus any other data you have considered in your analysis. You may ask for our preliminary approval of your test plan under § 1037.210.

(5) A complete description of the methodology used to estimate the off-cycle benefit of the technology and all supporting data, including vehicle testing and in-use activity data. Also include a statement regarding your recommendation for applying the provisions of this section for the given technology as an improvement factor or a credit.

(6) An estimate of the off-cycle benefit by vehicle model, and the fleetwide benefit based on projected sales of vehicle models equipped with the technology.

(7) A demonstration of the in-use durability of the off-cycle technology, based on any available engineering analysis or durability testing data (either by testing components or whole vehicles).

(8) A recommended method for auditing production vehicles consistent with the intent of 40 CFR part 1068, subpart E. We may approve your recommended method or specify a different method.

(e) We may seek public comment on your request, consistent with the provisions of 40 CFR 86.1866. However, we will generally not seek public comment on credits or adjustments based on A to B chassis testing performed according to the duty-cycle testing requirements of this part or in-use testing performed according to paragraph (c) of this section.

(f) We may approve an improvement factor or credit for any vehicle family that is properly represented by your testing. You may similarly continue to use an approved improvement factor or credit for any appropriate vehicle families in future model years through 2020. Starting in model year 2021, you must request our approval before applying an improvement factor or credit under this section for any kind of technology, even if we approved an improvement factor or credit for similar vehicle models before model year 2021.

§ 1037.615 Hybrid vehicles and other advanced technologies.

(a) This section applies for Phase 1 hybrid vehicles with regenerative braking, vehicles equipped with Rankine-cycle engines, electric vehicles, and fuel cell vehicles. You may not generate credits for engine features for which the engines generate credits under 40 CFR part 1036. Note that Phase 2 and later hybrid vehicles may be powertrain tested under § 1037.550 to demonstrate the performance of hybrid powertrains.

(b) Generate advanced technology emission credits for hybrid vehicles that include regenerative braking (or the equivalent) and energy storage systems, fuel cell vehicles, and vehicles equipped with Rankine-cycle engines as follows:

(1) Measure the effectiveness of the advanced system by chassis testing a vehicle equipped with the advanced system and an equivalent conventional vehicle, or by testing the hybrid systems and the equivalent non-hybrid systems as described in § 1037.555. Test the vehicles as specified in subpart F of this part. For purposes of this paragraph (b), a conventional vehicle is considered to be equivalent if it has the same footprint (as defined in 40 CFR 86.1803), vehicle service class, aerodynamic drag, and other relevant factors not directly related to the hybrid powertrain. If you use § 1037.540 to quantify the benefits of a hybrid system for PTO operation, the conventional vehicle must have the same number of PTO circuits and have equivalent PTO power. If you do not produce an equivalent vehicle, you may create and test a prototype equivalent vehicle. The conventional vehicle is considered Vehicle A and the advanced vehicle is considered Vehicle B. We may specify an alternate cycle if your vehicle includes a power take-off.

(2) Calculate an improvement factor and g/ton-mile benefit using the following equations and parameters:

(i) Improvement Factor = [(Emission Rate A) − (Emission Rate B)]/(Emission Rate A).

(ii) g/ton-mile benefit = Improvement Factor × (GEM Result B).

(iii) Emission Rates A and B are the g/ton-mile CO_2 emission rates of the conventional and advanced vehicles, respectively, as measured under the test procedures specified in this section. GEM Result B is the g/ton-mile CO_2 emission rate resulting from emission modeling of the advanced vehicle as specified in § 1037.520.

(3) If you apply an improvement factor to multiple vehicle configurations using the same advanced technology, use the vehicle configuration with the smallest potential reduction in greenhouse gas emissions resulting from the hybrid capability.

(4) Use the equations of § 1037.705 to convert the g/ton-mile benefit to emission credits (in Mg). Use the g/ton-mile benefit in place of the (Std-FEL) term.

(c) See § 1037.540 for special testing provisions related to vehicles equipped with hybrid power take-off units.

(d) You may use an engineering analysis to calculate an improvement factor for fuel cell vehicles based on measured emissions from the fuel cell vehicle.

(e) For electric vehicles, calculate CO_2 credits using an FEL of 0 g/ton-mile.

(f) As specified in subpart H of this part, credits generated under this section may be used under this part 1037 outside of the averaging set in which they were generated or used under 40 CFR part 1036.

(g) You may certify using both provisions of this section and the off-cycle technology provisions of § 1037.610, provided you do not double count emission benefits.

§ 1037.620 Responsibilities for multiple manufacturers.

This section describes certain circumstances in which multiple manufacturers share responsibilities for vehicle they produce together. This section does limit responsibilities that apply under the Act or these regulations for anyone meeting the definition of ''manufacturer'' in § 1037.801.

(a) The delegated assembly provisions of § 1037.621 apply for certifying manufacturers that rely on other manufacturers to finish assembly in a certified configuration. The provisions of § 1037.622 apply for manufacturers that ship vehicles subject to the requirements of this part to a certifying secondary vehicle manufacturer. The provisions of § 1037.622 also apply to the secondary manufacturer.

(b) Manufacturers of aerodynamic devices may perform the aerodynamic testing described in § 1037.525 to quantify C_DA values for trailers and submit that data to EPA verification under § 1037.211. Trailer manufacturers may use such verified data to establish modeling inputs for certifying their trailers. Both device manufacturers and trailer manufacturers are subject to the recall provisions described in 40 CFR part 1068, subpart F.

(c) Tire manufacturers must comply with the provisions of § 1037.650.

§ 1037.621 Delegated assembly.

(a) This section describes an exemption that allows certificate holders to sell or ship vehicles that are missing certain emission-related components if those components will be installed by a secondary vehicle manufacturer. (**Note:** See § 1037.622 for provisions related to manufacturers introducing into U.S. commerce partially complete vehicles for which a secondary vehicle manufacturer holds the certificate of conformity.) This exemption is temporary as described in 40 CFR 1068(f).

(b) The provisions of 40 CFR 1068.261 apply for vehicles subject to GHG standards under this part, with the following exceptions and clarifications:

(1) Understand references to ''engines'' to refer to vehicles.

(2) Understand references to ''aftertreatment components'' to refer to any emission-related components needed for complying with GHG standards under this part.

(3) Understand ''equipment manufacturers'' to be secondary vehicle manufacturers.

(4) The provisions of 40 CFR 1068.261(b), (c)(7), (d), and (e) do not apply. Accordingly, the provisions of 40 CFR 1068.261(c) apply regardless of pricing arrangements.

§ 1037.622 Shipment of incomplete vehicles to secondary vehicle manufacturers.

This section specifies how manufacturers may introduce partially complete vehicles into U.S. commerce. The provisions of this section do not apply for trailers, except in unusual circumstances. You may not use the provisions of this section to circumvent the intent of this part.

(a) The provisions of this section allow manufacturers to ship partially complete vehicles to secondary vehicle manufacturers or otherwise introduce them into U.S. commerce in the following circumstances:

(1) *Tractors.* Manufacturers may introduce partially complete tractors into U.S. commerce if they are covered by a certificate of conformity for tractors and will be in their certified tractor configuration before they reach the ultimate purchasers. For example, this would apply for sleepers initially shipped without the sleeper compartments attached. Note that delegated assembly provisions may apply (see § 1037.621).

(2) *Small businesses modifying certified tractors.* Small businesses that build custom sleeper cabs may modify complete or incomplete vehicles certified as tractors, as long as they do not increase the effective frontal area of the certified configuration.

(3) *Vocational vehicles.* Manufacturers may introduce partially complete vocational vehicles into U.S. commerce if they are covered by a certificate of conformity for vocational vehicles and will be in their certified vocational configuration before they reach the ultimate purchasers. Note that delegated assembly provisions may apply (see § 1037.621).

(4) *Uncertified vehicles that will be certified by secondary vehicle manufacturers.* Manufacturers may introduce into U.S. commerce partially complete vehicles for which they do not hold a certificate of conformity only as allowed by paragraph (b) of this section; however, the requirements of this section do not apply for tractors or vocational vehicles built before January 1, 2022, that are produced by a secondary vehicle manufacturer if they are excluded from the standards of this part under § 1037.150(c).

(b) The provisions of this paragraph (b) generally apply where the secondary vehicle manufacturer has substantial control over the design and assembly of emission controls. In unusual circumstances we may allow other secondary vehicle manufacturers to use these provisions. In determining whether a manufacturer has substantial control over the design and assembly of emission controls, we would consider the degree to which the secondary manufacturer would be able to ensure that the engine and vehicle will conform to the regulations in their final configurations.

(1) A secondary manufacturer may finish assembly of partially complete vehicles in the following cases:

(i) It obtains a vehicle that is not fully assembled with the intent to manufacture a complete vehicle in a certified configuration.

(ii) It obtains a vehicle with the intent to modify it to a certified configuration before it reaches the ultimate purchaser. For example, this may apply for converting a gasoline-fueled vehicle to operate on natural gas under the terms of a valid certificate.

(2) Manufacturers may introduce partially complete vehicles into U.S. commerce as described in this paragraph (b) if they have a written request for such vehicles from a secondary vehicle manufacturer that will finish the vehicle assembly and has certified the vehicle (or the vehicle has been exempted or excluded from the requirements of this part). The written request must include a statement that the secondary manufacturer has a certificate of conformity (or exemption/exclusion) for the vehicle and identify a valid vehicle family name associated with each vehicle model ordered (or the basis for an exemption/exclusion). The original vehicle manufacturer must apply a removable label meeting the requirements of 40 CFR 1068.45 that identifies the corporate name of the original manufacturer and states that the vehicle is exempt under the provisions of § 1037.622. The name of the certifying manufacturer must also be on the label or, alternatively, on the bill of lading that accompanies the vehicles during shipment. The original manufacturer may not apply a permanent emission control information label identifying the vehicle's eventual status as a certified vehicle.

(3) If you are the secondary manufacturer and you will hold the certificate, you must include the following information in your application for certification:

(i) Identify the original manufacturer of the partially complete vehicle or of the complete vehicle you will modify.

(ii) Describe briefly how and where final assembly will be completed. Specify how you have the ability to ensure that the vehicles will conform to the regulations in their final configuration. (**Note:** This section prohibits using the provisions of this paragraph (b) unless you have substantial control over the design and assembly of emission controls.)

(iii) State unconditionally that you will not distribute the vehicles without conforming to all applicable regulations.

(4) If you are a secondary manufacturer and you are already a certificate holder for other families, you may receive shipment of partially complete vehicles after you apply for a certificate of conformity but before the certificate's effective date. This exemption allows the original manufacturer to ship vehicles after you have applied for a certificate of conformity. Manufacturers may introduce partially complete vehicles into U.S. commerce as described in this paragraph (b)(4) if they have a written request for such vehicles from a secondary manufacturer stating that the

application for certification has been submitted (instead of the information we specify in paragraph (b)(2) of this section). We may set additional conditions under this paragraph (b)(4) to prevent circumvention of regulatory requirements.

(5) The provisions of this section also apply for shipping partially complete vehicles if the vehicle is covered by a valid exemption and there is no valid family name that could be used to represent the vehicle model. Unless we approve otherwise in advance, you may do this only when shipping engines to secondary manufacturers that are certificate holders. In this case, the secondary manufacturer must identify the regulatory cite identifying the applicable exemption instead of a valid family name when ordering engines from the original vehicle manufacturer.

(6) Both original and secondary manufacturers must keep the records described in this section for at least five years, including the written request for exempted vehicles and the bill of lading for each shipment (if applicable). The written request is deemed to be a submission to EPA.

(7) These provisions are intended only to allow secondary manufacturers to obtain or transport vehicles in the specific circumstances identified in this section so any exemption under this section expires when the vehicle reaches the point of final assembly identified in paragraph (b)(3)(ii) of this section.

(8) For purposes of this section, an allowance to introduce partially complete vehicles into U.S. commerce includes a conditional allowance to sell, introduce, or deliver such vehicles into commerce in the United States or import them into the United States. It does not include a general allowance to offer such vehicles for sale because this exemption is intended to apply only for cases in which the certificate holder already has an arrangement to purchase the vehicles from the original manufacturer. This exemption does not allow the original manufacturer to subsequently offer the vehicles for sale to a different manufacturer who will hold the certificate unless that second manufacturer has also complied with the requirements of this part. The exemption does not apply for any individual vehicles that are not labeled as specified in this section or which are shipped to someone who is not a certificate holder.

(9) We may suspend, revoke, or void an exemption under this section, as follows:

(i) We may suspend or revoke your exemption if you fail to meet the requirements of this section. We may suspend or revoke an exemption related to a specific secondary manufacturer if that manufacturer sells vehicles that are in not in a certified configuration in violation of the regulations. We may disallow this exemption for future shipments to the affected secondary manufacturer or set additional conditions to ensure that vehicles will be assembled in the certified configuration.

(ii) We may void an exemption for all the affected vehicles if you intentionally submit false or incomplete information or fail to keep and provide to EPA the records required by this section.

(iii) The exemption is void for a vehicle that is shipped to a company that is not a certificate holder or for a vehicle that is shipped to a secondary manufacturer that is not in compliance with the requirements of this section.

(iv) The secondary manufacturer may be liable for penalties for causing a prohibited act where the exemption is voided due to actions on the part of the secondary manufacturer.

(c) Provide instructions along with partially complete vehicles including all information necessary to ensure that an engine will be installed in its certified configuration.

§ 1037.630 Special purpose tractors.

(a) *General provisions.* This section allows a vehicle manufacturer to reclassify certain tractors as vocational tractors. Vocational tractors are treated as vocational vehicles and are exempt from the standards of § 1037.106. Note that references to ''tractors'' outside of this section mean non-vocational tractors.

(1) This allowance is intended only for vehicles that do not typically operate at highway speeds, or would otherwise not benefit from efficiency improvements designed for line-haul tractors. This allowance is limited to the following vehicle and application types:

(i) Low-roof tractors intended for intra-city pickup and delivery, such as those that deliver bottled beverages to retail stores.

(ii) Tractors intended for off-road operation (including mixed service operation), such as those with reinforced frames and increased ground clearance.

(iii) Model year 2020 and earlier tractors with a gross combination weight rating (GCWR) over 120,000 pounds. Note that tractors meeting the definition of ''heavy-haul'' in § 1037.801 may be certified to the heavy-haul standards in § 1037.106.

(2) Where we determine that a manufacturer is not applying this allowance in good faith, we may require the manufacturer to obtain preliminary approval before using this allowance.

(b) *Requirements.* The following requirements apply with respect to tractors reclassified under this section:

(1) The vehicle must fully conform to all requirements applicable to vocational vehicles under this part.

(2) Vehicles reclassified under this section must be certified as a separate vehicle family. However, they remain part of the vocational regulatory subcategory and averaging set that applies for their weight class.

(3) You must include the following additional statement on the vehicle's emission control information label under § 1037.135: ''THIS VEHICLE WAS CERTIFIED AS A VOCATIONAL TRACTOR UNDER 40 CFR 1037.630.''

(4) You must keep records for three years to document your basis for believing the vehicles will be used as described in paragraph (a)(1) of this section. Include in your application for certification a brief description of your basis.

(c) *Production limit.* No manufacturer may produce more than 21,000 vehicles under this section in any consecutive three model year period. This means you may not exceed 6,000 in a given model year if the combined total for the previous two years was 15,000. The production limit applies with respect to all Class 7 and Class 8 tractors certified or exempted as vocational tractors. Note that in most cases, the provisions of paragraph (a) of this section will limit the allowable number of vehicles to be a number lower than the production limit of this paragraph (c).

(d) *Off-road exemption.* All the provisions of this section apply for vocational tractors exempted under § 1037.631, except as follows:

(1) The vehicles are required to comply with the requirements of § 1037.631 instead of the requirements that would otherwise apply to vocational vehicles. Vehicles complying with the requirements of § 1037.631 and using an engine certified to the standards of 40 CFR part 1036 are deemed to fully conform to all requirements applicable to vocational vehicles under this part.

(2) The vehicles must be labeled as specified under § 1037.631 instead of as specified in paragraph (b)(3) of this section.

§ 1037.631 Exemption for vocational vehicles intended for off-road use.

This section provides an exemption from the greenhouse gas standards of this part for certain vocational vehicles intended to be used extensively in off-road environments such as forests, oil fields, and construction sites. This section does not exempt engines used in vocational vehicles from the standards of 40 CFR part 86 or part 1036. Note that you may not include these exempted vehicles in any credit calculations under this part. Note also that trailers designed specifically for off-road use are generally excluded from the requirements of this part under § 1037.5.

(a) *Qualifying criteria.* Vocational vehicles intended for off-road use are exempt without request, subject to the provisions of this section, if they are primarily designed to perform work off-road (such as in oil fields, mining, forests, or construction sites), and they meet at least one of the criteria of paragraph (a)(1) of this section and at least one of the criteria of paragraph (a)(2) of this section.

(1) The vehicle must have affixed components designed to work in an off-road environment (*i.e.*, hazardous material equipment or off-road drill equipment) or be designed to operate at low speeds such that it is unsuitable for normal highway operation.

(2) The vehicle must meet one of the following criteria:

(i) Have an axle that has a gross axle weight rating (GAWR) at or above 29,000 pounds.

(ii) Have a speed attainable in 2.0 miles of not more than 33 mph.

(iii) Have a speed attainable in 2.0 miles of not more than 45 mph, an unloaded vehicle weight that is not less than 95 percent of its gross vehicle weight rating, and no capacity to carry occupants other than the driver and operating crew.

(b) *Tractors.* The provisions of this section may apply for tractors only if each tractor qualifies as a vocational tractor under § 1037.630.

(c) *Recordkeeping and reporting.* (1) You must keep records to document that your exempted vehicle configurations meet all applicable requirements of this section. Keep these records for at least eight years after you stop producing the exempted vehicle model. We may review these records at any time.

(2) You must also keep records of the individual exempted vehicles you produce, including the vehicle identification number and a description of the vehicle configuration.

(3) Within 90 days after the end of each model year, you must send to the Designated Compliance Officer a report with the following information:

(i) A description of each exempted vehicle configuration, including an explanation of why it qualifies for this exemption.

(ii) The number of vehicles exempted for each vehicle configuration.

(d) *Labeling.* You must include the following additional statement on the vehicle's emission control information label under § 1037.135: ''THIS VEHICLE WAS EXEMPTED UNDER 40 CFR 1037.631.''

§ 1037.635 Glider kits.

Section 1037.601(a)(1) generally disallows the introduction into U.S. commerce of a new tractor or vocational vehicle (including a vehicle assembled from a glider kit) unless it has an engine that is certified to the standards that apply for the engine model year corresponding to the vehicle's date of manufacture. For example, for a vehicle with a 2020 date of manufacture, the engine must meet the standards that apply for model year 2020. Note that the engine may be from an earlier model year if the standards were identical. This section describes an exemption from the certification requirement that applies for qualifying manufacturers. Note that the Clean Air Act definition of ''manufacturer'' includes anyone who assembles motor vehicles, including entities that install engines in or otherwise complete assembly of glider kits.

(a) Vehicles conforming to the requirements in paragraphs (b) through (g) of this section are exempt from the emission standards of this part. Engines in such vehicles remain subject to the requirements of 40 CFR part 86 applicable for the engines' original model year, but are exempt from the standards of 40 CFR part 1036.

(b) You are eligible for an exemption under this section if you are a small manufacturer and you sold vehicles in 2014 under the provisions of § 1037.150(j). You must notify us of your plans to use this exemption before you introduce exempt vehicles into U.S. commerce. In your notification, you must identify your annual sales of such vehicles for calendar years 2010 through 2014. Vehicles you produce before notifying us, are not exempt under this section.

(c) In a given calendar year, you may sell up to 300 exempt vehicles under this section, or up to the highest annual sales volume you identify in paragraph (b) of this section, whichever is less.

(d) Identify the number of exempt vehicles you sold under this section for the prior calendar year in your annual report under § 1037.250,

(e) Include the following statement on the label required under § 1037.135: ''THIS VEHICLE AND ITS ENGINE ARE EXEMPT UNDER 40 CFR 1037.635.''

(f) This exemption is valid for a given vehicle only if you meet all the requirements and conditions of this section that apply with respect to that vehicle. Introducing such a vehicle into U.S. commerce without meeting all applicable requirements and conditions violates 40 CFR 1068.101(a)(1).

(g) Companies that are not small manufacturers may sell uncertified incomplete vehicles without engines to small manufacturers for the purpose of producing exempt vehicles under this section, subject to the provisions of § 1037.622.

§ 1037.640 Variable vehicle speed limiters.

This section specifies provisions that apply for vehicle speed limiters (VSLs) that you model under § 1037.520. This does not apply for VSLs that you do not model under § 1037.520.

(a) *General.* The regulations of this part do not constrain how you may design VSLs for your vehicles. For example, you may design your VSL to have a single fixed speed limit or a soft-top speed limit. You may also design your VSL to expire after accumulation of a predetermined number of miles. However, designs with soft tops or expiration features are subject to proration provisions under this section that do not apply to fixed VSLs that do not expire.

(b) *Definitions.* The following definitions apply for purposes of this section:

(1) Default speed limit means the speed limit that normally applies for the vehicle, except as follows:

(i) The default speed limit for adjustable VSLs must represent the speed limit that applies when the VSL is adjusted to its highest setting under paragraph (c) of this section.

(ii) For VSLs with soft tops, the default speed does not include speeds possible only during soft-top operation.

(iii) For expiring VSLs, the default does not include speeds that are possible only after expiration.

(2) Soft-top speed limit means the highest speed limit that applies during soft-top operation.

(3) Maximum soft-top duration means the maximum amount of time that a vehicle could operate above the default speed limit.

(4) Certified VSL means a VSL configuration that applies when a vehicle is new and until it expires.

(5) Expiration point means the mileage at which a vehicle's certified VSL expires (or the point at which tamper protections expire).

(6) Effective speed limit has the meaning given in paragraph (d) of this section.

(c) *Adjustments.* You may design your VSL to be adjustable; however, this may affect the value you use in GEM.

(1) Except as specified in paragraph (c)(2) of this section, any adjustments that can be made to the engine, vehicle, or their controls that change the VSL's actual speed limit are considered to be adjustable operating parameters. Compliance is based on the vehicle being adjusted to the highest speed limit within this range.

(2) The following adjustments are not adjustable parameters:

(i) Adjustments made only to account for changing tire size or final drive ratio.

(ii) Adjustments protected by encrypted controls or passwords.

(iii) Adjustments possible only after the VSL's expiration point.

(d) *Effective speed limit.* (1) For VSLs without soft tops or expiration points that expire before 1,259,000 miles, the effective speed limit is the highest speed limit that results by adjusting the VSL or other vehicle parameters consistent with the provisions of paragraph (c) of this section.

(2) For VSLs with soft tops and/or expiration points, the effective speed limit is calculated as specified in this paragraph (d)(2), which is based on 10 hours of operation per day (394 miles per day for day cabs and 551 miles per day for sleeper cabs). Note that this calculation assumes that a fraction of this operation is speed limited (3.9 hours and 252 miles for day cabs, and 7.3 hours and 474 miles for sleeper cabs). Use the following equation to calculate the effective speed limit, rounded to the nearest 0.1 mph:

$$\text{Effective speed} = ExF \cdot [STF \cdot STSL + (1\text{-}STF) \cdot DSL] + (1\text{-}ExF) \cdot 65 \text{ mph}$$

Where:

ExF = expiration point miles/1,259,000 miles.

STF = the maximum number of allowable soft top operation hours per day/3.9 hours for day cabs (or maximum miles per day/252), or the maximum number of allowable soft top operation hours per day/7.3 hours for sleeper cabs (or maximum miles per day/474).

STSL = the soft top speed limit.

DSL = the default speed limit.

§ 1037.645 In-use compliance with family emission limits (FELs).

Section 1037.225 describes how to change the FEL for a vehicle family during the model year. This section, which describes how you may ask us to increase a vehicle family's FEL after the end of the model year, is intended to address circumstances in which it is in the public interest to apply a higher in-use FEL based on forfeiting an appropriate number of emission credits.

(a) You may ask us to increase a vehicle family's FEL after the end of the model year if you believe some of your in-use vehicles exceed the CO_2 FEL that applied during the model year (or the CO_2 emission standard if the family did not generate or use emission credits). We may consider any available information in making our decision to approve or deny your request.

(b) If we approve your request under this section, you must apply emission credits to cover the increased FEL for all affected vehicles. Apply the emission credits as part of your credit demonstration for the current production year. Include the appropriate calculations in your final report under § 1037.730.

(c) Submit your request to the Designated Compliance Officer. Include the following in your request:

(1) Identify the names of each vehicle family that is the subject of your request. Include separate family names for different model years.

(2) Describe why your request does not apply for similar vehicle models or additional model years, as applicable.

(3) Identify the FEL that applied during the model year for each configuration and recommend replacement FELs for in-use vehicles; include a supporting rationale to describe how you determined the recommended replacement FELs.

(4) Describe whether the needed emission credits will come from averaging, banking, or trading.

(d) If we approve your request, we will identify one or more replacement FELs, as follows:

(1) Where your vehicle family includes more than one sub-family with different FELs, we may apply a higher FEL within the family than was applied to the vehicle's configuration in your final ABT report. For example, if your vehicle family included three sub-families, with FELs of 200 g/ton-mile, 210 g/ton-mile, and 220 g/ton-mile, we may apply a 220 g/ton-mile in-use FEL to vehicles that were originally designated as part of the 200 g/ton-mile or 210 g/ton-mile sub-families.

(2) Without regard to the number of sub-families in your certified vehicle family, we may specify one or more new sub-families with higher FELs than you included in your final ABT report. We may apply these higher FELs as in-use FELs for your vehicles. For example, if your vehicle family included three sub-families, with FELs of 200 g/ton-mile, 210 g/ton-mile, and 220 g/ton-mile, we may specify a new 230 g/ton-mile sub-family.

(3) Our selected values for the replacement FEL will reflect our best judgment to accurately reflect the actual in-use performance of your vehicles, consistent with the testing provisions specified in this part.

(4) We may apply the higher FELs to other vehicle families from the same or different model years to the extent they used equivalent emission controls. We may include any appropriate conditions with our approval.

(e) If we order a recall for a vehicle family under 40 CFR 1068.505, we will no longer approve a replacement FEL under this section for any of your vehicles from that vehicle family, or from any other vehicle family that relies on equivalent emission controls.

§ 1037.650 Tire manufacturers.

This section describes how the requirements of this part apply with respect to tire manufacturers that choose to provide test data or emission warranties for purposes of this part.

(a) *Testing.* You are responsible as follows for test tires and emission test results that you provide to vehicle manufacturers for the purpose of the manufacturer submitting them to EPA for certification under this part:

(1) Such test results are deemed under § 1037.825 to be submissions to EPA. This means that you may be subject to criminal penalties under 18 U.S.C. 1001 if you knowingly submit false test results to the manufacturer.

(2) You may not cause a vehicle manufacturer to violate the regulations by rendering inaccurate emission test results you provide (or emission test results from testing of test tires you provide) to the vehicle manufacturer.

(3) Your provision of test tires and emission test results to vehicle manufacturers for the purpose of certifying under this part is deemed to be an agreement to provide tires to EPA for confirmatory testing under § 1037.201.

(b) *Warranty.* You may contractually agree to process emission warranty claims on behalf of the manufacturer certifying the vehicle with respect to tires you produce.

(1) Your fulfillment of the warranty requirements of this part is deemed to fulfill the vehicle manufacturer's warranty obligations under this part with respect to tires you warrant.

(2) You may not cause a vehicle manufacturer to violate the regulations by failing to fulfill the emission warranty requirements that you contractually agreed to fulfill.

§ 1037.655 Post-useful life vehicle modifications.

This section specifies vehicle modifications that may occur in certain circumstances after a vehicle reaches the end of its regulatory useful life. It does not apply with respect to modifications that occur within the useful life period. It also does not apply with respect to engine modifications or recalibrations. Note that many such modifications to the vehicle during the useful life and to the engine at any time are presumed to violate 42 U.S.C. 7522(a)(3)(A).

(a) *General.* Except as allowed by this section, it is prohibited for any person to remove or render inoperative any emission control device installed to comply with the requirements of this part 1037.

(b) *Allowable modifications.* You may modify a vehicle for the purpose of reducing emissions, provided you have a reasonable technical basis for knowing that such modification will not increase emissions of any other pollutant. Reasonable technical basis has the meaning given in 40 CFR 1068.30. This generally requires you to have information that would lead an engineer or other person familiar with engine and vehicle design and function to reasonably believe that the modifications will not increase emissions of any regulated pollutant.

(c) *Examples of allowable modifications.* The following are examples of allowable modifications:

(1) It is generally allowable to remove tractor roof fairings after the end of the vehicle's useful life if the vehicle will no longer be used primarily to pull box trailers.

(2) Other fairings may be removed after the end of the vehicle's useful life if the vehicle will no longer be used significantly on highways with vehicle speed of 55 miles per hour or higher.

(d) *Examples of prohibited modifications.* The following are examples of modifications that are not allowable:

(1) No person may disable a vehicle speed limiter prior to its expiration point.

(2) No person may remove aerodynamic fairings from tractors that are used primarily to pull box trailers on highways.

§ 1037.660 Automatic engine shutdown systems.

This section specifies requirements that apply for certified automatic engine shutdown (AES) systems modeled under § 1037.520. It does not apply for AES systems you do not model under § 1037.520.

(a) *Minimum requirements.* Your AES system must meet all of the requirements of this paragraph (a) to be modeled under § 1037.520. The system must shut down the engine within 300 seconds when all the following conditions are met:

(1) The transmission is set in neutral with the parking brake engaged (or the transmission is set to park if so equipped).

(2) The operator has not reset the system timer within the 300 seconds by changing the position of the accelerator, brake, or clutch pedal; or by some other mechanism we approve.

(3) None of the override conditions of paragraph (b) of this section are met.

(b) *Override conditions.* The system may delay shutting the engine down while any of the conditions of this paragraph (b) apply. Engines equipped with auto restart may restart during override conditions. Note that these conditions allow the system to delay shutdown or restart, but do not allow it to reset the timer. The system may delay shutdown—

(1) While an exhaust emission control device is regenerating. The period considered to be regeneration for purposes of this allowance must be consistent with good engineering judgment and may differ in length from the period considered to be regeneration for other purposes. For example, in some cases it may be appropriate to include a cool down period for this purpose but not for infrequent regeneration adjustment factors.

(2) If necessary while servicing the vehicle, provided the deactivation of the AES system is accomplished using a diagnostic scan tool. The system must be automatically reactivated when the engine is shutdown for more than 60 minutes.

(3) If the vehicle's main battery state-of-charge is not sufficient to allow the main engine to be restarted.

(4) If the external ambient temperature reaches a level below which or above which the cabin temperature cannot be maintained within reasonable heat or cold exposure threshold limit values for the health and safety of the operator (not merely comfort).

(5) If the vehicle's engine coolant temperature is too low according to the manufacturer's engine protection guidance. This may also apply for fuel or oil temperatures. This allows the engine to continue operating until it reaches a predefined temperature at which the shutdown sequence of paragraph (a) of this section would resume.

(6) The system may delay shutdown while the vehicle's main engine is operating in power take-off (PTO) mode. For purposes of this paragraph (b)(6), an engine is considered to be in PTO mode when a switch or setting designating PTO mode is enabled.

(c) *Adjustments to AES systems.* (1) The AES system may include an expiration point (in miles) after which the AES system may be disabled. If your vehicle is equipped with an AES system that expires before 1,259,000 miles, adjust the model input as follows, rounded to the nearest 0.1 g/ton-mile: AES Input = 5 g CO_2/ton-mile × (miles at expiration/1,259,000 miles).

(2) For AES systems designed to limit idling to a specific number of hours less than 1,800 hours over any 12-month period, calculate an adjusted AES input using the following equation, rounded to the nearest 0.1 g/ton-mile: AES Input = 5 g CO_2/ton-mile × (1 − (maximum allowable number of idling hours per year/1,800 hours)). This is an annual allowance that starts when the vehicle is new and resets every 12 months after that. Manufacturers may propose an alternative method based on operating hours or miles instead of years.

(d) *Adjustable parameters.* Provisions that apply generally with respect to adjustable parameters also apply to the AES system operating parameters, except the following are not considered to be adjustable parameters:

(1) Accelerator, brake, and clutch pedals, with respect to resetting the idle timer. Parameters associated with other timer reset mechanisms we approve are also not adjustable parameters.

(2) Bypass parameters allowed for vehicle service under paragraph (b)(2) of this section.

(3) Parameters that are adjustable only after the expiration point.

§ 1037.665 In-use tractor testing.

Manufacturers with U.S.-directed production volumes of greater than 20,000 tractors must perform in-use testing as described in this section.

(a) The following test requirements apply beginning in model year 2021:

(1) Each year, select for testing three sleeper cabs and two day cabs certified to Phase 1 or Phase 2 standards. If we do not identify certain vehicle configurations for your testing, select models that you project to be among your 12 highest-selling vehicle configurations for the given year.

(2) Set up the tractors on a chassis dynamometer and operate them over all applicable duty cycles from § 1037.510(a). You may use emission-measurement systems meeting the specifications of 40 CFR part 1065, subpart J. Calculate coefficients for the road-load force equation as described in Section 10 of SAE J1263 or Section 11 of SAE J2263 (both incorporated by reference in § 1037.810). Use standard

payload. Measure emissions of NO_X, PM, CO, NMHC, CO_2, CH_4, and N_2O. Determine emission levels in g/hour for the idle test and g/ton-mile for other duty cycles.

(b) Send us an annual report with your test results for each duty cycle and the corresponding GEM results. We may make your test data publicly available.

Subpart H—Averaging, Banking, and Trading for Certification

§ 1037.701 General provisions.

(a) You may average, bank, and trade emission credits for purposes of certification as described in this subpart and in subpart B of this part to show compliance with the standards of §§ 1037.105 through 1037.107. Participation in this program is voluntary.

(b) The definitions of Subpart I of this part apply to this subpart. The following definitions also apply:

(1) *Actual emission credits* means emission credits you have generated that we have verified by reviewing your final report.

(2) *Averaging set* means a set of vehicles in which emission credits may be exchanged. Credits generated by one vehicle may only be used by other vehicles in the same averaging set. Note that an averaging set may comprise more than one regulatory subcategory. See § 1037.740.

(3) *Broker* means any entity that facilitates a trade of emission credits between a buyer and seller.

(4) *Buyer* means the entity that receives emission credits as a result of a trade.

(5) *Reserved emission credits* means emission credits you have generated that we have not yet verified by reviewing your final report.

(6) *Seller* means the entity that provides emission credits during a trade.

(7) *Standard* means the emission standard that applies under subpart B of this part for vehicles not participating in the ABT program of this subpart.

(8) *Trade* means to exchange emission credits, either as a buyer or seller.

(c) Emission credits may be exchanged only within an averaging set as specified in § 1037.740.

(d) You may not use emission credits generated under this subpart to offset any emissions that exceed an FEL or standard, except as allowed by § 1037.645.

(e) You may use either of the following approaches to retire or forego emission credits:

(1) You may trade emission credits generated from any number of your vehicles to the vehicle purchasers or other parties to retire the credits. Identify any such credits in the reports described in § 1037.730. Vehicles must comply with the applicable FELs even if you donate or sell the corresponding emission credits under this paragraph (e). Those credits may no longer be used by anyone to demonstrate compliance with any EPA emission standards.

(2) You may certify a family using an FEL below the emission standard as described in this part and choose not to generate emission credits for that family. If you do this, you do not need to calculate emission credits for those families and you do not need to submit or keep the associated records described in this subpart for that family.

(f) Emission credits may be used in the model year they are generated. Surplus emission credits may be banked for future model years. Surplus emission credits may sometimes be used for past model years, as described in § 1037.745.

(g) You may increase or decrease an FEL during the model year by amending your application for certification under § 1037.225. The new FEL may apply only to vehicles you have not already introduced into commerce.

(h) See § 1037.740 for special credit provisions that apply for credits generated under § 1037.104(d)(7), § 1037.615 or 40 CFR 1036.615.

(i) Unless the regulations explicitly allow it, you may not calculate credits more than once for any emission reduction. For example, if you generate CO_2 emission credits for a given hybrid vehicle under this part, no one may generate CO_2 emission credits for the hybrid engine under 40 CFR part 1036. However, credits could be generated for identical engine used in vehicles that did not generate credits under this part.

(j) You may use emission credits generated under the Phase 1 standards when certifying vehicles to Phase 2 standards. No credit adjustments are required other than corrections for different useful lives.

§ 1037.705 Generating and calculating emission credits.

(a) The provisions of this section apply separately for calculating emission credits for each pollutant.

(b) For each participating family or subfamily, calculate positive or negative emission credits relative to the otherwise applicable emission standard. Calculate positive emission credits for a family or subfamily that has an FEL below the standard. Calculate negative emission credits for a family or subfamily that has an FEL above the standard. Sum your positive and negative credits for the model year before rounding. Round the sum of emission credits to the nearest megagram (Mg), using consistent units with the following equation:

$$\textit{Emission credits}\ (\mathrm{Mg}) = (\textit{Std}-\textit{FEL}) \cdot (\textit{PL}) \cdot (\textit{Volume}) \cdot (\textit{UL}) \cdot (10^{-6})$$

Where:

Std = the emission standard associated with the specific regulatory subcategory (g/ton-mile).

FEL = the family emission limit for the vehicle subfamily (g/ton-mile).

PL = standard payload, in tons.

Volume = U.S.-directed production volume of the vehicle subfamily. For example, if you produce three configurations with the same FEL, the subfamily production volume would be the sum of the production volumes for these three configurations.

UL = useful life of the vehicle, in miles, as described in § 1037.105 and § 1037.106. Use 250,000 miles for trailers.

(c) As described in § 1037.730, compliance with the requirements of this subpart is determined at the end of the model year based on actual U.S.-directed production volumes. Keep appropriate records to document these production volumes. Do not include any of the following vehicles to calculate emission credits:

(1) Vehicles that you do not certify to the CO_2 standards of this part because they are permanently exempted under subpart G of this part or under 40 CFR part 1068.

(2) Exported vehicles.

(3) Vehicles not subject to the requirements of this part, such as those excluded under § 1037.5.

(4) Any other vehicles, where we indicate elsewhere in this part 1037 that they are not to be included in the calculations of this subpart.

§ 1037.710 Averaging.

(a) Averaging is the exchange of emission credits among your vehicle families. You may average emission credits only within the same averaging set.

(b) You may certify one or more vehicle families (or subfamilies) to an FEL above the applicable standard, subject to any applicable FEL caps and other provisions in subpart B of this part, if you show in your application for certification that your projected balance of all emission-credit transactions in that model year is greater than or equal to zero or that a negative balance is allowed under § 1037.745.

(c) If you certify a vehicle family to an FEL that exceeds the otherwise applicable standard, you must obtain enough emission credits to offset the vehicle family's deficit by the due date for the final report required in § 1037.730. The emission credits used to address the deficit may come from your other vehicle families that generate emission credits in the same model year (or from later model years as specified in § 1037.745), from emission credits you have banked from previous model years, or from emission credits generated in the same or previous model years that you obtained through trading. Note that the option for using banked or traded credits does not apply for trailers.

§ 1037.715 Banking.

(a) Banking is the retention of surplus emission credits by the manufacturer generating the emission credits for use in future model years for averaging or trading. Note that § 1037.107 does not allow banking for trailers.

(b) You may designate any emission credits you plan to bank in the reports you submit under § 1037.730 as reserved credits. During the model year and before the due date for the final report, you may designate your reserved emission credits for averaging or trading.

(c) Reserved credits become actual emission credits when you submit your final report. However, we may revoke these emission credits if we are unable to verify them after reviewing your reports or auditing your records.

(d) Banked credits retain the designation of the averaging set in which they were generated.

§ 1037.720 Trading.

(a) Trading is the exchange of emission credits between manufacturers, or the transfer of credits to another party to retire them. You may use traded emission credits for averaging, banking, or further trading transactions. Traded emission credits remain subject to the averaging-set restrictions based on the averaging set in which they were generated. Note that § 1037.107 does not allow trading for trailers.

(b) You may trade actual emission credits as described in this subpart. You may also trade reserved emission credits, but we may revoke these emission credits based on our review of your records or reports or those of the company with which you traded emission credits. You may trade banked credits within an averaging set to any certifying manufacturer.

(c) If a negative emission credit balance results from a transaction, both the buyer and seller are liable, except in cases we deem to involve fraud. See § 1037.255(e) for cases involving fraud. We may void the certificates of all vehicle families participating in a trade that results in a manufacturer having a negative balance of emission credits. See § 1037.745.

§ 1037.725 What must I include in my application for certification?

(a) You must declare in your application for certification your intent to use the provisions of this subpart for each vehicle family that will be certified using the ABT program. You must also declare the FELs you select for the vehicle family or subfamily for each pollutant for which you are using the ABT program. Your FELs must comply with the specifications of subpart B of this part, including the FEL caps. FELs must be expressed to the same number of decimal places as the applicable standards.

(b) Include the following in your application for certification:

(1) A statement that, to the best of your belief, you will not have a negative balance of emission credits for any averaging set when all emission credits are calculated at the end of the year; or a statement that you will have a negative balance of emission credits for one or more averaging sets but that it is allowed under § 1037.745.

(2) Calculations of projected emission credits (positive or negative) based on projected U.S.-directed production volumes. We may require you to include similar calculations from your other vehicle families to project your net credit balances for the model year. If you project negative emission credits for a family or subfamily, state the source of positive emission credits you expect to use to offset the negative emission credits.

§ 1037.730 ABT reports.

(a) If any of your vehicle families are certified using the ABT provisions of this subpart, you must send a final report by March 31 following the end of the model year. You may ask us to extend the deadline for the final report to April 30.

(b) Your final report must include the following information for each vehicle family participating in the ABT program:

(1) Vehicle-family and subfamily designations, and averaging set.

(2) The regulatory subcategory and emission standards that would otherwise apply to the vehicle family.

(3) The FEL for each pollutant. If you change the FEL after the start of production, identify the date that you started using the new FEL and/or give the vehicle identification number for the first vehicle covered by the new FEL. In this case, identify each applicable FEL and calculate the positive or negative emission credits as specified in § 1037.225.

(4) The projected and actual U.S.-directed production volumes for the model year. If you changed an FEL during the model year, identify the actual U.S.-directed production volume associated with each FEL.

(5) Useful life.

(6) Calculated positive or negative emission credits for the whole vehicle family. Identify any emission credits that you traded, as described in paragraph (d)(1) of this section.

(7) If you have a negative credit balance for the averaging set in the given model year, specify whether the vehicle family (or certain subfamilies with the vehicle family) have a credit deficit for the year. Consider for example, a manufacturer with three vehicle families (''A'', ''B'', and ''C'') in a given averaging set. If family A generates enough credits to offset the negative credits of family B but not enough to also offset the negative credits of family C (and the manufacturer has no banked credits in the averaging set), the manufacturer may designate families A and B as having no deficit for the model year, provided it designates family C as having a deficit for the model year.

(c) Your final report must include the following additional information:

(1) Show that your net balance of emission credits from all your participating vehicle families in each averaging set in the applicable model year is not negative, except as allowed under § 1037.745. Your credit tracking must account for the limitation on credit life under § 1037.40(c).

(2) State whether you will retain any emission credits for banking. If you choose to retire emission credits that would otherwise be eligible for banking, identify the families that generated the emission credits, including the number of emission credits from each family.

(3) State that the report's contents are accurate.

(4) Identify the technologies that make up the certified configuration associated with each vehicle identification number. You may identify this as a range of identification numbers for vehicles involving a single, identical certified configuration.

(d) If you trade emission credits, you must send us a report within 90 days after the transaction, as follows:

(1) As the seller, you must include the following information in your report:

(i) The corporate names of the buyer and any brokers.

(ii) A copy of any contracts related to the trade.

(iii) The vehicle families that generated emission credits for the trade, including the number of emission credits from each family.

(2) As the buyer, you must include the following information in your report:

(i) The corporate names of the seller and any brokers.

(ii) A copy of any contracts related to the trade.

(iii) How you intend to use the emission credits, including the number of emission credits you intend to apply to each vehicle family (if known).

(e) Send your reports electronically to the Designated Compliance Officer using an approved information format. If you want to use a different format, send us a written request with justification for a waiver.

(f) Correct errors in your final report as follows:

(1) If you or we determine before the due date for the final report that errors mistakenly decreased your balance of emission credits, you may correct the errors and recalculate the balance of emission credits. You may not make these corrections for errors that are determined after the due date for the final report. If you report a negative balance of emission credits, we may disallow corrections under this paragraph (f)(1).

(2) If you or we determine anytime that errors mistakenly increased your balance of emission credits, you must correct the errors and recalculate the balance of emission credits.

§ 1037.735 Recordkeeping.

(a) You must organize and maintain your records as described in this section.

(b) Keep the records required by this section for at least eight years after the due date for the final report. You may not use emission credits for any vehicles if you do not keep all the records required under this section. You must therefore keep these records to continue to bank valid credits.

(c) Keep a copy of the reports we require in §§ 1037.725 and 1037.730.

(d) Keep records of the vehicle identification number for each vehicle you produce. You may identify these numbers as a range. If you change the FEL after the start of production, identify the date you started using each FEL and the range of vehicle identification numbers associated with each FEL. You must also identify the purchaser and destination for each vehicle you produce to the extent this information is available.

(e) We may require you to keep additional records or to send us relevant information not required by this section in accordance with the Clean Air Act.

§ 1037.740 Restrictions for using emission credits.

The following restrictions apply for using emission credits:

(a) *Averaging sets.* Except as specified in paragraph (b) of this section, emission credits may be exchanged only within an averaging set. The following principal averaging sets apply for vehicles subject to this subpart:

(1) Class 2b through 5 vehicles that are subject to the standards of § 1037.105.

(2) Class 6 and 7 vehicles.

(3) Class 8 vehicles.

(4) Long box van trailers.

(5) Short box van trailers.

(6) Long refrigerated box van trailers.

(7) Short refrigerated box van trailers.

(8) Note that other separate averaging sets also apply for emission credits not related to this part. For example, vehicles certified to the greenhouse gas standards of 40 CFR 86.1819 comprise a single averaging set. Separate averaging sets also apply for engines under 40 CFR part 1036, including engines used in vehicles subject to this subpart.

(b) *Credits from hybrid vehicles and other advanced technologies.* Credits you generate under § 1037.615 in Phase 1 may be used for any of the averaging sets identified in paragraph (a) of this section; you may also use those credits to demonstrate compliance with the CO_2 emission standards in 40 CFR 86.1819 and 40 CFR part 1036. Similarly, you may use advanced-technology credits generated under 40 CFR 86.1819–14(k)(7) or 40 CFR 1036.615 to demonstrate compliance with the CO_2 standards in this part.

(1) The maximum amount of credits you may bring into the following service class groups is 60,000 Mg per model year:

(i) Spark-ignition engines, light heavy-duty compression-ignition engines, and light heavy-duty vehicles. This group comprises the averaging set listed in paragraphs (a)(1) of this section and the averaging set listed in 40 CFR 1036.740(a)(1) and (2).

(ii) Medium heavy-duty compression-ignition engines and medium heavy-duty vehicles. This group comprises the averaging sets listed in paragraph (a)(2) of this section and 40 CFR 1036.740(a)(3).

(iii) Heavy heavy-duty compression-ignition engines and heavy heavy-duty vehicles. This group comprises the averaging sets listed in paragraph (a)(3) of this section and 40 CFR 1036.740(a)(4).

(2) Paragraph (b)(1) of this section does not limit the advanced technology credits that can be used within a service class group if they were generated in that same service class group.

(c) *Credit life.* Banked credits may be used only for five model years after the year in which they are generated. For example, credits you generate in model year 2018 may be used to demonstrate compliance with emission standards only through model year 2023.

(d) *Other restrictions.* Other sections of this part specify additional restrictions for using emission credits under certain special provisions.

§ 1037.745 End-of-year CO_2 credit deficits.

Except as allowed by this section, we may void the certificate of any vehicle family certified to an FEL above the applicable standard for which you do not have sufficient credits by the deadline for submitting the final report.

(a) Your certificate for a vehicle family for which you do not have sufficient CO_2 credits will not be void if you remedy the deficit with surplus credits within three model years (this applies equally for tractors, trailers, and vocational vehicles). For example, if you have a credit deficit of 500 Mg for a vehicle family at the end of model year 2015, you must generate (or otherwise obtain) a surplus of at least 500 Mg in that same averaging set by the end of model year 2018.

(b) You may not bank or trade away CO_2 credits in the averaging set in any model year in which you have a deficit.

(c) You may apply only surplus credits to your deficit. You may not apply credits to a deficit from an earlier model year if they were generated in a model year for which any of your vehicle families for that averaging set had an end-of-year credit deficit.

(d) If you do not remedy the deficit with surplus credits within three model years, we may void your certificate for that vehicle family. Note that voiding a certificate applies *ab initio.* Where the net deficit is less than the total amount of negative credits originally generated by the family, we will void the certificate only with respect to the number of vehicles needed to reach the amount of the net deficit. For example, if the original vehicle family generated 500 Mg of negative credits, and the manufacturer's net deficit after three years was 250 Mg, we would void the certificate with respect to half of the vehicles in the family.

(e) For purposes of calculating the statute of limitations, the following actions are all considered to occur at the expiration of the deadline for offsetting a deficit as specified in paragraph (a) of this section:

(1) Failing to meet the requirements of paragraph (a) of this section.

(2) Failing to satisfy the conditions upon which a certificate was issued relative to offsetting a deficit.

(3) Selling, offering for sale, introducing or delivering into U.S. commerce, or importing vehicles that are found not to be covered by a certificate as a result of failing to offset a deficit.

§ 1037.750 What can happen if I do not comply with the provisions of this subpart?

(a) For each vehicle family participating in the ABT program, the certificate of conformity is conditioned upon full compliance with the provisions of this subpart during and after the model year. You are responsible to establish to our satisfaction that you fully comply with applicable requirements. We may void the certificate of conformity for a vehicle family if you fail to comply with any provisions of this subpart.

(b) You may certify your vehicle family or subfamily to an FEL above an applicable standard based on a projection that you will have enough emission credits to offset the deficit for the vehicle family. See § 1037.745 for provisions specifying what happens if you cannot show in your final report that you have enough actual emission credits to offset a deficit for any pollutant in a vehicle family.

(c) We may void the certificate of conformity for a vehicle family if you fail to keep records, send reports, or give us information we request. Note that failing to keep records, send reports, or give us information we request is also a violation of 42 U.S.C. 7522(a)(2).

(d) You may ask for a hearing if we void your certificate under this section (see § 1037.820).

§ 1037.755 Information provided to the Department of Transportation.

After receipt of each manufacturer's final report as specified in § 1037.730 and completion of any verification testing required to validate the manufacturer's submitted final data, we will issue a report to the Department of Transportation with CO_2 emission information and will verify the accuracy of each manufacturer's equivalent fuel consumption data required by NHTSA under 49 CFR 535.8. We will send a report to DOT for each vehicle manufacturer based on each regulatory category and subcategory, including sufficient information for NHTSA to determine fuel consumption and associated credit values. See 49 CFR 535.8 to determine if NHTSA deems submission of this information to EPA to also be a submission to NHTSA.

Subpart I—Definitions and Other Reference Information

§ 1037.801 Definitions.

The following definitions apply to this part. The definitions apply to all subparts unless we note otherwise. All undefined terms have the meaning the Act gives to them. The definitions follow:

Act means the Clean Air Act, as amended, 42 U.S.C. 7401–7671q.

Adjustable parameter means any device, system, or element of design that someone can adjust (including those which are difficult to access) and that, if adjusted, may affect measured or modeled emissions (as applicable). You may ask us to exclude a parameter that is difficult to access if it cannot be adjusted to affect emissions without significantly degrading vehicle performance, or if you otherwise show us that it will not be adjusted in a way that affects emissions during in-use operation.

Adjusted Loaded Vehicle Weight means the numerical average of vehicle curb weight and GVWR.

Advanced technology means vehicle technology certified under 40 CFR 86.1819–14(k)(7), 40 CFR 1036.615, or § 1037.615.

Aftertreatment means relating to a catalytic converter, particulate filter, or any other system, component, or technology mounted downstream of the exhaust valve (or exhaust port) whose design function is to decrease emissions in the vehicle exhaust before it is exhausted to the environment. Exhaust-gas recirculation (EGR) and turbochargers are not aftertreatment.

Aircraft means any vehicle capable of sustained air travel more than 100 feet off the ground.

Alcohol-fueled vehicle means a vehicle that is designed to run using an alcohol fuel. For purposes of this definition, alcohol fuels do not include fuels with a nominal alcohol content below 25 percent by volume.

Alternative fuel conversion has the meaning given for clean alternative fuel conversion in 40 CFR 85.502.

Ambulance has the meaning given in 40 CFR 86.1803.

Amphibious vehicle means a motor vehicle that is also designed for operation on water.

A to B testing means testing performed in pairs to allow comparison of two vehicles or other test articles. Back-to-back tests are performed on Article A and Article B, changing only the variable(s) of interest for the two tests.

Automatic tire inflation system means a system installed on a vehicle to keep each tire inflated to within 10 percent of the target value with no operator input.

Auxiliary emission control device means any element of design that senses temperature, motive speed, engine rpm, transmission gear, or any other parameter for the purpose of activating, modulating, delaying, or deactivating the operation of any part of the emission control system.

Averaging set has the meaning given in § 1037.701.

Axle ratio or Drive axle ratio, k_a, means the dimensionless number representing the angular speed of the transmission output shaft divided by the angular speed of the drive axle.

Basic vehicle frontal area means the area enclosed by the geometric projection of the basic vehicle along the longitudinal axis onto a plane perpendicular to the longitudinal axis of the vehicle, including tires but excluding mirrors and air deflectors.

Calibration means the set of specifications and tolerances specific to a particular design, version, or application of a component or assembly capable of functionally describing its operation over its working range.

Carryover means relating to certification based on emission data generated from an earlier model year.

Certification means relating to the process of obtaining a certificate of conformity for a vehicle family that complies with the emission standards and requirements in this part.

Certified emission level means the highest deteriorated emission level in a vehicle subfamily for a given pollutant from either transient or steady-state testing.

Class means relating to GVWR classes for vehicles other than trailers, as follows:

(1) *Class 2b* means heavy-duty motor vehicles at or below 10,000 pounds GVWR.

(2) *Class 3* means heavy-duty motor vehicles above 10,000 pounds GVWR but at or below 14,000 pounds GVWR.

(3) *Class 4* means heavy-duty motor vehicles above 14,000 pounds GVWR but at or below 16,000 pounds GVWR.

(4) *Class 5* means heavy-duty motor vehicles above 16,000 pounds GVWR but at or below 19,500 pounds GVWR.

(5) *Class 6* means heavy-duty motor vehicles above 19,500 pounds GVWR but at or below 26,000 pounds GVWR.

(6) *Class 7* means heavy-duty motor vehicles above 26,000 pounds GVWR but at or below 33,000 pounds GVWR.

(7) *Class 8* means heavy-duty motor vehicles above 33,000 pounds GVWR.

Complete vehicle has the meaning given in the definition of *vehicle* in this section.

Compression-ignition has the meaning given in § 1037.101.

Date of manufacture means the date on which the certifying vehicle manufacturer completes its manufacturing operations, except as follows:

(1) Where the certificate holder is an engine manufacturer that does not manufacture the chassis, the date of manufacture of the vehicle is based on the date assembly of the vehicle is completed.

(2) We may approve an alternate date of manufacture based on the date on which the certifying (or primary) manufacturer completes assembly at the place of main assembly, consistent with the provisions of § 1037.601 and 49 CFR 567.4.

Day cab means a type of tractor cab that is not a sleeper cab or a heavy-haul tractor cab.

Designated Compliance Officer means one of the following:

(1) For compression-ignition engines, *Designated Compliance Officer* means Director, Diesel Engine Compliance Center, U.S. Environmental Protection Agency, 2000 Traverwood Drive, Ann Arbor, MI 48105; *complianceinfo@epa.gov; epa.gov/otaq/verify.*

(2) For spark-ignition engines, *Designated Compliance Officer* means Director, Gasoline Engine Compliance Center, U.S. Environmental Protection Agency, 2000 Traverwood Drive, Ann Arbor, MI 48105; *nonroad-si-cert@epa.gov.*

Deteriorated emission level means the emission level that results from applying the appropriate deterioration factor to the official emission result of the emission-data vehicle. Note that where no deterioration factor applies, references in this part to the *deteriorated emission level* mean the official emission result.

Deterioration factor means the relationship between the highest emissions during the useful life and emissions at the low-hour test point, expressed in one of the following ways:

(1) For multiplicative deterioration factors, the ratio of the highest emissions to emissions at the low-hour test point.

(2) For additive deterioration factors, the difference between the highest emissions and emissions at the low-hour test point.

Driver model means an automated controller that simulates a person driving a vehicle.

Dual-fuel means relating to a vehicle or engine designed for operation on two different fuels but not on a continuous mixture of those fuels. For purposes of this part, such a vehicle or engine remains a dual-fuel vehicle or engine even if it is designed for operation on three or more different fuels.

Electric vehicle means a vehicle that does not include an engine, and is powered solely by an external source of electricity and/or solar power. Note that this does not include electric hybrid or fuel-cell vehicles that use a chemical fuel such as gasoline, diesel fuel, or hydrogen. Electric vehicles may also be referred to as all-electric vehicles to distinguish them from hybrid vehicles.

Emergency vehicle means a vehicle that is an ambulance or a fire truck.

Emission control system means any device, system, or element of design that controls or reduces the emissions of regulated pollutants from a vehicle.

Emission-data component means a vehicle component that is tested for certification. This includes vehicle components tested to establish deterioration factors.

Emission-data vehicle means a vehicle (or vehicle component) that is tested for certification. This includes vehicles tested to establish deterioration factors.

Emission-related maintenance means maintenance that substantially affects emissions or is likely to substantially affect emission deterioration.

Excluded means relating to vehicles that are not subject to some or all of the requirements of this part as follows:

(1) A vehicle that has been determined not to be a ''motor vehicle'' is excluded from this part.

(2) Certain vehicles are excluded from the requirements of this part under § 1037.5.

(3) Specific regulatory provisions of this part may exclude a vehicle generally subject to this part from one or more specific standards or requirements of this part.

Exempted has the meaning given in 40 CFR 1068.30.

Family emission limit (FEL) means an emission level declared by the manufacturer to serve in place of an otherwise applicable emission standard under the ABT program in subpart H of this part. The family emission limit must be expressed to the same number of decimal places as the emission standard it replaces. Note that an FEL may apply as a ''subfamily'' emission limit.

Final drive ratio, k_d, means the dimensionless number representing the angular speed of the transmission input shaft divided by the angular speed of the drive axle when the vehicle is operating in its highest available gear. The final drive ratio is the transmission gear ratio (in the highest available gear) multiplied by the drive axle ratio.

Fire truck has the meaning given in 40 CFR 86.1803.

Flexible-fuel means relating to an engine designed for operation on any mixture of two or more different fuels.

Fuel system means all components involved in transporting, metering, and mixing the fuel from the fuel tank to the combustion chamber(s), including the fuel tank, fuel pump, fuel filters, fuel lines, carburetor or fuel-injection components, and all fuel-system vents. It also includes components for controlling evaporative emissions, such as fuel caps, purge valves, and carbon canisters.

Fuel type means a general category of fuels such as diesel fuel or natural gas. There can be multiple grades within a single fuel type, such as high-sulfur or low-sulfur diesel fuel.

Gaseous fuel means a fuel that has a boiling point below 20 °C.

Gear ratio or Transmission gear ratio, k_g, means the dimensionless number representing the angular velocity of the transmission's input shaft divided by the angular velocity of the transmission's output shaft when the transmission is operating in a specific gear.

Glider kit means any of the following:

(1) A new vehicle that is incomplete because it lacks an engine, transmission, or axle.

(2) A new vehicle produced with a used engine (including a rebuilt or remanufactured engine).

(3) Any other new equipment that is intended to become a motor vehicle with a previously used engine (including a rebuilt or remanufactured engine).

Glider vehicle means a new vehicle produced with a used engine.

Good engineering judgment has the meaning given in 40 CFR 1068.30. See 40 CFR 1068.5 for the administrative process we use to evaluate good engineering judgment.

Gross axle weight rating (GAWR) means the value specified by the vehicle manufacturer as the maximum weight of a loaded axle or set of axles, consistent with good engineering judgment.

Gross combination weight rating (GCWR) means the value specified by the vehicle manufacturer as the maximum weight of a loaded vehicle and trailer, consistent with good engineering judgment. For example, compliance with SAE J2807 is generally considered to be consistent with good engineering judgment, especially for Class 3 and smaller vehicles.

Gross vehicle weight rating (GVWR) means the value specified by the vehicle manufacturer as the maximum design loaded weight of a single vehicle, consistent with good engineering judgment.

Heavy-duty engine means any engine used for (or for which the engine manufacturer could reasonably expect to be used for) motive power in a heavy-duty vehicle.

Heavy-duty vehicle means any trailer and any other motor vehicle that has a GVWR above 8,500 pounds, a curb weight above 6,000 pounds, or a basic vehicle frontal area greater than 45 square feet.

Heavy-haul tractor means a tractor with GCWR above 120,000 pounds, a total gear reduction at or above 57, and a frame Resisting Bending Moment at or above 2,000,000 in-lbs per rail, or per rail and liner combination. Total gear reduction is the transmission gear ratio in the lowest gear multiplied by the drive axle ratio. A heavy-haul tractor is not a vocational tractor.

Hybrid engine or *hybrid powertrain* means an engine or powertrain that includes energy storage features other than a conventional battery system or conventional flywheel. Supplemental electrical batteries and hydraulic accumulators are examples of hybrid energy storage systems. Note that certain provisions in this part treat hybrid engines and powertrains intended for vehicles that include regenerative braking different than those intended for vehicles that do not include regenerative braking.

Hybrid vehicle means a vehicle that includes energy storage features (other than a conventional battery system or conventional flywheel) in addition to an internal combustion engine or other engine using consumable chemical fuel. Supplemental electrical batteries and hydraulic accumulators are examples of hybrid energy storage systems Note that certain provisions in this part treat hybrid vehicles that include regenerative braking different than those that do not include regenerative braking.

Hydrocarbon (HC) means the hydrocarbon group on which the emission standards are based for each fuel type. For alcohol-fueled vehicles, HC means nonmethane hydrocarbon equivalent (NMHCE) for exhaust emissions and total hydrocarbon equivalent (THCE) for evaporative emissions. For all other vehicles, HC means nonmethane hydrocarbon (NMHC) for exhaust emissions and total hydrocarbon (THC) for evaporative emissions.

Identification number means a unique specification (for example, a model number/serial number combination) that allows someone to distinguish a particular vehicle from other similar vehicles.

Incomplete vehicle has the meaning given in the definition of *vehicle* in this section.

Innovative technology means technology certified under § 1037.610.

Light-duty truck means any motor vehicle rated at or below 8,500 pounds GVWR with a curb weight at or below 6,000 pounds and basic vehicle frontal area at or below 45 square feet, which is:

(1) Designed primarily for purposes of transportation of property or is a derivation of such a vehicle; or

(2) Designed primarily for transportation of persons and has a capacity of more than 12 persons; or

(3) Available with special features enabling off-street or off-highway operation and use.

Light-duty vehicle means a passenger car or passenger car derivative capable of seating 12 or fewer passengers.

Low-mileage means relating to a vehicle with stabilized emissions and represents the undeteriorated emission level. This would generally involve approximately 4000 miles of operation.

Low rolling resistance tire means a tire on a vocational vehicle with a TRRL at or below of 7.7 kg/metric ton, a steer tire on a tractor with a TRRL at or below 7.7 kg/metric ton, or a drive tire on a tractor with a TRRL at or below 8.1 kg/metric ton.

Manufacture means the physical and engineering process of designing, constructing, and/or assembling a vehicle.

Manufacturer has the meaning given in section 216(1) of the Act. In general, this term includes any person who manufactures or assembles a vehicle for sale in the United States or otherwise introduces a new motor vehicle into commerce in the United States. This includes importers who import vehicles or vehicles for resale and entities that assemble glider kits.

Medium-duty passenger vehicle (MDPV) has the meaning given in 40 CFR 86.1803.

Model year means the manufacturer's annual new model production period, except as restricted under this definition and 40 CFR part 85, subpart X. It must include January 1 of the calendar year for which the model year is named, may not begin before January 2 of the previous calendar year, and it must end by December 31 of the named calendar year.

(1) The manufacturer who holds the certificate of conformity for the vehicle must assign the model year based on the date when its manufacturing operations are completed relative to its annual model year period. In unusual circumstances where completion of your assembly is delayed, we may allow you to assign a model year one year earlier, provided it does not affect which regulatory requirements will apply.

(2) Unless a vehicle is being shipped to a secondary manufacturer that will hold the certificate of conformity, the model year must be assigned prior to introduction of the vehicle into U.S. commerce. The certifying manufacturer must redesignate the model year if it does not complete its manufacturing operations within the originally identified model year. A vehicle introduced into U.S. commerce without a model year is deemed to have a model year equal to the calendar year of its introduction into U.S. commerce unless the certifying manufacturer assigns a later date.

Motor vehicle has the meaning given in 40 CFR 85.1703.

Multi-Purpose Duty Cycle has the meaning given in § 1037.510.

New motor vehicle has the meaning given in the Act. It generally means a motor vehicle meeting the criteria of either paragraph (1) or (2) of this definition. *New motor vehicles* may be complete or incomplete.

(1) A motor vehicle for which the ultimate purchaser has never received the equitable or legal title is a *new motor vehicle.* This kind of vehicle might commonly be thought of as ''brand new'' although a *new motor vehicle* may include previously used parts. For example, vehicles commonly known as ''glider kits'' or ''gliders'' are new motor vehicles. Under this definition, the vehicle is new from the time it is produced until the ultimate purchaser receives the title or places it into service, whichever comes first.

(2) An imported heavy-duty motor vehicle originally produced after the 1969 model year is a *new motor vehicle.*

Noncompliant vehicle means a vehicle that was originally covered by a certificate of conformity, but is not in the certified configuration or otherwise does not comply with the conditions of the certificate.

Nonconforming vehicle means a vehicle not covered by a certificate of conformity that would otherwise be subject to emission standards.

Nonmethane hydrocarbon (NMHC) means the sum of all hydrocarbon species except methane, as measured according to 40 CFR part 1065.

Nonmethane hydrocarbon equivalent has the meaning given in 40 CFR 1065.1001.

Off-cycle technology means technology certified under § 1037.610.

Official emission result means the measured emission rate for an emission-data vehicle on a given duty cycle before the application of any required deterioration factor, but after the applicability of regeneration adjustment factors.

Owners manual means a document or collection of documents prepared by the vehicle manufacturer for the owners or operators to describe appropriate vehicle maintenance, applicable warranties, and any other information related to operating or keeping the vehicle. The owners manual is typically provided to the ultimate purchaser at the time of sale.

Oxides of nitrogen has the meaning given in 40 CFR 1065.1001.

Particulate trap means a filtering device that is designed to physically trap all particulate matter above a certain size.

Percent has the meaning given in 40 CFR 1065.1001. Note that this means percentages identified in this part are assumed to be infinitely precise without regard to the number of significant figures. For example, one percent of 1,493 is 14.93.

Phase 1 means relating to the Phase 1 standards specified in §§ 1037.105 and 1037.106. Note that there are no Phase 1 standards for trailers. For example, a vehicle subject to the Phase 1 standards is a Phase 1 vehicle.

Phase 2 means relating to the Phase 2 standards specified in §§ 1037.105 through 1037.107.

Placed into service means put into initial use for its intended purpose, excluding incidental use by the manufacturer or a dealer.

Power take-off (PTO) means a secondary engine shaft (or equivalent) that provides substantial auxiliary power for purposes unrelated to vehicle propulsion or normal vehicle accessories such as air conditioning, power steering, and basic electrical accessories. A typical PTO uses a secondary shaft on the engine to transmit power to a hydraulic pump that powers auxiliary equipment, such as a boom on a bucket truck. You may ask us to consider other equivalent auxiliary power configurations (such as those with hybrid vehicles) as power take-off systems.

Preliminary approval means approval granted by an authorized EPA representative prior to submission of an application for certification, consistent with the provisions of § 1037.210.

Rechargeable Energy Storage System (RESS) means the component(s) of a hybrid engine or vehicle that store recovered energy for later use, such as the battery system in an electric hybrid vehicle.

Regional Duty Cycle has the meaning given in § 1037.510.

Regulatory subcategory has the meaning given in § 1037.230.

Relating to as used in this section means relating to something in a specific, direct manner. This expression is used in this section only to define terms as adjectives and not to broaden the meaning of the terms.

Revoke has the meaning given in 40 CFR 1068.30.

Roof height means the maximum height of a vehicle (rounded to the nearest inch), excluding narrow accessories such as exhaust pipes and antennas, but including any wide accessories such as roof fairings. Measure roof height of the vehicle configured to have its maximum height that will occur during actual use, with properly inflated tires and no driver, passengers, or cargo onboard. *Roof height* may also refer to the following categories:

(1) Low-roof means relating to a vehicle with a roof height of 120 inches or less.

(2) Mid-roof means relating to a vehicle with a roof height of 121 to 147 inches.

(3) High-roof means relating to a vehicle with a roof height of 148 inches or more.

Round has the meaning given in 40 CFR 1065.1001.

Scheduled maintenance means adjusting, repairing, removing, disassembling, cleaning, or replacing components or systems periodically to keep a part or system from failing, malfunctioning, or wearing prematurely. It also may mean actions you expect are necessary to correct an overt indication of failure or malfunction for which periodic maintenance is not appropriate.

Secondary vehicle manufacturer anyone that produces a vehicle by modifying a complete or partially complete vehicle. For the purpose of this definition, ''modifying'' does not include making changes that do not remove a vehicle from its original certified configuration. This definition applies whether the production involves a complete or partially complete vehicle and whether the vehicle was previously certified to emission standards or not. Manufacturers controlled by the manufacturer of the base vehicle (or by an entity that also controls the manufacturer of the base vehicle) are not secondary vehicle manufacturers; rather, both entities are considered to be one manufacturer for purposes of this part.

Sleeper cab means a type of tractor cab that has a compartment behind the driver's seat intended to be used by the driver for sleeping, and is not a heavy-haul tractor cab. This includes cabs accessible from the driver's compartment and those accessible from outside the vehicle.

Small manufacturer means a manufacturer meeting the criteria specified in 13 CFR 121.201. The employee and revenue limits apply to the total number employees and total revenue together for affiliated companies.

Spark-ignition has the meaning given in § 1037.101.

Standard payload means the payload assumed for each vehicle, in tons, for modeling and calculating emission credits, as follows:

(1) For vocational vehicles:

(i) 2.85 tons for light heavy-duty vehicles.

(ii) 5.6 tons for medium heavy-duty vehicles.

(iii) 7.5 tons for heavy heavy-duty vehicles.

(2) For tractors:

(i) 12.5 tons for Class 7.

(ii) 19 tons for Class 8, other than heavy-haul tractors.

(iii) 43 tons for heavy-haul tractors.

(3) For trailers:

(i) 10 tons for short box vans.

(ii) 19 tons for other trailers.

Standard tractor has the meaning given in § 1037.501.

Standard trailer has the meaning given in § 1037.501.

Suspend has the meaning given in 40 CFR 1068.30.

Test sample means the collection of vehicles or components selected from the population of a vehicle family for emission testing. This may include testing for certification, production-line testing, or in-use testing.

Test vehicle means a vehicle in a test sample.

Test weight means the vehicle weight used or represented during testing.

Tire rolling resistance level (TRRL) means a value with units of kg/metric ton that represents the rolling resistance of a tire configuration. TRRLs are used as modeling inputs under §§ 1037.515 and 1037.520. Note that a manufacturer may use the measured value for a tire configuration's coefficient of rolling resistance, or assign some higher value.

Total hydrocarbon has the meaning given in 40 CFR 1065.1001. This generally means the combined mass of organic compounds measured by the specified procedure for measuring total hydrocarbon, expressed as a hydrocarbon with an atomic hydrogen-to-carbon ratio of 1.85:1.

Total hydrocarbon equivalent has the meaning given in 40 CFR 1065.1001.

This generally means the sum of the carbon mass contributions of non-oxygenated hydrocarbons, alcohols and aldehydes, or other organic compounds that are measured separately as contained in a gas sample, expressed as exhaust hydrocarbon from petroleum-fueled vehicles. The atomic hydrogen-to-carbon ratio of the equivalent hydrocarbon is 1.85:1.

Tractor has the meaning given for ''truck tractor'' in 49 CFR 571.3. This includes most heavy-duty vehicles specifically designed for the primary purpose of pulling trailers, but does not include vehicles designed to carry other loads. For purposes of this definition ''other loads'' would not include loads carried in the cab, sleeper compartment, or toolboxes. Examples of vehicles that are similar to tractors but that are not *tractors* under this part include dromedary tractors, automobile haulers, straight trucks with trailers hitches, and tow trucks. Note that the provisions of this part that apply for tractors do not apply for tractors that are classified as vocational tractors under § 1037.630.

Trailer means a piece of equipment designed for carrying cargo and for being drawn by a tractor when coupled to the tractor's fifth wheel. Trailers may be divided into different types and categories as described in paragraphs (1) through (4) of this definition. The types of equipment identified in paragraph (5) of this definition are not trailers for purposes of this part.

(1) Box vans are trailers with an enclosed cargo space that is permanently attached to the chassis, with fixed sides, nose, and roof and is designed to carry a wide range of freight. Tankers are not box vans.

(2) Box vans with front-mounted, self-contained HVAC systems are refrigerated vans. Note that this includes systems that provide cooling, heating, or both. All other box vans are dry vans.

(3) Trailers that are not box vans are non-box trailers. This includes chassis that are designed only for temporarily mounted containers.

(4) Box trailers with length greater than 50 feet are long box trailers. Other box trailers are short box trailers.

(5) The following types of equipment are not trailers:

(i) Containers that are not permanently mounted on chassis.

(ii) [Reserved]

Urban Duty Cycle has the meaning given in § 1037.510.

Ultimate purchaser means, with respect to any new vehicle, the first person who in good faith purchases such new vehicle for purposes other than resale.

United States has the meaning given in 40 CFR 1068.30.

Upcoming model year means for a vehicle family the model year after the one currently in production.

U.S.-directed production volume means the number of vehicle units, subject to the requirements of this part, produced by a manufacturer for which the manufacturer has a reasonable assurance that sale was or will be made to ultimate purchasers in the United States. This does not include vehicles certified to state emission standards that are different than the emission standards in this part.

Useful life means the period during which a vehicle is required to comply with all applicable emission standards.

Vehicle means equipment intended for use on highways that meets at least one of the criteria of paragraph (1) of this definition, as follows:

(1) The following equipment are vehicles:

(i) A piece of equipment that is intended for self-propelled use on highways becomes a vehicle when it includes at least an engine, a transmission, and a frame. (**Note:** For purposes of this definition, any electrical, mechanical, and/or hydraulic devices attached to engines for the purpose of powering wheels are considered to be transmissions.)

(ii) A piece of equipment that is intended for self-propelled use on highways becomes a vehicle when it includes a passenger compartment attached to a frame with axles.

(iii) Trailers. A trailer becomes a vehicle when it has a frame with axles attached.

(2) Vehicles other than trailers may be complete or incomplete vehicles as follows:

(i) A *complete vehicle* is a functioning vehicle that has the primary load carrying device or container (or equivalent equipment) attached. Examples of equivalent equipment would include fifth wheel trailer hitches, firefighting equipment, and utility booms.

(ii) An *incomplete vehicle* is a vehicle that is not a complete vehicle. Incomplete vehicles may also be cab-complete vehicles. This may include vehicles sold to secondary vehicle manufacturers.

(iii) The primary use of the terms ''complete vehicle'' and ''incomplete vehicle'' are to distinguish whether a vehicle is complete when it is first sold as a vehicle.

(iv) You may ask us to allow you to certify a vehicle as incomplete if you manufacture the engines and sell the unassembled chassis components, as long as you do not produce and sell the body components necessary to complete the vehicle.

Vehicle configuration means a unique combination of vehicle hardware and calibration (related to measured or modeled emissions) within a vehicle family. Vehicles with hardware or software differences, but that have no hardware or software differences related to measured or modeled emissions may be included in the same vehicle configuration. Note that vehicles with hardware or software differences related to measured or modeled emissions are considered to be different configurations even if they have the same GEM inputs and FEL. Vehicles within a vehicle configuration differ only with respect to normal production variability or factors unrelated to measured or modeled emissions.

Vehicle family has the meaning given in § 1037.230.

Vehicle service class means a vehicle's weight class as specified in this definition. Note that, while *vehicle service class* is similar to primary intended service class for engines, they are not necessarily the same. For example, a medium heavy-duty vehicle may include a light heavy-duty engine.

(1) Light heavy-duty vehicles are those vehicles with GVWR below 19,500 pounds. Vehicles In this class include heavy-duty pickup trucks and vans, motor homes and other recreational vehicles, and some straight trucks with a single rear axle. Typical applications would include personal transportation, light-load commercial delivery, passenger service, agriculture, and construction.

(2) Medium heavy-duty vehicles are those vehicles with GVWR from 19,500 to 33,000 pounds. Vehicles in this class include school buses, straight trucks with a single rear axle, city tractors, and a variety of special purpose vehicles such as small dump trucks, and refuse trucks. Typical applications would include commercial short haul and intra-city delivery and pickup.

(3) Heavy heavy-duty vehicles are those vehicles with GVWR above 33,000 pounds. Vehicles in this class include tractors, urban buses, and other heavy trucks.

Vehicle subfamily or *subfamily* means a subset of a vehicle family including vehicles subject to the same FEL(s).

Vocational tractor means a vehicle classified as a vocational tractor under § 1037.630.

Vocational vehicle means relating to a vehicle subject to the standards of § 1037.105 (including vocational tractors).

Void has the meaning given in 40 CFR 1068.30.

Volatile liquid fuel means any fuel other than diesel or biodiesel that is a liquid at atmospheric pressure and has a Reid Vapor Pressure higher than 2.0 pounds per square inch.

We (us, our) means the Administrator of the Environmental Protection Agency and any authorized representatives.

§ 1037.805 Symbols, abbreviations, and acronyms.

The procedures in this part generally follow either the International System of Units (SI) or the United States customary units, as detailed in NIST Special Publication 811, which we incorporate by reference in § 1037.810. See 40 CFR 1065.20 for specific provisions related to these conventions. This section summarizes the way we use symbols, units of measure, and other abbreviations.

(a) *Symbols for chemical species.* This part uses the following symbols for chemical species and exhaust constituents:

Symbol	Species
C	carbon.
CH_4	methane.
CO	carbon monoxide.
CO_2	carbon dioxide.
H_2O	water.
HC	hydrocarbon.
NMHC	nonmethane hydrocarbon.
NMHCE	nonmethane hydrocarbon equivalent.
NO	nitric oxide.
NO_2	nitrogen dioxide.
NO_X	oxides of nitrogen.
N_2O	nitrous oxide.
PM	particulate matter.
THC	total hydrocarbon.
THCE	total hydrocarbon equivalent.

(b) *Symbols for quantities.* This part uses the following symbols and units of measure for various quantities:

Symbol	Quantity	Unit	Unit symbol	Unit in terms of SI base units
α	atomic hydrogen-to-carbon ratio.	mole per mole	mol/mol	1
α_0	intercept of air speed correction.			
α_1	slope of air speed correction.			
A	vehicle frictional load	pound force or newton	lbf or N	$kg \cdot m \cdot s^{-2}$
a_g	acceleration of Earth's gravity.	meters per second squared.	m/s^2	$m \cdot s^{-2}$
a_0	intercept of least squares regression.			
a_1	slope of least squares regression.			
B	vehicle load from drag and rolling resistance.	pound force per mile per hour or newton second per meter.	lbf/mph^2 or $N \cdot s^2/m^2$	$kg \cdot s^{-1}$
β	atomic oxygen-to-carbon ratio.	mole per mole	mol/mol	1
β_0	intercept of air direction correction.			
β_1	slope of air direction correction.			
C	vehicle-specific aerodynamic effects.	pound force per mile per hour squared or newton-second squared per meter squared.	lbf/mph^2 or $N \cdot s^2/m^2$	$kg \cdot m^{-1}$
C_i	constant.			
C_{DA}	drag area	meter squared	m^2	m^2
C_D	drag coefficient.			
CF	correction factor.			
C_{rr}	coefficient of rolling resistance.	kilogram per metric ton	kg/tonne	10^{-3}
D	distance	miles or meters	mi or m	m
e	mass-weighted emission result.	grams/ton-mile	g/ton-mi	g/kg-km
Eff	efficiency.			
F	adjustment factor.			
F	force	pound force or newton	lbf or N	$kg \cdot m \cdot s^{-2}$
f_n	angular speed (shaft)	revolutions per minute	r/min	$\pi \cdot 30 \cdot s^{-1}$
G	road grade	percent	%	10^{-2}
g	gravitational acceleration.	meters per second squared.	m/s^2	$m \cdot s^{-2}$
h	elevation or height	meters	m	m
i	indexing variable.			
k_a	drive axle ratio.			
k_d	transmission gear ratio.			
$k_{topgear}$	highest available transmission gear.			
m	mass	pound mass or kilogram	lbm or kg	kg
M	molar mass	gram per mole	g/mol	$10^{-3} \cdot kg \cdot mol^{-1}$
M	vehicle mass	kilogram	kg	kg
M_e	vehicle effective mass	kilogram	kg	kg

Symbol	Quantity	Unit	Unit symbol	Unit in terms of SI base units
$M_{rotating}$	inertial mass of rotating components.	kilogram	kg	kg
N	total number in series.			
$\dot{n}$	amount of substance rate.	mole per second	mol/s	$mol \cdot s^{-1}$
p	pressure	pascal	Pa	$kg \cdot m^{-1} \cdot s^{-2}$
ρ	mass density	kilogram per cubic meter.	kg/m^3	$kg \cdot m^{-3}$
PL	payload	tons	ton	kg
r	tire radius	meter	m	m
r^2	coefficient of determination.			
$Re\#$	Reynolds number.			
SEE	standard estimate of error.			
$TRRL$	tire rolling resistance level.	kilogram per metric ton	kg/tonne	10^{-3}
θ	wind direction	degrees	°	°
T	absolute temperature	kelvin	K	K
T	Celsius temperature	degree Celsius	°C	K—273.15
T	torque (moment of force).	newton meter	N·m	$m^2 \cdot kg \cdot s^{-2}$
t	time	second	s	s
Δt	time interval, period, 1/frequency.	second	s	s
v	speed	miles per hour or meters per second.	mph or m/s	$m \cdot s^{-1}$
w	weighting factor.			
w	wind speed	miles per hour	mph	$m \cdot s^{-1}$
W	work	kilowatt-hour	kW·hr	$3.6 \cdot m^2 \cdot kg \cdot s^{-1}$
w_C	carbon mass fraction	gram/gram	g/g	1
WR	weight reduction	pound mass	lbm	kg
x	amount of substance mole fraction.	mole per mole	mol/mol	1

(c) *Superscripts.* This part uses the following superscripts to define a quantity:

Superscript	Quantity
overbar (such as $\bar{y}$)	arithmetic mean.
overdot (such as $\dot{y}$)	quantity per unit time.

(d) *Subscripts.* This part uses the following subscripts to define a quantity:

Subscript	Quantity
±6	6° yaw angle sweep.
aero	aerodynamic.
air	air.
alt.	alternative.
act	actual or measured condition.
air	air.
axle	axle.
brake	brake.
Ccombdry	carbon from fuel per mole of dry exhaust.
circuit	circuit.
coastdown	coastdown.
CO2PTO	CO_2 emissions for PTO cycle.
CO2urea	CO_2 from urea decomposition.
comp	composite.
cycle	test cycle.
driver	driver.
dyno	dynamometer.
event	event.
end	end.
fuel	fuel.
full	full.
grade	grade.
H2Oexhaustdry	H_2O in exhaust per mole of exhaust.
hi	high.
in	inlet.
idle	idle.
lo	low.
max	maximum.
meas	measured quantity.
min	minimum.
moving	moving.
out	outlet.
powertrain	powertrain.
record	record.
ref	reference quantity.
speed	speed.
start	start.
th	theoretical.
total	total.
trac	traction.
transient	transient.
urea	urea.
veh	vehicle.
w	wind.
wa	wind average.
yaw	yaw angle.
ys	yaw sweep.
zero	zero quantity.

(e) *Other acronyms and abbreviations.* This part uses the following additional abbreviations and acronyms:

ABT averaging, banking, and trading
AECD auxiliary emission control device
AES automatic engine shutdown
CFD computational fluid dynamics
CFR Code of Federal Regulations
CITT curb idle transmission torque
DOT Department of Transportation
EPA Environmental Protection Agency
FE fuel economy
FEL Family Emission Limit
GAWR gross axle weight rating
GCWR gross combination weight rating
GEM greenhouse gas emission model
GVWR gross vehicle weight rating
HVAC heating, ventilating, and air conditioning
ISO International Organization for Standardization
NARA National Archives and Records Administration
NHTSA National Highway Transportation Safety Administration
PTO power take-off
RESS rechargeable energy storage system
rpm revolutions per minute
SAE Society of Automotive Engineers
SKU stock-keeping unit
TRRL tire rolling resistance level

U.S.C United States Code
VSL vehicle speed limiter

(f) *Constants.* This part uses the following constants:

Symbol	Quantity	Value
g	gravitational constant.	9.81 $m \cdot s^{-2}$
R	specific gas constant.	287.058 J/(kg·K)

(g) *Prefixes.* This part uses the following prefixes to define a quantity:

Symbol	Quantity	Value
μ	micro	10^{-6}
m	milli	10^{-3}
c	centi	10^{-2}
k	kilo	10^{3}
M	mega	10^{6}

§ 1037.810 Incorporation by reference.

(a) Certain material is incorporated by reference into this part with the approval of the Director of the Federal Register under 5 U.S.C. 552(a) and 1 CFR part 51. To enforce any edition other than that specified in this section, the Environmental Protection Agency must publish a notice of the change in the **Federal Register** and the material must be available to the public. All approved material is available for inspection at U.S. EPA, Air and Radiation Docket and Information Center, 1301 Constitution Ave. NW., Room B102, EPA West Building, Washington, DC 20460, (202) 202–1744, and is available from the sources listed below. It is also available for inspection at the National Archives and Records Administration (NARA). For information on the availability of this material at NARA, call 202–741–6030, or go to *http://www.archives.gov/federal_register/code_of_federal_regulations/ibr_locations.html.*

§ 1037.815 Confidential information.

The provisions of 40 CFR 1068.10 apply for information you consider confidential.

§ 1037.820 Requesting a hearing.

(a) You may request a hearing under certain circumstances, as described elsewhere in this part. To do this, you must file a written request, including a description of your objection and any supporting data, within 30 days after we make a decision.

(b) For a hearing you request under the provisions of this part, we will approve your request if we find that your request raises a substantial factual issue.

(c) If we agree to hold a hearing, we will use the procedures specified in 40 CFR part 1068, subpart G.

§ 1037.825 Reporting and recordkeeping requirements.

(a) This part includes various requirements to submit and record data or other information. Unless we specify otherwise, store required records in any format and on any media and keep them readily available for eight years after you send an associated application for certification, or eight years after you generate the data if they do not support an application for certification. You may not rely on anyone else to meet recordkeeping requirements on your behalf unless we specifically authorize it. We may review these records at any time. You must promptly send us organized, written records in English if we ask for them. We may require you to submit written records in an electronic format.

(b) The regulations in § 1037.255 and 40 CFR 1068.25 and 1068.101 describe your obligation to report truthful and complete information. This includes information not related to certification. Failing to properly report information and keep the records we specify violates 40 CFR 1068.101(a)(2), which may involve civil or criminal penalties.

(c) Send all reports and requests for approval to the Designated Compliance Officer (see § 1037.801).

(d) Any written information we require you to send to or receive from another company is deemed to be a required record under this section. Such records are also deemed to be submissions to EPA. Keep these records for eight years unless the regulations specify a different period. We may require you to send us these records whether or not you are a certificate holder.

(e) Under the Paperwork Reduction Act (44 U.S.C. 3501 *et seq.*), the Office of Management and Budget approves the reporting and recordkeeping specified in the applicable regulations. The following items illustrate the kind of reporting and recordkeeping we require for vehicles regulated under this part:

(1) We specify the following requirements related to vehicle certification in this part 1037:

(i) In subpart C of this part we identify a wide range of information required to certify vehicles.

(ii) In subpart G of this part we identify several reporting and recordkeeping items for making demonstrations and getting approval related to various special compliance provisions.

(iii) In § 1037.725, 1037.730, and 1037.735 we specify certain records related to averaging, banking, and trading.

(2) We specify the following requirements related to testing in 40 CFR part 1066:

(i) In 40 CFR 1066.2 we give an overview of principles for reporting information.

(ii) In 40 CFR 1066.25 we establish basic guidelines for storing test information.

(iii) In 40 CFR 1066.695 we identify the specific information and data items to record when measuring emissions.

(3) We specify the following requirements related to the general compliance provisions in 40 CFR part 1068:

(i) In 40 CFR 1068.5 we establish a process for evaluating good engineering judgment related to testing and certification.

(ii) In 40 CFR 1068.25 we describe general provisions related to sending and keeping information.

(iii) In 40 CFR 1068.27 we require manufacturers to make engines available for our testing or inspection if we make such a request.

(iv) In 40 CFR 1068.105 we require vehicle manufacturers to keep certain records related to duplicate labels from engine manufacturers.

(v) In 40 CFR 1068.120 we specify recordkeeping related to rebuilding engines.

(vi) In 40 CFR part 1068, subpart C, we identify several reporting and recordkeeping items for making demonstrations and getting approval related to various exemptions.

(vii) In 40 CFR part 1068, subpart D, we identify several reporting and recordkeeping items for making demonstrations and getting approval related to importing engines.

(viii) In 40 CFR 1068.450 and 1068.455 we specify certain records related to testing production-line engines in a selective enforcement audit.

(ix) In 40 CFR 1068.501 we specify certain records related to investigating and reporting emission-related defects.

(x) In 40 CFR 1068.525 and 1068.530 we specify certain records related to recalling nonconforming engines.

Appendix III to Part 1037—Emission Control Identifiers

This appendix identifies abbreviations for emission control information labels, as required under § 1037.135.

Vehicle Speed Limiters

—VSL—Vehicle speed limiter
—VSLS—''Soft-top'' vehicle speed limiter
—VSLE—Expiring vehicle speed limiter
—VSLD—Vehicle speed limiter with both ''soft-top'' and expiration

Idle Reduction Technology

—IRT5—Engine shutoff after 5 minutes or less of idling
—IRTE—Expiring engine shutoff

Tires

—LRRA—Low rolling resistance tires (all)
—LRRD—Low rolling resistance tires (drive)
—LRRS—Low rolling resistance tires (steer)

Aerodynamic Components

—ATS—Aerodynamic side skirt and/or fuel tank fairing
—ARF—Aerodynamic roof fairing
—ARFR—Adjustable height aerodynamic roof fairing
—TGR—Gap reducing tractor fairing (tractor to trailer gap)
—TGRT—Gap reducing trailer fairing (tractor to trailer gap)
—TATS—Trailer aerodynamic side skirt
—TARF—Trailer aerodynamic rear fairing
—TAUD—Trailer aerodynamic underbody device

Other Components

—ADVH—Vehicle includes advanced hybrid technology components
—ADVO—Vehicle includes other advanced technology components (*i.e.*, non-hybrid system)
—INV—Vehicle includes innovative (off-cycle) technology components
—ATI—Automatic tire inflation system
—WRTW—Weight-reducing trailer wheels
—WRTC—Weight-reducing trailer upper coupler plate
—WRTS—Weight-reducing trailer axle sub-frames
—WBSW—Wide-based single trailer tires with steel wheel
—WBAW—Wide-based single trailer tires with aluminum wheel
—WBLW—Wide-based single trailer tires with light-weight aluminum alloy wheel
—DWSW—Dual-wide trailer tires with steel wheel
—DWAW—Dual-wide trailer tires with aluminum wheel
—DWLW—Dual-wide trailer tires with light-weight aluminum alloy wheel

Appendix IV to Part 1037—Heavy-Duty Grade Profile for Phase 2 Steady-State Test Cycles

PART 1039—CONTROL OF EMISSIONS FROM NEW AND IN-USE NONROAD COMPRESSION-IGNITION ENGINES

■ 117. The authority citation for part 1039 continues to read as follows:

Authority: 42 U.S.C. 7401–7671q.

Subpart A—Overview and Applicability

■ 118. Section 1039.2 is revised to read as follows:

§ 1039.2 Who is responsible for compliance?

The regulations in this part 1039 contain provisions that affect both manufacturers and others. However, the requirements of this part are generally addressed to the manufacturer. The term ''you'' generally means the manufacturer, as defined in § 1039.801, especially for issues related to certification. Note that for engines that become new after being placed into service (such as engines converted from highway or stationary use), the requirements that normally apply for manufacturers of freshly manufactured engines apply to the importer or any other entity we allow to obtain a certificate of conformity.

■ 119. Section 1039.5 is amended by revising the introductory text, adding paragraph (a)(2)(iii), and revising paragraph (e) to read as follows:

§ 1039.5 Which engines are excluded from this part's requirements?

This part does not apply to certain nonroad engines, as follows:

(a) * * *

(2) * * *

(iii) Locomotive engines produced under the provisions of 40 CFR 1033.625.

* * * * *

(e) *Engines used in recreational vehicles.* Engines certified to meet the requirements of 40 CFR part 1051 are not subject to the provisions of this part 1039.

■ 120. Section 1039.30 is revised to read as follows:

§ 1039.30 Submission of information.

Unless we specify otherwise, send all reports and requests for approval to the Designated Compliance Officer (see § 1039.801). See § 1039.825 for additional reporting and recordkeeping provisions.

Subpart B—Emission Standards and Related Requirements

■ 121. Section 1039.102 is amended by revising paragraph (e)(3) to read as follows:

§ 1039.102 What exhaust emission standards and phase-in allowances apply for my engines in model year 2014 and earlier?

* * * * *

(e) * * *

(3) You may use NO_X +NMHC emission credits to certify an engine family to the alternate NO_X +NMHC standards in this paragraph (e)(3) instead of the otherwise applicable alternate NO_X and NMHC standards. Calculate the alternate NO_X +NMHC standard by adding 0.1 g/kW-hr to the numerical value of the applicable alternate NO_X standard of paragraph (e)(1) or (2) of this section. Engines certified to the NO_X +NMHC standards of this paragraph (e)(3) may not generate emission credits. The FEL caps for engine families certified under this paragraph (e)(3) are the previously applicable NO_X +NMHC standards of 40 CFR 89.112 (generally the Tier 3 standards).

* * * * *

■ 122. Section 1039.104 is amended by revising paragraph (g)(5) and adding paragraph (i) to read as follows:

§ 1039.104 Are there interim provisions that apply only for a limited time?

* * * * *

(g) * * *

(5) You may certify engines under this paragraph (g) in any model year provided for in Table 1 of this section without regard to whether or not the engine family's FEL is at or below the otherwise applicable FEL cap. For example, a 200 kW engine certified to the NO_X + NMHC standard of § 1039.102(e)(3) with an FEL equal to the FEL cap of 4.0 g/kW-hr may nevertheless be certified under this paragraph (g).

* * * * *

(i) *Lead time for diagnostic controls.* Model year 2017 and earlier engines are not subject to the requirements for diagnostic controls specified in § 1039.110.

* * * * *

■ 123. Section 1039.107 is amended by revising paragraph (b)(2) to read as follows:

§ 1039.107 What evaporative emission standards and requirements apply?

* * * * *

(b) * * *

(2) Present test data to show that equipment using your engines meets the evaporative emission standards we specify in this section if you do not use design-based certification under 40 CFR 1048.245.

■ 124. Section 1039.110 is added to subpart B to read as follows:

§ 1039.110 Recording reductant use and other diagnostic functions.

(a) Engines equipped with SCR systems using a reductant other than the engine's fuel must have a diagnostic system that monitors reductant quality and tank levels and alert operators to the need to refill the reductant tank before it is empty, or to replace the reductant if it does not meet your concentration specifications. Unless we approve other alerts, use a warning lamp or an audible alarm. You do not need to separately monitor reductant quality if you include an exhaust NO_X sensor (or other sensor) that allows you to determine inadequate reductant quality. However, tank level must be monitored in all cases.

(b) You may equip your engine with other diagnostic features. If you do, they must be designed to allow us to read and interpret the codes. Note that § 1039.205 requires you to provide us any information needed to read, record, and interpret all the information broadcast by an engine's onboard computers and electronic control units.

■ 125. Section 1039.120 is amended by revising paragraph (b) introductory text to read as follows:

§ 1039.120 What emission-related warranty requirements apply to me?

* * * * *

(b) *Warranty period.* Your emission-related warranty must be valid for at least as long as the minimum warranty periods listed in this paragraph (b) in hours of operation and years, whichever comes first. You may offer an emission-related warranty more generous than we require. The emission-related warranty for the engine may not be shorter than any basic mechanical warranty you provide without charge for the engine. Similarly, the emission-related warranty for any component may not be shorter than any warranty you provide without charge for that component. This means that your warranty may not treat emission-related and nonemission-related defects differently for any component. If an engine has no hour meter, we base the warranty periods in this paragraph (b) only on the engine's age (in years). The warranty period begins when the engine is placed into service. The minimum warranty periods are shown in the following table:

* * * * *

■ 126. Section 1039.125 is amended by revising paragraphs (a)(2)(i), (a)(3)(i), (c), and (e) to read as follows:

§ 1039.125 What maintenance instructions must I give to buyers?

* * * * *

(a) * * *

(2) * * *

(i) For EGR-related filters and coolers, DEF filters, PCV valves, crankcase vent filters, and fuel injector tips (cleaning only), the minimum interval is 1,500 hours.

* * * * *

(3) * * *

(i) For EGR-related filters and coolers, DEF filters, PCV valves, crankcase vent filters, and fuel injector tips (cleaning only), the minimum interval is 1,500 hours.

* * * * *

(c) *Special maintenance.* You may specify more frequent maintenance to address problems related to special situations, such as atypical engine operation. You must clearly state that this additional maintenance is associated with the special situation you are addressing. You may also address maintenance of low-use engines (such as recreational or stand-by engines) by specifying the maintenance interval in terms of calendar months or years in addition to your specifications in terms of engine operating hours. All special maintenance instructions must be consistent with good engineering judgment. We may disapprove your maintenance instructions if we determine that you have specified special maintenance steps to address maintenance that is unlikely to occur in use, or engine operation that is not atypical. For example, this paragraph (c) does not allow you to design engines that require special maintenance for a certain type of expected operation. If we determine that certain maintenance items do not qualify as special maintenance under this paragraph (c), you may identify this as recommended additional maintenance under paragraph (b) of this section.

* * * * *

(e) *Maintenance that is not emission-related.* For maintenance unrelated to emission controls, you may schedule any amount of inspection or maintenance. You may also take these inspection or maintenance steps during service accumulation on your emission-data engines, as long as they are reasonable and technologically necessary. This might include adding engine oil, changing air, fuel, or oil filters, servicing engine-cooling systems or fuel-water separator cartridges or elements, and adjusting idle speed, governor, engine bolt torque, valve lash, or injector lash. You may not perform this nonemission-related maintenance on emission-data engines more often than the least frequent intervals that you recommend to the ultimate purchaser.

* * * * *

■ 127. Section 1039.130 is amended by adding paragraph (b)(4) and revising paragraph (b)(5) to read as follows:

§ 1039.130 What installation instructions must I give to equipment manufacturers?

* * * * *

(b) * * *

(4) Describe any necessary steps for installing the diagnostic system described in § 1039.110.

(5) Describe how your certification is limited for any type of application. For example, if your engines are certified only for constant-speed operation, tell equipment manufacturers not to install the engines in variable-speed applications.

* * * * *

■ 128. Section 1039.135 is amended by revising paragraphs (c)(2) and (d) to read as follows:

§ 1039.135 How must I label and identify the engines I produce?

* * * * *

(c) * * *

(2) Include your full corporate name and trademark. You may identify another company and use its trademark instead of yours if you comply with the branding provisions of 40 CFR 1068.45.

* * * * *

(d) You may add information to the emission control information label as follows:

(1) If your emission control information label includes all the information described in paragraphs (c)(5) through (10) of this section, you may identify other emission standards that the engine meets or does not meet (such as international standards). You may include this information by adding it to the statement we specify or by including a separate statement.

(2) You may add other information to ensure that the engine will be properly maintained and used.

(3) You may add appropriate features to prevent counterfeit labels. For example, you may include the engine's unique identification number on the label.

* * * * *

Subpart C—Certifying Engine Families

■ 129. Section 1039.201 is amended by revising paragraphs (a) and (g) to read as follows:

§ 1039.201 What are the general requirements for obtaining a certificate of conformity?

(a) You must send us a separate application for a certificate of conformity for each engine family. A certificate of conformity is valid for new production from the indicated effective date until the end of the model year for which it is issued, which may not extend beyond December 31 of that year. No new certificate will be issued after December 31 of the model year. You may amend your application for certification after the end of the model year in certain circumstances as described in §§ 1039.220 and 1039.225. You must renew your certification annually for any engines you continue to produce.

* * * * *

(g) We may require you to deliver your test engines to a facility we designate for our testing (see § 1039.235(c)). Alternatively, you may choose to deliver another engine that is identical in all material respects to the test engine, or another engine that we determine can appropriately serve as an emission-data engine for the engine family.

* * * * *

■ 130. Section 1039.205 is amended by revising paragraph (r)(1) and adding paragraph (bb) to read as follows:

§ 1039.205 What must I include in my application?

* * * * *

(r) * * *

(1) Report all valid test results involving measurement of pollutants for which emission standards apply. Also indicate whether there are test results from invalid tests or from any other tests of the emission-data engine, whether or not they were conducted according to the test procedures of subpart F of this part. We may require you to report these additional test results. We may ask you to send other information to confirm that your tests were valid under the requirements of this part and 40 CFR part 1065.

* * * * *

(bb) For imported engines or equipment, identify the following:

(1) Describe your normal practice for importing engines. For example, this

may include identifying the names and addresses of any agents you have authorized to import your engines.

(2) For engines below 560 kW, identify a test facility in the United States where you can test your engines if we select them for testing under a selective enforcement audit, as specified in 40 CFR part 1068, subpart E.

■ 131. Section 1039.220 is amended by revising the section heading as to read as follows:

§ 1039.220 How do I amend my maintenance instructions?

* * * * *

■ 132. Section 1039.225 is amended by revising the introductory text and adding paragraph (b)(4) to read as follows:

§ 1039.225 How do I amend my application for certification?

Before we issue you a certificate of conformity, you may amend your application to include new or modified engine configurations, subject to the provisions of this section. After we have issued your certificate of conformity, but before the end of the model year, you may send us an amended application requesting that we include new or modified engine configurations within the scope of the certificate, subject to the provisions of this section. Before the end of the model year, you must amend your application if any changes occur with respect to any information that is included or should be included in your application. After the end of the model year, you may amend your application only to update maintenance instructions as described in § 1039.220 or to modify an FEL as described in paragraph (f) of this section.

* * * * *

(b) * * *

(4) Include any other information needed to make your application correct and complete.

* * * * *

■ 133. Section 1039.230 is amended by revising paragraph (b)(1) to read as follows:

§ 1039.230 How do I select engine families?

* * * * *

(b) * * *

(1) The combustion cycle and fuel. However, you do not need to separate dual-fuel and flexible-fuel engines into separate engine families.

* * * * *

■ 134. Section 1039.235 is amended by revising paragraphs (a), (b), (c)(4), and (d)(1) to read as follows:

§ 1039.235 What testing requirements apply for certification?

* * * * *

(a) Select an emission-data engine from each engine family for testing. Select the engine configuration with the highest volume of fuel injected per cylinder per combustion cycle at the point of maximum torque—unless good engineering judgment indicates that a different engine configuration is more likely to exceed (or have emissions nearer to) an applicable emission standard or FEL. If two or more engines have the same fueling rate at maximum torque, select the one with the highest fueling rate at rated speed. In making this selection, consider all factors expected to affect emission-control performance and compliance with the standards, including emission levels of all exhaust constituents, especially NO_X and PM.

(b) Test your emission-data engines using the procedures and equipment specified in subpart F of this part. In the case of dual-fuel engines, measure emissions when operating with each type of fuel for which you intend to certify the engine. In the case of flexible-fuel engines, measure emissions when operating with the fuel mixture that best represents in-use operation or is most likely to have the highest NO_X emissions (or NO_X+NMHC emissions for engines subject to NO_X+NMHC standards), though you may ask us instead to perform tests with both fuels separately if you can show that intermediate mixtures are not likely to occur in use.

* * * * *

(c) * * *

(4) Before we test one of your engines, we may calibrate it within normal production tolerances for anything we do not consider an adjustable parameter. For example, this would apply for an engine parameter that is subject to production variability because it is adjustable during production, but is not considered an adjustable parameter (as defined in § 1039.801) because it is permanently sealed. For parameters that relate to a level of performance that is itself subject to a specified range (such as maximum power output), we will generally perform any calibration under this paragraph (c)(4) in a way that keeps performance within the specified range.

(d) * * *

(1) The engine family from the previous model year differs from the current engine family only with respect to model year, items identified in § 1039.225(a), or other characteristics unrelated to emissions. We may waive this criterion for differences we determine not to be relevant.

* * * * *

■ 135. Section 1039.240 is amended by revising paragraphs (c) and (d) and removing paragraph (e).

The revisions read as follows:

§ 1039.240 How do I demonstrate that my engine family complies with exhaust emission standards?

* * * * *

(c) To compare emission levels from the emission-data engine with the applicable emission standards, apply deterioration factors to the measured emission levels for each pollutant. Section 1039.245 specifies how to test your engine to develop deterioration factors that represent the deterioration expected in emissions over your engines' full useful life. Your deterioration factors must take into account any available data from in-use testing with similar engines. Small-volume engine manufacturers may use assigned deterioration factors that we establish. Apply deterioration factors as follows:

(1) *Additive deterioration factor for exhaust emissions.* Except as specified in paragraph (c)(2) of this section, use an additive deterioration factor for exhaust emissions. An additive deterioration factor is the difference between exhaust emissions at the end of the useful life and exhaust emissions at the low-hour test point. In these cases, adjust the official emission results for each tested engine at the selected test point by adding the factor to the measured emissions. If the factor is less than zero, use zero. Additive deterioration factors must be specified to one more decimal place than the applicable standard.

(2) *Multiplicative deterioration factor for exhaust emissions.* Use a multiplicative deterioration factor if good engineering judgment calls for the deterioration factor for a pollutant to be the ratio of exhaust emissions at the end of the useful life to exhaust emissions at the low-hour test point. For example, if you use aftertreatment technology that controls emissions of a pollutant proportionally to engine-out emissions, it is often appropriate to use a multiplicative deterioration factor. Adjust the official emission results for each tested engine at the selected test point by multiplying the measured emissions by the deterioration factor. If the factor is less than one, use one. A multiplicative deterioration factor may not be appropriate in cases where testing variability is significantly greater than engine-to-engine variability. Multiplicative deterioration factors must

be specified to one more significant figure than the applicable standard.

(3) *Sawtooth deterioration patterns.* The deterioration factors described in paragraphs (c)(1) and (2) of this section assume that the highest useful life emissions occur either at the end of useful life or at the low-hour test point. The provisions of this paragraph (c)(3) apply where good engineering judgment indicates that the highest emissions over the useful life will occur between these two points. For example, emissions may increase with service accumulation until a certain maintenance step is performed, then return to the low-hour emission levels and begin increasing again. Base deterioration factors for engines with such emission patterns on the difference between (or ratio of) the point of the sawtooth at which the highest emissions occur and the low-hour test point. Note that this applies for maintenance-related deterioration only where we allow such critical emission-related maintenance.

(4) *Deterioration factor for smoke.* Deterioration factors for smoke are always additive, as described in paragraph (c)(1) of this section.

(5) *Deterioration factor for crankcase emissions.* If your engine vents crankcase emissions to the exhaust or to the atmosphere, you must account for crankcase emission deterioration, using good engineering judgment. You may use separate deterioration factors for crankcase emissions of each pollutant (either multiplicative or additive) or include the effects in combined deterioration factors that include exhaust and crankcase emissions together for each pollutant.

(6) *Dual-fuel and flexible-fuel engines.* In the case of dual-fuel and flexible-fuel engines, apply deterioration factors separately for each fuel type. You may accumulate service hours on a single emission-data engine using the type of fuel or the fuel mixture expected to have the highest combustion and exhaust temperatures; you may ask us to approve a different fuel mixture if you demonstrate that a different criterion is more appropriate.

(d) Determine the official emission result for each pollutant to at least one more decimal place than the applicable standard. Apply the deterioration factor to the official emission result, as described in paragraph (c) of this section, then round the adjusted figure to the same number of decimal places as the emission standard. Compare the rounded emission levels to the emission standard for each emission-data engine. In the case of NO_X+NMHC standards, apply the deterioration factor to each pollutant and then add the results before rounding.

* * * * *

■ 136. Section 1039.250 is amended by revising paragraphs (b)(3)(iv) and (c) to read as follows:

§ 1039.250 What records must I keep and what reports must I send to EPA?

* * * * *

(b) * * *

(3) * * *

(iv) All your emission tests, including the date and purpose of each test and documentation of test parameters as specified in part 40 CFR part 1065.

* * * * *

(c) Keep required data from emission tests and all other information specified in this section for eight years after we issue your certificate. If you use the same emission data or other information for a later model year, the eight-year period restarts with each year that you continue to rely on the information.

* * * * *

■ 137. Section 1039.255 is amended by revising paragraphs (c)(2), (c)(4), (d), and (e) to read as follows:

§ 1039.255 What decisions may EPA make regarding my certificate of conformity?

* * * * *

(c) * * *

(2) Submit false or incomplete information (paragraph (e) of this section applies if this is fraudulent). This includes doing anything after submission of your application to render any of the submitted information false or incomplete.

* * * * *

(4) Deny us from completing authorized activities (see 40 CFR 1068.20). This includes a failure to provide reasonable assistance.

* * * * *

(d) We may void the certificate of conformity for an engine family if you fail to keep records, send reports, or give us information as required under this part or the Act. Note that these are also violations of 40 CFR 1068.101(a)(2).

(e) We may void your certificate if we find that you intentionally submitted false or incomplete information. This includes rendering submitted information false or incomplete after submission.

* * * * *

Subpart F—Test Procedures

■ 138. Section 1039.501 is amended by revising paragraphs (e), (f), and (g) and adding paragraph (h) to read as follows:

§ 1039.501 How do I run a valid emission test?

* * * * *

(e) The following provisions apply for engines using aftertreatment technology with infrequent regeneration events that may occur during testing:

(1) Adjust measured emissions to account for aftertreatment technology with infrequent regeneration as described in § 1039.525.

(2) If your engine family includes engines with one or more emergency AECDs approved under § 1039.115(g)(4) or (5), do not consider additional regenerations resulting from those AECDs when developing adjustments to measured values under this paragraph (e).

(3) Invalidate a smoke test if active regeneration starts to occur during the test.

(f) You may disable any AECDs that have been approved solely for emergency equipment applications under § 1039.115(g)(4). Note that the emission standards do not apply when any of these AECDs are active.

(g) You may use special or alternate procedures to the extent we allow them under 40 CFR 1065.10.

(h) This subpart is addressed to you as a manufacturer, but it applies equally to anyone who does testing for you, and to us when we perform testing to determine if your engines meet emission standards.

■ 139. Section 1039.505 is amended by revising paragraph (b)(2) to read as follows:

§ 1039.505 How do I test engines using steady-state duty cycles, including ramped-modal testing?

* * * * *

(b) * * *

(2) Use the 6-mode duty cycle or the corresponding ramped-modal cycle described in paragraph (b) of Appendix II of this part for variable-speed engines below 19 kW. You may instead use the 8-mode duty cycle or the corresponding ramped-modal cycle described in paragraph (c) of Appendix II of this part if some engines from your engine family will be used in applications that do not involve governing to maintain engine operation around rated speed.

* * * * *

■ 140. Section 1039.515 is amended by revising paragraph (a) to read as follows:

§ 1039.515 What are the test procedures related to not-to-exceed standards?

(a) *General provisions.* The provisions in 40 CFR 86.1370 apply for determining whether an engine meets the not-to-exceed emission standards in § 1039.101(e), except as noted in this section. Interpret references to vehicles and vehicle operation to mean equipment and equipment operation.

* * * * *

■ 141. Section 1039.525 is revised to read as follows:

§ 1039.525 How do I adjust emission levels to account for infrequently regenerating aftertreatment devices?

For engines using aftertreatment technology with infrequent regeneration events that may occur during testing, take one of the following approaches to account for the emission impact of regeneration:

(a) You may use the calculation methodology described in 40 CFR 1065.680 to adjust measured emission results. Do this by developing an upward adjustment factor and a downward adjustment factor for each pollutant based on measured emission data and observed regeneration frequency as follows:

(1) Adjustment factors should generally apply to an entire engine family, but you may develop separate adjustment factors for different configurations within an engine family. Use the adjustment factors from this section for all testing for the engine family.

(2) You may use carryover or carry-across data to establish adjustment factors for an engine family as described in § 1039.235, consistent with good engineering judgment.

(3) For engines that are required to certify to both transient and steady-state duty cycles, calculate a separate adjustment factor for steady-state and transient operation.

(b) You may ask us to approve an alternate methodology to account for regeneration events. We will generally limit approval to cases where your engines use aftertreatment technology with extremely infrequent regeneration and you are unable to apply the provisions of this section.

(c) You may choose to make no adjustments to measured emission results if you determine that regeneration does not significantly affect emission levels for an engine family (or configuration) or if it is not practical to identify when regeneration occurs. If you choose not to make adjustments under paragraph (a) or (b) of this section, your engines must meet emission standards for all testing, without regard to regeneration.

Subpart G—Special Compliance Provisions

■ 142. Section 1039.601 is revised to read as follows:

§ 1039.601 What compliance provisions apply?

(a) Engine and equipment manufacturers, as well as owners, operators, and rebuilders of engines subject to the requirements of this part, and all other persons, must observe the provisions of this part, the requirements and prohibitions in 40 CFR part 1068, and the provisions of the Act.

(b) Subpart C of this part describes how to test and certify dual-fuel and flexible-fuel engines. Some multi-fuel engines may not fit either of those defined terms. For such engines, we will determine whether it is most appropriate to treat them as single-fuel engines, dual-fuel engines, or flexible-fuel engines based on the range of possible and expected fuel mixtures. For example, an engine might burn natural gas but initiate combustion with a pilot injection of diesel fuel. If the engine is designed to operate with a single fueling algorithm (*i.e.,* fueling rates are fixed at a given engine speed and load condition), we would generally treat it as a single-fuel engine, In this context, the combination of diesel fuel and natural gas would be its own fuel type. If the engine is designed to also operate on diesel fuel alone, we would generally treat it as a dual-fueled engine. If the engine is designed to operate on varying mixtures of the two fuels, we would generally treat it as a flexible-fueled engine. To the extent that requirements vary for the different fuels or fuel mixtures, we may apply the more stringent requirements.

■ 143. Section 1039.605 is amended by revising paragraphs (b), (d)(5), and (d)(8) to read as follows:

§ 1039.605 What provisions apply to engines certified under the motor-vehicle program?

* * * * *

(b) *Equipment-manufacturer provisions.* If you are not an engine manufacturer, you may install motor-vehicle engines certified for the appropriate model year under 40 CFR part 86 in nonroad equipment as long as you meet all the requirements and conditions specified in paragraph (d) of this section. You must also add the fuel-inlet label we specify in § 1039.135(e). If you modify the motor-vehicle engine in any of the ways described in paragraph (d)(2) of this section, we will consider you a manufacturer of a new nonroad engine. Such engine modifications prevent you from using the provisions of this section.

* * * * *

(d) * * *

(5) You must add a permanent supplemental label to the engine in a position where it will remain clearly visible after installation in the equipment. In the supplemental label, do the following:

(i) Include the heading: ‘‘NONROAD ENGINE EMISSION CONTROL INFORMATION’’.

(ii) Include your full corporate name and trademark. You may identify another company and use its trademark instead of yours if you comply with the branding provisions of 40 CFR 1068.45.

(iii) State: ‘‘THIS ENGINE WAS ADAPTED FOR NONROAD USE WITHOUT AFFECTING ITS EMISSION CONTROLS. THE EMISSION–CONTROL SYSTEM DEPENDS ON THE USE OF FUEL MEETING SPECIFICATIONS THAT APPLY FOR MOTOR–VEHICLE APPLICATIONS. OPERATING THE ENGINE ON OTHER FUELS MAY BE A VIOLATION OF FEDERAL LAW.’’

(iv) State the date you finished modifying the engine (month and year), if applicable.

* * * * *

(8) Send the Designated Compliance Officer written notification describing your plans before using the provisions of this section. In addition, by February 28 of each calendar year (or less often if we tell you), send the Designated Compliance Officer a signed letter with all the following information:

(i) Identify your full corporate name, address, and telephone number.

(ii) List the engine or equipment models for which you used this exemption in the previous year and describe your basis for meeting the sales restrictions of paragraph (d)(3) of this section.

(iii) State: ‘‘We prepared each listed [engine or equipment] model for nonroad application without making any changes that could increase its certified emission levels, as described in 40 CFR 1039.605.’’

* * * * *

144. Section 1039.610 is amended by revising paragraphs (d)(5)(ii) and (d)(7) to read as follows:

§ 1039.610 What provisions apply to vehicles certified under the motor-vehicle program?

* * * * *

(d) * * *

(5) * * *

(ii) Include your full corporate name and trademark. You may identify another company and use its trademark instead of yours if you comply with the branding provisions of 40 CFR 1068.45.

* * * * *

(7) Send the Designated Compliance Officer written notification describing

your plans before using the provisions of this section. In addition, by February 28 of each calendar year (or less often if we tell you), send the Designated Compliance Officer a signed letter with all the following information:

(i) Identify your full corporate name, address, and telephone number.

(ii) List the equipment models for which you used this exemption in the previous year and describe your basis for meeting the sales restrictions of paragraph (d)(3) of this section.

(iii) State: ''We prepared each listed engine or equipment model for nonroad application without making any changes that could increase its certified emission levels, as described in 40 CFR 1039.610.''

* * * * *

Remove § 1039.640—[Removed]

■ 145. Section 1039.640 is removed.

Subpart H—Averaging, Banking, and Trading for Certification

■ 146. Section 1039.701 is amended by adding paragraph (h) to read as follows:

§ 1039.701 General provisions.

* * * * *

(h) You may use either of the following approaches to retire or forego emission credits:

(1) You may retire emission credits generated from any number of your engines. This may be considered donating emission credits to the environment. Identify any such credits in the reports described in § 1039.730. Engines must comply with the applicable FELs even if you donate or sell the corresponding emission credits under this paragraph (h). Those credits may no longer be used by anyone to demonstrate compliance with any EPA emission standards.

(2) You may certify a family using an FEL below the emission standard as described in this part and choose not to generate emission credits for that family. If you do this, you do not need to calculate emission credits for those families and you do not need to submit or keep the associated records described in this subpart for that family.

■ 147. Section 1039.705 is amended by revising paragraphs (b), (c) introductory text, and (c)(1) to read as follows:

§ 1039.705 How do I generate and calculate emission credits?

* * * * *

(b) For each participating family, calculate positive or negative emission credits relative to the otherwise applicable emission standard. Calculate positive emission credits for a family that has an FEL below the standard. Calculate negative emission credits for a family that has an FEL above the standard. Sum your positive and negative credits for the model year before rounding. Round the sum of emission credits to the nearest kilogram (kg), using consistent units throughout the following equation:

$$\text{Emission credits (kg)} = (\text{Std} - \text{FEL}) \times (\text{Volume}) \times (\text{AvgPR}) \times (\text{UL}) \times (10^{-3})$$

Where:

Std = the emission standard, in grams per kilowatt-hour, that applies under subpart B of this part for engines not participating in the ABT program of this subpart (the ''otherwise applicable standard'').

FEL = the family emission limit for the engine family, in grams per kilowatt-hour.

Volume = the number of engines eligible to participate in the averaging, banking, and trading program within the given engine family during the model year, as described in paragraph (c) of this section.

AvgPR = the average of maximum engine power values of all the engine configurations within an engine family, calculated on a sales-weighted basis, in kilowatts.

UL = the useful life for the given engine family, in hours.

(c) As described in § 1039.730, compliance with the requirements of this subpart is determined at the end of the model year based on actual U.S.-directed production volumes. Do not include any of the following engines to calculate emission credits:

(1) Engines with a permanent exemption under subpart G of this part or under 40 CFR part 1068.

* * * * *

■ 148. Section 1039.710 is amended by revising paragraph (c) to read as follows:

§ 1039.710 How do I average emission credits?

* * * * *

(c) If you certify an engine family to an FEL that exceeds the otherwise applicable standard, you must obtain enough emission credits to offset the engine family's deficit by the due date for the final report required in § 1039.730. The emission credits used to address the deficit may come from your other engine families that generate emission credits in the same model year, from emission credits you have banked from previous model years, or from emission credits generated in the same or previous model years that you obtained through trading.

