

There will be a number of hazards included in each image. The participant will be asked to search for and find the hazards. During the study, all 62 participants will be asked to search pictures. The participants will wear a light weight eye-tracking system so that eye-movements can be collected and search patterns can be mapped during

analysis to determine differences based on level of experience. Identification accuracy will also be collected to determine whether level of experience affects the number of hazards identified.

After the laboratory study is complete, all 62 respondents will complete the demographic questionnaire. This should take approximately six minutes for each

respondent to complete. All 62 respondents will then complete the Risk Assessment Measure (time to complete, 20 minutes), the Risk Propensity Scale (time to complete, 6 minutes), the Mine Specific Risk Tolerance Measure (time to complete, 6 minutes), and the Open-ended Questions (time to complete, 30 minutes).

The information collected with this survey will fulfill ANA's statutory requirement and will also serve as an important planning and performance tool for ANA.
