BILLING CODE 4910-81-P

DEPARTMENT OF TRANSPORTATION

Maritime Administration

[Docket No. MARAD-2016 0081]

Requested Administrative Waiver of the Coastwise Trade Laws: Vessel TENACITY; Invitation for Public Comments

AGENCY: Maritime Administration, Department of Transportation.

ACTION: Notice.

SUMMARY: As authorized by 46 U.S.C. 12121, the Secretary of Transportation, as represented by the Maritime Administration (MARAD), is authorized to grant waivers of the U.S.-build requirement of the coastwise laws under certain circumstances. A request for such a waiver has been received by MARAD. The vessel, and a brief description of the proposed service, is listed below.

DATES: Submit comments on or before September 12, 2016.

ADDRESSES: Comments should refer to docket number MARAD-2016-0081. Written comments may be submitted by hand or by mail to the Docket Clerk, U.S. Department of Transportation, Docket Operations, M-30, West Building Ground Floor, Room W12-140, 1200 New Jersey Avenue SE., Washington, DC 20590. You may also send comments electronically via the Internet at <http://www.regulations.gov>. All comments will become part of this docket and will be available for inspection and copying at the above address between 10 a.m. and 5 p.m., E.T., Monday through Friday, except federal holidays. An electronic version of this document and all documents entered into this docket is available on the World Wide Web at <http://www.regulations.gov>.

FOR FURTHER INFORMATION CONTACT:

Bianca Carr, U.S. Department of Transportation, Maritime Administration, 1200 New Jersey Avenue SE., Room W23-453, Washington, DC 20590. Telephone 202-366-9309, Email Bianca.carr@dot.gov.

SUPPLEMENTARY INFORMATION: As described by the applicant the intended service of the vessel TENACITY is:

Intended Commercial Use of Vessel: Private Vessel Charters.

Geographic Region: "Maine, New Hampshire, Massachusetts, Rhode Island, Connecticut, New York, New Jersey, Pennsylvania, Delaware, Maryland, Virginia, North Carolina, South Carolina, Georgia, Florida, California, Oregon, Washington, and Alaska (excluding waters in Southeastern Alaska and waters north of a line between Gore Point to Cape Suckling [including the North Gulf Coast and Prince William Sound])"

The complete application is given in DOT docket MARAD-2016-0081 at <http://www.regulations.gov>. Interested parties may comment on the effect this action may have on U.S. vessel builders or businesses in the U.S. that use U.S.-flag vessels. If MARAD determines, in accordance with 46 U.S.C. 12121 and MARAD's regulations at 46 CFR part 388, that the issuance of the waiver will have an unduly adverse effect on a U.S.-vessel builder or a business that uses U.S.-flag vessels in that business, a waiver will not be granted. Comments should refer to the docket number of this notice and the vessel name in order for MARAD to properly consider the comments. Comments should also state the commenter's interest in the waiver application, and address the waiver criteria given in § 388.4 of MARAD's regulations at 46 CFR part 388.

Privacy Act

Anyone is able to search the electronic form of all comments received into any of our dockets by the name of the individual submitting the comment (or signing the comment, if submitted on behalf of an association, business, labor union, etc.). You may review DOT's complete Privacy Act Statement in the **Federal Register** published on April 11, 2000 (Volume 65, Number 70; Pages 19477-78).

By Order of the Maritime Administrator.

Dated: August 4, 2016.

T. Mitchell Hudson, Jr.,

Secretary, Maritime Administration.

BILLING CODE 4910-81-P

DEPARTMENT OF TRANSPORTATION

National Highway Traffic Safety Administration

[Docket No. NHTSA-2016-0083]

National Emergency Medical Services Advisory Council (NEMSAC); Notice of Federal Advisory Committee Meeting

AGENCY: National Highway Traffic Safety Administration (NHTSA), Department of Transportation (DOT).

ACTION: Notice.

SUMMARY: The NHTSA announces meeting of NEMSAC to be held in the Metropolitan Washington, DC, area. This notice announces the date, time, and location of the meetings, which will be open to the public, as well as opportunities for public input to the NEMSAC. The purpose of NEMSAC, a nationally recognized council of emergency medical services representatives and consumers, is to advise and consult with DOT and the Federal Interagency Committee on Emergency Medical Services (FICEMS) on matters relating to emergency medical services (EMS).

DATES: The NEMSAC meeting will be held on September 7, 2016 from 8:30 a.m. to 12:30 p.m. EDT, and on September 8, 2016 from 8:30 a.m. to 12 p.m. EDT. A public comment period will take place on September 7, 2016 between 12 p.m. and 12:30 p.m. EDT and on September 8, 2016 between 10:45 a.m. and 11 a.m. EDT. NEMSAC committees will meet in the same location on Wednesday, September 7, 2016 from 2 p.m. to 5 p.m. EDT. Written comments for the NEMSAC from the public must be received no later than September 1, 2016.

ADDRESSES: The meetings will be held at the FHI 360 Conference Center, 8th Floor, 1825 Connecticut Avenue NW., Washington, DC 20009. Attendees should plan to arrive 20 minutes early to check in for the meeting.

FOR FURTHER INFORMATION CONTACT: Susan McHenry, U.S. Department of Transportation, Office of Emergency Medical Services, 1200 New Jersey Avenue SE., NTI-140, Washington, DC 20590, susan.mchenry@dot.gov or 202-366-6540.

SUPPLEMENTARY INFORMATION: Notice of these meetings is given under the

Federal Advisory Committee Act, Public Law 92-463, as amended (5 U.S.C. App.). The NEMSAC is authorized under Section 31108 of the Moving Ahead with Progress in the 21st Century Act of 2012.

Tentative Agenda of the National EMS Advisory Council Meeting

The tentative NEMSAC agenda includes the following:

Wednesday, September 7, 2016, (8:30 a.m. to 12:30 p.m. EDT)

- (1) Opening Remarks
 - (2) Disclosure of Conflicts of Interests by Members
 - (3) Federal Liaison Update—Reports and Updates from the Departments of Transportation, Homeland Security, and Health & Human Services
 - (4) NEMSAC Committee Updates
 - (5) Public Comment (12 p.m.–12:30 p.m. EDT)
 - (6) Recess for Day (12:30 p.m. EDT)
- NEMSAC Committees Breakout Sessions from 2 p.m.–5 p.m.—(on-site and open to the public)

Thursday, September 8, 2016 (8:30 a.m. to 12 p.m. EDT)

- (1) Reconvene and Approval of April 18–19, 2016 Meeting Minutes
- (2) NEMSAC Committee Reports (see committee list below)
- (3) Public Comment (10:45 a.m.–11 a.m. EDT)
- (4) Election of Chair and Vice Chair
- (5) Next Steps
- (6) Adjourn—12 p.m. EDT

Overview of NEMSAC Committees:

- a. Funding and Reimbursement
- b. Innovative Practices of EMS Workforce
- c. Data Integration and Technology
- d. Patient Care, Quality Improvement and General Safety
- e. Provider and Community Education
- f. Ad Hoc Committee on Recognition of EMS Personnel Licensure Interstate Compact (REPLICA)
- g. Ad Hoc Committee on EMS Scope of Practice Model & Administration of Narcotic Antagonists

Registration Information: This meeting will be open to the public; however, pre-registration is requested. Individuals wishing to attend must register online no later than September 1, 2016. For NEMSAC please register at: <http://www.cvent.com/d/9vq7db/4W>.

For assistance with registration, please contact Susan McHenry at Susan.Mchenry@dot.gov or at 202-366-6540. There will not be a teleconference option for these meetings.

Public Comment: Members of the public are encouraged to comment

directly to the NEMSAC during designated public comment periods. In order to allow as many people as possible to speak, speakers are requested to limit their remarks to 5 minutes. Written comments from members of the public will be distributed to NEMSAC members at the meeting and should reach the NHTSA Office of EMS no later than September 1, 2016. Written comments may be submitted by either one of the following methods: (1) You may submit comments by email: *nemsac@dot.gov* or (2) you may submit comments by fax: 202-366-7149.

A final agenda as well as meeting materials will be available to the public online through *www.EMS.gov* on or before August 29, 2016.

Issued on: August 9, 2016.

Jeffrey P. Michael,

Associate Administrator for Research and Program Development.

BILLING CODE 4910-59-P

DEPARTMENT OF THE TREASURY

Internal Revenue Service

Proposed Collection; Comment Request for Form 8911

AGENCY: Internal Revenue Service (IRS), Treasury.

ACTION: Notice and request for comments.

SUMMARY: The Department of the Treasury, as part of its continuing effort to reduce paperwork and respondent burden, invites the general public and other Federal agencies to take this opportunity to comment on proposed and/or continuing information

collections, as required by the Paperwork Reduction Act of 1995. Currently, the IRS is soliciting comments concerning Form 8911, Alternative Fuel Vehicle Refueling Property Credit.

DATES: Written comments should be received on or before October 11, 2016 to be assured of consideration.

ADDRESSES: Direct all written comments to Tuawana Pinkston, Internal Revenue Service, Room 6526, 1111 Constitution Avenue NW., Washington, DC 20224.

FOR FURTHER INFORMATION CONTACT: Requests for additional information or copies of the form and instructions should be directed to Sara Covington, at Internal Revenue Service, Room 6129, 1111 Constitution Avenue NW., Washington, DC 20224, or through the internet at *Sara.L.Covington@irs.gov*.

SUPPLEMENTARY INFORMATION:

Title: Alternative Fuel Vehicle Refueling Property Credit.

OMB Number: 1545-1981.

Form Number: Form 8911.

Abstract: IRC section 30C allows a credit for alternative fuel vehicle refueling property. Form 8911, Alternative Fuel Vehicle Refueling Property Credit, will be used by taxpayers to claim the credit.

Current Actions: There is no change in the paperwork burden previously approved by OMB. This form is being submitted for renewal purposes only.

Type of Review: Extension of a currently approved collection.

Affected Public: Businesses and other for-profit organizations.

Estimated Number of Respondents: 300,330.

Estimated Time per Respondent: 11 hours .39

Estimated Total Annual Burden Hours: 3,420,759.

The following paragraph applies to all of the collections of information covered by this notice:

An agency may not conduct or sponsor, and a person is not required to respond to, a collection of information unless the collection of information displays a valid OMB control number. Books or records relating to a collection of information must be retained as long as their contents may become material in the administration of any internal revenue law. Generally, tax returns and tax return information are confidential, as required by 26 U.S.C. 6103.

Request for Comments: Comments submitted in response to this notice will be summarized and/or included in the request for OMB approval. All comments will become a matter of public record. Comments are invited on: (a) Whether the collection of information is necessary for the proper performance of the functions of the agency, including whether the information shall have practical utility; (b) the accuracy of the agency's estimate of the burden of the collection of information; (c) ways to enhance the quality, utility, and clarity of the information to be collected; (d) ways to minimize the burden of the collection of information on respondents, including through the use of automated collection techniques or other forms of information technology; and (e) estimates of capital or start-up costs and costs of operation, maintenance, and purchase of services to provide information.

Approved: July 21, 2016.

Tuawana Pinkston,

IRS Supervisory Tax Analyst.

Vol. 81

Friday,

No. 156

August 12, 2016

Part II

Securities and Exchange Commission

17 CFR Part 242

Regulation SBSR—Reporting and Dissemination of Security-Based Swap Information; Final Rule

SECURITIES AND EXCHANGE COMMISSION

17 CFR Part 242

[Release No. 34-78321; File No. S7-03-15]

RIN 3235-AL71

Regulation SBSR—Reporting and Dissemination of Security-Based Swap Information

AGENCY: Securities and Exchange Commission.

ACTION: Final rule.

SUMMARY: The Securities and Exchange Commission (“SEC” or “Commission”) is adopting certain amendments to Regulation SBSR—Reporting and Dissemination of Security-Based Swap Information (“Regulation SBSR”). Specifically, new Rule 901(a)(1) of Regulation SBSR requires a platform (*i.e.*, a national securities exchange or security-based swap execution facility (“SB SEF”)) that is registered with the Commission or exempt from registration) to report a security-based swap executed on such platform that will be submitted to clearing. New Rule 901(a)(2)(i) of Regulation SBSR requires a registered clearing agency to report any security-based swap to which it is a counterparty. The Commission is adopting certain conforming amendments to other provisions of Regulation SBSR in light of the newly adopted amendments to Rule 901(a), and an amendment that would require registered security-based swap data repositories (“SDRs”) to provide the security-based swap transaction data that they are required to publicly disseminate to the users of the information on a non-fee basis. The Commission also is adopting amendments to Rule 908(a) to extend Regulation SBSR’s regulatory reporting and public dissemination requirements to additional types of cross-border security-based swaps. The Commission is offering guidance regarding the application of Regulation SBSR to prime brokerage transactions and to the allocation of cleared security-based swaps. Finally, the Commission is adopting a new compliance schedule for the portions of Regulation SBSR for which the Commission has not previously specified compliance dates.

DATES: *Effective Date:* October 11, 2016.

Compliance Dates: For a discussion of the Compliance Dates for Regulation SBSR, see Section X of the Supplementary Information.

FOR FURTHER INFORMATION CONTACT: Michael Gaw, Assistant Director, at (202) 551-5602; Sarah Albertson,

Special Counsel, at (202) 551-5647; Yvonne Fraticelli, Special Counsel, at (202) 551-5654; Kathleen Gross, Special Counsel, at (202) 551-5305; David Michehl, Special Counsel, at (202) 551-5627; or Geoffrey Pemble, Special Counsel, at (202) 551-5628; all of the Division of Trading and Markets, Securities and Exchange Commission, 100 F Street NE., Washington, DC 20549-7010.

I. Introduction

Section 13A(a)(1) of the Exchange Act¹ provides that each security-based swap that is not accepted for clearing by any clearing agency or derivatives clearing organization shall be subject to regulatory reporting. Section 13(m)(1)(G) of the Exchange Act² provides that each security-based swap (whether cleared or uncleared) shall be reported to a registered SDR, and Section 13(m)(1)(C) of the Exchange Act³ generally provides that

¹ 15 U.S.C. 78m–1(a)(1). All references in this release to the Exchange Act refer to the Securities Exchange Act of 1934.

² 15 U.S.C. 78m(m)(1)(G).

³ 15 U.S.C. 78m(m)(1)(C).

transaction, volume, and pricing data of security-based swaps shall be publically disseminated in real time.⁴

In February 2015, the Commission adopted Regulation SBSR,⁵ which consists of Rules 900 to 909 under the Exchange Act and provides for the regulatory reporting and public dissemination of security-based swap transactions. At the same time that it adopted Regulation SBSR, the Commission also proposed certain additional rules and guidance relating to regulatory reporting and public dissemination of security-based swap transactions that were not addressed in the Regulation SBSR Adopting Release.⁶ In April 2015, the Commission proposed certain rules that would address the application of Title VII requirements to security-based swap activity engaged in by non-U.S. persons within the United States,⁷ including how Regulation SBSR would apply to such activity, and certain related issues. In this release, the Commission is adopting, with a number of revisions, the amendments to Regulation SBSR contained in the Regulation SBSR Proposed Amendments Release and the U.S. Activity Proposal.

The Commission received 18 comments on the Regulation SBSR Proposed Amendments Release⁸ and 16

comments on the U.S. Activity Proposal, of which seven addressed issues relating to Regulation SBSR.⁹ Below, the Commission responds to issues raised in those comments and discusses the amendments to Regulation SBSR being adopted herein. Some commenters directed comments to the rules the Commission already adopted in the

Regulation SBSR Adopting Release.¹⁰ As the Commission stated in the Regulation SBSR Proposed Amendments Release, however, the Commission did not reopen comment on the rules that it adopted in the Regulation SBSR Adopting Release.¹¹ Accordingly, these comments are beyond the scope of this release and are not addressed herein.

II. Economic Considerations and Baseline Analysis

To provide context for understanding the rules being adopted today and the related economic analysis that follows, this section describes the current state of the security-based swap market and the existing regulatory framework; it also identifies broad economic considerations that underlie the likely economic effects of these rules.

A. Baseline

To assess the economic impact of the final rules described in this release, the Commission employs as a baseline the security-based swap market as it exists at the time of this release, including applicable rules that the Commission already has adopted but excluding rules that the Commission has proposed but not yet finalized.¹² The analysis includes the statutory and regulatory provisions that currently govern the security-based swap market pursuant to the Dodd-Frank Act, rules adopted in the Intermediary Definitions Adopting Release,¹³ the Cross-Border Adopting Release,¹⁴ the SDR Adopting Release,¹⁵ and the U.S. Activity Adopting Release.¹⁶ In addition, the baseline

¹⁰ The issues raised by these commenters included, for example, the 24-hour reporting delay adopted in the Regulation SBSR Adopting Release; the ability to report all transaction information required by Regulation SBSR in light of certain foreign privacy laws; the identification of indirect counterparties; public dissemination of certain illiquid security-based swaps; the requirement for registered SDRs to disseminate the full notional size of all transactions; and the requirement that a registered SDR immediately disseminate information upon receiving a transaction report.

¹¹ See 80 FR at 14741, n. 8.

¹² The Commission also considered, where appropriate, the impact of rules and technical standards promulgated by other regulators, such as the CFTC and the European Securities and Markets Authority (“ESMA”), on practices in the security-based swap market.

¹³ See Securities Exchange Act Release No. 66868 (April 27, 2012), 77 FR 30596 (May 23, 2012) (“Intermediary Definitions Adopting Release”).

¹⁴ See Securities Exchange Act Release No. 72472 (June 25, 2014), 79 FR 47278 (August 12, 2014) (“Cross-Border Adopting Release”).

¹⁵ See Securities Exchange Act Release No. 74246 (February 11, 2015), 80 FR 14438 (March 19, 2015) (“SDR Adopting Release”).

¹⁶ See Securities Exchange Act Release No. 77104 (February 10, 2016), 81 FR 8598 (February 19, 2016) (“U.S. Activity Adopting Release”).

⁴ In addition, Section 13(m)(1)(E) of the Exchange Act, 15 U.S.C. 78m(m)(1)(E), provides that, with respect to cleared security-based swaps, the rule promulgated by the Commission related to public dissemination shall contain provisions, among others, that “specify the criteria for determining what constitutes a large notional security-based swap transaction (block trade) for particular markets and contracts” and “specify the appropriate time delay for reporting large notional security-based swap transactions (block trades) to the public.”

⁵ Securities Exchange Act Release No. 74244 (February 11, 2015), 80 FR 14564 (March 19, 2015) (“Regulation SBSR Adopting Release”). The Commission initially proposed Regulation SBSR in November 2010. See Securities Exchange Act Release No. 63346 (November 19, 2010), 75 FR 75207 (December 2, 2010) (“Regulation SBSR Proposing Release”). In May 2013, the Commission re-proposed the entirety of Regulation SBSR as part of a larger release that proposed rules and interpretations regarding the application of Title VII of the Dodd-Frank Act (“Title VII”) to cross-border security-based swap activities. See Securities Exchange Act Release No. 69490 (May 1, 2013), 78 FR 30967 (May 23, 2013) (“Cross-Border Proposing Release”).

⁶ Securities Exchange Act Release No. 74244 (February 11, 2015), 80 FR 14740 (March 19, 2015) (“Regulation SBSR Proposed Amendments Release”).

⁷ Securities Exchange Act Release No. 74834 (April 29, 2015), 80 FR 27444 (May 13, 2015) (“U.S. Activity Proposal”).

⁸ See letters to Brent J. Fields, Secretary, Commission, from Larry E. Thompson, Vice Chairman and General Counsel, Depository Trust & Clearing Corporation (“DTCC”), dated May 4, 2015 (“DTCC Letter”); Susan Milligan, Head of U.S. Public Affairs, LCH.Clearnet Group Limited, dated

includes rules that have been adopted but for which compliance is not yet required, including the SBS Entity Registration Adopting Release,¹⁷ the Regulation SBSR Adopting Release,¹⁸ and the External Business Conduct Adopting Release,¹⁹ as these final rules—even if compliance is not required—are part of the existing regulatory landscape that market participants must take into account when conducting their security-based swap activity.

The following sections provide an overview of aspects of the security-based swap market that are likely to be most affected by the amendments and guidance being adopted today, as well as elements of the current market structure, such as central clearing and platform trading, that are likely to determine the scope of transactions that will be covered by them.

1. Available Data Regarding Security-Based Swap Activity

The Commission's understanding of the market is informed in part by available data on security-based swap transactions, though the Commission acknowledges that limitations in the data prevent the Commission from quantitatively characterizing certain aspects of the market.²⁰ Because these data do not cover the entire market, the Commission has developed an understanding of market activity using a sample of transaction data that includes only certain portions of the market. The Commission believes, however, that the data underlying its analysis here provide reasonably comprehensive information regarding single-name credit default swap ("CDS") transactions and the composition of participants in the single-name CDS market.

Specifically, the Commission's analysis of the state of the current security-based swap market is based on data obtained from the DTCC Derivatives Repository Limited Trade Information Warehouse ("TIW"), especially data regarding the activity of market participants in the single-name CDS market during the period from 2008 to 2015. According to data

published by the Bank for International Settlements ("BIS"), the global notional amount outstanding in single-name CDS was approximately \$7.18 trillion,²¹ in multi-name index CDS was approximately \$4.74 trillion, and in multi-name, non-index CDS was approximately \$373 billion. The total gross market value outstanding in single-name CDS was approximately \$284 billion, and in multi-name CDS instruments was approximately \$137 billion.²² The global notional amount outstanding in equity forwards and swaps as of December 2015 was \$3.32 trillion, with total gross market value of \$147 billion.²³ As these figures show (and as the Commission has previously noted), although the definition of security-based swaps is not limited to single-name CDS, single-name CDS make up a vast majority of security-based swaps in terms of notional amount outstanding, and the Commission believes that the single-name CDS data are sufficiently representative of the market to inform the Commission's analysis of the state of the current security-based swap market.²⁴

The Commission notes that the data available to it from TIW do not encompass those CDS transactions that both: (1) Do not involve U.S. counterparties;²⁵ and (2) are based on non-U.S. reference entities. Notwithstanding this limitation, the TIW data should provide sufficient information to permit the Commission to identify the types of market participants active in the security-based swap market and the general pattern of dealing within that market.²⁶

²¹ The global notional amount outstanding represents the total face amount of the swap used to calculate payments. The gross market value is the cost of replacing all open contracts at current market prices.

²² See Semi-annual OTC derivatives statistics (December 2015), Table D5, available at <http://www.bis.org/statistics/derstats.htm> (last viewed May 25, 2016).

²³ These totals include both swaps and security-based swaps, as well as products that are excluded from the definition of "swap," such as certain equity forwards.

²⁴ See U.S. Activity Adopting Release, 81 FR at 8601.

²⁵ The Commission has classified accounts as "U.S. counterparties" based on TIW's entity domicile determinations. The Commission notes, however, that TIW's entity domicile determinations are not necessarily identical in all cases to the definition of "U.S. person" under Exchange Act Rule 3a71-3(a)(4), 17 CFR 240.3a71-3(a)(4).

²⁶ The challenges the Commission faces in estimating measures of current market activity stems, in part, from the absence of comprehensive reporting requirements for security-based swap market participants. The Commission has adopted rules regarding trade reporting, data elements, and public reporting for security-based swaps that are designed to, when fully implemented, provide us

One commenter recommended that the Commission collect a more complete set of data to more precisely estimate the number of non-U.S. persons that would be affected by the proposed rules.²⁷ Given the absence of comprehensive reporting requirements for security-based swap transactions, and the fact that the location of personnel that arrange, negotiate, or execute a security-based swap transaction is not currently available in TIW, a more precise estimate of the number of non-U.S. persons affected by the adopted rules is not currently feasible.

2. Clearing Activity in Single-Name CDS

Currently, there is no regulatory requirement in the United States to clear security-based swaps. Clearing for certain single-name CDS products occurs on a voluntary basis. Voluntary clearing activity in single-name CDS has steadily increased in recent years. As of the end of 2015, ICE Clear Credit accepted for clearing security-based swap products based on a total of 232 North American corporate reference entities, 174 European corporate reference entities, and 21 individual sovereign reference entities.

Figure 1, below, shows characteristics of new trades in single-name CDS that reference North American standard corporate ISDA documentation. In particular, the figure documents that about half of all clearable transactions are cleared. Analysis of trade activity from January 2011 to December 2015 indicates that, out of \$3,460 billion of notional amount traded in North American corporate single-name CDS products that are accepted for clearing during the 60 months ending December 2015, approximately 70%, or \$2,422 billion, had characteristics making them suitable for clearing by ICE Clear Credit and represented trades between two ICE Clear Credit clearing members. Approximately 80% of this notional value, or \$1,938 billion, was cleared through ICE Clear Credit, or 56% of the total volume of new trade activity. As of the end of 2015, ICE Clear Europe

with appropriate measures of market activity. See Regulation SBSR Adopting Release, 80 FR at 14699-700.

²⁷ See ISDA Letter at 3, 7 (arguing that the Commission lacks complete data to estimate the number of non-U.S. persons that use U.S. personnel to arrange, negotiate, or execute security-based swap transactions or the number of registered U.S. broker-dealers that intermediate these transactions and that this "makes it difficult or impossible for the Commission to formulate a useful estimate of the market impact, cost and benefits of the Proposal"); suggesting that the Commission "gather[] more robust and complete data prior to finalizing a rulemaking that will have meaningful impact on a global market").

¹⁷ See Securities Exchange Act Release No. 75611 (August 5, 2015), 80 FR 48963 (August 14, 2015) ("SBS Entities Registration Adopting Release").

¹⁸ See *supra* note 5.

¹⁹ See Securities Exchange Act Release No. 77617 (April 14, 2016), 81 FR 29960 (May 13, 2016) ("External Business Conduct Adopting Release").

²⁰ The Commission also relies on qualitative information regarding market structure and evolving market practices provided by commenters, both in letters and in meetings with Commission staff, and knowledge and expertise of Commission staff.

accepted for clearing single-name CDS products referencing a total of 176 European corporate reference entities and seven sovereign reference entities. Analysis of new trade activity from January 2011 to December 2015 indicates that, out of €1,963 billion of

notional volume traded in European corporate single-name CDS products that are accepted for clearing during the 60 months ending December 2015, approximately 58%, or €1,139 billion, had characteristics making them suitable for clearing by ICE Clear Europe

and represented trades between two ICE Clear Europe clearing members. Approximately 71% of this notional amount, or €805 billion, was cleared through ICE Clear Europe, or 41% of the total volume of new trade activity.²⁸

Figure 1: The fraction of total gross notional amount of new trades and assign-entries in North American single-name CDS products that were accepted for clearing by ICE Clear Credit and were cleared within 14 days of the initial transaction.²⁹

3. Current Market Structure for Security-Based Swap Infrastructure

a. Exchanges and SB SEFs

The rules and amendments adopted herein address how transactions conducted on platforms (*i.e.*, national securities exchanges and SB SEFs) must be reported under Regulation SBSR. Currently, there are no SB SEFs registered with the Commission, and as a result, there is no registered SB SEF trading activity to report. There are, however, currently 22 swap execution facilities (“SEFs”) that are either temporarily registered with the Commodity Futures Trading

Commission (“CFTC”) or whose temporary registrations are pending with the CFTC and currently are exempt from registration with the Commission.³⁰ As the Commission noted in the U.S. Activity Adopting Release, the cash flows of security-based swaps and other swaps are closely related and many participants in the swap market also participate in the security-based swap market.³¹ Likewise, the Commission believes that it is possible that some entities that currently act as SEFs will register with the Commission as SB SEFs. The Commission anticipates that, owing to the smaller size of the security-based swap market, there will be fewer

platforms for executing transactions in security-based swaps than the 22 SEFs reported within the CFTC’s jurisdiction. Under newly adopted Rule 901(a)(1), a platform is required to report to a registered SDR any security-based swap transaction that is executed on the platform and submitted to clearing.

b. Clearing Agencies

The market for clearing services in the security-based swap market is currently concentrated among a handful of firms. Table 1 lists the firms that currently clear index and single-name CDS and identifies the segments of the market each firm serves. While there may be several choices available to participants interested in cleared index CDS

²⁸ These numbers do not include transactions in European corporate single-name CDS that were cleared by ICE Clear Credit. During the sample period, a total of 2,168 transactions in European corporate single-name CDS (with a total gross notional amount of approximately €11 billion) were cleared by ICE Clear Credit. All but one of these transactions occurred between 2014 and 2015. For historical data, see <https://www.theice.com/marketdata/reports/99> (last visited on May 25, 2016).

²⁹ The Commission believes that it is reasonable to assume that, when clearing occurs within 14

days of execution, counterparties made the decision to clear at the time of execution and not as a result of information arriving after execution.

³⁰ See Securities Exchange Act Release No. 64678 (June 15, 2011), 76 FR 36287, at 36306 (June 22, 2011) (Temporary Exemptions and Other Temporary Relief, Together With Information on Compliance Dates for New Provisions of the Securities Exchange Act of 1934 Applicable to Security-Based Swaps) (“Effective Date Release”) (exempting persons that operate a facility for the trading or processing of security-based swaps that is not currently registered as a national securities

exchange or that cannot yet register as an SB SEF because final rules for such registration have not yet been adopted from the requirements of Section 3D(a)(1) of the Exchange Act until the earliest compliance date set forth in any of the final rules regarding registration of SB SEFs). A list of SEFs that are either temporarily registered with the CFTC or whose temporary registrations are pending with the CFTC is available at <http://sirt.cftc.gov/SIRT/SIRT.aspx?Topic=SwapExecutionFacilities> (last visited May 25, 2016).

³¹ See 81 FR at 8609.

transactions, only two firms (albeit with the same parent) clear sovereign single-name CDS and only a single firm serves the market for North American single-name CDS. Concentration of clearing services within a limited set of clearing agencies can be explained, in part, by

the existence of strong economies of scale in central clearing.³²

The rules adopted today will, among other things, assign regulatory reporting duties for clearing transactions (*i.e.*, security-based swaps to which registered clearing agencies are direct counterparties). Any rule that would

assign reporting duties for clearing transactions would affect the accessibility of data related to a large number of security-based swap transactions. In addition, the number of clearing transactions would affect the magnitude of the regulatory burdens associated with those reporting duties.

TABLE 1—CLEARING AGENCIES CURRENTLY CLEARING INDEX AND SINGLE-NAME CDS

	North American	European	Japanese	Sovereign	Index

ICE Clear Europe ³⁴	X	X	X
CME ³⁵	X
LCH.Clearnet ³⁶	X	X
JSCC ³⁷	X	X

c. Trade Repositories

The market for data services has evolved along similar lines. While there is currently no mandatory reporting requirement for the single-name CDS market, virtually all transactions are voluntarily reported to TIW, which maintains a legal record of transactions.³⁸ That there currently is a single dominant provider of recordkeeping services for security-based swaps is consistent with the presence of a natural monopoly for a service that involves a predominantly fixed cost investment with low marginal costs of operation.

There are currently no SDRs registered with the Commission.³⁹ Registration requirements are part of the new rules discussed in the SDR Adopting Release.⁴⁰ In the absence of SEC-registered SDRs, the analysis of the economic effects of the adopted rules and amendments discussed in this release on SDRs is informed by the experience of the CFTC-registered swap data repositories that operate in the swap market. The CFTC has provisionally registered four swap data repositories to accept transactions in swap credit derivatives.⁴¹

It is reasonable to estimate that a similar number of persons provisionally registered with the CFTC to service the equity and credit swap markets might seek to register with the Commission as SDRs, and that other persons could seek to register with both the CFTC and the Commission as swap data repositories and SDRs, respectively. There are economic incentives for the dual registration attributed to the fact that many of the market participants in the security-based swap market also participate in the swap market. Moreover, once a swap data repository is registered with the CFTC and the required infrastructure for regulatory reporting and public dissemination is in place, the marginal costs for a swap data repository to also register with the Commission as an SDR, adding products and databases and implementing modifications to account for differences between Commission and CFTC rules, will likely be lower than the initial cost of registration with the CFTC.

d. Vertical Integration of Security-Based Swap Market Infrastructure

The Commission has already observed vertical integration of swap market infrastructure: Clearing agencies have

entered the market for record keeping services for swaps by provisionally registering themselves, or their affiliates, as swap data repositories with the CFTC. Under the CFTC swap reporting regime, two provisionally registered swap data repositories are, or are affiliated with, clearing agencies that clear swaps. These clearing agencies have adopted rules providing that they will satisfy their CFTC swap reporting obligations by reporting to their own, or their affiliated, swap data repository.⁴² As a result, beta and gamma transactions and subsequent netting transactions that arise from the clearing process are reported by each of these clearing agencies to their associated swap data repositories.

4. Security-Based Swap Market: Market Participants and Dealing Structures

a. Market Centers

Financial groups engaged in security-based swap dealing activity operate in multiple market centers and carry out such activity with counterparties

³² See Securities Exchange Act Release No. 68080 (October 22, 2012), 77 FR at 66265 (November 2, 2012) (noting that economies of scale can result in natural monopolies). See also Craig Pirrong, “The Industrial Organization of Execution, Clearing and Settlement in Financial Markets,” Working Paper (2007), available at http://www.bauer.uh.edu/spirrong/Clearing_silos.pdf (last visited May 25, 2016) (discussing the presence of economies of scale in central clearing).

around the world.⁴³ Several commenters noted that many market participants that engage in dealing activity prefer to use traders and manage risk for security-based swaps in the jurisdiction where the underlier is traded.⁴⁴ Thus, although a significant amount of the dealing activity in security-based swaps on U.S. reference entities involves non-U.S. dealers, the Commission understands that these dealers tend to carry out much of the security-based swap trading and related risk-management activities in these security-based swaps within the United States.⁴⁵ Some dealers have explained that being able to centralize their trading, sales, risk management, and other activities related to U.S. reference entities in U.S. operations (even when the resulting transaction is booked in a foreign entity) improves the efficiency of their dealing business.⁴⁶

Consistent with these operational concerns and the global nature of the security-based swap market, the available data appear to confirm that participants in this market are in fact active in market centers around the globe. Although, as noted above, the available data do not permit the Commission to identify the location of personnel in a transaction, TIW transaction records indicate that firms that are likely to be security-based swap dealers operate out of branch locations in key market centers around the world, including New York, London, Tokyo, Hong Kong, Chicago, Sydney, Toronto, Frankfurt, Singapore and the Cayman Islands.

Given these market characteristics and practices, participants in the security-based swap market may bear the financial risk of a security-based swap transaction in a location different from the location where the transaction is arranged, negotiated, or executed, or where economic decisions are made by managers on behalf of beneficial owners. And market activity may occur in a jurisdiction other than where the market participant or its counterparty books the transaction. Similarly, a participant in the security-based swap market may be exposed to counterparty risk from a counterparty located in a jurisdiction that is different from the market center or centers in which it participates.

b. Common Business Structures for Firms Engaged in Security-Based Swap Dealing Activity

A financial group that engages in a global security-based swap dealing business in multiple market centers may choose to structure its dealing business in a number of different ways. This structure, including where it books the transactions that constitute that business and how it carries out market-facing activities that generate those transactions, reflects a range of business and regulatory considerations, which each financial group may weigh differently.

A financial group may choose to book all of its security-based swap transactions, regardless of where the transaction originated, in a single, central booking entity. That entity generally retains the risk associated with that transaction, but it also may lay off that risk to another affiliate via a back-to-back transaction or an assignment of the security-based swap.⁴⁷ Alternatively, a financial group may book security-based swaps arising from its dealing business in separate affiliates, which may be located in the jurisdiction where it originates the risk associated with those security-based swaps, or alternatively, the jurisdiction where it manages that risk.⁴⁸ Some financial groups may book transactions originating in a particular region to an affiliate established in a jurisdiction located in that region.⁴⁹

Regardless of where a financial group determines to book its security-based swaps arising out of its dealing activity, it is likely to operate offices that perform sales or trading functions in one or more market centers in other jurisdictions. Maintaining sales and trading desks in global market centers permits the financial group to deal with counterparties in that jurisdiction or in a specific geographic region, or to ensure that it is able to provide liquidity to counterparties in other jurisdictions, for example, when a counterparty's home financial markets are closed.⁵⁰ A financial group engaged in security-based swap dealing business also may

⁴⁷ See U.S. Activity Adopting Release, 81 FR at 8604.

⁴⁸ See *id.*

⁴⁹ There is some indication that this booking structure is becoming increasingly common in the market. See, e.g., "Regional swaps booking replacing global hubs," *Risk.net* (Sept. 4, 2015), available at: <http://www.risk.net/risk-magazine/feature/2423975/regional-swaps-booking-replacing-global-hubs>.

⁵⁰ These offices may be branches or offices of the booking entity itself, or branches or offices of an affiliated agent, such as, in the United States, a registered broker-dealer. See U.S. Activity Adopting Release, 81 FR at 8604–605.

choose to manage its trading book in particular reference entities or securities primarily from a trading desk that can take advantage of local expertise in such products or that can gain access to better liquidity, which may permit it to more efficiently price such products or to otherwise compete more effectively in the security-based swap market.⁵¹ Some financial groups prefer to centralize risk management, pricing, and hedging for specific products with the personnel responsible for carrying out the trading of such products to mitigate operational risk associated with transactions in those products.

The financial group affiliate that books these transactions may carry out related market-facing activities, whether in its home jurisdiction or in a foreign jurisdiction, using either its own personnel or the personnel of an affiliated or unaffiliated agent. For example, the financial group may determine that another affiliate in the financial group employs personnel who possess expertise in relevant products or who have established sales relationships with key counterparties in a foreign jurisdiction, making it more efficient to use the personnel of the affiliate to engage in security-based swap dealing activity on its behalf in that jurisdiction.⁵² In these cases, the affiliate that books these transactions and its affiliated agent may operate as an integrated dealing business, each performing distinct core functions in carrying out that business.

Alternatively, the financial group affiliate that books these transactions may in some circumstances determine to engage the services of an unaffiliated agent through which it can engage in dealing activity. For example, a financial group may determine that using an interdealer broker may provide an efficient means of participating in the interdealer market in its own, or in another, jurisdiction, particularly if it is seeking to do so anonymously or to take a position in products that trade relatively infrequently.⁵³ A financial group may also use unaffiliated agents that operate at its direction. Such an arrangement may be particularly valuable in enabling a financial group to service clients or access liquidity in

⁵¹ See *id.* at 8605.

⁵² See *id.*

⁵³ The Commission understands that inter-dealer brokers may provide voice or electronic trading services that, among other things, permit dealers to take positions or hedge risks in a manner that preserves their anonymity until the trade is executed. These inter-dealer brokers also may play a particularly important role in facilitating transactions in less-liquid security-based swaps.

jurisdictions in which it has no security-based swap operations of its own.

The Commission understands that financial group affiliates (whether affiliated with U.S.-based financial groups or not) that are established in foreign jurisdictions may use any of these structures to engage in dealing activity in the United States, and that they may seek to engage in dealing activity in the United States to transact with both U.S.-person and non-U.S.-person counterparties. In transactions with non-U.S.-person counterparties, these foreign affiliates may affirmatively seek to engage in dealing activity in the United States because the sales personnel of the non-U.S.-person dealer (or of its agent) in the United States have existing relationships with counterparties in other locations (such as Canada or Latin America) or because the trading personnel of the non-U.S. person dealer (or of its agent) in the United States have the expertise to manage the trading books for security-based swaps on U.S. reference securities or entities. The Commission understands that some of these foreign affiliates engage in dealing activity in the United States through their personnel (or personnel of their affiliates) in part to ensure that they are able to provide their own counterparties, or those of financial group affiliates in other jurisdictions, with access to liquidity (often in non-U.S. reference entities) during U.S. business hours, permitting them to meet client demand even when the home markets are closed. In some cases, such as when seeking to transact with other dealers through an interdealer broker, these foreign affiliates may act, in a dealing capacity, in the United States through an unaffiliated, third-party agent.

c. Current Estimates of Number of Security-Based Swap Dealers

Security-based swap activity is concentrated in a relatively small number of dealers, which already represent a small percentage of all market participants active in the security-based swap market.⁵⁴ Based on an analysis of 2015 data, the Commission's earlier estimates of the number of entities likely to register as security-based swap dealers remain largely unchanged.⁵⁵ Of the approximately 50 entities that the Commission estimates might register as security-based swap dealers, the Commission believes that it is

reasonable to expect 22 to be non-U.S. persons.⁵⁶ Under the rules as they currently exist, the Commission identified approximately 170 entities engaged in single-name CDS activity, with all counterparties, of \$2 billion or more. Of those entities, 104 are expected to incur assessment costs to determine whether they meet the definition of "security-based swap dealer." Approximately 47 of these entities are non-U.S. persons.⁵⁷

Many of these dealers are already subject to other regulatory frameworks under U.S. law based on their role as intermediaries or on the volume of their positions in other products, such as swaps. Available data support the Commission's prior estimates, based on the Commission's experience and understanding of the swap and security-based swap market, that, of the 55 firms that might register as security-based swap dealers or major security-based swap participants, approximately 35 would also be registered with the CFTC as swap dealers or major swap participants.⁵⁸ Based on an analysis of TIW data and filings with the Commission, the Commission estimates that 16 market participants that will register as security-based swap dealers have already registered with the Commission as broker-dealers and are thus subject to Exchange Act and Financial Industry Regulatory Authority ("FINRA") requirements applicable to such entities. Finally, as the Commission discusses below, some dealers may be subject to similar requirements in one or more foreign jurisdictions.⁵⁹

Finally, the Commission also notes that it has adopted rules for the registration of security-based swap dealers and major security-based swap participants, although market participants are not yet required to comply with those rules.⁶⁰ Thus, there

⁵⁴ These estimates are based on the number of accounts in TIW data with total notional volume in excess of *de minimis* thresholds, increased by a factor of two, to account for any potential growth in the security-based swap market, to account for the fact that the Commission is limited in observing transaction records for activity between non-U.S. persons that reference U.S. underliers, and to account for the fact that the Commission does not observe security-based swap transactions other than in single-name CDS. See U.S. Activity Adopting Release, 81 FR at 8605.

⁵⁵ See *id.*

⁵⁶ See *id.*

⁵⁷ See *id.* at 8605–606.

⁵⁸ In the SBS Entity Registration Adopting Release, the Commission established the compliance date for security-based swap dealer and major security-based swap participant registration (the "SBS entities registration compliance date") as the later of six months after the date of publication in the **Federal Register** of a final rule release adopting rules establishing capital, margin and

are not yet any security-based swap dealers or major security-based swap participants registered with the Commission.

d. Arranging, Negotiating, and Executing Activity Using Personnel Located in a U.S. Branch or Office

Under rules recently adopted by the Commission as part of the U.S. Activity Adopting Release, non-U.S. persons will be required to apply transactions with other non-U.S. persons in connection with their dealing activity towards their *de minimis* thresholds when those transactions are arranged, negotiated, or executed by personnel located in a U.S. branch or office, or by personnel of an agent of such non-U.S. person located in a U.S. branch or office.⁶¹ As a result of this requirement, certain market participants will likely incur costs associated with determining the location of relevant personnel who arrange, negotiate, or execute a transaction,⁶² and, having determined the locations, these market participants will be able to identify those transactions that are arranged, negotiated, or executed by personnel located in a U.S. branch or office, or by personnel of an agent of such non-U.S. person located in a U.S. branch or office. The Commission estimated that an additional 20 non-U.S. persons, beyond the 56 identified under the Cross-Border Adopting Release, were likely to incur assessment costs in connection with the *de minimis* exception as a result of these rules.⁶³

To estimate the number of unregistered foreign entities that arrange, negotiate, or execute security-based swap transactions using U.S. personnel in connection with their dealing activity for the purpose of this rulemaking, Commission staff used 2015 TIW single-name CDS transaction data to identify foreign entities that have three or more counterparties that are not recognized as dealers by ISDA and that traded less than \$3 billion in notional volume and identified four entities that

segregation requirements for SBS entities; the compliance date of final rules establishing recordkeeping and reporting requirements for SBS entities; the compliance date of final rules establishing business conduct requirements under Exchange Act Sections 15F(h) and 15F(k); or the compliance date for final rules establishing a process for a registered SBS entities to make an application to the Commission to allow an associated person who is subject to a statutory disqualification to effect or be involved in effecting security-based swaps on the SBS entities' behalf. See 80 FR at 48964.

⁶¹ See Rule 3a71–3(C) under the Exchange Act, 17 CFR 240.3a71–3(C).

⁶² See U.S. Activity Adopting Release, 81 FR at 8627–28.

⁶³ See *id.* at 8627.

⁵⁴ See U.S. Activity Adopting Release, 81 FR at 8605.

⁵⁵ See *id.*

met these criteria. In 2015, these four entities were counterparties to 1,080 transactions in single-name CDS, referencing 186 reference entities, with a total notional volume of \$5.2 billion. The Commission believes that these foreign dealing entities that are likely to remain unregistered engage in transactions in essentially the same products as foreign dealing entities that are likely to register as security-based swap dealers. The Commission staff observed in the 2015 data that foreign dealing entities that are likely to register as security-based swap dealers based on single-name CDS transaction activity in 2015 traded in 185 out of the 186 reference entities that the smaller foreign dealing entities had traded in.

These smaller foreign dealing entities were counterparties to a very small number of security-based swaps involving foreign dealing entities engaging in U.S. activity. Using 2015 TIW data, the Commission estimates that foreign dealing entities that likely would register with Commission as security-based swap dealers based on their transaction activity in 2015, were counterparties to nearly all security-based swaps involving foreign dealing entities engaging in U.S. activity.⁶⁴

⁶⁴The Commission staff analysis of TIW transaction records indicates that approximately 99.72% of single-name CDS price-forming transactions and 99.73% of price-forming transaction volume in 2015 that involved foreign dealing entities involved a foreign dealing entity likely to register with the Commission as a security-based swap dealer based on its 2015 transaction activity.

5. Security-Based Swap Market: Levels of Security-Based Swap Trading Activity

As already noted, firms that act as dealers play a central role in the security-based swap market. Based on an analysis of 2015 single-name CDS data in TIW, accounts of those firms that are likely to exceed the security-based swap dealer *de minimis* thresholds and trigger registration requirements intermediated transactions with a gross notional amount of approximately \$5.8 trillion, approximately 60% of which was intermediated by the top five dealer accounts.⁶⁵

These dealers transact with hundreds or thousands of counterparties. Approximately 24% of accounts of firms expected to register as security-based dealers and observable in TIW have entered into security-based swaps with over 1,000 unique counterparty accounts as of year-end 2015.⁶⁶ Another 24% of these accounts transacted with 500 to 1,000 unique counterparty accounts; 16% transacted with 100 to 500 unique accounts; and 36% of these accounts intermediated swaps with fewer than 100 unique counterparties in

⁶⁵The Commission staff analysis of TIW transaction records indicates that approximately 99% of single-name CDS price-forming transactions in 2015 involved an ISDA-recognized dealer.

⁶⁶Many dealer entities and financial groups transact through numerous accounts. Given that individual accounts may transact with hundreds of counterparties, the Commission may infer that entities and financial groups may transact with at least as many counterparties as the largest of their accounts.

2015. The median dealer account transacted with 481 unique accounts (with an average of approximately 635 unique accounts). Non-dealer counterparties transacted almost exclusively with these dealers. The median non-dealer counterparty transacted with three dealer accounts (with an average of approximately four dealer accounts) in 2015.

Figure 2 below describes the percentage of global, notional transaction volume in North American corporate single-name CDS reported to TIW between January 2008 and December 2015, separated by whether transactions are between two ISDA-recognized dealers (interdealer transactions) or whether a transaction has at least one non-dealer counterparty.

Figure 2 also shows that the portion of the notional volume of North American corporate single-name CDS represented by interdealer transactions has remained fairly constant and that interdealer transactions continue to represent a significant majority of trading activity, even as notional volume has declined over the past seven years,⁶⁷ from more than \$6 trillion in 2008 to less than \$1.3 trillion in 2015.⁶⁸

⁶⁷The start of this decline predates the enactment of the Dodd-Frank Act and the proposal of rules thereunder, which is important to note for the purpose of understanding the economic baseline for this rulemaking.

⁶⁸This estimate is lower than the gross notional amount of \$5.8 trillion noted above as it includes only the subset of single-name CDS referencing North American corporate documentation. See *supra* note 65.

Figure 2: Global, notional trading volume in North American corporate single-name CDS by calendar year and the fraction of volume that is interdealer.

The high level of interdealer trading activity reflects the central position of a small number of dealers, each of which intermediates trades with many hundreds of counterparties. While the Commission is unable to quantify the current level of trading costs for single-name CDS, those dealers appear to enjoy market power as a result of their small number and the large proportion of order flow that they privately observe.

Against this backdrop of declining North American corporate single-name CDS activity, about half of the trading activity in North American corporate single-name CDS reflected in the set of data that the Commission analyzed was between counterparties domiciled in the United States and counterparties domiciled abroad, as shown in Figure 3 below. Using the self-reported registered office location of the TIW accounts as a proxy for domicile, the Commission estimates that only 12% of the global transaction volume by notional volume between 2008 and 2015 was between two U.S.-domiciled counterparties, compared to 48% entered into between one U.S.-domiciled counterparty and a foreign-domiciled counterparty and

40% entered into between two foreign-domiciled counterparties.⁶⁹

If the Commission considers the number of cross-border transactions instead from the perspective of the domicile of the corporate group (e.g., by classifying a foreign bank branch or foreign subsidiary of a U.S. entity as domiciled in the United States), the percentages shift significantly. Under this approach, the fraction of transactions entered into between two U.S.-domiciled counterparties increases to 33%, and to 52% for transactions entered into between a U.S.-domiciled counterparty and a foreign-domiciled counterparty. By contrast, the proportion of activity between two foreign-domiciled counterparties drops from 40% to 16%. This change in respective shares based on different classifications suggests that the activity of foreign subsidiaries of U.S. firms and foreign branches of U.S. banks accounts for a higher percentage of security-based

⁶⁹ For purposes of this discussion, the Commission has assumed that the registered office location reflects the place of domicile for the fund or account, but the Commission notes that this domicile does not necessarily correspond to the location of an entity's sales or trading desk. See U.S. Activity Adopting Release, 81 FR at 8607, n. 83.

swap activity than U.S. subsidiaries of foreign firms and U.S. branches of foreign banks. It also demonstrates that financial groups based in the United States are involved in an overwhelming majority (approximately 85%) of all reported transactions in North American corporate single-name CDS.

Financial groups based in the United States are also involved in a majority of interdealer transactions in North American corporate single-name CDS. Of transactions on North American corporate single-name CDS between two ISDA-recognized dealers and their branches or affiliates, 93% of transaction notional volume involved at least one account of an entity with a U.S. parent.

The Commission notes, in addition, that a significant majority of North American corporate single-name CDS transactions occur in the interdealer market or between dealers and foreign non-dealers, with the remaining (and much smaller) portion of the market consisting of transactions between dealers and U.S.-person non-dealers. Specifically, 74% of North American corporate single-name CDS transactions involved either two ISDA-recognized dealers or an ISDA-recognized dealer

and a foreign non-dealer. Approximately 16.5% of such transactions involved an ISDA-

recognized dealer and a U.S.-person non-dealer.

Figure 3: The fraction of notional volume in North American corporate single-name CDS between (1) two U.S.-domiciled accounts; (2) one U.S.-domiciled account and one non-U.S.-domiciled account; and (3) two non-U.S.-domiciled accounts, computed from January 2008 through December 2015.

6. Global Regulatory Efforts

In 2009, the G20 Leaders—whose membership includes the United States, 18 other countries, and the European Union—addressed global improvements in the OTC derivatives markets. They expressed their view on a variety of issues relating to OTC derivatives contracts. In subsequent summits, the G20 Leaders have returned to OTC derivatives regulatory reform and encouraged international consultation in developing standards for these markets.⁷⁰

Foreign legislative and regulatory efforts have focused on five general areas: moving OTC derivatives onto organized trading platforms, requiring central clearing of OTC derivatives, requiring post-trade reporting of transaction data for regulatory purposes and public dissemination of anonymized versions of such data, establishing or enhancing capital requirements for non-centrally cleared OTC derivatives transactions, and establishing or enhancing margin and other risk mitigation requirements for non-centrally cleared OTC derivatives

transactions. The rules being adopted in this release will affect a person's obligations with respect to post-trade reporting of transaction data for public dissemination and regulatory purposes under Regulation SBSR.

Foreign jurisdictions have been actively implementing regulations of the OTC derivatives markets. Regulatory transaction reporting requirements are in force in a number of jurisdictions, including the European Union, Hong Kong SAR, Japan, Australia, Brazil, Canada, China, India, Indonesia, South Korea, Mexico, Russia, Saudi Arabia, and Singapore; other jurisdictions are in the process of proposing legislation and rules to implement these requirements.⁷¹ The CFTC, the 13 Canadian provinces and territories, the European Union, and Japan have adopted requirements to publicly

disseminate transaction-level data about OTC derivatives transactions. In addition, a number of foreign jurisdictions have initiated the process of implementing margin and other risk mitigation requirements for non-centrally cleared OTC derivatives transactions.⁷² Several jurisdictions have also taken steps to implement the Basel III recommendations governing capital requirements for financial entities, which include enhanced capital charges for non-centrally cleared OTC derivatives transactions.⁷³ There

⁷² In November 2015, the Financial Stability Board reported that 12 member jurisdictions participating in its tenth progress report on OTC derivatives market reforms had in force a legislative framework or other authority to require exchange of margin for non-centrally cleared transactions and had published implementing standards or requirements for consultation or proposal. A further 11 member jurisdictions had a legislative framework or other authority in force or published for consultation or proposal. See Financial Stability Board, OTC Derivatives Market Reforms Tenth Progress Report on Implementation (November 2015), available at <http://www.fsb.org/wp-content/uploads/OTC-Derivatives-10th-Progress-Report.pdf> (last visited on May 25, 2016).

⁷³ In November 2015, the Financial Stability Board reported that 18 member jurisdictions participating in its tenth progress report on OTC derivatives market reforms had in force standards or requirements covering more than 90% of transactions that require enhanced capital charges for non-centrally cleared transactions. A further

⁷⁰ See, e.g., G20 Leaders' Final Declaration (November 2011), paragraph 24, available at: <http://www.g20.utoronto.ca/2011/2011-cannes-declaration-111104-en.html> (last visited on May 25, 2016).

⁷¹ See Financial Stability Board, OTC Derivatives Market Reforms Tenth Progress Report on Implementation (November 2015), available at <http://www.fsb.org/wp-content/uploads/OTC-Derivatives-10th-Progress-Report.pdf> (last visited on May 25, 2016). The Financial Stability Board's report on a peer review of trade reporting confirmed that most Financial Stability Board member jurisdictions have trade reporting requirements in place. See Financial Stability Board, Thematic Review on OTC Derivatives Trade Reporting (November 2015), available at <http://www.fsb.org/wp-content/uploads/Peer-review-on-trade-reporting.pdf> (last visited on May 25, 2016).

has been limited progress in moving OTC derivatives onto organized trading platforms among G20 countries. The CFTC mandated the trading of certain interest rate swaps and index CDS on CFTC-regulated SEFs in 2014. Japan implemented a similar requirement for a subset of Yen-denominated interest rate swaps in September 2015. The European Union has adopted legislation that addresses trading OTC derivatives on regulated trading platforms, but has not mandated specific OTC derivatives to trade on these platforms. This legislation also should promote post-trade public transparency in OTC derivatives markets by requiring the price, volume, and time of derivatives transactions conducted on these regulated trading platforms to be made public in as close to real time as technically possible.⁷⁴

B. Economic Considerations

In the Regulation SBSR Adopting Release, the Commission highlighted certain overarching effects on the security-based swap market that it believes will result from the adoption of Regulation SBSR. These benefits could include, generally, improved market quality, improved risk management, greater efficiency, and improved oversight by the Commission and other relevant authorities.⁷⁵ Regulation SBSR requires market participants to make infrastructure investments in order to report security-based swap transactions to registered SDRs, and for SDRs to make infrastructure investments to receive and store that transaction data and to publicly disseminate transaction data in a manner required by Rule 902 of Regulation SBSR.

The amendments to Regulation SBSR being adopted today will, among other things, impose certain requirements on the platforms,⁷⁶ registered clearing

agencies, and registered SDRs that constitute infrastructure for the security-based swap market and provide services to counterparties who participate in security-based swap transactions. The adopted amendments and the guidance provided will affect the manner in which these infrastructure providers compete with one another and exercise market power over security-based swap counterparties. In turn, there will be implications for the security-based swap counterparties who utilize these infrastructure providers and the security-based swap market generally.

In addition, the Commission is adopting regulatory reporting and public dissemination requirements under Regulation SBSR for certain types of cross-border security-based swaps not currently addressed in Regulation SBSR. Subjecting additional types of security-based swaps to regulatory reporting and public dissemination will affect the overall costs and benefits associated with Regulation SBSR and have implications for transparency, competition, and liquidity provision in the security-based swap market.

1. Security-Based Swap Market Infrastructure

Title VII requires the Commission to create a new regulatory regime for the security-based swap market that, among other things, includes trade execution, central clearing, and reporting requirements aimed at increasing transparency and customer protection as well as mitigating the risk of financial contagion.⁷⁷ These new requirements, once implemented, might require market participants, who may have previously engaged in bilateral transaction activity without any need to engage third-party service providers, to interface with platforms, registered clearing agencies, and registered SDRs.

As a general matter, rules that require regulated parties to obtain services can have a material impact on the prices of those services in the absence of a competitive market for those services. In particular, if service providers are monopolists or otherwise have market power, requiring market participants to obtain their services can potentially allow the service providers to increase the profits that they earn from providing the required services.⁷⁸ Because Title VII requires the Commission to implement rules requiring market

participants to use the services provided by platforms,⁷⁹ registered clearing agencies,⁸⁰ and registered SDRs,⁸¹ these requirements could reduce the sensitivity of demand to changes in prices or quality of the services of firms that create and develop security-based swap market infrastructure. As such, should security-based swap infrastructure providers—such as platforms, registered clearing agencies, and registered SDRs—enjoy market power, they might be able to change their prices or service quality without a significant effect on demand for their services. In turn, these changes in prices or quality could have negative effects on activity in the security-based swap market.

As discussed in Section XIII, *infra*, the amendments to Regulation SBSR being adopted today could have an impact on the level of competition among suppliers of trade reporting services and affect the relative bargaining power of suppliers and consumers in determining the prices of those services. In particular, when the supply of trade reporting services is concentrated among a small number of firms, consumers of these services have few alternative suppliers from which to choose. Such an outcome could limit the incentives to produce more efficient trade reporting processes and services and could, in certain circumstances, result in less security-based swap transaction activity than would otherwise be optimal. In the case of security-based swap transaction activity, welfare losses could result from higher costs to counterparties for hedging financial or commercial risks.

2. Competition Among Security-Based Swap Infrastructure Providers

As noted above, the Commission recognizes how regulatory requirements may affect the demand for services provided by platforms, registered clearing agencies, and SDRs, and, in turn, the ability of these entities to exercise their market power. The Commission's economic analysis of the amendments adopted today considers how the competitive landscape for platforms, registered clearing agencies, and registered SDRs might affect the market power of these entities and hence the level and allocation of costs related to regulatory requirements. Some of the factors that may influence this competitive landscape have to do with the nature of trade reporting and are unrelated to regulation, while others

three member jurisdictions had a legislative framework or other authority in force and had adopted implementing standards or requirements that were not yet in force. An additional three member jurisdictions had a legislative framework or other authority in force or published for consultation or proposal. may be a result of, or influenced by, the rules that the Commission is adopting in this release. To the extent that the adopted rules inhibit competition among infrastructure providers, they could result in fees charged to counterparties that deviate from the underlying costs of providing services.

As a general matter, trade execution, clearing, and reporting services are likely to be concentrated among a small number of providers. For example, SDRs and clearing agencies must make significant infrastructure and human capital investments to enter their respective markets, but once these start-up costs are incurred, the addition of data management by SDRs or transaction clearing services by clearing agencies is likely to occur at low marginal costs. As a result, the per-transaction cost to provide infrastructure services quickly falls for SDRs and clearing agencies as their customer base grows, because they are able to amortize the fixed costs associated with serving counterparties over a larger number of transactions. These economies of scale would be expected to favor incumbent service providers who can leverage their market position to discourage entry by potential new competitors that face significant fixed costs to enter the market. As a result, the markets for clearing services and SDR services are likely to be dominated by a small number of firms that each have large market share, which is borne out in the current security-based swap market.⁸²

Competition among registered clearing agencies and registered SDRs could also be influenced by the fact that security-based swap market participants incur up-front costs for each connection that they establish with an SDR or clearing agency. If these costs are sufficiently high, an SDR or clearing agency could establish itself as an industry leader by “locking-in” customers who are unwilling or unable to make a similar investment for establishing a connection with a competitor.⁸³ An SDR or clearing

agency attempting to enter the market or increase market share would have to provide services valuable enough, or set fees low enough, to offset the costs of switching from a competitor. In this way, costs to security-based swap market participants of interfacing with market infrastructure could serve as a barrier to entry for firms that would like to provide market infrastructure services provided by SDRs and clearing agencies.

The rules adopted today might also influence the competitive landscape for firms that provide security-based swap market infrastructure. Fundamentally, requiring the reporting of security-based swap transactions to SDRs creates an inelastic demand for reporting services that would not be present if not for regulation. This necessarily reduces a counterparty’s ability to bargain with infrastructure service providers over price or service because the option of not reporting is unavailable. Moreover, infrastructure requirements imposed by Title VII regulation will increase the fixed costs of an SDR operating in the security-based swap market and increase the barriers to entry into the market, potentially discouraging firms from entering the market for SDR services. For example, under Rule 907, as adopted, registered SDRs are required to establish and maintain certain written policies and procedures. The Commission estimated that this requirement will impose initial costs on each registered SDR of approximately \$12,250,000.⁸⁴

The rules adopted today might also affect the competitive landscape by increasing the incentives for security-based swap infrastructure service providers to integrate horizontally or vertically. As a general matter, firms engage in horizontal integration when they expand their product offerings to include similar goods and services or to acquire competitors. For example, swap data repositories that presently serve the swap market might horizontally integrate by offering similar services in the security-based swap market. Firms vertically integrate by entering into businesses that supply the market that they occupy (“backward vertical integration”) or by entering into businesses that they supply (“forward vertical integration”).

market participants. This is because, in a competitive market with free entry and exit of firms, a firm that charges a price that is higher than marginal cost would lose sales to existing firms or entrants that are willing to provide the same service at a lower price. Such price competition prevents firms from charging prices that are above marginal costs.

⁸⁴ See Regulation SBSR Adopting Release, 80 FR at 14718, n. 1343.

As discussed in more detail in Section XIII(A), *infra*, while adopting a reporting methodology that assigns reporting responsibilities to registered clearing agencies, which will hold the most complete and accurate information for cleared transactions, could minimize potential data discrepancies and errors, rules that give registered clearing agencies discretion over where to report transaction data could provide incentives for registered clearing agencies to create affiliate SDRs and compete with other registered SDRs for post-trade reporting services. The cost to a clearing agency of entering the market for SDR services is likely to be low, given that many of the infrastructure requirements for entrant SDRs are shared by clearing agencies. Clearing agencies already have the infrastructure necessary for capturing transaction records from clearing members and might be able to leverage that preexisting infrastructure to provide services as an SDR at lower incremental cost than other new SDRs. Because all clearing transactions, like all other security-based swaps, must be reported to a registered SDR, there would be a set of potentially captive transactions that clearing agencies could initially use to vertically integrate into SDR services.⁸⁵

Entry into the SDR market by registered clearing agencies could potentially lower the cost of SDR services if clearing agencies are able to transmit data to an affiliated SDR at a lower cost relative to transmitting the same data to an independent SDR. The Commission believes that this is likely to be true for clearing transactions, given that the clearing agency and the affiliated SDR would have greater control over the reporting process relative to sending clearing transaction data to an independent SDR. Even if registered clearing agencies did not enter the market for SDR services, their ability to pursue a vertical integration strategy could motivate incumbent SDRs to offer competitive service models.

However, the Commission recognizes that the entry of clearing-agency-affiliated SDRs might not necessarily result in increased competition among SDRs or result in lower costs for SDR services. In an environment where registered clearing agencies with affiliated SDRs have discretion to send their clearing transaction data to their

⁸⁵ A registered clearing agency expanding to provide SDR services is an example of forward vertical integration. In the context of the rules adopted today, SDRs “consume” the data supplied by registered clearing agencies. Clearing agencies engage in forward vertical integration by creating or acquiring the SDRs that consume the data that they produce as a result of their clearing business.

⁸² See *supra* Section II(A).

⁸³ See Joseph Farrell and Paul Klemperer, “Coordination and Lock-in: Competition with Switching Costs and Network Effects,” in *Handbook of Industrial Organization*, Mark Armstrong and Robert Porter (ed.) (2007), at 1972. The authors describe how switching costs affect entry, noting that, on one hand, “switching costs hamper forms of entry that must persuade customers to pay those costs” while, on the other hand, if incumbents must set a single price for both new and old customers, a large incumbent might focus on harvesting its existing customer base, ceding new customers to the entrant. In this case, a competitive market outcome would be characterized by prices for services that equal the marginal costs associated with providing services to

affiliates, security-based swap market participants who wish to submit their transactions to clearing may have reduced ability to direct the reporting of the clearing transaction to an independent SDR. As a result, clearing-agency-affiliated SDRs would not directly compete with independent SDRs on the basis of price or quality, because they inherit their clearing agency affiliate's market share. This might allow clearing agency incumbents to exercise market power through their affiliated SDRs relative to independent SDRs.

3. Security-Based Swaps Trading by Non-U.S. Persons Within the United States

Several broad economic considerations have informed the Commission's approach to identifying transactions between two non-U.S. persons that should be subject to certain Title VII requirements. The Commission has taken into account the potential impact that rules already adopted as part of the Regulation SBSR Adopting Release might have on competition between U.S. persons and non-U.S. persons when they engage in security-based swap transactions with non-U.S. persons, along with the implications of these competitive frictions for the ability of market participants to obtain liquidity in a market that is predominantly over-the-counter. In particular, competitive disparities could arise between U.S. dealing entities and foreign dealing entities⁸⁶ using personnel located in a U.S. branch or office when serving unregistered non-U.S. counterparties. In the absence of the rules adopted today, U.S. dealing entities and their agents would bear the costs associated with regulatory reporting and public dissemination requirements when trading with unregistered non-U.S. counterparties, while foreign dealing entities that use U.S.-based personnel to trade with the same unregistered non-U.S. counterparties would not bear such regulatory costs if these foreign dealing entities are not subject to comparable regulatory requirements in their home jurisdictions. Thus, these foreign dealing entities could offer liquidity at a lower cost to unregistered non-U.S.

⁸⁶ Throughout this release, a "dealing entity" refers to an entity that engages in security-based swap dealing activity regardless of whether the volume of such activity exceeds the *de minimis* threshold established by the Commission that would cause the entity to be a "security-based swap dealer" and thus require the entity to register with the Commission as a security-based swap dealer.

persons thereby gaining a competitive advantage over U.S. dealing entities.

Competitive disparities could also arise between U.S. persons and non-U.S. persons that trade with foreign dealing entities that use U.S. personnel to arrange, negotiate, or execute security-based swap transactions.⁸⁷ A transaction between an unregistered U.S. person and a foreign dealing entity that uses U.S. personnel to arrange, negotiate, or execute the transaction is subject to regulatory reporting and public dissemination under existing Rule 908(a)(1)(i). In the absence of newly adopted Rule 908(a)(1)(v), a transaction between an unregistered non-U.S. person and the foreign dealing entity engaging in ANE activity would not be subject to Regulation SBSR. This could create a competitive advantage for unregistered non-U.S. persons over similarly situated U.S. persons when unregistered non-U.S. persons trade with foreign dealing entities that engage in ANE activity. Such a foreign dealing entity might be able to offer liquidity to an unregistered non-U.S. person at a lower price than to an unregistered U.S. person, because the foreign dealing entity that is engaging in ANE activity would not have to embed the potential costs of regulatory reporting and public dissemination into the price offered to the unregistered non-U.S. counterparty. By contrast, the price offered by that foreign dealing entity to an unregistered U.S. counterparty likely would reflect these additional costs.

The Commission acknowledges, however, that applying Title VII rules based on the location of personnel who engage in relevant conduct could provide incentives for these foreign dealing entities to restructure their operations to avoid triggering requirements under Regulation SBSR. For example, a foreign dealing entity could restrict its U.S. personnel from intermediating transactions with non-U.S. persons or use agents who are located outside the United States when engaging in security-based swap transactions with non-U.S. persons.

⁸⁷ Throughout this release, a security-based swap transaction involving a non-U.S.-person counterparty that, in connection with its dealing activity, has arranged, negotiated, or executed using its personnel located in a U.S. branch or office, or the personnel of its agent located in a U.S. branch or office, is referred to as an "ANE transaction"; the arrangement, negotiation, and/or execution of such a security-based swap by personnel of a non-U.S. person located in a U.S. branch or office, or by the personnel of its agent located in a U.S. branch or office are referred to as "ANE activities" or "engaging in ANE activity"; and the personnel located in the U.S. branch or office of the foreign dealing entity, or (if applicable) the personnel of its agent located in a U.S. branch or office, are referred to as "U.S. personnel."

In addition, disparate treatment of transactions depending on whether they are arranged, negotiated, or executed by personnel located in a U.S. branch or office could create fragmentation among agents that may seek to provide services to foreign dealing entities. To the extent that using agents with personnel located in a U.S. branch or office might result in regulatory costs being imposed on foreign dealing entities, such entities might prefer and primarily use agents located outside the United States, while U.S. dealers might continue to use agents located in the United States.

III. Reporting by Registered Clearing Agencies

A. Background

Section 13(m)(1)(F) of the Exchange Act⁸⁸ provides that parties to a security-based swap (including agents of parties to a security-based swap) shall be responsible for reporting security-based swap transaction information to the appropriate registered entity in a timely manner as may be prescribed by the Commission. Section 13(m)(1)(G) of the Exchange Act⁸⁹ provides that each security-based swap (whether cleared or uncleared) shall be reported to a registered SDR. Section 13A(a)(3) of the Exchange Act⁹⁰ specifies the party obligated to report a security-based swap that is not accepted for clearing by any clearing agency or derivatives clearing organization. To implement these statutory provisions, the Commission in February 2015 adopted Rule 901(a) of Regulation SBSR, which designates the persons who must report all security-based swaps except: (1) Clearing transactions;⁹¹ (2) security-based swaps that are executed on a platform and that will be submitted to clearing; (3) transactions where there is no U.S. person, registered security-based swap dealer, or registered major security-based swap participant on either side; and (4) transactions where there is no registered security-based swap dealer or registered major security-based swap participant on either side and there is a U.S. person on only one

⁸⁸ 15 U.S.C. 78m(m)(1)(F).

⁸⁹ 15 U.S.C. 78m(m)(1)(G).

⁹⁰ 15 U.S.C. 78m-1(a)(3).

⁹¹ Rule 900(g) defines "clearing transaction" as "a security-based swap that has a registered clearing agency as a direct counterparty." This definition describes security-based swaps that arise when a registered clearing agency accepts a security-based swap for clearing as well as security-based swaps that arise as part of a clearing agency's internal processes, including those used to establish prices for cleared products and those resulting from netting other clearing transactions of the same product in the same account into a new open position. See Regulation SBSR Adopting Release, 80 FR at 14599.

side (“covered transactions”). This section addresses reporting duties for clearing transactions—*i.e.*, the security-based swaps in category (1) above.⁹²

1. Clearing Process for Security-Based Swaps

As discussed in the Regulation SBSR Adopting Release and the Regulation SBSR Proposed Amendments Release, two models of clearing—an agency model and a principal model—are currently used in the swap markets.⁹³ In the agency model, which predominates in the United States, a swap that is submitted to clearing—typically referred to in the industry as an “alpha”—is, if accepted by the clearing agency, terminated and replaced with two new swaps, known as the “beta” and “gamma.” One of the direct counterparties⁹⁴ to the alpha becomes a direct counterparty to the beta, the other direct counterparty to the alpha becomes a direct counterparty to the gamma, and the clearing agency becomes a direct counterparty to each of the beta and the gamma.⁹⁵ This release uses the terms “alpha,” “beta,” and “gamma” in the same way that the Commission understands they are used in the agency model of clearing in the U.S. swap market. As noted in the Regulation SBSR Adopting Release, an alpha is not a “clearing transaction”

⁹² Security-based swaps in category (2) are discussed in Section IV, *infra*. Security-based swaps in categories (3) and (4) are discussed in Section IX, *infra*.

⁹³ See Regulation SBSR Adopting Release, 80 FR at 14599; Regulation SBSR Proposed Amendments Release, 80 FR at 14742–43.

⁹⁴ Existing Rule 900(k) defines “direct counterparty” as “a person that is a primary obligor on a security-based swap.”

⁹⁵ If both direct counterparties to the alpha are clearing members, the direct counterparties would submit the transaction to the clearing agency directly and the resulting beta would be between the clearing agency and one clearing member, and the gamma would be between the clearing agency and the other clearing member. The Commission understands, however, that, if the direct counterparties to the alpha are a clearing member and a non-clearing member (a “customer”), the customer’s side of the trade would be submitted for clearing by a clearing member acting on behalf of the customer. When the clearing agency accepts the alpha for clearing, one of the resulting swaps—in this case, assume the beta—would be between the clearing agency and the customer, with the customer’s clearing member acting as guarantor for the customer’s trade. The other resulting swap—the gamma—would be between the clearing agency and the clearing member that was a direct counterparty to the alpha. See, e.g., Byungkwon Lim and Aaron J. Levy, “Contractual Framework for Cleared Derivatives: The Master Netting Agreement Between a Clearing Customer Bank and a Central Counterparty,” 10 Pratt’s J. of Bankr. Law 509, 515–517 (LexisNexis A.S. Pratt) (describing the clearing model for swaps in the United States); LCH.Clearnet Letter at 2 (generally concurring with the Commission’s depiction of the agency model of clearing).

under Regulation SBSR, even though it is submitted for clearing, because it does not have a registered clearing agency as a direct counterparty.⁹⁶

2. Proposed Rules and General Summary of Comments

In the Regulation SBSR Proposed Amendments Release, the Commission proposed a new paragraph (a)(2)(i) of existing⁹⁷ Rule 901(a), which would designate a registered clearing agency as the reporting side for all clearing transactions to which it is a counterparty. In its capacity as the reporting side, the registered clearing agency would be permitted to select the registered SDR to which it reports.⁹⁸

The Commission also proposed certain rules that would specify the reporting requirements for life cycle events attendant to the clearing process. The determination by a registered clearing agency of whether or not to accept an alpha for clearing is a life cycle event of the alpha.⁹⁹ Existing

⁹⁶ See 80 FR at 14599. This release does not address the application of Section 5 of the Securities Act of 1933, 15 U.S.C. 77a *et seq.* (“Securities Act”), to security-based swap transactions that are intended to be submitted to clearing (*i.e.*, alphas, in the agency model of clearing). Rule 239 under the Securities Act, 17 CFR 230.239, provides an exemption for certain security-based swap transactions involving an eligible clearing agency from all provisions of the Securities Act, other than anti-fraud provisions of Section 17(a) of the Securities Act. This exemption does not apply to security-based swap transactions not involving an eligible clearing agency, including a transaction that is intended to be submitted to clearing, regardless of whether the security-based swaps subsequently are cleared by an eligible clearing agency. See Exemptions for Security-Based Swaps Issued By Certain Clearing Agencies, Securities Act Release No. 33–9308 (March 30, 2012), 77 FR 20536 (April 5, 2012).

⁹⁷ Throughout this release, the Commission distinguishes “existing” provisions of Regulation SBSR—*i.e.*, provisions of Regulation SBSR that the Commission adopted in the Regulation SBSR Adopting Release in February 2015—from provisions that the Commission is adopting in this release.

⁹⁸ See Regulation SBSR Proposed Amendments Release, 80 FR at 14746–47.

⁹⁹ See *id.*, 80 FR at 14746, 14748. A life cycle event is, with respect to a security-based swap, any event that would result in a change in the information reported to a registered security-based swap data repository under Rule 901(c), 901(d), or 901(i), including an assignment or novation of the security-based swap; a partial or full termination of the security-based swap; a change in the cash flows originally reported; for a security-based swap that is not a clearing transaction, any change to the title or date of any master agreement, collateral agreement, margin agreement, or any other agreement incorporated by reference into the security-based swap contract; or a corporate action affecting a security or securities on which the security-based swap is based (*e.g.*, a merger, dividend, stock split, or bankruptcy). Notwithstanding the above, a life cycle event shall not include the scheduled expiration of the security-based swap, a previously described and anticipated interest rate adjustment (such as a quarterly interest rate adjustment), or other event

paragraph (i) of Rule 901(e)(1) generally requires the reporting side for a security-based swap to report a life cycle event of that security-based swap, “except that the reporting side shall not report whether or not a security-based swap has been accepted for clearing.” Under existing Rule 901(e)(2), a life cycle event must be reported “to the entity to which the original security-based swap transaction was reported.” In the Regulation SBSR Proposed Amendments Release, the Commission proposed a new paragraph (ii) of Rule 901(e)(1) that would require a registered clearing agency to report to the registered SDR that received or will receive the transaction report of the alpha (the “alpha SDR”) whether or not it has accepted an alpha security-based swap for clearing.¹⁰⁰ The Commission also proposed to amend the definition of “participant” in existing Rule 900(u) to include a registered clearing agency that is required to report whether or not it accepts an alpha for clearing.¹⁰¹

If the registered clearing agency does not know the identity of the alpha SDR, the registered clearing agency would be unable to report to the alpha SDR whether or not it accepted the alpha transaction for clearing, as required by proposed Rule 901(e)(1)(ii). Therefore, the Commission proposed a new paragraph (3) of Rule 901(a), which would require the platform or reporting side for a security-based swap that has been submitted to clearing to promptly provide the relevant registered clearing agency with the identity of the alpha SDR and the transaction ID of the alpha transaction that will be or has been submitted to clearing.¹⁰²

The Commission requested and received comment on a wide range of issues related to these proposed amendments. Four commenters generally supported the Commission’s proposal to require the registered clearing agency to report clearing transactions and to allow it to select the SDR to which it reports.¹⁰³ One of these commenters noted that a clearing agency is “the sole party who holds the complete and accurate record of transactions and positions” for clearing transactions.¹⁰⁴ Another commenter

that does not result in any change to the contractual terms of the security-based swap. See 17 CFR 242.900(q).

¹⁰⁰ See Regulation SBSR Proposed Amendments Release, 80 FR at 14748.

¹⁰¹ See *id.* at 14751.

¹⁰² See *id.* at 14748.

¹⁰³ See LCH.Clearnet Letter at 3; Better Markets Letter at 2; ISDA/SIFMA Letter at 24; ICE Letter at 1, 5.

¹⁰⁴ ICE Letter at 1, 3 (arguing that no person other than a clearing agency has complete information

agreed, noting that alternative reporting workflows “could require a person who does not have information about [a] clearing transaction at the time of its creation to report that transaction.”¹⁰⁵ The commenter expressed the view that the Commission’s proposal for reporting clearing transactions “is simple in that the same party in each and every transaction will be the party with the reporting requirement,” and that this approach would eliminate confusion “as to who has the obligation to report the initial trades and different life-cycle events.”¹⁰⁶ Two commenters expressed the view that clearing agencies can leverage existing reporting processes and the existing infrastructure that they have in place with market participants and vendors to report clearing transactions.¹⁰⁷ A third commenter observed that requiring clearing agencies to report clearing transactions would be “efficient, cost effective and promote[] global data consistency,” because clearing agencies already report transactions under swap data reporting rules established by the CFTC and certain foreign jurisdictions, such as the European Union and Canada.¹⁰⁸

However, one commenter opposed assigning the reporting duty to the registered clearing agency, arguing instead that the reporting side for the alpha transaction should be the reporting side for any subsequent clearing transactions.¹⁰⁹ Another commenter expressed support for the Commission’s proposal to require registered clearing agencies to report betas and gammas, but disagreed with the Commission’s proposal to permit registered clearing agencies to choose the registered SDR that receives these reports.¹¹⁰

B. Discussion and Final Rules

After careful consideration of the comments, the Commission is adopting paragraph (2)(i) of Rule 901(a) as proposed. As a result, a registered clearing agency is the reporting side for all clearing transactions to which it is a counterparty.¹¹¹ In its capacity as the

about beta and gamma security-based swaps and that the reporting hierarchy in Rule 901(a)(2)(ii) is not suitable for reporting clearing transactions).

¹⁰⁵ Better Markets Letter at 4.

¹⁰⁶ *Id.* at 2.

¹⁰⁷ See ICE Letter at 5; LCH.Clearnet Letter at 8.

¹⁰⁸ ISDA/SIFMA Letter at 24.

¹⁰⁹ See Markit Letter at 2–3.

¹¹⁰ See DTCC Letter at 5–6.

¹¹¹ In its capacity as a reporting side, a registered clearing agency must report all of the primary trade information and secondary trade information required by existing Rules 901(c) and 901(d), respectively, for each security-based swap to which it is a counterparty. See *infra* Section III(F)

reporting side, the registered clearing agency is permitted to select the registered SDR to which it reports.

The Commission believes that, because a registered clearing agency creates the clearing transactions to which it is a counterparty, the registered clearing agency is in the best position to provide complete and accurate information to a registered SDR about the clearing transactions resulting from the security-based swaps that it clears. Two commenters noted that swap clearing agencies currently report clearing transactions to CFTC-registered swap data repositories, thus evidencing their ability to report clearing transactions.¹¹² The Commission’s determination to assign to registered clearing agencies the duty to report clearing transactions should promote efficiency in the reporting process under Regulation SBSR by leveraging these existing workflows.

In the Regulation SBSR Proposed Amendments Release, the Commission considered three alternatives to requiring the clearing agency to report clearing transactions: (1) Utilize the reporting hierarchy in existing Rule 901(a)(2)(ii); (2) modify that reporting hierarchy to place registered clearing agencies above other non-registered persons, but below registered security-based swap dealers and major security-based swap participants; and (3) require the reporting side of the alpha to report both the beta and the gamma.¹¹³ The Commission assessed each alternative and expressed the preliminary view that none would be as efficient and reliable as assigning the reporting duty to the registered clearing agency.¹¹⁴ The Commission noted that each of the three alternatives could place the duty to report the clearing transaction on a person who does not have information about the clearing transaction at the time of its creation; to discharge its duty, this person would have to obtain necessary transaction information from the registered clearing agency or from a counterparty to the registered clearing agency.¹¹⁵

One commenter urged the Commission to adopt Alternative 3—*i.e.*, to designate the reporting side for

(discussing the UICs that a registered clearing agency must report).

¹¹² See ICE Letter at 5; LCH.Clearnet Letter at 8.

The Commission notes that the CFTC has adopted rules that would impose reporting responsibilities on these clearing agencies similar to those that the Commission is adopting today. See Amendments to Swap Data Recordkeeping and Reporting Requirements for Cleared Swaps, Final Rule, 80 FR 41736 (June 27, 2016).

¹¹³ See 80 FR at 14745–46.

¹¹⁴ See *id.*

¹¹⁵ See *id.*, 80 FR at 14746.

the alpha as the reporting side for the beta and gamma.¹¹⁶ The commenter stated that the non-clearing-agency counterparties to the beta and gamma will always obtain information regarding their clearing transactions as a part of the clearing process.¹¹⁷ The commenter suggested, therefore, that Alternative 3 would not result in unnecessary data transfers prior to reporting. In support of Alternative 3, the commenter noted that an alpha counterparty could rely on a “middleware reporting agent [who] could perform all steps necessary to report an alpha transaction as well as the associated beta and gamma security-based swaps in a matter of seconds, while a clearing agency could, at best, perform only the last two steps.”¹¹⁸ Furthermore, while endorsing Alternative 3, the commenter also believed that Alternatives 1 and 2 would be preferable to the Commission’s proposed approach.¹¹⁹

Finally, the commenter suggested a fourth alternative to address the concern of an alpha counterparty having to report a clearing transaction to which it is not a counterparty. The commenter suggested that “the platform would remain the reporting side for all platform-executed trades while for bilateral or off platform cleared transactions, the reporting side would be the clearing agency. However, the clearing agency would be required to submit beta and gamma trade records to the alpha SDR (which would be determined by the alpha trade reporting side and not the clearing agency).”¹²⁰

The Commission believes that assigning reporting duties for clearing transactions to registered clearing agencies will be more efficient and reliable than any of the alternatives discussed in the Regulation SBSR Proposed Amendments Release or

¹¹⁶ See Markit Letter at 13.

¹¹⁷ See *id.* at 5, 13. The commenter stated that a clearing agency “must, as a matter of course, send the cleared SBS trade record straight through to the sides of the trade or, if relevant, any non-affiliated reporting side (*e.g.*, the platform or reporting agent). In other words, for the clearing agency to transmit a message indicating that a trade has or has not been accepted for clearing (a necessary last step to conclude cleared transactions between the clearinghouse and the parties to the beta and gamma trades) there is no ‘extra step.’” *Id.* at 5.

¹¹⁸ *Id.* at 7 (also stating that the interconnectedness of the middleware provider makes it “better able to ensure the accuracy of trade records and the linkage between alpha, beta, and gamma trade records”).

¹¹⁹ See *id.* at 13 (“these other alternatives, relative to the Proposal, encourage competition based on quality of service and cost and the rule of reporting agents and are more likely to result in outcomes whereby the same SDR will receive alpha, beta, and gamma trades”).

¹²⁰ *Id.*

raised by the commenter. Because each of these alternatives could assign the reporting duty to a person who does not have information about the clearing transaction at the time of its creation, the person with the reporting duty would have to rely on the clearing agency, directly or indirectly, to provide it with the information to be reported:

- Alternative 1 would be to utilize the existing reporting hierarchy in Regulation SBSR. Since a registered clearing agency is not a registered security-based swap dealer or registered major security-based swap participant, it would occupy the lowest rung in the hierarchy. Therefore, in any clearing transaction between a registered clearing agency and a registered security-based swap dealer or registered major security-based swap participant, the registered security-based swap dealer or registered major security-based swap participant would incur the reporting duty. However, the registered security-based swap dealer or registered major security-based swap participant would be dependent on the registered clearing agency to supply the information that must be reported.¹²¹

- Alternative 2 is similar to Alternative 1 in that the registered security-based swap dealer or registered major security-based swap participant with the reporting duty would be dependent on the registered clearing agency to supply the information that would be reported.

- Alternative 3 would designate the reporting side for the alpha as the reporting side for the beta and gamma. Under this alternative, the alpha reporting side would need to obtain information from the clearing agency to report its own clearing transaction. The alpha reporting side also would need to obtain, either from the non-reporting side or from the registered clearing agency, information about the clearing transaction of the alpha's non-reporting side. The Commission believes that Alternative 3 would be difficult to implement operationally and could create confidentiality concerns, because it does not offer a mechanism for

reporting of subsequent clearing positions created by the registered clearing agency in the account of the non-reporting side of the alpha.¹²²

- Under the fourth alternative,¹²³ while the Commission concurs with the approach of requiring the registered clearing agency to report the resulting beta and gamma transactions, the Commission believes that the registered clearing agency, when it has the duty to report security-based swaps, should be able to choose the registered SDR to which it reports.¹²⁴

In general, the Commission believes that Regulation SBSR should not assign reporting obligations to persons who lack direct access to the information necessary to make the report. With respect to clearing transactions, a person who lacked direct access to the necessary information would be obligated to obtain the information from the clearing agency or another party who has access to that information to discharge its reporting duties. Placing the reporting duty on the non-clearing-agency side would create additional reporting steps and each extra reporting step could introduce some possibility for discrepancy, error, or delay. The Commission believes that discrepancies, errors, and delays are less likely to occur if the duty to report clearing transactions is assigned to registered clearing agencies directly, because there would be no intermediate steps where data would have to be transferred between parties before it is sent to a registered SDR. Therefore, the Commission is adopting Rule 901(a)(2)(i) as proposed. A registered clearing agency has complete information about all clearing transactions to which it is a counterparty. This includes not only betas and gammas that arise from clearing alphas, but also security-based

swaps that result from the clearing agency netting together betas and gammas of the same person in the same product to create new open positions in successive netting cycles. Under the alternatives discussed above, a person other than the registered clearing agency would have to obtain information from the clearing agency to report the clearing transactions—not just once, to report the initial beta and gamma, but potentially with every netting cycle of the registered clearing agency. This further increases the risks that there could be discrepancies, errors, or delays in reporting new clearing transactions as they are created.

The commenter who endorsed Alternative 3 also argued that “[t]he Proposal’s failure to acknowledge the efficiency benefits and reduced costs that result from the presence of middleware reporting agents is a serious defect.”¹²⁵ To the contrary, the Commission has considered the potential economic effects of new Rule 901(a)(2)(i) and the alternatives noted above, including the role that agents might play in reporting security-based swap transactions under these different alternatives.¹²⁶ The Commission notes that, while Regulation SBSR permits the use of agents to carry out reporting duties, it does not require the use of an agent.

C. Choice of Registered SDR for Clearing Transactions

In the Regulation SBSR Proposed Amendments Release, the Commission considered whether, if a registered clearing agency is assigned the duty to report clearing transactions, the clearing agency should be permitted to choose the registered SDR to which it reports or whether it should be required to report them to the alpha SDR.¹²⁷ The Commission proposed to allow a registered clearing agency to choose the registered SDR to which it reports clearing transactions.¹²⁸ The Commission recognized that this approach might result in beta and gamma security-based swaps being reported to a registered SDR other than

¹²¹ For any clearing transaction between a registered clearing agency and a non-registered person that is not guaranteed by a registered security-based swap dealer or registered major security-based swap participant, the reporting hierarchy in existing Rule 901(a)(2)(i) would require the sides to select the reporting side. In these circumstances, it is likely that the counterparties would select the registered clearing agency as the reporting side for the clearing transactions. Assigning the duty to report clearing transactions directly to the clearing agency is consistent with the Commission’s objective of minimizing the possibility that the reporting obligation would be imposed on a non-registered counterparty. See Regulation SBSR Adopting Release, 80 FR at 14598.

¹²² Assume, under Alternative 3, that P and Q execute a security-based swap (S1) and submit it to a registered clearing agency (CA). P is the reporting side of the S1 alpha. When CA accepts the alpha for clearing, P would then have to report the beta between P and CA and the gamma between Q and CA (gamma1). Further assume that Q executes a second transaction (S2) in the same product as S1 with R, and that R is the reporting side for S2. If CA accepts S2 for clearing, R then must report the beta between R and CA and the gamma between Q and CA (gamma2). In its next netting cycle, CA nets together gamma1 and gamma2 to create a new security-based swap representing the net open position (NOP) of Q in that product. Under Alternative 3, it is unclear who should report NOP as between P and R, because NOP is a security-based swap resulting from the netting of security-based swaps involving both P and R. Furthermore, Q likely will not want P or R to know of its additional activity in that product with other counterparties.

¹²³ See Markit Letter at 13.

¹²⁴ See *infra* Section III(C).

¹²⁵ Markit Letter at 8. See also *id.* at 6 (“The Proposal ignores the efficiency gains resulting from the presence of middleware reporting agents in the market for SDR and post-trade processing services despite noting such benefits in the Regulation SBSR Final Rule”) and 8 (“The efficiency benefits introduced by the presence of middleware reporting agents, if they were properly accounted for by the Commission . . . would have provided additional and, in our opinion, decisive support to the three alternative approaches described by the Commission”).

¹²⁶ See *infra* Sections XIII(A) and (B).

¹²⁷ See 80 FR at 14746–47.

¹²⁸ See *id.*

the alpha SDR, thereby requiring the Commission to link these trades together across SDRs.¹²⁹

Some commenters supported the Commission's proposal to allow the registered clearing agency to select the registered SDR to which it reports.¹³⁰ Other commenters, however, recommended that the Commission require the registered clearing agency to report the beta and gamma transactions to the alpha SDR.¹³¹ These commenters generally believed that requiring beta and gamma security-based swaps to be reported to the alpha SDR would reduce data fragmentation and enhance the Commission's ability to obtain a complete and accurate understanding of the security-based swap market.¹³²

One commenter endorsed the view that clearing should be considered a life cycle event of the alpha transaction, and that the clearing agency should be required to report the termination of the alpha, as well as the beta and gamma, to the alpha SDR.¹³³ In this commenter's view, "[m]aintaining all records related to an alpha trade in a single SB SDR will help to ensure that regulators are able to efficiently access and analyze all reports related to an SB swap regardless of where or how the transaction was executed and whether it is cleared."¹³⁴

Another commenter noted that, in its experience with CFTC swap data reporting rules, clearing agencies "generally send beta and gamma records to an affiliated SDR" even though other market participants generally prefer using an SDR not affiliated with the clearing agency.¹³⁵ In this commenter's view, clearing agencies do not "provide services or fees that make them competitive as SDRs for all swap trade records."¹³⁶ The commenter believed that the Commission's proposed approach would result in tying of clearing services to SDR services and create a market for SDR and post-trade

processing services that is unresponsive to market forces.¹³⁷ The commenter also stated that "middleware reporting agents can offer an even lower price" than registered clearing agencies for reporting beta and gamma transactions.¹³⁸

Regulation SBSR generally allows the person with a duty to report to choose the registered SDR to which it reports.¹³⁹ This approach is designed to promote efficiency by allowing the person with the reporting duty to select the registered SDR based on greatest ease of use, the lowest fees, or other factors that are relevant to the person with whom the duty rests. As noted in the Regulation SBSR Adopting Release, a clearing transaction is an independent security-based swap and not a life cycle event of an alpha security-based swap that is submitted to clearing.¹⁴⁰ Under Rule 901(a)(2)(i), as adopted herein, a registered clearing agency is the reporting side for all clearing transactions to which it is a counterparty; because the registered clearing agency has the duty to report, it also has the ability to choose the registered SDR. The Commission considered requiring the registered clearing agency to report the beta and gamma to the alpha SDR. But had the Commission done so, the registered clearing agency would be required to report clearing transactions to a registered SDR that might not offer the clearing agency what it believes to be the most efficient or convenient means of discharging its reporting duty, as others with a reporting duty are permitted to do. As noted in Section XIII(A), *infra*, a clearing agency may be able to realize efficiency gains through vertical integration of clearing and SDR services and may choose to use an

affiliated SDR. However, if an independent SDR or middleware reporting agent offers a competitive service model that provides a clearing agency with a duty to report a more efficient or cost-effective means of fulfilling its reporting obligations, the registered clearing agency may choose to use those instead.

One commenter expressed the view that requiring the beta and gamma to be reported to the alpha SDR would help to ensure that regulators are able to efficiently access and analyze all reports related to a security-based swap.¹⁴¹ The commenter also stated that a clearing agency will need to incur costs to establish connections with alpha SDRs for purposes of reporting whether or not the clearing agency has accepted the alpha for clearing.¹⁴² The commenter cautioned, furthermore, that "[t]he proposed process assumes that, in all instances, the transaction ID provided to the clearing agency would be accurate."¹⁴³ The commenter stated that only the alpha SDR would be able to ascertain whether the alpha transaction ID is valid based on its existing inventory.¹⁴⁴ The commenter concluded that, "[r]ather than establishing a complex reporting process for clearing transactions and potentially introducing data quality issues . . . the Commission [should] consider preservation of high quality data and ready access to a full audit trail as the paramount concerns that should govern the choice of SB SDR for clearing transactions."¹⁴⁵ Finally, the commenter questioned the ease with which the Commission would be able to track related transactions across SDRs through the transaction ID, stating that "the Commission would likely be forced to expend significant resources harmonizing data sets from multiple SDRs, thereby hindering the Commission's ready access to a comprehensive audit trail."¹⁴⁶

The Commission has considered the commenter's arguments but continues to believe that it is appropriate to allow a registered clearing agency to choose the registered SDR to which it reports. Although the commenter is correct that Regulation SBSR will require a

¹³⁷ See *id.* at 2–3, 12 (stating that, if a registered clearing agency is permitted to choose the registered SDR to which it reports clearing transactions, the clearing agency "can more easily leverage a dominant clearing agency position to gain a dominant SDR position by selecting an affiliated SDR as its SDR of choice for beta and gamma trades").

¹³⁸ See *id.* at 4, 7–8 (noting that, "[i]n contrast to currently registered SBS clearing agencies . . . middleware reporting agents, such as MarkitSERV, are connected to numerous trade repositories globally and have achieved economies of scale with respect to the straight-through processing of cleared swaps across numerous clearinghouses and regulatory reporting regimes").

¹³⁹ See Regulation SBSR Adopting Release, 80 FR at 14597–98 ("The reporting side may select the registered SDR to which it makes the required report").

¹⁴⁰ See 80 FR at 14599, n. 291. However, the determination by a registered clearing agency of whether or not to accept the alpha for clearing is a life cycle event of the alpha transaction. As discussed above, new Rule 901(e)(1)(ii) requires a registered clearing agency to report these life cycle events to the alpha SDR.

¹⁴¹ See DTCC Letter at 4. See also Markit Letter at 13 (raising as an alternative to the Commission's proposed approach that the Commission should require a clearing agency to report the beta and gamma to the alpha SDR).

¹⁴² See DTCC Letter at 5.

¹⁴³ *Id.* The commenter added that it has encountered issues under the CFTC's swap reporting framework when transaction IDs have been reported inconsistently for the same trade. See *id.*

¹⁴⁴ See *id.*

¹⁴⁵ *Id.*

¹⁴⁶ *Id.*

¹²⁹ See *id.*

¹³⁰ See ICE Letter at 1; LCH.Clearnet Letter at 3; ISDA/SIFMA Letter at 24.

¹³¹ See Better Markets Letter at 2, 4–5 ("we are concerned that allowing the clearing agency to report data to a different SDR than the one to which the initial alpha trade was reported could cause potential complications, such as double-counting or bifurcated data"); DTCC Letter at 2, 6; Markit Letter at 6.

¹³² See *id.* See also DTCC Letter at 5 (predicting that the Commission "would encounter various implementation challenges" in linking alpha security-based swaps to the associated beta and gamma transactions that had been reported to different SDRs because SDRs might "store, maintain, and furnish data to regulators in formats different from other trade repositories").

¹³³ See DTCC Letter at 4, 6.

¹³⁵ Markit Letter at 6.

¹³⁶ *Id.*

registered clearing agency to report to the alpha SDR whether or not the clearing agency accepts the alpha for clearing, this does not necessarily mean that the clearing agency would find it more efficient or convenient to make initial (and life cycle event) reports of clearing transactions to the alpha SDR. Betas, gammas, and transactions that arise from subsequent clearing cycles are independent security-based swaps. It is possible that a registered clearing agency might conclude that a registered SDR other than the alpha SDR is better suited for reporting these new transactions. Of course, if the registered clearing agency determines that reporting beta and gamma security-based swaps to the alpha SDR is, in fact, equally convenient or more convenient than connecting and reporting to a different SDR, the registered clearing agency would be free to make this choice under new Rule 901(a)(2)(i).

The Commission shares the commenter's concern about ensuring that a termination reported by a registered clearing agency to an alpha SDR includes a valid transaction ID of an alpha held by that SDR and acknowledges the commenter's observation that this might not always occur in the CFTC's swap reporting regime. Because Rule 901(g) requires a registered SDR to assign a transaction ID to each security-based swap (or establish or endorse a methodology for transaction IDs to be assigned by third parties), the registered SDR should know the transaction ID of every security-based swap reported to it on a mandatory basis. If a registered clearing agency submits a termination report with a transaction ID that the registered SDR cannot match to an alpha transaction report, the registered SDR's policies and procedures must specify how this situation will be addressed.¹⁴⁷ The SDR's policies and procedures could provide, for example, that the registered SDR will hold the termination report from the registered clearing agency in a pending state until either (1) the registered SDR obtains a valid transaction ID from the registered clearing agency (if the registered clearing agency originally had reported an incorrect transaction ID); or (2) the registered SDR determines that it can

otherwise match the termination report against the correct alpha (if the clearing agency reported the correct transaction ID but the correct transaction ID did not for some reason appear in the report of the alpha transaction). Furthermore, in the Regulation SBSR Proposed Amendments Release, the Commission acknowledged that it might not be possible for a registered SDR to determine immediately whether a particular transaction ID is invalid because a registered clearing agency could report whether or not it has accepted an alpha for clearing before the registered SDR has received a transaction report for that alpha.¹⁴⁸ The Commission stated that, in such case, the registered SDR should address this possibility in its policies and procedures, which could provide, for example, that the registered SDR would hold a registered clearing agency's report of the disposition of an alpha in a pending state until the registered SDR receives the transaction report of the alpha; the registered SDR could then disseminate as a single report the security-based swap transaction information and the fact that the alpha had been terminated.¹⁴⁹ Because the reporting side for an alpha generally has 24 hours from the time of execution to report the transaction,¹⁵⁰ the duration of the pending state generally should not exceed 24 hours after receipt of the clearing agency's report of whether or not it has accepted the alpha for clearing. The Commission staff intends to evaluate whether the termination reports submitted by registered clearing agencies to an alpha SDR are appropriately matched to the alpha.

The Commission also believes that the adopted approach of allowing a registered clearing agency to choose the registered SDR to which it reports clearing transactions is, unlike any alternatives considered,¹⁵¹ properly designed to account for the possibility that alphas could be reported to several different SDRs. Consider the following example:

- On Day 1, Party A executes three alpha transactions (T1, T2, and T3) in Product XYZ.
- T1 is reported to SDR1. T2 is reported to SDR2. T3 is reported to SDR3.
- All three alpha transactions are submitted to Clearing Agency K and accepted for clearing.

- Clearing Agency K creates Beta1 and Gamma1 after terminating T1, Beta2 and Gamma2 after terminating T2, and Beta3 and Gamma3 after terminating T3.

• Assume that Party A is the direct counterparty to Beta1, Beta2, and Beta3. If, as suggested by some commenters, the Commission required Beta1 and Gamma1 to be reported to SDR1, Beta2 and Gamma2 to be reported to SDR2, and Beta3 and Gamma3 to be reported to SDR3, operational difficulties would result when Clearing Agency K nets Beta1, Beta2, and Beta3 as part of its settlement cycle because each of the Betas has been reported to a different SDR.

- At the end of Day 1, Clearing Agency K nets Beta1, Beta2, and Beta3 together to create a net open position (NOP) of Party A in Product XYZ.

- As part of the netting process, Clearing Agency K terminates Beta1, Beta2, and Beta 3. Under new Rule 901(e)(1)(ii), Clearing Agency K would have to report the termination of Beta1 to SDR1, the termination of Beta2 to SDR2, and the termination of Beta3 to SDR3.

- NOP is a new security-based swap and must be reported to a registered SDR.

Under the commenters' alternate approach, it is not apparent which registered SDR should receive the report of NOP, because NOP incorporates transactions that were originally reported to three different registered SDRs. Reporting NOP to each of SDR1, SDR2, and SDR3 serves no purpose because the same position would be reflected in three separate SDRs and could lead to confusion about the true size of the security-based swap market.

The Commission also disagrees with the commenter's view that the Commission's ability to understand or analyze reported data would be impaired by permitting registered clearing agencies to select the registered SDR for reporting clearing transactions.¹⁵² The Commission acknowledges that it will likely be necessary for the Commission's staff to link an alpha to the associated beta and gamma across different SDRs to obtain a complete understanding of transactions that clear. The Commission believes, however, that there are sufficient tools to facilitate this effort. Existing Rule 901(d)(10), for example, requires reporting of the "prior transaction ID" if a security-based swap arises from the allocation, termination, novation, or assignment of one or more prior security-based swaps. Therefore, the Commission believes that it is

¹⁴⁷ See Rule 13n-5(b)(1)(i) under the Exchange Act, 17 CFR 240.13n-5(b)(1)(i) (requiring every SDR to establish, maintain, and enforce written policies and procedures reasonably designed for the reporting of complete and accurate transaction data); Rule 13n-5(b)(1)(iii) under the Exchange Act, 17 CFR 240.13n-5(b)(1)(iii) (requiring every SDR to establish, maintain, and enforce written policies and procedures reasonably designed to satisfy itself that the transaction data that has been submitted to the SDR is complete and accurate).

¹⁴⁸ See Regulation SBSR Proposed Amendments Release, 80 FR at 14748.

¹⁴⁹ See *id.*

¹⁵⁰ See Rule 901(j).

¹⁵¹ See *supra* notes 113 to 124 and accompanying text.

¹⁵² See DTCC Letter at 4.

appropriate to allow a registered clearing agency to choose where to report the beta and gamma, even if it chooses to report to a registered SDR other than the alpha SDR.

The Commission acknowledges that permitting a registered clearing agency to report clearing transactions to a registered SDR other than the alpha SDR also could increase complexity for market participants who would prefer to have reports of all of their security-based swaps in a single SDR.¹⁵³ The Commission notes that SDRs are required to “collect and maintain accurate SBS transaction data so that relevant authorities can access and analyze the data from secure, central locations, thereby putting them in a better position to monitor for potential market abuse and risks to financial stability.”¹⁵⁴ The Commission notes, in addition, that Regulation SBSR permits a security-based swap counterparty to make non-mandatory reports of security-based swaps to an SDR of its choice (if the SDR is willing to accept them).¹⁵⁵ Thus, to the extent that SDRs are willing to accept such non-mandatory reports, non-clearing-agency counterparties of clearing transactions would have a mechanism for consolidating reports of their transactions in a single SDR if such counterparties wished to do so.

The Commission does not agree with the assertion made by one commenter that permitting a registered clearing agency to report clearing transactions to a registered SDR of its choice necessarily results in the tying of clearing services to SDR services.¹⁵⁶ Under the rules being adopted today, the user of clearing services—*i.e.*, an alpha counterparty that clears a security-based swap at a registered clearing agency—has no obligation to report the subsequent clearing transaction.

Because Regulation SBSR does not require an alpha counterparty to have ongoing obligations to report subsequent information about the clearing transaction, such as life cycle events or daily marks, to the registered SDR that is selected by the clearing agency, alpha counterparties will not be required to establish connections to multiple SDRs and to incur fees for reporting information to those SDRs.

D. Scope of Clearing Agencies Covered by Final Rules

Proposed Rule 901(a)(2)(ii) would assign clearing agencies a duty to report under Regulation SBSR based on their registration status, not on their principal place of business. Thus, a foreign clearing agency, like a U.S. clearing agency, would be required to report all security-based swaps of which it is a counterparty if it is registered with the Commission. Commenters had differing recommendations with respect to the scope of clearing agencies that should be covered by proposed Rule 901(a)(2)(ii). Two commenters expressed the view that the rule should apply to all registered clearing agencies, regardless of their principal place of business.¹⁵⁷ A third commenter agreed that a registered clearing agency with its principal place of business inside the United States should be required to report all clearing transactions, but took a different view with respect to a registered clearing agency with its principal place of business outside the United States; the non-U.S. clearing agency, according to the commenter, should be required to report only clearing transactions involving a U.S. person.¹⁵⁸

Final Rule 901(a)(2)(i) assigns the reporting obligation for a clearing transaction to a *registered* clearing agency that is a counterparty to the transaction. The rule applies to any registered clearing agency without regard to the location of its principal place of business. The Commission generally believes that, if a person registers with the Commission as a clearing agency, it should assume the same obligations as all other persons that register as clearing agencies.¹⁵⁹

¹⁵⁷ See LCH.Clearnet Letter at 9 (“Registered clearing agencies are best placed to report cleared transactions. Assigning these obligations to other participants for foreign domiciled clearing agencies will needlessly complicate the reporting landscape”); ISDA/SIFMA Letter at 24.

¹⁵⁸ See ICE Letter at 5.

¹⁵⁹ The Commission notes, however, that the reporting duty of a registered clearing agency under new Rule 901(a)(2)(i) must be read in connection with Rule 908(a), amendments to which the Commission is adopting today. In other words, a registered clearing agency must report only those security-based swaps that fall within Rule 908(a). It is likely that many clearing transactions of a registered clearing agency having its principal place of business outside the United States would not fall within any prong of Rule 908(a) and thus would not have been reported by the registered clearing agency pursuant to Rule 901(a)(2)(i). For example, a clearing transaction between a registered clearing agency and a non-U.S. person that is not registered with the Commission as a security-based swap dealer or major security-based swap participant, and who is not utilizing U.S. personnel to arrange, negotiate, or execute the clearing transaction, would not fall within any prong of Rule 908(a).

Conversely, new Rule 901(a)(2)(i) does not apply to unregistered clearing agencies (*e.g.*, persons that act as clearing agencies outside the United States that are not required to, and choose not to, register with the Commission).

A fourth commenter requested the Commission to clarify whether clearing agencies that are “deemed registered” under the Exchange Act are “registered clearing agencies” for purposes of Regulation SBSR, which would trigger the duty to report clearing transactions even before they complete a full registration process with the Commission.¹⁶⁰ The Commission previously has stated that each clearing agency that is deemed registered is required “to comply with all requirements of the Exchange Act and the rules and regulations thereunder applicable to Registered Clearing Agencies.”¹⁶¹ Pursuant to this guidance, a “deemed registered” clearing agency is required to comply with all requirements of Regulation SBSR that are applicable to registered clearing agencies.¹⁶²

E. Reporting Under the Principal Model of Clearing

Two commenters acknowledged that the agency model of clearing predominates in the United States but requested that the Commission clarify the application of Rule 901(a)(2)(ii) to security-based swaps cleared under the principal model of clearing.¹⁶³ One of these commenters recommended that the Commission require all clearing transactions to be reported according to the workflows used in the agency model of clearing.¹⁶⁴ By contrast, the other

¹⁶⁰ See ISDA/SIFMA at 26.

¹⁶¹ Securities Exchange Act Release No. 69284 (April 3, 2013), 68 FR at 21046, 21048 (April 9, 2013).

¹⁶² This commenter also sought guidance regarding the reporting obligations relating to a security-based swap between a clearing agency that has been exempted from registration by the Commission and a counterparty. See ISDA/SIFMA Letter at 26. The Commission does not believe that this issue is ripe for consideration. The Commission anticipates that it would consider this issue if it exempts from registration a clearing agency that acts as a central counterparty for security-based swaps.

¹⁶³ See ISDA/SIFMA Letter at 25 (“Although we do not have reason to believe the principal model will become prevalent in the U.S. market, it will be used in a percentage of SBS reportable under SBSR especially by non-U.S. parties registered as SBSDS or MSBSPs which may be the direct or indirect counterparty to a SBS. Providing additional guidance on the treatment of SBS cleared via the principal model would be useful to promote data accuracy and consistency”); ICE Letter at 2–3.

¹⁶⁴ See ICE Letter at 3 (arguing that reporting principal clearing workflows is unnecessarily complicated and costly and “results in a

¹⁵³ See *id.* at 16.

¹⁵⁴ SDR Adopting Release, 80 FR at 14440.

¹⁵⁵ See Rule 900(r) (defining a “non-mandatory report” as any information provided to a registered SDR by or on behalf of a counterparty other than as required by Regulation SBSR).

¹⁵⁶ See Markit Letter at 3, 9–10.

commenter argued that “a set of clearing transactions should be reported in accordance with the actual applied clearing model.”¹⁶⁵

The Commission concurs with the latter commenter: Regulation SBSR requires reporting of clearing transactions in accordance with the actual clearing model. Under the rules adopted today, any security-based swap that is a clearing transaction—*i.e.*, that has a registered clearing agency as a direct counterparty—must be reported by the registered clearing agency pursuant to new Rule 901(a)(2)(i).¹⁶⁶ If a security-based swap is not a clearing transaction, it must be reported by the person designated by the other provisions of Rule 901(a).

F. Clearing Transactions and Unique Identification Codes

Rules 901(c) and 901(d), respectively, require the person with the duty to report to report all of the primary trade information and secondary trade information for each security-based swap to which it is a counterparty. Noting that existing Rule 901(d)(2) requires the reporting side to report, as applicable, the branch ID, broker ID, execution agent ID, trader ID, and trading desk ID of the direct counterparty on the reporting side, the Commission in the Regulation SBSR Proposed Amendments Release asked whether these types of unique identification codes (“UICs”)¹⁶⁷ would ever be applicable to a registered clearing agency when it incurs the duty to report a clearing transaction.¹⁶⁸ Three commenters suggested that these UICs are not applicable to clearing transactions and should not have to be reported by the clearing agency.¹⁶⁹

The Commission agrees. In its capacity as a central counterparty for security-based swaps, a registered clearing agency does not engage in market-facing activity and thus would not utilize a branch, broker, execution agent, trader, or trading desk to effect security-based swap transactions. Therefore, these UICs are not applicable to clearing transactions, and a registered

_____ duplicative representation of cleared records submitted to repositories”).

¹⁶⁵ ISDA/SIFMA Letter at 26.

¹⁶⁶ Existing Rule 902(c)(6) provides that a registered SDR shall not disseminate any information regarding a clearing transaction that arises from the acceptance of a security-based swap for clearing by a registered clearing agency or that results from netting other clearing transactions.

¹⁶⁷ See Rule 900(qq) (defining “UIC” as “a unique identification code assigned to a person, unit of a person, product, or transaction”).

¹⁶⁸ See 80 FR at 14752.

¹⁶⁹ See DTCC Letter at 16; ICE Letter at 4; LCH.Clearnet Letter at 8.

clearing agency need not report any UICs pursuant to Rule 901(d)(2).¹⁷⁰

G. Reporting Whether an Alpha Transaction Is Accepted for Clearing

Existing Rule 901(e)(1)(i) addresses the reporting requirements for most life cycle events and assigns the reporting duty for reporting those life cycle events to the reporting side of the original transaction. However, Rule 901(e)(1)(i) specifically provides that “the reporting side shall not report whether or not a security-based swap has been accepted for clearing.” In the Regulation SBSR Proposed Amendments Release, the Commission proposed a new paragraph (ii) to Rule 901(e)(1) that would require a registered clearing agency that receives an alpha to report to the alpha SDR whether or not it has accepted the alpha for clearing.¹⁷¹

Two commenters expressed support for proposed Rule 901(e)(1)(ii), noting that clearing agencies would be well-positioned to issue a termination report for the alpha and subsequently to report the beta and gamma to a registered SDR.¹⁷² However, two commenters

_____ ¹⁷⁰ The Commission also deems these UICs “not applicable” to the non-clearing agency side of a clearing transaction; therefore, under Rule 906(a), a registered SDR need not query a non-clearing-agency participant for these UICs with respect to a clearing transaction, and the participant need not provide these UICs to the registered SDR with respect to any clearing transaction. As the Commission has previously stated when exempting most types of clearing transactions from public dissemination, clearing transactions “are mechanical steps taken pursuant to the rules of the clearing agency.” Regulation SBSR Adopting Release, 80 FR at 14610. See also Rule 902(c)(6). Thus, the Commission does not believe that clearing transactions can meaningfully be said to involve a market-facing subdivision or agent of the counterparty such as the branch, trading desk, individual trader, broker, or execution agent. To the extent that there was meaningful participation by a branch, trading desk, individual trader, broker, or execution agent on behalf of the counterparty, these UICs must be provided in connection with the original alpha transaction—either in its capacity as the reporting side (in which case it would be required to provide these UICs pursuant to Rule 901(d)(2)) or as the non-reporting side (in which case it would be required to provide these UICs pursuant to Rule 906(a) if it were a participant of the registered SDR). Cf. DTCC Letter at 16 (while not specifically addressing the question of whether these UICs should be reported for the non-clearing-agency side of a clearing transaction, questioning whether the non-reporting side should be required to report these UICs for any transaction).

¹⁷¹ See *infra* Section III(J) (discussing when an alpha has been rejected from clearing).

¹⁷² See ICE Letter at 5 (“Upon acceptance for clearing, CAs should be required to report the alpha termination to the appropriate SDR storing the alpha swap”); ISDA/SIFMA Letter at 24 (noting that the proposal would prevent the “orphaning of alphas” that currently occurs under the CFTC swap data reporting rules). Cf. DTCC Letter at 5–6, 17 (expressing support for proposed Rule 901(e)(1)(ii), but in the context of DTCC’s view, discussed *supra*, that clearing agencies also should be required to report betas and gammas to the alpha SDR).

objected to proposed Rule 901(e)(1)(ii). One of these commenters argued that proposed Rule 901(e)(1)(ii) was unnecessary because the counterparties to the alpha would learn of the disposition of the alpha from the clearing agency in the normal course of business, and could report this information to the alpha SDR.¹⁷³ This commenter further asserted that concerns regarding “data discrepancies, errors, or delays” cited by the Commission in support of proposed Rule 901(e)(1)(ii) were unfounded and could be addressed, if necessary, through rulemaking or enforcement action to encourage clearing agencies to provide accurate and timely data to platforms and counterparties about clearing dispositions.¹⁷⁴ Similarly, the second commenter that objected to proposed Rule 901(e)(1)(ii) argued that the “party that originally reported the alpha trade is best placed to report the result of clearing”¹⁷⁵ and that clearing agencies should not have to incur costs associated with establishing connectivity to alpha SDRs.¹⁷⁶ This commenter also questioned why the Commission’s approach to the reporting of cleared transactions differed from its approach to the reporting of prime brokerage transactions,¹⁷⁷ where the Commission is requiring that the person who reported the initial leg of a prime brokerage transaction (not the prime broker) must report any life cycle event

_____ ¹⁷³ See Markit Letter at 5 (“the clearing agency must, as a matter of course, send the cleared SBS trade record straight through to the sides to the trade or, if relevant, any non-affiliated reporting side (*e.g.*, the platform or reporting agent). In other words, for the clearing agency to transmit a message indicating that a trade has or has not been accepted for clearing (a necessary last step to conclude cleared transactions between the clearinghouse and the parties to the beta and gamma trades), there is no ‘extra step.’ Moreover, the processing of cleared trades is nearly instantaneous, resulting in no operationally significant delay”).

¹⁷⁴ See *id.* This commenter also argued that Rule 901(e)(1)(ii) would be unnecessary if the Commission permitted the reporting side of the alpha to select the SDR that will receive reports of the associated beta and gamma. See *id.* at 15.

¹⁷⁵ LCH.Clearnet Letter at 8.

¹⁷⁶ See *id.* at 8–10 (arguing that the incremental costs of assigning the reporting obligation to the alpha reporting side would be small compared to the costs associated with registered clearing agencies having to establish connectivity to alpha SDRs). The Commission notes that one of the commenters that supported the general approach of requiring registered clearing agencies to incur reporting duties argued also that “CAs [*i.e.*, clearing agencies] should not incur SDR fees to report alpha termination messages. Requiring CAs to become a full ‘participant’ of alpha SDRs, is unnecessary and overly burdensome for CAs.” ICE Letter at 6.

¹⁷⁷ See LCH.Clearnet Letter at 7.

resulting from whether the prime broker accepts or rejects that transaction.¹⁷⁸

After carefully considering the comments received, the Commission is adopting paragraph (ii) of Rule 901(e)(1) as proposed. Final Rule 901(e)(1)(ii) is consistent with the Commission's general approach of assigning the reporting obligation for a security-based swap transaction to the person with the most complete and efficient access to the required information at the point of creation. Because a registered clearing agency determines whether to accept an alpha for clearing and controls the precise moment when the transaction is cleared, the Commission believes that the clearing agency is best placed to report the result of its decision.

One commenter argued that requiring a registered clearing agency to report to an SDR not of its choosing whether it accepts an alpha for clearing "is in contradiction with the Commission's reasons for permitting a registered clearing agency to decide which registered SDR to use for reporting of beta and gamma trades."¹⁷⁹ The Commission does not believe that there is a contradiction in its reasoning. The person with the duty to report whether or not the alpha was accepted for clearing must report that information to the alpha SDR or else it would be difficult to pair the alpha transaction report with the report of its clearing disposition.¹⁸⁰ The Commission believes that a registered clearing agency, because it chooses when and

how to handle an alpha that is submitted for clearing, is best placed to report whether or not it accepts the alpha for clearing.

The Commission considered, but determined not to adopt, the alternative recommended by certain commenters of assigning to the person who has the duty to report the initial alpha (and thus can choose the alpha SDR) the duty of also reporting to the alpha SDR whether or not the registered clearing agency has accepted the alpha for clearing. The Commission acknowledges, as one commenter pointed out, that counterparties to security-based swaps that are submitted to clearing would in the normal course learn from the clearing agency whether or not a security-based swap has been accepted for clearing. The Commission believes, however, that requiring a registered clearing agency to report the termination of the alpha will increase the likelihood that the alpha termination will be reported accurately and without delay, thereby helping to minimize the problem of orphan alphas and helping to promote the integrity of reported security-based swap information. The adopted approach centralizes the function of reporting alpha dispositions in self-regulatory organizations that operate under rules approved by the Commission. Centralizing this reporting function into registered clearing agencies, rather than relying on a potentially large number of platforms and reporting sides to report alpha clearing dispositions, should help minimize the potential for data discrepancies and delays.¹⁸¹ Not all counterparties that may have a reporting obligation would be registered entities. The Commission thus has greater confidence in the ability of clearing agencies registered with the Commission to accurately report alpha dispositions. The Commission believes that the approach adopted today is preferable to an approach that would require platforms and reporting sides to report the alpha clearing disposition, given that these entities would first have to receive that information from the registered clearing agency. The Commission believes that the approach of requiring the registered clearing agency to report that information directly to the alpha SDR is preferable to relying on Commission rulemaking or enforcement action, as one commenter suggests,¹⁸² to address data accuracy

concerns arising from the exchange of information from the clearing agency to the platform or reporting side.

The Commission believes that the approach suggested by commenters to require the person who had the duty to report the alpha transaction also to report whether or not a clearing agency accepts an alpha for clearing is particularly unsuitable for situations where the alpha was executed on a platform and the platform incurs the duty to report that alpha under new Rule 901(a)(1).¹⁸³ A platform is not a counterparty to the transaction and thus, unlike a counterparty, typically would not monitor or record life cycle events, or be involved in post-trade processing, of any transactions executed on the platform (beyond sending messages about executed transactions to other infrastructures, such as SDRs and clearing agencies, that do carry out post-trade processing functions). The commenters' suggested approach of requiring the person who has the duty to report the alpha also to report whether or not the clearing agency has accepted the alpha for clearing would thus require platforms to develop processes for tracking and reporting life cycle events of platform-executed alphas that they currently do not have.

The Commission believes that it is more efficient to require a registered clearing agency to report all alpha dispositions, rather than having one rule for reporting the disposition of alphas that are executed on-platform and a different rule for reporting the disposition of alphas that are executed off-platform. The potential candidates for reporting the disposition of on-platform alphas include the platform, one of the sides of the alpha, and the clearing agency. As noted above, a platform is not well-positioned to perform this function. Furthermore, because neither side has the duty to report an on-platform alpha (because the platform has the duty), difficulty could arise from attempting to assign to one of the sides the duty to report the alpha disposition, particularly if the sides traded anonymously on the platform. Given the alternatives and for the reasons noted above, the Commission believes that the clearing agency is in the best position to report whether or not it has accepted a transaction for clearing, with respect to both on- and off-platform alphas. In this regard, the Commission notes that, once a clearing agency has established a mechanism for reporting to an SDR whether or not it has accepted on-platform alphas for

¹⁷⁸ See *infra* Section VII (discussing application of Regulation SBSR to security-based swaps arising from prime brokerage arrangements).

¹⁷⁹ LCH.Clearnet Letter at 3.

¹⁸⁰ Existing Rule 901(e)(2) requires a life cycle event to be reported to the same entity to which the original security-based swap transaction was reported. A termination of an alpha resulting from action by a registered clearing agency is a life cycle event of the alpha, and thus must be reported to the alpha SDR. Requiring the clearing disposition report to go to the alpha SDR will allow the alpha SDR to match the relevant reports and understand the disposition of the alpha. Allowing the registered clearing agency to report the disposition of the alpha to a registered SDR of its choice, rather than to the alpha SDR, could make it difficult, if not impossible, to match the alpha transaction report with the report of the alpha's clearing disposition. The Commission seeks to minimize the problem of "orphan alphas," where it cannot readily be ascertained whether a transaction involving a product that is customarily submitted to clearing has in fact been submitted to clearing and, if so, whether it was accepted for clearing. If alpha transactions are not reported as terminated or they are reported as terminated but the alpha SDR cannot match the report of termination with the original transaction report—*i.e.*, the alpha is "orphaned"—it would be more difficult for the Commission to carry out various oversight functions, such as calculating the total amount of open exposures resulting from security-based swap activity and understanding trends in clearing activity, including adherence to any clearing mandate.

¹⁸¹ The Commission estimates that four registered clearing agencies will clear security-based swaps and thus incur duties under Regulation SBSR. See *infra* Section XI(B)(2)(b)(ii).

¹⁸² See Markit Letter at 5.

¹⁸³ See *infra* Section IV(A) (discussing adopting of new Rule 901(a)(1)).

clearing, there would be only minimal incremental burdens to send additional messages to that SDR to report whether or not the clearing agency has accepted off-platform alphas for clearing.

As noted above, one commenter questioned why the Commission's approach to the reporting of whether or not an alpha is accepted for clearing differs from its approach to the reporting of life cycle events stemming from the acceptance or rejection by a prime broker of the initial leg of a prime brokerage transaction.¹⁸⁴ The commenter correctly understands that, in the prime brokerage context, the reporting side of the first transaction of a prime brokerage workflow (whether in a two- or three-legged scenario) must report the termination of that transaction.¹⁸⁵ In contrast, for a transaction submitted to clearing, the registered clearing agency, rather than the reporting side for the initial alpha transaction, must report whether or not it has accepted the alpha for clearing. The commenter disagrees with this approach to the reporting of transactions submitted to clearing, asserting that the reporting side or platform, as applicable, should report whether the alpha has been accepted for clearing.¹⁸⁶

Although prime brokerage and clearing arrangements are similar in some ways, there also are differences that, the Commission believes, warrant different approaches to the reporting of a termination of the first leg of the overall transaction. A prime broker, like a registered clearing agency, has the most direct access to information about whether a transaction has been accepted. However, because a prime broker might not be subject to Rule 908(b) and thus might not be eligible to incur any duties under Regulation SBSR, there could be uncertainty as to who would be required to report the disposition of the first transaction. By contrast, a clearing transaction by definition includes a registered entity: The registered clearing agency. Therefore, there is no uncertainty as to whether the registered clearing agency could have the duty to report the disposition of the alpha.

Finally, two commenters expressed concern about the costs associated with requiring registered clearing agencies to report whether or not they accept alphas for clearing.¹⁸⁷ One commenter stated,

for example, that “[c]onnecting to all registered SDRs is necessary to ensure that the registered clearing agency is prepared to report to any SDR to which an alpha trade could be reported . . . [T]here is a significant cost to establishing and maintaining connectivity to registered SDRs to facilitate the reporting required by Rule 901.”¹⁸⁸ The second commenter argued that “CAs [*i.e.*, clearing agencies] should execute an agreement with [the alpha SDR] outlining the requirements to report termination messages; however, CAs should not incur SDR fees to report alpha termination messages.”¹⁸⁹ This commenter cautioned, furthermore, that “[r]equiring CAs to become a full ‘participant’ of alpha SDRs is unnecessary and overly burdensome for CAs.”¹⁹⁰

With respect to whether a registered SDR may impose a fee on a registered clearing agency for reporting to the SDR whether or not an alpha transaction has been accepted for clearing, neither the statute nor the applicable rules prohibit such a fee. The Commission notes, however, that existing Rule 13n-4(c)(1)(i) under the Exchange Act¹⁹¹ requires an SDR to ensure that any dues, fees, or other charges imposed by the SDR are fair and reasonable and not unreasonably discriminatory.

With respect to the wider costs associated with clearing agencies' reporting of alpha clearing dispositions to registered SDRs, the Commission notes that Rule 901(e)(1)(ii), by its terms, requires registered clearing agencies to report only a limited amount of information (*i.e.*, whether or not they have accepted a security-based swap for clearing, along with the transaction ID of the relevant alpha) and therefore does not require the clearing agency to have connectivity sufficient to report all of the primary and secondary trade information of a security-based swap.¹⁹² The Commission believes that registered SDRs should consider providing a minimally burdensome means for registered clearing agencies to report

whether or not they accept an alpha for clearing.¹⁹³

Accordingly, for similar reasons that the Commission is assigning to registered clearing agencies the duty to report all clearing transactions, the Commission also believes that it is appropriate to assign to the registered clearing agency—rather than to the person who had the initial duty to report the alpha (*i.e.*, a reporting side or a platform)—the duty to report to the alpha SDR whether or not the clearing agency has accepted the alpha for clearing.

H. A Registered Clearing Agency Must Know the Transaction ID of the Alpha and the Identity of the Alpha SDR

Existing Rule 901(e)(2) requires the person who has the duty to report a life cycle event to include in the report of the life cycle event the transaction ID of the original transaction. Under new Rule 901(e)(1)(ii), a registered clearing agency that accepts or rejects an alpha transaction from clearing incurs this duty. The transaction ID of the alpha transaction is information that the registered clearing agency might not have, because the registered clearing agency is not involved in the execution or reporting of the alpha. Therefore, the Commission proposed a new paragraph (a)(3) of Rule 901(a), which would require the person who has the duty to report the alpha security-based swap to provide the registered clearing agency with the transaction ID of the alpha and the identity of the alpha SDR.

One commenter “acknowledged the value” of the proposed rule and noted that in other jurisdictions the data flows to clearing agencies already include identification information for alpha transactions, so these data flows should be extensible to the security-based swap market.¹⁹⁴ By contrast, a second commenter expressed the view that the proposed rule “would add a layer of complexity to the reporting framework” and noted that the reporting person for the alpha might provide an inaccurate transaction ID to the registered clearing

termination messages”); LCH.Clearnet Letter at 8–10.

¹⁸⁸ LCH.Clearnet Letter at 3.

¹⁸⁹ ICE Letter at 6.

¹⁹⁰ *Id.*

¹⁹¹ 17 CFR 240.13n-4(c)(1)(i).

¹⁹² As described in more detail in Section XII(A), *infra*, the Commission has considered the costs of requiring registered clearing agencies to have the capability to report clearing dispositions to multiple alpha SDRs and the benefits associated with ensuring that the clearing disposition report is made by the person with immediate and direct access to the relevant information.

¹⁹³ For example, a registered SDR should consider how it will comply with Rule 13n-4(c)(1)(ii) under the Exchange Act, 17 CFR 240.13n-4(c)(1)(ii), which requires that the SDR permit market participants to access specific services offered by the SDR separately, and Rule 13n-4(c)(1)(iii) under the Exchange Act, 17 CFR 240.13n-4(c)(1)(iii), which requires the SDR to have objective criteria that would permit fair, open, and not unreasonably discriminatory access to services offered and data maintained by the SDR, when offering access to a registered clearing agency that seeks only to report whether or not it has accepted individual transactions for clearing.

¹⁹⁴ See ISDA/SIFMA Letter at 25.

¹⁸⁴ See LCH.Clearnet Letter at 7.

¹⁸⁵ See *infra* Section VII(B) for a discussion of how Regulation SBSR applies to prime brokerage transactions, including both a two-legged and three-legged model.

¹⁸⁶ See LCH.Clearnet Letter at 3, 7.

¹⁸⁷ See ICE Letter at 6 (stating that a clearing agency “should not incur SDR fees to report alpha

agency to which the trade is submitted.¹⁹⁵

After carefully considering the comments received, the Commission is adopting Rule 901(a)(3) as proposed. Although Rule 901(a)(3) adds an additional step to the reporting framework, the Commission believes that this additional step is necessary to facilitate the linking of related transactions. Under new Rule 901(e)(1)(ii), a registered clearing agency must report to the entity to which the original security-based swap was reported whether or not it accepts the alpha for clearing. For the alpha SDR to link the registered clearing agency's report of acceptance or rejection to the appropriate transaction, the registered clearing agency must be able to include the transaction ID of the alpha transaction in its report to the alpha SDR. The Commission further believes that the person having the duty to report the alpha is best situated to also report the transaction ID of the alpha and the identity of the alpha SDR to the registered clearing agency. While it is true, as the commenter asserts, that the person having the duty to report the alpha might provide an inaccurate transaction ID to the registered clearing agency, the same could be said about any reporting requirement imposed by Regulation SBSR. This situation should be addressed, at least in part, by Rule 13n-5(b)(1)(i) under the Exchange Act,¹⁹⁶ which requires every SDR to establish, maintain, and enforce written policies and procedures reasonably designed for the reporting of complete and accurate transaction data to the SDR.¹⁹⁷ Furthermore, the person with the duty to report the alpha is certain to know the transaction ID and the identity of the alpha (since it selected the SDR) and thus is well placed to provide this information to the registered clearing agency, which would allow the clearing agency to discharge its duty under new Rule 901(e)(1)(ii).

Two commenters sought guidance regarding the means by which persons with the duty to report the alpha transaction could provide the

transaction ID of the alpha and the identity of the alpha SDR to the registered clearing agency.¹⁹⁸ One of these commenters stated that some platforms can provide the information required by Rule 901(a)(3) using third-party service providers, but cautioned that "platforms would be forced to undertake a significant development investment if required to perform that function itself and to build functionality that replaces existing solutions."¹⁹⁹ The commenter requested, therefore, that the Commission "make clear in its final rules that platforms have discretion to determine the most appropriate technological manner in which they comply [with Rule 901(a)(3)]."²⁰⁰ The other commenter expressed the view that "the most efficient approach would be for clearing agencies to gather the choice of alpha SDR for an asset class or product once from all reporting sides and platforms, and retain and maintain as static data rather than requiring a notification on a transactional basis."²⁰¹

Final Rule 901(a)(3) does not prescribe a specific means by which the person with the duty to report an alpha must inform the registered clearing agency of the alpha's transaction ID and the identity of the alpha SDR. There is no prohibition on utilizing existing infrastructure. Thus, market participants may determine the most efficient way of communicating this information. The Commission notes, however, that Rule 901(a)(3) applies on a transaction-by-transaction basis. Thus, while it might be possible for a registered clearing agency to obtain and store static data regarding a reporting person's SDR preferences, Rule 901(a)(3) requires the person having the duty to report a particular alpha transaction to ensure that the registered clearing agency learns the identity of the SDR that holds the record of the *particular* alpha. If the person with the duty to report attempts to satisfy this obligation with static data and the data become stale or inaccurate with respect to a particular alpha, the reporting person would not satisfy its obligation under Rule 901(a)(3).

I. Alpha Submitted to Clearing Before It Is Reported to a Registered SDR

In the Regulation SBSR Adopting Release, the Commission described the interim phase for regulatory reporting and public dissemination,²⁰² under which security-based swap transactions

may be reported up to 24 hours after the time of execution (or, if 24 hours after the time of execution would fall on a day that is not a business day, by the same time on the next day that is a business day).²⁰³ However, the reporting timeframe for a life cycle event and any adjustment due to a life cycle event is within 24 hours after the occurrence of the life cycle event or the adjustment due to the life cycle event.²⁰⁴ Thus, an alpha might be submitted for clearing immediately after execution but not reported until 24 hours later (or longer, if 24 hours after the time of execution would fall on a day that is not a business day), and the clearing agency's obligation under new Rule 901(e)(1)(ii) to inform the alpha SDR whether or not it has accepted the alpha for clearing could arise before the alpha SDR has received the alpha's initial transaction report.²⁰⁵

To account for this possibility, the Commission proposed to amend existing Rule 901(e)(2) to require a life cycle event (which would include a notification by a registered clearing agency whether or not it has accepted an alpha for clearing) to be reported "to the entity to which the original security-based swap transaction *will be reported or has been reported*" (emphasis added). This amendment mirrors the language in new Rule 901(a)(3), which requires a person who reports an alpha to provide

²⁰³ See Rule 901(j). In the case of a security-based swap that is subject to regulatory reporting and public dissemination solely by operation of Rule 908(a)(1)(ii) (*i.e.*, the security-based swap is accepted for clearing by a clearing agency having its principal place of business in the United States), Rule 901(j) requires reporting within 24 hours of the time of acceptance for clearing (or, if 24 hours after the time of acceptance would fall on a day that is not a business day, by the same time on the next day that is a business day).

²⁰⁴ See Rule 901(j).

²⁰⁵ To submit the report contemplated by new Rule 901(e)(1)(ii), the registered clearing agency must know the transaction ID of the alpha. The person with the duty to report the alpha might know the alpha's transaction ID before it reports the transaction to a registered SDR. Under existing Rules 903(a) and 907(a)(5) there is no requirement that a registered SDR itself assign a transaction ID. Under those rules, a registered SDR may allow third parties, such as reporting sides or platforms, to assign a transaction ID using a methodology endorsed by the registered SDR. If the registered SDR allows third parties to assign the transaction ID, the reporting side or platform could tell the registered clearing agency the alpha's transaction ID, which in turn could allow the registered clearing agency to report to the alpha SDR whether or not the alpha has been accepted for clearing before the alpha has been reported to the registered SDR. If, however, the person with the duty to report the alpha does not obtain the alpha's transaction ID until it reports the alpha to a registered SDR, the person could not provide the alpha's transaction ID to the registered clearing agency, and the registered clearing agency could not report whether or not it accepts the alpha for clearing until after it receives the alpha's transaction ID.

¹⁹⁵ DTCC Letter at 4-5.

¹⁹⁶ 17 CFR 240.13n-5(b)(1)(i).

¹⁹⁷ A registered SDR should consider including in its policies and procedures under Rule 13n-5(b)(1)(i) what actions to take if it receives clearing disposition information from a registered clearing agency that includes transaction IDs of alpha transactions that do not match to the records of any alpha transactions held at the registered SDR. The SDR might seek to call this discrepancy to the attention of the registered clearing agency so that the registered clearing agency could work with persons who are required by Rule 901(a)(3) to provide the registered clearing agency with the transaction IDs of the alphas.

¹⁹⁸ See ISDA/SIFMA Letter at 25; WMBAA Letter at 3.

¹⁹⁹ WMBAA Letter at 3.

²⁰⁰ *Id.*

²⁰¹ ISDA/SIFMA Letter at 25.

²⁰² See 80 FR at 14616-25.

the registered clearing agency the alpha's transaction ID and the identity of the registered SDR to which the alpha "will be reported or has been reported."

The Commission received two comments on this proposed amendment, discussed below.²⁰⁶ For the reasons discussed below, the Commission is adopting the amendment to Rule 901(e)(2) as proposed.

One commenter stated that, "[i]n the situation where a termination message to an alpha swap is not found, the SDR should queue this message and attempt to reapply the termination message to newly submitted SBSs. This process should continue until the end of the current business day at which time an error message should be reported back to the clearing agency since the termination message could not be applied to a corresponding alpha."²⁰⁷ The Commission notes that it is not requiring a registered SDR to use a particular workflow to account for circumstances where the report of a life cycle event precedes the initial transaction report. Under Rule 901(e)(2), each registered SDR may use the workflow that it finds most effective, provided that it satisfies the requirements of the rule. A registered SDR generally should consider whether the policies and procedures it establishes under Rule 907(a) will address the situation where it receives a report from a registered clearing agency stating whether or not it has accepted an alpha (with a particular transaction ID) for clearing before the registered SDR receives a transaction report of the alpha. The policies and procedures could provide, for example, that the registered SDR would hold in a pending state a report from a registered clearing agency that it accepted the alpha for clearing until the SDR receives the alpha transaction report, and then disseminate the security-based swap transaction information and the fact that the alpha has been terminated as a single report.

The second commenter argued that Regulation SBSR should "prohibit [the alpha SDR] from publicly disseminating the rejection or acceptance report from the clearing agency ahead of the point at which the SDR receives and has publicly disseminated the report for the alpha."²⁰⁸ While the Commission shares the commenter's concern that a "stand alone" termination not be publicly disseminated without the

associated transaction report, the Commission does not believe that a new rule is necessary to avoid this result. Under existing rules, a registered SDR that receives a termination report of a security-based swap before it receives the initial transaction report cannot disseminate anything relating to the transaction. Existing Rule 902(a) requires this result because it provides, in relevant part, that the public report "shall consist of all the information reported pursuant to [Rule 901(c)]." Because the registered SDR has not yet received the transaction report of the alpha, it would lack "all of the information reported" pursuant to Rule 901(c) and thus could not make the report required by Rule 902(a). If the registered SDR holds in queue the notice of the disposition of the alpha, it would be required—when it subsequently receives the initial alpha transaction report—to immediately disseminate the Rule 901(c) information pertaining to the alpha as well as the fact that the alpha has been terminated if the alpha has been accepted for clearing.²⁰⁹

J. Consequences of Rejection

Two commenters raised issues relating to the reporting of an alpha that is rejected from clearing.²¹⁰ One of these commenters stated that "[c]areful consideration needs to be made by SDRs as to how a report by the clearing agency that a trade has not been accepted for clearing would be reflected in the record for the SBS."²¹¹ The other commenter noted that "[i]t is unclear what lifecycle event the registered clearing agency should report for rejected trades."²¹² This commenter stated that an alpha that is rejected from clearing might remain a bilateral trade, might be submitted to a different registered clearing agency, might be re-submitted to the same registered clearing agency, or might be torn up.²¹³

In some cases, depending on the contractual arrangement between the alpha counterparties, a registered clearing agency's rejection of an alpha will result in the immediate termination of the transaction.²¹⁴ In other cases, as the commenter indicates, an alpha that

is rejected from clearing could remain a bilateral trade with different terms. The latter case implies that the counterparties had effected a bilateral, off-platform transaction and that their contractual arrangement specifically contemplated that the counterparties could elect to preserve the original security-based swap as a bilateral transaction if the clearing agency rejects it from clearing.²¹⁵ If the alpha counterparties do not have such an arrangement, then rejection from clearing terminates the alpha.²¹⁶ But if the counterparties have such an arrangement and elect to preserve a transaction that has been rejected from clearing, the reporting side of the original transaction would be required by Rule 901(e) to report the amended terms of the security-based swap to the registered SDR as a life cycle event of the original transaction.²¹⁷ A registered SDR must establish and maintain written policies and procedures for specifying procedures for reporting life cycle events, including those relating to a clearing agency's rejection of an alpha. A registered SDR could, for example, provide in its policies and procedures that it would, in the absence of any information provided by the reporting side to the contrary or in the case of a platform-executed alpha, treat the clearing agency's rejection of the alpha as a termination of the alpha.

As noted in Section III(I), *supra*, during the interim phase for regulatory reporting and public dissemination,²¹⁸ an alpha might be submitted for clearing immediately after execution but not reported until more than 24 hours later, and the clearing agency's duty under new Rule 901(e)(1)(ii) to inform the alpha SDR whether or not the clearing agency has accepted the alpha for clearing could arise before the alpha SDR receives the initial transaction

²¹⁵ In the case of a platform-executed alpha, the security-based swap arises by operation of the platform's rules, and there likely would not be a separate agreement between the counterparties that would allow for amendment in case of rejection, particularly for anonymous trades.

²¹⁶ The counterparties could choose to negotiate a new security-based swap, but this would be a different transaction than the alpha that had been rejected from clearing.

²¹⁷ A life cycle event is defined, in part, as "with respect to a security-based swap, any event that would result in a change in the information reported to a registered security-based swap data repository under Rule 901(c). . . ." Rule 900(q). Because the resulting bilateral transaction would no longer be intended to be submitted to clearing, the reporting side would be required, among other things, to modify the information previously reported pursuant to Rule 901(c)(6) (whether or not the counterparties intend that the security-based swap be submitted to clearing).

²¹⁸ See Regulation SBSR Adopting Release, 80 FR at 14616–25.

²⁰⁶ Comments pertaining to the reporting of an alpha that is rejected from clearing are discussed in the section immediately following.

²⁰⁷ ICE Letter at 6.

²⁰⁸ ISDA/SIFMA Letter at 24.

²⁰⁹ To address the case where an alpha is rejected from clearing, the Commission is adopting new Rule 902(c)(8), discussed in the subsection immediately below.

²¹⁰ See ISDA/SIFMA Letter at 24; LCH.Clearnet Letter at 6.

²¹¹ ISDA/SIFMA Letter at 24.

²¹² LCH.Clearnet Letter at 6.

²¹³ See *id.*

²¹⁴ Under Rule 901(e)(1)(ii), as adopted herein, a registered clearing agency is required to report whether or not it has accepted a security-based swap for clearing.

report for the alpha. Therefore, during the interim phase, a registered SDR might receive notice of a clearing agency's rejection of an alpha before receiving the initial transaction report for that alpha.

In this limited case, the Commission believes that no transaction report should be disseminated, and it is adopting a minor revision to existing Rule 902(c) to accomplish that end. Rule 902(c) lists the types of reported information and the types of security-based swap transactions that a registered SDR shall not publicly disseminate. The Commission is adding a new paragraph (c)(8) to Rule 902(c) to prohibit a registered SDR from disseminating "[a]ny information regarding a security-based swap that has been rejected from clearing or rejected by a prime broker²¹⁹ if the original transaction report has not yet been publicly disseminated."²²⁰ New Rule 902(c)(8) is designed to avoid public dissemination of an alpha transaction that has been rejected by the clearing agency, if the original transaction report has not already been publicly disseminated by a registered SDR. Rule 902(c)(8) should help minimize public dissemination of events that do not reflect any ongoing market activity.²²¹

New Rule 902(c)(8) applies only in cases of rejection prior to public dissemination of the original transaction report of the alpha. When the action of a registered clearing agency results in a termination of an alpha—whether because it was accepted by the clearing agency and replaced by the beta and gamma, or because it was rejected by the clearing agency—the termination of the alpha is a life cycle event of the alpha. If the registered SDR already has publicly disseminated the primary trade information of the alpha, the termination life cycle event also must be publicly disseminated. Rule 907(a)(3) requires a registered SDR to have policies and procedures for flagging the

²¹⁹ Because rejection by a prime broker has a similar effect to rejection by a clearing agency (*i.e.*, it may result in termination of the initial transaction), the Commission is adopting language relating to prime broker transactions. *See infra* Section VII for additional discussion of prime broker transactions.

²²⁰ The Commission is also making minor technical corrections to paragraphs (c)(6) and (7) of Rule 902(c) to accommodate the addition of (c)(8). The Commission is deleting the word "or" from the end of (c)(6) and the period from the end of (c)(7) and adding "; or" to the end of paragraph (c)(7).

²²¹ As discussed in Section VII(D), *infra*, a similar situation could arise if a prime broker rejects a security-based swap that has been negotiated between a client and a third-party executing dealer. New Rule 902(c)(8) applies to security-based swaps that have been rejected by a registered clearing agency as well as those that have been rejected by a prime broker.

report to indicate that the report is a life cycle event to ensure that market observers can understand that the report represents a revision to a previous transaction.²²² A life cycle event is defined to include the termination of an alpha.

Rule 907(a)(4) requires the policies and procedures of a registered SDR, in relevant part, to identify characteristics of a security-based swap that could, in the fair and reasonable estimation of the registered SDR, cause a person without knowledge of those characteristics to receive a distorted view of the market and to apply condition flags to help prevent a distorted view of the market. The Commission believes that it would be difficult to comply with Rule 907(a)(4) if the condition flags do not provide sufficient information about the specific characteristics to prevent the report from distorting observers' view of the market, including by distinguishing between a termination that results from successful clearing and a termination that results from rejection from clearing. If market observers are not given the ability to distinguish between alphas that terminate because they are successfully cleared and alphas that terminate because they are rejected from clearing, there would be no means for market observers to avoid developing a distorted view of the market.²²³ Separate flags for terminations that result from successful clearing of an alpha and terminations that result from rejection from clearing, both of which can be derived from the report of the

²²² *See* Regulation SBSR Adopting Release, 80 FR at 14643 ("public reports of life cycle events should allow observers to identify the security-based swap subject to the lifecycle event"). However, the registered SDR may not use the transaction ID for this function and must use other means to link the transactions. *See id.*

²²³ For example, assume that two counterparties bilaterally execute a transaction that they wish to clear. The reporting side for the alpha reports the transaction to a registered SDR, which immediately publicly disseminates it. The counterparties then submit the transaction to clearing, but the alpha is rejected because there are clerical errors in the clearing submission report. The registered clearing agency reports the rejection to the alpha SDR, and the alpha SDR disseminates a termination. Shortly thereafter, the alpha counterparties re-execute the transaction, and the reporting side submits a second transaction report to the registered SDR, which immediately publicly disseminates it. The counterparties submit the new transaction to the clearing agency; this time the alpha successfully clears. The registered clearing agency reports this fact to the alpha SDR, which publicly disseminates the termination. If the condition flag indicates only that the alpha is terminated, market observers would likely draw the conclusion that twice as much market activity had occurred than was the case. However, if the condition flags distinguish termination for successful clearing from termination for rejection from clearing, market observers would understand that only the second transaction resulted in ongoing risk positions in the market.

alpha's clearing disposition provided by a registered clearing agency pursuant to Rule 901(e)(1)(ii), would be appropriate to prevent a distorted view of the market.

K. Scope of Clearing Transactions

One commenter expressed the view that the proposed rule does not address the reporting of trades that are part of a registered clearing agency's end-of-day pricing process.²²⁴ The commenter recommended that these trades be reported by a clearing agency because the clearing agency is "the sole party who holds the necessary information to report trades resulting from downstream clearing processes."²²⁵ In the Regulation SBSR Adopting Release, the Commission noted that the definition of "clearing transaction"—*i.e.*, any security-based swap that has a clearing agency as a direct counterparty²²⁶—includes "security-based swaps that arise as part of a clearing agency's internal processes, such as security-based swaps used to establish prices for cleared products."²²⁷ In this release, the Commission is adopting new Rule 901(a)(2)(i), as proposed, that makes a registered clearing agency the reporting side for any security-based swap to which it is a counterparty. Thus, a security-based swap that arises from a clearing agency's process for establishing a price for a cleared product must be reported by the registered clearing agency if it is a counterparty to the transaction. Otherwise, the transaction must be reported by the person determined by the reporting hierarchy in existing Rule 901(a)(2)(ii).

L. Reporting of Historical Clearing Transactions

One commenter requested that the Commission clarify that a registered clearing agency "is solely responsible for reporting historical SBS that are clearing transactions."²²⁸ The Commission concurs with this statement. Existing Rule 901(i) provides that, with respect to any historical security-based swap, the reporting side shall report all of the information required by Rules 901(c) and 901(d) to the extent that information about the transaction is available. Under new Rule 901(a)(2)(i), the reporting side for a clearing transaction is the registered clearing agency that is a counterparty to the transaction. The Commission

²²⁴ *See* ICE Letter at 9.

²²⁵ *Id.*

²²⁶ *See* Rule 900(g).

²²⁷ 80 FR at 14599.

²²⁸ ISDA/SIFMA Letter at 26.

understands that all clearing agencies that are counterparties to historical security-based swaps are “deemed registered” clearing agencies.²²⁹ Therefore, a registered clearing agency is the reporting side for every historical clearing transaction to which it is a counterparty and must report information about such transactions, to the extent that information is available.

This commenter also stated that “a clearing agency should not be expected to report the transaction ID of the alpha for an historical clearing transaction since such value may not be readily available.”²³⁰ The Commission notes that a registered clearing agency would not be the counterparty to an alpha transaction and thus would incur no duty to report any primary or secondary trade information about the alpha.²³¹

IV. Reporting by Platforms

A. Overview

In the Regulation SBSR Proposed Amendments Release, the Commission proposed a new paragraph (1) of Rule 901(a) providing that, if a security-based swap is executed on a platform and will

²²⁹ The Commission understands that ICE Clear Credit and ICE Clear Europe are the only registered clearing agencies that are counterparties to historical security-based swaps that fall within the definition of “clearing transaction” and thus would incur the duty to report those historical transactions. Both ICE Clear Credit LLC and ICE Clear Europe Limited were “deemed registered” in accordance with Title VII of the Dodd-Frank Act. See 15 U.S.C. 78q-1(l) (the “Deemed Registered Provision”). This provision applies to certain depository institutions that cleared swaps as multilateral clearing organizations and certain derivatives clearing organizations (“DCOs”) that cleared swaps pursuant to an exemption from registration as a clearing agency. As a result, ICE Clear Credit LLC, ICE Clear Europe Limited, and the Chicago Mercantile Exchange, Inc. (“CME”) were deemed registered with the Commission on July 16, 2011, solely for the purpose of clearing security-based swaps. In 2015 the Commission granted CME’s request to withdraw its registration as a clearing agency. See Securities Exchange Act Release No. 76678 (December 17, 2015), 80 FR 79983 (December 23, 2015). In its request to withdraw from registration, the CME stated that it had never conducted any clearing activity for security-based swaps. See Letter from Larry E. Bergmann and Joseph C. Lombard, on behalf of CME, to Brent J. Fields, Secretary, Commission, dated August 3, 2015.

²³⁰ ISDA/SIFMA Letter at 26.

²³¹ This commenter also noted that “in some cases a reporting side may be unable to report an historic alpha as before there was no regulatory need to distinguish the alpha from the beta or gamma and some firms may only have booked a position against the clearing agency. In that instance, our understanding is that the historical alpha would not be reportable.” *Id.* If it is true that transaction information about a historical alpha no longer exists, there would be no duty to report the alpha pursuant to Rule 901(i). As the Commission stated in the Regulation SBSR Adopting Release, Rule 901(i) requires the reporting of historical security-based swaps only to the extent that information about such transactions is available. See 80 FR at 14591.

be submitted to clearing (a “platform-executed alpha”), the platform would incur the duty to report. In proposing Rule 901(a)(1), the Commission carefully assessed the transaction information that the platform might not have or might not be able to obtain easily, and proposed to require the platform to report only the information set forth in Rules 901(c) (the primary trade information), 901(d)(1) (the participant ID or execution agent ID for each counterparty, as applicable), 901(d)(9) (the platform ID), and 901(d)(10) (the transaction ID of any related transaction).²³² For platform-executed security-based swaps that will not be submitted to clearing, existing Rule 901(a)(2) provides that one of the sides, as determined by that rule’s “reporting hierarchy,” will have the duty to report.

Five commenters generally supported proposed Rule 901(a)(1).²³³ However, two commenters, while not objecting to platforms having reporting duties, argued that the Commission should expand Rule 901(a)(1) to require a platform to report every transaction executed on the platform.²³⁴ In the view of one of these commenters, this approach would eliminate the confusion that could arise if the platform makes an erroneous determination about whether the transaction will be submitted to clearing.²³⁵ The second commenter cautioned that requiring a platform to report only platform-executed transactions that will be submitted to clearing would “depart from current market practice . . . and create different reporting process flows for SEF executed and cleared trades versus SEF executed and uncleared trades.”²³⁶ Another commenter, however, recommended that the Commission not expand the scope of Rule 901(a) to require platforms to report all platform-executed security-based swaps.²³⁷

²³² See Regulation SBSR Proposed Amendments Release, 80 FR at 14749–50.

²³³ See Better Markets Letter at 2, 4 (noting that the “proposal ensures that the reporting party is specified and has all requisite information”); DTCC Letter at 6, 15 (stating that “a platform is best placed to report the alpha trade because it has performed the execution and has all the relevant economic terms, IDs, and timestamps, to report to the [registered SDR]”); ICE Letter at 4; ISDA/SIFMA Letter at 5, 27; LCH.Clearnet Letter at 3.

²³⁴ See DTCC Letter at 6; WMBAA Letter at 2.

²³⁵ See WMBAA Letter at 2–3. Specifically, the commenter noted that the proposed rule could cause an SDR to receive duplicate reports, “if the platform believes the transaction will be cleared and the counterparties do not clear the trade,” or no post-trade report, “if the platform believes the transaction will not be cleared and counterparties clear the trade.” *Id.* at 3.

²³⁶ DTCC Letter at 6, n. 14.

²³⁷ See ISDA/SIFMA at 27.

After carefully considering all the comments, the Commission has determined to adopt Rule 901(a)(1) largely as proposed, but with minor revisions. The revisions, discussed further below, reduce the scope of information that platforms are required to report by eliminating the need for platforms to identify the participation of indirect counterparties. New Rule 901(a)(1) is intended to promote the accuracy and completeness of security-based swap transaction data, while aligning the reporting duty with persons that are best able to carry it out. As the person with the duty to report the transaction, the platform would be able to select the registered SDR to which it reports.²³⁸

B. A Platform Is Not Required To Report All Transactions Occurring on Its Facilities

If a platform-executed security-based swap will not be submitted to clearing, the platform would have no reporting duty under Regulation SBSR, and the reporting hierarchy in existing Rule 901(a)(2)(ii) would determine which side is the reporting side for the transaction.

One commenter argued that “a platform should report all trades executed on a SB SEF regardless of whether an SB swap will be submitted to clearing.”²³⁹ The Commission disagrees. The Commission did not propose and is not adopting an extension to Rule 901(a)(1) that would require a platform to report *all* security-based swaps that are executed on its facilities. Moreover, the approach being adopted by the Commission avoids the need to develop an overly complicated rule that would be needed to identify, with respect to a platform-executed transaction that will not be submitted to clearing, what information would be reported by the platform and what information would be reported by one of the sides.²⁴⁰ The commenter acknowledges that requiring a platform to report uncleared security-based swaps executed on its facilities would necessitate additional reporting by at

²³⁸ This is consistent with the Commission’s guidance in the Regulation SBSR Adopting Release that, for transactions subject to the reporting hierarchy, the reporting side may choose the registered SDR to which it makes the report required by Rule 901. See 80 FR at 14597–98.

²³⁹ WMBAA Letter at 2.

²⁴⁰ See ISDA/SIFMA Letter at 27 (agreeing with the Commission’s approach of not requiring shared reporting of the same transaction and noting that “[u]nder the CFTC Rules, we have experienced the difficulty of a shared obligation for reporting a swap”).

least one of the sides.²⁴¹ As discussed in the subsection immediately below, the Commission believes that the transaction information germane to a platform-executed alpha can and should be reported by the platform.²⁴² However, a transaction that will not be submitted to clearing is more likely to include bespoke or more counterparty-specific data elements that would be more difficult for the platform to obtain from the counterparties and to report because such non-standardized transactions would not lend themselves to routinized reporting.²⁴³ Rather than adopting an approach that would seek to identify each potential data element and to assign the duty to report it (as between the platform and one of the sides), the Commission instead is adopting an approach that requires the platform to report only those transactions executed on its system that will be submitted to clearing. In cases where a platform-executed transaction will not be submitted to clearing, existing Rule 901(a)(2)(ii) provides that one of the sides will have the duty to report, and this duty is not divided between the platform and the side.

The commenter expressed concern that this approach could lead to confusion over reporting obligations when “it is uncertain whether the transaction will be cleared upon execution.”²⁴⁴ A platform can determine whether a particular security-based swap will be submitted to clearing implicitly through the product ID (e.g., if the security-based swap has a product ID of a “made available to trade” product or if the product ID otherwise specifies that the product will be submitted to clearing) or explicitly because the counterparties inform the

platform of their intent.²⁴⁵ Counterparties could signal to a platform that they intend to clear a particular security-based swap using communications infrastructure provided by the platform to submit transaction information to a registered clearing agency or by otherwise specifically informing the platform before or at the time of execution of their intent to submit the trade to clearing. Absent an implicit or explicit indication before or at the time of execution that a particular security-based swap will be submitted to clearing, the platform can reasonably conclude that the transaction will not be submitted to clearing and thus that the platform has no reporting obligation. Thus, if the direct counterparties do not inform the platform before or at the point of execution that they intend to submit the transaction to clearing, the platform incurs no duty to report. In that case, the reporting hierarchy in existing Rule 901(a)(2)(ii) would apply to the security-based swap and the reporting side identified under Rule 901(a)(2)(ii) would be obligated to report the transaction.²⁴⁶

Furthermore, the Commission believes that another alternate approach—of requiring all platform-executed transactions, even those that will be submitted to clearing, to be reported by one of the sides and not imposing any reporting duties on platforms—is impractical. As the Commission has noted, platform-executed alphas can be executed anonymously.²⁴⁷ Although some platform-executed transactions that will be submitted to clearing might not be executed anonymously, the Commission believes that it is more efficient to require the platform to report all security-based swaps executed on that platform that will be submitted to clearing, regardless of whether the

counterparties are, in fact, anonymous to each other. The Commission believes that assigning the duty to report to the platform minimizes the number of reporting steps and thus minimizes the possibility of errors or delays in reporting the transaction to a registered SDR. Thus, the Commission believes that all platform-executed transactions that will be submitted to clearing should be reported by the platform. The Commission believes that this approach will be more efficient than if the platform had to assess on a transaction-by-transaction basis whether or not the counterparties are in fact unknown to each other.

C. Data Elements That a Platform Must Report

The Commission continues to believe that platforms should not be required to report information that they do not have or that it would be impractical for them to obtain. In the Regulation SBSR Proposed Amendments Release, the Commission carefully reviewed each data element contemplated by Rules 901(c) and 901(d) and proposed to require platforms to report only those data elements that it believed that would be readily obtainable and germane to the transaction.²⁴⁸ One commenter stated that “[p]latforms could reasonably be expected to gather and report the primary trade information contained under Rule 901(c),” but cautioned that “requiring platforms to report a subset of the secondary trade information contained under Rule 901(d) will be problematic,” specifically noting that the platform could not reasonably be expected to know the guarantors of the direct counterparties.²⁴⁹ A second commenter also pointed to difficulties with a platform identifying indirect counterparties.²⁵⁰ In view of these comments, the Commission is adopting, largely as proposed, the list of data elements that the platform must report, but with minor revisions that remove any need for platforms to learn about indirect counterparties.²⁵¹

²⁴¹ See WMBAA Letter at 3 (“For uncleared SB swaps, . . . the platform should provide all readily available information, and the reporting side should be responsible for reporting the information not provided to the SB SEF”) (emphasis added).

²⁴² Thus, the sides would have no duty to report anything except missing UICs, as required by existing Rule 906(a). In Rule 906(a), the Commission established a mechanism for obtaining missing UICs from non-reporting sides because it anticipated circumstances when they might be unable or unwilling to provide those UICs to the persons who have the initial reporting duty. See Regulation SBSR Adopting Release, 80 FR at 14644.

²⁴³ For example, an uncleared transaction between two counterparties executed on an SB SEF is likely to involve one or more bilateral agreements between the counterparties that govern other facets of their relationship, such as margining and collateral arrangements. The title and date of any such agreement that is incorporated by reference into a security-based swap contract must be reported pursuant to existing Rule 901(d)(4). The Commission does not believe that it would be appropriate to require a platform to obtain this information from the counterparties and to incur the duty for reporting it.

²⁴⁴ WMBAA Letter at 2.

²⁴⁵ The Commission notes that the certain execution venues that are registered with the CFTC as swap execution facilities have adopted rules that require swap counterparties to designate whether or not a swap will be submitted to clearing. See MarketAxess SEF Rulebook, Rule 905, available at: http://www.marketaxess.com/pdfs/cds/MKTX_SEF_Rulebook_Effective_08-24-2015.pdf (last visited May 25, 2016); Bloomberg SEF Rulebook, Rule 533(a), available at: <http://www.bbhub.io/professional/sites/4/BSEF-Rulebook-December-7-2015.pdf>, (last visited May 25, 2016).

²⁴⁶ The Commission encourages platforms and their participants to develop protocols for determining in advance of execution whether a particular transaction will be submitted to clearing to minimize ambiguity regarding which person—the platform or one of the sides—will have the duty to report under Rule 901(a). If there is ambiguity regarding whether a particular transaction will be submitted to clearing, the counterparties are in the best position to resolve that ambiguity.

²⁴⁷ See Regulation SBSR Proposed Amendments Release, 80 FR at 14748.

²⁴⁸ See 80 FR at 14749–50. One commenter generally agreed that platforms would have the information that the Commission proposed to require them to report. See Barnard I at 2.

²⁴⁹ ICE Letter at 4.

²⁵⁰ See ISDA/SIFMA Letter at 27.

²⁵¹ The Commission also is making a minor revision to replace the phrase “the information required by” in proposed Rule 901(a)(1) with “the information set forth in” in final Rule 901(a)(1). This revision is designed to clarify that a platform that incurs a reporting duty under Rule 901(a)(1) must discharge that duty by reporting certain elements that are set forth in Rules 901(c) and 901(d).

The Commission continues to believe that platforms will have or can readily obtain the primary trade information contemplated by Rules 901(c)(1)–(4). For example, the platform will have information that identifies the products that it offers for trading.²⁵² When a transaction is effected on the platform's facilities, the platform should have the ability to capture the price, the notional amount, and the date and time of execution.²⁵³ As discussed in the subsection immediately above, platforms should be able to ascertain either implicitly (via the product traded) or explicitly (from the counterparties) whether the direct counterparties intend that the security-based swap will be submitted to clearing, as required by Rule 901(c)(6). If the direct counterparties do not inform the platform before or at the point of execution that they intend to submit the transaction to clearing, the platform incurs no duty under Rule 901(c)(6).²⁵⁴

The platform will know the direct counterparty on each side of the transaction—or if one side will be allocated among a group of funds or accounts, the execution agent of that side. Therefore, final Rule 901(a)(1) requires the platform to report the counterparty ID or the execution agent ID, as applicable, of each direct counterparty.

The platform also can readily provide its own platform ID, as required by Rule 901(d)(9).

Rule 901(d)(10) applies only if the security-based swap being reported arises from the allocation, termination, novation, or assignment of one or more existing security-based swaps. To the extent that a platform facilitates allocations, terminations, novations, or assignments of existing security-based swaps, the platform would be in a position to require its participants that engage in such exercises to provide the platform with the transaction IDs of the relevant existing security-based swaps, which the platform would report—along with the transaction information about any newly created transaction(s)—pursuant to Rule 901(d)(10).

As noted above, two commenters noted that it would be impractical for platforms to learn the identity of indirect counterparties to transactions

effected on their facilities.²⁵⁵ The Commission agrees that it would be burdensome to require a platform to learn from the direct counterparties, on a trade-by-trade basis, whether either direct counterparty has a guarantor. Furthermore, the Commission now believes that there would be little benefit to imposing such a requirement. A platform-executed security-based swap, if it will be cleared, will be submitted to clearing shortly after execution and thus will have only a short lifespan. Shortly, or perhaps even immediately, after being submitted to clearing, it will likely either be terminated because it is accepted for clearing or terminated because it is rejected from clearing. In either case, the potential exposure of a guarantor of the alpha transaction—if there is a guarantor—is likely to be fleeting. In view of the potential burdens that a requirement to report indirect counterparties could place on platforms against only marginal benefits, the Commission has determined not to adopt any requirement for platforms to report indirect counterparties.²⁵⁶

Existing Rule 901(c)(5) requires reporting of whether both sides of a security-based swap include a registered security-based swap dealer. One of the commenters who argued for the removal of the requirement for platforms to report indirect counterparties also noted that it would be difficult for platforms to comply with Rule 901(c)(5) if a registered security-based swap dealer was an indirect counterparty.²⁵⁷ The Commission agrees. Therefore, for the same reasons that it has decided not to adopt a requirement for platforms to report whether either direct counterparty has a guarantor, the Commission has revised final Rule 901(a)(1) to require a platform to indicate only when both *direct*

²⁵⁵ See ICE Letter at 4; ISDA/SIFMA Letter at 27 (stating that “[a] platform will not likely have advance access to complete information pertaining to whether there is an indirect counterparty on either side of the transaction,” and that building a mechanism to capture the existence of indirect counterparties “must be factored into the implementation timeframe for platforms”).

²⁵⁶ This revision in final Rule 901(a)(1) does not affect the existing requirements for reporting a platform-executed transaction that *will not* be submitted to clearing. Such a transaction is governed by existing Rule 901(a)(2)(ii), which requires one of the sides to be the reporting side. The reporting side must report, among other things, all of the information required by Rule 901(d) including, as applicable, the identity of its own guarantor and any guarantor of the direct counterparty on the other side. Reporting of the guarantor(s) of a security-based swap will assist the Commission and other relevant authorities in monitoring the ongoing exposures of market participants.

²⁵⁷ See ISDA/SIFMA Letter at 27.

counterparties of a security-based swap are registered security-based swap dealers—not, as originally proposed, if a registered security-based swap dealer is present on both sides (e.g., as a guarantor). A platform will be able to learn from publicly available sources when its participants who effect transactions as direct counterparties are registered as security-based swap dealers.²⁵⁸

D. Platform Duty To Report Secondary Trade Information

Final Rule 901(a)(1) makes clear that the only secondary trade information that a platform must report is the counterparty ID of each direct counterparty (or execution agent, if applicable);²⁵⁹ the platform ID;²⁶⁰ and the transaction ID of the prior security-based swap if the platform-executed security-based swap results from the allocation, termination, novation, or assignment of the prior transaction.²⁶¹

One commenter expressed concern about a platform having to report other secondary trade information, such as the title and date of any agreements incorporated by reference into the security-based swap contract.²⁶² Rule 901(a)(1), both as proposed and as adopted, requires a platform to report only the secondary trade information specifically enumerated in the rule. The agreements contemplated by Rule 901(d)(4) are not so enumerated.²⁶³

E. Platform Has No Duty To Report Life Cycle Events

One commenter argued that platforms should have no duty to report life cycle event information because platforms have no involvement in a security-based swap after execution and would not have access to such information.²⁶⁴ The Commission agrees. Therefore, the Commission did not propose and is not adopting a requirement for platforms to report any life cycle events.

Existing Rule 901(e)(1)(i) provides that most life cycle events (and

²⁵⁸ See SBS Entity Registration Adopting Release, 80 FR at 48972 (“The Commission intends to notify entities electronically through the EDGAR system when registration is granted, and will make information regarding registration status publicly available on EDGAR”).

²⁵⁹ See Rule 901(d)(1). As noted above, final Rule 901(a)(1) requires a platform to report the counterparty IDs only of the direct counterparties to the transaction, not of any indirect counterparties.

²⁶⁰ See Rule 901(d)(9).

²⁶¹ See Rule 901(d)(10).

²⁶² See WMBAA Letter at 4 (referencing requirement in Rule 901(d)(4)).

²⁶³ See ISDA/SIFMA Letter at 27 (correctly observing that the Commission did not propose to require platforms to report agreement information).

²⁶⁴ See WMBAA Letter at 4.

²⁵² See Rule 901(c)(1).

²⁵³ See Rule 901(c)(2)–(4).

²⁵⁴ The Commission believes that this approach responds to the commenter who noted that, in some instances, a platform might not know the intent of the counterparties and thus would have difficulty complying with Rule 901(c)(6). See WMBAA Letter at 3.

adjustments due to life cycle events) must be reported *by the reporting side*. A platform is not a counterparty to a security-based swap and thus cannot be a reporting side. Therefore, existing Rule 901(e)(1)(i), by its terms, imposes no duty on platforms to report life cycle events. Furthermore, Rule 901(e)(1) includes one exception to the general rule that the reporting side must report life cycle events: New paragraph (e)(1)(ii), as adopted today, requires the registered clearing agency to which the platform-executed alpha is submitted to report to the alpha SDR whether or not it has accepted a security-based swap for clearing. The Commission believes that these are the only life cycle events germane to a platform-executed alpha—the transaction will either be terminated because it is accepted for clearing or terminated because it is rejected from clearing—and therefore is not imposing any requirement on the platform or either of the sides to report additional types of life cycle events for platform-executed alphas.

F. Implementation Issues

One commenter encouraged the Commission “to allow the use of existing reporting technology and reporting architecture to reduce the amount of additional technology investment required to comply” with any reporting obligations.²⁶⁵ This commenter further requested that the Commission “make clear in its final rules that platforms have discretion to determine the most appropriate technological manner in which they comply with the Commission’s rules.”²⁶⁶ The Commission has been sensitive to the current state of the security-based swap industry and, in particular, the technological baseline that is utilized by market participants and infrastructure providers to carry out business and regulatory functions. The Commission has sought to adopt final rules that minimize changes to systems and processes so far as they can be adapted to new reporting duties, while recognizing that new systems or processes, or fairly significant revisions to existing systems or processes, might be necessary in some cases.

The Commission acknowledges that Rule 901(a)(1) will require platforms to develop, test, implement, and maintain technology to ensure connectivity to at least one registered SDR.²⁶⁷ Rule 901(a)(1) does not specify the reporting technology or reporting architecture for platforms to use, and platforms may use

their existing technology and architecture to reduce the amount of additional technology investment required to comply with the rule. Moreover, the Commission affirms that platforms may retain third-party service providers to facilitate compliance with their reporting obligations. The Commission notes that platforms are no different from other persons having a duty to report that elect to use an agent to carry out that function; the person with the reporting duty would retain responsibility under Regulation SBSR for providing the required information in the required format.²⁶⁸

Finally, this commenter also urged the Commission to “clearly outline the specific data fields, and permissible formats for reporting those data fields, required for post-trade reporting.”²⁶⁹ When it adopted Regulation SBSR, the Commission took the approach of generally requiring reporting of general categories of data (such as the “price”)²⁷⁰ while requiring registered SDRs to establish and maintain written policies and procedures that specify the manner in which persons having a duty to report must provide security-based swap transaction data to the SDR.²⁷¹ In the Regulation SBSR Adopting Release, the Commission considered whether to prescribe formats for the data elements required by Regulation SBSR, and concluded that “it is neither necessary or appropriate to mandate a fixed schedule of data elements to be reported, or a single format or language for reporting such elements to a registered SDR.”²⁷² In the Regulation SBSR Proposed Amendments Release, the Commission did not propose a new approach for specifying how the required data elements must be reported to a registered SDR, and declines to adopt a new approach here.²⁷³

²⁶⁸ See Regulation SBSR Adopting Release, 80 FR at 14602.

²⁶⁹ WMBAA Letter at 2.

²⁷⁰ See Rule 901(c)(3).

²⁷¹ See Rules 907(a)(1) and 907(a)(2). The Commission did, however, require reporting of some specific data elements. See, e.g., Rule 901(c)(6) (requiring reporting of whether the direct counterparties intend that the security-based swap will be submitted to clearing); Rule 901(d)(9) (requiring reporting of the platform ID, if applicable).

²⁷² 80 FR at 14595. The Commission noted, furthermore, that new security-based swap products are likely to develop over time and a rule establishing a fixed schedule of data elements could become obsolete as new data elements might become necessary to reflect material economic terms of new security-based swap products. See *id.*

²⁷³ The Commission notes, however, that it has proposed an amendment to Rule 13n–4(a)(5) under the Exchange Act, 17 CFR 240.13n–4(a)(5), that would specify the form and manner with which SDRs will be required to make security-based swap data available to the Commission. See Securities

G. Reporting Duty Applies Even to Unregistered Platforms

New Rule 901(a)(1) imposes a reporting duty on any “platform” if a security-based swap that will be submitted to clearing is executed on the platform. One commenter requested the Commission to clarify “whether an alpha SBS entered into via an execution venue in advance of its registration or exemption as a national securities exchange or security-based swap execution facility is required to be reported to one of the sides.”²⁷⁴ The commenter stated that “[i]deally the registration or exemption of platforms would precede the compliance date for reporting under [Regulation] SBSR. Otherwise, the industry will need to transition the reporting responsibility which may lead to gaps or duplications in reporting since the relevant static data and any system architectural changes will not occur simultaneously.”²⁷⁵ The commenter argued, in the alternative, that “the Commission should exempt alphas from reporting in advance of platform registration.”²⁷⁶ A second commenter stated that it “is uncertain as to how the reporting obligations for a platform under Regulation SBSR would be fulfilled if the compliance dates are triggered before the Commission implements SB swap trading rules.”²⁷⁷

In the Regulation SBSR Adopting Release, the Commission explained that there are certain entities that currently meet the definition of “security-based swap execution facility” but that are not yet registered with the Commission and will not have a mechanism for registering as SB SEFs until the Commission adopts final rules governing the registration and core principles of SB SEFs. These entities currently operate pursuant to an exemption from certain provisions of the Exchange Act.²⁷⁸ To ensure that transactions that occur on such exempt SB SEFs are captured by Regulation

Exchange Act Release No. 76624 (December 11, 2015), 80 FR 79757 (December 23, 2015).

²⁷⁴ ISDA/SIFMA Letter at 28.

²⁷⁵ *Id.*

²⁷⁶ *Id.*

²⁷⁷ WMBAA Letter at 5.

²⁷⁸ See Securities Exchange Act Release No. 64795 (July 1, 2011), 76 FR 39927 (July 7, 2011). In this order, the Commission granted entities that meet the statutory definition of “exchange” solely due to their activities relating to security-based swaps a temporary exemption from the requirement to register as a national securities exchange in Sections 5 and 6 of the Exchange Act, 15 U.S.C. 78e and 78f. This included entities that would meet the statutory definition of “security-based swap execution facility” but that otherwise would not be subject to the requirements under Sections 5 and 6 of the Exchange Act.

²⁶⁵ See WMBAA Letter at 3.

²⁶⁶ *Id.*

²⁶⁷ See WMBAA Letter at 3.

SBSR, existing Rule 900(v) defines “platform” as “a national securities exchange or security-based swap execution facility that is registered or exempt from registration” (emphasis added). Therefore, the Commission does not believe that it is necessary, as the commenter suggests, to transfer reporting duties from the platform to one of the sides, or to exempt alphas from reporting entirely, until the Commission adopts registration rules for SB SEFs. Doing so could significantly delay the benefits of regulatory reporting and public dissemination of platform-executed alpha transactions. Furthermore, the Commission understands that, although platforms for security-based swaps might not yet be registered with the Commission, they likely already possess significant post-trade processing capabilities because of their activities in the swaps market, which subjects them to reporting duties under CFTC rules.²⁷⁹ In any event, unregistered platforms will have an extended period in which to prepare for their reporting duties under Regulation SBSR, as new transactions in an asset class will not have to be reported until at least six months after the first SDR that can accept transactions in that asset class registers with the Commission.²⁸⁰

V. Additional Matters Concerning Platforms and Registered Clearing Agencies

A. Extending “Participant” Status

Existing Rule 901(h) requires “a reporting side” to electronically transmit the information required by Rule 901 in a format required by the registered SDR. In the Regulation SBSR Proposed Amendments Release, the Commission proposed to replace the term “reporting side” in Rule 901(h) with the phrase “person having a duty to report.” Under Rule 901(a), as amended by this release, a platform or registered clearing agency might incur a reporting duty even if it is not one of the sides to the transaction.²⁸¹ All persons who have a duty to report under Regulation SBSR—*i.e.*, platforms, reporting sides, and registered clearing agencies that must report whether or not a security-based swap is accepted for clearing—must electronically transmit the information required by Rule 901 in a format required by the registered SDR.

²⁷⁹ See 17 CFR 43.8(h) (reporting by SEF or designated contract market).

²⁸⁰ See *infra* Section X (discussing compliance dates).

²⁸¹ The Commission proposed to expand Rule 908(b) to include all platforms and registered clearing agencies. This amendment to Rule 908(b) is discussed in Section IX, *infra*.

Replacing “reporting side” with “person having the duty to report” in Rule 901(h) extends this requirement to all persons with reporting duties, even if they are not one of the sides. The Commission received no comments that specifically addressed the amendment to Rule 901(h)²⁸² and is adopting this amendment as proposed.

Under existing Rule 900(u), platforms and registered clearing agencies would not be participants of registered SDRs solely as a result of having a duty to report security-based swap transaction information pursuant to Rule 901(a)(1) or 901(e)(1)(ii), respectively.²⁸³ In the Regulation SBSR Proposed Amendments Release, the Commission expressed the preliminary view that platforms and registered clearing agencies should be participants of any registered SDR to which they report security-based swap transaction information on a mandatory basis. Consistent with this view, the Commission proposed to amend the definition of “participant” in Rule 900(u) to include a platform that is required to report a security-based swap pursuant to Rule 901(a)(1) or a registered clearing agency that is required to report a life cycle event pursuant to Rule 901(e)(1)(ii).²⁸⁴

One commenter expressed general support for requiring platforms and clearing agencies to become participants of the registered SDRs to which they report.²⁸⁵ A second commenter agreed that a clearing agency or platform must be a participant of a registered SDR to which it reports to ensure that reports are submitted in a format required by the registered SDR.²⁸⁶ The second commenter, however, also expressed its understanding “that in this context, participant means a registered user of an

²⁸² *But see* ISDA/SIFMA Letter at 29 (endorsing a similar amendment to Rule 905(a)(1) that expands that rule from “the reporting side” to “the person having the duty to report”).

²⁸³ Existing Rule 900(u) provides that a “[p]articipant, with respect to a registered security-based swap data repository, means a counterparty, that meets the criteria of [Rule 908(b)], of a security-based swap that is reported to that registered security-based swap data repository to satisfy an obligation under [Rule 901(a)].”

²⁸⁴ A registered clearing agency that is required to report a clearing transaction pursuant to Rule 901(a)(2)(i) is a counterparty to that security-based swap and is thus covered by the existing definition of “participant.”

²⁸⁵ See DTCC Letter at 5–6, 17 (stating that “the clearing agency should become an onboarded participant of the SB SDR and adhere to the policy and procedures to report data in the format required by the SB SDR. In this regard, separate accommodations should not be made for clearing agencies, which should be required to comply with an SB SDR’s policies and procedures to the same extent as other market participants”).

²⁸⁶ See ISDA/SIFMA Letter at 24, 27.

SDR, submitting data in the format as requested by the SDR, rather than a ‘participant’ as defined in Final SBSR.”²⁸⁷ A third commenter agreed that platforms should be required to report transaction data to a registered SDR “in a format required by that registered SDR”; however, the commenter “does not believe that it should be required to become a member of an SDR.”²⁸⁸ A fourth commenter stated that, although a clearing agency “should execute an agreement outlining the requirements to report termination messages” to the alpha SDR, the clearing agency should not become a full participant of the alpha SDR because it is not a counterparty to the alpha.²⁸⁹ This commenter also argued that the clearing agency “should not incur SDR fees to report alpha termination messages.”²⁹⁰

After carefully considering the comments, the Commission is adopting the amendment to Rule 900(u) as proposed. Conferring “participant” status on these additional entities subjects them to the requirement in Rule 906(c), as amended herein,²⁹¹ for enumerated participants to establish, maintain, and enforce written policies and procedures that are reasonably designed to ensure that they comply with any obligations to report information to a registered SDR in a manner consistent with Regulation SBSR. The Commission believes that these policies and procedures will increase the accuracy and reliability of information reported to registered SDRs. Without written policies and procedures for carrying out their reporting obligations, clearing agencies and the other entities enumerated in Rule 906(c), as amended, might depend too heavily on key individuals or *ad hoc* and unreliable processes. Written policies and procedures, however, can be shared throughout an organization and generally should be independent of any specific individuals. Requiring clearing agencies, as well as the other participants enumerated in Rule 906(c), to adopt and maintain written policies and procedures relevant to their reporting responsibilities should help to improve the degree and quality of overall compliance with the reporting requirements of Regulation SBSR. Periodic review of these policies and procedures, as required by Rule 906(c), should help to ensure that these policies

²⁸⁷ *Id.* at 24.

²⁸⁸ WMBAA Letter at 4.

²⁸⁹ ICE Letter at 6.

²⁹⁰ *Id.*

²⁹¹ See *infra* Section V(E).

and procedures remain well-functioning over time.

A registered clearing agency that clears security-based swaps or a platform that executes security-based swaps that will be submitted to clearing incurs reporting duties under Regulation SBSR, which requires the platform or registered clearing agency, among other things, to submit transaction information to one or more registered SDRs. As a result of the amendment to Rule 900(u) being adopted today, the platform or registered clearing agency automatically becomes a “participant”—under Regulation SBSR—of any SDR to which it submits transaction information on a mandatory basis. The Commission notes, however, that “participant” status under Rule 900(u) does not require a platform or registered clearing agency to sign a formal participant agreement with a registered SDR or to establish connectivity sufficient to report all of the primary and secondary trade information of a security-based swap.²⁹² A registered SDR may impose certain obligations on persons who utilize the SDR’s services, regardless of whether such persons are deemed “participants” under Regulation SBSR. For example, an SDR may impose fees on such persons for submitting data.²⁹³

B. Examples of Reporting Workflows Involving Platforms and Registered Clearing Agencies

The following examples illustrate the reporting process for alpha, beta, and gamma security-based swaps, assuming an agency model of clearing under which a counterparty to an alpha security-based swap becomes a direct counterparty to a subsequent clearing transaction:²⁹⁴

- *Example 1.* A registered security-based swap dealer enters into a security-based swap with a private fund. The transaction is not executed on a platform. The counterparties intend to clear the transaction (*i.e.*, the transaction is an alpha). Neither side has a guarantor with respect to the

alpha, and both direct counterparties are U.S. persons.

- The registered security-based swap dealer is the reporting side under existing Rule 901(a)(2)(ii) and must report this alpha transaction to a registered SDR (and may choose the registered SDR).

- New Rule 901(a)(3) requires the registered security-based swap dealer, as the reporting side of the alpha transaction, to promptly provide to the registered clearing agency the transaction ID of the alpha and the identity of the alpha SDR.

- If the registered clearing agency accepts the alpha for clearing and terminates the alpha, two clearing transactions—a beta (between the registered security-based swap dealer and the registered clearing agency) and a gamma (between the registered clearing agency and the private fund)—take its place.

- New Rule 901(e)(1)(ii) requires the registered clearing agency to report to the alpha SDR that it accepted the transaction for clearing.

- Under new Rule 901(a)(2)(i), the registered clearing agency is the reporting side for each of the beta and the gamma. Therefore, the registered clearing agency must report the beta and gamma to a registered SDR (and the clearing agency may select the registered SDR). The report for each of the beta and the gamma must include the transaction ID of the alpha, as required by existing Rule 901(d)(10).

- *Example 2.* Same facts as Example 1, except that the private fund and the registered security-based swap dealer transact on an SB SEF.

- New Rule 901(a)(1) requires the SB SEF to report the alpha transaction (and allows the SB SEF to choose the registered SDR).

- After the alpha has been submitted to clearing, new Rule 901(a)(3) requires the SB SEF to promptly report to the registered clearing agency the transaction ID of the alpha and the identity of the alpha SDR.

- Once the alpha is submitted to clearing, the reporting workflows are the same as in Example 1.

C. Amendments to Rule 905(a)

Existing Rule 905(a) provides a mechanism for reporting corrections of previously submitted security-based swap transaction information.²⁹⁵ Rule 905(a)(1) requires a non-reporting side that discovers an error in a previously submitted security-based swap to promptly notify “the reporting side” of

the error.²⁹⁶ Under existing Rule 905(a)(2), once “the reporting side” receives notification of an error from the non-reporting side or discovers an error on its own, “the reporting side” is required to promptly submit an amended report containing the corrected information to the registered SDR that received the erroneous transaction report.

In the Regulation SBSR Proposed Amendments Release, the Commission proposed—and today is adopting—amendments to Rule 901(a) that require platforms and registered clearing agencies to report certain transaction information. To preserve the principle in existing Rule 905(a) that the person responsible for reporting information also should have responsibilities for correcting errors, the Commission proposed to replace the term “reporting side” in existing Rules 905(a)(1) and 905(a)(2) with the phrase “person having a duty to report.” This amendment was necessitated by the fact that a platform—and a registered clearing agency, when it has the duty to report whether or not it has accepted a security-based swap for clearing—is not a side to the transaction, and thus is not covered by existing Rule 905(a).

Under the proposed amendment to Rule 905(a)(1), a person that is not the reporting side who discovers an error in a previously submitted security-based swap would be required to promptly notify “the person having the duty to report” of the error. Under the proposed amendment to Rule 905(a)(2), “the person having the duty to report” a security-based swap would be required to correct previously reported erroneous information with respect to that security-based swap if it discovers an error or if it receives notification of an error from a counterparty. Four commenters expressed general support for the proposed amendments to Rule 905(a).²⁹⁷

After carefully considering the comments received, the Commission is adopting the amendments to Rule 905(a) as proposed. The Commission believes that, in light of the amendments to Rule 901(a) that also are being adopted today,²⁹⁸ Rule 905(a) is necessary to account for the possibility that a person who is not a counterparty and is thus

²⁹⁶ See Regulation SBSR Adopting Release, 80 FR at 14681.

²⁹⁷ See DTCC Letter at 18; LCH.Clearnet Letter at 11; ISDA/SIFMA Letter at 29; WMBAA Letter at 5. Another commenter acknowledged that the proposed amendments are “technical changes to the rules to incorporate these new reporting participants,” but made no further commentary on the proposed amendments to Rule 905(a). See Better Markets Letter at 3–4.

²⁹⁸ See *supra* Section II(B).

²⁹² At the same time, nothing in Regulation SBSR prevents a platform or registered clearing agency from signing such a participation agreement.

²⁹³ See *supra* note 191 and accompanying text. However, an SDR must offer fair, open, and not unreasonably discriminatory access to users of its services and ensure that any fees that it charges are fair and reasonable and not unreasonably discriminatory. See Rules 13n–4(c)(1)(i) and 13n–4(c)(1)(iii) under the Exchange Act, 17 CFR 240.13n–4(c)(1)(i) and 240.13n–4(c)(1)(iii).

²⁹⁴ Because clearing of security-based swaps in the United States is still evolving, other models of clearing might emerge where customers would not become direct counterparties of a registered clearing agency. See *supra* Section III(A)(1) (discussing the clearing process in the United States).

²⁹⁵ See Regulation SBSR Adopting Release, 80 FR at 14641–42.

not on either side of the transaction could have a duty to report. Thus, a platform or registered clearing agency (when the clearing agency is reporting whether or not it has accepted an alpha for clearing and thus is not the reporting side of the alpha) can incur a duty to report a correction, because it also can incur the initial duty to report the relevant information.

One commenter, discussing general difficulties in making non-reporting sides become “onboarded users” of registered SDRs, stated that only reporting sides—who presumably would be onboarded users—should be responsible for amending errors and omissions associated with previously submitted security-based swaps.²⁹⁹ The Commission agrees that the person having the duty to report the initial transaction should be responsible for amending errors and omissions. There is no scenario under Rule 905(a), as amended, in which a non-reporting side must report anything to a registered SDR. If a non-reporting side discovers an error, Rule 905(a)(1) requires the non-reporting side to inform the person who had a duty to report the initial transaction—which could be a platform, a registered clearing agency, or the reporting side—not the registered SDR.

A second commenter expressed the view that “[w]hen a correction is made to a trade which has already been accepted by a registered clearing agency or prime broker, then that party must also notify the registered clearing agency or prime broker of the correction.”³⁰⁰ Nothing in Regulation SBSR requires a person to notify the registered clearing agency or prime broker of a correction after the person reports the correction to a registered SDR. Rule 905(a) is concerned with maintaining accurate information in registered SDRs. The acceptance of a security-based swap by a registered clearing agency or a prime broker (in the case of a three-legged prime brokerage structure) terminates the initial transaction and results in the creation of new security-based swaps pursuant to the rules of the relevant registered clearing agency or the terms of the prime brokerage arrangement, respectively.³⁰¹ Rule 905(a) requires that, if the person having the duty to

report the original transaction becomes aware of erroneous information in the report of the transaction, that person must submit a correction to the registered SDR. If the sides of the security-based swap also provided incorrect information about the initial transaction to the registered clearing agency or prime broker, the sides presumably would follow the procedures required by the registered clearing agency or the prime brokerage arrangement to correct the error—but nothing in Regulation SBSR compels that result.

D. Requirements Related to Participant Providing Ultimate Parent and Affiliate Information to Registered SDR

As described in Section V(A), *supra*, the Commission is adopting, as proposed, an amendment to the definition of “participant” in Rule 900(u) to include platforms that are required to report platform-executed security-based swaps that will be submitted to clearing and registered clearing agencies that are required to report whether or not an alpha is accepted for clearing. Existing Rule 906(b) requires each participant—as defined by Rule 900(u)—of a registered SDR to provide the SDR with information sufficient to identify any affiliate(s) of the participant that also are participants of the SDR and any ultimate parent(s) of the participant.³⁰² By amending Rule 900(u) to make platforms and registered clearing agencies participants, these entities would become subject to Rule 906(b). In the Regulation SBSR Proposed Amendments Release, however, the Commission proposed to amend Rule 906(b) to exclude platforms or registered clearing agencies from the requirement to provide information about affiliates and ultimate parents to an SDR.

Three commenters expressed support for the Commission’s proposal to exempt platforms and registered clearing agencies from the obligations of Rule 906(b).³⁰³ The Commission continues to believe that platforms and registered clearing agencies should be exempt from the obligations of Rule 906(b) and is adopting the amendment to Rule 906(b) as proposed.

The Commission also proposed to make a similar amendment to existing Rule 907(a)(6), which requires a registered SDR to have policies and procedures “[f]or periodically obtaining from each participant information that

identifies the participant’s ultimate parent(s) and any participant(s) with which the participant is affiliated, using ultimate parent IDs and counterparty IDs.” The Commission proposed to amend Rule 907(a)(6) to require registered SDRs to have policies and procedures to obtain this information from each participant “other than a platform or a registered clearing agency.” One commenter supported the Commission’s proposal.³⁰⁴ The Commission continues to believe that this amendment to Rule 907(a)(6) is appropriate and is adopting the amendment as proposed.

One commenter asked the Commission to exclude from Rule 906(b) transactions that include an execution agent ID.³⁰⁵ The commenter stated: “Aggregation across affiliated entities under a common parent makes the most sense from a regulatory or systemic risk perspective where there is coordinated trading activity and/or the risk of such swap positions is borne by the parent under an explicit or implicit guarantee. In the context of asset management, neither is typically present. For separate account clients, virtually all the asset management assignments undertaken by our members are on a discretionary basis As a result, the separate account client (let alone its affiliates or parent) would not be responsible under its trading contracts for trading losses incurred by a manager acting on its behalf beyond the assets it has provided to that manager.”³⁰⁶

Rule 906(b) is designed to facilitate the Commission’s ability to measure security-based swap exposure within the same ownership group. The Commission believes that requiring the funds and accounts described in the commenter’s letter to report parent and

³⁰⁴ ISDA/SIFMA Letter at 29 (“as we support the assignment of reporting duties to platforms and clearing agencies, [we] also agree with the conforming changes to . . . Rule 907(a)(6)”).

³⁰⁵ See SIFMA-AMG II at 3–4. The commenter appears to be of the view that ultimate parent IDs and affiliate IDs are fields that must be included in reports of individual transactions. *See id.* at 3 (“AMG requests clarification that the parent and affiliate fields are not applicable (or ‘N/A’) for a trade if the trade report includes an execution agent’s ID”). The Commission notes, however, that a participant’s ultimate parent and affiliate information must be disclosed to the registered SDR of which it is a participant in a separate report, not in individual transaction reports.

³⁰⁶ *Id.* at 3–4. *See also id.* at 4 (“There is even less reason to require identification of the affiliates or parent of a collective investment vehicle. While funds in the same complex could be viewed as affiliated for certain purposes, aggregating swap positions across funds where recourse is legally and contractually limited would be misleading from a systemic risk and regulatory oversight perspective”).

²⁹⁹ See DTCC/ICE/CME Letter at 2 (also stating that requiring reporting sides to amend errors and omissions would support “current operational workflows since the reporting side is the only party with a contractual relationship with the non-reporting side as it relates to the trade details”).

³⁰⁰ LCH.Clearnet Letter at 11.

³⁰¹ See *supra* Section III(E) (discussing clearing process in the agency model of clearing); *infra* Section VII(B) (discussing prime brokerage workflows).

³⁰² See Regulation SBSR Adopting Release, 80 FR at 14645.

³⁰³ See LCH.Clearnet Letter at 11; ISDA/SIFMA Letter at 29; WMBAA Letter at 5.

affiliate information would not serve this goal. Accordingly, the Commission is amending Rule 906(b) to exclude externally managed investment vehicles from the requirement to provide ultimate parent and affiliate information to any registered SDR of which it is a participant.³⁰⁷ The Commission is not acting upon the commenter's specific suggestion to base an exclusion on the fact that the transaction reports submitted by a fund includes an ID of an execution agent. There could be situations where a corporate entity within a group that Rule 906(b) is designed to cover might use an execution agent and thus would be required to report an execution agent ID. Therefore, basing an exclusion from Rule 906(b) on the use of an execution agent ID would be broader than necessary. The Commission believes instead that an exclusion for externally managed investment vehicles is well tailored to satisfy the concerns raised by the commenter while minimizing the risk of unduly broadening the exclusion. In light of this amendment to Rule 906(b), the Commission is making a conforming change to Rule 907(a)(6). Under Rule 907(a)(6), as amended, a registered SDR need not include in its policies and procedures for obtaining ultimate parent and affiliate information a mechanism for obtaining such information from externally managed investment vehicles.

The Commission declines to grant the commenter's request to exclude accounts from Rule 906(b). Although, as the commenter indicates, the parent(s) or affiliate(s) of a separate account client may not be responsible for losses incurred in the account, the security-based swap exposure in multiple accounts of a parent would be relevant to understanding the total exposure within the same ownership group. Thus, an account's reporting of its parent and affiliate information will serve the

³⁰⁷ In the Cross-Border Adopting Release, the Commission added an express reference to "investment vehicle" in the non-exclusive list of legal persons that could fall within the final definition of "U.S. person" in Rule 3a71-3(a)(4) under the Exchange Act, 17 CFR 240.3a71-3(a)(4). The Commission observed that investment vehicles are commonly established as partnerships, trusts, or limited liability entities and required that an investment vehicle will be treated as a U.S. person for purposes of Title VII if it is organized, incorporated, or established under the laws of the United States or has its principal place of business in the United States. See Cross-Border Adopting Release, 79 FR at 47307. Thus, an investment vehicle—despite being incorporated, organized, or established under the laws of a foreign jurisdiction—would be a U.S. person if it is externally managed from the United States, *i.e.*, its operations "are primarily directed, controlled, and coordinated from a location within the United States." *Id.* at 47310.

purposes of Rule 906(b) by assisting the Commission in monitoring enterprise-wide risks related to security-based swaps.

E. Additional Entities Must Have Policies and Procedures for Supporting Their Reporting Duties

Existing Rule 906(c) requires each participant of a registered SDR that is a registered security-based swap dealer or registered major security-based swap participant to establish, maintain, and enforce written policies and procedures that are reasonably designed to ensure that the participant complies with any obligations to report information to a registered SDR in a manner consistent with Regulation SBSR. Rule 906(c) also requires each registered security-based swap dealer and registered major security-based swap participant to review and update its policies and procedures at least annually.

In the Regulation SBSR Proposed Amendments Release, the Commission proposed to extend the requirements of Rule 906(c) to registered clearing agencies and platforms that are participants of a registered SDR.³⁰⁸ Four commenters generally supported this amendment.³⁰⁹

In the U.S. Activity Proposal, the Commission proposed to extend the requirements of Rule 906(c) to any registered broker-dealer that incurs reporting obligations solely because it effects transactions between two unregistered non-U.S. persons that do not fall within proposed Rule 908(b)(5). The Commission received no comments regarding the proposed amendment to Rule 906(c) for registered broker-dealers. The Commission continues to believe that this amendment is appropriate and is adopting the amendment as proposed.³¹⁰

One commenter stated that the Commission should expand Rule 906(c) "to include all parties with reporting obligations under Regulation SBSR, including platforms and registered clearing agencies."³¹¹ While the Commission is expanding Rule 906(c) to include platforms and registered clearing agencies, the Commission did

³⁰⁸ See 80 FR at 14759.

³⁰⁹ See Better Markets Letter at 6; DTCC Letter at 18; ISDA/SIFMA Letter at 29; LCH.Clearnet Letter at 11.

³¹⁰ Existing Rule 906(c) is titled: "Policies and procedures of registered security-based swap dealers and registered major security-based swap participants." As the Commission has proposed to subject various other types of persons to Rule 906(c), the Commission also proposed to revise the title to "Policies and procedures to support reporting compliance." The Commission is adopting the amended title.

³¹¹ LCH.Clearnet Letter at 11.

not propose and is not adopting any amendment to expand Rule 906(c) to include "all parties" with reporting obligations under Regulation SBSR, which would include unregistered persons. Regulation SBSR was designed to minimize, to the extent feasible, instances where unregistered persons have the primary duty to report security-based swaps; an unregistered person that is a participant of a registered SDR in most cases will have only limited duties under Regulation SBSR, such as the duty to report UIC information pursuant to Rule 906(a).³¹² The Commission does not believe that it is appropriate to require unregistered persons to establish policies and procedures to support this limited reporting function.

VI. Reporting and Public Dissemination of Security-Based Swaps Involving Allocation

A. Background

The Regulation SBSR Adopting Release provides guidance for the reporting of certain security-based swaps executed by an asset manager on behalf of multiple clients—transactions involving what are sometimes referred to as "bunched orders."³¹³ That release

³¹² Existing Rule 906(a) applies to all participants of a registered SDR, including a participant that is the non-reporting side of a security-based swap reported to the registered SDR on a mandatory basis. Rule 906(a), in relevant part, requires a participant of a registered SDR, with respect to a transaction to which it is a direct counterparty, to provide the SDR with any UICs that the SDR lacks, including a counterparty ID "or (if applicable), the broker ID, branch ID, execution agent ID, desk ID, and trader ID." In the Regulation SBSR Adopting Release, the Commission explained why it adopted the term "trading desk" and "trading desk ID" rather than, as in earlier proposed versions, "desk" and "desk ID." See 80 FR at 14583-84. However, in one place in Rule 906(a), the Commission failed to revise the term "desk ID" to "trading desk ID" even though it had done so in another place in Rule 906(a). Therefore, the Commission in this release is adopting a technical correction to Rule 906(a) to utilize the term "trading desk ID" in both places. In addition, one commenter requested clarification "that trading desk ID and trader ID fields are not applicable (or 'N/A') for trades entered into by an execution agent." SIFMA-AMG II at 2. Based on the rule text, the Commission believes that this is a reasonable interpretation of Rule 906(a).

³¹³ See Regulation SBSR Adopting Release, 80 FR at 14625-27. The Commission recognizes that market participants may use a variety of other terms to refer to such transactions, including "blocks," "parent/child" transactions, and "splits." The Commission has determined to use a single term, "bunched orders," for purposes of this release, as this appears to be a widely accepted term. See, *e.g.*, "Bunched orders challenge SEFs," MarketsMedia (March 25, 2014), available at <http://marketsmedia.com/bunched-orders-challenge-sefs/> (last visited May 25, 2016); "Cleared bunched trades could become mandatory rule," *Futures and Options World* (October 31, 2013), available at <http://www.fow.com/3273356/Cleared-bunched->

explained how Regulation SBSR applies to executed bunched orders that are subject to the reporting hierarchy in existing Rule 901(a)(2)(ii), including bunched order alphas that are not executed on a platform and platform-executed bunched orders that will not be submitted to clearing. That release also explained how Regulation SBSR applies to the security-based swaps that result from allocation of an executed bunched order, if the resulting security-based swaps are uncleared.

As described in the Regulation SBSR Adopting Release, to execute a bunched order, an asset manager negotiates and executes a security-based swap with a counterparty, typically a security-based swap dealer, on behalf of multiple clients. The bunched order can be executed on- or off-platform. After execution of the bunched order, the asset manager allocates a fractional amount of the aggregate notional amount of the transaction to each of several clients, thereby creating several new security-based swaps and terminating the bunched order execution.³¹⁴ By executing a bunched order, the asset manager avoids having to negotiate the client-level transactions individually, and obtains exposure for each client on the same terms (except, perhaps, for size).

In the Regulation SBSR Adopting Release, the Commission explained that Rule 901 requires a bunched order execution and the security-based swaps resulting from the allocation of the bunched order execution, if they are not cleared, to be reported like other security-based swaps.³¹⁵ The Commission further explained that Rule 902(a) requires the registered SDR that receives the report required by Rule 901 to disseminate the information enumerated in Rule 901(c) for the bunched order execution, including the full notional amount of the transaction. The Commission observed that publicly disseminating bunched order executions in this manner would allow the public to “know the full size of the bunched order execution and that this size was negotiated at a single price.”³¹⁶ Existing Rule 902(c)(7) provides that a registered SDR shall not publicly disseminate any

[trades-could-become-mandatory-rule.html](#) (last visited May 25, 2016).

³¹⁴ In aggregate, the notional amount of the security-based swaps that result from the allocation is the same as the notional amount of the executed bunched order. However, as one commenter noted, “due to cross-border considerations the aggregate notional of a bunched order will not always tie out completely in reported SBSR data to the sum of the notional of its related allocations.” See ISDA/SIFMA Letter at 28.

³¹⁵ See 80 FR at 14625.

³¹⁶ *Id.* at 14626.

information regarding the allocation of a bunched order execution, which would include information about the security-based swaps resulting from the allocation of the initial transaction as well as the fact that the bunched order execution is terminated following this allocation.

B. Guidance on How Regulation SBSR Applies to Bunched Order Executions

In the Regulation SBSR Proposed Amendments Release, the Commission provided guidance explaining how Regulation SBSR would apply to a bunched order that is executed on a platform and will be submitted to clearing, and— if the bunched order execution is accepted for clearing—the security-based swaps that result.³¹⁷ Consistent with the principles laid out in the Regulation SBSR Adopting Release with respect to the reporting of bunched order executions that *will not* be submitted to clearing, the reporting hierarchy in existing Rule 901(a)(2)(ii) will apply to the reporting of original bunched order executions that *will be submitted to clearing*. However, the reporting of the security-based swaps resulting from the allocation of the original bunched order execution is different if a registered clearing agency is involved. Because the Commission proposed a new approach for the reporting of all clearing transactions, the Commission could not offer guidance on how Regulation SBSR applies to bunched order executions that are allocated through the clearing process until the Commission adopted final rules for the reporting of clearing transactions. Today, the Commission is adopting amendments to Rule 901 that will govern how clearing transactions must be reported, and also now is providing guidance for how bunched order executions and related allocations are to be reported when they are cleared.

1. Example 1: Off-Platform Cleared Transaction

Assume that an asset manager, acting on behalf of several advised accounts, executes a bunched order alpha with a registered security-based swap dealer. The execution does not occur on a platform, and there are no indirect counterparties on either side of the bunched order alpha. The transaction is submitted to a registered clearing agency.

a. Reporting the Bunched Order Alpha

The reporting hierarchy of existing Rule 901(a)(2)(ii) applies to the bunched

order alpha because the execution does not occur on a platform and the bunched order alpha is not a clearing transaction. Under existing Rule 901(a)(2)(ii)(B), the registered security-based swap dealer is the reporting side for the bunched order alpha because its side includes the only registered security-based swap dealer. As the reporting side, the registered security-based swap dealer must report the primary and secondary trade information for the bunched order alpha to a registered SDR (the “alpha SDR”) of its choice within 24 hours after the time of execution. Rule 902(a) requires the alpha SDR to publicly disseminate a transaction report of the bunched order alpha immediately upon receiving the report from the registered security-based swap dealer.³¹⁸

When the registered security-based swap dealer submits the bunched order alpha to a registered clearing agency for clearing, Rule 901(a)(3), as adopted today, requires the registered security-based swap dealer promptly to provide the registered clearing agency with the transaction ID of the bunched order alpha and the identity of the alpha SDR. This requirement facilitates the registered clearing agency’s ability to report whether or not it has accepted the bunched order alpha for clearing, as required by Rule 901(e)(1)(ii), which also is being adopted today.

b. Reporting the Security-Based Swaps Resulting From Allocation

New Rule 901(a)(2)(i) requires the registered clearing agency to report all clearing transactions that arise as a result of clearing the bunched order alpha, regardless of the workflows used to clear the bunched order alpha.³¹⁹

If the asset manager provides allocation instructions prior to or contemporaneous with the clearing of the bunched order alpha, clearing could result in the creation of a beta (*i.e.*, the clearing transaction between the registered clearing agency and the security-based swap dealer) and a “gamma series” (*i.e.*, the gammas between the registered clearing agency and each of the client accounts selected by the asset manager to receive a portion of the initial notional amount). The beta and each security-based swap that comprises the gamma series would not

³¹⁸ Pursuant to Rule 906(a), the registered SDR also would be required to obtain any missing UICs from the counterparties.

³¹⁹ Like other clearing transactions that arise from the acceptance of a security-based swap for clearing, these security-based swaps are not subject to public dissemination. See Rule 902(c)(6). See also Rule 902(c)(7) (exempting from public dissemination any “information regarding the allocation of a security-based swap”).

³¹⁷ See 80 FR at 14753–55.

be treated differently under Regulation SBSR than any other clearing transactions.

If the asset manager does not provide allocation instructions until after the bunched order alpha is cleared, clearing could result in the creation of a beta (*i.e.*, the clearing transaction between the registered clearing agency and the security-based swap dealer) and an “intermediate gamma” (*i.e.*, the clearing transaction between the clearing agency and the side representing the clients of the asset manager). The beta would be the same—and would be treated the same—as any other clearing transaction, while the intermediate gamma would continue to exist until the registered clearing agency receives the allocation information, which could come from the asset manager or its clearing member and would allow for the creation of the gamma series. The registered clearing agency would report the intermediate gamma to a registered SDR of its choice. As the registered clearing agency receives the allocation information, it would terminate the intermediate gamma and create new security-based swaps as part of the gamma series. The partial terminations of the intermediate gamma would be life cycle events of the intermediate gamma that the registered clearing agency must report under existing Rule 901(e)(1)(i). Existing Rule 901(e)(2) requires the registered clearing agency to report these life cycle events to the same registered SDR to which it reported the intermediate gamma. Under new Rule 901(a)(2)(i), as adopted today, the registered clearing agency also is required to report to a registered SDR each new security-based swap comprising part of the gamma series. Because these security-based swaps arise from the termination (or partial termination) of an existing security-based swap (*i.e.*, the intermediate gamma series), existing Rule 901(d)(10) requires the registered clearing agency to link each new transaction in the gamma series to the intermediate gamma by including the transaction ID of the intermediate gamma as part of the report of each new security-based swap in the gamma series.

2. Example 2: Cleared Platform Transaction

Assume the same facts as Example 1, except that the registered security-based swap dealer and asset manager execute the bunched order alpha on a SB SEF.

a. Reporting the Bunched Order Alpha

Because the initial transaction is executed on a platform and will be submitted to clearing, the platform would have the duty under Rule

901(a)(1), as adopted today, to report the bunched order alpha to a registered SDR. To satisfy this reporting obligation, the platform must provide the information required by Rule 901(a)(1). Even if the platform does not know and thus cannot report the counterparty IDs of each account that will receive an allocation, the platform would know the identity of the execution agent who executed the bunched order alpha on behalf of its advised accounts. The platform, therefore, would report the execution agent ID of the execution agent, even though it might not know the intended counterparties of the security-based swaps that will result from the allocation.³²⁰ Existing Rule 902(a) requires the registered SDR that receives the report of the bunched order alpha from the platform to publicly disseminate a report of the bunched order alpha. Then, pursuant to existing Rule 906(a), the registered SDR would be required to obtain any missing UICs from its participants.³²¹

b. Reporting the Security-Based Swaps Resulting From Allocation

If the asset manager provides allocation instructions prior to or contemporaneous with the clearing of the bunched order alpha, clearing would (under the agency model of clearing) result in the creation of a beta (*i.e.*, the clearing transaction between the registered clearing agency and the registered security-based swap dealer) and a “gamma series” (*i.e.*, the gammas between the clearing agency and each of the asset manager’s clients). The beta and each security-based swap that comprises the gamma series would be

³²⁰ See Rule 901(d)(1) (requiring reporting of the counterparty ID “or the execution agent ID of each counterparty, if applicable”). If the counterparties—*i.e.*, the specific accounts who will receive allocations—are not yet known, the requirement to report the execution agent ID instead of the counterparty ID would apply. Similarly, if the asset manager uses an execution agent to access the platform, the platform would report the identity of the asset manager’s execution agent.

³²¹ One commenter stated that a registered SDRs will be unable to compel non-reporting sides to become “onboarded users” of the SDR; the commenter recommended, therefore, that the Commission require any reports, such as those required by Rule 906(a), “to only be provided to onboarded users.” DTCC/ICE/CME Letter at 2. In the Regulation SBSR Adopting Release, the Commission resolved the issue of whether a non-reporting side becomes a participant of a registered SDR: It does, if the non-reporting side falls within Rule 908(b) and the transaction was reported to the registered SDR on a mandatory basis. See Regulation SBSR Adopting Release, 80 FR at 14645 (“The Commission recognizes that some non-reporting sides may not wish to connect directly to a registered SDR because they may not want to incur the costs of establishing a direct connection. Rule 906(a) does not prescribe the means registered SDRs must use to obtain information from non-reporting sides”).

no different—and would not be treated differently under Regulation SBSR—from other clearing transactions.

If the asset manager does not provide allocation instructions until after the bunched order alpha is cleared, clearing (under the agency model) would result in the creation of a beta (between the registered clearing agency and the security-based swap dealer) and an intermediate gamma (between the registered clearing agency and the side representing the clients of the asset manager). The registered clearing agency would then be required to report the termination of the bunched order alpha and the creation of the beta and intermediate gamma, pursuant to Rules 901(e)(1)(ii) and 901(a)(2)(i), as adopted today. From this point on, the beta would be treated the same as any other clearing transaction, while the intermediate gamma would be decremented and replaced by the gamma series, as described in Example 1.

C. Comments Received

The Commission received two comments that generally supported the guidance on the proposed rules for the reporting and public dissemination of a bunched order execution that is executed on a platform and will be submitted to clearing, and the security-based swap clearing transactions that result from the allocation.³²²

One of these commenters raised concerns, however, about the application of the guidance to cross-border situations where the identity of the asset manager’s clients (*i.e.*, the direct counterparties to the security-based swaps that result from the allocation) is not known at the time of bunched order execution, particularly if the Commission requires compliance with Regulation SBSR before security-based swap dealers have had the opportunity to register with the Commission as such.³²³ The commenter stated that “the Commission should be aware that in advance of dealer registration determining whether a

³²² See ISDA/SIFMA Letter at 28 (supporting “the requirement for a reporting side to report a bunched order executed off-platform, proposed rule 901(a)(1) that would require a platform to report a bunched order alpha executed on its facility, and proposed rule 901(a)(2)(i) that would require a registered clearing agency to report a cleared bunched order, if applicable, and the allocations that result from the cleared bunched order” and stating that “a bunched order should be subject to public dissemination instead of the related allocations”); ICE Trade Vault Letter at 7 (supporting inclusion of the transaction ID of the bunched order execution on each security-based swap resulting from its allocation as a “critical data element necessary to improve data quality”).

³²³ See ISDA/SIFMA Letter at 28.

bunched order is subject to reporting under SBSR can only be based on the reporting side's understanding of the execution agent's status as a U.S. person. The U.S. person status of the funds to which the bunched order will be allocated will determine whether the allocations are subject to reporting and will have no bearing on whether the bunched order is reported."³²⁴ The Commission shares the commenter's concern that there be clear and workable solutions for reporting transactions under Regulation SBSR even under complex cross-border scenarios. The Commission also notes that, as discussed below,³²⁵ compliance with Regulation SBSR will be required independent of when security-based swap dealers register as such with the Commission.

In the U.S. Activity Proposal, the Commission proposed a new paragraph (a)(1)(v) to existing Rule 908(a)(1) that would subject to regulatory reporting and public dissemination any transaction in connection with a non-U.S. person's security-based swap dealing activity that is arranged, negotiated, or executed by personnel of such non-U.S. person located in a U.S. branch or office, or by personnel of an agent of such non-U.S. person located in a U.S. branch or office (an "ANE transaction"). New Rule 908(a)(1)(v)—which is being adopted today³²⁶—coupled with the existing provisions of Rule 908(a)(1), will further clarify how the guidance discussed above applies to various cross-border scenarios, as illustrated in the following examples:

- If the dealing entity who executes the bunched order with the asset manager/execution agent is a U.S. person, whether registered or unregistered, the bunched order execution is subject to both regulatory reporting and public dissemination because of the U.S.-person status of the dealing entity, regardless of the U.S.-person status of the asset manager/execution agent or of the funds/accounts that later receive allocations.

- If the dealing entity who executes the bunched order with the asset manager is a non-U.S. person but the bunched order execution is an ANE transaction, the bunched order execution is again subject to both regulatory reporting and public dissemination, regardless of the U.S.-person status of the asset manager/execution agent or of the funds/accounts that later receive allocations.

- If all of the funds/accounts that could be eligible to receive allocations are U.S. persons, the bunched order execution is subject to both regulatory reporting and public dissemination because of the U.S.-person status of the funds/accounts, regardless of the U.S.-person status of the dealing entity or the location of the personnel (or agent) of the dealing entity. In other words, however the asset manager/execution agent allocates the bunched order execution in this example, there is no scenario where any part of the bunched order execution could be viewed as involving a non-U.S. person. Therefore, the initial bunched order execution involving the dealing entity on one side necessarily has a U.S. person on the other side, and the initial bunched order execution is subject to both regulatory reporting and public dissemination.

The Commission acknowledges that a more complex situation arises if the bunched order execution is between an unregistered non-U.S. person who is *not* engaging in ANE activity and an asset manager/execution agent acting on behalf of funds/accounts at least some of which are non-U.S. persons. In some cases, the status of the initial bunched order execution would be resolved if the asset manager/execution agent ultimately makes allocations only to funds/accounts that are U.S. persons.³²⁷ In other cases, however, the asset manager/execution agent³²⁸ might make allocations to some funds/accounts that are non-U.S. persons or might not, in unusual cases, make any allocations until more than 24 hours after the time of execution of the initial bunched order. Ordinarily, the U.S.-person status of the asset manager/execution agent is not determinative of whether the bunched order execution is subject to regulatory reporting and public dissemination under Rule 908(a)(1)(i) or any other provision of Rule 908(a).³²⁹ In

³²⁷ The Commission understands from discussions with market participants that allocation determinations are generally made within 24 hours after execution. In such cases, the asset manager/execution agent would know that all of the security-based swaps resulting from allocation—as well as the initial bunched order execution—are subject to regulatory reporting and public dissemination, because of the U.S.-person status of all of fund/account counterparties, before a transaction report for the initial bunched order execution is due, at least during the first interim phase of security-based swap reporting.

³²⁸ The Commission notes that some transactions could involve more than one execution agent, and that the execution agent IDs of all execution agents of each direct counterparty would be required to be reported. See Regulation SBSR Adopting Release, 80 FR at 14583 ("The Commission notes that some security-based transactions may involve multiple agents").

³²⁹ Existing Rule 908(a)(1)(i) provides that a security-based swap shall be subject to regulatory

this limited situation, however, the Commission believes that it would be reasonable for the sides to look to the U.S.-person status of the asset manager/execution agent to resolve whether or not the bunched order execution should be subject to regulatory reporting and public dissemination. Given that the true counterparties might be unknown or unknowable when the transaction report for the bunched order execution is due, the U.S.-person status of the asset manager/execution agent can serve as a reasonable proxy. Even if some or all of the allocation is subsequently made to funds/accounts that are not U.S. persons, it would not be inconsistent with Regulation SBSR if a regulatory report and public dissemination of the initial bunched order execution, including the full notional size, is made. Furthermore, if the asset manager/execution agent is not a U.S. person and the counterparties determine not to report the transaction on that basis, and if allocations are made to one or more funds/accounts that *are* U.S. persons, those security-based swaps resulting from the allocation would have to be reported, and the Commission would still have at least partial understanding of the overall transaction.³³⁰ The Commission staff intends to evaluate this issue after required reporting commences.

D. Conforming Amendment to Rule 901(d)(4)

Existing Rule 901(d)(4) requires the reporting side to report, as applicable, the branch ID, broker ID, execution agent ID, trader ID, and trading desk ID of the direct counterparty on the reporting side. One commenter requested that, for bunched order executions, the reporting side be

reporting and public dissemination if there "is a direct or indirect counterparty that is a U.S. person on either or both sides of the transaction." The execution agent/asset manager would not be a counterparty to the executed bunched order unless it was the primary obligor or a guarantor for the bunched order execution. See Rule 900(i) (defining "counterparty" for purposes of Regulation SBSR). If the asset manager/execution agent is the primary obligor or a guarantor of the security-based swap, it would be a counterparty and the outcome of the reporting hierarchy would have to reflect this fact.

³³⁰ The commenter observed that, "due to cross-border considerations the aggregate notional of a bunched order will not always tie out completely in reported SBSR data to the sum of the notional of its related allocations." ISDA/SIFMA Letter 28. This could occur if, for example, the initial bunched order execution were reported to a registered SDR, but certain security-based swaps resulting from the allocation were not, because they did not fall within any of the prongs of Rule 908(a)(1). The Commission recognizes this possibility. However, it does not appear that this would happen to such an extent as to compromise the Commission's ability to oversee the security-based swap market.

³²⁴ *Id.*

³²⁵ See *infra* Section X(C).

³²⁶ See *infra* Section IX(C).

excused from this requirement because the relevant information “can only be determined upon allocation as any reported values would refer to applicable agreements with each party to an allocation and not the execution agent. SBSR should explicitly absolve platforms, clearing agencies and reporting sides from the obligation to report the information required by § 242.901(d)(4) for bunched orders.”³³¹

The Commission agrees and has decided to amend Rule 901(d)(4) so that it does not apply to the initial bunched order execution, and instead applies only to the security-based swaps that result from the allocation of that bunched order execution. The relevant agreements that are to be reported pursuant to Rule 901(d)(4) are between the clients of the execution agent—*i.e.*, the funds that receive allocations—and the security-based swap dealer. The Commission believes that it is unnecessary to require these agreements to be reported twice, once with the report of the bunched order execution and once with the report of each security-based swap resulting from the allocation of the original bunched order execution. Requiring the reporting of agreement information for the bunched order execution could be challenging in instances when the clients that will receive the allocated security-based swaps are not known at the time of execution of the bunched order. Furthermore, the title and date of the relevant agreements will be included in the reports of the security-based swaps resulting from the allocation. Therefore, the Commission does not believe it is necessary to require the names and dates of the agreements to be reported with the initial bunched order execution.

VII. Reporting and Public Dissemination of Prime Brokerage Transactions

A. Background

In the Regulation SBSR Proposed Amendments Release, the Commission discussed how Regulation SBSR would apply to security-based swap transactions arising out of prime brokerage arrangements.³³² The Commission understands that, under a typical prime brokerage arrangement, a prime broker and a client enter into an agreement whereby the prime broker

facilitates the client’s participation in the security-based swap market by providing credit intermediation services. The prime brokerage arrangement permits the client to negotiate and agree to the terms of security-based swaps with one or more third-party “executing dealers,” subject to limits and parameters specified in the prime brokerage agreement. An executing dealer would negotiate a security-based swap with the client expecting that it would face the prime broker, rather than the client, for the duration of the security-based swap. The executing dealer and/or the client would submit the transaction that they have negotiated to the prime broker. In the Regulation SBSR Proposed Amendments Release, the Commission set forth its understanding that a typical prime brokerage transaction involved three security-based swap transactions or “legs”;³³³

- *Transaction 1.* The client and the executing dealer negotiate and agree to the terms of a security-based swap transaction (the “client/executing dealer transaction”) and notify the prime broker of these terms. Transaction 1 is terminated upon the creation of Transaction 2 and 3, as described below.

- *Transaction 2.* If the terms of Transaction 1 are within the parameters established by the prime brokerage arrangement, the prime broker accepts the transaction and faces the executing dealer in a new security-based swap (the “prime broker/executing dealer transaction”) having the same economic terms agreed to by the executing dealer and the client in Transaction 1.

- *Transaction 3.* Upon executing Transaction 2 with the executing dealer, the prime broker will enter into an offsetting security-based swap with the client (the “prime broker/client transaction”).

The Commission received three comments regarding this proposed interpretation. One commenter disagreed with the Commission’s view that a typical prime brokerage transaction comprises three legs, arguing that the negotiation of terms between the executing dealer and the client does not result in a transaction between the executing dealer and the client.³³⁴ The commenter also stated that, if the prime broker did not accept the transaction, there would be no security-based swap to report (*i.e.*, there would not be a client/executing dealer transaction in the absence of acceptance by the prime broker).³³⁵ Accordingly,

the commenter requested that the Commission limit all reporting requirements arising from a prime brokerage arrangement to Transactions 2 and 3.³³⁶ Another commenter concurred that a typical prime brokerage arrangement would result in only two legs, one between the prime broker and the executing dealer and one between the client and the prime broker.³³⁷ The commenter expressed the view that there is not a transaction between the executing dealer and the client,³³⁸ and that the initial negotiation between the executing dealer and the client results in a security-based swap between the executing dealer and the prime broker, with the client acting as the prime broker’s agent.³³⁹

After considering these comments, the Commission is supplementing its views regarding the application of Regulation SBSR to prime brokerage arrangements. The Commission understands that the documentation used to structure a prime brokerage arrangement may vary. As described more fully below, the documentation may provide that the client acts as agent for the prime broker when negotiating the first leg with the executing dealer, resulting in a prime brokerage structure comprised of two legs (the prime broker/executing dealer transaction and the prime broker/client transaction). Alternatively, the documentation could provide that the negotiation between the client and the executing dealer results in a transaction between those two parties,³⁴⁰ resulting in a prime brokerage structure comprised of three legs (the client/executing dealer transaction, the prime broker/executing dealer transaction, and the prime broker/client transaction). In cases where the client is acting as agent for the prime broker, the arrangement would result in the following two legs:

- *Transaction A.* The client, acting as agent for the prime broker, and the executing dealer negotiate a security-based swap transaction and notify the prime broker of its terms. If the transaction does not satisfy the parameters in the prime brokerage agreement, the prime broker may reject

³³⁶ See *id.* at 21.

³³⁷ See Memorandum from the Division of Trading and Markets regarding a November 13, 2015, meeting with representatives of SIFMA and Cleary Gottlieb Steen & Hamilton LLP (November 20, 2015), at slide 5.

³³⁸ See *id.* at slide 11.

³³⁹ See *id.* at slide 5.

³⁴⁰ For example, the client and executing dealer could agree in advance that, in the event of rejection by the prime broker, they would preserve their contract without the involvement of the prime broker. See ISDA, 2005 ISDA Compensation Agreement (“ISDA Compensation Agreement”) at Section 2.

³³¹ ISDA/SIFMA Letter at 28–29. The commenter noted that the Commission had not proposed to require a platform to report the title and date of agreements incorporated by reference for a bunched order alpha that will be submitted to clearing. See *id.* at 28.

³³² See Regulation SBSR Proposed Amendments Release, 80 FR at 14755–57.

³³³ See *id.* at 14755.

³³⁴ See ISDA/SIFMA Letter at 20.

³³⁵ See *id.*

the transaction. If the prime broker accepts the transaction, the prime broker and the executing dealer are counterparties to the security-based swap.