■ 149. Section 1039.725 is amended by revising paragraph (b)(2) to read as follows:

§ 1039.725 What must I include in my application for certification?

* * * * *

(b) * * *

(2) Detailed calculations of projected emission credits (positive or negative) based on projected production volumes. We may require you to include similar calculations from your other engine families to demonstrate that you will be able to avoid negative credit balances for the model year. If you project negative emission credits for a family, state the source of positive emission credits you expect to use to offset the negative emission credits.

■ 150. Section 1039.730 is amended by revising paragraphs (b)(1), (b)(4), and (c)(2) to read as follows:

§ 1039.730 What ABT reports must I send to EPA?

* * * * *

(b) * * *

(1) Engine-family designation and averaging set.

* * * * *

(4) The projected and actual U.S.-directed production volumes for the model year. If you changed an FEL during the model year, identify the actual U.S.-directed production volume associated with each FEL.

* * * * *

(c) * * *

(2) State whether you will retain any emission credits for banking. If you choose to retire emission credits that would otherwise be eligible for banking, identify the engine families that generated the emission credits, including the number of emission credits from each family.

* * * * *

■ 151. Section 1039.735 is amended by revising paragraphs (a) and (b) to read as follows:

§ 1039.735 What records must I keep?

(a) You must organize and maintain your records as described in this section.

(b) Keep the records required by this section for at least eight years after the due date for the end-of-year report. You may not use emission credits for any engines if you do not keep all the records required under this section. You must therefore keep these records to continue to bank valid credits.

* * * * *

■ 152. Section 1039.740 is amended by revising paragraph (a) to read as follows:

§ 1039.740 What restrictions apply for using emission credits?

* * * * *

(a) *Averaging sets.* Emission credits may be exchanged only within an averaging set. For emission credits generated by Tier 4 engines, there are two averaging sets—one for engines at or below 560 kW and another for engines above 560 kW.

* * * * *

Subpart I—Definitions and Other Reference Information

■ 153. Section 1039.801 is amended as follows:

■ a. By revising the definitions of ''Aircraft'' and ''Designated Compliance Officer''.

■ b. By removing the definition for ''Designated Enforcement Officer''.

■ c. By adding definitions for ''Dual-fuel'' and ''Flexible-fuel''.

■ d. By revising paragraph (1)(i) of the definition of ''Model year'' and the definition of ''Placed into service''.

■ e. By removing the definition for ''Point of first retail sale''.

The revisions and additions read as follows:

§ 1039.801 What definitions apply to this part?

* * * * *

Aircraft means any vehicle capable of sustained air travel more than 100 feet above the ground.

* * * * *

Designated Compliance Officer means the Director, Diesel Engine Compliance Center, U.S. Environmental Protection Agency, 2000 Traverwood Drive, Ann Arbor, MI 48105; *complianceinfo@epa.gov; epa.gov/otaq/verify.*

* * * * *

Dual-fuel means relating to an engine designed for operation on two different fuels but not on a continuous mixture of those fuels (see § 1039.601(b)). For purposes of this part, such an engine remains a dual-fuel engine even if it is designed for operation on three or more different fuels.

* * * * *

Flexible-fuel means relating to an engine designed for operation on any mixture of two or more different fuels (see § 1039.601(b)).

* * * * *

Model year means one of the following things:

(1) * * *

(i) Calendar year of production.

* * * * *

Placed into service means put into initial use for its intended purpose. Engines and equipment do not qualify as being ''placed into service'' based on incidental use by a manufacturer or dealer.

* * * * *

■ 154. Section 1039.815 is revised to read as follows:

§ 1039.815 What provisions apply to confidential information?

The provisions of 40 CFR 1068.10 apply for information you consider confidential.

■ 155. Section 1039.825 is revised to read as follows:

§ 1039.825 What reporting and recordkeeping requirements apply under this part?

(a) This part includes various requirements to submit and record data or other information. Unless we specify otherwise, store required records in any format and on any media and keep them readily available for eight years after you send an associated application for certification, or eight years after you generate the data if they do not support an application for certification. You are expected to keep your own copy of required records rather than relying on someone else to keep records on your behalf. We may review these records at any time. You must promptly send us organized, written records in English if we ask for them. We may require you to submit written records in an electronic format.

(b) The regulations in § 1039.255, 40 CFR 1068.25, and 40 CFR 1068.101 describe your obligation to report truthful and complete information. This includes information not related to certification. Failing to properly report information and keep the records we specify violates 40 CFR 1068.101(a)(2), which may involve civil or criminal penalties.

(c) Send all reports and requests for approval to the Designated Compliance Officer (see § 1039.801).

(d) Any written information we require you to send to or receive from another company is deemed to be a required record under this section. Such records are also deemed to be submissions to EPA. We may require you to send us these records whether or not you are a certificate holder.

(e) Under the Paperwork Reduction Act (44 U.S.C. 3501 *et seq.*), the Office of Management and Budget approves the reporting and recordkeeping specified in the applicable regulations. The following items illustrate the kind of reporting and recordkeeping we require for engines and equipment regulated under this part:

(1) We specify the following requirements related to engine certification in this part 1039:

(i) In § 1039.20 we require engine manufacturers to label stationary engines that do not meet the standards in this part.

(ii) In § 1039.135 we require engine manufacturers to keep certain records related to duplicate labels sent to equipment manufacturers.

(iii) [Reserved]

(iv) In subpart C of this part we identify a wide range of information required to certify engines.

(v) [Reserved]

(vi) In subpart G of this part we identify several reporting and recordkeeping items for making demonstrations and getting approval related to various special compliance provisions. For example, equipment manufacturers must submit reports and keep records related to the flexibility provisions in § 1039.625.

(vii) In § 1039.725, 1039.730, and 1039.735 we specify certain records related to averaging, banking, and trading.

(2) We specify the following requirements related to testing in 40 CFR part 1065:

(i) In 40 CFR 1065.2 we give an overview of principles for reporting information.

(ii) In 40 CFR 1065.10 and 1065.12 we specify information needs for establishing various changes to published test procedures.

(iii) In 40 CFR 1065.25 we establish basic guidelines for storing test information.

(iv) In 40 CFR 1065.695 we identify the specific information and data items to record when measuring emissions.

(3) We specify the following requirements related to the general compliance provisions in 40 CFR part 1068:

(i) In 40 CFR 1068.5 we establish a process for evaluating good engineering judgment related to testing and certification.

(ii) In 40 CFR 1068.25 we describe general provisions related to sending and keeping information.

(iii) In 40 CFR 1068.27 we require manufacturers to make engines available for our testing or inspection if we make such a request.

(iv) In 40 CFR 1068.105 we require equipment manufacturers to keep certain records related to duplicate labels from engine manufacturers.

(v) In 40 CFR 1068.120 we specify recordkeeping related to rebuilding engines.

(vi) In 40 CFR part 1068, subpart C, we identify several reporting and recordkeeping items for making demonstrations and getting approval related to various exemptions.

(vii) In 40 CFR part 1068, subpart D, we identify several reporting and recordkeeping items for making demonstrations and getting approval related to importing engines.

(viii) In 40 CFR 1068.450 and 1068.455 we specify certain records related to testing production-line engines in a selective enforcement audit.

(ix) In 40 CFR 1068.501 we specify certain records related to investigating and reporting emission-related defects.

(x) In 40 CFR 1068.525 and 1068.530 we specify certain records related to recalling nonconforming engines.

PART 1042—CONTROL OF EMISSIONS FROM NEW AND IN–USE MARINE COMPRESSION–IGNITION ENGINES AND VESSELS

■ 156. The authority citation for part 1042 continues to read as follows:

Authority: 42 U.S.C. 7401–7671q.

Subpart A—Overview and Applicability

■ 157. Section 1042.1 is amended by revising paragraphs (a) and (c) introductory text to read as follows:

§ 1042.1 Applicability.

* * * * *

(a) The emission standards of this part 1042 for freshly manufactured engines apply for new marine engines starting with the model years noted in the following table:

TABLE 1 TO § 1042.1—PART 1042 APPLICABILITY BY MODEL YEAR

Engine category	Maximum engine power[a]	Displacement (L/cyl) or application	Model year
Category 1	kW <75	disp.< 0.9	[b] 2009
	75 ≤ kW ≤ 3700	disp.< 0.9	2012
		0.9 ≤ disp. < 1.2	2013
		1.2 ≤ disp. < 2.5	2014
		2.5 ≤ disp. < 3.5	2013
		3.5 ≤ disp. < 7.0	2012
	kW > 3700	All	2014
Category 2	kW ≤ 3700	7.0 ≤ disp. < 15.0	2013
	kW > 3700	7.0 ≤ disp. < 15.0	2014
	All	15 ≤ disp. < 30	2014
Category 3	All	disp. ≥ 30	2011

[a] See § 1042.140, which describes how to determine maximum engine power.
[b] See Table 1 of § 1042.101 for the first model year in which this part 1042 applies for engines with maximum engine power below 75 kW and displacement at or above 0.9 L/cyl.

* * * * *

(c) Freshly manufactured engines with maximum engine power at or above 37 kW and originally manufactured and certified before the model years identified in Table 1 to this section are subject to emission standards and requirements of 40 CFR part 94. The provisions of this part 1042 do not apply for such engines certified under 40 CFR part 94, except as follows beginning June 29, 2010:

* * * * *

■ 158. Section 1042.2 is revised to read as follows:

§ 1042.2 Who is responsible for compliance?

The regulations in this part 1042 contain provisions that affect both engine manufacturers and others. However, the requirements of this part, other than those of subpart I of this part, are generally addressed to the engine manufacturer for freshly manufactured marine engines or other certificate holders. The term ‘‘you’’ generally means the engine manufacturer, as defined in § 1042.901, especially for issues related to certification (including production-line testing, reporting, etc.). Note that for engines that become new after being placed into service (such as engines converted from highway or stationary use, or engines installed on vessels that are reflagged to become U.S. vessels), the requirements that normally apply for manufacturers of freshly manufactured engines apply to the importer or any other entity we allow to obtain a certificate of conformity.

■ 159. Section 1042.30 is revised to read as follows:

§ 1042.30 Submission of information.

Unless we specify otherwise, send all reports and requests for approval to the Designated Compliance Officer (see § 1042.901). See § 1042.925 for additional reporting and recordkeeping provisions.

Subpart B—Emission Standards and Related Requirements

■ 160. Section 1042.101 is amended by revising the section heading and paragraphs (a), (b), and (c) to read as follows:

§ 1042.101 Exhaust emission standards for Category 1 and Category 2 engines.

(a) *Duty-cycle standards.* Exhaust emissions from your engines may not exceed emission standards, as follows:

(1) Measure emissions using the test procedures described in subpart F of this part.

(2) The following CO emission standards in this paragraph (a)(2) apply starting with the applicable model year identified in § 1042.1:

(i) 8.0 g/kW-hr for engines below 8 kW.

(ii) 6.6 g/kW-hr for engines at or above 8 kW and below 19 kW.

(iii) 5.5 g/kW-hr for engines at or above 19 kW and below 37 kW.

(iv) 5.0 g/kW-hr for engines at or above 37 kW.

(3) Except as described in paragraphs (a)(4) and (5) of this section, the Tier 3 standards for PM and NO_X+HC emissions are described in the following tables:

TABLE 1 TO § 1042.101—TIER 3 STANDARDS FOR CATEGORY 1 ENGINES BELOW 3700 kW[a]

Power density and application	Displacement (L/cyl)	Maximum engine power	Model year	PM (g/kW-hr)	NO_X+HC (g/kW-hr)[b]
all	disp. < 0.9	kW < 19	2009+	0.40	7.5
		19 > kW < 75	2009–2013	0.30	7.5
			2014+	[c] 0.30	[c] 4.7

TABLE 1 TO § 1042.101—TIER 3 STANDARDS FOR CATEGORY 1 ENGINES BELOW 3700 kW [a]—Continued

Power density and application	Displacement (L/cyl)	Maximum engine power	Model year	PM (g/kW-hr)	NO_X+HC (g/kW-hr) [b]
Commercial engines with kW/L ≤35.	disp. < 0.9	kW ≥ 75	2012+	0.14	5.4
	0.9 ≤ disp. < 1.2	all	2013+	0.12	5.4
	1.2 ≤ disp. < 2.5	kW < 600	2014–2017	0.11	5.6
			2018+	0.10	5.6
		kW ≥ 600.	2014+	0.11	5.6
	2.5 > disp. < 3.5	kW < 600	2013–2017	0.11	5.6
			2018+	0.10	5.6
		kW ≥ 600	2013+	0.11	5.6
Commercial engines with kW/L >35, and all recreational engines ≥75 kW.	disp. < 0.9	kW ≥ 75	2012+	0.15	5.8
	0.9 ≤ disp. < 1.2	all	2013+	0.14	5.8
	1.2 ≤ disp. < 2.5		2014+	0.12	5.8
	2.5 > disp. < 3.5		2013+	0.12	5.8
	3.5 > disp. < 7.0		2012+	0.11	5.8

[a] No Tier 3 standards apply for commercial Category 1 engines at or above 3700 kW. See § 1042.1(c) and paragraph (a)(7) of this section for the standards that apply for these engines.

[b] The applicable NO_X+HC standards specified for Tier 2 engines in Appendix I of this part continue to apply instead of the values noted in the table for commercial engines at or above 2000 kW. FELs for these engines may not be higher than the Tier 1 NO_X standard specified in Appendix I of this part.

[c] See paragraph (a)(4) of this section for alternative PM and NO_X+HC standards for engines at or above 19 kW and below 75 kW with displacement below 0.9 L/cyl.

TABLE 2 TO § 1042.101—TIER 3 STANDARDS FOR CATEGORY 2 ENGINES BELOW 3700 kW [a]

Displacement (L/cyl)	Maximum engine power	Model year	PM (g/kW-hr)	NO_X+HC (g/kW-hr)
7.0 ≤ disp. ≤ 15.0	kW < 2000	2013+	0.14	6.2
	2000 ≤ kW ≤ 3700	2013+	0.14	[b] 7.8
15.0 ≤ disp. < 20.0 [c]	kW < 2000	2014+	0.34	7.0
20.0 ≤ disp. < 25.0 [c]	kW < 2000	2014+	0.27	9.8
25.0 ≤ disp. < 30.0 [c]	kW < 2000	2014+	0.27	11.0

[a] The Tier 3 standards in this table do not apply for Category 2 engines at or above 2000 kW with per-cylinder displacement at or above 15.0 liters, or for any Category 2 engines at or above 3700 kW. See § 1042.1(c) and paragraphs (a)(6) through (8) of this section for the standards that apply for these engines.

[b] For engines subject to the 7.8 g/kW-hr NO_X+HC standard, FELs may not be higher than the Tier 1 NO_X standards specified in Appendix I of this part.

[c] There are no Tier 3 standards for Category 2 engines with per-cylinder displacement at or above 15 and 20 liters with maximum engine power at or above 2000 kW. See paragraphs (a)(6) and (7) of this section for the Tier 4 standards that apply for these engines starting with the 2014 model year.

(4) For Tier 3 engines at or above 19 kW and below 75 kW with displacement below 0.9 L/cyl, you may alternatively certify some or all of your engine families to a PM emission standard of 0.20 g/kW-hr and a NO_X+HC emission standard of 5.8 g/kW-hr for 2014 and later model years.

(5) Starting with the 2014 model year, recreational marine engines at or above 3700 kW (with any displacement) must be certified under this part 1042 to the Tier 3 standards specified in this section for 3.5 to 7.0 L/cyl recreational marine engines.

(6) Interim Tier 4 PM standards apply for 2014 and 2015 model year engines between 2000 and 3700 kW as specified in this paragraph (a)(6). These engines are considered to be Tier 4 engines.

(i) For Category 1 engines, the Tier 3 PM standards from Table 1 to this section continue to apply. PM FELs for these engines may not be higher than the applicable Tier 2 PM standards specified in Appendix I of this part.

(ii) For Category 2 engines with per-cylinder displacement below 15.0 liters, the Tier 3 PM standards from Table 2 to this section continue to apply. PM FELs for these engines may not be higher than 0.27 g/kW-hr.

(iii) For Category 2 engines with per-cylinder displacement at or above 15.0 liters, the PM standard is 0.34 g/kW-hr for engines at or above 2000 kW and below 3300 kW, and 0.27 g/kW-hr for engines at or above 3300 kW and below 3700 kW. PM FELs for these engines may not be higher than 0.50 g/kW-hr.

(7) Except as described in paragraph (a)(8) of this section, the Tier 4 standards for PM, NO_X, and HC emissions are described in the following table:

TABLE 3 TO § 1042.101—TIER 4 STANDARDS FOR CATEGORY 2 AND COMMERCIAL CATEGORY 1 ENGINES AT OR ABOVE 600 kW

Maximum engine power	Displacement (L/cyl)	Model year	PM (g/kW-hr)	NO_X (g/kW-hr)	HC (g/kW-hr)
600 ≤kW <1400	all	2017+	0.04	1.8	0.19
1400 ≤kW <2000	all	2016+	0.04	1.8	0.19
2000 ≤kW ≤3700 [a]	all	2014+	0.04	1.8	0.19
kW >3700	disp. <15.0	2014–2015	0.12	1.8	0.19
	15.0 ≤ disp. <30.0	2014–2015	0.25	1.8	0.19

TABLE 3 TO § 1042.101—TIER 4 STANDARDS FOR CATEGORY 2 AND COMMERCIAL CATEGORY 1 ENGINES AT OR ABOVE 600 kW—Continued

Maximum engine power	Displacement (L/cyl)	Model year	PM (g/kW-hr)	NO_X (g/kW-hr)	HC (g/kW-hr)
	all	2016+	0.06	1.8	0.19

[a] See paragraph (a)(6) of this section for interim PM standards that apply for model years 2014 and 2015 for engines between 2000 and 3700 kW. The Tier 4 NO_X FEL cap for engines at or above 2000 kW and below 3700 kW is 7.0 g/kW-hr. Starting in the 2016 model year, the Tier 4 PM FEL cap for engines at or above 2000 kW and below 3700 kW is 0.34 g/kW-hr.

(8) The following optional provisions apply for complying with the Tier 3 and Tier 4 standards specified in paragraphs (a)(3) through (7) of this section:

(i) You may use NO_X credits accumulated through the ABT program to certify Tier 4 engines to a NO_X+HC emission standard of 1.9 g/kW-hr instead of the NO_X and HC standards that would otherwise apply by certifying your family to a NO_X+HC FEL. Calculate the NO_X credits needed as specified in subpart H of this part using the NO_X+HC emission standard and FEL in the calculation instead of the otherwise applicable NO_X standard and FEL. You may not generate credits relative to the alternate standard or certify to the standard without using credits.

(ii) For engines below 1000 kW, you may delay complying with the Tier 4 standards in the 2017 model year for up to nine months, but you must comply no later than October 1, 2017.

(iii) For engines at or above 3700 kW, you may delay complying with the Tier 4 standards in the 2016 model year for up to twelve months, but you must comply no later than December 31, 2016.

(iv) For Category 2 engines at or above 1400 kW, you may alternatively comply with the Tier 3 and Tier 4 standards specified in Table 4 of this section instead of the NO_X, HC, NO_X+HC, and PM standards specified in paragraphs (a)(3) through (7) of this section. The CO standards specified in paragraph (a)(2) of this section apply without regard to whether you choose this option. If you choose this option, you must do so for all engines at or above 1400 kW in the same displacement category (that is, 7–15, 15–20, 20–25, or 25–30 liters per cylinder) in model years 2012 through 2015.

TABLE 4 TO § 1042.101—OPTIONAL TIER 3 AND TIER 4 STANDARDS FOR CATEGORY 2 ENGINES AT OR ABOVE 1400 kW

Tier	Maximum engine power	Model year	PM (g/kW-hr)	NO_X (g/kW-hr)	HC (g/kW-hr)
Tier 3	kW >1400	2012–2014	0.14	7.8 NO_X+HC	
Tier 4	1400 ≤kW ≤3700	2015	0.04	1.8	0.19
	kW >3700	2015	0.06	1.8	0.19

(b) *Averaging, banking, and trading.* You may generate or use emission credits under the averaging, banking, and trading (ABT) program as described in subpart H of this part for demonstrating compliance with NO_X, NO_X+HC, and PM emission standards for Category 1 and Category 2 engines. You may also use NO_X or NO_X+HC emission credits to comply with the alternate NO_X+HC standard in paragraph (a)(8)(i) of this section. Generating or using emission credits requires that you specify a family emission limit (FEL) for each pollutant you include in the ABT program for each engine family. These FELs serve as the emission standards for the engine family with respect to all required testing instead of the standards specified in paragraph (a) of this section. The FELs determine the not-to-exceed standards for your engine family, as specified in paragraph (c) of this section. Unless otherwise specified, the following FEL caps apply:

(1) FELs for Tier 3 engines may not be higher than the applicable Tier 2 standards specified in Appendix I of this part.

(2) FELs for Tier 4 engines may not be higher than the applicable Tier 3 standards specified in paragraph (a)(3) of this section.

(3) The following FEL caps apply for engines at or above 3700 kW that are not subject to Tier 3 standards under paragraph (a)(3) of this section:

(i) FELs may not be higher than the applicable Tier 1 NO_X standards specified in Appendix I of this part before the Tier 4 standards start to apply.

(ii) FELs may not be higher than the applicable Tier 2 NO_X+THC standards specified in Appendix I of this part after the Tier 4 standards start to apply.

(c) *Not-to-exceed standards.* Except as noted in § 1042.145(e), exhaust emissions from all engines subject to the requirements of this part may not exceed the not-to-exceed (NTE) standards as follows:

(1) Use the following equation to determine the NTE standards:

(i) NTE standard for each pollutant = STD × M.

Where:

STD = The standard specified for that pollutant in this section if you certify without using ABT for that pollutant; or the FEL for that pollutant if you certify using ABT.

M = The NTE multiplier for that pollutant.

(ii) Round each NTE standard to the same number of decimal places as the emission standard.

(2) Determine the applicable NTE zone and subzones as described in § 1042.515. Determine NTE multipliers for specific zones and subzones and pollutants as follows:

(i) For marine engines certified using the duty cycle specified in § 1042.505(b)(1), except for variable-speed propulsion marine engines used with controllable-pitch propellers or with electrically coupled propellers, apply the following NTE multipliers:

(A) Subzone 1: 1.2 for Tier 3 NO_X+HC standards.

(B) Subzone 1: 1.5 for Tier 4 standards and Tier 3 p.m. and CO standards.

(C) Subzone 2: 1.5 for Tier 4 NO_X and HC standards and for Tier 3 NO_X+HC standards.

(D) Subzone 2: 1.9 for PM and CO standards.

(ii) For recreational marine engines certified using the duty cycle specified in § 1042.505(b)(2), except for variable-speed marine engines used with controllable-pitch propellers or with electrically coupled propellers, apply the following NTE multipliers:

(A) Subzone 1: 1.2 for Tier 3 NO_X+HC standards.

(B) Subzone 1: 1.5 for Tier 3 p.m. and CO standards.

(C) Subzones 2 and 3: 1.5 for Tier 3 NO_X+HC standards.

(D) Subzones 2 and 3: 1.9 for PM and CO standards.

(iii) For variable-speed marine engines used with controllable-pitch propellers or with electrically coupled propellers that are certified using the duty cycle specified in § 1042.505(b)(1), (2), or (3), apply the following NTE multipliers:

(A) Subzone 1: 1.2 for Tier 3 NO_X+HC standards.

(B) Subzone 1: 1.5 for Tier 4 standards and Tier 3 p.m. and CO standards.

(C) Subzone 2: 1.5 for Tier 4 NO_X and HC standards and for Tier 3 NO_X+HC standards.

(D) Subzone 2: 1.9 for PM and CO standards. However, there is no NTE standard in Subzone 2b for PM emissions if the engine family's applicable standard for PM is at or above 0.07 g/kW-hr.

(iv) For constant-speed engines certified using a duty cycle specified in § 1042.505(b)(3) or (4), apply the following NTE multipliers:

(A) Subzone 1: 1.2 for Tier 3 NO_X+HC standards.

(B) Subzone 1: 1.5 for Tier 4 standards and Tier 3 p.m. and CO standards.

(C) Subzone 2: 1.5 for Tier 4 NO_X and HC standards and for Tier 3 NO_X+HC standards.

(D) Subzone 2: 1.9 for PM and CO standards. However, there is no NTE standard for PM emissions if the engine family's applicable standard for PM is at or above 0.07 g/kW-hr.

(v) For variable-speed auxiliary marine engines certified using the duty cycle specified in § 1042.505(b)(5)(ii) or (iii):

(A) Subzone 1: 1.2 for Tier 3 NO_X+HC standards.

(B) Subzone 1: 1.5 for Tier 4 standards and Tier 3 p.m. and CO standards.

(C) Subzone 2: 1.2 for Tier 3 NO_X+HC standards.

(D) Subzone 2: 1.5 for Tier 4 standards and Tier 3 p.m. and CO standards. However, there is no NTE standard for PM emissions if the engine family's applicable standard for PM is at or above 0.07 g/kW-hr.

(3) The NTE standards apply to your engines whenever they operate within the NTE zone for an NTE sampling period of at least thirty seconds, during which only a single operator demand set point may be selected. Engine operation during a change in operator demand is excluded from any NTE sampling period. There is no maximum NTE sampling period.

(4) Collect emission data for determining compliance with the NTE standards using the procedures described in subpart F of this part.

(5) You may ask us to accept as compliant an engine that does not fully meet specific requirements under the applicable NTE standards where such deficiencies are necessary for safety.

* * * * *

■ 161. Section 1042.104 is amended by revising paragraph (a)(2) to read as follows:

§ 1042.104 Exhaust emission standards for Category 3 engines.

(a) * * *

(2) NO_X standards apply based on the engine's model year and maximum in-use engine speed as shown in the following table:

TABLE 1 TO § 1042.104—NO_X EMISSION STANDARDS FOR CATEGORY 3 ENGINES

[g/kW-hr]

Emission standards	Model year	Maximum in-use engine speed		
		Less than 130 RPM	130–2000 RPM [a]	Over 2000 RPM
Tier 1	2004–2010 [b]	17.0	$45.0 \cdot n^{(-0.20)}$	9.8
Tier 2	2011–2015	14.4	$44.0 \cdot n^{(-0.23)}$	7.7
Tier 3 [c]	2016 and later	3.4	$9.0 \cdot n^{(-0.20)}$	2.0

[a] Applicable standards are calculated from n (maximum in-use engine speed, in RPM, as specified in § 1042.140). Round the standards to one decimal place.

[b] Tier 1 NO_X standards apply as specified in 40 CFR part 94 for engines originally manufactured in model years 2004 through 2010. They are shown here only for reference.

[c] For engines designed with on-off controls as specified in § 1042.115(g), the Tier 2 standards continue to apply anytime the engine has disabled its Tier 3 NO_X emission controls.

* * * * *

■ 162. Section 1042.110 is amended by removing and reserving paragraph (b) and revising paragraph (d).

The revision reads as follows:

§ 1042.110 Recording reductant use and other diagnostic functions.

* * * * *

(d) For Category 3 engines equipped with on-off NO_X controls (as allowed by § 1042.115(g)), you must also equip your engine to continuously monitor NO_X concentrations in the exhaust. See § 1042.650 to determine if this requirement applies for a given Category 1 or Category 2 engine. For measurement technologies involving discrete sampling events, measurements are considered continuous if they repeat at least once every 60 seconds; we may approve a longer sampling period if it is necessary or appropriate for sufficiently accurate measurements. Describe your system for onboard NO_X measurements in your application for certification. Use good engineering judgment to alert operators if measured NO_X concentrations indicate malfunctioning emission controls. Record any such operation in nonvolatile computer memory. You are not required to monitor NO_X concentrations during operation for which the emission controls may be disabled under § 1042.115(g). For the purpose of this paragraph (d), ''malfunctioning emission controls'' means any condition in which the measured NO_X concentration exceeds the highest value expected when the engine is in compliance with the installed engine standard of § 1042.104(g). Use good engineering judgment to determine these expected values during production-line testing of the engine using linear interpolation between test points and accounting for the degree to which the cycle-weighted emissions of the engine are below the standard. You may also use additional intermediate test points measured during the production-line test. Note that the provisions of paragraph (a) of this section also apply for SCR systems covered by this paragraph (d). For engines subject to both the provisions of paragraph (a) of this section and this paragraph (d), use good engineering judgment to integrate diagnostic features to comply with both paragraphs. For example, engines may use on-off NO_X controls to disable certain emission control functions only if the diagnostic system indicates that the monitoring described in this paragraph (d) is active.

■ 163. Section 1042.120 is amended by revising paragraph (b) introductory text to read as follows:

§ 1042.120 Emission-related warranty requirements.

* * * * *

(b) *Warranty period.* Your emission-related warranty must be valid for at least as long as the minimum warranty periods listed in this paragraph (b) in hours of operation and years, whichever comes first. You may offer an emission-related warranty more generous than we require. The emission-related warranty for the engine may not be shorter than any basic mechanical warranty you provide without charge for the engine. Similarly, the emission-related warranty for any component may not be shorter than any warranty you provide without charge for that component. This means that your warranty may not treat emission-related and nonemission-related defects differently for any component. If an engine has no hour meter, we base the warranty periods in this paragraph (b) only on the engine's age (in years). The warranty period begins when the engine is placed into service. The following minimum warranty periods apply:

* * * * *

■ 164. Section 1042.125 is amended by revising paragraphs (a)(2)(i), (a)(3)(i), (c), and (e) to read as follows:

§ 1042.125 Maintenance instructions.

* * * * *

(a) * * *

(2) * * *

(i) For EGR-related filters and coolers, DEF filters, PCV valves, and fuel injector tips (cleaning only), the minimum interval is 1,500 hours.

* * * * *

(3) * * *

(i) For EGR-related filters and coolers, DEF filters, PCV valves, and fuel injector tips (cleaning only), the minimum interval is 1,500 hours.

* * * * *

(c) *Special maintenance.* You may specify more frequent maintenance to address problems related to special situations, such as atypical engine operation. You must clearly state that this additional maintenance is associated with the special situation you are addressing. You may also address maintenance of low-use engines (such as recreational or stand-by engines) by specifying the maintenance interval in terms of calendar months or years in addition to your specifications in terms of engine operating hours. All special maintenance instructions must be consistent with good engineering judgment. We may disapprove your maintenance instructions if we determine that you have specified special maintenance steps to address maintenance that is unlikely to occur in use, or engine operation that is not atypical. For example, this paragraph (c) does not allow you to design engines that require special maintenance for a certain type of expected operation. If we determine that certain maintenance items do not qualify as special maintenance under this paragraph (c), you may identify this as recommended additional maintenance under paragraph (b) of this section.

* * * * *

(e) *Maintenance that is not emission-related.* For maintenance unrelated to emission controls, you may schedule any amount of inspection or maintenance. You may also take these inspection or maintenance steps during service accumulation on your emission-data engines, as long as they are reasonable and technologically necessary. This might include adding engine oil, changing air, fuel, or oil filters, servicing engine-cooling systems, and adjusting idle speed, governor, engine bolt torque, valve lash, or injector lash. You may not perform this nonemission-related maintenance on emission-data engines more often than the least frequent intervals that you recommend to the ultimate purchaser.

* * * * *

■ 165. Section 1042.130 is amended by revising paragraph (b) to read as follows:

§ 1042.130 Installation instructions for vessel manufacturers.

* * * * *

(b) Make sure these instructions have the following information:

(1) Include the heading: ''Emission-related installation instructions''.

(2) State: ''Failing to follow these instructions when installing a certified engine in a vessel violates federal law (40 CFR 1068.105(b)), subject to fines or other penalties as described in the Clean Air Act.''

(3) Describe the instructions needed to properly install the exhaust system and any other components. Include instructions consistent with the requirements of § 1042.205(u).

(4) Describe any necessary steps for installing the diagnostic system described in § 1042.110.

(5) Describe how your certification is limited for any type of application. . For example, if your engines are certified only for constant-speed operation, tell vessel manufacturers not to install the engines in variable-speed applications or modify the governor.

(6) Describe any other instructions to make sure the installed engine will operate according to design specifications in your application for certification. This may include, for example, instructions for installing aftertreatment devices when installing the engines.

(7) State: ''If you install the engine in a way that makes the engine's emission control information label hard to read during normal engine maintenance, you must place a duplicate label on the vessel, as described in 40 CFR 1068.105.''

(8) Describe any vessel labeling requirements specified in § 1042.135.

* * * * *

■ 166. Section 1042.135 is amended by revising paragraphs (c), (d)(1), and (e) introductory text to read as follows:

§ 1042.135 Labeling.

* * * * *

(c) The label must—

(1) Include the heading ''EMISSION CONTROL INFORMATION''.

(2) Include your full corporate name and trademark. You may identify another company and use its trademark instead of yours if you comply with the branding provisions of 40 CFR 1068.45.

(3) Include EPA's standardized designation for the engine family (and subfamily, where applicable).

(4) Identify all the emission standards that apply to the engine (or FELs, if applicable). If you do not declare an FEL under subpart H of this part, you may alternatively state the engine's category, displacement (in liters or L/cyl), maximum engine power (in kW), and power density (in kW/L) as needed to determine the emission standards for the engine family. You may specify displacement, maximum engine power, or power density as a range consistent with the ranges listed in § 1042.101. See § 1042.140 for descriptions of how to specify per-cylinder displacement, maximum engine power, and power density.

(5) State the date of manufacture [DAY (optional), MONTH, and YEAR]; however, you may omit this from the label if you stamp, engrave, or otherwise

permanently identify it elsewhere on the engine, in which case you must also describe in your application for certification where you will identify the date on the engine.

(6) Identify the application(s) for which the engine family is certified (such as constant-speed auxiliary, variable-speed propulsion engines used with fixed-pitch propellers, etc.). If the engine is certified as a recreational engine, state: ''INSTALLING THIS RECREATIONAL ENGINE IN A COMMERCIAL VESSEL OR USING THE VESSEL FOR COMMERCIAL PURPOSES MAY VIOLATE FEDERAL LAW SUBJECT TO CIVIL PENALTY (40 CFR 1042.601).''

(7) For engines using sulfur-sensitive technologies, state: ''ULTRA LOW SULFUR DIESEL FUEL ONLY''.

(8) State the useful life for your engine family if the applicable useful life is based on the provisions of § 1042.101(e)(2) or (3), or § 1042.104(d)(2).

(9) Identify the emission control system. Use terms and abbreviations as described in 40 CFR 1068.45. You may omit this information from the label if there is not enough room for it and you put it in the owners manual instead.

(10) State: ''THIS MARINE ENGINE COMPLIES WITH U.S. EPA REGULATIONS FOR [MODEL YEAR].''

(11) For a Category 1 or Category 2 engine that can be modified to operate on residual fuel, but has not been certified to meet the standards on such a fuel, include the statement: ''THIS ENGINE IS CERTIFIED FOR OPERATION ONLY WITH DIESEL FUEL. MODIFYING THE ENGINE TO OPERATE ON RESIDUAL OR INTERMEDIATE FUEL MAY BE A VIOLATION OF FEDERAL LAW SUBJECT TO CIVIL PENALTIES.''

(12) For an engine equipped with on-off emissions controls as allowed by § 1042.115, include the statement: ''THIS ENGINE IS CERTIFIED WITH ON–OFF EMISSION CONTROLS. OPERATION OF THE ENGINE CONTRARY TO 40 CFR 1042.115(g) IS A VIOLATION OF FEDERAL LAW SUBJECT TO CIVIL PENALTIES.''

(13) For engines intended for installation on domestic or public vessels, include the following statement: ''THIS ENGINE DOES NOT COMPLY WITH INTERNATIONAL MARINE REGULATIONS FOR COMMERCIAL VESSELS UNLESS IT IS ALSO COVERED BY AN EIAPP CERTIFICATE.''

(d) * * *

(1) If your emission control information label includes all the information described in paragraphs (c)(5) and (9) of this section, you may identify other emission standards that the engine meets or does not meet (such as international standards). You may include this information by adding it to the statement we specify or by including a separate statement.

* * * * *

(e) For engines using sulfur-sensitive technologies, create a separate label with the statement: ''ULTRA LOW SULFUR DIESEL FUEL ONLY''. Permanently attach this label to the vessel near the fuel inlet or, if you do not manufacture the vessel, take one of the following steps to ensure that the vessel will be properly labeled:

* * * * *

■ 167. Section 1042.140 is amended by revising paragraph (e) to read as follows:

§ 1042.140 Maximum engine power, displacement, power density, and maximum in-use engine speed.

* * * * *

(e) Throughout this part, references to a specific power value for an engine are based on maximum engine power. For example, the group of engines with maximum engine power below 600 kW may be referred to as engines below 600 kW.

* * * * *

Subpart C—Certifying Engine Families

■ 168. Section 1042.201 is amended by revising paragraphs (a) and (g) to read as follows:

§ 1042.201 General requirements for obtaining a certificate of conformity.

(a) You must send us a separate application for a certificate of conformity for each engine family. A certificate of conformity is valid for new production from the indicated effective date until the end of the model year for which it is issued, which may not extend beyond December 31 of that year. No certificate will be issued after December 31 of the model year. You may amend your application for certification after the end of the model year in certain circumstances as described in §§ 1042.220 and 1042.225. You must renew your certification annually for any engines you continue to produce.

* * * * *

(g) We may require you to deliver your test engines to a facility we designate for our testing (see § 1042.235(c)). Alternatively, you may choose to deliver another engine that is identical in all material respects to the test engine, or another engine that we determine can appropriately serve as an emission-data engine for the engine family.

* * * * *

■ 169. Section 1042.205 is amended by revising paragraphs (g), (o), (r)(1), and (bb)(1) to read as follows:

§ 1042.205 Application requirements.

* * * * *

(g) List the specifications of the test fuel(s) to show that they fall within the required ranges we specify in 40 CFR part 1065.

* * * * *

(o) Present emission data for HC, NO_X, PM, and CO on an emission-data engine to show your engines meet emission standards as specified in §§ 1042.101 or 1042.104. Note that you must submit PM data for all engines, whether or not a PM standard applies. Show emission figures before and after applying adjustment factors for regeneration and deterioration factors for each pollutant and for each engine. If we specify more than one grade of any fuel type (for example, high-sulfur and low-sulfur diesel fuel), you need to submit test data only for one grade, unless the regulations of this part specify otherwise for your engine. Include emission results for each mode for Category 3 engines or for other engines if you do discrete-mode testing under § 1042.505. For engines using on-off controls as described in § 1042.115(g), include emission data demonstrating compliance with the Tier 2 standards when the engines Tier 3 NOx emission controls are disabled. Note that §§ 1042.235 and 1042.245 allows you to submit an application in certain cases without new emission data.

* * * * *

(r) * * *

(1) Report all valid test results involving measurement of pollutants for which emission standards apply. Also indicate whether there are test results from invalid tests or from any other tests of the emission-data engine, whether or not they were conducted according to the test procedures of subpart F of this part. We may require you to report these additional test results. We may ask you to send other information to confirm that your tests were valid under the requirements of this part and 40 CFR part 1065.

* * * * *

(bb) * * *

(1) Describe your normal practice for importing engines. For example, this may include identifying the names and addresses of any agents you have authorized to import your engines.

* * * * *

■ 170. Section 1042.225 is amended by revising the introductory text and adding paragraph (b)(4) to read as follows:

§ 1042.225 Amending applications for certification.

Before we issue you a certificate of conformity, you may amend your application to include new or modified engine configurations, subject to the provisions of this section. After we have issued your certificate of conformity, but before the end of the model year, you may send us an amended application requesting that we include new or modified engine configurations within the scope of the certificate, subject to the provisions of this section. Before the end of the model year, you must amend your application if any changes occur with respect to any information that is included or should be included in your application. After the end of the model year, you may amend your application only to update maintenance instructions as described in § 1042.220 or to modify an FEL as described in paragraph (f) of this section.

* * * * *

(b) * * *

(4) Include any other information needed to make your application correct and complete.

* * * * *

■ 171. Section 1042.235 is amended by revising paragraphs (b), (c)(4), and (d)(1) to read as follows:

§ 1042.235 Emission testing related to certification.

* * * * *

(b) Test your emission-data engines using the procedures and equipment specified in subpart F of this part. In the case of dual-fuel engines, measure emissions when operating with each type of fuel for which you intend to certify the engine. In the case of flexible-fuel engines, measure emissions when operating with the fuel mixture that best represents in-use operation or is most likely to have the highest NO_X emissions (or NO_X+HC emissions for engines subject to NO_X+HC standards), though you may ask us to instead to perform tests with both fuels separately if you can show that intermediate mixtures are not likely to occur in use.

* * * * *

(c) * * *

(4) Before we test one of your engines, we may calibrate it within normal production tolerances for anything we do not consider an adjustable parameter. For example, this would apply for an engine parameter that is subject to production variability because it is adjustable during production, but is not considered an adjustable parameter (as defined in § 1042.901) because it is permanently sealed. For parameters that relate to a level of performance that is itself subject to a specified range (such as maximum power output), we will generally perform any calibration under this paragraph (c)(4) in a way that keeps performance within the specified range.

(d) * * *

(1) The engine family from the previous model year differs from the current engine family only with respect to model year, items identified in § 1042.225(a), or other characteristics unrelated to emissions. We may waive this criterion for differences we determine not to be relevant.

* * * * *

■ 172. Section 1042.240 is amended by revising paragraph (c)(3), adding paragraphs (c)(4) and (5), and revising paragraph (d) to read as follows:

§ 1042.240 Demonstrating compliance with exhaust emission standards.

* * * * *

(c) * * *

(3) *Sawtooth deterioration patterns.* The deterioration factors described in paragraphs (c)(1) and (2) of this section assume that the highest useful life emissions occur either at the end of useful life or at the low-hour test point. The provisions of this paragraph (c)(3) apply where good engineering judgment indicates that the highest emissions over the useful life will occur between these two points. For example, emissions may increase with service accumulation until a certain maintenance step is performed, then return to the low-hour emission levels and begin increasing again. Base deterioration factors for engines with such emission patterns on the difference between (or ratio of) the point of the sawtooth at which the highest emissions occur and the low-hour test point. Note that this applies for maintenance-related deterioration only where we allow such critical emission-related maintenance.

(4) *Deterioration factor for crankcase emissions.* If your engine vents crankcase emissions to the exhaust or to the atmosphere, you must account for crankcase emission deterioration, using good engineering judgment. You may use separate deterioration factors for crankcase emissions of each pollutant (either multiplicative or additive) or include the effects in combined deterioration factors that include exhaust and crankcase emissions together for each pollutant.

(5) *Dual-fuel and flexible-fuel engines.* In the case of dual-fuel and flexible-fuel engines, apply deterioration factors separately for each fuel type. You may accumulate service hours on a single emission-data engine using the type of fuel or the fuel mixture expected to have the highest combustion and exhaust temperatures; you may ask us to approve a different fuel mixture if you demonstrate that a different criterion is more appropriate.

(d) Determine the official emission result for each pollutant to at least one more decimal place than the applicable standard. Apply the deterioration factor to the official emission result, as described in paragraph (c) of this section, then round the adjusted figure to the same number of decimal places as the emission standard. Compare the rounded emission levels to the emission standard for each emission-data engine. In the case of NO_X+HC standards, apply the deterioration factor to each pollutant and then add the results before rounding.

* * * * *

■ 173. Section 1042.250 is amended by revising paragraphs (b)(3)(iv) and (c) to read as follows:

§ 1042.250 Recordkeeping and reporting.

* * * * *

(b) * * *

(3) * * *

(iv) All your emission tests, including the date and purpose of each test and documentation of test parameters as specified in part 40 CFR part 1065.

* * * * *

(c) Keep required data from emission tests and all other information specified in this section for eight years after we issue your certificate. If you use the same emission data or other information for a later model year, the eight-year period restarts with each year that you continue to rely on the information.

* * * * *

■ 174. Section 1042.255 is amended by revising paragraphs (c)(2), (d), and (e) to read as follows:

§ 1042.255 EPA decisions.

* * * * *

(c) * * *

(2) Submit false or incomplete information (paragraph (e) of this section applies if this is fraudulent). This includes doing anything after submission of your application to render any of the submitted information false or incomplete.

* * * * *

(d) We may void the certificate of conformity for an engine family if you fail to keep records, send reports, or give us information as required under this part or the Clean Air Act. Note that these are also violations of 40 CFR 1068.101(a)(2).

(e) We may void your certificate if we find that you intentionally submitted false or incomplete information. This includes rendering submitted information false or incomplete after submission.

* * * * *

Subpart D—Testing Production-Line Engines

■ 175. Section 1042.302 is amended by revising paragraph (a) to read as follows:

§ 1042.302 Applicability of this subpart for Category 3 engines.

* * * * *

(a) You must test each Category 3 engine at the sea trial of the vessel in which it is installed or within the first 300 hours of operation, whichever occurs first. This may involve testing a fully assembled production engine before it is installed in the vessel. Since you must test each engine, the provisions of §§ 1042.310 and 1042.315(b) do not apply for Category 3 engines. If we determine that an engine failure under this subpart is caused by defective components or design deficiencies, we may revoke or suspend your certificate for the engine family as described in § 1042.340. If we determine that an engine failure under this subpart is caused only by incorrect assembly, we may suspend your certificate for the engine family as described in § 1042.325. If the engine fails, you may continue operating only to complete the sea trial and return to port. It is a violation of 40 CFR 1068.101(b)(1) to operate the vessel further until you remedy the cause of failure. Each two-hour period of such operation constitutes a separate offense. A violation lasting less than two hours constitutes a single offense.

* * * * *

Subpart F—Test Procedures

■ 176. Section 1042.501 is amended by revising paragraphs (d), (e), and (f) and adding paragraph (h) to read as follows:

§ 1042.501 How do I run a valid emission test?

* * * * *

(d) Adjust measured emissions to account for aftertreatment technology with infrequent regeneration as described in § 1042.525.

(e) Duty-cycle testing is limited to atmospheric pressures between 91.000 and 103.325 kPa.

(f) You may use special or alternate procedures to the extent we allow them under 40 CFR 1065.10.

* * * * *

(h) This subpart is addressed to you as a manufacturer, but it applies equally to anyone who does testing for you, and to us when we perform testing to determine if your engines meet emission standards.

■ 177. Section 1042.505 is amended by revising paragraph (b)(5)(iii) to read as follows:

§ 1042.505 Testing engines using discrete-mode or ramped-modal duty cycles.

* * * * *

(b) * * *

(5) * * *

(iii) Use the 8-mode duty cycle or the corresponding ramped-modal cycle described in 40 CFR part 1039, Appendix II, paragraph (c) for variable-speed auxiliary engines with maximum engine power at or above 19 kW that are not propeller-law engines.

* * * * *

■ 178. Section 1042.515 is amended by revising paragraphs (f)(2), (f)(4), and (g) to read as follows:

§ 1042.515 Test procedures related to not-to-exceed standards.

* * * * *

(f) * * *

(2) You may ask us to approve a Limited Testing Region (LTR). An LTR is a region of engine operation, within the applicable NTE zone, where you have demonstrated that your engine family operates for no more than 5.0 percent of its normal in-use operation, on a time-weighted basis. You must specify an LTR using boundaries based on engine speed and power (or torque), where the LTR boundaries must coincide with some portion of the boundary defining the overall NTE zone. Any emission data collected within an LTR for a time duration that exceeds 5.0 percent of the duration of its respective NTE sampling period will be excluded when determining compliance with the applicable NTE standards. Any emission data collected within an LTR for a time duration of 5.0 percent or less of the duration of the respective NTE sampling period will be included when determining compliance with the NTE standards.

* * * * *

(4) You may exclude emission data based on catalytic aftertreatment temperatures as follows:

(i) For an engine equipped with a catalytic NO_X aftertreatment system, exclude NO_X emission data that is collected when the exhaust temperature at any time during the NTE event is less than 250 °C.

(ii) For an engine equipped with an oxidizing catalytic aftertreatment system, exclude HC and CO emission data that is collected when the exhaust temperature at any time during the NTE event is less than 250 °C. Also exclude PM emission data if the applicable PM standard (or family emission limit) is above 0.06 g/kW-hr. Where there are parallel paths, measure the temperature 30 cm downstream of the last oxidizing aftertreatment device in the path with the greatest exhaust flow.

(iii) Measure exhaust temperature within 30 cm downstream of the last applicable catalytic aftertreatment device. Where there are parallel paths, use good engineering judgment to measure the temperature within 30 cm downstream of the last applicable catalytic aftertreatment device in the path with the greatest exhaust flow.

(g) Emission sampling is not valid for NTE testing if it includes any active regeneration, unless the emission averaging period includes the complete regeneration event(s) and the full period of engine operation until the start of the next regeneration event. This provision applies only for engines that send an electronic signal indicating the start of the regeneration event.

■ 179. Section 1042.525 is revised to read as follows:

§ 1042.525 How do I adjust emission levels to account for infrequently regenerating aftertreatment devices?

For engines using aftertreatment technology with infrequent regeneration events that may occur during testing, take one of the following approaches to account for the emission impact of regeneration, or use an alternate methodology that we approve for Category 3 engines:

(a) You may use the calculation methodology described in 40 CFR 1065.680 to adjust measured emission results. Do this by developing an upward adjustment factor and a downward adjustment factor for each pollutant based on measured emission data and observed regeneration frequency as follows:

(1) Adjustment factors should generally apply to an entire engine family, but you may develop separate adjustment factors for different configurations within an engine family. Use the adjustment factors from this section in all testing for the engine family.

(2) You may use carryover or carry-across data to establish adjustment factors for an engine family as described in § 1042.235, consistent with good engineering judgment.

(3) Determine the frequency of regeneration, *F*, as described in 40 CFR 1065.680 from in-use operating data or from running repetitive tests in a

laboratory. If the engine is designed for regeneration at fixed time intervals, you may apply good engineering judgment to determine *F* based on those design parameters.

(4) Identify the value of *F* in each application for certification for which it applies.

(b) You may ask us to approve an alternate methodology to account for regeneration events. We will generally limit approval to cases where your engines use aftertreatment technology with extremely infrequent regeneration and you are unable to apply the provisions of this section.

(c) You may choose to make no adjustments to measured emission results if you determine that regeneration does not significantly affect emission levels for an engine family (or configuration) or if it is not practical to identify when regeneration occurs. If you choose not to make adjustments under paragraph (a) or (b) of this section, your engines must meet emission standards for all testing, without regard to regeneration.

Subpart G—Special Compliance Provisions

■ 180. Section 1042.601 is amended by adding paragraph (j) to read as follows:

§ 1042.601 General compliance provisions for marine engines and vessels.

* * * * *

(j) Subpart C of this part describes how to test and certify dual-fuel and flexible-fuel engines. Some multi-fuel engines may not fit either of those defined terms. For such engines, we will determine whether it is most appropriate to treat them as single-fuel engines, dual-fuel engines, or flexible-fuel engines based on the range of possible and expected fuel mixtures. For example, an engine might burn natural gas but initiate combustion with a pilot injection of diesel fuel. If the engine is designed to operate with a single fueling algorithm (*i.e.,* fueling rates are fixed at a given engine speed and load condition), we would generally treat it as a single-fuel engine, In this context, the combination of diesel fuel and natural gas would be its own fuel type. If the engine is designed to also operate on diesel fuel alone, we would generally treat it as a dual-fueled engine. If the engine is designed to operate on varying mixtures of the two fuels, we would generally treat it as a flexible-fueled engine. To the extent that requirements vary for the different fuels or fuel mixtures, we may apply the more stringent requirements.

■ 181. Section 1042.605 is amended by revising paragraphs (e)(3) to read as follows:

§ 1042.605 Dressing engines already certified to other standards for nonroad or heavy-duty highway engines for marine use.

* * * * *

(e) * * *

(3) Send the Designated Compliance Officer written notification describing your plans before using the provisions of this section. In addition, by February 28 of each calendar year (or less often if we tell you), send the Designated Compliance Officer a signed letter with all the following information:

(i) Identify your full corporate name, address, and telephone number.

(ii) List the engine models for which you used this exemption in the previous year and describe your basis for meeting the sales restrictions of paragraph (d)(4) of this section.

(iii) State: ''We prepared each listed engine model for marine application without making any changes that could increase its certified emission levels, as described in 40 CFR 1042.605.''

* * * * *

■ 182. Section 1042.610 is amended by revising paragraph (e)(2) to read as follows:

§ 1042.610 Certifying auxiliary marine engines to land-based standards.

* * * * *

(e) * * *

(2) Send the Designated Compliance Officer written notification describing your plans before using the provisions of this section. In addition, by February 28 of each calendar year (or less often if we tell you), send the Designated Compliance Officer a signed letter with all the following information:

(i) Identify your full corporate name, address, and telephone number.

(ii) List the engine models for which you used this exemption in the previous year and describe your basis for meeting the sales restrictions of paragraph (d)(3) of this section.

(iii) State: ''We prepared each listed engine model for marine application without making any changes that could increase its certified emission levels, as described in 40 CFR 1042.610.''

* * * * *

■ 183. Section 1042.630 is amended by revising paragraph (f) to read as follows:

§ 1042.630 Personal-use exemption.

* * * * *

(f) The vessel must be a vessel that is not classed or subject to Coast Guard inspections or surveys. Note that dockside examinations performed by the Coast Guard are not considered inspections (see 46 U.S.C. 3301 and 46 U.S.C. 4502).

§ 1042.640 [Removed]

■ 184. Section 1042.640 is removed.

■ 185. Section 1042.650 is amended by revising paragraphs (a) and (d) to read as follows:

§ 1042.650 Migratory vessels.

* * * * *

(a) *Temporary exemption.* A vessel owner may ask us for a temporary exemption from the tampering prohibition in 40 CFR 1068.101(b)(1) for a vessel if it will operate for an extended period outside the United States where ULSD is not available. In your request, describe where the vessel will operate, how long it will operate there, why ULSD will be unavailable, and how you will modify the engine, including its emission controls. If we approve your request, you may modify the engine, but only as needed to disable or remove the emission controls needed for meeting the Tier 4 standards. You must return the engine to its original certified configuration before the vessel returns to the United States to avoid violating the tampering prohibition in 40 CFR 1068.101(b)(1). We may set additional conditions to prevent circumvention of the provisions of this part.

* * * * *

(d) *Auxiliary engines on Category 3 vessels.* Auxiliary engines that will be installed on vessels with Category 3 propulsion engines qualify for an exemption from the standards of this part provided all the following conditions are met:

(1) To be eligible for this exemption, the engine must meet all of the following criteria.

(i) The engine must be certified to the applicable NO_X standards of Annex VI and meet all other applicable requirements of 40 CFR part 1043. Engines installed on vessels constructed on or after January 1, 2016 must conform fully to the Annex VI Tier III NO_X standards as described in 40 CFR part 1043 and meet all other applicable requirements in 40 CFR part 1043. Engines that would otherwise be subject to the Tier 4 standards of this part must also conform fully to the Annex VI Tier III NO_X standards as described in 40 CFR part 1043.

(ii) The engine may not be used for propulsion (except for emergency engines).

(iii) Engines certified to the Annex VI Tier III standards may be equipped with on-off NO_X controls, as long as they conform to the requirements of §§ 1042.110(d) and 1042.115(g);

however, the engines must comply fully with the Annex VI Tier II standards when the emission controls are disabled, and meet any other requirements that apply under Annex VI.

(2) You must notify the Designated Compliance Officer of your intent to use this exemption before you introduce engines into U.S. commerce, not later than the time that you apply for an EIAPP certificate for the engine under 40 CFR part 1043.

(3) The remanufactured engine requirements of subpart I of this part do not apply.

(4) If you introduce an engine into U.S. commerce under this paragraph (d), you must meet the labeling requirements in § 1042.135, but add the following statement instead of the compliance statement in § 1042.135(c)(10):

THIS ENGINE DOES NOT COMPLY WITH CURRENT U.S. EPA EMISSION STANDARDS UNDER 40 CFR 1042.650 AND IS FOR USE SOLELY IN VESSELS WITH CATEGORY 3 PROPULSION ENGINES. INSTALLATION OR USE OF THIS ENGINE IN ANY OTHER APPLICATION MAY BE A VIOLATION OF FEDERAL LAW SUBJECT TO CIVIL PENALTY.

(5) The reporting requirements of § 1042.660 apply for engines exempted under this paragraph (d).

■ 186. Section 1042.655 is amended by revising the section heading and paragraph (b) to read as follows:

§ 1042.655 Special certification provisions for Category 3 engines with aftertreatment.

* * * * *

(b) *Required testing.* The emission-data engine must be tested as specified in subpart F of this part to verify that the engine-out emissions comply with the Tier 2 standards. The catalyst material or other aftertreatment device must be tested under conditions that accurately represent actual engine conditions for the test points. This catalyst or aftertreatment testing may be performed on a benchscale.

* * * * *

■ 187. Section 1042.660 is amended by revising paragraphs (b) and (c)(1) to read as follows:

§ 1042.660 Requirements for vessel manufacturers, owners, and operators.

* * * * *

(b) For vessels equipped with SCR systems requiring the use of urea or other reductants, owners and operators must report to the Designated Enforcement Officer within 30 days any operation of such vessels without the appropriate reductant. This includes vessels with auxiliary engines certified to Annex VI standards under § 1042.650(d). Failure to comply with the requirements of this paragraph is a violation of 40 CFR 1068.101(a)(2). Note that such operation is a violation of 40 CFR 1068.101(b)(1).

(c) * * *

(1) The requirements of this paragraph (c)(1) apply only for Category 3 engines. All maintenance, repair, adjustment, and alteration of Category 3 engines subject to the provisions of this part performed by any owner, operator or other maintenance provider must be performed using good engineering judgment, in such a manner that the engine continues (after the maintenance, repair, adjustment or alteration) to meet the emission standards it was certified as meeting prior to the need for service. This includes but is not limited to complying with the maintenance instructions described in § 1042.125. Adjustments are limited to the range specified by the engine manufacturer in the approved application for certification. Note that where a repair (or other maintenance) cannot be completed while at sea, it is not a violation to continue operating the engine to reach your destination.

* * * * *

■ 188. Section 1042.670 is amended by revising paragraph (d) to read as follows:

§ 1042.670 Special provisions for gas turbine engines.

* * * * *

(d) *Equivalent displacement.* Apply displacement-based provisions of this part by calculating an equivalent displacement from maximum engine power. The equivalent per-cylinder displacement (in liters) equals maximum engine power in kW multiplied by 0.00311, except that all gas turbines with maximum engine power above 9,300 kW are considered to have an equivalent per-cylinder displacement of 29.0 liters. Also, determine the appropriate Tier 3 standards for Category 1 engines based on the engine having an equivalent power density below 35 kW per liter.

* * * * *

Subpart H—Averaging, Banking, and Trading for Certification

■ 189. Section 1042.701 is amended by adding paragraphs (j) and (k) to read as follows:

§ 1042.701 General provisions.

* * * * *

(j) NO_X+HC and PM credits generated under 40 CFR part 94 may be used under this part in the same manner as NO_X+HC and PM credits generated under this part.

(k) You may use either of the following approaches to retire or forego emission credits:

(1) You may retire emission credits generated from any number of your engines. This may be considered donating emission credits to the environment. Identify any such credits in the reports described in § 1042.730. Engines must comply with the applicable FELs even if you donate or sell the corresponding emission credits under this paragraph (k). Those credits may no longer be used by anyone to demonstrate compliance with any EPA emission standards.

(2) You may certify a family using an FEL below the emission standard as described in this part and choose not to generate emission credits for that family. If you do this, you do not need to calculate emission credits for those families and you do not need to submit or keep the associated records described in this subpart for that family.

■ 190. Section 1042.705 is amended by revising paragraph (c) to read as follows:

§ 1042.705 Generating and calculating emission credits.

* * * * *

(c) As described in § 1042.730, compliance with the requirements of this subpart is determined at the end of the model year based on actual U.S.-directed production volumes. Do not include any of the following engines to calculate emission credits:

(1) Engines with a permanent exemption under subpart G of this part or under 40 CFR part 1068.

(2) Exported engines.

(3) Engines not subject to the requirements of this part, such as those excluded under § 1042.5.

(4) [Reserved]

(5) Any other engines, where we indicate elsewhere in this part 1042 that they are not to be included in the calculations of this subpart.

■ 191. Section 1042.710 is amended by revising paragraph (c) to read as follows:

§ 1042.710 Averaging emission credits.

* * * * *

(c) If you certify an engine family to an FEL that exceeds the otherwise applicable emission standard, you must obtain enough emission credits to offset the engine family's deficit by the due date for the final report required in § 1042.730. The emission credits used to address the deficit may come from your other engine families that generate emission credits in the same model year, from emission credits you have banked from previous model years, or from emission credits generated in the same or previous model years that you obtained through trading.

■ 192. Section 1042.725 is amended by revising paragraph (b)(2) to read as follows:

§ 1042.725 Information required for the application for certification.

* * * * *

(b) * * *

(2) Detailed calculations of projected emission credits (positive or negative) based on projected production volumes. We may require you to include similar calculations from your other engine families to demonstrate that you will be able to avoid negative credit balances for the model year. If you project negative emission credits for a family, state the source of positive emission credits you expect to use to offset the negative emission credits.

■ 193. Section 1042.730 is amended by revising paragraphs (b) and (c)(2) to read as follows:

§ 1042.730 ABT reports.

* * * * *

(b) Your end-of-year and final reports must include the following information for each engine family participating in the ABT program:

(1) Engine-family designation and averaging set.

(2) The emission standards that would otherwise apply to the engine family.

(3) The FEL for each pollutant. If you change the FEL after the start of production, identify the date that you started using the new FEL and/or give the engine identification number for the first engine covered by the new FEL. In this case, identify each applicable FEL and calculate the positive or negative emission credits as specified in § 1042.225.

(4) The projected and actual U.S.-directed production volumes for the model year, as described in § 1042.705(c). If you changed an FEL during the model year, identify the actual U.S.-directed production volume associated with each FEL.

(5) Maximum engine power for each engine configuration, and the average engine power weighted by U.S.-directed production volumes for the engine family.

(6) Useful life.

(7) Calculated positive or negative emission credits for the whole engine family. Identify any emission credits that you traded, as described in paragraph (d)(1) of this section.

(c) * * *

(2) State whether you will retain any emission credits for banking. If you choose to retire emission credits that would otherwise be eligible for banking, identify the engine families that generated the emission credits, including the number of emission credits from each family.

* * * * *

■ 194. Section 1042.735 is amended by revising paragraphs (a) and (b) to read as follows:

§ 1042.735 Recordkeeping.

(a) You must organize and maintain your records as described in this section.

(b) Keep the records required by this section for at least eight years after the due date for the end-of-year report. You may not use emission credits for any engines if you do not keep all the records required under this section. You must therefore keep these records to continue to bank valid credits.

* * * * *

Subpart I—Special Provisions for Remanufactured Marine Engines

■ 195. Section 1042.810 is amended by revising paragraph (c) to read as follows:

§ 1042.810 Requirements for owner/operators and installers during remanufacture.

* * * * *

(c) Your engine is not subject to the standards of this subpart if we determine that no certified remanufacturing system is available for your engine as described in § 1042.815. For engines that are remanufactured during multiple events within a five-year period, you are not required to use a certified system until all of your engine's cylinders have been replaced after the system became available. For example, if you remanufacture your 16-cylinder engine by replacing four cylinders each January and a system becomes available for your engine June 1, 2010, your engine must be in a certified configuration when you replace four cylinders in January of 2014. At that point, all 16 cylinders would have been replaced after June 1, 2010.

* * * * *

■ 196. Section 1042.830 is revised to read as follows:

§ 1042.830 Labeling.

(a) The labeling requirements of this paragraph (a) apply for remanufacturing that is subject to the standards of this subpart. At the time of remanufacture, affix a permanent and legible label identifying each engine. The label must be—

(1) Attached in one piece so it is not removable without being destroyed or defaced.

(2) Secured to a part of the engine needed for normal operation and not normally requiring replacement.

(3) Durable and readable for the engine's entire useful life.

(4) Written in English.

(b) The label required under paragraph (a) of this section must—

(1) Include the heading ''EMISSION CONTROL INFORMATION''.

(2) Include your full corporate name and trademark.

(3) Include EPA's standardized designation for the engine family.

(4) State the engine's category, displacement (in liters or L/cyl), maximum engine power (in kW), and power density (in kW/L) as needed to determine the emission standards for the engine family. You may specify displacement, maximum engine power, and power density as ranges consistent with the ranges listed in § 1042.101. See § 1042.140 for descriptions of how to specify per-cylinder displacement, maximum engine power, and power density.

(5) State: ''THIS MARINE ENGINE MEETS THE STANDARDS OF 40 CFR 1042, SUBPART I, FOR [CALENDAR YEAR OF REMANUFACTURE].''

(c) For remanufactured engines that are subject to this subpart as described in § 1042.801(a), but are not subject to remanufacturing standards as allowed by § 1042.810 or § 1042.815, you may voluntarily add a label as specified in paragraphs (a) and (b) of this section, except that the label must omit the standardized designation for the engine family and include the following alternative compliance statement: ''THIS MARINE ENGINE IS NOT SUBJECT TO REMANUFACTURING STANDARDS UNDER 40 CFR 1042, SUBPART I, FOR [CALENDAR YEAR OF REMANUFACTURE].''

(d) You may add information to the emission control information label to identify other emission standards that the engine meets or does not meet (such as international standards). You may also add other information to ensure that the engine will be properly maintained and used.

(e) You may ask us to approve modified labeling requirements in this section if you show that it is necessary or appropriate. We will approve your request if your alternate label is consistent with the intent of the labeling requirements of this section.

■ 197. Section 1042.840 is amended by revising paragraphs (c) and (o) to read as follows:

§ 1042.840 Application requirements for remanufactured engines.

* * * * *

(c) Summarize the cost effectiveness analysis used to demonstrate your system will meet the availability criteria of § 1042.815. Identify the maximum allowable costs for vessel modifications to meet the criteria.

* * * * *

(o) Report all valid test results. Also indicate whether there are test results from invalid tests or from any other tests of the emission-data engine, whether or not they were conducted according to the test procedures of subpart F of this part. If you measure CO_2, report those emission levels. We may require you to report these additional test results. We may ask you to send other information to confirm that your tests were valid under the requirements of this part and 40 CFR part 1065.

* * * * *

Subpart J—Definitions and Other Reference Information

■ 198. Section 1042.901 is amended as follows:

■ a. By revising the definition of ''Designated Compliance Officer''.

■ b. By adding definitions for ''Designated Enforcement Officer'', ''Dual-fuel'', and ''Flexible-fuel''.

■ c. By revising the definition for ''Low-sulfur diesel fuel'', ''Model year'', and ''Placed into service''.

■ d. By removing the definition for ''Point of first retail sale''.

The revisions and additions read as follows:

§ 1042.901 Definitions.

* * * * *

Designated Compliance Officer means the Director, Diesel Engine Compliance Center, U.S. Environmental Protection Agency, 2000 Traverwood Drive, Ann Arbor, MI 48105; *complianceinfo@epa.gov*; *epa.gov/otaq/verify*.

Designated Enforcement Officer means the Director, Air Enforcement Division (2242A), U.S. Environmental Protection Agency, 1200 Pennsylvania Ave. NW.,Washington, DC 20460.

* * * * *

Dual-fuel means relating to an engine designed for operation on two different fuels but not on a continuous mixture of those fuels (see § 1042.601(j)). For purposes of this part, such an engine remains a dual-fuel engine even if it is designed for operation on three or more different fuels. Note that this definition differs from MARPOL Annex VI.

* * * * *

Flexible-fuel means relating to an engine designed for operation on any mixture of two or more different fuels (see § 1042.601(j)).

* * * * *

Low-sulfur diesel fuel means one of the following:

(1) For in-use fuels, *low-sulfur diesel fuel* means a diesel fuel marketed as low-sulfur diesel fuel having a maximum sulfur concentration of 500 parts per million.

(2) For testing, *low-sulfur diesel fuel* has the meaning given in 40 CFR part 1065.

* * * * *

Model year means any of the following:

(1) For freshly manufactured marine engines (see definition of ''new marine engine,'' paragraph (1)), model year means one of the following:

(i) Calendar year of production.

(ii) Your annual new model production period if it is different than the calendar year. This must include January 1 of the calendar year for which the model year is named. It may not begin before January 2 of the previous calendar year and it must end by December 31 of the named calendar year. For seasonal production periods not including January 1, model year means the calendar year in which the production occurs, unless you choose to certify the applicable engine family with the following model year. For example, if your production period is June 1, 2010 through November 30, 2010, your model year would be 2010 unless you choose to certify the engine family for model year 2011.

(2) For an engine that is converted to a marine engine after being certified and placed into service as a motor vehicle engine, a nonroad engine that is not a marine engine, or a stationary engine, model year means the calendar year in which the engine was originally produced. For an engine that is converted to a marine engine after being placed into service as a motor vehicle engine, a nonroad engine that is not a marine engine, or a stationary engine without having been certified, model year means the calendar year in which the engine becomes a new marine engine. (See definition of ''new marine engine,'' paragraph (2)).

(3) For an uncertified marine engine excluded under § 1042.5 that is later subject to this part 1042 as a result of being installed in a different vessel, model year means the calendar year in which the engine was installed in the non-excluded vessel. For a marine engine excluded under § 1042.5 that is later subject to this part 1042 as a result of reflagging the vessel, model year means the calendar year in which the engine was originally manufactured. For a marine engine that become new under paragraph (7) of the definition of ''new marine engine,'' model year means the calendar year in which the engine was originally manufactured. (See definition of ''new marine engine,'' paragraphs (3) and (7).)

(4) For engines that do not meet the definition of ''freshly manufactured'' but are installed in new vessels, model year means the calendar year in which the engine is installed in the new vessel (see definition of ''new marine engine,'' paragraph (4)).

(5) For remanufactured engines, model year means the calendar year in which the remanufacture takes place.

(6) For imported engines:

(i) For imported engines described in paragraph (6)(i) of the definition of ''new marine engine,'' *model year* has the meaning given in paragraphs (1) through (4) of this definition.

(ii) For imported engines described in paragraph (6)(ii) of the definition of ''new marine engine,'' *model year* means the calendar year in which the engine is remanufactured.

(iii) For imported engines described in paragraph (6)(iii) of the definition of ''new marine engine,'' *model year* means the calendar year in which the engine is first assembled in its imported configuration, unless specified otherwise in this part or in 40 CFR part 1068.

(iv) For imported engines described in paragraph (6)(iv) of the definition of ''new marine engine,'' *model year* means the calendar year in which the engine is imported.

(7) [Reserved]

(8) For freshly manufactured vessels, model year means the calendar year in which the keel is laid or the vessel is at a similar stage of construction. For vessels that become new under paragraph (2) or (3) of the definition of ''new vessel'' (as a result of modifications), model year means the calendar year in which the modifications physically begin.

* * * * *

Placed into service means put into initial use for its intended purpose. Engines and vessels do not qualify as being ''placed into service'' based on incidental use by a manufacturer or dealer.

* * * * *

■ 199. Section 1042.905 is revised to read as follows:

§ 1042.905 Symbols, acronyms, and abbreviations.

The following symbols, acronyms, and abbreviations apply to this part:

ABT	Averaging, banking, and trading.
AECD	auxiliary emission control device.
CFR	Code of Federal Regulations.
CH_4	methane.
CO	carbon monoxide.
CO_2	carbon dioxide.
cyl	cylinder.
disp.	displacement.
ECA	Emission Control Area.
EEZ	Exclusive Economic Zone.
EPA	Environmental Protection Agency.
FEL	Family Emission Limit.
g	grams.
HC	hydrocarbon.
IMO	International Maritime Organization.
hr	hours.
kPa	kilopascals.
kW	kilowatts.
L	liters.
LTR	Limited Testing Region.
N_2O	nitrous oxide.
NARA	National Archives and Records Administration.
NMHC	nonmethane hydrocarbon.
NO_X	oxides of nitrogen (NO and NO2).
NTE	not-to-exceed.
PM	particulate matter.
RPM	revolutions per minute.
SAE	Society of Automotive Engineers.
SCR	selective catalytic reduction.
THC	total hydrocarbon.
THCE	total hydrocarbon equivalent.
ULSD	ultra low-sulfur diesel fuel.
U.S.C.	United States Code.

■ 200. Section 1042.910 is revised to read as follows:

§ 1042.910 Incorporation by reference.

(a) Certain material is incorporated by reference into this part with the approval of the Director of the Federal Register under 5 U.S.C. 552(a) and 1 CFR part 51. To enforce any edition other than that specified in this section, the Environmental Protection Agency must publish a notice of the change in the **Federal Register** and the material must be available to the public. All approved material is available for inspection at U.S. EPA, Air and Radiation Docket and Information Center, 1301 Constitution Ave. NW., Room B102, EPA West Building, Washington, DC 20460, (202) 202–1744, and is available from the sources listed below. It is also available for inspection at the National Archives and Records Administration (NARA). For information on the availability of this material at NARA, call 202–741–6030, or go to: *http://www.archives.gov/federal_register/code_of_federal_regulations/ibr_locations.html*.

(b) The International Maritime Organization, 4 Albert Embankment, London SE1 7SR, United Kingdom, or *www.imo.org*, or 44–(0)20–7735–7611.

(1) MARPOL Annex VI, Regulations for the Prevention of Air Pollution from Ships, Third Edition, 2013, and NO_x Technical Code 2008.

(i) Revised MARPOL Annex VI, Regulations for the Prevention of Pollution from Ships, Third Edition, 2013 (''2008 Annex VI''); IBR approved for § 1042.901.

(ii) NO_x Technical Code 2008, Technical Code on Control of Emission of Nitrogen Oxides from Marine Diesel Engines, 2013 Edition, (''NO_x Technical Code''); IBR approved for §§ 1042.104(g), 1042.230(d), 1042.302(c) and (e), 1042.501(g), and 1042.901.

(iii) Annex 12, Resolution MEPC.251(66) from the Report of the Marine Environment Protection Committee on its Sixty-Sixth Session, April 25, 2014. This document describes new and revised provisions that are considered to be part of Annex VI and NO_x Technical Code 2008 as referenced in paragraphs (a)(1)(i) and (ii) of this section. IBR approved for §§ 1042.104(g), 1042.230(d), 1042.302(c) and (e), 1042.501(g), and 1042.901.

(2) [Reserved]

■ 201. Section 1042.915 is revised to read as follows:

§ 1042.915 Confidential information.

The provisions of 40 CFR 1068.10 apply for information you consider confidential.

■ 202. Section 1042.925 is revised to read as follows:

§ 1042.925 Reporting and recordkeeping requirements.

(a) This part includes various requirements to submit and record data or other information. Unless we specify otherwise, store required records in any format and on any media and keep them readily available for eight years after you send an associated application for certification, or eight years after you generate the data if they do not support an application for certification. You are expected to keep your own copy of required records rather than relying on someone else to keep records on your behalf. We may review these records at any time. You must promptly send us organized, written records in English if we ask for them. We may require you to submit written records in an electronic format.

(b) The regulations in § 1042.255, 40 CFR 1068.25, and 40 CFR 1068.101 describe your obligation to report truthful and complete information. This includes information not related to certification. Failing to properly report information and keep the records we specify violates 40 CFR 1068.101(a)(2), which may involve civil or criminal penalties.

(c) Send all reports and requests for approval to the Designated Compliance Officer (see § 1042.801).

(d) Any written information we require you to send to or receive from another company is deemed to be a required record under this section. Such records are also deemed to be submissions to EPA. We may require you to send us these records whether or not you are a certificate holder.

(e) Under the Paperwork Reduction Act (44 U.S.C. 3501 *et seq.*), the Office of Management and Budget approves the reporting and recordkeeping specified in the applicable regulations. The following items illustrate the kind of reporting and recordkeeping we require for engines and vessels regulated under this part:

(1) We specify the following requirements related to engine certification in this part 1042:

(i) In § 1042.135 we require engine manufacturers to keep certain records related to duplicate labels sent to vessel manufacturers.

(ii) In § 1042.145 we state the requirements for interim provisions.

(iii) In subpart C of this part we identify a wide range of information required to certify engines.

(iv) In §§ 1042.345 and 1042.350 we specify certain records related to production-line testing.

(v) In subpart G of this part we identify several reporting and recordkeeping items for making demonstrations and getting approval related to various special compliance provisions.

(vi) In §§ 1042.725, 1042.730, and 1042.735 we specify certain records related to averaging, banking, and trading.

(vii) In subpart I of this part we specify certain records related to meeting requirements for remanufactured engines.

(2) We specify the following requirements related to testing in 40 CFR part 1065:

(i) In 40 CFR 1065.2 we give an overview of principles for reporting information.

(ii) In 40 CFR 1065.10 and 1065.12 we specify information needs for establishing various changes to published test procedures.

(iii) In 40 CFR 1065.25 we establish basic guidelines for storing test information.

(iv) In 40 CFR 1065.695 we identify the specific information and data items to record when measuring emissions.

(3) We specify the following requirements related to the general

compliance provisions in 40 CFR part 1068:

(i) In 40 CFR 1068.5 we establish a process for evaluating good engineering judgment related to testing and certification.

(ii) In 40 CFR 1068.25 we describe general provisions related to sending and keeping information.

(iii) In 40 CFR 1068.27 we require manufacturers to make engines available for our testing or inspection if we make such a request.

(iv) In 40 CFR 1068.105 we require vessel manufacturers to keep certain records related to duplicate labels from engine manufacturers.

(v) In 40 CFR 1068.120 we specify recordkeeping related to rebuilding engines.

(vi) In 40 CFR part 1068, subpart C, we identify several reporting and recordkeeping items for making demonstrations and getting approval related to various exemptions.

(vii) In 40 CFR part 1068, subpart D, we identify several reporting and recordkeeping items for making demonstrations and getting approval related to importing engines.

(viii) In 40 CFR 1068.450 and 1068.455 we specify certain records related to testing production-line engines in a selective enforcement audit.

(ix) In 40 CFR 1068.501 we specify certain records related to investigating and reporting emission-related defects.

(x) In 40 CFR 1068.525 and 1068.530 we specify certain records related to recalling nonconforming engines.

■ 203. Appendix II is revised to read as follows:

Appendix II to Part 1042—Steady-State Duty Cycles

(a) The following duty cycles apply as specified in § 1042.505(b)(1):

(1) The following duty cycle applies for discrete-mode testing:

E3 mode No.	Engine speed [1]	Percent of maximum test power	Weighting factors
1	Maximum test speed	100	0.2
2	91%	75	0.5
3	80%	50	0.15
4	63%	25	0.15

[1] Maximum test speed is defined in 40 CFR part 1065. Percent speed values are relative to maximum test speed.

(2) The following duty cycle applies for ramped-modal testing:

RMC mode	Time in mode (seconds)	Engine speed [1 3]	Power (percent) [2 3]
1a Steady-state	229	Maximum test speed	100%.
1b Transition	20	Linear transition	Linear transition in torque.
2a Steady-state	166	63%	25%.
2b Transition	20	Linear transition	Linear transition in torque.
3a Steady-state	570	91%	75%.
3b Transition	20	Linear transition	Linear transition in torque.
4a Steady-state	175	80%	50%.

[1] Maximum test speed is defined in 40 CFR part 1065. Percent speed is relative to maximum test speed.
[2] The percent power is relative to the maximum test power.
[3] Advance from one mode to the next within a 20-second transition phase. During the transition phase, command a linear progression from the torque setting of the current mode to the torque setting of the next mode, and simultaneously command a similar linear progression for engine speed if there is a change in speed setting.

(b) The following duty cycles apply as specified in § 1042.505(b)(2):

(1) The following duty cycle applies for discrete-mode testing:

E5 mode No.	Engine speed [1]	Percent of maximum test power	Weighting factors
1	Maximum test speed	100	0.08
2	91%	75	0.13
3	80%	50	0.17
4	63%	25	0.32
5	Warm idle	0	0.3

[1] Maximum test speed is defined in 40 CFR part 1065. Percent speed values are relative to maximum test speed.

(2) The following duty cycle applies for ramped-modal testing:

RMC mode	Time in mode (seconds)	Engine speed [1 3]	Power (percent) [2 3]
1a Steady-state	167	Warm idle	0%.
1b Transition	20	Linear transition	Linear transition in torque.
2a Steady-state	85	Maximum test speed	100%.
2b Transition	20	Linear transition	Linear transition in torque.
3a Steady-state	354	63%	25%.
3b Transition	20	Linear transition	Linear transition in torque.
4a Steady-state	141	91%	75%.
4b Transition	20	Linear transition	Linear transition in torque.
5a Steady-state	182	80%	50%.
5b Transition	20	Linear transition	Linear transition in torque.
6 Steady-state	171	Warm idle	0%.

[1] Maximum test speed is defined in 40 CFR part 1065. Percent speed is relative to maximum test speed.
[2] The percent power is relative to the maximum test power.
[3] Advance from one mode to the next within a 20-second transition phase. During the transition phase, command a linear progression from the torque setting of the current mode to the torque setting of the next mode, and simultaneously command a similar linear progression for engine speed if there is a change in speed setting.

(c) The following duty cycles apply as specified in § 1042.505(b)(3):

(1) The following duty cycle applies for discrete-mode testing:

E2 mode No.	Engine speed [1]	Torque (percent) [2]	Weighting factors
1	Engine Governed	100	0.2
2	Engine Governed	75	0.5
3	Engine Governed	50	0.15
4	Engine Governed	25	0.15

[1] Speed terms are defined in 40 CFR part 1065.
[2] The percent torque is relative to the maximum test torque as defined in 40 CFR part 1065.

(2) The following duty cycle applies for ramped-modal testing:

RMC mode	Time in mode (seconds)	Engine speed	Torque (percent) [1 2]
1a Steady-state	229	Engine Governed	100%.
1b Transition	20	Engine Governed	Linear transition.
2a Steady-state	166	Engine Governed	25%.
2b Transition	20	Engine Governed	Linear transition.
3a Steady-state	570	Engine Governed	75%.
3b Transition	20	Engine Governed	Linear transition.
4a Steady-state	175	Engine Governed	50%.

[1] The percent torque is relative to the maximum test torque as defined in 40 CFR part 1065.
[2] Advance from one mode to the next within a 20-second transition phase. During the transition phase, command a linear progression from the torque setting of the current mode to the torque setting of the next mode.

■ 204. Appendix III is revised to read as follows:

Appendix III to Part 1042—Not-To-Exceed Zones

(a) The following definitions apply for this Appendix III:

(1) *Percent power* means the percentage of the maximum power achieved at Maximum Test Speed (or at Maximum Test Torque for constant-speed engines).

(2) *Percent speed* means the percentage of Maximum Test Speed.

(b) Figure 1 of this Appendix illustrates the default NTE zone for marine engines certified using the duty cycle specified in § 1042.505(b)(1), except for variable-speed propulsion marine engines used with controllable-pitch propellers or with electrically coupled propellers, as follows:

(1) Subzone 1 is defined by the following boundaries:

(i) Percent power ÷ 100 ≥ 0.7 · (percent speed ÷ 100)$^{2.5}$.

(ii) Percent power ÷ 100 ≤ (percent speed ÷ 90)$^{3.5}$.

(iii) Percent power ÷ 100 ≥ 3.0 · (1 − percent speed ÷ 100).

(2) Subzone 2 is defined by the following boundaries:

(i) Percent power ÷ 100 ≥ 0.7 · (percent speed ÷ 100)$^{2.5}$.

(ii) Percent power ÷ 100 ≤ (percent speed ÷ 90)$^{3.5}$.

(iii) Percent power ÷ 100 < 3.0 · (1 − percent speed ÷ 100).

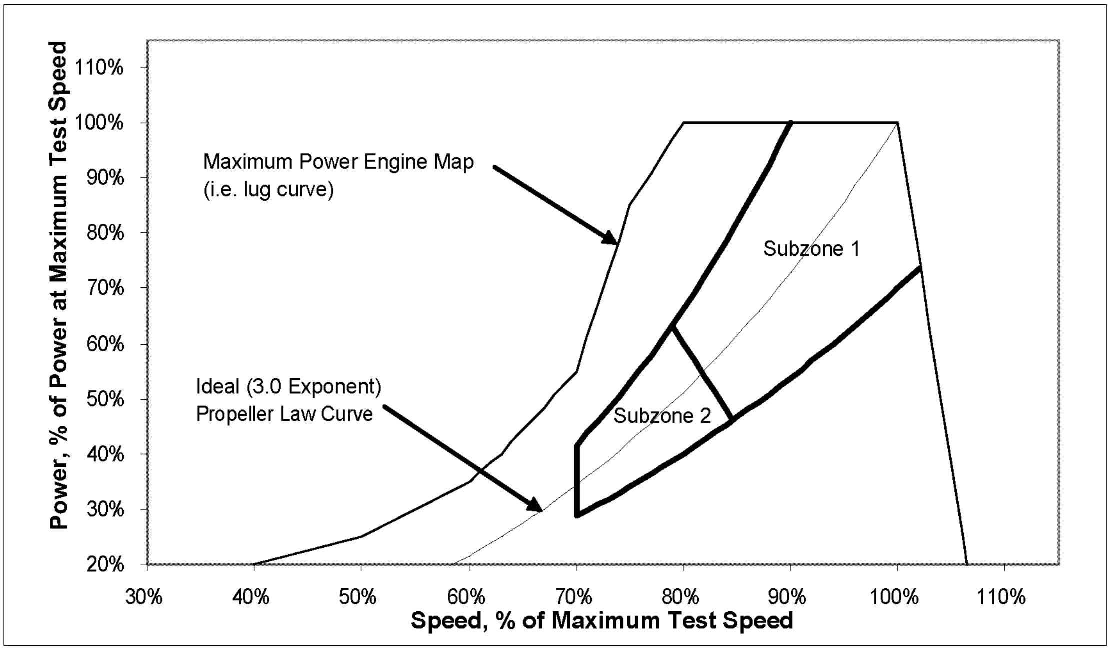
(iv) Percent speed ÷ 100 ≥ 0.7.

(3) Note that the line separating Subzone 1 and Subzone 2 includes the following endpoints:

(i) Percent speed = 78.9 percent; Percent power = 63.2 percent.

(ii) Percent speed = 84.6 percent; Percent power = 46.1 percent.

Figure 1 of Appendix III — NTE Zone and Subzones for Propeller-Law Marine Engines



(c) Figure 2 of this Appendix illustrates the default NTE zone for recreational marine engines certified using the duty cycle specified in § 1042.505(b)(2), except for variable-speed marine engines used with controllable-pitch propellers or with electrically coupled propellers, as follows:

(1) Subzone 1 is defined by the following boundaries:

(i) Percent power ÷ 100 ≥ 0.7 · (percent speed ÷ 100)$^{2.5}$.

(ii) Percent power ÷ 100 ≤ (percent speed ÷ 90)$^{3.5}$.

(iii) Percent power ÷ 100 ≥ 3.0 · (1 − percent speed ÷ 100).

(iv) Percent power ≤ 95 percent.

(2) Subzone 2 is defined by the following boundaries:

(i) Percent power ÷ 100 ≥ 0.7 · (percent speed ÷ 100)$^{2.5}$.

(ii) Percent power ÷ 100 ≤ (percent speed ÷ 90)$^{3.5}$.

(iii) Percent power ÷ 100 < 3.0 · (1 − percent speed ÷ 100).

(iv) Percent speed ≥ 70 percent.

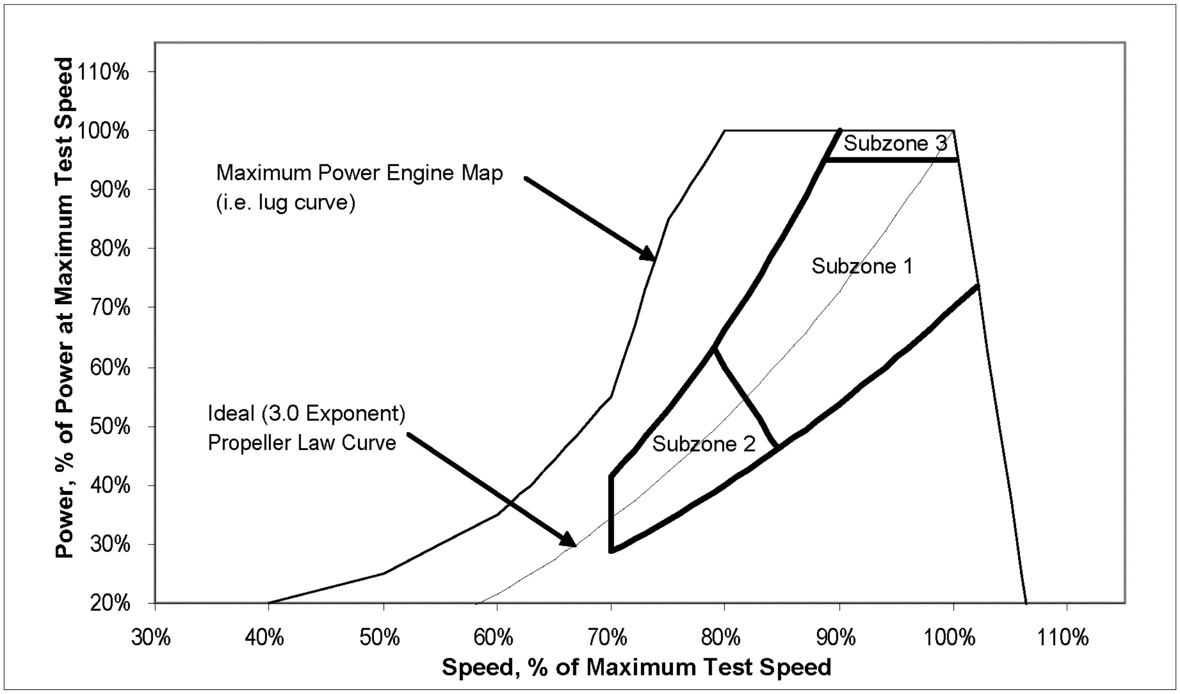
(3) Subzone 3 is defined by the following boundaries:

(i) Percent power ÷ 100 ≤ (percent speed ÷ 90)$^{3.5}$.

(ii) Percent power > 95 percent.

(4) Note that the line separating Subzone 1 and Subzone 3 includes a point at Percent speed = 88.7 percent and Percent power = 95.0 percent. See paragraph (b)(3) of this appendix regarding the line separating Subzone 1 and Subzone 2.

Figure 2 of Appendix III — NTE Zone and Subzones for Propeller-Law Recreational Marine Engines



(d) Figure 3 of this Appendix illustrates the default NTE zone for variable-speed marine engines used with controllable-pitch propellers or with electrically coupled propellers that are certified using the duty cycle specified in § 1042.505(b)(1), (2), or (3), as follows:

(1) Subzone 1 is defined by the following boundaries:

(i) Percent power ÷ 100 ≥ 0.7 · (percent speed ÷ 100)$^{2.5}$.

(ii) Percent power ÷ 100 ≥ 3.0 · (1 − percent speed ÷ 100).

(iii) Percent speed ≥ 78.9 percent.

(2) Subzone 2a is defined by the following boundaries:

(i) Percent power ÷ 100 ≥ 0.7 • (percent speed ÷ 100)$^{2.5}$.

(ii) Percent speed ≥ 70 percent.

(iii) Percent speed < 78.9 percent, for Percent power > 63.3 percent.

(iv) Percent power ÷ 100 < 3.0 · (1 − percent speed ÷ 100), for Percent speed ≥ 78.9 percent.

(3) Subzone 2b is defined by the following boundaries:

(i) The line formed by connecting the following two points on a plot of speed-vs.-power:

(A) Percent speed = 70 percent; Percent power = 28.7 percent.

(B) Percent power = 40 percent; Speed = governed speed.

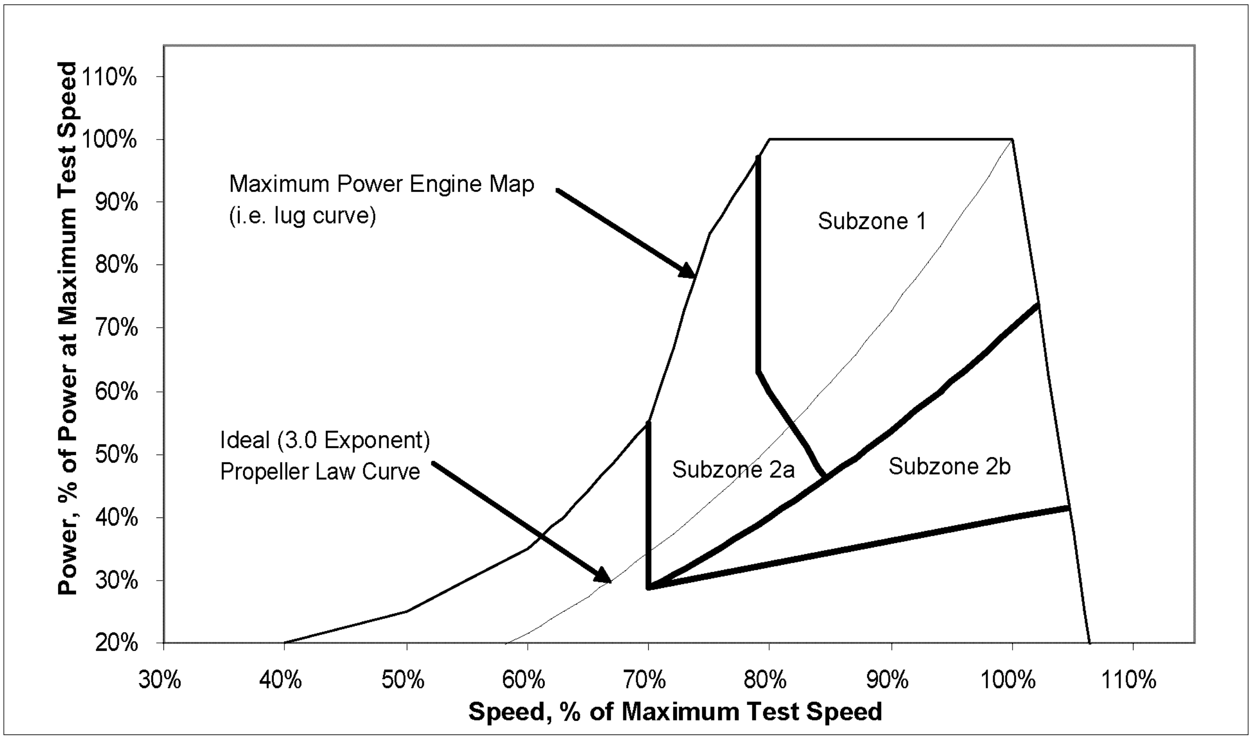
(ii) Percent power ÷ 100 < 0.7 · (percent speed ÷ 100)$^{2.5}$.

(4) Note that the line separating Subzone 1 and Subzone 2a includes the following endpoints:

(i) Percent speed = 78.9 percent; Percent power = 63.3 percent.

(ii) Percent speed = 84.6 percent; Percent power = 46.1 percent.

Figure 3 of Appendix III — NTE Zone and Subzones for Variable-Pitch or Electronically Coupled Engines*



*Shown for engines capable of operating on the E3 Duty Cycle.

(e) Figure 4 of this Appendix illustrates the default NTE zone for constant-speed engines certified using a duty cycle specified in § 1042.505(b)(3) or (b)(4), as follows:

(1) Subzone 1 is defined by the following boundaries:

(i) Percent power ≥ 70 percent.

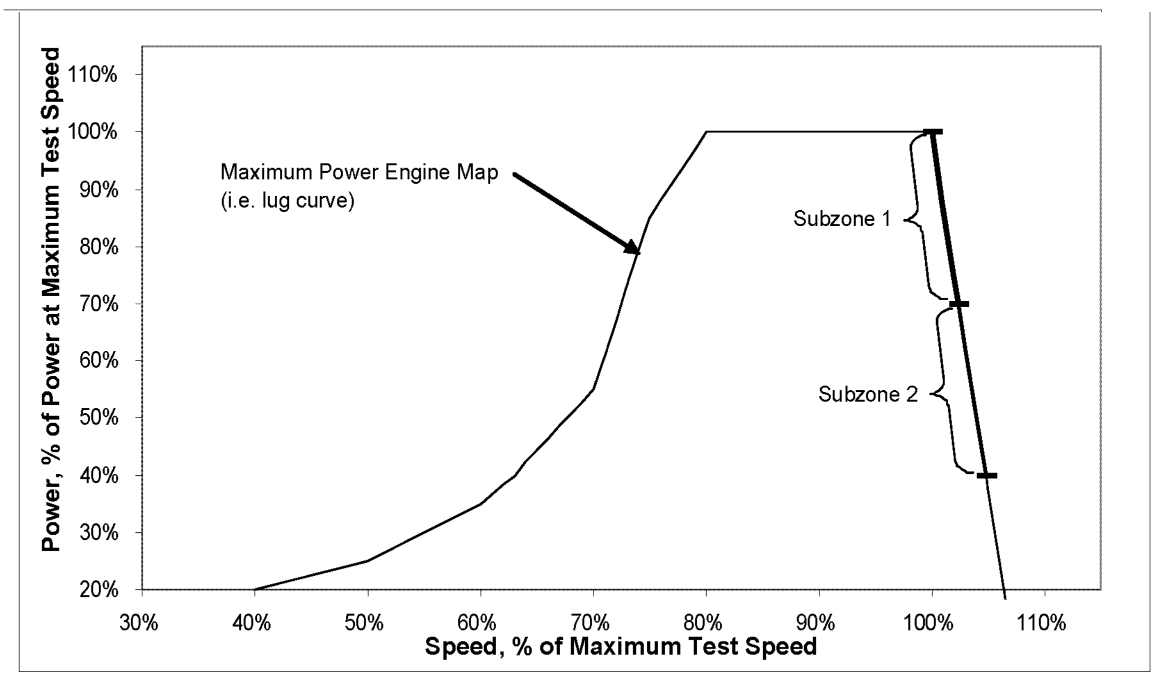
(ii) [Reserved]

(2) Subzone 2 is defined by the following boundaries:

(i) Percent power < 70 percent.

(ii) Percent power ≥ 40 percent.

Figure 4 of Appendix III — NTE Zone and Subzones for Constant-Speed Marine Engines

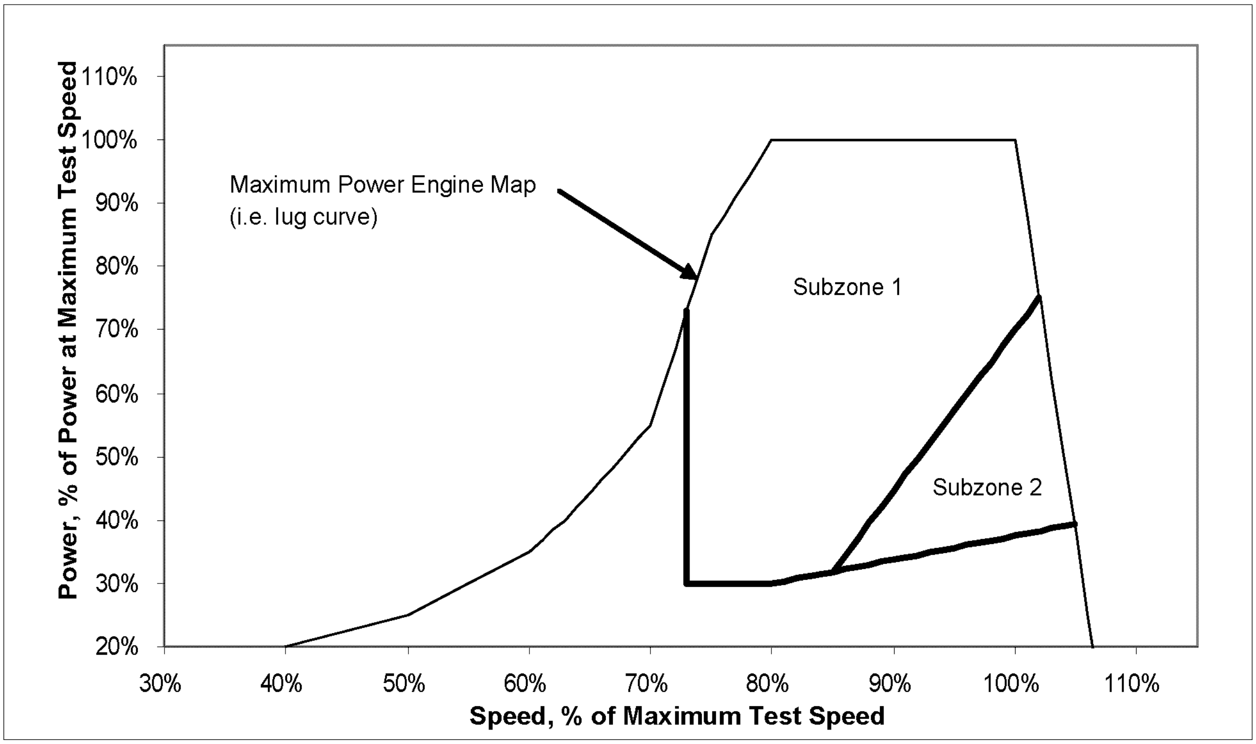


(f) Figure 5 of this Appendix illustrates the default NTE zone for variable-speed auxiliary marine engines certified using the duty cycle specified in § 1042.505(b)(5)(ii) or (iii), as follows:

(1) The default NTE zone is defined by the boundaries specified in 40 CFR 86.1370(b)(1), (2), and (4).

(2) A special PM subzone is defined in 40 CFR 1039.515(b).

Figure 5 of Appendix III — NTE Zone and Subzones for Variable-Speed Auxiliary Marine Engines (nonpropeller-law)



PART 1043—CONTROL OF NO_X, SO_X, AND PM EMISSIONS FROM MARINE ENGINES AND VESSELS SUBJECT TO THE MARPOL PROTOCOL

■ 205. The authority citation for part 1043 continues to read as follows:

Authority: 33 U.S.C. 1901–1912.

■ 206. Section 1043.60 is amended by revising paragraph (a) introductory text to read as follows:

§ 1043.60 Operating requirements for engines and vessels subject to this part.

* * * * *

(a) Except as specified otherwise in this part, NO_X emission limits apply to all engines with power output of more than 130 kW that will be installed on vessels subject to this part as specified in the following table:

* * * * *

■ 207. Section 1043.100 is revised to read as follows:

§ 1043.100 Incorporation by reference.

(a) Certain material is incorporated by reference into this part with the approval of the Director of the Federal Register under 5 U.S.C. 552(a) and 1 CFR part 51. To enforce any edition other than that specified in this section, the Environmental Protection Agency must publish a notice of the change in the **Federal Register** and the material must be available to the public. All approved material is available for inspection at U.S. EPA, Air and Radiation Docket and Information Center, 1301 Constitution Ave. NW., Room B102, EPA West Building, Washington, DC 20460, (202) 202–1744, and is available from the sources listed below. It is also available for inspection at the National Archives and Records Administration (NARA). For information on the availability of this material at NARA, call 202–741–6030, or go to: *http://www.archives.gov/federal_register/code_of_federal_regulations/ibr_locations.html.*

(b) The International Maritime Organization, 4 Albert Embankment, London SE1 7SR, United Kingdom, or *www.imo.org, or 44–(0)20–7735–7611.*

(1) MARPOL Annex VI, Regulations for the Prevention of Air Pollution from Ships, Third Edition, 2013, and NO_X Technical Code 2008.

(i) Revised MARPOL Annex VI, Regulations for the Prevention of Pollution from Ships, Third Edition, 2013 (''2008 Annex VI''); IBR approved for §§ 1043.1 introductory text, 1043.20, 1043.30(f), 1043.60(c), and 1043.70(a).

(ii) NO_X Technical Code 2008, Technical Code on Control of Emission of Nitrogen Oxides from Marine Diesel Engines, 2013 Edition, (''NO_X Technical Code''); IBR approved for §§ 1043.20, 1043.41(b) and (h), and 1043.70(a).

(iii) Annex 12, Resolution MEPC.251(66) from the Report of the Marine Environment Protection Committee on its Sixty-Sixth Sesson, April 25, 2014. This document describes new and revised provisions that are considered to be part of Annex VI and NO_X Technical Code 2008 as referenced in paragraphs (a)(1)(i) and (ii) of this section. IBR approved for §§ 1043.1 introductory text, 1043.20, 1043.30(f), 1043.41(b) and (h), 1043.60(c), and 1043.70(a).

(2) [Reserved]

PART 1065—ENGINE-TESTING PROCEDURES

■ 208. The authority citation for part 1065 continues to read as follows:

Authority: 42 U.S.C. 7401–7671q.

Subpart A—Applicability and General Provisions

■ 209. Section 1065.15 is amended by revising paragraphs (a)(2)(ii) and (iv) to read as follows:

§ 1065.15 Overview of procedures for laboratory and field testing.

* * * * *

(a) * * *

(2) * * *

(ii) Nonmethane hydrocarbon, NMHC, which results from subtracting methane, CH_4, from THC. You may choose to measure NMOG emissions to demonstrate compliance with NMHC standards.

* * * * *

(iv) Nonmethane hydrocarbon-equivalent, NMHCE, which results from adjusting NMHC mathematically to be equivalent on a carbon-mass basis. You may choose to measure NMOG emissions to demonstrate compliance with NMHCE standards.

* * * * *

Subpart F—Performing an Emission Test in the Laboratory

■ 210. Section 1065.510 is amended by revising paragraphs (c) introductory text and (d)(5)(iii) to read as follows:

§ 1065.510 Engine mapping.

* * * * *

(c) *Negative torque mapping.* If your engine is subject to a reference duty cycle that specifies negative torque values (*i.e.,* engine motoring), generate a motoring torque curve by any of the following procedures:

* * * * *

(d) * * *

(5) * * *

(iii) For any isochronous governed (0% speed droop) constant-speed engine, you may map the engine with two points as described in this paragraph (d)(5)(iii). After stabilizing at the no-load governed speed in paragraph (d)(4) of this section, record the mean feedback speed and torque. Continue to operate the engine with the governor or simulated governor controlling engine speed using operator demand, and control the dynamometer to target a speed of 99.5% of the recorded mean no-load governed speed. Allow speed and torque to stabilize. Record the mean feedback speed and torque. Record the target speed. The absolute value of the speed error (the mean feedback speed minus the target speed) must be no greater than 0.1% of the recorded mean no-load governed speed. From this series of two mean feedback speed and torque values, use linear interpolation to determine intermediate values. Use this series of two mean feedback speeds and torques to generate a power map as described in paragraph (e) of this section. Note that the measured maximum test torque as determined in § 1065.610 (b)(1) will be the mean feedback torque recorded on the second point.

* * * * *

Subpart G—Calculations and Data Requirements

■ 211. Section 1065.610 is amended by revising paragraphs (a)(1)(ii), (a)(1)(iii), (a)(1)(vi), (b), and (c)(1) and (2) to read as follows:

§ 1065.610 Duty cycle generation.

* * * * *

(a) * * *

(1) * * *

(ii) Determine the lowest and highest engine speeds corresponding to 98% of P_{max}, using linear interpolation, and no extrapolation, as appropriate.

(iii) Determine the engine speed corresponding to maximum power, f_{nPmax}, by calculating the average of the two speed values from paragraph (a)(1)(ii) of this section. If there is only one speed where power is equal to 98% of P_{max}, take f_{nPmax} as the speed at which P_{max} occurs.

* * * * *

(vi) Determine the lowest and highest engine speeds corresponding to the value calculated in paragraph (a)(1)(v) of this section, using linear interpolation as appropriate. Calculate f_{ntest} as the average of these two speed values. If there is only one speed corresponding to the value calculated in paragraph (a)(1)(v) of this section, take f_{ntest} as the speed where the maximum of the sum of the squares occurs.

* * * * *

(b) *Maximum test torque, T_{test}.* For constant-speed engines, determine the measured T_{test} from the torque and power-versus-speed maps, generated according to § 1065.510, as follows:

(1) For constant speed engines mapped using the methods in § 1065.510(d)(5)(i) or (ii), determine T_{test} as follows:

(i) Determine maximum power, P_{max}, from the engine map generated according to § 1065.510 and calculate the value for power equal to 98% of P_{max}.

(ii) Determine the lowest and highest engine speeds corresponding to 98% of P_{max}, using linear interpolation, and no extrapolation, as appropriate.

(iii) Determine the engine speed corresponding to maximum power, f_{nPmax}, by calculating the average of the two speed values from paragraph (a)(1)(ii) of this section. If there is only one speed where power is equal to 98% of P_{max}, take f_{nPmax} as the speed at which P_{max} occurs.

(iv) Transform the map into a normalized power-versus-speed map by dividing power terms by P_{max} and dividing speed terms by f_{nPmax}. Use the Equation 1065.610–1 to calculate a quantity representing the sum of squares from the normalized map.

(v) Determine the maximum value for the sum of the squares from the map and multiply that value by 0.98.

(vi) Determine the lowest and highest engine speeds corresponding to the value calculated in paragraph (a)(1)(v) of this section, using linear interpolation as appropriate. Calculate f_{ntest} as the average of these two speed values. If there is only one speed corresponding to the value calculated in paragraph (a)(1)(v) of this section, take f_{ntest} as the speed where the maximum of the sum of the squares occurs.

(vii) The measured T_{test} is the mapped torque at f_{ntest}.

(2) For constant-speed engines using the two-point mapping method in § 1065.510(d)(5)(iii), you may follow paragraph (a)(1) of this section to determine the measured T_{test}, or you may use the measured torque of the second point as the measured T_{test} directly.

(3) Transform normalized torques to reference torques according to paragraph (d) of this section by using the measured maximum test torque determined according to paragraph (b)(1) of this section—or use your declared maximum test torque, as allowed in § 1065.510.

(c) * * *

(1) *% speed.* If your normalized duty cycle specifies % speed values, use your warm idle speed and your maximum test speed to transform the duty cycle, as follows:

$$f_{\text{nref}} = \%\,speed \cdot (f_{\text{ntest}} - f_{\text{nidle}}) + f_{\text{nidle}} \qquad \text{Eq. 1065.610-3}$$

Example:

$\%\,speed = 85\%$
$f_{\text{ntest}} = 2364$ r/min
$f_{\text{nidle}} = 650$ r/min
$f_{\text{nref}} = 85\% \cdot (2364 - 650) + 650$
$f_{\text{nref}} = 2107$ r/min

(2) *A, B, and C speeds.* If your normalized duty cycle specifies speeds as A, B, or C values, use your power-versus-speed curve to determine the lowest speed below maximum power at which 50% of maximum power occurs. Denote this value as n_{lo}. Take n_{lo} to be warm idle speed if all power points at speeds below the maximum power speed are higher than 50% of maximum power. Also determine the highest speed above maximum power at which 70% of maximum power occurs. Denote this value as n_{hi}. If all power points at speeds above the maximum power speed are higher than 70% of maximum power, take n_{hi} to be the declared maximum safe engine speed or the declared maximum representative engine speed, whichever is lower. Use n_{hi} and n_{lo} to calculate reference values for A, B, or C speeds as follows:

$$f_{\text{nrefA}} = 0.25 \cdot (n_{\text{hi}} - n_{\text{lo}}) + n_{\text{lo}} \qquad \text{Eq. 1065.610-4}$$

$$f_{\text{nrefB}} = 0.50 \cdot (n_{\text{hi}} - n_{\text{lo}}) + n_{\text{lo}} \qquad \text{Eq. 1065.610-5}$$

$$f_{\text{nrefC}} = 0.75 \cdot (n_{\text{hi}} - n_{\text{lo}}) + n_{\text{lo}} \qquad \text{Eq. 1065.610-6}$$

Example:

$n_{\text{lo}} = 1005$ r/min
$n_{\text{hi}} = 2385$ r/min
$f_{\text{nrefA}} = 0.25 \cdot (2385 - 1005) + 1005$
$f_{\text{nrefB}} = 0.50 \cdot (2385 - 1005) + 1005$
$f_{\text{nrefC}} = 0.75 \cdot (2385 - 1005) + 1005$
$f_{\text{nrefA}} = 1350$ r/min
$f_{\text{nrefB}} = 1695$ r/min
$f_{\text{nrefC}} = 2040$ r/min

* * * * *

■ 212. Section 1065.655 is amended by revising paragraph (d)(1) to read as follows:

§ 1065.655 Chemical balances of fuel, intake air, and exhaust.

* * * * *

(d) * * *

(1) You may calculate w_{C} as described in this paragraph (d)(1) based on measured fuel properties. To do so, you must determine values for α and β in all cases, but you may set γ and δ to zero if the default value listed in Table 1 of this section is zero. Calculate w_{C} using the following equation:

$$w_{\text{C}} = \frac{1 \cdot M_{\text{C}}}{1 \cdot M_{\text{C}} + \alpha \cdot M_{\text{H}} + \beta \cdot M_{\text{O}} + \gamma \cdot M_{\text{S}} + \delta \cdot M_{\text{N}}} \qquad \text{Eq. 1065.655-19}$$

Where:

w_{C} = carbon mass fraction of fuel.
M_{C} = molar mass of carbon.
α = atomic hydrogen-to-carbon ratio of the mixture of fuel(s) being combusted.
M_{H} = molar mass of hydrogen.
β = atomic oxygen-to-carbon ratio of the mixture of fuel(s) being combusted.
M_{O} = molar mass of oxygen.
γ = atomic sulfur-to-carbon ratio of the mixture of fuel(s) being combusted.
M_{S} = molar mass of sulfur.
δ = atomic nitrogen-to-carbon ratio of the mixture of fuel(s) being combusted.
M_{N} = molar mass of nitrogen.

Example:

α = 1.8
β = 0.05
γ = 0.0003
δ = 0.0001
M_{C} = 12.0107
M_{H} = 1.00794
M_{O} = 15.9994
M_{S} = 32.065
M_{N} = 14.0067

$$\alpha = 1.8$$

$$\beta = 0.05$$

$$\gamma = 0.0003$$

$$\delta = 0.0001$$

$$M_C = 12.0107$$

$$M_H = 1.00794$$

$$M_O = 15.9994$$

$$M_S = 32.065$$

$$M_N = 14.0067$$

$$w_C = \frac{1 \cdot 12.0107}{1 \cdot 12.0107 + 1.8 \cdot 1.00794 + 0.05 \cdot 15.9994 + 0.0003 \cdot 32.065 + 0.0001 \cdot 14.0067}$$

$$w_C = 0.8206$$

$w_C = 0.8206$

* * * * *

■ 213. Section 1065.680 is added to read as follows:

§ 1065.680 Adjusting emission levels to account for infrequently regenerating aftertreatment devices.

This section describes how to calculate and apply emission adjustment factors for engines using aftertreatment technology with infrequent regeneration events that may occur during testing. These adjustment factors are typically calculated based on measurements conducted for the purposes of engine certification, and then used to adjust the results of testing related to demonstrating compliance with emission standards. For this section, ''regeneration'' means an intended event during which emission levels change while the system restores aftertreatment performance. For example, exhaust gas temperatures may increase temporarily to remove sulfur from adsorbers or to oxidize accumulated particulate matter in a trap. Also, ''infrequent'' refers to regeneration events that are expected to occur on average less than once over a transient or ramped-modal duty cycle, or on average less than once per mode in a discrete-mode test.

(a) *Adjustment factors.* Apply adjustment factors based on whether there is active regeneration during a test segment. The test segment may be a test interval or a full duty cycle, as described in paragraph (b) of this section. For engines subject to standards over more than one duty cycle, you must develop adjustment factors under this section for each separate duty cycle. You must be able to identify active regeneration in a way that is readily apparent during all testing. All adjustment factors for regeneration are additive.

(1) If active regeneration does not occur during a test segment, apply an upward adjustment factor, *UAF,* that will be added to the measured emission rate for that test segment. Use the following equation to calculate *UAF:*

$$UAF_{[\text{cycle}]} = EF_{A[\text{cycle}]} - EF_{L[\text{cycle}]} \quad \text{Eq. 1065.680-1}$$

Where:

$EF_{A[\text{cycle}]}$ = the average emission factor over the test segment as determined in paragraph (a)(4) of this section.

$EF_{L[\text{cycle}]}$ = measured emissions over a complete test segment in which active regeneration does not occur.

Example:

EF_{ARMC} = 0.15 g/kW·hr

EF_{LRMC} = 0.11 g/kW·hr

UAF_{RMC} = 0.15 − 0.11 = 0.04 g/kW·hr

(2) If active regeneration occurs or starts to occur during a test segment, apply a downward adjustment factor, *DAF,* that will be subtracted from the measured emission rate for that test segment. Use the following equation to calculate *DAF:*

$$DAF_{[\text{cycle}]} = EF_{\text{H[cycle]}} - EF_{\text{A[cycle]}} \qquad \text{Eq. 1065.680-2}$$

Where:

$EF_{\text{H[cycle]}}$ = measured emissions over the test segment from a complete regeneration event, or the average emission rate over multiple complete test segments with regeneration if the complete regeneration event lasts longer than one test segment.

Example:

EF_{ARMC} = 0.15 g/kW·hr

EF_{HRMC} = 0.50 g/kW·hr

DAF_{RMC} = 0.50 − 0.15 = 0.35 g/kW·hr

(3) Note that emissions for a given pollutant may be lower during regeneration, in which case EF_{L} would be greater than EF_{H}, and both *UAF* and *DAF* would be negative.

(4) Calculate the average emission factor, EF_{A}, as follows:

$$EF_{\text{A[cycle]}} = F_{[\text{cycle}]} \cdot EF_{\text{H[cycle]}} + (1.00 - F_{[\text{cycle}]}) \cdot EF_{\text{L[cycle]}} \qquad \text{Eq. 1065.680-3}$$

Where:

$F_{[\text{cycle}]}$ = the frequency of the regeneration event during the test segment, expressed in terms of the fraction of equivalent test segments during which active regeneration occurs, as described in paragraph (a)(5) of this section.

Example:

F_{RMC} = 0.10

EF_{ARMC} = 0.10 · 0.50 + (1.00 − 0.10) · 0.11 = 0.15 g/kW·hr

(5) The frequency of regeneration, *F,* generally characterizes how often a regeneration event occurs within a series of test segments. Determine *F* using the following equation, subject to the provisions of paragraph (a)(6) of this section:

$$F_{[\text{cycle}]} = \frac{i_{\text{r[cycle]}}}{i_{\text{f[cycle]}} + i_{\text{r[cycle]}}} \qquad \text{Eq. 1065.680-4}$$

Where:

$i_{\text{r[cycle]}}$ = the number of successive test segments required to complete an active regeneration, rounded up to the next whole number.

$i_{\text{f[cycle]}}$ = the number of test segments from the end of one complete regeneration event to the start of the next active regeneration, without rounding.

Example:

$$i_{\text{rRMC}} = 2$$

$$i_{\text{fRMC}} = 17.86$$

$$F_{\text{RMC}} = \frac{2}{17.86 + 2} = 0.10$$

(6) Use good engineering judgment to determine i_{r} and i_{f}, as follows:

(i) For engines that are programmed to regenerate after a specific time interval, you may determine the duration of a regeneration event and the time between regeneration events based on the engine's design parameters. For other engines, determine these values based on measurements from in-use operation or from running repetitive duty cycles in a laboratory.

(ii) For engines subject to standards over multiple duty cycles, such as for transient and steady-state testing, apply this same calculation to determine a value of *F* for each duty cycle.

(iii) Consider an example for an engine that is designed to regenerate its PM filter 500 minutes after the end of the last regeneration event, with the regeneration event lasting 30 minutes. If the RMC takes 28 minutes, i_{rRMC} = 2 (30 ÷ 28 = 1.07, which rounds up to 2), and i_{fRMC} = 500 ÷ 28 = 17.86.

(b) Develop adjustment factors for different types of testing as follows:

(1) *Discrete-mode testing.* Develop separate adjustment factors for each test mode (test interval) of a discrete-mode test. When measuring EF_{H}, if a regeneration event has started but is not complete when you reach the end of the sampling time for a test interval, extend the sampling period for that test interval until the regeneration event is complete.

(2) *Ramped-modal and transient testing.* Develop a separate set of adjustment factors for an entire ramped-modal cycle or transient duty cycle. When measuring EF_{H}, if a regeneration event has started but is not complete when you reach the end of the duty-cycle, start the next repeat test as soon as possible, allowing for the time needed to complete emission measurement and installation of new filters for PM measurement; in that case EF_{H} is the average emission level for the test segments that included regeneration.

(3) *Accounting for cold-start measurements.* For engines subject to cold-start testing requirements, incorporate cold-start operation into your analysis as follows:

(i) Determine the frequency of regeneration, *F,* in a way that incorporates the impact of cold-start operation in proportion to the cold-start weighting factor specified in the standard-setting part. You may use good engineering judgment to determine the effect of cold-start operation analytically.

(ii) Treat cold-start testing and hot-start testing together as a single test segment for adjusting measured emission results under this section.

Apply the adjustment factor to the composite emission result.

(iii) You may apply the adjustment factor only to the hot-start test result if your aftertreatment technology does not regenerate during cold operation as represented by the cold-start transient duty cycle. If we ask for it, you must demonstrate this by engineering analysis or by test data.

(c) If an engine has multiple regeneration strategies, determine and apply adjustment factors under this section separately for each type of regeneration.

