When the EPA issued a proposed PM_{2.5} NAAQS implementation rule in 2005, it requested comment on the same social acceptability factor, and ultimately did not include social acceptability as a factor for determining RACM in the final 2007 PM_{2.5} implementation rule. In the 2007 final rule, however, the EPA stated:

⁸⁴ See the proposed PM_{2.5} SIP requirements rule (80 FR 15340, 15373).

⁸⁰ See the **Federal Register** published on April 25, 2007 (72 FR 20586, 20623, 20624 and 20625).

⁸¹ See “Petition for Reconsideration,” filed by Paul Cort, Earthjustice, on behalf of the American Lung Association, Medical Advocates for Healthy Air, Natural Resources Defense Council, and the Sierra Club (June 25, 2007). A copy of the petition is in the docket for this action. The EPA’s decision to grant the petition for reconsideration on the issue of the CAIR being presumptively equal to RACT for EGUs was in part based on a D.C. Circuit decision related to a similar issue. Specifically, the Court decided that the provisions in the Phase 2 Ozone Implementation Rule indicating that a state need not perform (or submit) a NO_x RACM/RACR analysis for EGU sources subject to a cap-and-trade

“Therefore, given the concerns raised by commenters that establishment of ‘social acceptability’ as a factor in the RACM analysis is without basis in the CAA and might result in inappropriate skewing of control strategies, we have removed this term from the final rule. We reiterate, however, that capability of effective implementation and enforcement are relevant considerations in the RACM analysis, even though public ‘unpopularity’ is not. Moreover, in assessing the efficacy of measures and the credit they should be given in the context of attainment demonstrations or RFP calculations, EPA believes that such considerations are important.” For the same reason it was not included in the previous implementation rule, the EPA has decided to not include the social acceptability factor in this final rule as well. See 40 CFR 51.1009(a)(3)(i).

The following guidance is similar to what was presented in the proposal but has been updated to exclude the social acceptability factor:

Once a state has identified existing and potential control measures and technologies for sources of direct PM_{2.5} and PM_{2.5} precursors in the nonattainment area(s), it must evaluate these controls to determine if any of those controls would be technologically infeasible in the particular nonattainment area.

With respect to the technological feasibility of control technologies for stationary sources, the EPA has a longstanding approach to evaluating facts relevant to this criterion under subpart 4.⁸⁵ The EPA interprets the term technological feasibility to include consideration of factors such as a source’s processes and operating procedures, raw materials, physical plant layout, and potential environmental impacts such as increased water pollution, waste disposal and energy requirements. For example, the EPA recognizes that the process, operating procedures and raw materials used by a source can affect the feasibility of implementing process changes that reduce emissions and can also affect the selection of add-on emissions control equipment. The feasibility of modifying processes or applying control equipment also can be influenced by the physical layout of the particular plant, if the physical space available in which to implement such changes limits the choices. A state may consider such factors in determining

whether a control measure is or is not technologically feasible to implement.⁸⁶

In addition, with respect to determining whether a given control measure might not be technologically feasible for an area or mobile source, the EPA also retains its longstanding practice that a state may consider relevant factors in conducting its analysis, such as the condition and extent of needed infrastructure, population size, or workforce type and habits, which may prohibit certain potential control measures from being implementable.

c. Comments and Responses

Comment: Some commenters stated that the EPA should make clearer in its rule and guidance that some categories of sources, particularly those such as animal and crop production, do not lend themselves to national determinations of best control practices; instead, these types of sources should be evaluated on nonattainment area specific conditions in determining the appropriate level of control measures.

Response: The EPA agrees that nonattainment area-specific conditions are important factors when considering emission reduction options. States need to consider the feasibility of all identified options that have been demonstrated to reduce PM_{2.5} and PM_{2.5} precursors to determine whether such measures are appropriate for use in a particular PM_{2.5} nonattainment area.

The EPA believes the determination of best control practices for any operation, particularly for animal production or crop production operations, should be a case-specific process. The process should start with the identification of PM_{2.5} and PM_{2.5} precursor emissions from the operation. Then it should consider which of the measures for reducing PM_{2.5} and PM_{2.5} precursors in a particular PM_{2.5} nonattainment area are technically and economically feasible for a particular operation. The EPA recognizes that there are a number of factors specific to each operation that could determine whether a potential emission reduction measure is technically and economically feasible for implementation.

Although the EPA is not making any national determinations of best control practices for animal production and crop production operations, we do note that there are many relevant references on potential emissions reduction

options, including the Agricultural Air Quality Conservation Measures Reference Guide for Cropping Systems and Land Management.⁸⁷ The EPA and USDA jointly developed this document to identify measures that have been demonstrated to reduce emissions and describe factors related to the applicability of each measure. A companion document is under development by the EPA and USDA that will identify potential emission reduction approaches for livestock operations. Additionally, USDA’s Natural Resources Conservation Service (NRCS) provides a list of approved practices in managing air emissions of concern for particulate matter, ozone, greenhouse gas, and odor-related issues.⁸⁸ A number of regulatory and non-regulatory programs are already being implemented (in nonattainment and attainment areas alike) to reduce emissions of PM_{2.5} and PM_{2.5} precursors from agricultural operations. Finally, a large body of information is available on topics such as feed management, livestock housing, conservation tillage, road use and other topics from federal agencies, states, industry groups, academic institutions, and international organizations.

5. Step 4: Determine Whether an Available Control Measure or Technology Is Economically Feasible

a. Summary of Proposal

The proposal described that in the 1992 General Preamble, EPA’s longstanding interpretation of the term “economic feasibility” in the context of evaluating potential RACM and RACT has included a presumption that it is reasonable for similar sources to bear similar costs of emissions reductions, even if they are in different nonattainment areas or different states. The proposal indicated that this presumption was not included in the 2007 implementation rule for the PM_{2.5} NAAQS that the EPA had received a petition for reconsideration with respect to this issue, and that EPA had granted this petition in 2011.^{89 90} The March

⁸⁵ See the **Federal Register** published on April 16, 1992 (57 FR 13498, 13540 and 13541).

⁸⁶ Addendum to the General Preamble, 59 FR 41998 (August 16, 1994), at page 42013. Guidance is provided in the context of Serious area BACM determination, but the EPA is applying it here for Moderate area RACM determinations.

2015 proposed PM_{2.5} SIP requirements rule indicated the EPA's intention to not adopt the economic feasibility factors as described in the 2007 rule, but to return to the original interpretation from the 1992 General Preamble, including the presumption that it is reasonable for similar sources to bear similar costs of emissions reductions.

The proposal also characterized past guidance from the 1992 General Preamble as stating that if a state contends that a source-specific control level should not be established because the source(s) cannot afford the control measure that is demonstrated to be economically feasible for other sources in its source category, then the state must support the claim with information regarding the impact of imposing the identified control measure or technology on the several financial indicators. The proposal also recommended that cost effectiveness should generally be evaluated by assessing the cost per ton of emissions reduced associated with a control measure, but the proposal also requested comment on an alternative metric to assess cost effectiveness in terms of the cost per unit of air quality improvement (*i.e.*, "cost per microgram").

b. Final Rule

Based on a consideration of the comments received, the EPA has determined that economic feasibility considerations should generally align with the interpretation in the 1992 General Preamble. Note that the proposal indicated that if it is claimed that a control approach is not economically feasible for a specific source, the state needs to provide information related to several financial indicators to support the claim. We note that the original policy in the 1992 General Preamble suggests that if a source desires to make such a claim, it should provide such information to the state for its consideration. This final rule characterizes the policy in a similar manner, where the source would have the option of providing this financial information to the state for its review. This approach should address the concerns of some commenters that such financial information may not be readily available to the state. Thus, the final policy for considering economic feasibility of control measures is described in the following paragraphs.

The EPA has a longstanding interpretation of the term "economic feasibility" in the context of evaluating potential RACM and RACT which involves considering the cost of reducing emissions and the difference

between the cost of an emissions reduction measure at a particular source and the cost of emissions reduction measures that have been implemented at other similar sources in the same or other areas.⁹¹ Absent other indications, the EPA presumes that it is reasonable for similar sources to bear similar costs of emissions reductions. Economic feasibility of RACM and RACT is thus largely informed by evidence that other similar sources have implemented the control technology, process change or measure in question.

For each technologically feasible control measure, a state should evaluate the economic feasibility of the measure or control, through consideration of factors such as the capital costs, operating and maintenance costs, and cost effectiveness (*i.e.*, cost per ton of pollutant reduced by that measure or technology) associated with such measure or control. A state should not reject a technologically feasible control measure or technology as being economically infeasible if such a measure or technology has been implemented at other similar sources (*i.e.*, at sources that would be included in the same source category in the emissions inventory data collection process), unless the state provides an adequate justification that clearly explains the specific circumstances of the source or sources in the nonattainment area that make such a measure or technology economically infeasible for sources in the nonattainment area. *See* 40 CFR 51.1009(a)(3).