- *Transaction B.* If the prime broker accepts Transaction A, the prime broker also will enter into an offsetting security-based swap with the client.

In cases where the documentation provides for a three-legged structure, the Commission is making a minor modification to Rule 902(c) to account for the situation where a registered SDR receives notice that the prime broker has rejected the transaction before the SDR has received the initial transaction report.³⁴¹ The Commission discusses below the application of the reporting and dissemination requirements as they apply to the two-legged structure and provides additional clarification in response to comments.

B. Reporting of Security-Based Swaps Resulting From Prime Brokerage Arrangements

In the Regulation SBSR Proposed Amendments Release, the Commission stated its understanding that prime brokerage arrangements involve credit intermediation offered by the prime broker, rather than a registered clearing agency; thus, prime brokerage transactions are not cleared.³⁴² Therefore, the application of Regulation SBSR's reporting and dissemination requirements to a prime brokerage arrangement detailed below assumes none of the security-based swaps resulting from a prime brokerage arrangement is a clearing transaction, and that none is intended to be cleared.

1. If There Are Three Legs

In the Regulation SBSR Proposed Amendments Release, the Commission set forth its proposed interpretation of the application of Regulation SBSR to the three-legged prime brokerage structure.³⁴³ The Commission is finalizing this interpretation substantially as proposed.

Because Transaction 1 (*i.e.*, the client/executing dealer transaction) is not a clearing transaction and it is not intended to be cleared, the reporting hierarchy in existing Rule 901(a)(2)(ii) assigns the reporting duty for Transaction 1. If the prime broker accepts the transaction, the prime broker would initiate Transactions 2 and 3, which would have the effect of terminating Transaction 1. The termination would be a life cycle event

of Transaction 1, and existing Rule 901(e)(2) requires the reporting side for Transaction 1 (likely the executing dealer) to report this life cycle event to the same registered SDR to which it reported Transaction 1.³⁴⁴

Transactions 2 and 3 (*i.e.*, the prime broker/executing dealer transaction and the prime broker/client transaction, respectively) also are security-based swaps that must be reported pursuant to Rule 901(a)(2)(ii). Because each of these transactions is a security-based swap that arises from the termination of another security-based swap (*i.e.*, Transaction 1), existing Rule 901(d)(10) requires the reporting of Transaction 1's transaction ID as part of the secondary trade information for each of Transaction 2 and Transaction 3.

2. If There Are Two Legs

The Commission is providing the following interpretation of the application of the reporting requirements of Regulation SBSR in cases where the documentation provides for a two-legged structure.

Existing Rule 901(a)(2)(ii) assigns the reporting duty for Transaction A (*i.e.*, the prime broker/executing dealer transaction), because Transaction A is not a clearing transaction and it is not intended to be cleared. When the client, acting as agent for the prime broker, executes Transaction A with the executing dealer, the sides (*i.e.*, the executing dealer and the prime broker) would determine the reporting side pursuant to the hierarchy set forth in existing Rule 901(a)(2)(ii). The reporting side would have up to 24 hours after the time of execution to report the applicable primary and secondary trade information of Transaction A. The client would be disclosed as the execution agent of the prime broker pursuant to Rule 901(d)(2) (if the prime broker is the reporting side) or Rule 906(a) (if the prime broker is not the reporting side).

If the prime broker accepts the transaction, the prime broker would initiate Transaction B between itself and the client. The reporting side for Transaction B also would be determined pursuant to Rule 901(a)(2)(ii). The reporting side would have up to 24 hours after the time of execution to report the applicable primary and secondary trade information of Transaction B.

³⁴⁴ One commenter agreed with this approach, stating that the reporting obligation should remain with the original reporting side. See LCH.Clearnet Letter at 11.

C. Public Dissemination of Prime Brokerage Transactions

Existing Rule 902(a) requires public dissemination of each security-based swap, unless it falls within a category enumerated in Rule 902(c). If the documentation of the prime brokerage agreement is such that there are three security-based swaps, then each of the three is subject to public dissemination; if the documentation of the prime brokerage agreement is such that there are only two security-based swaps, both are subject to public dissemination.

If a prime broker rejects either Transaction 1 or Transaction A, the registered SDR would handle dissemination of information regarding the termination of the first transaction in the same manner as an alpha that has been rejected from clearing.³⁴⁵

One commenter reiterated an earlier request that the Commission exempt the prime broker/client leg of a prime broker transaction from public dissemination, arguing that dissemination of this transaction would provide misleading price data without providing any further transparency on costs related to prime brokerage.³⁴⁶ The commenter argued that the prime broker's service fee is not relevant to security-based swap pricing.³⁴⁷ In the Regulation SBSR Proposed Amendments Release, the Commission stated its preliminary belief that publicly disseminating reports of each leg of a prime brokerage transaction could provide market observers with useful information about the cost of the prime broker's credit intermediation services, because prime brokers may charge for these services by pricing the executing dealer/prime broker transaction differently than the prime broker/client transaction.³⁴⁸ The Commission also noted that, with prime brokerage transactions, the only mechanism for ascertaining the charge for the credit intermediation service offered by the prime broker would be to compare the prices of Transaction 1 with the prices of any subsequent transaction.³⁴⁹

In response, the commenter noted that prime brokers might not in all cases include their fees in transaction prices and stated that, if the fees charged for prime brokerage services were useful to market observers, then such information could be more "reliably and accurately

³⁴⁵ See *infra* Section VII(D) (discussing the effect of rejection by the prime broker). See also *supra* Section III(J).

³⁴⁶ See ISDA/SIFMA Letter at 21.

³⁴⁷ See *id.*

³⁴⁸ See 80 FR at 14756.

³⁴¹ See *infra* Section VII(D).

³⁴² See 80 FR at 14755.

³⁴³ See *id.* at 14755–57.

obtained by requesting it from a [prime broker].”³⁵⁰ The Commission, however, continues to believe that disseminating each leg of a prime brokerage arrangement will enhance price discovery by helping market observers to distinguish between the price of a security-based swap and the cost of credit intermediation. Market participants should not have to request information from a prime broker regarding the manner in which the cost of a prime broker’s credit intermediation service might affect the price of a security-based swap when the mandate of Section 13(m)(1)(C) provides all market observers with the ability to observe the prices directly. Even if the fees charged for prime brokerage services are not always reflected in transaction prices, at least some transaction prices will include the cost of credit intermediation. Therefore, the Commission believes that none of the legs of a prime brokerage transaction should be excluded from public dissemination.

In this regard, the Commission notes that Rule 907(a)(4) requires the policies and procedures of a registered SDR, in relevant part, to identify characteristics of a security-based swap that could, in the fair and reasonable estimation of the registered SDR, cause a person without knowledge of those characteristics to receive a distorted view of the market. The Commission believes that it would be difficult to comply with that requirements of the rule if a registered SDR did not identify whether individual security-based swaps are related legs of a prime brokerage transaction. If market observers are not given the ability to identify the two or three legs of a prime brokerage transaction as related, it would be difficult for market observers to avoid developing a distorted view of the market.³⁵¹

One commenter acknowledged that a prime brokerage flag had “potential value” for regulatory reporting but strongly disagreed with the Commission’s view that a prime brokerage flag should be publicly disseminated.³⁵² The commenter argued that the market for security-based swap prime brokerage services is limited, so a prime brokerage flag would have a “high probability of compromising the anonymity” of executing dealers and prime brokers.³⁵³ The Commission considered similar issues in the Regulation SBSR Adopting Release relating to thinly traded security-based

swaps.³⁵⁴ There, the Commission declined to provide any exception to public dissemination based on the fact that only a small number of market makers were active in particular segments of the market. Here, the Commission declines to make any exception to its approach to public dissemination of prime brokerage transactions. Absent a prime brokerage flag, market observers would have no ability to know that the separate legs of a single prime brokerage transaction are related, and would incorrectly conclude that there was more market activity than in fact occurred.

Finally, one commenter noted that a prime broker/client leg might be a bunched order execution where the allocations “are provided upfront,” and argued that the dissemination of these multiple transactions would not enhance price discovery.³⁵⁵ In the Regulation SBSR Adopting Release, the Commission provided guidance regarding how a bunched order execution must be reported and publicly disseminated (assuming that the bunched order execution is not cleared): The initial bunched order execution and any security-based swaps that result from allocating the bunched order execution are subject to regulatory reporting, while only the bunched order execution is subject to public dissemination.³⁵⁶ Thus, the Commission agrees with the commenter that the security-based swaps resulting from the allocation of a prime broker/client transaction should not be publicly disseminated. However, the initial bunched order execution between the prime broker and the client is subject to public dissemination.

D. If the Prime Broker Rejects the Initial Security-Based Swap

Under either the two-leg or three-leg prime brokerage arrangements described above, the prime broker could reject the initial transaction negotiated between the client and the executing dealer. The Commission is providing guidance regarding how Regulation SBSR applies to this possibility.

The effect of the rejection by the prime broker would depend on what, if any, contractual agreement exists between the executing dealer and its client. In some cases, the client and the executing dealer could have a pre-existing agreement that would allow them to revise the security-based swap

with new terms if the prime broker rejects a transaction that they have negotiated.³⁵⁷ If there is such an agreement and the client and executing dealer elect to preserve a security-based swap between them, the result would have to be reported in one of two ways. If the governing documentation provides that there are only two security-based swaps that could result from the prime brokerage arrangement (*i.e.*, the initial leg is between the prime broker and the executing dealer, with the client acting as agent for the prime broker), the rejection by the prime broker would have the effect of terminating this leg, and the termination would have to be reported by the reporting side of the initial leg. The security-based swap arising between the client and the executing dealer would, because there are new counterparties, be a new security-based swap, and the reporting side for this security-based swap would be determined by the reporting hierarchy. On the other hand, if the governing documentation provides that three security-swaps would result from the prime brokerage arrangement and the client and executing dealer intend to preserve the security-based swap with different terms, the rejection by the prime broker and the amendment with the new terms would have to be reported as a life cycle event of the initial leg (presumably by executing dealer). If there is no pre-existing agreement between the client and the executing dealer that would allow for an amendment to the initially negotiated leg or such an agreement exists but the client and executing dealer elect not to keep the security-based swap in existence, the prime broker’s rejection would terminate the initial leg and the reporting side of the initial leg would have to report the termination.

If rejection by the prime broker results in a termination, one of two things must occur next. If the registered SDR that received the report of the initial leg has already disseminated it, the SDR must then disseminate a follow-up report indicating that the initial security-based swap has been terminated.³⁵⁸ However, situations could arise where the registered SDR had not yet disseminated a report of the initial leg when it

³⁵⁷ See, e.g., ISDA Compensation Agreement, at Section 2.

³⁵⁸ See Rule 902(a) (requiring, in relevant part, dissemination of life cycle events when there are changes to information provided under Rule 901(c)); Rule 907(a)(3) (requiring a registered SDR, in relevant part, to have written policies and procedures for flagging transaction reports involving life cycle events).

receives notice of the termination.³⁵⁹ As noted in Section III(J), *supra*, the Commission is adopting a new paragraph (c)(8) to existing Rule 902(c) providing that a registered SDR shall not publicly disseminate “[a]ny information regarding a security-based swap that has been rejected from clearing or rejected by a prime broker if the original transaction report has not yet been publicly disseminated.” Therefore, if the registered SDR had not disseminated the transaction report for Transaction 1/Transaction A at the time that it receives the report of the termination of that transaction, the registered SDR would not disseminate any information regarding Transaction 1/Transaction A. Conversely, if the registered SDR had disseminated a transaction report of Transaction 1/Transaction A before receiving the termination report for that transaction, the registered SDR would disseminate a report of the termination of Transaction 1/Transaction A.

VIII. Prohibition on Registered SDRs From Charging Fees for or Imposing Usage Restrictions on Publicly Disseminated Data

A. Background

Existing Rule 902(a) requires a registered SDR to publicly disseminate a transaction report of a security-based swap, or a life cycle event or adjustment due to a life cycle event, immediately upon receipt of information about the security-based swap, with certain exceptions noted in existing Rule 902(c). Existing Rule 900(cc) defines “publicly disseminate” to mean “to make available through the Internet or other electronic data feed that is widely accessible and in machine-readable electronic format.” In the Regulation SBSR Proposed Amendments Release, the Commission stated its preliminary belief that a registered SDR should not be permitted to charge fees for the security-based swap transaction data that it is required to publicly disseminate pursuant to Regulation

SBSR.³⁶⁰ Accordingly, the Commission proposed new Rule 900(tt), which would define the term “widely accessible”—as used in the definition of “publicly disseminate” in existing Rule 900(cc)—to mean “widely available to users of the information on a non-fee basis.” As discussed in the SBSR Proposed Amendments Release, this proposed definition of “widely accessible” would have the effect of prohibiting a registered SDR from charging fees for, or imposing usage restrictions on, the security-based swap transaction data that it is required to publicly disseminate under Regulation SBSR.³⁶¹

In proposing this requirement, the Commission considered the statutory requirements to establish post-trade transparency in the security-based swap market, the CFTC’s rules for public dissemination, and comments received in response to Regulation SBSR, as originally proposed and as re-proposed. Title VII contains numerous provisions directing the Commission to establish a regime for post-trade transparency in the security-based swap market, which are designed to give the public pricing, volume, and other relevant information about all executed security-based swap transactions.³⁶² In the Regulation SBSR Proposed Amendments Release, the Commission expressed the preliminary view that the statutory requirement to make this transaction information publicly available would be frustrated if registered SDRs could charge members of the public for the right to access the disseminated data.³⁶³

The Commission also expressed the preliminary belief that it is necessary to prohibit a registered SDR from charging users of regulatorily mandated security-based swap transaction data for public dissemination of the data to reinforce existing Rule 903(b).³⁶⁴ Rule 903(b) provides that a registered SDR may disseminate information using UICs (such as product IDs or other codes, such as reference entity identifiers, that are embedded within the product IDs) or permit UICs to be used for reporting by its participants only if the information necessary to interpret such UICs is widely available on a non-fee basis. The Commission continues to be concerned that a registered SDR that wished to charge (or allow others to charge) users for the information necessary to understand these UICs—but could not, because of Rule 903(b)—

might seek to do so indirectly by recharacterizing the charge as being for public dissemination. Under these circumstances, the economic benefit to the registered SDR would be the same, but the manner in which the registered SDR characterizes the fee—*i.e.*, whether as a charge to users for public dissemination or as a charge of accessing the UICs within the publicly disseminated data—would be the difference between the fee being permissible or impermissible under Rule 903(b). Accordingly, the Commission took the preliminary view that permitting a registered SDR to charge users for receiving the publicly disseminated transaction data could undermine the purposes of Rule 903(b).

The CFTC, in adopting its own rules for public dissemination of swap transactions, addressed the issue of whether a swap data repository could be allowed to charge for its publicly disseminated data. In Section 43.2 of its rules,³⁶⁵ the CFTC defined “public dissemination” and “publicly disseminate” to mean “to publish and make available swap transaction and pricing data in a non-discriminatory manner, through the Internet or other electronic data feed that is widely published and in machine-readable electronic format.” The CFTC also defined “widely published” to mean “to publish and make available through electronic means and *in a manner that is freely available and readily accessible to the public.*”³⁶⁶ Section 43.3(d)(2) of the CFTC rules provides: “Data that is publicly disseminated . . . shall be available from an Internet Web site in a format that is freely available and readily accessible to the public.” The CFTC stated that “implicit in this mandate [of public dissemination] is the requirement that the data be made available to the public at no cost,”³⁶⁷ and that “Section 43.3(d)(2) reflects the [CFTC]’s belief that *data must be made freely available to market participants and the public*, on a nondiscriminatory basis.”³⁶⁸ Although prohibiting fees on the data that swap data repositories are required to publicly disseminate, the CFTC’s rules permit a swap data repository to offer, for a fee, value-added data products derived from the freely available regulatorily mandated public data and to charge fair and reasonable

³⁵⁹ For example, assume that the prime brokerage agreement provides for a three-legged structure and the executing dealer is the reporting side for the initial leg between itself and the client. However, there is no pre-existing agreement between the client and executing dealer that would allow for the terms of the initial leg to be renegotiated if the prime broker rejects the transaction. Assume further that the executing dealer does not immediately report the initial leg. *See* Rule 901(j) (generally allowing up to 24 hours after the time of execution to report a security-based swap). When the client and the executing dealer convey the results of their negotiation to the prime broker, the prime broker rejects the transaction. The executing dealer may simultaneously report to a registered SDR the terms of the initial leg and the fact that it has been rejected by the prime broker and terminated.

fees to providers of swap transaction and pricing data.³⁶⁹

B. Comments Received and Final Rule

The Commission received six comments on whether registered SDRs should be permitted to charge fees or impose usage restrictions on publicly disseminated data.³⁷⁰ Several commenters generally agreed with prohibiting an SDR from charging fees or imposing usage restrictions on the transaction data that it is required to publicly disseminate.³⁷¹ However, one commenter argued against imposing a prohibition against usage restrictions³⁷² and another requested that the Commission clarify the applicability of the prohibition.³⁷³ After carefully considering all of the comments received, the Commission is adopting Rule 900(tt) as proposed and provides clarification, below, regarding application of the rule.

The Commission stated in the Regulation SBSR Proposed Amendments Release that the requirement that information be “widely available to users of the information on a non-fee basis” necessarily implies that a registered SDR would not be permitted to impose—or allow to be imposed—any usage restrictions on the security-based swap transaction information that it is required to publicly disseminate, including restrictions on access to or further distribution of the regulatorily mandated public security-based swap data.³⁷⁴ One commenter agreed with this view³⁷⁵ and another disagreed, the latter stating that a registered SDR should be able to manage redistribution of data it disseminates.³⁷⁶ The commenter noted that a limitation on usage restrictions for publicly disseminated data would prevent a registered SDR from monetizing a potential revenue stream.³⁷⁷ In addition, the commenter was concerned about claims related to data redistributed by others.³⁷⁸ The commenter argued that a registered SDR should be permitted to

impose various usage restrictions on its publicly disseminated data, such as a requirement to attribute the SDR as the source of the data, a restriction of the data to internal use, and a prohibition on redistribution of the data “without first engaging the SB SDR and agreeing on licensing terms.”³⁷⁹

The Commission continues to believe that public dissemination would not satisfy the “widely available” standard in Rule 900(tt) if a registered SDR could deny access to users who do not agree to limit their use of the data in a manner directed by the registered SDR. Here, the Commission notes the asymmetric bargaining strength of the parties: A registered SDR has a monopoly position over the security-based swap transaction data that it is required to publicly disseminate, because the public has no access to that information until it is publicly disseminated. If a registered SDR could impose usage restrictions with which a user does not wish to comply, there would be no other source from which the user could freely obtain this transaction information.

The prohibition on usage restrictions would also prohibit an SDR-imposed restriction on bulk redistribution by third parties of the regulatorily mandated transaction data that the registered SDR publicly disseminates. Despite the objections of one commenter,³⁸⁰ the Commission continues to believe that it could prove useful to the public for intermediaries to collect, consolidate, and redistribute the regulatorily mandated transaction data to the public. Users of the data might, instead of obtaining data directly from each of several SDRs, find it preferable to obtain the data from a single person who itself obtains the data directly from the multiple registered SDRs and consolidates it. The Commission continues to believe that allowing unencumbered redistribution best serves the policy goals of wide availability of the data and minimization of information asymmetries in the security-based swap

market. Because the Commission is prohibiting registered SDRs from imposing a restriction on bulk redistribution, third parties (as well as registered SDRs themselves, as discussed below) will be able to take in the full data set and scrub, reconfigure, aggregate, analyze, repurpose, or otherwise add value to those data, and potentially sell that value-added product to others.

The Commission acknowledges the concern of the commenter who stated that “SB SDRs must be able to protect themselves from claims related to data sourced or scraped from the trade repository and redistributed by others where there are quality issues with respect to data redistributed.”³⁸¹ However, a registered SDR may not, consistent with its duty to publicly disseminate under Rule 902(a) when read in connection with Rule 900(tt), require a user of the data to “agree” to any terms purporting to disclaim the SDR’s responsibility for incorrect data before the user may access the regulatorily mandated public security-based swap data, as this would constitute a usage restriction. The Commission declines to make an exception for usage restrictions that are designed to limit a registered SDR’s potential liability to third parties. The Commission believes that unencumbered access best serves the policy goals of wide availability of the data and minimization of information asymmetries in the security-based swap market, and that the speculative risk of SDR liability does not justify foregoing the public benefits of promoting free and unrestricted access to the security-based swap transaction data that registered SDRs are required to disseminate.

The Commission recognizes that establishing and operating a registered SDR entails various costs. The Commission does not believe, however, that prohibiting a registered SDR from charging for data that it is required to publicly disseminate will impede its ability to carry out these functions because other viable sources of revenue are available to registered SDRs. One such source may be fees imposed on persons who are required to report transactions to the SDR. Thus, the Commission believes that, with the adopted definition of “widely accessible,” a registered SDR will have adequate sources of funding even if it is prohibited from charging users fees for receiving the security-based swap

³⁷⁹ *Id.* at 19. See also *id.* at 15 (“Typical restrictions on the use of data obtained from the trade repository’s public dissemination might include restricting data to internal use without a license and limiting publishing, redistributing, databasing, archiving, creating derivative works, or using the data to compete with the trade repository or in a manner otherwise adverse to the trade repository. These are relatively standard clauses in data licenses”). Even if these restrictions are “standard clauses in data licenses,” the Commission notes that they are not permitted under Regulation SBSR, in light of the amendments being adopted today.

³⁸⁰ See *id.* (“there should be no limitations on a registered trade repository’s ability to manage the redistribution of data it has previously disseminated”).

³⁸¹ *Id.* at 15.

transaction data that the SDR is required to publicly disseminate.³⁸²

C. Other Interpretive Issues

Two commenters advocated that a registered SDR be permitted to offer value-added services related to publicly disseminated data.³⁸³ One of these commenters stated, for example, that a registered SDR “should be permitted to commercialize aggregated SB swap data and charge fees for value-added data products that incorporate the regulatorily mandated transaction data.”³⁸⁴ As the Commission stated in the Regulation SBSR Proposed Amendments Release,³⁸⁵ existing Rule 902(a) does not prohibit a registered SDR from creating and charging fees for a value-added data product that incorporates the regulatorily mandated transaction data, provided that the registered SDR has first satisfied its duty under Rule 902(a) to publicly disseminate the regulatorily mandated transaction data in accordance with the definition of “widely accessible.” To comply with Rule 902(a), a registered SDR must publicly disseminate a transaction report of a security-based swap (assuming that the transaction does not fall within Rule 902(c)) *immediately* upon receipt of information about the security-based swap. Thus, a registered SDR would not be permitted to make its value-added product available before it publicly disseminated the regulatorily mandated transaction report because such dissemination would not comply with the requirement in Rule 902(a) that a registered SDR publicly disseminate a transaction report of a security-based swap immediately upon receipt of information about the security-based swap.

This approach is consistent with parallel CFTC rules that require

regulatorily mandated data to be freely available to the public but do not prohibit a CFTC-registered swap data repository from making commercial use of such data subsequent to its public dissemination.³⁸⁶ This approach also allows potential competitors in the market for value-added security-based swap data products to obtain the regulatorily mandated transaction information from registered SDRs that have a monopoly on this information until it is publicly disseminated.³⁸⁷ Potential competitors to the registered SDR could be at a disadvantage if, needing the raw data for their own services, they had to purchase a value-added data product from the registered SDR or could obtain the regulatorily mandated transaction data only on a delayed basis. The Commission notes, finally, that any value-added data product offered by an SDR may be subject to certain SDR rules.³⁸⁸

A final commenter “ask[ed] the Commission to clarify that the restrictions on user fees and usage in Proposed Rule 900(tt) extends only to data that is disseminated by SDRs in a post-trade context.”³⁸⁹ The commenter further stated: “We note and ask the Commission to confirm that certain information contained in publicly-disseminated SBS transaction records may be proprietary and therefore subject to usage restrictions in pre-trade contexts . . . We believe this clarification is needed because in its absence, we have reason to expect some market participants to infer that because SDRs may not impose usage restrictions on information contained in a publicly-disseminated SBS record, that all such limitations on user fees and usage restrictions, *i.e.*, in pre-trade contexts, are similarly prohibited. However, we do not believe that it is the Commission’s intention . . . to eliminate all user fees and usage restrictions on information contained in publicly disseminated SBS data.”³⁹⁰

³⁸⁶ See “Real-Time Public Reporting of Swap Transaction Data” (December 20, 2011), 77 FR 1182, 1207 (January 9, 2012) (adopting rules for the public dissemination of swaps).

³⁸⁷ See *infra* Section XIII(F).

³⁸⁸ See, e.g., Rule 13n-4(c)(1)(i) (requiring that any dues, fees, or other charges imposed by an SDR are fair and reasonable and not unreasonably discriminatory); Rule 13n-4(c)(1)(ii) (requiring an SDR to permit market participants to access specific services offered by the SDR separately); Rule 13n-4(c)(1)(iii) (requiring an SDR to establish, monitor on an ongoing basis, and enforce clearly stated objective criteria that would permit fair, open, and not unreasonably discriminatory access to services offered and data maintained by the SDR).

³⁸⁹ Markit Letter at 15.

³⁹⁰ *Id.* (stating that eliminating all user fees and usage restrictions in the pre-trade context “would erase much of the value of virtually all proprietary

The commenter further stated that there would not be any significant benefit to post-trade transparency from restrictions on user fees and usage in pre-trade contexts.³⁹¹

The Commission declines to make the clarification requested by the commenter. In fact, it is the Commission’s intention to eliminate all fees and usage restrictions on the information that a registered SDR is required to publicly disseminate. In the Commission’s view, the commenter’s distinction between “post-trade contexts”—where fees and usage restrictions could not be imposed—and “pre-trade contexts”—where, according to the commenter, they could be imposed—would be unworkable. The Commission intends for market observers to be able to take in the security-based swap transaction data that are publicly disseminated by registered SDRs on a mandatory basis and scrub, reconfigure, aggregate, analyze, repurpose, or otherwise add value to that publicly disseminated data in any manner that they see fit, without fear that doing so might subject them to liability to a third party for violating a license agreement.³⁹² It would be difficult if not impossible for a market observer to explain that its use of particular codes derives only from the “post-trade context” when utilization of the same codes “in the pre-trade context” might render the market observer liable to the third party who claims to own intellectual property in the code. When proposing the requirement that the information mandatorily disseminated by a registered SDR be “widely available on a non-fee basis,” the Commission stated that the requirement “necessarily implies that a registered SDR would not be permitted to impose—or allow to be imposed—any usage restrictions on the security-based swap transaction data that it is required to publicly disseminate.”³⁹³ Thus, if a registered SDR requires or permits the use of any code or other data element where there is a reasonable threat that a third-party holder of rights in that code or in other data elements might attempt to enforce those rights against market observers,

reference rates, underlier codes, prices, or indexes used in SBS transactions”).

³⁹¹ See *id.*

³⁹² For example, a third party could take in data that are publicly disseminated by one or more registered SDRs and develop its own value-added product. The third party would be entitled to include in its own value-added product any UICs that are included in the information publicly disseminated by any registered SDR pursuant to Rule 902.

³⁹³ Regulation SBSR Proposed Amendments Release, 80 FR at 14761 (emphasis added).

³⁸² One commenter, responding to the Commission’s request for comment on what means exist for registered SDRs to recoup their operating costs, stated: “Non-reporting sides should be charged a minimum monthly fee for system access. This minimum charge reflects the fact that non-reporting and small volume participants tend to require equal levels of support and other resources relative to moderate and high volume participants.” ICE Letter at 7. This issue is beyond the scope of this rulemaking, although the Commission notes that existing Rule 13n-4(c)(1)(i) under the Exchange Act requires an SDR to ensure that any dues, fees, or other charges imposed by the SDR are fair and reasonable and not unreasonably discriminatory.

³⁸³ See DTCC Letter at 14–15, 18–19; ISDA/SIFMA Letter at 29.

³⁸⁴ DTCC Letter at 14–15 (also stating that “[a]n SB SDR that is permitted to do so would likely be better equipped to bear the costs associated with operating a Commission-registered SB SDR. In turn, to the extent that such commercialization offsets the costs of operating the SDR, the costs of reporting for reporting counterparties would likely be reduced”).

³⁸⁵ See 80 FR at 14762.

the registered SDR would not be acting consistent with Rule 903 by requiring or permitting use of that code for reporting or publicly disseminating security-based swap transaction information pursuant to Regulation SBSR. If license restrictions or any other contractual restrictions in the “pre-trade context” could in any way impede usage of the data in a “post-trade context,” then any codes or other data elements that have license restrictions may not be used under Rule 903.

IX. Cross-Border Matters

A. Introduction

In November 2010,³⁹⁴ the Commission proposed Rule 908(a) to define the scope of cross-border transactions that would be subject to Regulation SBSR’s regulatory reporting and public dissemination requirements, and proposed Rule 901(a) to establish a reporting hierarchy for identifying the person that would have the duty to report the security-based swap in a variety of contexts, including cross-border contexts. In May 2013, the Commission re-proposed Rules 901 and 908 with substantial revisions as part of the Cross-Border Proposing Release.³⁹⁵ The Commission adopted modified versions of re-proposed Rules 901 and 908 as part of Regulation SBSR.³⁹⁶ When doing so, the Commission identified certain transactions involving non-U.S. persons that would not be addressed by Rules 901(a) and 908, as adopted in the Regulation SBSR Adopting Release, and stated its intention to seek additional comment regarding how Regulation SBSR should apply to those transactions. In April 2015, the Commission addressed those transactions in the U.S. Activity Proposal, which included proposed amendments to Rules 901(a), 908, and related rules in Regulation SBSR. These amendments would, among other things, apply Regulation SBSR’s regulatory reporting and public dissemination requirements to security-based swap transactions of a non-U.S.

dealing entity that are arranged, negotiated, or executed by personnel of the non-U.S. person located in a U.S. branch or office, or by the personnel of its agent located in a U.S. branch or office.³⁹⁷ In addition, the Commission solicited comment on whether certain transactions of non-U.S. persons whose obligations under a security-based swap are guaranteed by a U.S. person should be exempt from the public dissemination requirement.³⁹⁸

The Commission received 16 comments regarding the U.S. Activity Proposal, of which seven discussed the proposed amendments to Regulation SBSR. In February 2016, the Commission adopted rules that require a foreign dealing entity to count against its *de minimis* threshold transactions with non-U.S. persons where the foreign dealing entity is engaging in ANE activity.³⁹⁹ For the reasons discussed below, the Commission is adopting substantially as proposed the amendments to Regulation SBSR proposed in the U.S. Activity Proposal.

B. Existing Rules 901 and 908

Existing Rule 908(a)(1) requires regulatory reporting and public dissemination of any security-based swap transaction that (1) has a direct or indirect counterparty that is a U.S. person on either or both sides of the transaction, or (2) is accepted for clearing by a clearing agency having its principal place of business in the United States. Existing Rule 908(a)(2) requires regulatory reporting but not public dissemination of a transaction that has a direct or indirect counterparty that is a registered security-based swap dealer or registered major security-based swap participant on either or both sides of the transaction but does not otherwise fall within Rule 908(a)(1). In other words, Rule 908(a)(2) applies to uncleared security-based swaps of registered non-U.S. persons when there is no U.S. person on the other side.

Rule 908(b) is designed to specify the types of persons that will incur duties under Regulation SBSR. If a person does not come within any of the categories enumerated by Rule 908(b), it does not incur any duties under Regulation SBSR.⁴⁰⁰

Under Rule 908(a), as re-proposed in the Cross-Border Proposing Release, security-based swaps that would have fallen within the proposed definition of “transaction conducted within the

United States” would have been among the security-based swaps subjected to both regulatory reporting and public dissemination.⁴⁰¹ In adopting Regulation SBSR, the Commission did not include in Rule 908(a)(1) a prong for “transactions conducted within the United States,” noting that commenters had expressed divergent views on this particular element of the re-proposed rule.⁴⁰² Similarly, the Commission, in the Cross-Border Proposing Release, proposed to expand Rule 908(b) to include any counterparty to a transaction conducted in the United States. However, Rule 908(b), as adopted in the Regulation SBSR Adopting Release, included only U.S. persons, registered security-based swap dealers, and registered major security-based swap participants. Thus, under the rules adopted in the Regulation SBSR Adopting Release, a non-U.S.-person security-based swap dealer or major security-based swap participant would incur an obligation under Regulation SBSR only if it were registered. The Commission noted that it anticipated soliciting additional public comment on whether regulatory reporting and/or public dissemination requirements should be extended to transactions occurring within the United States between non-U.S. persons and, if so, which non-U.S. persons should incur reporting duties under Regulation SBSR.⁴⁰³ The Commission solicited comment on these questions in the U.S. Activity Proposal.⁴⁰⁴

While Rule 908(a) specifies what types of security-based swap transactions are subject to regulatory reporting and/or public dissemination and Rule 908(b) specifies the types of persons that will incur duties under Regulation SBSR, Rule 901(a) assigns the duty to report each individual transaction. Rule 901(a), as adopted in the Regulation SBSR Adopting Release, did not address the reporting of many types of cross-border transactions, and the Commission noted that it anticipated soliciting additional comment about how to apply Regulation SBSR, including which side should incur the reporting duty, in a security-based swap transaction between two unregistered non-U.S. persons and in a transaction between an unregistered

³⁹⁴ See Regulation SBSR Proposing Release, *supra* note 5.

³⁹⁵ See *supra* note 5. Rule 908(a), as initially proposed, would have required regulatory reporting of any security-based swap that is “executed in the United States or through any means of interstate commerce.” See Regulation SBSR Proposing Release, 75 FR at 75287. When the Commission re-proposed Rule 908(a)(1)(i) in the Cross-Border Proposing Release, the Commission expressed concern that the language in the Regulation SBSR Proposing Release could have unduly required a security-based swap to be reported if it had only the slightest connection with the United States. See Cross-Border Proposing Release, 78 FR at 31061.

³⁹⁶ See Regulation SBSR Adopting Release, 80 FR at 14596–604, 14649–68.

³⁹⁷ See *supra* note 87.

³⁹⁸ See U.S. Activity Proposal, 80 FR at 27478.

³⁹⁹ See *supra* note 16.

⁴⁰⁰ See Regulation SBSR Adopting Release, 80 FR at 14656.

⁴⁰¹ Rule 900(ii), as re-proposed in the Cross-Border Proposing Release, would have defined “transaction conducted within the United States” to have the same meaning as in Exchange Act Rule 3a71–3(a)(5)(i), as proposed in the Cross-Border Proposing Release.

⁴⁰² See Regulation SBSR Adopting Release, 80 FR at 14656.

⁴⁰³ See *id.*

⁴⁰⁴ See 80 FR at 27489–90.

U.S. person and an unregistered non-U.S. person.⁴⁰⁵ The U.S. Activity Proposal, among other things, proposed amendments to Rules 900, 901(a), 906, 907, and 908 of Regulation SBSR to address the regulatory reporting and public dissemination of transactions involving non-U.S. persons that were not addressed in the Regulation SBSR Adopting Release. The proposed amendments, the comments received, and final rules are discussed below.

C. Extending Regulation SBSR to All ANE Transactions

1. Description of Proposed Rule

In the U.S. Activity Proposal, the Commission proposed to add a new paragraph (a)(1)(v) to Rule 908(a)(1). Proposed Rule 908(a)(1)(v) would require any security-based swap transaction connected with a non-U.S. person's security-based swap dealing activity that is arranged, negotiated, or executed by personnel of such non-U.S. person located in a U.S. branch or office—or by personnel of its agent located in a U.S. branch or office—to be reported and publicly disseminated. This amendment would expand the scope of Regulation SBSR in two ways. First, it would require that a transaction of a foreign dealing entity be subject to both regulatory reporting and public dissemination if the non-U.S. person would be required to include the transaction in its *de minimis* threshold calculation under Rule 3a71–3(b)(1)(iii)(C) under the Exchange Act.⁴⁰⁶ Second, the proposed rule would require public dissemination of any ANE transaction of a foreign dealing entity, even if there is no U.S. person on the other side and the transaction is not accepted for clearing by a clearing agency having its principal place of business in the United States. Under existing Rule 908(a), a transaction of a registered foreign security-based swap dealer—even if it is an ANE transaction—would be subject to regulatory reporting *but not public dissemination* if there is no U.S. person on the other side and the transaction is not accepted for clearing by a clearing agency having its principal place of business in the United States.⁴⁰⁷

⁴⁰⁵ See Regulation SBSR Adopting Release, 80 FR at 14598.

⁴⁰⁶ 17 CFR 240.3a71–3(b)(1)(iii)(C).

⁴⁰⁷ Under Exchange Act Rule 3a71–1(c), 17 CFR 240.3a71–1(c), absent a limitation by the Commission, a security-based swap dealer is deemed to be a security-based swap dealer with respect to each security-based swap that it enters into, regardless of the type, class, or category of the security-based swap or the person's activities in connection with the security-based swap. Accordingly, for purposes of this rule, any

As discussed in more detail in Section X, *infra*, the Commission in the Regulation SBSR Proposed Amendments Release did not propose to align Regulation SBSR compliance with security-based swap dealer registration. Thus, as proposed, there could have been a period of indefinite length when compliance with Regulation SBSR—including the cross-border reporting provisions thereof—could have been required when no security-based swap dealers had yet registered with the Commission. During such a period, the only way a foreign dealing entity could have been subject to duties under Regulation SBSR would have been if the foreign dealing entity were using U.S. personnel to engage in ANE activity, and the only way that a transaction involving only foreign persons would have been subject to reporting and public dissemination under Regulation SBSR would be if at least one side included a foreign dealing entity that was using U.S. personnel to engage in ANE activity with respect to that specific transaction. After security-based swap dealers register as such with the Commission, most foreign dealing entities will become subject to Regulation SBSR and assume the highest rung in the reporting hierarchy because of their registration status.

2. Discussion of Comments and Final Rule

Several commenters opposed extending Regulation SBSR's regulatory reporting and public dissemination requirements to ANE transactions.⁴⁰⁸ One of these commenters stated, for example, that transactions between non-U.S. persons, where there is no guarantee by a U.S. person on either side, should not be required to be reported or publicly disseminated in the United States because they “lack the requisite nexus to the United States regardless of the location of conduct of the counterparties.”⁴⁰⁹ A second commenter stated that transactions that

transaction that a registered security-based swap dealer arranged, negotiated, or executed using personnel located in a U.S. branch or office would be “in connection with its dealing activity” and subject to both regulatory reporting and public dissemination.

⁴⁰⁸ See IIB Letter at 14–17; ISDA I at 3 (arguing generally that any security-based swap between two non-U.S. persons that is cleared outside the United States should not be subject to Regulation SBSR); SIFMA–AMG I at 5–7; SIFMA/FSR Letter at 11–14; UBS Letter at 3.

⁴⁰⁹ SIFMA/FSR Letter at 12. In the commenter's view, public dissemination of transactions between non-U.S. persons based on U.S.-located conduct could result in the dissemination of information that is not informative or that gives a distorted view of prevailing market prices, while the regulatory reporting of these transactions would not be useful because of the minimal U.S. nexus. See *id.*

have no U.S.-person counterparty should not be publicly disseminated because they “have minimal, if any, impact on or relevance for the U.S. SBS markets even if they are arranged, negotiated or executed in the United States.”⁴¹⁰ A third commenter argued that “[r]equiring non-registrants to publicly disseminate and report ANE transactions seems unnecessary in light of the fact that only small numbers of ANE transactions do not involve a registered SBSD or registered MSBSP and would also be unduly burdensome for non-registrants that are only engaged in *de minimis* SBS activities.”⁴¹¹ Two other commenters expressed concern about the costs that the proposed rule could impose on unregistered foreign dealing entities to report ANE transactions.⁴¹² One of these commenters stated that there would be significant costs associated with reporting ANE transactions because market participants that have already designed and implemented reporting systems based on the CFTC's “status-based” approach to the scope of reporting requirements and the rules of other jurisdictions would need to modify their systems to comply with the Commission's rules.⁴¹³

After carefully considering these comments, the Commission is adopting Rule 908(a)(1)(v) as proposed. Consistent with its territorial

⁴¹⁰ See ISDA I at 13.

⁴¹¹ UBS Letter at 3.

⁴¹² See IIB Letter at 16; SIFMA/FSR Letter at 13 (“It is generally not possible to directly determine the location of counterparty conduct without substantial effort, expense and operational changes to systematically capture and process this data—burdens on market participants that will certainly outweigh the perceived regulatory benefits of obtaining transaction data for security-based swaps required to be reported as a result of U.S.-located conduct. These burdens will also fall on unregistered entities that have no reporting infrastructure and that are not well-equipped to ascertain whether they have a reporting obligation, as long as there are trades between non-U.S. persons, neither of which is a dealer”).

⁴¹³ See IIB Letter at 16 (stating that, to modify its systems in connection with the Commission's requirements, a foreign dealing entity, including one operating below the *de minimis* threshold, “would need to install or modify a trade capture system capable of tracking, on a dynamic, trade-by-trade basis, the location of front-office personnel. The non-U.S. SBSD would then need to feed that data into its reporting system and re-code that system to account for the different rules that apply to non-U.S. SBS depending on whether they are arranged, negotiated or executed by U.S. personnel. The non-U.S. SBSD would also need to train its front office personnel in the use of this new trade capture system and develop policies, procedures, and controls to require, track, and test the proper use of that system. In addition, the non-U.S. SBSD would need to seek and obtain waivers from non-U.S. counterparties—to the extent such waivers are even permitted—with respect to privacy, blocking and secrecy laws in local jurisdictions”).

application of Title VII requirements,⁴¹⁴ the Commission believes that, when a foreign dealing entity uses U.S. personnel to arrange, negotiate, or execute a transaction in a dealing capacity, that transaction occurs at least in part within the United States and is relevant to the U.S. security-based swap market. The Commission has previously determined that ANE activity carried out by U.S. personnel warrants application of the security-based swap dealer registration requirements.⁴¹⁵ The Commission believes that there is sufficient “nexus” to apply Title VII’s regulatory reporting and public dissemination requirements to security-based swap transactions involving a foreign dealing entity that is using U.S. personnel to engage in ANE activity with respect to a particular transaction. As the Commission has stated previously, declining to apply Title VII requirements to security-based swaps of foreign dealing entities that use U.S. personnel to engage in ANE activity would have the effect of allowing such entities “to exit the Title VII regulatory regime without exiting the U.S. market.”⁴¹⁶ Further, as discussed in Section X, *infra*, reporting under Regulation SBSR will commence following security-based swap dealer registration. Thus, for the vast majority of transactions of foreign dealing entities falling within the scope of Rule 908(a), the reporting obligation under Regulation SBSR will arise from an entity’s status as a registered security-based swap dealer, and entities that are registered as security-based swap dealers will not be required to assess whether they have engaged in ANE activity with respect to a transaction. The costs associated with the reporting of ANE transactions are discussed more fully below.

a. Impact on Regulatory Reporting

The Commission notes that all security-based swaps of registered security-based swap dealers, whether U.S. or foreign, are subject to regulatory reporting under existing Rule 908(a)(2). For transactions involving foreign

dealing entities that register with the Commission as security-based swap dealers, the regulatory reporting requirement stems from the involvement of the registered person, not from the presence of any ANE activity. Therefore, new Rule 908(a)(1)(v) does not subject any additional transactions involving registered security-based swap dealers to Regulation SBSR’s regulatory reporting requirements.⁴¹⁷

New Rule 908(a)(1)(v) extends the regulatory reporting requirements only to transactions involving an unregistered foreign dealing entity (when it engages in ANE activity) when no other condition is present that would trigger regulatory reporting (*e.g.*, there is a U.S. person or registered security-based swap dealer on the other side). Thus, Rule 908(a)(1)(v) imposes regulatory reporting requirements only to transactions in which an unregistered foreign dealing entity enters into a transaction with another unregistered foreign person.

As noted in Section II(A)(4)(d), *supra*, the Commission believes that foreign dealing entities that will register with the Commission as security-based swap dealers will be counterparties to the vast majority of security-based swaps involving foreign dealing entities engaging in U.S. activity. The Commission estimates that only a few foreign dealing entities will remain below the *de minimis* threshold and utilize U.S. personnel to engage in ANE transactions with other unregistered foreign persons. Therefore, new Rule 908(a)(1)(v) will extend Regulation SBSR’s regulatory reporting requirements to only a small number of additional transactions in which an unregistered foreign dealing entity engaged in ANE activity transacts with another unregistered foreign person. In this release, the Commission estimates that only four foreign dealing entities likely will engage in ANE transactions and remain below the *de minimis* threshold, and thus be counterparties to security-based swaps that fall within Rule 908(a)(1)(v).⁴¹⁸

As noted above,⁴¹⁹ some commenters expressed concern about the costs associated with requiring ANE transactions of unregistered foreign dealing entities to be reported, which will require an assessment of whether

ANE activity is present in a particular transaction.⁴²⁰ One commenter argued, for example, that regulatory reporting of these transactions “seems unnecessary in light of the fact that only small numbers of ANE transactions” would be captured by Rule 908(a)(1)(v).⁴²¹ The Commission agrees that only a small number of additional transactions will become subject to regulatory reporting because of Rule 908(a)(1)(v). However, because all ANE transactions occur at least in part within the United States, reporting these transactions to a registered SDR will enhance the Commission’s ability to oversee relevant security-based swap activity within the United States as well as to evaluate market participants for compliance with specific Title VII requirements (including the requirement that a person register with the Commission as a security-based swap dealer if it exceeds the *de minimis* threshold).⁴²² The reporting of these additional ANE transactions also will enhance the Commission’s ability to monitor for manipulative and abusive practices involving security-based swaps or transactions in related assets, such as corporate bonds.⁴²³

The Commission believes that certain unregistered foreign dealing entities generally will already be assessing whether they utilize U.S. personnel and, if so, whether such personnel are involved in arranging, negotiating, or executing particular security-based swaps, so that they can count such transactions against their *de minimis* thresholds. Thus, the Commission believes that new Rule 908(a)(1)(v) will impose only limited assessment costs beyond those already being incurred by unregistered foreign dealing entities.⁴²⁴

The Commission acknowledges that subjecting ANE transactions between unregistered non-U.S. persons to regulatory reporting requirements under new Rule 908(a)(1)(v) also will result in

⁴¹⁴ See, *e.g.*, U.S. Activity Adopting Release, 81 FR at 8613–17; Regulation SBSR Adopting Release, 80 FR at 14649–50; Cross-Border Adopting Release, 79 FR at 47287–88.

⁴¹⁵ See U.S. Activity Adopting Release, 81 FR at 8614 (“we do not believe that security-based swap dealing activity must create counterparty credit risk in the United States for there to be a ‘nexus’ sufficient to warrant security-based swap dealer registration”).

⁴¹⁶ U.S. Activity Adopting Release, 81 FR at 8616. See also Cross-Border Adopting Release, 79 FR at 47288 (“Our territorial approach applying Title VII to dealing activity similarly looks to whether [relevant activities] occur with the United States, and not simply to the location of the risk”).

⁴¹⁷ But see *infra* Section IX(C)(2)(b) (explaining that new Rule 908(a)(1)(v) subjects additional transactions involving registered security-based swap dealers to Regulation SBSR’s public dissemination requirements).

⁴¹⁸ See *infra* note 885 and accompanying text.

⁴¹⁹ See *supra* notes 412–413 and accompanying text.

⁴²⁰ Other comments also discussed the costs of assessing whether ANE activity is present in a transaction involving only unregistered foreign persons, but under the assumption that the Commission would require reporting compliance before requiring security-based swap dealers to register as such. See ISDA I at 11–13; ISDA II at 3–10; ISDA III, *passim*; ISDA/SIFMA Letter at 9–12; SIFMA–AMG I at 6–7. These comments are addressed by Section X, *infra*, where the Commission revises the proposed compliance schedule and adopts a final compliance schedule that aligns Regulation SBSR compliance with security-based swap dealer registration.

⁴²¹ UBS Letter at 3.

⁴²² See U.S. Activity Proposal, 80 FR at 27483.

⁴²³ See *id.*

⁴²⁴ See *infra* Section XII(B)(1).

certain programmatic costs.⁴²⁵ The Commission assesses those costs against the benefits of the rule to the Commission, other relevant authorities, and the market in general.⁴²⁶ The Commission continues to believe that reporting of these ANE transactions to a registered SDR will enhance the Commission's ability to monitor relevant activity related to security-based swap dealing occurring within the United States as well as to monitor market participants for compliance with specific Title VII requirements (including the requirement that a person register with the Commission as a security-based swap dealer if it exceeds the *de minimis* threshold).

b. Impact on Public Dissemination

While Rule 908(a)(1)(v) will extend Regulation SBSR's regulatory reporting requirements to additional cross-border security-based swaps—those involving unregistered foreign dealing entities when they engage in ANE transactions with other unregistered foreign persons—Rule 908(a)(1)(v) will extend Regulation SBSR's public dissemination requirements to a potentially larger number of cross-border transactions that are, under existing Regulation SBSR, subject to regulatory reporting but not public dissemination. Under existing Rule 908(a)(2), a security-based swap that does not otherwise fall within Rule 908(a)(1) shall be subject to regulatory reporting but not public dissemination if there is a registered security-based swap dealer or registered major security-based swap participant on either or both sides of the transaction. Under existing Rule 908(a)(1), a security-based swap is subject to both regulatory reporting and public dissemination only if there is a direct or indirect counterparty that is a U.S. person on either or both sides of the transaction or if the security-based swap is accepted for clearing by a clearing agency having its principal place of business in the United States. Nothing in existing Rule 908(a)(1) extends the public dissemination requirements to transactions of registered security-based swap dealers and registered major security-based swap participants based on the location of personnel who engage in relevant conduct. Thus, under existing Rule

908(a), a transaction involving only non-U.S. persons on both sides, even if one or both sides include a registered foreign security-based swap dealer, would not be subject to public dissemination. Under new Rule 908(a)(1)(v), however, the location of the personnel who engage in relevant activity on behalf of a foreign dealing entity becomes a dispositive factor for determining whether the transaction is subject to public dissemination. The Commission anticipates that a significant number of transactions between foreign registered security-based swap dealers will be with other non-U.S. persons (including other foreign registered security-based swap dealers). Under existing Rule 908(a), the overwhelming majority of these transactions would have been subject only to regulatory reporting. However, with the adoption of Rule 908(a)(1)(v), many of these transactions also will be subject to public dissemination, if there is a foreign dealing entity on either side that is engaging in ANE activity.

The Commission believes that it is appropriate to apply the public dissemination requirements to all ANE transactions, even those between two foreign counterparties where only one side is engaging in ANE activity. Transactions that are arranged, negotiated, or executed by U.S. personnel of a foreign dealing entity exist at least in part within the United States. Subjecting such transactions to public dissemination is consistent with the Commission's territorial application of Title VII requirements.⁴²⁷ The Commission believes that the public dissemination of ANE transactions will increase price competition and price efficiency in the security-based swap market generally, and enable all market participants to have more comprehensive information with which to make trading and valuation determinations for security-based swaps and related and underlying assets.⁴²⁸

Thus, the Commission disagrees with the commenter who did “not believe the public dissemination of SBS between non-US Persons increases transparency to the public”⁴²⁹ and another commenter who asserted that publicly disseminating such transactions between non-U.S. persons could result in the dissemination of information that is not informative or that gives a distorted view of prevailing market

prices.⁴³⁰ The Commission believes, to the contrary, that public dissemination of transactions between non-U.S. persons, where one or both sides are engaging in ANE activity, will be informative and will provide useful information about prevailing market prices in the U.S. security-based swap market. The fact that a foreign dealing entity uses U.S. personnel to arrange, negotiate, or execute a transaction suggests that these personnel were selected because they have familiarity with the U.S. security-based swap market, and that the instruments involved in such transactions between non-U.S. persons are typically the same or similar to instruments traded between foreign dealing entities and U.S. persons.⁴³¹ The Commission believes, therefore, that public dissemination of all ANE transactions will contribute to price discovery and price competition in the U.S. security-based swap market. The Commission further believes that—rather than providing a distorted view of prevailing market prices, as these commenters suggest—the dissemination of ANE transactions will provide a more comprehensive view of activity in the U.S. market.

Another commenter questioned the transparency benefits of publicly disseminating uncleared bilateral trades that may include bespoke terms.⁴³² However, as the Commission previously discussed in the Regulation SBSR Adopting Release, even bespoke transactions have price discovery value and thus should be publicly

⁴³⁰ See SIFMA/FSR Letter at 12.

⁴³¹ Various commenters noted, for example, that foreign dealing entities typically utilize U.S. personnel because such personnel have familiarity with instruments traded in the U.S. market. See ISDA I at 5 (“The prudent risk management of global market participants therefore requires sales and trading experts in SBS transactions to typically be located in the region of the underlying asset. Accordingly, experts in SBS products that are linked to U.S.-based underliers will usually tend to be located in the United States”); IIB Letter at 2 (“we believe that it would be desirable to foster the continued use of U.S. personnel by non-U.S. SBSDs to engage in market-facing activities. These activities are important to effective risk management by non-U.S. SBSDs in connection with SBS involving U.S. reference entities. This is because the traders with the greatest expertise and familiarity with those types of SBS are best-positioned to risk manage those positions and are typically located in the United States. . . . Centralization of pricing, hedging and risk management functions and workable integration of these functions with sales activity by non-U.S. SBSDs also helps to promote U.S. market liquidity by integrating trading interest from non-U.S. counterparties into the U.S. market”); SIFMA/FSR Letter at 6 (“For U.S.-listed products and security-based swaps based on those products, many non-U.S. dealing entities concentrate that expertise in the United States to better serve client demands”).

⁴³² See IIB Letter at 15.

⁴²⁵ See *infra* notes 929 to 933 and accompanying text (discussing the programmatic costs associated with the reporting and public dissemination of ANE transactions). See also *infra* Section XIII(H) (discussing the possibility of foreign dealing entities restructuring their operations to avoid triggering reporting requirements).

⁴²⁶ See *infra* Section XII(A)(4)(a) (discussing the estimated costs and benefits of new Rule 908(a)(1)(v)).

⁴²⁷ See, e.g., U.S. Activity Adopting Release, 81 FR at 8613–17; Regulation SBSR Adopting Release, 80 FR at 14649–50; Cross-Border Adopting Release, 79 FR at 47287–88.

⁴²⁸ See *infra* Section XIII(H)(2).

⁴²⁹ ISDA III at 11.

disseminated.⁴³³ Requiring the public dissemination of all ANE transactions, whether cleared or uncleared, will increase price competition and price efficiency in the security-based swap market generally, and enable all market participants to have more comprehensive information with which to make trading and valuation determinations for security-based swaps and related and underlying assets.⁴³⁴

Another commenter expressed concerns about the market possibly front-running the hedges of a foreign dealing entity if all ANE transactions were subject to public dissemination. The Commission does not find this a persuasive argument against imposing the public dissemination requirements on all ANE transactions. The concern about public dissemination triggering adverse market impact, such as higher prices to hedge, is common to all security-based swap transactions, regardless of whether a transaction is subject to public dissemination because it involves a U.S. counterparty or because it is an ANE transaction. Therefore, as the Commission decided in the Regulation SBSR Adopting Release, all transactions will during the first phase of Regulation SBSR have up to 24 hours from the time of execution to be reported (and then immediately disseminated by a registered SDR).⁴³⁵

One commenter argued that the proposed rule would not enhance transparency in the U.S. security-based swap market because it would create incentives for non-U.S. counterparties to avoid interactions with U.S. personnel.⁴³⁶ The commenter believed

that the Commission's analysis of the trade-off between transparency and liquidity did not fully address the costs and benefits of applying a U.S.-personnel test to the public dissemination requirement.⁴³⁷ Such fragmentation, in the commenter's view, would lead to adverse effects on effective risk management, market liquidity, and U.S. jobs. The commenter also expressed concern that the costs associated with reporting ANE transactions could lead some non-U.S. security-based swap dealers to prevent their U.S. personnel from interacting with non-U.S. counterparties, and some non-U.S. counterparties to avoid interactions with U.S. personnel.⁴³⁸

The Commission acknowledges, as this commenter suggests, that to avoid public dissemination some foreign dealing entities might prevent their U.S. personnel from interacting with non-U.S. counterparties, and some non-U.S. counterparties might avoid interactions with U.S. personnel. The Commission believes, nevertheless, that public dissemination of all ANE transactions is necessary to advance the Title VII objectives of enhancing transparency in the security-based swap market. The Commission notes that new Rule 908(a)(1)(v) extends the public dissemination requirements only to ANE transactions of foreign dealing entities with non-U.S. persons; transactions of foreign dealing entities with U.S. persons—regardless of whether they are arranged, negotiated, or executed by U.S. personnel—are already subject to existing Rule 908(a)(1)(i) by virtue of a U.S. person's involvement in the transaction. The Commission believes, therefore, that extending the public dissemination requirements to ANE transactions involving non-U.S. persons will promote a level playing field. Without Rule 908(a)(1)(v), the U.S. personnel of a foreign dealing entity might be able to offer liquidity to non-U.S. persons at lower prices than to U.S. persons, because the foreign dealing entity would not have to embed the potential costs of public dissemination into the prices offered to non-U.S. persons. By contrast, the prices offered by the foreign dealing entity to U.S. persons would likely reflect any such additional costs, to the extent that public dissemination of a particular transaction imposes costs on the counterparties.⁴³⁹ While the benefit

of lower prices obtained by non-U.S. persons would depend on the magnitude of the perceived costs of public dissemination, the Commission believes that it is appropriate to place the transactions of U.S. persons and non-U.S. persons on a more equal footing, so that non-U.S. persons do not have a competitive advantage over U.S. persons when engaging in security-based swap transactions that, due to the involvement of U.S. personnel of the foreign dealing entity, exist at least in part within the United States.

The commenter also argued that it would be problematic for foreign dealing entities to assess for ANE activity, which would trigger the public dissemination requirement.⁴⁴⁰ However, such an assessment is not required unless a foreign dealing entity wishes to exclude the transaction from public dissemination because relevant activity does not occur within the United States (and there is no other basis for public dissemination under Rule 908(a)(1)). For any transaction report, the default assumption is that it is subject to public dissemination, unless the person submitting the report has appropriately flagged it as “do not disseminate.”⁴⁴¹ A registered foreign security-based swap dealer that does not wish to assess a transaction for ANE activity could simply refrain from applying the flag and the transaction would be publicly disseminated.⁴⁴²

c. Impact of Substituted Compliance

Commenters also stated that the proposed rule could result in duplicative reporting because transactions covered by the proposed rule also would likely be reported in

prices offered to their non-U.S. counterparties, and Rule 908(a)(1)(v) should not affect the prices that foreign dealing entities that engage in ANE transactions offer to their non-U.S. counterparties.

⁴⁴⁰ See ISDA III at 11 (noting that, even if the Commission were to defer Regulation SBSR compliance until after security-based swap dealer registration, “there would still be a need to exchange ANE on transactions between Non-U.S. Persons engaged in SBS dealing activity (including between non-U.S. registered SBSR) only so the reporting side will know that it needs to send a separate message or otherwise indicate to the SDR . . . that a SBS is subject to public reporting”).

⁴⁴¹ See Regulation SBSR Adopting Release, 80 FR at 14610 (“A registered SDR would not be liable for a violation of Rule 902(c) if it disseminated a report of a transaction that fell within Rule 902(c) if the reporting side for that transaction failed to appropriately flag the transaction as required by Rule 907(a)(4)”).

⁴⁴² Cf. U.S. Activity Adopting Release, 81 FR at 8628 (“a dealer may choose to count all transactions with other non-U.S. persons towards its *de minimis* threshold, regardless of whether counting them is required, to avoid the cost of assessing the locations of personnel involved with each transaction”).

⁴³³ See Regulation SBSR Adopting Release, 80 FR at 14611 (“The disseminated price [of a bespoke transaction] could, for example, still have an anchoring effect on price expectations for future negotiations in similar or related products, even in thinly-traded markets. Furthermore, even if it is difficult to compare price data across customized transactions, by disseminating reports of all bespoke transactions market observers can understand the relative number and aggregate notional amounts of transactions in bespoke products versus standardized products”).

⁴³⁴ See *infra* Section XIII(H)(2).

⁴³⁵ See Rule 901(j); Appendix to Rule 901 (Reports Regarding the Establishment of Block Thresholds and Reporting Delays for Regulatory Reporting of Security-Based Swap Data); Regulation SBSR Adopting Release, 80 FR at 14616–25.

⁴³⁶ See IIB Letter at 14. According to this commenter, a non-U.S. counterparty whose transaction was subject to public dissemination would receive a worse execution price because a dealer might widen its quotes for the transaction to counteract the risk that other market participants would front-run the dealer's hedges. The commenter suggested that, although a U.S. counterparty would have a similar incentive to avoid public dissemination of its trades, U.S. counterparties would not be in the same position as non-U.S. counterparties to avoid the application of U.S. public dissemination requirements. See *id.* at 14–15.

⁴³⁷ See *id.* at 15.

⁴³⁸ See *id.* at 15–16.

⁴³⁹ However, to the extent that transactions of foreign dealing entities are subject to public dissemination requirements under the rules of a foreign jurisdiction, the costs of public dissemination should already be factored into the

another jurisdiction.⁴⁴³ These commenters recommended that the Commission obtain information about these transactions through information-sharing arrangements with foreign regulatory authorities, rather than establishing duplicative reporting requirements.⁴⁴⁴ One of these commenters expressed concern that the potential for duplicative reporting could overstate trading volumes in the security-based swap market, which would not advance the G20's goal of improving transparency for derivatives.⁴⁴⁵ Two commenters argued that foreign regulators would have a greater interest than the Commission in establishing transparency requirements for security-based swaps involving non-U.S. counterparties.⁴⁴⁶

The Commission acknowledges that some ANE transactions of foreign dealing entities could be subject to reporting and/or public dissemination requirements in other jurisdictions. Substituted compliance could mitigate the concerns of these commenters if the Commission issues a substituted compliance order for regulatory reporting and public dissemination of security-based swaps with respect to a particular foreign jurisdiction. In such case, a cross-border transaction involving that jurisdiction would not be subject to any direct reporting and public dissemination requirements under Regulation SBSR. A substituted compliance order would eliminate duplication with the comparable reporting and public dissemination requirements of the other jurisdiction, and concerns regarding overstated trading volumes and distortions of the market would thus not arise.⁴⁴⁷ A

⁴⁴³ See SIFMA/FSR Letter at 12; SIFMA-AMG I at 6.

⁴⁴⁴ See *id.*

⁴⁴⁵ See SIFMA-AMG I at 2, 6. The commenter also stated that reporting the same transaction to trade repositories in the United States and the European Union could undermine the quality of publicly disseminated information because of errors caused by reporting the same transaction in multiple jurisdictions. See *id.* at 6.

⁴⁴⁶ See IIB Letter at 15; SIFMA/FSR Letter at 12.

⁴⁴⁷ The Commission further notes that, to the extent that ANE transactions involving foreign dealing entities are subject to comparable requirements for reporting and public dissemination in another foreign jurisdiction—a necessary but not sufficient condition for the Commission to issue a substituted compliance order—a foreign dealing entity would not have an incentive to avoid Regulation SBSR's public dissemination requirements by, for example, relocating its personnel, because the transaction would in any case be subject to the public dissemination requirements of the other jurisdiction. Relocating personnel or curtailing the activities of personnel who remain in the United States would be effective in avoiding public dissemination only if public dissemination

person relying on substituted compliance in this manner would remain subject to the applicable Exchange Act requirements but would be complying with those requirements in an alternative fashion.

The Commission recognizes that, in practice, there will be limits to the availability of substituted compliance. For example, if the Commission were unable to make a favorable comparability determination with respect to one or more foreign jurisdiction's security-based swap reporting and dissemination requirements because they do not achieve a comparable regulatory outcome, or because the foreign trade repository or foreign authority that receives and maintains transaction reports is not subject to requirements comparable to those imposed on SDRs, the Commission would not issue a substituted compliance order with respect to that jurisdiction. The availability of substituted compliance also will depend upon the availability of supervisory and enforcement arrangements among the Commission and relevant foreign financial regulatory authorities. Although comparability assessments will focus on regulatory outcomes rather than rule-by-rule comparisons, the assessments will require inquiry regarding whether foreign regulatory requirements adequately reflect the interests and protections associated with the particular Title VII requirement. Further, only transactions in which at least one of the direct counterparties to the security-based swap is a non-U.S. person or a foreign branch are eligible for substituted compliance.

Finally, one commenter asserted that, "[w]ith respect to Non-U.S. SBS cleared outside the United States, foreign regulators have a relatively greater interest than the Commission in establishing applicable transparency requirements."⁴⁴⁸ The Commission acknowledges that foreign regulatory authorities have a regulatory interest in security-based swaps that are cleared in their jurisdictions. However, for the reasons discussed above, the Commission also has a regulatory interest when a transaction involves ANE activity conducted by U.S. personnel of one or both sides of the transaction—even if the transaction is subsequently cleared outside the United States. Public dissemination of all ANE transactions should increase transparency and facilitate price

requirements applied to the transaction pursuant only to Regulation SBSR.

⁴⁴⁸ See IIB Letter at 15.

discovery and price competition in the U.S. security-based swap market; regulatory reporting of all ANE transactions will enhance the Commission's ability to oversee the U.S. security-based swap market and the activities of U.S. personnel who are involved in arranging, negotiating, or executing such transactions. The Commission believes, therefore, that it has a compelling interest in establishing regulatory reporting and public dissemination requirements for all ANE transactions.

D. Extending Regulation SBSR to All Transactions Executed on a U.S. Platform Effected By or Through a Registered Broker-Dealer

In the U.S. Activity Proposal, the Commission proposed a new paragraph (a)(1)(iii) to Rule 908(a)(1) that would have subjected any security-based swap transaction that is executed on a platform having its principal place of business in the United States to regulatory reporting and public dissemination. The Commission also proposed a new paragraph (a)(1)(iv) to Rule 908(a)(1) that would subject any security-based swap transaction that is effected by or through a registered broker-dealer (including a registered SB SEF) to regulatory reporting and public dissemination. The Commission notes that many types of security-based swap transactions that are executed on a platform or effected by or through a registered broker-dealer are already subject to Regulation SBSR—for example, if either side includes a U.S. person⁴⁴⁹ or a registered person,⁴⁵⁰ or if the transaction is accepted for clearing at a clearing agency having its principal place of business in the United States.⁴⁵¹ Thus, proposed Rules 908(a)(1)(iii) and (iv) would have had the effect of extending regulatory reporting and public dissemination requirements to transactions occurring on a platform having its principal place of business in the United States or executed by or through a registered broker-dealer only when the counterparties consist exclusively of unregistered non-U.S. persons. In addition, proposed Rules 908(a)(1)(iii) and (iv) would have extended the public dissemination requirement to transactions involving a registered foreign security-based swap dealer that are executed on a platform or through a registered broker-dealer and not otherwise subject to public

⁴⁴⁹ See Rule 908(a)(1)(i).

⁴⁵⁰ See Rule 908(a)(2).

⁴⁵¹ See Rule 908(a)(1)(ii).

dissemination (e.g., because there is a U.S. person on the other side).⁴⁵²

Two commenters generally opposed these amendments.⁴⁵³ One of these commenters stated that transactions between non-U.S. persons that have no U.S.-person guarantor—which would include transactions covered by proposed Rules 908(a)(1)(iii), (iv), and (v)—should not be subject to regulatory reporting or public dissemination in the United States because they lack the requisite nexus to the United States.⁴⁵⁴ The other commenter expressed the view that these requirements should not apply to the security-based swaps of non-U.S. persons unless they involve a registered security-based swap dealer.⁴⁵⁵ The commenter added that proposed Rule 908(a)(1)(iv) could provide incentives for non-U.S. counterparties to avoid transacting through registered broker-dealers, resulting in market fragmentation that would lead to adverse effects on risk management, market liquidity, and U.S. jobs.⁴⁵⁶

The Commission continues to believe that any transaction executed on a platform that has its principal place of business in the United States should be subject to regulatory reporting and public dissemination, even when the transaction involves two non-U.S. persons that are not engaged in dealing activity in connection with the transaction.⁴⁵⁷ Transactions executed on a platform having its principal place of business in the United States are consummated within the United States and therefore exist, at least in part, in the United States.⁴⁵⁸ Requiring these security-based swaps to be reported will permit the Commission and other relevant authorities to observe, in a registered SDR, all transactions executed on U.S. platforms and to carry out oversight of such transactions. With respect to public dissemination of platform-executed security-based swaps, the Commission notes that it would be inconsistent if a subset of the transactions executed on U.S. platforms—those involving unregistered

non-U.S. counterparties—were not subject to public dissemination, while all other transactions executed on U.S. platforms were subject to public dissemination. Furthermore, the Commission understands that platforms typically engage in the practice of disseminating information about completed transactions to their own participants. Accordingly, the Commission believes that it would be anomalous for a platform to broadcast information about a transaction involving two non-U.S. counterparties to its participants if such transaction were not also included within Regulation SBSR's public dissemination requirements.

As the Commission previously noted in the U.S. Activity Proposal,⁴⁵⁹ registered broker-dealers play a key role as intermediaries in the U.S. financial markets. To improve the integrity and transparency of those markets, the Commission believes that the Commission and other relevant authorities should have ready access to detailed information about the security-based swap transactions that such persons intermediate. Furthermore, the Commission believes that public dissemination of security-based swap transactions intermediated by a registered broker-dealer will provide useful information about prevailing market prices in the U.S. security-based swap market, and that regulatory reporting of such transactions will assist the Commission and other relevant authorities in overseeing the U.S. security-based swap market. Such reporting also will assist the Commission in overseeing the activities of market intermediaries that it registers.

The Commission agrees that there is some possibility that requiring the regulatory reporting and public dissemination of security-based swaps between unregistered non-U.S. persons that are intermediated by registered broker-dealers could create an incentive for those non-U.S. persons to avoid transacting through a registered broker-dealer. However, a rule that failed to capture these transactions could provide unregistered non-U.S. persons a competitive advantage over unregistered U.S. persons. The security-based swap transactions of U.S. persons effected by or through a registered broker-dealer are subject to Regulation SBSR, while the transactions between unregistered non-U.S. persons effected by or through a registered broker-dealer would not be subject to Regulation SBSR. Absent Rules 908(a)(1)(iii) and (iv), a registered broker-dealer (or platform) might be able

offer its services at a lower price to non-U.S. persons than to U.S. persons, because the platform or registered broker-dealer would not have to embed the potential costs of regulatory reporting and public dissemination when pricing services offered to non-U.S. persons. By contrast, the price offered by the platform or registered broker-dealer to U.S. persons would likely reflect these additional costs. The Commission does not see a basis for permitting non-U.S. persons to enjoy this competitive advantage over U.S. persons when engaging in security-based swap transactions that, due to the involvement of a U.S. platform or registered broker-dealer, exist at least in part within the United States. Accordingly, the Commission declines to adopt the commenters' recommendation that the Commission exclude from Regulation SBSR the transactions of unregistered non-U.S. persons that are effected by or through a registered broker-dealer.

E. Public Dissemination of Covered Cross-Border Transactions

Existing Rule 908(a)(1)(i) requires regulatory reporting and public dissemination of a security-based swap if there is a direct or indirect counterparty that is a U.S. person on either or both sides of the transaction. This would include, for example, a security-based swap having, on one side, a direct counterparty who is not a U.S. person but has a U.S. guarantor, and the other side includes no counterparty that is a U.S. person, registered security-based swap dealer, or registered major security-based swap participant (a "covered cross-border transaction").⁴⁶⁰ As discussed in the U.S. Activity Proposal, this treatment of covered cross-border transactions represented a departure from the re-proposed approach described in the Cross-Border Proposing Release, which would have excepted covered cross-border transactions from the public dissemination requirement.⁴⁶¹ The Commission noted, however, that it had determined to continue considering whether to except covered cross-border transactions from the public dissemination requirement and that it would solicit additional comment

⁴⁵² Under existing Rule 908(a)(2), transactions involving a registered foreign security-based swap dealer or registered foreign security-based swap market participant that do not otherwise fall within existing Rule 908(a)(1) are subject to regulatory reporting but not public dissemination.

⁴⁵³ See IIB Letter at 15, 17; SIFMA/FSR Letter at 12–14.

⁴⁵⁴ See SIFMA/FSR Letter at 12.

⁴⁵⁵ See IIB Letter at 15–17.

⁴⁵⁶ See *id.* at 16–17. As discussed in the subsection immediately above, the commenter also raised these concerns with respect to ANE transactions.

⁴⁵⁷ See U.S. Activity Proposal, 80 FR at 27484.

⁴⁵⁸ See *id.*

⁴⁵⁹ See 80 FR at 27485.

⁴⁶⁰ As in the Regulation SBSR Adopting Release, a "covered cross-border transaction" refers to a transaction that meets the description above and will not be submitted to clearing at a registered clearing agency having its principal place of business in the United States. See Regulation SBSR Adopting Release, 80 FR at 14653, n. 827.

⁴⁶¹ See U.S. Activity Proposal, 80 FR at 27485 (citing Cross-Border Proposing Release, 78 FR at 31062).

regarding whether such an exception would be appropriate.⁴⁶²

In the U.S. Activity Proposal, the Commission expressed its preliminary view that—in light of its determination to require all security-based swap transactions of U.S. persons, including all transactions conducted through a foreign branch, to be publicly disseminated—it did not think that it would be appropriate to exempt covered cross-border transactions from the public dissemination requirement.⁴⁶³ As the Commission had previously noted in the Regulation SBSR Adopting Release,⁴⁶⁴ a security-based swap transaction involving a U.S. person that guarantees a non-U.S. person exists, at least in part, within the United States, and the economic reality of these transactions is substantially identical to transactions entered into directly by a U.S. person (including through a foreign branch). Subjecting transactions through a foreign branch to public dissemination but excluding transactions involving a U.S.-person guarantor would treat these economically substantially identical transactions differently, and could create competitive disparities among U.S. persons, depending on how they structured their businesses. Thus, a U.S. person that engages in security-based swap transactions through a guaranteed foreign subsidiary could carry out an unlimited volume of covered cross-border transactions without being subject to the public dissemination requirement, while another U.S. person that engaged in similar transactions through a foreign branch would be subject to the public dissemination requirement.⁴⁶⁵

Two commenters disagreed with the Commission's proposed treatment of covered cross-border transactions.⁴⁶⁶ One of these commenters argued that the financial risks of such transactions lie outside the United States, and that the presence of a U.S.-person guarantor would not make the pricing information relating to the transaction relevant to the U.S. market.⁴⁶⁷ The other commenter argued not only that covered cross-

border transactions should be exempt from public dissemination, but that the Commission should expand this exemption to include transactions in which both sides include a U.S.-person guarantor but neither side includes a registered security-based swap dealer or major security-based swap participant, or a U.S. person as a direct counterparty.⁴⁶⁸ The commenter argued that, because these transactions take place outside the United States and are between two unregistered non-U.S. persons, “there is insufficient U.S. jurisdictional nexus to justify the public dissemination of the security-based swap data in the United States.”⁴⁶⁹

The Commission disagrees with the commenter's assertions that the financial risks of covered cross-border transactions lie outside the United States and that there is insufficient U.S. jurisdictional nexus to justify the public dissemination of these transactions in the United States. As the Commission noted in the Regulation SBSR Adopting Release, a security-based swap having an indirect counterparty that is a U.S. person is economically equivalent to a security-based swap with a U.S.-person direct counterparty, and both kinds of security-based swaps exist, at least in part, within the United States.⁴⁷⁰ The presence of a U.S. guarantor facilitates the activity of the non-U.S. person who is guaranteed and, as a result, the security-based swap activity of the non-U.S. person cannot reasonably be isolated from the U.S. person's activity in providing the guarantee.⁴⁷¹ The financial resources of the U.S. guarantor could be called upon to satisfy the contract if the direct counterparty fails to meet its obligations; thus, the extension of a guarantee is economically equivalent to a transaction entered into directly by the U.S. guarantor.⁴⁷² Because a U.S. guarantor might be obligated to perform under the guarantee, the Commission disagrees with the commenter's assertion that the financial risks of covered cross-border transactions lie outside the United States.

With respect to the commenter's view that covered cross-border transactions lack sufficient jurisdictional nexus to justify their public dissemination in the United States, the Commission takes the position that, under the territorial approach to Title VII described in the

Regulation SBSR Adopting Release,⁴⁷³ any security-based swap guaranteed by a U.S. person exists at least in part within the United States, which triggers the application of Title VII requirement for public dissemination.⁴⁷⁴ In the Regulation SBSR Adopting Release, the Commission noted that the transparency benefits of requiring public dissemination of security-based swaps involving at least one U.S.-person direct counterparty would inure to other U.S. persons and the U.S. market generally, as other participants in the U.S. market are likely to transact in the same or related instruments.⁴⁷⁵ In addition, the economic reality of covered cross-border transactions is substantially identical to transactions entered into directly by a U.S. person (including through a foreign branch).⁴⁷⁶ Excluding covered cross-border transactions from public dissemination would treat these economically similar transactions differently, potentially creating competitive disparities among U.S. persons, depending on how they have structured their business.⁴⁷⁷ To avoid such competitive disparities and to further the transparency goals of Title VII, the Commission believes that it is necessary and appropriate to require the public dissemination of covered cross-border transactions.

F. Expanding Rule 908(b)

Existing Rule 908(b) provides that, notwithstanding any other provision of Regulation SBSR, a person shall not incur any obligation under Regulation SBSR unless it is a U.S. person, a registered security-based swap dealer, or a registered major security-based swap participant. Rule 908(b) is designed to clarify the cross-border application of Regulation SBSR by specifying the types of counterparties that would and would not be subject to any duties under Regulation SBSR; if a person does not fall within any of the categories enumerated by Rule 908(b), it would not incur any duties under Regulation

⁴⁷³ See 80 FR at 14649–50.

⁴⁷⁴ See *id.* at 14653. See also Cross-Border Adopting Release, 79 FR at 47289–90 (“the economic reality of the non-U.S. person's dealing activity, where the resulting transactions are guaranteed by a U.S. person, is identical, in relevant respects, to a transaction entered into directly by the U.S. guarantor”).

⁴⁷⁵ See 80 FR at 14651.

⁴⁷⁶ See U.S. Activity Proposal, 80 FR at 27485.

⁴⁷⁷ See *id.* However, if the transactions of a guaranteed non-U.S. person are subject to regulatory reporting and public dissemination requirements in a foreign jurisdiction and the Commission finds that the foreign requirements are comparable to those imposed by Regulation SBSR and other conditions set forth in Rule 908(c) are met, such transactions could be eligible for substituted compliance.

⁴⁶² See U.S. Activity Proposal, 80 FR at 27485.

⁴⁶³ See *id.*

⁴⁶⁴ See Regulation SBSR Adopting Release, 80 FR at 14653.

⁴⁶⁵ See U.S. Activity Proposal, 80 FR at 27485. The Commission notes that, if the transactions of the U.S. guarantor and its foreign subsidiary are subject to regulatory reporting and public dissemination requirements in a foreign jurisdiction, such transactions could be eligible for substituted compliance if the Commission determines that the foreign requirements are comparable to those imposed by Regulation SBSR and other necessary conditions are met. See Rule 908(c).

⁴⁶⁷ See ISDA I at 14.

⁴⁶⁸ See *id.*

⁴⁶⁹ *Id.* However, the commenter did not object to subjecting these transactions to regulatory reporting to a registered SDR. See *id.*

⁴⁷⁰ See 80 FR at 14653.

⁴⁷¹ See *id.* (citing Cross-Border Adopting Release, 79 FR at 47289).

⁴⁷² See *id.*

SBSR.⁴⁷⁸ Rule 908(b) was designed to reduce regulatory assessment costs and provide greater legal certainty to counterparties engaging in cross-border security-based swaps.

1. Expanding Rule 908(b) To Include All Platforms and Registered Clearing Agencies

In the Regulation SBSR Proposed Amendments Release, the Commission expressed the preliminary view that all platforms and registered clearing agencies should incur the reporting duties specified in the proposed amendments to Rule 901(a),⁴⁷⁹ even if they are not U.S. persons. Consistent with this view, the Commission proposed to expand Rule 908(b) to include any platform or registered clearing agency as among the persons that may incur duties under Regulation SBSR.⁴⁸⁰ To the extent that a platform or registered clearing agency is a U.S. person, such entity falls within existing Rule 908(b)(1). Thus, the effect of this proposed amendment to Rule 908(b) would be to include within the rule any platform or registered clearing agency that is not a U.S. person.

Three commenters generally supported expanding Rule 908(b) to include all platforms and registered clearing agencies.⁴⁸¹

The Commission is adopting the amendments to Rule 908(b) as proposed. For the reasons explained above, the Commission continues to believe that all platforms and registered clearing agencies should incur the duties specified in the amendments to Rule 901(a), even if they are not U.S. persons. Without this amendment, U.S.-person platforms and registered clearing agencies would be subject to regulatory obligations from which non-U.S.-person platforms and registered clearing agencies would be free.

2. Expanding Rule 908(b) To Include Non-U.S. Persons Engaging in ANE Transactions

In the U.S. Activity Proposal, the Commission proposed to add a new paragraph (b)(5) to Rule 908(b) to include any non-U.S. person that, in connection with such person's security-based swap dealing activity, arranges, negotiates, or executes a security-based

swap using its personnel located in a U.S. branch or office, or using personnel of its agent located in a U.S. branch or office. Consistent with the proposed amendments to Rule 901(a)(2)(ii)(E) that would bring foreign dealing entities engaging in ANE transactions into the reporting hierarchy,⁴⁸² the Commission also proposed to add all non-U.S. persons engaging in ANE transactions into Rule 908(b). Because existing Rule 908(b)(2) already covers a non-U.S. person that is registered as a security-based swap dealer, the effect of proposed Rule 908(b)(5) would be to cover a non-U.S. person that engages in dealing activity in the United States but that does not meet the *de minimis* threshold and thus would not be required to register as a security-based swap dealer.⁴⁸³

The Commission received no comments that specifically addressed this proposed amendment⁴⁸⁴ and, for the reasons discussed in the U.S. Activity Proposal, is adopting Rule 908(b)(5) as proposed. Accordingly, Rule 908(b)(5) provides that a non-U.S. person that, in connection with such person's security-based swap dealing activity, arranged, negotiated, or executed the security-based swap using its personnel⁴⁸⁵ located in a U.S. branch or office, or using personnel of an agent located in a U.S. branch or office, may incur reporting duties under Regulation SBSR.

G. Reporting Duties of Unregistered Persons

1. Description of Proposed Rules

Existing Rule 901(a)(2)(ii) sets forth a reporting hierarchy that specifies the

⁴⁸² See *supra* Section IX(C).

⁴⁸³ See U.S. Activity Proposal, 80 FR at 27486.

⁴⁸⁴ However, two commenters noted that requiring the reporting of ANE transactions would place burdens on unregistered entities that do not have reporting infrastructure in place and would be compelled to engage third-party providers to report transactions. See ISDA I at 11; SIFMA/FSR Letter at 13. In addition, as discussed in Section IX(C)(2), *supra*, one commenter urged the Commission to eliminate the application of the U.S. Activity Proposal to Regulation SBSR. See ISDA I at 2; ISDA II at 3. These comments are addressed in Sections X(C)(7) and XII(A)(1)(d), *infra*.

⁴⁸⁵ The Commission intends the final rule to indicate the same type of activity by personnel located in the United States as described in Section IV(C)(3) of the U.S. Activity Adopting Release, 81 FR at 8624. Moreover, for purposes of Rule 908(b)(5), the Commission interprets the term "personnel" in a manner consistent with the definition of "associated person of a security-based swap dealer" contained in Section 3(a)(70) of the Exchange Act, 15 U.S.C. 78c(a)(70), regardless of whether such non-U.S. person or such non-U.S. person's agent is itself a security-based swap dealer. See U.S. Activity Adopting Release, 81 FR at 8624 (discussing the Commission's interpretation of the term "personnel" for purposes of Rule 3a71-3(b)(1)(iii)(C)).

side that has the duty to report a security-based swap, taking into account the types of entities present on each side. Existing Rule 901(a)(2)(ii) does not assign reporting obligations for transactions involving unregistered non-U.S. persons. In the Regulation SBSR Adopting Release, the Commission stated that it anticipated soliciting further comment regarding the duty to report a security-based swap where neither side includes a registered security-based swap dealer or a registered major security-based swap participant and neither side includes a U.S. person or only one side includes a U.S. person.⁴⁸⁶ In the U.S. Activity Proposal, the Commission proposed amendments to Rule 901(a)(2)(ii)(E) that would assign the duty to report such transactions.

As discussed in the U.S. Activity Proposal and in the Regulation SBSR Adopting Release, one commenter raised concerns about burdens that the previously re-proposed reporting hierarchy might place on U.S. persons in transactions with certain non-U.S.-person counterparties.⁴⁸⁷ Under the previous proposal, in a transaction between a non-U.S. person and a U.S. person where neither side included a security-based swap dealer or major security-based swap participant, the U.S. person would have had the duty to report. The commenter noted that in such transactions the non-U.S.-person counterparty might be engaged in dealing activity but at levels below the security-based swap dealer *de minimis* threshold and the U.S. person might not be acting in a dealing capacity in any of its security-based swap transactions. The commenter argued that, in such cases, the non-U.S. person may be better equipped to report the transaction and, accordingly, that when two unregistered persons enter into a security-based swap, the counterparties should be permitted to select which counterparty would report, even if one counterparty is a U.S. person.⁴⁸⁸

The U.S. Activity Proposal included proposed Rule 901(a)(2)(ii)(E)(2), which the Commission proposed to address concerns arising when a non-U.S. person is engaged in ANE transactions. Under the proposed rule, in a transaction between an unregistered U.S. person and an unregistered non-U.S. person who is engaging in ANE activity, the sides would be required to select which side is the reporting side.

⁴⁸⁶ See 80 FR at 14600, 14655.

⁴⁸⁷ See IIB Letter, *passim*; Letter from Institute of International Bankers to the Commission, dated August 21, 2013.

⁴⁸⁸ See U.S. Activity Proposal, 80 FR at 27486.

⁴⁷⁸ See Regulation SBSR Adopting Release, 80 FR at 14656.

⁴⁷⁹ See Regulation SBSR Proposed Amendments Release, 80 FR at 14759.

⁴⁸⁰ See *id.*

⁴⁸¹ See DTCC Letter at 18; LCH.Clearnet Letter at 11; ISDA/SIFMA Letter at 29 ("a registered platform or clearing agency should be responsible for reporting [security-based swaps] as specified in Proposed SBSR regardless of its U.S. person status").

Also under proposed Rule 901(a)(2)(ii)(E)(2), if both sides are unregistered non-U.S. persons and both are engaging in ANE activity, the sides would be required to select the reporting side.

Proposed Rule 901(a)(2)(ii)(E)(3) was designed to address the scenario where one side is subject to Rule 908(b) and the other side is not—*i.e.*, one side includes only unregistered non-U.S. persons and that side does not engage in any ANE activity. When the other side includes an unregistered U.S. person or an unregistered non-U.S. person that *is* engaging in ANE activity, the side with the unregistered U.S. person or the unregistered non-U.S. person engaging in ANE activity would be the reporting side. The Commission preliminarily believed that the U.S. person or the non-U.S. person engaged in ANE activity generally would be more likely than the other side to have the ability to report the transaction given that it has operations in the United States.⁴⁸⁹ The Commission also noted that, in a transaction where neither side includes a registered person, placing the duty on the side that has a presence in the United States should better enable the Commission to monitor and enforce compliance with the reporting requirement.⁴⁹⁰

Proposed Rule 901(a)(2)(ii)(E)(4) was designed to address the scenario where neither side includes a counterparty that falls within Rule 908(b)—*i.e.*, neither side includes a registered person, a U.S. person, or a non-U.S. person engaging in ANE activity—but the transaction is effected by or through a registered broker-dealer (including a registered SB SEF). In such case, the proposed rule would require the registered broker-dealer to report the transaction. The Commission preliminarily believed that the registered broker-dealer generally would be more likely than the unregistered non-U.S. counterparties (none of which are engaging in ANE activity with respect to that particular transaction) to have the ability to report the transaction given its presence in the United States and its familiarity with the Commission's regulatory requirements.⁴⁹¹

2. Discussion of Comments and Final Rules

a. Transactions Where One or Both Sides Consist Only of Unregistered Persons

After careful consideration of all the comments, to which the Commission

responds below, the Commission is adopting Rules 901(a)(2)(ii)(E)(2) and (3) as proposed. Rule 901(a)(2)(ii)(E)(2) contemplates that both sides of a security-based swap include only unregistered persons yet both sides include a person who is subject to Rule 908(b). In such case, the sides generally will have equal capacity to carry out the reporting duty; therefore, the Commission believes that it is appropriate to require them to select the reporting side. Rule 901(a)(2)(ii)(E)(3) contemplates that both sides include only unregistered persons and only one side includes a person who is subject to Rule 908(b). In such case, Rule 901(a)(2)(ii)(E)(3) assigns the reporting duty to the side that includes the person who is subject to Rule 908(b). The Commission believes that this result will help to ensure compliance with the reporting requirements of Regulation SBSR.

Two commenters expressed concerns about the expense and difficulty of determining which of these two rules to apply when one side is an unregistered foreign dealing entity who might or might not be utilizing U.S. personnel in a particular transaction.⁴⁹² These commenters warned that the burdens associated with determining whether a transaction was arranged, negotiated, or executed using U.S. personnel would unduly fall on unregistered entities that are not well-equipped to carry out a reporting obligation.⁴⁹³ In raising these concerns, the commenters assumed that the Commission would require compliance with Regulation SBSR before security-based swap dealers register as such with the Commission. Requiring compliance with Regulation SBSR prior to security-based swap dealer registration would have resulted in a large number of foreign dealing entities becoming subject to reporting requirements with respect to individual transactions in which they are engaging in ANE activity before security-based swap dealer registration was required. Because these foreign dealing entities would not yet have been required to be registered as security-based swap dealers, U.S. non-dealing entities could have been required to assume greater duties in reporting such transactions and to assess on a transaction-by-transaction basis whether the other side was engaging in ANE activity.⁴⁹⁴

⁴⁹² See ISDA I at 11–12; SIFMA/FSR Letter at 12–13.

⁴⁹³ See *id.*

⁴⁹⁴ See ISDA II at 6 (“The burden of exchanging and using this data *is much greater in advance of SBSD registration* since instead of relying on party level static data (such as for registration status) to apply the reporting hierarchy in SBSR in most

As discussed in Section X, *infra*, the Commission is adopting a revised compliance schedule that aligns Regulation SBSR compliance with the registration of security-based swap dealers. The Commission believes that foreign dealing entities that will register with the Commission as security-based swap dealers will be counterparties to the vast majority of security-based swaps involving foreign dealing entities engaging in U.S. activity.⁴⁹⁵ Such entities will thus occupy the highest rung of the reporting hierarchy. U.S. non-dealing entities that transact with registered foreign security-based swap dealers will not have to engage in any assessment of or negotiation with the other side, because reporting duties associated with these transactions will arise from the foreign security-based swap dealers' registration status rather than any ANE activity in which they might engage.

The Commission recognizes that, even after security-based swap dealer registration occurs, there likely will be a small number of foreign dealing entities that remain below the *de minimis* threshold and thus will not have to register as security-based swap dealers. Such an unregistered foreign dealing entity—when utilizing U.S. personnel to arrange, negotiate, or execute a security-based swap—would be subject to Rule 901(a)(2)(ii)(E)(2) if it transacts with a U.S. person or another unregistered foreign dealing entity that is engaging in ANE activity with respect to that transaction. In such case, the sides generally will have equal capacity to carry out the reporting duty; therefore, Rule 901(a)(2)(ii)(E)(2) requires the sides to select the reporting

cases, the parties may instead need to obtain and rely on transaction level party data for the U.S. Person status of the indirect counterparty or an indication of whether a non-U.S. Person with dealing activity has used U.S. personnel for ANE on each SBS” (emphasis added). The other commenter also argued that there would be significant costs and problems associated with the Commission's proposed rule. See SIFMA/FSR Letter at 12. The commenter recommended, however, that, “[i]f the Commission does expand the application of Regulation SBSR's regulatory reporting requirements to include transactions between two non-U.S. persons, reporting obligations triggered by U.S.-located conduct should only be triggered for registered security-based swap dealers,” and acknowledged that requiring compliance after security-based swap dealers were registered “would lessen the burden imposed by the expansion of reporting requirements on unregistered entities and those parties not acting in a dealing capacity.” *Id.* at 13.

⁴⁹⁵ See *supra* Section II(A)(5), where the Commission notes that ISDA-recognized dealers (both U.S. and foreign) are involved in 74% of North American corporate single-name CDS transactions. The Commission believes that all ISDA-recognized dealers will be registered as security-based swap dealers.

⁴⁸⁹ See *id.*

⁴⁹⁰ See *id.*

⁴⁹¹ See *id.*

side. An unregistered foreign dealing entity would be subject to Rule 901(a)(2)(ii)(E)(3) if it transacts with any unregistered foreign entity (including a foreign non-dealing entity or a foreign dealing entity that is not engaging in ANE activity with respect to that transaction). This approach places the duty to report directly on the only side that includes a person that is subject to Rule 908(b). The Commission estimates that only four foreign dealing entities will incur reporting obligations under new Rules 901(a)(2)(ii)(E)(2) and (3).⁴⁹⁶

Requiring additional ANE transactions of these foreign dealing entities to be reported—and requiring the foreign dealing entity and the other side to select the reporting side in a tie situation under Rule 901(a)(2)(ii)(E)(2) or requiring the foreign dealing entity to become the reporting side directly when it falls under Rule 901(a)(2)(ii)(E)(3)—will enhance the Commission's ability to oversee security-based swap dealing activity occurring with the United States and to monitor for compliance with specific Title VII requirements, including the requirement that a person register with the Commission as a security-based swap dealer if it exceeds the *de minimis* threshold. The Commission recognizes that unregistered foreign dealing entities (and other unregistered persons when they transact with unregistered foreign dealing entities) may incur costs in assessing whether these rules apply to their transactions.⁴⁹⁷ However, requiring these ANE transactions to be publicly disseminated will further enhance the level of transparency in the U.S. security-based swap market, potentially promoting greater price efficiency by reducing implicit transaction costs.

One commenter recommended that, in a transaction between an unregistered U.S. person and an unregistered non-U.S. person engaged in ANE activity, the Commission should not require the sides to select the reporting side, but should instead place the reporting obligation on the non-U.S. person, because it is engaged in dealing activity.⁴⁹⁸ The side engaged in dealing activity would, in the commenter's view, have a greater capacity to fulfill the reporting obligation and would likely face minimal incremental costs,

because many dealing entities already have in place arrangements to report derivatives transactions.⁴⁹⁹ The commenter expressed concern that U.S. funds “may not have the economic leverage to require their non-U.S. dealers to report” and, if an unregistered non-U.S. person did have to report, it would incur “considerable expense.”⁵⁰⁰

The Commission does not believe that it is appropriate to modify Rule 901(a)(2)(ii)(E)(2) to assign the reporting duty for this transaction pair to the unregistered non-U.S. person who is engaging in ANE activity. While the Commission acknowledges the commenter's concern about the potential expense that an unregistered U.S. person could incur if it were required to report a security-based swap transaction with an unregistered foreign dealing entity, the Commission believes that it is unlikely that U.S. non-dealing entities will incur costs associated with reporting transactions themselves or costs of assessing whether an unregistered foreign dealing entity is utilizing U.S. personnel to engage in ANE activity. The foreign dealing entity's willingness to clearly indicate whether it is using U.S. personnel and to assume the reporting obligation should be a factor that a U.S. non-dealing entity likely would consider when selecting a non-U.S. person with whom to transact. If an unregistered foreign dealing entity were unable or unwilling to be selected as the reporting side (or to agree to be the reporting side only at a cost that is prohibitive to the U.S. person), the U.S. person could elect to trade with one of several registered security-based swap dealers, both U.S. and foreign, for whom reporting obligations would attach by operation of Rule 901(a)(2)(ii)(B),⁵⁰¹ and negotiation about which side would incur the reporting duty would not be necessary.

b. Transactions Involving a Registered Broker-Dealer

Two commenters disagreed with proposed Rule 901(a)(2)(ii)(E)(4),⁵⁰² which would require a registered broker-dealer (including a registered SB SEF) to report a security-based swap that it effects between two unregistered non-U.S. persons who are not engaged in ANE activity. One commenter stated that the rule would require registered broker-dealers to implement costly and robust data capturing mechanisms and

requirements regarding the status of direct and indirect counterparties or the use of U.S. personnel to determine whether one side of a security-based swap is obligated to report the transaction, or whether the registered broker-dealer would have the reporting obligation.⁵⁰³ Another commenter stated that the proposed rule would create a disproportionate burden on registered broker-dealers relative to the small percentage of the market represented by the transactions between non-U.S. persons that would be covered by the proposed rule.⁵⁰⁴ Both commenters asserted that the registered broker-dealer that reports the transaction would be unable to report life cycle events for the transaction.⁵⁰⁵ Thus, in the view of one commenter, the Commission would be unable to rely on the reported information as current and accurate.⁵⁰⁶

The Commission continues to believe that, to improve the integrity and transparency of the U.S. financial markets, the Commission and other relevant authorities should have ready access to transaction reports of security-based swap transactions that registered broker-dealers intermediate.⁵⁰⁷ The Commission further believes that public dissemination of these transactions will have value to participants in the U.S. security-based swap market, who are likely to trade the same or similar products.⁵⁰⁸ The Commission acknowledges that registered broker-dealers are required to implement policies and procedures to comply with the reporting obligation under Rule 901(a)(2)(ii)(E)(4), including procedures for determining the status of direct and indirect counterparties and the use of U.S. personnel to arrange, negotiate, or execute a transaction.⁵⁰⁹ However, the Commission is not mandating specific policies and procedures, and registered broker-dealers will have flexibility in developing the appropriate processes.

The Commission further acknowledges that life cycle events for the transactions covered by Rule 901(a)(2)(ii)(E)(4) will not be reported. Under Rule 901(e), the reporting side for a security-based swap transaction is obligated to report life cycle event information for the transaction. Security-based swaps covered by Rule 901(a)(2)(ii)(E)(4) must be reported by a registered broker-dealer (including a

⁴⁹⁶ See *infra* Section XII(B).

⁴⁹⁷ See U.S. Activity Adopting Release, 81 FR at 8626–29 (estimating assessment costs of foreign dealing entities to count transactions toward the *de minimis* thresholds under Exchange Act Rules 3a71–3(b)(1)(iii)(C) and 3a71–5(c), even if some of them do not cross the thresholds and thus are not required to register as security-based swap dealers).

⁴⁹⁸ See ICI Global Letter at 7.

⁴⁹⁹ See *id.*

⁵⁰⁰ *Id.*

⁵⁰¹ Rule 901(a)(2)(ii)(B) provides that, if only one side of a security-based swap includes a registered security-based swap dealer, that side shall be the reporting side.

⁵⁰² See ISDA I at 14; SIFMA/FSR Letter at 14.

⁵⁰³ See ISDA I at 14.

⁵⁰⁴ See SIFMA/FSR Letter at 14.

⁵⁰⁵ See ISDA I at 14; SIFMA/FSR Letter at 14.

⁵⁰⁶ See ISDA I at 14.

⁵⁰⁷ See U.S. Activity Proposal, 80 FR at 27485.

⁵⁰⁸ See *id.*

⁵⁰⁹ See Rule 906(c).

registered SB SEF), not one of the sides. Thus, security-based swaps covered by Rule 901(a)(2)(ii)(E)(4) do not have a reporting side, and neither side will have an obligation to report life cycle event information for the transaction. The Commission believes, however, that the reports of these transactions, even without subsequent life cycle event reporting, will provide important information to the Commission and to market participants at the time of execution. In any event, the Commission expects that relatively few transactions will fall within Rule 901(a)(2)(ii)(E)(4).⁵¹⁰

Finally, the Commission is modifying Rule 901(a)(2)(ii)(E)(4) so that the reporting requirement for a registered broker-dealer under Rule 901(a)(2)(ii)(E)(4) parallels the reporting requirement for a platform under final Rule 901(a)(1). The Commission believes that this change is appropriate because a registered broker-dealer, like a platform, is unlikely to know and could not without undue difficulty obtain many of the data elements contemplated by Rule 901(d). Furthermore, in many cases, a registered broker-dealer that falls within Rule 901(a)(2)(ii)(E)(4) also will be an SB SEF. Rule 901(a)(2)(ii)(E)(4), as proposed, would have required a registered broker-dealer (including a registered SB SEF) to report the information required under Rules 901(c) and (d). In contrast, final Rule 901(a)(2)(ii)(E)(4) requires a registered broker-dealer (including a registered SB SEF) to report only the information set forth in Rules 901(c) (except that, with respect to Rule 901(c)(5), the registered broker-dealer (including a registered SB SEF) will be required to indicate only if both direct counterparties are registered security-based swap dealers), 901(d)(9), and 901(d)(10)—in other words, the same information that a platform is required to report when it incurs a reporting duty under new Rule 901(a)(1). By eliminating the need for a registered broker-dealer to report certain data elements under Rule 901(d) that the registered broker-dealer is unlikely to know and could not learn without undue difficulty,⁵¹¹ the Commission

believes that the revision will help to avoid placing undue reporting burdens on registered broker-dealers (including registered SB SEFs) that incur duties as a result of new Rule 901(a)(2)(ii)(E)(4).

H. Conforming Amendments

1. Expanding Definition of “Participant”

Rule 900(u), as adopted in the Regulation SBSR Adopting Release, defined a “participant” of a registered SDR as “a counterparty, that meets the criteria of [Rule 908(b) of Regulation SBSR], of a security-based swap that is reported to that [registered SDR] to satisfy an obligation under [Rule 901(a) of Regulation SBSR].” In the Regulation SBSR Proposed Amendments Release, the Commission proposed an amendment to expand the definition of “participant” to include registered clearing agencies and platforms⁵¹² and, as described above, has adopted that amendment as proposed. In the U.S. Activity Proposal, the Commission proposed to further amend the definition of “participant” to include a registered broker-dealer that is required by Rule 901(a) to report a security-based swap if it effects a transaction between unregistered non-U.S. persons that do not fall within proposed Rule 908(b)(5).⁵¹³

The Commission received no comments regarding the proposed amendment to Rule 900(u) to include these registered broker-dealers and is adopting this amendment as proposed. The Commission continues to believe, as it stated in the U.S. Activity Proposal, that these registered broker-dealers should be participants of any registered SDR to which they are required to report security-based swap transaction information because, as SDR participants, they become subject to the requirement in Rule 901(h) to report security-based swap transaction information to a registered SDR in a format required by the registered SDR.

2. Rule 901(d)(9)

Existing Rule 901(d)(9) requires the reporting, if applicable, of the platform ID of the platform on which a security-based swap is executed. In the Regulation SBSR Adopting Release, the

and date of any master agreement, collateral agreement, margin agreement, or other agreement incorporated by reference into a security-based swap, as contemplated by Rule 901(d)(4).

⁵¹² See *supra* Section V(A).

⁵¹³ See 80 FR at 27487. As in Section IX(G), *supra*, Rule 901(a)(2)(ii)(E)(4), as adopted herein, requires a registered broker-dealer (including a registered SB SEF) to report a security-based swap in cases where the registered broker-dealer effects a transaction between unregistered non-U.S. persons that do not fall within Rule 908(b)(5).

Commission recognized the importance of identifying the venue on which a security-based swap is executed because this information should enhance the ability of relevant authorities to conduct surveillance in the security-based swap market and understand developments in the security-based swap market generally.⁵¹⁴ In the U.S. Activity Proposal, the Commission proposed to amend Rule 901(d)(9) also to require the reporting, if applicable, of the broker ID of a registered broker-dealer (including a registered SB SEF) that is required by Rule 901(a)(2)(ii)(E)(4) to report a security-based swap effected by or through the registered broker-dealer.

The Commission received no comments regarding the proposed amendment to Rule 901(d)(9) and is adopting this amendment as proposed. The Commission continues to believe, as discussed in the U.S. Activity Proposal,⁵¹⁵ that being able to identify the registered broker-dealer that effects a security-based swap transaction in the manner described in Rule 901(a)(2)(ii)(E)(4) will enhance the Commission’s understanding of the security-based swap market and improve the ability of the Commission and other relevant authorities to conduct surveillance of security-based swap market activities.

3. Limitation of Duty To Report Ultimate Parent and Affiliate Information

As discussed above, Rule 900(u), as amended herein, expands the definition of “participant” to include a registered broker-dealer that incurs the reporting obligation if it effects a transaction between two unregistered non-U.S. persons that do not fall within Rule 908(b)(5). Existing Rule 906(b) generally requires a participant of a registered SDR to provide the identity of any ultimate parent and any of its affiliates that also are participants of that registered SDR. In the Regulation SBSR Proposed Amendments Release, the Commission proposed to except platforms and registered clearing agencies from Rule 906(b)⁵¹⁶ and, as described above, is adopting that amendment today.⁵¹⁷ In the U.S. Activity Proposal, the Commission proposed to further amend Rule 906(b) to except from the duty to provide ultimate parent and affiliate information a registered broker-dealer that becomes a participant solely as a result of making

⁵¹⁴ See Regulation SBSR Adopting Release, 80 FR at 14589.

⁵¹⁵ See 80 FR at 27487.

⁵¹⁶ See Regulation SBSR Proposed Amendments Release, 80 FR at 14645.

⁵¹⁷ See *supra* Section V(D).

⁵¹⁰ See *infra* note 663 (estimating that only 540 of 3,000,000 reportable events under Regulation SBSR will result from broker-dealers having to report transactions pursuant to new Rule 901(a)(2)(ii)(E)(4)).

⁵¹¹ While the registered broker-dealer would presumably know the primary economic terms of a transaction that it is effecting, it might not know or be in a position to easily learn about the bilateral documentation that exists between the counterparties to support transactions between those counterparties. Thus, the registered broker-dealer might not be in a position to report the title

a report to satisfy an obligation under Rule 901(a)(2)(ii)(E)(4).⁵¹⁸

The Commission received no comments regarding the amendment to Rule 906(b) proposed in the U.S. Activity Proposal and is adopting this amendment as proposed. The Commission continues to believe, as it stated in the U.S. Activity Proposal,⁵¹⁹ that the purposes of Rule 906(b)—namely, facilitating the Commission's ability to measure derivatives exposure within the same ownership group—would not be advanced by applying the requirement to a registered broker-dealer that incurs reporting obligations solely because it effects a transaction between two unregistered non-U.S. persons that do not fall within Rule 908(b)(5). A registered broker-dealer acting solely as a broker with respect to a security-based swap is not taking a principal position in the security-based swap. To the extent that such a registered broker-dealer has an affiliate that transacts in security-based swaps, such positions could be derived from other transaction reports indicating that affiliate as a counterparty.

The Commission proposed to make a conforming amendment to Rule 907(a)(6). In the Regulation SBSR Proposed Amendments Release, the Commission proposed, and today is adopting,⁵²⁰ an amendment to Rule 907(a)(6) that will require a registered SDR to have policies and procedures “[f]or periodically obtaining from each participant other than a platform or a registered clearing agency information that identifies the participant's ultimate parent(s) and any participant(s) with which the participant is affiliated, using ultimate parent IDs and counterparty IDs.”⁵²¹ In the U.S. Activity Proposal, the Commission proposed to further amend Rule 907(a)(6) to except a registered broker-dealer that incurs reporting obligations solely because it effects a transaction between two unregistered non-U.S. persons that do not fall within Rule 908(b)(5).⁵²² The Commission received no comments regarding the proposed amendment to Rule 907(a)(6) and is adopting the

⁵¹⁸ However, a registered broker-dealer would have to comply with Rule 906(b) if it became a participant of a registered SDR for another reason—e.g., the broker-dealer is a U.S. person and is a counterparty to a security-based swap that is reported to the registered SDR on a mandatory basis.

⁵¹⁹ See 80 FR at 27488.

⁵²⁰ See *supra* Section V(D).

⁵²¹ Once a participant reports parent and affiliate information to a registered SDR, Rule 906(b) requires the participant to “promptly notify the registered [SDR] of any changes” to its parent and affiliate information.

⁵²² See U.S. Activity Proposal, 80 FR at 27488.

amendment as proposed. Because such a broker-dealer has no duty under Rule 906(b), as amended, to provide such information to a registered SDR, no purpose would be served by requiring the registered SDR to have policies and procedures for obtaining this information from the broker-dealer.

I. Availability of Substituted Compliance

Existing Rule 908(c)(1) describes the possibility of substituted compliance with respect to regulatory reporting and public dissemination of security-based swap transactions. Substituted compliance could be available for transactions that will become subject to Regulation SBSR because of the amendments to Rule 908 being adopted today. Under Rule 908(c)(1), a security-based swap is eligible for substituted compliance with respect to regulatory reporting and public dissemination if at least one of the direct counterparties to the security-based swap is either a non-U.S. person or a foreign branch. As discussed in the U.S. Activity Proposal, existing Rule 908(c) does not condition substituted compliance eligibility on where a particular transaction was arranged, negotiated, or executed.⁵²³ Thus, Rule 908(c) permits a security-based swap between a U.S. person and the New York branch of a foreign bank (i.e., a non-U.S. person utilizing U.S.-located personnel) potentially to be eligible for substituted compliance, if the transaction is also subject to the rules of a foreign jurisdiction that is the subject of a Commission substituted compliance order.

The rules adopted today, among other things, subject to regulatory reporting and public dissemination both ANE transactions and security-based swaps executed on a U.S. platform or effected by a registered broker-dealer. The Commission did not propose, and is not adopting, any amendment to Rule 908(c) that would limit the availability of substituted compliance for such transactions based on the location of the relevant activity. Thus, a transaction that is required to be reported and publicly disseminated because it is an ANE transaction, or because it is executed on a U.S. platform or effected by or through a registered broker-dealer, could be eligible for substituted compliance if the Commission issues a substituted compliance order with respect to regulatory reporting and public dissemination of security-based swaps applying to that jurisdiction. This approach is consistent with the Commission's decision when adopting

⁵²³ See *id.*

Rule 908(c) that certain transactions involving U.S.-person counterparties could be eligible for substituted compliance (i.e., when the transaction is through the foreign branch of the U.S. person) even if the non-U.S.-person counterparty has engaged in dealing activity in connection with the transaction in the United States. One commenter who generally opposed the regulatory reporting and public dissemination requirements proposed in the U.S. Activity Proposal specifically supported the Commission's approach to substituted compliance.⁵²⁴

Finally, several commenters expressed the view that reporting pursuant to Regulation SBSR should not begin until the Commission has made substituted compliance determinations.⁵²⁵ As discussed in Section X(C)(5), *infra*, the Commission does not believe that it is necessary or appropriate to defer compliance with Regulation SBSR until after the Commission makes one or more substituted compliance determinations.⁵²⁶

X. Compliance Schedule for Regulation SBSR

In the Regulation SBSR Adopting Release, the Commission established a compliance date only for Rules 900, 907, and 909 of Regulation SBSR.⁵²⁷ In the Regulation SBSR Proposed Amendments Release, the Commission proposed a new compliance schedule for Rules 901, 902, 903, 904, 905, 906, and 908 of Regulation SBSR.⁵²⁸ The

⁵²⁴ See IIB Letter at 15, 17.

⁵²⁵ See ISDA I at 15 (stating that the reporting of security-based swap transactions of non-U.S. registered persons with other non-U.S. persons should not be required until a cross-border analysis has been understood and substituted compliance determinations have been made); ISDA/SIFMA Letter at 19 (stating that the security-based swap transactions of non-U.S. registered security-based swap dealers should not be required until the Commission has analyzed reporting regimes in other jurisdictions and made relevant substituted compliance determinations, consistent with the CFTC's determination to provide time-limited exemptive relief for swaps between non-U.S. swap dealers and non-U.S. persons while the CFTC analyzes the cross-border implications of reporting); SIFMA/FSR Letter at 15 (asking the Commission to defer compliance with Regulation SBSR “until [the Commission] has the opportunity to make comparability determinations for key non-U.S. jurisdictions, including Australia, Canada, the European Union, Japan and Switzerland,” and stating that “Requiring the changes to systems, personnel and trade flows necessary to comply with [the U.S. Activity Proposal] only to later be granted substituted compliance would impose significant and unnecessary burdens for negligible short-term benefits”).

⁵²⁶ See also *infra* Section XII(A)(7).

⁵²⁷ See 80 FR at 14564. The compliance date for Rules 900, 907, and 909 was also the effective date of Regulation SBSR: May 18, 2015.

⁵²⁸ See 80 FR at 14762–70.

Commission believed that proposing a new compliance schedule was necessary in light of the fact that industry infrastructure and capabilities had changed since the initial proposal,⁵²⁹ particularly because the CFTC regime for swap data reporting and dissemination had become operational. The Commission received 13 comments that discuss the proposed compliance schedule. After careful consideration of these comments, the Commission is adopting a revised compliance schedule, as described in detail below.

A. Proposed Compliance Schedule

The Commission proposed the following phased-in compliance schedule for Rules 901, 902, 903, 904, 905, 906, and 908 of Regulation SBSR.⁵³⁰ First, the Commission proposed a Compliance Date 1 to be the date six months after the first registered SDR that can accept reports of security-based swaps in a particular asset class commences operations as a registered SDR. On proposed Compliance Date 1, persons with a duty to report security-based swaps under Regulation SBSR would have been required to report all newly executed security-based swaps in that asset class to a registered SDR. After proposed Compliance Date 1, persons with a duty to report security-based swaps also would have a duty to report any life cycle events of any security-based swaps that previously had been required to be reported. In addition, under the proposed compliance schedule, transitional and pre-enactment security-based swaps would also have been reported, to the extent information was available, to a registered SDR that accepts reports of security-based swap transactions in the relevant asset class by proposed Compliance Date 1.⁵³¹ The Commission also proposed a Compliance Date 2, which would have been nine months after the first registered SDR that can accept security-based swaps in a particular asset class commences

operations as a registered SDR (*i.e.*, three months after proposed Compliance Date 1). On proposed Compliance Date 2, each registered SDR in that asset class would have had to comply with Rules 902 (regarding public dissemination), 904(d) (requiring dissemination of transaction reports held in queue during normal or special closing hours), and 905 (with respect to public dissemination of corrected transaction reports) for all security-based swaps in that asset class—except for covered cross-border transactions.⁵³²

The proposed compliance schedule with respect to security-based swaps in a particular asset class was tied to the commencement of operations of a registered SDR that can accept reports of security-based swaps in that asset class. In the Regulation SBSR Proposed Amendments Release, the Commission noted that both registered SDRs and persons with a duty to report would need time to make preparations related to the reporting of security-based swaps.⁵³³ The proposed compliance schedule was not, however, linked to security-based swap dealer registration.

B. General Summary of Comments Received

Commenters expressed a variety of concerns with the proposed compliance schedule. Most of the comments that addressed the proposed compliance schedule urged the Commission to delay implementation of Regulation SBSR until after security-based swap dealers are registered as such with the Commission.⁵³⁴ Commenters generally expressed concerns with the costs and burdens of implementing Regulation SBSR ahead of the SBS entities registration compliance date, particularly the costs for buy-side U.S. persons. Commenters also expressed concerns that allowing the SBS entities registration compliance date to follow the implementation of Regulation SBSR would complicate reporting in the interim period between the two dates. Many of these commenters also expressed concerns that the reporting of historical security-based swaps would

be significantly more difficult if compliance for reporting were required before the SBS entities registration compliance date.⁵³⁵

Some commenters expressed concerns about basing the compliance schedule for an asset class on the registration of the first SDR that can accept security-based swaps in that asset class, which, they argued, could confer an unfair “first mover” advantage.⁵³⁶ One of these commenters recommended that the Commission consider a compliance schedule that would base the first compliance date on the registration of a “critical mass” of SDRs.⁵³⁷

Other commenters expressed concern about how the reporting requirements contained in Regulation SBSR could be implemented before the Commission finalizes its rules regarding SB SEFs.⁵³⁸ Some commenters urged the Commission to defer compliance with Regulation SBSR until the Commission makes one or more substituted compliance determinations with respect to regulatory reporting and public dissemination of security-based swap transactions in foreign jurisdictions.⁵³⁹ Still others suggested that the Commission defer compliance with the requirement to report certain UICs until international standards for UICs are developed.⁵⁴⁰ Several commenters expressed concerns that differences between Regulation SBSR and the parallel CFTC rules would present significant implementation challenges for SDRs and market participants that seek to operate in both the swap and security-based swap markets.⁵⁴¹ Various commenters generally urged the Commission to provide adequate time for the development and implementation of the required compliance systems and procedures.⁵⁴²

⁵³⁸ See WMBAA Letter at 5–6; ISDA/SIFMA Letter at 3.

⁵³⁹ See ISDA/SIFMA Letter at 19–20; SIFMA/FSR Letter at 15; IIB Letter at 19.

⁵⁴⁰ See ISDA/SIFMA Letter at 3, 12; DTCC/ICE/CME Letter at 3–4; Financial InterGroup Letter at 4; DTCC Letter at 2–3.

⁵⁴¹ See DTCC Letter at 21 (“SB SDR applicants would be forced to expand their operations considerably, particularly to address the confirmation functions and code issuance responsibilities”); ICE Letter at 8; ISDA/SIFMA Letter at 8 (“reporting sides and market infrastructure providers will need to engage in significant builds and development of new industry standards in order to comply”); WMBAA Letter at 5.

⁵⁴² See Financial InterGroup Letter at 1; WMBAA Letter at 5–6; ISDA/SIFMA Letter at 8–18.

⁵²⁹ See 80 FR at 14762. See also Regulation SBSR Proposing Release, 75 FR at 75242–45 (proposing Rules 910 and 911 to explain compliance dates and related implementation requirements).

⁵³⁰ See Regulation SBSR Proposed Amendments Release, 80 FR at 14762–70.

⁵³¹ A transitional security-based swap is “a security-based swap executed on or after July 21, 2010, and before the first date on which trade-by-trade reporting of security-based swaps in that asset class to a registered security-based swap data repository is required pursuant to §§ 242.900 through 242.909.” See Rule 900(nn). A pre-enactment security-based swap is “any security-based swap executed before July 21, 2010 (the date of enactment of the Dodd-Frank Act (Pub. L. 111–203, H.R. 4173)), the terms of which had not expired as of that date.” See Rule 900(y).

⁵³² A covered cross-border transaction is a security-based swap that has, on one side, a direct counterparty who is not a U.S. person but has a U.S. guarantor, and on the other side has no counterparty that is a U.S. person, registered security-based swap dealer, or registered major security-based swap participant. Such a transaction will not be submitted to clearing at a registered clearing agency having its principal place of business in the United States. See Regulation SBSR Adopting Release, 80 FR at 14653, n. 827.

⁵³³ See 80 FR at 14763.

⁵³⁴ See IIB Letter at 17; ISDA I at 4, 11–13; ISDA II at 1–14; ISDA III at 1–12; SIFMA–AMG II at 6–7; UBS Letter at 2; WMBAA Letter at 5–6.

These comments and the Commission's responses thereto are discussed in more detail below. The Commission is adopting the primary features of the proposed compliance schedule but is making several revisions in response to comments. Most notably, as described below, the Commission had decided to align the compliance dates for Regulation SBSR with the SBS entities registration compliance date.

C. Compliance Date 1

Under the compliance schedule adopted today, with respect to newly executed security-based swaps in a particular asset class, Compliance Date 1 for Rule 901 of Regulation SBSR is the first Monday that is the later of: (1) Six months after the date on which the first SDR that can accept transaction reports in that asset class registers with the Commission; or (2) one month after the SBS entities registration compliance date. Every security-based swap in that asset class that is executed on or after Compliance Date 1 must be reported in accordance with Rule 901.⁵⁴³

Furthermore, Rule 901—which imposes reporting duties on specified persons beginning on Compliance Date 1—must be read in connection with Rules 908(a) and 908(b) on Compliance Date 1. Thus, for example, a non-U.S. person who falls within one of the categories set forth in Rule 908(b) could, under Rule 901(a), be required on Compliance Date 1 to report a cross-border security-based swap if the security-based swap falls within one of the categories set forth in Rule 908(a). Also, when persons with reporting duties begin mandatory reporting on Compliance Date 1, they must do so in a manner consistent with Rule 903, which addresses the use of coded information in the reporting of security-based swaps.

Beginning on Compliance Date 1, registered SDRs must comply with Rule 904, which addresses the operating hours of registered SDRs, except for Rule 904(d).⁵⁴⁴

Also beginning on Compliance Date 1, counterparties and registered SDRs must comply with Rule 905 regarding the

correction of errors in previously reported information about security-based swaps in that asset class, except that the registered SDR will not yet be subject to the requirement in Rule 905(b)(2) to publicly disseminate any corrected transaction reports (because it will not yet be required to publicly disseminate a report of the initial transaction). Furthermore, beginning on Compliance Date 1, each registered SDR must comply with the requirement in Rule 906(a) to provide to each participant of that SDR a report of any missing UICs, and any participant receiving such a report must comply with the requirement in Rule 906(a) to provide the missing UICs to the registered SDR. By Compliance Date 1, participants enumerated in Rule 906(c) must establish the policies and procedures required by Rule 906(c).

1. Compliance With Regulation SBSR Follows Security-Based Swap Dealer Registration

Several commenters strongly urged the Commission to defer Compliance Date 1 until security-based swap dealers must register with the Commission.⁵⁴⁵ These commenters correctly observed that, during any interim period beginning on the date that the Commission requires reporting of newly executed security-based swaps in a particular asset class but before the SBS entities registration compliance date (the “Interim Period”), there would be no registered security-based swap dealers or registered major security-based swap participants to occupy the highest rungs of the reporting hierarchy in Rule 901(a)(2)(ii). Therefore, during any such Interim Period, any security-based swap covered by the reporting hierarchy would either be a “tie”—because both sides are unregistered persons who fall within Rule 908(b)—or one side would become the reporting side because only that side includes a person that falls within Rule 908(b).⁵⁴⁶ The commenters argued generally that the absence of registered security-based swap dealers at the top of the reporting hierarchy during the Interim Period would create a number of difficulties in negotiating and carrying out reporting duties.⁵⁴⁷ Commenters pointed out

particular difficulties with ascertaining reporting duties for cross-border transactions under Rule 901(a)(2)(ii) during the Interim Period⁵⁴⁸ and emphasized that buy-side U.S. persons that transact with foreign dealing entities during the Interim Period would find it particularly difficult to make assessments of whether their non-U.S. counterparties were engaged in ANE activity. Furthermore, according to the commenters, attempts to address difficulties arising during the Interim Period would be costly, complicated, and inefficient,⁵⁴⁹ and such interim solutions would not be useful for the period after the SBS entities registration compliance date.⁵⁵⁰

The Commission acknowledges the commenters' concerns that requiring compliance with Regulation SBSR before the SBS entities registration compliance date would have raised numerous challenges, and that addressing these challenges would have necessitated time and investment to create interim solutions that might not be useful after the SBS entities registration compliance date. Therefore, the Commission has determined that market participants will not be required to comply with Regulation SBSR until after the SBS entities registration compliance date. As noted above, the second prong of Compliance Date 1 is one month after the SBS entities

⁵⁴⁸ See ISDA II at 1–10; ISDA III at 2–11; SIFMA/FSR Letter at 13–14; SIFMA–AMG II at 6–7. One commenter expressed the general view that costs to buy-side U.S. persons of negotiating with counterparties regarding reporting responsibilities, constructing reporting mechanisms, or engaging third parties to aid in their reporting are substantial and outweigh the benefits of beginning reporting prior to the SBS entities registration compliance date. See ISDA II at 4.

⁵⁴⁹ One commenter, for example, presented a complex set of possible options for facilitating industry compliance with Regulation SBSR during the Interim Period. See ISDA III, *passim*. These suggestions included the Commission adopting an “interim reporting side hierarchy” as well as “a publicly available industry declaration for entities willing to assume the role of a SBS dealing entity in such hierarchy,” regardless of whether or not they were engaging in ANE activity in a particular transaction. See *id.* at 9–10. The commenter also provided a detailed discussion of potential costs associated with these suggested interim solutions. See *id.* at 6–9.

⁵⁵⁰ See, e.g., ISDA II at 7; UBS Letter at 2; ISDA/SIFMA Letter at 9 (arguing that requiring compliance with the reporting duties before the SBS entities registration compliance date “creates unjustified additional costs to implement interim solutions” and that “[t]he cost and effort of such implementation will be wasted once dealer registration is required”). This commenter presented several potential alternatives for addressing concerns about implementing Regulation SBSR before the SBS entities registration compliance date, while stressing that its first choice was for the Commission to delay Compliance Date 1 until after the SBS entities registration compliance date. See ISDA III at 3–5, 9–10.

⁵⁴³ Every security-based swap in that asset class that is executed on or after July 21, 2010, and up and including to the day immediately before Compliance Date 1 is a transitional security-based swap. As discussed in Section X(E), *infra*, the Commission's final compliance schedule establishes a separate Compliance Date 3 for pre-enactment and transitional security-based swaps.

⁵⁴⁴ Rule 904(d) addresses how a registered SDR must publicly disseminate information about security-based swap transaction reports that were submitted during its closing hours. As discussed in Section X(D), *infra*, public dissemination will commence on Compliance Date 2.

⁵⁴⁵ One commenter submitted several comments regarding this issue. See ISDA I at 4, 11–13; ISDA II at 1–14; ISDA III at 1–2, 9–12; ISDA/SIFMA Letter at 6–9. Other commenters raised similar issues. See IIB Letter at 17; SIFMA–AMG II at 6–7; SIFMA/FSR Letter at 15.

⁵⁴⁶ If one side of a security-based swap includes no person that falls within Rule 908(b), that side does not incur any reporting duties under Regulation SBSR.

⁵⁴⁷ See, e.g., ISDA I at 11–13; ISDA II at 1–12; ISDA III at 1–2; ISDA/SIFMA at 6–7.

registration compliance date. This one-month period is designed to allow all security-based swap market participants to become familiar with which firms have registered as security-based swap dealers, and for registered security-based swap dealers to ensure that they have the systems, policies, and procedures in place to commence their primary reporting duties under Regulation SBSR. Without providing an additional period between the SBS entities registration compliance date and Compliance Date 1, unnecessary confusion could result if market participants were forced to readjust their reporting hierarchies within a very short period, particularly if several firms were to register only days before or actually on the SBS entities registration compliance date.

One commenter who urged that the Commission defer compliance with Regulation SBSR until after security-based swap dealers register also recommended that, “[i]f the Commission decides to require regulatory reporting of ANE transactions despite [comments] to the contrary, reporting should be required only with respect to those ANE transactions that are relevant for SBSR registration (*i.e.*, executed from the later of (a) February 21, 2017 or (ii) two months before the SBS registration compliance date).”⁵⁵¹ In light of the Commission’s final Compliance Date 1 schedule, this comment is now moot because dealing entities will not be required to report any security-based swap transactions before the SBS entities registration compliance date.

2. At Least Six Months Between First SDR To Register and Compliance Date 1

Final Compliance Date 1 retains a prong that generally follows the principle in proposed Compliance Date 1 of allowing six months between the registration of the first SDR that can accept transaction reports of security-based swaps in an asset class. The Commission continues to believe that it is appropriate to give market participants at least six months after the registration of the first SDR that can accept transaction reports of security-based swaps in an asset class before they are required to report transactions in that asset class. This period will enable market participants to prepare their systems for reporting to that SDR and to fully familiarize themselves with the SDR’s policies and procedures. However, as discussed below, final Compliance Date 1 eliminates the proposed reference to the date on which

such SDR “commences operations” as a registered SDR.

One commenter expressed the view that the proposed compliance timeline would give reporting sides and SDRs adequate time to implement Regulation SBSR.⁵⁵² A second commenter, however, argued that Compliance Date 1 should be extended to 12 months after the registration of the first SDR in an asset class.⁵⁵³ A third commenter recommended that Compliance Date 1 be nine months after the later of (1) the date by which security-based swap dealers and major security-based swap participants are required to register with the Commission; and (2) the date on which the Commission announces SDR readiness in an asset class.⁵⁵⁴

The Commission believes that six months is an appropriate minimum period between registration of the first SDR in an asset class and Compliance Date 1 with respect to that asset class, particularly in view of the Commission’s decision not to require compliance with Regulation SBSR until after the SBS entities registration compliance date. The Commission further notes that, before the Commission grants registration to any SDR, the application would be published for comment.⁵⁵⁵ The minimum six-month period between the Commission’s grant of an SDR’s registration and Compliance Date 1 should allow prospective participants sufficient time to analyze the final form of the SDR’s policies and procedures under Regulation SBSR, make inquiries to the SDR about technological and procedural matters for connecting to the SDR to report the necessary data, build or adapt existing connections as necessary, and conduct systems testing.⁵⁵⁶ The Commission staff intends to monitor participant readiness during the period between the granting of the first SDR registration and Compliance Date 1.

Certain commenters suggested establishing dates certain for compliance with Regulation SBSR.⁵⁵⁷ While the Commission appreciates

commenters’ desire to have certainty about when their duties under Regulation SBSR will commence, the Commission notes that there are not yet any registered SDRs and the Commission cannot predict when one or more SDRs will be granted registration. Furthermore, the SBS entities registration compliance date is contingent on the completion of several other rulemakings. The Commission believes, therefore, that the more practical approach is to base Compliance Date 1 on the later of these two events, rather than to establish dates certain.

Finally, two commenters noted that, although proposed Compliance Date 1 would have been tied to the commencement of operations of a registered SDR in an asset class, “commencement of operations” is not defined and it was not clear to the commenters how this date would be determined or how market participants would be made aware of that date.⁵⁵⁸ The Commission has determined to eliminate the “commencement of operations” as one of the triggering events in Compliance Date 1. The Commission acknowledges that this change from “commencement of operations” to the date of SDR registration in this prong could reduce the number of days between the issuance of this release and Compliance Date 1, if there is in fact a lag between registration and the “commencement of operations” for that registered SDR. However, the Commission believes that market participants will benefit from eliminating uncertainty about precisely when an SDR “commences operations” and how the fact of such commencement would be conveyed.

Finally, the Commission notes that it is setting Compliance Date 1 as *the first Monday* following the later of the two stipulated events. Beginning mandatory transaction reporting on a Monday will give registered SDRs and their participants at least one final weekend to conduct any final systems changes or testing.

3. There May Be Separate Compliance Dates for Separate Asset Classes

The Commission is adopting the proposed approach that the compliance dates are specific to a security-based swap asset class. One commenter expressed concern that the potential for varying compliance dates for different asset classes “would inject unnecessary complexity into the implementation process and potentially cause confusion

⁵⁵¹ UBS Letter at 3.

⁵⁵² See ICE Letter at 7.

⁵⁵³ See LCH.Clearnet Letter at 4, 12–13. The commenter believed that the proposed timeframe would not provide enough time to connect to all registered SDRs. See *id.* at 4.

⁵⁵⁴ See ISDA/SIFMA Letter at 17; UBS Letter at 2.

⁵⁵⁵ See SDR Adopting Release, 80 FR at 14465.

⁵⁵⁶ See WMBAA Letter at 6 (“Platforms’ compliance with the Proposed Rules will depend on the permissibility of functionality of services provided by third-party vendors and SDRs. These vital infrastructure components will determine how quickly platforms and market participants can comply with the Proposed Rules”).

⁵⁵⁷ See DTCC Letter at 3; DTCC/ICE/CME Letter at 4.

⁵⁵⁸ See DTCC Letter at 12; ISDA/SIFMA Letter at 17.

among market participants.”⁵⁵⁹ The Commission notes, however, that there is no requirement that a person that seeks registration as an SDR must accept security-based swaps in both the credit and equity asset classes. Thus, a person might submit an application to register as an SDR only with respect to a single asset class.⁵⁶⁰ If the Commission were to grant registration of an SDR applicant that could receive transactions in only a single asset class and assuming that the other prong of Compliance Date 1 were met, it would be impossible for market participants to report transactions in other asset classes to that SDR. Delaying Compliance Date 1 until an SDR has been registered in all security-based swap asset classes would prevent reporting from beginning in the asset class or classes that the first registered SDR is ready to accept. Therefore, the Commission believes that it is appropriate to make the compliance dates specific to each asset class.

4. “First-Mover” Concerns

Several commenters expressed concerns about triggering compliance based on the first SDR in an asset class to register with the Commission.⁵⁶¹ One commenter recommended that, to minimize these concerns, the Commission should “coordinate its processing of SDR applications received within a reasonable window and time its announcement of SDR registration and readiness to include all SDRs for an asset class that will be approved ahead of Compliance Date 1.”⁵⁶² Likewise, a second commenter urged the Commission “to uniformly review and approve SDR applicants that are acting in good faith to complete the application process in order to minimize ‘first mover’ advantages.”⁵⁶³

With respect to commenters’ concerns about multiple SDR applications for registration, the Commission previously stated in the SDR Adopting Release that it “intends to process such applications . . . within the same period of time so as to address competition concerns that could arise if such SDRs were granted registration at different times.”⁵⁶⁴ However, if an SDR application meets the criteria of Rule 13n-1(c)(3) under the Exchange Act,⁵⁶⁵ the Commission does not believe that it should be necessary to delay granting the registration because of the status of other pending applications. As the Commission also noted in the SDR Adopting Release: “Certain unexpected events that raise compliance concerns with respect to one applicant but not another, such as deficiencies identified in connection with the Commission’s consideration of whether an applicant meets the criteria of Rule 13n-1(c), may interfere with the Commission’s ability to process initial applications for registration within the same period of time.”⁵⁶⁶

The Commission acknowledges that, by requiring compliance based on the first SDR in an asset class to register with the Commission, a participant might not be able to report security-based swaps to its preferred SDR. However, this situation implies that the participant’s preferred SDR for reporting security-based swap transactions has not yet met the criteria for registration under Rule 13n-1(c)(3). The Commission believes that commencing reporting with only a single registered SDR in an asset class, should this prove necessary, would be preferable to any alternative. When the Commission grants the first SDR registration, delaying compliance with Regulation SBSR until additional registrations are granted would not further the objectives of Title VII.⁵⁶⁷ The opposite approach, whereby the Commission would not require compliance with Regulation SBSR until two or more SDRs had

registered with the Commission, could have the effect of giving an applicant that has not met the criteria for registration the power to delay the reporting regime contemplated by Title VII. The Commission believes that this outcome would unfairly retard the ability of a successful applicant to begin providing SDR services.

Finally, the Commission notes that, even if there is only one registered SDR for some period of time, other Commission rules are designed to minimize any undue advantage that the first SDR might otherwise enjoy. For example, every SDR, even the first and only registered SDR in a particular asset class, must offer fair, open, and not unreasonably discriminatory access to users of its services.⁵⁶⁸ Furthermore, any fees that it charges would have to be fair and reasonable and not unreasonably discriminatory.⁵⁶⁹

5. No Delay for Substituted Compliance Determinations

Three commenters urged the Commission to defer compliance with Regulation SBSR until the Commission has made substituted compliance determinations with respect to regulatory reporting and public dissemination of security-based swap transactions for certain foreign jurisdictions.⁵⁷⁰ In the view of one of these commenters, this approach could “save reporting sides the effort and cost of building to the SBSR requirements if their current builds will suffice.”⁵⁷¹ Another commenter stated that “[r]equiring the changes to systems, personnel and trade flows necessary to comply with the Commission’s Proposal only to later be granted substituted compliance would impose significant and unnecessary burdens for negligible short-term benefits.”⁵⁷²

The Commission declines to accept this suggestion and does not believe that compliance with Title VII’s regulatory reporting and public dissemination requirements, as implemented by Regulation SBSR, should be delayed until the Commission has made any substituted compliance determinations. The Commission has not yet received any substituted compliance applications

applications,” and “make best efforts to approve SDR applicants at the same time.” *Id.*

⁵⁶¹ See DTCC Letter at 12 (noting that market participants will likely be compelled to begin the onboarding process with the first registered SDR); DTCC/ICE/CME Letter at 4 (noting that market participants would have no choice but to join the first registered SDR to guarantee that they meet any compliance date tied to the first SDR); ICE Letter at 8; ISDA/SIFMA Letter at 18 (stating that a reporting side may not be able to freely select the SDR of its choice if another SDR is first to register and the desired SDR cannot complete the registration process before participants would be compelled to report to the first SDR).

⁵⁶² ISDA/SIFMA Letter at 18.

⁵⁶³ ICE Letter at 8. This commenter also urged the Commission to “focus equally on each application,” “provide applicants equal opportunities to address the Commission’s comments and amend their

and, therefore, does not yet have sufficient information regarding any foreign jurisdiction to make the findings necessary to issue a substituted compliance order. In addition, because many other jurisdictions are, like the Commission, still in the process of establishing and implementing their regulatory requirements, the Commission cannot predict when—or even if—any jurisdictions ultimately will have regulatory systems that are comparable to Regulation SBSR. If the Commission were to accept the commenters' suggestion, the Commission might have to defer compliance for a lengthy period, which would unnecessarily delay the implementation of the reporting and public dissemination regime.

6. No Delay for Adoption of SB SEF Rules

Two commenters urged the Commission to delay Compliance Date 1 until the Commission adopts final rules relating to SB SEFs and provides sufficient time for entities to register with the Commission as SB SEFs.⁵⁷³ One of these commenters argued, for example, that “the Commission should prepare alternative compliance regimes in the chance that all of the SB swap trading rules are not in place (and, as a result, market participants cannot meet the reporting obligations of Rule 901) by Compliance Date 1.”⁵⁷⁴

The Commission declines to act on the commenters' suggestion. Delaying compliance with Regulation SBSR until final rules relating to SB SEFs are adopted would result in the Commission and other relevant authorities continuing to lack complete records of all security-based swap transactions, which will facilitate market and systemic risk oversight. The Commission believes that Regulation SBSR can be successfully implemented even before the adoption of final SB SEF rules and the registration of SB SEFs with the Commission. The Commission understands that, currently, many security-based swaps trade off-platform and it is likely that a sizeable portion of the security-based swap market will continue to trade off-platform, even after SB SEFs have the opportunity to register with the Commission. The Commission believes that delaying Compliance Date 1 until SB SEFs have registered would unnecessarily delay the reporting of security-based swaps that trade off-platform.

⁵⁷³ See WMBAA Letter at 5–6; ISDA/SIFMA Letter at 3.

⁵⁷⁴ WMBAA Letter at 6.

The Commission understands that there are a small number of existing entities that likely meet the definition of “security-based swap execution facility” at present but are not yet registered with the Commission as such. However, Rule 901(a)(1) applies to all platforms, including unregistered SB SEF. Moreover, the Commission does not believe that the finalization of its SB SEF rules would affect their capability to report such transactions to a registered SDR because the Commission understands that such entities are likely to be swap execution facilities that already have incurred swap reporting duties under CFTC rules.⁵⁷⁵ Thus, these entities already have substantial reporting infrastructure that can likely be used to support security-based swap reporting duties.⁵⁷⁶ For transactions that occur on exempt SB SEFs, the Commission considered an alternative of requiring a side to report each transaction effected on the SB SEF that will be submitted to clearing until SB SEFs have an opportunity to register with the Commission. However, this alternative is unworkable because platform transactions that will be submitted to clearing may be anonymous, and the sides cannot be expected to ascertain the reporting side or report the necessary counterparty information if they are anonymous to each other.⁵⁷⁷

7. Compliance With UIC Requirements

Several commenters urged the Commission to defer compliance with Regulation SBSR's UIC requirements until international standards for these UICs are developed and can be used across multiple SDRs and multiple jurisdictions.⁵⁷⁸ Two of these commenters expressed concern that requiring each registered SDR to establish its own UIC system ahead of an internationally recognized standard would generate significant complexities and costs and would frustrate data aggregation efforts.⁵⁷⁹ One commenter argued that the Commission generally should “consider a separate compliance

⁵⁷⁵ See Swap Data Recordkeeping and Reporting Requirements, 77 FR 2136 (January 13, 2012) (discussing reporting under the CFTC rules and swap execution facilities roles in that reporting); see also “The Role of Swap Execution Facilities (SEFs) in Derivatives Trade Execution, Clearing and Reporting: Part 2” at <https://riskfocus.com/the-role-of-swap-execution-facilities-sefs-in-derivatives-trade-execution-clearing-and-reporting-part-2/> (last visited on May 25, 2016) for a summary of such reporting.

⁵⁷⁸ See DTCC Letter at 2–3; ISDA/SIFMA Letter at 3, 12; DTCC/ICE/CME Letter at 3–4; Financial InterGroup Letter at 4.

⁵⁷⁹ DTCC Letter at 10; DTCC/ICE/CME Letter at 3.

schedule for UIC fields to allow sufficient time for SB SDRs to work collaboratively with market participants, including prospective UIC issuers, to develop an industry standard or, at minimum, an SB SDR-specific methodology.”⁵⁸⁰

After carefully considering the issues raised by commenters, the Commission believes, for the reasons described below, that use of the various UICs must commence on Compliance Date 1:

a. UICs for Legal Entities

For any UIC that can be represented with a Legal Entity Identifier (“LEI”), compliance is required on Compliance Date 1. In the Regulation SBSR Adopting Release, the Commission recognized the Global Legal Entity Identifier System (“GLEIS”) as an internationally recognized standards-setting system (“IRSS”) that satisfies the requirements of Rule 903.⁵⁸¹ Under Rule 903(a), if an IRSS recognized by the Commission has assigned a UIC to a person, unit of a person, or product, each registered SDR must employ that UIC for reporting purposes under Regulation SBSR, and SDR participants must obtain such UICs for use under Regulation SBSR. Counterparties, ultimate parents, brokers, execution agents, platforms, registered clearing agencies, and registered broker-dealers typically are legal entities and typically already have or will be able to obtain an LEI. Accordingly, compliance with the LEI requirements under Regulation SBSR is required on Compliance Date 1.

b. Branch ID, Trading Desk ID, and Trader ID

Regulation SBSR also requires UICs for three types of “sub-legal entities”: Branches, trading desks, and individual traders. As commenters note, neither the GLEIS nor any other potential IRSS assigns identifiers to any sub-legal entities at this time.⁵⁸² Although the GLEIS has begun exploring the possibility of assigning identifiers to branches and certain natural persons,⁵⁸³ it is unclear when any final decision to do so might be taken. Given the

⁵⁸⁰ DTCC Letter at 11. See also DTCC/ICE/CME Letter at 3 (stating that the Commission should allow “sufficient time for the IDs to be developed in collaboration with the industry”).

⁵⁸¹ See 80 FR at 14631–32.

⁵⁸² See DTCC Letter at 9–10; Financial InterGroup Letter at 3–4.

⁵⁸³ See, e.g., LEI Regulatory Oversight Committee, “Consultation document on including data on branches in the Global LEI System,” available at http://www.lei.org/publications/gls/lou_20151019-1.pdf (last visited on May 25, 2016); and “Statement on Individuals Acting in a Business Capacity,” available at http://www.lei.org/publications/gls/lou_20150930-1.pdf (last visited on May 25, 2016).

uncertainty about when or even if an IRSS will eventually be able to issue identifiers for all branches, trading desks, and traders, the Commission does not believe that it would be appropriate to delay compliance with these UIC requirements until an IRSS can provide them.

The Commission recognizes that this approach raises the possibility that different SDRs could, in theory, assign different UICs to the same person, unit of a person, or product. If this were to occur, the Commission could have to map the UICs assigned by one registered SDR to the corresponding UICs assigned by one or more other SDRs to maintain a complete picture of the market activity pertaining to a particular person or sub-legal entity. The Commission specifically addressed this issue in the Regulation SBSR Adopting Release.⁵⁸⁴ However, the Commission previously noted a mechanism whereby a participant could use the same UICs at multiple SDRs.⁵⁸⁵ Regulation SBSR does not prohibit a participant from making suggestions to a registered SDR regarding the UICs that the SDR is required to assign, particularly for sub-legal entities.⁵⁸⁶ Through this mechanism for assignment, a person who is a participant of two or more registered SDRs could—with the concurrence of these SDRs—utilize the same UICs across multiple SDRs.⁵⁸⁷

⁵⁸⁴ See 80 FR at 14632 (“UICs, even if SDR-specific, will provide a streamlined way of reporting, disseminating, and interpreting security-based swap information. The Commission believes that requiring registered SDRs to develop their own UICs—but only for UICs that are not assigned by or through an IRSS that has been recognized by the Commission—will result in less confusion than the currently available alternatives, such as allowing each reporting side to utilize its own nomenclature conventions, which would subsequently have to be normalized by registered SDRs or by the Commission”).

⁵⁸⁵ See Regulation SBSR Adopting Release, 80 FR at 14723, n. 1371 (“assume that a person becomes a participant of a registered SDR and obtains UICs for its trading desks and individual traders from that SDR. Later, that person becomes a participant at a second registered SDR. The second SDR could issue its own set of UICs for this person’s trading desks and individual traders, or it could recognize and permit use of the same UICs that had been assigned by the first registered SDR”).

⁵⁸⁶ This could also be true for identifying counterparties that do not fall within Rule 908(b) and do not otherwise have an LEI that could be used for the counterparty ID.

⁵⁸⁷ In connection with its comments regarding how Regulation SBSR’s compliance dates should address UIC issues, one commenter recommended that the Commission “consult and agree with market participants” on how to assign various UICs, including branch ID, trading desk ID, trader ID, and product IDs. See DTCC Letter at 10–11. The commenter then recommended compliance dates of different lengths after a standard for each type of UIC had been agreed upon. See *id.* The Commission already has established a mechanism for how these UICs must be assigned: Rule 903(a), as adopted in

c. Transaction ID

Also beginning on Compliance Date 1, each registered SDR must comply with Rule 901(g), which requires the SDR to assign a transaction ID to each security-based swap, or establish or endorse a methodology for transaction IDs to be assigned by third parties. Because of the potential importance of identifying individual transactions for systemic risk and market oversight purposes, the Commission believes that it is essential for registered SDRs to comply with Rule 901(g) from the moment that they begin receiving mandatory transaction reports.⁵⁸⁸

One commenter expressed the belief that SDRs will be able to assign transaction IDs to pre-enactment and transitional security-based swaps by the date that the Commission had proposed in the Regulation SBSR Proposed Amendments Release.⁵⁸⁹ Since the proposed compliance schedule would have required historical security-based swaps to be reported by or before proposed Compliance Date 1, the comment implies that registered SDRs also should be able to assign transaction IDs to newly executed transactions beginning on Compliance Date 1.

A second commenter urged the Commission to “recognize the ‘first touch principle’ as an acceptable standard for SB SDRs to meet their 901(g) obligations.”⁵⁹⁰ The commenter explained that, under the existing CFTC swap data reporting rules, an SDR is not required to issue a transaction ID and can rely on the reporting side to submit its internal transaction ID.⁵⁹¹ As provided in existing Rule 901(g), a registered SDR may endorse a methodology for third parties to assign a transaction ID to an individual security-based swap. If an SDR wishes

the Regulation SBSR Adopting Release, provides that, in the absence of a Commission-recognized IRSS that can supply the UIC, a registered SDR must assign the UIC using its own methodology. Furthermore, in light of the guidance above regarding how a registered SDR may confer with a participant to assign a mutually agreeable set of UICs—and how, through this process, the same UICs could be used for a particular participant across multiple SDRs—the Commission does not believe that it is necessary or appropriate to establish different compliance dates for each type of UIC in the manner recommended by the commenter.

⁵⁸⁸ Also beginning on Compliance Date 1, each registered SDR must comply with the companion requirement in Rule 901(f) that a registered SDR time-stamp all incoming transaction reports.

⁵⁸⁹ See ICE Letter at 8.

⁵⁹⁰ DTCC Letter at 20.

⁵⁹¹ See *id.* The Commission notes, however, that, under CFTC Rule § 45.5(c), 17 CFR 45.5(c), a swap data repository must create and transmit a unique swap identifier for an off-facility swap if the reporting counterparty for that swap is a non-swap dealer/major swap participant.

to allow third parties (such as platforms or counterparties) to assign transaction IDs, the SDR must explain in its policies and procedures under Rule 907(a)(5)⁵⁹² any form or content requirements imposed by the SDR that the third party would be required to follow.

d. Product ID

One commenter argued that, before requiring compliance with the product ID requirement, the Commission should “consult and agree with market participants on a standard to be applied. An agreed upon public standard would provide greater certainty to reporting sides and SB SDRs to build to one uniform standard as opposed to bespoke models for each SDR.”⁵⁹³ After careful consideration of this comment, the Commission has determined not to delay compliance with the product ID requirement. At the present time, it is unclear if or when market participants could agree upon and implement standards for a product ID. Therefore, in the absence of an IRSS that can assign product IDs, registered SDRs must by Compliance Date 1 begin assigning product IDs, and persons with a duty to report transactions must use these SDR-assigned product IDs in their mandatory reports. To enable their participants to report transactions using the appropriate product IDs on Compliance Date 1, registered SDRs must set out in their written policies and procedures how they will assign product IDs (and all other UICs other than those available through an IRSS recognized by the Commission) in a manner consistent with Rule 903. A registered SDR should consider publishing as far in advance of Compliance Date 1 as possible the product IDs of the products most likely to be traded on or shortly after Compliance Date 1. The Commission recognizes, however, that it is not practical for a registered SDR to publish a list of all possible products with their product IDs, as many products have not yet been created (or certain types of contracts have not yet become sufficiently standardized as to become products, as that term is defined in Rule 900(aa), and thus require a product ID). Therefore, as a practical matter, the Commission does not believe that a registered SDR could comply with Rule 907(a) unless its policies and procedures include a mechanism or process for the registered SDR to assign a product ID to a new product before or

⁵⁹² Rule 907(a)(5) requires a registered SDR to establish and maintain written policies and procedures for assigning UICs, including but not limited to transaction IDs, in a manner consistent with Rule 903.

⁵⁹³ DTCC Letter at 10.

simultaneously with the initial transaction in that product, and to make available the product ID so that reports of transactions in that new product can include the correct product ID.

8. Switching of Reporting Side Designation

One commenter's analysis of the problems that could result from a Commission determination to require reporting compliance ahead of the SBS entities registration compliance date was premised on the assumption that a U.S. non-dealing entity that was the reporting side for a security-based swap executed during the Interim Period would remain the reporting side for the life of the security-based swap.⁵⁹⁴ The commenter argued that Regulation SBSR should not permit the reporting side designation to "switch" from one side to the other over life of a security-based swap contract.⁵⁹⁵ The Commission disagrees with this comment.

Rule 901(a)(2)(ii) sets forth a reporting hierarchy that has two possible outcomes for any transaction pair: (1) One side occupies a higher rung in the hierarchy than the other side, in which case the side that occupies the higher rung "shall be the reporting side"; or (2) the outcome is a tie, and "the sides shall select the reporting side." Sides in a tie situation, after having made an initial selection of the reporting side, can select a new reporting side later in the life of the contract.⁵⁹⁶

Over the life of a security-based swap, a registered SDR needs to know the reporting side of a security-based swap so that it knows whether it is receiving a report of a life cycle event or an error report from the entity that is obligated to report that information. A registered SDR should consider incorporating into its policies and procedures how it would accommodate any change to the reporting side designation. A registered SDR may, for example, seek to obtain, in the case of an elective switch, information from one or both sides that confirms the switch.

D. Compliance Date 2

Compliance Date 2 is the date on which all registered SDRs that can

accept security-based swaps in a particular asset class must begin public dissemination, pursuant to Rule 902, of transactions in that asset class. On Compliance Date 2, each such SDR will be required to comply with Rules 902 (regarding public dissemination generally), 904(d) (requiring dissemination of transaction reports held in queue during normal or special closing hours), and 905(b)(2) (with respect to public dissemination of corrected transaction reports) for all security-based swaps in that asset class, except as provided by Rule 902(c). As discussed further below, Compliance Date 2 is the first Monday that is three months after Compliance Date 1.

One commenter expressed the view that commencing the requirement for public dissemination nine months after SDR registration would be sufficient, provided that other compliance issues arising earlier in the compliance schedule are resolved.⁵⁹⁷ Likewise, a second commenter believed that Compliance Date 2 should be three months after Compliance Date 1, but only after stating its belief that Compliance Date 1 should be 12 months rather than six months after the first registered SDR commences operations.⁵⁹⁸ A third commenter believed that three months after Compliance Date 1 was not sufficient time for SDRs to comply with the data dissemination requirements in Regulation SBSR and recommended six months instead.⁵⁹⁹ A fourth commenter recommended that Compliance Date 2 be three months after the later of Compliance Date 1 and the date on which the Commission has determined appropriate exceptions, delays, and/or notional caps to preserve the identity, business transactions, and market positions of any person.⁶⁰⁰ The fourth commenter asserted that the longer time was necessary for Compliance Date 2 because "concerns regarding the compromise of market anonymity for illiquid and large notional trades have not adequately been addressed during the interim period."⁶⁰¹

The Commission has revised its proposed approach to Compliance Date 2 as it relates to the handling of covered cross-border transactions. In the Regulation SBSR Proposed Amendments Release, the Commission proposed that the public dissemination requirements associated with Compliance Date 2 would not have

applied to covered cross-border transactions.⁶⁰² However, as discussed in Section IX(E), *supra*, the Commission in the U.S. Activity Proposal sought additional comment on whether public dissemination of covered cross-border transactions should be made effective⁶⁰³ and, in this release, the Commission has determined that all transactions described in Rule 908(a)(1), including covered cross-border transactions, shall be subject to public dissemination, except as otherwise provided by Rule 902(c). Therefore, compliance with the public dissemination requirements shall commence on Compliance Date 2 for covered cross-border transactions along with other security-based swaps, and there is no longer any reason to consider an effective or compliance date for covered cross-border transactions separate from all other transactions that are subject to public dissemination.

The Commission proposed and is now adopting a three-month period between Compliance Date 1 and Compliance Date 2. This three-month period is designed to give registered SDRs and persons having a duty to report an opportunity to identify and resolve any issues related to trade-by-trade reporting by participants and further test their data dissemination systems. The Commission staff intends to monitor the implementation of Regulation SBSR between Compliance Dates 1 and 2.

Also, similar to the approach taken for Compliance Date 1, the Commission believes that it will be helpful to the industry to begin public dissemination on a Monday, which ensures that registered SDRs have at least the immediately preceding weekend to conduct any final systems changes or testing before public dissemination begins. Therefore, Compliance Date 2 is the first Monday that is three months after Compliance Date 1.

Finally, Compliance Date 2 is the date by which participants of registered SDRs that are subject to Rule 906(b) must comply with that rule.⁶⁰⁴ This

⁶⁰² See *supra* note 460 (explaining that term). One commenter supported excluding covered cross-border transactions from public dissemination on Compliance Date 2, as well as the Commission's decision to seek public comment before determining if and when to include them in the scope of transactions subject to public dissemination. See ISDA/SIFMA Letter at 18. The Commission addressed this comment in Section IX(E), *supra*.

⁶⁰³ See 80 FR at 27485.

⁶⁰⁴ Rule 906(b) requires each participant of a registered SDR to provide to the SDR information sufficient to identify the participant's ultimate parent(s) and any affiliate(s) of the participant that also are participants of that registered SDR. Rule 906(b) further provides that a participant must "promptly" notify the registered SDR of any

⁵⁹⁴ See ISDA I at 13; ISDA II at 7.

⁵⁹⁵ See ISDA I at 8 ("Switching the reporting side during the term of a trade is in every respect an enormous challenge . . . [and] will likely have a significant impact on the completeness, integrity and correctness of reported SBS data").

⁵⁹⁶ If the sides insisted on selecting a new reporting side but Rule 901(a)(2)(ii) did not permit them to do so, they could accomplish the new selection by tearing up the existing security-based swap and immediately replacing it with a new security-based swap having exactly the same terms, except that they select a different reporting side for the new transaction.

⁵⁹⁷ See DTCC Letter at 21.

⁵⁹⁸ See LCH.Clearnet Letter at 12.

⁵⁹⁹ See ICE Letter at 8.

⁶⁰⁰ See ISDA/SIFMA Letter at 17.

⁶⁰¹ ISDA/SIFMA Letter at 3.

represents a change from the proposed compliance schedule, under which covered participants would have been required to comply with Rule 906(b) on Compliance Date 1.⁶⁰⁵ A person does not become subject to Rule 906(b) until it becomes a participant of a registered SDR. A counterparty to a security-based swap becomes a participant of a registered SDR only when a security-based swap to which it is a counterparty is reported to that SDR on a mandatory basis.⁶⁰⁶ Thus, a security-based swap counterparty cannot become a participant until Compliance Date 1 at the earliest, because transactions will not be reported to a registered SDR on a mandatory basis until Compliance Date 1. A large number of security-based swap counterparties will become participants on Compliance Date 1 or the first days and weeks following Compliance Date 1. This could, in the Commission's view, cause unnecessary difficulties for registered SDRs and their new participants if participants were required to comply with Rule 906(b) on Compliance Date 1.⁶⁰⁷

In light of this concern, the Commission now believes that it is appropriate to delay compliance with

changes to that information. Rule 907(a)(6) requires each registered SDR to establish and maintain written policies and procedures for periodically obtaining from each participant information that identifies the participant's ultimate parent(s) and any participant(s) with which the participant is affiliated.

⁶⁰⁵ See Regulation SBSR Proposed Amendments Release, 80 FR at 14765.

⁶⁰⁶ See Rule 900(u).

⁶⁰⁷ For example, assume that S, T, and U are affiliated and all have a single ultimate parent (P) and the Commission had required compliance with Rule 906(b) on Compliance Date 1. At 09:30:02 UTC on Compliance Date 1, a security-based swap involving S as a counterparty is reported to SDR A on a mandatory basis. This is the first time that S is a counterparty to a transaction reported to SDR A on a mandatory basis, and no affiliates of S are counterparties to security-based swaps that have been reported to SDR A. Upon becoming a participant of SDR A, S must report to SDR A that it has an ultimate parent (P) and no affiliates that are also participants. At 10:30:57 UTC, a security-based swap involving T as a counterparty is reported to SDR A on a mandatory basis. T also becomes a participant of SDR A and must report to SDR A that it has an ultimate parent (P) and one affiliate (S) that also is a participant of SDR A. Because Rule 906(b) also requires S to promptly notify SDR A of any changes to its ultimate parent and affiliate information, S must amend its submission to SDR A to reflect that its affiliate T has just become a participant. At 11:30:33 UTC, a security-based swap involving U as a counterparty is reported to SDR A on a mandatory basis. U must report to SDR A that it has an ultimate parent (P) and two affiliates that are participants (S and T). U's becoming a participant also triggers revisions to S and T's reports to reflect that their affiliate U has just become a participant. Thus, the creation of new participants in the first hours and days after Compliance Date 1 could trigger the requirement to file a large number of amended reports under Rule 906(b).

Rule 906(b) for an additional three months to avoid triggering a large number of new filings and amendments that likely would have been required if the Commission had required compliance with Rule 906(b) on Compliance Date 1. Accordingly, the Commission is not requiring compliance with Rule 906(b) until Compliance Date 2. This will allow for a number of security-based swaps to be reported over the three-month period between Compliance Dates 1 and 2 that will create a critical mass of participants, thereby permitting the filing of initial reports under Rule 906(b) that are less likely to require repeated updating because of the addition of new participants that are affiliated with existing participants.⁶⁰⁸

E. New Compliance Date 3 for Historical Security-Based Swaps

In the Regulation SBSR Proposed Amendments Release, the Commission proposed that persons with a duty to report historical security-based swaps in the relevant asset class would have been required to report these transactions to a registered SDR that accepts transactions in that asset class, in accordance with Rule 901(i), by

⁶⁰⁸ The Commission recognizes, however, that several Rule 906(b) reports could have to be amended to reflect the addition of a new participant, even after Compliance Date 2. For example, assume that ultimate parent P has 20 subsidiaries, each of which is a participant of SDR A. Rule 906(b) requires a report from each subsidiary showing P as the ultimate parent and each of the other 19 subsidiaries as affiliates. Now assume that a new 21st subsidiary of P is a counterparty to a transaction reported to SDR A on a mandatory basis. This would trigger amendments to the existing 20 reports to reflect the addition of a new affiliate participant. Because these reports would be unnecessarily duplicative, the Commission interprets Rule 906(b) as being satisfied if one member of a financial group provides all of the required ultimate parent and affiliate information on behalf of each group member that is a participant of that registered SDR. While the registered SDR could seek to obtain a separate report from each group member that is a participant, the Commission encourages registered SDRs to consider establishing policies and procedures under Rule 907(a)(6) that would allow for abbreviated reporting for the entire group. Such abbreviated group reporting would still be subject to the requirement that any changes be reported to the registered SDR "promptly." Furthermore, a participant in the group would still be subject to a requirement to separately disclose any ultimate parent or affiliate information that differs from that of other members of the group. In the example above, assume that the 17th subsidiary of P is a 50-50 joint venture with Q. Under the approach suggested here, one member of the P group could file an abbreviated Rule 906(b) report on behalf of all members of the P group (that would identify all 20 subsidiaries, including the 17th). However, the 17th subsidiary would be subject to a separate requirement to notify the registered SDR that, unlike all of the other P group affiliates, it has two ultimate parents (P and Q) and would have to identify any additional participant affiliates that it might have through its Q parent.

Compliance Date 1. As discussed further below, the Commission is adopting a new Compliance Date 3 for the reporting of historical security-based swaps. Compliance Date 3 is two months after Compliance Date 2.

One commenter expressed the view that requiring reporting of historical security-based swaps in advance of the SBS entities registration compliance date would place the bulk of the reporting burden on U.S. persons, including buy-side U.S. persons, because U.S. persons would be the reporting side for all historical security-based swaps entered into with a foreign dealing entity that did not involve ANE activity.⁶⁰⁹ Furthermore, this commenter expressed concern that it could not be reliably determined whether U.S. personnel were used to engage in ANE activity for historical security-based swaps because parties were not required to capture or exchange such information at the time the transactions were executed.⁶¹⁰ The commenter concluded that it would be significantly easier to ascertain the reporting side for historical transactions after the SBS entities registration compliance date, because most would involve a counterparty that will register as a security-based swap dealer.⁶¹¹ This commenter, in a joint letter with another association, also expressed the view that the volume of non-live historic security-based swaps "will be enormous" and that "reporting over five years of security-based swap transaction data will require tremendous effort and coordination between reporting sides and their SDR."⁶¹² These comments recommended an extended period for reporting non-live historical security-based swaps after the SBS entities registration compliance date, and argued that the commencement of reporting under Regulation SBSR would be more effective if the reporting of non-live historic security-based swaps were done separately and after security-based swap dealer registration.⁶¹³

These commenters also argued that "[d]ealer registration will greatly expand the scope of SBS subject to reporting at a later date, essentially creating additional individual compliance dates for registrants and their counterparties to report additional SBS activity and historic SBS," which "will also trigger the question as to who has the reporting obligation for

⁶⁰⁹ See ISDA II at 10; ISDA III at 2, 4.

⁶¹⁰ See ISDA II at 10.

⁶¹¹ See *id.*

⁶¹² ISDA/SIFMA Letter at 16.

⁶¹³ See *id.* at 16-17.

historical SBS.”⁶¹⁴ This comment is premised on the correct observation that a historical security-based swap between two unregistered non-U.S. persons, neither of whom engaged in ANE activity, would fall within Rule 908(a) only after one side or the other registers with the Commission as a security-based swap dealer. One of these commenters also expressed the view that “existing TIW functionality cannot be leveraged to accomplish reporting [of historical security-based swaps] in advance of registration.”⁶¹⁵ Therefore, in the commenter’s view, to satisfy obligations to report historical transactions before the SBS entities registration compliance date, market participants would need to expend “significant effort and cost to develop appropriate new industry agreements, conduct significant outreach to U.S. Persons and build interim reporting logic.”⁶¹⁶

In light of these considerations, the Commission is adopting a new Compliance Date 3, which is designed to minimize the concerns raised by the commenters. Persons with a duty to report historical security-based swaps in an asset class must do so by the date that is two months after Compliance Date 2. To the extent that historical transactions involve a non-U.S. counterparty that is likely to register as a security-based swap dealer, deferring compliance with the requirement to report historical transactions until security-based swap dealers are registered will significantly reduce undue burdens on non-dealing persons who are their counterparties. After the SBS entities registration compliance date, registered security-based swap dealers will be clearly identifiable as such and will bear the responsibility for reporting any historical transactions with unregistered persons to the extent that information about such transactions is available. The two-month gap between Compliance Date 2 and Compliance Date 3 is designed to avoid problems that could arise if registered SDRs and their participants had been required to achieve major compliance milestones on the same day or in close proximity.

The Commission notes that the relevant transactions need not be reported *on* Compliance Date 3, but rather *by* Compliance Date 3. The Commission encourages reporting sides to report historical security-based swaps as far in advance of Compliance Date 3 as possible, to avoid difficulties that

might arise if reporting sides attempt to report a large number of historical transactions in the last few days or hours before Compliance Date 3.

The Commission believes that a new Compliance Date 3, occurring after the SBS entities registration compliance date, for reporting of historical transactions represents an appropriate consideration of the benefits of mandatory reporting in light of the likely costs. Before security-based swap dealers register as such with the Commission, the only way a foreign dealing entity could incur any duty under Regulation SBSR is if it were engaging in ANE activity with respect to a particular transaction. The Commission is persuaded by commenters who argued that it could be difficult or impossible to ascertain whether historical transactions of foreign dealing entities involved ANE activity, as information about the involvement of U.S. personnel in particular transactions might not exist or might be difficult to reconstruct for transactions that were executed, in some cases, many years ago.⁶¹⁷ Because the Commission anticipates that foreign dealing entities that account for the vast majority of cross-border transactions will register as security-based swap dealers, the issues associated with identifying whether a foreign dealing entity has engaged in ANE activity will not arise for the vast majority of historical cross-border transactions. After the SBS entities registration compliance date, the reporting hierarchy can easily be applied because at least one side will likely include a registered security-based swap dealer. This approach will minimize instances where unregistered U.S. persons could become the reporting side when they are counterparties with foreign dealing entities.

A registered SDR that accepts reports of transactions in the relevant asset class may allow persons with a duty to report historical transactions in that asset class on a rolling basis at any time after Compliance Date 1. When it begins accepting reports of historical security-based swaps submitted on a mandatory basis, a registered SDR must comply with Rule 901(f) and time-stamp, to the second, any security-based swap data that it receives pursuant to Rule 901(i). The registered SDR also must comply with Rule 901(g) with respect to transaction IDs for each historical security-based swap that it receives.

As participants begin reporting historical security-based swaps to a

registered SDR, participants and registered SDRs also must comply with Rules 901(e) and 905 regarding any historical security-based swaps that are so reported. A report of a life cycle event of a historical transaction that relates to information required by Rule 901(c) would trigger public dissemination of the life cycle event if the report is submitted on or after Compliance Date 2.⁶¹⁸

The Commission notes that registered SDRs and their participants need not comply with Rule 906(a) with respect to historical security-based swaps. Rule 906(a) requires a registered SDR to identify security-based swaps for which the SDR lacks counterparty ID and (if applicable) broker ID, branch ID, execution agent ID, trading desk ID, and trader ID. Regulation SBSR requires reporting of historical security-based swaps only “to the extent that information about such transactions is available”—including information pertaining to the remaining UICs. Because broker IDs, branch IDs, execution agent IDs, trading desk IDs, and trader IDs will not be assigned by registered SDRs until they become operational, these UICs likely will not have existed or been recorded in connection with any historical security-based swaps. Therefore, because these UICs are not applicable to historical security-based swaps, a registered SDR is not required by Rule 906(a) to query non-reporting sides for those UICs with respect to any historical transactions, and non-reporting sides are not required by Rule 906(a) to provide any UICs with respect to historical transactions.

F. No Separate Compliance Dates for Cross-Border Transactions

Compliance Dates 1, 2, and 3 apply equally to all security-based swaps that fall within Rule 908(a), as amended herein, and all security-based swap counterparties that fall within Rule 908(b), as amended herein. Compliance Dates 1, 2, and 3 apply to all transactions contemplated by the reporting hierarchy in Rule 901(a)(2), as amended herein, including the cross-border provisions of new Rule 901(a)(2)(ii)(E). Thus, U.S.-to-U.S. transactions do not have different compliance dates than the cross-border transactions that fall within Rule 908(a).

⁶¹⁸ See Regulation SBSR Adopting Release, 80 FR at 14609 (“life cycle events relating to the primary trade information of historical security-based swaps must, after the public dissemination requirement goes into effect, be publicly disseminated”). However, an error correction of a historical security-based swap involving Rule 901(c) information would not trigger public dissemination, even after Compliance Date 2. See *id.*

⁶¹⁴ *Id.* at 7.

⁶¹⁵ ISDA II at 11.

⁶¹⁶ *Id.*

⁶¹⁷ See ISDA II at 10; ISDA/SIFMA Letter at 16–17.

One commenter, responding to the proposed compliance schedule in the Regulation SBSR Proposed Amendments Release, warned that, if the Commission required regulatory reporting before security-based swap dealer registration, U.S. non-dealing entities would incur the reporting duty when they traded against large foreign dealing entities⁶¹⁹ and that U.S.-to-U.S. transactions would be subject to public dissemination before U.S.-to-non-U.S. transactions.⁶²⁰ As a result, the commenter argued, “U.S. person end-users may avoid trading with other U.S. persons until after dealer registration to avoid their data being publicly disseminated.”⁶²¹ The commenter concluded that U.S. non-dealing entities’ avoidance of other U.S. counterparties would disadvantage U.S. dealing entities and result in less liquidity for U.S. non-dealing entities.⁶²² The commenter also cautioned that “[w]ith a limited list of counterparties and an even narrower list of dealers to such transactions, public dissemination of this smaller segment of SBS data bears the risk that counterparty identity could be disclosed to the public.”⁶²³

As noted in Section IX, *supra*, the Commission is adopting amendments to Rules 901(a) and 908 substantially as proposed to cover additional types of cross-border transactions, and Compliance Dates 1, 2, and 3 will apply equally to all counterparties that fall within Rule 908(b) and all security-based swaps that fall within Rule 908(a). Thus, because Regulation SBSR’s compliance dates for U.S.-to-U.S. transactions are the same as for U.S.-to-non-U.S. transactions, there is no incentive for U.S. counterparties to trade only with non-U.S. persons to avoid any Regulation SBSR requirements.⁶²⁴

G. Exemptions Related to the Compliance Schedule

In June 2011, the Commission exercised its authority under Section 36 of the Exchange Act⁶²⁵ to exempt any person from having to report any pre-enactment security-based swaps, as

required by Section 3C(e)(1) of the Exchange Act,⁶²⁶ until six months after an SDR that is capable of receiving security-based swaps in that asset class is registered by the Commission.⁶²⁷ In the Regulation SBSR Proposed Amendments Release, the Commission proposed to extend the exemption from the requirement to report pre-enactment security-based swaps to ensure consistency between the proposed compliance schedule and the exemption.⁶²⁸ Because Compliance Date 1, as proposed in the Regulation SBSR Proposed Amendments Release, would have required the reporting of pre-enactment security-based swaps within six months after the commencement of operations of the first registered SDR in that asset class rather than six months after the date of the registration of the first SDR, the Commission also proposed to extend the exemption from Section 3C(e)(1) exemption to synchronize it with proposed Compliance Date 1.

The Commission received one comment on this aspect of its proposed exemption. The commenter agreed that the exemption for the reporting of pre-enactment security-based swaps should be extended to and terminate on Compliance Date 1.⁶²⁹

As discussed above, the Commission is adopting new Compliance Date 3 relating to the reporting of historical security-based swaps, which includes pre-enactment security-based swaps. To harmonize the existing exemption with the compliance date for reporting of pre-enactment security-based swaps, the Commission is exercising its authority under Section 36 of the Exchange Act to exempt any person from having to report any pre-enactment security-based swaps, as required by Section 3C(e)(1) of the Exchange Act, in a particular asset class until Compliance Date 3. The Commission finds that such exemption is necessary or appropriate in the public interest, and is consistent with the protection of investors, because such action prevents the existing exemption from expiring before persons with a duty to report pre-enactment security-based swaps are able and are required to report them to a registered SDR.

In conjunction with the proposed extension of the Section 3C(e)(1) exemption included in the Regulation SBSR Proposed Amendments Release, the Commission also proposed that, with respect to security-based swaps in a particular asset class, the exemption

from Section 29(b) of the Exchange Act,⁶³⁰ in connection with Section 3C(e)(1), would terminate on proposed Compliance Date 1. One commenter agreed with this proposed extension of the Section 29(b) exemption in connection with Section 3C(e)(1).⁶³¹ In addition, one commenter asked that the Commission clarify how Section 3C(e)(1) of the Exchange Act relates to the Section 29(b) exemption.⁶³² The commenter noted that the Commission’s Section 29(b) exemption applies to security-based swap entered into on or after July 16, 2011, and that Section 3C(e)(1) applies only to pre-enactment security-based swaps, *i.e.*, those entered into before July 21, 2010.⁶³³

The Commission confirms that the existing exemption from Section 29(b) set forth in the Effective Date Release applies only to security-based swaps entered into on or after July 16, 2011.⁶³⁴ Section 3C(e)(1) applies only to pre-enactment security-based swaps.⁶³⁵ As a result, an extension of the Section 29(b) exemption in connection with Section 3C(e)(1) would have had no effect. Therefore, there is no need for the Commission to revise or extend the exemption from Section 29(b) in connection with Section 3C(e)(1).⁶³⁶

⁶³⁰ 15 U.S.C. 78cc(b). In the Effective Date Release, the Commission exercised its authority under Section 36 of the Exchange Act to temporarily exempt any security-based swap contract entered into on or after July 16, 2011, from being void or considered voidable by reason of Section 29(b) of the Exchange Act, because any person that is a party to the security-based swap contract violated a provision of the Exchange Act that was amended or added by Subtitle B of Title VII of the Dodd Frank Act and for which the Commission has taken the view that compliance will be triggered by registration of a person or by adoption of final rules by the Commission, or for which the Commission has provided an exception or exemptive relief, until such date as the Commission specifies. *See* Effective Date Release, 76 FR at 36305. Section 29(b) of the Exchange Act provides, in relevant part: “Every contract made in violation of any provision of this title or of any rule or regulation thereunder, and every contract . . . heretofore or hereafter made, the performance of which involves the violation of, or the continuance of any relationship or practice in violation of, any provision of this title or any rule or regulation thereunder, shall be void (1) as regards the rights of any person who, in violation of any such provision, rule, or regulation, shall have made or engaged in the performance of any such contract, and (2) as regards the rights of any person who, not being a party to such contract, shall have acquired any right thereunder with actual knowledge of the facts by reason of much the making or performance of such contract was in violation of any such provision rule or regulation . . .”

H. Substituted Compliance Requests

Rule 908(c) permits a person that potentially would become subject to Regulation SBSR or a foreign financial regulatory authority to submit a substituted compliance request with respect to the rules of a foreign jurisdiction pertaining to regulatory reporting and public dissemination of security-based swap transactions. The submission of a substituted compliance request is elective; therefore, the Commission is not establishing a “compliance date” for Rule 908(c). Nevertheless, such persons may begin submitting substituted compliance requests pursuant to the requirements of Rule 908(c) upon the effective date of this release.

XI. Paperwork Reduction Act

Certain amendments to Regulation SBSR that the Commission is adopting today contain “collection of information requirements” within the meaning of the Paperwork Reduction Act of 1995 (“PRA”).⁶³⁷ The Commission published notices requesting comment on the collection of information requirements relating to Regulation SBSR in the Regulation SBSR Proposed Amendments Release⁶³⁸ and the U.S. Activity Proposal⁶³⁹ and submitted relevant information to the Office of Management and Budget (“OMB”) for review in accordance with the PRA.⁶⁴⁰ In addition, the Commission adopted portions of Regulation SBSR that contain collections of information requirements in the Regulation SBSR Adopting Release.⁶⁴¹ The titles of the collections for Regulation SBSR are: (1) Rule 901—Reporting Obligations—For Reporting Sides; (2) Rule 901—Reporting Obligations—For Registered SDRs; (3) Rule 901—Reporting Obligations—For Platforms; (4) Rule 901—Reporting Obligations—For Registered Clearing Agencies; (5) Rule 901—Reporting Obligations—For New Broker-Dealer Respondents; (6) Rule

902—Public Dissemination of Transaction Reports; (7) Rule 903—Coded Information; (8) Rule 904—Operating Hours of Registered Security-Based Swap Data Repositories; (9) Rule 905—Correction of Errors in Security-Based Swap Information—For Reporting Sides; (10) Rule 905—Correction of Errors in Security-Based Swap Information—For Non-Reporting Sides; (11) Rule 905—Correction of Errors in Security-Based Swap Information—For Registered SDRs; (12) Rule 905—Correction of Errors in Security-Based Swap Information—For Platforms; (13) Rule 905—Correction of Errors in Security-Based Swap Information—For Registered Clearing Agencies; (14) Rule 905—Correction of Errors in Security-Based Swap Information—For New Broker-Dealer Respondents; (15) Rule 906(a)—Other Duties of All Participants—For Registered SDRs; (16) Rule 906(a)—Other Duties of All Participants—For Non-Reporting Sides; (17) Rule 906(b)—Other Duties of All Participants—For All Participants; (18) Rule 906(c)—Other Duties of All Participants—For Covered Participants; (19) Rule 906(c)—Other Duties of All Participants—For Platforms; (20) Rule 906(c)—Other Duties of All Participants—For Registered Clearing Agencies; (21) Rule 906(c)—Other Duties of All Participants—For New Broker-Dealer Respondents; (22) Rule 907—Policies and Procedures of Registered Security-Based Swap Data Repositories; and (23) Rule 908(c)—Substituted Compliance (OMB Control No. 3235–0718). Compliance with these collections of information requirements is mandatory. An agency may not conduct or sponsor, and a person is not required to respond to, a collection of information unless the agency displays a currently valid control number.

The Commission is adopting the amendments to Regulation SBSR largely as proposed, with certain revisions. These amendments impact Rules 900, 901, 902, 905, 906, 907, and 908 of Regulation SBSR.

The hours and costs associated with complying with Regulation SBSR constitute reporting and cost burdens imposed by each collection of information. Certain estimates (e.g., the number of reporting sides, the number of non-reporting sides, the number of participants, and the number of reportable events⁶⁴² pertaining to security-based swap transactions) contained in the Commission’s earlier

PRA assessments have been revised to reflect the amendments to Regulation SBSR being adopted today, as well as additional information and data now available to the Commission. The revised paperwork burdens estimated by the Commission herein are consistent with those made in the Regulation SBSR Proposed Amendments Release and the U.S. Activity Proposal. However, as described in more detail below, certain estimates have been modified, as necessary, to reflect the most recent data available to the Commission.

The Commission requested comment on the collection of information requirements associated with the amendments to Regulation SBSR proposed in the Regulation SBSR Proposed Amendments Release and the U.S. Activity Proposal. As noted above, the Commission received 25 comment letters on the Regulation SBSR Proposed Amendments Release and the U.S. Activity Proposal that specifically address Regulation SBSR. Any comments related to the collection of information burdens potentially arising from the proposed amendments are addressed below.

A. Definitions—Rule 900

Rule 900 sets forth definitions of various terms used in Regulation SBSR. In this release, the Commission is adopting certain amendments to Rule 900, including amendments to the definition of “participant” in existing Rule 900(u)⁶⁴³ and a new defined term “widely accessible” in Rule 900(tt).⁶⁴⁴ These changes, in themselves, will not result in any new “collection of information” requirements within the meaning of the PRA. Changes in definitions that might impact a collection of information requirement are considered with the respective rule that imposes the requirement.⁶⁴⁵

⁶⁴³ Rule 900(u) has been amended such that the definition of “participant” now includes platforms, registered clearing agencies that are required to report alpha dispositions pursuant to new Rule 901(e)(1)(ii), and registered broker-dealers that incur the duty to report security-based swap transactions to a registered SDR pursuant to new Rule 901(a)(2)(ii)(E)(4). See *supra* Section V(A).

⁶⁴⁴ The adopted definition of “widely accessible” has the effect of prohibiting a registered SDR from charging fees for or imposing usage restrictions on the security-based swap transaction data that it is required to publicly disseminate under Regulation SBSR. See *supra* Section VIII(A).

⁶⁴⁵ For example, as a result of the expanded definition of “participant,” additional entities now are subject to the requirement in Rule 906(c) to establish, maintain, and enforce written policies and procedures that are reasonably designed to ensure compliance with any obligations to report information to a registered SDR in a manner consistent with Regulation SBSR. See *infra* Section XI(D)(2)(c). The new defined term “widely accessible,” however, will not create a new

Section 29(b) exemption solely to promote legal certainty and to avoid doubt as to the applicability of Section 29(b) to other Exchange Act provisions and that the Commission has “not taken any view as to whether, when, or under what circumstances Section 29(b) might apply to any provision of Title VII of Dodd-Frank or rule or regulation thereunder, including SBSR.” ISDA/SIFMA Letter at 18. Because the Commission is not today providing any relief related to the Section 29(b) exemption, the Commission is not modifying the view set forth in the Effective Date Release. See Effective Date Release, 76 FR at 36305–306.

⁶³⁷ 44 U.S.C. 3501 *et seq.*

⁶³⁸ See Regulation SBSR Proposed Amendments Release, 80 FR at 14742–43.

⁶³⁹ See U.S. Activity Proposal, 80 FR at 27503.

⁶⁴⁰ 44 U.S.C. 3507; 5 CFR 1320.11.

⁶⁴¹ See Regulation SBSR Adopting Release, 80 FR at 14787.

⁶⁴² Reportable events include initial security-based swap transactions, life cycle events, and corrections of errors in previously reported information.

B. Reporting Obligations—Rule 901

1. Existing Rule 901

Existing Rule 901 specifies, with respect to initial security-based swap transactions and life cycle events (and adjustments due to life cycle events), who is required to report, what data must be reported, when it must be reported, where it must be reported, and how it must be reported. Existing Rule 901(a) sets forth a “reporting hierarchy” that specifies the side that has the duty to report a security-based swap. Existing Rule 901(b) states that if there is no registered SDR that will accept the report required by Rule 901(a), the person required to make the report must report the transaction to the Commission. Existing Rule 901(c) sets forth the primary trade information and Rule 901(d) sets forth the secondary trade information that must be reported. Existing Rule 901(e) requires the reporting of life cycle events and adjustments due to life cycle events. Existing Rule 901(f) requires a registered SDR to timestamp, to the second, any information submitted to it pursuant to Rule 901, and existing Rule 901(g) requires a registered SDR to assign a transaction ID to each security-based swap, or establish or endorse a methodology for transaction IDs to be assigned by third parties. Existing Rule 901(h) requires reporting sides to electronically transmit the information required by Rule 901 in a format required by the registered SDR. Existing Rule 901(i) requires reporting of pre-enactment security-based swaps and transitional security-based swaps to the extent that information about such transactions is available. Existing Rule 901(j) generally provides the person with the duty to report 24 hours from the time of execution to report the required information.

For Reporting Sides. In the Regulation SBSR Adopting Release, the Commission estimated that existing Rule 901 will impose an estimated total first-year burden of approximately 1,394 hours⁶⁴⁶ per reporting side for a total

collection of information requirement or affect an existing collection of information requirement.

⁶⁴⁶ See 80 FR at 14676. The Commission derived its estimate from the following: (355 hours (one-time hourly burden for establishing an OMS) + 172 hours (one-time hourly burden for establishing security-based swap reporting mechanisms) + 180 hours (one-time hourly burden for compliance and ongoing support) = 707 hours (one-time total hourly burden). See Regulation SBSR Adopting Release, 80 FR at 14676, n. 1074 (436 hours (annual-ongoing hourly burden for internal order management) + 33.3 hours (revised annual-ongoing hourly burden for security-based swap reporting mechanisms) + 218 hours (annual-ongoing hourly burden for compliance and ongoing support) = 687.3 hours (one-time total hourly burden). See *id.* (707 one-

first-year burden of 418,200 hours for all reporting sides.⁶⁴⁷ The Commission further estimated that existing Rule 901 will impose ongoing annualized aggregate burdens of approximately 687 hours⁶⁴⁸ per reporting side for a total aggregate annualized cost of 206,100 hours for all reporting sides.⁶⁴⁹ The Commission further estimated that existing Rule 901 will impose initial and ongoing annualized dollar cost burdens of \$201,000 per reporting side, for total aggregate initial and ongoing annualized dollar cost burdens of \$60,300,000.⁶⁵⁰

For Registered SDRs. In the Regulation SBSR Adopting Release, the Commission estimated that the first-year aggregate annualized burden on registered SDRs associated with existing Rules 901(f) and (g) will be 2,720 burden hours, which corresponds to 272 burden hours per registered SDR.⁶⁵¹ The Commission also estimated that the ongoing aggregate annualized burden associated with existing Rules 901(f) and (g) will be 1,520 burden hours, which corresponds to 152 burden hours per registered SDR.⁶⁵²

2. Rule 901—Amendment

The amendments to Rule 901, as adopted herein, establish certain additional requirements relating to the reporting of security-based swap transactions. These amendments contain additional “collection of information requirements” within the meaning of the PRA. The amendments to Rule 901 are contained in three collections: (a) “Rule 901—Reporting Obligations—For New Broker-Dealer Respondents”; (b) “Rule 901—Reporting Obligations—For Platforms”; and (c) “Rule 901—Reporting Obligations—For Registered Clearing Agencies.” The following discussion sets forth the additional burdens resulting from the

time hourly burden + 687 revised annual ongoing hourly burden = 1,394 total first-year hourly burden).

⁶⁴⁷ See Regulation SBSR Adopting Release, 80 FR at 14676. The Commission derived its estimate from the following: (1,394 hours per reporting side x 300 reporting sides) = 418,200 hours.

⁶⁴⁸ See *id.*

⁶⁴⁹ See *id.* The Commission derived its estimate from the following: (687 hours per reporting side x 300 reporting sides) = 206,100 hours.

⁶⁵⁰ See *id.* The Commission derived its estimate from the following: (\$201,000 per reporting side x 300 reporting sides) = \$60,300,000. See Cross-Border Proposing Release, 78 FR at 31113-15.

⁶⁵¹ See Regulation SBSR Adopting Release, 80 FR at 14676. See Regulation SBSR Proposing Release, 75 FR at 75250. This figure is based on the following: [(1,200) + (1,520)] = 2,720 burden hours, which corresponds to 272 burden hours per registered SDR.

⁶⁵² See Regulation SBSR Adopting Release, 80 FR at 14676-77.

amendments to Rule 901 adopted in this release.

a. Rule 901—Reporting Obligations Resulting From Amendments to Rule 901(a)(2)(ii)(E)

i. Summary of Collection of Information

In the U.S. Activity Proposal, the Commission proposed certain amendments to Rule 901 to assign the duty to report security-based swaps in certain cross-border situations. In this release, the Commission is adopting those amendments as proposed. Under new Rule 901(a)(2)(ii)(E)(2), in a transaction between an unregistered U.S. person and an unregistered non-U.S. person who is engaging in ANE activity, the sides are required to select the reporting side. In addition, if both sides are unregistered non-U.S. persons and both are engaging in ANE activity, the sides are required to select the reporting side. New Rule 901(a)(2)(ii)(E)(3) addresses the scenario where one side is subject to Rule 908(b) and the other side is not—*i.e.*, one side includes only unregistered non-U.S. persons and that side does not engage in any ANE activity, and the other side includes an unregistered U.S. person or an unregistered non-U.S. person that is engaging in ANE activity. Under Rule 901(a)(2)(ii)(E)(3), the side with the unregistered U.S. person or the unregistered non-U.S. person engaging in ANE activity is the reporting side. New Rule 901(a)(2)(ii)(E)(4) addresses the scenario where neither side includes a counterparty that falls within Rule 908(b)—*i.e.*, neither side includes a registered person, a U.S. person, or a non-U.S. person engaging in ANE activity—but the transaction is effected by or through a registered broker-dealer (including a registered SB SEF). Under Rule 901(a)(2)(ii)(E)(4), the registered broker-dealer is required to report the transaction.⁶⁵³

ii. Respondents

In the Regulation SBSR Proposed Amendments Release, the Commission estimated that there will be 300 reporting side respondents and that, among the 300 reporting sides,

⁶⁵³ In this release, the Commission also is adopting an amendment to Rule 901(d)(9) that requires a registered broker-dealer, if it is required to report a security-based swap under Rule 902(a)(2)(ii)(E)(4), to include in the transaction report its broker ID. As discussed in Section XII(A)(6), *infra*, the requirement to identify itself in such a transaction report is considered part of the overall burden of establishing and operating the broker-dealer's reporting infrastructure. As a result, the burdens associated with identifying itself in the transaction report are included in the burdens discussed below. See *infra* notes 916-917 and accompanying discussion.

approximately 50 will likely have to register with the Commission as security-based swap dealers and approximately five will likely have to register as major security-based swap participants, restating an estimate contained in the Regulation SBSR Adopting Release.⁶⁵⁴ The Commission noted that these 55 reporting sides likely will account for the vast majority of security-based swap transactions and transaction reports, and that only a limited number of security-based swap transactions would not include at least one of these larger counterparties on either side.⁶⁵⁵

One commenter to the U.S. Activity Proposal recommended that the Commission collect a more complete set of data to more precisely estimate the number of non-U.S. persons that would be affected by the proposed rules.⁶⁵⁶ In the U.S. Activity Adopting Release, the Commission stated that, in the absence of comprehensive reporting requirements for security-based swap transactions, and the fact that the location of personnel that arrange, negotiate, or execute a security-based swap transaction is not currently recorded by participants, a more precise estimate of the number of non-U.S. persons affected by the rule is not currently feasible. However, because the Commission assumes that all transactions by foreign dealing entities with other non-U.S. persons on U.S. reference entities are arranged, negotiated, or executed by personnel located in the United States, the analysis contained in the U.S. Activity Adopting Release results in an estimate of the upper bound of the number of firms that would likely assess the location of their dealing activity. The results of such an assessment, already accounted for in the U.S. Activity Adopting Release, determines the number of new respondents impacted by the amendments to Rule 901.

The Commission believes that the amendments to Rule 901(a)(2)(ii)(E), as adopted herein, will result in an additional 20 respondents that will be required to report transactions under the amendments to Regulation SBSR.⁶⁵⁷

⁶⁵⁴ See Regulation SBSR Proposed Amendments Release, 80 FR at 14788.

⁶⁵⁵ See *id.*

⁶⁵⁶ See ISDA I at 7. See also *id.* at 3 (arguing that “the SEC currently lacks the data necessary to precisely estimate . . . the number of registered broker-dealers that intermediate SBS transactions; and the number of additional non-U.S. persons that might incur reporting obligations under the Proposal”).

⁶⁵⁷ The Commission is unable to determine, at this time, how many of the non-U.S. persons performing the assessments discussed in the U.S. Activity Adopting Release will result in those

The Commission estimates that these 20 new respondents will consist solely of registered broker-dealers that are required to report one or more security-based swaps by new Rule 901(a)(2)(ii)(E)(4). The Commission acknowledges that amendments to Rule 901(a)(2)(ii)(E) adopted in this release place reporting obligations, in certain circumstances, on unregistered foreign dealing entities, as explained in Section IX(G), *supra*, which may suggest that a larger number of additional respondents is appropriate. However, the Commission notes that, based on observed transaction data in TIW that provided the basis for its estimate of the number of respondents used in the Cross-Border Adopting Release and Regulation SBSR Adopting Release, unregistered foreign dealing entities were already included in the subset of 245 unregistered person respondents that will not be registered security-based swap dealers or major security-based swap participants.⁶⁵⁸

iii. Total Initial and Annual Reporting Burdens

Pursuant to Rule 901, all security-based swap transactions must be reported to a registered SDR or to the Commission. Together, paragraphs (a), (b), (c), (d), (e), (h), and (j) of Rule 901 set forth the parameters that govern how covered transactions are reported. These reporting requirements impose initial and ongoing burdens on respondents. The Commission believes that these burdens will be a function of, among other things, the number of reportable events and the data elements required to be reported for each such event.

Respondents that fall under the reporting hierarchy in Rule 901(a)(2)(ii) incur certain burdens as a result thereof with respect to their reporting of covered transactions. As stated above, the Commission believes that an estimate of 20 additional respondents will incur the duty to report under Regulation SBSR. This estimate includes all persons that will incur a reporting duty under the amendments to Regulation SBSR that are not already subject to burdens under existing Rule

entities being required to report transactions under Regulation SBSR. The Commission is therefore basing these burdens on the assumption that all entities performing the assessment will be required to report under Regulation SBSR. Further, the 20 respondents here reflect the 30 registered-broker dealers discussed in the U.S. Activity Proposal, reduced by ten to account for registered broker-dealers that are likely also to register as SB SEFs.

⁶⁵⁸ The 245 respondents that are unregistered persons are calculated as follows: (300 reporting sides – 50 registered security-based swap dealers – 5 registered major security-based swap participants) = 245 unregistered persons that are reporting sides.

901, as adopted in the Regulation SBSR Adopting Release.

In the Regulation SBSR Adopting Release, the Commission estimated that there will likely be approximately 3 million reportable events per year under Rule 901.⁶⁵⁹ The Commission further estimated that approximately 2 million of these reportable events will consist of uncleared transactions. The Commission estimated that 2 million of the 3 million total reportable events will consist of the initial reporting of security-based swaps as well as the reporting of any life cycle events. The Commission also estimated that of the 2 million reportable events, approximately 900,000 will involve the reporting of new security-based swap transactions, and approximately 1,100,000 will involve the reporting of life cycle events under Rule 901(e).⁶⁶⁰

Based on the Commission’s assessment of the effect of the amendments to Rule 901(a)(2)(ii)(E) adopted herein, the Commission believes that there will be approximately 2,700 additional reportable events per year under Rule 901.⁶⁶¹ Using a similar approach to the Regulation SBSR Adopting Release,⁶⁶² while also accounting for security-based swaps that will be reported by a registered broker-dealer, the Commission estimates that, of the 2,700 new reportable events, 1,512 will involve the reporting of new security-based swap transactions, and approximately 1,188 will involve the

⁶⁵⁹ See Regulation SBSR Adopting Release, 80 FR at 14675.

⁶⁶⁰ The Commission notes that it is adopting an amendment to Rule 901(e)(2). Existing Rule 901(e)(2) states in relevant part that a life cycle event must be reported “to the entity to which the original security-based swap transaction was reported” (emphasis added). As amended, Rule 901(e)(2) now states that a life cycle event would have to be reported “to the entity to which the original security-based swap transaction will be reported or has been reported” (emphasis added). This amendment accounts for the possibility that persons with a duty to report a transaction generally may do so up to 24 hours after the time of execution, a registered clearing agency might submit a report of a termination of an alpha to the alpha SDR before the alpha SDR has received the transaction report of the alpha transaction itself. See *supra* Section III(I). The Commission does not believe that this amendment to Rule 901(e)(2) gives rise to any PRA burdens not already accounted for in its analysis of burdens under Rule 901. See *infra* Section XI(B)(2)(b).

⁶⁶¹ See U.S. Activity Proposal, 80 FR at 27504.

⁶⁶² See 80 FR at 14676. The Commission notes that, while the approach for determining the burdens is similar to that used in the Regulation SBSR Adopting Release, the aggregate burden hours for all aspects of Rule 901 differ slightly as a result of these new respondents having to report a different number of reportable events.

reporting of life cycle events under Rule 901(e).⁶⁶³

Based on these estimates, the Commission believes that Rule 901(a) will result in the additional new respondents resulting from amendments to Rule 901(a)(2)(ii)(E), having a total burden of 7.6 hours attributable to the initial reporting of security-based swaps by respondents to registered SDRs under Rules 901(c) and 901(d) over the course of a year.⁶⁶⁴ The Commission further estimates that these respondents will have a total burden of 5.9 hours attributable to the reporting of life cycle events under Rule 901(e) over the course of a year.⁶⁶⁵ Therefore, the Commission believes that the amendments to Rule 901(a)(2)(ii)(E), as adopted herein, will result in a total reporting burden for respondents under Rules 901(c) and (d) along with the reporting of life cycle events under Rule 901(e) of 14 burden hours per year. The Commission believes that many reportable events will be reported through electronic means and that the ratio of electronic reporting to manual reporting is likely to increase over time. The Commission believes that the bulk of the burden hours will be attributable to manually reported transactions.⁶⁶⁶ Thus, respondents that capture and report transactions electronically will likely incur fewer burden hours than

those respondents that capture and report transactions manually.

Based on the foregoing and applying the same calculation methods used in the Regulation SBSR Adopting Release, the Commission estimates that the amendments to Rule 901 proposed in the U.S. Activity Proposal and adopted herein will impose an estimated total first-year burden of approximately 1,362 hours per respondent⁶⁶⁷ for a total first-year burden of 27,240 hours for all additional respondents that will incur the duty to report under the adopted amendments to Rule 901(a)(2)(ii)(E)(1)–(4).⁶⁶⁸ The Commission estimates that the amendments to Rule 901 will impose ongoing annualized aggregate burdens of approximately 655 hours⁶⁶⁹ per respondent for a total aggregate annualized burden of 13,100 hours for those respondents.⁶⁷⁰ The Commission further estimates that the amendments to Rule 901 will impose initial and ongoing annualized dollar cost burdens of \$201,000 per respondent, for total aggregate initial and ongoing annualized dollar cost burdens of \$4,020,000.⁶⁷¹

b. Rule 901—Reporting Obligations for Platforms and Clearing Agencies Resulting From Amendments to Rules 901(a)(1) and (2) and Platforms and Reporting Sides Resulting From Amendments to Rule 901(a)(3)

i. Summary of Collection of Information

In addition to amendments to Rule 901 to assign the duty to report security-based swaps in certain cross-border

situations proposed in the U.S. Activity Proposal, in this release the Commission also is assigning the duty to report security-based swaps that are clearing transactions or are executed on a platform and will be submitted to clearing. To facilitate such reporting, the Commission is adopting amendments to Rules 901(a)(1), (a)(2)(i), and (a)(3). Specifically, under new Rule 901(a)(1), if a security-based swap is executed on a platform and will be submitted to clearing, the platform on which the transaction was executed shall have the duty to report the transaction to a registered SDR. New Rule 901(a)(2)(i) assigns the reporting duty for a clearing transaction to the registered clearing agency that is a counterparty to the security-based swap. New Rule 901(a)(3) requires any person that has a duty to report a security-based swap that is submitted to clearing—which would be a platform or a reporting side—to provide the registered clearing agency with the transaction ID of the alpha and the identity of the registered SDR to which the alpha will be reported or has been reported.

ii. Respondents

The amendments to Rules 901(a)(1) and (a)(2)(i) adopted herein assign reporting duties for security-based swap transactions, in certain enumerated cases set forth in these rules, to platforms and registered clearing agencies, respectively. The Commission estimates that these amendments to Rule 901(a) will result in 14 additional respondents incurring the duty to report under Regulation SBSR: Ten platforms and four registered clearing agencies.⁶⁷² Amended Rule 901(a)(3) will require a person—either the platform upon which the security-based swap was executed or the reporting side for those security-based swaps other than clearing transactions—to report, for those security-based swaps submitted to a registered clearing agency, the transaction ID of the submitted security-based swap and the identity of the registered SDR to which the transaction will be or has been reported. The Commission believes that new Rule 901(a)(3), as amended, will place

⁶⁶³ See U.S. Activity Proposal, 80 FR at 27504. The Commission expects 540 reportable events $(2,700 \times 0.2)$ to be new security-based swap transactions reported by registered broker-dealers, and 972 reportable events to be other new security-based swap transactions that would be required to be reported under the rule $((2,700 - 540) \times 0.45)$, for a total of 1,512 reportable events that are new security-based swap transactions. The remaining 1,188 reportable events $((2,700 - 540) \times 0.55)$ are estimated to be life cycle events reportable under Rule 901(e).

⁶⁶⁴ The Commission calculated the following: $((1,512 \times 0.005) / (20 \text{ respondents})) = 0.38$ burden hours per respondent or 7.6 total burden hours attributable to the initial reporting of security-based swaps. See U.S. Activity Proposal, 80 FR at 27505 (adjusted to reflect revised number of respondents). In the Regulation SBSR Adopting Release, the Commission estimated that it would take approximately 0.005 hours for each security-based swap transaction to be reported. See 80 FR at 14676, n. 1073. See also Regulation SBSR Proposing Release, 75 FR at 75249, n. 195.

⁶⁶⁵ The Commission calculated the following: $((1,188 \times 0.005) / (20 \text{ respondents})) = 0.30$ burden hours per reporting side or 5.9 total burden hours attributable to the reporting of life cycle events under Rule 901(e). See U.S. Activity Proposal, 80 FR at 27505 (adjusted to reflect revised number of respondents). In the Regulation SBSR Adopting Release, the Commission estimated that it would take approximately 0.005 hours for each security-based swap transaction to be reported. See 80 FR at 14676, n. 1073. See also Regulation SBSR Proposing Release, 75 FR at 75249, n. 195.

⁶⁶⁶ See Regulation SBSR Adopting Release, 80 FR at 14676.

⁶⁶⁷ The Commission derived its estimate from the following: (355 hours (one-time hourly burden for establishing an OMS) + 172 hours (one-time hourly burden for establishing security-based swap reporting mechanisms) + 180 hours (one-time hourly burden for compliance and ongoing support) = 707 hours (one-time total hourly burden). See U.S. Activity Proposal, 80 FR at 27505, n. 454 (436 hours (annual ongoing hourly burden for internal order management) + 0.68 hours (revised annual ongoing hourly burden for security-based swap reporting mechanisms as a result of reduced estimate of number of respondents) + 218 hours (annual-ongoing hourly burden for compliance and ongoing support) = 654.7 hours (one-time total hourly burden). See U.S. Activity Proposal, 80 FR at 27505, n. 454 (revised to take into account reduced estimate of number of respondents) (707 one-time hourly burden + 654.7 revised annual-ongoing hourly burden = 1,362 total first-year hourly burden).

⁶⁶⁸ The Commission derived its estimate from the following: (1,362 hours per respondent \times 20 respondents) = 27,240 hours.

⁶⁶⁹ See *supra* note 667.

⁶⁷⁰ The Commission derived its estimate from the following: (655 hours per respondent \times 20 respondents) = 13,100 hours.

⁶⁷¹ The Commission derived its estimate from the following: (\$201,000 per respondent \times 20 respondents) = \$4,020,000. See U.S. Activity Release, 80 FR at 27505 (providing preliminary estimates based on a higher number of respondents). See also Regulation SBSR Adopting Release, 80 FR at 14676, nn. 1066 and 1078.

⁶⁷² The Commission made the same preliminary estimate of the number of respondents resulting from these proposed amendments in the Regulation SBSR Proposed Amendments Release. See 80 FR at 14788.

reporting obligations on 300 reporting sides⁶⁷³ and ten platforms.⁶⁷⁴

iii. Total Initial and Annual Reporting Burdens

(a) Platforms and Registered Clearing Agencies

Pursuant to Rule 901, all security-based swap transactions must be reported to a registered SDR or to the Commission. Together, paragraphs (a), (b), (c), (d), (e), (h), and (j) of Rule 901 set forth the parameters that reporting entities must follow to report security-based swap transactions. Because platforms and registered clearing agencies now have the duty to report, initial and ongoing burdens will be placed on these entities. The Commission continues to believe that these burdens will be a function of, among other things, the number of reportable events and the data elements required to be reported for each such event.

In the Regulation SBSR Adopting Release, the Commission estimated that respondents will face three categories of burdens to comply with Rule 901.⁶⁷⁵ The Commission believes that platforms and registered clearing agencies will face the same categories of burdens as those identified in the Regulation SBSR Adopting Release for other types of respondents. First, each platform and registered clearing agency will likely have to develop the ability to capture the relevant transaction information.⁶⁷⁶

⁶⁷³ As stated above, the Commission has estimated that there would be 300 reporting sides plus the 20 new broker-dealer respondents discussed in Section XI(B)(2)(a), *supra*. See also *supra* note 657.

⁶⁷⁴ Although new Rule 901(a)(2)(ii)(E)(4) requires a registered broker-dealer to report security-based swaps in some circumstances, the Commission believes that registered broker-dealers will not incur duties under Rule 901(a)(3). A registered broker-dealer would incur the reporting duty only if it effects a transaction for unregistered non-U.S. counterparties, neither of which is engaging in ANE activity. If the unregistered non-U.S. direct counterparties have guarantors that would clear the transaction on their behalf, it is likely that one or both of these guarantors would occupy a higher rung on the reporting hierarchy such that the duty would not fall to the registered broker-dealer under Rule 901(a)(2)(ii)(E)(4). Therefore, it is unlikely that a broker-dealer that effects such a transaction would incur the duty under Rule 901(a)(3) to provide the transaction ID and the identity of the alpha SDR to the registered clearing agency.

⁶⁷⁵ See Regulation SBSR Adopting Release, 80 FR at 14675–77.

⁶⁷⁶ In the Regulation SBSR Adopting Release, the Commission discussed the development, by reporting sides, of an internal order and trade management system. See 80 FR at 14675–76. The Commission continues to believe that the costs of developing a transaction processing system are comparable to the costs discussed therein. Although the actual reporting infrastructure needed by platforms and registered clearing agencies could have some attributes that differ from the attributes

Second, each platform and registered clearing agency will have to implement a reporting mechanism. Third, each platform and registered clearing agency will have to establish an appropriate compliance program and support for the operation of any system related to the capture and reporting of transaction information. The Commission continues to believe that platforms and registered clearing agencies will need to develop capabilities similar to those highlighted in the Regulation SBSR Adopting Release in order to be able to capture and report security-based swap transactions. The Commission also continues to believe that, once a platform or registered clearing agency's reporting infrastructure and compliance systems are in place, the burden of reporting each individual reportable event will be small when compared to the burdens of establishing the reporting infrastructure and compliance systems.⁶⁷⁷ The Commission continues to believe that all of the reportable events, for which platforms and registered clearing agencies will be responsible for reporting, will be reported through electronic means.⁶⁷⁸

In the Regulation SBSR Adopting Release, the Commission estimated that the total burden placed upon reporting sides as a result of existing Rule 901 will be approximately 1,361 hours⁶⁷⁹

of an internal order and trade management system, the Commission nonetheless believes that the cost of implementing a transaction processing system, and establishing an appropriate compliance program and support for the operation of the system, will be similar to the costs for reporting sides discussed in the Regulation SBSR Adopting Release.

⁶⁷⁷ In the Regulation SBSR Adopting Release, the Commission reiterated its belief that reporting specific security-based swap transactions to a registered SDR—separate from the establishing of infrastructure and compliance systems that support reporting—will impose an annual aggregate cost of approximately \$5,400,000. See 80 FR at 14675–77.

⁶⁷⁸ As a result of the amendment to Rule 901(h) adopted herein, which replaces “reporting side” with “person having the duty to report,” all persons who have a duty to report under Regulation SBSR must electronically transmit the information required by Rule 901 in a format required by the registered SDR. The Commission believes that the infrastructure build described above will necessarily include the ability to electronically transmit to a registered SDR the information required by Rule 901, such that any burdens resulting from the amendment to Rule 901(h) are included within the Rule 901 burdens for persons with the duty to report that are not reporting sides.

⁶⁷⁹ The Commission derived its estimate from the following: (355 hours (one-time hourly burden for establishing an OMS) + 172 hours (one-time hourly burden for establishing security-based swap reporting mechanisms) + 180 hours (one-time hourly burden for compliance and ongoing support) = 707 hours (one-time total hourly burden). See Regulation SBSR Proposed Amendments Release, 80 FR at 14789, n. 298 (436 hours (annual ongoing hourly burden for internal order management) + 218 hours (annual-ongoing hourly burden for

per reporting side during the first year,⁶⁸⁰ before taking into account the reporting of individual reportable events. The Commission believes that the per-entity cost will be comparable for platforms and registered clearing agencies, resulting in a total first-year burden of 1,361 hours and an annual burden of 654 hours for each platform and registered clearing agency, before taking into account the reporting of individual reportable events, under new Rules 901(a)(1) and (a)(2)(i), as adopted herein.

In the Regulation SBSR Adopting Release, the Commission estimated that there will be approximately 3 million reportable events per year under Rule 901, of which approximately 2 million will consist of uncleared transactions (*i.e.*, those transactions that will be reported by a reporting side).⁶⁸¹ In the Regulation SBSR Adopting Release, the Commission did not assign reporting duties for the remaining 1 million annual reportable events, which consist of platform-executed alphas, clearing transactions, and any life cycle events pertaining to these two types of transactions.

In this release, the Commission is adopting amendments to Rule 901 that assign the reporting duty for these 1 million reportable events to platforms and registered clearing agencies. The Commission estimates that, of the 1 million reportable events, approximately 370,000 will be new security-based swap transactions.⁶⁸² Of these 370,000 new transactions, the Commission estimates that platforms will be responsible for reporting approximately one-third, or 120,000, of them.⁶⁸³ The Commission estimates that the amendments to Rule 901(a) will result in platforms having a total burden of 600 hours attributable to the reporting of security-based swaps under Rule 901 over the course of a year, or 60 hours per platform.⁶⁸⁴

compliance and ongoing support) = 654 hours (one-time total hourly burden. See *id.* (707 one-time hourly burden + 654 revised annual-ongoing hourly burden = 1,361 total first-year hourly burden).

⁶⁸⁰ See Regulation SBSR Adopting Release, 80 FR at 14675–77.

⁶⁸¹ See *id.*

⁶⁸² See Regulation SBSR Amendments Proposing Release, 80 FR at 14777, n. 235.

⁶⁸³ Since only platform-executed security-based swaps that will be submitted to a registered clearing agency for clearing are subject to this release, platforms are not responsible for any life cycle event reporting under Rule 901(e). See Regulation SBSR Amendments Proposing Release, 80 FR at 14777.

⁶⁸⁴ The Commission calculates the following: $((120,000 \times 0.005) / (10 \text{ platforms})) = 60$ burden hours per platform or 600 total burden hours attributable to the reporting of security-based swaps. See Regulation SBSR Proposed

The Commission estimates that registered clearing agencies will be responsible for reporting 880,000 reportable events.⁶⁸⁵ These reportable events consist of 250,000 initial security-based swaps along with 630,000 life cycle events. The Commission estimates that the amendments to Rule 901(a) will result in registered clearing agencies having a total burden of 1,250 hours attributable to the reporting of new security-based swaps to registered SDRs over the course of a year, or 312.5 hours per registered clearing agency.⁶⁸⁶ The Commission estimates that the amendments to Rule 901(a) will result in registered clearing agencies having a total burden of 3,150 hours attributable to the reporting of life cycle events to registered SDRs under Rule 901(e) over the course of a year, or 787.5 hours per registered clearing agency.⁶⁸⁷ The Commission continues to believe that the amendments will result in a total reporting burden for registered clearing agencies under Rules 901(c) and 901(d) along with the reporting of life cycle events under Rule 901(e) of 4,400 burden hours, or 1,100 hours per registered clearing agency.⁶⁸⁸ The

Amendments Release, 80 FR at 14789–90. In the Regulation SBSR Proposing Release, the Commission estimated that it would take approximately 0.005 hours for each security-based swap transaction to be reported. See 75 FR at 75249, n. 195.

⁶⁸⁵ As is discussed above, the Commission estimates that platforms will be responsible for reporting only approximately 120,000 of the 1 million new reportable events and registered clearing agencies will be responsible for reporting the remainder.

⁶⁸⁶ The Commission calculates the following: $((250,000 \text{ security-based swaps} \times 0.005 \text{ hours per security-based swap}) / (4 \text{ registered clearing agencies})) = 312.5 \text{ burden hours per registered clearing agency}$ or 1,250 total burden hours attributable to the reporting of such security-based swaps. See Regulation SBSR Proposed Amendments Release, 80 FR at 14789–90. In the Regulation SBSR Proposing Release, the Commission estimated that it would take approximately 0.005 hours for each security-based swap to be reported. See 75 FR at 75249, n. 195.

⁶⁸⁷ The Commission calculates the following: $((630,000 \text{ security-based swaps} \times 0.005 \text{ hours per security-based swap}) / (4 \text{ registered clearing agencies})) = 787.5 \text{ burden hours per registered clearing agency}$ or 3,150 total burden hours attributable to the reporting of life cycle events under Rule 901(e). See Regulation SBSR Proposed Amendments Release, 80 FR at 14789–90. In the Regulation SBSR Proposing Release, the Commission estimated that it would take approximately 0.005 hours for each security-based swap to be reported. See 75 FR at 75249, n. 195.

⁶⁸⁸ As is discussed immediately above, the Commission believes that registered clearing agencies would incur a burden of 1,250 hours attributable to the reporting of security-based swaps pursuant to Rule 901(a)(2)(i) along with a burden of 3,150 hours attributable to the reporting of life cycle events under Rule 901(e). As discussed in note 683, *supra*, a platform is not responsible for the reporting of any life cycle events of any

Commission believes that all reportable events that will be reported by platforms and registered clearing agencies pursuant to these amendments will be reported through electronic means.

The Commission estimates that the amendments to Rule 901 will impose ongoing annualized aggregate burdens of approximately 714 hours per platform⁶⁸⁹ for a total aggregate annualized burden of 7,140 hours for all platforms.⁶⁹⁰ The Commission further believes that the first year burden on platforms will be 1,421 burden hours per platform⁶⁹¹ for a total first year burden of 14,210 burden hours for all platforms.⁶⁹² The Commission further estimates that the amendments to Rule 901 will impose initial and ongoing annualized dollar cost burdens of \$201,000 per platform,⁶⁹³ for total aggregate initial and ongoing annualized dollar cost burden of \$2,010,000.⁶⁹⁴

The Commission estimates that the amendments to Rule 901 will impose ongoing annualized aggregate burdens of approximately 1,754 hours per registered clearing agency⁶⁹⁵ for a total aggregate annualized burden of 7,016 hours for all registered clearing agencies.⁶⁹⁶ The Commission further believes that the first year burden on registered clearing agencies will be 2,461 burden hours per registered clearing agency⁶⁹⁷ for a total first year

platform-executed security-based swap that will be submitted to clearing.

⁶⁸⁹ As discussed above, the Commission believes that platforms will incur a burden of 654 hours per year (before taking into account individual transaction reporting) plus a transaction reporting burden of 60 hours per year resulting in a total annual burden per platform of 714 burden hours.

⁶⁹⁰ The Commission derived its estimate from the following: $(714 \text{ hours per platform} \times 10 \text{ platforms}) = 7,140 \text{ hours}$.

⁶⁹¹ As discussed above, the Commission believes that platforms will incur an initial burden of 707 hours plus an annual burden of 714 hours for a total burden of 1,421 per platform.

⁶⁹² The Commission derived its estimate from the following: $(1,421 \text{ hours per platform} \times 10 \text{ platforms}) = 14,210 \text{ hours}$.

⁶⁹³ See Regulation SBSR Proposed Amendments Release, 80 FR at 14789, n. 303 (these burdens reflect the dollar costs of hardware and software related expenses, including necessary back-up and redundancy, per SDR connection, for two SDR connections, along with cost of storage capacity, reduced to account only for platforms).

⁶⁹⁴ The Commission derived its estimate from the following: $(\$201,000 \text{ per reporting person} \times 10 \text{ platforms}) = \$2,010,000$.

⁶⁹⁵ As discussed above, the Commission believes that registered clearing agencies will incur a burden of 654 hours per year (before taking into account individual transaction reporting) plus a transaction reporting burden of 1,100 hours per year resulting in a total annual burden of 1,754 burden hours.

⁶⁹⁶ The Commission derived its estimate from the following: $(1,754 \text{ hours per registered clearing agency} \times 4 \text{ registered clearing agencies}) = 7,016 \text{ hours}$.

⁶⁹⁷ As discussed above, the Commission believes that platforms will incur an initial burden of 707

burden of 9,844 burden hours for all registered clearing agencies.⁶⁹⁸ The Commission further estimates that the amendments to Rule 901 will impose initial and ongoing annualized dollar cost burdens of \$401,000 per registered clearing agency,⁶⁹⁹ for total aggregate initial and ongoing annualized dollar cost burden of \$1,604,000.⁷⁰⁰

The Commission recognizes that some entities that will qualify as platforms or registered clearing agencies may have already spent time and resources building the infrastructure that will support their eventual reporting of security-based swaps. The Commission notes that, as a result, the burdens and costs estimated herein could be greater than those actually incurred by affected parties as a result of compliance with the amendments to Rule 901(a). Nonetheless, the Commission believes that its estimates represent a reasonable approach to estimating the paperwork burdens associated with the amendments to Rule 901(a).

(b) Rule 901(a)(3) Burdens

Rule 901(a)(3), as adopted herein, requires a person who has the duty to report an alpha security-based swap to promptly provide the registered clearing agency to which the alpha has been submitted the transaction ID of the submitted security-based swap and the identity of the registered SDR to which the transaction will be or has been

hours plus an annual burden of 1,754 hours for a total burden of 2,461 per registered clearing agency.

⁶⁹⁸ The Commission derived its estimate from the following: $(2,461 \text{ hours per registered clearing agency} \times 4 \text{ registered clearing agencies}) = 9,844 \text{ hours}$.

⁶⁹⁹ See Regulation SBSR Proposed Amendments Release, 80 FR at 14789, n. 303 (reduced to account only for registered clearing agencies). The Commission estimates that a registered clearing agency, as a result of newly adopted Rule 901(e)(1)(ii), might have to establish connectivity to an alpha SDR, to which it might not otherwise establish connectivity. Accordingly, the Commission estimates that each registered clearing agency will connect to four registered SDRs. The Commission derived the total estimated expense for registered clearing agencies as $(\$100,000 \text{ hardware- and software-related expenses, including necessary backup and redundancy, per SDR connection}) \times (4 \text{ SDR connections per registered clearing agency}) + (\$1,000 \text{ cost of storage capacity}) = \$401,000 \text{ per registered clearing agency}$. See Regulation SBSR Proposed Amendments Release, 80 FR at 14776 (estimating the hardware- and software-related expenses per SDR connection at \$100,000). This estimate assumes that the systems required to establish connectivity to a registered SDR to meet requirements under Rule 901(e)(1)(ii) are similar to those required by reporting sides to meet regulatory reporting requirements. To the extent that a registered clearing agency is able to utilize a limited purpose connection to report only the information required by Rule 901(e)(1)(ii), the cost of establishing such a connection could be less.

⁷⁰⁰ The Commission derived its estimate from the following: $(\$401,000 \text{ per registered clearing agency} \times 4 \text{ registered clearing agencies}) = \$1,604,000$.

reported. Entities that report alphas to registered SDRs also will already have established the infrastructure needed to submit security-based swaps to a registered clearing agency that acts as a central counterparty; this connectivity to a registered clearing agency is not required by Regulation SBSR. Rule 901(a)(3) will require the person who reports the alpha to a registered SDR to provide the registered clearing agency two additional data elements—the transaction ID of the alpha and the identity of the alpha SDR—along with all of the other transaction information that must be submitted to clear the transaction. The Commission estimates that the additional one-time burden related to the development of the ability to capture and submit these two additional data elements will be 10 burden hours per respondent and the additional one-time burden related to the implementation of a reporting mechanism will be 6 burden hours per respondent.⁷⁰¹ The Commission estimates that the additional ongoing burden related to the ability to capture the additional specific data elements required by amended Rule 901(a)(3) will be 10 burden hours and the additional ongoing burden related to the maintenance of the reporting mechanism will be 2 burden hours, per platform and reporting side.⁷⁰²

(c) Bunched Order Executions and Allocations

Bunched order executions and the security-based swaps that result from their allocation are types of security-based swaps that must be reported pursuant to Rule 901(a). In the Regulation SBSR Adopting Release, the

⁷⁰¹ The Commission estimates that the additional burdens related to programming systems to allow for the reporting of the additional data fields will be: [(Sr. Programmer (5 hours) + Sr. Systems Analyst (5 hours)) = 10 burden hours (development of the ability to capture transaction information); (Sr. Programmer (3 hours) + Sr. Systems Analyst (3 hours)) = 6 burden hours (implementation of reporting mechanism)]. The total one-time burden associated with Rule 901(a)(3) will be 16 burden hours per respondent for a total one-time burden of 4,960 hours (16 × 310 (i.e., 300 reporting sides + 10 platforms)). See Regulation SBSR Proposed Amendments Release, 80 FR at 14790, n. 315.

⁷⁰² The Commission estimates that the additional burdens related to the reporting of these additional data fields will be: [(Sr. Programmer (5 hours) + Sr. Systems Analyst (5 hours)) = 10 burden hours (maintenance of transaction capture system); (Sr. Programmer (1 hour) + Sr. Systems Analyst (1 hour)) = 2 burden hours (maintenance of reporting mechanism)]. The total ongoing burden associated with amended Rule 901(a) will be 12 burden hours per platform and reporting side for a total ongoing burden of 3,720 hours (12 × 310 (i.e., 300 reporting sides + 10 platforms)). For the Commission's preliminary estimate of the burdens associated with Rule 901(a)(3), see Regulation SBSR Proposed Amendments Release, 80 FR at 14790, n. 316.

Commission provided guidance regarding how Regulation SBSR applies to uncleared bunched order executions and the security-based swaps that result from their allocation.⁷⁰³ In Section VI, *supra*, the Commission provides guidance regarding how Regulation SBSR applies to bunched order executions that will be submitted to clearing and the security-based swaps that result from the allocation of any bunched order execution, if the resulting security-based swaps are cleared.

This guidance does not increase the number of respondents under Regulation SBSR or increase the burdens for any respondent.⁷⁰⁴ The estimates of the number of reportable events provided by the Commission in the Regulation SBSR Adopting Release included bunched order executions and the security-based swaps that result from their allocation. Thus, there are no burdens associated with this guidance that the Commission has not already taken into account.

(d) Prime Brokerage Transactions

In the Regulation SBSR Proposed Amendments Release, the Commission set forth the application of Regulation SBSR to a prime brokerage transaction involving three security-based swap legs. In Section VII(B)(2), *supra*, the Commission supplements its views to account for cases where the documentation among the relevant market participants provides for a two-legged structure rather than a three-legged structure. Since the Commission's initial estimates of the number of reportable events provided for the reporting of all legs of a prime brokerage transaction,⁷⁰⁵ those estimates assumed that prime brokerage transactions involved a three-legged structure. In light of the possibility that some prime brokerage transactions may involve only two legs, the Commission may have overestimated the total number of reportable events arising from prime brokerage transactions. However, because prime brokerage transactions are unlikely to represent a significant percentage of reportable events, the Commission continues to believe that its previous estimate of reportable events is reasonable.⁷⁰⁶

⁷⁰³ See 80 FR at 14626–27.

⁷⁰⁴ For the Commission's preliminary estimate of the burdens associated with this guidance, see Regulation SBSR Proposed Amendments Release, 80 FR at 14790.

⁷⁰⁵ See Regulation SBSR Proposed Amendments Release, 80 FR at 14785, n. 276.

⁷⁰⁶ Combining the Commission's estimates in the Regulation SBSR Adopting Release and this release, the Commission believes that there will be

3. Rule 901—Aggregate Total PRA Burdens and Costs

Based on the foregoing, the Commission estimates the following aggregate total PRA burdens and costs, by category of entity, resulting from Rule 901, as contained in the Regulation SBSR Adopting Release and as amended in this release.

a. For Platforms

As discussed in Section XI(B)(2)(b)(iii)(a), *supra*, the Commission estimates that the hourly burden resulting from the amendments to Rule 901(a)(1) on platforms would be 1,421 hours in the first year and 714 hours annually thereafter, per platform. The Commission further estimates that the annual dollar cost of the amendments will be \$201,000. The Commission also estimates that the hourly burden resulting from the amendments to Rule 901(a)(3) on platforms will be 28 hours in the first year and 12 hours annually thereafter, per platform. In aggregate, the Commission estimates that the amendments to Rule 901 will result in a first year burden 1,449 hours per platform for a total first year hourly burden of 14,490 hours. The Commission further estimates that the annual aggregate burden resulting from the amendments to Rule 901 will be 726 hours per platform, for a total annual hourly burden of 7,260 hours. Finally, the Commission estimates that the annual dollar cost of the amendments will be \$201,000 per platform, for a total annual dollar cost of \$2,010,000.

b. For Registered Clearing Agencies

As discussed in Section XI(B)(2)(b)(iii)(a), *supra*, the Commission estimates that the hourly burden resulting from the amendments to Rule 901(a)(2) on registered clearing agencies will be 2,461 hours in the first year and 1,754 hours annually thereafter, per registered clearing agency. The Commission estimates that the total hourly burden on all registered clearing agencies will be 9,844 in the first year and 7,016 annually thereafter. The Commission further estimates that the annual dollar cost of the amendments will be \$401,000 per registered clearing agency, or \$1,604,000 for all registered clearing agencies.

approximately 3 million reportable events per year under Rules 901 and 905. Two million of those reportable events were required to be reported pursuant to provisions adopted in the Regulation SBSR Adopting Release, and 1 million are required to be reported by amendments adopted herein. See *supra* Section XI(B)(2)(a)(iv).

c. For New Broker-Dealer Respondents

The Commission believes that, as a result of amendments to Rule 901(a)(2)(ii)(E) adopted herein, there will be 20 new broker-dealer respondents who will incur reporting responsibilities, and that they will incur first-year burdens of 1,362 hours. The Commission further believes that these new respondents will incur annual burdens of 655 hours each year thereafter. In addition, the Commission believes that these new respondents will incur annual costs of \$201,000.

d. For Reporting Sides

In the Regulation SBSR Adopting Release, the Commission estimated that reporting sides will incur a first-year burden of 1,394 hours per reporting side and an hourly burden of 687 hours annually thereafter.⁷⁰⁷ As a result of the amendments to Rule 901(a)(3) adopted herein, the Commission believes that these burdens will increase. The Commission believes that reporting sides will have a new first-year burden of 1,422 hours per reporting side,⁷⁰⁸ or 426,600 hours for all reporting sides.⁷⁰⁹ The Commission further estimates that reporting sides will have a new annual burden after the first year of 699 hours per reporting side,⁷¹⁰ or 209,700 hours for all reporting sides.⁷¹¹ The Commission also believes that the annual dollar cost of Rule 901 to reporting sides will remain unchanged at \$201,000 per reporting side, or \$60,300,000 for all reporting sides.