■ 214. Section 1065.1005 is amended by revising paragraph (f)(2) to read as follows:

§ 1065.1005 Symbols, abbreviations, acronyms, and units of measure.

* * * * *

(f) * * *

(2) This part uses the following molar masses or effective molar masses of chemical species:

Symbol	Quantity	$10^{-3}\cdot kg\cdot mol^{-1}$
M_{air}	molar mass of dry air [1]	28.96559
M_{Ar}	molar mass of argon	39.948
M_{C}	molar mass of carbon	12.0107
M_{CH3OH}	molar mass of methanol	32.04186
M_{C2H5OH}	molar mass of ethanol	46.06844
M_{C2H4O}	molar mass of acetaldehyde	44.05256
M_{CH4N2O}	molar mass of urea	60.05526
M_{C3H8}	molar mass of propane	44.09562
M_{C3H7OH}	molar mass of propanol	60.09502
M_{CO}	molar mass of carbon monoxide	28.0101
M_{CH4}	molar mass of methane	16.0425
M_{CO2}	molar mass of carbon dioxide	44.0095
M_{H}	molar mass of atomic hydrogen	1.00794
M_{H2}	molar mass of molecular hydrogen	2.01588
M_{H2O}	molar mass of water	18.01528
M_{CH2O}	molar mass of formaldehyde	30.02598
M_{He}	molar mass of helium	4.002602
M_{N}	molar mass of atomic nitrogen	14.0067
M_{N2}	molar mass of molecular nitrogen	28.0134
M_{NH3}	molar mass of ammonia	17.03052
M_{NMHC}	effective C_1 molar mass of nonmethane hydrocarbon [2]	13.875389
M_{NMHCE}	effective C_1 molar mass of nonmethane hydrocarbon equivalent [2]	13.875389
M_{NOX}	effective molar mass of oxides of nitrogen [3]	46.0055
M_{N2O}	molar mass of nitrous oxide	44.0128
M_{O}	molar mass of atomic oxygen	15.9994
M_{O2}	molar mass of molecular oxygen	31.9988
M_{S}	molar mass of sulfur	32.065
M_{THC}	effective C_1 molar mass of total hydrocarbon [2]	13.875389
M_{THCE}	effective C_1 molar mass of total hydrocarbon equivalent [2]	13.875389

[1] See paragraph (f)(1) of this section for the composition of dry air.

[2] The effective molar masses of THC, THCE, NMHC, and NMHCE are defined on a C_1 basis and are based on an atomic hydrogen-to-carbon ratio, α, of 1.85 (with β, γ, and δ equal to zero).

[3] The effective molar mass of NO_X is defined by the molar mass of nitrogen dioxide, NO_2.

* * * * *

PART 1066—VEHICLE-TESTING PROCEDURES

■ 215. The authority citation for part 1066 continues to read as follows:

Authority: 42 U.S.C. 7401–7671q.

Subpart C—Dynamometer Specifications

■ 216. Section 1066.210 is amended by revising paragraph (d)(3) to read as follows:

§ 1066.210 Dynamometers.

* * * * *

(d) * * *

(3) The load applied by the dynamometer simulates forces acting on the vehicle during normal driving according to the following equation:

$$FR_i = A \cdot \frac{100}{\sqrt{100^2 + G_i^2}} + B \cdot v_i + C \cdot v_i^2 + M_e \cdot \frac{v_i - v_{i-1}}{t_i - t_{i-1}} + M \cdot a_g \cdot \frac{G_i}{\sqrt{100^2 + G_i^2}} \quad \text{Eq. 1066.210-1}$$

Where:

FR = total road-load force to be applied at the surface of the roll. The total force is the sum of the individual tractive forces applied at each roll surface.

i = a counter to indicate a point in time over the driving schedule. For a dynamometer operating at 10-Hz intervals over a 600-second driving schedule, the maximum value of *i* should be 6,000.

A = a vehicle-specific constant value representing the vehicle's frictional load in lbf or newtons. See subpart D of this part.

G_i = instantaneous road grade, in percent (increase in elevation per 100 units horizontal length).

B = a vehicle-specific coefficient representing load from drag and rolling resistance, which are a function of vehicle speed, in lbf/mph or N·s/m. See subpart D of this part.

v = instantaneous linear speed at the roll surfaces as measured by the dynamometer, in mph or m/s. Let v_{i-1} = 0 for i = 0.

C = a vehicle-specific coefficient representing aerodynamic effects, which are a function of vehicle speed squared, in lbf/mph² or N·s²/m². See subpart D of this part.

M_e = the vehicle's effective mass in lbm or kg, including the effect of rotating axles as specified in § 1066.310(b)(7).
t = elapsed time in the driving schedule as measured by the dynamometer, in seconds. Let $t_{i-1} = 0$ for $i = 0$.
M = the measured vehicle mass, in lbm or kg.
a_g = acceleration of Earth's gravity, as described in 40 CFR 1065.630.

* * * * *

Subpart D—Coastdown

■ 217. Section 1066.301 is amended by adding introductory text to read as follows:

§ 1066.301 Overview of road-load determination procedures.

Vehicle testing on a chassis dynamometer involves simulating the road-load force, which is the sum of forces acting on a vehicle from aerodynamic drag, tire rolling resistance, driveline losses, and other effects of friction. Determine dynamometer settings to simulate road-load force in two stages. First, perform a road-load force specification by characterizing on-road operation. Second, perform a road-load derivation to determine the appropriate dynamometer load settings to simulate the road-load force specification from the on-road test.

* * * * *

■ 218. Section 1066.310 is amended by revising paragraphs (b)(7)(ii)(B) and (D) to read as follows:

§ 1066.310 Coastdown procedures for vehicles above 14,000 pounds GVWR.

* * * * *

(b) * * *

(7) * * *

(ii) * * *

(B) Calculate the vehicle's effective mass, M_e, in kg by adding 56.7 kg to the measured vehicle mass, M, for each tire making road contact. This accounts for the rotational inertia of the wheels and tires.

* * * * *

(D) Plot the data from all the coastdown runs on a single plot of F_i vs. v_i^2 to determine the slope correlation, D, based on the following equation:

$$F_i - M \cdot a_g \cdot \frac{\Delta h}{\Delta s} = A_m + D \cdot v_i^2 \qquad \text{Eq. 1066.310-2}$$

Where:
M = the measured vehicle mass, expressed to at least the nearest 0.1 kg.
a_g = acceleration of Earth's gravity, as described in 40 CFR 1065.630.
Δh = change in elevation over the measurement interval, in m. Assume Δh = 0 if you are not correcting for grade.
Δs = distance the vehicle travels down the road during the measurement interval, in m.
A_m = the calculated value of the y-intercept based on the curve-fit.

* * * * *

Subpart E—Preparing Vehicles and Running an Exhaust Emission Test

■ 219. Section 1066.410 is amended by revising paragraph (h) introductory text to read as follows:

§ 1066.410 Dynamometer test procedure.

* * * * *

(h) Determine equivalent test weight as follows:

* * * * *

Subpart G—Calculations

■ 220. Section 1066.605 is amended by redesignating paragraphs (d) through (g) as paragraphs (e) through (h), respectively and adding a new paragraph (d) to read as follows:

§ 1066.605 Mass-based and molar-based exhaust emission calculations.

* * * * *

(d) Calculate g/mile emission rates using the following equation unless specified otherwise in the standard-setting part:

$$e_{[\text{emission}]} = \frac{m_{[\text{emission}]}}{D}$$

Where:
$e_{[\text{emission}]}$ = emission rate over the test interval.
$m_{[\text{emission}]}$ = emission mass over the test interval.
D = the measured driving distance over the test interval.

Example:

$$m_{\text{NOx}} = 0.3177 \text{ g}$$

$$D_{\text{HFET}} = 10.19$$

$$e_{\text{NOx}} = \frac{0.3177}{10.19} = 0.0312 \text{ g/mi}$$

* * * * *

Subpart H—Cold Temperature Test Procedures

■ 221. Section 1066.710 is amended by revising paragraphs (a)(5) and (d)(3) introductory text to read as follows:

§ 1066.710 Cold temperature testing procedures for measuring CO and NMHC emissions and determining fuel economy.

* * * * *

(a) * * *

(5) Adjust the dynamometer to simulate vehicle operation on the road at −7 °C as described in § 1066.305(b)(2).

* * * * *

(d) * * *

(3) You may start the preconditioning drive once the fuel in the fuel tank reaches (–12.6 to –1.4) °C. Precondition the vehicle as follows:

* * * * *

Subpart I—Exhaust Emission Test Procedures for Motor Vehicles

■ 222. Section 1066.815 is amended by revising paragraph (b) introductory text to read as follows:

§ 1066.815 Exhaust emission test procedures for FTP testing.

* * * * *

(b) *PM sampling options.* Collect PM using any of the procedures specified in paragraphs (b)(1) through (5) of this section and use the corresponding equation in § 1066.820 to calculate FTP composite emissions. Testing must meet the requirements related to filter face velocity as described in 40 CFR 1065.170(c)(1)(vi), except as specified in paragraphs (b)(4) and (5) of this section. For procedures involving flow weighting, set the filter face velocity to a weighting target of 1.0 to meet the requirements of 40 CFR 1065.170(c)(1)(vi). Allow filter face velocity to decrease as a percentage of the weighting factor if the weighting factor is less than 1.0. Use the appropriate equations in § 1066.610 to show that you meet the dilution factor requirements of § 1066.110(b)(2)(iii)(B). If you collect PM using the procedures specified in paragraph (b)(4) or (b)(5) of this section, the residence time requirements in 40 CFR 1065.140(e)(3) apply, except that you may exceed an overall residence time of 5.5 s for sample flow rates below the highest expected sample flow rate.

* * * * *

PART 1068—GENERAL COMPLIANCE PROVISIONS FOR HIGHWAY, STATIONARY, AND NONROAD PROGRAMS

■ 223. The authority citation for part 1068 continues to read as follows:

Authority: 42 U.S.C. 7401–7671q.

Subpart A—Applicability and Miscellaneous Provisions

■ 224. Section 1068.1 is revised to read as follows:

§ 1068.1 Does this part apply to me?

(a) The provisions of this part apply to everyone with respect to the engine and equipment categories as described in this paragraph (a). They apply to everyone, including owners, operators, parts manufacturers, and persons performing maintenance. Where we identify an engine category, the provisions of this part also apply with respect to the equipment using such engines. This part 1068 applies to different engine and equipment categories as follows:

(1) This part 1068 applies to motor vehicles we regulate under 40 CFR part 86, subpart S, to the extent and in the manner specified in 40 CFR parts 85 and 86.

(2) This part 1068 applies for heavy-duty motor vehicles certified under 40 CFR part 1037, subject to the provisions of 40 CFR parts 85 and 1037. This part 1068 applies to other heavy-duty motor vehicles and motor vehicle engines to the extent and in the manner specified in 40 CFR parts 85, 86, and 1036.

(3) This part 1068 applies to highway motorcycles we regulate under 40 CFR part 86, subparts E and F, to the extent and in the manner specified in 40 CFR parts 85 and 86.

(4) This part 1068 applies to aircraft we regulate under 40 CFR part 87 to the extent and in the manner specified in 40 CFR part 87.

(5) This part 1068 applies for locomotives that are subject to the provisions of 40 CFR part 1033. This part 1068 does not apply for locomotives or locomotive engines that were originally manufactured before July 7, 2008, and that have not been remanufactured on or after July 7, 2008.

(6) This part 1068 applies for land-based nonroad compression-ignition engines that are subject to the provisions of 40 CFR part 1039. This part 1068 does not apply for engines certified under 40 CFR part 89.

(7) This part 1068 applies for stationary compression-ignition engines certified using the provisions of 40 CFR parts 89, 94, 1039, and 1042 as described in 40 CFR part 60, subpart IIII.

(8) This part 1068 applies for marine compression-ignition engines that are subject to the provisions of 40 CFR part 1042. This part 1068 does not apply for marine compression-ignition engines certified under 40 CFR part 94.

(9) This part 1068 applies for marine spark-ignition engines that are subject to the provisions of 40 CFR part 1045. This part 1068 does not apply for marine spark-ignition engines certified under 40 CFR part 91.

(10) This part 1068 applies for large nonroad spark-ignition engines that are subject to the provisions of 40 CFR part 1048.

(11) This part 1068 applies for stationary spark-ignition engines certified using the provisions of 40 CFR part 1048 or part 1054, as described in 40 CFR part 60, subpart JJJJ.

(12) This part 1068 applies for recreational engines and vehicles, including snowmobiles, off-highway motorcycles, and all-terrain vehicles that are subject to the provisions of 40 CFR part 1051.

(13) This part applies for small nonroad spark-ignition engines that are subject to the provisions of 40 CFR part 1054. This part 1068 does not apply for nonroad spark-ignition engines certified under 40 CFR part 90.

(14) This part applies for fuel-system components installed in nonroad equipment powered by volatile liquid fuels that are subject to the provisions of 40 CFR part 1060.

(b) [Reserved]

(c) Paragraph (a) of this section identifies the parts of the CFR that define emission standards and other requirements for particular types of engines and equipment. This part 1068 refers to each of these other parts generically as the ''standard-setting part.'' For example, 40 CFR part 1051 is always the standard-setting part for snowmobiles. Follow the provisions of the standard-setting part if they are different than any of the provisions in this part.

(d) Specific provisions in this part 1068 start to apply separate from the schedule for certifying engines/equipment to new emission standards, as follows:

(1) The provisions of §§ 1068.30 and 1068.310 apply for stationary spark-ignition engines built on or after January 1, 2004, and for stationary compression-ignition engines built on or after January 1, 2006.

(2) The provisions of §§ 1068.30 and 1068.235 apply for the types of engines/equipment listed in paragraph (a) of this section beginning January 1, 2004, if they are used solely for competition.

(3) The standard-setting part may specify how the provisions of this part 1068 apply for uncertified engines/equipment.

■ 225. Section 1068.10 is amended by revising the section heading to read as follows:

§ 1068.10 Confidential information.

* * * * *

■ 226. Section 1068.15 is amended by revising the section heading and paragraph (a) to read as follows:

§ 1068.15 General provisions for EPA decision-making.

(a) Not all EPA employees may represent the Agency with respect to EPA decisions under this part or the standard-setting part. Only the Administrator of the Environmental Protection Agency or an official to whom the Administrator has delegated specific authority may represent the Agency. For more information, ask for a copy of the relevant sections of the EPA Delegations Manual from the Designated Compliance Officer.

* * * * *

§ 1068.20—[Amended]

■ 227. Section 1068.20 is amended by removing paragraphs (b) and (c) and redesignating paragraphs (d) through (f) as paragraphs (b) through (d), respectively.

■ 228. Section 1068.27 is revised to read as follows:

§ 1068.27 May EPA conduct testing with my engines/equipment?

(a) As described in the standard-setting part, we may perform testing on your engines/equipment before we issue a certificate of conformity. This is generally known as confirmatory testing.

(b) If we request it, you must make a reasonable number of production-line engines or pieces of production-line equipment available for a reasonable time so we can test or inspect them for compliance with the requirements of this chapter.

(c) If your emission-data engine/equipment or production engine/equipment requires special components for proper testing, you must promptly provide any such components to us if we ask for them.

■ 229. Section 1068.30 is revised to read as follows:

§ 1068.30 Definitions.

The following definitions apply to this part. The definitions apply to all subparts unless we note otherwise. All undefined terms have the meaning the Clean Air Act gives to them. The definitions follow:

Affiliated companies or *affiliates* means one of the following:

(1) For determinations related to small manufacturer allowances or other small business provisions, these terms mean all entities considered to be affiliates with your entity under the Small Business Administration's regulations in 13 CFR 121.103.

(2) For all other provisions, these terms mean all of the following:

(i) Parent companies (as defined in this section).

(ii) Subsidiaries (as defined in this section).

(iii) Subsidiaries of your parent company.

Aftertreatment means relating to a catalytic converter, particulate filter, or any other system, component, or technology mounted downstream of the exhaust valve (or exhaust port) whose design function is to reduce emissions in the engine exhaust before it is exhausted to the environment. Exhaust-gas recirculation (EGR) is not aftertreatment.

Aircraft means any vehicle capable of sustained air travel more than 100 feet above the ground.

Certificate holder means a manufacturer (including importers) with a valid certificate of conformity for at least one family in a given model year, or the preceding model year. Note that only manufacturers may hold certificates. Your applying for or accepting a certificate is deemed to be your agreement that you are a manufacturer.

Clean Air Act means the Clean Air Act, as amended, 42 U.S.C. 7401–7671q.

Date of manufacture means one of the following:

(1) For engines, the date on which the crankshaft is installed in an engine block, with the following exceptions:

(i) For engines produced by secondary engine manufacturers under § 1068.262, date of manufacture means the date the engine is received from the original engine manufacturer. You may assign an earlier date up to 30 days before you received the engine, but not before the crankshaft was installed. You may not assign an earlier date if you cannot demonstrate the date the crankshaft was installed.

(ii) Manufacturers may assign a date of manufacture at a point in the assembly process later than the date otherwise specified under this definition. For example, a manufacturer may use the build date printed on the label or stamped on the engine as the date of manufacture.

(2) For equipment, the date on which the engine is installed, unless otherwise specified in the standard-setting part. Manufacturers may alternatively assign a date of manufacture later in the assembly process.

Days means calendar days, including weekends and holidays.

Defeat device has the meaning given in the standard-setting part.

Designated Compliance Officer means one of the following:

(1) For motor vehicles regulated under 40 CFR part 86, subpart S: Director, Light-Duty Vehicle Center, U.S. Environmental Protection Agency, 2000 Traverwood Drive, Ann Arbor, MI 48105; *complianceinfo@epa.gov; epa.gov/otaq/verify.*

(2) For compression-ignition engines used in heavy-duty highway vehicles regulated under 40 CFR part 86, subpart A, and 40 CFR parts 1036 and 1037, and for nonroad and stationary compression-ignition engines or equipment regulated under 40 CFR parts 60, 1033, 1039, and 1042: Director, Diesel Engine Compliance Center, U.S. Environmental Protection Agency, 2000 Traverwood Drive, Ann Arbor, MI 48105; *complianceinfo@epa.gov*; *epa.gov/otaq/verify*.

(3) Director, Gasoline Engine Compliance Center, U.S. Environmental Protection Agency, 2000 Traverwood Drive, Ann Arbor, MI 48105; *nonroad-si-cert@epa.gov*; *epa.gov/otaq/verify*, for all the following engines and vehicles:

(i) For spark-ignition engines used in heavy-duty highway vehicles regulated under 40 CFR part 86, subpart A, and 40 CFR parts 1036 and 1037,

(ii) For highway motorcycles regulated under 40 CFR part 86, subpart E.

(iii) For nonroad and stationary spark-ignition engines or equipment regulated under 40 CFR parts 60, 1045, 1048, 1051, 1054, and 1060.

Engine means an engine block with an installed crankshaft, or a gas turbine engine. The term engine does not include engine blocks without an installed crankshaft, nor does it include any assembly of reciprocating engine components that does not include the engine block. (**Note:** For purposes of this definition, any component that is the primary means of converting an engine's energy into usable work is considered a crankshaft, whether or not it is known commercially as a crankshaft.) This includes complete and partially complete engines as follows:

(1) A complete engine is a fully assembled engine in its final configuration. In the case of equipment-based standards, an engine is not considered complete until it is installed in the equipment, even if the engine itself is fully assembled.

(2) A partially complete engine is an engine that is not fully assembled or is not in its final configuration. Except where we specify otherwise in this part or the standard-setting part, partially complete engines are subject to the same standards and requirements as complete engines. The following would be considered examples of partially complete engines:

(i) An engine that is missing certain emission-related components.

(ii) A new engine that was originally assembled as a motor-vehicle engine that will be recalibrated for use as a nonroad engine.

(iii) A new engine that was originally assembled as a land-based engine that will be modified for use as a marine propulsion engine.

(iv) A short block consisting of a crankshaft and other engine components connected to the engine block, but missing the head assembly.

(v) A long block consisting of all engine components except the fuel system and an intake manifold.

(vi) In the case of equipment-based standards, a fully functioning engine that is not yet installed in the equipment. For example, a fully functioning engine that will be installed in an off-highway motorcycle or a locomotive is considered partially complete until it is installed in the equipment.

Engine-based standard means an emission standard expressed in units of grams of pollutant per kilowatt-hour (or grams of pollutant per horsepower-hour) that applies to the engine. Emission standards are either engine-based or equipment-based. Note that engines may be subject to additional standards such as smoke standards.

Engine-based test means an emission test intended to measure emissions in units of grams of pollutant per kilowatt-hour (or grams of pollutant per horsepower-hour), without regard to whether the standard applies to the engine or equipment. Note that some products that are subject to engine-based testing are subject to additional test requirements such as for smoke.

Engine configuration means a unique combination of engine hardware and calibration within an engine family. Engines within a single engine configuration differ only with respect to normal production variability or factors unrelated to emissions.

Engine/equipment and *engines/equipment* mean engine(s) and/or equipment depending on the context. Specifically these terms mean the following:

(1) Engine(s) when only engine-based standards apply.

(2) Engine(s) for testing issues when engine-based testing applies.

(3) Engine(s) and equipment when both engine-based and equipment-based standards apply.

(4) Equipment when only equipment-based standards apply.

(5) Equipment for testing issues when equipment-based testing applies.

Equipment means one of the following things:

(1) Any vehicle, vessel, or other type of equipment that is subject to the requirements of this part or that uses an engine that is subject to the requirements of this part. An installed engine is part of the equipment.

(2) Fuel-system components that are subject to an equipment-based standard under this chapter. Installed fuel-system components are also considered part of the engine/equipment to which they are attached.

Equipment-based standard means an emission standard that applies to the equipment in which an engine is used or to fuel-system components associated with an engine, without regard to how the emissions are measured. If equipment-based standards apply, we require that the equipment or fuel-system components be certified rather than just the engine. Emission standards are either engine-based or equipment-based. For example, recreational vehicles we regulate under 40 CFR part 1051 are subject to equipment-based standards even if emission measurements are based on engine operation alone.

Excluded engines/equipment means engines/equipment that are not subject to emission standards or other requirements because they do not meet the definitions or other regulatory provisions that define applicability. For example, a non-stationary engine that is used solely for off-highway competition is excluded from the requirements of this part because it meets neither the definition of ‘‘motor vehicle engine’’ nor ‘‘nonroad engine’’ under section 216 of the Clean Air Act.

Exempted means relating to engines/equipment that are not required to meet otherwise applicable standards. Exempted engines/equipment must conform to regulatory conditions specified for an exemption in this part 1068 or in the standard-setting part. Exempted engines/equipment are deemed to be ‘‘subject to’’ the standards of the standard-setting part even though they are not required to comply with the otherwise applicable requirements. Engines/equipment exempted with respect to a certain tier of standards may be required to comply with an earlier tier of standards as a condition of the exemption; for example, engines exempted with respect to Tier 3 standards may be required to comply with Tier 1 or Tier 2 standards.

Family means engine family or emission family, as applicable under the standard-setting part.

Final deteriorated test result has the meaning given in the standard-setting part. If it is not defined in the standard-setting part, it means the emission level that results from applying all appropriate adjustments (such as deterioration factors) to the measured emission result of the emission-data engine.

Gas turbine engine means anything commercially known as a gas turbine engine or any collection of assembled engine components that is substantially similar to engines commercially known as gas turbine engines. For example, a jet engine is a gas turbine engine. Gas turbine engines may be complete or partially complete. Turbines that rely on external combustion such as steam engines are not gas turbine engines.

Good engineering judgment means judgments made consistent with generally accepted scientific and engineering principles and all available relevant information. See § 1068.5.

Manufacturer has the meaning given in section 216(1) of the Clean Air Act (42 U.S.C. 7550(1)). In general, this term includes any person who manufactures or assembles an engine or piece of equipment for sale in the United States or otherwise introduces a new engine or piece of equipment into U.S. commerce. This includes importers that import new engines or new equipment into the United States for resale. It also includes secondary engine manufacturers.

Model year has the meaning given in the standard-setting part. Unless the standard-setting part specifies otherwise, model year for individual engines/equipment is based on the date of manufacture or a later stage in the assembly process determined by the manufacturer, subject to the limitations described in §§ 1068.103 and 1068.360. The model year of a new engine that is neither certified nor exempt is deemed to be the calendar year in which it is sold, offered for sale, imported, or delivered or otherwise introduced into U.S. commerce.

Motor vehicle has the meaning given in 40 CFR 85.1703(a).

New has the meaning we give it in the standard-setting part. Note that in certain cases, used and remanufactured engines/equipment may be ‘‘new’’ engines/equipment.

Nonroad engine means:

(1) Except as discussed in paragraph (2) of this definition, a nonroad engine is an internal combustion engine that meets any of the following criteria:

(i) It is (or will be) used in or on a piece of equipment that is self-propelled or serves a dual purpose by both propelling itself and performing another function (such as garden tractors, off-highway mobile cranes and bulldozers).

(ii) It is (or will be) used in or on a piece of equipment that is intended to be propelled while performing its function (such as lawnmowers and string trimmers).

(iii) By itself or in or on a piece of equipment, it is portable or transportable, meaning designed to be and capable of being carried or moved from one location to another. Indicia of transportability include, but are not limited to, wheels, skids, carrying handles, dolly, trailer, or platform.

(2) An internal combustion engine is not a nonroad engine if it meets any of the following criteria:

(i) The engine is used to propel a motor vehicle, an aircraft, or equipment used solely for competition.

(ii) The engine is regulated under 40 CFR part 60, (or otherwise regulated by a federal New Source Performance Standard promulgated under section 111 of the Clean Air Act (42 U.S.C. 7411)). Note that this criterion does not apply for engines meeting any of the criteria of paragraph (1) of this definition that are voluntarily certified under 40 CFR part 60.

(iii) The engine otherwise included in paragraph (1)(iii) of this definition remains or will remain at a location for more than 12 consecutive months or a shorter period of time for an engine located at a seasonal source. A location is any single site at a building, structure, facility, or installation. For any engine (or engines) that replaces an engine at a location and that is intended to perform the same or similar function as the engine replaced, include the time period of both engines in calculating the consecutive time period. An engine located at a seasonal source is an engine that remains at a seasonal source during the full annual operating period of the seasonal source. A seasonal source is a stationary source that remains in a single location on a permanent basis (*i.e.*, at least two years) and that operates at that single location approximately three months (or more) each year. See § 1068.31 for provisions that apply if the engine is removed from the location.

Operating hours means:

(1) For engine and equipment storage areas or facilities, times during which people other than custodians and security personnel are at work near, and can access, a storage area or facility.

(2) For other areas or facilities, times during which an assembly line operates or any of the following activities occurs:

(i) Testing, maintenance, or service accumulation.

(ii) Production or compilation of records.

(iii) Certification testing.

(iv) Translation of designs from the test stage to the production stage.

(v) Engine or equipment manufacture or assembly.

Parent company means any entity that has a controlling ownership of another company. Note that the standard-setting part may treat a partial owner as a parent company even if it does not have controlling ownership of a company.

Piece of equipment means any vehicle, vessel, locomotive, aircraft, or other type of equipment equipped with engines to which this part applies.

Placed into service means used for its intended purpose. Engines/equipment do not qualify as being ''placed into service'' based on incidental use by a manufacturer or dealer.

Reasonable technical basis means information that would lead a person familiar with engine design and function to reasonably believe a conclusion related to compliance with the requirements of this part. For example, it would be reasonable to believe that parts performing the same function as the original parts (and to the same degree) would control emissions to the same degree as the original parts. Note that what is a reasonable basis for a person without technical training might not qualify as a reasonable technical basis.

Relating to as used in this section means relating to something in a specific, direct manner. This expression is used in this section only to define terms as adjectives and not to broaden the meaning of the terms. Note that ''relating to'' is used in the same manner as in the standard-setting parts.

Replacement engine means an engine exempted as a replacement engine under § 1068.240.

Revoke means to terminate the certificate or an exemption for a family. If we revoke a certificate or exemption, you must apply for a new certificate or exemption before continuing to introduce the affected engines/equipment into U.S. commerce. This does not apply to engines/equipment you no longer possess.

Secondary engine manufacturer means anyone who produces a new engine by modifying a complete or partially complete engine that was made by a different company. For the purpose of this definition, ''modifying'' does not include making changes that do not remove an engine from its original certified configuration. Secondary engine manufacturing includes, for example, converting automotive engines for use in industrial applications, or land-based engines for use in marine applications. This applies whether it involves a complete or partially complete engine and whether the engine was previously certified to emission standards or not.

(1) Manufacturers controlled by the manufacturer of the base engine (or by an entity that also controls the manufacturer of the base engine) are not secondary engine manufacturers; rather, both entities are considered to be one manufacturer for purposes of this part.

(2) This definition applies equally to equipment manufacturers that modify engines. Also, equipment manufacturers that certify to equipment-based standards using engines produced by another company are deemed to be secondary engine manufacturers.

(3) Except as specified in paragraph (2) of this definition, companies importing complete engines into the United States are not secondary engine manufacturers regardless of the procedures and relationships between companies for assembling the engines.

Small business means either of the following:

(1) A company that qualifies under the standard-setting part for special provisions for small businesses or small-volume manufacturers.

(2) A company that qualifies as a small business under the regulations adopted by the Small Business Administration at 13 CFR 121.201 if the standard-setting part does not establish such qualifying criteria.

Standard-setting part means a part in the Code of Federal Regulations that defines emission standards for a particular engine and/or piece of equipment (see § 1068.1(a)). For example, the standard-setting part for marine spark-ignition engines is 40 CFR part 1045. For provisions related to evaporative emissions, the standard-setting part may be 40 CFR part 1060, as specified in 40 CFR 1060.1.

Subsidiary means an entity that is owned or controlled by a parent company.

Suspend means to temporarily discontinue the certificate or an exemption for a family. If we suspend a certificate, you may not sell, offer for sale, or introduce or deliver into commerce in the United States or import into the United States engines/equipment from that family unless we reinstate the certificate or approve a new one. This also applies if we suspend an exemption, unless we reinstate the exemption.

Ultimate purchaser means the first person who in good faith purchases a new engine or new piece of equipment for purposes other than resale.

United States, in a geographic sense, means the States, the District of Columbia, the Commonwealth of Puerto Rico, the Commonwealth of the Northern Mariana Islands, Guam, American Samoa, and the U.S. Virgin Islands.

U.S.-directed production volume has the meaning given in the standard-setting part.

Void means to invalidate a certificate or an exemption *ab initio* (''from the beginning''). If we void a certificate, all the engines/equipment introduced into U.S. commerce under that family for that model year are considered uncertified (or nonconforming) and are therefore not covered by a certificate of conformity, and you are liable for all engines/equipment introduced into U.S. commerce under the certificate and may face civil or criminal penalties or both. This applies equally to all engines/equipment in the family, including engines/equipment introduced into U.S. commerce before we voided the certificate. If we void an exemption, all the engines/equipment introduced into U.S. commerce under that exemption are considered uncertified (or nonconforming), and you are liable for engines/equipment introduced into U.S. commerce under the exemption and may face civil or criminal penalties or both. You may not sell, offer for sale, or introduce or deliver into commerce in the United States or import into the United States any additional engines/equipment using the voided exemption.

Voluntary emission recall means a repair, adjustment, or modification program voluntarily initiated and conducted by a manufacturer to remedy any emission-related defect for which engine owners have been notified.

We (us, our) means the Administrator of the Environmental Protection Agency and any authorized representatives.

■ 230. Section 1068.31 is amended by revising the section heading, the introductory text, and paragraph (c) to read as follows:

§ 1068.31 Changing the status of nonroad or stationary engines under the definition of ''nonroad engine''.

This section specifies the provisions that apply when an engine previously used in a nonroad application is subsequently used in an application other than a nonroad application, or when an engine previously used in a stationary application (*i.e.*, an engine that was not used as a nonroad engine and that was not used to propel a motor vehicle, an aircraft, or equipment used solely for competition) is moved.

* * * * *

(c) A stationary engine does not become a new nonroad engine if it is moved but continues to meet the criteria specified in paragraph (2)(iii) in the definition of ''nonroad engine'' in § 1068.30 in its new location. For example, a transportable engine that is used in a single specific location for 18 months and is later moved to a second specific location where it will remain for at least 12 months is considered to be a stationary engine in both locations. Note that for stationary engines that are neither portable nor transportable in actual use, the residence-time restrictions in the definition of ''nonroad engine'' generally do not apply.

* * * * *

■ 231. A new § 1068.32 is added to read as follows:

§ 1068.32 Explanatory terms.

This section explains how certain phrases and terms are used in 40 CFR parts 1000 through 1099, especially those used to clarify and explain regulatory provisions.

(a) *Types of provisions.* The term ''provision'' includes all aspects of the regulations. As described in this section, regulatory provisions include standards, requirements, prohibitions, and allowances, along with a variety of other types of provisions. In certain cases, we may use these terms to apply to some but not all of the provisions of a part or section. For example, we may apply the allowances of a section for certain engines, but not the requirements. We may also apply all provisions except the requirements and prohibitions.

(1) A standard is a requirement established by regulation that limits the emissions of air pollutants. Examples of standards include numerical emission standards (such as 0.01 g/kW-hr) and design standards (such a closed crankcase standard). Compliance with or conformance to a standard is a specific type of requirement, and in some cases a standard may be discussed as a requirement. Thus, a statement about the requirements of a part or section also applies with respect to the standards of the part or section.

(2) The regulations apply other requirements in addition to standards. For example, manufacturers are required to keep records and provide reports to EPA.

(3) While requirements state what someone must do, prohibitions state what someone may not do. Prohibitions are often referred to as prohibited acts or prohibited actions. Most penalties apply for violations of prohibitions. A list of prohibitions may therefore include the failure to meet a requirement as a prohibited action.

(4) Allowances provide some form of relief from requirements. This may include provisions delaying implementation, establishing exemptions or test waivers, or creating alternative compliance options. Allowances may be conditional. For example, we may exempt you from certain requirements on the condition that you meet certain other requirements.

(5) The regulations also include important provisions that are not standards, requirements, prohibitions, or allowances, such as definitions.

(6) Engines/equipment are generally considered ''*subject to*'' a specific provision if that provision applies, or if it does not apply because of an exemption authorized under the regulation. For example, locomotives are subject to the provisions of 40 CFR part 1033 even if they are exempted from the standards of part 1033.

(b) *Singular and plural.* Unless stated otherwise or unless it is clear from the regulatory context, provisions written in singular form include the plural form and provisions written in plural form include the singular form. For example, the statement ''The manufacturer must keep this report for three years'' is equivalent to ''The manufacturers must keep these reports for three years.''

(c) *Inclusive lists.* Lists in the regulations prefaced by ''including'' or ''this includes'' are not exhaustive. The terms ''including'' and ''this includes'' should be read to mean ''including but not limited to'' and ''this includes but is not limited to''. For example, the phrase ''including small manufacturers'' does not exclude large manufacturers. However, prescriptive statements to ''include'' specific items (such as those related to recordkeeping and reporting requirements) may be exhaustive.

(d) *Notes.* Statements that begin with ''**Note:**'' or ''Note that'' are intended to clarify specific regulatory provisions stated elsewhere in the regulations. By themselves, such statements are not intended to specify regulatory requirements. Such statements are typically used for regulatory text that, while legally sufficient to specify a requirement, may be misunderstood by some readers. For example, the regulations might note that a word is defined elsewhere in the regulations to have a specific meaning that may be either narrower or broader than some readers might assume.

(e) *Examples.* Examples provided in the regulations are typically introduced by either ''for example'' or ''such as''. Specific examples given in the regulations do not necessarily represent the most common examples. The regulations may specify examples conditionally (that is, specifying that they are applicable only if certain criteria or conditions are met). Lists of examples cannot be presumed to be exhaustive lists.

(f) *Generally and typically.* Statements that begin with ''generally'', ''in general'', or ''typically'' should not be read to apply universally or absolutely. Rather they are intended to apply for the most common circumstances. ''Generally'' and ''typically'' statements may be identified as notes as described in paragraph (d) of this section.

(g) *Unusual circumstances.* The regulations specify certain allowances that apply ''in unusual circumstances''. While it is difficult to precisely define what ''unusual circumstances'' means, this generally refers to specific circumstances that are both rare and unforeseeable. For example, a severe hurricane in the northeastern United States may be considered to be an unusual circumstance, while a less severe hurricane in the southeastern United States may not be. Where the regulations limit an allowance to unusual circumstances, manufacturers and others should not presume that such an allowance will be available to them. Provisions related to unusual circumstances may be described using the phrase ''normal circumstances'', which are those circumstances that are not unusual circumstances.

(h) *Exceptions and other specifications.* Regulatory provisions may be expressed as a general prohibition, requirement, or allowance that is modified by other regulatory text. Such provisions may include phrases such as ''unless specified otherwise'', ''except as specified'', or ''as specified in this section''. It is important that the exceptions and the more general statement be considered together. This regulatory construct is intended to allow the core requirement or allowance to be stated in simple, clear sentences, rather than more precise and comprehensive sentences that may be misread. For example, where an action is prohibited in most but not all circumstances, the provision may state that you may not take the action, ''except as specified in this section.'' The exceptions could then be stated in subsequent regulatory text.

■ 232. Section 1068.35 is amended by revising the section heading to read as follows:

§ 1068.35 Symbols, acronyms, and abbreviations.

* * * * *

■ 233. Section 1068.40 is amended by revising the section heading and paragraph (a) and removing paragraph (c).

The revisions read as follows:

§ 1068.40 Special provisions for implementing changes in the regulations.

(a) During the 12 months following the effective date of any change in the provisions of this part, you may ask to apply the previously applicable provisions. Note that the effective date is generally 30 or 60 days after publication in the **Federal Register**, as noted in the final rule. We will generally approve your request if you can demonstrate that it would be impractical to comply with the new requirements. We may consider the potential for adverse environmental impacts in our decision. Similarly, in unusual circumstances, you may ask for relief under this paragraph (a) from new requirements that apply under the standard-setting part.

* * * * *

■ 234. Section 1068.45 is amended by revising paragraph (e) and adding paragraphs (g) and (h) to read as follows:

§ 1068.45 General labeling provisions.

* * * * *

(e) *Prohibitions against removing labels.* As specified in § 1068.101(b)(7), removing permanent labels is prohibited except for certain circumstances. Removing temporary or removable labels prematurely is also prohibited by § 1068.101(b)(7).

* * * * *

(g) *Date format.* If you use a coded approach to identify the engine/equipment's date of manufacture, describe or interpret the code in your application for certification.

(h) *Branding.* The following provisions apply if you identify the name and trademark of another company instead of your own on your emission control information label, as provided in the standard-setting part:

(1) You must have a contractual agreement with the other company that obligates that company to take the following steps:

(i) Meet the emission warranty requirements that apply under the standard-setting part. This may involve a separate agreement involving reimbursement of warranty-related expenses.

(ii) Report all warranty-related information to the certificate holder.

(2) In your application for certification, identify the company whose trademark you will use.

(3) You remain responsible for meeting all the requirements of this chapter, including warranty and defect-reporting provisions.

■ 235. Section 1068.95 is revised to read as follows:

§ 1068.95 Incorporation by reference.

(a) Certain material is incorporated by reference into this part with the approval of the Director of the Federal Register under 5 U.S.C. 552(a) and 1 CFR part 51. To enforce any edition other than that specified in this section, a document must be published in the **Federal Register** and the material must be available to the public. All approved materials are available for inspection at the Air and Radiation Docket and Information Center (Air Docket) in the EPA Docket Center (EPA/DC) at Rm. 3334, EPA West Bldg., 1301 Constitution Ave. NW., Washington, DC. The EPA/DC Public Reading Room hours of operation are 8:30 a.m. to 4:30 p.m., Monday through Friday, excluding legal holidays. The telephone number of the EPA/DC Public Reading Room is (202) 566–1744, and the telephone number for the Air Docket is (202) 566–1742. These approved materials are also available for inspection at the National Archives and Records Administration (NARA). For information on the availability of this material at NARA, call (202) 741–6030 or go to *http://www.archives.gov/federal_register/code_of_federal_regulations/ibr_locations.html.* In addition, these materials are available from the sources listed below.

(b) SAE International, 400 Commonwealth Dr., Warrendale, PA 15096–0001, (724) 776–4841, or *http://www.sae.org*:

(1) SAE J1930, Electrical/Electronic Systems Diagnostic Terms, Definitions, Abbreviations, and Acronyms, revised April 2002 (''SAE J1930''), IBR approved for § 1068.45(f).

(2) [Reserved]

Subpart B—Prohibited Actions and Related Requirements

■ 236. Section 1068.101 is amended by revising the introductory text and paragraphs (a)(1), (b), and (h) introductory text to read as follows:

§ 1068.101 What general actions does this regulation prohibit?

This section specifies actions that are prohibited and the maximum civil penalties that we can assess for each violation in accordance with 42 U.S.C. 7522 and 7524. The maximum penalty values listed in paragraphs (a) and (b) of this section and in § 1068.125 apply as of December 7, 2013. As described in paragraph (h) of this section, these maximum penalty limits are different for earlier violations and they may be adjusted as set forth in 40 CFR part 19.

(a) * * *

(1) *Introduction into commerce.* You may not sell, offer for sale, or introduce

or deliver into commerce in the United States or import into the United States any new engine/equipment after emission standards take effect for the engine/equipment, unless it is covered by a valid certificate of conformity for its model year and has the required label or tag. You also may not take any of the actions listed in the previous sentence with respect to any equipment containing an engine subject to this part's provisions unless the engine is covered by a valid certificate of conformity for its model year and has the required engine label or tag. We may assess a civil penalty up to $37,500 for each engine or piece of equipment in violation.

(i) For purposes of this paragraph (a)(1), a valid certificate of conformity is one that applies for the same model year as the model year of the equipment (except as allowed by § 1068.105(a)), covers the appropriate category or subcategory of engines/equipment (such as locomotive or sterndrive/inboard Marine SI or nonhandheld Small SI), and conforms to all requirements specified for equipment in the standard-setting part. Engines/equipment are considered not covered by a certificate unless they are in a configuration described in the application for certification.

(ii) The prohibitions of this paragraph (a)(1) also apply for new engines you produce to replace an older engine in a piece of equipment, except that the engines may qualify for the replacement-engine exemption in § 1068.240.

(iii) The prohibitions of this paragraph (a)(1) also apply for new engines that will be installed in equipment subject to equipment-based standards, except that the engines may qualify for an exemption under § 1068.260(c) or § 1068.262.

(iv) Where the regulations specify that you are allowed to introduce engines/equipment into U.S. commerce without a certificate of conformity, you may take any of the otherwise prohibited actions specified in this paragraph (a)(1) with respect to those engines/equipment.

* * * * *

(b) The following prohibitions apply to everyone with respect to the engines and equipment to which this part applies:

(1) *Tampering.* You may not remove or render inoperative any device or element of design installed on or in engines/equipment in compliance with the regulations prior to its sale and delivery to the ultimate purchaser. You also may not knowingly remove or render inoperative any such device or element of design after such sale and delivery to the ultimate purchaser. This includes, for example, operating an engine without a supply of appropriate quality urea if the emission control system relies on urea to reduce NO_X emissions or the use of incorrect fuel or engine oil that renders the emissions control system inoperative. Section 1068.120 describes how this applies to rebuilding engines. See the standard-setting part, which may include additional provisions regarding actions prohibited by this requirement. For a manufacturer or dealer, we may assess a civil penalty up to $37,500 for each engine or piece of equipment in violation. For anyone else, we may assess a civil penalty up to $3,750 for each engine or piece of equipment in violation. This prohibition does not apply in any of the following situations:

(i) You need to repair the engine/equipment and you restore it to proper functioning when the repair is complete.

(ii) You need to modify the engine/equipment to respond to a temporary emergency and you restore it to proper functioning as soon as possible.

(iii) You modify new engines/equipment that another manufacturer has already certified to meet emission standards and recertify them under your own family. In this case you must tell the original manufacturer not to include the modified engines/equipment in the original family.

(2) *Defeat devices.* You may not knowingly manufacture, sell, offer to sell, or install, any component that bypasses, impairs, defeats, or disables the control of emissions of any regulated pollutant, except as explicitly allowed by the standard-setting part. We may assess a civil penalty up to $3,750 for each component in violation.

(3) *Stationary engines.* For an engine that is excluded from any requirements of this chapter because it is a stationary engine, you may not move it or install it in any mobile equipment except as allowed by the provisions of this chapter. You may not circumvent or attempt to circumvent the residence-time requirements of paragraph (2)(iii) of the nonroad engine definition in § 1068.30. Anyone violating this paragraph (b)(3) is deemed to be a manufacturer in violation of paragraph (a)(1) of this section. We may assess a civil penalty up to $37,500 for each engine or piece of equipment in violation.

(4) *Competition engines/equipment.* (i) For uncertified engines/equipment that are excluded or exempted as new engines/equipment from any requirements of this chapter because they are to be used solely for competition, you may not use any of them in a manner that is inconsistent with use solely for competition. Anyone violating this paragraph (b)(4)(i) is deemed to be a manufacturer in violation of paragraph (a)(1) of this section. We may assess a civil penalty up to $37,500 for each engine or piece of equipment in violation.

(ii) For certified nonroad engines/equipment that qualify for exemption from the tampering prohibition as described in § 1068.235 because they are to be used solely for competition, you may not use any of them in a manner that is inconsistent with use solely for competition. Anyone violating this paragraph (b)(4)(ii) is in violation of paragraph (b)(1) or (2) of this section. Certified motor vehicles and motor vehicle engines and their emission control devices must remain in their certified configuration even if they are used solely for competition or if they become nonroad vehicles or engines; anyone modifying a certified motor vehicle or motor vehicle engine for any reason is subject to the tampering and defeat device prohibitions of 40 CFR 1068.101(b) and 42 U.S.C. 7522(a)(3).

(5) *Importation.* You may not import an uncertified engine or piece of equipment if it is defined to be new in the standard-setting part with a model year for which emission standards applied. Anyone violating this paragraph (b)(5) is deemed to be a manufacturer in violation of paragraph (a)(1) of this section. We may assess a civil penalty up to $37,500 for each engine or piece of equipment in violation. Note the following:

(i) The definition of new is broad for imported engines/equipment; uncertified engines and equipment (including used engines and equipment) are generally considered to be new when imported.

(ii) Used engines/equipment that were originally manufactured before applicable EPA standards were in effect are generally not subject to emission standards.

(6) *Warranty, recall, and maintenance instructions.* You must meet your obligation to honor your emission-related warranty under § 1068.115, including any commitments you identify in your application for certification. You must also fulfill all applicable requirements under subpart F of this part related to emission-related defects and recalls. You must also provide emission-related installation and maintenance instructions as described in the standard-setting part. Failure to meet these obligations is prohibited. Also, except as specifically

provided by regulation, you are prohibited from directly or indirectly communicating to the ultimate purchaser or a later purchaser that the emission-related warranty is valid only if the owner has service performed at authorized facilities or only if the owner uses authorized parts, components, or systems. We may assess a civil penalty up to $37,500 for each engine or piece of equipment in violation.

(7) *Labeling.* (i) You may not remove or alter an emission control information label or other required permanent label except as specified in this paragraph (b)(7) or otherwise allowed by this chapter. Removing or altering an emission control information label is a violation of paragraph (b)(1) of this section. However, it is not a violation to remove a label in the following circumstances:

(A) The engine is destroyed, is permanently disassembled, or otherwise loses its identity such that the original title to the engine is no longer valid.

(B) The regulations specifically direct you to remove the label. For example, see § 1068.235.

(C) The part on which the label is mounted needs to be replaced. In this case, you must have a replacement part with a duplicate of the original label installed by the certifying manufacturer or an authorized agent, except that the replacement label may omit the date of manufacture if applicable. We generally require labels to be permanently attached to parts that will not normally be replaced, but this provision allows for replacements in unusual circumstances, such as damage in a collision or other accident.

(D) The original label is incorrect, provided that it is replaced with the correct label from the certifying manufacturer or an authorized agent. This allowance to replace incorrect labels does not affect whether the application of an incorrect original label is a violation.

(ii) Removing or altering a temporary or removable label contrary to the provisions of this paragraph (b)(7)(ii) is a violation of paragraph (b)(1) of this section.

(A) For labels identifying temporary exemptions, you may not remove or alter the label while the engine/equipment is in an exempt status. The exemption is automatically revoked for each engine/equipment for which the label has been removed.

(B) For temporary or removable consumer information labels, only the ultimate purchaser may remove the label.

(iii) You may not apply a false emission control information label. You also may not manufacture, sell, or offer to sell false labels. The application, manufacture, sale, or offer for sale of false labels is a violation of this section (such as paragraph (a)(1) or (b)(2) of this section). Note that applying an otherwise valid emission control information label to the wrong engine is considered to be applying a false label.

(iv) Information on engine/equipment labels as specified in this chapter is deemed to be information submitted to EPA and is therefore subject to the prohibition against knowingly submitting false information under paragraph (a)(2) of this section and 18 U.S.C. 1001.

* * * * *

(h) The maximum penalty values listed in paragraphs (a) and (b) of this section and in § 1068.125 apply as of December 7, 2013. Maximum penalty values for earlier violations are published in 40 CFR part 19. Maximum penalty limits may be adjusted after December 7, 2013 based on the Consumer Price Index. The specific regulatory provisions for changing the maximum penalties, published in 40 CFR part 19, reference the applicable U.S. Code citation on which the prohibited action is based. The following table is shown here for informational purposes:

* * * * *

■ 237. Section 1068.103 is revised to read as follows:

§ 1068.103 Provisions related to the duration and applicability of certificates of conformity.

(a) Engines/equipment covered by a certificate of conformity are limited to those that are produced during the period specified in the certificate and conform to the specifications described in the certificate and the associated application for certification. For the purposes of this paragraph (a), ''specifications'' includes the emission control information label and any conditions or limitations identified by the manufacturer or EPA. For example, if the application for certification specifies certain engine configurations, the certificate does not cover any configurations that are not specified. We may ignore any information provided in the application that we determine is not relevant to a demonstration of compliance with applicable regulations, such as your projected production volumes in many cases.

(b) Unless the standard-setting part specifies otherwise, determine the production period corresponding to each certificate of conformity as specified in this paragraph (b). In general, the production period is the manufacturer's annual production period identified as a model year.

(1) For engines/equipment subject to emission standards based on model years, the first day of the annual production period can be no earlier than January 2 of the calendar year preceding the year for which the model year is named, or the earliest date of manufacture for any engine/equipment in the engine family, whichever is later. The last day of the annual production period can be no later than December 31 of the calendar year for which the model year is named or the latest date of manufacture for any engine/equipment in the engine family, whichever is sooner. Note that this approach limits how you can designate a model year for your engines/equipment; however, it does not limit your ability to meet more stringent emission standards early where this is permitted in the regulation.

(2) For fuel-system components certified to evaporative emission standards based on production periods rather than model years, the production period is either the calendar year or a longer period we specify consistent with the manufacturer's normal production practices.

(c) A certificate of conformity will not cover engines/equipment you produce with a date of manufacture earlier than the date you submit the application for certification for the family. You may start to produce engines/equipment after you submit an application for certification and before the effective date of a certificate of conformity, subject to the following conditions:

(1) The engines/equipment must conform in all material respects to the engines/equipment described in your application. Note that if we require you to modify your application, you must ensure that all engines/equipment conform to the specifications of the modified application.

(2) The engines/equipment may not be sold, offered for sale, introduced into U.S. commerce, or delivered for introduction into U.S. commerce before the effective date of the certificate of conformity.

(3) You must notify us in your application for certification that you plan to use the provisions of this paragraph (c) and when you intend to start production. If the standard-setting part specifies mandatory testing for production-line engines, you must start testing as directed in the standard-setting part based on your actual start of production, even if that occurs before we approve your certification. You must also agree to give us full opportunity to inspect and/or test the engines/

equipment during and after production. For example, we must have the opportunity to specify selective enforcement audits as allowed by the standard-setting part and the Clean Air Act as if the engines/equipment were produced after the effective date of the certificate.

(4) See § 1068.262 for special provisions that apply for secondary engine manufacturers receiving shipment of partially complete engines before the effective date of a certificate.

(d) The prohibition in § 1068.101(a)(1) against offering to sell engines/equipment without a valid certificate of conformity generally does not apply for engines/equipment that have not yet been produced. You may contractually agree to produce engines/equipment before obtaining the required certificate of conformity. This is intended to allow manufacturers of low-volume products to establish a sufficient market for engines/equipment before going through the effort to certify.

(e) Engines/equipment with a date of manufacture after December 31 of the calendar year for which a model year is named are not covered by the certificate of conformity for that model year. You must submit an application for a new certificate of conformity demonstrating compliance with applicable standards even if the engines/equipment are identical to those built before December 31.

(f) The flexible approach to naming the annual production period described in paragraph (b)(1) of this section is intended to allow you to introduce new products at any point during the year. This is based on the expectation that production periods generally run on consistent schedules from year to year. You may not use this flexibility to arrange your production periods such that you can avoid annual certification.

(g) An engine is generally assigned a model year based on its date of manufacture, which is typically based on the date the crankshaft is installed in the engine (see § 1068.30). You may not circumvent the provisions of § 1068.101(a)(1) by stockpiling engines with a date of manufacture before new or changed emission standards take effect by deviating from your normal production and inventory practices. (For purposes of this paragraph (g), normal production and inventory practices means those practices you typically use for similar families in years in which emission standards do not change. We may require you to provide us routine production and inventory records that document your normal practices for the preceding eight years.) For most engines you should plan to complete the assembly of an engine of a given model year into its certified configuration within the first week after the end of the model year if new emission standards start to apply in that model year. For special circumstances it may be appropriate for your normal business practice to involve more time. For engines with per-cylinder displacement below 2.5 liters, if new emission standards start to apply in a given year, we would consider an engine not to be covered by a certificate of conformity for the preceding model year if the engine is not assembled in a compliant configuration within 30 days after the end of the model year for that engine family. (**Note:** an engine is considered ''in a compliant configuration'' without being fully assembled if § 1068.260(a) or (b) authorizes shipment of the engine without certain components.) For example, in the case where new standards apply in the 2010 model year, and your normal production period is based on the calendar year, you must complete the assembly of all your 2009 model year engines before January 31, 2010, or an earlier date consistent with your normal production and inventory practices. For engines with per-cylinder displacement at or above 2.5 liters, this time may not exceed 60 days. Note that for the purposes of this paragraph (g), an engine shipped under § 1068.261 is deemed to be a complete engine. Note also that § 1068.245 allows flexibility for additional time in unusual circumstances. Note finally that disassembly of complete engines and reassembly (such as for shipment) does not affect the determination of model year; the provisions of this paragraph (g) apply based on the date on which initial assembly is complete.

(h) This paragraph (h) describes the effect of suspending, revoking, or voiding a certificate of conformity. See the definitions of ''suspend,'' ''revoke,'' and ''void'' in § 1068.30. Engines/equipment produced at a time when the otherwise applicable certificate of conformity has been suspended or revoked are not covered by a certificate of conformity. Where a certificate of conformity is void, all engines/equipment produced under that certificate of conformity are not and were not covered by a certificate of conformity. In cases of suspension, engines/equipment will be covered by a certificate only if they are produced after the certificate is reinstated or a new certificate is issued. In cases of revocation and voiding, engines/equipment will be covered by a certificate only if they are produced after we issue a new certificate. 42 U.S.C. 7522(a)(1) and § 1068.101(a)(1) prohibit selling, offering for sale, introducing into commerce, delivering for introduction into commerce, and importing engines/equipment that are not covered by a certificate of conformity, and they prohibit anyone from causing another to violate these prohibitions.

(i) You may transfer a certificate to another entity only in the following cases:

(1) You may transfer a certificate to a parent company, including a parent company that purchases your company after we have issued your certificate.

(2) You may transfer a certificate to a subsidiary including a subsidiary you purchase after we have issued your certificate.

(3) You may transfer a certificate to a subsidiary of your parent company.

■ 238. Section 1068.105 is amended by revising paragraphs (a) and (c)(2) to read as follows:

§ 1068.105 What other provisions apply to me specifically if I manufacture equipment needing certified engines?

* * * * *

(a) *Transitioning to new engine-based standards.* If new engine-based emission standards apply in a given model year, your equipment produced in that calendar year (or later) must have engines that are certified to the new standards, except that you may continue to use up normal inventories of earlier engines that were built before the date of the new or changed standards. For purposes of this paragraph (a), normal inventory applies for engines you possess and engines from your engine supplier's normal inventory. (**Note:** this paragraph (a) does not apply in the case of new remanufacturing standards.) We may require you and your engine suppliers to provide us routine production and/or inventory records that document your normal practices for the preceding eight years. For example, if you have records documenting that your normal inventory practice is to keep on hand a one-month supply of engines based on your upcoming production schedules, and a new tier of standards starts to apply for the 2015 model year, you may order engines consistent with your normal inventory requirements late in the engine manufacturer's 2014 model year and install those engines in your equipment consistent with your normal production schedule. Also, if your model year starts before the end of the calendar year preceding new standards, you may use engines from the previous model year for those units you completely assemble before January 1 of the year that new standards apply. If emission standards for the engine do not change in a given model year, you may continue to install engines from the previous model year without restriction (or any earlier model year for which the same standards apply). You may not circumvent the provisions of § 1068.101(a)(1) by stockpiling engines that were built before new or changed standards take effect. Similarly, you may not circumvent the provisions of § 1068.101(a)(1) by knowingly installing engines that were stockpiled by engine suppliers in violation of § 1068.103(f). Note that this allowance does not apply for equipment subject to equipment-based standards. See 40 CFR 1060.601 for similar provisions that apply for equipment subject to evaporative emission standards. Note that the standard-setting part may impose further restrictions on using up inventories of engines from an earlier model year under this paragraph (a).

* * * * *

(c) * * *

(2) Permanently attach the duplicate label to your equipment by securing it to a part needed for normal operation and not normally requiring replacement. Make sure an average person can easily read it. Note that attaching an inaccurate duplicate label may be a violation of § 1068.101(b)(7).

* * * * *

■ 239. Section 1068.110 is amended by revising the section heading and paragraph (d) to read as follows:

§ 1068.110 Other provisions for engines/equipment in service.

* * * * *

(d) *Defeat devices.* We may test components, engines, and equipment to investigate potential defeat devices. We may also require the manufacturer to do this testing. If we choose to investigate one of your designs, we may require you to show us that a component is not a defeat device, and that an engine/equipment does not have a defeat device. To do this, you may have to share with us information regarding test programs, engineering evaluations, design specifications, calibrations, on-board computer algorithms, and design strategies. It is a violation of the Clean Air Act for anyone to make, install or use defeat devices as described in § 1068.101(b)(2) and the standard-setting part.

* * * * *

■ 240. Section 1068.115 is amended by revising the section heading to read as follows:

§ 1068.115 What are manufacturers' emission-related warranty requirements?

* * * * *

■ 241. Section 1068.120 is amended by revising the section heading and paragraph (f) to read as follows:

§ 1068.120 Requirements for rebuilding engines.

* * * * *

(f) A rebuilt engine or other used engine may replace a certified engine in a piece of equipment only if the engine was built and/or rebuilt to a certified configuration meeting equivalent or more stringent emission standards. Note that a certified configuration would generally include more than one model year. A rebuilt engine being installed that is from the same model year or a newer model year than the engine being replaced meets this requirement. The following examples illustrate the provisions of this paragraph (f):

(1) In most cases, you may use a rebuilt Tier 2 engine to replace a Tier 1 engine or another Tier 2 engine.

(2) You may use a rebuilt Tier 1 engine to replace a Tier 2 engine if the two engines differ only with respect to model year or other characteristics unrelated to emissions since such engines would be considered to be in the same configuration. This may occur if the Tier 1 engine had emission levels below the Tier 2 standards or if the Tier 2 engine was certified with a Family Emission Limit for calculating emission credits.

(3) You may use a rebuilt engine that originally met the Tier 1 standards without certification, as provided under § 1068.265, to replace a certified Tier 1 engine. This may occur for engines produced under a Transition Program for Equipment Manufacturers such as that described in 40 CFR 1039.625.

(4) You may never replace a certified engine with an engine rebuilt to a configuration that does not meet EPA emission standards. Note that, for purposes of this paragraph (f)(4), a configuration is considered to meet EPA emission standards if it was previously certified or was otherwise shown to meet emission standards (see § 1068.265).

* * * * *

■ 242. Section 1068.125 is amended by revising paragraph (b) introductory text to read as follows:

§ 1068.125 What happens if I violate the regulations?

* * * * *

(b) *Administrative penalties.* Instead of bringing a civil action, we may assess administrative penalties if the total is less than $320,000 against you individually. This maximum penalty may be greater if the Administrator and the Attorney General jointly determine that a greater administrative penalty assessment is appropriate, or if the limit is adjusted under 40 CFR part 19. No court may review this determination. Before we assess an administrative penalty, you may ask for a hearing as described in subpart G of this part. The Administrator may compromise or remit, with or without conditions, any administrative penalty that may be imposed under this section.

* * * * *

Subpart C— Exemptions and Exclusions

■ 243. Section 1068.201 is amended by revising the section heading and paragraphs (a), (c), and (i) to read as follows:

§ 1068.201 General exemption and exclusion provisions.

* * * * *

(a) This subpart identifies which engines/equipment qualify for exemptions and what information we need. We may require more information.

* * * * *

(c) If you use an exemption under this subpart, we may require you to add a permanent or temporary label to your exempted engines/equipment. You may ask us to modify these labeling requirements if it is appropriate for your engine/equipment.

* * * * *

(i) If you want to take an action with respect to an exempted or excluded engine/equipment that is prohibited by the exemption or exclusion, such as selling it, you need to certify the engine/equipment or qualify for a different exemption.

(1) We will issue a certificate of conformity if you send us an application for certification showing that you meet all the applicable requirements from the standard-setting part and pay the appropriate fee. Alternatively, we may allow you to include in an existing certified engine family those engines/equipment you modify (or otherwise demonstrate) to be identical to engines/equipment already covered by the certificate. We would base such an approval on our review of any appropriate documentation. These engines/equipment must have emission control information labels that accurately describe their status.

(2) The exemption provisions of this part may be applied to new engines without regard to whether or not they have already been certified or exempted. You may ask to apply the exemption

provisions prospectively to used engines to cover circumstances not otherwise allowed by the original certification or exemption. Note that application of new exemption provisions does not apply with respect to actions that occur before the new exemption applies. For example, you may ask for a testing exemption for a new or used engine that has already been introduced into commerce under a competition exemption, but the testing exemption would not cover non-competition use that occurred before we approved the testing exemption.

■ 244. Section 1068.210 is amended by revising the section heading and paragraph (e) to read as follows:

§ 1068.210 Exempting test engines/equipment.

* * * * *

(e) If we approve your request for a testing exemption, we will send you a letter or a memorandum describing the basis and scope of the exemption. It will also include any necessary terms and conditions, which normally require you to do the following:

(1) Stay within the scope of the exemption.

(2) Create and maintain adequate records that we may inspect.

(3) Add a permanent label to all engines/equipment exempted under this section, consistent with § 1068.45, with at least the following items:

(i) The label heading ''EMISSION CONTROL INFORMATION''.

(ii) Your corporate name and trademark.

(iii) Engine displacement, family identification, and model year of the engine/equipment (as applicable), or whom to contact for further information.

(iv) The statement: ''THIS [engine, equipment, vehicle, etc.] IS EXEMPT UNDER 40 CFR 1068.210 OR 1068.215 FROM EMISSION STANDARDS AND RELATED REQUIREMENTS.''

(4) Tell us when the test program is finished.

(5) Tell us the final disposition of the engines/equipment.

■ 245. Section 1068.215 is amended by revising the section heading and paragraphs (a) and (c)(3)(iv) to read as follows:

§ 1068.215 Exempting manufacturer-owned engines/equipment.

(a) You are eligible for this exemption for manufacturer-owned engines/equipment only if you are a certificate holder. Any engine for which you meet all applicable requirements under this section is exempt without request.

* * * * *

(c) * * *

(3) * * *

(iv) The statement: ''THIS [engine, equipment, vehicle, etc.] IS EXEMPT UNDER 40 CFR 1068.210 OR 1068.215 FROM EMISSION STANDARDS AND RELATED REQUIREMENTS.''

■ 246. Section 1068.220 is revised to read as follows:

§ 1068.220 Exempting display engines/equipment.

(a) Anyone may request an exemption for display engines/equipment.

(b) Nonconforming display engines/equipment will be exempted if they are used only for displays in the interest of a business or the general public. This exemption does not apply to engines/equipment displayed for private use, private collections, or any other purpose we determine is inappropriate for a display exemption.

(c) You may operate the exempted engine/equipment, but only if we approve specific operation that is part of the display, or is necessary for the display (possibly including operation that is indirectly necessary for the display). We may consider any relevant factor in our approval process, including the extent of the operation, the overall emission impact, and whether the engine/equipment meets emission requirements of another country.

(d) You may sell or lease the exempted engine/equipment only with our advance approval.

(e) To use this exemption, you must add a permanent label to all engines/equipment exempted under this section, consistent with § 1068.45, with at least the following items:

(1) The label heading ''EMISSION CONTROL INFORMATION''.

(2) Your corporate name and trademark.

(3) Engine displacement, family identification, and model year of the engine/equipment (as applicable), or whom to contact for further information.

(4) The statement: ''THIS [engine, equipment, vehicle, etc.] IS EXEMPT UNDER 40 CFR 1068.220 FROM EMISSION STANDARDS AND RELATED REQUIREMENTS.''

(f) We may set other conditions for approval of this exemption.

■ 247. Section 1068.225 is amended by revising the section heading and paragraph (d)(4) to read as follows:

§ 1068.225 Exempting engines/equipment for national security.

* * * * *

(d) * * *

(4) The statement: ''THIS [engine, equipment, vehicle, etc.] HAS AN EXEMPTION FOR NATIONAL SECURITY UNDER 40 CFR 1068.225.''

■ 248. Section 1068.230 is amended by revising the section heading and paragraphs (b) and (c) to read as follows:

§ 1068.230 Exempting engines/equipment for export.

* * * * *

(b) Engines/equipment exported to a country not covered by paragraph (a) of this section are exempt from the prohibited acts in this part without a request. If you produce exempt engines/equipment for export and any of them are sold or offered for sale to an ultimate purchaser in the United States, the exemption is automatically void for those engines/equipment, except as specified in § 1068.201(i). You may operate engines/equipment in the United States only as needed to prepare and deliver them for export.

(c) Except as specified in paragraph (d) of this section, label exempted engines/equipment (including shipping containers if the label on the engine/equipment will be obscured by the container) with a label showing that they are not certified for sale or use in the United States. This label may be permanent or removable. See § 1068.45 for provisions related to the use of removable labels and applying labels to containers without labeling individual engines/equipment. The label must include your corporate name and trademark and the following statement: ''THIS [engine, equipment, vehicle, etc.] IS SOLELY FOR EXPORT AND IS THEREFORE EXEMPT UNDER 40 CFR 1068.230 FROM U.S. EMISSION STANDARDS AND RELATED REQUIREMENTS.''

* * * * *

■ 249. Section 1068.235 is revised to read as follows:

§ 1068.235 Exempting nonroad engines/equipment used solely for competition.

The following provisions apply for nonroad engines/equipment, but not for motor vehicles:

(a) New nonroad engines/equipment you produce that are used solely for competition are excluded from emission standards. We may exempt (rather than exclude) new nonroad engines/equipment you produce that you intend to be used solely for competition, where we determine that such engines/equipment are unlikely to be used contrary to your intent. See the standard-setting parts for specific provisions where applicable. Note that the definitions in the standard-setting part may deem uncertified engines/equipment to be new upon importation.

(b) If you modify any nonroad engines/equipment after they have been placed into service in the United States so they will be used solely for competition, they are exempt without request. This exemption applies only to the prohibitions in § 1068.101(b)(1) and (2) and are valid only as long as the engine/equipment is used solely for competition. You may not use the provisions of this paragraph (b) to circumvent the requirements that apply to the sale of new competition engines under the standard-setting part.

(c) If you modify any nonroad engines/equipment under paragraph (b) of this section, you must destroy the original emission labels. If you loan, lease, sell, or give any of these engines/equipment to someone else, you must tell the new owner (or operator, if applicable) in writing that they may be used only for competition.

■ 250. Section 1068.240 is amended by revising the section heading and paragraphs (c)(1), (c)(3), and (e) introductory text to read as follows:

§ 1068.240 Exempting new replacement engines.

* * * * *

(c) * * *

(1) You may produce a limited number of replacement engines under this paragraph (c) representing 0.5 percent of your annual production volumes for each category and subcategory of engines identified in Table 1 to this section (1.0 percent through 2013). Calculate this number by multiplying your annual U.S.-directed production volume by 0.005 (or 0.01 through 2013) and rounding to the nearest whole number. Determine the appropriate production volume by identifying the highest total annual U.S.-directed production volume of engines from the previous three model years for all your certified engines from each category or subcategory identified in Table 1 to this section, as applicable. In unusual circumstances, you may ask us to base your production limits on U.S.-directed production volume for a model year more than three years prior. You may include stationary engines and exempted engines as part of your U.S.-directed production volume. Include U.S.-directed engines produced by any affiliated companies and those from any other companies you license to produce engines for you.

* * * * *

(3) Send the Designated Compliance Officer a report by September 30 of the year following any year in which you produced exempted replacement engines under this paragraph (c). In your report include the total number of replacement engines you produce under this paragraph (c) for each category or subcategory, as appropriate, and the corresponding total production volumes determined under paragraph (c)(1) of this section. If you send us a report under this paragraph (c)(3), you must also include the total number of replacement engines you produced under paragraphs (b), (d), and (e) of this section. Count exempt engines as tracked under paragraph (b) of this section only if you meet all the requirements and conditions that apply under paragraph (b) of this section by the due date for the annual report. You may include the information required under this paragraph (c)(3) in production reports required under the standard-setting part.

* * * * *

(e) *Partially complete current-tier replacement engines.* The provisions of paragraph (d) of this section apply for engines you produce from a current line of certified engines or vehicles if you ship them as partially complete engines for replacement purposes. This applies for engine-based and equipment-based standards as follows:

* * * * *

■ 251. Section 1068.245 is amended by revising the section heading and paragraph (g)(4) to read as follows:

§ 1068.245 Temporary provisions addressing hardship due to unusual circumstances.

* * * * *

(g) * * *

(4) A statement describing the engine's status as an exempted engine:

(i) If the engine/equipment does not meet any emission standards, add the following statement:''THIS [engine, equipment, vehicle, etc.] IS EXEMPT UNDER 40 CFR 1068.245 FROM EMISSION STANDARDS AND RELATED REQUIREMENTS.''

(ii) If the engines/equipment meet alternate emission standards as a condition of an exemption under this section, we may specify a different statement to identify the alternate emission standards.

■ 252. Section 1068.250 is amended by revising the section heading and paragraphs (c) introductory text and (k)(4) and removing and reserving paragraph (h).

The revisions read as follows:

§ 1068.250 Extending compliance deadlines for small businesses under hardship.

* * * * *

(c) Send the Designated Compliance Officer a written request for an extension as soon as possible before you are in violation. In your request, show that all the following conditions and requirements apply:

* * * * *

(k) * * *

(4) A statement describing the engine's status as an exempted engine:

(i) If the engine/equipment does not meet any emission standards, add the following statement:''THIS [engine, equipment, vehicle, etc.] IS EXEMPT UNDER 40 CFR 1068.250 FROM EMISSION STANDARDS AND RELATED REQUIREMENTS.''

(ii) If the engine/equipment meets alternate emission standards as a condition of an exemption under this section, we may specify a different statement to identify the alternate emission standards.

■ 253. Section 1068.255 is amended by revising the section heading and paragraph (a) introductory text to read as follows:

§ 1068.255 Exempting engines and fuel-system components for hardship for equipment manufacturers and secondary engine manufacturers.

* * * * *

(a) *Equipment exemption.* As an equipment manufacturer, you may ask for approval to produce exempted equipment for up to 12 months. We will generally limit this to a single interval up to 12 months in the first year that new or revised emission standards apply. Exemptions under this section are not limited to small businesses. Send the Designated Compliance Officer a written request for an exemption before you are in violation. In your request, you must show you are not at fault for the impending violation and that you would face serious economic hardship if we do not grant the exemption. This exemption is not available under this paragraph (a) if you manufacture the engine or fuel-system components you need for your own equipment, or if complying engines or fuel-system components are available from other manufacturers that could be used in your equipment, unless we allow it elsewhere in this chapter. We may impose other conditions, including provisions to use products meeting less stringent emission standards or to recover the lost environmental benefit. In determining whether to grant the exemptions, we will consider all relevant factors, including the following:

* * * * *

■ 254. Section 1068.260 is revised to read as follows:

§ 1068.260 General provisions for selling or shipping engines that are not yet in their certified configuration.

Except as specified in paragraph (e) of this section, all new engines in the United States are presumed to be subject to the prohibitions of § 1068.101, which generally require that all new engines be in a certified configuration before being sold, offered for sale, or introduced or delivered into commerce in the United States or imported into the United States. All emission-related components generally need to be installed on an engine for such an engine to be in its certified configuration. This section specifies clarifications and exemptions related to these requirements for engines. Except for paragraph (c) of this section, the provisions of this section generally apply for engine-based standards but not for equipment-based exhaust emission standards.

(a) The provisions of this paragraph (a) apply for emission-related components that cannot practically be assembled before shipment because they depend on equipment design parameters.

(1) You do not need an exemption to ship an engine that does not include installation or assembly of certain emission-related components, if those components are shipped along with the engine. For example, you may generally ship aftertreatment devices along with engines rather than installing them on the engine before shipment. We may require you to describe how you plan to use this provision.

(2) You may ask us at the time of certification for an exemption to allow you to ship your engines without emission-related components. If we allow this, we may specify conditions that we determine are needed to ensure that shipping the engine without such components will not result in the engine being operated outside of its certified configuration. You must identify unshipped parts by specific part numbers if they cannot be properly characterized by performance specification. For example, electronic control units, turbochargers, and EGR coolers must generally be identified by part number. Parts that we believe can be properly characterized by performance specification include air filters, noncatalyzed mufflers, and charge air coolers. See paragraph (d) of this section for additional provisions that apply in certain circumstances.

(b) You do not need an exemption to ship engines without specific components if they are not emission-related components identified in Appendix I of this part. For example, you may generally ship engines without the following parts:

(1) Radiators needed to cool the engine.

(2) Exhaust piping between the engine and an aftertreatment device, between two aftertreatment devices, or downstream of the last aftertreatment device.

(c) If you are a certificate holder, partially complete engines/equipment shipped between two of your facilities are exempt, subject to the provisions of this paragraph (c), as long as you maintain ownership and control of the engines/equipment until they reach their destination. We may also allow this where you do not maintain actual ownership and control of the engines/equipment (such as hiring a shipping company to transport the engines) but only if you demonstrate that the engines/equipment will be transported only according to your specifications. See § 1068.261(b) for the provisions that apply instead of this paragraph (c) for the special case of integrated manufacturers using the delegated-assembly exemption. Notify us of your intent to use this exemption in your application for certification, if applicable. Your exemption is effective when we grant your certificate. You may alternatively request an exemption in a separate submission; for example, this would be necessary if you will not be the certificate holder for the engines in question. We may require you to take specific steps to ensure that such engines/equipment are in a certified configuration before reaching the ultimate purchaser. Note that since this is a temporary exemption, it does not allow you to sell or otherwise distribute to ultimate purchasers an engine/equipment in an uncertified configuration with respect to exhaust emissions. Note also that the exempted engine/equipment remains new and subject to emission standards (see definition of ''exempted'' in § 1068.30) until its title is transferred to the ultimate purchaser or it otherwise ceases to be new.

(d) See § 1068.261 for delegated-assembly provisions in which certificate-holding manufacturers ship engines that are not yet equipped with certain emission-related components. See § 1068.262 for provisions related to manufacturers shipping partially complete engines for which a secondary engine manufacturer holds the certificate of conformity.

(e) Engines used in hobby vehicles are not presumed to be engines subject to the prohibitions of § 1068.101. Hobby vehicles are reduced-scale models of vehicles that are not capable of transporting a person. Some gas turbine engines are subject to the prohibitions of § 1068.101, but we do not presume that all gas turbine engines are subject to these prohibitions. Other engines that do not have a valid certificate of conformity or exemption when sold, offered for sale, or introduced or delivered into commerce in the United States or imported into the United States are presumed to be engines subject to the prohibitions of § 1068.101 unless we determine that such engines are excluded from the prohibitions of § 1068.101.

(f) While we presume that new non-hobby engines are subject to the prohibitions of § 1068.101, we may determine that a specific engine is not subject to these prohibitions based on information you provide or other information that is available to us. For example, the provisions of this part 1068 and the standard-setting parts provide for exemptions in certain circumstances. Also, some engines may be subject to separate prohibitions under subchapter C instead of the prohibitions of § 1068.101.

■ 255. Section 1068.261 is amended by revising the section heading and paragraph (a) to read as follows:

§ 1068.261 Delegated assembly and other provisions related to engines not yet in the certified configuration.

* * * * *

(a) Shipping an engine separately from an aftertreatment component that you have specified as part of its certified configuration will not be a violation of the prohibitions in § 1068.101(a)(1) subject to the provisions in this section. We may also require that you apply some or all of the provisions of this section for other components if we determine it is necessary to ensure that shipping the engine without such components will not result in the engine being operated outside of its certified configuration. In making this determination, we will consider the importance of the component for controlling emissions and the likelihood that equipment manufacturers will have an incentive to disregard your emission-related installation instructions based on any relevant factors, such as the cost of the component and any real or perceived expectation of a negative impact on engine or equipment performance.

* * * * *

■ 256. Section 1068.262 is revised to read as follows:

§ 1068.262 Shipment of engines to secondary engine manufacturers.

This section specifies how manufacturers may introduce into U.S. commerce partially complete engines that have an exemption or a certificate of conformity held by a secondary engine manufacturer and are not yet in a certified configuration. See the standard-setting part to determine whether and how the provisions of this section apply. (**Note:** See § 1068.261 for provisions related to manufacturers introducing into U.S. commerce partially complete engines for which they hold the certificate of conformity.) This exemption is temporary as described in paragraph (g) of this section.

(a) The provisions of this section generally apply where the secondary engine manufacturer has substantial control over the design and assembly of emission controls. In unusual circumstances we may allow other secondary engine manufacturers to use these provisions. In determining whether a manufacturer has substantial control over the design and assembly of emission controls, we would consider the degree to which the secondary engine manufacturer would be able to ensure that the engine will conform to the regulations in its final configuration. Such secondary engine manufacturers may finish assembly of partially complete engines in the following cases:

(1) You obtain an engine that is not fully assembled with the intent to manufacture a complete engine.

(2) You obtain an engine with the intent to modify it before it reaches the ultimate purchaser.

(3) You obtain an engine with the intent to install it in equipment that will be subject to equipment-based standards.

(b) Manufacturers may introduce into U.S. commerce partially complete engines as described in this section if they have a written request for such engines from a secondary engine manufacturer that has certified the engine and will finish the engine assembly. The written request must include a statement that the secondary engine manufacturer has a certificate of conformity for the engine and identify a valid engine family name associated with each engine model ordered (or the basis for an exemption if applicable, as specified in paragraph (e) of this section). The original engine manufacturer must apply a removable label meeting the requirements of § 1068.45 that identifies the corporate name of the original manufacturer and states that the engine is exempt under the provisions of § 1068.262. The name of the certifying manufacturer must also be on the label or, alternatively, on the bill of lading that accompanies the engines during shipment. The original engine manufacturer may not apply a permanent emission control information label identifying the engine's eventual status as a certified engine.

(c) If you are the secondary engine manufacturer and you will hold the certificate, you must include the following information in your application for certification:

(1) Identify the original engine manufacturer of the partially complete engine or of the complete engine you will modify.

(2) Describe briefly how and where final assembly will be completed. Specify how you have the ability to ensure that the engines will conform to the regulations in their final configuration. (**Note:** Paragraph (a) of this section prohibits using the provisions of this section unless you have substantial control over the design and assembly of emission controls.)

(3) State unconditionally that you will not distribute the engines without conforming to all applicable regulations.

(d) If you are a secondary engine manufacturer and you are already a certificate holder for other families, you may receive shipment of partially complete engines after you apply for a certificate of conformity but before the certificate's effective date. In this case, all the provisions of § 1068.103(c)(1) through (3) apply. This exemption allows the original manufacturer to ship engines after you have applied for a certificate of conformity. Manufacturers may introduce into U.S. commerce partially complete engines as described in this paragraph (d) if they have a written request for such engines from a secondary engine manufacturer stating that the application for certification has been submitted (instead of the information we specify in paragraph (b) of this section). We may set additional conditions under this paragraph (d) to prevent circumvention of regulatory requirements. Consistent with § 1068.103(c), we may also revoke an exemption under this paragraph (d) if we have reason to believe that the application for certification will not be approved or that the engines will otherwise not reach a certified configuration before reaching the ultimate purchaser. This may require that you export the engines.

(e) The provisions of this section also apply for shipping partially complete engines if the engine is covered by a valid exemption and there is no valid engine family name that could be used to represent the engine model. Unless we approve otherwise in advance, you may do this only when shipping engines to secondary engine manufacturers that are certificate holders. In this case, the secondary engine manufacturer must identify the regulatory cite identifying the applicable exemption instead of a valid engine family name when ordering engines from the original engine manufacturer.

(f) If secondary engine manufacturers determine after receiving an engine under this section that the engine will not be covered by a certificate or exemption as planned, they may ask us to allow for shipment of the engines back to the original engine manufacturer or to another secondary engine manufacturer. This might occur in the case of an incorrect shipment or excess inventory. We may modify the provisions of this section as appropriate to address these cases.

(g) Both original and secondary engine manufacturers must keep the records described in this section for at least five years, including the written request for engines and the bill of lading for each shipment (if applicable). The written request is deemed to be a submission to EPA and is thus subject to the reporting requirements of 40 CFR 1068.101(a)(2).

(h) These provisions are intended only to allow secondary engine manufacturers to obtain or transport engines in the specific circumstances identified in this section so any exemption under this section expires when the engine reaches the point of final assembly identified in paragraph (c)(2) of this section.

(i) For purposes of this section, an allowance to introduce partially complete engines into U.S. commerce includes a conditional allowance to sell, introduce, or deliver such engines into commerce in the United States or import them into the United States. It does not include a general allowance to offer such partially complete engines for sale because this exemption is intended to apply only for cases in which the certificate holder already has an arrangement to purchase the engines from the original engine manufacturer. This exemption does not allow the original engine manufacturer to subsequently offer the engines for sale to a different manufacturer who will hold the certificate unless that second manufacturer has also complied with the requirements of this part. The exemption does not apply for any individual engines that are not labeled as specified in this section or which are shipped to someone who is not a certificate holder.

(j) We may suspend, revoke, or void an exemption under this section, as follows:

(1) We may suspend or revoke your exemption if you fail to meet the requirements of this section. We may suspend or revoke an exemption related to a specific secondary engine manufacturer if that manufacturer sells engines that are in not in a certified configuration in violation of the regulations. We may disallow this exemption for future shipments to the affected secondary engine manufacturer or set additional conditions to ensure that engines will be assembled in the certified configuration.

(2) We may void an exemption for all the affected engines if you intentionally submit false or incomplete information or fail to keep and provide to EPA the records required by this section.

(3) The exemption is void for an engine that is shipped to a company that is not a certificate holder or for an engine that is shipped to a secondary engine manufacturer that is not in compliance with the requirements of this section.

(4) The secondary engine manufacturer may be liable for causing a prohibited act if voiding the exemption is due to its own actions.

(k) No exemption is needed to import equipment that does not include an engine. No exemption from exhaust emission standards is available under this section for equipment subject to equipment-based standards if the engine has been installed.

■ 257. Section 1068.265 is amended by revising the section heading to read as follows:

§ 1068.265 Provisions for engines/equipment conditionally exempted from certification.

* * * * *

Subpart D—Imports

■ 258. Section 1068.301 is amended by revising the section heading and paragraphs (b) and (d) and adding paragraph (e) to read as follows:

§ 1068.301 General provisions for importing engines/equipment.

* * * * *

(b) In general, engines/equipment that you import must be covered by a certificate of conformity unless they were built before emission standards started to apply. This subpart describes the limited cases where we allow importation of exempt or excluded engines/equipment. If an engine has an exemption from exhaust emission standards, this allows you to import the equipment under the same exemption.

* * * * *

(d) Complete the appropriate EPA declaration before importing any engines or equipment. These forms may be submitted and stored electronically and are available on the Internet at *http://www.epa.gov/OTAQ/imports/* or by phone at 734–214–4100. Importers must keep these records for five years and make them available promptly upon request.

(e) The standard-setting part may define uncertified engines/equipment to be ''new'' upon importation, whether or not they have already been placed into service. This may affect how the provisions of this subpart apply for your engines/equipment. (See the definition of ''new'' and other relevant terms in the standard-setting part.)

■ 259. Section 1068.305 is amended by revising paragraphs (b)(1) and (2) to read as follows:

§ 1068.305 How do I get an exemption or exclusion for imported engines/equipment?

* * * * *

(b) * * *

(1) Give your name, address, and telephone number.

(2) Give the engine/equipment owner's name, address, and telephone number.

* * * * *

■ 260. Section 1068.310 is amended by revising the section heading and paragraph (a) to read as follows:

§ 1068.310 Exclusions for imported engines/equipment.

* * * * *

(a) *Engines/equipment used solely for competition.* Engines/equipment that you demonstrate will be used solely for competition are excluded from the restrictions on imports in § 1068.301(b), but only if they are properly labeled. See the standard-setting part for provisions related to this demonstration that may apply. Section 1068.101(b)(4) prohibits anyone from using these excluded engines/equipment for purposes other than competition. We may waive the labeling requirement or allow a removable label for engines/equipment that are being temporarily imported for one or more specific competition events.

* * * * *

■ 261. Section 1068.315 is amended by revising the section heading and paragraph (i) to read as follows:

§ 1068.315 Permanent exemptions for imported engines/equipment.

* * * * *

(i) *Ancient engine/equipment exemption.* If you are not the original engine/equipment manufacturer, you may import nonconforming engines/equipment that are subject to a standard-setting part and were first manufactured at least 21 years earlier, as long as they are still substantially in their original configurations.

■ 262. Section 1068.325 is amended by revising the section heading, introductory text, and paragraphs (a), (c), (d), and (j)(5) to read as follows:

§ 1068.325 Temporary exemptions for imported engines/equipment.

You may import engines/equipment under certain temporary exemptions, subject to the conditions in this section. We may ask U.S. Customs and Border Protection to require a specific bond amount to make sure you comply with the requirements of this subpart. You may not sell or lease one of these engines/equipment while it is in the United States except as specified in this section or § 1068.201(i). You must eventually export the engine/equipment as we describe in this section unless it conforms to a certificate of conformity or it qualifies for one of the permanent exemptions in § 1068.315 or the standard-setting part.

(a) *Exemption for repairs or alterations.* You may temporarily import nonconforming engines/equipment under bond solely for repair or alteration, subject to our advance approval as described in paragraph (j) of this section. You may operate the engine/equipment in the United States only as necessary to repair it, alter it, or ship it to or from the service location. Export the engine/equipment directly after servicing is complete, or confirm that it has been destroyed.

* * * * *

(c) *Display exemption.* You may temporarily import nonconforming engines/equipment under bond for display if you follow the requirements of § 1068.220, subject to our advance approval as described in paragraph (j) of this section. This exemption expires one year after you import the engine/equipment, unless we approve your request for an extension. The engine/equipment must be exported (or destroyed) by the time the exemption expires or directly after the display concludes, whichever comes first.

(d) *Export exemption.* You may temporarily import nonconforming engines/equipment to export them, as described in § 1068.230. Label the engine/equipment as described in § 1068.230. You may sell or lease the engines/equipment for operation outside the United States consistent with the provisions of § 1068.230.

* * * * *

(j) * * *

(5) Acknowledge that EPA enforcement officers may conduct inspections or testing as allowed under the Clean Air Act.

* * * * *

■ 263. Section 1068.335 is amended by revising the section heading to read as follows:

§ 1068.335 Penalties for violations.

* * * * *

■ 264. Section 1068.360 is amended by revising the section heading and paragraph (b) to read as follows:

§ 1068.360 Restrictions for assigning a model year to imported engines and equipment.

* * * * *

(b) This paragraph (b) applies for the importation of engines and equipment that have not been placed into service, where the importation occurs in any calendar year that is more than one year after the named model year of the engine or equipment when emission control requirements applying to current engines are different than for engines or equipment in the named model year, unless they are imported under special provisions for Independent Commercial Importers as allowed under the standard-setting part. Regardless of what other provisions of this subchapter U specify for the model year of the engine or equipment, such engines and equipment are deemed to have an applicable model year no more than one year earlier than the calendar year in which they are imported. For example, a new engine identified as a 2007 model-year product that is imported on January 31, 2010 will be treated as a 2009 model-year engine; the same engine will be treated as a 2010 model-year engine if it is imported any time in calendar year 2011.

* * * * *

Subpart E—Selective Enforcement Auditing

■ 265. Section 1068.401 is revised to read as follows:

§ 1068.401 What is a selective enforcement audit?

(a) We may conduct or require you as a certificate holder to conduct emission tests on production engines/equipment in a selective enforcement audit. This requirement is independent of any requirement for you to routinely test production-line engines/equipment. Where there are multiple entities meeting the definition of manufacturer, we may require manufacturers other than the certificate holder to conduct or participate in the audit as necessary. For products subject to equipment-based standards, but tested using engine-based test procedures, this subpart applies to the engines and/or the equipment, as applicable. Otherwise this subpart applies to engines for products subject to engine-based standards and to equipment for products subject to equipment-based standards.

(b) If we send you a signed test order, you must follow its directions and the provisions of this subpart. We may tell you where to test the engines/equipment. This may be where you produce the engines/equipment or any other emission testing facility. You are responsible for all testing costs whether the testing is conducted at your facility or another facility.

(c) If we select one or more of your families for a selective enforcement audit, we will send the test order to the person who signed the application for certification or we will deliver it in person.

(d) If we do not select a testing facility, notify the Designated Compliance Officer within one working day of receiving the test order where you will test your engines/equipment.

(e) You must do everything we require in the audit without delay. We may suspend or revoke your certificate of conformity for the affected engine families if you do not fulfill your obligations under this subpart.

■ 266. Section 1068.405 is amended by revising paragraph (a)(1) to read as follows:

§ 1068.405 What is in a test order?

(a) * * *

(1) The family we have identified for testing. We may also specify individual configurations.

* * * * *

■ 267. Section 1068.415 is amended by revising paragraphs (c) and (d) to read as follows:

§ 1068.415 How do I test my engines/equipment?

* * * * *

(c) Test at least two engines/equipment in each 24-hour period (including void tests). However, for engines with maximum engine power above 560 kW, you may test one engine per 24-hour period. If you request and justify it, we may approve a lower testing rate.

(d) For exhaust emissions, accumulate service on test engines/equipment at a minimum rate of 6 hours per engine or piece of equipment during each 24-hour period; however, service accumulation to stabilize an engine's emission levels may not take longer than eight days. The first 24-hour period for service accumulation begins when you finish preparing an engine or piece of equipment for testing. The minimum service accumulation rate does not apply on weekends or holidays. We may approve a longer stabilization period or a lower service accumulation rate if you request and justify it. We may require you to accumulate hours more rapidly than the minimum rate, as appropriate. Plan your service accumulation to allow testing at the rate specified in paragraph (c) of this section. Select operation for accumulating operating hours on your test engines/equipment to represent normal in-use operation for the family.

* * * * *

■ 268. Section 1068.420 is amended by revising paragraphs (b) and (e) to read as follows:

§ 1068.420 How do I know when my engine family fails an SEA?

* * * * *

(b) Continue testing engines/equipment until you reach a pass decision for all pollutants or a fail decision for one pollutant, as described in paragraph (c) of this section.

* * * * *

(e) If you reach a pass decision for one pollutant, but need to continue testing for another pollutant, we will not use these later test results for the pollutant with the pass decision as part of the SEA.

* * * * *

■ 269. Section 1068.425 is amended by revising paragraph (b) to read as follows:

§ 1068.425 What happens if one of my production-line engines/equipment exceeds the emission standards?

* * * * *

(b) You may ask for a hearing relative to the suspended certificate of conformity for the failing engine/equipment as specified in subpart G of this part.

■ 270. Section 1068.430 is amended by revising paragraph (c) to read as follows:

§ 1068.430 What happens if a family fails an SEA?

* * * * *

(c) You may ask for a hearing as described in subpart G of this part up to 15 days after we suspend the certificate for a family. If we agree that we used erroneous information in deciding to suspend the certificate before a hearing is held, we will reinstate the certificate.

■ 271. Section 1068.450 is amended by revising paragraph (b) to read as follows:

§ 1068.450 What records must I send to EPA?

* * * * *

(b) We may ask you to add information to your written report, so we can determine whether your new engines/equipment conform to the requirements of this subpart.

* * * * *

Subpart F—Reporting Defects and Recalling Engines/Equipment

■ 272. Section 1068.501 is amended by revising paragraphs (a)(1)(iv), (a)(8), and (b)(1)(iii) to read as follows:

§ 1068.501 How do I report emission-related defects?

* * * * *

(a) * * *

(1) * * *

(iv) Any other component whose failure would commonly increase emissions of any regulated pollutant without significantly degrading engine/equipment performance.

* * * * *

(8) Send all reports required by this section to the Designated Compliance Officer.

* * * * *

(b) * * *

(1) * * *

(iii) You receive any other information for which good engineering judgment would indicate the component or system may be defective, such as information from dealers, field-service personnel, equipment manufacturers, hotline complaints, in-use testing, or engine diagnostic systems.

* * * * *

■ 273. Section 1068.505 is amended by revising paragraphs (a), (c), and (g) to read as follows:

§ 1068.505 How does the recall program work?

(a) If we make a determination that a substantial number of properly maintained and used engines/equipment do not conform to the regulations of this chapter during their useful life, you must submit a plan to remedy the nonconformity of your engines/equipment. We will notify you of our determination in writing. Our notice will identify the class or category of engines/equipment affected and describe how we reached our conclusion. If this happens, you must meet the requirements and follow the instructions in this subpart. You must remedy at your expense noncompliant engines/equipment that have been properly maintained and used, as described in § 1068.510(a)(7), regardless of their age or extent of service accumulation at the time of repair. You may not transfer this expense to a dealer (or equipment manufacturer for engine-based standards) through a franchise or other agreement.

* * * * *

(c) Unless we withdraw the determination of noncompliance, you must respond to it by sending a remedial plan to the Designated Compliance Officer. We will designate a date by which you must send us the remedial plan; the designated date will be no sooner than 45 days after we notify you, and no sooner than 30 days after a hearing.

* * * * *

(g) For purposes of recall, ''owner'' means someone who owns an engine or piece of equipment affected by a remedial plan.

■ 274. Section 1068.510 is amended by revising paragraph (a)(6) to read as follows:

§ 1068.510 How do I prepare and apply my remedial plan?

(a) * * *

(6) How you will notify owners; include a copy of any notification letters.

* * * * *

■ 275. Section 1068.515 is amended by revising paragraph (c) to read as follows:

§ 1068.515 How do I mark or label repaired engines/equipment?

* * * * *

(c) On the label, designate the specific recall campaign and identify the facility where you repaired or inspected the engine/equipment.

* * * * *

■ 276. Section 1068.530 is amended by revising the introductory text to read as follows:

§ 1068.530 What records must I keep?

We may review your records at any time so it is important that you keep required information readily available. Keep records associated with your recall campaign for five years after you send the last report we require under § 1068.525(b). Organize and maintain your records as described in this section.

* * * * *

■ 277. Subpart G is revised to read as follows:

Subpart G—Hearings

Subpart G—Hearings

§ 1068.601 Overview.

The regulations of this chapter involve numerous provisions that may result in EPA making a decision or judgment that you may consider adverse to your interests and that either limits your business activities or requires you to pay penalties. As specified in the regulations, this might involve an opportunity for an informal hearing or a formal hearing that follows specific procedures and is directed by a Presiding Officer. The regulations generally specify when we would hold a hearing. In limited circumstances, we may grant a request for a hearing related to adverse decisions regarding regulatory provisions for which we do not specifically describe the possibility of asking for a hearing.

(a) If you request a hearing regarding our decision to assess administrative penalties under § 1068.125, we will hold a formal hearing according to the provisions of 40 CFR 22.1 through 22.32 and 22.34.

(b) For other issues where the regulation allows for a hearing in response to an adverse decision, you may request an informal hearing as described in § 1068.650. Sections 1068.610 through 1068.625 describe when and how to request an informal hearing under various circumstances.

(c) The time limits we specify are calendar days and include weekends and holidays, except that a deadline falling on a Saturday, Sunday, or a federal holiday is understood to move to the next business day. Your filing will be considered timely based on the following criteria relative to the specified deadline:

(1) The postmarked date for items sent by U.S. mail must be on or before the specified date.

(2) The ship date for items sent from any location within the United States by commercial carriers must be on or before the specified date.

(3) Items sent by mail or courier from outside the United States must be received by the specified date.

(4) The time and date stamp on an email message must be at or before 5:00 p.m. on the specified date.

(5) The time and date stamp on faxed pages must be at or before 5:00 p.m. on the specified date.

(6) Hand-delivered items must be received by the appropriate personnel by 3:00 p.m. on the specified date.

(d) See the standard-setting part for additional information. If the standard-setting part specifies any provisions that are contrary to those described in this subpart, the provisions of the standard-setting part apply instead of those described in this subpart.

§ 1068.610 Request for hearing—suspending, revoking, or voiding a certificate of conformity.

(a) You may request an informal hearing as described in § 1068.650 if you disagree with our decision to suspend, revoke, or void a certificate of conformity. We will approve your request for an informal hearing under this paragraph (a) if we find that your request raises a substantial factual issue in the decision we made that, if addressed differently, could alter the outcome of that decision.

(b) If you request a hearing regarding the outcome of a testing regimen with established evaluation criteria, such as selective enforcement audits or routine production-line testing, we will hold a hearing limited to the following issues that are relevant to your circumstances:

(1) Whether tests were conducted in accordance with applicable regulations.

(2) Whether test equipment was properly calibrated and functioning.

(3) Whether specified sampling procedures were followed to select engines/equipment for testing.

(4) Whether there is a basis for determining that the problems identified do not apply for engines/equipment produced at plants other than the one from which engines/equipment were selected for testing.

(c) You must send your hearing request in writing to the Designated Compliance Officer no later than 30 days after we notify you of our decision to suspend, revoke, or void your certificate, or by some later deadline we specify. If the deadline passes, we may nevertheless grant you a hearing at our discretion.

(d) Your hearing request must include the following information:

(1) Identify the classes or categories of engines/equipment that will be the subject of the hearing.

(2) State briefly which issues you will raise at the hearing for each affected class or category of engines/equipment.

(3) Specify why you believe the hearing will conclude in your favor for each of the issues you will raise.

(4) Summarize the evidence supporting your position on each of the issues you will raise and include any supporting data.

§ 1068.615 Request for hearing—denied application for certification, automatically suspended certificate, and determinations related to certification.

(a) You may request an informal hearing as described in § 1068.650 if we deny your application for a certificate of conformity, if your certificate of conformity is automatically suspended under the regulations, or if you disagree with determinations we make as part of the certification process. For example, you might disagree with our determinations regarding adjustable parameters under § 1068.50 or regarding your good engineering judgment under § 1068.5.

(b) You must send your hearing request in writing to the Designated Compliance Officer no later than 30 days after we notify you of our decision, or by some later deadline we specify. If the specified deadline passes, we may nevertheless grant you a hearing at our discretion.

(c) Your hearing request must include the information specified in § 1068.610(d).

(d) We will approve your request for an informal hearing if we find that your request raises a substantial factual issue in the decision we made that, if addressed differently, could alter the outcome of that decision.

§ 1068.620 Request for hearing—recall.

(a) You may request an informal hearing as described in § 1068.650 if you disagree with our decision to order a recall.

(b) You must send your hearing request in writing to the Designated Compliance Officer no later than 45 days after we notify you of our decision, or by some later deadline we specify. If the specified deadline passes, we may nevertheless grant you a hearing at our discretion.

(c) Your hearing request must include the information specified in § 1068.610(d).

§ 1068.625 Request for hearing—nonconformance penalties.

(a) You may request an informal hearing as described in § 1068.650 if you disagree with our determination of compliance level or penalty calculation or both. The hearing will address only whether the compliance level or penalty was determined in accordance with the regulations.

(b) Send a request for a hearing in writing to the Designated Compliance Officer within the following time frame, as applicable:

(1) No later than 15 days after we notify you that we have approved a nonconformance penalty under this subpart if the compliance level is in the allowable range of nonconformity.

(2) No later than 15 days after completion of the Production Compliance Audit if the compliance level exceeds the upper limit.

(3) No later than 15 days after we notify you of an adverse decision for all other cases.

(c) If you miss the specified deadline in paragraph (b) of this section, we may nevertheless grant you a hearing at our discretion.

(d) Your hearing request must include the information specified in § 1068.610(d).

(e) We will approve your request for an informal hearing if we find that your request raises a substantial factual issue in the decision we made that, if addressed differently, could alter the outcome of that decision.

§ 1068.650 Procedures for informal hearings.

(a) The following provisions apply for arranging the hearing:

(1) After granting your request for an informal hearing, we will designate a Presiding Officer for the hearing.

(2) The Presiding Officer will select the time and place for the hearing. The hearing must be held as soon as practicable for all parties involved.

(3) The Presiding Officer may require that all argument and presentation of evidence be concluded by a certain date after commencement of the hearing.

(b) The Presiding Officer will establish a paper or electronic hearing record, which may be made available for inspection. The hearing record includes, but is not limited to, the following materials:

(1) All documents relating to the application for certification, including the certificate of conformity itself, if applicable.

(2) Your request for a hearing and the accompanying supporting data.

(3) Correspondence and other data relevant to the hearing.

(4) The Presiding Officer's written decision regarding the subject of the hearing, together with any accompanying material.

(c) You may appear in person or you may be represented by counsel or by any other representative you designate.

(d) The Presiding Officer may arrange for a prehearing conference, either in response to a request from any party or at his or her own discretion. The Presiding Officer will select the time and place for the prehearing conference. The Presiding Officer will summarize the results of the conference and include the written summary as part of the record. The prehearing conference may involve consideration of the following items:

(1) Simplification of the issues.

(2) Stipulations, admissions of fact, and the introduction of documents.

(3) Limitation of the number of expert witnesses.

(4) Possibility of reaching an agreement to resolve any or all of the issues in dispute.

(5) Any other matters that may aid in expeditiously and successfully concluding the hearing.

(e) Hearings will be conducted as follows:

(1) The Presiding Officer will conduct informal hearings in an orderly and expeditious manner. The parties may offer oral or written evidence; however, the Presiding Officer may exclude evidence that is irrelevant, immaterial, or repetitious.

(2) Witnesses will not be required to testify under oath; however, the Presiding Officer must make clear that 18 U.S.C. 1001 specifies civil and criminal penalties for knowingly making false statements or representations or using false documents in any matter within the jurisdiction of EPA or any other department or agency of the United States.

(3) Any witness may be examined or cross-examined by the Presiding Officer, by you, or by any other parties.

(4) Written transcripts must be made for all hearings. Anyone may purchase copies of transcripts from the reporter.

(f) The Presiding Officer will make a final decision with written findings, conclusions and supporting rationale on all the substantial factual issues presented in the record. The findings, conclusions, and written decision must be provided to the parties and made a part of the record.

■ 278. Appendix I to part 1068 is amended by revising paragraph IV to read as follows:

APPENDIX I TO PART 1068—EMISSION–RELATED COMPONENTS

* * * * *

IV. Emission-related components also include any other part whose primary purpose is to reduce emissions or whose failure would commonly increase emissions without significantly degrading engine/equipment performance.

Department of Transportation

National Highway Traffic Safety Administration

49 CFR Chapter V

In consideration of the foregoing, under the authority of 49 U.S.C. 322, 5 U.S.C. 552, 49 U.S.C. 30166, 49 U.S.C. 30167, 49 U.S.C. 32307, 49 U.S.C. 32505, 49 U.S.C. 32708, 49 U.S.C. 32910, 49 U.S.C. 33116, 49 U.S.C. 32901, 49 U.S.C. 32902, 49 U.S.C. 30101, 49 U.S.C. 32905, 49 U.S.C. 32906, and delegation of authority at 49 CFR 1.95, NHTSA amends 49 CFR chapter V as follows:

PART 512—CONFIDENTIAL BUSINESS INFORMATION

■ 279. Revise the authority citation for part 512 to read as follows:

Authority: 49 U.S.C. 322; 5 U.S.C. 552; 49 U.S.C. 30166; 49 U.S.C. 30167; 49 U.S.C. 32307; 49 U.S.C. 32505; 49 U.S.C. 32708; 49 U.S.C. 32910; 49 U.S.C. 33116; delegation of authority at 49 CFR 1.95.

■ 280. Amend § 512.6 by revising paragraph (c)(2) to read as follows:

§ 512.6 How should I prepare documents when submitting a claim for confidentiality?

* * * * *

(c) * * *

(2) Confidential portions of electronic files submitted in other than their original format must be marked ''Confidential Business Information'' or ''Entire Page Confidential Business Information'' at the top of each page. If only a portion of a page is claimed to be confidential, that portion shall be designated by brackets. Files submitted in their original format that cannot be marked as described above must, to the extent practicable, identify confidential information by alternative markings using existing attributes within the file or means that are accessible through use of the file's associated program. When alternative markings are used, such as font changes or symbols, the submitter must use one method consistently for electronic files of the same type within the same submission. The method used for such markings must be described in the request for confidentiality. Files and materials that cannot be marked internally, such as video clips or executable files or files provided in a format specifically requested by the agency, shall be renamed prior to submission so the words ''Confidential Bus Info'' appears in the file name or, if that is not practicable, the characters ''Conf Bus Info'' or ''CBI'' appear. In all cases, a submitter shall provide an electronic copy of its request for confidential treatment on any medium containing confidential information, except where impracticable.

* * * * *

■ 281. Revise § 512.7 to read as follows:

§ 512.7 Where should I send the information for which I am requesting confidentiality?

Except for requests pertaining to information submitted under 49 CFR part 537, any claim for confidential treatment must be submitted to the Chief Counsel of the National Highway Traffic Safety Administration, 1200 New Jersey Avenue SE., West Building W41–227, Washington, DC 20590. Requests for confidential treatment for information submitted under 49 CFR part 537 shall accompany the submission and be provided to NHTSA through the electronic portal identified in 49 CFR 537.5(a)(4) or through an email address that will be provided and maintained by NHTSA.

PART 523—VEHICLE CLASSIFICATION

■ 282. Revise the authority citation for part 523 to read as follows:

Authority: 49 U.S.C. 32901; delegation of authority at 49 CFR 1.95.

■ 283. Revise § 523.2 to read as follows:

§ 523.2 Definitions.

Ambulance has the meaning given in 40 CFR 86.1803.

Approach angle means the smallest angle, in a plane side view of an automobile, formed by the level surface on which the automobile is standing and a line tangent to the front tire static loaded radius arc and touching the underside of the automobile forward of the front tire.

Axle clearance means the vertical distance from the level surface on which an automobile is standing to the lowest point on the axle differential of the automobile.

Base tire (for passenger automobiles, light trucks, and medium duty passenger vehicles) means the tire size specified as standard equipment by the manufacturer on each unique combination of a vehicle's footprint and model type. Standard equipment is defined in 40 CFR 86.1803.

Basic vehicle frontal area is used as defined in 40 CFR 86.1803 for passenger automobiles, light trucks, medium duty passenger vehicles and Class 2b through 3 pickup trucks and vans. For heavy-duty tracts and vocational vehicles, it has the meaning given in 40 CFR 1037.801.

Breakover angle means the supplement of the largest angle, in the plan side view of an automobile that can be formed by two lines tangent to the front and rear static loaded radii arcs and intersecting at a point on the underside of the automobile.

Cab-complete vehicle means a vehicle that is first sold as an incomplete vehicle that substantially includes the vehicle cab section as defined in 40 CFR 1037.801. For example, vehicles known commercially as chassis-cabs, cab-chassis, box-deletes, bed-deletes, and cut-away vans are considered cab-complete vehicles. A cab includes a steering column and a passenger compartment. Note that a vehicle lacking some components of the cab is a cab-complete vehicle if it substantially includes the cab.

Cargo-carrying volume means the luggage capacity or cargo volume index, as appropriate, and as those terms are defined in 40 CFR 600.315–08, in the case of automobiles to which either of these terms apply. With respect to automobiles to which neither of these terms apply, ''cargo-carrying volume'' means the total volume in cubic feet, rounded to the nearest 0.1 cubic feet, of either an automobile's enclosed nonseating space that is intended primarily for carrying cargo and is not accessible from the passenger compartment, or the space intended primarily for carrying cargo bounded in the front by a vertical plane that is perpendicular to the longitudinal centerline of the automobile and passes through the rearmost point on the rearmost seat and elsewhere by the automobile's interior surfaces.

Class 2b vehicles are vehicles with a gross vehicle weight rating (GVWR) ranging from 8,501 to 10,000 pounds.

Class 3 through Class 8 vehicles are vehicles with a gross vehicle weight rating (GVWR) of 10,001 pounds or more as defined in 49 CFR 565.15.

Commercial medium- and heavy-duty on-highway vehicle means an on-highway vehicle with a gross vehicle weight rating of 10,000 pounds or more as defined in 49 U.S.C. 32901(a)(7).

Complete vehicle has the meaning given to *completed vehicle* as defined in 49 CFR 567.3.

Curb weight has the meaning given in 49 CFR 571.3.

Dedicated vehicle has the same meaning as dedicated automobile as defined in 49 U.S.C. 32901(a)(8).

Departure angle means the smallest angle, in a plane side view of an automobile, formed by the level surface on which the automobile is standing and a line tangent to the rear tire static loaded radius arc and touching the underside of the automobile rearward of the rear tire.

Dual-fueled vehicle (multi-fuel, or flexible-fuel vehicle) has the same meaning as dual fueled automobile as defined in 49 U.S.C. 32901(a)(9).

Electric vehicle means a vehicle that does not include an engine, and is powered solely by an external source of electricity and/or solar power. Note that this does not include electric hybrid or fuel-cell vehicles that use a chemical fuel such as gasoline, diesel fuel, or hydrogen. Electric vehicles may also be referred to as all-electric vehicles to distinguish them from hybrid vehicles.

Emergency vehicle means one of the following:

(1) For passenger cars, light trucks and medium duty passenger vehicles, emergency vehicle has the meaning in 49 U.S.C. 32902(e).

(2) For heavy-duty vehicles, emergency vehicle has the meaning given in 40 CFR 1037.801.

Engine code has the meaning given in 40 CFR 86.1803.

Final stage manufacturer has the meaning given in 49 CFR 567.3.

Fire truck has the meaning given in 40 CFR 86.1803.

Footprint is defined as the product of track width (measured in inches, calculated as the average of front and rear track widths, and rounded to the nearest tenth of an inch) times wheelbase (measured in inches and rounded to the nearest tenth of an inch), divided by 144 and then rounded to the nearest tenth of a square foot. For purposes of this definition, track width is the lateral distance between the centerlines of the base tires at ground, including the camber angle. For purposes of this definition, wheelbase is the longitudinal distance between front and rear wheel centerlines.

Full-size pickup truck means a light truck or medium duty passenger vehicle that meets the requirements specified in 40 CFR 86.1866–12(e).

Gross axle weight rating (GAWR) has the meaning given in 49 CFR 571.3.

Gross combination weight rating (GCWR) has the meaning given in 49 CFR 571.3.

Gross vehicle weight rating (GVWR) has the meaning given in 49 CFR 571.3.

Heavy-duty engine means any engine used for (or for which the engine manufacturer could reasonably expect to be used for) motive power in a heavy-duty vehicle. For purposes of this definition in this part, the term ''engine'' includes internal combustion engines and other devices that convert chemical fuel into motive power. For example, a fuel cell and motor used in a heavy-duty vehicle is a heavy-duty engine.

Heavy-duty vehicle means a vehicle as defined in § 523.6.

Incomplete vehicle has the meaning given in 49 CFR 567.3.

Innovative technology means technology certified under 40 CFR 1036.610, 40 CFR 1037.610 and 49 CFR 535.7(f).

Light truck means a non-passenger automobile meeting the criteria in § 523.5.

Manufacturer has the meaning in 49 U.S.C. 30102.

Medium duty passenger vehicle means a vehicle which would satisfy the criteria in § 523.5 (relating to light trucks) but for its gross vehicle weight rating or its curb weight, which is rated at more than 8,500 lbs GVWR or has a vehicle curb weight of more than 6,000 pounds or has a basic vehicle frontal area in excess of 45 square feet, and which is designed primarily to transport passengers, but does not include a vehicle that—

(1) Is an ''incomplete vehicle''' as defined in this subpart; or

(2) Has a seating capacity of more than 12 persons; or

(3) Is designed for more than 9 persons in seating rearward of the driver's seat; or

(4) Is equipped with an open cargo area (for example, a pick-up truck box or bed) of 72.0 inches in interior length or more. A covered box not readily accessible from the passenger compartment will be considered an open cargo area for purposes of this definition.

Mild hybrid gasoline-electric vehicle means a vehicle as defined by EPA in 40 CFR 86.1866–12(e).

Motor home has the meaning given in 49 CFR 571.3.

Motor vehicle has the meaning giving in 49 U.S.C. 30102.

Off-cycle technology means technology certified under 40 CFR 1036.610, 40 CFR 1037.610 and 49 CFR 535.7(f).

Passenger-carrying volume means the sum of the front seat volume and, if any, rear seat volume, as defined in 40 CFR 600.315–08, in the case of automobiles to which that term applies. With respect to automobiles to which that term does not apply, ''passenger-carrying volume'' means the sum in cubic feet, rounded to the nearest 0.1 cubic feet, of the volume of a vehicle's front seat and seats to the rear of the front seat, as applicable, calculated as follows with the head room, shoulder room, and leg room dimensions determined in accordance with the procedures outlined in Society of Automotive Engineers Recommended Practice J1100, Motor Vehicle Dimensions (Report of Human Factors Engineering Committee, Society of Automotive Engineers, approved November 2009).

(1) For front seat volume, divide 1,728 into the product of the following SAE dimensions, measured in inches to the nearest 0.1 inches, and round the quotient to the nearest 0.001 cubic feet.

(i) H61-Effective head room—front.

(ii) W3-Shoulder room—front.

(iii) L34-Maximum effective leg room-accelerator.

(2) For the volume of seats to the rear of the front seat, divide 1,728 into the product of the following SAE dimensions, measured in inches to the nearest 0.1 inches, and rounded the quotient to the nearest 0.001 cubic feet.

(i) H63-Effective head room—second.

(ii) W4-Shoulder room—second.

(iii) L51-Minimum effective leg room—second.

Phase 1 means the greenhouse gas emissions standards and fuel efficiency standards for medium- and heavy-duty engines and vehicles program published in 2011, effective beginning with model year 2013.

Phase 2 means means the greenhouse gas emissions standards and fuel efficiency standards for medium- and heavy-duty engines and vehicles program effective beginning with model year 2018 for heavy-duty trailers and model year 2021 for all other heavy-duty vehicles and engines.

Pickup truck means a non-passenger automobile which has a passenger compartment and an open cargo area (bed).

Recreational vehicle or RV means a motor vehicle equipped with living space and amenities found in a motor home.

Running clearance means the distance from the surface on which an automobile is standing to the lowest point on the automobile, excluding unsprung weight.

Static loaded radius arc means a portion of a circle whose center is the center of a standard tire-rim combination of an automobile and whose radius is the distance from that center to the level surface on which the automobile is standing, measured with the automobile at curb weight, the wheel parallel to the vehicle's longitudinal centerline, and the tire inflated to the manufacturer's recommended pressure.

Strong hybrid gasoline-electric vehicle means a vehicle as defined by EPA in 40 CFR 86.1866–12(e).

Temporary living quarters means a space in the interior of an automobile in which people may temporarily live and which includes sleeping surfaces, such as beds, and household conveniences, such as a sink, stove, refrigerator, or toilet.

Transmission class has the meaning given in 40 CFR 600.002.

Tranmission configuration has the meaning given in 40 CFR 600.002.

Transmission type has the meaning given in 40 CFR 86.1803.

Van means a vehicle with a body that fully encloses the driver and a cargo carrying or work performing compartment. The distance from the leading edge of the windshield to the foremost body section of vans is typically shorter than that of pickup trucks and sport utility vehicles.

Vocational tractor means a tractor that is classified as a vocational vehicle according to 40 CFR 1037.630

Vocational vehicle means a vehicle that is equipped for a particular industry, trade or occupation such as construction, heavy hauling, mining, logging, oil fields, refuse and includes vehicles such as school buses, motorcoaches and RVs.

Work truck means a vehicle that is rated at more than 8,500 pounds and less than or equal to 10,000 pounds gross vehicle weight, and is not a medium-duty passenger vehicle as defined in 40 CFR 86.1803.

■ 284. Revise § 523.6 to read as follows:

§ 523.6 Heavy-duty vehicle.

(a) A heavy-duty vehicle is any commercial medium or heavy-duty on-highway vehicle or a work truck, as defined in 49 U.S.C. 32901(a)(7) and (19). For the purpose of this section, heavy-duty vehicles are divided into four regulatory categories as follows:

(1) Heavy-duty pickup trucks and vans;

(2) Heavy-duty vocational vehicles;

(3) Truck tractors with a GVWR above 26,000 pounds; and

(4) Heavy-duty trailers.

(b) The heavy-duty vehicle classification does not include vehicles excluded as specified in 49 CFR 535.3.

■ 285. Revise § 523.7 to read as follows:

§ 523.7 Heavy-duty pickup trucks and vans.

Heavy-duty pickup trucks and vans are pickup trucks and vans with a gross vehicle weight rating between 8,501 pounds and 14,000 pounds (Class 2b through 3 vehicles) manufactured as complete vehicles by a single or final stage manufacturer or manufactured as incomplete vehicles as designated by a manufacturer. A manufacturer may also optionally designate as a heavy-duty pickup truck or van any cab-complete or complete vehicle having a GVWR over 14,000 pounds and below 26,001 pounds equipped with a spark ignition engine or any spark ignition engine certified and sold as a loose engine manufactured for use in a heavy-duty pickup truck or van. See references in 40 CFR 86.1819, 40 CFR 1037.150, and 49 CFR 535.5(a).

■ 286. Add § 523.10 to read as follows:

§ 523.10 Heavy-duty trailers.

(a) A trailer means a motor vehicle with or without motive power, designed for carrying persons or property and for being drawn by another motor vehicle as defined in 49 CFR 571.3. For the purpose of this part, heavy-duty trailers include only those trailers designed to be drawn by a truck tractor or vocational tractor. Heavy-duty trailers may be divided into different types and categories as follows:

(1) Box vans are trailers with an enclosed cargo space that is permanently attached to the chassis, with fixed sides, nose, and roof and is designed to carry a wide range of freight. Tankers are not box vans.

(2) Box vans with self-contained refrigeration systems are refrigerated vans. All other box vans are dry vans.

(3) Trailers that are not box vans are non-box trailers. This includes chassis that are designed only for temporarily mounted containers.

(4) Box trailers with length greater than 50 feet are long box trailers. Other box trailers are short box trailers.

(b) Heavy-duty trailers does not include excluded trailers as specified in 49 CFR 535.3.

PART 534—RIGHTS AND RESPONSIBILITIES OF MANUFACTURERS IN THE CONTEXT OF CHANGES IN CORPORATE RELATIONSHIPS

■ 287. Revise the authority citation for part 534 to read as follows:

Authority: 49 U.S.C. 32901; delegation of authority at 49 CFR 1.95.

■ 288. Add § 534.8 to read as follows:

§ 534.8 Shared corporate relationships.

(a) Vehicles and engines built by multiple manufacturers can share responsibility for complying with fuel consumption standards in 49 CFR part 535, if allowed by EPA under 40 CFR 1037.620 and a joint agreement between the parties is sent to EPA and NHTSA.

(1) Each agreement must—

(i) Define how the vehicles and engines will be divided among each manufacturer;

(ii) Specify which manufacturer(s) will be responsible for the EPA certificates of conformity required in 40 CFR 1036.201 and 40 CFR 1037.201;

(iii) Describe the vehicles and engines in terms of the model types, production volumes, and model years (production periods if necessary);

(iv) Describe which manufacturer(s) have engineering and design control and sale distribution ownership over the vehicles and/or engines; and

(v) Include signatures from all parties involved in the shared corporate relationship.

(2) After defining the shared relationship between the manufacturers for the initiating model year, manufacturers cannot change the defined ownerships for subsequent model years unless one manufacturer assumes a successor relationship over another manufacturer that previously shared ownership.

(3) Multiple manufacturers must designate the same shared responsibility for complying with fuel consumption as selected for GHG standards unless otherwise allowed by EPA and NHTSA.

(b) NHTSA reserves the right to reject the joint agreement.

■ 289. Revise part 535 to read as follows:

PART 535 MEDIUM- AND HEAVY-DUTY VEHICLE FUEL EFFICIENCY PROGRAM

Sec.

Authority: 49 U.S.C. 32902 and 30101; delegation of authority at 49 CFR 1.95.