The EPA believes that it is appropriate for states to give substantial weight to cost effectiveness in evaluating the economic feasibility of an emission reduction measure or technology. The cost effectiveness of a measure is its annualized cost (\$/year) divided by the emissions reduced (tons/year) which yields a cost per amount of emission reduction (\$/ton). Cost effectiveness provides a relative value for each emissions reduction option that is comparable with other options and, in the case of control technologies, other facilities. In considering what level of control is reasonable, the EPA does not recommend a specific fixed dollar per ton cost threshold for economic feasibility of controls identified as potential RACM and RACT.

If a source contends that a source-specific control-level should not be established because the source cannot afford the control measure or technology that is demonstrated to be economically

feasible for other sources in its source category, the source should make its claim known to the state and support the claim with information regarding the impact of imposing the identified control measure or technology on the following financial indicators, to the extent applicable:

- (1) Fixed and variable production costs (\$/unit)
- (2) Product supply and demand elasticity
- (3) Product prices (cost absorption vs. cost pass-through)
- (4) Expected costs incurred by competitors
- (5) Company profits
- (6) Employment costs
- (7) Other costs (*e.g.*, for RACM implemented by public sector entities).⁹²

c. Comments and Responses

Comment: With regard to the presumption that it is reasonable for similar sources to bear similar costs of emissions reductions, some commenters supported returning to the approach described in the General Preamble as EPA proposed, while other commenters suggested that based on its experience with industry the EPA knows that just because a technology will work at one source does not mean that it will necessarily work at a similar source due to source configuration and non-RACT reasons (*e.g.*, enforcement proceedings) for the installation of different technology at "similar" sources.

Response: The latter commenters appear concerned that the rule would require the imposition of all controls on similar sources without allowing for consideration of whether such controls are technologically and economically feasible. This is not what EPA proposed. Instead, the EPA proposed, and is now finalizing, a requirement that the state first identify potential control measures for sources in a nonattainment area. The state should then identify which control measures are economically and technologically feasible based on its review of various factors. If the state determines that certain controls are not reasonably available based on its review of these factors, it must provide a written justification to the EPA explaining its rationale. This review should at least evaluate the feasibility of all the identified controls on similar sources to determine whether implementation of such controls in the nonattainment area at issue is

⁹¹ See the **Federal Register** published on April 16, 1992 (57 FR 13498, 13540 and 13541).

⁹² These longstanding factors were established in the EPA guidance in 1992 and are applicable to implementation programs for all the NAAQS pollutants. *See* the appendices to the General Preamble, 57 FR 18070 (April 28, 1992).

reasonable. The EPA recognizes that there are a number of source-specific factors that the state can take into account in making these determinations. Factors such as the physical onsite configuration of a facility may determine whether a particular control device or operation can be feasibly implemented. Likewise, a state should take into account information provided by the source on particular economic factors such as those described earlier in making a case-by-case determination of the economic feasibility of a control measure.

Comment: Two commenters supported the EPA's proposal that cost-effectiveness should consider capital costs, operating costs and maintenance costs at the particular source in question.

Some commenters supported using an alternative cost effectiveness metric such as cost per microgram of air quality improvement where appropriate air quality modeling has been developed for the area and can reasonably characterize the relative importance of various precursors. Some commenters opposed the proposal's alternative cost-effectiveness metric because the approach is overly complex and the impacts are rarely uniform across an area.

Response: The EPA has decided to maintain its traditional recommendation to use a cost per ton approach for evaluating the cost effectiveness of particular control options. The EPA does not recommend the cost per microgram alternative approach because there are a number of technical and resource challenges associated with implementing it in a technically rigorous manner based on detailed air quality modeling information. The EPA believes that this policy approach would unnecessarily add complication and extra burden to the state's process for determining economic feasibility for subject sources in a nonattainment area. Moreover, the EPA believes that the flexibility described here to consider cost-effectiveness in assessing economic feasibility, when coupled with the upcoming discussion of Step 6, and with the major stationary source and comprehensive precursor demonstrations previously described will ensure that unreasonable application of measures (e.g., those that are not effective in reducing PM_{2.5} concentrations) will not occur.

6. Step 5: Determine the Earliest Date by Which a Control Measure or Technology Can be Implemented in Whole or in Part

a. Summary of Proposal

In this section, the proposal discussed two main issues related to the date by which control measures can be implemented. First, it proposed that when a state is determining RACM/RACT, it must consider whether a control measure can be implemented in part when full implementation of the measure within 4 years of designation is not feasible. The proposal also introduced the concept of "additional reasonable measures," meaning those measures that can only be implemented after the fourth year but prior to the Moderate area 6-year attainment date. It was proposed that a state must identify additional reasonable measures and adopt those measures as needed for expeditious attainment.

b. Final Rule

This section remains relatively unchanged from the proposal. CAA section 189(a)(1)(C) requires that the attainment plan for a Moderate PM_{2.5} nonattainment area provide for the implementation of RACM and RACT no later than 4 years after designation. The agency has long interpreted the term "implemented" to mean that a control measure or technology has not only been submitted to the EPA for approval as part of a SIP but has also been built, installed and/or otherwise physically manifested, and is achieving the intended emissions reductions, and the EPA retains this definition in this rule. See 40 CFR 51.1000.

The EPA recognizes that a state may be able to implement a given control measure only partially within 4 years after designation. The EPA addressed this situation in the General Preamble, stating: "It is important to note that a State should consider the feasibility of implementing measures in part when full implementation would be infeasible."⁹³ The EPA continues to interpret the RACM/RACT definition to mean that a state should not reject an otherwise technologically and economically feasible control measure or technology as RACM or RACT even if it can be only partially implemented within the statutory 4-year timeframe following designation of the area. Instead, a state must adopt as RACM and RACT that portion of a control measure or technology that can feasibly be implemented within 4 years of the effective date of designation. See 40 CFR 51.1009(a)(4)(i)(A). For instance, if

paving unpaved roads is a control measure that is technologically and economically feasible in a nonattainment area but a state cannot pave all candidate roads within 4 years of designation, the state must adopt as RACM a measure that requires paving of that portion of roads that the state could feasibly accomplish within 4 years if such a measure is needed for timely attainment of the PM_{2.5} NAAQS in the area.

Therefore, for the purposes of meeting the RACM/RACT requirement, a state must identify those technologically and economically feasible control measures and technologies that it can implement fully or partially within 4 years of designation of its Moderate PM_{2.5} nonattainment area. Depending on the severity of the PM_{2.5} nonattainment problem in the area, some or all of these measures identified as implementable within 4 years may be needed in order to bring the area into attainment as expeditiously as practicable. These candidate measures may constitute RACM and RACT if the state determines, through its attainment demonstration that it needs to implement them to achieve timely attainment for the area.

In addition, a state must separately identify those technologically and economically feasible control measures that can only be implemented after the statutory window for implementing RACM and RACT, but before the attainment date. The statutory 4-year timing requirement for implementing RACM and RACT under CAA section 189(a)(1)(C) limits the control measures and technologies that can qualify as RACM and RACT for a Moderate PM_{2.5} nonattainment area. However, the statutory requirement of CAA 172(c)(6) also requires states to implement "other measures" necessary to provide for timely attainment in an area. The EPA interprets this provision to include "additional reasonable measures," which are those measures and technologies that can be applied at sources in the nonattainment area that are otherwise technologically and economically feasible but can only be implemented in whole or in part later than 4 years after designation.⁹⁴

⁹⁴ With respect to "partial measures" under this proposed approach, the EPA would require that a state implement as RACM that portion of any control measure determined to be technologically and economically feasible and implementable within 4 years after designation of a nonattainment area. The state would then be required to implement as an additional reasonable measure that portion of the same control measure that can be implemented starting 4 years from designation

⁹³ 57 FR 13498 (April 16, 1992), at page 13541.

7. Step 6: Evaluate the Collective Impact of Potential Control Measures To Determine Whether the Area Can Attain Expeditiously or Whether it is Impracticable to Attain by the Attainment Date, and Adopt the Appropriate Set of Control Measures

a. Summary of Proposal

The proposal described the control measure requirements for two situations: The case where the state can demonstrate attainment by the attainment date; and the case where the state demonstrates the area cannot practicably attain by the attainment date. If a state determines that a Moderate nonattainment area can attain the PM_{2.5} NAAQS by the statutory attainment date, the state must adopt and implement any technologically and economically feasible control measures that are necessary to ensure that the area will attain the NAAQS as expeditiously as practicable. Those technologically and economically feasible measures needed for attainment that can be implemented within 4 years of the date of designation would be considered to be RACM/RACT. Those measures needed for attainment that cannot be implemented within 4 years but can be implemented no later than the attainment date would be considered to be "additional reasonable measures." The proposal stated that, consistent with longstanding policy, this means that the state may choose to not adopt certain measures if collectively they would not advance the attainment date by 1 year.⁹⁵

For the situation where a state determines that it is impracticable to attain by the Moderate area attainment date, the proposal included two policy options for describing what control measures must be adopted and implemented. One option would have required the state to adopt all technologically and economically feasible control measures, as stated in past guidance in the General Preamble. The other option would have required adoption of technologically and economically feasible control measures with an explicit exception for those measures that collectively are determined to be "ineffective in reducing ambient PM_{2.5} levels." The proposal also reviewed the proposed

options for demonstrating that a precursor does not make a significant contribution to PM_{2.5} levels that exceed the standard, and discussed how the final precursor policy may be an important consideration in deciding upon a control measure policy approach for Moderate areas that demonstrate they cannot practicably attain.

b. Final Rule (General)

For an area that can demonstrate that it will attain by the attainment date, the final rule maintains the same approach as described in the proposal regarding the collective evaluation of potential control measures to determine whether the area can advance the attainment date by 1 year. For an area that demonstrates that it would be impracticable to attain by the attainment date, the final rule does not include an explicit exception for those measures that collectively are determined to be "ineffective in reducing ambient PM_{2.5} levels." More details are provided in sections (c) and (d) that follow.

