Use of *Roseomonas* species to treat eczematous (atopic dermatitis) skin disease Description of Technology: Atopic dermatitis, also known as eczema, is a chronic itchy skin disease that affects over 20% of infants and young children in industrialized nations and may persist into adulthood for up to 50% of these cases, making it one of the most common skin diseases in the US and other developed countries.

Scientists at NIAID have developed a method of treating or preventing atopic dermatitis via the topical application of selected probiotic strains of gram-negative *Roseomonas mucosa* bacteria. This approach avoids the exhausting treatment demands of standard therapies and has been shown to be beneficial in a preclinical mouse model of atopic dermatitis.

Potential Commercial Applications:

- Treatment of eczema
- Competitive Advantages:
- May be formulated as a cream or ointment