§ 535.1 Scope.

This part establishes fuel consumption standards pursuant to 49 U.S.C. 32902(k) for work trucks and commercial medium-duty and heavy-duty on-highway vehicles, including trailers (hereafter referenced as heavy-duty vehicles), and engines manufactured for sale in the United States and establishes a credit program manufacturers may use to comply with standards and requirements for manufacturers to provide reports to the National Highway Traffic Safety Administration regarding their efforts to reduce the fuel consumption of heavy-duty vehicles.

§ 535.2 Purpose.

The purpose of this part is to reduce the fuel consumption of new heavy-duty vehicles by establishing maximum levels for fuel consumption standards while providing a flexible credit program to assist manufacturers in complying with standards.

§ 535.3 Applicability.

(a) This part applies to manufacturers that produce complete and incomplete heavy-duty vehicles as defined in 49 CFR part 523, and to the manufacturers of all heavy-duty engines manufactured for use in the applicable vehicles for each given model year.

(b) Vehicle and engine manufacturers that must comply with this part include manufacturers required to have approved certificates of conformity from EPA as specified in 40 CFR parts 86, 1036, and 1037, except for minor differences in excluded vehicles as specified in paragraph (d) of this section.

(c) In certain special conditions where EPA allows manufacturers to designate other manufacturers to comply with GHG standards or grants special allowances in the construction of vehicles, as specified in 40 CFR 1037.620, 1037.621, and 1037.650, these allowances can be used to comply with the fuel consumption standards of this part.

(d) Manufacturers required to meet the fuel consumption standards of this part also include manufacturers completing, altering, or assembling motor vehicles or motor vehicle equipment into—

(1) Electric vehicles; and

(2) Alternative fueled vehicles from all types of heavy duty engine conversions.

(i) Entities that install alternative fuel conversion systems into vehicles acquired from vehicle manufacturers prior to first retail sale or introduction into interstate commerce may be regulated under this part if designated by the vehicle manufacturer and EPA to be the certificate holder.

(ii) Entities installing alternative fuel conversions are regulated as vehicle and engine manufacturers.

(iii) Entities can be omitted from compliance with vehicle based standards, if–

(A) Allowed by EPA;

(B) They provide a reasonable technical basis that the modified vehicle continues to meet vehicle standards; and

(C) They provide a joint agreement to EPA and NHTSA as specified in 49 CFR 534.7.

(e) The following heavy-duty vehicles and engines are excluded from the requirements of this part:

(1) Medium-duty passenger vehicles and other vehicles subject to the light-duty corporate average fuel economy standards in 49 CFR parts 531 and 533.

(2) Recreational vehicles, including motor homes manufactured before model year 2021 exept those produced by manufacturers voluntarily complying with NHTSA's early voational standards for model years 2013 through 2020.

(3) Heavy-duty trailers meeting one or more of the following criteria are excluded from vehicle standards in § 535.5(e):

(i) Trailers designed for in-field operations in logging or mining.

(ii) Trailers designed to operate at low speeds such that they are unsuitable for normal highway operation.

(iii) Trailers designed to perform their primary function while stationary, if they have permanently affixed components designed for heavy construction. This would include crane trailers and concrete trailers. Trailers would not qualify under this paragraph based on welding equipment or other components that are commonly used separate from trailers.

(iv) Trailers less than 35 feet long with three axles, and all trailers with four or more axles.

(v) Trailers intended for temporary or permanent residence, office space, or other work space, such as campers, mobile homes, and carnival trailers.

(vi) Trailers built before January 1, 2021, except those trailers voluntarily complaying with NHTSA's early trailer standards for model years 2018–2020.

(vii) Equipment that serves similar purposes to trailers but is not intended to be pulled by a tractor.

(viii) Containers that are not permanently mounted on chassis.

(ix) Trailers designed to be drawn by vehicles other than tractors, and those that are coupled to vehicles with pintle hooks or hitches instead of a fifth wheel.

(f) The following heavy-duty vehicles and engines are exempted from the requirements of this part:

(1) *Off-road vehicles.* Manufacturers producing heavy-duty vocational vehicles or vocational tractors that are intended for off-road use meeting the criteria of paragraph (f)(1)(i) of this section are exempted from vehicle standards in § 535.5(b) and (c) but must comply with engine standards in § 535.5(d).

(i) Vehicles primarily designed to perform work off-road (such as in oil fields, mining, forests, or construction sites), and meeting at least one of the criteria of paragraph (f)(1)(i)(A) of this section and at least one of the criteria of paragraph (f)(1)(i)(B) of this section.

(A) Vehicle must have affixed components designed to work in an off-road environment (for example, hazardous material equipment or drilling equipment) or was designed to operate at low speeds making them unsuitable for normal highway operation.

(B) Vehicles must—

(*1*) Have an axle that has a gross axle weight rating (GAWR) of 29,000 pounds or more;

(*2*) Have a speed attainable in 2 miles of not more than 33 mph; or

(*3*) Have a speed attainable in 2 miles of not more than 45 mph, an unloaded vehicle weight that is not less than 95 percent of its gross vehicle weight rating (GVWR), and no capacity to carry occupants other than the driver and operating crew.

(C) Manufacturers building tractors exempted under this provision must request preliminary approval before introducing vehicles into commerce. The request with supporting information must be sent to EPA that will coordinate with NHTSA in making a determination in accordance with 40 CFR 1037.210. Vehicles introduced into U.S. commerce without approval under this paragraph violate 40 CFR 1068.101(a)(1).

(ii) [Reserved]

(2) *Small business manufacturers.* (i) For Phase 1, small business manufacturers are exempted from the vehicle and engine standards of § 535.5, but must comply with the reporting requirements of § 535.8(g).

(ii) For Phase 2, fuel consumption standards apply on a delayed schedule for manufacturers meeting the small business criteria specified in 13 CFR 121.201 and in 40 CFR 86.1819–14(k)(5), 40 CFR 1036.150, and 40 CFR 1037.150. Qualifying manufacturers of truck tractors, vocational vehicles, heavy duty pickups and vans, and engines are not subject to the fuel consumption standards for vehicles and engines built before January 1, 2022. Qualifying manufacturers may choose to voluntarily comply early.

(iii) Small business manufacturers producing vehicles and engines that run on any fuel other than gasoline, E85, or diesel fuel meeting the criteria specified in 13 CFR 121.201 and in 40 CFR 86.1819–14(k)(5), 40 CFR 1036.150, and 40 CFR 1037.150 may delay complying with every new mandatory standard under this part by one model year.

(g) For model year 2021 and later, emergency vehicles may comply with alternative fuel consumption standards as specified in § 535.5(b)(5) instead of the standards specified in § 535.5(b)(4). Vehicles certified to these alternative standards may not generate or use positive fuel consumption credits but negative credits must be averaged within an averaging set.

(h) NHTSA may exclude or exempt vehicles and engines under special conditions allowed by EPA in accordance with 40 CFR parts 85, 86, 1036, 1037, and 1068. Manufacturers should consult the agencies if uncertain how to apply any EPA provision under the NHTSA fuel consumption program. Upon notification by EPA of a fraudulent use of an exemption, NHTSA reserves that right to suspend or revoke any exemption or exclusion.

§ 535.4 Definitions.

The terms manufacture and manufacturer are used as defined in section 501 of the Act and the terms commercial medium-duty and heavy-duty on highway vehicle, fuel and work truck are used as defined in 49 U.S.C. 32901.

Act means the Motor Vehicle Information and Cost Savings Act, as amended by Pub. L. 94–163 and 96–425.

Administrator means the Administrator of the National Highway Traffic Safety Administration (NHTSA) or the Administrator's delegate.

Advanced technology means vehicle technology under this fuel consumption program in §§ 535.6 and 535.7 and by EPA under 40 CFR 86.1819–14(d)(7), 1036.615, or 1037.615.

Alternative fuel conversion has the meaning given for clean alternative fuel conversion in 40 CFR 85.502.

A to B testing has the meaning given in 40 CFR 1037.801.

Automatic tire inflation system has the meaning in 40 CFR 1037.801.

Averaging set means, a set of engines or vehicles in which fuel consumption credits may be exchanged. Credits generated by one engine or vehicle family may only be used by other respective engine or vehicle families in the same averaging set. Note that an averaging set may comprise more than one regulatory subcategory. The averaging sets for this HD program are defined as follows:

(1) Heavy-duty pickup trucks and vans.

(2) Vocational light-heavy vehicles with a GVWR above 8,500 pounds but at or below 19,500 pounds.

(3) Vocational and tractor medium-heavy vehicles with a GVWR above 19,500 pounds but at or below 33,000 pounds.

(4) Vocational and tractor heavy-heavy vehicles with a GVWR above 33,000 pounds.

(5) Compression-ignition light heavy-duty engines for Class 2b to 5 vehicles with a GVWR above 8,500 pounds but at or below 19,500 pounds.

(6) Compression-ignition medium heavy-duty engines for Class 6 and 7 vehicles with a GVWR above 19,500 but at or below 33,000 pounds.

(7) Compression-ignition heavy heavy-duty engines for Class 8 vehicles with a GVWR above 33,000 pounds.

(8) Spark-ignition engines in Class 2b to 8 vehicles with a GVWR above 8,500 pounds.

(9) Long box van trailers.

(10) Short box van trailers.

(11) Long refrigerated box van trailers.

(12) Short refrigerated box van trailers.

Cab-complete vehicle has the meaning given in 49 CFR part 523.

Carryover means relating to certification based on emission data generated from an earlier model year.

Certificate holder means the manufacturer who holds the certificate of conformity for the vehicle or engine and that assigns the model year based on the date when its manufacturing operations are completed relative to its annual model year period.

Certificate of Conformity means an approval document granted by EPA to a manufacturer that submits an application for a vehicle or engine emissions family in 40 CFR 1036.205 and 1037.205. A certificate of conformity is valid from the indicated effective date until December 31 of the model year for which it is issued. The certificate must be renewed annually for any vehicle a manufacturer continues to produce.

Certification means process of obtaining a certificate of conformity for a vehicle family that complies with the emission standards and requirements in this part.

Certified emission level means the highest deteriorated emission level in an engine family for a given pollutant from the applicable transient and/or steady-state testing rounded to the same number of decimal places as the applicable standard. Note that you may have two certified emission levels for CO_2 if you certify a family for both vocational and tractor use.

Chassis-cab means the incomplete part of a vehicle that includes a frame, a completed occupant compartment and that requires only the addition of cargo-carrying, work-performing, or load-bearing components to perform its intended functions.

Chief Counsel means the NHTSA Chief Counsel, or his or her designee.

Complete sister vehicle is a complete vehicle of the same configuration as a cab-complete vehicle.

Complete vehicle has the meaning given in 49 CFR part 523.

Compression-ignition (CI) means relating to a type of reciprocating, internal-combustion engine, such as a diesel engine, that is not a spark-ignition engine. Note that 40 CFR 1036.1 also deems gas turbine engines and other engines to be compression-ignition engines.

Configuration means a subclassification within a test group for passenger cars, light trucks and medium-duty passenger vehicles and heavy-duty pickup trucks and vans which is based on basic engine, engine code, transmission type and gear ratios, and final drive ratio.

Curb weight has the meaning given in 40 CFR 86.1803.

Date of manufacture means the date on which the certifying vehicle manufacturer completes its manufacturing operations, except as follows:

(1) Where the certificate holder is an engine manufacturer that does not manufacture the complete or incomplete vehicle, the date of manufacture of the vehicle is based on the date assembly of the vehicle is completed.

(2) EPA and NHTSA may approve an alternate date of manufacture based on the date on which the certifying (or primary) vehicle manufacturer completes assembly at the place of main assembly, consistent with the provisions of 40 CFR 1037.601 and 49 CFR 567.4.

(3) A vehicle manufacturer that completes assembly of a vehicle at two or more facilities may ask to use as the month and year of manufacture, for that vehicle, the month and year in which manufacturing is completed at the place of main assembly, consistent with provisions of 49 CFR 567.4, as the model year. Note that such staged assembly is subject to the provisions of 40 CFR 1068.260(c). NHTSA's allowance of this provision is effective when EPA approves the manufacturer's certificates of conformity for these vehicles.

Day cab has the meaning given in 40 CFR 1037.801.

Emergency vehicle means a vehicle that meets one of the criteria in 40 CFR 1037.801.

Engine family has the meaning given in 40 CFR 1036.230.

Excluded means a vehicle or engine manufacturer or component is not required to comply with any aspects with the NHTSA fuel consumption program.

Exempted means a vehicle or engine manufacturer or component is not required to comply with certain provisions of the NHTSA fuel consumption program.

Family certification level (FCL) has the meaning given in 40 CFR 1036.801.

Family emission limit (FEL) has the meaning given in 40 CFR 1037.801.

Final drive ratio has the meaning in 40 CFR 1037.801.

Final-stage manufacturer has the meaning given in 49 CFR 567.3.

Fleet in this part means all the heavy-duty vehicles or engines within each of the regulatory sub-categories that are manufactured by a manufacturer in a particular model year and that are subject to fuel consumption standards under § 535.5.

Fleet average fuel consumption is the calculated average fuel consumption performance value for a manufacturer's fleet derived from the production weighted fuel consumption values of the unique vehicle configurations within each vehicle model type that makes up that manufacturer's vehicle fleet in a given model year. In this part, the fleet average fuel consumption value is determined for each manufacturer's fleet of heavy-duty pickup trucks and vans.

Fleet average fuel consumption standard is the actual average fuel consumption standard for a manufacturer's fleet derived from the production weighted fuel consumption standards of each unique vehicle configuration, based on payload, tow capacity and drive configuration (2, 4 or all-wheel drive), of the model types that makes up that manufacturer's vehicle fleet in a given model year. In this part, the fleet average fuel consumption standard is determined for each manufacturer's fleet of heavy-duty pickup trucks and vans.

Fuel cell means an electrochemical cell that produces electricity via the non-combustion reaction of a consumable fuel, typically hydrogen.

Fuel cell electric vehicle means a motor vehicle propelled solely by an electric motor where energy for the motor is supplied by a fuel cell.

Fuel efficiency means the amount of work performed for each gallon of fuel consumed.

Gaseous fuel has the meaning given in 40 CFR 1037.801.

Good engineering judgment has the meaning given in 40 CFR 1068.30. See 40 CFR 1068.5 for the administrative process used to evaluate good engineering judgment.

Heavy-duty off-road vehicle means a heavy-duty vocational vehicle or vocational tractor that is intended for off-road use.

Heavy-duty vehicle has the meaning given in 49 CFR part 523.

Heavy-haul tractor has the meaning given in 40 CFR 1037.801.

Heavy heavy-duty (HHD) vehicle means a Class 8 vehicle with a GVWR above 33,000 pounds.

Hybrid engine or hybrid powertrain means an engine or powertrain that includes energy storage features other than a conventional battery system or conventional flywheel. Supplemental electrical batteries and hydraulic accumulators are examples of hybrid energy storage systems. Note that certain provisions in this part treat hybrid engines and powertrains intended for vehicles that include regenerative braking different than those intended for vehicles that do not include regenerative braking.

Hybrid vehicle means a vehicle that includes energy storage features (other than a conventional battery system or conventional flywheel) in addition to an internal combustion engine or other engine using consumable chemical fuel. Supplemental electrical batteries and hydraulic accumulators are examples of hybrid energy storage systems Note that certain provisions in this part treat hybrid vehicles that include regenerative braking different than those that do not include regenerative braking.

Incomplete vehicle has the meaning given in 49 CFR part 523. For the purpose of this regulation, a manufacturer may request EPA and NHTSA to allow the certification of a vehicle as an incomplete vehicle if it manufactures the engine and sells the unassembled chassis components, provided it does not produce and sell the body components necessary to complete the vehicle.

Light heavy-duty (LHD) vehicle means a Class 2b through 5 vehicle with a GVWR at or below 19,500 pounds.

Liquefied petroleum gas (LPG) has the meaning given in 40 CFR 1036.801.

Low rolling resistance tire means a tire on a vocational vehicle with a tire rolling resistance level (TRRL) of 7.7 kg/metric ton or lower, a steer tire on a tractor with a TRRL of 7.7 kg/metric ton or lower, or a drive tire on a tractor with a TRRL of 8.1 kg/metric ton or lower.

Medium heavy-duty (MHD) vehicle means a Class 6 or 7 vehicle with a GVWR above 19,500 pounds GVWR but at or below 33,000 pounds.

Model type has the meaning given in 40 CFR 600.002.

Model year as it applies to engines means the manufacturer's annual new model production period, except as restricted under this definition. It must include January 1 of the calendar year for which the model year is named, may not begin before January 2 of the previous calendar year, and it must end by December 31 of the named calendar year. Manufacturers may not adjust model years to circumvent or delay compliance with standards.

Model year as it applies to vehicles means the manufacturer's annual new model production period, except as restricted under this definition and 40 CFR part 85, subpart X. It must include January 1 of the calendar year for which the model year is named, may not begin before January 2 of the previous calendar year, and it must end by December 31 of the named calendar year.

(1) The manufacturer who holds the certificate of conformity for the vehicle must assign the model year based on the date when its manufacturing operations are completed relative to its annual model year period.

(2) Unless a vehicle is being shipped to a secondary manufacturer that will hold the certificate of conformity, the model year must be assigned prior to introduction of the vehicle into U.S. commerce. The certifying manufacturer must redesignate the model year if it does not complete its manufacturing operations within the originally identified model year. A vehicle introduced into U.S. commerce without a model year is deemed to have a model year equal to the calendar year of its introduction into U.S. commerce unless the certifying manufacturer assigns a later date.

Natural gas has the meaning given in 40 CFR 1036.801. Vehicles that use a pilot-ignited natural gas engine (which uses a small diesel fuel ignition system), are still considered natural gas vehicles.

NHTSA Enforcement means the NHTSA Associate Administrator for Enforcement, or his or her designee.

Party means the person alleged to have committed a violation of § 535.9, and includes manufacturers of vehicles and manufacturers of engines.

Payload means in this part the resultant of subtracting the curb weight from the gross vehicle weight rating.

Petroleum has the meaning given in 40 CFR 1036.801.

Pickup truck has the meaning given in 49 CFR part 523.

Plug-in hybrid electric vehicle (PHEV) means a hybrid electric vehicle that has the capability to charge the battery or batteries used for vehicle propulsion from an off-vehicle electric source, such that the off-vehicle source cannot be connected to the vehicle while the vehicle is in motion.

Power take-off (PTO) means a secondary engine shaft or other system on a vehicle that provides substantial auxiliary power for purposes unrelated to vehicle propulsion or normal vehicle accessories such as air conditioning, power steering, and basic electrical accessories. A typical PTO uses a secondary shaft on the engine to transmit power to a hydraulic pump that powers auxiliary equipment such as a boom on a bucket truck.

Powertrain family has the meaning given in 40 CFR 1037.231. Manufacturers choosing to perform powertrain testing as specified in 40 CFR 1037.550, divide product lines into powertrain families that are expected to have similar fuel consumptions and CO_2 emission characteristics throughout the useful life.

Preliminary approval means approval granted by an authorized EPA representative prior to submission of an application for certification, consistent with the provisions of 40 CFR 1037.210. For requirements involing NHTSA, EPA will ensure decisions are jointly made and will convey the decision to the manufacturer.

Primary intended service class has the meaning for engines as specified in 40 CFR 1036.140.

Rechargeable Energy Storage System (RESS) means the component(s) of a hybrid engine or vehicle that store recovered energy for later use, such as the battery system in a electric hybrid vehicle.

Regulatory category means each of the four types of heavy-duty vehicles defined in 49 CFR 523.6 and the heavy-duty engines used in these heavy-duty vehicles.

Regulatory subcategory means the sub-groups in each regulatory category to which fuel consumption standards and requirements apply, and are defined as follows:

(1) Heavy-duty pick-up trucks and vans.

(2) Vocational vehicle subcategories are shown in Tables 1 and 2 below and include vocational tractors. Table 1 includes vehicles complying with Phase 1 standards. Phase 2 vehicles are included in Table 2 which have 21 separate subcategories to account for differences in engine type, GVWR, and the vehicle characteristics corresponding to the duty cycles for vocational vehicles.

TABLE 1—PHASE 1 VOCATIONAL VEHICLE SUBCATEGORIES

LHD vocational vehicles.
MHD vocational vehicles.
HHD vocational vehicles.

TABLE 2—PHASE 2 VOCATIONAL VEHICLE SUBCATEGORIES

Engine type	LHD vocational vehicles	MHD vocational vehicles	HHD vocational vehicles
CI	Urban	Urban	Urban.
CI	Multi-Purpose	Multi-Purpose	Multi-Purpose.
CI	Regional	Regional	Regional.
CI and SI	Emergency	Emergency	Emergency.
SI	Urban	Urban	Urban.
SI	Multi-Purpose	Multi-Purpose	Multi-Purpose.
SI	Regional	Regional	Regional.

(3) Tractor subcategories are shown in Table 3 below for Phase 1 and 2. Table 3 includes 10 separate subcategories for tractors complying with Phase 1 and 2 standards. The heavy-haul tractor subcategory only applies for Phase 2.

TABLE 3—PHASE 1 AND 2 TRUCK TRACTOR SUBCATEGORIES

Class 7	Class 8 day cabs	Class 8 sleeper cabs
Low-roof tractors	Low-roof day cab tractors	Low-roof sleeper cab tractors.
Mid-roof tractors	Mid-roof day cab tractors	Mid-roof sleeper cab tractors.
High-roof tractors	High-roof day cab tractors	High-roof sleeper cab tractors.
		Heavy-haul tractors (applies only to Phase 2 program).

(4) Trailer subcategories are shown in Table 4 of this section for the Phase 2 program. Trailers do not comply under the Phase 1 program. Table 4 includes 10 separate subcategories for trailers, which are only subject to Phase 2 only standards.

TABLE 4—TRAILER SUBCATEGORIES

Full-aero trailers	Partial-aero trailers	Other trailers
Long box dry vans	Long box dry vans	Non-aero box vans.
Short box dry vans	Short box dry vans	Non-box trailers.
Long box refrigerated vans	Long box refrigerated vans	
Short box refrigerated vans	Short box refrigerated vans	

(5) Engine subcategories are shown in Table 5 below. Table 5 includes 6 separate subcategories for engines which are the same for Phase 1 and 2 standards.

TABLE 5—ENGINE SUBCATEGORIES

LHD engines	MHD engines	HHD engines
CI engines for vocational vehicles	CI engines for vocational vehicles	CI engines for vocational vehicles.
	CI engines for truck tractors	CI engines for truck tractors.
All spark-ignition engines.		

Roof height means the maximum height of a vehicle (rounded to the nearest inch), excluding narrow accessories such as exhaust pipes and antennas, but including any wide accessories such as roof fairings. Measure roof height of the vehicle configured to have its maximum height that will occur during actual use, with properly inflated tires and no driver, passengers, or cargo onboard. Determine the base roof height on fully inflated tires having a static loaded radius equal to the arithmetic mean of the largest and smallest static loaded radius of tires a manufacturer offers or a standard tire EPA approves. If a vehicle is equipped with an adjustable roof fairing, measure the roof height with the fairing in its lowest setting. Once the maximum height is determined, roof heights are divided into the following categories:

(1) Low-roof means a vehicle with a roof height of 120 inches or less.

(2) Mid-roof means a vehicle with a roof height between 121 and 147 inches.

(3) High-roof means a vehicle with a roof height of 148 inches or more.

Service class group means a group of engine and vehicle averaging sets defined as follows:

(1) Spark-ignition engines, light heavy-duty compression-ignition engines, light heavy-duty vocational vehicles and heavy-duty pickup trucks and vans.

(2) Medium heavy-duty compression-ignition engines and medium heavy-duty vocational vehicles and tractors.

(3) Heavy heavy-duty compression-ignition engines and heavy heavy-duty vocational vehicles and tractors.

Sleeper cab means a type of truck cab that has a compartment behind the driver's seat intended to be used by the driver for sleeping. This includes both cabs accessible from the driver's compartment and those accessible from outside the vehicle.

Small business manufacturer means a manufacturer meeting the criteria specified in 13 CFR 121.201. For manufacturers owned by a parent company, the employee and revenue limits apply to the total number employees and total revenue of the parent company and all its subsidiaries.

Spark-ignition (SI) means relating to a gasoline-fueled engine or any other type of engine with a spark plug (or other sparking device) and with operating characteristics significantly similar to the theoretical Otto combustion cycle. Spark-ignition engines usually use a throttle to regulate intake air flow to control power during normal operation. Note that some spark-ignition engines are subject to requirements that apply for compression-ignition engines as described in 40 CFR 1036.140.

Subconfiguration means a unique combination within a vehicle configuration of equivalent test weight, road-load horsepower, and any other operational characteristics or parameters that EPA determines may significantly affect CO_2 emissions within a vehicle configuration as defined in 40 CFR 600.002.

Standard payload means the payload assumed for each vehicle, in tons, for modeling and calculating emission credits, as follows:

(1) For vocational vehicles:

(i) 2.85 tons for light heavy-duty vehicles.

(ii) 5.6 tons for medium heavy-duty vehicles.

(iii) 7.5 tons for heavy heavy-duty vocational vehicles.

(2) For tractors:

(i) 12.5 tons for Class 7.

(ii) 19 tons for Class 8.

(iii) 43 tons for heavy-haul tractors.

(3) For trailers:

(i) 10 tons for short box vans.

(ii) 19 tons for other trailers.

Standard tractor has the meaning given in 40 CFR 1037.501.

Standard trailer has the meaning given in 40 CFR 1037.501.

Test group means the multiple vehicle lines and model types that share critical emissions and fuel consumption related features and that are certified as a group by a common certificate of conformity issued by EPA and is used collectively with other test groups within an averaging set or regulatory subcategory and is used by NHTSA for determining the fleet average fuel consumption.

Tire rolling resistance level (TRRL) means a value with units of kg/metric ton that represents that rolling resistance of a tire configuration. TRRLs are used as inputs to the GEM model under 40 CFR 1037.520. Note that a manufacturer may assign a value higher than a measured rolling resistance of a tire configuration.

Towing capacity in this part is equal to the resultant of subtracting the gross vehicle weight rating from the gross combined weight rating.

Trade means to exchange fuel consumption credits, either as a buyer or a seller.

Truck tractor has the meaning given in 49 CFR 571.3. This includes most heavy-duty vehicles specifically designed for the primary purpose of pulling trailers, but does not include vehicles designed to carry other loads. For purposes of this definition ''other loads'' would not include loads carried in the cab, sleeper compartment, or toolboxes. Examples of vehicles that are similar to tractors but that are not tractors under this part include dromedary tractors, automobile haulers, straight trucks with trailers hitches, and tow trucks.

U.S.-directed production volume means the number of vehicle units, subject to the requirements of this part, produced by a manufacturer for which the manufacturer has a reasonable assurance that sale was or will be made to ultimate purchasers in the United States.

Useful life has the meaning given in 40 CFR 1036.801 and 1037.801.

Vehicle configuration means a unique combination of vehicle hardware and calibration (related to measured or modeled emissions) within a vehicle family. Vehicles with hardware or software differences, but that have no hardware or software differences related to measured or modeled emissions or fuel consumption can be included in the same vehicle configuration. Note that vehicles with hardware or software differences related to measured or modeled emissions or fuel consumption are considered to be different configurations even if they have the same GEM inputs and FEL. Vehicles within a vehicle configuration differ only with respect to normal production variability or factors unrelated to measured or modeled emissions and fuel consumption for EPA and NHTSA.

Vehicle family has the meaning given in 40 CFR 1037.230. Manufacturers designate families in accordance with EPA provisions and may not choose different families between the NHTSA and EPA programs.

Vehicle service class has the meaning for vehicles as specified in the 40 CFR 1037.801.

Vocational tractor has the meaning given in 40 CFR 1037.801.

Zero emissions vehicle means an electric vehicle or a fuel cell vehicle.

§ 535.5 Standards.

(a) *Heavy-duty pickup trucks and vans.* Each manufacturer's fleet of heavy-duty pickup trucks and vans shall comply with the fuel consumption standards in this paragraph (a) expressed in gallons per 100 miles. Each vehicle must be manufactured to comply for its useful life. If the manufacturer's fleet includes conventional vehicles (gasoline, diesel and alternative fueled vehicles) and advanced technology vehicles in Phase 1 (hybrids with regenerative braking, vehicles equipped with Rankine-cycle engines, electric and fuel cell vehicles), it should divide its fleet into two separate fleets each with its own separate fleet average fuel consumption standard which the manufacturer must comply with the requirements of this paragraph (a). NHTSA standards correspond to the same requirements for EPA as specified in 40 CFR 86.1819–14.

(1) *Mandatory standards.* For model years 2016 and later, each manufacturer must comply with the fleet average standard derived from the unique subconfiguration target standards (or groups of subconfigurations approved by EPA in accordance with 40 CFR 86.1819) of the model types that make up the manufacturer's fleet in a given model year. Each subconfiguration has a unique attribute-based target standard, defined by each group of vehicles having the same payload, towing capacity and whether the vehicles are equipped with a 2-wheel or 4-wheel drive configuration. Phase 1 target standards apply for model years 2016 through 2020. Phase 2 target standards apply for model year 2021 and afterwards.

(2) *Subconfiguration target standards.* (i) Two alternatives exist for determining the subconfiguration target standards for Phase 1. For each alternative, separate standards exist for compression-ignition and spark-ignition vehicles:

(A) The first alternative allows manufacturers to determine a fixed fuel consumption standard that is constant over the model years; and

(B) The second alternative allows manufacturers to determine standards that are phased-in gradually each year.

(ii) Calculate the subconfiguration target standards as specified in this paragraph (a)(2)(ii), using the appropriate coefficients from Table 6 choosing between the alternatives in paragraph (a)(2)(i) of this section. For electric or fuel cell heavy-duty vehicles, use compression-ignition vehicle coefficients ''c'' and ''d'' and for hybrid (including plug-in hybrid), dedicated and dual-fueled vehicles, use coefficients ''c'' and ''d'' appropriate for the engine type used. Round each standard to the nearest 0.001 gallons per 100 miles and specify all weights in pounds rounded to the nearest pound. Calculate the subconfiguration target standards using the following equation:

Subconfiguration Target Standard (gallons per 100 miles) = $[c \times (WF)] + d$

Where:

WF = Work Factor = $[0.75 \times (\text{Payload Capacity} + \text{Xwd})] + [0.25 \times \text{Towing Capacity}]$

Xwd = 4wd Adjustment = 500 lbs if the vehicle group is equipped with 4wd and all-wheel drive, otherwise equals 0 lbs for 2wd.

Payload Capacity = GVWR (lbs) − Curb Weight (lbs) (for each vehicle group)

Towing Capacity = GCWR (lbs) − GVWR (lbs) (for each vehicle group)

TABLE 6—COEFFICIENTS FOR MANDATORY SUBCONFIGURATION TARGET STANDARDS

2022	0.0004703	3.623
2023	0.0004591	3.533
2024	0.0004478	3.443
2025	0.0004366	3.364
2026	0.0004253	3.274
2027 and later	0.0004152	3.196

(3) *Fleet average fuel consumption standard.* (i) Calculate each manufacturer's fleet average fuel consumption standard for conventional and advanced technology fleets separately based on the subconfiguration target standards specified in paragraph (a)(2) of this section, weighted to production volumes and averaged using the following equation combining all the applicable vehicles in a manufacturer's U.S.-directed fleet (compression-ignition, spark-ignition and advanced technology vehicles) for a given model year, rounded to the nearest 0.001 gallons per 100 miles:

$$\text{Fleet Average Standard} = \frac{\sum\left[\text{Subconfiguration Target Standard}_i \times \text{Volume}_i\right]}{\sum\left[\text{Volume}_i\right]}$$

Subconfiguration Target Standard$_i$ = fuel consumption standard for each group of vehicles with same payload, towing capacity and drive configuration (gallons per 100 miles).
Volume$_i$ = production volume of each unique subconfiguration of a model type based upon payload, towing capacity and drive configuration.

(A) A manufacturer may group together subconfigurations that have the same test weight (ETW), GVWR, and GCWR. Calculate work factor and target value assuming a curb weight equal to two times ETW minus GVWR.

(B) A manufacturer may group together other subconfigurations if it uses the lowest target value calculated for any of the subconfigurations.

(ii) For Phase 1, manufacturers must select an alternative for subconfiguration target standards at the same time they submit the model year 2016 pre-model year Report, specified in § 535.8. Once selected, the decision cannot be reversed and the manufacturer must continue to comply with the same alternative for subsequent model years.

(4) *Voluntary standards.* (i) Manufacturers may choose voluntarily to comply early with fuel consumption standards for model years 2013 through 2015, as determined in paragraphs (a)(4)(iii) and (iv) of this section, for example, in order to begin accumulating credits through over-compliance with the applicable standard. A manufacturer choosing early compliance must comply with all the vehicles and engines it manufactures in each regulatory category for a given model year.

(ii) A manufacturer must declare its intent to voluntarily comply with fuel consumption standards at the same time it submits a Pre-Model Report, prior to the compliance model year beginning as specified in § 535.8; and, once selected, the decision cannot be reversed and the manufacturer must continue to comply for each subsequent model year for all the vehicles and engines it manufactures in each regulatory category for a given model year.

(iii) Calculate separate subconfiguration target standards for compression-ignition and spark-ignition vehicles for model years 2013 through 2015 using the equation in paragraph (a)(2)(ii) of this section, substituting the appropriate values for the coefficients in the following table as appropriate:

TABLE 7—COEFFICIENTS FOR VOLUNTARY SUBCONFIGURATION TARGET STANDARDS

Model year(s)	c	d
CI Vehicle Coefficients		
2013 and 14	0.0004695	3.615
2015	0.0004656	3.595
SI Vehicle Coefficients		
2013 and 14	0.0005424	4.175
2015	0.0005390	4.152

(iv) Calculate the fleet average fuel consumption standards for model years 2013 through 2015 using the equation in paragraph (a)(3) of this section.

(5) *Exclusion of vehicles not certified as complete vehicles.* The vehicle standards in paragraph (a) of this section do not apply for vehicles that are chassis-certified with respect to EPA's criteria pollutant test procedure in 40 CFR part 86, subpart S. Any chassis-certified vehicles must comply with the vehicle standards and requirements of paragraph (b) of this section and the engine standards of paragraph (d) of this section for engines used in these vehicles. A vehicle manufacturer choosing to comply with this paragraph and that is not the engine manufacturer is required to notify the engine manufacturers that their engines are subject to paragraph (d) of this section and that it intends to use their engines in excluded vehicles.

(6) *Optional certification under this section.* Manufacturers may certify any complete or cab-complete Class 2b through 5 vehicles weighing at or below 19,500 pounds GVWR and any incomplete vehicles approved by EPA for inclusion under this paragraph to the same testing and standard that applies to a comparable complete sister vehicles as determined in accordance in 40 CFR 86.1819–14(j). Calculate the target standard value under paragraph (a)(2) of this section based on the same work factor value that applies for the complete sister vehicle.

(7) *Loose engines.* This paragraph applies for model year 2020 and earlier spark-ignition engines identical to engines used in vehicles certified to the standards of this paragraph (a), where manufacturers sell such engines as loose engines or installed in incomplete vehicles that are not cab-complete vehicles in accordance with 40 CFR 86.1819–14(k)(8). Vehicles in which those engines are installed are subject to standards in paragraph (b) of this section and the engines are subject to standards in paragraph (d) of this section. Loose engines produced each model year must comply with provisions of 40 CFR 86.1819–14(k)(8).

(8) *Alternative fuel vehicle conversions.* Alternative fuel vehicle conversions may demonstrate compliance with the standards of this part or other alternative compliance approaches allowed by EPA in 40 CFR 85.525.

(9) *Useful life.* The following useful life values apply for the standards of this section:

(i) 120,000 miles or 10 years, whichever comes first, for Class 2b through Class 3 heavy-duty pickup trucks and vans certified to Phase 1 standards.

(ii) 150,000 miles or 15 years, whichever comes first, for Class 2b through Class 3 heavy-duty pickup trucks and vans certified to Phase 2 standards.

(iii) For Phase 1 credits that you calculate based on a useful life of 120,000 miles, multiply any banked credits that you carry forward for use into the Phase 2 program by 1.25. For Phase 1 credit deficits that you generate based on a useful life of 120,000 miles multiply the credit deficit by 1.25 if offsetting the shortfall with Phase 2 credits.

(10) *Optional standards.* For model years 2013 through 2019, manufacturers may calculate target standards ''c'' coefficients rounded to the nearest six decimal places (0.000001) and ''d'' coefficients rounded to the nearest two decimal places (0.01) based on the standards listed in tables 6 or 7. If a manufacturer chooses this option, the fleet standard calculated in accordance with paragraph (a)(3) of this section and fuel consumption rate calculated in accordance with paragraph (a)(5) of this section must be rounded to the nearest 0.01 gallons per 100 miles. If a manufacturer chooses this provision it will be applicable for all model years 2013 through 2019.

(b) *Heavy-duty vocational vehicles.* Each manufacturer building a complete or incomplete heavy-duty vocational vehicles shall comply with the fuel consumption standards in this paragraph (b) expressed in gallons per 1000 ton-miles. Engines used in heavy-duty vocational vehicles shall comply with the standards in paragraph (d) of this section. Each vehicle must be manufactured to comply for its useful life.

(1) *Mandatory standards.* Heavy-duty vocational vehicles produced for Phase 1 must comply with the fuel consumption standards in paragraph (b)(3) of this section. For Phase 2, each vehicle manufacturer of heavy-duty vocational vehicles must comply with the fuel consumption standards in paragraph (b)(4) of this section.

(i) For model years 2016 to 2020, the heavy-duty vocational vehicles are subdivided by GVWR into three regulatory subcategories as defined in § 535.4, each with its own assigned standard.

(ii) For model years 2021 and later, the heavy-duty vocational vehicle category is subdivided into 21 regulatory subcategories depending upon whether vehicles are equipped with a compression or spark ignition engine, as defined in § 535.4. Each subcategory has its own assigned standard.

(iii) For purposes of certifying vehicles to fuel consumption standards, manufacturers must divide their product lines in each regulatory subcategory into vehicle families that have similar emissions and fuel consumption features, as specified by EPA in 40 CFR part 1037, subpart C. These families will be subject to the applicable standards. Each vehicle family is limited to a single model year.

(2) *Voluntary compliance.* (i) For model years 2013 through 2015, a manufacturer may choose voluntarily to comply early with the fuel consumption standards provided in paragraph (b)(3) of this section. For example, a manufacturer may choose to comply early in order to begin accumulating credits through over-compliance with the applicable standards. A manufacturer choosing early compliance must comply with all the vehicles and engines it manufacturers in each regulatory category for a given model year.

(ii) A manufacturer must declare its intent to voluntarily comply with fuel consumption standards and identify its plans to comply before it submits its first application for a certificate of conformity for the respective model year as specified in § 535.8; and, once selected, the decision cannot be reversed and the manufacturer must continue to comply for each subsequent model year for all the vehicles and engines it manufacturers in each regulatory category for a given model year.

(3) *Regulatory subcategory standards for model years 2013 to 2020.* The mandatory and voluntary fuel consumption standards for heavy-duty vocational vehicles are given in the following table:

TABLE 8—PHASE 1 VOCATIONAL VEHICLE FUEL CONSUMPTION STANDARDS

[Gallons per 1000 ton-miles]

Regulatory subcategories	LHD Vocational vehicles	MHD Vocational vehicles	HHD Vocational vehicles
Model Years 2013 to 2016 Voluntary Standards			
Standard	38.1139	22.9862	22.2004
Model Years 2017 to 2020 Mandatory Standards			
Standard	36.6405	22.1022	21.8075

(4) *Regulatory subcategory standards for model years 2021 and later.* The mandatory fuel consumption standards for heavy-duty vocational vehicles are given in the following table:

TABLE 9—PHASE 2 VOCATIONAL VEHICLE FUEL CONSUMPTION STANDARDS

[gallons per 1000 ton-miles]

Duty cycle	LHD Vocational vehicles	MHD Vocational vehicles	HHD Vocational vehicles

[gallons per 1000 ton-miles]

Duty cycle	LHD Vocational vehicles	MHD Vocational vehicles	HHD Vocational vehicles
Regional	36.1202	21.0420	21.1545

(5) *Regulatory subcategory standards for model year 2021 and later emergency vehicles.* The mandatory fuel consumption standards for heavy-duty emergency vehicles are given in the following table:

TABLE 10—PHASE 2 EMERGENCY VEHICLE FUEL CONSUMPTION STANDARDS

[Gallons per 1000 ton-miles] *

Regulatory subcategories	LHD Vocational vehicles	MHD Vocational vehicles	HHD Vocational vehicles
Model Years 2021 and later Emergency Vehicle Standards	30.6483	19.1552	21.1198

* Vehicles certified to these alternative standards may not generate fuel consumption credits.

(6) *Subfamily standards.* Manufacturers may specify a family emission limit (FEL) in terms of fuel consumption for each vehicle subfamily. The FEL may not be less than the result of fuel consumption modeling from 40 CFR 1037.520. The FELs is the fuel consumption standards for the vehicle subfamily instead of the standards specified in paragraph (b)(3) and (4) of this section and can be used for calculating fuel consumption credits in accordance with § 535.7.

(7) *Vehicle families for advanced and innovative technologies.* For vocational vehicles subject to Phase 1 standards, manufacturers must create separate vehicle families for vehicles that contain advanced or off-cycle technologies and group those vehicles together in a vehicle family if they use the same advanced or innovative technologies.

(8) *Certifying across service classes.* A manufacturer may optionally certify a vocational vehicle to the standards and useful life applicable to a heavier vehicle service class (or regulatory subcategory changes such as complying with the heavy heavy-duty standard instead of medium heavy-duty standard), provided the manufacturer does not generate credits with the vehicle. If a manufacturer includes lighter vehicles in a credit-generating subfamily (with an FEL below the standard), they must exclude their production volume from the credit calculation. Note that if the subfamily is a credit-using subfamily, the manufacturer must include the production volume of the lighter vehicles in the credit calculations.

(9) *Off-road exemptions.* Heavy-duty vocational vehicles, including vocational tractors meeting the off-road criteria in § 535.3 are exempted from the requirements in this paragraph (b) of this section, but the engines in these vehicles must meet the requirements of paragraph (d) of this section. Manufacturers may request approval in accordance with the provisions in 40 CFR 1037.150 and 40 CFR 1037.210 to determine if they are producing vehicles that meet the criteria for the heavy-duty off-road vehicle exemption. A manufacturer's request must be submitted in advance of the model year, or early enough in the model year, to ensure that an application for a certificate of conformity, as required in 40 CFR 1037.201, can be submitted if the approval is denied. The approval is a collaboration between NHTSA and EPA and can be given informally or through a formal determination. If a manufacturer requests a formal determination, the manufacturer must submit the required documentation in 40 CFR 1037.150 to both agenices.

(10) *Small business alternative fuel engine converters.* Small business alternative fuel engine converters may delay implementation of the standards in paragraph (b)(4) of this section for one year for each increase in stringency throughout the proposed rule.

(11) *Useful life.* The following useful life values apply for the standards of this section:

(i) 110,000 miles or 10 years, whichever comes first, for Class 2b through Class 5 vocational vehicles certified to Phase 1 standards.

(ii) 150,000 miles or 15 years, whichever comes first, for Class 2b through Class 5 vocational vehicles certified to Phase 2 standards.

(iii) 185,000 miles or 10 years, whichever comes first, for Class 6 and Class 7 vehicles above 19,500 pounds GVWR and at or below 33,000 pounds GVWR for Phase 1 and for Phase 2.

(iv) 435,000 miles or 10 years, whichever comes first, for Class 8 vehicles above 33,000 pounds GVWR for Phase 1 and for Phase 2.

(v) For Phase 1 credits that you calculate based on a useful life of 110,000 miles, multiply any banked credits that you carry forward for use into the Phase 2 program by 1.36. For Phase 1 credit deficits that you generate based on a useful life of 110,000 miles multiply the credit deficit by 1.36, if offsetting the shortfall with Phase 2 credits.

(12) *Recreational vehicles.* Recreational vehicles manufactured after model year 2020 must comply with the fuel consumption standards of this section. Manufacturers producing these vehicles may also certify to fuel consumption standards from 2014 through model year 2020. Manufacturers may earn credits retroactively for early compliance with fuel consumption standards. Once selected, a manufacturer cannot reverse the decision and the manufacturer must continue to comply for each subsequent model year for all the vehicles it manufacturers in each regulatory subcategory for a given model year.

(13) *Optional standards.* (i) For model years 2013 through 2019, manufacturers have the option to use heavy-duty vocational vehicle fuel consumption standards given in the following table:

TABLE 11—OPTIONAL VOCATIONAL VEHICLE FUEL CONSUMPTION STANDARDS

[Gallons per 1,000 ton-miles]

Regulatory subcategories	LH vehicles	MH vehicles	HH vehicles
Model Years 2017 to 2019 Mandatory Standards			
Standard	36.7	22.1	21.8
Model Year 2016 Mandatory Standard			
Standard	38.1	23.0	22.2
Model Years 2013 to 2015 Voluntary Standards			
Standard	38.1	23.0	22.2

(ii) If a manufacturer chooses this option, the fuel consumption rate calculated in accordance with 49 CFR 535.6(b)(4) must be rounded to the nearest 0.1 gallons per 1,000 ton-miles.

(iii) If a manufacturer chooses this option, it must apply these same standards for each model year from 2013 through 2019.

(c) *Truck tractors.* Each manufacturer building truck tractors, except vocational tractors, with a GVWR above 26,000 pounds shall comply with the fuel consumption standards in this paragraph (c) expressed in gallons per 1000 ton-miles. Each vehicle must be manufactured to comply for its useful life.

(1) *Mandatory standards.* For model years 2016 and later, each manufacturer of truck tractors must comply with the fuel consumption standards in paragraph (c)(3) of this section.

(i) Based on the roof height and the design of the cab, truck tractors are divided into subcatagories as described in § 535.4. The standards that apply to each regulatory subcategory are shown in paragraphs (c)(2) and (3) of this section, each with its own assigned standard.

(ii) For purposes of certifying vehicles to fuel consumption standards, manufacturers must divide their product lines in each regulatory subcategory into vehicles families that have similar emissions and fuel consumption features, as specified by EPA in 40 CFR 1037.230, and these families will be subject to the applicable standards. Each vehicle family is limited to a single model year.

(iii) Standards for truck tractor engines are given in paragraph (d) of this section.

(2) *Voluntary compliance.* (i) For model years 2013 through 2015, a manufacturer may choose voluntarily to comply early with the fuel consumption standards provided in paragraph (c)(3) of this section. For example, a manufacturer may choose to comply early in order to begin accumulating credits through over-compliance with the applicable standards. A manufacturer choosing early compliance must comply with all the vehicles and engines it manufacturers in each regulatory category for a given model year.

(ii) A manufacturer must declare its intent to voluntarily comply with fuel consumption standards and identify its plans to comply before it submits its first application for a certificate of conformity for the respective model year as specified in § 535.8; and, once selected, the decision cannot be reversed and the manufacturer must continue to comply for each subsequent model year for all the vehicles and engines it manufacturers in each regulatory category for a given model year.

(3) *Regulatory subcategory standards.* The fuel consumption standards for truck tractors, except for vocational tractors, are given in the following table:

TABLE 12—TRUCK TRACTOR FUEL CONSUMPTION STANDARDS

[Gallons per 1,000 ton-miles]

Regulatory subcategories	Day cab		Sleeper cab	Heavy-haul
	Class 7	Class 8	Class 8	
Phase 1—Model Years 2013 to 2015 Voluntary Standards				
Low Roof	10.5108	7.9568	6.6798	
Mid Roof	11.6896	8.6444	7.4656	
High Roof	12.1807	9.0373	7.3674	
Phase 1—Model Year 2016 Mandatory Standard				
Low Roof	10.5108	7.9568	6.6798	
Mid Roof	11.6896	8.6444	7.4656	
High Roof	12.1807	9.0373	7.3674	
Phase 1—Model Years 2017 to 2020 Mandatory Standards				
Low Roof	10.2161	7.8585	6.4833	
Mid Roof	11.2967	8.4479	7.1709	
High Roof	11.7878	8.7426	7.0727	

TABLE 12—TRUCK TRACTOR FUEL CONSUMPTION STANDARDS—Continued

[Gallons per 1,000 ton-miles]

Regulatory subcategories	Day cab		Sleeper cab	Heavy-haul
	Class 7	Class 8	Class 8	
Phase 2—Model Years 2021 to 2023 Mandatory Standards				
Low Roof	9.5285	7.6621	6.8762	5.3045
Mid Roof	10.5108	8.2515	7.6621	
High Roof	10.7073	8.4479	7.5639	
Phase 2—Model Years 2024 to 2026 Mandatory Standards				
Low Roof	8.8409	7.0727	6.2868	5.1081
Mid Roof	9.8232	7.6621	6.9745	
High Roof	9.9214	7.7603	6.8762	
Phase 2—Model Years 2027 and later Mandatory Standards				
Low Roof	8.5462	6.8762	6.0904	5.0098
Mid Roof	9.4303	7.4656	6.7780	
High Roof	9.4303	7.4656	6.5815	

(4) *Subfamily standards.* Manufacturers may specify a family emission limit (FEL) in terms of fuel consumption for each vehicle subfamily. The FEL may not be less than the result of fuel consumption modeling from 40 CFR 1037.520. The FEL serves as the fuel consumption standards for the vehicle subfamily instead of the standards specified in paragraph (c)(3) of this section and can be used for calculating fuel consumption credits in accordance with § 535.7.

(5) *Vehicle families for advanced and innovative technologies.* For tractors subject to Phase 1 standards, manufacturers must create separate vehicle families for vehicles that contain advanced or off-cycle technologies and group those vehicles together in a vehicle family if they use the same advanced or innovative technologies.

(6) *Certifying across service classes.* A manufacturer may optionally certify a tractor to the standards and useful life applicable to a heavier vehicle service class (or regulatory subcategory changes such as complying with the Class 8 day-cab tractor standard instead of Class 7 day-cab tractor), provided the manufacturer does not generate credits with the vehicle. If a manufacturer includes lighter vehicles in a credit-generating subfamily (with an FEL below the standard), exclude their production volume from the credit calculation. Note that if the subfamily is a credit-using subfamily, the manufacturer must include the production volume of the lighter vehicles in the credit calculations.

(7) *Vocational tractors.* Tractors meeting the definition of vocational tractors in 49 CFR 523.2 must comply with requirements for heavy-duty vocational vehicles specified in paragraphs (b) and (d) of this section. Class 7 and Class 8 tractors certified or exempted as vocational tractors are limited in production to no more than 21,000 vehicles in any three consecutive model years. If a manufacturer is determined as not applying this allowance in good faith by EPA in its applications for certification in accordance with 40 CFR 1037.205 and 1037.610, a manufacturer must comply with the tractor fuel consumption standards in paragraph (c)(3) of this section.

(8) *Optional standards.* (i) For Phase 1, manufacturers may use the heavy-duty truck tractor fuel consumption standards given in the following table:

TABLE 13— OPTIONAL TRUCK TRACTOR FUEL CONSUMPTION STANDARDS FOR MODEL YEARS 2013 THROUGH 2019

[Gallons per 1,000 ton-miles]

Regulatory subcategories	Day cab		Sleeper cab
	Class 7	Class 8	Class 8
Model Years 2017 to 2019 Mandatory Standards			
Low Roof	10.2	7.8	6.5
Mid Roof	11.3	8.4	7.2
High Roof	11.8	8.7	7.1
Model Years 2016 Mandatory Standards			
Low Roof	10.5	8	6.7
Mid Roof	11.7	8.7	7.4
High Roof	12.2	9	7.3
Model Years 2013 to 2015 Voluntary Standards			
Low Roof	10.5	8	6.7
Mid Roof	11.7	8.7	7.4

TABLE 13— OPTIONAL TRUCK TRACTOR FUEL CONSUMPTION STANDARDS FOR MODEL YEARS 2013 THROUGH 2019—Continued

[Gallons per 1,000 ton-miles]

Regulatory subcategories	Day cab		Sleeper cab
	Class 7	Class 8	Class 8
High Roof	12.2	9	7.3

(ii) If a manufacturer chooses this option, the fuel consumption rate calculated in accordance with § 535.6(b)(4) must be rounded to the nearest 0.1 gallons per 1,000 ton-miles.

(iii) If a manufacturer chooses this option, it must apply these same standards for each model year from 2013 through 2019.

(9) *Useful life.* The following useful life values apply for the standards of this section:

(i) 185,000 miles or 10 years, whichever comes first, for Class 6 and Class 7 tractors above 19,500 pounds GVWR and at or below 33,000 pounds GVWR for Phase 1 and for Phase 2.

(ii) 435,000 miles or 10 years, whichever comes first, for Class 8 tractors above 33,000 pounds GVWR for Phase 1 and for Phase 2.

(d) *Heavy-duty engines.* Each manufacturer of heavy-duty engines shall comply with the fuel consumption standards in this paragraph (d) of this section expressed in gallons per 100 horsepower-hour. Each engine must be manufactured to comply for its useful life. The provisions of this part apply to all new 2014 model year and later heavy-duty engines. This includes engines fueled by conventional and alternative fuels for engines that will be installed in heavy-duty vehicles above 14,000 pounds GVWR. These provisions also apply for engines that will be installed in heavy-duty glider vehicles at or below 14,000 pounds GVWR Each engine manufactured for use in a heavy-duty tractor or vocational vehicle must be certified to the primary intended service class that it is designed for in accordance with 40 CFR 1036.108 and 1036.140.

(1) *Mandatory standards.* Manufacturers of heavy-duty engines shall comply with the mandatory fuel consumption standards in paragraphs (d)(3) through (6) of this section for model years 2017 and later for compression-ignition engines and for model years 2016 and later for spark-ignition engines.

(i) The heavy-duty engine regulatory category is divided into six regulatory subcategories, five compression-ignition subcategories and one spark-ignition subcategory, as shown in Table 14 of this section.

(ii) Separate standards exist for engines manufactured for use in heavy-duty vocational vehicles and in truck tractors.

(iii) For purposes of certifying engines to fuel consumption standards, manufacturers must divide their product lines in each regulatory subcategory into engine families that have similar fuel consumption features and the same primary intended service class, as specified by EPA in 40 CFR 1036.230, and these families will be subject to the same standards. Each engine family is limited to a single model year.

(2) *Voluntary compliance.* (i) For model years 2013 through 2016 for compression-ignition engines, and for model year 2015 for spark-ignition engines, a manufacturer may choose voluntarily to comply with the fuel consumption standards provided in paragraph (d)(3) through (5) of this section. For example, a manufacturer may choose to comply early in order to begin accumulating credits through over-compliance with the applicable standards. A manufacturer choosing early compliance must comply with all the vehicles and engines it manufacturers in each regulatory category for a given model year except in model year 2013 the manufacturer may comply with individual engine families as specified in 40 CFR 1036.150(a)(2).

(ii) A manufacturer must declare its intent to voluntarily comply with fuel consumption standards and identify its plans to comply before it submits its first application for a certificate of conformity for the respective model year as specified in § 535.8; and, once selected, the decision cannot be reversed and the manufacturer must continue to comply for each subsequent model year for all the vehicles and engines it manufacturers in each regulatory category for a given model year.

(3) *Regulatory subcategory standards.* The primary fuel consumption standards for heavy-duty engines are given in the following table:

TABLE 14—PRIMARY HEAVY-DUTY ENGINE FUEL CONSUMPTION STANDARDS

[Gallons per 100 hp-hr]

Regulatory subcategory	LHD CI engines and all other engines	MHD CI engines and all other engines		HHD CI engines and all other engines		SI engines
Application	Vocational	Vocational	Tractor	Vocational	Tractor	All
Phase 1—Voluntary Standards						
2015						7.0552
2013 to 2016	5.8939	5.8939	4.9312	5.5697	4.666	
Phase 1—Mandatory Standards						
2016						7.0552
2017 to 2020	5.6582	5.6582	4.7839	5.4519	4.5187	7.0552

TABLE 14—PRIMARY HEAVY-DUTY ENGINE FUEL CONSUMPTION STANDARDS—Continued

[Gallons per 100 hp-hr]

Regulatory subcategory	LHD CI engines and all other engines	MHD CI engines and all other engines		HHD CI engines and all other engines		SI engines
Application	Vocational	Vocational	Tractor	Vocational	Tractor	All
Phase 2—Mandatory Standards						
2021 to 2023	5.5501	5.5501	4.7053	5.3438	4.4499	7.0552
2024 to 2026	5.4617	5.4617	4.6071	5.2652	4.3517	7.0552
2027 and later	5.4322	5.4322	4.5776	5.2358	4.3320	7.0552

(4) *Alternate subcategory standards.* The alternative fuel consumption standards for heavy-duty compression-ignition engines are as follows:

(i) Manufacturers entering the voluntary program in model years 2014 through 2016, may choose to certify compression-ignition engine families unable to meet standards provided in paragraph (d)(3) of this section to the alternative fuel consumption standards of this paragraph (d)(4).

(ii) Manufacturers may not certify engines to these alternate standards if they are part of an averaging set in which they carry a balance of banked credits. For purposes of this section, manufacturers are deemed to carry credits in an averaging set if they carry credits from advance technology that are allowed to be used in that averaging set in accordance with § 535.7(d)(12).

(iii) The emission standards of this section are determined as specified by EPA in 40 CFR 1036.620(a) through (c) and should be converted to equivalent fuel consumption values.

(5) *Alternate phase-in standards.* Manufacturers have the option to comply with EPA emissions standards for compression-ignition engines using an alternative phase-in schedule that correlates with EPA's OBD standards. If a manufacturer chooses to use the alternative phase-in schedule for meeting EPA standards and optionally chooses to comply early with the NHTSA fuel consumption program, it must use the same phase-in schedule beginning in model year 2013 for fuel consumption standards and must remain in the program for each model year thereafter until model year 2020. The fuel consumption standard for each model year of the alternative phase-in schedule is provided in Table 15 of this section. Note that engines certified to these standards are not eligible for early credits under § 535.7.

TABLE 15—PHASE 1 ALTERNATIVE PHASE-IN CI ENGINE FUEL CONSUMPTION STANDARDS

[Gallons per 100 hp-hr]

Tractors	LHD engines	MHD engines	HHD engines
Model Years 2013 to 2015	NA	5.0295	4.7642
Model Years 2016 to 2020 †	NA	4.7839	4.5187
Vocational	**LHD engines**	**MHD engines**	**HHD engines**
Model Years 2013 to 2015	6.0707	6.0707	5.6680
Model Years 2016 to 2020 †	5.6582	5.6582	5.4519

Note: † These alternate standards for 2016 and later are the same as the otherwise applicable standards through 2020.

(6) *Optional standards.* (i) For model years 2013 through 2020, manufacturers may use heavy-duty engine fuel consumption standards given in the following tables:

TABLE 16—OPTIONAL PRIMARY HEAVY-DUTY ENGINE FUEL CONSUMPTION STANDARDS

[Gallons per 100 hp-hr]

Regulatory subcategory	LHD CI engines	MHD CI engines		HHD CI engines		SI Engines
Application	Vocational	Vocational	Tractor	Vocational	Tractor	All
Mandatory Standards						
Model Years	2017 to 2020					2016 to 2019
Standards	5.66	5.66	4.78	5.45	4.52	7.06
Voluntary Standards						
Model Years	2013 to 2016					2015
Standards	5.89	5.89	4.93	5.57	4.67	7.06

TABLE 17—ALTERNATIVE PHASE-IN CI ENGINE FUEL CONSUMPTION STANDARDS

[Gallons per 100 hp-hr]

Truck Tractors	LHD CI engines	MHD CI engines	HHD CI engines
Model Years 2013 to 2015	NA	5.03	4.76
Model Years 2016 to 2020 †	NA	4.78	4.52
Vocational vehicles	LHD CI Engines	MHD CI Engines	HHD CI Engines
Model Years 2013 to 2015	6.07	6.07	5.67
Model Years 2016 and later †	5.66	5.66	5.45

(ii) If a manufacturer chooses this option, the fuel consumption rate calculated in accordance with § 535.6(c)(4) must be rounded to the nearest 0.01 gallon per 100 hp-hr.

(iii) If a manufacturer chooses this option, it must apply these same standards for each model year from 2013 through 2020.

(7) *Specialty vehicles.* Manufacturers of specialty vehicles as identified in 40 CFR 1037.605 may comply with fuel consumption standards by complying with alternate emission standards that are equivalent to standards that apply for non-road engines as identified in 40 CFR 1037.605, and using § 535.6 and exercising good engineering judgment to determine equivalent fuel consumption standards.

(8) *Alternative fuel conversions.* Engines that have been converted to operate on alternative fuels may demonstrate compliance with the standards of this part or other alternative compliance approaches allowed by EPA in 40 CFR 85.525.

(9) *Useful life.* The following useful life values apply for the standards of this section:

(i) 110,000 miles or 10 years, whichever comes first, for engines used in Class 2b through Class 5 vehicles certified to Phase 1 standards.

(ii) 150,000 miles or 15 years, whichever comes first, for engines used in Class 2b through Class 5 vehicles certified to Phase 2 standards.

(iii) 185,000 miles or 10 years, whichever comes first, for engines used in Class 6 and Class 7 vehicles above 19,500 pounds GVWR and at or below 33,000 pounds GVWR for Phase 1 and for Phase 2.

(iv) 435,000 miles or 10 years, whichever comes first, for engines used in Class 8 vehicles above 33,000 pounds GVWR for Phase 1 and for Phase 2.

(v) For Phase 1 credits that you calculate based on a useful life of 110,000 miles, multiply any banked credits that you carry forward for use into the Phase 2 program by 1.36. For Phase 1 credit deficits that you generate based on a useful life of 110,000 miles multiply the credit deficit by 1.36, if offsetting the shortfall with Phase 2 credits.

(e) *Heavy-duty Trailers.* Each manufacturer of heavy-duty trailers as specified in 49 CFR 523.10, shall comply with the fuel consumption standards in paragraph (e)(1) of this section expressed in gallons per 1000 ton-miles. Each vehicle must be manufactured to comply for its useful life. There are no Phase 1 standards for trailers. Different levels of stringency apply for box vans depending on features that may affect aerodynamic performance.

(1) *Fuel consumption standards.* Trailers manufactured in model year 2021 and later must comply with the fuel consumption standards of this section. For model years 2018 through 2020, trailer manufacturers have the option to voluntarily comply with the fuel consumption standards of this section.

(i) *Non-aero and non-box trailer standards.* Non-aero and non-box trailers must comply with the regulatory subcategory fuel consumption standards in this section.

(A) ''Non-aero trailers'' for trailers 35 feet or longer are box vans that have a rear lift gate or rear hinged ramp, and at least one of the following side features: Side lift gate, belly box, side-mounted pull-out platform, steps for side-door access, or a drop-deck design. ''Non-aero trailers'' for trailers less than 35 feet long are refrigerated box vans with at least one of the side features identified for longer trailers.

(B) Non-box trailers and non-aero trailers must meet the following standards:

(1) Trailers must use qualified automatic tire inflation systems with all load-bearing wheels.

(2) Trailers must use tires with a TRRL at or below 4.7 kg/ton. Through model year 2023, trailers may instead use tires with a TRRL at or below 5.1 kg/ton.

(ii) *Partial-aero trailer standards.* Partial-aero trailers must comply with the regulatory subcategory fuel consumption standards as follows:

(A) ''Partial-aero trailers'' are box vans that have at least one of the side features identified in paragraph (e)(1)(i)(A) of this section. Long box vans also qualify as partial-aero trailers if they have a rear lift gate or rear hinged ramp.

(B) Partial-aero trailers may continue to meet the 2024 standards in 2027 and later model years. This provision does not apply for short refrigerated vans because their standard does not change in 2027.

(iii) *Full-aero trailers.* Full-aero trailers comply with the regulatory subcategory fuel consumption standards as follows:

(A) ''Full-aero trailers'' are box vans that do not meet the specifications for non-areo or partial-aero trailers in paragraph (e)(1)(i)(A) or (e)(1)(ii)(A) of this section.

(B) Fuel consumption standards apply for full-aero trailers as specified in the following table:

TABLE 18—PHASE 2 FUEL AERO TRAILER FUEL CONSUMPTION STANDARDS

[Gallons per 1,000 ton-miles]

Model years	Dry van		Refrigerated van	
	Long	Short	Long	Short
Voluntary Standards				
2018 to 2020	8.1532	14.1454	8.2515	14.4401

TABLE 18—PHASE 2 FUEL AERO TRAILER FUEL CONSUMPTION STANDARDS—Continued

[Gallons per 1,000 ton-miles]

Model years	Dry van		Refrigerated van	
	Long	Short	Long	Short
Mandatory Standards				
2021 to 2023	7.9568	13.9489	8.0550	14.3418
2024 to 2026	7.7603	13.8507	7.9568	14.1454
2027 and later	7.5639	13.7525	7.8585	14.1454

(C) For purposes of certifying vehicles to fuel consumption standards, manufacturers must divide their product lines into vehicles families that have similar emissions and fuel consumption features, as specified by EPA in 40 CFR part 1037.230, and these families will be subject to the applicable standards. Each vehicle family is limited to a single model year.

(2) *Subfamily standards.* Manufacturers may specify a Family Emission Limit (FEL) in terms of fuel consumption for each vehicle subfamily. The FEL may not be less than the result of fuel consumption modeling from 40 CFR 1037.520. The FEL is the fuel consumption standard for the vehicle subfamily instead of the standard specified in paragraph (e)(1)(ii) and (iii) of this section and can be used for calculating fuel consumption credits in accordance with § 535.7. Manufacturers may not use averaging for non-box trailers, partial-aero trailers, or non-aero trailers that meet standards under paragraph (e)(1) of this section, and may not use fuel consumption credits for banking or trading for any trailers.

(3) *Useful life.* The fuel consumption standards of this section apply for a useful life equal to 10 years.

§ 535.6 Measurement and calculation procedures.

Determine all vehicle parameters used for testing in accordance with EPA's provisions in 40 CFR 1037.140. Manufacturers conducting testing for certification or annual demonstration testing and providing CO_2 emissions data to EPA must also provide equivalent fuel consumption results for all values. NHTSA and EPA reserve the right to verify separately or in coordination the results of any testing and measurement established by manufacturers in complying with the provisions of this program and as specified in 40 CFR 1037.301 and § 535.9. Any carry over data from the Phase 1 program may be carried into the Phase 2 only with approval from EPA and by using good engineering judgment considering differences in test protocols for testing procedure.

(a) *Heavy-duty pickup trucks and vans.* This section describes the testing a manufacturer must perform for each model year and the method for determining the fleet fuel consumption performance to show compliance with the fleet average fuel consumption standard for heavy-duty pickup trucks and vans in § 535.5(a).

(1) For each model year, the heavy-duty pickup trucks and vans selected by a manufacturer to comply with fuel consumption standards in § 535.5(a) must be used to determine the manufacturer's fleet average fuel consumption performance. If the manufacturer's fleet includes conventional and advanced technology heavy-duty pickup trucks and vans, the fleet should be sub-divided into two separate vehicle fleets, with all of the conventional vehicles in one fleet and all of the advanced technology vehicles in the other fleet.

(2) Vehicles in each fleet should be divided into test groups or subconfigurations according to EPA in 40 CFR part 86, subpart S.

(3) Test and measure the CO_2 emissions test results for the selected vehicles and determine the CO_2 emissions test group result, in grams per mile in accordance with 40 CFR part 86, subpart S.

(i) Perform exhaust testing on vehicles fueled by conventional and alternative fuels, including dedicated and dual-fueled (multi-fuel and flexible-fuel) vehicles and measure the CO_2 emissions test result.

(ii) Adjust the CO_2 emissions test result of dual-fueled vehicles using a weighted average of your emission results as specified in 40 CFR 600.510–12(k) for light-duty trucks.

(iii) All electric vehicles are deemed to have zero emissions of CO_2, CH_4, and N_2O. No emission testing is required for such electric vehicles. Assign the fuel consumption test group result to a value of zero gallons per 100 miles in paragraph (a)(4) of this section.

(iv) Test cab-complete and incomplete vehicles using the applicable complete sister vehicles as determined in 40 CFR part 86.

(v) Test loose engines using applicable complete vehicles as determined in 40 CFR part 86.

(vi) Manufacturers can choose to analytically derive CO_2 emission rates (ADCs) for test groups or subconfigurations. Calculate the ADCs for test groups or subconfigurations in accordance with 40 CFR 86.1819–14 (g).

(4) Calculate equivalent fuel consumption test group results, in gallons per 100 miles, from CO_2 emissions test group results, in grams per miles, and round to the nearest 0.001 gallon per 100 miles.

(i) Calculate the equivalent fuel consumption test group results as follows for compression-ignition vehicles and alternative fuel compression-ignition vehicles. CO_2 emissions test group result (grams per mile)/10,180 grams per gallon of diesel fuel) $\times$ (10^2) = Fuel consumption test group result (gallons per 100 mile).

(ii) Calculate the equivalent fuel consumption test group results as follows for spark-ignition vehicles and alternative fuel spark-ignition vehicles. CO_2 emissions test group result (grams per mile)/8,877 grams per gallon of gasoline fuel) $\times$ (10^2) = Fuel consumption test group result (gallons per 100 mile).

(5) Calculate the fleet average fuel consumption result, in gallons per 100 miles, from the equivalent fuel consumption test group results and round the fuel consumption result to the nearest 0.001 gallon per 100 miles. Calculate the fleet average fuel consumption result using the following equation.

$$\text{Fleet Average Fuel Consumption} = \frac{\sum\left[\text{Fuel Consumption Test Group Result}_i \times \text{Volume}_i\right]}{\sum\left[\text{Volume}_i\right]}$$

Where:

Fuel Consumption Test Group Result$_i$ = fuel consumption performance for each test group as defined in 49 CFR 523.4.

Volume$_i$ = production volume of each test group.

(6) Compare the fleet average fuel consumption standard to the fleet average fuel consumption performance. The fleet average fuel consumption performance must be less than or equal to the fleet fuel consumption standard to comply with standards in § 535.5(a).

(b) *Heavy-duty vocational vehicles and tractors.* This section describes the testing a manufacturer must perform and the method for determining fuel consumption performance to show compliance with the fuel consumption standards for vocational vehicles and tractors in § 535.5(b) and (c).

(1) Select vehicles and vehicle family configurations to test as specified in 40 CFR 1037.230 for vehicles that make up each of the manufacturer's regulatory subcategories of vocational vehicles and tractors.

(2) Determine the CO_2 emissions and fuel consumption results for all vehicles(conventional, alternative fueled and advanced technology vehicles) using the Greenhouse Emissions Model (GEM) in accordance with 40 CFR part 1037, subpart F. Vocational vehicles and tractors are modeled using the following inputs in the GEM model.

(3) For Phase 1, all of the following GEM inputs apply for sleeper cab tractors, and day cab tractors. Some do not apply for vocational vehicles and other tractor regulatory subcategories, as follows:

(i) Manufacturers must identify vehicles according to their regulatory subcategory, as defined in § 535.4, for use in GEM (such as ''Class 8 Combination—Sleeper Cab—High Roof'').

(ii) Coefficient of aerodynamic drag in accordance with 40 CFR 1037.520 and 1037.525. Do not use for vocational vehicles.

(iii) Steer tire rolling resistance for low rolling resistance tires in accordance with 40 CFR 1037.520 and 1037.650.

(iv) Drive tire rolling resistance for low rolling resistance tires in accordance with 40 CFR 1037.520 and 1037.650.

(v) Vehicle speed limit as governed by vehicles speed limiters in accordance with 40 CFR 1037.520 and 1037.640. Do not use for vocational vehicles.

(vi) Vehicle weight reduction as provided in accordance with 40 CFR 1037.520. Do not use for vocational vehicles.

(vii) Extended idle reduction credit using automatic engine shutdown systems in accordance with 40 CFR 1037.520 and 1037.660. Do not use for vehicles other than Class 8 sleeper cabs.

(4) For Phase 1, engine performance and the advanced technologies equipped on vocational vehicles and tractors are tested separately as follows:

(i) Test results for engines installed in vocational vehicles and tractors, for both conventional and alternative fueled vehicles, are determined in accordance with paragraph (c) of this section.

(ii) Improvements for advanced technologies are determined as follows:

(A) Test hybrid vehicles with power take-off in accordance with 40 CFR 1037.540.

(B) Vehicles with post-transmission hybrid systems are determined in accordance with 40 CFR 1037.550.

(5) For Phase 2, manufacturers are allowed to add additional specifications to improve fuel consumption performance in GEM as specified in 40 CFR 1037.520. Additional GEM inputs apply for Phase 2 tractors and vocational vehicles as follows:

(i) Transmission make, model, type, and the gear ratio for every available forward gears.

(ii) Engine make, model, fuel type, engine family name, calibration identification. Also identify whether the engine is subject to spark-ignition or compression-ignition standards under 40 CFR part 1036.

(iii) Drive axle ratio. If a vehicle is designed with two or more user-selectable axle ratios, use the axle ratio that is expected to be engaged for the greatest driving distance.

(iv) Various engine and vehicle operational characteristics, as described in 40 CFR 1037.520(f).

(v) Engine fuel maps, which include an idle fuel map for vocational vehicles.

(vi) Engine full-load torque curve and motoring torque curve.

(vii) Loaded tire radius, based upon nominal design specifications, expressed to the nearest 0.01m as described in 40 CFR 1037.140.

(viii) Hybrid power take-off (for vocational vehicles only).

(6) Manufacturers may certify their vehicles based on powertrain testing as described in 40 CFR 1037.550, rather than fuel maps, to characterize fuel consumption rates at different speed and torque values.

(7) Emergency vehicles complying with alternative standards specified in § 535.5(b) and 40 CFR 1037.105(b)(4), run GEM by identifying the vehicle as an emergency vehicle and enter values for tire rolling resistance only.

(8) You may use a default fuel map for specialty vehicles using engines certified to alternate standards under 40 CFR 1037.605.

(9) Manufacturers of vehicles that run on fuel other than gasoline or diesel, should use good engineering judgment to adjust modeling output values to account for the physical properties of the fuel.

(10) From the GEM results, select the CO_2 family emissions level (FEL) and equivalent fuel consumption values for vocational vehicle and tractor families in each regulatory subcategory for each model year. Equivalent fuel consumption FELs are derived in GEM and expressed to the nearest 0.0001 gallons per 1000 ton-mile. For families containing multiple subfamilies, identify the FELs for each subfamily.

(11) All electric vehicles are deemed to have zero CO_2 emissions and fuel consumption. No emission testing is required for such electric vehicles. Assign the vehicle family with a fuel consumption FEL result to a value of zero gallons per 1000-ton miles.

(c) [Reserved]

(d) *Heavy-duty engines.* This section describes the testing a manufacturer must perform and the method for determining fuel consumption performance to show compliance with the fuel consumption standards for engines in § 535.5(d). Each engine must be tested to the primary intended service class that it is designed for in accordance with 40 CFR 1036.108. For engines using aftertreatment technology with infrequent regeneration events test in accordance with 40 CFR 86.004–28,

(1) Manufacturers must select emission-data engines and engine family configurations to test as specified in 40 CFR part 86 for engines in heavy-duty pickup trucks and vans and 40 CFR 1036.235 for engines installed in truck tractors and vocational vehicles that make up each of the manufacture's regulatory subcategories.

(2) Test the CO_2 emissions for each emissions-data engine subject to the

standards in § 535.5(d) using the procedures and equipment specified in 40 CFR part 1036, subpart F. Measure the CO_2 emissions in grams per hp-hr as specified in 40 CFR 1036.501. For medium and heavy heavy-duty engines certified as tractor engines, measure CO_2 emissions using the steady-state duty cycle specified in 40 CFR 86.1362. For medium and heavy heavy-duty engines certified as both tractor and vocational engines, measure CO_2 emissions using the steady-state duty cycle and the transient duty cycle (sometimes referred to as the FTP engine cycle), both of which are specified in 40 CFR part 86, subpart N.

(i) Perform exhaust testing on each fuel type for conventional, dedicated, dual-fueled (multi-fuel, and flexible-fuel) vehicles and measure the CO_2 emissions level as specified in 40 CFR part 1036.

(ii) Adjust the CO_2 emissions result of dual-fueled vehicles using a weighted average of the demonstrated emission results as specified in 40 CFR 1036.225. If EPA disapproves a manufacturer's dual-fueled vehicle demonstrated use submission, NHTSA will require the manufacturer to only use the test results with 100 percent conventional fuel to determine the fuel consumption of the engine.

(iii) All electric vehicles are deemed to have zero emissions of CO_2 and zero fuel consumption. No emission or fuel consumption testing is required for such electric vehicles.

(3) Determine the CO_2 emissions for the family certification level (FCL) from the emissions test results in paragraph (c)(2) of this section for engine families within the heavy-duty engine regulatory subcategories for each model year.

(i) If a manufacturer certifies an engine family for use both as a vocational engine and as a tractor engine, the manufacturer must split the family into two separate subfamilies in accordance with 40 CFR 1036.230. The manufacturer may assign the numbers and configurations of engines within the respective subfamilies at any time prior to the submission of the end-of-year report required by 40 CFR 1036.730 and § 535.8. The manufacturer must track into which type of vehicle each engine is installed, although EPA may allow the manufacturer to use statistical methods to determine this for a fraction of its engines.

(ii) The following engines are excluded from the engine families used to determined FCL values and the benefit for these engines is determined as an advanced technology credit under the ABT provisions provided in § 535.7(e); these provisions apply only for the Phase 1 program:

(A) Engines certified as hybrid engines or power packs.

(B) Engines certified as hybrid engines designed with PTO capability and that are sold with the engine coupled to a transmission.

(C) Engines with Rankine cycle waste heat recovery.

(4) Calculate equivalent fuel consumption values for emissions FCLs and the CO_2 levels for certified engines, in gallons per 100 hp-hr and round each fuel consumption value to the nearest 0.0001 gallon per 100 hp-hr.

(i) Calculate equivalent fuel consumption FCL values for compression-ignition engines and alternative fuel compression-ignition engines. CO_2 FCL value (grams per hp-hr)/10,180 grams per gallon of diesel fuel) x (10^2) = Fuel consumption FCL value (gallons per 100 hp-hr).

(ii) Calculate equivalent fuel consumption FCL values for spark-ignition engines and alternative fuel spark-ignition engines. CO_2 FCL value (grams per hp-hr)/8,877 grams per gallon of gasoline fuel) x (10^2) = Fuel consumption FCL value (gallons per 100 hp-hr).

(iii) Manufacturers may carryover fuel consumption data from a previous model year if allowed to carry over emissions data for EPA in accordance with 40 CFR 1036.235.

(iv) If a manufacturer uses an alternate test procedure under 40 CFR 1065.10 and subsequently the data is rejected by EPA, NHTSA will also reject the data.

(e) *Heavy-duty trailers.* This section describes the testing a manufacturer must perform and the method for determining fuel consumption performance to show compliance with the fuel consumption standards for trailers in § 535.5(e).

(1) Select trailer family configurations to test as specified in 40 CFR 1037.235 for trailers that make up each of the manufacture's regulatory subcategories of heavy-duty trailers.

(2) Obtain preliminary approvals for trailers aerodynamic devices from EPA in accordance with 40 CFR 1037.150.

(3) For manufacturers voluntarily complying in model years 2018 through 2020, and for trailers complying with mandatory standards in model years 2021 and later, determine the CO_2 emissions and fuel consumption results for partial- and full-aero trailers using the equations and technologies specified in CFR part 1037, subpart F. Use testing to determine input values in accordance with 40 CFR 1037.515.

(4) Non-box trailers and non-aero trailers certified using design-based certification must meet tire rolling resistance levels, and use tire inflation systems on all load-bearing wheels as prescribed in 40 CFR 1037.150.

(5) Box trailer manufacturers shall use a GEM-based equation to calculate CO_2 emissions, as specified in 40 CFR 1037.515. From the equation results, calculate the CO_2 family emissions level (FEL) and equivalent fuel consumption values for trailer families in the long dry van, short dry van, long refrigerated van, and short refrigerated van regulatory subcategories for each model year. Equivalent fuel consumption FELs are expressed to the nearest 0.0001 gallons per 1000 ton-mile. For families containing multiple subfamilies, identify the FELs for each subfamily.

§ 535.7 Averaging, banking, and trading (ABT) credit program.

(a) *General provisions.* After the end of each model year, manufacturers must comply with the fuel consumption standards in § 535.5 by averaging, banking and trading credits. Trailer manufacturers are excluded from this section except for those producing full-aero box trailers, which may comply with special provisions in paragraph (e) of this section. Manufacturers comply with standards if the sum of averaged, banked and traded credits generate a ''zero'' credit balance or a credit surplus within an averaging set of vehicles or engines. Manufacturers fail to comply with standards if the sum of the credit flexibilities generate a credit deficit (or shortfall) in an averaging set. Credit shortfalls must be offset by banked or traded credits within three model years after the shortfall is incurred. These processes are hereafter referenced as the NHTSA ABT credit program. The following provisions apply to all fuel consumption credits.

(1) *Credits (or fuel consumption credits (FCCs)).* Credits in this part mean a calculated weighted value representing the difference between the fuel consumption performance and the standard of a vehicle or engine family or fleet within a particular averaging set. Positive credits represent cases where a vehicle or engine family or fleet perform better than the applicable standard (the fuel consumption performance is less than the standard) whereas negative credits represent underperforming cases. The value of a credit is calculated according to sections (b) through (e) of this section. FCCs are only considered earned or useable for averaging, banking or trading after EPA and NHTSA have verified the information in a manufacturer's final reports required in § 535.8. Types of FCCs include the following:

(i) *Conventional credits.* Credits generated by vehicle or engine families or fleets containing conventional vehicles (*i.e.,* gasoline, diesel and alternative fueled vehicles).

(ii) *Early credits.* Credits generated by vehicle or engine families or fleets produced for model year 2013. Early credits are multiplied by an incentive factor of 1.5 times.

(iii) *Advanced technology credits.* Credits generated by vehicle or engine families or subconfigurations containing vehicles with advanced technologies (*i.e.,* hybrids with regenerative braking, vehicles equipped with Rankine-cycle engines, electric and fuel cell vehicles) and incentivized under this ABT credit program in paragraph (f)(1) of this section and by EPA under 40 CFR 86.1819–14(d)(7), 1036.615, and 1037.615.

(iv) *Innovative and off-cycle technology credits.* Credits generated by vehicle or engine families or subconfigurations having fuel consumption reductions resulting from technologies not reflected in the GEM simulation tool or in the FTP chassis dynomometer. These innovative and off-cycle technology are incentivized under this fuel consumption program in paragraph (f)(2) of this section and by EPA under 40 CFR 86.1819–14(d)(13), 1036.610, and 1037.610.

(2) *Averaging.* Averaging is the summing of a manufacturer's positive and negative FCCs for engines or vehicle families or fleets within an averaging set. The principle averaging sets are defined in § 535.4.

(i) A credit surplus occurs when the net sum of the manufacturer's generated credits for engines or vehicle families or fleets within an averaging set is positive (a zero credit balance is when the sum equals zero).

(ii) A credit deficit occurs when the net sum of the manufacturer's generated credits for engines or vehicle families or fleets within an averaging set is negative.

(iii) Positive credits, other than advanced technology credits, generated and calculated within an averaging set may only be used to offset negative credits within the same averaging set.

(iv) Manufacturers may certify one or more vehicle families (or subfamilies) to an FEL above the applicable fuel consumption standard, subject to any applicable FEL caps and other provisions allowed by EPA in 40 CFR parts 1036 and 1037, if the manufacturer shows in its application for certification to EPA that its projected balance of all FCC transactions in that model year is greater than or equal to zero or that a negative balance is allowed by EPA under 40 CFR 1036.745 and 1037.745.

(v) If a manufacturer certifies a vehicle family to an FEL that exceeds the otherwise applicable standard, it must obtain enough FCC to offset the vehicle family's deficit by the due date of its final report required in § 535.8. The emission credits used to address the deficit may come from other vehicle families that generate FCCs in the same model year (or from the next three subsequent model years), from banked FCCs from previous model years, or from FCCs generated in the same or previous model years that it obtained through trading. Note that the option for using banked or traded credits does not apply for trailers.

(vi) Manufacturers may certify a vehicle or engine family using an FEL (as described in § 535.6) below the fuel consumption standard (as described in § 535.5) and choose not to generate conventional fuel consumption credits for that family. Manufacturers do not need to calculate fuel consumption credits for those families and do not need to submit or keep the associated records described in § 535.8 for these families. Manufacturers participating in NHTSA's FCC program must provide reports as specified in § 535.8.

(3) *Banking.* Banking is the retention of surplus FCC in an averaging set by the manufacturer for use in future model years for the purpose of averaging or trading.

(i) Surplus credits may be banked by the manufacturer for use in future model years, or traded, given the restriction that the credits have an expiration date of five model years after the year in which the credits are generated. For example, banked credits earned in model year 2014 may be utilized through model year 2019. Surplus credits will become banked credits unless a manufacturer contacts NHTSA to expire its credits.

(ii) Surplus credits become earned or usable banked FCCs when the manufacturer's final report is approved by both agencies. However, the agencies may revoke these FCCs at any time if they are unable to verify them after reviewing the manufacturer's reports or auditing its records.

(iii) Banked FCC retain the designation from the averaging set and model year in which they were generated.

(iv) Banked credits retain the designation of the averaging set in which they were generated.

(v) Trailer manufacturers generating credits in paragraph (e) of this section may not bank credits except to resolve credit deficits in the same model year or from up to three prior model years.

(4) *Trading.* Trading is a transaction that transfers banked FCCs between manufacturers or other entities in the same averaging set. A manufacturer may use traded FCCs for averaging, banking, or further trading transactions.

(i) Manufacturers may only trade banked credits to other manufacturers with vehicle or engines in the same averaging set. Traded FCCs, other than advanced technology credits, may be used only within the averaging set in which they were generated. Manufacturers may only trade credits to other entities for the purpose of expiring credits.

(ii) Advanced technology credits can be traded across different averaging sets.

(iii) The agencies may revoke traded FCCs at any time if they are unable to verify them after reviewing the manufacturer's reports or auditing its records.

(iv) If a negative FCC balance results from a transaction, both the buyer and seller are liable, except in cases the agencies deem to involve fraud. See § 535.9 for cases involving fraud. EPA also may void the certificates of all vehicle families participating in a trade that results in a manufacturer having a negative balance of emission credits. See 40 CFR 1037.745.

(v) Trailer manufacturers generating credits in paragraph (e) of this section may not trade credits.

(5) *Credit deficit (or credit shortfall).* A credit shortfall or deficit occurs when the sum of the manufacturer's generated credits for engines or vehicle families or fleets within an averaging set is negative. Credit shortfalls must be offset by an available credit surplus within three model years after the shortfall was incurred. If the shortfall cannot be offset, the manufacturer is liable for civil penalties as discussed in § 535.9.

(6) *FCC transaction plan.* In order to provide the maximum flexibility to a manufacturer, during the model year and before the due date for its final report, an FCC transaction plan must be submitted to the agencies as specified in § 535.8 anytime a manufacturer wants to executes a credit transaction involving banked or tradeding credits. For example, if a manufacturer executes a plan to apply banked credits over multiple subsequent model years.

(7) *Revoked credits.* NHTSA may revoke fuel consumption credits if unable to verify any information after auditing reports or records or conducting conformitory testing. In the cases where EPA revokes emissions CO_2 credits, NHTSA will revoke the same amount of fuel consumption credits.

(b) *ABT provisions for heavy-duty pickup trucks and vans.* (1) Calculate fuel consumption credits in a model year for one fleet of conventional heavy-duty pickup trucks and vans and if designated by the manufacturer another consisting of advance technology vehicles for the averaging set as defined in § 535.4. Calculate credits for each fleet separately using the following equation:

Total MY Fleet FCC (gallons) = (Std − Act) x (Volume) x (UL) x (10^2)

Std = Fleet average fuel consumption standard (gal/100 mile).
Act = Fleet average actual fuel consumption value (gal/100 mile).
Volume = the total U.S.-directed production of vehicles in the regulatory subcategory.
UL = the useful life for the regulatory subcategory. The useful life value for heavy-pickup trucks and vans manufactured for model years 2013 through 2020 is equal to the 120,000 miles. The useful life for model years 2021 and later is equal to 150,000 miles.

(2) Adjust the fuel consumption performance of subconfigurations with advanced technology for determining the fleet average actual fuel consumption value as specified in paragraph (f)(1) of this section and 40 CFR 86.1819–14(d)(7). Advanced technology vehicles can be separated in a different fleet for the purpose of applying credit incentives as described in paragraph (f)(1) of this section.

(3) Adjust the fuel consumption performance for subconfigurations with innovative technology. A manufacturer is eligible to increase the fuel consumption performance of heavy-duty pickup trucks and vans in accordance with procedures established by EPA set forth in 40 CFR part 600. The eligibility of a manufacturer to increase its fuel consumption performance through use of an off-cycle technology requires an application request made to EPA and NHTSA in accordance with 40 CFR 86.1869–12 and an approval granted by the agencies. For off-cycle technologies that are covered under 40 CFR 86.1869–12, NHTSA will collaborate with EPA regarding NHTSA's evaluation of the specific off-cycle technology to ensure its impact on fuel consumption and the suitability of using the off-cycle technology to adjust fuel consumption performance. NHTSA will provide its views on the suitability of the technology for that purpose to EPA. NHTSA will apply the criteria in section (f) of this section in granting or denying off-cycle requests.

(4) Fuel consumption credits may be generated for vehicles certified in model year 2013 to the model year 2014 standards in § 535.5(a). If a manufacturer chooses to generate CO_2 emission credits under EPA's provisions in 40 CFR part 86, it may also voluntarily generate early credits under the NHTSA fuel consumption program. To do so, a manufacturer must certify its entire U.S.-directed production volume of vehicles in its fleet. The same production volume restrictions specified in 40 CFR 1037.150(a)(2) relating to when test groups are certified apply to the NHTSA early credit provisions. Credits are calculated as specified in paragraph (b)(3) of this section relative to the fleet standard that would apply for model year 2014 using the model year 2013 production volumes. Surplus credits generated under this paragraph (b)(4) are available for banking or trading. Credit deficits for an averaging set prior to model year 2014 do not carry over to model year 2014. These credits may be used to show compliance with the standards of this part for 2014 and later model years. Once a manufacturer opts into the NHTSA program they must stay in the program for all of the optional model years and remain standardized with the same implementation approach being followed to meet the EPA CO_2 emission program.

(5) Calculate the averaging set credit value by summing together the fleet credits for conventional and advanced technology vehicles including any adjustments for innovative technologies. Manufacturers may sum conventional and innovative technology credits before adding any advanced technology credits in each averaging set.

(6) Credit adjustment for useful life. For credits that manufacturers calculate based on a useful life of 120,000 miles, multiply any banked credits carried forward for use in model year 2021 and later by 1.25. For credit deficits that you calculate based on a useful life of 120,000 miles and that you offset with credits originally earned in model year 2021 and later, multiply the credit deficit by 1.25.

(c) *ABT provisions for vocational vehicles and tractors.* (1) Calculate the fuel consumption credits in a model year for each participating family or subfamily consisting of conventional vehicles in each averaging set (as defined in § 535.4) using the equation in this section. Each designated vehicle family or subfamily has a ''family emissions limit'' (FEL) that is compared to the associated regulatory subcategory standard. An FEL that falls below the regulatory subcategory standard creates ''positive credits,'' while fuel consumption level of a family group above the standard creates a ''negative credits.'' The value of credits generated for each family or subfamily in a model year is calculated as follows:

Vehicle Family FCC (gallons) = (Std − FEL) x (Payload) x (Volume) x (UL) x (10^3)

Where:
Std = the standard for the respective vehicle family regulatory subcategory (gal/1000 ton-mile).
FEL = family emissions limit for the vehicle family (gal/1000 ton-mile).
Payload = the prescribed payload in tons for each regulatory subcategory as shown in the following table:

Regulatory subcategory	Payload (tons)
LHD Vocational Vehicles	2.85
MHD Vocational Vehicles	5.60
HHD Vocational Vehicles	7.5
Class 7 Tractor	12.50
Class 8 Tractor	19.00

Volume = the number of U.S.-directed production volume of vehicles in the corresponding vehicle family.
UL = the useful life for the regulatory subcategory (miles) as shown in the following table:

Regulatory subcategory	UL (miles)
LHD Vocational Vehicles	110,000 (Phase 1), 150,000 (Phase 2).
MHD Vocational Vehicles	185,000.
HHD Vocational Vehicles	435,000.
Class 7 Tractor	185,000.
Class 8 Tractor	435,000.

(i) Calculate the value of credits generated in a model year for each family or subfamily consisting of vehicles with advanced technology vehicles in each averaging set using the equation above and the guidelines provided in paragraph (f)(1) of this section. Manufacturers may generate credits for advanced technology vehicles using incentives specified in paragraph (f)(1) of this section.

(ii) Calculate the value of credits generated in a model year for each family or subfamily consisting of vehicles with off-cycle technology vehicles in each averaging set using the equation above and the guidelines provided in paragraph (f)(2) of this section.

(2) Manufacturers must sum all negative and positive credits for each vehicle family within each applicable averaging set to obtain the total credit balance for the model year before rounding. The sum of fuel consumptions credits must be rounded to the nearest gallon. Calculate the total

credits generated in a model year for each averaging set using the following equation:

Total averaging set MY credits = Σ Vehicle family credits within each averaging set

(3) Manufacturers can sum conventional and innovative technology credits before adding any advanced technology credits in each averaging set.

(4) If a manufacturer chooses to generate CO_2 emission credits under EPA provisions of 40 CFR 1037.150(a), it may also voluntarily generate early credits under the NHTSA fuel consumption program as follows:

(i) Fuel consumption credits may be generated for vehicles certified in model year 2013 to the model year 2014 standards in § 535.5(b) and (c). To do so, a manufacturer must certify its entire U.S.-directed production volume of vehicles. The same production volume restrictions specified in 40 CFR 1037.150(a)(1) relating to when test groups are certified apply to the NHTSA early credit provisions. Credits are calculated as specified in paragraph (c)(11) of this section relative to the standards that would apply for model year 2014. Surplus credits generated under this paragraph (c)(4) may be increased by a factor of 1.5 for determining total available credits for banking or trading. For example, if you have 10 gallons of surplus credits for model year 2013, you may bank 15 gallons of credits. Credit deficits for an averaging set prior to model year 2014 do not carry over to model year 2014. These credits may be used to show compliance with the standards of this part for 2014 and later model years. Once a manufacturer opts into the NHTSA program they must stay in the program for all of the optional model years and remain standardized with the same implementation approach being followed to meet the EPA CO_2 emission program.

(ii) A tractor manufacturer may generate fuel consumption credits for the number of additional SmartWay designated tractors (relative to its MY 2012 production), provided that credits are not generated for those vehicles under paragraph (c)(4)(i) of this section. Calculate credits for each regulatory sub-category relative to the standard that would apply in model year 2014 using the equations in paragraph (c)(2) of this section. Use a production volume equal to the number of verified model year 2013 SmartWay tractors minus the number of verified model year 2012 SmartWay tractors. A manufacturer may bank credits equal to the surplus credits generated under this paragraph multiplied by 1.50. A manufacturer's 2012 and 2013 model years must be equivalent in length. Once a manufacturer opts into the NHTSA program they must stay in the program for all of the optional model years and remain standardized with the same implementation approach being followed to meet the EPA CO_2 emission program.

(5) If a manufacturer generates credits from vehicles certified for advanced technology in accordance with paragraph (e)(1) of this section, a multiplier of 1.5 can be used, but this multiplier cannot be used on the same credits for which the early credit multiplier is used.

(d) *ABT provisions for heavy-duty engines.* (1) Calculate the fuel consumption credits in a model year for each participating family or subfamily consisting of engines in each averaging set (as defined in § 535.4) using the equation in this section. Each designated engine family has a ''family certification level'' (FCL) which is compared to the associated regulatory subcategory standard. A FCL that falls below the regulatory subcategory standard creates ''positive credits,'' while fuel consumption level of a family group above the standard creates a ''credit shortfall.'' The value of credits generated in a model year for each engine family or subfamily is calculated as follows:

Engine Family FCC (gallons) = $(\text{Std} - \text{FCL}) \times (\text{CF}) \times (\text{Volume}) \times (\text{UL}) \times (10^2)$

Where:

Std = the standard for the respective engine regulatory subcategory (gal/100 hp-hr).

FCL = family certification level for the engine family (gal/100 hp-hr).

CF= a transient cycle conversion factor in hp-hr/mile which is the integrated total cycle horsepower-hour divided by the equivalent mileage of the applicable test cycle. For spark-ignition heavy-duty engines, the equivalent mileage is 6.3 miles. For compression-ignition heavy-duty engines, the equivalent mileage is 6.5 miles.

Volume = the number of engines in the corresponding engine family.

UL = the useful life of the given engine family (miles) as shown in the following table:

Regulatory subcategory	UL (miles)
Class 2b-5 Vocational Vehicles, Spark Ignited (SI), and Light Heavy-Duty Diesel Engines.	110,000 (Phase 1), 150,000 (Phase 2).
Class 6–7 Vocational Vehicles and Medium Heavy-Duty Diesel Engines.	185,000.
Class 8 Vocational Vehicles and Heavy Heavy-Duty Diesel Engines.	435,000.
Class 7 Tractors and Medium Heavy-Duty Diesel Engines.	185,000.
Class 8 Tractors and Heavy Heavy-Duty Diesel Engines.	435,000.

(i) Calculate the value of credits generated in a model year for each family or subfamily consisting of engines with advanced technology vehicles in each averaging set using the equation above and the guidelines provided in paragraph (f)(1) of this section. Manufacturers may generate credits for advanced technology vehicles using incentives specified in paragraph (f)(1) of this section.

(ii) Calculate the value of credits generated in a model year for each family or subfamily consisting of engines with off-cycle technology vehicles in each averaging set using the equation above and the guidelines provided in paragraph (f)(2) of this section.

(2) Manufacturers shall sum all negative and positive credits for each engine family within the applicable averaging set to obtain the total credit balance for the model year before rounding. The sum of fuel consumptions credits should be rounded to the nearest gallon. Calculate the total credits generated in a model year for each averaging set using the following equation:

Total averaging set MY credits = Σ Engine family credits within each averaging set

(3) The provisions of this section apply to manufacturers utilizing the compression-ignition engine voluntary alternate standard provisions specified in § 535.5(d)(4) as follows:

(i) Manufacturers may not certify engines to the alternate standards if they are part of an averaging set in which they carry a balance of banked credits. For purposes of this section, manufacturers are deemed to carry credits in an averaging set if they carry credits from advance technology that are allowed to be used in that averaging set.

(ii) Manufacturers may not bank fuel consumption credits for any engine family in the same averaging set and model year in which it certifies engines to the alternate standards. This means a manufacturer may not bank advanced technology credits in a model year it certifies any engines to the alternate standards.

(iii) Note that the provisions of paragraph (a) of this section apply with respect to credit deficits generated while utilizing alternate standards.

(4) Where a manufacturer has chosen to comply with the EPA alternative compression ignition engine phase-in standard provisions in 40 CFR 1036.150(e), and has optionally decided to follow the same path under the NHTSA fuel consumption program, it must certify all of its model year 2013 compression-ignition engines within a given averaging set to the applicable alternative standards in § 535.5(d)(5). Engines certified to these standards are not eligible for early credits under paragraph (d)(5) of this section. Credits are calculated using the same equation provided in paragraph (d)(1) of this section.

(5) If a manufacturer chooses to generate early CO_2 emission credits under EPA provisions of 40 CFR 1036.150, it may also voluntarily generate early credits under the NHTSA fuel consumption program. Fuel consumption credits may be generated for engines certified in model year 2013 (2015 for spark-ignition engines) to the standards in § 535.5(d). To do so, a manufacturer must certify its entire U.S.-directed production volume of engines except as specified in 40 CFR 1036.150(a)(2). Credits are calculated as specified in paragraph (d)(1) of this section relative to the standards that would apply for model year 2014 (2016 for spark-ignition engines). Surplus credits generated under this paragraph (d)(3) may be increased by a factor of 1.5 for determining total available credits for banking or trading. For example, if you have 10 gallons of surplus credits for model year 2013, you may bank 15 gallons of credits. Credit deficits for an averaging set prior to model year 2014 (2016 for spark-ignition engines) do not carry over to model year 2014 (2016 for spark-ignition engines). These credits may be used to show compliance with the standards of this part for 2014 and later model years. Once a manufacturer opts into the NHTSA program they must stay in the program for all of the optional model years and remain standardized with the same implementation approach being followed to meet the EPA CO_2 emission program.

(e) *ABT provisions for trailers.* (1) Manufacturers can not use averaging for non-box trailers, partial-aero trailers, or non-aero trailers and can not use fuel consumption credits for banking or trading for any trailers. Full aero box trailer manufactures may average credits but cannot bank credits except to resolve deficits in future model years.

(2) Calculate the fuel consumption credits in a model year for each participating family or subfamily consisting of full aero box trailers (vehicles) in each averaging set (as defined in § 535.4) using the equation in this section. Each designated vehicle family or subfamily has a ''family emissions limit'' (FEL) which is compared to the associated regulatory subcategory standard. An FEL that falls below the regulatory subcategory standard creates ''positive credits,'' while fuel consumption level of a family group above the standard creates a ''negative credits.'' The value of credits generated for each family or subfamily in a model year is calculated as follows:

$$\text{Vehicle Family FCC (gallons)} = (\text{Std} - \text{FEL}) \times (\text{Payload}) \times (\text{Volume}) \times (\text{UL}) \times (10^3)$$

Where:

Std = the standard for the respective vehicle family regulatory subcategory (gal/1000 ton-mile).

FEL = family emissions limit for the vehicle family (gal/1000 ton-mile).

Payload = 19 tons.

Volume = the number of U.S.-directed production volume of vehicles in the corresponding vehicle family.

UL = the useful life for the regulatory subcategory. The useful life value for heavy-duty trailers is equal to the 250,000 miles.

(3) Trailer manufacturers may not generate advanced or innovative technology credits.

(4) Manufacturers shall sum all negative and positive credits for each vehicle family within the applicable averaging set to obtain the total credit balance for the model year before rounding. The sum of fuel consumptions credits should be rounded to the nearest gallon.

Calculate the total credits generated in a model year for each averaging set using the following equation:

$$\text{Total averaging set MY credits} = \Sigma \text{ Vehicle family credits within each averaging set}$$

(5) Trailer manufacturers may not generate a credit surplus within an averaging set for the purpose of banking except to offset a credit deficit from a prior model year.

(f) *Additional credit provisions.* (1) *Advanced technology credits.* Manufacturers of heavy-duty pickup trucks and vans, vocational vehicles, tractors and the associated engines showing improvements in CO_2 emissions and fuel consumption using hybrid vehicles with regenerative braking, vehicles equipped with Rankine-cycle engines, electric vehicles and fuel cell vehicles are eligible for advanced technology credits. Manufacturers shall use sound engineering judgment to determine the performance of the vehicle or engine with advanced techonology. Advanced technology credits for vehicles or engines complying with Phase 1 standards may be increased by a 1.5 multiplier for Phase 2. Manufacturers may not apply this multiplier in addition to any early-credit multipliers. The maximum amount of credits a manufacturer may bring into the service class group that contains the heavy-duty pickup and van averaging set is $5.89 \cdot 10^6$ gallons (for advanced technology credits based upon compression ignition engines) or $6.76 \cdot 10^6$ gallons (for advanced technology credits based upon spark-ignition engines) per model year as specified in 40 CFR part 86 for heavy-duty pickup trucks and vans, 40 CFR 1036.740 for engines and 40 CFR 1037.740 for tractors and vocational vehicles. The specified limit does not cap the amount of advanced technology credits that can be used across averaging sets within the same service class group. Advanced technology credits can be used to offset negative credits in the same averaging set or other averaging sets. A manufacturer must first apply advanced technology credits to any deficits in the same averaging set before applying them to other averaging.

(i) *Heavy-duty pickup trucks and vans.* For advanced technology systems (hybrid vehicles with regenerative braking, vehicles equipped with Rankine-cycle engines and fuel cell vehicles), calculate fleet-average performance rates consistent with good engineering judgment and the provisions of 40 CFR 86.1819–14 and 40 CFR 86.1865.

(ii) *Tractors and vocational vehicles.* For advanced technology system (hybrid vehicles with regenerative braking, vehicles equipped with Rankine-cycle engines and fuel cell vehicles), calculate the advanced technology credits as follows:

(A) Measure the effectiveness of the advanced system by conducting A to B testing a vehicle equipped with the advanced system and an equivalent conventional system in accordance with 40 CFR 1037.615.

(B) For purposes of this paragraph (e), a conventional vehicle is considered to be equivalent if it has the same footprint, intended vehicle service class, aerodynamic drag, and other relevant factors not directly related to the advanced system powertrain. If there is no equivalent vehicle, the manufacturer may create and test a prototype equivalent vehicle. The conventional vehicle is considered Vehicle A, and the advanced technology vehicle is considered Vehicle B.

(C) The benefit associated with the advanced system for fuel consumption is determined from the weighted fuel consumption results from the chassis tests of each vehicle using the following equation:

Benefit (gallon/1000 ton mile) = Improvement Factor × GEM Fuel Consumption Result_B

Where:

Improvement Factor = (Fuel Consumption_A − Fuel Consumption_B)/(Fuel Consumption_A)

Fuel Consumption Rates A and B are the gallons per 1000 ton-mile of the conventional and advanced vehicles, respectively as measured under the test procedures specified by EPA.

GEM Fuel Consumption Result B is the estimated gallons per 1000 ton-mile rate resulting from emission modeling of the advanced vehicle as specified in 40 CFR 1037.520 and § 535.6(b).

(D) Calculate the benefit in credits using the equation in paragraph (c) of this section and replacing the term (Std-FEL) with the benefit.

(E) For electric vehicles calculate the fuel consumption credits using an FEL of 0 g/1000ton-mile.

(iii) *Heavy-duty engines.* (A) This section specifies how to generate advanced technology-specific fuel consumption credits for hybrid powertrains that include energy storage systems and regenerative braking (including regenerative engine braking) and for engines that include Rankine-cycle (or other bottoming cycle) exhaust energy recovery systems.

(*1*) Pre-transmission hybrid powertrains are those engine systems that include features that recover and store energy during engine motoring operation but not from the vehicle wheels. These powertrains are tested using the hybrid engine test procedures of 40 CFR part 1065 or using the post-transmission test procedures.

(*2*) Post-transmission hybrid powertrains are those powertrains that include features that recover and store energy from braking at the vehicle wheels. These powertrains are tested by simulating the chassis test procedure applicable for hybrid vehicles under 40 CFR 1037.550.

(*3*) Test engines that include Rankine-cycle exhaust energy recovery systems according to the test procedures specified in 40 CFR part 1036, subpart F, unless EPA approves the manufacturer's alternate procedures.

(B) Calculate credits as specified in paragraph (c) of this section. Credits generated from engines and powertrains certified under this section may be used in other averaging sets as described in 40 CFR 1036.740(d).

(2) *Innovative and off-cycle technology credits.* This provision allows fuel saving innovative and off-cycle engine and vehicle technologies to generate fuel consumption credits comparable to CO_2 emission credits consistent with the provisions of 40 CFR 1036.610 (for engines), 40 CFR part 86 (for heavy-duty pickup trucks and vans) and 40 CFR 1037.610 (for vocational vehicles and tractors).

(i) For model years 2013 through 2020, manufacturers may generate innovative technology credits for introducing technologies that were not in-common use for heavy-duty vehicles or engines before model year 2010 and that are not reflected in the EPA specified test procedures. Upon identification and joint approval with EPA, NHTSA will allow equivalent fuel consumption credits into its program to those allowed by EPA for manufacturers seeking to obtain innovative technology credits in a given model year. Such credits must remain within the same regulatory subcategory in which the credits were generated. NHTSA will adopt fuel consumption credits depending upon whether—

(A) The technology has a direct impact upon reducing fuel consumption performance; and

(B) The manufacturer has provided sufficient information to make sound engineering judgments on the impact of the technology in reducing fuel consumption performance.

(ii) For model years 2021 and later, manufacturers may generate off-cycle technology credits for introducing technologies that are not reflected in the EPA specified test procedures. Upon identification and joint approval with EPA, NHTSA will allow equivalent fuel consumption credits into its program to those allowed by EPA for manufacturers seeking to obtain innovative technology credits in a given model year. Such credits must remain within the same regulatory subcategory in which the credits were generated. NHTSA will adopt fuel consumption credits depending upon whether—

(A) The technology meets paragraph (f)(2)(i)(A) and (B) of this section.

(B) For heavy-duty pickup trucks and vans, manufacturers using the 5-cycle test to quantify the benefit of a technology are not required to obtain approval from the agencies to generate results.

(iii) The following provisions apply to all innovative and off-cycle technologies:

(A) Technologies found to be defective, or identified as a part of NHTSA's safety defects program, and technologies that are not performing as intended will have the values of approved off-cycle credits removed from the manufacturer's credit balance.

(B) Approval granted for innovative and off-cycle technology credits under NHTSA's fuel efficiency program does not affect or relieve the obligation to comply with the Vehicle Safety Act (49 U.S.C. Chapter 301), including the ''make inoperative'' prohibition (49 U.S.C. 30122), and all applicable Federal motor vehicle safety standards issued thereunder (FMVSSs) (49 CFR part 571). In order to generate off-cycle or innovative technology credits manufacturers must state—

(1) That each vehicle equipped with the technology for which they are seeking credits will comply with all applicable FMVSS(s); and

(2) Whether or not the technology has a fail-safe provision. If no fail-safe provision exists, the manufacturer must explain why not and whether a failure of the innovative technology would affect the safety of the vehicle.

(C) Manufacturers requesting approval for innovative technology credits are required to provide documentation in accordance with 40 CFR 86.1869–12, 1036.610, and 1037.610.

(D) Credits will be accepted on a one-for-one basis expressed in terms of gallons in comparison to those approved by EPA.

(E) For the heavy-duty pickup trucks and vans, the average fuel consumption will be calculated as a separate credit amount (rounded to the nearest whole number) using the following equation:

Off-cycle FC credits = (CO_2 Credit/CF) × 100 × Production × VLM

Where:

CO_2 Credits = the credit value in grams per mile determined in 40 CFR 86.1869–12(c)(3), (d)(1), (d)(2) or (d)(3).

CF = conversion factor, which for spark ignition engines is 8,887 and for compression ignition engines is 10,180.

Production = the total production volume for the applicable category of vehicles

VLM = vehicle lifetime miles, which for 2b-3 vehicles shall be 150,000 for the Phase 2 program.

(F) NHTSA will not approve innovative technology credits for technology that is related to crash-avoidance technologies, safety critical systems or systems affecting safety-critical functions, or technologies designed for the purpose of reducing the frequency of vehicle crashes.

(iv) Manufacturers may carryover an approved innovative technology into the Phase 2 off-cycle credit program. Manufacturers may continue to carryover the improvement factor (not the credit value) if—

(A) The FEL is generated by GEM or 5-cycle testing;

(B) The technology is not changed or paired with any other off-cycle technology;

(C) The improvement factor only applies to approved vehicle or engine families;

(D) The agencies do not expect the technology to be incorporated into GEM at any point during the Phase 2 program; and

(E) The documentation to carryover credits that would primarily justify the difference in fuel efficiency between real world and compliance protocols is the same for both Phase 1 and Phase 2 compliance protocols. The agencies must approve the justification. If the agencies do not approve the justification, the manufacturer must recertify.

§ 535.8 Reporting and recordkeeping requirements.

(a) *General requirements.* Manufacturers producing heavy-duty vehicles and engines applicable to fuel consumption standards in § 535.5, for each given model year, must submit the required information as specified in paragraphs (b) through (h) of this section.

(1) The information required by this part must be submitted by the deadlines specified in this section and must be based upon all the information and data available to the manufacturer 30 days before submitting information.

(2) Manufacturers must submit information electronically through the EPA database system as the single point of entry for all information required for this national program and both agencies will have access to the information. The format for the required information is specified by EPA in coordination with NHTSA.

(3) Manufacturers providing incomplete reports missing any of the required information or providing untimely reports are considered as not complying with standards (*i.e.,* if good-faith estimates of U.S.-directed production volumes for EPA certificates of conformity are not provided) and are liable to pay civil penalties in accordance with 49 U.S.C. 32912.

(4) Manufacturers certifying a vehicle or engine family using an FEL or FCL below the applicable fuel consumption standard as described in § 535.5 may choose not to generate fuel consumption credits for that family. In which case, the manufacturer is not required to submit reporting or keep the associated records described in this part for that family.

(5) Manufacturers must use good engineering judgment and provide comparable fuel consumption information to that of the information or data provided to EPA under 40 CFR 86.1865, 1036.250, 1036.730, 1036.825 1037.250, 1037.730, and 1037.825.

(6) Any information that must be sent directly to NHTSA. In instances in which EPA has not created an electronic pathway to receive the information, the information should be sent through an electronic portal identified by NHTSA or through the NHTSA CAFE database (*i.e.,* information on fuel consumption credit transactions). If hardcopy documents must be sent, the information should be sent to the Associate Administrator of Enforcement at 1200 New Jersey Avenue, NVS–200, Office W45–306, SW., Washington, DC 20590.

(b) *Pre-model year reports.* Manufacturers producing heavy-duty pickup trucks and vans must submit reports in advance of the model year providing early estimates demonstrating how their fleet(s) would comply with GHG emissions and fuel consumption standards. Note, the agencies understand that early model year reports contain estimates that may change over the course of a model year and that compliance information manufacturers submit prior to the beginning of a new model year may not represent the final compliance outcome. The agencies view the necessity for requiring early model reports as a manufacturer's good faith projection for demonstrating compliance with emission and fuel consumption standards.

(1) *Report deadlines.* For model years 2013 and later, manufacturer of heavy-duty pickup trucks and vans complying with voluntary and mandatory standards must submit a pre-model year report for the given model year as early as the date of the manufacturer's annual certification preview meeting with EPA and NHTSA, or prior to submitting its first application for a certificate of conformity to EPA in accordance with 40 CFR 86.1819–14 (d). For example, a manufacturer choosing to comply in model year 2014 could submit its pre-model year report during its precertification meeting which could occur before January 2, 2013, or could provide its pre-model year report any time prior to submitting its first application for certification for the given model year.

(2) *Contents.* Each pre-model year report must be submitted including the following information for each model year.

(i) A list of each unique subconfiguration in the manufacturer's fleet describing the make and model designations, attribute based-values (*i.e.,* GVWR, GCWR, Curb Weight and drive configurations) and standards;

(ii) The emission and fuel consumption fleet average standard derived from the unique vehicle configurations;

(iii) The estimated vehicle configuration, test group and fleet production volumes;

(iv) The expected emissions and fuel consumption test group results and fleet average performance;

(v) If complying with MY 2013 fuel consumption standards, a statement must be provided declaring that the manufacturer is voluntarily choosing to comply early with the EPA and NHTSA programs. The manufacturers must also acknowledge that once selected, the decision cannot be reversed and the manufacturer will continue to comply with the fuel consumption standards for subsequent model years for all the vehicles it manufacturers in each regulatory category for a given model year;

(vi) If complying with MYs 2014, 2015 or 2016 fuel consumption standards, a statement must be provided declaring whether the manufacturer will use fixed or increasing standards in accordance with § 535.5(a). The manufacturer must also acknowledge that once selected, the decision cannot be reversed and the manufacturer must continue to comply with the same alternative for subsequent model years for all the vehicles it manufacturers in each regulatory category for a given model year;

(vii) If complying with MYs 2014 or 2015 fuel consumption standards, a statement must be provided declaring that the manufacturer is voluntarily choosing to comply with NHTSA's voluntary fuel consumption standards in accordance with § 535.5(a)(4). The manufacturers must also acknowledge that once selected, the decision cannot be reversed and the manufacturer will continue to comply with the fuel consumption standards for subsequent model years for all the vehicles it manufacturers in each regulatory category for a given model year;

(viii) The list of Class 2b and 3 incomplete vehicles (cab-complete or chassis complete vehicles) and the method used to certify these vehicles as complete pickups and vans identifying the most similar complete sister- or other complete vehicles used to derive the target standards and performance test results;

(ix) The list of Class 4 and 5 incomplete and complete vehicles and the method use to certify these vehicles as complete pickups and vans identifying the most similar complete or sister vehicles used to derive the target standards and performance test results;

(x) List of loose engines included in the heavy-duty pickup and van category and the list of vehicles used to derive target standards and performance test results;

(xi) Copy of any notices a vehicle manufacturer sends to the engine manufacturer to notify the engine manufacturers that their engines are subject to emissions and fuel consumption standards and that it intends to use their engines in excluded vehicles;

(xii) A credit plan identifying the manufacturers estimated credit balances, planned credit flexibilities (*i.e.,* credit balances, planned credit trading, innovative, advanced and early credits and etc.) and if needed a credit deficit plan demonstrating how it plans to resolve any credit deficits that might occur for a model year within a period of up to three model years after that deficit has occurred; and

(xiii) The supplemental information specified in paragraph (h) of this section. [**Note:** NHTSA may also ask a manufacturer to provide additional information if necessary to verify compliance with the fuel consumption requirements of this regulation.]

(c) *Applications for certificate of conformity.* Manufacturers producing vocational vehicles, tractors and heavy-duty engines are required to submit applications for certificates of conformity to EPA in accordance with 40 CFR 1036.205 and 1037.205 in advance of introducing vehicles for commercial sale. Applications contain early model year information demonstrating how manufacturers plan to comply with GHG emissions. For model years 2013 and later, manufacturers of vocational vehicles, tractors and engine complying with NHTSA's voluntary and mandatory standards must submit applications for certificates of conformity in accordance through the EPA database including both GHG emissions and fuel consumption information for each given model year.

(1) *Submission deadlines.* Applications are primarily submitted in advance of the given model year to EPA but cannot be submitted any later than December 31 of the given model year.

(2) *Contents.* Each application for certificates of conformity submitted to EPA must include the following equivalent fuel consumption.

(i) Equivalent fuel consumption values for emissions CO_2 FCLs values used to certify each engine family in accordance with 40 CFR 1036.205(e). This provision applies only to manufacturers producing heavy-duty engines.

(ii) Equivalent fuel consumption values for emission CO_2 data engines used to comply with emission standards in 40 CFR 1036.108. This provision applies only to manufacturers producing heavy-duty engines.

(iii) Equivalent fuel consumption values for emissions CO_2 FELs values used to certify each vehicle families or subfamilies in accordance with 40 CFR 1037.205(k). This provision applies only to manufacturers producing vocational vehicles and tractors.

(iv) Report modeling results for ten configurations in terms of CO_2 emissions and equivalent fuel consumption results in accordance with 40 CFR 1037.205(o). Include modeling inputs and detailed descriptions of how they were derived. This provision applies only to manufacturers producing vocational vehicles and tractors.

(3) *Additional supplemental information.* Manufacturers are required to submit additional information as specified in paragraph (h) of this section for the NHTSA program before or at the same time it submits its first application for a certificate of conformity to EPA. Under limited conditions, NHTSA may also ask a manufacturer to provide additional information directly to the Administrator if necessary to verify the fuel consumption requirements of this regulation.

(d) *Final reports.* Heavy-duty vehicle and engine manufacturers participating and not-participating in the ABT program are required to submit an end-of-the-year (EOY) report containing information for NHTSA as specified in paragraph (d)(2) of this section and in accordance with 40 CFR 86.1865, 1036.730, and 1037.730. The final reports are used to review a manufacturer's preliminary or final compliance information and to identify manufacturers that might have a credit deficit for the given model year. For model years 2013 and later, heavy-duty vehicle and engine manufacturers complying with NHTSA's voluntary and mandatory standards must submit final reports through the EPA database including both GHG emissions and fuel consumption information for each given model year.

(1) *Report deadlines.* For model year 2013 and later, heavy-duty vehicle and engine manufacturers complying with NHTSA voluntary and mandatory standards must submit EOY reports through the EPA database including both GHG emissions and fuel consumption information within 90 days after the end of the given model year and no later than April 1 of the next calendar year. For example, the final report for model year 2014 must be submitted no later than April 1, 2015. A manufacturer may ask NHTSA and EPA to extend the deadline of a final report by up to 30 days. A manufacturer unable to provide, and requesting to omit an emissions rate or fuel consumption value from a final report must obtain approval from the agencies prior to the submission deadline of its final report.

(i) If a manufacturer expects differences in the information reported between the EOY and the final year report specified in 40 CFR 1036.730 and 1037.730, it must provide the most up-to-date fuel consumption projections in its final report and identify the information as preliminary.

(ii) If the manufacturer cannot provide any of the required fuel consumption information, it must state the specific reason for the insufficiency and identify the additional testing needed or explain what analytical methods are believed by the manufacturer will be necessary to eliminate the insufficiency and certify that the results will be available for the final report.

(2) *Contents.* Each final report must be submitted including the following fuel consumption information for each model year. final reports for manufacturers participating in the ABT program must include final estimates.

(i) Engine and vehicle family designations and averaging sets.

(ii) Engine and vehicle regulatory subcategory and fuel consumption standards including any alternative standards used.

(iii) Engine and vehicle family FCLs and FELs in terms of fuel consumption.