Section 189(a)(1) of the CAA establishes a requirement that the attainment plan for a Moderate PM_{2.5} nonattainment area must demonstrate either that an area can attain the relevant NAAQS by the applicable attainment date, or that it is impracticable for the area to do so. As noted previously, for Moderate PM_{2.5} nonattainment areas, the "applicable attainment date" is as expeditious as practicable, but no later than the end of the sixth calendar year after designation as nonattainment. A complete discussion of the requirements for attainment demonstration modeling is presented in Section IV.E of this preamble. However, one of the key features of attainment demonstration modeling and related analysis is that they provide a means of synthesizing the effects of emissions reductions from all existing and potential new control measures identified for sources in a given nonattainment area on overall air quality in that area. States will use the results of their analyses to identify the appropriate combination of reasonable control measures for sources in their Moderate PM_{2.5} nonattainment area and any other control measures needed on sources outside the nonattainment area to ensure expeditious attainment of the relevant NAAQS in the area and to meet the statutory requirements of CAA sections 189(a)(1)(B) and 172(c)(6) as explained later.⁹⁶

⁹⁶ Note that under section 110(l) of the CAA, after a state has adopted a control measure into the SIP for an attainment demonstration, it may remove or modify a measure if the state demonstrates to the

Section 188 establishes the attainment dates for Moderate and Serious PM₁₀ nonattainment areas, and this rule also applies such dates to Moderate and Serious PM_{2.5} nonattainment areas. As described in Sections IV.D and IV.E of this preamble, in the case of a Moderate PM_{2.5} nonattainment area for which a state can demonstrate attainment by the end of the sixth calendar year following designation, the state must follow a two-step process for determining the appropriate attainment date for the area. First, the state must demonstrate through air quality modeling that the area can attain the relevant NAAQS by the latest statutory attainment date and determine which control measures and technologies are needed for the area to attain by that date. Second, the state must determine whether implementing other reasonable controls (*i.e.*, those not needed for attainment by the latest possible date but that are technologically and economically feasible) can cumulatively advance the attainment date for the area by at least 1 year. In the event that a state determines that the area can attain the relevant NAAQS earlier through the application of other measures, the state must propose the earlier date as part of the attainment plan submission for the area. When the EPA takes action to approve the different elements of the attainment plan for the area, one of the elements that the agency will take action on will be the state's proposed attainment date for the area. If the EPA approves an attainment date for the area that is earlier than the latest date allowed by statute, then the applicable attainment date for the area will be the approved date. *See* 40 CFR 51.1004(a)(1)(i). If the area ultimately needs additional time to attain the relevant NAAQS, the state may request an attainment date extension for the Moderate nonattainment area under section 188 as long as certain conditions are met, as described in Section IV.J of this preamble.

c. Final Rule—Step 6 (Attainment Case): If the State Can Demonstrate Attainment in the Area by the Statutory Attainment Date for a Moderate Area, Then the State Must Implement Those Control Measures Needed for Expeditious Attainment of the NAAQS in the Area

If a state determines that a Moderate nonattainment area can attain the PM_{2.5} NAAQS by the statutory attainment date, the state must adopt and

satisfaction of the EPA that such removal or modification will not interfere with any applicable requirement of the CAA, such as attainment of the PM_{2.5} NAAQS or meeting RFP requirements.

through the sixth calendar year following designation.

⁹⁵ In the context of the PM₁₀ NAAQS, the EPA has concluded that "advancement of the attainment date" should mean an advancement of at least 1 calendar year. *See* "State Implementation Plans; General Preamble for the Implementation of Title I of the CAA Amendments of 1990," 57 FR 13498 (April 16, 1992). *See also Sierra Club v. EPA*, 294 F.3d 155 (D.C. Cir. 2002).

implement any technologically and economically feasible control measures that are necessary to ensure that the area will attain the NAAQS as expeditiously as practicable. The EPA will consider any such measures that can be implemented within 4 years of designation of the area to fulfill the RACM and RACT requirements for the area. In addition, the EPA will consider any such measures that can only be implemented between 4 years and the sixth calendar year after designation to meet the requirements of CAA section 172(c)(6) as “additional reasonable measures” for the area and necessary to demonstrate timely attainment under CAA section 189(a)(1)(B).

For this type of situation, the state may reject any otherwise technologically or economically feasible measures that are not needed to demonstrate attainment or that will not advance the attainment date by at least 1 year. That is, for a Moderate area that can demonstrate attainment by the statutory Moderate area attainment date, the EPA defines as “reasonable” only those technologically and economically feasible measures that are necessary for expeditious attainment of the NAAQS, as the CAA does not require a state to adopt measures that are not needed for expeditious attainment in a Moderate PM_{2.5} nonattainment area. Thus, a state may exclude those otherwise reasonably available measures that, if adopted and considered collectively, would not advance the attainment date for the area by at least 1 year, so long as the state can demonstrate attainment as expeditiously as practicable and no later than the statutory Moderate area attainment date. The EPA maintains that identifying a complete set of measures that qualify as RACM/RACT and additional reasonable measures but that are not necessary for attainment within 6 years is imperative to adequately demonstrate that such measures will not collectively advance the attainment date for a Moderate area by at least 1 year. The EPA will require a robust analysis and explanation by the state when such determinations are made. See 40 CFR 51.1009(a)(4)(i).

d. Final Rule—Step 6 (Impracticability Case): If the State Cannot Demonstrate Attainment by the Statutory Attainment Date for a Moderate Area, Then the State Must Adopt All Reasonably Available Control Measures

Section 189(a)(1)(B) of the CAA anticipates that not all Moderate nonattainment areas will be able to demonstrate attainment by the attainment date, and it incorporates the concept of an “impracticability

demonstration” for such areas.⁹⁷ Commenters on this issue stated that nowhere in the statute is there an explicit exception for those measures that collectively are determined to be “ineffective in reducing ambient PM_{2.5} levels.” Further, they suggested that such an approach would enable the most polluted areas to exempt sources that individually are small by some arbitrary test when in other cleaner areas such sources would be required to reduce emissions because they collectively would advance attainment. Other commenters emphasized that sources located in such Moderate areas should still be subject to the regular review process for determining whether potential control measures are not technologically or economically feasible.

After considering comments on the two options described in the proposal, the EPA has decided to keep the policy in this final rule consistent with past guidance in the General Preamble. This guidance stated that “the EPA believes it is reasonable for all available control measures that are technologically and economically feasible to be adopted for areas that do not demonstrate attainment [by the applicable attainment date].”⁹⁸ The EPA believes that this interpretation is compelled by the language of CAA section 189(a)(1)(C), which separately requires a state to submit a Moderate area attainment plan and meet the RACM and RACT requirement, even if the state submits a demonstration showing that with those measures it cannot attain the NAAQS by the applicable attainment date.

Under this approach, if the state had an approved precursor demonstration (as described in Section III of this preamble) showing that a particular precursor does not have a significant contribution on PM_{2.5} levels that exceed the standard, then it would not need to adopt control measures for that particular precursor. The state then would be required to identify potential control measures for sources in the area that emit direct PM_{2.5} and any remaining significant precursors. Of these potential measures, the state

⁹⁷ The concept of an “impracticability demonstration” is established in CAA section 188(b), which addresses reclassifying Moderate PM_{2.5} areas to Serious. Section 188(b)(1) of the CAA describes the EPA’s discretionary authority to reclassify an area upon a determination that an area cannot practicably attain by the Moderate area attainment date. More relevant to this determination, however, CAA section 189(a)(1)(B) specifically provides for submission of a demonstration addressing this concept in the case of Moderate areas that cannot attain the NAAQS by the applicable attainment date.

⁹⁸ 57 FR 13498 (April 16, 1992), at page 13544.

would determine which would be technologically feasible to implement. Then the state would identify which of the technologically feasible measures are economically feasible to implement.