C. Correction of Errors in Security-Based Swap Information—Rule 905

1. Existing Rule 905

Existing Rule 905 sets out a process for correcting errors in reported and disseminated security-based swap information. Under Rule 905(a)(1), where a counterparty that was not on the reporting side for a security-based swap transaction discovers an error in the information reported with respect to such security-based swap, that

⁷⁰⁷ See Regulation SBSR Adopting Release, 80 FR at 14676.

⁷⁰⁸ The Commission estimates the new first year burden as follows: (1,394 hours (original burden resulting from previously adopted rules) + 28 hours (burden resulting from amendments to Rule 901(a)(3))) = 1,422 hours.

⁷⁰⁹ The Commission estimates the new aggregate burden as follows: (1,422 hours × 300 reporting sides) = 426,600 hours.

⁷¹⁰ The Commission estimates the new annual burden as follows: (687 hours (original burden resulting from previously adopted rules) + 12 hours (burden resulting from amendments to Rule 901(a)(3))) = 699 hours.

⁷¹¹ The Commission estimates the new aggregate burden as follows: (699 hours × 300 reporting sides) = 209,700 hours.

counterparty must promptly notify the reporting side of the error. Under existing Rule 905(a)(2), where a reporting side for a security-based swap transaction discovers an error in the information reported with respect to a security-based swap, or receives notification from its counterparty of an error, the reporting side must promptly submit to the entity to which the security-based swap was originally reported an amended report pertaining to the original transaction. An amended report must be submitted to a registered SDR in a manner consistent with the policies and procedures of the registered SDR required pursuant to Rule 907(a)(3).

Existing Rule 905(b) sets forth the duties of a registered SDR relating to corrections. If the registered SDR either discovers an error in a transaction on its system or receives notice of an error from a reporting side, the registered SDR must verify the accuracy of the terms of the security-based swap and, following such verification, promptly correct the erroneous information contained in its system. Rule 905(b)(2) further requires that, if such erroneous information relates to a security-based swap that the registered SDR previously disseminated and falls into any of the categories of information enumerated in Rule 901(c), the registered SDR must publicly disseminate a corrected transaction report of the security-based swap promptly following verification of the trade by the counterparties, with an indication that the report relates to a previously disseminated transaction.

In the Regulation SBSR Adopting Release, the Commission estimated that Rule 905(a) will impose an initial, one-time burden associated with designing and building a reporting side's reporting system to be capable of submitting amended security-based swap transactions to a registered SDR. The Commission further estimated that Rule 905(a) will impose on all reporting sides an initial (first-year) aggregate burden of 15,015 hours, which is 50.0 burden hours per reporting side,⁷¹² and an ongoing aggregate annualized burden of 7,035 hours, which is 23.5 burden hours per reporting side.⁷¹³

With regard to non-reporting-side participants, the Commission estimated in the Regulation SBSR Adopting Release that Rule 905(a) will impose an initial and ongoing burden associated with promptly notifying the reporting side after discovery of an error as

⁷¹² See Regulation SBSR Adopting Release, 80 FR at 14681–83.

⁷¹³ See *id.*

required under Rule 905(a)(1).⁷¹⁴ The Commission estimated that the annual burden will be 998,640 hours, which corresponds to 208.05 burden hours per non-reporting-side participant.⁷¹⁵

Existing Rule 905(b) requires a registered SDR to develop protocols regarding the reporting and correction of erroneous information. In the Regulation SBSR Adopting Release, the Commission noted that the rules adopted in the SDR Adopting Release generally require a registered SDR to have the ability to collect and maintain security-based swap transaction reports and update relevant records and, in light of these broader duties, that the burdens imposed by Rule 905(b) on a registered SDR will represent only a minor extension of these main duties.⁷¹⁶ The Commission also stated that a registered SDR must have the capacity to disseminate additional, corrected security-based swap transaction reports pursuant to Rule 902. The Commission concluded that the burdens on registered SDRs associated with Rule 905—including systems development, support, and maintenance—are addressed in the Commission's analysis of those other rules and, thus, that Rule 905(b) imposes only an incremental additional burden on registered SDRs.⁷¹⁷

The Commission estimated in the Regulation SBSR Adopting Release that the initial (first-year) aggregate annualized burden on registered SDRs under Rule 905 will be 21,900 burden hours, which corresponds to 2,190 burden hours for each registered SDR.⁷¹⁸ The Commission further estimated that the ongoing aggregate annualized burden on registered SDRs under Rule 905 will be 14,600 burden hours, which corresponds to 1,460 burden hours for each registered SDR.⁷¹⁹

⁷¹⁴ See *id.*

⁷¹⁵ This figure was based on the Commission's estimate of (1) 4,800 non-reporting-side participants; and (2) one transaction per day per non-reporting-side participant. The Commission noted that the burdens of Rule 905 on reporting sides and non-reporting-side participants will be reduced to the extent that complete and accurate information is reported to registered SDRs in the first instance pursuant to Rule 901. See *id.*

⁷¹⁶ See *id.*

⁷¹⁷ The Commission estimated that developing and publicly providing the necessary procedures will impose on each registered SDR an initial one-time burden of approximately 730 burden hours, and that to review and update such procedures on an ongoing basis will impose an annual burden on each registered SDR of approximately 1,460 burden hours. See *id.*

⁷¹⁸ See *id.* at 14682, n. 1130–32.

⁷¹⁹ See *id.*, nn. 1131, 1133.

2. Amendments to Rule 905

In this release, the Commission is adopting amendments to Rule 905 that broaden the scope and increase the number of respondents that will incur duties under the rule. These amendments will not increase the number of registered SDRs that are respondents to the rule or increase the burdens on SDRs.

Certain provisions of Rule 905 of Regulation SBSR contain “collection of information requirements” within the meaning of the PRA. The title of these collections are: (a) “Rule 905—Correction of Errors in Security-Based Swap Information—For New Broker-Dealer Respondents”; (b) “Rule 901—Correction of Errors in Security-Based Swap Information—For Platforms”; and (c) “Rule 901—Correction of Errors in Security-Based Swap Information—For Registered Clearing Agencies.”

a. Summary of Collection of Information

Rule 905, as adopted in the Regulation SBSR Adopting Release, imposes duties on: (1) Non-reporting sides, to inform the reporting side if the non-reporting side discovers an error; (2) reporting sides, to correct the original transaction report if the reporting side discovers an error or is notified of an error by the non-reporting side; and (3) registered SDRs, upon discovery of an error or receipt of a notice of an error, to verify the accuracy of the terms of the security-based swap and, following such verification, correcting the record and, if necessary, publicly disseminating a corrected transaction report. The amendments to Rule 905, as adopted herein, do not alter the basic duties under Rule 905 but instead are designed to account for the fact that a person other than a side might, under other amendments adopted herein, have the duty to report the initial transaction. Thus, Rule 905, as amended herein, requires non-reporting sides to notify “the person having the duty to report the security-based swap” of the error (not “the reporting side”), and “the person having the duty to report the security-based swap” (not “the reporting side”) must correct the original transaction report if such person discovers an error or is notified of an error by a non-reporting side.

The amendments to Rule 905 adopted herein do not alter the nature of the duties incurred by registered SDRs. However, amendments to other parts of Regulation SBSR adopted herein will increase the number of security-based swap transactions that must be reported to a registered SDR. Because the

Commission assumes that some number of those transactions will be reported with errors and will have to be corrected pursuant to Rule 905, these other amendments will indirectly increase the burdens imposed on registered SDRs by Rule 905(b), because registered SDRs will have to correct the records for more transactions (and, in appropriate cases, disseminate more corrected transaction reports). These amendments also will increase the number of non-reporting sides and “persons having the duty to report the security-based swap” who will incur duties under Rule 905(a).

b. Respondents

The Commission previously estimated that Rule 905, as adopted in the Regulation SBSR Adopting Release, will have the following respondents: 300 reporting sides that incur the duty to report security-based swap transactions pursuant to existing Rule 901 and thus might incur duties to submit error corrections to registered SDRs under Rule 905(a)(2); up to 4,800 participants of one or more SDRs (or non-reporting sides) that might incur duties under Rule 905(a)(1); and ten registered SDRs that might incur duties under Rule 905(b).⁷²⁰

As a result of various amendments being adopted today, the Commission estimates that ten platforms, four registered clearing agencies, and 20 new broker-dealers respondents (exclusive of SB SEFs) also will incur duties under Rule 905(a)(2), because these entities will incur the duty to report initial transactions and thus will likely have to report some error corrections. The Commission’s estimates of the number of reporting sides (300), non-reporting sides (4,800), and registered SDRs (10) that will be respondents of Rule 905 remain unchanged. However, the Commission now believes that four registered clearing agencies, ten platforms, and 20 new broker-dealer respondents will also like have to report some error corrections.

c. Total Initial and Annual Reporting Burdens

i. New Broker-Dealer Respondents

In the U.S. Activity Proposal, the Commission preliminarily estimated that the incremental burden imposed on registered broker-dealers to comply with the error reporting requirements of Rule 905 would be equal to 5% of the one-time and annual burdens associated with designing and building the reporting infrastructure necessary for reporting transactions under Rule 901, plus 10% of the corresponding one-time

and annual burdens associated with developing the reporting side’s overall compliance program required under Rule 901.⁷²¹ The Commission preliminarily estimated that the new broker-dealer respondents would incur, as a result of Rule 905(a), an initial (first-year) burden of 48.4 burden hours per respondent, and an ongoing annual burden of 21.8 burden hours. Based on additional information available to the Commission, the Commission now estimates that, as a result of amendments to Rule 901(a)(2)(ii)(E), there will be only 20 new broker-dealer respondents who will be required to report transactions and other reportable events. These new broker-dealer respondents will have error correction duties similar to reporting sides; the Commission believes, therefore, that respondent broker-dealers will incur burdens similar to reporting sides under Rule 905(a). The Commission estimates that these 20 new broker-dealer respondents will each incur an initial (first-year) 48.4 burden hours per respondent,⁷²² and an annualized burden of 21.8 burden hours per respondent,⁷²³ which remain unchanged from the Commission’s preliminary estimates in the Regulation SBSR Proposed Amendments Release.

ii. For Platforms and Registered Clearing Agencies

The Commission is applying the same methodology for calculating the burdens of error reporting by reporting sides to calculating the burdens of error reporting by platforms, under the amendments to Rule 905(a). However, the Commission believes that, on average, a platform will be reporting a greater number of reportable events than, on average, a reporting side. As a result, the Commission believes that a platform will likely be required to report more error corrections than an average reporting side, so the burdens imposed

⁷²¹ See 80 FR at 27506.

⁷²² This figure is calculated as follows: $(((172 \text{ burden hours for one-time development of reporting system}) \times (0.05)) + ((0.68 \text{ burden hours annual maintenance of reporting system}) \times (0.05)) + ((180 \text{ burden hours one-time compliance program development}) \times (0.1)) + ((218 \text{ burden hours annual support of compliance program}) \times (0.1))) \times (20 \text{ respondents}) = 48.4 \text{ burden hours per new broker-dealer respondent. See supra nn. 667 and 668 for the discussion of estimates of the burden hours for annual maintenance of the reporting system for these new broker-dealer respondents.}$

⁷²³ This figure is calculated as follows: $(((0.68 \text{ burden hours annual maintenance of reporting system}) \times (0.05)) + ((218 \text{ burden hours annual support of compliance program}) \times (0.1))) = 21.8 \text{ burden hours per new broker-dealer respondent. See supra nn. 667 and 668 for the discussion of estimates of the burden hours for annual maintenance of the reporting system for these new broker-dealer respondents.}$

⁷²⁰ See 80 FR at 14681.

by Rule 905(a) on a platform will likely be greater than the average burden imposed by Rule 905(a) on a reporting side. Thus, for platforms, the Commission estimates that the amendments to Rule 905(a) will impose an initial (first-year) burden of 51.4 hours per platform,⁷²⁴ and an ongoing annualized burden of 24.8 hours per platform.⁷²⁵

The Commission also believes that this methodology is applicable to the error reporting that will be done by registered clearing agencies as a result of the amendments to Rule 905(a).⁷²⁶ However, because registered clearing agencies will be responsible for a large number of reportable events, they will likely be required to report more error corrections. As a result, the burdens imposed by Rule 905(a) on registered clearing agencies will be greater. Thus, for registered clearing agencies, the Commission estimates that the amendments to Rule 905(a) will impose

⁷²⁴ See Regulation SBSR Proposed Amendments Release, 80 FR at 14794. This figure is calculated as follows: $[(172 \text{ burden hours for one-time development of reporting system}) \times (0.05)] + [(60 \text{ burden hours annual maintenance of reporting system}) \times (0.05)] + [(180 \text{ burden hours one-time compliance program development}) \times (0.1)] + [(218 \text{ burden hours annual support of compliance program}) \times (0.1)] = 51.4 \text{ burden hours per platform}$. See *supra* note 679 for the discussion of estimates of the burden hours for annual maintenance of the reporting system for platforms. The Commission notes that the Regulation SBSR Proposed Amendments Release inadvertently used 33 burden hours to represent annual maintenance of the reporting system. The correct figure should have been 60 burden hours for the annual maintenance of the reporting system. As a result, the Commission preliminarily estimated a first-year burden, as a result of proposed amendments to Rule 905(a), of 50 hours instead of the correct first-year burden of 51.4 hours. See *supra* note 684 (calculating the annual reporting burden used to determine the annual maintenance burden of the reporting system).

⁷²⁵ See Regulation SBSR Proposed Amendments Release, 80 FR at 14794. This figure is calculated as follows: $[(60 \text{ burden hours annual maintenance of reporting system}) \times (0.05)] + [(218 \text{ burden hours annual support of compliance program}) \times (0.1)] = 24.8 \text{ hours per platform}$. See *supra* note 679 for the discussion of estimates of the burden hours for annual maintenance of the reporting system for platforms. The Commission notes that the Regulation SBSR Proposed Amendments Release inadvertently used 33 burden hours to represent annual maintenance of the reporting system. The correct figure should have been 60 burden hours for the annual maintenance of the reporting system. As a result, the Commission originally estimated an annual ongoing burden, as a result of amendments to Rule 905(a), of 23.5 hours instead of the correct first-year burden of 24.8 hours.

⁷²⁶ In the Regulation SBSR Proposed Amendments Release, the Commission did not include estimates for the burdens that would be imposed on registered clearing agencies for the reporting of errors under Rule 905(a). Upon further review, the Commission recognizes that registered clearing agencies will be required to report error corrections under Rule 905(a). As a result, the Commission has provided estimates of such burdens herein.

an initial (first-year) burden of 153.4 hours per registered clearing agency,⁷²⁷ and an ongoing annualized burden of 76.8 hours per registered clearing agency.⁷²⁸

iii. For Non-Reporting Sides

For non-reporting sides, the Commission estimated in the Regulation SBSR Adopting Release that the annual burden (first-year and each subsequent year) will be 998,640 hours, which corresponds to 208.05 burden hours per non-reporting-side participant.⁷²⁹ As a result of the amendments adopted herein, there will be more transactions reported to registered SDRs (*i.e.*, clearing transactions and platform-executed transactions that will be submitted to clearing) and thus more transactions that in theory could have errors. If a non-reporting side were to discover any such error, it would incur an obligation under Rule 905(a)(1) to notify the person with the initial duty to report (*i.e.*, the platform or registered clearing agency, as applicable) of the error. The Commission believes, however, that the expansion of Regulation SBSR to include clearing transactions and platform-executed transactions that will be submitted to clearing will not impact non-reporting sides under Rule 905(a)(1). Such transactions will likely be in standardized security-based swap products that occur electronically pursuant to the rules of such entities. Errors, when they occur, will mostly likely be observed and corrected by the platforms or registered clearing agencies

⁷²⁷ This figure is calculated as follows: $[(172 \text{ burden hours for one-time development of reporting system}) \times (0.05)] + [(1100 \text{ burden hours annual maintenance of reporting system}) \times (0.05)] + [(180 \text{ burden hours one-time compliance program development}) \times (0.1)] + [(218 \text{ burden hours annual support of compliance program}) \times (0.1)] = 153.4 \text{ burden hours per registered clearing agency}$. See also Regulation SBSR Adopting Release, 80 FR at 14681–83 (describing the manner in which similar burdens were calculated for reporting sides). See *supra* note 679 (discussing estimates of the burden hours for annual maintenance of the reporting system for registered clearing agencies).

⁷²⁸ This figure is calculated as follows: $[(1100 \text{ burden hours annual maintenance of reporting system}) \times (0.05)] + [(218 \text{ burden hours annual support of compliance program}) \times (0.1)] = 76.8 \text{ hours per registered clearing agency}$. See also Regulation SBSR Adopting Release, 80 FR at 14681–83 (describing the manner in which similar burdens were calculated for reporting sides). See *supra* note 679 for the discussion of estimates of the burden hours for annual maintenance of the reporting system for platforms.

⁷²⁹ This figure is based on the following: $[(1 \text{ error notifications per non-reporting-side participant per day}) \times (365 \text{ days/year}) \times (\text{Compliance Clerk at } 0.5 \text{ hours/report}) \times (4,800 \text{ non-reporting-side participants})] = 998,640 \text{ burden hours}$, which corresponds to 208.05 burden hours per non-reporting-side participant. See Regulation SBSR Adopting Release, 80 FR at 14681–83.

themselves. Therefore, the Commission believes that the amendments adopted herein will not increase the burdens per non-reporting side or change the number of non-reporting sides that are required to comply with Rule 905(a)(1). Consequently, the Commission continues to estimate that the annual burden on non-reporting sides pursuant to Rule 905(a)(1) will be 998,640 hours, which corresponds to 208.05 burden hours per non-reporting-side participant.⁷³⁰

iv. For Registered SDRs

Rule 905(b) requires a registered SDR to undertake certain actions if it discovers or receives notice of an error in a transaction report. The Commission stated in the Regulation SBSR Adopting Release that it believes that this duty will represent only a minor extension of other duties of registered SDRs for which the Commission is estimating burdens.⁷³¹ A registered SDR is required to have the ability to collect and maintain security-based swap transaction reports and update relevant records under the rules adopted in the SDR Adopting Release.⁷³² Likewise, a registered SDR must have the capacity to disseminate additional, corrected security-based swap transaction reports under Rule 902, the burdens for which were calculated in the Regulation SBSR Adopting Release.⁷³³ Thus, the burdens associated with Rule 905—including systems development, support, and maintenance—are addressed in the Commission's analysis of those other rules.

As discussed above, the Commission estimated in the Regulation SBSR Adopting Release that the initial (first-year) aggregate annualized burden on registered SDRs under Rule 905 will be 21,900 burden hours, which corresponds to 2,190 burden hours for each registered SDR.⁷³⁴ The Commission further estimated that the ongoing aggregate annualized burden on registered SDRs under Rule 905 will be 14,600 burden hours, which corresponds to 1,460 burden hours for

⁷³⁰ This figure is based on the following: $[(1 \text{ error notifications per non-reporting-side participant per day}) \times (365 \text{ days/year}) \times (\text{Compliance Clerk at } 0.5 \text{ hours/report}) \times (4,800 \text{ non-reporting-side participants})] = 998,640 \text{ burden hours}$, which corresponds to 208.05 burden hours per non-reporting-side participant. See Regulation SBSR Adopting Release, 80 FR at 14681–83.

⁷³¹ See *id.* at 14682.

⁷³² See Rules 13n–4(b)(4) and 13n–5 under the Exchange Act, 17 CFR 240.13n–4(b)(4) and 240.13n–5.

⁷³³ See 80 FR at 14678.

⁷³⁴ See *id.* at 14682, n. 1130–32.

each registered SDR.⁷³⁵ With respect to Rule 905(a)(2), the Commission stated that the submission of amended transaction reports required under Rule 905(a)(2) likely will not result in a material burden because this will be done electronically though the reporting system that the reporting side must develop and maintain to comply with Rule 901. The overall burdens associated with such a reporting system were addressed in the Commission's analysis of Rule 901.⁷³⁶

The amendments adopted herein do not increase the number of registered SDRs that are respondents to Rule 905(b), but they do increase the number of error reports that will have to be processed by each registered SDR. The Commission notes, however, consistent with its analysis in the Regulation SBSR Adopting Release, that any burdens associated with Rule 905 for registered SDRs are a result of systems development, support, and maintenance and are not dependent on the number of error reports received or processed. Consequently, for registered SDRs, the Commission estimates that the initial (first-year) aggregate annualized burden on registered SDRs under Rule 905, as previously adopted and as amended herein, will be 21,900 burden hours, which corresponds to 2,190 burden hours for each registered SDR.⁷³⁷ The Commission further estimates that the ongoing aggregate annualized burden on registered SDRs under Rule 905, as previously adopted and as amended herein, will be 14,600 burden hours, which corresponds to 1,460 burden hours for each registered SDR.⁷³⁸

v. Aggregate Reporting Burdens Under Rule 905

As discussed above, the Commission estimates that Rule 905(a) will impose an initial (first-year) burden on each reporting side of 50 hours for a total aggregate first-year burden on all reporting sides of 15,000 hours⁷³⁹ and an ongoing annualized burden on each reporting side of 23.5 hours, for a total aggregate annual burden on all reporting

sides of 7,050 hours.⁷⁴⁰ The Commission estimates that the 20 new broker-dealer respondents will each incur an initial (first-year) 48.4 burden hours per respondent, for a total aggregate first-year burden on all new broker-dealer respondents of 968 hours,⁷⁴¹ and an ongoing annualized burden of 21.8 burden hours per respondent, for a total aggregate annual burden on all new broker-dealer respondents of 436 hours.⁷⁴²

Furthermore, for platforms, the Commission estimates that the amendments to Rule 905(a) will impose an initial (first-year) burden of 51.4 hours per platform for a total aggregate first-year burden on all platforms of 514 hours,⁷⁴³ and an ongoing annualized burden of 22.1 hours per platform for a total aggregate annual burden on all platforms of 221 hours.⁷⁴⁴ The Commission estimates that the amendments to Rule 905(a) will impose an initial (first-year) burden of 153.4 hours per registered clearing agency for a total aggregate first-year burden of 612.6 hours,⁷⁴⁵ and an ongoing annualized burden of 76.8 hours per registered clearing agency for a total aggregate annual burden of 307.2 hours.⁷⁴⁶

The Commission estimates that the annual burden on non-reporting sides will remain unchanged at 208.1 burden hours per non-reporting-side participant, for a total aggregate annual burden (first-year and each subsequent year) of 998,640 hours for all non-reporting-side participants.⁷⁴⁷

The Commission estimates that the initial (first-year) aggregate annualized burden on registered SDRs will be 2,190 burden hours for each registered SDR, for a total aggregate first-year burden of

⁷⁴⁰ This figure is calculated as follows: (23.5 burden hours per reporting side × 300 reporting sides) = 7,050 burden hours.

⁷⁴¹ This figure is calculated as follows: (48.4 burden hours per new broker-dealer respondent × 20 new respondents) = 968 burden hours.

⁷⁴² This figure is calculated as follows: (21.8 burden hours per new broker-dealer respondent × 20 new respondents) = 436 burden hours.

⁷⁴³ This figure is calculated as follows: (51.4 burden hours per platform × 10 platforms) = 514 burden hours.

⁷⁴⁴ This figure is calculated as follows: (22.1 burden hours per platform × 10 platforms) = 221 burden hours.

⁷⁴⁵ This figure is calculated as follows: (153.4 burden hours per registered clearing agency × 4 registered clearing agencies) = 612.6 burden hours.

⁷⁴⁶ This figure is calculated as follows: (76.8 burden hours per registered clearing agency × 4 registered clearing agencies) = 307.2 burden hours.

⁷⁴⁷ This figure is calculated as follows: (208.05 burden hours per non-reporting-side participant × 4,800 non-reporting-side participants) = 998,640 burden hours.

21,900 hours on all registered SDRs.⁷⁴⁸ The Commission estimates that the ongoing aggregate annualized burden on registered SDRs will be 1,460 burden hours for each registered SDR, which equals a total aggregate annual burden of 14,600 burden hours for all registered SDRs.⁷⁴⁹

In summary, the Commission estimates that the aggregate first-year burden of Rule 905 for all entities will be 1,037,635 hours.⁷⁵⁰ The Commission estimates that the annual burden (after the first year) of Rule 905 for all entities will be 1,021,254 hours.⁷⁵¹

D. Other Duties of Participants—Rule 906

1. Existing Rule 906

Existing Rule 906(a) sets forth a procedure designed to ensure that a registered SDR obtains relevant UICs for both sides of a security-based swap, not just of the reporting side. Rule 906(a) requires a registered SDR to identify any security-based swap reported to it for which the registered SDR does not have a counterparty ID and (if applicable) broker ID, trading desk ID, and trader ID of each direct counterparty. Rule 906(a) further requires the registered SDR, once a day, to send a report to each participant identifying, for each security-based swap to which that participant is a counterparty, the security-based swap(s) for which the registered SDR lacks counterparty ID and (if applicable) broker ID, trading desk ID, and trader ID. Finally, Rule 906(a) requires a participant that receives such a report to provide the missing ID information to the registered SDR within 24 hours.

Existing Rule 906(b) requires each participant of a registered SDR to provide the registered SDR with information sufficient to identify the participant's ultimate parent(s) and any

⁷⁴⁸ This figure is calculated as follows: (2,190 burden hours per registered SDR × 10 registered SDRs) = 21,900 burden hours.

⁷⁴⁹ This figure is calculated as follows: (2,190 burden hours per registered SDR × 10 registered SDRs) = 21,900 burden hours.

⁷⁵⁰ This figure is calculated as follows: (15,000 burden hours for reporting sides) + (968 burden hours for new broker-dealer respondents) + (514 burden hours for platforms) + (612.6 burden hours for registered clearing agencies) + (998,640 burden hours for non-reporting-side participants) + (21,900 burden hours for registered SDRs) = 1,037,634.6 burden hours during the first year.

⁷⁵¹ This figure is calculated as follows: (7,050 burden hours for reporting sides) + (436 burden hours for new broker-dealer respondents) + (221 burden hours for platforms) + (307.2 burden hours for registered clearing agencies) + (998,640 burden hours for non-reporting-side participants) + (14,600 burden hours for registered SDRs) = 1,021,254.2 burden hours during each year following the first year.

⁷³⁵ See *id.*, nn. 1131, 1133.

⁷³⁶ See *id.* at 14675–77.

⁷³⁷ This figure is based on the following: [(730 burden hours to develop protocols) + (1,460 burden hours annual support)] × (10 registered SDRs) = 21,900 burden hours, which corresponds to 2,190 burden hours per registered SDR. See *id.* at 14681–83.

⁷³⁸ This figure is based on the following: [(1,460 burden hours annual support) × (10 registered SDRs)] = 14,600 burden hours, which corresponds to 1,460 burden hours per registered SDR. See SBSR Adopting Release, 80 FR at 14681–83.

⁷³⁹ This figure is calculated as follows: (50.0 burden hours per reporting side × 300 reporting sides) = 15,000 burden hours.

affiliate(s) of the participant that also are participants of the registered SDR.

Existing Rule 906(c) requires each participant that is a registered security-based swap dealer or registered major security-based swap participant to establish, maintain, and enforce written policies and procedures that are reasonably designed to ensure compliance with any security-based swap transaction reporting obligations in a manner consistent with Regulation SBSR. In addition, Rule 906(c) requires each such participant to review and update its policies and procedures at least annually.

For Registered SDRs. Rule 906(a) requires a registered SDR, once a day, to send a report to each of its participants identifying, for each security-based swap to which that participant is a counterparty, any security-based swap(s) for which the registered SDR lacks counterparty ID and (if applicable) broker ID, trading desk ID, and trader ID. In the Regulation SBSR Adopting Release, the Commission estimated that there will be a one-time, initial burden of 112 burden hours for a registered SDR to create a report template and develop the necessary systems and processes to produce a daily report required by Rule 906(a).⁷⁵² The Commission estimated that there will be an ongoing annualized burden of 308 burden hours for a registered SDR to generate and issue the daily reports, and to enter into its systems the UIC information supplied by participants in response to the daily reports.⁷⁵³

Accordingly, in the Regulation SBSR Adopting Release, the Commission estimated that the initial aggregate annualized burden for registered SDRs under Rule 906(a) will be 4,200 burden hours for all SDR respondents, which corresponds to 420 burden hours per registered SDR.⁷⁵⁴ The Commission estimated that the ongoing aggregate annualized burden for registered SDRs under Rule 906(a) will be 3,080 burden hours, which corresponds to 308 burden hours per registered SDR.⁷⁵⁵

For Participants. Existing Rule 906(a) requires any participant of a registered SDR that receives a report from that registered SDR to provide the missing UICs to the registered SDR within 24 hours. All SDR participants will likely be the non-reporting side for at least some transactions to which they are counterparties; therefore, all participants will be impacted by Rule 906(a). In the Regulation SBSR

Adopting Release, the Commission estimated that the initial and ongoing annualized burden under Rule 906(a) for all participants will be 199,728 burden hours, which corresponds to 41.6 burden hours per participant.⁷⁵⁶

Existing Rule 906(b) requires every participant of a registered SDR to provide that SDR an initial ultimate parent/affiliate report and updates as needed. In the Regulation SBSR Adopting Release, the Commission estimated that there will be 4,800 participants, that each participant will connect to two registered SDRs on average, and that each participant will submit two Rule 906(b) reports each year.⁷⁵⁷ Accordingly, the Commission estimated that the initial and ongoing aggregate annualized burden associated with Rule 906(b) will be 9,600 burden hours, which corresponds to 2 burden hours per participant.⁷⁵⁸

Existing Rule 906(c) requires each participant that is a registered security-based swap dealer or registered major security-based swap participant to establish, maintain, and enforce written policies and procedures that are reasonably designed to ensure compliance with applicable security-based swap reporting obligations, and to review and update such policies and procedures at least annually. In the Regulation SBSR Adopting Release, the Commission estimated that the one-time, initial burden for each covered participant⁷⁵⁹ to create these written policies and procedures will be approximately 216 burden hours.⁷⁶⁰ The Commission also estimated the burden of maintaining such policies and procedures, including a full review at least annually, will be approximately 120 burden hours for each covered participant.⁷⁶¹ Accordingly, the

⁷⁵⁶ This figure is based on the Commission's estimates of 4,800 participants and approximately 1.14 transactions per day per participant. *See id.*

⁷⁵⁷ *See id.* The Commission estimated that, during the first year, each participant will submit an initial report and one update report and, in subsequent years, will submit two update reports.

⁷⁵⁸ *See id.* This estimated aggregate burden represents an upper estimate for all participants; the actual burden could be reduced to the extent that the registered SDR permits one member of the group to report the ultimate parent(s) and affiliates on behalf of each participant member of the group. *See supra* note 608.

⁷⁵⁹ Only some participants of registered SDRs are subject to the requirements of Rule 906(c). As used in this release, any participant that is "covered" by Rule 906(c) is deemed a "covered participant."

⁷⁶⁰ This figure is based on the estimated number of hours to develop a set of written policies and procedures, program systems, implement internal controls and oversight, train relevant employees, and perform necessary testing. *See* 80 FR at 14684.

⁷⁶¹ This figure includes an estimate of hours related to reviewing existing policies and procedures, making necessary updates, conducting

Commission estimated the initial aggregate annualized burden associated with Rule 906(c) to be 18,480 burden hours, which corresponds to 336 burden hours per covered participant.⁷⁶² The Commission estimated the ongoing aggregate annualized burden associated with Rule 906(c) to be 6,600 burden hours, which corresponds to 120 burden hours per covered participant.⁷⁶³

In sum, the Commission in the Regulation SBSR Adopting Release estimated that the total initial aggregate annualized burden associated with Rule 906 will be 230,370 burden hours, and that the total ongoing aggregate annualized burden will be 217,370 burden hours for all participants.⁷⁶⁴

2. Amendments to Rule 906

a. Rule 906(a)

In this release, the Commission is making only a minor amendment to Rule 906(a)⁷⁶⁵ which does not affect the estimated number of respondents or the estimated burdens for existing respondents to the rule.

However, because of the amendments to Rule 901(a) adopted herein, the scope of transactions covered by Regulation SBSR is increasing. As a result, a registered SDR will have to review a larger number of transactions to assess whether there is missing UIC information. The Commission believes that the process whereby a registered SDR reviews transactions and generates the associated reports will be automated, and that the costs of performing this automated review will be approximately the same even if the review covers a larger set of transactions. Furthermore, although Rule 906(a) notices sent by a registered SDR could in some cases be longer because they cover more transactions, the amendments to Rule 901(a) will not increase the number of participants (4,800) to which the registered SDR will likely have to send such notices. Therefore, the Commission does not believe that the larger number of transactions will result in any burdens on registered SDRs under Rule 906(a) that were not already accounted for in the Regulation SBSR Adopting Release.⁷⁶⁶ Thus, the Commission

ongoing training, maintaining internal controls systems, and performing necessary testing. *See id.*

⁷⁶² *See id.*

⁷⁶³ *See id.*

⁷⁶⁴ *See id.*

⁷⁶⁵ *See supra* note 312.

⁷⁶⁶ The Commission estimated that a registered SDR will incur an initial, one-time burden of 112 hours to create a report template and develop the necessary systems and processes to produce a daily report required by Rule 906(a). The Commission

Continued

⁷⁵² *See* 80 FR at 14683–85.

⁷⁵³ *See id.*

⁷⁵⁴ *See id.*

⁷⁵⁵ *See id.*

believes that its original burden estimates for registered SDRs to comply with Rule 906(a) remain appropriate.

With respect to the 4,800 participants that will likely be required to provide missing UIC information to a registered SDR for at least some transactions, the Commission is revising its original estimate of the burdens imposed by Rule 906(a) because participants will have to provide missing UIC information for a larger number of transactions. Although a registered SDR's process for generating a Rule 906(a) notice is likely to be automated, at least some participants might rely on manual procedures to reply. In the Regulation SBSR Adopting Release, the Commission estimated that the initial and ongoing annualized burden under Rule 906(a) for all participants will be 199,728 burden hours, which corresponds to 41.6 burden hours per participant.⁷⁶⁷

The Commission continues to believe that there will be approximately one million additional reportable events under Regulation SBSR.⁷⁶⁸ Of these one million reportable events, the Commission estimates that approximately 120,000 platform-executed alphas reflected in estimates in the Regulation SBSR Adopting Release could have missing UIC information. Both sides of a platform-executed alpha might have to report missing UIC information since neither side is the reporting side and thus both sides are non-reporting sides. Therefore, the Commission believes that each participant, on average, will now be required to provide missing UIC information for 1.27 transactions each day.⁷⁶⁹ As a result, the Commission

also estimated that a registered SDR will incur an ongoing annualized burden of 308 hours to generate and issue the daily reports, and to enter into its systems the ID information supplied by participants in response to the daily reports. See Regulation SBSR Adopting Release, 80 FR at 14684.

⁷⁶⁷ This figure is based on the Commission's estimates of (1) 4,800 participants; and (2) approximately 1.14 transactions per day per participant. See *id.*

⁷⁶⁸ See Regulation SBSR Adopting Release, 80 FR at 14675–76.

⁷⁶⁹ The Commission originally estimated that participants could have to provide missing UIC information for up to two million security-based swap transactions annually. This results in each participant, on average, having to provide missing information for 1.14 transactions each day. As a result, the Commission originally estimated the total burden to be 199,728 hours, or 41.6 hours annually for each participant. See 80 FR at 14684. The Commission now believes that these same participants will be responsible for providing missing UIC information for a greater number of security-based swap transactions. The Commission estimates: $(((2,000,000 \text{ original estimate of annual security-based swap transactions for which mission UIC information would need to be provided to the SDR}) + (120,000 \text{ additional security-based swap$

believes that the burden placed on each participant by Rule 906(a) will be 46.4 hours annually,⁷⁷⁰ for a total burden of 222,504 hours for all participants.

b. Rule 906(b)—Amendments

Existing Rule 906(b) requires each participant of a registered SDR to provide the registered SDR information sufficient to identify its ultimate parent(s) and any affiliate(s) of the participant that also are participants of the registered SDR, using ultimate parent IDs and participant IDs. In this release, the Commission is adopting amendments to Rule 906(b) to *exclude* from this reporting requirement participants that are platforms, registered clearing agencies, externally managed investment vehicles, and registered broker-dealers (including SB SEFs) that become participants of a registered SDR solely as a result of making a report to satisfy an obligation under Rule 901(a)(2)(ii)(E)(4). Therefore, this amendment does not create any new respondents that have burdens under the rule or increase burdens for any existing respondents.

Platforms and registered clearing agencies were not covered respondents to Rule 906(b) when the Commission estimated the burdens of Rule 906(b), as adopted in the Regulation SBSR Adopting Release. Therefore, the amendment to Rule 906(b) adopted today that specifically excludes them does not affect the Commission's estimate in the Regulation SBSR Adopting Release of the burdens associated with Rule 906(b).

However, externally managed investment vehicles were considered respondents of Rule 906(b), as adopted in the Regulation SBSR Adopting Release, and the estimated burdens on all participant respondents in that adopting release included burdens imposed on externally managed investment vehicles.⁷⁷¹ Therefore, the amendment to Rule 906(b) adopted herein that excludes externally managed investment vehicles has the effect of reducing the number of respondents and the associated burdens of Rule 906(b) that the Commission estimated in the

transactions for which UIC information is required) \times (2 since both sides could be required to provide missing UIC information)) / (4,800 participants) / (365 days/year) = 1.27 average security-based swap transactions per day for which each participant will need to provide missing UIC information.

⁷⁷⁰ The Commission estimates that the total burden for all participants will be 222,504 calculated as follows: (1.27 missing information reports per day) \times (365 days per year) \times (Compliance Clerk at 0.1 hours/report) \times (4,800 participants) = 222,504 hours/year or 46.4 hours for each participant.

⁷⁷¹ See 80 FR at 14684.

Regulation SBSR Adopting Release. Based on an analysis of TIW transaction data, the Commission believes that, of the 4,800 estimated participants, approximately 1,920 are externally managed investment vehicles.⁷⁷² Therefore, the Commission now estimates that there are only 2,880 participant respondents to Rule 906(b), as amended herein. In the Regulation SBSR Adopting Release, the Commission further estimated that each respondent to Rule 906(b) will submit two reports per year and that each report will result in one burden hour.⁷⁷³ The Commission continues to believe that each respondent will incur two burden hours per year in connection with Rule 906(b), but is reducing its estimate of total burden hours for all participants from 9,600 (estimated in the Regulation SBSR Adopting Release) to 5,760 (2,880 respondents \times 2 hours/respondent = 5,760 hours).

c. Rule 906(c)—Amendments

i. Summary of Collection of Information

Persons that are subject to Rule 906(c) must establish, maintain, and enforce written policies and procedures that are reasonably designed to ensure compliance with applicable security-based swap transaction reporting obligations. Respondents also must review and update their policies and procedures at least annually.

ii. Respondents

The amendments to Rule 906(c) adopted today will extend the requirements of existing Rule 906(c) to registered clearing agencies, platforms, and registered broker-dealers that incur duties to report security-based swaps pursuant to Rule 901(a)(2)(ii)(E)(4). The Commission estimates that there will be 4 registered clearing agencies, 10 platforms, and 20 registered broker-dealers that will become subject to Rule 906(c).

iii. Total Initial and Annual Reporting and Recordkeeping Burdens

For Registered Clearing Agencies and Platforms. In the Regulation SBSR Proposed Amendments Release, the Commission preliminarily estimated that the one-time, initial burden for each registered clearing agency or platform to adopt written policies and procedures as required under the amendment to Rule 906(c) would be similar to the Rule 906(c) burdens for other covered

⁷⁷² Roughly 40% of TIW accounts on average have been identified by staff as private funds or registered investment companies, $4,800 \times 0.4 = 1,920$.

⁷⁷³ See *id.*

participants.⁷⁷⁴ In the Regulation SBSR Adopting Release, the Commission estimated that Rule 906(c) will impose a burden of approximately 216 hours on each registered security-based swap dealer or registered major security-based swap participant (together, “covered participants”).⁷⁷⁵ In addition, the Commission estimated that the burden of maintaining such policies and procedures, including a full review at least annually, will be approximately 120 burden hours for each covered participant.⁷⁷⁶ The Commission continues to believe that, by amending Rule 906(c) to apply the policies and procedures requirement to registered clearing agencies and platforms, these entities will face burdens similar to those of the existing covered participants. Accordingly, the Commission estimates that the initial aggregate annualized burden associated with the amendments to Rule 906(c) will be 4,704 burden hours, which corresponds to 336 burden hours per registered clearing agency or platform.⁷⁷⁷ The Commission estimates that the ongoing aggregate annualized burden associated with the amendments to Rule 906(c) will be 1,680 burden hours, which corresponds to 120 burden hours per registered clearing agency or platform.⁷⁷⁸

For Registered Broker-Dealers. The amendments to Rule 906(c) will require each registered broker-dealer that becomes a participant solely as a result of incurring a reporting duty under Rule 901(a)(2)(ii)(E)(4) (a “respondent broker-dealer”) to establish, maintain, and enforce written policies and procedures

that are reasonably designed to ensure compliance with applicable security-based swap transaction reporting obligations. The amendments to Rule 906(c) also will require each respondent broker-dealer to review and update such policies and procedures at least annually.

In the U.S. Activity Proposal, the Commission preliminarily estimated that the one-time, initial burden for each respondent broker-dealer to adopt written policies and procedures as required under the amendment to Rule 906(c) would be similar to the Rule 906(c) burdens for existing covered participants.⁷⁷⁹ In the Regulation SBSR Adopting Release, the Commission estimated that Rule 906(c) will impose a burden of approximately 216 hours on each covered participant.⁷⁸⁰ In addition, the Commission estimated that the burden of maintaining such policies and procedures, including a full review at least annually, will be approximately 120 burden hours for each covered participant.⁷⁸¹ The Commission continues to believe that, by amending Rule 906(c) to impose the policies and procedures requirement on respondent broker-dealers, these entities will face burdens similar to those of other covered participants. Accordingly, the Commission estimates that the initial aggregate annualized burdens on respondent broker-dealers associated with the amendment to Rule 906(c) will be 6,720 burden hours, which corresponds to 336 burden hours per respondent broker-dealer.⁷⁸² The Commission estimates that the ongoing aggregate annualized burdens on all respondent broker-dealers associated with the amendments to Rule 906(c) will be 2,400 burden hours, which corresponds to 120 burden hours per respondent broker-dealer.⁷⁸³

3. Rule 906—Aggregate Total PRA Burdens and Costs

Based on the foregoing, the Commission estimates the following aggregate total PRA burdens and costs, by category of entity, resulting from Rule 906. These figures add the burdens and costs estimated in the Regulation SBSR Adopting Release for the existing covered participants with the burdens and costs estimated for the additional covered participants resulting from the

amendments to Rule 906(c) adopted herein.

a. For Platforms and Registered Clearing Agencies

The Commission estimates that the one-time, initial burden for each registered clearing agency or platform to adopt written policies and procedures as required under the amendments to Rule 906(c) will be similar to the Rule 906(c) burdens discussed in the Regulation SBSR Adopting Release for covered participants, and will be approximately 216 burden hours per registered clearing agency or platform.⁷⁸⁴ This figure is based on the estimated number of hours to develop a set of written policies and procedures, program systems, implement internal controls and oversight, train relevant employees, and perform necessary testing. In addition, the Commission estimates the burden of maintaining such policies and procedures, including a full review at least annually, as required by Rule 906(c), will be approximately 120 burden hours for each registered clearing agency or platform.⁷⁸⁵ This figure includes an estimate of hours related to reviewing existing policies and procedures, making necessary updates, conducting ongoing training, maintaining internal controls systems, and performing necessary testing. Accordingly, the Commission estimates that the initial, or first year, aggregate annualized burden associated with the amendments to Rule 906(c) will be 4,704 burden hours, which corresponds to 336 burden hours per registered clearing agency or platform.⁷⁸⁶ The Commission estimates that the ongoing aggregate annualized burden associated with the amendments to Rule 906(c) will be 1,680 burden hours, which corresponds to 120 burden hours per registered clearing agency or platform.⁷⁸⁷

b. For Registered SDRs

As a result of changes in other rules, registered SDRs will have to identify missing UIC information from a larger number of transactions and send more requests to non-reporting sides seeking such missing UIC information.

In the Regulation SBSR Adopting Release, the Commission estimated that there will be a one-time, initial burden of 112 burden hours for each registered SDR to create a report template and develop the necessary systems and processes to produce a daily report

⁷⁷⁴ See 80 FR at 14797.

⁷⁷⁵ See *id.* This figure is based on the following: [(Sr. Programmer at 40 hours) + (Compliance Manager at 40 hours) + (Compliance Attorney at 40 hours) + (Compliance Clerk at 40 hours) + (Sr. Systems Analyst at 32 hours) + (Director of Compliance at 24 hours)] = 216 burden hours per registered clearing agency or platform. This figure is based on the estimated number of hours to develop a set of written policies and procedures, program systems, implement internal controls and oversight, train relevant employees, and perform necessary testing.

⁷⁷⁶ See *id.* This figure is based on the following: [(Sr. Programmer at 8 hours) + (Compliance Manager at 24 hours) + (Compliance Attorney at 24 hours) + (Compliance Clerk at 24 hours) + (Sr. Systems Analyst at 16 hours) + (Director of Compliance at 24 hours)] = 120 burden hours per registered clearing agency or platform. This figure includes an estimate of hours related to reviewing existing policies and procedures, making necessary updates, conducting ongoing training, maintaining internal controls systems, and performing necessary testing.

⁷⁷⁷ This figure is based on the following: [(216 + 120 burden hours) × (14 registered clearing agencies and platforms)] = 4,704 burden hours.

⁷⁷⁸ This figure is based on the following: [(120 burden hours) × (14 registered clearing agencies and platforms)] = 1,680 burden hours.

⁷⁷⁹ See U.S. Activity Proposal, 80 FR at 27506.

⁷⁸⁰ See *supra* note 775.

⁷⁸¹ See *supra* note 776.

⁷⁸² This figure is based on the following: (216 + 120 burden hours) × (20 respondent broker-dealers) = 6,720 burden hours.

⁷⁸³ This figure is based on the following: (120 burden hours) × (20 respondent broker-dealers) = 2,400 burden hours.

⁷⁸⁴ See *supra* note 775.

⁷⁸⁵ See *supra* note 776.

⁷⁸⁶ See *supra* note 777.

⁷⁸⁷ See *supra* note 778.

required by Rule 906(a), or 1,120 burden hours for all SDRs.⁷⁸⁸ The Commission believes that this estimate continues to be valid, as an SDR's initial investment in the infrastructure necessary to carry out its duties under Rule 906(a) should be unaffected by the precise number of transactions covered by Regulation SBSR.

In the Regulation SBSR Adopting Release, the Commission estimated that there will be an ongoing annualized burden of 308 burden hours for each registered SDR to generate and issue the daily reports, and to enter into its systems the UIC information supplied by participants in response to the daily reports, or 3,308 burden hours for all SDRs.⁷⁸⁹ Although the scope of security-based swap transactions covered by Regulation SBSR has increased, the Commission continues to believe that there will be an ongoing annualized burden of 308 burden hours for a registered SDR to generate and issue the daily reports, and to enter into its systems the UIC information supplied by participants in response to the daily reports.

c. For Participants

The Commission estimates that, as a result of the amendments adopted herein, the initial and ongoing annualized burden under Rule 906(a) for all participants will be 222,504 burden hours, which corresponds to 46.4 burden hours per participant.⁷⁹⁰ The Commission notes that each participant will, on average, have to provide missing UIC information for more security-based swap transactions than it would have prior to the amendments adopted in this release. The revised estimates account for these additional transactions.

In the Regulation SBSR Adopting Release, the Commission estimated that the initial and ongoing aggregate annualized burden associated with Rule 906(b) will be 9,600 burden hours, which corresponds to 2 burden hours per participant.⁷⁹¹ The amendment to Rule 906(b) does not create any new respondents or impose any new burdens on existing respondents, as the amendment excludes platforms, registered clearing agencies, registered broker-dealers, and externally managed

investment vehicles from having to report ultimate parent and affiliate information to registered SDRs of which they are participants. Therefore, the Commission's estimate of the burdens imposed by Rule 906(b) on individual participants remains unchanged. However, because of the exclusions discussed above, only 2,880 participants will be subject to the requirement of Rule 906(b). As a result, the aggregate annualized burden associated with Rule 906(b) will fall from 9,600 hours (estimated in the Regulation SBSR Adopting Release) to 5,760 hours.

d. For New Broker-Dealer Respondents

In this release, the Commission is adopting an amendment to Rule 906(c) that extends the requirement to establish policies and procedures for carrying out reporting duties under Regulation SBSR to platforms, registered clearing agencies, and registered broker-dealers that incur a duty to report security-based swaps under new Rule 901(a)(2)(ii)(E)(4). The Commission estimates 20 registered broker-dealers will become subject to Rule 906(c). The Commission discussed the burdens placed upon platforms and registered clearing agencies as a result of the amendments to Rule 906(c) in Section XI(D)(3)(a), *supra*. The Commission believes that the per-respondent costs of establishing and updating the required policies will be the same for new broker-dealer respondents identified in this release as well as the respondents identified in the Regulation SBSR Adopting Release, as discussed in Section XI(D)(1), *supra*. Therefore, the Commission estimates that the new broker-dealer respondents will incur a one-time, initial burden of 216 burden hours per new broker-dealer respondent, or 6,480 hours for all new broker-dealer respondents, and an ongoing annual burden of 120 hours per new broker-dealer respondent, or 2,400 hours for all new broker-dealer respondents.

e. Aggregate Rule 906 Burdens

In sum, Rule 906(a) will place a total first-year burden on registered SDRs of 1,120 hours.⁷⁹² Rule 906(a) will place a total annual burden on registered SDRs and covered participants of 269,384 hours.⁷⁹³ Rule 906(b) will place a total annual burden on covered participants

of 5,760 hours.⁷⁹⁴ Rule 906(c) will place a total first-year burden on covered participants of 19,224 hours.⁷⁹⁵ Rule 906(c) will place a total annual burden on covered participants of 10,680 hours.⁷⁹⁶ These figures combine the burdens associated with Rule 906 estimated in the Regulation SBSR Adopting Release with the revisions to these burdens associated with the amendments to Rule 906 adopted herein.

E. Policies and Procedures of Registered SDRs—Rule 907

1. Existing Rule 907

Existing Rule 907(a) requires a registered SDR to establish and maintain written policies and procedures with respect to the receipt, reporting, and public dissemination of security-based swap transaction information. Existing Rule 907(c) requires a registered SDR to make its policies and procedures available on its Web site. Existing Rule 907(d) requires a registered SDR to review, and update as necessary, the policies and procedures that it is required to have by Regulation SBSR at least annually. Existing Rule 907(e) requires a registered SDR to provide to the Commission, upon request, information or reports related to the timeliness, accuracy, and completeness of data reported to it pursuant to Regulation SBSR and the registered SDR's policies and procedures established thereunder.

2. Rule 907—Amendments

In this release, the Commission is making only one amendment to Rule 907: The Commission is revising Rule 907(a)(6) to carve out platforms, registered clearing agencies, externally managed investment vehicles, and registered broker-dealers (including SB SEFs) that become a participant of a registered SDR solely as a result of making a report to satisfy an obligation under Rule 901(a)(2)(ii)(E)(4) from the requirement in Rule 907(a)(6) that a registered SDR have policies and procedures for obtaining ultimate parent

⁷⁹⁴ The Commission calculated this estimate as follows: (2 hours (annual burden on participants as a result of Rule 906(b)) × 2,880 revised number of participants impacted by Rule 906(b)) = 5,760 hours.

⁷⁹⁵ The Commission calculated this estimate as follows: (216 hours (first-year burden on each respondent) × 89 respondents (*i.e.*, 55 registered security-based swap dealers + registered major security-based swap participants + 20 new broker-dealer respondents + 14 platforms and registered clearing agencies)) = 19,224 hours.

⁷⁹⁶ The Commission calculated this estimate as follows: (120 hours (annual burden per covered participants) × 89 covered participants) = 10,680 hours.

⁷⁸⁸ See 80 FR at 14683–85.

⁷⁸⁹ See *id.*

⁷⁹⁰ See *supra* note 770 and accompanying text.

⁷⁹¹ See Regulation SBSR Adopting Release, 80 FR at 14683–85. This figure is based on the following: [(Compliance Clerk at 0.5 hours per report) × (2 reports/year/SDR connection) × (2 SDR connections/participant) × (4,800 participants)] = 9,600 burden hours, which corresponds to 2 burden hours per covered participant.

⁷⁹² The Commission calculated this estimate as follows: (112 hours (first year burden on SDRs as a result of Rule 906(a)) × 10 SDRs) = 1,120 hours.

⁷⁹³ The Commission calculated this estimate as follows: ((308 hours (annual burden on SDRs as a result of Rule 906(a)) × 10 SDRs) + ((5.5 hours (annual burden on participants as a result of Rule 906(a)) × 4,800 participants) = 269,384 hours.

and affiliate information from its participants, as contemplated by an amendment to Rule 906(b) adopted herein. The amendment to Rule 907(a)(6) has the effect of preventing existing respondent SDRs from incurring additional burdens because they will not have to obtain ultimate parent and affiliate information from additional types of participants.

However, amendments to other rules in Regulation SBSR will have the effect of requiring a registered SDR to expand its policies and procedures to cover additional types of reporting persons and additional types of reporting scenarios. For example, platforms and registered broker-dealers may now incur duties to report certain security-based swaps and are required to become participants of registered SDRs to which they report. In addition, a registered clearing agency also incurs the duty to report to the alpha SDR whether the clearing agency has accepted an alpha for clearing. Registered SDRs that record alpha transactions will have to expand their policies and procedures to be able to link the report of the original alpha transaction (which would be reported either by a reporting side or, if the alpha was platform-executed and will be submitted to clearing, by the platform) to the report of the clearing disposition, which would be submitted by the registered clearing agency.

3. Rule 907—Aggregate Total PRA Burdens and Costs

In the Regulation SBSR Adopting Release, the Commission estimated that the one-time, initial burden for a registered SDR to adopt written policies and procedures as required under existing Rule 907 will be approximately 15,000 hours. In addition, the Commission estimated the annual burden of maintaining such policies and procedures, including a full review at least annually, making available its policies and procedures on the registered SDR's Web site, and information or reports on non-compliance (as required under Rule 907(e)) will be approximately 30,000 hours for each registered SDR. The Commission estimated that the total initial annualized burden associated with Rule 907 will be approximately 45,000 hours per registered SDR, which corresponds to an initial annualized aggregate burden of approximately 450,000 hours.⁷⁹⁷ The Commission further estimated that the ongoing

⁷⁹⁷ This figure is based on the following: $[(15,000 \text{ burden hours per registered SDR}) + (30,000 \text{ burden hours per registered SDR})] \times (10 \text{ registered SDRs}) = 450,000 \text{ initial annualized aggregate burden hours during the first year.}$

annualized burden associated with Rule 907 will be approximately 30,000 hours per registered SDR,⁷⁹⁸ which corresponds to an ongoing annualized aggregate burden of approximately 300,000 hours.⁷⁹⁹

As a result of amendments made to various provisions of Regulation SBSR in this release, registered SDRs will need to broaden the scope of the written policies and procedures that Rule 907 requires them to have.⁸⁰⁰ The Commission believes that a registered SDR's expansion of its policies and procedures in response to the amendments to Regulation SBSR adopted in this release represents an "add-on" to the burdens already calculated with respect to the SDR policies and procedures under existing Rule 907. The Commission estimates the incremental burden to be an additional 10% of the one-time and annual burdens estimated to result from existing Rule 907.

Accordingly, the Commission believes that the one-time, initial burden for a registered SDR to adopt written policies and procedures as required under Rule 907 will be approximately 16,500 hours.⁸⁰¹ In addition, the Commission estimates the annual burden of maintaining such policies and procedures, including a full review at least annually, making available its policies and procedures on the registered SDR's Web site, and information or reports on non-compliance, as required under Rule 907(e), will be approximately 33,000

⁷⁹⁸ See Regulation SBSR Adopting Release, 80 FR at 14685. This figure is based on the following: $[(\text{Sr. Programmer at } 3,333 \text{ hours}) + (\text{Compliance Manager at } 6,667 \text{ hours}) + (\text{Compliance Attorney at } 10,000 \text{ hours}) + (\text{Compliance Clerk at } 5,000 \text{ hours}) + (\text{Sr. System Analyst at } 3,333 \text{ hours}) + (\text{Director of Compliance at } 1,667 \text{ hours})] = 30,000 \text{ burden hours per registered SDR.}$

⁷⁹⁹ See Regulation SBSR Adopting Release, 80 FR at 14685–86. This figure is based on the following: $[(30,000 \text{ burden hours per registered SDR}) \times (10 \text{ registered SDRs})] = 300,000 \text{ ongoing, annualized aggregate burden hours.}$

⁸⁰⁰ For example, new Rule 901(e)(1)(ii) requires a registered clearing agency to report to the alpha SDR whether or not it has accepted the alpha for clearing. The alpha SDR must revise its policies and procedures to allow for the information from the registered clearing agency to be connected to the initial report of the alpha. See *supra* Section III(G). In addition, new Rule 902(c)(8) requires a registered SDR to avoid public dissemination of a security-based swap that has been rejected from clearing or rejected by a prime broker if the original transaction report has not yet been publicly disseminated. See *supra* Section III(J). A registered SDR must adjust its policies and procedures for public dissemination to comply with new Rule 902(c)(8).

⁸⁰¹ This figure is calculated as follows: $[15,000 \text{ one-time written policies and procedures development} \times (1.1)] = 16,500.$

hours for each registered SDR.⁸⁰² The Commission therefore estimates that the initial annualized burden associated with Rule 907 will be approximately 45,000 hours per registered SDR, which corresponds to an initial annualized aggregate burden of approximately 495,000 hours.⁸⁰³ The Commission further estimates that the ongoing annualized burden associated with Rule 907 will be approximately 33,000 hours per registered SDR, which corresponds to an ongoing annualized aggregate burden of approximately 330,000 hours.⁸⁰⁴

F. Cross-Border Matters—Rule 908

1. Existing Rule 908

Rule 908(a) defines when certain cross-border security-based swap transactions are subject to regulatory reporting and/or public dissemination. Rule 908(a), as adopted in the Regulation SBSR Adopting Release, covered security-based swaps consisting of only certain counterparty pairs. Existing Rule 908(a)(1)(i) provides that a security-based swap shall be subject to regulatory reporting and public dissemination if "[t]here is a direct or indirect counterparty that is a U.S. person on either or both sides of the transaction," and existing Rule 908(a)(1)(ii) provides that a security-based swap shall be subject to regulatory reporting and public dissemination if "[t]he security-based swap is submitted to a clearing agency having its principal place of business in the United States." Existing Rule 908(a)(2) provides that a security-based swap not included within Rule 908(a)(1) would be subject to regulatory reporting but not public dissemination "if there is a direct or indirect counterparty on either or both sides of the transaction that is a registered security-based swap dealer or a registered major security-based swap participant." Rule 908(a), as adopted in the Regulation SBSR Adopting Release, did not otherwise address when an uncleared security-based swap involving only unregistered non-U.S. persons would be subject to regulatory reporting and/or public dissemination.

⁸⁰² This figure is calculated as follows: $[(30,000 \text{ one-time written policies and procedures development}) \times (1.1)] = 33,000.$

⁸⁰³ This figure is based on the following: $[(16,500 \text{ burden hours per registered SDR}) + (33,000 \text{ burden hours per registered SDR})] \times (10 \text{ registered SDRs}) = 495,000 \text{ initial annualized aggregate burden hours during the first year.}$

⁸⁰⁴ This figure is based on the following: $[(33,000 \text{ burden hours per registered SDR}) \times (10 \text{ registered SDRs})] = 330,000 \text{ ongoing, annualized aggregate burden hours.}$

Rule 908(b) defines when a person might incur obligations under Regulation SBSR. Existing Rule 908(b) provides that, notwithstanding any other provision of Regulation SBSR, a person shall not incur any obligation under Regulation SBSR unless it is a U.S. person, a registered security-based swap dealer, or a registered major security-based swap participant.

The Commission stated in the Regulation SBSR Adopting Release that Rules 908(a) and 908(b) do not impose any collection of information requirements and that, to the extent that a security-based swap transaction or a person is subject to Rule 908(a) or (b), respectively, the collection of information burdens are calculated as part of the underlying rule (e.g., Rule 901, which imposes the basic duty to report security-based swap transaction information).⁸⁰⁵

Existing Rule 908(c) sets forth the requirements for a substituted compliance request relating to regulatory reporting and public dissemination of security-based swaps in a particular foreign jurisdiction, and is the only part of Rule 908 to impose paperwork burdens. Rule 908(c) is not being amended by this release. In the Regulation SBSR Adopting Release, the Commission estimated that it will receive approximately ten substituted compliance requests in the first year and two requests each subsequent year.⁸⁰⁶ The total paperwork burden associated with submitting a request for a substituted compliance determination with respect to regulatory reporting and public dissemination will be approximately 1,120 hours, plus \$1,120,000 for 14 estimated requests.⁸⁰⁷ In the Regulation SBSR Adopting Release, the Commission estimated that it would receive ten requests in the first year resulting in an aggregated burden for the first year of 800 hours, plus \$800,000 for the services of outside professionals.⁸⁰⁸ The Commission further estimates that it would receive two requests in each subsequent year resulting in an aggregate annual burden, after the first year, of up to 160 hours of company time and \$160,000 for the services of outside professionals.⁸⁰⁹

2. Rule 908—Amendments

The Commission today is adopting amendments to Rule 908(a) to subject additional types of security-based swap transactions to regulatory reporting and

public dissemination under Regulation SBSR, and amendments to Rule 908(b) to clarify that additional types of persons may incur duties under Regulation SBSR. However, these amendments do not themselves impose any paperwork burdens. Additional paperwork burdens caused by increasing the number of respondents or by increasing the burdens imposed on respondents are considered under the rule that imposes the substantive duties. The Commission is not amending Rule 908(c) herein.

3. Rule 908—Aggregate Total Burdens and Costs

Because the only part of Rule 908 that imposes any paperwork burdens is paragraph (c), the Commission's estimate from the Regulation SBSR Adopting Release of the total paperwork burden associated with Rule 908(c) remains approximately 1,120 hours, plus \$1,120,000 for 14 substituted compliance requests.⁸¹⁰ The Commission continues to believe that the first-year aggregated burden will be 800 hours, plus \$800,000 for the services of outside professionals, and that the aggregate burden for each year following the first year will be up to 160 hours of company time and \$160,000 for the services of outside professionals.⁸¹¹

G. Additional PRA Discussion

1. Use of Information

The security-based swap transaction information that is required by the amendments to Regulation SBSR adopted herein will be used by registered SDRs, market participants, the Commission, and other relevant authorities. The information reported by respondents pursuant to the amendments to Regulation SBSR adopted herein will be used by registered SDRs to publicly disseminate reports of security-based swap transactions, as well as to offer a resource for the Commission and other relevant authorities to obtain detailed information about the security-based swap market. Market participants also will use the information about these transactions that is publicly disseminated, among other things, to assess the current market for security-based swaps and any underlying and related securities, and to assist in the valuation of their own positions. The Commission and other relevant authorities will use information about security-based swap transactions reported to and held by registered SDRs

to monitor and assess systemic risks, as well as to examine for and consider whether to take enforcement action against potentially abusive trading behavior, as appropriate.

The policies and procedures required under the amendments to Regulation SBSR will be used by participants to aid in their compliance with Regulation SBSR, and also used by the Commission as part of its ongoing efforts to monitor and enforce compliance with the federal securities laws, including Regulation SBSR, through, among other things, examinations and inspections.

2. Recordkeeping Requirements

Apart from the duty to report certain transaction information, Regulation SBSR does not impose any recordkeeping requirement on reporting sides.

Security-based swap transaction information received by a registered SDR pursuant to Regulation SBSR is subject to Rule 13n-5(b)(4) under the Exchange Act,⁸¹² which requires an SDR to maintain such information for not less than five years after the applicable security-based swap expires and historical positions for not less than five years. Rule 13n-7(b) under the Exchange Act⁸¹³ requires the SDR to keep and preserve at least one copy of all documents, including all documents and policies and procedures required by the Exchange Act and the rules or regulations thereunder, for a period of not less than five years, the first two years in a place that is immediately available to representatives of the Commission for inspection and examination. The Commission does not believe that the amendments to Regulation SBSR adopted herein will have any impact on the PRA burdens of registered SDRs related to recordkeeping as they were already accounted for in the SDR Adopting Release.⁸¹⁴

The Commission has proposed recordkeeping requirements for registered clearing agencies⁸¹⁵ and SB SEFs.⁸¹⁶ The amendments to Regulation SBSR adopted herein do not impose any recordkeeping requirements on registered clearing agencies or platforms.

3. Collection of Information Is Mandatory

Each collection of information discussed above is mandatory.

4. Confidentiality of Responses to Collection of Information

An SDR, pursuant to Section 13(n)(5)(F) of the Exchange Act⁸¹⁷ and Rules 13n-4(b)(8) and 13n-9 thereunder,⁸¹⁸ is required to maintain the privacy of the security-based swap transaction information that it receives. For the majority of security-based swap transactions, the information collected pursuant to Rule 901(c) by a registered SDR will be publicly disseminated. Furthermore, to the extent that information previously reported and publicly disseminated is corrected, such information also will be widely available. However, certain security-based swaps are not subject to Rule 902's public dissemination requirement; therefore, information about these transactions will not be publicly available. For all security-based swaps, the information collected pursuant to Rule 901(d) is for regulatory purposes and will not generally be available to the public, although the Commission or Commission staff may make available statistics or aggregated data derived from these transaction reports. To the extent that the Commission receives confidential information pursuant to this collection of information, such information would be kept confidential, subject to the provisions of applicable law.

XII. Economic Analysis

The Dodd-Frank Act amended the Exchange Act, among other things, to require regulatory reporting and public dissemination of security-based swap transactions. Regulation SBSR, which the Commission adopted in February 2015, implements this mandate. At the same time that it adopted Regulation SBSR, the Commission proposed additional rules and guidance to address issues that were not resolved in the Regulation SBSR Adopting Release.⁸¹⁹ Later, in April 2015, the Commission issued the U.S. Activity Proposal, which (among other things) proposed further amendments to Regulation SBSR to address the reporting and public dissemination of additional types of cross-border security-based swaps.⁸²⁰ In this release, the Commission is adopting, with certain revisions, the amendments to Regulation SBSR

contained in the Regulation SBSR Proposed Amendments Release and the U.S. Activity Proposal.

The Commission is sensitive to the economic consequences and effects, including costs and benefits, of its rules. Some of these costs and benefits stem from statutory mandates, while others are affected by the discretion exercised in implementing these mandates. The following economic analysis identifies and considers the benefits and costs that could result from the amendments adopted herein. The Commission also discusses the potential economic effects of certain alternatives to the approach taken by these amendments. To the extent applicable, the views of commenters relevant to the Commission's analysis of the economic effects, costs, and benefits of these amendments are included in the discussion below.

A. Programmatic Costs of Amendments to Regulation SBSR

In this section, the Commission discusses the programmatic costs and benefits associated with the amendments to Regulation SBSR adopted in this release. This discussion includes a summary of and response to comments relating to the Commission's initial analysis of the costs and benefits associated with these amendments.

1. Programmatic Costs of Newly Adopted Requirements

New Rule 901(a)(2)(i) provides that the reporting side for a clearing transaction is the registered clearing agency that is a direct counterparty to the clearing transaction, and allows the registered clearing agency to select the SDR. New Rule 901(a)(3) requires any person that has a duty to report a security-based swap that has been submitted to clearing at a registered clearing agency to promptly provide that registered clearing agency with the transaction ID of the submitted security-based swap and the identity of the registered SDR to which the transaction will be reported or has been reported. These amendments to Rule 901 will impose initial and ongoing costs on platforms, registered clearing agencies, and reporting entities. These costs will be a function of the number of additional events reportable as a result of these amendments and the number of data elements required to be submitted for each additional reportable event.⁸²¹

⁸²¹ This release considers only the events that must be reported as a result of the amendments to Rule 901 being adopted today. In the Regulation SBSR Adopting Release, the Commission estimated the number of reportable events that will result

a. For Platforms and Registered Clearing Agencies

The Commission believes that platforms and registered clearing agencies, when carrying out duties to report security-based swaps, will generally incur the same infrastructure costs that reporting sides face. Like a reporting side, a platform or registered clearing agency must: (1) Develop a transaction processing system; (2) implement a reporting mechanism; and (3) establish an appropriate compliance program and support for the operation of the transaction processing system.⁸²² Once platforms and registered clearing agencies have established the infrastructure to report security-based swap transactions, reportable events will be reported through electronic means and the marginal cost of reporting an additional transaction once the infrastructure to support the reporting function has been established should be *de minimis*. The Commission continues to estimate that there will be ten platforms and four registered clearing agencies that will incur duties to report security-based swap transactions under the amendments to Rule 901 adopted herein.

For platforms, the costs of reporting infrastructure consist of start-up costs in the first year and ongoing costs each year thereafter. For each platform, the estimated start-up costs include: (1) \$102,000 for the initial set-up of the reporting infrastructure to carry out duties under Rule 901;⁸²³ (2) \$200,000 for establishing connectivity to a registered SDR;⁸²⁴ (3) \$49,000 for developing, testing, and supporting a reporting mechanism for security-based swap transactions;⁸²⁵ (4) \$77,000 for

from the rules adopted in that release and the associated costs. See generally 80 FR at 14700-704.

⁸²² See *id.* at 14701.

⁸²³ This estimate is based on the following: [(Sr. Programmer (160 hours) at \$303 per hour) + (Sr. Systems Analyst (160 hours) at \$260 per hour) + (Compliance Manager (10 hours) at \$283 per hour) + (Director of Compliance (5 hours) at \$446 per hour) + (Compliance Attorney (20 hours) at \$334 per hour)] = approximately \$102,000 per platform. All hourly cost figures are based upon data from SIFMA's Management & Professional Earnings in the Securities Industry 2013 (modified by Commission staff to account for a 1,800-hour work-year and multiplied by 5.35 to account for bonuses, firm size, employee benefits, and overhead). See also Regulation SBSR Proposed Amendments Release, 80 FR at 14775-76.

⁸²⁴ The Commission derived the total estimated expense from the following: (\$100,000 hardware- and software related expenses, including necessary backup and redundancy, per SDR connection) × (2 SDR connections per platform) = \$200,000 per platform. See also Regulation SBSR Proposed Amendments Release, 80 FR at 14776.

⁸²⁵ This figure is calculated as follows: [(Sr. Programmer (80 hours) at \$303 per hour) + (Sr.

⁸¹⁷ 15 U.S.C. 78m(n)(5)(F).

⁸¹⁸ 17 CFR 240.13n-4(b)(8) and 240.13n-9.

⁸¹⁹ See *supra* note 6.

⁸²⁰ See *supra* note 7.

order management costs;⁸²⁶ (5) \$1,000 for data storage costs;⁸²⁷ (6) \$54,000 for designing and implementing an appropriate compliance and support program;⁸²⁸ and (7) \$38,500 for maintaining the compliance and support program.⁸²⁹ Therefore, the Commission estimates total start-up costs of \$521,500 per platform and \$5,215,000 for all platforms.⁸³⁰

The Commission estimates that the amendments to Rule 901 being adopted today also will require each platform to incur the following ongoing costs: (1) \$200,000 for maintaining connectivity to a registered SDR;⁸³¹ (2) \$77,000 for order management costs; (3) \$1,000 for data storage costs; and (4) \$38,500 for maintaining its compliance and support program. Therefore, the total estimated ongoing cost per year is \$316,500 per platform, and \$3,165,000 for all platforms.⁸³²

Systems Analyst (80 hours) at \$260 per hour) + (Compliance Manager (5 hours) at \$283 per hour) + (Director of Compliance (2 hours) at \$446 per hour) + (Compliance Attorney (5 hours) at \$334 per hour)] = approximately \$49,000 per platform. See also Regulation SBSR Proposed Amendments Release, 80 FR at 14776.

⁸²⁶ This estimate is based on the following: [(Sr. Programmer (32 hours) at \$303 per hour) + (Sr. Systems Analyst (32 hours) at \$260 per hour) + (Compliance Manager (60 hours) at \$283 per hour) + (Compliance Clerk (240 hours) at \$64 per hour) + (Director of Compliance (24 hours) at \$446 per hour) + (Compliance Attorney (48 hours) at \$334 per hour)] = approximately \$77,000 per platform. See also Regulation SBSR Proposed Amendments Release, 80 FR at 14776.

⁸²⁷ This estimate is calculated as follows: [\$250/gigabyte of storage capacity × (4 gigabytes of storage)] = \$1,000 per platform. See also Regulation SBSR Proposed Amendments Release, 80 FR at 14776.

⁸²⁸ This figure is calculated as follows: [(Sr. Programmer (100 hours) at \$303 per hour) + (Sr. Systems Analyst (40 hours) at \$260 per hour) + (Compliance Manager (20 hours) at \$283 per hour) + (Director of Compliance (10 hours) at \$446 per hour) + (Compliance Attorney (10 hours) at \$334 per hour)] = approximately \$54,000 per platform. See also Regulation SBSR Proposed Amendments Release, 80 FR at 14776.

⁸²⁹ This figure is calculated as follows: [(Sr. Programmer (16 hours) at \$303 per hour) + (Sr. Systems Analyst (16 hours) at \$260 per hour) + (Compliance Manager (30 hours) at \$283 per hour) + (Compliance Clerk (120 hours) at \$64 per hour) + (Director of Compliance (12 hours) at \$446 per hour) + (Compliance Attorney (24 hours) at \$334 per hour)] = approximately \$38,500 per platform. See also Regulation SBSR Proposed Amendments Release, 80 FR at 14776.

⁸³⁰ For each platform, the start-up cost is obtained by summing up its components = \$102,000 + \$200,000 + \$49,000 + \$77,000 + \$1,000 + \$54,000 + \$38,500 = \$521,500. The start-up cost for all platforms = 10 platforms × \$521,500 = \$5,215,000.

⁸³¹ For each platform, the Commission estimates the cost of maintaining connectivity to an SDR to be the same as the cost of establishing connectivity to a registered SDR.

⁸³² For each platform, the on-going cost per year is obtained by summing up its components = \$200,000 + \$77,000 + \$1,000 + \$38,500 = \$316,500. The ongoing cost per year for all platforms = 10 platforms × \$316,500 = \$3,165,000.

The Commission estimates that a registered clearing agency will have the same reporting infrastructure cost components as a platform, except that the costs to a registered clearing agency will be marginally higher because Rule 901(e)(1)(ii), as adopted herein, imposes a burden on registered clearing agencies that does not apply to platforms.⁸³³ Although a registered clearing agency might not otherwise establish connectivity to an alpha SDR, the registered clearing agency will have to establish connectivity to alpha SDRs to comply with new Rule 901(e)(1)(ii). Accordingly, the Commission estimates that each registered clearing agency will connect to four registered SDRs.⁸³⁴

For each registered clearing agency, the estimated start-up costs consist of: (1) \$102,000 for the initial setting-up of the reporting infrastructure to carry out duties under Rule 901; (2) \$400,000 for establishing connectivity to a registered SDR;⁸³⁵ (3) \$49,000 for developing, testing, and supporting a reporting mechanism for security-based swap transactions; (4) \$77,000 for order management costs; (5) \$1,000 for data storage costs; (6) \$54,000 for designing and implementing an appropriate compliance and support program; and (7) \$38,500 for maintaining its compliance and support program. Therefore, the total estimated start-up cost is \$721,500 per registered clearing agency and \$2,886,000 in aggregate for all registered clearing agencies.⁸³⁶

⁸³³ Rule 901(e)(1)(ii) requires a registered clearing agency to report whether or not it has accepted an alpha for clearing to the alpha SDR. See *supra* Section III(G).

⁸³⁴ Cf. *supra* Section XII(A)(1)(a) (estimating that each platform will connect to only two registered SDRs).

⁸³⁵ The Commission derived the total estimated expense for registered clearing agencies as (\$100,000 hardware- and software-related expenses, including necessary backup and redundancy, per SDR connection) × (4 SDR connections per registered clearing agency) = \$400,000 per registered clearing agency. See Regulation SBSR Proposed Amendments Release, 80 FR at 14776 (estimating the hardware- and software-related expenses per SDR connection at \$100,000).

⁸³⁶ For each registered clearing agency, the start-up cost is obtained by summing up its components = \$102,000 + \$400,000 + \$49,000 + \$77,000 + \$1,000 + \$54,000 + \$38,500 = \$683,000. The start-up cost for all registered clearing agencies = 4 registered clearing agencies × \$721,500 = \$2,886,000. These figures represent an estimate of the costs to a registered clearing agency to be fully onboarded with a registered SDR to allow reporting of all of the primary and secondary trade information associated with security-based swaps, as reporting sides are required to report. To the extent that a registered clearing agency must report to a registered SDR only alpha clearing dispositions and not entire transaction reports, the cost incurred by the clearing agency to carry out such reporting could be less. Regulation SBSR does not require full onboarding with an alpha SDR to report the limited number of data elements necessary to convey

For each registered clearing agency, the ongoing estimated annual costs consist of: (1) \$400,000 for maintaining connectivity to a registered SDR;⁸³⁷ (2) \$77,000 for order management costs; (3) \$1,000 for data storage costs; and (4) \$38,500 for maintaining its compliance and support program. Therefore, the Commission estimates the ongoing cost per year as \$516,500 per registered clearing agency and \$2,066,000 for all registered clearing agencies.⁸³⁸

The Commission previously estimated, using available transaction data from TIW, that there will be approximately 3 million transaction events per year related to security-based swaps, including the execution of new transactions and various types of life cycle events.⁸³⁹ The Commission also estimated that Rule 901(a), as adopted in the Regulation SBSR Adopting Release, will require approximately 2 million of those events to be reported under Regulation SBSR.⁸⁴⁰ In the Regulation SBSR Proposed Amendments Release, the Commission further estimated that the proposed amendments to Rule 901 would subject another 1 million events to a reporting requirement. This estimate of 1 million reportable events included platform-executed security-based swaps that will be submitted to clearing, all clearing transactions, and all life cycle events associated with such transactions. Specifically, the Commission estimates that platforms will be responsible for the reporting of approximately 120,000 of the 1 million additional reportable events per year.⁸⁴¹ Since a platform must report only the security-based swaps executed on the platform that will be submitted to clearing, the Commission estimates that essentially all 120,000 platform-executed alphas will be terminated. The Commission estimates that there will be approximately 760,000 reportable events per year that are clearing transactions or life cycle events associated with clearing transactions.⁸⁴²

whether or not the clearing agency has accepted a particular alpha for clearing.

⁸³⁷ The Commission estimates that a registered clearing agency's cost of maintaining connectivity to an SDR is the same as the registered clearing agency's cost of establishing connectivity to an SDR.

⁸³⁸ The ongoing cost per year is obtained by summing up its components = \$400,000 + \$77,000 + \$1,000 + \$38,500 = \$516,500. The ongoing cost per year for all registered clearing agencies = 4 registered clearing agencies × \$516,500 = \$2,066,000.

⁸³⁹ See Regulation SBSR Proposed Amendments Release, 80 FR at 14776.

⁸⁴⁰ See *id.*

⁸⁴¹ See *supra* Section XI(B)(2)(b)(iv).

⁸⁴² See *id.*

The Commission estimates that platforms will be responsible for reporting approximately 120,000 security-based swaps per year, at an annual cost of approximately \$45,300 or \$4,530 per platform,⁸⁴³ and that registered clearing agencies will be responsible for reporting approximately 760,000 reportable events at an annual cost of approximately \$286,900 or \$71,725 per registered clearing agency.⁸⁴⁴ The Commission believes that all reportable events that will be reported by platforms and registered clearing agencies pursuant to the amendments to Rule 901(a) will be reported through electronic means.

In the Regulation SBSR Adopting Release, the Commission stated that, to the extent that security-based swaps become more standardized and trade more frequently on electronic platforms (rather than manually), the act of reporting transactions to a registered SDR should become less costly.⁸⁴⁵ Together, these trends are likely to reduce the number of transactions that necessitate the manual capture of bespoke data elements, which is likely to take more time and be more expensive than electronic capture of standardized transactions. New Rules 901(a)(1) and (a)(2)(i), respectively, assign reporting duties to clearing transactions and platform-executed security-based swaps that will be submitted to clearing. To the extent that registered clearing agencies make standardized security-based swaps available for clearing and platforms make standardized security-based swaps available for trading, the reporting of transactions covered by Rules 901(a)(1) and (a)(2)(i) should be less costly on average than the reporting of bespoke security-based swaps.

One commenter argued that the incremental costs of assigning the

reporting obligation to the alpha reporting side would be small compared to the costs associated with registered clearing agencies incurring the reporting duty and having to establish connectivity to alpha SDRs.⁸⁴⁶ The Commission estimates that a registered clearing agency will connect to four registered SDRs as a result of Rule 901(e)(1)(ii),⁸⁴⁷ but that, in the absence of this rule, a registered clearing agency, like a platform, would connect to only two registered SDRs.⁸⁴⁸ Thus, the Commission estimates that a registered clearing agency has to connect to two additional alpha SDRs as a result of new Rule 901(e)(1)(ii). The estimated cost of establishing connectivity to two SDRs is \$200,000, and the estimated annual cost of maintaining connectivity to two SDRs is \$200,000.⁸⁴⁹ The estimated aggregate cost of establishing connectivity to alpha SDRs is \$800,000, and the estimated aggregate annual cost of maintaining connectivity to alpha SDRs is \$800,000. The Commission estimates that the costs to the alpha reporting side of reporting the initial alpha transaction are an upper bound estimate of the costs of assigning the duty to report clearing dispositions of alphas to the alpha reporting side.⁸⁵⁰ To estimate the costs to the alpha reporting side of reporting the initial alpha transaction, the Commission assumes that the total annual number of platform-executed alpha transactions that will be submitted for clearing is 120,000.⁸⁵¹ The Commission estimates the costs to the

alpha reporting sides of reporting the initial alpha transactions to be the same as the platforms' costs of reporting the 120,000 platform-executed alpha transactions. Thus, the aggregate reporting costs are approximately \$45,300 per year,⁸⁵² which represent an upper bound estimate of the costs of assigning the reporting obligation to the alpha reporting side.

The Commission recognizes that its estimate of the costs that an alpha reporting side would incur to report whether a security-based swap was accepted for clearing are lower than its estimate of the cost that a registered clearing agency would incur in order to establish connectivity to alpha SDRs to meet the same regulatory obligation under Rule 901(e)(1)(ii). Nevertheless, the Commission is adopting Rule 901(e)(1)(ii) as proposed because, as explained above, this approach is likely to efficiently support data quality at registered SDRs. Accordingly, the Commission believes that the approach reflected in newly adopted Rule 901(e)(1)(ii) is appropriate even in light of the costs. The Commission notes that existing Rule 901(c)(6) requires reporting of an indication whether the direct counterparties intend that a security-based swap will be submitted to clearing so that this information will appear in the transaction records of the alpha SDR. The Commission believes that requiring reporting to the alpha SDR of whether or not a registered clearing agency accepts the alpha for clearing will facilitate the Commission's ability to measure outstanding bilateral exposures, including exposures to registered clearing agencies.

Moreover, the Commission's determination that the clearing agency to which the security-based swap is submitted for clearing should be required to report the disposition of the alpha rather than the alpha reporting side (or a platform, in the case of a platform-executed alpha) is designed to improve the integrity of information about cleared security-based swaps. The Commission believes that centralizing responsibility for reporting this information in a small number of registered clearing agencies rather than a larger number of alpha reporting sides and platforms minimizes the likelihood of orphan alphas. The adopted approach should facilitate the ability of alpha SDRs to match clearing disposition reports with the original alpha transaction reports and help the Commission to obtain a more accurate view of the exposures of counterparties that intended to clear transactions. A

⁸⁴⁶ See *supra* Section III(G).

⁸⁴⁷ See *supra* Section XII(A)(1)(a).

⁸⁴⁸ See *id.*

⁸⁴⁹ The cost of establishing SDR connectivity is estimated as $(\$100,000 \text{ hardware- and software-related expenses, including necessary backup and redundancy, per SDR connection}) \times (2 \text{ SDR connections per registered clearing agency}) = \$200,000 \text{ per registered clearing agency. See also Regulation SBSR Adopting Release, 80 FR at 14701. The Commission estimates that a registered clearing agency's cost of maintaining connectivity to two alpha SDRs is the same as the registered clearing agency's cost of establishing connectivity to two alpha SDRs. These costs do not represent new compliance costs. They are part of the start-up and ongoing costs incurred by a registered clearing agency to comply with the amendments to Rule 901 adopted today and discussed in Section XII(A)(1)(a), *supra*. The estimated aggregate cost of establishing connectivity to alpha SDRs is } (\$200,000 \text{ alpha SDR connectivity cost per registered clearing agency}) \times (4 \text{ registered clearing agencies}) = \$800,000. The estimated aggregate annual cost of maintaining connectivity to alpha SDRs is } (\$200,000 \text{ alpha SDR connectivity maintenance cost per registered clearing agency}) \times (4 \text{ registered clearing agencies}) = \$800,000.$

⁸⁵⁰ The costs of reporting the initial alpha trade form an upper bound estimate because the initial alpha trade report likely requires more data elements to be captured and transmitted than would a report of whether the alpha trade has been accepted for clearing.

⁸⁵¹ See *supra* Section XII(A)(1)(a).

⁸⁵² See *id.*

⁸⁴³ The Commission estimates: $((120,000 \times 0.005 \text{ hours per transaction}) / (10 \text{ platforms})) = 60 \text{ hours per platform, or } 600 \text{ total hours. The Commission further estimates the total cost to be: } [((\text{Compliance Clerk (30 hours) at } \$64 \text{ per hour}) + (\text{Sr. Computer Operator (30 hours) at } \$87 \text{ per hour})) \times (10 \text{ platforms})] = \text{approximately } \$45,300, \text{ or } \$4,530 \text{ per platform. See also Regulation SBSR Proposed Amendments Release, 80 FR at 14777.}$

⁸⁴⁴ The Commission estimates: $((760,000 \times 0.005 \text{ hours per transaction}) / (4 \text{ registered clearing agencies})) = 950 \text{ hours per registered clearing agency, or } 3,800 \text{ total hours. The Commission further estimates the total cost to be: } [((\text{Compliance Clerk (475 hours) at } \$64 \text{ per hour}) + (\text{Sr. Computer Operator (475 hours) at } \$87 \text{ per hour})) \times (4 \text{ registered clearing agencies})] = \$286,900, \text{ or } \$71,725 \text{ per registered clearing agency. See also Regulation SBSR Proposed Amendments Release, 80 FR at 14777, which estimates the time taken to process a transaction at } 0.005 \text{ hours, the hourly rate of a Compliance Clerk at } \$64 \text{ per hour, and the hourly rate of a Sr. Computer Operator at } \87 per hour.

⁸⁴⁵ See 80 FR at 14703.

more accurate view of the exposures of counterparties will enable the Commission to conduct robust monitoring of the security-based swap market for potential risks to financial markets and financial market participants.⁸⁵³

Furthermore, Rule 901(e)(1)(ii) is consistent with the Commission's approach of assigning the reporting obligation for a transaction to the person with the most complete and efficient access to the required information at the point of creation. The registered clearing agency determines whether to accept an alpha for clearing and controls the precise moment when the transaction is cleared; the Commission believes, therefore, that the clearing agency is best placed to report the result of its decision. If the alpha reporting side were required to report whether or not the alpha has been accepted for clearing, it would first need to learn this information from the registered clearing agency.⁸⁵⁴ As the Commission noted in Section III(B), *supra*, a rule that required reporting by a person who lacks direct access, at the time of creation, to the information that must be reported would increase the risks of data discrepancies, errors, or delays. Accordingly, for the same reasons that the Commission is assigning to registered clearing agencies the duty to report all clearing transactions, the Commission also believes that it is more efficient to require a registered clearing agency to report to the alpha SDR whether or not the clearing agency has accepted the alpha for clearing.

b. For Platforms and Reporting Sides of Alphas

Under new Rule 901(a)(3), a person who has a duty to report an alpha transaction also is required to promptly provide the registered clearing agency with the transaction ID of the alpha transaction and the identity of the registered SDR to which the transaction will be or has been reported.

Reporting sides and platforms are likely already to have in place the infrastructure needed to report security-based swaps to a registered clearing agency, as voluntary clearing of standardized single-name CDS has become a significant feature of the existing security-based swap market in

the United States. Furthermore, as additional platforms enter the security-based swap market, it is likely that they also will seek to establish connectivity to one or more registered clearing agencies, as there are market incentives to clear platform-executed security-based swaps and platforms will likely seek to offer their participants the ability to transmit information about platform-executed transactions directly to a clearing agency. Thus, the Commission does not believe that new Rule 901(a)(3) will require additional infrastructure or connectivity that otherwise would not exist.

However, Rule 901(a)(3) will require persons with the duty to report alphas to provide two additional data elements—the transaction ID of the alpha and the name of the alpha SDR—to the registered clearing agency. The Commission believes that persons who submit security-based swap transactions to registered clearing agencies will comply with Rule 901(a)(3) by including these two data elements along with all of the other transaction data submitted to the clearing agency. The Commission estimates that the one-time cost for developing the ability to report these two data elements will be \$2,815 per reporting person, and the additional one-time burden related to the implementation of a reporting mechanism for these two data elements will be \$1,689 per reporting person.⁸⁵⁵ The Commission believes that the additional ongoing cost related to the development of the ability to capture the relevant transaction information will be \$2,815 per reporting person and the additional ongoing burden related to the maintenance of the reporting mechanism will be \$563 per reporting person.⁸⁵⁶

⁸⁵⁵ The Commission estimates the cost of developing the ability to capture the alpha's transaction ID and the alpha SDR as: [(Sr. Programmer (5 hours at \$303 per hour) + Sr. Systems Analyst (5 hours) at \$260 per hour) = \$2,815 per platform or reporting side. The Commission estimates the cost of implementing the reporting mechanism as: (Sr. Programmer (3 hours) at \$303 per hour + Sr. Systems Analyst (3 hours) at \$260 per hour) = \$1,689 per platform or reporting side.

⁸⁵⁶ The Commission estimates the additional ongoing development cost as (Sr. Programmer (5 hours at \$303 per hour) + Sr. Systems Analyst (5 hours at \$260 per hour)) = \$2,815 per platform or reporting side. The Commission estimates the ongoing maintenance cost as (Sr. Programmer (1 hour at \$303 per hour) + Sr. Systems Analyst (1 hour at \$260 per hour)) = \$563 per platform or reporting side.

c. Total Costs of Platforms, Registered Clearing Agencies, and Reporting Sides Relating to Amendments to Rule 901

Summing these costs,⁸⁵⁷ the Commission estimates that the initial, first-year costs of complying with the amendments to Rule 901 (including the initial reporting and the reporting of any life cycle events) will be \$5,260,300, which corresponds to \$526,030 per platform.⁸⁵⁸ The Commission estimates that the ongoing aggregate annual costs, after the first year, of complying with the amendments to Rule 901 (including the initial reporting and the reporting of any life cycle events) will be \$3,210,300, which corresponds to \$321,030 per platform.⁸⁵⁹

For registered clearing agencies, the Commission estimates that the initial, first-year costs of complying with the amendments to Rule 901 (including the initial reporting and the reporting of any life cycle events) will be \$3,172,900, which corresponds to \$793,225 per registered clearing agency.⁸⁶⁰ The Commission estimates that the ongoing aggregate annual costs, after the first year, of complying with the amendments to Rule 901 (including the initial reporting and the reporting of any life cycle events) will be \$2,352,900, which corresponds to \$588,225 per registered clearing agency.⁸⁶¹

For compliance with new Rule 901(a)(3), the Commission estimates that the initial, first-year costs of complying will be \$1,396,240, which corresponds to \$4,504 per respondent.⁸⁶² The

⁸⁵⁷ In the Regulation SBSR Proposed Amendments Release, platforms' initial, first-year costs and ongoing aggregate annual costs included costs incurred under Rule 901(a)(3). In this release, platforms' initial, first-year costs and ongoing aggregate annual costs do not include costs incurred under Rule 901(a)(3). Instead, platforms' Rule 901(a)(3) costs have been added to the Rule 901(a)(3) costs of the 300 reporting sides to estimate the initial, first-year and ongoing aggregate annual costs of Rule 901(a)(3) for 300 reporting sides and 10 platforms.

⁸⁵⁸ This estimate is based on the following: $((\$102,000 + \$200,000 + \$49,000 + \$77,000 + \$54,000 + \$1,000 + \$38,500 + \$4,530) \times (10 \text{ platforms})) = \$5,260,300$ which corresponds to \$526,030 per platform.

⁸⁵⁹ This estimate is based on the following: $((\$200,000 + \$77,000 + \$1,000 + \$38,500 + \$4,530) \times (10 \text{ platforms})) = \$3,210,300$, or \$321,030 per platform.

⁸⁶⁰ This estimate is based on the following: $((\$102,000 + \$400,000 + \$49,000 + \$77,000 + \$54,000 + \$1,000 + \$38,500 + \$71,725) \times (4 \text{ registered clearing agencies})) = \$3,172,900$, which corresponds to \$793,225 per registered clearing agency.

⁸⁶¹ This estimate is based on the following: $((\$400,000 + \$77,000 + \$1,000 + \$38,500 + \$71,725) \times (4 \text{ registered clearing agencies})) = \$2,352,900$, or \$588,225 per registered clearing agency.

⁸⁶² This estimate is based on the following: $(\$2,815 + \$1,689) \times 310 (300 \text{ reporting sides} + 10 \text{ platforms}) = \$1,396,240$, which corresponds to

⁸⁵³ See Regulation SBSR Adopting Release 80 FR at 14700.

⁸⁵⁴ The commenter who advocated that the duty to report whether or not the transaction has been accepted for clearing should be given to the reporting side of the alpha acknowledged that the alpha reporting side must rely on the clearing agency to provide information about the disposition of any transaction submitted to clearing. See LCH.Clearnet Letter at 9–10.

Commission estimates that the ongoing aggregate annual costs, after the first year, of complying with Rule 901(a)(3) will be \$1,047,180, which corresponds to \$3,378 per respondent.⁸⁶³

d. Reporting by Unregistered Persons

As noted in Section IX(G), *supra*, the amendments to existing Rule 901(a)(2)(ii)(E) that are being adopted today expand the reporting hierarchy to assign the duty to report additional cross-border transactions when there is no registered person on either side. As under existing Rule 901, the reporting side, as determined by the reporting hierarchy, is required to submit the information required by Rule 901.

Under newly adopted Rule 901(a)(2)(ii)(E)(2), in a transaction between an unregistered U.S. person and an unregistered foreign dealing entity that is engaging in ANE activity, the sides are required to select which side is the reporting side. Also under Rule 901(a)(2)(ii)(E)(2), if both sides are unregistered non-U.S. persons and both are engaging in ANE activity, the sides would be required to select the reporting side. In both scenarios, both sides would be subject to Rule 908(b) and thus the Commission could impose reporting duties on either side.

Newly adopted Rule 901(a)(2)(ii)(E)(3) addresses the scenario where one side is subject to Rule 908(b) and the other side is not—*i.e.*, one side includes only unregistered non-U.S. persons that do not engage in any ANE activity. When the other side includes an unregistered U.S. person or an unregistered foreign dealer that is engaging in ANE activity, the side with the unregistered U.S. person or the unregistered foreign dealing entity would be the reporting side.⁸⁶⁴

\$4,504 per respondent. In the Regulation SBSR Proposed Amendments Release, the estimate only included the one-time cost related to the development of the ability to capture the relevant transaction information (\$2,815). The estimation has been revised to also include the one-time cost of implementing a reporting mechanism for the transaction information (\$1,689).

⁸⁶³ This estimate is based on the following: $((\$2,815 + \$563) \times 310 \text{ (300 reporting sides + 10 platforms)}) = \$1,047,180$, or \$3,378 per respondent. In the Regulation SBSR Proposed Amendments Release, the estimate only included the ongoing cost related to the development of the ability to capture the relevant transaction information (\$2,815). The estimation has been revised to also include the ongoing cost of implementing a reporting mechanism for the transaction information (\$563).

⁸⁶⁴ While Rules 901(a)(2)(ii)(E)(2)–(3) admit the possibility that some of these unregistered persons are U.S. persons, the Commission does not expect unregistered U.S. persons to be responsible for reporting a significant amount of additional transaction under Rules 901(a)(2)(ii)(E)(2)–(3). In current market practice, larger, more sophisticated participants assume reporting duties. As a result, in

In the Regulation SBSR Adopting Release,⁸⁶⁵ the Commission estimated that 300 respondents will incur reporting duties under Regulation SBSR, of which 50 are likely to register as security-based swap dealers and five are likely to register as major security-based swap market participants. Unregistered persons covered by new Rules 901(a)(2)(ii)(E)(2) and (3) are already included in the remaining subset of 245 respondents that are not likely to register as security-based swap dealers or major security-based swap participants. Because the Commission had already accounted for the programmatic costs of building reporting infrastructure and reporting security-based swap transactions incurred by these 300 respondents in the Regulation SBSR Adopting Release,⁸⁶⁶ Rules 901(a)(2)(ii)(E)(2) and (3) will not result in additional programmatic costs associated with reporting infrastructure or transaction reporting. Two commenters noted that requiring the reporting of ANE transactions would place burdens on unregistered entities that do not have reporting infrastructure in place and would be compelled to engage third-party providers to report transactions.⁸⁶⁷ The Commission acknowledges that the reporting of ANE transactions will place burdens on unregistered entities, but in only a limited number of cases. The Commission estimates that the initial aggregate annual costs associated with Rule 901 will be approximately \$2,096,000, which corresponds to approximately \$524,000 per unregistered entity.⁸⁶⁸ The Commission estimates that the ongoing aggregate annual costs associated with Rule 901 will be approximately \$1,276,000, which corresponds to approximately \$319,000 per unregistered entity.⁸⁶⁹ As

cases where an unregistered U.S. person and a non-U.S. person engaged in dealing activity in the United States select the reporting side, the reporting duty is likely to be assigned to the non-U.S. person. *See supra* Section IX(G)(2)(a).

⁸⁶⁵ *See* 80 FR at 14674.

⁸⁶⁶ *See id.* at 14701–702.

⁸⁶⁷ *See* ISDA I at 11; SIFMA/FSR Letter at 13.

⁸⁶⁸ The initial cost estimates are based on the following: $\$524,000 \times 4 \text{ unregistered entities} = \$2,096,000$, which corresponds to \$524,000 per unregistered entity. *See* Regulation SBSR Adopting Release, 80 FR at 14702. The four unregistered entities are the estimated number of unregistered foreign dealing entities that will engage in ANE activity. *See supra* Section II(A)(4)(d). The Commission assumes that unregistered U.S. persons that fall under Rules 901(a)(2)(ii)(E)(2) and (3) will not assume reporting duties. *See supra* Section IX(G)(2)(a).

⁸⁶⁹ The ongoing cost estimates are based on the following: $\$319,000 \times 4 \text{ unregistered entities} = \$1,276,000$, which corresponds to \$319,000 per unregistered entity. *See id.* for a discussion of the assumptions underlying the calculations.

discussed earlier, these programmatic costs are part of the programmatic costs associated with Rule 901 that were accounted for in the Regulation SBSR Adopting Release. Unregistered foreign dealing entities could fulfil their reporting obligations by incurring the programmatic costs of building reporting infrastructure and reporting security-based swap transactions. Alternatively, these entities could engage with third-party service providers to carry out any reporting duties incurred under Regulation SBSR.⁸⁷⁰ The Commission disagrees with the commenters that unregistered entities would use third-party service providers without considering alternatives. Though the Commission does not have specific information on the pricing of third-party reporting services on which to base estimates of the cost of engaging third-parties to provide reporting services, the Commission notes that unregistered entities will likely choose the method of compliance that they deem to be most cost efficient. Thus, the Commission assumes that unregistered entities would engage third-party service providers only if they provide services at costs less than the programmatic costs of Rule 901 estimated above.

Under new Rule 901(a)(2)(ii)(E)(4), a registered broker-dealer would incur the duty to report a security-based swap that is effected by or through that broker-dealer only when neither side includes a person that falls within Rule 908(b)(5). The Commission estimates that a maximum of 20 registered broker-dealers, excluding registered SB SEFs, will incur this reporting duty and will report 540 security-based swap transactions per year. Unlike the unregistered counterparties covered by Rules 901(a)(2)(ii)(E)(2) and (3), these 20 registered broker-dealers were not part of the 300 respondents the Commission estimated in the Regulation SBSR Adopting Release. Therefore, by subjecting the 20 registered broker-dealers to Regulation SBSR, new Rule 901(a)(2)(ii)(E)(4) adds new programmatic costs associated with reporting infrastructure.

The Commission estimated the costs of reporting on a per-entity basis in the Regulation SBSR Adopting Release and has no reason to believe that these per-entity costs are substantially different

⁸⁷⁰ The Commission does not have data with which to estimate the costs of using third-party service providers to carry out reporting duties incurred under Regulation SBSR. The two commenters did not provide such cost estimates in their letters. *See* ISDA I at 11; SIFMA/FSR Letter at 13).

for different types of entities.⁸⁷¹

Therefore, the Commission is applying these per-entity costs to estimate the Rule 901 programmatic costs for the 20 registered broker-dealers.⁸⁷²

For a registered broker-dealer, the cost of reporting infrastructure consists of start-up cost in the first year and, thereafter, ongoing annual costs. For each registered broker-dealer, the start-up cost is broken down into: (1) \$102,000 for the initial set-up of the reporting infrastructure to carry out duties under Rule 901; (2) \$200,000 for establishing connectivity to a registered SDR; (3) \$49,000 for developing, testing, and supporting a reporting mechanism for security-based swap transactions; (4) \$77,000 for order management costs; (5) \$1,000 for data storage costs; (6) \$54,000 for designing and implementing an appropriate compliance and support program; and (7) \$38,500 for maintaining the compliance and support program.⁸⁷³ Therefore, the total start-up cost is \$521,500 per registered broker-dealer and \$10,430,000 in aggregate, across all registered broker-dealers.⁸⁷⁴

For each registered broker-dealer, the ongoing annual cost consists of: (1) \$200,000 for maintaining connectivity to a registered SDR;⁸⁷⁵ (2) \$77,000 for order management costs; (3) \$1,000 for data storage costs; and (4) \$38,500 for maintaining its compliance and support program. Therefore, the ongoing cost per year is \$316,500 per registered broker-dealer, and \$6,330,000 for all registered broker-dealers.⁸⁷⁶ In the Regulation

SBSR Adopting Release,⁸⁷⁷ the Commission estimated that there will be 3 million reportable events per year under Rule 901. Of the 3 million events, 2 million are not clearing transactions. The transactions that will be reported by registered broker-dealers as a result of new Rule 901(a)(2)(ii)(E)(4) were assessed by the Commission as part of the 2 million non-clearing transactions. The Commission already accounted for the cost of reporting the 2 million non-clearing transactions in the Regulation SBSR Adopting Release.

2. Amendments to Rule 905(a)

The amendments to Rule 905(a) adopted herein provide that any counterparty or other person having a duty to report a security-based swap that discovers an error in information previously reported pursuant to Regulation SBSR must correct such error in accordance with the procedures laid out in Rule 905(a). As the Commission noted in the Regulation SBSR Adopting Release, requiring participants to promptly correct erroneous transaction information should help ensure that the Commission and other relevant authorities have an accurate view of the risks in the security-based swap market.

In the Regulation SBSR Adopting Release, the Commission estimated that Rule 905(a) will impose an initial, one-time burden associated with designing and building a reporting side's reporting system to be capable of submitting amended security-based swap transaction information to a registered SDR.⁸⁷⁸ The Commission stated its belief that designing and building appropriate reporting system functionality to comply with Rule 905(a)(2) will be a component of, and represent an incremental "add-on" to, the cost to build a reporting system and develop a compliance function as required under Rule 901.⁸⁷⁹ Specifically, the Commission estimated that, based on discussions with industry participants, the incremental burden will be equal to 5% of the one-time and annual burdens associated with designing and building a reporting system that is in compliance with Rule 901, plus 10% of the corresponding one-time and annual burdens associated with developing the reporting side's overall compliance program required under Rule 901.⁸⁸⁰ This estimate was based on similar calculations contained

in the Regulation SBSR Proposing Release,⁸⁸¹ updated to reflect new estimates relating to the number of reportable events and the number of reporting sides.⁸⁸²

The Commission continues to believe that the above methodology is applicable to error reporting by platforms and registered clearing agencies under the amendment to Rule 905(a). Thus, for these new respondents, the Commission estimates that Rule 905(a) will impose an initial (first-year) aggregate cost of \$165,550, or \$11,825 per respondent,⁸⁸³ and an ongoing aggregate annualized cost of \$55,650, which is \$3,975 per respondent.⁸⁸⁴

The Commission estimates that four unregistered foreign dealing entities will engage in ANE activity and incur a duty to report as a result of new Rules 901(a)(2)(ii)(E)(2) and (3).⁸⁸⁵ These unregistered persons also will incur costs associated with error reporting under Rule 905. As noted in Section XII(A)(1)(d), *supra*, these unregistered persons are part of the subset of 300 respondents that were identified in the Regulation SBSR Adopting Release as not likely to register as security-based swap dealers or major security-based swap participants. Because the Commission already accounted for the programmatic costs of building and maintaining error reporting capabilities incurred by these 300 respondents in the Regulation SBSR Adopting Release,⁸⁸⁶ the amendments to Rule 905(a) will not result in additional programmatic costs for the four unregistered persons.

The Commission estimates that 20 registered broker-dealers, excluding SB SEFs, will incur a duty to report security-based swap transactions because of new Rule

⁸⁷¹ See *id.*

⁸⁷² One commenter argued that Rule 901(a)(2)(ii)(E)(4) "would create a disproportionate burden on registered broker-dealers relative to the small percentage of the market that these transactions compromise." SIFMA/FSR Letter at 14. The Commission notes that many registered broker-dealers may already have order management systems in place to facilitate voluntary reporting of security-based swap transactions or clearing activity. As a result, any additional costs related to systems and infrastructure will be limited to those broker-dealers that either invest in new systems or must upgrade existing systems to meet minimum requirements for reporting. To the extent that the cost estimates discussed here do not take this cost limiting fact into account, they are an upper bound for the estimated costs. See Regulation SBSR Adopting Release, 80 FR at 14701.

⁸⁷³ See *supra* Section XII(A)(1)(a).

⁸⁷⁴ For each registered broker-dealer, the start-up cost is obtained by summing up its components = \$102,000 + \$200,000 + \$49,000 + \$77,000 + \$1,000 + \$54,000 + \$38,500 = \$521,500. The start-up cost for all registered broker-dealers = 20 registered broker-dealers × \$521,500 = \$10,430,000.

⁸⁷⁵ See *supra* Section XII(A)(1)(a).

⁸⁷⁶ For each registered broker-dealer, the on-going cost per year is obtained by summing up its components = \$200,000 + \$77,000 + \$1,000 + \$38,500 = \$316,500. The on-going cost per year for all registered broker-dealers is estimated to be (20 registered broker-dealers × \$316,500) = \$6,330,000.

⁸⁷⁷ See Regulation SBSR Adopting Release, 80 FR at 14676.

⁸⁷⁸ See 80 FR at 14714.

⁸⁷⁹ See *id.*

⁸⁸⁰ See *id.*

⁸⁸¹ See 75 FR at 75254.

⁸⁸² See Regulation SBSR Adopting Release, 80 FR at 14701–702.

⁸⁸³ See Regulation SBSR Proposing Release, 75 FR at 75254–55. This figure is calculated as follows: [(((\$49,000 for one-time development of reporting system) × (0.05)) + ((\$2,500 annual maintenance of reporting system) × (0.05)) + ((\$54,000 one-time compliance program development) × (0.1)) + ((\$38,500 annual support of compliance program) × (0.1))] × 14 reporting entities (10 platforms + 4 registered clearing agencies)] = \$165,550, which is \$11,825 per platform or registered clearing agency.

⁸⁸⁴ See Regulation SBSR Proposing Release, 75 FR at 75254–55. This figure is calculated as follows: [(((\$2,500 annual maintenance of reporting system) × (0.05)) + ((\$38,500 annual support of compliance program) × (0.1))] × 14 reporting entities (10 platforms + 4 registered clearing agencies)] = \$55,650, which is \$3,975 per platform or registered clearing agency.

⁸⁸⁵ See *supra* Section II(A)(4)(d) for a discussion of how these dealing entities are identified in the TIW data.

⁸⁸⁶ See 80 FR at 14714.

901(a)(2)(ii)(E)(4).⁸⁸⁷ Thus, these registered broker-dealers are subject to the amendment to Rule 905(a) adopted herein and will incur costs associated with error reporting.

The Commission continues to believe that the cost estimation methodology previously applied in the Regulation SBSR Adopting Release is applicable to error reporting by registered broker-dealers.⁸⁸⁸ Thus, for registered broker-dealers, the Commission estimates that the amendment to Rule 905(a) will impose an initial (first-year) aggregate cost of \$236,500, or \$11,825 per respondent,⁸⁸⁹ and an ongoing aggregate annualized cost of \$79,500, or \$3,975 per respondent.⁸⁹⁰

Rule 905(a)(1) as amended herein states that, if a person that was not the reporting side for a security-based swap transaction discovers an error in the information reported with respect to such security-based swap, that person shall promptly notify the person having the duty to report the security-based swap of the error. Clients of registered broker-dealers likely will incur costs, because Rule 905(a)(1) requires them to notify registered broker-dealers of errors in transaction reports made by the registered broker-dealers pursuant to Rule 901(a)(2)(ii)(E)(4). As stated in Section XII(A)(1)(d), *supra*, the Commission estimates that registered broker-dealers will incur the duty to report 540 security-based swap transactions per year under Rule 901(a)(2)(ii)(E)(4). Assuming that each of the 540 transactions is reported in error, the upper bound estimate of the annual cost associated with this obligation is approximately \$17,280, which corresponds to roughly \$576 per respondent.⁸⁹¹

⁸⁸⁷ See *supra* Section XII(A)(1)(d).

⁸⁸⁸ See 80 FR at 14714.

⁸⁸⁹ See Regulation SBSR Proposing Release, 75 FR at 75254–55. This figure is calculated as follows: $(((\$49,000 \text{ for one-time development of reporting system}) \times (0.05)) + ((\$2,500 \text{ annual maintenance of reporting system}) \times (0.05)) + ((\$54,000 \text{ one-time compliance program development}) \times (0.1)) + ((\$38,500 \text{ annual support of compliance program}) \times (0.1))) \times 20 \text{ registered broker-dealers}] = \$236,500$, which is \$11,825 per registered broker-dealer.

⁸⁹⁰ See Regulation SBSR Proposing Release, 75 FR at 75254–55. This figure is calculated as follows: $(((\$2,500 \text{ annual maintenance of reporting system}) \times (0.05)) + ((\$38,500 \text{ annual support of compliance program}) \times (0.1))) \times 20 \text{ registered broker-dealers}] = \$79,500$, which is \$3,975 per registered broker-dealer.

⁸⁹¹ These figures are based on the assumption that approximately 540 additional security-based swap transactions per year will have to be reported by registered broker-dealers pursuant to Rule 901(a)(2)(ii)(E)(4), and that these trades involve 30 entities with reporting duties. Using cost estimated provided in the Regulation SBSR Adopting Release, if each trade is reported in error, then the aggregate annual cost of error notification is $540 \text{ errors} \times \text{Compliance Clerk at } \$64 \text{ per hour} \times 0.5 \text{ hours per}$

3. Amendments to Rule 906(c)

Existing Rule 906(c) requires each participant of a registered SDR that is a registered security-based swap dealer or registered major security-based swap participant to establish, maintain, and enforce written policies and procedures that are reasonably designed to ensure compliance with any security-based swap transaction reporting obligations in a manner consistent with Regulation SBSR. Rule 906(c) also requires each such participant to review and update the required policies and procedures at least annually. The amendment to Rule 906(c) adopted herein extends these same requirements to participants of a registered SDR that are platforms, registered clearing agencies, and registered broker-dealers.

The Commission continues to believe that the cost estimation methodology previously applied in the Regulation SBSR Adopting Release is applicable to the adoption and maintenance of policies and procedures.⁸⁹² Thus, for registered clearing agencies and platforms, the Commission estimates that the amendments to Rule 906(c) will impose an initial (first-year) aggregate cost of \$1,288,000, or \$92,000 per registered clearing agency or platform,⁸⁹³ and an ongoing aggregate annualized cost of \$476,000, or \$34,000 per registered clearing agency or platform.⁸⁹⁴ In addition, for registered broker-dealers likely to become participants solely as a result of making a report to satisfy an obligation under Rule 901(a)(2)(ii)(E)(4) (a “respondent broker-dealer”), the Commission estimates that the amendments to Rule 906(c) will impose an initial (first-year) aggregate cost of \$1,840,000, or \$92,000 per respondent broker-dealer,⁸⁹⁵ and an

report = \$17,280, or \$576 per participant. See Regulation SBSR Adopting Release, 80 FR at 14714. Salary figures are taken from SIFMA’s Management & Professional Earnings in the Securities Industry 2013, modified to account for a 1,800-hour work-week and multiplied by 5.35 to account for bonuses, firm size, employee benefits, and overhead.

⁸⁹² See Regulation SBSR Adopting Release, 80 FR at 14716.

⁸⁹³ See *id.* This figure is based on the following: $(((\$58,000 \text{ for one time developing of written policies and procedures}) + (\$34,000 \text{ for annual updates to policies and procedures})) \times 14 \text{ registered clearing agencies and platforms}] = \$1,288,000$, which is \$92,000 per registered clearing agency or platform.

⁸⁹⁴ See Regulation SBSR Adopting Release, 80 FR at 14716. This figure is based on the following: $[(\$34,000 \text{ for annual updates to policies and procedures}) \times 14 \text{ registered clearing agencies and platforms}] = \$476,000$, which is \$34,000 per registered clearing agency or platform.

⁸⁹⁵ See Regulation SBSR Adopting Release, 80 FR at 14716. This figure is based on the following: $(((\$58,000 \text{ for one time developing of written policies and procedures}) + (\$34,000 \text{ for annual}$

ongoing aggregate annualized cost of \$680,000, or \$34,000 per respondent broker-dealer.⁸⁹⁶ The Commission does not believe that the amendments to Rule 906(c) will impose any economic costs beyond the paperwork burdens described herein and in Section XI(D)(2)(c), *supra*.

4. Amendments That Subject Additional Cross-Border Security-Based Swaps to Regulation SBSR

a. ANE Transactions Involving Unregistered Entities

New Rule 908(a)(1)(v) provides that any security-based swap transaction connected with a non-U.S. person’s security-based swap dealing activity that is arranged, negotiated, or executed by U.S. personnel is subject to regulatory reporting and public dissemination under Regulation SBSR.

Several commenters expressed concern about the complexities and expense of implementing the adopted rules.⁸⁹⁷ One commenter stated there would be significant costs associated with reporting because market participants that have already designed and implemented reporting systems based on the CFTC’s cross-border guidance and the rules of other jurisdictions would need to modify their systems to comply with the Commission’s proposed rules.⁸⁹⁸

updates to policies and procedures)) $\times 20$ respondent broker-dealers] = \$1,840,000, which is \$92,000 per respondent broker-dealer.

⁸⁹⁶ See Regulation SBSR Adopting Release, 80 FR at 14716. This figure is based on the following: $[(\$34,000 \text{ for annual updates to policies and procedures}) \times 20 \text{ respondent broker-dealers}] = \$680,000$, which is \$34,000 per respondent broker-dealer.

⁸⁹⁷ See IIB Letter at 16 (stating that regulatory reporting of transactions where neither reporting side includes a U.S. person, guaranteed affiliate, or registered security-based swap dealer would come with significant cost); ISDA I at 11 (stating that expanding the reporting requirements to non-U.S. trades would be burdensome and costly); SIFMA-AMG I at 2 (stating that requiring the reporting of transactions that were arranged, negotiated or executed in the United States would increase the transactional burdens on “an already taxed system”); SIFMA/FSR Letter at 12 (taking the view that monitoring for conduct in the United States and building the infrastructure needed for reporting based purely on conduct will be an unnecessary expense for security-based swap market participants since the information being added to the public dissemination stream would not be informative or could give a distorted view of market prices and would result in data at SDRs that has minimal U.S. nexus).

⁸⁹⁸ See IIB Letter at 16. The commenter stated that, to modify its systems in connection with the U.S. personnel test, a non-U.S. dealing entity (including one operating below the *de minimis* threshold) “would need to install or modify a trade capture system capable of tracking, on a dynamic, trade-by-trade basis, the location of front-office personnel. The non-U.S. SBSR would then need to feed that data into its reporting system and re-code

The Commission agrees that market participants will incur costs to comply with the reporting requirements of Rule 908(a)(1)(v). However, the Commission notes that all ANE transactions where a U.S. person is on one side as either a direct or indirect counterparty are already subject to regulatory reporting under the rules adopted in the Regulation SBSR Adopting Release. Thus, only a small number of ANE transactions—which the Commission estimates will result in at most 1,080 reportable events per year—will be subject to regulatory reporting as a result of new Rule 908(a)(1)(v); accordingly, the attendant costs of complying with Rule 908(a)(1)(v) will also be relatively small. The Commission understands that market participants may have to incur costs to modify their existing reporting systems to comply with the Commission's rules.⁸⁹⁹ However, to the extent that these rules and rules in other jurisdictions require the collection of the same or similar information, the system modification costs will be minimized.⁹⁰⁰

The Commission believes that the reporting and public dissemination of all ANE transactions will provide benefits to the Commission and relevant authorities and to market participants. The Commission also believes that requiring the public dissemination of these transactions could help to increase price competition and price efficiency in the security-based swap market and enable all market participants to have more comprehensive information with which to make trading and valuation determinations. Publicly disseminating these transactions also could reduce implicit transaction costs.⁹⁰¹ In addition, the amendments being adopted today reflect the Commission's assessment of the impact that the scope of security-based swap transactions subject to regulatory reporting may have

that system to account for the different rules that apply to non-U.S. SBS depending on whether they are arranged, negotiated or executed by U.S. personnel. The non-U.S. SBSD would also need to train its front office personnel in the use of this new trade capture system and develop policies, procedures, and controls to require, track, and test the proper use of that system. In addition, the non-U.S. SBSD would need to seek and obtain waivers from non-U.S. counterparties—to the extent such waivers are even permitted—with respect to privacy, blocking and secrecy laws in local jurisdictions." *Id.* In the U.S. Activity Adopting Release, the Commission addressed generally the costs that firms would incur as a result of firms having to register as security-based swap dealers. See 81 FR at 8629–31.

⁸⁹⁹ See IIB Letter at 16.

⁹⁰⁰ See *supra* Section II(A)(6).

⁹⁰¹ See U.S. Activity Proposal, 80 FR at 27483–84.

on the ability of the Commission and other relevant authorities to detect emerging risks and abusive trading in the security-based swap market. Regulatory reporting of these transactions to a registered SDR should enhance the Commission's ability to oversee relevant activity related to security-based swap dealing occurring within the United States as well as to monitor market participants for compliance with specific Title VII requirements (including the requirement that a person register with the Commission as a security-based swap dealer if it exceeds the *de minimis* threshold).⁹⁰² The reporting of these transactions also will enhance the Commission's ability to monitor manipulative and abusive practices involving security-based swap transactions or transactions in related underlying assets, such as corporate bonds or other securities transactions that result from dealing activity, or other relevant activity, in the U.S. market.⁹⁰³

b. Transactions Executed on a Platform or By or Through a Registered Broker-Dealer

New Rule 908(a)(1)(iii) requires any security-based swap transaction that is executed on a platform having its principal place of business in the United States both to be reported to a registered SDR and to be publicly disseminated pursuant to Regulation SBSR. New Rule 908(a)(1)(iv) requires the reporting and public dissemination of any security-based swap transaction that is effected by or through a registered broker-dealer (including a registered SB SEF). The Commission notes that many security-based swaps that are executed on platforms or by or through a registered broker-dealer are already subject to Regulation SBSR because they meet one or both prongs of existing Rule 908(a)(1)—*i.e.*, there is a direct or indirect counterparty that is a U.S. person on either or both sides of the transaction or the security-based swap is accepted for clearing by a clearing agency having its principal place of business in the United States.⁹⁰⁴ Thus, new Rules 908(a)(1)(iii) and (iv) extend regulatory reporting and public dissemination to an additional number of uncleared security-based

⁹⁰² See *id.* at 27483.

⁹⁰³ See *id.*

⁹⁰⁴ See Rule 908(a)(2) (stating that a security-based swap that is not included within Rule 908(a)(1) shall be subject to regulatory reporting but not public dissemination if there is a direct or indirect counterparty on either or both sides of the transaction that is a registered security-based swap dealer or a registered major security-based swap participant).

swaps: Those involving only non-U.S. persons. The costs of reporting these additional cross-border security-based swaps are considered in the Commission's analysis of the amendments to Rule 901(a)(2)(ii)(E), which assigns the duty to report those cross-border security-based swaps.⁹⁰⁵ Thus, new Rules 908(a)(1)(iii) and (iv) do not independently impose any additional reporting costs.

One commenter suggested that new Rule 908(a)(1)(iv) could provide incentives for non-U.S. counterparties to avoid transacting through registered broker-dealers, resulting in market fragmentation that would lead to adverse effects on risk management, market liquidity, and U.S. jobs.⁹⁰⁶ The Commission acknowledges that market fragmentation could result if non-U.S. counterparties avoid transacting through registered broker-dealers. However, as discussed above, because of the small number of security-based swaps that are subject to Rule 908(a)(1)(iv), any market fragmentation due to the avoidance of registered broker-dealers by non-U.S. counterparties would be limited. To the extent that adverse effects on risk management, market liquidity, and U.S. jobs flow from market fragmentation, the Commission does not believe these effects should be significant, given the limited fragmentation that will likely arise as a result of the rule.

5. Amendments to Rule 908(b)

Rule 908(b) clarifies the types of persons that can incur duties under Regulation SBSR. In the Regulation SBSR Proposed Amendments Release, the Commission proposed to amend Rule 908(b) by adding platforms and registered clearing agencies to the list of persons that might incur obligations under Regulation SBSR.⁹⁰⁷ The Commission has adopted these changes to Rule 908(b), as discussed in Section IX(F)(1), *supra*.

The Commission also is adopting new Rule 908(b)(5) to include a non-U.S. person that, in connection with such person's security-based swap dealing activity, arranged, negotiated, or executed a security-based swap using U.S. personnel. Because existing Rule 908(b)(2) covers a non-U.S. person that is registered as a security-based swap dealer, the effect of new Rule 908(b)(5) is to cover a foreign dealing entity that engages in ANE activity but that does not meet the *de minimis* threshold and thus would not have to register as a security-based swap dealer.

⁹⁰⁵ See *supra* Section XII(A)(1).

⁹⁰⁶ See IIB Letter at 16–17.

⁹⁰⁷ See 80 FR at 14759.

The costs incurred by an unregistered non-U.S. person that falls under Rule 908(b)(5) include the costs of setting up reporting infrastructure and compliance systems, which have been discussed in connection with the adoption of new Rules 901(a)(2)(ii)(E)(2) and (3).⁹⁰⁸ Once an unregistered non-U.S. person's reporting infrastructure and compliance systems are in place, the marginal cost of reporting an individual transaction would be minimal⁹⁰⁹ when compared to the costs of putting those systems in place and maintaining them over time.⁹¹⁰

6. Other Conforming Amendments

As discussed in Section V(A), *supra*, the Commission today is adopting amendments to Rule 900(u) to expand the definition of "participant" to include platforms, registered clearing agencies that are required to report alpha dispositions pursuant to new Rule 901(e)(1)(ii), and registered broker-dealers that incur the duty to report security-based swap transactions pursuant to new Rule 901(a)(2)(ii)(E)(4).

Existing Rule 906(b) generally requires a participant of a registered SDR to provide the identity of its ultimate parent and any affiliates that also are participants of that registered SDR. In the Regulation SBSR Proposed Amendments Release, the Commission proposed to amend Rule 906(b) to except platforms and registered clearing agencies from this requirement. In the U.S. Activity Proposal, the Commission further proposed to amend Rule 906(b) to except from this requirement a registered broker-dealer that becomes a participant solely as a result of making a report to satisfy an obligation under Rule 901(a)(2)(ii)(E)(4). The Commission also proposed similar amendments to existing Rule 907(a)(6), which requires a registered SDR to have policies and procedures for periodically obtaining from each participant information that identifies the participant's ultimate parent(s) and any participant(s) with which the participant is affiliated, to avoid extending these policies and procedures to cover platforms, registered clearing agencies, and registered broker-dealers (assuming that they are not counterparties to security-based swap transactions). For the

reasons discussed above,⁹¹¹ the Commission is adopting these amendments. Accordingly, platforms, registered clearing agencies, and registered broker-dealers (assuming they are not counterparties to security-based swap transactions) will not incur costs to report ultimate parent and affiliate information and, registered SDRs will not incur costs to extend the scope of their policies and procedures.

Existing Rule 906(c) requires certain participants of a registered SDR to establish, maintain, and enforce written policies and procedures that are reasonably designed to ensure that the participant complies with any obligations to report information to a registered SDR in a manner consistent with Regulation SBSR. Rule 906(c) also requires participants covered by the rule to review and update their policies and procedures at least annually. In the Regulation SBSR Proposed Amendments Release, the Commission proposed to amend Rule 906(c) by extending this requirement to platforms and registered clearing agencies. In the U.S. Activity Proposal, the Commission proposed to amend Rule 906(c) by extending this requirement to a registered broker-dealer that incurs reporting obligations solely because it effects transactions between two unregistered non-U.S. persons that do not fall within proposed Rule 908(b)(5). In this release, the Commission is adopting the amendments to Rule 906(c) as proposed.

The Commission continues to estimate that the cost associated with establishing such policies and procedures, for each covered participant, will be approximately \$58,000 and the cost associated with annual updates will be approximately \$34,000.⁹¹² Accordingly, the Commission estimates that the initial aggregate annual cost associated with the amendments to Rule 906(c) will be approximately \$3,128,000, which corresponds to \$92,000 per covered participant.⁹¹³ The Commission further estimates that the ongoing aggregate annual cost associated with the amendment Rule 906(c) will be

⁹¹¹ See *supra* Sections V (excepting platforms and registered clearing agencies from Rule 906(b)) and IX (excepting registered broker-dealers from Rule 906(b) if they become participants solely as a result of making a report to satisfy an obligation under Rule 901(a)(2)(ii)(E)(4)).

⁹¹² See Regulation SBSR Adopting Release, 80 FR at 14716.

⁹¹³ The Commission derived its estimate from the following: $[(\$58,000 + \$34,000) \times 34 \text{ covered participants (10 platforms + 4 registered clearing agencies + 20 registered broker-dealers)}] = \$3,128,000$, or approximately \$92,000 per covered participant.

approximately \$1,156,000,⁹¹⁴ which corresponds to \$34,000 per covered participant. The Commission believes that the costs imposed on participants by these amendments are necessary because written policies and procedures that are reasonably designed to ensure that covered participants comply with any obligations to report information to a registered SDR in a manner consistent with Regulation SBSR will enhance the overall reliability of security-based swap transaction data reported to registered SDRs.

Finally, existing Rule 901(d)(9) requires the reporting, if applicable, of the platform ID for a platform on which a security-based swap was executed. In the U.S. Activity Proposal, the Commission proposed to amend Rule 901(d)(9) to require the reporting, if applicable, of the broker ID of a registered broker-dealer (including a registered SB SEF) that is required by Rule 901(a)(2)(ii)(E)(4) to report a security-based swap effected by or through the registered broker-dealer.⁹¹⁵ As discussed above, the Commission has adopted the requirements that the registered broker-dealer effecting the transaction report the transaction.

As discussed in Section XII(A)(1)(d), *supra*, the Commission estimates that a maximum of 20 registered broker-dealers, excluding registered SB SEFs, will incur a reporting duty and together will report 540 security-based swaps per year. These 20 registered broker-dealers are subject to the amendment to Rule 901(d)(9) adopted herein. To comply with the amendment, a registered broker-dealer likely will build and maintain its reporting infrastructure to include the functionality to capture and incorporate its broker ID into transaction reports. The Commission believes that the cost of creating this functionality is part of the start-up cost of building the broker-dealer's reporting infrastructure,⁹¹⁶ while the cost of maintaining this functionality is part of

⁹¹⁴ The Commission derived its estimate from the following: $[\$34,000 \times 34 \text{ covered participants (10 platforms + 4 registered clearing agencies + 20 registered broker-dealers)}] = \$1,156,000$, or approximately \$34,000 per covered participant.

⁹¹⁵ As described above, final Rule 901(a)(2)(ii)(E)(4) requires a registered broker-dealer to report the information in Rules 901(c) and 901(d) for any transaction between two unregistered non-U.S. persons that do not fall within Rule 908(b)(5) where the transaction is effected by or through the registered broker-dealer.

⁹¹⁶ See *supra* Section XII(A)(1)(d), where the Commission estimates the total start-up cost to be \$521,500 per registered broker-dealer and \$10,430,000 in aggregate, across all registered broker-dealers.

⁹⁰⁸ See *supra* Section XII(A)(1)(d).

⁹⁰⁹ See *infra* Section XII(B)(1) (discussing the costs incurred by unregistered non-U.S. persons to assess whether they engage in ANE transactions and thus could incur reporting duties under Rule 901(a)(2)(ii)(E)).

⁹¹⁰ See Regulation SBSR Adopting Release, 80 FR at 14702.

the annual ongoing cost of the broker-dealer's reporting infrastructure.⁹¹⁷

7. Discussion of Comments Received

The Commission received a number of comments relating to its analysis of the programmatic costs and benefits associated with the amendments described above.

One commenter stated that the Commission lacks complete data to estimate the number of non-U.S. persons that engage in ANE transactions or the number of registered broker-dealers that intermediate security-based swap transactions, and recommended that the Commission collect a more complete set of data to more precisely estimate the number of non-U.S. persons that would be affected by the proposed rules. The commenter further argued that the lack of complete data made it difficult for the Commission to estimate the market impact, costs, and benefits associated with amendments that apply Regulation SBSR to ANE transactions and transactions intermediated by registered broker-dealers.⁹¹⁸

The Commission acknowledges that there are limitations in the TIW data but believes that the data do allow the Commission to arrive at a reasonable estimate of the number of non-U.S. persons affected by the newly adopted rules. In Section II(A)(4)(d), *supra*, the Commission notes that it identified four foreign dealing entities that likely engaged in ANE activity in 2015 but, based on the level of relevant activity, would be unlikely to register as security-based swap dealers. Based on the analysis, the Commission estimates that four unregistered foreign dealing entities will engage in ANE activity and thus be affected by the newly adopted rules.⁹¹⁹ In Section XII(A)(1)(d), *supra*, the Commission estimates the compliance costs associated with Rule 901 for these four unregistered foreign

dealing entities.⁹²⁰ As discussed earlier, these programmatic costs are part of the programmatic costs associated with Rule 901 that were accounted for in the Regulation SBSR Adopting Release. While data limitations do not allow the quantification of the benefits associated with the amendments that apply Regulation SBSR to ANE transactions and transactions intermediated by registered broker-dealers, the Commission discusses these benefits qualitatively in Section XIII(H), *infra*.

B. Assessment Costs of Unregistered Entities Related to ANE Transactions

1. Assessment Costs of Foreign Dealing Entities Engaging in ANE Transactions

New Rule 908(b)(5) provides that an unregistered foreign dealing entity that engages in ANE transactions may incur reporting duties under Regulation SBSR, and the amendments to Rule 901(a)(2)(ii)(E) adopted herein provide that such foreign dealing entities will be the reporting side in certain cases. Thus, unregistered foreign dealing entities will incur costs to assess whether they engage in ANE transactions and, if so, whether they will incur reporting duties under Rule 901(a)(2)(ii)(E). The Commission estimates that four unregistered foreign dealing entities will incur such assessment costs. The four unregistered foreign dealing entities are in addition to the 20 additional non-U.S. persons that the Commission estimated would incur assessment costs as a result of the rules finalized in the U.S. Activity Adopting Release.⁹²¹ In what follows, the Commission discusses costs that these four unregistered foreign dealing entities might incur to assess whether they engage in ANE transactions.

In the U.S. Activity Adopting Release, the Commission discussed the approaches that market participants may use to determine which transactions involve relevant activity involving U.S. personnel and thus would apply toward dealer *de minimis* thresholds. The Commission notes that, as an initial matter, a foreign dealing entity likely will review its current

dealing operations to ascertain whether it has U.S. personnel that could be used to arrange, negotiate, or execute security-based swaps. The Commission believes that such a determination will not result in significant costs because it requires only that the foreign dealing entity check for the existence of U.S. personnel. If the foreign dealing entity does not have U.S. personnel that could be used to arrange, negotiate, or execute security-based swaps, then the foreign dealing entity's assessment of whether it has engaged in ANE activity ends.

If, based on the review described above, the foreign dealing entity determines that it has U.S. personnel that could be used to arrange, negotiate, or execute security-based swaps, then the foreign dealing entity could choose between a number of alternative means of compliance.⁹²² One alternative would be for the entity to implement systems to check the location of personnel used in arranging, negotiating, or executing individual security-based swap transactions. The Commission believes that the cost of developing and modifying systems to track the location of persons with dealing activity will be substantially similar to the costs of such systems discussed in the U.S. Activity Adopting Release, or \$410,000 for the average foreign dealing entity. To the extent that non-U.S. persons already employ systems that track the location of persons with dealing activity, the costs of modifying such IT systems may be lower than the Commission's estimate.⁹²³ In addition to the development or modification of such systems, the Commission estimates that entities would incur the cost of \$6,500 per location per year on an ongoing basis for training, compliance, and verification costs.⁹²⁴ Second, the foreign dealing entity could choose to restrict personnel located in a U.S. branch or office from engaging in ANE activity in connection with the entity's dealing activity with non-U.S. counterparties. Such a restriction on communication and staffing for purposes of avoiding certain Title VII requirements would reduce the costs of assessing the location of personnel involved in ANE activity and could remove entirely the need to implement systems to track the activities of U.S. personnel on a per-transaction basis. The Commission estimates that the costs of establishing

⁹¹⁷ See *supra* Section XII(A)(1)(d), where the Commission estimates the ongoing cost per year to be \$316,500 per registered broker-dealer, and \$6,330,000 for all registered broker-dealers.

⁹¹⁸ See ISDA I at 3, 7. This commenter also argued that the data available to the Commission at the time of the proposal would not have allowed the Commission to precisely estimate, among other things, the number of non-U.S. persons that carry out dealing activity using personnel in the United States. See *id.* at 7.

⁹¹⁹ Because of the relatively low volume of transaction activity of these four entities during 2015 and the existence of affiliations with other entities expected to register as security-based swap dealers, the Commission believes, even after accounting for growth in the security-based swap market and acknowledging the limitations of the transaction data available for analysis, four is a reasonable estimate of the number of unregistered dealing entities likely to incur assessment costs as a result of new Rule 908(b)(5).

⁹²⁰ The initial aggregate annual costs associated with Rule 901 will be approximately \$3,668,000, which corresponds to approximately \$524,000 per unregistered entity. The Commission estimates that the ongoing aggregate annual costs on an unregistered entity associated with Rule 901 will be approximately \$2,233,000, which corresponds to approximately \$319,000 per unregistered entity.

⁹²¹ See U.S. Activity Adopting Release, 81 FR at 8627. This is calculated as 134 non-U.S. persons likely to incur assessment costs to determine the level of ANE activity, less the 114 persons that are likely to incur assessment costs associated with the dealer *de minimis* rules adopted in the Cross-Border Adopting Release.

⁹²² See U.S. Activity Adopting Release, 81 FR at 8627–28.

⁹²³ See *id.* at 8627.

⁹²⁴ This cost is calculated as (internal cost, 90 hours × \$50 per hour = \$4,500) + (consulting costs, 10 hours × \$200 per hour = \$2,000) = a total cost of \$6,500 per location per year. See also U.S. Activity Adopting Release, 81 FR at 8627.

policies and procedures to restrict communication between personnel located in the United States employed by non-U.S. persons (or their agents) and other personnel involved in dealing activity would be approximately \$28,300 for each entity that chooses this approach.⁹²⁵

Finally, a foreign dealing entity could avoid assessing transactions on a per-transaction basis by choosing to report all transactions to a registered SDR, regardless of the location of personnel engaged in ANE activity. Such an alternative may be reasonable for foreign dealing entities that expect few transactions involving foreign counterparties to be arranged, negotiated, or executed by personnel located outside the United States, such as foreign dealing entities that primarily transact in security-based swaps on U.S. reference entities or securities, and generally rely on personnel located in the United States to perform market-facing activities.⁹²⁶

The Commission believes that the same principles apply to foreign dealing entities that rely on agents to arrange, negotiate, or execute security-based swaps on their behalf. The Commission anticipates that foreign dealing entities may employ any of the strategies above to comply with the final rules through the choice of their agents. For example, a foreign dealing entity may choose an agent that does not use U.S.-based personnel for arranging, negotiating, or executing security-based swap transactions with non-U.S. counterparties to avoid assessment costs. The Commission also anticipates that a foreign dealing entity might rely on representations from its agents about whether transactions conducted on its behalf involved relevant dealing activity by personnel from a location in the United States. This could occur on a transaction-by-transaction basis, or, if the agent uses personnel located in the United States in all or none of its transactions, it could choose to make a representation about the entirety of the agent's business.

As in the U.S. Activity Adopting Release, the Commission believes that a foreign dealing entity will inform its choice between the alternative compliance strategies with a one-time review of its security-based swap business lines. This review likely will encompass both employees of the foreign dealing entity as well as employees of agents used by the foreign dealing entity, and identify whether these personnel are involved in

arranging, negotiating, or executing security-based swaps. The information gathered as a result of this review will allow the foreign dealing entity to assess the revenues that it expects to flow from transaction activity performed by U.S. personnel. This information also will help these market participants form preliminary estimates about the costs associated with various alternative compliance strategies, including the trade-by-trade analysis outlined above. This initial review may be followed with reassessment at regular intervals or subsequent to major changes in the market participant's security-based swap business, such as acquisition or divestiture of business units. The Commission estimates that the per-entity initial costs of a review of business lines will be approximately \$104,000. Further, the Commission believes that periodic reassessment of business lines will cost, on average, \$52,000 per year, per entity.⁹²⁷

2. Assessment Costs of Unregistered U.S. Persons Engaging in Security-Based Swaps Against Foreign Entities

New Rules 901(a)(2)(ii)(E)(2) and 901(3) create reporting duties for unregistered U.S. persons that transact security-based swaps with unregistered entities. Under Rule 901(a)(2)(ii)(E)(2), in a transaction between an unregistered U.S. person and an unregistered foreign dealing entity that is engaging in ANE activity, the sides would be required to select the reporting side. Under Rule 901(a)(2)(ii)(E)(3), in a transaction between an unregistered U.S. person and an unregistered non-U.S. person that is not engaging in ANE activity, the unregistered U.S. person is the reporting side. Because of these reporting duties, an unregistered U.S. person could incur costs to assess whether its foreign counterparty in a security-based swap transaction is an unregistered foreign dealing entity engaging in ANE activity.

The Commission believes that unregistered U.S. persons likely will seek to avoid the costs of assessing whether a foreign counterparty is engaging in ANE activity by choosing to transact only with registered entities for which assessment is not required.⁹²⁸ The incentive of unregistered U.S. persons to avoid transacting with unregistered foreign counterparties is strengthened by the fact that there will be very few unregistered foreign dealing entities that might engage in ANE activities, and that they likely will

participate in a relatively small number of security-based swap transactions in the U.S. market. As noted earlier,⁹²⁹ the Commission estimates that only four foreign dealing entities will remain below the *de minimis* threshold and thus not have to register as security-based swap dealers.⁹³⁰ Furthermore, to the extent that the usage of U.S. personnel by such a foreign dealing entity to engage in ANE activity is a question for an unregistered U.S. person who is a potential counterparty, the foreign dealing entity has an incentive to readily provide this information to the unregistered U.S. person—thereby obviating the need for the U.S. person to conduct an assessment—and to agree to be the reporting side. If the foreign dealing entity did not agree to be the reporting side, the unregistered U.S. person would have the option of transacting with one of several registered security-based swap dealers, both U.S. and foreign, for which the U.S. counterparty would not have to assess for ANE activity or negotiate with the other side about the reporting duty, because the duty would fall to the registered security-based swap dealer pursuant to existing Rule 901(a)(2)(ii)(B). Therefore, the Commission believes that any assessment costs incurred by unregistered U.S. persons will be limited.

3. Assessment Costs Associated With Rule 901(a)(2)(ii)(E)(4)

Under new Rule 901(a)(2)(ii)(E)(4), respondent broker-dealers (including SB SEFs) will be required to report security-based swap transactions that they intermediate if neither side incurs the duty to report (*i.e.*, neither side includes a U.S. person, a registered security-based swap dealer, a registered major security-based swap participant, or a non-U.S. person engaging in an ANE transaction). As a result, respondent broker-dealers will incur certain costs to assess the circumstances in which they incur the duty to report transactions because neither side incurs the duty. Any such assessment costs are reflected in the cost estimates for the policies and procedures that respondent broker-dealers are required to establish, maintain, and enforce under Rule

⁹²⁹ See *supra* note 885 and accompanying text.

⁹³⁰ For foreign dealing entities that register with the Commission as security-based swap dealers, reporting duties stem from their registration status, not from the presence of any ANE activity. Therefore, for these entities, no assessment will be needed to know whether a reporting duty arises from a particular transaction.

⁹²⁵ See *id.* at 8628.

⁹²⁶ See *id.*

⁹²⁷ See *id.* at n. 283.

⁹²⁸ See *infra* Section XIII(H)(1) (discussing the potential competitive effects associated with assessments for ANE activity by unregistered U.S. persons).

906(c).⁹³¹ The programmatic costs estimated by the Commission for the amendment to Rule 906(c) already incorporate the cost incurred by respondent broker-dealers when assessing whether they have a duty to report security-based swap transactions. Therefore, respondent broker-dealers will not incur any additional costs beyond the programmatic cost for the amendment to Rule 906(c) adopted herein.⁹³²

4. Discussion of Comments Received

The Commission received a number of comments relating to its analysis of the assessment costs associated with the proposed amendments to Rules 901 and 908 included in the U.S. Activity Proposal. One commenter pointed out that the Commission's analysis of assessment costs was incomplete because the analysis did not account for the additional work that market participants might undertake to meet reporting requirements during the Interim Period (*i.e.*, the period beginning on Compliance Date 1 but before the SBS entities registration compliance date).⁹³³ According to the commenter, this additional work and the associated cost could be avoided if the Commission scheduled Compliance Date 1 after the SBS entities registration compliance date.⁹³⁴ The same commenter also suggested that the Commission's cost analysis failed to account for the possibility that some of the documentation and processes developed by market participants for Interim Period reporting would become obsolete after security-based swap dealers register with the Commission.⁹³⁵

As discussed in Section X(C), *supra*, the Commission acknowledges the commenters' concerns that requiring compliance with Regulation SBSR before the SBS entities registration compliance date would have raised numerous challenges, and that addressing these challenges would have necessitated time and investment to

⁹³¹ See *supra* Section XII(A)(3) (discussing the costs of amended Rule 906(c)).

⁹³² See *id.*

⁹³³ See ISDA II at 11 (stating that the additional work involves efforts to "exchange transaction level party data, develop a new approach to use the tie-breaker logic, enter into reporting side agreements and delegation agreements, and build dual sets of reporting side logic to develop an organized industry approach to comply with SBSR"); ISDA III at 9 (stating that the Commission did not consider the cost and effort that market participants would spend to develop and implement interim reporting side agreements, and the "cost that market infrastructure providers would incur to duplicate efforts in order to support both pre- and post-registration reporting side approaches").

⁹³⁴ See ISDA II at 12; ISDA III at 9, 12.

⁹³⁵ See ISDA I at 13.

create interim solutions that might not have been useful after the SBS entities registration compliance date. Therefore, the Commission has determined that market participants will not be required to comply with Regulation SBSR until after the SBS entities registration compliance date.

XIII. Economic Effects and Effects on Efficiency, Competition, and Capital Formation

Section 3(f) of the Exchange Act⁹³⁶ requires the Commission, whenever it engages in rulemaking and is required to consider or determine whether an action is necessary or appropriate in the public interest, to consider, in addition to the protection of investors, whether the action will promote efficiency, competition, and capital formation. In addition, Section 23(a)(2) of the Exchange Act⁹³⁷ requires the Commission, when making rules under the Exchange Act, to consider the impact of such rules on competition. Section 23(a)(2) also prohibits the Commission from adopting any rule that would impose a burden on competition not necessary or appropriate in furtherance of the purposes of the Exchange Act.

The Commission believes that the amendments to Regulation SBSR adopted herein will result in further progress towards providing a means for the Commission and other relevant authorities to gain a better understanding of the aggregate risk exposures and trading behaviors of participants in the security-based swap market; facilitate public dissemination of security-based swap transaction information, thus promoting price discovery and competition by improving the level of information to all market participants; and improve risk management by security-based swap counterparties.⁹³⁸

The economic effects of these amendments on firms that provide infrastructure services to security-based swap counterparties and the security-based swap market generally are discussed in detail below. The Commission also considered the effects that these amendments might have on efficiency, competition, and capital formation. The Commission believes that its action today is likely to affect competition among firms that provide security-based swap infrastructure services to market participants and affect efficiency as a result of the way that these amendments allocate

⁹³⁶ 15 U.S.C. 78c(f).

⁹³⁷ 15 U.S.C. 78w(a)(2).

⁹³⁸ See 80 FR at 14779.

regulatory burdens. The effects of these amendments on capital formation are likely to be indirect and will result from the way in which these amendments affect the behavior of registered clearing agencies, counterparties to security-based swaps, and registered SDRs. To the extent that these amendments promote more efficient provision of security-based swap market infrastructure services, there would be lower transactions costs,⁹³⁹ which would free resources for investment and capital formation.

This analysis has been informed by the relationships among regulation, competition, and market power discussed in Section II(B), *supra*. An environment in which there is limited competition in SDR services could impose costs on the security-based swap market, including higher prices or lower quality services from SDRs. For example, a registered SDR that faces few or no competitors could seek to impose higher prices, because persons with a duty to report security-based swaps under Regulation SBSR might not be able to identify a competing SDR that offers prices close enough to marginal cost to make changing service providers efficient. Further, if consumers of SDR services have few alternative suppliers from which to choose, SDRs would have fewer incentives to produce more efficient SDR processes and services. This combination of higher prices for SDR services and/or less efficient SDR services could reduce security-based swap transaction activity undertaken by market participants to hedge assets that have cash flows that are related to the cash flows of security-based swaps. A reduction in hedging activity through security-based swaps could reduce the values of assets held by market participants and in turn result in welfare losses for these market participants.

However, there could be some offsetting benefit to limited competition in the market for SDR services for both regulatory authorities and the public. A small set of registered SDRs could make it simpler for the Commission and other relevant authorities to build a complete picture of transaction activity and outstanding risk exposures in the security-based swap market, and could limit the need for market observers to aggregate the security-based swap transaction data disseminated by

⁹³⁹ These transactions costs would include both implicit and explicit costs. Implicit transactions costs are the spread between transaction prices and the fundamental value of the assets being traded. Explicit transactions costs, by contrast, are commissions and other fees paid by counterparties for effecting transactions in the market.

multiple SDRs before using it as an input to economic decisions.

The Commission also considered the effects on efficiency, competition, and capital formation stemming from the amendments to Rules 901 and 908 that will subject additional cross-border security-based swaps to regulatory reporting and public dissemination, and assign the duty to report those cross-border transactions. The adopted amendments might affect the security-based swap market in a number of ways, many of which are difficult to quantify. In particular, a number of the potential effects that the Commission discusses below are related to price efficiency, liquidity, and risk sharing. These effects are difficult to quantify for a number of reasons. First, in many cases the effects are contingent upon strategic responses of market participants. For instance, the Commission notes in Section XIII(H)(2), *infra*, that under the adopted approach non-U.S. persons may choose to relocate personnel, making it difficult for U.S. counterparties to access liquidity in security-based swaps. The magnitude of these effects on liquidity and on risk sharing depend upon a number of factors that the Commission cannot estimate, including the likelihood of relocation, the availability of substitute liquidity suppliers, and the availability of substitute hedging assets. Therefore, much of the discussion below is qualitative in nature, although the Commission tries to describe, where possible, the direction of these effects.

Not only can some of these effects be difficult to quantify, but there are many cases where a rule could have two opposing effects, making it difficult to estimate a net impact on efficiency, competition, or capital formation. For example, in the discussion of the net effect of certain amendments to Regulation SBSR on efficiency, the Commission expects that post-trade transparency may have a positive effect on price efficiency, while it could negatively affect liquidity by providing incentives for non-U.S. persons to avoid contact with U.S. persons. The magnitude of these two opposing effects will depend on factors such as the sensitivity of traders to information about order flow, the impact of public dissemination of transaction information on the execution costs of large orders, and the ease with which non-U.S. persons can find substitutes that avoid contact with U.S. personnel. Each of these factors is difficult to quantify individually, which makes the net impact on efficiency equally difficult to quantify.

A. Reporting of Clearing Transactions

New Rule 901(a)(2)(i) assigns the duty to report a security-based swap that has a registered clearing agency as a direct counterparty to that registered clearing agency. Existing Rule 901(a) does not assign reporting obligations for any clearing transactions; thus, in the absence of Rule 901(a)(2)(i), clearing transactions would not be subject to any regulatory reporting requirement. Without a requirement for clearing transactions to be reported to a registered SDR, the Commission and other relevant authorities would have only limited ability to carry out market oversight functions. For example, while the Commission could access transaction reports of alphas and uncleared transactions, the Commission would not be able to obtain from registered SDRs information about the open security-based swap positions of the relevant counterparties after alpha transactions are cleared. Requiring that clearing transactions be reported to registered SDRs and delineating reporting responsibilities for these transactions are particularly important given the level of voluntary clearing activity in the market as well as the mandatory clearing determinations that will be required under Title VII.⁹⁴⁰

The Commission believes that, because a registered clearing agency creates the clearing transactions to which it is a counterparty, the registered clearing agency is in the best position to provide complete and accurate information for the clearing transactions resulting from the security-based swaps that it clears.⁹⁴¹ If the Commission assigned the reporting obligation for clearing transactions to a person who lacked direct access to the information required to be reported, that person would be obligated to obtain the required information from the clearing agency or another party who had access to the information to discharge its reporting obligation. Thus, assigning reporting obligations to the non-clearing-agency side could increase the number of reporting steps, thereby increasing the possibility of discrepancy, error, or delay in the reporting process. Placing the reporting duty on the non-clearing-agency side could also reduce data reliability if the

⁹⁴⁰ See General Policy on Sequencing, 77 FR at 35636.

⁹⁴¹ Although registered clearing agencies might pass on the costs associated with reporting clearing transactions, at least in part, to their non-reporting counterparties, the costs that are passed on to non-reporting parties are likely to be lower than the costs that the non-reporting parties would face if they had direct responsibility to report these transactions.

data has to be reconfigured to be acceptable by the SDR.⁹⁴² Inaccurate or delayed reporting of clearing transactions would negatively impact the ability of the Commission and other relevant authorities to understand, aggregate, and act on the transaction information.

New Rule 901(a)(2)(i) also allows the registered clearing agency that is required to report all clearing transactions to which it is a counterparty to select the registered SDR to which to report. As noted in Section II(B), *supra*, because many of the infrastructure requirements for entrant SDRs are shared by registered clearing agencies, registered clearing agencies might pursue vertical integration into the market for SDR services at a lower cost relative to potential entrants from unrelated markets. If the costs of reporting to affiliated SDRs are lower than the costs of reporting to unaffiliated SDRs, registered clearing agencies will likely choose to report clearing transactions to an affiliated SDR. Because a registered clearing agency is likely to be involved in developing an affiliated SDR's systems, the clearing agency will likely avoid costs related to translating or reformatting data due to incompatibilities between data reporting by the registered clearing agency and data intake by the SDR. To the extent that a clearing agency incurs a lower cost when connecting to an affiliated SDR, the cost of reporting clearing transactions to an affiliated SDR is likely to be lower than the cost of reporting to an independent SDR. While both a clearing-agency-affiliated SDR and an independent SDR could lower their average costs by adding clearing transactions to their existing volume of reported transactions, only the clearing agency can reduce the cost of connecting to its affiliated SDR.

Vertical integration of security-based swap clearing and SDR services could be beneficial to other market participants if they ultimately share in these efficiency gains. For example, efficiency gains due to straight-through processing from execution to reporting could lower transactions costs for market participants and reduce the likelihood of data discrepancies and delays. Even if registered clearing agencies do not enter the market for SDR services, the potential for them to pursue a vertical integration strategy could motivate independent SDRs to offer more competitive service models.

The Commission is aware of the potential costs of allowing registered

⁹⁴² See *supra* Section III(B).

clearing agencies to select the SDR to which they report. If Rule 901(a)(2)(i) encourages the formation of clearing-agency-affiliated SDRs that would not otherwise emerge, the aggregate number of registered SDRs might reflect an inefficient level of service provision. Once an entity has established the functionality to offer clearing and central counterparty services for security-based swaps, only marginal additional investments would likely be needed to offer SDR services. The ease with which registered clearing agencies set up affiliated SDRs could affect how well all SDRs exploit economies of scale. As noted in Section II(B)(2), *supra*, in the market for SDR services, economies of scale arise from the ability to amortize the fixed costs associated with infrastructure over a large volume of transactions. With a fixed volume of reportable transactions, exploitation of economies of scale by each SDR becomes more limited as the number of SDRs increases. Thus, the entry of clearing-agency-affiliated SDRs could indicate that each SDR benefits from an affiliation with a clearing agency and might not, in aggregate, result in the provision of transaction reporting services at a lower per-transaction cost than if there were fewer SDRs. Inefficiencies could result if the Commission and the public had to receive and process security-based swap transaction data from a larger number of registered SDRs. Connecting to a larger number of SDRs and merging transaction data with potentially different data formats could be costly and difficult.

The potential for efficiency gains through vertical integration of clearing agencies and SDRs could foreclose entry into the market for SDR services except by firms that are already present in the market for clearing agency services. Registered clearing agencies are more likely to benefit from efficiencies in shared infrastructure than independent SDRs, given that it is more difficult for an SDR to enter the market for clearing services than for a clearing agency to enter the market for SDR services.⁹⁴³ Moreover, to the extent that an affiliated SDR is not as cost-effective as a competing independent SDR, a registered clearing agency could

⁹⁴³ A registered clearing agency, particularly one that acts as a central counterparty for security-based swaps, needs significant financial resources to ensure that it can absorb losses from clearing member defaults, while SDRs do not. Similarly, a registered clearing agency requires significant risk management expertise that an SDR does not. Thus, the barriers to entry into the clearing agency market are higher than the barriers to entry into the SDR market.

subsidize the operation of its affiliate SDR to provide a competitive advantage in its cost structure over independent SDRs. Hence, providing a registered clearing agency with the discretion to select the registered SDR could provide a competitive advantage for clearing-agency-affiliated SDRs relative to independent SDRs. If a registered clearing agency subsidizes its affiliated SDR using revenue generated from its clearing business, the clearing agency's members would indirectly bear some of the costs of operating the affiliated SDR. Such an allocation of SDR cost to clearing members could be inefficient because the benefits of reporting transactions to an SDR (*i.e.*, the benefits of regulatory reporting and public dissemination) accrue to market participants generally, and not just to clearing members.

As a result of new Rule 901(a)(2)(i), clearing members might find that the records of their security-based swap transactions are fragmented across multiple registered SDRs (*i.e.*, alpha SDRs and, in addition, clearing-agency-affiliated SDRs to which registered clearing agencies report clearing transactions). The Commission does not believe, however, that fragmentation in the storage of transaction reports would create significant difficulties or inefficiencies for a clearing member that wishes to consolidate all its security-based swap transaction reports at a chosen SDR to facilitate activities such as risk management. Such a clearing member might contract with a registered clearing agency, for a fee, to transmit data for its clearing transactions to an SDR of the clearing member's choice as a duplicate report. This would allow the registered clearing agency to satisfy its obligations while permitting the clearing member to establish and maintain access to a consolidated record of all of its security-based swap transactions in a single SDR. However, in this case, the registered clearing agency could choose a fee schedule that encourages the clearing member to report its uncleared bilateral transactions to the affiliated SDR. Such a fee schedule might involve the clearing agency offering to terminate alpha transactions reported to its affiliate SDR for a lower price than alpha transactions to an independent SDR.

As discussed in Section XII(B)(1)(a), *supra*, the Commission has estimated the annual and on-going costs associated with requiring registered clearing agencies to establish connections to registered SDRs. The Commission believes that, for a given registered clearing agency, these costs

are likely to be lower for a connection to an affiliated SDR than to an independent SDR. Because the registered clearing agency is likely to have been involved in developing its affiliated SDR's systems, the clearing agency can likely avoid costs related to translating or reformatting data due to incompatibilities between the clearing agency's data format and the data format required by the SDR. The reporting of clearing transactions by registered clearing agencies to their affiliated SDRs could promote efficiency in two ways. First, a registered clearing agency would incur lower connection costs when reporting to an affiliated SDR. Second, the quality of transaction data available to the Commission could be improved to the extent that the Commission gains access to marginally more reliable transaction data because reporting by a registered clearing agency to an affiliated SDR avoids introducing errors or other data discrepancies that otherwise could occur when translating or reformatting transaction data for submission to an independent SDR.

B. Alternative Approaches to Reporting Clearing Transactions

As part of the economic analysis of the amendments adopted herein, the Commission has considered the market power that providers of security-based swap market infrastructure might be able to exercise in pricing the services that they offer and the possibility that these infrastructures could shift the costs created by regulatory burdens onto their customers. The Commission included these economic considerations in its evaluation of alternative approaches to assigning reporting obligations for clearing transactions. As outlined above, the Commission considered four alternatives for assigning these reporting obligations as well as comments received related to these alternatives. The following section discusses the likely economic effects of these alternatives, including their likely impacts on efficiency, competition, and, indirectly, capital formation.

1. Alternative 1

The first alternative would be to apply the reporting hierarchy in existing Rule 901(a)(2)(ii) to clearing transactions. Under Alternative 1, a counterparty to a clearing transaction other than the clearing agency, such as a registered security-based swap dealer, would have the duty to report the clearing transaction. As discussed above, assigning reporting obligations to the non-clearing-agency side could increase the number of reporting steps, thereby increasing the possibility of

discrepancy, error, or delay in the reporting process. Placing the reporting duty on the non-clearing-agency side also could reduce data reliability if the data has to be reconfigured to be acceptable by the SDR.⁹⁴⁴

The Commission continues to believe that it is unlikely that non-clearing-agency counterparties would be subject to significant additional costs associated with building infrastructure to support regulatory reporting for clearing transactions under this alternative, for two reasons.⁹⁴⁵ First, to the extent that market participants that submit security-based swaps to clearing also engage in uncleared transactions and sit atop the reporting hierarchy, they likely already have the required infrastructure in place to support regulatory reporting of alphas and uncleared transactions. The Commission anticipates that, as a result, there might be only marginal additional costs for reporting sides to report clearing transactions, if the Commission selected Alternative 1. Moreover, the Commission anticipates that, once infrastructure is built, the per-transaction cost of data transmission would not vary substantially between registered clearing agencies, who are required to report under new Rule 901(a)(2)(i), and reporting sides, who would be required to report under Alternative 1.

Second, non-clearing agency counterparties, particularly those who engage solely in cleared trades or who are not high in the reporting hierarchy, could enter into an agreement under which the registered clearing agency would submit the information to a registered SDR on their behalf. This service could be bundled as part of the other clearing services purchased, and would result in an outcome substantially similar to giving the registered clearing agency the duty to report. One difference, however, is that the customer of the registered clearing agency could, under this alternative, request that the information be submitted to a registered SDR unaffiliated with the registered clearing agency, a choice that, under the adopted approach, is at the discretion of the registered clearing agency. Nevertheless, the Commission believes that, to the extent that it is economically efficient for the registered clearing agency to report the details of cleared transactions on behalf of its counterparties, Alternative 1 would likely result in ongoing costs of data transmission for market participants and infrastructure

providers that are, in the aggregate, similar to the Commission's approach in Rule 901(a)(2)(i).

If registered clearing agencies reporting to registered SDRs on behalf of counterparties is not available under Alternative 1, then some counterparties would be required to build infrastructure to support regulatory reporting for clearing transactions. Analysis of single-name CDS transactions in 2015 in which a clearing agency was a direct counterparty shows approximately 54 market participants that are not likely to register as security-based swap dealers or major security-based swap participants, and therefore might be required to build infrastructure to support regulatory reporting for clearing transactions in order to maintain current trading practices in the security-based swap market.⁹⁴⁶ One commenter asserted that the Commission did not adequately address the role of third parties that could perform reporting duties on behalf of reporting parties.⁹⁴⁷ As noted in Section III(B), *supra*, Regulation SBSR permits the use of agents to carry out reporting duties and the Commission expects that a market participant that would be assigned the reporting obligation for clearing transactions under Alternative 1 would contract with an agent if it expects use of an agent to be less costly than carrying out the reporting obligation itself. As a result, the ability to use agents could further reduce costs to market participants under Alternative 1.

Under Alternative 1, non-clearing-agency counterparties would have the ability to choose which registered SDR receives their reports. Because non-clearing-agency counterparties would have this choice, registered SDRs under the alternative approach might have additional incentive to provide high levels of service to attract this reporting business by, for example, providing such counterparties with convenient access to reports submitted to the registered SDR or by supporting the counterparties' efforts at data validation

⁹⁴⁶ See Regulation SBSR Proposed Amendments Release, 80 FR at 14781–82. To arrive at this estimate, the Commission staff used single-name CDS transaction data for 2015 to produce a list of all direct counterparties to a clearing agency and removed those persons likely to register as security-based swap dealers or major security-based swap participants. The list of likely registrants was constructed using the methodology described in the Cross-Border Adopting Release. See 79 FR at 47296, n. 150 (describing the methodology employed by the Commission to estimate the number of potential security-based swap dealers); *id.* at 47297, n. 153 (describing the methodology employed by the Commission to estimate the number of potential major security-based swap participants).

⁹⁴⁷ See Markit Letter at 8.

and error correction. Additionally, ensuring that these counterparties have discretion over which registered SDR receives the transaction data could allow these counterparties to consolidate their security-based swap transactions into a single SDR for record-keeping purposes or for operational reasons, though only to the extent that they can identify a registered SDR that accepts reports for all relevant asset classes.

In assessing Alternative 1, the Commission recognizes that registered clearing agencies have a comparative advantage in processing and preparing data for reporting cleared transactions to a registered SDR. Registered clearing agencies terminate alpha transactions, as well as create beta and gamma transactions and all subsequent netting transactions, and so already possess all of the relevant information to report these transaction events to a registered SDR. Moreover, the volume of transactions at registered clearing agencies means that they can amortize the fixed costs of establishing and maintaining connections to a registered SDR over a large quantity of reportable activity, potentially allowing them to report transactions at a lower average cost per transaction than many other market participants, particularly non-registered persons.

The Commission believes that, given this comparative advantage, applying to clearing transactions the same reporting hierarchy that it has adopted for uncleared transactions would result in a registered clearing agency reporting the transaction data to a registered SDR of a non-clearing-agency counterparty's choice as a service to the non-clearing-agency counterparties to its clearing transactions. In this respect, the entity that performs the actual reporting of clearing transactions would likely be the same as with adopted Rule 901(a)(2)(i), which would assign this duty to the registered clearing agency. The key difference under Alternative 1 is that the non-clearing-agency counterparty would generate this responsibility through private contract and could terminate the agreement and assume the reporting responsibility, should it perceive the fee or service terms as unreasonable. Such an agreement also could specify the registered SDR to which the clearing agency should send transaction data on behalf of the non-clearing-agency counterparty. The ability to terminate such an agreement could diminish the potential bargaining power that the registered clearing agency would otherwise have if the registered clearing agency were assigned the duty to report. Further, by allowing

⁹⁴⁴ See *supra* Section III(B).

⁹⁴⁵ See Regulation SBSR Proposed Amendments Release, 80 FR at 14781.

the non-clearing-agency counterparty to choose between registered SDRs, such an agreement could promote competition between SDRs.

However, because the non-clearing-agency counterparty might still have to rely on assistance from the clearing agency to satisfy the reporting obligations—particularly for any subsequent clearing transactions resulting from netting and compression of multiple betas and gammas—the reduction in clearing agency bargaining power might not be substantial. A registered clearing agency that supplies this information and converts it into the format prescribed by a non-clearing-agency counterparty's chosen SDR so that the counterparty can fulfill its reporting duty by submitting transaction data to a registered SDR of its choice could still have significant bargaining power with respect to providing that information.

The Commission believes that the adopted rules are generally consistent with the outcome under Alternative 1 in a number of key respects. First, under both approaches to reporting—one in which the Commission assigns the reporting responsibility for clearing transactions to registered clearing agencies, and the other in which the market allocates the reporting responsibility in the same way—it is likely that registered clearing agencies will report clearing transactions to their affiliated SDRs.⁹⁴⁸ Under an approach in which the Commission does not assign any reporting duties to registered clearing agencies, counterparties would likely be assessed an explicit fee by registered clearing agencies for submitting reports on the counterparties' behalf. Under Rule 901(a)(2)(i), the fees associated with these services will likely be part of the total fees associated with clearing security-based swaps.

In light of comments received on its proposal, the Commission acknowledges caveats to this analysis.⁹⁴⁹ Under Alternative 1, a non-

clearing agency counterparty may alter the disposition of its clearing transaction data as a result of having the right to select the registered SDR to which this information is submitted. In particular, a non-clearing agency counterparty with the duty to report clearing transactions would compare the costs and benefits of contracting with the clearing agency to fulfil reporting obligations on its behalf by reporting to an affiliated SDR,⁹⁵⁰ with the costs and benefits of alternative arrangements that would place the same data at an independent SDR of its choice.

Second, under Alternative 1 and under the adopted approach, efficiency gains stemming from consolidation of the reporting function within registered clearing agencies would be split between such clearing agencies and security-based swap counterparties. The difference between these two regulatory approaches turn on how these gains are split.

The Commission believes that Alternative 1 would not necessarily restrict the ability of registered clearing agencies to exercise market power in ways that may allow them to capture the bulk of any efficiency gains.⁹⁵¹ First, while a counterparty to a registered clearing agency could contract with the clearing agency to receive the information about netting and compression transactions that would enable re-transmission of the cleared transaction data to a registered SDR, depending on the policies and procedures of the registered clearing agency, these data might not be in the format that is required for submission to the counterparty's SDR of choice. As a result, counterparties to registered clearing agencies would bear the costs associated with restructuring the data that they receive from registered clearing agencies before submitting transaction reports to a registered SDR. Such costs could limit the feasibility of assuming the reporting responsibility rather than contracting to have the registered clearing agency perform the duty. However, the Commission acknowledges, in line with comments received on its proposal,⁹⁵² that the use of agents to carry out reporting duties could mitigate these costs, if agents are

able to restructure data more efficiently than counterparties.

Second, in an environment where reporting obligations for clearing transactions rest with counterparties and there is limited competition among registered clearing agencies, registered clearing agencies might be able to charge high fees to counterparties who must rely on them to provide information necessary to make required reports to registered SDRs. A registered clearing agency could otherwise impair the ability of its counterparties to perform their own reporting if the clearing agency does not provide sufficient support or access to clearing transaction data. In particular, the clearing agency might have incentives to underinvest in the infrastructure necessary to provide clearing transaction data to its counterparties unless the Commission, by rule, were to establish minimum standards for communication of clearing transaction data from registered clearing agencies to their counterparties. As a result, counterparties could face greater difficulties in reporting data and an increased likelihood of incomplete, inaccurate, or untimely data being submitted to registered SDRs.

Third, under this alternative the registered clearing agency that is party to the transaction potentially has weaker incentives to provide high-quality regulatory data to the counterparty with a duty to report, which could reduce the quality of regulatory data collected by registered SDRs. The person with the duty to report a transaction has strong incentives to ensure that the transaction details are transmitted in a well-structured format with data fields clearly defined, and that contain data elements that are validated and free of errors because, pursuant to Regulation SBSR, this person is responsible for making accurate reports and, if necessary, making corrections to previously submitted data. Not only would the registered clearing agency have no duty under Regulation SBSR to provide information to its counterparty, but additionally, market forces might not provide sufficient motivation to the registered clearing agency to provide data to the counterparty in a manner that would minimize the counterparty's reporting burden. If registered clearing agencies exercise their market power against counterparties, the counterparties might have limited ability to demand high-quality data reporting services from registered clearing agencies and may require the services of agents that clean and validate transaction data that they receive.

⁹⁴⁸ Unless it preferred a particular registered SDR for operational reasons discussed above, a non-clearing-agency counterparty to a clearing transaction would likely contract with the clearing agency to report clearing transactions to the registered SDR that offers the lowest price, most likely the clearing agency affiliate. As discussed in Section II(B)(1), *supra*, a registered clearing agency and its affiliated SDR have greater control over the reporting process relative to sending transaction data to an independent SDR. This greater control lowers the cost of transmitting transaction data from the clearing agency to its affiliated SDR relative to transmitting the same data to an independent SDR. The lower cost potentially allows the affiliated SDR to charge the lowest price among competing SDRs.

⁹⁴⁹ See Markit Letter at 12. Although the commenter asserts the benefits of allowing non-

clearing agency counterparties discretion over which registered SDR receives their data in its assessment of Alternative 3, the Commission believes that this analysis applies equally to the assessment of Alternative 1.

⁹⁵⁰ See *supra* note 948.

⁹⁵¹ See Regulation SBSR Proposed Amendments Release, 80 FR at 14782.

⁹⁵² See Markit Letter at 8.

The Commission believes, however, that despite a similarity in ultimate outcomes, and any benefits that might flow from enabling registered SDRs to compete for clearing transaction business, this alternative does not compare favorably to the adopted approach. As discussed above, assigning reporting obligations to the non-clearing-agency side could increase the number of reporting steps, thereby increasing the possibility of discrepancy, error, or delay in the reporting process. Placing the reporting duty on the non-clearing-agency side also could reduce data reliability if the data has to be reconfigured to be acceptable by the SDR. The Commission believes that discrepancies, errors, and delays are less likely to occur if the duty to report clearing transactions is assigned to registered clearing agencies directly, because there would be no additional or intermediate steps where data would have to be transferred or reconfigured.⁹⁵³

2. Alternative 2

A second, closely related alternative would involve placing registered clearing agencies within the Regulation SBSR reporting hierarchy, below registered security-based swap dealers and registered major security-based swap participants but above counterparties that are not registered with the Commission. Alternative 2 would assign the reporting obligation to a registered security-based swap dealer or registered major security-based swap participant when it is a counterparty to a registered clearing agency, while avoiding the need for non-registered persons to negotiate reporting obligations with registered clearing agencies.

As with Alternative 1, Alternative 2 potentially results in additional reporting steps and could marginally reduce the quality of regulatory data relative to the adopted approach. A key difference, however, is that Alternative 2 would reduce the likelihood of reporting obligations falling on unregistered persons, who would likely have less market power in negotiations with registered clearing agencies over the terms of reporting to a registered SDR. Larger counterparties, *i.e.*, those with greater transaction flow, would likely be better able to negotiate better terms by which clearing agencies report transactions on their behalf or provide the counterparties with access to the clearing data so that they can perform their own reporting.

⁹⁵³ See *supra* Section III(B).

In its discussion of Alternative 1, the Commission noted three particular ways in which limited competition among registered clearing agencies could result in poorer outcomes for non-clearing-agency counterparties. First, when these counterparties obtain clearing data from a registered clearing agency, they would likely incur any costs related to reformatting the data for submission to a registered SDR, including the costs of outsourcing these activities to an agent. Second, registered clearing agencies might charge these counterparties high fees for access to regulatory data that counterparties are required to submit to registered SDRs. Third, registered clearing agencies might have weak incentives to ensure that the data that they supply to non-clearing-agency counterparties are of high quality, since the non-clearing-agency counterparties would bear the costs of error correction.

Limiting the extent to which registered clearing agencies can exercise the market power resulting from limited competition over their counterparties could reduce some of the drawbacks to the Alternative 1. In particular, registered clearing agencies may be less likely to exercise market power in negotiations with larger market participants, particularly when these market participants are also clearing members. Clearing members play key roles in the governance and operation of registered clearing agencies, often contributing members of the board of directors. Moreover, clearing members contribute to risk management at registered clearing agencies by, for example, contributing to clearing funds that mutualize counterparty risk.⁹⁵⁴ Nevertheless, the Commission believes that Alternative 2 does not fully address frictions that arise from limited competition among registered clearing agencies, such as high clearing fees or low quality services. The Commission believes that Alternative 2 would be less efficient than requiring the registered clearing agency to report the transaction information directly to a registered SDR, because the registered clearing agency is the only person who has complete information about a clearing transaction immediately upon its creation.

3. Alternative 3

The Commission considered a third alternative that would make the reporting side for the alpha responsible for reporting both the beta and

gamma.⁹⁵⁵ Alternative 3 would require the reporting side for the alpha also to report information about a security-based swap to which it is not a counterparty, *i.e.*, the clearing transaction between the registered clearing agency and the non-reporting side of the alpha. As discussed in Section III(B), *supra*, Alternative 3 would be operationally difficult to implement, could create confidentiality concerns, and could increase the likelihood of data discrepancy, error, and delay because Alternative 3 requires additional reporting steps. Alternative 3 also would require reporting sides to negotiate with registered clearing agencies to obtain transaction data and to bear the costs of correcting errors in these data, exposing them to the market power exercised by registered clearing agencies. Also, because the reporting side of the alpha would report the beta and gamma, Alternative 3 is premised on the view that the beta and gamma are life cycle events of the alpha. The Commission, however, considered and rejected this approach in the Regulation SBSR Adopting Release.

In addition, Alternative 3 could result in incomplete regulatory data because it could raise questions about who would report clearing transactions associated with the compression and netting of beta or gamma transactions. For example, suppose a non-dealer clears two standard contracts on the same reference entity using a single registered clearing agency, each contract having a different registered security-based swap dealer as counterparty. Under this alternative to the adopted approach, each dealer would be responsible for reporting a gamma security-based swap between the non-dealer and the registered clearing agency. However, this alternative does not specify which of four potential persons (the non-dealer, one or the two registered security-based swap dealers, or the clearing agency) would be required to report the contract that results from the netting of the two gamma security-based swaps between the non-dealer and the registered clearing agency.

⁹⁵⁵ The Commission considered and rejected this approach in the Regulation SBSR Adopting Release. See 80 FR at 14639 (“the new term ‘clearing transaction’ makes clear that security-based swaps that result from clearing (*e.g.*, betas and gammas in the agency model) are independent security-based swaps, not life cycle events of the security-based swap that is submitted to clearing (*e.g.*, alpha security-based swaps)”). However, the Commission is discussing this alternative in response to a commenter that, in response to the Regulation SBSR Proposed Amendments Release, recommended that the Commission adopt this approach. See Market Letter at 11–13.

⁹⁵⁴ See Securities Exchange Act Release No. 68080 (October 22, 2013), 77 FR 66220, 66267 (November 2, 2012) (“Clearing Agency Standards Adopting Release”) (discussing financial resources of clearing agencies).

4. Commenter Views

One commenter proposed a fourth alternative to assigning reporting duties for cleared transactions.⁹⁵⁶ Under this alternative, “the platform would remain the reporting side for all platform-executed trades while for bilateral or off platform cleared transactions, the reporting side would be the clearing agency. However, the clearing agency would be required to submit beta and gamma trade records to the alpha SDR (which would be determined by the alpha trade reporting side and not the clearing agency).”⁹⁵⁷ For the reasons discussed above, the Commission considers this alternative less appropriate than the adopted approach.⁹⁵⁸ While the Commission concurs with the approach of requiring the registered clearing agency to report the resulting beta and gamma transactions, the Commission believes that the registered clearing agency, when it has the duty to report security-based swaps, should be able to choose the registered SDR to which it reports.⁹⁵⁹

The same commenter stated that requiring registered clearing agencies to report their clearing transactions “is not supported by an adequate consideration of factors contained in Section 3(f) of [the Exchange Act]” and provided comments that focused on the proposed rule’s “considerations of efficiency and competition.”⁹⁶⁰ Specifically, this commenter believed that the proposed rule “ignores the efficiency benefits and reduced costs introduced by middleware reporting agencies,” and it “needlessly and unjustifiably proposes an approach to cleared [security-based swap] reporting that imposes a burden on competition.”⁹⁶¹ Further, the commenter expressed the view that Rule 901(a)(2)(i) would deter competition based on service quality and cost in the market for SDR services, whereas the three alternatives would encourage such competition in the same market.⁹⁶² The

Commission believes that it has adequately considered the factors contained in Section 3(f) of the Exchange Act in this release and in the Regulation SBSR Proposing Release.⁹⁶³ Further, the Commission has evaluated four alternative allocations of reporting obligations, including their likely effects on efficiency and competition. The Commission appreciates the commenter’s concern that competition in the market for SDR services could be hindered by Rule 901(a)(2)(i) with the possible result that clearing-agency-affiliated SDRs might charge higher fees and/or offer lower quality services to their users. However, the Commission notes that such effects on competition, should they occur, would be limited because Rule 13n-4(c)(1)(i) under the Exchange Act⁹⁶⁴ requires an SDR, including a clearing-agency-affiliated SDR, to ensure that any dues, fees, or other charges imposed by, and any discounts or rebates offered by, the SDR are fair and reasonable and not unreasonably discriminatory. As noted in Section XIII, *supra*, an affiliated SDR might offer higher quality services and/or lower fees to its participants to the extent that the affiliated SDR realizes efficiency gains from vertical integration and shares some of these gains with its participants. Further, other commenters expressed the view that requiring registered clearing agencies to report clearing transactions could enhance market efficiency and improve the accuracy of reported data. Two commenters observed that clearing agencies will be able to leverage existing reporting processes and the existing infrastructure that they have in place with market participants and vendors to report clearing transactions.⁹⁶⁵ Another commenter observed that requiring clearing agencies to report clearing transactions in security-based swaps would be “efficient, cost effective and promot[] global data consistency,” because “clearing agencies have demonstrated their ability and preference to report data for cleared transactions” under swap data reporting rules established by the CFTC and in non-U.S. jurisdictions, including the European Union and Canada.⁹⁶⁶ One commenter agreed with the Commission’s preliminary view that proposed Rule 901(a)(2)(i) was superior to alternative reporting workflows that

“could require a person who does not have information about [a] clearing transaction at the time of its creation to report that transaction.”⁹⁶⁷ As discussed above, the Commission acknowledges that Rule 901(a)(2)(i) could place a burden on competition in the market for clearing services and the market for security-based swap data reporting. However, the Commission rejects the commenter’s view that the adopted approach needlessly and unjustifiably imposes a burden on competition. As discussed above, the Commission believes that the adopted approach is appropriate because it would eliminate additional steps in the reporting process that would be needed if another market participant were assigned the duty to report a clearing transaction or if the duty were to remain unassigned. By adopting a reporting methodology with as few steps as possible, the Commission intends to minimize potential delays, discrepancies, and errors in data transmission by assigning reporting duties to the person that holds the most complete and accurate information about clearing transactions at the moment of their creation.⁹⁶⁸

C. Reporting by Platforms

Pursuant to new Rule 901(a)(1), a platform is required to report a security-based swap transaction executed on that platform that will be submitted to clearing.⁹⁶⁹ With the ability to clear security-based swap transactions, it is possible for two counterparties to trade anonymously on a platform. In an anonymous trade, because neither counterparty would be aware of the name or registration status of the other, it might not be possible for either counterparty to use the reporting hierarchy in existing Rule 901(a)(2)(i) to determine who would be required to report this alpha transaction.⁹⁷⁰ The Commission is requiring a platform to report all alpha transactions executed on the platform that will be submitted to clearing, even those that might not be anonymous; this approach avoids the need for the platform and the counterparties to ascertain whether the counterparties are in fact unknown to each other.

Furthermore, the platform is the only entity at the time of execution—*i.e.*, before the transaction is submitted for clearing—that knows the identity of both sides. Requiring the platform to

⁹⁷⁰ See Regulation SBSR Proposed Amendments Release, 80 FR at 14748–49.

report information associated with transactions that will be submitted to clearing also reduces the number of data transmission steps between execution and reporting to a registered SDR. A platform that matches orders and executes transactions will possess or can readily obtain all of the primary trade information necessary to be reported to a registered SDR, and new Rule 901(a)(1) makes it unnecessary for counterparties to report these transactions. This approach is designed to result in a more efficient reporting process for platform-executed alphas. By reducing the number of steps between the creation of transaction data and reporting to a registered SDR, Rule 901(a)(1) reduces the possibility of data discrepancies and delays.

While the level of security-based swap activity that currently takes place on platforms and is subsequently submitted for clearing is low, future rulemaking under Title VII could cause security-based swap trading volume on platforms to increase.⁹⁷¹ Efficiencies resulting from requiring platforms to report platform-executed alphas will increase to the extent that security-based swap trading volumes on platforms increases.

As discussed above in the context of reporting obligations for registered clearing agencies, the Commission believes that the reporting infrastructure costs associated with required reporting pursuant to the adopted amendments could represent a barrier to entry for new, smaller platforms that do not yet have the ability to report transactions to a registered SDR. To the extent that the adopted rules and amendments might deter new trading platforms from entering the security-based swap market, this could negatively impact competition.

1. Alternative Approaches to Reporting Platform-Executed Transactions

For platform-executed transactions that are submitted to clearing but are not anonymous, an alternative would be to use the reporting hierarchy in existing Rule 901(a)(2)(ii) to assign the reporting duty. Under such an alternative, a platform would have to determine which of the trades that it executes are anonymous and which are not, which would impose additional costs on platforms.⁹⁷² It is likely that platforms

⁹⁷¹ The Commission has proposed, but not adopted, rules governing the registration and operation of SB SEFs. See SB SEF Proposing Release, 76 FR at 10948.

⁹⁷² There could be situations where a market participant splits an order into two or more child orders and some child orders are anonymously executed while other child orders are not

would seek to pass on these costs to its participants. The Commission believes that the due diligence that platforms would have to perform under this alternative would impose unnecessary costs without enhancing the benefits of regulatory reporting. Such costs can be avoided by requiring a platform to report all platform-executed alphas, which is what adopted Rule 901(a)(2)(i) requires.

A second alternative would be to assign the reporting duty for all platform-executed alphas to the registered clearing agency to which the alphas are submitted. While the registered clearing agency would likely have the information necessary for reporting—because the clearing agency will need much of the same information about the alpha to clear it—the Commission believes that it would be more appropriate to assign the reporting duty to the platform. This approach creates a more direct flow of information from the point of execution on the platform to the registered SDR, thus minimizing opportunities for data discrepancies or delays. This approach also avoids the need for the registered clearing agency to invest resources in systems to receive data elements from platforms beyond what is already required for clearing, and to report transactions to which it is not a counterparty.

D. Reporting of Clearing Transactions Involving Allocation

In the Regulation SBSR Adopting Release, the Commission explained the application of Regulation SBSR to bunched order executions that are not submitted to clearing.⁹⁷³ In the Regulation SBSR Proposed Amendments Release, the Commission discussed the application of Regulation SBSR to bunched order executions that are submitted to clearing, and the security-based swaps that result from the allocation of the bunched order if the resulting security-based swaps are cleared. In this release, the Commission discusses how the amendments to Regulation SBSR that the Commission is adopting today apply to bunched order executions that are cleared. The discussion is designed to accommodate the various workflows that market participants employ to execute and allocate bunched order alphas. This guidance does not create any new duties under Regulation SBSR but does explain the application of Regulation SBSR to

anonymously executed. This could further complicate separation of anonymous and non-anonymous executions.

⁹⁷³ See 80 FR at 14625–27.

events that occur as part of the allocation process.⁹⁷⁴ Additionally, because the guidance explains how Regulation SBSR applies to a platform-executed bunched order that will be submitted to clearing—and the security-based swaps that result from the allocation of any bunched order execution, if the resulting security-based swaps are cleared—the interpretation is not likely to have consequences for efficiency, competition, or capital formation beyond those stemming from imposing reporting obligations on registered clearing agencies and platforms, as discussed above in Sections II and III, respectively.

E. Application of Regulation SBSR to Prime Brokerage Transactions

In Section VII, *supra*, the Commission discussed how Regulation SBSR applies to security-based swaps arising out of prime brokerage arrangements. This guidance does not create any new duties; it merely explains how a series of security-based swaps arising from a prime brokerage arrangement should be reported and publicly disseminated under Regulation SBSR. Therefore, there are no additional costs or benefits beyond those already considered in the Regulation SBSR Adopting Release.⁹⁷⁵

A prime brokerage arrangement involves a reallocation of counterparty risk, as the prime broker interposes itself between its client and a third-party executing dealer. Regulatory reporting of each security-based swap leg will allow the Commission and other relevant authorities to more accurately conduct market surveillance and monitor counterparty risk. As a result of public dissemination of all security-based swaps arising from a prime brokerage arrangement, market observers will have access to information regarding each leg. This could help market observers infer from these disseminated reports the fees that the prime broker charges for its credit intermediation service and separate these fees from the transaction price of the security-based swap.

F. Prohibition of Fees and Usage Restrictions for Public Dissemination

New Rule 900(tt), as adopted herein, defines the term “widely accessible”—

⁹⁷⁴ The Commission’s estimates of events reportable under these amendments includes observable allocation by clearing agencies in the TIW data. Therefore, the costs associated with clearing transactions involving allocation are included in the Commission’s estimate of the programmatic costs of Rules 901(a)(1) and (a)(2)(i).

⁹⁷⁵ See 80 FR 14700–704. The Commission’s estimates in that release of the total number of reportable events included all security-based swap legs arising out of prime brokerage arrangements.

which appears in the definition of “publicly disseminate” in existing Rule 900(cc)—to mean “widely available to users of the information on a non-fee basis.” This new definition has the effect of prohibiting a registered SDR from charging fees for or imposing usage restrictions on the security-based swap transaction data that it is required to publicly disseminate under Regulation SBSR.

Allowing free and unrestricted access to the security-based swap data that registered SDRs are required to publicly disseminate is designed to reinforce the economic effects of public dissemination generally, because market observers will be able to enjoy the benefits of public dissemination without cost and without any restriction on how they use the disseminated data. Furthermore, new Rule 900(tt) reinforces the benefits of existing Rule 903(b), which provides that a registered SDR may utilize codes in the reported or disseminated data only if the information necessary to understand the codes is free and not subject to any usage restrictions. As the Commission pointed out in the Regulation SBSR Adopting Release, Rule 903(b) could improve the efficiency of data intake by registered SDRs and data analysis by relevant authorities and other users of security-based swap data; improve efficiency by minimizing operational risks arising from inconsistent identification of persons, units of persons, products, or transactions by counterparties; and promote competition by prohibiting fee-based licensing of reference information that could create barriers to entry into the security-based swap market.⁹⁷⁶ If the Commission did not prohibit fees and usage restrictions relating to the publicly disseminated data, a registered SDR that wished to charge (or allow others to charge) users for the information necessary to understand these UICs—but could not, because of Rule 903(b)—might seek to do so indirectly by recharacterizing the charge as being for public dissemination. Such potential action by a registered SDR could reduce the economic benefits of Rule 903(b) and public dissemination generally. New Rule 900(tt) is designed in part to reinforce the economic effects, and help prevent avoidance, of Rule 903(b).

The adopted prohibition on a registered SDR charging fees for public dissemination of the regulatorily mandated security-based swap transaction data also is consistent with the CFTC’s current prohibition on

CFTC-registered swap data repositories charging for public dissemination of regulatorily mandated swap transaction data. Such consistency lessens the incentives for swap data repositories registered with the CFTC to enter the security-based swap market and also register with the Commission as SDRs and charge for public dissemination of security-based swap market data.⁹⁷⁷ If the Commission did not take this approach, a CFTC-registered swap data repository could enter the security-based swap market and charge for public dissemination of security-based swap market data, and use revenues from this business to subsidize its operations in the swap market, where it is not permitted to charge for public dissemination of swap market data. If an SEC-registered SDR charges fees for security-based swap data to subsidize its reporting activity in the CFTC regime, then security-based swap market participants reporting to this SDR could face higher costs than those it would face if the SDR participated only in the security-based swap market.

The Commission recognizes that, because registered SDRs are prohibited from charging for the security-based swap data that Regulation SBSR requires them to publicly disseminate, they must obtain funds for their operating expenses through other means.⁹⁷⁸ A registered SDR could pass the costs of publicly disseminating security-based swap data through to the persons who report transactions to the registered SDR. Direct fees imposed on market participants would likely be in proportion to the number of transactions they execute, with more active market participants, who contribute more to the production of transaction information, paying a larger share of the cost of disseminating that information. By contrast, it would be more difficult to equitably calibrate a fee based on the consumption of the publicly disseminated data, because it would be difficult to measure the intensity of a market observer’s usage of the disseminated data. As the Commission discussed in the Regulation SBSR Adopting Release, the positive effects of public dissemination on efficiency, competition, and capital formation derive from the broad based use of

disseminated data by a multitude of users.⁹⁷⁹ There are likely to be a large number of marginal users of the disseminated data who would not obtain the data if they were required to pay for it. Thus, many potential users of the data might never have the opportunity to develop new uses for the data. While a funding model relying on fees for transaction reporting could result in security-based swap market participants subsidizing other users of security-based swap market data, charging fees for the consumption of publicly disseminated data could drastically reduce the number of data users and the associated positive effects on efficiency, competition, and capital formation.

The Commission notes that new Rule 900(tt) does not prohibit a registered SDR from offering value-added security-based swap market products for sale, provided that the SDR does not make transaction information available through the value-added product sooner than it publicly disseminates each individual transaction. This requirement is designed to prevent a registered SDR from obtaining an unfair competitive advantage over other firms that might wish to sell value-added market data products. Any such products could allow market observers to enjoy the positive impacts of Regulation SBSR on efficiency, competition, and capital formation more directly, by making it easier for market observers to understand the publicly disseminated data. Even if the SDR does not make transaction information available through the value-added product sooner than it publicly disseminates each individual transaction, the SDR retains a time advantage over a competing provider of value-added data products. This time advantage is the time taken for the SDR to electronically disseminate transaction information to the public. While the SDR has such a time advantage, the competitive effect of this advantage depends in part on the nature of the value-added data product. For value-added data products whose usefulness is not highly sensitive to data transmission time, such as a summary of monthly security-based swap trading activity, the SDR’s time advantage would not exert a significant negative effect on other competitors. On the other hand, for value-added products whose usefulness decreases with data

⁹⁷⁷ Dual registration is likely to occur independent of the ability to charge for public dissemination of data in the security-based swap market. However, the ability to charge for public dissemination would add an additional incentive to do so.

⁹⁷⁸ It is unlikely, however, in the absence of Rule 900(tt) that registered SDRs would have relied on charges for public dissemination as the sole means of funding their operations.

⁹⁷⁹ See 80 FR 14720–22 (explaining how efficiency, competition, and capital formation could be enhanced when market participants, market observers, debt issuers, lenders, and business owners and managers, among others, make use of publicly disseminated security-based swap data).

⁹⁷⁶ See 80 FR at 14723.

transmission time, such as a product that predicts security-based swap prices or volumes over the next minute, the SDR's time advantage could have a negative effect on other competitors. Even for such products, the SDR's time advantage would be limited if there are multiple competing SDRs accepting data in the same asset class and the SDR is offering a value-added product that requires not only the data that it accepts but also the data publicly disseminated by other competing SDRs. Any time advantage that the SDR might enjoy with respect to the data that it accepts could be offset by the absence of time advantage when receiving data publicly disseminated by other competing SDRs.

G. Compliance Schedule for Regulation SBSR

The compliance schedule adopted in this release is designed to provide affected persons, especially registered SDRs and persons with a duty to report security-based swap transactions, with time to develop, test, and implement systems for carrying out their respective duties under Regulation SBSR. The new compliance schedule takes into consideration the fact that the CFTC's regulatory reporting and public dissemination rules are already in effect. As a result, several SDRs have provisionally registered and are operating in the swap market under CFTC rules, and swap market participants have developed substantial infrastructure to support swap transaction reporting. It is likely that participants in both the swap and security-based swap markets will seek to repurpose much of the infrastructure implemented in the swap market to support activities in the security-based swap market, which would enable more efficient implementation of the Commission's regime for security-based swap reporting.

Also, as discussed in Section X(C), *supra*, the new compliance schedule aligns Regulation SBSR compliance with security-based swap dealer registration. Thus, with respect to newly executed security-based swaps in a particular asset class, Compliance Date 1 for Rule 901 of Regulation SBSR is the first Monday that is the later of: (1) Six months after the date on which the first SDR that can accept transaction reports in that asset class registers with the Commission; or (2) one month after the SBS entities registration compliance date. Every security-based swap in that asset class that is executed on or after Compliance Date 1 must be reported in accordance with Rule 901. Compliance Date 2, when public dissemination shall commence, is the first Monday that is

three months after Compliance Date 1. Compliance Date 3, by which all historical security-based swaps in that asset class must be reported to a registered SDR (to the extent that information about such transactions is available), is two months after Compliance Date 2.⁹⁸⁰

The proposed compliance schedule would have required affected persons to begin complying with Regulation SBSR before security-based swap dealers register with the Commission. A number of comments urged the Commission to delay Regulation SBSR compliance until after security-based swap dealers register.⁹⁸¹ One commenter provided extensive estimates of the costs that market participants could have incurred to develop reporting procedures for the Interim Period that likely would not have been applicable to the period after security-based swap dealer registration.⁹⁸² This commenter also pointed out that the Interim Period could create a competitive disadvantage for non-U.S. dealing entities because these entities could assume the responsibility but not the liability for reporting and thus might be less attractive to buy-side U.S. clients than U.S. dealing entities that could assume both the responsibility and liability for reporting.⁹⁸³

The Commission agrees with commenters that it would be more efficient for affected persons to focus on developing compliance procedures only for the period after security-based swap dealer registration, rather than require affected persons to expend resources to develop procedures for both the period after registration as well as for the Interim Period, because Interim Period procedures might be inapplicable to the period after registration. The Commission believes that, by eliminating the Interim Period and thus the need to expend resources for developing interim procedures, the adopted compliance schedule will promote efficiency. The adopted compliance schedule should also promote capital formation to the extent that persons that would have incurred reporting obligations during the Interim

⁹⁸⁰ Every security-based swap in that asset class that is executed on or after July 21, 2010, and up and including to the day immediately before Compliance Date 1 is a transitional security-based swap. As discussed in Section X(E), *infra*, the Commission's final compliance schedule establishes a separate Compliance Date 3 for the reporting of pre-enactment and transitional security-based swaps.

⁹⁸¹ See IIB Letter at 17; ISDA I at 4, 11–13; ISDA II at 1–14; ISDA III at 1–12; SIFMA–AMG II at 6–7; WMBAA Letter at 5–6; UBS Letter at 2.

⁹⁸² See ISDA III at 8–9.

⁹⁸³ See *id.* at 3.

Period could invest the resources that would otherwise be expended in developing Interim Period procedures into productive assets.

Furthermore, the Commission acknowledges the commenters' concern that the Interim Period could create competitive disparities between U.S. and foreign dealing entities if buy-side U.S. persons were less willing to transact with foreign dealing entities if certain foreign dealing entities could not assume the liability for reporting. The adopted compliance schedule avoids the need for the Interim Period and thus eliminates any potential competitive disadvantage for foreign dealing entities described by the commenters. Thus, relative to the proposed compliance schedule, the adopted compliance schedule should promote competition among U.S. and foreign dealing entities that supply liquidity to the security-based swap market.

In summary, the Commission now believes, in light of the comments received on its proposal, that it would better promote efficiency, competition, and capital formation to delay compliance with the reporting obligations of Regulation SBSR until after the SBS entities registration compliance date.

The compliance schedule adopted herein also is based on the first SDR in an asset class to register with the Commission, which could confer a "first-mover advantage."⁹⁸⁴ The first registered SDR could potentially capture a significant share of the SDR market because reporting parties, uncertain as to whether or when registration of other SDRs' applications might be granted, could feel compelled to onboard with the first registered SDR to secure sufficient time to prepare for Compliance Date 1.⁹⁸⁵ Furthermore, the first registered SDR could hold on to its share of the SDR market for long periods if reporting persons that are connected to it face high costs of switching to a different registered SDR. Thus, the first mover advantage could potentially limit competition by making it more difficult for new SDR entrants to sign on reporting clients.

The Commission acknowledges that a first mover could emerge. Nevertheless, the Commission believes that, if one SDR application satisfies the criteria of Rule 13n–1(c)(3) under the Exchange Act before any others, it would not be appropriate for the Commission to delay

⁹⁸⁴ See WMBAA Letter at 6; DTCC Letter at 12; SIFMA Letter at 17; DTCC/ICE/CME Letter at 4–5; ISDA/SIFMA Letter at 18.

⁹⁸⁵ See DTCC Letter at 12; DTCC/ICE/CME Letter at 4–5; ISDA/SIFMA Letter at 18.

granting its registration because of the status of other SDR applications.⁹⁸⁶ The Commission continues to believe that most persons that have the desire and ability to operate as SEC-registered SDRs are already operational in the swaps market as swap data repositories provisionally registered with the CFTC, and each should have a strong incentive to submit applications to register with the Commission quickly.⁹⁸⁷ Thus, there is less likelihood of multiple applications arriving over an extended period of time, and consequently, a lower likelihood of a first mover emerging.

Even if a first mover emerges, other Commission rules are designed to minimize any potential of a monopoly advantage that the first SDR might otherwise enjoy. All SDRs, even the first or only registered SDR in a particular asset class, must offer fair, open, and not unreasonably discriminatory access to users of its services.⁹⁸⁸ Moreover, any fees charged by an SDR must be fair and reasonable and not unreasonably discriminatory.⁹⁸⁹

The newly adopted compliance schedule could give added incentive to avoid delaying the submission of an application for registration as an SDR and to commence operation as an SEC-registered SDR as quickly as possible. This result would help the Commission and other relevant authorities obtain information about the security-based swap market for oversight purposes as quickly as possible, and also allow the public to obtain price, volume, and transaction information about all security-based swaps as quickly as possible.

As proposed in the Regulation SBSR Proposed Amendments Release, all historical security-based swaps in a particular asset class would have had to be reported to a registered SDR by proposed Compliance Date 1. As discussed in Section X(E), *supra*, the Commission has revised the compliance schedule to dissociate the requirement to report historical security-based swaps from Compliance Date 1. With respect to historical security-based swaps in a particular asset class, new Compliance Date 3 for the reporting of historical transactions is two months after Compliance Date 2, the date on which public dissemination commences. The Commission believes that the additional compliance delay for reporting

historical security-based swaps represents an appropriate balancing of the benefits of mandatory reporting against the likely costs. Mandatory reporting of historical security-based swaps is generally less urgent than the reporting of newly executed transactions, particularly in light of the fact that most security-based swaps in the credit derivative asset class are already being reported on a voluntary basis to TIW. Because only available information about historical transactions must be reported, the Commission does not anticipate that reports of historical transactions made to registered SDRs will be significantly more informative than the reports already available through TIW.

Several commenters were concerned that requiring reporting pursuant to Regulation SBSR to begin before the Commission has made substituted compliance determinations “would impose significant and unnecessary burdens” on non-U.S. registered persons. Changes made by non-U.S. persons to their reporting infrastructure to comply with Regulation SBSR may not be necessary, in the commenters’ views, if the Commission subsequently grants substituted compliance to these non-U.S. persons.⁹⁹⁰ The Commission acknowledges the commenters’ concern regarding burdens that may arise if compliance with Regulation SBSR precedes substituted compliance determinations. However, as discussed in Section X(C)(5), *supra*, the Commission does not believe that it is appropriate to defer compliance with Regulation SBSR until after the Commission makes one or more substituted compliance determinations. The Commission understands that changes made by non-U.S. persons to their reporting infrastructure to comply with Regulation SBSR might become unnecessary if substituted compliance is granted. However, these changes could be limited to the extent that the Commission and other jurisdictions require the collection and reporting of similar transaction information.

H. Amendments Related to Cross-Border Transactions

The amendments to Rules 901 and 908 adopted today will, among other things, apply Regulation SBSR’s regulatory reporting and public dissemination requirements to all security-based swap transactions of a foreign dealing entity that are arranged, negotiated, or executed by U.S. personnel. Such ANE transactions are

already subject to regulatory reporting and public dissemination if the other side includes a U.S. person. The amendments adopted today extend the regulatory reporting and public dissemination requirement to all ANE transactions, even if the other side is non-U.S. and not engaging in ANE activity. These amendments also for the first time assign the duty to report transactions between unregistered U.S. persons and unregistered non-U.S. persons. These amendments will have several effects on efficiency, competition, and capital formation in the U.S. financial market.

1. Competition

These amendments to Rules 901 and 908 will have implications for competition among market participants that intermediate transactions in security-based swaps as well as counterparties to security-based swaps. These amendments are designed to promote competition among liquidity providers in the security-based swap market by imposing consistent reporting and public dissemination requirements on both U.S. and foreign dealing entities, when the latter are engaging in ANE activity. If only U.S. dealing entities were subject to regulatory reporting and public dissemination requirements, the costs of these requirements would primarily affect U.S. dealing entities, their agents, and their counterparties. In contrast, foreign dealing entities and their agents, who might not be subject to comparable requirements in their home jurisdictions, could have a competitive advantage over U.S. dealing entities in serving unregistered non-U.S. counterparties using personnel located in a U.S. branch or office, were their activities not subject to the same requirements.⁹⁹¹

These amendments to Rules 901 and 908 also are designed to promote competition between U.S. persons and non-U.S. persons that trade with foreign dealing entities, when a foreign dealing entity is utilizing U.S. personnel. A transaction between an unregistered foreign dealing entity engaging in ANE activity and a U.S. counterparty already is subject to regulatory reporting and public dissemination under existing Rule 908(a)(1)(i). In the absence of

⁹⁹¹ See, e.g., Arnoud W.A. Boot, Silva Dezellan, and Todd T. Milbourn, “Regulatory Distortions in a Competitive Financial Services Industry,” *Journal of Financial Services Research*, Vol. 17, No. 1 (2000) (showing that, in a simple industrial organization model of bank lending, a change in the cost of capital resulting from regulation results in a greater loss of profits when regulated banks face competition from unregulated banks than when regulations apply equally to all competitors).

⁹⁸⁶ See *supra* Section X(C)(4).

⁹⁸⁷ See Regulation SBSR Proposed Amendments Release, 80 FR at 14786.

⁹⁸⁸ See Rule 13n-4(c)(1)(iii) under the Exchange Act, 17 CFR 240.13n-4(c)(1)(iii).

⁹⁸⁹ See Rule 13n-4(c)(1)(i) under the Exchange Act, 17 CFR 240.13n-4(c)(1)(i).

⁹⁹⁰ See ISDA I at 15; ISDA/SIFMA Letter at 19; SIFMA/FSR Letter at 15.

newly adopted Rules 901(a)(2)(ii)(E)(2) and (3), however, no one would be assigned to report such a transaction. Furthermore, in the absence of new Rule 908(b)(5), an unregistered foreign dealing entity engaged in an ANE transaction would not be subject to Regulation SBSR. This could create a competitive advantage for non-U.S. persons over similarly situated U.S. persons when they trade with foreign dealing entities. An unregistered foreign dealing entity might be able offer liquidity to a non-U.S. person at a lower price than to the U.S. person because the foreign dealing entity would not have to embed the potential costs of regulatory reporting and public dissemination into the price offered to the non-U.S. person. By contrast, the price offered by the unregistered foreign dealing entity to the U.S. person would likely reflect these additional costs, to the extent that public dissemination of a particular transaction imposes costs on the counterparties.⁹⁹² While the benefit of lower prices obtained by non-U.S. persons would depend on the magnitude of the perceived costs of public dissemination, the Commission believes that it is appropriate to place the transactions of U.S. persons and non-U.S. persons on a more equal footing, so that non-U.S. persons do not have a competitive advantage over U.S. persons when engaging in security-based swap transactions that, due to the involvement of U.S. personnel of the foreign dealing entity, exist at least in part within the United States.

The amendments to Rules 901 and 908 adopted herein also apply consistent regulatory reporting and public dissemination requirements to transactions between unregistered non-U.S. persons that are platform-executed or effected by or through registered broker-dealers. Because there will be very few such transactions, the Commission believes that the application of regulatory requirements is unlikely to generate competitive frictions between these different types of providers of intermediation services.⁹⁹³

As discussed in Section XII(B)(1)(2), *supra*, unregistered U.S. persons likely will seek to avoid the costs of assessing whether a foreign counterparty is engaging in ANE activity by choosing to transact only with registered entities for which assessment is not required. To

the extent that unregistered U.S. persons avoid transacting with unregistered foreign dealing entities engaging in ANE activity in favor of transacting with registered entities, these foreign dealing entities could be at a competitive disadvantage when competing with registered entities to provide liquidity to unregistered U.S. persons. However, this competitive disadvantage could be limited if unregistered foreign dealing entities readily provide information on their use of U.S. personnel to unregistered U.S. persons who are potential counterparties, thereby obviating the need for the U.S. persons to conduct an assessment. Further, the competitive disadvantage could be eliminated entirely if a foreign dealing entity registers with the Commission as a security-based swap dealer. An unregistered foreign dealing entity that remains below the *de minimis* threshold may seek to register as a security-based swap dealer if the benefits from providing liquidity to unregistered U.S. persons are sufficient to justify the costs associated with dealer registration.

2. Efficiency

The Regulation SBSR Adopting Release did not address when an uncleared security-based swap involving only unregistered non-U.S. persons would be subject to regulatory reporting and/or public dissemination. The amendments to Rules 901 and 908 adopted herein, by requiring the public dissemination of ANE transactions, including those that are uncleared security-based swaps involving only unregistered non-U.S. persons, will increase price competition and price efficiency in the security-based swap market generally,⁹⁹⁴ and enable all market participants to have more comprehensive information with which to make trading and valuation determinations for security-based swaps and related and underlying assets. The reporting of all ANE transactions to a registered SDR should enhance the Commission's ability to oversee security-based swap activity occurring within the United States and to monitor for compliance with specific Title VII requirements (including the requirement that a person register with the Commission as a security-based swap dealer if it exceeds the *de minimis* threshold). The reporting of these transactions likely will enhance the Commission's ability to monitor for manipulative and abusive practices involving security-based swap transactions or transactions in related

underlying assets, such as corporate bonds or other securities transactions that result from dealing activity, or other relevant activity, in the U.S. market. The knowledge that the Commission and other relevant authorities are able to conduct surveillance on the basis of regulatory reporting could encourage greater participation in the security-based swap market since surveillance and the resulting increased probability of detection may deter potential market abuse. This could result in improved efficiency, due to the availability of more risk-sharing opportunities between market participants.

The Commission acknowledges the risk that, in response to the adopted amendments, foreign dealing entities, trading platforms, and/or registered broker-dealers could restructure their operations to avoid triggering requirements under Regulation SBSR. For example, a foreign dealing entity could restrict its U.S. personnel from intermediating transactions with non-U.S. persons, a trading platform might choose to move its principal place of business offshore, or a registered broker-dealer might cease to effect transactions in security-based swaps between unregistered non-U.S. persons. Such restructurings, if they occurred, could have an adverse effect on the efficiency of the security-based swap market by fragmenting liquidity between a U.S. security-based swap market—occupied by U.S. persons and non-U.S. persons willing to participate within the Title VII regulatory framework, with intermediation services provided by registered broker-dealers and U.S.-based trading platforms—and an offshore market in which participants seek to avoid any activity that could trigger application of Title VII to their security-based swap activity.⁹⁹⁵ Such market fragmentation could reduce the amount of liquidity available to market participants whose activity is regulated by Title VII, increase their search costs, or erode any gains in price efficiency and allocative efficiency that might otherwise result from regulatory reporting and public dissemination of all security-based swap transactions that exist at least in part within the United States. If foreign dealing entities use only agents who are located outside the United States, there could be reduced competition in the market for security-based swap intermediation services and this smaller pool of competitors could in turn charge higher prices for intermediation. The result would be higher costs of searching for suitable

⁹⁹² This effect would be diminished to the extent that a transaction of a foreign dealing entity is subject to public dissemination requirements under the rules of a foreign jurisdiction, and the costs of public dissemination are already factored into the prices offered to its counterparties.

⁹⁹³ See U.S. Activity Proposal, 80 FR at 27501.

⁹⁹⁴ See Regulation SBSR Adopting Release, 80 FR at 14720–21.

⁹⁹⁵ See Cross-Border Adopting Release, 79 FR at 47364.

counterparties. Higher search costs could in turn reduce the number of risk-sharing trades that foreign dealing entities execute and thus adversely affect risk-sharing efficiency in the security-based swap market broadly.

The Commission has already considered the likelihood that foreign dealing entities will cease using U.S. personnel to avoid Title VII requirements (such as security-based swap dealer registration).⁹⁹⁶ The Commission continues to believe that market fragmentation that results from relocation of personnel is less likely because foreign dealing entities that elect to use such a strategy to avoid regulatory reporting requirements under Title VII also would bear the costs of restructuring their operations and potentially forgoing the benefits of access to local expertise in security-based swaps that are traded in the U.S. market.⁹⁹⁷ Furthermore, the Commission believes that the amendments adopted herein, by extending Regulation SBSR to a small set of ANE transactions involving only non-U.S. persons and assigning the duty for reporting them, will impose only marginal burdens on platforms and registered broker-dealers.

3. Capital Formation

The amendments adopted herein could affect capital formation by affecting the transparency, liquidity, and stability of the market in which issuers seek capital. In the Regulation SBSR Adopting Release, the Commission identified benefits associated with the regulatory reporting and public dissemination of security-based swaps, such as increased transparency, improved liquidity, and greater market stability.⁹⁹⁸ The Regulation SBSR Adopting Release did not impose any requirements on transactions between unregistered non-U.S. persons, even if one side was engaging in ANE activity. The amendments adopted in this release, by extending Regulation SBSR to all ANE transactions, should extend the benefits of regulatory reporting and public dissemination to all ANE transactions, which in turn could lead to more efficient allocation of capital by market participants and market observers.

The Commission recognizes that the amendments to Rules 901 and 908 adopted herein could impede capital formation by fragmenting the security-based swap market. As discussed in

Section XIII(H)(2), *supra*, fragmentation of the security-based swap market could occur if market participants restructure their business activities by moving their personnel and operations offshore or restrict the counterparties to whom such persons may provide services. Such actions could impede capital formation because resources that market participants expend to restructure would not be available for investing in productive assets. Furthermore, fragmentation could create two separate security-based swap markets: A U.S. security-based swap market and an offshore security-based swap market.⁹⁹⁹ If fragmentation reduces the pool of market participants in the U.S. market, the market could experience lower trading activity and liquidity which in turn could reduce the ability of U.S. market participants to hedge financial and commercial risks and force them to put more resources into precautionary savings instead of investing those resources into productive assets.

However, as the Commission noted in Section XIII(H)(2), *supra*, the amendments adopted herein, by extending Regulation SBSR to all ANE transactions, will impose only marginal burdens on foreign dealing entities. The Commission does not believe that these limited burdens will cause foreign dealing entities to restructure their operations and fragment the security-based swap market such that capital formation would be adversely affected.

XIV. Regulatory Flexibility Act Certification

The Regulatory Flexibility Act (“RFA”) requires federal agencies, in promulgating rules, to consider the impact of those rules on small entities. Section 603(a) of the Administrative Procedure Act,¹⁰⁰⁰ as amended by the RFA, generally requires the Commission to undertake a regulatory flexibility analysis of all proposed rules, or proposed rule amendments, to determine the impact of such rulemaking on “small entities.”¹⁰⁰¹ Section 605(b) of the RFA¹⁰⁰² states that this requirement shall not apply to any proposed rule or proposed rule

amendment which, if adopted, would not have a significant economic impact on a substantial number of small entities.

In developing the final rules contained in Regulation SBSR, the Commission has considered their potential impact on small entities. For purposes of Commission rulemaking in connection with the RFA, a small entity includes: (1) When used with reference to an “issuer” or a “person,” other than an investment company, an “issuer” or “person” that, on the last day of its most recent fiscal year, had total assets of \$5 million or less;¹⁰⁰³ or (2) a broker-dealer with total capital (net worth plus subordinated liabilities) of less than \$500,000 on the date in the prior fiscal year as of which its audited financial statements were prepared pursuant to Rule 17a-5(d) under the Exchange Act,¹⁰⁰⁴ or, if not required to file such statements, a broker-dealer with total capital (net worth plus subordinated liabilities) of less than \$500,000 on the last day of the preceding fiscal year (or in the time that it has been in business, if shorter); and is not affiliated with any person (other than a natural person) that is not a small business or small organization.¹⁰⁰⁵ Under the standards adopted by the Small Business Administration, small entities in the finance and insurance industry include the following: (1) For entities engaged in credit intermediation and related activities,¹⁰⁰⁶ entities with \$550 million or less in assets; (2) for non-depository credit intermediation and certain other activities,¹⁰⁰⁷ entities engaged in non-depository credit intermediation and related activities, \$38.5 million or less in annual receipts; (3) for entities engaged in financial investments and related activities,¹⁰⁰⁸ entities with \$38.5 million or less in annual receipts; (4) for

¹⁰⁰³ See 17 CFR 240.0-10(a).

¹⁰⁰⁴ 17 CFR 240.17a-5(d).

¹⁰⁰⁵ See 17 CFR 240.0-10(c).

¹⁰⁰⁶ Including commercial banks, savings institutions, credit unions, firms involved in other depository credit intermediation, credit card issuing, sales financing, consumer lending, real estate credit, and international trade financing. See 13 CFR 121.201 at Subsector 522.

¹⁰⁰⁷ Including firms involved in secondary market financing, all other non-depository credit intermediation, mortgage and nonmortgage loan brokers, financial transactions processing, reserve, and clearing house activities, and other activities related to credit intermediation. See 13 CFR 121.201 at Subsector 522.

¹⁰⁰⁸ Including firms involved in investment banking and securities dealing, securities brokerage, commodity contracts dealing, commodity contracts brokerage, securities and commodity exchanges, miscellaneous intermediation, portfolio management, providing investment advice, trust, fiduciary and custody activities, and miscellaneous financial investment activities. See 13 CFR 121.201 at Subsector 523.

⁹⁹⁹ See *id.*

¹⁰⁰⁰ 5 U.S.C. 603(a).

¹⁰⁰¹ Although Section 601(b) of the RFA defines the term “small entity,” the statute permits agencies to formulate their own definitions. The Commission has adopted definitions of the term “small entity” for the purposes of Commission rulemaking in accordance with the RFA. Those definitions, as relevant to this proposed rulemaking, are set forth in Rule 0-10 under the Exchange Act, 17 CFR 240.0-10. See Securities Exchange Act Release No. 18451 (January 28, 1982), 47 FR 5215 (February 4, 1982) (File No. AS-305).

¹⁰⁰² 5 U.S.C. 605(b).

⁹⁹⁶ See U.S. Activity Adopting Release, 81 FR at 8629-30.

⁹⁹⁷ See *id.* at 8633.

⁹⁹⁸ See 80 FR at 14719-22.

insurance carriers and entities engaged in related activities,¹⁰⁰⁹ entities with \$38.5 million or less in annual receipts, or 1,500 employees for direct property and casualty insurance carriers; and (5) for funds, trusts, and other financial vehicles,¹⁰¹⁰ entities with \$32.5 million or less in annual receipts.

In the U.S. Activity Proposal, the Commission stated its belief that the majority of the amendments to Regulation SBSR proposed in that release would not have a significant economic impact on a substantial number of small entities for the purposes of the RFA.¹⁰¹¹ However, the Commission acknowledged that the proposed amendments would require a registered broker-dealer (including a registered SB SEF) to report a security-based swap transaction that is effected by or through it.¹⁰¹² The Commission further estimated that 30 registered broker-dealers (including SB SEFs) could be required to report such transactions, although the Commission was not able to estimate the number of those registered broker-dealers that would be “small entities.”¹⁰¹³ As a result, the Commission stated its preliminary belief that it is unlikely that these registered broker-dealers would be small entities and requested comment on the number of registered broker-dealers that are small entities that would be impacted by the proposed amendments, including any available empirical data.¹⁰¹⁴

In the Regulation SBSR Proposed Amendments Release, the Commission certified that the amendments proposed in that release would not have a significant economic impact on a substantial number of small entities for purposes of the RFA.¹⁰¹⁵ The Commission believes, based on input from security-based swap market participants and its own information, that the majority of security-based swap transactions have at least one counterparty that is either a security-based swap dealer or major security-

based swap participant, and that these entities—whether registered broker-dealers or not—would exceed the thresholds defining “small entities” set out above. The Commission continues to believe that the vast majority of, if not all, security-based swap transactions are between large entities for purposes of the RFA.

In addition, the Commission believes that persons that are likely to register as SDRs would not be small entities. Based on input from security-based swap market participants and its own information, the Commission continues to believe that most if not all registered SDRs will be part of large business entities, and that all registered SDRs will have assets in excess of the thresholds discussed above. Therefore, the Commission continues to believe that no registered SDRs will be small entities.

The Commission received no comments on the certification in the Regulation SBSR Proposed Amendments Release or, as indicated above, the Initial Regulatory Flexibility Analysis in the U.S. Activity Proposal. Accordingly, the Commission hereby certifies that the final rules adopted in this release will not have a significant impact on a substantial number of small entities for the purposes of the RFA.

XV. Statutory Basis

Pursuant to the Exchange Act, 15 U.S.C. 78a *et seq.*, and particularly Sections 3C(e), 11A(b), 13(m)(1), 13A(a), 23(a)(1), 30(c), and 36(a) thereof, 15 U.S.C. 78c-3(e), 78k-1(b), 78m(m)(1), 78m-1(a), 78w(a)(1), 78dd(c), and 78mm(a), the Commission is amending Rules 900, 901, 902, 905, 906, 907, and 908 of Regulation SBSR under the Exchange Act, 17 CFR 242.900, 242.901, 242.902, 242.905, 242.906, 242.907, and 242.908.

List of Subjects in 17 CFR Part 242

Brokers, Reporting and recordkeeping requirements, Securities.

Text of Amendments

In accordance with the foregoing, the Commission amends 17 CFR part 242 as follows:

PART 242—REGULATIONS M, SHO, ATS, AC, NMS, AND SBSR AND CUSTOMER MARGIN REQUIREMENTS FOR SECURITY FUTURES

■ 1. The authority citation for part 242 continues to read as follows:

Authority: 15 U.S.C. 77g, 77q(a), 77s(a), 78b, 78c, 78g(c)(2), 78i(a), 78j, 78k-1(c), 78l, 78m, 78n, 78o(b), 78o(c), 78o(g), 78q(a), 78q(b), 78q(h), 78w(a), 78dd-1, 78mm, 80a-23, 80a-29, and 80a-37.

■ 2. In § 242.900, revise paragraph (u) and add paragraph (tt) to read as follows:

§ 242.900 Definitions.

* * * * *

(u) *Participant*, with respect to a registered security-based swap data repository, means:

(1) A counterparty, that meets the criteria of § 242.908(b), of a security-based swap that is reported to that registered security-based swap data repository to satisfy an obligation under § 242.901(a);

(2) A platform that reports a security-based swap to that registered security-based swap data repository to satisfy an obligation under § 242.901(a);

(3) A registered clearing agency that is required to report to that registered security-based swap data repository whether or not it has accepted a security-based swap for clearing pursuant to § 242.901(e)(1)(ii); or

(4) A registered broker-dealer (including a registered security-based swap execution facility) that is required to report a security-based swap to that registered security-based swap data repository by § 242.901(a).

* * * * *

(tt) *Widely accessible*, as used in paragraph (cc) of this section, means widely available to users of the information on a non-fee basis.

■ 3. In § 242.901 add paragraphs (a)(1), (a)(2)(i), (a)(2)(ii)(E)(2) through (4), (a)(3), and (e)(1)(ii) and revise paragraphs (d)(4), (d)(8), (d)(9), (e)(2), and (h) to read as follows:

§ 242.901 Reporting obligations.

(a) * * *

(1) *Platform-executed security-based swaps that will be submitted to clearing.* If a security-based swap is executed on a platform and will be submitted to clearing, the platform on which the transaction was executed shall report to a registered security-based swap data repository the counterparty ID or the execution agent ID of each direct counterparty, as applicable, and the information set forth in paragraph (c) of this section (except that, with respect to paragraph (c)(5) of this section, the platform need indicate only if both direct counterparties are registered security-based swap dealers) and paragraphs (d)(9) and (10) of this section.

(2) * * *

(i) *Clearing transactions.* For a clearing transaction, the reporting side is the registered clearing agency that is a counterparty to the transaction.

(ii) * * *

(E) * * *

¹⁰⁰⁹ Including direct life insurance carriers, direct health and medical insurance carriers, direct property and casualty insurance carriers, direct title insurance carriers, other direct insurance (except life, health and medical) carriers, reinsurance carriers, insurance agencies and brokerages, claims adjusting, third party administration of insurance and pension funds, and all other insurance related activities. See 13 CFR 121.201 at Subsector 524.

¹⁰¹⁰ Including pension funds, health and welfare funds, other insurance funds, open-end investment funds, trusts, estates, and agency accounts, real estate investment trusts and other financial vehicles. See 13 CFR 121.201 at Subsector 525.

¹⁰¹¹ See 80 FR at 27509.

¹⁰¹² See *id.*

¹⁰¹³ See *id.*

¹⁰¹⁴ See *id.*

¹⁰¹⁵ See 80 FR at 14801.

(2) If one side includes a non-U.S. person that falls within § 242.908(b)(5) or a U.S. person and the other side includes a non-U.S. person that falls within § 242.908(b)(5), the sides shall select the reporting side.

(3) If one side includes only non-U.S. persons that do not fall within § 242.908(b)(5) and the other side includes a non-U.S. person that falls within § 242.908(b)(5) or a U.S. person, the side including a non-U.S. person that falls within § 242.908(b)(5) or a U.S. person shall be the reporting side.

(4) If neither side includes a U.S. person and neither side includes a non-U.S. person that falls within § 242.908(b)(5) but the security-based swap is effected by or through a registered broker-dealer (including a registered security-based swap execution facility), the registered broker-dealer (including a registered security-based swap execution facility) shall report the counterparty ID or the execution agent ID of each direct counterparty, as applicable, and the information set forth in paragraph (c) of this section (except that, with respect to paragraph (c)(5) of this section, the registered broker-dealer (including a registered security-based swap execution facility) need indicate only if both direct counterparties are registered security-based swap dealers) and paragraphs (d)(9) and (10) of this section.

(3) *Notification to registered clearing agency.* A person who, under paragraph (a)(1) or (a)(2)(ii) of this section, has a duty to report a security-based swap that has been submitted to clearing at a registered clearing agency shall promptly provide that registered clearing agency with the transaction ID of the submitted security-based swap and the identity of the registered security-based swap data repository to which the transaction will be reported or has been reported.

* * * * *

(d) * * *

(4) For a security-based swap that is not a clearing transaction and that will not be allocated after execution, the title and date of any master agreement, collateral agreement, margin agreement, or any other agreement incorporated by reference into the security-based swap contract;

* * * * *

(8) To the extent not provided pursuant to the other provisions of this paragraph (d), if the direct counterparties do not submit the security-based swap to clearing, a description of the settlement terms, including whether the security-based

swap is cash-settled or physically settled, and the method for determining the settlement value;

(9) The platform ID, if applicable, or if a registered broker-dealer (including a registered security-based swap execution facility) is required to report the security-based swap by § 242.901(a)(2)(ii)(E)(4), the broker ID of that registered broker-dealer (including a registered security-based swap execution facility); and

* * * * *

(e) * * *

(1) * * *

(ii) *Acceptance for clearing.* A registered clearing agency shall report whether or not it has accepted a security-based swap for clearing.

(2) All reports of life cycle events and adjustments due to life cycle events shall, within the timeframe specified in paragraph (j) of this section, be reported to the entity to which the original security-based swap transaction will be reported or has been reported and shall include the transaction ID of the original transaction.

* * * * *

(h) *Format of reported information.* A person having a duty to report shall electronically transmit the information required under this section in a format required by the registered security-based swap data repository to which it reports.

* * * * *

■ 4. In § 242.902, revise paragraphs (c)(6) and (7) and add paragraph (c)(8) to read as follows:

§ 242.902 Public dissemination of transaction reports.

* * * * *

(c) * * *

(6) Any information regarding a clearing transaction that arises from the acceptance of a security-based swap for clearing by a registered clearing agency or that results from netting other clearing transactions;

(7) Any information regarding the allocation of a security-based swap; or

(8) Any information regarding a security-based swap that has been rejected from clearing or rejected by a prime broker if the original transaction report has not yet been publicly disseminated.

* * * * *

■ 5. In § 242.905, revise paragraph (a) to read as follows:

§ 242.905 Correction of errors in security-based swap information.

(a) *Duty to correct.* Any counterparty or other person having a duty to report a security-based swap that discovers an error in information previously reported

pursuant to §§ 242.900 through 242.909 shall correct such error in accordance with the following procedures:

(1) If a person that was not the reporting side for a security-based swap transaction discovers an error in the information reported with respect to such security-based swap, that person shall promptly notify the person having the duty to report the security-based swap of the error; and

(2) If the person having the duty to report a security-based swap transaction discovers an error in the information reported with respect to a security-based swap, or receives notification from a counterparty of an error, such person shall promptly submit to the entity to which the security-based swap was originally reported an amended report pertaining to the original transaction report. If the person having the duty to report reported the initial transaction to a registered security-based swap data repository, such person shall submit an amended report to the registered security-based swap data repository in a manner consistent with the policies and procedures contemplated by § 242.907(a)(3).

* * * * *

■ 6. Revise § 242.906 to read as follows:

§ 242.906 Other duties of participants.