(iv) Final production volumes for engines and vehicles.

(v) A final credit plan (for manufacturers participating in the ABT program) identifying the manufacturers actual fuel consumption credit balances, credit flexibilities, credit trades and a credit deficit plan if needed demonstrating how it plans to resolve any credit deficits that might occur for a model year within a period of up to three model years after that deficit has occurred.

(vi) A summary as specified in paragraph (g)(7) of this section describing the vocational vehicles and vocational tractors that were exempted as heavy-duty off-road vehicles. This applies to manufacturers participating and not participating in the ABT program.

(vii) A summary describing any advanced or innovative technology engines or vehicles including alternative fueled vehicles that were produced for the model year identifying the approaches used to determine compliance and the production volumes.

(viii) A list of each unique subconfiguration included in a manufacturer's fleet of heavy-duty pickup trucks and vans identifying the attribute based-values (GVWR, GCWR, Curb Weight, and drive configurations) and standards. This provision applies only to manufacturers producing heavy-duty pickup trucks and vans.

(ix) The fuel consumption fleet average standard derived from the unique vehicle configurations. This provision applies only to manufacturers producing heavy-duty pickup trucks and vans.

(x) The subconfiguration and test group production volumes. This provision applies only to manufacturers producing heavy-duty pickup trucks and vans.

(xi) The fuel consumption test group results and fleet average performance. This provision applies only to manufacturers producing heavy-duty pickup trucks and vans.

(xii) Under limited conditions, NHTSA may also ask a manufacturer to provide additional information directly to the Administrator if necessary to verify the fuel consumption requirements of this regulation.

(e) *Amendments to applications for certification.* At any time, a manufacturer modifies an application for certification in accordance with 40 CFR 1036.225 and 1037.225, it must submit GHG emissions changes with equivalent fuel consumption values for the information required in paragraphs (b) through (e) and (h) of this section.

(f) *Confidential information.* Manufacturers must submit a request for confidentiality with each electronic submission specifying any part of the for information or data in a report that it believes should be withheld from *public* disclosure as trade secret or other confidential business information. Information submitted to EPA should follow EPA guidelines for treatment of confidentiality. Requests for confidential treatment for information submitted to NHTSA must be filed in accordance with the requirements of 49 CFR part 512, including submission of a request for confidential treatment and the information for which confidential treatment is requested as specified by part 512. For any information or data requested by the manufacturer to be withheld under 5 U.S.C. 552(b)(4) and 49 U.S.C. 32910(c), the manufacturer shall present arguments and provide evidence in its request for confidentiality demonstrating that–

(1) The item is within the scope of 5 U.S.C. 552(b)(4) and 49 U.S.C. 32910(c);

(2) The disclosure of the information at issue would cause significant competitive damage;

(3) The period during which the item must be withheld to avoid that damage; and

(4) How earlier disclosure would result in that damage.

(g) *Additional required information.* The following additional information is required to be submitted through the EPA database. NHTSA reserves the right to ask a manufacturer to provide additional information if necessary to verify the fuel consumption requirements of this regulation.

(1) *Small businesses.* For model years 2013 through 2020, vehicles and engines produced by small business manufacturers meeting the criteria in 13 CFR 121.201 are exempted from the requirements of this part. Qualifying small business manufacturers must notify EPA and NHTSA Administrators before importing or introducing into U.S. commerce exempted vehicles or engines. This notification must include a description of the manufacturer's qualification as a small business under 13 CFR 121.201. Manufacturers must submit this notification to EPA, and EPA will provide the notification to NHTSA. The agencies may review a manufacturer's qualification as a small business manufacturer under 13 CFR 121.201.

(2) *Emergency vehicles.* For model years 2021 and later, emergency vehicles produced by heavy-duty pickup truck and van manufacturers are exempted except those produced by manufacturers voluntarily complying with standards in § 535.5(a). Manufacturers must notify the agencies in writing if using the provisions in § 535.5(a) to produce exempted emergency vehicles in a given model year, either in the report specified in 40 CFR 86.1865 or in a separate submission.

(3) *Early introduction.* The provision applies to manufacturers seeking to comply early with the NHTSA's fuel consumption program prior to model year 2014. The manufacturer must send the request to EPA before submitting its first application for a certificate of conformity.

(4) *NHTSA voluntary compliance model years.* Manufacturers must submit a statement declaring whether the manufacturer chooses to comply voluntarily with NHTSA's fuel consumption standards for model years 2014 through 2015. The manufacturers must acknowledge that once selected, the decision cannot be reversed and the manufacturer will continue to comply with the fuel consumption standards for subsequent model years. The manufacturer must send the statement to EPA before submitting its first application for a certificate of conformity.

(5) *Alternative engine standards.* Manufacturers choosing to comply with the alternative engine standards must notify EPA and NHTSA of their choice and include in that notification a demonstration that it has exhausted all available credits and credit opportunities. The manufacturer must send the statement to EPA before submitting its EOY report.

(6) *Alternate phase-in.* Manufacturers choosing to comply with the alternative engine phase-in must notify EPA and NHTSA of their choice. The manufacturer must send the statement to EPA before submitting its first application for a certificate of conformity.

(7) *Off-road exclusion (tractors, vocational vehicles and trailers only).* (i) Tractors and vocational vehicles intended to be used extensively in off-road environments such as forests, oil fields, and construction sites may be exempted without request from the requirements of this regulation as specified in 49 CFR 523.2 and § 535.5(b). Within 90 days after the end of each model year, manufacturers must send EPA and NHTSA through the EPA database a report with the following information:

(A) A description of each excluded vehicle configuration, including an explanation of why it qualifies for this exclusion.

(B) The number of vehicles excluded for each vehicle configuration.

(ii) A manufacturer having an off-road vehicle failing to meet the criteria under the agencies' off-road exclusions will be allowed to request an exclusion of such a vehicle from EPA and NHTSA. The approval will be granted through the certification process for the vehicle family and will be done in collaboration between EPA and NHTSA in accordance with the provisions in 40 CFR 1037.150, 1037.210, and 1037.630.

(8) *Vocational tractors.* Tractors intended to be used as vocational tractors may comply with vocational vehicle standards in § 535.5(b) of this regulation. Manufacturers classifying tractors as vocational tractors must provide a description of how they meet

the qualifications in their applications for certificates of conformity as specified in 40 CFR 1037.205.

(9) *Approval of alternate methods to determine drag coefficients (tractors only).* Manufacturers seeking to use alternative methods to determine aerodynamic drag coefficients must provide a request and gain approval by EPA in accordance with 40 CFR 1037.525. The manufacturer must send the request to EPA before submitting its first application for a certificate of conformity.

(10) *Innovative and off-cycle technology credits.* Manufacturers pursuing innovative and off-cycle technology credits must submit information to the agencies and may be subject to a public evaluation process in which the public would have opportunity for comment if the manufacturer is not using a test procedure in accordance with 40 CFR 1037.610(c). Whether the approach involves on-road testing, modeling, or some other analytical approach, the manufacturer would be required to present a final methodology to EPA and NHTSA. EPA and NHTSA would approve the methodology and credits only if certain criteria were met. Baseline emissions and fuel consumption and control emissions and fuel consumption would need to be clearly demonstrated over a wide range of real world driving conditions and over a sufficient number of vehicles to address issues of uncertainty with the data. Data would need to be on a vehicle model-specific basis unless a manufacturer demonstrated model-specific data was not necessary. The agencies may publish a notice of availability in the **Federal Register** notifying the public of a manufacturer's proposed alternative off-cycle credit calculation methodology and provide opportunity for comment. Any notice will include details regarding the methodology, but not include any Confidential Business Information.

(11) *Credit trades.* If a manufacturer trades fuel consumption credits, it must send EPA and NHTSA a fuel consumption credit plan as specified in § 535.7(a) and provide the following information within 90 days after the transaction:

(i) As the seller, the manufacturer must include the following information in its report:

(A) The corporate names of the buyer and any brokers.

(B) A copy of any contracts related to the trade.

(C) The fleet, vehicle or engine families that generated fuel consumption credits for the trade, including the number of fuel consumption credits from each family.

(ii) As the buyer, the manufacturer or entity must include the following information in its report:

(A) The corporate names of the seller and any brokers.

(B) A copy of any contracts related to the trade.

(C) How the manufacturer or entity intends to use the fuel consumption credits, including the number of fuel consumption credits it intends to apply to each vehicle family (if known).

(D) A copy of the contract with signatures from both the buyer and the seller.

(12) *Production reports.* Within 90 days after the end of the model year, manufacturers must send to EPA a report including the total U.S.-directed production volume of vehicles it produced in each vehicle and engine family during the model year (based on information available at the time of the report) as required by 40 CFR 1036.250 and 40 CFR 1037.250. Each manufacturer shall report by vehicle or engine identification number and by configuration and identify the subfamily identifier. Report uncertified vehicles sold to secondary vehicle manufacturers. Small business manufacturers may omit reporting. Identify any differences between volumes included for EPA but excluded for NHTSA.

(h) *Public information.* Based upon information submitted by manufacturers and EPA, NHTSA will publish fuel consumption standards and performance results.

(i) *Information received from EPA.* NHTSA will receive information from EPA as specified in 40 CFR 1036.755 and 1037.755.

(j) *Recordkeeping.* NHTSA has the same recordkeeping requirements as EPA, specified in 40 CFR 86.1865–12(k), 1036.250, 1036.735, 1036.825, 1037.250, 1037.735, and 1037.825. The agencies each reserve the right to request information contained in records separately. If collected separately and NHTSA finds that information is provided fraudulent or grossly negligent or otherwise provided in bad faith, the manufacturer may be liable to civil penalties in accordance with each agencies authority.

§ 535.9 Enforcement approach.

(a) *Compliance.* (1) Each year NHTSA will assess compliance with fuel consumption standards as specified in § 535.10.

(i) NHTSA may conduct audits or verification testing prior to first sale throughout a given model year or after the model year in order to validate data received from manufacturers and will discuss any potential issues with EPA and the manufacturer. Audits may periodically be performed to confirm manufacturers credit balances or other credit transactions.

(ii) NHTSA may also conduct field inspections either at manufacturing plants or at new vehicle dealerships to validate data received from manufacturers. Field inspections will be carried out in order to validate the condition of vehicles, engines or technology prior to first commercial sale to verify each component's certified configuration as initially built. NHTSA reserves the right to conduct inspections at other locations but will target only those components for which a violation would apply to OEMs and not the fleets or vehicle owners. Compliance inspections could be carried out through a number of approaches including during safety inspections or during compliance safety testing.

(iii) NHTSA will conduct audits and inspections in the same manner and, when possible, in conjunction with EPA. NHTSA will also attempt to coordinate inspections with EPA and share results.

(iv) Documents collected under NHTSA safety authority may be used to support fuel efficiency audits and inspections.

(2) At the end of each model year NHTSA will confirm a manufacturer's fleet or family performance values against the applicable standards and, if a manufacturer uses a credit flexibility, the amount of credits in each averaging set. The averaging set balance is based upon the engines or vehicles performance above or below the applicable regulatory subcategory standards in each respective averaging set and any credits that are traded into or out of an averaging set during the model year.

(i) If the balance is positive, the manufacturer is designated as having a credit surplus.

(ii) If the balance is negative, the manufacturer is designated as having a credit deficit.

(iii) NHTSA will provide notification to each manufacturer confirming its credit balance(s) after the end of each model year directly or through EPA.

(3) Manufacturer are required to confirm the negative balance and submit a fuel consumption credit plan as specified in § 535.7(a) along with supporting documentation indicating how it will allocate existing credits or earn (providing information on future vehicles, engines or technologies), and/ or acquire credits, or else be liable for

a civil penalty as determined in paragraph (b) of this section. The manufacturer must submit the information within 60 days of receiving agency notification.

(4) Credit shortfall within an averaging set may be carried forward only three years, and if not offset by earned or traded credits, the manufacturer may be liable for a civil penalty as described in paragraph (b) of this section.

(5) Credit allocation plans received from a manufacturer will be reviewed and approved by NHTSA. NHTSA will approve a credit allocation plan unless it determines that the proposed credits are unavailable or that it is unlikely that the plan will result in the manufacturer earning or acquiring sufficient credits to offset the subject credit shortfall. In the case where a manufacturer submits a plan to acquire future model year credits earned by another manufacturer, NHTSA will require a signed agreement by both manufacturers to initiate a review of the plan. If a plan is approved, NHTSA will revise the respective manufacturer's credit account accordingly by identifying which existing or traded credits are being used to address the credit shortfall, or by identifying the manufacturer's plan to earn future credits for addressing the respective credit shortfall. If a plan is rejected, NHTSA will notify the respective manufacturer and request a revised plan. The manufacturer must submit a revised plan within 14 days of receiving agency notification. The agency will provide a manufacturer one opportunity to submit a revised credit allocation plan before it initiates civil penalty proceedings.

(6) For purposes of this regulation, NHTSA will treat the use of future credits for compliance, as through a credit allocation plan, as a deferral of civil penalties for non-compliance with an applicable fuel consumption standard.

(7) If NHTSA receives and approves a manufacturer's credit allocation plan to earn future credits within the following three model years in order to comply with regulatory obligations, NHTSA will defer levying civil penalties for non-compliance until the date(s) when the manufacturer's approved plan indicates that credits will be earned or acquired to achieve compliance, and upon receiving confirmed CO_2 emissions and fuel consumption data from EPA. If the manufacturer fails to acquire or earn sufficient credits by the plan dates, NHTSA will initiate civil penalty proceedings.

(8) In the event that NHTSA fails to receive or is unable to approve a plan for a non-compliant manufacturer due to insufficiency or untimeliness, NHTSA may initiate civil penalty proceedings.

(9) In the event that a manufacturer fails to report accurate fuel consumption data for vehicles or engines covered under this rule, noncompliance will be assumed until corrected by submission of the required data, and NHTSA may initiate civil penalty proceedings.

(10) If EPA suspends or revoke a certificate of conformity as specified in 40 CFR 1036.255 or 1037.255, and a manufacturer is unable to take a corrective action allowed by EPA, noncompliance will be assumed, and NHTSA may initiate civil penalty proceedings or revoke fuel consumption credits.

(b) *Civil penalties*—(1) *Generally.* NHTSA may assess a civil penalty for any violation of this part under 49 U.S.C. 32902(k). This section states the procedures for assessing civil penalties for violations of § 535.3(h). The provisions of 5 U.S.C. 554, 556, and 557 do not apply to any proceedings conducted pursuant to this section.

(2) *Initial determination of noncompliance.* An action for civil penalties is commenced by the execution of a Notice of Violation. A determination by NHTSA's Office of Enforcement of noncompliance with applicable fuel consumption standards utilizing the certified and reported CO_2 emissions and fuel consumption data provided by the Environmental Protection Agency as described in this part, and after considering all the flexibilities available under § 535.7, underlies a Notice of Violation. If NHTSA Enforcement determines that a manufacturer's averaging set of vehicles or engines fails to comply with the applicable fuel consumption standard(s) by generating a credit shortfall, the incomplete vehicle, complete vehicle or engine manufacturer, as relevant, shall be subject to a civil penalty.

(3) *Numbers of violations and maximum civil penalties.* Any violation shall constitute a separate violation with respect to each vehicle or engine within the applicable regulatory averaging set. The maximum civil penalty is not more than $37,500.00 per vehicle or engine. The maximum civil penalty under this section for a related series of violations shall be determined by multiplying $37,500.00 times the vehicle or engine production volume for the model year in question within the regulatory averaging set. NHTSA may adjust this civil penalty amount to account for inflation.

(4) *Factors for determining penalty amount.* In determining the amount of any civil penalty proposed to be assessed or assessed under this section, NHTSA shall take into account the gravity of the violation, the size of the violator's business, the violator's history of compliance with applicable fuel consumption standards, the actual fuel consumption performance related to the applicable standards, the estimated cost to comply with the regulation and applicable standards, the quantity of vehicles or engines not complying, and the effect of the penalty on the violator's ability to continue in business. The ''estimated cost to comply with the regulation and applicable standards,'' will be used to ensure that penalties for non-compliance will not be less than the cost of compliance.

(5) *NHTSA enforcement report of determination of non-compliance.* (i) If NHTSA Enforcement determines that a violation has occurred, NHTSA Enforcement may prepare a report and send the report to the NHTSA Chief Counsel.

(ii) The NHTSA Chief Counsel will review the report prepared by NHTSA Enforcement to determine if there is sufficient information to establish a likely violation.

(iii) If the Chief Counsel determines that a violation has likely occurred, the Chief Counsel may issue a Notice of Violation to the party.

(iv) If the Chief Counsel issues a Notice of Violation, he or she will prepare a case file with recommended actions. A record of any prior violations by the same party shall be forwarded with the case file.

(6) *Notice of violation.* (i) The Notice of Violation will contain the following information:

(A) The name and address of the party;

(B) The alleged violation(s) and the applicable fuel consumption standard(s) violated;

(C) The amount of the proposed penalty and basis for that amount;

(D) The place to which, and the manner in which, payment is to be made;

(E) A statement that the party may decline the Notice of Violation and that if the Notice of Violation is declined within 30 days of the date shown on the Notice of Violation, the party has the right to a hearing, if requested within 30 days of the date shown on the Notice of Violation, prior to a final assessment of a penalty by a Hearing Officer; and

(F) A statement that failure to either pay the proposed penalty or to decline the Notice of Violation and request a hearing within 30 days of the date shown on the Notice of Violation will result in a finding of violation by default and that NHTSA will proceed with the civil penalty in the amount proposed on the Notice of Violation without processing the violation under the hearing procedures set forth in this subpart.

(ii) The Notice of Violation may be delivered to the party by—

(A) Mailing to the party (certified mail is not required);

(B) Use of an overnight or express courier service; or

(C) Facsimile transmission or electronic mail (with or without attachments) to the party or an employee of the party.

(iii) At any time after the Notice of Violation is issued, NHTSA and the party may agree to reach a compromise on the payment amount.

(iv) Once a penalty amount is paid in full, a finding of ''resolved with payment'' will be entered into the case file.

(v) If the party agrees to pay the proposed penalty, but has not made payment within 30 days of the date shown on the Notice of Violation, NHTSA will enter a finding of violation by default in the matter and NHTSA will proceed with the civil penalty in the amount proposed on the Notice of Violation without processing the violation under the hearing procedures set forth in this subpart.

(vi) If within 30 days of the date shown on the Notice of Violation a party fails to pay the proposed penalty on the Notice of Violation, and fails to request a hearing, then NHTSA will enter a finding of violation by default in the case file, and will assess the civil penalty in the amount set forth on the Notice of Violation without processing the violation under the hearing procedures set forth in this subpart.

(vii) NHTSA's order assessing the civil penalty following a party's default is a final agency action.

(7) *Hearing Officer.* (i) If a party timely requests a hearing after receiving a Notice of Violation, a Hearing Officer shall hear the case.

(ii) The Hearing Officer will be appointed by the NHTSA Administrator, and is solely responsible for the case referred to him or her. The Hearing Officer shall have no other responsibility, direct or supervisory, for the investigation of cases referred for the assessment of civil penalties. The Hearing Officer shall have no duties related to the light-duty fuel economy or medium- and heavy-duty fuel efficiency programs.

(iii) The Hearing Officer decides each case on the basis of the information before him or her.

(8) *Initiation of action before the Hearing Officer.* (i) After the Hearing Officer receives the case file from the Chief Counsel, the Hearing Officer notifies the party in writing of–

(A) The date, time, and location of the hearing and whether the hearing will be conducted telephonically or at the DOT Headquarters building in Washington, DC;

(B) The right to be represented at all stages of the proceeding by counsel as set forth in paragraph (b)(9) of this section; and

(C) The right to a free copy of all written evidence in the case file.

(ii) On the request of a party, or at the Hearing Officer's direction, multiple proceedings may be consolidated if at any time it appears that such consolidation is necessary or desirable.

(9) *Counsel.* A party has the right to be represented at all stages of the proceeding by counsel. A party electing to be represented by counsel must notify the Hearing Officer of this election in writing, after which point the Hearing Officer will direct all further communications to that counsel. A party represented by counsel bears all of its own attorneys' fees and costs.

(10) *Hearing location and costs.* (i) Unless the party requests a hearing at which the party appears before the Hearing Officer in Washington, DC, the hearing may be held telephonically. In Washington, DC, the hearing is held at the headquarters of the U.S. Department of Transportation.

(ii) The Hearing Officer may transfer a case to another Hearing Officer at a party's request or at the Hearing Officer's direction.

(iii) A party is responsible for all fees and costs (including attorneys' fees and costs, and costs that may be associated with travel or accommodations) associated with attending a hearing.

(11) *Hearing procedures.* (i) There is no right to discovery in any proceedings conducted pursuant to this subpart.

(ii) The material in the case file pertinent to the issues to be determined by the Hearing Officer is presented by the Chief Counsel or his or her designee.

(iii) The Chief Counsel may supplement the case file with information prior to the hearing. A copy of such information will be provided to the party no later than three business days before the hearing.

(iv) At the close of the Chief Counsel's presentation of evidence, the party has the right to examine respond to and rebut material in the case file and other information presented by the Chief Counsel. In the case of witness testimony, both parties have the right of cross-examination.

(v) In receiving evidence, the Hearing Officer is not bound by strict rules of evidence. In evaluating the evidence presented, the Hearing Officer must give due consideration to the reliability and relevance of each item of evidence.

(vi) At the close of the party's presentation of evidence, the Hearing Officer may allow the introduction of rebuttal evidence that may be presented by the Chief Counsel.

(vii) The Hearing Officer may allow the party to respond to any rebuttal evidence submitted.

(viii) After the evidence in the case has been presented, the Chief Counsel and the party may present arguments on the issues in the case. The party may also request an opportunity to submit a written statement for consideration by the Hearing Officer and for further review. If granted, the Hearing Officer shall allow a reasonable time for submission of the statement and shall specify the date by which it must be received. If the statement is not received within the time prescribed, or within the limits of any extension of time granted by the Hearing Officer, it need not be considered by the Hearing Officer.

(ix) A verbatim transcript of the hearing will not normally be prepared. A party may, solely at its own expense, cause a verbatim transcript to be made. If a verbatim transcript is made, the party shall submit two copies to the Hearing Officer not later than 15 days after the hearing. The Hearing Officer shall include such transcript in the record.

(12) *Determination of violations and assessment of civil penalties.* (i) Not later than 30 days following the close of the hearing, the Hearing Officer shall issue a written decision on the Notice of Violation, based on the hearing record. This may be extended by the Hearing officer if the submissions by the Chief Counsel or the party are voluminous. The decision shall address each alleged violation, and may do so collectively. For each alleged violation, the decision shall find a violation or no violation and provide a basis for the finding. The decision shall set forth the basis for the Hearing Officer's assessment of a civil penalty, or decision not to assess a civil penalty. In determining the amount of the civil penalty, the gravity of the violation, the size of the violator's business, the violator's history of compliance with applicable fuel consumption standards, the actual fuel consumption performance related to the applicable standard, the estimated cost to comply with the regulation and applicable standard, the quantity of vehicles or engines not complying, and

the effect of the penalty on the violator's ability to continue in business. The assessment of a civil penalty by the Hearing Officer shall be set forth in an accompanying final order. The Hearing Officer's written final order is a final agency action.

(ii) If the Hearing Officer assesses civil penalties in excess of $1,000,000, the Hearing Officer's decision shall contain a statement advising the party of the right to an administrative appeal to the Administrator within a specified period of time. The party is advised that failure to submit an appeal within the prescribed time will bar its consideration and that failure to appeal on the basis of a particular issue will constitute a waiver of that issue in its appeal before the Administrator.

(iii) The filing of a timely and complete appeal to the Administrator of a Hearing Officer's order assessing a civil penalty shall suspend the operation of the Hearing Officer's penalty, which shall no longer be a final agency action.

(iv) There shall be no administrative appeals of civil penalties assessed by a Hearing Officer of less than $1,000,000.

(13) *Appeals of civil penalties in excess of $1,000,000.* (i) A party may appeal the Hearing Officer's order assessing civil penalties over $1,000,000 to the Administrator within 21 days of the date of the issuance of the Hearing Officer's order.

(ii) The Administrator will review the decision of the Hearing Officer de novo, and may affirm the decision of the hearing officer and assess a civil penalty, or

(iii) The Administrator may—

(A) Modify a civil penalty;

(B) Rescind the Notice of Violation; or

(C) Remand the case back to the Hearing Officer for new or additional proceedings.

(iv) In the absence of a remand, the decision of the Administrator in an appeal is a final agency action.

(14) *Collection of assessed or compromised civil penalties.* (i) Payment of a civil penalty, whether assessed or compromised, shall be made by check, postal money order, or electronic transfer of funds, as provided in instructions by the agency. A payment of civil penalties shall not be considered a request for a hearing.

(ii) The party must remit payment of any assessed civil penalty to NHTSA within 30 days after receipt of the Hearing Officer's order assessing civil penalties, or, in the case of an appeal to the Administrator, within 30 days after receipt of the Administrator's decision on the appeal.

(iii) The party must remit payment of any compromised civil penalty to NHTSA on the date and under such terms and conditions as agreed to by the party and NHTSA. Failure to pay may result in NHTSA entering a finding of violation by default and assessing a civil penalty in the amount proposed in the Notice of Violation without processing the violation under the hearing procedures set forth in this part.

(c) *Changes in corporate ownership and control.* Manufacturers must inform NHTSA of corporate relationship changes to ensure that credit accounts are identified correctly and credits are assigned and allocated properly.

(1) In general, if two manufacturers merge in any way, they must inform NHTSA how they plan to merge their credit accounts. NHTSA will subsequently assess corporate fuel consumption and compliance status of the merged fleet instead of the original separate fleets.

(2) If a manufacturer divides or divests itself of a portion of its automobile manufacturing business, it must inform NHTSA how it plans to divide the manufacturer's credit holdings into two or more accounts. NHTSA will subsequently distribute holdings as directed by the manufacturer, subject to provision for reasonably anticipated compliance obligations.

(3) If a manufacturer is a successor to another manufacturer's business, it must inform NHTSA how it plans to allocate credits and resolve liabilities per 49 CFR part 534.

§ 535.10 How do manufacturers comply with fuel consumption standards?

(a) *Pre-certification process.* (1) Regulated manufacturers determine eligibility to use exemptions or exclusions in accordance with § 535.3.

(2) Manufacturers may seek preliminary approvals as specified in 40 CFR 1036.210 and 40 CFR 1037.210. Manufacturers may request to schedule pre-certification meetings with EPA and NHTSA prior to submitting approval requests for certificates of conformity to address any joint compliance issues and gain informal feedback from the agencies.

(3) The requirements and prohibitions required by EPA in special circumstances in accordance with 40 CFR 1037.601 and 40 CFR part 1068 apply to manufacturers for the purpose of complying with fuel consumption standards. Manufacturers should use good judgment when determining how EPA requirements apply in complying with the NHTSA program. Manufacturers may contact NHTSA and EPA for clarification about how these requirements apply to them.

(4) In circumstances in which EPA provides multiple compliance approaches manufacturers must choose the same compliance path to comply with NHTSA's fuel consumption standards that they choose to comply with EPA's greenhouse gas emission standards.

(5) Manufacturers may not introduce new vehicles into commerce without a certificate of conformity from EPA. Manufacturers must attest to several compliance standards in order to obtain a certificate of conformity. This includes stating comparable fuel consumption results for all required CO_2 emissions rates. Manufacturers not completing these steps do not comply with the NHTSA fuel consumption standards.

(6) Manufacturers apply the fuel consumption standards specified in § 535.5 to vehicles, engines and components that represent production units and components for vehicle and engine families, sub-families and configurations consistent with the EPA specifications in 40 CFR 86.1819, 1036.230, and 1037.230.

(7) Only certain vehicles and engines are allowed to comply differently between the NHTSA and EPA programs as detailed in this section. These vehicles and engines must be identified by manufacturers in the ABT and production reports required in § 535.8.

(b) *Model year compliance.* Manufacturers are required to conduct testing to demonstrate compliance with CO_2 exhaust emissions standards in accordance with EPA's provisions in 40 CFR part 600, subpart B, 40 CFR 1036, subpart F, 40 CFR part 1037, subpart R, and 40 CFR part 1066. Manufacturers determine equivalent fuel consumption performance values for CO_2 results as specified in § 535.6 and demonstrate compliance by comparing equivalent results to the applicable fuel consumption standards in § 535.5.

(c) *End-of-the-year process.* Manufacturers comply with fuel consumption standards after the end of each model year, if—

(1) For heavy-duty pickup trucks and vans, the manufacturer's fleet average performance, as determined in § 535.6, is less than the fleet average standard; or

(2) For truck tractors, vocational vehicles, engines and box trailers the manufacturer's fuel consumption performance for each vehicle or engine family (or sub-family), as determined in § 535.6, is lower than the applicable regulatory subcategory standards in § 535.5.

(3) For non-box and non-aero trailers, a manufacturer is considered in compliance with fuel consumption standards if all trailers meet the specified standards in § 535.5(e)(1)(i).

(4) NHTSA will use the EPA final verified values as specified in 40 CFR 86.1819, 40 CFR 1036.755 and 1037.755 for making final determinations on whether vehicles and engines comply with fuel consumption standards.

(5) A manufacturer fails to comply with fuel consumption standards if its final reports are not provided in accordance with § 535.7 and 40 CFR 86.1865, 1036.730, and 1037.730. Manufacturers not providing complete or accurate final reports by the required deadlines do not comply with fuel consumption standards. A manufacturer that is unable to provide any emissions results along with comparable fuel consumption values must obtain permission for EPA to exclude the results prior to the deadline for submitting final reports.

(6) A manufacturer that would otherwise fail to directly comply with fuel consumption standards as described in paragraphs (c)(1) through (3) of this section may use one or more of the credit flexibilities provided under the NHTSA averaging, banking and trading program, as specified in § 535.7, but must offset all credit deficits in its averaging sets to achieve compliance.

(7) A manufacturer failing to comply with the provisions specified in this part may be liable to pay civil penalties in accordance with § 535.9.

(8) A manufacturer may also be liable to pay civil penalties if found by EPA or NHTSA to have provided false information as identified through NHTSA or EPA enforcement audits or new vehicle verification testing as specified in § 535.9 and 40 CFR parts 86, 1036, and 1037.

PART 537—AUTOMOTIVE FUEL ECONOMY REPORTS

■ 290. Revise the authority citation for part 537 to read as follows:

Authority: 49 U.S.C. 32907; delegation of authority at 49 CFR 1.95.

■ 291. Revise § 537.5 to read as follows:

§ 537.5 General requirements for reports.

(a) For each current model year, each manufacturer shall submit a pre-model year report, a mid-model year report, and, as required by § 537.8, supplementary reports.

(b)(1) The pre-model year report required by this part for each current model year must be submitted during the month of December (*e.g.,* the pre-model year report for the 1983 model year must be submitted during December, 1982).

(2) The mid-model year report required by this part for each current model year must be submitted during the month of July (*e.g.,* the mid-model year report for the 1983 model year must be submitted during July 1983).

(3) Each supplementary report must be submitted in accordance with § 537.8(c).

(c) Each report required by this part must–

(1) Identify the report as a pre-model year report, mid-model year report, or supplementary report as appropriate;

(2) Identify the manufacturer submitting the report;

(3) State the full name, title, and address of the official responsible for preparing the report;

(4) Be submitted through an electronic portal identified by NHTSA (*i.e.* the Environmental Protection Agency VERYIFY database) or through the NHTSA CAFE database.

(5) Identify the current model year;

(6) Be written in the English language; and

(7)(i) Specify any part of the information or data in the report that the manufacturer believes should be withheld from public disclosure as trade secret or other confidential business information.

(ii) With respect to each item of information or data requested by the manufacturer to be withheld under 5 U.S.C. 552(b)(4) and 15 U.S.C. 2005(d)(1), the manufacturer shall–

(A) Show that the item is within the scope of sections 552(b)(4) and 2005(d)(1);

(B) Show that disclosure of the item would result in significant competitive damage;

(C) Specify the period during which the item must be withheld to avoid that damage; and

(D) Show that earlier disclosure would result in that damage.

(d) Each report required by this part must be based upon all information and data available to the manufacturer 30 days before the report is submitted to the Administrator.

PART 538—MANUFACTURING INCENTIVES FOR ALTERNATIVE FUEL VEHICLES

■ 292. Revise the authority citation for part 538 to read as follows:

Authority: 49 U.S.C. 32901, 32905, and 32906; delegation of authority at 49 CFR 1.95.

■ 293. Revise § 538.5 to read as follows:

§ 538.5 Minimum driving range.

(a) The minimum driving range that a passenger automobile must have in order to be treated as a dual fueled automobile pursuant to 49 U.S.C. 32901(c) is 200 miles when operating on its nominal useable fuel tank capacity of the alternative fuel, except when the alternative fuel is electricity or compressed natural gas. Beginning model year 2016, a natural gas passenger automobile must have a minimum driving range of 150 miles when operating on its nominal useable fuel tank capacity of the alternative fuel to be treated as a dual fueled automobile, pursuant to 49 U.S.C. 32901(c)(2).

(b) The minimum driving range that a passenger automobile using electricity as an alternative fuel must have in order to be treated as a dual fueled automobile pursuant to 49 U.S.C. 32901(c) is 7.5 miles on its nominal storage capacity of electricity when operated on the EPA urban test cycle and 10.2 miles on its nominal storage capacity of electricity when operated on the EPA highway test cycle.

Dated: June 19, 2015.

RIN 1004–AE15

Onshore Oil and Gas Operations; Federal and Indian Oil and Gas Leases; Site Security

AGENCY: Bureau of Land Management, Interior.

ACTION: Proposed rule.

SUMMARY: This proposed rule would replace Onshore Oil and Gas Order No. 3, Site Security (Order 3), with new regulations that would be codified in the Code of Federal Regulations (CFR). Order 3 establishes minimum standards for oil and gas facility site security. It includes provisions intended to ensure that oil and gas produced from Federal and Indian (except Osage Tribe) oil and gas leases are properly and securely handled, so as to ensure accurate measurement, production accountability, and royalty payments, and to prevent theft and loss. Order 3 was issued in 1989.

The changes proposed as part of this proposed rule would allow the BLM to strengthen its policies governing production verification and accountability by updating Order 3's requirements to address changes in technology and industry practices that have occurred in the 25 years since Order 3 was issued, and to respond to recommendations made by the Government Accountability Office (GAO) with respect to the BLM's production verification efforts. The proposed rule addresses Facility Measurement Points (FMPs), site facility diagrams, the use of seals, bypasses around meters, documentation, recordkeeping, commingling, off-lease measurement, and the reporting of incidents of unauthorized removal or mishandling of oil and condensate. The proposed rule also identifies certain acts of noncompliance that would result in an immediate assessment. Finally, it sets forth a process for the BLM to consider variances from the requirements of this proposed regulation.

The BLM believes these proposed changes will enhance its overall production verification and accountability efforts. As part of those efforts, the BLM also anticipates that it will separately propose new regulations to update and replace Onshore Oil and Gas Orders Nos. 4 (Order 4) and 5 (Order 5) related to measurement of oil and gas, respectively.

DATES: Send your comments on this proposed rule to the BLM on or before September 11, 2015. The BLM is not obligated to consider any comments received after the above date in making its decision on the final rule.

As explained later, the changes that follow would establish proposed new information collection requirements that must be approved by OMB. If you wish to comment on the information collection requirements in this proposed rule, please note that the OMB is required to make a decision concerning the collection of information contained in this proposed rule between 30 and 60 days after publication of this proposed rule in the **Federal Register**. Therefore, a comment to OMB on the proposed information collection requirements is best assured of being considered if OMB receives it by August 12, 2015.

ADDRESSES: *Mail:* U.S. Department of the Interior, Director (630), Bureau of Land Management, Mail Stop 2134 LM, 1849 C St., NW., Washington, DC 20240, Attention: 1004–AE15. *Personal or messenger delivery:* 20 M Street SE., Room 2134LM, Washington, DC 20003. *Federal eRulemaking Portal: http://www.regulations.gov.* Follow the instructions at this Web site.

Comments on the information collection burdens: *Fax:* Office of Management and Budget (OMB), Office of Information and Regulatory Affairs, Desk Officer for the Department of the Interior, fax (202) 395–5806. *Electronic mail: oira_docket@omb.eop.gov.* Please indicate ''Attention: OMB Control Number 1004–XXXX,'' regardless of the method used to submit comments on the information collection burdens. If you submit comments on the information collection burdens, you should also provide the BLM with a copy of those comments, at one of the addresses shown above, so that we can summarize all written comments and address them in the final rule.

FOR FURTHER INFORMATION CONTACT: Michael Wade, BLM Colorado State Office, at 303–239–3737. For questions relating to regulatory process issues, please contact Faith Bremner, BLM Washington Office, at 202–912–7441. Persons who use a telecommunications device for the deaf (TDD) may call the Federal Information Relay Service (FIRS) at 1–800–877–8339 to contact the above individuals during normal business hours. FIRS is available 24 hours a day, 7 days a week to leave a message or question with the above individual. You will receive a reply during normal business hours.

SUPPLEMENTARY INFORMATION:

I. Public Comment Procedures

If you wish to comment on the proposed rule, you may submit your comments by any one of several methods specified (see **ADDRESSES** above). If you wish to comment on the information collection requirements, you should send those comments directly to the OMB as outlined (see **ADDRESSES**); however, we ask that you also provide a copy of those comments to the BLM.

Please make your comments as specific as possible by confining them to issues for which comments are sought in this notice, and explain the basis for your comments. The comments and recommendations that will be most useful and likely to influence agency decisions are:

1. Those supported by quantitative information or studies; and
2. Those that include citations to, and analyses of, the applicable laws and regulations.

The BLM is not obligated to consider or include in the Administrative Record for the rule comments received after the close of the comment period (see **DATES**) or comments delivered to an address other than those listed above (see **ADDRESSES**).

Comments, including names and street addresses of respondents, will be available for public review at the address listed under **ADDRESSES** during regular hours (7:45 a.m. to 4:15 p.m.), Monday through Friday, except holidays.

Before including your address, phone number, email address, or other personal identifying information in your comment, you should be aware that your entire comment—including your personal identifying information—may be made publicly available at any time. While you can ask us in your comment to withhold your personal identifying information from public review, we cannot guarantee that we will be able to do so.

II. Background

Under applicable law, royalties are owed on all production removed or sold from Federal and Indian oil and gas leases. The basis for those royalty payments is the measured production from those leases. In fiscal year (FY) 2014, onshore Federal oil and gas leases produced about 148 million barrels of oil, 2.48 trillion cubic feet of natural gas, and 2.9 billion gallons of natural gas liquids, with a market value of more than $27 billion and generating royalties of almost $3.1 billion. Nearly half of these revenues were distributed to the States in which the leases are located. Leases on tribal and Indian lands produced 56 million barrels of oil, 240 billion cubic feet of natural gas, 182 million gallons of natural gas liquids, with a market value of over $6 billion and generating royalties of over $1 billion that were all distributed to the applicable tribes and individual allottee owners.

Given the magnitude of this production and the BLM's statutory and management obligations, it is critically important that the BLM ensure that operators accurately measure, properly report, and account for that production. The BLM is proposing updates to Order 3's requirements because they are necessary to reflect changes in oil measurement practices and technology since Order 3 was first promulgated.[1] Specifically, this proposed rule is designed to ensure the proper and secure handling of production from Federal and Indian (except Osage) oil and gas leases. The proper handling of production is essential to the accurate measurement, proper reporting, and accountability that are necessary to ensure that the American public, as well as Indian tribes and allottees, receive the royalties to which they are entitled on oil and gas produced from Federal and Indian leases, respectively.

Order 3 is one of seven Onshore Oil and Gas Orders that the BLM issued under its regulations at 43 CFR part 3160.[2] Order 3 primarily supplements the regulations at 43 CFR 3162.4 (records and reports), 3162.5 (environmental safety), 3162.7 (disposition and measurement of oil and gas production and site security on Federal and Indian (except Osage Tribe) oil and gas leases), subpart 3163 (non-compliance, assessments, and civil penalties), and subpart 3165 (relief, conflicts, and appeals). To date, the BLM's Onshore Orders have been published in the **Federal Register**, both for public comment and in final form, but they have not been codified in the CFR. With this rule, the BLM is now proposing to replace Order 3 and update and codify the requirements regarding site security, as explained below.

In 2007, the Secretary appointed an independent panel—the Subcommittee on Royalty Management (Subcommittee)—to review the Department's procedures and processes related to the management of mineral revenues and to provide advice to the Department based on that review.[3] In a report dated December 17, 2007, the Subcommittee determined that the BLM's guidance regarding production accountability is ''unconsolidated, outdated, and sometimes insufficient'' (Subcommittee report, p. 30). The Subcommittee report found that this results in inconsistent and outmoded approaches to production accountability tasks and potential reductions in royalty revenue.

The Subcommittee report expressed concern that the applicable ''BLM policy and guidance is outdated'' and ''some policy memoranda have expired'' (Subcommittee report, p. 31). For example, the BLM issued Order 3 in 1989 and has not updated it since, even though BLM and industry practices and technologies have changed significantly in the intervening 25 years. The Subcommittee also expressed concern that ''BLM policy and guidance have not been consolidated in a single document or publication'', which has led to the ''BLM's 31 oil and gas field offices using varying policy and guidance'' (id.). For example, ''some BLM State Offices have issued their own 'Notices to Lessees' for oil and gas operations'' (id.). While the Subcommittee recognized that such Notices to Lessees may have a positive effect on some oil and gas field operations, it also observed that they necessarily ''lack a national perspective and may introduce inconsistencies among State [Offices]'' (id.).

The Subcommittee specifically recommended that the BLM re-evaluate its regulations and update its policy and guidance on production accountability, including requiring that requests to commingle production from multiple leases, unit participating areas (PAs), or communitization agreements identify allocation among zones (Subcommittee report, p. 32). The Subcommittee also recommended that the BLM re-evaluate its policies and guidance for royalty-free use of gas in lease operations. It also specifically recommended that the BLM establish a workgroup to evaluate Order 3. In response, the Department formed a fluid minerals team, comprised of Departmental employees who are oil and gas experts. Based on its review, the team determined that Order 3 should be updated.

In addition to the Subcommittee report, the GAO issued findings and recommendations addressing similar issues in 2010 (Report to Congressional Requesters, *Oil and Gas Management, Interior's Oil and Gas Production Verification Efforts Do Not Provide Reasonable Assurance of Accurate Measurement of Production Volumes* GAO–10–313 (GAO Report 10–313)).

The GAO found that Interior's measurement regulations and policies do not provide reasonable assurance that oil and gas are accurately measured. Regarding matters relevant to Order 3, the report found that the BLM lacks regulatory or policy requirements for operators to clearly identify measurement points, creating challenges for the BLM in verifying production (GAO Report 10–313, p. 34). It also found that the BLM does not have sufficient national policies and a consistent process for approving arrangements that allow operators to commingle production from multiple Federal, Indian, State, and private leases, which also makes it difficult for the agency to verify production (GAO Report 10–313, p. 36). The GAO specifically recommended that: (1) The BLM develop guidance clarifying when Federal oil and gas may be commingled and establish standardized measurement methods for such circumstances so that production can be adequately measured and verified; (2) BLM staff confirm that commingling agreements are consistent with Interior guidance before they are approved, and that the agreements facilitate key production verification activities; and (3) The BLM track all onshore meters, including information about meter location, identification number, and owner to help ensure that Interior is consistently tracking where and how oil and gas are measured.

The GAO reiterated some of these concerns in 2015 (Report to Congressional Requesters, *Oil and Gas Resources, Interior's Production Verification Efforts and Royalty Data Have Improved, But Further Actions Needed* GAO–15–39 (GAO Report 15–39)). In the 2015 report, the GAO acknowledged the improvements BLM had made in its processes and policies (*e.g.,* issuing additional guidance regarding commingling approvals in 2013), but reiterated its view of the importance of the BLM undertaking an

[1] This proposed rule would replace Order 3, which was published in the **Federal Register** on February 24, 1989 (54 FR 8056), and which has been in effect since March 27, 1989.

[2] These regulations provide for the issuance of Onshore Oil and Gas Orders to ''implement and supplement'' the regulations found in part 3160. 43 CFR 3164.1(a). The Onshore Orders apply nationwide to all Federal onshore and Indian (except Osage Tribe) oil and gas leases.

[3] The Subcommittee was commissioned to report to the Royalty Policy Committee, which is chartered under the Federal Advisory Committee Act to provide advice to the Secretary and other departmental officials responsible for managing mineral leasing activities and to provide a forum for the public to voice concerns about mineral leasing activities.

update of its regulations related to measurement and site security (GAO Report 15–39, pp. 31–32).

Based in part on its concerns that the BLM's production verification efforts do ''. . . not provide reasonable assurance that operators are accurately measuring and reporting'' the volumes of oil and gas produced from Federal and Indian leases, the GAO included the BLM's onshore oil and gas program on its High Risk List in 2011 (Report to Congressional Committees, *High Risk Series, An Update,* GAO–11–278 (GAO Report 11–278), p. 15). Because the GAO's recommendations have not yet been fully implemented, the onshore oil and gas program has remained on the High Risk List in subsequent updates in 2013 (Report to Congressional Committees, *High Risk Series, An Update,* GAO–13–283) and 2015 (Report to Congressional Committees, *High Risk Series, An Update,* GAO–15–290).

In addition to concerns expressed by other parties, the BLM also recognizes, based on its own field experience, that its site security requirements need to be strengthened. For example, on the issue of the point of royalty measurement, it is not uncommon for a BLM inspector, a lease operator, and field employees to all have different understandings of where that point is on a given lease because Order 3 does not require operators to formally identify and obtain BLM approval for a specific measurement point. One result of this confusion is that BLM inspectors sometimes drive out to remote locations to witness calibrations on meters that they believed were measuring production for purposes of determining royalty when, in fact, they were not. The inspectors may not discover the discrepancies until months or even years later, during audits when operators submit their production accountability paperwork and the meter information does not match. This can create needless uncertainties in production accounting and verification and can increase the time spent on individual inspections and audits by both operators and the BLM, which strains the BLM's limited resources, while also requiring additional response and resources on the part of operators.

Similarly, with respect to existing commingling approvals, the BLM recognizes that in the absence of uniform national guidance, some of the existing BLM-approved commingling agreements may not provide the production data that the BLM needs to independently verify production that is attributable to the Federal or Indian leases covered by those agreements. The absence of this data limits the BLM's ability to fulfill its obligation to ensure that all production from Federal and Indian (except Osage Tribe) oil and gas leases is properly accounted for and that royalties are properly calculated.

Many of the provisions in this proposed rule were developed in response to the BLM's experience and the recommendations made by the Subcommittee and the GAO. Others were developed by the BLM to enhance and clarify some of Order 3 requirements in response to changes in technology and industry practice, and changes to applicable statutory requirements. The provisions discussed below also respond to comments received during a series of public meetings held by the BLM on April 24 and 25, 2013, to discuss proposed revisions to Orders 3, 4, and 5. In aggregate, these provisions will help ensure that the production of Federal and Indian (except Osage Tribe) oil and gas is adequately accounted for. By replacing the patchwork of guidance developed by BLM state and field offices, the provisions of this proposed rule would also provide operators with a level of consistency as to the requirements applicable to their operations on Federal and Indian (except Osage Tribe) lands nationwide.

III. Discussion of the Proposed Rule

A. General Overview

The following table provides an overview of the changes contemplated as part of this proposed rule and identifies the substantive proposed changes relative to Order 3.

BILLING CODE 4310–84–C

Order 3	Proposed Rule	Substantive Changes
I.A. Authority	43 CFR 3170.1 Authority	The proposed rule would update the authority section.
I.B. Purpose	(No separate section in the proposed rule.)	
I.C. Scope	43 CFR 3170.2	The proposed rule would add language regarding Indian Mineral Development Act agreements and Tribal Energy Resource Agreements.
II. Definitions	43 CFR 3170.3 and 3173.1	The proposed rule would add definitions of key terms used in the rule as well as a list of acronyms used. Terms for which new definitions would be added include: "allocation," "audit trail," "commingling," "communitization agreement," "condition of approval (COA)," "days," "facility measurement point (FMP)," "incident of noncompliance (INC)," "land description," "oil," "maximum ultimate economic recovery," "notice to lessees and operators," "off-lease measurement," "participating area," "production," "purchaser," "source record," "transporter," and "variance."
III. Requirements	43 CFR subpart 3173	
III.A. Storage and Sales Facilities – Seals	43 CFR 3173.2	
III.A.1.a.	None	The proposed rule would remove language in Order 3 referring to American Petroleum Institute (API) practices outlined in manual 12 R1 because the BLM anticipates referring to them in a new proposed oil measurement rule to replace Order 4 that the BLM anticipates issuing separately.

Order 3	Proposed Rule	Substantive Changes
III.A.1.b.	43 CFR 3173.2(a)	No significant change
III.A.1.c.	43 CFR 3173.2(b)	The proposed rule would require that appropriate valves be in an operable condition and accurately reflect whether the valve is open or closed.
III.A.1.d. Exclusion for waste oil.	43 CFR 3173.2(c)(3).	No significant change.
III.A.1.e. and f.	43 CFR 3173.2(c)	The proposed rule would make minor changes to clarify the exclusions to sealing appropriate valves.
III.A.1.g.	43 CFR 3173.2(a)	No significant change.
None	43 CFR 3173.2(d)	The proposed rule would add a provision that prohibits tampering with any appropriate valve (i.e., those valves that must be effectively sealed during the production or sales phase). Under the proposed rule, tampering with an appropriate valve could result in an assessment of civil penalties for knowingly or willfully preparing, maintaining, or submitting false, inaccurate, or misleading reports, records, or information under 30 U.S.C. 1719(d)(1) and existing 43 CFR 3163.2(f)(1), or knowingly or willfully removing, transporting, using, or diverting oil or gas from a lease site without valid legal authority under 30 U.S.C. 1719(d)(2) and existing 43 CFR 3163.2(f)(2), together with any other remedies provided by law.
None	43 CFR 3173.9	The proposed rule would require operators to maintain an inventory of the total observed volume in storage and would specify the records that an operator must maintain for each seal.

Order 3	Proposed Rule	Substantive Changes
III.A.2. Enforcement Provisions	43 CFR 3170.9	The proposed rule would remove all specific reference to: "Violation" (major or minor), "Corrective Action" (what needs to be done to resolve the violation), and "Normal Abatement Period" (how much time is allowed to correct the violation). The BLM will address these issues in an internal inspection and enforcement handbook, and, as appropriate, manuals or instructional memoranda (IMs). The new proposed section (43 CFR 3170.9) would provide that noncompliance with any requirements of part 3170 or any order issued thereunder may result in enforcement actions under 43 CFR subpart 3163 or any other remedy available under applicable law or regulation.
III.B. Lease Automatic Custody Transfer (LACT) Systems - Seals	43 CFR 3173.3	The proposed rule would expand the list of components that require seals.
III.C. Removal of Crude Oil from Storage Facilities by Means Other than Through a LACT.	43 CFR 3173.5	No significant change.
III.C.1.a. and b.	None	The proposed rule would remove run ticket requirements for quantity and quality because they would be covered in greater detail in the proposed new rule that is anticipated to replace Order 4.
III.C.1.c.	43 CFR 3173.5	No significant change.
III.D. Bypass Around Meters	43 CFR 3170.4	The prohibition against bypassing meters would remain; however, language would be added that would prohibit tampering with any measurement device, component of a

Order 3	Proposed Rule	Substantive Changes
		measurement device, or measurement process.
III.E. Theft or Mishandling of Oil	43 CFR 3173.8	The proposed rule would require purchasers and transporters, in addition to operators, to report incidents of apparent theft or production mishandling.
None	43 CFR 3173.6.	The rule proposes new standards for water-draining operations.
III.F Self-Inspection	None	This proposed rule would eliminate self-inspections.
None	43 CFR 3173.7	The rule proposes new standards for hot-oiling, clean-up, and completion operations.
III.G. Recordkeeping	43 CFR 3170.7	The proposed rule would require purchasers and transporters to comply with the same standards as operators for keeping, retaining, and submitting records associated with Federal and Indian leases. It would also clarify record retention requirements. Consistent with applicable statutory requirements, the proposed rule would require records generated for Federal leases to be maintained for at least 7 years, and records generated for Indian leases to be maintained for at least 6 years. These proposed changes would require the BLM to amend its regulations at 43 CFR 3162.4-1 by revising paragraph (d) and adding a new paragraph (e). The BLM is also proposing to amend 43 CFR 3163.2 and 43 CFR 3165.3 to include purchasers and transporters where appropriate.
III.H. Site Security Plan	None	This proposed rule would eliminate the need for a Site Security Plan. In its place, the rule would require additional recordkeeping and documentation relevant to site security in

Order 3	Proposed Rule	Substantive Changes
		connection with specific functions and operations. This proposed change would require the BLM to remove 43 CFR 3162.7-5(c) from its regulations. (Various provisions of the proposed rule, taken together, would result in removing all of 43 CFR 3162.7-5.)
III.I. Site Facility Diagrams	43 CFR 3173.11	This proposed rule would increase the level of detail contained in site facility diagrams currently required under 43 CFR 3162.7-5(d), by requiring information about the manufacturer, model, and serial number of each major component involved in royalty-free use of production in lease operations. It would also require lessees and operators to sign the site facility diagrams, certifying their accuracy. These proposed revisions would require the BLM to remove 43 CFR 3162.7-5(d) from its regulations.
None	43 CFR 3173.10	The proposed rule would add a new requirement that operators to submit a Form 3160-5 electronically when submitting for the record or requesting approval for: Site facility diagrams, FMP numbers, FMP amendments, off-lease measurement, or commingling and allocation approvals (CAAs).
None	43 CFR 3173.12	This proposed rule would require operators to obtain an FMP number for all measurement points. This requirement would be phased in according to the production levels of the properties the measurement point serves.
None	43 CFR 3173.13	This proposed rule would require operators to label FMPs with the FMP number, use the FMP number in required recordkeeping, and submit a Form 3160-5 to amend an FMP that details any modifications to the FMP within 20 business days after the change.

Order 3	Proposed Rule	Substantive Changes
None	43 CFR 3173.14 through 43 CFR 3173.21	This proposed rule would provide specific standards and requirements for surface and downhole commingling and allocation approvals of production from different leases, unit PAs, or communitized areas (CAs) that are consistent with the BLM's existing guidance as reflected in Instruction Memorandum (IM) 2013-152. Unlike the existing IM, the provisions of this proposed rule would establish standards for both new and existing commingling agreements.
None	43 CFR 3173.22 through 3173.28	This proposed rule would provide specific standards and requirements for approval of off-lease measurement of production from leases, unit PAs, CAs, or CAAs.
None	43 CFR 3173.29	This proposed rule would require the imposition of immediate assessments upon discovery of certain instances of noncompliance. For the first time, purchasers and transporters would be subject to immediate assessments if they: (1) Do not comply with requirements for keeping, retaining, and submitting accurate records associated with Federal and Indian leases; (2) Remove Federal seals without the Authorized Officer's (AO) or Authorized Representative's (AR) prior approval; or (3) Fail to report theft or mishandling of production to the BLM.
IV. Federal Seals	43 CFR 3173.4 and 3173.29	The proposed rule would increase immediate assessments from $250 to $1,000 for removing a Federal seal without the AO or AR's prior approval.
V. Variances from Minimum Standards	43 CFR 3170.6	The proposed rule contains language clarifying that the BLM has the right to rescind variances and modify conditions of approval due to changes in Federal law, technology, regulation, BLM policy, field operations, noncompliance, or other reasons.

Order 3	Proposed Rule	Substantive Changes
		With respect to variance requests themselves, the proposed rule would require that they be submitted separately from any plans or applications, such as for Master Development Plans, applications for permits to drill (APDs), or applications for rights-of-way. Finally, the proposed rule would strengthen and standardize the criteria the BLM uses for considering and granting variances.
None	43 CFR 3170.8	The proposed rule would specifically state that "BLM decisions, orders, assessments, or other actions under the regulations in this part are administratively appealable under the procedures prescribed in 43 CFR 3165.3(b) and 3165.4 and part 4."

BILLING CODE 4310–84–P

B. Section-by-Section Analysis

This proposed rule would be codified primarily in a new 43 CFR subpart 3173 within a new part 3170. The BLM is also concurrently preparing and anticipates issuing separate proposed rules to update and replace Onshore Oil and Gas Order 4 (oil measurement) and Onshore Oil and Gas Order 5 (gas measurement). Those proposed rules are anticipated to be codified at new 43 CFR subparts 3174 and 3175, respectively. As a result, the proposed rule also includes a new subpart 3170 that would contain definitions of certain terms and common provisions, *i.e.,* provisions prohibiting by-pass of and tampering with meters; procedures for obtaining variances from the requirements of a particular rule; requirements for recordkeeping, records retention, and submission; and administrative appeal procedures.

In addition, the proposed rule would also make several changes to various provisions in 43 CFR part 3160. Proposed changes to 43 CFR 3162.3–2, 3162.4–1, 3162.6, 3162.7–1, 3163.2, and 3163.5 are discussed in connection with the proposed new subpart 3170 or 3173 provision to which the particular change relates. Other changes to provisions in part 3160 are discussed at the end of this section-by-section analysis.

Subpart 3170—Onshore Oil and Gas Operations; General and Related Provisions

Section 3170.1 Authority

Proposed § 3170.1 would identify the various grants of rulemaking authority in the Federal and Indian mineral leasing statutes and related statutes that give the Secretary authority to promulgate this rule.

Section 3170.2 Scope

Proposed § 3170.2 would explain that the regulations in part 3170 would apply to all Federal onshore and Indian oil and gas leases (except those of the Osage Tribe), and, with certain exceptions, to agreements for oil and gas under the Indian Mineral Development Act and agreements under a Tribal Energy Resource Agreement entered into with the Secretary. In addition, State or private tracts committed to a federally approved unit or communitization agreement as defined by or established under 43 CFR subpart 3105 or 43 CFR part 3180 also would be subject to the rule.

Section 3170.3 Definitions and Acronyms

This proposed section would define terms and acronyms used in more than one of the subparts of part 3170 that the BLM has proposed here (subpart 3173) or anticipates proposing (subparts 3174 (oil measurement) and 3175 (gas measurement)).

Of these new terms, the proposed definition of ''facility measurement point (FMP)'' merits discussion here; other terms are discussed below. Under the proposed rule, an FMP is a ''BLM-approved point where oil or gas produced from a Federal or Indian lease, unit, or CA is measured and the measurement affects the calculation of the volume or quality of production on which royalty is owed.'' As explained below, the proposed rule sets forth a process for an operator of a new or an existing facility to apply for approval of an FMP and issuance of an FMP number in proposed § 3173.12. Because proposed § 3173.12 would require operators of existing facilities to apply for an FMP in stages over a 27-month period, it will require 3 years from the effective date of the final rule for the BLM to receive, evaluate, and act on FMP applications for existing facilities. Therefore, for purposes of compliance with other provisions of this proposed rule, during this interim period, the proposed definition of an FMP makes clear that an FMP ''also includes a meter or measurement facility used in the determination of the volume or quality of royalty-bearing oil or gas produced before BLM approval of an FMP under § 3173.12 of this part.''

While meters used in determining the volume or quality of production include allocation meters,[4] the proposed

[4] An allocation meter is a meter that measures production from a particular lease, unit, unit PA, or CA that is commingled with production from

Continued

definition of FMP does not include allocation facilities that are part of a commingling and allocation approval issued pursuant to proposed § 3173.15 below or that were approved after July 9, 2013. Since July 9, 2013, under BLM Instruction Memorandum (IM) 2013–152, issued on that date, BLM authorized officers may approve only those commingling requests that: (1) Have no royalty impacts (*e.g.,* commingled properties have the same mineral ownership, royalty rate, and revenue distribution); (2) Involve ''low-volume properties'' [5]; or (3) Involve circumstances where overriding considerations of continued production outweigh the potential inaccuracies of the allocation method. As explained below, proposed § 3173.15 carries forward the requirements of IM 2013–152 related to the approval of commingling requests. For commingling requests that meet these requirements, it is not necessary for the allocation facilities to meet the applicable oil measurement or gas measurement standard. Thus, it is not necessaryfor these facilities (*i.e.,* those approved after July 9, 2013 or pursuant to proposed 3173.15) to be regarded as FMPs. Allocation meters or facilities approved before July 9, 2013, must meet the standards of the applicable current Order and would have to meet the standards of the proposed rules according to the prescribed timeframes for compliance; therefore, they will continue to be FMPs.

Section 3170.4 Prohibitions Against By-Pass and Tampering

Proposed § 3170.4 would strengthen the existing prohibition against meter by-passes in section III.D. of Order 3 by adding language that would prohibit tampering with any measurement device, component of a measurement device, or measurement process. Tampering would include any adjustment or alteration to the meter or measurement device or measurement process that could introduce bias into the measurement or affect the BLM's ability to independently verify volumes or qualities reported. Examples of tampering include installing an orifice plate in a gas meter with the bevel upstream, adjusting a transducer to read higher or lower than a certified test device, entering incorrect information into the configuration log of an electronic gas measurement system, submitting derived integral values on a volume statement in lieu of raw data, or making analogous adjustments or alterations to an oil measurement system.

Section 3170.5 Industry Standards Incorporated by Reference

§ 3170.5 would be reserved for potential future incorporation by reference of standards that would apply to more than one of the subparts of part 3170.

Section 3170.6 Variances

Proposed § 3170.6 would make the BLM's existing process and regulations for granting variances from the minimum standards of this rule more clear and uniform.

Proposed § 3170.6(a)(1) through (3) would prescribe the requirements for submitting a request for a variance from a requirement in the regulations in part 3170. Importantly, paragraph (a)(2) would require that a request for a variance be submitted as a separate document from any plans or applications. A request for a variance ''buried'' in another document, such as a request submitted as part of a master development plan, application for permit to drill, right-of-way application, or other applications for approval rather than submitted separately would not be considered. Approval of a plan or application that contains a request for a variance would not constitute approval of the variance.

Proposed § 3170.6(a)(4) would strengthen and standardize the criteria the BLM uses for granting variances. Under Order 3, the AO is required to make only one determination—whether or not the variance request meets or exceeds the objectives of the applicable minimum standard. Under this proposed paragraph, the AO still would have to make that determination before granting a variance. Additionally, the proposed change would require the AO to make two more determinations before granting a variance—that issuing a variance would not adversely affect royalty income or production accountability and is consistent with maximum ultimate economic recovery.

Proposed § 3170.6(a)(5) and (6) would specify that granting or denying a variance is entirely within the BLM's discretion, and that a variance from a requirement in a regulation does not constitute a variance to any other regulations, including Onshore Oil and Gas Orders.

Proposed § 3170.6(b) would make clear that the BLM has the right to rescind a variance or modify any condition of approval of a variance due to changes in Federal law, technology, regulation, BLM policy, field operations, noncompliance, or other reasons.

Section 3170.7 Required Recordkeeping, Records Retention and Records Submission

Proposed § 3170.7 would update BLM regulations to reflect the records retention requirement for Federal oil and gas leases that Congress established in 1996 amendments to the Federal Oil and Gas Royalty Management Act (FOGRMA).

Paragraphs (a) and (b) would establish the coverage of the records-retention requirement relative to both persons covered and the time period in which records are generated. Purchasers and transporters would be held to the same minimum standards as operators for recordkeeping, records retention, and records submission—*i.e.*, to maintain all records that are relevant to determining the quality, quantity, disposition, and verification of production from Federal and Indian leases. Section 103(a) of FOGRMA, 30 U.S.C. 1713(a), requires persons involved in transporting and purchasing oil or gas through the point of first sale or the point of royalty computation, whichever is later (along with persons involved in producing or selling), to ''establish and maintain any records, make any reports, and provide any information that the Secretary may, by rule, reasonably require.'' Order 3, however, does not expressly require transporters and purchasers to establish and maintain any records (except for the requirement in section III.C.2.c. that truck drivers transporting production have information about the load in their possession (see 30 U.S.C. 1712(c)(1)).

Under proposed § 3170.7(c), records pertaining to Federal leases, units, or CAs would have to be maintained for at least 7 years, subject to applicable statutory requirements for further retention under certain circumstances (see 30 U.S.C. 1724(f)), as required under the 1996 amendments to FOGRMA. Under proposed § 3170.7(d), records pertaining to Indian leases, units, or CAs would have to be maintained for at least 6 years, subject to applicable statutory requirements for

other leases, units, unit PAs, or CAs before the point of royalty measurement, *i.e.,* the meter that measures the production for purposes of determining royalty. The production measured at the point of royalty measurement is then allocated back to the respective contributing properties on the basis of each allocation meter's proportion of the total production measured by all allocation meters.

[5] As explained below, ''low-volume properties'' include leases, unit PAs, or CAs that do not produce sufficient volumes for the operator to realize from continued production a sufficient rate of return on the investment required to achieve non-commingled measurement, such that a prudent operator would opt to plug a well or shut in the lease, unit PA, or CA if the commingling request were not approved. In these situations, the economic considerations of continued production outweigh the inaccuracies of the allocation method.

further retention under certain circumstances (see 30 U.S.C. 1713(b)). The records-retention requirement on Indian leases would be unchanged because the 1996 amendments, by their express terms, applied only to Federal leases and not to Indian leases.

Proposed § 3170.7(e) would address the relationship of these two requirements for units and CAs that contain both Federal and Indian leases.

Proposed § 3170.7(f) would require the record holders to maintain an audit trail.

Under proposed § 3170.7(g) and (h), purchasers and transporters also would be required to place the new FMP numbers on all records associated with Federal and Indian leases, units, or CAs, after the BLM has assigned them, and to provide these records to the BLM upon request.

These changes are proposed to ensure that all records—whether they are created by lessees, operators, transporters, or purchasers—are clear, accurate, and readily available to the BLM. Under existing requirements, if BLM staff, in the course of auditing and verifying production, needs to review transporter or purchaser records, staff typically must ask the operator or lessee to provide the documents. Many transporters and purchasers have their own internal systems for identifying sales measurement points, with which operators may not be familiar. Sometimes operators do not maintain their own records properly, preferring instead to rely on the transporters' and purchasers' records. This has the potential to create long delays when transporters and purchasers fail to respond quickly to operators' document requests. Sometimes operators go out of business or are acquired by other companies and their records are destroyed, making it impossible for BLM staff to verify production. The BLM believes that it is important for everyone involved in the production and sale of oil and gas produced from Federal and Indian leases to be responsible for maintaining and providing their own records.

If a purchaser or transporter fails to maintain and submit records as required under this proposed rule, the purchaser or transporter would be subject to civil penalties under Section 109 of FOGRMA, 30 U.S.C. 1719. Consequently, the BLM is proposing to amend its civil penalty rules at 43 CFR 3163.2 to designate the first sentence of paragraph (a) of the existing § 3163.2 as paragraph (a)(1), and to add a new paragraph (a)(2). The second sentence of the existing paragraph (a) (pertaining to the maximum amount of the penalty if the violation is not corrected within 20 days of the date of notice) would be redesignated as paragraph (b)(1). The existing paragraph (b) (pertaining to the maximum amount of the penalty if the violation is not corrected within 40 days of the date of notice) would be redesignated as paragraph (b)(2). References to purchasers and transporters would be added to the penalty amount provisions in paragraph (b).

Similarly, the BLM proposes to add to the notice requirements of existing regulations at 43 CFR 3165.3 a provision regarding notice to a purchaser or transporter (who is not an operating rights owner or operator) of failure to comply with records maintenance or production requirements. The BLM proposes to divide the several sentences of the existing paragraph (a) into numbered subparagraphs. After the first sentence, which would be redesignated as paragraph (a)(1) (and rephrased into active voice), the BLM proposes to add a new paragraph (a)(2). Enforcement of recordkeeping violations taken against an entity other than the lessee or operator under these proposed provisions also would be addressed in the proposed inspection and enforcement handbook being developed. These enforcement actions would include the issuance of Incidents of Noncompliance (INCs) and the assessment of civil penalties.

In 43 CFR 3162.4–1, the BLM is proposing to revise paragraph (a) to reflect that the new recordkeeping requirements also would apply to ''source records'' that are relevant to ''determining and verifying the quality, quantity, and disposition of production from or allocable to Federal or Indian leases.'' Paragraph (d) would be revised to establish the new records retention period, and would mirror for part 3160 the provisions in paragraphs (c) through (e) of proposed § 3170.7. A new paragraph (e) would be added that would list the ''record holders'' who would be subject to the new recordkeeping requirements. Additionally, the BLM is proposing to remove paragraph (f) from 43 CFR 3162.7–1, Disposition of production, which refers to the 6-year retention period, since the initial statutory retention period is now 7 years, as would be prescribed in the proposed amendment to § 3162.4–1 and in proposed § 3170.7.

Section 3170.8 Appeal Procedures

Proposed § 3170.8 would provide that BLM decisions, orders, assessments, or other actions under the proposed part 3170 are administratively appealable (first to the BLM State Director and then to the Interior Board of Land Appeals) under 43 CFR 3165.3(b), 3165.4, and part 4.

Section 3170.9 Enforcement

Proposed § 3170.9 would provide that noncompliance with any requirements of part 3170 or any order issued thereunder may result in enforcement actions under 43 CFR subpart 3163 or any other remedy available under applicable law or regulation.

Subpart 3173—Requirements for Site Security and Production Handling and Related Provisions

Section 3173.1 Definitions and Acronyms

Section 3173.1 of the proposed rule would define the terms and acronyms that are unique to proposed subpart 3173. The section would adopt the same definitions of some of the terms defined in Order 3, with some minor revisions to either simplify or clarify those definitions. Several of the terms defined in Order 3 would be defined in proposed § 3170.3.

The proposed rule adds a definition of ''low-volume property,'' which is intended to define one category of circumstances under which commingled measurement of production from a lease, unit PA, or CA may be justified, even though it would not meet the conditions of proposed § 3173.14(a)(1) regarding mineral interest ownership of commingled production. The proposed rule also provides a definition for ''land description.''

Section 3173.2 Storage and Sales Facilities—Seals

Paragraphs (a) and (b) of proposed § 3173.2 would require any lines entering or leaving any oil storage tank or storage facility to have valves capable of being effectively sealed. These paragraphs would prescribe which valves must be effectively sealed during which operational phases (production, sales, water draining, or hot oiling). Paragraph (c) identifies the specific types of valves that are not considered ''appropriate valves'' (*i.e.*, valves that must be sealed during the production phase or the sales phase) for purposes of this requirement. The requirements of paragraphs (a) through (c) would largely correspond to the existing requirements in Order 3, with some refinements.

Paragraph (d) would prohibit tampering with an ''appropriate valve,'' and would provide that tampering may result in assessment of a civil penalty for knowingly or willfully preparing, maintaining, or submitting false, inaccurate, or misleading information under Section 109(d)(1) of FOGRMA, 30 U.S.C. 1719(d)(1), and 43 CFR 3163.2(f)(1), or for knowingly or willfully taking, removing, or diverting oil or gas from a lease without valid legal authority under Section 109(d)(2) of FOGRMA, 30 U.S.C. 1719(d)(2), and 43 CFR 3163.2(f)(2).

Section 3173.3 Oil Measurement System Components—Seals

Proposed § 3173.3 would identify a nonexclusive list of the components used in LACT meters or Coriolis oil measurement systems that must be effectively sealed to indicate tampering.

Section 3173.4 Federal Seals

Paragraph (a) of proposed § 3173.4 would codify the authority in section IV of Order 3 for the BLM to place a Federal seal on any appropriate valve, sealing device, or oil meter system component that does not comply with the requirements of proposed § 3713.2 or § 3173.3. Paragraph (b) clarifies that the placement of a Federal seal does not relieve the operator of the requirement to comply with § 3713.2 or § 3173.3. Paragraph (c) would prohibit the removal of a Federal seal without BLM approval.

Section 3173.5 Removing Production From Tanks for Sale and Transportation by Truck

Consistent with the existing requirements of section III.C.1.c. of Order 3, paragraphs (a) and (b) of proposed § 3173.5 would identify who must possess the information that would be required by § 3174.12 of this part (which the BLM intends to propose separately) when production is removed from storage tanks for transportation by truck. Paragraph (c) would make the purchaser or transporter responsible for the entire contents of a tank until it is resealed.

Section 3173.6 Water-Draining Operations

Proposed § 3173.6 would require that specific information be recorded when water is drained from tanks that hold hydrocarbons. Under existing regulations, the operator is required to record only the date, seal number removed, new seal number installed, and the reason for draining. The operator currently is not required to record the volume of hydrocarbons that are in the tank before and after water is drained. This could lead to hydrocarbons being drained with the water and removed without proper measurement and accounting, and without royalties being paid. This proposed rule would require operators to record the volume of hydrocarbons that are in the tank both before and after water is drained.

Section 3173.7 Hot Oiling, Clean-up, and Completion Operations

Proposed § 3173.7 would require that specific information be recorded when hydrocarbons are removed from storage and used on the lease, unit, or CA for hot oiling, clean-up, and completion operations, including the volume of hydrocarbons removed from storage and expected to be returned to storage.

Under existing requirements, the operator is required to record only the date, seal number removed, new seal number installed, and reason for removing oil for hot-oiling, clean-up, or completion operations. The operator currently is not required to record the volume of hydrocarbons that is removed from storage and is expected to be returned. This could lead to the volume of produced hydrocarbons being counted twice; first when it was initially produced then later after it is returned to storage.

Section 3173.8 Report of Theft or Mishandling of Production

Paragraph (a) of proposed § 3173.8 would require transporters and purchasers, along with operators, to report incidents of theft and mishandling of production to the BLM whenever they or their employees discover it. Such reports may be made orally or through a ''written incident report.'' In the proposed rule any oral reports must be followed by a written report within 10 business days. This reporting requirement is important because sometimes transporters and purchasers are the first ones to discover theft and mishandling of production or to recognize suspicious activity. Proposed paragraph (b) would specify the information that must be included in a written incident report.

Section 3173.9 Required Recordkeeping for Inventory and Seal Records

Paragraph (a) of proposed § 3173.9 would require operators to measure and record the total observed volume in storage at the end of each calendar month. Proposed paragraph (b) would specify the records that an operator must maintain for each seal.

Section 3173.10 Form 3160–5, Sundry Notices and Reports on Wells

Proposed § 3173.10 would require all parties involved in Federal and Indian oil and gas production to submit a Form 3160–5 electronically to the BLM for their site facility diagrams, requests for FMP designations, requests for CAAs, requests for off-lease measurement, and any amendments to the diagrams or requests. This would, in the long run, increase efficiencies throughout BLM field offices for both the BLM and operators by making the diagrams easier to track and more accessible to inspectors in the field. This new requirement would also make it easier for the BLM to keep track of equipment and operational changes at a given facility and ensure that the parties are complying with Federal laws, rules, and regulations, while at the same time reducing the need for operators to respond to requests for information and making what information is needed easier to submit. Operators who are small businesses that do not have access to the Internet would be exempt from this requirement. BLM notes that the Office of Natural Resources Revenue (ONRR) already requires operators producing oil and gas from onshore Federal and Indian leases onshore to file their monthly Oil and Gas Operations Reports (OGORs) electronically, and thus this requirement is expected to be relatively easy to implement.

This proposed rule would increase the number of companies and company representatives using the e-filing capabilities of the BLM's Automated Fluid Minerals Support System (AFMSS). Currently, filing parties inconsistently use this e-filing system because it is not required. Preliminary estimates are that the BLM would see a tenfold increase in e-filings, from 500 to 5,000.

Section 3173.11 Site Facility Diagrams

Paragraphs (a) through (c) of proposed § 3171.11 would set forth the requirements for the content and format of site facility diagrams. These requirements are important because inspection and verification of company-submitted site facility diagrams is one of the BLM's primary mechanisms for ensuring operators are complying with measurement regulations and policy. The requirements in the proposed section would update and replace Order 3's Site Security Plan. Currently, the BLM requires operators to provide generalized diagrams showing each piece of equipment being used at a facility, including connections between each piece of equipment, valve positions on production storage tanks (sales valves, drain valves, equalizers, and overflow valves), and their relative positions to each other. Tank valve positions (open or closed) are dependent upon whether the tank is in the production, sales, or drain phase of operations.

Under proposed § 3173.11, new site facility diagrams would, in addition to the drawings, include important and specific information such as the FMP number; land description; Federal or Indian lease, unit, or CA number; site equipment with any corresponding serial identification numbers and manufacturer's consumption ratings; a reasonable royalty-free use determination; and a signature block. This more detailed information would provide the BLM with a more useful tool to achieve improved production accountability.

In addition to the requirements above, proposed § 3173.11(c) would also allow the BLM, for the first time, to verify royalty-free-use volumes reported by the operator on OGORs. Under the applicable statutes and lease terms, the portion of the oil and gas produced that is used to power operations on the lease, CA, or unit, such as using natural gas to power drilling and pumping equipment, is not royalty-bearing. This use of oil and gas is referred to as ''royalty-free use.''

Currently, operators provide estimates of their royalty-free-use volumes to ONRR each month, but the BLM lacks an ability to verify those estimates. Proposed § 3173.1(c)(11) would require operators to report to the BLM on their site facility diagrams what equipment is being used on the lease and how they determine the volume of oil or gas used royalty free by that equipment (based on equipment manufacturers' fuel-use ratings), if the volume is not measured. This new requirement would provide greater consistency in how the volume of oil and gas used royalty free is determined and enable the BLM to more easily verify those volumes. This requirement enhances production accountability and responds to key recommendations made by the GAO (Report 10–313). Requiring this information to be reported on the more detailed facility diagram would ultimately save time because it would eliminate the need for the BLM to obtain the information in connection with a production accountability review.

Proposed 3173.11(d) would require the operator of an existing facility (*i.e.,* one in service before the effective date of the final rule) to submit a new site facility diagram that complies with the requirements of this proposed section within 30 days of obtaining an FMP number under proposed § 3173.12 below. Under proposed § 3173.11(e), operators of existing facilities that do not require an FMP number, but for which a diagram would be required under the proposed rule (for example, facilities that dispose of produced water), would have 60 days after the effective date of the final rule to submit compliant diagrams.

Section 3173.12 Applying for a Facility Measurement Point

Section 3173.12 of the proposed rule would, for the first time, establish a formal nationwide process for designating and approving the point at which oil or gas must be measured for the purpose of determining royalty. Currently, the BLM does not have a formal, written process for designating measurement points on the leases it manages. (Some Field Offices have their own internal policies for establishing these points.) This lack of uniform guidance across Field Offices has resulted in instances of confusion about the location of royalty measurement points, which interferes with the production verification process. This proposed section would require operators to obtain BLM approval of FMPs for all measurement points used to determine royalties. The BLM would approve an FMP that meets the requirements of this proposed rule (the most important elements of which would be identification of the wells associated with the FMP, the measurement method, and component information). The BLM would assign each FMP a unique identifying number, which the operator, transporter, or purchaser would then use when reporting production results to ONRR.

The Bureau of Safety and Environmental Enforcement (BSEE) already assigns a similar FMP number for offshore oil and gas leases, which the operator, transporter, or purchaser must then use when reporting production results to ONRR. The changes in this proposed rule would make BLM practices consistent with existing BSEE and ONRR practices, for production reporting without having to create an entirely new numbering system.

Paragraph (a)(1) of this proposed section would provide that the FMP(s) for a lease, unit PA, or CA would have to be located within the boundaries of the lease, unit, or CA from which the oil or gas is produced, and must measure only production from that lease, unit PA, or CA, unless otherwise approved. Proposed paragraph (a)(2) would provide that off-lease measurement, commingling, or allocation of production requires prior approval under 43 CFR 3162.7–2 and 3162.7–3 and proposed §§ 3173.15, 3173.16, 3173.24, and 3173.25 of this proposed rule.

Proposed paragraph (b) would provide that the BLM will not approve a meter at the tailgate of a gas processing plant located off the lease, unit, or CA as an FMP. This continues existing uniform practice.

Proposed paragraph (c) would provide that the operator must apply for approval of separate FMP numbers for an FMP that measures oil produced from a particular lease, unit PA, CA, or CAA and an FMP that measures gas produced from the same lease, unit PA, CA, or CAA, even if the measurement equipment or facilities are at the same location. In the numbering system for FMPs in use by both ONRR and BSEE (for offshore leases), the first pair of numbers in the FMP number specifies whether the FMP measures oil or measures gas. The BLM would not approve the same FMP number for a facility that measures oil and a facility that measures gas.

Proposed paragraph (d) would require the operator to obtain approval for the FMP for a new measurement facility (*i.e.*, one coming into service after the effective date of the final rule) before any production leaves the facility.

Proposed paragraph (e) would provide that for existing production measurement facilities, an operator would have 9 months, 18 months or 27 months from the effective date of the final rule within which to apply for BLM approval of its FMP, depending on the production level of the lease, unit PA, CA, or CAA that the measurement facility serves. The prescribed application deadline would apply to both oil and gas measurement facilities measuring production from that lease, unit PA, CA, or CAA. The BLM proposes to require applications for FMPs for existing measurement facilities that serve operations with the highest production volumes first. For stand-alone leases, unit PAs, CAs, and CAAs that produce 6,000 Mcf or more of gas per month, or 40 barrels or more of oil per month, the BLM is proposing that the operator would have to apply for approval of the FMP(s) within 9 months after the effective date of the final rule. For stand-alone leases, unit PAs, CAs, or CAAs that produce 3,000 Mcf or more but less than 6,000 Mcf of gas per month, or 20 barrels or more but less than 40 barrels of oil per month, the operator would have to apply for approval of the FMP(s) within 18 months after the effective date of the final rule. For stand-alone leases, unit PAs, CAs, or CAAs that produce less than 3,000 Mcf of gas per month and less than 20 barrels of oil per month, the operator would have to apply for approval of the FMP(s) within 27 months after the effective date of the final rule. These thresholds would be calculated as an average over the 12 months preceding the effective date of the final rule or the period the lease, unit, CA, or CAA has been in production, whichever is shorter.

If the operator applies for an FMP approval by the required date, the operator could continue to use the existing measurement points until the BLM acts on the application. If the operator fails to apply for an FMP approval by the required date, the operator would be subject to an incident of noncompliance and assessment of civil penalty under 43 CFR subpart 3163, together with any other remedy available under applicable law or regulation.

The BLM specifically solicits comments regarding its proposed threshold volumes and required periods for submitting applications for FMP approvals. Should the BLM consider alternative application periods or volume thresholds? If so, what periods of time would be appropriate for what production volume levels and on what basis? Based on comments received and further review, the BLM may prescribe different application periods in the final rule.

Proposed paragraph (f) would prescribe the information that a request for FMP approval would have to include. Proposed paragraph (g) would allow concurrent requests for FMP approval and requests for approval of off-lease measurement or commingling. Under proposed paragraph (h), the BLM will assign a number to the FMP if it approves a request.

This proposed section would implement one of the GAO's recommendations that the Interior Department consistently track where and how oil and gas are measured, including information about meter location, identification number, and owner. Operators would be required to obtain approval from the BLM for the location of the FMP at which oil or gas is measured. The BLM would then tie the FMP numbers to other appropriate approvals, such as site facility diagrams, off- lease measurement, commingling, and royalty-free use (if volumes used royalty free are measured).

Operators, purchasers, and transporters would be required to label each FMP with the assigned number, to use the FMP number on related documents or records, and to use the number for production reporting to ONRR. Related documents or records would include, but would not be limited to, calibration reports, gas analysis, sales statements, manifests, seal records, and approvals.

The BLM estimates there are approximately 120,000 existing oil and gas facilities associated with Federal and Indian leases. Many facilities would have one FMP for oil and one FMP for gas, resulting in approximately 220,000 FMPs. We anticipate that designating FMPs for almost all operators would not require any physical changes to existing facilities other than the signage requirements discussed below. The only exception would be in some instances of commingling or off-lease measurement, which are discussed below in connection with proposed §§ 3173.14 through 3173.21 (commingling) and proposed §§ 3173.22 through 3173.28 (off-lease measurement).

In connection with its creation of a new FMP system, the BLM is proposing to revise its existing well and facility identification provisions at 43 CFR 3162.6(b) and (c) to include a signage requirement for wells on Federal and Indian lands and facilities at which Federal or Indian oil or gas is measured or processed. Additional proposed revisions to § 3162.6 would:

(1) Make the surveyed-location language in paragraphs (b) and (c) consistent, including a new reference to longitude and latitude; and (2) Remove a sentence in paragraph (b) that provided a grace period for well signs that were in existence on the effective date of the earlier rulemaking

(2) in which that section was promulgated.

Section 3173.13 Requirements for Approved Facility Measurement Points

Proposed § 3173.13 sets forth the requirements that would be applicable to all approved FMPs. Proposed paragraphs (a) and (b) would require operators to stamp or stencil FMP numbers on a fixed plate on specified measurement equipment within 30 days after BLM approval of the FMP, and maintain that stamp/stencil in a legible condition. Under proposed paragraph (c), the operator would be required to use any assigned FMP numbers in reporting and recordkeeping on the first day of the month after an FMP is assigned. Finally, proposed paragraph (d) would require an operator to file a Sundry Notice in connection with any changes or modifications to an approved FMP.

Sections 3173.14 through 3173.21 Commingling and Allocation Approvals

As explained below, §§ 3173.14 through 3173.21 of the proposed rule would restrict the instances in which the BLM would approve commingling and would establish standards that an operator would need to meet to obtain an approval. Current regulations (43 CFR 3162.7–2 and 3162.7–3) require BLM approval before commingling production from a Federal or Indian lease with production from other sources; however, there are no regulations addressing how or under what circumstance commingling should be approved. The requirements proposed in these sections are consistent with and would codify the policy outlined by the BLM in 2013 with respect to commingling approvals in IM 2013–152, ''Reviewing Requests for Surface and Downhole Commingling of Oil and Gas Produced from Federal and Indian Leases.'' The principal substantive difference between the provisions proposed below and the BLM's existing IM is that the proposed rule would establish a procedure for the BLM to review existing CAAs when the operator applies for approval of an FMP. In contrast, the IM focuses solely on new commingling arrangements.

Section 3173.14 Conditions for Commingling and Allocation Approval (Surface and Downhole)

Commingling, for the purpose of this proposed rule, is the combining of production from multiple sources (leases, unit PAs, CAs, or non-Federal or non-Indian properties) before measurement for royalty purposes. For example, an operator may have multiple leases or properties in the same vicinity with a single sales point for all the production from those leases or properties. While the volume measured at the sales point is used to determine royalty due, an allocation method is employed to determine what percentage of that volume is attributable to each lease or property. The allocation percentage is typically determined by dividing the volume or rate of production from a lease, unit PA, or CA by the total volume or rate from all sources. Allocation by volume is determined using allocation meters; allocation by rate is determined through periodic well testing.

Industry often uses the term ''commingling'' to mean any combining of production before measurement. The industry informal usage could include the combining of production from more than one well on a single lease, unit PA, or CA, and the combining of downhole production from multiple formations, even if they are within the same lease, unit PA, or CA and have the same ownership. For the purpose of this proposed rule, none of these examples would be considered commingling and this proposed rule would not affect any of them.

The BLM generally uses the term ''downhole commingling'' to refer to combining production between intervals within a wellbore (see 43 CFR 3162.3–2). Downhole commingling requires BLM approval under that section as a subsequent well operation; however, unless the approval under § 3162.3–2 includes combining production from different leases, unit PAs, or CAs, or production from different geologic formations within the same lease, unit PA, or CA that have different ownership, an operator would not need a separate approval for downhole commingling with respect to production measurement under this proposed rule.

Operators apply for commingling approval for several reasons, including: (1) It can simplify accounting to have the sales point be the same as the point of royalty measurement; (2) Lower operating costs can be achieved by reducing the number of meters required (when using well testing as the allocation method); and (3) Lower operating costs can also be achieved by eliminating the need for separate plumbing and surface equipment (pipelines, separators, dehydrators, compressors, tanks, etc.).

Commingling can also have some advantages for the BLM: (1) More accurate measurement can sometimes be achieved from a meter measuring combined flows due to better-conditioned, more consistent, and higher flow rates than from a single low-volume meter measuring erratic flow with a high potential for multiple phases of fluid; (2) The environmental footprint can be reduced by reducing the need for duplicate surface equipment; and (3) Production accounting can be simplified by reducing the number of meters to inspect and verify.

However, these advantages may be realized without potential negative effects on royalty only if the leases, unit PAs, and CAs being commingled are all 100 percent Federal or are leased 100 percent by the same Indian tribe and are all at the same fixed royalty rate. In that situation, the allocation method is irrelevant because the total amount of Federal or Indian royalty due will be the same regardless of how it is allocated to the individual leases, unit PAs, or CAs included in the commingling approval. Consequently, the BLM can ensure accurate measurement and proper reporting by inspecting and verifying only the sales/royalty meter(s).

On the other hand, if the properties being commingled are not 100 percent Federal or leased 100 percent by the same Indian tribe, or have different royalty rates, then the method of allocation will affect the royalty due. The same is true of Indian allotted leases in virtually all circumstances. The ownership of Indian allotted leases has descended from the original allottees through several generations to numerous current owners, each owning a small percentage of the royalty interest. A situation in which two allotted leases have the same lessor ownership (*i.e.,* the royalty interests are owned by the same individual allottees in identical proportions) would be extremely rare. Consequently, the method of allocation would affect the royalty due in essentially all circumstances involving allotted leases.

Because the allocation method in these instances has royalty implications, the BLM would have to be able to ensure accurate measurement and proper reporting of all meters or facilities involved in the allocation process. This includes the sales meters and all allocation meters or facilities. Approval of commingling in these situations would greatly increase the workload for the BLM because there could be dozens of allocation meters involved, all of which would be subject to inspection and verification. In addition, the allocation methods are often complex and prone to errors and adjustments which increase the risk of mis-measurement and mis-reporting if commingling were to be permitted.

Commingling production from Federal or Indian leases with production from State or private properties that are not part of a unit or CA introduces additional complexities. Unlike a unit or CA, where the BLM has explicit authority over measurement points on non-Federal or non-Indian properties included in the agreement, the BLM has no authority over measurement points on non-Federal or non-Indian lands whose production would be commingled with production from Federal or Indian leases where no unit or CA exists. Therefore, it would be impossible, as a practical matter, for the BLM to verify that the allocation percentages are correct, regardless of how they were determined.

Not only does commingling in situations where there are potential impacts to royalty make verification more difficult, it also increases the uncertainty of volume and quality measurements of oil and gas removed or sold from the lease, unit PA, or CA. When royalty is based on allocated volumes (whether determined by allocation meter or well testing), it is virtually impossible to achieve or verify the required uncertainty level for the allocated volumes. For example, when allocation is done by well testing,[6] the royalty-bearing volume of oil and gas is calculated by multiplying the oil and gas measured at the central point of royalty measurement by the allocation percentage obtained through well testing. The uncertainty of the measurement of the allocated volume is the combined uncertainty of the volume measurement at the central point of royalty measurement and the uncertainty inherent in the allocation percentage. The BLM currently has no standards for well testing and, even if it did, the fact that the production remains unmeasured for 29 out of 30 days (in the case of monthly well testing) results in an indeterminate level of uncertainty. For allocation by allocation meter, the uncertainty of the allocation percentage is the cumulative uncertainty of every allocation meter and the central point of royalty measurement.

Based on these considerations, and to ensure that the BLM can verify the measurements on which royalty is based, paragraph (a) of proposed § 3173.14 would generally prohibit the commingling of production from Federal or Indian leases, unit PAs, or CAs, unless all the properties proposed for commingling were 100 percent Federal or leased 100 percent by the same Indian tribe, and at the same fixed royalty rate.

Proposed paragraph (b) sets forth the proposed rule's only two exceptions that would allow commingling outside these circumstances (in other words, where commingling would be allowed if, for example, there is a combination of Federal and non-Federal ownership, or Indian allotted leases are involved, etc.). First, under proposed paragraph (b)(1), the BLM would consider approving commingling for certain low-volume properties. These would be leases, unit PAs, or CAs that do not produce sufficient volumes for the operator to realize, from continued production, a sufficient rate of return on the investment required to achieve non-commingled measurement of volumes produced from the lease, unit PA, or CA, such that a prudent operator would opt to plug a well or shut-in the lease, unit PA, or CA if the commingling request were not approved. In the absence of information demonstrating a different rate, a rate of return less than 10 percent (calculated before Federal,

[6] Well testing involves periodic testing of the production rate for a well, lease, unit, or CA—for example, for 1 or 2 days of each production month. Commingled volumes are then allocated back to the contributing properties according to the relative production rates measured for each of the contributing properties.

State, and local taxes) will be regarded as not sufficient to achieve non-commingled measurement. The BLM may accept a different rate of return if the operator provides sufficient justification. The BLM is seeking comments on the suitability of this rate of return for defining a low-volume property. The BLM would also define a low-volume property as a lease, unit PA, or CA where the cost required to achieve non-commingled production would exceed the net present value of the royalty projected from the lease, unit PA, or CA proposed for commingling over the equipment life.

Second, under proposed § 3173.14(b)(2), the BLM is also proposing to consider approving commingling where overriding considerations indicate that the BLM should approve a commingling application notwithstanding potential negative royalty impacts from commingled measurement. Such situations could include topographic or other environmental considerations that make non-commingled measurement physically impractical or undesirable, in view of where additional measurement and related equipment necessary to achieve non-commingled measurement would have to be located. Proposed paragraph (b)(3) would require the AO to determine whether approving the commingling would be in the public interest, taking into account relevant environmental considerations and production verifiability and accountability.

In connection with these proposed changes, the BLM is proposing to revise 43 CFR 3162.3–2 to differentiate between the combining of production between intervals within a wellbore on the same lease, unit PA, or CA (downhole commingling)—which does not affect production accountability—and the combining of production from different leases, unit PAs or CAs—which does. Proposed revisions to 43 CFR 3162.3–2(a) would make it clear that operators who wish to combine production between intervals within a wellbore on the same lease, unit PA, or CA could continue to seek approval for this activity under that section, and would not need a separate approval under this proposed rule.

Section 3173.15 Applying for a Commingling and Allocation Approval

Section 3173.15 of the proposed rule would establish the requirements operators must follow when requesting a CAA and the information they would need to include.

Section 3173.16 Existing Commingling and Allocation Approvals

Under proposed § 3173.16, the BLM would be required to review an existing CAA upon receipt of an operator's request for assignment of an FMP number to a facility associated with the CAA. Proposed paragraph (a) would require the BLM to review the existing CAA for consistency with the minimum standards and requirements under proposed § 3173.14. The AO would notify the operator in writing of any inconsistencies or deficiencies.

Under proposed paragraph (b), the operator would have 20 business days to correct any inconsistencies or deficiencies. Under proposed paragraph (c), the BLM could impose new or amended conditions of approval (COAs) on an existing CAA to make it compliant with the requirements of this proposed rule. If the operator fails to correct the deficiencies identified by the BLM, proposed paragraph (d) would allow the AO to terminate the CAA. Under proposed paragraph (e), if the BLM approved a new CAA to replace an existing agreement, it would be effective on the first day of the month following its approval.

The BLM estimates that there are currently approximately 2,600 surface commingling approvals nationally, approximately 300 of which involve commingling production from Federal or Indian leases with production from State or private properties. It is also estimated that there are another approximately 8,000 downhole commingling approvals, 400 of which involve commingling production from Federal or Indian leases with production from State or private properties.

The BLM is proposing a review of existing commingling approvals for two reasons. First, many existing commingling approvals are old and are not well documented. Operators are sometimes unaware of existing commingling approvals or the provisions in the approvals. Second, many approvals have involved allocation methods that are difficult or impossible to inspect and verify for a variety of reasons, including a lack of a well-defined allocation method, overly-complex or unverifiable allocation methods, and the inclusion of properties with allocation meters over which the BLM has no jurisdiction.

The following are some common existing commingling situations that would likely not be approved under this proposed rule unless an operator could show that it meets one of the exceptions identified above. In addition to describing these situations, the discussion below also identifies alternative arrangements that would help minimize surface impacts:

Example 1: Commingling production from Federal or Indian leases with production from State or private properties, using allocation meters on each property.

Under the proposed rule, commingling in this situation would not be approved due to the mixed ownership. However, because existing allocation meters on Federal leases or federally approved units or CAs are already subject to the applicable BLM oil and gas measurement requirements, those meters generally could be used as FMPs to determine royalty value directly instead of being used to determine allocation percentages. As a result, there would be little or no additional surface impacts or significant economic impacts from disallowing such commingling, as the measurement for purposes of royalty would simply occur at the meters that previously had served as allocation meters.

Example 2: Commingling production from Federal or Indian leases with production from State or private properties, using well testing as the allocation method.

Under the proposed rule, commingling in this situation again would not be approved due to mixed ownership. The operator would be required to install FMPs to measure the oil and gas sold or removed from each lease, unit PA, or CA. (If there is more than one Federal lease with the same fixed royalty rate or more than one Indian tribal lease 100 percent owned by the same tribe at the same fixed royalty rate, the BLM could approve commingling production from the Federal leases only or from the Indian leases only, but not from both Federal leases and Indian leases.) Installing additional FMPs could require some additional surface disturbance for measurement and treatment equipment. However, well testing typically requires both a test separator and equipment to measure the oil and gas produced during the well test. While permanent separation and measurement equipment for an FMP may require more surface area than the test equipment, the effect on surface area disturbance should be minimal.

Example 3: A liquids-gathering system collects commingled production from properties including both Federal or Indian leases and State or private lands, and pipes it to a central off-lease facility for processing and measurement.

This situation often arises as a result of environmental mitigation measures designed to reduce surface impacts, especially those resulting from tanker-truck traffic transporting oil from tanks located on the lease, unit PA, or CA. Under the proposed rule, commingling in this situation again would not be approved due to mixed ownership. Instead, there would be at least two alternatives that would ensure that the BLM could verify production and at the same time minimize surface impacts:

First, under the proposed rule, a CAA could be obtained for those Federal or Indian leases, unit PAs, and CAs meeting the requirements of § 3173.14 of this proposed rule. Separate lines would be needed to keep Federal or Indian production segregated from State or private production until it was measured at a central processing facility. An off-lease measurement approval under §§ 3173.22 through 3173.24 of this proposed rule would also be required. Some additional surface disturbance would be necessary for the additional pipeline and duplicate separation and measurement equipment at the central location. However, this alternative would eliminate the need for tanks (and the resulting truck traffic), separators, and measurement equipment on-site. If a CAA were not practical, then separate pipelines would be needed for each Federal or Indian lease, unit PA, or CA.

Second, a CAA could be obtained for those Federal or Indian leases, unit PAs, and CAs meeting the requirements of §§ 3173.22 through 3173.24 of this proposed rule. The Federal or Indian oil and gas could be separated and measured on one of the Federal or Indian leases, units PAs, or CAs and then either removed by separate pipelines, or recombined into a single stream and removed in a single pipeline. This would require at least two sets of separators and measurement equipment on the producing properties—one set for the Federal or Indian production, and one set for the State and private production. As with the previous option, however, there would be no tanks on the properties, thereby eliminating truck traffic. This scenario would require that the oil be measured at the outlet of a separator with no associated tank. While this adds some complexity, it has proven to be feasible using technology such as Coriolis meters. If a CAA were not practical, then individual separation and measurement equipment would be needed for each Federal or Indian lease, unit PA, or CA.

Section 3173.17 Relationship of a Comingling and Allocation Approval to Royalty-Free Use of Production

Section 3173.17 of the proposed rule would clarify that approval of a CAA does not constitute approval of off-lease royalty-free use of production as fuel in facilities located at an FMP approved under the CAA. Under the currently applicable rule (see Notice to Lessees and Operators of Onshore Federal and Indian Oil and Gas Leases No. 4A (NTL–4A), 44 FR 76600 (Dec. 27, 1979), which implements judicial decisions construing relevant statutory provisions and lease terms), the lessee or operator may claim royalty-free use only for gas or oil used on the same lease, on the unit for the same unit PA, or on the same CA from which the gas or oil was produced. Thus, if an FMP approved under a CAA is located on one of the leases or CAs or units whose production flows to the FMP, the lessee or operator generally may claim royalty-free use only for that portion of the gas or oil used as fuel in facilities at the FMP that corresponds to the portion of the total production flowing to the FMP that is allocable to that lease, CA, or unit, unless the BLM approves ''off-lease'' royalty-free use of production from other Federal leases, CAs, or units whose production flows to the FMP (see discussion below). Similarly, if the FMP is not on any of the leases or CAs or units whose production flows to the FMP, the lessee or operator may not claim royalty-free use for any of the production used as fuel, absent BLM approval. The lessee or operator could seek such approval for ''off-lease'' royalty-free use by separate application, as discussed further below.

Section 3173.18 Modification of a Commingling and Allocation Approval

Section 3173.18(a) of the proposed rule identifies the circumstances under which all operators who are parties to a CAA may request a modification, including: Changes to the allocation schedule; inclusion of additional leases, unit PAs, or CAs; termination of a lease, unit, or PA within the CAA; or a change in operator. Proposed § 3173.18(b) would identify the information that must be submitted in connection with a modification request.

Section 3173.19 Effective Date of a Commingling and Allocation Approval

Section 3173.19(a) and (b) of the proposed rule would identify the effective date of a CAA after the approval of an application or modification, respectively. Proposed § 3173.19(c) would clarify that a CAA does not modify any of the terms of any leases, unit PAs, or CAs

Section 3173.20 Terminating a Commingling and Allocation Approval

Section 3173.20(a) of the proposed rule would provide that any operator who is a party to a CAA may unilaterally terminate it by submitting a Sundry Notice to the BLM. The operator would be required to identify new FMPs for its lease(s), unit PA(s), or CA(s) in the Sundry Notice.

Proposed paragraph (b) would authorize the BLM to terminate an approved CAA for any reason. By way of illustration, the proposed rule identifies certain circumstances in which the BLM might exercise that authority, such as when there have been changes in technology, regulation, or policy, or the operator has not complied with the terms of the CAA. Proposed paragraph (c) would provide for automatic termination of a CAA if only one lease, unit PA, or CA remains in the CAA.

After termination, proposed paragraph (d) would require the BLM to notify in writing all operators who are party to the CAA of the effective date of the termination and the reasons for it. Under proposed paragraph (e), upon termination, each lease, unit PA, or CA, would revert to separate on-lease measurement, unless off-lease measurement is approved under §§ 3173.22 through 3173.28 of this proposed rule.

Section 3173.21 Combining Production Downhole in Certain Circumstances

Section 3173.21 of the proposed rule would identify certain circumstances in which downhole comingling would be subject to the requirements of this proposed rule. Under proposed paragraph (a)(1), the combination of production from a single well drilled into different hydrocarbon pools or geologic formations under separate adjacent properties, regardless of ownership, where none of the pools or formations are common to more than one of the properties, would constitute commingling under the proposed rule. If, on the other hand, the pools or geologic formations are common to more than one property, then under proposed paragraph (a)(2), the operator would be required to establish a unit PA or communitization agreement as opposed to obtaining a CAA. Proposed paragraph (b) would clarify that combining production downhole from different geologic formations on the same lease from a single well, while requiring AO approval, is not considered commingling for purposes of this proposed rule, unless those formations have different ownership.

Sections 3173.22 through 3173.28 Off-Lease Measurement Approvals

Sections 3173.22 through 3173.28 of the proposed rule would establish the circumstances in which the BLM would approve measurement of production off the lease, unit, or CA (referred to as ''off-lease measurement''). Under the BLM's existing regulations (43 CFR 3162.7–2 (oil) and 43 CFR 3162.7–3 (gas)), all measurement must be on-lease, unit, or CA, unless otherwise authorized by the BLM. However, there are currently no national standards that operators must meet when applying for off-lease measurement. Neither Order 3 nor other regulations address how or under what circumstances the BLM will approve off-lease measurement. The proposed provisions below would provide such standards.

Section 3713.22 Requirements for Off-Lease Measurement

Off-lease measurement has led to much confusion over the location of measurement points. Many existing meters measure commingled Federal, private, and State production, which the operators allocate back to the individual lease, unit PA, CA, or CAA located upstream. These off-lease central-delivery-point allocation systems have led to significant discrepancies between operator-allocated volumes, which operators report to ONRR, and the volumes that the BLM calculates during follow-up audits. In the absence of a national standard for off-lease measurement, BLM State Offices have created their own standards, which are not consistent.

Section 3173.22 of this proposed rule would establish conditions under which off-lease measurement would be approved. Under this proposed section, the BLM would allow off-lease measurement of production only from a single Federal or Indian lease, unit PA, CA, or CAA, and only at an approved FMP. This proposal could restrict the types of situations in which off-lease measurement could occur, and therefore could result in the construction of facilities (*i.e.,* meters) that previously would not have been required under existing practice. Although the BLM generally prefers to limit the number of facilities and surface disturbances that occur on Federal leases, the BLM believes that limiting the use of off-lease measurement would provide for more accurate accounting of oil and gas production as required by Section 101(a) of FOGRMA, 30 U.S.C. 1711(a).

Section 3173.23 Applying for Off-Lease Measurement

Section 3173.23 of the proposed rule would establish the requirements operators must follow when applying for an off-lease measurement approval or amending an existing approval, including required supporting information and related documentation.

Section 3173.24 Effective Date of an Off-Lease Measurement Approval

Proposed § 3173.24 would provide that off-lease measurement approvals are effective immediately, unless the BLM specifies a different effective date in the approval.

Section 3173.25 Existing Off-Lease Measurement Approval

Under this proposed section, an existing off-lease measurement approval would be reviewed upon receipt of an operator's request for the assignment of an FMP number to a facility associated with the off-lease measurement approval. Proposed § 3173.25(a) would require the BLM to review the existing off-lease measurement approval for consistency with the minimum standards and requirements in proposed § 3173.22. The AO would notify the operator in writing of any inconsistencies or deficiencies. Under proposed paragraph (b), the operator would have to correct the inconsistencies or deficiencies within 20 business days. Under proposed paragraph (c), in connection with approving the requested FMP, the BLM could impose new or amended COAs on an existing off-lease measurement approval to make it consistent with the requirements of this proposed rule. If the operator fails to correct the deficiencies, proposed paragraph (d) would allow the AO to terminate the off-lease measurement approval. Under proposed paragraph (e), if the BLM approves a new off-lease measurement arrangement, that new arrangement would be effective on the first day of the month following its approval.

The BLM estimates that for FY 2014, there were approximately 25,404 producing onshore Federal and Indian leases, unit PAs, and CAs. Of those, approximately 1,500 have off-lease measurement approvals where there is no commingling (in situations, for example, where the well is located in difficult-to-access or environmentally sensitive area). The BLM anticipates that a few of these off-lease measurement points may not meet the minimum standards of this rule and would not be re-approved. If any existing off-lease measurement point is not re-approved under the proposed rule, the lessee or operator would be required to move the measurement facilities back on-lease or install new measurement facilities on-lease.

Section 3173.26 Relationship of Off-Lease Measurement Approval to Royalty-Free Use of Production

Section 3173.26 of the proposed rule would clarify that approval of off-lease measurement does not constitute approval of off-lease royalty-free use of production as fuel in facilities located at an approved off-lease FMP. Under NTL–4A, as noted above, the lessee or operator may claim royalty-free use only for gas or oil used on the same lease, on the unit for the same unit PA, or on the same CA from which the gas or oil was produced. Thus, the lessee or operator may not claim royalty-free use for any of the production used as fuel at an off-lease FMP, absent BLM approval. The lessee or operator could seek such approval by separate application.

Section 3173.27 Termination of Off-Lease Measurement Approval

Section 3173.27(a) of the proposed rule would provide that an operator may terminate an off-lease measurement arrangement through the submittal of a Sundry Notice to the BLM, which would have to identify the new FMPs for the lease(s), unit(s), or CA(s) that had been subject to the off-lease measurement approval. Proposed paragraph (b) of this section would authorize the BLM to terminate an approved off-lease measurement arrangement for any reason. By way of illustration, this proposed paragraph would identify certain circumstances under which the BLM might exercise that authority. Proposed paragraph (c) would provide that the BLM would notify the operator in writing of the termination of the off-lease measurement approval, the reasons for termination, and the effective date of the termination. Under proposed paragraph (d), after termination, each lease, unit, or CA that was subject to the off-lease measurement approval would revert to on-lease measurement.

Section 3173.28 Instances Not Constituting Off-Lease Measurement, for which No Approval Is Required

Section 3173.28 of the proposed rule would identify two circumstances that would not be considered off-lease measurement for purposes of the proposed rule. The first is where an FMP is located on a well pad of a directionally-drilled well that produces oil or gas from a lease, unit, or CA on which the well pad is not located. The second is where a lease, unit, or CA is made up of separate non-contiguous tracts. If production is moved from one tract to another tract within the same lease, unit, or CA, and the production is not diverted during movement between the tracts before the FMP (except for production used royalty-free), measurement would not be considered to be off-lease measurement.

Section 3173.29 Immediate Assessments for Certain Violations

Proposed § 3173.29 would expand the number and types of violations that would be subject to immediate assessments. Currently, BLM regulations at 43 CFR 3163.1(b) identify three violations that warrant immediate assessments. Section IV. of Order 3 identifies one further violation that results in an immediate assessment. The existing immediate assessments are not civil penalties and are separate from the civil penalties authorized under Section 109 of FOGRMA, 30 U.S.C. 1719.

The authority for the BLM to impose these assessments was explained in the preamble to the final rule in which 43 CFR 3163.1 was originally promulgated in 1987:

> The provisions providing assessments have been promulgated under the Secretary of the Interior's general authority, which is set out in Section 32 of the Mineral Leasing Act of 1920, as amended and supplemented (30 U.S.C. 189), and under the various other mineral leasing laws. Specific authority for the assessments is found in Section 31(a) of the Mineral Leasing Act (30 U.S.C. 188(a)), which states, in part ''. . . the lease may provide for resort to [sic] appropriate methods for the settlement of disputes or for remedies for breach of specified conditions thereof.'' All Federal onshore and Indian oil and gas lessees must, by the specific terms of their leases which incorporate the regulations by reference, comply with all applicable laws and regulations. Failure of the lessee to comply with the law and applicable regulations is a breach of the lease, and such failure may also be a breach of other specific lease terms and conditions. Under Section 31(a) of the Act and the terms of its leases, the BLM may go to court to seek cancellation of the lease in these circumstances. However, since at least 1942, the BLM (and formerly the Conservation Division, U.S. Geological Survey), has recognized that lease cancellation is too drastic a remedy, except in extreme cases. Therefore, a system of liquidated damages was established to set lesser remedies in lieu of lease cancellation.
>
> The BLM recognizes that liquidated damages cannot be punitive, but are a reasonable effort to compensate as fully as possible the offended party, in this case the lessor, for the damage resulting from a breach where a precise financial loss would be difficult to establish. This situation occurs when a lessee fails to comply with the operating and reporting requirements. The rules, therefore, establish uniform estimates for the damages sustained, depending on the nature of the breach.

53 FR 5384, 5387 (Feb. 20, 1987). The immediate assessments reflect a recognition that the BLM continues to incur costs associated with correcting violations of lease terms and regulations.

The additional assessments in this proposed rule address violations that pose particular threats to the integrity of the BLM's production accounting system. These are violations that significantly increase the BLM's workload and enforcement costs. Accordingly, the BLM proposes to make the 10 violations listed in proposed § 3173.29 subject to immediate assessments.

Three immediate assessments would apply to purchasers and transporters as well as operators. This extension is being proposed because they pertain to operational functions on the lease site that a purchaser or transporter may, in some circumstances, perform instead of the operator—*e.g.,* removing a Federal seal without authorization (proposed § 3173.4) or failure to report theft or mishandling of production (proposed § 3173.8). Extending responsibility to purchasers and transporters with respect to functions they perform also implements the site security provisions of Section 102(b) of FOGRMA, 30 U.S.C. 1712(b), which require operators to develop and comply with site security plans, or minimum site security measures that the Secretary deems appropriate, that are designed to protect the oil or gas produced or stored on an onshore lease site from theft. Thus, the authority for these requirements is found in both the general rulemaking authority of the various mineral leasing statutes (including the MLA at 30 U.S.C. 189 and the Mineral Leasing Act for Acquired Lands at 30 U.S.C. 359) and the rulemaking authority in Section 301(a) of FOGRMA, 30 U.S.C. 1751(a).

The recordkeeping requirements imposed on purchasers and transporters in § 3170.7 of the proposed rule discussed above are imposed under Section 103(a) of FOGRMA, 30 U.S.C. 1713(a). Similar to the authority granted in the MLA at 30 U.S.C. 189, the general rulemaking authority of FOGRMA Section 301(a) provides authority for the BLM to impose immediate assessments on purchasers and transporters who fail to follow the proposed new requirements for recordkeeping and records maintenance.

All of the immediate assessments under this proposed rule would be set at $1,000 per violation. The BLM chose the $1,000 figure because it generally approximates what it would cost the agency on average to identify and document a violation and verify remedial action and compliance.

Enforcement Actions

This proposal would remove the enforcement, corrective action, and abatement period provisions of Order 3. In their place, the BLM would develop an internal inspection and enforcement handbook that would provide direction to BLM inspectors on how to classify a violation—as either major or minor—what the corrective action should be, and what the timeframes for correction should be. The proposed rule would take the approach that the violation's severity and corrective action timeframes should be decided on a case-by-case basis, determined based on the definitions in the regulations. In deciding how severe a violation is, BLM inspectors must take into account whether a violation could result in ''immediate, substantial, and adverse impacts on public health and safety, the environment, production accountability, or royalty income.'' (Definition of ''major violation,'' 43 CFR 3160.0–5.) The AO would use the enforcement handbook in conjunction with 43 CFR subpart 3163, which provides for assessments and civil penalties when lessees and operators fail to remedy their violations in a timely fashion, and for immediate assessments for certain violations.

Elimination of Self Inspections

The BLM is proposing to eliminate the self-inspection provision of Order 3, section III.F., because it has been impractical for the BLM to enforce. Order 3 requires a lessee or operator to establish an inspection program for the purpose of periodically measuring production volumes and assuring that there is compliance with the BLM's minimum site security requirements. However, Order 3's language is vague and the BLM has never supplemented it with internal guidance or enforcement policy. As a result, the BLM determined this requirement was of limited utility. In lieu of reworking or updating this requirement, this proposed rule would strengthen recordkeeping requirements for operators, transporters, and purchasers, which the BLM believes will ultimately accomplish the same results and be of more use going forward.

Miscellaneous changes to other BLM regulations in 43 CFR part 3160

As noted at the beginning of this section-by-section analysis, the BLM is proposing other changes to provisions in 43 CFR part 3160. Some of those have already been discussed above in connection with provisions of this proposed rule to which they relate. The remaining proposed revisions are those noted here.

1. The authority citation for part 3160 would be corrected to include 25 U.S.C. 396, the grant of rulemaking authority to the Secretary for allotted Indian leases, which does not appear in the current print edition of the CFR.

2. Section 3160.0–3, Authority, would be updated to include the amendments to the Federal Oil and Gas Royalty Management Act of 1982 enacted by the Federal Oil and Gas Royalty Simplification Act of 1996.

3. Section 3161.1, Jurisdiction, would be updated to include references to FMPs, the Indian Mineral Development Act, and Tribal Energy Resource Agreements. The revisions would also mirror the new language in proposed § 3170.2.

4. Section 3162.3–2 would be revised by adding a new paragraph (d), which would refer operators to proposed provisions in subpart 3173 for details on how to apply for approval of FMPs, surface or subsurface commingling from different leases, unit PAs and CAs, or off-lease measurement.

5. Section 3162.4–3, the provisions regarding the no-longer-used Form 3160–6 (the monthly report of operations) would be removed.

6. Section 3162.6, Well and facility identification, would be revised to correct the misspelled word ''indentification'' in paragraph (a) to read ''identification.'' Paragraph (b) would be revised to remove a provision allowing abbreviated sign designations and a ''grandfathering'' provision for old well signs. Paragraph (c) would be revised to extend signage requirements to include facilities at which oil or gas produced from Federal or Indian leases is stored or processed. The fifth sentence of the current paragraph (c) would become the new paragraph (d), with its wording revised. The current paragraph (d) would become paragraph (e).

7. Section 3162.7–5, Site security on Federal and Indian (except Osage) oil and gas leases, would be removed. The provisions in the proposed rule that correspond to, or cover the same subject matter as, the several paragraphs in § 3162.7–5 are shown in the following table:

BILLING CODE 4310–84–C

43 CFR 3162.7-5 paragraph	Proposed new provision
(a) Definitions	43 CFR 3173.1
(b)(1) Lines and valves; effective sealing	43 CFR 3173.2(a), 3173.9(b) and 3173.11(c)(7)
(b)(2) LACT meters and effective sealing of components	43 CFR 3170.4, 3173.3, and two sections in anticipated new subpart 3174
(b)(3) By-passes around meters	43 CFR 3170.4
(b)(4) Sealing of appropriate valves during oil measurement by hand gauging	43 CFR 3173.2(a) and (b)
(b)(5) Circulating lines with valves allowing access to remove oil from storage tanks	43 CFR 3173.1
(b)(6) Records retention requirements	43 CFR 3170.7
(b)(7) Removal of oil for transportation by vehicle and required documentation	43 CFR 3173.5
(b)(8) Reporting theft or mishandling of oil	43 CFR 3173.8
(b)(9) Variances	43 CFR 3170.6
(c) Site security plans	None (site security plans eliminated)
(d) Site facility diagrams	43 CFR 3173.11

BILLING CODE 4310–84–P

8. Section 3163.2, Civil penalties, would be rewritten to address purchasers and transporters who are not operating rights owners. Paragraph (k) would be amended to change ''shall'' to ''will'' and to remove the references to ''other liquid hydrocarbons,'' because other liquid hydrocarbons would be encompassed within the definition of the term ''oil'' in proposed § 3170.3.

9. Section 3164.1, Onshore Oil and Gas Orders, would be revised to remove the reference to Order No. 3, Site Security, from the table in paragraph (b) because the Order would be replaced by this codified proposed rule.

Onshore Order Public Meetings, April 23–24, 2013

On April 24 and 25, 2013, the BLM held a series of public meetings to discuss proposed revisions to Orders 3, 4, and 5. The meetings were webcast so tribal members, industry, and the public across the country could participate and ask questions either in person or over the internet. Following the forum, the BLM opened a 36-day informal comment period, during which 13 comment letters were submitted. The following summarizes comments the BLM received relating to Order 3 and our response:

1. *The BLM should use the API number or the LR (Legacy Rehost) 2000 system serial number rather than create a new FMP numbering system.*

The BLM disagrees with this comment and believes that this suggestion would be unworkable. The BLM and State regulators use API numbers to identify individual wells while at the same time the BLM uses LR 2000 system serial numbers to identify leases. The BLM's proposed FMP numbering system would be used to identify facilities (meters) that serve any number of wells and leases, and whose measurements affect the calculation of the volume or quality of production on which royalty is owed. The FMP numbers would be based on an FMP numbering system that the former Minerals Management Service developed for offshore production reporting. ONRR continues to use that system. The FMP numbering system used by ONRR will generate numbers that indicate whether a lease is onshore or offshore, the mineral produced (oil or gas), whether the measurement is commingled or off-lease, and other relevant information. The BLM believes that using the same FMP numbering system for production reporting for onshore leases likely will save time and money by developing a system compatible with that already in use by ONRR.

2. *Clarify the level of detail on site facility diagrams involving royalty-free use.*

The BLM agrees with this comment. In light of this suggestion, the BLM is proposing that the operator identify each piece of equipment powered by production from the lease, unit, or CA. If the operator claims royalty-free volumes, the diagram (or an attachment) would have to state the estimated volume the equipment consumes per day and per month, how the volume is determined, the equipment manufacturer's name, rated use, and equipment serial number. (Alternatively, the royalty-free volume used by the equipment could be measured.) The proposed rule includes a number of general sample site facility diagrams.

3. *Reduce the level of detail required on site facility diagrams for equipment used to determine quality and quantity of production.*

The BLM agrees with this comment. The proposed rule would require the operator to submit the relevant information regarding meters and other measurement equipment when it requests an FMP designation or amends an existing FMP. Thus, requiring this information on the site facility diagrams is unnecessary.

4. *''Grandfather'' existing approvals for off-lease measurement and commingling, and ''grandfather'' existing site facility diagrams.*

The BLM believes that a ''grandfathering'' approach is not workable. ''Grandfathering'' would result in a patchwork of multiple and incompatible requirements. The BLM would have to track which approvals were grandfathered. The BLM is proposing to update commingling approval requirements because existing requirements have proven problematic in ensuring and verifying accurate measurement. If existing approvals were ''grandfathered,'' updated requirements would come into effect only incrementally and over many years as new facilities came on line and older facilities were modified.

5. *''Grandfather'' existing equipment and Order 3 requirements.*

The BLM disagrees with this comment. Grandfathering is generally unworkable for two reasons. First, grandfathering results in two tiers of equipment—older equipment that must meet the standards of a rule that is no longer in effect and newer equipment that has to meet the standards of the new rule. This not only requires the BLM to maintain, inspect against, and enforce two sets of regulations (one of which no longer applies to equipment coming into service), but also to track which FMPs have been grandfathered and which are subject to the new regulations. Second, the purpose for promulgating new regulations is to ensure accurate and verifiable measurement of oil and gas removed or sold from Federal and Indian leases. In lieu of grandfathering, the BLM has proposed grace periods for bringing existing facilities into compliance with the proposed standards (see §§ 3173.12, 3173.16, and 3173.25). These grace periods would be tied to volumes measured by the soon-to-be-designated FMPs, giving lower-volume operations more time to apply for their FMPs.