Subpart 4 requires that Moderate areas that cannot or do not meet the Moderate area attainment date be reclassified as Serious nonattainment areas, in which case sources in the areas are then subject to BACM and BACT requirements. In the General Preamble, the EPA indicated that “it may be reasonable, in some limited circumstances, for states to consider the compatibility of RACM and RACT with the BACM and BACT that will ultimately be implemented under the Serious area plans for those areas.”⁹⁹ Furthermore, for such areas that do not meet the Moderate area attainment date, the EPA indicated that “in the case of RACM for area sources, EPA anticipates that any future implementation of BACM for these sources will be additive to, and hence compatible with, RACM. This is because BACM will generally consist of a more extensive implementation of the RACM measures Since EPA anticipates that RACM and BACM for these sources will be compatible, the SIP’s (*sic*) for these areas should reflect the application of available control measures to existing sources in moderate nonattainment areas as determined by the analysis described . . . for RACM.”¹⁰⁰ Thus, the state should assess the remaining set of technologically and economically feasible measures with regard to the compatibility of implementing RACM/RACT in the near term in a way that supports addressing BACM/BACT for such sources when the area is reclassified to Serious.

The General Preamble also provided guidance for stationary source controls in this situation: “In many instances, the installation of pollution controls representing RACT may involve substantial capital expenditures. In the event that BACT is later required for those sources, this may require controls significantly incompatible with those recently installed as RACT, largely wasting those recent expenditures. Under such circumstances, the installation of controls in the first round of SIP planning would be unreasonable.” Accordingly, SIPs for the Moderate areas that cannot practicably attain need not require major changes to the control systems for specific stack and process sources where a State reasonably demonstrates that such changes will be significantly

⁹⁹ *Ibid.* at 13544.

¹⁰⁰ *Ibid.*

incompatible with the application of BACT-level control systems. A State's demonstration should include, for example, showing what the State believes are RACT and BACT for the source, and why they are significantly incompatible.

The EPA believes that in such cases, a state should consider selecting and implementing controls that may qualify as BACM or BACT in a Moderate nonattainment area as part of their RACM and RACT analysis. Early adoption of controls that would constitute BACM or BACT could be more efficient and could further the objectives of attaining the NAAQS expeditiously to protect public health and the environment.

e. Comments and Responses

Any additional comments received on this section are addressed in the Response to Comments document found in the docket for this action.

8. RACM and RACT and Additional Reasonable Measures Submission Requirements

a. Summary of Proposal

The proposal described a set of submission requirements for RACM/RACT and additional reasonable measures.

b. Final Rule

The requirements in the final rule remain very similar to those that were included in the proposal. To ensure that attainment plan submissions contain the necessary supporting information to enable the EPA to review and approve a state's evaluation and selection of measures that constitute RACM and RACT in a given nonattainment area, the EPA requires under the authority of section 301(a) of the CAA that a state must submit the following information as part of its submission:

(1) A list of all sources and activities in the nonattainment area that emit direct PM_{2.5} or any PM_{2.5} precursor (for multi-state nonattainment areas, this would include source categories, sources and activities from all states which make up the area). *See* 40 CFR 51.1008(a)(1).

(2) For each source or activity in the nonattainment area, an inventory of direct PM_{2.5} emissions and emissions of all PM_{2.5} precursors, and a comprehensive list of potential control measures considered by the state for the nonattainment area. *See* 40 CFR 51.1009(a)(2). If the state submitted a precursor demonstration that was approved by the EPA, the state would not be required to submit a list of sources and potential measures to

control emissions of the relevant precursor from the stationary sources addressed by the demonstration (*i.e.*, all sources for a comprehensive precursor demonstration, or major sources for a major source precursor demonstration). *See* 40 CFR 51.1006(a)(1) and (2). Note that the emissions inventory would still need to include all sources of the relevant precursor. *See* 40 CFR 51.1008(a)(1).

(3) For each potential control measure considered by the state but eliminated from further consideration due to a determination by the state that the control measure or technology was not technologically feasible, a narrative explanation and quantitative or qualitative supporting documentation to justify the state's conclusion. *See* 40 CFR 51.1009(a)(3).

(4) For each technologically feasible emission control measure or technology, a determination of whether the measure is economically feasible must be included, with narrative explanation and quantitative supporting documentation to justify the state's conclusion. *See* 40 CFR 51.1009(a)(3). The following additional information relevant to economic feasibility should be included as necessary to justify the determination: (a) The control efficiency by pollutant; (b) the possible emissions reductions by pollutant; and, (c) the estimated cost per ton of pollutant reduced.

(5) For each technologically and economically feasible emission control measure or technology, the date by which the technology or measure could reasonably be implemented, in whole or in part. *See* 40 CFR 51.1009(a)(4)(i)–(ii).

Each of these elements will provide information needed by the EPA to evaluate whether the state is meeting the statutory requirements for an attainment plan, and in particular meeting the statutory requirement for states to implement RACM and RACT on sources within the nonattainment area. The EPA recognizes that the base year emissions inventory for the area that the state submits in conjunction with its attainment plan will likely contain some of the information proposed to be required under the first two items in this list. However, the EPA is finalizing a requirement for emissions inventory information specifically relevant to the RACM and RACT element of the state's attainment plan in order to ensure that the EPA or any other party can appropriately evaluate the state's RACM and RACT analysis.

c. Comments and Responses

Comment: Some commenters supported the general submission

requirements because in some cases RACM/RACT demonstrations fail to provide the information necessary for the EPA to reasonably conclude that these requirements have been met and are supported by a systematic analysis.

Response: The EPA agrees with the commenters and the final rule generally tracks the proposal.

9. Criteria for Effective Regulations to Implement RACM and RACT and Additional Reasonable Measures

a. Summary of Proposal

The preamble to the proposed rule described the four main criteria for effective control measure regulations: Such regulations must be quantifiable, enforceable, replicable and accountable.

b. Final Rule

The guidance in this preamble to the final rule remains very similar to what was proposed. After a state has identified a particular control measure as RACM or RACT or additional reasonable measure for a particular nonattainment area, it must then implement that measure through a legally enforceable mechanism that will be included in the SIP (*e.g.*, a state rule that the EPA will approve as a part of the federally enforceable SIP for the state). The EPA is proposing that in order for the EPA to be able to approve any such measure as part of the SIP, the state would have to provide information to meet the following four criteria. These criteria are similar to the criteria finalized as part of the remanded 2007 PM_{2.5} Implementation Rule.

First, the base year emissions from the source or group of sources to which the control measure applies and the future year projected emissions from those sources once controlled must be quantifiable so that the projected emissions reductions from the sources can be attributed to the specific measures being implemented. It is important that the emissions from the source category in question are accurately represented in the base year inventory so that emissions reductions are properly calculated. In particular, it is especially important to ensure that both the filterable and condensable components of direct PM_{2.5} emissions are accurately represented in the base year.

Second, the control measures must be enforceable. This means that they must specify clear, unambiguous and measurable requirements. The measurable requirements for larger emitting facilities must include periodic source testing, monitoring or other viable means to establish whether the

affected source meets the applicable emission limit. Additionally, to verify the continued performance of the control measure, specific emissions monitoring programs appropriate for the type of control measure employed and the level of emissions must be included to verify the continued performance of the control measure. The control measures and monitoring program must also have been adopted according to proper legal procedures. Note that if measures are found to be technically and economically feasible for reducing condensable PM_{2.5} emissions as well as filterable PM_{2.5} emissions from a source, the state will need to adopt a new emission limit for the source that accounts for both the filterable and condensable portions, and includes requirements for ensuring compliance using condensable PM_{2.5} source test methods updated in 2011.¹⁰¹

In response to a comment on this criterion, the EPA clarifies that an enforceable regulation for a CAA program must be enforceable by the EPA, the state, and citizens. By taking action to approve emissions limitations and related provisions into the SIP, the EPA thereby makes those emission limitations a federally enforceable component of the SIP that the state, the EPA, and citizens can enforce thereafter in the event of a violation. SIP provisions that effectively preclude enforcement of violations by the EPA or citizens, whether through impermissible exemptions or other SIP provisions that function to bar effective enforcement, are not acceptable.

Third, the results of application of the control measures must be replicable. This means that where a rule contains procedures for interpreting, changing or determining compliance with the rule, the procedures are sufficiently specific and objective so that two independent entities applying the procedures would obtain the same result.

Fourth, the control measures must be accountable. This means, for example, that source-specific emission limits must be permanent and must reflect the assumptions used in the attainment plan for the area, including the modeling conducted in conjunction with the attainment demonstration. It also means that the attainment plan must establish requirements to track emissions changes at sources and provide for corrective action if emissions reductions are not achieved according to the plan.

¹⁰¹ See 75 FR 80118 (December 21, 2010), revisions to test methods for measuring condensable PM emissions from stationary sources (Method 202).

c. Comments and Responses

Any additional comments received on this section are addressed in the Response to Comments document found in the docket for this action.