(a) *Identifying missing UIC information.* A registered security-based swap data repository shall identify any security-based swap reported to it for which the registered security-based swap data repository does not have the counterparty ID and (if applicable) the broker ID, branch ID, execution agent ID, trading desk ID, and trader ID of each direct counterparty. Once a day, the registered security-based swap data repository shall send a report to each participant of the registered security-based swap data repository or, if applicable, an execution agent, identifying, for each security-based swap to which that participant is a counterparty, the security-based swap(s) for which the registered security-based swap data repository lacks counterparty ID and (if applicable) broker ID, branch ID, execution agent ID, trading desk ID, and trader ID. A participant of a registered security-based swap data repository that receives such a report shall provide the missing information with respect to its side of each security-based swap referenced in the report to the registered security-based swap data repository within 24 hours.

(b) *Duty to provide ultimate parent and affiliate information.* Each participant of a registered security-based swap data repository that is not a

platform, a registered clearing agency, an externally managed investment vehicle, or a registered broker-dealer (including a registered security-based swap execution facility) that becomes a participant solely as a result of making a report to satisfy an obligation under § 242.901(a)(2)(ii)(E)(4) shall provide to the registered security-based swap data repository information sufficient to identify its ultimate parent(s) and any affiliate(s) of the participant that also are participants of the registered security-based swap data repository, using ultimate parent IDs and counterparty IDs. Any such participant shall promptly notify the registered security-based swap data repository of any changes to that information.

(c) *Policies and procedures to support reporting compliance.* Each participant of a registered security-based swap data repository that is a registered security-based swap dealer, registered major security-based swap participant, registered clearing agency, platform, or registered broker-dealer (including a registered security-based swap execution facility) that becomes a participant solely as a result of making a report to satisfy an obligation under § 242.901(a)(2)(ii)(E)(4) shall establish, maintain, and enforce written policies and procedures that are reasonably designed to ensure that it complies with any obligations to report information to a registered security-based swap data repository in a manner consistent with §§ 242.900 through 242.909. Each such participant shall review and update its policies and procedures at least annually.

■ 7. In § 242.907, revise paragraph (a)(6) to read as follows:

§ 242.907 Policies and procedures of registered security-based swap data repositories.

(a) * * *

(6) For periodically obtaining from each participant other than a platform, registered clearing agency, externally managed investment vehicle, or registered broker-dealer (including a registered security-based swap execution facility) that becomes a participant solely as a result of making a report to satisfy an obligation under § 242.901(a)(2)(ii)(E)(4) information that identifies the participant's ultimate parent(s) and any participant(s) with which the participant is affiliated, using ultimate parent IDs and counterparty IDs.

* * * * *

■ 8. In § 242.908:

- a. Amend paragraph (a)(1)(i) by removing the "or" at the end of the paragraph;
- b. Amend paragraph (a)(1)(ii) by removing the period at the end of the paragraph and adding in its place a semicolon;
- c. Add paragraphs (a)(1)(iii) through (v);
- d. Revise paragraphs (b)(1) and (2); and
- e. Add paragraphs (b)(3) through (5).

The revisions and additions read as follows:

§ 242.908 Cross-border matters.

(a) * * *

(1) * * *

(iii) The security-based swap is executed on a platform having its principal place of business in the United States;

(iv) The security-based swap is effected by or through a registered broker-dealer (including a registered security-based swap execution facility); or

(v) The transaction is connected with a non-U.S. person's security-based swap dealing activity and is arranged, negotiated, or executed by personnel of such non-U.S. person located in a U.S. branch or office, or by personnel of an agent of such non-U.S. person located in a U.S. branch or office.

* * * * *

(b) * * *

- (1) A U.S. person;
- (2) A registered security-based swap dealer or registered major security-based swap participant;
- (3) A platform;
- (4) A registered clearing agency; or
- (5) A non-U.S. person that, in connection with such person's security-based swap dealing activity, arranged, negotiated, or executed the security-based swap using its personnel located in a U.S. branch or office, or using personnel of an agent located in a U.S. branch or office.

Part III

Department of Agriculture

Federal Crop Insurance Corporation

7 CFR Part 400

Submission of Policies, Provisions of Policies, Rates of Premium, and Non-Reinsured Supplemental Policies; Final Rule

DEPARTMENT OF AGRICULTURE**Federal Crop Insurance Corporation****7 CFR Part 400**

[Docket No. FCIC-13-0006]

RIN 0563-AC46

Submission of Policies, Provisions of Policies, Rates of Premium, and Non-Reinsured Supplemental Policies**AGENCY:** Federal Crop Insurance Corporation, USDA.**ACTION:** Final rule.

SUMMARY: The Federal Crop Insurance Corporation (FCIC) finalizes the General Administrative Regulation—Subpart V—Submission of Policies, Provisions of Policies, Rates of Premium, and Non-Reinsured Supplemental Policies. The intended effect of this action is to incorporate legislative changes to the Federal Crop Insurance Act (Act) stemming from the Agricultural Act of 2014, clarify existing regulations, lessen the burden on submitters of crop insurance policies, provisions of policies, or rates of premium under section 508(h) of the Act, provide guidance on the submission and payment for concept proposals under section 522 of the Act, provide provisions for submission and approval of index-based weather plans of insurance as authorized by section 523(i) of the Act, and to incorporate changes that are consistent with those made in the Common Crop Insurance Policy Basic Provisions (Basic Provisions).

DATES: This rule is effective September 12, 2016.

FOR FURTHER INFORMATION CONTACT: Tim Hoffmann, Product Administration and Standards Division, Risk Management Agency, United States Department of Agriculture, Beacon Facility, Stop 0812, Room 421, P.O. Box 419205, Kansas City, MO 64141-6205, telephone (816) 926-7730.

SUPPLEMENTARY INFORMATION:**Background**

This rule finalizes changes to the General Administrative Regulation—Subpart V—Submission of Policies, Provisions of Policies, Rates of Premium, and Non-Reinsured Supplemental Policies (7 CFR part 400, subpart V), that were published by FCIC on February 25, 2015, as a notice of proposed rulemaking in the **Federal Register** at 80 FR 10008—10022. The public was afforded 60 days to submit comments after the regulation was published in the **Federal Register**.

A total of 80 comments were received from 10 commenters. The commenters were insurance providers, insurance organizations, grower organizations, crop insurance product developers, and a business council.

The public comments received regarding the proposed rule and FCIC's responses to the comments are as follows:

General

Comment: A commenter stated they believe the 508(h) process serves agriculture well. The commenter believes Congress intended the 508(h) process to protect the best interest of most growers through inclusion in the farm bill. As the size of government shrinks, the ability to engage the private sector in creating functional insurance products will grow. In serving the American farmer, and to be consistent with the farm bill, RMA should seek a vibrant and functional regulation that will encourage development of insurance products. A clear regulation would be a step in the right direction.

Response: FCIC agrees with the commenter that the regulation should be written as clearly as possible. FCIC has made a number of changes in the final rule to clarify provisions in the regulation.

Comment: A commenter offered support for the proposed rule. The commenter stated they believe that under the current rules, smaller farmers and organizations are placed at a competitive disadvantage compared to large corporate farms due to the current procedures favoring these bigger businesses. The commenter stated they believe that under the current proposal, these procedures would be simplified to facilitate increased access to FCIC's services by smaller farmers, commodity groups, and others to make it easier for these producers to develop brand new programs. In that light, the commenter also favors the expansion of FCIC's current programs in western Washington to include many crops which are classed as specialty crops and currently not covered by FCIC. The commenter stated they value their agricultural industry in western Washington and the working relationship they have with many of the local farmers. Moreover, the commenter stated they are committed to supporting the small agricultural industry and continuing to work with farmers, especially at the individual and small producer level, in addressing collective interests. The commenter sees the proposed simplification of the procedures and expansion of crops covered as positive and vital steps in a

direction that encourages the smaller agricultural businesses in their region.

Response: FCIC appreciates the commenter's support for the Federal crop insurance program.

Comment: A commenter offered a general concern with the 508(h) process, which is that any individual or organization can submit a proposal following the guidelines in these regulations even if they do not plan to write or retain any of the risk for the proposed program. While the submitter must have a commitment in writing from at least one approved insurance provider (AIP) to sell and support the policy or plan of insurance, this is often very informal and the supporting AIP will generally have little or no involvement in the development process of such product. These developers establish all of the terms, conditions, and rates for the proposed program, but often have no exposure to the actual results that may occur from the product that is developed. The AIPs who choose to participate in these approved 508(h) submissions retain the risk for such coverages and suffer the consequences of any flaws or deficiencies that may exist with them. The commenter proposed that the FCIC should allow the opportunity for AIPs who choose to participate in writing these approved 508(h) submissions to reduce their risk exposure for these programs beyond what is currently allowed during the initial years until a credible number of years of experience have been developed to determine the adequacy of the program from both an underwriting and rating standpoint.

Response: FCIC agrees that the current regulations do not contain enough involvement of the AIP in the development process or consideration of the impact of the submission on other AIPs and the delivery system. As a result, FCIC is adding provisions that require a more formal involvement by an AIP in the development process, requiring that an AIP be included as a submitter, and having that AIP and one other independent AIP provide an assessment of marketability, risks, and anticipated impacts on the delivery system. With respect to the risks, AIPs can independently assess the potential risk of a privately developed policy, and based on their own assessment, may choose whether or not to sell the product. AIPs have the option to reduce their risk exposure by assigning higher risk policies to the Assigned Risk Fund under the Standard Reinsurance Agreement (SRA), a fund that significantly limits risk exposure to the AIP and transfers that risk to FCIC.

Comment: A commenter stated that this regulation incorporates language to address the index-based weather plans of insurance, which were authorized by the Agricultural Act of 2014 (2014 Farm Bill). One of the requirements for these products is that they must first be approved by the applicable regulatory authority for the state in which the AIP intends to offer the product. The commenter stated their understanding is that there are currently no states that will approve these type of products as they are considered to be derivative products whereby the product may allow a loss payment to be made even though no physical damage to the crop has occurred. If no states will approve such products, this effectively makes the additional language addressing such index-based weather plans of insurance meaningless. The commenter recommended that the RMA consider not including any reference to index-based weather plans of insurance until such time that a state regulatory authority will approve a product of this nature. Otherwise, the portion of the regulation related to index-based weather products is not implementable.

Response: The proposed rule required that index-based weather plans of insurance must first be approved by the state in which they will be sold prior to FCIC approval. This provision is necessary because these products are not reinsured by FCIC, so the provisions regarding Federal preemption do not apply. Each state will be required to regulate the sale and service of these index-based weather plans of insurance. Regardless of whether any states have previously approved any index-based weather plans of insurance, FCIC is obligated to implement the process for submitting, reviewing, approving, and implementing these products in accordance with the Federal Crop Insurance Act because states may elect to approve such plans of insurance in the future. In such case, for any index-based weather plan of insurance that may be approved by a state, the process to submit, review, approve, and implement such plans of insurance will timely be in place.

§ 400.701—Definitions

Comment: A commenter stated that the definition of “advanced payment” as proposed, could be read to allow 50 percent of the development cost after the applicant has begun research and development activities. The commenter contends the intent of the definition is to allow an additional 25 percent advance payment after research and development activities are underway. The phrase “after the applicant has

begun research and development” should be moved to the end of the definition to eliminate any possible confusion.

Response: FCIC agrees with the commenter and moved the phrase to prevent possible confusion. In addition, FCIC added the 25 percent advance payment requirements from the Federal Crop Insurance Act. These requirements are as follows: (1) The concept proposal will provide coverage for a region or crop that is underserved, including specialty crops; and (2) the submitter is making satisfactory progress towards developing a viable and marketable 508(h) submission. FCIC intended to include these requirements in the Procedures Handbook 17030—Approved Procedures for Submission of Concept Proposals Seeking Advance Payment of Research and Development Costs, but determined it more appropriate to include these in this regulation. However, the evidence necessary to show satisfactory progress, or to determine if the crop or region is underserved, may be included in the Procedures Handbook 17030—Approved Procedures for Submission of Concept Proposals Seeking Advance Payment of Research and Development Costs.

Comment: A commenter stated that the definition of the term “complete” is confusing or subjective. The commenter stated the definition of complete in § 400.701 attempts to redefine the word to include unrelated subjects. This can be very confusing, especially because the word complete is hardly a term of art. A better definition of complete would be found in any dictionary. The commenter suggested a 508(h) submission be considered either complete or not complete (although the commenter suggested materiality should be considered) if it contains the required elements in § 400.705. The term “sufficient quality” is included within the definition of complete, but is a performance standard. Performance standards are better placed within § 400.705. The inclusion of performance standards within a definition is suspect. Significant effort will be expended to develop concept proposals and 508(h) submissions. In fact, it is a very reasonable assumption that the submitting public will invest tens of thousands of hours (if not hundreds of thousands of hours) in efforts to improve the crop insurance system under this rule. FCIC can support the improvements certain to come out of the private sector by expending relatively small efforts to clearly codify its notion as to what is sufficient quality. The term “meaningful” is subjective and should

also be removed from the definition. Meaningful should also be described within § 400.705. The commenter suggested the following revised definition of complete: “a submission, concept proposal, or index-based weather plan of insurance that contains all required documentation shown at § 400.705.”

Response: FCIC disagrees with the commenter that the definition of “complete” is subjective. The definition relies on submitters meeting the requirements in § 400.705 and the submission must be of “sufficient quality” as defined in § 400.701. Sufficient quality is not a performance standard so much as it is a determination of whether there is adequate information to consider the submission comprehensive enough and complete to allow for a meaningful external reviewer to provide their assessment of the product submitted. The main purpose of a determination of completeness is to determine whether to send the submission for external expert review. Therefore, in addition to providing the required information, it is also necessary that the information provided is of sufficient quality in order for external expert reviewers to conduct a meaningful review and be able to determine if the 508(h) submission meets the standards for approval by the Board. There is a cost for external reviews so sufficient quality of a 508(h) submission is an important consideration for quality external expert reviews that provide the Board with meaningful feedback and analysis, and make prudent use of public funds. The definition in the dictionary would be insufficient to evaluate the information necessary to determine completeness. No change has been made.

Comment: A commenter stated that the definition of “complexity” should be eliminated from the final rule. A developer’s notion of complexity has little to do with any of the factors considered in the proposed rule. Underwriting complexity arises from the identification and treatment of risk. Tying complexity to the format of existing crop insurance policy materials is naïve. Actuarial complexity resides with the types, quantity and quality of available price and yield data. Crops with significant recorded histories are significantly easier to work with than crops with sparse or scattered data. The proposed methodology has little to do with a complexity determination. In addition, the complexity determination seems to be a discriminatory tool placed against grower organizations needing crop insurance programs. The complexity determination can and will

discourage developers from treating specialty crop insurable risks. Whereas the generally accepted notion of a professional risk manager is to reduce risk, the complexity determination is certain to increase risk for developers precisely where an insurance treatment of risk is often needed. The commenter concludes that the discriminatory complexity determination should be eliminated from the final rule so that all grower groups have equal access to the benefits of crop insurance.

Response: FCIC disagrees with the commenter that the definition of “complexity” should be removed. First, the Board is required to consider complexity when assessing the reimbursement of costs under section 522(b)(6) of the Act. Therefore, a standard for determining complexity is required. Second, this provision is neither intended nor expected to discourage development of products for specialty crops. However, the use of the term “processes” is unclear and the term has been removed in the final rule and replaced with the phrase “all other steps required.” FCIC recognizes the complexity of a product should be reflected in the level of effort it takes to complete a particular submission requirement. The purpose of these provisions is to protect taxpayer dollars by reimbursing developers appropriate amounts to reflect the level of effort and work performed. This allows distinctions to be made between submissions that may simply add a new coverage to an existing policy without changing the policy terms, underwriting, or premium rating and submissions that create whole new plans of insurance that measure risk differently than the yield or revenue based policies available under the Common Crop Insurance Policy (7 CFR part 457) and the Area Risk Protection Policy (7 CFR part 407). Completely new plans of insurance may require new underwriting and loss adjustment handbooks or premium rating methodology and that will be reflected in the research and development for the submission. Presently, regardless of the type of submission, most requests are generally near the same dollar amount, even though the level of work required may not be the same. This gives the Board the discretion to reduce payments to submissions where the costs seem excessive for the amount of work needed. FCIC is revising the provisions in § 400.712(e) by removing the percentage reductions for complexity and scope and giving the Board discretion to make adjustments as required by the Federal Crop Insurance

Act based on type of submission and amount of work required and the size of the area proposed to be covered.

Comment: A commenter stated that the definition of “concept proposal” stretches into evaluative criteria. The definition introduces a new concept, “enough information.” This section of the proposed rule should be limited to the section title, “Definitions.” A more accurate definition would be: “A written proposal for the funding of research and development of a crop insurance plan that will comply with the provisions of this rule and authorized by section 522 of the Act.” Whether the concept proposal is complete or of sufficient quality are evaluative criteria best managed in their proper location (§ 400.705) and not within the definitions section.

Response: FCIC agrees with the commenter that the proposed use of the phrase “enough information” in the definition of “concept proposal” is vague and subjective. A better approach would be to reference where the required information is contained. FCIC has revised the definition by removing the phrase “enough information” and replacing it with a reference to this regulation and the Procedures Handbook 17030—Approved Procedures for Submission of Concept Proposals Seeking Advance Payment of Research and Development Costs, which can be found on the RMA Web site at www.rma.usda.gov.

Comment: A few commenters stated that the definition of “delivery system” should be modified. One commenter stated that the phrase “but is not limited to” is not a necessary component of the definition and recommended that the phrase be removed from the definition of “delivery system.” Several commenters stated that this definition would undermine the private-public partnership that has been the cornerstone of Federal Crop Insurance for 35 years. One of the commenters suggested this definition be stricken from the proposed rule. The commenter stated that when the United States Congress and American agriculture have placed so much responsibility and confidence in Federal Crop Insurance and just recently emphasized and renewed their trust in the context of the 2014 Farm Bill, this provision of the rule, which could very well be used to undermine the entire system, is both perplexing and especially ill-timed.

Response: Congress expressly requires the Board to consider the potential impact on the delivery system. Therefore, a definition of “delivery system” is necessary. Consistent with section 508(a)(4)(C) of the Act, the

delivery system includes the AIPs. However, there are numerous other entities that are necessary to sell and service policies to producers. Therefore, FCIC agrees with the commenter that the second sentence containing the phrase “includes but is not limited to” is not necessary. Therefore, the definition has been retained in the final rule, but the second sentence has been removed.

Comment: A commenter stated that portions of the definition of “maintenance,” regarding the addition of a new commodity and concept proposals that are similar to a previously approved 508(h) submission, should be removed. The commenter stated that it seems new insured crops and new concept proposals should be eligible for advance payments and a full four reinsurance years of maintenance expenses in accordance with the Act. The portion of the definition that considers expanding a 508(h) program maintenance, restricts the ability of farmers to receive the benefits of crop insurance. The result is discriminatory because it prevents developers from expanding a program into a new area if the program is successful. For example, developers manage their risk by limiting the scope of the program. USDA rules, rather than encouraging the expansion of crop insurance, in fact cause developers to cautiously approach the development problem. For a developer, risk management may involve limiting the scope of the program to avoid the potential financial losses from having the current arbitrary standards, and the increasingly arbitrary standards shown in this proposed rule, reducing their operating capital. This is particularly a problem given the Board’s resistance to expanding approved 508(h) products into other territories due to an over-cautious approach on the part of the Board and a failure to understand the substantive risk the 508(h) process presents to developers. Unfortunately, with this regulation, including this definition of maintenance, the FCIC continues to pressure developers, with the result being fewer growers served by the insurance program.

Response: FCIC disagrees with the commenter that the language in the definition of “maintenance” regarding the addition of a new commodity and concept proposals should be removed. FCIC disagrees this language is discriminatory and arbitrary. The language does not prevent the expansion or reimbursement for expanding approved products, but rather it prevents the inappropriate use of limited funds for activities that require little additional effort, work, or

development on the part of the submitter to add additional commodities similar in nature and scope. To the extent that added costs are incurred during an expansion, the submitter is able to request reimbursement of such costs in the maintenance reimbursement. No change made in the final rule.

Comment: A commenter stated the definition of “marketing plan” is unnecessary and only serves to confuse reviewers and submitters. A marketing plan is a submission requirement listed in § 400.705. The definition of a marketing plan is redundant and should be struck from the final rule. All requirements for a marketing plan, including a standard for sufficient quality, should be shown in the regulatory language requiring the marketing plan.

Response: FCIC agrees the definition of “marketing plan” is somewhat repetitive because much of the information is contained in § 400.705(e) and does not really capture the information that is required to assess the potential marketability of a submission. Since the enactment of the 2014 Farm Bill, marketability is a standard used by the Board in determining whether to approve a submission. Previously, marketability was only considered in the reimbursement of research and development costs. Therefore, FCIC has changed the term to “marketability assessment” to more accurately reflect the information necessary. FCIC has also removed the definition and moved the substantive provisions to § 400.705(e).

Comment: Several commenters were concerned the definition of the term “sufficient quality” could be interpreted as subjective, confusing, and contains performance standards. The commenters stated that the definition should be transparent, concrete and reasonable. The commenters proposed FCIC revisit the terminology and publish in the final rule definitions that provide clear and measurable standards that can be met by a submitter. One commenter suggested the definition of “sufficient quality” should be stricken from the final rule and an actual standard placed with the requirement in § 400.705. A commenter stated the requirement that “The material book must be presented in Microsoft Office format . . .” is a submission requirement that belongs in § 400.703—Timing and Format. A commenter stated the phrase “must contain adequate information for determination to be made whether RMA has the resources to implement, administer and deliver” is a performance standard that should be contained in § 400.705—Contents for

New and Changed Submissions. The commenter stated it seems unlikely that any submitter should be placed in the position of attempting to determine whether FCIC can implement any particular product. Although it seems logical that confusing regulations should be interpreted against the author, when a regulation is confusing, it is likely to be held against the submitter. Under this proposed rule, even if a submitter complies with a reasonable interpretation of the submission requirement and its evaluative standard, the 508(h) submission could be judged as being of insufficient quality. To complicate a regulation with confusing, arbitrary and subjective language is a disservice to the farmers and ranchers whose financial well-being provides purpose for the crop insurance program. The expectation of the FCIC should be described using objective standards so submitters’ efforts can match the standard. The lack of a clear definition for sufficient quality allows for arbitrary and possibly even discriminatory decisions. Because there is no clear standard and many of the decisions of the Board are made “at the sole discretion of the Board or RMA,” the proposed rule invites disparate treatment of submitters. The final rule should be drafted with clear standards to create a level playing field for all submitters. Because there are only about 12 places where sufficient quality needs to be defined, the commenter strongly encouraged FCIC to expend effort to place its concept of sufficient quality into § 400.705.

Response: FCIC agrees the performance standards included in the proposed definition of “sufficient quality” should be located in § 400.705 so that the submitter is aware of the standards by which the product will be measured. FCIC disagrees that the definition of “sufficient quality” should be removed because it is confusing or subjective. The definition of “sufficient quality” is necessarily subjective because each submission is different, and an objective one-size-fits-all definition would do a disservice to unique submissions that may differ substantially from others. Further, the purpose of the term “sufficient quality” is to ensure that there is sufficient data and analysis to support the provisions in the concept or submission, and that the submission is clear, so the Board, RMA, and external expert reviewers can evaluate the submission to determine whether it meets the qualifications for approval. Therefore, the Board, RMA, and external expert reviewers must be able to understand what the submitter

has done and why and draw conclusions based on the data, analysis and information provided by the submitter. The definition has been simplified to reflect this, and FCIC removed the reference to, and definition of “disinterested third party” because it is really the external expert reviewers, RMA and the Board who have to evaluate concept proposals and submissions. FCIC has also revised the definition of “sufficient quality” to clarify the determination is made by RMA and the Board. FCIC agrees the requirement in the definition of “sufficient quality” for the material to be presented in Microsoft Office format can be removed because this requirement is contained in § 400.705. FCIC has also added a reference to the Plain Writing Act of 2010 in order to clarify the “clearly written” requirement.

Comment: A few commenters stated that the definition of “viable and marketable” should be clearer and contain the qualities and standards to be applied. One commenter states the definition of viable and marketable provides for a determination by the Board. The commenter suggested that the determination of viable and marketable should be clear enough so a submitter is able to arrive at the same conclusion as the Board or external expert reviewers regarding the marketability of the proposed product. The lack of a standard is certain to provide divergent views between submitters, the Board, RMA, and the external expert reviewers. Given the number of entities involved in this process and the difficulties and costs involved in producing a 508(h) submission, FCIC should include a clear definition of viable and marketable in the final rule. A commenter stated that the proposed definition of viable and marketable addresses neither viable nor marketable and should be removed in the final rule.

Response: Consideration of whether a submission is “viable and marketable” is required by the Act. The requirements of the Act cannot be waived by this regulation. However, to be clearer, separate definitions are provided for “viable” and “marketable” to reflect the different concepts embodied in each. With respect to marketability, the Board is specifically tasked with making the determination of whether or not a sufficient number of producers will purchase the product to justify the resources and expenses required to offer the product for sale and maintain the product for subsequent years. There is no specific number of producers or dollar amount that could be included in

the definition that would be appropriate for all scenarios. Therefore, it is necessary to give discretion to the Board to make this determination. With respect to viability, the Board needs to make a judgment regarding whether a policy or plan of insurance can be developed into an insurance product meeting actuarial and underwriting standards, and that the new product can be implemented into the market by the delivery system. However, because submissions and markets vary, FCIC is reluctant to create set standards or goals that may not be appropriate in all situations. In addition, no matter what standards are created, external expert reviewers, RMA and the Board may still differ because they may be emphasizing one aspect over the other. For example, actuaries may believe the rates are not viable because they do not reflect the risk but underwriters may believe the policy is viable because it can be developed into a product that can provide meaningful coverage to producers. It is the Board's responsibility to consider all comments and use its best judgment. Costs of development and implementation can be a consideration of the potential to develop the concept proposal or submission into a policy or plan of insurance that can be offered for sale to producers. The Board has received numerous submissions and concept proposals where the original cost estimates are substantially less than the amount of research and development reimbursement actually requested. In some cases, actual costs were more than double the original estimates. Excessive costs may be an indication that a concept or submission may not be viable or marketable.

Given the inaccuracy of the estimates received by the Board, FCIC is revising the provisions to require that submitters provide more accurate estimates of costs, and since this is a consideration of viability, reimbursement may be limited to the estimated amount unless the submitter can justify the additional costs.

§ 400.703—Timing and Format

Comment: A commenter stated that the proposed rule in § 400.703(b)(1) requires 508(h) submissions, concept proposals or index-based weather plans of insurance to be provided in electronic format. The electronic format is required to be in a single document. The commenter stated they appreciate the desire for single documents, but FCIC must recognize that some of the requirements it places on submitters and materials that may be submitted to FCIC with a concept paper, 508(h)

submission etc., may include PDF files, Excel files, databases and other forms of documentation that do not fit neatly into a requirement for a single document. The commenter states that as written, the requirement for electronic format in § 400.703 will be difficult to impossible to meet. For example, further within this regulation the agency asks for letters demonstrating support. Those letters are likely to be in PDF format and they will not fit neatly inside a Microsoft word document. Additionally, the commenter asked, how a submitter would place an Excel workbook inside a word document if a submitter wishes to include an Excel workbook. While the commenter stated they appreciate the concern FCIC may have with multiple documents, the proposed solution falls short of solving the problem for all parties involved in the submission process. A different solution, such as a zip file with a control document, seems more appropriate.

Response: FCIC agrees with the commenter that the required information may not conveniently fit into a single document. The purpose of this proposed provision is to assure information is in the correct order and easily locatable by the reviewers. Because PDF files can be converted to Microsoft Word files and Excel files can be embedded in a Microsoft word document, FCIC believes it is possible to provide the required information in a single document. However, FCIC agrees it may not always be practical to embed such files in a single document. For example, an Excel file may have more columns than what will easily fit within the margins of a Word document. Therefore, FCIC has revised the provision by removing the requirement that all required information must be included in a single document. FCIC has replaced this requirement with a requirement to provide a document that contains a detailed index that, in sequential order, references the location of the required information that may either be contained within the document or in a separate file. The detailed index must clearly identify each required section and include the page number if the information is contained in the document or file name if the information is contained in a separate file.

Comment: A commenter stated that the requirement to provide two hard copies in § 400.703(b)(2) directly conflicts with the FCIC stated intention of easing the burden on submitters. This requirement increases the burden on submitters to no benefit for the FCIC. Electronic communication should be

preferred and the requirement for hard copies should be eliminated from the final rule. By requiring two hard copies from the submitters, submitters must now keep a store of the appropriate materials necessary to submit the hard copies that are required only by FCIC, allow time for the production of hard copies that provide minor benefit to the FCIC, proceed to the post office or mail store to put the hard copies in the mail, incur the risk of not having the hard copies exactly match the electronic copy, etc. Because FCIC very clearly stated in the preamble to the rule that its intention was to ease the burden on submitters, FCIC should recognize requirement for hard copies increases the burden on submitters and the requirement for hard copies should be eliminated from the final rule. The background material for the regulation indicates that the rule was drafted in part to lessen the burden on submitters by reducing the number of printed copies required. However, what the drafters of the regulation have done increases the effort of submitters. The requirement for materials to be submitted in a three ring binder in subsection (a) with page numbers in section dividers is not at all helpful and does not lessen the burden. The requirement substantially increases the paperwork difficulty for submitters and in so doing contradicts the stated objective of reducing the burden on submitters. This will increase the burden for submitters at no foreseeable benefit for the RMA. A single copy of the electronic document is insufficient for review purposes, therefore the FCIC will need additional copies of the 508(h) submission, presumably from the electronic version, for reviewers. So the gain to FCIC appears to be nil, while the burden on submitters increases. FCIC should drop the requirement for a hard copy altogether and accept electronic copies only because FCIC has already proposed a system whereby it agrees to make copies for its review process.

Response: FCIC proposed to reduce the number of hard copies required to be submitted from six down to two. Therefore, FCIC disagrees with the commenter that the proposal to provide two hard copies increases the burden on submitters. However, FCIC recognizes that removing the requirement for a hard copy to be submitted would further reduce the burden. Therefore, FCIC has revised the final rule to eliminate the requirement for the submitter to provide hard copies. Submitters will be required to submit an electronic copy either by email or on a removable storage device (including CD or USB drive) by mail,

but not both. FCIC has also provided a single email address and a single postal address to avoid duplicative work by submitters and to prevent confusion for FCIC.

Comment: A commenter referenced § 400.703(g), which states that the Board, or RMA if authorized by the Board, shall determine when sales can begin for a 508(h) submission approved by the Board. The commenter recommends that either RMA be given more authority by the Board or that RMA is always authorized by the Board to make determinations when sales can begin for an approved 508(h) submission. A recent example of the problems created by not taking all of the above into consideration is the Livestock Risk Protection (LRP) program for lambs. The insurance year for LRP Lamb starts on July 1 and ends on June 30 of the following year. The LRP program rules require that agents be trained for three hours annually before they are authorized to write a livestock policy. The AIPs generally plan their livestock training for late May and June in order to have their agents properly trained by the time the insurance period begins on July 1. The LRP lamb program was previously developed and written for several years, but was suspended due to some problems with the program. The developers made significant revisions to the program and RMA recently announced that sales would resume on May 4, 2015. The AIPs already scheduled livestock training sessions for their agents for late May and June in preparation for the beginning of the livestock insurance period, which begins on July 1. The commenter notes that submitters have to hold additional training sessions for those agents who wish to write LRP lambs to assure they are aware of all the revisions made to this program. This could have easily been included with the normal training cycle if program sales would have resumed on July 1 instead of May 4. This is a perfect example of problems that occur with releasing a program and not considering the time cycle of the program along with the administrative issues the release causes to the AIPs who will be administering this program. The ideal release date for the revised LRP lamb program would be July 1, which coincides with the start of the insurance period and allows the AIPs to properly train their agents about the LRP lamb revisions made during the normal scheduled time frame for livestock training sessions. In summary, the commenter stated the Board needs to provide RMA with more authority to

make the determinations when sales should begin for an approved 508(h) submission. RMA should take into consideration the time cycle of the approved product and the administrative functions AIPs must complete when making the decision of when sales will begin for the approved 508(h) submission. AIPs who choose to participate in these approved 508(h) submissions are the ones responsible for all administrative tasks involved with writing new programs from agent training, computer programming, form development etc. The decision to determine when sales begin should include the administrative tasks completed by the AIPs and the time cycle of the approved 508(h) submission.

Response: While the comment is relevant to the referenced provision, FCIC does not believe changing the provision to give RMA more authority to determine when a 508(h) submission can be implemented will solve the issues identified by the commenter. The problem is that RMA and the Board may not be aware of the types of issues raised by the commenter and submitters are asking for implementation as quickly as possible. In response to this and other comments, FCIC has revised the rule to require applicants to include a marketability assessment from an AIP supporting the submission and that the AIP be more involved in the submission process. FCIC is also revising the rule to require that at least one other AIP be consulted and provide analysis of potential implementation issues. If a marketability assessment by another AIP is not provided as part of the submission, the applicant must provide information regarding the names of the persons and AIPs contacted and the basis for their refusal to provide the marketability assessment. If the applicant cannot obtain a marketability assessment by another AIP, the Board will presume that the submission is unmarketable and it will be a very heavy burden on the submitter to overcome the presumption. By requiring involvement of at least two AIPs, RMA and the Board can be made aware of implementation and other issues before the issues become problems and take appropriate actions.

§ 400.704—Covered by This Subpart

Comment: A commenter offered support of the provision in § 400.704 that allows an applicant to submit a concept proposal to the Board prior to developing a full 508(h) submission. The commenter believes this will expedite and streamline the process by enabling the applicant to develop a

better initial product with feedback from the Board.

Response: FCIC appreciates the comment and the support for concept proposals.

§ 400.705—Contents for New and Changed 508(h) Submissions, Concept Proposals, and Index-Based Weather Plans of Insurance

Comment: A commenter stated that new requirements in § 400.705(a) disallowing appended items or requiring a single software to be used may also result in important information being excluded.

Response: FCIC agrees the requirement for information to be included in single document and disallowing appended items could result in important information being excluded. Therefore, FCIC has removed the provision in § 400.705(a) restricting items from being appended to the end of the document. FCIC has also removed the requirement in § 400.703(b) that requires information to be included in a single document and replaced it with a requirement to provide a document that contains a detailed index that, in sequential order, references the location of the required information that may either be contained within the document or in a separate file.

Comment: A commenter stated they believe the revisions made in § 400.705 are problematic due to the fact that the ability of a concept proposal or complete 508(h) submission to move forward will be reliant on standards that are not easily measured. It will be very difficult for a submitter to know whether a proposal meets RMA and the Board's sole view that the concept proposal or 508(h) submission is both "complete" and of "sufficient quality." The determination leaves a submitter with no opportunity for appeal of the decision if rejected. The commenter recommends FCIC incorporate language that provides submitters clear and measurable standards and a fair appeal process when the Board deems a 508(h) submission fails to meet those standards. The commenter continues to offer that § 400.705 is the heart of the 508(h) submission itself. RMA has been accepting 508(h) submissions for over 10 years. With over a decade of experience, RMA should have a clear notion of sufficient quality for the finite number of requirements contained in this paragraph. The commenter stated they believe this paragraph requires approximately 12 standards for clear communication with submitters. In particular, clear and transparent standards should be provided for § 400.705(d), the policy provisions,

§ 400.705(e), the marketing plan, § 400.705(g), the prices and rates of premium. The three paragraphs require the creation of standards that describe a successful set of Crop Provisions, approximately six standards for the marketing plan and standards for the prices and rates of premium that include standards for acceptable data (although this can be a little dangerous).

Response: FCIC believes the requirements contained in § 400.705 are clear and transparent, but simply providing an item on a list does not mean that the submission is complete. Unfortunately, over the years the Board has experienced a number of submissions that contained all the required items in § 400.705 but the contents were of such poor quality that it cost the Board, RMA and ultimately taxpayer's unnecessary funds to review the submission numerous times before the submission morphed into a level of quality that could be sent to expert review or be considered for approval. For this reason, and the reasons stated above, RMA is revising the definition of "sufficient quality" to make it clear that the submission must contain the data, analysis, and conclusions to support the information provided in the submission. In many instances where the Board concluded the submission or concept proposal was not complete was because it lacked the data or analysis needed for external expert reviewers, RMA and the Board to determine that the information provided was reasonable and would meet the standards necessary for approval. For example, some submissions identified a proxy crop without providing any agronomic or risk information to show that the proxy crop would correlate with the crop to be insured. In some cases, adjustments are made to rates without explaining why such adjustments are necessary and the basis for the amount of the adjustment. In other cases, assumptions are made without stating the basis for the assumptions. In those cases, external expert review would be meaningless because there is not enough information to make any judgments on whether the standards for approval have been met. Instead of a formal appeals process, section 508(h) of the Federal Crop Insurance Act provides a process whereby the Board provides notice of intent to disapprove a 508(h) submission outlining its concerns and reasons, and the submitter has the opportunity to address the Board's concerns with additional information or making changes as needed. In addition, the submitter can request a time delay to address issues raised by the Board.

Comment: A commenter stated that the request in § 400.705(c)(2) is redundant. It is the same request found in § 400.705(e)(4) rephrased. The commenter stated that redundancy is always problematic because it tends to precipitate questions if there is not precise agreement in the responses to the redundant requests. The commenter urges FCIC to list a requirement one time and especially that the RMA not repeat any requirement in the final rule.

Response: FCIC agrees with the commenter that these sections are somewhat redundant. Section 400.705(c)(2) requests similar information to what is required under § 400.705(e). FCIC has revised the final rule by consolidating the requirement in § 400.705(c)(2) under § 400.705(e).

Comment: A commenter states that the requirement in § 400.705(c)(3) seems better placed within § 400.705(e).

Response: FCIC agrees with the commenter that § 400.705(c)(3) would be better placed within § 400.705(e). FCIC has revised the final rule by moving the requirements in § 400.705(c)(3) to section § 400.705(e).

Comment: A commenter stated that the requirement in § 400.705(c)(5) seems better placed in § 400.705(d). Section 400.705(d) contains the Crop Provisions. It seems far more logical to describe the coverage in the section containing the very language creating the coverage, the Crop Provisions.

Response: FCIC disagrees with the commenter. Section 400.705(c) is related to clearly understanding the benefits the plan provides to producers and asks for a summary of such benefits. Section 400.705(c)(5) requests a detailed description of the coverage provided and its applicability to all producers, including targeted producers. Section 400.705(d) contains the actual policy. Although the information requested in § 400.705(c)(5) is relevant to policy referenced in § 400.705(d), it more appropriately resides in § 400.705(c) to allow the Board to assess the benefits provided.

Comment: A commenter stated that the language in § 400.705(d) suggests the 508(h) submission must be clearly written so that the producers are able to understand the coverage being offered and that the policy language permits actuaries to form a clear understanding of payment contingencies. The commenter stated that this is a good and reasonable standard and suggests that RMA apply the same standard to this proposed rule. The commenter states that the proposed rule is too vague for a submitter to form a clear understanding regarding what the FCIC considers sufficient quality. In

approximately 12 locations within § 400.705 are 508(h) submission requirements lacking a definition that is either clear or understandable. Worse, the proposed rule resolves the problem by incorporating a statement regarding sufficient quality and then allows that determination to be arbitrary and capricious. And yet, here is a standard imposed on the submitter to be clear.

Response: FCIC understands the commenter's desire for clear standards. In § 400.705, FCIC attempted to clearly state the requirements for 508(h) submissions, as appropriate. Sufficient quality is a measurement of how well the submitters have supported the information provided in the 12 categories. FCIC has attempted to do this by revising the definition of "sufficient quality" to make it clear that all information provided and assertions made in § 400.705 must be supported by data or analysis. Bare assertions without establishing the basis for the assertions are no longer sufficient. This provides a more concrete standard and one submitters should be able to meet. However, because submissions vary so greatly, it is impossible to show standards for sufficiency in each subsection in § 400.705.

Comment: A commenter questioned whether the development of the proposed marketing plan, as required in § 400.705(e), is really in the best interest of taxpayers since it will significantly increase the cost of developing a 508(h) submission. The commenter would understand the need for a marketing plan if there was limited interest in a proposed insurance program. However, this seems to be largely unnecessary if there is an obvious and broad-based demand for the crop insurance program by the potential insureds. If the marketing plan requirement is ultimately included in the final rule, RMA should publish standards that a submitter can follow in order to meet the requirements and for the external expert reviewers to use in evaluating the marketing plan for the proposed program.

Response: As stated above, a "marketing plan" is a misnomer because the name suggests how a product will be marketed to producers. However, the purpose of § 400.705(e) is to provide information regarding the marketability of the policy or other coverage because now this is one of the criteria for approval of concept proposals and submissions. Concept proposals and submissions must be deemed marketable to be approved for reinsurance by the Board. The commenter claims that the marketing plan is unnecessary when there is an

obvious and broad-based demand for the product, but history has shown a substantial percentage of submissions where submitters provided letters stating there was great interest and demand for the product but only a very small percentage of producers actually bought the policy or coverage when it was available for sale. Therefore, § 400.705(e) is necessary to provide information to the Board to allow it to better make an assessment of marketability. Further, FCIC has revised the standards to allow a more meaningful assessment by looking at actual indicators of producer interest and marketability, such as the amount of data producers are willing to provide, their participation in the development process, etc. FCIC has made revisions in the final rule to § 400.705(e) in an attempt to clarify the marketability requirements. FCIC believes the standards published in the final rule are clearly defined and achievable.

Comment: A commenter stated that the requirement in § 400.705(e)(3) has two problems. First, the vague term “reasonable estimate” begs the question reasonable to whom. Rather than using vague terms, the commenter suggested FCIC describe reasonable in objective terms. Furthermore, the commenter finds the use of other similar products for comparison purposes likely to lead reviewers down the wrong path. Market acceptance increases with grower involvement and participation in the development process and decreases when growers’ confidence in the product is diminished. For example, the fresh market bean insurance program began strong. Most acres were insured at the buy-up level. However, after growers made a request to correct a program feature they considered disadvantageous and the correction was not implemented, grower confidence in the program wavered and sales declined. One would not want to use the fresh market bean product for comparison purposes given that the wound is self-inflicted.

Response: “Reasonable estimate” means in the best judgment of the submitter based on all the information available to the submitter, and provided with the submission. RMA has revised the rule to require that submitters provide the information upon which they judge the reasonableness of the projected participation estimate, including the level of participation of producers in the development of the product, their type of participation, and whether they have provided the available data to assist the submitter in the development of the product. Although “reasonable estimate” is not

an objective term, FCIC believes this is an appropriate standard to describe what is expected of the submitter. With respect to the requirement to estimate the market penetration of other similar products, FCIC agrees with the commenter that simply estimating the market penetration of other similar products may not adequately convey expected producer interest and participation. Therefore, FCIC has revised the final rule to require the submitter compare other similar products with the 508(h) submission and identify potential differences between the 508(h) submission and the similar products that might make the participation and level of coverage of the proposed product different.

Comment: A commenter stated that it seems unlikely the requirement in § 400.705(e)(5) provides real value within the 508(h) submission process and § 400.705(e)(5) should not be in the final rule. Given the requirement shown at § 400.705(e)(6), the commenter questioned what the vague requirement at § 400.705(e)(5) can add. In fact, the vagueness of this requirement indicates the drafters of the proposed rule are not entirely clear regarding what this requirement should contain.

Response: FCIC disagrees with the commenter that the focus group results requirement in § 400.705(e)(5) should not be included in the final rule. However, FCIC determined this requirement can be combined under § 400.705(e)(6). Therefore, FCIC deleted § 400.705(e)(5), redesignated the succeeding sections, and added the focus group requirement under the newly redesignated § 400.705(e)(5). FCIC also added provisions that add more detail so the results of focus groups can provide more useful information to the Board so it can be considered one of the tools to assist the Board in determining marketability. Focus group information to be provided will now include the type of coverage producers want and what they are willing to pay, which, with all the other available information, will allow the external expert reviewers, RMA, and the Board to make better judgments on whether the product is viable and marketable.

Comment: A commenter stated they believe it would be helpful for FCIC to describe its concept of a market research study at § 400.705(e)(6). The requirement in § 400.705(e)(6) to show demand and coverage levels for which producers are willing to pay introduces a complex problem for submitters because the standard itself lacks definition. According to the regulation, an estimate that shows demand and the

level of coverage for which producers are willing to pay is sufficient to meet the standard. It is unlikely this is the intent. In short, it appears the concept of an acceptable market research study remains fuzzy even to the drafters of the proposed rule.

Response: FCIC has combined the focus group provisions with the market research study to allow submitters to provide data on its efforts to judge market interest in the product. Some policies approved under section 508(h) fail to sell because the coverage provided is not specifically desired by producers and the coverage they desire may not be insurable under the Act, or cannot be properly underwritten. Even when coverage may be available, it may not be available at a price producers are willing to pay. Collection of this information during the research and development process can provide more useful information to judge whether a product is marketable.

Comment: A commenter stated that nothing within the expertise of most submitters qualifies the submitter to estimate cost for organizations whose cost structures are unknown to the submitter as required at § 400.705(e)(8). This requirement appears to be the addition of a requirement that cannot be practically answered. It is possible to answer questions related to training requirements, whether the proposed program is amenable to current data record layouts. However, estimating the impact on 17 or 18 or 20 AIP computer systems, estimating administrative and training costs for 17 or 18 or 20 AIP’s and determining whether any efficiency will be gained is not likely to net insightful answers. The commenter concludes that what does seem practical at § 400.705(e)(8) is a discussion of whether the proposed program will place new demands upon the computer system that go beyond existing database structures.

Response: FCIC agrees that it may be impractical to expect submitters to assess expected costs for these items. However, the effect of new products on the delivery system is statutorily mandated and given the limited resources available to RMA and AIPs, it is a serious consideration. For this and the other reasons stated herein, FCIC has revised the rule to require that submitters obtain an assessment from at least one AIP who is involved in the development of the product and that at least one other AIP is consulted. FCIC believes it is useful for the submitting AIP to provide insight not only marketability, but also on computer system impacts, administrative and training requirements, potential

efficiencies or effects on workload for AIPs or others participating in the program, and whether the policy or plan of insurance is consistent with the terms of the SRA. Therefore, FCIC added requirements to assess potential effects on the workload for AIPs or others participating in the program and whether the policy or plan of insurance is consistent with the terms of the SRA.

Comment: A commenter stated that the requirement to include correspondence from producers in § 400.705(e)(9) does not appear to provide valuable information. For example, at § 400.705(e)(5) of this proposed rule, the requirement is to provide focus groups results. In addition, at § 400.705(e)(6)(i) of the proposed rule requests evidence the proposed 508(h) submission will be positively received. At the very least, § 400.705(e)(9) requests information that is required in a different form at several other locations within the proposed rule. The commenter suggests that the RMA combine its requests regarding grower interest in the insurance program into a single unified requirement. Furthermore, if the 508(h) submission is from or includes a grower organization, then it appears the spirit of § 400.705(e)(9) is met. Asking for additional correspondence creates redundant effort, § 400.705(e)(9) should be required only in the absence of other means of demonstrating grower interest in the proposal.

Response: FCIC agrees with the commenter that the requirement in § 400.705(e)(9) to include correspondence from producers expressing the need for a policy or plan of insurance may not be as valuable as other information requested in the revised rule. There have been a number of submissions where producers have written letters in support or appeared in person to present the submission, but when the product is made available for sale there are few producers actually buying the product. There are a number of reasons for this, including the final product approved does not contain the coverage actually wanted by producers because of statutory or underwriting limitations or the price for the coverage is too high. Therefore, as stated above, FCIC has revised the information regarding the marketing research to address these and other issues so that the external expert reviewers, RMA and the Board can make more informed decisions on marketability before the submission is approved and before significant time, money and resources are invested in implementation of the product.

Comment: A commenter noted that it appears the information required in § 400.705(f)(1) through (5) should be contained within the underwriting guide. Rather than another redundant request, the commenter suggested FCIC require an underwriting guide with definitions that include and may expand upon items one through five in a manner similar to the information contained in § 400.705(f)(7).

Response: FCIC agrees the contents of § 400.705(f)(1) through (3) should be contained in the underwriting guide. However, the contents of § 400.705(f)(4) and (5) fit more appropriately in the loss adjustment standards handbook. FCIC agrees it is not necessary to have duplicate requirements that can be included in these handbooks. Therefore, FCIC revised the final rule to include the contents of § 400.705(f)(1) through (5) in the requirements for the underwriting guide and the loss adjustment standards handbook, as appropriate.

Comment: A commenter stated that § 400.705(f)(2) “Relevant Dates” is a nonspecific requirement. The commenter stated FCIC should list the dates it considers relevant in the final rule.

Response: FCIC agrees that it may be helpful to include example dates that may be relevant. Therefore, FCIC included in the final rule an example of dates that may be relevant in § 400.705(f).

Comment: A commenter noted that the proposed rule in § 400.705(g)(1) appears to contain a requirement to propose a specific premium rating methodology. If that is the intention of FCIC, the commenter suggests that the word “specific” be deleted from the final rule. As FCIC and expert reviewers have noted, many of the crops remaining to receive the benefits of a crop insurance program will require creative efforts to estimate rates.

Response: FCIC agrees the term “specific” is superfluous. Therefore, FCIC removed the term “specific” from § 400.705(g)(1) in the final rule.

Comment: A commenter noted that the requirement in § 400.705(h) appears to be a redundant requirement. If, for example, the underwriting guide and loss adjustment manual contain forms, and they will, those forms must be separated from the document and placed in § 400.705(h). Completing this section becomes an exercise in cut and paste with dubious relevance in a review process. A reviewer needs to review any form within the context of its use and the form has context within the document that contains the form and its instructions for use. The

requirement at § 400.705(h) should be removed from the final rule.

Response: FCIC agrees the requirements in § 400.705(h) are redundant. Therefore, FCIC deleted this section in the final rule and redesignated the succeeding sections.

Comment: A commenter suggested that the clause in § 400.705(i)(1) proposes to restrict open commerce. It seems unlikely this requirement is legal. The statement attempts to undo the long history of using insurance brokers to facilitate the creation of insurance. Insurance brokers are forbidden in crop insurance. The requirement is discriminatory. One who is a submitter is prohibited from marketing that which they developed. The statement attempts to restrict the AIP and its agents from selling the crop insurance they have signed up to support. The commenter questioned how a submitter who is not an AIP will be able to meet the requirement in § 400.705(e)(10) given that this would appear to bar the AIP from sales. The commenter stated the requirement serves no legitimate business purpose other than to discourage development of new insurance products.

Response: The proposed § 400.705(i)(1) requires a statement certifying the submitter and AIP, or its affiliates, will not solicit or market the 508(h) submission until at least 60 days after all policy materials are released to the public by RMA, unless otherwise specified by the Board. The purpose is to create a level playing field so the submitter does not have an unfair marketing or sales advantage. Section 508(h) of the Act states that any submission approved for reinsurance can be sold by any AIP wanting to do so. It would not be fair to other AIPs if the submitter was allowed to start soliciting sooner than the other AIPs. However, FCIC recognizes, as currently written the 60-day delay is not necessary and has generally not been enforced. Rather, it has been FCIC intent and past practice to allow marketing to commence once all policy materials are released to the public. FCIC strives to release policy materials at least 60 days prior to the earliest sales closing date. Therefore, FCIC has revised this provision to state that the submitter must certify that the submitter and any approved insurance provider or its affiliates will not solicit or market the submission until all policy materials are released to the public by RMA, unless otherwise specified by the Board.

Comment: With respect to the requirement in the proposed § 400.705(i)(3), a commenter questioned

when agent and loss adjuster training plans are applicable.

Response: Agent and loss adjuster training plans are not applicable to proposed rates of premium for a policy. Therefore, FCIC has revised newly redesignated § 400.705(h)(3) by removing the phrase “if applicable” and specifying agent and loss adjuster training plans must be provided, except for 508(h) submissions only proposing changes to rates of premium for an existing policy.

§ 400.706—Review

Comment: A few commenters expressed concern about the lack of a suitable appeal or review process for submitters who put together packages in good faith, but are then subject to a closed review process dependent on the Board and RMA being given the ability to determine “at its sole discretion” [in § 400.706(a)(3) and elsewhere in the rule] whether or not a proposal is complete or meets the subjective requirements outlined in the proposed rule. The commenters stated the proposed rule fails to give submitters a clear standard by which to judge the quality of a proposal. The commenters are concerned that as written the proposed rule eliminates due process, increases the potential for the intent of the Act to be administered inconsistent with its intent. One commenter stated the clause in § 400.706(a)(3) is hostile toward submitters. Another commenter requested FCIC provide clear, measurable standards in regards to the requirements that submitters must meet, as well as to ensure that the decisions they make are based on the same sound and transparent standards.

Response: The 2014 Farm Bill revised the criteria in the Act for review of submissions and expressly gave RMA the authority to determine whether the policy or plan of insurance will likely result in a viable and marketable policy that will provide crop insurance coverage in a significantly improved form and adequately protect the interests of producers. The provisions contained in the Act cannot be waived by this regulation. Unfortunately, over the years the Board has experienced addressing a number of submissions that were of poor quality that cost the Board, RMA and ultimately taxpayer’s unnecessary funds to review numerous times before the submission morphed into a level of quality that could be sent to expert review or be considered for approval. FCIC agrees these standards are necessarily general but given all potential products have not been conceived, it is impossible to set tighter standards. However, FCIC will be

reviewing the submitter’s detailed description of why the terms have been met. Further, even if RMA were to use its discretion and reject a submission, it does not end the process. It simply means that the submitter must make improvements to the quality or contents of the submission.

Comment: A few commenters raised concerns with § 400.706(b)(2)(i), which indicates that no reviewer can be employed by an approved insurance provider (AIP) or be a representative of an AIP. The commenters stated they understand why a competing AIP should not be a reviewer, but question why an organization like the National Crop Insurance Services (NCIS) should be excluded from a confidential review. This is a review that the NCIS would conduct in a confidential manner without any involvement of their member AIPs. The commenters would recommend that RMA not exclude organizations like the NCIS from a possible review as it could add industry perspective that RMA would not otherwise be able to receive as a part of the expert review process.

Response: FCIC understands the commenter’s perspective that an agency that is representative of AIPs could provide valuable reviews. However, the provision is intended to prevent bias that may result if an organization that represents interested stakeholders is involved in reviewing products that may be sold by those stakeholders. This provision was not proposed to be changed in the proposed rule. No change has been made in the final rule. However, in response to other comments, FCIC has increased the required involvement of the AIP in the process by requiring that at least one AIP be part of the submitter and that another AIP provide an assessment of the impacts of the submission on the delivery system and marketability of the submission.

Comment: A commenter stated that the use of the word “appropriate” in § 400.706(b)(2)(ii)(C) leads to subjective determinations. The commenter questioned who determines what is appropriate. The commenter suggested that a better wording would be “follows recognized insurance principles.”

Response: FCIC agrees the provision would be better worded if the term “appropriate” was changed to “recognized.” FCIC has made this change in § 400.706(b)(2)(ii)(C) of the final rule.

Comment: A commenter asked what an “excessive risk” is, in reference to § 400.706(b)(2)(ii)(E).

Response: FCIC has clarified in the final rule that excessive risk includes,

but is not limited to, risk that encourages adverse selection, moral hazard, or risks that cannot be properly rated. Examples of excessive risk might be proposing to insure commodities in an area where the commodity is not generally recognized as a suitable growing environment or in an area likely to be frequently adversely affected by a known peril.

Comment: A commenter stated that, including § 400.706(b)(2)(ii)(I), the term “new kind of coverage” appears in several locations throughout the proposed rule. The term is not entirely clear. For example, in the clause above new kind of coverage applies to a crop that previously had no available crop insurance, but it also applies to crops with low participation or that are insured at a low coverage level. Attempts to remedy low participation or low coverage levels may not involve “a new kind of coverage.” It is conceivable, and even likely, that efforts to improve participation may simply involve redesigned coverage, but not necessarily anything “new.” Certainly in the case of crops with low participation concerns, the term “new kind of coverage” could easily become problematic. The commenter suggests the RMA either define the term or reconsider its use for crops with existing insurance programs where low participation levels are a concern.

Response: FCIC agrees with the commenter that the provision in § 400.706(b)(2)(ii)(I) could be problematic if the phrase “new kind of coverage” applies to the second part of the sentence in § 400.706(b)(2)(ii)(I). FCIC has revised the provision by removing the term “new kind of coverage” and replacing it with the phrase “new or improved coverage.” This change clarifies that a policy or plan of insurance could fall under the context of this provision if it provides improved coverage that addresses low participation or high levels of participation at low coverage levels.

Comment: A commenter stated no marketing plan can demonstrate an insurance product is marketable as required in § 400.706(b)(2)(ii)(K). Marketability comes from the ability of the insurance instrument to adequately cover risk at a price growers will be willing to pay. The commenter stated the marketing plan is simply “the delivery system will sell and service the insurance plan.” The commenter asserts that within hours of the announcement of a new program, agents respond by chasing the new commission money. The commenter believes the real challenge is to give the agent something to sell.

Response: As stated above, FCIC has removed the concept of a marketing plan and replaced it with a marketability assessment of the policy or plan of insurance. Further, those provisions now will require submitters to provide additional indicators of marketability, such as producer interest as measured by their willingness to assist and provide the data necessary in the development process, whether the submission can provide the coverage desired by producers at a price producers are willing to pay, AIPs assessment of the ability to sell the product, etc. FCIC believes that looking at these additional factors will allow the Board to make better judgments in approving policies and plans of insurance agents can sell.

Comment: A commenter stated that it is not entirely clear from the regulation if the proposed requirement in § 400.706(b)(2)(ii)(K) to have a comprehensive “marketing plan” submitted is with the concept proposal or with the complete 508(h) submission. If it is with the concept proposal, this requirement is premature given that the policy has not been fully developed nor have the premium rates been established. The purpose of the concept proposal is to have a proof of concept approved prior to the majority of the investment of time and resources into developing a complete 508(h) submission. For the marketing plan to be complete for the concept proposal, it would essentially have to have been developed prior to the concept being approved, which is obviously in contradiction to the purpose of the concept proposal.

Response: Marketability is a consideration in both the concept proposal and submission stages. However, FCIC recognizes that more information will be available at the submission stage and scrutiny by the Board will be higher. Therefore, while the Board will consider marketability at both stages, requirements may differ. Those requirements and standards relating to concept proposals are contained in Procedures Handbook 17030—Approved Procedures for Submission of Concept Proposals Seeking Advance Payment of Research and Development Cost. While the definition of submission excludes concept proposals, FCIC recognizes that the term “submission” is also commonly used when referring to concept proposals. Therefore, FCIC has changed the definition and all references of “submission” to “508(h) submission.” This change is expected to help eliminate potential confusion by providing a clearer distinction between

508(h) submissions and concept proposals in this regulation.

Comment: A commenter stated that the proposed rule in § 400.706(b)(5) establishes the unabashedly arbitrary rule. No standard applies. What seems most unsettling about this rule is the three items the rule applies to, lend themselves to an objective decision.

Response: FCIC determined the provision in § 400.706(b)(5) is out of place and is not needed because subsequent provisions describe the process for approval and disapproval. Therefore, to prevent confusion the provision in § 400.706(b)(5) relating to 508(h) submissions, and similar provisions in § 400.706(c)(9) and (d)(5) referencing concept proposals and index-based weather plans have been deleted in the final rule.

Comment: A commenter stated it is important to note that while the law allows the Board to prioritize the approval of policies or plans of insurance as described in § 400.706(g), the exercise of this authority must be performed in an open and transparent manner. Doing so is vital to the ongoing success of the 508(h) process and is necessary to avoid the perception that the 508(h) process is not being implemented in a manner as intended by Congress. Further, it is the commenter’s belief that any products related to cotton should be included under the second priority of “existing policies or plans of insurance for which there is inadequate coverage or there exists low levels of participation.” While there are products available to cotton producers including STAX as well as yield and revenue policies; these products are the sole risk management tool for cotton producers. In 2014, 30 percent of cotton acres bought coverage at the 60 percent buy-up level or below—17 percent of acres either had no coverage or coverage at the lowest levels available. Any enhancements to these products or the addition of new products or endorsements would be a benefit for cotton growers.

Response: FCIC understands the concern of the submitter that provisions of the Act should be implemented in a transparent manner. However, the Act contains confidentiality standards that prevent FCIC from disclosing information about products that are under consideration for approval, which limits the transparency of the process. However, the Board is considering implementing procedures that will make the process more transparent. In the meantime, to assist the Board in determining if certain commodities such as cotton meet the provision in § 400.706(g)(2), for each policy or plan

of insurance submitted for approval, RMA will research and present to the Board information on whether there are existing policies for that commodity and the level of coverage and participation.

Comment: With regard to § 400.706(k)(1), a commenter stated that because protecting the interests of agricultural producers is a review criterion, the Board, RMA, developers and external expert reviewers must share a common understanding of the standard for judging whether a 508(h) submission protects the interests of agricultural producers and taxpayers. This proposed rule does not provide such a standard. The commenter requested that FCIC clarify the meaning of protecting the interests of agricultural producers and taxpayers so that developers can provide America’s farmers with 508(h) submissions of sufficient quality.

Response: FCIC disagrees with the commenter that provisions in § 400.706(k)(1) do not provide clear standards for what it means to protect the interests of producers and taxpayers. Because it is not possible to list every scenario that may not protect the interests of producers and taxpayers, the provision includes a list of activities that meet this criteria that is not all-inclusive. This list includes: The 508(h) submission does not provide adequate coverage or treats producers disparately; the applicant has not presented sufficient documentation that the 508(h) submission will provide a new kind of coverage likely to be viable and marketable; coverage would be similar to another policy or plan of insurance that has not demonstrated a low level of participation or does not contain a clear and identifiable flaw and the producer would not significantly benefit from the 508(h) submission; the 508(h) submission may create adverse market distortions or adversely impact other crops or agricultural commodities if marketed; the 508(h) submission will have a significant adverse impact on the private delivery system; or the 508(h) submission cannot be implemented, administered, and delivered effectively and efficiently using RMA’s information technology and delivery systems. To address the commenters concern, FCIC included two additional items to describe what protecting producer and taxpayer interests mean. These include ensuring the 508(h) submission does not contain flaws that may encourage adverse selection, moral hazard, or vulnerabilities that allow indemnities to exceed the value of the crop.

§ 400.708—Post Approval

Comment: A commenter stated that § 400.708(a)(1)(ii) indicates that after the 508(h) submission has been approved, a reinsurance agreement must be executed if the terms and conditions differ from the available existing reinsurance agreements. If a separate reinsurance agreement needs to be developed this now creates a situation in which the person or organization who has submitted the product, is more than likely not an existing AIP, but will now be charged with establishing the reinsurance terms for all other AIPs who choose to participate in writing the approved 508(h) submission. This is a major flaw in this regulation as all AIPs who choose to participate in writing this approved 508(h) submission should be involved in the discussions establishing the reinsurance terms for such product or program. This would result in a reinsurance agreement that is more equitable to all parties involved and likely enhance the chances of the new product being successful in the marketplace. The AIPs who must administer and bear the risk of the new product or program need to be involved in the development of the new reinsurance agreement and this regulation should be revised to take this into consideration. An example of this is the flawed Livestock Price Reinsurance Agreement (LPRA) which was developed in accordance with this regulation. The structure of the LPRA provides the AIPs with very little incentive to actively pursue and write livestock policies as it is currently structured. This subsequently results in limited sales and reduces the potential success of the livestock program.

Response: FCIC agrees the terms of the reinsurance agreement developed in accordance with this provision should be established in an equitable manner that takes into consideration the interests of all participating AIPs. However, it is not possible to involve all AIPs that will sell the product, because it is not known which AIPs will choose to sell the product and confidentiality rights of the submitter must be respected. However, if a new or different reinsurance agreement is needed for a newly developed product, FCIC will endure to establish the standard terms of such reinsurance agreement so that they apply equitably to all AIPs, and that no one AIP (including any AIP who is part of the product submission) has a marketing or financial advantage over another AIP. FCIC has revised the final rule to clarify that participating AIPs interests will be

considered when the terms of the reinsurance agreement are established.

§ 400.712—Research and Development Reimbursement, Maintenance Reimbursement, Advance Payments for Concept Proposals, and User Fees

Comment: A commenter expressed support of the provision in § 400.712(c) that allows an advance payment of up to 50 percent of the projected total research and develop costs and the new provision which would allow the Board to provide up to an additional 25 percent advance payment. The commenter stated research and development costs of a major plan of insurance can be substantial, with many organizations unable to cover these up-front costs. The additional 25 percent advance payment could be instrumental in these situations, and the commenter encouraged FCIC to proactively use this authority to advance the ability of the RMA to provide growers with sound risk management options.

Response: FCIC appreciates the commenter's support of this provision.

Comment: A commenter stated that § 400.712(c)(1)(ii) is government sanctioned usury. The proposed rule attempts to collect interest at 18 percent per annum for submitters attempting to help American farmers achieve risk management goals. The commenter concludes that this is a shameful proposal.

Response: FCIC disagrees that § 400.712(c)(1)(ii) attempts to collect interest at 18 percent per annum. The provision requires interest to be charged at a rate of 1.25 percent simple interest per calendar month, which results in an annual rate of 15 percent. Furthermore, the referenced provisions are intended to protect taxpayer dollars if developers accept funding from FCIC, but then fail to deliver an acceptable product. Failure to collect interest on the funds provided for development would be fiscally irresponsible. This interest rate was previously included in 17030—Approved Procedures for Submission of Concept Proposals Seeking Advance Payment of Research and Development Expenses. This interest rate is also consistent with the rate charged in section 24(a) of the Common Crop Insurance Policy Basic Provisions for amounts owed to FCIC and in the Standard Reinsurance Agreement. No change has been made in the final rule.

Comment: A few commenters expressed concerns with the reduction in research and development costs contained in § 400.712(e) based on the plan of insurance, complexity of the policy and rates of premium. A common concern was that the proposed

reductions in reimbursement for research and development will make it difficult for farm organizations to obtain the services of qualified individuals who can meet the complicated requirements of § 400.705. Another concern that was raised was that if agricultural organizations obtain the services of a developer who does not understand the requirements of this section, the agricultural organization may be required to make up the difference due to reimbursement reductions. Commenters were concerned the criteria used to gauge the level of program complexity may not always be representative of the actual challenges in developing a crop insurance program. Commenters were also concerned that the reductions will come as a surprise to submitters after they have already completed the work. Another concern was that the reductions are based on arbitrary standards. Several commenters recommended the provision be excluded from the final rule.

Response: FCIC understands the concerns of grower groups that may contract with other companies to develop insurance products under the 508(h) process. However, FCIC is statutorily required to consider complexity when making payments, and FCIC is striving to do that in a fair and equitable manner. This means that all submitters must be treated the same regardless of their experience. This rule requires that certain tasks be performed and those tasks are the same for all submitters. However, some of the tasks are simplified because the submitter uses existing policy materials, handbooks, procedures, or rating methodologies so that the hours required to perform the tasks are reduced. The Board takes this reduction into consideration. Therefore, FCIC has revised § 400.712(e) by eliminating the reduction percentages and giving the Board discretion to reduce reimbursement for research and development costs and maintenance costs, as necessary, when requested reimbursement is not commensurate with the complexity or the size of the area proposed to be covered.

Comment: A commenter stated that the proposed rule in § 400.712(i) speaks to the problem submitters will have with this proposed rule. A 508(h) submission may be determined to be of insufficient quality to refer to expert reviewers and the costs associated with perfecting the 508(h) submission may not be considered reimbursable. This may not be a disagreeable rule provided submitters have a clear target. If a submitter knows what the standard is

for sufficient quality, fails to meet the standard for sufficient quality then it may be reasonable for the Board to avoid payment for perfecting the 508(h) submission. However, with the standard that is almost completely arbitrary, this rule holds out the possibility of treating submitters disparately. Since the 508(h) process can be considered an invitation to perform work on behalf of the American farmer, FCIC should produce a clear and helpful rule. A substantial number of farmers rely upon the actions of the Board and RMA. Should they choose to become submitters, they deserve clear targets.

Response: The provision in 712(i) is intended to prevent FCIC from paying for the same activities numerous times before a submission is ready for review or consideration of approval due to insufficient quality to conduct a meaningful review, or for errors, omissions and incomplete materials preventing an independent third party from being able to fully read, comprehend and understand the components of a submission. FCIC has clarified provisions regarding sufficient quality to require that the submission include all data, analysis and justification for assumptions made and in support of the information provided in the submission. This is crucial for the conduct of a meaningful external expert review. Therefore, the standard is not arbitrary and can be met by submitters. For example, if the submitter uses a proxy crop, the submitter must include the data and analysis that shows why the proxy was selected, why a proxy is needed, why the proxy selected best correlates with the crop to be insured under the submission, etc. The same applies with premium rating. The submitter must explain all assumptions made and all adjustments. Simply stating math formulas or a complete listing of all types of methodologies is no longer sufficient.

§ 400.713—Non-Reinsured Supplemental (NRS) Policy

Comment: A commenter stated that language was added to § 400.713(a) requiring submission of any non-reinsured supplemental (NRS) policy that covers the same agricultural commodity as any policy reinsured by FCIC under the Federal Crop Insurance Act. The commenter questioned whether the changes now require Crop-Hail policies to be approved by RMA. The commenter stated the regulation should specifically state that Crop-Hail policies are excluded from these rules.

Response: The definition of “non-reinsured supplemental” contained in § 400.701 specifically excludes Crop

Hail policies. Therefore, it is not necessary to state in § 400.713 that Crop-Hail policies are excluded. No change has been made in the final rule.

Comment: A commenter stated that the proposed rule in § 400.713(a) and (c) says that failure to provide such NRS policy or endorsement to RMA prior to its issuance shall result in the denial of reinsurance, A&O subsidy and risk subsidy on the underlying FCIC reinsured policy for which such NRS policy was sold. Because FCIC prohibits the tying of FCIC reinsured policies and private policies, the AIP that sold the FCIC reinsured policy may not be the AIP that sold the NRS policy. The commenter asked how this language will apply in these cases. The commenter adds that the regulation should exclude penalties from applying to the AIP that sold the underlying FCIC reinsured policy if the NRS is sold by a different AIP.

Response: FCIC agrees with the commenter that the regulation should exclude penalties from applying to AIPs that sold the FCIC reinsured policy if the NRS is sold by a different AIP. However, FCIC does not believe AIPs that sell an NRS policy that is not submitted in accordance with § 400.713 of this regulation or that is found to meet the conditions of § 400.713(c)(1) through (5), should be excluded from penalty. FCIC has revised § 400.713(a) and (c) by removing the penalty for denying reinsurance, A&O subsidy, and risk subsidy on the underlying FCIC reinsured policy if the AIP selling such underlying FCIC reinsured policy is not the company that sold the NRS. FCIC has added in its place a provision that makes the AIP that sold the NRS liable for an amount equal to the reinsurance, A&O subsidy, and risk subsidy on any underlying FCIC policies sold by other AIPs to which the NRS is attached.

Comment: A commenter stated § 400.713(a) states that any NRS policy that is issued before it is approved by RMA will result in a denial or reinsurance on the underlying FCIC reinsurance policy. The denial of reinsurance set-forth in paragraph (a) makes sense. However, in paragraph (c), which sets forth the approval process that RMA will go through 150 days prior to the sales closing date for any NRS policy, RMA states that reinsurance will also be denied on any FCIC reinsured policy not a meeting the prior approval criteria set forth in paragraphs (c)(1) through (5). Since it appears that RMA must approve NRS policies before they are sold, the commenter stated they do not understand the purpose of including a denial of reinsurance penalty in paragraph (c). The commenter suggested

that the denial of reinsurance language in paragraph (c) be deleted and that the denial of reinsurance language in paragraph (a) be revised to read as follows: Reinsurance, A&O subsidy and risk subsidy on the underlying FCIC policy will be denied for any NRS policy issued without the prior approval of FCIC under this section.

Response: RMA does not approve NRS policies, rather RMA reviews the policy to determine if the conditions in § 400.713(c)(1) through (5) exist. Therefore, FCIC does not intend to add the suggested “approval” language. The provision in § 400.713(a) requires the NRS to be submitted, and if not submitted, provides consequences for not being submitted. The provision in § 400.713(c) requires FCIC to notify the submitter of the consequences if the NRS meets the conditions contained in § 400.713(c)(1) through (5). Therefore, both paragraphs are necessary because they contain different requirements. However, in response to a previous comment, FCIC has revised § 400.713(c)(1) to state that FCIC will notify the AIP that submitted the NRS policy that if they sell the NRS policy, it will result in denial of reinsurance, A&O subsidy, and risk subsidy on all underlying FCIC reinsured policies, unless the underlying FCIC policy was sold by another AIP. If the underlying FCIC reinsured policy is sold by another AIP, the AIP that sold the NRS may be required to pay FCIC an amount equal to the reinsurance, A&O subsidy, and risk subsidy on the underlying FCIC policy.

Comment: A commenter stated that the proposed rule indicates in § 400.713(b) that the NRS policy and related materials must be submitted at least 150 days prior to the first sales closing date applicable to the NRS policy, which is 30 days more lead time than what is currently required. Since the AIPs are being required to submit the NRS policy 30 days earlier, it would also be beneficial for the AIPs if the RMA also responded back to the AIP 90 days before the first sales closing date rather than 60 days as currently required. This would allow additional time to train the agents and to market the NRS product prior to the applicable sales closing date. The commenter recommended that § 400.713(d) of this regulation be changed to require that the RMA will respond back to the AIP not less than 90 days before the first sales closing date rather than 60 days as currently indicated.

Response: FCIC understands the commenter’s desire for additional time to train agents and market the product. To give both the AIP and RMA

additional time, FCIC has revised § 400.713(d) in the final rule to require RMA to respond 75 days before the first sales closing date, or provide notice why RMA is unable to respond within the time frame allotted. This change gives both FCIC and the AIP an additional 15 days from what was allotted under the previous rule.

Comment: A commenter stated that § 400.713(b)(1) and (2) indicate that three hard copies and an electronic copy of the NRS policy must be sent to the Deputy Administrator for Product Management. If an electronic copy is sent, the commenter does not see the need or value in also sending three hard copies of the same material via regular postal mail. The commenter recommends that the regulation be clarified to indicate that either three hard copies or an electronic copy of the NRS policy be sent, but that both methods of submitting the NRS are not required.

Response: FCIC agrees with the commenter that both an electronic and a hard copy are not necessary. FCIC removed the hard copy requirement from the final rule.

Comment: A few commenters questioned the use of the term “moral hazard” in § 400.713(c)(1)(i). One commenter stated the term moral hazard was added with an example, but it is not a defined term. The commenter asked what constitutes a moral hazard and if moral hazard is applied on a product basis or on an individual insured behavior basis. The commenter asks for clarification on whether FCIC will determine a policy creates a moral hazard based on its performance over a period of time or based on a single instance of abuse. Another commenter suggested defining moral hazard as “the tendency for an insured party to take less care to avoid an insured loss than the party would have taken if the loss had not been insured, or even to act intentionally to bring about that loss.”

Response: FCIC disagrees that the term “moral hazard” should be defined in the context of this provision. The term is commonly used in the insurance industry and because the term is not defined it takes on the common meaning. A moral hazard could be on an individual or product basis. FCIC may consider a policy to create a moral hazard if provisions lend themselves to abuse or if data collected shows the performance of the product over time creates an incentive for abuse. No change has been made in the final rule.

Comment: A commenter stated the phrase “aggregate indemnities” was added to § 400.713(c)(1)(i), but does not include a definition. The commenter

asks, what is included in determining aggregate indemnities. The commenter adds that the regulation needs to specifically exclude hail insurance indemnities from the aggregate indemnities definition and to define what is included. A commenter also stated that the phrase “expected value” of the insured commodity was added to § 400.713(c)(1)(i). The commenter asks what the definition is of expected value and when the expected value is determined. The commenter stated the regulation needs to define expected value, including what information can be used to determine the expected value and what the time frame is around when the expected value is determined.

Response: FCIC agrees the provision should be revised to clarify what is included in the determination of aggregate indemnities. Hail policies and other policies not reinsured by FCIC would not be included. FCIC also agrees that the concept of expected value needs to be expanded upon in the final rule. FCIC intentionally did not include parameters for determining expected value because this can be defined differently by the submitter. However, the expected value must be based on parameters that represent the value a producer could reasonably expect to receive for the insured commodity. Therefore, FCIC has revised the provision in the final rule by removing the term “aggregate” and adding language stating that a policy will be considered to shift or increase risk if it: (1) Results in the underlying FCIC policy either triggering a loss sooner, or paying a larger indemnity than would otherwise be allowed by the terms and conditions of the underlying reinsured policy; or (2) allows for combined indemnities between the underlying FCIC reinsured policy and the NRS that are in excess of the value a producer would reasonably expect to receive for the insured commodity if a normal crop was produced and sold at a reasonable market price.

Comment: A commenter stated § 400.713(c)(2) can be better and more equitably phrased as follows: “The NRS reduces or limits the rights of the insured with respect to the underlying policy or plan of insurance reinsured by FCIC. An NRS policy will be considered to reduce or limit the rights of the insured with respect to the underlying policy or plan of insurance if it materially affects the terms or conditions of the underlying policy or otherwise materially undermines procedures issued by FCIC.”

Response: FCIC agrees with the commenter that including the terms “affects” and “undermines” help to

describe when an NRS reduces or limits the rights of the insured. However, FCIC disagrees the phrasing proposed by the commenter to include the term “materially” is appropriate because this would allow for a determination of a degree of significance. FCIC maintains that if an NRS affects, alters, preempts, or undermines the terms or conditions of the underlying policy to any degree, such NRS policy is reducing or limiting the rights of the insured with respect to the underlying policy or plan of insurance. Therefore, FCIC revised the final rule by: Including the terms “affects” and “undermines”; the terms “alters” and “preempts” has been retained; and the term “materially” has not been included.

Comment: A commenter stated that § 400.713(c)(3) may be improved and more equitably phrased by adding the term “materially” prior to the phrase “in excess of normal market demand.”

Response: FCIC disagrees that including the term “materially” prior to the phrase “in excess of market demand” is appropriate. FCIC considers an NRS that encourages planting more acres of the insured commodity in excess of normal market demand to disrupt the marketplace, regardless of extent or degree. No change has been made in the final rule.

Comment: A commenter stated that an example of disruption in the marketplace was added in § 400.713(c)(3). The commenter asked what the basis will be for the evaluation. The commenter also asked if this will be applied on an individual insured basis or a program basis and how much more than normal will be deemed to be excessive. The commenter questioned if the evaluation of excessive will be based on a single year or a certain number of years. A spike in planting may be attributable to factors other than the NRS policy.

Response: The determination will be based on the evaluation of the policy language and any available evidence that substantiates or verifies the NRS will or has disrupted the marketplace. This determination may be applied on an individual or collective basis. If the NRS encourages planting of more acres of the insured commodity in excess of market demand it will be considered to disrupt the marketplace and may be assessed based on a single year or multiple years. FCIC agrees that an increase in planting could be due to factors other than the NRS policy, so RMA will consider all other potential factors before concluding the NRS is the cause of the disruption in the marketplace. FCIC has added the phrase “RMA determines” in § 400.713(c)(1)

through (4) to indicate the decision is based on RMA's determination.

Comment: A commenter stated that language was added to the proposed rule in § 400.713(e) requiring a review if the NRS policy exceeds a 2.0 loss ratio. The commenter questions what are the parameters of the 2.0 (e.g., a one year loss ratio, a rolling 3–5 year loss ratio, etc.). The commenter stated the current year loss ratio will be unknown when the required 150 days prior to sales closing date is applied. A gap year must be included in evaluation of loss ratio. The commenter asked if RMA will approve private product rating methodology and/or rates. The commenter also questioned if state department of insurance approval of the rate methodology and/or rates will be superseded by RMA's rejection of the same. The commenter stated that states regulate and approve private product rates. If a state approves the rates associated with a private product, the commenter questioned whether FCIC has the authority under the McCarran-Ferguson Act to reject or dispute those rates.

Response: RMA will not review the premium rates of an NRS policy. Rather, FCIC was proposing to use the loss ratio as a possible indication there could be an underlying issue that may result in risk being shifted to the underlying FCIC reinsured policy. However, FCIC agrees with the commenter that a one year loss ratio would not be sufficient to determine if there was an underlying issue and FCIC already requires a NRS policy to be submitted for review in accordance with § 400.713(c)(1) through (5). FCIC also agrees the AIP may not know the loss ratio 150 days prior to the sales closing date. Because these issues were not addressed in the proposed rule, FCIC has not included this provision in the final rule.

Executive Orders 12866 and 13563

Executive Order 12866, "Regulatory Planning and Review," and Executive Order 13563, "Improving Regulation and Regulatory Review," direct agencies to assess all costs and benefits of available regulatory alternatives and, if regulation is necessary, to select regulatory approaches that maximize net benefits (including potential economic, environmental, public health and safety effects, distributive impacts, and equity). Executive Order 13563 emphasized the importance of quantifying both costs and benefits, of reducing costs, of harmonizing rules, and of promoting flexibility.

The Office of Management and Budget (OMB) designated this rule as not significant under Executive Order

12866, "Regulatory Planning and Review," and therefore, OMB has not reviewed this rule.

Paperwork Reduction Act of 1995

Pursuant to the provisions of the Paperwork Reduction Act of 1995 (44 U.S.C. chapter 35), the collections of information in this rule have been approved by the Office of Management and Budget (OMB) under control number 0563–0064.

E-Government Act Compliance

FCIC is committed to complying with the E-Government Act of 2002, to promote the use of the Internet and other information technologies to provide increased opportunities for citizen access to Government information and services, and for other purposes.

Unfunded Mandates Reform Act of 1995

Title II of the Unfunded Mandates Reform Act of 1995 (UMRA, Pub. L. 104–4) requires Federal agencies to assess the effects of their regulatory actions on State, local, and Tribal governments, or the private sector. Agencies generally need to prepare a written statement, including a cost-benefit analysis, for proposed and final rules with Federal mandates that may result in expenditures of \$100 million or more in any year for State, local, or Tribal governments, in the aggregate, or to the private sector. UMRA generally requires agencies to consider alternatives and adopt the more cost effective or least burdensome alternative that achieves the objectives of the rule. This rule contains no Federal mandates, as defined in Title II of UMRA, for State, local, and Tribal governments or the private sector. Therefore, this rule is not subject to the requirements of sections 202 and 205 of UMRA.

Executive Order 13132

It has been determined under section 1(a) of Executive Order 13132, Federalism, that this rule does not have sufficient implications to warrant consultation with the States. The provisions contained in this rule will not have a substantial direct effect on States, or on the relationship between the national government and the States, or on the distribution of power and responsibilities among the various levels of government, except as required by law.

Executive Order 13175

This rule has been reviewed in accordance with the requirements of Executive Order 13175, "Consultation and Coordination with Indian Tribal

Governments." Executive Order 13175 requires Federal agencies to consult and coordinate with tribes on a government-to-government basis on policies that have tribal implications, including regulations, legislative comments or proposed legislation, and other policy statements or actions that have substantial direct effects on one or more Indian tribes, on the relationship between the Federal Government and Indian tribes or on the distribution of power and responsibilities between the Federal Government and Indian tribes. FCIC has assessed the impact of this rule on Indian tribes and determined that this rule does not, to our knowledge, have tribal implications that require tribal consultation under Executive Order 13175. If a Tribe requests consultation, FCIC will work with the USDA Office of Tribal Relations to ensure meaningful consultation is provided where changes, additions, and modifications identified in this rule are not expressly mandated by law.

Regulatory Flexibility Act

The Regulatory Flexibility Act (5 U.S.C. 601–612), as amended by the Small Business Regulatory Enforcement Fairness Act of 1996 (SBREFA, Pub. L. 104–121), generally requires an agency to prepare a regulatory flexibility analysis of any rule subject to the notice and comment rulemaking requirements under the Administrative Procedure Act or any other law, unless the agency certifies that the rule will not have a significant economic impact on a substantial number of small entities. FCIC certifies that this regulation will not have a significant economic impact on a substantial number of small entities. The regulation does not require any more action on the part of the small entities than is required on the part of large entities. No matter the size of the submitter, all submitters are required to perform the same tasks and those tasks are necessary to ensure that the concept proposal can be made into a viable and marketable 508(h) submission and any 508(h) submission can be made into viable and marketable, actuarially sound insurance product. A Regulatory Flexibility Analysis has not been prepared since this regulation does not have an impact on small entities, and, therefore, this regulation is exempt from the provisions of the Regulatory Flexibility Act.

Federal Assistance Program

This program is listed in the Catalog of Federal Domestic Assistance under No. 10.450.

Executive Order 12372

This program is not subject to the provisions of Executive Order 12372, which require intergovernmental consultation with State and local officials. See the Notice related to 7 CFR part 3015, subpart V, published at 48 FR 29115, June 24, 1983.

Executive Order 12988

This rule has been reviewed in accordance with Executive Order 12988 on civil justice reform. The provisions of this rule will not have a retroactive effect. The provisions of this rule will preempt State and local laws to the extent such State and local laws are inconsistent herewith. With respect to any direct action taken by FCIC or to require the insurance provider to take specific action under the terms of the crop insurance policy, the administrative appeal provisions published at 7 CFR part 11 must be exhausted before any action against FCIC for judicial review may be brought.

Environmental Evaluation

This action is not expected to have a significant economic impact on the quality of the human environment, health, or safety. Therefore, neither an Environmental Assessment nor an Environmental Impact Statement is needed.

List of Subjects in 7 CFR Part 400

Administrative practice and procedure, Crop insurance.

Final Rule

Accordingly, as set forth in the preamble, FCIC amends 7 CFR part 400 as follows:

PART 400—GENERAL ADMINISTRATIVE REGULATIONS

■ 1. Revise subpart V to read as follows:

Subpart V—Submission of Policies, Provisions of Policies, Rates of Premium, and Non-Reinsured Supplemental Policies

Sec.

- 400.700 Basis, purpose, and applicability.
- 400.701 Definitions.
- 400.702 Confidentiality and duration of confidentiality.
- 400.703 Timing and format.
- 400.704 Covered by this subpart.
- 400.705 Contents for new and changed 508(h) submissions, concept proposals, and index-based weather plans of insurance.
- 400.706 Review.
- 400.707 Presentation to the Board for approval or disapproval.
- 400.708 Post approval.
- 400.709 Roles and responsibilities.
- 400.710 Preemption and premium taxation.
- 400.711 Right of review, modification, and the withdrawal of approval.

- 400.712 Research and development reimbursement, maintenance reimbursement, advance payments for concept proposals, and user fees.
- 400.713 Non-reinsured supplemental (NRS) policy.

Authority: 7 U.S.C. 1506(l), 1506(o), 1508(h), 1522(b), 1523(i).

Subpart V—Submission of Policies, Provisions of Policies, Rates of Premium, and Non-Reinsured Supplemental Policies

§ 400.700 Basis, purpose, and applicability.

This subpart establishes guidelines, the approval process, and responsibilities of FCIC and the applicant for policies, provisions of policies, and rates of premium submitted to the Board as authorized under section 508(h) of the Act. It also provides procedures for reimbursement of research and development costs and maintenance costs for concept proposals and approved 508(h) submissions. Guidelines for submitting concept proposals and the standards for approval and advance payments are provided in this subpart. This subpart also provides guidelines and reference to procedures for submitting index-based weather plans of insurance as authorized under section 523(i) of the Act. The procedures for submitting non-reinsured supplemental policies in accordance with the Standard Reinsurance Agreement (SRA) are also contained within.

§ 400.701 Definitions.

508(h) submission. A policy, plan of insurance, provision of a policy or plan of insurance, or rates of premium provided by an applicant to FCIC in accordance with the requirements of § 400.705.508(h) submissions as referenced in this subpart do not include concept proposals, index-based weather plans of insurance, or non-reinsured supplemental policies.

Act. Subtitle A of the Federal Crop Insurance Act, as amended (7 U.S.C. 1501–1524).

Actuarial documents. The information for the crop or insurance year that is available for public inspection in an agent's office and published on RMA's Web site, and that shows available insurance policies, coverage levels, information needed to determine amounts of insurance and guarantees, prices, premium rates, premium adjustment percentages, practices, particular types or varieties of the insurable crop or agricultural commodity, insurable acreage, and other related information regarding insurance in the county or state.

Actuarially appropriate. A term used to describe premium rates when such rates are expected to cover anticipated losses and establish a reasonable reserve based on valid reasoning, an examination of available risk data, or knowledge or experience of the expected value of future costs associated with the risk to be covered. This will be expressed by a combination of data including, but not limited to liability, premium, indemnity, and loss ratios based on actual data or simulations reflecting the risks covered by the policy.

Administrative and operating (A&O) subsidy. The subsidy for the administrative and operating expenses authorized by the Act and paid by FCIC on behalf of the producer to the approved insurance provider. Loss adjustment expense reimbursement paid by FCIC for catastrophic risk protection (CAT) eligible crop insurance contracts is not considered as A&O subsidy.

Advance payment. A portion, up to 50 percent, of the estimated research and development costs, that may be approved by the Board under section 522(b) of the Act for an approved concept proposal. Upon request of the submitter the Board may at its sole discretion provide up to an additional 25 percent advance payment of the estimated research and development costs after the applicant begins research and development activities if:

(1) The concept proposal will provide coverage for a region or crop that is underserved, including specialty crops; and

(2) The submitter is making satisfactory progress towards developing a viable and marketable 508(h) submission.

Agent. An individual licensed by the State in which an eligible crop insurance contract is sold and serviced for the reinsurance year, and who is employed by, or under contract with, the approved insurance provider, or its designee, to sell and service such eligible crop insurance contracts.

Applicant. Any person or entity that submits to the Board for approval a 508(h) submission under section 508(h) of the Act, a concept proposal under section 522 of the Act, or an index-based weather plan of insurance under section 523(i) of the Act, who must include the AIP that has committed to be involved in the development and submission process and to market, sell and service the policy or plan of insurance.

Approved insurance provider (AIP). A legal entity, including the Company, which has entered into a reinsurance

agreement with FCIC for the applicable reinsurance year.

Approved procedures. The applicable handbooks, manuals, memoranda, bulletins or other directives issued by RMA or the Board.

Board. The Board of Directors of FCIC.

Commodity. Has the same meaning as section 518 of the Act.

Complete. A 508(h) submission, concept proposal, or index-based weather plan of insurance determined by RMA and the Board to contain all required documentation in accordance with § 400.705 and is of sufficient quality.

Complexity. Consideration of factors such as originality of policy materials, underwriting methods, actuarial rating methodology, and the pricing methodology used in design, construction and all other steps required for the full development of a policy or plan of insurance.

Concept proposal. A written proposal for a prospective 508(h) submission, submitted under section 522(b) of the Act for advance payment of research and development costs, and containing all the information required in this regulation and the Procedures Handbook 17030—Approved Procedures for Submission of Concept Proposals Seeking Advance Payment of Research and Development Costs, which can be found on the RMA Web site at www.rma.usda.gov, such that the Board is able to determine that, if approved, will be developed into a viable and marketable policy consistent with Board approved procedures, these regulations, and section 508(h) of the Act.

Delivery system. The components or parties that make the policy or plan of insurance available to the public for sale.

Development. The process of composing documentation and procedures, pricing and rating methodologies, administrative and operating procedures, systems and software, supporting materials, and documentation necessary to create and implement a 508(h) submission.

Endorsement. A document that amends or revises an insurance policy reinsured under the Act in a manner that changes existing, or provides additional, coverage provided by such policy.

Expert reviewer. Independent persons contracted by the Board who meet the criteria for underwriters or actuaries that are selected by the Board to review a concept proposal, 508(h) submission, or index-based weather plan of insurance and provide advice to the

Board regarding the results of their review.

FCIC. The Federal Crop Insurance Corporation, a wholly owned government corporation within USDA, whose programs are administered by RMA.

Index-based weather plan of insurance. A risk management product in which indemnities are based on a defined weather parameter exceeding or failing to meet a given threshold during a specified time period. The weather index is a proxy to measure expected loss of production when the defined weather parameter does not meet the threshold.

Limited resource producer. Has the same meaning as the term defined by USDA at: www.lrftool.sc.egov.usda.gov/LRP_Definition.aspx or a successor Web site.

Livestock commodity. Has the same meaning as the term in section 523(i) of the Act.

Maintenance. For the purposes of this subpart only, the process of continual support, revision or improvement, as needed, for an approved 508(h) submission, including the periodic review of premium rates and prices, updating or modifying the rating or pricing methodologies, updating or modifying policy terms and conditions, adding a new commodity under similar policy terms and conditions with similar rating and pricing methodology, or expanding a plan or policy to additional states and counties, and any other actions necessary to provide adequate, reasonable and meaningful protection for producers, ensure actuarial soundness, or to respond to statutory or regulatory changes. A concept proposal that is similar to a previously approved 508(h) submission will be considered maintenance for the similar approved 508(h) submission if submitted by the same person.

Maintenance costs. Specific expenses associated with the maintenance of an approved 508(h) submission as authorized by § 400.712.

Maintenance period. A period of time that begins on the date the Board approves the 508(h) submission and ends on the date that is not more than four reinsurance years after such approval.

Manager. The Manager of FCIC.

Marketable. A determination by the Board, based on a detailed, written marketability assessment provided in accordance with § 400.705(e), that demonstrates a sufficient number of producers will purchase the product to justify the resources and expenses required to offer the product for sale and

maintain the product for subsequent years.

Multiple peril crop insurance (MPCI). Policies reinsured by FCIC that provide protection against multiple causes of loss that adversely affect production or revenue, such as to natural disasters, such as hail, drought, and floods.

National Agricultural Statistics Service (NASS). An agency within USDA, or its successor agency that collects and analyzes data collected from producers and other sources.

Non-reinsured supplemental policy (NRS). A policy, endorsement, or other risk management tool not reinsured by FCIC under the Act, that offers additional coverage, other than for loss related to hail.

Non-significant changes. Minor changes to the policy or plan of insurance, such as technical corrections, that do not affect the rating or pricing methodologies, the amount of subsidy owed, the amount or type of coverage, FCIC's reinsurance risk, or any other condition that does not affect liability or the amount of loss to be paid under the policy. Revisions to approved plans required by statutory or regulatory changes are included in this category. Changes to the policy that involve concepts that have been previously sent for expert review are also included in this category.

Plan of insurance. A class of policies, such as yield, revenue, or area based that offers a specific type of coverage to one or more agricultural commodities.

Policy. Has the same meaning as the term in section 1 of the Basic Provisions (7 CFR 457.8).

Rate of premium. The dollar amount per insured unit, or percentage rate per dollar of liability, that is needed to pay anticipated losses and provide a reasonable reserve.

Reinsurance year. The term beginning July 1 and ending on June 30 of the following year and, for reference purposes, identified by reference to the year containing June.

Related material. The actuarial documents for the insured commodity and any underwriting or loss adjustment manuals, handbooks, forms, instructions or other information needed to administer the policy.

Research. For the purposes of development, the gathering of information related to: Producer needs and interests for risk management; the marketability of the policy or plan of insurance; appropriate policy terms, premium rates, price elections, administrative and operating procedures, supporting materials, documentation, and the systems and software necessary to implement a

policy or plan of insurance. The gathering of information to determine whether it is feasible to expand a policy or plan of insurance to a new area or to cover a new commodity under the same policy terms and conditions, price, and premium rates is not considered research.

Research and development costs.

Specific expenses incurred and directly related to the research and development activities of a 508(h) submission as authorized in § 400.712.

Risk Management Agency (RMA). An agency within USDA that is authorized to administer the crop insurance program on behalf of FCIC.

Risk subsidy. The portion of the premium paid by FCIC on behalf of the insured.

Sales closing date. A date contained in the Special Provisions by which an application must be filed and the last date by which the insured may change the crop insurance coverage for a crop year.

Secretary. The Secretary of the United States Department of Agriculture.

Significant change. Any change to the policy or plan of insurance that may affect the rating and pricing methodologies, the amount of subsidy owed, the amount of coverage, the interests of producers, FCIC's reinsurance risk, or any condition that may affect liability or the amount of loss to be paid under the policy.

Special Provisions. Has the same meaning as the term in section 1 of the Basic Provisions (7 CFR 457.8).

Specialty crops. Fruits and vegetables, tree nuts, dried fruits, and horticulture and nursery crops (including floriculture).

Socially disadvantaged producer. Has the same meaning as section 2501(E) of the Food, Agriculture, Conservation, and Trade Act of 1990 (7 U.S.C. 2279(e)).

Standard Reinsurance Agreement (SRA). The reinsurance agreement between FCIC and the approved insurance provider, under which the approved insurance provider is authorized to sell and service eligible crop insurance contracts. For the purposes of this subpart, all references to the SRA will also include any other reinsurance agreements entered into with FCIC, including the Livestock Price Reinsurance Agreement.

Submitter. Same meaning as applicant.

Sufficient quality. A determination made by RMA and the Board that the material presented is clearly written in plain language in accordance with the Plain Writing Act of 2010 (5 U.S.C. 301), unambiguous, and is supported by

detailed analysis and data so that expert reviewers, RMA and the Board can understand, comprehend and make calculations, draw substantiated conclusions or results to determine whether the 508(h) submission, concept proposal, or index-based weather plan of insurance meets the standards required for approval.

Targeted producer. Producers who are considered small, socially disadvantaged, beginning and limited resource or other specific aspects designated by FCIC for review.

USDA. The United States Department of Agriculture.

User fees. Fees, approved by the Board, that can be charged to approved insurance provider for use of a policy or plan of insurance once the period for maintenance has expired that only covers the expected maintenance costs to be incurred by the submitter.

Viable. A determination by the Board that the concept proposal, index-based weather plan of insurance, or 508(h) submission is or can be developed into a policy or plan of insurance that can be implemented by the delivery system with actuarially appropriate rates in accordance with Board procedures.

§ 400.702 Confidentiality and duration of confidentiality.

(a) Pursuant to section 508(h)(4)(A) of the Act, prior to approval by the Board, any 508(h) submission submitted to the Board under section 508(h) of the Act, concept proposal submitted under section 522 of the Act, or index-based weather plan of insurance submitted under section 523(i) of the Act, including any information generated from the 508(h) submission, concept proposal, or index-based weather plan of insurance, will be considered confidential commercial or financial information for purposes of 5 U.S.C. 552(b)(4) and will not be released by FCIC to the public, unless the applicant authorizes such release in writing.

(b) Once the Board approves a 508(h) submission or an index-based weather plan of insurance, information provided with the 508(h) submission (including information from the concept proposal) or the index-based weather plan of insurance, or generated in the approval process, may be released to the public, as applicable, including any mathematical modeling and data, unless it remains confidential business information under 5 U.S.C. 552(b)(4). While the expert reviews are releasable once the 508(h) submission or an index-based weather plan of insurance has been approved, the names of the expert reviewers may be redacted to prevent

any undue pressure on the expert reviewers.

(c) Any 508(h) submission, concept proposal, or index-based weather plan of insurance disapproved by the Board will remain confidential commercial or financial information in accordance with 5 U.S.C. 552(b)(4) (no information related to such 508(h) submission, concept proposal, or index-based weather plan of insurance will be released by FCIC unless authorized in writing by the applicant).

(d) All 508(h) submissions, concept proposals, and index-based weather plans of insurance, will be kept confidential until approved by the Board and will be given an identification number for tracking purposes, unless the applicant advises otherwise.

§ 400.703 Timing and format.

(a) A 508(h) submission, concept proposal, or index-based weather plan of insurance may only be provided to FCIC during the first five business days in January, April, July, and October.

(b) A 508(h) submission, concept proposal, or index-based weather plan of insurance must be provided as an electronic file to FCIC in Microsoft Office compatible format, sent to either the address in paragraph (d)(1) or (d)(2) of this section by the due date in paragraph (a) of this section. The electronic file must contain a document with a detailed index that, in sequential order, references the location of the required information that may either be contained within the document or in a separate file. The detailed index must clearly identify each required section and include the page number if the information is contained in the document or file name if the information is contained in a separate file; and

(c) Any 508(h) submission, concept proposal, or index-based weather plan of insurance not provided within the first 5 business days of a month stated in paragraph (a) of this section will be considered to have been provided in the next month stated in paragraph (a). For example, if an applicant provides a 508(h) submission on January 10, it will be considered to have been received on April 1.

(d) Any 508(h) submission, concept proposal, or index-based weather plan of insurance must be provided to one of the following addresses, but not both:

(1) By email to the Deputy Administrator for Product Management (or successor) at DeputyAdministrator@rma.usda.gov; or

(2) By mail on a removable storage device such as a compact disk or

Universal Serial Bus (USB) drive, sent to the Deputy Administrator for Product Management (or any successor position), USDA/Risk Management Agency, 2312 East Bannister Road, Kansas City, MO 64131-3011.

(e) In addition to the requirements in paragraph (a) of this section, a 508(h) submission must be received not later than 240 days prior to the earliest proposed sales closing date to be considered for sale in the requested crop year.

(f) To be offered for sale in a crop year, there must be at least sixty days between the date the policy is ready to be made available for sale and the earliest sales closing date, unless this requirement is expressly waived by the Board.

(g) Notwithstanding, paragraph (f) of this section, the Board, or RMA if authorized by the Board, shall determine when sales can begin for a 508(h) submission approved by the Board after consideration of the analysis provided by the applicant AIP of the impact of the proposed implementation date on the delivery system.

§ 400.704 Covered by this subpart.

(a) An applicant may submit to the Board, in accordance with § 400.705, a 508(h) submission that is:

(1) A policy or plan of insurance not currently reinsured by FCIC;

(2) One or more proposed revisions to a policy or plan of insurance authorized under the Act; or

(3) Rates of premium for any policy or plan of insurance authorized under the Act.

(b) An applicant must submit to the Board, any significant change to a previously approved 508(h) submission, including requests for expansion, prior to making the change in accordance with § 400.705.

(c) An applicant may submit a concept proposal to the Board prior to developing a full 508(h) submission, in accordance with this subpart and the Procedures Handbook 17030—Approved Procedures for Submission of Concept Proposals Seeking Advance Payment of Research and Development Costs, which can be found on the RMA Web site at www.rma.usda.gov.

(d) An applicant who is an approved insurance provider may submit an index-based weather plan of insurance for consideration as a pilot program in accordance with this subpart and the Procedures Handbook 17050—Approved Procedures for Submission of Index-based Weather Plans of Insurance, which can be found on the RMA Web site at www.rma.usda.gov.

(e) An applicant must submit a non-reinsured supplemental policy or endorsement to RMA in accordance with § 400.713.

§ 400.705 Contents for new and changed 508(h) submissions, concept proposals, and index-based weather plans of insurance.

(a) A complete 508(h) submission must contain the following material, as applicable, submitted in accordance with § 400.703(b). A complete 508(h) submission must be a viable and marketable insurance product that protects the interests of producers, is actuarially appropriate and ensures program integrity. The material must contain adequate information as required in this section, that is presented clearly to ensure the Board and RMA can determine whether RMA and the delivery system have the resources to implement, administer, and deliver the 508(h) submission effectively and efficiently. Calculations, procedures and methodologies must be consistent throughout the submission and appropriate for the commodity and the risks covered.

(b) The first section will contain general information numbered as follows (1, 2, 3, etc.), including, as applicable:

(1) The applicant's name(s), address or primary business location, phone number, and email address;

(2) The type of 508(h) submission (see § 400.704) and a notation of whether or not the 508(h) submission was approved by the Board as a concept proposal;

(3) A statement of whether the applicant is requesting:

(i) Reinsurance;

(ii) Risk subsidy;

(iii) A&O subsidy;

(iv) Reimbursement for research and development costs, as applicable and, if the 508(h) submission was previously submitted as a concept proposal, the amount of the advance payment for expected research and development costs; or

(v) Reimbursement for expected maintenance costs, if applicable;

(4) The proposed agricultural commodities to be covered, including types, varieties, and practices covered by the 508(h) submission;

(5) The crop or insurance year and reinsurance year in which the 508(h) submission is proposed to be available for purchase by producers;

(6) The proposed sales closing date, if applicable, or the sales window or the earliest date the applicant expects to release the product to the public;

(7) The proposed states and counties where the plan of insurance is proposed to be offered;

(8) Any known or anticipated future expansion plans;

(9) Identification, including names, addresses, telephone numbers, and email addresses, of the person(s) responsible for:

(i) Addressing questions regarding the policy, underwriting rules, loss adjustment procedures, rate and price methodologies, data processing and record-keeping requirements, and any other questions that may arise in implementing or administering the program if it is approved; and

(ii) Annual reviews to ensure compliance with all requirements of the Act, this subpart, and any agreements executed between the applicant and FCIC;

(10) A statement of whether the 508(h) submission will be filed with the applicable office responsible for regulating insurance in each state proposed for insurance coverage, and if not, reasons why the 508(h) submission will not be filed for review; and

(11) A statement of whether the submitter wants the 508(h) submission to remain confidential.

(c) The second section must contain the benefits of the plan, including, as applicable, a summary that includes:

(1) How the 508(h) submission offers coverage or other benefits not currently available from existing public or private programs;

(2) How the 508(h) submission meets public policy goals and objectives consistent with the Act and other laws, as well as policy goals supported by USDA and the Federal Government; and

(3) A detailed description of the coverage provided by the 508(h) submission and its applicability to all producers, including targeted producers.

(d) Except as provided in this section, the third section must contain the policy, that is clearly written in plain language in accordance with the Plain Writing Act of 2010 (5 U.S.C. 301) such that producers will be able to understand the coverage being offered. The policy language permits actuaries to form a clear understanding of the payment contingencies for which they will set rates. The policy language does not encourage an excessive number of disputes or legal actions because of misinterpretations.

(1) If the 508(h) submission involves a new insurance policy or plan of insurance:

(i) All applicable policy provisions; and

(ii) A list of any additional coverage that may be elected by the insured in conjunction with the 508(h) submission such as applicable endorsements

(include a description of the coverage and how such coverage may be obtained).

(2) If the 508(h) submission involves a change to a previously approved policy, plan of insurance, or rates of premium, the proposed revisions, rationale for each change, data and analysis supporting each change, the impact of each change, and the impact of all changes in aggregate.

(e) The fourth section must contain the following:

(1) Potential impacts the 508(h) submission may have on producers both where the new plan will and will not be available (include both positive and negative impacts) and if applicable, the reasons why the 508(h) submission is not being proposed for other areas producing the commodity;

(2) The amount of commodity (acres, head, board feet, etc.), the amount of production, and the value of each agricultural commodity proposed to be covered in each proposed county and state;

(3) A reasonable estimate of the expected number of potential buyers, liability and premium for each proposed county and state, total expected liability and premium by crop year based on the detailed assessment of producer interest, including a description of the number of producers involved in the development of the product, their level of participation, their type of participation, how many producers have provided data to assist the submitter in the development of the product, and a comparison with other similar products, including differences between the 508(h) submission and the similar products that may make participation different;

(4) If available, any insurance experience for each year and in each proposed county and state in which the policy has been previously offered for sale including an evaluation of the policy's performance and, if data are available, a comparison with other similar insurance policies reinsured under the Act;

(5) Market research studies; "market research" is the systematic gathering and interpretation of information about individuals or organizations using statistical and analytical methods and techniques of the applied social sciences to gain insight or support decision making, and that must include:

(i) Focus group results (both positive and negative reactions) where a discussion is facilitated amongst a group of stakeholders in order to gain insight into their perceptions, opinions, beliefs, and attitudes towards a product, which must include the number of focus group

sessions held, where they were held, when they were held, the number of attendees at each session, the attendees affiliation (producer, agent or other), and specific feedback from the attendees regarding levels of coverage the product should include to cover anticipated risks or perils encountered, the range of costs the producer is willing to pay, what coverages the producers are specifically looking for and an assessment of whether that coverage can be provided at the price the producers are willing to pay, what shortfall or gap in risk protection the product may address, tolerance of risk, perceptions of other similar products, policy features producers may desire, and quality issues;

(ii) Other evidence the proposed 508(h) submission will be positively received by producers, agents, lending institutions, and other interested parties, including correspondence from producers, agents, grower organizations, or other stakeholders expressing the need for a certain risk management strategy, desired coverage for perils faced, and willingness to provide critical information for developing a product;

(iii) An assessment of factors that could negatively or adversely affect the market and responses from a reasonable representative cross-section of producers or significant market segment to be affected by the policy or plan of insurance; and

(iv) For 508(h) submissions proposing products for specialty crops a consultation report must be provided that includes a summary and analysis of discussions with groups representing producers of those agricultural commodities in all major producing areas for commodities to be served or potentially impacted, either directly or indirectly, and the expected impact of the proposed 508(h) submission on the general marketing and production of the crop from both a regional and national perspective including evidence that the 508(h) submission will not create adverse market distortions; and

(6) A marketability assessment from the applicant AIP who is part of the applicant and from at least one other AIP. If a marketability assessment is not provided by a separate AIP who is not part of the applicant, the applicant must provide information regarding the names of the persons and AIPs contacted and the basis for their refusal to provide the marketability assessment. The marketability assessment will include:

(i) An assessment of whether producers will buy the proposed 508(h) submission;

(ii) An assessment of whether AIPs and their agents will want to sell and service the proposed 508(h) submission;

(iii) An assessment of the risks associated with the proposed 508(h) submission and its likely effect under the SRA;

(iv) Estimated computer system impacts and costs;

(v) Estimated administrative and training requirement and costs;

(vi) An analysis of the complexity of the product; and

(vii) What, if any, efficiency will be gained or potential effects on the workload of AIPs or others participating in the program.

(f) The fifth section must contain the information related to the underwriting and loss adjustment of the 508(h) submission, prepared in accordance with the RMA-14050 Risk Management Agency External Standards Handbook located at <http://www.rma.usda.gov/handbooks/14000/index.html>, including as applicable:

(1) An underwriting guide that includes:

(i) A table of contents and introduction;

(ii) A section containing abbreviations, acronyms, and definitions;

(iii) Relevant dates, including as applicable, sales closing, cancellation, termination, earliest planting, final planting, acreage reporting, premium billing, and end of insurance;

(iv) A section containing insurance contract information (insurability requirements; producer elections, Crop Provisions not applicable to Catastrophic Risk Protection, specific unit division guidelines, etc.);

(v) Detailed rules for determining insurance eligibility, including all producer reporting requirements;

(vi) All form standards needed for inspections and producer certifications, plus detailed instructions for their use and completion;

(vii) Step-by-step examples of the data and calculations needed to establish the insurance guarantee (liability) and premium per acre or other unit of measure, including worksheets that provide the calculations in sufficient detail and in the same order as presented in the policy to allow verification that the premiums charged for the coverage are consistent with policy provisions;

(viii) A section containing any special coverage information (*i.e.*, replanting, tree replacement or rehabilitation, prevented planting, etc.), as applicable; and

(ix) A section containing all applicable reference material (*i.e.*,

minimum sample requirements, row width factors, etc.).

(2) Any statements to be included in the actuarial documents including any intended Special Provisions statements that may change any underlying policy terms or conditions; and

(3) The loss adjustment standards handbook for the policy or plan of insurance that includes:

(i) A table of contents and introduction;

(ii) A section containing abbreviations, acronyms, and definitions;

(iii) A section containing insurance contract information (insurability requirements; Crop Provisions not applicable to catastrophic risk protection; specific unit division guidelines, if applicable; notice of damage or loss provisions; quality adjustment provisions; etc.);

(iv) A detailed description of the causes of loss covered by the policy or plan of insurance and any causes of loss excluded;

(v) A section that thoroughly explains appraisal methods, if applicable;

(vi) Illustrative samples of all the applicable forms needed for insuring and adjusting losses in regards to the 508(h) submission in a format compatible with the Document and Supplemental Standards Handbook (FCIC 24040) located at <http://www.rma.usda.gov/handbooks/24000/index.html>, plus detailed instructions for their use and completion;

(vii) Instructions, step-by-step examples of calculations used to determine indemnity payments for all probable situations where a partial or total loss may occur, and loss adjustment procedures that are necessary to establish the amounts of coverage and loss;

(viii) A section containing any special coverage information (*i.e.*, replanting, tree replacement or rehabilitation, prevented planting, etc.), as applicable; and

(ix) A section containing all applicable reference material (*i.e.*, minimum sample requirements, row width factors, etc.).

(g) The sixth section must contain information related to prices and rates of premium, including, as applicable:

(1) A detailed description of the premium rating methodology proposed to be used and the basis for selection of the rating methodology;

(2) A list of all assumptions made in the premium rating and commodity pricing methodologies, and the basis for these assumptions;

(3) A detailed description of the pricing and rating methodologies, including:

(i) Supporting documentation needed for the rate methodology;

(ii) All mathematical formulas and equations;

(iii) Data and data sources used in determining rates and prices and a detailed assessment of the data (including availability, access, long term reliability, and the percentage of the total commercial production that the available data represents) and how it supports the proposed rates and prices;

(iv) A detailed explanation of how the rates account for each of the risks covered by the policy; and

(v) A detailed explanation of how the prices are applicable to the policy;

(4) An example of both a rate calculation and a price calculation;

(5) A discussion of the applicant's objective evaluation of the accuracy of the data, the short and long term availability of the data, and how the data will be obtained (if the data source is confidential or proprietary explain the cost of obtaining the data); and

(6) An analysis of the results of simulations or modeling showing the performance of proposed rates and commodity prices, as applicable, based on one or more of the following (Such simulations must use all years of experience available to the applicant and must reflect both partial losses and total losses):

(i) A recalculation of total premium and losses compared to a similar or comparable insurance plan offered under the authority of the Act with modifications, as needed, to represent the components of the 508(h) submission;

(ii) A simulation that shows liability, premium, indemnity, and loss ratios for the proposed insurance product based on the probability distributions used to develop the rates and commodity prices, as applicable, including sensitivity tests that demonstrate price or yield extremes, and the impact of inappropriate assumptions; or

(iii) Any other comparable simulation that provides results indicating both aggregate and individual performance of the 508(h) submission including expected liability, premium, indemnity, and loss ratios for the proposed insurance product, under various scenarios depicting good and poor actuarial experience.

(h) The seventh section must contain the following:

(1) A statement certifying that the submitter and any approved insurance provider or its affiliates will not solicit or market the 508(h) submission until

after all policy materials are released to the public by RMA, unless otherwise specified by the Board;

(2) An explanation of any provision of the policy not authorized under the Act and identification of the portion of the rate of premium due to these provisions; and

(3) Agent and loss adjuster training plans, except for 508(h) submissions proposing only changes to rates of premium to an existing policy.

(i) The eighth section must contain a statement from the submitter that, if the 508(h) submission is approved, the submitter will work with RMA and its computer programmers as needed to assure an effective and efficient implementation process. This section must also contain a description of any expected implementation or administration issues. The applicant must consult with RMA prior to providing the 508(h) submission to determine whether or not the 508(h) submission can be effectively and efficiently implemented and administered through the current information technology systems and that all reporting requirements, terminology, and dates conform to USDA standards and initiatives.

(1) If FCIC approves the 508(h) submission and determines that its information technology systems have the capacity to implement and administer the 508(h) submission, the applicant must provide a document detailing acceptable computer processing requirements consistent with those used by RMA as shown on the RMA Web site in the Appendix III/M-13 Handbook. This information details the acceptable computer processing requirements in a manner consistent with that used by RMA to facilitate the acceptance of producer applications and related data.

(2) Any computer systems, requirements, code and software must be consistent with that used by RMA and comply with the standards established in Appendix III/M-13 Handbook, or any successor document, of the SRA or other reinsurance agreement as specified by FCIC.

(3) These requirements are available from the USDA/Risk Management Agency, 2312 East Bannister Road, Kansas City, MO 64131-3011, or on RMA's Web site at <http://www.rma.usda.gov/data/m13>, or a successor Web site.

(j) The ninth section submitted on separate pages and in accordance with § 400.712 and any applicable Board procedures must specify:

(1) The following amounts, which may be limited to the amount originally

estimated in the submission, unless the applicant can justify the additional costs:

(i) For new products, the amount received for an advance payment, and a detailed estimate of the total amount of reimbursement for research and development costs; or

(ii) For products that are within the maintenance period, an estimate for maintenance costs for the year that the 508(h) submission will be effective; and

(2) A detailed estimate of maintenance costs for future years of the maintenance period and the basis that such maintenance costs will be incurred, including, but not limited to:

(i) Any anticipated expansion;

(ii) Anticipated changes or updates to policy materials;

(iii) The generation of premium rates;

(iv) The determination of prices; and

(v) Any other costs that the applicant anticipates will be requested for reimbursement of maintenance costs or expenses;

(k) The tenth section must contain executed (signed) certification statements in accordance with the following:

(1) “{Applicant’s Name} hereby claim that the basis and amounts set forth in this section and § 400.712 are correct and due and owing to {Applicant’s Name} by FCIC under the Federal Crop Insurance Act”; and

(2) “{Applicant Name} understands that, in addition to criminal fines and imprisonment, the 508(h) submission of false or fraudulent statements or claims may result in civil and administrative sanctions.”

(l) The contents required for concept proposals are found in the Procedures Handbook 17030—Approved Procedures for Submission of Concept Proposals Seeking Advance Payment of Research and Development Costs. In addition, the proposal must provide a detailed description of why the concept provides insurance:

(1) In a significantly improved form;

(2) To a crop or region not traditionally served by the Federal crop insurance program; or

(3) In a form that addresses a recognized flaw or problem in the program;

(m) The contents required for index-based weather plans of insurance are found in the Procedures Handbook 17050—Approved Procedures for Submission of Index-based Weather Plans of Insurance. In accordance with the Board approved procedures, the approved insurance provider that submits the index-based weather plan of insurance must provide evidence they have:

(1) Adequate experience in underwriting and administering policies or plans of insurance that are comparable to the proposed policy of plan of insurance;

(2) Sufficient assets or reinsurance to satisfy the underwriting obligations of the approved insurance provider, and a sufficient insurance credit rating from an appropriate credit rating bureau; and

(3) Applicable authority and approval from each State in which the approved insurance provider intends to sell the insurance product.

§ 400.706 Review.

(a) Prior to providing a 508(h) submission, concept proposal, or index-based weather plan of insurance to the Board, RMA will:

(1) Review the 508(h) submission, concept proposal, or index-based weather plan of insurance to determine if all required documentation is included in accordance with § 400.705;

(2) Review the 508(h) submission, concept proposal, or index-based weather plan of insurance to determine whether it is of sufficient quality to conduct a meaningful review such that the Board will be able to make an informed decision regarding approval or disapproval;

(3) In accordance with section 508(h)(1)(B) of the Act, at its sole discretion, determine if the policy or plan of insurance:

(i) Will likely result in a viable and marketable policy;

(ii) Will provide crop insurance coverage in a significantly improved form; and

(iii) Adequately protect the interests of producers.

(4) RMA may reject and return any 508(h) submission, concept proposal, or index based weather plan of insurance that:

(i) Is not complete;

(ii) Is unlikely to result in a viable and marketable policy;

(iii) Will not provide crop insurance coverage in a significantly improved form; and

(iv) Will not adequately protect the interests of producers.

(5) Except as provided in paragraph (a)(4) of this section, forward the 508(h) submission, concept proposal, or index-based weather plan of insurance, and the results of RMA’s initial review, to the Board for its determination of completeness and quality.

(b) Upon the Board’s receipt of a 508(h) submission, the Board will:

(1) Determine if the 508(h) submission is complete (the date the Board votes to contract with expert reviewers is the date the 508(h) submission is deemed to

be complete for the start of the 120 day time-period for approval);

(2) Unless the 508(h) submission makes non-significant changes to a policy or plan of insurance, or involves policy provisions that have already undergone expert review, forward the complete 508(h) submission to at least five expert reviewers to review the 508(h) submission:

(i) Of the five expert reviewers, no more than one will be employed by the Federal Government, and none may be employed by any approved insurance provider or their representative; and

(ii) The expert reviewers will each provide their individual assessment of whether the 508(h) submission:

(A) Protects the interests of agricultural producers and taxpayers;

(B) Is actuarially appropriate;

(C) Follows recognized insurance principles;

(D) Meets the requirements of the Act;

(E) Does not contain excessive risks (risks may be considered excessive if they encourage adverse selection, moral hazard, or if premium rates cannot be adequately or appropriately determined);

(F) Follows sound, reasonable, and appropriate underwriting principles;

(G) Will provide a new kind of coverage that is likely to be viable and marketable;

(H) Will provide crop insurance coverage in a manner that addresses a clear and identifiable flaw or problem in an existing policy;

(I) Will provide a new or improved coverage for a commodity that previously had no available crop insurance, or has demonstrated a low level of participation or coverage level under existing coverage;

(J) May have a significant adverse impact on the crop insurance delivery system;

(K) The marketability assessment reasonably demonstrates the product would be viable and marketable (if the applicant cannot obtain a marketability assessment by another AIP, the Board shall presume that the submission is unmarketable);

(L) If applicable, contains a consultation report that provides evidence the 508(h) submission will not create adverse market distortions; and

(M) Meets any other criteria the Board may deem necessary;

(3) Return to the applicant any 508(h) submission the Board determines is not complete, along with an explanation of the reason for the determination and:

(i) With respect to 508(h) submissions developed from approved concept proposals, the provisions in § 400.712(c)(1) shall apply; and

(ii) Except for 508(h) submissions developed from concept proposals, if the 508(h) submission is resubmitted at a later date, it will be considered a new 508(h) submission solely for the purpose of determining the amount of time that the Board must take action; and

(4) For complete 508(h) submissions:

(i) Request review by RMA to provide its assessment of whether the 508(h) submission:

(A) Meets the criteria listed in subsections (b)(2)(ii)(A) through (M);

(B) Is consistent with USDA's public policy goals;

(C) Does not increase or shift risk to any other FCIC reinsured policy;

(D) Can be implemented, administered, and delivered effectively and efficiently using RMA's information technology and delivery systems; and

(E) Contains requested amounts of government reinsurance, risk subsidy, and administrative and operating subsidies that are reasonable and appropriate for the type of coverage provided by the policy; and

(ii) Seek review from the Office of the General Counsel (OGC) to determine if the 508(h) submission conforms to the requirements of the Act and all applicable Federal statutes and regulations.

(c) Upon the Board's receipt of a concept proposal, the Board will:

(1) Determine whether the concept proposal is complete (the date the Board votes to contract with expert reviewers is the date the concept proposal is deemed to be a complete concept proposal for the start of the 120 day time-period for approval);

(2) If complete, forward the concept proposal to at least two expert reviewers with underwriting or actuarial experience to review the concept in accordance with section 522(b)(2) of the Act, this subpart, and Procedures Handbook 17030—Approved Procedures for Submission of Concept Proposals Seeking Advance Payment of Research and Development Costs;

(3) Return to the applicant any concept proposal the Board determines is not complete, along with an explanation of the reason for the determination (If the concept proposal is resubmitted at a later date, it will be considered a new concept proposal solely for the purposes of determining the amount of time that the Board must take action);

(4) Determine whether the concept proposal, if developed into a policy or plan of insurance would, in good faith, would meet the requirement of being likely to result in a viable and marketable policy consistent with

section 508(h) (if the applicant cannot obtain a marketability assessment by another AIP, the Board shall presume that the submission is unmarketable);

(5) At its sole discretion, determine whether the concept proposal, if developed into a policy or plan of insurance would meet the requirement of providing coverage:

(i) In a significantly improved form;

(ii) To a crop or region not traditionally served by the Federal crop insurance program; or

(iii) In a form that addresses a recognized flaw or problem in the program;

(6) Determine whether the proposed budget and timetable are reasonable;

(7) Determine whether the concept proposal meets all other requirements imposed by the Board or as otherwise specified in Procedures Handbook 17030—Approved Procedures for Submission of Concept Proposals Seeking Advance Payment of Research and Development Costs; and

(8) Provide a date by which the 508(h) submission must be provided in consultation with the applicant.

(d) Upon the Board's receipt of an index-based weather plan of insurance, the Board will:

(1) Determine whether the index-based weather plan of insurance is complete (the date the Board votes to contract with expert reviewers is the date the index-based weather plan of insurance is deemed to be complete for the start of the 120-day time-period for approval);

(2) If determined to be complete, contract with five expert reviewers and review the index-based weather plan of insurance in accordance with section 523(i) of the Act, this subpart, and Procedures Handbook 17050—Approved Procedures for Submission of Index-based Weather Plans of Insurance;

(3) Return to the applicant any index-based weather plan of insurance the Board determines is not complete, along with an explanation of the reason for the determination (if the index-based weather plan of insurance is resubmitted at a later date, it will be considered a new index-based weather plan of insurance solely for the purposes of determining the amount of time that the Board must take action); and

(4) Give the highest priority for approval of index-based weather plans of insurance that provide a new kind of coverage for specialty crops and livestock commodities that previously had no available crop insurance, or have demonstrated a low level of participation under existing coverage.

(e) All comments and evaluations will be provided to the Board by a date determined by the Board to allow the Board adequate time for review.

(f) The Board will consider all comments, evaluations, and recommendations in its review process. Prior to making a decision, the Board may request additional information from RMA, OGC, the expert reviewers, or the applicant.

(g) In considering whether to approve policies or plans of insurance and when such policies or plans of insurance will be offered for sale, the Board will:

(1) First, consider policies or plans of insurance that address underserved commodities, including commodities for which there is no insurance;

(2) Second, consider existing policies or plans of insurance for which there is inadequate coverage or there exists low levels of participation; and

(3) Last, consider all policies or plans of insurance submitted to the Board that do not meet the criteria described in paragraph (g)(1) or (2) of this section.

(h) At any time an applicant may request a time delay after the 508(h) submission, concept proposal, or index-based weather plan of insurance has been placed on the Board meeting agenda. The Board is not required to agree to such an extension.

(1) With respect to 508(h) submissions from concept proposals approved by the Board for advanced payment, the applicant must provide good cause why consideration should be delayed.

(2) Any requested time delay is not limited in the length of time unless a date is set by the Board by which all revisions to the 508(h) submission, concept proposal or index-based weather plan of insurance must be made. However, delays may make implementation of the 508(h) submission for the targeted crop year impractical or impossible as determined by the Board.

(3) The time period during which the Board will make a decision to approve or disapprove the 508(h) submission, concept proposal or index-based weather plan of insurance shall be extended commensurately with any time delay requested by the applicant.

(i) The applicant may withdraw a 508(h) submission, concept proposal, index-based weather plan of insurance, or a portion of a 508(h) submission or concept proposal, at any time by presenting a request to the Board. A withdrawn 508(h) submission, concept proposal or index-based weather plan of insurance that is resubmitted will be deemed a new 508(h) submission, concept proposal, or index-based weather plan of insurance solely for the

purposes of determining the amount of time that the Board must take action.

(j) The Board will render a decision on a 508(h) submission or index-based weather plan of insurance, with or without revision or give notice of intent to disapprove within 90 days after the date the 508(h) submission or index-based weather plan of insurance is considered complete by the Board, unless the Board agrees to a time delay in accordance with paragraph (h) of this section.

(k) The Board may provide a notice of intent to disapprove a 508(h) submission if it determines:

(1) The interests of producers and taxpayers are not protected, including but not limited to:

(i) The 508(h) submission does not provide adequate coverage or treats producers disparately;

(ii) The applicant has not presented sufficient documentation that the 508(h) submission will provide a new kind of coverage that is likely to be viable and marketable (if the applicant cannot obtain a marketability assessment by another AIP, the Board shall presume that the submission is unmarketable);

(iii) Coverage would be similar to another policy or plan of insurance that has not demonstrated a low level of participation or does not contain a clear and identifiable flaw, and the producer would not significantly benefit from the 508(h) submission;

(iv) The 508(h) submission may create adverse market distortions or adversely impact other crops or agricultural commodities if marketed;

(v) The 508(h) submission will have a significant adverse impact on the private delivery system;

(vi) The 508(h) submission cannot be implemented, administered, and delivered effectively and efficiently using RMA's information technology and delivery systems;

(vii) The 508(h) submission contains flaws that may encourage adverse selection or moral hazard; or

(viii) The 508(h) submission contains vulnerabilities that allow indemnities to exceed the value of the crop;

(2) The premium rates are not actuarially appropriate;

(3) The 508(h) submission does not conform to sound insurance and underwriting principles;

(4) The risks associated with the 508(h) submission are excessive or it increases or shifts risk to another reinsured policy;

(5) The 508(h) submission does not meet the requirements of the Act; or

(6) The 90-day deadline under subsection (j) will expire before the Board has time to make an informed

decision to approve or disapprove the 508(h) submission.

(l) The Board may disapprove a concept proposal if it determines:

(1) The concept, in good faith, will not likely result in a viable and marketable policy consistent with section 508(h);

(2) At the sole discretion of the Board, the concept, if developed into a policy and approved by the Board, would not provide crop insurance coverage:

(i) In a significantly improved form;

(ii) To a crop or region not traditionally served by the Federal crop insurance program; or

(iii) In a form that addresses a recognized flaw or problem in the program;

(3) The proposed budget and timetable are not reasonable, as determined by the Board; or

(4) The concept proposal fails to meet one or more requirements established by the Board.

(m) The Board shall provide a notice of intent to disapprove an index-based weather plan of insurance if it determines there is not:

(1) Adequate experience in underwriting and administering policies or plans of insurance that are comparable to the proposed policy or plan of insurance;

(2) Sufficient assets or reinsurance to satisfy the underwriting obligations of the approved insurance provider, and possess a sufficient insurance credit rating from an appropriate credit rating bureau, in accordance with Board procedures; and

(3) Applicable authority and approval from each State in which the approved insurance provider intends to sell the insurance product.

(n) Unless otherwise provided for in this section:

(1) If the Board intends to disapprove a 508(h) submission or index-based weather plan of insurance, the Board will provide the applicant with a written explanation outlining the basis for the intent to disapprove; and

(2) Any approval or disapproval of a 508(h) submission, concept proposal, or index-based weather plan of insurance must be made by the Board in writing not later than 120 days after the Board has determined it to be complete.

(o) If a notice of intent to disapprove all or part of a 508(h) submission or index-based weather plan of insurance has been provided by the Board, the applicant must provide written notice to the Board not later than 30 days after the Board provides such notice if the 508(h) submission or index-based weather plan of insurance will be modified. If the applicant does not

respond within the 30-day period, the Board will send the applicant a letter stating the 508(h) submission or index-based weather plan of insurance is disapproved.

(p) If the applicant elects to modify the 508(h) submission or index-based weather plan of insurance:

(1) The applicant must advise the Board of a date by which the modified 508(h) submission or index-based weather plan of insurance will be presented to the Board; and

(2) The remainder of the time left between the Board's notice of intent to disapprove and the expiration of the 120-day deadline is paused until the modified 508(h) submission or index-based weather plan of insurance is received by the Board.

(3) The Board will disapprove a modified 508(h) submission or index-based weather plan of insurance if the:

(i) Causes for disapproval stated by the Board in its notification of intent to disapprove the 508(h) submission or index-based weather plan of insurance are not satisfactorily addressed;

(ii) Board determines there is insufficient time for the Board to finish its review before the expiration of the 120-day deadline for disapproval of a 508(h) submission or index-based weather plan of insurance, unless the applicant grants the Board an extension of time to adequately consider the modified 508(h) submission or index-based weather plan of insurance (If an extension of time is agreed upon, the time period during which the Board must act on the modified 508(h) submission or index-based weather plan of insurance will be paused during the extension); or

(iii) Applicant does not present a modification of the 508(h) submission or index-based weather plan of insurance to the Board on the date the applicant specified and the applicant does not request an additional time delay.

(q) If the Board fails to render a decision on a new 508(h) submission or index-based weather plan of insurance within the time periods specified in paragraph (j) or (n) of this section, such 508(h) submission or index-based weather plan of insurance will be deemed approved by the Board for the initial reinsurance year designated for the 508(h) submission or index-based weather plan of insurance. The Board must approve the 508(h) submission or index-based weather plan of insurance for it to be available for any subsequent reinsurance year.

§ 400.707 Presentation to the Board for approval or disapproval.

(a) The Board will inform the applicant of the date, time, and place of the Board meeting.

(b) The applicant will be given the opportunity and is encouraged to present the 508(h) submission, concept proposal, or index-based weather plan of insurance to the Board in person. The applicant must confirm in writing, email or fax whether the applicant will present in person to the Board.

(c) If the applicant elects not to present the 508(h) submission, concept proposal, or index-based weather plan of insurance to the Board, the Board will make its decision based on the information provided in accordance with § 400.705 and § 400.706.

§ 400.708 Post approval.

(a) After a 508(h) submission is approved by the Board, and prior to it being made available for sale to producers:

(1) The following must be executed, as applicable:

(i) If required by FCIC, an agreement between the applicant and FCIC that specifies:

(A) In addition to the requirements in § 400.709, responsibilities of each with respect to the implementation, delivery and maintenance of the 508(h) submission; and

(B) The required timeframes for submitting any information and documentation needed to administer the approved 508(h) submission;

(ii) A reinsurance agreement if the approved submission does not meet, or is not expected to perform in a financial manner consistent with the terms and conditions of the Standard Reinsurance Agreement or any other existing reinsurance agreement offered by FCIC in effect for the crop year, and that considers the interests of all participating AIPs; and

(iii) A training package to facilitate implementation of the approved 508(h) submission;

(2) The Board may limit the availability of coverage, for any policy or plan of insurance developed under the authority of the Act and this regulation, on any farm or in any county or area;

(3) A 508(h) submission approved by the Board under this subpart will be made available to all approved insurance providers under the same reinsurance, subsidy, and terms and conditions as received by the applicant;

(4) Any solicitation, sales, marketing, or advertising of the approved 508(h) submission by the applicant before FCIC has made the policy materials available

to all interested parties through its official issuance system will result in the denial of reinsurance, risk subsidy, and A&O subsidy for those policies affected; and

(5) The property rights to the 508(h) submission will automatically transfer to FCIC if the applicant elects not to maintain the 508(h) submission under § 400.712(a)(3) or fails to notify FCIC of its decision to elect or not elect maintenance of the program under § 400.712(l).

(b) Requirements and procedures for approved index-based weather plans of insurance are contained in Procedures Handbook 17050—Approved Procedures for Submission of Index-based Weather Plans of Insurance. In accordance with the Board approved procedures, index-based weather plans of insurance are not eligible for federal reinsurance, but may be approved for risk subsidy and A&O subsidy.

§ 400.709 Roles and responsibilities.

(a) With respect to the applicant:

(1) The applicant is responsible for:

(i) Preparing and ensuring that all policy documents, rates of premium, prices, and supporting materials, including actuarial documents, are submitted by the deadline specified by FCIC, in the form approved by the Board, and are in compliance with section 508 of the Rehabilitation Act;

(ii) Annually updating and providing maintenance changes no later than 180 days prior to the earliest contract change date for the commodity in all counties or states in which the policy or plan of insurance is sold;

(iii) Timely addressing questions, problems or clarifications in regard to a policy or plan of insurance (all such resolutions for approved 508(h) submissions will be communicated to all approved insurance providers through FCIC's official issuance system); and

(iv) If requested by the Board, providing an annual review of the policy's performance, in writing to the Board, 180 days prior to the contract change date for the plan of insurance (The first annual report will be submitted one full year after implementation of an approved policy or plan of insurance, as agreed to by the submitter and RMA);

(2) Only the applicant may make changes to the policy, plan of insurance, or rates of premium approved by the Board:

(i) Any changes to approved 508(h) submissions, both non-significant and significant, must be submitted to FCIC in the form of a 508(h) submission for review in accordance with this subpart

no later than 180 days prior to the earliest contract change date for the commodity in all counties or states in which the policy or plan of insurance is sold; and

(ii) Significant changes will be considered a new 508(h) submission;

(3) Except as provided in paragraph (a)(4) of this section, the applicant is solely liable for any mistakes, errors, or flaws in the submitted policy, plan of insurance, their related materials, or the rates of premium that have been approved by the Board unless, or until, the policy or plan of insurance is transferred to FCIC in accordance with § 400.712(l) (the applicant remains liable for any mistakes, errors, or flaws that occurred prior to transfer of the policy or plan of insurance to FCIC);

(4) If the mistake, error, or flaw in the policy, plan of insurance, their related materials, or the rates of premium is discovered more than 45 days prior to the cancellation or termination date for the policy or plan of insurance, the applicant may request in writing that FCIC withdraw the approved policy, plan of insurance, or rates of premium:

(i) Such request must state the discovered mistake, error, or flaw in the policy, plan of insurance, or rates of premium, and the expected impact on the program; and

(ii) For all timely received requests for withdrawal, no liability will attach to such policies, plans of insurance, or rates of premium that have been withdrawn and no producer, approved insurance provider, or any other person will have a right of action against the applicant;

(5) Notwithstanding the policy provisions regarding cancellation, any policy, plan of insurance, or rates of premium that have been withdrawn by the applicant, in accordance with paragraph (a)(4) of this section is deemed canceled and applications are deemed not accepted as of the date that FCIC publishes the notice of withdrawal on its Web site at www.rma.usda.gov.

(i) Approved insurance providers will be notified in writing by FCIC that the policy, plan of insurance, or premium rates have been withdrawn; and

(ii) Producers will have the option of selecting any other policy or plan of insurance authorized under the Act that is available in the area by the sales closing date for such policy or plan of insurance; and

(6) Failure of the applicant to perform all of the applicant's responsibilities may result in the withdrawal of approval for the policy or plan of insurance.

(b) With respect to FCIC:

(1) FCIC is responsible for:

(j) Conducting a review in accordance with § 400.706 and providing its recommendations to the Board;

(ii) With respect to 508(h) submissions:

(A) Ensuring that all approved insurance providers receive the approved policy or plan of insurance, and related material, for sale to producers in a timely manner (All such information shall be communicated to all approved insurance providers through FCIC's official issuance system);

(B) As applicable, ensuring that approved insurance providers receive reinsurance under the same terms and conditions as the applicant (Approved insurance providers should contact FCIC to obtain and execute a copy of the reinsurance agreement) if required; and

(C) Reviewing the activities of approved insurance providers, agents, loss adjusters, and producers to ensure that they are in accordance with the terms of the policy or plan of insurance, the reinsurance agreement, and all applicable procedures;

(2) FCIC will not be liable for any mistakes, errors, or flaws in the policy, plan of insurance, their related materials, or the rates of premium and no cause of action may be taken against FCIC as a result of such mistake, error, or flaw in a 508(h) submission or index-based weather plan of insurance submitted under this subpart;

(3) If at any time prior to the cancellation date, FCIC discovers there is a mistake, error, or flaw in the policy, plan of insurance, their related materials, or the rates of premium, or any other reason for withdrawal of approval contained in § 400.706(k) exists, FCIC will withdraw reinsurance for such policy or plan of insurance to all AIPs for the subsequent crop year (If reinsurance is denied, a written notice will be provided on RMA's Web site at www.rma.usda.gov);

(4) If maintenance of the policy or plan of insurance is transferred to FCIC in accordance with § 400.712(l), FCIC will assume liability for the policy or plan of insurance for any mistake, error, or flaw that occur after the date the policy is transferred.

(c) If approval by the Board is withdrawn or reinsurance is denied for any 508(h) submission, RMA will provide such notice on its Web site and the approved insurance provider must cancel the policy or plan of insurance in accordance with its terms.

§ 400.710 Preemption and premium taxation.

A policy or plan of insurance that is approved by the Board for FCIC reinsurance is preempted from state and

local taxation. This preemption does not apply to index-based weather plans of insurance approved for premium subsidy or A&O subsidy under this part.

§ 400.711 Right of review, modification, and the withdrawal of approval.

(a) At any time after approval, the Board may review any policy, plan of insurance, related material, or rates of premium approved under this subpart, including index-based weather plans of insurance and request additional information to determine whether the policy, plan of insurance, related material, or rates of premium comply with the requirements of this subpart.

(b) The Board will notify the applicant of any problem or issue that may arise and allow the applicant an opportunity to make any needed change. If the contract change date has passed, the applicant will be liable for such problems or issues for the crop year in accordance with § 400.709 until the policy may be changed.

(c) The Board may withdraw approval for the applicable policy, plan of insurance or rate of premium, including index-based weather plans of insurance, as applicable, if:

(1) The applicant fails to perform the responsibilities stated under § 400.709(a);

(2) The applicant does not timely and satisfactorily provide materials or resolve any issue to the Board's satisfaction so that necessary changes can be made prior to the earliest contract change date;

(3) The Board determines the applicable policy, plan of insurance or rate of premium, including index-based weather plans of insurance is not in conformance with the Act, these regulations or the applicable procedures;

(4) The policy, plan of insurance, or rates of premium are not sufficiently marketable according to the applicant's estimate or fails to perform sufficiently as determined by the Board; or

(5) The interest of producers or tax payers is not protected or the continuation of the program raises questions or issues of program integrity.

§ 400.712 Research and development reimbursement, maintenance reimbursement, advance payments for concept proposals, and user fees.

(a) For 508(h) submissions approved by the Board for reinsurance under section 508(h) of the Act:

(1) The 508(h) submission may be eligible for a one-time payment of research and development costs and reimbursement of maintenance costs for up to four reinsurance years, as determined by the Board;

(2) Reimbursement of research and development costs or maintenance costs will be considered as payment in full by FCIC for the 508(h) submission, and no additional amounts will be owed to the applicant if the 508(h) submission is transferred to FCIC in accordance with paragraph (l) of this section; and

(3) If the applicant elects at any time not to continue to maintain the 508(h) submission, it will automatically become the property of FCIC and the applicant will no longer have any property rights to the 508(h) submission and will not receive any user fees for the plan of insurance;

(b) The Board approved procedures and time-frames must be followed, or research and development costs and maintenance costs may not be reimbursed.

(1) After a 508(h) submission has been approved by the Board for reinsurance, to be considered for reimbursement of:

(i) Research and development costs, the applicant must submit the total amount requested and all supporting documentation to FCIC by electronic method or by hard copy and such information must be received by FCIC on or before August 1 immediately following the date the 508(h) submission was released to approved insurance providers through FCIC's issuance system; or

(ii) Maintenance costs, the applicant must submit the total amount requested and all supporting documentation to FCIC by electronic method or by hard copy and such information must be received by FCIC on or before August 1 of each year of the maintenance period.

(2) Given the limitation on funds, regardless of when the request is received, no payment will be made prior to September 15 of the applicable fiscal year.

(c) Applicants submitting a concept proposal may request an advance payment of up to 50 percent of the projected total research and development costs, and after the applicant has begun research and development activities, the Board may, at its sole discretion, provide up to an additional 25 percent advance payment of the estimated research and development costs, if the requirements in the definition of advance payment are met and the additional advance payment is requested in accordance with Procedures Handbook 17030—Approved Procedures for Submission of Concept Proposals Seeking Advance Payment of Research and Development Costs.

(1) If a concept proposal is approved by the Board for advance payment, the applicant is responsible for

independently developing a 508(h) submission that is complete as specified in this subpart by the deadline set by the Board.

(i) If an applicant fails to fulfill the obligation to provide a 508(h) submission that is complete by the deadline set by the Board, the Board shall provide a notice of non-compliance to the applicant and allow not less than 30 days for the applicant to respond;

(ii) If the applicant fails to respond, to the satisfaction of the Board, with just cause as to why a 508(h) submission that is complete was not provided by the deadline set by the Board, the applicant shall return the amount of the advance payment plus interest at the rate of 1.25 percent simple interest per calendar month;

(iii) If the applicant responds, to the satisfaction of the Board, with just cause as to why a 508(h) submission that is complete was not provided by the deadline set by the Board, the applicant will be given a new deadline by which to provide a 508(h) submission that is complete; and

(iv) If the applicant fails to provide a 508(h) submission that is complete by the deadline, no additional extensions will be approved by the Board and the applicant shall return the amount of the advance payment plus interest at the rate of 1.25 percent simple interest per calendar month.

(2) If an applicant receives an advance payment for a portion of the expected research and development costs for a concept proposal that is developed into a 508(h) submission and determined by the Board to be complete, but the 508(h) submission is not approved by the Board following expert review, the Board will not:

(i) Seek a refund of any advance payments for research and development costs; and

(ii) Make any further research and development cost reimbursements associated with the 508(h) submission.

(d) Under section 522 of the Act, there are limited funds available on an annual fiscal year basis to pay for reimbursements of research and development costs (including advance payments for concept proposals) and maintenance costs. Consistent with paragraphs (e) through (j) of this section if all applicants' requests for reimbursement of research and development costs (including advance payments for concept proposals) and maintenance costs in any fiscal year:

(1) Do not exceed the maximum amount authorized by law, the applicants may receive the full amount

of reimbursement determined reasonable by the Board; or

(2) Exceed the amount authorized by law, each applicant's reimbursement determined reasonable by the Board will be determined by dividing the total amount of each individual applicant's reimbursable costs authorized in paragraphs (e) through (j) of this section by the total amount of the aggregate of all applicants' reimbursable costs authorized in paragraphs (e) through (j) for the year and multiplying the result by the amount of reimbursement authorized under the Act.

(e) The amount of reimbursement for research and development costs and maintenance costs requested by the applicant may be reduced as necessary when the requested amount is not commensurate with the complexity or the size of the area proposed to be covered.

(f) Research and development costs and maintenance costs must be supported by itemized statements and supporting documentation (copies of contracts, billing statements, time sheets, travel vouchers, accounting ledgers, etc.).

(1) Actual costs submitted will be examined for reasonableness and may be adjusted at the sole discretion of the Board.

(2) Allowable research and development costs and maintenance costs (directly related to research and development or maintenance of the 508(h) submission only) may include the following:

(i) Wages and benefits, exclusive of bonuses, overtime pay, or shift differentials;

(A) One line per employee or contractor, include job title, total hours, and total dollars;

(B) The rates charged must be commensurate with the tasks performed (For example, a person performing the task of data entry should not be paid at the rate for performing data analysis);

(C) The wage rate and benefits shall not exceed two times the hourly wage rate plus benefits provided by the Bureau of Labor Statistics; and

(D) The applicant must report any familial or business relationship that exists between the applicant and the contractor or employee (Reimbursement may be limited or denied if the contractor or employee is associated to the applicant and they may be considered as one and the same. This includes a separate entity being created by the applicant to conduct research and development. Reimbursement may be limited or denied if the contractor is paid a salary or other compensation);

(ii) Travel and transportation (One line per event, include the job title, destination, purpose of travel, lodging cost, mileage, air or other identified transportation costs, food and miscellaneous expenses, other costs, and the total cost);

(iii) Software and computer programming developed specifically to determine appropriate rates, prices, or coverage amounts (Identify the item, include the purpose, and provide receipts or contract or straight-time hourly wage, hours, and total cost. Software developed to send or receive data between the producer, agent, approved insurance provider or RMA or such other similar software may not be included as an allowable cost);

(iv) Miscellaneous expenses such as postage, telephone, express mail, and printing (Identify the item, cost per unit, number of items, and total dollars); and

(v) Training costs expended to facilitate implementation of a new approved 508(h) submission (Include instructor(s) hourly rate, hours, and cost of materials and travel) conducted at a national level, directed to all approved insurance providers interested in selling the 508(h) submission, and approved prior to the training by RMA).

(3) The following expenses are specifically not eligible for research and development and maintenance cost reimbursement:

(i) Copyright fees, patent fees, or any other charges, costs or expenses related to the use of intellectual property;

(ii) Training costs, excluding training costs to facilitate implementation of the approved 508(h) submission in accordance with subsection (f)(2)(v);

(iii) State filing fees and expenses;

(iv) Normal ongoing administrative expenses or indirect overhead costs (for example, costs associated with the management or general functions of an organization, such as costs for internet service, telephone, utilities, and office supplies);

(v) Paid or incurred losses;

(vi) Loss adjustment expenses;

(vii) Sales commission;

(viii) Marketing costs;

(ix) Lobbying costs;

(x) Product or applicant liability

resulting from the research, development, preparation or marketing of the policy;

(xi) Copyright infringement claims resulting from the research, development, preparation or marketing of the policy;

(xii) Costs of making program changes as a result of any mistakes, errors or flaws in the policy or plan of insurance;

(xiii) Costs associated with building rents or space allocation;

(xiv) Costs in paragraphs (i) and (j) of this section determined by the Board to be ineligible for reimbursement; and

(xv) Local, State, or Federal taxes.

(g) Requests for reimbursement of maintenance costs must be supported by itemized statements and supporting documentary evidence for each reinsurance year in the maintenance period.

(1) Actual costs submitted will be examined for reasonableness and may be adjusted at the sole discretion of the Board.

(2) Maintenance costs for the following activities may be reimbursed:

(i) Expansion of the original 508(h) submission into additional crops, counties or states;

(ii) Non-significant changes to the policy and any related material;

(iii) Non-significant or significant changes to the policy as necessary to protect program integrity or as required by Congress; and

(iv) Any other activity that qualifies as maintenance.

(h) Projected costs for research and development for concept proposals shall be based on a detailed estimate of the costs allowed in paragraph (f) of this section. Since costs are one measurement of the viability to develop an efficient policy, the Board may limit reimbursements for research and development to the estimated costs contained in the concept proposal, unless the submitter can justify a higher reimbursement in accordance with Board procedures.

(i) If a 508(h) submission is determined to be incomplete and is subsequently resubmitted and approved, the costs to perfect the 508(h) submission may not be considered reimbursable costs depending on the level of insufficiency or incompleteness of the 508(h) submission, as determined at the sole discretion of the Board.

(j) Reimbursement of costs associated with addressing issues raised by the Board, expert reviewers and RMA will be evaluated based on the substance of the issue and the amount of time reasonably necessary to address the specific issue. Delays and additional costs caused by the inability or refusal to adequately address issues may not be considered reimbursable, as determined at the sole discretion of the Board.

(k) If the Board withdraws its approval for reinsurance at any time during the period that reimbursement for maintenance is being made or user fees are being collected, no maintenance reimbursement shall be made nor any user fee be owed after the date of such withdrawal.

(l) Not later than 180 days prior to the end of the last reinsurance year in which a maintenance reimbursement will be paid for the approved 508(h) submission, the applicant must notify FCIC in writing regarding its decision on future ownership and maintenance of the policy or plan of insurance.

(1) The applicant must notify FCIC in writing whether it intends to:

(i) Continue to maintain the policy or plan of insurance and charge approved insurance providers a user fee to cover maintenance expenses for all policies earning premium; or

(ii) Transfer responsibility for maintenance to FCIC.

(2) If the applicant fails to notify FCIC in writing by the deadline, the policy or plan of insurance will automatically transfer to FCIC beginning with the next reinsurance year.

(3) If the applicant elects to:

(i) Continue to maintain the policy or plan of insurance, the applicant must submit a request for approval of the user fee by the Board at the time of the election; or

(ii) Transfer the policy or plan of insurance to FCIC, FCIC may at its sole discretion, continue to maintain the policy or plan of insurance or elect to withdraw the availability of the policy or plan of insurance.

(4) Requests for approval of the user fee must be accompanied by written documentation to support the amount requested will only cover direct costs to maintain the plan of insurance. Costs that are not eligible for research and development and maintenance reimbursements under this section are not eligible to be considered for determining the user fee.

(5) The Board will approve the amount of user fee, including the maximum amount of total maintenance that may be collected per year, that is payable to the applicant by approved insurance providers unless the Board determines that the user fee charged:

(i) Is unreasonable in relation to the maintenance costs associated with the policy or plan of insurance; or

(ii) Unnecessarily inhibits the use of the policy or plan of insurance by approved insurance providers.

(6) If the total user fee exceeds the maximum amount determined by the Board, the maximum amount determined by the Board will be divided by the number of policies earning premium to determine the amount to be paid by each approved insurance provider.

(7) Reasonableness of the initial request to charge a user fee will be determined by the Board based on a comparison of the amount of

reimbursement for maintenance previously received, the number of policies, the number of approved insurance providers, and the expected total amount of user fees to be received in any reinsurance year.

(8) A user fee unnecessarily inhibits the use of a policy or plan of insurance if it is so high that approved insurance providers will not sell the policy, or the user fee represents an unreasonable portion of the A&O subsidy paid to the AIP such that it prevents the AIP from meeting its other obligations under the SRA.

(9) The user fee charged to each approved insurance provider will be considered payment in full for the use of such policy, plan of insurance or rate of premium for the reinsurance year in which payment is made.

(10) It is the sole responsibility of the applicant to collect such fees from an approved insurance provider and any indebtedness for such fees must be resolved by the applicant and approved insurance provider.

(i) Applicants may request that FCIC provide the number of policies sold by each approved insurance provider.

(ii) Such information will be provided not later than 90 days after such request is made or not later than 90 days after the requisite information has been provided to FCIC by the approved insurance provider, whichever is later.

(11) Every two years after approval of a user fee, or if the applicant has made a significant change to the approved 508(h) submission, applicants must submit documentation to the Board for review in determining if the user fee should be revised.

(12) The Board may review the amount of the user fee at any time at its sole discretion.

(m) The Board may consider information from the Equal Access to Justice Act, 5 U.S.C. 504, the Bureau of Labor Statistic's Occupational Employment Statistics Survey, the Bureau of Labor Statistic's Employment Cost Index, and any other information determined applicable by the Board, in making a determination whether to approve a 508(h) submission for reimbursement of research and development costs, maintenance costs, or user fees.

(n) For purposes of this section, rights to, or obligations of, research and development cost reimbursement, maintenance cost reimbursement, or user fees cannot be transferred from any individual or entity unless specifically approved in writing by the Board.

(o) Applicants requesting reimbursement for research and development costs, maintenance costs,

or user fees, may present their request in person to the Board prior to consideration for approval.

(p) Index-based weather plans of insurance are not eligible for reimbursement from FCIC for maintenance costs or research and development costs. Submitters of approved index-based weather plans of insurance may collect user fees from other approved insurance providers in accordance with Procedures Handbook 17050—Approved Procedures for Submission of Index-based Weather Plans of Insurance.

§ 400.713 Non-reinsured supplemental (NRS) policy.

(a) Unless otherwise specified by FCIC, any NRS policy that covers the same agricultural commodity as any policy reinsured by FCIC under the Act must be provided to RMA to ensure it does not shift any loss or risk that does not exist under the FCIC reinsured policy. Failure to provide such NRS policy or endorsement to RMA prior to its issuance shall result in the denial of reinsurance, A&O subsidy, and risk subsidy on all underlying FCIC reinsured policies unless the underlying FCIC policy was sold by another AIP. If the underlying FCIC reinsured policy is sold by another AIP, the AIP that sold the NRS may be required to pay FCIC an amount equal to the reinsurance, A&O subsidy, and risk subsidy on the underlying FCIC policy.

(b) An electronic copy in Microsoft Office compatible format, of the new or revised NRS policy and related materials must be submitted at least 150 days prior to the first sales closing date applicable to the NRS policy. At a minimum, examples that demonstrate how liability and indemnities are calculated under differing scenarios must be included. Electronic copies of the NRS must be sent to the Deputy Administrator for Product Management (or successor) at *DeputyAdministrator@rma.usda.gov*.

(c) RMA will review the NRS policy. If any of the conditions found in paragraphs (c)(1) through (5) of this section are found to occur, FCIC will notify the AIP that submitted the NRS policy that if they sell the NRS policy, it will result in denial of reinsurance, A&O subsidy, and risk subsidy on all underlying FCIC reinsured policies, unless the underlying FCIC policy was sold by another AIP. If the underlying FCIC reinsured policy is sold by another AIP, the AIP that sold the NRS may be required to pay FCIC an amount equal to the reinsurance, A&O subsidy, and risk subsidy on the underlying FCIC policy.

(1) If the NRS policy materially increases or shifts risk to the underlying policy or plan of insurance reinsured by FCIC.

(i) An NRS policy will be considered to materially increase or shift risk to the underlying policy or plan of insurance reinsured by FCIC if RMA determines it:

(A) Creates a moral hazard, such as a financial incentive for the policyholder to behave in a way that increases the number or size of losses;

(B) Results in the underlying FCIC policy either triggering a loss sooner, or paying a larger indemnity than would otherwise be allowed by the terms and conditions of the underlying reinsured policy; or

(C) Allows for combined indemnities between the underlying FCIC reinsured policy and the NRS that are in excess of the value a producer would reasonably expect to receive for the insured commodity if a normal crop was produced and sold at a reasonable market price.

(ii) The NRS must include language that clearly states no indemnity will be paid in excess of the initial value of the insured commodity.

(2) The NRS reduces or limits the rights of the insured with respect to the underlying policy or plan of insurance reinsured by FCIC. An NRS policy will be considered to reduce or limit the

rights of the insured with respect to the underlying policy or plan of insurance if RMA determines it affects, alters, preempts, or undermines the terms or conditions of the underlying policy or procedures issued by FCIC.

(3) The NRS disrupts the marketplace. An NRS policy will be considered to disrupt the marketplace if RMA determines it encourages planting more acres of the insured commodity in excess of normal market demand, adversely affects the sales or administration of reinsured policies, undermines producers' confidence in the Federal crop insurance program, or harms public perception of the Federal crop insurance program.

(4) The NRS is an impermissible rebate. An NRS may be considered to be an impermissible rebate if RMA determines that the premium rates charged are insufficient to cover the expected losses and a reasonable reserve or it offers other benefits that are generally provided at a cost.

(5) The NRS policy is conditioned upon or provides incentive for the purchase of the underlying policy or plan of insurance reinsured by FCIC with a specific agent or approved insurance provider.

(d) RMA will respond not less than 75 days before the first sales closing date or provide notice why RMA is unable to respond within the time frame allotted.

(e) NRS policies reviewed by RMA will need to be submitted once every five years unless a change is made to the NRS or the underlying policy. Once any changes are made to either policy, or the five year period has concluded, the NRS must be resubmitted for review.

Signed in Washington, DC, on August 2, 2016.

Timothy J. Gannon,

Acting Manager, Federal Crop Insurance Corporation.

Proposed Rules and Applications To Become Registered Under the
Controlled Substances Act To Manufacture Marijuana To Supply
Researchers in the United States; Policy Statement

DEPARTMENT OF JUSTICE**Drug Enforcement Administration****21 CFR Chapter II**

[Docket No. DEA-426]

Denial of Petition To Initiate Proceedings To Reschedule Marijuana**AGENCY:** Drug Enforcement Administration, Department of Justice.**ACTION:** Denial of petition to initiate proceedings to reschedule marijuana.

SUMMARY: By letter dated July 19, 2016 the Drug Enforcement Administration (DEA) denied a petition to initiate rulemaking proceedings to reschedule marijuana. Because the DEA believes that this matter is of particular interest to members of the public, the agency is publishing below the letter sent to the petitioner which denied the petition, along with the supporting documentation that was attached to the letter.

DATES: August 12, 2016.

FOR FURTHER INFORMATION CONTACT: Michael J. Lewis, Office of Diversion Control, Drug Enforcement Administration; Mailing Address: 8701 Morrisette Drive, Springfield, Virginia 22152; Telephone: (202) 598-6812.

SUPPLEMENTARY INFORMATION:

July 19, 2016

Dear Ms. Raimondo and Mr. Inslee:

On November 30, 2011, your predecessors, The Honorable Lincoln D. Chafee and The Honorable Christine O. Gregoire, petitioned the Drug Enforcement Administration (DEA) to initiate rulemaking proceedings under the rescheduling provisions of the Controlled Substances Act (CSA). Specifically, your predecessors petitioned the DEA to have marijuana and “related items” removed from Schedule I of the CSA and rescheduled as medical cannabis in Schedule II.

Your predecessors requested that the DEA remove marijuana and related items from Schedule I based on their assertion that:

- (1) Cannabis has accepted medical use in the United States;
- (2) Cannabis is safe for use under medical supervision;
- (3) Cannabis for medical purposes has a relatively low potential for abuse, especially in comparison with other Schedule II drugs.

In accordance with the CSA rescheduling provisions, after gathering the necessary data, the DEA requested a scientific and medical evaluation and scheduling recommendation from the Department of Health and Human Services (HHS). The HHS concluded that marijuana has a high potential for abuse, has no accepted medical use in the United States, and lacks an acceptable level of safety for use even under medical supervision. Therefore, the HHS recommended that marijuana remain in Schedule I. The scientific and medical evaluation and scheduling

recommendation that the HHS submitted to the DEA is enclosed with this letter.

Based on the HHS evaluation and all other relevant data, the DEA has concluded that there is no substantial evidence that marijuana should be removed from Schedule I. A document prepared by the DEA addressing these materials in detail also is enclosed. In short, marijuana continues to meet the criteria for Schedule I control under the CSA because:

(1) *Marijuana has a high potential for abuse.* The HHS evaluation and the additional data gathered by the DEA show that marijuana has a high potential for abuse.

(2) *Marijuana has no currently accepted medical use in treatment in the United States.* Based on the established five-part test for making such determination, marijuana has no “currently accepted medical use” because: As detailed in the HHS evaluation, the drug’s chemistry is not known and reproducible; there are no adequate safety studies; there are no adequate and well-controlled studies proving efficacy; the drug is not accepted by qualified experts; and the scientific evidence is not widely available.

(3) *Marijuana lacks accepted safety for use under medical supervision.* At present, there are no marijuana products approved by the U.S. Food and Drug Administration (FDA), nor is marijuana under a New Drug Application (NDA) evaluation at the FDA for any indication. The HHS evaluation states that marijuana does not have a currently accepted medical use in treatment in the United States or a currently accepted medical use with severe restrictions. At this time, the known risks of marijuana use have not been shown to be outweighed by specific benefits in well-controlled clinical trials that scientifically evaluate safety and efficacy.

The statutory mandate of Title 21 United States Code, Section 812(b) (21 U.S.C. 812(b)) is dispositive. Congress established only one schedule, Schedule I, for drugs of abuse with “no currently accepted medical use in treatment in the United States” and “lack of accepted safety for use . . . under medical supervision.” 21 U.S.C. 812(b).

Although the HHS evaluation and all other relevant data lead to the conclusion that marijuana must remain in schedule I, it should also be noted that, in view of United States obligations under international drug control treaties, marijuana cannot be placed in a schedule less restrictive than schedule II. This is explained in detail in accompanying document titled “Preliminary Note Regarding Treaty Considerations.” Accordingly, and as set forth in detail in the accompanying HHS and DEA documents, there is no statutory basis under the CSA for the DEA to grant your predecessors’ petition to initiate rulemaking proceedings to reschedule marijuana. The petition is, therefore, hereby denied.

Sincerely,
 Chuck Rosenberg,
Acting Administrator.

Preliminary Note Regarding Treaty Considerations

Cover Letter from HHS to DEA Summarizing the Scientific and Medical Evaluation and Scheduling Recommendation for Marijuana.

U.S. Department of Health and Human Services (HHS)—Basis for the Recommendation for Maintaining Marijuana in Schedule I of the Controlled Substances Act

U.S. Department of Justice—Drug Enforcement Administration (DEA), Schedule of Controlled Substances: Maintaining Marijuana in Schedule I of the Controlled Substances Act, Background, Data, and Analysis: Eight Factors Determinative of Control and Findings Pursuant to 21 U.S.C. 812(b)

Dated: July 19, 2016.

Chuck Rosenberg,

Acting Administrator, Preliminary Note Regarding Treaty Considerations.

As the Controlled Substances Act (CSA) recognizes, the United States is a party to the Single Convention on Narcotic Drugs, 1961 (referred to here as the Single Convention or the treaty). 21 U.S.C. 801(7). Parties to the Single Convention are obligated to maintain various control provisions related to the drugs that are covered by the treaty. Many of the provisions of the CSA were enacted by Congress for the specific purpose of ensuring U.S. compliance with the treaty. Among these is a scheduling provision, 21 U.S.C. 811(d)(1). Section 811(d)(1) provides that, where a drug is subject to control under the Single Convention, the DEA Administrator (by delegation from the Attorney General) must “issue an order controlling such drug under the schedule he deems most appropriate to carry out such [treaty] obligations, without regard to the findings required by [21 U.S.C. 811(a) or 812(b)] and without regard to the procedures prescribed by [21 U.S.C. 811(a) and (b)].”

Marijuana is a drug listed in the Single Convention. The Single Convention uses the term “cannabis” to refer to marijuana.¹ Thus, the DEA

¹ Under the Single Convention, “cannabis plant” means any plant of the genus *Cannabis*.” Article 1(c). The Single Convention defines “cannabis” to include “the flowering or fruiting tops of the cannabis plant (excluding the seeds and leaves when not accompanied by the tops) from which the resin has not been extracted, by whatever name they may be designated.” Article 1(b). This definition of “cannabis” under the Single Convention is slightly less inclusive than the CSA definition of “marihuana,” which includes all parts of the cannabis plant except for the mature stalks, sterilized seeds, oil from the seeds, and certain derivatives thereof. See 21 U.S.C. 802(16). Cannabis and cannabis resin are included in the list of drugs in Schedule I and Schedule IV of the Single Convention. In contrast to the CSA, the drugs listed in Schedule IV of the Single Convention are also

Administrator is obligated under section 811(d) to control marijuana in the schedule that he deems most appropriate to carry out the U.S. obligations under the Single Convention. It has been established in prior marijuana rescheduling proceedings that placement of marijuana in either schedule I or schedule II of the CSA is “necessary as well as sufficient to satisfy our international obligations” under the Single Convention. *NORML v. DEA*, 559 F.2d 735, 751 (D.C. Cir. 1977). As the United States Court of Appeals for the DC Circuit has stated, “several requirements imposed by the Single Convention would not be met if cannabis and cannabis resin were placed in CSA schedule III, IV, or V.”² *Id.* Therefore, in accordance with section 811(d)(1), DEA must place marijuana in either schedule I or schedule II.

Because schedules I and II are the only possible schedules in which marijuana may be placed, for purposes of evaluating this scheduling petition, it is essential to understand the differences between the criteria for placement of a substance in schedule I and those for placement in schedule II. These criteria are set forth in 21 U.S.C. 812(b)(1) and (b)(2), respectively. As indicated therein, substances in both schedule I and schedule II share the characteristic of “a high potential for abuse.” Where the distinction lies is that schedule I drugs have “no currently accepted medical use in treatment in the United States” and “a lack of accepted safety for use of the drug . . . under medical supervision,” while schedule II drugs do have “a currently accepted medical use in treatment in the United States.”³

Accordingly, in view of section 811(d)(1), this scheduling petition turns on whether marijuana has a currently accepted medical use in treatment in the United States. If it does not, DEA must, pursuant to section 811(d), deny the

listed in Schedule I of the Single Convention and are subject to the same controls as Schedule I drugs as well as additional controls. Article 2, par. 5

² The Court further stated: “For example, [article 31 paragraph 4 of the Single Convention] requires import and export permits that would not be obtained if the substances were placed in CSA schedules III through V. In addition, the quota and [recordkeeping] requirements of Articles 19 through 21 of the Single Convention would be satisfied only by placing the substances in CSA schedule I or II.” *Id.* n. 71 (internal citations omitted).

³ As DEA has stated in evaluating prior marijuana rescheduling petitions, “Congress established only one schedule, schedule I, for drugs of abuse with ‘no currently accepted medical use in treatment in the United States’ and ‘lack of accepted safety for use . . . under medical supervision.’” 21 U.S.C. 812(b).” 76 FR 40552 (2011); 66 FR 20038 (2001).

petition and keep marijuana in schedule I.

As indicated, where section 811(d)(1) applies to a drug that is the subject of a rescheduling petition, the DEA Administrator must issue an order controlling the drug under the schedule he deems most appropriate to carry out United States obligations under the Single Convention, without regard to the findings required by sections 811(a) or 812(b) and without regard to the procedures prescribed by sections 811(a) and (b). Thus, since the only determinative issue in evaluating the present scheduling petition is whether marijuana has a currently accepted medical use in treatment in the United States, DEA need not consider the findings of sections 811(a) or 812(b) that have no bearing on that determination, and DEA likewise need not follow the procedures prescribed by sections 811(a) and (b) with respect to such irrelevant findings. Specifically, DEA need not evaluate the relative abuse potential of marijuana or the relative extent to which abuse of marijuana may lead to physical or psychological dependence.

As explained below, the medical and scientific evaluation and scheduling recommendation issued by the Secretary of Health and Human Services concludes that marijuana has no currently accepted medical use in treatment in the United States, and the DEA Administrator likewise so concludes. For the reasons just indicated, no further analysis beyond this consideration is required. Nonetheless, because of the widespread public interest in understanding all the facts relating to the harms associated with marijuana, DEA is publishing here the entire medical and scientific analysis and scheduling evaluation issued by the Secretary, as well as DEA’s additional analysis.

Department of Health and Human Services,
Office of the Secretary Assistant Secretary
for Health, Office of Public Health and
Science, Washington, DC 20201.

June 25, 2015.

The Honorable Chuck Rosenberg
Acting Administrator, Drug Enforcement
Administration, U.S. Department of Justice,
8701 Morrisette Drive, Springfield, VA
22152.

Dear Mr. Rosenberg:
Pursuant to the Controlled Substances Act (CSA, 21 U.S.C. § 811(b), (c), and (f)), the Department of Health and Human Services (HHS) is recommending that marijuana continue to be maintained in Schedule I of the CSA.

The Food and Drug Administration (FDA) has considered the abuse potential and dependence-producing characteristics of marijuana.

Marijuana meets the three criteria for placing a substance in Schedule I of the CSA under 21 U.S.C. 812(b)(1). As discussed in the enclosed analyses, marijuana has a high potential for abuse, no currently accepted medical use in treatment in the United States, and a lack of accepted safety for use under medical supervision. Accordingly, HHS recommends that marijuana be maintained in Schedule I of the CSA. Enclosed are two documents prepared by FDA’s Controlled Substance Staff (in response to petitions filed in 2009 by Mr. Bryan Krumm and in 2011 by Governors Lincoln D. Chafee and Christine O. Gregoire) that form the basis for the recommendation. Pursuant to the requests in the petitions, FDA broadly evaluated marijuana, and did not focus its evaluation on particular strains of marijuana or components or derivatives of marijuana.

FDA’s Center for Drug Evaluation and Research’s current review of the available evidence and the published clinical studies on marijuana demonstrated that since our 2006 scientific and medical evaluation and scheduling recommendation responding to a previous DEA petition, research with marijuana has progressed. However, the available evidence is not sufficient to determine that marijuana has an accepted medical use. Therefore, more research is needed into marijuana’s effects, including potential medical uses for marijuana and its derivatives. Based on the current review, we identified several methodological challenges in the marijuana studies published in the literature. We recommend they be addressed in future clinical studies with marijuana to ensure that valid scientific data are generated in studies evaluating marijuana’s safety and efficacy for therapeutic use. For example, we recommend that studies need to focus on consistent administration and reproducible dosing of marijuana, potentially through the use of administration methods other than smoking. A summary of our review of the published literature on the clinical uses of marijuana, including recommendations for future studies, is attached to this document.

FDA and the National Institutes of Health’s National Institute on Drug Abuse (NIDA) also believe that work continues to be needed to ensure support by the federal government for the efficient conduct of clinical research using marijuana. Concerns have been raised about whether the existing federal regulatory system is flexible enough to respond to increased interest in research into the potential therapeutic uses of marijuana and marijuana-derived drugs. HHS welcomes an opportunity to continue to explore these concerns with DEA.

Should you have any questions regarding these recommendations, please contact Corinne P. Moody, Science Policy Analyst, Controlled Substances Staff, Center for Drug Evaluation and Research, FDA, at (301) 796–3152.

Sincerely yours,

Karen B. DeSalvo, MD, MPH, MSc

Acting Assistant Secretary for Health.

Enclosure: Basis for the Recommendation for Maintaining Marijuana in Schedule I of the Controlled Substances Act

Basis for the Recommendation for Maintaining Marijuana in Schedule I of the Controlled Substances Act

On November 30, 2011, Governors Lincoln D. Chafee of Rhode Island and Christine O. Gregoire of Washington submitted a petition to the Drug Enforcement Administration (DEA) requesting that proceeding be initiated to repeal the rules and regulations that place marijuana⁴ in Schedule I of the Controlled Substances Act (CSA). The petition contends that cannabis has an accepted medical use in the United States, is safe for use under medical supervision, and has a relatively low abuse potential compared to other Schedule II drugs. The petition requests that marijuana and “related items” be rescheduled in Schedule II of the CSA. In June 2013, the DEA Administrator requested that the U.S. Department of Health and Human Services (HHS) provide a scientific and medical evaluation of the available information and a scheduling recommendation for marijuana, in accordance with the provisions of 21 U.S.C. 811(b).

In accordance with 21 U.S.C. 811(b), DEA has gathered information related to the control of marijuana (*Cannabis sativa*)⁵ under the CSA. Pursuant to 21 U.S.C. 811(b), the Secretary of HHS is required to consider in a scientific and medical evaluation eight factors determinative of control under the CSA. Following consideration of the eight factors, if it is appropriate, the Secretary must make three findings to recommend scheduling a substance in the CSA. The findings relate to a substance’s abuse potential, legitimate medical use, and safety or dependence liability.

Administrative responsibilities for evaluating a substance for control under the CSA are performed by the Food and Drug Administration (FDA), with the concurrence of the National Institute on Drug Abuse (NIDA), as described in the Memorandum of Understanding (MOU) of March 8, 1985 (50 FR 9518–20).

In this document, FDA recommends the continued control of marijuana in

Schedule I of the CSA. Pursuant to 21 U.S.C. 811(c), the eight factors pertaining to the scheduling of marijuana are considered below.

1. Its Actual or Relative Potential for Abuse

Under the first factor the Secretary must consider marijuana’s actual or relative potential for abuse. The CSA does not define the term “abuse.” However, the CSA’s legislative history suggests the following in determining whether a particular drug or substance has a potential for abuse:⁶

a. There is evidence that individuals are taking the drug or drugs containing such a substance in amounts sufficient to create a hazard to their health or to the safety of other individuals or to the community.

b. There is a significant diversion of the drug or drugs containing such a substance from legitimate drug channels.

c. Individuals are taking the drug or drugs containing such a substance on their own initiative rather than on the basis of medical advice from a practitioner licensed by law to administer such drugs in the course of his professional practice.

d. The drug or drugs containing such a substance are new drugs so related in their action to a drug or drugs already listed as having a potential for abuse to make it likely that the drug will have the same potentiality for abuse as such drugs, thus making it reasonable to assume that there may be significant diversions from legitimate channels, significant use contrary to or without medical advice, or that it has a substantial capability of creating hazards to the health of the user or to the safety of the community.

In the development of this scientific and medical evaluation for the purpose of scheduling, the Secretary analyzed considerable data related to the substance’s abuse potential. The data include a discussion of the prevalence and frequency of use, the amount of the substance available for illicit use, the ease of obtaining or manufacturing the substance, the reputation or status of the substance “on the street,” and evidence relevant to at-risk populations. Importantly, the petitioners define marijuana as including all *Cannabis* cultivated strains. Different marijuana samples derived from various cultivated strains may have very different chemical constituents, thus the analysis is based

on what is known about the range of these constituents across all cultivated strains.

Determining the abuse potential of a substance is complex with many dimensions, and no single test or assessment provides a complete characterization. Thus, no single measure of abuse potential is ideal. Scientifically, a comprehensive evaluation of the relative abuse potential of a substance can include consideration of the following elements: Receptor binding affinity, preclinical pharmacology, reinforcing effects, discriminative stimulus effects, dependence producing potential, pharmacokinetics, route of administration, toxicity, data on actual abuse, clinical abuse potential studies, and public health risks. Importantly, abuse can exist independently from tolerance or physical dependence because individuals may abuse drugs in doses or patterns that do not induce these phenomena. Additionally evidence of clandestine population and illicit trafficking of a substance can shed light on both the demand for a substance as well as the ease of obtaining a substance. Animal and human laboratory data and epidemiological data are all used in determining a substance’s abuse potential. Moreover, epidemiological data can indicate actual abuse.

The petitioners compare the effects of marijuana to currently controlled Schedule II substances and make repeated claims about their comparative effects. Comparisons between marijuana and the diverse array of Schedule II substances is difficult, because of the pharmacologically dissimilar actions of substances of Schedule II of the CSA. For example, Schedule II substances include stimulant-like drugs (*e.g.*, cocaine, methylphenidate, and amphetamine), opioids (*e.g.*, oxycodone, fentanyl), sedatives (*e.g.*, pentobarbital, amobarbital), dissociative anesthetics (*e.g.*, PCP), and naturally occurring plant components (*e.g.*, coca leaves and poppy straw). The mechanism(s) of action of the above Schedule II substances are wholly different from one another, and they are different from tetrahydrocannabinol (THC) and marijuana as well. For example, Schedule II stimulants typically function by increasing monoaminergic tone via an increase in dopamine and norepinephrine (Schmitt et al., 2013). In contrast, opioid analgesics function via mu-opioid receptor agonist effects. These differing mechanism(s) of action result in vastly different behavioral and adverse effect profiles, making comparisons across the range of

⁴ Note that “marihuana” is the spelling originally used in the Controlled Substances Act (CSA). This document uses the spelling that is more common in current usage, “marijuana.”

⁵ The CSA defines marijuana as the following: All parts of the plant *Cannabis Sativa* L., whether growing or not; the seeds thereof; the resin extracted from any part of such plant; and every compound, manufacture, salt, derivative, mixture, or preparation of such plant, its seeds or resin. Such term does not include the mature stalks of such plant, fiber produced from such stalks, oil or cake made from the seeds of such plant, any other compound, manufacture, salt, derivative, mixture, or preparation of such mature stalks (except the resin extracted therefrom), fiber, oil, or cake, or the sterilized seed of such plant which is incapable of germination (21 U.S.C. 802(16)).

⁶ Comprehensive Drug Abuse Prevention and Control Act of 1970, H.R. Rep. No. 91–1444, 91st Cong., Sess. 1 (1970) reprinted in U.S.C.C.A.N. 4566, 4603.

pharmacologically diverse C-II substances inappropriate.

In addition, many substances scheduled under the CSA are reviewed and evaluated within the context of commercial drug development, using data submitted in the form of a new drug application (NDA). A new analgesic drug might be compared to a currently scheduled analgesic drug as part of the assessment of its relative abuse potential. However, because the petitioners have not identified a specific indication for the use of marijuana, identifying an appropriate comparator based on indication cannot be done.

a. There is evidence that individuals are taking the substance in amounts sufficient to create a hazard to their health or to the safety of other individuals or to the community.

Evidence shows that some individuals are taking marijuana in amounts sufficient to create a hazard to their health and to the safety of other individuals and the community. A large number of individuals use marijuana. HHS provides data on the extent of marijuana abuse through NIDA and the Substance Abuse and Mental Health Services Administration (SAMHSA). According to the most recent data from SAMHSA's 2012 National Survey on Drug Use and Health (NSDUH), which estimates the number of individuals who have used a substance within a month prior to the study (described as "current use"), marijuana is the most commonly used illicit drug among Americans aged 12 years and older, with an estimated 18.9 million Americans having used marijuana within the month prior to the 2012 NSDUH. Compared to 2004, when an estimated 14.6 million individuals reported using marijuana within the month prior to the study, the estimated rates in 2012 show an increase of approximately 4.3 million individuals. The 2013 Monitoring the Future (MTF) survey of 8th, 10th, and 12th grade students also indicates that marijuana is the most widely used illicit substance in this age group. Specifically, current month use was at 7.0 percent of 8th graders, 18.0 percent of 10th graders and 22.7 percent of 12th graders. Additionally, the 2011 Treatment Episode Data Set (TEDS) reported that primary marijuana abuse accounted for 18.1 percent of non-private substance-abuse treatment facility admissions, with 24.3 percent of those admitted reporting daily use. However, of these admissions for primary marijuana abuse, the criminal justice system referred 51.6 percent to treatment. SAMHSA's Drug Abuse Warning Network (DAWN) was a national

probability survey of U.S. hospitals with emergency departments (EDs) and was designed to obtain information on ED visits in which marijuana was mentioned, accounting for 36.4 percent of illicit drug related ED visits. There are some limitations related to DAWN data on ED visits, which are discussed in detail in Factor 4, "Its History and Current Pattern of Abuse;" Factor 5, "The Scope, Duration, and Significance of Abuse;" and Factor 6, "What, if any, Risk There is to the Public Health." These factors contain detailed discussions of these data.

A number of risks can occur with both acute and chronic use of marijuana. Detailed discussions of the risks are addressed in Factor 2, "Scientific Evidence of its Pharmacological Effect, if Known," and Factor 6, "What, if any, Risk There is to the Public Health."

b. There is significant diversion of the substance from legitimate drug channels.

There is a lack of evidence of significant diversion of marijuana from legitimate drug channels, but this is likely due to the fact that marijuana is more widely available from illicit sources rather than through legitimate channels. Marijuana is not an FDA-approved drug product, as an NDA or biologics license application (BLA) has not been approved for marketing in the United States. Numerous states and the District of Columbia have state-level medical marijuana laws that allow for marijuana use within that state. These state-level drug channels do not have sufficient collection of data related to medical treatment, including efficacy and safety.

Marijuana is used by researchers for nonclinical research as well as clinical research under investigational new drug (IND) applications; this represents the only legitimate drug channel in the United States. However, marijuana used for research represents a very small contribution of the total amount of marijuana available in the United States, and thus provides limited information about diversion. In addition, the lack of significant diversion of investigation supplies is likely because of the widespread availability of illicit marijuana of equal or greater amounts of delta⁹-THC. The data originating from the DEA on seizure statistics demonstrate the magnitude of the availability for illicit marijuana. DEA's System to Retrieve Information from Drug Evidence (STRIDE) provides information on total domestic drug seizures. STRIDE reports a total domestic seizure of 573,195 kg of marijuana in 2011, the most recent year with complete data that is currently

publically available (DEA Domestic Drug Seizures, n.d.).

c. Individuals are taking the substance on their own initiative rather than on the basis of medical advice from a practitioner licensed by law to administer such substances.

Because the FDA has not approved an NDA or BLA for a marijuana drug product for any therapeutic indication, the only way an individual can take marijuana on the basis of medical advice through legitimate channels at the federal level is by participating in research under an IND application. That said, numerous states and the District of Columbia have passed state-level medical marijuana laws allowing for individuals to use marijuana under certain circumstances. However, data are not yet available to determine the number of individuals using marijuana under these state-level medical marijuana laws. Regardless, according to the 2012 NSDUH data, 18.9 million American adults currently use marijuana (SAMHSA, 2013). Based on the large number of individuals reporting current use of marijuana and the lack of an FDA-approved drug product in the United States, one can assume that it is likely that the majority of individuals using marijuana do so on their own initiative rather than on the basis of medical advice from a licensed practitioner.

d. The substance is so related in its action to a substance already listed as having a potential for abuse to make it likely that it will have the same potential for abuse as such substance, thus making it reasonable to assume that there may be significant diversions from legitimate channels, significant use contrary to or without medical advice, or that it has a substantial capability of creating hazards to the health of the user or to the safety of the community.

FDA has approved two drug products containing cannabinoid compounds that are structurally related to the active components in marijuana. These two marketed products are controlled under the CSA. Once a specific drug product containing cannabinoids becomes approved, that specific drug product may be moved from Schedule I to a different Schedule (II-V) under the CSA. Firstly, Marinol—generically known as dronabinol—is a Schedule III drug product containing synthetic delta⁹-THC. Marinol, which is formulated in sesame oil in soft gelatin capsules, was first placed in Schedule II under the CSA following its approval by the FDA. Marinol was later rescheduled to Schedule III under the CSA because of low numbers of reports of abuse relative to marijuana. Dronabinol is

listed in Schedule I under the CSA. FDA approved Marinol in 1985 for the treatment of nausea and vomiting associated with cancer chemotherapy in patients who failed to respond adequately to conventional anti-emetic treatments. In 1992, FDA approved Marional for anorexia associated with weight loss in patients with acquired immunodeficiency syndrome (AIDS). Secondly, in 1985, FDA approved Cesamet, a drug product containing the Schedule II substance nabilone, for the treatment of nausea and vomiting associated with cancer chemotherapy. Besides the two cannabinoid-containing drug products FDA approved for marketing, other naturally occurring cannabinoids and their derivatives (from *Cannabis*) and their synthetic equivalents with similar chemical structure and pharmacological activity are included in the CSA as Schedule I substances.

2. Scientific Evidence of Its Pharmacological Effects, if Known

Under the second factor, the Secretary must consider the scientific evidence of marijuana's pharmacological effects. Abundant scientific data are available on the neurochemistry, toxicology, and pharmacology of marijuana. This section includes a scientific evaluation of marijuana's neurochemistry; pharmacology; and human and animal behavioral, central nervous system, cognitive, cardiovascular, autonomic, endocrinological, and immunological system effects. The overview presented below relies upon the most current research literature on cannabinoids.

Neurochemistry and Pharmacology of Marijuana

Marijuana is a plant that contains numerous natural constituents, such as cannabinoids, that have a variety of pharmacological actions. The petition defines marijuana as including all *Cannabis* cultivated strains. Different marijuana samples derived from various cultivated strains may have very different chemical constituents including delta⁹-THC and other cannabinoids (Appendino et al., 2011). As a consequence, marijuana products from different strains will have different biological and pharmacological profiles.

According to ElSohly and Slade (2005) and Appendino et al. (2011), marijuana contains approximately 525 identified natural constituents, including approximately 100 compounds classified as cannabinoids. Cannabinoids primarily exist in *Cannabis*, and published data suggests that most major cannabinoid compounds occurring naturally have

been identified chemically. New and minor cannabinoids and other new compounds are continuously being characterized (Pollastro et al., 2011). So far, only two cannabinoids (cannabigerol and its corresponding acid) have been obtained from a non-*Cannabis* source. A South African *Helichrysum* (*H. umbraculigerum*) accumulates these compounds (Appendino et al., 2011). The chemistry of marijuana is described in more detail in Factor 3, "The State of Current Scientific Knowledge Regarding the Drug or Other Substance."

The site of cannabinoid action is at the cannabinoid receptors. Cloning of cannabinoid receptors, first from rat brain tissue (Matsuda et al., 1990) and then from human brain tissue (Gerard et al., 1991), has verified the site of action. Two cannabinoid receptors, CB₁ and CB₂, were characterized (Battista et al., 2012; Piomelli, 2005). Evidence of a third cannabinoid receptor exists, but it has not been identified (Battista et al., 2012).

The cannabinoid receptors, CB₁ and CB₂, belong to the family of G-protein-coupled receptors, and present a typical seven transmembrane-spanning domain structure. Cannabinoid receptors link to an inhibitory G-protein (G_i), such that adenylate cyclase activity is inhibited when a ligand binds to the receptor. This, in turn, prevents the conversion of ATP to the second messenger, cyclic AMP (cAMP). Examples of inhibitory coupled receptors include opioid, muscarinic cholinergic, alpha₂-adrenoreceptors, dopamine (D₂), and serotonin (5-HT₁).

Cannabinoid receptor activation inhibits N- and P/Q-type calcium channels and activates inwardly rectifying potassium channels (Mackie et al., 1995; Twitchell et al., 1997). N-type calcium channel inhibition decreases neurotransmitter release from several tissues. Thus, calcium channel inhibition may be the mechanism by which cannabinoids inhibit acetylcholine, norepinephrine, and glutamate release from specific areas of the brain. These effects may represent a potential cellular mechanism underlying cannabinoids' antinociceptive and psychoactive effects (Ameri, 1999).

CB₁ receptors are found primarily in the central nervous system, but are also present in peripheral tissues. CB₁ receptors are located mainly in the basal ganglia, hippocampus, and cerebellum of the brain (Howlett et al., 2004). The localization of these receptors may explain cannabinoid interference with movement coordination and effects on memory and cognition. Additionally,

CB₁ receptors are found in the immune system and numerous other peripheral tissues (Petrocellis and Di Marzo, 2009). However, the concentration of CB₁ receptors is considerably lower in peripheral tissues than in the central nervous system (Herkenharn et al., 1990 and 1992).

CB₂ receptors are found primarily in the immune system, but are also present in the central nervous system and other peripheral tissues. In the immune system, CB₂ receptors are found predominantly in B lymphocytes and natural killer cells (Bouaboula et al., 1993). CB₂ receptors may mediate cannabinoids' immunological effects (Galiegue et al., 1995). Additionally, CB₂ receptors have been localized in the brain, primarily in the cerebellum and hippocampus (Gong et al., 2006). The distribution of CB₂ receptors throughout the body is less extensive than the distribution of CB₁ receptors (Petrocellis and Di Marzo, 2009). However, both CB₁ and CB₂ receptors are present in numerous tissues of the body.

Cannabinoid receptors have endogenous ligands. In 1992 and 1995, two endogenous cannabinoid receptor agonists, anandamide and arachidonyl glycerol (2-AG), respectively, were identified (Di Marzo, 2006). Anandamide is a low efficacy agonist (Breivogel and Childers, 2000) and 2-AG is a high efficacy agonist (Gonsiorek et al., 2000). Cannabinoid endogenous ligands are present in central as well as peripheral tissues. A combination of uptake and hydrolysis terminate the action of the endogenous ligands. The endogenous cannabinoid system is a locally active signaling system that, to help restore homeostasis, is activated "on demand" in response to changes to the local homeostasis (Petrocellis and Di Marzo, 2009). The endogenous cannabinoid system, including the endogenous cannabinoids and the cannabinoid receptors, demonstrate substantial plasticity in response to several physiological and pathological stimuli (Petrocellis and Di Marzo, 2009). This plasticity is particularly evident in the central nervous system.

Delta⁹-THC and cannabidiol (CBD) are two abundant cannabinoids present in marijuana. Marijuana's major psychoactive cannabinoid is delta⁹-THC (Wachtel et al., 2002). In 1964, Gaoni and Mechoularn first described delta⁹-THC's structure and function. In 1963, Mechoularn and Shvo first described CBD's structure. The pharmacological actions of CBD have not been fully studied in humans.

Delta⁹-THC and CBD have varying affinity and effects at the cannabinoid receptors. Delta⁹-THC displays similar

affinity for CB₁ and CB₂ receptors, but behaves as a weak agonist for CB₂ receptors. The identification of synthetic cannabinoid ligands that selectively bind to CB₂ receptors but do not have the typical delta⁹-THC-like psychoactive properties suggests that the activation of CB₁-receptors mediates cannabinoids' psychotropic effects (Hanus et al., 1999). CBD has low affinity for both CB₁ and CB₂ receptors (Mechoulam et al., 2007). According to Mechoulam et al. (2007), CBD has antagonistic effects at CB₁ receptors and some inverse agonist properties at CB₂ receptors. When cannabinoids are given subacutely to rats, CB₁ receptors down-regulate and the binding of the second messenger system coupled to CB₁ receptors, GTPγS, decreases (Breivogel et al., 2001).

Animal Behavioral Effects

Self-Administration

Self-administration is a method that assesses the ability of a drug to produce rewarding effects. The presence of rewarding effects increases the likelihood of behavioral responses to obtain additional drug. Animal self-administration of a drug is often useful in predicting rewarding effects in humans, and is indicative of abuse liability. A good correlation is often observed between those drugs that rhesus monkeys self-administer and those drugs that humans abuse (Balster and Bigelow, 2003). Initially, researchers could not establish self-administration of cannabinoids, including delta⁹-THC, in animal models. However, self-administration of delta⁹-THC can now be established in a variety of animal models under specific training paradigms (Justinova et al., 2003, 2004, 2005).

Squirrel monkeys, with and without prior exposure to other drugs of abuse, self-administer delta⁹-THC under specific conditions. For instance, Tanda et al. (2000) observed that when squirrel monkeys are initially trained to self-administer intravenous cocaine, they will continue to bar-press delta⁹-THC at the same rate as they would with cocaine. The doses were notably comparable to those doses used by humans who smoke marijuana. SR141716, a CB₁ cannabinoid receptor agonist-antagonist, can block this rewarding effect. Other studies show that naïve squirrel monkeys can be successfully trained to self-administer delta⁹-THC intravenously (Justinova et al., 2003). The maximal responding rate is 4 µg/kg per injection, which is 2–3 times greater than observed in previous studies using cocaine-experienced

monkeys. Naltrexone, a mu-opioid antagonist, partially antagonizes these rewarding effects of delta⁹-THC (Justinova et al., 2004).

Additionally, data demonstrate that under specific conditions, rodents self-administer cannabinoids. Rats will self-administer delta⁹-THC when applied intracerebroventricularly (i.c.v.), but only at the lowest doses tested (0.01–0.02 µg/infusion) (Braidia et al., 2004). SR141716 and the opioid antagonist naloxone can antagonize this effect. However, most studies involve rodents self-administering the synthetic cannabinoid WIN 55212, a CB₁ receptor agonist with a non-cannabinoid structure (Deiana et al., 2007; Fattore et al., 2007; Martellotta et al., 1998; Mendizabal et al., 2006).

Aversive effects, rather than reinforcing effects, occur in rats that received high doses of WIN 55212 (Chaperon et al., 1998) or delta⁹-THC (Sanudo-Pena et al., 1997), indicating a possible critical dose-dependent effect. In both studies, SR141716 reversed these aversive effects.

Conditioned Place Preference

Conditioned place preference (CPP) is a less rigorous method than self-administration for determining whether or not a drug has rewarding properties. In this behavioral test, animals spend time in two distinct environments: one where they previously received a drug and one where they received a placebo. If the drug is reinforcing, animals will choose to spend more time in the environment paired with the drug, rather than with the placebo, when presented with both options simultaneously.

Animals show CPP to delta⁹-THC, but only at the lowest doses tested (0.075–1.0 mg/kg, intraperitoneal (i.p.)) (Braidia et al., 2004). SR141716 and naloxone antagonize this effect (Braidia et al., 2004). As a partial agonist, SR141716 can induce CPP at doses of 0.25, 0.5, 2 and 3 mg/kg (Cheer et al., 2000). In knockout mice, those without µ-opioid receptors do not develop CPP to delta⁹-THC (Ghozland et al., 2002).

Drug Discrimination Studies

Drug discrimination is a method where animals indicate whether a test drug produces physical or psychic perceptions similar to those produced by a known drug of abuse. In this test, an animal learns to press one bar when it receives the known drug of abuse and another bar when it receives placebo. To determine whether the test drug is like the known drug of abuse, a challenge session with the test drug demonstrates

which of the two bars the animal presses more often.

In addition to humans (Lile et al., 2009; Lile et al., 2011), it has been noted that animals, including monkeys (McMahon, 2009), mice (McMahon et al., 2008), and rats (Gold et al., 1992), are able to discriminate cannabinoids from other drugs or placebo. Moreover, the major active metabolite of delta⁹-THC, 11-hydroxy-delta⁹-THC, also generalizes (following oral administration) to the stimulus cues elicited by delta⁹-THC (Browne and Weissman, 1981). Twenty-two other cannabinoids found in marijuana also fully substitute for delta⁹-THC. However, CBD does not substitute for delta⁹-THC in rats (Vann et al., 2008).

Discriminative stimulus effects of delta⁹-THC are pharmacologically specific for marijuana containing cannabinoids (Balster and Prescott, 1992; Browne and Weissman, 1981; Wiley et al., 1993, 1995). The discriminative stimulus effects of the cannabinoid group appear to provide unique effects because stimulants, hallucinogens, opioids, benzodiazepines, barbiturates, NMDA antagonists, and antipsychotics do not fully substitute for delta⁹-THC.

Central Nervous System Effects

Human Physiological and Psychological Effects

Psychoactive Effects

Below is a list of the common subjective responses to cannabinoids (Adams and Martin, 1996; Gonzalez, 2007; Hollister 1986, 1988; Institute of Medicine, 1982). According to Maldonado (2002), these responses to marijuana are pleasurable to many humans and are often associated with drug-seeking and drug-taking. High levels of positive psychoactive effects are associated with increased marijuana use, abuse, and dependence (Scherrer et al., 2009; Zeiger et al., 2010).

- (1) Disinhibition, relaxation, increased sociability, and talkativeness.
- (2) Increased merriment and appetite, and even exhilaration at high doses.
- (3) Enhanced sensory perception, which can generate an increased appreciation of music, art, and touch.
- (4) Heightened imagination, which can lead to a subjective sense of increased creativity.
- (5) Initial dizziness, nausea, tachycardia, facial flushing, dry mouth, and tremor.
- (6) Disorganized thinking, inability to converse logically, time distortions, and short-term memory impairment.
- (7) Ataxia and impaired judgment, which can impede driving ability or

lead to an increase in risk-tasking behavior.

(8) Illusions, delusions, and hallucinations that intensify with higher doses.

(9) Emotional lability, incongruity of affect, dysphoria, agitation, paranoia, confusion, drowsiness, and panic attacks, which are more common in inexperienced or high-dosed users.

As with many psychoactive drugs, a person's medical, psychiatric, and drug-taking history can influence the individual's response to marijuana. Dose preferences to marijuana occur in that marijuana users prefer higher concentrations of the principal psychoactive substance (1.95 percent delta⁹-THC) over lower concentrations (0.63 percent delta⁹-THC) (Chait and Burke, 1994). Nonetheless, frequent marijuana users (>100 times of use) were able to identify a drug effect from low-dose delta⁹-THC better than occasional users (<10 times of use) while also experiencing fewer sedative effects from marijuana (Kirk and de Wit, 1999).

The petitioners contend that many of marijuana's naturally occurring cannabinoids mitigate the psychoactive effects of delta⁹-THC, and therefore that marijuana lacks sufficient abuse potential to warrant Schedule I placement, because Marinol, which is in Schedule III, contains only delta⁹-THC. This theory has not been demonstrated in controlled studies. Moreover, the concept of abuse potential encompasses all properties of a substance, including its chemistry, pharmacology, and pharmacokinetics, as well as usage patterns and diversion history. The abuse potential of a substance is associated with the repeated or sporadic use of a substance in nonmedical situations for the psychoactive effects the substance produces. These psychoactive effects include euphoria, perceptual and other cognitive distortions, hallucinations, and mood changes. However, as stated above, the abuse potential not only includes the psychoactive effects, but also includes other aspects related to a substance.

DEA's final published rule entitled "Rescheduling of the Food and Drug Administration Approved Product Containing Synthetic Dronabinol [(–)-delta⁹-(trans)-Tetrahydrocannabinol] in Sesame Oil and Encapsulated in Soft Gelatin Capsules From Schedule II to Schedule III" (64 FR 35928, July 2, 1999) rescheduled Marinol from Schedule II to Schedule III. The HHS assessment of the abuse potential and subsequent scheduling recommendation compared Marinol to marijuana on different aspects related to abuse

potential. Major differences in formulation, availability, and usage between marijuana and the drug product, Marinol, contribute to their differing abuse potentials.

Hollister and Gillespie (1973) estimated that delta⁹-THC by smoking is 2.6 to 3 times more potent than delta⁹-THC ingested orally. The intense psychoactive drug effect achieved, rapidly by smoking is generally considered to produce the effect desired by the abuser. This effect explains why abusers often prefer to administer certain drugs by inhalation, intravenously, or intranasally rather than orally. Such is the case with cocaine, opium, heroin, phencyclidine, methamphetamine, and delta⁹-THC from marijuana (0.1–9.5 percent delta⁹-THC range) or hashish (10–30 percent delta⁹-THC range) (Wesson and Washburn, 1990). Thus, the delayed onset and longer duration of action for Marinol may be contributing factors limiting the abuse or appeal of Marinol as a drug of abuse relative to marijuana.

The formulation of Marinol is a factor that contributes to differential scheduling of Marinol and marijuana. For example, extraction and purification of dronabinol from the encapsulated sesame oil mixture of Marinol is highly complex and difficult. Additionally, the presence of sesame oil mixture in the formulation may preclude the smoking of Marinol-laced cigarettes.

Additionally, there is a dramatic difference between actual abuse and illicit trafficking of Marinol and marijuana. Despite Marinol's availability in the United States, there have been no significant reports of abuse, diversion, or public health problems due to Marinol. By comparison, 18.9 million American adults report currently using marijuana (SAMHSA, 2013).

In addition, FDA's approval of an NDA for Marinol allowed for Marinol to be rescheduled to Schedule II, and subsequently to Schedule III of the CSA. In conclusion, marijuana and Marinol differ on a wide variety of factors that contribute to each substance's abuse potential. These differences are major reasons distinguishing the higher abuse potential for marijuana and the different scheduling determinations of marijuana and Marinol.

In terms of the petitioners' claim that different cannabinoids present in marijuana mitigate the psychoactive effects of delta⁹-THC, only three of the cannabinoids present in marijuana were simultaneously administered with delta⁹-THC to examine how the combinations of these cannabinoids such as CBD, cannabichromene (CBC)

and cannabinol (CBN) influence delta⁹-THC's psychoactive effects. Dalton et al. (1976) observed that smoked administration of placebo marijuana cigarettes containing injections of 0.15 mg/kg CBD combined with 0.025mg/kg of delta⁹-THC, in a 7:1 ratio of CBD to delta⁹-THC, significantly decreased ratings of acute subjective effects and "high" when compared to smoking delta⁹-THC alone. In contrast, Ilan et al. (2005) calculated the naturally occurring concentrations of CBC and CBD in a batch of marijuana cigarettes with either 1.8 percent or 3.6 percent delta⁹-THC concentration by weight. For each strength of delta⁹-THC in marijuana cigarettes, the concentrations of CBC and CBD were classified in groups of either low or high. The study varied the amount of CBC and CBD within each strength of delta⁹-THC marijuana cigarettes, with administrations consisting of either low CBC (between 0.1–0.2 percent CBC concentration by weight) and low CBD (between 0.1–0.4 percent CBD concentration by weight), high CBC (>0.5 percent CBC concentration by weight) and low CBD, or low CBC and high CBD (>1.0 percent CBD concentration by weight). Overall, all combinations scored significantly greater than placebo on ratings of subjective effects, and there was no significant difference between any combinations.

The oral administration of a combination of either 15, 30, or 60 mg CBD with 30 mg delta⁹-THC dissolved in liquid (in a ratio of at least 1:2 CBD to delta⁹-THC) reduced the subjective effects produced by delta⁹-THC alone (Karniol et al., 1974). Additionally, orally administering a liquid mixture combining 1 mg/kg CBD with 0.5 mg/kg of delta⁹-THC (ratio of 2:1 CBD to delta⁹-THC) decreased scores of anxiety and marijuana drug effect on the Addiction Research Center Inventory (ARCI) compared to delta⁹-THC alone (Zuardi et al., 1982). Lastly, oral administration of either 12.5, 25, or 50 mg CBN combined with 25 mg delta⁹-THC dissolved in liquid (ratio of at least 1:2 CBN to delta⁹-THC) significantly increased subjective ratings of "drugged," "drowsy," "dizzy," and "drunk," compared to delta⁹-THC alone (Karniol et al., 1975).

Even though some studies suggest that CBD may decrease some of delta⁹-THC's psychoactive effects, the ratios of CBD to delta⁹-THC administered in these studies are not present in marijuana used by most people. For example, in one study, researchers used smoked marijuana with ratios of CBD to delta⁹-THC naturally present in marijuana

plant material and they found out that varying the amount of CBD actually had no effect on delta⁹-THC's psychoactive effects (Ilan et al., 2005). Because most marijuana currently available on the street has high amounts of delta⁹-THC with low amounts of CBD and other cannabinoids, most individuals use marijuana with low levels of CBD present (Mehmedic et al., 2010). Thus, any possible mitigation of delta⁹-THC's psychoactive effects by CBD will not occur for most marijuana users. In contrast, one study indicated that another cannabinoid present in marijuana, CBN, may enhance delta⁹-THC's psychoactive effects (Karniol et al., 1975).

Behavioral Impairment

Marijuana induces various psychoactive effects that can lead to behavioral impairment. Marijuana's acute effects can significantly interfere with a person's ability to learn in the classroom or to operate motor vehicles. Acute administration of smoked marijuana impairs performance on learning, associative processes, and psychomotor behavioral tests (Block et al., 1992). Ramaekers et al. (2006a) showed that acute administration of 250 µg/kg and 500 µg/kg of delta⁹-THC in smoked marijuana dose-dependently impairs cognition and motor control, including motor impulsivity and tracking impairments (Ramaekers et al., 2006b). Similarly, administration of 290 µg/kg delta⁹-THC in a smoked marijuana cigarette resulted in impaired perceptual motor speed and accuracy: Two skills which are critical to driving ability (Kurzthaler et al., 1999). Lastly, administration of 3.95 percent delta⁹-THC in a smoked marijuana cigarette not only increased disequilibrium measures, but also increased the latency in a task of simulated vehicle braking at a rate comparable to an increase in stopping distance of five feet at 60 mph (Liguori et al., 1998). However, acute administration of marijuana containing 2.1 percent delta⁹-THC does not produce "hangover effects" (Chait, 1990).

In addition to measuring the acute effects immediately following marijuana administration, researchers have conducted studies to determine how long behavioral impairments last after abstinence. Some of marijuana's acute effects may not fully resolve until at least one day after the acute psychoactive effects have subsided. Heishman et al. (1990) showed that impairment on memory tasks persists for 24 hours after smoking marijuana cigarettes containing 2.57 percent delta⁹-THC. However, Fant et al. (1998)

showed that the morning after exposure to 1.8 percent or 3.6 percent smoked delta⁹-THC, subjects had minimal residual alterations in subjective or performance measures.

A number of factors may influence marijuana's behavioral effects including the duration of use (chronic or short term), frequency of use (daily, weekly, or occasionally), and amount of use (heavy or moderate). Researchers also have examined how long behavioral impairments last following chronic marijuana use. These studies used self-reported histories of past duration, frequency, and amount of past marijuana use, and administered a variety of performance and cognitive measures at different time points following marijuana abstinence. In chronic marijuana users, behavioral impairments may persist for up to 28 days of abstinence. Solowij et al. (2002) demonstrated that after 17 hours of abstinence, 51 adult heavy chronic marijuana users performed worse on memory and attention tasks than 33 non-using controls or 51 heavy, short-term users. Another study noted that heavy, frequent marijuana users, abstinent for at least 24 hours, performed significantly worse than the controls on verbal memory and psychomotor speed tests (Messinis et al., 2006). Additionally, after at least 1 week of abstinence, young adult frequent marijuana users, aged 18–28, showed deficits in psychomotor speed, sustained attention, and cognitive inhibition (Lisdahl and Price, 2012). Adult heavy, chronic marijuana users showed deficits on memory tests after 7 days of supervised abstinence (Pope et al., 2002). However, when these same individuals were again tested after 28 days of abstinence, they did not show significant memory deficits. The authors concluded, "cannabis-associated cognitive deficits are reversible and related to recent cannabis exposure, rather than irreversible and related to cumulative lifetime use."⁷ However, other researchers reported neuropsychological deficits in memory, executive functioning, psychomotor speed and manual dexterity in heavy marijuana users abstinent for 28 days (Bolla et al., 2002). Furthermore, a follow-up study of heavy marijuana users noted decision-making deficits after 25 days of supervised abstinence. (Bolla et al., 2005). However, moderate marijuana users did not show decision-making deficits after 25 days of abstinence, suggesting the amount of

marijuana use may impact the duration of residual impairment.

The effects of chronic marijuana use do not seem to persist after more than 1 to 3 months of abstinence. After 3 months of abstinence, any deficits observed in IQ, immediate memory, delayed memory, and information-processing speeds following heavy marijuana use compared to pre-drug use scores were no longer apparent (Fried et al., 2005). Marijuana did not appear to have lasting effects on performance of a comprehensive neuropsychological battery when 54 monozygotic male twins (one of whom used marijuana, one of whom did not) were compared 1–20 years after cessation of marijuana use (Lyons et al., 2004). Similarly, following abstinence for a year or more, both light and heavy adult marijuana users did not show deficits on scores of verbal memory compared to non-using controls (Tait et al., 2011). According to a recent meta-analysis looking at non-acute and long-lasting effects of marijuana use on neurocognitive performance, any deficits seen within the first month following abstinence are generally not present after about 1 month of abstinence (Schreiner and Dunn, 2012).

Another aspect that may be a critical factor in the intensity and persistence of impairment resulting from chronic marijuana use is the age of first use. Individuals with a diagnosis of marijuana misuse or dependence who were seeking treatment for substance use, who initiated marijuana use before the age of 15 years, showed deficits in performance on tasks assessing sustained attention, impulse control, and general executive functioning compared to non-using controls. These deficits were not seen in individuals who initiated marijuana use after the age of 15 years (Fontes et al., 2011). Similarly, heavy, chronic marijuana users who began using marijuana before the age of 16 years had greater decrements in executive functioning tasks than heavy, chronic marijuana users who started using after the age of 16 years and non-using controls (Gruber et al., 2012). Additionally, in a prospective longitudinal birth cohort study of 1,037 individuals, marijuana dependence or chronic marijuana use was associated with a decrease in IQ and general neuropsychological performance compared to pre-marijuana exposure levels in adolescent onset users (Meier et al., 2012). The decline in adolescent-onset user's IQ persisted even after reduction or abstinence of marijuana use for at least 1 year. In contrast, the adult-onset chronic marijuana users showed no significant changes in IQ compared to pre-exposure

⁷ In this quotation the term *Cannabis* is used interchangeably for *marijuana*.

levels whether they were current users or abstinent for at least 1 year (Meier et al., 2012).

In addition to the age of onset of use, some evidence suggests that the amount of marijuana used may relate to the intensity of impairments. In the above study by Gruber et al. (2012), where early-onset users had greater deficits than late-onset users, the early-onset users reported using marijuana twice as often and using three times as much marijuana per week than the late-onset users. Meier et al. (2012) showed that the deficits in IQ seen in adolescent-onset users increased with the amount of marijuana used. Moreover, when comparing scores for measures of IQ, immediate memory, delayed memory, and information-processing speeds to pre-drug-use levels, the current, heavy, chronic marijuana users showed deficits in all three measures while current, occasional marijuana users did not (Fried et al., 2005).

Behavioral Effects of Prenatal Exposure

Studies with children at different stages of development are used to examine the impact of prenatal marijuana exposure on performance in a series of cognitive tasks. However, many pregnant women who reported marijuana use were more likely to also report use of alcohol, tobacco, and cocaine (Goldschmidt et al., 2008). Thus, with potential exposure to multiple drugs, it is difficult to determine the specific impact of prenatal marijuana exposure.

Most studies assessing the behavioral effects of prenatal marijuana exposure included women who, in addition to using marijuana, also reported using alcohol and tobacco. However, some evidence suggests an association between heavy prenatal marijuana exposure and deficits in some cognitive domains. In both 4-year-old and 6-year-old children, heavy prenatal marijuana use is negatively associated with performance on tasks assessing memory, verbal reasoning, and quantitative reasoning (Fried and Watkinson, 1987; Goldschmidt et al., 2008). Additionally, heavy prenatal marijuana use is associated with deficits in measures of sustained attention in children at the ages of 6 years and 13–16 years (Fried et al., 1992; Fried, 2002). In 9- to 12-year-old children, prenatal marijuana exposure is negatively associated with executive functioning tasks that require impulse control, visual analysis, and hypothesis (Fried et al., 1998).

Association of Marijuana Use With Psychosis

This analysis evaluates only the evidence for a direct link between prior marijuana use and the subsequent development of psychosis. Thus, this discussion does not consider issues such as whether marijuana's transient effects are similar to psychotic symptoms in healthy individuals or exacerbate psychotic symptoms in individuals already diagnosed with schizophrenia.

Extensive research has been conducted to investigate whether exposure to marijuana is associated with the development of schizophrenia or other psychoses. Although many studies are small and inferential, other studies in the literature use hundreds to thousands of subjects. At present, the available data do not suggest a causative link between marijuana use and the development of psychosis (Minozzi et al., 2010). Numerous large, longitudinal studies show that subjects who used marijuana do not have a greater incidence of psychotic diagnoses compared to those who do not use marijuana (Fergusson et al., 2005; Kuepper et al., 2011; Van Os et al., 2002).

When analyzing the available evidence of the connection between psychosis and marijuana, it is critical to determine whether the subjects in the studies are patients who are already diagnosed with psychosis or individuals who demonstrate a limited number of symptoms associated with psychosis without qualifying for a diagnosis of the disorder. For example, instead of using a diagnosis of psychosis, some researchers relied on non-standard methods of representing symptoms of psychosis including "schizophrenic cluster" (Maremmani et al., 2004), "subclinical psychotic symptoms" (Van Gastel et al., 2012), "pre-psychotic clinical high risk" (Van der Meer et al., 2012), and symptoms related to "psychosis vulnerability" (Griffith-Lendering et al., 2012). These groupings do not conform to the criteria in the Diagnostic and Statistical Manual (DSM-5) or the International Classification of Diseases (ICD-10) for a diagnosis of psychosis. Thus, these groupings are not appropriate for use in evaluating marijuana's impact on the development of actual psychosis. Accordingly, this analysis includes only those studies that use subjects diagnosed with a psychotic disorder.

In the largest study evaluating the link between psychosis and drug use, 274 of the approximately 45,500 Swedish conscripts in the study population

(<0.01 percent) received a diagnosis of schizophrenia within the 14-year period following military induction from 1969 to 1983 (Andreasson et al., 1987). Of the conscripts diagnosed with psychosis, 7.7 percent (21 of the 274 conscripts with psychosis) had used marijuana more than 50 times at induction, while 72 percent (197 of the 274 conscripts with psychosis) had never used marijuana. Although high marijuana use increased the relative risk for schizophrenia to 6.0, the authors note that substantial marijuana use history "accounts for only a minority of all cases" of psychosis (Andreasson et al., 1987). Instead, the best predictor for whether a conscript would develop psychosis was a non-psychotic psychiatric diagnosis upon induction. The authors concluded that marijuana use increased the risk for psychosis only among individuals predisposed to develop the disorder. In addition, a 35-year follow up to this study reported very similar results (Manrique-Garcia et al., 2012). In this follow up study, 354 conscripts developed schizophrenia; of these 354 conscripts, 32 used marijuana more than 50 times at induction (9 percent, an odds ratio of 6.3), while 255 had never used marijuana (72 percent).

Additionally, the conclusion that the impact of marijuana may manifest only in individuals likely to develop psychotic disorders has been shown in many other types of studies. For example, although evidence shows that marijuana use may precede the presentation of symptoms in individuals later diagnosed with psychosis (Schimmelmann et al., 2011), most reports conclude that prodromal symptoms of schizophrenia appear prior to marijuana use (Schiffman et al., 2005). Similarly, a review of the gene-environment interaction model for marijuana and psychosis concluded that some evidence supports marijuana use as a factor that may influence the development of psychosis, but only in those individuals with psychotic liability (Pelayo-Teran et al., 2012).

A similar conclusion was drawn when the prevalence of schizophrenia was modeled against marijuana use across eight birth cohorts in Australia in individuals born between the years 1940 to 1979 (Degenhardt et al., 2003). Although marijuana use increased over time in adults born during the four-decade period, there was not a corresponding increase in diagnoses for psychosis in these individuals. The authors conclude that marijuana may precipitate schizophrenic disorders only in those individuals who are vulnerable to developing psychosis. Thus, marijuana *per se* does not appear to

induce schizophrenia in the majority of individuals who have tried or continue to use marijuana. However, in individuals with a genetic vulnerability for psychosis, marijuana use may influence the development of psychosis.

Cardiovascular and Autonomic Effects

Single smoked or oral doses of delta⁹-THC produce tachycardia and may increase blood pressure (Capriotti et al., 1988; Benowitz and Jones, 1975). Some evidence associates the tachycardia produced by delta⁹-THC with excitation of the sympathetic and depression of the parasympathetic nervous systems (Malinowska et al., 2012). During chronic marijuana ingestion, a tolerance to tachycardia develops (Malinowska et al., 2012).

However, prolonged delta⁹-THC ingestion produces bradycardia and hypotension (Benowitz and Jones, 1975). Plant-derived cannabinoids and endocannabinoids elicit hypotension and bradycardia via activation of peripherally-located CB1 receptors (Wagner et al., 1998). Specifically, the mechanism of this effect is through presynaptic CB1 receptor-mediated inhibition of norepinephrine release from peripheral sympathetic nerve terminals, with possible additional direct vasodilation via activation of vascular cannabinoid receptors (Pacher et al., 2006). In humans, tolerance can develop to orthostatic hypotension (Jones, 2002; Sidney, 2002) possibly related to plasma volume expansion, but tolerance does not develop to the supine hypotensive effects (Benowitz and Jones, 1975). Additionally, electrocardiographic changes are minimal, even after large cumulative doses of delta⁹-THC are administered. (Benowitz and Jones, 1975).

Marijuana smoking by individuals, particularly those with some degree of coronary artery or cerebrovascular disease, poses risks such as increased cardiac work, catecholamines and carboxyhemoglobin, myocardial infarction, and postural hypotension (Benowitz and Jones, 1981; Hollister, 1988; Mittleman et al., 2001; Malinowska et al., 2012).

Respiratory Effects

After acute exposure to marijuana, transient bronchodilation is the most typical respiratory effect (Gong et al., 1984). A recent 20-year longitudinal study with over 5,000 individuals collected information on the amount of marijuana use and pulmonary function data at years 0, 2, 5, 10, and 20 (Pletcher et al., 2012). Among the more than 5,000 individuals who participated in the study, almost 800 of them reported

current marijuana use but not tobacco use at the time of assessment. Pletcher et al. (2012) found that the occasional use of marijuana is not associated with decreased pulmonary function. However, some preliminary evidence suggests that heavy marijuana use may be associated with negative pulmonary effects (Pletcher et al., 2012). Long-term use of marijuana can lead to chronic cough and increased sputum, as well as an increased frequency of chronic bronchitis and pharyngitis. In addition, pulmonary function tests reveal that large-airway obstruction can occur with chronic marijuana smoking, as can cellular inflammatory histopathological abnormalities in bronchial epithelium (Adams and Martin 1996; Hollister 1986).

Evidence regarding marijuana smoking leading to cancer is inconsistent, as some studies suggest a positive correlation while others do not (Lee and Hancox, 2011; Tashkin, 2005). Several lung cancer cases have been reported in young marijuana users with no tobacco smoking history or other significant risk factors (Fung et al., 1999). Marijuana use may dose-dependently interact with mutagenic sensitivity, cigarette smoking, and alcohol use to increase the risk of head and neck cancer (Zhang et al., 1999). However, in a large study with 1,650 subjects, a positive association was not found between marijuana and lung cancer (Tashkin et al., 2006). This finding remained true, regardless of the extent of marijuana use, when controlling for tobacco use and other potential confounding variables. Overall, new evidence suggests that the effects of marijuana smoking on respiratory function and carcinogenicity differ from those of tobacco smoking (Lee and Hancox, 2011).

Endocrine System

Experimental marijuana administration to humans does not consistently alter many endocrine parameters. In an early study, male subjects who experimentally received smoked marijuana showed a significant depression in luteinizing hormone and a significant increase in cortisol (Cone et al., 1986). However, two later studies showed no changes in hormones. Male subjects experimentally exposed to smoked delta⁹-THC (18 mg/marijuana cigarette) or oral delta⁹-THC (10 mg three times per day for 3 days and on the morning of the fourth day) showed no changes in plasma adrenocorticotropic hormone (ACTH), cortisol, prolactin, luteinizing hormone, or testosterone levels (Dax et al., 1989). Similarly, a study with 93 men and 56

women showed that chronic marijuana use did not significantly alter concentrations of testosterone, luteinizing hormone, follicle stimulating hormone, prolactin, or cortisol (Block et al., 1991). Additionally, chronic marijuana use did not affect serum levels of thyrotropin, thyroxine, and triiodothyronine (Bonnet, 2013). However, in a double-blind, placebo-controlled, randomized clinical trial of HIV-positive men, smoking marijuana dose-dependently increased plasma levels of ghrelin and leptin, and decreased plasma levels of peptide YY (Riggs et al., 2012).

The effects of marijuana on female reproductive system functionality differ between humans and animals. In monkeys, delta⁹-THC administration suppressed ovulation (Asch et al., 1981) and reduced progesterone levels (Almirez et al., 1983). However, in women, smoked marijuana did not alter hormone levels or the menstrual cycle (Mendelson and Mello, 1984). Brown and Dobs (2002) suggest that the development of tolerance in humans may be the cause of the discrepancies between animal and human hormonal response to cannabinoids.

The presence of *in vitro* delta⁹-THC reduces binding of the corticosteroid, dexamethasone, in hippocampal tissue from adrenalectomized rats, suggesting an interaction with the glucocorticoid receptor (Eldridge et al., 1991). Although acute delta⁹-THC presence releases corticosterone, tolerance develops in rats with chronic administration (Eldridge et al., 1991).

Some studies support a possible association between frequent, long-term marijuana use and increased risk of testicular germ cell tumors (Trabert et al., 2011). On the other hand, recent data suggest that cannabinoid agonists may have therapeutic value in the treatment of prostate cancer, a type of carcinoma in which growth is stimulated by androgens. Research with prostate cancer cells shows that the mixed CB₁/CB₂ agonist, WIN-55212-2, induces apoptosis in prostate cancer cells, as well as decreases the expression of androgen receptors and prostate-specific antigens (Sarfraz et al., 2005).

Immune System

Cannabinoids affect the immune system in many different ways. Synthetic, natural, and endogenous cannabinoids often cause different effects in a dose-dependent biphasic manner (Croxford and Yamamura, 2005; Tanasescu and Constantinescu, 2010).

Studies in humans and animals give conflicting results about cannabinoid

effects on immune functioning in subjects with compromised immune systems. Abrams et al. (2003) investigated marijuana's effect on immunological functioning in 62 AIDS patients taking protease inhibitors. Subjects received one of the following three times a day: A smoked marijuana cigarette containing 3.95 percent delta⁹-THC, an oral tablet containing delta⁹-THC (2.5 mg oral dronabinol), or an oral placebo. The results showed no changes in CD4+ and CD8+ cell counts, HIV RNA levels, or protease inhibitor levels between groups. Thus, the use of cannabinoids showed no short-term adverse virologic effects in individuals with compromised immune systems. However, these human data contrast with data generated in immunodeficient mice, which demonstrated that exposure to delta⁹-THC *in vivo* suppresses immune function, increases HIV co-receptor expression, and acts as a cofactor to enhance HIV replication (Roth et al., 2005).

3. The State of Current Scientific Knowledge Regarding the Drug or Other Substance

Under the third factor, the Secretary must consider the state of current scientific knowledge regarding marijuana. Thus, this section discusses the chemistry, human pharmacokinetics, and medical uses of marijuana.

Chemistry

Marijuana is one of the common names of *Cannabis sativa* L. in the family Cannabaceae.

Cannabis is one of the oldest cultivated crops, providing a source of fiber, food, oil, and drug. Botanists still debate whether *Cannabis* should be considered as a single (The Plant List, 2010) or three species, *i.e.*, *C. sativa*, *C. indica*, and *C. ruderalis* (Hillig, 2005). Specifically, marijuana is developed as *sativa* and *indica* cultivated varieties (strains) or various hybrids.

The petition defines marijuana as including all *Cannabis* cultivated strains. Different marijuana samples derived from various cultivated strains may have very different chemical constituents including delta⁹-THC and other cannabinoids (Appendino et al., 2011). As a consequence, marijuana products from different strains will have different safety, biological, pharmacological, and toxicological profiles. Thus, all *Cannabis* strains cannot be considered together because of the varying chemical constituents between strains.

Marijuana contains numerous naturally occurring constituents

including cannabinoids. Overall, various *Cannabis* strains contain more than 525 identified natural constituents. Among those constituents, the most important ones are the 21 (or 22) carbon terpenoids found in the plant, as well as their carboxylic acids, analogues, and transformation products, known as cannabinoids (Aguirell et al., 1984, 1986; Mechoulam, 1973; Appendino et al., 2011). Thus far, more than 100 compounds classified as cannabinoids have been characterized (ElSohly and Slade, 2005; Radwan, ElSohly et al., 2009; Appendino et al. 2011).

Cannabinoids primarily exist in *Cannabis*, and published data suggest that most major cannabinoid compounds occurring naturally have been chemically identified. New and minor cannabinoids and other new compounds are continuously being characterized (Pollastro et al., 2011). So far, only two cannabinoids (cannabigerol and its corresponding acid) have been obtained from a *non-Cannabis* source. A South African *Helichrysum* (*H umbraculigerum*) accumulates these compounds (Appendino et al. 2011).

Among the cannabinoids found in marijuana, delta⁹-THC (alternate name delta¹-THC) and delta-8-tetrahydrocannabinol (delta⁸-THC, alternate name delta⁶-THC) produce marijuana's characteristic psychoactive effects. Because delta⁹-THC is more abundant than delta⁸-THC, marijuana's psychoactivity is largely attributed to the former. Only a few varieties of marijuana analyzed contain delta⁸-THC at significant amounts (Hively et al., 1966). Delta⁹-THC is an optically active resinous substance, insoluble in water, and extremely lipid soluble. Chemically, delta⁹-THC is (6aR-trans)-6a,7,8,10a-tetrahydro-6,6,9-trimethyl-3-pentyl-6H-dibenzo-[b,d]pyran-1-ol, or (–)-delta⁹-(trans)-tetrahydrocannabinol. The (–)-trans isomer of delta⁹-THC is pharmacologically 6–100 times more potent than the (+)-trans isomer (Dewey et al., 1984).

Other cannabinoids present in marijuana include CBD, CBC, and CBN. CBD, a major cannabinoid of marijuana, is insoluble in water and lipid-soluble. Chemically, CBD is 2-[(1R,6R)-3-methyl-6-prop-1-en-2-ylcyclohex-2-en-1-yl]-5-pentylbenzene-1,3-diol. CBD does not have cannabinol-like psychoactivity (Adams and Martin, 1996; Agurell et al., 1984, 1986; Hollister, 1986). CBC is another major cannabinoid in marijuana. Chemically, CBC is 2-methyl-2-(4-methylpent-3-enyl)-7-pentyl-5-chromenol. CBN, a major metabolite of delta⁹-THC, is also a minor naturally-occurring cannabinoid

with weak psychoactivity. Chemically, CBN is 6,6,9-trimethyl-3-pentylbenzo[c]chromen-1-ol.

Different marijuana samples derived from various cultivated strains may differ in chemical constituents including delta⁹-THC and other cannabinoids (Appendino et al. 2011). As a consequence, marijuana products from different strains may have different safety, biological, pharmacological, and toxicological profiles. In addition to differences between cultivated strains, the concentration of delta⁹-THC and other cannabinoids in marijuana may vary with growing conditions and processing after harvest. In addition to genetic differences among *Cannabis* species, the plant parts collected—for example, flowers, leaves, and stems—can influence marijuana's potency, quality, and purity (Adams and Martin, 1996; Agurell et al., 1984; Mechoulam, 1973). All these variations produce marijuana with potencies, as indicated by cannabinoid content, on average from as low as 1–2 percent to as high as 17 percent.