6. *Determine if commingling is economically justified by using net present value of investment cost of non-commingled measurement in lieu of a rate-of-return method (used in this proposed rule), and that if the net present value of the investment cost was less than 1.5 times the investment, then commingling should be approved.*

The BLM requested clarification of this comment to analyze the potential impacts of the proposed method. However, the BLM received no response to its inquiry. Consequently, the BLM does not believe it has an adequate basis on which to propose such a method. In connection with this proposed rule, the BLM would be interested in any information regarding alternate methods for determining if commingling is economically justified.

7. *The economic analysis of a request for commingling approval should consider all costs of lease development and not just the costs associated with achieving non-commingled measurement.*

The BLM disagrees with this comment. The BLM believes this would be unworkable, time-consuming, and expensive, as well as inaccurate with respect to the issue addressed. The BLM would not have access to all of the drilling and development costs, the calculations would be inordinately complex, and those costs in any event are not determinative of whether commingled measurement is economically justified. Whether commingled measurement is economically justified is a function of the marginal cost difference between commingled measurement and non-commingled measurement.

8. *The BLM should not take enforcement actions against purchasers and transporters for not maintaining and submitting records.*

The BLM disagrees with this comment. The requirement for purchasers and transporters to maintain records is imposed by FOGRMA. This proposed rule would affect approximately 200–300 purchasers and transporters, but as explained earlier, the BLM believes it is necessary to support the BLM's production verification and accountability efforts.

9. *Immediate assessments are arbitrary, ambiguous, and unnecessary.*

The BLM disagrees with this comment. The specific immediate assessments proposed and the reasons for proposing them are discussed earlier.

10. *The BLM Enforcement Manual should be made public.*

The BLM agrees with this comment. The Enforcement Manual will be posted on the BLM Web site at approximately the same time as the effective date of the final rule.

IV. Procedural Matters

Executive Orders 12866 and 13563, Regulatory Planning and Review

Executive Order 12866 provides that the Office of Information and Regulatory Affairs (OIRA) will review all significant rules. OIRA has determined that this rule is not significant.

Executive Order 13563 reaffirms the principles of E.O. 12866 while calling for improvements in the nation's regulatory system to promote predictability, to reduce uncertainty, and to use the best, most innovative, and least burdensome tools for achieving regulatory ends. The executive order directs agencies to consider regulatory approaches that reduce burdens and maintain flexibility and freedom of choice for the public where these approaches are relevant, feasible, and consistent with regulatory objectives. E.O. 13563 emphasizes further that regulations must be based on the best available science and that the rulemaking process must allow for public participation and an open exchange of ideas. We have developed this proposed rule in a manner consistent with these requirements.

1. The proposed rule would not have an annual effect on the economy of $100 million or more or adversely affect in a material way the economy, a sector of the economy, productivity, competition, jobs, the environment, public health or safety, or State, local, or tribal governments or communities.

The requirement for more detailed site facility diagrams is the most significant proposed provision that could increase the cost associated with the development of Federal and Indian oil and gas leases. The BLM already requires Federal and Indian oil and gas producers to provide generalized diagrams that show each piece of equipment that is used at a facility, including connections between each piece of equipment, and valve positions on production storage tanks. Under this proposed rule, operators would be required to submit new diagrams that also show additional information. Companies may incur additional costs associated with verifying and submitting this information and new diagrams.

The BLM estimates that 3,700 operators would submit approximately 125,000 new diagrams when the requirement is first implemented and that it would take the BLM approximately 3 years to process the submissions. The total one-time cost to the regulated community would be approximately $63.3 million, spread over 3 years. An operator would be required to submit the new diagrams for a facility that is in service before the final rule's effective date within 30 days after the BLM assigns the FMP number(s) to that facility. An operator would be required to submit the new diagrams for a new facility (*i.e.,* one not yet in service on the effective date of the final rule) within 30 days after construction of the facility. On an ongoing basis, the BLM estimates operators would submit about 5,000 new diagrams per year for a total annual cost to the regulated community of $2.5 million. Once incorporated into the submission and review process, this requirement should not significantly change costs for the BLM, lessees, operators, purchasers, or transporters.

Another proposed administrative change in this rule would require operators, within 27 months after the effective date of the final rule, to obtain BLM-issued FMP numbers, which would be used for labeling facilities and for reporting. Currently, companies have their own individualized internal systems for identifying facilities where production is measured for determining royalty. The BLM anticipates that 3,700 operators would submit 220,000 initial applications for the new FMP numbers, which operators would then stamp or stencil on a fixed plate. It would take the BLM approximately 3 years to process the FMP applications. The BLM estimates there would be a total one-time cost to the regulated community of approximately $55.7 million to convert to the new numbering system, which would be spread over 3 years. On an ongoing basis, the BLM anticipates operators would submit approximately 4,000 new and amended FMP applications each year, for an approximate cost to the regulated community of $1 million per year.

This proposed rule would establish new requirements associated with lessees and operators commingling production from different leases, CAs, or PAs, and in some instances existing commingling approvals would be modified. Of the approximately 10,541 existing commingling approvals, the BLM anticipates that only 710 of them would not meet the new requirements because they include private and State leases whose production is commingled with production from Federal or Indian oil and gas leases. Under the proposed rule, the BLM would modify or terminate these unless the operator could demonstrate that the cost of achieving non-commingled measurement would not be economically recoverable based on the low volume of oil and gas produced or could show other extenuating circumstances.

The BLM estimates that 50 percent, or 355, of the existing approvals that do not meet the proposed new requirements would remain in place due to their low production volumes and the other 50 percent would be terminated or modified. Measuring equipment, most likely allocation meters, serving the terminated arrangements would have to be converted into FMPs and updated to meet the new oil and gas measurement standards that the BLM anticipates proposing as separate rules that would be codified at new 43 CFR subparts 3174 and 3175. The costs for upgrading measuring equipment would be most appropriately discussed in the preambles and economic analyses supporting those proposed rules. Operators could incur some administrative costs associated with converting allocation meters into FMPs if they wish to continue to use these facilities for their own internal allocation purposes. For new and modified commingling agreements, we anticipate the proposed revision would increase industry costs by about $5.1 million per year.

Proposed new records management requirements could, depending on individual business practices, have a small direct economic impact on lessees, operators, transporters, and purchasers. These minor added expenses would primarily relate to incorporating the new requirements into existing records management practices and procedures. An estimated 200 to 300 purchasers and transporters would have new recordkeeping responsibilities under this proposed rule. It is highly probable that purchasers and transporters are already compiling records that would, for the most part, satisfy the proposed requirements. The BLM believes that these new recordkeeping requirements would impose a minimal cost on the regulated community.

Expanded recordkeeping requirements pertaining to water-draining and hot-oiling operations would cost lessees and operators approximately $1.2 million per year in annual ongoing costs. This change would enhance production accountability by making it easier for the BLM to verify the volumes of water that operators drain from storage tanks and the volumes of oil that they temporarily remove from storage, use for operational purposes, and then return to storage.

The fifth and final provision that would involve a direct cost to the regulated community is a proposal that would establish new requirements that would apply to lessees and operators who measure production off-lease, but who are not part of any commingling approval. Of the approximately 1,500 existing off-lease measurement approvals, the BLM estimates that less than 5 percent would be terminated or modified because they do not meet the standards of the proposed rule. Operators of those leases, CAs, or units that do not meet the new requirements would have to install and maintain new meters on the lease, CA, or unit. The BLM estimates that the cost of moving or installing new meters on the lease, CA, or unit would be $20,000 per measurement point, for a one-time total cost to industry of $1.6 million.

This proposed rule would increase the number of categories of violations where immediate assessments could be imposed. The BLM anticipates enforcement actions and immediate assessments would continue to be relatively infrequent occurrences.

To accommodate the issuance of FMP numbers and the inclusion of purchasers and transporters within certain of the rule's requirements, the BLM would need to enhance AFMSS, the BLM's main oil and gas data system. The BLM would also experience an increased workload associated with issuing FMP numbers, diagram reviews, and other administrative requirements. The BLM estimates a one-time cost, spread over a 3-year period, to the BLM of about $29.1 million to implement the proposed changes. On an ongoing basis the BLM estimates its costs would increase by about $3.4 million per year.

In total, the BLM estimates these requirements would increase operator annual expenses by approximately $13.5 million. In addition, there would be a one-time cost to implement the new provisions of about $121.5 million. The one-time implementation costs would be spread over 3 years, or about $40 million per year.

2. The proposed rule would not create inconsistencies with other agencies' actions. It would not change the relationships of the BLM to other agencies and their actions.

3. The proposed rule would not materially affect entitlements, grants, user fees, or loan programs, or the rights and obligations of their recipients. The proposed rule does not address any of these programs or issues.

4. The proposed rule would not raise novel legal or policy issues arising out of legal mandates, the President's priorities, or the principles set forth in the Executive Order.

Regulatory Flexibility Act

The BLM certifies that this proposed rule would not have a significant economic effect on a substantial number of small entities as defined under the Regulatory Flexibility Act (5 U.S.C. 601 *et seq.*). The Small Business Administration (SBA) has developed size standards to carry out the purposes of the Small Business Act and those size standards can be found at 13 CFR 121.201. Small entities for mining, including the extraction of crude oil and natural gas, are defined by the SBA as an individual, limited partnership, or small company considered being at ''arm's length'' from the control of any parent companies, with fewer than 500 employees.

Of the 6,628 domestic firms involved nationwide in oil and gas extraction, 99 percent, or 6,530, had fewer than 500 employees. There are another 10,160 firms involved nationwide in drilling and other support functions. Of the firms providing support functions, 98 percent of those firms had fewer than 500 employees. Based on this national data, the preponderance of firms involved in developing on-shore oil and gas resources are small entities as defined by the SBA.

In addition to lessees and operators, the BLM must consider the size of the purchasers' and transporters' firms. There are multiple North American Industry Classification System (NAICS) categories that could include firms involved in the purchasing and transporting of petroleum from Federal and Indian leases. For example, some purchasers could be petroleum refiners. For petroleum refiners, the SBA standard says a small business cannot have more than 1,500 employees or more than 125,000 barrels per calendar day total Operable Atmospheric Crude Oil Distillation capacity. Capacity includes owned or leased facilities as well as facilities under a processing agreement or an arrangement such as an exchange agreement or a throughput agreement. For wholesalers, including petroleum wholesalers, the SBA standard for a small entity is one that has fewer than 100 employees. For truck transporters, the SBA defines a small entity as a firm with less than $27.5 million in annual receipts. For natural gas pipeline operators, the standard is a maximum of $27.5 million in receipts per year. For crude oil pipelines the standard is fewer than 1,500 employees.

As discussed above, national data, including number of firms, number of employees by firm, and annual receipts by firm, is not discretely identified for purchasers and transporters of petroleum or natural gas. The potentially affected purchasers and transporters would likely be a minor component in any number of the relevant NAICS categories. Of the few NAICS categories where reported employment, receipt, and production data matches up with the SBA size standards, the preponderance of the firms would be considered small entities as defined by the SBA.

Based on the available national data, the preponderance of firms involved in developing, producing, purchasing, and transporting oil and gas from Federal and Indian lands are small entities as defined by the SBA. As such, it appears a substantial number of small entities would be potentially affected by the proposed rule to some degree.

Using the best available government data, the BLM estimates there are approximately 3,700 lessees and operators conducting operations on Federal and Indian lands that could be affected by the proposed rule. Additionally, the BLM estimates there are approximately 200 to 300 purchasers and transporters operating on Federal and Indian lands that potentially could be affected by this proposed rule.

In addition to determining whether a substantial number of small entities are likely to be affected by this rule, the BLM must also determine whether the rule is anticipated to have a significant economic impact on those small entities. Based on its analysis, the BLM anticipates the cost of implementing the proposed provisions to potentially reduce the average annual net income of impacted small entities by less than 0.001 percent. Except for the electronic filing requirement, all of the proposed provisions would apply to entities regardless of size. However, entities with the greatest activity would likely experience the greatest increase in compliance costs. As a general matter, smaller business entities are more likely to operate a smaller number of sites and FMPs for which they would have to submit the information and documentation that this proposed rule would require. Copies of the analysis can be obtained from the contact person listed earlier (see **FOR FURTHER INFORMATION CONTACT**).

Based on the available information, we conclude that the proposed rule would not have a significant impact on a substantial number of small entities. Therefore, a final Regulatory Flexibility Analysis is not required, and a Small Entity Compliance Guide is not required.

Small Business Regulatory Enforcement Fairness Act

This proposed rule is not a major rule under 5 U.S.C. 804(2), the Small Business Regulatory Enforcement Fairness Act. This rule would not have an annual effect on the economy of $100 million or more. As explained in the discussion above concerning Executive Order 12866, Regulatory Planning and Review, changes in the proposed rule would increase the ongoing cost associated with the development of Federal and Indian oil and gas resources by an estimated $13.5 million annually for all operators together. In addition, there would be a one-time cost to implement the new provisions of about $121.5 million. The one-time implementation costs would be spread over 3 years, or about $40 million per year.

This rule proposes to replace Order 3 to ensure that oil and gas produced from Federal and Indian leases is properly and securely handled so that these resources are accurately accounted for.

This proposed rule:

- Would not cause a major increase in costs or prices for consumers, individual industries, Federal, State, tribal, or local government agencies, or geographic regions; and
- Would not have significant adverse effects on competition, employment, investment, productivity, innovation, or the ability of U.S.-based enterprises to compete with foreign-based enterprises.

Unfunded Mandates Reform Act

In accordance with the Unfunded Mandates Reform Act (2 U.S.C. 1501 *et seq.*), the BLM finds that:

- This proposed rule would not ''significantly or uniquely'' affect small governments. A Small Government Agency Plan is unnecessary.

• This proposed rule would not produce a Federal mandate of $100 million or greater in any single year.

The proposed rule is not a ''significant regulatory action'' under the Unfunded Mandates Reform Act. The changes proposed in this rule would not impose any requirements on any non-Federal governmental entity.

Executive Order 12630, Governmental Actions and Interference With Constitutionally Protected Property Rights (Takings)

Under Executive Order 12630, the proposed rule would not have significant takings implications. A takings implication assessment is not required. This proposed rule would set minimum standards for ensuring that oil and gas produced from Federal and Indian (except the Osage Tribe) oil and gas leases are properly and securely handled, so as to prevent theft and loss and to enable accurate measurement and production accountability. All such actions are subject to lease terms which expressly require that subsequent lease activities be conducted in compliance with applicable Federal laws and regulations. The proposed rule conforms to the terms of those Federal leases and applicable statutes, and as such the proposed rule is not a governmental action capable of interfering with constitutionally protected property rights. Therefore, the proposed rule would not cause a taking of private property or require further discussion of takings implications under this Executive Order.

Executive Order 13132, Federalism

In accordance with Executive Order 13132, the BLM finds that the proposed rule would not have significant Federalism effects. A Federalism assessment is not required. This proposed rule would not change the role of or responsibilities among Federal, State, and local governmental entities. It does not relate to the structure and role of the states and would not have direct, substantive, or significant effects on states.

Executive Order 13175, Consultation and Coordination with Indian Tribal Governments

Under Executive Order 13175, the President's memorandum of April 29, 1994, ''Government-to-Government Relations with Native American Tribal Governments'' (59 FR 22951), and 512 Departmental Manual 2, the BLM evaluated possible effects of the proposed rule on federally recognized Indian tribes. The BLM approves proposed operations on all Indian onshore oil and gas leases (other than those of the Osage Tribe). Therefore, the proposed rule has the potential to affect Indian tribes. In conformance with the Secretary's policy on tribal consultation, the BLM held three tribal consultation meetings to which more than 175 tribal entities were invited. The consultations were held in:

• Tulsa, Oklahoma on July 11, 2011;
• Farmington, New Mexico on July 13, 2011; and
• Billings, Montana on August 24, 2011.
• In addition, the BLM hosted a tribal workshop and webcast on April 24, 2013.

The purpose of these meetings was to solicit initial feedback and preliminary comments from the tribes. Comments from the tribes will continue to be accepted and consultation will continue as this rulemaking proceeds. To date, the tribes have expressed concerns about the subordination of tribal laws, rules, and regulations to the proposed rule; tribes' representation on the Department of the Interior's Gas and Oil Measurement Team; and the BLM's Inspection and Enforcement program's ability to enforce the terms of this proposed rule. While the BLM will continue to address these concerns, none of the concerns expressed affect the substance of the proposed rule.

Executive Order 12988, Civil Justice Reform

Under Executive Order 12988, the Office of the Solicitor has determined that the proposed rule would not unduly burden the judicial system and meets the requirements of Sections 3(a) and 3(b)(2) of the Order. The Office of the Solicitor has reviewed the proposed rule to eliminate drafting errors and ambiguity. It has been written to minimize litigation, provide clear legal standards for affected conduct rather than general standards, and promote simplification and burden reduction.

Executive Order 13352, Facilitation of Cooperative Conservation

Under Executive Order 13352, the BLM has determined that this proposed rule would not impede the facilitation of cooperative conservation and would take appropriate account of and consider the interests of persons with ownership or other legally recognized interests in land or other natural resources. This rulemaking process will involve Federal, State, local and tribal governments, private for-profit and nonprofit institutions, other nongovernmental entities and individuals in the decision-making via the public comment process for the proposed rule. The process would provide that the programs, projects, and activities are consistent with protecting public health and safety.

Paperwork Reduction Act

I. Overview

The Paperwork Reduction Act (PRA) (44 U.S.C. 3501–3521) provides that an agency may not conduct or sponsor, and a person is not required to respond to, a ''collection of information,'' unless it displays a currently valid control number. Collections of information include requests and requirements that an individual, partnership, or corporation obtain information, and report it to a Federal agency. 44 U.S.C. 3502(3); 5 CFR 1320.3(c) and (k).

This proposed rule contains information collection requirements that are subject to review by OMB under the PRA. Collections of information include any request or requirement that persons obtain, maintain, retain, or report information to an agency, or disclose information to a third party or to the public (44 U.S.C. 3502(3) and 5 CFR 1320.3(c)). In accordance with the PRA, the BLM is inviting public comment on proposed new information collection requirements for which the BLM is requesting a new OMB control number.

Some of the proposed requirements would add new uses and burdens for BLM Form 3160–5, Sundry Notices and Reports on Wells. Form 3160–5 has been approved by OMB for uses enumerated at 43 CFR 3162.3–2, and is one of 17 information collection activities that are included in control number 1004–0137, Onshore Oil and Gas Operations (43 CFR part 3160) (expiration date January 31, 2018). After promulgating a final rule and receiving approval (in the form of a new control number) from the OMB, the BLM intends to ask OMB to combine the activities associated with the new control number with existing Control Number 1004–0137.

The information collection activities in this proposed rule are described below along with estimates of the annual burdens. Included in the burden estimates are the time for reviewing instructions, searching existing data sources, gathering and maintaining the data needed, and completing and reviewing each component of the proposed information collection requirements.

The information collection request for this proposed rule has been submitted to OMB for review under 44 U.S.C. 3507(d). A copy of the request can be obtained from the BLM by electronic mail request to Jennifer Spencer at *j35spenc@blm.gov* or by telephone request to 202–912–7146. You may also review the information collection request online at *http://www.reginfo.gov/public/do/PRAMain.*

The BLM requests comments on the following subjects:

1. Whether the collection of information is necessary for the proper functioning of the BLM, including whether the information will have practical utility;

2. The accuracy of the BLM's estimate of the burden of collecting the information, including the validity of the methodology and assumptions used;

3. The quality, utility, and clarity of the information to be collected; and

4. How to minimize the information collection burden on those who are to respond, including the use of appropriate automated, electronic, mechanical, or other forms of information technology.

If you want to comment on the information collection requirements of this proposed rule, please send your comments directly to OMB, with a copy to the BLM, as directed in the **ADDRESSES** section of this preamble. Please identify your comments with ''OMB Control Number 1004–XXXX.'' OMB is required to make a decision concerning the collection of information contained in this proposed rule between 30 to 60 days after publication of this document in the **Federal Register.** Therefore, a comment to OMB is best assured of having its full effect if OMB receives it by August 12, 2015.

II. Summary of Proposed Information Collection Requirements

Title: Oil and Gas Facility Site Security.

Forms: Form 3160–5, Sundry Notices and Reports on Wells.

OMB Control Number: None. This is a new collection of information.

Description of Respondents: Holders of Federal and Indian (except Osage Tribe) oil and gas leases, operators, purchasers, transporters, and any other person directly involved in producing, transporting, purchasing, or selling, including measuring, oil or gas through the point of royalty measurement or the point of first sale.

Respondents' Obligation: Required to obtain or retain a benefit.

Frequency of Collection: On occasion.

Abstract: This proposed rule would establish minimum security standards for Federal and Indian (except Osage Tribe) oil and gas leases.

Estimated Total Annual Burden Hours: The proposed rule would result in 147,181 estimated responses and 849,452 estimated hours of burden annually. Of these totals, 127,876 responses and 782,902 hours would be for new uses of Sundry Notices.

III. New Uses of Sundry Notices (Form 3160–5)

A. Variance Requests

This proposed rule includes a new § 3170.6, which would authorize any party subject to the regulations in 43 CFR part 3170 to request a variance from any of the regulations in part 3170. Those would include the proposed new subpart 3173 set forth above. While proposed § 3170.6 states that a request for a variance should be filed using the BLM's electronic system, it also allows the use of Sundry Notices. Thus, § 3170.6 represents a new use of Form 3160–5, Sundry Notices and Reports on Wells.

B. Information Collection Activities Listed in Proposed § 3173.10

Proposed § 3173.10 would list additional information collection requirements that would be new uses of Sundry Notices. These requirements would apply to all parties involved in Federal and Indian (except Osage Tribe) oil and gas production. As discussed below, other proposed regulations provide detail on these requirements.

1. Submission of Site Facility Diagrams for Existing Facilities

Proposed § 3173.11(d) would apply to facilities in service before the effective date of the final rule. Operators of each such facility would be required to submit a new site facility diagram that complies with paragraphs (a) through (c) of § 3173.11 within 30 days after the BLM assigns an FMP number. The requirements of paragraphs (a) through (c) are described in detail below.

Proposed § 3173.11(e) would apply to facilities that are in service before the effective date of the final rule, and for which the BLM will not assign an FMP (*e.g.,* facilities that dispose of produced water). Operators of each such facility would be required to submit a new site facility diagram within 60 days after the effective date of the final rule.

2. Site Facility Diagrams for New or Modified Facilities

Proposed § 3173.11(c)(2) would require a site facility diagram for all new facilities and for modification of a facility. Each site facility diagram would be required to:

- Be submitted electronically to the BLM with a completed Sundry Notice for each lease, unit PA, or CA through the BLM's Well Information System (WIS) or other system identified by the BLM;
- Be submitted within 30 days of completion of construction of a new facility, when existing facilities are modified, or when a non-Federal facility located on a Federal lease or federally approved unit or CA is constructed or modified;
- Reflect the position of the production and water recovery equipment, piping for oil, gas, and water, and metering or other measuring systems in relation to each other, but need not be to scale;
- Commencing with the header, identify all of the equipment, including, but not limited to, the header, wellhead, piping, tanks, and metering systems located on the site, and include the appropriate valves and any other equipment used in the handling, conditioning, or disposal of production and water, and indicate the direction of flow;
- Identify by API number the wells flowing into headers;
- Indicate which valve(s) must be sealed and in what position during the production and sales phases and during the conduct of other production activities (*e.g.,* circulating tanks or drawing off water), which may be shown by an attachment, if necessary;
- Clearly identify the lease, unit PA, or CA to which the diagram applies and the land description of the facility, and the name of the company submitting the diagram, with co-located facilities being identified for each lease, unit PA, or CA; and
- Clearly identify on the diagram, or an attachment, all meters and measurement equipment. Specifically identify all approved and assigned FMPs.

If another operator operates a co-located facility, the site facility diagram would be required to depict the co-located facilities or list them as an attachment and identify them by company name, facility name(s), lease, unit PA, or communitization agreement number, and FMP number(s).

When describing co-located facilities operated by one operator, the site facility diagram would be required to include a skeleton diagram of the co-located facility, showing equipment only. For storage facilities common to co-located facilities operated by one operator, one diagram would be sufficient.

If the operator claims royalty-free use, the site facility diagram would be required to clearly identify on the diagram or as an attachment, the equipment for which the operator claims royalty-free use.

3. Application for Approval of an FMP for Existing Measurement Facilities

Section 3173.12 of the proposed rule would require operators to obtain an FMP number for all measurement points where the measurement affects the calculation of the volume or quality of production on which royalty is owed, and thus establish a standardized process for BLM approval of the point at which oil or gas must be measured for the purpose of determining royalty. The deadline for submitting a request for an FMP number for facilities in service on or before the effective date of the final rule would depend on the production level of the lease, unit PA, CA, or CAA.

For stand-alone leases, unit PAs, CAs, and CAAs that produce 6,000 Mcf or more of gas per month, or 40 barrels or more of oil per month, the operator would have to apply for approval of the FMP(s) within 9 months after the effective date of the final rule. For stand-alone leases, unit PAs, CAs, or CAAs that produce 3,000 Mcf or more but less than 6,000 Mcf of gas per month, or 20 barrels or more but less than 40 barrels of oil per month, the operator would have to apply for approval of the FMP(s) within 18 months after the effective date of the final rule. For stand-alone leases, unit PAs, CAs, or CAAs that produce less than 3,000 Mcf of gas per month and less than 20 barrels of oil per month, the operator would have to apply for approval of the FMP(s) within 27 months after the effective date of the final rule. These thresholds would be calculated as an average over the 12 months preceding the effective date of the final rule or the period the lease, unit, CA, or CAA has been in production, whichever is shorter.

Proposed § 3173.12(f) would require all applications for approval of an FMP to include the following:

- A complete Sundry Notice;
- The applicable Measurement Type Code specified in the BLM's Well Information System (WIS) or any successor electronic system;
- For gas and oil, a list of the measurement component names and the manufacturer, model, and serial number of each component;
- For gas, the gas sampling method (*i.e.,* spot, composite, or on-line gas chromatograph); and
- Where production from more than one well will flow to the requested FMP, a list of the API well numbers associated with the FMP.

4. Request for Approval of an FMP for a New Measurement Facility

Proposed § 3173.12(d) would require operators to obtain approval of an FMP for new measurement facilities (*i.e.,* measurement facilities coming into service after the effective date of the final rule) before any production leaves the facility.

5. Modifications to an FMP

Proposed § 3173.13(d)(1) would require operators with an approved FMP to submit a Sundry Notice that details any modifications to the FMP within 20 business days after the change. These details would include, but would not be limited to, the old and new meter manufacturer, serial number(s), owner's name, tank number(s), and wells or facilities using the FMP. The Sundry Notice would be required to specify what was changed, why the change was made, the effective date, and include, if appropriate, an amended site facility diagram.

6. Request for Approval of a CAA

Proposed § 3173.15 would require the following information:

- A completed Sundry Notice seeking approval of commingling and allocation, and of off-lease measurement, if any of the proposed FMPs are outside the boundaries of any of the leases, units, or CAs whose production would be commingled;
- A proposed allocation agreement and a proposed allocation schedule (including allocation of produced water) signed by each operator of each of the leases, unit PAs, or CAs whose production would be included in the CAA;
- A list of all Federal or Indian lease, unit PA, or communitization agreement numbers in the proposed CAA, specifying the type of production (*i.e.,* oil, gas, or both) for which commingling is requested;
- A map or maps showing the boundaries of all the leases, units, unit PAs, or CAs whose production is proposed to be commingled; the proposed location by land description for the FMP used to measure the commingled production; and a map or diagram of existing or planned facilities that shows the location of all wellheads, production facilities, flow lines (including water flow lines), and FMPs existing or proposed to be installed to the extent known or anticipated;
- Documentation demonstrating that each of the leases, unit PAs, or CAs proposed for inclusion in the CAA is producing in paying quantities (or, in the case of Federal leases, is capable of production in paying quantities) pending approval of the CAA; and
- All gas analyses, including Btu content (if the CAA request includes gas) and all oil gravities (if the CAA request includes oil) for previous periods of production from the leases, units, unit PAs, or CAs proposed for inclusion in the CAA, up to 6 years before the date of the application for approval of the CAA.

For existing facilities, site facility diagrams clearly showing any proposed change to current site facility diagrams would be required. For all new proposed facilities (including water handling facilities), the application for approval of a CAA would be required to include a schematic or engineering drawing showing the relative location of pipes, tanks, meters, separators, dehydrators, compressors, and other equipment.

If new surface disturbance is proposed on one or more of the leases, units, or CAs and the surface is managed by the BLM, the application would be required to include a request for approval of the proposed surface disturbance.

If new surface disturbance is proposed on BLM-managed land outside any of the leases, units, or CAs whose production would be commingled, the application would be required to include a right-of-way grant application, under 43 CFR part 2880 if the FMP is on a pipeline, or under 43 CFR part 2800, if the FMP is a storage tank. Applications for rights-of-way are authorized under control number 0596–0082.

If new surface disturbance is proposed on Federal land managed by an agency other than the BLM, the application would be required to include written approval from the appropriate surface-management agency.

7. Response to Notice of Insufficient CAA

Proposed § 3173.16 would provide that upon receipt of a request for an FMP number for a facility associated with a CAA existing on the effective date of the final rule, the BLM would review the existing CAA for consistency with proposed § 3173.14. The BLM would then notify the operator of any inconsistencies or deficiencies. The operator would be obligated to correct the flaws, or provide additional information, within 20 business days of receiving the notice.

8. Request to Modify a CAA

Proposed § 3173.18 would provide that a CAA may be modified at the request of all the operators who are parties to the CAA. The following information would be required in a request to modify a CAA:

• A completed Sundry Notice describing the modification requested;
• A new allocation schedule, if appropriate; and
• Certification by each operator that it agrees to the CAA modification.

9. Request for Approval of Off-Lease Measurement

Proposed § 3173.23(a) through (j) would require the following information in an application for approval of off-lease measurement:
• A completed Sundry Notice;
• Justification for off-lease measurement;
• A topographic map of appropriate scale showing the following: The boundary of the lease(s), unit(s), or CA(s) from which the production originates; the location by land description of all wells, pipelines, facilities, and FMPs associated with the proposal, with equipment identified as existing or proposed; and the surface ownership of all land on which equipment is, or is proposed to be, located;
• A schematic or engineering drawing for all new proposed facilities showing the relative location of pipes, tanks, meters, separators, dehydrators, compressors, and other equipment; and
• A statement that indicates whether the proposal includes all, or only a portion of, the production from the lease, unit, or CA and if the proposal includes only a portion of the production, the application would be required to identify the FMP(s) where the remainder of the production from the lease, unit, or CA is measured or is proposed to be measured.

For existing facilities, the application would be required to include site facility diagrams clearly showing any proposed change to current site facility diagrams.

If any of the proposed off-lease measurement facilities are located on non-federally owned surface, the application would be required to include a written concurrence signed by the owner(s) of the surface and the owner(s) of the measurement facilities, including each owner(s)' name, address, and telephone number, granting the BLM unrestricted access to the off-lease measurement facility and the surface on which it is located, for the purpose of inspecting any production, measurement, water handling, or transportation equipment located on the non-Federal surface up to and including the FMP, and for otherwise verifying production accountability.

If the proposed off-lease FMP consists of a storage tank or is on a pipeline, a right-of-way grant application would be required. Applications for rights-of-way are authorized under control number 0596–0082.

If the operator proposes to use production from the lease, unit or CA as fuel at the off-lease measurement facility without payment of royalty, the application would be required to include an application for approval of off-lease royalty-free use under applicable rules.

10. Response to Notice of Insufficient Off-Lease Measurement Approval

Proposed § 3173.25 provides that upon receipt of an operator's request for assignment of an FMP number to a facility associated with an off-lease measurement approval existing on the effect date of the final rule, the BLM would review the existing approval for consistency with the requirements listed at proposed § 3173.22. The BLM would notify the operator of any inconsistencies or deficiencies. The operator would be obligated to correct any of the identified flaws within 20 business days of receiving the notice.

11. Request to Amend Approval of Off-Lease Measurement

Proposed § 3173.23(k) provides that to apply for an amendment of an existing approval of off-lease measurement, the operator must submit the information listed at paragraphs (a) through (j) of proposed § 3173.23 to the extent the previously submitted information has changed.

IV. Other Proposed Information Collection Activities

A. Required Records Submission

Proposed § 3170.7(h) would apply to lessees, operators, purchasers, transporters, and any other person directly involved in producing, transporting, purchasing, selling, or measuring oil or gas through the point of royalty measurement of the point of first sale, whichever is later. Those parties would be required to submit all records that are relevant to determining the quality, quantity, disposition, and verification of production attributable to Federal or Indian leases upon request, in accordance with a regulation, written order, Onshore Order, NTL, or COA.

B. Water-Draining Records

Proposed § 3173.6 would require submission of information when water is drained from a production storage tank. The operator, purchaser, or transporter, as appropriate, would have to submit the following information:
• Federal or Indian lease, unit PA, or CA number(s);
• FMP number associated with the tank;
• The tank location by land description;
• The unique tank number and nominal capacity;
• Date and time for opening gauge;
• Opening gauge and color cut measurements;
• Name of the person and company draining the tank;
• Unique identifying number of each seal removed;
• Time of the closing gauge;
• Closing gauge measurement; and
• Unique identifying number of each seal installed.

C. Hot Oiling, Clean-up, and Completion Records

Proposed § 3173.7 would require the submission of information during hot oil, clean-up, or completion operations, or any other situation where the operator removes oil from storage, temporarily uses it for operational purposes, and then returns it to storage on the same lease, unit PA, or CA. The operator would have to submit the following information:
• Federal or Indian lease, unit PA, or communitization agreement number(s);
• FMP number associated with the tank or group of tanks;
• The tank location by land description;
• The unique tank number and nominal capacity;
• Date and time of the opening gauge;
• Opening gauge measurement;
• Name of the person and company removing production from the tank;
• Unique identifying number of each seal removed;
• Time of the closing gauge;
• Closing gauge measurement;
• Unique identifying number of each seal installed;
• How the oil was used; and
• Where the oil was used (*i.e.,* well or facility name and number).

D. Report of Theft or Mishandling of Production

Proposed 3173.8 would require operators, purchasers, or transporters to submit a report no later than the next business day after discovery of an incident of apparent theft or mishandling of production. A written incident report would have to follow an oral report within 10 business days of the oral report. The incident report would include the following information:
• Company name and name of the person reporting the incident;
• Lease, unit PA, or communitization agreement number, well or facility name

and number, and FMP number, as appropriate;

- Land description of the facility location where the incident occurred;
- The estimated volume of production removed;
- The manner in which access was obtained to the production or how the mishandling occurred;
- The name of the person who discovered the incident; and
- The date and time of the discovery of the incident.

E. Required Recordkeeping for Inventory and Seal Records

Proposed § 3173.9 would require operators to measure and record at the end of each calendar month an inventory consisting of total observed volume in storage.

For each seal, the operator would be required to maintain a record that includes the unique identifying number of each seal and the valve or meter component on which the seal is or was used; the date of installation or removal of each seal; for valves, the position (open or closed) in which it was sealed; and the reason the seal was removed.

V. Burden Estimates

The following table details the proposed information collection activities that would be new uses of Form 3160–5, Sundry Notices and Reports on Wells.

BILLING CODE 4310–84–C

A. Type of Response	B. Number of Responses	C. Hours per Response	D. Total Hours (Column B x Column C)
Variance Requests (43 CFR 3170.6)	100	8	800
Submission of Site Facility Diagrams for Existing Facilities (43 CFR 3173.11(d) and (e))	42,000	8	336,000
Site Facility Diagrams for New or Modified Facilities (43 CFR 3173.11(c)(2))	5,000	8	40,000
Application for Approval of an FMP for Existing Measurement Facilities (43 CFR 3173.12)	73,500	4	294,000
Request for Approval of an FMP for a New Measurement Facility (43 CFR 3173.12(d))	2,000	4	8,000
Modifications to an FMP (43 CFR 3173.13(d)(1))	2,000	4	8,000
Request for Approval of a CAA (43 CFR 3173.15)	1,000	40	40,000
Response to Notice of Insufficient CAA (43 CFR 3173.16)	118	40	4,720
Request to Modify a CAA (43 CFR 3173.18)	1,000	40	40,000
Request for Approval of Off-Lease Measurement (43 CFR 3173.23(a) through (j))	1,100	10	11,000
Response to Notice of Insufficient Off-Lease Measurement Approval (43 CFR 3173.25)	33	4	132
Request to Amend Approval of Off-Lease Measurement (43 CFR 3173.23(k))	25	10	250
Totals	127,876	—	782,902

The following table details the rest of the proposed information collection activities.

A. Type of Response	B. Number of Responses	C. Hours Per Response	D. Total Hours
Records Submission Requirements (43 CFR 3170.7 (h))	4,300	5	21,500
Water-Draining Records (43 CFR 3173.6)	5,000	2	10,000
Hot Oiling, Clean-Up, and Completion Records (43 CFR 3173.7)	5,000	2	10,000
Report of Theft or Mishandling of Production (43 CFR 3173.8)	5	10	50
Required Recordkeeping for Inventory and Seal Records (43 CFR 3173.9)	5,000	5	25,000
Totals	19,305		66,550

The proposed rule would remove[7] 43 CFR 3162.7–5, which would result in the removal of three information collection activities from control number 1004–0137, as shown in the following table:

A. Type of Response	B. Number of Responses Authorized Annually	C. Hours Per Response Authorized Annually	D. Total Hours (Column B x Column C)
Schematic / Facility Diagrams (43 CFR 3162.4-1(a) and 3162.7-5(d)(1))[7]	1,000	8	8,000
Records for Seals (43 CFR 3162.7-5(b))	90,000	0.75	67,500
Site Security (43 CFR 3162.7-5(c))	2,500	8	20,000
Totals	93,500		95,500

[7] Section 3162.4–1 is merely descriptive. Section 3162.7–5 is prescriptive.

BILLING CODE 4310–84–P

The proposed rule would result in the following program changes to 1004–0137 due to the removal of 43 CFR 3162.75, and due to the addition of new requirements.

1. The total estimated burdens would be 147,181 responses and 849,452 hours. Of those totals, 127,876 responses and 782,902 hours would be due to new uses of Sundry Notices.

2. The proposed rule would remove 43 CFR 3162.7–5, which would result in the removal of three information collection activities from control number 1004–0137 that represent a total of 93,500 estimated responses and 95,500 burden hours.

3. The net estimated burdens for the proposed rule would be 53,681 responses and 753,952 hours.

National Environmental Policy Act

The BLM has prepared a draft environmental assessment (EA) that concludes that the proposed rule would not constitute a major Federal action significantly affecting the quality of the human environment under § 102(2)(C) of the National Environmental Policy Act (NEPA), 42 U.S.C. 4332(2)(C). Under the draft EA, a detailed statement under NEPA is therefore not required. A copy of the draft EA can be viewed at *www.regulations.gov* (use the search term 1004–AE15, open the Docket Folder, and look under Supporting Documents) and at the address specified in the **ADDRESSES** section.

The proposed rule would not affect the environment significantly because, for the most part, the revisions to the requirements of Order 3 proposed here would involve changes that are of an administrative, technical, or procedural nature that would apply to the BLM's and the lessee's and/or operator's management processes. For example, operators would now be required to maintain records generated for Federal leases for at least 7 years, consistent with statutory requirements. Similarly, the proposed rule would require more detailed information on site facility diagrams such as information about the manufacturer, model, and serial number of equipment, and information regarding royalty free use. The submission of this additional information would not result in any on-the-ground effects. However, compliance with some of these requirements may result in additional surface disturbing activities (*e.g.,* additional surface disturbance might be required if an operator with an existing off lease measurement authorization had to move those measurement facilities back on lease because they did not comply with the requirements of this proposed rule.) Such surface disturbing activities would be conducted in accordance with existing surface operating standards and guidelines for oil and gas exploration and development and include appropriate Best Management Practices (BMP). The BLM will consider any new information we receive during the public comment period for the proposed rule that may inform our analysis of the potential environmental impacts of the proposed rule.

Executive Order 13211, Actions Concerning Regulations That Significantly Affect Energy Supply, Distribution, or Use

This proposed rule would not have a substantial direct effect on the nation's energy supply, distribution or use, including a shortfall in supply or price increase. Changes in this proposed rule would strengthen the BLM's accountability requirements for operators under Federal and Indian oil and gas leases. As discussed above, these changes would increase recordkeeping requirements, place additional restrictions on CAAs and on off-lease measurement, and provide for significant new immediate assessments for violations of the regulations. All of these changes are administrative in nature and would have a one-time transition cost of an average of about $32,800 per regulated entity and an ongoing annual average cost of about $3,600 per entity per year. Entities with the greatest activity (*e.g.,* numerous FMPs) would incur higher costs.

The BLM expects that the proposed rule would not result in a net change in the quantity of oil and gas that is produced from oil and gas leases on Federal and Indian lands.

Information Quality Act

In developing this proposed rule, the BLM did not conduct or use a study, experiment, or survey requiring peer review under the Information Quality Act (Pub. L. 106–554, Appendix C Title IV, § 515, 114 Stat. 2763A–153).

Clarity of the Regulations

Executive Order 12866 requires each agency to write regulations that are simple and easy to understand. The BLM invites your comments on how to make these proposed regulations easier to understand, including answers to questions such as the following:

1. Are the requirements in the proposed regulations clearly stated?

2. Do the proposed regulations contain technical language or jargon that interferes with their clarity?

3. Does the format of the proposed regulations (grouping and order of sections, use of headings, paragraphing, etc.) aid or reduce their clarity?

4. Would the regulations be easier to understand if they were divided into more (but shorter) sections?

5. Is the description of the proposed regulations in the **SUPPLEMENTARY INFORMATION** section of this preamble helpful in understanding the proposed regulations? How could this description be more helpful in making the proposed regulations easier to understand?

Please send any comments you have on the clarity of the regulations to the address s specified in the **ADDRESSES** section.

Authors

The principal author of this proposed rule is Michael Wade, Senior Oil and Gas Compliance Specialist, BLM, Washington Office. Contributing authors include:

Steve McCracken, Petroleum Engineering Technician, BLM, Great Falls Field Office; Darla McMillan, Petroleum Engineering Technician, BLM, Moore Field Office; Leslie Peterson, Petroleum Engineer, BLM, Royal Gorge Field Office; Loren Wickstorm, Petroleum Engineering Technician, BLM, Dolores Field Office; Cris Carey, ONRR, Denver Office; Luke Lundmark, ONRR, Denver Office; and Vicky Stafford, ONRR, Denver Office. The team was assisted by Rich Estabrook, Petroleum Engineer Washington Office; Faith Bremner, Division of Regulatory Affairs, BLM, Washington Office; and Geoffrey Heath, Office of the Solicitor, DOI, Washington Office.

43 CFR part 3170

Government contracts; Indians-lands; Mineral royalties; Oil and gas exploration; Penalties; Public lands—mineral resources; Reporting and recordkeeping requirements.

Dated: July 1, 2015.__

Janice M. Schneider,

Assistant Secretary,

Land and Minerals Management.

43 CFR Chapter II

For the reasons set out in the preamble, the Bureau of Land Management proposes to amend 43 CFR chapter II as follows:

PART 3160—ONSHORE OIL AND GAS OPERATIONS

■ 1. Revise the authority citation for part 3160 to read as follows:

AUTHORITY: 25 U.S.C. 396, 396d and 2107; 30 U.S.C. 189, 306, 359, and 1751; and 43 U.S.C. 1732(b), 1733 and 1740.

■ 2. Amend § 3160.0–3 by removing the words ''the Federal Oil and Gas Royalty Management Act of 1982 (30 U.S.C. 1701)'' and adding in their place the words ''the Federal Oil and Gas Royalty Management Act of 1982, as amended by the Federal Oil and Gas Royalty Simplification Act of 1996 (30 U.S.C. 1701 *et seq.*)''.

■ 3. Revise § 3161.1 to read as follows:

§ 3161.1 Jurisdiction.

The regulations in this part apply to:

(a) All Federal and Indian onshore oil and gas leases (other than those of the Osage Tribe);

(b) All onshore facility measurement points where Federal or Indian oil or gas is measured;

(c) Indian Mineral Development Act agreements for oil and gas, unless specifically excluded in the agreement;

(d) Leases and other business agreements for the development of tribal energy resources under a Tribal Energy Resource Agreement entered into with the Secretary, unless specifically excluded in the lease, other business agreement, or Tribal Energy Resource Agreement; and

(e) State or private tracts committed to a federally approved unit or communitization agreement as defined by or established under 43 CFR subpart 3105 or 43 CFR part 3180.

■ 4. Amend § 3162.3–2 by adding paragraph (d) to read as follows:

§ 3162.3–2 Subsequent well operations.

* * * * *

(d) For details on how to apply for approval of a facility measurement point; approval for surface or subsurface commingling from different leases, unit participating areas and communitized areas; or approval for off-lease measurement, see 43 CFR 3173.12, 3173.15, and 3173.23, respectively.

■ 5. Amend § 3162.4–1 by revising paragraphs (a) and (d) and adding paragraph (e) to read as follows:

§ 3162.4–1 Well records and reports.

(a) The operator must keep accurate and complete records with respect to:

(1) All lease operations, including, but not limited to, drilling, producing, redrilling, repairing, plugging back, and abandonment operations;

(2) Production facilities and equipment (including schematic diagrams as required by applicable orders and notices); and

(3) Determining and verifying the quantity, quality, and disposition of production from or allocable to Federal or Indian leases (including source records).

* * * * *

(d) All records and reports required by this section must be maintained for the following time periods:

(1)(i) For Federal leases and units or communitized areas that include Federal leases, but do not include Indian leases, 7 years after the records are generated.

(ii) If a judicial proceeding or demand involving such records is timely commenced, the record holder must maintain such records until the final nonappealable decision in such judicial proceeding is made, or with respect to that demand is rendered, unless the Secretary or the applicable delegated State authorizes in writing an earlier release of the requirement to maintain such records.

(2)(i) For Indian leases, and units or communitized areas that include Indian leases, but do not include Federal leases, 6 years after the records are generated.

(ii) If the Secretary or his/her designee notifies the record holder that the Department has initiated or is participating in an audit or investigation involving such records, the record holder must maintain such records until the Secretary or his designee releases the record holder from the obligation to maintain the records.

(3)(i) For units and communitized areas that include both Federal and Indian leases, if the Secretary or his/her designee has notified the record holder within 6 years after the records are generated that an audit or investigation involving such records has been initiated, but a judicial proceeding or demand is not commenced within 7 years after the records are generated, the record holder must retain all records regarding production from the unit or communitized area until the Secretary or his/her designee releases the record holder from the obligation to maintain the records.

(ii) If a judicial proceeding or demand is commenced within 7 years after the records are generated, the record holder must retain all records regarding production from the unit or communitized area until the final nonappealable decision in such judicial proceeding is made, or with respect to that demand is rendered, or until the Secretary or his designee releases the record holder from the obligation to maintain the records, whichever is later, unless the Secretary or his designee authorizes in writing a release of the requirement to maintain such records before a final nonappealable decision is made or rendered.

(e) Record holders include lessees, operators, purchasers, transporters, and any other person directly involved in producing, transporting, purchasing, or selling, including measuring, oil or gas through the point of royalty measurement or the point of first sale, whichever is later. Record holders must maintain records generated during or for the period for which the lessee or operator has an interest in or conducted operations on the lease, or in which a person is involved in transporting, purchasing, or selling production from the lease, for the period of time required in paragraph (d) of this section.

§ 3162.4–3 [Removed]

■ 6. Remove § 3162.4–3.

■ 7. Amend § 3162.6 as follows:

■ a. In paragraph (a), revise the word ''indentification'' to read ''identification''; and

■ b. Revise paragraphs (b) and (c), redesignate paragraph (d) as paragraph (e), and add a new paragraph (d).

The revisions and addition read as follows:

§ 3162.6 Well and facility identification.

* * * * *

(b) For wells located on Federal and Indian lands, the operator must properly identify, by a sign in a conspicuous place, each well, other than those permanently abandoned. The well sign must include the well number, the name of the operator, the lease serial number, and the surveyed location (the quarter-quarter section, section, township and range or other authorized survey designation acceptable to the authorized officer, such as metes and bounds or longitude and latitude). When specifically requested by the authorized officer, the sign must include the unit or communitization agreement name or number. The authorized officer may also require the sign to include the name of the Indian allottee lessor(s) preceding the lease serial number.

(c) All facilities at which oil or gas produced from a Federal or Indian lease is stored, measured, or processed must be clearly identified with a sign that contains the name of the operator, the lease serial number or communitization or unit agreement identification number, as appropriate, and the surveyed location (the quarter-quarter section, section, township and range or other authorized survey designation acceptable to the authorized officer, such as metes and bounds or longitude and latitude). On Indian leases, the sign also must include the name of the appropriate tribe and whether the lease is tribal or allotted. For situations of 1 tank battery servicing 1 well in the same location, the requirements of this paragraph and paragraph (b) of this section may be met by 1 sign as long as it includes the information required by both paragraphs. In addition, each storage tank must be clearly identified by a unique number. With regard to the quarter-quarter designation and the unique tank number, any such designation established by state law or regulation satisfies this requirement.

(d) All signs must be maintained in legible condition and must be clearly apparent to any person at or approaching the storage, measurement, or transportation point.

* * * * *

§ 3162.7–1 [Amended]

■ 8. Amend § 3162.7–1 by removing paragraph (f).

§ 3162.7–5 [Removed]

■ 9. Remove § 3162.7–5.

■ 10. Amend § 3163.2 by revising paragraphs (a), (b), and (k), to read as follows:

§ 3163.2 Civil penalties.

(a)(1) Whenever an operating rights owner or operator, as appropriate, fails or refuses to comply with any applicable requirements of the Federal Oil and Gas Royalty Management Act, any mineral leasing law, any regulation thereunder, or the terms of any lease or permit issued thereunder, the authorized officer will notify the operating rights owner or operator, as appropriate, in writing of the violation, unless the violation was discovered and reported to the authorized officer by the liable person or the notice was previously issued under § 3163.1 of this subpart.

(2) Whenever a purchaser or transporter who is not an operating rights owner or operator fails or refuses to comply with 30 U.S.C. 1713 or applicable rules or regulations regarding records relevant to determining the quality, quantity, and disposition of oil or gas produced from or allocable to a Federal or Indian oil and gas lease, the authorized officer will notify the purchaser or transporter, as appropriate, in writing of the violation.

(b)(1) If the violation is not corrected within 20 days of such notice or report, or such longer time as the authorized officer may agree to in writing, the operating rights owner, operator, purchaser, or transporter, as appropriate, will be liable for a civil penalty of up to $500 per violation for each day such violation continues, dating from the date of such notice or report. Any amount imposed and paid as assessments under § 3163.1(a)(1) will be deducted from penalties under this section.

(2) If the violation specified in paragraph (a) of this section is not corrected within 40 days of such notice or report, or a longer period as the authorized officer may agree to in writing, the operating rights owner, operator, purchaser, or transporter, as appropriate, will be liable for a civil penalty of up to $5,000 per violation for each day the violation continues, not to exceed a maximum of 60 days, dating from the date of such notice or report. Any amount imposed and paid as assessments under § 3163.1(a)(1) of this subpart will be deducted from penalties under this section.

* * * * *

(k) If the violation continues beyond the 20-day maximum specified in paragraph (d) of this section, the authorized officer will revoke the transporter's authority to remove crude oil from any Federal or Indian lease under the authority of that authorized officer or to remove any crude oil allocated to such lease site. This revocation of the transporter's authority will continue until compliance is achieved and any related penalty paid.

§ 3164.1 [Amended]

■ 11. Amend § 3164.1, in paragraph (b), by removing the third entry in the chart (the reference to Order No. 3, Site Security).

■ 12. Amend § 3165.3 by revising paragraphs (a) and (d) to read as follows:

§ 3165.3 Notice, State Director review and hearing on the record.

(a) *Notice.* (1) Whenever an operating rights owner or operator, as appropriate, fails to comply with any provisions of the lease, the regulations in this part, applicable orders or notices, or any other appropriate order of the authorized officer, the authorized officer will issue a written notice or order to the appropriate party and the lessee(s) to remedy any defaults or violations.

(2) Whenever any purchaser or transporter, who is not an operating rights owner or operator, fails or refuses to comply with 30 U.S.C. 1713 or applicable rules or regulations regarding records relevant to determining the quality, quantity, and disposition of oil or gas produced from or allocable to a Federal or Indian oil and gas lease, applicable orders or notices, or any other appropriate orders of the authorized officer, the authorized officer will give written notice or order to the purchaser or transporter to remedy any violations.

(3) Written orders or a notice of violation, assessment, or proposed penalty will be issued and served by personal service by the authorized officer, or by certified mail, return receipt requested. Service will be deemed to occur when the document is received or 7 business days after the date it is mailed, whichever is earlier.

(4) Any person may designate a representative to receive any notice of violation, order, assessment, or proposed penalty on that person's behalf.

(5) In the case of a major violation, the authorized officer will make a good faith effort to contact such designated representative by telephone, to be followed by a written notice or order. Receipt of a notice or order will be deemed to occur at the time of such verbal communication, and the time of notice and the name of the receiving party will be documented in the file. If the good faith effort to contact the designated representative is unsuccessful, notice of the major violation or order may be given to any person conducting or supervising operations subject to the regulations in this part.

(6) In the case of a minor violation, the authorized officer will only provide a written notice or order to the designated representative.

(7) A copy of all orders, notices, or instructions served on any contractor or field employee or designated representative will also be mailed to the operator. Any notice involving a civil penalty against an operator will be mailed to the operator, with a copy to the operating rights owner.

* * * * *

(d) *Action on request for State Director review.* The State Director will issue a final decision within 10 business days after the receipt of a complete request for administrative review or, where oral presentation has been made, within 10 business days after the oral presentation. The State Director's decision represents the final Bureau decision from which further review may be obtained as provided in paragraph (c) of this section for proposed penalties, and in § 3165.4 for all other decisions.

■ 13. Add part 3170 to read as follows:

PART 3170—ONSHORE OIL AND GAS PRODUCTION

Subpart 3170—Onshore Oil and Gas Production: General

Sec.

§ 3170.1 Authority.

The authorities for promulgating the regulations in this part are the Mineral Leasing Act, 30 U.S.C. 181 *et seq.;* the Mineral Leasing Act for Acquired Lands, 30 U.S.C. 351 *et seq.;* the Indian Mineral Leasing Act, 25 U.S.C. 396a *et seq.;* the Act of March 3, 1909, 25 U.S.C. 396; and the Indian Mineral Development Act, 25 U.S.C. 2101 *et seq.* Each of these statutes gives the Secretary the authority to promulgate necessary and appropriate rules and regulations. See 30 U.S.C. 189; 30 U.S.C. 359; 25 U.S.C. 396d; 25 U.S.C. 396; and 25 U.S.C. 2107. The Secretary has delegated this authority to the Bureau of Land Management (BLM). For Indian leases, the delegation of authority to the BLM appears at 25 CFR parts 211, 212, 213, 225, and 227. In addition, various provisions of the Federal Oil and Gas Royalty Management Act, as amended, 30 U.S.C. 1701 *et seq.,* provide additional authority regarding records, inspection, and enforcement for onshore oil and gas operations, in addition to granting rulemaking authority at 30 U.S.C. 1751.

§ 3170.2 Scope.

The regulations in this part apply to:

(a) All Federal onshore and Indian oil and gas leases (other than those of the Osage Tribe);

(b) Indian Mineral Development Act (IMDA) agreements for oil and gas, unless specifically excluded in the agreement or unless the relevant provisions of the rule are inconsistent with the agreement;

(c) Leases and other business agreements for the development of tribal energy resources under a Tribal Energy Resource Agreement entered into with the Secretary, unless specifically excluded in the lease, other business agreement, or Tribal Energy Resource Agreement;

(d) State or private tracts committed to a federally approved unit or communitization agreement as defined by or established under 43 CFR subpart 3105 or 43 CFR part 3180; and

(e) All onshore facility measurement points where oil or gas produced from the leases or agreements identified earlier in this section is measured.

§ 3170.3 Definitions and acronyms.

(a) As used in this part, the term:

Allocation means a method or process by which production is measured at a central point and apportioned to the individual lease, unit or unit Participating Area (PA), or Communitized Area (CA) from which the production originated.

API MPMS (followed by a number) means the American Petroleum Institute Manual of Petroleum Measurement Standards, with the number referring to the Chapter and Section in that manual.

Audit trail means all source records necessary to verify and recalculate the volume and quality of oil and gas production measured at facility measurement points (FMPs) and reported to the Office of Natural Resources Revenue (ONRR).

Authorized officer (AO) has the same meaning as defined in 43 CFR 3000.0–5.

By-pass means any piping or other arrangement around or avoiding a meter or other measuring device or method (or component thereof) at an FMP that allows oil or gas to flow without measurement. Equipment that permits the changing of the orifice plate of a gas meter without bleeding the pressure off the gas meter run (*e.g.,* senior fitting) is not considered to be a by-pass.

Commingling, for production accounting and reporting purposes, means combining production from multiple leases, unit PAs, or CAs, or combining production from one or more leases, unit PAs, or CAs with production from State, local governmental, or private properties before the point of royalty measurement. Combining production from multiple wells on a single lease, unit PA, or CA before measurement is not considered commingling for production accounting purposes. Combining production downhole from different geologic formations on the same lease, unit PA, or CA is not considered commingling for production accounting purposes.

Communitized area (CA) means the area committed to a BLM approved communitization agreement.

Communitization agreement means an agreement to combine a lease or a portion of a lease that cannot otherwise be independently developed and operated in conformity with an established well spacing or well development program, with other tracts for purposes of cooperative development and operations.

Condition of Approval (COA) means a site-specific requirement included in the approval of an application that may limit or modify the specific actions covered by the application. Conditions of approval may minimize, mitigate, or prevent impacts to public lands or resources.

Days means consecutive calendar days, unless otherwise indicated.

Facility means:

(i) A site and associated equipment used to process, treat, store, or measure production from or allocated to a

Federal or Indian lease, unit, or CA that is located upstream of or at (and including) the approved point of royalty measurement; and

(ii) A site and associated equipment used to store, measure, or dispose of produced water that is located on a lease, unit, or CA.

Facility measurement point (FMP) means a BLM-approved point where oil or gas produced from a Federal or Indian lease, unit, or CA is measured and the measurement affects the calculation of the volume or quality of production on which royalty is owed. It includes, but is not limited to, the approved point of royalty measurement and measurement points relevant to determining the allocation of production to Federal or Indian leases, unit PAs, or CAs. However, allocation facilities that are part of a commingling and allocation approval under§ 3173.15 or that are part of a commingling and allocation approval approved after July 9, 2013, are not FMPs. An FMP also includes a meter or measurement facility used in the determination of the volume or quality of royalty-bearing oil or gas produced before BLM approval of an FMP under § 3173.12 of this part. An FMP must be located on the lease, unit, or CA unless the BLM approves measurement off the lease, unit, or CA. The BLM will not approve a gas processing plant tailgate meter located off the lease, unit, or CA, as an FMP.

Gas means any fluid, either combustible or noncombustible, hydrocarbon or non-hydrocarbon, that has neither independent shape nor volume, but tends to expand indefinitely and exists in a gaseous state under metered temperature and pressure conditions.

Incident of Noncompliance (INC) means documentation that identifies violations and notifies the recipient of the notice of required corrective actions or potential assessments of civil penalties.

Lease has the same meaning as defined in 43 CFR 3160.0–5.

Lessee has the same meaning as defined in 43 CFR 3160.0–5.

NIST traceable means an unbroken and documented chain of comparisons relating measurements from field or laboratory instruments to a known standard maintained by the National Institute of Standards and Technology (NIST).

Notice to lessees and operators (NTL) has the same meaning as defined in 43 CFR 3160.0–5.

Off-lease measurement means measurement at an FMP that is not located on the lease, unit, or CA from which the production came.

Oil means a mixture of hydrocarbons that exists in the liquid phase at the temperature and pressure at which it is measured. Condensate is considered to be oil for purposes of this part. Natural gas liquids extracted from a gas stream upstream of the approved point of royalty measurement are considered to be oil for purposes of this part.

(i) *Clean Oil or Pipeline Oil* means oil that is of such quality that it is acceptable to normal purchasers.

(ii) *Slop oil* means oil that is of such quality that it is not acceptable to normal purchasers and is usually sold to oil reclaimers. Oil that can be made acceptable to normal purchasers through special treatment that can be economically provided at the existing or modified facilities or using portable equipment at or upstream of the FMP is not slop oil.

(iii) *Waste oil* means oil that has been determined by the AO to be of such quality that it cannot be treated economically and put in a marketable condition with existing or modified lease facilities or portable equipment, cannot be sold to reclaimers, and has been determined by the AO to have no economic value.

Operator has the same meaning as defined in 43 CFR 3160.0–5.

Participating area (PA) has the same meaning as defined in 43 CFR 3180.0–5.

Point of royalty measurement means a BLM-approved FMP at which the volume and quality of oil or gas which is subject to royalty is measured. The point of royalty measurement is to be distinguished from meters that determine only the allocation of production to particular leases, unit PAs, CAs, or non-Federal and non-Indian properties. The point of royalty measurement is also known as the point of royalty settlement.

Production means oil or gas removed from a well bore and any products derived therefrom.

Production Measurement Team (PMT) means a panel of members from the BLM (which may include BLM-contracted experts) that reviews changes in industry measurement technology and standards to determine whether regulations should be updated and provides guidance on measurement technologies not addressed in current regulation. The purpose of the PMT is to act as a central advisory body to ensure that oil and gas produced from Federal and Indian leases is accurately measured and properly reported.

Purchaser means any person or entity who legally takes ownership of oil or gas in exchange for financial or other consideration.

Source record means any unedited and original record, document, or data that is used to determine volume and quality of production, regardless of format or how it was created or stored (*e.g.,* paper or electronic). It includes, but is not limited to, raw and unprocessed data (*e.g.,* instantaneous and continuous information used by flow computers to calculate volumes); gas charts; measurement tickets; calibration, verification, prover, and configuration reports; pumper and gauger field logs; volume statements; event logs; seal records; and gas analyses.

Statistically significant means the difference between two data sets that exceeds the threshold of significance.

Threshold of significance means the maximum difference between two data sets (a and b) that can be attributed to uncertainty effects. The threshold of significance is determined as follows:

$$T_s = \sqrt{U_a^2 + U_b^2}$$

where:
T_s = Threshold of significance, in percent
U_a = Uncertainty (95 percent confidence) of data set a, in percent
U_b = Uncertainty (95 percent confidence) of data set b, in percent

Total observed volume (TOV) means the total measured volume of all oil, sludges, sediment and water, and free water at the measured or observed temperature and pressure.

Transporter means any person or entity who legally moves or transports oil or gas from an FMP.

Uncertainty means the statistical range of error that can be expected between a measured value and the true value of what is being measured. Uncertainty is determined at a 95 percent confidence level for the purposes of this part.

Unit means the land within a unit area as defined in 43 CFR 3180.0–5.

Unit PA means the unit participating area, if one is in effect, the exploratory unit if there is no associated participating area, or an enhanced recovery unit.

Variance means an approved alternative to a provision or standard of a regulation, Onshore Oil and Gas Order, or NTL.

(b) As used in this part, the following additional acronyms apply:

API means American Petroleum Institute.

BLM means the Bureau of Land Management.

CMS means Coriolis Measurement System.

OGOR means Oil and Gas Operations Report (Form ONRR–4054 or any successor report).

ONRR means the Office of Natural Resources Revenue, U.S. Department of the Interior, and includes any successor agency.

WIS means Well Information System or any successor electronic system.

§ 3170.4 Prohibitions against by-pass and tampering.

(a) All by-passes are prohibited.

(b) Tampering with any measurement device, component of a measurement device, or measurement process is prohibited.

(c) Any by-pass or tampering with a measurement device, component of a measurement device, or measurement process may, together with any other remedies provided by law, result in an assessment of civil penalties for knowingly or willfully:

(1) Taking, removing, transporting, using, or diverting oil or gas from a lease site without valid legal authority under 30 U.S.C. 1719(d)(2) and 43 CFR. 3163.2(f)(2); or

(2) Preparing, maintaining, or submitting false, inaccurate, or misleading reports, records, or information under 30 U.S.C. 1719(d)(1) and 43 CFR 3163.2(f)(1).

§ 3170.5 [Reserved]

§ 3170.6 Variances.

(a) Any party subject to a requirement of a regulation in this part may request a variance from that requirement.

(1) A request for a variance must include the following:

(i) Identification of the specific requirement from which the variance is requested;

(ii) Identification of the length of time for which the variance is requested, if applicable;

(iii) An explanation of the need for the variance;

(iv) A detailed description of the proposed alternative;

(v) A showing that the proposed alternative will produce a result that meets or exceeds the objectives of the applicable requirement for which the variance is requested; and

(vi) The FMP number(s) for which the variance is requested, if applicable.

(2) A request for a variance must be submitted as a separate document from any plans or applications. A request for a variance that is submitted as part of a master development plan, application for permit to drill, right-of-way application, or applications for approval of other types of operations rather than submitted separately will not be considered. Approval of a plan or application that contains a request for a variance does not constitute approval of the variance. This paragraph does not prohibit submitting a separate request for a variance simultaneously with a plan or application.

For plans or applications that are contingent upon the approval of the variance request, we encourage the simultaneous submission of the request for variance and the plan or application.

(3) The party requesting the variance must submit the request and any supporting documents to the BLM Field Office having jurisdiction over the lands described in the application. The operator should file the request using the BLM's electronic system. If electronic filing is not possible or practical, the operator may submit a request for variance on the Form 3160–5, Sundry Notices and Reports on Wells (Sundry Notice) to the BLM Field Office having jurisdiction.

(4) The AO, after considering all relevant factors, may approve the variance, or approve it with COAs, only if the AO determines that:

(i) The proposed alternative meets or exceeds the objectives of the applicable requirement(s) of the regulation;

(ii) Approving the variance will not adversely affect royalty income and production accountability; and

(iii) Issuing the variance is consistent with maximum ultimate economic recovery as defined in 43 CFR 3160.0–5.

(5) The decision whether to grant or deny the variance request is entirely within the BLM's discretion.

(6) A variance from the requirements of a regulation in this part does not constitute a variance to provisions of other regulations, including Onshore Oil and Gas Orders.

(b) The BLM reserves the right to rescind a variance or modify any COA of a variance due to changes in Federal law, technology, regulation, BLM policy, field operations, noncompliance, or other reasons. The BLM will provide a written justification if it rescinds a variance or modifies a COA.

§ 3170.7 Required recordkeeping, records retention, and records submission.

(a) Lessees, operators, purchasers, transporters, and any other person directly involved in producing, transporting, purchasing, selling, or measuring oil or gas through the point of royalty measurement or the point of first sale, whichever is later, must retain all records, including source records, that are relevant to determining the quality, quantity, disposition, and verification of production attributable to Federal or Indian leases for the periods prescribed in paragraphs (c) through (e) of this section.

(b) This retention requirement applies to records generated during or for the period for which the lessee or operator has an interest in or conducted operations on the lease, or in which a person is involved in transporting, purchasing, or selling production from the lease.

(c)(1) For Federal leases, and units or CAs that include Federal leases but do not include Indian leases, the record holder must maintain records for 7 years after the records are generated.

(2) If a judicial proceeding or demand involving such records is timely commenced, the record holder must maintain such records until the final nonappealable decision in such judicial proceeding is made, or with respect to that demand is rendered, unless the Secretary or his designee or the applicable delegated State authorizes in writing an earlier release of the requirement to maintain such records.

(d)(1) For Indian leases, and units or CAs that include Indian leases but do not include Federal leases, the record holder must maintain records for 6 years after the records are generated.

(2) If the Secretary or his designee notifies the record holder that the Department of the Interior has initiated or is participating in an audit or investigation involving such records, the record holder must maintain such records until the Secretary or his designee releases the record holder from the obligation to maintain the records.

(e)(1) For units and CAs that include both Federal and Indian leases, if the Secretary or his designee has notified the record holder within 6 years after the records are generated that an audit or investigation involving such records has been initiated, but a judicial proceeding or demand is not commenced within 7 years after the records are generated, the record holder must retain all records regarding production from the unit or CA until the Secretary or his designee releases the record holder from the obligation to maintain the records.

(2) If a judicial proceeding or demand is commenced within 7 years after the records are generated, the record holder must retain all records regarding production from the unit or CA until the final nonappealable decision in such judicial proceeding is made, or with respect to that demand is rendered, or until the Secretary or his designee releases the record holder from the obligation to maintain the records, whichever is later, unless the Secretary or his designee authorizes in writing a release of the requirement to maintain

such records before a final nonappealable decision is made or rendered.

(f) The lessee, operator, purchaser, and transporter must maintain an audit trail.

(g) All records, including source records that are used to determine quality, quantity, disposition and verification of production attributable to a Federal or Indian lease, unit PA, or CA, must include the FMP number and the name of the company that created the record. For existing measurement facilities, in the interim period before the assignment of an FMP number, all records must include the following information:

(1) The name of the operator;

(2) The lease, unit PA, or communitization agreement number; and

(3) The well or facility name and number.

(h) Upon request of the AO, the operator, purchaser, or transporter must provide such records to the AO as may be required by regulation, written order, Onshore Order, NTL, or COA.

(i) All records must be legible.

(j) All records requiring a signature must also have the signer's printed name.

§ 3170.8 Appeal procedures.

BLM decisions, orders, assessments, or other actions under the regulations in this part are administratively appealable under the procedures prescribed in 43 CFR 3165.3(b), 3165.4, and part 4.

§ 3170.9 Enforcement.

Noncompliance with any of the requirements of this part or any order issued under this part may result in enforcement actions under 43 CFR subpart 3163 or any other remedy available under applicable law or regulation.

Subpart 3171—[Reserved]

Subpart 3172—[Reserved]

Subpart 3173—Requirements for Site Security and Production Handling

§ 3173.1 Definitions and acronyms.

(a) As used in this subpart, the term:

Access means the ability to:

(i) Add liquids to or remove liquids from, any tank or piping system, through a valve or combination of valves or by moving liquids from one tank to another tank; or

(ii) Enter any component in a measuring system affecting the accuracy of the measurement of the quality or quantity of the liquid being measured.

Appropriate valves means those valves that must be sealed during the production or sales phase (*e.g.,* fill lines, equalizer, overflow lines, sales lines, circulating lines, or drain lines).

Authorized representative (AR) has the same meaning as defined in 43 CFR 3160.0–5.

Business day means any day Monday through Friday, excluding Federal holidays.

Effectively sealed means the placement of a seal in such a manner that the sealed component cannot be accessed, moved, or altered without the seal being broken.

Land description means the geographical coordinates referenced to the National Spatial Reference System, North American Datum 1983 or latest edition, in feet and direction from the nearest two adjacent section lines, or, if not within the Rectangular Survey System, the nearest two adjacent property lines, generated from the BLM's current Geographic Coordinate database (Public Land Survey System).

Low-volume property means a lease, unit PA, or CA that does not produce sufficient volumes for the operator to realize from continued production a sufficient rate of return on the investment required to achieve non-commingled measurement of volumes produced from that lease, unit PA, or CA, such that a prudent operator would opt to plug a well or shut-in the lease, unit PA, or CA if the commingling request were not approved. The volumes produced from a lease, unit PA, or CA include all volumes produced and are not limited to volumes allocated to Federal leases or the Federal interest. In the absence of information demonstrating a different rate, a rate of return less than 10 percent (before Federal, State, and local taxes) will be regarded as not sufficient. A lease, unit PA, or CA may also be regarded as a low-volume property if the operator demonstrates that the cost of the capital expenditures required to achieve measurement of non-commingled production from that property is more than the net present value (NPV) of the projected royalty from continued production from the lease, CA, or unit PA over the life of the equipment.

Maximum ultimate economic recovery has the same meaning as defined in 43 CFR 3160.0–5.

Mishandling means unmeasured or unaccounted-for removal of production from a facility.

Piping means a tubular system (*e.g.,* metallic, plastic, fiberglass, or rubber) used to move fluids (liquids and gases).

Production phase means that event during which oil is delivered directly to or through production equipment to the storage facilities and includes all operations at the facility other than those defined by the sales phase.

Sales phase means that event during which oil is removed from storage facilities for sale at an FMP.

Seal means a uniquely numbered device which completely secures either a valve or those components of a measuring system that affect the quality or quantity of the oil being measured.

(b) As used in this subpart, the following additional acronyms apply:

BMPs means Best Management Practices.

Btu means British thermal unit.

CAA means commingling and allocation approval.

§ 3173.2 Storage and sales facilities—seals.

(a) All lines entering or leaving any oil storage tank must have valves capable of being effectively sealed during the production and sales phases unless otherwise provided under this subpart. During the production phase, all appropriate valves that allow unmeasured production to be removed from storage must be effectively sealed in the closed position. During any other phase (sales, water drain, hot oiling), and prior to taking the top tank gauge measurement, all appropriate valves that allow unmeasured production to enter or leave the sales tank must be effectively sealed in the closed position (see Appendix to Subpart 3173). Each unsealed or ineffectively sealed appropriate valve is a separate violation.

(b) Valves or combinations of valves and tanks that provide access to the production before it is measured for sales are considered appropriate valves and are subject to the seal requirements of this subpart (see Appendix to 3173). If there is more than one valve on a line from a tank, the valve closest to the tank must be sealed. All appropriate valves must be in an operable condition and accurately reflect whether the valve is open or closed.

(c) The following are not considered appropriate valves and are not subject to the sealing requirements of this subpart:

(1) Valves on production equipment (*e.g.,* separator, dehydrator, gun barrel, or wash tank);

(2) Valves on water tanks, provided that the possibility of access to production in the sales and storage tanks does not exist through a common circulating, drain, overflow, or equalizer system;

(3) Valves on tanks that contain oil that has been determined by the AO or AR to be waste or slop oil;

(4) Sample cock valves used on piping or tanks with a Nominal Pipe Size of 1 inch or less in diameter;

(5) When a single tank with a nominal capacity of 500 barrels (bbl) or less is used for collecting marginal production of oil produced from a single well (*i.e.,* production that is less than 3 bbl per day), the requirement for the fill-line valve to be sealed during shipment is waived, but all other seal requirements of this subpart apply;

(6) Gas line valves used on piping with a Nominal Pipe Size of 1 inch or less used as tank bottom ''roll'' lines are not required to be sealed, provided there is no access to the contents of the storage tank and the roll lines cannot be used as equalizer lines;

(7) Valves on tank heating systems which use a fluid other than the contents of the storage tank (*i.e.,* steam, water, or glycol);

(8) Valves used on piping with a Nominal Pipe Size of 1 inch or less connected directly to the pump body or used on pump bleed off lines;

(9) Tank vent-line valves; and

(10) Sales, equalizer, or fill-line valves on systems where production may be removed only through approved oil metering systems (*e.g.,* lease automatic custody transfer and CMS). However, any valve which allows access for removing oil before it is measured through the metering system must be effectively sealed (see Appendix to 3173).

(d) Tampering with any appropriate valve is prohibited. Tampering with an appropriate valve may result in an assessment of civil penalties for knowingly or willfully preparing, maintaining, or submitting false, inaccurate, or misleading reports, records, or written information under 30 U.S.C. 1719(d)(1) and 43 CFR 3163.2(f)(1), or knowingly or willfully taking, removing, transporting, using, or diverting oil or gas from a lease site without valid legal authority under 30 U.S.C. 1719(d)(2) and 43 CFR 3163.2(f)(2), together with any other remedies provided by law.

§ 3173.3 Oil measurement system components—seals.

(a) Components used for quantity or quality determination of oil must be effectively sealed to indicate tampering, including, but not limited to, the following components (see §§ 3174.8(a) (lease automatic custody transfer meters) and 3174.9(d) (Coriolis measurement systems) of this part):

(1) Sample probe;

(2) Sampler volume control;

(3) All valves on lines entering or leaving the sample container, excluding the safety pop-off valve (if so equipped). Each valve must be sealed in the open or closed position, as appropriate;

(4) Meter assembly, including the counter head and meter head;

(5) Temperature averager/flow computer;

(6) Back pressure valve downstream of the meter;

(7) Any drain valves in the system;

(8) Manual sampling valves (if so equipped);

(9) Valves on diverter lines larger than 1″ in nominal diameter;

(10) Right-angle drive;

(11) Totalizer; and

(12) Prover connections.

(b) Each missing or ineffectively sealed component is a separate violation.

§ 3173.4 Federal seals.

(a) In addition to any INC issued for a seal violation, the AO or AR may place one or more Federal seals on any appropriate valve, sealing device, or oil metering system component that does not comply with the requirements in §§ 3173.2 and 3173.3 of this subpart if the operator is not present, refuses to cooperate with the AO or AR, or is unable to correct the noncompliance.

(b) The placement of a Federal seal does not constitute compliance with the requirements of §§ 3173.2 and 3173.3 of this subpart.

(c) A Federal seal may not be removed without the approval of the AO or AR.

§ 3173.5 Removing production from tanks for sale and transportation by truck.

(a) When a single truck load constitutes a completed sale, the driver must possess documentation containing the information required in § 3174.12 of this part.

(b) When multiple truckloads are involved in a sale and the oil measurement method is based on the difference between the opening and closing gauges, the driver of the last truck must possess the documentation containing the information required in § 3174.12 of this part. All other drivers involved in the sale must possess a trip log or manifest.

(c) After the seals have been broken, the purchaser or transporter is responsible for the entire contents of the tank until it is resealed.

§ 3173.6 Water-draining operations.

When water is drained from a production storage tank, the operator, purchaser, or transporter, as appropriate, must document the following information:

(a) Federal or Indian lease, unit PA, or CA number(s);

(b) FMP number associated with the tank;

(c) The tank location by land description;

(d) The unique tank number and nominal capacity;

(e) Date and time for opening gauge;

(f) Opening gauge and color cut measurements;

(g) Name of the person and company draining the tank;

(h) Unique identifying number of each seal removed;

(i) Time of the closing gauge;

(j) Closing gauge measurement; and

(k) Unique identifying number of each seal installed.

§ 3173.7 Hot oiling, clean-up, and completion operations.

(a) During hot oil, clean-up, or completion operations, or any other situation where the operator removes oil from storage, temporarily uses it for operational purposes, and then returns it to storage on the same lease, unit PA, or CA, the operator must document the following information:

(1) Federal or Indian lease, unit PA, or communitization agreement number(s);

(2) FMP number associated with the tank or group of tanks;

(3) The tank location by land description;

(4) The unique tank number and nominal capacity;

(5) Date and time of the opening gauge;

(6) Opening gauge measurement;

(7) Name of the person and company removing production from the tank;

(8) Unique identifying number of each seal removed;

(9) Time of the closing gauge;

(10) Closing gauge measurement;

(11) Unique identifying number of each seal installed;

(12) How the oil was used; and

(13) Where the oil was used (*i.e.,* well or facility name and number).

(b) During hot oiling, line flushing, or completion operations or any other situation where the operator removes production from storage for use on a different lease, unit PA, or CA, the production is considered sold and must be measured in accordance with the applicable requirements of this subpart and reported as sold to ONRR on the OGOR (30 CFR part 1210 subpart C).

§ 3173.8 Report of theft or mishandling of production.

(a) No later than the next business day after discovery of an incident of apparent theft or mishandling of production, the operator, purchaser, or transporter must report the incident to the AO. All oral reports must be followed up with a written incident report within 10 business days of the oral report.

(b) The incident report must include the following information:

(1) Company name and name of the person reporting the incident;

(2) Lease, unit PA, or communitization agreement number, well or facility name and number, and FMP number, as appropriate;

(3) Land description of the facility location where the incident occurred;

(4) The estimated volume of production removed;

(5) The manner in which access was obtained to the production or how the mishandling occurred;

(6) The name of the person who discovered the incident; and

(7) The date and time of the discovery of the incident.

§ 3173.9 Required recordkeeping for inventory and seal records.

(a) At the end of each calendar month, the operator must measure and record an inventory consisting of TOV in storage;

(b) For each seal, the operator must maintain a record that includes:

(1) The unique identifying number of each seal and the valve or meter component on which the seal is or was used;

(2) The date of installation or removal of each seal;

(3) For valves, the position (open or closed) in which it was sealed; and

(4) The reason the seal was removed.

§ 3173.10 Form 3160–5, Sundry Notices and Reports on Wells.

(a) The operator must submit a Form 3160–5, Sundry Notices and Reports on Wells (Sundry Notice) for the following:

(1) Site facility diagrams (see § 3173.11 of this subpart);

(2) Request for an FMP number (see § 3173.12 of this subpart);

(3) Request for FMP amendments (see § 3173.13 of this subpart);

(4) Requests for approval of off-lease measurement (see § 3173.23 of this subpart);

(5) Request to amend an approval of off-lease measurement (see § 3173.23(k) of this subpart);

(6) Requests for approval of proposed CAAs (see § 3173.15 of this subpart); and

(7) Request to modify a CAA (see § 3173.18 of this subpart).

(b) The operator must submit all Sundry Notices electronically to the BLM office having jurisdiction over the lease, unit, or CA using the BLM's WIS, or other electronic system the BLM designates, unless the submitter:

(1) Is a small business, as defined by the U.S. Small Business Administration; and

(2) Does not have access to the Internet.

§ 3173.11 Site facility diagram.

(a) A site facility diagram is required for all facilities.

(b) Except for the requirement to submit a Form 3160–5 with the site facility diagram, no format is prescribed for site facility diagrams. The diagram should be formatted to fit on an 8½ × 11 sheet of paper, if possible, and must be legible and comprehensible to an individual with an ordinary working knowledge of oil field operations (See Appendix to 3173). If more than one page is required, each page must be numbered (in the format ''N of X pages'').

(c) The diagram must:

(1) Be submitted within 30 days of completion of construction of a new facility, when existing facilities are modified, or when a non-Federal facility located on a Federal lease or federally approved unit or CA is constructed or modified;

(2) Reflect the position of the production and water recovery equipment, piping for oil, gas, and water, and metering or other measuring systems in relation to each other, but need not be to scale;

(3) Commencing with the header, identify all of the equipment, including, but not limited to, the header, wellhead, piping, tanks, and metering systems located on the site, and include the appropriate valves and any other equipment used in the handling, conditioning, or disposal of production and water, and indicate the direction of flow;

(4) Identify by API number the wells flowing into headers;

(5) If another operator operates a co-located facility, depict the co-located facilities on the diagram or list them as an attachment and identify them by company name, facility name(s), lease, unit PA, or communitization agreement number, and FMP number(s);

(6) Indicate which valve(s) must be sealed and in what position during the production and sales phases and during the conduct of other production activities (*e.g.,* circulating tanks or drawing off water), which may be shown by an attachment, if necessary;

(7) When describing co-located facilities operated by one operator, include a skeleton diagram of the co-located facility, showing equipment only. For storage facilities common to co-located facilities operated by one operator, one diagram is sufficient;

(8) Clearly identify the lease, unit PA, or CA to which the diagram applies and the land description of the facility, and the name of the company submitting the diagram, with co-located facilities being identified for each lease, unit PA, or CA;

(9) Clearly identify on the diagram, or an attachment, all meters and measurement equipment. Specifically identify all approved and assigned FMPs.

(10) If the operator claims royalty-free use, clearly identify on the diagram or as an attachment, the equipment for which the operator claims royalty-free use. The operator must either:

(i) For each engine, motor, or major component (*e.g.,* compressor, separator, dehydrator, heater-treater, or tank heater) powered by production from the lease, unit, or CA, state the volume (oil or gas) consumed per day and per month, how the volume is determined, the equipment manufacturer's name, rated use, and equipment serial number; or

(ii) Measure the volume used by meter or tank gauge.

(11) Each diagram must contain a signature block certifying ''I (print company representative's name) representing (print company name) certify the accuracy and completeness of the information contained within this site facility diagram. (signature of company representative) on (date signed) (printed name of company representative).'' The person certifying must have the authority to act on behalf of the operator or lessee and possess knowledge of the accuracy and completeness of the information presented in the diagram.

(d) For a facility in service before [EFFECTIVE DATE OF THE FINAL RULE], the operator must submit a new site facility diagram that complies with this section within 30 days after the BLM assigns an FMP number under § 3173.12 of this subpart; and

(e) For facilities in service before [EFFECTIVE DATE OF THE FINAL RULE], for which the BLM will not assign an FMP number under § 3173.12 of this subpart (*e.g.*, facilities that dispose of produced water), the operator must submit a new site facility diagram by [DATE 60 DAYS AFTER THE EFFECTIVE DATE OF THE FINAL RULE].

§ 3173.12 Applying for a facility measurement point.

(a)(1) Unless otherwise approved, the FMP(s) for all Federal and Indian leases, unit PAs, or CAs must be located within the boundaries of the lease, unit, or CA from which the production originated and must measure only production from that lease, unit PA, or CA.

(2) Off-lease measurement, commingling, or allocation of Federal or Indian production requires prior approval (see 43 CFR 3162.7–2, 3162.7–3, 3173.15, 3173.16, 3173.23, and 3173.24).

(b) The BLM will not approve a gas processing plant tailgate meter located off the lease, unit, or CA as an FMP.

(c) The operator must separately apply for approval of separate FMP numbers for an FMP that measures oil produced from a lease, unit PA, CA, or CAA and an FMP that measures gas produced from the same lease, unit PA, CA, or CAA, even if the measurement equipment or facilities are at the same location.

(d) For a measurement facility that comes into service after [EFFECTIVE DATE OF THE FINAL RULE], the operator must obtain BLM approval for the FMP before any production leaves the facility.

(e) For a measurement facility in service on or before [EFFECTIVE DATE OF THE FINAL RULE], the operator must apply for BLM approval of an FMP within the time prescribed in this paragraph, based on the production level of the lease, unit PA, CA, or CAA that the facility serves. The required time to apply for approval of an FMP applies to both oil and gas measurement facilities measuring production from that lease, unit PA, CA, or CAA.

(1) For a stand-alone lease, unit PA, CA, or CAA that produces 6,000 Mcf or more of gas per month or 40 barrels or more of oil per month, by [DATE 9 MONTHS AFTER THE EFFECTIVE DATE OF THE FINAL RULE].

(2) For a stand-alone lease, unit PA, CA, or CAA that produces 3,000 Mcf or more but less than 6,000 Mcf of gas per month or 20 barrels or more but less than 40 barrels of oil per month, by [DATE 18 MONTHS AFTER THE EFFECTIVE DATE OF THE FINAL RULE].

(3) For a stand-alone lease, unit PA, CA, or CAA that produces less than 3,000 Mcf of gas per month and less than 20 barrels of oil per month, [DATE 27 MONTHS AFTER THE EFFECTIVE DATE OF THE FINAL RULE].

(4) Calculate the production levels prescribed in paragraphs (e)(1) through (3) of this section as an average over the 12 months preceding the effective date of this section or the period the lease, unit PA, CA, or CAA has been in production, whichever is shorter.

(5) If the operator applies for an FMP approval by the date required under this paragraph, the operator may continue to use the existing measurement points until the BLM acts on the application.

(6) If the operator fails to apply for an FMP approval by the date required under this paragraph, the operator will be subject to an incident of noncompliance and assessment of civil penalty under 43 CFR subpart 3163, together with any other remedy available under applicable law or regulation.

(f) All requests for FMP approval must include the following:

(1) A complete Sundry Notice for approval of the FMP;

(2) The applicable Measurement Type Code specified in WIS;

(3) For gas and oil, a list of the measurement component names and the manufacturer, model, and serial number of each component. For example:

(i) ''Gas measurement,'' electronic flow computer—manufacturer, model, serial number; primary element (holder, *e.g.*, senior fitting)—manufacturer, serial number, size; transducer (static, differential and temperature)—manufacturer, model, serial number, upper range limit; temperature chart recorder—model, serial number, etc.;

(ii) ''Oil measurement by tank gauge,'' oil tank—tank number and/or serial number (there may be more than one tank associated with an FMP); and

(iii) ''Oil measurement by LACT,'' totalizer—model, serial number, temperature averager—model, serial number, etc.

(iv) ''Oil measurement by CMS,'' Coriolis meter—manufacturer, model, size serial number; transducer (pressure and temperature)—manufacturer, model, upper range limit; tertiary device, manufacturer, model.

(4) For gas, the gas sampling method (*i.e.*, spot, composite, or on-line gas chromatograph);

(5) Where production from more than one well will flow to the requested FMP, list the API well numbers associated with the FMP.

(g) FMP approval may be requested concurrently with requests for off-lease measurement or commingling and allocation approval.

(h) If the FMP request is approved, the BLM will assign an FMP number.

§ 3173.13 Requirements for approved facility measurement points.

(a) Within 30 days after BLM approval, the operator must stamp or stencil the FMP number on a fixed plate:

(1) For gas, either on the meter run or meter house, and, as required in 43 CFR 3175.101(b)(4)(i), on the flow computer display; and

(2) For oil measured by:

(i) LACT, on the non-resettable totalizer;

(ii) CMS, on the Coriolis meter and on the display of the tertiary device; or

(iii) Tank, on the pipeline, tank, or valve closest to the tank where the connection for removal or delivery is made.

(b) The operator must maintain the stamped or stenciled FMP number in a legible condition. The FMP number must be clearly visible to any person at or approaching the FMP and clearly identified with each FMP;

(c) Beginning on the first day of the month after the FMP number is assigned, the operator must use the FMP number in recordkeeping, as required by this subpart;

(d)(1) The operator must file a Sundry Notice that details any modifications to the FMP within 20 business days after the change.

(2) These details include, but are not limited to, the old and new meter manufacturer, serial number(s), owner's name, tank number(s), and wells or facilities using the FMP.

(3) The Sundry Notice must specify what was changed, why the change was made, the effective date, and include, if appropriate, an amended site facility diagram (see § 3173.11 of this subpart).

§ 3173.14 Conditions for commingling and allocation approval (surface and downhole).

(a) With the exceptions stated in paragraph (b) of this section, the BLM will grant a CAA only if:

(1) The proposed commingling includes production from only:

(i) Federal leases, unit PAs, or CAs with 100 percent Federal mineral ownership and the same fixed royalty rate and revenue distribution; or

(ii) Indian tribal leases, unit PAs, or CAs wholly owned by the same tribe and with the same fixed royalty rate;

(2) There is a signed agreement prescribing an allocation method among the properties whose production is to be commingled (including a method for allocating produced water);

(3) For each of the leases, unit PAs, or CAs proposed for inclusion in the CAA, the applicant demonstrates to the AO that a lease, unit PA, or CA proposed for inclusion is producing in paying quantities (or, in the case of Federal leases, capable of production in paying quantities) pending approval of the CAA; and

(4) The FMP(s) for the proposed CAA measure production originating only from the leases, unit PAs, or CAs in the CAA.

(b) The BLM will consider proposed commingling of production from Federal or Indian leases, unit PAs, or

CAs with less than 100 percent Federal or same Indian tribal ownership, or proposed commingling of production from one or more Federal or Indian leases, unit PAs, or CAs with production from State or private properties, only if the proposed commingling meets the conditions of subparagraphs (a)(2) through (4) of this section and if:

(1) The Federal or Indian lease, unit PA, or CA meets the definition of a low-volume property; or

(2) There are overriding considerations which indicate that the BLM should approve a commingling application notwithstanding potential negative royalty impacts from commingled measurement. Such considerations could include topographic or other environmental considerations that make non-commingled measurement physically impractical or undesirable, in view of where additional measurement and related equipment necessary to achieve non-commingled measurement would have to be located; and

(3) In either case, the AO determines that the requested CAA is in the public interest, taking into account relevant environmental considerations and the BLM's ability to verify and account for the production proposed to be commingled.

§ 3173.15 Applying for a commingling and allocation approval.

To apply for a CAA, the operator(s) must submit the following information, if applicable, to the BLM office having jurisdiction over the leases, unit PAs, or CAs whose production is proposed to be commingled:

(a) A completed Sundry Notice for approval of:

(1) Commingling and allocation; and

(2) Off-lease measurement under § 3173.23 of this subpart, if any of the proposed FMPs are outside the boundaries of any of the leases, units, or CAs whose production would be commingled (which may be included in the same Sundry Notice as the request for approval of commingling and allocation);

(b) A proposed allocation agreement and a proposed allocation schedule (including allocation of produced water) signed by each operator of each of the leases, unit PAs, or CAs whose production would be included in the CAA;

(c) A list of all Federal or Indian lease, unit PA, or communitization agreement numbers in the proposed CAA, specifying the type of production (*i.e.,* oil, gas, or both) for which commingling is requested;

(d) A map or maps showing the following:

(1) The boundaries of all the leases, units, unit PAs, or CAs whose production is proposed to be commingled;

(2) The proposed location by land description for the FMP used to measure the commingled production; and

(3) A map or diagram of existing or planned facilities that shows the location of all wellheads, production facilities, flow lines (including water flow lines), and FMPs existing or proposed to be installed to the extent known or anticipated;

(e) For existing facilities, site facility diagrams clearly showing any proposed change to current site facility diagrams (see § 3173.11 of this subpart);

(f) A schematic or engineering drawing for all new proposed facilities (including water handling facilities) showing the relative location of pipes, tanks, meters, separators, dehydrators, compressors, and other equipment;

(g) If new surface disturbance is proposed on one or more of the leases, units, or CAs and the surface is BLM-managed land, a request to the AO for approval of the proposed surface disturbance (by Sundry Notice if the affected land is leased, or in an application for right-of-way if the affected land is unleased land within a CA or unit);

(h) If new surface disturbance is proposed on BLM-managed land outside any of the leases, units, or CAs whose production would be commingled, a right-of-way grant application, under 43 CFR part 2880 if the FMP is on a pipeline, or under 43 CFR part 2800, if the FMP is a storage tank;

(i) If new surface disturbance is proposed on Federal land managed by an agency other than the BLM, written approval from the appropriate surface-management agency;

(j) Documentation demonstrating that each of the leases, unit PAs, or CAs proposed for inclusion in the CAA is producing in paying quantities (or, in the case of Federal leases, is capable of production in paying quantities) pending approval of the CAA; and

(k) All gas analyses, including Btu content (if the CAA request includes gas) and all oil gravities (if the CAA request includes oil) for previous periods of production from the leases, units, unit PAs, or CAs proposed for inclusion in the CAA, up to 6 years before the date of the application for approval of the CAA.

§ 3173.16 Existing commingling and allocation approvals.

(a) Upon receipt of an operator's request for assignment of an FMP number to a facility associated with a CAA existing on the effective date of this subpart, the AO will review the existing CAA for consistency with the minimum standards and requirements for a CAA under § 3173.14 of this subpart. The AO will notify the operator in writing of any inconsistencies or deficiencies.

(b) The operator must correct any inconsistencies or deficiencies that the AO identifies, or provide additional information, within 20 business days of receipt of the AO's notice.

(c) The AO may impose new or amended COAs on an existing commingling approval to make the approval consistent with the requirements for a CAA under § 3173.14 of this subpart in connection with approving the requested FMP. If the operator appeals one of more of the new COAs, the existing FMP approval will continue in effect during the pendency of the appeal.

(d) If the existing commingling approval does not meet the standards and requirements of § 3173.14 of this subpart and the operator does not correct the deficiencies, the AO may terminate the existing commingling approval under § 3173.20 of this subpart and deny the request for an FMP number for the facility associated with the existing commingling approval.

(e) If the BLM approves a new CAA to replace an existing CAA, the new CAA is effective on the first day of the month following its approval.

§ 3173.17 Relationship of a commingling and allocation approval to royalty-free use of production.

A CAA does not constitute approval of off-lease royalty-free use of production as fuel in facilities located at an FMP approved under the CAA. The operator may seek such approval under applicable rules.

§ 3173.18 Modification of a commingling and allocation approval.

(a) At the request of all the operators who are a party to a CAA, the CAA may be modified when:

(1) There is a change in the allocation schedule (including allocation of produced water) resulting from a change in relative production from wells subject to the CAA or addition or elimination of a well from the CAA;

(2) Additional leases, unit PAs, or CAs are proposed for inclusion in the CAA;

(3) A lease, unit PA, or communitization agreement within the

CAA terminates, or a unit PA within the CAA ceases production; or

(4) There is a change in operator.

(b) To request a modification of a CAA, all operators must submit to the AO:

(1) A completed Sundry Notice describing the modification requested;

(2) A new allocation schedule, if appropriate; and

(3) Certification by each operator that it agrees to the CAA modification.

§ 3173.19 Effective date of a commingling and allocation approval.

(a) If the BLM approves a commingling application, the effective date is the first day of the month following first production through the FMP(s) for the CAA.

(b) If the BLM approves a modification, the effective date is the first day of the month following approval of the modification.

(c) A CAA does not modify any of the terms of the leases, units, or communitization agreements covered by the CAA.

§ 3173.20 Terminating a commingling and allocation approval.

(a) Any operator who is party to a CAA may unilaterally terminate the CAA by submitting a Sundry Notice to the BLM. The Sundry Notice must identify the new FMP(s) for the lease(s), unit PA(s), or CA(s) operated by that operator.

(b) The BLM may terminate the CAA for any reason, including, but not limited to, the following:

(1) Changes in technology, regulation, or BLM policy;

(2) Non-compliance with the terms or COAs of the CAA or this subpart; or

(3) The BLM determines that a lease, unit, or communitization agreement subject to the CAA has terminated, or a unit PA subject to the CAA has ceased production.

(c) If only one lease, unit PA, or CA remains subject to the CAA, the CAA terminates automatically.

(d) The BLM will notify in writing all operators who are a party to the CAA of the CAA termination, the reason for the termination, and the effective date of the termination.

(e) If a CAA is terminated, each lease, unit PA, or CA that was included in the CAA will revert to separate measurement. The separate measurement must be on the lease, unit, or CA unless off-lease measurement is approved.

§ 3173.21 Combining production downhole in certain circumstances.

(a)(1) Combining production from a single well (*e.g.*, a directional well) drilled into different hydrocarbon pools or geologic formations underlying separate adjacent properties (whether Federal, Indian, State, or private), where none of the hydrocarbon pools or geologic formations underlie or are common to more than one of the respective properties, constitutes commingling for purposes of §§ 3173.14 through 3173.20.

(2) If any of the hydrocarbon pools or geologic formations underlie or are common to more than one of the properties, the operator must establish a unit PA (see 43 CFR part 3180) or communitization agreement (see 43 CFR 3105.2–1–3105.2–3), as applicable, rather than applying for a CAA.

(b) Combining production downhole from different geologic formations on the same lease from a single well requires approval of the AO (see 43 CFR 3162.3–2), but it is not considered commingling for production accounting purposes, unless the respective geologic formations have different ownership.

§ 3173.22 Requirements for off-lease measurement.

Off-lease measurement must:

(a) Involve only production from a single lease, unit PA, or CA or from a single CAA;

(b) Provide for accurate production accountability;

(c) Be in the public interest (considering factors including, but not limited to, BMPs and maximum ultimate economic recovery); and

(d) Occur at an approved FMP. A request for approval of an FMP (see § 3173.13 of this subpart) may be filed concurrently with the request for off-lease measurement.

§ 3173.23 Applying for off-lease measurement.

To apply for approval of off-lease measurement, the operator must submit the following to the BLM office having jurisdiction over the leases, units, or CAs:

(a) A completed Sundry Notice. The Sundry Notice should include a request for a CAA if the proposed off-lease measurement is associated with a proposed CAA (see § 3173.15 of this subpart);

(b) Justification for off-lease measurement (*e.g.*, necessary for economic or physical accessibility reasons, or BMPs);

(c) A topographic map of appropriate scale showing the following:

(1) The boundary of the lease(s), unit(s), or CA(s) from which the production originates;

(2) The location by land description of all wells, pipelines, facilities, and FMPs associated with the proposal, with equipment identified as existing or proposed; and

(3) The surface ownership of all land on which equipment is, or is proposed to be, located.

(d) A schematic or engineering drawing for all new proposed facilities showing the relative location of pipes, tanks, meters, separators, dehydrators, compressors, and other equipment;

(e) For existing facilities, site facility diagrams clearly showing any proposed change to current site facility diagrams (see § 3173.11 of this subpart);

(f) If any of the proposed off-lease measurement facilities are located on non-federally owned surface, a written concurrence signed by the owner(s) of the surface and the owner(s) of the measurement facilities, including each owner(s)' name, address, and telephone number, granting the BLM unrestricted access to the off-lease measurement facility and the surface on which it is located, for the purpose of inspecting any production, measurement, water handling, or transportation equipment located on the non-Federal surface up to and including the FMP, and for otherwise verifying production accountability. If the ownership of the non-Federal surface or of the measurement facility changes, the operator must obtain and provide to the AO the written concurrence required under this paragraph from the new owner(s);

(g) A right-of-way grant application, filed under 43 CFR part 2880 if the proposed off-lease FMP is on a pipeline, or under 43 CFR part 2800 if the proposed off-lease FMP is a storage tank;

(h) A right-of-way grant application, filed under 25 CFR part 169, if any of the proposed surface facilities are on Indian land outside the lease, unit, or CA from which the production originated;

(i) An application for approval of off-lease royalty-free use under applicable rules, if the operator proposes to use production from the lease, unit, or CA as fuel at the off-lease measurement facility without payment of royalty; and

(j) A statement that indicates whether the proposal includes all, or only a portion of, the production from the lease, unit, or CA. (For example, gas, but not oil, could be proposed for off-lease measurement.) If the proposal includes only a portion of the production, identify the FMP(s) where the remainder of the production from the lease, unit, or CA is measured or is proposed to be measured.

(k) To apply for an amendment of an existing approval of off-lease measurement, the operator must submit a completed Sundry Notice required under paragraph (a) of this section, and information required under paragraphs (b) through (j) of this section to the extent the information previously submitted has changed.

§ 3173.24 Effective date of an off-lease measurement approval.

If the BLM approves off-lease measurement, the approval is effective on the date that the approval is issued, unless the approval specifies a different effective date.

§ 3173.25 Existing off-lease measurement approval.

(a) Upon receipt of an operator's request for assignment of an FMP number to a facility associated with an off-lease measurement approval existing on [EFFECTIVE DATE OF THE FINAL RULE], the AO will review the existing off-lease measurement approval for consistency with the minimum standards and requirements for an off-lease measurement approval under § 3173.22 of this subpart. The AO will notify the operator in writing of any inconsistencies or deficiencies.

(b) The operator must correct any inconsistencies or deficiencies that the AO identifies, or provide additional information, within 20 business days of receipt of the AO's notice.

(c) The AO may impose new or amended COAs on an existing off-lease measurement approval to make the approval consistent with the requirements for off-lease measurement under § 3173.22 of this subpart in connection with approving the requested FMP. If the operator appeals one of more of the new COAs, the existing FMP approval will continue in effect during the pendency of the appeal.

(d) If the existing off-lease measurement approval does not meet the standards and requirements of § 3173.22 of this subpart and the operator does not correct the deficiencies, the AO may terminate the existing off-lease measurement approval under § 3173.27 of this subpart and deny the request for an FMP number for the facility associated with the existing off-lease measurement approval.

(e) If the BLM approves a new off-lease measurement arrangement to replace an existing off-lease measurement approval, the new arrangement is effective on the first day of the month following its approval.

§ 3173.26 Relationship of off-lease measurement approval to royalty-free use of production.

Approval of off-lease measurement does not constitute approval of off-lease royalty-free use of production as fuel in facilities located at an FMP approved under the off-lease measurement approval. The operator may seek such approval under applicable rules.

§ 3173.27 Termination of off-lease measurement approval.

(a) The operator may terminate the off-lease measurement by submitting a Sundry Notice to the BLM. The Sundry Notice must identify the new FMP(s) for the lease(s), unit(s), or CA(s) previously subject to the off-lease measurement approval.

(b) The BLM may terminate off-lease measurement approval for any reason, including, but not limited to, the following:

(1) Changes in technology, regulation, or BLM policy; or

(2) Non-compliance with the terms or conditions of approval of the off-lease measurement approval or §§ 3173.22 through 3173.26 of this subpart.

(c) The BLM will notify the operator in writing that the off-lease measurement approval has been terminated, the reason for the termination, and the effective date of the termination.

(d) If off-lease measurement is terminated, each lease, unit, or CA that was subject to the off-lease measurement will revert to measurement on the respective lease, unit, or CA.

§ 3173.28 Instances not constituting off-lease measurement, for which no approval is required.

(a) If the approved FMP is located on the well pad of a directionally drilled well that produces oil and gas from a lease, unit, or CA on which the well pad is not located, measurement at the FMP does not constitute off-lease measurement. However, if the FMP is located off of the well pad, regardless of distance, measurement at the FMP constitutes off-lease measurement, and BLM approval is required under §§ 3173.22 through 3173.26 of this subpart.

(b) If a lease, unit, or CA consists of more than one separate tract whose boundaries are not contiguous (*e.g.*, a single lease comprised of two or more separate tracts), measurement of production at an FMP located on one of the tracts is not considered to be off-lease measurement if:

(1) The production is moved from one tract to another tract within the same lease, unit, or CA to another area of the lease, unit, or CA on which the FMP is located; and

(2) Production is not diverted during the movement between the tracts before the FMP, except for production used royalty free.

§ 3173.29 Immediate assessments.

Certain instances of noncompliance warrant the imposition of immediate assessments upon discovery, as prescribed in the following table. Imposition of these assessments does not preclude other appropriate enforcement actions:

BILLING CODE 4310–84–P

Violations subject to an immediate assessment		
Violation:	**Assessment amount per violation:**	**Assessment will be issued to:**
1. An appropriate valve on an oil storage tank was not sealed, as required by § 3173.2 of this subpart.	$1,000	Operator
2. An appropriate valve or component on an oil metering system was not sealed, as required by § 3173.3 of this subpart.	$1,000	Operator
3. A Federal seal is removed without prior approval of the AO or AR, as required by § 3173.4 of this subpart.	$1,000	Operator, purchaser, or transporter, as appropriate
4. Oil was not properly measured before removal from storage for use on a different lease, unit, or CA, as required by § 3173.7(b) of this subpart.	$1,000	Operator
5. An FMP was bypassed, in violation of § 3170.4 of this part.	$1,000	Operator
6. Theft or mishandling of production was not reported to the BLM, as required by § 3173.8 of this subpart.	$1,000	Operator, purchaser, or transporter, as appropriate
7. Records necessary to determine quantity and quality of production were not retained, as required by § 3173.9(a)(1) of this subpart for Federal operations or § 3173.9(a)(2) of this subpart for Indian operations.	$1,000	Operator, purchaser, or transporter, as appropriate.
8. BLM approval for an FMP was not obtained before removing production, as required by § 3173.12 of this subpart.	$1,000	Operator
9. BLM approval for off-lease measurement was not obtained before removing production, as required by § 3173.23 of this subpart.	$1,000	Operator
10. BLM approval for surface commingling was not obtained before removing production, as required by § 3173.15 of this subpart.	$1,000	Operator
11. BLM approval for downhole commingling was not obtained before removing production, as required by §§ 3173.14 and 3173.15 of this subpart.	$1,000	Operator

1. ***Site Facility Diagrams** and **Sealing of Valves Introduction***

Introduction

Appendix to 3173 is provided not as a requirement but solely as an example to aid operators, purchasers and transporters in determining what valves are considered to be "appropriate valves" subject to the seal requirements of this proposed rule, and to aid in the preparation of facility diagrams. It is impossible to include every type of equipment that could be used or situation that could occur in production activities. In making the determination of what is an "appropriate valve," the entire facility must be considered as a whole, including the facility size, the equipment type, and the on-going activities at the facility. The signature block, in which a company representative certifies each diagram's accuracy, may be placed directly on the diagram or on a separate piece of paper accompanying the diagram. As shown in this Appendix, the signature block may appear in a box or as a line of text.

I-A

Facility Operator/Owner Name: ABC Oil and Gas

Federal/Indian Lease, unit PA, or CA Number: NMNM12345

Land Description: New Mexico Principal Meridian,
T. 36 N., R. 11 W., sec. 2, NW1/4NE1/4

Part IV

Federal Deposit Insurance Corporation

12 CFR Part 327

Assessments; Proposed Rule

FEDERAL DEPOSIT INSURANCE CORPORATION

12 CFR Part 327

RIN 3064–AE37

Assessments

AGENCY: Federal Deposit Insurance Corporation (FDIC).

ACTION: Notice of proposed rulemaking (NPR) and request for comment.

SUMMARY: The FDIC is proposing to amend 12 CFR part 327 to refine the deposit insurance assessment system for small insured depository institutions that have been federally insured for at least 5 years (established small banks) by: revising the financial ratios method so that it would be based on a statistical model estimating the probability of failure over three years; updating the financial measures used in the financial ratios method consistent with the statistical model; and eliminating risk categories for established small banks and using the financial ratios method to determine assessment rates for all such banks (subject to minimum or maximum initial assessment rates based upon a bank's CAMELS composite rating). The FDIC does not propose changing the range of assessment rates that will apply once the Deposit Insurance Fund (DIF or fund) reserve ratio reaches 1.15 percent; thus, under the proposal, as under current regulations, the range of initial deposit insurance assessment rates will fall once the reserve ratio reaches 1.15 percent. The FDIC proposes that a final rule would go into effect the quarter after a final rule is adopted; by their terms, however, the proposed amendments would not become operative until the quarter after the DIF reserve ratio reaches 1.15 percent.

DATES: Comments must be received by the FDIC no later than September 11, 2015.

ADDRESSES: You may submit comments on the notice of proposed rulemaking using any of the following methods:

- *Agency Web site: http://www.fdic.gov/regulations/laws/federal/.* Follow the instructions for submitting comments on the agency Web site.
- *Email: comments@fdic.gov.* Include RIN 3064–AE37 on the subject line of the message.
- *Mail:* Robert E. Feldman, Executive Secretary, Attention: Comments, Federal Deposit Insurance Corporation, 550 17th Street NW., Washington, DC 20429.
- *Hand Delivery:* Comments may be hand delivered to the guard station at the rear of the 550 17th Street Building (located on F Street) on business days between 7 a.m. and 5 p.m.
- *Public Inspection:* All comments received, including any personal information provided, will be posted generally without change to *http://www.fdic.gov/regulations/laws/federal.*

SUPPLEMENTARY INFORMATION:

I. Policy Objectives

The Federal Deposit Insurance Act (FDI Act) requires that the FDIC Board of Directors (Board) establish a risk-based deposit insurance assessment system.[1] Pursuant to this requirement, the FDIC adopted a risk-based deposit insurance assessment system effective in 1993 that applied to all banks.[2] A risk-based assessment system reduces the subsidy that lower-risk banks provide higher-risk banks and provides incentives for banks to monitor and reduce risks that could increase potential losses to the DIF. Since 1993, the FDIC has met its statutory mandate and has pursued these policy goals by periodically introducing improvements in the deposit insurance assessment system's ability to differentiate for risk. The primary purpose of the proposals in this NPR is to improve the risk-based deposit insurance assessment system applicable to small banks to more accurately reflect risk.[3]

[1] 12 U.S.C. 1817(b). A ''risk-based assessment system'' means a system for calculating an insured depository institution's assessment based on the institution's probability of causing a loss to the DIF due to the composition and concentration of the institution's assets and liabilities, the likely amount of any such loss, and the revenue needs of the DIF. See 12 U.S.C. 1817(b)(1)(C).

[2] As used in this NPR, the term ''bank'' is synonymous with the term ''insured depository institution'' as it is used in section 3(c)(2) of the FDI Act, 12 U.S.C 1813(c)(2).

On January 1, 2007, the FDIC instituted separate assessment systems for small and large banks. 71 FR 69282 (Nov. 30, 2006). See 12 U.S.C. 1817(b)(1)(D) (granting the Board the authority to establish separate risk-based assessment systems for large and small insured depository institutions).

[3] As used in this NPR, the term ''small bank'' is synonymous with the term ''small institution'' as it is used in 12 CFR 327.8. In general, a ''small bank'' is one with less than $10 billion in total assets.

II. Background

Risk-Based Deposit Insurance Assessments for Small Banks

Since 2007, assessment rates for small banks have been determined by placing each bank into one of four risk categories, Risk Categories I, II, III, and IV. These four risk categories are based on two criteria: capital levels and supervisory ratings. The three capital groups—well capitalized, adequately capitalized, and undercapitalized—are based on the leverage ratio and three risk-based capital ratios used for regulatory capital purposes.[4] The three supervisory groups, termed A, B, and C, are based upon supervisory evaluations by the small bank's primary federal regulator, state regulator or the FDIC.[5] Group A consists of financially sound institutions with only a few minor weaknesses (generally, banks with CAMELS[6] composite ratings of 1 or 2); Group B consists of institutions that demonstrate weaknesses that, if not corrected could result in significant deterioration of the institution and increased risk of loss to the DIF (generally, banks with CAMELS composite ratings of 3); and Group C consists of institutions that pose a substantial probability of loss to the DIF unless effective corrective action is taken (generally, banks with CAMELS composite ratings of 4 or 5). An institution's capital and supervisory group determine its risk category as set out in Table 1 below.

[4] The common equity tier 1 capital ratio, a new risk-based capital ratio, was incorporated into the deposit insurance assessment system effective January 1, 2015. 79 FR 70427 (November 26, 2014). Beginning January 1, 2018, a supplementary leverage ratio will also be used to determine whether an advanced approaches bank is: (a) well capitalized, if the bank is subject to the enhanced supplementary leverage ratio standards under 12 CFR 6.4(c)(1)(iv)(B), 12 CFR 208.43(c)(1)(iv)(B), or 12 CFR 324.403(b)(1)(vi), as each may be amended from time to time; and (b) adequately capitalized, if the bank is subject to the advanced approaches risk-based capital rules under 12 CFR 6.4(c)(2)(iv)(B), 12 CFR 208.43(c)(2)(iv)(B), or 12 CFR 324.403(b)(2)(vi), as each may be amended from time to time. 79 FR 70427, 70437 (November 26, 2014.) The supplementary leverage ratio is expected to affect the capital group assignment of few, if any, small banks.

[5] The term ''primary federal regulator'' is synonymous with the term ''appropriate federal banking agency'' as it is used in section 3(q) of the FDI Act, 12 U.S.C. 1813(q).

[6] A financial institution is assigned a composite rating based on an evaluation and rating of six essential components of an institution's financial condition and operations. These component factors address the adequacy of capital (C), the quality of assets (A), the capability of management (M), the quality and level of earnings (E), the adequacy of liquidity (L), and the sensitivity to market risk (S).

TABLE 1—DETERMINATION OF RISK CATEGORY

Capital group	Supervisory group		
	A CAMELS 1 or 2	B CAMELS 3	C CAMELS 4 or 5
Well Capitalized	Risk Category I.		
Adequately Capitalized	Risk Category II		Risk Category III.
Under Capitalized	Risk Category III		Risk Category IV

To further differentiate risk within Risk Category I (which includes most small banks), the FDIC uses the *financial ratios method,* which combines supervisory CAMELS component ratings with current financial ratios to determine a small Risk Category I bank's initial assessment rate.[7]

Within Risk Category I, those institutions that pose the least risk are charged a minimum initial assessment rate and those that pose the greatest risk are charged an initial assessment rate that is four basis points higher than the minimum. All other banks within Risk Category I are charged a rate that varies between these rates. In contrast, all banks in Risk Category II are charged the same initial assessment rate, which is higher than the maximum initial rate for Risk Category I. A single, higher, initial assessment rate applies to each bank in Risk Category III and another, higher, rate to each bank in Risk Category IV.[8]

The financial ratios method determines the assessment rates in Risk Category I using a combination of weighted CAMELS component ratings and the following financial ratios:

- Tier 1 Leverage Ratio;
- Net Income before Taxes/Risk-Weighted Assets;
- Nonperforming Assets/Gross Assets;
- Net Loan Charge-Offs/Gross Assets;
- Loans Past Due 30–89 days/Gross Assets;
- Adjusted Brokered Deposit Ratio; and
- Weighted Average CAMELS Composite Rating.[9]

To determine a Risk Category I bank's initial assessment rate, the weighted CAMELS components and financial ratios are multiplied by statistically derived pricing multipliers, the products are summed, and the sum is added to a uniform amount that applies to all Risk Category I banks. If, however, the rate is below the minimum initial assessment rate for Risk Category I, the bank will pay the minimum initial assessment rate; if the rate derived is above the maximum initial assessment rate for Risk Category I, then the bank will pay the maximum initial rate for the risk category.

The financial ratios used to determine rates come from a statistical model that predicts the probability that a Risk Category I institution will be downgraded from a composite CAMELS rating of 1 or 2 to a rating of 3 or worse within one year. The probability of a CAMELS downgrade is intended as a proxy for the bank's probability of failure. When the model was developed in 2006, the FDIC decided not to attempt to determine a bank's probability of failure because of the lack of bank failures in the years between the end of the bank and thrift crisis in the early 1990s and 2006.[10]

The financial ratios method does not apply to new small banks or to insured branches of foreign banks (insured branches).[11] The manner in which assessment rates for these institutions is determined is described further below.

Assessment Rates Under Current Rules

The Dodd-Frank Wall Street Reform and Consumer Protection Act (the Dodd-Frank Act), enacted in July 2010, revised the statutory authorities governing the FDIC's management of the DIF. The Dodd-Frank Act granted the FDIC authority to manage the fund in a manner that would help maintain a positive fund balance during a banking crisis and promote moderate, steady assessment rates throughout economic credit cycles.[12]

Among other things, the Dodd-Frank Act: (1) raised the minimum designated reserve ratio (DRR), which the FDIC must set each year, to 1.35 percent (from the former minimum of 1.15 percent) and removed the upper limit on the DRR (which was formerly capped at 1.5 percent); [13] (2) required that the fund reserve ratio reach 1.35 percent by September 30, 2020 (rather than 1.15 percent by the end of 2016, as formerly required); [14] and (3) required that, in setting assessments, the FDIC ''offset the effect of [requiring that the reserve ratio reach 1.35 percent by September 30, 2020 rather than 1.15 percent by the end of 2016] on insured depository institutions with total consolidated assets of less than $10,000,000,000.'' [15]

In 2011, the FDIC adopted a schedule of assessment rates designed to ensure that the reserve ratio reaches 1.15 percent by September 30, 2020.[16] In the near future, the FDIC plans to propose a rule to implement the Dodd-Frank Act requirement that the cost of raising the reserve ratio from 1.15 percent to 1.35

[7] New small banks in Risk Category I, however, are charged the highest initial assessment rate in effect for that risk category. Subject to exceptions, a new bank is one that has been federally insured for less than five years as of the last day of any quarter for which it is being assessed. 12 CFR 327.8(j).

[8] In 2011, the Board revised and approved regular assessment rate schedules. See 76 FR 10672 (Feb. 25, 2011); 12 CFR 327.10.

[9] The weights applied to CAMELS components are as follows: 25 percent each for Capital and Management; 20 percent for Asset quality; and 10 percent each for Earnings, Liquidity, and Sensitivity to market risk. These weights reflect the view of the FDIC regarding the relative importance of each of the CAMELS components for differentiating risk among institutions for deposit insurance purposes. The FDIC and other bank supervisors do not use such a system to determine CAMELS composite ratings.

[10] See 71 FR 41910, 41913 (July 24, 2006).

[11] Insured branches of foreign banks are deemed small banks for purposes of the deposit insurance assessment system.

[12] 12 U.S.C. 1817(e) (granting the Board the discretion to suspend or limit dividends).

[13] 12 U.S.C. 1817(b)(3)(B).

[14] Public Law 111–203, 334(d), 124 Stat. 1376, 1539 (12 U.S.C. 1817(note)).

[15] Public Law 111–203, 334(e), 124 Stat. 1376, 1539 (12 U.S.C. 1817(note)). The Dodd-Frank Act also: (1) eliminated the requirement that the FDIC provide dividends from the fund when the reserve ratio is between 1.35 percent and 1.5 percent, 12 U.S.C. 1817(e), and (2) continued the FDIC's authority to declare dividends when the reserve ratio at the end of a calendar year is at least 1.5 percent, but granted the FDIC sole discretion in determining whether to suspend or limit the declaration of payment or dividends, 12 U.S.C. 1817(e)(2)(A)–(B).

[16] See 76 FR 10672.

percent be paid by banks with $10 billion or more in assets.

The current initial assessment rates for small and large banks are set forth in Table 2 below.

TABLE 2—INITIAL BASE ASSESSMENT RATES

[In basis points per annum]

	Risk category					
	I*		II	III	IV	Large & highly complex institutions**
	Minimum	Maximum				
Annual Rates (in basis points)	5	9	14	23	35	5–35

* Initial base rates that are not the minimum or maximum will vary between these rates.
** See § 327.8(f) and § 327.8(g) for the definition of large and highly complex institutions.

An institution's total assessment rate may vary from the initial assessment rate as the result of possible adjustments.[17] After applying all possible adjustments, minimum and maximum total assessment rates for each risk category are set forth in Table 3 below.