10. Determination of RACM and RACT and Additional Reasonable Measures in Multi-State Nonattainment Areas

a. Summary of Proposal

The proposal included several proposed recommendations about the development of control measures by states with multi-state nonattainment areas.

b. Final Rule

The guidance in the final preamble remains very similar to what was proposed. States in multi-state nonattainment areas will need to consult with each other on appropriate control measures for the shared nonattainment area. The agency anticipates that states could decide upon RACM and RACT and additional reasonable measures that differ from state to state in a shared nonattainment area, based upon each state's determination of the most effective strategies given the relevant mixture of sources and potential controls in the respective states' portions of a shared nonattainment area. As long as each state can adequately demonstrate that its chosen attainment strategy, including its selection and adoption of RACM and RACT and additional reasonable measures, will provide for meeting RFP requirements and for attainment of the NAAQS as expeditiously as practicable for the nonattainment area at issue, the EPA anticipates being able to approve individual state plans that may elect to control a different mix of sources or to implement different controls, under the proper circumstances. Nevertheless, in evaluating RACM and RACT and additional reasonable measures for a particular nonattainment area, states must consider potential reasonable control measures developed for other areas or other states, and particularly for other portions of an interstate nonattainment area. In addition, states in multi-state nonattainment areas must evaluate whether the reasonable measures each state may have identified as not being necessary for attainment could collectively advance the attainment date for the area by at least 1 year. The EPA may consider such measures in assessing the approvability of each state's individual attainment plan for a multistate nonattainment area.

c. Comments and Responses

Any additional comments received on this section are addressed in the Response to Comments document found in the docket for this action.

11. Environmental Justice Considerations in Developing the Attainment Plan Control Strategy for a Moderate PM_{2.5} Nonattainment Area

a. Summary of Proposal

The proposal provided guidance about environmental justice considerations in developing the attainment plan control strategy for a Moderate area.

b. Final Rule

The guidance remains very similar to what was proposed. Current air quality data indicate that the more severe PM_{2.5} nonattainment areas contain a high population of people with low socio-economic status, who are among the most at-risk for adverse health effects from exposure to PM_{2.5}. As part of its EJ2020 Action Agenda, the EPA is committed to making progress on improving air quality in communities with high particulate pollution. The EPA, therefore, strongly urges states to consider environmental justice concerns with respect to any control measures they have identified as potential RACM or RACT or additional reasonable measures in an area, particularly to the extent that control measures that a state may be considering are otherwise approximately equal (in terms of technological and economic feasibility) but unequal with respect to their direct or indirect impacts on overburdened populations.¹⁰² In such cases, the EPA encourages the state to prioritize imposition of the control measures that will result in the least possible burden and greatest degree of health protection for overburdened populations in the nonattainment area. Section XI of this preamble discusses possible approaches for states to address environmental justice concerns associated with implementation of the PM_{2.5} NAAQS in their SIP development process and attainment plans.

¹⁰² The term "overburdened populations" is defined in the EPA's "Plan EJ 2014" to describe the minority, low-income, tribal, and indigenous populations or communities in the U.S. that potentially experience disproportionate environmental harms and risks as a result of greater vulnerability to environmental hazards. This increased vulnerability may be attributable to an accumulation of both negative and lack of positive environmental, health, economic or social conditions within these populations or communities. For more information on Plan EJ 2014, see <https://www.epa.gov/environmentaljustice>.

c. Comments and Responses

Any comments received on this section are addressed in the Response to Comments document found in the docket for this action.

E. Modeling for Attainment Demonstrations

1. Demonstrations for Moderate Areas

a. Summary of Proposal

Section 189(a) of the CAA generally requires a state with a designated Moderate nonattainment area to submit an attainment plan for such area. Section 189(a)(1)(B) of the CAA requires the state to submit an attainment demonstration including air quality modeling to establish either: (i) That the area will attain the relevant NAAQS by the applicable attainment date; or (ii) that it is impracticable for the area to attain the relevant NAAQS by the applicable attainment date. For Moderate nonattainment areas, the attainment date is as expeditiously as practicable, but no later than the end of the sixth calendar year after designation as nonattainment. The EPA therefore proposed to require all Moderate nonattainment areas to submit either an attainment demonstration which includes air quality modeling which establishes that the area will attain the PM_{2.5} NAAQS by the applicable attainment date, or an impracticability demonstration which documents that the area will not attain the NAAQS by the applicable attainment date. The EPA proposed that the impracticability demonstration must also include air quality modeling, but also asked for comments on an alternative option that would not require air quality modeling as part of an impracticability demonstration. The EPA also proposed to allow states to fulfill the statutory modeling requirement through either locally generated photochemical and/or dispersion modeling or, with proper justification, appropriate regional or national modeling.

An attainment demonstration is a plan that provides an explanation of how a state will attain the PM_{2.5} NAAQS by the applicable attainment date in a particular nonattainment area.¹⁰³ The EPA proposed that the demonstration must contain: (i) Technical analyses such as base year and future year modeling of emissions which identifies sources and quantifies their emissions that are contributing to violations of the

PM_{2.5} NAAQS; and (ii) analyses of future year emissions reductions and air quality improvement resulting from existing (*i.e.*, already-adopted or “on the books”) national, regional and local programs, and potential new local measures needed for attainment, including RACM and RACT controls for the area.

The EPA further proposed that each state with a Moderate nonattainment area must submit an attainment plan with an attainment demonstration that includes analyses supporting the state’s determination of its proposed attainment date. In all cases, the state must show that the area will attain the NAAQS as expeditiously as practicable, but not later than the sixth calendar year after designation. In order to establish that the attainment date is as expeditious as practicable, the state must explain why the control measures adopted in the attainment plan provide for the most expeditious attainment and, in particular, must explain why any cumulative group of reasonable and available control measures that the state elected not to adopt will not collectively advance the attainment date by at least 1 year.

b. Final Rule. As required by CAA section 189(a)(1)(B), the EPA is finalizing a requirement for states with Moderate nonattainment areas to submit a demonstration to establish either: (i) That the area will attain the relevant NAAQS by the applicable attainment date; or (ii) that it is impracticable for the area to attain the relevant NAAQS by the applicable attainment date.

As proposed, attainment demonstrations must include analyses (including air quality modeling) supporting the state’s determination of its proposed attainment date. In all cases, the state must show that the area will attain the NAAQS as expeditiously as practicable, but not later than the sixth calendar year after designation. The demonstration must include implementation of all measures identified as RACT/RACM plus additional reasonable measures, as necessary, for expeditious attainment. In order to establish that the attainment date is as expeditious as practicable, the state must explain why the control measures adopted in the attainment plan provide for the most expeditious attainment and, in particular, must explain why the cumulative group of reasonable and available control measures that the state elected not to adopt will not collectively advance the attainment date by at least 1 year. *See* 40 CFR 51.1009(a)(4).

The EPA is not finalizing a regulatory requirement for air quality modeling to

be included as part of an impracticability demonstration. *See* 40 CFR 51.1009(a)(4). Since all nonattainment areas will have modeling requirements associated with their attainment demonstration, the EPA believes it is likely that modeling will be submitted in support of impracticability demonstrations. However, it may be possible in some cases to support an impracticability demonstration with ambient PM_{2.5} data and other relevant non-modeling information. For example, the ambient data in a nonattainment area may be so far above the NAAQS, and the reasonable and available controls (*i.e.* RACT/RACM and additional reasonable measures) so limited, that it is clearly impossible (and thus also impracticable) for the area to attain by the Moderate area attainment date.¹⁰⁴ In order to support this type of demonstration, the state must show that, even if all reasonable controls (*i.e.* RACT or RACT and additional reasonable measures) were implemented, the state could not attain the NAAQS within the statutory timeframe for a Moderate area.

The EPA continues to assume that in most cases photochemical grid modeling will be required to demonstrate attainment with the PM_{2.5} NAAQS. However, the EPA recognizes that more simplistic modeling techniques (such as dispersion, receptor, and/or box models) may suffice to demonstrate that an area will attain the NAAQS, especially in areas that are dominated by primary PM_{2.5} emissions (*e.g.* residential wood smoke).

c. Comments and Responses.

Comment: Some commenters supported the EPA’s proposal to require modeling to demonstrate that attainment is not practicable. The commenters stated that such an interpretation flows logically from the Act’s requirement in section 189(a)(1)(B) that attainment demonstrations be supported by modeling. One commenter supported the alternative approach described in the proposal in which air quality modeling would not be required for a Moderate area impracticability demonstration.

Response: After further consideration of this issue, the EPA has determined that modeling need not be a regulatory requirement to support an impracticability demonstration. We note that CAA section 189(a)(1)(B)(i) includes the parenthetical “including air quality modeling” which clearly

¹⁰³ An area is designated nonattainment for either the annual PM_{2.5} NAAQS or the 24-hr PM_{2.5} NAAQS or both. The attainment demonstration should show that the area is attaining the form of the NAAQS for which they have been designated nonattainment.

¹⁰⁴ Pursuant to CAA section 188(b)(1)(B), upon the EPA determination that attainment by the Moderate date is impracticable, the EPA shall reclassify the area as Serious within 18 months after the Moderate area SIP due date.

makes modeling a statutory requirement for moderate area attainment demonstrations. However, the same parenthetical statement is absent from CAA section 189(a)(1)(B)(ii), which addresses an impracticability demonstration. While we believe that most impracticability demonstrations will indeed be supported by air quality modeling, there are cases where a modeling demonstration may not be needed. In addition, the EPA believes the burden of proof for an impracticability demonstration is logically lower than for an attainment demonstration because submission of an impracticability demonstration also requires reclassification to a serious nonattainment area and the accompanying more stringent regulatory requirements (e.g. BACT/BACM). The area is still required to meet RACT/RACM requirements and will also be required to submit a serious area attainment demonstration, which will necessarily need to include air quality modeling.