Overall, these variations in the concentrations of cannabinoids and other chemical constituents in marijuana complicate the interpretation of clinical data using marijuana. The lack of consistent concentrations of delta⁹-THC and other substances in marijuana from diverse sources makes interpreting the effect of different marijuana constituents difficult. In addition to different cannabinoid concentrations having different pharmacological and toxicological profiles, the non-cannabinoid components in marijuana, such as other terpenoids and flavonoids, might also contribute to the overall pharmacological and toxicological profiles of various marijuana strains and products derived from those strains.

The term marijuana is often used to refer to a mixture of the dried flowering tops and leaves from *Cannabis*. Marijuana in this limiting definition is one of three major derivatives sold as separate illicit products, which also include hashish and hash oil. According to the DEA, *Cannabis saliva* is the primary species of *Cannabis* currently marketed illegally in the United States.

Marijuana can vary in cannabinoid content and potency (Aguirell et al., 1984, 1986; Mechoulam 1973, Cascini et al., 2012). In the usual mixture of leaves and stems distributed as marijuana, the concentration of delta⁹-THC averages over 12 percent by weight. However, specially grown and selected marijuana can contain 15 percent or greater delta⁹-THC (Appendino et al., 2011). Thus, a 1-gram marijuana cigarette might

contain delta⁹-THC in a range from as little as 3 milligrams to as much as 150 milligrams or more. Additionally, a recent systematic review and meta-analysis found that marijuana's delta⁹-THC content has increased significantly from 1979–2009 (Cascini et al., 2012). In addition to smoking marijuana, individuals ingest marijuana through food made with butter or oil infused with marijuana and its extracts. These marijuana butters are generally made by adding marijuana to butter and heating it. The resultant butter is then used to cook a variety of foods. There are no published studies measuring the concentrations of cannabinoids in these marijuana food products.

Hashish consists of the dried and compressed cannabinoid-rich resinous material of *Cannabis* and comes in a variety of forms (e.g. balls and cakes). Individuals may break off pieces, place it into a pipe and smoke it. DEA reports that cannabinoid content in hashish averages six percent (DEA, 2005). With the development and cultivation of more high potency *Cannabis* strains, the average cannabinoid content in hashish will likely increase.

Hash oil is produced by solvent extraction of the cannabinoids from plant material. The extract's color and odor vary, depending on the solvent type used. Hash oil is a viscous brown- or amber-colored liquid containing approximately 50 percent cannabinoids. One or two drops of the liquid placed on a cigarette purportedly produce the equivalent of a single marijuana cigarette (DEA, 2005).

In conclusion, marijuana has hundreds of cultivars containing variable concentrations of delta⁹-THC, cannabinoids, and other compounds. Thus, marijuana is not a single chemical with a consistent and reproducible chemical profile or predictable and consistent clinical effects. A guidance for industry, entitled *Botanical Drug Products*,⁸ provides information on the approval of botanical drug products. To investigate marijuana for medical use in a manner acceptable as support for marketing approval under an NDA, clinical studies under an IND of consistent batches of a particular marijuana product for particular disease indications should be conducted. In addition, information and data regarding the marijuana product's chemistry, manufacturing and control, pharmacology, and animal toxicology data, among others must be provided

and meet the requirements for new drug approval (See 21 CFR 314.50).

Human Pharmacokinetics

Marijuana can be taken in a variety of formulations by multiple routes of administration. Individuals smoke marijuana as a cigarette, weighing between 0.5 and 1.0 gram, or in a pipe. Additionally, individuals take marijuana orally in foods or as an extract in ethanol or other solvents. More recently, access to vaporizers provides another means for abusers to inhale marijuana.

The absorption, metabolism, and pharmacokinetic profile of delta⁹-THC, cannabinoids, and drug products containing delta⁹-THC vary with route of administration and formulation (Adams and Martin, 1996; Agurell et al., 1984, 1986).

Pharmacokinetics of Smoked Administration of Cannabinoids

Characterization of the pharmacokinetics of delta⁹-THC and other cannabinoids from smoked marijuana is difficult because a subject's smoking behavior during an experiment varies (Agurell et al., 1986; Heming et al., 1986; Huestis et al., 1992a). Each puff delivers a discrete dose of delta⁹-THC. An experienced marijuana smoker can titrate and regulate the dose to obtain the desired acute psychological effects and minimize undesired effects. For example, under naturalistic conditions, users hold marijuana smoke in their lungs for an extended period of time which causes prolonged absorption and increases psychoactive effects. The effect of experience in the psychological response may explain why delta⁹-THC venous blood levels correlate poorly with intensity of effects and intoxication level (Agurell et al. 1986; Barnett et al. 1985; Huestis et al., 1992a). Puff and inhalation volumes should be recorded in studies as the concentration (dose) of cannabinoids administered can vary at different stages of smoking.

Smoked marijuana results in absorption of delta⁹-THC in the form of an aerosol within seconds. Psychoactive effects occur immediately following absorption, with mental and behavioral effects measurable for up to 6 hours (Grotenhermen, 2003; Hollister 1986, 1988). Delta⁹-THC is delivered to the brain rapidly and efficiently as expected of a very lipid soluble drug.

The bioavailability of the delta⁹-THC, from marijuana in a cigarette or pipe, can range from 1 to 24 percent with the fraction absorbed rarely exceeding 10 to 20 percent (Agurell et al., 1986; Hollister, 1988). The relatively low and variable bioavailability results from

significant loss of delta⁹-THC in side-stream smoke, variation in individual smoking behaviors, cannabinoid pyrolysis, incomplete absorption of inhaled smoke, and metabolism in the lungs. An individual's experience and technique with smoking marijuana also determines the dose absorbed (Heming et al., 1986; Johansson et al., 1989). After smoking, delta⁹-THC venous levels decline precipitously within minutes, and continue to go down to about 5 to 10 percent of the peak level within an hour (Agurell et al., 1986, Huestis et al., 1992a, 1992b).

Pharmacokinetics for Oral Administration of Cannabinoids

After oral administration of delta⁹-THC or marijuana, the onset of effects starts within 30 to 90 minutes, reaches its peak after 2 to 3 hours and then remains for 4 to 12 hours (Grotenhermen, 2003; Adams and Martin, 1996; Agurell et al., 1984, 1986). Due to the delay in onset of effects, users have difficulty in titrating oral delta⁹-THC doses compared to smoking marijuana. Oral bioavailability of delta⁹-THC, whether pure or in marijuana, is low and extremely variable, ranging between 5 and 20 percent (Agurell et al., 1984, 1986). Following oral administration of radioactive-labeled delta⁹-THC, delta⁹-THC plasma levels are low relative to plasma levels after smoking or intravenous administration. Inter- and intra-subject variability occurs even with repeated dosing under controlled conditions. The low and variable oral bioavailability of delta⁹-THC is a consequence of its first-pass hepatic elimination from blood and erratic absorption from stomach and bowel.

Cannabinoid Metabolism and Excretion

Cannabinoid metabolism is complex. Delta⁹-THC is metabolized via microsomal hydroxylation to both active and inactive metabolites (Lemberger et al., 1970, 1972a, 1972b; Agurell et al., 1986; Hollister, 1988). The primary active metabolite of delta⁹-THC following oral ingestion is 11-hydroxy-delta⁹-THC. This metabolite is approximately equipotent to delta⁹-THC in producing marijuana-like subjective effects (Agurell et al., 1986, Lemberger and Rubin, 1975). After oral administration, metabolite levels may exceed that of delta⁹-THC and thus contribute greatly to the pharmacological effects of oral delta⁹-THC or marijuana.

Plasma clearance of delta⁹-THC approximates hepatic blood flow at about 950 ml/min or greater. The rapid disappearance of delta⁹-THC from blood

⁸ This guidance is available on the Internet at <http://www.fda.gov/Drugs/default.htm> under Guidance (Drugs).

is largely due to redistribution to other tissues in the body, rather than to metabolism (Agurell et al., 1984, 1986). Metabolism in most tissues is relatively slow or absent. Slow release of delta⁹-THC and other cannabinoids from tissues and subsequent metabolism results in a long elimination half-life. The terminal half-life of delta⁹-THC ranges from approximately 20 hours to as long as 10 to 13 days, though reported estimates vary as expected with any slowly cleared substance and the use of assays with variable sensitivities (Hunt and Jones, 1980). Lemberger et al. (1970) determined the half-life of delta⁹-THC to range from 23 to 28 hours in heavy marijuana users to 60 to 70 hours in naive users. In addition to 11-hydroxy-delta⁹-THC, some inactive carboxy metabolites have terminal half-lives of 50 hours to 6 days or more. The latter substances serve as long-term markers in urine tests for earlier marijuana use.

The majority of the absorbed delta⁹-THC dose is eliminated in feces, and about 33 percent in urine. Delta⁹-THC enters enterohepatic circulation and undergoes hydroxylation and oxidation to 11-nor-9-carboxy-delta⁹-THC. The glucuronide is excreted as the major urine metabolite along with about 18 non-conjugated metabolites. Frequent and infrequent marijuana users metabolize delta⁹-THC similarly (Agurell et al., 1986).

Status of Research Into the Medical Uses for Marijuana

State-level public initiatives, including laws and referenda in support of the medical use of marijuana, have generated interest in the medical community and the need for high quality clinical investigation as well as comprehensive safety and effectiveness data. In order to address the need for high quality clinical investigations, the state of California established the Center for Medicinal Cannabis Research (CMCR, www.cmcr.ucsd.edu) in 2000 “in response to scientific evidence for therapeutic possibilities of cannabis⁹ and local legislative initiatives in favor of compassionate use” (Grant, 2005). State legislation establishing the CMCR called for high quality medical research that would “enhance understanding of the efficacy and adverse effects of marijuana as a pharmacological agent,” but stressed the project “should not be construed as encouraging or sanctioning the social or recreational use of marijuana.” The CMCR funded many of the published studies on marijuana’s

potential use for treating multiple sclerosis, neuropathic pain, appetite suppression and cachexia. However, aside from the data produced by CMCR, no state-level medical marijuana laws have produced scientific data on marijuana’s safety and effectiveness.

FDA approves medical use of a drug following a submission and review of an NDA or BLA. The FDA has not approved any drug product containing marijuana for marketing. Even so, results of small clinical exploratory studies have been published in the current medical literature. Many studies describe human research with marijuana in the United States under FDA-regulated IND applications.

However, FDA approval of an NDA is not the only means through which a drug can have a currently accepted medical use in treatment in the United States. In general, a drug may have a “currently accepted medical use” in treatment in the United States if the drug meets a five-part test. Established case law (*Alliance for Cannabis Therapeutics v. DEA*, 15 F.3d 1131, 1135 (D.C. Cir. 1994)) upheld the Administrator of DEA’s application of the five-part test to determine whether a drug has a “currently accepted medical use.” The following describes the five elements that characterize “currently accepted medical use” for a drug:¹⁰

i. the drug’s chemistry must be known and reproducible.

“The substance’s chemistry must be scientifically established to permit it to be reproduced into dosages which can be standardized. The listing of the substance in a current edition of one of the official compendia, as defined by section 201 G) of the Food, Drug and Cosmetic Act, 21 U.S.C. 321G), is sufficient to meet this requirement.”

ii. there must be adequate safety studies.

“There must be adequate pharmacological and toxicological studies, done by all methods reasonably applicable, on the basis of which it could fairly and responsibly be concluded, by experts qualified by scientific training and experience to evaluate the safety and effectiveness of drugs, that the substance is safe for treating a specific, recognized disorder.”

iii. there must be adequate and well-controlled studies proving efficacy.

“There must be adequate, well-controlled, well-designed, well-conducted, and well-documented studies, including clinical investigations, by experts qualified by scientific training and experience to

evaluate the safety and effectiveness of drugs, on the basis of which it could be fairly and responsibly concluded by such experts that the substance will have the intended effect in treating a specific, recognized disorder.”

iv. the drug must be accepted by qualified experts.

“The drug has a New Drug Application (NDA) approved by the Food and Drug Administration, pursuant to the Food, Drug and Cosmetic Act, 21 U.S.C. 355. Or, a consensus of the national community of experts, qualified by scientific training and experience to evaluate the safety and effectiveness of drugs, accepts the safety and effectiveness of the substance for use in treating a specific, recognized disorder. A material conflict of opinion among experts precludes a finding of consensus.” and

v. the scientific evidence must be widely available.

“In the absence of NDA approval, information concerning the chemistry, pharmacology, toxicology, and effectiveness of the substance must be reported, published, or otherwise widely available, in sufficient detail to permit experts, qualified by scientific training and experience to evaluate the safety and effectiveness of drugs, to fairly and responsibly conclude the substance is safe and effective for use in treating a specific, recognized disorder.”

Marijuana does not meet any of the five elements necessary for a drug to have a “currently accepted medical use.”

Firstly, the chemistry of marijuana, as defined in the petition, is not reproducible in terms of creating a standardized dose. The petition defines marijuana as including all *Cannabis* cultivated strains. Different marijuana samples derived from various cultivated strains may have very different chemical constituents including delta⁹-THC and other cannabinoids (Appendino et al., 2011). As a consequence, marijuana products from different strains will have different safety, biological, pharmacological, and toxicological profiles. Thus, when considering all *Cannabis* strains together, because of the varying chemical constituents, reproducing consistent standardized doses is not possible. Additionally, smoking marijuana currently has not been shown to allow delivery of consistent and reproducible doses. However, if a specific *Cannabis* strain is grown and processed under strictly controlled conditions, the plant chemistry may be kept consistent enough to produce reproducible and standardized doses.

⁹ In this quotation the term cannabis is interchangeable with marijuana.

¹⁰ 57 FR 10499, 10504–06 (March 26, 1992).

As to the second and third criteria; there are neither adequate safety studies nor adequate and well-controlled studies proving marijuana's efficacy. To support the petitioners' assertion that marijuana has accepted medical use, the petitioners cite the American Medical Association's (AMA) 2009 report entitled "Use of Cannabis for Medicinal Purposes." The petitioners claim the AMA report is evidence the AMA accepts marijuana's safety and efficacy. However, the 2009 AMA report clarifies that the report "should not be viewed as an endorsement of state-based medical cannabis programs, the legalization of marijuana, or that scientific evidence on the therapeutic use of cannabis meets the same and current standards for a prescription drug product."¹¹

Currently, no published studies conducted with marijuana meet the criteria of an adequate and well-controlled efficacy study. The criteria for an adequate and well-controlled study for purposes of determining the safety and efficacy of a human drug are defined under the Code of Federal Regulations (CFR) in 21 CFR 314.126. In order to assess this element, FDA conducted a review of clinical studies published and available in the public domain before February, 2013. Studies were identified through a search of PubMed¹² for articles published from inception to February 2013, for randomized controlled trials using marijuana to assess marijuana's efficacy in any therapeutic indication. Additionally, the review included studies identified through a search of bibliographic references in relevant systematic reviews and identified studies presenting original research in any language. Selected studies needed to be placebo-controlled and double-blinded. Additionally, studies needed to encompass administered marijuana plant material. There was no requirement for any specific route of administration, nor any age limits on study subjects. Studies were excluded that used placebo marijuana supplemented by the addition of specific amounts of THC or other cannabinoids. Additionally, studies administering marijuana plant extracts were excluded.

The PubMed search yielded a total of 566 abstracts of scientific articles. Of

these abstracts, a full-text review was conducted with 85 papers to assess eligibility. Of the studies identified through the search of the references and the 566 abstracts from the PubMed search, only 11 studies met all the criteria for selection (Abrams et al., 2007; Corey-Bloom et al., 2012; Crawford and Merritt, 1979; Ellis et al., 2009; Haney et al., 2005; Haney et al., 2007; Merritt et al., 1980; Tashkin et al., 1974; Ware et al., 2010; Wilsey et al., 2008; Wilsey et al., 2013). These 11 studies were published between 1974 and 2013. Ten of these studies were conducted in the United States and one study was conducted in Canada. The identified studies examine the effects of smoked and vaporized marijuana for the indications of chronic neuropathic pain, spasticity related to Multiple Sclerosis (MS), appetite stimulation in human immunodeficiency virus (HIV) patients, glaucoma, and asthma. All studies used adult subjects.

The 11 identified studies were individually evaluated to determine if they successfully meet accepted scientific standards. Specifically, they were evaluated on study design including subject selection criteria, sample size, blinding techniques, dosing paradigms, outcome measures, and the statistical analysis of the results. The analysis relied on published studies, thus information available about protocols, procedures, and results were limited to documents published and widely available in the public domain. The review found that all 11 studies that examined effects of inhaled marijuana do not currently prove efficacy of marijuana in any therapeutic indication based on a number of limitations in their study design; however, they may be considered proof of concept studies. Proof of concept studies provide preliminary evidence on a proposed hypothesis involving a drug's effect. For drugs under development, the effect often relates to a short-term clinical outcome being investigated. Proof of concept studies often serve as the link between preclinical studies and dose ranging clinical studies. Thus, proof of concept studies generally are not sufficient to prove efficacy of a drug because they provide only preliminary information about the effects of a drug.

In addition to the lack of published adequate and well-controlled efficacy studies proving efficacy, the criteria for adequate safety studies has also not been met. Importantly, in its discussion of the five-part test used to determine whether a drug has a "currently accepted medical use," DEA said, "No drug can be considered safe in the abstract. Safety has meaning only when

judged against the intended use of the drug, its known effectiveness, its known and potential risks, the severity of the illness to be treated, and the availability of alternative remedies" (57 FR 10504). When determining whether a drug product is safe and effective for any indication, FDA performs an extensive risk-benefit analysis to determine whether the risks posed by the drug product's side effects are outweighed by the drug product's potential benefits for a particular indication. Thus, contrary to the petitioner's assertion that marijuana has accepted safety, in the absence of an accepted therapeutic indication which can be weighed against marijuana's risks, marijuana does not satisfy the element for having adequate safety studies such that experts may conclude that it is safe for treating a specific, recognized disorder.

The fourth of the five elements for determining "currently accepted medical use" requires that the national community of experts, qualified by scientific training and experience to evaluate the safety and effectiveness of drugs, accepts the safety and effectiveness of the substance for use in treating a specific, recognized disorder. A material conflict of opinion among experts precludes a finding of consensus. Medical practitioners who are not experts in evaluating drugs are not qualified to determine whether a drug is generally recognized as safe and effective or meets NDA requirements (57 FR 10499-10505).

There is no evidence that there is a consensus among qualified experts that marijuana is safe and effective for use in treating a specific, recognized disorder. As discussed above, there are not adequate scientific studies that show marijuana is safe and effective in treating a specific, recognized disorder. In addition, there is no evidence that a consensus of qualified experts have accepted the safety and effectiveness of marijuana for use in treating a specific, recognized disorder. Although medical practitioners are not qualified by scientific training and experience to evaluate the safety and effectiveness of drugs, we also note that the AMA's report, entitled "Use of Cannabis for Medicinal Purposes," does not accept that marijuana currently has accepted medical use. Furthermore, based on the above definition of a "qualified expert", who is an individual qualified by scientific training and experience to evaluate the safety and effectiveness of a drug, state-level medical marijuana laws do not provide evidence of a consensus among qualified experts that marijuana is safe and effective for use in treating a specific, recognized disorder.

¹¹ In this quotation the term cannabis is used interchangeably for marijuana.

¹² The following search strategy was used, "(cannabis OR marijuana) AND (therapeutic use OR therapy) AND (RCT OR randomized controlled trial OR "systematic review" OR clinical trial OR clinical trials) NOT ("marijuana abuse"[Mesh] OR addictive behavior OR substance related disorders)."

As to the fifth part of the test, which requires that information concerning the chemistry, pharmacology, toxicology, and effectiveness of marijuana to be reported in sufficient detail, the scientific evidence regarding all of these aspects is not available in sufficient detail to allow adequate scientific scrutiny. Specifically, the scientific evidence regarding marijuana's chemistry in terms of a specific *Cannabis* strain that could produce standardized and reproducible doses is not currently available.

Alternately, a drug can be considered to have a "currently accepted medical use with severe restrictions" (21 U.S.C. 812(b)(2)(B)), as allowed under the stipulations for a Schedule II drug. Yet, as stated above, currently marijuana does not have any accepted medical use, even under conditions where its use is severely restricted.

In conclusion, to date, research on marijuana's medical use has not progressed to the point where marijuana is considered to have a "currently accepted medical use" or a "currently accepted medical use with severe restrictions."

4. Its History and Current Pattern of Abuse

Under the fourth factor, the Secretary must consider the history and current pattern of marijuana abuse. A variety of sources provide data necessary to assess abuse patterns and trends of marijuana. The data indicators of marijuana use include the NSDUH, MTF, DAWN, and TEDS. The following briefly describes each data source, and summarizes the data from each source.

*National Survey on Drug Use and Health (NSDUH)*¹³

According to 2012 NSDUH¹⁴ data, the most recent year with complete data, the

use of illicit drugs, including marijuana, is increasing. The 2012 NSDUH estimates that 23.9 million individuals over 12 years of age (9.2 percent of the U.S. population) currently use illicit drugs, which is an increase of 4.8 million individuals from 2004 when 19.1 million individuals (7.9 percent of the U.S. population) were current illicit drug users. NSDUH reports marijuana as the most commonly used illicit drug, with 18.9 million individuals (7.3 percent of the U.S. population) currently using marijuana in 2012. This represents an increase of 4.3 million individuals from 2004, when 14.6 million individuals (6.1 percent of the U.S. population) were current marijuana users.

The majority of individuals who try marijuana at least once in their lifetime do not currently use marijuana. The 2012 NSDUH estimates that 111.2 million individuals (42.8 percent of the U.S. population) have used marijuana at least once in their lifetime. Based on this estimate and the estimate for the number of individuals currently using marijuana, approximately 16.9 percent of those who have tried marijuana at least once in their lifetime currently use marijuana; conversely, 83.1 percent do not currently use marijuana. In terms of the frequency of marijuana use, an estimated 40.3 percent of individuals who used marijuana in the past month used marijuana on 20 or more days within the past month. This amount corresponds to an estimated 7.6 million individuals who used marijuana on a daily or almost daily basis.

Some characteristics of marijuana users are related to age, gender, and criminal justice system involvement. In observing use among different age cohorts, the majority of individuals who currently use marijuana are shown to be

between the ages of 18–25, with 18.7 percent of this age group currently using marijuana. In the 26 and older age group, 5.3 percent of individuals currently use marijuana. Additionally, in individuals aged 12 years and older, males reported more current marijuana use than females.

NSDUH includes a series of questions aimed at assessing the prevalence of dependence and abuse of different substances in the past 12 months.¹⁵ In 2012, marijuana was the most common illicit drug reported by individuals with past year dependence or abuse. An estimated 4.3 million individuals meet the NSDUH criteria for marijuana dependence or abuse in 2012. The estimated rates and number of individuals with marijuana dependence or abuse has remained similar from 2002 to 2012. In addition to data on dependence and abuse, NSDUH includes questions aimed at assessing treatment for a substance use problem.¹⁶ In 2012, an estimated 957,000 persons received treatment for marijuana use during their most recent treatment in the year prior to the survey.

*Monitoring the Future (MTF)*¹⁷

According to MTF,¹⁸ rates of marijuana and illicit drug use declined for all three grades from 2005 through 2007. However, starting around 2008, rates of annual use of illicit drugs and marijuana increased through 2013 for all three grades. Marijuana remained the most widely used illicit drug during all time periods. The prevalence of annual and past month marijuana use in 10th and 12th graders in 2013 is greater than in 2005. Table 1 lists the lifetime, annual, and monthly prevalence rates of various drugs for 8th, 10th, and 12th graders in 2013.

¹³ NSDUH provides national estimates of the prevalence and incidence of illicit drug, alcohol and tobacco use in the United States. NSDUH is an annual study conducted by SAMHSA. Prior to 2002, the database was known as the National Household Survey on Drug Abuse (NHSDA). NSDUH utilizes a nationally representative sample of United States civilian, non-institutionalized population aged 12 years and older. The survey excludes homeless people who do not use shelters, active military personnel, and residents of institutional group quarters such as jails and hospitals. The survey identifies whether an individual used a drug within a specific time period, but does not identify the amount of the drug used on each occasion. NSDUH defines "current use" as having used the substance within the month prior to the study.

¹⁴ 2013; <http://www.samhsa.gov/data/NSDUH.aspx>.

¹⁵ "These questions are used to classify persons as dependent on or abusing specific substances

based on criteria specified in the *Diagnostic and Statistical Manual of Mental Disorder*, 4th edition (DSM-IV). The questions related to dependence ask about health and emotional problems associated with substance use, unsuccessful attempts to cut down on use, tolerance, withdrawal, reducing other activities to use substances, spending a lot of time engaging in activities related to substance use, or using the substance in greater quantities or for longer time than intended. The questions on abuse ask about problems at work, home, and school; problems with family or friends; physical danger; and trouble with the law due to substance use. Dependence is considered to be a more severe substance use problem than abuse because it involves the psychological and physiological effects of tolerance and withdrawal." (NSDUH, 2013).

¹⁶ "Estimates . . . refer to treatment received for illicit drug or alcohol use, or for medical problems associated with the use of illicit drugs or alcohol. This includes treatment received in the past year at any location, such as a hospital (inpatient),

rehabilitation facility (outpatient or inpatient), mental health center, emergency room, private doctor's office, prison or jail, or a self-help group, such as Alcoholics Anonymous or Narcotics Anonymous." (NSDUH, 2013).

¹⁷ Monitoring the Future is a national survey that tracks drug use prevalence and trends among adolescents in the United States. MTF is reported annually by the Institute for Social Research at the University of Michigan under a grant from NIDA. Every spring, MTF surveys 8th, 10th, and 12th graders in randomly selected U.S. schools. MTF has been conducted since 1975 for 12th graders and since 1991 for 8th and 10th graders. The MTF survey presents data in terms of prevalence among the sample interviewed. For 2012, the latest year with complete data, the sample sizes were 15,200—8th graders; 13,300—10th graders; and 13,200—12th graders. In all, a total of about 41,700 students of 389 schools participated in the 2013 MTF.

¹⁸ 2013; <http://www.monitoringthefuture.org/index.html>.

Table 1: Trends in lifetime, annual, and monthly prevalence of use of various drugs for eighth, tenth, and twelfth graders. Percentages represent students in survey responding that they had used a drug at least once in their lifetime, in the past year, or in the past 30 days.

	Lifetime			Annual			30-Day		
	2011	2012	2013	2011	2012	2013	2011	2012	2013
Any illicit Drug (a)									
8 th Grade	20.1	18.5	20.3	14.7	13.4	14.9	8.5	7.7	8.5
10 th Grade	37.7	36.8	38.8	31.1	30.1	31.8	19.2	18.6	19.4
12 th Grade	49.9	49.1	50.4	40.0	39.7	40.3	25.2	25.2	25.5
Marijuana/Hashish									
8 th Grade	16.4	15.2	16.5	12.5	11.4	12.7	7.2	6.5	7.0
10 th Grade	34.5	33.8	35.8	28.8	28.0	29.8	17.6	17.0	18.0
12 th Grade	45.5	45.2	45.5	36.4	36.4	36.4	22.6	22.9	22.7

SOURCE: The Monitoring the Future Study, the University of Michigan

a. For 12th graders only: "any illicit drug" includes any use of marijuana, LSD, other hallucinogens, crack, other cocaine, or heroin; or any narcotics use other than heroin, amphetamines, sedatives (barbiturates), or tranquilizers not under a doctor's orders. For 8th and 10th graders only: the use of narcotics other than heroin and sedatives (barbiturates) was excluded.

Drug Abuse Warning Network (DAWN)¹⁹

Importantly, many factors can influence the estimates of ED visits, including trends in overall use of a substance as well as trends in the reasons for ED usage. For instance, some drug users may visit EDs for life-threatening issues while others may visit to seek care for detoxification because they needed certification before entering treatment. Additionally, DAWN data do not distinguish the drug responsible for the ED visit from other drugs that may have been used concomitantly. As stated in a DAWN report, "Since marijuana/hashish is frequently present in combination with other drugs, the reason for the ED visit may be more relevant to the other drug(s) involved in the episode."

For 2011, DAWN²⁰ estimates a total of 5,067,374 (95 percent confidence interval [CI]: 4,616,753 to 5,517,995) drug-related ED visits from the entire United States. Of these, approximately

2,462,948 ([CI]: 2,112,868 to 2,813,028) visits involved drug misuse or abuse.

During the same period, DAWN estimates that 1,252,500 (CI: 976,169 to 1,528,831) drug related ED visits involved illicit drugs. Thus, over half of all drug-related ED visits associated with drug misuse or abuse involved an illicit drug. For ED visits involving illicit drugs, 56.3 percent involved multiple drugs while 43.7 percent involved a single drug.

Marijuana was involved in 455,668 ED visits (CI: 370,995 to 540,340), while cocaine was involved in 505,224 (CI: 324,262 to 686, 185) ED visits, heroin was involved in 258,482 (CI: 205,046 to 311,918) ED visits and stimulants including amphetamine and methamphetamine were involved in 159,840 (CI: 100,199 to 219,481) ED visits. Other illicit drugs, such as PCP, MDMA, GHB and LSD were much less frequently associated with ED visits. The number of ED visits involving marijuana has increased by 62 percent since 2004.

Marijuana-related ED visits were most frequent among young adults and minors. Individuals under the age of 18 accounted for 13.2 percent of these marijuana-related visits, whereas this age group accounted for approximately 1.2 percent of ED visits involving cocaine, and less than 1 percent of ED visits involving heroin. However, the age group with the most marijuana-related ED visits was between 25 and 29 years old. Yet, because populations differ between age groups, a standardized measure for population size is useful to make comparisons. For

marijuana, the rates of ED visits per 100,000 population were highest for patients aged 18 to 20 (443.8 ED visits per 100,000) and for patients aged 21 to 24 (446.9 ED visits per 100,000).

While DAWN provides estimates for ED visits associated with the use of medical marijuana for 2009–2011, the validity of these estimates is questionable. Because the drug is not approved by the FDA, reporting medical marijuana may be inconsistent and reliant on a number of factors including whether the patient self-reports the marijuana use as medicinal, how the treating health care provider records the marijuana use, and lastly how the SAMHSA coder interprets the report. All of these aspects will vary greatly between states with medical marijuana laws and states without medical marijuana laws. Thus, even though estimates are reported for medical marijuana related ED visits, medical marijuana estimates cannot be assessed with any acceptable accuracy at this time, as FDA has not approved marijuana treatment of any medical condition. These data show the difficulty in evaluating abuse of a product that is not currently approved by FDA, but authorized for medical use, albeit inconsistently, at the state level. Thus, we believe the likelihood of the treating health care provider or SAMHSA coder attributing the ED visit to "medical marijuana" versus "marijuana" to be very low. Overall, the available data are inadequate to characterize its abuse at the community level.

¹⁹DAWN is a national probability survey of the U.S. hospitals with ED designed to obtain information on drug related ED visits. DAWN is sponsored by SAMHSA. The DAWN system provides information on the health consequences of drug use in the United States, as manifested by drug-related visits to ED. The ED data from a representative sample of hospital emergency departments are weighted to produce national estimates. Importantly, DAWN data and estimates, starting in 2004, are not comparable to those for prior years because of vast changes in the methodology used to collect the data. Furthermore, estimates for 2004 are the first to be based on a redesigned sample of hospitals, which ended in 2011.

²⁰2011; <http://www.samhsa.gov/data/dawn.aspx>.

*Treatment Episode Data Set (TEDS)*²¹

Primary marijuana abuse accounted for 18.1 percent of all 2011 TEDS²² admissions. Individuals admitted for primary marijuana abuse were nearly three-quarters (73.4 percent) male, and almost half (45.2 percent) were white. The average age at admission was 24 years old, and 31.1 percent of individuals admitted for primary marijuana abuse were under the age of 18. The reported frequency of marijuana use was 24.3 percent reporting daily use. Almost all (96.8 percent) primary marijuana users utilized the substance by smoking. Additionally, 92.9 percent reported using marijuana for the first time before the age of 18.

An important aspect of TEDS admission data for marijuana is of the referral source for treatment. Specifically, primary marijuana admissions were less likely than all other admissions to either be self-referred or referred by an individual for treatment. Instead, the criminal justice system referred more than half (51.6 percent) of primary marijuana admissions.

Since 2003, the percent of admissions for primary marijuana abuse increased from 15.5 percent of all admissions in 2003 to 18.1 percent in 2011. This increase is less than the increase seen for admissions for primary opioids other than heroin, which increased from 2.8 percent in 2003 to 7.3 percent in 2011. In contrast, the admissions for primary cocaine abuse declined from 9.8 percent in 2003 to 2.0 percent in 2011.

²¹ The TEDS system is part of SAMHSA's Drug and Alcohol Services Information System (Office of Applied Science, SAMHSA). The TEDS report presents information on the demographic and substance use characteristics of the 1.8 million annual admissions to treatment for alcohol and drug abuse in facilities that report to individual state administrative data systems. Specifically, TEDS includes facilities licensed or certified by the states to provide substance abuse treatment and is required by the states to provide TEDS client-level data. Facilities that report TEDS data are those receiving State alcohol and drug agency funds for the provision of alcohol and drug treatment services. Since TEDS is based only on reports from these facilities, TEDS data do not represent the total national demand for substance abuse treatment or the prevalence of substance abuse in the general population. The primary goal for TEDS is to monitor the characteristics of treatment episodes for substance abusers. Importantly, TEDS is an admissions-based system, where admittance to treatment is counted as an anonymous tally. For instance, a given individual who is admitted to treatment twice within a given year would be counted as two admissions. The most recent year with complete data is 2011.

²² 2011; <http://www.samhsa.gov/data/DASIS.aspx?qr=#TEDS>.

5. The Scope, Duration, and Significance of Abuse

Under the fifth factor, the Secretary must consider the scope, duration, and significance of marijuana abuse. According to 2012 data from NSDUH and 2013 data from MTF, marijuana remains the most extensively used illegal drug in the United States, with 42.8 percent of U.S. individuals over age 12 (111.2 million) and 45.5 percent of 12th graders having used marijuana at least once in their lifetime. Although the majority of individuals over age 12 (83.1 percent) who have ever used marijuana in their lifetime do not use the drug monthly, 18.9 million individuals (7.3 percent of the U.S. population) report that they used marijuana within the past 30 days. An examination of use among various age cohorts through NSDUH demonstrates that monthly use occurs primarily among college-aged individuals, with use dropping off sharply after age 25. Additionally, NSDUH data show the number of individuals reporting past-month use of marijuana has increased by 4.3 million individuals since 2004. Data from MTF shows that annual prevalence of marijuana use declined for all three grades from 2005 through 2007, then began to rise through 2013. Additionally, in 2013, 1.1 percent of 8th graders, 4.0 percent of 10th graders, and 6.5 percent of 12th graders reported daily use of marijuana, defined as use on 20 or more days within the past 30 days.

The 2011 DAWN data show that marijuana use was mentioned in 455,668 ED visits, which amounts to approximately 36.4 percent of all illicit drug-related ED visits.²³

TEDS data for 2011 show that 18.1 percent of all admissions were for primary marijuana abuse.²⁴ Between 2003 and 2011, there was a 2.6 percent increase in the number of TEDS admissions for primary marijuana use.

²³ Many factors can influence the estimates of ED visits, including trends in the reasons for ED usage. For instance, some drug users may visit EDs for life-threatening issues while others may visit to seek care for detoxification because they needed certification before entering treatment. Additionally, DAWN data do not distinguish the drug responsible for the ED visit from other drugs that may have been used concomitantly. As stated in a DAWN report, "Since marijuana/hashish is frequently present in combination with other drugs, the reason for the ED visit may be more relevant to the other drug(s) involved in the episode."

²⁴ An important aspect of TEDS admission data for marijuana is of the referral source for treatment. Specifically, primary marijuana admissions were less likely than all other admissions to either be self-referred or referred by an individual for treatment. Instead, the criminal justice system referred more than half (51.6 percent) of primary marijuana admissions.

Approximately 61.5 percent of primary marijuana admissions in 2011 were for individuals under the age of 25 years.

6. WHAT, if Any, Risk There Is to the Public Health

Under the sixth factor, the Secretary must consider the risks posed to the public health by marijuana. Factors 1, 4, and 5 include a discussion of the risk to the public health as measured by emergency room episodes and drug treatment admissions. Additionally, Factor 2 includes a discussion of marijuana's central nervous system, cognitive, cardiovascular, autonomic, respiratory, and immune system effects. Factor 6 focuses on the health risks to the individual user in terms of the risks from acute and chronic use of marijuana, as well as the "gateway hypothesis."

Risks From Acute Use of Marijuana

Acute use of marijuana impairs psychomotor performance, including complex task performance, which makes operating motor vehicles or heavy equipment after using marijuana inadvisable (Ramaekers et al., 2004; Ramaekers et al., 2006a). A meta-analysis conducted by Li et al. (2011) showed an association between marijuana use by the driver and a significantly increased risk of involvement in a car accident. Additionally, in a minority of individuals who use marijuana, some potential responses include dysphoria and psychological distress, including prolonged anxiety reactions (Haney et al., 1999).

Risks From Chronic Use of Marijuana

A distinctive marijuana withdrawal syndrome following long term or chronic use has been identified. The withdrawal syndrome indicates that marijuana produces physical dependence that is mild, short-lived, and comparable to tobacco withdrawal (Budney et al., 2008). Marijuana withdrawal syndrome is described in detail below under Factor 7.

The following states how the DSM-V (2013) of the American Psychiatric Association describes the consequences of *Cannabis*²⁵ abuse:

Individuals with cannabis use disorder may use cannabis throughout the day over a period of months or years, and thus may spend many hours a day under the influence. Others may use less frequently, but their use causes recurrent problems related to family,

²⁵ *Cannabis* is the term used in the DSM-V to refer to marijuana. In the following excerpt the term *Cannabis* is interchangeable for the term *marijuana*.

school, work, or other important activities (e.g., repeated absences at work; neglect of family obligations). Periodic cannabis use and intoxication can negatively affect behavioral and cognitive functioning and thus interfere with optimal performance at work or school, or place the individual at increased physical risk when performing activities that could be physically hazardous (e.g., driving a car; playing certain sports; performing manual work activities, including operating machinery). Arguments with spouses or parents over the use of cannabis in the home, or its use in the presence of children, can adversely impact family functioning and are common features of those with cannabis use disorder. Last, individuals with cannabis use disorder may continue using marijuana despite knowledge of physical problems (e.g., chronic cough related to smoking) or psychological problems (e.g., excessive sedation or exacerbation of other mental health problems) associated with its use.

Marijuana as a "Gateway Drug"

Kandel (1975) proposed nearly 40 years ago the hypothesis that marijuana is a "gateway drug" that leads to the use or abuse of other illicit drugs. Since that time, epidemiological research explored this premise. Overall, research does not support a direct causal relationship between regular marijuana use and other illicit drug use. The studies examining the gateway hypothesis are limited. First, in general, studies recruit individuals influenced by a myriad of social, biological, and economic factors that contribute to extensive drug abuse (Hall & Lynskey, 2005). Second, most studies that test the hypothesis that marijuana use causes abuse of illicit drugs use the determinative measure *any use of an illicit drug*, rather than DSM-5 criteria for drug abuse or dependence on an illicit drug (DSM-5, 2013). Consequently, although an individual who used marijuana may try other illicit drugs, the individual may not regularly use drugs, or have a diagnosis of drug abuse or dependence.

Little evidence supports the hypothesis that initiation of marijuana use leads to an abuse disorder with other illicit substances. For example, one longitudinal study of 708 adolescents demonstrated that early onset marijuana use did not lead to problematic drug use (Kandel & Chen, 2000). Similarly, Nace et al. (1975) examined Vietnam-era soldiers who extensively abused marijuana and heroin while they were in the military, and found a lack of correlation of a causal relationship demonstrating

marijuana use leading to heroin addiction. Additionally, in another longitudinal study of 2,446 adolescents, marijuana dependence was uncommon but when it did occur, the common predictors of marijuana dependence were the following: Parental death, deprived socio-economic status, and baseline illicit drug use other than marijuana (von Sydow et al., 2002).

When examining the association between marijuana and illicit drugs, focusing on drug use versus abuse or dependence, different patterns emerge. For example, a study examining the possible causal relationship of the gateway hypothesis found a correlation between marijuana use in adolescents and other illicit drug use in early adulthood and, adjusting for age-linked experiences, did not effect this correlation (Van Gundy and Rebellon, 2010). However, when examining the association in terms of development of drug abuse; age-linked stressors and social roles moderated the correlation between marijuana use in adolescents and other illicit drug abuse. Similarly, Degenhardt et al. (2009) examined the development of drug dependence and found an association that did not support the gateway hypothesis. Specifically, drug dependence was significantly associated with the use of other illicit drugs prior to marijuana use.

Interestingly, the order of initiation of drug use seems to depend on the prevalence of use of each drug, which varies by country. Based on the World Health Organization (WHO) World Mental Health Survey that includes data from 17 different countries, the order of drug use initiation varies by country and relates to prevalence of drug use in each country (Degenhardt et al., 2010). Specifically, in the countries with the lowest prevalence of marijuana use, use of other illicit drugs before marijuana was common. This sequence of initiation is less common in countries with higher prevalence of marijuana use. A study of 9,282 households in the United States found that marijuana use often preceded the use of other illicit drugs; however, prior non-marijuana drug dependence was also frequently correlated with higher levels of illicit drug abuse (Degenhardt et al., 2009). Additionally, in a large 25-year longitudinal study of 1,256 New Zealand children, the author concluded that marijuana use correlated to an increased risk of abuse of other drugs, including cocaine and heroin (Fergusson et al., 2005).

Although many individuals with a drug abuse disorder may have used marijuana as one of their first illicit

drugs, this fact does not correctly lead to the reverse inference that most individuals who used marijuana will inherently go on to try or become regular users of other illicit drugs. Specifically, data from the 2011 NSDUH survey illustrates this issue (SAMHSA, 2012). NSDUH data estimates 107.8 million individuals have a lifetime history of marijuana use, which indicates use on at least one occasion, compared to approximately 36 million individuals having a lifetime history of cocaine use and approximately 4 million individuals having a lifetime history of heroin use. NSDUH data do not provide information about each individual's specific drug history. However, even if one posits that every cocaine and heroin user previously used marijuana, the NSDUH data show that marijuana use at least once in a lifetime does not predict that an individual will also use another illicit drug at least once.

Finally, a review of the gateway hypothesis by Vanyukov et al. (2012) notes that because the gateway hypothesis only addresses the order of drug use initiation, the gateway hypothesis does not specify any mechanistic connections between drug "stages" following exposure to marijuana and does not extend to the risks for addiction. This concept contrasts with the concept of a common liability to addiction that involves mechanisms and biobehavioral characteristics pertaining to the entire course of drug abuse risk and disorders.

7. Its Psychic or Physiologic Dependence Liability

Under the seventh factor, the Secretary must consider marijuana's psychic or physiological dependence liability.

Psychic or psychological dependence has been shown in response to marijuana's psychoactive effects. Psychoactive responses to marijuana are pleasurable to many humans and are associated with drug-seeking and drug-taking (Maldonado, 2002). Moreover, high levels of psychoactive effects, notably positive reinforcement, are associated with increased marijuana use, abuse, and dependence (Scherrer et al., 2009; Zeiger et al., 2010). Epidemiological data support these findings through 2012 NSDUH statistics that show that of individuals years 12 or older who used marijuana in the past month, an estimated 40.3 percent used marijuana on 20 or more days within the past month. This equates to approximately 7.6 million individuals aged 12 or older who used marijuana on a daily or almost daily basis.

Additionally, the 2013 MTF data report the prevalence of daily marijuana use, defined as use on 20 or more days within the past 30 days, in 8th, 10th, and 12th graders is 1.1 percent, 4.0 percent, and 6.5 percent, respectively.

Tolerance is a state of adaptation where exposure to a drug induces changes that result in a diminution of one or more of the drug's effects over time (American Academy of Pain Medicine, American Pain Society and American Society of Addiction Medicine consensus document, 2001). Tolerance can develop to some, but not all, of marijuana's effects. Specifically, tolerance does not seem to develop in response to many of marijuana's psychoactive effects. This lack of tolerance may relate to electrophysiological data demonstrating that chronic delta⁹-THC administration does not affect increased neuronal firing in the ventral tegmental area, a region known to play a critical role in drug reinforcement and reward (Wu and French, 2000). In the absence of other abuse indicators, such as rewarding properties, the presence of tolerance or physical dependence does not determine whether a drug has abuse potential.

However, humans can develop tolerance to marijuana's cardiovascular, autonomic, and behavioral effects (Jones et al., 1981). Tolerance to some of marijuana's behavioral effects seems to develop after heavy marijuana use, but not after occasional marijuana use. For instance, following acute administration of marijuana, heavy marijuana users did not exhibit impairments in tracking and attention tasks, as were seen in occasional marijuana users (Ramaekers et al., 2009). Furthermore, a neurophysiological assessment administered through an electroencephalograph (EEG) which measures event-related potentials (ERP) conducted in the same subjects as the previous study, found a corresponding effect in the P100²⁶ component of ERPs. Specifically, corresponding to performance on tracking and attention tasks, heavy marijuana users showed no changes in P100 amplitudes following acute marijuana administration, although occasional users showed a decrease in P100 amplitudes (Theunissen et al., 2012). A possible mechanism underlying tolerance to marijuana's effects may be the down-regulation of cannabinoid receptors (Hirvonen et al., 2012; Gonzalez et al.,

2005; Rodriguez de Fonseca et al., 1994; Oviedo et al., 1993).

Importantly, pharmacological tolerance alone does not indicate a drug's physical dependence liability. In order for physical dependence to exist, evidence of a withdrawal syndrome is needed. Physical dependence is a state of adaptation, manifested by a drug-class specific withdrawal syndrome produced by abrupt cessation, rapid dose reduction, decreasing blood level of the drug, and/or administration of an antagonist (*ibid*). Many medications not associated with abuse or addiction can produce physical dependence and withdrawal symptoms after chronic use.

Discontinuation of heavy, chronic marijuana use has been shown to lead to physical dependence and withdrawal symptoms (American Psychiatric Association DSM-V, 2013; Budney and Hughes, 2006; Haney et al., 1999). In heavy, chronic marijuana users, the most commonly reported withdrawal symptoms are sleep difficulties, decreased appetite or weight loss, irritability, anger, anxiety or nervousness, and restlessness. Some less commonly reported withdrawal symptoms are depressed mood, sweating, shakiness, physical discomfort, and chills (Budney and Hughes, 2006; Haney et al., 1999). The occurrence of marijuana withdrawal symptoms in light or non-daily marijuana users has not been established. The American Psychiatric Association's DSM-V (2013) includes a list of symptoms of "cannabis withdrawal." Most marijuana withdrawal symptoms begin within 24–48 hours of discontinuation, peak within 4–6 days, and last for 1–3 weeks. Marijuana withdrawal syndrome has been reported in adolescents and adults admitted for substance abuse treatment.

Based on clinical descriptions, this syndrome appears to be mild compared to classical alcohol and barbiturate withdrawal syndromes, which can include more serious symptoms such as agitation, paranoia, and seizures. Multiple studies comparing marijuana and tobacco withdrawal symptoms in humans demonstrate that the magnitude and time course of the two withdrawal syndromes are similar (Budney et al., 2008; Vandrey et al., 2005, 2008).

8. Whether the Substance Is an Immediate Precursor of a Substance Already Controlled Under This Article

Under the eight factor analysis, the Secretary must consider whether marijuana is an immediate precursor of a controlled substance. Marijuana is not an immediate precursor of another controlled substance.

Recommendation

After consideration of the eight factors discussed above, FDA recommends that marijuana remain in Schedule I of the CSA. NIDA concurs with this scheduling recommendation. Marijuana meets the three criteria for placing a substance in Schedule I of the CSA under 21 U.S.C. 812(b)(1):

(1) Marijuana has a high potential for abuse:

A number of factors indicate marijuana's high abuse potential, including the large number of individuals regularly using marijuana, marijuana's widespread use, and the vast amount of marijuana available for illicit use. Approximately 18.9 million individuals in the United States (7.3 percent of the U.S. population) used marijuana monthly in 2012. Additionally, approximately 4.3 million individuals met diagnostic criteria for marijuana dependence or abuse in the year prior to the 2012 NSDUH survey. A 2013 survey indicates that by 12th grade, 36.4 percent of students report using marijuana within the past year, and 22.7 percent report using marijuana monthly. In 2011, 455,668 ED visits were marijuana-related, representing 36.4 percent of all illicit drug-related episodes. Primary marijuana use accounted for 18.1 percent of admissions to drug treatment programs in 2011. Additionally, marijuana has dose-dependent reinforcing effects, as demonstrated by data showing that humans prefer relatively higher doses to lower doses. Furthermore, marijuana use can result in psychological dependence.

(2) Marijuana has no currently accepted medical use in treatment in the United States:

FDA has not approved a marketing application for a marijuana drug product for any indication. The opportunity for scientists to conduct clinical research with marijuana exists, and there are active INDs for marijuana; however, marijuana does not have a currently accepted medical use for treatment in the United States, nor does marijuana have an accepted medical use with severe restrictions.

A drug has a "currently accepted medical use" if all of the following five elements have been satisfied:

- a. the drug's chemistry is known and reproducible;
- b. there are adequate safety studies;
- c. there are adequate and well-controlled studies proving efficacy;
- d. the drug is accepted by qualified experts; and
- e. the scientific evidence is widely available.

²⁶ The P100 component of ERPs is thought to relate to the visual processing of stimuli and can be modulated by attention.

[57 FR 10499, March 26, 1992]

Marijuana does not meet any of the elements for having a “currently accepted medical use.”

First, FDA broadly evaluated marijuana, and did not focus its evaluation on particular strains of marijuana or components or derivatives of marijuana. Since different strains may have different chemical constituents, marijuana, as identified in this petition, does not have a known and reproducible chemistry, which would be needed to provide standardized doses.

Second, there are not adequate safety studies on marijuana in the medical literature in relation to a specific, recognized disorder. Third, there are no published adequate and well controlled studies proving efficacy of marijuana. Fourth, there is no evidence that qualified experts accept marijuana for use in treating a specific, recognized disorder. Lastly, the scientific evidence regarding marijuana’s chemistry in terms of a specific *Cannabis* strain that could produce standardized and reproducible doses is not currently available, so the scientific evidence on marijuana is not widely available.

Alternately, a Schedule II drug can be considered to have a “currently accepted medical use with severe restrictions” (21 U.S.C. 812(b)(2)(B)). Yet as stated above, the lack of accepted medical use for a specific, recognized disorder precludes the use of marijuana even under conditions where its use is severely restricted.

In conclusion, to date, research on marijuana’s medical use has not developed to the point where marijuana is considered to have a “currently accepted medical use” or a “currently accepted medical use with severe restrictions.”

(3) There is a lack of accepted safety for use of marijuana under medical supervision:

There are currently no FDA-approved marijuana drug products. Marijuana does not have a currently accepted medical use in treatment in the United States or a currently accepted medical use with severe restrictions. Thus, FDA has not determined that marijuana is safe for use under medical supervision.

In addition, FDA cannot conclude that marijuana has an acceptable level of safety relative to its effectiveness in treating a specific, recognized disorder without evidence that the substance is contamination free, and assurance of a consistent and predictable dose. Investigations into the medical use of marijuana should include information and data regarding the chemistry,

manufacturing, and specifications of marijuana. Additionally, a procedure for delivering a consistent dose of marijuana should also be developed. Therefore, FDA concludes marijuana does not currently have an accepted level of safety for use under medical supervision.

Executive Summary

Marijuana is a Schedule I substance under the Controlled Substances Act (CSA). Schedule I indicates a high potential for abuse, no currently accepted medical use in the United States, and a lack of accepted safety for use under medical supervision. To date, marijuana has not been subject to an approved new drug application (NDA) that demonstrates its safety and efficacy for a specific indication under the Food Drug and Cosmetic Act (FDCA).

Nevertheless, as of October 2014, twenty-three states and the District of Columbia have passed state-level medical marijuana laws that allow for marijuana use within that state; similar bills are pending in other states.

The present review was undertaken by the Food and Drug Administration (FDA) to analyze the clinical studies published in the medical literature investigating the use of marijuana in any therapeutic areas. First, we discuss the context for this scientific review. Next, we describe the methods used in this review to identify adequate and well-controlled studies evaluating the safety and efficacy of marijuana for particular therapeutic uses.

The FDA conducted a systematic search for published studies in the medical literature that meet the described criteria for study design and outcome measures prior to February 2013. While not part of our systematic review, we have continued to routinely follow the literature beyond that date for subsequent studies. Studies were considered to be relevant to this review if the investigators administered marijuana to patients with a diagnosed medical condition in a well-controlled, double-blind, placebo-controlled clinical trial. Of the eleven studies that met the criteria for review, five different therapeutic areas were investigated:

- Five studies examined chronic neuropathic pain
- Two studies examined appetite stimulation in human immunodeficiency virus (HIV) patients
- Two studies examined glaucoma
- One study examined spasticity and pain in multiple sclerosis (MS)
- One study examined asthma.

For each of these eleven clinical studies, information is provided regarding the subjects studied, the drug conditions tested (including dose and method of administration), other drugs used by subjects during the study, the physiological and subjective measures collected, the outcome of these measures comparing treatment with marijuana to placebo, and the reported

and observed adverse events. The conclusions drawn by the investigators are then described, along with potential limitations of these conclusions based on the study design. A brief summary of each study's findings and limitations is provided at the end of the section.

The eleven clinical studies that met the criteria and were evaluated in this review showed positive signals that marijuana may produce a desirable therapeutic outcome, under the specific experimental conditions tested. Notably, it is beyond the scope of this review to determine whether these data demonstrate that marijuana has a currently accepted medical use in the United States. However, this review concludes that these eleven clinical studies serve as proof-of-concept studies, based on the limitations of their study designs, as described in the study summaries. Proof-of-concept studies provide preliminary evidence on a proposed hypothesis regarding a drug's effect. For drugs under development, the effect often relates to a short-term clinical outcome being investigated. Proof-of-concept studies serve as the link between preclinical studies and dose ranging clinical studies. Therefore, proof-of-concept studies are not sufficient to demonstrate efficacy of a drug because they provide only preliminary information about the effects of a drug. However, the studies reviewed produced positive results, suggesting marijuana should be further evaluated as an adjunct treatment for neuropathic pain, appetite stimulation in HIV patients, and spasticity in MS patients.

The main limitations identified in the eleven studies testing the medical applications of marijuana are listed below:

- The small numbers of subjects enrolled in the studies, which limits the statistical analyses of safety and efficacy.
 - The evaluation of marijuana only after acute administration in the studies, which limits the ability to determine efficacy following chronic administration.
 - The administration of marijuana typically through smoking, which exposes ill patients to combusted material and introduces problems with determining the doses delivered.
 - The potential for subjects to identify whether they received marijuana or placebo, which breaks the blind of the studies.
 - The small number of cannabinoid naïve subjects, which limits the ability to determine safety and tolerability in these subjects.

- The low number of female subjects, which makes it difficult to generalize the study findings to subjects of both genders.

Thus, this review discusses the following methodological changes that may be made in order to resolve these limitations and improve the design of future studies which examine the safety and efficacy of marijuana for specific therapeutic indications:

- Determine the appropriate number of subjects studied based on recommendations in various FDA *Guidances for Industry* regarding the conduct of clinical trials for specific medical indications.
 - Administer consistent and reproducible doses of marijuana based on recommendations in the FDA *Guidance for Industry: Botanical Drug Products (2004)*.²⁷
 - Evaluate the effects of marijuana under therapeutic conditions following both acute and chronic administration.
 - Consider alternatives to smoked marijuana (e.g., vaporization).
 - Address and improve whenever possible the difficulty in blinding of marijuana and placebo treatments in clinical studies.
 - Evaluate the effect of prior experience with marijuana with regard to the safety and tolerability of marijuana.
 - Strive for gender balance in the subjects used in studies.

In conclusion, the eleven clinical studies conducted to date do not meet the criteria required by the FDA to determine if marijuana is safe and effective in specific therapeutic areas. However, the studies can serve as proof-of-concept studies and support further research into the use of marijuana in these therapeutic indications. Additionally, the clinical outcome data and adverse event profiles reported in these published studies can beneficially inform how future research in this area is conducted. Finally, application of the recommendations listed above by investigators when designing future studies could greatly improve the available clinical data that can be used to determine if marijuana has validated and reliable medical applications.

1. Introduction

In response to citizen petitions submitted to the Drug Enforcement Administration (DEA) requesting DEA to reschedule marijuana, the DEA Administrator requested that the U.S. Department of Health and Human

²⁷ This Guidance is available on the internet at <http://www.fda.gov/Drugs/default.htm> under Guidance (Drugs).

Services (HHS) provide a scientific and medical evaluation of the available information and a scheduling recommendation for marijuana, in accordance with 21 U.S.C. 811(b). The Secretary of HHS is required to consider in a scientific and medical evaluation eight factors determinative of control under the Controlled Substance Act (CSA). Administrative responsibilities for evaluating a substance for control under the CSA are performed by the Food and Drug Administration (FDA), with the concurrence of the National Institute on Drug Abuse (NIDA). Part of this evaluation includes an assessment of whether marijuana has a currently accepted medical use in the United States. This assessment necessitated a review of the available data from published clinical studies to determine whether there is adequate scientific evidence of marijuana's effectiveness.

Under Section 202 of the CSA, marijuana is currently controlled as a Schedule I substance (21 U.S.C. 812). Schedule I includes those substances that have a high potential for abuse, have no currently accepted medical use in treatment in the United States, and lack accepted safety for use under medical supervision (21 U.S.C. § 812(b)(1)(A)–(C)).

A drug product which has been approved by FDA for marketing in the United States is considered to have a "currently accepted medical use." Marijuana is not an FDA-approved drug product, as a New Drug Application (NDA) or Biologics License application (BLA) for marijuana has not been approved by FDA. However, FDA approval of an NDA is not the only means through which a drug can have a currently accepted medical use in the United States.

In general, a drug may have a "currently accepted medical use" in the United States if the drug meets a five-part test. Established case law (*Alliance for Cannabis Therapeutics v. DEA*, 15 F.3d 1131, 1135 (D.C. Cir. 1994)) upheld the Administrator of DEA's application of the five-part test to determine whether a drug has a "currently accepted medical use." The following describes the five elements that characterize "currently accepted medical use" for a drug:²⁸

i. the drug's chemistry must be known and reproducible.

"The substance's chemistry must be scientifically established to permit it to be reproduced into dosages which can be standardized. The listing of the substance in a current edition of one of the official compendia, as defined by

section 201(j) of the Food, Drug and Cosmetic Act, 21 U.S.C. 321(j), is sufficient to meet this requirement."

ii. there must be adequate safety studies.

"There must be adequate pharmacological and toxicological studies, done by all methods reasonably applicable, on the basis of which it could fairly and responsibly be concluded, by experts qualified by scientific training and experience to evaluate the safety and effectiveness of drugs, that the substance is safe for treating a specific, recognized disorder."

iii. there must be adequate and well-controlled studies proving efficacy.

"There must be adequate, well-controlled, well-designed, well-conducted, and well-documented studies, including clinical investigations, by experts qualified by scientific training and experience to evaluate the safety and effectiveness of drugs, on the basis of which it could be fairly and responsibly concluded by such experts that the substance will have the intended effect in treating a specific, recognized disorder."

iv. the drug must be accepted by qualified experts.

"The drug has a New Drug Application (NDA) approved by the Food and Drug Administration, pursuant to the Food, Drug and Cosmetic Act, 21 U.S.C. 355. Or, a consensus of the national community of experts, qualified by scientific training and experience to evaluate the safety and effectiveness of drugs, accepts the safety and effectiveness of the substance for use in treating a specific, recognized disorder. A material conflict of opinion among experts precludes a finding of consensus." and

v. the scientific evidence must be widely available.

"In the absence of NDA approval, information concerning the chemistry, pharmacology, toxicology, and effectiveness of the substance must be reported, published, or otherwise widely available, in sufficient detail to permit experts, qualified by scientific training and experience to evaluate the safety and effectiveness of drugs, to fairly and responsibly conclude the substance is safe and effective for use in treating a specific, recognized disorder."

One way to pass the five-part test for having "currently accepted medical use" is through submission of an NDA or BLA which is approved by FDA. However, FDA approval of an NDA or BLA is not required for a drug to pass the five-part test.

This review focuses on FDA's analysis of one element of the five-part test for determining whether a drug has

"currently accepted medical use". Specifically, the present review assesses the 3rd criterion that addresses whether marijuana has "adequate and well-controlled studies proving efficacy". Thus, this review evaluates published clinical studies that have been conducted using marijuana in subjects who have a variety of medical conditions by assessing the adequacy of the summarized study designs and the study data. The methodology for selecting the studies that were evaluated is delineated below.

FDA's evaluation and conclusions regarding the remaining four criteria for whether marijuana has a "currently accepted medical use," as well as the eight factors pertaining to the scheduling of marijuana, are outside the scope of this review. A detailed discussion of these factors is contained in FDA's scientific and medical evaluation of marijuana.

2. Methods

The methods for selecting the studies to include in this review involved the following steps, which are described in detail in the subsections below:

1. Define the objective of the review.
2. Define "marijuana" in order to facilitate the medical literature search for studies that administered the substance,
3. Define "adequate and well-controlled studies" in order to facilitate the search for relevant data and literature,
4. Search medical literature databases and identify relevant adequate and well-controlled studies, and
5. Review and analyze the adequate and well-controlled clinical studies to determine if they demonstrate efficacy of marijuana for any therapeutic indication.

2.1 Define the Objective of the Review

The objective of this review is to assess the study designs and resulting data from clinical studies published in the medical literature that were conducted with marijuana (as defined below) as a treatment for any therapeutic indication, in order to determine if they meet the criteria of "adequate and well-controlled studies proving efficacy".

2.2 Define "Marijuana"

In this review, the term "marijuana" refers to the flowering tops or leaves of the *Cannabis* plant. There were no restrictions on the route of administration used for marijuana in the studies.

Studies which administered individual cannabinoids (whether

²⁸ 57 FR 10499, 10504–06 (March 26, 1992).

experimental substances or marketed drug products) or marijuana extracts were excluded from this review. Additionally, studies of administered neutral plant material or placebo marijuana (marijuana with all cannabinoids extracted) that had subsequently been supplemented by the addition of specific amounts of THC or other cannabinoids were also excluded (Chang et al., 1979).

2.3 Define “Adequate and Well-Controlled Clinical Studies”

The criteria for an “adequate and well-controlled study” for purposes of determining the safety and efficacy of a human drug is defined under the Code of Federal Regulations (CFR) in 21 CFR 314.126. The elements of an adequate and well-controlled study as described in 21 CFR 314.126 can be summarized as follows:

1. The main objective must be to assess a therapeutically relevant outcome.
2. The study must be placebo-controlled.
3. The subjects must qualify as having the medical condition being studied.
4. The study design permits a valid comparison with an appropriate control condition.
5. The assignment of subjects to treatment and control groups must be randomized.
6. There is minimization of bias through the use of a double-blind study design.
7. The study report contains a full protocol and primary data.
8. Analysis of the study data is appropriately conducted.

As noted above, the current review examines only those data available in the public domain and thus relies on clinical studies published in the medical literature. Published studies by their nature are summaries that do not include the level of detail required by studies submitted to FDA in an NDA.

While the majority of the elements defining an adequate and well-controlled study can be satisfied through a published paper (elements #1–6), there are two elements that cannot be met by a study published in the medical literature: element #7 (availability of a study report with full protocol and primary data) and element #8 (a determination of whether the data analysis was appropriate). Thus, for purposes of this review, only elements #1–6 will be used to qualify a study as being adequate and well-controlled.

2.4 Search Medical Literature Databases and Identify Relevant Studies

We identified randomized, double-blind, placebo-controlled clinical studies conducted with marijuana to assess marijuana’s efficacy in any therapeutic indication. Two primary medical literature databases were searched for all studies posted to the databases prior to February 2013:²⁹

- *PubMed*: PubMed is a database of published medical and scientific studies that is maintained by the U.S. National Library of Medicine (NLM) at NIH as a part of the Entrez system of information retrieval. PubMed comprises more than 24 million citations for biomedical literature from MEDLINE, life science journals, and online books (<http://www.ncbi.nlm.nih.gov/pubmed>).

- *ClinicalTrials.gov*: ClinicalTrials.gov is a database of publicly and privately supported clinical studies that is maintained by the NLM. Information about the clinical studies is provided by the Sponsor or Principal Investigator of the study. Information about the studies is submitted to the Web site (“registered”)

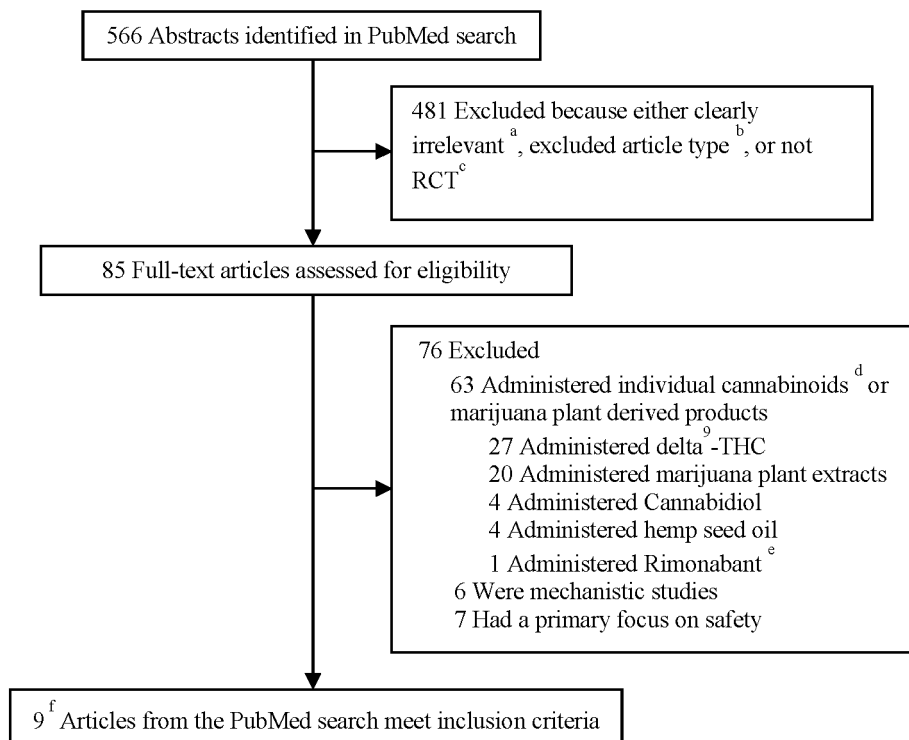

²⁹ While not a systematic review, we have followed the recent published literature on marijuana use for possible therapeutic purposes and, as of January 2015, we found only one new study that would meet our criteria (Naftali et al., 2013). This study examined the effects of smoked marijuana on Crohn’s disease.

when the studies begin, and is updated throughout the study. In some cases, results of the study or resulting publication citations are submitted to the Web site after the study ends (<https://clinicaltrials.gov/ct2/about-site/background>).

ClinicalTrials.gov was searched for all studies administering marijuana. The results of this search were used to confirm that no completed studies with published data were missed in the literature search. During the literature search, references found in relevant studies and systematic reviews were evaluated for additional relevant citations. All languages were included in the search. The PubMed search yielded a total of 566 abstracts.³⁰ Of these abstracts, a full-text review was conducted with 85 papers to assess eligibility. From this evaluation, only eleven of 85 studies met the 6 CFR elements for inclusion as adequate and well-controlled studies.

Figure 1 (below) provides an overview of the process used to identify studies from the PubMed search. The eleven studies reviewed were published between 1974 and 2013. Ten of these studies were conducted in the United States and one study was conducted in Canada. These eleven studies examined the effects of smoked and vaporized marijuana for the indications of chronic neuropathic pain, spasticity related to multiple sclerosis (MS), appetite stimulation in patients with human immunodeficiency virus (HIV), glaucoma, and asthma. All included studies used adult patients as subjects. All studies conducted in the United States were conducted under an IND as Phase 2 investigations.

³⁰ The following search strategy was used, “(cannabis OR marijuana) AND (therapeutic use OR therapy) AND (RCT OR randomized controlled trial OR “systematic review” OR clinical trial OR clinical trials) NOT (“marijuana abuse” [Mesh] OR addictive behavior OR substance related disorders)”.

Figure 1: Identification of Studies from PubMed Search

^a Articles were deemed irrelevant if they examined safety or adverse event related outcomes, including psychoactive effects or other adverse events. ^b Excluded article types included comments, reviews, meta-analyses, and news articles. ^c Randomized Controlled Trials. ^d Cannabinoids administered included synthetic cannabinoids. ^e Rimonabant is a cannabinoid receptor antagonist. ^f An additional 2 studies meeting the inclusion criteria were found through

Two qualifying studies, which assessed marijuana for glaucoma, were previously reviewed in the 1999 Institute of Medicine (IOM) report entitled “Marijuana and Medicine: Assessing the Science Base”.³¹ We did our own analysis of these two studies and concurred with the conclusions in the IOM report. Thus, a detailed discussion of the two glaucoma studies is not included in the present review. The present review only discusses 9 of the identified 11 studies. For a summary of the study design for all eleven qualifying studies, see Tables 1–5 (located in the Appendix).

Based on the selection criteria for relevant studies described in Section 2.3 (Define Adequate and Well-Controlled

Clinical Studies), a number of clinical studies that investigated marijuana, as defined in this review, were excluded from this review. Studies that examined the effects of marijuana in healthy subjects were excluded because they did not test a patient population with a medical condition (Flom et al., 1975; Foltin et al., 1986; Foltin et al., 1988; Hill et al., 1974; Milstein et al., 1974; Milstein et al., 1975; Soderpalm et al., 2001; Wallace et al., 2007; Greenwald and Stitzer, 2000). A 1975 study by Tashkin et al. was excluded because it had a single-blind, rather than double-blind, study design. Two other studies were excluded because the primary outcome measure assessed safety rather than a therapeutic outcome (Greenberg et al., 1994; Abrams et al., 2003).

2.5 Review and Analyze Qualifying Clinical Studies

Qualified clinical studies that evaluated marijuana for therapeutic purposes were examined in terms of adequacy of study design including method of drug administration, study size, and subject inclusion and exclusion criteria. Additionally, the

measures and methods of analysis used in the studies to assess the treatment effect were examined.

3. Results and Discussion

The eleven qualifying studies in this review assessed a variety of therapeutic indications. In order to better facilitate analysis and discussion of the studies, the following sections group the studies by therapeutic area. Within each section, each individual study is summarized in terms of its design, outcome data and important limitations. This information is also provided in the Appendix in tabular form for each study.

3.1 Neuropathic Pain

Five randomized, double-blind, placebo-controlled Phase 2 clinical studies have been conducted to examine the effects of inhaled marijuana smoke on neuropathic pain associated with HIV-sensory neuropathy (Abrams et al., 2007; Ellis et al., 2009) and chronic neuropathic pain from multiple causes (Wilsey et al., 2008; Ware et al., 2010; Wilsey et al., 2013). Table 1 of the Appendix summarizes these studies.

³¹ In January 1997, the White House Office of National Drug Control Policy (ONDCP) requested that the IOM conduct a review of the scientific evidence to assess the potential health benefits and risks of marijuana and its constituent cannabinoids. Information for this study was gathered through scientific workshops, site visits to cannabis buyers' clubs and HIV/Acquired Immunodeficiency Syndrome (AIDS) clinics, analysis of the relevant scientific literature, and extensive consultation with biomedical and social scientists. The report was finalized and published in 1999.

3.1.1 Neuropathic Pain Associated with HIV-Sensory Neuropathy

Two studies examined the effect of marijuana to reduce the pain induced by HIV-sensory neuropathy.

Abrams et al. (2007) conducted the first study entitled, “Cannabis in painful HIV-associated sensory neuropathy: A randomized placebo-controlled trial”. The subjects were 50 adult patients with uncontrolled HIV-associated sensory neuropathy, who had at least 6 experiences with smoking marijuana. The subjects were split into two parallel groups of 25 subjects each. More than 68% of subjects were current marijuana users, but all individuals were required to discontinue using marijuana prior to the study. Most subjects were taking medication for pain during the study, with the most common medications being opioids and gabapentin. Upon entry into the study, subjects had an average daily pain score of at least 30 on a 0–100 visual analog scale (VAS).

Subjects were randomized to receive either smoked marijuana (3.56% THC³²) or smoked placebo cigarettes three times per day for 5 days, using a standardized cued smoking procedure: (1) 5 second inhale, (2) 10 second holding smoke in the lungs, (3) 40 second exhale and breathing normally between puffs. The authors did not specify how many puffs the subjects smoked at each smoking session, but they stated that one cigarette was smoked per smoking session.

Primary outcome measures included daily VAS ratings of chronic pain and the percentage of subjects who reported a result of more than 30% reduction in pain intensity. The ability of smoked marijuana to induce acute analgesia was assessed using both thermal heat model and capsaicin sensitization model, while anti-hyperalgesia was assessed with brush and von Frey hair stimuli. The immediate analgesic effects of smoked marijuana was assessed using a 0–100 point VAS at 40-minute intervals three times before and three times after the first and last smoking sessions, which was done to correspond to the time of peak plasma cannabinoid levels. Notably, not all subjects completed the induced pain portion of the study (n = 11 in marijuana group, 9 in placebo group) because of their inability to tolerate the stimuli. Throughout the study, subjects also completed the Profile of Mood States (POMS)

questionnaire, as well as subjective VAS measures of anxiety, sedation, disorientation, paranoia, confusion, dizziness, and nausea.

As a result, the median daily pain was reduced 34% by smoked marijuana compared to 17% by placebo ($p = 0.03$). Fifty-two percent of subjects who smoked marijuana reported a >30% reduction in pain compared to 24% in the placebo group ($p = 0.04$). Although marijuana reduced experimentally-induced hyperalgesia ($p \leq 0.05$) during the first smoking sessions, marijuana did not alter responses to acutely painful stimuli.

There were no serious AEs and no episodes of hypertension, hypotension, or tachycardia requiring medical intervention. No subjects withdrew from the study for drug related reasons. Subjects in the marijuana group reported higher ratings on the subjective measures of anxiety, sedation, disorientation, confusion, and dizziness compared to the placebo group. There was one case of severe dizziness in a marijuana-treated subject. By the end of the study, subjects treated with marijuana and placebo reported a reduction in total mood disturbance as measured by POMS.

The authors conclude that smoked marijuana effectively reduced chronic neuropathic pain from HIV-associated sensory neuropathy with tolerable side effects. However, limitations of this study include: maintenance of subjects on other analgesic medication while being tested with marijuana and a lack of information about the number of puffs during each inhalation of smoke. These limitations make it difficult to conclude that marijuana has analgesic properties on its own and that the actual AEs experienced during the study in response to marijuana are tolerable. However, the study produced positive results suggesting that marijuana should be studied further as an adjunct treatment for uncontrolled HIV-associated sensory neuropathy.

Ellis et al. (2009) conducted a more recent study entitled “Smoked medicinal cannabis for neuropathic pain in HIV: A randomized, crossover clinical trial”. The subjects were 28 HIV-positive adult male patients with intractable neuropathic pain that was refractory to the effects of at least two drugs taken for analgesic purposes. Upon entry into the study, subjects had a mean score of >5 on the Pain Intensity subscale of the Descriptor Differential Scale (DDS). Subjects were allowed to continue taking their current routine of pain medications, which included opioids, non-narcotic analgesics, antidepressants, and anticonvulsants.

Previous experience with marijuana was not required for participation in the study, but 27 of 28 subjects (96%) reported previous experience with marijuana. However, of these 27 experienced subjects, 63% (n = 18) reported no marijuana use within the past year.

The study procedures compared the effects of the target dose of marijuana and placebo during two treatment periods lasting 5 days, with 2 weeks washout periods. The marijuana strengths available were 1%, 2%, 4%, 6%, or 8% THC concentration by weight. Subjects smoked marijuana or placebo cigarettes four times per day, approximately 90–120 minutes apart, using a standardized cued smoking procedure: (1) 5 second smoke inhalation, (2) 10 second hold of smoke in lungs, (3) 40 second exhale and normal breathing between puffs. The investigators did not provide a description of the number of puffs taken at any smoking session. All subjects practiced the smoking procedures using placebo marijuana prior to test sessions.

On the first day of each test period, dose titration occurred throughout the four smoking sessions scheduled for that day, with a starting strength of 4% THC concentration. Subjects were allowed to titrate to a personalized “target dose”, which was defined as the dose that provided the best pain relief without intolerable adverse effects. This dose titration was accomplished by allowing subjects to either increase the dose incrementally (to 6% or 8% THC) to improve analgesia, or to decrease the dose incrementally (to 1% or 2% THC) if AEs were intolerable. For the next 4 days of each test period, the subjects smoked their target dose during each of the four daily smoking sessions. To maintain the blind, placebo marijuana was represented as containing 1%–8% THC, even though it did not contain any cannabinoids.

The primary outcome measure was the change in pain magnitude on the DDS at the end of each test period compared to baseline, with a clinically significant level of analgesia considered to be a reduction in pain of at least 30%. Additional measures included the POMS, the Sickness Impact Profile (SIP), the Brief Symptom Inventory (BSI) and the UKU Side Effect Rating Scale and a subjective highness/sedation VAS.

During the marijuana treatment week, 19 subjects titrated to the 2%–4% THC dose while the 6%–8% dose was preferred by 8 subjects and 1 subject chose the 1% dose. In contrast, during the placebo treatment week, all 28 subjects titrated to the highest possible

³²The drug dose is reported as percentage of THC present in the marijuana rather than milligrams of THC present in each cigarette because of the difficulty in determining the amount of THC delivered by inhalation (see discussion in the section entitled “3.7.2 Marijuana Dose Standardization”).

dose of “8% THC” that contained no actual cannabinoids, suggesting that placebo treatment provided little analgesic relief.

The degree of pain reduction was significantly greater after administration of marijuana compared to placebo (median change of 3.3 points on DDS, $p = 0.016$). The median change from baseline in VAS pain scores was -17 for marijuana treatment compared to -4 for placebo treatment ($p < 0.001$). A larger proportion of subjects who were treated with marijuana (0.46) reported a $>30\%$ reduction in pain, compared to placebo (0.18). Additionally, the authors report improvements in total mood disturbance, physical disability, and quality of life as measured on POMS, SIP, and BSI scales after both placebo and marijuana treatment (data not provided in paper).

In terms of safety, there were no alterations in HIV disease parameters in response to marijuana or placebo. The authors report that marijuana led to a greater degree of UKU responses as well as AEs such as difficulty in concentration, fatigue, sleepiness or sedation, increased duration of sleep, reduced salivation and thirst compared to placebo (data not provided in paper). Two subjects withdrew from the study because of marijuana-related AEs: one subject developed an intractable smoking-related cough during marijuana administration and the sole marijuana-naïve subject in the study experienced an incident of acute cannabis-induced psychosis.³³

The authors conclude that smoked marijuana effectively reduced chronic neuropathic pain from HIV-associated sensory neuropathy. The limitations of this study include: a lack of information about the number of puffs during each inhalation of smoke; a lack of information about the specific timing of the subjective assessments and collection of AEs relative to initiation of the smoking sessions; and the inclusion of only one marijuana-naïve subject. These limitations make it difficult to conclude that the actual AEs experienced during the study in response to marijuana are tolerable. It is especially concerning that the only marijuana-naïve subject left the study because of serious psychiatric responses

³³ At the time of the study, the following criteria from the Diagnostic and Statistical Manual of Mental Disorders (DSM-IV-TR, 2000) were used to diagnose substance-induced psychotic disorders: Prominent hallucinations or delusions; Hallucinations and/or delusions that develop during, or within one month of, intoxication or withdrawal; The disturbance is not better accounted for by a psychotic disorder that is not substance induced. The disturbance does not occur exclusively during the course of a delirium.

to marijuana exposure at analgesic doses. However, the study produced positive results suggesting that marijuana should be studied further as an adjunct treatment for uncontrolled HIV-associated sensory neuropathy.

3.1.2 Central and Peripheral Neuropathic Pain

Three studies examined the effect of marijuana on chronic neuropathic pain.

Wilsey et al. (2008) examined chronic neuropathic pain from multiple causes in the study entitled, “A Randomized, Placebo-Controlled, Crossover Trial of Cannabis Cigarettes in Neuropathic Pain”. The subjects were 32 patients with a variety of neuropathic pain conditions, including 22 with complex regional pain syndrome, 6 with spinal cord injury, 4 with multiple sclerosis, 3 with diabetic neuropathy, 2 with ilioinguinal neuralgia, and 1 with lumbosacral plexopathy. All subjects reported a pain intensity of at least 30 on a 0–100 VAS and were allowed to continue taking their regular medications during the study period, which included opioids, antidepressants, anticonvulsants, and NSAIDs. All subjects were required to have experience with marijuana but could not use any cannabinoids for 30 days before study sessions.

The study consisted of three test sessions with an interval of 3–21 days between sessions. Treatment conditions were high-strength marijuana (7% delta-9-THC), low-strength marijuana (3.5% delta-9-THC), and placebo cigarettes, administered through a standardized cue-puff procedure: (1) “light the cigarette” (30 seconds), (2) “get ready” (5 seconds), (3) “inhale” (5 seconds), (4) “hold smoke in lungs” (10 seconds), (5) “exhale,” and (6) wait before repeating the puff cycle (40 seconds). Participants took 2 puffs after baseline measurements, 3 puffs an hour later, and 4 puffs an hour after that, for a cumulative dose of 9 puffs per test session.

Hourly assessment periods were scheduled before and after each set of puffs and for 2 additional hours during the recovery period. Plasma cannabinoids were measured at baseline, 5 minutes after the first puff and again at 3 hours after the last puff cycle.

The primary outcome measure was spontaneous pain relief, as measured by a 0–100 point VAS for current pain. Pain unpleasantness was measured on a 0–100 point VAS, and degree of pain relief was measured on a 7-point Patient Global Impression of Change (PGIC) scale. Secondary measures included the Neuropathic Pain Scale (NPS), a 0–100

point VAS for allodynia, and changes in thermal pain threshold. Subjective measures were also evaluated with unipolar 0–100 point VAS for any drug effect, good drug effect, bad drug effect, high, drunk, impaired, stoned, like the drug effect, sedated, confused, nauseated, desire more of the drug, anxious, down, hungry, and bipolar 0–100 point VAS for sad/happy, anxious/relaxed, jittery/calm, bad/good, paranoid/self-assured, fearful/unafraid. Neurocognitive assessments measured attention and concentration, learning and memory, and fine motor speed.

Marijuana produced a reduction in pain compared to placebo, as measured by the pain VAS, the PGIC and on pain descriptors in the NPS, including sharp ($P < .001$), burning ($P < .001$), aching ($P < .001$), sensitive ($P = .03$), superficial ($P < .01$) and deep pain ($P < .001$). Notably, there were no additional benefits from the 7% THC strength of marijuana compared to the 3.5% THC strength, seemingly because of cumulative drug effects over time. There were no changes in allodynia or thermal pain responsivity following administration of either dose of marijuana.

Marijuana at both strengths produced increases on measures of any drug effect, good drug effect, high, stoned, impairment, sedation, confusion, and hunger. The 7% THC marijuana increased anxiety scores and bad drug effect (later in session) compared to placebo. Neither strength of marijuana affected the measures of mood. On neurocognitive measures, both the 3.5% THC and 7% THC marijuana produced impairment in learning and memory, while only the 7% THC marijuana impaired attention and psychomotor speed, compared to placebo. There were no adverse cardiovascular side effects and no subjects dropped out because of an adverse event related to marijuana.

The authors conclude that marijuana may be effective at ameliorating neuropathic pain at doses that induce mild cognitive effects, but that smoking is not an optimum route of administration. The limitations of this study include: inclusion of subjects with many forms of neuropathic pain and maintenance of subjects on other analgesic medication while being tested with marijuana. These limitations make it difficult to conclude that marijuana has analgesic properties on its own and that the actual AEs experienced during the study in response to marijuana are tolerable. The authors compared pain score results by the type of pain condition, with no significant differences found; however, the sample size of this study was small thus a type II error may have been present. Thus, it

is difficult to determine if any particular subset of neuropathic pain conditions would benefit specifically from marijuana administration. However, the study produced positive results suggesting that marijuana should be studied further as an adjunct treatment for uncontrolled neuropathic pain.

The second study, conducted by Ware et al. (2010) in Canada is entitled, "Smoked cannabis for chronic neuropathic pain: a randomized controlled trial". The subjects were 21 adult patients with neuropathic pain caused by trauma or surgery compounded with allodynia or hyperalgesia, and a pain intensity score greater than 4 on a 10 point VAS. All subjects maintained their current analgesic medication and they were allowed to use acetaminophen for breakthrough pain. Eighteen subjects had previous experience with marijuana but none of them had used marijuana within a year before the study.

The study design used a four-period crossover design, testing marijuana (2.5%, 6.0% and 9.4% THC) and placebo marijuana. The 2.5% and 6.0% doses of marijuana were included to increase successful blinding. Each period was 14 days in duration, beginning with 5 days on the study drug followed by a 9-day washout period. Doses were delivered as 25 mg of marijuana that was smoked in a single inhalation using a titanium pipe. The first dose of each period was self-administered using a standardized puff procedure: (1) Inhale for 5 seconds, (2) hold the smoke in their lungs for 10 seconds, and (3) exhale. Subsequent doses were self-administered in the same manner for a total of three times daily at home on an outpatient basis for the first five days of each period.

The primary measure was an 11-point pain intensity scale, averaged over the 5 day treatment period, which was administered once daily for present, worst, least and average pain intensity during the previous 24 hours. Secondary measures included an acute pain 0–100 point VAS, pain quality assessed with the McGill Pain Questionnaire, sleep assessed with the Leeds Sleep Evaluation Questionnaire, mood assessed with the POMS, quality of life assessed using the EQ-5D health outcome instrument. Subjective measures included 0–100 point VAS scales for high, relaxed, stressed and happy.

Over the first three hours after smoking marijuana, ratings of pain, high, relaxation, stress, happiness and heart rate were recorded. During the five days of each study period, participants were contacted daily to administer

questionnaires on pain intensity, sleep, medication and AEs. Subjects returned on the fifth day to complete questionnaires on pain quality, mood, quality of life and assessments of potency. At the end of the study, participants completed final adverse event reports and potency assessments.

The average daily pain intensity was significantly lower on 9.4% THC marijuana (5.4) than on placebo marijuana (6.1) ($p = 0.023$). The 9.4% THC strength also produced more drowsiness, better sleep, with less anxiety and depression, compared to placebo (all $p < 0.05$). However, there were no significant differences on POMS scores or on VAS scores for high, happy, relaxed or stressed between THC doses.

The most frequent drug-related adverse events reported in the group receiving 9.4% THC marijuana were headache, dry eyes, burning sensation, dizziness, numbness and cough. Reports of high and euphoria occurred on only three occasions, once in each dose of THC. There were no significant changes in vital signs, heart-rate variability, or renal function. One subject withdrew from the study due to increased pain during administration of 6% THC marijuana.

The authors conclude that smoked marijuana reduces neuropathic pain, improves mood and aids in sleep, but that smoking marijuana is not a preferable route of administration. The limitations of this study include: The lack of information on timing of assessments during the outpatient portion of the study and maintenance of subjects on other analgesic medication while being tested with marijuana. These limitations make it difficult to conclude that marijuana has analgesic properties on its own and that the actual AEs experienced during the study in response to marijuana are tolerable. However, the study produced positive results suggesting that marijuana should be studied further as an adjunct treatment for uncontrolled neuropathic pain.

Wilsey et al. (2013) conducted the most recent study entitled, "Low-Dose Vaporized Cannabis Significantly Improves Neuropathic Pain". This study is the only one in this review that utilized vaporization as a method of marijuana administration. The subjects were 36 patients with a neuropathic pain disorder (CRPS, thalamic pain, spinal cord injury, peripheral neuropathy, radiculopathy, or nerve injury) who were maintained on their current medications (opioids, anticonvulsants, antidepressants, and NSAIDs). Although subjects were

required to have a history of marijuana use, they refrained from use of cannabinoids for 30 days before study sessions.

Subjects participated in three sessions in which they received 1.29% or 3.53% THC marijuana or placebo marijuana. The marijuana was vaporized using the Volcano vaporizer and a standardized cued-puff procedure: (1) "hold the vaporizer bag with one hand and put the vaporizer mouthpiece in their mouth" (30 seconds), (2) "get ready" (5 seconds), (3) "inhale" (5 seconds), (4) "hold vapor in lungs" (10 seconds), (5) "exhale and wait" before repeating puff cycle (40 seconds). Subjects inhaled 4 puffs at 60 minutes. At 180 minutes, the vaporizer was refilled with marijuana vapor and subjects were allowed to inhale 4 to 8 puffs using the cued procedure. Thus, cumulative dosing allowed for a range of 8 to 12 puffs in total for each session, depending on the subjects desired response and tolerance. The washout time between each session ranged from 3–14 days.

The primary outcome variable was spontaneous pain relief, as assessed using a 0–100 point VAS for current pain. Secondary measures included the Patient Global Impression of Change (PGIC), the Neuropathic Pain Scale (NPS), a 0–100 point VAS for allodynia. Acute pain threshold was measured with a thermal pain model. Subjective measures included 0–100 point unipolar VAS for any drug effect, good drug effect, bad drug effect, high, drunk, impaired, stoned, drug liking, sedated, confused, nauseated, desire more drug, anxious, down and hungry. Bipolar 0–100 point VAS included sad/happy, anxious/relaxed, jittery/calm, bad/good, paranoid/self-assured, and fearful/unafraid. Neurocognitive assessments assessed attention and concentration, learning and memory, and fine motor speed.

A 30% reduction in pain was achieved in 61% of subjects who received the 3.53% THC marijuana, in 57% of subjects who received the 1.29% THC marijuana and in 26% of subjects who received the placebo marijuana ($p = 0.002$ for placebo vs. 3.53% THC, $p = 0.007$ for placebo vs 1.29% THC; $p > 0.05$ 1.29% THC vs. 3.53% THC). Both strengths of marijuana significantly decreased pain intensity, unpleasantness, sharpness, and deepness on the NPS, as well as pain ratings on the PGIC, compared to placebo. These effects on pain were maximal with cumulative dosing over the course of the study session, with maximal effects at 180 minutes. There were no effects of marijuana compared to placebo on measures of allodynia or

thermal pain. Subjects correctly identified the study treatment 63% of the time for placebo, 61% of the time for 1.29% THC, and 89% of the time for 3.53% THC.

On subjective measures, marijuana produced dose-dependent increases compared to placebo on ratings for: any drug effect, good drug effect, drug liking, high, stoned, sedated, confused, and hungry. Both strengths of marijuana produced similar increases in drunk or impaired compared to placebo. In contrast, desire for drug was rated as higher for the 1.29% THC marijuana compared to the 3.53% THC marijuana. There were no changes compared to placebo for bad effect, nauseous, anxiety, feeling down or any of the bipolar mood assessments. There was dose-dependent impairment on learning and memory from marijuana compared to placebo, but similar effects between the two strengths of marijuana on attention.

The authors conclude that vaporization of relatively low doses of marijuana can produce improvements in analgesia in neuropathic pain patients, especially when patients are allowed to titrate their exposure. However, this individualization of doses may account for the general lack of difference between the two strengths of marijuana. No data were presented regarding the total amount of THC consumed by each subject, so it is difficult to determine a proper dose-response evaluation. Additional limitations of this study are the inclusion of subjects with many forms of neuropathic pain and maintenance of subjects on other analgesic medication while being tested with marijuana. These limitations make it difficult to conclude that marijuana has analgesic properties on its own. It is also difficult to determine if any particular subset of neuropathic pain conditions would benefit specifically from marijuana administration. However, the study produced positive results suggesting that marijuana should be studied further as an adjunct treatment for uncontrolled neuropathic pain.

3.2 Appetite Stimulation in HIV

Two randomized, double-blind, placebo-controlled Phase 2 studies examined the effects of smoked marijuana on appetite in HIV-positive subjects (Haney et al., 2005; Haney et al., 2007). Table 2 of the Appendix summarizes both studies.

The first study, conducted by Haney et al. (2005) is entitled, "Dronabinol and marijuana in HIV+ marijuana smokers: acute effects on caloric intake and mood". The subjects were 30 HIV-

positive patients who were maintained on two antiretroviral medications and either had clinically significant decreases in lean muscle mass³⁴ (low-BIA group, n = 15) or normal lean muscle mass (normal-BIA group, n = 15). All subjects had a history of smoking marijuana at least twice weekly for 4 weeks prior to entry into the study. On average, individuals had smoked 3 marijuana cigarettes per day, 5–6 times per week for 10–12 years.

Subjects participated in 8 sessions that tested the acute effects of 0, 10, 20, and 30 mg dronabinol oral capsules and marijuana cigarettes with 0%, 1.8%, 2.8%, and 3.9% THC concentration by weight, using a double-dummy design (with only one active drug per session). The doses of dronabinol are higher than those doses typically prescribed for appetite stimulation in order to help preserve the blinding. There was a one-day washout period between test sessions.

Marijuana was administered using a standardized cued procedure: (1) "light the cigarette" (30 seconds), (2) "prepare" (5 seconds), (3) "inhale" (5 seconds), (4) "hold smoke in lungs" (10 seconds), and (5) "exhale." Each subject smoked three puffs in this manner, with a 40-second interval between each puff.

Caloric intake was used as a surrogate measure for weight gain. Subjects received a box containing a variety of food and beverage items and were told to record consumption of these items following that day's administration of the test drug. Subjective measures included 0–100 point VAS for feel drug effect, good effect, bad effect, take drug again, drug liking, hungry, full, nauseated, thirsty, desire to eat. Neurocognitive measures and vital signs were monitored.

The low BIA group consumed significantly more calories in the 1.8% and 3.9% THC marijuana conditions ($p < 0.01$) and the 10, 20, and 30 mg dronabinol conditions ($p < 0.01$) compared with the placebo condition. In contrast, in the normal BIA group, neither marijuana nor dronabinol significantly affected caloric intake. This lack of effect may be accountable, however, by the fact that this group consumed approximately 200 calories more than the low BIA group under baseline conditions.

Ratings of high and good drug effect were increased by all drug treatments in both the low-BIA and normal-BIA groups, except in response to the 10 mg

dose of dronabinol. The 3.9% THC marijuana increased ratings of good drug effect, drug liking and desire to smoke again compared with placebo. Ratings of sedation were increased in both groups by 10 and 30 mg dronabinol, and in the normal BIA group by the 2.8% THC marijuana. Ratings of stimulation were increased in the normal BIA group by 2.8% and 3.9% THC marijuana and by 20 mg dronabinol. Increases in ratings of forgetfulness, withdrawn, dreaming, clumsy, heavy limbs, heart pounding, jittery, and decreases in ratings of energetic, social, and talkative were reported in the normal BIA group with 30 mg dronabinol. There were no significant changes in vital signs or performance on neurocognitive measures in response to marijuana. Notably, the time course of subjective effects peaked quickly and declined thereafter for smoked marijuana, while oral dronabinol responses took longer to peak and persisted longer. Additionally, marijuana but not dronabinol produced dry mouth and thirst.

In general, AEs reported in this study were low in both drug conditions for both subject groups. In the low BIA group, nausea was reported by one subject in both the 10 and 20 mg dronabinol conditions, while an uncomfortable level of intoxication was produced by the 30 mg dose in two subjects. There were no AEs reported in this group following marijuana at any dose. In the normal BIA group, the 30 mg dose of dronabinol produced an uncomfortable level of intoxication in three subjects and headache in one subject, while the 3.9% marijuana produced diarrhea in one subject.

The authors conclude that smoked marijuana can acutely increase caloric intake in low BIA subjects without significant cognitive impairment. However, it is possible that the low degree of cognitive impairment reported in this study may reflect the development of tolerance to cannabinoids in this patient population, since all individuals had current histories of chronic marijuana use. Additional limitations in this study include not utilizing actual weight gain as a primary measure. However, the study produced positive results suggesting that marijuana should be studied further as a treatment for appetite stimulation in HIV patients.

A second study conducted by Haney et al. (2007) is entitled, "Dronabinol and marijuana in HIV-positive marijuana smokers: Caloric intake, mood, and sleep". The design of this study was nearly identical to the one conducted by this laboratory in 2005 (see above), but

³⁴ Lean muscle mass was assessed using bioelectrical impedance analysis (BIA). The low-BIA group was classified with having <90% BIA, and the normal-BIA group was classified with having >90% BIA.

there was no stratification of subjects by BIA. The subjects were 10 HIV-positive patients who were maintained on two antiretroviral medications and had a history of smoking marijuana at least twice weekly for 4 weeks prior to entry into the study. On average, individuals had smoked 3 marijuana cigarettes per day, 5 times per week for 19 years.

Subjects participated in 8 sessions that tested the acute effects of 0, 5 and 10 mg dronabinol oral capsules and marijuana cigarettes with 0, 2.0% and 3.9% THC concentration by weight, using a double-dummy design (with 4 sessions involving only one active drug and 4 interspersed placebo sessions). Both drug and placebo sessions lasted for 4 days each, with active drug administration occurring 4 times per day (every 4 hours). Testing occurred in two 16-day inpatient stays. In the intervening outpatient period, subjects were allowed to smoke marijuana prior to re-entry to the study unit for the second inpatient stay.

Marijuana was administered using a standardized cued procedure: (1) "light the cigarette" (30 seconds), (2) "prepare" (5 seconds), (3) "inhale" (5 seconds), (4) "hold smoke in lungs" (10 seconds), and (5) "exhale." Each subject smoked three puffs in this manner, with a 40-second interval between each puff.

Caloric intake was used as a surrogate measure for weight gain, but subjects were also weighed throughout the study (a measure which was not collected in the 2005 study by this group). Subjects received a box containing a variety of food and beverage items and were told to record consumption of these items following that day's administration of the test drug. Subjective measures included 0–100 point VAS for drug effect, good effect, bad effect, take drug again, drug liking, hungry, full, nauseated, thirsty, desire to eat. Neurocognitive measures and vital signs were monitored. Sleep was assessed using both the Nightcap sleep monitoring system and selected VAS measures related to sleep.

Both 5 and 10 mg dronabinol ($p < 0.008$) and 2.0% and 3.9% THC marijuana ($p < 0.01$) dose-dependently increased caloric intake compared with placebo. This increase was generally accomplished through increases in incidents of eating, rather than an increase in the calories consumed in each incident. Subjects also gained similar amounts of weight after the highest dose of each cannabinoid treatment: 1.2 kg (2.6 lbs) after 4 days of 10 mg dronabinol, and 1.1 kg (2.4 lbs) after 4 days of 3.9% THC marijuana. The 3.9% THC marijuana dose also

increased the desire to eat and ratings of hunger.

Ratings of good drug effect, high, drug liking, and desire to smoke again were significantly increased by 10 mg dronabinol and 2.0% and 3.9% THC marijuana doses compared to placebo. Both marijuana doses increased ratings of stimulated, friendly, and self-confident. The 10 mg dose of dronabinol increased ratings of concentration impairment, and the 2.0% THC marijuana dose increased ratings of anxious. Dry mouth was induced by 10 mg dronabinol (10 mg) and 2.0% THC marijuana. There were no changes in neurocognitive performance or objective sleep measures from administration of either cannabinoid. However, 3.9% THC marijuana increased subjective ratings of sleep.

The authors conclude that both dronabinol and smoked marijuana increase caloric intake and produce weight gain in HIV-positive patients. However, it is possible that the low degree of cognitive impairment reported in this study may reflect the development of tolerance to cannabinoids in this subject population, since all individuals had current histories of chronic marijuana use. This study produced positive results suggesting that marijuana should be studied further as a treatment for appetite stimulation in HIV patients.

3.3 Spasticity in Multiple Sclerosis

Only one randomized, double-blind, placebo-controlled Phase 2 study examined the effects of smoked marijuana on spasticity in MS.

This study was conducted by Corey-Bloom et al. (2012) and is entitled, "Smoked cannabis for spasticity in multiple sclerosis: A randomized, placebo-controlled trial". The subjects were 30 patients with MS-associated spasticity and had moderate increase in tone (score ≥ 3 points on the modified Ashworth scale). Participants were allowed to continue other MS medications, with the exception of benzodiazepines. Eighty percent of subjects had a history of marijuana use and 33% had used marijuana within the previous year.

Subjects participated in two 3-day test sessions, with an 11 day washout period. During each test session they smoked a 4.0% THC marijuana cigarette once per day or a placebo cigarette once per day. Smoking occurred through a standardized cued-puff procedure: (1) Inhalation for 5 seconds, (2) breath-hold and exhalation for 10 seconds, (3) pause between puffs for 45 seconds. Subjects completed an average of four puffs per cigarette.

The primary outcome measure was change in spasticity on the modified Ashworth scale. Additionally, subjects were assessed using a VAS for pain, a timed walk, and cognitive tests (Paced Auditory Serial Addition Test) and AEs.

Treatment with 4.0% THC marijuana reduced subject scores on the modified Ashworth scale by an average of 2.74 points more than placebo ($p < 0.0001$) and reduced VAS pain scores compared to placebo ($p = 0.008$). Scores on the cognitive measure decreased by 8.7 points more than placebo ($p = 0.003$). However, marijuana did not affect scores for the timed walk compared to placebo. Marijuana increased rating of feeling high compared to placebo.

7 subjects did not complete the study due to adverse events (two subjects felt uncomfortably "high", two had dizziness and one had fatigue). Of those 7 subjects who withdrew, 5 had little or no previous experience with marijuana. When the data were re-analyzed to include these drop-out subjects, with the presumption they did not have a positive response to treatment, the effect of marijuana was still significant on spasticity.

The authors conclude that smoked marijuana had usefulness in reducing pain and spasticity associated with MS. It is concerning that marijuana-naïve subjects dropped out of the study because they were unable to tolerate the psychiatric AEs induced by marijuana. The authors suggest that future studies should examine whether different doses can result in similar beneficial effects with less cognitive impact. However, the current study produced positive results suggesting that marijuana should be studied further as an adjunct treatment for spasticity in MS patients.

3.4 Asthma

Tashkin et al. (1974) examined bronchodilation in 10 subjects with bronchial asthma in the study entitled, "Acute Effects of Smoked Marijuana and Oral Δ^9 -Tetrahydrocannabinol on Specific Airway Conductance in Asthmatic Subjects". The study was a double-blind, placebo-controlled, crossover design. All subjects were clinically stable at the time of the study; four subjects were symptom free, and six subjects had chronic symptoms of mild to moderate severity. Subjects were tested with 0.25ml of isoproterenol HCl prior to the study to ensure they responded to bronchodilator medications. Subjects were not allowed to take bronchodilator medication within 8 hours prior to the study. Previous experience with marijuana was not required for participation in the study, but 7 of the 10 subjects reported

previous use of marijuana at a rate of less than 1 marijuana cigarette per month. No subjects reported marijuana use within 7 days of the study.

The study consisted of four test sessions with an interval of at least 48 hours between sessions. On two test sessions subjects smoked 7 mg/kg of body weight of either marijuana, with 2% THC concentration by weight, or placebo marijuana. During the other two test sessions, subjects ingested capsules with either 15mg of synthetic THC or placebo. Marijuana was administered using a uniform smoking technique: subjects inhaled deeply for 2–4 seconds, held smoke in lungs for 15 seconds, and resumed normal breathing for approximately 5 seconds. The author did not provide a description of the number of puffs taken at any smoking session. The authors state that the smoking procedure was repeated until the cigarette was consumed, which took approximately 10 minutes.

The outcome measure used was specific airway conductance (SGaw), as calculated using measurements of thoracic gas volume (TGV) and airway resistance (Raw) using a variable-pressure body plethysmograph. Additionally, an assessment of degree of intoxication was administered only to those subjects reporting previous marijuana use. This assessment consisted of subjects rating “how ‘high’ they felt” on a scale of 0–7, 7 representing “the ‘highest’ they had ever felt after smoking marijuana”.

Marijuana produced a significant increase of 33–48% in average SGaw compared to both baseline and placebo ($P < 0.05$). This significant increase in SGaw lasted for at least 2 hours after administration. The average TGV significantly decreased by 4–13% compared to baseline and placebo ($P < 0.05$). The author stated that all subjects reported feelings of intoxication after marijuana administration.

The authors conclude that marijuana produced bronchodilation in clinically stable asthmatic subjects with minimal to moderate bronchospasms. Study limitations include: inclusion of subjects with varying severity of asthmatic symptoms, use of SGaw to measure lung responses to marijuana administration, and administration of smoke to asthmatic subjects. Smoke delivers a number of harmful substances and is not an optimal delivery symptom, especially for asthmatic patients. FEV1 via spirometry is the gold standard to assess changes in lung function, pre and post asthma treatment, by pharmacotherapy. SGaw has been shown to be a valid tool in bronchoconstriction lung assessment;

however, since the FEV1 method was not utilized, it is unclear whether these results would correlate if the FEV1 method had been employed.

3.5 Glaucoma

Two randomized, double-blind, placebo-controlled Phase 2 clinical studies examined smoked marijuana in glaucoma (Crawford and Merritt, 1979; Merritt et al., 1980). In both studies, intraocular pressure (IOP) was significantly reduced 30 minutes after smoking marijuana. Maximal effects occurred 60–90 minutes after smoking, with IOP returning to baseline within 3–4 hours. These two studies were included in the 1999 IOM report on the medical uses of marijuana. Because our independent analysis of these studies concurred with the conclusions from the 1999 IOM report, these studies will not be discussed in further detail in this review. No recent studies have been conducted examining the effect of inhaled marijuana on IOP in glaucoma patients. This lack of recent studies may be attributed to the conclusions made in the 1999 IOM report that while cannabinoids can reduce intraocular pressure (IOP), the therapeutic effects require high doses that produce short-lasting responses, with a high degree of AEs. This high degree of AEs means that the potential harmful effects of chronic marijuana smoking may outweigh its modest benefits in the treatment of glaucoma.

3.6 Conclusions

Of the eleven randomized, double-blind, placebo-controlled Phase 2 clinical studies that met the criteria for review (see Sections 2.2 and 2.3), ten studies administered marijuana through smoking, while one study utilized marijuana vaporization. In these eleven studies, there were five different therapeutic indications: Five examined chronic neuropathic pain, two examined appetite stimulation in HIV patients, two examined glaucoma, one examined spasticity in MS, and one examined asthma.

There are limited conclusions that can be drawn from the data in these published studies evaluating marijuana for the treatment of different therapeutic indications. The analysis relied on published studies, thus information available about protocols, procedures, and results were limited to documents published and widely available in the public domain. The published studies on medical marijuana are effectively proof-of-concept studies. Proof-of-concept studies provide preliminary evidence on a proposed hypothesis regarding a drug's effect. For drugs

under development, the effect often relates to a short-term clinical outcome being investigated. Proof-of-concept studies serve as the link between preclinical studies and dose ranging clinical studies. Therefore, proof-of-concept studies are not sufficient to demonstrate efficacy of a drug because they provide only preliminary information about the effects of a drug. Although these studies do not provide evidence that marijuana is effective in treating a specific, recognized disorder, these studies do support future larger well-controlled studies to assess the safety and efficacy of marijuana for a specific medical indication. Overall, the conclusions below are preliminary, based on very limited evidence.

3.6.1 Conclusions for Chronic Neuropathic Pain

In subjects with chronic neuropathic pain who are refractory to other pain treatments, five proof-of-concept studies produced positive results regarding the use of smoked marijuana for analgesia. However, the subjects in these studies continued to use their current analgesic drug regime, and thus no conclusions can be made regarding the potential efficacy of marijuana for neuropathic pain in patients not taking other analgesic drugs. Subjects also had numerous forms of neuropathic pain, making it difficult to identify whether a specific set of symptoms might be more responsive to the effects of marijuana. It is especially concerning that some marijuana-naïve subjects had intolerable psychiatric responses to marijuana exposure at analgesic doses.

3.6.2 Conclusions for Appetite Stimulation in HIV

In subjects who were HIV-positive, two proof-of-concept studies produced positive results with the use of both dronabinol and smoked marijuana to increase caloric intake and produce weight gain in HIV-positive patients. However, the amount of THC in the marijuana tested in these studies is four times greater than the dose of dronabinol typically tested for appetite stimulation (10 mg vs. 2.5 mg; Haney et al., 2005). Thus, it is possible that the low degree of AEs reported in this study may reflect the development of tolerance to cannabinoids in this patient population, since all individuals had current histories of chronic marijuana use. Thus, individuals with little prior exposure to marijuana may not respond similarly and may not be able to tolerate sufficient marijuana to produce appetite stimulation.

3.6.3 Conclusions for Spasticity in MS

In subjects with MS, a proof of concept study produced positive results using smoked marijuana as a treatment for pain and symptoms associated with treatment-resistant spasticity. The subjects in this study continued to take their current medication regimen, and thus no conclusions can be made regarding the potential efficacy of marijuana when taken on its own. It is also concerning that marijuana-naïve subjects dropped out of the study because they were unable to tolerate the psychiatric AEs induced by marijuana. The authors suggest that future studies should examine whether different doses can result in similar beneficial effects with less cognitive impact.

3.6.4 Conclusions for Asthma

In subjects with clinically stable asthma, a proof of concept study produced positive results of smoked marijuana producing bronchodilation. However, in this study marijuana was administered at rest and not while experiencing bronchospasms. Additionally, the administration of marijuana through smoking introduces harmful and irritating substances to the subject, which is undesirable especially in asthmatic patients. Thus the results suggest marijuana may have bronchodilator effects, but it may also have undesirable adverse effects in subjects with asthma.

3.6.5 Conclusions for Glaucoma

As noted in Sections 3.5, the two studies that evaluated smoked marijuana for glaucoma were conducted decades ago, and they have been thoroughly evaluated in the 1999 IOM report. The 1999 IOM report concludes that while the studies with marijuana showed positive results for reduction in IOP, the effect is short-lasting, requires a high dose, and is associated with many AEs. Thus, the potential harmful effects may outweigh any modest benefit of marijuana for this condition. We agree with the conclusions drawn in the 1999 IOM report.

3.7 Design Challenges for Future Studies

The positive results reported by the studies discussed in this review support the conduct of more rigorous studies in the future. This section discusses methodological challenges that have occurred in clinical studies with smoked marijuana. These design issues should be addressed when larger-scale clinical studies are conducted to ensure that valid scientific data are generated in studies evaluating marijuana's safety

and efficacy for a particular therapeutic use.

3.7.1 Sample Size

The ability for results from a clinical study to be generalized to a broader population is reliant on having a sufficiently large study sample size. However, as noted above, all of the 11 studies reviewed in this document were early Phase 2 proof of concept studies for efficacy and safety. Thus, the sample sizes used in these studies were inherently small, ranging from 10 subjects per treatment group (Tashkin et al., 1974; Haney et al., 2007) to 25 subjects per treatment group (Abrams et al., 2007). These sample sizes are statistically inadequate to support a showing of safety or efficacy. FDA's recommendations about sample sizes for clinical trials can be found in the *Guidance for Industry: E9 Statistical Principles for Clinical Trials (1998)*.³⁵ For example, "the number of subjects in a clinical trial should always be large enough to provide a reliable answer to the questions addressed. This number is usually determined by the primary objective of the trial. The method by which the sample size is calculated should be given in the protocol, together with the estimates of any quantities used in the calculations (such as variances, mean values, response rates, event rates, difference to be detected)." (pg. 21). Other clinical FDA *Guidance for Industry*³⁶ may also contain recommendations regarding the appropriate number of subjects that should be investigated for a specific medical indication.

3.7.2 Marijuana Dose Standardization

Dose standardization is critical for any clinical study in order to ensure that each subject receives a consistent exposure to the test drug. The *Guidance for Industry: Botanical Drug Products (2004)*³⁷ provides specific information on the development of botanical drug products. Specifically, this guidance includes information about the need for well-characterized and consistent chemistry for the botanical plant product and for consistent and reliable

dosing. Specifically for marijuana studies, dose standardization is important because if marijuana leads to plasma levels of cannabinoids that are significantly different between subjects, this variation may lead to differences in therapeutic responsivity or in the prevalence of psychiatric AEs.

In most marijuana studies discussed in this review, investigators use a standardized cued smoking procedure. In this procedure, a subject is instructed to inhale marijuana smoke for 5 seconds, hold the smoke in the lungs for 10 seconds, exhale and breathe normally for 40 seconds. This process is repeated to obtain the desired dose of the drug. However, this procedure may not lead to equivalent exposure to marijuana and its constituent cannabinoids, based on several factors:

- Intentional or unintentional differences in the depth of inhalation may change the amount of smoke in the subject's lungs.
- Smoking results in loss from side stream smoke, such that the entire dose is not delivered to the subject.
- There may be differences in THC concentration along the length of a marijuana cigarette. According to Tashkin et al. (1991), the area of the cigarette closest to the mouth tends to accumulate a higher concentration of THC, but this section of the cigarette is not smoked during a study.

For example, Wilsey et al. (2008) used this standardized smoking procedure. The reported mean (range) of marijuana cigarettes consumed was 550 mg (200–830mg) for the low strength marijuana (3.5% THC) and 490 mg (270–870mg) for the high strength marijuana (7% THC). This wide range of amounts of marijuana cigarette smoked by the individual subjects, even with standardized smoking procedure and controlled number of puffs, supports the issues with delivering consistent doses with smoke marijuana.

In other marijuana studies that do not use a cued smoking procedure, subjects are simply told to smoke the marijuana cigarette over a specific amount of time (usually 10 minutes) without further instruction (Crawford and Merritt, 1979; Merritt et al., 1980; Ellis et al., 2009). The use of a nonstandardized procedure may lead to non-equivalent exposures to marijuana and its constituent cannabinoids between subjects because of additional factors that are not listed above, such as:

- Differences in absorption and drug response if subjects (especially marijuana-naïve ones) are not instructed to hold marijuana smoke in their lungs for a certain period of time.

³⁵ The *Guidance for Industry: E9 Statistical Principles for Clinical Trials* can be found at: www.fda.gov/downloads/Drugs/GuidanceComplianceRegulatoryInformation/Guidances/ucm073137.pdf.

³⁶ Other *Guidances for Industry* can be found at: www.fda.gov/Drugs/GuidanceComplianceRegulatoryInformation/Guidances/ucm064981.htm.

³⁷ The *Guidance for Industry: Botanical Drug Products* can be found at: <http://www.fda.gov/downloads/Drugs/GuidanceComplianceRegulatoryInformation/Guidances/ucm070491.pdf>.

- Prolonged periods between puffs may increase loss to side stream smoke.
- Subjects may attempt to smoke the marijuana cigarette in the way they would smoke a tobacco cigarette, which relies primarily on short, shallow puffs.

In both standardized and non-standardized smoking procedures, subjects may seek to control the dose of THC through self-titration (Crawford and Merritt, 1979; Merritt et al., 1980; Tashkin et al., 1974; Abrams et al., 2007; Ellis et al., 2009). Self-titration involves an individual moderating the amount of marijuana smoke inhaled over time in order to obtain a preferred level of psychoactive or clinical response. The ability of an individual to self-titrate by smoking is one reason given by advocates of “medical marijuana” in support of smoking of marijuana rather than through its ingestion via edibles. However, for research purposes, self-titration interferes with the ability to maintain consistent dosing levels between subjects, and thus, valid comparisons between study groups.

All of these factors can make the exact dose of cannabinoids received by a subject in a marijuana study difficult to determine with accuracy. Testing whether plasma levels of THC or other cannabinoids are similar between subjects following the smoking procedure would establish whether the procedure is producing appropriate results. Additionally, studies could be conducted to determine if vaporization can be used to deliver consistent doses of cannabinoids from marijuana plant material. Specifically, vaporization devices that involve the collection of vapors in an enclosed bag or chamber may help with delivery of consistent doses of marijuana. Thus, more information could be collected on whether vaporization is comparable to or different than smoking in terms of producing similar plasma levels of THC in subjects using identical marijuana plant material.

3.7.3 Acute vs. Chronic Therapeutic Marijuana Use

The studies that were reviewed administered the drug for short durations lasting no longer than 5 days (Abrams et al., 2007; Ellis et al., 2009; Ware et al., 2010). Thus all studies examined the short-term effect of marijuana administration for therapeutic purposes. However, many of the medical conditions that have been studied are persistent or expected to last the rest of a patient’s life. Therefore, data on chronic exposure to smoked marijuana in clinical studies is needed. In this way, more information will be available regarding whether tolerance,

physical dependence, or specific adverse events develop over the course of time with continuing use of therapeutic marijuana.

3.7.4 Smoking as a Route of Administration

As has been pointed out by the IOM and other groups, smoking is not an optimum route of administration for marijuana-derived therapeutic drug products, primarily because introducing the smoke from a burnt botanical substance into the lungs of individuals with a disease state is not recommended when their bodies may be physically compromised. The 1999 IOM report on medicinal uses of marijuana noted that alternative delivery methods offering the same ability of dose titration as smoking marijuana will be beneficial and may limit some of the possible long-term health consequences of smoking marijuana. The primary alternative to smoked marijuana is vaporization, which can reduce exposure to combusted plant material containing cannabinoids. The only study to use vaporization as the delivery method was Wilsey et al. (2013). The results from Wilsey et al. (2013) showed a similar effect of decreased pain as seen in the other studies using smoking as the delivery method (Ware et al., 2010; Wilsey et al., 2008). This similar effect of decrease pain supports vaporization as a possibly viable route to administer marijuana in research, while potentially limiting the risks associated with smoking.

3.7.5 Difficulty in Blinding of Drug Conditions

An adequate and well-controlled clinical study involves double-blinding, where both the subjects and the investigators are unable to tell the difference between the test treatments (typically consisting of at least a test drug and placebo) when they are administered. All of the studies reviewed in this document administered study treatments under double-blind conditions and thus were considered to have an appropriate study design.

However, even under the most rigorous experimental conditions, blinding can be difficult in studies with smoked marijuana because the rapid onset of psychoactive effects readily distinguishes active from placebo marijuana. The presence of psychoactive effects also occurs with other drugs. However, most other drugs have a similar psychoactive effect with substances with similar mechanisms of actions. These substances can be used as positive controls to help maintain blinding to the active drug being tested.

Marijuana on the other hand, has a unique set of psychoactive effects which makes the use of appropriate positive controls difficult (Barrett et al., 1995). However, two studies did use Dronabinol as a positive control drug to help maintain blinding (Haney et al., 2005; Haney et al., 2007).

When blinding is done using only placebo marijuana, the ability to distinguish active from placebo marijuana may lead to expectation bias and an alteration in perceived responsiveness to the therapeutic outcome measures. With marijuana-experienced subjects, for example, there may be an early recognition of the more subtle cannabinoid effects that can serve as a harbinger of stronger effects, which is less likely to occur with marijuana-naïve subjects. To reduce this possibility, investigators have tested doses of marijuana other than the one they were interested in experimentally to maintain the blind (Ware et al., 2010).

Blinding can also be compromised by differences in the appearance of marijuana plant material based on THC concentration. Marijuana with higher concentrations of THC tends to be heavier and seemingly darker, with more “tar-like” substance. Subjects who have experience with marijuana have reported being able to identify marijuana from placebo cigarettes by sight alone when the plant material in a cigarette was visible (Tashkin et al., 1974; Ware et al., 2010). Thus, to maintain a double-blind design, many studies obscure the appearance of plant material by closing both ends of the marijuana cigarette and placing it in an opaque plastic tube.

While none of these methods to secure blinding may be completely effective, it is important to reduce bias as much as possible to produce consistent results between subjects under the same experimental conditions.

3.7.6 Prior Marijuana Experience

Marijuana use histories in test subjects may influence outcomes, related to both therapeutic responsiveness and psychiatric AEs. Marijuana-naïve subjects may also experience a marijuana drug product as so aversive that they would not want to use the drug product. Thus, subjects’ prior experience with marijuana may affect the conduct and results of studies.

Most of the studies reviewed in this document required that subjects have a history of marijuana use (see tables in Appendix that describe specific requirements for each study). However, in studies published in the scientific literature, the full inclusion criteria with

regard to specific amount of experience with marijuana may not be provided. For those studies that do provide inclusion criteria, acceptable experience with marijuana can range from once in a lifetime to use multiple times a day.

The varying histories of use might affect everything from scores on adverse event measures, safety measures, or efficacy measures. Additionally, varying amounts of experience can impact cognitive effect measures assessed during acute administration studies. For instance, Schreiner and Dunn (2012) contend cognitive deficits in heavy marijuana users continue for approximately 28 days after cessation of smoking. Studies requiring less than a month of abstinence prior to the study may still see residual effects of heavy use at baseline and after placebo marijuana administration, thus showing no significant effects on cognitive measures. However, these same measurements in occasional or naïve marijuana users may demonstrate a significant effect after acute marijuana administration. Therefore, the amount of experience and the duration of abstinence of marijuana use are important to keep in mind when analyzing results for cognitive and other adverse event measures. Lastly, a study population with previous experience with marijuana may underreport the incidence and severity of adverse events. Because most studies used subjects with prior marijuana experience, we are limited in our ability to generalize the results, especially for safety measures, to marijuana naïve populations.

Five of 11 studies reviewed in this document included both marijuana-naïve and marijuana-experienced subjects (Corey-Bloom et al., 2012; Ellis et al., 2009; Ware et al., 2010; Merritt et al., 1980; Tashkin et al., 1974). Since the number of marijuana-naïve subjects in these studies was low, it was not possible to conduct a separate analysis compared to experienced users. However, systematically evaluating the effect of marijuana experience on study outcomes is important, since many patients who might use a marijuana product for a therapeutic use will be marijuana-naïve.

Research shows that marijuana-experienced subjects have a higher ability to tolerate stronger doses of oral dronabinol than marijuana-naïve subjects (Haney et al., 2005). Possibly, this increased tolerance is also the case when subjects smoke or vaporize marijuana. Thus, studies could be conducted that investigate the role of marijuana experience in determining

tolerability of and responses to a variety of THC concentrations in marijuana.

3.7.7 Inclusion and Exclusion Criteria

For safety reasons, all clinical studies have inclusion and exclusion criteria that restrict the participation of individuals with certain medical conditions. For studies that test marijuana, these criteria may be based on risks associated with exposure to smoked material and the effects of THC. Thus, most studies investigating marijuana require that subjects qualify for the study based on restrictive symptom criteria such that individuals do not have other symptoms that may be known to interact poorly with cannabinoids.

Similarly, clinical studies with marijuana typically exclude individuals with cardiac or pulmonary problems, as well as psychiatric disorders. These exclusion criteria are based on the well-known effects of marijuana smoke to produce increases in heart rate and blood pressure, lung irritation, and the exacerbation of psychiatric disturbances in vulnerable individuals. Although these criteria are medically reasonable for research protocols, it is likely that future marijuana products will be used in patients who have cardiac, pulmonary or psychiatric conditions. Thus, individuals with these conditions should be evaluated, whenever possible.

Additionally, all studies reviewed in this document allowed the subjects to continue taking their current regimen of medications. Thus all results evaluated marijuana as an adjunct treatment for each therapeutic indication.

3.7.8 Number of Female Subjects

A common problem in clinical research is the limited number of females who participate in the studies. This problem is present in the 11 studies reviewed in this document, in which one study did not include any female subjects (Ellis et al., 2009), and three studies had a low percentage of female subjects (Abrams et al., 2007; Haney et al., 2005; Haney et al., 2007). However, each of these four studies investigated an HIV-positive patient population, where there may have been a larger male population pool from which to recruit compared to females.

Since there is some evidence that the density of CB1 receptors in the brain may vary between males and females (Crane et al., 2012), there may be differing therapeutic or subjective responsiveness to marijuana. Studies using a study population that is equal parts male and female may show whether and how the effects of marijuana differ between male and female subjects.

Appendix (Tables)

Table 1: Randomized, controlled, double-blind trials examining smoked marijuana in treatment of neuropathic pain

Author & Date Indication	Subjects (n) completed/randomized Subject characteristics	Drugs Admin. Methods	Study Type Duration	Primary Outcome Measure	Primary Outcome Measure Results	Adverse events/AEs
Abrams et al. (2007) <i>HIV-Sensory Neuropathy; Neuropathic Pain</i>	Marijuana Group: 25/27 22 males 5 females Placebo Group: 25/28 26 males 2 females <u>Inclusion Criteria:</u> -documented HIV -documented HIV-SN -pain score \geq 30mm VAS -prior marijuana use of six or more times in lifetime <u>Previous Marijuana Experience:</u> -marijuana group: 21 current users -placebo group: 19 current users <u>Exclusion Criteria:</u> -substance abuse (including tobacco) -family history of neuropathy due to causes not HIV related -use of isoniazid, dapsons, or metronidazole within 8 weeks of enrollment	NIDA marijuana, smoked 0%, 3.65% THC <u>Smoking Procedure:</u> -signal light cued smoking of marijuana cigarette with each puff consisting of: 1) 5s inhale smoke, 2) 10s hold smoke in lungs 3) 40s exhale and breath normally 4) repeat procedure for desired number of puffs # of puffs not specified, only specified that subjects smoked the entire marijuana/placebo cigarette On 1 st and last day of intervention period BID. For all other days TID	Parallel Group <i>5-day treatment period</i>	VAS daily pain score	-52% of the marijuana group showed >30% decrease in pain score compared to 24% of placebo group. -Marijuana group had significantly greater reduction in daily pain score than placebo group. -NNT=3.6	-Rating for adverse events of anxiety, sedation, disorientation, confusion, and dizziness were significantly higher in the marijuana group compared to placebo group. -Marijuana and placebo groups showed a reduction in total mood disturbance on POMS. <u>AEs:</u> -1 grade 3 dizziness in marijuana group -2 grade 3 anxiety, 1 in each group.
Ellis et al. (2009) <i>HIV Sensory Neuropathy; Neuropathic</i>	28/34 28 males <u>Inclusion Criteria:</u> -documented HIV -documented neuropathic	NIDA marijuana, smoked 0%, 1%, 2%, 4%, 6%, 8% THC <u>Smoking Procedures:</u>	Crossover Dose-titration (on 1 st day)	Pain magnitude on DDS	-Pain reduction was significantly greater after marijuana compared to placebo.	-Mood disturbance, quality of life, and psychological disability improved for both marijuana and placebo. -Moderate to severe adverse events were more common with marijuana than placebo.

Author & Date Indication	Subjects (n) completed/randomized Subject characteristics	Drugs Admin. Methods	Study Type Duration	Primary Outcome Measure	Primary Outcome Measure Results	Adverse events/AEs
<i>Pain</i>	<p>pain refractory to ≥ 2 analgesics -pain score ≥ 5 on pain intensity subscale of DDS</p> <p><u>Previous Marijuana Experience:</u> -27 subjects had previous experience -63% of subjects had no exposure for >1 year before study</p> <p><u>Exclusion Criteria:</u> -current DSM-IV substance abuse disorder -lifetime history of dependence on marijuana -previous psychosis with or intolerance to cannabinoids -concurrent use of approved cannabinoid medications -positive UDS for cannabinoids during wash-in week -serious medical conditions that affect safety -alcohol or drug dependence within 12 months of study</p>	<p>- Verbally cued smoking of marijuana cigarette with each puff consisting of: 1) 5s inhale smoke, 2) 10s hold smoke in lungs 3) 40s exhale and breath normally 4) repeat procedure for desired number of puffs -unknown number of puffs</p> <p>QID</p>	2, 5-day treatment phase, with 2-week washout period		-NNT=3.5	<p>-HIV disease parameters did not differ for marijuana or placebo. -Adverse events included: concentration difficulties, fatigue, sleepiness or sedation, increased duration of sleep, reduced salivation, and thirst. These adverse events were more frequent in marijuana compared to placebo.</p> <p><u>Withdrawals for drug related reasons:</u> -1 cannabis-naïve subject had acute cannabis-induced psychosis -1 subjects developed an intractable smoking-related cough during marijuana administration</p>
<p>Wilsey et al. (2008)</p> <p><i>Neuropathic pain; Various Causes</i></p>	<p>32/38 20 males 18 females</p> <p><u>Inclusion Criteria:</u> -CRPS type I, spinal cord</p>	<p>NIDA marijuana, smoked 0%, 3.55%, 7% THC</p> <p><u>Smoking Procedure:</u> Verbally cued</p>	<p>Crossover</p> <p>3, 6-hour sessions, with 3-day between</p>	<p>VAS spontaneous pain intensity</p>	<p>-A significant decrease in pain intensity for both strengths of marijuana compared to placebo</p>	<p>-7% THC marijuana significantly decreased functioning on neurocognitive measures compared to placebo. -Subjective effects were greater for 7% THC marijuana than 3.55%</p>

Author & Date Indication	Subjects (n) completed/randomized Subject characteristics	Drugs Admin. Methods	Study Type Duration	Primary Outcome Measure	Primary Outcome Measure Results	Adverse events/AEs
	<p>injury, peripheral neuropathy, or nerve damage -previous marijuana use</p> <p><u>Previous Marijuana Experience:</u> -median (range) time from previous exposure: 1.7 years (31 days to 30 years) -median (range) exposure duration: 2 years (1 day to 22 years).</p> <p><u>Exclusion Criteria:</u> -no marijuana or cannabinoid medication use for 30 days prior to study; confirmed by UDS -severe depression -history of schizophrenia or bipolar depression -uncontrolled hypertension, cardiovascular disease, and pulmonary disease -active substance abuse</p>	<p>smoking of marijuana cigarette with each puff consisting of: 1) 5s inhale smoke, 2) 10s hold smoke in lungs 3) 40s exhale and breath normally 4) repeat procedure for desired number of puffs</p> <p>Cumulative dosing procedure: -escalate the number of puffs from 2 to 4 puffs over 3 smoking sessions with 1 hour between sessions</p> <p>TID</p>	<i>sessions</i>			<p>THC marijuana with significantly more ratings of good drug effect, bad drug effect, feeling high, feeling stoned, impaired, sedation, confusion, and hunger compared to placebo.</p>
<p>Ware et al. (2010)</p> <p><i>Post-traumatic or postsurgical neuropathic pain</i></p>	<p>21/23 11 males 12 females</p> <p><u>Inclusion Criteria:</u> -neuropathic pain for ≥ 3 months caused by trauma or surgery -allodynia and hyperalgesia -pain score >4cm VAS -no marijuana use for 1</p>	<p>NIDA placebo; Prairie Plant System Inc. (Canada) marijuana, smoked 0%, 2.5%, 6%, 9.4% THC</p> <p>(25 mg of marijuana/placebo plant material was placed in opaque</p>	<p>Crossover</p> <p><i>4, 5-day out-patient* treatment phase, with 9-day washout periods</i></p>	<p>Pain intensity on 11-item NRS</p>	<p>-Average daily pain intensity was significantly lower after 9.4% THC compared to placebo.</p>	<p>-Anxiety and depression were significantly improved with 9.4% THC compared to placebo. -No significant difference between placebo and 9.4% THC for subjective effects.</p> <p><u>AEs:</u> -248 mild AEs were reported -6 moderate AEs were reported: 2 fall, 1 increased pain, 1 numbness,</p>

Author & Date <i>Indication</i>	Subjects (n) completed/randomized Subject characteristics	Drugs Admin. Methods	Study Type Duration	Primary Outcome Measure	Primary Outcome Measure Results	Adverse events/AEs
	<p>year prior to study -stable analgesic regimen -normal liver and renal function</p> <p><u>Previous Marijuana Experience:</u> -18 subjects had used marijuana before</p> <p><u>Exclusion Criteria:</u> -pain due to cancer or nociceptive causes -significant cardiac or pulmonary disease -current substance abuse or dependence (including marijuana) -history of psychotic disorders -current suicidal ideations</p>	<p>gelatin capsules)</p> <p><u>Smoking Procedures:</u> -1) Break one capsule open and tip content into the bowl of a titanium pipe 2) light marijuana material 3) 5s inhale smoke 4) 10s hold smoke in lungs 5) Exhale 1 puff burned all 25 mg of plant material</p> <p>TID</p> <p>Intermediate doses were used to help maintain blinding</p>				<p>1 drowsiness, 1 pneumonia -Most frequently reported drug-related AEs for 9.4% THC: headache, dry eyes, burning sensation, dizziness, numbness, and cough.</p> <p><u>Withdrawals for drug related reason:</u> -1 subject had increased pain after 6% THC administration -1 subject tested positive for cannabinoids in urine test during placebo treatment</p>
<p>Wilsey et al. (2013)</p> <p><i>Neuropathic Pain; Various Causes</i></p>	<p>36/39 28 males 11 females</p> <p><u>Inclusion Criteria:</u> -CRPS type 1, thalamic pain, spinal cord injury, peripheral neuropathy, radiculopathy, or nerve injury -previous marijuana use</p> <p><u>Previous Marijuana Experience:</u> - median (range) time from last exposure prior to</p>	<p>NIDA marijuana, vaporized 0%, 1.29%, 3.53% THC</p> <p><u>Smoking Procedures:</u> - Verbally cued inhalation of vaporized material in the balloon with each puff consisting of: 1) 5s inhale vapors, 2) 10s hold vapors in lungs 3) 40s exhale and breath normally</p>	<p>Crossover</p> <p><i>3, 6-hour sessions, with at least 3 days between sessions</i></p>	<p>VAS spontaneous pain intensity</p>	<p>-Number of subjects that showed a 30% reduction in pain intensity was significantly greater for both strengths of marijuana compared to placebo. -Both strengths of marijuana showed a similar significant decrease in pain compared to placebo. -NNT=3.2 for 1.29% THC marijuana vs.</p>	<p>-Scores for feeling stoned, feeling high, like the drug effect, feeling sedated, and feeling confused were significantly greater for 3.53% THC marijuana compared to 1.29% THC marijuana, and for both strengths of marijuana compared to placebo. -Scores for feeling drunk and feeling impaired are significantly greater in both strengths of marijuana compared to placebo. -Scores for desired more of the drug were significantly greater for 1.29% THC marijuana compared to placebo, with no significant</p>

Author & Date Indication	Subjects (n) completed/randomized Subject characteristics	Drugs Admin. Methods	Study Type Duration	Primary Outcome Measure	Primary Outcome Measure Results	Adverse events/AEs
	<p>screening: 9.6 years (1 day to 45 years)</p> <p>-16 current marijuana users and 23 past users</p> <p>-# smoked daily: 6 current users, 5 past users</p> <p>-# used approx. once every 2 weeks: 8 current users, 6 past users</p> <p>-# used once every 4 weeks or less: 2 current users, 12 past users</p> <p><u>Exclusion Criteria:</u></p> <p>-no marijuana or cannabinoid medication use for 30 days prior to study; confirmed by UDS</p> <p>-severe depression</p> <p>-suicidal ideations</p> <p>-diagnoses of serious mental illness</p> <p>-uncontrolled hypertension, cardiovascular disease, or chronic pulmonary disease</p> <p>-active substance abuse</p>	<p>4) repeat procedure for desired number of puffs</p> <p>BID</p> <p>Cumulative & Flexible Dosing:</p> <p>-1st drug admin. consisted of 4 puffs from balloon.</p> <p>-Followed 2 hours later by 2nd drug admin.</p> <p>-2nd drug admin. consisted of 4 to 8 puffs from balloon; number of puffs taken was left up to the subject so they could self-titrate to their target does, which balanced desired response and tolerance levels.</p>			<p>placebo.</p> <p>-NNT=2.9 for 3.53% THC marijuana vs. placebo.</p>	<p>difference seen for 3.53% THC marijuana.</p> <p>-3.53% THC marijuana had significantly worse performance than 1.29% THC marijuana for learning and memory.</p> <p>-Both strengths of marijuana significantly reduced scores on attention compared to placebo.</p>

*Out-patient: subjects were given enough doses of marijuana/placebo to last the 5-day treatment phase, and then were sent home for the remainder of the treatment phase.

Tashkin et al. (1974) <i>Bronchial Asthma</i>	10 5 males 5 females <u>Inclusion Criteria:</u> -diagnosis of bronchial asthma -asthma relieved by bronchodilator medication -clinically stable <u>Previous Marijuana Experience:</u> -7 subjects had previous exposure to marijuana -amount of exposure <1 cigarette/month <u>Exclusion Criteria:</u> -no marijuana use ≤7 days of study -psychiatric illness	NIMH (NIDA) marijuana, smoked 0%, 2% THC Dronabinol, oral 0, 15mg Dosing is 7mg/kg of body weight of plant material <u>Smoking Procedure:</u> smoking of marijuana cigarette with each puff consisting of: 1) 2-4s deep inhale smoke, 2) 15s hold smoke in lungs 3) 5s exhale and breath normally 4) repeat till entire cigarette is smoked QD	Crossover <i>4, 1-day sessions, with at least 48 hours between sessions</i>	No primary outcome measure is specified Related outcome measure was sGaw	-Marijuana significantly increased sGaw (33-48%) compared to placebo and baseline	-Marijuana initially significantly increased pulse rate compared to placebo, and then at 90 minutes pulse rate was significantly decreased compared to baseline. -All subjects felt intoxicated after marijuana.

AE=Adverse Event; NIDA=National Institute of Drug Abuse; QD=drug administered one time per day; sGaw=Specific Airway Conductance; THC=delta-9-tetrahydrocannabinol

U.S. Department of Justice—Drug Enforcement Administration

Schedule of Controlled Substances: Maintaining Marijuana in Schedule I of the Controlled Substances Act

Background, Data, and Analysis: Eight Factors Determinative of Control and Findings Pursuant to 21 U.S.C. 812(b)

Prepared by: Office of Diversion Control, Drug and Chemical Evaluation Section, Washington, DC 20537

July 2016

Background

On November 30, 2011, Governors Lincoln D. Chafee of Rhode Island and Christine O. Gregoire of Washington submitted a petition to the Drug Enforcement Administration (DEA) to initiate proceedings for a repeal of the rules or regulations that place marijuana³⁸ in schedule I of the Controlled Substances Act (CSA). The petition requests that marijuana³⁹ and “related items” be rescheduled in schedule II of the CSA. The petitioners claim that:

1. Cannabis has accepted medical use in the United States;
2. Cannabis is safe for use under medical supervision;
3. Cannabis for medical purposes has a relatively low potential for abuse, especially in comparison with other schedule II drugs.

The DEA accepted this petition for filing on January 30, 2012.

The Attorney General may by rule transfer a drug or other substance between schedules of the CSA if she finds that such drug or other substance has a potential for abuse, and makes the findings prescribed by 21 U.S.C. 812(b) for the schedule in which such drug is to be placed. 21 U.S.C. 811(a)(1). The Attorney General has delegated this responsibility to the Acting Administrator of the DEA. 28 CFR 0.100(b).

In accordance with 21 U.S.C. 811(b), after gathering the necessary data, the

DEA submitted the petition and necessary data to the Department of Health and Human Services (HHS) on June 11, 2013, and requested that HHS provide a scientific and medical evaluation and scheduling recommendation for marijuana. In documents dated June 3 and June 25, 2015, the acting Assistant Secretary for Health of the HHS⁴⁰ recommended to the DEA that marijuana continue to be controlled in Schedule I of the CSA, and provided to the DEA its scientific and medical evaluation titled “Basis for the Recommendation for Maintaining Marijuana in Schedule I of the Controlled Substances Act.” The HHS’s recommendations are binding on the DEA as to scientific and medical matters. 21 U.S.C. 811(b).

Before initiating proceedings to reschedule a substance, the CSA requires the Acting Administrator to determine whether the HHS scheduling recommendation, scientific and medical evaluation, and “all other relevant data” constitute substantial evidence that the drug should be rescheduled as proposed. 21 U.S.C. 811(b). The Acting Administrator must determine whether there is substantial evidence to conclude that the drug meets the criteria for placement in another schedule based on the criteria set forth in 21 U.S.C. 812(b). The CSA requires that both the DEA and the HHS consider the eight factors specified by Congress in 21 U.S.C. 811(c). This document lays out those considerations and is organized according to the eight factors. As DEA sets forth in detail below, the evidence shows:

1. *Actual or relative potential for abuse.* Marijuana has a high potential for abuse. Preclinical and clinical data show that it has reinforcing effects characteristic of drugs of abuse. National databases on actual abuse show marijuana is the most widely abused drug, including significant numbers of substance abuse treatment admissions. Data on marijuana seizures show widespread availability and trafficking.

2. *Scientific evidence of its pharmacological effect.* The scientific understanding of marijuana, cannabinoid receptors, and the endocannabinoid system continues to

be studied and elucidated. Marijuana produces various pharmacological effects, including subjective (e.g., euphoria, dizziness, disinhibition), cardiovascular, acute and chronic respiratory, immune system, and prenatal exposure effects, as well as behavioral and cognitive impairment.

3. *Current scientific knowledge.* There is no currently accepted medical use for marijuana in the United States. Marijuana sources are derived from numerous cultivated strains and may have different levels of Δ^9 -THC and other cannabinoids. Under the five-element test for currently accepted medical use discussed in more detail below and upheld by the Court of Appeals for the District of Columbia in *Alliance for Cannabis Therapeutics v. DEA*, 15 F.3d 1131, 1135 (D.C. Cir. 1994) (hereinafter “ACT”), there is no complete scientific analysis of marijuana’s chemical components; there are not adequate safety studies; there are not adequate and well-controlled efficacy studies; there is not a consensus of medical opinion concerning medical applications of marijuana; and the scientific evidence regarding marijuana’s safety and efficacy is not widely available. To date, scientific and medical research has not progressed to the point that marijuana has a currently accepted medical use, even under conditions where its use is severely restricted.

4. *History and current pattern of abuse.* Marijuana continues to be the most widely used illicit drug. In 2014, there were 22.2 million current users. There were also 2.6 million new users, most of whom were less than 18 years of age. During the same period, marijuana was the most frequently identified drug exhibit in federal, state, and local forensic laboratories.

5. *Scope, duration, and significance of abuse.* Abuse of marijuana is widespread and significant. In 2014, for example, an estimated 6.5 million people aged 12 or older used marijuana on a daily or almost daily basis over a 12-month period. In addition, a significant proportion of all admissions for substance abuse treatment are for marijuana/hashish as their primary drug of abuse. In 2013, 16.8% of all such admissions—281,991 over the course of the year—were for primary marijuana/hashish abuse.

6. *Risk, if any, to public health.* Together with the health risks outlined in terms of pharmacological effects above, public health risks from acute use of marijuana include impaired psychomotor performance, impaired driving, and impaired performance on tests of learning and associative

³⁸The Controlled Substances Act (CSA) defines marijuana as: “All parts of the plant *Cannabis sativa L.*, whether growing or not; the seeds thereof; the resin extracted from any part of such plant; and every compound, manufacture, salt, derivative, mixture, or preparation of such plant, its seeds or resin. Such term does not include the mature stalks of such plant, fiber produced from such stalks, oil or cake made from the seeds of such plant, any other compound, manufacture, salt, derivative, mixture, or preparation of such mature stalks (except the resin extracted therefrom), fiber, oil, or cake, or the sterilized seed of such plant which is incapable of germination.” 21 U.S.C. 802(16). Note that “marihuana” is the spelling used in the CSA. This document uses the spelling that is more common in current usage, “marijuana.”

³⁹Petitioners defined marijuana as all cultivated strains of cannabis.

⁴⁰As set forth in a memorandum of understanding entered into by the HHS, the Food and Drug Administration (FDA), and the National Institute on Drug Abuse (NIDA), the FDA acts as the lead agency within the HHS in carrying out the Secretary’s scheduling responsibilities under the CSA, with the concurrence of the NIDA. 50 FR 9518, Mar. 8, 1985. The Secretary of the HHS has delegated to the Assistant Secretary for Health of the HHS the authority to make domestic drug scheduling recommendations.

processes. Chronic use of marijuana poses a number of other risks to the public health including physical as well as psychological dependence.

7. *Psychic or physiological dependence liability.* Long-term, heavy use of marijuana can lead to physical dependence and withdrawal following discontinuation, as well as psychic or psychological dependence. In addition, a significant proportion of all admissions for treatment for substance abuse are for primary marijuana abuse; in 2013, 16.8% of all admissions were for primary marijuana/hashish abuse, representing 281,991 individuals.

8. *Immediate precursor.* Marijuana is not an immediate precursor of any controlled substance.

As specified in 21 U.S.C. 812(b)(1), in order for a substance to be placed in schedule I, the Acting Administrator must find that:

A. The drug or other substance has a high potential for abuse.

B. The drug or other substance has no currently accepted medical use in treatment in the United States.

C. There is a lack of accepted safety for use of the drug or other substance under medical supervision.

To be classified in another schedule under the CSA (e.g., II, III, IV, or V), a substance must have a “currently accepted medical use in treatment in the United States.” 21 U.S.C. 812(b)(2)–(5). A substance also may be placed in schedule II if it is found to have “a currently accepted medical use with severe restrictions.” 21 U.S.C. 812(b)(2). If a controlled substance has no such currently accepted medical use, it must be placed in schedule I. *See* Notice of Denial of Petition, 66 FR 20038 (Apr. 18, 2001) (“Congress established only one schedule—schedule I—for drugs of abuse with ‘no currently accepted medical use in treatment in the United States’ and ‘lack of accepted safety for use . . . under medical supervision.’”).

A drug that is the subject of an approved new drug application (NDA) or abbreviated new drug application (ANDA) under Federal Food, Drug, and Cosmetic Act (21 U.S.C. 355), is considered to have a currently accepted medical use in treatment in the United States for purposes of the CSA. The HHS stated in its review, however, that FDA has not approved any NDA for marijuana for any indication.

In the absence of NDA or ANDA approval, DEA has established a five-element test for determining whether the drug has a currently accepted medical use in treatment in the United States. Under this test, a drug will be considered to have a currently accepted

medical use only if the following five elements are satisfied:

1. The drug’s chemistry is known and reproducible;
2. There are adequate safety studies;
3. There are adequate and well-controlled studies proving efficacy;
4. The drug is accepted by qualified experts; and
5. The scientific evidence is widely available.

(57 FR 10499, 10506 (March 26, 1992)). *See also* ACT, 15 F.3d at 1135.

As discussed in Factor 3, below, HHS concluded, and DEA agrees, that the scientific evidence is insufficient to demonstrate that marijuana has a currently accepted medical use under the five-element test. The evidence was insufficient in this regard also when the DEA considered petitions to reschedule marijuana in 1992 (57 FR 10499),⁴¹ in 2001 (66 FR 20038), and in 2011 (76 FR 40552).⁴² Little has changed since 2011 with respect to the lack of clinical evidence necessary to establish that marijuana has a currently accepted medical use. No studies have scientifically assessed the efficacy and full safety profile of marijuana for any specific medical condition.

The limited existing clinical evidence is not adequate to warrant rescheduling of marijuana under the CSA. To the contrary, the data in this scheduling review document show that marijuana continues to meet the criteria for schedule I control under the CSA for the following reasons:

1. Marijuana has a high potential for abuse.
2. Marijuana has no currently accepted medical use in treatment in the United States.
3. Marijuana lacks accepted safety for use under medical supervision.

Factor 1: The Drug’s Actual or Relative Potential for Abuse

Marijuana is the most commonly abused illegal drug in the United States. It is also the most commonly used illicit drug by high school students in the United States. Further, marijuana is the most frequently identified drug by state, local and federal forensic laboratories. Marijuana’s main psychoactive ingredient, Δ^9 -tetrahydrocannabinol (Δ^9 -THC),⁴³ is an effective reinforcer in laboratory animals, including primates and rodents. These animal studies both predict and support the observations

that marijuana produces reinforcing effects in humans. Such reinforcing effects can account for the repeated abuse of marijuana.

A. Indicators of Abuse Potential

The HHS has concluded in its document, “Basis for the Recommendation for Maintaining Marijuana in Schedule I of the Controlled Substances Act,” that marijuana has a high potential for abuse. The finding of “abuse potential” is critical for control under the Controlled Substances Act (CSA). Although the term is not defined in the CSA, guidance in determining abuse potential is provided in the legislative history of the Act (Comprehensive Drug Abuse Prevention and Control Act of 1970, H.R. Rep. No. 91–1444, 91st Cong., Sess. 2 (1970), reprinted in 1970 U.S.C.A.N. 4566, 4603). Accordingly, the following items are indicators that a drug or other substance has potential for abuse:

- *There is evidence that individuals are taking the drug or drugs containing such a substance in amounts sufficient to create a hazard to their health or to the safety of other individuals or of the community; or*
- *There is significant diversion of the drug or drugs containing such a substance from legitimate drug channels; or*
- *Individuals are taking the drug or drugs containing such a substance on their own initiative rather than on the basis of medical advice from a practitioner licensed by law to administer such drugs in the course of his professional practice; or*
- *The drug or drugs containing such a substance are new drugs so related in their action to a drug or drugs already listed as having a potential for abuse to make it likely that the drug will have the same potentiality for abuse as such drugs, thus making it reasonable to assume that there may be significant diversions from legitimate channels, significant use contrary to or without medical advice, or that it has a substantial capability of creating hazards to the health of the user or to the safety of the community.*

Of course, evidence of actual abuse of a substance is indicative that a drug has a potential for abuse.

In its recommendation, the HHS analyzed and evaluated data on marijuana as applied to each of the above four criteria. The analysis presented in the recommendation (HHS, 2015) is discussed below:

1. *There is evidence that individuals are taking the drug or drugs containing such a substance in amounts sufficient to create a hazard to their health or to*

⁴¹ *See Alliance for Cannabis Therapeutics v. DEA*, 15 F.3d 1131 (D.C. Cir. 1994).

⁴² *See Americans for Safe Access v. DEA*, 706 F.3d 438 (D.C. Cir. 2013) (rhg den. 2013).

⁴³ The terms Δ^9 -THC and THC are used interchangeably though out this document.

the safety of other individuals or of the community.

The HHS stated that some individuals are taking marijuana in amounts sufficient to create a hazard to their health and to the safety of other individuals and the community. Data from national databases on actual abuse of marijuana support the idea that a large number of individuals use marijuana. In its recommendation (HHS, 2015), the HHS presented data from the National Survey on Drug and Health (NSDUH) of the Substance Abuse and Mental Health Services Administration (SAMHSA) and the Monitoring the Future (MTF) survey of the National Institute on Drug Abuse (NIDA), and the DEA has since updated this information. The most recent data from SAMHSA's NSDUH in 2014 reported that marijuana was the most used illicit drug. Among Americans aged 12 years and older, an estimated 22.2 million Americans used marijuana within the past month according to the 2014 NSDUH. In 2004, an estimated 14.6 million individuals reported using marijuana within the month prior to the study. The estimated rates in 2014 thus reflect an increase of approximately 7.6 million individuals over a 10-year period. According to the 2013 NSDUH report, an estimated 19.8 million individuals reported using marijuana. Thus, over a period of one year (2013 NSDUH–2014 NSDUH), there was an estimated increase of 2.4 million individuals in the United States using marijuana.

The results from the 2015 Monitoring the Future survey of 8th, 10th, and 12th grade students indicate that marijuana was the most widely used illicit drug in these age groups. Current monthly use was 6.5% of 8th graders, 14.8% of 10th graders, and 21.3% of 12th graders. The Treatment Episode Data Set (TEDS) in 2013 reported that marijuana abuse was the primary factor in 16.8 percent of non-private substance-abuse treatment facility admissions. In 2011, SAMHSA's Drug Abuse Warning Network (DAWN) reported that marijuana was mentioned in 36.4% (455,668 out of approximately 1.25 million) of illicit drug-related Emergency Department (ED) visits.

Data on the extent and scope of marijuana abuse are presented under Factors 4 and 5 of this analysis. Discussion of the health effects of marijuana is presented under Factor 2, and the assessment of risk to the public health posed by acute and chronic marijuana abuse is presented under Factor 6 of this analysis.

2. There is significant diversion of the drug or drugs containing such a substance from legitimate drug channels.

In accordance with the CSA, the only lawful source of marijuana in the United States is that produced and distributed for research purposes under the oversight of NIDA and in conformity with United States obligations under the Single Convention on Narcotic Drugs.⁴⁴ The HHS stated that there is a lack of significant diversion from legitimate drug sources, but that this is likely due to high availability of marijuana from illicit sources. Marijuana is not an FDA-approved drug product. Neither a New Drug Application (NDA) nor a Biologics License Application (BLA) has been approved for marketing in the United States. However, the marijuana used for nonclinical and clinical research represents a very small amount of the total amount of marijuana available in the United States and therefore information about marijuana diversion from legitimate sources is limited or not available.

The DEA notes that the magnitude of the demand for illicit marijuana is evidenced by information from a number of databases presented under Factor 4. Briefly, marijuana is the most commonly used illegal drug in the United States. It is also the most commonly used illicit drug by American high schoolers. Marijuana is the most frequently identified drug in state, local, and federal forensic laboratories, with increasing amounts of both domestically grown and of illicitly smuggled marijuana.

Given that marijuana has long been the most widely trafficked and abused controlled substance in the United States, and that all aspects of such illicit activity are entirely outside of the closed system of distribution mandated by the CSA, it may well be the case that there is little thought given to diverting marijuana from the small supplies produced for legitimate research purposes. Thus, the lack of data indicating diversion of marijuana from legitimate channels to the illicit market is not indicative of a lack of potential for abuse of the drug.

3. Individuals are taking the drug or drugs containing such a substance on their own initiative rather than on the basis of medical advice from a practitioner licensed by law to administer such drugs in the course of his professional practice.

The HHS stated that the FDA has not evaluated or approved an NDA or BLA for marijuana for any therapeutic indication. Consistent with federal law, therefore, an individual legitimately can

take marijuana based on medical advice from a practitioner only by participating in research that is being conducted under an Investigational New Drug (IND) application. The HHS noted that there are several states as well as the District of Columbia which have passed laws allowing for individuals to use marijuana for purported "medical" use under certain circumstances, but data are not available yet to determine the number of individuals using marijuana under these state laws. Nonetheless, according to 2014 NSDUH data, 22.2 million American adults currently use marijuana (SAMHSA, 2015a). Based on the large number of individuals who use marijuana and the lack of an FDA-approved drug product, the HHS concluded that the majority of individuals using marijuana do so on their own initiative rather than by following medical advice from a licensed practitioner.

4. The drug or drugs containing such a substance are new drugs so related in their action to a drug or drugs already listed as having a potential for abuse to make it likely that the drug will have the same potentiality for abuse as such drugs, thus making it reasonable to assume that there may be significant diversions from legitimate channels, significant use contrary to or without medical advice, or that it has a substantial capability of creating hazards to the health of the user or to the safety of the community.

Marijuana and its primary psychoactive ingredient, Δ^9 -THC, are controlled substances in schedule I under the CSA.

The HHS stated that one approved, marketed drug product contains synthetic Δ^9 -THC, also known as dronabinol, and another approved, marketed drug product contains a cannabinoid-like synthetic compound that is structurally related to Δ^9 -THC, the main active component in marijuana. Both products are controlled under the CSA.

Marinol is a schedule III drug product containing synthetic Δ^9 -THC (dronabinol) formulated in sesame oil in soft gelatin capsules. Marinol was approved by the FDA in 1985 for the treatment of nausea and vomiting associated with cancer chemotherapy in patients who did not respond to conventional anti-emetic treatments. In 1992, FDA approved Marinol for the treatment of anorexia associated with weight loss in patients with acquired immunodeficiency syndrome (AIDS). Marinol was originally placed into schedule II and later rescheduled to schedule III under the CSA due to the

⁴⁴ See 76 FR 51403, 51409–51410 (2011) (discussing cannabis controls required under the Single Convention).

low reports of abuse relative to marijuana.

Cesamet is a drug product containing the schedule II substance nabilone, a synthetic substance structurally related to Δ^9 -THC. Cesamet was approved for marketing by the FDA in 1985 for the treatment of nausea and vomiting associated with cancer chemotherapy. All other naturally occurring cannabinoids in marijuana and their synthetic equivalents with similar chemical structure and pharmacological activity are already included as schedule I drugs under the CSA.

B. Abuse Liability Studies

In addition to the indicators suggested by the CSA's legislative history, data as to preclinical and clinical abuse liability studies, as well as actual abuse, including clandestine manufacture, trafficking, and diversion from legitimate sources, are considered in this factor.

Abuse liability evaluations are obtained from studies in the scientific and medical literature. There are many preclinical measures of a drug's effects that when taken together provide an accurate prediction of the human abuse liability. Clinical studies of the subjective and reinforcing effects in humans and epidemiological studies provide quantitative data on abuse liability in humans and some indication of actual abuse trends. Both preclinical and clinical studies have clearly demonstrated that marijuana and Δ^9 -THC possess the attributes associated with drugs of abuse: They function as a positive reinforcer to maintain drug-seeking behavior, they function as a discriminative stimulus, and they have dependence potential.

Preclinical and most clinical abuse liability studies have been conducted with the psychoactive constituents of marijuana, primarily Δ^9 -THC and its metabolite, 11-hydroxy- Δ^9 -THC. Δ^9 -THC's subjective effects are considered to be the basis for marijuana's abuse liability. The following studies provide a summary of that data.

1. Preclinical Studies

Δ^9 -THC, the primary psychoactive component in marijuana, is an effective reinforcer in laboratory animals, including primates and rodents, as these animals will self-administer Δ^9 -THC. These animal studies both predict and support the observations that Δ^9 -THC, whether smoked as marijuana or administered by other routes, produces reinforcing effects in humans. Such reinforcing effects can account for the repeated abuse of marijuana.

a. Drug Discrimination Studies

The drug discrimination paradigm is used as an animal model of human subjective effects (Solinas et al., 2006) and is a method where animals are able to indicate whether a test drug is able to produce physical or psychological changes similar to a known drug of abuse. Animals are trained to press one bar (in an operant chamber) when they receive a known drug of abuse and another bar when they receive a placebo. When a trained animal receives a test drug, if the drug is similar to the known drug of abuse, it will press the bar associated with the drug.

Discriminative stimulus effects of Δ^9 -THC have specificity for the pharmacological effects of cannabinoids found in marijuana (Balster and Prescott, 1992; Browne and Weissman, 1981; Wiley et al., 1993; Wiley et al., 1995). As mentioned by the HHS, the discriminative stimulus effects of cannabinoids appear to be unique because abused drugs of other classes including stimulants, hallucinogens, opioids, benzodiazepines, barbiturates, NMDA antagonists, and antipsychotics do not fully substitute for Δ^9 -THC.

Laboratory animals including monkeys (McMahon et al., 2009), mice (McMahon et al., 2008), and rats (Gold et al., 1992) are able to discriminate cannabinoids from other drugs and placebo. The major active metabolite of Δ^9 -THC, 11-hydroxy- Δ^9 -THC, generalizes to Δ^9 -THC (Browne and Weissman, 1981). In addition, according to the HHS, twenty-two other cannabinoids found in marijuana also substitute for Δ^9 -THC. At least one cannabinoid, CBD, does not substitute for Δ^9 -THC in rats (Vann et al., 2008).

b. Self-Administration Studies

Animal self-administration behavior associated with a drug is a commonly used method for evaluating if the drug produces rewarding effects and for predicting abuse potential (Balster, 1991; Balster and Bigelow, 2003). Drugs that are self-administered by animals are likely to produce rewarding effects in humans. As mentioned in the HHS review document, earlier attempts to demonstrate self-administration of Δ^9 -THC were unsuccessful and confounded by diet restrictions, animal restraint, and known analgesic activity of Δ^9 -THC at testing doses (Tanda and Goldberg, 2003; Justinova et al., 2003). Self-administration of Δ^9 -THC was first demonstrated by Tanda et al. (2000). Tanda et al. (2000) showed that squirrel monkeys that were initially trained to self-administer cocaine (30 μ g/kg, i.v.) self-administered 2 μ g/kg Δ^9 -THC (i.v.)

and at a rate of 30 injections per one hour session. Tanda et al. (2000) used a lower dose of Δ^9 -THC that was rapidly delivered (0.2 ml injection over 200 ms) than in previous self-administration studies such that analgesic activity of Δ^9 -THC was not a confounding factor. The authors also stated that the doses were comparable to those doses used by humans who smoke marijuana. A CB1 receptor antagonist (SR141716) blocked this rewarding effect of THC.

Justinova et al. (2003) were able to demonstrate self-administration of Δ^9 -THC in drug-naïve squirrel monkeys (no previous exposure to other drugs). The authors tested the monkeys with several doses of Δ^9 -THC (1, 2, 4, 8, and 16 μ g/kg, i.v.) and found that the maximal rates of self-administration were observed with the 4 μ g/kg/infusion. Subsequently, Braida et al. (2004) reported that rats will self-administer Δ^9 -THC when delivered intracerebroventricularly (i.c.v.), but only at the lowest doses tested (0.01–0.02 μ g/infusion, i.c.v.).

Self-administration behavior with Δ^9 -THC was found to be antagonized in rats and squirrel monkeys by rimonabant (SR141716A, CB1 antagonist) and the opioid antagonists (naloxone and naltrexone) (Tanda et al., 2000; Braida et al., 2004; Justinova et al., 2004).

c. Conditioned Place Preference Studies

Conditioned place preference (CPP) is a behavioral assay where animals are given the opportunity to spend time in two distinct environments: one where they previously received a drug and one where they received a placebo. If the drug is reinforcing, animals in a drug-free state will choose to spend more time in the environment paired with the drug when both environments are presented simultaneously.

CPP has been demonstrated with Δ^9 -THC in rats but only at low doses (0.075–1.0 mg/kg, i.p.; Braida et al., 2004). Rimonabant (0.25–1.0 mg/kg, i.p.) and naloxone (0.5–2.0 mg/kg, i.p.) antagonized Δ^9 -THC-mediated CPP (Braida et al., 2004). However, in another study with rats, rimonabant was demonstrated to induce CPP at doses ranging from 0.25–3.0 mg/kg (Cheer et al., 2000). Mice without μ -opioid receptors did not exhibit CPP to Δ^9 -THC (paired with 1 mg/kg Δ^9 -THC, i.p.) (Ghozland et al., 2002).

2. Clinical Studies

In its scientific review (HHS, 2015), the HHS provided a list of common subjective psychoactive responses to cannabinoids based on information from several references (Adams and Martin, 1996; Gonzalez, 2007; Hollister, 1986;

Hollister, 1988; Institute of Medicine, 1982). Furthermore, Maldonado (2002) characterized these subjective responses as pleasurable to most humans and are generally associated with drug-seeking and/or drug-taking. Later studies (Scherrer et al., 2009; Zeiger et al., 2010) reported that high levels of positive psychoactive effects correlate with increased marijuana use, abuse, and dependence. The list of the common subjective psychoactive effects provided by the HHS (HHS, 2015) is presented below:

(1) *Disinhibition, relaxation, increased sociability, and talkativeness.*

(2) *Increased merriment and appetite, and even exhilaration at high doses.*

(3) *Enhanced sensory perception, which can generate an increased appreciation of music, art, and touch.*

(4) *Heightened imagination, which can lead to a subjective sense of increased creativity.*

(5) *Initial dizziness, nausea, tachycardia, facial flushing, dry mouth, and tremor.*

(6) *Disorganized thinking, inability to converse logically, time distortions, and short-term memory impairment.*

(7) *Ataxia and impaired judgment, which can impede driving ability or lead to an increase in risk-taking behavior.*

(8) *Illusions, delusions, and hallucinations that intensify with higher doses.*

(9) *Emotional lability, incongruity of affect, dysphoria, agitation, paranoia, confusion, drowsiness, and panic attacks, which are more common in inexperienced or high-dosed users.*

The HHS mentioned that marijuana users prefer higher concentrations of the principal psychoactive component (Δ^9 -THC) over lower concentrations. In a clinical study with marijuana users ($n = 12$, usage ranged from once a month to 4 times a week), subjects were given a choice of 1.95% Δ^9 -THC marijuana or 0.63% Δ^9 -THC marijuana after sampling both marijuana cigarettes in two choice sessions. The marijuana cigarette with high THC was chosen in 21 out of 24 choice sessions or 87.5% of the time (Chait and Burke, 1994). Furthermore, in a double-blind study, frequent marijuana users ($n = 11$, usage at least 2 times per month with at least 100 occasions) when given a low-dose of oral Δ^9 -THC (7.5 mg) were able to distinguish the psychoactive effects better than occasional users ($n = 10$, no use within the past 4 years with 10 or fewer lifetime uses) and also experienced fewer sedative effects (Kirk and de Wit, 1999).

Marijuana has also been recognized by scientific experts to have withdrawal symptoms (negative reinforcement)

following moderate and heavy use. As discussed further in Factor 7, the DEA notes that the American Psychiatric Association's (APA) Diagnostic and Statistical Manual of Mental Disorders, Fifth Edition (DSM-5) included a list of withdrawal symptoms following marijuana [cannabis] use (DSM-5, 2013).

C. Actual Abuse of Marijuana—National Databases Related to Marijuana Abuse and Trafficking

Marijuana continues to be the most widely used illicit drug. Evidence of actual abuse can be defined by episodes/mentions in databases indicative of abuse/dependence. The HHS provided in its recommendation (HHS, 2015) information relevant to actual abuse of marijuana including data results from the National Survey on Drug Use and Health (NSDUH), a Monitoring the Future (MTF) survey, the Drug Abuse Warning Network (DAWN), and the Treatment Episode Data Set (TEDS). These data sources provide quantitative information on many factors related to abuse of a particular substance, including incidence and patterns of use, and profile of the abuser of specific substances. The DEA is providing updated information from these databases in this discussion. The DEA also includes data on trafficking and illicit availability of marijuana from DEA databases including the National Forensic Laboratory Information System (NFLIS) and the National Seizure System (NSS), formerly the Federal-wide Drug Seizure System (FDSS), as well as other sources of data specific to marijuana, including the Potency Monitoring Project and the Domestic Cannabis Eradication and Suppression Program (DCE/SP).

1. National Survey on Drug Use and Health (NSDUH)

The National Survey on Drug Use and Health (NSDUH) is conducted annually by the Department of Health and Human Service's Substance Abuse and Mental Health Services Administration (SAMHSA). SAMHSA is the primary source of estimates of the prevalence and incidence of pharmaceutical drugs, illicit drugs, alcohol, and tobacco use in the United States. The survey is based on a nationally representative sample of the civilian, non-institutionalized population 12 years of age and older. The survey excludes homeless people who do not use shelters, active military personnel, and residents of institutional group quarters such as jails and hospitals.

According to the 2014 NSDUH report, marijuana was the most commonly used and abused illicit drug. That data showed that there were 22.2 million people who were past month users (8.4%) among those aged 12 and older in the United States. (Note: NSDUH figures on marijuana use include hashish use; the relative proportion of hashish use to marijuana use is very low.) Marijuana had the highest rate of past-year dependence or abuse in 2014. The NSDUH report estimates that 3.0 million people aged 12 or older used an illicit drug for the first time in 2014; a majority (70.3%) of these past year initiates reported that their first drug used was marijuana. Among those who began using illicit drugs in the past year, 65.6%, 70.3%, and 67.6% reported marijuana as the first illicit drug initiated in 2012, 2013, and 2014 respectively. In 2014, the average age of marijuana initiates among 12- to 49-year-olds was 18.5 years. These usage rates and demographics are relevant in light of the risks presented.

Marijuana had the highest rate of past year dependence or abuse of any illicit drug in 2014. The 2014 NSDUH report stated that 4.2 million persons were classified with substance dependence or abuse of marijuana in the past year (representing 1.6% of the total population aged 12 or older, and 59.0% of those classified with illicit drug dependence or abuse) based on criteria specified in the Diagnostic and Statistical Manual of Mental Disorders, 4th edition (DSM-IV).

Among past year marijuana users age 12 or older, 18.5% used marijuana on 300 or more days within the previous 12 months in 2014. This translates into 6.5 million people using marijuana on a daily or almost daily basis over a 12-month period, significantly more than the estimated 5.7 million daily or almost daily users in just the year before. Among past month marijuana users, 41.6% (9.2 million) used the drug on 20 or more days in the past month, a significant increase from the 8.1 million who used marijuana 20 days or more in 2013.

2. Monitoring the Future (MTF)

Monitoring the Future (MTF) is an ongoing study which is funded under a series of investigator-initiated competing research grants from the National Institute on Drug Abuse (NIDA). MTF tracks drug use trends among American adolescents in the 8th, 10th, and 12th grades. According to its 2015 survey results, marijuana was the most commonly used illicit drug, as was the case in previous years. Approximately 6.5% of 8th graders,

14.8% of 10th graders, and 21.3% of 12th graders surveyed in 2015 reported marijuana use during the past month prior to the survey. A number of high school students in 2015 also reported daily use in the past month, including 1.1%, 3.0%, and 6.0% of 8th, 10th, and 12th graders, respectively.

3. Drug Abuse Warning Network (DAWN), Emergency Department (ED) Visits

The Drug Abuse Warning Network (DAWN) is a public health surveillance system that monitors drug-related hospital emergency department (ED) visits to track the impact of drug use, misuse, and abuse in the United States. For the purposes of DAWN, the term "drug abuse" applies if the following conditions are met: (1) The case involved at least one of the following: use of an illegal drug, use of a legal drug contrary to directions, or inhalation of a non-pharmaceutical substance; and (2) the substance was used for one of the following reasons: Because of drug dependence, to commit suicide (or attempt to commit suicide), for recreational purposes, or to achieve other psychic effects. Importantly, many factors can influence the estimates of ED visits, including trends in overall use of a substance as well as trends in the reasons for ED usage. For instance, some drug users may visit EDs for life-threatening issues while others may visit to seek care for detoxification because they needed certification before entering treatment. Additionally, DAWN data do not distinguish the drug responsible for the ED visit from other drugs that may have been used concomitantly. As stated in a DAWN report, "Since marijuana/hashish is frequently present in combination with other drugs, the reason for the ED visit may be more relevant to the other drug(s) involved in the episode."

In 2011, marijuana was involved in 455,668 ED visits out of 2,462,948 total

ED visits involving all abuse or misuse in the United States and out of 1.25 million visits involving abuse or misuse of illicit drugs (excluding alcohol-related visits), as estimated by DAWN. This is lower than the number of ED visits involving cocaine (505,224) and higher than the number of ED visits involving heroin (258,482) and stimulants (e.g., amphetamine, methamphetamine) (159,840). Visits involving the other major illicit drugs, such as MDMA, GHB, LSD and other hallucinogens, PCP, and inhalants, were much less frequent, comparatively.

In young patients, marijuana is the illicit drug most frequently involved in ED visits, according to DAWN estimates, with 240.2 marijuana-related ED visits per 100,000 population ages 12 to 17, 443.8 per 100,000 population ages 18 to 20, and 446.9 per 100,000 population ages 21 to 24.

4. Treatment Episode Data Set (TEDS) System

The Treatment Episode Data Set (TEDS) system is part of the SAMHSA Drug and Alcohol Services Information System and is a national census of annual admissions to state licensed or certified, or administratively tracked, substance abuse treatment facilities. The TEDS system contains information on patient demographics and substance abuse problems of admissions to treatment for abuse of alcohol and/or drugs in facilities that report to state administrative data systems. For this database, the primary substance of abuse is defined as the main substance of abuse reported at the time of admission. TEDS also allows for the recording of two other substances of abuse (secondary and tertiary).

In 2011, the TEDS system included 1,928,792 admissions to substance abuse treatment; in 2012 there were 1,801,385 admissions; and in 2013 there were 1,683,451 admissions. Marijuana/hashish was the primary substance of

abuse for 18.3% (352,397) of admissions in 2011; 17.5% (315,200) in 2012; and 16.8% (281,991) in 2013. Of the 281,991 admissions for marijuana/hashish treatment in 2013, 24.3% used marijuana/hashish daily. Among those treated for marijuana/hashish as the primary substance in 2013, 27.4% were ages 12 to 17 years and 29.7% were ages 18 to 24 years. Those admitted for marijuana/hashish were mostly male (72.6%) and non-Hispanic (82.2%). Non-hispanic whites (43.2%) represented the largest ethnic group of marijuana admissions.

5. Forensic Laboratory Data

Data on marijuana seizures from federal, state, and local forensic laboratories have indicated that there is significant trafficking of marijuana. The National Forensic Laboratory System (NFLIS) is a program sponsored by the Drug Enforcement Administration's Office of Diversion Control. NFLIS systematically collects drug identification results and associated information from drug exhibits encountered by law enforcement and analyzed in federal, state, and local forensic laboratories. NFLIS is a comprehensive information system that includes data from 278 individual forensic laboratories that report more than 91% of the drug caseload in the U.S. NFLIS captures data for all drugs and chemicals identified and reported by forensic laboratories. More than 1,700 unique substances are represented in the NFLIS database.

Data from NFLIS showed that marijuana was the most frequently identified drug in federal, state, and local laboratories from January 2004 through December 2014. Marijuana accounted for between 29.47% and 34.84% of all drug exhibits analyzed annually during that time frame (Table 1).

Table 1. NFLIS Federal, State and Local Forensic Laboratory Data of Marijuana Reports (other than hashish)

Year	Reports	Percent of Total Reports
2004	454,582	34.42%
2005	483,134	32.53%
2006	520,060	32.55%
2007	525,668	33.66%
2008	526,420	34.07%
2009	536,888	34.30%
2010	544,418	34.91%
2011	495,937	33.42%
2012	485,591	32.02%
2013	452,839	30.70%
2014	432,989	29.27%
2015*	341,162	26.73%

NFLIS database queried 03-23-2016, by date of submission, all drugs reported

*2015 data are still being reported to NFLIS due to normal lag time.

Since 2004, the total number of reports of marijuana and the amount of marijuana encountered federally has remained high (see data from Federal-wide Drug Seizure System and Domestic Cannabis Eradication and Suppression Program below).

6. Federal-Wide Drug Seizure System

The Federal-wide Drug Seizure System (FDSS) contains information about drug seizures made within the jurisdiction of the United States by the Drug Enforcement Administration, the

Federal Bureau of Investigation, United States Customs and Border Protection, and United States Immigration and Customs Enforcement. It also records maritime seizures made by the United States Coast Guard. Drug seizures made by other Federal agencies are included in the FDSS database when drug evidence custody is transferred to one of the agencies identified above. FDSS is now incorporated into the National Seizure System (NSS), which is a repository for information on

clandestine laboratory and contraband (chemicals and precursors, currency, drugs, equipment and weapons). FDSS reports total federal drug seizures [in kilograms (kg)] of substances such as cocaine, heroin, MDMA, methamphetamine, and cannabis (marijuana and hashish). The yearly volume of cannabis seized (Table 2), consistently exceeding a thousand metric tons per year, shows that cannabis is very widely trafficked in the United States.

Table 2. Total Federal Seizures of Cannabis (Expressed in Kg)
(Source: NSS, U.S. Seizures, EPIC System Portal, queried 08-05-2015)

	2010	2011	2012	2013	2014
Cannabis	4,071,328	3,622,256	2,756,439	2,622,494	1,768,277
Marijuana	4,070,850	3,621,322	2,754,457	2,618,340	1,767,741
Hashish	478	934	1,982	4,154	536

7. Potency Monitoring Project

The University of Mississippi's Potency Monitoring Project (PMP), through a contract with the National Institute on Drug Abuse (NIDA), analyzes and compiles data on the Δ^9 -

THC concentrations of marijuana, hashish and hash oil samples provided by DEA regional laboratories and by state and local police agencies. After 2010, PMP has analyzed only marijuana samples provided by DEA regional laboratories. As indicated in Figure 1,

the percentage of Δ^9 -THC increased from 1995 to 2010 with an average THC content of 3.75% in 1995 and 9.53% in 2010. In examining marijuana samples only provided by DEA laboratories, the average Δ^9 -THC content was 3.96% in 1995 in comparison to 11.16% in 2015.

Figure 1. Average Percentage of Δ^9 -THC in Samples of Seized Marijuana (1995 – 2015)*

(Source: The University of Mississippi Potency Monitoring Program, Quarterly Report # 131)

*PMP discontinued analysis of state samples after 2010.

**Data for 2015 are incomplete. Figure 1 contains percentage of Δ^9 -THC data through Dec. 22. Due to lack of funding, 4,177 samples haven't yet been analyzed.

8. The Domestic Cannabis Eradication and Suppression Program

The Domestic Cannabis Eradication and Suppression Program (DCE/SP) was established in 1979 to reduce the supply of domestically cultivated marijuana in the United States. The program was designed to serve as a partnership between federal, state, and local

agencies. Only California and Hawaii were active participants in the program at its inception. However, by 1982 the program had expanded to 25 states and by 1985 all 50 states were participants. Cannabis is cultivated in remote locations and frequently on public lands and illicitly grown in all states. Data provided by the DCE/SP (Table 3) show

that in the United States in 2014, there were 3,904,213 plants eradicated in outdoor cannabis cultivation areas compared to 2,597,798 plants in 2000. Significant quantities of marijuana were also eradicated from indoor cultivation operations. There were 396,620 indoor plants eradicated in 2014 compared to 217,105 eradicated in 2000.

Table 3. Domestic Cannabis Eradication, Outdoor and Indoor Plants Seized, 2000–2014 (Source: Domestic Cannabis Eradication/Suppression Program)

	2000	2001	2002	2003	2004
Outdoor	2,597,798	3,068,632	3,128,800	3,427,923	2,996,144
Indoor	217,105	236,128	213,040	223,183	203,896
Total	2,814,903	3,304,760	3,341,840	3,651,106	3,200,040

	2005	2006	2007	2008	2009
Outdoor	3,938,151	4,830,766	6,599,599	7,562,322	9,980,038
Indoor	270,935	400,892	434,728	450,986	414,604
Total	4,209,086	5,231,658	7,034,327	8,013,308	10,394,642

	2010	2011	2012	2013	2014
Outdoor	9,866,766	6,226,288	3,631,582	4,033,513	3,904,213
Indoor	462,419	509,231	302,377	361,727	396,620
Total	10,329,185	6,735,519	3,933,959	4,395,240	4,300,833

The recent statistics from these various surveys and databases show that marijuana continues to be the most commonly used illicit drug, with considerable rates of heavy abuse and dependence. They also show that marijuana is the most readily available illicit drug in the United States.

Petitioners' Major Comments in Relation to Factor 1 and the Government's Responses

(1) In Exhibit B, the petitioners compared the effects of marijuana to currently controlled schedule II substances and made repeated claims about the comparative effects.

The HHS noted that comparisons between marijuana and schedule II substances are difficult because of differences in the actions of different pharmacological classes of schedule II drugs in the CSA. The HHS notes that schedule II substances include stimulant-like drugs (e.g., cocaine, amphetamine), opioids (e.g., fentanyl, oxycodone), depressant drugs (e.g., pentobarbital), dissociative anesthetics (e.g., phencyclidine), and naturally occurring plant components (e.g., coca leaves and poppy straw). The mechanism of action of Δ^9 -THC and marijuana, which act primarily through the cannabinoid receptors (discussed further in Factor 2) are completely different from the above-mentioned classes of schedule II substances. The HHS concludes that the differences in the mechanisms of action in the various classes of schedule II substances make it inappropriate to compare the range of those substances with marijuana.

Furthermore, as noted by the HHS, many substances scheduled under the CSA are evaluated within the context of drug development using data submitted under a New Drug Application (NDA). However, the petitioners have not identified a specific indication for use of marijuana and therefore the HHS notes that an appropriate comparator based on indication cannot be identified.

(2) The petitioners indicated that the actual or relative potential of abuse of marijuana is low. The petitioners state, “Some researchers claim that cannabis is not particularly addictive. Experts assert that cannabis’s addictive potential parallels caffeine’s.” (Exhibit B, page 19, lines 20–21). Furthermore, petitioners stated that, “Cannabis use indicates a lower likelihood of addiction and abuse potential as compared to other substances.” (Exhibit B, page 22, lines 12–13).

Under the CSA, for a substance to be placed in schedule II, III, IV, or V, it must have a currently accepted medical use in treatment in the United States.⁴⁵ As DEA has previously stated, Congress established only one schedule, schedule I, for drugs of abuse with “no currently accepted medical use in treatment in the United States.” 76 FR 40552 (2011). Thus, any attempt to compare the relative abuse potential of schedule I substance to that of a substance in another schedule is inconsequential since a schedule I substance must remain in schedule I until it has been found to have a currently accepted

medical use in treatment in the United States.

Moreover, the petitioners failed to review the indicators of abuse potential, as discussed in the legislative history of the CSA. The petitioners did not use data on marijuana usage, diversion, psychoactive properties, and dependence in their evaluation of marijuana abuse potential. The HHS and the DEA discuss those indicators above in this factor. HHS’s evaluation of the full range of data led HHS and DEA to conclude that marijuana has a high potential for abuse.

The petitioners, based on their review of a survey by Gore and Earleywine (2007), concluded that marijuana has a low abuse potential. Gore and Earleywine surveyed 746 mental health professionals and asked them to rate the addictiveness (based on a seven-point scale) of several drugs (heroin, nicotine, cocaine/crack, oxycodone, methamphetamine, amphetamine, caffeine, alcohol, and marijuana). The petitioners stated that the health professionals rated marijuana as least addictive of the drugs surveyed. The DEA notes that the survey cited by the petitioners is based on subjective opinions from health professionals.

(3) The petitioners mentioned that many of the cannabinoids in marijuana decrease the psychoactive effects of Δ^9 -THC, and therefore marijuana lacks sufficient abuse potential for placement into schedule I. Further, the petitioners mentioned on page 4 in Exhibit B (lines 11–15), “While the DEA considers cannabis a schedule I drug, it classifies dronabinol (Marinol) as schedule III. Dronabinol is 100 percent THC and is

⁴⁵ See *Americans for Safe Access*, 706 F.3d at 440.

potentially very psychoactive. Natural cannabis typically would be no more than 15 percent THC by weight. Thus it is inconsistent that cannabis, with 15 percent weight THC, remains a [s]chedule I drug, while dronabinol, at 100 percent THC, is schedule III.”

The HHS addressed this issue by indicating that the modulating effects of the other cannabinoids in marijuana on Δ^9 -THC have not been demonstrated in controlled studies. The HHS and the DEA also note that the determination of the abuse potential of a substance considers not only psychoactive effects but also chemistry, pharmacology, pharmacokinetics, usage patterns, and diversion history among other measures.

Marinol (dronabinol in sesame oil) was rescheduled from schedule II to schedule III on July 2, 1999 (64 FR 35928, DEA 1999). In assessing Marinol, HHS compared Marinol to marijuana on several aspects of abuse potential and found that major differences between the two, such as formulation, availability, and usage, contribute to differences in abuse potential. The psychoactive effects from smoking are generally more rapid and intense than those that occur through oral administration (HHS, 2015; Wesson and Washburn, 1990; Hollister and Gillespie, 1973). Therefore, as concluded by both the HHS and the DEA, the delayed onset of action and longer duration of action from an oral dose of Marinol may contribute in limiting the abuse potential of Marinol relative to marijuana, which is most often smoked. The HHS also stated that the extraction and purification of dronabinol from the encapsulated sesame oil mixture of Marinol is highly complex and difficult, and that the presence of sesame oil mixture may preclude the smoking of Marinol-laced cigarettes.

Furthermore, marijuana and Marinol show significant differences in actual abuse and illicit trafficking. There have been no reports of abuse, diversion, or public health risks due to Marinol. In contrast, 22.2 million American adults report currently using marijuana (SAMHSA, 2015a). The DEA database, NFLIS, showed that marijuana was the most frequently identified drug in state and local forensic laboratories from January 2001 to December 2014 and indicates the high availability of marijuana. The differences in composition, actual abuse, and diversion contribute to the differences in scheduling between marijuana and Marinol.

Additionally, the FDA approved a New Drug Application (NDA) for Marinol, indicating a legitimate medical

use for Marinol in the United States and allowing for Marinol to be rescheduled into schedule II and subsequently into schedule III of the CSA. The HHS mentioned that marijuana and Marinol differ on a wide variety of factors and these differences are major reasons for differential scheduling of marijuana and Marinol. Marijuana, as discussed more fully in Factors 3 and 6, does not have a currently accepted medical use in the United States, is highly abused, and has a lack of accepted safety.

Factor 2: Scientific Evidence of the Drug Pharmacological Effects, if Known

The HHS stated that there are large amounts of scientific data on the neurochemistry, mechanistic effects, toxicology, and pharmacology of marijuana. A scientific evaluation, as conducted by the HHS and the DEA, of marijuana's neurochemistry, human and animal behavioral pharmacology, central nervous system effects, and other pharmacological effects (e.g., cardiovascular, immunological effects) is presented below.

Neurochemistry

Marijuana contains numerous constituents such as cannabinoids that have a variety of pharmacological actions. The petition defined marijuana as including all cannabis cultivated strains. The HHS stated that different marijuana samples derived from various cultivated strains may differ in their chemical constituents including Δ^9 -THC and other cannabinoids. Therefore marijuana products from different strains will have different biological and pharmacological effects. The chemical constituents of marijuana are discussed further in Factor 3.

The primary site of action for cannabinoids such as Δ^9 -THC is at the cannabinoid receptor. Two cannabinoid receptors, CB1 and CB2, have been identified and characterized (Battista et al., 2012; Piomelli, 2005) and are G-protein-coupled receptors. Activation of these inhibitory G-protein-coupled receptors inhibits adenylate cyclase activity, which prevents conversion of ATP to cyclic AMP. Cannabinoid receptor activation also results in inhibition of N- and P/Q-type calcium channels and activates inwardly rectifying potassium channels (Mackie et al., 1995; Twitchell et al., 1997). The HHS mentioned that inhibition of N-type calcium channels decreases neurotransmitter release and this may be the underlying mechanism in the ability of cannabinoids to inhibit acetylcholine, norepinephrine and glutamate from specific areas of the brain. These cellular actions may

underlie the antinociceptive and psychoactive effects of cannabinoids. Δ^9 -THC acts as an agonist at cannabinoid receptors.

CB1 receptors are primarily found in the central nervous system and are located mainly in the basal ganglia, hippocampus and cerebellum of the brain (Howlett et al., 2004). CB1 receptors are also located in peripheral tissues such as the immune system (De Petrocellis and Di Marzo, 2009), but the concentration of CB1 receptors there is considerably lower than in the central nervous system (Herkenham et al., 1990; 1992). CB2 receptors are found primarily in the immune system and predominantly in B lymphocytes and natural killer cells (Bouaboula et al., 1993). CB2 receptors are also found in the central nervous system, primarily in the cerebellum and hippocampus (Gong et al., 2006).

Two endogenous ligands to the cannabinoid receptors, anandamide and arachidonyl glycerol (2-AG), were identified in 1992 (Devane et al., 1992) and 1995 (Mechoulam et al., 1995), respectively. Anandamide is a low-efficacy agonist (Brievogel and Childers, 2000) and 2-AG is a high efficacy agonist (Gonsiorek et al., 2000) to the cannabinoid receptors. These endogenous ligands are present in both the central nervous system and in the periphery (HHS, 2015).

Δ^9 -THC and cannabidiol (CBD) are two of the major cannabinoids in marijuana. Δ^9 -THC is the major psychoactive cannabinoid (Wachtel et al., 2002). Δ^9 -THC has similar affinity for CB1 and CB2 receptors and acts as a weak agonist at CB2 receptors. The HHS indicated that activation of CB1 receptors mediates psychotropic effects of cannabinoids. CBD has low affinity for both CB1 and CB2 receptors. CBD has antagonistic effects at CB1 receptors, and some inverse agonistic properties at CB2 receptors.

Animal Behavioral Effects

Animal abuse potential studies (drug discrimination, self-administration, conditioned place preference) are discussed more fully in Factor 1. Briefly, it was consistently demonstrated that Δ^9 -THC, the primary psychoactive component in marijuana, and other cannabinoids in marijuana have a distinct drug discriminative profile. In addition, animals self-administer Δ^9 -THC, and Δ^9 -THC in low doses produces conditioned place preference.

Central Nervous System Effects

Psychoactive Effects

The clinical psychoactive effects of marijuana are discussed more fully in Factor 1. Briefly, the psychoactive effects from marijuana use are considered pleasurable and associated with drug-seeking or drug-taking (HHS, 2015; Maldonado, 2002). Further, it was noted by HHS that marijuana users prefer higher concentrations of the principal psychoactive component (Δ^9 -THC) over lower concentrations (HHS, 2015).

Studies have evaluated psychoactive effects of THC in the presence of high CBD, CBC, or CBN ratios. Even though some studies suggest that CBD may decrease some of Δ^9 -THC's psychoactive effects, the HHS found that the ratios of CBD to Δ^9 -THC administered in the studies were not comparable to the amounts found in marijuana used by most people (Dalton et al., 1976; Karniol et al., 1974; Zwardi et al., 1982). In fact, the CBD ratios in these studies are significantly higher than the CBD found in most marijuana currently found on the streets (Mehmedic et al., 2010). HHS indicated that most of the marijuana available on the street has a high THC and low CBD content and therefore any lessening of THC's psychoactive effects by CBD will not occur for most marijuana users (HHS, 2015). Dalton et al. (1976) reported that when volunteers smoked cigarettes with a ratio of 7 CBD to 1 Δ^9 -THC (0.15 mg/kg CBD and 0.025 mg/kg Δ^9 -THC), there was a significant decrease in ratings of acute subjective effects and achieving a "high" in comparison to smoking Δ^9 -THC alone. In oral administration studies, the subjective effects and anxiety produced by combination of CBD and THC in a ratio of at least 1:2 CBD to Δ^9 -THC (15, 30, 60 mg CBD to 30 mg Δ^9 -THC; Karniol et al., 1974) or a ratio of 2:1 CBD to Δ^9 -THC (1 mg/kg CBD to 0.5 mg/kg Δ^9 -THC; Zuardi et al., 1982) are less than those produced by Δ^9 -THC administered alone.

In one study (Ilan et al., 2005), the authors calculated the naturally occurring concentrations of CBC and CBD in marijuana cigarettes with either 1.8 or 3.6% Δ^9 -THC by weight. The authors varied the concentrations of CBC and CBD for each concentration of Δ^9 -THC in the marijuana cigarettes. Administrations in healthy marijuana users (n=23) consisted of either: (1) Low CBC (0.1% by weight) and low CBD (0.2% by weight); (2) high CBC (0.5% by weight) and low CBD; (3) low CBC and high CBD (1.0% by weight); or (4) high CBC and high CBD and the users were divided into low Δ^9 -THC (1.8% by

weight) and high Δ^9 -THC (3.6% by weight) groups. Subjective psychoactive effects were significantly greater for all groups in comparison to placebo and there were no significant differences in effects among the treatments (Ilan et al., 2005).

The HHS also referred to a study with Δ^9 -THC and cannabitol (CBN) (Karniol et al., 1975). In this study, oral administration of either 12.5, 25, or 50 mg CBN combined with 25 mg Δ^9 -THC (ratio of at least 1:2 CBN to Δ^9 -THC) significantly increased subjective psychoactive ratings of Δ^9 -THC compared to Δ^9 -THC alone (Karniol et al., 1975).

Behavioral Impairment

Several factors may influence marijuana's behavioral effects including the duration (chronic or short term), frequency (daily, weekly, or occasionally), and amount of use (heavy or moderate). Researchers have examined how long behavioral impairments persist following chronic marijuana use. These studies used self-reported histories of exposure duration, frequency, and amount of marijuana use, and administered several performance and cognitive tests at different time points following marijuana abstinence. According to HHS, behavioral impairments may persist for up to 28 days of abstinence in chronic marijuana users.

Psychoactive effects of marijuana can lead to behavioral impairment including cognitive decrements and decreased ability to operate motor vehicles (HHS, 2015). Block et al. (1992) evaluated cognitive measures in 48 healthy male subjects following smoking a marijuana cigarette that contained 2.57% or 19 mg Δ^9 -THC by weight or placebo. Each subject participated in eight sessions (four sessions with marijuana; four sessions with placebo) and several cognitive and psychomotor tests were administered (e.g. verbal recall, facial recognition, text learning, reaction time). Marijuana significantly impaired performances in most of these cognitive and psychomotor tests (Block et al., 1992).

Ramaekers et al. (2006) reported that in 20 recreational users of marijuana, acute administration of 250 μ g/kg and 500 μ g/kg Δ^9 -THC in smoked marijuana resulted in dose-dependent impairments in cognition, motor impulsivity, motor control (tracking impairments), and risk taking. In another study (Kurzthaler et al., 1999), when 290 μ g/kg Δ^9 -THC was administered via a smoked marijuana cigarette in 30 healthy volunteers with no history of substance abuse there were significant impairments of motor speed

and accuracy. Furthermore, administration of 3.95% Δ^9 -THC in a smoked marijuana cigarette increased the latency in a task of simulated braking in a vehicle (Liguori et al., 1998). The HHS noted that the motor impairments reported in these studies (Kurzthaler et al., 1999; Liguori et al., 1998) are critical skills needed for operating a vehicle.

As mentioned in the HHS document, some studies examined the persistence of the behavioral impairments immediately after marijuana administration. Some of marijuana's acute effects may still be present for at least 24 hours after the acute psychoactive effects have subsided. In a brief communication, Heishmann et al. (1990) reported that there were cognitive impairments (digit recall and arithmetic tasks) in two out of three experienced marijuana smokers for 24 hours after smoking marijuana cigarettes containing 2.57% Δ^9 -THC. However, Fant et al. (1998) evaluated subjective effects and performance measures for up to 25 hours in 10 healthy males after exposure to either 1.8% or 3.6% Δ^9 -THC in marijuana cigarettes. Peak decrements in subjective and performance measures were noted within 2 hours of marijuana exposure but there were minimal residual alterations in subjective or performance measures at 23–25 hours after exposure.

Persistence of behavioral impairments following repeated and chronic use of marijuana has also been investigated and was reviewed in the HHS document (HHS, 2015). In particular, researchers examined how long behavioral impairments last following chronic marijuana use. In studies examining persistence of effects in chronic and heavy marijuana users, there were significant decrements in cognitive and motor function tasks in all studies of up to 27 days, and in most studies at 28 days (Solowij et al., 2002; Messinis et al., 2006; Lisdahl and Price, 2012; Pope et al., 2002; Bolla et al., 2002; Bolla et al., 2005). In studies that followed heavy marijuana users for longer than 28 days and up to 20 years of marijuana abstinence, cognitive and psychomotor impairments were no longer detected (Fried et al., 2005; Lyons et al., 2004; Tait et al., 2011). For example, Fried et al. (2005) reported that after 3 months of abstinence from marijuana, any deficits in intelligence (IQ), memory, and processing speeds following heavy marijuana use were no longer observed (Fried et al., 2005). In a meta-analysis that examined non-acute and long-lasting effects of marijuana, any deficits in neurocognitive performance that were observed within the first month

were no longer apparent after approximately one month of abstinence (Schreiner and Dunn, 2012). HHS further notes that in moderate marijuana users deficits in decision-making skills were not observed after 25 days of abstinence and additionally IQ, immediate memory and delayed memory skills were not significantly impacted as observed with heavy and chronic marijuana users (Fried et al., 2005; HHS, 2015).

As mentioned in the HHS document (HHS, 2015), the intensity and persistence of neurological impairment from chronic marijuana use also may be dependent on the age of first use. In two separate smaller scale studies (less than 100 participants per exposure group), Fontes et al. (2011) and Gruber et al. (2012) compared neurological function in early onset (chronic marijuana use prior to age 15 or 16) and late onset (chronic marijuana use after age 15 or 16) heavy marijuana users and found that there were significant deficits in executive neurological function in early onset users which were not observed or were less apparent in late onset users. In a prospective longitudinal birth cohort study following 1,037 individuals (Meier et al., 2012), a significant decrease in IQ and neuropsychological performance was observed in adolescent-onset users and persisted even after abstinence from marijuana for at least one year. However, Meier et al. (2012) reported in there was no significant change in IQ in adult-onset users.

The HHS noted that there is some evidence that the severity of the persistent neurological impairments may also be due in part to the amount of marijuana usage. In the study mentioned above, Gruber et al. (2012) found that the early onset users consumed three times as much marijuana per week and used it twice as often as late onset users. Meier et al. (2012) reported in their study, mentioned above, that there was a correlation between IQ deficits in adolescent onset users and the increased amount of marijuana used.

Behavioral Effects of Prenatal Exposure

In studies that examined effects of prenatal marijuana exposure, many of the pregnant women also used alcohol and tobacco in addition to marijuana. Even though other drugs were used in conjunction with marijuana, there is evidence of an association between heavy prenatal marijuana exposure and deficits in some cognitive function. There have been two prospective longitudinal birth cohort studies following individuals prenatally

exposed to marijuana from birth until adulthood: The Ottawa Prenatal Prospective Study (OPPS; Fried et al., 1980), and the Maternal Health Practices and Child Development Project (MHPCD; Day et al., 1985). Both longitudinal studies report that heavy prenatal marijuana use is associated with decreased performance on tasks assessing memory, verbal and quantitative reasoning in 4-year-olds (Fried and Watkinson, 1990) and in 6 year olds (Goldschmidt et al., 2008). In subsequent studies with the OPPS cohort, deficits in sustained attention were reported in children ages 6 and 13–16 years (Fried et al., 1992; Fried, 2002) and deficits in executive neurological function were observed in 9- and 12-year-old children (Fried et al., 1998). DEA further notes that with the MHPCD cohort, follow-up studies reported an increased rate of delinquent behavior (Day et al., 2011) and decreased achievement test scores (Goldschmidt et al., 2012) at age 14. When the MHPCD cohort was followed to age 22, there was a marginal ($p = 0.06$) increase in psychosis with prenatal marijuana exposure and early onset of marijuana use (Day et al., 2015).

Association of Marijuana Use With Psychosis

There has been extensive research to determine whether marijuana usage is associated with development of schizophrenia or other psychoses, and the HHS indicated that the available data do not suggest a causative link between marijuana and the development of psychosis (HHS, 2015; Minozzi et al., 2010). As mentioned in the HHS review (HHS, 2015), numerous large scale longitudinal studies demonstrated that subjects who used marijuana do not have a greater incidence of psychotic diagnoses compared to non-marijuana users (van Os et al., 2002; Fergusson et al., 2005; Kuepper et al., 2011). Further, the HHS commented that when analyzing the available data examining the association between marijuana and psychosis, it is critical to differentiate whether the patients in a study are already diagnosed with psychosis or if the individuals have a limited number of symptoms associated with psychosis without qualifying for a diagnosis of the disorder.

As mentioned by the HHS, some of the studies examining the association between marijuana and psychosis utilized non-standard methods to categorize psychosis and these methods did not conform to the criteria in the Diagnostic and Statistical Manual (DSM–5) or the International

Classification of Diseases (ICD–10) and would not be appropriate for use in evaluating the association between marijuana use and psychosis. For example, researchers characterized psychosis as “schizophrenic cluster” (Maremmani et al., 2004), “subclinical psychotic symptoms” (van Gastel et al., 2012), “pre-psychotic clinical high risk” (van der Meer et al., 2012), and symptoms related to “psychosis vulnerability” (Griffith-Lending et al., 2012).

The HHS discussed an early epidemiological study conducted by Andreasson et al. (1987), which examined the link between psychosis and marijuana use. In this study, about 45,000 18- and 19-year-old male Swedish subjects provided detailed information on their drug-taking history and 274 of these subjects were diagnosed with schizophrenia over a 14-year period (1969–1983). Out of the 274 subjects diagnosed with psychosis, 21 individuals (7.7%) had used marijuana more than 50 times, while 197 individuals (72%) never used marijuana. As presented by the authors (Andreasson et al., 1987), individuals who claimed to take marijuana on more than 50 occasions were 6 times more likely to be diagnosed with schizophrenia than those who had never consumed the drug. The authors concluded that marijuana users who are vulnerable to developing psychoses are at the greatest risk for schizophrenia. In a 35 year follow up to the subjects evaluated in Andreasson et al. (1987), Manrique-Garcia et al. (2012) reported similar findings. In the follow up study, 354 individuals developed schizophrenia. Of those, 32 individuals (9%) had used marijuana more than 50 times and were 6.3 times more likely to develop schizophrenia. 255 of the 354 individuals (72%) never used marijuana.

The HHS also noted that many studies support the assertion that psychosis from marijuana usage may manifest only in individuals already predisposed to development of psychotic disorders. Marijuana use may precede diagnosis of psychosis (Schimmelmann et al., 2011), but most reports indicate that prodromal symptoms of schizophrenia are observed prior to marijuana use (Schiffman et al., 2005). In a review examining gene-environmental interaction between marijuana exposure and the development of psychosis, it was concluded that there is some evidence to support that marijuana use may influence the development of psychosis but only for susceptible individuals (Pelayo-Teran et al., 2012).

Degenhardt et al. (2003) modeled the prevalence of schizophrenia against marijuana use across eight birth cohorts in individuals born during 1940 to 1979 in Australia. Even though there was an increase in marijuana use in the adult subjects over this time period, there was not an increase in diagnoses of psychosis for these same subjects. The authors concluded that use of marijuana may increase schizophrenia only in persons vulnerable to developing psychosis.

Cardiovascular and Autonomic Effects

The HHS stated that acute use of marijuana causes an increase in heart rate (tachycardia) and may increase blood pressure (Capriotti et al., 1988; Benowitz and Jones, 1975). There is some evidence that associates the increased heart rate from Δ^9 -THC exposure with excitation of the sympathetic and depression of the parasympathetic nervous systems (Malinowska et al., 2012). Tolerance to tachycardia develops with chronic exposure to marijuana (Jones, 2002; Sidney, 2002).

Prolonged exposure to Δ^9 -THC results in a decrease in heart rate (bradycardia) and hypotension (Benowitz and Jones, 1975). These effects are thought to be mediated through peripherally located, presynaptic CB1 receptor inhibition of norepinephrine release with possible direct activation of vascular cannabinoid receptors (Wagner et al., 1998; Pacher et al., 2006).

As stated in the HHS recommendation (HHS, 2015), marijuana exposure causes orthostatic hypotension (fainting-like feeling; sudden drop in blood pressure upon standing up) and tolerance can develop to this effect upon repeated, chronic exposure (Jones, 2002). Tolerance to orthostatic hypotension is potentially related to plasma volume expansion, but tolerance does not develop to supine hypotensive effects (Benowitz and Jones, 1975).

Marijuana smoking, particularly by those with some degree of coronary artery or cerebrovascular disease, poses risks such as increased cardiac work, increased catecholamines and carboxyhemoglobin, myocardial infarction and postural hypotension (Benowitz and Jones, 1981; Hollister, 1988; Mittleman et al., 2001; Malinowska et al., 2012). However, electrocardiographic changes were minimal after administration of large cumulative doses of Δ^9 -THC (Benowitz and Jones, 1975).

The DEA notes two recent reports that reviewed several case studies on marijuana and cardiovascular complications (Panayiotides, 2015;

Hackam, 2015). Panayiotides (2015) reported that approximately 25.6% of the cardiovascular cases from marijuana use resulted in death from data provided by the French Addictovigilance Network during the period of 2006–2010. Several case studies on marijuana usage and cardiovascular events were discussed and it was concluded that although a causal link cannot be established due to not knowing exact amounts of marijuana used in the cases and confounding variables, the available evidence supports a link between marijuana and cardiotoxicity. Hackam (2015) reviewed 34 case reports or case series reports of marijuana and stroke/ ischemia in 64 stroke patients and reported that in 81% of the cases there was a temporal relationship between marijuana usage and stroke or ischemic event. The author concluded that collective analysis of the case reports supports a causal link between marijuana use and stroke.

Respiratory Effects

The HHS stated that transient bronchodilation is the most typical respiratory effect of acute exposure to marijuana (Gong et al., 1984). In a recent longitudinal study, information on marijuana use and pulmonary data function were collected from 5,115 individuals over 20 years from 4 communities in the United States (Oakland, CA; Chicago, IL; Minneapolis, MN; Birmingham, AL) (Pletcher et al., 2012). Of the 5,115 individuals, 795 individuals reported use of only marijuana (without tobacco). The authors reported that occasional use of marijuana (7 joint-years for lifetime or 1 joint/day for 7 years or 1 joint/week for 49 years) does not adversely affect pulmonary function. Pletcher et al. (2012) further concluded that there is some preliminary evidence suggesting that heavy marijuana use may have a detrimental effect on pulmonary function, but the sample size of heavy marijuana users in the study was too small. Further, as mentioned in the HHS recommendation document (HHS, 2015), long-term use of marijuana may lead to chronic cough, increased sputum, as well as increased frequency of chronic bronchitis and pharyngitis (Adams and Martin, 1996; Hollister, 1986).

The HHS stated that the evidence that marijuana may lead to cancer of the respiratory system is inconsistent, with some studies suggesting a positive correlation while others do not (Lee and Hancox, 2011; Tashkin, 2005). The HHS noted a case series that reported lung cancer occurrences in three marijuana

smokers (age range 31–37 years) with no history of tobacco smoking (Fung et al., 1999). Furthermore, in a case-control study (n = 173 individuals with squamous cell carcinoma of the head and neck; n = 176 controls; Zhang et al., 1999), prevalence of marijuana use was 9.7% in controls and 13.9% in cases and the authors reported that marijuana use may dose-dependently interact with mutagenic sensitivity, cigarette smoking, and alcohol use to increase risk associated with head and neck cancers (Zhang et al., 1999). However, in a large clinical study with 1,650 subjects, no positive correlation was found between marijuana use and lung cancer (Tashkin et al., 2006). This finding held true regardless of the extent of marijuana use when both tobacco use and other potential confounding factors were controlled. The HHS concluded that new evidence suggests that the effects of smoking marijuana on respiratory function and cancer are different from the effects of smoking tobacco (Lee and Hancox, 2011).

The DEA further notes the publication of recent review articles critically evaluating the association between marijuana and lung cancer. Most of the reviews agree that the association is weak or inconsistent (Huang et al., 2015; Zhang et al., 2015; Gates et al., 2014; Hall and Degenhardt, 2014). Huang et al. (2015) identified and reviewed six studies evaluating the association between marijuana use and lung cancer and the authors concluded that an association is not supported most likely due to the small amounts of marijuana smoked in comparison to tobacco. Zhang et al. (2015) examined six case control studies from the US, UK, New Zealand, and Canada within the International Lung Cancer Consortium and found that there was a weak association between smoking marijuana and lung cancer in individuals who never smoked tobacco, but precision of the association was low at high marijuana exposure levels. Hall and Degenhardt (2014) noted that even though marijuana smoke contains several of the same carcinogens and co-carcinogens as tobacco smoke (Roth et al., 1998) and has been found to be mutagenic and carcinogenic in the mouse skin test, epidemiological studies have been inconsistent, but more consistent positive associations have been reported in case control studies. Finally Gates et al. (2014), reviewed the studies evaluating marijuana use and lung cancer and concluded that there is evidence that marijuana produces changes in the respiratory system (precursors to cancer) that could lead to

lung cancer, but overall association is weak between marijuana use and lung cancer especially when controlling for tobacco use.

Endocrine System

Reproductive Hormones

The HHS stated that administration of marijuana to humans does not consistently alter the endocrine system. In a controlled human exposure study (n = 4 males), subjects were acutely administered smoked marijuana containing 2.8% Δ^9 -THC or placebo and an immediate significant decrease in luteinizing hormone and an increase in cortisol was reported in the subjects that smoked marijuana (Cone et al., 1986). Furthermore, as cited by the HHS, two later studies (Dax et al., 1989; Block et al., 1991) reported no changes in hormone levels. Dax et al. (1989) recruited male volunteers (n = 17) that were occasional or heavy users of marijuana. Following exposure to smoked Δ^9 -THC (18 mg/cigarette) or oral Δ^9 -THC (10 mg three times per day for three days and on the morning of the fourth day), the subjects in that study showed no changes in plasma adrenocorticotropic hormone (ACTH), cortisol, prolactin, luteinizing hormone, or testosterone levels. Additionally, Block et al. (1991) compared plasma hormone levels amongst non-users as well as infrequent, moderate, and frequent users of marijuana (n = 93 men and 56 women) and found that chronic use of marijuana (infrequent, moderate, and frequent users) did not significantly alter concentrations of testosterone, luteinizing hormone, follicle stimulating hormone, prolactin, or cortisol.

The HHS noted that there is a discrepancy in the effect of marijuana on female reproductive system functionality between animals and humans (HHS, 2015). Female rhesus monkeys that were administered 2.5 mg/kg Δ^9 -THC, i.m., during days 1–18 of the menstrual cycle had reduced progesterone levels and ovulation was suppressed (Asch et al., 1981). However, women who smoked marijuana (1 gram marijuana cigarette with 1.8% Δ^9 -THC) during the periovulatory period (24–36 hours prior to ovulation) did not exhibit changes in reproductive hormone levels or their menstrual cycles (Mendelson and Mello, 1984). In a review article by Brown and Dobs (2002), the authors state that endocrine changes observed with marijuana are no longer observed with chronic administration and this may be due to drug tolerance.

Reproductive Cancers

The HHS stated that recent studies support a possible association between frequent, long-term marijuana use and increased risk of testicular germ cell tumors. In a hospital-based case-control study, the frequency of marijuana use was compared between testicular germ cell tumor (TGCT) patients (n = 187) and controls (n = 148) (Trabert et al., 2011).

TGCT patients were more likely to be frequent marijuana users than controls with an odds ratio (OR) of 2.2 (95% confidence limits of 1.0–5.1) and were less likely to be infrequent or short-term users with odds ratios of 0.5 and 0.6, respectively in comparison to controls (Trabert et al., 2011). The DEA further notes that in two population-based case-control studies (Daling et al., 2009; Lacson et al., 2012), marijuana use was compared between patients diagnosed with TGCT and matched controls in Washington State or Los Angeles County. In both studies, it was reported that TGCT patients were twice as likely as controls to use marijuana. Authors of both studies concluded that marijuana use is associated with an elevated risk of TGCT (Daling et al., 2009; Lacson et al., 2012).

The HHS cited a study (Sarfaraz et al., 2005) demonstrating that WIN 55,212–2 (a mixed CB1/CB2 agonist) induces apoptosis (one form of cell death) in prostate cancer cells and decreases expression of androgen receptors and prostate specific antigens, suggesting a potential therapeutic value for cannabinoid agonists in the treatment of prostate cancer, an androgen-stimulated type of carcinoma.

Other Hormones (e.g. Thyroid, Appetite)

In more recent studies, as cited by the HHS, chronic marijuana use by subjects (n = 39) characterized as dependent on marijuana according to the ICD–10 criteria did not affect serum levels of thyroid hormones: TSH (thyrotropin), T4 (thyroxine), and T3 (triiodothyronine) (Bonnet, 2013). With respect to appetite hormones, in a pilot study with HIV-positive males, smoking marijuana dose-dependently increased plasma levels of ghrelin and leptin and decreased plasma levels of peptide YY (Riggs et al., 2012).

The HHS stated that Δ^9 -THC reduces binding of the corticosteroid dexamethasone in hippocampal tissue from adrenalectomized rats and acute Δ^9 -THC releases corticosterone, with tolerance developing to this effect with chronic administration (Eldridge et al., 1991). These data suggest that Δ^9 -THC

may interact with the glucocorticoid receptor system.

Immune System

The HHS stated that cannabinoids alter immune function but that there can be differences between the effects of synthetic, natural, and endogenous cannabinoids (Croxford and Yamamura, 2005; Tanasescu and Constantinescu, 2010).

The HHS noted that there are conflicting results in animal and human studies with respect to cannabinoid effects on immune functioning in subjects with compromised immune systems. Abrams et al. (2003) examined the effects of marijuana and Δ^9 -THC in 62 HIV–1-infected patients. Subjects received one of three treatments, three times a day: smoked marijuana cigarette containing 3.95% Δ^9 -THC, oral tablet containing Δ^9 -THC (2.5 mg oral dronabinol), or oral placebo. There were no changes in CD4+ and CD8+ cell counts, HIV RNA levels, or protease inhibitor levels in any of the treatment groups (Abrams et al., 2003). Therefore, use of cannabinoids showed no short-term adverse virologic effects in individuals with compromised immune systems. Conversely, Roth et al. (2005) reported that in immunodeficient mice implanted with human blood cells infected with HIV, exposure to Δ^9 -THC *in vivo* suppresses immune function, increases HIV co-receptor expression, and acts as a cofactor to enhance HIV replication.

The DEA notes two recent clinical studies reporting a decrease in cytokine and interleukin levels following marijuana use. Keen et al. (2014) compared the differences in the levels of IL–6 (interleukin-6), a proinflammatory cytokine, amongst non-drug users (n = 78), marijuana only users (n = 46) and marijuana plus other drug users (n = 45) in a community-based sample of middle-aged African Americans (Keen et al., 2014). After adjusting for confounders, analyses revealed that lifetime marijuana only users had significantly lower IL–6 levels than the nonuser group. Further, Sexton et al. (2014) compared several immune parameters in healthy individuals and subjects with multiple sclerosis (MS) and found that the chronic use of marijuana resulted in reduced monocyte migration, and decreased levels of CCL2 and IL–17 in both healthy and MS groups.

The DEA also notes a review suggesting that Δ^9 -THC suppresses the immune responses in experimental animal models and *in vitro* and that these changes may be primarily

mediated through the CB2 cannabinoid receptor (Eisenstein and Meissler, 2015).

Petitioners' Major Comments in Relation to Factor 2 and the Government's Responses

(1) The petitioners state that “[m]edical use of cannabis is considered safe.” (Exhibit B, page 7); and that “[t]here are adequate and well-controlled studies proving the medical efficacy of cannabis.” (Exhibit B, page 10). The petitioners also allege that “Cannabis is safer than current, legal Schedule II opiate drugs” and that it presents milder side effects (Exhibit B, page 9–10).

As detailed in the HHS review and as discussed later in this document (see Factor 3), there are neither adequate safety studies nor adequate, well-controlled studies proving marijuana’s efficacy. The DEA notes that neither the CSA nor established scheduling criteria suggest that the HHS and DEA should consider the relative safety profiles of drugs when determining the proper schedule. To the extent that the petitioners were referring to abuse and dependence liability, this document discusses those effects in factors 1, 4, and 7.

(2) The petitioners state that “scientific evidence regarding the safety and efficacy of cannabis is readily available directly from the National Library of Medicine.” (Exhibit B, page 14).

The government agrees that many articles discuss marijuana and its constituents. Yet, these articles in no way demonstrate that marijuana is safe and effective for the treatment of any disease or condition. As mentioned in the HHS review and as discussed later in this document (see Factor 3), the current research does not provide adequate detailed scientific evidence regarding chemistry, pharmacology, toxicology, and effectiveness derived from well-controlled clinical investigations to permit a conclusion that marijuana is safe and effective for treating a specific, recognized disorder.

(3) The petitioners mentioned on page 9 of exhibit B that “[t]here has never been a lethal overdose of marijuana reported in humans” and that “[t]here is no known LD50 for any form of cannabis.”

As more fully discussed in Factor 3 below, the HHS and DEA conclude that there are not adequate studies to determine the safety of marijuana. As discussed in the HHS document and below, the determination of safety is more complex than a mere determination of the rate or likelihood of death. Moreover, the lack of overdose

deaths attributed to a drug is not evidence that the drug is safe for medical use.

Factor 3: The State of the Current Scientific Knowledge Regarding the Drug or Substance

Chemistry

The HHS stated that marijuana, also known as *Cannabis sativa* L., is part of the Cannabaceae plant family and is one of the oldest cultivated crops. The term “marijuana” is generally used to refer to a mixture of the dried flowering tops and leaves from *Cannabis*. Marijuana users primarily smoke the marijuana leaves, but individuals also ingest marijuana through food infused with marijuana and its extracts. *Cannabis sativa* is the primary species of *Cannabis* that is illegally marketed in the United States. Marijuana is one of three major derivatives sold as separate illicit products, the other two being hashish and hash oil. Hashish is composed of the dried and compressed cannabinoid-rich resinous material of *Cannabis* and is found as balls and cakes as well as other forms. Individuals may break off pieces and place them into a pipe to smoke. Hash oil, a viscous brown or amber colored liquid, is produced by solvent extraction of cannabinoids from *Cannabis* and contains approximately 50% cannabinoids. One to two drops of hash oil on a cigarette has been reported to produce the equivalent of a single marijuana cigarette (DEA, 2015).

The HHS indicated in its evaluation that the petitioners defined marijuana as including all *Cannabis* cultivated strains. However, different marijuana samples are derived from numerous cultivated strains and may have different chemical compositions including levels of Δ^9 -THC and other cannabinoids (Appendino et al., 2011). A consequence of having different chemical compositions in the various marijuana samples is that there will be significant differences in safety, biological, pharmacological, and toxicological profiles and therefore, according to the HHS, all *Cannabis* strains cannot be considered collectively because of the variations in chemical composition. Furthermore, the concentration of Δ^9 -THC and other cannabinoids present in marijuana may vary due to growing conditions and processing of the plant after harvesting. For example, the plant parts collected such as flowers, leaves and stems can influence marijuana’s potency, quality, and purity (Adams and Martin, 1996; Agurell et al., 1984; Mechoulam, 1973). Variations in marijuana harvesting have

resulted in potencies ranging from a low of 1 to 2% up to a high of 17% as indicated by cannabinoid content. The concentration of Δ^9 -THC averages approximately 12% by weight in a typical marijuana mixture of leaves and stems. However, some specifically grown and selected marijuana samples can contain 15% or greater Δ^9 -THC (Appendino et al., 2011). As a result, the Δ^9 -THC content in a 1 gram marijuana cigarette can range from as little as 3 milligrams to 150 milligrams or more. In a systematic review conducted by Cascini et al. (2012), it was reported that marijuana’s Δ^9 -THC content has increased significantly from 1979–2009.

Since there is considerable variability in the cannabinoid concentrations and chemical constituency among marijuana samples, the interpretation of clinical data with marijuana is complicated. A primary issue is the lack of consistent concentrations of Δ^9 -THC and other substances in marijuana which complicates the interpretation of the effects of different marijuana constituents. An added issue is that the non-cannabinoid components in marijuana may potentially modify the overall pharmacological and toxicological properties of various marijuana strains and products.

Various *Cannabis* strains contain more than 525 identified natural constituents including cannabinoids, 21 (or 22) carbon terpenoids found in the plant, as well as their carboxylic acids, analogues, and transformation products (Agurell et al., 1984; 1986; Mechoulam, 1973; Appendino et al., 2011). To date, more than 100 cannabinoids have been characterized (ElSohly and Slade, 2005; Radwan et al., 2009; Appendino et al., 2011), and most major cannabinoid compounds occurring naturally have been identified. There are still new and comparably more minor cannabinoids being characterized (Pollastro et al., 2011). The majority of the cannabinoids are found in *Cannabis*. One study reported accumulation of two cannabinoids, cannabigerol and its corresponding acid, in *Helichrysum* (*H. umbraculigerum*) which is a non-*Cannabis* source (Appendino et al., 2011).

Of the cannabinoids found in marijuana, Δ^9 -THC (previously known as Δ^1 -THC) and delta-8-tetrahydrocannabinol (Δ^8 -THC, Δ^6 -THC) have been demonstrated to produce marijuana’s psychoactive effects. Psychoactive effects from marijuana usage have been mainly attributed to Δ^9 -THC because Δ^9 -THC is present in significantly more quantities than Δ^8 -THC in most marijuana varieties. There are only a few marijuana strains that

contain Δ^8 -THC in significant amounts (Hively et al., 1966). Δ^9 -THC is an optically active resinous substance that is extremely lipophilic. The chemical name for Δ^9 -THC is (6a*R*-trans)-6a,7,8,10a-tetrahydro-6,6,9-trimethyl-3-pentyl-6*H*-dibenzo-[b,d]pyran-1-ol, or (-)- Δ^9 -THC isomer is pharmacologically 6 to 100 times more potent than the (+)-trans isomer (Dewey et al., 1984).

Other relatively well-characterized cannabinoids present in marijuana include cannabidiol (CBD), cannabichromene (CBC), and cannabitol (CBN). CBD and CBC are major cannabinoids in marijuana and are both lipophilic. The chemical name for CBD is 2-[(1*R*,6*R*)-3-methyl-6-prop-1-en-2-ylcyclohex-2-en-1-yl]-5-pentylbenzene-1,3-diol and the chemical name for CBC is 2-methyl-2-(4-methylpent-3-enyl)-7-pentyl-5-chromenol. CBN is a minor naturally-occurring cannabinoid with weak psychoactivity and is also a major metabolite of Δ^9 -THC. The chemical name for CBN is 6,6,9-trimethyl-3-pentyl-benzo[*c*]chromen-1-ol.

In summary, marijuana has several strains with high variability in the concentrations of Δ^9 -THC, the main psychoactive component, as well as other cannabinoids and compounds. Marijuana is not a single chemical and does not have a consistent and reproducible chemical profile with predictable or consistent clinical effects. In the HHS recommendation for marijuana scheduling (HHS, 2015), it was recommended that investigators consult a guidance for industry entitled, *Botanical Drug Products*,⁴⁶ which provides information on the approval of botanical drug products. Specifically, in order to investigate marijuana in support of a New Drug Application (NDA), clinical studies under an Investigational New Drug (IND) application should include "consistent batches of a particular marijuana product for [a] particular disease." (HHS, 2015). Furthermore, the HHS noted that investigators must provide data meeting the requirements for new drug approval as stipulated in 21 CFR 314.50 (HHS, 2015).

Human Pharmacokinetics

Pharmacokinetics of marijuana in humans is dependent on the route of administration and formulation (Adams and Martin, 1996; Agurell et al., 1984; Agurell et al., 1986). Individuals primarily smoke marijuana as a cigarette

(weighing between 0.5 and 1 gram) or in a pipe. More recently, vaporizers have been used as another means for individuals to inhale marijuana. Marijuana may also be ingested orally in foods or as an extract in ethanol or other solvents. Pharmacokinetic studies with marijuana focused on evaluating the absorption, metabolism, and elimination profile of Δ^9 -THC and other cannabinoids (Adams and Martin, 1996; Agurell et al., 1984; Agurell et al., 1986).

Absorption and Distribution of Inhaled Marijuana Smoke

There is high variability in the pharmacokinetics of Δ^9 -THC and other cannabinoids from smoked marijuana due to differences in individual smoking behavior even under controlled experimental conditions (Agurell et al., 1986; Herning et al., 1986; Huestis et al., 1992a). Experienced marijuana users can titrate and regulate the dose by holding marijuana smoke in their lungs for an extended period of time resulting in increased psychoactive effects by prolonging absorption of the smoke. This property may also help explain why there is a poor correlation between venous levels of Δ^9 -THC and the intensity of effects and intoxication (Agurell et al., 1986; Barnett et al., 1985; Huestis et al., 1992a). The HHS recommended that puff and inhalation volumes should be tracked in experimental studies because the concentration of cannabinoids can vary at different stages of smoking.

Δ^9 -THC from smoked marijuana is rapidly absorbed within seconds. Psychoactive effects are observed immediately following absorption with measurable neurological and behavioral changes for up to 6 hours (Grotenhermen, 2003; Hollister, 1986; Hollister, 1988). Δ^9 -THC is distributed to the brain in a rapid and efficient manner. Bioavailability of Δ^9 -THC from marijuana (from a cigarette or pipe) ranges from 1 to 24% with the fraction absorbed rarely exceeding 10 to 20% (Agurell et al., 1986; Hollister, 1988). The low and variable bioavailability of Δ^9 -THC is due to loss in side-stream smoke, variation in individual smoking behaviors and experience, incomplete absorption of inhaled smoke, and metabolism in lungs (Herning et al., 1986; Johansson et al., 1989). After cessation of smoking, Δ^9 -THC venous levels decline within minutes and continue to decline to about 5% to 10% of the peak level within an hour (Agurell et al., 1986; Huestis et al., 1992a; Huestis et al., 1992b).

Absorption and Distribution of Orally Administered Marijuana

Following oral administration of Δ^9 -THC or marijuana, onset of effects start within 30 to 90 minutes, peak after 2 to 3 hours and effects remain for 4 to 12 hours (Grotenhermen, 2003; Adams and Martin, 1996; Agurell et al., 1984; Agurell et al., 1986). Dose titration of Δ^9 -THC from orally ingested marijuana is difficult for users in comparison to smoked or inhaled marijuana due to the delay in the onset of effects. Oral bioavailability of Δ^9 -THC, either in its pure form or in marijuana, is low and variable with a range from 5% to 20% (Agurell et al., 1984; Agurell et al., 1986). There is also inter- and intra-subject variability of orally administered Δ^9 -THC under experimental conditions and even under repeated dosing experiments (HHS, 2015). The HHS noted that in bioavailability studies using radiolabeled Δ^9 -THC, Δ^9 -THC plasma levels following oral administration of Δ^9 -THC were low relative to plasma levels after inhaled or intravenously administered Δ^9 -THC. The low and variable bioavailability of orally administered Δ^9 -THC is due to first pass hepatic elimination from blood and erratic absorption from stomach and bowel (HHS, 2015).

Metabolism and Excretion of Cannabinoids From Marijuana

Studies evaluating cannabinoid metabolism and excretion focused on Δ^9 -THC because it is the primary psychoactive component in marijuana. Δ^9 -THC is metabolized via microsomal hydroxylation and oxidation to both active and inactive metabolites (Lemberger et al., 1970; Lemberger et al., 1972a; Lemberger et al., 1972b; Agurell et al., 1986; Hollister, 1988). Metabolism of Δ^9 -THC is consistent among frequent and infrequent marijuana users (Agurell et al., 1986). The primary active metabolite of Δ^9 -THC following oral ingestion is 11-hydroxy- Δ^9 -THC which is equipotent to Δ^9 -THC in producing marijuana-like subjective effects (Agurell et al., 1986; Lemberger and Rubin, 1975). Metabolite levels following oral administration may be greater than that of Δ^9 -THC and may contribute greatly to the pharmacological effects of oral Δ^9 -THC or marijuana.