TABLE 3—TOTAL BASE ASSESSMENT RATES*

[In basis points per annum]

	Risk category I	Risk category II	Risk category III	Risk category IV	Large & highly complex institutions **
Initial Assessment Rate	5–9	14	23	35	5–35
Unsecured Debt Adjustment ***	−4.5 to 0	−5 to 0	−5 to 0	−5 to 0	−5 to 0
Brokered Deposit Adjustment	N/A	0 to 10	0 to 10	0 to 10	0 to 10
Total Assessment Rate	2.5 to 9	9 to 24	18 to 33	30 to 45	2.5 to 45

* Total base assessment rates do not include the DIDA.
** See § 327.8(f) and (g) for the definition of large and highly complex institutions.
*** The unsecured debt adjustment cannot exceed the lesser of 5 basis points or 50 percent of an insured depository institution's initial base assessment rate. The unsecured debt adjustment does not apply to new banks or insured branches.

Before adopting the current assessment rate schedules, the FDIC undertook a historical analysis to determine how high the reserve ratio would have to have been to have maintained both a positive balance and stable assessment rates from 1950 through 2010.[18] The analysis shows that the fund reserve ratio would have needed to be approximately 2 percent or more before the onset of the 1980s and 2008 crises to maintain both a positive fund balance and stable assessment rates, assuming, in lieu of dividends, that the long-term industry average nominal assessment rate would have been reduced by 25 percent when the reserve ratio reached 2 percent, and by 50 percent when the reserve ratio reached 2.5 percent.

In 2011, consistent with the FDIC's historical analysis and the FDIC's long-term fund management plan adopted as a result of the historical analysis, the Board adopted lower, moderate assessment rates that will go into effect when the DIF reserve ratio reaches 1.15 percent.[19] Pursuant to the FDIC's authority to set assessments, the initial base and total base assessment rates set forth in Table 4 below will take effect beginning the assessment period after the fund reserve ratio first meets or exceeds 1.15 percent, without the necessity of further action by the Board. The rates will remain in effect unless and until the reserve ratio meets or exceeds 2 percent.[20]

[17] A bank's total base assessment rate can vary from its initial base assessment rate as the result of three possible adjustments. Two of these adjustments—the unsecured debt adjustment and the depository institution debt adjustment (DIDA)—apply to all banks (except that the unsecured debt adjustment does not apply to new banks or insured branches). The unsecured debt adjustment lowers a bank's assessment rate based on the bank's ratio of long-term unsecured debt to the bank's assessment base. The DIDA increases a bank's assessment rate when it holds long-term, unsecured debt issued by another insured depository institution. The third possible adjustment—the brokered deposit adjustment—applies only to small banks in Risk Category II, III and IV (and to large and highly complex institutions that are not well capitalized or that are not CAMELS composite 1 or 2-rated). It does not apply to insured branches. The brokered deposit adjustment increases a bank's assessment when it holds significant amounts of brokered deposits. 12 CFR 327.9 (d).

[18] The historical analysis and long-term fund management plan are described at 76 FR at 10675 and 75 FR 66272, 66272–281 (Oct. 27, 2010).

[19] See 76 FR at 10717–720.

[20] For new banks, however, the rates will remain in effect even if the reserve ratio equals or exceeds 2 percent (or 2.5 percent).

[21] The reserve ratio for the immediately prior assessment period must also be less than 2 percent.

TABLE 4—INITIAL AND TOTAL BASE ASSESSMENT RATES *

[In basis points per annum]

[Once the reserve ratio reaches 1.15 percent] [21]

	Risk category I	Risk category II	Risk category III	Risk category IV	Large & highly complex institutions **
Initial Base Assessment Rate	3–7	12	19	30	3–30
Unsecured Debt Adjustment ***	−3.5 to 0	−5 to 0	−5 to 0	−5 to 0	−5 to 0
Brokered Deposit Adjustment	N/A	0 to 10	0 to 10	0 to 10	0 to 10
Total Base Assessment Rate	1.5 to 7	7 to 22	14 to 29	25 to 40	1.5 to 40

* Total base assessment rates do not include the DIDA.

** See § 327.8(f) and (g) for the definition of large and highly complex institutions.

** The unsecured debt adjustment cannot exceed the lesser of 5 basis points or 50 percent of an insured depository institution's initial base assessment rate; thus, for example, an insured depository institution with an initial base assessment rate of 3 basis points will have a maximum unsecured debt adjustment of 1.5 basis points and cannot have a total base assessment rate lower than 1.5 basis points. The unsecured debt adjustment does not apply to new banks or insured branches.

In lieu of dividends, and pursuant to the FDIC's authority to set assessments and consistent with the FDIC's long-term fund management plan, the initial base and total base assessment rates set forth in Table 5 below will come into effect without further action by the Board when the fund reserve ratio at the end of the prior assessment period meets or exceeds 2 percent, but is less than 2.5 percent.[22]

TABLE 5—INITIAL AND TOTAL BASE ASSESSMENT RATES*

[In basis points per annum]

[If the reserve ratio for the prior assessment period is equal to or greater than 2 percent and less than 2.5 percent]

	Risk category I	Risk category II	Risk category III	Risk category IV	Large & highly complex institutions **
Initial Base Assessment Rate	2–6	10	17	28	2–28
Unsecured Debt Adjustment ***	−3 to 0	−5 to 0	−5 to 0	−5 to 0	−5 to 0
Brokered Deposit Adjustment	N/A	0 to 10	0 to 10	0 to 10	0 to 10
Total Base Assessment Rate	1 to 6	5 to 20	12 to 27	23 to 38	1 to 38

* Total base assessment rates do not include the DIDA.

** See § 327.8(f) and (g) for the definition of large and highly complex institutions.

*** The unsecured debt adjustment cannot exceed the lesser of 5 basis points or 50 percent of an insured depository institution's initial base assessment rate; thus, for example, an insured depository institution with an initial base assessment rate of 2 basis points will have a maximum unsecured debt adjustment of 1 basis point and cannot have a total base assessment rate lower than 1 basis point. The unsecured debt adjustment does not apply to insured branches.

The initial base and total base assessment rates set forth in Table 6 below will come into effect, again, without further action by the Board when the fund reserve ratio at the end of the prior assessment period meets or exceeds 2.5 percent.

TABLE 6—INITIAL AND TOTAL BASE ASSESSMENT RATES*

[In basis points per annum]

[If the reserve ratio for the prior assessment period is equal to or greater than 2.5 percent]

	Risk category I	Risk category II	Risk category III	Risk category IV	Large & highly complex institutions **
Initial Base Assessment Rate	1—5	9	15	25	1–25
Unsecured Debt Adjustment ***	−2.5 to 0	−4.5 to 0	−5 to 0	−5 to 0	−5 to 0
Brokered Deposit Adjustment	N/A	0 to 10	0 to 10	0 to 10	0 to 10
Total Base Assessment Rate	0.5 to 5	4.5 to 19	10 to 25	20 to 35	0.5 to 35

* Total base assessment rates do not include the DIDA.

** See § 327.8(f) and (g) for the definition of large and highly complex institutions.

*** The unsecured debt adjustment cannot exceed the lesser of 5 basis points or 50 percent of an insured depository institution's initial base assessment rate; thus, for example, an insured depository institution with an initial base assessment rate of 1 basis point will have a maximum unsecured debt adjustment of 0.5 basis points and cannot have a total base assessment rate lower than 0.5 basis points. The unsecured debt adjustment does not apply to insured branches.

[22] New small banks will remain subject to the assessment schedule in Table 5 when the reserve ratio reaches 2 percent and 2.5 percent.

With respect to each of the four assessment rate schedules (Tables 3, 4, 5 and 6), the Board has the authority to adopt rates without further notice and comment rulemaking that are higher or lower than the total assessment rates (also known as the total base assessment rates) shown in the tables, provided that: (1) The Board cannot increase or decrease rates from one quarter to the next by more than two basis points; and (2) cumulative increases and decreases cannot be more than two basis points higher or lower than the total base assessment rates.[23]

III. Justification for Proposal

While the current deposit insurance assessment system effectively reflects the risk posed by small banks, it can be improved by incorporating newer data from the recent financial crisis and revising the methodology to directly estimate the probability of failure three years ahead. These improvements will allow the FDIC to more effectively price risk. The proposed improvements to the small bank risk-based assessment system will further the goals of reducing cross-subsidization of high-risk institutions by low risk institutions and help ensure that banks that take on greater risks will pay more for deposit insurance.

IV. Description of the Proposed Rule

Summary of the Proposed Rule

The FDIC proposes to improve the assessment system applicable to established small banks[24] (that is, small banks other than new small banks and insured branches of foreign banks) by: (1) Revising the financial ratios method so that it is based on a statistical model estimating the probability of failure over three years; (2) updating the financial measures used in the financial ratios method consistent with the statistical model; and (3) eliminating risk categories for all established small banks and using the financial ratios method to determine assessment rates for all such banks. CAMELS composite ratings, however, would be used to place a maximum on the assessment rates that CAMELS composite 1- and 2-rated banks could be charged and minimums on the assessment rates that CAMELS composite 3-, 4- and 5-rated banks could be charged.

Over 500 banks have failed since the end of 2007. These failures, together with the hundreds of failures during the banking crisis of the late 1980s and early 1990s, have generated a robust set of data on bank failures. The FDIC need no longer rely on a model that estimates a proxy for failure—the probability that a bank with a CAMELS composite rating of 1 or 2 will be downgraded to a CAMELS composite rating of 3, 4, or 5 within 12 months; rather, the FDIC can base small bank deposit insurance assessments on a statistical model that estimates a bank's probability of failure directly.

In addition to estimating probability of failure directly, the proposal improves the small bank deposit insurance assessment system in other ways. First, it allows the assessment system to better capture risk when the risk is assumed, rather than when the risk has already resulted in losses. The statistical model on which the proposed deposit insurance assessment system for small banks is based estimates the probability of failure within three years, balancing the need to capture risk when it is assumed with the need for accurate failure predictions. (The longer the prediction period, the less accurate a model's predictions will tend to be; so, for example, the FDIC cannot create a model that predicts failure ten years in the future with sufficient accuracy.) The risk-based assessment system established in 2011 for large banks is also designed to capture performance over a period longer than one year. The FDIC would update the financial measures used in the financial ratios method to be consistent with the proposed statistical model. All of the proposed measures were statistically significant in predicting a bank's probability of failure within a three-year period.

Second, because the model allows the FDIC to estimate the probability of failure directly, it allows the FDIC to apply the model to all established small banks, not just those in Risk Category I. In part because CAMELS ratings can incorporate information that the model cannot, the FDIC proposes to apply minimum or maximum initial base assessment rates that will depend on a bank's CAMELS composite rating. Thus, as it has with large banks, the FDIC would eliminate risk categories for small banks (other than new small banks and insured branches of foreign banks).

Third, because the model predicts the probability of failure three years ahead using data on hundreds of failures (including failures during the recent crisis), it better reflects banks' actual risks and provides incentives to banks to monitor and reduce risks that increase potential losses to the DIF. Because it measures risk more accurately, the model reduces the subsidization of riskier banks by less risky banks.

The FDIC intends to preserve the lower range of initial base assessment rates previously adopted by the Board. The FDIC is proposing that the new assessment system go into operation the quarter after the reserve ratio reaches 1.15 percent. At that time, under the initial base assessment rate schedules adopted by the Board in 2011, initial based assessment rates will fall automatically from the current 5 basis point to 35 basis point range to a 3 basis point to 30 basis point range, as reflected in Table 4.[25] The FDIC adopted this schedule of assessment rates pursuant to its long-term fund management plan as the FDIC's best estimate of the assessment rates that would have been needed from 1950 to 2010 to maintain a positive fund balance during the past two banking crises.

The FDIC proposes to convert the statistical model to assessment rates within this 3 basis point to 30 basis point assessment range in a revenue neutral way; that is, in a manner that does not change the aggregate assessment revenue collected from established small banks. Specifically, the conversion would be done to ensure that aggregate assessments for an assessment period shortly before adoption of a final rule would have been approximately the same under the final rule as they would have been under the assessment rate schedule set forth in Table 4 (the rates that, under current rules, will automatically go into effect when the reserve ratio reaches 1.15 percent).

To avoid unnecessary burden, the FDIC is proposing a revised small bank assessment system that does not require small banks to report any new data in their Reports of Condition and Income (Call Reports).

Implementation of the Proposed Rule

The FDIC proposes that a final rule go into effect the quarter after a final rule is adopted; by their terms, however, the proposed revisions would not become operative until the quarter after the DIF reserve ratio reaches 1.15 percent.

[23] See 12 CFR 327.10(f); 76 FR at 10684.

[24] Subject to exceptions, an established insured depository institution is one that has been federally insured for at least five years as of the last day of any quarter for which it is being assessed. 12 CFR 327.8(k).

[25] As under current rules, the brokered deposit adjustment would continue to apply only to established small banks that are less than well capitalized or that have a CAMELS composite rating of 3, 4 or 5.

Detailed Description of the Proposed Rule

Risk Differentiation

As mentioned above, the FDIC is proposing to update the financial measures used in the financial ratios method consistent with the statistical model, eliminate risk categories for all established small banks, and use the financial ratios method to determine assessment rates for all such banks. CAMELS composite ratings would be used to place a maximum on the assessment rates that CAMELS composite 1- and 2-rated banks could be charged, and minimums on the assessment rates that CAMELS composite 3-, 4- and 5-rated banks could be charged.

The financial ratios method as revised would use the measures described in the right-hand column of Table 7 below. For comparison's sake, the measures currently used in the financial ratios method are set out on the left-hand column of the table.

TABLE 7—COMPARISON OF CURRENT AND PROPOSED MEASURES IN THE FINANCIAL RATIOS METHOD

Current risk category I financial ratios method	Proposed financial ratios method
• Weighted Average CAMELS Component Rating	• Weighted Average CAMELS Component Rating.
• Tier 1 Leverage Ratio	• Tier 1 Leverage Ratio.
• Net Income before Taxes/Risk-Weighted Assets	• Net Income before Taxes/Total Assets.
• Nonperforming Assets/Gross Assets	• Nonperforming Loans and Leases/Gross Assets.
	• Other Real Estate Owned/Gross Assets.
• Adjusted Brokered Deposit Ratio	• Core Deposits/Total Assets.
	• One Year Asset Growth.
• Net Loan Charge-Offs/Gross Assets	
• Loans Past Due 30–89 Days/Gross Assets	
	• Loan Mix Index.

All of the proposed measures are derived from a statistical analysis that estimates a bank's probability of failure within three years. Each of the measures was statistically significant in predicting a bank's probability of failure over that period. The statistical analysis used bank financial data and CAMELS ratings from 1985 through 2011, failure data from 1986 through 2014, and loan charge-off data from 2001 through 2014.[26] Appendix 1 to the Supplementary Information section of this notice and the proposed Appendix E describe the statistical analysis and the derivation of these proposed measures in detail.

Two of the proposed measures—the weighted average CAMELS component rating and the tier 1 leverage ratio—are identical to the measures currently used in the financial ratios method.[27] The proposed net income before taxes/total assets measure is also identical to the current measure, except that the denominator is total assets rather than risk-weighted assets. The current measure nonperforming assets/gross assets includes other real estate owned. In the proposal, other real estate owned/gross assets is a separate measure from nonperforming loans and leases/gross assets.

The remaining three proposed measures—core deposits/total assets, one-year asset growth, and the loan mix index—are new.[28]

Under the proposal, the core deposits/total assets and the one-year asset growth measures would replace the adjusted brokered deposit ratio currently used in the financial ratios method. The adjusted brokered deposit ratio increases a Risk Category I small bank's assessment rate only if the bank has both large amounts of brokered deposits and high asset growth.[29] Few banks have both, so the ratio affects few banks.[30] One of the proposed replacement measures—core deposits/total assets—will tend to lower assessment rates for most small banks. The other proposed replacement measure—one-year asset growth—will tend to raise assessment rates for small banks that grow significantly over a year (other than through merger or by acquiring failed banks).

The loan mix index is a measure of the extent to which a bank's total assets include higher-risk categories of loans. Each category of loan in a bank's loan portfolio is divided by the bank's total assets to determine the percentage of the bank's assets represented by that category of loan. Each percentage is then multiplied by that category of loan's historical weighted average industry-wide charge-off rate. The products are then summed to determine the loan mix index value for that bank.

The loan categories in the loan mix index were selected based on the availability of category-specific charge-off rates over a sufficiently lengthy period (2001 through 2014) to be representative. The loan categories exclude credit card loans.[31] For each loan category, the weighted average charge-off rate weights each industry-wide charge-off rate for each year by the number of bank failures in that year. Thus, charge-off rates from 2009 through 2014, during the recent banking crisis, have a much greater influence on the weighted average charge-off rate than charge-off rates from the years before the crisis, when few failures occurred. The weighted averages assure that types of loans that have high

[26] For certain lagged variables, such as one-year asset growth rates, the statistical analysis also used bank financial data from 1984.

[27] Current rules provide that, if a Risk Category I small bank's CAMELS component ratings change during a quarter in a way that changes the bank's initial base assessment rate, the initial base assessment rate for the period before the change shall be determined under the financial ratios method using the CAMELS component ratings in effect before the change. Beginning on the date of the CAMELS component ratings change, the initial base assessment rate for the remainder of the quarter is determined using the CAMELS component ratings in effect after the change. 12 CFR 327.9(a)(4)(iv)(B). Under the proposal, this rule would remain essentially unchanged, but would apply to all established small banks rather than just banks within Risk Category I.

[28] Two measures in the current financial ratios method—net loan charge-offs/gross assets and loans past due 30–89 days/gross assets—are not used in the statistical analysis and are not among the proposed measures.

[29] The adjusted brokered deposit ratio can affect assessment rates only if a bank's brokered deposits (excluding reciprocal deposits) exceed 10 percent of its non-reciprocal brokered deposits and its assets have grown more than 40 percent in the previous 4 years. 12 CFR 327 Appendix A to Subpart A.

[30] As of December 31, 2014, the adjusted brokered deposit ratio affected the assessment rate of 81 banks.

[31] Credit card loans were excluded from the loan mix index because they produced anomalously high assessment rates for banks with significant credit card loans. Credit card loans have very high charge-off rates, which the loan mix index can capture, but they also tend to have very high interest rates to compensate. In addition, few small banks have significant concentrations of credit card loans. Consequently, credit card loans are omitted from the index.

charge-off rates during downturns have an appropriate influence on assessment rates.

Table 8 below illustrates how the loan mix index is calculated for a hypothetical bank.

TABLE 8—LOAN MIX INDEX FOR A HYPOTHETICAL BANK [32]

	Weighted charge-off rate percent	Loan category as a percent of hypothetical bank's total assets	Product of two columns to the left
Construction & Development	4.50	1.40	6.29
Commercial & Industrial	1.60	24.24	38.75
Leases	1.50	0.64	0.96
Other Consumer	1.46	14.93	21.74
Loans to Foreign Government	1.34	0.24	0.32
Real Estate Loans Residual	1.02	0.11	0.11
Multifamily Residential	0.88	2.42	2.14
Nonfarm Nonresidential	0.73	13.71	9.99
1–4 Family Residential	0.70	2.27	1.58
Loans to Depository banks	0.58	1.15	0.66
Agricultural Real Estate	0.24	3.43	0.82
Agriculture	0.24	5.91	1.44
SUM (Loan Mix Index)	....	70.45	84.79

The weighted charge-off rates in the table are the same for all small banks. The remaining two columns vary from bank to bank, depending on the bank's loan portfolio. For each loan type, the value in the rightmost column is calculated by multiplying the weighted charge-off rate by the bank's loans of that type as a percent of its total assets. In this illustration, the sum of the right-hand column (84.79) is the loan mix index for this bank.

As in the current methodology for Risk Category I small banks, under the proposal the weighted CAMELS components and financial ratios would be multiplied by statistically derived pricing multipliers, the products would be summed, and the sum would be added to a uniform amount that would be: (a) Derived from the statistical analysis, (b) adjusted for assessment rates set by the FDIC, and (c) applied to all established small banks. The total would equal the bank's initial assessment rate. If, however, the resulting rate were below the minimum initial assessment rate for small banks, the bank's initial assessment rate would be the minimum initial assessment rate; if the rate were above the maximum, then the bank's initial assessment rate would be the maximum initial rate for small banks. In addition, if the resulting rate for a small bank were below the minimum or above the maximum initial assessment rate applicable to banks with the bank's CAMELS composite rating, the bank's initial assessment rate would be the respective minimum or maximum assessment rate for a small bank with its CAMELS composite rating. This approach would allow rates to vary incrementally across a wide range of rates for all small banks (other than new small banks and insured branches). The conversion of the statistical model to pricing multipliers and uniform amount are discussed further below and in detail in the proposed Appendix E. Appendix E also discusses the derivation of the pricing multipliers and the uniform amount.

Adjustments to Initial Base Assessment Rates

As under current rules: (1) The DIDA would continue to apply to all banks; (2) the unsecured debt adjustment would continue to apply to all banks except new banks and insured branches; and (3) the brokered deposit adjustment would continue to apply to all small banks except those that are well capitalized and have a CAMELS composite rating of 1 or 2.[33] As under current rules, if, during a quarter, a bank's supervisory rating changes from a CAMELS composite 1 or 2 rating to a CAMELS composite 3, 4 or 5 rating or vice versa, the bank would be subject to the brokered deposit adjustment for the portion of the quarter that it did not have a CAMELS composite 1 or 2 rating.[34]

Proposed Assessment Rates

As described above and as set out in the rate schedule in Table 9 below, for established small banks, the FDIC proposes to eliminate risk categories, but maintain the range of initial assessment rates (3 basis points to 30 basis points) that the Board has previously determined will go into effect starting the quarter after the reserve ratio reaches 1.15 percent and include a maximum assessment rate that would apply to CAMELS composite 1- and 2-rated banks and the minimum assessment rates that would apply to CAMELS composite 3-rated banks and CAMELS composite 4- and 5-rated banks.[35] Unless revised by the Board, these rates would remain in effect so long as the reserve ratio is less than 2 percent.

[32] As discussed above, the loan mix index uses loan charge-off data from 2001 through 2014. As discussed in greater detail below, if financial, failure and charge-off data from later years is available at the time the FDIC adopts a final rule pursuant to this proposal, the FDIC may update the statistical model, including the loan mix index, using the methodology described in Appendix E.

The table shows industry-wide weighted charge-off percentage rates, the loan category as a percentage of total assets and the products to two decimal places. In fact, the FDIC proposes to use seven decimal places for industry-wide weighted charge-off percentage rates, and as many decimal places as permitted by the FDIC's computer systems for the loan category as a percentage of total assets and the products. The total (the loan mix index itself) would use three decimal places.

[33] As under current rules, however, no adjustments would apply to bridge banks or conservatorships. These banks would continue to be charged the minimum assessment rate applicable to small banks. As under current rules, the brokered deposit adjustment would not apply to insured branches.

[34] If the bank were less than well capitalized, it would be subject to the brokered deposit adjustment for the whole quarter.

[35] See 12 CFR 327.10(b); 76 FR at 10718.

TABLE 9—INITIAL AND TOTAL BASE ASSESSMENT RATES *

[In basis points per annum]

[Once the reserve ratio reaches 1.15 percent][36]

	Established small banks			Large & highly complex institutions **
	CAMELS Composite			
	1 or 2	3	4.or 5	
Initial Base Assessment Rate	3 to 16	6 to 30	16 to 30	3 to 30
Unsecured Debt Adjustment ***	−5 to 0	−5 to 0	−5 to 0	−5 to 0
Brokered Deposit Adjustment	0 to10 ****	0 to10	0 to10	0 to 10
Total Base Assessment Rate	1.5 to 26	3 to 40	11 to 40	1.5 to 40

* Total base assessment rates in the table do not include the DIDA.

** See § 327.8(f) and (g) for the definition of large and highly complex institutions.

*** The unsecured debt adjustment cannot exceed the lesser of 5 basis points or 50 percent of an insured depository institution's initial base assessment rate; thus, for example, an insured depository institution with an initial base assessment rate of 3 basis points will have a maximum unsecured debt adjustment of 1.5 basis points and cannot have a total base assessment rate lower than 1.5 basis points.

**** The brokered deposit adjustment applies to established small banks with CAMELS composite ratings of 1 or 2 only if they are less than well capitalized.

As discussed above, the FDIC adopted the range of assessment rates in this rate schedule pursuant to its long-term fund management plan as the FDIC's best estimate of the assessment rates that would have been needed from 1950 to 2010 to maintain a positive fund balance during the past two banking crises. This assessment rate schedule remains the FDIC's best estimate of the long-term rates needed. Consequently, and as discussed in greater detail further below and in detail in Appendix E, the FDIC proposes to convert its statistical model to assessment rates within this 3 basis point to 30 basis point assessment range in a revenue neutral way.

The FDIC proposes to maintain the range of initial assessment rates, set out in the rate schedule in Table 10 below, that the Board has previously determined will go into effect starting the quarter after the reserve ratio reaches or exceeds 2 percent and is less than 2.5 percent. Unless revised by the Board, these rates would remain in effect so long as the reserve ratio is in this range. Table 10 also includes the maximum assessment rates that will apply to CAMELS composite 1- and 2-rated banks and the minimum assessment rates that will apply to CAMELS composite 3-rated banks and CAMELS composite 4- and 5-rated banks.

TABLE 10—INITIAL AND TOTAL BASE ASSESSMENT RATES *

[In basis points per annum]

[If the reserve ratio for the prior assessment period is equal to or greater than 2 percent and less than 2.5 percent]

	Established small banks			Large & highly complex institutions **
	CAMELS Composite			
	1 or 2	3	4 or 5	
Initial Base Assessment Rate	2 to 14	5 to 28	14 to 28	2 to 28
Unsecured Debt Adjustment ***	−5 to 0	−5 to 0	−5 to 0	−5 to 0
Brokered Deposit Adjustment	0 to 10 ****	0 to 10	0 to 10	0 to 10
Total Base Assessment Rate	1 to 24	2.5 to 38	9 to 38	1 to 38

* Total base assessment rates in the table do not include the DIDA.

** See § 327.8(f) and (g) for the definition of large and highly complex institutions.

*** The unsecured debt adjustment cannot exceed the lesser of 5 basis points or 50 percent of an insured depository institution's initial base assessment rate; thus, for example, an insured depository institution with an initial base assessment rate of 2 basis points will have a maximum unsecured debt adjustment of 1 basis point and cannot have a total base assessment rate lower than 1 basis point.

**** The brokered deposit adjustment applies to established small banks with CAMELS composite ratings of 1 or 2 only if they are less than well capitalized.

The FDIC proposes to maintain the range of initial assessment rates, set out in the rate schedule in Table 11 below, that the Board has previously determined will go into effect, again without further action by the Board, when the fund reserve ratio at the end of the prior assessment period meets or exceeds 2.5 percent. Unless changed by the Board, these rates would remain in effect so long as the reserve ratio is at or above this level. Table 11 also includes the maximum assessment rates that will apply to CAMELS composite 1- and 2-rated banks and the minimum assessment rates that will apply to CAMELS composite 3-rated banks and CAMELS composite 4- and 5-rated banks.

[36] The reserve ratio for the immediately prior assessment period must also be less than 2 percent.

TABLE 11—INITIAL AND TOTAL BASE ASSESSMENT RATES *

[In basis points per annum]

[If the reserve ratio for the prior assessment period is equal to or greater than 2.5 percent]

	Established small banks			Large & highly complex institutions **
	CAMELS Composite			
	1 or 2	3	4 or 5	
Initial Base Assessment Rate	1 to 13	4 to 25	13 to 25	1 to 25
Unsecured Debt Adjustment ***	−5 to 0	−5 to 0	−5 to 0	−5 to 0
Brokered Deposit Adjustment	0 to 10 ****	0 to 10	0 to 10	0 to 10
Total Base Assessment Rate	0.5 to 23	2 to 35	8 to 35	0.5 to 35

* Total base assessment rates in the table do not include the DIDA.

** See § 327.8(f) and (g) for the definition of large and highly complex institutions.

*** The unsecured debt adjustment cannot exceed the lesser of 5 basis points or 50 percent of an insured depository institution's initial base assessment rate; thus, for example, an insured depository institution with an initial base assessment rate of 1 basis point will have a maximum unsecured debt adjustment of 0.5 basis points and cannot have a total base assessment rate lower than 0.5 basis points.

**** The brokered deposit adjustment applies to established small banks with CAMELS composite ratings of 1 or 2 only if they are less than well capitalized.

With respect to each of the three assessment rate schedules (Tables 9, 10 and 11), the FDIC proposes that the Board would retain its authority to uniformly adjust assessment rates up or down from the total base assessment rate schedule without further rulemaking, as long as adjustment does not exceed 2 basis points. Also, with respect to each of the three schedules, the FDIC proposes that, if a bank's CAMELS composite or component ratings change during a quarter in a way that changes the institution's initial base assessment rate, then its assessment rate would be determined separately for each portion of the quarter in which it had different CAMELS composite or component ratings.

Conversion of Statistical Model to Pricing Multipliers and Uniform Amount

As discussed above, the FDIC proposes to convert its statistical model to assessment rates set out in Table 9 in a revenue neutral manner.[37] Specifically, and as described in detail in Appendix E, the FDIC proposes to convert the statistical model to assessment rates to ensure that aggregate assessments for an assessment period shortly before adoption of a final rule would have been approximately the same under the final rule as they would have been under the assessment rate schedule set forth in Table 4 (the rates that, under current rules, will automatically go into effect when the reserve ratio reaches 1.15 percent).

To illustrate the conversion, Table 12 below sets out the pricing multipliers and uniform amounts that would have resulted if the FDIC had converted the statistical model to the assessment rate schedule set out in Table 9 (with a range of assessment rates from 3 basis points to 30 basis points) so that, for the fourth quarter of 2014, aggregate assessments for all established small banks under the proposal would have equaled, as closely as reasonably possible, aggregate assessments for all established small banks had the assessment rate schedule in Table 4 been in effect for that assessment period.[38] Partly because the actual conversion will be based upon a later quarter (and partly for the reasons discussed directly below), the pricing multipliers and the uniform amount shown in Table 12 are likely to differ somewhat from those in the final rule.

TABLE 12—PRICING MULTIPLIERS AND THE UNIFORM AMOUNT UNDER A HYPOTHETICAL CONVERSION OF THE STATISTICAL MODEL TO ASSESSMENT RATES BASED ON THE FOURTH QUARTER OF 2014

Model measures	Pricing multiplier
Weighted Average CAMELS Component Rating	1.731
Tier 1 Leverage Ratio	−1.337
Net Income Before Taxes/Total Assets	−0.652
Nonperforming Loans and Leases/Gross Assets	0.924

TABLE 12—PRICING MULTIPLIERS AND THE UNIFORM AMOUNT UNDER A HYPOTHETICAL CONVERSION OF THE STATISTICAL MODEL TO ASSESSMENT RATES BASED ON THE FOURTH QUARTER OF 2014—Continued

Model measures	Pricing multiplier
Other Real Estate Owned/Gross Assets	0.620
Core Deposits/Total Assets	−0.139
One Year Asset Growth	0.043
Loan Mix Index	0.066
Uniform Amount	19.376

Updating the Statistical Model, Pricing Multipliers and Uniform Amount

The statistical analysis used bank financial data and CAMELS ratings from 1985 through 2011, failure data from 1986 through 2014 and loan charge-off data from 2001 through 2014. The FDIC proposes to retain the flexibility to update the statistical model from time to time using financial, failure and charge-off data from later years and publish a new loan mix index, uniform amount and pricing multipliers based on the updated model without further notice-and-comment rulemaking. Any update to the model would be done pursuant to the methodology described in Appendix E. No new financial ratios or other measures would be introduced into the model without notice-and-comment rulemaking. Because the analysis would continue to use earlier years' data as well, changes in estimations of failure probability should usually be relatively small. Similarly, if financial, failure and charge-off data from later years is available at the time the FDIC adopts a final rule pursuant to this proposal, the FDIC may update the statistical model,

[37] The FDIC proposes to convert a linear version of its model, which was estimated in a non-linear manner. (See Appendix E.) The conversion using a linear version of the model preserves the same rank ordering as the non-linear model, but using the linear version of the model allows initial assessment rates to be expressed as a linear function of the model variables. The FDIC also used a linear version of its original non-linear downgrade probability statistical model when it instituted variable rates within Risk Category 1 (effective January 1, 2007).

[38] Initial assessment rates under the rate schedule actually in effect for the fourth quarter of 2014 ranged from 5 basis points to 35 basis points, since the DIF reserve ratio was under 1.15 percent.

including the loan mix index, using the methodology described in Appendix E.

Insured Branches of Foreign Banks and New Small Banks

The FDIC proposes to make no changes to the rules governing the assessment rate schedules applicable to insured branches or to the assessment rate schedule applicable to new small banks. The FDIC also proposes to make no changes to the way in which assessment rates for insured branches and new small banks are determined.

Insured Branches

The current risk-based deposit insurance assessment system for small banks assigns insured branches an assessment risk classification that is based on the FDIC's consideration of supervisory evaluations provided by the institution's primary federal regulator.[39] Within Risk Category I, each insured branch's assessment rate is based on these supervisory evaluations.[40] Insured branches not in Risk Category I are charged the initial base assessment rate for the risk category to which they are assigned.[41] Once the DIF reserve ratio reaches 1.15 percent, 2 percent, and 2.5 percent, assessment rate schedules previously adopted by the Board will go into effect and remain in place for insured branches.

The FDIC does not propose changing the way assessment rates applicable to insured branches are determined.[42] Insured branches do not report the information that the FDIC would need to apply the financial ratios method to them.[43] Moreover, because insured branches operate as extensions of a foreign bank's global banking operations, they pose unique risks, which the financial ratios method may not be able to capture. An insured branch operates without capital of its own (capital is held by the foreign bank), its business strategies are typically directed by the foreign bank, it relies extensively on the foreign bank for liquidity and funding, and it often has considerable country and transfer risk exposures not typically found in other insured institutions of similar size. Insured branches also present potentially challenging concerns in the event of failure.

New Small Banks

New small banks are currently assigned to risk categories in the same manner as all other small banks. All new small banks in Risk Category I, however, are charged the maximum rate applicable to Risk Category I. New small banks not in Risk Category I are charged the initial base assessment rate for the risk category to which they are assigned.[44] Once the DIF reserve ratio reaches 1.15 percent, new small banks will be charged initial rates under the previously adopted rate schedule that automatically goes into effect then. This rate schedule will remain in place even if the reserve ratio equals or exceeds 2 percent or 2.5 percent.[45] After applying all possible adjustments, minimum and maximum total assessment rates for new small banks in each risk category are set forth in Table 13 below.

TABLE 13—TOTAL BASE ASSESSMENT RATES, NEW SMALL BANKS *

[In basis points per annum]

	Risk category I	Risk category II	Risk category III	Risk category IV
Initial Assessment Rate	7	12	19	30
Brokered Deposit Adjustment (added)	N/A	0 to 10	0 to 10	0 to 10
Total Assessment Rate	7	12 to 22	19 to 29	30 to 40

* The unsecured debt adjustment does not apply to new banks. Total assessment rates do not include the DIDA.

The FDIC does not propose changing the way assessment rates applicable to new small banks are determined.[46] The financial data on which the financial ratios method is based tends to be harder to interpret and less meaningful for new small banks. A new bank undergoes rapid changes in the scale and scope of operations, often causing financial ratios to be fairly volatile. In addition, a new bank's loan portfolio is often unseasoned, and therefore it is difficult to assess credit risk based solely on current financial ratios.[47]

[39] These supervisory evaluations result in the assignment of supervisory ratings referred to as ROCA ratings. ROCA stands for Risk Management, Operational Controls, Compliance, and Asset Quality. Like CAMELS components, ROCA component ratings range from a ''1'' (best rating) to a ''5'' rating (worst rating). A Risk Category I insured branch generally has a ROCA composite rating of 1 or 2.

[40] Specifically, the assessment rate depends on the insured branch's weighted average ROCA component ratings. The weights applied to individual ROCA component ratings are 35 percent, 25 percent, 25 percent, and 15 percent, respectively.

[41] No insured branch in any risk category is subject to the unsecured debt adjustment or brokered deposit adjustment. Insured branches are subject to the DIDA.

[42] As of March 31, 2015, there were only 9 insured branches that file regulatory financial submissions (FFIEC Form 002). (One of these branches, however, files for itself and another branch of the same foreign bank that does not file separately.)

[43] For example, insured branches of foreign banks do not report earnings and report only limited balance sheet information in FFIEC Form 002.

[44] New small banks are subject to the DIDA. New small banks in Risk Categories II, III, and IV are subject to the brokered deposit adjustment. New small banks are not subject to the unsecured debt adjustment.

[45] As with other assessment rates, the Board has the ability to adopt actual rates that are higher or lower than these total assessment rates without the necessity of further notice and comment rulemaking, provided that: (1) The Board cannot increase or decrease rates from one quarter to the next by more than two basis points; and (2) cumulative increases and decreases cannot be more than two basis points higher or lower than the total base rates.

[46] Current rules provide that: (1) under specified conditions, certain subsidiary small banks will be considered established rather than new, 12 CFR 327.8(k)(4); and (2) the time that a bank has spent as a federally insured credit union is included in determining whether a bank is established, 12 CFR 327.8(k)(5). If a Risk Category I small bank is considered established under these rules, but has no CAMELS component ratings, its initial assessment rate is 2 basis points above the minimum initial assessment rate applicable to Risk Category I (which is equivalent to 2 basis points above the minimum initial assessment rate for established small banks) until it receives CAMELS component ratings. Thereafter, the assessment rate is determined by annualizing, where appropriate, financial ratios obtained from all quarterly Call Reports that have been filed, until the bank files four quarterly Call Reports. For small banks that are considered established under these rules, but do not have CAMELS component ratings, the FDIC proposes the following:

1. If the bank has no CAMELS composite rating, its initial assessment rate would be 2 basis points above the minimum initial assessment rate for established small banks until it receives a CAMELS composite rating; and

2. If the bank has a CAMELS composite rating but no CAMELS component ratings, its initial assessment rate would be determined using the financial ratios method by substituting its CAMELS composite rating for its weighted average CAMELS component rating and, if the bank has not yet filed four quarterly Call Reports, by annualizing, where appropriate, financial ratios obtained from all quarterly Call Reports that have been filed.

[47] Empirical studies show that new banks exhibit a ''life cycle'' pattern, and it takes close to a decade after its establishment for a new bank to mature.

Continued

Further, on average, new banks have a higher failure rate than established institutions.

V. Expected Effects of the Proposed Rule

Effect on Assessment Rates

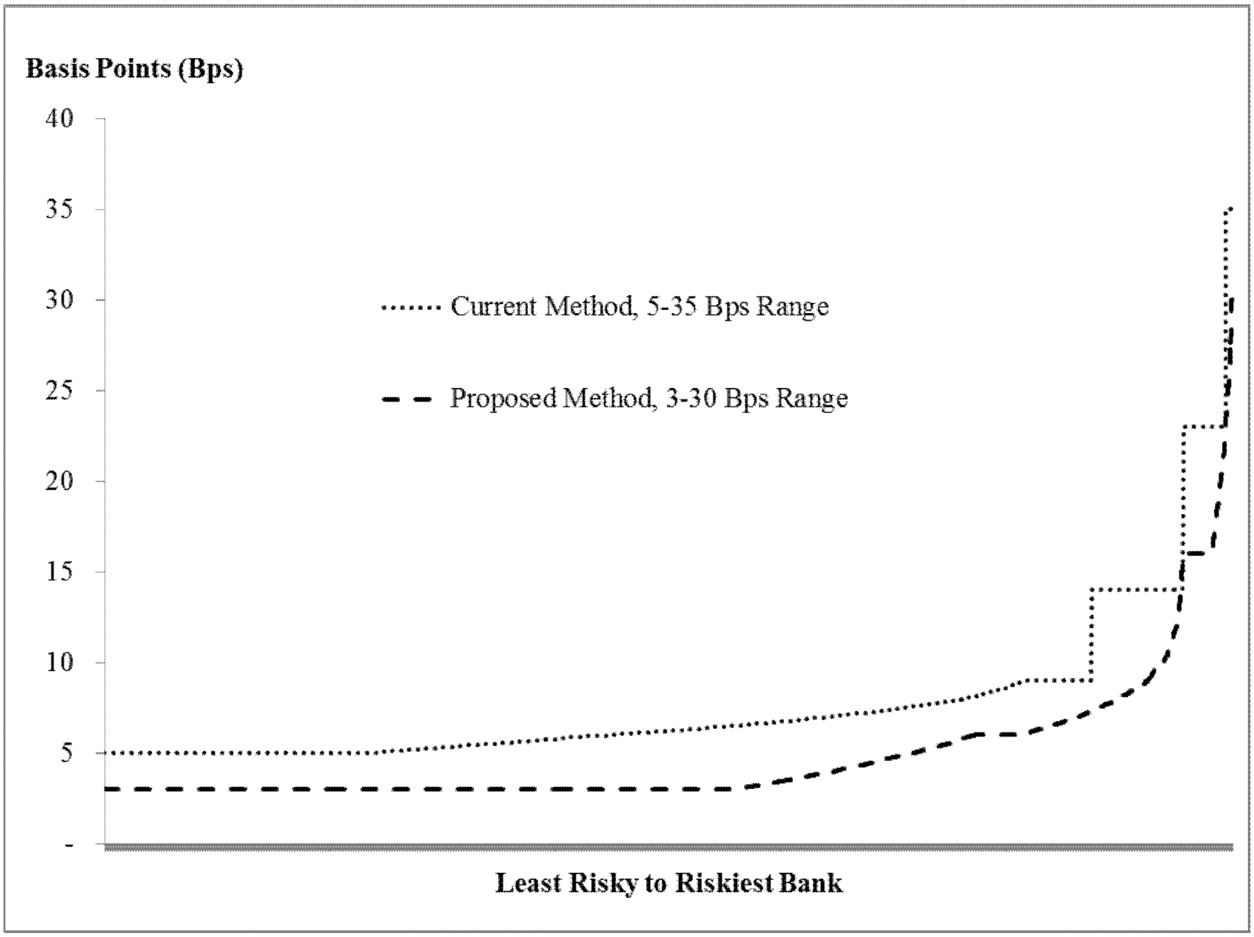
To illustrate the effects of the proposal on small bank assessment rates, the FDIC compared actual assessment rates of established small banks as of the end of 2014, using a range of initial assessment rates of 5 basis points to 35 basis points with hypothetical assessment rates under Table 9 of the proposal (which has an overall range of assessment rates of 3 basis points to 30 basis points).[48] The proportion (and number) of established small banks paying the minimum initial assessment rate would have increased significantly, from 23.3 percent in actuality (1,493 small banks) to 56.0 percent under the proposal (3,584 small banks). The proportion (and number) of established small banks paying the maximum assessment rate would have decreased from 0.7 percent of established small banks in actuality (43 small banks) to 0.1 percent of established small banks under the proposal (7 small banks). Most established small banks (5,922 or 92.5 percent) would have had rate decreases. On average, Risk Category I established small banks would have had a rate decrease of 2.4 basis points, and Risk Category II, III, and IV established small banks would have had a rate decrease of 6.5 basis points. Of the Risk Category II, III, and IV established small banks, 96.3 percent would have had rate decreases; the average decrease would have been 6.8 basis points. 481 established small banks (7.5 percent of established small banks) would have had rate increases. Of the Risk Category I established small banks, 8.0 percent would have had rate increases; the average increase would have been 1.6 basis points.

Chart 1 below graphically compares the distribution of established small bank initial assessment rates under this illustration. The horizontal axis in the chart represents established small banks ranked by risk, from the least risky on the left to the most risky on the right. Because actual risk rankings under the current small bank deposit insurance assessment system differ from risk rankings under the proposal, a particular point on the horizontal axis is not likely to represent the same bank for the current system and the proposal. Thus, the chart does not show how an individual bank's assessment would change under the proposal; it simply compares the distribution of assessment rates under the current system to the distribution under the proposal.

Despite low profitability and rapid growth, banks that are three years or newer have, on average, a probability of failure lower than established banks, perhaps owing to large capital cushions and close supervisory attention. However, after three years, new banks' failure probability, on average, surpasses that of established banks. New banks typically grow more rapidly than established banks and tend to engage in more high-risk lending activities funded by large deposits. Studies based on data from the 1980s showed that asset quality deteriorated rapidly for many new banks as a result, and failure probability (conditional upon survival in prior years) reached a peak by the ninth year. Many financial ratios of new banks generally begin to resemble those of established banks by about the seventh or eighth year of their operation. See Chiwon Yom, ''Recently Chartered Banks'' Vulnerability to Real Estate Crisis,'' FDIC Banking Review 17 (2005): 115 and Robert DeYoung, ''For How Long Are Newly Chartered Banks Financially Fragile?'' Federal Reserve Bank of Chicago Working Paper Series 2000–09.

[48] The proposal assumes a range of initial assessment rates from 3 basis points to 30 basis points. For purposes of determining assessment rates for the illustration, the FDIC converted the statistical model to a range of assessment rates from 3 basis points to 30 basis points so that, for the fourth quarter of 2014, aggregate assessments for all established small banks under the proposal would have equaled, as closely as reasonably possible, aggregate assessments for all established small banks under the rate schedule in Table 4 (the rates that, under current rules, will automatically go into effect when the reserve ratio reaches 1.15 percent). Initial assessment rates under the rate schedule actually in effect for the fourth quarter of 2014 ranged from 5 basis points to 35 basis points, since the DIF reserve ratio was under 1.15 percent.

Chart 1 – Illustrative, Hypothetical Comparison of Distribution of Assessment Rates For Established Small Banks (Comparing Actual Fourth Quarter of 2014 Initial Assessment Rates for the Current System to the Proposal)



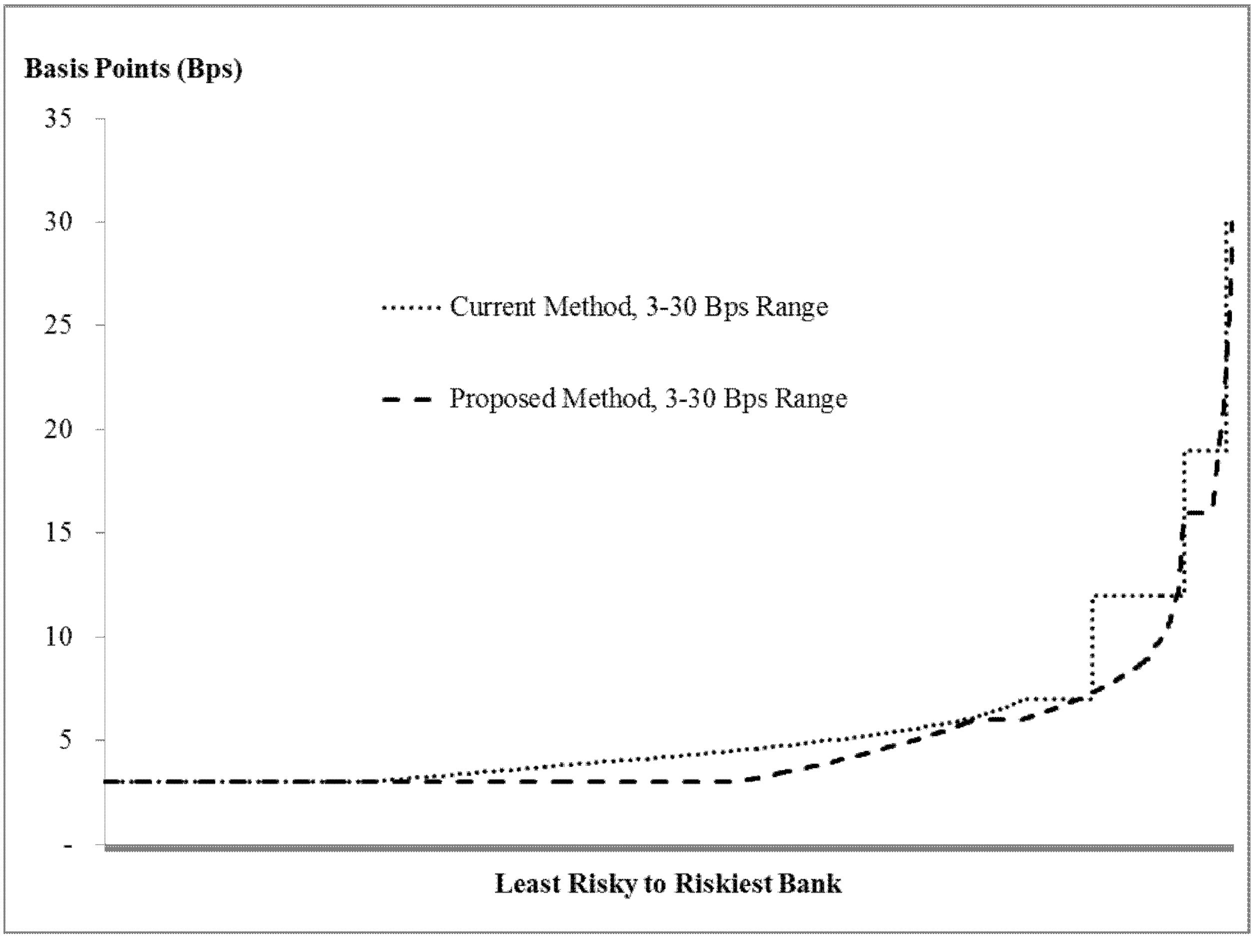
To further illustrate the effects of the proposal on small bank assessment rates, the FDIC compared hypothetical assessment rates under the proposal with the assessment rates established small banks would have been charged as of the end of 2014 if the assessment rate schedule that, under current rules, will go into effect when the reserve ratio reaches 1.15 percent had been in effect. The proportion of established small banks paying the minimum initial assessment rate would also have increased from 23.3 percent in actuality to 56.0 percent under the proposal and the proportion of established small banks paying the maximum assessment rate would also have decreased from 0.7 percent of established small banks in actuality to 0.1 percent of established small banks under the proposal. Most established small banks (3,814 or 59.5 percent) would have had rate decreases. On average, Risk Category I established small banks would have had a rate decrease of 0.4 basis points, and Risk Category II, III, and IV established small banks would have had a rate decrease of 3.7 basis points. Of the Risk Category II, III, and IV established small banks, 90.9 percent would have had rate decreases; the average decrease would have been 4.4 basis points. 1,268 established small banks (19.8 percent of established small banks) would have had rate increases. Of the Risk Category I established small banks, 21.4 percent would have had rate increases; the average increase would have been 1.9 basis points.

Chart 2 below graphically compares the distribution of established small bank initial assessment rates under this illustration.

Chart 2 – Illustrative, Hypothetical Comparison of Distribution of Assessment Rates

For Established Small Banks Based on the Fourth Quarter of 2014

(Comparing Table 4 Initial Assessment Rates for the Current System to the Proposal)



Effect on Capital and Earnings

Appendix 2 to the Supplementary Information section of this notice discusses the effect of the proposal on the capital and earnings of small established banks in detail. Annualizing fourth quarter 2014 balance sheet data, Appendix 2 analyzes the effects of the proposal on capital and income in two ways: (1) The effect of the proposal compared to the current small bank deposit insurance assessment system under the rate schedule in Table 3 (with an initial assessment rate range of 5 basis points to 35 basis points) (the first comparison); and (2) the effect of the proposal compared to the current small bank deposit insurance assessment system under the rate schedule in Table 4 (with an initial assessment rate range of 3 basis points to 30 basis points; this rate schedule is to go into effect the quarter after the DIF reserve ratio reaches 1.15 percent) (the second comparison).

Under either comparison, the proposal would cause no small banks to fall below a 4 percent or 2 percent leverage ratio that would otherwise be above these thresholds. Similarly, the proposal would cause no small banks to rise above a 2 percent leverage ratio that would otherwise be below this threshold. Two established small banks facing a decrease in assessments under the first comparison and one established small bank facing a decrease in assessments under the second comparison would, as a result of the proposal, have their leverage ratios rise above 4 percent, when they would have been below 4 percent otherwise.

In the first comparison, only approximately 7 percent of profitable established small banks and approximately 6 percent of unprofitable small banks would face a rate increase; all but a very few (26) banks would have resulting declines in income (or increases in losses, where the bank is unprofitable) of 5 percent or less. As discussed above, assessment rates for approximately 92 percent of established small banks would decline, resulting in increases in income (or decreases in losses), some of which would be substantial.

In the second comparison, approximately 20 percent of profitable established small banks and approximately 14 percent of unprofitable established small banks would face a rate increase; all but 111 established small banks would have resulting declines in income (or increases in losses, where the bank is unprofitable) of 5 percent or less. As discussed above, assessment rates for approximately 60 percent of established small banks would decline, resulting in increases in income (or decreases in losses), some of which would be substantial.

In sum, because the proposed revisions are intended to generate the same total revenue from small banks as would have been generated absent the proposal, the revisions should, overall, have no effect on the capital and earnings of the banking industry, although the revisions will affect the earnings and capital of individual institutions.

VI. Backtesting

To evaluate the proposed revisions to the risk-based deposit insurance assessment system for small banks, the FDIC tested how well the revised system would have differentiated between banks that failed and those that did not during the recent crisis compared to the current small bank deposit insurance assessment system.

Table 14 compares accuracy ratios for the proposed system and the current small bank deposit insurance assessment system. An accuracy ratio compares how well each approach would have discriminated between banks that failed within the projection period and those that did not. The projection period in each case is the three years following the date of the projection (the first column), which is the last day of the year given. Thus, for example, the accuracy ratios for 2006 reflect how well each approach would have discriminated in its projection between banks that failed and those that did not from 2007 through 2009.[49] A ''perfect'' projection would receive an accuracy ratio of 1; a random projection would receive an accuracy ratio of 0.[50]

TABLE 14—ACCURACY RATIO COMPARISON BETWEEN THE PROPOSAL AND THE CURRENT SMALL BANK DEPOSIT INSURANCE ASSESSMENT SYSTEM

Year of projection	Accuracy ratio for the proposal * (A)	Accuracy ratio for the current small bank assessment system (B)	Accuracy ratio for the proposal—accuracy ratio for the current system (A–B)
2006	0.7029	0.3491	0.3539
2007	0.7779	0.5616	0.2163
2008	0.8930	0.7825	0.1105
2009	0.9398	0.9015	0.0383
2010	0.9657	0.9394	0.0262
2011	0.9485	0.9323	0.0161

* The accuracy ratio for the proposal is based on the conversion of the statistical model as estimated through 2014.

The table reveals that, while the current system did relatively well at capturing risk and predicting failures in more recent years, the proposed system would have not only done significantly better immediately before the recent crisis and at the beginning of the crisis, but also better overall.[51] In the early part of the crisis, when CAMELS ratings had not fully reflected the worsening condition of many banks, the proposed system would have recognized risk far better than the current system, primarily because the rates under the proposed system are not constrained by risk categories. As the crisis progressed and CAMELS ratings more fully reflected crisis conditions, the superiority of the proposed system decreased, but it still performed better than the current system.

Appendix 1 to the Supplementary Information section of this notice contains a more detailed description of the FDIC's backtests of the proposal.

VII. Alternatives Considered

Alternative Minimum and Maximum Assessment Rates Based on CAMELS Composite Ratings

The FDIC considered imposing no minimum or maximum initial assessment rates based on a bank's CAMELS composite rating, which would have allowed initial assessment rates to vary between the minimum and maximum initial assessment rates of the entire rate schedule without regard to a bank's CAMELS composite rating (the unbounded variation). Thus, for example, under the 3 basis point to 30 basis point initial assessment range, a CAMELS composite 5 rated bank could, in principle, have paid a 3 basis point initial rate and a CAMELS composite 1 rated bank could, in principle, have paid a 30 basis point initial rate. As Table 15 shows, the accuracy ratios for this unbounded variation would have been similar to the accuracy ratios for the proposal.

[49] The current small bank deposit insurance assessment system did not exist at the end of 2006 and existed in somewhat different forms in years before 2011. The comparison assumes that the small bank deposit insurance assessment system in its current form existed in each year of the comparison.

[50] A ''perfect'' projection is defined as one where the projection rates every bank that fails over the projection period as more risky than every bank that does not fail. A random projection is one where the projection does no better than chance; that is, any given percentage of banks with projected higher risk will include the same percentage of banks that fail over the projection period. Thus, for example, in a random projection, the 10 percent of banks that receive the highest risk projections will include 10 percent of the banks that fail over the projection period; the 20 percent of banks that receive the highest risk projections will include 20 percent of the banks that fail over the projection period, and so on.

[51] As implied in the footnote to Table 14, the accuracy ratios in the table for the proposed system are based on in-sample backtesting. In-sample backtesting compares model forecasts to actual outcomes where those outcomes are included in the data used in model development. Out-of-sample backtesting is the comparison of model predictions against outcomes where those outcomes are not used as part of the model development used to generate predictions. Out-of-sample backtesting, discussed in Appendix 1 of the Supplementary Information section of this notice, also shows that, while the current assessment system for small banks did relatively well at predicting failures in more recent years, the proposed system would have done significantly better immediately before the recent crisis and at the beginning of the crisis, but also better overall.

TABLE 15—ACCURACY RATIO COMPARISON BETWEEN THE PROPOSAL AND THE UNBOUNDED VARIATION

Year of projection	Accuracy ratio for the unbounded variation (A)	Accuracy ratio for the proposal * (B)	Accuracy ratio for the unbounded variation—accuracy ratio for the proposal (A–B)
2006	0.6959	0.7029	−0.0070
2007	0.7779	0.7779	0.0001
2008	0.9121	0.8930	0.0191
2009	0.9407	0.9398	0.0010
2010	0.9670	0.9657	0.0013
2011	0.9514	0.9485	0.0029

* The accuracy ratios for the variation and for the proposal are based on the conversion of the statistical model as estimated through 2014.

The FDIC decided not to propose the unbounded variation, however. Other than taking into account weighted average CAMELS component ratings, the statistical model uses historical financial data to estimate average relationships between financial measures and the risk of failure. The statistical model does not take into account idiosyncratic or unquantifiable risk or risk mitigators (*e.g.,* entering or exiting a risky line of lending; having inexperienced or experienced management, reducing or tightening underwriting requirements), again except through weighted average CAMELS component ratings. The model does take into account weighted average CAMELS component ratings, but it assigns the same weight to them for each bank. Thus, for banks that have significant idiosyncratic or unquantifiable risk or risk mitigators, the model may not assign an assessment rate that reflects their actual risk. The proposal, however, ensures that the assessment system takes idiosyncratic and unquantifiable risks and risk mitigators into account to the extent that they are reflected in CAMELS composite ratings, and prevents the assessment system from assigning a rate that reflects either too little risk (for a bank with a CAMELS composite 3, 4 or 5 rating) or too much risk (for a bank with a CAMELS composite 1 or 2 rating). As a result, under the proposal, initial assessment rates for small banks that are well rated (those with CAMELS composite ratings of 1 or 2) would not overlap with initial assessment rates for troubled small banks (those with CAMELS composite ratings of 4 or 5), except at the maximum initial rate for CAMELS composite 1- and 2-rated banks and the minimum initial rate for CAMELS composite 4- and 5-rated banks.

In seeking the proper balance between maintaining the accuracy of the assessment system overall and reducing the risk that a particular bank's assessment rate might be inappropriate, the FDIC considered many other variations of minimum and maximum initial assessment rates based on a bank's CAMELS composite rating. Some variations with lower (or no) minimums for CAMELS 3- and/or CAMELS 4- and 5-rated banks and/or higher (or no) maximums for CAMELS 1- and/or CAMELS 2-rated banks had slightly higher accuracy ratios, but would have increased the risk of inappropriate assessment rates for some banks. Some variations with higher minimums for CAMELS 3- and/or CAMELS 4- and 5-rated banks and/or lower maximums for CAMELS 1- and/or CAMELS 2-rated banks had somewhat lower (or significantly lower) accuracy ratios. The maximums and minimums in the proposal represent the FDIC's best judgment on the proper balance. The FDIC is requesting comment on whether the proposal achieves the proper balance and whether the final rule should, instead, use alternative (or no) maximums and minimums based on CAMELS composite ratings. Because the FDIC intends that the effect of the proposal be revenue neutral, any reduction in the maximum initial assessment rate applicable to CAMELS composite 1- or CAMELS 2-rated banks that lowers some banks' assessment rates will increase the assessment rates of other banks.[52]

The FDIC is particularly interested in comment on two alternatives to the proposal, both of which would distinguish between CAMELS composite 1- and 2-rated small banks. The first alternative would maintain the assessment rate schedule that would go into effect starting the quarter after the reserve ratio reaches 1.15 percent (with a range of initial assessment rates of 3 basis points to 30 basis points) and include the same maximum and minimum assessment rates based upon banks' CAMELS composite ratings (see Table 9), except that it would lower the maximum initial assessment rate for a CAMELS composite 1-rated bank from 16 basis points to 12 basis points.[53] As reflected in Table 16 below, compared to the proposal, this alternative would have virtually no effect on accuracy (that is, on how well the assessment system would have differentiated between banks that failed and those that did not during the recent crisis); the alternative, like the proposal, is also significantly more accurate than the current small bank deposit insurance assessment system. On the other hand, the FDIC has never before distinguished between CAMELS composite 1-rated banks and CAMELS composite 2-rated banks for deposit insurance assessment purposes.

[52] To be revenue neutral, using different maximums or minimums will lead to different uniform amounts and pricing multipliers from the proposal when the new statistical model is converted to assessment rates.

[53] Similarly, the first alternative would maintain the proposed assessment rate schedule that would go into effect the quarter after the reserve ratio reaches or exceeds 2 percent, but is less than 2.5 percent, and include the same maximum and minimum assessment rates determined by CAMELS composite ratings (see Table 10), except that it would lower the maximum initial assessment rate for a CAMELS composite 1 rated bank from 14 basis points to 10 basis points. Also, the first alternative would maintain the proposed assessment rate schedule that would go into effect the quarter after the reserve ratio reaches or exceeds 2.5 percent, and include the same maximum and minimum assessment rates determined by CAMELS composite ratings (see Table 11), except that it would lower the maximum initial assessment rate for a CAMELS composite 1 rated bank from 13 basis points to 9 basis points.

TABLE 16—ACCURACY RATIO COMPARISON BETWEEN THE FIRST ALTERNATIVE, THE PROPOSAL AND THE CURRENT SMALL BANK DEPOSIT INSURANCE ASSESSMENT SYSTEM

Year of projection	Accuracy ratio for the alternative * (A)	Accuracy ratio for the proposal * (B)	Accuracy ratio for the alternative—accuracy ratio for the proposal (A–B)	Accuracy ratio for the current small bank assessment system (C)	Accuracy ratio for the alternative—accuracy ratio for the current system (A–C)
2006	0.7045	0.7029	0.0016	0.3491	0.3555
2007	0.7770	0.7779	−0.0009	0.5616	0.2154
2008	0.8895	0.8930	−0.0035	0.7825	0.1070
2009	0.9398	0.9398	0.0000	0.9015	0.0383
2010	0.9657	0.9657	0.0000	0.9394	0.0262
2011	0.9485	0.9485	0.0000	0.9323	0.0161

* The accuracy ratios for the alternative and for the proposal are based on the conversion of the statistical model as estimated through 2014.

The second alternative is the same as the first, except that, for the rate schedule that would go into effect the quarter after the reserve ratio reaches 1.15 percent, the minimum initial assessment rate applicable to CAMELS composite 4- and 5-rated banks would be lowered from 16 basis points to 12 basis points.[54] [55] As reflected in Table 17 below, compared to the proposal, this alternative would also have little effect on accuracy and, like the proposal, is significantly more accurate than the current small bank deposit insurance assessment system.

TABLE 17—ACCURACY RATIO COMPARISON BETWEEN THE SECOND ALTERNATIVE, THE PROPOSAL AND THE CURRENT SMALL BANK DEPOSIT INSURANCE ASSESSMENT SYSTEM

Year of projection	Accuracy ratio for the alternative *	Accuracy ratio for the proposal *	Accuracy ratio for the alternative-accuracy ratio for the proposal (A–B)	Accuracy ratio for the current small bank assessment system	Accuracy ratio for the alternative-accuracy ratio for the current system (A–C)
2006	0.7061	0.7029	0.0032	0.3491	0.3570
2007	0.7779	0.7779	0.0000	0.5616	0.2163
2008	0.8903	0.8930	−0.0027	0.7825	0.1078
2009	0.9407	0.9398	0.0009	0.9015	0.0392
2010	0.9671	0.9657	0.0014	0.9394	0.0276
2011	0.9504	0.9485	0.0019	0.9323	0.0180

* The accuracy ratios for the alternative and for the proposal are based on the conversion of the statistical model as estimated through 2014.

In addition to the numerous variations on minimum and maximum initial assessment rates based on CAMELS composite ratings, the FDIC also considered other alternatives when developing this proposal.

Loss Given Default

Though expected losses to the DIF are a function of both the probability of a failure (or probability of default (PD)) and the loss given failure (or loss given default (LGD)), the new statistical model estimates only the PD. As discussed in Appendix 1 to the Supplementary Information section of this notice, the FDIC did not model LGD. Actual losses for many failed banks during the recent crisis are still estimated, primarily because of the use of loss-sharing agreements that have not yet terminated. Until the losses are actually realized, estimating an LGD model using current data would be circular, as other FDIC models are used to estimate expected losses where losses have not yet been realized. Relying solely on realized losses would exclude much of the failure data from the recent crisis, leaving mainly failure data from the banking crisis of the late 1980s and early 1990s. However, the vast majority of the bank failures in that crisis occurred in a different regulatory regime (prior to the Federal Deposit Insurance Corporation Improvement Act of 1991) and may, therefore, not reflect expected LGD in the current environment as well. For these reasons, the FDIC considered but rejected including LGD in the new statistical model. Nevertheless, after losses from failures during the recent crisis are more fully realized, it may be appropriate to consider whether LGD should be included in a small bank pricing model.

No Change

The FDIC also considered leaving the current small bank deposit insurance assessment system in place unchanged. While the backtesting discussed in Appendix 1 revealed that the new statistical model generally performed

[54] The second alternative would have the same assessment rate schedule go into effect the quarter after the reserve ratio reaches or exceeds 2 percent, but is less than 2.5 percent, as the first alternative and include the same maximum and minimum assessment rates determined by CAMELS composite ratings, except that it would lower the minimum initial assessment rate for a CAMELS composite 4 and 5 rated banks from 14 basis points to 10 basis points. Also, the second alternative would have the same assessment rate schedule go into effect the quarter after the reserve ratio reaches or exceeds 2.5 percent as the first alternative, and include the same maximum and minimum assessment rates determined by CAMELS composite ratings (see Table 11), except that it would lower the minimum initial assessment rate for a CAMELS composite 4- and 5-rated banks from 13 basis points to 9 basis points.

[55] Under either alternative, if a bank's CAMELS composite or component ratings changed during a quarter (other than a change in CAMELS composite rating from a 4 to a 5 or a 5 to a 4 with no change in component ratings), including a change in CAMELS composite rating from a 1 to a 2 or a 2 to a 1, its assessment rate would be determined separately for each portion of the quarter in which it had different CAMELS composite or component ratings.

better than the current small bank deposit insurance assessment system, the current system performed relatively well. Nevertheless, the FDIC is proposing to change the small bank deposit insurance assessment system and base it on the new statistical model because the new model is superior to the current small bank deposit insurance assessment system. Under the proposed system, fewer riskier small banks would pay lower assessments and fewer safer banks would pay higher assessments than their conditions warrant.

VIII. Request for Comments

The FDIC seeks comment on every aspect of this proposed rulemaking, including the alternatives considered. In addition, the FDIC seeks comment on the following:

- Are there other variables, besides the eight included in the statistical model and proposal, that both predict the likelihood of bank failure with statistical significance and do not have perverse incentive effects?
- Are there variables that can be shown to predict likely losses given failure with statistical significance?
- Should the upper end of the assessment rate range decline from 35 basis points to 30 basis points as proposed or should higher assessment rates continue to apply to the riskiest banks?

IX. Regulatory Analysis

A. Regulatory Flexibility Act

The Regulatory Flexibility Act (RFA) requires that each federal agency either certify that a proposed rule would not, if adopted in final form, have a significant economic impact on a substantial number of small entities or prepare an initial regulatory flexibility analysis of the proposal and publish the analysis for comment.[56] Certain types of rules, such as rules of particular applicability relating to rates or corporate or financial structures, or practices relating to such rates or structures, are expressly excluded from the definition of ''rule'' for purposes of the RFA.[57] The proposed rule relates directly to the rates imposed on insured depository institutions for deposit insurance and to the deposit insurance assessment system that measures risk and determines each established small bank's assessment rate. Nonetheless, the FDIC is voluntarily undertaking an initial regulatory flexibility analysis of the proposal and seeking comment on it.

As of December 31, 2014, of the 6,509 insured commercial banks and savings institutions, there were 5,257 small insured depository institutions as that term is defined for purposes of the RFA (*i.e.,* those with $550 million or less in assets).[58]

For purposes of this analysis, whether the FDIC were to collect needed assessments under the existing rule or under the proposed rule, the total amount of assessments collected would be the same. The FDIC's total assessment needs are driven by the FDIC's aggregate projected and actual insurance losses, expenses, investment income, and insured deposit growth, among other factors, and assessment rates are set pursuant to the FDIC's long-term fund management plan. This analysis demonstrates how the new pricing system under the proposed range of assessment rates of 3 basis points to 30 basis points (P330) could affect small entities relative to the current assessment rate schedule (C535) and relative to the rate schedule that under current regulations will be in effect when the reserve ratio exceeds 1.15 percent (C330). Using data as of December 31, 2014, the FDIC calculated the total assessments that would be collected under both rate schedules and under the proposed rule.

The economic impact of the proposal on each small institution for RFA purposes (*i.e.,* institutions with assets of $550 million or less) was then calculated as the difference in annual assessments under the proposed rule compared to the existing rule as a percentage of the institution's annual revenue and annual profits, assuming the same total assessments collected by the FDIC from the banking industry.[59]

Projected Effects on Small Entities Assuming a Range of Assessment Rates Under Both the Current Established Small Bank Deposit Insurance Assessment System and the Proposed System of 3 Basis Points to 30 Basis Points (P330–C330)

Based on the December 31, 2014 data, of the total of 5,257 small institutions, one institution would have experienced an increase in assessments equal to five percent or more of its total revenue. These figures do not reflect a significant economic impact on revenues for a substantial number of small insured institutions. Table 18 below sets forth the results of the analysis in more detail.

TABLE 18—PERCENT CHANGE IN ASSESSMENTS RESULTING FROM THE PROPOSAL

[Assuming No Change in the Assessment Rate Range]

Change in assessments	Number of institutions	Percent of Institutions
More than 10 percent lower	0	0
5 to 10 percent lower	3	0
0 to 5 percent lower	3,296	63
0 to 5 percent higher	1,957	37
5 to 10 percent higher	1	0
More than 10 percent higher	0	0
Total	5,257	100

The FDIC performed a similar analysis to determine the impact on profits for small institutions. Based on December 31, 2014 data, of those small institutions with reported profits, 21 institutions would have an increase in assessments equal to 10 percent or more of their profits. Again, these figures do not reflect a significant economic impact on profits for a substantial number of small insured institutions.

[56] See 5 U.S.C. 603, 604 and 605.

[57] 5 U.S.C. 601.

[58] Throughout this RFA analysis (unlike the rest of this NPR), a ''small institution'' refers to an institution with assets of $550 million or less; a ''small bank,'' however, continues to refer to a small insured depository institution for purposes of deposit insurance assessments (generally, a bank with less than $10 billion in assets).

[59] For purposes of the analysis, an institution's total revenue is defined as the sum of its interest income and noninterest income and an institution's profit is defined as income before taxes and extraordinary items.

Table 19 sets forth the results of the analysis in more detail.

TABLE 19*—ASSESSMENT CHANGES RELATIVE TO PROFITS FOR PROFITABLE SMALL INSTITUTIONS UNDER THE PROPOSAL

[Assuming No Change in the Assessment Rate Range]

Change in assessments relative to profits	Number of institutions	Percent of institutions
Decrease in assessments equal to more than 40 percent of profits	65	1
Decrease in assessments equal to 20 to 40 percent of profits	64	1
Decrease in assessments equal to 10 to 20 percent of profits	131	3
Decrease in assessments equal to 5 to 10 percent of profits	306	6
Decrease in assessments equal to 0 to 5 percent of profits	3,541	73
Increase in assessments equal to 0 to 5 percent of profits	706	14
Increase in assessments equal to 5 to 10 percent of profits	40	1
Increase in assessments equal to 10 to 20 percent of profits	8	0
Increase in assessments equal to 20 to 40 percent of profits	5	0
Increase in assessments equal to more than 40 percent of profits	8	0
Total	4,874	100

*Institutions with negative or no profit were excluded. These institutions are shown in Table 20.

Table 19 excludes small institutions that either show no profit or show a loss, because a percentage cannot be calculated. The FDIC analyzed the effect of the proposal on these institutions by determining the annual assessment change (either an increase or a decrease) that would result. Table 20 below shows that 27 (seven percent) of the 383 small insured institutions with negative or no reported profits would have an increase of $20,000 or more in their annual assessments.

TABLE 20—CHANGE IN ASSESSMENTS FOR UNPROFITABLE SMALL INSTITUTIONS RESULTING FROM THE PROPOSAL

[Assuming No Change in the Assessment Rate Range]

Change in assessments	Number of Institutions	Percent of Institutions
$20,000 or more decrease	170	44
$10,000–$20,000 decrease	74	19
$5,000–$10,000 decrease	43	11
$1,000–$5,000 decrease	28	7
$0–$1,000 decrease	11	3
$0–$1,000 increase	3	1
$1,000–$5,000 increase	16	4
$5,000–$10,000 increase	6	2
$10,000–$20,000 increase	5	1
$20,000 increase or more	27	7
Total	383	100

Projected Effects on Small Entities Assuming a Range of Assessment Rates Under the Current Established Small Bank Deposit Insurance Assessment System of 5 Basis Points to 35 Basis Points and Under the Proposed System of 3 Basis Points to 30 Basis Points (Assessment Change P330–C535)

Based on the December 31, 2014 data, of the total of 5,257 small institutions, no institution would have experienced an increase in assessments equal to five percent or more of its total revenue. These figures do not reflect a significant economic impact on revenues for a substantial number of small insured institutions. Table 21 below sets forth the results of the analysis in more detail.

TABLE 21—PERCENT CHANGE IN ASSESSMENTS RESULTING FROM THE PROPOSAL

[Assuming Assessment Rate Range Change From 5–35 Bps to 3–30 Bps]

Change in assessments	Number of institutions	Percent of institutions
More than 10 percent or lower	4	0
5 to 10 percent lower	4	0
0 to 5 percent lower	4,969	95
0 to 5 percent higher	280	5
More than 5 percent higher	0	0
Total	5,257	100

The FDIC performed a similar analysis to determine the impact on profits for small institutions. Based on December 31, 2014 data, of those small institutions with reported profits, eight institutions would have an increase in assessments equal to 10 percent or more of their profits. Again, these figures do not reflect a significant economic impact on profits for a substantial number of small insured institutions. Table 22 sets forth the results of the analysis in more detail.

TABLE 22*—ASSESSMENT CHANGES RELATIVE TO PROFITS FOR PROFITABLE SMALL INSTITUTIONS UNDER THE PROPOSAL

[Assuming Assessment Rate Range Change From 5–35 Bps to 3–30 Bps]

Change in assessments relative to profits	Number of institutions	Percent of institutions
Decrease in assessments equal to more than 40 percent of profits	119	2
Decrease in assessments equal to 20 to 40 percent of profits	99	2
Decrease in assessments equal to 10 to 20 percent of profits	285	6
Decrease in assessments equal to 5 to 10 percent of profits	603	12
Decrease in assessments equal to 0 to 5 percent of profits	3,513	72
Increase in assessments equal to 0 to 5 percent of profits	239	5
Increase in assessments equal to 5 to 10 percent of profits	8	0
Increase in assessments equal to 10 to 20 percent of profits	4	0
Increase in assessments equal to 20 to 40 percent of profits	3	0
Increase in assessments equal to more than 40 percent of profits	1	0
Total	4,874	100

* Institutions with negative or no profit were excluded. These institutions are shown in Table 23.

Table 22 excludes small institutions that either show no profit or show a loss, because a percentage cannot be calculated. The FDIC analyzed the effect of the proposal on these institutions by determining the annual assessment change (either an increase or a decrease) that would result. Table 23 below shows that just 11 (three percent) of the 383 small insured institutions with negative or no reported profits would have an increase of $20,000 or more in their annual assessments. Again, these figures do not reflect a significant economic impact on profits for a substantial number of small insured institutions.

TABLE 23—CHANGE IN ASSESSMENTS FOR UNPROFITABLE SMALL INSTITUTIONS RESULTING FROM THE PROPOSAL

[Assuming No Change in the Assessment Rate Range]

Change in assessments	Number of institutions	Percent of institutions
$20,000 or more decrease	262	68
$10,000–$20,000 decrease	57	15
$5,000–$10,000 decrease	23	6
$1,000–$5,000 decrease	14	4
$0–$1,000 decrease	3	1
$0–$1,000 increase	1	0
$1,000–$5,000 increase	6	2
$5,000–$10,000 increase	1	0
$10,000–$20,000 increase	5	1
$20,000 increase or more	11	3
Total	383	100

The proposed rule does not directly impose any ''reporting'' or ''recordkeeping'' requirements within the meaning of the Paperwork Reduction Act. The compliance requirements for the proposed rule would not exceed (and, in fact, would be the same as) existing compliance requirements for the current risk-based deposit insurance assessment system for small banks. The FDIC is unaware of any duplicative, overlapping or conflicting federal rules.

The initial RFA analysis set forth above demonstrates that, if adopted in final form, the proposed rule would not have a significant economic impact on a substantial number of small institutions within the meaning of those terms as used in the RFA.[60]

Commenters are invited to provide the FDIC with any information they may have about the likely quantitative effects of the proposal on small insured depository institutions (those with $550 million or less in assets).

B. Riegle Community Development and Regulatory Improvement Act:

The Riegle Community Development and Regulatory Improvement Act (RCDRIA) requires that the FDIC, in determining the effective date and administrative compliance requirements of new regulations that impose additional reporting, disclosure, or other requirements on insured depository institutions, consider, consistent with principles of safety and soundness and the public interest, any administrative burdens that such regulations would place on depository institutions, including small depository institutions, and customers of depository institutions, as well as the benefits of such regulations.[61]

This NPR proposes no additional reporting or disclosure requirements on insured depository institutions, including small depository institutions, nor on the customers of depository institutions.

[60] 5 U.S.C. 605.

[61] 12 U.S.C. 4802.

C. Paperwork Reduction Act:

No collections of information pursuant to the Paperwork Reductions Act (44 U.S.C. 3501 *et seq.*) are contained in the proposed rule.

D. The Treasury and General Government Appropriations Act, 1999—Assessment of Federal Regulations and Policies on Families

The FDIC has determined that the proposed rule will not affect family well-being within the meaning of section 654 of the Treasury and General Government Appropriations Act, enacted as part of the Omnibus Consolidated and Emergency Supplemental Appropriations Act of 1999 (Pub. L. 105–277, 112 Stat. 2681).

E. Solicitation of Comments on Use of Plain Language

Section 722 of the Gramm-Leach-Bliley Act, Public Law 106–102, 113 Stat. 1338, 1471 (Nov. 12, 1999), requires the Federal banking agencies to use plain language in all proposed and final rules published after January 1, 2000. The FDIC invites your comments on how to make this proposal easier to understand. For example:

• Has the FDIC organized the material to suit your needs? If not, how could the material be better organized?

• Are the requirements in the proposed regulation clearly stated? If not, how could the regulation be stated more clearly?

• Does the proposed regulation contain language or jargon that is unclear? If so, which language requires clarification?

• Would a different format (grouping and order of sections, use of headings, paragraphing) make the regulation easier to understand?

Appendix 1—Description of Statistical Model Underlying Proposed Method for Determining Deposit Insurance Assessments For Established Small Insured Depository Institutions

This appendix provides a technical description of the statistical model (the ''new model'') [62] underlying the proposed method for determining deposit insurance assessments for established small banks. The appendix provides background information, reviews the data and methodology used to estimate the new model underlying the proposed method, discusses estimation results and alternative specifications considered, and evaluates the results.

[62] The preamble to the NPR refers to the new model as the ''statistical model.''

I. Background

A. RRPS

The current small bank deposit insurance assessment system has been in effect, with some modifications, since January 1, 2007. The current small bank deposit insurance system assigns assessment rates in several steps. The first step assigns small banks to risk categories. The categories are jointly determined by bank capital and supervisory ratings. Well-capitalized small banks rated CAMELS 1 or 2 are placed in Risk Category I.[63] Small banks with lower capital or weaker CAMELS ratings are placed in either Risk Category II, Risk Category III or Risk Category IV.

The second step differentiates risk further among Risk Category I small banks using the *financial ratios method,* which combines supervisory CAMELS component ratings with current financial ratios to determine a Risk Category I small bank's initial assessment rate. The contribution of these variables (the CAMELS component ratings and the financial ratios) to assessment rates is determined using a linear model (the downgrade probability model or existing model) estimating the probability that a CAMELS 1- or 2-rated bank will be downgraded to a CAMELS rating of 3 or worse within 12 months.

In November 2006, when the final rule establishing the current small bank deposit insurance system was adopted, it had been more than a decade since the United States experienced a significant number of bank failures. Consequently, historical downgrades were used as a proxy for the risk to the DIF of a bank's failure.

The data generated by the rash of bank failures since the financial crisis of 2008 suggests that the model underlying the small bank deposit insurance assessment system can be improved and updated.

B. Probability of Default

The data generated from the approximately 500 bank failures since 2008 suggests that the probability of downgrade probability model can be replaced by a probability of default (that is, a probability of failure) model. Failures are nearly always costly to the FDIC, whereas downgrades lead to DIF losses relatively infrequently, since many downgraded banks do not fail.

[63] Unless explicitly stated otherwise, references to CAMELS ratings are references to CAMELS composite ratings.

C. Loss Given Default

Though expected losses to the DIF are a function of both the probability of a default (PD) and the loss given default (LGD), the new model estimates only the PD. LGD was not modeled. Actual losses for many of the failed banks during the crisis are still estimated, primarily because of the use of loss-sharing agreements that have not yet terminated. Until the losses are actually realized, estimating a loss given default model using current data would be circular, as FDIC models are used to estimate expected losses where losses have not yet been realized. Relying solely on realized losses would exclude much of the failure data from the recent crisis, leaving mainly failure data from the banking crisis of the late 1980s and early 1990s. However, the vast majority of the bank failures in that crisis occurred in a different regulatory regime (prior to the Federal Deposit Insurance Corporation Improvement Act of 1991[64]) and may, therefore, not reflect expected LGD in the current environment as well. See Bennett and Unal (2014).

Notwithstanding these concerns, a careful consideration of whether future rulemaking should include LGD in a small bank deposit insurance assessment model may be appropriate after most losses are realized from failures during the recent crisis.

II. Methodology

A. Variable Selection

In addition to the existing model, the FDIC relied on other existing models of bank risk, both regulatory and academic, to select candidate variables for inclusion in the new model.

1. SCOR

The Statistical CAMELS Offsite Rating (SCOR) system is one of FDIC's offsite monitoring models and is used to identify banks whose financial condition has deteriorated since their last on-site examination. SCOR is designed as a short-term model with a one-year forecast horizon, to identify institutions that are currently CAMELS 1 or 2 rated that might receive a rating of CAMELS 3, 4 or 5 at the next examination.

The SCOR model uses an ordered logistic regression to predict the composite CAMELS rating and the six CAMELS component ratings. A logistic regression allows for nonlinear relationships between each explanatory

[64] FDIC (1998), Legislation Governing the FDIC's Roles as Insurer and Receiver,'' from *Managing the Crisis, https://www.fdic.gov/bank/historical/managing/history3-A.pdf,* p. 774–747.

variable and the dependent variable (the variable that depends upon the explanatory variable). In an ordered logistic regression, the dependent variable (CAMELS) can only have discrete values that are ordered. (In the case of CAMELS, the ordered values are 1 through 5.) The other variables (the explanatory variables) are then used to predict the likelihood of observing each of the possible outcomes.

SCOR uses twelve variables to measure banks' financial condition. These financial measures are (as a ratio to total assets): equity, loan loss reserves, loans past due 30–89 days, loans past due 90+ days, nonaccrual loans, other real estate owned, charge-offs, provisions for loan losses and transfer risk, income before taxes and extraordinary charges, volatile liabilities, liquid assets, and loans and long term securities.[65]

2. GMS

The Growth Monitoring System (GMS) is one of FDIC's offsite monitoring models designed to monitor banks' risk taking associated with rapid growth and heavy reliance on non-traditional sources of funds. GMS is designed to identify distress and failure before bank conditions actually weaken, thereby allowing supervisors to take preventive action.

GMS estimates the likelihood that a bank will be downgraded from a CAMELS 1 or 2 rating to a CAMELS 3, 4 or 5 rating within three years as a function of the bank's current risk characteristics. The explanatory variables include a bank's asset growth, equity ratio, loan to asset ratio, noncore funds to asset ratio, change in loan mix index, reserve coverage ratio and a binary variable indicating whether a bank is currently CAMELS 1 rated.[66]

3. Academic

There exist numerous papers discussing models that predict bank failures. In these papers, the explanatory variables predicting bank failures are largely divided into measures of (1) capital; (2) asset quality; (3) earnings; (4) liquidity; (5) sensitivity to market risk; and (6) other risk measures.

A bank's capital adequacy is an important predictor of its survival because it provides a cushion to withstand unanticipated losses. Studies have used a total equity to total assets ratio (Santoni, Ricci, and Kelshiker (2010), Betz, Oprica, Peltonen, Sarlin (2012)) or the leverage ratio (Santoni, Ricci, and Kelshiker (2010)) to measure a bank's equity position. These studies find that higher capital ratios are correlated with lower failure probability.

To measure a bank's asset quality, nonperforming loans (Wheelock and Wilson (2000), Santoni, Ricci, and Kelshiker (2010), Gilbert, Meyer, and Vaughan (1999)) and other real estate owned to total assets ratios have been used. A large volume of nonperforming loans and other real estate owned relative to total loans (or total assets) signal low credit quality in a bank's loan portfolio.

Higher bank earnings also provide a cushion to withstand adverse economic shocks and lower failure probability. To measure bank earnings, measures such as net income before taxes, interest expense (Betz, Oprica, Peltonen, Sarlin (2012)), and total operating income (Lane, Looney, and Wansley (1986)) have been used.

Loan portfolio ratios, such as commercial and industrial (C&I) loans, commercial real estate loans, construction and development (C&D) loans, and consumer loans (Cole and Gunther (1995), Whalen (1991), Lane, Looney, and Wansley (1986)), have been used to measure a bank's concentration in different loan types.

Rapid loan growth or asset growth can be indicators of a bank's aggressive risk-taking and of underwriting loans or acquiring assets with lower creditworthiness. A correlation between rapid credit growth and bank distress has been well documented in academic research (Solttila and Vihriala (1994), Clair (1992), Salas and Saurina (2002), Keeton (1999), Foos, Norden, and Weber (2009), and Logan (2001)).

Liquidity measures include a core deposits to total assets ratio (Gilbert, Meyer, Vaughan (1999)) and a liquid assets to total assets ratio (Gilbert, Meyer, Vaughan (1999), Lane, Looney, and Wansley (1986)). These measures can indicate a bank's ability to meet unexpected liquidity needs. A high loans to total deposits ratio (Gilbert, Meyer, Vaughan (1999)) or loans to total assets ratio can indicate a bank's illiquidity, since loans are typically less liquid than other assets on a bank's balance sheet.

Bank size (Gilbert, Meyer, Vaughan (1999), Wheelock and Wilson (2000)) can predict failure likelihood, since large banks can benefit from diversification across product lines and geographic regions.

Whether a bank is a part of a holding company is another measure used by some studies (Gilbert, Meyer, Vaughan (1999), Wheelock and Wilson (2000)). An indicator of holding company affiliation can predict failure probability, since a holding company can serve as a source of strength to banks.

Onali (2012) finds a positive relation between bank default risk and dividend payout ratios. This finding is consistent with the theory that dividend payouts exacerbate moral hazard. He finds, however, that the relationship is insignificant for banks that are very close to failure.

B. Variables

Table 1.1 lists and describes the variables that are included in the new model as the result of reviewing academic studies on bank risk and testing candidate variables.

TABLE 1.1—NEW MODEL VARIABLE DESCRIPTION

Variables	Description
Tier 1 Leverage Ratio (%)	Tier 1 capital divided by adjusted average assets. (Numerator and denominator are both based on the definition for prompt corrective action.)
Net Income before Taxes/Total Assets (%)	Income (before income taxes and extraordinary items and other adjustments) for the most recent twelve months divided by total assets.
Nonperforming Loans and Leases/Gross Assets[67] (%)	Sum of total loans and lease financing receivables past due 90 or more days and still accruing interest and total nonaccrual loans and lease financing receivables (excluding, in both cases, the maximum amount recoverable from the U.S. Government, its agencies or government-sponsored enterprises, under guarantee or insurance provisions) divided by gross assets.*

[65] Detailed description of the model and the variables used in SCOR can be found in ''The SCOR System of Off-Site Monitoring: Its Objectives, Functioning, and Performance,'' Collier, Forbush, Nuxoll, and O'Keefe (2003).

[66] Detailed description of the GMS model can be found in ''Bank Growth and Long Term Risk,'' Hwa, Jacewitz, and Yom (May 2011).

TABLE 1.1—NEW MODEL VARIABLE DESCRIPTION—Continued

Variables	Description
Other Real Estate Owned/Gross Assets (%)	Other real estate owned divided by gross assets.
Core Deposits/Total Assets (%)	Domestic office deposits (excluding time deposits over the deposit insurance limit and the amount of brokered deposits below the standard maximum deposit insurance amount) divided by total assets.
Weighted Average of C, A, M, E, L, and S Component Ratings.	The weighted sum of the "C," "A," "M," "E", "L", and "S" CAMELS components, with weights of 25 percent each for the "C" and "M" components, 20 percent for the "A" component, and 10 percent each for the "E", "L", and "S" components. In instances where the "S" component is missing, the remaining components are scaled by a factor of 10/9.**
Loan Mix Index	A measure of credit risk described below.
Asset Growth (%)	Growth in assets (merger adjusted) over the previous year. If growth is negative, then the value is set to zero.

[67] "Gross assets" are total assets plus the allowance for loan and lease financing receivable losses (ALLL); for purposes of estimating the statistical model, for years before 2001, when allocated transfer risk was not included in ALLL in Call Reports, allocated transfer risk was included in gross assets separately.

* Delinquency and non-accrual data on government guaranteed loans are not available for the entire estimation period. As a result, the model is estimated without deducting delinquent or past-due government guaranteed loans from the nonperforming loans and leases to gross assets ratio.

** The component rating for sensitivity to market risk (the "S" rating) is not available for years before 1997. As a result, and as described in the table, the model is estimated using a weighted average of five component ratings excluding the "S" component where the component is not available.

1. Equity

The new model includes the leverage ratio (as defined in the FDIC's capital regulations[68]). This variable was statistically significant across specifications (that is, it was statistically significant regardless of the other variables included in the model).

2. Loan Mix Index

Consistent with the GMS model, the FDIC included a loan mix index ("LMI") variable that aggregates a bank's loan portfolio and historical loan category charge-offs into a single variable. Statistically, combining the loan categories into a single index increases the explanatory power of the model.

For each loan category, the LMI assigns an industry-wide charge-off rate based on historical data. A bank's LMI value is then the sum of the products of each of that bank's loan category exposures as a percentage of total assets and the associated charge-off rate. Appendix 1.1 to the Supplementary Information section of this notice shows how the LMI is constructed for a hypothetical bank.

In constructing the LMI, many alternatives were considered, including: using the change in a bank's amount of loans in a loan category rather than simply the amount of loans in a loan category, weighting charge-offs more heavily during crises and evaluating loans in a loan category as a proportion of total loans rather than as a proportion of assets.

Both in in-sample and out-of-sample backtesting, the LMI using a bank's amount of loans in a loan category had higher forecast accuracy than using the change in a bank's amount of loans in a loan category from a previous period. In-sample backtesting compares model forecasts to actual outcomes where those outcomes are included in the data used in model development. Out-of-sample backtesting is the comparison of model predictions against outcomes where those outcomes are not used as part of the model development used to generate predictions.

In-sample, all of the explanatory power came from using the amount of loans in a loan category. Out-of-sample, including the change in a bank's amount of loans in a loan category in addition to the amount of loans in a loan category did not improve performance.

Three alternative methods of averaging yearly historical industry-wide charge-off rates were considered: an unweighted average of each year's industry-wide charge-off rate, an unweighted average of each of the recent crisis years' industry-wide charge-off rates, and an average of each year's industry-wide charge-off rate weighted by the number of bank failures in the year. Out-of-sample performance for the LMI variable using an average weighted by the number of bank failures in the year slightly outperformed the LMI variable using an unweighted average over recent crisis years and more significantly outperformed the LMI variable using an unweighted average. The LMI variable using an average weighted by the number of bank failures in a year was selected over the LMI variable using an unweighted average over recent crisis years because the latter variable requires a determination of what constitutes a crisis. No such determination is necessary using the variable selected.

The FDIC also considered using total loans as the denominator of the LMI along with a liquidity variable, but elected to use total assets as the denominator to avoid imposing excessive penalties on banks that hold few loans relative to assets. (The liquidity variable was not statistically significant when total assets were used as the denominator.) Using loans as a proportion of total assets has the advantage of not extrapolating risk exposures in loans to a bank's entire asset portfolio, although it effectively assigns zero risk to all non-loan assets, implicitly treating loans as riskier than investments in other assets. Many of these other assets, however, are liquid assets. Out-of-sample performance of the models using total assets as the denominator did not differ much from the performance using total loans as the denominator along with a liquidity variable.

3. Asset Growth

Among the variables included in the specifications was a one-year asset growth rate. The FDIC also considered a two-year growth rate and lagged one- and two-year growth rates. The one-year growth rates generally had the most explanatory power and additional growth rates did not tend to improve the model's fit.

Mergers of troubled banks into healthier banks and purchases of failed banks help limit losses to the DIF. Penalizing banks for growth that occurs through the acquisition of troubled or failed banks would create a disincentive for such mergers. Consequently, bank

[68] 12 CFR 3.10; 12 CFR 217.10; 12 CFR 324.10.

asset growth was adjusted to remove growth resulting from mergers and failed bank acquisitions.

4. Income

Consistent with previous findings, net income before taxes was found to be a significant explanatory variable.

5. Core Deposits

Early test versions of the new model used noncore liabilities as a variable predictive of failure. This variable was statistically significant in-sample across all specifications with a positive correlation with failure. Subsequent versions used core deposits as the alternative variable. It provides similar predictive power, and is the variable maintained for the proposed version of the new model.

6. Nonperforming Loans and Leases

Nonperforming loans and leases are defined as the sum of total loans and leases past due 90 or more days and total nonaccrual loans and leases. This variable, which measures bank asset quality, was found to be a statistically significant predictor of failure.

7. Other Real Estate Owned

The ratio of other real estate owned to gross assets is another measure of a bank's asset quality and was a significant predictor of failure across specifications.

8. CAMELS

A weighted CAMELS component variable was included in the new model to capture examination ratings. The weighted CAMELS component variable is calculated with the following weights on the component ratings: Capital (25%), Asset quality (20%), Management (25%), Earnings (10%), Liquidity (10%), Sensitivity to market risk (10%). For model estimation, in instances where the ''S'' component is missing, the remaining components are scaled by a factor of 10/9.

Other specifications tested separate dummy variables for CAMELS composite ratings of 3, 4, and 5. (A dummy variable for CAMELS 2 composite ratings was not statistically significant.) However, the single weighted CAMELS component measure performed comparably in out-of-sample tests and was chosen over the dummy variable specification for both the reduction in the number of variables, for its more continuous treatment of examination ratings and for its consistency with the current financial ratios method.

C. Considered Variables

1. Loan Loss Reserves

Loan loss reserves were tested in the development of the new model and were a positive predictor of failure across all specifications. Including reserves in the new model, however, would lead to higher deposit insurance assessments for banks with higher loan loss reserves, creating a disincentive for banks to build these reserves. Because loan loss reserves protect the FDIC in the event of failure, they were ultimately excluded from the new model. (Loan loss reserves were excluded from the downgrade probability model for the same reason.) The losses to forecasting accuracy were small.

2. Lagged moving averages

To capture the possibility that changes in variables (as opposed to point-in-time values of variables) are correlated with failure, the FDIC tested the model using lagged moving averages. In theory, these lagged moving averages could also capture the effect of variables that do not change frequently. However, lagged moving averages were not consistently significant across specifications.

3. Insignificant Variables

A number of variables were also tested but ultimately not included in the model because they did not remain statistically significant across specifications. These variables are listed in Appendix 1.2 to the Supplementary Information section of this notice.

D. Excluded Variables

1. Distance to Default

Distance to default measures, which compare the amount of loss absorbing capital against the volatility of the return on underlying assets, are commonly used in failure prediction models. These variables are generally constructed with market data. However, such measures are not available for most small banks.

2. Macroeconomic Variables

Macroeconomic variables were excluded for three primary reasons. First, the assessment rates proposed are (and the rates previously adopted by the FDIC's Board were) explicitly intended to reduce procyclicality; that is, to maintain a positive reserve ratio while keeping relatively constant assessment rates.[69] Second, macroeconomic factors would add considerable complexity to the model. Finally, macroeconomic factors are imprecise measures of economic conditions for small banks that often operate only locally.

3. Holding Company Affiliation

The FDIC does not believe it is appropriate to charge a small bank a higher assessment rate because it is not part of a multi-bank holding company; consequently, the new model does not include a measure indicating whether a bank is a part of a holding company.

4. Brokered Deposits

The FDIC ultimately chose the related measure of core deposits (see above).

5. Bank Size

The FDIC is disinclined to discriminate for deposit insurance assessment purposes based on the size of an established small bank. Assessing the smallest banks at higher rates because of their size would raise the costs of many banks that are the only bank in their community. Assessing the largest of the small banks at higher rates because of their size would impair their ability to compete with large banks, which are not charged higher rates based on their size.

III. Estimation Model

A. Shumway (2001)

The FDIC chose to estimate failure using a discrete-time hazard model with a constant hazard rate. Hazard models are designed to capture the duration of time until a particular event occurs (in this case, bank failure). The defining feature of a hazard model is that at every interval of time, a bank is exposed to some risk of failure that depends on certain observed measures. If the bank fails during a period, then it is not in the sample for later periods. If the bank survives, then it remains in the sample the following period and is exposed to a new risk of failure that depends on any changes in the bank risk variables. The FDIC used a discrete time assumption because of the regular reporting schedule for Call Report data, and the simplicity and transparency of estimation. A discrete time assumption implies that only the failure or survival of the bank is modeled for a given time period. This is in contrast to a continuous time model that also considers the exact failure time within that time period.

Shumway (2001) demonstrates that if each period's probability of failure (or default probability) follows a logistic function, then the discrete-time hazard model is equivalent to a multi-period logistic model. The logistic function relates a set of variables (in this case,

[69] *See* 75 FR 66272, 66273–66281, 66292 (Oct. 27, 2010).

measures of bank risk) to a number between 0 and 1 (in this case, the probability of bank failure). It is nonlinear, so that the effect of a change in the values of bank risk variables on the probability of bank failure depends on the level of bank risk. A multi-period logistic model estimates the probability of failure for all observations across banks and time. However, relative to a pooled logistic model in which each bank-year observation is treated as an independent event, the standard errors of the coefficients of a discrete-time hazard model require an adjustment. The adjustment is required because of the serial dependence of the failure variable; a bank that is observed in any period necessarily has not failed in any previous period and any bank that fails necessarily drops out of the sample after failing.

A multi-period model was chosen over a single time period model. A single time period failure model requires the choice of the appropriate estimation time period. Therefore, it is unable to exploit data outside of the chosen time horizon and cannot be readily adapted to include new data. For example, a single time period model could not be used to capture bank failures in the 1990s, stability in the early 2000s, and the bank failures following the 2008 financial crisis. Furthermore, there is no systematic way to choose the right sample period for a static model.

The FDIC imposed a constant hazard rate on the model. A constant hazard rate implies that the age of the bank does not affect its likelihood of future failure. This is in contrast to a non-constant hazard rate that may be more appropriate for newer banks that do not yet have an established business model or management. However, new banks are excluded from the model. Because there is no relationship between the age of an established bank (one at least five years old) and failure, a constant hazard rate is more appropriate.

C. Time Horizon

Because deposit insurance assessments should ideally reflect risks posed by banking activity as they are assumed rather than when they are realized, a three year time horizon was chosen for both the estimation and forecasting periods. To obtain predictions for the three-year forecast, the FDIC considered one-year, two-year, and three-year time horizons in estimating the new model. In each case, the FDIC used only contemporaneous data to calculate three-year forecasts. That is, the FDIC alternatively used one-year, two-year, and three-year intervals in the estimation period (1984—2010) to forecast failures out-of-sample from January 1, 2011 through December 31, 2013 based on yearend 2010 data. The three-year interval tended to outperform the one- and two-year intervals for three-year out-of-sample forecasting.

D. In-Sample Estimation

The in-sample estimation time period was chosen to be 1985 through 2011, incorporating Call Report data through the end of 2011 and failures through the end of 2014.

To avoid having overlapping three-year look-ahead periods for a given regression, each regression uses data in which only every third year is included. One regression uses insured depository institutions' Call Report and TFR data for the end of 1985 and failures from 1986 through 1988; Call Report and TFR data for the end of 1988 and failures from 1989 through 1991; and so on, ending with Call Report data for the end of 2009 and failures from 2010 through 2012. (See Table 1.2A below.) The second regression uses insured depository institutions' Call Report and TFR data for the end of 1986 and failures from 1987 through 1989, and so on, ending with Call Report data for the end of 2010 and failures from 2011 through 2013. (See Table 1.2B below.) The third regression uses insured depository institutions' Call Report and TFR data for the end of 1987 and failures from 1988 through 1990, and so on, ending with Call Report data for the end of 2011 and failures from 2012 through 2014. (See Table 1.2C below.) Since there is no particular reason for favoring any one of these three regressions over another, the actual model estimates are constructed as an average of each of the three regression estimates for each parameter.

The regressions only include observations for institutions that are at least five years of age, since younger institutions will be subject to a different assessment methodology. Also, since the model will be applied to banks with under $10 billion in assets, larger banks are not included in the regressions.

The data used for estimation is winsorized (that is, extreme values in the data are reset to reduce the effect of outliers) at the 1st percentile and 99th percentile levels for each year. For example, if a variable for a bank has a value greater than the 99th percentile value for that year, then the value for that bank is set to the 99th percentile value before estimation is made.

The test statistics applied follow the analysis of Shumway (2001). In Shumway's formulation, the standard test statistics from a logistic regression used to assess statistical significance are divided by the average number of bank-years per bank; this adjustment corrects for the lack of independence between bank-year observations. That is, an adjustment is made to account for a bank no longer being observed after failure. In tables 1.2A, 1.2B, and 1.2C below, ''WaldChiSq2'' shows the adjusted χ-square statistic, and ''ProbChiSq2'' the associated probability value. (The lower the value of ProbChisSq2, the more statistically significant is the parameter estimate. Parameter estimates with a ProbChiSq2 below .05 are considered to be statistically significant at the .05 level.)

As reported in Tables 1.2A, 1.2B, and 1.2C, banks with a higher leverage ratio are less likely to fail within the next three years. Similarly, banks' earnings before taxes and their core deposits to assets ratios are negatively correlated with failure probability. In contrast, nonperforming loans and the other real estate owned to assets ratios are positively correlated with failure probability. Moreover, banks with a higher LMI, faster asset growth, and worse weighted CAMELS component ratings are more likely to fail within the next three years.

The estimated coefficients of the variables are statistically significant at the 5% level for all three regression sets except for the asset growth rate variable. The asset growth rate is statistically significant for two out of the three regressions.

When the new model is used to determine assessment rates, the variables Asset Growth and Net Income before Taxes/Total Assets are each bounded as follows:

Asset Growth ≤ 190-25 ≤ Net Income before Taxes/Total Assets ≤ 3.

For example, if Asset Growth is greater than 190 (percent) then it is reset to 190 to determine assessment rates. After the parameters shown in table 1.2D were obtained, the values of these bounds were determined by performing an iterative series of backtests covering data from 1985 to 2011, with each iteration testing a different combination of bounds; the combination of bounds that resulted in the best rank correlation (Kendall's tau) between probability of failure and actual failure is the combination of bounds selected.

IV. Validation

A. Backtest Comparison of the Proposal to the Current RRPS System

Using initial base assessment rates,[70] the FDIC also compared the out-of-sample forecast accuracy of the proposal in this NPR, which is based on the new model, to the current small bank deposit insurance system's financial ratios method's assessment rankings.[71] Comparisons were made for projections as of the end of six different years, 2006 through 2011, and are shown graphically using cumulative accuracy profile (CAP) curves. A CAP curve is illustrated in Figure 1.1. Suppose that banks are ranked on a percentile basis according to a model's predicted probability of failure, with the ranking in descending order. Thus the banks with the highest predicted probability of failure would have a percentile rank near zero, while the banks with the

[70] The current small bank deposit insurance assessment system did not exist at the end of 2006 and existed in somewhat different forms in years before 2011. The comparison assumes that the small bank deposit insurance assessment system in its current form and the proposal in this NPR (assuming a revenue neutral conversion to assessment rates as of the end of 2014) had been in effect in each year of the comparison.

[71] For the out-of-sample backtests, the parameters applied are the average of the parameters from three separate regressions, as in the new model, except with more recent three-year periods omitted. Using Table 1.3 as an example, one regression uses data from the end of 1985 and failures from 1986 through 1988; data for the end of 1988 and failures from 1989 through 1991; and so on, ending with data for the end of 2003 and failures from 2004 through 2006. The second regression uses data from the end of 1987 and failures from 1988 through 1990, and so on, ending with data for the end of 2002 and failures from 2003 through 2005. The third regression uses data from the end of 1986 and failures from 1987 through 1989, and so on, ending with data for the end of 2001 and failures from 2002 through 2004.

lowest predicted probability of failure would have a percentile rank near 100. In Figure 1.1, the horizontal axis represents this bank percentile rank. The vertical axis represents the cumulative percentage of actual failures. For example, the point marked by ''X'' indicates that the 30 percent of banks with the highest projected probability of failure included 50 percent of the banks that actually failed. In general, when comparing a CAP curve for alternative models, a model with a higher CAP curve (one with more area underneath it) would be the superior model.

Figure 1.1. Cumulative Accuracy Profile (CAP) Illustration

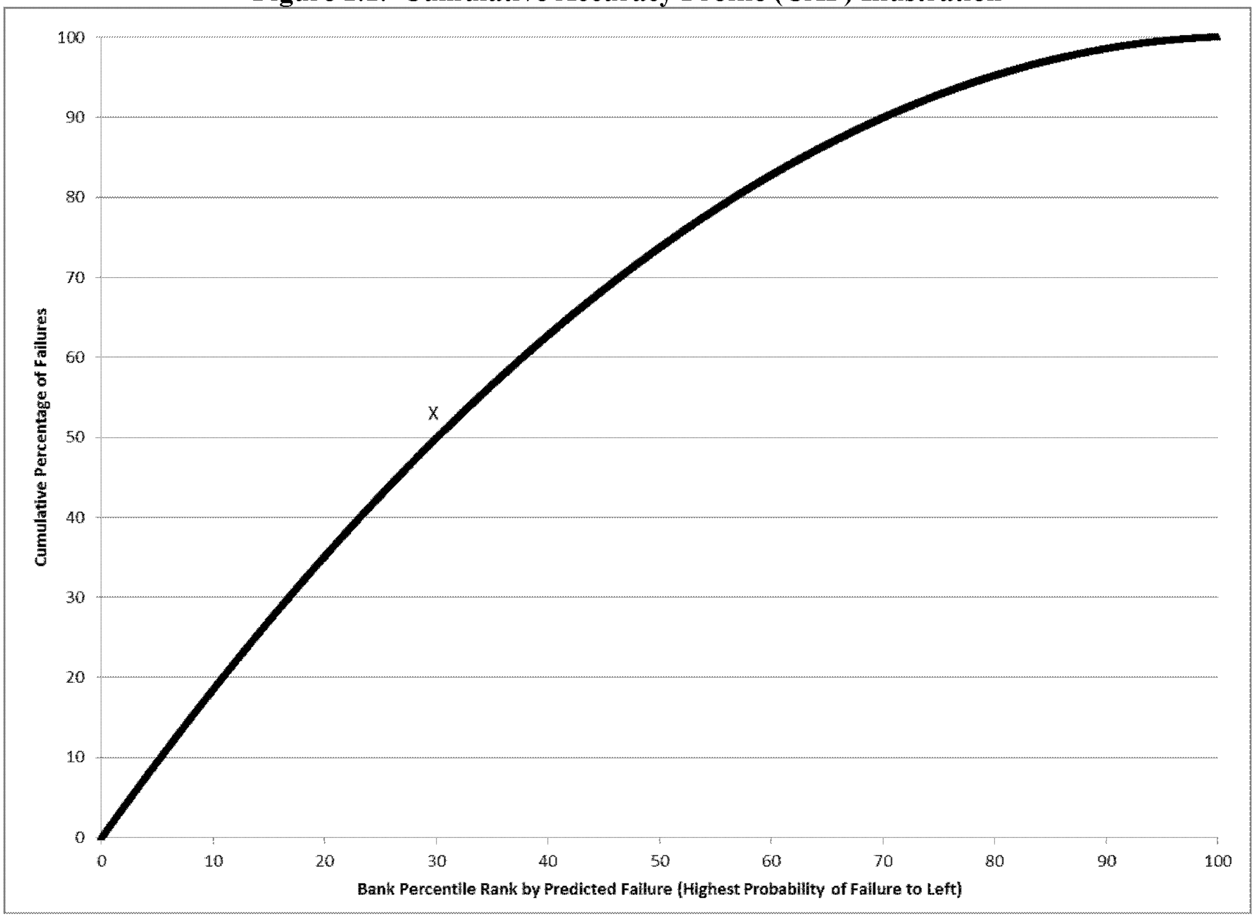

Figure 1.2 shows the CAP curve for a model (dotted line) compared with two limiting CAP curves. The ''random'' curve (single straight line) shows what the CAP would look like if the model prediction were purely random; for example, the 30 percent of banks with the highest failure projections would include 30 percent of actual failures. At the other extreme, the two solid straight lines show a CAP curve for a model that perfectly differentiates banks that fail from banks that do not in its projections; thus, for example, assuming that 20 percent of all banks actually failed, for the ''perfect'' model, the 20 percent of banks with the highest projected failure probability would identify 100 percent of failures.[72]

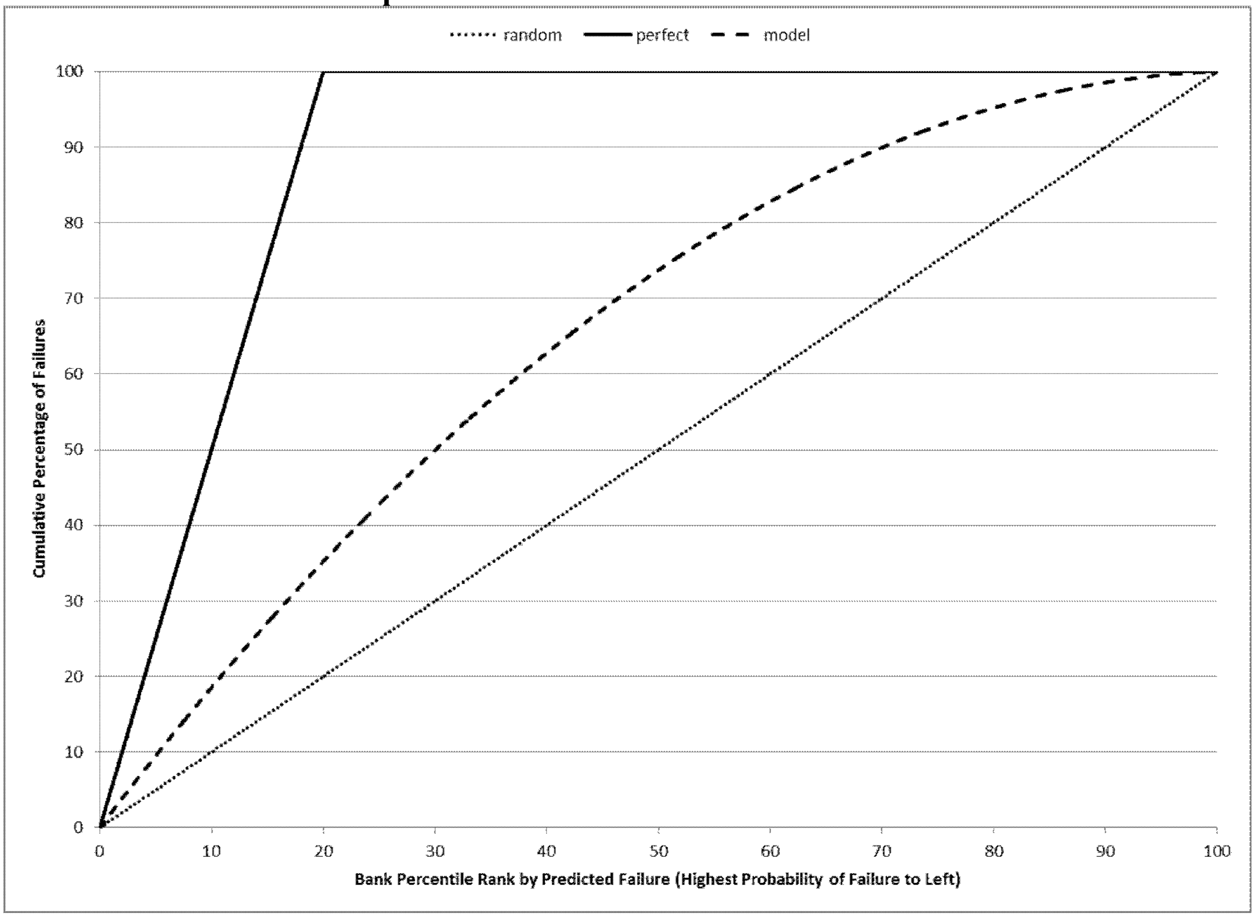
[72] The accuracy ratio can be derived from the CAP curve. For the model depicted by the curved line in Figure 1.2, the area between the curved line and the dotted straight line is a measure of the superiority of the model over the random benchmark. The area between the solid line and the dotted straight line is a measure of the superiority of a ''perfect'' model over the random benchmark. The ratio of these two areas is the accuracy ratio for the model depicted by the curved line. The value is normalized so that it is always less than or equal to 1. An accuracy ratio of 1 occurs in the case of a perfect model, and is 0 in the case of a model that does no better than random guessing. (For the illustrative example in Figure 1.2, the accuracy ratio of the model depicted by the curved line is .396.)

Figure 1.2. Cumulative Accuracy Profile (CAP) Illustration Compared with "Perfect" and Random Cases



To illustrate the application of CAP curves to the assessment system, Figure 1.3 shows a CAP curve for the current small bank deposit insurance system based on its risk ranking (as reflected in assessment rates) as of 2006 and on failures over the next three years (2007 through 2009). The horizontal axis coordinates for four points on this curve, ''IV'', ''III'', ''II'', and ''I Max'', corresponding to the percentage of small banks reported in Column (A) in Table 1.3 below, and the vertical axis coordinates for the points correspond to the percentage of failures contained within these percentages of small banks, as shown in column (B) in Table 1.3. For example, the point in Figure 1.3 marked ''IV'' is 0.06 (percentage of small banks in Risk Category IV) on the horizontal axis and 0.65 (percentage of actual failures among small banks in Risk Category IV) on the vertical axis. Similarly, all points to the left of the point marked ''III'' in Figure 1.3 are Risk Category III and IV rated small banks.

The banks along the horizontal axis corresponding to the horizontal axis coordinates between the points ''II'' and ''I Max'' represent Risk Category I small banks that are assessed at the maximum assessment rate for that category. The banks corresponding to the horizontal axis coordinates between the points ''I Max'' and ''I Var'' represent Risk Category I small banks that are differentially assessed between the maximum and minimum assessment rates for Risk Category I. (Point ''I Var'' is not included in Table 1.3.) Banks to the right of the horizontal axis coordinate for the point ''I Var'' represent Risk Category I small banks that were assessed at the minimum assessment rate.

TABLE 1.3—COMPARISONS OF OUT-OF-SAMPLE PROJECTION OF NEW MODEL TO THE SMALL BANK DEPOSIT INSURANCE ASSESSMENT SYSTEM'S RANKINGS FOR 2006 *

	(A)	(B)	(C)
	Percentage of Small Banks in Risk Categories (X Percent)	Percentage of actual failures among the X Percent	Percentage of actual failures among riskiest X Percent of banks under the proposal
Risk Category IV	0.06	0.65	1.29
Risk Categories IV and III	0.66	3.23	6.61
Risk Categories IV, III, and II	5.35	14.19	40.00

TABLE 1.3—COMPARISONS OF OUT-OF-SAMPLE PROJECTION OF NEW MODEL TO THE SMALL BANK DEPOSIT INSURANCE ASSESSMENT SYSTEM'S RANKINGS FOR 2006 *—Continued

	(A) Percentage of Small Banks in Risk Categories (X Percent)	(B) Percentage of actual failures among the X Percent	(C) Percentage of actual failures among riskiest X Percent of banks under the proposal
Risk Categories IV, III, II, and Max. Rate RC I	12.79	34.19	57.42

* New Model Projections use 2003 as Last Year of Estimation Data.

Where a group of banks along the horizontal axis all have the same risk ranking (that is, where they would all pay the same assessment rate), the CAP curve is constructed as if the failures that occur within this group are uniformly distributed, resulting in a straight line (shown as two parallel lines in CAP curve). Thus, for example, the 26 failures that occurred among the banks on the horizontal axis to the right of ''I Var'', which represent the 3,011 Risk Category I small banks that were assessed at the minimum assessment rate as of the end of 2006, are shown as uniformly distributed among this group (that is, as if each successive bank represented 26/3,011 of a failure). This representation results in the straight line between point ''I Var'' and the point to the extreme upper right of the curve.

Figure 1.3 – Cumulative Accuracy Profile for the Small Bank Deposit Insurance Assessment System Based on Its Risk Rankings for 2006

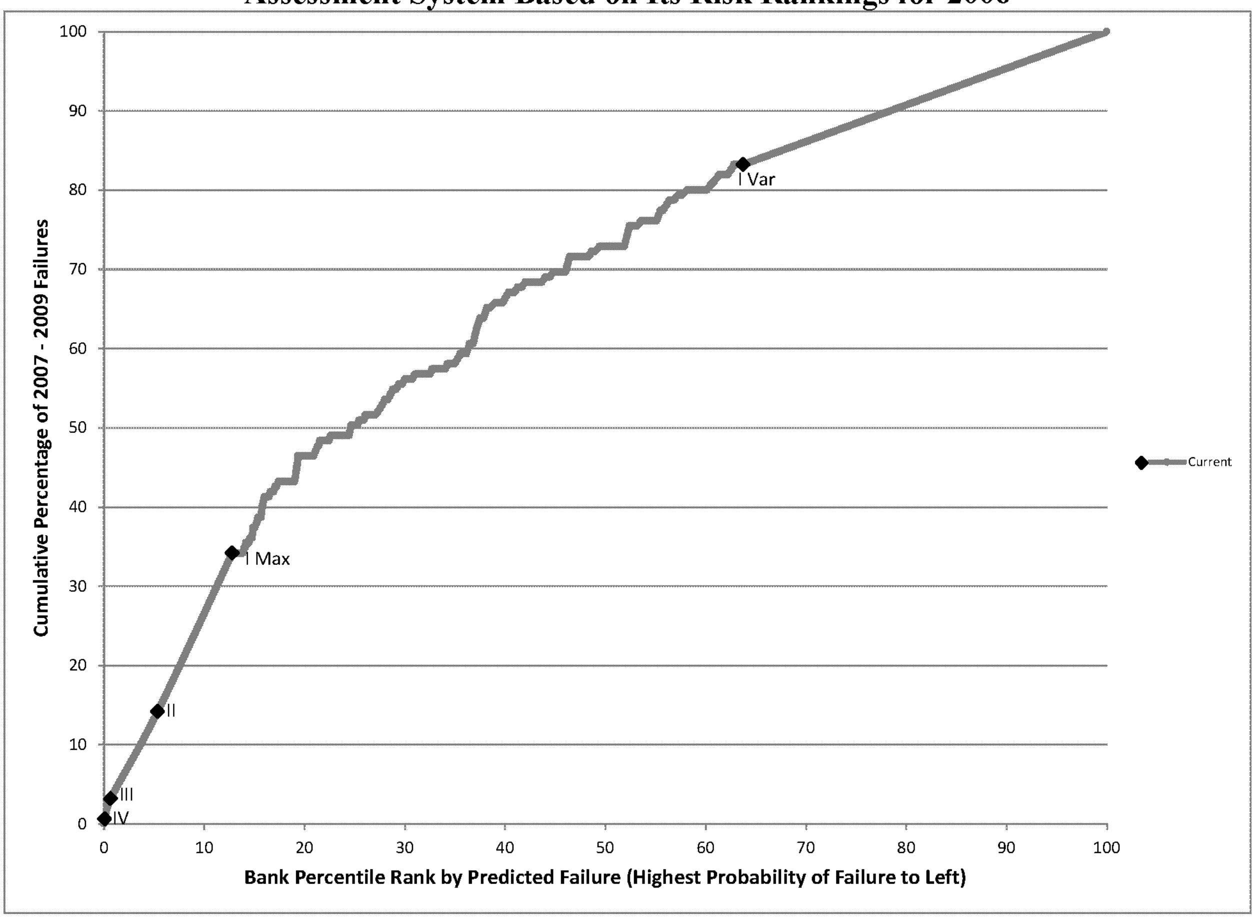


Figure 1.4 shows the same CAP curve as Figure 1.3, but adds a CAP curve based on the proposal's risk ranking (as reflected in assessment rates) as of 2006 and on failures over the next three years (2007 through 2009).[73] Just as Table 1.3 implies, the proposal is superior to the current system at all points. The proposal is obviously superior at the

[73] The horizontal axis shows the risk rank order percentile for each model (the current small bank deposit insurance assessment system and the proposal), but, because the rankings are different under the two models, as a general rule, the bank that corresponds to any given point along the horizontal axis is likely to be different from one model to the other.

points marked by ''III'', ''II'', and ''I Max''. The distinction between the point marked by ''IV'' (for the current small bank deposit insurance system) and the graph for the proposal is difficult to see in the graph, but Table 1.3 shows that the proposal has a vertical value of 1.29 at that point, which is superior to the value of 0.65 for the current small bank deposit insurance system.