Comment: Some commenters agreed with the EPA that states should be afforded flexibility to fulfill the statutory modeling requirement through appropriate regional or national modeling.

Response: The EPA agrees that, where appropriate, regional and/or national scale air quality modeling could be sufficient to fulfill the statutory modeling requirement for attainment demonstration modeling. However, as with any attainment demonstration, the modeling must be shown to be appropriate for the nonattainment area, including good model performance, appropriate emissions and meteorological inputs, and consideration of emissions control strategies. It should be noted, however, that it may be difficult to fulfill other CAA requirements (such as emissions inventory, RACM, RFP, establishing motor vehicle emissions budgets for transportation conformity purposes, etc.) using regional or national modeling data. In order to fulfill those requirements, states may need more detailed data for sources in their nonattainment area compared to what is available through regional or national modeling.

Comment: Some commenters stated that, as the proposal stands, if states wish to preclude RACT/RACM for any sources in the nonattainment area, they must do modeling for the year preceding the attainment year to demonstrate early attainment; this would require modeling for 3 years, rather than 2 years.

Response: Although a RACM analysis is required, and eliminating potential

control measures requires an assessment of whether the measures collectively could advance the attainment date by 1 year, EPA did not propose any specific modeling requirements for the RACM analysis. There are several components to the analysis. First, potential emissions reductions need to be assessed. Then, an assessment of whether those emissions reductions can advance attainment by at least a year needs to be completed. One way to minimize the number of future modeled years is to establish (through sensitivity modeling) a relationship between PM_{2.5} and PM_{2.5} precursor emissions reductions and PM_{2.5} concentrations in the nonattainment area. The established relationship can be used to estimate whether a particular set of emissions reductions will be able to advance the attainment date by at least a year. Also, in some cases, the emissions reductions identified through the RACM analysis may be relatively small (as a percentage of area-wide emissions) that a modeling analysis is not needed to show that the attainment date cannot be advanced.

2. Available Modeling Guidance for Demonstrating Attainment

a. *Summary of Proposal.* The EPA proposed that attainment demonstrations should be consistent with the procedures for modeling PM_{2.5} as described in the EPA's "Guidance on the Use of Models and Other Analyses for Demonstrating Attainment of Air Quality Goals for Ozone, PM_{2.5}, and Regional Haze"¹⁰⁵ as well as the Guideline on Air Quality Models (40 CFR part 51, Appendix W).

The PM_{2.5} attainment demonstration modeling guidance (hereafter referenced as the "modeling guidance") describes how states can apply air quality models to generate results needed to demonstrate attainment. Models are used to test whether control measures in an attainment plan to be adopted into a SIP are likely to result in attainment of the relevant standards. The attainment demonstration modeling guidance recommends a modeled attainment test for the annual and 24-hour PM_{2.5} NAAQS that uses a combination of ambient PM_{2.5} and PM_{2.5} species data and modeled PM_{2.5} concentrations to estimate future year air quality. In the recommended attainment test the state applies the test at each PM_{2.5} ambient monitor location within or near a designated nonattainment area. Models are used in a relative sense to estimate the response of measured air quality to

future changes in emissions. Future air quality is estimated by multiplying recent monitored PM_{2.5} values by the modeled relative response (percent change) to projected future changes in emissions. If the future design value at all monitoring locations in the nonattainment area does not exceed the concentration of PM_{2.5} specified in the NAAQS, the area is projected to attain the NAAQS.

b. *Final Rule.* In the final rule, EPA is continuing to recommend that attainment demonstrations should be consistent with the procedures for modeling PM_{2.5} as described in the PM_{2.5} attainment demonstration modeling guidance and Appendix W. The modeling guidance describes how states can apply air quality models to generate results needed to demonstrate attainment. These recommendations include developing a conceptual description of the problem to be addressed; developing a modeling/analysis protocol; selecting an appropriate model to support the demonstration; selecting appropriate meteorological episodes or time periods to model; choosing an appropriate area to model with appropriate horizontal/vertical resolution; generating meteorological and air quality inputs to the air quality model; generating emissions inputs to the air quality model; and evaluating performance of the air quality model. After these steps are completed, the state can apply a model to simulate effects of future year emissions and candidate control strategies.

The EPA has updated the 2007 PM_{2.5} modeling guidance to include additional information related to the 2012 PM_{2.5} NAAQS and associated monitoring requirements.¹⁰⁶ The main components of the modeling guidance and the modeled attainment test have not changed. Additional information has been added to address near-road monitoring sites and other information that was not available when the guidance was first released in 2007.

The modeling guidance continues to recommend a relative attainment test for both the annual and 24-hour PM_{2.5} NAAQS. The EPA is not recommending a specific model for use in the attainment demonstration for the PM_{2.5} NAAQS. At present, there is no single model that has been extensively tested and shown to be clearly superior to other available models. The current

¹⁰⁵ The PM_{2.5} attainment demonstration modeling guidance can be found at the following Web site: http://www3.epa.gov/ttn/scram/guidance_sip.htm.

¹⁰⁶ See updated guidance at https://www3.epa.gov/ttn/scram/guidance/guide/Draft_O3-PM-RH_Modeling_Guidance-2014.pdf: "Draft Modeling Guidance for Demonstrating Attainment of Air Quality Goals for Ozone, PM_{2.5}, and Regional Haze," December 2014.

modeling guideline, 40 CFR part 51, appendix W, does not identify a preferred model for use in attainment demonstrations of the NAAQS for PM_{2.5}. Thus, states may choose from several alternatives.

The EPA has developed software to perform both the annual and 24-hour PM_{2.5} attainment test (including interpolating PM species data where necessary). The current software is called the Software for the Modeled Attainment Test—Community Edition (SMAT—CE).¹⁰⁷ The software is provided as a way to make it relatively easy for states to apply the recommended modeled attainment test(s). However, states are not required to use SMAT—CE and can develop their own post-processing software as necessary.

The modeling guidance continues to describe the opportunity for states to supplement their modeling with a “weight of evidence” demonstration. States may use other information and analyses, in addition to the modeled attainment test to estimate whether future attainment of the NAAQS in an area is likely. Other analyses may include, but are not limited to, emissions trends, ambient data trends and analyses, other modeling analyses, and documentation of other non-modeled emissions control strategies, including voluntary programs.

The application of air quality models requires a substantial effort by state and local agencies. Therefore, states should work closely with their EPA regional office in executing each step of the modeling process. By doing so, it will increase the likelihood of the EPA’s approval of the state demonstration submitted at the end of the modeling and overall attainment plan development process.

c. Comments and Responses.

Comment: Several commenters questioned the ability of the current most common photochemical models to accurately model how the PM_{2.5} precursors impact overall PM_{2.5} concentrations. They raise particular concerns about ammonia emissions and the ability of models to predict PM_{2.5} formation from ammonia precursor emissions. The commenters stated that emissions inventories necessary for such modeling, as well as the tools used to measure those emissions, remain uncertain and are sometimes inaccurate; e.g., emission rates are too often based on unreliable data, due to either lack of

representative information or technical issues associated with test methods. Some commenters stated that these concerns are particularly salient here because the PM_{2.5} SIP Requirements Proposal requires that states account for new precursors, including VOCs and ammonia.

Response: The EPA disagrees with the commenters’ assertion that emissions inventory and modeling tools are insufficient to estimate PM_{2.5} concentrations and the predicted change in PM_{2.5} due to changes in PM_{2.5} emissions and PM_{2.5} precursors. While there will always be uncertainty in emissions inventories and modeling, photochemical models of PM_{2.5} concentrations, including secondary formation through chemistry, have been used in the scientific and regulatory community for over 30 years. State attainment demonstration modeling has been performed by numerous states over the last 10+ years to support the 1st round of PM_{2.5} SIPs that were due in 2007. In addition, the EPA has used photochemical modeling of PM_{2.5} to support numerous regulatory rulemakings over the last decade.

The technical tools to perform photochemical modeling are well established and have been improved almost continuously over many years. New versions of the CMAQ and CAMx models with numerous science updates are released every 1 to 2 years. National emissions inventories that include primary PM_{2.5} and all scientific precursors (SO₂, NO_x, VOC and ammonia) have existed since the NEI for 2002. The NEI is released every 3 years with methodological improvements with every release.

In addition, the commenters refer to VOC and ammonia as “new precursors,” which is not accurate. VOC and ammonia have always been “scientific” PM_{2.5} precursors, and as such have always been inventoried and modeled with chemistry in PM_{2.5} photochemical models. The only thing “new” is that VOC and ammonia are now assumed to be presumptive PM_{2.5} precursors. However, even though the previous implementation rule did not assume that VOC and ammonia were default precursors, all photochemical modeling of PM_{2.5} has always included VOC and ammonia emissions and the resultant chemical formation of ammonium sulfate, ammonium nitrate, and secondary organic carbon.