Plasma clearance of Δ^9 -THC approximates hepatic blood flow at a rate of approximately 950 ml/min or greater. Rapid clearance of Δ^9 -THC from blood is primarily due to redistribution to other tissues in the body rather than to metabolism (Agurell et al., 1984; Agurell et al., 1986). Outside of the

⁴⁶ Available at <http://www.fda.gov/Drugs/default.htm> under Guidance (Drugs).

liver, metabolism in most tissues is considerably slow or does not occur. The elimination half-life of Δ^9 -THC ranges from 20 hours to between 10 and 13 days (Hunt and Jones, 1980). Lemberger et al. (1970) reported that the half-life of Δ^9 -THC ranged from 23–28 hours in heavy marijuana users and up to 60 to 70 hours in naïve users. The long elimination half-life of Δ^9 -THC is due to slow release of Δ^9 -THC and other cannabinoids from tissues and subsequent metabolism. Inactive carboxy metabolites of Δ^9 -THC have terminal half-lives of 50 hours to 6 days or more and serve as long-term markers in urine tests for marijuana use.

Most of the absorbed Δ^9 -THC dose is eliminated in the feces and about 33% in urine. The glucuronide metabolite of Δ^9 -THC is excreted as the major urine metabolite along with 18 non-conjugated metabolites (Agurell et al., 1986).

Research Status and Test of Currently Accepted Medical Use for Marijuana

According to the HHS, there are numerous human clinical studies with marijuana in the United States under FDA-regulated IND applications. Results of small clinical exploratory studies have been published in the medical literature. Approval of a human drug for marketing, however, is contingent upon FDA approval of a New Drug Application (NDA) or a Biologics License Application (BLA). According to the HHS, the FDA has not approved any drug product containing marijuana for marketing.

The HHS noted that a drug may be found to have a medical use in treatment in the United States for purposes of the CSA if the drug meets the five elements described by the DEA in 1992. Those five elements “are both necessary and sufficient to establish a prima facie case of currently accepted medical use” in treatment in the United States.” (57 FR 10499, 10504 (March 26, 1992)). This five-element test, which the HHS and DEA have utilized in all such analyses for more than two decades, has been upheld by the Court of Appeals. *ACT*, 15 F.3d at 1135. The five elements that characterize “currently accepted medical use” for a drug are summarized here and expanded upon in the discussion below:

1. *The drug’s chemistry must be known and reproducible;*
2. *There must be adequate safety studies;*
3. *There must be adequate and well-controlled studies proving efficacy;*
4. *The drug must be accepted by qualified experts; and*

5. Scientific evidence must be widely available.

In its review (HHS, 2015), the HHS evaluated the five elements with respect to the currently available research for marijuana. The HHS concluded that marijuana does not meet any of the five elements—all of which must be demonstrated to find that a drug has a “currently accepted medical use.” A brief summary of the HHS’s evaluation is provided below.

Element #1: The drug’s chemistry must be known and reproducible.

“*The substance’s chemistry must be scientifically established to permit it to be reproduced into dosages which can be standardized. The listing of the substance in a current edition of one of the official compendia, as defined by section 201(j) of the Food, Drug and Cosmetic Act, 21 U.S.C. 321(j), is sufficient generally to meet this requirement.*” 57 FR 10499, 10506 (March 26, 1992).

Marijuana, as defined in the petition, includes all *Cannabis* strains. (For purposes of the CSA, marijuana includes all species of the genus *Cannabis*, including all strains therein⁴⁷). Based on the definition of marijuana in the petition, the chemistry of marijuana is not reproducible such that a standardized dose can be created. Chemical constituents including Δ^9 -THC and other cannabinoids vary significantly in marijuana samples derived from different strains (Appendino et al., 2011). As a result, there will be significant differences in safety, biological, pharmacological, and toxicological parameters amongst the various marijuana samples. Due to the variation of the chemical composition in marijuana samples, it is not possible to reproduce a standardized dose when considering all strains together. The HHS does advise that if a specific *Cannabis* strain is cultivated and processed under controlled conditions, the plant chemistry may be consistent

⁴⁷ Although the CSA definition of marijuana refers only to the species “*Cannabis sativa L.*,” federal courts have consistently ruled that all species of the genus *cannabis* are included in this definition. See *United States v. Kelly*, 527 F.2d 961, 963–964 (9th Cir. 1976) (collecting and examining cases). The Single Convention (article 1, par. 1(c)) likewise defines the “cannabis plant” to mean “any plant of the genus *Cannabis*.” As explained above in the attachment titled “Preliminary Note Regarding Treaty Considerations,” 21 U.S.C. 811(d)(1) provides that, where a drug is subject to control under the Single Convention, the DEA Administrator must control the drug under the schedule he deems most appropriate to carry out such treaty obligations, without regard to the findings required by 21 U.S.C. 811(a) or 812(b) and without regard to the procedures prescribed by 21 U.S.C. 811(a) and (b).

enough to derive reproducible and standardized doses.

Element #2: There must be adequate safety studies.

“*There must be adequate pharmacological and toxicological studies, done by all methods reasonably applicable, on the basis of which it could fairly and responsibly be concluded, by experts qualified by scientific training and experience to evaluate the safety and effectiveness of drugs, that the substance is safe for treating a specific, recognized disorder.*” 57 FR 10499, 10506 (March 26, 1992).

The HHS stated that there are no adequate safety studies on marijuana. As indicated in their evaluation of Element #1, the considerable variation in the chemistry of marijuana complicates the safety evaluation. The HHS concluded that marijuana does not satisfy Element #2 for having adequate safety studies such that medical and scientific experts may conclude that it is safe for treating a specific ailment.

Element #3: There must be adequate and well-controlled studies of efficacy.

“*There must be adequate, well-controlled, well-designed, well-conducted and well-documented studies, including clinical investigations, by experts qualified by scientific training and experience to evaluate the safety and effectiveness of drugs, on the basis of which it could be fairly and responsibly concluded by such experts that the substance will have the intended effect in treating a specific, recognized disorder.*” 57 FR 10499, 10506 (March 26, 1992).

As indicated in the HHS’s review of marijuana (HHS, 2015), there are no adequate or well-controlled studies that prove marijuana’s efficacy. The FDA independently reviewed (FDA, 2015) publicly available clinical studies on marijuana published prior to February 2013 to determine if there were appropriate studies to determine marijuana’s efficacy (please refer to FDA, 2015 and HHS, 2015 for more details). After review, the FDA determined that out of the identified articles, including those identified through a search of bibliographic references and 566 abstracts located on PubMed, 11 studies met the *a priori* selection criteria, including placebo control and double-blinding. FDA and HHS critically reviewed each of the 11 studies to determine if the studies met accepted scientific standards. FDA and HHS concluded that these studies do not “currently prove efficacy of marijuana” for any therapeutic indication due to limitations in the study designs. The HHS indicated that these studies could be used as proof of

concept studies, providing preliminary evidence on a proposed hypothesis involving a drug's effect.

Element #4: The drug must be accepted by qualified experts.

"[A] consensus of the national community of experts, qualified by scientific training and experience to evaluate the safety and effectiveness of drugs, accepts the safety and effectiveness of the substance for use in treating a specific, recognized disorder. A material conflict of opinion among experts precludes a finding of consensus." 57 FR 10499, 10506 (March 26, 1992).

The HHS concluded that there is currently no evidence of a consensus among qualified experts that marijuana is safe and effective in treating a specific and recognized disorder. The HHS indicated that medical practitioners who are not experts in evaluating drugs cannot be considered qualified experts (HHS, 2015; 57 FR 10499, 10505). Further, the HHS noted that the 2009 American Medical Association (AMA) report entitled, "Use of Cannabis for Medicinal Purposes" does not conclude that there is a currently accepted medical use for marijuana. HHS also pointed out that state-level "medical marijuana" laws do not provide evidence of such a consensus among qualified experts.

Element #5: The scientific evidence must be widely available.

"In the absence of NDA approval, information concerning the chemistry, pharmacology, toxicology, and effectiveness of the substance must be reported, published, or otherwise widely available, in sufficient detail to permit experts, qualified by scientific training and experience to evaluate the safety and effectiveness of drugs, to fairly and responsibly conclude the substance is safe and effective for use in treating a specific, recognized disorder." 57 FR 10499, 10506 (March 26, 1992).

The HHS concluded that the currently available data and information on marijuana is not sufficient to allow scientific scrutiny of the chemistry, pharmacology, toxicology, and effectiveness. In particular, scientific evidence demonstrating the chemistry of a specific *Cannabis* strain that could provide standardized and reproducible doses is not available.

Petitioners' Major Comments in Relation to Factor 3 and the Government's Responses

(1) The petitioners indicate that there is medical support and acceptance for the medical use of marijuana and stated that "[c]annabis has been accepted by the medical community as meeting the

current, modern accepted standards for what constitutes medicine." (Exhibit B, page 13). On page 3 of the cover letter of the petition, the petitioners stated, "The American medical community supports rescheduling, and there are safe pharmacy-based methods to dispense medical cannabis."

Furthermore, they stated that "[i]n 2009, the American Medical Association (AMA) reversed its earlier position that supported [s]chedule I classification of cannabis. The AMA now supports investigation and clinical research of cannabis for medicinal use, and urged the federal government to reassess the [s]chedule I classification. The American College of Physicians [ACP] recently expressed similar support." In addition, they note that the Institute of Medicine (IOM) also documented the scientific basis and therapeutic effects of cannabis (Exhibit B, page 13).

The DEA notes that the statements by the cited organizations (AMA, ACP, IOM) support more research into the potential medical properties associated with marijuana. The HHS did not find that the statements by these organizations provide evidence supporting a conclusion that adequate safety studies and adequate, well-controlled efficacy studies demonstrate the safety and efficacy of marijuana (HHS, 2015). The AMA's official policy on medicinal use of marijuana is as follows: "Our AMA urges that marijuana's status as a federal [s]chedule I controlled substance be reviewed with the goal of facilitating the conduct of clinical research and development of cannabinoid-based medicines, and alternative delivery methods. This should not be viewed as an endorsement of state-based medical cannabis programs, the legalization of marijuana, or that scientific evidence on the therapeutic use of cannabis meets the current standards for a prescription drug product." (AMA, 2009).

The DEA further notes that the 2013 AMA House of Delegates report states that, "cannabis is a dangerous drug and as such is a public health concern." (AMA, 2013). In 2008, the ACP indicated that "further research is needed to compare cannabinoids' efficacy and safety with current treatments." (ACP, 2008). The ACP stated that, "ACP urges an evidence-based review of marijuana's status as a [s]chedule I controlled substance to determine whether it should be reclassified to a different schedule. This review should consider the scientific findings regarding marijuana's safety and efficacy in some clinical conditions as well as evidence on the health risks associated with marijuana

consumption, particularly in its crude smoked form" (ACP, 2008). The IOM, consistent with others in the medical community, endorses further studies into the potential therapeutic uses of marijuana, but did not advocate for medicinal use without further testing (IOM, 2009).

As detailed in the HHS review, in order for a drug to be found to have a "currently accepted medical use," it must be accepted by qualified experts. There is no evidence that there is a consensus among qualified experts that marijuana is safe and effective for use in treating a specific, recognized disorder.

(2) The petitioners claim that, "The chemistry of cannabis is known and reproducible" (Exhibit B, page 6) and "newer medicinal strains of cannabis are lower in THC and higher in the non-psychoactive, more therapeutic cannabinoids, such as CBD, and CBN. These compounds further improved the efficacy of cannabis." (Exhibit B, page 10).

As indicated by the HHS, the petitioners defined marijuana to include all *Cannabis* strains. As such, the chemistry of marijuana is not reproducible such that a standardized dose can be created. Chemical constituents including Δ^9 -THC and other cannabinoids vary significantly in different marijuana samples (Appendino et al., 2011). Furthermore, the HHS cited a published report that indicates that new substances in marijuana are continually being characterized (Pollastro et al., 2011). If there is significant variance in the chemical composition of marijuana between samples, it is not possible for the chemistry to be reproducible.

Because the petition defines marijuana as including all cultivated strains, the DEA believes that the THC and CBD level of specific strains is not relevant to this consideration. In fact, the average Δ^9 -THC content in marijuana has steadily risen from 1995 to 2014 as reported by the University of Mississippi Potency Monitoring Project, as presented in Factor 1. In 1995, the Δ^9 -THC content was 4% on average and by 2015, the average content of THC had risen to 11.2% over a 20 year period. In the same time period, CBD and CBN percentages have ranged from 0.15% to 0.60% on average.

The DEA also notes statements in the petitioners' document that support the conclusion reached by DEA and HHS that the chemistry of marijuana as broadly defined by the petitioners is not reproducible or well-defined. For example, the petitioners acknowledge that "Cannabis is a complex plant, with several subtypes of cannabis." (Exhibit

B, page 6). The petitioners also acknowledge that “the ratios of the various cannabinoids differ according to the plant strain, and, to some extent, how the plant is grown.” (Exhibit B, page 12).

(3) The petitioners stated in Exhibit B, page 8, that “[o]verall, the 33 completed and published American controlled clinical trials with cannabis have studied its safety, routes of administration, and use in comparison with placebos, standard drugs, and in some cases dronabinol . . . ,” and further cited a systematic review by Wang et al. (2008), that evaluated 23 randomized controlled trials and 8 observational studies, stating that, “[o]f all the adverse events reported, 97 percent were considered ‘not serious,’ with the most commonly reported ‘dizziness.’”

The petitioners also cited in Exhibit B, page 8, “There has been a long-term, prospective, federally funded cannabis clinical study jointly administered by National Institute on Drug Abuse (NIDA) and FDA. This study has been running for over 30 years without any demonstrable adverse outcomes related to chronic medicinal cannabis use.”

As cited in the HHS recommendation document (HHS, 2015), the FDA conducted its own evaluation of the published clinical studies on the medical application of marijuana prior to February 2013 (FDA, 2015). Further details on the FDA review can be found in the published report (FDA, 2015). Based on the analysis, 11 studies were evaluated further and the FDA concluded that none of these studies “meet the criteria required by the FDA to determine if marijuana is safe and effective in specific therapeutic areas.” (page 6; FDA, 2015).

The DEA has reviewed the systematic review by Wang et al. (2008) and notes that most of the studies included in the review were synthetic cannabinoid medicines (e.g. dronabinol) or cannabinoid extracts (e.g. Sativex®); these types of studies were excluded in the FDA review as the analysis focused solely on natural forms of marijuana (FDA, 2015). Wang et al. (2008) concluded that “good safety and efficacy data on smoked cannabis are urgently needed.”

With respect to the 30-year study cited by the petitioners (Russo et al., 2001) on page 8 of Exhibit B, it should be clarified that the referenced study was not jointly administered by NIDA and the FDA. As with other clinical studies, an IND application was approved by the FDA and marijuana was supplied by NIDA. The authors evaluated only 8 patients over this

period, of which one patient died. While the findings cited by the petitioners and authors (e.g. no adverse outcomes with long term marijuana use) are informative, conclusions on long-term use of marijuana cannot be applied to the general population.

Factor 4: Its History and Current Pattern of Abuse

Marijuana continues to be the most widely used illicit drug. In 2013, an estimated 24.6 million Americans age 12 or older were current (past month) illicit drug users. Of those, 19.8 million were current (past month) marijuana users. As of 2013, an estimated 114.7 million Americans age 12 and older had used marijuana or hashish in their lifetime and 33.0 million had used it in the past year.

According to the NSDUH estimates, 3.0 million people age 12 or older used an illicit drug for the first time in 2014. Marijuana initiates totaled 2.6 million in 2014. Nearly half (46.8%) of the 2.6 million new users were less than 18 years of age. In 2014, marijuana was used by 82.2% of current (past month) illicit drug users. In 2014, among past year marijuana users age 12 or older, 18.5% used marijuana on 300 or more days within the previous 12 months. This translates into 6.5 million people using marijuana on a daily or almost daily basis over a 12-month period, a significant increase from the 3.1 million daily or almost daily users in 2006 and from the 5.7 million in just the previous year. In 2014, among past month marijuana users, 41.6% (9.2 million people) used the drug on 20 or more days in the past month, a significant increase from the 8.1 million in 2013.

Marijuana is also the illicit drug with the highest numbers of past year dependence or abuse in the U.S. population. According to the 2014 NSDUH report, of the 7.1 million persons aged 12 or older who were classified with illicit drug dependence or abuse, 4.2 million of them abused or were dependent on marijuana (representing 59.0% of all those classified with illicit drug dependence or abuse and 1.6% of the total U.S. non-institutionalized population aged 12 or older).

According to the 2015 Monitoring the Future (MTF) survey, marijuana is used by a large percentage of American youths, and is the most commonly used illicit drug among American youth. Among students surveyed in 2015, 15.5% of 8th graders, 31.1% of 10th graders, and 44.7% of 12th graders reported that they had used marijuana in their lifetime. In addition, 11.8%, 25.4%, and 34.9% of 8th, 10th, and 12th

graders, respectively, reported using marijuana in the past year. A number of high school students reported daily use in the past month, including 1.1%, 3.0%, and 6.0% of 8th, 10th, and 12th graders, respectively.

The prevalence of marijuana use and abuse is also indicated by criminal investigations for which drug evidence was analyzed in federal, state, and local forensic laboratories, as discussed above in Factor 1. The National Forensic Laboratory System (NFLIS), a DEA program, systematically collects drug identification results and associated information from drug cases submitted to and analyzed by federal, state, and local forensic laboratories. NFLIS data shows that marijuana was the most frequently identified drug from January 2001 through December 2014. In 2014, marijuana accounted for 29.3% (432,989) of all drug exhibits in NFLIS.

The high consumption of marijuana is being fueled by increasing amounts of domestically grown marijuana as well as increased amounts of foreign source marijuana being illicitly smuggled into the United States. In 2014, the Domestic Cannabis Eradication and Suppression Program (DCE/SP) reported that 3,904,213 plants were eradicated in outdoor cannabis cultivation areas compared to 2,597,798 in 2000, as shown above in Table 3. Significant quantities of marijuana were also eradicated from indoor cultivation operations. There were 396,620 indoor plants eradicated in 2014 compared to 217,105 eradicated in 2000. As shown in Table 2 above, in 2014, the National Seizure System (NSS) reported seizures of 1,767,741 kg of marijuana.

Petitioners’ Major Comments in Relation to Factor 4 and the Government’s Responses

(1) The petitioners indicated that the history and current pattern of abuse is difficult to estimate since “a large percentage of United States citizens” have used marijuana at least once in their lifetime and some estimates have indicated that “over 40 percent of the nation has tried the plant.” Further, the petitioners stated that “trying marijuana once should not be confused with a health problem, let alone a diagnosis of dependence or abuse.” (Exhibit B, page 26).

Marijuana usage numbers mentioned in both the HHS Recommendation and this DEA document include surveys from NSDUH and MTF. These surveys measure extent of use of marijuana. As mentioned in this Factor, according to the results of the 2013 NSDUH survey, 17.4% of past year marijuana users age 12 or older used marijuana on 300 or

more days within the previous 12 months. This indicates that 5.7 million people used marijuana on a daily or almost daily basis over this 12-month period, which is a 1.8-fold increase from the 3.1 million daily or almost daily users in 2006. Furthermore, 6% of all twelfth graders in the United States reported daily use of marijuana in the 2015 MTF survey. These data strongly indicate that there is a significant portion of the U.S. population using marijuana on a daily basis.

(2) As stated in Exhibit B on page 26, subpart A, “*Rates of dependence or abuse are remarkably low*” and further suggest that “[i]nterviews for the *National Longitudinal Alcohol Epidemiological Survey (NLAES)* [sic] and *National Epidemiological Survey on Alcohol and Related Conditions (NESARC)* [sic] each confirm that rates of dependence or abuse of cannabis have never exceeded (sic) two percent in a given year.”

The authors of study cited by the petitioners (Compton et al., 2004) concluded that a higher percentage of American adults had a marijuana use disorder in 2001–2002 (1.5%) than in 1991–1992 (1.2%). Compton et al. (2004) noted that the marijuana use disorder increase of 0.3% over the 10 year period would equate to an increase from 2.2 million people to 3 million people in the United States. The petitioners failed to explain the impact of 1.5% (or less than 2 percent) of the U.S. population having a marijuana use disorder. In order to put these numbers into perspective, the DEA reviewed the literature and found that non-medical prescription drug use and abuse rates were examined in the same NLAES and NESARC (1991–1992 and 2001–2002) populations (Blanco et al., 2007). Blanco et al (2007) examined non-medical prescription drug use and abuse rates from the periods of 1991–1992 and 2001–2002. In 1991 through 1992, the prevalence of non-medical prescription drug (opioid, stimulant, and tranquilizer) abuse and dependence was 0.1%. Non-medical prescription drug (primarily opioid-based drugs) abuse and dependence increased to 0.3% in 2001 through 2002. Therefore, in the same 2001–2002 NLAES and NESARC populations, the percentage of people with a marijuana use disorder was approximately five-fold higher (1.5% versus 0.3%) than those with opioid abuse and dependence resulting from non-medical prescription drug use.

Further, Volkow et al. (2014) reported that in long-term or heavy marijuana users, 9% of users become addicted to marijuana. This percentage increases to 17% when marijuana use starts in

adolescence and it increases to 25 to 50% of those who are daily users.

Factor 5: The Scope, Duration, and Significance of Abuse

Abuse of marijuana is widespread and significant. As previously noted, according to the NSDUH, in 2014, an estimated 117.2 million Americans (44.2%) age 12 or older had used marijuana or hashish in their lifetime, 35.1 million (13.2%) had used it in the past year, and 22.2 million (8.4%) had used it in the past month. Past year and past month marijuana use has increased significantly since 2013. Past month marijuana use is highest among 18–21 year olds and it declines among those 22 years of age and older. In 2014, an estimated 18.5% of past year marijuana users age 12 or older used marijuana on 300 or more days within the past 12 months. This translates into 6.5 million persons using marijuana on a daily or almost daily basis over a 12-month period. In 2014, an estimated 41.6% (9.2 million) of past month marijuana users age 12 or older used the drug on 20 or more days in the past month (SAMHSA, NSDUH). Chronic use of marijuana is associated with a number of health risks (see Factors 2 and 6).

Furthermore, the average percentage of Δ^9 -THC in seized marijuana has increased over the past two decades (The University of Mississippi Potency Monitoring Project). Additional studies are needed to clarify the impact of greater potency, but one study shows that higher levels of Δ^9 -THC in the body are associated with greater psychoactive effects (Harder and Rietbrock, 1997), which can be correlated with higher abuse potential (Chait and Burke, 1994).

TEDS data show that in 2013, marijuana/hashish was the primary substance of abuse in 16.8% of all admissions to substance abuse treatment among patients age 12 and older. TEDS data also show that marijuana/hashish was the primary substance of abuse for 77.0% of all 12- to 14-year-olds admitted for drug treatment and 75.5% of all 15- to 17-year-olds admitted for drug treatment in 2013. Among the 281,991 admissions to drug treatment in 2013 in which marijuana/hashish was the primary drug, the average age at admission was 25 years and the peak age cohort was 15 to 17 years (22.5%). Thirty-nine percent of the 281,991 primary marijuana/hashish admissions (35.9%) were under the age of 20.

In summary, the recent statistics from these various surveys and databases (see Factor 1 for more details) demonstrate that marijuana continues to be the most commonly used illicit drug, with large incidences of heavy use and

dependence in teenagers and young adults.

Petitioners' Major Comment in Relation to Factor 5 and DEA's Response

(1) Petitioners' contend that, “*The prevalence and significance of potential abuse are limited for cannabis, especially in relation to other [s]chedule II substances.*” The petitioners cited results from the 1990 NIDA Household Survey on Drug Abuse and indicated that, “*more than four out of five people who had used cannabis in the previous year reported no problems related to the drug.*” (Exhibit B, page 28).

The prevalence of marijuana usage and marijuana dependence is significant in the United States. The 2014 NSDUH findings indicate that there are approximately 6.5 million Americans using marijuana on a daily or almost daily basis. Further, Volkow et al. (2014) reported that in long-term or heavy marijuana users, 9% of users become addicted to marijuana. Among those who began using marijuana in adolescence, marijuana dependence increases to 17%, and it further increases to 25 to 50% of daily users that started using marijuana during adolescence. These collective findings indicate that there is considerable significance associated with marijuana use and abuse since 9% of users become addicted to marijuana, 25 to 50% of daily marijuana users started during adolescence, and prevalence of usage is significantly high based on the data presented from Volkow et al (2014) and the 2014 NSDUH survey.

Factor 6: What, if any, Risk There is to the Public Health

In its recommendation, the HHS discussed public health risks associated with acute and chronic marijuana use in Factor 6. Public health risks as measured by emergency department visits and drug treatment admissions are discussed by HHS and DEA in Factors 1, 4, and 5. Similarly, Factor 2 discusses marijuana's pharmacology and presents some of the adverse health effects associated with use. Marijuana use may affect the physical and/or psychological functioning of an individual user, but may also have broader public impacts including driving impairments and fatalities from car accidents.

Risks From Acute Use of Marijuana

As discussed in the HHS review document (HHS, 2015), acute usage of marijuana impairs psychomotor performance including motor control and impulsivity, risk taking and executive function (Ramaekers et al., 2004; Ramaekers et al., 2006). In a

minority of individuals using marijuana, dysphoria, prolonged anxiety, and psychological distress may be observed (Haney et al., 1999). The DEA further notes a recent review of acute marijuana effects (Wilkinson et al., 2014) that reported impaired neurological function including altered perception, paranoia, delayed response time, and memory deficits.

In its recommendation, HHS references a meta-analysis conducted by Li et al (2012) where the authors concluded that psychomotor impairments associated with acute marijuana usage have also been associated with increased risk of car accidents with individuals experiencing acute marijuana intoxication (Li et al., 2012; HHS, 2015). The DEA further notes more recent studies examining the risk associated with marijuana use and driving. Younger drivers (under 21) have been characterized as the highest risk group associated with marijuana use and driving (Whitehill et al., 2014). Furthermore, in 2013, marijuana was found in 13% of the drivers involved in automobile-related fatal accidents (McCartt, 2015). The potential risk of automobile accidents associated with marijuana use appears to be increasing since there has been a steady increase in individuals intoxicated with marijuana over the past 20 years (Wilson et al., 2014). However, a recent study commissioned by the National Highway Traffic Safety Administration (NHTSA) reported that when adjusted for confounders (e.g., alcohol use, age, gender, ethnicity), there was not a significant increase in crash risk (fatal and nonfatal, $n = 2,682$) associated with marijuana use (Compton and Berning, 2015).

The DEA also notes recent studies examining unintentional exposures of children to marijuana (Wang et al., 2013; 2014). Wang et al. (2013) reviewed emergency department (ED) visits at a children's hospital in Colorado from January 1, 2005 to December 31, 2011. As stated by the authors, in 2000 Colorado passed Amendment 20 which allowed for the use of marijuana. Following the passage of "a new Justice Department policy" instructing "federal prosecutors not to seek arrest of medical marijuana users and suppliers as long as they conform to state laws" (as stated in Wang et al., 2013), 14 patients in Colorado under the age of 12 were admitted to the ED for the unintended use of marijuana over a 27 month period. Prior to the passage of this policy, from January 1, 2005 to September 30, 2009 (57 months), there were no pediatric ED visits due to unintentional marijuana exposure

(Wang et al., 2013). The DEA also notes a larger scale evaluation of pediatric exposures using the National Poison Data System (Wang et al., 2014). That study reported that there were 985 unintentional marijuana exposures in children (9 years and younger) between January 1, 2005 to December 31, 2011. The authors stratified the ED visits by states with laws allowing medical use of marijuana, states transitioning to legalization for medical use, and states with no such laws. Out of the 985 exposures, 495 were in non-legal states ($n = 33$ states), 93 in transitional states ($n = 8$ states), and 396 in "legal" states ($n = 9$ states). The authors reported that there was a twofold increase ($OR = 2.1$) in moderate or major effects in children with unintentional marijuana use and a threefold increase ($OR = 3.4$) in admissions to critical care units in states allowing medical use of marijuana, in comparison to non-legal states.

Risks Associated With Chronic Use of Marijuana

The HHS noted that a major risk from chronic marijuana use is a distinctive withdrawal syndrome, as described in the 2013 DSM-5. The HHS analysis also quoted the following description of risks associated with marijuana [cannabis] abuse from the DSM-5:

Individuals with cannabis use disorder may use cannabis throughout the day over a period of months or years, and thus may spend many hours a day under the influence. Others may use less frequently, but their use causes recurrent problems related to family, school, work, or other important activities (e.g., repeated absences at work; neglect of family obligations). Periodic cannabis use and intoxication can negatively affect behavioral and cognitive functioning and thus interfere with optimal performance at work or school, or place the individual at increased physical risk when performing activities that could be physically hazardous (e.g. driving a car; playing certain sports; performing manual work activities, including operating machinery). Arguments with spouses or parents over the use of cannabis in the home, or its use in the presence of children, can adversely impact family functioning and are common features of those with cannabis use disorder. Last, individuals with cannabis use disorder may continue using marijuana despite knowledge of physical problems (e.g. chronic cough related to smoking) or psychological problems (e.g. excessive sedation or exacerbation of other mental health problems) associated with its use. (HHS 2015, page 34).

The HHS stated that chronic marijuana use produces acute and chronic adverse effects on the respiratory system, memory and learning. Regular marijuana smoking can produce a number of long-term

pulmonary consequences, including chronic cough and increased sputum (Adams and Martin, 1996), and histopathologic abnormalities in bronchial epithelium (Adams and Martin, 1996).

Marijuana as a "Gateway Drug"

The HHS reviewed the clinical studies evaluating the gateway hypothesis in marijuana and found them to be limited. The primary reasons were: (1) Recruited participants were influenced by social, biological, and economic factors that contribute to extensive drug abuse (Hall and Lynskey, 2005), and (2) most studies testing the gateway drug hypothesis for marijuana use the determinative measure *any use of an illicit drug* rather than applying DSM-5 criteria for drug abuse or dependence (DSM-5, 2013).

The HHS cited several studies where marijuana use did not lead to other illicit drug use (Kandel and Chen, 2000; von Sydow et al., 2002; Nace et al., 1975). Two separate longitudinal studies with adolescents using marijuana did not demonstrate an association with use of other illicit drugs (Kandel and Chen, 2000; von Sydow et al., 2002).

It was noted by the HHS that, when evaluating the gateway hypothesis, differences appear when examining use versus abuse or dependence of other illicit drugs. Van Gundy and Rebellon (2010) reported that there was a correlation between marijuana use in adolescence and other illicit drug use in early adulthood, but when examined in terms of drug abuse of other illicit drugs, age-linked stressors and social roles were confounders in the association. Degenhardt et al. (2009) reported that marijuana use often precedes use of other illicit drugs, but dependence involving drugs other than marijuana frequently correlated with higher levels of illicit drug abuse. Furthermore, Degenhardt et al. (2010) reported that in countries with lower prevalence of marijuana usage, use of other illicit drugs before marijuana was often documented.

Based on these studies among others, the HHS concluded that although many individuals with a drug abuse disorder may have used marijuana as one of their first illicit drugs, this does not mean that individuals initiated with marijuana inherently will go on to become regular users of other illicit drugs.

Petitioners' Major Comment in Relation to Factor 6 and the Government's Responses

(1) The petitioners commented that marijuana does not significantly impact social behavior in domains such as motivation, driving, aggression, or hostility (Exhibit B, pages 30–41).

The HHS concluded that “Marijuana’s acute effects can significantly interfere with a person’s ability . . . to operate motor vehicles.” (HHS, 2015) As mentioned in this factor, there is a significant risk with marijuana use and driving. Marijuana was found in 13% of drivers involved in automobile fatal accidents (McCartt, 2015). Furthermore, in a meta-analysis conducted by Li et al. (2011), an association was identified between marijuana use by the driver and an increased risk of getting into a car accident.

The DEA notes that the petitioners only considered whether marijuana creates social problems, and did not consider physiological changes and impacts that also should be evaluated in determining the risk to public health. The HHS and DEA considered the public health impacts of such physiological effects, as discussed in this factor and others above. Marijuana may result in acute cardiovascular toxicity as indicated by recent reviews examining these associations (Hackham, 2015; Panayiotides, 2015). There is a possible association between frequent, long-term marijuana use and increased risk of testicular germ cell cancers and some evidence that chronic marijuana use may lead to lung cancer although the evidence is inconsistent. Furthermore, a more recent risk is the increase in ED visits of children unintentionally exposed to marijuana with increased risk factors for major adverse effects or admission to critical care units in states that have legalized marijuana for medical purposes (Wang et al., 2014).

Factor 7: Its Psychic or Physiological Dependence Liability

Physiological (Physical) Dependence in Humans

The HHS stated that heavy and chronic use of marijuana can lead to physical dependence (DSM–5, 2013; Budney and Hughes, 2006; Haney et al., 1999). Tolerance is developed following repeated administration of marijuana and withdrawal symptoms are observed as following discontinuation of marijuana usage (HHS, 2015).

The HHS mentioned that tolerance can develop to some of marijuana’s effects, but does not appear to develop with respect to the psychoactive effects.

It is believed that lack of tolerance to psychoactive effects may relate to electrophysiological data demonstrating that chronic Δ^9 -THC administration does not affect increased neuronal firing in the ventral tegmental area, a brain region that plays a critical role in drug reinforcement and reward (Wu and French, 2000). Humans can develop tolerance to marijuana’s cardiovascular, autonomic, and behavioral effects (Jones et al., 1981). Tolerance to some behavioral effects appears to develop with heavy and chronic use, but not with occasional usage. Ramaekers et al. (2009) reported that following acute administration of marijuana, occasional marijuana users still exhibited impairments in tracking and attention tasks whereas performance of heavy users on the these tasks was not affected. In a follow-up study with the same subjects that participated in the study by Ramaekers et al. (2009), a neurophysiological assessment was conducted where event-related potentials (ERPs) were measured using electroencephalography (EEG) (Theunissen et al., 2012). Similar to the earlier results, the heavy marijuana users (n = 11; average of 340 marijuana uses per year) had no changes in their ERPs with the acute marijuana exposure. However, occasional users (n = 10; average of 55 marijuana uses per year) had significant decreases in the amplitude of an ERP component (categorized as P100) on tracking and attention tasks and ERP amplitude change is indicative of a change in brain activity (Theunissen et al., 2012).

The HHS indicated that down-regulation of cannabinoid receptors may be a possible mechanism for tolerance to marijuana’s effects (Hirvonen et al., 2012; Gonzalez et al., 2005; Rodriguez de Fonseca et al., 1994; Oviedo et al., 1993).

As indicated by the HHS, the most common withdrawal symptoms in heavy, chronic marijuana users are sleep difficulties, decreased appetite or weight loss, irritability, anger, anxiety or nervousness, and restlessness (Budney and Hughes, 2006; Haney et al., 1999). As reported by HHS, most marijuana withdrawal symptoms begin within 24–48 hours of discontinuation, peak within 4–6 days, and last for 1–3 weeks.

The HHS pointed out that the American Psychiatric Association’s (APA’s) Diagnostic and Statistical Manual of Mental Disorders-5 (DSM–5) included a list of withdrawal symptoms following marijuana [cannabis] use (DSM–5, 2013). The DEA notes that a DSM–5 working group report indicated that marijuana withdrawal symptoms were added to DSM–5 (they were not

previously included in DSM–IV) because marijuana withdrawal has now been reliably presented in several studies (Hasin et al., 2013). In short, marijuana withdrawal signs are reported in up to one-third of regular users and between 50% and 90% of heavy users (Hasin et al., 2013). According to DSM–5 criteria, in order to be characterized as having marijuana withdrawal, an individual must develop at least three of the seven symptoms within one week of decreasing or stopping the heavy and prolonged use (DSM–5, 2013). These seven symptoms are: (1) Irritability; anger or aggression, (2) nervousness or anxiety, (3) sleep difficulty, (4) decreased appetite or weight loss, (5) restlessness, (6) decreased mood, (7) somatic symptoms causing significant discomfort (DSM–5, 2013).

Psychological (Psychic) Dependence in Humans

High levels of psychoactive effects such as positive reinforcement correlate with increased marijuana abuse and dependence (Scherrer et al., 2009; Zeiger et al., 2010). Epidemiological marijuana use data reported by NSDUH, MTF, and TEDS support this assertion as presented in the HHS 2015 review of marijuana and updated by the DEA. According to the findings in the 2014 NSDUH survey, an estimated 9.2 million individuals 12 years and older used marijuana daily or almost daily (20 or more days within the past month). In the 2015 MTF report, daily marijuana use (20 or more days within the past 30 days) in 8th, 10th, and 12th graders is 1.1%, 3.0%, and 6.0%, respectively.

The 2014 NSDUH report stated that 4.2 million persons were classified with dependence on or abuse of marijuana in the past year (representing 1.6% of the total population age 12 or older, and 59.0% of those classified with illicit drug dependence or abuse) based on criteria specified in the Diagnostic and Statistical Manual of Mental Disorders, 4th edition (DSM–IV). Furthermore, of the admissions to licensed substance abuse facilities, as presented in TEDS, marijuana/hashish was the primary substance of abuse for; 18.3% (352,297) of 2011 admissions; 17.5% (315,200) of 2012 admissions; and 16.8% (281,991) of 2013 admissions. Of the 281,991 admissions in 2013 for marijuana/hashish as the primary substance, 24.3% used marijuana/hashish daily. Among admissions to treatment for marijuana/hashish as the primary substance in 2013, 27.4% were ages 12 to 17 years and 29.7% were ages 20 to 24 years.

Petitioners' Major Comment in Relation to Factor 7 and the Government's Response

(1) The petitioners stated, "There is no severe physical withdrawal syndrome associated with cannabis. Cannabis addiction is amenable to treatment." (Exhibit B, page 10). The petitioners further indicated that marijuana "may be psychologically addictive, but much less so than other Scheduled [sic] II drugs," (Exhibit B, page 10) and that there is a low risk of dependence associated with marijuana use. Petitioners further stated in Exhibit B, page 23, "Cannabis has low relative dependence risk and does not reach the severity associated with other drugs."

The HHS states that marijuana withdrawal syndrome "appears to be mild compared to classical alcohol and barbiturate withdrawal syndromes" and is similar in magnitude and time course to tobacco withdrawal syndrome.

DSM-5 now recognizes and describes a marijuana [cannabis] withdrawal syndrome. The lifetime risk of dependence to marijuana is approximately 9% among heavy or long-term users (Volkow et al., 2014). Marijuana results in tolerance and withdrawal as described earlier in this Factor 7. The data from NSDUH indicate that there is constant desire for marijuana as noted by the consistently high numbers of current daily users in adults and adolescents. Marijuana use also persists despite problems associated with the drug. Changes in IQ have been noted in adolescent-onset, chronic or dependent marijuana users, in addition to withdrawal symptoms. However, marijuana use has not declined in the time that usage of this drug has been monitored. Additionally, there has been an increase in content of the primary psychoactive chemical, Δ^9 -THC, in marijuana samples analyzed by the University of Mississippi's Potency Monitoring Project, suggesting preference for marijuana strains with higher levels of Δ^9 -THC.

Factor 8: Whether the Substance is an Immediate Precursor of a Substance Already Controlled Under the CSA

Marijuana is not an immediate precursor of another controlled substance.

Determination

After consideration of the eight factors discussed above and of the HHS's Recommendation, the DEA finds that marijuana meets the three criteria for placing a substance in schedule I of the CSA under 21 U.S.C. 812(b)(1):

1. Marijuana has a high potential for abuse.

The HHS concluded that marijuana has a high potential for abuse based on a large number of people regularly using marijuana, its widespread use, and the vast amount of marijuana that is available through illicit channels.

Marijuana is the most abused and trafficked illicit substance in the United States. Approximately 22.2 million individuals in the United States (8.4% of the United States population) were past month users of marijuana according to the 2014 NSDUH survey. A 2015 national survey (Monitoring the Future) that tracks drug use trends among high school students showed that by 12th grade, 21.3% of students reported using marijuana in the past month, and 6.0% reported having used it daily in the past month. In 2011, SAMHSA's Drug Abuse Warning Network (DAWN) reported that marijuana was mentioned in 36.4% of illicit drug-related emergency department (ED) visits, corresponding to 455,668 out of approximately 1.25 million visits. The Treatment Episode Data Set (TEDS) showed that 16.8% of non-private substance-abuse treatment facility admissions in 2013 were for marijuana as the primary drug.

Marijuana has dose-dependent reinforcing effects that encourage its abuse. Both clinical and preclinical studies have demonstrated that marijuana and its principle psychoactive constituent, Δ^9 -THC, possess the pharmacological attributes associated with drugs of abuse. They function as discriminative stimuli and as positive reinforcers to maintain drug use and drug-seeking behavior. Additionally, use of marijuana can result in psychological dependence.

2. Marijuana has no currently accepted medical use in treatment in the United States.

The HHS stated that the FDA has not approved an NDA for marijuana. The HHS noted that there are opportunities for scientists to conduct clinical research with marijuana and there are active INDs for marijuana, but marijuana does not have a currently accepted medical use in the United States, nor does it have an accepted medical use with severe restrictions.

FDA approval of an NDA is not the sole means through which a drug can be determined to have a "currently accepted medical use" under the CSA. Applying the five-part test summarized below, a drug has a currently accepted medical use if all of the following five elements have been satisfied. As detailed in the HHS evaluation and as set forth below, none of these elements has been fulfilled for marijuana:

i. *The drug's chemistry must be known and reproducible.*

Chemical constituents including Δ^9 -THC and other cannabinoids in marijuana vary significantly in different marijuana strains. In addition, the concentration of Δ^9 -THC and other cannabinoids may vary between strains. Therefore the chemical composition among different marijuana samples is not reproducible. Due to the variation of the chemical composition in marijuana strains, it is not possible to derive a standardized dose. The HHS does advise that if a specific *Cannabis* strain is cultivated and processed under controlled conditions, the plant chemistry may be consistent enough to derive standardized doses.

ii. *There must be adequate safety studies.*

There are not adequate safety studies on marijuana for use in any specific, recognized medical condition. The considerable variation in the chemistry of marijuana results in differences in safety, biological, pharmacological, and toxicological parameters amongst the various marijuana samples.

iii. *There must be adequate and well-controlled studies proving efficacy.*

There are no adequate and well-controlled studies that determine marijuana's efficacy. In an independent review performed by the FDA of publicly available clinical studies on marijuana (FDA, 2015), FDA concluded that these studies do not have enough information to "currently prove efficacy of marijuana" for any therapeutic indication.

iv. *The drug must be accepted by qualified experts.*

At this time, there is no consensus of opinion among experts concerning the medical utility of marijuana for use in treating specific recognized disorders.

v. *The scientific evidence must be widely available.*

The currently available data and information on marijuana is not sufficient to address the chemistry, pharmacology, toxicology, and effectiveness. The scientific evidence regarding marijuana's chemistry with regard to a specific cannabis strain that could be formulated into standardized and reproducible doses is not currently available.

3. There is a lack of accepted safety for use of marijuana under medical supervision.

Currently, there are no FDA-approved marijuana products. The HHS also concluded that marijuana does not have a currently accepted medical use in treatment in the United States or a currently accepted medical use with severe restrictions. According to the HHS, the FDA is unable to conclude that marijuana has an acceptable level of

safety in relation to its effectiveness in treating a specific and recognized disorder due to lack of evidence with respect to a consistent and reproducible dose that is contamination free. The HHS indicated that marijuana research investigating potential medical use should include information on the chemistry, manufacturing, and specifications of marijuana. The HHS further indicated that a procedure for delivering a consistent dose of marijuana should also be developed. Therefore, the HHS concluded that marijuana does not have an acceptable level of safety for use under medical supervision.

BILLING CODE 4410–09–P

DEPARTMENT OF JUSTICE**Drug Enforcement Administration****21 CFR Chapter II**

[Docket No. DEA-427]

Denial of Petition To Initiate Proceedings To Reschedule Marijuana**AGENCY:** Drug Enforcement Administration, Department of Justice.**ACTION:** Denial of petition to initiate proceedings to reschedule marijuana.

SUMMARY: By letter dated July 19, 2016 the Drug Enforcement Administration (DEA) denied a petition to initiate rulemaking proceedings to reschedule marijuana. Because the DEA believes that this matter is of particular interest to members of the public, the agency is publishing below the letter sent to the petitioner which denied the petition, along with the supporting documentation that was attached to the letter.

DATES: August 12, 2016.

FOR FURTHER INFORMATION CONTACT: Michael J. Lewis, Office of Diversion Control, Drug Enforcement Administration; Mailing Address: 8701 Morrisette Drive, Springfield, Virginia 22152; Telephone: (202) 598-6812

SUPPLEMENTARY INFORMATION: July 19, 2016

Dear Mr. Krumm:

On December 17, 2009, you petitioned the Drug Enforcement Administration (DEA) to initiate rulemaking proceedings under the rescheduling provisions of the Controlled Substances Act (CSA). Specifically, you petitioned DEA to have marijuana removed from schedule I of the CSA and rescheduled in any schedule other than schedule I of the CSA.

You requested that DEA remove marijuana from schedule I based on your assertion that:

1. Marijuana has accepted medical use in the United States;
2. Studies have shown that smoked marijuana has proven safety and efficacy;
3. Marijuana is safe for use under medical supervision; and
4. Marijuana does not have the abuse potential for placement in schedule I

In accordance with the CSA scheduling provisions, after gathering the necessary data, DEA requested a scientific and medical evaluation and scheduling recommendation from the Department of Health and Human Services (HHS). HHS concluded that marijuana has a high potential for abuse, has no accepted medical use in the United States, and lacks an acceptable level of safety for use even under medical supervision. Therefore, HHS recommended that marijuana remain in schedule I. The scientific and medical evaluation and scheduling recommendation that HHS submitted to DEA is attached hereto.

Based on the HHS evaluation and all other relevant data, DEA has concluded that there is no substantial evidence that marijuana should be removed from schedule I. A document prepared by DEA addressing these materials in detail also is attached hereto. In short, marijuana continues to meet the criteria for schedule I control under the CSA because:

(1) *Marijuana has a high potential for abuse.* The HHS evaluation and the additional data gathered by DEA show that marijuana has a high potential for abuse.

(2) *Marijuana has no currently accepted medical use in treatment in the United States.* Based on the established five-part test for making such determination, marijuana has no “currently accepted medical use” because: As detailed in the HHS evaluation, the drug’s chemistry is not known and reproducible; there are no adequate safety studies; there are no adequate and well-controlled studies proving efficacy; the drug is not accepted by qualified experts; and the scientific evidence is not widely available.

(3) *Marijuana lacks accepted safety for use under medical supervision.* At present, there are no U.S. Food and Drug Administration (FDA)-approved marijuana products, nor is marijuana under a New Drug Application (NDA) evaluation at the FDA for any indication. The HHS evaluation states that marijuana does not have a currently accepted medical use in treatment in the United States or a currently accepted medical use with severe restrictions. At this time, the known risks of marijuana use have not been shown to be outweighed by specific benefits in well-controlled clinical trials that scientifically evaluate safety and efficacy.

The statutory mandate of 21 U.S.C. 812(b) is dispositive. Congress established only one schedule, schedule I, for drugs of abuse with “no currently accepted medical use in treatment in the United States” and “lack of accepted safety for use under medical supervision.” 21 U.S.C. 812(b).

Although the HHS evaluation and all other relevant data lead to the conclusion that marijuana must remain in schedule I, it should also be noted that, in view of United States obligations under international drug control treaties, marijuana cannot be placed in a schedule less restrictive than schedule II. This is explained in detail in the accompanying document titled “Preliminary Note Regarding Treaty Considerations.”

Accordingly, and as set forth in detail in the accompanying HHS and DEA documents, there is no statutory basis under the CSA for DEA to grant your petition to initiate rulemaking proceedings to reschedule marijuana. Your petition is, therefore, hereby denied.

Sincerely,

Chuck Rosenberg,

Acting Administrator

Preliminary Note Regarding Treaty Considerations

Cover Letter from HHS to DEA
Summarizing the Scientific and Medical Evaluation and Scheduling Recommendation for Marijuana.

U.S. Department of Health and Human Services (HHS)—Basis for the Recommendation for Maintaining Marijuana in Schedule I of the Controlled Substances Act

U.S. Department of Justice—Drug Enforcement Administration (DEA), Schedule of Controlled Substances: Maintaining Marijuana in Schedule I of the Controlled Substances Act, Background, Data, and Analysis: Eight Factors Determinative of Control and Findings Pursuant to 21 U.S.C. 812(b)

Dated: July 19, 2016.

Chuck Rosenberg,*Acting Administrator.***Preliminary Note Regarding Treaty Considerations**

As the Controlled Substances Act (CSA) recognizes, the United States is a party to the Single Convention on Narcotic Drugs, 1961 (referred to here as the Single Convention or the treaty). 21 U.S.C. 801(7). Parties to the Single Convention are obligated to maintain various control provisions related to the drugs that are covered by the treaty. Many of the provisions of the CSA were enacted by Congress for the specific purpose of ensuring U.S. compliance with the treaty. Among these is a scheduling provision, 21 U.S.C. 811(d)(1). Section 811(d)(1) provides that, where a drug is subject to control under the Single Convention, the DEA Administrator (by delegation from the Attorney General) must “issue an order controlling such drug under the schedule he deems most appropriate to carry out such [treaty] obligations, without regard to the findings required by [21 U.S.C. 811(a) or 812(b)] and without regard to the procedures prescribed by [21 U.S.C. 811(a) and (b)].”

Marijuana is a drug listed in the Single Convention. The Single Convention uses the term “cannabis” to refer to marijuana.¹ Thus, the DEA Administrator is obligated under section 811(d) to control marijuana in the

¹ Under the Single Convention, “‘cannabis plant’ means any plant of the genus *Cannabis*.” Article 1(c). The Single Convention defines “cannabis” to include “the flowering or fruiting tops of the cannabis plant (excluding the seeds and leaves when not accompanied by the tops) from which the resin has not been extracted, by whatever name they may be designated.” Article 1(b). This definition of “cannabis” under the Single Convention is slightly less inclusive than the CSA definition of “marihuana,” which includes all parts of the cannabis plant except for the mature stalks, sterilized seeds, oil from the seeds, and certain derivatives thereof. See 21 U.S.C. 802(16). Cannabis and cannabis resin are included in the list of drugs in Schedule I and Schedule IV of the Single Convention. In contrast to the CSA, the drugs listed in Schedule IV of the Single Convention are also listed in Schedule I of the Single Convention and are subject to the same controls as Schedule I drugs as well as additional controls. Article 2, par. 5

schedule that he deems most appropriate to carry out the U.S. obligations under the Single Convention. It has been established in prior marijuana rescheduling proceedings that placement of marijuana in either schedule I or schedule II of the CSA is “necessary as well as sufficient to satisfy our international obligations” under the Single Convention. *NORML v. DEA*, 559 F.2d 735, 751 (D.C. Cir. 1977). As the United States Court of Appeals for the D.C. Circuit has stated, “several requirements imposed by the Single Convention would not be met if cannabis and cannabis resin were placed in CSA schedule III, IV, or V.”² *Id.* Therefore, in accordance with section 811(d)(1), DEA must place marijuana in either schedule I or schedule II.

Because schedules I and II are the only possible schedules in which marijuana may be placed, for purposes of evaluating this scheduling petition, it is essential to understand the differences between the criteria for placement of a substance in schedule I and those for placement in schedule II. These criteria are set forth in 21 U.S.C. 812(b)(1) and (b)(2), respectively. As indicated therein, substances in both schedule I and schedule II share the characteristic of “a high potential for abuse.” Where the distinction lies is that schedule I drugs have “no currently accepted medical use in treatment in the United States” and “a lack of accepted safety for use of the drug . . . under medical supervision,” while schedule II drugs do have “a currently accepted medical use in treatment in the United States.”³

Accordingly, in view of section 811(d)(1), this scheduling petition turns on whether marijuana has a currently accepted medical use in treatment in the United States. If it does not, DEA must, pursuant to section 811(d), deny the petition and keep marijuana in schedule I.

As indicated, where section 811(d)(1) applies to a drug that is the subject of a rescheduling petition, the DEA

Administrator must issue an order controlling the drug under the schedule he deems most appropriate to carry out United States obligations under the Single Convention, without regard to the findings required by sections 811(a) or 812(b) and without regard to the procedures prescribed by sections 811(a) and (b). Thus, since the only determinative issue in evaluating the present scheduling petition is whether marijuana has a currently accepted medical use in treatment in the United States, DEA need not consider the findings of sections 811(a) or 812(b) that have no bearing on that determination, and DEA likewise need not follow the procedures prescribed by sections 811(a) and (b) with respect to such irrelevant findings. Specifically, DEA need not evaluate the relative abuse potential of marijuana or the relative extent to which abuse of marijuana may lead to physical or psychological dependence.

As explained below, the medical and scientific evaluation and scheduling recommendation issued by the Secretary of Health and Human Services concludes that marijuana has no currently accepted medical use in treatment in the United States, and the DEA Administrator likewise so concludes. For the reasons just indicated, no further analysis beyond this consideration is required. Nonetheless, because of the widespread public interest in understanding all the facts relating to the harms associated with marijuana, DEA is publishing here the entire medical and scientific analysis and scheduling evaluation issued by the Secretary, as well as DEA’s additional analysis.

Department of Health and Human Services,
Office of the Secretary Assistant Secretary for
Health, Office of Public Health and Science
Washington DC 20201.

June 25, 2015.

The Honorable Chuck Rosenberg
*Acting Administrator, Drug Enforcement
Administration, U.S. Department of
Justice, 8701 Morrisette Drive, Springfield,
VA 22152*

Dear Mr. Rosenberg:

Pursuant to the Controlled Substances Act (CSA, 21 U.S.C. 811(b), (c), and (f)), the Department of Health and Human Services (HHS) is recommending that marijuana continue to be maintained in Schedule I of the CSA.

The Food and Drug Administration (FDA) has considered the abuse potential and dependence-producing characteristics of marijuana.

Marijuana meets the three criteria for placing a substance in Schedule I of the CSA under 21 U.S.C. 812(b)(1). As discussed in the enclosed analyses, marijuana has a high potential for abuse, no currently accepted

medical use in treatment in the United States, and a lack of accepted safety for use under medical supervision. Accordingly, HHS recommends that marijuana be maintained in Schedule I of the CSA. Enclosed are two documents prepared by FDA’s Controlled Substance Staff (in response to petitions filed in 2009 by Mr. Bryan Krumm and in 2011 by Governors Lincoln D. Chafee and Christine O. Gregoire) that form the basis for the recommendation. Pursuant to the requests in the petitions, FDA broadly evaluated marijuana, and did not focus its evaluation on particular strains of marijuana or components or derivatives of marijuana.

FDA’s Center for Drug Evaluation and Research’s current review of the available evidence and the published clinical studies on marijuana demonstrated that since our 2006 scientific and medical evaluation and scheduling recommendation responding to a previous DEA petition, research with marijuana has progressed. However, the available evidence is not sufficient to determine that marijuana has an accepted medical use. Therefore, more research is needed into marijuana’s effects, including potential medical uses for marijuana and its derivatives. Based on the current review, we identified several methodological challenges in the marijuana studies published in the literature. We recommend they be addressed in future clinical studies with marijuana to ensure that valid scientific data are generated in studies evaluating marijuana’s safety and efficacy for therapeutic use. For example, we recommend that studies need to focus on consistent administration and reproducible dosing of marijuana, potentially through the use of administration methods other than smoking. A summary of our review of the published literature on the clinical uses of marijuana, including recommendations for future studies, is attached to this document.

FDA and the National Institutes of Health’s National Institute on Drug Abuse (NIDA) also believe that work continues to be needed to ensure support by the federal government for the efficient conduct of clinical research using marijuana. Concerns have been raised about whether the existing federal regulatory system is flexible enough to respond to increased interest in research into the potential therapeutic uses of marijuana and marijuana-derived drugs. HHS welcomes an opportunity to continue to explore these concerns with DEA.

Should you have any questions regarding these recommendations, please contact Corinne P. Moody, Science Policy Analyst, Controlled Substances Staff, Center for Drug Evaluation and Research, FDA, at (301) 796–3152.

Sincerely yours,

Karen B. DeSalvo, MD, MPH, MSc
*Acting Assistant Secretary for Health
Enclosure:*

Basis for the Recommendation for
Maintaining Marijuana in Schedule I of the
Controlled Substances Act

² The Court further stated: “For example, [article 31 paragraph 4 of the Single Convention] requires import and export permits that would not be obtained if the substances were placed in CSA schedules III through V. In addition, the quota and [recordkeeping] requirements of Articles 19 through 21 of the Single Convention would be satisfied only by placing the substances in CSA schedule I or II.” *Id.* n. 71 (internal citations omitted).

³ As DEA has stated in evaluating prior marijuana rescheduling petitions, “Congress established only one schedule, schedule I, for drugs of abuse with ‘no currently accepted medical use in treatment in the United States’ and ‘lack of accepted safety for use . . . under medical supervision.’ 21 U.S.C. 812(b).” 76 FR 40552 (2011); 66 FR 20038 (2001).

Basis for the Recommendation for Maintaining Marijuana in Schedule I of the Controlled Substances Act

On December 17, 2009, Mr. Bryan Krumm submitted a petition to the Drug Enforcement Administration (DEA) requesting that proceedings be initiated to repeal the rules and regulations that place marijuana⁴ in Schedule I of the Controlled Substances Act (CSA). The petitioner contends that marijuana has an accepted medical use in the United States, has proven safety and efficacy, is safe for use under medical supervision, and does not have the abuse potential for placement in Schedule I. The petitioner requests that marijuana be rescheduled to any schedule other than Schedule I of the CSA. In May 2011, the DEA Administrator requested that the U.S. Department of Health and Human Services (HHS) provide a scientific and medical evaluation of the available information and a scheduling recommendation for marijuana, in accordance with the provisions of 21 U.S.C. 811(b).

In accordance with 21 U.S.C. 811(b), the DEA has gathered information related to the control of marijuana (*Cannabis sativa*)⁵ under the CSA. Pursuant to 21 U.S.C. 811(b), the Secretary of HHS is required to consider in a scientific and medical evaluation eight factors determinative of control under the CSA. Following consideration of the eight factors, if it is appropriate, the Secretary must make three findings to recommend scheduling a substance in the CSA or transferring a substance from one schedule to another. The findings relate to a substance's abuse potential, legitimate medical use, and safety or dependence liability. Administrative responsibilities for evaluating a substance for control under the CSA are performed by the Food and Drug Administration (FDA), with the concurrence of the National Institute on Drug Abuse (NIDA), as described in the

Memorandum of Understanding (MOU) of March 8, 1985 (50 FR 9518–20).

In this document, FDA recommends continued control of marijuana in Schedule I of the CSA. Pursuant to 21 U.S.C. 811(c), the eight factors pertaining to the scheduling of marijuana are considered below.

1. Its Actual or Relative Potential for Abuse

Under the first factor the Secretary must consider marijuana's actual or relative potential for abuse. The CSA does not define the term "abuse." However, the CSA's legislative history suggests the following in determining whether a particular drug or substance has a potential for abuse:⁶

a. There is evidence that individuals are taking the drug or drugs containing such a substance in amounts sufficient to create a hazard to their health or to the safety of other individuals or to the community.

b. There is a significant diversion of the drug or drugs containing such a substance from legitimate drug channels.

c. Individuals are taking the drug or drugs containing such a substance on their own initiative rather than on the basis of medical advice from a practitioner licensed by law to administer such drugs in the course of his professional practice.

d. The drug or drugs containing such a substance are new drugs so related in their action to a drug or drugs already listed as having a potential for abuse to make it likely that the drug will have the same potentiality for abuse as such drugs, thus making it reasonable to assume that there may be significant diversions from legitimate channels, significant use contrary to or without medical advice, or that it has a substantial capability of creating hazards to the health of the user or to the safety of the community.

In the development of this scientific and medical evaluation for the purpose of scheduling, the Secretary analyzed considerable data related to the substance's abuse potential. The data include a discussion of the prevalence and frequency of use, the amount of the substance available for illicit use, the ease of obtaining or manufacturing the substance, the reputation or status of the substance "on the street," and evidence relevant to at-risk populations. Importantly, the petitioners define marijuana as including all *Cannabis*

cultivated strains. Different marijuana samples derived from various cultivated strains may have very different chemical constituents, thus the analysis is based on what is known about the range of these constituents across all cultivated strains.

Determining the abuse potential of a substance is complex with many dimensions, and no single test or assessment provides a complete characterization. Thus, no single measure of abuse potential is ideal. Scientifically, a comprehensive evaluation of the relative abuse potential of a substance can include consideration of the following elements: Receptor binding affinity, preclinical pharmacology, reinforcing effects, discriminative stimulus effects, dependence producing potential, pharmacokinetics, route of administration, toxicity, data on actual abuse, clinical abuse potential studies, and public health risks. Importantly, abuse can exist independently from tolerance or physical dependence because individuals may abuse drugs in doses or patterns that do not induce these phenomena. Additionally evidence of clandestine population and illicit trafficking of a substance can shed light on both the demand for a substance as well as the ease of obtaining a substance. Animal and human laboratory data and epidemiological data are all used in determining a substance's abuse potential. Moreover, epidemiological data can indicate actual abuse.

The petitioner compares the effects of marijuana to currently controlled Schedule II substances and make repeated claims about their comparative effects. Comparisons between marijuana and the diverse array of Schedule II substances is difficult, because of the pharmacologically dissimilar actions of substances of Schedule II of the CSA. For example, Schedule II substances include stimulant-like drugs (e.g., cocaine, methylphenidate, and amphetamine), opioids (e.g., oxycodone, fentanyl), sedatives (e.g., pentobarbital, amobarbital), dissociative anesthetics (e.g., PCP), and naturally occurring plant components (e.g., coca leaves and poppy straw). The mechanism(s) of action of the above Schedule II substances are wholly different from one another, and they are different from tetrahydrocannabinol (THC) and marijuana as well. For example, Schedule II stimulants typically function by increasing monoaminergic tone via an increase in dopamine and norepinephrine (Schmitt et al., 2013). In contrast, opioid analgesics function via mu-opioid receptor agonist effects.

⁴Note that "marihuana" is the spelling originally used in the Controlled Substances Act (CSA). This document uses the spelling that is more common in current usage, "marijuana."

⁵The CSA defines marihuana (marijuana) as the following:

All parts of the plant *Cannabis sativa* L., whether growing or not; the seeds thereof; the resin extracted from any part of such plant; and every compound, manufacture, salt, derivative, mixture, or preparation of such plant, its seeds or resin. Such term does not include the mature stalks of such plant, fiber produced from such stalks, oil or cake made from the seeds of such plant, any other compound, manufacture, salt, derivative, mixture, or preparation of such mature stalks (except the resin extracted therefrom), fiber, oil, or cake, or the sterilized seed of such plant which is incapable of germination (21 U.S.C. 802(16)).

⁶Comprehensive Drug Abuse Prevention and Control Act of 1970, H.R. Rep. No. 91–1444, 91st Cong., Sess. 1 (1970) reprinted in U.S.C.C.A.N. 4566, 4603.

These differing mechanism(s) of action result in vastly different behavioral and adverse effect profiles, making comparisons across the range of pharmacologically diverse C-II substances inappropriate.

In addition, many substances scheduled under the CSA are reviewed and evaluated within the context of commercial drug development, using data submitted in the form of a new drug application (NDA). A new analgesic drug might be compared to a currently scheduled analgesic drug as part of the assessment of its relative abuse potential. However, because the petitioners have not identified a specific indication for the use of marijuana, identifying an appropriate comparator based on indication cannot be done.

a. There is evidence that individuals are taking the substance in amounts sufficient to create a hazard to their health or to the safety of other individuals or to the community.

Evidence shows that some individuals are taking marijuana in amounts sufficient to create a hazard to their health and to the safety of other individuals and the community. A large number of individuals use marijuana. HHS provides data on the extent of marijuana abuse through NIDA and the Substance Abuse and Mental Health Services Administration (SAMHSA). According to the most recent data from SAMHSA's 2012 National Survey on Drug Use and Health (NSDUH), which estimates the number of individuals who have used a substance within a month prior to the study (described as "current use"), marijuana is the most commonly used illicit drug among American aged 12 years and older, with an estimated 18.9 million Americans having used marijuana within the month prior to the 2012 NSDUH.

Compared to 2004, when an estimated 14.6 million individuals reported using marijuana within the month prior to the study, the estimated rates in 2012 show an increase of approximately 4.3 million individuals. The 2013 Monitoring the Future (MTF) survey of 8th, 10th, and 12th grade students also indicates that marijuana is the most widely used illicit substance in this age group.

Specifically, current month use was at 7.0 percent of 8th graders, 18.0 percent of 10th, graders and 22.7 percent of 12th graders. Additionally, the 2011 Treatment Episode Data Set (TEDS) reported that primary marijuana abuse accounted for 18.1 percent of non-private substance-abuse treatment facility admissions, with 24.3 percent of those admitted reporting daily use. However, of these admissions for primary marijuana abuse, the criminal

justice system referred 51.6 percent to treatment. SAMHSA's Drug Abuse Warning Network (DAWN) was a national probability survey of U.S. hospitals with emergency departments (EDs) and was designed to obtain information on ED visits in which marijuana was mentioned, accounting for 36.4 percent of illicit drug related ED visits. There are some limitations related to DAWN data on ED visits, which are discussed in detail in Factor 4, "Its History and Current Pattern of Abuse;" Factor 5, "The Scope, Duration, and Significance of Abuse;" and Factor 6, "What, if any, Risk There is to the Public Health." These factors contain detailed discussions of these data.

A number of risks can occur with both acute and chronic use of marijuana. Detailed discussions of the risks are addressed in Factor 2, "Scientific Evidence of its Pharmacological Effect, if Known," and Factor 6, "What, if any, Risk There is to the Public Health."

b. There is significant diversion of the substance from legitimate drug channels.

There is a lack of evidence of significant diversion of marijuana from legitimate drug channels, but this is likely due to the fact that marijuana is more widely available from illicit sources rather than through legitimate channels. Marijuana is not an FDA-approved drug product, as an NDA or biologics license application (BLA) has not been approved for marketing in the United States. Numerous states and the District of Columbia have state-level medical marijuana laws that allow for marijuana use within that state. These state-level drug channels do not have sufficient collection of data related to medical treatment, including efficacy and safety.

Marijuana is used by researchers for nonclinical research as well as clinical research under investigational new drug (IND) applications; this represents the only legitimate drug channel in the United States. However, marijuana used for research represents a very small contribution of the total amount of marijuana available in the United States, and thus provides limited information about diversion. In addition, the lack of significant diversion of investigation supplies is likely because of the widespread availability of illicit marijuana of equal or greater amounts of delta⁹-THC. The data originating from the DEA on seizure statistics demonstrate the magnitude of the availability for illicit marijuana. DEA's System to Retrieve Information from Drug Evidence (STRIDE) provides information on total domestic drug seizures, STRIDE reports a total

domestic seizure of 573,195 kg of marijuana in 2011, the most recent year with complete data that is currently publically available (DEA Domestic Drug Seizures, n.d.).

c. Individuals are taking the substance on their own initiative rather than on the basis of medical advice from a practitioner licensed by law to administer such substances.

Because the FDA has not approved an NDA or BLA for a marijuana drug product for any therapeutic indication, the only way an individual can take marijuana on the basis of medical advice through legitimate channels at the federal level is by participating in research under an IND application. That said, numerous states and the District of Columbia have passed state-level medical marijuana laws allowing for individuals to use marijuana under certain circumstances. However, data are not yet available to determine the number of individuals using marijuana under these state-level medical marijuana laws. Regardless, according to the 2012 NSDUH data, 18.9 million American adults currently use marijuana (SAMHSA, 2013). Based on the large number of individuals reporting current use of marijuana and the lack of an FDA-approved drug product in the United States, one can assume that it is likely that the majority of individuals using marijuana do so on their own initiative rather than on the basis of medical advice from a licensed practitioner.

d. The substance is so related in its action to a substance already listed as having a potential for abuse to make it likely that it will have the same potential for abuse as such substance, thus making it reasonable to assume that there may be significant diversions from legitimate channels, significant use contrary to or without medical advice, or that it has a substantial capability of creating hazards to the health of the user or to the safety of the community.

FDA has approved two drug products containing cannabinoid compounds that are structurally related to the active components in marijuana. These two marketed products are controlled under the CSA. Once a specific drug product containing cannabinoids becomes approved, that specific drug product may be moved from Schedule I to a different Schedule (II-V) under the CSA. Firstly, Marinol—generically known as dronabinol—is a Schedule III drug product containing synthetic delta⁹-THC. Marinol, which is formulated in sesame oil in soft gelatin capsules, was first placed in Schedule II under the CSA following its approval by the FDA. Marinol was later rescheduled

to Schedule III under the CSA because of low numbers of reports of abuse relative to marijuana. Dronabinol is listed in Schedule I under the CSA. FDA approved Marinol in 1985 for the treatment of nausea and vomiting associated with cancer chemotherapy in patients who failed to respond adequately to conventional anti-emetic treatments. In 1992, FDA approved Marional for anorexia associated with weight loss in patients with acquired immunodeficiency syndrome (AIDS). Secondly, in 1985, FDA approved Cesamet, a drug product containing the Schedule II substance nabilone, for the treatment of nausea and vomiting associated with cancer chemotherapy. Besides the two cannabinoid-containing drug products FDA approved for marketing, other naturally occurring cannabinoids and their derivatives (from *Cannabis*) and their synthetic equivalents with similar chemical structure and pharmacological activity are included in the CSA as Schedule I substances.

2. Scientific Evidence of Its Pharmacological Effects, if Known

Under the second factor, the Secretary must consider the scientific evidence of marijuana's pharmacological effects. Abundant scientific data are available on the neurochemistry, toxicology, and pharmacology of marijuana. This section includes a scientific evaluation of marijuana's neurochemistry; pharmacology; and human and animal behavioral, central nervous system, cognitive, cardiovascular, autonomic, endocrinological, and immunological system effects. The overview presented below relies upon the most current research literature on cannabinoids.

Neurochemistry and Pharmacology of Marijuana

Marijuana is a plant that contains numerous natural constituents, such as cannabinoids, that have a variety of pharmacological actions. The petition defines marijuana as including all *Cannabis* cultivated strains. Different marijuana samples derived from various cultivated strains may have very different chemical constituents including delta⁹-THC and other cannabinoids (Appendino et al., 2011). As a consequence, marijuana products from different strains will have different biological and pharmacological profiles.

According to ElSohly and Slade (2005) and Appendino et al. (2011), marijuana contains approximately 525 identified natural constituents, including approximately 100 compounds classified as cannabinoids. Cannabinoids primarily exist in

Cannabis, and published data suggests that most major cannabinoid compounds occurring naturally have been identified chemically. New and minor cannabinoids and other new compounds are continuously being characterized (Pollastro et al., 2011). So far, only two cannabinoids (cannabigerol and its corresponding acid) have been obtained from a non-*Cannabis* source. A South African *Helichrysum* (*H. umbraculigerum*) accumulates these compounds (Appendino et al., 2011). The chemistry of marijuana is described in more detail in Factor 3, "The State of Current Scientific Knowledge Regarding the Drug or Other Substance."

The site of cannabinoid action is at the cannabinoid receptors. Cloning of cannabinoid receptors, first from rat brain tissue (Matsuda et al., 1990) and then from human brain tissue (Gerard et al., 1991), has verified the site of action. Two cannabinoid receptors, CB₁ and CB₂, were characterized (Battista et al., 2012; Piomelli, 2005). Evidence of a third cannabinoid receptor exists, but it has not been identified (Battista et al., 2012).

The cannabinoid receptors, CB₁ and CB₂, belong to the family of G-protein-coupled receptors, and present a typical seven transmembrane-spanning domain structure. Cannabinoid receptors link to an inhibitory G-protein (G_i), such that adenylate cyclase activity is inhibited when a ligand binds to the receptor. This, in turn, prevents the conversion of ATP to the second messenger, cyclic AMP (cAMP). Examples of inhibitory coupled receptors include opioid, muscarinic cholinergic, alpha₂-adrenoreceptors, dopamine (D₂), and serotonin (5-HT₁).

Cannabinoid receptor activation inhibits N- and P/Q-type calcium channels and activates inwardly rectifying potassium channels (Mackie et al., 1995; Twitchell et al., 1997). N-type calcium channel inhibition decreases neurotransmitter release from several tissues. Thus, calcium channel inhibition may be the mechanism by which cannabinoids inhibit acetylcholine, norepinephrine, and glutamate release from specific areas of the brain. These effects may represent a potential cellular mechanism underlying cannabinoids' antinociceptive and psychoactive effects (Ameri, 1999).

CB₁ receptors are found primarily in the central nervous system, but are also present in peripheral tissues. CB₁ receptors are located mainly in the basal ganglia, hippocampus, and cerebellum of the brain (Howlett et al., 2004). The localization of these receptors may

explain cannabinoid interference with movement coordination and effects on memory and cognition. Additionally, CB₁ receptors are found in the immune system and numerous other peripheral tissues (Petrocellis and Di Marzo, 2009). However, the concentration of CB₁ receptors is considerably lower in peripheral tissues than in the central nervous system (Herkenharn et al., 1990 and 1992).

CB₂ receptors are found primarily in the immune system, but are also present in the central nervous system and other peripheral tissues. In the immune system, CB₂ receptors are found predominantly in B lymphocytes and natural killer cells (Bouaboula et al., 1993). CB₂ receptors may mediate cannabinoids' immunological effects (Galiegue et al., 1995). Additionally, CB₂ receptors have been localized in the brain, primarily in the cerebellum and hippocampus (Gong et al., 2006). The distribution of CB₂ receptors throughout the body is less extensive than the distribution of CB₁ receptors (Petrocellis and Di Marzo, 2009). However, both CB₁ and CB₂ receptors are present in numerous tissues of the body.

Cannabinoid receptors have endogenous ligands. In 1992 and 1995, two endogenous cannabinoid receptor agonists, anandamide and arachidonyl glycerol (2-AG), respectively, were identified (Di Marzo, 2006). Anandamide is a low efficacy agonist (Breivogel and Childers, 2000) and 2-AG is a high efficacy agonist (Gonsiorek et al., 2000). Cannabinoid endogenous ligands are present in central as well as peripheral tissues. A combination of uptake and hydrolysis terminate the action of the endogenous ligands. The endogenous cannabinoid system is a locally active signaling system that, to help restore homeostasis, is activated "on demand" in response to changes to the local homeostasis (Petrocellis and Di Marzo, 2009). The endogenous cannabinoid system, including the endogenous cannabinoids and the cannabinoid receptors, demonstrate substantial plasticity in response to several physiological and pathological stimuli (Petrocellis and Di Marzo, 2009). This plasticity is particularly evident in the central nervous system.

Delta⁹-THC and cannabidiol (CBD) are two abundant cannabinoids present in marijuana. Marijuana's major psychoactive cannabinoid is delta⁹-THC (Wachtel et al., 2002). In 1964, Gaoni and Mechoulam first described delta⁹-THC's structure and function. In 1963, Mechoulam and Shvo first described CBD's structure. The pharmacological actions of CBD have not been fully studied in humans.

Delta⁹-THC and CBD have varying affinity and effects at the cannabinoid receptors. Delta⁹-THC displays similar affinity for CB₁ and CB₂ receptors, but behaves as a weak agonist for CB₂ receptors. The identification of synthetic cannabinoid ligands that selectively bind to CB₂ receptors but do not have the typical delta⁹-THC-like psychoactive properties suggests that the activation of CB₁-receptors mediates cannabinoids' psychotropic effects (Hanus et al., 1999). CBD has low affinity for both CB₁ and CB₂ receptors (Mechoulam et al., 2007). According to Mechoulam et al. (2007), CBD has antagonistic effects at CB₁ receptors and some inverse agonistic properties at CB₂ receptors. When cannabinoids are given subacutely to rats, CB₁ receptors down-regulate and the binding of the second messenger system coupled to CB₁ receptors, GTPγS, decreases (Breivogel et al., 2001).

Animal Behavioral Effects

Self-Administration

Self-administration is a method that assesses the ability of a drug to produce rewarding effects. The presence of rewarding effects increases the likelihood of behavioral responses to obtain additional drug. Animal self-administration of a drug is often useful in predicting rewarding effects in humans, and is indicative of abuse liability. A good correlation is often observed between those drugs that rhesus monkeys self-administer and those drugs that humans abuse (Balster and Bigelow, 2003). Initially, researchers could not establish self-administration of cannabinoids, including delta⁹-THC, in animal models. However, self-administration of delta⁹-THC can now be established in a variety of animal models under specific training paradigms (Justinova et al., 2003, 2004, 2005).

Squirrel monkeys, with and without prior exposure to other drugs of abuse, self-administer delta⁹-THC under specific conditions. For instance, Tanda et al. (2000) observed that when squirrel monkeys are initially trained to self-administer intravenous cocaine, they will continue to bar-press delta⁹-THC at the same rate as they would with cocaine. The doses were notably comparable to those doses used by humans who smoke marijuana. SR141716, a CB₁ cannabinoid receptor agonist-antagonist, can block this rewarding effect. Other studies show that naïve squirrel monkeys can be successfully trained to self-administer delta⁹-THC intravenously (Justinova et al., 2003). The maximal responding rate

is 4 μg/kg per injection, which is 2–3 times greater than observed in previous studies using cocaine-experienced monkeys. Naltrexone, a mu-opioid antagonist, partially antagonizes these rewarding effects of delta⁹-THC (Justinova et al., 2004).

Additionally, data demonstrate that under specific conditions, rodents self-administer cannabinoids. Rats will self-administer delta⁹-THC when applied intracerebroventricularly (i.c.v.), but only at the lowest doses tested (0.01–0.02 μg/infusion) (Braidia et al., 2004). SR141716 and the opioid antagonist naloxone can antagonize this effect. However, most studies involve rodents self-administering the synthetic cannabinoid WIN 55212, a CB₁ receptor agonist with a non-cannabinoid structure (Deiana et al., 2007; Fattore et al., 2007; Martellotta et al., 1998; Mendizabal et al., 2006).

Aversive effects, rather than reinforcing effects, occur in rats that received high doses of WIN 55212 (Chaperon et al., 1998) or delta⁹-THC (Sanudo-Pena et al., 1997), indicating a possible critical dose-dependent effect. In both studies, SR141716 reversed these aversive effects.

Conditioned Place Preference

Conditioned place preference (CPP) is a less rigorous method than self-administration for determining whether or not a drug has rewarding properties. In this behavioral test, animals spend time in two distinct environments: One where they previously received a drug and one where they received a placebo. If the drug is reinforcing, animals will choose to spend more time in the environment paired with the drug, rather than with the placebo, when presented with both options simultaneously.

Animals show CPP to delta⁹-THC, but only at the lowest doses tested (0.075–1.0 mg/kg, intraperitoneal (i.p.)) (Braidia et al., 2004). SR141716 and naloxone antagonize this effect (Braidia et al., 2004). As a partial agonist, SR141716 can induce CPP at doses of 0.25, 0.5, 2 and 3 mg/kg (Cheer et al., 2000). In knockout mice, those without μ-opioid receptors do not develop CPP to delta⁹-THC (Ghozland et al., 2002).

Drug Discrimination Studies

Drug discrimination is a method where animals indicate whether a test drug produces physical or psychic perceptions similar to those produced by a known drug of abuse. In this test, an animal learns to press one bar when it receives the known drug of abuse and another bar when it receives placebo. To determine whether the test drug is like

the known drug of abuse, a challenge session with the test drug demonstrates which of the two bars the animal presses more often.

In addition to humans (Lile et al., 2009; Lile et al., 2011), it has been noted that animals, including monkeys (McMahon, 2009), mice (McMahon et al., 2008), and rats (Gold et al., 1992), are able to discriminate cannabinoids from other drugs or placebo. Moreover, the major active metabolite of delta⁹-THC, 11-hydroxy-delta⁹-THC, also generalizes (following oral administration) to the stimulus cues elicited by delta⁹-THC (Browne and Weissman, 1981). Twenty-two other cannabinoids found in marijuana also fully substitute for delta⁹-THC. However, CBD does not substitute for delta⁹-THC in rats (Vann et al., 2008).

Discriminative stimulus effects of delta⁹-THC are pharmacologically specific for marijuana containing cannabinoids (Balster and Prescott, 1992; Browne and Weissman, 1981; Wiley et al., 1993, 1995). The discriminative stimulus effects of the cannabinoid group appear to provide unique effects because stimulants, hallucinogens, opioids, benzodiazepines, barbiturates, NMDA antagonists, and antipsychotics do not fully substitute for delta⁹-THC.

Central Nervous System Effects

Human Physiological and Psychological Effects

Psychoactive Effects

Below is a list of the common subjective responses to cannabinoids (Adams and Martin, 1996; Gonzalez, 2007; Hollister 1986, 1988; Institute of Medicine, 1982). According to Maldonado (2002), these responses to marijuana are pleasurable to many humans and are often associated with drug-seeking and drug-taking. High levels of positive psychoactive effects are associated with increased marijuana use, abuse, and dependence (Scherrer et al., 2009; Zeiger et al., 2010).

(1) Disinhibition, relaxation, increased sociability, and talkativeness.

(2) Increased merriment and appetite, and even exhilaration at high doses.

(3) Enhanced sensory perception, which can generate an increased appreciation of music, art, and touch.

(4) Heightened imagination, which can lead to a subjective sense of increased creativity.

(5) Initial dizziness, nausea, tachycardia, facial flushing, dry mouth, and tremor.

(6) Disorganized thinking, inability to converse logically, time distortions, and short-term memory impairment.

(7) Ataxia and impaired judgment, which can impede driving ability or lead to an increase in risk-tasking behavior.

(8) Illusions, delusions, and hallucinations that intensify with higher doses.

(9) Emotional lability, incongruity of affect, dysphoria, agitation, paranoia, confusion, drowsiness, and panic attacks, which are more common in inexperienced or high-dosed users.

As with many psychoactive drugs, a person's medical, psychiatric, and drug-taking history can influence the individual's response to marijuana.

Dose preferences to marijuana occur in that marijuana users prefer higher concentrations of the principal psychoactive substance (1.95 percent delta⁹-THC) over lower concentrations (0.63 percent delta⁹-THC) (Chait and Burke, 1994). Nonetheless, frequent marijuana users (≤100 times of use) were able to identify a drug effect from low-dose delta⁹-THC better than occasional users (<10 times of use) while also experiencing fewer sedative effects from marijuana (Kirk and de Wit, 1999).

The petitioners contend that many of marijuana's naturally occurring cannabinoids mitigate the psychoactive effects of delta⁹-THC, and therefore that marijuana lacks sufficient abuse potential to warrant Schedule I placement, because Marinol, which is in Schedule III, contains only delta⁹-THC. This theory has not been demonstrated in controlled studies. Moreover, the concept of abuse potential encompasses all properties of a substance, including its chemistry, pharmacology, and pharmacokinetics, as well as usage patterns and diversion history. The abuse potential of a substance is associated with the repeated or sporadic use of a substance in nonmedical situations for the psychoactive effects the substance produces. These psychoactive effects include euphoria, perceptual and other cognitive distortions, hallucinations, and mood changes. However, as stated above, the abuse potential not only includes the psychoactive effects, but also includes other aspects related to a substance.

DEA's final published rule entitled "Rescheduling of the Food and Drug Administration Approved Product Containing Synthetic Dronabinol [(–)-delta⁹-(trans)-Tetrahydrocannabinol] in Sesame Oil and Encapsulated in Soft Gelatin Capsules From Schedule II to Schedule III" (64 FR 35928, July 2, 1999) rescheduled Marinol from Schedule II to Schedule III. The HHS assessment of the abuse potential and subsequent scheduling recommendation

compared Marinol to marijuana on different aspects related to abuse potential. Major differences in formulation, availability, and usage between marijuana and the drug product, Marinol, contribute to their differing abuse potentials.

Hollister and Gillespie (1973) estimated that delta⁹-THC by smoking is 2.6 to 3 times more potent than delta⁹-THC ingested orally. The intense psychoactive drug effect achieved, rapidly by smoking is generally considered to produce the effect desired by the abuser. This effect explains why abusers often prefer to administer certain drugs by inhalation, intravenously, or intranasally rather than orally. Such is the case with cocaine, opium, heroin, phencyclidine, methamphetamine, and delta⁹-THC from marijuana (0.1–9.5 percent delta⁹-THC range) or hashish (10–30 percent delta⁹-THC range) (Wesson and Washburn, 1990). Thus, the delayed onset and longer duration of action for Marinol may be contributing factors limiting the abuse or appeal of Marinol as a drug of abuse relative to marijuana.

The formulation of Marinol is a factor that contributes to differential scheduling of Marinol and marijuana. For example, extraction and purification of dronabinol from the encapsulated sesame oil mixture of Marinol is highly complex and difficult. Additionally, the presence of sesame oil mixture in the formulation may preclude the smoking of Marinol-laced cigarettes.

Additionally, there is a dramatic difference between actual abuse and illicit trafficking of Marinol and marijuana. Despite Marinol's availability in the United States, there have been no significant reports of abuse, diversion, or public health problems due to Marinol. By comparison, 18.9 million American adults report currently using marijuana (SAMHSA, 2013).

In addition, FDA's approval of an NDA for Marinol allowed for Marinol to be rescheduled to Schedule II, and subsequently to Schedule III of the CSA. In conclusion, marijuana and Marinol differ on a wide variety of factors that contribute to each substance's abuse potential. These differences are major reasons distinguishing the higher abuse potential for marijuana and the different scheduling determinations of marijuana and Marinol.

In terms of the petitioners' claim that different cannabinoids present in marijuana mitigate the psychoactive effects of delta⁹-THC, only three of the cannabinoids present in marijuana were simultaneously administered with delta⁹-THC to examine how the

combinations of these cannabinoids such as CBD, cannabichromene (CBC) and cannabinol (CBN) influence delta⁹-THC's psychoactive effects. Dalton et al. (1976) observed that smoked administration of placebo marijuana cigarettes containing injections of 0.15 mg/kg CBD combined with 0.025mg/kg of delta⁹-THC, in a 7:1 ratio of CBD to delta⁹-THC, significantly decreased ratings of acute subjective effects and "high" when compared to smoking delta⁹-THC alone. In contrast, Ilan et al. (2005) calculated the naturally occurring concentrations of CBC and CBD in a batch of marijuana cigarettes with either 1.8 percent or 3.6 percent delta⁹-THC concentration by weight. For each strength of delta⁹-THC in marijuana cigarettes, the concentrations of CBC and CBD were classified in groups of either low or high. The study varied the amount of CBC and CBD within each strength of delta⁹-THC marijuana cigarettes, with administrations consisting of either low CBC (between 0.1–0.2 percent CBC concentration by weight) and low CBD (between 0.1–0.4 percent CBD concentration by weight), high CBC (≤ 0.5 percent CBC concentration by weight) and low CBD, or low CBC and high CBD (≤1.0 percent CBD concentration by weight). Overall, all combinations scored significantly greater than placebo on ratings of subjective effects, and there was no significant difference between any combinations.

The oral administration of a combination of either 15, 30, or 60 mg CBD with 30 mg delta⁹-THC dissolved in liquid (in a ratio of at least 1:2 CBD to delta⁹-THC) reduced the subjective effects produced by delta⁹-THC alone (Karniol et al., 1974). Additionally, orally administering a liquid mixture combining 1 mg/kg CBD with 0.5 mg/kg of delta⁹-THC (ratio of 2:1 CBD to delta⁹-THC) decreased scores of anxiety and marijuana drug effect on the Addiction Research Center Inventory (ARCI) compared to delta⁹-THC alone (Zuardi et al., 1982). Lastly, oral administration of either 12.5, 25, or 50 mg CBN combined with 25 mg delta⁹-THC dissolved in liquid (ratio of at least 1:2 CBN to delta⁹-THC) significantly increased subjective ratings of "drugged," "drowsy," "dizzy," and "drunk," compared to delta⁹-THC alone (Karniol et al., 1975).

Even though some studies suggest that CBD may decrease some of delta⁹-THC's psychoactive effects, the ratios of CBD to delta⁹-THC administered in these studies are not present in marijuana used by most people. For example, in one study, researchers used smoked

marijuana with ratios of CBD to delta⁹-THC naturally present in marijuana plant material and they found out that varying the amount of CBD actually had no effect on delta⁹-THC's psychoactive effects (Ilan et al., 2005). Because most marijuana currently available on the street has high amounts of delta⁹-THC with low amounts of CBD and other cannabinoids, most individuals use marijuana with low levels of CBD present (Mehmedic et al., 2010). Thus, any possible mitigation of delta⁹-THC's psychoactive effects by CBD will not occur for most marijuana users. In contrast, one study indicated that another cannabinoid present in marijuana, CBN, may enhance delta⁹-THC's psychoactive effects (Karniol et al., 1975).

Behavioral Impairment

Marijuana induces various psychoactive effects that can lead to behavioral impairment. Marijuana's acute effects can significantly interfere with a person's ability to learn in the classroom or to operate motor vehicles. Acute administration of smoked marijuana impairs performance on learning, associative processes, and psychomotor behavioral tests (Block et al., 1992). Ramaekers et al. (2006a) showed that acute administration of 250 µg/kg and 500 µg/kg of delta⁹-THC in smoked marijuana dose-dependently impairs cognition and motor control, including motor impulsivity and tracking impairments (Ramaekers et al., 2006b). Similarly, administration of 290 µg/kg delta⁹-THC in a smoked marijuana cigarette resulted in impaired perceptual motor speed and accuracy: Two skills which are critical to driving ability (Kurzthaler et al., 1999). Lastly, administration of 3.95 percent delta⁹-THC in a smoked marijuana cigarette not only increased disequilibrium measures, but also increased the latency in a task of simulated vehicle braking at a rate comparable to an increase in stopping distance of five feet at 60 mph (Liguori et al., 1998). However, acute administration of marijuana containing 2.1 percent delta⁹-THC does not produce "hangover effects" (Chait, 1990).

In addition to measuring the acute effects immediately following marijuana administration, researchers have conducted studies to determine how long behavioral impairments last after abstinence. Some of marijuana's acute effects may not fully resolve until at least one day after the acute psychoactive effects have subsided. Heishman et al. (1990) showed that impairment on memory tasks persists for 24 hours after smoking marijuana

cigarettes containing 2.57 percent delta⁹-THC. However, Fant et al. (1998) showed that the morning after exposure to 1.8 percent or 3.6 percent smoked delta⁹-THC, subjects had minimal residual alterations in subjective or performance measures.

A number of factors may influence marijuana's behavioral effects including the duration of use (chronic or short term), frequency of use (daily, weekly, or occasionally), and amount of use (heavy or moderate). Researchers also have examined how long behavioral impairments last following chronic marijuana use. These studies used self-reported histories of past duration, frequency, and amount of past marijuana use, and administered a variety of performance and cognitive measures at different time points following marijuana abstinence. In chronic marijuana users, behavioral impairments may persist for up to 28 days of abstinence. Solowij et al. (2002) demonstrated that after 17 hours of abstinence, 51 adult heavy chronic marijuana users performed worse on memory and attention tasks than 33 non-using controls or 51 heavy, short-term users. Another study noted that heavy, frequent marijuana users, abstinent for at least 24 hours, performed significantly worse than the controls on verbal memory and psychomotor speed tests (Messinis et al., 2006). Additionally, after at least 1 week of abstinence, young adult frequent marijuana users, aged 18–28, showed deficits in psychomotor speed, sustained attention, and cognitive inhibition (Lisdahl and Price, 2012). Adult heavy, chronic marijuana users showed deficits on memory tests after 7 days of supervised abstinence (Pope et al., 2002). However, when these same individuals were again tested after 28 days of abstinence, they did not show significant memory deficits. The authors concluded, "cannabis-associated cognitive deficits are reversible and related to recent cannabis exposure, rather than irreversible and related to cumulative lifetime use."⁷ However, other researchers reported neuropsychological deficits in memory, executive functioning, psychomotor speed and manual dexterity in heavy marijuana users abstinent for 28 days (Bolla et al., 2002). Furthermore, a follow-up study of heavy marijuana users noted decision-making deficits after 25 days of supervised abstinence. (Bolla et al., 2005). However, moderate marijuana users did not show decision-making deficits after 25 days of

abstinence, suggesting the amount of marijuana use may impact the duration of residual impairment.

The effects of chronic marijuana use do not seem to persist after more than 1 to 3 months of abstinence. After 3 months of abstinence, any deficits observed in IQ, immediate memory, delayed memory, and information-processing speeds following heavy marijuana use compared to pre-drug use scores were no longer apparent (Fried et al., 2005). Marijuana did not appear to have lasting effects on performance of a comprehensive neuropsychological battery when 54 monozygotic male twins (one of whom used marijuana, one of whom did not) were compared 1–20 years after cessation of marijuana use (Lyons et al., 2004). Similarly, following abstinence for a year or more, both light and heavy adult marijuana users did not show deficits on scores of verbal memory compared to non-using controls (Tait et al., 2011). According to a recent meta-analysis looking at non-acute and long-lasting effects of marijuana use on neurocognitive performance, any deficits seen within the first month following abstinence are generally not present after about 1 month of abstinence (Schreiner and Dunn, 2012).

Another aspect that may be a critical factor in the intensity and persistence of impairment resulting from chronic marijuana use is the age of first use. Individuals with a diagnosis of marijuana misuse or dependence who were seeking treatment for substance use, who initiated marijuana use before the age of 15 years, showed deficits in performance on tasks assessing sustained attention, impulse control, and general executive functioning compared to non-using controls. These deficits were not seen in individuals who initiated marijuana use after the age of 15 years (Fontes et al., 2011). Similarly, heavy, chronic marijuana users who began using marijuana before the age of 16 years had greater decrements in executive functioning tasks than heavy, chronic marijuana users who started using after the age of 16 years and non-using controls (Gruber et al., 2012). Additionally, in a prospective longitudinal birth cohort study of 1,037 individuals, marijuana dependence or chronic marijuana use was associated with a decrease in IQ and general neuropsychological performance compared to pre-marijuana exposure levels in adolescent onset users (Meier et al., 2012). The decline in adolescent-onset user's IQ persisted even after reduction or abstinence of marijuana use for at least 1 year. In contrast, the adult-onset chronic marijuana users showed no significant

⁷ In this quotation the term *Cannabis* is used interchangeably for *marijuana*.

changes in IQ compared to pre-exposure levels whether they were current users or abstinent for at least 1 year (Meier et al., 2012).

In addition to the age of onset of use, some evidence suggests that the amount of marijuana used may relate to the intensity of impairments. In the above study by Gruber et al. (2012), where early-onset users had greater deficits than late-onset users, the early-onset users reported using marijuana twice as often and using three times as much marijuana per week than the late-onset users. Meier et al. (2012) showed that the deficits in IQ seen in adolescent-onset users increased with the amount of marijuana used. Moreover, when comparing scores for measures of IQ, immediate memory, delayed memory, and information-processing speeds to pre-drug-use levels, the current, heavy, chronic marijuana users showed deficits in all three measures while current, occasional marijuana users did not (Fried et al., 2005).

Behavioral Effects of Prenatal Exposure

Studies with children at different stages of development are used to examine the impact of prenatal marijuana exposure on performance in a series of cognitive tasks. However, many pregnant women who reported marijuana use were more likely to also report use of alcohol, tobacco, and cocaine (Goldschmidt et al., 2008). Thus, with potential exposure to multiple drugs, it is difficult to determine the specific impact of prenatal marijuana exposure.

Most studies assessing the behavioral effects of prenatal marijuana exposure included women who, in addition to using marijuana, also reported using alcohol and tobacco. However, some evidence suggests an association between heavy prenatal marijuana exposure and deficits in some cognitive domains. In both 4-year-old and 6-year-old children, heavy prenatal marijuana use is negatively associated with performance on tasks assessing memory, verbal reasoning, and quantitative reasoning (Fried and Watkinson, 1987; Goldschmidt et al., 2008). Additionally, heavy prenatal marijuana use is associated with deficits in measures of sustained attention in children at the ages of 6 years and 13–16 years (Fried et al., 1992; Fried, 2002). In 9- to 12-year-old children, prenatal marijuana exposure is negatively associated with executive functioning tasks that require impulse control, visual analysis, and hypothesis (Fried et al., 1998).

Association of Marijuana Use With Psychosis

This analysis evaluates only the evidence for a direct link between prior marijuana use and the subsequent development of psychosis. Thus, this discussion does not consider issues such as whether marijuana's transient effects are similar to psychotic symptoms in healthy individuals or exacerbate psychotic symptoms in individuals already diagnosed with schizophrenia.

Extensive research has been conducted to investigate whether exposure to marijuana is associated with the development of schizophrenia or other psychoses. Although many studies are small and inferential, other studies in the literature use hundreds to thousands of subjects. At present, the available data do not suggest a causative link between marijuana use and the development of psychosis (Minozzi et al., 2010). Numerous large, longitudinal studies show that subjects who used marijuana do not have a greater incidence of psychotic diagnoses compared to those who do not use marijuana (Fergusson et al., 2005; Kuepper et al., 2011; Van Os et al., 2002).

When analyzing the available evidence of the connection between psychosis and marijuana, it is critical to determine whether the subjects in the studies are patients who are already diagnosed with psychosis or individuals who demonstrate a limited number of symptoms associated with psychosis without qualifying for a diagnosis of the disorder. For example, instead of using a diagnosis of psychosis, some researchers relied on non-standard methods of representing symptoms of psychosis including "schizophrenic cluster" (Maremmani et al., 2004), "subclinical psychotic symptoms" (Van Gastel et al., 2012), "pre-psychotic clinical high risk" (Van der Meer et al., 2012), and symptoms related to "psychosis vulnerability" (Griffith-Lendering et al., 2012). These groupings do not conform to the criteria in the Diagnostic and Statistical Manual (DSM-5) or the International Classification of Diseases (ICD-10) for a diagnosis of psychosis. Thus, these groupings are not appropriate for use in evaluating marijuana's impact on the development of actual psychosis. Accordingly, this analysis includes only those studies that use subjects diagnosed with a psychotic disorder.

In the largest study evaluating the link between psychosis and drug use, 274 of the approximately 45,500 Swedish conscripts in the study population

(<0.01 percent) received a diagnosis of schizophrenia within the 14-year period following military induction from 1969 to 1983 (Andreasson et al., 1987). Of the conscripts diagnosed with psychosis, 7.7 percent (21 of the 274 conscripts with psychosis) had used marijuana more than 50 times at induction, while 72 percent (197 of the 274 conscripts with psychosis) had never used marijuana. Although high marijuana use increased the relative risk for schizophrenia to 6.0, the authors note that substantial marijuana use history "accounts for only a minority of all cases" of psychosis (Andreasson et al., 1987). Instead, the best predictor for whether a conscript would develop psychosis was a non-psychotic psychiatric diagnosis upon induction. The authors concluded that marijuana use increased the risk for psychosis only among individuals predisposed to develop the disorder. In addition, a 35-year follow up to this study reported very similar results (Manrique-Garcia et al., 2012). In this follow up study, 354 conscripts developed schizophrenia; of these 354 conscripts, 32 used marijuana more than 50 times at induction (9 percent, an odds ratio of 6.3), while 255 had never used marijuana (72 percent).

Additionally, the conclusion that the impact of marijuana may manifest only in individuals likely to develop psychotic disorders has been shown in many other types of studies. For example, although evidence shows that marijuana use may precede the presentation of symptoms in individuals later diagnosed with psychosis (Schimmelmann et al., 2011), most reports conclude that prodromal symptoms of schizophrenia appear prior to marijuana use (Schiffman et al., 2005). Similarly, a review of the gene-environment interaction model for marijuana and psychosis concluded that some evidence supports marijuana use as a factor that may influence the development of psychosis, but only in those individuals with psychotic liability (Pelayo-Teran et al., 2012).

A similar conclusion was drawn when the prevalence of schizophrenia was modeled against marijuana use across eight birth cohorts in Australia in individuals born between the years 1940 to 1979 (Degenhardt et al., 2003). Although marijuana use increased over time in adults born during the four-decade period, there was not a corresponding increase in diagnoses for psychosis in these individuals. The authors conclude that marijuana may precipitate schizophrenic disorders only in those individuals who are vulnerable to developing psychosis. Thus, marijuana *per se* does not appear to

induce schizophrenia in the majority of individuals who have tried or continue to use marijuana. However, in individuals with a genetic vulnerability for psychosis, marijuana use may influence the development of psychosis.

Cardiovascular and Autonomic Effects

Single smoked or oral doses of delta⁹-THC produce tachycardia and may increase blood pressure (Capriotti et al., 1988; Benowitz and Jones, 1975). Some evidence associates the tachycardia produced by delta⁹-THC with excitation of the sympathetic and depression of the parasympathetic nervous systems (Malinowska et al., 2012). During chronic marijuana ingestion, a tolerance to tachycardia develops (Malinowska et al., 2012).

However, prolonged delta⁹-THC ingestion produces bradycardia and hypotension (Benowitz and Jones, 1975). Plant-derived cannabinoids and endocannabinoids elicit hypotension and bradycardia via activation of peripherally-located CB₁ receptors (Wagner et al., 1998). Specifically, the mechanism of this effect is through presynaptic CB₁ receptor-mediated inhibition of norepinephrine release from peripheral sympathetic nerve terminals, with possible additional direct vasodilation via activation of vascular cannabinoid receptors (Pacher et al., 2006). In humans, tolerance can develop to orthostatic hypotension (Jones, 2002; Sidney, 2002) possibly related to plasma volume expansion, but tolerance does not develop to the supine hypotensive effects (Benowitz and Jones, 1975). Additionally, electrocardiographic changes are minimal, even after large cumulative doses of delta⁹-THC are administered. (Benowitz and Jones, 1975).

Marijuana smoking by individuals, particularly those with some degree of coronary artery or cerebrovascular disease, poses risks such as increased cardiac work, catecholamines and carboxyhemoglobin, myocardial infarction, and postural hypotension (Benowitz and Jones, 1981; Hollister, 1988; Mittleman et al., 2001; Malinowska et al., 2012).

Respiratory Effects

After acute exposure to marijuana, transient bronchodilation is the most typical respiratory effect (Gong et al., 1984). A recent 20-year longitudinal study with over 5,000 individuals collected information on the amount of marijuana use and pulmonary function data at years 0, 2, 5, 10, and 20 (Pletcher et al., 2012). Among the more than 5,000 individuals who participated in the study, almost 800 of them reported

current marijuana use but not tobacco use at the time of assessment. Pletcher et al. (2012) found that the occasional use of marijuana is not associated with decreased pulmonary function. However, some preliminary evidence suggests that heavy marijuana use may be associated with negative pulmonary effects (Pletcher et al., 2012). Long-term use of marijuana can lead to chronic cough and increased sputum, as well as an increased frequency of chronic bronchitis and pharyngitis. In addition, pulmonary function tests reveal that large-airway obstruction can occur with chronic marijuana smoking, as can cellular inflammatory histopathological abnormalities in bronchial epithelium (Adams and Martin 1996; Hollister 1986).

Evidence regarding marijuana smoking leading to cancer is inconsistent, as some studies suggest a positive correlation while others do not (Lee and Hancox, 2011; Tashkin, 2005). Several lung cancer cases have been reported in young marijuana users with no tobacco smoking history or other significant risk factors (Fung et al., 1999). Marijuana use may dose-dependently interact with mutagenic sensitivity, cigarette smoking, and alcohol use to increase the risk of head and neck cancer (Zhang et al., 1999). However, in a large study with 1,650 subjects, a positive association was not found between marijuana and lung cancer (Tashkin et al., 2006). This finding remained true, regardless of the extent of marijuana use, when controlling for tobacco use and other potential confounding variables. Overall, new evidence suggests that the effects of marijuana smoking on respiratory function and carcinogenicity differ from those of tobacco smoking (Lee and Hancox, 2011).

Endocrine System

Experimental marijuana administration to humans does not consistently alter many endocrine parameters. In an early study, male subjects who experimentally received smoked marijuana showed a significant depression in luteinizing hormone and a significant increase in cortisol (Cone et al., 1986). However, two later studies showed no changes in hormones. Male subjects experimentally exposed to smoked delta⁹-THC (18 mg/marijuana cigarette) or oral delta⁹-THC (10 mg three times per day for 3 days and on the morning of the fourth day) showed no changes in plasma adrenocorticotrophic hormone (ACTH), cortisol, prolactin, luteinizing hormone, or testosterone levels (Dax et al., 1989). Similarly, a study with 93 men and 56

women showed that chronic marijuana use did not significantly alter concentrations of testosterone, luteinizing hormone, follicle stimulating hormone, prolactin, or cortisol (Block et al., 1991). Additionally, chronic marijuana use did not affect serum levels of thyrotropin, thyroxine, and triiodothyronine (Bonnet, 2013). However, in a double-blind, placebo-controlled, randomized clinical trial of HIV-positive men, smoking marijuana dose-dependently increased plasma levels of ghrelin and leptin, and decreased plasma levels of peptide YY (Riggs et al., 2012).

The effects of marijuana on female reproductive system functionality differ between humans and animals. In monkeys, delta⁹-THC administration suppressed ovulation (Asch et al., 1981) and reduced progesterone levels (Almirez et al., 1983). However, in women, smoked marijuana did not alter hormone levels or the menstrual cycle (Mendelson and Mello, 1984). Brown and Dobs (2002) suggest that the development of tolerance in humans may be the cause of the discrepancies between animal and human hormonal response to cannabinoids.

The presence of *in vitro* delta⁹-THC reduces binding of the corticosteroid, dexamethasone, in hippocampal tissue from adrenalectomized rats, suggesting an interaction with the glucocorticoid receptor (Eldridge et al., 1991). Although acute delta⁹-THC presence releases corticosterone, tolerance develops in rats with chronic administration (Eldridge et al., 1991).

Some studies support a possible association between frequent, long-term marijuana use and increased risk of testicular germ cell tumors (Trabert et al., 2011). On the other hand, recent data suggest that cannabinoid agonists may have therapeutic value in the treatment of prostate cancer, a type of carcinoma in which growth is stimulated by androgens. Research with prostate cancer cells shows that the mixed CB₁/CB₂ agonist, WIN-55212-2, induces apoptosis in prostate cancer cells, as well as decreases the expression of androgen receptors and prostate-specific antigens (Sarfraz et al., 2005).

Immune System

Cannabinoids affect the immune system in many different ways. Synthetic, natural, and endogenous cannabinoids often cause different effects in a dose-dependent biphasic manner (Croxford and Yamamura, 2005; Tanasescu and Constantinescu, 2010).

Studies in humans and animals give conflicting results about cannabinoid

effects on immune functioning in subjects with compromised immune systems. Abrams et al. (2003) investigated marijuana's effect on immunological functioning in 62 AIDS patients taking protease inhibitors. Subjects received one of the following three times a day: A smoked marijuana cigarette containing 3.95 percent delta⁹-THC, an oral tablet containing delta⁹-THC (2.5 mg oral dronabinol), or an oral placebo. The results showed no changes in CD4+ and CD8+ cell counts, HIV RNA levels, or protease inhibitor levels between groups. Thus, the use of cannabinoids showed no short-term adverse virologic effects in individuals with compromised immune systems. However, these human data contrast with data generated in immunodeficient mice, which demonstrated that exposure to delta⁹-THC *in vivo* suppresses immune function, increases HIV co-receptor expression, and acts as a cofactor to enhance HIV replication (Roth et al., 2005).

3. The State of Current Scientific Knowledge Regarding the Drug or Other Substance

Under the third factor, the Secretary must consider the state of current scientific knowledge regarding marijuana. Thus, this section discusses the chemistry, human pharmacokinetics, and medical uses of marijuana.

Chemistry

Marijuana is one of the common names of *Cannabis sativa* L. in the family Cannabaceae. *Cannabis* is one of the oldest cultivated crops, providing a source of fiber, food, oil, and drug. Botanists still debate whether *Cannabis* should be considered as a single (The Plant List, 2010) or three species, *i.e.*, *C. sativa*, *C. indica*, and *C. ruderalis* (Hillig, 2005). Specifically, marijuana is developed as *sativa* and *indica* cultivated varieties (strains) or various hybrids.

The petition defines marijuana as including all *Cannabis* cultivated strains. Different marijuana samples derived from various cultivated strains may have very different chemical constituents including delta⁹-THC and other cannabinoids (Appendino et al., 2011). As a consequence, marijuana products from different strains will have different safety, biological, pharmacological, and toxicological profiles. Thus, all *Cannabis* strains cannot be considered together because of the varying chemical constituents between strains.

Marijuana contains numerous naturally occurring constituents

including cannabinoids. Overall, various *Cannabis* strains contain more than 525 identified natural constituents. Among those constituents, the most important ones are the 21 (or 22) carbon terpenoids found in the plant, as well as their carboxylic acids, analogues, and transformation products, known as cannabinoids (Aguirell et al., 1984, 1986; Mechoulam, 1973; Appendino et al., 2011). Thus far, more than 100 compounds classified as cannabinoids have been characterized (ElSohly and Slade, 2005; Radwan, ElSohly et al., 2009; Appendino et al. 2011).

Cannabinoids primarily exist in *Cannabis*, and published data suggest that most major cannabinoid compounds occurring naturally have been chemically identified. New and minor cannabinoids and other new compounds are continuously being characterized (Pollastro et al., 2011). So far, only two cannabinoids (cannabigerol and its corresponding acid) have been obtained from a *non-Cannabis* source. A South African *Helichrysum* (*H umbraculigerum*) accumulates these compounds (Appendino et al. 2011).

Among the cannabinoids found in marijuana, delta⁹-THC (alternate name delta¹-THC) and delta-8-tetrahydrocannabinol (delta⁸-THC, alternate name delta⁶-THC) produce marijuana's characteristic psychoactive effects. Because delta⁹-THC is more abundant than delta⁸-THC, marijuana's psychoactivity is largely attributed to the former. Only a few varieties of marijuana analyzed contain delta⁸-THC at significant amounts (Hively et al., 1966). Delta⁹-THC is an optically active resinous substance, insoluble in water, and extremely lipid soluble. Chemically, delta⁹-THC is (6aR-trans)-6a,7,8,10a-tetrahydro-6,6,9-trimethyl-3-pentyl-6H-dibenzo-[b,d]pyran-1-ol, or (–)-delta⁹-(trans)-tetrahydrocannabinol. The (–)-trans isomer of delta⁹-THC is pharmacologically 6–100 times more potent than the (+)-trans isomer (Dewey et al., 1984).

Other cannabinoids present in marijuana include CBD, CBC, and CBN. CBD, a major cannabinoid of marijuana, is insoluble in water and lipid-soluble. Chemically, CBD is 2-[(1R,6R)-3-methyl-6-prop-1-en-2-ylcyclohex-2-en-1-yl]-5-pentylbenzene-1,3-diol. CBD does not have cannabinol-like psychoactivity (Adams and Martin, 1996; Agurell et al., 1984, 1986; Hollister, 1986). CBC is another major cannabinoid in marijuana. Chemically, CBC is 2-methyl-2-(4-methylpent-3-enyl)-7-pentyl-5-chromenol. CBN, a major metabolite of delta⁹-THC, is also a minor naturally-occurring cannabinoid

with weak psychoactivity. Chemically, CBN is 6,6,9-trimethyl-3-pentylbenzo[c]chromen-1-ol.

Different marijuana samples derived from various cultivated strains may differ in chemical constituents including delta⁹-THC and other cannabinoids (Appendino et al. 2011). As a consequence, marijuana products from different strains may have different safety, biological, pharmacological, and toxicological profiles. In addition to differences between cultivated strains, the concentration of delta⁹-THC and other cannabinoids in marijuana may vary with growing conditions and processing after harvest. In addition to genetic differences among *Cannabis* species, the plant parts collected—for example, flowers, leaves, and stems—can influence marijuana's potency, quality, and purity (Adams and Martin, 1996; Agurell et al., 1984; Mechoulam, 1973). All these variations produce marijuana with potencies, as indicated by cannabinoid content, on average from as low as 1–2 percent to as high as 17 percent.

Overall, these variations in the concentrations of cannabinoids and other chemical constituents in marijuana complicate the interpretation of clinical data using marijuana. The lack of consistent concentrations of delta⁹-THC and other substances in marijuana from diverse sources makes interpreting the effect of different marijuana constituents difficult. In addition to different cannabinoid concentrations having different pharmacological and toxicological profiles, the non-cannabinoid components in marijuana, such as other terpenoids and flavonoids, might also contribute to the overall pharmacological and toxicological profiles of various marijuana strains and products derived from those strains.

The term marijuana is often used to refer to a mixture of the dried flowering tops and leaves from *Cannabis*. Marijuana in this limiting definition is one of three major derivatives sold as separate illicit products, which also include hashish and hash oil. According to the DEA, *Cannabis saliva* is the primary species of *Cannabis* currently marketed illegally in the United States.

Marijuana can vary in cannabinoid content and potency (Aguirell et al., 1984, 1986; Mechoulam 1973, Cascini et al., 2012). In the usual mixture of leaves and stems distributed as marijuana, the concentration of delta⁹-THC averages over 12 percent by weight. However, specially grown and selected marijuana can contain 15 percent or greater delta⁹-THC (Appendino et al. 2011). Thus, a 1-gram marijuana cigarette might contain

delta⁹-THC in a range from as little as 3 milligrams to as much as 150 milligrams or more. Additionally, a recent systematic review and meta-analysis found that marijuana's delta⁹-THC content has increased significantly from 1979–2009 (Cascini et al., 2012). In addition to smoking marijuana, individuals ingest marijuana through food made with butter or oil infused with marijuana and its extracts. These marijuana butters are generally made by adding marijuana to butter and heating it. The resultant butter is then used to cook a variety of foods. There are no published studies measuring the concentrations of cannabinoids in these marijuana food products.

Hashish consists of the dried and compressed cannabinoid-rich resinous material of *Cannabis* and comes in a variety of forms (e.g. balls and cakes). Individuals may break off pieces, place it into a pipe and smoke it. DEA reports that cannabinoid content in hashish averages six percent (DEA, 2005). With the development and cultivation of more high potency *Cannabis* strains, the average cannabinoid content in hashish will likely increase.

Hash oil is produced by solvent extraction of the cannabinoids from plant material. The extract's color and odor vary, depending on the solvent type used. Hash oil is a viscous brown- or amber-colored liquid containing approximately 50 percent cannabinoids. One or two drops of the liquid placed on a cigarette purportedly produce the equivalent of a single marijuana cigarette (DEA, 2005).

In conclusion, marijuana has hundreds of cultivars containing variable concentrations of delta⁹-THC, cannabinoids, and other compounds. Thus, marijuana is not a single chemical with a consistent and reproducible chemical profile or predictable and consistent clinical effects. A guidance for industry, entitled *Botanical Drug Products*,⁸ provides information on the approval of botanical drug products. To investigate marijuana for medical use in a manner acceptable as support for marketing approval under an NDA, clinical studies under an IND of consistent batches of a particular marijuana product for particular disease indications should be conducted. In addition, information and data regarding the marijuana product's chemistry, manufacturing and control, pharmacology, and animal toxicology data, among others must be provided

⁸ This guidance is available on the Internet at <http://www.fda.gov/Drugs/default.htm> under Guidance (Drugs).

and meet the requirements for new drug approval (See 21 CFR 314.50).

Human Pharmacokinetics

Marijuana can be taken in a variety of formulations by multiple routes of administration. Individuals smoke marijuana as a cigarette, weighing between 0.5 and 1.0 gram, or in a pipe. Additionally, individuals take marijuana orally in foods or as an extract in ethanol or other solvents. More recently, access to vaporizers provides another means for abusers to inhale marijuana.

The absorption, metabolism, and pharmacokinetic profile of delta⁹-THC, cannabinoids, and drug products containing delta⁹-THC vary with route of administration and formulation (Adams and Martin, 1996; Agurell et al., 1984, 1986).

Pharmacokinetics of Smoked Administration of Cannabinoids

Characterization of the pharmacokinetics of delta⁹-THC and other cannabinoids from smoked marijuana is difficult because a subject's smoking behavior during an experiment varies (Agurell et al., 1986; Heming et al., 1986; Huestis et al., 1992a). Each puff delivers a discrete dose of delta⁹-THC. An experienced marijuana smoker can titrate and regulate the dose to obtain the desired acute psychological effects and minimize undesired effects. For example, under naturalistic conditions, users hold marijuana smoke in their lungs for an extended period of time which causes prolonged absorption and increases psychoactive effects. The effect of experience in the psychological response may explain why delta⁹-THC venous blood levels correlate poorly with intensity of effects and intoxication level (Agurell et al. 1986; Barnett et al. 1985; Huestis et al., 1992a). Puff and inhalation volumes should be recorded in studies as the concentration (dose) of cannabinoids administered can vary at different stages of smoking.

Smoked marijuana results in absorption of delta⁹-THC in the form of an aerosol within seconds. Psychoactive effects occur immediately following absorption, with mental and behavioral effects measurable for up to 6 hours (Grotenhermen, 2003; Hollister 1986, 1988). Delta⁹-THC is delivered to the brain rapidly and efficiently as expected of a very lipid soluble drug.

The bioavailability of the delta⁹-THC, from marijuana in a cigarette or pipe, can range from 1 to 24 percent with the fraction absorbed rarely exceeding 10 to 20 percent (Agurell et al., 1986; Hollister, 1988). The relatively low and variable bioavailability results from

significant loss of delta⁹-THC in side-stream smoke, variation in individual smoking behaviors, cannabinoid pyrolysis, incomplete absorption of inhaled smoke, and metabolism in the lungs. An individual's experience and technique with smoking marijuana also determines the dose absorbed (Heming et al., 1986; Johansson et al., 1989). After smoking, delta⁹-THC venous levels decline precipitously within minutes, and continue to go down to about 5 to 10 percent of the peak level within an hour (Agurell et al., 1986, Huestis et al., 1992a, 1992b).

Pharmacokinetics for Oral Administration of Cannabinoids

After oral administration of delta⁹-THC or marijuana, the onset of effects starts within 30 to 90 minutes, reaches its peak after 2 to 3 hours and then remains for 4 to 12 hours (Grotenhermen, 2003; Adams and Martin, 1996; Agurell et al., 1984, 1986). Due to the delay in onset of effects, users have difficulty in titrating oral delta⁹-THC doses compared to smoking marijuana. Oral bioavailability of delta⁹-THC, whether pure or in marijuana, is low and extremely variable, ranging between 5 and 20 percent (Agurell et al., 1984, 1986). Following oral administration of radioactive-labeled delta⁹-THC, delta⁹-THC plasma levels are low relative to plasma levels after smoking or intravenous administration. Inter- and intra-subject variability occurs even with repeated dosing under controlled conditions. The low and variable oral bioavailability of delta⁹-THC is a consequence of its first-pass hepatic elimination from blood and erratic absorption from stomach and bowel.

Cannabinoid Metabolism and Excretion

Cannabinoid metabolism is complex. Delta⁹-THC is metabolized via microsomal hydroxylation to both active and inactive metabolites (Lemberger et al., 1970, 1972a, 1972b; Agurell et al., 1986; Hollister, 1988). The primary active metabolite of delta⁹-THC following oral ingestion is 11-hydroxy-delta⁹-THC. This metabolite is approximately equipotent to delta⁹-THC in producing marijuana-like subjective effects (Agurell et al., 1986; Lemberger and Rubin, 1975). After oral administration, metabolite levels may exceed that of delta⁹-THC and thus contribute greatly to the pharmacological effects of oral delta⁹-THC or marijuana.

Plasma clearance of delta⁹-THC approximates hepatic blood flow at about 950 ml/min or greater. The rapid disappearance of delta⁹-THC from blood

is largely due to redistribution to other tissues in the body, rather than to metabolism (Agurell et al., 1984, 1986). Metabolism in most tissues is relatively slow or absent. Slow release of delta⁹-THC and other cannabinoids from tissues and subsequent metabolism results in a long elimination half-life. The terminal half-life of delta⁹-THC ranges from approximately 20 hours to as long as 10 to 13 days, though reported estimates vary as expected with any slowly cleared substance and the use of assays with variable sensitivities (Hunt and Jones, 1980). Lemberger et al. (1970) determined the half-life of delta⁹-THC to range from 23 to 28 hours in heavy marijuana users to 60 to 70 hours in naive users. In addition to 11-hydroxy-delta⁹-THC, some inactive carboxy metabolites have terminal half-lives of 50 hours to 6 days or more. The latter substances serve as long-term markers in urine tests for earlier marijuana use.

The majority of the absorbed delta⁹-THC dose is eliminated in feces, and about 33 percent in urine. Delta⁹-THC enters enterohepatic circulation and undergoes hydroxylation and oxidation to 11-nor-9-carboxy-delta⁹-THC. The glucuronide is excreted as the major urine metabolite along with about 18 non-conjugated metabolites. Frequent and infrequent marijuana users metabolize delta⁹-THC similarly (Agurell et al., 1986).

Status of Research Into the Medical Uses for Marijuana

State-level public initiatives, including laws and referenda in support of the medical use of marijuana, have generated interest in the medical community and the need for high quality clinical investigation as well as comprehensive safety and effectiveness data. In order to address the need for high quality clinical investigations, the state of California established the Center for Medicinal Cannabis Research (CMCR, www.cmcr.ucsd.edu) in 2000 “in response to scientific evidence for therapeutic possibilities of cannabis⁹ and local legislative initiatives in favor of compassionate use” (Grant, 2005). State legislation establishing the CMCR called for high quality medical research that would “enhance understanding of the efficacy and adverse effects of marijuana as a pharmacological agent,” but stressed the project “should not be construed as encouraging or sanctioning the social or recreational use of marijuana.” The CMCR funded many of the published studies on marijuana’s potential use for treating multiple

sclerosis, neuropathic pain, appetite suppression and cachexia. However, aside from the data produced by CMCR, no state-level medical marijuana laws have produced scientific data on marijuana’s safety and effectiveness.

FDA approves medical use of a drug following a submission and review of an NDA or BLA. The FDA has not approved any drug product containing marijuana for marketing. Even so, results of small clinical exploratory studies have been published in the current medical literature. Many studies describe human research with marijuana in the United States under FDA-regulated IND applications.

However, FDA approval of an NDA is not the only means through which a drug can have a currently accepted medical use in treatment in the United States. In general, a drug may have a “currently accepted medical use” in treatment in the United States if the drug meets a five-part test. Established case law (*Alliance for Cannabis Therapeutics v. DEA*, 15 F.3d 1131, 1135 (D.C. Cir. 1994)) upheld the Administrator of DEA’s application of the five-part test to determine whether a drug has a “currently accepted medical use.” The following describes the five elements that characterize “currently accepted medical use” for a drug:¹⁰

i. the drug’s chemistry must be known and reproducible

“The substance’s chemistry must be scientifically established to permit it to be reproduced into dosages which can be standardized. The listing of the substance in a current edition of one of the official compendia, as defined by section 201 G) of the Food, Drug and Cosmetic Act, 21 U.S.C. 321G), is sufficient to meet this requirement.”

ii. there must be adequate safety studies

“There must be adequate pharmacological and toxicological studies, done by all methods reasonably applicable, on the basis of which it could fairly and responsibly be concluded, by experts qualified by scientific training and experience to evaluate the safety and effectiveness of drugs, that the substance is safe for treating a specific, recognized disorder.”

iii. there must be adequate and well-controlled studies proving efficacy

“There must be adequate, well-controlled, well-designed, well-conducted, and well-documented studies, including clinical investigations, by experts qualified by scientific training and experience to evaluate the safety and effectiveness of

drugs, on the basis of which it could be fairly and responsibly concluded by such experts that the substance will have the intended effect in treating a specific, recognized disorder.”

iv. the drug must be accepted by qualified experts

“The drug has a New Drug Application (NDA) approved by the Food and Drug Administration, pursuant to the Food, Drug and Cosmetic Act, 21 U.S.C. 355. Or, a consensus of the national community of experts, qualified by scientific training and experience to evaluate the safety and effectiveness of drugs, accepts the safety and effectiveness of the substance for use in treating a specific, recognized disorder. A material conflict of opinion among experts precludes a finding of consensus.” and

v. the scientific evidence must be widely available

“In the absence of NDA approval, information concerning the chemistry, pharmacology, toxicology, and effectiveness of the substance must be reported, published, or otherwise widely available, in sufficient detail to permit experts, qualified by scientific training and experience to evaluate the safety and effectiveness of drugs, to fairly and responsibly conclude the substance is safe and effective for use in treating a specific, recognized disorder.”

Marijuana does not meet any of the five elements necessary for a drug to have a “currently accepted medical use.”

Firstly, the chemistry of marijuana, as defined in the petition, is not reproducible in terms of creating a standardized dose. The petition defines marijuana as including all *Cannabis* cultivated strains. Different marijuana samples derived from various cultivated strains may have very different chemical constituents including delta⁹-THC and other cannabinoids (Appendino et al., 2011). As a consequence, marijuana products from different strains will have different safety, biological, pharmacological, and toxicological profiles. Thus, when considering all *Cannabis* strains together, because of the varying chemical constituents, reproducing consistent standardized doses is not possible. Additionally, smoking marijuana currently has not been shown to allow delivery of consistent and reproducible doses. However, if a specific *Cannabis* strain is grown and processed under strictly controlled conditions, the plant chemistry may be kept consistent enough to produce reproducible and standardized doses.

⁹In this quotation the term cannabis is interchangeable with marijuana.

¹⁰ 57 FR I 0499, 10504–06 (March 26, 1992).

As to the second and third criteria; there are neither adequate safety studies nor adequate and well-controlled studies proving marijuana's efficacy. To support the petitioners' assertion that marijuana has accepted medical use, the petitioners cite the American Medical Association's (AMA) 2009 report entitled "Use of Cannabis for Medicinal Purposes." The petitioners claim the AMA report is evidence the AMA accepts marijuana's safety and efficacy. However, the 2009 AMA report clarifies that the report "should not be viewed as an endorsement of state-based medical cannabis programs, the legalization of marijuana, or that scientific evidence on the therapeutic use of cannabis meets the same and current standards for a prescription drug product."¹¹

Currently, no published studies conducted with marijuana meet the criteria of an adequate and well-controlled efficacy study. The criteria for an adequate and well-controlled study for purposes of determining the safety and efficacy of a human drug are defined under the Code of Federal Regulations (CFR) in 21 CFR 314.126. In order to assess this element, FDA conducted a review of clinical studies published and available in the public domain before February, 2013. Studies were identified through a search of PubMed¹² for articles published from inception to February 2013, for randomized controlled trials using marijuana to assess marijuana's efficacy in any therapeutic indication. Additionally, the review included studies identified through a search of bibliographic references in relevant systematic reviews and identified studies presenting original research in any language. Selected studies needed to be placebo-controlled and double-blinded. Additionally, studies needed to encompass administered marijuana plant material. There was no requirement for any specific route of administration, nor any age limits on study subjects. Studies were excluded that used placebo marijuana supplemented by the addition of specific amounts of THC or other cannabinoids. Additionally, studies administering marijuana plant extracts were excluded.

The PubMed search yielded a total of 566 abstracts of scientific articles. Of

these abstracts, a full-text review was conducted with 85 papers to assess eligibility. Of the studies identified through the search of the references and the 566 abstracts from the PubMed search, only 11 studies met all the criteria for selection (Abrams et al., 2007; Corey-Bloom et al., 2012; Crawford and Merritt, 1979; Ellis et al., 2009; Haney et al., 2005; Haney et al., 2007; Merritt et al., 1980; Tashkin et al., 1974; Ware et al., 2010; Wilsey et al., 2008; Wilsey et al., 2013). These 11 studies were published between 1974 and 2013. Ten of these studies were conducted in the United States and one study was conducted in Canada. The identified studies examine the effects of smoked and vaporized marijuana for the indications of chronic neuropathic pain, spasticity related to Multiple Sclerosis (MS), appetite stimulation in human immunodeficiency virus (HIV) patients, glaucoma, and asthma. All studies used adult subjects.

The 11 identified studies were individually evaluated to determine if they successfully meet accepted scientific standards. Specifically, they were evaluated on study design including subject selection criteria, sample size, blinding techniques, dosing paradigms, outcome measures, and the statistical analysis of the results. The analysis relied on published studies, thus information available about protocols, procedures, and results were limited to documents published and widely available in the public domain. The review found that all 11 studies that examined effects of inhaled marijuana do not currently prove efficacy of marijuana in any therapeutic indication based on a number of limitations in their study design; however, they may be considered proof of concept studies. Proof of concept studies provide preliminary evidence on a proposed hypothesis involving a drug's effect. For drugs under development, the effect often relates to a short-term clinical outcome being investigated. Proof of concept studies often serve as the link between preclinical studies and dose ranging clinical studies. Thus, proof of concept studies generally are not sufficient to prove efficacy of a drug because they provide only preliminary information about the effects of a drug.

In addition to the lack of published adequate and well-controlled efficacy studies proving efficacy, the criteria for adequate safety studies has also not been met. Importantly, in its discussion of the five-part test used to determine whether a drug has a "currently accepted medical use," DEA said, "No drug can be considered safe in the abstract. Safety has meaning only when

judged against the intended use of the drug, its known effectiveness, its known and potential risks, the severity of the illness to be treated, and the availability of alternative remedies" (57 FR 10504). When determining whether a drug product is safe and effective for any indication, FDA performs an extensive risk-benefit analysis to determine whether the risks posed by the drug product's side effects are outweighed by the drug product's potential benefits for a particular indication. Thus, contrary to the petitioner's assertion that marijuana has accepted safety, in the absence of an accepted therapeutic indication which can be weighed against marijuana's risks, marijuana does not satisfy the element for having adequate safety studies such that experts may conclude that it is safe for treating a specific, recognized disorder.

The fourth of the five elements for determining "currently accepted medical use" requires that the national community of experts, qualified by scientific training and experience to evaluate the safety and effectiveness of drugs, accepts the safety and effectiveness of the substance for use in treating a specific, recognized disorder. A material conflict of opinion among experts precludes a finding of consensus. Medical practitioners who are not experts in evaluating drugs are not qualified to determine whether a drug is generally recognized as safe and effective or meets NDA requirements (57 FR 10499-10505).

There is no evidence that there is a consensus among qualified experts that marijuana is safe and effective for use in treating a specific, recognized disorder. As discussed above, there are not adequate scientific studies that show marijuana is safe and effective in treating a specific, recognized disorder. In addition, there is no evidence that a consensus of qualified experts have accepted the safety and effectiveness of marijuana for use in treating a specific, recognized disorder. Although medical practitioners are not qualified by scientific training and experience to evaluate the safety and effectiveness of drugs, we also note that the AMA's report, entitled "Use of Cannabis for Medicinal Purposes," does not accept that marijuana currently has accepted medical use. Furthermore, based on the above definition of a "qualified expert", who is an individual qualified by scientific training and experience to evaluate the safety and effectiveness of a drug, state-level medical marijuana laws do not provide evidence of a consensus among qualified experts that marijuana is safe and effective for use in treating a specific, recognized disorder.

¹¹ In this quotation the term cannabis is used interchangeably for marijuana.

¹² The following search strategy was used, "(cannabis OR marijuana) AND (therapeutic use OR therapy) AND (RCT OR randomized controlled trial OR "systematic review" OR clinical trial OR clinical trials) NOT ("marijuana abuse"[Mesh] OR addictive behavior OR substance related disorders)."

As to the fifth part of the test, which requires that information concerning the chemistry, pharmacology, toxicology, and effectiveness of marijuana to be reported in sufficient detail, the scientific evidence regarding all of these aspects is not available in sufficient detail to allow adequate scientific scrutiny. Specifically, the scientific evidence regarding marijuana's chemistry in terms of a specific *Cannabis* strain that could produce standardized and reproducible doses is not currently available.

Alternately, a drug can be considered to have a "currently accepted medical use with severe restrictions" (21 U.S.C. 812(b)(2)(B)), as allowed under the stipulations for a Schedule II drug. Yet, as stated above, currently marijuana does not have any accepted medical use, even under conditions where its use is severely restricted.

In conclusion, to date, research on marijuana's medical use has not progressed to the point where marijuana is considered to have a "currently accepted medical use" or a "currently accepted medical use with severe restrictions."

4. Its History and Current Pattern of Abuse

Under the fourth factor, the Secretary must consider the history and current pattern of marijuana abuse. A variety of sources provide data necessary to assess abuse patterns and trends of marijuana. The data indicators of marijuana use include the NSDUH, MTF, DAWN, and TEDS. The following briefly describes each data source, and summarizes the data from each source.

National Survey on Drug Use and Health (NSDUH)¹³

According to 2012 NSDUH¹⁴ data, the most recent year with complete data, the

use of illicit drugs, including marijuana, is increasing. The 2012 NSDUH estimates that 23.9 million individuals over 12 years of age (9.2 percent of the U.S. population) currently use illicit drugs, which is an increase of 4.8 million individuals from 2004 when 19.1 million individuals (7.9 percent of the U.S. population) were current illicit drug users. NSDUH reports marijuana as the most commonly used illicit drug, with 18.9 million individuals (7.3 percent of the U.S. population) currently using marijuana in 2012. This represents an increase of 4.3 million individuals from 2004, when 14.6 million individuals (6.1 percent of the U.S. population) were current marijuana users.

The majority of individuals who try marijuana at least once in their lifetime do not currently use marijuana. The 2012 NSDUH estimates that 111.2 million individuals (42.8 percent of the U.S. population) have used marijuana at least once in their lifetime. Based on this estimate and the estimate for the number of individuals currently using marijuana, approximately 16.9 percent of those who have tried marijuana at least once in their lifetime currently use marijuana; conversely, 83.1 percent do not currently use marijuana. In terms of the frequency of marijuana use, an estimated 40.3 percent of individuals who used marijuana in the past month used marijuana on 20 or more days within the past month. This amount corresponds to an estimated 7.6 million individuals who used marijuana on a daily or almost daily basis.

Some characteristics of marijuana users are related to age, gender, and criminal justice system involvement. In observing use among different age cohorts, the majority of individuals who currently use marijuana are shown to be

between the ages of 18–25, with 18.7 percent of this age group currently using marijuana. In the 26 and older age group, 5.3 percent of individuals currently use marijuana. Additionally, in individuals aged 12 years and older, males reported more current marijuana use than females.

NSDUH includes a series of questions aimed at assessing the prevalence of dependence and abuse of different substances in the past 12 months.¹⁵ In 2012, marijuana was the most common illicit drug reported by individuals with past year dependence or abuse. An estimated 4.3 million individuals meet the NSDUH criteria for marijuana dependence or abuse in 2012. The estimated rates and number of individuals with marijuana dependence or abuse has remained similar from 2002 to 2012. In addition to data on dependence and abuse, NSDUH includes questions aimed at assessing treatment for a substance use problem.¹⁶ In 2012, an estimated 957,000 persons received treatment for marijuana use during their most recent treatment in the year prior to the survey.

Monitoring the Future (MTF)¹⁷

According to MTF,¹⁸ rates of marijuana and illicit drug use declined for all three grades from 2005 through 2007. However, starting around 2008, rates of annual use of illicit drugs and marijuana increased through 2013 for all three grades. Marijuana remained the most widely used illicit drug during all time periods. The prevalence of annual and past month marijuana use in 10th and 12th graders in 2013 is greater than in 2005. Table 1 lists the lifetime, annual, and monthly prevalence rates of various drugs for 8th, 10th, and 12th graders in 2013.

¹³ NSDUH provides national estimates of the prevalence and incidence of illicit drug, alcohol and tobacco use in the United States. NSDUH is an annual study conducted by SAMHSA. Prior to 2002, the database was known as the National Household Survey on Drug Abuse (NHSDA). NSDUH utilizes a nationally representative sample of United States civilian, non-institutionalized population aged 12 years and older. The survey excludes homeless people who do not use shelters, active military personnel, and residents of institutional group quarters such as jails and hospitals. The survey identifies whether an individual used a drug within a specific time period, but does not identify the amount of the drug used on each occasion. NSDUH defines "current use" as having used the substance within the month prior to the study.

¹⁴ 2013; <http://www.samhsa.gov/data/NSDUH.aspx>.

¹⁵ "These questions are used to classify persons as dependent on or abusing specific substances

based on criteria specified in the *Diagnostic and Statistical Manual of Mental Disorder*, 4th edition (DSM-IV). The questions related to dependence ask about health and emotional problems associated with substance use, unsuccessful attempts to cut down on use, tolerance, withdrawal, reducing other activities to use substances, spending a lot of time engaging in activities related to substance use, or using the substance in greater quantities or for longer time than intended. The questions on abuse ask about problems at work, home, and school; problems with family or friends; physical danger; and trouble with the law due to substance use. Dependence is considered to be a more severe substance use problem than abuse because it involves the psychological and physiological effects of tolerance and withdrawal." (NSDUH, 2013).

¹⁶ "Estimates . . . refer to treatment received for illicit drug or alcohol use, or for medical problems associated with the use of illicit drugs or alcohol. This includes treatment received in the past year at any location, such as a hospital (inpatient),

rehabilitation facility (outpatient or inpatient), mental health center, emergency room, private doctor's office, prison or jail, or a self-help group, such as Alcoholics Anonymous or Narcotics Anonymous." (NSDUH, 2013).

¹⁷ Monitoring the Future is a national survey that tracks drug use prevalence and trends among adolescents in the United States. MTF is reported annually by the Institute for Social Research at the University of Michigan under a grant from NIDA. Every spring, MTF surveys 8th, 10th, and 12th graders in randomly selected U.S. schools. MTF has been conducted since 1975 for 12th graders and since 1991 for 8th and 10th graders. The MTF survey presents data in terms of prevalence among the sample interviewed. For 2012, the latest year with complete data, the sample sizes were 15,200—8th graders; 13,300—10th graders; and 13,200—12th graders. In all, a total of about 41,700 students of 389 schools participated in the 2013 MTF.

¹⁸ 2013; <http://www.monitoringthefuture.org/index.html>.

Table 1: Trends in lifetime, annual, and monthly prevalence of use of various drugs for eighth, tenth, and twelfth graders. Percentages represent students in survey responding that they had used a drug at least once in their lifetime, in the past year, or in the past 30 days.

	Lifetime			Annual			30-Day		
	2011	2012	2013	2011	2012	2013	2011	2012	2013
Any illicit Drug (a)									
8 th Grade	20.1	18.5	20.3	14.7	13.4	14.9	8.5	7.7	8.5

12 th Grade	45.5	45.2	45.5	36.4	36.4	36.4	22.6	22.9	22.7

SOURCE: The Monitoring the Future Study, the University of Michigan

a. For 12th graders only: "any illicit drug" includes any use of marijuana, LSD, other hallucinogens, crack, other cocaine, or heroin; or any narcotics use other than heroin, amphetamines, sedatives (barbiturates), or tranquilizers not under a doctor's orders. For 8th and 10th graders only: the use of narcotics other than heroin and sedatives (barbiturates) was excluded.

Drug Abuse Warning Network (DAWN)¹⁹

Importantly, many factors can influence the estimates of ED visits, including trends in overall use of a substance as well as trends in the reasons for ED usage. For instance, some drug users may visit EDs for life-threatening issues while others may visit to seek care for detoxification because they needed certification before entering treatment. Additionally, DAWN data do not distinguish the drug responsible for the ED visit from other drugs that may have been used concomitantly. As stated in a DAWN report, "Since marijuana/hashish is frequently present in combination with other drugs, the reason for the ED visit may be more relevant to the other drug(s) involved in the episode."

For 2011, DAWN²⁰ estimates a total of 5,067,374 (95 percent confidence interval [CI]: 4,616,753 to 5,517,995) drug-related ED visits from the entire United States. Of these, approximately

2,462,948 ([CI]: 2,112,868 to 2,813,028) visits involved drug misuse or abuse.

During the same period, DAWN estimates that 1,252,500 (CI: 976,169 to 1,528,831) drug related ED visits involved illicit drugs. Thus, over half of all drug-related ED visits associated with drug misuse or abuse involved an illicit drug. For ED visits involving illicit drugs, 56.3 percent involved multiple drugs while 43.7 percent involved a single drug.

Marijuana was involved in 455,668 ED visits (CI: 370,995 to 540,340), while cocaine was involved in 505,224 (CI: 324,262 to 686,185) ED visits, heroin was involved in 258,482 (CI: 205,046 to 311,918) ED visits and stimulants including amphetamine and methamphetamine were involved in 159,840 (CI: 100,199 to 219,481) ED visits. Other illicit drugs, such as PCP, MDMA, GHB and LSD were much less frequently associated with ED visits. The number of ED visits involving marijuana has increased by 62 percent since 2004.

Marijuana-related ED visits were most frequent among young adults and minors. Individuals under the age of 18 accounted for 13.2 percent of these marijuana-related visits, whereas this age group accounted for approximately 1.2 percent of ED visits involving cocaine, and less than 1 percent of ED visits involving heroin. However, the age group with the most marijuana-related ED visits was between 25 and 29 years old. Yet, because populations differ between age groups, a standardized measure for population

size is useful to make comparisons. For marijuana, the rates of ED visits per 100,000 population were highest for patients aged 18 to 20 (443.8 ED visits per 100,000) and for patients aged 21 to 24 (446.9 ED visits per 100,000).

While DAWN provides estimates for ED visits associated with the use of medical marijuana for 2009–2011, the validity of these estimates is questionable. Because the drug is not approved by the FDA, reporting medical marijuana may be inconsistent and reliant on a number of factors including whether the patient self-reports the marijuana use as medicinal, how the treating health care provider records the marijuana use, and lastly how the SAMHSA coder interprets the report. All of these aspects will vary greatly between states with medical marijuana laws and states without medical marijuana laws. Thus, even though estimates are reported for medical marijuana related ED visits, medical marijuana estimates cannot be assessed with any acceptable accuracy at this time, as FDA has not approved marijuana treatment of any medical condition. These data show the difficulty in evaluating abuse of a product that is not currently approved by FDA, but authorized for medical use, albeit inconsistently, at the state level. Thus, we believe the likelihood of the treating health care provider or SAMHSA coder attributing the ED visit to "medical marijuana" versus "marijuana" to be very low. Overall, the available data are inadequate to

¹⁹DAWN is a national probability survey of the U.S. hospitals with ED designed to obtain information on drug related ED visits. DAWN is sponsored by SAMHSA. The DAWN system provides information on the health consequences of drug use in the United States, as manifested by drug-related visits to ED. The ED data from a representative sample of hospital emergency departments are weighted to produce national estimates. Importantly, DAWN data and estimates, starting in 2004, are not comparable to those for prior years because of vast changes in the methodology used to collect the data. Furthermore, estimates for 2004 are the first to be based on a redesigned sample of hospitals, which ended in 2011.

²⁰2011; <http://www.samhsa.gov/data/dawn.aspx>.

characterize its abuse at the community level.

Treatment Episode Data Set (TEDS)²¹

Primary marijuana abuse accounted for 18.1 percent of all 2011 TEDS²² admissions. Individuals admitted for primary marijuana abuse were nearly three-quarters (73.4 percent) male, and almost half (45.2 percent) were white. The average age at admission was 24 years old, and 31.1 percent of individuals admitted for primary marijuana abuse were under the age of 18. The reported frequency of marijuana use was 24.3 percent reporting daily use. Almost all (96.8 percent) primary marijuana users utilized the substance by smoking. Additionally, 92.9 percent reported using marijuana for the first time before the age of 18.

An important aspect of TEDS admission data for marijuana is of the referral source for treatment. Specifically, primary marijuana admissions were less likely than all other admissions to either be self-referred or referred by an individual for treatment. Instead, the criminal justice system referred more than half (51.6 percent) of primary marijuana admissions.

Since 2003, the percent of admissions for primary marijuana abuse increased from 15.5 percent of all admissions in 2003 to 18.1 percent in 2011. This increase is less than the increase seen for admissions for primary opioids other than heroin, which increased from 2.8 percent in 2003 to 7.3 percent in 2011. In contrast, the admissions for primary cocaine abuse declined from 9.8 percent in 2003 to 2.0 percent in 2011.

²¹ The TEDS system is part of SAMHSA's Drug and Alcohol Services Information System (Office of Applied Science, SAMHSA). The TEDS report presents information on the demographic and substance use characteristics of the 1.8 million annual admissions to treatment for alcohol and drug abuse in facilities that report to individual state administrative data systems. Specifically, TEDS includes facilities licensed or certified by the states to provide substance abuse treatment and is required by the states to provide TEDS client-level data. Facilities that report TEDS data are those receiving State alcohol and drug agency funds for the provision of alcohol and drug treatment services. Since TEDS is based only on reports from these facilities, TEDS data do not represent the total national demand for substance abuse treatment or the prevalence of substance abuse in the general population. The primary goal for TEDS is to monitor the characteristics of treatment episodes for substance abusers. Importantly, TEDS is an admissions-based system, where admittance to treatment is counted as an anonymous tally. For instance, a given individual who is admitted to treatment twice within a given year would be counted as two admissions. The most recent year with complete data is 2011.

²² 2011; <http://www.samhsa.gov/data/DASIS.aspx?qr=#TEDS>.

5. The Scope, Duration, and Significance of Abuse

Under the fifth factor, the Secretary must consider the scope, duration, and significance of marijuana abuse. According to 2012 data from NSDUH and 2013 data from MTF, marijuana remains the most extensively used illegal drug in the United States, with 42.8 percent of U.S. individuals over age 12 (111.2 million) and 45.5 percent of 12th graders having used marijuana at least once in their lifetime. Although the majority of individuals over age 12 (83.1 percent) who have ever used marijuana in their lifetime do not use the drug monthly, 18.9 million individuals (7.3 percent of the U.S. population) report that they used marijuana within the past 30 days. An examination of use among various age cohorts through NSDUH demonstrates that monthly use occurs primarily among college-aged individuals, with use dropping off sharply after age 25. Additionally, NSDUH data show the number of individuals reporting past-month use of marijuana has increased by 4.3 million individuals since 2004. Data from MTF shows that annual prevalence of marijuana use declined for all three grades from 2005 through 2007, then began to rise through 2013. Additionally, in 2013, 1.1 percent of 8th graders, 4.0 percent of 10th graders, and 6.5 percent of 12th graders reported daily use of marijuana, defined as use on 20 or more days within the past 30 days.

The 2011 DAWN data show that marijuana use was mentioned in 455,668 ED visits, which amounts to approximately 36.4 percent of all illicit drug-related ED visits.²³

TEDS data for 2011 show that 18.1 percent of all admissions were for primary marijuana abuse.²⁴ Between 2003 and 2011, there was a 2.6 percent increase in the number of TEDS admissions for primary marijuana use.

²³ Many factors can influence the estimates of ED visits, including trends in the reasons for ED usage. For instance, some drug users may visit EDs for life-threatening issues while others may visit to seek care for detoxification because they needed certification before entering treatment. Additionally, DAWN data do not distinguish the drug responsible for the ED visit from other drugs that may have been used concomitantly. As stated in a DAWN report, "Since marijuana/hashish is frequently present in combination with other drugs, the reason for the ED visit may be more relevant to the other drug(s) involved in the episode."

²⁴ An important aspect of TEDS admission data for marijuana is of the referral source for treatment. Specifically, primary marijuana admissions were less likely than all other admissions to either be self-referred or referred by an individual for treatment. Instead, the criminal justice system referred more than half (51.6 percent) of primary marijuana admissions.

Approximately 61.5 percent of primary marijuana admissions in 2011 were for individuals under the age of 25 years.

6. What, if Any, Risk There Is to the Public Health

Under the sixth factor, the Secretary must consider the risks posed to the public health by marijuana. Factors 1, 4, and 5 include a discussion of the risk to the public health as measured by emergency room episodes and drug treatment admissions. Additionally, Factor 2 includes a discussion of marijuana's central nervous system, cognitive, cardiovascular, autonomic, respiratory, and immune system effects. Factor 6 focuses on the health risks to the individual user in terms of the risks from acute and chronic use of marijuana, as well as the "gateway hypothesis."

Risks From Acute Use of Marijuana

Acute use of marijuana impairs psychomotor performance, including complex task performance, which makes operating motor vehicles or heavy equipment after using marijuana inadvisable (Ramaekers et al., 2004; Ramaekers et al., 2006a). A meta-analysis conducted by Li et al. (2011) showed an association between marijuana use by the driver and a significantly increased risk of involvement in a car accident. Additionally, in a minority of individuals who use marijuana, some potential responses include dysphoria and psychological distress, including prolonged anxiety reactions (Haney et al., 1999).

Risks From Chronic Use of Marijuana

A distinctive marijuana withdrawal syndrome following long term or chronic use has been identified. The withdrawal syndrome indicates that marijuana produces physical dependence that is mild, short-lived, and comparable to tobacco withdrawal (Budney et al., 2008). Marijuana withdrawal syndrome is described in detail below under Factor 7.

The following states how the DSM-V (2013) of the American Psychiatric Association describes the consequences of *Cannabis*²⁵ abuse:

Individuals with cannabis use disorder may use cannabis throughout the day over a period of months or years, and thus may spend many hours a day under the influence. Others may use less frequently, but their use causes recurrent problems related to family,

²⁵ *Cannabis* is the term used in the DSM-V to refer to marijuana. In the following excerpt the term *Cannabis* is interchangeable for the term *marijuana*.

school, work, or other important activities (e.g., repeated absences at work; neglect of family obligations). Periodic cannabis use and intoxication can negatively affect behavioral and cognitive functioning and thus interfere with optimal performance at work or school, or place the individual at increased physical risk when performing activities that could be physically hazardous (e.g., driving a car; playing certain sports; performing manual work activities, including operating machinery). Arguments with spouses or parents over the use of cannabis in the home, or its use in the presence of children, can adversely impact family functioning and are common features of those with cannabis use disorder. Last, individuals with cannabis use disorder may continue using marijuana despite knowledge of physical problems (e.g., chronic cough related to smoking) or psychological problems (e.g., excessive sedation or exacerbation of other mental health problems) associated with its use.

Marijuana as a “Gateway Drug”

Kandel (1975) proposed nearly 40 years ago the hypothesis that marijuana is a “gateway drug” that leads to the use or abuse of other illicit drugs. Since that time, epidemiological research explored this premise. Overall, research does not support a direct causal relationship between regular marijuana use and other illicit drug use. The studies examining the gateway hypothesis are limited. First, in general, studies recruit individuals influenced by a myriad of social, biological, and economic factors that contribute to extensive drug abuse (Hall & Lynskey, 2005). Second, most studies that test the hypothesis that marijuana use causes abuse of illicit drugs use the determinative measure *any use of an illicit drug*, rather than DSM-5 criteria for drug abuse or dependence on an illicit drug (DSM-5, 2013). Consequently, although an individual who used marijuana may try other illicit drugs, the individual may not regularly use drugs, or have a diagnosis of drug abuse or dependence.

Little evidence supports the hypothesis that initiation of marijuana use leads to an abuse disorder with other illicit substances. For example, one longitudinal study of 708 adolescents demonstrated that early onset marijuana use did not lead to problematic drug use (Kandel & Chen, 2000). Similarly, Nace et al. (1975) examined Vietnam-era soldiers who extensively abused marijuana and heroin while they were in the military, and found a lack of correlation of a causal relationship demonstrating

marijuana use leading to heroin addiction. Additionally, in another longitudinal study of 2,446 adolescents, marijuana dependence was uncommon but when it did occur, the common predictors of marijuana dependence were the following: parental death, deprived socio-economic status, and baseline illicit drug use other than marijuana (von Sydow et al., 2002).

When examining the association between marijuana and illicit drugs, focusing on drug use versus abuse or dependence, different patterns emerge. For example, a study examining the possible causal relationship of the gateway hypothesis found a correlation between marijuana use in adolescents and other illicit drug use in early adulthood and, adjusting for age-linked experiences, did not effect this correlation (Van Gundy and Rebellon, 2010). However, when examining the association in terms of development of drug abuse; age-linked stressors and social roles moderated the correlation between marijuana use in adolescents and other illicit drug abuse. Similarly, Degenhardt et al. (2009) examined the development of drug dependence and found an association that did not support the gateway hypothesis. Specifically, drug dependence was significantly associated with the use of other illicit drugs prior to marijuana use.

Interestingly, the order of initiation of drug use seems to depend on the prevalence of use of each drug, which varies by country. Based on the World Health Organization (WHO) World Mental Health Survey that includes data from 17 different countries, the order of drug use initiation varies by country and relates to prevalence of drug use in each country (Degenhardt et al., 2010). Specifically, in the countries with the lowest prevalence of marijuana use, use of other illicit drugs before marijuana was common. This sequence of initiation is less common in countries with higher prevalence of marijuana use. A study of 9,282-households in the United States found that marijuana use often preceded the use of other illicit drugs; however, prior non-marijuana drug dependence was also frequently correlated with higher levels of illicit drug abuse (Degenhardt et al., 2009). Additionally, in a large 25-year longitudinal study of 1,256 New Zealand children, the author concluded that marijuana use correlated to an increased risk of abuse of other drugs, including cocaine and heroin (Fergusson et al., 2005).

Although many individuals with a drug abuse disorder may have used marijuana as one of their first illicit

drugs, this fact does not correctly lead to the reverse inference that most individuals who used marijuana will inherently go on to try or become regular users of other illicit drugs. Specifically, data from the 2011 NSDUH survey illustrates this issue (SAMHSA, 2012). NSDUH data estimates 107.8 million individuals have a lifetime history of marijuana use, which indicates use on at least one occasion, compared to approximately 36 million individuals having a lifetime history of cocaine use and approximately 4 million individuals having a lifetime history of heroin use. NSDUH data do not provide information about each individual’s specific drug history. However, even if one posits that every cocaine and heroin user previously used marijuana, the NSDUH data show that marijuana use at least once in a lifetime does not predict that an individual will also use another illicit drug at least once.

Finally, a review of the gateway hypothesis by Vanyukov et al. (2012) notes that because the gateway hypothesis only addresses the order of drug use initiation, the gateway hypothesis does not specify any mechanistic connections between drug “stages” following exposure to marijuana and does not extend to the risks for addiction. This concept contrasts with the concept of a common liability to addiction that involves mechanisms and biobehavioral characteristics pertaining to the entire course of drug abuse risk and disorders.

7. Its Psychic or Physiologic Dependence Liability

Under the seventh factor, the Secretary must consider marijuana’s psychic or physiological dependence liability.

Psychic or psychological dependence has been shown in response to marijuana’s psychoactive effects. Psychoactive responses to marijuana are pleasurable to many humans and are associated with drug-seeking and drug-taking (Maldonado, 2002). Moreover, high levels of psychoactive effects, notably positive reinforcement, are associated with increased marijuana use, abuse, and dependence (Scherrer et al., 2009; Zeiger et al., 2010). Epidemiological data support these findings through 2012 NSDUH statistics that show that of individuals years 12 or older who used marijuana in the past month, an estimated 40.3 percent used marijuana on 20 or more days within the past month. This equates to approximately 7.6 million individuals aged 12 or older who used marijuana on a daily or almost daily basis.

Additionally, the 2013 MTF data report the prevalence of daily marijuana use, defined as use on 20 or more days within the past 30 days, in 8th, 10th, and 12th graders is 1.1 percent, 4.0 percent, and 6.5 percent, respectively.

Tolerance is a state of adaptation where exposure to a drug induces changes that result in a diminution of one or more of the drug's effects over time (American Academy of Pain Medicine, American Pain Society and American Society of Addiction Medicine consensus document, 2001). Tolerance can develop to some, but not all, of marijuana's effects. Specifically, tolerance does not seem to develop in response to many of marijuana's psychoactive effects. This lack of tolerance may relate to electrophysiological data demonstrating that chronic delta⁹-THC administration does not affect increased neuronal firing in the ventral tegmental area, a region known to play a critical role in drug reinforcement and reward (Wu and French, 2000). In the absence of other abuse indicators, such as rewarding properties, the presence of tolerance or physical dependence does not determine whether a drug has abuse potential.

However, humans can develop tolerance to marijuana's cardiovascular, autonomic, and behavioral effects (Jones et al., 1981). Tolerance to some of marijuana's behavioral effects seems to develop after heavy marijuana use, but not after occasional marijuana use. For instance, following acute administration of marijuana, heavy marijuana users did not exhibit impairments in tracking and attention tasks, as were seen in occasional marijuana users (Ramaekers et al., 2009). Furthermore, a neurophysiological assessment administered through an electroencephalograph (EEG) which measures event-related potentials (ERP) conducted in the same subjects as the previous study, found a corresponding effect in the P100²⁶ component of ERPs. Specifically, corresponding to performance on tracking and attention tasks, heavy marijuana users showed no changes in P100 amplitudes following acute marijuana administration, although occasional users showed a decrease in P100 amplitudes (Theunissen et al., 2012). A possible mechanism underlying tolerance to marijuana's effects may be the down-regulation of cannabinoid receptors (Hirvonen et al., 2012; Gonzalez et al.,

2005; Rodriguez de Fonseca et al., 1994; Oviedo et al., 1993).

Importantly, pharmacological tolerance alone does not indicate a drug's physical dependence liability. In order for physical dependence to exist, evidence of a withdrawal syndrome is needed. Physical dependence is a state of adaptation, manifested by a drug-class specific withdrawal syndrome produced by abrupt cessation, rapid dose reduction, decreasing blood level of the drug, and/or administration of an antagonist (*ibid*). Many medications not associated with abuse or addiction can produce physical dependence and withdrawal symptoms after chronic use.

Discontinuation of heavy, chronic marijuana use has been shown to lead to physical dependence and withdrawal symptoms (American Psychiatric Association DSM-V, 2013; Budney and Hughes, 2006; Haney et al., 1999). In heavy, chronic marijuana users, the most commonly reported withdrawal symptoms are sleep difficulties, decreased appetite or weight loss, irritability, anger, anxiety or nervousness, and restlessness. Some less commonly reported withdrawal symptoms are depressed mood, sweating, shakiness, physical discomfort, and chills (Budney and Hughes, 2006; Haney et al., 1999). The occurrence of marijuana withdrawal symptoms in light or non-daily marijuana users has not been established. The American Psychiatric Association's DSM-V (2013) includes a list of symptoms of "cannabis withdrawal." Most marijuana withdrawal symptoms begin within 24–48 hours of discontinuation, peak within 4–6 days, and last for 1–3 weeks. Marijuana withdrawal syndrome has been reported in adolescents and adults admitted for substance abuse treatment.

Based on clinical descriptions, this syndrome appears to be mild compared to classical alcohol and barbiturate withdrawal syndromes, which can include more serious symptoms such as agitation, paranoia, and seizures. Multiple studies comparing marijuana and tobacco withdrawal symptoms in humans demonstrate that the magnitude and time course of the two withdrawal syndromes are similar (Budney et al., 2008; Vandrey et al., 2005, 2008).

8. Whether the Substance is an Immediate Precursor of a Substance Already Controlled Under This Article

Under the eight factor analysis, the Secretary must consider whether marijuana is an immediate precursor of a controlled substance. Marijuana is not an immediate precursor of another controlled substance.

Recommendation

After consideration of the eight factors discussed above, FDA recommends that marijuana remain in Schedule I of the CSA. NIDA concurs with this scheduling recommendation. Marijuana meets the three criteria for placing a substance in Schedule I of the CSA under 21 U.S.C. 812(b)(1):

(1) Marijuana has a high potential for abuse:

A number of factors indicate marijuana's high abuse potential, including the large number of individuals regularly using marijuana, marijuana's widespread use, and the vast amount of marijuana available for illicit use. Approximately 18.9 million individuals in the United States (7.3 percent of the U.S. population) used marijuana monthly in 2012. Additionally, approximately 4.3 million individuals met diagnostic criteria for marijuana dependence or abuse in the year prior to the 2012 NSDUH survey. A 2013 survey indicates that by 12th grade, 36.4 percent of students report using marijuana within the past year, and 22.7 percent report using marijuana monthly. In 2011, 455,668 ED visits were marijuana-related, representing 36.4 percent of all illicit drug-related episodes. Primary marijuana use accounted for 18.1 percent of admissions to drug treatment programs in 2011. Additionally, marijuana has dose-dependent reinforcing effects, as demonstrated by data showing that humans prefer relatively higher doses to lower doses. Furthermore, marijuana use can result in psychological dependence.

(2) Marijuana has no currently accepted medical use in treatment in the United States:

FDA has not approved a marketing application for a marijuana drug product for any indication. The opportunity for scientists to conduct clinical research with marijuana exists, and there are active INDs for marijuana; however, marijuana does not have a currently accepted medical use for treatment in the United States, nor does marijuana have an accepted medical use with severe restrictions.

A drug has a "currently accepted medical use" if all of the following five elements have been satisfied:

- a. The drug's chemistry is known and reproducible;
- b. there are adequate safety studies;
- c. there are adequate and well-controlled studies proving efficacy;
- d. the drug is accepted by qualified experts; and
- e. the scientific evidence is widely available.

²⁶ The P100 component of ERPs is thought to relate to the visual processing of stimuli and can be modulated by attention.

[57 FR 10499, March 26, 1992]

Marijuana does not meet any of the elements for having a “currently accepted medical use.” First, FDA broadly evaluated marijuana, and did not focus its evaluation on particular strains of marijuana or components or derivatives of marijuana. Since different strains may have different chemical constituents, marijuana, as identified in this petition, does not have a known and reproducible chemistry, which would be needed to provide standardized doses. Second, there are not adequate safety studies on marijuana in the medical literature in relation to a specific, recognized disorder. Third, there are no published adequate and well controlled studies proving efficacy of marijuana. Fourth, there is no evidence that qualified experts accept marijuana for use in treating a specific, recognized disorder. Lastly, the scientific evidence regarding marijuana’s chemistry in terms of a specific *Cannabis* strain that could produce standardized and reproducible doses is not currently available, so the scientific evidence on marijuana is not widely available.

Alternately, a Schedule II drug can be considered to have a “currently accepted medical use with severe restrictions” (21 U.S.C. 812(b)(2)(B)). Yet as stated above, the lack of accepted medical use for a specific, recognized disorder precludes the use of marijuana even under conditions where its use is severely restricted.

In conclusion, to date, research on marijuana’s medical use has not developed to the point where marijuana is considered to have a “currently accepted medical use” or a “currently accepted medical use with severe restrictions.”

(3) There is a lack of accepted safety for use of marijuana under medical supervision:

There are currently no FDA-approved marijuana drug products. Marijuana does not have a currently accepted medical use in treatment in the United States or a currently accepted medical use with severe restrictions. Thus, FDA has not determined that marijuana is safe for use under medical supervision.

In addition, FDA cannot conclude that marijuana has an acceptable level of safety relative to its effectiveness in treating a specific, recognized disorder without evidence that the substance is contamination free, and assurance of a consistent and predictable dose. Investigations into the medical use of marijuana should include information and data regarding the chemistry, manufacturing, and specifications of marijuana. Additionally, a procedure for

delivering a consistent dose of marijuana should also be developed. Therefore, FDA concludes marijuana does not currently have an accepted level of safety for use under medical supervision.

The Medical Application of Marijuana: A Review of Published Clinical Studies

March 19, 2015

Prepared by:

U.S. Food and Drug Administration
Center for Drug Evaluation and Research
(FDA/CDER)
Controlled Substance Staff (CSS)

TABLE OF CONTENTS

1. Introduction	71
2. Methods	73
2.1 Define the Objective of the Review	73
2.2 Define “Marijuana”	74
2.3 Define “Adequate and Well-Controlled Clinical Studies”	74
2.4 Search Medical Literature Databases and Identify Relevant Studies	75
2.5 Review and Analyze Qualifying Clinical Studies	77
3. Results and Discussion	77
3.1 Neuropathic Pain	77
3.1.1 Neuropathic Pain Associated with HIV-Sensory Neuropathy	77
3.1.2 Central and Peripheral Neuropathic Pain	81
3.2 Appetite Stimulation in HIV	86
3.3 Spasticity in Multiple Sclerosis	89
3.4 Asthma	90
3.5 Glaucoma	91
3.6 Conclusions	91
3.6.1 Conclusions for Chronic Neuropathic Pain	92
3.6.2 Conclusions for Appetite Stimulation in HIV	92
3.6.3 Conclusions for Spasticity in MS	92
3.6.4 Conclusions for Asthma	93
3.6.5 Conclusions for Glaucoma	93
3.7 Design Challenges for Future Studies	93
3.7.1 Sample Size	93
3.7.2 Marijuana Dose Standardization	94
3.7.3 Acute vs. Chronic Therapeutic Marijuana Use	96
3.7.4 Smoking as a Route of Administration	96
3.7.5 Difficulty in Blinding of Drug Conditions	96
3.7.6 Prior Marijuana Experience	97
3.7.7 Inclusion and Exclusion Criteria	98
3.7.8 Number of Female Subjects	99
Appendix (Tables)	103
List of Figure	
Figure 1: Identification of Studies From PubMed Search	76
List of Tables	
Table 1: Randomized, controlled, double-blind trials examining smoked marijuana in treatment of neuropathic pain	103
Table 2: Randomized, controlled, double-blind trials examining smoked marijuana in treatment of appetite stimulation in HIV/AIDS	109
Table 3: Randomized, controlled, double-blind trails examining smoked marijuana in treatment of spasticity in Multiple Sclerosis	112
Table 4: Randomized, controlled, double-blind trails examining smoked marijuana in treatment of intraocular pressure in Glaucoma	114
Table 5: Randomized, controlled, double-blind trails examining smoked marijuana in treatment of asthma	116

Executive Summary

Marijuana is a Schedule I substance under the Controlled Substances Act (CSA). Schedule I indicates a high potential for abuse, no currently

accepted medical use in the United States, and a lack of accepted safety for use under medical supervision. To date, marijuana has not been subject to an approved new drug application (NDA)

that demonstrates its safety and efficacy for a specific indication under the Food Drug and Cosmetic Act (FDCA).

Nevertheless, as of October 2014, twenty-three states and the District of

Columbia have passed state-level medical marijuana laws that allow for marijuana use within that state; similar bills are pending in other states.

The present review was undertaken by the Food and Drug Administration (FDA) to analyze the clinical studies published in the medical literature investigating the use of marijuana in any therapeutic areas. First, we discuss the context for this scientific review. Next, we describe the methods used in this review to identify adequate and well-controlled studies evaluating the safety and efficacy of marijuana for particular therapeutic uses.

The FDA conducted a systematic search for published studies in the medical literature that meet the described criteria for study design and outcome measures prior to February 2013. While not part of our systematic review, we have continued to routinely follow the literature beyond that date for subsequent studies. Studies were considered to be relevant to this review if the investigators administered marijuana to patients with a diagnosed medical condition in a well-controlled, double-blind, placebo-controlled clinical trial. Of the eleven studies that met the criteria for review, five different therapeutic areas were investigated:

- Five studies examined chronic neuropathic pain
- Two studies examined appetite stimulation in human immunodeficiency virus (HIV) patients
- Two studies examined glaucoma
- One study examined spasticity and pain in multiple sclerosis (MS)
- One study examined asthma.

For each of these eleven clinical studies, information is provided regarding the subjects studied, the drug conditions tested (including dose and method of administration), other drugs used by subjects during the study, the physiological and subjective measures collected, the outcome of these measures comparing treatment with marijuana to placebo, and the reported and observed adverse events. The conclusions drawn by the investigators are then described, along with potential limitations of these conclusions based on the study design. A brief summary of each study's findings and limitations is provided at the end of the section.

The eleven clinical studies that met the criteria and were evaluated in this review showed positive signals that marijuana may produce a desirable therapeutic outcome, under the specific experimental conditions tested. Notably, it is beyond the scope of this review to determine whether these data

demonstrate that marijuana has a currently accepted medical use in the United States. However, this review concludes that these eleven clinical studies serve as proof-of-concept studies, based on the limitations of their study designs, as described in the study summaries. Proof-of-concept studies provide preliminary evidence on a proposed hypothesis regarding a drug's effect. For drugs under development, the effect often relates to a short-term clinical outcome being investigated. Proof-of-concept studies serve as the link between preclinical studies and dose ranging clinical studies. Therefore, proof-of-concept studies are not sufficient to demonstrate efficacy of a drug because they provide only preliminary information about the effects of a drug. However, the studies reviewed produced positive results, suggesting marijuana should be further evaluated as an adjunct treatment for neuropathic pain, appetite stimulation in HIV patients, and spasticity in MS patients.

The main limitations identified in the eleven studies testing the medical applications of marijuana are listed below:

- The small numbers of subjects enrolled in the studies, which limits the statistical analyses of safety and efficacy.
- The evaluation of marijuana only after acute administration in the studies, which limits the ability to determine efficacy following chronic administration.
- The administration of marijuana typically through smoking, which exposes ill patients to combusted material and introduces problems with determining the doses delivered.
- The potential for subjects to identify whether they received marijuana or placebo, which breaks the blind of the studies.
- The small number of cannabinoid naïve subjects, which limits the ability to determine safety and tolerability in these subjects.
- The low number of female subjects, which makes it difficult to generalize the study findings to subjects of both genders.

Thus, this review discusses the following methodological changes that may be made in order to resolve these limitations and improve the design of future studies which examine the safety and efficacy of marijuana for specific therapeutic indications:

- Determine the appropriate number of subjects studied based on recommendations in various FDA *Guidances for Industry* regarding the

conduct of clinical trials for specific medical indications.

- Administer consistent and reproducible doses of marijuana based on recommendations in the FDA *Guidance for Industry: Botanical Drug Products (2004)*.²⁷

- Evaluate the effects of marijuana under therapeutic conditions following both acute and chronic administration.

- Consider alternatives to smoked marijuana (e.g., vaporization).

- Address and improve whenever possible the difficulty in blinding of marijuana and placebo treatments in clinical studies.

- Evaluate the effect of prior experience with marijuana with regard to the safety and tolerability of marijuana.

- Strive for gender balance in the subjects used in studies.

In conclusion, the eleven clinical studies conducted to date do not meet the criteria required by the FDA to determine if marijuana is safe and effective in specific therapeutic areas. However, the studies can serve as proof-of-concept studies and support further research into the use of marijuana in these therapeutic indications.

Additionally, the clinical outcome data and adverse event profiles reported in these published studies can beneficially inform how future research in this area is conducted. Finally, application of the recommendations listed above by investigators when designing future studies could greatly improve the available clinical data that can be used to determine if marijuana has validated and reliable medical applications.

1. Introduction

In response to citizen petitions submitted to the Drug Enforcement Administration (DEA) requesting DEA to reschedule marijuana, the DEA Administrator requested that the U.S. Department of Health and Human Services (HHS) provide a scientific and medical evaluation of the available information and a scheduling recommendation for marijuana, in accordance with 21 U.S.C. 811(b). The Secretary of HHS is required to consider in a scientific and medical evaluation eight factors determinative of control under the Controlled Substance Act (CSA). Administrative responsibilities for evaluating a substance for control under the CSA are performed by the Food and Drug Administration (FDA), with the concurrence of the National Institute on Drug Abuse (NIDA). Part of

²⁷ This Guidance is available on the internet at <http://www.fda.gov/Drugs/default.htm> under Guidance (Drugs).

this evaluation includes an assessment of whether marijuana has a currently accepted medical use in the United States. This assessment necessitated a review of the available data from published clinical studies to determine whether there is adequate scientific evidence of marijuana's effectiveness.

Under Section 202 of the CSA, marijuana is currently controlled as a Schedule I substance (21 U.S.C. 812). Schedule I includes those substances that have a high potential for abuse, have no currently accepted medical use in treatment in the United States, and lack accepted safety for use under medical supervision (21 U.S.C. 812(b)(1)(A)–(C)).

A drug product which has been approved by FDA for marketing in the United States is considered to have a "currently accepted medical use." Marijuana is not an FDA-approved drug product, as a New Drug Application (NDA) or Biologics License application (BLA) for marijuana has not been approved by FDA. However, FDA approval of an NDA is not the only means through which a drug can have a currently accepted medical use in the United States.

In general, a drug may have a "currently accepted medical use" in the United States if the drug meets a five-part test. Established case law (*Alliance for Cannabis Therapeutics v. DEA*, 15 F.3d 1131, 1135 (D.C. Cir. 1994)) upheld the Administrator of DEA's application of the five-part test to determine whether a drug has a "currently accepted medical use." The following describes the five elements that characterize "currently accepted medical use" for a drug:²⁸

i. The drug's chemistry must be known and reproducible

"The substance's chemistry must be scientifically established to permit it to be reproduced into dosages which can be standardized. The listing of the substance in a current edition of one of the official compendia, as defined by section 201(j) of the Food, Drug and Cosmetic Act, 21 U.S.C. 321(j), is sufficient to meet this requirement."

ii. there must be adequate safety studies

"There must be adequate pharmacological and toxicological studies, done by all methods reasonably applicable, on the basis of which it could fairly and responsibly be concluded, by experts qualified by scientific training and experience to evaluate the safety and effectiveness of drugs, that the substance is safe for treating a specific, recognized disorder."

iii. there must be adequate and well-controlled studies proving efficacy

"There must be adequate, well-controlled, well-designed, well-conducted, and well-documented studies, including clinical investigations, by experts qualified by scientific training and experience to evaluate the safety and effectiveness of drugs, on the basis of which it could be fairly and responsibly concluded by such experts that the substance will have the intended effect in treating a specific, recognized disorder."

iv. the drug must be accepted by qualified experts

"The drug has a New Drug Application (NDA) approved by the Food and Drug Administration, pursuant to the Food, Drug and Cosmetic Act, 21 U.S.C. 355. Or, a consensus of the national community of experts, qualified by scientific training and experience to evaluate the safety and effectiveness of drugs, accepts the safety and effectiveness of the substance for use in treating a specific, recognized disorder. A material conflict of opinion among experts precludes a finding of consensus." and

v. the scientific evidence must be widely available.

"In the absence of NDA approval, information concerning the chemistry, pharmacology, toxicology, and effectiveness of the substance must be reported, published, or otherwise widely available, in sufficient detail to permit experts, qualified by scientific training and experience to evaluate the safety and effectiveness of drugs, to fairly and responsibly conclude the substance is safe and effective for use in treating a specific, recognized disorder."

One way to pass the five-part test for having "currently accepted medical use" is through submission of an NDA or BLA which is approved by FDA. However, FDA approval of an NDA or BLA is not required for a drug to pass the five-part test.

This review focuses on FDA's analysis of one element of the five-part test for determining whether a drug has "currently accepted medical use". Specifically, the present review assesses the 3rd criterion that addresses whether marijuana has "adequate and well-controlled studies proving efficacy". Thus, this review evaluates published clinical studies that have been conducted using marijuana in subjects who have a variety of medical conditions by assessing the adequacy of the summarized study designs and the study data. The methodology for selecting the studies that were evaluated is delineated below.

FDA's evaluation and conclusions regarding the remaining four criteria for whether marijuana has a "currently accepted medical use," as well as the eight factors pertaining to the scheduling of marijuana, are outside the scope of this review. A detailed discussion of these factors is contained in FDA's scientific and medical evaluation of marijuana.

2. Methods

The methods for selecting the studies to include in this review involved the following steps, which are described in detail in the subsections below:

1. Define the objective of the review.
2. Define "marijuana" in order to facilitate the medical literature search for studies that administered the substance,
3. Define "adequate and well-controlled studies" in order to facilitate the search for relevant data and literature,
4. Search medical literature databases and identify relevant adequate and well-controlled studies, and
5. Review and analyze the adequate and well-controlled clinical studies to determine if they demonstrate efficacy of marijuana for any therapeutic indication.

2.1 Define the Objective of the Review

The objective of this review is to assess the study designs and resulting data from clinical studies published in the medical literature that were conducted with marijuana (as defined below) as a treatment for any therapeutic indication, in order to determine if they meet the criteria of "adequate and well-controlled studies proving efficacy".

2.2 Define "Marijuana"

In this review, the term "marijuana" refers to the flowering tops or leaves of the *Cannabis* plant. There were no restrictions on the route of administration used for marijuana in the studies.

Studies which administered individual cannabinoids (whether experimental substances or marketed drug products) or marijuana extracts were excluded from this review. Additionally, studies of administered neutral plant material or placebo marijuana (marijuana with all cannabinoids extracted) that had subsequently been supplemented by the addition of specific amounts of THC or other cannabinoids were also excluded (Chang et al., 1979).

²⁸ 57 FR 10499, 10504–06 (March 26, 1992).

2.3 Define “Adequate and Well-Controlled Clinical Studies”

The criteria for an “adequate and well-controlled study” for purposes of determining the safety and efficacy of a human drug is defined under the Code of Federal Regulations (CFR) in 21 CFR 314.126. The elements of an adequate and well-controlled study as described in 21 CFR 314.126 can be summarized as follows:

1. The main objective must be to assess a therapeutically relevant outcome.
2. The study must be placebo-controlled.
3. The subjects must qualify as having the medical condition being studied.
4. The study design permits a valid comparison with an appropriate control condition.
5. The assignment of subjects to treatment and control groups must be randomized.
6. There is minimization of bias through the use of a double-blind study design.
7. The study report contains a full protocol and primary data.
8. Analysis of the study data is appropriately conducted.

As noted above, the current review examines only those data available in the public domain and thus relies on clinical studies published in the medical literature. Published studies by their nature are summaries that do not include the level of detail required by studies submitted to FDA in an NDA.

While the majority of the elements defining an adequate and well-controlled study can be satisfied through a published paper (elements #1–6), there are two elements that cannot be met by a study published in the medical literature: element #7 (availability of a study report with full

protocol and primary data) and element #8 (a determination of whether the data analysis was appropriate). Thus, for purposes of this review, only elements #1–6 will be used to qualify a study as being adequate and well-controlled.

2.4 Search Medical Literature Databases and Identify Relevant Studies

We identified randomized, double-blind, placebo-controlled clinical studies conducted with marijuana to assess marijuana’s efficacy in any therapeutic indication. Two primary medical literature databases were searched for all studies posted to the databases prior to February 2013:²⁹

- *PubMed*: PubMed is a database of published medical and scientific studies that is maintained by the U.S. National Library of Medicine (NLM) at NIH as a part of the Entrez system of information retrieval. PubMed comprises more than 24 million citations for biomedical literature from MEDLINE, life science journals, and online books (<http://www.ncbi.nlm.nih.gov/pubmed>).

- *ClinicalTrials.gov*: ClinicalTrials.gov is a database of publicly and privately supported clinical studies that is maintained by the NLM. Information about the clinical studies is provided by the Sponsor or Principal Investigator of the study. Information about the studies is submitted to the Web site (“registered”) when the studies begin, and is updated throughout the study. In some cases, results of the study or resulting publication citations are submitted to the Web site after the study ends

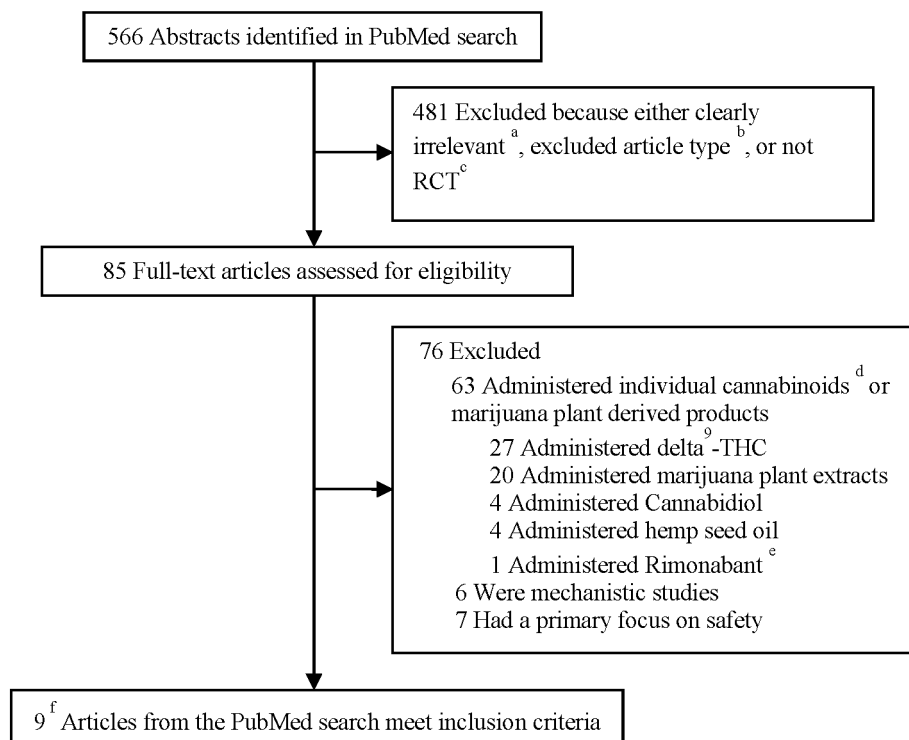

²⁹ While not a systematic review, we have followed the recent published literature on marijuana use for possible therapeutic purposes and, as of January 2015, we found only one new study that would meet our criteria (Naftali et al., 2013). This study examined the effects of smoked marijuana on Crohn’s disease.

(<https://clinicaltrials.gov/ct2/about-site/background>).

ClinicalTrials.gov was searched for all studies administering marijuana. The results of this search were used to confirm that no completed studies with published data were missed in the literature search. During the literature search, references found in relevant studies and systematic reviews were evaluated for additional relevant citations. All languages were included in the search. The PubMed search yielded a total of 566 abstracts.³⁰ Of these abstracts, a full-text review was conducted with 85 papers to assess eligibility. From this evaluation, only eleven of 85 studies met the 6 CFR elements for inclusion as adequate and well-controlled studies.

Figure 1 (below) provides an overview of the process used to identify studies from the PubMed search. The eleven studies reviewed were published between 1974 and 2013. Ten of these studies were conducted in the United States and one study was conducted in Canada. These eleven studies examined the effects of smoked and vaporized marijuana for the indications of chronic neuropathic pain, spasticity related to multiple sclerosis (MS), appetite stimulation in patients with human immunodeficiency virus (HIV), glaucoma, and asthma. All included studies used adult patients as subjects. All studies conducted in the United States were conducted under an IND as Phase 2 investigations.

³⁰ The following search strategy was used, “(cannabis OR marijuana) AND (therapeutic use OR therapy) AND (RCT OR randomized controlled trial OR “systematic review” OR clinical trial OR clinical trials) NOT (“marijuana abuse”[Mesh] OR addictive behavior OR substance related disorders)”.

Figure 1: Identification of Studies from PubMed Search

^a Articles were deemed irrelevant if they examined safety or adverse event related outcomes, including psychoactive effects or other adverse events. ^b Excluded article types included comments, reviews, meta-analyses, and news articles. ^c Randomized Controlled Trials. ^d Cannabinoids administered included synthetic cannabinoids. ^e Rimonabant is a cannabinoid receptor antagonist. ^f An additional 2 studies meeting the inclusion criteria were found through the reference search.

Two qualifying studies, which assessed marijuana for glaucoma, were previously reviewed in the 1999 Institute of Medicine (IOM) report entitled “Marijuana and Medicine: Assessing the Science Base”.³¹ We did our own analysis of these two studies and concurred with the conclusions in the IOM report. Thus, a detailed discussion of the two glaucoma studies is not included in the present review. The present review only discusses 9 of the identified 11 studies. For a summary of the study design for all eleven qualifying studies, see Tables 1–5 (located in the Appendix).

Based on the selection criteria for relevant studies described in Section 2.3

³¹ In January 1997, the White House Office of National Drug Control Policy (ONDCP) requested that the IOM conduct a review of the scientific evidence to assess the potential health benefits and risks of marijuana and its constituent cannabinoids. Information for this study was gathered through scientific workshops, site visits to cannabis buyers’ clubs and HIV/Acquired Immunodeficiency Syndrome (AIDS) clinics, analysis of the relevant scientific literature, and extensive consultation with biomedical and social scientists. The report was finalized and published in 1999.

(Define Adequate and Well-Controlled Clinical Studies), a number of clinical studies that investigated marijuana, as defined in this review, were excluded from this review. Studies that examined the effects of marijuana in healthy subjects were excluded because they did not test a patient population with a medical condition (Flom et al., 1975; Foltin et al., 1986; Foltin et al., 1988; Hill et al., 1974; Milstein et al., 1974; Milstein et al., 1975; Soderpalm et al., 2001; Wallace et al., 2007; Greenwald and Stitzer, 2000). A 1975 study by Tashkin et al. was excluded because it had a single-blind, rather than double-blind, study design. Two other studies were excluded because the primary outcome measure assessed safety rather than a therapeutic outcome (Greenberg et al., 1994; Abrams et al., 2003).

2.5 Review and Analyze Qualifying Clinical Studies

Qualified clinical studies that evaluated marijuana for therapeutic purposes were examined in terms of adequacy of study design including method of drug administration, study

size, and subject inclusion and exclusion criteria. Additionally, the measures and methods of analysis used in the studies to assess the treatment effect were examined.

3. Results and Discussion

The eleven qualifying studies in this review assessed a variety of therapeutic indications. In order to better facilitate analysis and discussion of the studies, the following sections group the studies by therapeutic area. Within each section, each individual study is summarized in terms of its design, outcome data and important limitations. This information is also provided in the Appendix in tabular form for each study.

3.1 Neuropathic Pain

Five randomized, double-blind, placebo-controlled Phase 2 clinical studies have been conducted to examine the effects of inhaled marijuana smoke on neuropathic pain associated with HIV-sensory neuropathy (Abrams et al., 2007; Ellis et al., 2009) and chronic neuropathic pain from multiple causes

(Wilsey et al., 2008; Ware et al., 2010; Wilsey et al., 2013). Table 1 of the Appendix summarizes these studies.

3.1.1 Neuropathic Pain Associated With HIV-Sensory Neuropathy

Two studies examined the effect of marijuana to reduce the pain induced by HIV-sensory neuropathy.

Abrams et al. (2007) conducted the first study entitled, "Cannabis in painful HIV-associated sensory neuropathy: A randomized placebo-controlled trial". The subjects were 50 adult patients with uncontrolled HIV-associated sensory neuropathy, who had at least 6 experiences with smoking marijuana. The subjects were split into two parallel groups of 25 subjects each. More than 68% of subjects were current marijuana users, but all individuals were required to discontinue using marijuana prior to the study. Most subjects were taking medication for pain during the study, with the most common medications being opioids and gabapentin. Upon entry into the study, subjects had an average daily pain score of at least 30 on a 0–100 visual analog scale (VAS).

Subjects were randomized to receive either smoked marijuana (3.56% THC³²) or smoked placebo cigarettes three times per day for 5 days, using a standardized cued smoking procedure: (1) 5 second inhale, (2) 10 second holding smoke in the lungs, (3) 40 second exhale and breathing normally between puffs. The authors did not specify how many puffs the subjects smoked at each smoking session, but they stated that one cigarette was smoked per smoking session.

Primary outcome measures included daily VAS ratings of chronic pain and the percentage of subjects who reported a result of more than 30% reduction in pain intensity. The ability of smoked marijuana to induce acute analgesia was assessed using both thermal heat model and capsaicin sensitization model, while anti-hyperalgesia was assessed with brush and von Frey hair stimuli. The immediate analgesic effects of smoked marijuana was assessed using a 0–100 point VAS at 40-minute intervals three times before and three times after the first and last smoking sessions, which was done to correspond to the time of peak plasma cannabinoid levels. Notably, not all subjects completed the induced pain portion of the study ($n = 11$ in marijuana group, 9 in placebo

group) because of their inability to tolerate the stimuli. Throughout the study, subjects also completed the Profile of Mood States (POMS) questionnaire, as well as subjective VAS measures of anxiety, sedation, disorientation, paranoia, confusion, dizziness, and nausea.

As a result, the median daily pain was reduced 34% by smoked marijuana compared to 17% by placebo ($p = 0.03$). Fifty-two percent of subjects who smoked marijuana reported a >30% reduction in pain compared to 24% in the placebo group ($p = 0.04$). Although marijuana reduced experimentally-induced hyperalgesia ($p \leq 0.05$) during the first smoking sessions, marijuana did not alter responses to acutely painful stimuli.

There were no serious AEs and no episodes of hypertension, hypotension, or tachycardia requiring medical intervention. No subjects withdrew from the study for drug related reasons. Subjects in the marijuana group reported higher ratings on the subjective measures of anxiety, sedation, disorientation, confusion, and dizziness compared to the placebo group. There was one case of severe dizziness in a marijuana-treated subject. By the end of the study, subjects treated with marijuana and placebo reported a reduction in total mood disturbance as measured by POMS.

The authors conclude that smoked marijuana effectively reduced chronic neuropathic pain from HIV-associated sensory neuropathy with tolerable side effects. However, limitations of this study include: Maintenance of subjects on other analgesic medication while being tested with marijuana and a lack of information about the number of puffs during each inhalation of smoke. These limitations make it difficult to conclude that marijuana has analgesic properties on its own and that the actual AEs experienced during the study in response to marijuana are tolerable. However, the study produced positive results suggesting that marijuana should be studied further as an adjunct treatment for uncontrolled HIV-associated sensory neuropathy.

Ellis et al. (2009) conducted a more recent study entitled "Smoked medicinal cannabis for neuropathic pain in HIV: a randomized, crossover clinical trial". The subjects were 28 HIV-positive adult male patients with intractable neuropathic pain that was refractory to the effects of at least two drugs taken for analgesic purposes. Upon entry into the study, subjects had a mean score of >5 on the Pain Intensity subscale of the Descriptor Differential Scale (DDS). Subjects were allowed to

continue taking their current routine of pain medications, which included opioids, non-narcotic analgesics, antidepressants, and anticonvulsants. Previous experience with marijuana was not required for participation in the study, but 27 of 28 subjects (96%) reported previous experience with marijuana. However, of these 27 experienced subjects, 63% ($n = 18$) reported no marijuana use within the past year.

The study procedures compared the effects of the target dose of marijuana and placebo during two treatment periods lasting 5 days, with 2 weeks washout periods. The marijuana strengths available were 1%, 2%, 4%, 6%, or 8% THC concentration by weight. Subjects smoked marijuana or placebo cigarettes four times per day, approximately 90–120 minutes apart, using a standardized cued smoking procedure: (1) 5 second smoke inhalation, (2) 10 second hold of smoke in lungs, (3) 40 second exhale and normal breathing between puffs. The investigators did not provide a description of the number of puffs taken at any smoking session. All subjects practiced the smoking procedures using placebo marijuana prior to test sessions.

On the first day of each test period, dose titration occurred throughout the four smoking sessions scheduled for that day, with a starting strength of 4% THC concentration. Subjects were allowed to titrate to a personalized "target dose", which was defined as the dose that provided the best pain relief without intolerable adverse effects. This dose titration was accomplished by allowing subjects to either increase the dose incrementally (to 6% or 8% THC) to improve analgesia, or to decrease the dose incrementally (to 1% or 2% THC) if AEs were intolerable. For the next 4 days of each test period, the subjects smoked their target dose during each of the four daily smoking sessions. To maintain the blind, placebo marijuana was represented as containing 1%–8% THC, even though it did not contain any cannabinoids.

The primary outcome measure was the change in pain magnitude on the DDS at the end of each test period compared to baseline, with a clinically significant level of analgesia considered to be a reduction in pain of at least 30%. Additional measures included the POMS, the Sickness Impact Profile (SIP), the Brief Symptom Inventory (BSI) and the UKU Side Effect Rating Scale and a subjective highness/sedation VAS.

During the marijuana treatment week, 19 subjects titrated to the 2%–4% THC dose while the 6%–8% dose was

³²The drug dose is reported as percentage of THC present in the marijuana rather than milligrams of THC present in each cigarette because of the difficulty in determining the amount of THC delivered by inhalation (see discussion in the section entitled "3.7.2 Marijuana Dose Standardization").

preferred by 8 subjects and 1 subject chose the 1% dose. In contrast, during the placebo treatment week, all 28 subjects titrated to the highest possible dose of “8% THC” that contained no actual cannabinoids, suggesting that placebo treatment provided little analgesic relief.

The degree of pain reduction was significantly greater after administration of marijuana compared to placebo (median change of 3.3 points on DDS, $p = 0.016$). The median change from baseline in VAS pain scores was -17 for marijuana treatment compared to -4 for placebo treatment ($p < 0.001$). A larger proportion of subjects who were treated with marijuana (0.46) reported a $>30\%$ reduction in pain, compared to placebo (0.18). Additionally, the authors report improvements in total mood disturbance, physical disability, and quality of life as measured on POMS, SIP, and BSI scales after both placebo and marijuana treatment (data not provided in paper).

In terms of safety, there were no alterations in HIV disease parameters in response to marijuana or placebo. The authors report that marijuana led to a greater degree of UKU responses as well as AEs such as difficulty in concentration, fatigue, sleepiness or sedation, increased duration of sleep, reduced salivation and thirst compared to placebo (data not provided in paper). Two subjects withdrew from the study because of marijuana-related AEs: one subject developed an intractable smoking-related cough during marijuana administration and the sole marijuana-naïve subject in the study experienced an incident of acute cannabis-induced psychosis.³³

The authors conclude that smoked marijuana effectively reduced chronic neuropathic pain from HIV-associated sensory neuropathy. The limitations of this study include: a lack of information about the number of puffs during each inhalation of smoke; a lack of information about the specific timing of the subjective assessments and collection of AEs relative to initiation of the smoking sessions; and the inclusion of only one marijuana-naïve subject. These limitations make it difficult to conclude that the actual AEs experienced during the study in

response to marijuana are tolerable. It is especially concerning that the only marijuana-naïve subject left the study because of serious psychiatric responses to marijuana exposure at analgesic doses. However, the study produced positive results suggesting that marijuana should be studied further as an adjunct treatment for uncontrolled HIV-associated sensory neuropathy.

3.1.2 Central and Peripheral Neuropathic Pain

Three studies examined the effect of marijuana on chronic neuropathic pain.

Wilsey et al. (2008) examined chronic neuropathic pain from multiple causes in the study entitled, “A Randomized, Placebo-Controlled, Crossover Trial of Cannabis Cigarettes in Neuropathic Pain”. The subjects were 32 patients with a variety of neuropathic pain conditions, including 22 with complex regional pain syndrome, 6 with spinal cord injury, 4 with multiple sclerosis, 3 with diabetic neuropathy, 2 with ilioinguinal neuralgia, and 1 with lumbosacral plexopathy. All subjects reported a pain intensity of at least 30 on a 0–100 VAS and were allowed to continue taking their regular medications during the study period, which included opioids, antidepressants, anticonvulsants, and NSAIDs. All subjects were required to have experience with marijuana but could not use any cannabinoids for 30 days before study sessions.

The study consisted of three test sessions with an interval of 3–21 days between sessions. Treatment conditions were high-strength marijuana (7% delta-9-THC), low-strength marijuana (3.5% delta-9-THC), and placebo cigarettes, administered through a standardized cued-puff procedure: (1) “light the cigarette” (30 seconds), (2) “get ready” (5 seconds), (3) “inhale” (5 seconds), (4) “hold smoke in lungs” (10 seconds), (5) “exhale,” and (6) wait before repeating the puff cycle (40 seconds). Participants took 2 puffs after baseline measurements, 3 puffs an hour later, and 4 puffs an hour after that, for a cumulative dose of 9 puffs per test session.

Hourly assessment periods were scheduled before and after each set of puffs and for 2 additional hours during the recovery period. Plasma cannabinoids were measured at baseline, 5 minutes after the first puff and again at 3 hours after the last puff cycle.

The primary outcome measure was spontaneous pain relief, as measured by a 0–100 point VAS for current pain. Pain unpleasantness was measured on a 0–100 point VAS, and degree of pain

relief was measured on a 7-point Patient Global Impression of Change (PGIC) scale. Secondary measures included the Neuropathic Pain Scale (NPS), a 0–100 point VAS for allodynia, and changes in thermal pain threshold. Subjective measures were also evaluated with unipolar 0–100 point VAS for any drug effect, good drug effect, bad drug effect, high, drunk, impaired, stoned, like the drug effect, sedated, confused, nauseated, desire more of the drug, anxious, down, hungry, and bipolar 0–100 point VAS for sad/happy, anxious/relaxed, jittery/calm, bad/good, paranoid/self-assured, fearful/unafraid. Neurocognitive assessments measured attention and concentration, learning and memory, and fine motor speed.

Marijuana produced a reduction in pain compared to placebo, as measured by the pain VAS, the PGIC and on pain descriptors in the NPS, including sharp ($P < .001$), burning ($P < .001$), aching ($P < .001$), sensitive ($P = .03$), superficial ($P < .01$) and deep pain ($P < .001$). Notably, there were no additional benefits from the 7% THC strength of marijuana compared to the 3.5% THC strength, seemingly because of cumulative drug effects over time. There were no changes in allodynia or thermal pain responsivity following administration of either dose of marijuana.

Marijuana at both strengths produced increases on measures of any drug effect, good drug effect, high, stoned, impairment, sedation, confusion, and hunger. The 7% THC marijuana increased anxiety scores and bad drug effect (later in session) compared to placebo. Neither strength of marijuana affected the measures of mood. On neurocognitive measures, both the 3.5% THC and 7% THC marijuana produced impairment in learning and memory, while only the 7% THC marijuana impaired attention and psychomotor speed, compared to placebo. There were no adverse cardiovascular side effects and no subjects dropped out because of an adverse event related to marijuana.

The authors conclude that marijuana may be effective at ameliorating neuropathic pain at doses that induce mild cognitive effects, but that smoking is not an optimum route of administration. The limitations of this study include: Inclusion of subjects with many forms of neuropathic pain and maintenance of subjects on other analgesic medication while being tested with marijuana. These limitations make it difficult to conclude that marijuana has analgesic properties on its own and that the actual AEs experienced during the study in response to marijuana are tolerable. The authors compared pain score results by the type of pain

³³ At the time of the study, the following criteria from the Diagnostic and Statistical Manual of Mental Disorders (DSM-IV-TR, 2000) were used to diagnose substance-induced psychotic disorders: Prominent hallucinations or delusions; Hallucinations and/or delusions that develop during, or within one month of, intoxication or withdrawal; The disturbance is not better accounted for by a psychotic disorder that is not substance induced. The disturbance does not occur exclusively during the course of a delirium.

condition, with no significant differences found; however, the sample size of this study was small thus a type II error may have been present. Thus, it is difficult to determine if any particular subset of neuropathic pain conditions would benefit specifically from marijuana administration. However, the study produced positive results suggesting that marijuana should be studied further as an adjunct treatment for uncontrolled neuropathic pain.

The second study, conducted by Ware et al. (2010) in Canada is entitled, "Smoked cannabis for chronic neuropathic pain: a randomized controlled trial". The subjects were 21 adult patients with neuropathic pain caused by trauma or surgery compounded with allodynia or hyperalgesia, and a pain intensity score greater than 4 on a 10 point VAS. All subjects maintained their current analgesic medication and they were allowed to use acetaminophen for breakthrough pain. Eighteen subjects had previous experience with marijuana but none of them had used marijuana within a year before the study.

The study design used a four-period crossover design, testing marijuana (2.5%, 6.0% and 9.4% THC) and placebo marijuana. The 2.5% and 6.0% doses of marijuana were included to increase successful blinding. Each period was 14 days in duration, beginning with 5 days on the study drug followed by a 9-day washout period. Doses were delivered as 25 mg of marijuana that was smoked in a single inhalation using a titanium pipe. The first dose of each period was self-administered using a standardized puff procedure: (1) Inhale for 5 seconds, (2) hold the smoke in their lungs for 10 seconds, and (3) exhale. Subsequent doses were self-administered in the same manner for a total of three times daily at home on an outpatient basis for the first five days of each period.

The primary measure was an 11-point pain intensity scale, averaged over the 5 day treatment period, which was administered once daily for present, worst, least and average pain intensity during the previous 24 hours. Secondary measures included an acute pain 0–100 point VAS, pain quality assessed with the McGill Pain Questionnaire, sleep assessed with the Leeds Sleep Evaluation Questionnaire, mood assessed with the POMS, quality of life assessed using the EQ-5D health outcome instrument. Subjective measures included 0–100 point VAS scales for high, relaxed, stressed and happy.

Over the first three hours after smoking marijuana, ratings of pain,

high, relaxation, stress, happiness and heart rate were recorded. During the five days of each study period, participants were contacted daily to administer questionnaires on pain intensity, sleep, medication and AEs. Subjects returned on the fifth day to complete questionnaires on pain quality, mood, quality of life and assessments of potency. At the end of the study, participants completed final adverse event reports and potency assessments.

The average daily pain intensity was significantly lower on 9.4% THC marijuana (5.4) than on placebo marijuana (6.1) ($p = 0.023$). The 9.4% THC strength also produced more drowsiness, better sleep, with less anxiety and depression, compared to placebo (all $p < 0.05$). However, there were no significant differences on POMS scores or on VAS scores for high, happy, relaxed or stressed between THC doses.

The most frequent drug-related adverse events reported in the group receiving 9.4% THC marijuana were headache, dry eyes, burning sensation, dizziness, numbness and cough. Reports of high and euphoria occurred on only three occasions, once in each dose of THC. There were no significant changes in vital signs, heart-rate variability, or renal function. One subject withdrew from the study due to increased pain during administration of 6% THC marijuana.

The authors conclude that smoked marijuana reduces neuropathic pain, improves mood and aids in sleep, but that smoking marijuana is not a preferable route of administration. The limitations of this study include: The lack of information on timing of assessments during the outpatient portion of the study and maintenance of subjects on other analgesic medication while being tested with marijuana. These limitations make it difficult to conclude that marijuana has analgesic properties on its own and that the actual AEs experienced during the study in response to marijuana are tolerable. However, the study produced positive results suggesting that marijuana should be studied further as an adjunct treatment for uncontrolled neuropathic pain.

Wilsey et al. (2013) conducted the most recent study entitled, "Low-Dose Vaporized Cannabis Significantly Improves Neuropathic Pain". This study is the only one in this review that utilized vaporization as a method of marijuana administration. The subjects were 36 patients with a neuropathic pain disorder (CRPS, thalamic pain, spinal cord injury, peripheral neuropathy, radiculopathy, or nerve

injury) who were maintained on their current medications (opioids, anticonvulsants, antidepressants, and NSAIDs). Although subjects were required to have a history of marijuana use, they refrained from use of cannabinoids for 30 days before study sessions.

Subjects participated in three sessions in which they received 1.29% or 3.53% THC marijuana or placebo marijuana. The marijuana was vaporized using the Volcano vaporizer and a standardized cued-puff procedure: (1) "hold the vaporizer bag with one hand and put the vaporizer mouthpiece in their mouth" (30 seconds), (2) "get ready" (5 seconds), (3) "inhale" (5 seconds), (4) "hold vapor in lungs" (10 seconds), (5) "exhale and wait" before repeating puff cycle (40 seconds). Subjects inhaled 4 puffs at 60 minutes. At 180 minutes, the vaporizer was refilled with marijuana vapor and subjects were allowed to inhale 4 to 8 puffs using the cued procedure. Thus, cumulative dosing allowed for a range of 8 to 12 puffs in total for each session, depending on the subjects desired response and tolerance. The washout time between each session ranged from 3–14 days.

The primary outcome variable was spontaneous pain relief, as assessed using a 0–100 point VAS for current pain. Secondary measures included the Patient Global Impression of Change (PGIC), the Neuropathic Pain Scale (NPS), a 0–100 point VAS for allodynia. Acute pain threshold was measured with a thermal pain model. Subjective measures included 0–100 point unipolar VAS for any drug effect, good drug effect, bad drug effect, high, drunk, impaired, stoned, drug liking, sedated, confused, nauseated, desire more drug, anxious, down and hungry. Bipolar 0–100 point VAS included sad/happy, anxious/relaxed, jittery/calm, bad/good, paranoid/self-assured, and fearful/unafraid.

Neurocognitive assessments assessed attention and concentration, learning and memory, and fine motor speed.

A 30% reduction in pain was achieved in 61% of subjects who received the 3.53% THC marijuana, in 57% of subjects who received the 1.29% THC marijuana and in 26% of subjects who received the placebo marijuana ($p = 0.002$ for placebo vs. 3.53% THC, $p = 0.007$ for placebo vs 1.29% THC; $p \leq 0.05$ 1.29% THC vs. 3.53% THC). Both strengths of marijuana significantly decreased pain intensity, unpleasantness, sharpness, and deepness on the NPS, as well as pain ratings on the PGIC, compared to placebo. These effects on pain were maximal with cumulative dosing over

the course of the study session, with maximal effects at 180 minutes. There were no effects of marijuana compared to placebo on measures of allodynia or thermal pain. Subjects correctly identified the study treatment 63% of the time for placebo, 61% of the time for 1.29% THC, and 89% of the time for 3.53% THC.

On subjective measures, marijuana produced dose-dependent increases compared to placebo on ratings for: any drug effect, good drug effect, drug liking, high, stoned, sedated, confused, and hungry. Both strengths of marijuana produced similar increases in drunk or impaired compared to placebo. In contrast, desire for drug was rated as higher for the 1.29% THC marijuana compared to the 3.53% THC marijuana. There were no changes compared to placebo for bad effect, nausea, anxiety, feeling down or any of the bipolar mood assessments. There was dose-dependent impairment on learning and memory from marijuana compared to placebo, but similar effects between the two strengths of marijuana on attention.

The authors conclude that vaporization of relatively low doses of marijuana can produce improvements in analgesia in neuropathic pain patients, especially when patients are allowed to titrate their exposure. However, this individualization of doses may account for the general lack of difference between the two strengths of marijuana. No data were presented regarding the total amount of THC consumed by each subject, so it is difficult to determine a proper dose-response evaluation. Additional limitations of this study are the inclusion of subjects with many forms of neuropathic pain and maintenance of subjects on other analgesic medication while being tested with marijuana. These limitations make it difficult to conclude that marijuana has analgesic properties on its own. It is also difficult to determine if any particular subset of neuropathic pain conditions would benefit specifically from marijuana administration. However, the study produced positive results suggesting that marijuana should be studied further as an adjunct treatment for uncontrolled neuropathic pain.

3.2 Appetite Stimulation in HIV

Two randomized, double-blind, placebo-controlled Phase 2 studies examined the effects of smoked marijuana on appetite in HIV-positive subjects (Haney et al., 2005; Haney et al., 2007). Table 2 of the Appendix summarizes both studies.

The first study, conducted by Haney et al. (2005) is entitled, “Dronabinol and marijuana in HIV+ marijuana smokers: Acute effects on caloric intake and mood”. The subjects were 30 HIV-positive patients who were maintained on two antiretroviral medications and either had clinically significant decreases in lean muscle mass³⁴ (low-BIA group, n = 15) or normal lean muscle mass (normal-BIA group, n = 15). All subjects had a history of smoking marijuana at least twice weekly for 4 weeks prior to entry into the study. On average, individuals had smoked 3 marijuana cigarettes per day, 5–6 times per week for 10–12 years.

Subjects participated in 8 sessions that tested the acute effects of 0, 10, 20, and 30 mg dronabinol oral capsules and marijuana cigarettes with 0%, 1.8%, 2.8%, and 3.9% THC concentration by weight, using a double-dummy design (with only one active drug per session). The doses of dronabinol are higher than those doses typically prescribed for appetite stimulation in order to help preserve the blinding. There was a one-day washout period between test sessions.

Marijuana was administered using a standardized cued procedure: (1) “light the cigarette” (30 seconds), (2) “prepare” (5 seconds), (3) “inhale” (5 seconds), (4) “hold smoke in lungs” (10 seconds), and (5) “exhale.” Each subject smoked three puffs in this manner, with a 40-second interval between each puff.

Caloric intake was used as a surrogate measure for weight gain. Subjects received a box containing a variety of food and beverage items and were told to record consumption of these items following that day’s administration of the test drug. Subjective measures included 0–100 point VAS for feel drug effect, good effect, bad effect, take drug again, drug liking, hungry, full, nauseated, thirsty, desire to eat. Neurocognitive measures and vital signs were monitored.

The low BIA group consumed significantly more calories in the 1.8% and 3.9% THC marijuana conditions ($p < 0.01$) and the 10, 20, and 30 mg dronabinol conditions ($p < 0.01$) compared with the placebo condition. In contrast, in the normal BIA group, neither marijuana nor dronabinol significantly affected caloric intake. This lack of effect may be accountable, however, by the fact that this group consumed approximately 200 calories

more than the low BIA group under baseline conditions.

Ratings of high and good drug effect were increased by all drug treatments in both the low-BIA and normal-BIA groups, except in response to the 10 mg dose of dronabinol. The 3.9% THC marijuana increased ratings of good drug effect, drug liking and desire to smoke again compared with placebo. Ratings of sedation were increased in both groups by 10 and 30 mg dronabinol, and in the normal BIA group by the 2.8% THC marijuana. Ratings of stimulation were increased in the normal BIA group by 2.8% and 3.9% THC marijuana and by 20 mg dronabinol. Increases in ratings of forgetfulness, withdrawn, dreaming, clumsy, heavy limbs, heart pounding, jittery, and decreases in ratings of energetic, social, and talkative were reported in the normal BIA group with 30 mg dronabinol. There were no significant changes in vital signs or performance on neurocognitive measures in response to marijuana. Notably, the time course of subjective effects peaked quickly and declined thereafter for smoked marijuana, while oral dronabinol responses took longer to peak and persisted longer. Additionally, marijuana but not dronabinol produced dry mouth and thirst.

In general, AEs reported in this study were low in both drug conditions for both subject groups. In the low BIA group, nausea was reported by one subject in both the 10 and 20 mg dronabinol conditions, while an uncomfortable level of intoxication was produced by the 30 mg dose in two subjects. There were no AEs reported in this group following marijuana at any dose. In the normal BIA group, the 30 mg dose of dronabinol produced an uncomfortable level of intoxication in three subjects and headache in one subject, while the 3.9% marijuana produced diarrhea in one subject.

The authors conclude that smoked marijuana can acutely increase caloric intake in low BIA subjects without significant cognitive impairment. However, it is possible that the low degree of cognitive impairment reported in this study may reflect the development of tolerance to cannabinoids in this patient population, since all individuals had current histories of chronic marijuana use. Additional limitations in this study include not utilizing actual weight gain as a primary measure. However, the study produced positive results suggesting that marijuana should be studied further as a treatment for appetite stimulation in HIV patients.

³⁴ Lean muscle mass was assessed using bioelectrical impedance analysis (BIA). The low-BIA group was classified with having <90% BIA, and the normal-BIA group was classified with having >90% BIA.

A second study conducted by Haney et al. (2007) is entitled, "Dronabinol and marijuana in HIV-positive marijuana smokers: Caloric intake, mood, and sleep". The design of this study was nearly identical to the one conducted by this laboratory in 2005 (see above), but there was no stratification of subjects by BIA. The subjects were 10 HIV-positive patients who were maintained on two antiretroviral medications and had a history of smoking marijuana at least twice weekly for 4 weeks prior to entry into the study. On average, individuals had smoked 3 marijuana cigarettes per day, 5 times per week for 19 years.

Subjects participated in 8 sessions that tested the acute effects of 0, 5 and 10 mg dronabinol oral capsules and marijuana cigarettes with 0, 2.0% and 3.9% THC concentration by weight, using a double-dummy design (with 4 sessions involving only one active drug and 4 interspersed placebo sessions). Both drug and placebo sessions lasted for 4 days each, with active drug administration occurring 4 times per day (every 4 hours). Testing occurred in two 16-day inpatient stays. In the intervening outpatient period, subjects were allowed to smoke marijuana prior to re-entry to the study unit for the second inpatient stay.

Marijuana was administered using a standardized cued procedure: (1) "light the cigarette" (30 seconds), (2) "prepare" (5 seconds), (3) "inhale" (5 seconds), (4) "hold smoke in lungs" (10 seconds), and (5) "exhale." Each subject smoked three puffs in this manner, with a 40-second interval between each puff.

Caloric intake was used as a surrogate measure for weight gain, but subjects were also weighed throughout the study (a measure which was not collected in the 2005 study by this group). Subjects received a box containing a variety of food and beverage items and were told to record consumption of these items following that day's administration of the test drug. Subjective measures included 0–100 point VAS for drug effect, good effect, bad effect, take drug again, drug liking, hungry, full, nauseated, thirsty, desire to eat. Neurocognitive measures and vital signs were monitored. Sleep was assessed using both the Nightcap sleep monitoring system and selected VAS measures related to sleep.

Both 5 and 10 mg dronabinol ($p < 0.008$) and 2.0% and 3.9% THC marijuana ($p < 0.01$) dose-dependently increased caloric intake compared with placebo. This increase was generally accomplished through increases in incidents of eating, rather than an increase in the calories consumed in each incident. Subjects also gained

similar amounts of weight after the highest dose of each cannabinoid treatment: 1.2 kg (2.6 lbs) after 4 days of 10 mg dronabinol, and 1.1 kg (2.4 lbs) after 4 days of 3.9% THC marijuana. The 3.9% THC marijuana dose also increased the desire to eat and ratings of hunger.

Ratings of good drug effect, high, drug liking, and desire to smoke again were significantly increased by 10 mg dronabinol and 2.0% and 3.9% THC marijuana doses compared to placebo. Both marijuana doses increased ratings of stimulated, friendly, and self-confident. The 10 mg dose of dronabinol increased ratings of concentration impairment, and the 2.0% THC marijuana dose increased ratings of anxious. Dry mouth was induced by 10 mg dronabinol (10 mg) and 2.0% THC marijuana. There were no changes in neurocognitive performance or objective sleep measures from administration of either cannabinoid. However, 3.9% THC marijuana increased subjective ratings of sleep.

The authors conclude that both dronabinol and smoked marijuana increase caloric intake and produce weight gain in HIV-positive patients. However, it is possible that the low degree of cognitive impairment reported in this study may reflect the development of tolerance to cannabinoids in this subject population, since all individuals had current histories of chronic marijuana use. This study produced positive results suggesting that marijuana should be studied further as a treatment for appetite stimulation in HIV patients.

3.3 Spasticity in Multiple Sclerosis

Only one randomized, double-blind, placebo-controlled Phase 2 study examined the effects of smoked marijuana on spasticity in MS.

This study was conducted by Corey-Bloom et al. (2012) and is entitled, "Smoked cannabis for spasticity in multiple sclerosis: a randomized, placebo-controlled trial". The subjects were 30 patients with MS-associated spasticity and had moderate increase in tone (score ≥ 3 points on the modified Ashworth scale). Participants were allowed to continue other MS medications, with the exception of benzodiazepines. Eighty percent of subjects had a history of marijuana use and 33% had used marijuana within the previous year.

Subjects participated in two 3-day test sessions, with an 11 day washout period. During each test session they smoked a 4.0% THC marijuana cigarette once per day or a placebo cigarette once per day. Smoking occurred through a

standardized cued-puff procedure: (1) Inhalation for 5 seconds, (2) breath-hold and exhalation for 10 seconds, (3) pause between puffs for 45 seconds. Subjects completed an average of four puffs per cigarette.

The primary outcome measure was change in spasticity on the modified Ashworth scale. Additionally, subjects were assessed using a VAS for pain, a timed walk, and cognitive tests (Paced Auditory Serial Addition Test) and AEs.

Treatment with 4.0% THC marijuana reduced subject scores on the modified Ashworth scale by an average of 2.74 points more than placebo ($p < 0.0001$) and reduced VAS pain scores compared to placebo ($p = 0.008$). Scores on the cognitive measure decreased by 8.7 points more than placebo ($p = 0.003$). However, marijuana did not affect scores for the timed walk compared to placebo. Marijuana increased rating of feeling high compared to placebo.

7 subjects did not complete the study due to adverse events (two subjects felt uncomfortably "high", two had dizziness and one had fatigue). Of those 7 subjects who withdrew, 5 had little or no previous experience with marijuana. When the data were re-analyzed to include these drop-out subjects, with the presumption they did not have a positive response to treatment, the effect of marijuana was still significant on spasticity.

The authors conclude that smoked marijuana had usefulness in reducing pain and spasticity associated with MS. It is concerning that marijuana-naïve subjects dropped out of the study because they were unable to tolerate the psychiatric AEs induced by marijuana. The authors suggest that future studies should examine whether different doses can result in similar beneficial effects with less cognitive impact. However, the current study produced positive results suggesting that marijuana should be studied further as an adjunct treatment for spasticity in MS patients.

3.4 Asthma

Tashkin et al. (1974) examined bronchodilation in 10 subjects with bronchial asthma in the study entitled, "Acute Effects of Smoked Marijuana and Oral Δ^9 -Tetrahydrocannabinol on Specific Airway Conductance in Asthmatic Subjects". The study was a double-blind, placebo-controlled, crossover design. All subjects were clinically stable at the time of the study; four subjects were symptom free, and six subjects had chronic symptoms of mild to moderate severity. Subjects were tested with 0.25ml of isoproterenol HCl prior to the study to ensure they responded to bronchodilator

medications. Subjects were not allowed to take bronchodilator medication within 8 hours prior to the study. Previous experience with marijuana was not required for participation in the study, but 7 of the 10 subjects reported previous use of marijuana at a rate of less than 1 marijuana cigarette per month. No subjects reported marijuana use within 7 days of the study.

The study consisted of four test sessions with an interval of at least 48 hours between sessions. On two test sessions subjects smoked 7 mg/kg of body weight of either marijuana, with 2% THC concentration by weight, or placebo marijuana. During the other two test sessions, subjects ingested capsules with either 15 mg of synthetic THC or placebo. Marijuana was administered using a uniform smoking technique: subjects inhaled deeply for 2–4 seconds, held smoke in lungs for 15 seconds, and resumed normal breathing for approximately 5 seconds. The author did not provide a description of the number of puffs taken at any smoking session. The authors state that the smoking procedure was repeated until the cigarette was consumed, which took approximately 10 minutes.

The outcome measure used was specific airway conductance (SGaw), as calculated using measurements of thoracic gas volume (TGV) and airway resistance (Raw) using a variable-pressure body plethysmograph. Additionally, an assessment of degree of intoxication was administered only to those subjects reporting previous marijuana use. This assessment consisted of subjects rating “how ‘high’ they felt” on a scale of 0–7, 7 representing “the ‘highest’ they had ever felt after smoking marijuana”.

Marijuana produced a significant increase of 33–48% in average SGaw compared to both baseline and placebo ($P < 0.05$). This significant increase in SGaw lasted for at least 2 hours after administration. The average TGV significantly decreased by 4–13% compared to baseline and placebo ($P < 0.05$). The author stated that all subjects reported feelings of intoxication after marijuana administration.

The authors conclude that marijuana produced bronchodilation in clinically stable asthmatic subjects with minimal to moderate bronchospasms. Study limitations include: inclusion of subjects with varying severity of asthmatic symptoms, use of SGaw to measure lung responses to marijuana administration, and administration of smoke to asthmatic subjects. Smoke delivers a number of harmful substances and is not an optimal delivery symptom, especially for asthmatic patients. FEV1

via spirometry is the gold standard to assess changes in lung function, pre and post asthma treatment, by pharmacotherapy. SGaw has been shown to be a valid tool in bronchoconstriction lung assessment; however, since the FEV1 method was not utilized, it is unclear whether these results would correlate if the FEV1 method had been employed.

3.5 Glaucoma

Two randomized, double-blind, placebo-controlled Phase 2 clinical studies examined smoked marijuana in glaucoma (Crawford and Merritt, 1979; Merritt et al., 1980). In both studies, intraocular pressure (IOP) was significantly reduced 30 minutes after smoking marijuana. Maximal effects occurred 60–90 minutes after smoking, with IOP returning to baseline within 3–4 hours. These two studies were included in the 1999 IOM report on the medical uses of marijuana. Because our independent analysis of these studies concurred with the conclusions from the 1999 IOM report, these studies will not be discussed in further detail in this review. No recent studies have been conducted examining the effect of inhaled marijuana on IOP in glaucoma patients. This lack of recent studies may be attributed to the conclusions made in the 1999 IOM report that while cannabinoids can reduce intraocular pressure (IOP), the therapeutic effects require high doses that produce short-lasting responses, with a high degree of AEs. This high degree of AEs means that the potential harmful effects of chronic marijuana smoking may outweigh its modest benefits in the treatment of glaucoma.

3.6 Conclusions

Of the eleven randomized, double-blind, placebo-controlled Phase 2 clinical studies that met the criteria for review (see Sections 2.2 and 2.3), ten studies administered marijuana through smoking, while one study utilized marijuana vaporization. In these eleven studies, there were five different therapeutic indications: five examined chronic neuropathic pain, two examined appetite stimulation in HIV patients, two examined glaucoma, one examined spasticity in MS, and one examined asthma.

There are limited conclusions that can be drawn from the data in these published studies evaluating marijuana for the treatment of different therapeutic indications. The analysis relied on published studies, thus information available about protocols, procedures, and results were limited to documents published and widely available in the

public domain. The published studies on medical marijuana are effectively proof-of-concept studies. Proof-of-concept studies provide preliminary evidence on a proposed hypothesis regarding a drug's effect. For drugs under development, the effect often relates to a short-term clinical outcome being investigated. Proof-of-concept studies serve as the link between preclinical studies and dose ranging clinical studies. Therefore, proof-of-concept studies are not sufficient to demonstrate efficacy of a drug because they provide only preliminary information about the effects of a drug. Although these studies do not provide evidence that marijuana is effective in treating a specific, recognized disorder, these studies do support future larger well-controlled studies to assess the safety and efficacy of marijuana for a specific medical indication. Overall, the conclusions below are preliminary, based on very limited evidence.

3.6.1 Conclusions for Chronic Neuropathic Pain

In subjects with chronic neuropathic pain who are refractory to other pain treatments, five proof-of-concept studies produced positive results regarding the use of smoked marijuana for analgesia. However, the subjects in these studies continued to use their current analgesic drug regime, and thus no conclusions can be made regarding the potential efficacy of marijuana for neuropathic pain in patients not taking other analgesic drugs. Subjects also had numerous forms of neuropathic pain, making it difficult to identify whether a specific set of symptoms might be more responsive to the effects of marijuana. It is especially concerning that some marijuana-naïve subjects had intolerable psychiatric responses to marijuana exposure at analgesic doses.

3.6.2 Conclusions for Appetite Stimulation in HIV

In subjects who were HIV-positive, two proof-of-concept studies produced positive results with the use of both dronabinol and smoked marijuana to increase caloric intake and produce weight gain in HIV-positive patients. However, the amount of THC in the marijuana tested in these studies is four times greater than the dose of dronabinol typically tested for appetite stimulation (10 mg vs. 2.5 mg; Haney et al., 2005). Thus, it is possible that the low degree of AEs reported in this study may reflect the development of tolerance to cannabinoids in this patient population, since all individuals had current histories of chronic marijuana use. Thus, individuals with little prior

exposure to marijuana may not respond similarly and may not be able to tolerate sufficient marijuana to produce appetite stimulation.

3.6.3 Conclusions for Spasticity in MS

In subjects with MS, a proof of concept study produced positive results using smoked marijuana as a treatment for pain and symptoms associated with treatment-resistant spasticity. The subjects in this study continued to take their current medication regiment, and thus no conclusions can be made regarding the potential efficacy of marijuana when taken on its own. It is also concerning that marijuana-naïve subjects dropped out of the study because they were unable to tolerate the psychiatric AEs induced by marijuana. The authors suggest that future studies should examine whether different doses can result in similar beneficial effects with less cognitive impact.

3.6.4 Conclusions for Asthma

In subjects with clinically stable asthma, a proof of concept study produced positive results of smoked marijuana producing bronchodilation. However, in this study marijuana was administered at rest and not while experiencing bronchospasms. Additionally, the administration of marijuana through smoking introduces harmful and irritating substances to the subject, which is undesirable especially in asthmatic patients. Thus the results suggest marijuana may have bronchodilator effects, but it may also have undesirable adverse effects in subjects with asthma.

3.6.5 Conclusions for Glaucoma

As noted in Sections 3.5, the two studies that evaluated smoked marijuana for glaucoma were conducted decades ago, and they have been thoroughly evaluated in the 1999 IOM report. The 1999 IOM report concludes that while the studies with marijuana showed positive results for reduction in IOP, the effect is short-lasting, requires a high dose, and is associated with many AEs. Thus, the potential harmful effects may outweigh any modest benefit of marijuana for this condition. We agree with the conclusions drawn in the 1999 IOM report.

3.7 Design Challenges for Future Studies

The positive results reported by the studies discussed in this review support the conduct of more rigorous studies in the future. This section discusses methodological challenges that have occurred in clinical studies with smoked marijuana. These design issues

should be addressed when larger-scale clinical studies are conducted to ensure that valid scientific data are generated in studies evaluating marijuana's safety and efficacy for a particular therapeutic use.

3.7.1 Sample Size

The ability for results from a clinical study to be generalized to a broader population is reliant on having a sufficiently large study sample size. However, as noted above, all of the 11 studies reviewed in this document were early Phase 2 proof of concept studies for efficacy and safety. Thus, the sample sizes used in these studies were inherently small, ranging from 10 subjects per treatment group (Tashkin et al., 1974; Haney et al., 2007) to 25 subjects per treatment group (Abrams et al., 2007). These sample sizes are statistically inadequate to support a showing of safety or efficacy. FDA's recommendations about sample sizes for clinical trials can be found in the *Guidance for Industry: E9 Statistical Principles for Clinical Trials (1998)*.³⁵ For example, "the number of subjects in a clinical trial should always be large enough to provide a reliable answer to the questions addressed. This number is usually determined by the primary objective of the trial. The method by which the sample size is calculated should be given in the protocol, together with the estimates of any quantities used in the calculations (such as variances, mean values, response rates, event rates, difference to be detected)." (pg. 21). Other clinical FDA *Guidance for Industry*³⁶ may also contain recommendations regarding the appropriate number of subjects that should be investigated for a specific medical indication.

3.7.2 Marijuana Dose Standardization

Dose standardization is critical for any clinical study in order to ensure that each subject receives a consistent exposure to the test drug. The *Guidance for Industry: Botanical Drug Products (2004)*³⁷ provides specific information on the development of botanical drug products. Specifically, this guidance

³⁵ The *Guidance for Industry: E9 Statistical Principles for Clinical Trials* can be found at: www.fda.gov/downloads/Drugs/GuidanceComplianceRegulatoryInformation/Guidances/ucm073137.pdf.

³⁶ Other *Guidances for Industry* can be found at: www.fda.gov/Drugs/GuidanceComplianceRegulatoryInformation/Guidances/ucm064981.htm.

³⁷ The *Guidance for Industry: Botanical Drug Products* can be found at: <http://www.fda.gov/downloads/Drugs/GuidanceComplianceRegulatoryInformation/Guidances/ucm070491.pdf>.

includes information about the need for well-characterized and consistent chemistry for the botanical plant product and for consistent and reliable dosing. Specifically for marijuana studies, dose standardization is important because if marijuana leads to plasma levels of cannabinoids that are significantly different between subjects, this variation may lead to differences in therapeutic responsiveness or in the prevalence of psychiatric AEs.