As discussed earlier, for the current small bank deposit insurance assessment system, banks along the horizontal axis corresponding to the horizontal axis coordinates between the points ''I Max'' and ''I Var'' represent Risk Category I small banks that are assessed between the maximum and minimum assessment rates for Risk Category I. The proposal is superior in this entire range for 2006.

Figure 1.4 – Cumulative Accuracy Profiles of Proposal vs. the Small Bank Deposit Insurance Assessment System Based on Their Risk Rankings for 2006

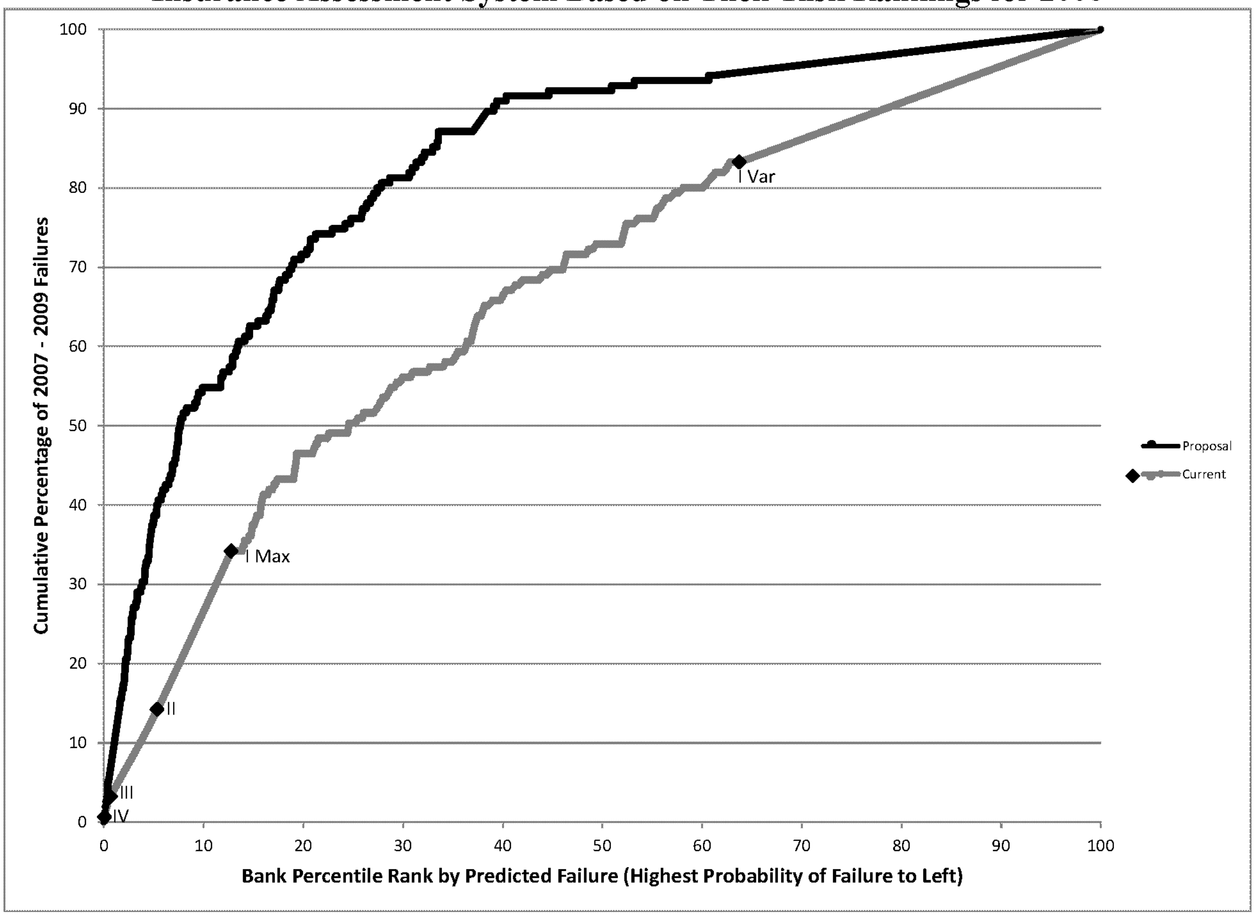

Figure 1.5 shows the same CAP curve based on the proposal's projections as of 2007 and on failures over the next three years (2008 through 2010). The proposal is superior at all points except ''IV'' and the points to the left of that point, where the two models yield identical results.

Figure 1.5 – Cumulative Accuracy Profiles of Proposal vs. the Small Bank Deposit Insurance Assessment System Based on Their Risk Rankings for 2007

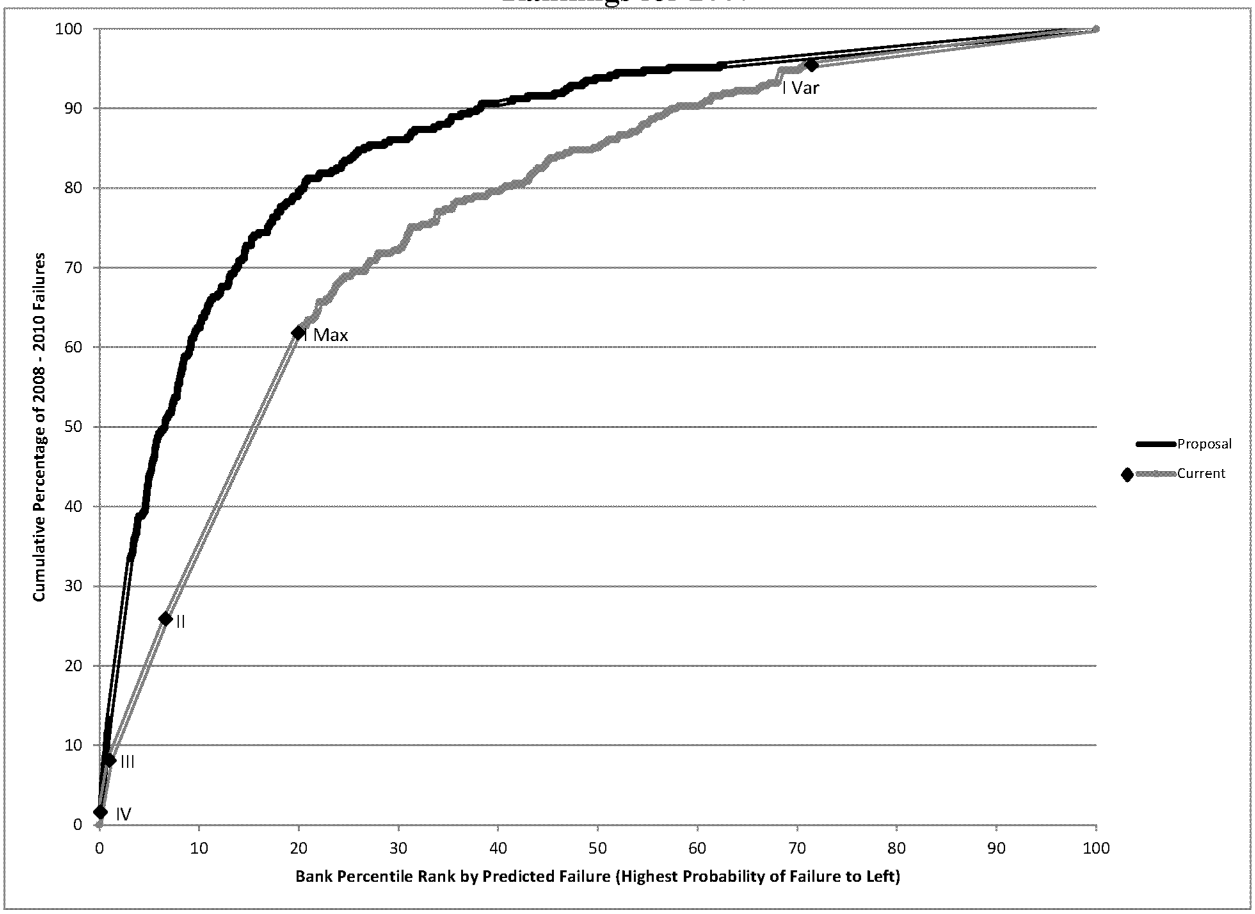

Figure 1.6 shows the same CAP curve based on the proposal's projections as of 2008 and on failures over the next three years (2009 through 2011). The proposal is superior at most points (especially between ''III'' and the horizontal-axis 57-percentile level) and is nearly identical to the current model at remaining points.

Figure 1.6 – Cumulative Accuracy Profiles of Proposal vs. the Small Bank Deposit Insurance Assessment System Based on Their Risk Rankings for 2008

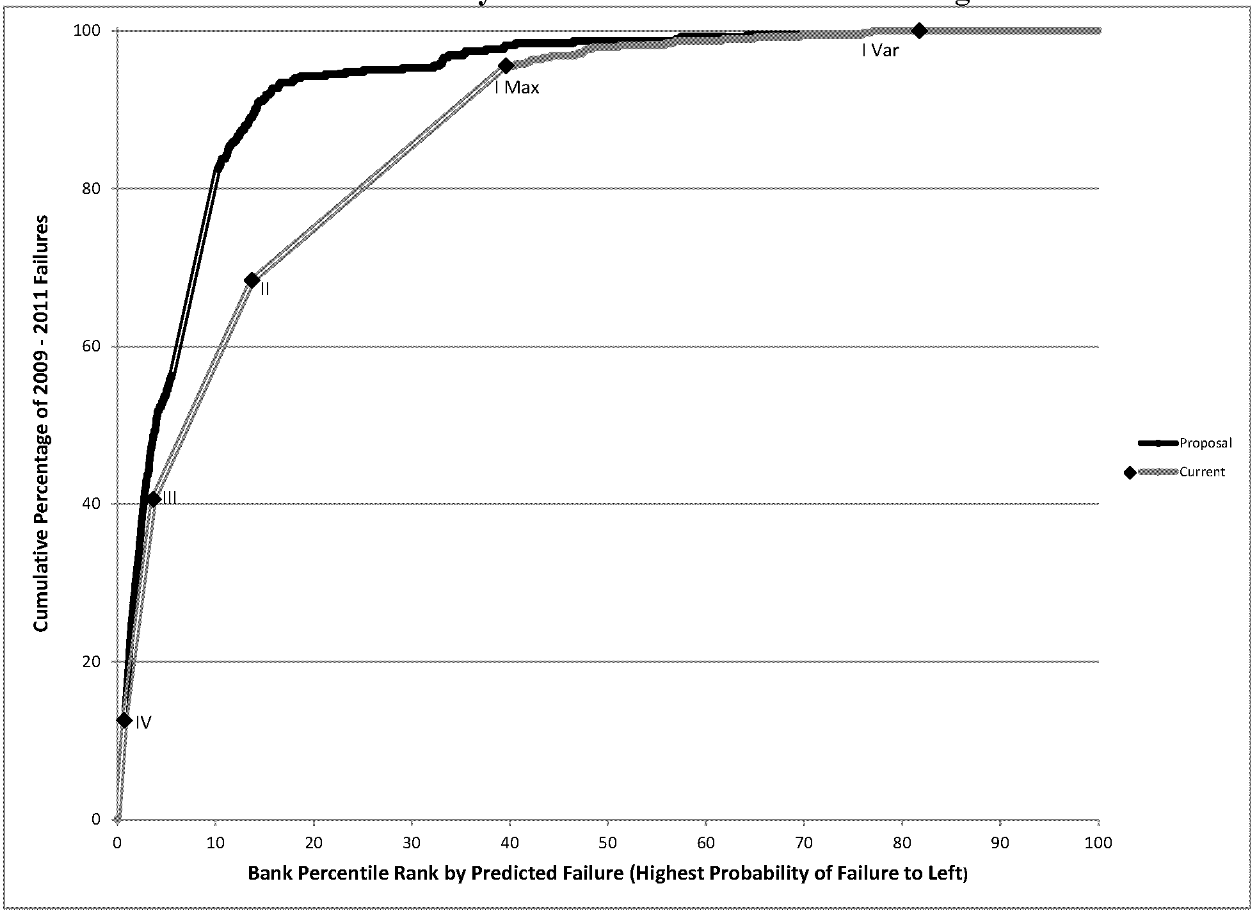

Figure 1.7 shows CAP curves for 2009. (Note that the vertical axis is not zero based.) The proposal is superior at most points and approximately equal to the current model at some points (near IV, and at points to the right of the ‘‘X’’).

Figure 1.7 – Cumulative Accuracy Profiles of Proposal vs. the Small Bank Deposit Insurance Assessment System Based on Their Risk Rankings for 2009

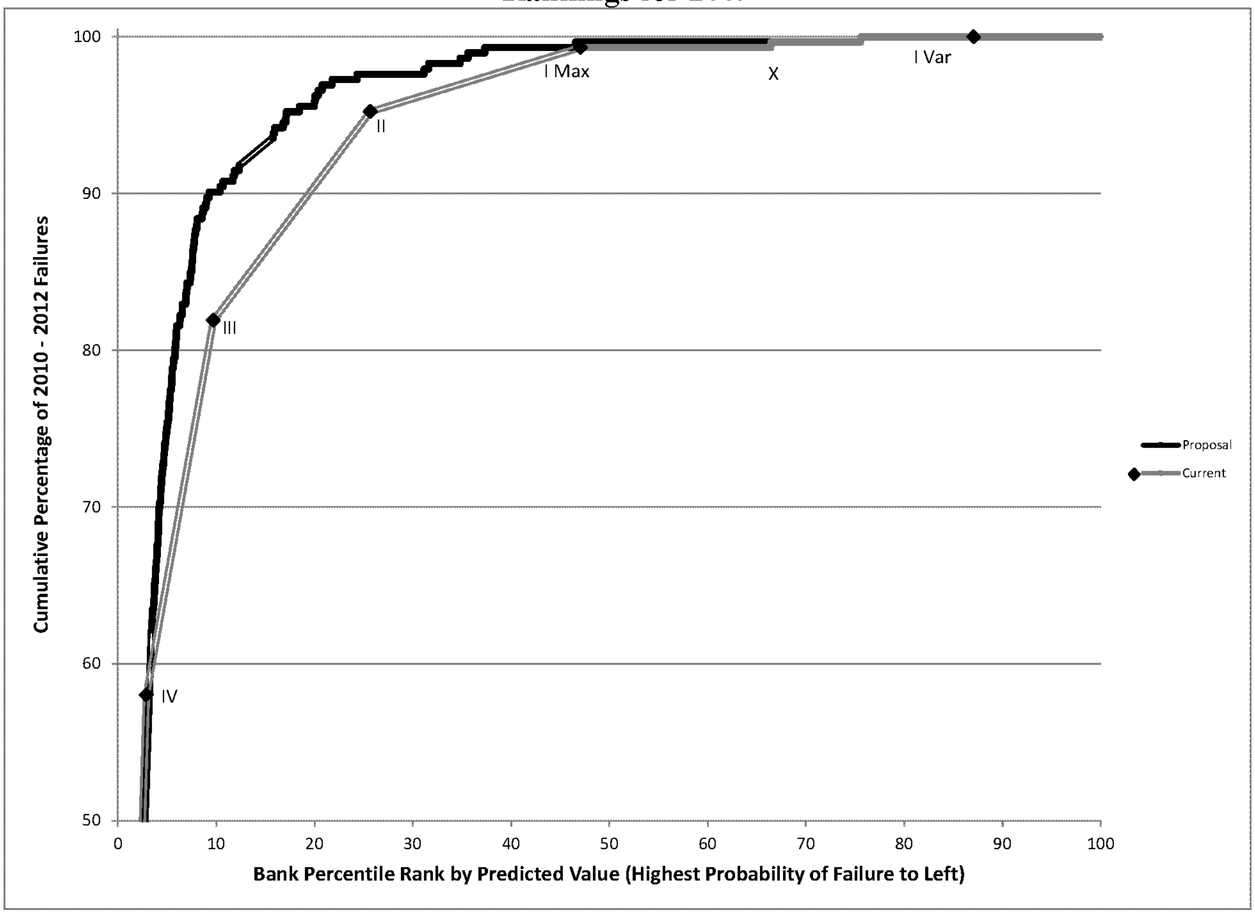

Figure 1.8 shows CAP curves for 2010. When using 2010 data to rank-order small banks based on failure likelihood, the proposal performs worse than the current small bank deposit insurance system for the 2.76 percent of worst-rated small banks (the percentage of banks in Risk Category IV). Bank failures after 2010 occurred in the earlier part of the three-year horizon (more failures in 2011 than in 2013). In such instances, the current small bank deposit insurance system, which has a one-year forecast horizon, can perform better than the proposal with a longer forecast horizon. However, the proposal performs better than or as well as the current model for all points to the right of the intersection of the two curves (near the point marked ''IV'').

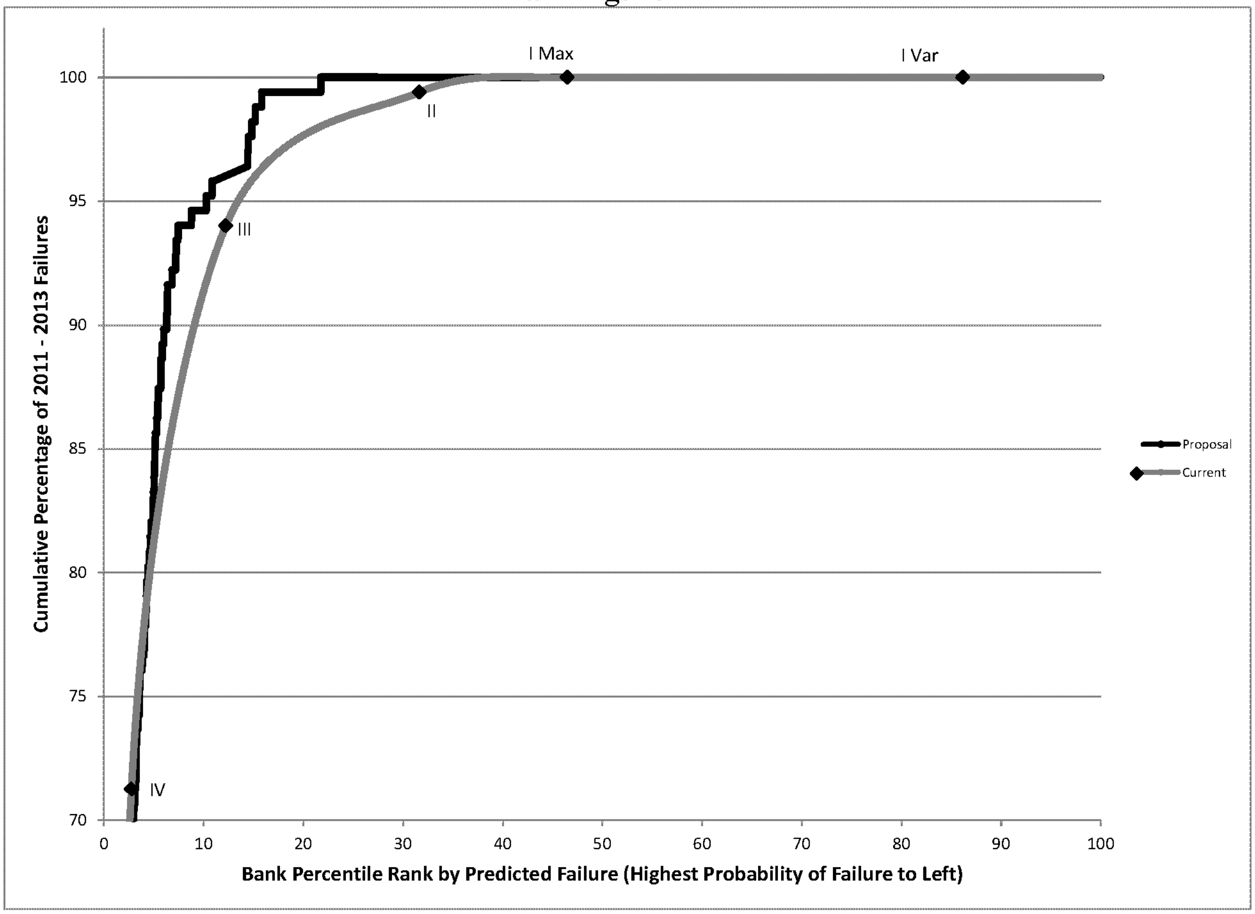
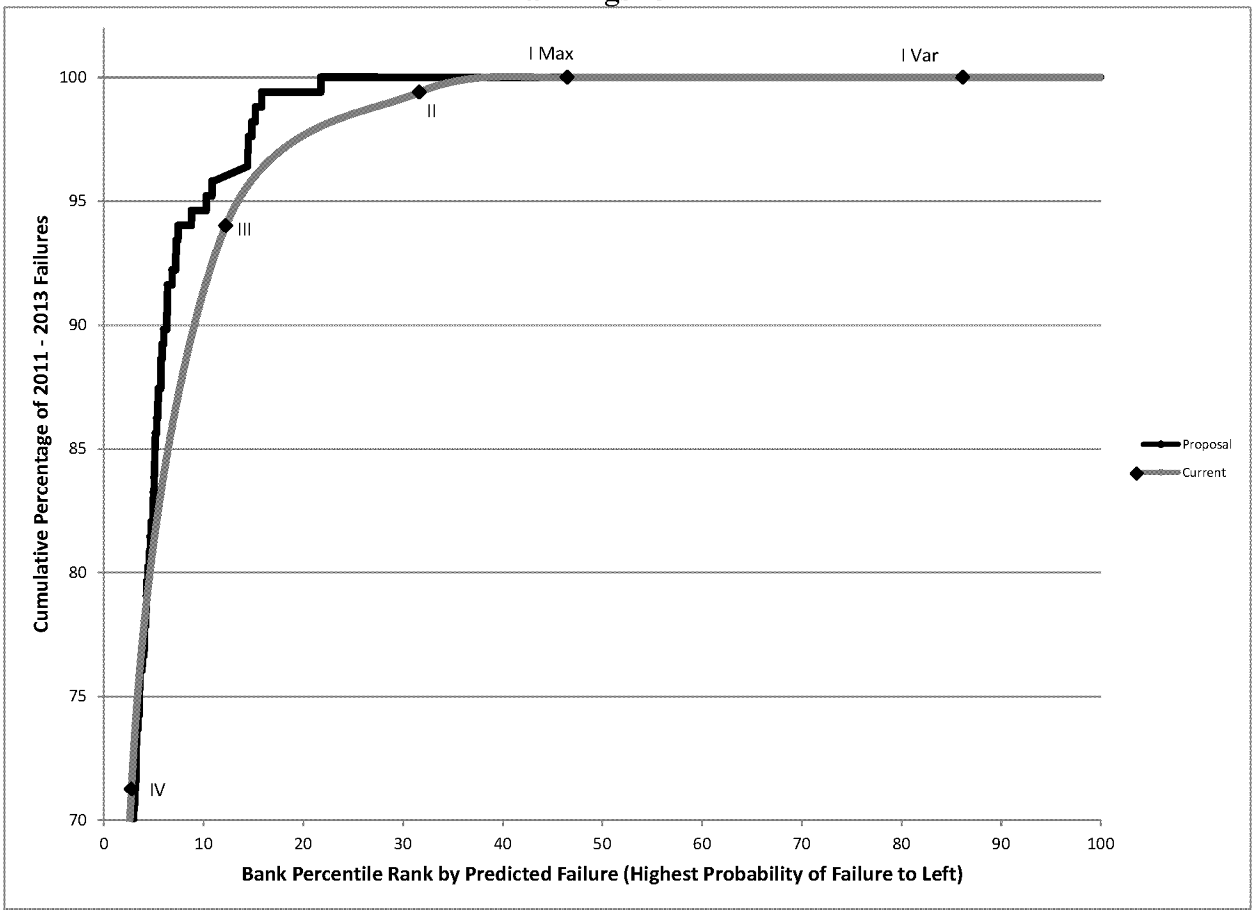
Figure 1.8 – Cumulative Accuracy Profiles of Proposal vs. the Small Bank Deposit Insurance Assessment System Based on Their Risk Rankings for 2010



A similar pattern is observed for projections from 2011, in Figure 1.9. The current small bank deposit insurance system is superior at point IV, as well as a few points from the 51st to 60th percentiles on the horizontal axis. At all other points, the proposal is superior or equal to the current model.

Figure 1.9 – Cumulative Accuracy Profiles of Proposal vs. the Small Bank Deposit Insurance Assessment System Based on Their Risk Rankings for 2011



Overall, the proposal is superior to the current small bank deposit insurance system for all years. The superiority of the new model is much stronger for projections from the years 2006, 2007, and 2008 than in the years 2010 and 2011. By 2010, CAMELS ratings largely reflected the weakened condition of many banks. Furthermore, for projections from 2010 and 2011, a large portion of the failures of the subsequent three-year horizon were near term—that is, in the earlier part of the three-year horizon. For projections done from 2006, 2007 and 2008, a larger portion of the actual failures were further out in the three-year horizon. Thus, while CAMELS 4 and 5 ratings can be good predictors of near-term failures, the additional indicators from the new model contribute more to forecasting accuracy when the failures are further out in time.

Appendix 1.1—Loan Mix Index

The ''Loan Mix Index'' provides a measure of the extent to which banks hold higher risk types of assets. This index uses historical charge-off rates to identify loans types with higher risk. For each loan type, a ''weighted charge-off rate'' (shown in the table below) is calculated, which is the average charge-off rate for that loan type for each year since 2001 weighted by the number of bank failures in the year. (Thus charge-off rates during crisis years have more weight.) Table 1.1.1 below illustrates how the LMI is calculated for a hypothetical bank. The ''weighted charge-off rate'' values shown in the table are the same for all banks because they are industry-wide weighted averages. The remaining two columns will vary across banks, depending on the banks' portfolios. For each loan type, the value in the rightmost column is calculated by multiplying the ''weighted charge-off rate'' by the bank's loans (for that type) as a percent of its total assets. In this illustration, the sum of the right-hand column (84.79) is the LMI for this bank.

TABLE 1.1.1—LOAN MIX INDEX FOR A HYPOTHETICAL BANK [1]

	Weighted charge-off rate percent	Loan category as a percent of hypothetical bank's total assets	Product of two columns to the left
Construction & Development	4.50	1.40	6.29
Commercial & Industrial	1.60	24.24	38.75
Leases	1.50	0.64	0.96
Other Consumer	1.46	14.93	21.74
Loans to Foreign Government	1.34	0.24	0.32
Real Estate Loans Residual	1.02	0.11	0.11
Multifamily Residential	0.88	2.42	2.14
Nonfarm Nonresidential	0.73	13.71	9.99
1–4 Family Residential	0.70	2.27	1.58
Loans to Depository banks	0.58	1.15	0.66
Agricultural Real Estate	0.24	3.43	0.82
Agriculture	0.24	5.91	1.44
SUM (Loan Mix Index)	....	70.45	84.79

Credit card loans are excluded from the list of ''loan types. Although credit card loans have high charge-off rates, they tend to also have high interest rates. The LMI also excludes obligations of states and other political subdivisions in the U.S., loans to nondepository financial institutions, and loans classified as ''other loans.'' There is no reported charge-off data for these types of loans.

[1] The table shows industry-wide weighted charge-off percentage rates, the loan category as a percentage of total assets, the products and the sum (the loan mix index) to two decimal places. The final rule will use seven decimal places for industry-wide weighted charge-off percentage rates, and as many decimal places as permitted by the FDIC's computer systems for the loan category as a percentage of total assets and the products. The total (the loan mix index itself) will use three decimal places.

Appendix 1.2—Variables Tested

Capital

Total equity/Total assets
Reserves/Total assets
Reserve coverage ratio = (allowance for loan & lease losses + allocated transfer risk reserve)/(past-due 90 days and non-accrual loans)

Asset Quality

Loans past due 30–89/Assets
Loans past due 90+ days/Assets
Nonaccrual loans and leases/Assets
Other real estate owned/Assets
Nonperforming Loans/Assets = SUM(past dues 90+, nonaccrual loans)/Assets
Gross loan charge-offs/Assets
Net loan charge-offs/Assets
Loan loss provision/Assets
Loan loss provision/Gross charge-offs
Change in loan loss provision
Gross loan charge-offs/(Net income + Provisions of loan losses)

Earnings

Income before taxes/Assets
Interest income
Interest expense
Net operating income/Assets
Net interest income/Assets
Deposit interest expense/Total deposits
Earnings volatility: 4-quarter standard deviation of income before taxes, 8-quarter standard deviation of income before taxes

Liquidity

Noncore liabilities/Assets
Loans and Leases/Total deposits
Liquid assets/Assets

Other measures

Loan concentration index
One-year asset growth rate
Quartile ranking of one-year asset growth rate
Retained earnings/Assets
Cash dividends on capital stock/Net income

Efficiency Ratio = Non-interest expenses/(Interest income + Non-interest income)

Supervisory Rating

Weighted average CAMELS component rating

CAMELS composite rating

Appendix 2—Analysis of the Projected Effects of the Payment of Assessments on the Capital and Earnings of Insured Depository Institutions

I. Introduction

This analysis estimates the effect of the changes in the deposit insurance assessment system and assessment rates in the proposed rule on the equity capital and profitability of banks.[1] The changes considered in the proposed rule affect only established small banks; they do not affect new banks, large banks or insured branches of foreign banks.

This appendix analyzes how the new assessment system under the proposed range of initial base assessment rates of 3 basis points to 30 basis points (P330) could increase or decrease earnings and capital relative to the current initial base assessment rate schedule of 5 basis points to 35 basis points (C535) and relative to the initial base assessment rate schedule of 3 basis points to 30 basis points (C330) that will take effect when the reserve ratio exceeds 1.15 percent under current regulations (*i.e.,* absent adoption of the proposed rule as a final rule). The proposed rule (P330) is intended to maintain approximate revenue neutrality compared to C330. Therefore, for insured established small banks in aggregate, the proposed rule will not affect aggregate earnings and capital compared to C330. Compared to the current system under current assessment rates, however, banks in the aggregate will have higher earnings and capital under the proposal. This analysis focuses on the magnitude of increases or decreases to individual established small banks' earnings and capital resulting from the proposed rule.

II. Assumptions and Data

The analysis assumes that pre-tax income for the next four quarters for each established small bank is equal to income in the fourth quarter of 2014. The analysis also assumes that the effects of changes in assessments are not transferred to customers in the form of changes in borrowing rates, deposit rates, or service fees. Since deposit insurance assessments are a tax-deductible operating expense, increases in the assessment expense can lower taxable income and decreases in the assessment expense can increase taxable income. Therefore, the analysis considers the effective after-tax cost of assessments in calculating the effect on capital.

The effect of the change in assessments on an established small bank's income is measured by the change in deposit insurance assessments as a percent of income before assessments, taxes, and extraordinary items (hereafter referred to as ''income''). This income measure is used in order to eliminate the potentially transitory effects of extraordinary items and taxes on profitability. In order to facilitate a comparison of the impact of assessment changes, established small banks were assigned to one of two groups: those that were profitable and those that were unprofitable for the year ending December 31, 2014. For this analysis, data as of December 31, 2014 are used to calculate each bank's assessment base and risk-based assessment rate. The base and rate are assumed to remain constant throughout the one year projection period. An established small bank's earnings retention and dividend policies also influence the extent to which assessments affect equity levels. If an established small bank maintains the same *dollar* amount of dividends when it pays a higher deposit insurance assessment under the proposed rule, equity (retained earnings) will be less by the full amount of the after-tax cost of the increase in the assessment. This analysis instead assumes that an established small bank will maintain its dividend *rate* (that is, dividends as a fraction of net income) unchanged from the weighted average rate reported over the four quarters ending December 31, 2014.

III. Projected Effects on Capital and Earnings Assuming a Range of Assessment Rates under the Current Established Small Bank Deposit Insurance Assessment System of 5 Basis Points to 35 Basis Points and under the Proposed System of 3 Basis Points to 30 Basis Points (Assessment Change P330–C535)

Under this scenario, no established small banks facing an increase in assessments would, as a result of the assessment increase, fall below a 4 percent or 2 percent leverage ratio. Two established small banks facing a decrease in assessments would, as a result of the decrease, have their leverage ratio rise above the 4 percent threshold. No established small banks facing a decrease in assessments would, as a result of the assessment decrease, have their leverage ratio rise above the 2 percent threshold.

[1] As it is elsewhere in this NPR, in this appendix, the term ''bank'' is synonymous with the term ''insured depository institution'' and the term ''established small bank'' is synonymous with the term ''established small depository institution'' as it is used in 12 CFR part 327. In general, an ''established small bank'' is one that has less than $10 billion in assets and that has been federally insured for at least five years as of the last day of any quarter for which it is being assessed.

Table 2.1 shows that approximately 83 percent of profitable established small banks are projected to have a decrease in assessments in an amount between 0 and 10 percent of income. Another 9 percent of profitable established small banks would have a reduction in assessments exceeding 10 percent of their income. 453 profitable established small banks would have an increase in assessments, with all but 7 of them facing assessment increases between 0 and10 percent of their income.

Table 2.1 – Effect of the Proposal on Income for Profitable Established Small Banks

(P330 compared to C535)

Change in Assessments Relative to Income	INSTITUTIONS		ASSETS	
	Number	Percent of Total Profitable Established Small Banks	Assets ($ billions)	Percent of Total Assets of Profitable Established Small Banks
Decrease over 40%	125	2	21	1
Decrease 20% to 40%	108	2	25	1
Decrease 10% to 20%	312	5	75	3
Decrease 5% to 10%	663	11	179	6
Decrease 0% to 5%	4,317	72	2,101	74
No Change	2	0	1	0
Increase 0% to 5%	432	7	430	15
Increase 5% to 10%	14	0	16	1
Increase 10% to 20%	3	0	1	0
Increase 20% to 40%	2	0	1	0
Increase over 40%	2	0	1	0
All	5,982	100	2,849	100

Table 2.2 provides the same analysis for established small banks that were unprofitable during the year ending December 31, 2014. Table 2.2 shows that about 51 percent of unprofitable established small banks are projected to have a decrease in assessments in an amount between 0 and 10 percent of their losses. Another 43 percent will have lower assessments in amounts exceeding 10 percent income. Only 25 unprofitable banks will face assessment increases, all but 2 of them in amounts between 0 and 10 percent of losses.

Table 2.2 – Effect of the Proposal on Income for Unprofitable Established Small Banks

(P330 compared to C535)

Change in Assessment Relative to Losses	INSTITUTIONS		ASSETS	
	Number	Percent of Total Unprofitable Established Small Banks	Assets ($ billions)	Percent of Total Assets of Unprofitable Established Small Banks
Decrease over 40%	55	13	8	8
Decrease 20% to 40%	49	12	7	7
Decrease 10% to 20%	74	18	14	14
Decrease 5% to 10%	80	20	27	28
Decrease 0% to 5%	126	31	32	33
No Change	1	0	0	0
Increase 0% to 5%	20	5	8	8
Increase 5% to 10%	3	1	0	0
Increase 10% to 20%	1	0	0	0
Increase 20% to 40%	0	0	0	0
Increase over 40%	1	0	0	0
All	410	100	96	100

IV. Projected Effects on Capital and Earnings Assuming a Range of Initial Base Assessment Rates Under Both the Current Established Small Bank Deposit Insurance Assessment System and the Proposed System of 3 Basis Points to 30 Basis Points (P330–C330)

Under this scenario, no established small banks facing an increase in assessments would, as a result of the assessment increase, fall below a 4 percent or 2 percent leverage ratio. One established small bank facing a decrease in assessments would, as a result of the assessment decrease, have its leverage ratio rise above the 4 percent threshold.

Table 2.3 shows that approximately 54 percent of profitable established small banks are projected to have a decrease in assessments in an amount between 0 and 10 percent of income. Another 4 percent of profitable established small banks would have a reduction in assessments exceeding 10 percent of their income. 1,211 profitable established small banks would have an increase in assessments, with all but 27 facing assessment increases between 0 and10 percent of their income.

Table 2.3 – Effect of the Proposal on Income for Profitable Established Small Banks

(P330 compared to C330)

Change in Assessments Relative to Income	INSTITUTIONS		ASSETS	
	Number	Percent of Total Profitable Established Small Banks	Assets ($ billions)	Percent of Total Assets of Profitable Established Small Banks
Decrease over 40%	69	1	11	0
Decrease 20% to 40%	69	1	18	1
Decrease 10% to 20%	145	2	29	1
Decrease 5% to 10%	333	6	85	3
Decrease 0% to 5%	2,849	48	1,097	38
No Change	1,306	22	459	16
Increase 0% to 5%	1,115	19	1,070	38
Increase 5% to 10%	69	1	61	2
Increase 10% to 20%	11	0	15	1
Increase 20% to 40%	7	0	2	0
Increase over 40%	9	0	2	0
All	5,982	100	2,849	100

Table 2.4 provides the same analysis for established small banks that were unprofitable during the year ending December 31, 2014. Table 2.4 shows that about 57 percent of unprofitable established small banks are projected to have a decrease in assessments in an amount between 0 and 10 percent of their losses. Another 27 percent will have lower assessments in amounts exceeding 10 percent of their losses. Only 59 unprofitable banks will face assessment increases, all but 6 of them in amounts between 0 and 10 percent of losses.

Table 2.4 – Effect of the Proposal on Income for Unprofitable Established Small Banks

(P330 compared to C330)

Change in Assessments Relative to Losses	INSTITUTIONS		ASSETS	
	Number	Percent of Total Unprofitable Established Small Banks	Assets ($ billions)	Percent of Total Assets of Unprofitable Established Small Banks
Decrease over 40%	34	8	5	5
Decrease 20% to 40%	30	7	5	5
Decrease 10% to 20%	48	12	6	7

X. Revisions to Code of Federal Regulations

List of subjects in 12 CFR Part 327.

Bank deposit insurance, Banks, Savings Associations.

For the reasons set forth above, the FDIC proposes to amend part 327 as follows:

PART 327—ASSESSMENTS

■ 1. The authority for 12 CFR part 327 continues to read as follows:

Authority: 12 U.S.C. 1441, 1813, 1815, 1817–19, 1821.

§ 327.3 [Amended]

■ 2. Amend § 327.3, in paragraph (b), by removing ''§§ 327.4(a) and 327.9'' and adding its place ''§ 327.4(a) and § 327.9 or § 327.16''.

§ 327.4 [Amended]

■ 3. Amend § 327.4:

■ a. In paragraph (a), by removing ''§ 327.9'' and adding in its place ''§ 327.9 or § 327.16''.

■ b. In paragraph (c), by removing ''§ 327.9(e)(3)'' and adding in its place ''§§ 327.9(f)(3) and 327.16 (f)(3)''.

■ 4. Amend § 327.8:

■ a. In paragraph (e) and (f), by removing ''§ 327.9(e)'' and adding in its place ''§§ 327.9(f) and 327.16 (f)''.

■ b. In paragraph (k)(1), by removing ''§ 327.9(f)(3) and (4)'' and adding in its place ''§§ 327.9(g)(3) and (4) and 327.16 (f)(3) and (4)''.

■ c. By revising paragraph (l).

■ d. In paragraphs (m), (n), (o), and (p), by removing ''§ 327.9(d)(1)'' and adding in its place ''§§ 327.9(e)(1) and 327.16(e)(1)'' and removing ''§ 327.9(d)(2)'' and adding in its place ''§§ 327.9(e)(2) and 327.16(e)(2).''

■ e. By adding paragraphs (v) through (z).

The revision and additions read as follows:

§ 327.8 Definitions.

* * * * *

(l) *Risk assignment.* Under § 327.9, for all small institutions and insured branches of foreign banks, risk assignment include assignment to Risk Category I, II, III, or IV and, within Risk Category I, assignment to an assessment rate. Under § 327.16, for all new small institutions and insured branches of foreign banks, risk assignment includes assignment to Risk Category I, II, III, or IV, and for insured branches of foreign banks within Risk Category I, assignment to an assessment rate or rates. For all established small institutions, large institutions and highly complex institutions, risk assignment includes assignment to an assessment rate.

* * * * *

(v) *Established small institution*—An established small institution is a ''small institution'' as defined under paragraph (e) of this section that meets the definition of ''established depository institution'' under paragraph (k) of this section.

(w) *New small institution*—A new small institution is a ''small institution'' as defined under paragraph (e) of this section that meets the definition of ''new depository institution'' under paragraph (j) of this section.

(y) *Deposit Insurance Fund and DIF*—the Deposit Insurance Fund established pursuant to 12 U.S.C. 1813(y)(1).

(z) *Reserve ratio of the DIF*—the reserve ratio as defined in 12 U.S.C. 1813(y)(3).

■ 5. Amend § 327.9 by adding introductory text to read as follows:

§ 327.9 Assessment pricing methods.

The following pricing methods shall apply through the calendar quarter in which the reserve ratio of the DIF reaches 1.15 percent for the first time after June 30, 2015.

* * * * *

■ 6. Add § 327.16 to read as follows:

§ 327.16 Assessment pricing methods—beginning the first calendar quarter after the calendar quarter in which the reserve ratio of the DIF reaches 1.15 percent.

(a) *Established small institutions.* Beginning the first calendar quarter after June 30, 2015 in which the reserve ratio of the DIF reached or exceeded 1.15 percent in the previous calendar quarter, an established small institution shall have its initial base assessment rate determined by using the financial ratios methods set forth in paragraph (a)(1) of this section.

(1) Under the financial ratios method, each of seven financial ratios and a weighted average of CAMELS component ratings will be multiplied by a corresponding pricing multiplier. The sum of these products will be added to a uniform amount. The resulting sum shall equal the institution's initial base assessment rate; provided, however, that no institution's initial base assessment rate shall be less than the minimum initial base assessment rate in effect for established small institutions with a particular CAMELS component rating for that quarter nor greater than the maximum initial base assessment rate in effect for established small institutions with a particular CAMELS component rating for that quarter. An institution's initial base assessment rate, subject to adjustment pursuant to paragraphs (e)(1), (2), and (3) of this section, as appropriate (resulting in the institution's total base assessment rate, which in no case can be lower than 50 percent of the institution's initial base assessment rate), and adjusted for the actual assessment rates set by the Board under § 327.10(g), will equal an institution's assessment rate. The seven financial ratios are: Tier 1 Leverage Ratio (%); Net Income before Taxes/Total Assets (%); Nonperforming Loans and Leases/Gross Assets (%); Other Real Estate Owned/Gross Assets (%); Core Deposits/Total Assets (%); One Year Asset Growth (%); and Loan Mix Index. The ratios are defined in Table A.1 of Appendix A to this subpart. The ratios will be determined for an assessment period based upon information contained in an institution's report of condition filed as of the last day of the assessment period as set out in paragraph (a)(2) of this section. The weighted average of CAMELS component ratings is created by multiplying each component by the following percentages and adding the products: Capital adequacy—25%, Asset quality—20%, Management—25%, Earnings—10%, Liquidity—10%, and Sensitivity to market risk—10%. The following table sets forth the initial values of the pricing multipliers:

Risk measures *	Pricing multipliers **
Tier 1 Leverage ratio	[___]
Net Income before Taxes/Total Assets	[___]
Nonperforming Loans and Leases/Gross Assets	[___]
Other Real Estate Owned/Gross Assets	[___]
Core Deposits/Total Assets	[___]
One Year Asset Growth	[___]
Loan Mix Index	[___]
Weighted Average CAMELS Component Rating	[___]

* Ratios are expressed as percentages.
** Multipliers are rounded to three decimal places.

(i) The seven financial ratios and the weighted average CAMELS component rating will be multiplied by the respective pricing multiplier, and the products will be summed. To this result will be added the uniform amount. The resulting sum shall equal the institution's initial base assessment rate; provided, however, that no institution's initial base assessment rate shall be less than the minimum initial base assessment rate in effect for the applicable CAMELS composite grouping set out in § 327.10 for that quarter nor greater than the maximum initial base assessment rate in effect for the applicable CAMELS composite grouping set out in § 327.10 for that quarter.

(ii) Uniform amount and pricing multipliers. Except as adjusted for the actual assessment rates set by the Board under § 327.10(f), the uniform amount shall be:

(A) ____ whenever the assessment rate schedule set forth in § 327.10(b) is in effect;

(C) ____ whenever the assessment rate schedule set forth in § 327.10(c) is in effect; or

(D) ____ whenever the assessment rate schedule set forth in § 327.10(d) is in effect.

(iii) *Implementation of CAMELS rating changes*—(A) *Composite rating change.* If, during a quarter, a CAMELS composite rating change occurs in a way that changes the institution's initial base assessment rate, then the institution's initial base assessment rate for the portion of the quarter prior to the change shall be determined using the assessment schedule for the appropriate CAMELS composite rating in effect before the change, including any minimum or maximum initial base assessment rates, and subject to adjustment pursuant to paragraphs (e)(1) through (3) of this section, as appropriate, and adjusted for actual assessment rates set by the Board under § 327.10(f). For the portion of the quarter after the CAMELS composite rating change, the institution's initial base assessment rate shall be determined using the assessment schedule for the applicable CAMELS composite rating in effect, including any minimum or maximum initial base assessment rates, and subject to adjustment pursuant to paragraphs (e)(1) through (3) of this section, as appropriate, and adjusted for actual assessment rates set by the Board under § 327.10(f).

(B) *Component ratings changes.* If, during a quarter, a CAMELS component rating change occurs in a way that changes the institution's initial base assessment rate, the initial base assessment rate for the period before the change shall be determined under the financial ratios method using the CAMELS component ratings in effect before the change, subject to adjustment under paragraphs (e)(1) through (3) of this section, as appropriate. Beginning on the date of the CAMELS component rating change, the initial base assessment rate for the remainder of the quarter shall be determined under the financial ratios method using the CAMELS component ratings in effect after the change, again subject to adjustment under paragraphs (e)(1) through (3), as appropriate.

(2) *Applicable reports of condition.* The financial ratios used to determine the assessment rate for an established small institution shall be based upon information contained in an institution's Consolidated Reports of Condition and Income or Thrift Financial Report (or successor report, as appropriate) dated as of March 31 for the assessment period beginning the preceding January 1; dated as of June 30 for the assessment period beginning the preceding April 1; dated as of September 30 for the assessment period beginning the preceding July 1; and dated as of December 31 for the assessment period beginning the preceding October 1.

(b) *Large and Highly Complex institutions*—(1) *Assessment scorecard for large institutions (other than highly complex institutions).* (i) A large institution other than a highly complex institution shall have its initial base assessment rate determined using the scorecard for large institutions.

SCORECARD FOR LARGE INSTITUTIONS

	Scorecard measures and components	Measure weights (percent)	Component weights (percent)
P	Performance Score		
P.1	Weighted Average CAMELS Rating	100	30
P.2	Ability to Withstand Asset-Related Stress		50
	Leverage ratio	10	
	Concentration Measure	35	
	Core Earnings/Average Quarter-End Total Assets*	20	
	Credit Quality Measure	35	
P.3	Ability to Withstand Funding-Related Stress		20
	Core Deposits/Total Liabilities	60	
	Balance Sheet Liquidity Ratio	40	
L	Loss Severity Score		
L.1	Loss Severity Measure		100

* Average of five quarter-end total assets (most recent and four prior quarters).

(ii) The scorecard for large institutions produces two scores: performance score and loss severity score.

(A) Performance score for large institutions. The performance score for large institutions is a weighted average of the scores for three measures: the weighted average CAMELS rating score, weighted at 30 percent; the ability to withstand asset-related stress score, weighted at 50 percent; and the ability to withstand funding-related stress score, weighted at 20 percent.

(*1*) *Weighted average CAMELS rating score.* (*i*) To compute the weighted average CAMELS rating score, a weighted average of an institution's CAMELS component ratings is calculated using the following weights:

CAMELS component	Weight (percent)
C	25
A	20
M	25
E	10
L	10
S	10

(*ii*) A weighted average CAMELS rating converts to a score that ranges from 25 to 100. A weighted average rating of 1 equals a score of 25 and a weighted average of 3.5 or greater equals a score of 100. Weighted average CAMELS ratings between 1 and 3.5 are assigned a score between 25 and 100. The score increases at an increasing rate as the weighted average CAMELS rating increases. Appendix B of this subpart describes the conversion of a weighted average CAMELS rating to a score.

(*2*) *Ability to withstand asset-related stress score.* (*i*) The ability to withstand asset-related stress score is a weighted average of the scores for four measures: Leverage ratio; concentration measure; the ratio of core earnings to average quarter-end total assets; and the credit quality measure. Appendices A and C of this subpart define these measures.

(*ii*) The Leverage ratio and the ratio of core earnings to average quarter-end total assets are described in appendix A and the method of calculating the scores is described in appendix C of this subpart.

(*iii*) The score for the concentration measure is the greater of the higher-risk assets to Tier 1 capital and reserves score or the growth-adjusted portfolio concentrations score. Both ratios are described in appendix C.

(*iv*) The score for the credit quality measure is the greater of the criticized and classified items to Tier 1 capital and reserves score or the underperforming assets to Tier 1 capital and reserves score.

(*v*) The following table shows the cutoff values and weights for the measures used to calculate the ability to withstand asset-related stress score. Appendix B of this subpart describes how each measure is converted to a score between 0 and 100 based upon the minimum and maximum cutoff values, where a score of 0 reflects the lowest risk and a score of 100 reflects the highest risk.

CUTOFF VALUES AND WEIGHTS FOR MEASURES TO CALCULATE ABILITY TO WITHSTAND ASSET-RELATED STRESS SCORE

Measures of the ability to withstand asset-related stress	Cutoff values		Weights (percent)
	Minimum (percent)	Maximum (percent)	
Leverage ratio	6	13	10
Concentration Measure			35
Higher-Risk Assets to Tier 1 Capital and Reserves; or	0	135	
Growth-Adjusted Portfolio Concentrations	4	56	
Core Earnings/Average Quarter-End Total Assets*	0	2	20
Credit Quality Measure			35
Criticized and Classified Items/Tier 1 Capital and Reserves; or	7	100	
Underperforming Assets/Tier 1 Capital and Reserves	2	35	

* Average of five quarter-end total assets (most recent and four prior quarters).

(*vi*) The score for each measure in the table in paragraph (b)(1)(ii)(A)(*2*)(*v*) is multiplied by its respective weight and the resulting weighted score is summed to arrive at the score for an ability to withstand asset-related stress, which can range from 0 to 100, where a score of 0 reflects the lowest risk and a score of 100 reflects the highest risk.

(*3*) Ability to withstand funding-related stress score. Two measures are used to compute the ability to withstand funding-related stress score: a core deposits to total liabilities ratio, and a balance sheet liquidity ratio. Appendix A of this subpart describes these measures. Appendix B of this subpart describes how these measures are converted to a score between 0 and 100, where a score of 0 reflects the lowest risk and a score of 100 reflects the highest risk. The ability to withstand funding-related stress score is the weighted average of the scores for the two measures. In the following table, cutoff values and weights are used to derive an institution's ability to withstand funding-related stress score:

CUTOFF VALUES AND WEIGHTS TO CALCULATE ABILITY TO WITHSTAND FUNDING-RELATED STRESS SCORE

Measures of the ability to withstand funding-related stress	Cutoff values		Weights (percent)
	Minimum (percent)	Maximum (percent)	
Core Deposits/Total Liabilities	5	87	60
Balance Sheet Liquidity Ratio	7	243	40

(*4*) Calculation of Performance Score. In paragraph (b)(1)(ii)(A)(*3*), the scores for the weighted average CAMELS rating, the ability to withstand asset-related stress, and the ability to withstand funding-related stress are multiplied by their respective weights (30 percent, 50 percent and 20 percent, respectively) and the results are summed to arrive at the performance score. The performance score cannot be less than 0 or more than 100, where a score of 0 reflects the lowest risk and a score of 100 reflects the highest risk.

(B) *Loss severity score.* The loss severity score is based on a loss severity measure that is described in appendix D of this subpart. Appendix B also describes how the loss severity measure is converted to a score between 0 and 100. The loss severity score cannot be less than 0 or more than 100, where a score of 0 reflects the lowest risk and a score of 100 reflects the highest risk. Cutoff values for the loss severity measure are:

CUTOFF VALUES TO CALCULATE LOSS SEVERITY SCORE

Measure of loss severity	Cutoff values	
	Minimum (percent)	Maximum (percent)
Loss Severity	0	28

(C) *Total score.* (*1*) The performance and loss severity scores are combined to produce a total score. The loss severity score is converted into a loss severity factor that ranges from 0.8 (score of 5 or lower) to 1.2 (score of 85 or higher). Scores at or below the minimum cutoff of 5 receive a loss severity factor of 0.8, and scores at or above the maximum cutoff of 85 receive a loss severity factor of 1.2. The following linear interpolation converts loss severity scores between the cutoffs into a loss severity factor:

(Loss Severity Factor = 0.8 + [0.005 * (Loss Severity Score − 5)].

(*2*) The performance score is multiplied by the loss severity factor to produce a total score (total score = performance score * loss severity factor). The total score can be up to 20 percent higher or lower than the performance score but cannot be less than 30 or more than 90. The total score is subject to adjustment, up or down, by a maximum of 15 points, as set forth in paragraph (b)(3) of this section. The resulting total score after adjustment cannot be less than 30 or more than 90.

(D) *Initial base assessment rate.* A large institution with a total score of 30 pays the minimum initial base assessment rate and an institution with a total score of 90 pays the maximum initial base assessment rate. For total scores between 30 and 90, initial base assessment rates rise at an increasing rate as the total score increases, calculated according to the following formula:

$$Rate = Minimum\ Rate + \left[\left(\left(1.4245 \times \left(\frac{Score}{100} \right)^{3} \right) - 0.0385 \right) \times (Maximum\ Rate - Minimum\ Rate) \right]$$

where Rate is the initial base assessment rate (expressed in basis points), Maximum Rate is the maximum initial base assessment rate then in effect (expressed in basis points), and Minimum Rate is the minimum initial base assessment rate then in effect (expressed in basis points). Initial base assessment rates are subject to adjustment pursuant to paragraphs (b)(3), (e)(1), (e)(2), of this section; large institutions that are not well capitalized or have a CAMELS composite rating of 3, 4 or 5 shall be subject to the adjustment at paragraph (e)(3) of this section; these adjustments shall result in the institution's total base assessment rate, which in no case can be lower than 50 percent of the institution's initial base assessment rate.

(2) *Assessment scorecard for highly complex institutions.* (i) A highly complex institution shall have its initial base assessment rate determined using the scorecard for highly complex institutions.

SCORECARD FOR HIGHLY COMPLEX INSTITUTIONS

	Measures and components	Measure weights (percent)	Component weights (percent)
P	Performance Score		
P.1	Weighted Average CAMELS Rating	100	30
P.2	Ability To Withstand Asset-Related Stress		50
	Leverage ratio	10	
	Concentration Measure	35	
	Core Earnings/Average Quarter-End Total Assets	20	
	Credit Quality Measure and Market Risk Measure	35	
P.3	Ability To Withstand Funding-Related Stress		20
	Core Deposits/Total Liabilities	50	
	Balance Sheet Liquidity Ratio	30	
	Average Short-Term Funding/Average Total Assets	20	
L	Loss Severity Score		
L.1	Loss Severity		100

(ii) The scorecard for highly complex institutions produces two scores: performance and loss severity.

(A) Performance score for highly complex institutions. The performance score for highly complex institutions is the weighted average of the scores for three components: weighted average CAMELS rating, weighted at 30 percent; ability to withstand asset-related stress score, weighted at 50 percent; and ability to withstand funding-related stress score, weighted at 20 percent.

(*1*) *Weighted average CAMELS rating score.* (*i*) To compute the score for the weighted average CAMELS rating, a weighted average of an institution's CAMELS component ratings is calculated using the following weights:

CAMELS component	Weight (percent)
C	25
A	20
M	25
E	10
L	10
S	10

(*ii*) A weighted average CAMELS rating converts to a score that ranges from 25 to 100. A weighted average rating of 1 equals a score of 25 and a weighted average of 3.5 or greater equals a score of 100. Weighted average CAMELS ratings between 1 and 3.5 are assigned a score between 25 and 100. The score increases at an increasing rate as the weighted average CAMELS rating increases. Appendix B of this subpart describes the conversion of a weighted average CAMELS rating to a score.

(*2*) *Ability to withstand asset-related stress score.* (*i*) The ability to withstand asset-related stress score is a weighted average of the scores for four measures: Leverage ratio; concentration measure; ratio of core earnings to average quarter-end total assets; credit quality measure and market risk measure. Appendix A of this subpart describes these measures.

(*ii*) The Leverage ratio and the ratio of core earnings to average quarter-end total assets are described in appendix A and the method of calculating the scores is described in appendix B of this subpart.

(*iii*) The score for the concentration measure for highly complex institutions is the greatest of the higher-risk assets to the sum of Tier 1 capital and reserves score, the top 20 counterparty exposure to the sum of Tier 1 capital and reserves score, or the largest counterparty exposure to the sum of Tier 1 capital and reserves score. Each ratio is described in appendix A of this subpart. The method used to convert the concentration measure into a score is described in appendix C of this subpart.

(*iv*) The credit quality score is the greater of the criticized and classified items to Tier 1 capital and reserves score or the underperforming assets to Tier 1 capital and reserves score. The market risk score is the weighted average of three scores—the trading revenue volatility to Tier 1 capital score, the market risk capital to Tier 1 capital score, and the level 3 trading assets to Tier 1 capital score. All of these ratios are described in appendix A of this subpart and the method of calculating the scores is described in appendix B. Each score is multiplied by its respective weight, and the resulting weighted score is summed to compute the score for the market risk measure. An overall weight of 35 percent is allocated between the scores for the credit quality measure and market risk measure. The allocation depends on the ratio of average trading assets to the sum of average securities, loans and trading assets (trading asset ratio) as follows:

(*v*) Weight for credit quality score = 35 percent * (1—trading asset ratio); and,

(*vi*) Weight for market risk score = 35 percent * trading asset ratio.

(*vii*) Each of the measures used to calculate the ability to withstand asset-related stress score is assigned the following cutoff values and weights:

CUTOFF VALUES AND WEIGHTS FOR MEASURES TO CALCULATE THE ABILITY TO WITHSTAND ASSET-RELATED STRESS SCORE

Measures of the ability to withstand asset-related stress	Cutoff values		Market risk measure (percent)	Weights (percent)
	Minimum (percent)	Maximum (percent)		
Leverage ratio	6	13		10.
Concentration Measure				35.
Higher Risk Assets/Tier 1 Capital and Reserves;	0	135		
Top 20 Counterparty Exposure/Tier 1 Capital and Reserves; or	0	125		
Largest Counterparty Exposure/Tier 1 Capital and Reserves	0	20		
Core Earnings/Average Quarter-end Total Assets	0	2		20.
Credit Quality Measure*				35* (1 − Trading Asset Ratio).
Criticized and Classified Items to Tier 1 Capital and Reserves; or	7	100		
Underperforming Assets/Tier 1 Capital and Reserves	2	35		
Market Risk Measure*				35* Trading Asset Ratio.
Trading Revenue Volatility/Tier 1 Capital	0	2	60	
Market Risk Capital/Tier 1 Capital	0	10	20	
Level 3 Trading Assets/Tier 1 Capital	0	35	20	

*Combined, the credit quality measure and the market risk measure are assigned a 35 percent weight. The relative weight of each of the two scores depends on the ratio of average trading assets to the sum of average securities, loans and trading assets (trading asset ratio).

(*viii*) [Reserved]

(*ix*) The score of each measure is multiplied by its respective weight and the resulting weighted score is summed to compute the ability to withstand asset-related stress score, which can range from 0 to 100, where a score of 0 reflects the lowest risk and a score of 100 reflects the highest risk.

(*3*) Ability to withstand funding related stress score. Three measures are used to calculate the score for the ability to withstand funding-related stress: a core deposits to total liabilities ratio, a balance sheet liquidity ratio, and average short-term funding to average total assets ratio. Appendix A of this subpart describes these ratios. Appendix B of this subpart describes how each measure is converted to a score. The ability to withstand funding-related stress score is the weighted average of the scores for the three measures. In the following table, cutoff values and weights are used to derive an institution's ability to withstand funding-related stress score:

CUTOFF VALUES AND WEIGHTS TO CALCULATE ABILITY TO WITHSTAND FUNDING-RELATED STRESS MEASURES

Measures of the ability to withstand funding-related stress	Cutoff values		Weights (percent)
	Minimum (percent)	Maximum (percent)	
Core Deposits/Total Liabilities	5	87	50
Balance Sheet Liquidity Ratio	7	243	30
Average Short-term Funding/Average Total Assets	2	19	20

(*4*) Calculation of Performance Score. The weighted average CAMELS score, the ability to withstand asset-related stress score, and the ability to withstand funding-related stress score are multiplied by their respective weights (30 percent, 50 percent and 20 percent, respectively) and the results are summed to arrive at the performance score, which cannot be less than 0 or more than 100.

(B) *Loss severity score.* The loss severity score is based on a loss severity measure described in appendix D of this subpart. Appendix B of this subpart also describes how the loss severity measure is converted to a score between 0 and 100. Cutoff values for the loss severity measure are:

CUTOFF VALUES FOR LOSS SEVERITY MEASURE

Measure of loss severity	Cutoff values	
	Minimum (percent)	Maximum (percent)
Loss Severity	0	28

(C) *Total score.* The performance and loss severity scores are combined to produce a total score. The loss severity score is converted into a loss severity factor that ranges from 0.8 (score of 5 or lower) to 1.2 (score of 85 or higher). Scores at or below the minimum cutoff of 5 receive a loss severity factor of 0.8, and scores at or above the maximum cutoff of 85 receive a loss severity factor of 1.2. The following linear interpolation converts loss severity scores between the cutoffs into a loss severity factor: (Loss Severity Factor = 0.8 + [0.005 * (Loss Severity Score − 5)]. The performance score is multiplied by the loss severity factor to produce a total score (total score = performance score * loss severity factor). The total score can be up to 20 percent higher or lower than the performance score but cannot be less than 30 or more than 90. The total score is subject to adjustment, up or down, by a maximum of 15 points, as set forth in paragraph (b)(3) of this section. The resulting total score after adjustment cannot be less than 30 or more than 90.

(D) *Initial base assessment rate.* A highly complex institution with a total score of 30 pays the minimum initial base assessment rate and an institution with a total score of 90 pays the maximum initial base assessment rate. For total scores between 30 and 90, initial base assessment rates rise at an increasing rate as the total score increases, calculated according to the following formula:

$$Rate = Minimum\ Rate + \left[\left(\left(1.4245 \times \left(\frac{Score}{100}\right)^3\right) - 0.0385\right) \times (Maximum\ Rate - Minimum\ Rate)\right]$$

where Rate is the initial base assessment rate (expressed in basis points), Maximum Rate is the maximum initial base assessment rate then in effect (expressed in basis points), and Minimum Rate is the minimum initial base assessment rate then in effect (expressed in basis points). Initial base assessment rates are subject to adjustment pursuant to paragraphs (b)(3), (e)(1), and (e)(2) of this section; highly complex institutions that are not well capitalized or have a CAMELS composite rating of 3, 4 or 5 shall be subject to the adjustment at paragraph (e)(3) of this section; these adjustments shall result in the institution's total base assessment rate, which in no case can be lower than 50 percent of the institution's initial base assessment rate.

(3) Adjustment to total score for large institutions and highly complex institutions. The total score for large institutions and highly complex institutions is subject to adjustment, up or down, by a maximum of 15 points, based upon significant risk factors that are not adequately captured in the appropriate scorecard. In making such adjustments, the FDIC may consider such information as financial performance and condition information and other market or supervisory information. The FDIC will also consult with an institution's primary federal regulator and, for state chartered institutions, state banking supervisor.

(i) *Prior notice of adjustments*—(A) *Prior notice of upward adjustment.* Prior to making any upward adjustment to an institution's total score because of considerations of additional risk information, the FDIC will formally notify the institution and its primary federal regulator and provide an opportunity to respond. This notification will include the reasons for the adjustment and when the adjustment will take effect.

(B) *Prior notice of downward adjustment.* Prior to making any downward adjustment to an institution's total score because of considerations of additional risk information, the FDIC will formally notify the institution's primary federal regulator and provide an opportunity to respond.

(ii) *Determination whether to adjust upward; effective period of adjustment.* After considering an institution's and the primary federal regulator's responses to the notice, the FDIC will determine whether the adjustment to an institution's total score is warranted, taking into account any revisions to scorecard measures, as well as any actions taken by the institution to address the FDIC's concerns described in the notice. The FDIC will evaluate the need for the adjustment each subsequent assessment period. Except as provided in paragraph (b)(3)(iv) of this section, the amount of adjustment cannot exceed the proposed adjustment amount contained in the initial notice unless additional notice is provided so that the primary federal regulator and the institution may respond.

(iii) *Determination whether to adjust downward; effective period of adjustment.* After considering the primary federal regulator's responses to the notice, the FDIC will determine whether the adjustment to total score is warranted, taking into account any revisions to scorecard measures. Any downward adjustment in an institution's total score will remain in effect for subsequent assessment periods until the FDIC determines that an adjustment is no longer warranted. Downward adjustments will be made without notification to the institution. However, the FDIC will provide advance notice to an institution and its primary federal regulator and give them an opportunity to respond before removing a downward adjustment.

(iv) *Adjustment without notice.* Notwithstanding the notice provisions set forth above, the FDIC may change an institution's total score without advance notice under this paragraph, if the institution's supervisory ratings or the scorecard measures deteriorate.

(c) *New small institutions*—(1) *Risk Categories.* Each new small institution shall be assigned to one of the following four Risk Categories based upon the institution's capital evaluation and supervisory evaluation as defined in this section.

(i) *Risk Category I.* New small institutions in Supervisory Group A that are Well Capitalized will be assigned to Risk Category I.

(ii) *Risk Category II.* New small institutions in Supervisory Group A that are Adequately Capitalized, and new small institutions in Supervisory Group B that are either Well Capitalized or Adequately Capitalized will be assigned to Risk Category II.

(iii) *Risk Category III.* New small institutions in Supervisory Groups A and B that are Undercapitalized, and new small institutions in Supervisory Group C that are Well Capitalized or Adequately Capitalized will be assigned to Risk Category III.

(iv) *Risk Category IV.* New small institutions in Supervisory Group C that are Undercapitalized will be assigned to Risk Category IV.

(2) *Capital evaluations.* Each new small institution will receive one of the following three capital evaluations on the basis of data reported in the institution's Consolidated Reports of Condition and Income or Thrift Financial Report (or successor report, as appropriate) dated as of March 31 for the assessment period beginning the preceding January 1; dated as of June 30 for the assessment period beginning the

preceding April 1; dated as of September 30 for the assessment period beginning the preceding July 1; and dated as of December 31 for the assessment period beginning the preceding October 1.

(i) *Well Capitalized.* A Well Capitalized institution is one that satisfies each of the following capital ratio standards: Total risk-based capital ratio, 10.0 percent or greater; tier 1 risk-based capital ratio, 8.0 percent or greater; leverage ratio, 5.0 percent or greater; and common equity tier 1 capital ratio, 6.5 percent or greater, and after January 1, 2018, if the institution is an insured depository institution subject to the enhanced supplementary leverage ratio standards under 12 CFR 6.4(c)(1)(iv)(B), 12 CFR 208.43(c)(1)(iv)(B), or 12 CFR 324.403(b)(1)(vi), as each may be amended from time to time, a supplementary leverage ratio of 6.0 percent or greater.

(ii) *Adequately Capitalized.* An Adequately Capitalized institution is one that does not satisfy the standards of Well Capitalized in paragraph (c)(2)(i) of this section but satisfies each of the following capital ratio standards: Total risk-based capital ratio, 8.0 percent or greater; tier 1 risk-based capital ratio, 6.0 percent or greater; leverage ratio, 4.0 percent or greater; and common equity tier 1 capital ratio, 4.5 percent or greater, and after January 1, 2018, if the institution is an insured depository institution subject to the advanced approaches risk-based capital rules under 12 CFR 6.4(c)(2)(iv)(B), 12 CFR 208.43(c)(2)(iv)(B), or 12 CFR 324.403(b)(2)(vi), as each may be amended from time to time, a supplementary leverage ratio of 3.0 percent or greater.

(iii) *Undercapitalized.* An undercapitalized institution is one that does not qualify as either Well Capitalized or Adequately Capitalized under paragraphs (c)(2)(i) and (ii) of this section.

(3) *Supervisory evaluations.* Each new small institution will be assigned to one of three Supervisory Groups based on the Corporation's consideration of supervisory evaluations provided by the institution's primary federal regulator. The supervisory evaluations include the results of examination findings by the primary federal regulator, as well as other information that the primary federal regulator determines to be relevant. In addition, the Corporation will take into consideration such other information (such as state examination findings, as appropriate) as it determines to be relevant to the institution's financial condition and the risk posed to the Deposit Insurance Fund. The three Supervisory Groups are:

(i) *Supervisory Group "A."* This Supervisory Group consists of financially sound institutions with only a few minor weaknesses;

(ii) *Supervisory Group "B."* This Supervisory Group consists of institutions that demonstrate weaknesses which, if not corrected, could result in significant deterioration of the institution and increased risk of loss to the Deposit Insurance Fund; and

(iii) *Supervisory Group "C."* This Supervisory Group consists of institutions that pose a substantial probability of loss to the Deposit Insurance Fund unless effective corrective action is taken.

(4) *Assessment method for new small institutions in Risk Category I*—(i) *Maximum Initial Base Assessment Rate for Risk Category I New Small Institutions.* A new small institution in Risk Category I shall be assessed the maximum initial base assessment rate for Risk Category I small institutions in the relevant assessment period.

(ii) *New small institutions not subject to certain adjustments.* No new small institution in any risk category shall be subject to the adjustment in (e)(1) of this section.

(iii) *Implementation of CAMELS rating changes*—(A) *Changes between risk categories.* If, during a quarter, a CAMELS composite rating change occurs that results in a Risk Category I institution moving from Risk Category I to Risk Category II, III or IV, the institution's initial base assessment rate for the portion of the quarter that it was in Risk Category I shall be the maximum initial base assessment rate for the relevant assessment period, subject to adjustment pursuant to paragraph (e)(2) of this section, as appropriate, and adjusted for the actual assessment rates set by the Board under § 327.10(g). For the portion of the quarter that the institution was not in Risk Category I, the institution's initial base assessment rate, which shall be subject to adjustment pursuant to paragraphs (e)(2) and (3) of this section, as appropriate, shall be determined under the assessment schedule for the appropriate Risk Category. If, during a quarter, a CAMELS composite rating change occurs that results in an institution moving from Risk Category II, III or IV to Risk Category I, then the maximum initial base assessment rate for new small institutions in Risk Category I shall apply for the portion of the quarter that it was in Risk Category I, subject to adjustment pursuant to paragraph (e)(2) of this section, as appropriate, and adjusted for the actual assessment rates set by the Board under § 327.10(g). For the portion of the quarter that the institution was not in Risk Category I, the institution's initial base assessment rate, which shall be subject to adjustment pursuant to paragraphs (e)(2) and (3) of this section shall be determined under the assessment schedule for the appropriate Risk Category.

(d) *Insured branches of foreign banks*—(1) *Risk categories for insured branches of foreign banks.* Insured branches of foreign banks shall be assigned to risk categories as set forth in paragraph (c)(1) of this section.

(2) *Capital evaluations for insured branches of foreign banks.* Each insured branch of a foreign bank will receive one of the following three capital evaluations on the basis of data reported in the institution's Report of Assets and Liabilities of U.S. Branches and Agencies of Foreign Banks dated as of March 31 for the assessment period beginning the preceding January 1; dated as of June 30 for the assessment period beginning the preceding April 1; dated as of September 30 for the assessment period beginning the preceding July 1; and dated as of December 31 for the assessment period beginning the preceding October 1.

(i) *Well Capitalized.* An insured branch of a foreign bank is Well Capitalized if the insured branch:

(A) Maintains the pledge of assets required under § 347.209 of this chapter; and

(B) Maintains the eligible assets prescribed under § 347.210 of this chapter at 108 percent or more of the average book value of the insured branch's third-party liabilities for the quarter ending on the report date specified in paragraph (d)(2) of this section.

(ii) *Adequately Capitalized.* An insured branch of a foreign bank is Adequately Capitalized if the insured branch:

(A) Maintains the pledge of assets required under § 347.209 of this chapter; and

(B) Maintains the eligible assets prescribed under § 347.210 of this chapter at 106 percent or more of the average book value of the insured branch's third-party liabilities for the quarter ending on the report date specified in paragraph (d)(2) of this section; and

(C) Does not meet the definition of a Well Capitalized insured branch of a foreign bank.

(iii) *Undercapitalized.* An insured branch of a foreign bank is undercapitalized institution if it does not qualify as either Well Capitalized or Adequately Capitalized under paragraphs (d)(2)(i) and (ii) of this section.

(3) *Supervisory evaluations for insured branches of foreign banks.* Each insured branch of a foreign bank will be assigned to one of three supervisory groups as set forth in paragraph (c)(3) of this section.

(4) *Assessment method for insured branches of foreign banks in Risk Category I.* Insured branches of foreign banks in Risk Category I shall be assessed using the weighted average ROCA component rating.

(i) *Weighted average ROCA component rating.* The weighted average ROCA component rating shall equal the sum of the products that result from multiplying ROCA component ratings by the following percentages: Risk Management—35%, Operational Controls—25%, Compliance—25%, and Asset Quality—15%. The weighted average ROCA rating will be multiplied by 5.076 (which shall be the pricing multiplier). To this result will be added a uniform amount. The resulting sum—the initial base assessment rate—will equal an institution's total base assessment rate; provided, however, that no institution's total base assessment rate will be less than the minimum total base assessment rate in effect for Risk Category I institutions for that quarter nor greater than the maximum total base assessment rate in effect for Risk Category I institutions for that quarter.

(ii) *Uniform amount.* Except as adjusted for the actual assessment rates set by the Board under § 327.10(g), the uniform amount for all insured branches of foreign banks shall be:

(A) −3.127 whenever the assessment rate schedule set forth in § 327.10(a) is in effect;

(B) −5.127 whenever the assessment rate schedule set forth in § 327.10(b) is in effect;

(C) −6.127 whenever the assessment rate schedule set forth in § 327.10(c) is in effect; or

(D) −7.127 whenever the assessment rate schedule set forth in § 327.10(d) is in effect.

(iii) *Insured branches of foreign banks not subject to certain adjustments.* No insured branch of a foreign bank in any risk category shall be subject to the adjustments in paragraphs (b)(3) or (e)(1) or (3) of this section.

(iv) *Implementation of changes between Risk Categories for insured branches of foreign banks.* If, during a quarter, a ROCA rating change occurs that results in an insured branch of a foreign bank moving from Risk Category I to Risk Category II, III or IV, the institution's initial base assessment rate for the portion of the quarter that it was in Risk Category I shall be determined using the weighted average ROCA component rating. For the portion of the quarter that the institution was not in Risk Category I, the institution's initial base assessment rate shall be determined under the assessment schedule for the appropriate Risk Category. If, during a quarter, a ROCA rating change occurs that results in an insured branch of a foreign bank moving from Risk Category II, III or IV to Risk Category I, the institution's assessment rate for the portion of the quarter that it was in Risk Category I shall equal the rate determined as provided using the weighted average ROCA component rating. For the portion of the quarter that the institution was not in Risk Category I, the institution's initial base assessment rate shall be determined under the assessment schedule for the appropriate Risk Category.

(v) *Implementation of changes within Risk Category I for insured branches of foreign banks.* If, during a quarter, an insured branch of a foreign bank remains in Risk Category I, but a ROCA component rating changes that will affect the institution's initial base assessment rate, separate assessment rates for the portion(s) of the quarter before and after the change(s) shall be determined under this paragraph (d)(4) of this section.

(e) *Adjustments*—(1) *Unsecured debt adjustment to initial base assessment rate for all institutions.* All institutions, except new institutions as provided under paragraphs (g)(1) and (2) of this section and insured branches of foreign banks as provided under paragraph (d)(4)(iii) of this section, shall be subject to an adjustment of assessment rates for unsecured debt. Any unsecured debt adjustment shall be made after any adjustment under paragraph (b)(3) of this section.

(i) *Application of unsecured debt adjustment.* The unsecured debt adjustment shall be determined as the sum of the initial base assessment rate plus 40 basis points; that sum shall be multiplied by the ratio of an insured depository institution's long-term unsecured debt to its assessment base. The amount of the reduction in the assessment rate due to the adjustment is equal to the dollar amount of the adjustment divided by the amount of the assessment base.

(ii) *Limitation.* No unsecured debt adjustment for any institution shall exceed the lesser of 5 basis points or 50 percent of the institution's initial base assessment rate.

(iii) *Applicable quarterly reports of condition.* Unsecured debt adjustment ratios for any given quarter shall be calculated from quarterly reports of condition (Consolidated Reports of Condition and Income and Thrift Financial Reports, or any successor reports to either, as appropriate) filed by each institution as of the last day of the quarter.

(2) *Depository institution debt adjustment to initial base assessment rate for all institutions.* All institutions shall be subject to an adjustment of assessment rates for unsecured debt held that is issued by another depository institution. Any such depository institution debt adjustment shall be made after any adjustment under paragraphs (b)(3) and (e)(1) of this section.

(i) *Application of depository institution debt adjustment.* An insured depository institution shall pay a 50 basis point adjustment on the amount of unsecured debt it holds that was issued by another insured depository institution to the extent that such debt exceeds 3 percent of the institution's Tier 1 capital. The amount of long-term unsecured debt issued by another insured depository institution shall be calculated using the same valuation methodology used to calculate the amount of such debt for reporting on the asset side of the balance sheets.

(ii) *Applicable quarterly reports of condition.* Depository institution debt adjustment ratios for any given quarter shall be calculated from quarterly reports of condition (Consolidated Reports of Condition and Income and Thrift Financial Reports, or any successor reports to either, as appropriate) filed by each institution as of the last day of the quarter.

(3) *Brokered Deposit Adjustment.* All new small institutions in Risk Categories II, III, and IV, all established small institutions, all large institutions and all highly complex institutions, except established small institutions and large and highly complex institutions (including new large and new highly complex institutions) that are well capitalized and have a CAMELS composite rating of 1 or 2, shall be subject to an assessment rate adjustment for brokered deposits. Any such brokered deposit adjustment shall be made after any adjustment under paragraphs (b)(3) and (e)(1) and (2) of this section. The brokered deposit adjustment includes all brokered deposits as defined in Section 29 of the Federal Deposit Insurance Act (12 U.S.C. 1831f), and 12 CFR 337.6, including reciprocal deposits as defined in § 327.8(p), and brokered deposits that

consist of balances swept into an insured institution from another institution. The adjustment under this paragraph is limited to those institutions whose ratio of brokered deposits to domestic deposits is greater than 10 percent; asset growth rates do not affect the adjustment. Insured branches of foreign banks are not subject to the brokered deposit adjustment as provided in paragraph (d)(4)(iii) of this section.

(i) *Application of brokered deposit adjustment.* The brokered deposit adjustment shall be determined by multiplying 25 basis points by the ratio of the difference between an insured depository institution's brokered deposits and 10 percent of its domestic deposits to its assessment base.

(ii) *Limitation.* The maximum brokered deposit adjustment will be 10 basis points; the minimum brokered deposit adjustment will be 0.

(iii) *Applicable quarterly reports of condition.* Brokered deposit ratios for any given quarter shall be calculated from the quarterly reports of condition (Call Reports and Thrift Financial Reports, or any successor reports to either, as appropriate) filed by each institution as of the last day of the quarter.

(f) *Request to be treated as a large institution*—(1) *Procedure.* Any institution with assets of between $5 billion and $10 billion may request that the FDIC determine its assessment rate as a large institution. The FDIC will consider such a request provided that it has sufficient information to do so. Any such request must be made to the FDIC's Division of Insurance and Research. Any approved change will become effective within one year from the date of the request. If an institution whose request has been granted subsequently reports assets of less than $5 billion in its report of condition for four consecutive quarters, the institution shall be deemed a small institution for assessment purposes.

(2) *Time limit on subsequent request for alternate method.* An institution whose request to be assessed as a large institution is granted by the FDIC shall not be eligible to request that it be assessed as a small institution for a period of three years from the first quarter in which its approved request to be assessed as a large institution became effective. Any request to be assessed as a small institution must be made to the FDIC's Division of Insurance and Research.

(3) *Request for review.* An institution that disagrees with the FDIC's determination that it is a large, highly complex, or small institution may request review of that determination pursuant to § 327.4(c).

(g) *New and established institutions and exceptions*—(1) *New small institutions.* A new small Risk Category I institution shall be assessed the Risk Category I maximum initial base assessment rate for the relevant assessment period. No new small institution in any risk category shall be subject to the unsecured debt adjustment as determined under paragraph (e)(1) of this section. All new small institutions in any Risk Category shall be subject to the depository institution debt adjustment as determined under paragraph (e)(2) of this section. All new small institutions in Risk Categories II, III, and IV shall be subject to the brokered deposit adjustment as determined under paragraph (e)(3) of this section.

(2) *New large institutions and new highly complex institutions.* All new large institutions and all new highly complex institutions shall be assessed under the appropriate method provided at paragraph (b)(1) or (2) of this section and subject to the adjustments provided at paragraphs (b)(3) and (e)(2) and (3) of this section. No new highly complex or large institutions are entitled to adjustment under paragraph (e)(1) of this section. If a large or highly complex institution has not yet received CAMELS ratings, it will be given a weighted CAMELS rating of 2 for assessment purposes until actual CAMELS ratings are assigned.

(3) *CAMELS ratings for the surviving institution in a merger or consolidation.* When an established institution merges with or consolidates into a new institution, if the FDIC determines the resulting institution to be an established institution under § 327.8(k)(1), its CAMELS ratings for assessment purposes will be based upon the established institution's ratings prior to the merger or consolidation until new ratings become available.

(4) *Rate applicable to institutions subject to subsidiary or credit union exception*—(i) *Established small institutions.* A small institution that is established under § 327.8(k)(4) or (5) shall be assessed as follows:

(A) If the institution does not have a CAMELS composite rating, its initial base assessment rate shall be 2 basis points above the minimum initial base assessment rate applicable to established small institutions until it receives a CAMELS composite rating.

(B) If the institution has a CAMELS composite rating but no CAMELS component ratings, its initial assessment rate shall be determined using the financial ratios method, as set forth in (a)(1) of this section, but its CAMELS composite rating will be substituted for its weighted average CAMELS component rating and, if the institution has not filed four quarterly reports of condition, then the assessment rate will be determined by annualizing, where appropriate, financial ratios from all quarterly reports of condition that have been filed.

(ii) *Large or highly complex institutions.* If a large or highly complex institution is considered established under § 327.8(k)(4) or (5), but does not have CAMELS component ratings, it will be given a weighted CAMELS rating of 2 for assessment purposes until actual CAMELS ratings are assigned.

(5) *Request for review.* An institution that disagrees with the FDIC's determination that it is a new institution may request review of that determination pursuant to § 327.4(c).

(h) *Assessment rates for bridge depository institutions and conservatorships.* Institutions that are bridge depository institutions under 12 U.S.C. 1821(n) and institutions for which the Corporation has been appointed or serves as conservator shall, in all cases, be assessed at the Risk Category I minimum initial base assessment rate, which shall not be subject to adjustment under paragraphs (b)(3), (e)(1), (2), or (3) of this section.

■ 7. In § 327.10, revise paragraphs (b) through (f) to read as follows:

(b) Assessment rate schedules for established small institutions and large and highly complex institutions applicable in the first calendar quarter after June 30, 2015, that the reserve ratio of the DIF reaches or exceeds 1.15 percent for the previous calendar quarter and in all subsequent quarters that the reserve ratio is less than 2 percent.

(1) *Initial base assessment rate schedule for established small institutions and large and highly complex institutions.* In the first calendar quarter after June 30, 2015, that the reserve ratio of the DIF reaches or exceeds 1.15 percent for the previous calendar quarter and in all subsequent quarters that the reserve ratio is less than 2 percent, the initial base assessment rate for established small institutions and large and highly complex institutions, except as provided in paragraph (f) of this section, shall be the rate prescribed in the following schedule:

INITIAL BASE ASSESSMENT RATE SCHEDULE ONCE THE RESERVE RATIO OF THE DIF REACHES 1.15 PERCENT AND THE RESERVE RATIO FOR THE IMMEDIATELY PRIOR ASSESSMENT PERIOD IS LESS THAN 2 PERCENT *

	Established small institutions			Large & highly complex institutions
	CAMELS Composite			
	1 or 2	3	4 or 5	
Initial Base Assessment Rate	3 to 16	6 to 30	16 to 30	3 to 30

* All amounts for all risk categories are in basis points annually. Initial base rates that are not the minimum or maximum rate will vary between these rates.

(i) CAMELS Composite 1- and 2-rated Established Small Institutions Initial Base Assessment Rate Schedule. The annual initial base assessment rates for all established small institutions with a CAMELS composite rating of 1 or 2 shall range from 3 to 16 basis points.

(ii) CAMELS Composite 3-rated Established Small Institutions Initial Base Assessment Rate Schedule. The annual initial base assessment rates for all established small institutions with a CAMELS composite rating of 3 shall range from 6 to 30 basis points.

(iii) CAMELS Composite 4- and 5-rated Established Small Institutions Initial Base Assessment Rate Schedule. The annual initial base assessment rates for all established small institutions with a CAMELS composite rating of 4 or 5 shall range from 16 to 30 basis points.

(iv) Large and Highly Complex Institutions Initial Base Assessment Rate Schedule. The annual initial base assessment rates for all large and highly complex institutions shall range from 3 to 30 basis points.

(2) *Total base assessment rate schedule after adjustments.* Once the reserve ratio of the DIF first reaches 1.15 percent, and the reserve ratio for the immediately prior assessment period is less than 2 percent, the total base assessment rates after adjustments for established small institutions and large and highly complex institutions shall be as prescribed in the following schedule.

TOTAL BASE ASSESSMENT RATE SCHEDULE (AFTER ADJUSTMENTS) * IF RESERVE RATIO OF THE DIF REACHES 1.15 PERCENT AND THE RESERVE RATIO FOR THE IMMEDIATELY PRIOR ASSESSMENT PERIOD IS LESS THAN 2 PERCENT **

	Established small institutions			Large & highly complex institutions
	CAMELS composite			
	1 or 2	3	4 or 5	
Initial Base Assessment Rate.	3 to 16	6 to 30	16 to 30	3 to 30.
Unsecured Debt Adjustment.	−5 to 0	−5 to 0	−5 to 0	−5 to 0
Brokered Deposit Adjustment.	0 to 10 ***	0 to 10	0 to 10	0 to 10
Total Base Assessment Rate.	1.5 to 26	3 to 40	11 to 40	1.5 to 40

* The depository institution debt adjustment, which is not included in the table, can increase total base assessment rates above the maximum assessment rates shown in the table.

** All amounts for all risk categories are in basis points annually. Total base rates that are not the minimum or maximum rate will vary between these rates.

*** The brokered deposit adjustment applies to established small banks with CAMELS composite ratings of 1 or 2 only if they are less than well capitalized.

(i) *CAMELS Composite 1- and 2-rated Established Small Institutions Total Base Assessment Rate Schedule.* The annual total base assessment rates for all established small institutions with a CAMELS composite rating of 1 or 2 shall range from 1.5 to 26 basis points.

(ii) CAMELS Composite 3-rated Established Small Institutions Total Base Assessment Rate Schedule. The annual total base assessment rates for all established small institutions with a CAMELS composite rating of 3 shall range from 3 to 40 basis points.

(iii) CAMELS Composite 4- and 5-rated Established Small Institutions Total Base Assessment Rate Schedule. The annual total base assessment rates for all established small institutions with a CAMELS composite rating of 4 or 5 shall range from 11 to 40 basis points.

(iv) Large and Highly Complex Institutions Total Base Assessment Rate Schedule. The annual total base assessment rates for all large and highly complex institutions shall range from 1.5 to 40 basis points.

(c) *Assessment rate schedules if the reserve ratio of the DIF for the prior assessment period is equal to or greater than 2 percent and less than 2.5 percent*—(1) *Initial base assessment rate schedule for established small institutions and large and highly complex institutions.* If the reserve ratio of the DIF for the prior assessment period is equal to or greater than 2 percent and less than 2.5 percent, the initial base assessment rate for established small institutions and large and highly complex institutions, except as provided in paragraph (f) of this section, shall be the rate prescribed in the following schedule:

INITIAL BASE ASSESSMENT RATE SCHEDULE IF RESERVE RATIO FOR PRIOR ASSESSMENT PERIOD IS EQUAL TO OR GREATER THAN 2 PERCENT BUT LESS THAN 2.5 PERCENT *

	Established small banks			Large & highly complex institutions
	CAMELS Composite			
	1 or 2	3	4 or 5	
Initial Base Assessment Rate	2 to 14	5 to 28	14 to 28	2 to 28

* All amounts for all risk categories are in basis points annually. Initial base rates that are not the minimum or maximum rate will vary between these rates.

(i) *CAMELS Composite 1- and 2-rated Established Small Institutions Initial Base Assessment Rate Schedule.* The annual initial base assessment rates for all established small institutions with a CAMELS composite rating of 1 or 2 shall range from 2 to 14 basis points.

(ii) *CAMELS Composite 3-rated Established Small Institutions Initial Base Assessment Rate Schedule.* The annual initial base assessment rates for all established small institutions with a CAMELS composite rating of 3 shall range from 5 to 28 basis points.

(iii) *CAMELS Composite 4- and 5-rated Established Small Institutions Initial Base Assessment Rate Schedule.* The annual initial base assessment rates for all established small institutions with a CAMELS composite rating of 4 or 5 shall range from 14 to 28 basis points.

(iv) *Large and Highly Complex Institutions Initial Base Assessment Rate Schedule.* The annual initial base assessment rates for all large and highly complex institutions shall range from 2 to 28 basis points.

(2) *Total Base Assessment Rate Schedule after Adjustments for Established Small Institutions and Large and Highly Complex Institutions.* If the reserve ratio of the DIF for the prior assessment period is equal to or greater than 2 percent and less than 2.5 percent, the total base assessment rates after adjustments for established small institutions and large and highly complex institutions, except as provided in paragraph (f) of this section, shall be as prescribed in the following schedule.

TOTAL BASE ASSESSMENT RATE SCHEDULE (AFTER ADJUSTMENTS) * IF RESERVE RATIO FOR PRIOR ASSESSMENT PERIOD IS EQUAL TO OR GREATER THAN 2 PERCENT BUT LESS THAN 2.5 PERCENT **

	Established small banks			Large & highly complex institutions
	CAMELS composite			
	1 or 2	3	4 or 5	
Initial Base Assessment Rate	2 to 14	5 to 28	14 to 28	2 to 28.
Unsecured Debt Adjustment **	−5 to 0	−5 to 0	−5 to 0	−5 to 0.
Brokered Deposit Adjustment	0 to 10 ***	0 to 10	0 to 10	0 to 10.
Total Base Assessment Rate	1 to 24	2.5 to 38	9 to 38	1 to 38.

* The depository institution debt adjustment, which is not included in the table, can increase total base assessment rates above the maximum assessment rates shown in the table.
** All amounts for all risk categories are in basis points annually. Total base rates that are not the minimum or maximum rate will vary between these rates.
*** The brokered deposit adjustment applies to established small banks with CAMELS composite ratings of 1 or 2 only if they are less than well capitalized.

(i) *CAMELS Composite 1- and 2-rated Established Small Institutions Total Base Assessment Rate Schedule.* The annual total base assessment rates for all established small institutions with a CAMELS composite rating of 1 or 2 shall range from 1 to 24 basis points.

(ii) *CAMELS Composite 3-rated Established Small Institutions Total Base Assessment Rate Schedule.* The annual total base assessment rates for all established small institutions with a CAMELS composite rating of 3 shall range from 2.5 to 38 basis points.

(iii) *CAMELS Composite 4- and 5-rated Established Small Institutions Total Base Assessment Rate Schedule.* The annual total base assessment rates for all established small institutions with a CAMELS composite rating of 4 or 5 shall range from 9 to 38 basis points.

(iv) *Large and Highly Complex Institutions Total Base Assessment Rate Schedule.* The annual total base assessment rates for all large and highly complex institutions shall range from 1 to 38 basis points.

(d) *Assessment rate schedules if the reserve ratio of the DIF for the prior assessment period is greater than 2.5 percent*—(1) *Initial Base Assessment Rate Schedule.* If the reserve ratio of the DIF for the prior assessment period is greater than 2.5 percent, the initial base assessment rate for established small institutions and a large and highly complex institutions, except as provided in paragraph (f) of this section, shall be the rate prescribed in the following schedule:

INITIAL BASE ASSESSMENT RATE SCHEDULE IF RESERVE RATIO FOR PRIOR ASSESSMENT PERIOD IS GREATER THAN OR EQUAL TO 2.5 PERCENT *

	Established small banks			Large & highly complex institutions
	CAMELS composite			
	1 or 2	3	4 or 5	
Initial Base Assessment Rate	1 to 13	4 to 25	13 to 25	1 to 25

* All amounts for all risk categories are in basis points annually. Initial base rates that are not the minimum or maximum rate will vary between these rates.

(i) CAMELS Composite 1- and 2-rated Established Small Institutions Initial Base Assessment Rate Schedule. The annual initial base assessment rates for all established small institutions with a CAMELS composite rating of 1 or 2 shall range from 1 to 13 basis points.

(ii) CAMELS Composite 3-rated Established Small Institutions Initial Base Assessment Rate Schedule. The annual initial base assessment rates for all established small institutions with a CAMELS composite rating of 3 shall range from 4 to 25 basis points.

(iii) CAMELS Composite 4- and 5-rated Established Small Institutions Initial Base Assessment Rate Schedule. The annual initial base assessment rates for all established small institutions with a CAMELS composite rating of 4 or 5 shall range from 13 to 25 basis points.

(iv) Large and Highly Complex Institutions Initial Base Assessment Rate Schedule. The annual initial base assessment rates for all large and highly complex institutions shall range from 1 to 25 basis points.

(2) Total Base Assessment Rate Schedule after Adjustments. If the reserve ratio of the DIF for the prior assessment period is greater than 2.5 percent, the total base assessment rates after adjustments for established small institutions and large and highly complex institutions, except as provided in paragraph (f) of this section, shall be the rate prescribed in the following schedule.

TOTAL BASE ASSESSMENT RATE SCHEDULE (AFTER ADJUSTMENTS) * IF RESERVE RATIO FOR PRIOR ASSESSMENT PERIOD IS GREATER THAN OR EQUAL TO 2.5 PERCENT **

	Small banks			Large & highly complex institutions
	CAMELS composite			
	1 or 2	3	4 or 5	
Initial Base Assessment Rate	1 to 13	4 to 25	13 to 25	1 to 25.
Unsecured Debt Adjustment **	−5 to 0	−5 to 0	−5 to 0	−5 to 0.
Brokered Deposit Adjustment	0 to 10 ***	0 to 10	0 to 10	0 to 10.
Total Base Assessment Rate	.5 to 23	2 to 35	8 to 35	.5 to 35.

* The depository institution debt adjustment, which is not included in the table, can increase total base assessment rates above the maximum assessment rates shown in the table.
** All amounts for all risk categories are in basis points annually. Total base rates that are not the minimum or maximum rate will vary between these rates.
*** The brokered deposit adjustment applies to established small banks with CAMELS composite ratings of 1 or 2 only if they are less than well capitalized.

(i) CAMELS Composite 1- and 2-rated Established Small Institutions Total Base Assessment Rate Schedule. The annual total base assessment rates for all established small institutions with a CAMELS composite rating of 1 or 2 shall range from 0.5 to 23 basis points.

(ii) CAMELS Composite 3-rated Established Small Institutions Total Base Assessment Rate Schedule. The annual total base assessment rates for all established small institutions with a CAMELS composite rating of 3 shall range from 2 to 35 basis points.

(iii) CAMELS Composite 4- and 5-rated Established Small Institutions Total Base Assessment Rate Schedule. The annual total base assessment rates for all established small institutions with a CAMELS composite rating of 4 or 5 shall range from 8 to 35 basis points.

(iv) Large and Highly Complex Institutions Total Base Assessment Rate Schedule. The annual total base assessment rates for all large and highly complex institutions shall range from 0.5 to 35 basis points.

(e) Assessment Rate Schedules for New Institutions and Insured Branches of Foreign Banks.

(1) New depository institutions, as defined in 327.8(j), shall be subject to the assessment rate schedules as follows:

(i) *Prior to the reserve ratio of the DIF first reaching 1.15 percent after June 30, 2015.* Prior to the reserve ratio of the DIF reaching 1.15 percent for the first time after June 30, 2015, all new institutions shall be subject to the initial and total base assessment rate schedules provided for in paragraph (a) of this section.

(ii) *Assessment rate schedules for new large and highly complex institutions once the DIF reserve ratio first reaches 1.15 percent after June 30, 2015.* Beginning the first calendar quarter after June 30, 2015 in which the reserve ratio of the DIF reaches or exceeds 1.15 percent in the previous calendar quarter, new large and highly complex institutions shall be subject to the initial and total base assessment rate schedules provided for in paragraph (b) of this section, even if the reserve ratio equals or exceeds 2 percent or 2.5 percent.

(iii) *Assessment rate schedules for new small institutions once the DIF reserve ratio first reaches 1.15 percent after June 30, 2015.*

(A) Initial Base Assessment Rate Schedule for New Small Institutions. Beginning the first calendar quarter after June 30, 2015 in which the reserve ratio of the DIF reaches or exceeds 1.15 percent in the previous calendar quarter, the initial base assessment rate for a new small institution shall be the rate prescribed in the following schedule, even if the reserve ratio equals or exceeds 2 percent or 2.5 percent.

INITIAL BASE ASSESSMENT RATE SCHEDULE IF RESERVE RATIO FOR PRIOR ASSESSMENT PERIOD IS EQUAL TO OR GREATER THAN 1.15 PERCENT

	Risk category I	Risk category II	Risk category III	Risk category IV
Initial Assessment Rate	7	12	19	30

* All amounts for all risk categories are in basis points annually.

(*1*) Risk Category I Initial Base Assessment Rate Schedule. The annual initial base assessment rates for all new small institutions in Risk Category I shall be 7 basis points.

(*2*) Risk Category II, III, and IV Initial Base Assessment Rate Schedule. The annual initial base assessment rates for all new small institutions in Risk Categories II, III, and IV shall be 12, 19, and 30 basis points, respectively.

(*3*) All new small institutions in any one risk category, other than Risk Category I, will be charged the same initial base assessment rate, subject to adjustment as appropriate.

(B) Total Base Assessment Rate Schedule for New Small Institutions. Beginning the first calendar quarter after June 30, 2015 in which the reserve ratio of the DIF reaches or exceeds 1.15 percent in the previous calendar quarter, the total base assessment rates after adjustments for a new small institution shall be the rate prescribed in the following schedule, even if the reserve ratio equals or exceeds 2 percent or 2.5 percent.

TOTAL BASE ASSESSMENT RATE SCHEDULE (AFTER ADJUSTMENTS) * IF RESERVE RATIO FOR PRIOR ASSESSMENT PERIOD IS EQUAL TO OR GREATER THAN 1.15 PERCENT **

	Risk category I	Risk category II	Risk category III	Risk category IV
Initial Assessment Rate	7	12	19	30.
Brokered Deposit Adjustment (added)	N/A	0 to 10	0 to 10	0 to 10.
Total Assessment Rate	7	12 to 22	19 to 29	30 to 40.

* The depository institution debt adjustment, which is not included in the table, can increase total base assessment rates above the maximum assessment rates shown in the table.
** All amounts for all risk categories are in basis points annually. Total base rates that are not the minimum or maximum rate will vary between these rates.

(*1*) Risk Category I Total Assessment Rate Schedule. The annual total base assessment rates for all new small institutions in Risk Category I shall be 7 basis points.

(*2*) Risk Category II Total Assessment Rate Schedule. The annual total base assessment rates for all new small institutions in Risk Category II shall range from 12 to 22 basis points.

(*3*) Risk Category III Total Assessment Rate Schedule. The annual total base assessment rates for all new small institutions in Risk Category III shall range from 19 to 29 basis points.

(*4*) Risk Category IV Total Assessment Rate Schedule. The annual total base assessment rates for all new small institutions in Risk Category IV shall range from 30 to 40 basis points.

(2) *Insured branches of foreign banks*—(i) *Assessment rate schedule for insured branches of foreign banks once the reserve ratio of the DIF first reaches 1.15 percent, and the reserve ratio for the immediately prior assessment period is less than 2 percent.* Once the reserve ratio of the DIF first reaches 1.15 percent, and the reserve ratio for the immediately prior assessment period is less than 2 percent, the initial and total base assessment rates for an insured branch of a foreign bank, except as provided in paragraph (f) of this section, shall be the rate prescribed in the following schedule.

INITIAL AND TOTAL BASE ASSESSMENT RATE SCHEDULE * ONCE THE RESERVE RATIO OF THE DIF REACHES 1.15 PERCENT AND THE RESERVE RATIO FOR THE IMMEDIATELY PRIOR ASSESSMENT PERIOD IS LESS THAN 2 PERCENT **

	Risk category I	Risk category II	Risk category III	Risk category IV
Initial and Total Assessment Rate	3 to 7	12	19	30

* The depository institution debt adjustment, which is not included in the table, can increase total base assessment rates above the maximum assessment rates shown in the table.
** All amounts for all risk categories are in basis points annually. Initial and total base rates that are not the minimum or maximum rate will vary between these rates.

(A) Risk Category I Initial and Total Base Assessment Rate Schedule. The annual initial and total base assessment rates for an insured branch of a foreign bank in Risk Category I shall range from 3 to 7 basis points.

(B) Risk Category II, III, and IV Initial and Total Base Assessment Rate Schedule. The annual initial and total base assessment rates for Risk Categories II, III, and IV shall be 12, 19, and 30 basis points, respectively.

(C) All insured branches of foreign banks in any one risk category, other than Risk Category I, will be charged the same initial base assessment rate, subject to adjustment as appropriate.

(ii) *Assessment rate schedule for insured branches of foreign banks if the reserve ratio of the DIF for the prior assessment period is equal to or greater than 2 percent and less than 2.5 percent.* If the reserve ratio of the DIF for the prior assessment period is equal to or greater than 2 percent and less than 2.5 percent, the initial and total base assessment rates for an insured branch of a foreign bank, except as provided in paragraph (f), shall be the rate prescribed in the following schedule.

INITIAL AND TOTAL BASE ASSESSMENT RATE SCHEDULE * IF RESERVE RATIO FOR PRIOR ASSESSMENT PERIOD IS EQUAL TO OR GREATER THAN 2 PERCENT BUT LESS THAN 2.5 PERCENT **

	Risk category I	Risk category II	Risk category III	Risk category IV
Initial and Total Assessment Rate	2 to 6	10	17	28

* The depository institution debt adjustment, which is not included in the table, can increase total base assessment rates above the maximum assessment rates shown in the table.

** All amounts for all risk categories are in basis points annually. Initial and total base rates that are not the minimum or maximum rate will vary between these rates.

(A) Risk Category I Initial and Total Base Assessment Rate Schedule. The annual initial and total base assessment rates for an insured branch of a foreign bank in Risk Category I shall range from 2 to 6 basis points.

(B) Risk Category II, III, and IV Initial and Total Base Assessment Rate Schedule. The annual initial and total base assessment rates for Risk Categories II, III, and IV shall be 10, 17, and 28 basis points, respectively.

(C) All insured branches of foreign banks in any one risk category, other than Risk Category I, will be charged the same initial base assessment rate, subject to adjustment as appropriate.

(iii) *Assessment rate schedule for insured branches of foreign banks if the reserve ratio of the DIF for the prior assessment period is greater than 2.5 percent.* If the reserve ratio of the DIF for the prior assessment period is greater than 2.5 percent, the initial and total base assessment rate for an insured branch of foreign bank, except as provided in paragraph (f) of this section, shall be the rate prescribed in the following schedule:

INITIAL AND TOTAL BASE ASSESSMENT RATE SCHEDULE * IF RESERVE RATIO FOR PRIOR ASSESSMENT PERIOD IS GREATER THAN OR EQUAL TO 2.5 PERCENT **

	Risk category I	Risk category II	Risk category III	Risk category IV
Initial Assessment Rate	1 to 5	9	15	25

* The depository institution debt adjustment, which is not included in the table, can increase total base assessment rates above the maximum assessment rates shown in the table.

** All amounts for all risk categories are in basis points annually. Initial and total base rates that are not the minimum or maximum rate will vary between these rates.

(A) Risk Category I Initial and Total Base Assessment Rate Schedule. The annual initial and total base assessment rates for an insured branch of a foreign bank in Risk Category I shall range from 1 to 5 basis points.

(B) Risk Category II, III, and IV Initial and Total Base Assessment Rate Schedule. The annual initial and total base assessment rates for Risk Categories II, III, and IV shall be 9, 15, and 25 basis points, respectively.

(C) All insured branches of foreign banks in any one risk category, other than Risk Category I, will be charged the same initial base assessment rate, subject to adjustment as appropriate.

(f) Total Base Assessment Rate Schedule adjustments and procedures—(1) Board Rate Adjustments. The Board may increase or decrease the total base assessment rate schedule in paragraphs (a) through (e) of this section up to a maximum increase of 2 basis points or a fraction thereof or a maximum decrease of 2 basis points or a fraction thereof (after aggregating increases and decreases), as the Board deems necessary. Any such adjustment shall apply uniformly to each rate in the total base assessment rate schedule. In no case may such rate adjustments result in a total base assessment rate that is mathematically less than zero or in a total base assessment rate schedule that, at any time, is more than 2 basis points above or below the total base assessment schedule for the Deposit Insurance Fund in effect pursuant to paragraph (b) of this section, nor may any one such adjustment constitute an increase or decrease of more than 2 basis points.

(2) Amount of revenue. In setting assessment rates, the Board shall take into consideration the following:

(i) Estimated operating expenses of the Deposit Insurance Fund;

(ii) Case resolution expenditures and income of the Deposit Insurance Fund;

(iii) The projected effects of assessments on the capital and earnings of the institutions paying assessments to the Deposit Insurance Fund;

(iv) The risk factors and other factors taken into account pursuant to 12 U.S.C. 1817(b)(1); and

(v) Any other factors the Board may deem appropriate.

(3) Adjustment procedure. Any adjustment adopted by the Board pursuant to this paragraph will be adopted by rulemaking, except that the Corporation may set assessment rates as necessary to manage the reserve ratio,

within set parameters not exceeding cumulatively 2 basis points, pursuant to paragraph (f)(1) of this section, without further rulemaking.

(4) Announcement. The Board shall announce the assessment schedules and the amount and basis for any adjustment thereto not later than 30 days before the quarterly certified statement invoice date specified in § 327.3(b) of this part for the first assessment period for which the adjustment shall be effective. Once set, rates will remain in effect until changed by the Board.

■ 8. Add Appendix E to part 327 to read as follows:

Appendix E—Method To Derive Pricing Multipliers and Uniform Amount

I. Introduction

The uniform amount and pricing multipliers are derived from:

- A model (the Statistical Model) that estimates the probability of failure of an institution over a three-year horizon;
- The minimum initial base assessment rate;
- The maximum initial base assessment rate;
- Thresholds marking the points at which the maximum and minimum assessment rates become effective.

II. The Statistical Model

The Statistical Model estimates the probability of an insured depository institution failing within three years using a logistic regression and pooled time-series cross-sectional data;[1] that is, the dependent variable in the estimation is whether an insured depository institution failed during the following three-year period. Actual model parameters for the Statistical Model are an average of each of three regression estimates for each parameter. Each of the three regressions uses end-of-year data from insured depository institutions' quarterly reports of condition and income (Call Reports and Thrift Financial Reports or TFRs[2]) for every third year to estimate probability of failure within the ensuing three years. One regression (Regression 1) uses insured depository institutions' Call Report and TFR data for the end of 1985 and failures from 1986 through 1988; Call Report and TFR data for the end of 1988 and failures from 1989 through 1991; and so on, ending with Call Report data for the end of 2009 and failures from 2010 through 2012. The second regression (Regression 2) uses insured depository institutions' Call Report and TFR data for the end of 1986 and failures from 1987 through 1989, and so on, ending with Call Report data for the end of 2010 and failures from 2011 through 2013. The third regression (Regression 3) uses insured depository institutions' Call Report and TFR data for the end of 1987 and failures from 1988 through 1990, and so on, ending with Call Report data for the end of 2011 and failures from 2012 through 2014. The regressions include only Call Report data and failures for established small institutions.

Table E.1 lists and defines the explanatory variables (regressors) in the Statistical Model and the measures used in Sec. 327.16(a)(1).

TABLE E.1—DEFINITIONS OF REGRESSORS

Variables	Description
Tier 1 Leverage Ratio (%)	Tier 1 capital divided by adjusted average assets. (Numerator and denominator are both based on the definition for prompt corrective action.)
Net Income before Taxes/Total Assets (%)	Income (before income taxes and extraordinary items and other adjustments) for the most recent twelve months divided by total assets.[1]
Nonperforming Loans and Leases/Gross Assets (%)	Sum of total loans and lease financing receivables past due 90 or more days and still accruing interest and total nonaccrual loans and lease financing receivables (excluding, in both cases, the maximum amount recoverable from the U.S. Government, its agencies or government-sponsored enterprises, under guarantee or insurance provisions) divided by gross assets.[2 3]
Other Real Estate Owned/Gross Assets (%)	Other real estate owned divided by gross assets.[2]
Core Deposits/Total Assets (%)	Domestic office deposits (excluding time deposits over the deposit insurance limit and the amount of brokered deposits below the standard maximum deposit insurance amount) divided by total assets.
Weighted Average of C, A, M, E, L, and S Component Ratings	The weighted sum of the "C," "A," "M," "E", "L", and "S" CAMELS components, with weights of 25 percent each for the "C" and "M" components, 20 percent for the "A" component, and 10 percent each for the "E", "L", and "S" components. In instances where the "S" component is missing, the remaining components are scaled by a factor of 10/9.[4]
Loan Mix Index	A measure of credit risk described below.
Asset Growth (%)	Growth in assets (adjusted for mergers[5]) over the previous year. If growth is negative, then the value is set to zero.[6]

[1] For purposes of calculating actual assessment rates (as opposed to model estimation), the ratio of Net Income Before Taxes to Total Assets is bounded below by (and cannot be less than) −25 percent and is bounded above by (and cannot exceed) 3 percent.

[2] For purposes of calculating actual assessment rates (as opposed to model estimation), "Gross assets" are total assets plus the allowance for loan and lease financing receivable losses (ALLL); for purposes of estimating the Statistical Model, for years before 2001, when allocated transfer risk was not included in ALLL in Call Reports, allocated transfer risk is included in gross assets separately.

[3] Delinquency and non-accrual data on government guaranteed loans are not available for the entire estimation period. As a result, the Statistical Model is estimated without deducting delinquent or past-due government guaranteed loans from the nonperforming loans and leases to gross assets ratio.

[4] The component rating for sensitivity to market risk (the "S" rating) is not available for years before 1997. As a result, and as described in the table, the Statistical Model is estimated using a weighted average of five component ratings excluding the "S" component where the component is not available.

[5] Growth in assets is also adjusted for acquisitions of failed banks.

[6] For purposes of calculating actual assessment rates (as opposed to model estimation), Asset Growth is bounded above by (and cannot exceed) 190 percent.

[1] Tests for the statistical significance of parameters use adjustments discussed by Tyler Shumway (2001) "Forecasting Bankruptcy More Accurately: A Simple Hazard Model," Journal of Business 74:1, 101–124.

[2] Beginning in 2012, all insured depository institutions began filing quarterly Call Reports and the TFR was no longer filed.

The financial variable regressors used to estimate the failure probabilities are obtained from Call Reports and TFRs. The weighted average of the ''C,'' ''A,'' ''M,'' ''E'', ''L'', and ''S'' component ratings regressor is based on component ratings obtained from the most recent bank examination conducted within 24 months before the date of the Call Report or TFR.

The Loan Mix Index assigns loans to the categories of loans described in Table E.2. For each loan category, a charge-off rate is calculated for each year from 2001 through 2014. The charge-off rate for each year is the aggregate charge-off rate on all such loans held by small institutions in that year. A weighted average charge-off rate is then calculated for each loan category, where the weight for each year is based on the number of small-bank failures during that year.[3] A Loan Mix Index for each established small institution is calculated by: (1) Multiplying the ratio of the institution's amount of loans in a particular loan category to its total assets by the associated weighted average charge-off rate for that loan category; and (2) summing the products for all loan categories. Table E.2 gives the weighted average charge-off rate for each category of loan, as calculated through the end of 2014. The Loan Mix Index excludes credit card loans.

TABLE E.2—LOAN MIX INDEX CATEGORIES

	Weighted charge-off rate percent
Construction & Development	4.4965840
Commercial & Industrial	1.5984506
Leases	1.4974551
Other Consumer	1.4559717
Loans to Foreign Government	1.3384093
Real Estate Loans Residual	1.0169338
Multifamily Residential	0.8847597
Nonfarm Nonresidential	0.7286274
1–4 Family Residential	0.6973778
Loans to Depository banks	0.5760532
Agricultural Real Estate	0.2376712
Agricultural	0.2432737

For each of the three regression estimates (Regression 1, Regression 2 and Regression 3), the estimated probability of failure (over a three-year horizon) of institution *i* at time *T* is

Equation 1

$$P_{iT} = 1/((1+\exp(-Z_{iT}))$$

where

Equation 2

$$Z_{iT} = \beta_0 + \beta_1(\text{Tier 1 Leverage Ratio}_{iT}) + \beta_2(\text{Nonperforming loans and leases ratio}_{iT}) + \beta_3(\text{Other real estate owned ratio}_{iT}) + \beta_4(\text{Net income before taxes ratio}_{iT}) + \beta_5(\text{Core deposits ratio}_{iT}) + \beta_6(\text{Weighted average CAMELS component rating}_{iT}) + \beta_7(\text{Loan mix index}_{iT}) + \beta_8(\text{Asset growth}_{iT})$$

where the β variables are parameter estimates. As stated earlier, for actual assessments, the β values that are applied are averages of each of the individual parameters over three separate regressions. Pricing multipliers (discussed in the next section) are based on Z_{iT}.[4]

III. Derivation of Uniform Amount and Pricing Multipliers

The uniform amount and pricing multipliers used to compute the annual initial base assessment rate in basis points, R_{iT}, for any such institution *i* at a given time *T* will be determined from the Statistical[5] Model as follows:

Equation 3

$$R_{iT} = \alpha_0 + \alpha_1 * Z_{iT} \text{ subject to } Min \leq R_{iT} \leq Max^{5}$$

where α_0 and α_1 are a constant term and a scale factor used to convert Z_{iT} to an assessment rate, *Max* is the maximum initial base assessment rate in effect and *Min* is the minimum initial base assessment rate in effect. (R_{iT} is expressed as an annual rate, but the actual rate applied in any quarter will be $R_{iT}/4$.)

Solving equation 3 for minimum and maximum initial base assessment rates simultaneously,

$Min = \alpha_0 + \alpha_1 * Z_N$ and $Max = \alpha_0 + \alpha_1 * Z_X$

where Z_X is the value of Z_{iT} above which the maximum initial assessment rate (*Max*) applies and Z_N is the value of Z_{iT} below which the minimum initial assessment rate (*Min*) applies,

results in values for the constant amount, α_0, and the scale factor, α_1:

[3] An exception is ''Real Estate Loans Residual,'' which consists of real estate loans held in foreign offices. Few small insured depository institutions report this item and a statistically reliable estimate of the weighted average charge-off rate could not be obtained. Instead, a weighted average of the weighted average charge-off rates of the other real estate loan categories is used. (The other categories are construction & development, multifamily residential, nonfarm nonresidential, 1–4 family residential, and agricultural real estate.) The weight for each of the other real estate loan categories is based on the aggregate amount of the loans held by small insured depository institutions as of December 31, 2014.

[4] The Z_{iT} values have the same rank ordering as the probability measures P_{iT}.

[5] R_{iT} is also subject to the minimum and maximum assessment rates applicable to established small institutions based upon their CAMELS composite ratings.

Equation 4

$$\alpha_0 = Min - \frac{Z_N * (Max - Min)}{Z_X - Z_N}$$

and *Equation 5*

$$\alpha_1 = \frac{Max - Min}{Z_X - Z_N}$$

The values for Z_X and Z_N will be selected to ensure that, for an assessment period shortly before adoption of a final rule, aggregate assessments for all established small institutions would have been approximately the same under the final rule as they would have been under the assessment rate schedule that, under rules in effect before adoption of the final rule, would have automatically gone into effect when the reserve ratio reached 1.15 percent. As an example, using aggregate assessments for all established small institutions for the fourth quarter of 2014 to determine Z_X and Z_N, and assuming that *Min* had equaled 3 basis points and *Max* had equaled 30 basis points, the value of Z_X would have been 0.49 and Z_N −6.60. Hence based on equations 4 and 5,
$\alpha_0 = 28.134$ and
$\alpha_1 = 3.808$.

Therefore from equation 3, it follows that

Equation 6

$$R_{iT} = 28.134 + 3.808 * Z_{iT} \text{ subject to } 3 \leq R_{iT} \leq 30$$

Substituting equation 2 produces an annual initial base assessment rate for institution *i* at time *T*, R_{iT}, in terms of the uniform amount, the pricing multipliers and model variables:

Equation 7

$$R_{iT} = [28.134 + 3.808 * \beta_0] + 3.808 * [\beta_1 (\text{Tier 1 leverage ratio}_{iT})] + 3.808 * \beta_2 (\text{Nonperforming loans and leases ratio}_{iT}) + 3.808 * \beta_3 (\text{Other real estate owned ratio}_{iT}) + 3.808 * \beta_4 (\text{Net income before taxes ratio}_{iT}) + 3.808 * \beta_5 (\text{Core deposits ratio}_{iT}) + 3.808 * \beta_6 (\text{Weighted average CAMELS component rating}_{iT}) + 3.808 * \beta_7 (\text{Loan mix index}_{iT}) + 3.808 * \beta_8 (\text{Asset growth}_{iT})$$

again subject to $3 \leq R_{iT} \leq 30$ [6]
where 28.134 + 3.808 * β_0 equals the uniform amount, 3.808 * β_j is a pricing multiplier for the associated risk measure *j*, and *T* is the date of the report of condition corresponding to the end of the quarter for which the assessment rate is computed.

Once the minimum and maximum cutoff values, Z_X and Z_N, are established as described in Section III of this Appendix, they will not change without additional notice-and-comment rulemaking. If *Max* (the maximum initial assessment rate) in effect or *Min* (the minimum initial assessment rate) in effect change, the uniform amount and pricing multipliers will be recalculated as described in equations 3 through 7 without additional notice-and-comment rulemaking.

IV. Updating the Statistical Model, Uniform Amount, and Pricing Multipliers

The Statistical Model is estimated using year-end financial ratios and the weighted average of the ''C,'' ''A,'' ''M,'' ''E'' and ''L'' component ratings (and the ''S'' component where it was available) from the end of 1984 through the end of 2011, failure data from the 1985 through 2014 and data for the weighted average charge-off rates for the Loan Mix Index from 2001 through 2014. The FDIC may, from time to time, but no more frequently than annually, re-estimate the Statistical Model with financial, failure and charge-off data from later years and publish a new Loan Mix Index, uniform amount and pricing multipliers based upon the methodology described in Sections I through III of this Appendix without further notice-and-comment rulemaking.

By order of the Board of Directors.

Dated at Washington, DC, this 16th day of June, 2015.

Federal Deposit Insurance Corporation.

Robert Feldman,

Executive Secretary.

[FR Doc. 2015–16514 Filed 7–10–15; 8:45 am]

BILLING CODE 6714–01–P

[6] As stated above, R_{iT} is also subject to the minimum and maximum assessment rates applicable to established small institutions based upon their CAMELS composite ratings.