The commenters were concerned that model errors in the formation of PM_{2.5} from ammonia sources would impose an unreasonable regulatory burden on sources of ammonia such as animal agriculture. Even though there may be

general uncertainty in ammonia inventories, it is not clear how those uncertainties would lead to an unreasonable regulatory burden on any emissions sources in particular. Every modeling application in support of an attainment demonstration must be shown to adequately represent the emissions, chemistry, and PM_{2.5} concentrations in the nonattainment area. Ambient measurements of PM_{2.5} and precursors are used in a model performance evaluation to demonstrate that the modeling system is appropriate to use to determine the sensitivity of PM_{2.5} mass to emissions changes. In addition, all SIPs are required to undergo a public comment process where specific emissions and/or modeling concerns can be raised to the state. And then, after review of the SIP submission by EPA, all approvals or disapprovals of attainment SIPs go through a notice and comment rulemaking process. There are therefore numerous opportunities for both industry and the general public to participate in the SIP development process. States are expected to use the appropriate tools and the best information available to demonstrate how they will attain the PM_{2.5} NAAQS by the attainment date. The EPA believes that the appropriate tools are available to perform the modeling needed for an attainment demonstration.

3. Demonstrating Attainment at Near-Road Monitors

a. *Summary of Proposal.* The 2012 PM_{2.5} NAAQS final rule contains new requirements for operating near-road monitors in the largest metropolitan areas.¹⁰⁸ The first set of monitors was required to be in place by January 1, 2015. Some of the near-road monitors began operation prior to 2015. However, none of the monitors will have the requisite 3 years of monitoring data that can be used to calculate a PM_{2.5} design value until 2017 at the earliest. Therefore, these data were not used for the initial designations for the 2012 PM_{2.5} NAAQS (finalized in December 2014) and in most nonattainment areas, there will be less than 3 years’ worth of data available when the initial attainment demonstrations for Moderate nonattainment areas are due in 2016. As a result of this timing, the EPA proposed that the initial set of Moderate area attainment demonstrations will not need to include projected design values for near-road monitors. But when 3 or more years’ worth of complete ambient data are available at near-road monitors,

¹⁰⁷ SMAT—CE replaced the Modeled Attainment Test Software (MATS) in January 2016. SMAT—CE performs the same functionality as MATS, but is open source, runs faster, and is more stable than its predecessor.

¹⁰⁸ 78 FR 3283.

states will need to address those monitors in their attainment demonstrations and will need to include a demonstration that those monitors will attain the NAAQS by the applicable statutory attainment date.

b. Final Rule. For the final rule, the EPA maintains the policy of not requiring the use of ambient air quality data in a modeled PM_{2.5} attainment demonstration unless there is at least one complete design value of data available (generally 3 complete years of data). This applies to both near-road and other PM_{2.5} ambient monitoring data. Some states may have installed their monitors well before the January 1, 2015 deadline and may therefore have complete data before the SIP deadline. In addition, some attainment demonstrations may be submitted after the statutory deadline. Because of the varying monitor installation dates, the use of near-road monitoring data in attainment demonstrations depends on the timing of the attainment demonstration submission relative to the installation date of the monitor(s). Ambient data with sufficient completeness to calculate a design value may not be ignored in an attainment demonstration. Such data can be addressed either in the attainment demonstration analysis of ambient monitors or as part of an unmonitored area analysis (see the next section), as appropriate.

The revised PM_{2.5} modeling guidance document includes procedures for applying a dispersion model or a combination of photochemical grid models and dispersion modeling to demonstrate attainment at monitors with large primary PM_{2.5} concentration gradients. Depending on the nature of the ambient data in a particular area, it may be appropriate to treat near-road monitors as high concentration gradient locations. However, in other cases, near-road monitors may have little or no gradient compared to other nearby monitors. Therefore, the appropriate treatment of near-road monitors in attainment demonstrations should be evaluated on a case-by-case, depending on the facts and circumstances in each nonattainment area.

c. Comments and Responses.

Comment: Some commenters stated the EPA's proposal to excuse areas from having to include projected design values for near-road monitoring locations promises to undermine the likelihood of success for attainment demonstrations. The commenters stated the EPA's blanket waiver for near-road data has no rational basis and that just because such monitors were not required before January 1, 2015, does

not mean that areas did not have them in place before then. The commenters stated the EPA should at least clarify that if an area has 3 years of near-road monitoring data, it should use such data in its attainment modeling. The commenters stated this would be particularly important, for example, if an area is late in preparing its demonstration.

Response: The EPA agrees there should not be a "blanket waiver" for the use of near-road monitoring data in attainment demonstrations that are due in 2016 or thereafter. The statements in the proposal referenced the fact that the near-road monitors were not required to be in place before January 1, 2015. This makes it unlikely that sufficient data from these monitors will be available to be considered in attainment demonstrations that are due in 2016. However, if complete data are available at near-road monitors during the development of the attainment demonstration, the data should be considered as appropriate (similar to any other PM_{2.5} monitoring data). Since the near-road PM_{2.5} monitoring network is relatively new, there may not be 3 years of complete data in time to be considered in the upcoming attainment demonstrations. In addition, the base modeling year of the attainment demonstration may predate the startup date of the near-road monitor(s). In this case, it may be possible to consider the near-road data in the attainment demonstration, but the recommended default projection methodology may not be applicable (since the time period of the near-road data may not correspond to the 5 year time period centered about the base modeling year, as recommended in the modeling guidance). Additionally, near-road PM_{2.5} monitors are only required in the 27 largest metropolitan areas of the country. Some PM_{2.5} nonattainment areas may not have any near-road monitoring sites. States should consult with the appropriate EPA regional office to determine the best way to treat near-road data in their attainment demonstration.

4. Demonstrating Attainment in Unmonitored Areas

a. Summary of Proposal. The 2007 PM_{2.5} modeling guidance describes a recommended "relative" attainment test that is based on showing attainment at ambient monitoring locations. The guidance also recommends that states conduct further analyses based on modeling results to determine whether there are unmonitored areas that merit additional analysis or investigation. In order to clarify the statutory and rule

requirements of a modeled attainment demonstration, the EPA proposed four options for demonstrating attainment in unmonitored areas in an attainment demonstration.

Option 1 would require the attainment demonstration modeling to demonstrate attainment at ambient monitoring locations. There would be no requirement to specifically examine attainment in unmonitored areas. Option 2 would require modeling to demonstrate attainment at ambient monitoring locations and in unmonitored areas within the nonattainment area. Enforceable emissions reductions would be required to eliminate any potential future year NAAQS violations in all locations within the nonattainment area (including unmonitored areas). Option 3 would require modeling to demonstrate attainment at ambient monitoring locations and in unmonitored areas within the nonattainment area. However, rather than requiring states to impose additional enforceable emissions reductions in the SIP to address potential violations in unmonitored areas, states would be required to use the unmonitored area analysis results to develop an assessment of the likelihood of violations in unmonitored areas. The assessment would be used to evaluate the need for additional controls and/or could be used to inform the ambient monitoring plan (the need to add additional monitors or move existing monitors). Option 4 would require modeling to demonstrate attainment at ambient monitoring locations and recommend the analysis of unmonitored areas within the nonattainment area. This differs from Option 3 in that there would be no rule requirement to perform an unmonitored area analysis. But the submission of an unmonitored area analysis would still be recommended, especially in areas with a relatively sparse PM_{2.5} monitoring network or in locations where information such as modeling data, emissions inventories or non-FEM monitoring data (such as from special purpose monitors or saturation monitoring studies) may indicate potential high PM_{2.5} concentrations in areas that are currently unmonitored.

b. Final Rule. The EPA is finalizing proposed Option 4. This option requires states to show attainment at all current and recent monitoring locations. States will not be required to provide an unmonitored area analysis as a mandatory element of each attainment demonstration. However, an unmonitored area analysis can provide useful information about PM_{2.5}

concentrations and gradients in the nonattainment area and therefore the EPA recommends that all attainment demonstrations should contain an unmonitored area analysis. The EPA encourages states to use information available to them to consider what, if any, impacts may be occurring in unmonitored areas. States can evaluate the need to perform an unmonitored area analysis by using available information such as modeling data, emissions inventories, or non-FEM monitoring data (such as from special purpose monitors or saturation monitoring studies) to indicate the potential high PM_{2.5} concentrations in areas that are currently unmonitored. An unmonitored area analysis is strongly recommended where the state and/or the EPA has reason to believe that potential violations may be occurring in unmonitored areas, or other available information indicates that further analysis is warranted. The EPA will consider whether the state has adequately addressed all available information about potential exceedances of the NAAQS in unmonitored areas when determining whether the plan can be approved.