In most marijuana studies discussed in this review, investigators use a standardized cued smoking procedure. In this procedure, a subject is instructed to inhale marijuana smoke for 5 seconds, hold the smoke in the lungs for 10 seconds, exhale and breathe normally for 40 seconds. This process is repeated to obtain the desired dose of the drug. However, this procedure may not lead to equivalent exposure to marijuana and its constituent cannabinoids, based on several factors:

- Intentional or unintentional differences in the depth of inhalation may change the amount of smoke in the subject's lungs.
- Smoking results in loss from side stream smoke, such that the entire dose is not delivered to the subject.
- There may be differences in THC concentration along the length of a marijuana cigarette. According to Tashkin et al. (1991), the area of the cigarette closest to the mouth tends to accumulate a higher concentration of THC, but this section of the cigarette is not smoked during a study.

For example, Wilsey et al. (2008) used this standardized smoking procedure. The reported mean (range) of marijuana cigarettes consumed was 550 mg (200–830mg) for the low strength marijuana (3.5% THC) and 490 mg (270–870mg) for the high strength marijuana (7% THC). This wide range of amounts of marijuana cigarette smoked by the individual subjects, even with standardized smoking procedure and controlled number of puffs, supports the issues with delivering consistent doses with smoke marijuana.

In other marijuana studies that do not use a cued smoking procedure, subjects are simply told to smoke the marijuana cigarette over a specific amount of time (usually 10 minutes) without further instruction (Crawford and Merritt, 1979; Merritt et al., 1980; Ellis et al., 2009). The use of a nonstandardized procedure may lead to non-equivalent exposures to marijuana and its constituent cannabinoids between subjects because of additional factors that are not listed above, such as:

- Differences in absorption and drug response if subjects (especially

marijuana-naïve ones) are not instructed to hold marijuana smoke in their lungs for a certain period of time.

- Prolonged periods between puffs may increase loss to side stream smoke.
- Subjects may attempt to smoke the marijuana cigarette in the way they would smoke a tobacco cigarette, which relies primarily on short, shallow puffs.

In both standardized and non-standardized smoking procedures, subjects may seek to control the dose of THC through self-titration (Crawford and Merritt, 1979; Merritt et al., 1980; Tashkin et al., 1974; Abrams et al., 2007; Ellis et al., 2009). Self-titration involves an individual moderating the amount of marijuana smoke inhaled over time in order to obtain a preferred level of psychoactive or clinical response. The ability of an individual to self-titrate by smoking is one reason given by advocates of “medical marijuana” in support of smoking of marijuana rather than through its ingestion via edibles. However, for research purposes, self-titration interferes with the ability to maintain consistent dosing levels between subjects, and thus, valid comparisons between study groups.

All of these factors can make the exact dose of cannabinoids received by a subject in a marijuana study difficult to determine with accuracy. Testing whether plasma levels of THC or other cannabinoids are similar between subjects following the smoking procedure would establish whether the procedure is producing appropriate results. Additionally, studies could be conducted to determine if vaporization can be used to deliver consistent doses of cannabinoids from marijuana plant material. Specifically, vaporization devices that involve the collection of vapors in an enclosed bag or chamber may help with delivery of consistent doses of marijuana. Thus, more information could be collected on whether vaporization is comparable to or different than smoking in terms of producing similar plasma levels of THC in subjects using identical marijuana plant material.

3.7.3 Acute vs. Chronic Therapeutic Marijuana Use

The studies that were reviewed administered the drug for short durations lasting no longer than 5 days (Abrams et al., 2007; Ellis et al., 2009; Ware et al., 2010). Thus all studies examined the short-term effect of marijuana administration for therapeutic purposes. However, many of the medical conditions that have been studied are persistent or expected to last the rest of a patient’s life. Therefore, data on chronic exposure to smoked

marijuana in clinical studies is needed. In this way, more information will be available regarding whether tolerance, physical dependence, or specific adverse events develop over the course of time with continuing use of therapeutic marijuana.

3.7.4 Smoking as a Route of Administration

As has been pointed out by the IOM and other groups, smoking is not an optimum route of administration for marijuana-derived therapeutic drug products, primarily because introducing the smoke from a burnt botanical substance into the lungs of individuals with a disease state is not recommended when their bodies may be physically compromised. The 1999 IOM report on medicinal uses of marijuana noted that alternative delivery methods offering the same ability of dose titration as smoking marijuana will be beneficial and may limit some of the possible long-term health consequences of smoking marijuana. The primary alternative to smoked marijuana is vaporization, which can reduce exposure to combusted plant material containing cannabinoids. The only study to use vaporization as the delivery method was Wilsey et al. (2013). The results from Wilsey et al. (2013) showed a similar effect of decreased pain as seen in the other studies using smoking as the delivery method (Ware et al., 2010; Wilsey et al., 2008). This similar effect of decrease pain supports vaporization as a possibly viable route to administer marijuana in research, while potentially limiting the risks associated with smoking.

3.7.5 Difficulty in Blinding of Drug Conditions

An adequate and well-controlled clinical study involves double-blinding, where both the subjects and the investigators are unable to tell the difference between the test treatments (typically consisting of at least a test drug and placebo) when they are administered. All of the studies reviewed in this document administered study treatments under double-blind conditions and thus were considered to have an appropriate study design.

However, even under the most rigorous experimental conditions, blinding can be difficult in studies with smoked marijuana because the rapid onset of psychoactive effects readily distinguishes active from placebo marijuana. The presence of psychoactive effects also occurs with other drugs. However, most other drugs have a similar psychoactive effect with substances with similar mechanisms of

actions. These substances can be used as positive controls to help maintain blinding to the active drug being tested. Marijuana on the other hand, has a unique set of psychoactive effects which makes the use of appropriate positive controls difficult (Barrett et al., 1995). However, two studies did use Dronabinol as a positive control drug to help maintain blinding (Haney et al., 2005; Haney et al., 2007).

When blinding is done using only placebo marijuana, the ability to distinguish active from placebo marijuana may lead to expectation bias and an alteration in perceived responsiveness to the therapeutic outcome measures. With marijuana-experienced subjects, for example, there may be an early recognition of the more subtle cannabinoid effects that can serve as a harbinger of stronger effects, which is less likely to occur with marijuana-naïve subjects. To reduce this possibility, investigators have tested doses of marijuana other than the one they were interested in experimentally to maintain the blind (Ware et al., 2010).

Blinding can also be compromised by differences in the appearance of marijuana plant material based on THC concentration. Marijuana with higher concentrations of THC tends to be heavier and seemingly darker, with more “tar-like” substance. Subjects who have experience with marijuana have reported being able to identify marijuana from placebo cigarettes by sight alone when the plant material in a cigarette was visible (Tashkin et al., 1974; Ware et al., 2010). Thus, to maintain a double-blind design, many studies obscure the appearance of plant material by closing both ends of the marijuana cigarette and placing it in an opaque plastic tube.

While none of these methods to secure blinding may be completely effective, it is important to reduce bias as much as possible to produce consistent results between subjects under the same experimental conditions.

3.7.6 Prior Marijuana Experience

Marijuana use histories in test subjects may influence outcomes, related to both therapeutic responsiveness and psychiatric AEs. Marijuana-naïve subjects may also experience a marijuana drug product as so aversive that they would not want to use the drug product. Thus, subjects’ prior experience with marijuana may affect the conduct and results of studies.

Most of the studies reviewed in this document required that subjects have a history of marijuana use (see tables in Appendix that describe specific

requirements for each study). However, in studies published in the scientific literature, the full inclusion criteria with regard to specific amount of experience with marijuana may not be provided. For those studies that do provide inclusion criteria, acceptable experience with marijuana can range from once in a lifetime to use multiple times a day.

The varying histories of use might affect everything from scores on adverse event measures, safety measures, or efficacy measures. Additionally, varying amounts of experience can impact cognitive effect measures assessed during acute administration studies. For instance, Schreiner and Dunn (2012) contend cognitive deficits in heavy marijuana users continue for approximately 28 days after cessation of smoking. Studies requiring less than a month of abstinence prior to the study may still see residual effects of heavy use at baseline and after placebo marijuana administration, thus showing no significant effects on cognitive measures. However, these same measurements in occasional or naïve marijuana users may demonstrate a significant effect after acute marijuana administration. Therefore, the amount of experience and the duration of abstinence of marijuana use are important to keep in mind when analyzing results for cognitive and other adverse event measures. Lastly, a study population with previous experience with marijuana may underreport the incidence and severity of adverse events. Because most studies used subjects with prior marijuana experience, we are limited in our ability to generalize the results, especially for safety measures, to marijuana naïve populations.

Five of 11 studies reviewed in this document included both marijuana-naïve and marijuana-experienced subjects (Corey-Bloom et al., 2012; Ellis et al., 2009; Ware et al., 2010; Merritt et al., 1980; Tashkin et al., 1974). Since the number of marijuana-naïve subjects in these studies was low, it was not possible to conduct a separate analysis compared to experienced users. However, systematically evaluating the effect of marijuana experience on study outcomes is important, since many patients who might use a marijuana product for a therapeutic use will be marijuana-naïve.

Research shows that marijuana-experienced subjects have a higher ability to tolerate stronger doses of oral dronabinol than marijuana-naïve subjects (Haney et al., 2005). Possibly, this increased tolerance is also the case when subjects smoke or vaporize marijuana. Thus, studies could be

conducted that investigate the role of marijuana experience in determining tolerability of and responses to a variety of THC concentrations in marijuana.

3.7.7 Inclusion and Exclusion Criteria

For safety reasons, all clinical studies have inclusion and exclusion criteria that restrict the participation of individuals with certain medical conditions. For studies that test marijuana, these criteria may be based on risks associated with exposure to smoked material and the effects of THC. Thus, most studies investigating marijuana require that subjects qualify for the study based on restrictive symptom criteria such that individuals do not have other symptoms that may be known to interact poorly with cannabinoids.

Similarly, clinical studies with marijuana typically exclude individuals with cardiac or pulmonary problems, as well as psychiatric disorders. These exclusion criteria are based on the well-known effects of marijuana smoke to produce increases in heart rate and blood pressure, lung irritation, and the exacerbation of psychiatric disturbances in vulnerable individuals. Although these criteria are medically reasonable for research protocols, it is likely that future marijuana products will be used in patients who have cardiac, pulmonary or psychiatric conditions. Thus, individuals with these conditions should be evaluated, whenever possible.

Additionally, all studies reviewed in this document allowed the subjects to continue taking their current regimen of medications. Thus all results evaluated marijuana as an adjunct treatment for each therapeutic indication.

3.7.8 Number of Female Subjects

A common problem in clinical research is the limited number of females who participate in the studies. This problem is present in the 11 studies reviewed in this document, in which one study did not include any female subjects (Ellis et al., 2009), and three studies had a low percentage of female subjects (Abrams et al., 2007; Haney et al., 2005; Haney et al., 2007). However, each of these four studies investigated an HIV-positive patient population, where there may have been a larger male population pool from which to recruit compared to females.

Since there is some evidence that the density of CB1 receptors in the brain may vary between males and females (Crane et al., 2012), there may be differing therapeutic or subjective responsiveness to marijuana. Studies using a study population that is equal parts male and female may show whether and

how the effects of marijuana differ between male and female subjects.

Table 1: Randomized, controlled, double-blind trials examining smoked marijuana in treatment of neuropathic pain

Author & Date <i>Indication</i>	Subjects (n) completed/randomized Subject characteristics	Drugs Admin. Methods	Study Type <i>Duration</i>	Primary Outcome Measure	Primary Outcome Measure Results	Adverse events/AEs
Abrams et al. (2007) <i>HIV-Sensory Neuropathy; Neuropathic Pain</i>	Marijuana Group: 25/27 22 males 5 females Placebo Group: 25/28 26 males 2 females <u>Inclusion Criteria:</u> -documented HIV -documented HIV-SN -pain score \geq 30mm VAS -prior marijuana use of six or more times in lifetime <u>Previous Marijuana Experience:</u> -marijuana group: 21 current users -placebo group: 19 current users <u>Exclusion Criteria:</u> -substance abuse (including tobacco) -family history of neuropathy due to causes not HIV related -use of isoniazid,	NIDA marijuana, smoked 0%, 3.65% THC <u>Smoking Procedure:</u> -signal light cued smoking of marijuana cigarette with each puff consisting of: 1) 5s inhale smoke, 2) 10s hold smoke in lungs 3) 40s exhale and breath normally 4) repeat procedure for desired number of puffs # of puffs not specified, only specified that subjects smoked the entire marijuana/placebo cigarette On 1 st and last day of intervention period BID. For all other days TID	Parallel Group <i>5-day treatment period</i>	VAS daily pain score	-52% of the marijuana group showed >30% decrease in pain score compared to 24% of placebo group. -Marijuana group had significantly greater reduction in daily pain score than placebo group. -NNT=3.6	-Rating for adverse events of anxiety, sedation, disorientation, confusion, and dizziness were significantly higher in the marijuana group compared to placebo group. -Marijuana and placebo groups showed a reduction in total mood disturbance on POMS. <u>AEs:</u> -1 grade 3 dizziness in marijuana group -2 grade 3 anxiety, 1 in each group.

Author & Date <i>Indication</i>	Subjects (n) completed/randomized Subject characteristics	Drugs Admin. Methods	Study Type Duration	Primary Outcome Measure	Primary Outcome Measure Results	Adverse events/AEs
	dapsone, or metronidazole within 8 weeks of enrollment					
Ellis et al. (2009) <i>HIV Sensory Neuropathy; Neuropathic Pain</i>	28/34 28 males <u>Inclusion Criteria:</u> -documented HIV -documented neuropathic pain refractory to ≥ 2 analgesics -pain score ≥ 5 on pain intensity subscale of DDS <u>Previous Marijuana Experience:</u> -27 subjects had previous experience -63% of subjects had no exposure for >1 year before study <u>Exclusion Criteria:</u> -current DSM-IV substance abuse disorder -lifetime history of dependence on marijuana -previous psychosis with or intolerance to cannabinoids -concurrent use of approved cannabinoid medications -positive UDS for	NIDA marijuana, smoked 0%, 1%, 2%, 4%, 6%, 8% THC <u>Smoking Procedures:</u> - Verbally cued smoking of marijuana cigarette with each puff consisting of: 1) 5s inhale smoke, 2) 10s hold smoke in lungs 3) 40s exhale and breath normally 4) repeat procedure for desired number of puffs -unknown number of puffs QID	Crossover Dose-titration (on 1 st day) <i>2, 5-day treatment phase, with 2-week washout period</i>	Pain magnitude on DDS	-Pain reduction was significantly greater after marijuana compared to placebo. -NNT=3.5	-Mood disturbance, quality of life, and psychical disability improved for both marijuana and placebo. -Moderate to severe adverse events were more common with marijuana than placebo. -HIV disease parameters did not differ for marijuana or placebo. -Adverse events included: concentration difficulties, fatigue, sleepiness or sedation, increased duration of sleep, reduced salivation, and thirst. These adverse events were more frequent in marijuana compared to placebo. <u>Withdrawals for drug related reasons:</u> -1 cannabis-naïve subject had acute cannabis-induced psychosis -1 subjects developed an intractable smoking-related cough during marijuana administration

Author & Date <i>Indication</i>	Subjects (n) completed/randomized Subject characteristics	Drugs Admin. Methods	Study Type <i>Duration</i>	Primary Outcome Measure	Primary Outcome Measure Results	Adverse events/AEs
	cannabinoids during wash-in week -serious medical conditions that affect safety -alcohol or drug dependence within 12 months of study					
Wilsey et al. (2008) <i>Neuropathic pain; Various Causes</i>	32/38 20 males 18 females <u>Inclusion Criteria:</u> -CRPS type I, spinal cord injury, peripheral neuropathy, or nerve damage -previous marijuana use <u>Previous Marijuana Experience:</u> -median (range) time from previous exposure: 1.7 years (31 days to 30 years) -median (range) exposure duration: 2 years (1 day to 22 years). <u>Exclusion Criteria:</u> -no marijuana or cannabinoid medication use for 30 days prior to study; confirmed by UDS	NIDA marijuana, smoked 0%, 3.55%, 7% THC <u>Smoking Procedure:</u> Verbally cued smoking of marijuana cigarette with each puff consisting of: 1) 5s inhale smoke, 2) 10s hold smoke in lungs 3) 40s exhale and breath normally 4) repeat procedure for desired number of puffs Cumulative dosing procedure: -escalate the number of puffs from 2 to 4 puffs over 3 smoking sessions with 1 hour between sessions	Crossover <i>3, 6-hour sessions, with 3-day between sessions</i>	VAS spontaneous pain intensity	-A significant decrease in pain intensity for both strengths of marijuana compared to placebo	-7% THC marijuana significantly decreased functioning on neurocognitive measures compared to placebo. -Subjective effects were greater for 7% THC marijuana than 3.55% THC marijuana with significantly more ratings of good drug effect, bad drug effect, feeling high, feeling stoned, impaired, sedation, confusion, and hunger compared to placebo.

Author & Date <i>Indication</i>	Subjects (n) completed/randomized Subject characteristics	Drugs Admin. Methods	Study Type <i>Duration</i>	Primary Outcome Measure	Primary Outcome Measure Results	Adverse events/AEs
	-severe depression -history of schizophrenia or bipolar depression -uncontrolled hypertension, cardiovascular disease, and pulmonary disease -active substance abuse	TID				
Ware et al. (2010) <i>Post- traumatic or postsurgical neuropathic pain</i>	21/23 11 males 12 females <u>Inclusion Criteria:</u> -neuropathic pain for ≥ 3 months caused by trauma or surgery -allodynia and hyperalgesia -pain score >4cm VAS -no marijuana use for 1 year prior to study -stable analgesic regimen -normal liver and renal function <u>Previous Marijuana Experience:</u> -18 subjects had used marijuana before <u>Exclusion Criteria:</u> -pain due to cancer or nociceptive causes -significant cardiac or	NIDA placebo; Prairie Plant System Inc. (Canada) marijuana, smoked 0%, 2.5%, 6%, 9.4% THC (25 mg of marijuana/placebo plant material was placed in opaque gelatin capsules) <u>Smoking Procedures:</u> -1) Break one capsule open and tip content into the bowl of a titanium pipe 2) light marijuana material 3) 5s inhale smoke 4) 10s hold smoke in lungs 5) Exhale 1 puff burned all 25 mg of plant material	Crossover <i>4, 5-day out- patient* treatment phase, with 9-day washout periods</i>	Pain intensity on 11- item NRS	-Average daily pain intensity was significantly lower after 9.4% THC compared to placebo.	-Anxiety and depression were significantly improved with 9.4% THC compared to placebo. -No significant difference between placebo and 9.4% THC for subjective effects. <u>AEs:</u> -248 mild AEs were reported -6 moderate AEs were reported: 2 fall, 1 increased pain, 1 numbness, 1 drowsiness, 1 pneumonia -Most frequently reported drug- related AEs for 9.4% THC: headache, dry eyes, burning sensation, dizziness, numbness, and cough. <u>Withdrawals for drug related reason:</u> -1 subject had increased pain after 6% THC administration -1 subject tested positive for cannabinoids in urine test during placebo treatment

Author & Date <i>Indication</i>	Subjects (n) completed/randomized Subject characteristics	Drugs Admin. Methods	Study Type <i>Duration</i>	Primary Outcome Measure	Primary Outcome Measure Results	Adverse events/AEs
	pulmonary disease -current substance abuse or dependence (including marijuana) -history of psychotic disorders -current suicidal ideations	TID Intermediate doses were used to help maintain blinding				
Wilsey et al. (2013) <i>Neuropathic Pain; Various Causes</i>	36/39 28 males 11 females <u>Inclusion Criteria:</u> -CRPS type 1, thalamic pain, spinal cord injury, peripheral neuropathy, radiculopathy, or nerve injury -previous marijuana use <u>Previous Marijuana Experience:</u> - median (range) time from last exposure prior to screening: 9.6 years (1 day to 45 years) -16 current marijuana users and 23 past users -# smoked daily: 6 current users, 5 past users -# used approx. once every 2 weeks: 8 current users, 6 past users -# used once every 4 weeks or less: 2 current	NIDA marijuana, vaporized 0%, 1.29%, 3.53% THC <u>Smoking Procedures:</u> - Verbally cued inhalation of vaporized material in the balloon with each puff consisting of: 1) 5s inhale vapors, 2) 10s hold vapors in lungs 3) 40s exhale and breath normally 4) repeat procedure for desired number of puffs BID Cumulative & Flexible Dosing: -1 st drug admin. consisted of 4 puffs from balloon.	Crossover <i>3, 6-hour sessions, with at least 3 days between sessions</i>	VAS spontaneous pain intensity	-Number of subjects that showed a 30% reduction in pain intensity was significantly greater for both strengths of marijuana compared to placebo. -Both strengths of marijuana showed a similar significant decrease in pain compared to placebo. -NNT=3.2 for 1.29% THC marijuana vs. placebo. -NNT=2.9 for 3.53% THC marijuana vs. placebo.	-Scores for feeling stoned, feeling high, like the drug effect, feeling sedated, and feeling confused were significantly greater for 3.53% THC marijuana compared to 1.29% THC marijuana, and for both strengths of marijuana compared to placebo. -Scores for feeling drunk and feeling impaired are significantly greater in both strengths of marijuana compared to placebo. -Scores for desired more of the drug were significantly greater for 1.29% THC marijuana compared to placebo, with no significant difference seen for 3.53% THC marijuana. -3.53% THC marijuana had significantly worse performance than 1.29% THC marijuana for learning and memory. -Both strengths of marijuana significantly reduced scores on attention compared to placebo.

Author & Date Indication	Subjects (n) completed/randomized Subject characteristics	Drugs Admin. Methods	Study Type Duration	Primary Outcome Measure	Primary Outcome Measure Results	Adverse events/AEs
	users, 12 past users <u>Exclusion Criteria:</u> -no marijuana or cannabinoid medication use for 30 days prior to study; confirmed by UDS -severe depression -suicidal ideations -diagnoses of serious mental illness -uncontrolled hypertension, cardiovascular disease, or chronic pulmonary disease -active substance abuse	-Followed 2 hours later by 2 nd drug admin. -2 nd drug admin. consisted of 4 to 8 puffs from balloon; number of puffs taken was left up to the subject so they could self-titrate to their target does, which balanced desired response and tolerance levels.				

*Out-patient: subjects were given enough doses of marijuana/placebo to last the 5-day treatment phase, and then were sent home for the remainder of the treatment phase. AE=Adverse Event; BID=drug administered two times per day; CRPS=complex regional pain syndrome; DDS=Descriptor Differential Scale; NIDA=National Institute of Drug Abuse; NNT=Number Needed to Treat; NRS=Numeric Rating Scale; QID=drug administered four times per day; THC=delta-9-tetrahydrocannabinol; TID=drug administered three times per day; UDS=urine drug screen; VAS=Visual Analog Scale.

U.S. Department of Justice—Drug Enforcement Administration

Schedule of Controlled Substances: Maintaining Marijuana in Schedule I of the Controlled Substances Act

Background, Data, and Analysis: Eight Factors Determinative of Control and Findings Pursuant to 21 U.S.C. 812(b)

Prepared by: Office of Diversion
Control, Drug and Chemical
Evaluation Section, Washington, DC
20537

July 2016

Background

On December 17, 2009, Bryan Krumm, CNP, submitted a petition to the Drug Enforcement Administration (DEA) to initiate proceedings for a repeal of the rules or regulations that place marijuana³⁸ in schedule I of the Controlled Substances Act (CSA). The petition requests that marijuana be rescheduled in any schedule other than schedule I of the CSA. The petitioner claims that:

1. Marijuana has accepted medical use in the United States;
 2. Studies have shown that smoked marijuana has proven safety and efficacy;
 3. Marijuana is safe for use under medical supervision; and
 4. Marijuana does not have the abuse potential for placement in schedule I
- The DEA accepted this petition for filing on April 3, 2010.

The Attorney General may by rule transfer a drug or other substance between schedules of the CSA if she finds that such drug or other substance has a potential for abuse, and makes the findings prescribed by 21 U.S.C. 812(b) for the schedule in which such drug is to be placed. 21 U.S.C. 811(a)(1). The Attorney General has delegated this responsibility to the Acting Administrator of the DEA. 28 CFR 0.100(b).

In accordance with 21 U.S.C. 811(b), after gathering the necessary data, the DEA submitted the petition and

necessary data to the Department of Health and Human Services (HHS) on May 6, 2011, and requested that HHS provide a scientific and medical evaluation and scheduling recommendation for marijuana. In documents dated June 3 and June 25, 2015, the acting Assistant Secretary for Health of the HHS³⁹ recommended to the DEA that marijuana continue to be controlled in Schedule I of the CSA, and provided to the DEA its scientific and medical evaluation titled “Basis for the Recommendation for Maintaining Marijuana in Schedule I of the Controlled Substances Act.” The HHS’s recommendations are binding on the DEA as to scientific and medical matters. 21 U.S.C. 811(b).

Before initiating proceedings to reschedule a substance, the CSA requires the Acting Administrator to determine whether the HHS scheduling recommendation, scientific and medical evaluation, and “all other relevant data” constitute substantial evidence that the drug should be rescheduled as proposed. 21 U.S.C. 811(b). The Acting Administrator must determine whether there is substantial evidence to conclude that the drug meets the criteria for placement in another schedule based on the criteria set forth in 21 U.S.C. 812(b). The CSA requires that both the DEA and the HHS consider the eight factors specified by Congress in 21 U.S.C. 811(c). This document lays out those considerations and is organized according to the eight factors. As DEA sets forth in detail below, the evidence shows:

1. *Actual or relative potential for abuse.* Marijuana has a high potential for abuse. Preclinical and clinical data show that it has reinforcing effects characteristic of drugs of abuse. National databases on actual abuse show marijuana is the most widely abused drug, including significant numbers of substance abuse treatment admissions. Data on marijuana seizures show widespread availability and trafficking.

2. *Scientific evidence of its pharmacological effect.* The scientific understanding of marijuana, cannabinoid receptors, and the endocannabinoid system continues to be studied and elucidated. Marijuana

produces various pharmacological effects, including subjective (e.g., euphoria, dizziness, disinhibition), cardiovascular, acute and chronic respiratory, immune system, and prenatal exposure effects, as well as behavioral and cognitive impairment.

3. *Current scientific knowledge.* There is no currently accepted medical use for marijuana in the United States. Marijuana sources are derived from numerous cultivated strains and may have different levels of Δ⁹-THC and other cannabinoids. Under the five-element test for currently accepted medical use discussed in more detail below and upheld by the Court of Appeals for the District of Columbia in *Alliance for Cannabis Therapeutics v. DEA*, 15 F.3d 1131, 1135 (D.C. Cir. 1994) (hereinafter “ACT”), there is no complete scientific analysis of marijuana’s chemical components; there are not adequate safety studies; there are not adequate and well-controlled efficacy studies; there is not a consensus of medical opinion concerning medical applications of marijuana; and the scientific evidence regarding marijuana’s safety and efficacy is not widely available. To date, scientific and medical research has not progressed to the point that marijuana has a currently accepted medical use, even under conditions where its use is severely restricted.

4. *History and current pattern of abuse.* Marijuana continues to be the most widely used illicit drug. In 2014, there were 22.2 million current users. There were also 2.6 million new users, most of whom were less than 18 years of age. During the same period, marijuana was the most frequently identified drug exhibit in federal, state, and local forensic laboratories.

5. *Scope, duration, and significance of abuse.* Abuse of marijuana is widespread and significant. In 2014, for example, an estimated 6.5 million people aged 12 or older used marijuana on a daily or almost daily basis over a 12-month period. In addition, a significant proportion of all admissions for substance abuse treatment are for marijuana/hashish as their primary drug of abuse. In 2013, 16.8% of all such admissions—281,991 over the course of the year—were for primary marijuana/hashish abuse.

6. *Risk, if any, to public health.* Together with the health risks outlined in terms of pharmacological effects above, public health risks from acute use of marijuana include impaired psychomotor performance, impaired driving, and impaired performance on tests of learning and associative processes. Chronic use of marijuana

³⁸ The Controlled Substances Act (CSA) defines marijuana as the following: “All parts of the plant *Cannabis sativa L.*, whether growing or not; the seeds thereof; the resin extracted from any part of such plant; and every compound, manufacture, salt, derivative, mixture, or preparation of such plant, its seeds or resin. Such term does not include the mature stalks of such plant, fiber produced from such stalks, oil or cake made from the seeds of such plant, any other compound, manufacture, salt, derivative, mixture, or preparation of such mature stalks (except the resin extracted there from), fiber, oil, or cake, or the sterilized seed of such plant which is incapable of germination. 21 U.S.C. 802(16). Note that “marihuana” is the spelling originally used in the CSA. This document uses the spelling that is more common in current usage, “marijuana.”

³⁹ As set forth in a memorandum of understanding entered into by the HHS, the Food and Drug Administration (FDA), and the National Institute on Drug Abuse (NIDA), the FDA acts as the lead agency within the HHS in carrying out the Secretary’s scheduling responsibilities under the CSA, with the concurrence of the NIDA. 50 FR 9518, Mar. 8, 1985. The Secretary of the HHS has delegated to the Assistant Secretary for Health of the HHS the authority to make domestic drug scheduling recommendations.

poses a number of other risks to the public health including physical as well as psychological dependence.

7. *Psychic or physiological dependence liability.* Long-term, heavy use of marijuana can lead to physical dependence and withdrawal following discontinuation, as well as psychic or psychological dependence. In addition, a significant proportion of all admissions for treatment for substance abuse are for primary marijuana abuse; in 2013, 16.8% of all admissions were for primary marijuana/hashish abuse, representing 281,991 individuals.

8. *Immediate precursor.* Marijuana is not an immediate precursor of any controlled substance.

As specified in 21 U.S.C. 812(b)(1), in order for a substance to be placed in schedule I, the Acting Administrator must find that:

A. The drug or other substance has a high potential for abuse.

B. The drug or other substance has no currently accepted medical use in treatment in the United States.

C. There is a lack of accepted safety for use of the drug or other substance under medical supervision.

To be classified in another schedule under the CSA (e.g., II, III, IV, or V), a substance must have a “currently accepted medical use in treatment in the United States.” 21 U.S.C. 812(b)(2)–(5). A substance also may be placed in schedule II if it is found to have “a currently accepted medical use with severe restrictions.” 21 U.S.C. 812(b)(2). If a controlled substance has no such currently accepted medical use, it must be placed in schedule I. See Notice of Denial of Petition, 66 FR 20038 (Apr. 18, 2001) (“Congress established only one schedule—schedule I—for drugs of abuse with ‘no currently accepted medical use in treatment in the United States’ and ‘lack of accepted safety for use . . . under medical supervision.’”).

A drug that is the subject of an approved new drug application (NDA) or abbreviated new drug application (ANDA) under Federal Food, Drug, and Cosmetic Act (21 U.S.C. 355), is considered to have a currently accepted medical use in treatment in the United States for purposes of the CSA. The HHS stated in its review, however, that FDA has not approved any NDA for marijuana for any indication.

In the absence of NDA or ANDA approval, DEA has established a five-element test for determining whether the drug has a currently accepted medical use in treatment in the United States. Under this test, a drug will be considered to have a currently accepted medical use only if the following five elements are satisfied:

1. The drug’s chemistry is known and reproducible;

2. There are adequate safety studies;

3. There are adequate and well-controlled studies proving efficacy;

4. The drug is accepted by qualified experts; and

5. The scientific evidence is widely available.

57 FR 10499, 10506 (March 26, 1992). See also *ACT*, 15 F.3d at 1135.

As discussed in Factor 3, below, HHS concluded, and DEA agrees, that the scientific evidence is insufficient to demonstrate that marijuana has a currently accepted medical use under the five-element test. The evidence was insufficient in this regard also when the DEA considered petitions to reschedule marijuana in 1992 (57 FR 10499),⁴⁰ in 2001 (66 FR 20038), and in 2011 (76 FR 40552).⁴¹ Little has changed since 2011 with respect to the lack of clinical evidence necessary to establish that marijuana has a currently accepted medical use. No studies have scientifically assessed the efficacy and full safety profile of marijuana for any specific medical condition.

The limited existing clinical evidence is not adequate to warrant rescheduling of marijuana under the CSA. To the contrary, the data in this scheduling review document show that marijuana continues to meet the criteria for schedule I control under the CSA for the following reasons:

1. Marijuana has a high potential for abuse.

2. Marijuana has no currently accepted medical use in treatment in the United States.

3. Marijuana lacks accepted safety for use under medical supervision.

Factor 1: The Drug’s Actual or Relative Potential for Abuse

Marijuana is the most commonly abused illegal drug in the United States. It is also the most commonly used illicit drug by high school students in the United States. Further, marijuana is the most frequently identified drug by state, local and federal forensic laboratories. Marijuana’s main psychoactive ingredient, Δ^9 -tetrahydrocannabinol (Δ^9 -THC),⁴² is an effective reinforcer in laboratory animals, including primates and rodents. These animal studies both predict and support the observations that marijuana produces reinforcing effects in humans. Such reinforcing

effects can account for the repeated abuse of marijuana.

A. Indicators of Abuse Potential

The HHS has concluded in its document, “Basis for the Recommendation for Maintaining Marijuana in Schedule I of the Controlled Substances Act,” that marijuana has a high potential for abuse. The finding of “abuse potential” is critical for control under the Controlled Substances Act (CSA). Although the term is not defined in the CSA, guidance in determining abuse potential is provided in the legislative history of the Act (Comprehensive Drug Abuse Prevention and Control Act of 1970, H.R. Rep. No. 91–1444, 91st Cong., Sess. 2 (1970), reprinted in 1970 U.S.C.A.N. 4566, 4603). Accordingly, the following items are indicators that a drug or other substance has potential for abuse:

- *There is evidence that individuals are taking the drug or drugs containing such a substance in amounts sufficient to create a hazard to their health or to the safety of other individuals or of the community; or*

- *There is significant diversion of the drug or drugs containing such a substance from legitimate drug channels; or*

- *Individuals are taking the drug or drugs containing such a substance on their own initiative rather than on the basis of medical advice from a practitioner licensed by law to administer such drugs in the course of his professional practice; or*

- *The drug or drugs containing such a substance are new drugs so related in their action to a drug or drugs already listed as having a potential for abuse to make it likely that the drug will have the same potentiality for abuse as such drugs, thus making it reasonable to assume that there may be significant diversions from legitimate channels, significant use contrary to or without medical advice, or that it has a substantial capability of creating hazards to the health of the user or to the safety of the community.*

Of course, evidence of actual abuse of a substance is indicative that a drug has a potential for abuse.

In its recommendation, the HHS analyzed and evaluated data on marijuana as applied to each of the above four criteria. The analysis presented in the recommendation (HHS, 2015) is discussed below:

1. *There is evidence that individuals are taking the drug or drugs containing such a substance in amounts sufficient to create a hazard to their health or to the safety of other individuals or of the community.*

⁴⁰ See *Alliance for Cannabis Therapeutics v. DEA*, 15 F.3d 1131 (D.C. Cir. 1994).

⁴¹ See *Americans for Safe Access v. DEA*, 706 F.3d 438 (D.C. Cir. 2013)(rhg den. 2013).

⁴² The terms Δ^9 -THC and THC are used interchangeably throughout this document.

The HHS stated that some individuals are taking marijuana in amounts sufficient to create a hazard to their health and to the safety of other individuals and the community. Data from national databases on actual abuse of marijuana support the idea that a large number of individuals use marijuana. In its recommendation (HHS, 2015), the HHS presented data from the National Survey on Drug and Health (NSDUH) of the Substance Abuse and Mental Health Services Administration (SAMHSA) and the Monitoring the Future (MTF) survey of the National Institute on Drug Abuse (NIDA), and the DEA has since updated this information. The most recent data from SAMHSA's NSDUH in 2014 reported that marijuana was the most used illicit drug. Among Americans aged 12 years and older, an estimated 22.2 million Americans used marijuana within the past month according to the 2014 NSDUH. In 2004, an estimated 14.6 million individuals reported using marijuana within the month prior to the study. The estimated rates in 2014 thus reflect an increase of approximately 7.6 million individuals over a 10-year period. According to the 2013 NSDUH report, an estimated 19.8 million individuals reported using marijuana. Thus, over a period of one year (2013 NSDUH–2014 NSDUH), there was an estimated increase of 2.4 million individuals in the United States using marijuana.

The results from the 2015 Monitoring the Future survey of 8th, 10th, and 12th grade students indicate that marijuana was the most widely used illicit drug in these age groups. Current monthly use was 6.5% of 8th graders, 14.8% of 10th graders, and 21.3% of 12th graders. The Treatment Episode Data Set (TEDS) in 2013 reported that marijuana abuse was the primary factor in 16.8 percent of non-private substance-abuse treatment facility admissions. In 2011, SAMHSA's Drug Abuse Warning Network (DAWN) reported that marijuana was mentioned in 36.4% (455,668 out of approximately 1.25 million) of illicit drug-related Emergency Department (ED) visits.

Data on the extent and scope of marijuana abuse are presented under Factors 4 and 5 of this analysis. Discussion of the health effects of marijuana is presented under Factor 2, and the assessment of risk to the public health posed by acute and chronic marijuana abuse is presented under Factor 6 of this analysis.

2. There is significant diversion of the drug or drugs containing such a substance from legitimate drug channels.

In accordance with the CSA, the only lawful source of marijuana in the United

States is that produced and distributed for research purposes under the oversight of NIDA and in conformity with United States obligations under the Single Convention on Narcotic Drugs.⁴³ The HHS stated that there is a lack of significant diversion from legitimate drug sources, but that this is likely due to high availability of marijuana from illicit sources. Marijuana is not an FDA-approved drug product. Neither a New Drug Application (NDA) nor a Biologics License Application (BLA) has been approved for marketing in the United States. However, the marijuana used for nonclinical and clinical research represents a very small amount of the total amount of marijuana available in the United States and therefore information about marijuana diversion from legitimate sources is limited or not available.

The DEA notes that the magnitude of the demand for illicit marijuana is evidenced by information presented from a number of databases presented under Factor 4. Briefly, marijuana is the most commonly used illegal drug in the United States. It is also the most commonly used illicit drug by American high schoolers. Marijuana is the most frequently identified drug in state, local, and federal forensic laboratories, with increasing amounts of both domestically grown and of illicitly smuggled marijuana.

Given that marijuana has long been the most widely trafficked and abused controlled substance in the United States, and that all aspects of such illicit activity are entirely outside of the closed system of distribution mandated by the CSA, it may well be the case that there is little thought given to diverting marijuana from the small supplies produced for legitimate research purposes. Thus, the lack of data indicating diversion of marijuana from legitimate channels to the illicit market is not indicative of a lack of potential for abuse of the drug.

3. Individuals are taking the drug or drugs containing such a substance on their own initiative rather than on the basis of medical advice from a practitioner licensed by law to administer such drugs in the course of his professional practice.

The HHS stated that the FDA has not evaluated or approved an NDA or BLA for marijuana for any therapeutic indication. Consistent with federal law, therefore, an individual legitimately can take marijuana based on medical advice from a practitioner only by participating

in research that is being conducted under an Investigational New Drug (IND) application. The HHS noted that there are several states as well as the District of Columbia which have passed laws allowing for individuals to use marijuana for purported "medical" use under certain circumstances, but data are not available yet to determine the number of individuals using marijuana under these state laws. Nonetheless, according to 2014 NSDUH data, 22.2 million American adults currently use marijuana (SAMHSA, 2015a). Based on the large number of individuals who use marijuana and the lack of an FDA-approved drug product, the HHS concluded that the majority of individuals using marijuana do so on their own initiative rather than by following medical advice from a licensed practitioner.

4. The drug or drugs containing such a substance are new drugs so related in their action to a drug or drugs already listed as having a potential for abuse to make it likely that the drug will have the same potentiality for abuse as such drugs, thus making it reasonable to assume that there may be significant diversions from legitimate channels, significant use contrary to or without medical advice, or that it has a substantial capability of creating hazards to the health of the user or to the safety of the community.

Marijuana and its primary psychoactive ingredient, Δ^9 -THC, are controlled substances in schedule I under the CSA.

The HHS stated that one approved, marketed drug product contains synthetic Δ^9 -THC, also known as dronabinol, and another approved, marketed drug product contains a cannabinoid-like synthetic compound that is structurally related to Δ^9 -THC, the main active component in marijuana. Both products are controlled under the CSA.

Marinol is a schedule III drug product containing synthetic Δ^9 -THC (dronabinol) formulated in sesame oil in soft gelatin capsules. Marinol was approved by the FDA in 1985 for the treatment of nausea and vomiting associated with cancer chemotherapy in patients who did not respond to conventional anti-emetic treatments. In 1992, FDA approved Marinol for the treatment of anorexia associated with weight loss in patients with acquired immunodeficiency syndrome (AIDS). Marinol was originally placed into schedule II and later rescheduled to schedule III under the CSA due to the low reports of abuse relative to marijuana.

⁴³ See 76 FR 51403, 51409–51410 (2011) (discussing cannabis controls required under the Single Convention).

Cesamet is a drug product containing the schedule II substance nabilone, a synthetic substance structurally related to Δ^9 -THC. Cesamet was approved for marketing by the FDA in 1985 for the treatment of nausea and vomiting associated with cancer chemotherapy. All other naturally occurring cannabinoids in marijuana and their synthetic equivalents with similar chemical structure and pharmacological activity are already included as schedule I drugs under the CSA.

B. Abuse Liability Studies

In addition to the indicators suggested by the CSA's legislative history, data as to preclinical and clinical abuse liability studies, as well as actual abuse, including clandestine manufacture, trafficking, and diversion from legitimate sources, are considered in this factor.

Abuse liability evaluations are obtained from studies in the scientific and medical literature. There are many preclinical measures of a drug's effects that when taken together provide an accurate prediction of the human abuse liability. Clinical studies of the subjective and reinforcing effects in humans and epidemiological studies provide quantitative data on abuse liability in humans and some indication of actual abuse trends. Both preclinical and clinical studies have clearly demonstrated that marijuana and Δ^9 -THC possess the attributes associated with drugs of abuse: They function as a positive reinforcer to maintain drug-seeking behavior, they function as a discriminative stimulus, and they have dependence potential.

Preclinical and most clinical abuse liability studies have been conducted with the psychoactive constituents of marijuana, primarily Δ^9 -THC and its metabolite, 11-hydroxy- Δ^9 -THC. Δ^9 -THC's subjective effects are considered to be the basis for marijuana's abuse liability. The following studies provide a summary of that data.

1. Preclinical Studies

Δ^9 -THC, the primary psychoactive component in marijuana, is an effective reinforcer in laboratory animals, including primates and rodents, as these animals will self-administer Δ^9 -THC. These animal studies both predict and support the observations that Δ^9 -THC, whether smoked as marijuana or administered by other routes, produces reinforcing effects in humans. Such reinforcing effects can account for the repeated abuse of marijuana.

a. Drug Discrimination Studies

The drug discrimination paradigm is used as an animal model of human subjective effects (Solinas et al., 2006) and is a method where animals are able to indicate whether a test drug is able to produce physical or psychological changes similar to a known drug of abuse. Animals are trained to press one bar (in an operant chamber) when they receive a known drug of abuse and another bar when they receive a placebo. When a trained animal receives a test drug, if the drug is similar to the known drug of abuse, it will press the bar associated with the drug.

Discriminative stimulus effects of Δ^9 -THC have specificity for the pharmacological effects of cannabinoids found in marijuana (Balster and Prescott, 1992; Browne and Weissman, 1981; Wiley et al., 1993; Wiley et al., 1995). As mentioned by the HHS, the discriminative stimulus effects of cannabinoids appear to be unique because abused drugs of other classes including stimulants, hallucinogens, opioids, benzodiazepines, barbiturates, NMDA antagonists, and antipsychotics do not fully substitute for Δ^9 -THC.

Laboratory animals including monkeys (McMahon et al., 2009), mice (McMahon et al., 2008), and rats (Gold et al., 1992) are able to discriminate cannabinoids from other drugs and placebo. The major active metabolite of Δ^9 -THC, 11-hydroxy- Δ^9 -THC, generalizes to Δ^9 -THC (Browne and Weissman, 1981). In addition, according to the HHS, twenty-two other cannabinoids found in marijuana also substitute for Δ^9 -THC. At least one cannabinoid, CBD, does not substitute for Δ^9 -THC in rats (Vann et al., 2008).

b. Self-Administration Studies

Animal self-administration behavior associated with a drug is a commonly used method for evaluating if the drug produces rewarding effects and for predicting abuse potential (Balster, 1991; Balster and Bigelow, 2003). Drugs that are self-administered by animals are likely to produce rewarding effects in humans. As mentioned in the HHS review document, earlier attempts to demonstrate self-administration of Δ^9 -THC were unsuccessful and confounded by diet restrictions, animal restraint, and known analgesic activity of Δ^9 -THC at testing doses (Tanda and Goldberg, 2003; Justinova et al., 2003). Self-administration of Δ^9 -THC was first demonstrated by Tanda et al. (2000). Tanda et al. (2000) showed that squirrel monkeys that were initially trained to self-administer cocaine (30 μ g/kg, i.v.) self-administered 2 μ g/kg Δ^9 -THC (i.v.)

and at a rate of 30 injections per one hour session. Tanda et al. (2000) used a lower dose of Δ^9 -THC that was rapidly delivered (0.2 ml injection over 200 ms) than in previous self-administration studies such that analgesic activity of Δ^9 -THC was not a confounding factor. The authors also stated that the doses were comparable to those doses used by humans who smoke marijuana. A CB1 receptor antagonist (SR141716) blocked this rewarding effect of THC.

Justinova et al. (2003) were able to demonstrate self-administration of Δ^9 -THC in drug-naïve squirrel monkeys (no previous exposure to other drugs). The authors tested the monkeys with several doses of Δ^9 -THC (1, 2, 4, 8, and 16 μ g/kg, i.v.) and found that the maximal rates of self-administration were observed with the 4 μ g/kg/infusion. Subsequently, Braida et al. (2004) reported that rats will self-administer Δ^9 -THC when delivered intracerebroventricularly (i.c.v.), but only at the lowest doses tested (0.01–0.02 μ g/infusion, i.c.v.).

Self-administration behavior with Δ^9 -THC was found to be antagonized in rats and squirrel monkeys by rimonabant (SR141716A, CB1 antagonist) and the opioid antagonists (naloxone and naltrexone) (Tanda et al., 2000; Braida et al., 2004; Justinova et al., 2004).

c. Conditioned Place Preference Studies

Conditioned place preference (CPP) is a behavioral assay where animals are given the opportunity to spend time in two distinct environments: one where they previously received a drug and one where they received a placebo. If the drug is reinforcing, animals in a drug-free state will choose to spend more time in the environment paired with the drug when both environments are presented simultaneously.

CPP has been demonstrated with Δ^9 -THC in rats but only at low doses (0.075–1.0 mg/kg, i.p.; Braida et al., 2004). Rimonabant (0.25–1.0 mg/kg, i.p.) and naloxone (0.5–2.0 mg/kg, i.p.) antagonized Δ^9 -THC-mediated CPP (Braida et al., 2004). However, in another study with rats, rimonabant was demonstrated to induce CPP at doses ranging from 0.25–3.0 mg/kg (Cheer et al., 2000). Mice without μ -opioid receptors did not exhibit CPP to Δ^9 -THC (paired with 1 mg/kg Δ^9 -THC, i.p.) (Ghozland et al., 2002).

2. Clinical Studies

In its scientific review (HHS, 2015), the HHS provided a list of common subjective psychoactive responses to cannabinoids based on information from several references (Adams and Martin, 1996; Gonzalez, 2007; Hollister, 1986;

Hollister, 1988; Institute of Medicine, 1982). Furthermore, Maldonado (2002) characterized these subjective responses as pleasurable to most humans and are generally associated with drug-seeking and/or drug-taking. Later studies (Scherrer et al., 2009; Zeiger et al., 2010) reported that high levels of positive psychoactive effects correlate with increased marijuana use, abuse, and dependence. The list of the common subjective psychoactive effects provided by the HHS (HHS, 2015) is presented below:

(1) *Disinhibition, relaxation, increased sociability, and talkativeness.*

(2) *Increased merriment and appetite, and even exhilaration at high doses.*

(3) *Enhanced sensory perception, which can generate an increased appreciation of music, art, and touch.*

(4) *Heightened imagination, which can lead to a subjective sense of increased creativity.*

(5) *Initial dizziness, nausea, tachycardia, facial flushing, dry mouth, and tremor.*

(6) *Disorganized thinking, inability to converse logically, time distortions, and short-term memory impairment.*

(7) *Ataxia and impaired judgment, which can impede driving ability or lead to an increase in risk-taking behavior.*

(8) *Illusions, delusions, and hallucinations that intensify with higher doses.*

(9) *Emotional lability, incongruity of affect, dysphoria, agitation, paranoia, confusion, drowsiness, and panic attacks, which are more common in inexperienced or high-dosed users.*

The HHS mentioned that marijuana users prefer higher concentrations of the principal psychoactive component (Δ^9 -THC) over lower concentrations. In a clinical study with marijuana users ($n = 12$, usage ranged from once a month to 4 times a week), subjects were given a choice of 1.95% Δ^9 -THC marijuana or 0.63% Δ^9 -THC marijuana after sampling both marijuana cigarettes in two choice sessions. The marijuana cigarette with high THC was chosen in 21 out of 24 choice sessions or 87.5% of the time (Chait and Burke, 1994). Furthermore, in a double-blind study, frequent marijuana users ($n = 11$, usage at least 2 times per month with at least 100 occasions) when given a low-dose of oral Δ^9 -THC (7.5 mg) were able to distinguish the psychoactive effects better than occasional users ($n = 10$, no use within the past 4 years with 10 or fewer lifetime uses) and also experienced fewer sedative effects (Kirk and de Wit, 1999).

Marijuana has also been recognized by scientific experts to have withdrawal symptoms (negative reinforcement)

following moderate and heavy use. As discussed further in Factor 7, the DEA notes that the American Psychiatric Association's (APA) Diagnostic and Statistical Manual of Mental Disorders, Fifth Edition (DSM-5) included a list of withdrawal symptoms following marijuana [cannabis] use (DSM-5, 2013).

C. Actual Abuse of Marijuana—National Databases Related to Marijuana Abuse and Trafficking

Marijuana continues to be the most widely used illicit drug. Evidence of actual abuse can be defined by episodes/mentions in databases indicative of abuse/dependence. The HHS provided in its recommendation (HHS, 2015) information relevant to actual abuse of marijuana including data results from the National Survey on Drug Use and Health (NSDUH), a Monitoring the Future (MTF) survey, the Drug Abuse Warning Network (DAWN), and the Treatment Episode Data Set (TEDS). These data sources provide quantitative information on many factors related to abuse of a particular substance, including incidence and patterns of use, and profile of the abuser of specific substances. The DEA is providing updated information from these databases in this discussion. The DEA also includes data on trafficking and illicit availability of marijuana from DEA databases including the National Forensic Laboratory Information System (NFLIS) and the National Seizure System (NSS), formerly the Federal-wide Drug Seizure System (FDSS), as well as other sources of data specific to marijuana, including the Potency Monitoring Project and the Domestic Cannabis Eradication and Suppression Program (DCE/SP).

1. National Survey on Drug Use and Health (NSDUH)

The National Survey on Drug Use and Health (NSDUH) is conducted annually by the Department of Health and Human Service's Substance Abuse and Mental Health Services Administration (SAMHSA). SAMHSA is the primary source of estimates of the prevalence and incidence of pharmaceutical drugs, illicit drugs, alcohol, and tobacco use in the United States. The survey is based on a nationally representative sample of the civilian, non-institutionalized population 12 years of age and older. The survey excludes homeless people who do not use shelters, active military personnel, and residents of institutional group quarters such as jails and hospitals.

According to the 2014 NSDUH report, marijuana was the most commonly used and abused illicit drug. That data showed that there were 22.2 million people who were past month users (8.4%) among those aged 12 and older in the United States. (Note: NSDUH figures on marijuana use include hashish use; the relative proportion of hashish use to marijuana use is very low). Marijuana had the highest rate of past-year dependence or abuse in 2014. The NSDUH report estimates that 3.0 million people aged 12 or older used an illicit drug for the first time in 2014; a majority (70.3%) of these past year initiates reported that their first drug used was marijuana. Among those who began using illicit drugs in the past year, 65.6%, 70.3%, and 67.6% reported marijuana as the first illicit drug initiated in 2012, 2013, and 2014 respectively. In 2014, the average age of marijuana initiates among 12- to 49-year-olds was 18.5 years. These usage rates and demographics are relevant in light of the risks presented.

Marijuana had the highest rate of past year dependence or abuse of any illicit drug in 2014. The 2014 NSDUH report stated that 4.2 million persons were classified with substance dependence or abuse of marijuana in the past year (representing 1.6% of the total population aged 12 or older, and 59.0% of those classified with illicit drug dependence or abuse) based on criteria specified in the Diagnostic and Statistical Manual of Mental Disorders, 4th edition (DSM-IV).

Among past year marijuana users age 12 or older, 18.5% used marijuana on 300 or more days within the previous 12 months in 2014. This translates into 6.5 million people using marijuana on a daily or almost daily basis over a 12-month period, significantly more than the estimated 5.7 million daily or almost daily users in just the year before. Among past month marijuana users, 41.6% (9.2 million) used the drug on 20 or more days in the past month, a significant increase from the 8.1 million who used marijuana 20 days or more in 2013.

2. Monitoring the Future (MTF)

Monitoring the Future (MTF) is an ongoing study which is funded under a series of investigator-initiated competing research grants from the National Institute on Drug Abuse (NIDA). MTF tracks drug use trends among American adolescents in the 8th, 10th, and 12th grades. According to its 2015 survey results, marijuana was the most commonly used illicit drug, as was the case in previous years. Approximately 6.5% of 8th graders,

14.8% of 10th graders, and 21.3% of 12th graders surveyed in 2015 reported marijuana use during the past month prior to the survey. A number of high school students in 2015 also reported daily use in the past month, including 1.1%, 3.0%, and 6.0% of 8th, 10th, and 12th graders, respectively.

3. Drug Abuse Warning Network (DAWN), Emergency Department (ED) Visits

The Drug Abuse Warning Network (DAWN) is a public health surveillance system that monitors drug-related hospital emergency department (ED) visits to track the impact of drug use, misuse, and abuse in the United States. For the purposes of DAWN, the term "drug abuse" applies if the following conditions are met: (1) The case involved at least one of the following: use of an illegal drug, use of a legal drug contrary to directions, or inhalation of a non-pharmaceutical substance; and (2) the substance was used for one of the following reasons: because of drug dependence, to commit suicide (or attempt to commit suicide), for recreational purposes, or to achieve other psychic effects. Importantly, many factors can influence the estimates of ED visits, including trends in overall use of a substance as well as trends in the reasons for ED usage. For instance, some drug users may visit EDs for life-threatening issues while others may visit to seek care for detoxification because they needed certification before entering treatment. Additionally, DAWN data do not distinguish the drug responsible for the ED visit from other drugs that may have been used concomitantly. As stated in a DAWN report, "Since marijuana/hashish is frequently present in combination with other drugs, the reason for the ED visit may be more relevant to the other drug(s) involved in the episode."

In 2011, marijuana was involved in 455,668 ED visits out of 2,462,948 total

ED visits involving all abuse or misuse in the United States and out of 1.25 million visits involving abuse or misuse of illicit drugs (excluding alcohol-related visits), as estimated by DAWN. This is lower than the number of ED visits involving cocaine (505,224) and higher than the number of ED visits involving heroin (258,482) and stimulants (e.g., amphetamine, methamphetamine) (159,840). Visits involving the other major illicit drugs, such as MDMA, GHB, LSD and other hallucinogens, PCP, and inhalants, were much less frequent, comparatively.

In young patients, marijuana is the illicit drug most frequently involved in ED visits, according to DAWN estimates, with 240.2 marijuana-related ED visits per 100,000 population ages 12 to 17, 443.8 per 100,000 population ages 18 to 20, and 446.9 per 100,000 population ages 21 to 24.

4. Treatment Episode Data Set (TEDS) System

The Treatment Episode Data Set (TEDS) system is part of the SAMHSA Drug and Alcohol Services Information System and is a national census of annual admissions to state licensed or certified, or administratively tracked, substance abuse treatment facilities. The TEDS system contains information on patient demographics and substance abuse problems of admissions to treatment for abuse of alcohol and/or drugs in facilities that report to state administrative data systems. For this database, the primary substance of abuse is defined as the main substance of abuse reported at the time of admission. TEDS also allows for the recording of two other substances of abuse (secondary and tertiary).

In 2011, the TEDS system included 1,928,792 admissions to substance abuse treatment; in 2012 there were 1,801,385 admissions; and in 2013 there were 1,683,451 admissions. Marijuana/hashish was the primary substance of

abuse for 18.3% (352,397) of admissions in 2011; 17.5% (315,200) in 2012; and 16.8% (281,991) in 2013. Of the 281,991 admissions for marijuana/hashish treatment in 2013, 24.3% used marijuana/hashish daily. Among those treated for marijuana/hashish as the primary substance in 2013, 27.4% were ages 12 to 17 years and 29.7% were ages 18 to 24 years. Those admitted for marijuana/hashish were mostly male (72.6%) and non-Hispanic (82.2%). Non-hispanic whites (43.2%) represented the largest ethnic group of marijuana admissions.

5. Forensic Laboratory Data

Data on marijuana seizures from federal, state, and local forensic laboratories have indicated that there is significant trafficking of marijuana. The National Forensic Laboratory System (NFLIS) is a program sponsored by the Drug Enforcement Administration's Office of Diversion Control. NFLIS systematically collects drug identification results and associated information from drug exhibits encountered by law enforcement and analyzed in federal, state, and local forensic laboratories. NFLIS is a comprehensive information system that includes data from 278 individual forensic laboratories that report more than 91% of the drug caseload in the U.S. NFLIS captures data for all drugs and chemicals identified and reported by forensic laboratories. More than 1,700 unique substances are represented in the NFLIS database.

Data from NFLIS showed that marijuana was the most frequently identified drug in federal, state, and local laboratories from January 2004 through December 2014. Marijuana accounted for between 29.47% and 34.84% of all drug exhibits analyzed annually during that time frame (Table 1).

Table 1. NFLIS Federal, State and Local Forensic Laboratory Data of Marijuana Reports (other than hashish)

Year	Reports	Percent of Total Reports
2004	454,582	34.42%
2005	483,134	32.53%
2006	520,060	32.55%
2007	525,668	33.66%
2008	526,420	34.07%
2009	536,888	34.30%
2010	544,418	34.91%
2011	495,937	33.42%
2012	485,591	32.02%
2013	452,839	30.70%
2014	432,989	29.27%
2015*	341,162	26.73%

NFLIS database queried 03-23-2016, by date of submission, all drugs reported

*2015 data are still being reported to NFLIS due to normal lag time.

Since 2004, the total number of reports of marijuana and the amount of marijuana encountered federally has remained high (see data from Federal-wide Drug Seizure System and Domestic Cannabis Eradication and Suppression Program below).

6. Federal-Wide Drug Seizure System

The Federal-wide Drug Seizure System (FDSS) contains information about drug seizures made within the jurisdiction of the United States by the Drug Enforcement Administration, the

Federal Bureau of Investigation, United States Customs and Border Protection, and United States Immigration and Customs Enforcement. It also records maritime seizures made by the United States Coast Guard. Drug seizures made by other Federal agencies are included in the FDSS database when drug evidence custody is transferred to one of the agencies identified above. FDSS is now incorporated into the National Seizure System (NSS), which is a repository for information on

clandestine laboratory and contraband (chemicals and precursors, currency, drugs, equipment and weapons). FDSS reports total federal drug seizures [in kilograms (kg)] of substances such as cocaine, heroin, MDMA, methamphetamine, and cannabis (marijuana and hashish). The yearly volume of cannabis seized (Table 2), consistently exceeding a thousand metric tons per year, shows that cannabis is very widely trafficked in the United States.

Table 2. Total Federal Seizures of Cannabis (Expressed in Kg)
(Source: NSS, U.S. Seizures, EPIC System Portal, queried 08-05-2015)

	2010	2011	2012	2013	2014
Cannabis	4,071,328	3,622,256	2,756,439	2,622,494	1,768,277
Marijuana	4,070,850	3,621,322	2,754,457	2,618,340	1,767,741
Hashish	478	934	1,982	4,154	536

7. Potency Monitoring Project

The University of Mississippi's Potency Monitoring Project (PMP), through a contract with the National Institute on Drug Abuse (NIDA), analyzes and compiles data on the

Δ^9 -THC concentrations of marijuana, hashish and hash oil samples provided by DEA regional laboratories and by state and local police agencies. After 2010, PMP has analyzed only marijuana samples provided by DEA regional laboratories. As indicated in Figure 1,

the percentage of Δ^9 -THC increased from 1995 to 2010 with an average THC content of 3.75% in 1995 and 9.53% in 2010. In examining marijuana samples only provided by DEA laboratories, the average Δ^9 -THC content was 3.96% in 1995 in comparison to 11.16% in 2015.

Figure 1. Average Percentage of Δ^9 -THC in Samples of Seized Marijuana (1995 – 2015)*

(Source: The University of Mississippi Potency Monitoring Program, Quarterly Report # 131)

*PMP discontinued analysis of state samples after 2010.

**Data for 2015 are incomplete. Figure 1 contains percentage of Δ^9 -THC data through Dec. 22. Due to lack of funding, 4,177 samples haven't yet been analyzed.

8. The Domestic Cannabis Eradication and Suppression Program

The Domestic Cannabis Eradication and Suppression Program (DCE/SP) was established in 1979 to reduce the supply of domestically cultivated marijuana in the United States. The program was designed to serve as a partnership between federal, state, and local

agencies. Only California and Hawaii were active participants in the program at its inception. However, by 1982 the program had expanded to 25 states and by 1985 all 50 states were participants. Cannabis is cultivated in remote locations and frequently on public lands and illicitly grown in all states. Data provided by the DCE/SP (Table 3) show

that in the United States in 2014, there were 3,904,213 plants eradicated in outdoor cannabis cultivation areas compared to 2,597,798 plants in 2000. Significant quantities of marijuana were also eradicated from indoor cultivation operations. There were 396,620 indoor plants eradicated in 2014 compared to 217,105 eradicated in 2000.

Table 3. Domestic Cannabis Eradication, Outdoor and Indoor Plants Seized, 2000–2014 (Source: Domestic Cannabis Eradication/Suppression Program)

	2000	2001	2002	2003	2004
Outdoor	2,597,798	3,068,632	3,128,800	3,427,923	2,996,144
Indoor	217,105	236,128	213,040	223,183	203,896
Total	2,814,903	3,304,760	3,341,840	3,651,106	3,200,040

	2005	2006	2007	2008	2009
Outdoor	3,938,151	4,830,766	6,599,599	7,562,322	9,980,038
Indoor	270,935	400,892	434,728	450,986	414,604
Total	4,209,086	5,231,658	7,034,327	8,013,308	10,394,642

	2010	2011	2012	2013	2014
Outdoor	9,866,766	6,226,288	3,631,582	4,033,513	3,904,213
Indoor	462,419	509,231	302,377	361,727	396,620
Total	10,329,185	6,735,519	3,933,959	4,395,240	4,300,833

The recent statistics from these various surveys and databases show that marijuana continues to be the most commonly used illicit drug, with considerable rates of heavy abuse and dependence. They also show that marijuana is the most readily available illicit drug in the United States.

Petitioners' Major Comment in Relation to Factor 1 and the Government's Responses

(1) The petitioner states on pages 1–2 of the petition that “[p]ure THC (Marinol), the primary psychoactive ingredient in marijuana has been placed in Schedule III. However, unlike Marinol, marijuana has other cannabinoids that help to mitigate the psychoactive effects of THC and reduce the potential for abuse. Therefore, the THC in marijuana can not have the high potential for abuse required for placement in Schedule I.”

First, the petitioners failed to review the indicators of abuse potential, as discussed in the legislative history of the CSA. The petitioners did not use data on marijuana usage, diversion, psychoactive properties, and dependence in their evaluation of marijuana abuse potential. The HHS and the DEA discuss those indicators above in this factor. HHS's evaluation of the full range of data led HHS and DEA to conclude that marijuana has a high potential for abuse.

Second, the HHS indicated that modulating effects of the other cannabinoids in marijuana on Δ^9 -THC have not been demonstrated in controlled studies. Specifically, HHS concluded in its 8-factor analysis that

“any possible mitigation of delta-9-THC's psychoactive effects by CBD will not occur for most marijuana users.”

Marinol was rescheduled from schedule II to schedule III on July 2, 1999 (64 FR 35928, DEA 1999). In assessing Marinol, HHS compared Marinol to marijuana on several aspects of abuse potential and found that major differences between the two, such as formulation, availability, and usage, contribute to differences in abuse potential. The psychoactive effects from smoking are generally more rapid and intense than those that occur through oral administration (HHS, 2015; Wesson and Washburn, 1990; Hollister and Gillespie, 1973). Therefore, as concluded by both the HHS and the DEA, the delayed onset of action and longer duration of action from an oral dose of Marinol may contribute in limiting the abuse potential of Marinol relative to marijuana, which is most often smoked. The HHS also stated that the extraction and purification of dronabinol from the encapsulated sesame oil mixture of Marinol is highly complex and difficult and that the presence of sesame oil mixture may preclude the smoking of Marinol-laced cigarettes.

Additionally, the FDA approved a New Drug Application (NDA) for Marinol, indicating a legitimate medical use for Marinol in the United States and allowing for Marinol to be rescheduled into schedule II and subsequently into schedule III of the CSA. The HHS mentioned that marijuana and Marinol differ on a wide variety of factors and these differences are major reasons for

differential scheduling of marijuana and Marinol. Marijuana, as discussed more fully in Factors 3 and 6, does not have a currently accepted medical use in the United States, is highly abused, and has a lack of accepted safety.

Finally, the DEA notes that under the CSA, for a substance to be placed in schedule II, III, IV, or V, it must have a currently accepted medical use in treatment in the United States.⁴⁴ As DEA has previously stated, Congress established only one schedule, schedule I, for drugs of abuse with “no currently accepted medical use in treatment in the United States.” 76 FR 40552 (2011). Thus, any attempt to compare the relative abuse potential of schedule I substance to that of a substance in another schedule is inconsequential since a schedule I substance must remain in schedule I until it has been found to have a currently accepted medical use in treatment in the United States.

Factor 2: Scientific Evidence of the Drug's Pharmacological Effects, if Known

The HHS stated that there are large amounts of scientific data on the neurochemistry, mechanistic effects, toxicology, and pharmacology of marijuana. A scientific evaluation, as conducted by the HHS and the DEA, of marijuana's neurochemistry, human and animal behavioral pharmacology, central nervous system effects, and other pharmacological effects (e.g. cardiovascular, immunological effects) is presented below.

⁴⁴ See *Americans for Safe Access*, 706 F.3d at 440.

Neurochemistry

Marijuana contains numerous constituents such as cannabinoids that have a variety of pharmacological actions. The HHS stated that different marijuana samples derived from various cultivated strains may differ in their chemical constituents including Δ^9 -THC and other cannabinoids. Therefore marijuana products from different strains will have different biological and pharmacological effects. The chemical constituents of marijuana are discussed further in Factor 3.

The primary site of action for cannabinoids such as Δ^9 -THC is at the cannabinoid receptor. Two cannabinoid receptors, CB1 and CB2, have been identified and characterized (Battista et al., 2012; Piomelli, 2005) and are G-protein-coupled receptors. Activation of these inhibitory G-protein-coupled receptors inhibits adenylate cyclase activity, which prevents conversion of ATP to cyclic AMP. Cannabinoid receptor activation also results in inhibition of N- and P/Q-type calcium channels and activates inwardly rectifying potassium channels (Mackie et al., 1995; Twitchell et al., 1997). The HHS mentioned that inhibition of N-type calcium channels decreases neurotransmitter release and this may be the underlying mechanism in the ability of cannabinoids to inhibit acetylcholine, norepinephrine and glutamate from specific areas of the brain. These cellular actions may underlie the antinociceptive and psychoactive effects of cannabinoids. Δ^9 -THC acts as an agonist at cannabinoid receptors.

CB1 receptors are primarily found in the central nervous system and are located mainly in the basal ganglia, hippocampus and cerebellum of the brain (Howlett et al., 2004). CB1 receptors are also located in peripheral tissues such as the immune system (De Petrocellis and Di Marzo, 2009), but the concentration of CB1 receptors there is considerably lower than in the central nervous system (Herkenham et al., 1990; 1992). CB2 receptors are found primarily in the immune system and predominantly in B lymphocytes and natural killer cells (Bouaboula et al., 1993). CB2 receptors are also found in the central nervous system, primarily in the cerebellum and hippocampus (Gong et al., 2006).

Two endogenous ligands to the cannabinoid receptors, anandamide and arachidonyl glycerol (2-AG), were identified in 1992 (Devane et al., 1992) and 1995 (Mechoulam et al., 1995), respectively. Anandamide is a low-efficacy agonist (Brievogel and Childers,

2000) and 2-AG is a high efficacy agonist (Gonsiorek et al., 2000) to the cannabinoid receptors. These endogenous ligands are present in both the central nervous system and in the periphery (HHS, 2015).

Δ^9 -THC and cannabidiol (CBD) are two of the major cannabinoids in marijuana. Δ^9 -THC is the major psychoactive cannabinoid (Wachtel et al., 2002). Δ^9 -THC has similar affinity for CB1 and CB2 receptors and acts as a weak agonist at CB2 receptors. The HHS indicated that activation of CB1 receptors mediates psychotropic effects of cannabinoids. CBD has low affinity for both CB1 and CB2 receptors. CBD has antagonistic effects at CB1 receptors, and some inverse agonistic properties at CB2 receptors.

Animal Behavioral Effects

Animal abuse potential studies (drug discrimination, self-administration, conditioned place preference) are discussed more fully in Factor 1. Briefly, it was consistently demonstrated that Δ^9 -THC, the primary psychoactive component in marijuana, and other cannabinoids in marijuana have a distinct drug discriminative profile. In addition, animals self-administer Δ^9 -THC, and Δ^9 -THC in low doses produces conditioned place preference.

Central Nervous System Effects

Psychoactive Effects

The clinical psychoactive effects of marijuana are discussed more fully in Factor 1. Briefly, the psychoactive effects from marijuana use are considered pleasurable and associated with drug-seeking or drug-taking (HHS, 2015; Maldonado, 2002). Further, it was noted by HHS that marijuana users prefer higher concentrations of the principal psychoactive component (Δ^9 -THC) over lower concentrations (HHS, 2015).

Studies have evaluated psychoactive effects of THC in the presence of high CBD, CBC, or CBN ratios. Even though some studies suggest that CBD may decrease some of Δ^9 -THC's psychoactive effects, the HHS found that the ratios of CBD to Δ^9 -THC administered in the studies were not comparable to the amounts found in marijuana used by most people (Dalton et al., 1976; Karniol et al., 1974; Zwardi et al., 1982). In fact, the CBD ratios in these studies are significantly higher than the CBD found in most marijuana currently found on the streets (Mehmedic et al., 2010). HHS indicated that most of the marijuana available on the street has a high THC and low CBD content and therefore any

lessening of THC's psychoactive effects by CBD will not occur for most marijuana users (HHS, 2015). Dalton et al. (1976) reported that when volunteers smoked cigarettes with a ratio of 7 CBD to 1 Δ^9 -THC (0.15 mg/kg CBD and 0.025 mg/kg Δ^9 -THC), there was a significant decrease in ratings of acute subjective effects and achieving a "high" in comparison to smoking Δ^9 -THC alone. In oral administration studies, the subjective effects and anxiety produced by combination of CBD and THC in a ratio of at least 1:2 CBD to Δ^9 -THC (15, 30, 60 mg CBD to 30 mg Δ^9 -THC; Karniol et al., 1974) or a ratio of 2:1 CBD to Δ^9 -THC (1 mg/kg CBD to 0.5 mg/kg Δ^9 -THC; Zuardi et al., 1982) are less than those produced by Δ^9 -THC administered alone.

In one study (Ilan et al., 2005), the authors calculated the naturally occurring concentrations of CBC and CBD in marijuana cigarettes with either 1.8 or 3.6% Δ^9 -THC by weight. The authors varied the concentrations of CBC and CBD for each concentration of Δ^9 -THC in the marijuana cigarettes. Administrations in healthy marijuana users (n=23) consisted of either: (1) Low CBC (0.1% by weight) and low CBD (0.2% by weight); (2) high CBC (0.5% by weight) and low CBD; (3) low CBC and high CBD (1.0% by weight); or 4) high CBC and high CBD and the users were divided into low Δ^9 -THC (1.8% by weight) and high Δ^9 -THC (3.6% by weight) groups. Subjective psychoactive effects were significantly greater for all groups in comparison to placebo and there were no significant differences in effects among the treatments (Ilan et al., 2005).

The HHS also referred to a study with Δ^9 -THC and cannabidiol (CBD) (Karniol et al., 1975). In this study, oral administration of either 12.5, 25, or 50 mg CBD combined with 25 mg Δ^9 -THC (ratio of at least 1:2 CBD to Δ^9 -THC) significantly increased subjective psychoactive ratings of Δ^9 -THC compared to Δ^9 -THC alone (Karniol et al., 1975).

Behavioral Impairment

Several factors may influence marijuana's behavioral effects including the duration (chronic or short term), frequency (daily, weekly, or occasionally), and amount of use (heavy or moderate). Researchers have examined how long behavioral impairments persist following chronic marijuana use. These studies used self-reported histories of exposure duration, frequency, and amount of marijuana use, and administered several performance and cognitive tests at different time points following

marijuana abstinence. According to HHS, behavioral impairments may persist for up to 28 days of abstinence in chronic marijuana users.

Psychoactive effects of marijuana can lead to behavioral impairment including cognitive decrements and decreased ability to operate motor vehicles (HHS, 2015). Block et al. (1992) evaluated cognitive measures in 48 healthy male subjects following smoking a marijuana cigarette that contained 2.57% or 19 mg Δ^9 -THC by weight or placebo. Each subject participated in eight sessions (four sessions with marijuana; four sessions with placebo) and several cognitive and psychomotor tests were administered (e.g. verbal recall, facial recognition, text learning, reaction time). Marijuana significantly impaired performances in most of these cognitive and psychomotor tests (Block et al., 1992).

Ramaekers et al. (2006) reported that in 20 recreational users of marijuana, acute administration of 250 $\mu\text{g}/\text{kg}$ and 500 $\mu\text{g}/\text{kg}$ Δ^9 -THC in smoked marijuana resulted in dose-dependent impairments in cognition, motor impulsivity, motor control (tracking impairments), and risk taking. In another study (Kurzthaler et al., 1999), when 290 $\mu\text{g}/\text{kg}$ Δ^9 -THC was administered via a smoked marijuana cigarette in 30 healthy volunteers with no history of substance abuse there were significant impairments of motor speed and accuracy. Furthermore, administration of 3.95% Δ^9 -THC in a smoked marijuana cigarette increased the latency in a task of simulated braking in a vehicle (Liguori et al., 1998). The HHS noted that the motor impairments reported in these studies (Kurzthaler et al., 1999; Liguori et al., 1998) are critical skills needed for operating a vehicle.

As mentioned in the HHS document, some studies examined the persistence of the behavioral impairments immediately after marijuana administration. Some of marijuana's acute effects may still be present for at least 24 hours after the acute psychoactive effects have subsided. In a brief communication, Heishmann et al. (1990) reported that there were cognitive impairments (digit recall and arithmetic tasks) in two out of three experienced marijuana smokers for 24 hours after smoking marijuana cigarettes containing 2.57% Δ^9 -THC. However, Fant et al. (1998) evaluated subjective effects and performance measures for up to 25 hours in 10 healthy males after exposure to either 1.8% or 3.6% Δ^9 -THC in marijuana cigarettes. Peak decrements in subjective and performance measures were noted within 2 hours of marijuana exposure

but there were minimal residual alterations in subjective or performance measures at 23–25 hours after exposure.

Persistence of behavioral impairments following repeated and chronic use of marijuana has also been investigated and was reviewed in the HHS document (HHS, 2015). In particular, researchers examined how long behavioral impairments last following chronic marijuana use. In studies examining persistence of effects in chronic and heavy marijuana users, there were significant decrements in cognitive and motor function tasks in all studies of up to 27 days, and in most studies at 28 days (Solowij et al., 2002; Messinis et al., 2006; Lisdahl and Price, 2012; Pope et al., 2002; Bolla et al., 2002; Bolla et al., 2005). In studies that followed heavy marijuana users for longer than 28 days and up to 20 years of marijuana abstinence, cognitive and psychomotor impairments were no longer detected (Fried et al., 2005; Lyons et al., 2004; Tait et al., 2011). For example, Fried et al. (2005) reported that after 3 months of abstinence from marijuana, any deficits in intelligence (IQ), memory, and processing speeds following heavy marijuana use were no longer observed (Fried et al., 2005). In a meta-analysis that examined non-acute and long-lasting effects of marijuana, any deficits in neurocognitive performance that were observed within the first month were no longer apparent after approximately one month of abstinence (Schreiner and Dunn, 2012). HHS further notes that in moderate marijuana users deficits in decision-making skills were not observed after 25 days of abstinence and additionally IQ, immediate memory and delayed memory skills were not significantly impacted as observed with heavy and chronic marijuana users (Fried et al., 2005; HHS, 2015)

As mentioned in the HHS document (HHS, 2015), the intensity and persistence of neurological impairment from chronic marijuana use also may be dependent on the age of first use. In two separate smaller scale studies (less than 100 participants per exposure group), Fontes et al. (2011) and Gruber et al. (2012) compared neurological function in early onset (chronic marijuana use prior to age 15 or 16) and late onset (chronic marijuana use after age 15 or 16) heavy marijuana users and found that there were significant deficits in executive neurological function in early onset users which were not observed or were less apparent in late onset users. In a prospective longitudinal birth cohort study following 1,037 individuals (Meier et al., 2012), a significant decrease in IQ and

neuropsychological performance was observed in adolescent-onset users and persisted even after abstinence from marijuana for at least one year. However, Meier et al (2012) reported in there was no significant change in IQ in adult-onset users.

The HHS noted that there is some evidence that the severity of the persistent neurological impairments may also be due in part to the amount of marijuana usage. In the study mentioned above, Gruber et al. (2012) found that the early onset users consumed three times as much marijuana per week and used it twice as often as late onset users. Meier et al. (2012) reported in their study, mentioned above, that there was a correlation between IQ deficits in adolescent onset users and the increased amount of marijuana used.

Behavioral Effects of Prenatal Exposure

In studies that examined effects of prenatal marijuana exposure, many of the pregnant women also used alcohol and tobacco in addition to marijuana. Even though other drugs were used in conjunction with marijuana, there is evidence of an association between heavy prenatal marijuana exposure and deficits in some cognitive function. There have been two prospective longitudinal birth cohort studies following individuals prenatally exposed to marijuana from birth until adulthood: The Ottawa Prenatal Prospective Study (OPPS; Fried et al., 1980), and the Maternal Health Practices and Child Development Project (MHPCD; Day et al., 1985). Both longitudinal studies report that heavy prenatal marijuana use is associated with decreased performance on tasks assessing memory, verbal and quantitative reasoning in 4-year-olds (Fried and Watkinson, 1990) and in 6 year olds (Goldschmidt et al., 2008). In subsequent studies with the OPPS cohort, deficits in sustained attention were reported in children ages 6 and 13–16 years (Fried et al., 1992; Fried, 2002) and deficits in executive neurological function were observed in 9- and 12-year-old children (Fried et al., 1998). DEA further notes that with the MHPCD cohort, follow-up studies reported an increased rate of delinquent behavior (Day et al., 2011) and decreased achievement test scores (Goldschmidt et al., 2012) at age 14. When the MHPCD cohort was followed to age 22, there was a marginal ($p = 0.06$) increase in psychosis with prenatal marijuana exposure and early onset of marijuana use (Day et al., 2015).

Association of Marijuana Use With Psychosis

There has been extensive research to determine whether marijuana usage is associated with development of schizophrenia or other psychoses, and the HHS indicated that the available data do not suggest a causative link between marijuana and the development of psychosis (HHS, 2015; Minozzi et al., 2010). As mentioned in the HHS review (HHS, 2015), numerous large scale longitudinal studies demonstrated that subjects who used marijuana do not have a greater incidence of psychotic diagnoses compared to non-marijuana users (van Os et al., 2002; Fergusson et al., 2005; Kuepper et al., 2011). Further, the HHS commented that when analyzing the available data examining the association between marijuana and psychosis, it is critical to differentiate whether the patients in a study are already diagnosed with psychosis or if the individuals have a limited number of symptoms associated with psychosis without qualifying for a diagnosis of the disorder.

As mentioned by the HHS, some of the studies examining the association between marijuana and psychosis utilized non-standard methods to categorize psychosis and these methods did not conform to the criteria in the Diagnostic and Statistical Manual (DSM-5) or the International Classification of Diseases (ICD-10) and would not be appropriate for use in evaluating the association between marijuana use and psychosis. For example, researchers characterized psychosis as “schizophrenic cluster” (Maremmanni et al., 2004), “subclinical psychotic symptoms” (van Gastel et al., 2012), “pre-psychotic clinical high risk” (van der Meer et al., 2012), and symptoms related to “psychosis vulnerability” (Griffith-Lending et al., 2012).

The HHS discussed an early epidemiological study conducted by Andreasson et al. (1987), which examined the link between psychosis and marijuana use. In this study, about 45,000 18- and 19-year-old male Swedish subjects provided detailed information on their drug-taking history and 274 of these subjects were diagnosed with schizophrenia over a 14-year period (1969–1983). Out of the 274 subjects diagnosed with psychosis, 21 individuals (7.7%) had used marijuana more than 50 times, while 197 individuals (72%) never used marijuana. As presented by the authors (Andreasson et al., 1987), individuals who claimed to take marijuana on more

than 50 occasions were 6 times more likely to be diagnosed with schizophrenia than those who had never consumed the drug. The authors concluded that marijuana users who are vulnerable to developing psychoses are at the greatest risk for schizophrenia. In a 35 year follow up to the subjects evaluated in Andreasson et al. (1987), Manrique-Garcia et al. (2012) reported similar findings. In the follow up study, 354 individuals developed schizophrenia. Of those, 32 individuals (9%) had used marijuana more than 50 times and were 6.3 times more likely to develop schizophrenia. 255 of the 354 individuals (72%) never used marijuana.

The HHS also noted that many studies support the assertion that psychosis from marijuana usage may manifest only in individuals already predisposed to development of psychotic disorders. Marijuana use may precede diagnosis of psychosis (Schimmelmann et al., 2011), but most reports indicate that prodromal symptoms of schizophrenia are observed prior to marijuana use (Schiffman et al., 2005). In a review examining gene-environmental interaction between marijuana exposure and the development of psychosis, it was concluded that there is some evidence to support that marijuana use may influence the development of psychosis but only for susceptible individuals (Pelayo-Teran et al., 2012).

Degenhardt et al. (2003) modeled the prevalence of schizophrenia against marijuana use across eight birth cohorts in individuals born during 1940 to 1979 in Australia. Even though there was an increase in marijuana use in the adult subjects over this time period, there was not an increase in diagnoses of psychosis for these same subjects. The authors concluded that use of marijuana may increase schizophrenia only in persons vulnerable to developing psychosis.

Cardiovascular and Autonomic Effects

The HHS stated that acute use of marijuana causes an increase in heart rate (tachycardia) and may increase blood pressure (Capriotti et al., 1988; Benowitz and Jones, 1975). There is some evidence that associates the increased heart rate from Δ^9 -THC exposure with excitation of the sympathetic and depression of the parasympathetic nervous systems (Malinowska et al., 2012). Tolerance to tachycardia develops with chronic exposure to marijuana (Jones, 2002; Sidney, 2002).

Prolonged exposure to Δ^9 -THC results in a decrease in heart rate (bradycardia) and hypotension (Benowitz and Jones,

1975). These effects are thought to be mediated through peripherally located, presynaptic CB1 receptor inhibition of norepinephrine release with possible direct activation of vascular cannabinoid receptors (Wagner et al., 1998; Pacher et al., 2006).

As stated in the HHS recommendation (HHS, 2015), marijuana exposure causes orthostatic hypotension (fainting-like feeling; sudden drop in blood pressure upon standing up) and tolerance can develop to this effect upon repeated, chronic exposure (Jones, 2002). Tolerance to orthostatic hypotension is potentially related to plasma volume expansion, but tolerance does not develop to supine hypotensive effects (Benowitz and Jones, 1975).

Marijuana smoking, particularly by those with some degree of coronary artery or cerebrovascular disease, poses risks such as increased cardiac work, increased catecholamines and carboxyhemoglobin, myocardial infarction and postural hypotension (Benowitz and Jones, 1981; Hollister, 1988; Mittleman et al., 2001; Malinowska et al., 2012). However, electrocardiographic changes were minimal after administration of large cumulative doses of Δ^9 -THC (Benowitz and Jones, 1975).

The DEA notes two recent reports that reviewed several case studies on marijuana and cardiovascular complications (Panayiotides, 2015; Hackam, 2015). Panayiotides (2015) reported that approximately 25.6% of the cardiovascular cases from marijuana use resulted in death from data provided by the French Addictovigilance Network during the period of 2006–2010. Several case studies on marijuana usage and cardiovascular events were discussed and it was concluded that although a causal link cannot be established due to not knowing exact amounts of marijuana used in the cases and confounding variables, the available evidence supports a link between marijuana and cardiotoxicity. Hackam (2015) reviewed 34 case reports or case series reports of marijuana and stroke/ ischemia in 64 stroke patients and reported that in 81% of the cases there was a temporal relationship between marijuana usage and stroke or ischemic event. The author concluded that collective analysis of the case reports supports a causal link between marijuana use and stroke.

Respiratory Effects

The HHS stated that transient bronchodilation is the most typical respiratory effect of acute exposure to marijuana (Gong et al., 1984). In a recent

longitudinal study, information on marijuana use and pulmonary data function were collected from 5,115 individuals over 20 years from 4 communities in the United States (Oakland, CA; Chicago, IL; Minneapolis, MN; Birmingham, AL) (Pletcher et al., 2012). Of the 5,115 individuals, 795 individuals reported use of only marijuana (without tobacco). The authors reported that occasional use of marijuana (7 joint-years for lifetime or 1 joint/day for 7 years or 1 joint/week for 49 years) does not adversely affect pulmonary function. Pletcher et al. (2012) further concluded that there is some preliminary evidence suggesting that heavy marijuana use may have a detrimental effect on pulmonary function, but the sample size of heavy marijuana users in the study was too small. Further, as mentioned in the HHS recommendation document (HHS, 2015), long-term use of marijuana may lead to chronic cough, increased sputum, as well as increased frequency of chronic bronchitis and pharyngitis (Adams and Martin, 1996; Hollister, 1986).

The HHS stated that the evidence that marijuana may lead to cancer of the respiratory system is inconsistent, with some studies suggesting a positive correlation while others do not (Lee and Hancox, 2011; Tashkin, 2005). The HHS noted a case series that reported lung cancer occurrences in three marijuana smokers (age range 31–37 years) with no history of tobacco smoking (Fung et al., 1999). Furthermore, in a case-control study (n = 173 individuals with squamous cell carcinoma of the head and neck; n = 176 controls; Zhang et al., 1999), prevalence of marijuana use was 9.7% in controls and 13.9% in cases and the authors reported that marijuana use may dose-dependently interact with mutagenic sensitivity, cigarette smoking, and alcohol use to increase risk associated with head and neck cancers (Zhang et al., 1999). However, in a large clinical study with 1,650 subjects, no positive correlation was found between marijuana use and lung cancer (Tashkin et al., 2006). This finding held true regardless of the extent of marijuana use when both tobacco use and other potential confounding factors were controlled. The HHS concluded that new evidence suggests that the effects of smoking marijuana on respiratory function and cancer are different from the effects of smoking tobacco (Lee and Hancox, 2011).

The DEA further notes the publication of recent review articles critically evaluating the association between marijuana and lung cancer. Most of the reviews agree that the association is

weak or inconsistent (Huang et al., 2015; Zhang et al., 2015; Gates et al., 2014; Hall and Degenhardt, 2014). Huang et al. (2015) identified and reviewed six studies evaluating the association between marijuana use and lung cancer and the authors concluded that an association is not supported most likely due to the small amounts of marijuana smoked in comparison to tobacco. Zhang et al. (2015) examined six case control studies from the US, UK, New Zealand, and Canada within the International Lung Cancer Consortium and found that there was a weak association between smoking marijuana and lung cancer in individuals who never smoked tobacco, but precision of the association was low at high marijuana exposure levels. Hall and Degenhardt (2014) noted that even though marijuana smoke contains several of the same carcinogens and co-carcinogens as tobacco smoke (Roth et al., 1998) and has been found to be mutagenic and carcinogenic in the mouse skin test, epidemiological studies have been inconsistent, but more consistent positive associations have been reported in case control studies. Finally Gates et al. (2014), reviewed the studies evaluating marijuana use and lung cancer and concluded that there is evidence that marijuana produces changes in the respiratory system (precursors to cancer) that could lead to lung cancer, but overall association is weak between marijuana use and lung cancer especially when controlling for tobacco use.

Endocrine System

Reproductive Hormones

The HHS stated that administration of marijuana to humans does not consistently alter the endocrine system. In a controlled human exposure study (n = 4 males), subjects were acutely administered smoked marijuana containing 2.8% Δ^9 -THC or placebo and an immediate significant decrease in luteinizing hormone and an increase in cortisol was reported in the subjects that smoked marijuana (Cone et al., 1986). Furthermore, as cited by the HHS, two later studies (Dax et al., 1989; Block et al., 1991) reported no changes in hormone levels. Dax et al. (1989) recruited male volunteers (n = 17) that were occasional or heavy users of marijuana. Following exposure to smoked Δ^9 -THC (18 mg/cigarette) or oral Δ^9 -THC (10 mg three times per day for three days and on the morning of the fourth day), the subjects in that study showed no changes in plasma adrenocorticotrophic hormone (ACTH), cortisol, prolactin, luteinizing hormone,

or testosterone levels. Additionally, Block et al. (1991) compared plasma hormone levels amongst non-users as well as infrequent, moderate, and frequent users of marijuana (n = 93 men and 56 women) and found that chronic use of marijuana (infrequent, moderate, and frequent users) did not significantly alter concentrations of testosterone, luteinizing hormone, follicle stimulating hormone, prolactin, or cortisol.

The HHS noted that there is a discrepancy in the effect of marijuana on female reproductive system functionality between animals and humans (HHS, 2015). Female rhesus monkeys that were administered 2.5 mg/kg Δ^9 -THC, i.m., during days 1–18 of the menstrual cycle had reduced progesterone levels and ovulation was suppressed (Asch et al., 1981). However, women who smoked marijuana (1 gram marijuana cigarette with 1.8% Δ^9 -THC) during the periovulatory period (24–36 hours prior to ovulation) did not exhibit changes in reproductive hormone levels or their menstrual cycles (Mendelson and Mello, 1984). In a review article by Brown and Dobs (2002), the authors state that endocrine changes observed with marijuana are no longer observed with chronic administration and this may be due to drug tolerance.

Reproductive Cancers

The HHS stated that recent studies support a possible association between frequent, long-term marijuana use and increased risk of testicular germ cell tumors. In a hospital-based case-control study, the frequency of marijuana use was compared between testicular germ cell tumor (TGCT) patients (n = 187) and controls (n = 148) (Trabert et al., 2011). TGCT patients were more likely to be frequent marijuana users than controls with an odds ratio (OR) of 2.2 (95% confidence limits of 1.0–5.1) and were less likely to be infrequent or short-term users with odds ratios of 0.5 and 0.6, respectively in comparison to controls (Trabert et al., 2011). The DEA further notes that in two population-based case-control studies (Daling et al., 2009; Lacson et al., 2012), marijuana use was compared between patients diagnosed with TGCT and matched controls in Washington State or Los Angeles County. In both studies, it was reported that TCGT patients were twice as likely as controls to use marijuana. Authors of both studies concluded that marijuana use is associated with an elevated risk of TGCT (Daling et al., 2009; Lacson et al., 2012).

The HHS cited a study (Sarfraz et al., 2005) demonstrating that WIN 55,212–2 (a mixed CB1/CB2 agonist) induces apoptosis (one form of cell death) in

prostate cancer cells and decreases expression of androgen receptors and prostate specific antigens, suggesting a potential therapeutic value for cannabinoid agonists in the treatment of prostate cancer, an androgen-stimulated type of carcinoma.

Other hormones (e.g. Thyroid, Appetite)

In more recent studies, as cited by the HHS, chronic marijuana use by subjects (n = 39) characterized as dependent on marijuana according to the ICD-10 criteria did not affect serum levels of thyroid hormones: TSH (thyrotropin), T4 (thyroxine), and T3 (triiodothyronine) (Bonnet, 2013). With respect to appetite hormones, in a pilot study with HIV-positive males, smoking marijuana dose-dependently increased plasma levels of ghrelin and leptin and decreased plasma levels of peptide YY (Riggs et al., 2012).

The HHS stated that Δ^9 -THC reduces binding of the corticosteroid dexamethasone in hippocampal tissue from adrenalectomized rats and acute Δ^9 -THC releases corticosterone, with tolerance developing to this effect with chronic administration (Eldridge et al., 1991). These data suggest that Δ^9 -THC may interact with the glucocorticoid receptor system.

Immune System

The HHS stated that cannabinoids alter immune function but that there can be differences between the effects of synthetic, natural, and endogenous cannabinoids (Croxford and Yamamura, 2005; Tanasescu and Constantinescu, 2010).

The HHS noted that there are conflicting results in animal and human studies with respect to cannabinoid effects on immune functioning in subjects with compromised immune systems. Abrams et al. (2003) examined the effects of marijuana and Δ^9 -THC in 62 HIV-1-infected patients. Subjects received one of three treatments, three times a day: smoked marijuana cigarette containing 3.95% Δ^9 -THC, oral tablet containing Δ^9 -THC (2.5 mg oral dronabinol), or oral placebo. There were no changes in CD4+ and CD8+ cell counts, HIV RNA levels, or protease inhibitor levels in any of the treatment groups (Abrams et al., 2003). Therefore, use of cannabinoids showed no short-term adverse virologic effects in individuals with compromised immune systems. Conversely, Roth et al. (2005) reported that in immunodeficient mice implanted with human blood cells infected with HIV, exposure to Δ^9 -THC *in vivo* suppresses immune function, increases HIV co-receptor expression,

and acts as a cofactor to enhance HIV replication.

The DEA notes two recent clinical studies reporting a decrease in cytokine and interleukin levels following marijuana use. Keen et al. (2014) compared the differences in the levels of IL-6 (interleukin-6), a proinflammatory cytokine, amongst non-drug users (n = 78), marijuana only users (n = 46) and marijuana plus other drug users (n = 45) in a community-based sample of middle-aged African Americans (Keen et al., 2014). After adjusting for confounders, analyses revealed that lifetime marijuana only users had significantly lower IL-6 levels than the nonuser group. Further, Sexton et al. (2014) compared several immune parameters in healthy individuals and subjects with multiple sclerosis (MS) and found that the chronic use of marijuana resulted in reduced monocyte migration, and decreased levels of CCL2 and IL-17 in both healthy and MS groups.

The DEA also notes a review suggesting that Δ^9 -THC suppresses the immune responses in experimental animal models and *in vitro* and that these changes may be primarily mediated through the CB2 cannabinoid receptor (Eisenstein and Meissler, 2015).

Factor 3: The State of the Current Scientific Knowledge Regarding the Drug or Substance

Chemistry

The HHS stated that marijuana, also known as *Cannabis sativa L.*, is part of the Cannabaceae plant family and is one of the oldest cultivated crops. The term “marijuana” is generally used to refer to a mixture of the dried flowering tops and leaves from *Cannabis*. Marijuana users primarily smoke the marijuana leaves, but individuals also ingest marijuana through food infused with marijuana and its extracts. *Cannabis sativa* is the primary species of *Cannabis* that is illegally marketed in the United States. Marijuana is one of three major derivatives sold as separate illicit products, the other two being hashish and hash oil. Hashish is composed of the dried and compressed cannabinoid-rich resinous material of *Cannabis* and is found as balls and cakes as well as other forms. Individuals may break off pieces and place them into a pipe to smoke. Hash oil, a viscous brown or amber colored liquid, is produced by solvent extraction of cannabinoids from *Cannabis* and contains approximately 50% cannabinoids. One to two drops of hash oil on a cigarette has been reported to

produce the equivalent of a single marijuana cigarette (DEA, 2015).

Different marijuana samples are derived from numerous cultivated strains and may have different chemical compositions including levels of Δ^9 -THC and other cannabinoids (Appendino et al., 2011). A consequence of having different chemical compositions in the various marijuana samples is that there will be significant differences in safety, biological, pharmacological, and toxicological profiles and therefore, according to the HHS, all *Cannabis* strains cannot be considered collectively because of the variations in chemical composition. Furthermore, the concentration of Δ^9 -THC and other cannabinoids present in marijuana may vary due to growing conditions and processing of the plant after harvesting. For example, the plant parts collected such as flowers, leaves and stems can influence marijuana's potency, quality, and purity (Adams and Martin, 1996; Agurell et al., 1984; Mechoulam, 1973). Variations in marijuana harvesting have resulted in potencies ranging from a low of 1 to 2% up to a high of 17% as indicated by cannabinoid content. The concentration of Δ^9 -THC averages approximately 12% by weight in a typical marijuana mixture of leaves and stems. However, some specifically grown and selected marijuana samples can contain 15% or greater Δ^9 -THC (Appendino et al., 2011). As a result, the Δ^9 -THC content in a 1 gram marijuana cigarette can range from as little as 3 milligrams to 150 milligrams or more. In a systematic review conducted by Cascini et al. (2012), it was reported that marijuana's Δ^9 -THC content has increased significantly from 1979–2009.

Since there is considerable variability in the cannabinoid concentrations and chemical constituency among marijuana samples, the interpretation of clinical data with marijuana is complicated. A primary issue is the lack of consistent concentrations of Δ^9 -THC and other substances in marijuana which complicates the interpretation of the effects of different marijuana constituents. An added issue is that the non-cannabinoid components in marijuana may potentially modify the overall pharmacological and toxicological properties of various marijuana strains and products.

Various *Cannabis* strains contain more than 525 identified natural constituents including cannabinoids, 21 (or 22) carbon terpenoids found in the plant, as well as their carboxylic acids, analogues, and transformation products (Agurell et al., 1984; 1986; Mechoulam, 1973; Appendino et al., 2011). To date,

more than 100 cannabinoids have been characterized (ElSohly and Slade, 2005; Radwan et al., 2009; Appendino et al., 2011), and most major cannabinoid compounds occurring naturally have been identified. There are still new and comparably more minor cannabinoids being characterized (Pollastro et al., 2011). The majority of the cannabinoids are found in *Cannabis*. One study reported accumulation of two cannabinoids, cannabigerol and its corresponding acid, in *Helichrysum (H. umbraculigerum)* which is a non-*Cannabis* source (Appendino et al., 2011).

Of the cannabinoids found in marijuana, Δ^9 -THC (previously known as Δ^1 -THC) and delta-8-tetrahydrocannabinol (Δ^8 -THC, Δ^6 -THC) have been demonstrated to produce marijuana's psychoactive effects. Psychoactive effects from marijuana usage have been mainly attributed to Δ^9 -THC because Δ^9 -THC is present in significantly more quantities than Δ^8 -THC in most marijuana varieties. There are only a few marijuana strains that contain Δ^8 -THC in significant amounts (Hively et al., 1966). Δ^9 -THC is an optically active resinous substance that is extremely lipophilic. The chemical name for Δ^9 -THC is (6aR-trans)-6a,7,8,10a-tetrahydro-6,6,9-trimethyl-3-pentyl-6H-dibenzo-[b,d]pyran-1-ol, or (-)-delta9-(trans)-tetrahydrocannabinol. The (-)-trans Δ^9 -THC isomer is pharmacologically 6 to 100 times more potent than the (+)-trans isomer (Dewey et al., 1984).

Other relatively well-characterized cannabinoids present in marijuana include cannabidiol (CBD), cannabichromene (CBC), and cannabinol (CBN). CBD and CBC are major cannabinoids in marijuana and are both lipophilic. The chemical name for CBD is 2-[(1R,6R)-3-methyl-6-prop-1-en-2-ylcyclohex-2-en-1-yl]-5-pentylbenzene-1,3-diol and the chemical name for CBC is 2-methyl-2-(4-methylpent-3-enyl)-7-pentyl-5-chromenol. CBN is a minor naturally-occurring cannabinoid with weak psychoactivity and is also a major metabolite of Δ^9 -THC. The chemical name for CBN is 6,6,9-trimethyl-3-pentyl-benzo[c]chromen-1-ol.

In summary, marijuana has several strains with high variability in the concentrations of Δ^9 -THC, the main psychoactive component, as well as other cannabinoids and compounds. Marijuana is not a single chemical and does not have a consistent and reproducible chemical profile with predictable or consistent clinical effects. In the HHS recommendation for marijuana scheduling (HHS, 2015), it

was recommended that investigators consult a guidance for industry entitled, *Botanical Drug Products*,⁴⁵ which provides information on the approval of botanical drug products. Specifically, in order to investigate marijuana in support of a New Drug Application (NDA), clinical studies under an Investigational New Drug (IND) application should include "consistent batches of a particular marijuana product for [a] particular disease." (HHS, 2015). Furthermore, the HHS noted that investigators must provide data meeting the requirements for new drug approval as stipulated in 21 CFR 314.50 (HHS, 2015).

Human Pharmacokinetics

Pharmacokinetics of marijuana in humans is dependent on the route of administration and formulation (Adams and Martin, 1996; Agurell et al., 1984; Agurell et al., 1986). Individuals primarily smoke marijuana as a cigarette (weighing between 0.5 and 1 gram) or in a pipe. More recently, vaporizers have been used as another means for individuals to inhale marijuana. Marijuana may also be ingested orally in foods or as an extract in ethanol or other solvents. Pharmacokinetic studies with marijuana focused on evaluating the absorption, metabolism, and elimination profile of Δ^9 -THC and other cannabinoids (Adams and Martin, 1996; Agurell et al., 1984; Agurell et al., 1986).

Absorption and Distribution of Inhaled Marijuana Smoke

There is high variability in the pharmacokinetics of Δ^9 -THC and other cannabinoids from smoked marijuana due to differences in individual smoking behavior even under controlled experimental conditions (Agurell et al., 1986; Herning et al., 1986; Huestis et al., 1992a). Experienced marijuana users can titrate and regulate the dose by holding marijuana smoke in their lungs for an extended period of time resulting in increased psychoactive effects by prolonging absorption of the smoke. This property may also help explain why there is a poor correlation between venous levels of Δ^9 -THC and the intensity of effects and intoxication (Agurell et al., 1986; Barnett et al., 1985; Huestis et al., 1992a). The HHS recommended that puff and inhalation volumes should be tracked in experimental studies because the concentration of cannabinoids can vary at different stages of smoking.

Δ^9 -THC from smoked marijuana is rapidly absorbed within seconds.

Psychoactive effects are observed immediately following absorption with measurable neurological and behavioral changes for up to 6 hours (Grotenhermen, 2003; Hollister, 1986; Hollister, 1988). Δ^9 -THC is distributed to the brain in a rapid and efficient manner. Bioavailability of Δ^9 -THC from marijuana (from a cigarette or pipe) ranges from 1 to 24% with the fraction absorbed rarely exceeding 10 to 20% (Agurell et al., 1986; Hollister, 1988). The low and variable bioavailability of Δ^9 -THC is due to loss in side-stream smoke, variation in individual smoking behaviors and experience, incomplete absorption of inhaled smoke, and metabolism in lungs (Herning et al., 1986; Johansson et al., 1989). After cessation of smoking, Δ^9 -THC venous levels decline within minutes and continue to decline to about 5% to 10% of the peak level within an hour (Agurell et al., 1986; Huestis et al., 1992a; Huestis et al., 1992b).

Absorption and Distribution of Orally Administered Marijuana

Following oral administration of Δ^9 -THC or marijuana, onset of effects start within 30 to 90 minutes, peak after 2 to 3 hours and effects remain for 4 to 12 hours (Grotenhermen, 2003; Adams and Martin, 1996; Agurell et al., 1984; Agurell et al., 1986). Dose titration of Δ^9 -THC from orally ingested marijuana is difficult for users in comparison to smoked or inhaled marijuana due to the delay in the onset of effects. Oral bioavailability of Δ^9 -THC, either in its pure form or in marijuana, is low and variable with a range from 5% to 20% (Agurell et al., 1984; Agurell et al., 1986). There is also inter- and intra-subject variability of orally administered Δ^9 -THC under experimental conditions and even under repeated dosing experiments (HHS, 2015). The HHS noted that in bioavailability studies using radiolabeled Δ^9 -THC, Δ^9 -THC plasma levels following oral administration of Δ^9 -THC were low relative to plasma levels after inhaled or intravenously administered Δ^9 -THC. The low and variable bioavailability of orally administered Δ^9 -THC is due to first pass hepatic elimination from blood and erratic absorption from stomach and bowel (HHS, 2015).

Metabolism and Excretion of Cannabinoids From Marijuana

Studies evaluating cannabinoid metabolism and excretion focused on Δ^9 -THC because it is the primary psychoactive component in marijuana.

Δ^9 -THC is metabolized via microsomal hydroxylation and oxidation to both active and inactive

⁴⁵ Available at <http://www.fda.gov/Drugs/default.htm> under Guidance (Drugs).

metabolites (Lemberger et al., 1970; Lemberger et al., 1972a; Lemberger et al., 1972b; Agurell et al., 1986; Hollister, 1988). Metabolism of Δ^9 -THC is consistent among frequent and infrequent marijuana users (Agurell et al., 1986). The primary active metabolite of Δ^9 -THC following oral ingestion is 11-hydroxy- Δ^9 -THC which is equipotent to Δ^9 -THC in producing marijuana-like subjective effects (Agurell et al., 1986; Lemberger and Rubin, 1975). Metabolite levels following oral administration may be greater than that of Δ^9 -THC and may contribute greatly to the pharmacological effects of oral Δ^9 -THC or marijuana.

Plasma clearance of Δ^9 -THC approximates hepatic blood flow at a rate of approximately 950 ml/min or greater. Rapid clearance of Δ^9 -THC from blood is primarily due to redistribution to other tissues in the body rather than to metabolism (Agurell et al., 1984; Agurell et al., 1986). Outside of the liver, metabolism in most tissues is considerably slow or does not occur. The elimination half-life of Δ^9 -THC ranges from 20 hours to between 10 and 13 days (Hunt and Jones, 1980). Lemberger et al. (1970) reported that the half-life of Δ^9 -THC ranged from 23–28 hours in heavy marijuana users and up to 60 to 70 hours in naïve users. The long elimination half-life of Δ^9 -THC is due to slow release of Δ^9 -THC and other cannabinoids from tissues and subsequent metabolism. Inactive carboxy metabolites of Δ^9 -THC have terminal half-lives of 50 hours to 6 days or more and serve as long-term markers in urine tests for marijuana use.

Most of the absorbed Δ^9 -THC dose is eliminated in the feces and about 33% in urine. The glucuronide metabolite of Δ^9 -THC is excreted as the major urine metabolite along with 18 non-conjugated metabolites (Agurell et al., 1986).

Research Status and Test of Currently Accepted Medical Use for Marijuana

According to the HHS, there are numerous human clinical studies with marijuana in the United States under FDA-regulated IND applications. Results of small clinical exploratory studies have been published in the medical literature. Approval of a human drug for marketing, however, is contingent upon FDA approval of a New Drug Application (NDA) or a Biologics License Application (BLA). According to the HHS, the FDA has not approved any drug product containing marijuana for marketing.

The HHS noted that a drug may be found to have a medical use in treatment in the United States for

purposes of the CSA if the drug meets the five elements described by the DEA in 1992. Those five elements “are both necessary and sufficient to establish a prima facie case of currently accepted medical use” in treatment in the United States.” (57 FR 10499, 10504 (March 26, 1992)). This five-element test, which the HHS and DEA have utilized in all such analyses for more than two decades, has been upheld by the Court of Appeals. *ACT*, 15 F.3d at 1135. The five elements that characterize “currently accepted medical use” for a drug are summarized here and expanded upon in the discussion below:

1. *The drug's chemistry must be known and reproducible;*
2. *There must be adequate safety studies;*
3. *There must be adequate and well-controlled studies proving efficacy;*
4. *The drug must be accepted by qualified experts; and*
5. *Scientific evidence must be widely available.*

In its review (HHS, 2015), the HHS evaluated the five elements with respect to the currently available research for marijuana. The HHS concluded that marijuana does not meet any of the five elements—all of which must be demonstrated to find that a drug has a “currently accepted medical use.” A brief summary of the HHS’s evaluation is provided below.

Element #1: The drug's chemistry must be known and reproducible.

“The substance's chemistry must be scientifically established to permit it to be reproduced into dosages which can be standardized. The listing of the substance in a current edition of one of the official compendia, as defined by section 201(j) of the Food, Drug and Cosmetic Act, 21 U.S.C. 321(j), is sufficient generally to meet this requirement.” 57 FR 10499, 10506 (March 26, 1992).

As defined by the CSA, marijuana includes all species of the genus *Cannabis*, including all strains therein.⁴⁶ Chemical constituents

⁴⁶ Although the CSA definition of marijuana refers only to the species “*Cannabis sativa* L.,” federal courts have consistently ruled that all species of the genus *cannabis* are included in this definition. See *United States v. Kelly*, 527 F.2d 961, 963–964 (9th Cir. 1976) (collecting and examining cases). The Single Convention (article 1, par. 1(c)) likewise defines the “cannabis plant” to mean “any plant of the genus *Cannabis*.” As explained above in the attachment titled “Preliminary Note Regarding Treaty Considerations,” 21 U.S.C. 811(d)(1) provides that, where a drug is subject to control under the Single Convention, the DEA Administrator must control the drug under the schedule he deems most appropriate to carry out such treaty obligations, without regard to the findings required by 21 U.S.C. 811(a) or 812(b) and without regard to the procedures prescribed by 21 U.S.C. 811(a) and (b).

including Δ^9 -THC and other cannabinoids vary significantly in marijuana samples derived from different strains (Appendino et al., 2011). As a result, there will be significant differences in safety, biological, pharmacological, and toxicological parameters amongst the various marijuana samples. Due to the variation of the chemical composition in marijuana samples, it is not possible to reproduce a standardized dose when considering all strains together. The HHS does advise that if a specific *Cannabis* strain is cultivated and processed under controlled conditions, the plant chemistry may be consistent enough to derive reproducible and standardized doses.

Element #2: There must be adequate safety studies.

“There must be adequate pharmacological and toxicological studies, done by all methods reasonably applicable, on the basis of which it could fairly and responsibly be concluded, by experts qualified by scientific training and experience to evaluate the safety and effectiveness of drugs, that the substance is safe for treating a specific, recognized disorder.” 57 FR 10499, 10506 (March 26, 1992).

The HHS stated that there are no adequate safety studies on marijuana. As indicated in their evaluation of Element #1, the considerable variation in the chemistry of marijuana complicates the safety evaluation. The HHS concluded that marijuana does not satisfy Element #2 for having adequate safety studies such that medical and scientific experts may conclude that it is safe for treating a specific ailment.

Element #3: There must be adequate and well-controlled studies of efficacy.

“There must be adequate, well-controlled, well-designed, well-conducted and well-documented studies, including clinical investigations, by experts qualified by scientific training and experience to evaluate the safety and effectiveness of drugs, on the basis of which it could be fairly and responsibly concluded by such experts that the substance will have the intended effect in treating a specific, recognized disorder.” 57 FR 10499, 10506 (March 26, 1992).

As indicated in the HHS’s review of marijuana (HHS, 2015), there are no adequate or well-controlled studies that prove marijuana’s efficacy. The FDA independently reviewed (FDA, 2015) publicly available clinical studies on marijuana published prior to February 2013 to determine if there were appropriate studies to determine marijuana’s efficacy (please refer to FDA, 2015 and HHS, 2015 for more

details). After review, the FDA determined that out of the identified articles, including those identified through a search of bibliographic references and 566 abstracts located on PubMed, 11 studies met the *a priori* selection criteria, including placebo control and double-blinding. FDA and HHS critically reviewed each of the 11 studies to determine if the studies met accepted scientific standards. FDA and HHS concluded that these studies do not “currently prove efficacy of marijuana” for any therapeutic indication due to limitations in the study designs. The HHS indicated that these studies could be used as proof of concept studies, providing preliminary evidence on a proposed hypothesis involving a drug’s effect.

Element #4: The drug must be accepted by qualified experts.

“[A] consensus of the national community of experts, qualified by scientific training and experience to evaluate the safety and effectiveness of drugs, accepts the safety and effectiveness of the substance for use in treating a specific, recognized disorder. A material conflict of opinion among experts precludes a finding of consensus.” 57 FR 10499, 10506 (March 26, 1992).

The HHS concluded that there is currently no evidence of a consensus among qualified experts that marijuana is safe and effective in treating a specific and recognized disorder. The HHS indicated that medical practitioners who are not experts in evaluating drugs cannot be considered qualified experts (HHS, 2015; 57 FR 10499, 10505). Further, the HHS noted that the 2009 American Medical Association (AMA) report entitled, “Use of Cannabis for Medicinal Purposes” does not conclude that there is a currently accepted medical use for marijuana. HHS also pointed out that state-level “medical marijuana” laws do not provide evidence of such a consensus among qualified experts.

Element #5: The scientific evidence must be widely available.

“In the absence of NDA approval, information concerning the chemistry, pharmacology, toxicology, and effectiveness of the substance must be reported, published, or otherwise widely available, in sufficient detail to permit experts, qualified by scientific training and experience to evaluate the safety and effectiveness of drugs, to fairly and responsibly conclude the substance is safe and effective for use in treating a specific, recognized disorder.” 57 FR 10499, 10506 (March 26, 1992).

The HHS concluded that the currently available data and information on

marijuana is not sufficient to allow scientific scrutiny of the chemistry, pharmacology, toxicology, and effectiveness. In particular, scientific evidence demonstrating the chemistry of a specific *Cannabis* strain that could provide standardized and reproducible doses is not available.

Petitioners’ Major Comments in Relation to Factor 3 and the Government’s Responses

(1) The petitioner states on page 2 of the petition, “*Marijuana has accepted medical use in the United States. Thirteen states accept the safety of marijuana for medical use Marijuana has been accepted as having medical use by dozens of professional medical and nursing organizations throughout the U.S. . . . Even the American Medical Association has now accepted the safety and efficacy of cannabinoid medicines and supports removal of marijuana from schedule I of the CSA in order to support further research.*”

As noted above, the HHS concluded that there is currently no evidence of a consensus among qualified experts that marijuana is safe and effective in treating a specific and recognized disorder, as required by the established standards. HHS pointed out that state-level “medical marijuana” laws do not provide evidence of such a consensus among qualified experts. HHS also indicated that medical practitioners who are not experts in evaluating drugs cannot be considered qualified experts (HHS, 2015; 57 FR 10499, 10505).

Further, the HHS pointed out that the 2009 AMA report entitled, “Use of Cannabis for Medicinal Purposes” does not conclude that there is a currently accepted medical use for marijuana. Instead, the AMA, like several other professional and medical associations, recommended further testing with marijuana to determine its medicinal value. The AMA official policy on medicinal use of marijuana is as follows: “*Our AMA urges that marijuana’s status as a federal Schedule I controlled substance be reviewed with the goal of facilitating the conduct of clinical research and development of cannabinoid-based medicines, and alternative delivery methods. This should not be viewed as an endorsement of state-based medical cannabis programs, the legalization of marijuana, or that scientific evidence on the therapeutic use of cannabis meets the current standards for a prescription drug product.*” (AMA, 2009). The DEA further notes that the 2013 AMA House of Delegates report states that, “*cannabis is a dangerous drug and as*

such is a public health concern.” (AMA, 2013).

(2) The petitioner asserts on page 3 of the petition that, “*Several recent studies of smoked marijuana have confirmed the safety and efficacy of smoked marijuana for medical use.*”

The HHS, in its scientific and medical evaluation, reviewed marijuana clinical studies evaluating therapeutic properties and concluded that there is not enough data to confirm the safety and efficacy of smoked marijuana for use in treating a specific and recognized disorder. Relevant to efficacy, for instance, the HHS concluded, for instance, that “smoking marijuana currently has not been shown to allow delivery of consistent and reproducible doses,” and that the bioavailability of the delta-9 -THC from marijuana in a cigarette or pipe can range from 1 percent to 24 percent with the fraction absorbed rarely exceeding 10 to 20%. Issues relating to the safety of smoked marijuana were discussed above in Factor 2.

(3) On page 3, the petitioner states that “*marijuana has been determined to be safe for use under medical supervision by the DEA’s own administrative law judge.*”

As described above, in the absence of NDA or ANDA approval, DEA has established a five-element test for determining whether the drug has a currently accepted medical use in treatment in the United States. 57 FR 10499, 10506 (March 26, 1992)). See also *ACT*, 15 F.3d at 1135. In response to this petition, HHS concluded, and DEA agrees, that the scientific evidence is insufficient to demonstrate that marijuana has a currently accepted medical use under the five-element test. The evidence was insufficient in this regard also when the DEA considered petitions to reschedule marijuana in 1992 (57 FR 10499), in 2001 (66 FR 20038), and in 2011 (76 FR 40552). Little has changed since 2011 with respect to the lack of clinical evidence necessary to establish that marijuana has a currently accepted medical use. No studies have scientifically assessed the efficacy and full safety profile of marijuana for any specific medical condition.

Factor 4: Its History and Current Pattern of Abuse

Marijuana continues to be the most widely used illicit drug. In 2013, an estimated 24.6 million Americans age 12 or older were current (past month) illicit drug users. Of those, 19.8 million were current (past month) marijuana users. As of 2013, an estimated 114.7 million Americans age 12 and older had

used marijuana or hashish in their lifetime and 33.0 million had used it in the past year.

According to the NSDUH estimates, 3.0 million people age 12 or older used an illicit drug for the first time in 2014. Marijuana initiates totaled 2.6 million in 2014. Nearly half (46.8%) of the 2.6 million new users were less than 18 years of age. In 2014, marijuana was used by 82.2% of current (past month) illicit drug users. In 2014, among past year marijuana users age 12 or older, 18.5% used marijuana on 300 or more days within the previous 12 months. This translates into 6.5 million people using marijuana on a daily or almost daily basis over a 12-month period, a significant increase from the 3.1 million daily or almost daily users in 2006 and from the 5.7 million in just the previous year. In 2014, among past month marijuana users, 41.6% (9.2 million people) used the drug on 20 or more days in the past month, a significant increase from the 8.1 million in 2013.

Marijuana is also the illicit drug with the highest numbers of past year dependence or abuse in the U.S. population. According to the 2014 NSDUH report, of the 7.1 million persons aged 12 or older who were classified with illicit drug dependence or abuse, 4.2 million of them abused or were dependent on marijuana (representing 59.0% of all those classified with illicit drug dependence or abuse and 1.6% of the total U.S. non-institutionalized population aged 12 or older).

According to the 2015 Monitoring the Future (MTF) survey, marijuana is used by a large percentage of American youths, and is the most commonly used illicit drug among American youth. Among students surveyed in 2015, 15.5% of 8th graders, 31.1% of 10th graders, and 44.7% of 12th graders reported that they had used marijuana in their lifetime. In addition, 11.8%, 25.4%, and 34.9% of 8th, 10th, and 12th graders, respectively, reported using marijuana in the past year. A number of high school students reported daily use in the past month, including 1.1%, 3.0%, and 6.0% of 8th, 10th, and 12th graders, respectively.

The prevalence of marijuana use and abuse is also indicated by criminal investigations for which drug evidence was analyzed in federal, state, and local forensic laboratories, as discussed above in Factor 1. The National Forensic Laboratory System (NFLIS), a DEA program, systematically collects drug identification results and associated information from drug cases submitted to and analyzed by federal, state, and local forensic laboratories. NFLIS data

shows that marijuana was the most frequently identified drug from January 2001 through December 2014. In 2014, marijuana accounted for 29.3% (432,989) of all drug exhibits in NFLIS.

The high consumption of marijuana is being fueled by increasing amounts of domestically grown marijuana as well as increased amounts of foreign source marijuana being illicitly smuggled into the United States. In 2014, the Domestic Cannabis Eradication and Suppression Program (DCE/SP) reported that 3,904,213 plants were eradicated in outdoor cannabis cultivation areas compared to 2,597,798 in 2000, as shown above in Table 3. Significant quantities of marijuana were also eradicated from indoor cultivation operations. There were 396,620 indoor plants eradicated in 2014 compared to 217,105 eradicated in 2000. As shown in Table 2 above, in 2014, the National Seizure System (NSS) reported seizures of 1,767,741 kg of marijuana.

Factor 5: The Scope, Duration, and Significance of Abuse

Abuse of marijuana is widespread and significant. As previously noted, according to the NSDUH, in 2014, an estimated 117.2 million Americans (44.2%) age 12 or older had used marijuana or hashish in their lifetime, 35.1 million (13.2%) had used it in the past year, and 22.2 million (8.4%) had used it in the past month. Past year and past month marijuana use has increased significantly since 2013. Past month marijuana use is highest among 18–21 year olds and it declines among those 22 years of age and older. In 2014, an estimated 18.5% of past year marijuana users age 12 or older used marijuana on 300 or more days within the past 12 months. This translates into 6.5 million persons using marijuana on a daily or almost daily basis over a 12-month period. In 2014, an estimated 41.6% (9.2 million) of past month marijuana users age 12 or older used the drug on 20 or more days in the past month (SAMHSA, NSDUH). Chronic use of marijuana is associated with a number of health risks (see Factors 2 and 6).

Furthermore, the average percentage of Δ^9 -THC in seized marijuana has increased over the past two decades (The University of Mississippi Potency Monitoring Project). Additional studies are needed to clarify the impact of greater potency, but one study shows that higher levels of Δ^9 -THC in the body are associated with greater psychoactive effects (Harder and Rietbrock, 1997), which can be correlated with higher abuse potential (Chait and Burke, 1994).

TEDS data show that in 2013, marijuana/hashish was the primary

substance of abuse in 16.8% of all admissions to substance abuse treatment among patients age 12 and older. TEDS data also show that marijuana/hashish was the primary substance of abuse for 77.0% of all 12- to 14-year-olds admitted for drug treatment and 75.5% of all 15- to 17-year-olds admitted for drug treatment in 2013. Among the 281,991 admissions to drug treatment in 2013 in which marijuana/hashish was the primary drug, the average age at admission was 25 years and the peak age cohort was 15 to 17 years (22.5%). Thirty-nine percent of the 281,991 primary marijuana/hashish admissions (35.9%) were under the age of 20.

In summary, the recent statistics from these various surveys and databases (see Factor 1 for more details) demonstrate that marijuana continues to be the most commonly used illicit drug, with large incidences of heavy use and dependence in teenagers and young adults.

Factor 6: What, if Any, Risk There Is to the Public Health

In its recommendation, the HHS discussed public health risks associated with acute and chronic marijuana use in Factor 6. Public health risks as measured by emergency department visits and drug treatment admissions are discussed by HHS and DEA in Factors 1, 4, and 5. Similarly, Factor 2 discusses marijuana's pharmacology and presents some of the adverse health effects associated with use. Marijuana use may affect the physical and/or psychological functioning of an individual user, but may also have broader public impacts including driving impairments and fatalities from car accidents.

Risks From Acute Use of Marijuana

As discussed in the HHS review document (HHS, 2015), acute use of marijuana impairs psychomotor performance including motor control and impulsivity, risk taking and executive function (Ramaekers et al., 2004; Ramaekers et al., 2006). In a minority of individuals using marijuana, dysphoria, prolonged anxiety, and psychological distress may be observed (Haney et al., 1999). The DEA further notes a recent review of acute marijuana effects (Wilkinson et al., 2014) that reported impaired neurological function including altered perception, paranoia, delayed response time, and memory deficits.

In its recommendation, HHS references a meta-analysis conducted by Li et al. (2012) where the authors concluded that psychomotor impairments associated with acute marijuana usage have also been

associated with increased risk of car accidents with individuals experiencing acute marijuana intoxication (Li et al., 2012; HHS, 2015). The DEA further notes more recent studies examining the risk associated with marijuana use and driving. Younger drivers (under 21) have been characterized as the highest risk group associated with marijuana use and driving (Whitehill et al., 2014). Furthermore, in 2013, marijuana was found in 13% of the drivers involved in automobile-related fatal accidents (McCartt, 2015). The potential risk of automobile accidents associated with marijuana use appears to be increasing since there has been a steady increase in individuals intoxicated with marijuana over the past 20 years (Wilson et al., 2014). However, a recent study commissioned by the National Highway Traffic Safety Administration (NHTSA) reported that when adjusted for confounders (e.g., alcohol use, age, gender, ethnicity), there was not a significant increase in crash risk (fatal and nonfatal, n = 2,682) associated with marijuana use (Compton and Berning, 2015).

The DEA also notes recent studies examining unintentional exposures of children to marijuana (Wang et al., 2013; 2014). Wang et al. (2013) reviewed emergency department (ED) visits at a children's hospital in Colorado from January 1, 2005 to December 31, 2011. As stated by the authors, in 2000 Colorado passed Amendment 20 which allowed for the use of marijuana. Following the passage of "a new Justice Department policy" instructing "federal prosecutors not to seek arrest of medical marijuana users and suppliers as long as they conform to state laws" (as stated in Wang et al., 2013), 14 patients in Colorado under the age of 12 were admitted to the ED for the unintended use of marijuana over a 27 month period. Prior to the passage of this policy, from January 1, 2005 to September 30, 2009 (57 months), there were no pediatric ED visits due to unintentional marijuana exposure (Wang et al., 2013). The DEA also notes a larger scale evaluation of pediatric exposures using the National Poison Data System (Wang et al., 2014). That study reported that there were 985 unintentional marijuana exposures in children (9 years and younger) between January 1, 2005 to December 31, 2011. The authors stratified the ED visits by states with laws allowing medical use of marijuana, states transitioning to legalization for medical use, and states with no such laws. Out of the 985 exposures, 495 were in non-legal states (n=33 states), 93 in transitional states

(n=8 states), and 396 in "legal" states (n=9 states). The authors reported that there was a twofold increase (OR = 2.1) in moderate or major effects in children with unintentional marijuana use and a threefold increase (OR = 3.4) in admissions to critical care units in states allowing medical use of marijuana, in comparison to non-legal states.

Risks Associated With Chronic Use of Marijuana

The HHS noted that a major risk from chronic marijuana use is a distinctive withdrawal syndrome, as described in the 2013 DSM-5. The HHS analysis also quoted the following description of risks associated with marijuana [cannabis] abuse from the DSM-5:

Individuals with cannabis use disorder may use cannabis throughout the day over a period of months or years, and thus may spend many hours a day under the influence. Others may use less frequently, but their use causes recurrent problems related to family, school, work, or other important activities (e.g., repeated absences at work; neglect of family obligations). Periodic cannabis use and intoxication can negatively affect behavioral and cognitive functioning and thus interfere with optimal performance at work or school, or place the individual at increased physical risk when performing activities that could be physically hazardous (e.g. driving a car; playing certain sports; performing manual work activities, including operating machinery). Arguments with spouses or parents over the use of cannabis in the home, or its use in the presence of children, can adversely impact family functioning and are common features of those with cannabis use disorder. Last, individuals with cannabis use disorder may continue using marijuana despite knowledge of physical problems (e.g. chronic cough related to smoking) or psychological problems (e.g. excessive sedation or exacerbation of other mental health problems) associated with its use. (HHS 2015, page 34).

The HHS stated that chronic marijuana use produces acute and chronic adverse effects on the respiratory system, memory and learning. Regular marijuana smoking can produce a number of long-term pulmonary consequences, including chronic cough and increased sputum (Adams and Martin, 1996), and histopathologic abnormalities in bronchial epithelium (Adams and Martin, 1996).

Marijuana as a "Gateway Drug"

The HHS reviewed the clinical studies evaluating the gateway hypothesis in marijuana and found them to be limited. The primary reasons were: (1) Recruited participants were influenced by social, biological, and economic factors that contribute to

extensive drug abuse (Hall and Lynskey, 2005), and (2) most studies testing the gateway drug hypothesis for marijuana use the determinative measure *any use of an illicit drug* rather than applying DSM-5 criteria for drug abuse or dependence (DSM-5, 2013).

The HHS cited several studies where marijuana use did not lead to other illicit drug use (Kandel and Chen, 2000; von Sydow et al., 2002; Nace et al., 1975). Two separate longitudinal studies with adolescents using marijuana did not demonstrate an association with use of other illicit drugs (Kandel and Chen, 2000; von Sydow et al., 2002).

It was noted by the HHS that, when evaluating the gateway hypothesis, differences appear when examining use versus abuse or dependence of other illicit drugs. Van Gundy and Rebellon (2010) reported that there was a correlation between marijuana use in adolescence and other illicit drug use in early adulthood, but when examined in terms of drug abuse of other illicit drugs, age-linked stressors and social roles were confounders in the association. Degenhardt et al. (2009) reported that marijuana use often precedes use of other illicit drugs, but dependence involving drugs other than marijuana frequently correlated with higher levels of illicit drug abuse. Furthermore, Degenhardt et al. (2010) reported that in countries with lower prevalence of marijuana usage, use of other illicit drugs before marijuana was often documented.

Based on these studies among others, the HHS concluded that although many individuals with a drug abuse disorder may have used marijuana as one of their first illicit drugs, this does not mean that individuals initiated with marijuana inherently will go on to become regular users of other illicit drugs.

Factor 7: Its Psychic or Physiological Dependence Liability

Physiological (Physical) Dependence in Humans

The HHS stated that heavy and chronic use of marijuana can lead to physical dependence (DSM-5, 2013; Budney and Hughes, 2006; Haney et al., 1999). Tolerance is developed following repeated administration of marijuana and withdrawal symptoms are observed as following discontinuation of marijuana usage (HHS, 2015).

The HHS mentioned that tolerance can develop to some of marijuana's effects, but does not appear to develop with respect to the psychoactive effects. It is believed that lack of tolerance to

psychoactive effects may relate to electrophysiological data demonstrating that chronic Δ^9 -THC administration does not affect increased neuronal firing in the ventral tegmental area, a brain region that plays a critical role in drug reinforcement and reward (Wu and French, 2000). Humans can develop tolerance to marijuana's cardiovascular, autonomic, and behavioral effects (Jones et al., 1981). Tolerance to some behavioral effects appears to develop with heavy and chronic use, but not with occasional usage. Ramaekers et al. (2009) reported that following acute administration of marijuana, occasional marijuana users still exhibited impairments in tracking and attention tasks whereas performance of heavy users on the these tasks was not affected. In a follow-up study with the same subjects that participated in the study by Ramaekers et al. (2009), a neurophysiological assessment was conducted where event-related potentials (ERPs) were measured using electroencephalography (EEG) (Theunissen et al., 2012). Similar to the earlier results, the heavy marijuana users (n = 11; average of 340 marijuana uses per year) had no changes in their ERPs with the acute marijuana exposure. However, occasional users (n = 10; average of 55 marijuana uses per year) had significant decreases in the amplitude of an ERP component (categorized as P100) on tracking and attention tasks and ERP amplitude change is indicative of a change in brain activity (Theunissen et al., 2012).

The HHS indicated that down-regulation of cannabinoid receptors may be a possible mechanism for tolerance to marijuana's effects (Hirvonen et al., 2012; Gonzalez et al., 2005; Rodriguez de Fonseca et al., 1994; Oviedo et al., 1993).

As indicated by the HHS, the most common withdrawal symptoms in heavy, chronic marijuana users are sleep difficulties, decreased appetite or weight loss, irritability, anger, anxiety or nervousness, and restlessness (Budney and Hughes, 2006; Haney et al., 1999). As reported by HHS, most marijuana withdrawal symptoms begin within 24–48 hours of discontinuation, peak within 4–6 days, and last for 1–3 weeks.

The HHS pointed out that the American Psychiatric Association's (APA's) Diagnostic and Statistical Manual of Mental Disorders—5 (DSM–5) included a list of withdrawal symptoms following marijuana [cannabis] use (DSM–5, 2013). The DEA notes that a DSM–5 working group report indicated that marijuana withdrawal symptoms were added to DSM–5 (they were not previously

included in DSM–IV) because marijuana withdrawal has now been reliably presented in several studies (Hasin et al., 2013). In short, marijuana withdrawal signs are reported in up to one-third of regular users and between 50% and 90% of heavy users (Hasin et al., 2013). According to DSM–5 criteria, in order to be characterized as having marijuana withdrawal, an individual must develop at least three of the seven symptoms within one week of decreasing or stopping the heavy and prolonged use (DSM–5, 2013). These seven symptoms are: (1) Irritability; anger or aggression, (2) nervousness or anxiety, (3) sleep difficulty, (4) decreased appetite or weight loss, (5) restlessness, (6) decreased mood, (7) somatic symptoms causing significant discomfort (DSM–5, 2013).

Psychological (Psychic) Dependence in Humans

High levels of psychoactive effects such as positive reinforcement correlate with increased marijuana abuse and dependence (Scherrer et al., 2009; Zeiger et al., 2010). Epidemiological marijuana use data reported by NSDUH, MTF, and TEDS support this assertion as presented in the HHS 2015 review of marijuana and updated by the DEA. According to the findings in the 2014 NSDUH survey, an estimated 9.2 million individuals 12 years and older used marijuana daily or almost daily (20 or more days within the past month). In the 2015 MTF report, daily marijuana use (20 or more days within the past 30 days) in 8th, 10th, and 12th graders is 1.1%, 3.0%, and 6.0%, respectively.

The 2014 NSDUH report stated that 4.2 million persons were classified with dependence on or abuse of marijuana in the past year (representing 1.6% of the total population age 12 or older, and 59.0% of those classified with illicit drug dependence or abuse) based on criteria specified in the Diagnostic and Statistical Manual of Mental Disorders, 4th edition (DSM–IV). Furthermore, of the admissions to licensed substance abuse facilities, as presented in TEDS, marijuana/hashish was the primary substance of abuse for; 18.3% (352,297) of 2011 admissions; 17.5% (315,200) of 2012 admissions; and 16.8% (281,991) of 2013 admissions. Of the 281,991 admissions in 2013 for marijuana/hashish as the primary substance, 24.3% used marijuana/hashish daily. Among admissions to treatment for marijuana/hashish as the primary substance in 2013, 27.4% were ages 12 to 17 years and 29.7% were ages 20 to 24 years.

Factor 8: Whether the Substance is an Immediate Precursor of a Substance Already Controlled Under the CSA

Marijuana is not an immediate precursor of another controlled substance.

Determination

After consideration of the eight factors discussed above and of the HHS's Recommendation, the DEA finds that marijuana meets the three criteria for placing a substance in schedule I of the CSA under 21 U.S.C. 812(b)(1):

1. Marijuana has a high potential for abuse.

The HHS concluded that marijuana has a high potential for abuse based on a large number of people regularly using marijuana, its widespread use, and the vast amount of marijuana that is available through illicit channels.

Marijuana is the most abused and trafficked illicit substance in the United States. Approximately 22.2 million individuals in the United States (8.4% of the United States population) were past month users of marijuana according to the 2014 NSDUH survey. A 2015 national survey (Monitoring the Future) that tracks drug use trends among high school students showed that by 12th grade, 21.3% of students reported using marijuana in the past month, and 6.0% reported having used it daily in the past month. In 2011, SAMHSA's Drug Abuse Warning Network (DAWN) reported that marijuana was mentioned in 36.4% of illicit drug-related emergency department (ED) visits, corresponding to 455,668 out of approximately 1.25 million visits. The Treatment Episode Data Set (TEDS) showed that 16.8% of non-private substance-abuse treatment facility admissions in 2013 were for marijuana as the primary drug.

Marijuana has dose-dependent reinforcing effects that encourage its abuse. Both clinical and preclinical studies have demonstrated that marijuana and its principle psychoactive constituent, Δ^9 -THC, possess the pharmacological attributes associated with drugs of abuse. They function as discriminative stimuli and as positive reinforcers to maintain drug use and drug-seeking behavior. Additionally, use of marijuana can result in psychological dependence.

2. Marijuana has no currently accepted medical use in treatment in the United States.

The HHS stated that the FDA has not approved an NDA for marijuana. The HHS noted that there are opportunities for scientists to conduct clinical research with marijuana and there are active INDs for marijuana, but marijuana

does not have a currently accepted medical use in the United States, nor does it have an accepted medical use with severe restrictions.

FDA approval of an NDA is not the sole means through which a drug can be determined to have a “currently accepted medical use” under the CSA. Applying the five-part test summarized below, a drug has a currently accepted medical use if all of the following five elements have been satisfied. As detailed in the HHS evaluation and as set forth below, none of these elements has been fulfilled for marijuana:

i. The drug’s chemistry must be known and reproducible

Chemical constituents including Δ^9 -THC and other cannabinoids in marijuana vary significantly in different marijuana strains. In addition, the concentration of Δ^9 -THC and other cannabinoids may vary between strains. Therefore the chemical composition among different marijuana samples is not reproducible. Due to the variation of the chemical composition in marijuana strains, it is not possible to derive a standardized dose. The HHS does advise that if a specific *Cannabis* strain is cultivated and processed under controlled conditions, the plant chemistry may be consistent enough to derive standardized doses.

ii. There must be adequate safety studies

There are not adequate safety studies on marijuana for use in any specific, recognized medical condition. The considerable variation in the chemistry of marijuana results in differences in safety, biological, pharmacological, and toxicological parameters amongst the various marijuana samples.

iii. There must be adequate and well-controlled studies proving efficacy

There are no adequate and well-controlled studies that determine marijuana’s efficacy. In an independent review performed by the FDA of publicly available clinical studies on marijuana (FDA, 2015), FDA concluded that these studies do not have enough information to “currently prove efficacy of marijuana” for any therapeutic indication.

iv. The drug must be accepted by qualified experts

At this time, there is no consensus of opinion among experts concerning the medical utility of marijuana for use in treating specific recognized disorders.

v. The scientific evidence must be widely available

The currently available data and information on marijuana is not sufficient to address the chemistry, pharmacology, toxicology, and

effectiveness. The scientific evidence regarding marijuana’s chemistry with regard to a specific cannabis strain that could be formulated into standardized and reproducible doses is not currently available.

3. There is a lack of accepted safety for use of marijuana under medical supervision.

Currently, there are no FDA-approved marijuana products. The HHS also concluded that marijuana does not have a currently accepted medical use in treatment in the United States or a currently accepted medical use with severe restrictions. According to the HHS, the FDA is unable to conclude that marijuana has an acceptable level of safety in relation to its effectiveness in treating a specific and recognized disorder due to lack of evidence with respect to a consistent and reproducible dose that is contamination free. The HHS indicated that marijuana research investigating potential medical use should include information on the chemistry, manufacturing, and specifications of marijuana. The HHS further indicated that a procedure for delivering a consistent dose of marijuana should also be developed. Therefore, the HHS concluded that marijuana does not have an acceptable level of safety for use under medical supervision.

BILLING CODE 4410–09–P

DEPARTMENT OF JUSTICE**Drug Enforcement Administration****21 CFR Part 1301**

[Docket No. DEA-447]

Applications To Become Registered Under the Controlled Substances Act To Manufacture Marijuana To Supply Researchers in the United States

AGENCY: Drug Enforcement Administration, Department of Justice.
ACTION: Policy statement.

SUMMARY: To facilitate research involving marijuana and its chemical constituents, DEA is adopting a new policy that is designed to increase the number of entities registered under the Controlled Substances Act (CSA) to grow (manufacture) marijuana to supply legitimate researchers in the United States. This policy statement explains how DEA will evaluate applications for such registration consistent with the CSA and the obligations of the United States under the applicable international drug control treaty.

DATES: August 12, 2016.

FOR FURTHER INFORMATION CONTACT: Michael J. Lewis, Office of Diversion Control, Drug Enforcement Administration; Mailing Address: 8701 Morrisette Drive, Springfield, Virginia 22152; Telephone: (202) 598-6812.

SUPPLEMENTARY INFORMATION:**Background***Reasons for This Policy Statement*

There is growing public interest in exploring the possibility that marijuana or its chemical constituents may be used as potential treatments for certain medical conditions. The Federal Food, Drug and Cosmetic Act requires that before a new drug is allowed to enter the U.S. market, it must be demonstrated through adequate and well-controlled clinical trials to be both safe and effective for its intended uses. Congress long ago established this process, recognizing that it was essential to protect the health and welfare of the American people.

Although no drug product made from marijuana has yet been shown to be safe and effective in such clinical trials, DEA—along with the Food and Drug Administration (FDA) and the National Institutes of Health (NIH)—fully supports expanding research into the potential medical utility of marijuana and its chemical constituents.¹

¹ There are two FDA-approved drugs that contain a synthetic form of dronabinol, which is one of the

There are a variety of factors that influence whether and to what extent such research takes place. Some of the key factors—such as funding—are beyond DEA's control.² However, one of the ways DEA can help to facilitate research involving marijuana is to take steps, within the framework of the CSA and U.S. treaty obligations, to increase the lawful supply of marijuana available to researchers.

For nearly 50 years, the United States has relied on a single grower to produce marijuana used in research. This grower operates under a contract with the National Institute on Drug Abuse (NIDA). This longstanding arrangement has historically been considered by the U.S. Government to be the best way to satisfy our nation's obligations under the applicable international drug control treaty, as discussed in more detail below. For most of the nearly 50 years that this single marijuana grower arrangement has been in existence, the demand for research-grade marijuana in the United States was relatively limited—and the single grower was able to meet such limited demand. However, in recent years, there has been greater public interest in expanding marijuana-related research, particularly with regard to certain chemical constituents in the plant known as cannabinoids.

The term “cannabinoids” generally refers to those chemicals unique to the cannabis plant (marijuana).³ To date, more than 100 different cannabinoids have been found in the plant. One such cannabinoid—known as cannabidiol or CBD—has received increased attention in recent years. Although the effects of CBD are not yet fully understood by

chemicals found in marijuana. These drugs are Marinol (which the FDA approved for the treatment of nausea and vomiting associated with cancer chemotherapy, and for the treatment of anorexia associated with weight loss in patients with AIDS) and Syndros (which was approved for the same indications as Marinol).

² Funding may actually be the most important factor in whether research with marijuana (or any other experimental drug) takes place. What appears to have been the greatest spike in marijuana research in the United States occurred shortly after the State of California enacted legislation in 1999 to fund such research. Specifically, in 1999, California enacted a law that established the “California Marijuana Research Program” to develop and conduct studies on the potential medical utility of marijuana. Cal. Health & Safety Code § 11362.9. The state legislature appropriated a total of \$9 million for the marijuana research studies. Over the next five years, DEA received applications for registration in connection with at least 17 State-sponsored pre-clinical or clinical studies of marijuana (all of which DEA granted). 74 FR 2101, 2105 (2009). However, it appears that once the State stopped funding the research, the studies ended.

³ An acceptable and broader definition of “cannabinoids” includes not only those chemicals unique to the cannabis plant but also their derivatives and transformation products.

scientists, and research is ongoing in this area, some studies suggest that CBD may have uses in the treatment of seizures and other neurological disorders. A growing number of researchers have expressed interest in conducting research with extracts of marijuana that have a particular percentage of CBD and other cannabinoids. DEA fully supports research in this area. Based on discussions with NIDA and FDA, DEA has concluded that the best way to satisfy the current researcher demand for a variety of strains of marijuana and cannabinoid extracts is to increase the number of federally authorized marijuana growers. To achieve this result, DEA, in consultation with NIDA and FDA, has developed a new approach to allow additional marijuana growers to apply to become registered with DEA, while upholding U.S. treaty obligations and the CSA. This policy statement explains the new approach, provides details about the process by which potential growers may apply for a DEA registration, and describes the steps they must take to ensure their activity will be carried out in conformity with U.S. treaty obligations and the CSA.

The historical system, under which NIDA relied on one grower to supply marijuana on a contract basis, was designed primarily to supply marijuana for use in federally funded research—not for commercial product development. Thus, under the historical system, there was no clear legal pathway for commercial enterprises to produce marijuana for product development. In contrast, under the new approach explained in this policy statement, persons may become registered with DEA to grow marijuana not only to supply federally funded or other academic researchers, but also for strictly commercial endeavors funded by the private sector and aimed at drug product development. Likewise, under the new approach, should the state of scientific knowledge advance in the future such that a marijuana-derived drug is shown to be safe and effective for medical use, pharmaceutical firms will have a legal means of producing such drugs in the United States— independent of the NIDA contract process.

Legal Considerations*Applicable CSA Provisions*

Under the CSA, all persons who seek to manufacture or distribute a controlled substance must apply for a DEA registration. 21 U.S.C. 822(a)(1). Applications by persons seeking to grow

marijuana to supply researchers are governed by 21 U.S.C. 823(a); *see generally* 76 FR 51403 (2011); 74 FR 2101 (2009). Under section 823(a), for DEA to grant a registration, two conditions must be satisfied: (1) The registration must be consistent with the public interest (based on the enumerated criteria listed in section 823(a)) and (2) the registration must be consistent with U.S. obligations under the Single Convention on Narcotic Drugs, 1961 (Single Convention). An applicant seeking registration under section 823(a) has “the burden of proving that the requirements for such registration pursuant to [this section] are satisfied.” 21 CFR 1301.44(a). Although each application for registration that DEA receives will be evaluated individually based on its own merit, some general considerations warrant mention here.

First, while it is DEA’s intention to increase the number of registered marijuana growers who will be supplying U.S. researchers, the CSA does not authorize DEA to register an unlimited number of manufacturers. As subsection 823(a)(1) provides, DEA is obligated to register only the number of bulk manufacturers of a given schedule I or II controlled substance that is necessary to “produce an adequate and uninterrupted supply of these substances under adequately competitive conditions for legitimate medical, scientific, research, and industrial purposes.” *See* 74 FR at 2127–2130 (discussing meaning of subsection 823(a)(1)). This provision is based on the long-established principle that having fewer registrants of a given controlled substances tends to decrease the likelihood of diversion.

Consistent with subsection 823(a)(1), DEA will evaluate each application it receives to determine whether adding such applicant to the list of registered growers is necessary to provide an adequate and uninterrupted supply of marijuana (including extracts and other derivatives thereof) to researchers in the United States.⁴

Second, as with any application submitted pursuant to section 823(a), in determining whether the proposed registration would be consistent with the public interest, among the factors to be considered are whether the applicant has previous experience handling controlled substances in a lawful manner and whether the applicant has engaged in illegal activity involving controlled substances. In this context, illegal activity includes any activity in

violation of the CSA (regardless of whether such activity is permissible under State law) as well as activity in violation of State or local law. While past illegal conduct involving controlled substances does not automatically disqualify an applicant, it may weigh heavily against granting the registration.

Third, given the in-depth nature of the analysis that the CSA requires DEA to conduct in evaluating these applications, applicants should anticipate that, in addition to the information requested in the application itself, they will be asked to submit other information germane to the application in accordance with 21 CFR 1301.15. This will include, among other things, detailed information regarding an applicant’s past experience in the manufacture of controlled substances. In addition, applicants will be asked to provide a written explanation of how they believe they would be able to augment the nation’s supply of research-grade marijuana within the meaning of subsection 823(a)(1). Applicants may be asked to provide additional written support for their application and other information that DEA deems relevant in evaluating the application under section 823(a).

Treaty Considerations

As stated above, DEA may only issue a registration to grow marijuana to supply researchers if the registration is consistent with U.S. obligations under the Single Convention. Although this policy document will not list all of the applicable requirements of the Single Convention,⁵ the following is a summary of some of the key considerations.

Under articles 23 and 28 of the Single Convention, a party (*i.e.*, a country that is a signatory to the treaty) that allows the cultivation of cannabis for lawful uses (*e.g.*, FDA-authorized clinical trials) must:

(a) Designate the areas in which, and the plots of land on which, cultivation of the cannabis plant for the purpose of producing cannabis shall be permitted;

(b) License cultivators authorized to cultivate cannabis;

(c) Specify through such licensing the extent of the land on which the cultivation is permitted;

(d) Purchase and take physical possession of all cannabis crops from all cultivators as soon as possible, but not later than four months after the end of the harvest; and

(e) Have the exclusive right of importing, exporting, wholesale trading and maintaining stocks of cannabis.

As DEA has stated in a prior publication, DEA carries out those functions of article 23, paragraph 2, that are encompassed by the DEA registration system (paragraphs (a) through (c) above), and NIDA carries out those functions relating to purchasing the marijuana and maintaining a monopoly over the wholesale distribution (paragraphs (d) and (e) above).⁶ 76 FR at 51409.

As indicated, DEA’s historical approach to ensuring compliance with the foregoing treaty requirements was to limit the registration of marijuana growers who supply researchers to those entities that operate under a contract with NIDA. Under this historical approach, the grower could be considered an extension of NIDA and thus all marijuana produced by the grower was effectively owned by NIDA, with NIDA controlling all distribution to researchers.

However, as further indicated, DEA has concluded, based on discussions with NIDA and FDA, that it would be beneficial for research to allow additional marijuana growers outside the NIDA-contract system, provided this could be accomplished in a manner consistent with the CSA and the treaty. Toward this end, DEA took into account the following statement contained in the official commentary to the Single Convention:

Countries . . . which produce . . . cannabis . . . , [i]n so far as they permit private farmers to cultivate the plants . . . , cannot establish with sufficient exactitude the quantities harvested by individual producers. If they allowed the sale of the crops to private traders, they would not be in a position to ascertain with reasonable exactitude the amounts which enter their controlled trade. The effectiveness of their control régime would thus be considerably weakened. In fact, experience has shown that permitting licensed private traders to purchase the crops results in diversion of large quantities of drugs into illicit channels. . . . [T]he acquisition of the crops and the wholesale and international trade in these agricultural products cannot be entrusted to private traders, but must be undertaken by governmental authorities in the producing countries. Article 23 . . . and article 28 . . . therefore require a government monopoly of the wholesale and international trade in the agricultural product in question in the country which authorizes its production.

Commentary at 278

⁶In accordance with the CSA, DEA carries out functions that are indirectly related to those specified in article 23, paragraph 2(e). For example, DEA controls imports and exports of cannabis through the CSA registration and permitting system.

⁴In making this determination, DEA will consult with NIH and FDA, as warranted.

⁵A detailed explanation of the relevant Single Convention requirements can be found in 74 FR at 2114–2118.

Given the foregoing considerations, DEA believes it would be consistent with the purposes of articles 23 and 28 of the Single Convention for DEA to register marijuana growers outside of the NIDA-contract system to supply researchers, *provided the growers agree that they may only distribute marijuana with prior, written approval from DEA*. In other words, in lieu of requiring the growers to operate under a contract with NIDA, a registered grower will be permitted to operate independently, provided the grower agrees (through a written memorandum of agreement with DEA) that it will only distribute marijuana with prior, written approval from DEA. DEA believes this new approach will succeed in avoiding one of the scenarios the treaty is designed to prevent: Private parties trading in marijuana outside the supervision or direction of the federal government.

Also, consistent with the purposes and structure of the CSA, persons who become registered to grow marijuana to supply researchers will only be authorized to supply DEA-registered researchers whose protocols have been determined by the Department of Health

and Human Services (HHS) to be scientifically meritorious. *See* 21 U.S.C. 823(f). In 2015, HHS announced the details of its current policy for evaluating the merits of research protocols involving marijuana. 80 FR 35960 (2015).

Finally, potential applicants should note that any entity granted a registration to manufacture marijuana to supply researchers will be subject to all applicable requirements of the CSA and DEA regulations, including those relating to quotas, record keeping, order forms, security, and diversion control.

How To Apply for a Registration

Persons interested in applying for a registration to become a bulk manufacturer of marijuana to supply legitimate researchers can find instructions and the application form by going to the DEA Office of Diversion Control Web site registration page at www.deadiversion.usdoj.gov/drugreg/index.html#regapps. Applicants will need to submit Form 225.

Note Regarding the Nature of This Document

This document is a general statement of DEA policy. While this document reflects how DEA intends to implement the relevant statutory and regulatory provisions, it does not establish a rule that is binding on any member of the public. Any person who applies for a registration to grow marijuana (as with any other applicant for registration under the CSA) is entitled to due process in the consideration of the application by the Agency. To ensure such due process, the CSA provides that, before taking action to deny an application for registration, DEA must serve upon the applicant an order to show cause why the application should not be denied, which shall provide the applicant with an opportunity to request a hearing on the application in accordance with the Administrative Procedure Act. 21 U.S.C. 824(c).

Dated: July 25, 2016.

Chuck Rosenberg,
Acting Administrator.

49 CFR Part 270

System Safety Program; Final Rule

DEPARTMENT OF TRANSPORTATION**Federal Railroad Administration****49 CFR Part 270**

[Docket No. FRA–2011–0060, Notice No. 3]

RIN 2130–AC31

System Safety Program

AGENCY: Federal Railroad Administration (FRA), Department of Transportation (DOT).

ACTION: Final rule.

SUMMARY: FRA is issuing this final rule to mandate that commuter and intercity passenger railroads develop and implement a system safety program (SSP) to improve the safety of their operations. A SSP is a structured program with proactive processes and procedures, developed and implemented by commuter and intercity passenger railroads to identify and mitigate or eliminate hazards and the resulting risks on each railroad's system. A railroad has the flexibility to tailor a SSP to its specific operations. A SSP will be implemented after receiving approval by FRA of a submitted SSP plan. FRA will audit a railroad's compliance with its SSP.

DATES: This final rule is effective October 11, 2016. Petitions for reconsideration must be received on or before October 3, 2016. Comments in response to petitions for reconsideration must be received on or before November 15, 2016.

ADDRESSES: *Petitions for reconsideration and comments on petitions for reconsideration:* Any petitions for reconsideration or comments on petitions for reconsideration related to this Docket No. FRA–2011–0060, Notice No. 3, may be submitted by any of the following methods:

- *Web site:* The Federal eRulemaking Portal, www.regulations.gov. Follow the Web site's online instructions for submitting comments.

- *Fax:* 202–493–2251.

- *Mail:* Docket Management Facility, U.S. Department of Transportation, 1200 New Jersey Avenue SE., Room W12–140, Washington, DC 20590.

- *Hand Delivery:* Docket Management Facility, Room W12–140 on the ground level of the West Building, U.S. Department of Transportation, 1200 New Jersey Avenue SE., Washington, DC, between 9 a.m. and 5 p.m., Monday through Friday, except Federal holidays.

Instructions: All submissions must include the agency name and docket number or Regulatory Identification Number (RIN) for this rulemaking

(2130–AC31). Note that all petitions and comments received will be posted without change to <http://www.regulations.gov>, including any personal information provided. Please see the Privacy Act heading in the **SUPPLEMENTARY INFORMATION** section of this document for Privacy Act information related to any submitted petitions, comments or materials.

Docket: For access to the docket to read background documents, petitions for reconsideration, or comments received, go to <http://www.regulations.gov> at any time or visit the Docket Management Facility, U.S. Department of Transportation, 1200 New Jersey Avenue SE., Room W12–140, on the Ground level of the West Building, between 9 a.m. and 5 p.m., Monday through Friday, except Federal holidays.

I. Executive Summary**A. Purpose of Rulemaking**

This rule requires commuter and intercity passenger railroads (passenger railroads) to develop and implement a system safety program (SSP). A SSP is a structured program with proactive processes and procedures, developed and implemented by passenger railroads. These processes and procedures will identify then mitigate or eliminate hazards and the resulting risks on the railroad's system. A SSP encourages a railroad and its employees to work together to proactively identify hazards and to jointly determine what, if any, action to take to mitigate or eliminate the resulting risks. The rule provides each railroad with a certain amount of flexibility to tailor its SSP to its specific operations. The SSP rule is part of FRA's efforts to continuously improve rail safety and to satisfy the statutory mandate in the Rail Safety Improvement Act of 2008 (RSIA), secs. 103 and 109, Public Law 110–432, Division A, 122 Stat. 4848 *et seq.*, codified at 49 U.S.C. 20156, 20118, and 20119.

On September 7, 2012, FRA published a notice of proposed rulemaking (NPRM) to address the following mandates for commuter and intercity passenger railroads. 77 FR 55372, Sept. 7, 2012. Section 103 (49 U.S.C. 20156) of RSIA enacted a statutory provision directing the Secretary of Transportation (Secretary) to issue a regulation requiring certain railroads, including passenger railroads, to develop, submit to the Secretary for review and approval, and implement a railroad safety risk reduction program. FRA is establishing separate safety risk reduction program rules for passenger

railroads (SSP) and certain freight railroads (Risk Reduction Program) to account for the significant differences between passenger and freight operations. Section 109 (codified at 49 U.S.C. 20118 and 20119) of RSIA enacted a statutory provision authorizing the Secretary to issue a regulation protecting from discovery and admissibility into evidence in litigation documents generated for the purpose of developing, implementing, or evaluating a safety risk reduction program. This final rule implements these statutory mandates with respect to the system safety program covered by part 270. The Secretary has delegated such statutory responsibilities to the Administrator of FRA. *See* 49 CFR 1.89.

B. Summary of Major Provisions

A SSP is implemented by a written SSP plan. The SSP regulation sets forth various elements that a railroad's SSP plan is required to contain to properly implement a SSP. The main components of a SSP are the risk-based hazard management program and risk-based hazard analysis. A properly implemented risk-based hazard management program and risk-based hazard analysis will identify the hazards and resulting risks on the railroad's system, require railroads to develop methods to mitigate or eliminate, if practicable, these hazards and risks, and set forth a plan to implement these methods. As part of its risk-based hazard analysis, a railroad will consider various technologies that may mitigate or eliminate the identified hazards and risks.

As part of its SSP plan, a railroad will also be required to describe the various procedures, processes, and programs it has in place that support the goals of the SSP. These procedures, processes, and programs include, but are not limited to, the following: A maintenance, inspection, and repair program; rules compliance and procedures review(s); SSP employee/contractor training; and a public safety outreach program. Since railroads should already have most of these procedures, processes, and programs in place, railroads will most likely only have to identify and describe such procedures, processes, and programs to comply with the regulation.

A SSP can be successful only if a railroad engages in a robust assessment of the hazards and resulting risks on its system. However, a railroad may be reluctant to reveal such hazards and risks if there is the possibility that such information may be used against it in a court proceeding for damages. Congress directed FRA to conduct a study to determine if it was in the public interest

to withhold certain information, including the railroad's assessment of its safety risks and its statement of mitigation measures, from discovery and admission into evidence in proceedings for damages involving personal injury and wrongful death. *See* 49 U.S.C. 20119. Furthermore, Congress authorized FRA, by delegation from the Secretary, to prescribe a rule, subject to notice and comment, to address the results of the study. *See* 49 U.S.C. 20119(b). FRA contracted to have the study performed and the SSP NPRM addressed the study's results and set forth proposed protections for certain information from discovery, admission into evidence, or use for other purposes in a proceeding for damages. 77 FR 55406, Sept. 7, 2012.

To minimize the information protected, information that is generated *solely for the purpose of developing, implementing, or evaluating a SSP* is protected from (1) discovery, or admissibility into evidence, or use for other purposes in a proceeding for damages involving personal injury, wrongful death, or property damage, and (2) State discovery rules and sunshine laws which could be used to require the disclosure of such information. Information that is compiled or collected for a purpose unrelated to the railroad's SSP is not protected. Under section 109 of RSIA, the information protection provision is not effective until one year after its publication.

In addition to protection from discovery, 49 U.S.C. 20118 specifies that certain risk reduction records obtained by the Secretary also are exempt from the public disclosure requirements of the Freedom of Information Act (FOIA). Records protected under this exemption may only be disclosed if disclosure is necessary to enforce or carry out any Federal law, or disclosure is necessary when a record is comprised of facts otherwise available to the public and FRA has determined that disclosure would be consistent with the confidentiality needed for SSPs. FRA therefore believes that railroad risk reduction records in FRA's possession would generally be exempted from mandatory disclosure under FOIA. Unless one of the two exceptions provided by section 20118 would apply, FRA would withhold disclosing any such records in response to a FOIA request. *See* 5 U.S.C. 552(b)(3) and 49 CFR 7.13(c)(3).

A SSP will affect almost all facets of a railroad's operations. To ensure all employees directly affected by a SSP have an opportunity to provide input on the development, implementation, and

evaluation of a railroad's SSP, a railroad must consult in good faith and use best efforts to reach agreement with all directly affected employees on the contents of the SSP plan and amendments to the plan. In an appendix, the rule provides guidance regarding what constitutes "good faith" and "best efforts."

This rule will become effective 60 days after the publication of the final rule except the protection of certain information discussed above will not become effective until one year after the final rule is published. A railroad is required to submit its SSP plan to FRA for review not more than 180 days after the applicability date of the discovery protections, *i.e.*, 485 days after the effective date of the final rule, or not less than 90 days before commencing operations, whichever is later. Within 90 days of receipt of the SSP plan, FRA will review the plan and determine if it meets all the requirements in the regulation. If, during the review, FRA determines that the railroad's SSP plan does not comply with the requirements, FRA will notify the railroad of the specific points in which the plan is deficient. The railroad will then have 90 days to correct these deficient points and resubmit the plan to FRA. Whenever a railroad amends its SSP, it is required to submit an amended SSP plan to FRA for approval and provide a cover letter describing the amendments. A similar approval process and timeline would apply whenever a railroad amends its SSP.

FRA will work with the railroad and other necessary stakeholders throughout the development of its SSP to help the railroad properly tailor the program to its specific operation.

C. Summary of the Costs and Benefits

Most of the passenger railroads affected by this rulemaking already participate in the American Public Transportation Association (APTA) system safety program and are currently participating in the APTA audit program. Railroads that are still negotiating contracts or not participating directly with APTA, have developed, or are in the process of developing an APTA system safety program. Since the majority of intercity passenger or commuter railroads already have APTA system safety programs, there will not be a significant cost for these railroads to implement the regulatory requirements in this final rule. Thus, the economic impact of the final rule is generally incremental in nature for documentation of existing information and inclusion of certain

elements not already addressed by railroads in their existing programs.

FRA estimated costs in the following areas: Documenting the SSP plan and the safety certification process; SSP training; preparing for and providing information in response to external audits; providing mitigation method information to FRA; preparing technology analysis results and providing them to FRA; providing an annual assessment of SSP performance and improvement plans; consulting with directly affected employees and preparing consultation statements, amending SSP plans; retaining records; and conducting internal SSP assessments.

FRA also addressed the use and costs of data protection, which is an important element of this rule. While the rule may protect from discovery some information that in the absence of the rule would not be protected, FRA concludes that the benefits of the protections justify the costs. Without the protections, railroads' risk-based hazard analysis and mitigations may be less robust, which may lead to a less safe environment than with the protections in place. No specific or net incremental costs are incurred by the protections (record keeping and reporting paperwork costs are accounted for in the rule). The information protections are important to ensure the effectiveness of a SSP at almost no additional regulatory cost to the railroad. This means that the information protections provide an incentive to the railroad to be forthright about identified risks, without concern the information may be used in litigation against them.

Total estimated twenty-year costs associated with implementation of the final rule, for existing passenger railroads, range from \$2.0 million (discounted at 7%) to \$2.9 million (discounted at 3%).

FRA believes that there will be new, startup passenger railroads that will be formed during the twenty-year analysis period. FRA is aware of two passenger railroads that intend to begin operations in the near future. FRA assumed that one of these railroads would begin developing its SSP in Year 2, and that the other would begin developing its SSP in Year 3. FRA further assumed that one additional passenger railroad would be formed and begin developing its SSP every other year after that, in Years 5, 7, 9, 11, 13, 15, 17 and 19. Total estimated twenty-year costs associated with implementation of the final rule, for startup passenger railroads, range from \$297 thousand (discounted at 7%) to \$485 thousand (discounted at 3%).

Total estimated twenty-year costs associated with implementation of the final rule, for existing passenger railroads and startup passenger railroads, range from \$2.3 million (discounted at 7%) to \$3.4 million (discounted at 3%).

The estimated costs for existing and startup passenger railroads to implement this rule do not include costs of mitigations that railroads may implement to address hazards, as the cost of hazard mitigation will vary greatly depending on what hazard is being eliminated or mitigated. FRA expects that railroads will implement the most cost-effective mitigations to eliminate or mitigate hazards.

Properly implemented SSPs may be successful in optimizing the returns on railroad safety investments. Railroads can use them to proactively identify potential hazards and resulting risks at an early stage, thus minimizing associated casualties and property damage or avoiding them altogether. Railroads can also use them to identify a wide array of potential safety issues and solutions, which in turn may allow them to simultaneously evaluate various alternatives for improving overall safety with resources available. This results in more cost effective investments. In addition, system safety planning may help railroads maintain safety gains over time. Without a SSP plan to guide them, railroads could adopt countermeasures to safety problems that become less effective over time as the focus shifts to other issues. With SSP plans, those safety gains are likely to continue for longer time periods. SSP plans can also be instrumental in reducing casualties resulting from hazards that are not well addressed through conventional safety programs.

During the course of daily operations, hazards are routinely discovered. Railroads must decide which hazards to address and how, with the limited resources available for this purpose. Without a SSP plan in place, the decision process might become arbitrary. In the absence of the information protections provided by the final rule, railroads might also be reluctant to keep detailed records of known hazards. With a SSP plan in place, railroads may be better able to identify and implement the most cost-effective measures to reduce accidents and incidents and resulting casualties.

The SSP NPRM Regulatory Impact Analysis (RIA) was performed on a breakeven basis. The approach has been modified for the final rule due to the lack of empirical evidence currently available to estimate all relevant regulatory costs, namely those from risk

analysis and risk mitigation. These costs are not reasonably predictable until the data protections are in place and each railroad produces and implements their SSP plans assessing their hazards and risk levels. The pool of potential safety benefits is large as evidenced by the totality of accidents and incidents experienced on passenger railroads that this final rule could impact. FRA expects that railroads can achieve sufficient safety benefits to justify quantified and unquantified costs.

SSPs under the APTA program are currently voluntary. This rule focuses on a robust risk-based hazard analysis and mitigation, and the oversight required to achieve full compliance. Passenger railroads must demonstrate a robust SSP and the means to implement the SSP and assure compliance. Railroad management and employees will be accountable to achieve the safety goals in their SSPs, but there will also be FRA oversight to monitor and demand corrective actions if and when necessary.

As documented in the RIA, FRA expects that regulatory costs under the SSP final rule will be modest and only incremental in relation to the railroads' non-regulatory costs because the rule provides information to the industry on what FRA's expectations are for a robust SSP. Railroads should be able to assemble a SSP plan to satisfy the rule by packaging what they currently have under the APTA program that complies with the SSP rule's provisions, along with (1) greater emphasis on eliminating or reducing hazards and the resulting risks, (2) rigorous analysis process, and (3) commitment to achieve the railroad's safety goal through setting priorities of its risk reduction efforts of mitigation. The SSP final rule would also address any gaps in those plans that do not meet the requirements of this rule. The few railroads that are not under the APTA program have their own SSPs or are developing such with FRA's assistance. For instance, when a hazard analysis is performed, this rule requires the railroad to demonstrate the processes and procedures it used to carry-out the analysis and mitigation. This means that, for the most part, FRA would only require actions to address gaps in the SSP plans, such as providing a clear or more robust description of the methods and processes they will use. These actions are expected to maintain and improve the economic benefit that can be achieved through the use of a robust SSP. However, it is difficult to provide a precise cap on the regulatory costs and benefits because the type and level of hazards and corresponding risk are not

known, which is why FRA could not estimate benefits quantitatively.

A benefit (not quantified) of this rule is that it may promote more cost-effective investment of railroad resources. However, FRA does not know to what extent. Therefore, FRA focused on the passenger railroad accidents and incidents this rule will impact. FRA analyzed passenger operation-related accident costs—the costs of accidents

this final rule could affect. Between 2001 and 2010, on average, passenger railroads had 3,724 accidents, resulting in 208 fatalities, 3,340 other casualties, and \$20.6 million in damage to railroad track and equipment each year. Total quantified twenty-year accident costs total between \$33 billion (discounted at 7%) and \$51 billion (discounted at 3%). Of course, these accidents also resulted in damage to other property, delays to

both railroads and highway users, emergency response and clean-up costs, and other costs not quantified in this analysis. In conclusion, FRA is confident that the accident reduction benefits should justify the \$2.3 million (discounted at 7%) to \$3.4 million (discounted at 3%) implementation cost over the first twenty years of the final rule.

TABLE 1—TOTAL COSTS (OVER 20-YEAR PERIOD) AND ANNUALIZED

	Current dollar value	Discounted value 7 percent	Discounted value 3 percent
Total	\$4,743,039	\$2,327,224	\$3,412,651
Annualized	237,152	219,674	229,384

This rule will certainly have benefits incremental to the APTA program. However, FRA could not estimate the benefits of the final rule as SSPs are mostly an organizational structure and program to manage safety through hazard analysis and mitigation. FRA cannot accurately estimate the rule's incremental safety benefits because FRA cannot reliably predict the specific risks each railroad will identify or the specific actions they will take to mitigate such risks relative to the APTA program.

II. Background and History

A. System Safety Program—Generally

On September 7, 2012, FRA published an NPRM proposing to require commuter and intercity passenger railroads to develop and implement a SSP to improve the safety of their operations. 77 FR 55372, Sept. 7, 2012. The NPRM was proposed as part of FRA's efforts to continuously improve rail safety and to satisfy the statutory mandates in 49 U.S.C. 20156, 20118, and 20119.

Railroads operate in a dynamic, fast-paced environment that at one time posed extreme safety risks. Through concerted efforts by railroads, labor organizations, the U.S. DOT, and many other entities, railroad safety has vastly improved. Even though FRA has issued safety regulations and guidance that address many aspects of railroad operations, gaps in safety exist, and hazards and risks may arise from these gaps. FRA believes that railroads are in an excellent position to identify many of these gaps and take the necessary action to mitigate or eliminate the arising hazards and resulting risks. Rather than prescribing the specific actions the railroads need to take, FRA believes it will be more effective to allow the

railroads to use their knowledge of their unique operating environment to identify the gaps and determine the best methods to mitigate or eliminate the hazards and resulting risks. A SSP provides a railroad with the tools to systematically and continuously evaluate its system to identify hazards and the resulting risks gaps in safety and to mitigate or eliminate these hazards and risks.

There are many programs that are similar to a SSP. Most notably, the Federal Aviation Administration (FAA) has published a final rule requiring each certificate holder operating under 14 CFR part 121 to develop and implement a safety management system (SMS). 80 FR 1308, Jan. 8, 2015. An SMS is a comprehensive, process-oriented approach to managing safety throughout the organization. An SMS includes an organization-wide safety policy; formal methods for identifying hazards, controlling, and continually assessing risk; and promotion of safety culture. Under FAA's final rule an SMS has four components: Safety Policy, Safety Risk Management, Safety Assurance, and Safety Promotion. *Id.* Similar components can also be found in this SSP rule.

The U.S. Department of Defense (DoD) has also set forth guidelines for a System Safety Program. In July 1969, DoD published "System Safety Program Plan Requirements" (MIL-STD-882). MIL-STD-882 is DoD's standard practice for system safety, with the most recent version, MIL-STD-882E, published on May 11, 2012. DoD, *MIL-STD-882E, Department of Defense Standard Practice System Safety*. MIL-STD-882 is used by many industries in the U.S. and internationally and certainly could be of use to a railroad when trying to determine which

methods to use to comply with the SSP rule. In fact, MIL-STD-882 is cited in FRA's safety regulations for railroad passenger equipment, 49 CFR part 238, as an example of a formal safety methodology to use in complying with certain analysis requirements in that rule. *See* 49 CFR 238.103 and 238.603.

B. System Safety Program Overview and Related Actions

i. System Safety at FRA

As discussed in the NPRM, system safety is not a new concept to FRA. *See* 77 FR 55374. This final rule responds to the statutory mandates set forth in RSIA and is based on lessons learned from past experience with various elements of system safety, as well as recommendations from the Railroad Safety Advisory Committee (RSAC).

ii. Federal Transit Administration's Part 659 and MAP-21 Program

As discussed in the NPRM, the Federal Transit Administration has set forth a regulation that covers State-conducted oversight of the safety and security of rail fixed guideway systems that were not regulated by FRA. *See* 77 FR 55375, Sept. 7, 2012; 49 CFR part 659. On March 16, 2016, FTA published the State Safety Oversight (SSO) final rule. 81 FR 14230, Mar. 16, 2016. The SSO rule replaces part 659 and implements certain provisions of the Moving Ahead for Progress in the 21st Century Act, Public Law 112-141 (2012). Many of the same concepts from part 659 are incorporated in the SSP final rule.

MAP-21 made a number of fundamental changes to the statutes that authorize FTA programs at 49 U.S.C. ch. 53. On October 3, 2013, FTA published an advance notice of proposed rulemaking (ANPRM) seeking comment

on the implementation of these changes. See 78 FR 61251, Oct. 3, 2013. The ANPRM sought comment on several provisions within the Public Transportation Safety Program (National Safety Program) authorized at 49 U.S.C. 5329, and the transit asset management (National TAM System) requirements authorized at 49 U.S.C. 5326. *Id.* Specifically, FTA sought comment on its initial interpretations, proposals, and questions regarding: (1) The requirements of the National Safety Program relating to the National Public Transportation Safety Plan, the Public Transportation Agency Safety Plan, and the Public Transportation Safety Certification Training Program; (2) the requirements of the National TAM System, including four proposed options under consideration for defining and measuring state of good repair; and (3) the relationship between safety, transit asset management, and state of good repair. *Id.* at 61252. FTA also sought comment on its intent to propose adoption of the SMS¹ approach as the method to develop and implement the National Safety Program. *Id.* While many of the requirements of the National Safety Program and the National TAM System apply equally to all modes of public transportation, FTA intends to focus, initially, on rail transit systems' implementation of and compliance with these requirements. *Id.* at 61251.

In the ANPRM, FTA made it clear that if another Federal agency (*e.g.*, FRA) regulates the safety of a particular mode of transportation, FTA, as part of the rulemaking pursuant to MAP-21, does not intend to set forth duplicative, inconsistent, or conflicting regulations. 78 FR 61251, Oct. 3, 2013. FTA specifically highlighted that it does not intend to promulgate safety regulations that will apply to either commuter rail systems that are regulated by FRA. *Id.* Further, FTA's regulatory jurisdiction is explicitly limited by two statutory provisions. *Id.* at 61253. First, FTA is prohibited from promulgating safety performance standards for rolling stock that is already regulated by another Federal agency, *e.g.*, FRA. See 49 U.S.C. 5329(b)(2)(C)(i). Second, the requirements of the State Safety Oversight Program will not apply to rail transit systems that are subject to regulation by FRA. See 49 U.S.C. 5329(e)(1) and (e)(2).

On February 5, 2016, FTA published an NPRM proposing requirements for

the Public Transportation Agency Safety Plan. 81 FR 6344. The NPRM proposed "requirements for the adoption of Safety Management Systems (SMS) principles and methods; the development, certification, and update of Public Transportation Agency Safety Plans; and the coordination of Public Transportation Agency Safety Plan elements with other FTA programs and proposed rules, as specified in 49 U.S.C. 5329." *Id.* at 6344-45. The NPRM reaffirms FTA's intent not to promulgate safety regulations that would apply to commuter rail systems that are regulated by the FRA. *Id.* at 6345, 6346, 6351, 6353, 6361, and 6369. FTA clarifies that, primarily, due to the information protections set forth in this FRA SSP rule, a public transportation provider cannot use its SSP for other modes of transportation aside from a commuter rail operation that falls under this SSP rule. *Id.* at 6351.

Since FRA is publishing the SSP final rule after FTA published the NPRM for Public Transportation Agency Safety Plans (the FTA Agency Safety Plan NPRM), but before the FTA Agency Safety Plan final rule, railroads and other interested stakeholders will have the opportunity to compare the SSP final rule with the FTA Agency Safety Plan NPRM.

iii. Risk Reduction Program Rulemaking

FRA is currently developing, with the assistance of the RSAC, a separate risk reduction rule, referred to as the risk reduction program (RRP), that would implement the requirements of sections 20156, 20118, and 20119 for Class I freight railroads and railroads with inadequate safety performance. The RRP NPRM was published in the **Federal Register** on February 27, 2015. 80 FR 10949. The RRP rulemaking is discussed *infra* in the "Statutory Background" section.

iv. FRA's Confidential Close Call Reporting System and Clear Signal for Action Program

FRA also has established two voluntary, independent programs that exemplify the philosophy of risk reduction: The Confidential Close Call Reporting System (C3RS) and the Clear Signal for Action (CSA) program.² FRA has developed these programs in the belief that, in addition to process and technology innovations, human factors-based solutions can make a significant

contribution to improving safety in the railroad industry.

The C3RS and CSA program embody many of the concepts and principles found in a SSP: Proactive identification of hazards and risks, analysis of those hazards and risks, and implementation of appropriate action to eliminate or mitigate the hazards and risks. While FRA does not require any railroad to implement a C3RS or CSA program as part of their SSP, FRA does believe that these types of programs would prove useful in the development of a SSP and encourages railroads to include such programs as part of their SSP.

C. FRA's Railroad Safety Advisory Committee

The SSP rule was developed with the assistance of the RSAC.³ This rule incorporates the majority of RSAC's recommendations. FRA decided not to incorporate certain recommendations because they were unnecessary or duplicative and their exclusion would not have a substantive effect on the rule. The rule also contains elements that were not part of RSAC's recommendations. The majority of these elements are added to provide clarity and to conform to **Federal Register** formatting requirements. However, FRA notes the areas in which the exclusion of the RSAC recommendations or the inclusion of elements not part of the RSAC recommendations do have a substantive effect on the rule and will provide an explanation for doing so.

III. Statutory Background

A. Rail Safety Improvement Act of 2008

In section 103 of the RSIA, Congress enacted a statutory provision directing the Secretary to issue a regulation requiring certain railroads to develop, submit to the Secretary for review and approval, and implement a railroad safety risk reduction program. This statutory mandate is codified at 49 U.S.C. 20156 (section 20156). The Secretary has delegated this statutory responsibility to the FRA Administrator. See 49 CFR 1.89, 77 FR 49965, 49984, Aug. 17, 2012; *see also* 49 U.S.C. 103(g). The railroads required to be subject to such a regulation include the following:

- (1) Class 1 railroads;
- (2) Railroad carriers with inadequate safety performance, as determined by the Secretary; and
- (3) Railroad carriers that provide intercity rail passenger or commuter rail passenger transportation (passenger railroads).

¹ As discussed previously, FAA has published a final rule requiring each certificate holder operating under 14 CFR part 121 to develop and implement an SMS. See 80 FR 1308.

² The history and structure of C3RS and CSA program were discussed extensively in the SSP NPRM. 77 FR 55375-76.

³ The history, structure, and SSP-related proceedings were discussed extensively in the SSP NPRM. 77 FR 55376-78.

The SSP rule implements sections 20156, 20118, and 20119 as they apply to railroad carriers that provide intercity rail passenger or commuter rail passenger transportation (passenger railroads). The SSP rule is a risk reduction program in that it requires a passenger railroad to assess and manage risk and to develop proactive hazard management methods to promote safety improvement. The rule contains provisions that, while not explicitly required by the statutory safety risk reduction program mandate, are necessary to properly implement the mandate and are consistent with the intent behind the mandate. Further, as mentioned previously, many of the elements in the rule are modeled after the APTA System Safety Manual; therefore, the majority of railroads will have already implemented those elements. The rule also implements section 20119, which addresses the protection of information in railroad safety risk analyses and will be discussed further in the rule.

B. Related Risk Reduction Rulemaking

As discussed, *supra*, the RRP NPRM proposes implementing the requirements of sections 20156, 20118, and 20119 for Class I freight railroads and railroads with inadequate safety performance. To avoid duplicative requirements, as proposed, the RRP rule would not apply to any passenger railroad already required to comply with the SSP rule. Establishing separate safety risk reduction rules for passenger railroads and Class I freight railroads will allow those rules to account for the significant differences between passenger and freight operations. For example, passenger operations generate risks uniquely associated with the passengers that utilize their services. The SSP rule can be tailored specifically to these types of risks, which are not independently generated by freight railroads. Further, freight railroads may generate risks uniquely associated with the transportation of hazardous materials and the proposed RRP rule can be specifically tailored to these types of risks, which are not independently generated by passenger railroads.

Some overlap may exist between certain components of the SSP and RRP rules. Most significantly, the SSP and RRP final rules most likely will contain similar provisions implementing the consultation requirements of section 20156(g) and responding to the information protection study section 20119(a) mandated. There was significant discussion during the SSP and RRP RSAC processes on how to

implement these statutory mandates. FRA worked with the General Passenger Safety Task Force's System Safety Task Group and the RRP Working Group to receive input regarding how information protection and the consultation process should be addressed, with the understanding that the same language would be included in both the SSP and RRP NPRMs for review and comment. Based on the comments received in response to the SSP NPRM, FRA has revised the consultation process requirement and the information protections. These revisions are discussed further in the discussion of comments section.

C. System Safety Information Protection

Section 20119(b) authorizes FRA to issue a rule protecting risk analysis information generated by railroads. These provisions would apply to information generated by passenger railroads pursuant to a SSP.

i. Exemption From Freedom of Information Act Disclosure

In section 20118, Congress determined that for risk reduction programs to be effective, the risk analyses must be shielded from production in response to FOIA requests. FOIA is a Federal statute establishing certain requirements for the public disclosure of records held by Federal agencies. *See* 5 U.S.C. 552. Formal rules for making FOIA requests to DOT agencies are set forth in 49 CFR part 7. Generally, FOIA requires a Federal agency to make most records available upon request, unless a record is protected from mandatory disclosure by one of nine exemptions. One of those exemptions, known as Exemption 3, applies to records that are specifically exempted from disclosure by statute, if the statute requires that matters be withheld from the public in such a manner as to leave no discretion on the issue or establishes particular criteria for withholding or refers to particular types of matters to be withheld. *See* 5 U.S.C. 552(b)(3) and 49 CFR 7.13(c)(3).

Section 20118(a) specifically provides that a record obtained by FRA pursuant to a provision, regulation, or order related to a risk reduction program or pilot program is exempt from disclosure under FOIA. The term "record" includes, but is not limited to, "a railroad carrier's analysis of its safety risks and its statement of the mitigation measures it has identified with which to address those risks." *Id.* This FOIA exemption also applies to records made available to FRA for inspection or copying pursuant to a risk reduction program or pilot program. Section

20118(c) also gives FRA the discretion to prohibit the public disclosure of risk analyses or risk mitigation analyses obtained under other FRA regulations if FRA determines that the prohibition of public disclosure is necessary to promote public safety.

FRA believes that section 20118 qualifies as an Exemption 3 statute under FOIA.⁴ FRA therefore believes that SSP records in its possession are exempted from mandatory disclosure under FOIA, unless one of two exceptions provided by the statute would apply. *See* 49 U.S.C. 20118(a)–(b). The first exception permits disclosure when it is necessary to enforce or carry out any Federal law. The second exception permits disclosure when a record is comprised of facts otherwise available to the public and when FRA, in its discretion, has determined that disclosure would be consistent with the confidentiality needed for a risk reduction program or pilot program.

ii. Discovery and Other Use of Risk Analysis Information in Litigation

1. The Statutory Mandate

The RSIA also addressed the disclosure and use of risk analysis information in litigation. Section 20119(a), one of the statutory provisions enacted by the RSIA, directed FRA to conduct a study to determine whether it was in the public interest to withhold from discovery or admission into evidence in a Federal or State court proceeding for damages involving personal injury or wrongful death against a carrier any information (including a railroad's analysis of its safety risks and its statement of the mitigation measures with which it will address those risks) compiled or collected for the purpose of evaluating, planning, or implementing a risk reduction program. In conducting this study, section 20119(a) required FRA to solicit input from railroads, railroad non-profit employee labor organizations, railroad accident victims and their families, and the general public. *See id.* Section 20119(b) also states that upon completion of the study, if in the public interest, FRA may prescribe a rule to address the results of the study (*i.e.*, a rule to protect risk analysis information from disclosure during litigation). Section 20119(b)

⁴ In 2009, Congress amended 5 U.S.C. 552(b)(3) to require Exemption 3 statutes to specifically cite to section 552(b)(3). *See* OPEN FOIA Act of 2009, Public Law 111–83, 123 Stat. 2142, 2184 (Oct. 28, 2009). Because this requirement applies only to statutes enacted after October 29, 2009, however, it does not apply to section 20118, which was enacted in October of 2008.

prohibits any such rule from becoming effective until one year after its adoption.

2. The Study and Its Conclusions

FRA contracted with a law firm, Baker Botts L.L.P., to conduct the study on FRA's behalf. Various documents related to the study are available for review in public docket number FRA–2011–0025, which can be accessed online at www.regulations.gov. As a first step, the contracted law firm prepared a comprehensive report identifying and evaluating other Federal safety programs that protect risk reduction information from use in litigation. See *Report on Federal Safety Programs and Legal Protections for Safety-Related Information*, FRA, docket no. FRA–2011–0025–0002, April 14, 2011. Next, as required by section 20119(a), FRA published a **Federal Register** notice seeking public comment on the issue of whether it would be in the public interest to protect certain railroad risk reduction information from use in litigation. See 76 FR 26682, May 9, 2011. Comments received in response to this notice may be viewed in the public docket.

On October 21, 2011, the contracted law firm produced a final report on the study. See *Study of Existing Legal Protections for Safety-Related Information and Analysis of Considerations For and Against Protecting Railroad Safety Risk Reduction Program Information* (final report), FRA, docket no. FRA–2011–0025–0031, Oct. 21, 2011. The final report contained analyses of other Federal programs that protect similar risk reduction data, the public comments submitted to the docket, and whether it would be in the public interest, including the interests of public safety and the legal rights of persons injured in railroad accidents, to protect railroad risk reduction information from disclosure during litigation.

The final report determined that substantial support exists for the conclusion that a rule that protects “railroad safety risk information from use in civil litigation involving claims for personal injuries or wrongful death would serve the broader public interest.” *Study of Existing Legal Protections* at 63. The final report highlighted the fact that, in the past with similar programs, Congress has deemed that it is in the public's interest to place statutory limitations on the disclosure or use of certain information for use by the Federal government. *Id.* The safety risk reduction programs RSIA mandated, according to the final report,

involve public interest considerations similar to the ones Congress has protected through statutory limitations and these limitations have been upheld by courts. Many of the comments to the final report agree that limiting the use on information collected pursuant to a safety risk reduction program mandated by RSIA in discovery or litigation would serve the broad public interest by encouraging and facilitating the timely and complete disclosure of safety-related information to FRA. Further, the final report underscored FRA's statutory duty to protect the broader public interest in ensuring rail safety and that this public interest outweighs the individual interests of future litigants who may bring damage claims against railroads. Therefore, the final report concluded “after balancing all of the considerations that bear upon the public interest . . . the balance weighs in favor of adopting rules prohibiting the admissibility or discovery of information compiled or collected for FRA railroad safety risk reduction programs in a civil action where a plaintiff seeks damages for personal injury or wrongful death.” *Id.* at 64.

In response to the final report, the SSP NPRM proposed in § 270.105 to protect any information compiled or collected solely for the purpose of developing, implementing or evaluating a RRP from discovery, admission into evidence, or consideration for other purposes in a Federal or State court proceeding for damages involving personal injury, wrongful death, and property damage. The information protected includes a railroad's identification of its safety hazards, analysis of its safety risks, and its statement of the mitigation measures with which it would address those risks and could be in the following forms or other forms: plans, reports, documents, surveys, schedules, lists, or data. FRA received multiple comments in response to the proposed information protections and made revisions based on these comments. These revisions are discussed further in the discussion of comments section and the corresponding section-by-section analysis.

D. Consultation Requirements

Section 20156(g)(1), states that a railroad required to establish a safety risk reduction program must “consult with, employ good faith and use its best efforts to reach agreement with, all of its directly affected employees, including any non-profit employee labor organization representing a class or craft of directly affected employees of the railroad carrier, on the contents of the

safety risk reduction program.” Section 20156(g)(2) further provides that if a “railroad carrier and its directly affected employees, including any nonprofit employee labor organization representing a class or craft of directly affected employees of the railroad carrier, cannot reach consensus on the proposed contents of the plan, then directly affected employees and such organizations may file a statement with the Secretary explaining their views on the plan on which consensus was not reached.” FRA must consider these views during review and approval of a railroad's SSP plan.

In the NPRM, FRA proposed to implement this mandate by requiring each railroad required to establish a SSP to consult with its directly affected employees (using good faith and best efforts) on the contents of its SSP plan. A railroad is required to include a consultation statement in its submitted plan describing how it consulted with its employees. If a railroad and its employees were not able to reach consensus, directly affected employees could file a statement with FRA describing their views on the plan.

As with the information protection provisions, FRA anticipates the RRP rule will have essentially identical provisions regarding the consultation requirements since there was significant discussion during the SSP and RRP RSAC processes on how to implement section 20156(g). FRA worked with the System Safety Task Group to receive input regarding how the consultation process should be addressed, with the understanding that the same language would be included in both the SSP and RRP NPRMs for review and comment.

E. Related Fatigue Management Plans Rulemaking

Section 20156(d)(2) states that a SSP must include a fatigue management plan that meets the requirements of section 20156(f). This SSP final rule does not address this mandate because it is currently being considered by a separate rulemaking process.

On December 8, 2011, the RSAC voted to establish a Fatigue Management Plans Working Group (FMP Working Group). The purpose of the FMP Working Group is to provide “advice regarding the development of implementing regulations for Fatigue Management Plans and their deployment under the Rail Safety Improvement Act of 2008.” *Railroad Safety Advisory Committee Task Statement: Fatigue Management Plans*, Task No.: 11–03, Dec. 8, 2011. Specifically, the FMP Working Group is tasked to: “review the mandates and objectives of the [RSIA] related to the

development of Fatigue Management Plans, determine how medical conditions that affect alertness and fatigue will be incorporated into Fatigue Management Plans, review available data on existing alertness strategies, consider the role of innovative scheduling practices in the reduction of employee fatigue, and review the existing data on fatigue countermeasures." *Id.*

The working group completed its work in September 2013 and submitted its recommendations to FRA for further consideration. Ultimately, any fatigue management plans required by FRA pursuant to section 20156(d)(2) and 20156(f) would be considered part of a railroad's overall SSP.

FRA notes that the SSP NPRM had a placeholder in proposed § 270.103(t) that would require a railroad, as part of its SSP, to develop a fatigue management plan no later than three years after the effective date of the final rule, or three years after commencing operations, whichever is later. This placeholder did not contain any additional substantive requirements and was intended merely to be an acknowledgement of the statutory fatigue management plan mandate. FRA has elected to not include this placeholder in the final rule because it may create confusion regarding the separate FMP Working Group process and the ongoing fatigue management plans rulemaking.

IV. Guidance Manual

The preamble of the SSP NPRM outlined FRA's plan to publish a guidance manual that would assist in the development, implementation, and evaluation of a railroad's SSP. FRA believes sufficient guidance is currently available to railroads that would assist in implementing a SSP. As discussed previously, a majority of passenger railroads affected by this rule participate in the APTA system safety program and are currently participating in the APTA audit program. APTA has published significant guidance regarding its program, primarily, APTA's Manual for the Development of System Safety Program Plans for Commuter Railroads. APTA, *Manual for the Development of System Safety Program Plans for Commuter Railroads*, (May 15, 2006), available on APTA's Web site at <http://www.apta.com/resources/reportsandpublications/Pages/Rail.aspx>. FRA has also developed guidance regarding implementing system safety principals in its Collision Hazard Analysis Guide. The Collision Hazard Analysis Guide supports APTA's Manual by providing a "step-

by-step procedure on how to perform hazard analysis and how to develop effective mitigation strategies that will improve passenger rail safety." FRA, *Collision Hazard Analysis Guide: Commuter and Intercity Passenger Rail Service*, 5 (October 2007), available at www.fra.dot.gov. FRA believes APTA's guidance on its system safety program and FRA's Collision Hazard Analysis Guide would provide the necessary assistance to railroads implementing a SSP. As noted previously, FRA will work with each railroad to provide the necessary assistance and guidance for implementing a SSP.

V. Discussion of Specific Comments and Conclusions

FRA received 19 written comments in response to the NPRM, including comments from members of the railroad industry, trade organizations, labor organizations, as well as members of the general public. Specifically, comments were received from the following organizations: Alaska Railroad Corporation, American Association for Justice, Amtrak, Association of American Railroads (AAR), APTA, Maelstrom Society, National Safety Council, New York State Metropolitan Transportation Authority (MTA), Northeast Illinois Regional Commuter Railroad Corporation (Metra), Parsons Brinkerhoff, Inc., and Trinity Railway Express. Interested labor organizations (Labor Organizations) jointly filed a comment. The Labor Organizations included: American Train Dispatchers Association, Brotherhood of Locomotive Engineers and Trainmen, Brotherhood of Maintenance of Way Employees Division, Brotherhood Railway Carmen Division TCU/IAM, Sheet Metal, Air, Rail and Transportation Workers, and Transportation Workers Union of America (TWU). The following discussion provides an overview of the written comments FRA received in response to the NPRM. More detailed discussions of specific comments and how FRA has chosen to address these comments in the final rule can be found in the relevant section-by-section analysis portion of this preamble.

Generally, all of the comments submitted were in favor of SSP. While the comments varied on the structure and breadth of a SSP, there was agreement that a properly implemented SSP would increase safety of the railroad's operations. As discussed previously, there are two concurrent rulemakings that will implement sections 20156, 20118, and 20119, the SSP rule and the RRP rule. FRA established separate safety risk reduction rules for passenger railroads

and the Class I freight railroads to account for significant differences between passenger and freight operations. Many commenters requested that FRA make it clear that the SSP requirements are separate from the forthcoming RRP rule and a railroad will not be required to submit both a SSP plan and RRP plan to FRA. It is not the intent that one railroad will be required to satisfy both regulations, *i.e.*, be required to implement both a SSP and RRP and submit the corresponding plans to FRA for review and approval.

Certain commenters provided specific scenarios involving multiple rail operations and inquired which railroad would be required to comply with which regulation. One example involved a commuter railroad subject to the SSP rule that contracts certain portions of its passenger operations to a freight railroad that may be subject to the proposed RRP rule. In this scenario, the entity that is ultimately responsible for providing the passenger service would be responsible for complying with the SSP rule, which would be the commuter railroad. The fact that the commuter railroad contracts its operations to the freight railroad does not result in the delegation of the duty to comply with the SSP rule to that freight railroad. Contracting out these operations may pose certain hazards and risks. Therefore, the commuter railroad's SSP needs to take into account that the passenger operations are contracted out to another railroad. If the freight railroad also conducts freight operations over the same track in which it conducts the passenger operations for the commuter railroad and the freight railroad is required to implement a RRP, that segment will be included in the freight railroad's RRP and must take into consideration the risks and hazards posed by the passenger operation. Further, if the freight railroad conducts freight operations over the same track in which it conducts the passenger operations for the commuter railroad, the commuter railroad's SSP must take into consideration the risks and hazards posed by the freight operations.

Another commenter presented the scenario in which a passenger railroad subject to the SSP rule owns and maintains, but does not dispatch, a segment of track in which there are freight operations. From the example, it is not clear if the passenger railroad is also operating on that segment. If the passenger railroad is operating on that segment, pursuant to § 270.3(a), it will need to include that segment in its SSP. If the passenger railroad is not operating on that segment of track, but there are freight operations on that segment of

track by another railroad, the passenger railroad will include that segment in its SSP because, as discussed in the section-by-section analysis for § 270.103(d)(2), the passenger railroad will be required to identify the persons that utilize significant safety-related services and by operating on track that the passenger railroad owns and maintains, the freight operators are utilizing significant safety-related services of the passenger railroad. Further, FRA would expect the passenger railroad to include that segment in the description of its rail system pursuant to § 270.103(d)(1). The railroad conducting freight operations on that segment of track may be required to implement a RRP and that segment may need to be included in its RRP.

Another example was a situation in which a passenger railroad has two terminals on its system where there are freight operations adjacent (within 25') to the passenger operations. In this scenario, FRA would expect the passenger railroad's SSP to assess what hazards and resulting risks arise due to the proximity of the freight operations to the passenger operations; however, the actual freight operations would not be included in the passenger railroad's SSP. FRA does not intend these three examples to cover every scenario a railroad may encounter; rather, these examples provide guidance concerning what facts FRA will find determinative regarding which railroad will be required to comply with which regulation. Since FRA cannot contemplate every scenario, railroads and other interested parties are welcomed and encouraged to reach out to FRA for guidance regarding application of the SSP rule to a railroad's specific operations.

In many instances in the NPRM, FRA stated that it plans on working with the railroads on certain aspects of the rule. The Labor Organizations expressed concern that FRA plans on exclusively working with the railroads and not allowing any other interested party to be involved, effectively substituting FRA for the Labor Organizations in the statutory-mandated consultation role. This was not FRA's intent behind those statements. Rather, the intent was to make it clear that FRA would be available to provide guidance to the railroads on the various aspects of the rule, not that there would be an exclusive partnership between FRA and the railroads to develop the railroads' SSPs. FRA will work with the railroads and will not replace the Labor Organizations and any other directly affected employee in their consultation

role. FRA has amended the language to make this intention clear. It is also important to note that through the consultation process in § 270.107, railroad employees will always have an opportunity to provide input on the railroads' SSPs.

The Labor Organizations also believe that the NPRM supports a continuation of self-analysis by the railroads, which, they claim, is inconsistent with the intent behind RSIA. As evidence, the Labor Organizations point to multiple instances in the NPRM where FRA states that railroads have flexibility and/or discretion to make certain determinations on certain requirements of the rule, such as the waiver section proposed in § 270.7, the lack of a penalty schedule in the NPRM, and that, in limited instances, a railroad is allowed to make safety-critical changes to its SSP without prior FRA approval.

The SSP rule is directly dependent on a railroad's ability to thoroughly and candidly assess its hazards and resulting risks. The SSP requires a railroad to engage in self-analysis that will be conducted in conjunction with the railroad's directly affected employees and FRA oversight. Since no two railroads operations are exactly the same, no SSP will be exactly the same, which means that a railroad will need a certain degree of flexibility to tailor a SSP to its specific operations. Regardless of the amount of flexibility afforded to the railroads, the directly affected employees, including the Labor Organizations, will have an opportunity to provide input and work with the railroads on the development of the SSP. Regarding the lack of a penalty schedule, FRA typically does not include penalty schedules in an NPRM; however, this final rule does include a penalty schedule.

APTA expressed concern that the proposed rule was more prescriptive in significant respects than current FRA practices. APTA believes that the level of specificity in the proposed rule diminishes the flexibility needed so that the railroads can adapt their SSP plans to local conditions. Further, APTA states such specificity could divert a railroad's attention from assessing its operation risk to assessing regulatory compliance risk and would only expand the amount of paper and bureaucracy needed to comply with the rule with little to no increase in safety. APTA believes that FRA has expanded the elements of the APTA program which threatens to divert attention from the railroad's core safety practices and the highest risk of railroad operations. As examples, APTA points to the requirements associated with

scheduling, reporting, and conducting consultation with the directly affected employees pursuant to § 270.102; defining, outlining, measuring, and promoting a positive safety culture pursuant to § 270.103(c) and (v); the concept of fully implemented; and the requirement that the railroad establish milestones to track the progress of implementation. Each one of these examples, according to APTA, is an instance in which railroads may have a different understanding of the requirement and therefore, subjectivity is introduced into the process and does not support a consistent regulatory framework.

FRA disagrees with APTA's assertions. As discussed above, the SSP rule is structured so that a railroad can tailor the program to its operations. The SSP rule sets forth general parameters and the railroad will design its program so that it fits these parameters, addresses the railroad's operations, and eliminates or reduces hazards on the railroad's operations. As with most new FRA regulations, significant interaction between FRA, the railroads, and other stakeholders will be necessary to ensure all parties understand the proper implementation for the rule. The majority of railroads that are required to comply with this rule already participate in APTA's system safety program. FRA believes that this rule does not add a significant paperwork and bureaucracy burden compared to what is already required by APTA's program. FRA does not believe the rule is more directive than the APTA program; rather, since most of the railroads that will implement a SSP already participate in the APTA program, the railroads are familiar with the concept and application of system safety and will be ready to adapt their existing APTA program to the requirements set forth in this rule. Further, implementation of the SSP rule will more than likely be the railroad conducting a gap analysis between its current APTA program and the SSP rule and modifying that program where necessary to bring it into compliance with the SSP rule.

The majority of the comments supported and understood that the discovery protections are necessary for a railroad to engage in a thorough and candid analysis of the hazards and resulting risks on its system; however, the American Association for Justice (AAJ) objected to the inclusion of any information protections. AAJ claims that: (1) The proposed information protections are unprecedented; (2) FRA can promulgate a SSP regulation without the information protections; (3)

the information protections will reduce the rights of persons injured in railroad accidents; (4) the information protections will allow railroads to hide safety hazards; and (5) FRA should specifically preserve State tort law based claims.

First, AAJ claims that proposed information protections are unprecedented. AAJ recognizes that there are existing programs that have information protections; however, AAJ argues that these programs have two key features: (1) Congress directed that disclosure of documents be limited, and (2) limited disclosure applies predominately to documents actually submitted to a federal agency. AAJ believes that the SSP information protections do not have either of these key features.

While Congress did not set forth specific information protections in section 20119, Congress gave FRA authority to set forth such specific protections. As discussed previously, in section 20119(a), Congress directed FRA to conduct a study to determine if certain information protections would be in the public interest. Congress set forth the specific parameters of the information protections that the study must consider. Congress then authorized FRA to promulgate a rule, subject to notice and comment, which addressed the results of the study. *Id.* FRA has complied with Congress' mandate and has set forth information protections that are consistent with the specific parameters set forth by Congress. FRA does not believe that the information protections are invalid simply because Congress didn't promulgate specific protections.

Nothing in section 20119 limits the information protections to documents that are submitted to FRA. The language used by Congress in section 20119 indicates the information protections, depending on the results of the study, could apply to information that may not even be submitted to FRA. Pursuant to section 20119(a), the study must consider information protections that would apply to documents that are compiled and collected for "the purpose of planning, implementing, or evaluating a safety risk reduction program." Since Congress did not limit the information protections only to documents that are submitted to FRA, it is within FRA's authority to set forth information protections that apply to documents within a railroad's possession.

Nothing in 23 U.S.C. 409 (section 409), the statute that SSP information protections are modeled after, or the Supreme Court's decision in *Guillen*

(which reviewed the validity and constitutionality of section 409), limits the information protections to documents submitted to the Federal Highway Administration (FHWA).⁵ The Court's interpretation of section 409 was not based on whether the documents were submitted to FHWA. Rather, the Court held that the information protections were extended to the information because the Hazard Elimination Program required compiling or collection of that information. *Pierce County v. Guillen*, 537 U.S. 129, 146 (2003). In the case of the SSP, the railroads are required by statute to compile and collect information for a SSP, so, like section 409 and the holding in *Guillen*, the protections are extended to that information.

AAJ claims that in the limited circumstances in which data has been protected, the provisions have been narrowly tailored and construed. AAJ believes that SSP information protections are overly broad and inconsistent with any other government program that limits some disclosure of evidence.

FRA agrees with AAJ's assertion that the SSP information protections must be narrowly tailored and construed. In *Guillen*, the Court recognized that "statutes establishing evidentiary privileges must be construed narrowly because privileges impede the search for truth." *Guillen* at 144–45. Since section 409 established a privilege, the Court construed it narrowly to the extent the text of the statute permitted. *Id.* at 145. FRA believes the SSP information protections are consistent with the Court's narrow interpretation of section 409.

Furthermore, the SSP protections are more narrowly tailored than the protections in section 409. Section 270.105(a)(2) limits the protections to information that was originally compiled and collected "solely" for the purpose of planning, implementing or evaluating a SSP. This means that information compiled or collected for any other purpose is not protected, even if the railroad also uses that information for its SSP. For example, if a railroad is required by another provision of law or regulation to compile or collect information, the information protections do not apply to that information. "Solely" also means that a railroad must continue to use that information only for its SSP. If a railroad subsequently uses for any other purpose information that was initially compiled or collected

for a SSP, that information is not protected to the extent that it is used for the non-SSP purpose. These additional limits result in protections that are more narrow and specific than those in section 409, which does not include any language similar to "solely" that would limit protected information to information generated only for the exclusive purpose of the Hazard Elimination Program.

Second, AAJ contends that FRA can issue a SSP rule without the discovery protections, just like FAA did in its SMS rulemaking. A significant difference between the FRA and FAA programs is the scope of statutory authority Congress gave each agency for protection of information collected or maintained as part of an SMS. The FAA's authority, set forth in 49 U.S.C. 44735, limits the protection of SMS data that is voluntarily submitted, such as reports, data, or other information produced or collected for purposes of developing and implementing an SMS, from FOIA disclosure by the FAA. FRA's authority to implement SMS information protections is based on 49 U.S.C. 20119, and recommendations resulting from the required study under section 20119.

As discussed previously, the Study concluded that it would be within FRA's authority and in the public interest for FRA to promulgate a regulation protecting certain risk analysis information held by the railroads from discovery and use in litigation and makes recommendations for the drafting and structuring of such a regulation. *See Study of Existing Legal Protections for Safety-Related Information and Analysis of Considerations For and Against Protecting Railroad Safety Risk Reduction Program Information* at 63–64. Therefore, FRA believes the information protections are consistent with the authority provided by Congress as set forth in 49 U.S.C. 20119 and the conclusion of the Study.

Third, AAJ believes the SSP information protections will reduce the rights of persons injured in railroad accidents. AAJ points to the fact that in many cases, evidence a railroad knew or should have known of a hazard is the key to proving the railroad's liability, particularly for Federal Employers Liability Act cases. AAJ believes that the study concluded without analysis that injured people could continue to be able to pursue legal remedies because access to documents that are currently discoverable would remain discoverable. AAJ does not believe this conclusion is accurate because the information protections may shield the

⁵ Section 409 and *Guillen* are discussed extensively in the section-by-section analysis of § 270.105.

documents/data necessary to show that the railroad knew or should have known of the hazard.

The SSP information protections have been drafted with the goal that a plaintiff is no worse off than they would have been had the SSP rule never existed. This is consistent with section 409 and the Court's interpretation of that section. *See Guillen* at 146. To ensure a plaintiff is no worse off, § 270.105(b) sets forth certain exceptions to the information protections. Pursuant to § 270.105(b), the information protections are not extended to information compiled or collected for a purpose other than that specifically identified in § 270.105(a). Further, if certain information was discoverable and admissible before the enactment of the SSP rule protections, § 270.105(b) ensures that the information remains discoverable and admissible. These exceptions are discussed extensively in the section-by-section analysis for § 270.105(b). FRA believes that these exceptions strike an appropriate balance between ensuring that plaintiffs are no worse than they would have been if the SSP rule had not existed and encouraging the railroads to make a robust and candid assessment of the hazards and resulting risks on their system.

According to AAJ, the information protections will allow railroads to hide safety hazards. AAJ believes that the threat of disclosure of these hazards creates an incentive for railroads to correct them immediately. AAJ points to multiple cases that they believe provide proof that railroads routinely hide evidence of hazards.

FRA disagrees with this assertion. The purpose of the SSP is for railroads to identify hazards and resulting risks on their system and take the appropriate measures to mitigate or eliminate these hazards. Without the information protections, a SSP could result in an effort-free tool for plaintiffs in litigation against railroads, which would discourage railroads from identifying hazards and resulting risks, thus frustrating the intent behind section 20156. FRA believes that the SSP and information protections will encourage railroads to identify and address, rather than hide, hazards. Furthermore, if a railroad is already required by another law or regulation to collect information to show compliance with existing laws or regulations, that information will not be protected. Therefore, railroads will not be able to use the SSP information protections to hide issues of non-compliance.

Finally, AAJ requests that FRA specifically preserve state tort law based

claims. AAJ believes that since railroads are required to submit their SSP plans to FRA for approval, railroads may claim that they are immune from any safety hazard claim or either that the state law claim is preempted by FRA's approval of the SSP.

This concern was also raised by the Labor Organizations. To address this issue, FRA included § 270.201(b)(4) in the final rule, which provides that approval of a railroad's SSP plan under this part does not constitute approval of the specific actions the railroad will implement under its SSP plan pursuant to § 270.103(q)(2) and shall not be construed as establishing a Federal standard regarding those specific actions.

FRA will not review or approve the specific mitigation and elimination measures that a railroad may adopt to address the hazards and risks that it identifies. *See* § 270.201(a)(2). The SSP rule is not intended to preempt State standards of care regarding the specific risk mitigation actions a railroad will implement under its SSP. Accordingly, § 270.201(b)(4) clarifies that FRA approval of a railroad's SSP plan under this final rule does not constitute approval of the specific mitigation and elimination measures that the railroad will implement pursuant to § 270.103(q)(2) and should not be construed as establishing a Federal standard of care regarding those specific actions.

VI. Section-by-Section Analysis

FRA is adding a new part 270 to title 49 of the CFR. Part 270 satisfies the statutory requirements regarding safety risk reduction programs for railroads providing intercity rail passenger or commuter rail passenger service. *See* 49 U.S.C. 20156. Part 270 also protects certain information compiled or collected pursuant to a safety risk reduction program from admission into evidence or discovery during certain court proceedings for damages. *See* 49 U.S.C. 20119.

Subpart A—General

Section 270.1 Purpose and Scope

This section contains a formal statement of the final rule's purpose and scope and remains unchanged from the NPRM. Paragraph (a) states that the purpose of the rule is to improve railroad safety through structured, proactive processes and procedures developed and implemented by railroads. The rule requires a railroad to establish a program that systematically evaluates railroad safety hazards and the resulting risks on its system and

manages those risks in order to reduce the number and rates of railroad accidents, incidents, injuries, and fatalities.

Paragraph (b) states that the rule prescribes minimum Federal safety standards for the preparation, adoption, and implementation of railroad system safety programs. The rule does not restrict railroads from adopting and enforcing additional or more stringent requirements not inconsistent with this part.

Paragraph (c) explains that the rule provides for the protection of information generated solely for the purpose of developing, implementing, or evaluating a system safety program under this part. In addition to the SSP, § 270.1(c) of the NPRM proposed implementing protection of information for a railroad safety risk reduction rule required by FRA for Class I freight railroads and railroads with inadequate safety performance, *i.e.*, the RRP rule. 77 FR 55379. Upon further consideration, FRA has determined that the RRP protections should be implemented in the RRP final rule, not in this rule. Accordingly, this section has been revised to only apply to this SSP final rule.

NY MTA recommended that the term "solely" be deleted from paragraph (c) and § 270.105(a) to protect studies or risk analyses that are not developed expressly to comply with this part. NY MTA believes that it is in the public interest to ensure that railroads conduct on-going and thorough self-critical examinations and expressed concern that if these types of studies or analyses are not protected, they may be used against the railroad in a court proceeding. As discussed further in the section-by-section analysis for § 270.105, FRA only has the authority under section 20119(b) to protect documents that are created pursuant to a SSP; therefore, deleting the term "solely" would improperly expand the protections beyond the limits of FRA's authority.

Section 270.3 Application

This section sets forth the applicability of the rule and remains unchanged from the NPRM. Section 20156(a)(1) mandates that FRA require each Class I railroad, a railroad carrier that has inadequate safety performance, or a railroad that provides intercity rail passenger or commuter rail passenger transportation to establish a railroad safety risk reduction program. This rule sets forth the requirements of a railroad safety risk reduction program for a railroad that provides intercity rail passenger or commuter rail passenger

transportation. Safety risk reduction programs for Class I railroads and railroads with inadequate safety performance will be addressed in the separate RRP rulemaking proceeding. See 80 FR 10950 (RRP NPRM).

Paragraph (a) explains that this rule applies to railroads that operate intercity or commuter passenger train service on the general railroad system of transportation and railroads that provide commuter or other short-haul rail passenger train service in a metropolitan or suburban area (as described by 49 U.S.C. 20102(2)), including public authorities operating passenger train service. A public authority that provides passenger commuter train service by contracting out the actual operation to another railroad or independent contractor is regulated by FRA as a railroad under the provisions of the rule. Although the public authority is ultimately responsible for the development and implementation of a SSP (along with all related recordkeeping requirements), the railroad or other independent contractor that operates the authority's commuter passenger train service is expected to comply with the SSP established by the public authority, including implementation of the SSP plan.

In commenting on the NPRM, the Alaska Railroad proposed that when FRA next submits technical corrections of Federal statutes to Congress, FRA no longer use the terms "intercity passenger" and "commuter passenger" and instead use the term "passenger" to refer to these type of railroads. The Alaska Railroad believes that the terms, "intercity passenger" and "commuter passenger," are based on an old, outdated statutory context. While FRA does not agree or disagree with the Alaska Railroad's position regarding the use of these terms, FRA agrees with the Alaska Railroad that this issue is a matter to be handled legislatively by Congress—not a matter to be handled by FRA in a rulemaking.

AAR expressed concern that paragraph (a) could lead to confusion that certain freight railroads may be required to have a SSP in addition to a RRP because some freight railroads operate commuter trains on behalf of commuter agencies and some freight railroads provide tracks over which passenger trains operate. To avoid confusion, AAR proposed that "railroads that primarily provide freight service and are potentially subject to risk reduction program regulations" should be excepted from the rule. The discussion of comments section addressed multiple scenarios raised by commenters that involve freight

operations and passenger operations and which railroad would be responsible for which program. Simply because a passenger railroad contracts out passenger service to a freight railroad does not mean the duty to comply with this rule has been automatically delegated to the freight railroad and the passenger railroad no longer is required to comply with this rule. The passenger railroad ultimately is responsible for complying with this rule and the freight railroad providing the passenger service is required to comply with the passenger railroad's SSP. See § 270.7(b). FRA believes that AAR's suggested language would only lead to further confusion rather than clarification. It is not clear which railroads would be classified as "primarily provid[ing] freight service" and, therefore, it would not be clear which railroad would be excepted from complying with this rule. Due to this ambiguity, AAR's suggested language is not adopted.

Metra requested that an RSAC recommendation regarding delegation of duties under this rule be inserted into the final rule. The RSAC recommended that if a passenger railroad contracts all activities that relate to the passenger service to another entity, the sponsoring passenger railroad may seek approval from the FRA Associate Administrator of Safety to delegate responsibility for the SSP to the other entity. FRA chose not to adopt this recommendation. It would not be consistent with FRA's statutory jurisdiction over passenger railroads to allow delegation of responsibility under this part, so that a passenger railroad could effectively divest itself of legal responsibility under the rule. In certain instances, including this part, FRA allows a railroad to contract with another entity to perform the duties required by a rule; however, FRA's approach has always been never to allow a railroad to delegate completely responsibility for compliance with a rule to another entity. Since the SSP rule is the first of its kind for FRA and the railroad industry, FRA believes it is important for the passenger railroad to be responsible for compliance with the rule to ensure that the railroad is involved in system safety planning and implementation under the rule.

In paragraph (b), certain railroads are excepted from the final rule's applicability. The exceptions proposed in the NPRM are adopted in the final rule. The first exception, in paragraph (b)(1), covers rapid transit operations in an urban area that are not connected to the general railroad system of transportation. This paragraph clarifies

the circumstances under which rapid transit operations are not subject to FRA jurisdiction under this part. It should be noted, however, that some operations having rapid transit characteristics are within FRA's jurisdiction given their connections to the general system, *e.g.*, shared use of the general system right-of-way. FRA specifically intends for part 270 to apply to such operations.

Paragraph (b)(2) sets forth an exemption for operations commonly described as tourist, scenic, historic, or excursion service whether on or off the general railroad system. Tourist, scenic, historic, or excursion rail operations is defined in § 270.5. This exemption is consistent with the treatment of tourist, scenic, historic, or excursion rail operations in FRA's other regulations concerning passenger operations, including the underlying basis for the regulatory approach taken in those regulations. See 49 CFR 238.3(c)(3), 64 FR 25576 (May 12, 1999); and 239.3(b)(3), 63 FR 24644 (May 4, 1998).

Paragraph (b)(3) makes clear that the requirements of the rule do not apply to the operation of private passenger train cars, including business or office cars and circus train cars. While FRA believes that a private passenger car operation should be held to the same basic level of safety as other passenger train operations, such operations were not specifically identified in the statutory mandate and FRA is taking into account the burden that would be imposed by requiring private passenger car owners and operators to conform to the requirements of this part. Private passenger cars are often hauled by host railroads, such as Amtrak and commuter railroads, and these hosts often impose their own safety requirements on the operation of the private passenger cars. Pursuant to this rule, these host railroads are required to have SSPs in place to protect the safety of their own passengers; in turn, the private car passengers benefit from these programs even without the rule directly covering private car owners or operators. In the case of non-revenue passengers, including employees and guests of railroads that are transported in business and office cars, as well as persons traveling on circus trains, the railroads are expected to provide for their safety consistent with existing safety operating procedures and protocols for normal train operations.

Finally, paragraph (b)(4) sets forth an exception from the requirements of this part for railroads that operate only on track inside an installation that is not part of the general railroad system of transportation (*i.e.*, plant railroads, as defined in § 270.5). Plant railroads are

typified by operations such as those in steel mills that do not go beyond the plant's boundaries and that do not involve the switching of rail cars for entities other than themselves.

Section 20156(a)(4) allows a railroad carrier that is not required to submit a railroad safety risk reduction program to voluntarily submit such a program. If the railroad voluntarily submits a program, it shall comply with the requirements set forth in section 20156 and is subject to approval by the Secretary. In the NPRM, FRA sought comment on whether a provision that allows a railroad to establish voluntarily a SSP should be added to the final rule. FRA did not receive a significant number of comments in response to this request and the comments FRA did receive, supported voluntary compliance with the rule.

As discussed in the NPRM, FRA anticipates that the majority of railroads which voluntarily submit a railroad safety risk reduction program under section 20156(a)(4) would do so pursuant to the RRP regulation that is the subject of a separate proceeding. Paragraph (a) is broad and intended to cover the majority of the railroads that provide commuter and intercity passenger service. Absent the exceptions in paragraph (b), if a railroad is not required by this part to establish a SSP, that railroad more than likely does not provide commuter and intercity passenger service and, therefore, may be required to establish a RRP. If these railroads are not required to establish a RRP but decide to voluntarily establish a railroad safety risk reduction program pursuant to section 20156(a)(4), the RRP regulation would more than likely be better suited for their operations because, due to the breadth of paragraph (a), they are most likely not a railroad that provides commuter or intercity passenger service. Therefore, FRA believes voluntary compliance with a statutory-mandated risk reduction program, including a SSP, is better addressed in the forthcoming RRP rule. See 80 FR 10969 and 10992 for the proposed RRP voluntary compliance section and discussion.

Section 270.5 Definitions

This section contains a set of definitions that clarify the meaning of important terms as they are used in the rule. The definitions are carefully worded in an attempt to minimize the potential for misinterpretation of the rule. Many of the definitions are based on definitions in FTA's part 659 and APTA's system safety program. In the NPRM, FRA requested comment and

input regarding the proposed terms defined in this section and specifically whether other terms should be defined. FRA received multiple comments in response to this request. Generally, commenters did not have significant issues with the proposed definitions; however, some commenters recommended adding definitions for certain terms.

The Labor Organizations suggested that FRA add the definitions that the RSAC recommended but FRA chose not to include in the NPRM. The definitions were for the following terms: Contractor, FTA, hazard analysis, improvement plan, individual investigation, passenger operations, passenger railroad, railroad property, risk-based hazard management, safety, safety certification, safety culture, safety-related services, safety-related employee, sponsoring railroad, system safety program, and system safety program plan. Trinity Railways also requested that FRA add definitions for passenger railroad, safety-related services, and sponsoring railroad. Regarding the terms FTA, individual investigation, passenger operations, railroad property, safety-related employee, and sponsoring railroad, FRA declines to add definitions for these terms because these terms are not used in the rule text. Regarding the terms contractor and safety, these terms have a common understanding throughout the railroad industry and do not have a particular meaning within the rule, so definitions for these terms are not necessary. Regarding the terms hazard analysis, improvement plan, passenger railroad, safety certification, and safety-related services, there are sections within the rule that address the meaning of each term and FRA believes that it is unnecessary to include definitions for these terms as well. See §§ 270.3(a), 270.103(d)(2) and (3), (q), and (s)(3), 270.303(b)(4), and 305(b)(1). However, FRA has decided to add definitions for the terms risk-based hazard management, safety culture, system safety program, and system safety program plan. A discussion of all the definitions used in this part follows.

"Administrator" refers to Federal Railroad Administrator or his or her delegate.

"Configuration management" means the process a railroad uses to ensure that the configurations of all property, equipment and system design elements are properly documented.

"FRA" means the Federal Railroad Administration.

"Fully implemented" means that all the elements of the railroad's SSP plan required by this part are established and

applied to the safety management of the railroad. APTA commented that the proposed definition for "fully implemented" included two sentences and that each sentence provided the same information but in a different context and that this could lead to confusion as to how it should be applied. However, FRA notes that the proposed definition contained only one sentence and believes that it was sufficiently clear to avoid confusion. APTA may have been referring to the section-by-section analysis discussion for this definition. In this regard, FRA has not included that additional discussion here to maintain clarity.

"Hazard" means any real or potential condition, as identified in the railroad's risk-based hazard analysis under § 270.103(q), that can cause injury, illness, or death; damage to or loss of a system; or damage to equipment, property, or the environment. This definition is based on the existing definition of the term in FTA's part 659. 49 CFR 659.5. FRA does not intend this definition to include hazards that are completely unrelated to railroad safety, such as environmental hazards that would fall under the exclusive jurisdiction of the United States Environmental Protection Agency (EPA) or workplace safety hazards that would fall under the exclusive jurisdiction of the United States Department of Labor's Occupational Safety and Health Administration (OSHA). Railroad safety hazards that fall under FRA jurisdiction that could cause damage to the environment, however, would be included in this definition. For example, the potential of a derailment of a tank car at a location due to track geometry would fall under this definition. If that derailment would not likely result in a release of hazardous materials, it would fall under FRA's jurisdiction. However, if the derailment has a high potential for the release of hazardous material, that would be a hazard that would fall under this definition that is related to railroad safety and may fall under both FRA's and EPA's jurisdiction. An example of a railroad hazard that would fall exclusively under EPA's jurisdiction is air pollution caused by locomotive emissions. This hazard is not within FRA's jurisdiction and would not be included in this definition. See *e.g.*, 40 CFR part 92 (Control of Air Pollution from Locomotives and Locomotive Engines).

"Passenger" means a person, excluding an on-duty employee, who is on board, boarding, or alighting from a rail vehicle for the purpose of travel. This definition is modeled after the

definition of “passenger” in FTA’s regulations at part 659, which defines a “passenger” as “a person who is on board, boarding, or alighting from a rail transit vehicle for the purpose of travel.” 49 CFR 659.5. FRA has added the phrase “excluding an on-duty employee” to the definition to clarify that, if a person is engaging in these activities (on board, boarding, or alighting) and they are an off-duty railroad employee, that person is considered a passenger for the purposes of this rule.

“Person” means an entity of any type covered under 1 U.S.C. 1, including, but not limited to, the following: A railroad; a manager, supervisor, official, or other employee or agent of a railroad; any owner, manufacturer, lessor, or lessee of railroad equipment, track, or facilities; any independent contractor or subcontractor providing goods or services to a railroad; and any employee of such owner, manufacturer, lessor, lessee, or independent contractor or subcontractor.

“Plant railroad” means a type of operation that has traditionally been excluded from the application of FRA regulations because it is not part of the general railroad system of transportation. Under § 270.3, FRA has chosen to exempt plant railroads, as defined in § 270.5, from the regulation. In the past, FRA has not defined the term “plant railroad” in other regulations that it has issued because FRA assumed that its *Statement of Agency Policy Concerning Enforcement of the Federal Railroad Safety Laws, The Extent and Exercise of FRA’s Safety Jurisdiction*, 49 CFR part 209, Appendix A (FRA’s Policy Statement or the Policy Statement) provided sufficient clarification as to the meaning of that term. However, it has come to FRA’s attention that certain rail operations believed that they met the characteristics of a plant railroad, as set forth in the Policy Statement, when, in fact, their rail operations were part of the general railroad system of transportation (general system) and therefore did not meet the definition of a plant railroad. FRA would like to avoid any confusion as to what types of rail operations qualify as plant railroads. FRA would also like to save interested persons the time and effort needed to cross-reference and review FRA’s Policy Statement to determine whether a certain operation qualifies as a plant railroad. Consequently, FRA has decided to define the term “plant railroad” in part 270.

The definition clarifies that when an entity operates a locomotive to move rail cars in service for other entities,

rather than solely for its own purposes or industrial processes, the services become public in nature. Such public services represent the interchange of goods, which characterizes operations on the general system. As a result, even if a plant railroad moves rail cars for entities other than itself solely on its property, the rail operations will likely be subject to FRA’s safety jurisdiction because those rail operations bring plant trackage into the general system.

The definition of the term “plant railroad” is consistent with FRA’s longstanding policy that it will exercise its safety jurisdiction over a rail operation that moves rail cars for entities other than itself because those movements bring the track over which the entity is operating into the general system. See 49 CFR part 209, Appendix A. Indeed, FRA’s Policy Statement provides that “operations by the plant railroad indicating it [i]s moving cars on . . . trackage for other than its own purposes (e.g., moving cars to neighboring industries for hire)” brings plant track into the general system and thereby subjects it to FRA’s safety jurisdiction. 49 CFR part 209, Appendix A. Additionally, this interpretation of the term “plant railroad” has been upheld in litigation before the U.S. Court of Appeals for the Fifth Circuit. See *Port of Shreveport-Bossier v. Federal Railroad Administration*, No. 10–60324 (5th Cir. 2011) (unpublished per curiam opinion). APTA believes that since the term “plant railroad” is provided in support of 49 CFR part 209 it does not need to be defined within the context of the SSP rule. FRA disagrees. Plant railroads will be exempt from the rule; therefore, FRA believes it is necessary to clearly define what type of operations will be considered a “plant railroad.”

