aguring of transmission tower foundations, and other infrastructure excavations. The Project will place new structures outside of floodplains where possible. In areas where floodplains cannot be avoided, Western will engineer transmission towers to withstand a 100-year flood. Additionally, new structures will be located and designed so as not to impede flood flows. All construction within a designated 100-year floodplain will be undertaken in consultation with the U.S. Army Corps of Engineers. No floodwater will be blocked, nor will floodwater be diverted outside of an existing floodplain. If avoidance is infeasible, transmission towers will be located and engineered so as not to block or substantially alter the natural drainage pattern. In accordance with Western’s Environmental Protection Measures and Construction Standard 13, culverts or bridges will be installed where needed to avoid surface water impacts during construction of transmission line structures.

**Decision**

Western’s decision is to construct the project along the Agency Preferred Alternative described in the Final EIS/EIR. The measures identified in Final EIS Table 6.1 are adopted as part of this decision. The selection of the Agency Preferred Alternative, the adopted measures from Final EIS Table 6.1, and all terms and conditions of required permits and consultation agreements satisfies Western’s statutory mission while minimizing harm to the environment. This decision is based on the information in the Final EIS/EIR. The EIS including this Record of Decision was prepared according to the requirements of NEPA (42 U.S.C. 4321, et seq.), the Council on Environmental Quality’s regulations for implementing NEPA (40 CFR parts 1500–1508) and DOE’s procedures for implementing NEPA (10 CFR part 1021).