“Positive train control system” means a system designed to prevent train-to-train collisions, overspeed derailments, incursions into established work zone limits, and the movement of a train through a switch left in the wrong position, as described in subpart I of 49 CFR part 236. APTA believes that since the term “positive train control” is provided in support of 49 CFR part 236 it does not need to be defined within the context of the SSP rule. FRA disagrees. Since “positive train control system” has a specific meaning within FRA’s regulations, it is important that the meaning of the term used within the SSP rule is consistent with part 236.

“Rail vehicle” means railroad rolling stock, including, but not limited to, passenger and maintenance vehicles.

“Railroad” means: (1) Any form of non-highway ground transportation that

runs on rails or electromagnetic guideways, including—

(i) Commuter or other short-haul rail passenger service in a metropolitan or suburban area and commuter railroad service that was operated by the Consolidated Rail Corporation on January 1, 1979; and

(ii) High speed ground transportation systems that connect metropolitan areas, without regard to whether those systems use new technologies not associated with traditional railroads, but does not include rapid transit operations in an urban area that are not connected to the general railroad system of transportation; and

(2) A person or organization that provides railroad transportation, whether directly or by contracting out operation of the railroad to another person.

The definition of “railroad” is based upon 49 U.S.C. 20102(1) and (2), and encompasses any person providing railroad transportation directly or indirectly, including a commuter rail authority that provides railroad transportation by contracting out the operation of the railroad to another person, and any form of non-highway ground transportation that runs on rails or electromagnetic guideways, but excludes urban rapid transit not connected to the general system.

“Risk” means the combination of the probability (or frequency of occurrence) and the consequence (or severity) of a hazard.

“Risk-based hazard management” means the processes (including documentation) used to identify and analyze hazards, assess and rank corresponding risks, and eliminate or mitigate the resulting risks. This is a high-level definition of “risk-based hazard management” and will provide a general understanding of the concept of what is “risk-based hazard management.” Risk-based hazard management is a key component of a railroad’s SSP and § 270.103(p) sets forth the requirements for a risk-based hazard management program.

“Safety culture” means the shared values, actions and behaviors that demonstrate commitment to safety over competing goals and demands. This definition was proposed in the NPRM section-by-section analysis of § 270.101(b). This definition is from the DOT Safety Council’s May 2011 research paper, *SAFETY CULTURE: A Significant Driver Affecting Safety in Transportation*. The DOT Safety Council developed this definition after extensive review of definitions for safety culture used in a wide range of industries and organizations over the

past two decades. FRA recognizes that railroads may have a slightly different understanding of what exactly makes up safety culture; however, for the purposes of this rule, FRA believes it is important to establish a shared definition of safety culture.

Organizations with a strong safety culture will consistently choose safety over performance when faced with the choice of cutting corners to increase performance. Safety culture is discussed further in section-by-section analysis for § 270.101(b), which requires a railroad to design its SSP so that it promotes a positive safety culture.

“System safety” means the application of management, economic, and engineering principles and techniques to optimize all aspects of safety, within the constraints of operational effectiveness, time, and cost, throughout all phases of the system life cycle. By specifying that system safety operates within certain constraints, this definition clarifies that there may be hazards on the railroad’s system that a railroad may not be capable of fully mitigating or eliminating, or where the costs to address the hazard are not commensurate with the risks. Rather, the railroad would monitor the hazard and at some point, if feasible, employ methods to mitigate or eliminate that hazard and resulting risk.

“System safety program” means a comprehensive process for the application management and engineering principles and techniques to optimize all aspects of safety. A railroad’s SSP sets out how the railroad will implement system safety in its operations. Because this part describes specific requirements of a system safety program, this definition is intended to be high-level.

“System safety program plan” means a document developed by the railroad that implements and supports the railroad’s SSP. Section 270.103 sets forth the specific requirements of a SSP plan.

“Tourist, scenic, historic, or excursion operations” means railroad operations that carry passengers, often using antiquated equipment, with the conveyance of the passengers to a particular destination not being the principal purpose. Train movements of new passenger equipment for demonstration purposes are not tourist, scenic, historic, or excursion operations. This definition is consistent with FRA’s other regulations concerning passenger operations. See 49 CFR 238.5 and 239.5.

The NPRM proposed a waiver process in § 270.7 in which a railroad could request a waiver from a provision of the SSP rule. FRA determined that such a

provision is unnecessary because the rules governing the FRA waiver process are already set forth in 49 CFR part 211. Therefore, a waiver provision has not been included in the SSP final rule.

Section 270.7 Penalties and Responsibility for Compliance

This section, originally proposed as § 270.9, contains provisions regarding the penalties for failure to comply with the rule and the responsibility for compliance. It is adopted and remains unchanged from the NPRM.

As explained in the NPRM, paragraph (a) identifies the civil penalties that FRA may impose upon any person that violates or causes a violation of any requirement of this part. These penalties are authorized by 49 U.S.C. 20156(h), 21301, 21302, and 21304. The penalty provision parallels penalty provisions included in numerous other safety regulations issued by FRA. In general, any person who violates any requirement of this part or causes the violation of any such requirement is subject to a civil penalty of at least \$839 and not more than \$27,455 per violation. Civil penalties may be assessed against individuals only for willful violations. Where a grossly negligent violation or a pattern of repeated violations creates an imminent hazard of death or injury to persons, or causes death or injury, a penalty not to exceed \$109,819 per violation may be assessed. In addition, each day a violation continues constitutes a separate offense. Maximum penalties of \$27,455 and \$109,819 are required by the Federal Civil Penalties Inflation Adjustment Act of 1990, Public Law 101–410, 28 U.S.C. 2461, note, as amended by the Federal Civil Penalties Inflation Adjustment Act Improvements Act of 2015, Public Law 114–74, Sec. 701. Furthermore, a person may be subject to criminal penalties under 49 U.S.C. 21311 for knowingly and willfully falsifying reports required by these regulations. FRA believes that the inclusion of penalty provisions for failure to comply with the regulations is important in ensuring that compliance is achieved. This final rule includes a schedule of civil penalties as Appendix A to this part. Because a penalty schedule is a statement of agency policy, notice and comment was not required before its issuance. See 5 U.S.C. 553(b)(3)(A).

Paragraph (b) clarifies that the requirements in the rule are applicable to any person (as defined in the rule) that performs any function or task required by the rule. Although various sections of the rule address the duties of passenger railroads, FRA intends that

any person who performs any action on behalf of a passenger railroad or any person who performs any action covered by the rule is required to perform that action in the same manner as required of the passenger railroad, or be subject to FRA enforcement action. For example, if a passenger railroad contracts with another entity to perform duties covered by this rule, that entity is required to perform those duties in the same manner as the passenger railroad. While the passenger railroad remains responsible for complying with the rule, FRA can take enforcement action any person who performs any action on behalf of a passenger railroad or any person who performs any action covered by the rule.

Subpart B—System Safety Program Requirements

Section 270.101 System Safety Program: General

This section sets forth the general requirements of the rule and remains unchanged from the NPRM. Each railroad subject to this part (*i.e.*, each passenger railroad) is required to establish and fully implement a SSP that systematically evaluates railroad safety hazards on its system and manages the resulting risks to reduce the number and rates of railroad accidents, incidents, injuries, and fatalities. The main components of a railroad’s SSP will be the risk-based hazard management program and risk-based hazard analysis that will be designed to proactively identify hazards and mitigate or eliminate the resulting risks from those hazards. The risk-based hazard management program and risk-based hazard analysis requirements are set forth in § 270.103(p) and (q).

To properly implement a SSP, a railroad is required to set forth a SSP plan pursuant to § 270.103. The SSP plan will be a document or a series/ collection of documents that contain all of the elements required by this part and shall be designed to support the railroad’s SSP.

Paragraph (b) requires that a railroad’s SSP be designed so that it promotes a positive safety culture. Safety culture, as defined in § 270.5, is the shared values, actions and behaviors that demonstrate commitment to safety over competing goals and demands. U.S. DOT, Safety Council Research Paper, *SAFETY CULTURE: A Significant Driver Affecting Safety in Transportation* (May 2011). Research has shown that when an organization has a strong safety culture, accidents and incidents are less frequent and less severe. *Id.* at 4. Conversely, if an organization’s safety culture is weak,

significant and catastrophic accidents are more likely to occur. *Id.* For a railroad to achieve its SSP goals, the mitigation or elimination of safety hazards and risks on the rail system, the railroad must have a positive and strong safety culture, so it is vital that the railroad's SSP be designed so that it promotes a positive safety culture. Consistent with the Safety Council Research Paper, FRA believes that there are 10 elements that support a strong safety culture on a railroad. *Id.* at 7. These elements are: (1) Having leadership that is clearly committed to safety; (2) practicing continuous learning; (3) making decisions that demonstrate that safety is prioritized over competing demands; (4) having clearly defined reporting systems and accountability; (5) promoting a safety-conscious work environment; (6) making employees feel personally responsible for safety; (7) fostering open and effective communication across the railroad; (8) fostering mutual trust between employees and the railroad; (9) responding to safety concerns in a fair and consistent manner; and (10) having training and other resources available to support safety. *Id.* at 7–8. While these 10 elements are not requirements of this rule, FRA believes that if a railroad incorporates each element, the railroad will have a strong safety culture. Further, implementing these elements will provide the railroad the necessary framework to effectively describe its safety culture as required by § 270.103(b)(2) and describe how it measures the success of its safety culture as required § 270.103(t).

Section 270.103 System Safety Program Plan

This section implements a railroad's SSP through a SSP plan. This section received numerous comments and these comments are addressed in the appropriate subsection to which they refer. As mentioned previously, a railroad is required to create a written SSP plan to fully implement and support its SSP. This section sets forth all of the required elements of the railroad's SSP plan.

Paragraph (a) establishes that a railroad's SSP plan must contain the minimum elements set forth in this section. FRA did not receive any comments regarding paragraph (a) and therefore it remains unchanged from the NPRM. As provided in § 270.201, a railroad's SSP plan must be submitted to and approved by the FRA Associate Administrator for Railroad Safety and Chief Safety Officer. FRA Associate Administrator for Railroad Safety and Chief Safety Officer approval of the SSP

plan will be considered approval of the railroad's SSP as required by section 20156(a)(3).

In certain scenarios, a railroad providing passenger service is not the railroad that owns the track on which passenger service is being operated. Rather, the railroad that owns the track hosts the railroad providing the passenger train service. For a railroad providing passenger train service to effectively identify, evaluate, and manage the hazards and resulting risks on the system over which it operates, as required by this part, the railroad needs to evaluate all aspects of the operation. As such, paragraph (a)(2) of this section addresses the coordination that must occur between a railroad providing passenger service and a railroad hosting that passenger service. If certain aspects of the operation are not under the control of the railroad providing passenger service but are controlled by the railroad hosting the operation, the two railroads need to communicate so those aspects can be adequately addressed by the railroad's SSP. A passenger railroad may have multiple railroads hosting its passenger train service on its system and therefore needs to coordinate with each railroad. If a railroad hosting the passenger train service does not cooperate with the railroad providing the passenger train service to coordinate the applicable parts of the SSP, under § 270.7, the railroad hosting the passenger train service may be subject to civil penalties because it may cause the railroad providing the passenger service to violate the requirements of this part. For example, if a passenger railroad service is hosted by a freight railroad and that freight railroad is responsible for track maintenance, the freight railroad will need to provide the passenger railroad the necessary information regarding track maintenance for the passenger railroad to prepare its SSP plan. Since track maintenance has significant impact on the safety of rail operations, it is a vital element of a railroad's SSP plan. Therefore, if the freight railroad refuses to provide the passenger railroad the necessary information regarding track maintenance, the passenger railroad will not be able to fully comply with this part and, consequently, the freight railroad may be subject to civil penalties for causing the passenger railroad to fail to comply with this part.

APTA requested that FRA address coordination issues whereby one railroad can adopt and operate under another railroad's SSP plan. There is nothing in this rule prohibiting a railroad's SSP plan from adopting certain portions of another railroad's

SSP plan if those portions cover the same operations on both railroads. However, no two railroad operations are exactly the same; therefore, no two SSP plans will be exactly the same. If a railroad adopts portions of another railroad's plan, the operations covered by those portions of the plan must involve the same directly affected employees and both railroads must independently comply with the consultation requirements under this rule.

APTA also requested that FRA allow railroads to develop SSP plans for a jointly served facility and allow properties with multiple host railroads to have SSP plans specific to each of the territories that a host railroad supports. There is nothing in the rule prohibiting railroads from jointly developing portions of their SSP plans; however, the railroads must ensure that the jointly developed portions address all the necessary requirements of this rule. Each railroad can include the jointly developed portions in their plans, but each portion must involve the same directly affected employees and both railroads must independently comply with the consultation requirements under this rule.

Paragraph (b) requires each SSP plan to have a policy statement that endorses the railroad's SSP. It should be noted that proposed paragraph (c)(1) has been moved to paragraph (b). The policy statement required by this paragraph should define, as clearly as possible, the railroad's authority for the establishment and implementation of the SSP. This includes the legal name of the entity responsible for developing the railroad, any authorizing or implementing legislation, and federal, state & local statutes enacted to establish the railroad.

The policy statement is required to be signed by the chief official of the railroad. This signature would indicate that the top level of management at the railroad endorses the railroad's SSP. AAR requested that the chief official for safety should be required to sign the system safety program, not the chief official at the railroad. AAR believes that the title of "chief official at the railroad" is ambiguous because railroads have different organizational structures and there may not be one person with the title of "chief official." AAR claims that FRA has departed from the language in the statutory mandate which requires the chief official for safety to sign the SSP plan. AAR also believes that the chief official for safety is the more appropriate person to sign the SSP plan because he/she will be more familiar with the details of the SSP

than the other senior railroad officials and the chief official for safety will be directly responsible for the preparation of the SSP plan. FRA does not disagree that the chief official for safety should be required to sign the SSP plan. Indeed, the chief official for safety is not only required by this rule to sign the SSP plan but is required to certify that the contents of the SSP plan are accurate and that the railroad will implement the contents of the plan. See 49 CFR 270.201(a)(3)(i). FRA is not deviating from the requirements in the statutory mandate. Section 270.201(a)(3)(i) virtually mirrors the language in section 20156(b). AAR has mistaken § 270.103(b) as requiring the chief official at the railroad to sign the SSP plan. This paragraph requires the chief official at the railroad only to sign the SSP policy statement, not the entire SSP plan. Prior experience with effective risk management programs has demonstrated to FRA the importance of the active involvement of the highest officials in improving safety and safety culture. For this reason, FRA has determined that the chief official at the railroad must sign the SSP policy statement.

FRA notes that this policy statement is also required to describe the safety philosophy and culture of the railroad. Section 270.101(b) requires a railroad to design its SSP so that it promotes and supports a positive safety culture as defined by § 270.5. In order for a railroad to properly design its SSP so that it promotes and supports a positive safety culture, it first needs to describe its safety culture and philosophy. As discussed previously, FRA believes that there are 10 elements that are critical to a strong safety culture and these 10 elements provide the necessary framework for a railroad to comprehensively describe its safety culture. Once its safety culture is described, the railroad must also describe how it measures the success of its safety culture pursuant to paragraph (t) of this section. The requirement for this description was proposed in § 270.103(c)(1) of the NPRM; however, as discussed in the next paragraph, FRA has determined to delete proposed § 270.103(c).

As proposed in the NPRM, paragraph (c) would have required a railroad to set forth a statement in its SSP plan that describes the purpose and scope of the railroad's SSP. The statement would have been required to have, at a minimum, three elements. However, upon further consideration, FRA has determined that these three elements are better placed elsewhere in the rule. Therefore, proposed § 270.103(c),

Purpose and scope of system safety program, has been removed. As noted above, proposed § 270.103(c)(1) has been moved to § 270.103(b), System safety program policy statement, and proposed § 270.103(c)(2) and (3) have been moved to § 270.103(e), Railroad management and organizational structure, which was proposed as § 270.103(f) in the NPRM. FRA believes by moving these sections, the requirements are clearer and more consistent.

Paragraph (c) of the final rule, proposed as paragraph (d) in the NPRM, addresses the importance of goals in a SSP. The central goal of a SSP is to manage or eliminate hazards and the resulting risks to reduce the number and rates of railroad accidents, incidents, injuries, and fatalities. FRA believes one way to achieve this central goal is for a railroad to set forth goals that are designed in such a way that when the railroad achieves these goals, the central goal is achieved as well. The APTA System Safety Manual served as the model for the guidelines set forth in paragraph (c).

Paragraph (c) requires a railroad to include as part of its SSP plan a statement that defines the goals for its SSP. The statement must describe the clear strategies on how the railroad will achieve these goals. These strategies will be the railroad's opportunity to provide its vision on how these particular goals will ultimately reduce the number and rates of railroad accidents, incidents, injuries and fatalities. The statement must also describe what the railroad's management's responsibilities are to achieve the system safety goals. This statement will make it clear to the railroad, railroad employees, and FRA who, and at what level within management, is responsible for ensuring that the stated goals are achieved.

Rather than setting forth specific requirements that these goals must satisfy, paragraph (c) contains general requirements. This allows railroads the flexibility to establish goals specific to their operations. The general parameters of these goals are that they should be—

- long-term, so that they are relevant to the railroad's SSP. This does not mean that goals cannot have relevance in the short-term. Rather, goals must have significance beyond the short-term and continue to contribute to the SSP. The NPRM proposed that the goals should be relevant to the railroad "throughout the foreseeable life of the railroad." FRA determined to delete the quoted language to reduce any confusion;

- meaningful, so that they are not so broad that they cannot be attributed to specific aspects of the railroad's operations. The desired results must be specific and must have a meaningful impact on safety;

- measurable, so that they are designed in such a way that it is easily determined whether each goal is achieved or at least progress is being made to achieve the goal; and
- consistent with the overall goal(s) of the SSP, in that they must be focused on the identification of hazards and the elimination or mitigation of the resulting risks.

FRA notes that the NY MTA, in commenting on the NPRM, believes it is critical that FRA and OSHA align their positions related to numerical goals. NY MTA states that OSHA has indicated that simply setting numerical safety goals discourages accident reporting and that the goal of a SSP as described in the NPRM appears to be focused on setting such numerical goals. NY MTA is concerned that any conflict between OSHA's perspective and the main goal of a SSP program could have the unattended effect of hampering safety programs.

FRA agrees with NY MTA that the goals of a SSP cannot be focused exclusively on numerical values, *e.g.*, accident rates, employee injury rates, etc.; however, FRA believes that paragraph (c), like the SSP rule as a whole, does not focus solely on numerical goals. While the central goal of a SSP is to manage risks to reduce the number and rates of railroad accidents, incidents, injuries, and fatalities, this is not the sole goal of a SSP. A SSP must be designed and implemented so that it systematically reduces hazards and the resulting risks on a railroad's system. This rule provides each railroad with the flexibility to adapt a SSP to its system—the rule is not focused on a rigid numerical goal. A properly implemented SSP should naturally result in reduced rates of railroad accidents, incidents, injuries, and fatalities.

Paragraph (d), proposed as paragraph (e) in the NPRM, requires a railroad to set forth a statement in its SSP plan describing the characteristics of the railroad's system. FRA received comments from AAR, Labor Organizations, and the NY MTA regarding this paragraph. The railroad's system description is an important part of the overall SSP. This is the section where the railroad will provide sufficient information to allow a basic understanding of the railroad and its operations. A good system description is important to understand the operating

environment and interfaces that occur during operation of passenger trains, especially those elements that may positively or negatively affect safety. If the system is not described accurately, then the risk-based hazard analysis and resulting mitigations may be flawed.

Understanding the breadth of the railroad system is also fundamentally necessary for FRA to be able to review and audit a railroad's SSP. This description will allow FRA to determine whether the railroad's program sufficiently covers the railroad's operations and the extent of the risks/hazards on its system. The description will also focus the railroad on its staff and contractors that have an effect on the safety of its operations and, therefore, have an effect on the success of its SSP.

This information is required for FRA to understand the extent of infrastructure and operations so that they can relate the safety aspects of the plan to the railroad specifically. When carrying out enforcement action such as reviewing annual assessments or performing audits, FRA will have a basis of understanding for what, where and who is responsible. This is a key input in order to establish a "baseline" of a railroad's safety environment and culture.

FRA notes that passenger railroads often answer to officials representing governmental jurisdictions served by those railroads. FRA believes a SSP plan will be ineffective if those officials cannot easily be made aware of the nature of the railroads' operations and how those operations are made safer through the SSPs. FRA believes that for the SSPs required by RSIA to be effective, this information must be readily available to relevant governmental officials. Further, this information will make it easier for those governmental officials to inform railroads of, or place emphasis upon, relevant hazards, improving the quality of the SSPs. For example, States have safety rail inspectors who work in collaboration with FRA, to which that information will be useful. Railroads for the most part have this information currently; it's simply a matter of inserting into the plan document.

Generally, the description of the characteristics of the railroad's system should be sufficient to allow persons who are not familiar with the railroad's operations and railroad operations in general to understand the railroad's system and its basic operations. Specifically, this statement describes the following:

- The railroad's operations (including any host operations), including the role,

responsibilities, and organization of the railroad's operating departments.

- The physical characteristics of the railroad, including the number miles of track over which the railroad operates, the number of stations the railroad services, the number and types of grade crossings over which the railroad operates, on which segments the railroad shares track with other railroads, the maximum authorized speed, and toxic inhalation hazard routing.

- The scope of the service the railroad provides, including the number of passengers, the number of routes, and the days and hours when service is provided. The railroad may also provide a system map.

- The maintenance activities performed by the railroad, including the role, responsibilities, and organization of the railroad's various maintenance departments and the type of maintenance required by the railroad's operations and facilities.

- Any other aspects of the railroad pertinent to the railroad's operations.

The NPRM proposed requiring a description of the history of the railroad's operations and physical plant. FRA determined that these descriptions were not necessary because any pertinent information they would provide is already addressed by the other descriptions required by paragraph (d)(1).

Paragraph (d)(2) requires a railroad to identify in its SSP plan certain persons that provide or utilize significant safety-related services. The railroad will identify persons that have entered into a contractual relationship with the railroad to either perform significant safety-related services on the railroad's behalf or to utilize significant safety-related services provided by the railroad for purposes related to railroad operations. The term "significant safety-related services" is intended to be understood broadly to give a railroad the flexibility to evaluate the services other entities provide to the railroad and the degree that these services are safety-related. FRA has edited this section from the NPRM to clarify who needs to be identified by the railroad. First, the NPRM proposed that a railroad identify "entities or persons that provide significant safety-related services." However, FRA determined that the term "entities" was redundant because the definition for "person" in § 270.5 covers all of the entities that would need to be identified, therefore, the term "entities" has been removed. Second, the proposed rule text in the NPRM did not include the requirement that the person must be providing the services on the

railroad's behalf. This was added to clarify the relationship between the railroad and the person providing the service. The contractual basis of this relationship is discussed further in this section.

Third, the proposed rule text in the NPRM did not include the requirement that the railroad describe the persons that utilize significant safety-related services of the railroad; however, the NPRM did request comment on whether FRA should add this requirement. FRA received comments from AAR, APTA, Labor Organizations, and NY MTA in response to this request. AAR was unsure of which persons FRA meant when referring to persons that utilize significant safety-related services and suggested that the railroad itself could be a person that utilizes significant safety-related services. APTA commented that general considerations can be given for customers, motorists using highway rail-grade crossings and communities served by safe alternative transportation. However, APTA believes that there is no useful purpose for including this requirement in the rule. FRA has added the requirement that the railroad identify persons that utilize significant safety-related services, but included language to clarify which persons would fall under this category. The railroad will identify persons that utilize significant safety-related services provided by the railroad for the purpose related to railroad operations. For example, if a railroad contracts with a company to perform bridge maintenance, that company provides a significant safety-related service to the railroad on behalf of the railroad and would be identified as so under this paragraph. If during the bridge maintenance, the company uses the railroad's roadway worker protection, that company is then utilizing a significant safety-related service (roadway worker protection) provided by the railroad and would be identified as so under this paragraph. A railroad does not have to identify persons providing or utilizing significant safety-related services for purposes unrelated to railroad operations, such as railroad passengers or motor vehicle drivers who benefit from a highway-rail grade crossing warning system.

Fourth, FRA has added a contractual element to the relationship between the railroad and persons that provide or utilize significant safety-related services. This was added to ensure that there is a formalized agreement between the railroad and the person regarding the service that is provided or utilized. With the formalized agreement, the duties of the contractor would be clear

and, therefore, the extent they are performing or utilizing significant safety-related services of the railroad would be clear as well. FRA would give a railroad significant discretion to identify which persons utilize or provide significant safety-related services. In interpreting this proposed provision, emphasis would be placed upon the words "significant" and "safety-related." FRA does not expect a railroad to identify every person that provides it services. For example, a railroad would be expected to identify a signal contractor that routinely performed services on its behalf, but not a contractor hired on a one-time basis to pave a grade crossing. If a railroad was uncertain whether a person should be identified, it would be encouraged to contact FRA for further guidance. Generally, however, this section would require identification of those persons whose significant safety-related services or utilization would be affected by the railroad's SSP. FRA recognizes that not all railroad operations are the same; thus, not all persons that utilize or provide significant safety-related services will be the same. During its review of a railroad's SSP plan, FRA will determine whether the persons the railroad has sufficiently described significant safety-related services and identified the proper persons.

NY MTA recommended that FRA permit railroads to use the same safety-related matrix for designating employees that was proposed in the Training Standards NPRM to identify persons that provide significant safety-related services. NY MTA believes this will be more practical for staff changes, while still establishing accountability. On November 7, 2014, FRA published in the **Federal Register** a Final Rule entitled "Training, Qualification, and Oversight for Safety-Related Railroad Employees." 79 FR 66460. Generally, the Training Standards Rule requires each railroad or contractor that employs one or more "safety-related railroad employee" as defined by § 243.5, to develop and submit a training program to FRA for approval and to designate the minimum qualifications for each occupational category of employee. *Id.* The Training Standards Rule defines "safety-related railroad employee" as follows:

Safety-related railroad employee means an individual who is engaged or compensated by an employer to: (1) Perform work covered under the hours of service laws found at 49 U.S.C. 21101, *et seq.*; (2) Perform work as an operating railroad employee who is not subject to the hours of service laws found at 49 U.S.C. 21101, *et seq.*; (3) In the application of parts 213 and 214 of this chapter, inspect,

install, repair, or maintain track, roadbed, and signal and communication systems, including a roadway worker or railroad bridge worker as defined in § 214.7 of this chapter; (4) Inspect, repair, or maintain locomotives, passenger cars or freight cars; (5) Inspect, repair, or maintain other railroad on-track equipment when such equipment is in a service that constitutes a train movement under part 232 of this chapter; (6) Determine that an on-track roadway maintenance machine or hi-rail vehicle may be used in accordance with part 214, subpart D of this chapter, without repair of a non-complying condition; (7) Directly instruct, mentor, inspect, or test, as a primary duty, any person while that other person is engaged in a safety-related task; or (8) Directly supervise the performance of safety-related duties in connection with periodic oversight in accordance with § 243.205.

79 FR 66502.

Pursuant to § 243.101(c), the railroad is required to provide a table or other suitable format that lists, among other things, the railroad's safety-related employees. 49 CFR 243.101(c). While the matrix required by the Training Standards rule may provide the railroads with guidance regarding which persons provide significant safety-related services, it is not clear whether the matrix would cover persons that utilize significant safety-related services. Therefore, FRA declines to adopt NY MTA's suggestion.

The Labor Organizations expressed concern that railroads may contract out the majority of their safety-related services or allow a third party to perform such services to evade their statutory obligations under this part. The Labor Organizations believe that simply requiring identification of the persons that a railroad may or may not use for safety-related services would make it very difficult for FRA to determine whether the railroads are complying with this part. To avoid such difficulty, the Labor Organizations request that FRA make clear that the responsibility for compliance with this rule is non-delegable. Pursuant to §§ 270.3 and 270.7, as explained above in the accompanying section-by-section analysis, the railroad is ultimately responsible for compliance with this final rule and cannot delegate this duty. Section 270.7(b) provides that a railroad may contract with another person to perform the duties under this rule; however, that person is required to perform these duties in the same manner as the railroad and is subject to FRA enforcement action. The railroad remains accountable even if it does contract with another person to perform the duties required by this rule. Of course, the other person must perform the required duties in compliance with

this rule, and both the railroad and the contracted person are subject to FRA enforcement action.

Finally, an individual also commented that it is important to ensure that persons providing significant safety-related services are qualified or credentialed, or both, to provide such services. FRA believes such a requirement is unnecessary because persons that perform any duty on behalf of the railroad are required to perform these duties consistent with this regulation and any other applicable safety laws and regulations. Therefore, a railroad is required to ensure that any person that provides significant safety-related services do so consistent with this regulation and any other applicable safety laws and regulations.

Paragraph (d)(3) incorporates text from proposed paragraph (f)(4) of the NPRM. FRA determined that the requirements in proposed paragraph (f)(4) were better placed in paragraph (d) because the requirements are part of the railroad system description. Paragraph (d)(3) requires the railroad to describe the relationship and responsibilities between it and certain other persons. These persons include any host railroads, contract operators, shared track/corridor operators, and other persons that utilize or provide significant safety-related services as identified by the railroad in paragraph (d)(2) of this section. Describing the relationship and responsibilities between the railroad and any host railroads, contract operators, or shared track/corridor operators should be relatively straight forward because a railroad most likely has entered into contracts or memoranda of agreement with these persons that outline this information. The description should be detailed enough so that FRA can understand the basis of the relationship and the responsibilities of each person based on that relationship. For example a commuter railroad may contract out operation of the commuter trains to one corporation and contract out track maintenance on the commuter railroad's own trackage to another corporation. For a certain section of the route, the commuter railroad's trains are hosted by another railroad on the other railroad's tracks and that other railroad provides the dispatching and signal/track maintenance for that portion of track. The commuter railroad would need to outline these relationships and responsibilities in the plan. Not only to ensure that FRA understands, but also to ensure the railroad has a complete understanding of who performs the various activities. Many departments know who and what they do and

contract out, but do not have a grasp of the big picture for the entire commuter railroad.

Paragraph (e), proposed as paragraph (f) in the NPRM, requires a railroad to set forth a statement in its SSP plan that describes the management and organizational structure of the railroad. RSIA requires a railroad's hazard analysis to identify and analyze the railroad's management structure. 49 U.S.C. 20156(c). Under this section, the railroad will identify its management structure and how safety responsibilities are distributed throughout the railroad.

As discussed previously, to maintain consistency and increase clarity, proposed paragraphs (c)(2) and (3) have been incorporated into paragraph (e) of this section. The statement pursuant to paragraph (e) shall include a chart or other visual representation of the organizational structure of the railroad; description of the railroad's management responsibilities within the SSP; description of how the safety responsibilities are distributed within the railroad organization; clear identification of the lines of authority used by the railroad to manage safety issues; and a description of the roles and responsibilities in the railroad's system safety program for each host railroad, contract operator, shared track/corridor operator, and other person that utilizes or provides significant safety-related services as identified by the railroad pursuant to (d)(2) of this section. The statement shall also describe how each host railroad, contractor operator, shared track/corridor operator, and any other person that utilizes or provides significant safety-related services as identified by the railroad pursuant to paragraph (d)(2) of this section supports and participates in the railroad's system safety program, as appropriate. Under paragraph (e)(1), the chart or other visual representation of the organizational structure of the railroad does not need to be overly detailed. Rather, it must identify the divisions within the railroad, the key management positions within each division, and titles of the officials in those positions.

Under paragraph (e)(2), the railroad shall describe the railroad's management's responsibilities within the SSP. This description clarifies who within the railroad's management are responsible for which aspects of the SSP.

Under paragraph (e)(3), a railroad must identify how the safety responsibilities are distributed within the railroad's departments. A railroad may have one department that handles safety matters or there may be multiple

departments and each department has separate and distinct responsibilities for handling safety matters. Regardless of how the railroad distributes the overall responsibility to manage safety issues, it is important that the railroad identifies and describes how safety is being managed on its system.

Under paragraph (e)(4), the railroad also needs to clearly identify which of the management positions within the department(s) are responsible for managing the safety issues within the railroad. Identification of these lines of authority allows FRA to determine who within the organization and at what level has responsibility for managing the safety issues. While FRA recognizes that safety is everybody's responsibility within the railroad organization, the management personnel responsible for managing the safety issues need to be identified.

Paragraph (e)(5) requires the railroad to describe the roles and responsibilities in the railroad's SSP for each host railroad, contract operator, shared track/corridor operator, and any other person that utilizes or provides significant safety-related services. Since these persons play a key role in the safe operation of the railroad, their role and responsibilities in the railroad's SSP must be described.

Paragraph (e)(5) also requires the railroad to describe how each host railroad, contractor, shared track/corridor operator, and any other person that utilizes or provides significant safety-related services as identified by the railroad pursuant to paragraph (d)(2) supports and participates in the railroad's SSP, as appropriate.

Paragraph (f), proposed as paragraph (g) in the NPRM, requires a railroad's SSP plan to include a description of the process the railroad will use to implement its SSP. RSIA requires passenger railroads to implement a SSP plan that is approved by the Secretary. 49 U.S.C. 20156(a)(1)(C). Under this section, the railroad will describe how it will implement its SSP, which will allow FRA, during initial plan approval and subsequent audits, to determine if the railroad is properly implementing its SSP.

The implementation process must, at a minimum, address the roles and responsibilities of each position (including those held by employees, contractors, and other persons that utilize or provide significant safety-related services) that has significant responsibilities to implement the SSP. The addition of persons that utilize significant safety-related services is consistent with the discussion in paragraph (d)(2). The NPRM proposed

that the statement would address the roles and responsibilities of each position and job function that has significant responsibilities to implement the SSP. FRA determined that the term "job function" was redundant; therefore, all references in the rule have been removed. The process must also identify the milestones necessary to be reached to properly implement the SSP. FRA did not receive any comments in response to paragraph (f); however, as discussed in the next paragraph, FRA has included the requirement in paragraph (f) that the SSP be fully implemented within 36 months of FRA approval. Further, in the NPRM this paragraph proposed to require an implementation plan; however, FRA has determined that a description of the implementation process is more appropriate than requiring a formal plan.

FRA notes that in the NPRM there was no proposal for the railroad to specify a timeframe in which it would be required to fully implement, as defined in § 270.5, its SSP; however FRA believes such a timeline is necessary. FRA has determined that 36 months is a sufficient amount of time for a railroad to fully implement its SSP. With such a time frame, a railroad can effectively allocate the resources necessary to fully implement its SSP while also prioritizing the implementation of specific elements. Further, with this timeframe, the railroad will be able to more precisely set the milestones as required by this section. While "fully implemented" is defined in § 270.5, there are no rigid criteria that determine if a program is fully implemented. To determine if a program is fully implemented, FRA will consider the extent to which each section of the plan is implemented and the railroad, along with its stakeholders, are actively fulfilling each section. For example, regarding paragraph (c), System safety program goals, FRA will consider the extent to which a railroad has developed written goals that are long-term, meaningful, measurable, and focused on the identification of hazards and the mitigation or elimination of the resulting risks, and whether there are programs in place for the railroad to achieve the written goals.

The positions that will be described pursuant to paragraph (f) are those that are responsible for implementing the major elements of the SSP, to the extent that the individuals having these positions have clear and concrete roles and responsibilities. Not every individual who participates in the railroad's SSP needs to be described as part of the implementation process but

rather only those individuals who have significant responsibilities for implementing the railroad's SSP. The phrase "significant responsibilities" is intended to be broadly defined to provide the railroads the flexibility to determine, based on their individual operations, what may be considered "significant responsibilities."

In its SSP plan a railroad will set forth the milestones to demonstrate that it has properly implemented its SSP. Each railroad's SSP will be different; therefore, the milestones that must be achieved to properly implement a SSP will be different. A railroad has the flexibility to determine, based on its own SSP and not rigid requirements, realistic benchmarks that need to be achieved to properly implement its SSP. FRA understands that there may be unforeseeable circumstances that can cause a railroad to adjust the implementation of its SSP and subsequently adjust these milestones. The important consideration is that the railroad sets forth milestones that can be used to determine the progress of the railroad's implementation of its SSP.

Paragraph (g), proposed paragraph (h) in the NPRM, addresses a railroad's maintenance and repair program. RSIA requires a railroad's hazard analysis to "identify and analyze" the railroad's "infrastructure" and "equipment." 49 U.S.C. 20156(c). Under this section, the railroad will identify its procedures and processes for the maintenance, repair, and inspection of such infrastructure and equipment. This identification is necessary for the railroad to conduct a thorough risk-based hazard analysis and will allow FRA, during initial plan review and subsequent audits, to determine if the railroad's SSP sufficiently addresses the risk and hazards generated by the railroad's infrastructure and equipment. FRA received three comments in response to this paragraph. Based on these comments, paragraph (g)(4) was added.

Paragraph (g)(1) requires a railroad's SSP plan to identify and describe the processes and procedures used for maintenance and repair of its infrastructure and equipment directly affecting railroad safety. The phrase "infrastructure and equipment directly affecting railroad safety" is intended to be broadly understood to provide the railroad the opportunity to take a realistic survey of its particular operations and make the determination of which infrastructure and equipment directly affect the safety of that railroad. However, as guidance, a list of the types of infrastructure and equipment that are considered to directly affect railroad safety is provided. This list includes:

Fixed facilities and equipment, rolling stock, signal and train control systems, track and right-of-way, passenger train/station platform interface (gaps), and traction power distribution systems. The list in the NPRM did not include passenger train/station platform interface (gaps); however, FRA believes passenger train/station platform interface (gaps) are an important element of a railroad's infrastructure and will provide the railroad with further opportunities to identify hazards and the resulting risks and eliminate or mitigating these hazards. Once the railroad has determined what infrastructure and equipment directly affect railroad safety, it will then identify and describe the processes and procedures used for the maintenance and repair of that infrastructure and equipment. The safety of a railroad's operations depends greatly upon the condition of its infrastructure and equipment; therefore, these maintenance and repair processes and procedures should and are expected to already be in place.

Under paragraph (g)(2), each description of the processes and procedures used for maintenance and repair of infrastructure and equipment directly affecting safety must include the processes and procedures used to conduct testing and inspections of the infrastructure and equipment. Multiple FRA regulations require a railroad to conduct testing and inspection of infrastructure and equipment, and paragraph (g)(2) addresses the processes and procedures that the railroad has developed to meet these regulatory standards. For example, pursuant to 49 CFR part 234, a railroad must inspect, test, and repair warning systems at highway-rail grade crossings. Under paragraph (g)(2), the railroad will describe the internal procedures it has developed to conduct such inspections, tests, and repairs and how it educates its employees on the proper way to conduct the inspection, testing and repair of highway-rail grade crossing warning systems. As discussed below, in certain situations, paragraph (g)(3) permits referencing these manuals in the SSP plan rather than providing the entire manual.

Typically, railroads have a manual or manuals that describe the maintenance and testing procedures and processes used to conduct testing and inspections of the infrastructure and equipment. FRA has included paragraph (g)(3) to address the use of such manuals in a SSP plan. Rather than including an entire manual in its SSP plan, if the manual satisfies all applicable Federal regulations, in most cases simply

referencing the manual in the SSP plan will satisfy this paragraph. If a manual does not comply with all applicable Federal regulations, it cannot be included in the plan. If any the regulations that apply to these are updated, the manuals and references to such will need to be updated as well. Approval of a SSP plan that references manuals that describe the maintenance and testing procedures and processes used to conduct testing and inspections of the infrastructure and equipment does not necessarily mean that the manuals satisfy all applicable regulations. Rather, each manual must independently comply with the applicable regulations and is subject to a civil penalty if not in compliance. If FRA finds it necessary to review the manuals, FRA will examine whether the manuals are current, if they are readily available to the employees who are performing the functions the manuals address, and if these employees have been trained on their use.

While FRA is always concerned with the safety of railroad employees performing their duties, employee safety in maintenance and servicing areas generally falls within the jurisdiction of OSHA. It is not FRA's intent in this rule to displace OSHA's jurisdiction regarding the safety of employees while performing inspections, tests, and maintenance, except where FRA has already addressed workplace safety issues, such as blue signal protection in 49 CFR part 218. In other rules, FRA has included a provision that makes it clear that FRA does not intend to displace OSHA's jurisdiction over certain subject matters. *See, e.g.,* 49 CFR 238.107(c).

In the NPRM, FRA sought comment on whether such a clarifying statement was necessary for any such subject matter that the proposed rule may affect. APTA, the Labor Organizations, and an individual commenter all provided comments in response to this request. All of the commenters agree that the final rule should contain such a clarifying statement; therefore, paragraph (g)(4) has been included in this section. Modeled after 49 CFR 238.107(c), paragraph (g)(4) makes clear that FRA neither intends to displace OSHA jurisdiction with respect to employee working conditions generally nor specifically with respect to the maintenance, repair, and inspection of infrastructure and equipment directly affecting railroad safety. FRA does not intend to approve any specific portion of a SSP plan that relates exclusively to employee working conditions covered by OSHA. The term "approve" is used to make it clear that any part of a plan that relates to employee working

conditions exclusively covered by OSHA will not be approved even if the overall plan is approved. Additionally, the term “specific” reinforces that the particular portion of the plan that relates to employee working conditions exclusively covered by OSHA will not be approved; however, the rest of the plan may still be approved. As discussed below, paragraph (g)(4) also applies to paragraph (k) regarding OSHA jurisdiction over any workplace safety programs. If there is any confusion regarding whether a plan covers an OSHA-regulated area, FRA is available to provide assistance.

Paragraph (h), proposed as paragraph (i) in the NPRM, requires a railroad’s SSP plan to set forth a statement describing the railroad’s processes and procedures for developing, maintaining, and ensuring compliance with the railroad’s rules and procedures directly affecting railroad safety and the railroad’s processes for complying with applicable railroad safety laws and regulations. RSIA requires a railroad’s hazard analysis to identify and analyze the railroad’s operating rules and practices. 49 U.S.C. 20156(c). Under this paragraph, the railroad will identify the railroad’s operating rules and practices. FRA did not receive any comments in response to this paragraph as proposed in the NPRM; however, the term “maintenance” has been included in paragraph (h)(1) to be consistent with paragraph (h)(3). This statement describes how the railroad not only develops, maintains, and complies with its own safety rules, but also how the railroad complies with applicable railroad safety laws and regulations. The statement includes identification of the railroad’s operating and safety rules and procedures that are subject to review under chapter II, subtitle B of title 49 of the Code of Federal Regulations, *i.e.*, all of FRA’s railroad safety regulations.

The railroad must also identify the techniques used to assess the compliance of its employees with applicable railroad safety laws and regulations and the railroad’s operating and safety rules and maintenance procedures. Both Federal railroad safety laws and regulations and railroad operating and safety rules and maintenance procedures are effective at increasing the safety of the railroad’s operations only if the railroad and its employees comply with such rules and procedures. By ensuring compliance with such rules and procedures, the overall safety of the railroad is improved. The NPRM proposed requiring that the railroad identify the techniques to assess compliance of the railroad’s employees with “applicable

FRA regulations”; however, to be consistent with the other requirements in paragraph (h), FRA has revised this language to “railroad safety laws and regulations.”

The railroad must identify the techniques used to assess the effectiveness of the railroad’s supervision relating to compliance with applicable railroad safety laws and regulations and the railroad’s operating and safety rules and maintenance procedures. If the railroad’s supervision relating to compliance with these rules and procedures is effective, the employees’ compliance should also be effective, thus improving the overall safety of the railroad.

Paragraph (i), proposed as paragraph (j) in the NPRM, requires each railroad to train necessary personnel on in its SSP plan. As proposed, paragraph (i) did not have the explicit requirement that the railroad train the necessary employees; thus, paragraph (i)(1) has been added to make this clear. Paragraph (i) also requires that each railroad establish and describe its plan how the necessary personnel will be trained on the SSP. As proposed in the NPRM, paragraph (i) did not require a railroad to establish a plan addressing how its employees will be trained on the SSP. Since some railroads will not have a SSP in place before the effective date of this final rule, FRA determined that it was necessary to include the requirement that a railroad not only describe but also establish a plan addressing how its employees will be trained on the SSP. This ensures that a railroad has such a plan in place and that it can be properly described pursuant to this paragraph.

The SSP training plan will describe the procedures in which employees that are responsible for implementing and supporting the program and any other person that utilizes or provides significant safety-related services will be trained on the railroad’s SSP. The NPRM proposed that “contractors who provide significant safety-related services” needed to be trained as well. However, FRA determined that the phrase “persons utilizing or performing significant safety-related services” includes contractors who provide significant safety-related services; therefore, the phrase “contractors who provide significant safety-related services” has been removed. A railroad’s SSP can be successful only if those who are responsible for implementing and supporting the program understand the requirements and goals of the program. To this end, a railroad would train those responsible for implementing and supporting the

railroad’s SSP on the elements of the program so that they have the knowledge and skills to fulfill their responsibilities under the program.

For each position or job title that has been identified under paragraph (f)(1)(i) as having significant responsibility for implementing a railroad’s SSP, the railroad’s training plan must describe the frequency and the content of the training on the SSP that the position or job title receives. If the railroad does not identify a position or job title under paragraph (f)(1)(i) as having significant responsibility to implement the SSP but the position or job title is safety-related or has a significant impact on safety, personnel in these positions will be required to receive basic training on the system safety concepts and the system safety implications of their position. Even though the personnel may not have responsibilities to implement the railroad’s SSP, they do have an impact on the program because their position is safety-related or has a significant impact on safety, or both. It is important that all persons who may have an impact on the success of a railroad’s SSP understand the requirements of the program so they can work together to achieve its goals.

Paragraph (i)(5) provides that a railroad may conduct its SSP training by classroom, computer-based, or correspondence training. Paragraph (i) is not intended to limit the forms of training; rather, it provides the railroads the flexibility to conduct training using methods other than traditional classroom training. SSP training may also be combined with a railroad’s regular safety or rules training and in some cases SSP training could be included in field “tool box” safety training sessions. APTA requested that FRA make it clear in the rule text that the methods listed in paragraph (i)(4) were illustrative and not restrictive. FRA has revised the text of paragraph (i)(4) to address this concern. Additionally, for clarity and consistency with 49 CFR part 243, the methods listed are “classroom, computer-based, or correspondence training,” which differs slightly from the NPRM; however, as discussed, the list is only illustrative and not restrictive.

Paragraph (i)(6) requires each railroad to keep a record of all training conducted under paragraph (i) and describe the process it will use to maintain and update these training records. The requirement that the railroad keep a record of all training was originally proposed in paragraph (i)(1); however, FRA believes it is more consistent to include it in paragraph (i)(6). Paragraph (i)(7) requires each railroad to describe the process that it

will use to ensure that it is complying with the requirements of the training plans as required by this part.

NY MTA commented that the training required under this part should apply only to railroads that contract out their operations. NY MTA believed that contractors who are not responsible for actual railroad operations will be governed by the then-forthcoming Training Standards Rule, which proposed to require these contractors to certify that they have trained their employees on all the appropriate safety protocols

Requiring a SSP training component for certain railroad employees and officers is necessary because FRA's Training Standards Rule would not cover such SSP training for each type of employee or officer that this final rule describes as needing the training. As discussed *supra*, in late 2014, FRA published the final Training Standards Rule. 79 FR 66460. Generally, the Training Standards Rule requires each railroad or contractor that employs one or more "safety-related railroad employee" as defined by § 243.5, to develop and submit a training program to FRA for approval and to designate the minimum qualifications for each occupational category of employee. 49 CFR part 243. Some employees and officers required by paragraph (i) to receive system safety training would be considered a "safety-related railroad employee" under the Training Standards Rule and others would not. Since all employees and officers required to receive system safety program training under this final rule would not be required to receive such training pursuant to the Training Standards Rule, FRA declines to narrow the applicability of paragraph (i) as suggested by NY MTA. Furthermore, having a training component in this final rule does not create a duplicate training program filing requirement or require duplicate training as the Training Standards Rule specifically permits an employer to elect to cross-reference training programs or plans required by other FRA regulations in a part 243 submission, rather than resubmitting that program or plan for additional FRA review and approval. 49 CFR 243.103(b). As on-the-job training (OJT) is not expected to be a requirement of any SSP training program or plan, the provision of § 243.103(b) that mentions adding an OJT component would not be applicable to this final rule.

Paragraph (j), proposed as paragraph (k) in the NPRM, requires that a railroad's SSP plan describe the processes used by the railroad to

manage emergencies that may arise within its system. A strong SSP will include effective emergency management processes. This description will allow FRA, during initial plan review and subsequent audits, to understand the railroad's emergency management processes, assess whether the railroad is complying with them, and determine if the processes adequately cover potential emergencies. FRA did not receive any comments in response to the proposal; its text remains unchanged in this final rule. The description must include the processes the railroad uses to comply with the applicable emergency equipment standards in part 238 of this chapter and the passenger train emergency preparedness requirements in part 239 of this chapter.

Paragraph (k), proposed as paragraph (l) in the NPRM, requires that the railroad's SSP plan describe the programs that the railroad has established that protect the safety of its employees and contractors. The description must include: (1) The processes that have been established to help ensure the safety of employees and contractors while working on or in close proximity to the railroad's property as described in paragraph (d) of this section; (2) the processes to help ensure that employees and contractors understand the requirements established by the railroad pursuant to paragraph (f)(1) of this section; (3) any fitness-for-duty programs or any medical monitoring programs; and (4) the standards for the control of alcohol and drug use in part 219 of this chapter.

Workplace safety is an integral part of a railroad's SSP and has a significant impact on railroad safety. Workplace safety touches many of the elements embedded in a SSP and should also be part of the railroad's overall safety philosophy and culture. This description will allow FRA, during initial plan review and subsequent audits, to understand the railroad's workplace safety programs and determine whether the railroad's SSP sufficiently addresses any gaps in the programs.

The NPRM originally proposed that the statement "describe any" of the programs and processes listed; however, FRA believes that this may have indicated that a railroad would not be required to describe all of the programs and processes listed, which was not the intent. FRA has revised the language to make clear that a railroad is required to describe all of the programs and processes listed. FRA also notes that proposed paragraph (k)(3) listed "fatigue management programs established by

this part" as one of the fitness-for-duty programs to be described. However, as discussed in the Statutory Background section, to minimize confusion regarding the separate FMP Working Group process and the ongoing fatigue management plans rulemaking, the placeholder in this rule for fatigue management plans, paragraph (s), has been deleted. Therefore, the proposed requirement in paragraph (k)(3) that the railroad describe "fatigue management programs established by this part" has not been included in this final rule.

Moreover, in the NPRM, paragraph (k)(3) proposed that the statement include a description of "fitness-for-duty programs, including standards for the control of alcohol and drug use contained in part 219 of this chapter, and medical monitoring programs." However, the standards under part 219 are not necessarily "fitness-for-duty programs." Therefore, to minimize the potential for confusion, the final rule separates the required description of any fitness-for-duty programs or any medical monitoring programs (paragraph (k)(3)) from the description of the standards for the control of alcohol and drug use in part 219 of this chapter (included as paragraph (k)(4)). This change from the NPRM does not add to or remove any of the substantive requirements proposed in the NPRM.

Employees and contractors of the railroad are exposed to many hazards and risks while on railroad property. A railroad's SSP is required to take into consideration the safety of these persons and the programs and processes the railroad already has in place to address the hazards they face and resulting risks. As explained in the discussion of paragraph (g)(4), FRA is always concerned with the safety of employees in performing their duties; however, employee safety in maintenance and servicing areas generally falls within the jurisdiction of OSHA. It is not FRA's intent in this rule to displace OSHA's jurisdiction regarding the safety of employees while performing inspections, tests, and maintenance, except where FRA has already addressed workplace safety issues, such as blue signal protection. As with paragraph (g), FRA requested comment on whether it is necessary to include in the final rule a provision making clear that FRA does not intend to displace OSHA's jurisdiction over certain subject matters. Paragraph (g)(4) was included in response to the comments received and that provision makes clear that nothing in this rule, including paragraph (k), is intended to displace OSHA's jurisdiction.

The Labor Organizations raised a concern on whether paragraph (k) would create new, if any, rights for carriers to use fitness-for-duty programs and medical monitoring programs to undermine the forthcoming statutory-mandated fatigue management program. The Labor Organizations requested that FRA make clear in the final rule that the SSP regulation is not a fitness-for-duty or medical standards regulation. Neither paragraph (k) nor the SSP rule as a whole create any new rights regarding fitness-for-duty or medical monitoring programs, consistent with FRA's intent.

Paragraph (l), proposed as paragraph (m) in the NPRM, requires a railroad to establish and describe in its SSP plan the railroad's public safety outreach program to provide safety information to the railroad's passengers and the general public. Paragraph (l) also requires the railroad's safety outreach program to have a means in which railroad passengers and the general public can report hazards to the railroad.

A railroad's passengers and the general public play a vital role in the success of the railroad's SSP. The public safety outreach program requires the railroad to directly communicate safety information to both passengers and the general public and also allow these individuals to alert the railroad about safety hazards they observe. FRA will review the programs during the initial SSP plan review and subsequent audits to determine if the railroad's SSP sufficiently addresses any gaps in the programs.

FRA did not receive any comments in response to this paragraph; however, as proposed in the NPRM, paragraph (l) did not require a railroad's safety outreach to include a means for railroad passengers and the general public to report hazards.

As proposed in the NPRM, a railroad's safety outreach program would only provide safety information to railroad passengers and the general public, which was not the intent. While it is important for a railroad's safety outreach program to provide the necessary safety information to the railroad's passengers and to the general public so that they can minimize their exposure to the hazards and resulting risks on the railroad and take appropriate precautions, it is not the sole purpose of the program. FRA believes that it is also important for railroad passengers and the general public to provide the railroad with information regarding any hazards they observed. This information will allow the railroad to address these identified hazards and resulting risks and improve the safety of the overall railroad and the

safety information provided to the railroad passengers and the general public.

Paragraph (m), proposed as paragraph (n) in the NPRM, requires that a railroad's SSP plan describe the processes that the railroad uses to receive notification of accidents/incidents, investigate and report those accidents/incidents, and develop, implement, and track any corrective actions found necessary to address an investigation's finding(s). These processes should already be in place because they are necessary to comply with the requirements of part 225 of this chapter. Accidents and incidents can reveal hazards and risks on the railroad's system, which the railroad can then address as part of its SSP. While 49 CFR part 225 sets forth FRA's accident/incident reporting requirements, this section focuses on the actions the railroad will take to address accident/incident investigation results. These actions are important to the overall safety of a railroad's operations and will provide information to the railroad on what additional actions it can take as part of its SSP to address the hazards and resulting risks that contributed to the accident/incident.

FRA did not receive any comments in response to this paragraph as proposed in the NPRM. However, FRA has modified the paragraph to address "accidents/incidents"—rather than just "accidents," as proposed. This makes clear FRA's intent that the paragraph covers events that provide the railroad with information that may improve the safety of the railroad, which is not exclusive to accidents.

Paragraph (n), proposed as paragraph (o) in the NPRM, requires a railroad to establish and describe in its SSP plan processes that the railroad has or puts in place to collect, maintain, analyze, and distribute safety data in support of the SSP. Accurate safety data collection and the analysis and distribution of that data within a railroad can help the railroad determine where safety problems or hazards exist, develop targeted programs to address the problems and hazards, and focus resources towards the prevention of future incidents and improvement of safety culture. This description will assist FRA's review of these programs during the initial SSP plan review and audits to determine if the railroad's SSP sufficiently addresses any gaps in the programs. As proposed in the NPRM, paragraph (n) did not require a railroad to establish processes to collect, maintain, analyze, and distribute safety data in support of the SSP. Since some

railroads will not have a SSP in place before the effective date of this final rule, FRA determined that it was necessary to include the requirement that a railroad not only describe but also establish SSP data acquisition processes. This ensures that a railroad has these processes in place and that it can be properly described pursuant to this paragraph. The data acquisition process described in APTA's System Safety Manual provides guidance on the processes a railroad may use to comply with this part.

Paragraph (o), proposed as paragraph (p) in the NPRM, requires a railroad's SSP plan to describe the process(es) it employs to address safety concerns and hazards during the safety-related contract procurement process. This applies to safety-related contracts to help ensure that the railroad can address as necessary safety concerns and hazards that may result from the procurement. FRA did not receive any comments in response to this proposed paragraph. However, the term "process" was changed to "process(es)" to recognize that a railroad may have more than one process in place.

The main components of a SSP are the risk-based hazard management program and the risk-based hazard analysis. The railroad will use the risk-based hazard management program to describe the various methods, processes, and procedures it will employ to properly and effectively identify, analyze, and mitigate or eliminate hazards and resulting risks. In turn, through the risk-based hazard analysis the railroad will actually identify, analyze, and determine the specific actions it will take to mitigate or eliminate the hazards and the resulting risks. Paragraphs (p) and (q), proposed as paragraphs (q) and (r) in the NPRM, set forth the elements of the railroad's risk-based hazard management program and risk-based hazard analysis. Both of these paragraphs implement sections 20156(c) through (f). FRA received multiple comments addressing the risk-based hazard management program and the risk-based hazard analysis, and these comments are addressed accordingly.

The risk-based hazard management program will be a fully implemented program within the railroad's SSP. Paragraph (p) requires a railroad to establish and describe the various methods, processes, and procedures that, when implemented, will identify, analyze, and mitigate or eliminate hazards and the resulting risks on the railroad's system. This paragraph embodies FRA's intent to provide each railroad with the flexibility to tailor its

SSP to its specific operations. Paragraph (p) does not set forth rigid requirements for a risk-based hazard management program. Rather, more general guidelines are provided and the railroad is able to apply these general guidelines to its specific operations.

APTA commented that paragraph (p) and paragraph (q), Risk-based hazard analysis, do not contain a discussion of the variety of controls or the flexibility this SSP rule provides to the railroads to choose which procedures they will put into place to mitigate or eliminate risks. APTA points out there was substantial discussion at the RSAC on this issue and it was recognized that there are many methods a railroad can apply to keep risk as low as reasonably practicable. APTA further points out that the analysis methods were grouped by RSAC into non-formal (*e.g.*, 5 Y method) and formal (*e.g.*, fault trees and cut sets). APTA therefore requests that FRA clarify that the understandings reached by the RSAC, and which were voted upon as recommendations, are still available as tools and have not been replaced by a formal analysis required by paragraphs (p) and (q).

FRA makes clear that the rule does not limit the methods a railroad may use in its risk-based hazard management program. FRA recognizes that there was agreement in the RSAC that many methods exist to keep risk low, such as MIL-STD-882 or the Government Electronics & Information Technology Association 010 Standard. However, this rule does not prescribe which of these methods must be used. Specifically, the discussion in the NPRM of proposed paragraph (q)(5) (paragraph (p)(1)(i) of the final rule) explained that the railroad would determine the methods it would use in the risk-based hazard analysis in proposed paragraph (r) (paragraph (q) of the final rule), to identify hazards on various aspects of its system. FRA intends that each railroad use this opportunity to use known methods and consider any new or novel techniques or methods to identify hazards that best suits that railroad's operations.

FRA notes that paragraph (p) is structured differently from what was proposed in the NPRM; however, the substance of paragraph (p) remains the same.

Paragraph (p)(1) requires the railroad's risk-based hazard management program to contain eight elements. All of these elements will be fully described in the railroad's SSP plan. First, the railroad shall establish the processes or procedures that will be used in the risk-based hazard analysis to identify the hazards on the railroad's

system. This will be the railroad's opportunity to consider any new or novel techniques or methods that best suit the railroad's operations to identify hazards.

Second, the railroad must establish the processes or procedures that will be used in the risk-based hazard analysis that will analyze the identified hazards and, therefore, support the risk-based hazard management program. These processes and procedures will allow the railroad to analyze the hazards and, thus, gain the necessary knowledge to effectively identify the resulting risk.

Third, the railroad must establish the methods that will be used in the risk-based hazard analysis to determine the severity and frequency of hazards and to determine the corresponding risk. Once the railroad has identified the hazards, it will determine the corresponding risk. By developing a method that effectively identifies the severity and frequency of the hazards and determines the resulting risks, the railroad will be able to effectively prioritize the mitigation or elimination of the hazards and resulting risks.

In its comments on the NPRM, Parsons Brinckerhoff inquired as to FRA's intent behind using the terms "calculate" and "resulting risk" in the proposed rule text for paragraph (p)(1)(iii). Parsons Brinckerhoff questioned if FRA's use of the term "calculate" meant that the estimation of the resulting risk should be quantitative and that the use of the term "resulting risk" meant that the risk is a precise product of determining severity and consequence of hazards. Parsons Brinckerhoff suggested replacing "calculate the resulting risk" with "determine the corresponding risk" so that paragraph (p)(1)(iii) is more consistent with paragraph (p)(1)(iv) and allows for a broader range of risk assessment methodologies, which may include: Quantitative, semi-quantitative, qualitative, or some combination of all three. FRA agrees that the estimation of the risk does not necessarily have to involve a formal quantitative analysis, and therefore FRA adopts Parsons Brinckerhoff's suggested language.

Fourth, the railroad must establish the methods that will be used in the risk-based hazard analysis to identify the actions that mitigate or eliminate hazards and corresponding risks. Here the railroad will identify the methods or techniques it will use to determine which actions it will need to take to mitigate or eliminate the identified hazards and risks. As is the case with identifying the hazards and resulting risks, this is the railroad's opportunity to consider any new or novel methods

best suited to the railroad's operations to mitigate or eliminate hazards and resulting risks. FRA recognizes that not all hazards and resulting risks can be eliminated or even mitigated, due to costs, feasibility, or other reasons. However, FRA expects the railroads to consider all reasonable actions that may mitigate or eliminate hazards and the resulting risks and to implement those actions that are best suited for that railroad's operations.

Fifth, the railroad must establish the process that will be used in the risk-based hazard analysis to set goals for the risk-based hazard management program and how performance against the goals will be reported. Establishing clear and concise goals will play an important role in the success of a railroad's risk-based hazard management program. The goals should be tailored so that the central goal of the risk-based hazard management program (to effectively identify, analyze, and mitigate or eliminate hazards and resulting risks) is supported for the individual railroad.

Sixth, the railroad must establish a process to make decisions that affect the safety of the rail system relative to the risk-based hazard management program. Railroads make numerous decisions every day that affect the safety of the rail system and this paragraph requires a railroad to describe how those decisions will be made when they relate to the risk-based hazard management program. FRA notes that Parsons Brinckerhoff commented whether this paragraph was meant to address risk acceptance, based on its reading of the discussion of this paragraph in the NPRM. Parsons Brinckerhoff requested that FRA revise this paragraph to make that clear, if it was FRA's intent.

Risk acceptance is a process in which an organization determines the appropriate level of risk to accept. An organization will determine which risks are acceptable based on the resources available to mitigate or eliminate those risks. While risk acceptance is an integral part of a SSP, FRA does not intend this paragraph to establish a risk acceptance requirement. Rather, the overall risk-based hazard management program, in part, establishes a risk acceptance framework for the railroad.

Seventh, the railroad must establish the methods that will be used in the risk-based hazard analysis to support continuous safety improvement throughout the life of the rail system. Consistent with the overall SSP, the railroad will implement methods as part of the risk-based hazard management program that will support continuous safety improvement.

Eighth, the railroad must establish the methods that will be used in the risk-based hazard analysis to maintain records of identified hazards and risks and the mitigation or elimination of the identified hazards and risks throughout the life of the rail system. In this paragraph the railroad will describe how it plans to maintain the records of the results of the risk-based hazard analysis. The railroad will also describe how it will maintain records of the mitigation or elimination of the identified hazards and risks. FRA notes that the proposal in the NPRM expressly addressed only the description of the methods used to maintain records of mitigating the identified hazards and risks. Because the hazards and risks may be eliminated by the railroad—not just mitigated—the text of this paragraph in the final rule makes clear that records of the elimination of the identified hazards and risks are covered as well. As a separate matter, while the railroad will not be required to provide in its SSP plan submission to FRA any of the specific records addressed by this paragraph, the railroad will be required to make the results of the risk-based hazard analysis available upon request to representatives of FRA pursuant to § 270.201(a)(2).

Paragraph (p)(2) requires the risk-based hazard management program to identify certain key individuals. First, the railroad must identify the position title of the individual(s) responsible for administering the risk-based hazard management program. These positions will be responsible for developing and implementing the risk-based hazard management program. Rather than identifying the specific individual(s), the railroad will identify the position(s) responsible for administering the risk-based hazard management program so that the SSP will not have to be updated merely because an individual changes positions. This clarification addresses an AAR comment on the NPRM in which AAR opposed the proposed requirements in paragraphs that the railroad identify the individuals responsible for administering the hazard management program and participating in hazard management teams or safety committees. AAR believes the problem with identifying such individuals is that whenever one of these individuals is removed or added, the plan must be amended and no real purpose is served. As a result, FRA makes clear that the final rule only requires the identification of the position titles, not the specific individuals.

Second, the railroad must identify the stakeholders who will participate in the hazard management program. This

means the railroad will identify the persons who will be affected by and may play a role in the risk-based hazard management program.

Third, the railroad must identify the position title of the participants and structure of any hazard management teams or safety committees that a railroad may establish to support the risk-based hazard management program. By establishing these types of teams or committees, the railroad can focus on specific hazards and risks and more thoroughly consider the specific actions to effectively mitigate or eliminate the hazards and risks.

Paragraph (q), proposed as paragraph (r) in the NPRM, provides that once FRA has approved a railroad's SSP plan pursuant to § 270.201(b), the railroad shall conduct a risk-based hazard analysis. Paragraph (q)(1) serves to implement the section 20156(c) statutory mandate that a railroad must conduct a "risk analysis." As discussed earlier, section 20156(c) requires the railroad, as part of its development of a railroad safety risk reduction program (e.g., a SSP), to "identify and analyze the aspects of its railroad, including operating rules and practices, infrastructure, equipment, employee levels and schedules, safety culture, management structure, employee training, and other matters, including those not covered by railroad safety regulations or other Federal regulations, that impact railroad safety." *Id.* Paragraph (q)(1) follows the language of section 20156(c); however, in the list of the aspects of the railroad system that must be analyzed, paragraph (q)(1) does not include "safety culture." Safety culture, which paragraph (b)(2) of this section requires the railroad to describe, is not something that a railroad can necessarily "identify and analyze" as readily as the other aspects listed. Nonetheless, the railroad must describe how it measures the success of its safety culture pursuant to paragraph (t) of this section.

As proposed in the NPRM, paragraph (q)(1) originally included employee fatigue as identified in proposed paragraph (s), in the list of the aspects of the railroad system that must be analyzed. However, as discussed in the Statutory Background section above, to minimize confusion regarding the separate FMP Working Group process and the ongoing fatigue management plans rulemaking, proposed paragraph (s) has not been included in the final rule; therefore the requirement that the railroad analyze employee fatigue as part of its risk analysis is not included in paragraph (q)(1) of the final rule. FRA also notes that proposed paragraph

(q)(1) included "new technology as identified in paragraph (s) of this section"; however, since paragraph (r) of the final rule addresses a separate analysis regarding new technology, including new technology in paragraph (q)(1) would be duplicative.

As provided in the final rule, paragraph (q)(1) requires a railroad to analyze operating rules and practices, infrastructure, equipment, employee levels and schedules, management structure, employee training, and other aspects that have an impact on railroad safety not covered by railroad safety regulations or other Federal regulations. Pursuant to paragraphs (d), (e), and (g) through (i) of this section, a railroad is required to describe in its plan its operating rules and practices, infrastructure, equipment, employee levels and schedules, management structure, and employee training; therefore, the analysis and identification of hazards and resulting risks regarding these aspects pursuant to paragraph (q)(1) should be straightforward. The railroad will determine which aspects of the railroad system have an impact on railroad safety that are not covered by railroad safety regulations or other Federal regulations. When analyzing the various aspects, the railroad will apply the risk-based hazard analysis methodology previously identified in paragraphs (p)(1)(i) through (iii) of this section.

In commenting on the NPRM, Parsons Brinckerhoff stated that paragraph (q)(1) proposed to require that railroads apply the risk-based hazard analysis up through the application of mitigations but that it would not require the railroads to achieve an acceptable level of risk. While the rule does not specifically require a railroad to reduce risk to an acceptable level, paragraph (q)(2) requires a railroad, in part, to implement specific actions that will mitigate or eliminate the identified hazards and resulting risks. FRA believes that requiring railroads to achieve an acceptable level of risk would set forth an ambiguous standard because, due to differences in the size and complexity of passenger railroad operations, an acceptable level of risk for one railroad may not necessarily be the same for another railroad. Requiring a railroad to implement specific actions that will mitigate or eliminate the identified hazards and resulting risks will reduce risk and if FRA determines that a railroad is not properly addressing and reducing risk, FRA will work with the railroad and other stakeholders to address this issue and may take enforcement action if necessary.

Parsons Brinckerhoff also believed that proposed paragraph (q)(1) would not require the application of the risk-based hazard management program to support continuous safety improvement throughout the life of the rail system. Pursuant to paragraph (p)(1)(vii), the railroad will be required to describe the methods it will implement as part of the risk-based hazard management program that will support continuous safety improvement throughout the life of the rail system. Further, as discussed below, pursuant to paragraph (q)(3) a railroad will be required to conduct a risk-based hazard analysis when there are significant operational changes, system extensions, system modifications, or other circumstances that have a direct impact on railroad safety. FRA believes paragraphs (p)(1)(vii) and (q)(3) support continuous safety improvement throughout the life of the rail system.

Once the railroad has analyzed the various aspects of its operations and identified hazards and the resulting risks, the railroad is required to mitigate or eliminate these risks. This requirement is derived directly from section 20156(d), which requires a railroad, as part of its SSP, to have a risk mitigation plan that mitigates the aspects that increase risks to railroad safety and enhances the aspects that decrease the risks to railroad safety. In paragraph (q)(2), the railroad will use the methods described in paragraph (p)(1)(iv) to identify and implement specific actions to mitigate or eliminate the hazards and risks identified by paragraph (q)(1).

FRA makes clear that a risk-based hazard analysis is not a one-time event. Railroads operate in a dynamic environment and certain changes in that environment may expose new hazards and risks that a previous risk-based hazard analysis did not address. Paragraph (q)(3) identifies the changes that FRA believes are significant enough to require that a railroad conduct a new risk-based hazard analysis. Railroads must conduct a risk-based hazard analysis when there are significant operational changes, system extensions, system modifications, or other circumstances that have a direct impact on railroad safety.

As part of its SSP plan, paragraph (r), proposed as paragraph (s) in the NPRM, requires a railroad to conduct a technology analysis and set forth a technology analysis and implementation plan. Paragraph (r) implements sections 20156(d)(2) and 20156(e). Paragraph (r) has been substantially modified from the proposal in the NPRM. As proposed in the NPRM, this paragraph would have required railroads to first conduct

a technology analysis, then establish a technology implementation plan containing the results of the technology analysis, and, if the railroad determined to implement any of the technologies, establish a plan and a prioritized implementation schedule for the development, adoption, implementation and maintenance of the technologies over a 10-year period.

FRA believes that the technology analysis and implementation plan requirements should be consistent with the risk-based hazard management program and risk-based hazard analysis requirements. Therefore, FRA has modified paragraph (r) from the proposed rule to ensure that it is consistent with these other requirements. A railroad, in its SSP plan submission to FRA, will describe the process it will use to: (1) Identify and analyze technologies that will mitigate or eliminate the hazards identified by the risk-based hazard analysis, and (2) analyze the safety impact, feasibility, and costs and benefits of implementing the identified technologies. The initial submission to FRA is required to describe only the processes the railroad will use to identify and analyze technology that will mitigate or eliminate hazards and the resulting risks.

The requirement that the railroad “periodically update as necessary” its technology analysis and implementation plan has been added to paragraph (r)(1). This was not proposed in the NPRM; however, section 20156(e) requires the plan to be periodically updated as necessary.

As with the overall SSP, the railroads will have flexibility to determine the processes they will use pursuant to paragraph (r)(2). One of the purposes of the technology analysis and implementation plan is to provide railroads and their stakeholders the opportunity to consider current, new, and novel technology to address hazards and the resulting risks; therefore, FRA encourages the railroads to consider as many different types of technology as possible.

Once FRA reviews and approves a railroad’s technology analysis and implementation plan, as part of the SSP plan approval process, the railroad will apply the process identified in paragraph (r)(2)(i) to identify and analyze current, new, or novel technologies that will mitigate or eliminate the hazards and resulting risks identified by the risk-based hazard analysis. As with risk-based hazard analysis, the railroad will not conduct its technology analysis until after FRA has approved its technology analysis

and implementation plan. Section 20156(e)(2) mandates that a railroad consider certain technologies as part of its technology analysis. These technologies are: Processor-based technologies, positive train control systems, electronically-controlled pneumatic brakes, rail integrity inspection systems, rail integrity warning systems, switch position monitors and indicators, trespasser prevention technology, and highway-rail grade crossing warning and protection technology.

Once the railroad has identified and analyzed current, new, or novel technologies that will mitigate or eliminate the hazards and resulting risks, the railroad shall apply the processes described in paragraph (r)(2)(ii) to analyze the safety impact, feasibility, and costs and benefits of implementing these technologies. FRA expects the railroads to engage in an appropriate and realistic analysis of the technologies. FRA is not requiring that a railroad use a specific formula to determine whether it should implement any of the technology analyzed in the technology analysis. Rather, the railroad must consider the safety impact, feasibility, and the costs and benefits of these technologies and, based on the railroad’s specific operations, decide whether to implement any of the technologies. Technology has proved to be an invaluable tool to manage hazards across all modes of transportation, and a robust SSP certainly needs to include risk mitigation technology.

If a railroad decides to implement any of the technologies identified in paragraph (r)(3), the railroad would be required to update its technology analysis and implementation plan in its SSP to describe how it will develop, adopt, implement, maintain, and use the technologies. This description should be sufficient to allow FRA and other interested stakeholders to determine which technologies the railroad will implement, how they will be implemented, how the technologies will eliminate or reduce hazards and the resulting risks, and how the technologies will be maintained. The railroad will also be required to set forth in its SSP plan a prioritized implementation schedule for the development, adoption, implementation, and maintenance of those technologies over a 10-year period. By establishing this implementation schedule, the railroad will be able to describe its plan as to how it will apply technology on its system to mitigate or eliminate the identified hazards and resulting risks.

Paragraph (r)(5) provides that, except as required by 49 CFR part 236, subpart I (Positive Train Control Systems), if a railroad decides to implement a positive train control (PTC) system as part of its technology implementation plan, the railroad shall set forth and comply with a schedule for implementation of the PTC system consistent with the deadlines in the Positive Train Control Enforcement and Implementation Act of 2015 (PTCEI Act), Public Law 114–73, 129 Stat. 576–82 (Oct. 29, 2015), and 49 CFR 236.1005(b)(7). The NPRM proposed that the railroad would have to implement the PTC system by December 31, 2018, which was consistent with 49 U.S.C. 20156(e)(4)(B). However, Congress subsequently passed the PTCEI Act and FRA has revised paragraph (r)(5) to reflect the changes to PTC implementation deadlines set forth in the Act. This paragraph does not, in itself, require a railroad to implement a PTC system. In the NPRM, FRA sought comment on whether a railroad electing to implement a PTC system would find it difficult to meet the December 31, 2018 implementation deadline. If so, FRA invited comment as to what measures could be taken to assist a railroad struggling to meet the deadline and achieve the safety purposes of the statute. FRA received one comment in response to this request. AAR commented that it does not object to this requirement but that it is impossible to meet the 2015 deadline for an interoperable nationwide PTC system that complies with the statutory mandate. Consequently, AAR believes that no railroad will take advantage of paragraph (r)(5). FRA recognizes the challenges associated with implementing a PTC system; however, FRA also recognizes that PTC is a technology that a railroad may seek to implement to eliminate or mitigate hazards and the resulting risks. Therefore, the regulation provides railroads the flexibility to decide whether they want to implement a PTC system as part of their technology analysis and implementation plan; if they do so, they must comply with an implementation schedule consistent with the deadlines in the PTCEI Act.

Consistent with the risk-based hazard analysis, a railroad will not include its technology analysis conducted pursuant to paragraph (r)(3) in the SSP submission to FRA under § 270.201. The SSP plan should only include the processes used to conduct its technology analysis as described in paragraph (r)(3). FRA may work with the railroads to ensure that the technology analysis is robust and

analyzes a sufficient number of technologies. To achieve this goal, FRA, its representatives, and States participating under part 212 of this chapter will have access to the railroad's technology analysis pursuant to paragraph (r)(5). Furthermore, in its initial submission, a railroad will not include the description and implementation schedule required by paragraph (r)(4) because the railroad will not draft the description and implementation schedule until FRA approves the railroad's technology analysis and implementation plan.

Paragraph (s) sets forth the requirements for ensuring that safety issues are addressed whenever there are certain changes to the railroad's operations. Paragraph (s)(1) requires each railroad to establish and set forth a statement in its SSP plan that describes the processes and procedures used by the railroad to manage significant operational changes, system extensions, system modifications, or other circumstances that will have a direct impact on railroad safety. Since these changes have a direct impact on safety, it is vital that the railroad has a process to manage these changes so that safety is not compromised. Change management processes ensure that, when there is a need for a change to a safety-critical program, the proposed change is vetted through a formalized process within the organization. This description will assist FRA's review of these processes during the initial SSP plan review and subsequent audits to determine if the railroad's SSP sufficiently addresses any gaps in the processes. The term "significant changes that will have a direct impact on railroad safety" is intended to be broadly understood; however, the other changes listed (significant operational changes, system extensions, system modifications) are the type of changes that will also necessitate a process/procedure to properly manage them.

Paragraph (s)(2) requires each railroad to establish in its SSP plan a configuration management program. The term configuration management is defined in § 270.5 as a process that ensures that the configurations of all property, equipment, and system design elements are accurately documented. Accordingly, the railroad's configuration management program shall: (1) Identify who within the railroad has authority to make configuration changes; (2) establish processes to make configuration changes to the railroad's system; and (3) establish processes to ensure that all departments of the railroad affected by the configuration change are formally

notified and approve of the change. Configuration management is a process that ensures that all safety-critical documentation relating to the railroad and its various components is current and reflects the actual functional and physical characteristics of the railroad. This description will assist FRA's review of these processes during the initial SSP plan review and subsequent audits to determine if the railroad's SSP sufficiently addresses any gaps in the processes.

Paragraph (s)(3) requires the railroad to establish and describe in its SSP plan the process it uses to certify that safety concerns and hazards are adequately addressed before the initiation of operations or major projects to extend, rehabilitate, or modify an existing system or repair vehicles and equipment. Through a process certifying that safety concerns have been addressed before the railroad initiates operations or major projects to extend, rehabilitate, or modify an existing system or replace vehicles and equipment, the railroad helps to minimize the potential for any negative impact on safety resulting from any of these activities.

In commenting on the NPRM, APTA states that safety certifications are not common in commuter rail operations mostly because these railroads follow FRA regulations and standards and most, if not all, safety certifications have been performed because an FTA funding agreement required one to be performed. According to APTA, FTA does not have a set of regulations and standards to allow operation on the general railroad system of transportation that applies to all railroads under FTA's jurisdiction. Without these national standards, APTA notes that FTA and transit properties rely on design criteria and best engineering practices, and since these design criteria differ at each transit agency, safety certification is the method relied upon to ensure the system is safe. APTA believes that it would be a rare occasion when a commuter railroad would be required to perform a safety certification under paragraph (s)(3) and that the paragraph uses the term "major projects" without elaboration. APTA does not believe that every project will need safety certification unless it falls outside of FRA's existing standards. APTA therefore recommends that FRA clarify the term "major projects" by adding to the end of the sentence: "not otherwise addressed by existing FRA standards."

FRA expects every major project to be designed and built so that it meets or exceeds existing FRA standards. However, paragraph (s)(3) requires a

process that certifies the major project is in compliance with these FRA standards or with appropriate design criteria, or both. Safety certification is part of APTA's Manual for the Development of System Safety Program Plans for Commuter Railroads. Section 6 of APTA's manual, Safety Assurance, contains Element 22, Configuration Management, and within Element 22 is section 6.1.1.4, Safety Certification. Section 6.1.1.4 states: "Safety Certification is used to oversee the addition and introduction of completely new systems and the integration to the existing system if the project is not a new start. The US DOT Federal Transit Administration and APTA have jointly published a manual on how to conduct a safety certification program." A railroad is free to use the standards published in the manual/guide that APTA and FTA have developed regarding safety certification to comply with paragraph (s)(3).

As discussed previously, a SSP can only be effective at mitigating or eliminating hazards and risks if the railroad has a robust and positive safety culture. Pursuant to § 270.101(b), the railroad will design its SSP so that it promotes and supports a positive safety culture; pursuant to § 270.103(b)(2), the railroad will identify in its SSP plan its safety culture; and pursuant to paragraph (t) a railroad will describe in its SSP plan how it measures the success of its safety culture. A railroad cannot have a robust safety culture unless it actively promotes it and evaluates whether it is successful. With respect to measuring safety culture, the rule permits railroads to identify the safety culture measurement methods that they find most effective and appropriate for their own operations. It is important that a railroad regularly measure its safety culture. This measurement may be based upon the DOT's 10 traits of a positive safety culture discussed above or the Nuclear Regulatory Commission's nine traits. See 76 FR 34777-78, Jun. 14, 2011. The key is to be continuously measuring because organizational culture, which safety culture is a part of, can change. Measuring to determine a positive safety culture demonstrates that there is a clear connection, and inverse relationship, between safety culture and event occurrence. Measuring safety culture, such as findings from previous employee assessments, demonstrates that there is a positive relationship between safety culture and employee engagement which supports improved decision-making. When measuring safety culture, FRA expects a railroad to

use a method that is capable of correlating a railroad's safety culture with actual safety outcomes. A safety culture assessment focuses on the people side of safety—cultural behaviors that enable, equip, and empower—such as communication, trust, leadership, commitment, peer group norms and organizational influences. For example, such measurement methods can include surveys that assess safety culture using validated scales, or some other method or measurement that appropriately identifies aspects of the railroad's safety culture that correlate to safety outcomes. Ultimately, FRA expects a railroad to demonstrate that improvements in the measured aspects of safety culture will reliably lead to reductions in accidents, injuries, and fatalities.

Measuring safety culture that is done on a regular basis would be very difficult to establish costs and benefits. As discussed above DOT has 10 traits to guide the measurement of safety culture. A number of different tools have been developed to measure safety culture, and are used in various industries, including aviation and certain manufacturing sectors. To illustrate, one research review listed 24 different tools used to measure safety culture in the health care industry alone.⁶ It is important to note that each tool measures factors using its own scale, and the scales are not calibrated across the different tools. Calibration is the process of finding a mathematical relationship between different scales—the Fahrenheit and Celsius temperature scales are calibrated, for example, so it is possible to convert a reading from one scale to the other. Thus, although in the aggregate many studies suggest there is a link between improved safety culture and decreases in accidents or injuries,⁷ it is not possible to definitively quantify the benefits that accrue due to improvements in safety culture. FRA recognizes that there are many ways to accomplish the task of measuring a railroad's safety culture. For purposes of this rule FRA will assume that this is accomplished with some type of survey instrument.⁸

⁶ Health Foundation. "Evidence scan: Measuring safety culture," http://patientsafety.health.org.uk/sites/default/files/resources/measuring_safety_culture.pdf as of October 30, 2014 (February, 2011) p. 7.

⁸ One organization that provides safety culture surveys includes a price list on their Web site. Perhaps averaging a few such organizations' prices would help refine this estimate. See http://www.nsc.org/safety_work/employee_perception_

Section 270.105 Discovery and Admission as Evidence of Certain Information

As discussed in the Statutory Background section, FRA's Study concluded that it is in the public interest to protect certain information generated by railroads from discovery or admission into evidence in litigation. Section 20119(b) provides FRA with the authority to promulgate a regulation if FRA determines that it is in the public interest, including public safety and the legal rights of persons injured in railroad accidents, to prescribe a rule that addresses the results of the Study.

Following the issuance of the Study, the RSAC met and reached consensus on recommendations for this rulemaking, including a recommendation on the discovery and admissibility issue. RSAC recommended that FRA issue a rule that would protect documents generated solely for the purpose of planning, implementing, or evaluating a SSP from (1) discovery, or admissibility into evidence, or considered for other purposes in a Federal or State court proceeding for damages involving property damage, personal injury, or wrongful death; and (2) State discovery rules and sunshine laws that could be used to require the disclosure of such information.

Section 270.105, Discovery and admission as evidence of certain information, sets forth the discovery and admissibility protections that are based on the Study's results and the RSAC recommendations. These protections are narrow and apply only to information that was generated solely for a railroad's SSP, and aim to ensure that a litigant will not be better or worse off than if the protections had never existed. FRA intends these provisions to be strictly construed.

FRA modeled § 270.105 after 23 U.S.C. 409. In section 409, Congress enacted statutory protections for certain information compiled or collected pursuant to Federal highway safety or construction programs. See 23 U.S.C. 409. Section 409 protects both data compilations and raw data. Intermodal Surface Transportation Efficiency Act of 1991, sec. 1035(a), 105 Stat. 1978; National Highway System Designation Act of 1995, sec. 323, 109 Stat. 591. A litigant may rely on section 409 to withhold certain documents from a discovery request, in seeking a protective order, or as the basis to object to a line of questioning during a trial or

[surveys/Pages/SurveyCosts.aspx](#) (showing costs for safety culture surveys of different levels of complexity).

deposition. Section 409 extends this protection to information that has never been in any Federal entity's possession.

Section 409 was enacted by Congress in response to concerns raised by the States that compliance with the Federal road hazard reporting requirements could reveal certain information that would increase the State's risk of liability. Without confidentiality protections, States feared that their "efforts to identify roads eligible for aid under the Program would increase the risk of liability for accidents that took place at hazardous locations before improvements could be made." *Pierce County v. Guillen*, 537 U.S. 129, 133–34 (2003) (citing H.R. Doc. No. 94–366, p. 36 (1976)).

The constitutionality and validity of section 409 has been affirmed by the Supreme Court of the United States. See *Pierce County v. Guillen*. In *Guillen*, the Court considered the application of section 409 to documents created pursuant to the Hazard Elimination Program, which is a Federal highway program that provides funding to State and local governments to improve the most dangerous sections of their roads. *Id.* at 133. To be eligible for the program, the State or local government must (1) maintain a systematic engineering survey of all roads, with descriptions of all obstacles, hazards, and other dangerous conditions; and (2) create a prioritized plan for improving those conditions. *Id.*

The Court held that section 409 protects information actually compiled or collected by any government entity for the purpose of participating in a Federal highway program, but does not protect information that was originally compiled or collected for purposes unrelated to the Federal highway program, even if the information was at some point used for the Federal highway program. *Guillen* at 144. The Court took into consideration Congress' desire to make clear that the Hazard Elimination Program "was not intended to be an effort-free tool in litigation against state and local governments." *Id.* at 146. However, the Court also noted that the text of section 409 "evinces no intent to make plaintiffs worse off than they would have been had section 152 [Hazard Management Program] funding never existed." *Id.* The Court also held that section 409 was a valid exercise of Congress' powers under the Commerce Clause because section 409 "can be viewed as legislation aimed at improving safety in the channels of commerce and increasing protection for the instrumentalities of interstate commerce." *Id.*

FRA believes that given the similar concepts between section 409 and section 20119 and the Supreme Court's expressed acknowledgement of the constitutionality of section 409, section 409 is an appropriate model for § 270.105.

Under § 270.105(a) there are certain circumstances in which information will not be subject to discovery, admitted into evidence, or considered for other purposes in a Federal or State court proceeding for damages involving personal injury, wrongful death, or property damage. This information may not be used in such litigation when it is compiled or collected solely for the purpose of planning, implementing, or evaluating a SSP. Section 270.105(a) applies to information whether or not it is also in the Federal government's possession.

FRA notes that paragraph (a) has been reformatted for clarity from the proposal in the NPRM. Paragraph (a) is divided into paragraph (a)(1) and (2) after its introductory text. However, the formatting change does not, in itself, result in any substantive change to the paragraph.

Paragraph (a)(1) describes what may be considered "information" for the purposes of this section. Section 20119(a) identifies reports, surveys, schedules, lists, and data as the forms of information that should be included as part of FRA's Study. However, FRA does not necessarily view this as an exclusive list. In the statute, Congress directed FRA to consider the need for protecting information that includes a railroad's analysis of its safety risks and its statement of the mitigation measures with which it will address those risks. *Id.* While the railroad is not required to provide in the SSP plan that it submits to FRA the results of the risk-based hazard analysis and the specific elimination or mitigation measures it will be implementing, the railroad may have a specific plan within its SSP that does contain this information. Therefore, to adequately protect this type of information, the term "plan" is included in the definition of "information" to cover a railroad's submitted SSP plan and any elimination or mitigation plans the railroad otherwise develops within its SSP. FRA also deems it necessary to include "documents" in this provision to maintain consistency and properly effectuate Congress' directive in section 20119.

This paragraph does not protect all information that is part of a SSP; these protections will extend only to information that is compiled or collected after August 14, 2017, solely

for purpose of planning, implementing, or evaluating a system safety program. The term "compiled or collected" is taken directly from section 20119(a). FRA recognizes that railroads may be reluctant to compile or collect extensive and detailed information regarding the safety hazards and resulting risks on their systems if this information could potentially be used against them in litigation. The term "compiled" refers to information that was generated by the railroad for the purposes of a SSP; whereas the term "collected" refers to information that was not necessarily generated for the purposes of the SSP, but was assembled in a collection for use by the SSP. It is important to note that in this context, only the collection is protected; however, each separate piece of information that was not originally compiled for use by the SSP remains subject to discovery and admission into evidence subject to any other applicable provision of law or regulation.

Section 20119(b) prohibits the protections from becoming effective until one year after the adoption of the SSP rule. The necessary text has been added to paragraph (a) to implement this effective date.

The information has to be compiled or collected solely for the purpose of planning, implementing, or evaluating a SSP. APTA commented that the use of the term "solely" is not adequately explained in the text of the regulation. APTA proposes that FRA either use a more appropriate term such as "primarily" or "initially" or that FRA define "solely" in the rule text, not just in the preamble. FRA agrees. The use of the term "solely" is deliberate and it is important that the term is understood as used within the four corners of the regulation. Therefore, FRA has included paragraph (a)(2), which defines the term "solely."

As discussed in the section-by-section analysis for § 270.1(c), NY MTA recommended that the term "solely" be deleted from paragraph (a) to protect studies or risk analyses that are not developed expressly to comply with this part. NY MTA believes that it is in the public interest to ensure that railroads conduct on-going and thorough self-critical examinations and expressed concern if these types of studies or analyses are not protected, they may be used against the railroad in court. As discussed below in response to APTA's request that FRA extend the protections to information collected as part of programs that existed before the SSP regulation but were similar to a SSP, FRA has the authority to protect only documents that are created pursuant to

a SSP; therefore, omitting the term “solely” would improperly expand the protections beyond the limits of FRA’s authority.

The term “solely” is intended to narrow circumstances in which the information will be protected. The use of the term “solely” means that the original purpose of compiling or collecting the information was exclusively for the railroad’s SSP. A railroad cannot compile or collect information for one purpose and then try to use paragraph (a) to protect that information because it uses that information for its SSP as well. The railroad’s original and singular purpose of compiling or collecting the information must be for planning, implementing, or evaluating its SSP in order for the protections to be extended to that information. The term “solely” also means that a railroad shall continue to use the information only for its SSP. If a railroad subsequently uses, for any other purpose, information that was initially compiled or collected for its SSP, paragraph (a) does not protect that information to the extent that it is used for the non-system safety program purpose. The use of that information within the railroad’s SSP, however, will remain protected. If the railroad is required by another provision of law or regulation to collect the information, the protections of paragraph (a) do not extend to that information because it is not being compiled or collected solely for the purpose of planning, implementing, or evaluating a SSP. For example, 49 CFR 234.313 requires railroads to retain records regarding emergency notification system (ENS) reports of unsafe conditions at highway-rail grade crossings. Those individual records are not protected by § 270.105. However, if as part of its risk-based hazard analysis a railroad collects several of its § 234.313 reports from a specific time period for the sole purpose of determining if there are any hazards at highway-rail grade crossings, this collection will be protected as used in the SSP. If the railroad decides to use the collection for another purpose other than in its SSP, such as submitting it to an ENS maintenance contractor for routine maintenance, the protections are not extended to that non-SSP use.

The information must be compiled or collected solely for the purpose of planning, implementing, or evaluating a SSP. The three terms—planning, implementing, or evaluating—are taken directly from section 20119(a). These terms cover the necessary uses of the information compiled or collected solely for the SSP. To properly plan and develop a SSP, a railroad will need to

determine the proper processes and procedures to identify hazards, the resulting risks, and elimination or mitigation measures to address those hazards and risks. This planning will involve gathering information about the various analysis tools and processes best suited for that particular railroad’s operations. This type of information is essential to the risk-based hazard analysis and is information that a railroad does not necessarily already have. In order for the railroad to plan its SSP, the protections are extended to the SSP planning stage. The NPRM used the term “developing” instead of “planning”; however, to remain consistent with section 20119(a), FRA has determined that the term “planning” is more appropriate.

Based on the information generated by the risk-based hazard analysis, the railroad will implement measures to eliminate or mitigate the hazards and risks identified. To properly implement these measures, the railroad will need the information regarding the hazards and risks on the railroad’s system identified during the development stage. Therefore, the protection of this information is extended to the implementation stage.

The protections do not apply to information regarding mitigations that the railroad implements. Rather, the railroad’s statement of mitigation measures, which could include various proposed and alternate mitigations for a specific hazard, that address the hazards identified by the risk-based hazard analysis is protected. Additionally, the underlying risk analysis information that the implemented mitigation measure addresses is also protected. For instance, if a railroad builds a structure to address a risk identified by the risk-based hazard analysis, the information regarding that structure (*e.g.*, blueprints, contracts, permits, etc.) is not protected by this section; however, the underlying risk-based hazard analysis that identified the hazard and any statement of mitigations that included the structure is protected.

The protections also do not apply to any hazards, risks, or mitigations that fall under the exclusive jurisdiction of another Federal agency. If FRA does not have jurisdiction over a hazard, risk, or mitigation, then the protections under this paragraph cannot be extended to that hazard, risk, or mitigation.

The railroad will also be required to evaluate whether the measures it implements to mitigate or eliminate the hazards and risks identified by the risk-based hazard analysis are effective. To do so, it will need to review the information developed by the risk-based

hazard analysis and the methods used to implement the elimination/mitigation measures. The use of this information in the evaluation of the railroad’s SSP is protected.

The information covered by this section shall not be subject to discovery, admitted into evidence, or considered for other purposes in a Federal or State court proceeding that involves a claim for damages involving personal injury, wrongful death, or property damage. The protections affect the discovery, admission into evidence, or consideration for other purposes of the information described in this section. The first two situations come directly from section 20119(a); however, FRA determined that for the protections to be effective they must also apply to any other situation where a litigant might try to use the information in a Federal or State court proceeding that involves a claim for damages involving personal injury, wrongful death, or property damage. For example, under this section a litigant will be prohibited from admitting into evidence a railroad’s risk-based hazard analysis. Nonetheless, without the additional language: “or considered for other purposes,” the railroad’s risk-based hazard analysis could be used by a party for the purpose of refreshing the recollection of a witness or by an expert witness to support an opinion. The additional language ensures that the protected information remains out of such a proceeding completely. The protections would be ineffective if a litigant were able to use the information in the proceeding for another purpose. To encourage railroads to perform the necessary vigorous risk analysis and to implement truly effective elimination or mitigation measures, the protections are extended to any use in a proceeding.

This section applies to Federal or State court proceedings that involve a claim for damages involving personal injury, wrongful death, or property damage. This means, for example, if a proceeding has a claim for personal injury and a claim for property damage, the protections are extended to that entire proceeding; therefore, a litigant cannot use any of the information protected by this section as it applies to either the personal injury or property damage claim. Section 20119(a) required the Study to consider proceedings that involve a claim for damages involving personal injury or wrongful death; however, to effectuate Congress’ intent behind section 20156, that railroads engage in a robust and candid hazard analysis and develop meaningful mitigation measures, FRA has determined that it is necessary for

the protections to be extended to proceedings that involve a claim solely for property damage. The typical railroad accident resulting in injury or death also involves some form of property damage. Without extending the protection to proceedings that involve a claim for property damage, a litigant could bring two separate claims arising from the same incident in two separate proceedings, the first for property damages and the second one for personal injury or wrongful death, and be able to conduct discovery regarding the railroad's risk analysis and to introduce this analysis in the property damage proceeding but not in the personal injury or wrongful death proceeding. This would mean that a railroad's risk analysis could be used against the railroad in a proceeding for damages. If this were the case, a railroad would be hesitant to engage in a robust and candid hazard analysis and develop meaningful elimination or mitigation measures. Such an approach would be nonsensical and would completely frustrate Congress' intent in providing FRA the ability to protect that information which is necessary to ensure that open and complete risk assessments are performed and appropriate mitigation measures are selected and implemented. Therefore, to be consistent with Congressional intent behind section 20156, FRA has decided to extend the protections in paragraph (a) to proceedings that involve a claim for property damage. Furthermore, RSAC, which includes railroads and rail labor organizations as members, recommended to FRA that the protections be extended in this way to proceedings that involve a claim for property damage.

Paragraph (b) ensures that the protections set forth in paragraph (a) do not extend to information compiled or collected for a purpose other than that specifically identified in paragraph (a). This type of information shall continue to be discoverable, admissible into evidence, or considered for other purposes if it was before the date the protections take effect. The type of information that will not receive the protections provided by paragraph (a) include: (1) Information that was compiled or collected on or before August 14, 2017; (2) information that was compiled or collected on or before August 14, 2017, and continues to be compiled or collected, even if used to plan, implement, or evaluate a railroad's SSP; or (3) information that is compiled or collected after August 14, 2017, for a purpose other than that specifically identified in paragraph (a) of this

section. Paragraph (b) affirms the intent behind the use of the term "solely" in paragraph (a), in that a railroad may not compile or collect information for a different purpose and then expect to use paragraph (a) to protect that information just because the information is also used in its SSP. If the information was originally compiled or collected for a purpose unrelated to the railroad's SSP, then it is unprotected and will continue to be unprotected.

Examples of the types of information that paragraph (b) applies to may be records related to prior incidents/accidents and reports prepared in the normal course of railroad business (such as inspection reports). Generally, this type of information is often discoverable, may be admissible in Federal and State proceedings, and should remain discoverable and admissible where it is relevant and not unduly prejudicial to a party after the implementation of this part. However, FRA recognizes that evidentiary decisions are based on the facts of each particular case; therefore, FRA does not intend this to be a definitive and authoritative list. Rather, FRA merely provides these as examples of the types of information that paragraph (a) is not intended to protect.

In commenting on the NPRM, the Labor Organizations requested that FRA provide a list of examples of information that is currently discoverable and admissible and will remain so after the enactment of the protections. The Labor Organizations pointed out that such a list was provided to FRA during the Risk Reduction Working Group deliberations and they would like the list to be placed in the discussion of the final rule. While the list that was provided was instructive, as mentioned in the previous paragraph, evidentiary decisions are based on the facts of each particular case and a court's ruling in one case does not guarantee that another court's ruling in another jurisdiction will be the same. FRA believes that the examples provided in the previous paragraph are more than sufficient to provide a general idea of the types of information covered by paragraph (b) that are not protected.

APTA requested that FRA extend the protections to information collected as part of programs that existed before the SSP regulation but were similar to a SSP. APTA pointed out that this information will now be collected under the SSP rule and therefore should receive the protections provided by paragraph (a). APTA believes that the exclusions in paragraph (b) will incentivize railroads with existing SSP-

like programs to shut down their programs in anticipation of this part because the information from the SSP-like programs will not be protected even if it were collected as part of the SSP under this part. While FRA understands APTA's concern, FRA does not have the authority to provide retroactive protection to information that was compiled or collected before the protections take effect. The study section 20119(a) mandated only addresses information compiled and collected pursuant to the statutory-mandated risk reduction program. Since a SSP is a risk reduction program mandated by statute (section 20156), the information protections can only be extended to information compiled or collected pursuant to a SSP. This means that any information compiled or collected before the protections take effect is not protected because that is not information compiled or collected pursuant to a SSP. Furthermore, since this is information compiled or collected before the protections take effect, the fact that after the protections take effect the information will be compiled or collected pursuant to the SSP does not mean that the information will then be protected. By virtue of the information being compiled or collected before the SSP rule protections take effect, it is not information collected "solely" for the SSP that is protected by this rule. To clarify this distinction, FRA has included language in the exception in paragraph (b)(2).

Pursuant to paragraph (b)(2), if a railroad compiled or collected certain information that was subject to discovery, admissibility, or consideration for other purposes before the protections take effect and the railroad continues to collect the same type of information pursuant to its SSP required by this part, that information will not be protected by paragraph (a) of this section. For example, before this section takes effect and all else being equal, a litigant that would have been able to have admitted into evidence certain information the railroad compiled will still be able to have that type of information admitted after this section takes effect even if the railroad compiles the information pursuant to this rule. The protections are designed to apply only when the original purpose for the generation of the information was for a SSP required by this part. The original purpose of the generation of the information for the SSP-like programs that existed before the SSP rule would not be for a SSP required by this part; therefore, such information is not protected by paragraph (a).

Paragraph (b)(3) reaffirms that information that is compiled or collected for a purpose other than solely for the purpose of planning, implementing, or evaluating a SSP, shall not be protected.

This section is not intended to replace any other protections provided by law or regulation. Accordingly, paragraph (c) states that the protections set forth in this section will not affect or abridge in any way any other protection of information provided by another provision of law or regulation. Any such provision of law or regulation shall apply independently of the protections provided by this section.

Paragraph (d) clarifies that a litigant cannot rely on State discovery rules, evidentiary rules, or sunshine laws that could be used to require the disclosure of information that is protected by paragraph (a) in a Federal or State court proceeding for damages involving personal injury, wrongful death, or property damage. This provision is necessary to ensure the effectiveness of the Federal protections established in paragraph (a) in situations where there is a conflict with State discovery rules or sunshine laws in a Federal or State court proceeding for damages involving personal injury, wrongful death, or property damage. The concept that Federal law takes precedence where there is a direct conflict between State and Federal law should not be controversial as it derives from the constitutional principal that “the Laws of the United States . . . shall be the supreme Law of the Land.” U.S. Const., Art. VI. Additionally, FRA notes that 49 U.S.C. 20106 is applicable to this section. Section 20106 provides that States may not adopt or continue in effect any law, regulation, or order related to railroad safety or security that covers the subject matter of a regulation prescribed or order issued by the Secretary of Transportation (with respect to railroad safety matters) or the Secretary of Homeland Security (with respect to railroad security matters), except when the State law, regulation, or order qualifies under the “essentially local safety or security hazard” exception to section 20106. In this regard, FRA’s Study concluded that a rule “limiting the use of information collected as part of a railroad safety risk reduction program in discovery or litigation” furthers the public interest by “ensuring safety through effective railroad safety risk reduction program plans” (see Study at 64); FRA concurs in this conclusion.

NY MTA commented that it is in the public interest to protect risk analysis information from production in

response to FOIA requests and State freedom of information laws. NY MTA requested that the protection from these types of information disclosure laws be applied to information about system vulnerabilities that could be of interest to terrorist threats. As discussed in the Statutory Background section, section 20118(c) gives FRA the discretion to prohibit the public disclosure of risk analyses or risk mitigation analyses obtained under other FRA regulations if FRA determines that the prohibition of public disclosure is necessary to promote public safety. Furthermore, if a railroad believes that certain risk analysis information qualifies as Sensitive Security Information (SSI), the information can be submitted to FRA for such a determination. If FRA determines the information qualifies as SSI or if the railroad has some other acceptable basis for requesting confidential treatment, pursuant to 49 CFR 209.11, the information will be appropriately marked and handled, which includes redacting it from any publicly disclosed documents.

Section 20119(b) mandates that the effective date of any rule prescribed pursuant to that section must be one year after the adoption of that rule. As discussed in the Statutory Background section, FRA is developing, with the assistance of the RSAC, a separate risk reduction rule that would implement the requirements of sections 20156, 20118, and 20119 for Class I freight railroads and railroads with inadequate safety performance. In the NPRM for this final rule, FRA proposed to apply the protections and the exceptions for SSP information proposed in that NPRM to the information in the forthcoming RRP final rule. The effect of that proposal would have been to make the protections for the forthcoming RRP final rule applicable one year after the publication of this final rule establishing part 270 rather than one year after publication of the RRP final rule. FRA sought comment on this proposal and received one comment from APTA, who supported the proposal.

After further consideration, FRA has determined to implement the RRP protections in the RRP final rule rather than in this rule. Because section 20119(b) states that “[a]ny such rule prescribed pursuant to this subsection shall not become effective until 1 year after its adoption,” FRA has concluded that the RSIA requires that each rule’s implementing information protections must have its own independent implementation timeline. (Emphasis added.) FRA believes this revised approach is a better reflection of the

Congressional intent in section 20119(b). Further, the revised approach ensures that FRA has complied with notice and comment procedures of the Administrative Procedure Act for both the SSP and RRP rulemakings.

Section 270.107 Consultation Requirements

This section implements section 20156(g)(1), which states that a railroad required to establish a SSP must “consult with, employ good faith and use its best efforts to reach agreement with, all of its directly affected employees, including any non-profit employee labor organization representing a class or craft of directly affected employees of the railroad carrier, on the contents of the safety risk reduction program.” This section also implements section 20156(g)(2), which further provides that if a “railroad carrier and its directly affected employees, including any nonprofit employee labor organization representing a class or craft of directly affected employees of the railroad carrier, cannot reach consensus on the proposed contents of the plan, then directly affected employees and such organizations may file a statement with the Secretary explaining their views on the plan on which consensus was not reached.” Section 20156(g)(2) requires FRA to consider these views during review and approval of a railroad’s SSP plan. The consultation requirements were proposed in § 270.102 of the NPRM; however, to remain consistent with CFR section numbering format, this section is designated as § 270.107 in this final rule.

RSAC did not provide recommended language for this section. Rather, FRA worked with the System Safety Task Group to receive input regarding how the consultation process should be addressed, with the understanding that language would be provided in the NPRM for review and comment. In response to consultation process language proposed in the NPRM, FRA received comments from AAR, APTA, Labor Organizations, Metra, NY MTA, and an individual commenter.

The Labor Organizations commented that FRA improperly classified the process under section 20156(g) as one of consultation. The Labor Organizations believe that section 20156(g) requires a process of negotiation or bargaining with the directly affected employees, not one of consultation. Nothing in the text of section 20156(g) requires railroads to negotiate or bargain with directly affected employees; rather, the statute requires the railroads to “consult with, employ good faith and use [their]

best efforts to reach agreement with” directly affected employees (including the Labor Organizations) on the contents of the SSP plan. Throughout the RSAC discussions, FRA referred to this process as one of consultation, not one of negotiation or bargaining. The proposed text in the NPRM is consistent with section 20156(g), and FRA does not agree with the Labor Organizations’ belief that the statute requires a process of negotiation or bargaining. Requiring a process of negotiation and bargaining would be beyond the scope of section 20156(g).

APTA believes that the consultation requirements in the final rule should mirror text in section 20156(g), and nothing more is needed. Specifically, APTA believes that anything more than the statutory text would be counter-productive, interfere with business relationships, and blur the line between FRA and the National Labor Relations Board’s (NLRB) responsibilities. FRA disagrees. FRA believes that § 270.107 and the accompanying Appendix clarify and provide a workable framework for the railroads. As for the blurring of FRA’s and NLRB’s responsibilities, APTA did not provide any examples in which FRA proposed to intrude upon NLRB’s responsibilities. It isn’t clear, therefore, to which NLRB responsibilities APTA is referring.

Paragraph (a)(1) of this section implements section 20156(g)(1) by requiring a railroad to consult with its directly affected employees on the contents of its SSP plan. As part of that consultation, a railroad must utilize good faith and best efforts to reach agreement with its directly affected employees on the contents of its plan. APTA requested that FRA expand the consultation requirement to include all parties, including the directly affected employees and those with significant safety responsibilities because, as proposed, the rule would not require any entities other than the railroads to consult in good faith. APTA is concerned that some railroads may not have authority or leverage to successfully bring the other parties to the table during the consultations. FRA agrees that all of the necessary entities should participate in the consultation process; however, section 20156(g) requires only the railroad to employ good faith and use its best efforts to reach agreement with all of its directly affected employees. Pursuant to paragraph (b)(2), if the railroad and certain directly affected employees cannot reach agreement, the railroad will provide a consultation statement to FRA that identifies any known areas of non-agreement and an explanation of

why the railroad believes agreement was not reached. This will be the railroad’s opportunity to explain whether the result of non-agreement is due to the directly affected employees not acting in good faith or not using their best efforts. Pursuant to paragraph (c), the employees will then have the opportunity to file a statement which will be their opportunity to explain why they or why the railroad believes they did not use good faith or best efforts. Since section 20156(g) requires only the railroad to act in good faith and use best efforts, FRA may approve a plan even if the directly affected employees did not act in good faith or did not use their best efforts, just as long as the railroad employed good faith and best efforts. This means that a railroad will satisfy section 20156(g) if it can show that it acted in good faith and used best efforts to reach agreement, even if other parties did not. FRA believes this will provide the “authority” or “leverage” raised by APTA for a railroad to bring the necessary parties to the table. The directly affected employees will not be able to block approval of a railroad’s SSP plan by not acting in good faith or using their own best efforts, as APTA suggests. Rather, the consultation process is the opportunity for the directly affected employees to provide input and work with the railroad to create a SSP plan that addresses any issues the employees believe are critical to the safety of the railroad. If the directly affected employees fail to act in good faith or do not use their best efforts, they will miss an opportunity to have their voices fully heard and may end up being required to comply under the regulation with a SSP plan in which they did not effectively provide input.

APTA also requested that the consultation process be modified so that the process provides a structure for working collaboratively in the development of the SSP and a methodology to handle disputes or reasonable differences in opinion on how to implement the plan. FRA believes that § 270.107 and Appendix B provide a workable, but flexible framework so that the parties can work collaboratively on the development of a SSP and handle any disputes that arise. APTA did not provide any suggestions regarding what type of modifications should be made, so it is unclear to FRA what in the rule should be modified from the NPRM.

Paragraph (a)(2) as proposed in the NPRM specified that the term directly affected employees included any non-profit employee labor organization representing a class or craft of the railroad’s directly affected employees.

The proposed paragraph made it clear that a railroad that consults with a non-profit employee labor organization is considered to have consulted with the directly affected employees represented by that organization. However, FRA has removed this language from paragraph (a)(2) and incorporated it into paragraphs (a)(1) and (2).

Paragraph (a)(2) clarifies that if a railroad contracts out significant portions of its operations, the contractor and the contractor’s employees performing the railroad’s operations shall be considered directly affected employees for the purposes of this part. While this provision was not expressly proposed in the NPRM, FRA believes it is necessary to address how the consultation process will be handled when a railroad contracts out significant portions of its operations to other entities. The contracts should be ongoing and involve significant aspects of the railroad’s operations. For example, if a railroad contracts out maintenance of its locomotives and rail cars to another entity, it is vital for the employees who are performing this maintenance to be part of that railroad’s SSP and have the opportunity to provide their valuable input on the SSP. Another example would be if a railroad contracts out the actual operations of its passenger rail to another entity; the contracted entity that is operating the trains on behalf of the railroad would certainly need to be part of the consultation process. If a railroad is unsure whether a contracted entity is a directly affected employee for the purposes of this part, FRA encourages the railroads and other interested stakeholders to contact FRA for guidance.

Paragraph (a)(3) in the NPRM proposed to require a railroad to meet with its directly affected employees no later than 180 days after the effective date of the final rule to discuss the consultation process. This requirement has been included in paragraph (a)(3) of the final rule. This meeting will be the railroad’s and directly affected employees’ opportunity to schedule, plan, and discuss the consultation process. FRA does not expect a railroad to discuss any substantive material until the information protections provisions of § 270.105 become applicable. Because some commenters appeared to believe that this meeting would discuss the substance of the SSP plan, FRA is including language in paragraph (a)(3) specifying that the railroad is not required to discuss the substance of a SSP plan. Rather, this meeting should be administrative in nature so that all parties understand the consultation

process as they go forward and that they may engage in substantive discussions as soon as possible after the protections of § 270.105 become applicable. The meeting will also be an opportunity for the railroad to educate the directly affected employees on system safety and how it may affect them. Under paragraph (a)(3)(ii), the railroad will be required to provide notice to the directly affected employees no less than 60 days before the meeting is held.

In commenting on the NPRM, the Labor Organizations pointed out that the meeting under paragraph (a)(3) is the only meeting required by this rule and there is no requirement to have a meeting to discuss the substance of the SSP plan. The Labor Organizations believe that meetings regarding the substance of the SSP plan can occur before the protections of § 270.105 become applicable, because in the past with other programs (e.g., the Confidential Close Call Reporting Program), the railroads and the Labor Organizations have agreed to confidentiality. As stated in the previous paragraph, the meeting required by paragraph (a)(3) will be the railroad's and the Labor Organizations' opportunity to schedule and plan the consultation process. This means that at the first meeting, the parties will schedule the future meetings to discuss the substance of the SSP plan. Since every railroad operation varies by scale and work force, FRA believes setting forth a rigid consultation meeting schedule would be unworkable and inconsistent with the flexibility that the SSP aims to provide. The initial meeting under paragraph (a)(3) provides both the railroad and the labor organizations the flexibility to tailor the consultation process to their specific needs. Additionally, FRA has extended the time between the date that the § 270.105 information protections are applicable and when the railroads will be required to submit their SSP plans, thereby extending the amount of time during which consultation on the substance of the SSP plans will occur. As for consultation on the substance of a SSP plan before the date the § 270.105 protections are applicable, nothing in the rule restricts any railroad from doing so, and if the parties can enter into a confidentiality agreement regarding this information, they are free to do so. FRA does note, however, that any such confidentiality agreement is unrelated to this rule and would not affect the use of any such information in legal proceedings, to the extent otherwise permitted by law.

The Labor Organizations also expressed concern with the amount of

time estimated in the rule's Paperwork Reduction Act analysis for the railroads to consult with the directly affected employees and the amount of time to prepare a statement under paragraph (b)(2). The Paperwork Reduction Act analysis estimated that each railroad would have four consultation meetings at 4 hours each for a total of 16 hours and that a statement under paragraph (b)(2) would take 20 minutes to prepare. The Labor Organizations claim that these estimated time periods are too short and would result in an inconsequential amount of time for consultation on the contents of the plan. FRA notes that the time periods in the Paperwork Reduction Act analysis were only estimates and comments were requested on these estimates. *See* 77 FR 55401. The Labor Organizations' comments do not provide suggested time periods that they believe are more appropriate. However, in this final rule, FRA has reevaluated the burdens under the Paperwork Reduction Act and is providing new estimates based on the Labor Organizations' concerns. FRA has increased its estimate of the number of consultations with directly affected employees to 28 and has increased the burden time of each consultation to 40 hours. Further, FRA has increased the number of consultation statements to 30. Of these, 28 consultation statements will take 80 hours to complete and two consultations will take two hours to complete.

Multiple commenters requested FRA modify the timeline in paragraph (a)(3). APTA believes that the proposed consultation (and SSP implementation) schedule is not practical and may not be possible to comply with. APTA states that the requirement to have the initial consultation with the directly affected employees within 180 days of the effective date of the rule is not reasonably achievable. According to APTA, some railroads would be hard pressed to meet this deadline due to the size of their operations and the variety of directly affected employees they would be required to notify. APTA proposes that, rather than requiring the initial consultation to be completed, § 270.201 should require that the initial consultation only begin within the 180 days. FRA notes that § 270.107(a)(3) requires the railroad only to meet "to discuss the consultation process," not to complete the initial consultation process. As discussed in the previous paragraph, this meeting will be administrative in nature and FRA does not expect the railroad to discuss the substance of the SSP plan. FRA makes clear that it does not expect the railroad

to complete an initial consultation on the substance of the SSP plan within this 180-day period; rather, it is understandable that the railroad will wait until the date the § 270.105 protections become applicable before it begins the consultation on the substance of the plan. APTA also requested that the deadline to file the SSP plan pursuant to § 270.201 be extended so that there would be more time to consult with the directly affected employees on the substance of the SSP plan. FRA is extending this time period as discussed in the section-by-section analysis for § 270.201(a), below.

NY MTA and Metra proposed that FRA extend the 180-day deadline for the meeting to 365 days due to the number of employees working under numerous contracts that would need to meet to discuss the consultation process. FRA declines to extend this 180-day period to 365 days because it would be inconsistent with the purpose of requiring the meeting. As discussed above, this meeting will be administrative in nature and FRA does not expect the meeting to address the substance of the SSP plan. If the time period were extended to 365 days after the effective date of the rule, a railroad could hold the initial meeting on day 364, and 121 days⁹ later the railroad would be required to submit the SSP plan to FRA. This would make it very difficult for the railroads and directly affected employees to initiate and complete the consultation process in a timely and meaningful manner. Instead, by having the initial meeting within 180 days after the effective date of the rule, all parties will have a clear understanding of the consultation process, so that once the meetings begin regarding the substance of the SSP plan (presumably after the date the § 270.105 protections become applicable), the parties can focus on the SSP plan and not the actual consultation process.

NY MTA also commented that the consultation process should not even begin until after the date the protections in § 270.105 become applicable because protection is needed to ensure that railroads and employees are not discouraged from actively identifying hazards. FRA agrees that the consultation regarding the substance of a SSP plan could not fully begin until after the date the § 270.105 protections

⁹Based on comments received, the deadline to submit SSP plans to FRA pursuant to § 270.201 is extended to 545 days after the publication of the final SSP rule. This is discussed further in the section-by-section analysis for § 270.201(a)(1). The statement that a railroad would have 121 days to submit an SSP plan takes into account this extension of the submission deadline.

become applicable, which is why the meeting required by paragraph (a)(3) is required only to address the consultation process, not the substance of the SSP plan.

Finally, Metra requested that FRA clarify that the 60-day notification requirement only applies to the initial meeting to discuss the consultation process, and no other meeting. FRA agrees and has included paragraph (a)(3)(ii), which is based on the last sentence of proposed paragraph (a)(3). Paragraph (a)(3)(ii) provides that a railroad shall notify the directly affected employees of the preliminary meeting no less than 60 days before it is held, thereby clarifying that the 60-day period refers only to this preliminary meeting.

Paragraph (a)(4) directs readers to Appendix B for additional guidance on how a railroad might comply with the consultation requirements of § 270.107. The appendix and the comments received in response are discussed later in this preamble in the section-by-section analysis for the Appendix B.

An individual commenter requested that the consultation requirements be more detailed. The commenter suggested adding the following requirements: (1) Visibly post the SSP requirements under this part before the SSP is created because, according to the commenter, the parties tend to get “dug in” once the consultation begins and everyone has expressed their position; (2) hold biannual or quarterly meetings between parties regarding safety hazards and risks and provide the meeting minutes to FRA; (3) have a system in which perceived unsafe work orders can be challenged; (4) do not allow a fully implemented SSP to be changed in a way that reduces safety without FRA approval; and (5) establish a committee to make recommendations on uniform minimum standards for working on the right-of-way, including intercity rail.

As for the commenter’s first and second suggested requirements, FRA seeks to provide the railroads and their directly affected employees the flexibility to tailor the consultation process to their specific operations. Therefore, adopting these requirements would only take away some of this flexibility. The commenter’s third suggested requirement is actually a type of mitigation measure a railroad may put in place to address identified hazards and resulting risks. However, FRA is not requiring specific mitigation measures under this rule; consequently, FRA declines to adopt the suggested mitigation measure. The commenter’s fourth suggested requirement raises an issue that is addressed in § 270.201(c), below. Finally, regarding the

commenter’s fifth suggested requirement, FRA’s RSAC has established working groups and task forces to address safety across a wide range of areas, including right-of-way safety. In fact, the safety of roadway workers along the right-of-way is specifically addressed in FRA’s regulations at 49 CFR part 214. Accordingly, FRA believes it unnecessary to adopt this suggested requirement.

Paragraph (b) requires a railroad to submit, together with its SSP plan, a consultation statement. The purpose of this consultation statement is twofold: (1) To help FRA determine whether the railroad has complied with § 270.107(a) by, in good faith, consulting with and using its best efforts to reach agreement with its directly affected employees on the contents of its SSP plan; and (2) to ensure that the directly affected employees with which the railroad has consulted are aware of the railroad’s submission of its SSP plan to FRA for review. The consultation statement must contain specific information described in paragraphs (b)(1) through (4) of this section.

Paragraph (b)(1) requires that the consultation statement contain a detailed description of the process the railroad utilized to consult with its directly affected employees. This description should contain information such as (but not limited to) the following: (1) How many meetings the railroad held with its directly affected employees; (2) what materials the railroad provided its directly affected employees regarding the draft SSP plan; and (3) how input from directly affected employees was received and handled during the consultation process.

If the railroad is unable to reach agreement with its directly affected employees on the contents of its SSP plan, paragraph (b)(2) requires that the consultation statement identify any known areas of disagreement and provide the railroad’s explanation for why it believed agreement was not reached. A railroad could specify, in this portion of the statement, whether it was able to reach agreement on the contents of its SSP plan with certain directly affected employees, but not others.

In commenting on the NPRM, AAR believes that paragraph (b)(2) should be removed. AAR states that a railroad cannot know the motivation behind its directly affected employees’ decision (including a labor union’s decision) to disagree with a railroad’s SSP plan. FRA agrees that the railroad may not know the actual reason(s) why its directly affected employees could not reach

agreement with it on the contents of the SSP plan. It is because of this that paragraph (b)(2) requires an explanation only as to why the railroad believes agreement was not reached—not what the directly affected employees believe. If agreement cannot be reached, this statement will provide a record of the railroad’s account of the consultation process, and in turn will serve to help FRA evaluate whether good faith and best efforts were used.

In the NPRM, § 270.102(b)(3) proposed to require that the consultation statement identify any provision that would affect a provision of a collective bargaining agreement between the railroad and a non-profit employee labor organization and then explain how the railroad’s SSP plan would affect it. In commenting on the NPRM, AAR believes this proposal is unnecessary and requested that FRA delete it. FRA agrees and has not included this provision in the final rule. Generally, FRA is not involved in the collective bargaining process and does not intend to become involved in the process because of this rule. However, if the labor organizations believe that the railroad’s SSP plan violates the collective bargaining agreement, they may include this as part of their statement pursuant to paragraph (c)(1) of this section.

Under paragraph (b)(3) in the final rule, proposed as paragraph (b)(4), the consultation statement must include a service list containing the name and contact information for the international/national president of any non-profit employee labor organization representing directly affected employees and any directly affected employee who significantly participated in the consultation process independently of a non-profit labor organization. This paragraph also requires a railroad (at the same time it submits its proposed SSP plan and consultation statement to FRA) to provide individuals identified in the service list a copy of the SSP plan and consultation statement. This service list will help FRA determine whether the railroad has complied with the § 270.107(a) requirement to consult with its directly affected employees. Requiring the railroad to provide individuals identified in the service list with a copy of its submitted plan and consultation statement also serves to notify those individuals that they have 30 days under § 270.107(c)(2) (discussed below) to submit a statement to FRA if they were not able to come to reach agreement with the railroad on the contents of the SSP plan.

As proposed in the NPRM, this paragraph would have required the

consultation statement to include a service list containing the names and contact information for the international/national president and general chairperson of the non-profit employee labor organizations representing a class or craft of the railroad's directly affected employees; any labor organization representative who participated in the consultation process; and any directly affected employee who significantly participated in the consultation process independently of a non-profit employee labor organization. In its comments on the NPRM, AAR requested that the service list be limited to the international/national president of any non-profit employee labor organization representing a class or craft of the railroad's directly affected employees. AAR believes that including the general chairperson of these labor organizations and any labor organization representative who participated in the consultation process would be overly burdensome and that a railroad's inadvertent failure to serve one of the parties listed could be used against them and lead to FRA not approving the plan. AAR cites certain regulations of the Surface Transportation Board (STB) for which, when notification of labor unions is required, notice is given to the national office of the labor unions of the employee affected. *See* 49 CFR 1150.32(e) and 1150.42(e). AAR believes that service on the union presidents is sufficient because the unions are capable of notifying the necessary employees. FRA agrees. To minimize the paperwork burden and the potential for confusion, the service list under paragraph (b)(3) contains only the following: (1) The international/national president of any non-profit employee labor organization representing directly affected employees and (2) any directly affected employee who significantly participated in the consultation process independently of a non-profit employee labor organization. When directly affected employees are represented by a non-profit employee labor organization, limiting service to the president of the labor organization serves to ensure that the employees receive the same version of the SSP plan, thereby minimizing potential confusion.

In commenting on the NPRM, the Labor Organizations requested that when a railroad submits its SSP plan and consultation statement to FRA, the railroad also "simultaneously" send a copy of these documents to all individuals identified in the service list. FRA agrees and has adopted this suggestion to ensure the directly

affected employees receive the SSP plan and consultation statement at approximately the same time FRA does so that they have sufficient time to submit a statement to FRA pursuant to paragraph (c)(2).

Finally, FRA notes that APTA, in commenting on the NPRM, believes that paragraph (b) applies different standards to the parties (railroads and directly affected employees) and presumes that failure to reach agreement would be based on the railroad's failure to use good faith. APTA recognizes that RSIA allows directly affected employees to file a statement with FRA regarding the areas of disagreement; however, APTA believes that paragraph (b) effectively shifts the burden to the railroads. APTA also claims that paragraph (b) presumes that if no agreement is reached, the SSP plan is deficient and the railroad failed to act in good faith, instead of considering the possibility that the SSP plan is adequate but the parties simply disagree. APTA therefore requests that proposed paragraphs (b)(1) through (3) not be included in the final rule.

As discussed previously, FRA has not included proposed paragraph (b)(3) in this final rule. FRA also makes clear that, if there is disagreement between the railroad and certain directly affected employees, including their union representatives, the failure to reach an agreement does not, in itself, lead to a presumption that the railroad acted in bad faith or failed to use best efforts. Rather, the consultation statement required by paragraph (b) is the railroad's opportunity to explain why it believes there was disagreement. If paragraphs (b)(1) and (2) were not included in the final rule, as requested by APTA, FRA would only have the statement from the directly affected employees as an explanation as to why agreement was not reached. To make a balanced and well-informed decision on whether the railroad used good faith and best efforts, FRA believes it necessary to have a statement from both the railroad and the directly affected employees. Further, as noted in the discussion of paragraph (a)(1), FRA may approve a plan even if there is disagreement between the parties, as long as FRA can determine that the railroad consulted in good faith and used its best efforts to reach agreement. In this regard, it would be more difficult for FRA to make this determination without the consultation statement required by paragraphs (b)(1) and (2).

Paragraph (c)(1) implements section 20156(g)(2) by providing that, if a railroad and its directly affected employees cannot reach agreement on the proposed contents of a SSP plan,

then the directly affected employees may file a statement with the FRA Associate Administrator for Railroad Safety and Chief Safety Officer explaining his or her views on the plan on which agreement was not reached. The FRA Associate Administrator for Railroad Safety and Chief Safety Officer will consider any such views during the plan review and approval process. Appendix C sets forth the procedures for the submission of statements by directly affected employees.

Paragraph (c)(2) specifies that a railroad's directly affected employees have 30 days following the date of the railroad's submission of its proposed SSP plan to submit the statement described in paragraph (c)(1) of this section. While the NPRM proposed to provide the directly affected employees 60 days to file such a statement, FRA believes that 30 days is more appropriate. This decision takes into account that paragraph (b)(3) ensures that the directly affected employees are provided the SSP plan and the consultation statement at approximately the same time the documents are provided to FRA for review, as requested by the Labor Organizations. Moreover, pursuant to § 270.201(b), FRA will review a SSP plan within 90 days of receipt, as discussed below. As a result, if the directly affected employees were to have up to 60 days to submit a statement when agreement on the SSP plan was not reached, FRA would have only 30 days to consider the directly affected employees' views while reviewing the SSP plan. Thirty days would not be enough time to ensure that the directly affected employees' views are sufficiently addressed during the SSP plan review process.

Paragraph (d) requires that a railroad's SSP plan include a description of the process a railroad will use to consult with its directly affected employees on any substantive amendments to the railroad's SSP plan. As with its initial SSP plan, a railroad must use good faith and best efforts to reach agreement with directly affected employees on any substantive amendments to the plan. Examples of substantive amendments could include the following: The addition of new stakeholder groups (or the removal of a stakeholder group); major changes to the processes employed, including changes to the frequency of governing body meetings; or changing the organizational level of the manager responsible for the SSP (e.g., changing from the Chief Safety Officer to someone who reports to the Chief Safety Officer). Requiring a railroad to detail that process in its plan facilitates the consultation by

establishing a known path to be followed. A railroad that does not follow this process when substantively amending its SSP plan may be subject to penalties for failing to comply with the provisions of its plan. However, this requirement does not apply to non-substantive amendments (*e.g.*, amendments updating names and addresses of railroad personnel). If a railroad is uncertain as to whether a proposed amendment is substantive or non-substantive, it should contact FRA for guidance.

Subpart C—Review, Approval, and Retention of System Safety Program Plans

Section 20156(a)(1)(B) requires a railroad to submit its SSP, including any of the required plans, to the Administrator (as delegate of the Secretary) for review and approval. Subpart C, Review, Approval, and Retention of System Safety Program Plans, addresses these statutory requirements.

Section 270.201 Filing and Approval

This section sets forth the requirements for the filing of a SSP plan and FRA's approval process.

Paragraph (a)(1) requires that each railroad submit one copy of its SSP plan to the FRA Associate Administrator for Railroad Safety and Chief Safety Officer no later than February 8, 2018, or not less than 90 days before commencing operations, whichever is later. In the NPRM, FRA proposed requiring submission no later 395 days after the effective date of the final rule; however, many commenters expressed concern regarding this timeframe. The commenters believe that 395 days after the effective date of the rule is not a sufficient amount of time for a railroad to draft its SSP and conduct the necessary consultation with directly affected employees pursuant to § 270.107. The commenters point out that since the protections under § 270.105 do not go into effect until 365 days after the publication date of the rule, the requirement that the railroad submit its plan to FRA 395 days after the effective date does not provide enough time to conduct consultation regarding the substance of the SSP. To address these concerns, FRA has extended this submission deadline.

The final rule requires a railroad to submit its SSP plan 180 days after the effective date of the protections. Per section 20119(b), the protections cannot go onto effect until 1 year after adoption of the final rule. The final rule will not be effective until 60 days after publication. Therefore, 365 days after

publication, the railroad will have 180 days to submit its SSP. In other words, the railroad will submit its SSP plan to FRA 545 days after publication or 485 days after the effective date of the rule. FRA believes providing the railroads with additional time to submit their plans will allow for sufficient time to draft the SSP plan and conduct the necessary consultation with the directly affected employees pursuant to § 270.107.

In addition, APTA raised concerns regarding the requirement that new starts submit their plans not less than 90 days before commencing operations. APTA believes this is not sufficient time if operations begin before the protections under § 270.105 are effective and therefore requests FRA consider extending the amount of time a railroad has to submit a plan before commencing operations. Under paragraph (a)(1), a railroad must have its SSP plan in place 90 days before commencing operations, or by February 8, 2018 (*i.e.*, 180 days after the date the protections of § 270.105 become applicable), whichever is later. This means that if a new start is commencing operations before the date the protections of § 270.105 become applicable, the railroad will have at least until 180 days after the date the protections of § 270.105 become applicable to submit a plan, given that the later submission date will apply. Accordingly, FRA believes that the rule provides a sufficient amount of time for a new start to develop its SSP plan in consultation with its directly affected employees and submit the plan to FRA for approval.

Paragraph (a)(2) provides that the railroad shall not include the results of its risk-based hazard analysis in its SSP plan that it submits to FRA pursuant to paragraph (a)(1) of this section. The SSP plan should only include the processes and methods used in the risk-based hazard analysis as described in § 270.103(p). However, since the risk-based hazard analysis is a vital element of a SSP, FRA will be available to assist the railroads and other stakeholders to ensure that this analysis is robust and addresses all the necessary aspects of the railroad's operations. To achieve this goal, representatives of FRA and States participating under part 212 of this chapter will have access to the railroad's risk-based hazard analysis pursuant to paragraph (a)(2).

As part of its submission, the railroad must provide certain additional information. Primarily, under paragraph (a)(3), the SSP plan submission shall include the signature, name, title, address, and telephone number of the chief official responsible for safety and

who bears primary managerial authority for implementing the SSP for the submitting railroad. By signing, this chief official is certifying that the contents of the SSP plan are accurate and that the railroad will implement the contents of the program as approved by FRA. The SSP plan shall also include the contact information for the primary person managing the SSP and the senior representatives of host railroads, contract operators, and shared track/corridor operators, if any, and any other person who utilizes or provides significant safety-related services. The term "person" has been included in paragraph (a)(3)(iii) to clarify what was meant by "others" as proposed in the NPRM. The inclusion of a person that utilizes or provides significant safety-related services is consistent with the discussion of § 270.103(d)(2). The contact information for the primary person managing the SSP is necessary so that FRA knows who to contact regarding any issues with the railroad's SSP. Likewise, the contact information for the senior representatives of any host railroad, contract operator, shared track/corridor operator, or other person who utilizes or provides significant safety-related services is necessary so that FRA knows who to contact regarding the involvement of these parties in implementing and supporting the railroad's SSP. Separately, FRA notes that it has included proposed paragraph (a)(5) in paragraph (a)(3) to maintain clarity. Paragraph (a)(5) in the NPRM proposed to require the chief official responsible for safety and who bears primary managerial authority for implementing the railroad's SSP to certify that the contents of the railroad's SSP plan are accurate and that the railroad will implement the contents of the program as approved by § 270.201(b). This proposed requirement is specifically reflected in paragraph (a)(3)(i).

Paragraph (a)(4) references the requirements of § 270.107(b), which requires a railroad to submit with its SSP plan a consultation statement describing how it consulted with its directly affected employees on the contents of its SSP. When the railroad provides the consultation statement to FRA, § 270.107(b)(3) also requires that the railroad simultaneously provide a copy of the statement to certain directly affected employees identified in a service list. The directly affected employees can then file a statement for FRA's consideration in evaluating the proposed plan if they do so within 30 days after the railroad has filed its

consultation statement, as discussed in § 270.107(c)(2).

Paragraph (b) sets forth the FRA approval process for a railroad's SSP plan. Within 90 days of receipt, FRA will review the SSP plan to determine if the elements prescribed in this part are sufficiently addressed in the railroad's submission. FRA notes that the NPRM also proposed that FRA review would alternatively take place "within 90 days of receipt of each SSP plan submitted before the commencement of railroad operations." However, FRA has not included this alternative condition in the final rule because it would be duplicative and erroneously imply a difference in the 90-day period, when there would be none. FRA's review will consider any statement submitted by directly affected employees pursuant to § 270.107. As with drafting the plan, FRA intends to work with the railroad and any necessary stakeholders when reviewing the plan.

Once FRA determines whether a railroad's SSP plan complies with the requirements of this part, FRA will notify, in writing, each person identified by the railroad in § 270.201(a)(3) whether the railroad's SSP plan is approved or not. The NPRM proposed that FRA notify "the primary contact person of each affected railroad"; however, to maintain consistency within this section, FRA revised the language to "each person identified by the railroad in § 270.201(a)(3)." If FRA does not approve a plan, it will inform the railroad of the specific points in which the plan is deficient. FRA will also provide the notification to each individual identified in the service list accompanying the consultation statement required under § 270.107(b). When the railroad receives notification that the plan is not approved and notice of the specific points in which the plan is deficient, the railroad has 90 days to correct all of the deficiencies identified and resubmit the plan to FRA under paragraph (b)(3). FRA had received comments expressing concern that 60 days was not a sufficient amount of time for a railroad to address the deficient points of a SSP plan, as proposed in the NPRM. To address this concern, FRA has extended the deadline to 90 days in the final rule.

AAJ and the Labor Organizations expressed concern that railroads may claim that they are immune from any safety hazard claim or that a State law claim is preempted because FRA has approved a railroad's SSP plan. The Labor Organizations provided the example that if an employee is injured because of defective ballast in a yard,

and a State has a regulation that sets forth walkway standards, a railroad may claim that the State law is preempted because FRA had approved the railroad's SSP which included walkway safety. Accordingly, the Labor Organizations suggested the following language to address this concern: "Neither the approval by FRA of a railroad's System Safety Plan nor its compliance by a railroad shall be admitted into evidence in a lawsuit seeking damages for alleged negligence, nor shall a railroad claim that a state law or regulation is preempted, or that a federal law or regulation is precluded, because of such FRA approval or a railroad's compliance." FRA understands the concerns expressed by the commenters, and has included paragraph (b)(4) to address those concerns.

The final rule requires the development of a SSP that must be approved by FRA. Under § 270.103(p), the SSP includes a risk-based hazard management program that establishes the processes used in the risk-based hazard analysis to identify hazards and corresponding risks on the railroad's system and the methods used to identify actions that mitigate or eliminate the hazards and corresponding risks. Section 270.201(a)(2) provides that the railroad shall not include in its SSP the risk-based hazard analysis that is conducted pursuant to § 270.103(q). Section 270.103(q) in turn provides that once FRA approves a railroad's SSP, the railroad is to apply the risk-based hazard analysis to identify and analyze hazards on the railroad's system, determine the resulting risks, and identify and implement specific actions that will mitigate or eliminate the hazards. Since FRA will not be reviewing or approving the specific mitigation and elimination measures that a railroad may adopt to address the hazards and risks that it identifies, the final rule is not intended to preempt State standards of care regarding the specific risk mitigation and mitigation actions a railroad will implement under its SSP. Accordingly, § 270.201(b)(4) clarifies that FRA approval of a railroad's SSP plan under this final rule does not constitute approval of the specific mitigation and elimination measures that the railroad will implement pursuant to § 270.103(q)(2) and should not be construed as establishing a Federal standard of care regarding those specific actions.

Paragraph (c) addresses the process a railroad will follow whenever it amends its SSP. When a railroad amends its SSP plan it shall submit the amended SSP plan to FRA not less than 60 days before

the proposed effective date of the amendment(s). The railroad shall file the amended SSP plan with a cover letter outlining the proposed changes to the original, approved SSP plan. The cover letter should provide enough information so that FRA knows what is being added, removed, or changed from the original approved SSP. The railroad will also be required to follow the process described pursuant to § 270.107(d) regarding the consultation with directly affected employees concerning the amendment(s) to the SSP plan. The railroad will describe in the cover letter the process it used to consult with its directly affected employees on the amendment(s).

FRA recognizes that some amendments may be safety-critical and that the railroad may not be able to submit the amended SSP plan to FRA 60 days before the proposed effective date of the amendments. In these instances, the railroad shall submit the amended SSP plan to FRA as near as possible to 60 days before the proposed effective date of the amendment(s). The railroad shall provide an explanation why the amendment is safety-critical and describe the effects of the amendment. The requirement that the railroad explain why the amendment is safety-critical was not proposed in the NPRM; however, it was added to the final rule to ensure that it is clear to FRA and other stakeholders the nature of the amendment and why the railroad believes it is safety-critical.

FRA also recognizes that some amendments may be purely administrative in nature. While § 270.201 subjects all changes to a SSP plan to a formal review and approval process, FRA believes that purely administrative changes should be excluded from the process so that the agency can focus its resources on more substantive matters. FRA has therefore included paragraph (c)(1)(iii) in the final rule to limit the need for formal FRA approval of purely administrative changes to previously approved SSP plans. This paragraph will allow these specific types of amendments to become effective immediately upon filing with FRA and thereby help to streamline the approval process. All other proposed amendments must comply with the formal approval process in paragraph (c) of this section.

Except as provided in paragraph (c)(1)(iii), FRA will review the proposed amended SSP plan within 45 days of receipt, under paragraph (c)(2)(i). FRA will then notify the primary contact person whether the proposed amended SSP plan has been approved by FRA. If the amended plan is not approved, FRA

will provide the specific points in which each proposed amendment to the plan is deficient. If FRA does not notify the railroad whether the amended plan is approved or not by the proposed effective date of the amendment(s) to the plan, the railroad may implement the amendment(s) to the plan. This implementation, however, is subject to FRA's pending decision regarding whether the amendment is approved or not. This provision provides flexibility for railroads to implement proposed amendments pending FRA's decision, should FRA not affirmatively act within the prescribed time periods. However, should FRA not approve a proposed amendment, the railroad must follow the procedures in paragraph (c)(2)(iii) to re-implement the amendment.

If a proposed amendment to the SSP plan is not approved by FRA, the railroad has two options: Correct all deficiencies and resubmit the amendment to FRA, or provide notice to FRA that it is retracting the proposed amendment. The final rule makes clear that the railroad may retract the proposed amendment rather than correct it, whichever option it believes best. The railroad will have 60 days following receipt of FRA's written notice that any proposed amendment was not approved to either submit a corrected copy of the amendment that addresses all deficiencies noted by FRA or to submit notice that the railroad is retracting the amendment.

Paragraph (d) allows FRA to reopen consideration of a plan or amendment after initial approval of the plan or amendment. Examples of the types of cause for which FRA may reopen review include FRA's determination that the railroad is not complying with its plan or plan amendment, and FRA's awareness of material information about which FRA was unaware when it originally reviewed the plan or amendment. The determination of whether to reopen consideration will be made solely within FRA's discretion on a case-by-case basis.

FRA sought comment in the NPRM on whether electronic submission of a SSP plan should be permitted and, if so, what type of process FRA should use to accept such submissions. All of the commenters who responded to this request supported electronic submission. Therefore, paragraph (e) permits documents to be submitted electronically. To provide guidance on electronic submission, FRA added Appendix C, Procedures for Submission of System Safety Program Plans and Statements from Directly Affected Employees, which is addressed below.

Section 270.203 Retention of System Safety Program Plan

This section sets forth the requirements for a railroad's retention of its SSP plan. FRA did not receive any comments in response to this section and, therefore, it remains unchanged from the NPRM. A railroad will be required to retain at its system headquarters, and at any division headquarters, a copy of its SSP plan and a copy of any amendments to the plan. The railroad must make the plan and any amendments available to representatives of FRA and States participating under part 212 of this chapter for inspection and copying during normal business hours.

Subpart D—System Safety Program Internal Assessments and External Auditing

Subpart D sets forth the requirements for a railroad's internal SSP assessment and FRA's external audit of the railroad's SSP.

Section 270.301 General

To determine whether a SSP is successful, it will need to be evaluated by both the railroad and FRA on a periodic basis. This section sets forth the general requirement that a railroad's SSP and its implementation will be assessed internally by the railroad and audited externally by FRA or FRA's designee. FRA did not receive any comments in response to this section and, therefore, it remains unchanged from the NPRM.

Section 270.303 Internal System Safety Program Assessment.

This section sets forth the requirements for the railroad's internal SSP assessment. FRA did not receive any comments in response to this section and, therefore, it remains substantively unchanged from the NPRM. Once FRA approves a railroad's SSP plan, the railroad shall conduct an annual assessment of the extent to which: (1) The SSP is fully implemented; (2) the railroad is in compliance with the implemented elements of the approved SSP plan; and (3) the railroad has achieved the goals set forth in § 270.103(c). This internal assessment will provide the railroad with an overall survey of the progress of its SSP implementation and the areas in which improvement is necessary.

As part of its SSP plan, the railroad will describe the processes used to: (1) Conduct internal SSP assessments; (2) report the findings of the internal SSP assessments internally; (3) develop, track, and review recommendations as a result of the internal SSP assessments;

(4) develop improvement plans based on the internal SSP assessments that, at a minimum, identify who is responsible for carrying out the necessary tasks to address assessment findings and specify a schedule of target dates with milestones to implement the improvements that address the assessment findings; and (5) manage revisions and updates to the SSP plan based on the internal SSP assessments. By describing these processes, the railroad will detail how it plans to assess its SSP and how it will improve it if necessary. Since this is an internal assessment, a railroad will tailor the processes to its specific operations.

FRA notes that the NPRM also proposed that the railroad would describe the process it uses to comply with the reporting requirements set forth in proposed § 270.201. However, FRA has determined that it is not necessary to adopt this proposed requirement, and it is not included in this paragraph (b).

Within 60 days of completing its internal assessment, the railroad will submit a copy of its internal assessment report to the FRA Associate Administrator for Railroad Safety and Chief Safety Officer, Mail Stop 25, 1200 New Jersey Avenue SE., Washington, DC 20590. The NPRM did not specify the individual at FRA to whom the internal assessment report will be sent, which has been clarified in the final rule. This report will include the SSP assessment and the status of internal assessment findings and improvement plans. The railroad will also outline the specific improvement plans for achieving full implementation of its SSP and the milestones it has set forth. The railroad's chief official responsible for safety shall certify the results of the railroad's internal SSP plan assessment.

Section 270.305 External Safety Audit

This section sets forth the process FRA will utilize when it conducts audits of a railroad's SSP. FRA did not receive any comments in response to this section and, therefore, it is essentially unchanged from the NPRM. These audits will evaluate the railroad's compliance with the elements required by this part in the railroad's approved SSP plan. Because this section is predicated on the railroad's SSP plan and any amendments having already been approved by FRA pursuant to § 270.201(b) and (c), this section permits FRA to focus on the extent to which the railroad is complying with its own program.

Similar to the SSP plan review process, FRA does not intend the audit to be conducted in a vacuum. Rather,

during the audit, FRA will maintain communication with the railroad and attempt to resolve any issues before completion of the audit. Once the audit is completed, FRA will provide the railroad with written notification of the audit results. These results will identify any areas where the railroad is not properly complying with its SSP, any areas that need to be addressed by the SSP but are not, and any other areas in which FRA believes the railroad and its plan are not in compliance with this part.

If the results of the audit require the railroad to take any corrective action, the railroad is provided 60 days to submit for approval an improvement plan to address the audit findings. The improvement plan will identify who is responsible for carrying out the necessary tasks to address the audit findings and specify target dates and milestones to implement the improvements that address the audit findings. Specification of milestones is important because it will allow the railroad to determine the appropriate progress of the improvements while allowing FRA to gauge the railroad's compliance with its improvement plan.

If FRA does not approve a railroad's improvement plan, FRA will notify the railroad of the specific deficiencies in the improvement plan. The railroad will then amend the improvement plan to correct the deficiencies identified by FRA and provide FRA a copy of the amended improvement plan no later than 30 days after the railroad has received notice from FRA that its improvement plan was not approved. This process is similar to the process provided in § 270.201(b)(3) when FRA does not initially approve a railroad's SSP. Upon request, the railroad shall provide to FRA and States participating under part 212 of this chapter for review a report regarding the status of the implementation of the improvements set forth in the improvement plan established pursuant to paragraph (b)(1) of this section.

Appendix A to Part 270—Schedule of Civil Penalties

Appendix A to part 270 contains a schedule of civil penalties for use to enforce this part. Because such penalty schedules are statements of agency policy, notice and comment are not required before their issuance. *See* 5 U.S.C. 553(b)(3)(A). Nevertheless, FRA invited comment on the penalty schedule. However, FRA did not receive any comments other than the Labor Organizations' comment that the NPRM lacked a penalty schedule. As noted above, FRA typically does not include a

penalty schedule in an NPRM. Accordingly, FRA is issuing this penalty schedule reflecting the requirements of this final rule.

Appendix B to Part 270—Federal Railroad Administration Guidance on the System Safety Program Consultation Process

Appendix B contains guidance on how a railroad could comply with § 270.107, which states that a railroad must in good faith consult with and use its best efforts to reach agreement with all of its directly affected employees on the contents of the SSP plan. The appendix begins with a general discussion of the terms "good faith" and "best efforts," explaining that they are separate terms and that each has a specific and distinct meaning. For example, the good faith obligation is concerned with a railroad's state of mind during the consultation process, and the best efforts obligation is concerned with the specific efforts made by the railroad in an attempt to reach agreement with its directly affected employees. The appendix also explains that FRA will determine a railroad's compliance with the § 270.107 requirements on a case-by-case basis and outlines the potential consequences for a railroad that fails to consult with its directly affected employees in good faith and using best efforts.

The appendix also contains specific guidance on the process a railroad may use to consult with its directly affected employees. This guidance would not establish prescriptive requirements with which a railroad must comply, but provides the road map for how a railroad may conduct the consultation process. The guidance also distinguishes between employees who are represented by a non-profit employee labor organization and employees who are not, as the processes a railroad may use to consult with represented and non-represented employees could differ significantly. Overall, however, the appendix stresses that there are many compliant ways in which a railroad may choose to consult with its directly affected employees and that FRA believes, therefore, that it is important to maintain a flexible approach to the § 270.107 consultation requirements, so a railroad and its directly affected employees may consult in the manner best suited to their specific circumstances.

Appendix C to Part 270—Procedures for Submission of System Safety Program Plans and Statements From Directly Affected Employees

Appendix C provides railroads and directly affected employees the option to file SSP plans or consultation statements electronically. As discussed above, the NPRM requested comment regarding whether electronic submission of SSP materials should be allowed. All of the comments received in response to this request supported electronic submission, and, therefore, Appendix C has been added.

FRA intends to create a secure document submission site and needs basic information from railroads or directly affected employees before setting up a user's account. To provide secure access, information regarding the points of contact is required. It is anticipated that FRA will be able to approve or disapprove all or part of a program and generate automated notifications by email to a railroad's points of contact. Thus, FRA needs each point of contact to understand that by providing any email addresses, the railroad is consenting to receive approval and disapproval notices from FRA by email. Railroads that allow notice from FRA by email gain the benefit of receiving such notices quickly and efficiently.

Those railroads that choose to submit printed materials to FRA are required to deliver them directly to the specified address. Some railroads may choose to deliver a CD, DVD, or other electronic storage format to FRA rather than requesting access to upload the documents directly to the secure electronic database. Although that is an acceptable method of submission, FRA encourages each railroad to utilize the electronic submission capabilities of the system. Of course, if FRA does not have the capability to read the type of electronic storage format sent, FRA will reject the submission.

FRA may be able to develop a secure document submission site so that confidential materials would be identified and not shared with the general public. However, FRA does not expect the information in a SSP plan to be of such a confidential or proprietary nature, particularly since each railroad is required to share the submitted SSP plan with individuals identified in the service list pursuant to § 270.107(b)(3). SSP records in FRA's possession are also exempted from disclosure under the Freedom of Information Act pursuant to section 20118, and § 270.105 protects any information compiled or collected solely for the

purpose of developing, implementing, or evaluating a SSP from discovery, admission into evidence, or consideration for other purposes in a Federal or State court proceeding for damages involving personal injury, wrongful death, and property damage. Accordingly, FRA does not at this time believe it is necessary to develop a document submission system which addresses confidential materials at this time.

VII. Regulatory Impact and Notices

A. Executive Orders 12866 and 13563 and DOT Regulatory Policies and Procedures

This final rule has been evaluated under existing policies and procedures, and determined to be “Other Significant” under both Executive

Orders 12866 and 13563 and DOT policies and procedures. 44 FR 11034, Feb. 26, 1979. FRA has prepared and placed in the docket a regulatory impact analysis (RIA) addressing the economic impact of this final rule.

This final rule directly responds to the Congressional mandate in section 20156(a) that FRA, by delegation from the Secretary, require each railroad that provides intercity rail passenger or commuter rail passenger transportation to establish a railroad safety risk reduction program. This final rule also implements section 20119(b), which authorizes FRA, by delegation from the Secretary, to issue a regulation protecting from discovery and admissibility into evidence in litigation documents generated for the purpose of developing, implementing, or evaluating a SSP. FRA believes that all of the

requirements of this final rule are directly or implicitly required by these statutory mandates and will promote railroad safety.

Most of the 30 existing commuter and intercity passenger railroads required to comply with the final rule belong to the APTA system safety program and are currently participating in the APTA system safety triennial audit program. The rule adopts many of the elements contained in the APTA “Manual for the Development of System Safety Program Plans for Commuter Railroads.”¹⁰ The rule’s costs and benefits are incremental to the APTA program. Because FRA believes all but one covered railroad follows the APTA program, FRA does not expect this rule will have significant costs. Table E–1 presents a summary of the rule’s benefits and costs.

TABLE E–1—SUMMARY OF THE RULE’S COSTS AND BENEFITS

		Undiscounted	Discounted at 7 percent	Discounted at 3 percent
Estimated Costs	Over 20-years ... Annualized	¹¹ \$4,743,039 237,152	\$2,327,224 219,674	\$3,412,651 229,384
Cost From Risk Analyses and Risk Mitigation	Not estimated, as FRA lacks information to reliably estimate such costs, and it does not know the level of hazards and risks on each railroad and means railroads will use to mitigate.		
Benefits	Not estimated but expected to include safety improvements and operational efficiencies resulting primarily from more robust SSPs, additional and improved risk analysis and mitigation, better information about systems, and improved safety culture.		

The SSP NPRM RIA was performed on a breakeven basis. FRA modified that approach in this final rule because FRA could not estimate all relevant regulatory costs, namely those resulting from risk analysis and risk mitigation. These costs are not reasonably predictable until data protections are in place and each railroad produces and implements their SSP plans assessing their hazards and risk levels. Nevertheless, the pool of potential safety benefits is large as evidenced by the number of accidents and incidents experienced on passenger railroads this rule could impact. FRA expects railroads will achieve sufficient safety benefits to justify quantified and unquantified costs.

Costs

The rule has requirements in addition to those in the APTA program. FRA estimated the rule’s costs for those additional requirements which include: Documenting the SSP plan and the safety certification process; SSP training; preparing for and providing information in response to external audits; providing mitigation method information to FRA; preparing technology analysis results and providing them to FRA; providing an annual assessment of SSP performance and improvement plans; consulting with directly affected employees and preparing consultation statements; amending SSP plans; retaining records;

and conducting internal SSP assessments. (Table E–1 above summarizes these costs.) FRA did not estimate the full incremental costs of railroads conducting additional and more robust hazard and risk analysis or implementing actions to mitigate identified hazards and risks. FRA lacks information to reliably estimate such costs, as it does not know the level of hazards and risks on each railroad and the means railroads will use to mitigate these risks.

Benefits

FRA could not estimate the final rule’s full benefits quantitatively as SSPs are primarily an organizational structure and program to manage safety

¹⁰ http://www.apta.com/resources/reportsandpublications/Documents/commuter_rail_manual.pdf (last accessed on March 22, 2016).

¹¹ The NPRM estimated the costs of the proposed rule to be \$4.1 million. FRA estimates the final rule’s costs are \$4.7 million, a nominal increase of \$620,000 (14.6 percent). The cost estimate increased

from the NPRM to the final rule due to the following: (1) Application of the Congressional Budget Office real wage forecasts for each year of the analysis; (2) updating the wage inputs used to account for the Surface Transportation Board’s newest wage rates for 2012 and a 2015 base year; and (3) an adjustment to allow more time for railroad consultation with directly affected

employees and statement preparation. (The consultation time with labor and affected employees is \$135,000 of the \$620,000 total.) See: <http://www.dot.gov/regulations/economic-values-used-in-analysis> (DOT’s guidance on Value of a Statistical Life (VSL)). (The VSL was further updated June 17, 2015 to \$9.4 million.)

through hazard analysis and mitigation. FRA cannot accurately estimate the rule's incremental safety benefits because FRA cannot reliably predict the specific risks each railroad will identify or the specific actions they will take to mitigate such risks relative to the APTA program. For these reasons, FRA assessed the rule's benefits qualitatively. FRA expects that safety and operational benefits will result from mechanisms in the rule leading to improved safety analysis and risk mitigation, including (1) requirements to demonstrate a robust SSP to FRA, (2) requirements designed to improve safety culture, and (3) protection of certain SSP information. Railroad management and employees will have to achieve the safety goals in their SSPs, but there will also be FRA oversight to monitor and require corrective actions if and when necessary.

Congress directed FRA to conduct a study to determine if it was in the public interest to withhold certain information from discovery and admission into evidence in Federal or State court proceedings for damages involving personal injury and wrongful death, including the railroad's assessment of its safety risks and its mitigation measures. FRA contracted with an outside organization to conduct this study and the study concluded it was in the public interest to withhold this type of information from these types of proceedings. Thus, the rule sets forth protections of certain SSP information from discovery, admission into evidence, or use for other purposes in a proceeding for damages. FRA expects the information protections will result in railroads conducting more robust risk-based hazard analysis, keeping more detailed records of hazards and risks, and implementing additional actions to mitigate safety risks. FRA could not estimate the costs of the information protections or the resulting incremental safety risk analysis and mitigation activities, but believes they are justified by the resultant safety improvements' benefits.

In conclusion, FRA determined the final rule's benefits justify its costs. To illustrate, FRA estimated the total cost of passenger railroad accidents/incidents is \$33 billion (discounted at 3 percent) and \$51 billion (discounted at 3 percent) over a 20-year future period. These costs show the potential pool of safety benefits this rule can impact is very large, especially compared to the rule's quantified costs. FRA expects railroads will implement the most cost-effective mitigations to eliminate or mitigate hazards. Railroads are not required to implement mitigations with

net costs and FRA expects that railroads will implement mitigations with net benefits. FRA expects railroads can achieve sufficient safety benefits to justify both the costs FRA could estimate and those it could not.

B. Regulatory Flexibility Act and Executive Order 13272

FRA developed the final rule under Executive Order 13272 ("Proper Consideration of Small Entities in Agency Rulemaking") and DOT's procedures and policies to promote compliance with the Regulatory Flexibility Act (5 U.S.C. 601 *et seq.*) to ensure potential impacts of rules on small entities are properly considered.

The Regulatory Flexibility Act (RFA) requires an agency to review regulations to assess their impact on small entities. An agency must conduct a regulatory flexibility analysis unless it determines and certifies that a rule is not expected to have a significant economic impact on a substantial number of small entities.

FRA conducted an Initial Regulatory Impact Analysis (IRFA) pursuant to the Regulatory Flexibility Act (5 U.S.C. 605(b)) for the SSP NPRM. 77 FR 55397-99, Sept. 7, 2012. Furthermore, FRA invited all interested parties to submit data and information regarding this certification. The comments received are addressed below. FRA certifies that this final rule would not have a significant economic impact on a substantial number of small entities. Although a substantial number of small railroads would be affected by this final rule, none would be significantly impacted.

1. Description of Regulated Entities and Impacts

The "universe" of the entities under consideration includes only those small entities that can reasonably be expected to be directly affected by the provisions of this final rule. For this final rule there is only one type of small entity that is affected: Small railroads.

"Small entity" is defined in 5 U.S.C. 601. Section 601(6) defines "small entity" as having "the same meaning as the terms 'small business', 'small organization' and 'small governmental jurisdiction'" as defined by section 601. Section 601(3) defines "small business" as having the same meaning as "small business concern" under section 3 of the Small Business Act. Section 601(4) defines "small organization" as "any not-for-profit enterprise which is independently owned and operated and is not dominant in its field." Section 601(5) defines "small governmental jurisdiction" as "governments of cities,

counties, towns, townships, villages, school districts, or special districts, with a population of less than fifty thousand."

The U.S. Small Business Administration (SBA) stipulates "size standards" for small entities. It provides that the largest a for-profit railroad business firm may be (and still classify as a "small entity") is 1,500 employees for "Line-Haul Operating" railroads, and 500 employees for "Short-Line Operating" railroads.¹²

Federal agencies may adopt their own size standards for small entities in consultation with SBA, and in conjunction with public comment. Pursuant to the authority provided to it by SBA, FRA has published a final policy, which formally establishes small entities as railroads that meet the line haulage revenue requirements of a Class III railroad.¹³ FRA used this definition for this rule making in preparation of the proposed rule along with the stipulation on government entities or agencies that serve small communities as stated above.

Passenger and Commuter Railroads

Commuter and intercity passenger railroads will have to comply with all provisions of part 270; however, the amount of effort to comply with this rule is commensurate with the size of the entity.

For purposes of this analysis, FRA analyzed two intercity passenger railroads, Amtrak and the Alaska Railroad.¹⁴ Neither is considered a small entity. Amtrak is a Class I railroad and the Alaska Railroad is a Class II railroad. The Alaska Railroad is owned by the State of Alaska, which has a population well in excess of 50,000.

There are 28 commuter or other short-haul passenger railroad operations in the U.S. Most of these commuter railroads are part of larger transit organizations that receive Federal funds and serve major metropolitan areas with populations greater than 50,000. However, two of these railroads do not fall in this category and are considered small entities: Saratoga & North Creek Railway (SNC) and the Hawkeye Express (operated by the Iowa Northern Railway Company (IANR)). All other passenger railroad operations in the United States are part of larger governmental entities, whose service jurisdictions exceed 50,000 in population, and based on the definition,

¹² "Table of Size Standards," U.S. Small Business Administration, January 31, 1996, 13 CFR part 121.

¹³ See 68 FR 24891, May 9, 2003.

¹⁴ There are state-sponsored intercity passenger rail services, the vast majority of which will be part of Amtrak's SSP.

they are not considered to be small entities.

Significant Economic Impact Criteria

FRA estimates that the total cost for the final rule will be \$4.7 million (undiscounted)—\$2.3 million (discounted at 7 percent), or \$3.4 million (discounted at 3 percent), for the railroad industry over a 20-year period. The cost burden to the two small entities will be considerably less on average than that of the other 28 railroads. FRA estimates impacts on these two railroads could range on average between \$1,590 and \$3,346 annualized (non-discounted) to comply with the regulation, depending on the existing level of compliance and discount rate. This estimate was prepared and presented in the IRFA for the NPRM and adjusted in the final rule for revised cost factors applied in the Regulatory Impact Analysis, *e.g.* inflating wages and salaries at 1.07 percent per annum.

Since the time that the NPRM IRFA was prepared, both of the two small entities herein have produced preliminary SSP plans. That plan preparation, with the assistance of FRA and others, will have accomplished much of the work effort envisioned for preparing the formal SSP Plans once the Rule is in effect.

Based on this, FRA concludes that the expected burden of this final rule will not have a significant impact on the competitive position of small entities, or on the small entity segment of the railroad industry as a whole.

Substantial Number Criteria

This final rule will likely burden only two small railroads; however, this is two out of 30 total railroads impacted by this Rule, and two out of two small railroads. Thus, as noted above, this final rule will impact a substantial number of small railroads.

Public Comments and Revisions to the Analysis

The final rule is a performance-based rule and the NPRM, and the regulatory evaluation for the NPRM, requested comments and input on the rulemaking and its supporting documents. The following provides a summary of the comments received that pertained to RFA for small businesses, and how those comments were addressed. FRA did not receive any comments from SBA.

APTA commented that they “believe FRA has applied faulty criteria in determining only two railroads should be treated as small entities.” FRA determined that there would be only

two passenger railroads affected by the SSP rulemaking as small entities. In applying the guidelines of RFA, FRA includes most Class III railroads impacted by a rule as a small business. Only one railroad that will be governed under this final rule is a Class III railroad. RFA guidelines also indicate that if the entity is a part of or agent of governments of cities, counties, towns, townships, villages, or special districts serving a population of more than 50,000, they would not be classified as a small business. Essentially all, except the two railroads FRA classified as small businesses, are a governmental related transportation agency serving population areas of 50,000 or more or an intercity service provider (Amtrak and Alaska), or both.¹⁵ (The definition, SBA based, of small entity that FRA used in the IRFA, results in only two entities considered to be small.)

APTA also suggested that FRA should ensure “that this proposed rule’s requirements are commensurate to the size of the entity” and “compliance with this proposed rule should include flexibility, scalability, and program maturity as relevant factors to determine whether a program is fully implemented.” FRA does expect the structure and scope of a SSP will be commensurate with the size and maturity of the entity. FRA has regularly provided assistance to both new and smaller passenger entities, including the two small entities considered herein, with setting up their safety programs, and with approaches to hazard and risk management. FRA will continue to provide that assistance in the plan development phase of preparing their SSP Plans. The SSP regulation provides a scalable approach that will be easier to implement on a small railroad.

2. Certification

Pursuant to the Regulatory Flexibility Act (5 U.S.C. 605(b)), FRA certifies that this final rule will not have a significant economic impact on a substantial number of small entities. FRA invited all interested parties to submit data and information regarding the potential economic impact that will result from adoption of the proposals in the NPRM and has addressed those comments in determining that although a substantial number of small railroads will be affected by this final rule, none of these entities will be significantly impacted.

¹⁵ Regulatory Flexibility Act (5 U.S.C. 601 *et seq.*): “Small governmental jurisdictions” are governments of cities, counties, towns, townships, villages, school districts, or special districts with a population of less than 50,000.

C. Federalism

Executive Order 13132, “Federalism” (64 FR 43255, Aug. 10, 1999), requires FRA to develop an accountable process to ensure “meaningful and timely input by State and local officials in the development of regulatory policies that have federalism implications.” “Policies that have federalism implications” are defined in the Executive Order to include regulations that have “substantial direct effects on the States, on the relationship between the national government and the States, or on the distribution of power and responsibilities among the various levels of government.” Under Executive Order 13132, the agency may not issue a regulation with federalism implications that imposes substantial direct compliance costs and that is not required by statute, unless the Federal government provides the funds necessary to pay the direct compliance costs incurred by State and local governments or the agency consults with State and local government officials early in the process of developing the regulation. Where a regulation has federalism implications and preempts State law, the agency seeks to consult with State and local officials in the process of developing the regulation.

This final rule has been analyzed under the principles and criteria in Executive Order 13132. FRA has determined that this rule does not have substantial direct effects on the States, on the relationship between the national government and the States, or on the distribution of power and responsibilities among the various levels of government. In addition, FRA has determined that this rule does not impose substantial direct compliance costs on State and local governments. Therefore, the consultation and funding requirements of Executive Order 13132 do not apply.

This rule adds part 270, System Safety Program. FRA notes that this part could have preemptive effect by the operation of law under a provision of the former Federal Railroad Safety Act of 1970, repealed and codified at 49 U.S.C. 20106 (Sec. 20106). Sec. 20106 provides that States may not adopt or continue in effect any law, regulation, or order related to railroad safety or security that covers the subject matter of a regulation prescribed or order issued by the Secretary of Transportation (with respect to railroad safety matters) or the Secretary of Homeland Security (with respect to railroad security matters), except when the State law, regulation, or order qualifies under the “essentially

local safety or security hazard” exception to Sec. 20106. FRA has determined that certain State laws may be preempted by this part. FRA is aware of one State that has a State Safety Oversight program pursuant to 49 CFR part 659 that has certain elements that will be preempted by part 270. Further, § 270.105(d) specifically addresses the preemption of State discovery rules and sunshine laws to the extent those laws would require disclosure of information protected by § 270.105 in a Federal or State court proceedings for damages involving personal injury, wrongful death, or property damage. The preemption of State discovery rules and sunshine laws are discussed further in the section-by-section analysis of § 270.105(d). In addition, as previously discussed, section 20119(b) authorizes FRA to issue a rule governing the

discovery and use of risk analysis information in litigation.

In sum, FRA has analyzed this proposed rule under the principles and criteria in Executive Order 13132. As explained above, FRA has determined that this proposed rule has minimal federalism implications. Accordingly, FRA has determined that preparation of a federalism summary impact statement for this proposed rule is not required.

D. International Trade Impact Assessment

The Trade Agreement Act of 1979 prohibits Federal agencies from engaging in any standards or related activities that create unnecessary obstacles to the foreign commerce of the United States. Legitimate domestic objectives, such as safety, are not considered unnecessary obstacles. The

statute also requires consideration of international standards and where appropriate, that they be the basis for U.S. standards. This rulemaking is purely domestic in nature and is not expected to affect trade opportunities for U.S. firms doing business overseas or for foreign firms doing business in the United States.

E. Paperwork Reduction Act

The information collection requirements in this final rule are being submitted for approval to the Office of Management and Budget (OMB) under the Paperwork Reduction Act of 1995, 44 U.S.C. 3501 *et seq.* The sections that contain the new information collection requirements are duly designated, and the estimated time to fulfill each requirement is as follows:

CFR Section/Subject	Respondent universe	Total annual responses	Average time per response	Total annual burden hours
270.103—System Safety Program Plan (SSPP)—Comprehensive Written SSPP Meeting All of This Section’s Requirements.	30 railroads	30 plans	40 hours (32 hrs. for plan + 8 hrs. review).	1,200
—System Safety Training by RR of Employees/Contractors/Others.	30 railroads	450 trained individuals	2 hours	900
—Records of System Safety Trained Employees/Contractors/Others.	30 railroads	450 records	2 minutes	15
—Furnishing of RR Results of Risk-based Hazard Analysed Upon FRA/Participating Part 212 States.	30 railroads	10 analyses results	20 hours	200
—Furnishing of Descriptions of Railroad’s Specific Risk Mitigation Methods That Address Hazards Upon FRA Request.	30 railroads	10 mitigation methods descriptions.	10 hours	100
—Furnishing of Results of Railroad’s Technology Analysis Upon FRA/Participating Part 212 States’ Request.	30 railroads	30 results of technology analysis.	40 hours	1,200
270.107(a)—Consultation Requirements—RR Consultation with Its Directly Affected Employees on System Safety Program Plan (SSPP).	30 railroads	30 consults (w/labor union reps.).	40 hours	1,200
—RR Notification to Directly Affected Employees of Preliminary Meeting at Least 60 Days Before Being Held.	30 railroads	30 notices	8 hours	240
—(b) RR Consultation Statements	30 railroads	28 statements + 2 statement.	80 hours + 2 hours	2,244
—Copies of Consultations Statements by RR to Service List Individuals.	30 railroads	30 copies	1 minute	1
270.201—SSPPs Found Deficient by FRA and Requiring Amendment.	30 railroads	4 amended plans	40 hours	160
—Review of Amended SSPPs Found Deficient and Requiring Amendment.	30 railroads	1 amended plans	40 hours	40
—Reopened Review of Initial SSPP Approval For Cause Stated.	30 railroads	2 amended plans	40 hours	80
270.203—Retention of SSPPs	30 railroads	37 copies	10 minutes	6
—Retained copies of SSPPs	30 railroads	30 evaluation reports ...	40 hours	1,200
270.303—Annual Internal SSPP Assessments/ Reports Conducted by RRs.	30 railroads	30 statements	8 hours	240
—Certification of Results of RR Internal Assessment by Chief Safety Official.	30 railroads	6 plans	40 hours	240
270.305—External Safety Audit	30 railroads	2 amended plans	24 hours	48
—RR Submission of Improvement Plans in Response to Results of FRA Audit.	30 railroads	2 reports	4 hours	8
—Improvement Plans Found Deficient by FRA and Requiring Amendment.	30 railroads	2 reports	4 hours	8
—RR Status Report to FRA of Implementation of Improvements Set Forth in the Improvement Plan.	30 railroads	2 documents	30 minutes	1
Appendix B—Additional Documents Provided to FRA Upon Request.	30 railroads	2 documents	30 minutes	1

CFR Section/Subject	Respondent universe	Total annual responses	Average time per response	Total annual burden hours
—Notifications/Good Faith Consultation with Non-Represented Employees by RRs.	2 railroads	2 notices/consults	8 hours	16
—Meeting with Non-Represented Employees within 180 Days of Final Rule Effective Date About Consultation Process.	2 railroads	2 meetings	8 hours	16
Appendix C—Written Requests by RRs to File Required Submissions Electronically.	30 railroads	20 written requests	30 minutes	10
Totals	30 railroads	1,240 replies/responses	6.832 hours	9,365

All estimates include the time for reviewing instructions; searching existing data sources; gathering or maintaining the needed data; and reviewing the information. For information or a copy of the paperwork package submitted to OMB, contact Mr. Robert Brogan at 202-493-6292 or Ms. Kimberly Toone at 202-493-6132 or via email at the following addresses: *Robert.Brogan@dot.gov*; or *Kim.Toone@dot.gov*.

Organizations and individuals desiring to submit comments on the collection of information requirements should direct them to the Office of Management and Budget, Office of Information and Regulatory Affairs, Washington, DC 20503, Attention: FRA Desk Officer. Comments may also be sent via email to the Office of Management and Budget at the following address: *oira_submissions@omb.eop.gov*

OMB is required to make a decision concerning the collection of information requirements contained in this final rule between 30 and 60 days after publication of this document in the **Federal Register**. Therefore, a comment to OMB is best assured of having its full effect if OMB receives it within 30 days of publication.

FRA is not authorized to impose a penalty on persons for violating information collection requirements which do not display a current OMB control number, if required. FRA intends to obtain current OMB control numbers for any new information collection requirements resulting from this rulemaking action prior to the effective date of the final rule. The OMB control number, when assigned, will be announced by separate notice in the **Federal Register**.

F. Environmental Assessment

FRA has evaluated this rule under its “Procedures for Considering Environmental Impacts” (FRA’s Procedures) (64 FR 28545, May 26, 1999) as required by the National Environmental Policy Act (42 U.S.C. 4321 *et seq.*), other environmental

statutes, Executive Orders, and related regulatory requirements. FRA has determined that this rule is not a major FRA action (requiring the preparation of an environmental impact statement or environmental assessment) because it is categorically excluded from detailed environmental review pursuant to section 4(c)(20) of FRA’s Procedures. See 64 FR 28547, May 26, 1999. Section 4(c)(20) reads as follows: “(c) Actions categorically excluded. Certain classes of FRA actions have been determined to be categorically excluded from the requirements of these Procedures as they do not individually or cumulatively have a significant effect on the human environment. * * * The following classes of FRA actions are categorically excluded:

* * * (20) Promulgation of railroad safety rules and policy statements that do not result in significantly increased emissions or air or water pollutants or noise or increased traffic congestion in any mode of transportation.”

Consistent with section 4(c) and (e) of FRA’s Procedures, the agency has further concluded that no extraordinary circumstances exist with respect to this regulation that might trigger the need for a more detailed environmental review. As a result, FRA finds that this rule is not a major Federal action significantly affecting the quality of the human environment.

G. Unfunded Mandates Reform Act of 1995

Pursuant to section 201 of the Unfunded Mandates Reform Act of 1995 (Public Law 104-4, 2 U.S.C. 1531), each Federal agency “shall, unless otherwise prohibited by law, assess the effects of Federal regulatory actions on State, local, and tribal governments, and the private sector (other than to the extent that such regulations incorporate requirements specifically set forth in law).” Section 202 of the Act (2 U.S.C. 1532) further requires that “before promulgating any general notice of proposed rulemaking that is likely to result in the promulgation of any rule that includes any Federal mandate that

may result in expenditure by State, local, and tribal governments, in the aggregate, or by the private sector, of \$100,000,000 or more (adjusted annually for inflation) in any 1 year, and before promulgating any final rule for which a general notice of proposed rulemaking was published, the agency shall prepare a written statement” detailing the effect on State, local, and tribal governments and the private sector. For the year 2015, this monetary amount of \$100,000,000 has been adjusted to \$156,000,000 to account for inflation. This final rule will not result in the expenditure of more than \$156,000,000 by the public sector in any one year, and thus preparation of such a statement is not required.

H. Energy Impact

Executive Order 13211 requires Federal agencies to prepare a Statement of Energy Effects for any “significant energy action.” 66 FR 28355, May 22, 2001. Under the Executive Order, a “significant energy action” is defined as any action by an agency (normally published in the **Federal Register**) that promulgates, or is expected to lead to the promulgation of, a final rule or regulation (including a notice of inquiry, advance notice of proposed rulemaking, and notice of proposed rulemaking) that (1)(i) is a significant regulatory action under Executive Order 12866 or any successor order and (ii) is likely to have a significant adverse effect on the supply, distribution, or use of energy; or (2) is designated by the Administrator of the Office of Information and Regulatory Affairs as a significant energy action. FRA has evaluated this rule under Executive Order 13211. FRA has determined that this rule will not have a significant adverse effect on the supply, distribution, or use of energy. Consequently, FRA has determined that this regulatory action is not a “significant energy action” within the meaning of Executive Order 13211.

I. Privacy Act

Interested parties should be aware that anyone is able to search the electronic form of all comments received into any agency docket by the name of the individual submitting the comment (or signing the comment, if submitted on behalf of an association, business, labor union, etc.). You may review DOT's complete Privacy Act Statement in the **Federal Register** published on April 11, 2000 (65 FR 19477–78), or you may visit <http://www.transportation.gov/privacy.html>.

List of Subjects in 49 CFR Part 270

Penalties; Railroad safety; Reporting and recordkeeping requirements; and System safety.

The Rule

■ In consideration of the foregoing, FRA adds part 270 to Chapter II, Subtitle B of Title 49, Code of Federal Regulations, to read as follows:

PART 270—SYSTEM SAFETY PROGRAM

Subpart A—General

Sec.

270.1 Purpose and scope.

270.3 Application.

270.5 Definitions.

270.7 Penalties and responsibility for compliance.

Subpart B—System Safety Program Requirements

270.101 System safety program; general.

270.103 System safety program plan.

270.105 Discovery and admission as evidence of certain information.

270.107 Consultation requirements.

Subpart C—Review, Approval, and Retention of System Safety Program Plans

270.201 Filing and approval.

270.203 Retention of system safety program plan.

Subpart D—System Safety Program Internal Assessments and External Auditing

270.301 General.

270.303 Internal system safety program assessment.

270.305 External safety audit.

Appendix A to Part 270—Schedule of Civil Penalties

Appendix B to Part 270—Federal Railroad Administration Guidance on the System Safety Program Consultation Process

Appendix C to Part 270—Procedures for Submission of SSP Plans and Statements from Directly Affected Employees

Authority: 49 U.S.C. 20103, 20106–20107, 20118–20119, 20156, 21301, 21304, 21311; 28 U.S.C. 2461, note; and 49 CFR 1.89.

Subpart A—General

§ 270.1 Purpose and scope.

(a) The purpose of this part is to improve railroad safety through structured, proactive processes and procedures developed and implemented by railroads. This part requires certain railroads to establish a system safety program that systematically evaluates railroad safety hazards and the resulting risks on their systems and manages those risks to reduce the number and rates of railroad accidents, incidents, injuries, and fatalities.

(b) This part prescribes minimum Federal safety standards for the preparation, adoption, and implementation of railroad system safety programs. This part does not restrict railroads from adopting and enforcing additional or more stringent requirements not inconsistent with this part.

(c) This part prescribes the protection of information generated solely for the purpose of planning, implementing, or evaluating a system safety program under this part.

§ 270.3 Application.

(a) Except as provided in paragraph (b) of this section, this part applies to all—

(1) Railroads that operate intercity or commuter passenger train service on the general railroad system of transportation; and

(2) Railroads that provide commuter or other short-haul rail passenger train service in a metropolitan or suburban area (as described by 49 U.S.C. 20102(2)), including public authorities operating passenger train service.

(b) This part does not apply to:

(1) Rapid transit operations in an urban area that are not connected to the general railroad system of transportation;

(2) Tourist, scenic, historic, or excursion operations, whether on or off the general railroad system of transportation;

(3) Operation of private cars, including business/office cars and circus trains; or

(4) Railroads that operate only on track inside an installation that is not part of the general railroad system of transportation (*i.e.*, plant railroads, as defined in § 270.5).

§ 270.5 Definitions.

As used in this part—

Administrator means the Federal Railroad Administrator or his or her delegate.

Configuration management means a process that ensures that the

configurations of all property, equipment, and system design elements are accurately documented.

FRA means the Federal Railroad Administration.

Fully implemented means that all elements of a system safety program as described in the SSP plan are established and applied to the safety management of the railroad.

Hazard means any real or potential condition (as identified in the railroad's risk-based hazard analysis) that can cause injury, illness, or death; damage to or loss of a system, equipment, or property; or damage to the environment.

Passenger means a person, excluding an on-duty employee, who is on board, boarding, or alighting from a rail vehicle for the purpose of travel.

Person means an entity of any type covered under 1 U.S.C. 1, including, but not limited to, the following: a railroad; a manager, supervisor, official, or other employee or agent of a railroad; any owner, manufacturer, lessor, or lessee of railroad equipment, track, or facilities; any independent contractor or subcontractor providing goods or services to a railroad; and any employee of such owner, manufacturer, lessor, lessee, or independent contractor or subcontractor.

Plant railroad means a plant or installation that owns or leases a locomotive, uses that locomotive to switch cars throughout the plant or installation, and is moving goods solely for use in the facility's own industrial processes. The plant or installation could include track immediately adjacent to the plant or installation if the plant railroad leases the track from the general system railroad and the lease provides for (and actual practice entails) the exclusive use of that trackage by the plant railroad and the general system railroad for purposes of moving only cars shipped to or from the plant. A plant or installation that operates a locomotive to switch or move cars for other entities, even if solely within the confines of the plant or installation, rather than for its own purposes or industrial processes, is not considered a plant railroad because the performance of such activity makes the operation part of the general railroad system of transportation.

Positive train control system means a system designed to prevent train-to-train collisions, overspeed derailments, incursions into established work zone limits, and the movement of a train through a switch left in the wrong position, as described in subpart I of part 236 of this chapter.

Rail vehicle means railroad rolling stock, including, but not limited to, passenger and maintenance vehicles.

Railroad means—

(1) Any form of non-highway ground transportation that runs on rails or electromagnetic guideways, including—

(i) Commuter or other short-haul rail passenger service in a metropolitan or suburban area and commuter railroad service that was operated by the Consolidated Rail Corporation on January 1, 1979; and

(ii) High speed ground transportation systems that connect metropolitan areas, without regard to whether those systems use new technologies not associated with traditional railroads, but does not include rapid transit operations in an urban area that are not connected to the general railroad system of transportation; and

(2) A person or organization that provides railroad transportation, whether directly or by contracting out operation of the railroad to another person.

Risk means the combination of the probability (or frequency of occurrence) and the consequence (or severity) of a hazard.

Risk-based hazard management means the processes (including documentation) used to identify and analyze hazards, assess and rank corresponding risks, and eliminate or mitigate the resulting risks.

Safety culture means the shared values, actions and behaviors that demonstrate commitment to safety over competing goals and demands.

SSP plan means system safety program plan.

System safety means the application of management, economic, and engineering principles and techniques to optimize all aspects of safety, within the constraints of operational effectiveness, time, and cost, throughout all phases of a system life cycle.

System safety program means a comprehensive process for the application of management and engineering principles and techniques to optimize all aspects of safety.

System safety program plan means a document developed by the railroad that implements and supports the railroad's system safety program.

Tourist, scenic, historic, or excursion operations means railroad operations that carry passengers, often using antiquated equipment, with the conveyance of the passengers to a particular destination not being the principal purpose. Train movements of new passenger equipment for demonstration purposes are not tourist, scenic, historic, or excursion operations.

§ 270.7 Penalties and responsibility for compliance.

(a) Any person who violates any requirement of this part or causes the violation of any such requirement is subject to a civil penalty of at least \$839 and not more than \$27,455 per violation, except that: Penalties may be assessed against individuals only for willful violations, and, where a grossly negligent violation or a pattern of repeated violation has created an imminent hazard of death or injury to persons, or has caused death or injury, a penalty not to exceed \$109,819 per violation may be assessed. Each day a violation continues shall constitute a separate offense. Any person who knowingly and willfully falsifies a record or report required by this part may be subject to criminal penalties under 49 U.S.C. 21311 (formerly codified in 45 U.S.C. 438(e)). Appendix A to this part contains a schedule of civil penalty amounts used in connection with this part.

(b) Although the requirements of this part are stated in terms of the duty of a railroad, when any person, including a contractor or subcontractor to a railroad, performs any function covered by this part, that person (whether or not a railroad) shall perform that function in accordance with this part.

Subpart B—System Safety Program Requirements

§ 270.101 System safety program; general.

(a) Each railroad subject to this part shall establish and fully implement a system safety program that continually and systematically evaluates railroad safety hazards on its system and manages the resulting risks to reduce the number and rates of railroad accidents, incidents, injuries, and fatalities. A system safety program shall include a risk-based hazard management program and risk-based hazard analysis designed to proactively identify hazards and mitigate or eliminate the resulting risks. The system safety program shall be fully implemented and supported by a written SSP plan described in § 270.103.

(b) A railroad's system safety program shall be designed so that it promotes and supports a positive safety culture at the railroad.

§ 270.103 System safety program plan.

(a) *General.* (1) Each railroad subject to this part shall adopt and fully implement a system safety program through a written SSP plan that, at a minimum, contains the elements in this section. This SSP plan shall be

approved by FRA under the process specified in § 270.201.

(2) Each railroad subject to this part shall communicate with each railroad that hosts passenger train service for that railroad and coordinate the portions of the SSP plan applicable to the railroad hosting the passenger train service.

(b) *System safety program policy statement.* Each railroad shall set forth in its SSP plan a policy statement that endorses the railroad's system safety program. This policy statement shall:

(1) Define the railroad's authority for the establishment and implementation of the system safety program;

(2) Describe the safety philosophy and safety culture of the railroad; and

(3) Be signed by the chief official at the railroad.

(c) *System safety program goals.* Each railroad shall set forth in its SSP plan a statement defining the goals for the railroad's system safety program. This statement shall describe clear strategies on how the goals will be achieved and what management's responsibilities are to achieve them. At a minimum, the goals shall be:

(1) Long-term;

(2) Meaningful;

(3) Measurable; and

(4) Focused on the identification of hazards and the mitigation or elimination of the resulting risks.

(d) *Railroad system description.* (1) Each railroad shall set forth in its SSP plan a statement describing the railroad's system. The description shall include: the railroad's operations, including any host operations; the physical characteristics of the railroad; the scope of service; the railroad's maintenance activities; and any other pertinent aspects of the railroad's system.

(2) Each railroad shall identify the persons that enter into a contractual relationship with the railroad to either perform significant safety-related services on the railroad's behalf or to utilize significant safety-related services provided by the railroad for purposes related to railroad operations.

(3) Each railroad shall describe the relationships and responsibilities between the railroad and: host railroads, contract operators, shared track/corridor operators, and persons providing or utilizing significant safety-related services as identified by the railroad pursuant to paragraph (d)(2) of this section.

(e) *Railroad management and organizational structure.* Each railroad shall set forth a statement in its SSP plan that describes the management and organizational structure of the railroad.

This statement shall include the following:

- (1) A chart or other visual representation of the organizational structure of the railroad;
- (2) A description of the railroad's management responsibilities within the system safety program;
- (3) A description of how safety responsibilities are distributed within the railroad organization;
- (4) Clear identification of the lines of authority used by the railroad to manage safety issues; and
- (5) A description of the roles and responsibilities in the railroad's system safety program for each host railroad, contract operator, shared track/corridor operator, and any persons utilizing or providing significant safety-related services as identified by the railroad pursuant to (d)(2) of this section. As part of this description, the railroad shall describe how each host railroad, contractor operator, shared track/corridor operator, and any persons utilizing or providing significant safety-related services as identified by the railroad pursuant to paragraph (d)(2) of this section supports and participates in the railroad's system safety program, as appropriate.

(f) *System safety program implementation process.* (1) Each railroad shall set forth a statement in its SSP plan that describes the process the railroad will use to implement its system safety program. As part of the railroad's implementation process, the railroad shall describe:

- (i) Roles and responsibilities of each position that has significant responsibility for implementing the system safety program, including those held by employees and other persons utilizing or providing significant safety-related services as identified by the railroad pursuant to (d)(2) of this section; and
- (ii) Milestones necessary to be reached to fully implement the program.

(2) A railroad's system safety program shall be fully implemented within 36 months of FRA's approval of the SSP plan pursuant to subpart C of this part.

(g) *Maintenance, repair, and inspection program.* (1) Each railroad shall identify and describe in its SSP plan the processes and procedures used for maintenance and repair of infrastructure and equipment directly affecting railroad safety. Examples of infrastructure and equipment that directly affect railroad safety include: Fixed facilities and equipment, rolling stock, signal and train control systems, track and right-of-way, passenger train/station platform interface (gaps), and traction power distribution systems.

(2) Each description of the processes and procedures used for maintenance and repair of infrastructure and equipment directly affecting safety shall include the processes and procedures used to conduct testing and inspections of the infrastructure and equipment.

(3) If a railroad has a manual or manuals that comply with all applicable Federal regulations and that describe the processes and procedures that satisfy this section, the railroad may reference those manuals in its SSP plan. FRA approval of a SSP plan that contains or references such manuals is not approval of the manuals themselves; each manual must independently comply with applicable regulations and is subject to a civil penalty if not in compliance with applicable regulations.

(4) The identification and description required by this section of the processes and procedures used for maintenance, repair, and inspection of infrastructure and equipment directly affecting railroad safety is not intended to address and should not include procedures to address employee working conditions that arise in the course of conducting such maintenance, repair, and inspection of infrastructure and equipment directly affecting railroad safety as set forth in the plan. FRA does not intend to approve any specific portion of a SSP plan that relates exclusively to employee working conditions.

(h) *Rules compliance and procedures review.* Each railroad shall set forth a statement describing the processes and procedures used by the railroad to develop, maintain, and comply with the railroad's rules and procedures directly affecting railroad safety and to comply with the applicable railroad safety laws and regulations found in this chapter. The statement shall identify:

- (1) The railroad's operating and safety rules and maintenance procedures that are subject to review under this chapter;
- (2) Techniques used to assess the compliance of the railroad's employees with the railroad's operating and safety rules and maintenance procedures, and applicable railroad safety laws and regulations; and
- (3) Techniques used to assess the effectiveness of the railroad's supervision relating to the compliance with the railroad's operating and safety rules and maintenance procedures, and applicable railroad safety laws and regulations.

(i) *System safety program employee/contractor training.* (1) Each employee who is responsible for implementing and supporting the system safety program, and any persons utilizing or providing significant safety-related

services will be trained on the railroad's system safety program.

(2) Each railroad shall establish and describe in its SSP plan the railroad's system safety program training plan. A system safety program training plan shall set forth the procedures by which employees that are responsible for implementing and supporting the system safety program, and any persons utilizing or providing significant safety-related services will be trained on the railroad's system safety program. A system safety program training plan shall help ensure that all personnel who are responsible for implementing and supporting the system safety program understand the goals of the program, are familiar with the elements of the program, and have the requisite knowledge and skills to fulfill their responsibilities under the program.

(3) For each position identified pursuant to paragraph (f)(1)(i) of this section, the training plan shall describe the frequency and content of the system safety program training that the position receives.

(4) If a position is not identified under paragraph (f)(1)(i) of this section as having significant responsibility to implement the system safety program but the position is safety-related or has a significant impact on safety, personnel in those positions shall receive training in basic system safety concepts and the system safety implications of their position.

(5) Training under this subpart may include, but is not limited to, classroom, computer-based, or correspondence training.

(6) The railroad shall keep a record of all training conducted under this part and update that record as necessary. The system safety program training plan shall set forth the process used to maintain and update the necessary training records required by this part.

(7) The system safety program training plan shall set forth the process used by the railroad to ensure that it is complying with the training requirements set forth in the training plan.

(j) *Emergency management.* Each railroad shall set forth a statement in its SSP plan that describes the processes used by the railroad to manage emergencies that may arise within its system including, but not limited to, the processes to comply with applicable emergency equipment standards in part 238 of this chapter and the passenger train emergency preparedness requirements in part 239 of this chapter.

(k) *Workplace safety.* Each railroad shall set forth a statement in its SSP plan that describes the programs

established by the railroad that protect the safety of the railroad's employees and contractors. The statement shall include a description of:

(1) The processes that help ensure the safety of employees and contractors while working on or in close proximity to the railroad's property as described in paragraph (d) of this section;

(2) The processes that help ensure that employees and contractors understand the requirements established by the railroad pursuant to paragraph (f)(1) of this section;

(3) Any fitness-for-duty programs or any medical monitoring programs; and

(4) The standards for the control of alcohol and drug use in part 219 of this chapter.

(l) *Public safety outreach program.* Each railroad shall establish and set forth a statement in its SSP plan that describes its public safety outreach program to provide safety information to railroad passengers and the general public. Each railroad's safety outreach program shall provide a means for railroad passengers and the general public to report any observed hazards.

(m) *Accident/incident reporting and investigation.* Each railroad shall set forth a statement in its SSP plan that describes the processes that the railroad uses to receive notification of accidents/incidents, investigate and report those accidents/incidents, and develop, implement, and track any corrective actions found necessary to address an investigation's finding(s).

(n) *Safety data acquisition.* Each railroad establish and shall set forth a statement in its SSP plan that describes the processes it uses to collect, maintain, analyze, and distribute safety data in support of the system safety program.

(o) *Contract procurement requirements.* Each railroad shall set forth a statement in its SSP plan that describes the process(es) used to help ensure that safety concerns and hazards are adequately addressed during the safety-related contract procurement process.

(p) *Risk-based hazard management program.* Each railroad shall establish a risk-based hazard management program as part of the railroad's system safety program. The risk-based hazard management program shall be fully described in the SSP plan.

(1) The risk-based hazard management program shall establish:

(i) The processes or procedures used in the risk-based hazard analysis to identify hazards on the railroad's system;

(ii) The processes or procedures used in the risk-based hazard analysis to

analyze identified hazards and support the risk-based hazard management program;

(iii) The methods used in the risk-based hazard analysis to determine the severity and frequency of hazards and to determine the corresponding risk;

(iv) The methods used in the risk-based hazard analysis to identify actions that mitigate or eliminate hazards and corresponding risks;

(v) The process for setting goals for the risk-based hazard management program and how performance against the goals will be reported;

(vi) The process to make decisions that affect the safety of the rail system relative to the risk-based hazard management program;

(vii) The methods used in the risk-based hazard management program to support continuous safety improvement throughout the life of the rail system; and

(viii) The methods used to maintain records of identified hazards and risks and the mitigation or elimination of the identified hazards and risks throughout the life of the rail system.

(2) The railroad's description of the risk-based hazard management program shall include:

(i) The position title of the individual(s) responsible for administering the risk-based hazard management program;

(ii) The identities of stakeholders who will participate in the risk-based hazard management program; and

(iii) The position title of the participants and structure of any hazard management teams or safety committees that a railroad may establish to support the risk-based hazard management program.

(q) *Risk-based hazard analysis.* (1) Once FRA approves a railroad's SSP plan pursuant to § 270.201(b), the railroad shall apply the risk-based hazard analysis methodology identified in paragraphs (p)(1)(i) through (iii) of this section to identify and analyze hazards on the railroad system and to determine the resulting risks. At a minimum, the aspects of the railroad system that shall be analyzed include: Operating rules and practices, infrastructure, equipment, employee levels and schedules, management structure, employee training, and other aspects that have an impact on railroad safety not covered by railroad safety regulations or other Federal regulations.

(2) A risk-based hazard analysis shall identify and the railroad shall implement specific actions using the methods described in paragraph (p)(1)(iv) of this section that will mitigate or eliminate the hazards and

resulting risks identified by paragraph (q)(1) of this section.

(3) A railroad shall also conduct a risk-based hazard analysis pursuant to paragraphs (q)(1) and (2) of this section when there are significant operational changes, system extensions, system modifications, or other circumstances that have a direct impact on railroad safety.

(r) *Technology analysis and implementation plan.* (1) A railroad shall develop, and periodically update as necessary, a technology analysis and implementation plan as described by this paragraph. The railroad shall include this technology analysis and implementation plan in its SSP plan.

(2) A railroad's technology analysis and implementation plan shall describe the process the railroad will use to:

(i) Identify and analyze current, new, or novel technologies that will mitigate or eliminate the hazards and resulting risks identified by the risk-based hazard analysis pursuant to paragraph (q)(1) of this section; and

(ii) Analyze the safety impact, feasibility, and costs and benefits of implementing the technologies identified by the processes under paragraph (r)(2)(i) of this section that will mitigate or eliminate hazards and the resulting risks.

(3) Once FRA approves a railroad's SSP plan pursuant to § 270.201(b), including the technology analysis and implementation plan, the railroad shall apply:

(i) The processes described in paragraph (r)(2)(i) of this section to identify and analyze technologies that will mitigate or eliminate the hazards and resulting risks identified by the risk-based hazard analysis pursuant to paragraph (q)(1) of this section. At a minimum, the technologies a railroad shall consider as part of its technology analysis are: Processor-based technologies, positive train control systems, electronically-controlled pneumatic brakes, rail integrity inspection systems, rail integrity warning systems, switch position monitors and indicators, trespasser prevention technology, and highway-rail grade crossing warning and protection technology; and

(ii) The processes described in paragraph (r)(2)(ii) of this section to the technologies identified by the analysis under paragraph (r)(3)(i) of this section.

(4) If a railroad decides to implement any of the technologies identified in paragraph (r)(3) of this section, in the technology analysis and implementation plan in the SSP plan, the railroad shall:

(i) Describe how it will develop, adopt, implement, maintain, and use the identified technologies; and

(ii) Set forth a prioritized implementation schedule for the development, adoption, implementation and maintenance of those technologies over a 10-year period.

(5) Except as required by subpart I of part 236 of this chapter, if a railroad decides to implement a positive train control system as part of its technology analysis and implementation plan, the railroad shall set forth and comply with a schedule for implementation of the positive train control system consistent with the deadlines in the Positive Train Control Enforcement and Implementation Act of 2015, Public Law 114–73, 129 Stat. 576–82 (Oct. 29, 2015), and 49 CFR 236.1005(b)(7).

(6) The railroad shall not include in its SSP plan the analysis conducted pursuant to paragraph (r)(3) of this section. The railroad shall make the results of any analysis conducted pursuant to paragraph (r)(3) of this section available upon request to representatives of FRA and States participating under part 212 of this chapter.

(s) *Safety Assurance*—(1) *Change management*. Each railroad shall establish and set forth a statement in its SSP plan describing the processes and procedures used by the railroad to manage significant operational changes, system extensions, system modifications, or other significant changes that will have a direct impact on railroad safety.

(2) *Configuration management*. Each railroad shall establish a configuration management program and describe the program in its SSP plan. The configuration management program shall—

(i) Identify who within the railroad has authority to make configuration changes;

(ii) Establish processes to make configuration changes to the railroad's system; and

(iii) Establish processes to ensure that all departments of the railroad affected by the configuration changes are formally notified and approve of the change.

(3) *Safety certification*. Each railroad shall establish and set forth a statement in its SSP plan that describes the certification process used by the railroad to help ensure that safety concerns and hazards are adequately addressed before the initiation of operations or major projects to extend, rehabilitate, or modify an existing system or replace vehicles and equipment.

(t) *Safety culture*. A railroad shall set forth a statement in its SSP plan that describes how it measures the success of its safety culture identified in paragraph (b)(2) of this section.

§ 270.105 Discovery and admission as evidence of certain information.

(a) *Protected information*. Any information compiled or collected after August 14, 2017, solely for the purpose of planning, implementing, or evaluating a system safety program under this part shall not be subject to discovery, admitted into evidence, or considered for other purposes in a Federal or State court proceedings for damages involving personal injury, wrongful death, or property damage. For purposes of this section—

(1) “Information” includes plans, reports, documents, surveys, schedules, lists, or data, and specifically includes a railroad's analysis of its safety risks under § 270.103(q)(1) and a railroad's statement of mitigation measures under § 270.103(q)(2); and

(2) “Solely” means that a railroad originally compiled or collected the information for the exclusive purpose of planning, implementing, or evaluating a system safety program under this part. Information compiled or collected for any other purpose is not protected, even if the railroad also uses that information for a system safety program. “Solely” also means that a railroad continues to use that information only for its system safety program. If a railroad subsequently uses for any other purpose information that was initially compiled or collected for a system safety program, this section does not protect that information to the extent that it is used for the non-system safety program purpose. The use of that information within the railroad's system safety program, however, remains protected. This section does not protect information that is required to be compiled or collected pursuant to any other provision of law or regulation.

(b) *Non-protected information*. This section does not affect the discovery, admissibility, or consideration for other purposes in a Federal or State court proceedings for damages involving personal injury, wrongful death, or property damage of information compiled or collected for a purpose other than that specifically identified in paragraph (a) of this section. Such information shall continue to be discoverable, admissible, or considered for other purposes in a Federal or State court proceedings for damages involving personal injury, wrongful death, or property damage if it was discoverable, admissible, or considered for other

purposes in a Federal or State court proceedings for damages involving personal injury, wrongful death, or property damage on or before August 14, 2017. Specifically, the types of information not affected by this section include:

(1) Information compiled or collected on or before August 14, 2017;

(2) Information compiled or collected on or before August 14, 2017, and that continues to be compiled or collected, even if used to plan, implement, or evaluate a railroad's system safety program; or

(3) Information that is compiled or collected after August 14, 2017, and is compiled or collected for a purpose other than that identified in paragraph (a) of this section.

(c) *Information protected by other law or regulation*. Nothing in this section shall affect or abridge in any way any other protection of information provided by another provision of law or regulation. Any such provision of law or regulation applies independently of the protections provided by this section.

(d) *Preemption*. To the extent that State discovery rules and sunshine laws would require disclosure of information protected by this section in a Federal or State court proceedings for damages involving personal injury, wrongful death, or property damage, those rules and laws are preempted.

§ 270.107 Consultation requirements.

(a) *General duty*. (1) Each railroad required to establish a system safety program under this part shall in good faith consult with, and use its best efforts to reach agreement with, all of its directly affected employees, including any non-profit labor organization representing a class or craft of directly affected employees, on the contents of the SSP plan.

(2) A railroad that consults with such a non-profit employee labor organization as required by paragraph (a)(1) of this section is considered to have consulted with the directly affected employees represented by that organization. If a railroad contracts out significant portions of its operations, the contractor and the contractor's employees performing the railroad's operations shall be considered directly affected employees for the purposes of this part.

(3) A railroad shall have a preliminary meeting with its directly affected employees to discuss how the consultation process will proceed. A railroad is not required to discuss the substance of a SSP plan during this preliminary meeting. A railroad must:

(i) Hold the preliminary meeting no later than April 10, 2017; and

(ii) Notify the directly affected employees of the preliminary meeting no less than 60 days before it is held.

(4) Appendix B to this part contains non-mandatory guidance on how a railroad may comply with the requirements of this section.

(b) *Railroad consultation statements.* A railroad required to submit a SSP plan under § 270.201 must also submit, together with the plan, a consultation statement that includes the following information:

(1) A detailed description of the process the railroad utilized to consult with its directly affected employees;

(2) If the railroad could not reach agreement with its directly affected employees on the contents of its SSP plan, identification of any known areas of disagreement and an explanation of why it believes agreement was not reached; and

(3) A service list containing the name and contact information for each international/national president of any non-profit employee labor organization representing a class or craft of the railroad's directly affected employees. The service list must also contain the name and contact information for any directly affected employee who significantly participated in the consultation process independently of a non-profit employee labor organization. When a railroad submits its SSP plan and consultation statement to FRA pursuant to § 270.201, it must also simultaneously send a copy of these documents to all individuals identified in the service list.

(c) *Statements from directly affected employees.* (1) If a railroad and its directly affected employees cannot reach agreement on the proposed contents of a SSP plan, the directly affected employees may file a statement with the FRA Associate Administrator for Railroad Safety and Chief Safety Officer explaining their views on the plan on which agreement was not reached with the FRA Associate Administrator for Railroad Safety and Chief Safety Officer at Mail Stop 25, 1200 New Jersey Ave SE., Washington, DC 20590. The FRA Associate Administrator for Railroad Safety and Chief Safety Officer shall consider any such views during the plan review and approval process.

(2) A railroad's directly affected employees have 30 days following the date of the railroad's submission of a proposed SSP plan to submit the statement described in paragraph (c)(1) of this section.

(d) *Consultation requirements for system safety program plan amendments.* A railroad's SSP plan must include a description of the process the railroad will use to consult with its directly affected employees on any subsequent substantive amendments to the railroad's system safety program. The requirements of this paragraph do not apply to non-substantive amendments (e.g., amendments that update names and addresses of railroad personnel).

Subpart C—Review, Approval, and Retention of System Safety Program Plans

§ 270.201 Filing and approval.

(a) *Filing.* (1) Each railroad to which this part applies shall submit one copy of its SSP plan to the FRA Associate Administrator for Railroad Safety and Chief Safety Officer, Mail Stop 25, 1200 New Jersey Avenue SE., Washington, DC 20590, no later than February 8, 2018 or not less than 90 days before commencing operations, whichever is later.

(2) The railroad shall not include in its SSP plan the risk-based hazard analysis conducted pursuant to § 270.103(q). The railroad shall make the results of any risk-based hazard analysis available upon request to representatives of FRA and States participating under part 212 of this chapter.

(3) The SSP plan shall include:

(i) The signature, name, title, address, and telephone number of the chief safety officer who bears primary managerial authority for implementing the program for the submitting railroad. By signing, this chief official is certifying that the contents of the SSP plan are accurate and that the railroad will implement the contents of the program as approved by FRA;

(ii) The contact information for the primary person responsible for managing the system safety program; and

(iii) The contact information for the senior representatives of any host railroad, contract operator, shared track/corridor operator or persons utilizing or providing significant safety-related services.

(4) As required by § 270.107(b), each railroad must submit with its SSP plan a consultation statement describing how it consulted with its directly affected employees on the contents of its system safety program plan. Directly affected employees may also file a statement in accordance with § 270.107(c).

(b) *Approval.* (1) Within 90 days of receipt of a SSP plan, FRA will review

the SSP plan to determine if the elements prescribed in this part are sufficiently addressed in the railroad's submission. This review will also consider any statement submitted by directly affected employees pursuant to § 270.107(c).

(2) FRA will notify each person identified by the railroad in § 270.201(a)(3) in writing whether the proposed plan has been approved by FRA, and, if not approved, the specific points in which the SSP plan is deficient. FRA will also provide this notification to each individual identified in the service list accompanying the consultation statement required under § 270.107(b).

(3) If FRA does not approve a SSP plan, the affected railroad shall amend the proposed plan to correct all deficiencies identified by FRA and provide FRA with a corrected copy of the SSP plan not later than 90 days following receipt of FRA's written notice that the proposed SSP plan was not approved.

(4) Approval of a railroad's SSP plan under this part does not constitute approval of the specific actions the railroad will implement under its SSP plan pursuant to § 270.103(q)(2) and shall not be construed as establishing a Federal standard regarding those specific actions.

(c) *Review of amendments.* (1)(i) A railroad shall submit any amendment(s) to the SSP plan to FRA not less than 60 days before the proposed effective date of the amendment(s). The railroad shall file the amended SSP plan with a cover letter outlining the changes made to the original approved SSP plan by the proposed amendment(s). The cover letter shall also describe the process the railroad used pursuant to § 270.107(d) to consult with its directly affected employees on the amendment(s).

(ii) If an amendment is safety-critical and the railroad is unable to submit the amended SSP plan to FRA 60 days before the proposed effective date of the amendment, the railroad shall submit the amended SSP plan with a cover letter outlining the changes made to the original approved SSP plan by the proposed amendment(s) and why the amendment is safety-critical to FRA as near as possible to 60 days before the proposed effective date of the amendment(s).

(iii) If the proposed amendment is limited to adding or changing a name, title, address, or telephone number of a person, FRA approval is not required under the process in paragraphs (c)(1)(i) and (ii) of this section, although the railroad shall still file the proposed amendment with FRA's Associate

Administrator for Railroad Safety and Chief Safety Officer. These proposed amendments may be implemented by the railroad upon filing with FRA. All other proposed amendments must comply with the formal approval process in paragraph (c) of this section.

(2)(i) Except as provided in paragraph (c)(1)(iii) of this section, FRA will review the proposed amended SSP plan within 45 days of receipt. FRA will then notify the primary contact person of each affected railroad whether the proposed amended plan has been approved by FRA, and if not approved, the specific points in which each proposed amendment to the SSP plan is deficient.

(ii) If FRA has not notified the railroad by the proposed effective date of the amendment(s) whether the proposed amended plan has been approved or not, the railroad may implement the amendment(s) pending FRA's decision.

(iii) If a proposed SSP plan amendment is not approved by FRA, no later than 60 days following the receipt of FRA's written notice, the railroad shall provide FRA either a corrected copy of the amendment that addresses all deficiencies noted by FRA or written notice that the railroad is retracting the amendment.

(d) *Reopened review.* Following initial approval of a plan, or amendment, FRA may reopen consideration of the plan or amendment for cause stated.

(e) *Electronic submission.* All documents required to be submitted to FRA under this part may be submitted electronically. Appendix C to this part provides instructions on electronic submission of documents.

§ 270.203 Retention of system safety program plan.

Each railroad to which this part applies shall retain at its system headquarters, and at any division headquarters, one copy of the SSP plan required by this part and one copy of each subsequent amendment to that plan. These records shall be made available to representatives of FRA and States participating under part 212 of this chapter for inspection and copying during normal business hours.

Subpart D—System Safety Program Internal Assessments and External Auditing

§ 270.301 General.

The system safety program and its implementation shall be assessed internally by the railroad and audited externally by FRA or FRA's designee.

§ 270.303 Internal system safety program assessment.

(a) Following FRA's initial approval of the railroad's SSP plan pursuant to § 270.201, the railroad shall annually conduct an assessment of the extent to which:

(1) The system safety program is fully implemented;

(2) The railroad is in compliance with the implemented elements of the approved system safety program; and

(3) The railroad has achieved the goals set forth in § 270.103(c).

(b) As part of its SSP plan, the railroad shall set forth a statement describing the processes used to:

(1) Conduct internal system safety program assessments;

(2) Internally report the findings of the internal system safety program assessments;

(3) Develop, track, and review recommendations as a result of the internal system safety program assessments;

(4) Develop improvement plans based on the internal system safety program assessments. Improvement plans shall, at a minimum, identify who is responsible for carrying out the necessary tasks to address assessment findings and specify a schedule of target dates with milestones to implement the improvements that address the assessment findings; and

(5) Manage revisions and updates to the SSP plan based on the internal system safety program assessments.

(c)(1) Within 60 days of completing its internal SSP plan assessment pursuant to paragraph (a) of this section, the railroad shall:

(i) Submit to FRA a copy of the railroad's internal assessment report that includes a system safety program assessment and the status of internal assessment findings and improvement plans to the FRA Associate

Administrator for Railroad Safety and Chief Safety Officer, Mail Stop 25, 1200 New Jersey Avenue SE., Washington, DC 20590; and

(ii) Outline the specific improvement plans for achieving full implementation of the SSP plan, as well as achieving the goals of the plan.

(2) The railroad's chief official responsible for safety shall certify the results of the railroad's internal SSP plan assessment.

§ 270.305 External safety audit.

(a) FRA may conduct, or cause to be conducted, external audits of a railroad's system safety program. Each audit will evaluate the railroad's compliance with the elements required by this part in the railroad's approved SSP plan. FRA shall provide the railroad written notification of the results of any audit.

(b)(1) Within 60 days of FRA's written notification of the results of the audit, the railroad shall submit to FRA for approval an improvement plan to address the audit findings that require corrective action. At a minimum, the improvement plan shall identify who is responsible for carrying out the necessary tasks to address audit findings and specify target dates and milestones to implement the improvements that address the audit findings.

(2) If FRA does not approve the railroad's improvement plan, FRA will notify the railroad of the specific deficiencies in the improvement plan. The affected railroad shall amend the proposed plan to correct the deficiencies identified by FRA and provide FRA with a corrected copy of the improvement plan no later than 30 days following its receipt of FRA's written notice that the proposed plan was not approved.

(3) Upon request, the railroad shall provide to FRA and States participating under part 212 of this chapter for review a report upon request regarding the status of the implementation of the improvements set forth in the improvement plan established pursuant to paragraph (b)(1) of this section.

Appendix A to Part 270—Schedule of Civil Penalties

PENALTY SCHEDULE ¹

	Violation	Willful violation
Subpart B—System Safety Program Requirements		
270.101—System safety program; general:		
(a) Failure to establish a system safety program	\$15,000	\$30,000
(a) Failure to include a risk-based hazard management program in the railroad's system safety program ..	10,000	20,000
270.103—System safety program plan:		

PENALTY SCHEDULE ¹—Continued

	Violation	Willful violation
(a)(1) Failure to include and comply with any required element or any sub-element in the SSP plan	7,500	15,000
(a)(2) Failure to communicate and coordinate with host railroad on the SSP plan	7,500	15,000
270.107—Consultation Requirements:		
(a)(1) Failure to consult with directly affected employees	10,000	20,000
Failure to consult in good faith and/or use best efforts	10,000	20,000
(a)(3) Failure to hold preliminary meeting	7,500	15,000
Failure to hold preliminary meeting within April 10, 2017	5,000	10,000
Failure to notify directly affected employees no less than 60 days before meeting is held	7,500	15,000
(b) Failure to submit consultation statement with plan submission	7,500	15,000
Failure to include all required elements in consultation statement	5,000	10,000
(d) Failure to submit consultation statement with submission of plan amendment	5,000	10,000
Subpart C—Review, Approval, and Retention of SSP Plans		
270.201—Filing and approval:		
(a)(1) Failure to file an initial SSP plan	10,000	20,000
Failure to file a SSP plan within 90 days of commencing operations	10,000	20,000
(a)(3) Failure to include all required information in submission	5,000	10,000
(b)(3) Failure to correct identified deficiencies and amend SSP plan	7,500	15,000
Failure to submit amended SSP plan	7,500	15,000
Failure to submit amended SSP plan within 90 days	5,000	10,000
(c)(1)(i) Failure to submit amendment to SSP plan	7,500	15,000
Failure to submit amendment to SSP plan within 60 days	5,000	10,000
(c)(2)(iii) Failure to submit corrected amendment or notify FRA of retraction	7,500	15,000
Failure to submit corrected amendment within 60 days	5,000	10,000
270.203—Retention of SSP plan:		
Failure to retain a copy of the SSP plan at the system/division headquarters	10,000	20,000
Failure to make records available to representatives of FRA and States participating under part 212 of this chapter	7,500	15,000
Subpart D—System Safety Program Internal Assessments and External Auditing		
270.303—Internal program assessment:		
(a) Failure to conduct an annual internal assessment	10,000	20,000
Failure to include all required elements in the internal assessment	7,500	15,000
(b) Failure to include a statement in the SSP plan describing the required elements	5,000	10,000
(c)(1)(i) Failure to submit to FRA the internal assessment report	7,500	15,000
Failure for the internal assessment report to contain all required elements and sub-elements	5,000	10,000
(c)(1)(ii) Failure to develop and outline improvement plans	7,500	15,000
Failure to comply with improvement plans	7,500	15,000
(c)(2) Failure of chief official responsible for safety to certify the results of the internal assessment	5,000	10,000
270.305—External safety audit:		
(b)(1) Failure to submit improvement plans	7,500	15,000
Failure to submit improvement plans within 60 days	5,000	10,000
Failure to include all required elements in the improvement plans	5,000	10,000
(b)(2) Failure to amend and submit to FRA the improvement plan	7,500	15,000
Failure to submit amended improvement plan within 30 days	5,000	10,000
(b)(3) Failure to provide a report regarding the status of the implementation of the improvements set forth in the improvement plan	7,500	15,000

¹ A penalty may be assessed against an individual only for a willful violation. The Administrator reserves the right to assess a penalty of up to \$109,819 for any violation where circumstances warrant. See 49 CFR part 209, appendix A.

Appendix B to Part 270—Federal Railroad Administration Guidance on the System Safety Program Consultation Process

A railroad required to develop a system safety program under this part must in good faith consult with and use its best efforts to reach agreement with its directly affected employees on the contents of the SSP plan. See § 270.107(a). This appendix discusses the meaning of the terms “good faith” and “best efforts,” and provides non-mandatory guidance on how a railroad may comply with the requirement to consult with directly affected employees on the contents of its SSP plan. Guidance is provided for employees who are represented by a non-profit

employee labor organization and employees who are not represented by any such organization.

The Meaning of “Good Faith” and “Best Efforts”

“Good faith” and “best efforts” are not interchangeable terms representing a vague standard for the § 270.107 consultation process. Rather, each term has a specific and distinct meaning. When consulting with directly affected employees, therefore, a railroad must independently meet the standards for both the good faith and best efforts obligations. A railroad that does not meet the standard for one or the other will not be in compliance with the consultation requirements of § 270.107.

The good faith obligation requires a railroad to consult with employees in a manner that is honest, fair, and reasonable, and to genuinely pursue agreement on the contents of a SSP plan. If a railroad consults with its employees merely in a perfunctory manner, without genuinely pursuing agreement, it will not have met the good faith requirement. For example, a lack of good faith may be found if a railroad’s directly affected employees express concerns with certain parts of the railroad’s SSP plan, and the railroad neither addresses those concerns in further consultation nor attempts to address those concerns by making changes to the SSP plan.

On the other hand, “best efforts” establishes a higher standard than that

imposed by the good faith obligation, and describes the diligent attempts that a railroad must pursue to reach agreement with its employees on the contents of its system safety program. While the good faith obligation is concerned with the railroad's state of mind during the consultation process, the best efforts obligation is concerned with the specific efforts made by the railroad in an attempt to reach agreement. This would include considerations such as whether a railroad had held sufficient meetings with its employees to address or make an attempt to address any concerns raised by the employees, or whether the railroad had made an effort to respond to feedback provided by employees during the consultation process. For example, a railroad would not meet the best efforts obligation if it did not initiate the consultation process in a timely manner, and thereby failed to provide employees sufficient time to engage in the consultation process. A railroad may, however, wish to hold off substantive consultations regarding the contents of its SSP until one year after the publication date of the rule to ensure that certain information generated as part of the process is protected from discovery and admissibility into evidence under § 270.105 of the rule. Generally, best efforts are measured by the measures that a reasonable person in the same circumstances and of the same nature as the acting party would take. Therefore, the standard imposed by the best efforts obligation may vary with different railroads, depending on a railroad's size, resources, and number of employees.

When reviewing SSP plans, FRA will determine on a case-by-case basis whether a railroad has met its § 270.107 good faith and best efforts obligations. This determination will be based upon the consultation statement submitted by the railroad pursuant to § 270.107(b) and any statements submitted by employees pursuant to § 270.107(c). If FRA finds that these statements do not provide sufficient information to determine whether a railroad used good faith and best efforts to reach agreement, FRA may investigate further and contact the railroad or its employees to request additional information. If FRA determines that a railroad did not use good faith and best efforts, FRA may disapprove the SSP plan submitted by the railroad and direct the railroad to comply with the consultation requirements of § 270.107. Pursuant to § 270.201(b)(3), if FRA does not approve the SSP plan, the railroad will have 90 days, following receipt of FRA's written notice that the plan was not approved, to correct any deficiency identified. In such cases, the identified deficiency would be that the railroad did not use good faith and best efforts to consult and reach agreement with its directly affected employees. If a railroad then does not submit to FRA within 90 days a SSP plan meeting the consultation requirements of § 270.107, the railroad could be subject to penalties for failure to comply with § 270.201(b)(3).

Guidance on How a Railroad May Consult With Directly Affected Employees

Because the standard imposed by the best efforts obligation will vary depending upon

the railroad, there may be countless ways for various railroads to comply with the consultation requirements of § 270.107. Therefore, FRA believes it is important to maintain a flexible approach to the § 270.107 consultation requirements, to give a railroad and its directly affected employees the freedom to consult in a manner best suited to their specific circumstances.

FRA is nevertheless providing guidance in this appendix as to how a railroad may proceed when consulting (utilizing good faith and best efforts) with employees in an attempt to reach agreement on the contents of a SSP plan. FRA believes this guidance may be useful as a starting point for railroads that are uncertain about how to comply with the § 270.107 consultation requirements. This guidance distinguishes between employees who are represented by a non-profit employee labor organization and employees who are not, as the processes a railroad may use to consult with represented and non-represented employees could differ significantly.

This guidance does not establish prescriptive requirements with which a railroad must comply, but merely outlines a consultation process a railroad may choose to follow. A railroad's consultation statement could indicate that the railroad followed the guidance in this appendix as evidence that it utilized good faith and best efforts to reach agreement with its employees on the contents of a SSP plan.

Employees Represented by a Non-Profit Employee Labor Organization

As provided in § 270.107(a)(2), a railroad consulting with the representatives of a non-profit employee labor organization on the contents of a SSP plan will be considered to have consulted with the directly affected employees represented by that organization.

A railroad may utilize the following process as a roadmap for using good faith and best efforts when consulting with represented employees in an attempt to reach agreement on the contents of a SSP plan.

- Pursuant to § 270.107(a)(3)(i), a railroad must meet with representatives from a non-profit employee labor organization (representing a class or craft of the railroad's directly affected employees) no later than April 10, 2017, to begin the process of consulting on the contents of the railroad's SSP plan. A railroad must provide notice at least 60 days before the scheduled meeting.

- During the time between the initial meeting and the applicability date of § 270.105 the parties may meet to discuss administrative details of the consultation process as necessary.

- Within 60 days after the applicability date of § 270.105 a railroad should have a meeting with the directed affected employees to discuss substantive issues with the SSP.

- Pursuant to § 270.201(a)(1), a railroad would file its SSP plan with FRA no later than February 8, 2018, or not less than 90 days before commencing operations, whichever is later.

- As provided by § 270.107(c), if agreement on the contents of a SSP plan could not be reached, a labor organization (representing a class or craft of the railroad's

directly affected employees) may file a statement with the FRA Associate Administrator for Railroad Safety and Chief Safety Officer explaining its views on the plan on which agreement was not reached.

Employees Who Are Not Represented by a Non-Profit Employee Labor Organization

FRA recognizes that some (or all) of a railroad's directly affected employees may not be represented by a non-profit employee labor organization. For such non-represented employees, the consultation process described for represented employees may not be appropriate or sufficient. For example, FRA believes that a railroad with non-represented employees should make a concerted effort to ensure that its non-represented employees are aware that they are able to participate in the development of the railroad's SSP plan. FRA therefore is providing the following guidance regarding how a railroad may utilize good faith and best efforts when consulting with non-represented employees on the contents of its SSP plan.

- By December 12, 2016 (*i.e.*, within 60 days of the effective date of the final rule), a railroad may notify non-represented employees that—

- (1) The railroad is required to consult in good faith with, and use its best efforts to reach agreement with, all directly affected employees on the proposed contents of its SSP plan;

- (2) The railroad is required to meet with its directly affected employees within 180 days of the effective date of the final rule to address the consultation process;

- (3) Non-represented employees are invited to participate in the consultation process (and include instructions on how to engage in this process); and

- (4) If a railroad is unable to reach agreement with its directly affected employees on the contents of the proposed SSP plan, an employee may file a statement with the FRA Associate Administrator for Railroad Safety and Chief Safety Officer explaining his or her views on the plan on which agreement was not reached.

- This initial notification (and all subsequent communications, as necessary or appropriate) could be provided to non-represented employees in the following ways:

- (1) Electronically, such as by email or an announcement on the railroad's Web site;

- (2) By posting the notification in a location easily accessible and visible to non-represented employees; or

- (3) By providing all non-represented employees a hard copy of the notification. A railroad could use any or all of these methods of communication, so long as the notification complies with the railroad's obligation to utilize best efforts in the consultation process.

- Following the initial notification and initial meeting to discuss the consultation process (and before the railroad submits its SSP plan to FRA), a railroad should provide non-represented employees a draft proposal of its SSP plan. This draft proposal should solicit additional input from non-represented employees, and the railroad should provide

non-represented employees 60 days to submit comments to the railroad on the draft.

- Following this 60-day comment period and any changes to the draft SSP plan made as a result, the railroad should submit the proposed SSP plan to FRA, as required by this part.

- As provided by § 270.107(c), if agreement on the contents of a SSP plan cannot be reached, then a non-represented employee may file a statement with the FRA Associate Administrator for Railroad Safety and Chief Safety Officer explaining his or her views on the plan on which agreement was not reached.

Appendix C to Part 270—Procedures for Submission of SSP Plans and Statements From Directly Affected Employees

This appendix establishes procedures for the submission of a railroad's SSP plan and statements by directly affected employees consistent with the requirements of this part.

Submission by a Railroad and Directly Affected Employees

As provided for in § 270.101, a system safety program shall be fully implemented and supported by a written SSP plan. Each railroad must submit its SSP plan to FRA for approval as provided for in § 270.201.

As provided for in § 270.107(c), if a railroad and its directly affected employees cannot come to agreement on the proposed contents of the railroad's SSP plan, the directly affected employees have 30 days following the railroad's submission of its proposed SSP plan to submit a statement to

the FRA Associate Administrator for Railroad Safety and Chief Safety Officer explaining the directly affected employees' views on the plan on which agreement was not reached.

The railroad's and directly affected employees' submissions shall be sent to the FRA Associate Administrator for Railroad Safety and Chief Safety Officer, Mail Stop 25, 1200 New Jersey Avenue SE., Washington, DC 20590. When a railroad submits its SSP plan and consultation statement to FRA pursuant to § 270.201, it must also simultaneously send a copy of these documents to all individuals identified in the service list pursuant to § 270.107(b)(3).

Each railroad and directly affected employee is authorized to file by electronic means any submissions required under this part. Before any person submitting anything electronically, the person shall provide the FRA Associate Administrator for Railroad Safety and Chief Safety Officer with the following information in writing:

(1) The name of the railroad or directly affected employee(s);

(2) The names of two individuals, including job titles, who will be the railroad's or directly affected employees' points of contact and will be the only individuals allowed access to FRA's secure document submission site;

(3) The mailing addresses for the railroad's or directly affected employees' points of contact;

(4) The railroad's system or main headquarters address located in the United States;

(5) The email addresses for the railroad's or directly affected employees' points of contact; and

(6) The daytime telephone numbers for the railroad's or directly affected employees' points of contact.

A request for electronic submission or FRA review of written materials shall be addressed to the FRA Associate Administrator for Railroad Safety and Chief Safety Officer, Mail Stop 25, 1200 New Jersey Avenue SE., Washington, DC 20590. Upon receipt of a request for electronic submission that contains the information listed above, FRA will then contact the requestor with instructions for electronically submitting its program or statement. A railroad that electronically submits an initial SSP plan or new portions or revisions to an approved program required by this part shall be considered to have provided its consent to receive approval or disapproval notices from FRA by email. FRA may electronically store any materials required by this part regardless of whether the railroad that submits the materials does so by delivering the written materials to the Associate Administrator and opts not to submit the materials electronically. A railroad that opts not to submit the materials required by this part electronically, but provides one or more email addresses in its submission, shall be considered to have provided its consent to receive approval or disapproval notices from FRA by email or mail.

Issued in Washington, DC, pursuant to the authority delegated under 49 CFR 1.89(b).

Sarah E. Feinberg,
Administrator.