The EPA is requiring an attainment demonstration approach that relies primarily on existing monitoring sites and modeling to project attainment in future years. This approach to evaluating monitored and unmonitored areas is consistent with how EPA determines whether an area meets the PM_{2.5} NAAQS for purposes of designations and redesignations. As discussed in Section II of this preamble, the EPA promulgates designations for PM_{2.5} NAAQS nonattainment areas based primarily on ambient data measured at FRM and FEM monitors.¹⁰⁹ Although the EPA considers other information for purposes of evaluating areas with sources that contribute to those monitored violations for inclusion within the nonattainment area boundaries, the fundamental basis for designating an area as nonattainment for a PM_{2.5} NAAQS is the presence of one or more FRM or FEM monitors with data showing violations of the NAAQS. Similarly, determinations of attainment of the PM_{2.5} NAAQS for purposes of redesignation actions are based primarily on monitored data. When all FRM and FEM monitors in a nonattainment area measure attainment of the PM_{2.5} NAAQS, the state is eligible to submit a redesignation request for the

area, assuming that it has complied with all other applicable requirements for purposes of redesignation. Specifically, the EPA's approval of a redesignation request is subject to meeting the requirements of CAA section 107(d)(3)(E). Among those requirements is that the area has attained the NAAQS. For the PM_{2.5} NAAQS, this determination is based on ambient data measured at the FRM and FEM monitors in the area in question.

In addition, the "relative" attainment test for PM_{2.5} attainment demonstrations uses FRM or FEM ambient monitoring data, combined with future year modeled percentage changes in PM_{2.5} concentrations to project future year design values. Since the attainment test relies on ambient monitoring data, an analysis of future year concentrations in unmonitored areas can only be accomplished by interpolating ambient data to a particular location where there is no existing monitor or recent monitoring data. Therefore, in the context of an attainment demonstration, the projection of future year PM_{2.5} concentrations in unmonitored locations is inherently more uncertain than projections in monitored locations due to the fact that the ambient concentrations from which these projections are developed are unknown in the unmonitored locations.

While the unmonitored area analysis is not a regulatory requirement, and states are not required to identify enforceable emissions reductions to eliminate potential violations in unmonitored areas, an unmonitored area analysis has the potential to provide additional important information about PM_{2.5} levels and gradients in the nonattainment area. The results of the analysis can be used to provide information to inform future monitoring plans, to examine the need for potential emissions controls, to evaluate potential environmental justice concerns, and to provide additional information to the public. The EPA believes that Option 4 provides the best balance between the regulatory requirements of the attainment demonstration and additional analyses which could provide helpful information to inform future regulatory activities.

Where information is available, states and the EPA have obligations to address potential violations in unmonitored areas, and, although we expect this to be relatively rare, attainment plans need to address air quality in unmonitored areas where information exists suggesting the potential for such violations. Where an unmonitored area analysis is performed, states should use model results and

available ambient data to develop an assessment of the likelihood of violations in unmonitored areas. The nature of the assessment depends on the available information and the nature of the local PM_{2.5} problem, but could include, as appropriate, elements such as an evaluation of the emissions inventory (particularly for local direct PM_{2.5} sources), the existing ambient data for the area, and meteorological model inputs to evaluate the accuracy of the modeled violations in unmonitored areas. If potential violations are determined to be likely, additional steps could include imposition of emissions reductions at nearby emission sources or a commitment to deploy special purpose monitors and/or saturation monitors in the area (in order to further evaluate the problem). The state should document the assessment, including analyses of emissions, meteorological inputs and ambient data.

The PM_{2.5} modeling guidance recommends a default procedure for applying an unmonitored area analysis, which combines gridded model data with interpolated ambient data. States can apply the default recommended approach or develop their own analysis which may be more appropriate for the specific area or situation. States are expected to consult with the appropriate EPA Regional Office to evaluate available information to determine if an unmonitored area analysis is needed for a particular area and how the analysis should be performed.

c. Comments and Responses.

Comment: Some commenters stated that, of the options for addressing unmonitored areas, only Option 2 is technically and legally defensible (80 FR 15382). The commenters stated the Act requires that ambient concentrations in all areas meet the applicable NAAQS and cited 42 U.S.C. 7407(a) as requiring states to assure "air quality within the entire geographic area comprising such State" will achieve the national standards and requiring "an implementation plan [to] . . . specify the manner in which national primary and secondary ambient air quality standards will be achieved and maintained"). The commenters also cited 42 U.S.C. 7410(a)(1) as requiring implementation plans to provide for implementation of the NAAQS "in each air quality control region (or portion thereof) within such State"). The commenters stated it is insufficient to suggest that an area need only show attainment at monitored locations and need only adopt controls that will address those locations.

Response: The EPA does not agree that Option 2 is the only technically and

¹⁰⁹ A monitor must have 3 years of quality assured ambient data available to be used to calculate a PM_{2.5} design value and determine compliance with the NAAQS.

legally defensible option. The CAA requires states with nonattainment areas to submit an attainment demonstration as part of their PM_{2.5} SIP. States must show that they will attain the NAAQS by their attainment date. The CAA also requires states to use air quality modeling in their attainment demonstration. But other than those general requirements, the EPA believes states have discretion to interpret how and where to show attainment of the NAAQS through modeling in support of an attainment demonstration.

In addition, the EPA believes that a monitor based attainment demonstration satisfies the CAA requirement to show that “the entire geographic area” will attain the NAAQS. The EPA’s monitoring requirements for PM_{2.5} are designed to ensure a robust nationwide monitoring network in both nonattainment and attainment areas. States have achieved this by maintaining their PM_{2.5} networks in accordance with EPA’s network design criteria. Historically, these criteria provided that CBSAs have at least one PM_{2.5} monitoring site located in an “area-wide” location of expected maximum concentration (within the CBSA).¹¹⁰ Thus, by assuring compliance with the NAAQS at the location of the expected highest area-wide concentration in the CBSA, air quality is protected throughout each CBSA. The EPA has identified recommended procedures for PM_{2.5} modeled attainment demonstrations. These recommendations are contained in modeling guidance. The recommended attainment test relies on the ambient monitors to provide the “anchor point” for future year air quality projections. This ensures that future year concentration predictions are grounded by “real world” measurements. Since the attainment test relies on ambient monitoring data, the projection of future year PM_{2.5} concentrations in unmonitored locations is inherently more uncertain than projections in monitored locations due to the fact that the ambient concentrations from which these projections are developed are unknown in the unmonitored locations. Therefore, the EPA continues to believe that for PM_{2.5} attainment demonstrations, modeling results in unmonitored areas are too uncertain to use in this manner. For the reasons stated earlier, in the final rule, the EPA does not believe that it is necessary to require states to submit an unmonitored area analysis and to show that any potential violations of the NAAQS in

unmonitored areas have been eliminated through enforceable controls.

Comment: Several commenters supported Option 1 where only monitored grid cells are included in the attainment plan. Commenters stated that, due to their concerns related to the accuracy of air dispersion modeling tools and protocols, it is not appropriate to use air dispersion modeling to predict receptor impacts in unmonitored areas. Some commenters stated that Option 1 is the approach that most closely describes the current EPA rule.

Response: The EPA agrees that the modeling results are too uncertain in unmonitored areas to require an unmonitored area analysis as part of the attainment demonstration (for the reasons enumerated earlier). However, the EPA disagrees that Option 1 is the approach that most closely describes the attainment demonstration requirements in the 2007 PM_{2.5} implementation rule. An unmonitored area analysis has never been an implementation rule requirement, but was a recommended analysis in the PM_{2.5} modeling guidance. Therefore, the EPA believes that Option 4 is closer to the current status quo. This final rule clearly states the continued recommendation to perform an unmonitored area analysis and the benefits of doing so.

Comment: Some commenters stated that an “unmonitored area analysis” is essential since speciation monitoring is conducted at a limited number of sites. The commenters stated that, however, given the inherent uncertainty from modeling analysis in unmonitored areas, results from such analysis should only be used to inform additional actions. The commenters stated that, while modeling analysis in unmonitored areas can be used as a reference for additional studies, it should not be used for the attainment demonstration in the SIP. The commenters stated that, under any of the options, the EPA should specify the recommended level of detail for an unmonitored area analysis, especially if it is required. The commenters recommended that the analysis need not require modeled results at finer spatial scales than those specified in the modeling protocol.

Response: The EPA agrees that an unmonitored area analysis is important and continues to recommend development of unmonitored area analyses to support attainment demonstrations. The EPA also agrees that due to uncertainty, the results from such analysis should only be used to inform additional actions. As stated earlier, the PM_{2.5} modeling guidance contains a default recommended

unmonitored area analysis technique which combines gridded modeling data and interpolated ambient data (including PM_{2.5} speciation data). But the exact nature of the unmonitored area analysis can be considered based on the information relevant to each nonattainment area. The EPA also agrees that where an unmonitored area analysis is conducted, it should be at the same spatial scale (model resolution) as the modeled attainment demonstration at monitoring locations. For example, if the gridded modeling analysis is performed at 4km resolution (model grids that are 4km on a side), then the unmonitored areas should be examined at the same resolution. Similarly, if near road monitors are examined with a dispersion model at a finer resolution (compared to the other monitors) as part of the attainment demonstration, the unmonitored area analysis could also examine unmonitored near-road areas at a finer resolution.

Comment: Several commenters disagreed with the proposal to require states to perform the attainment test at “recent” monitoring locations. Commenters stated that, within the EPA’s description of Option 1, the proposal indicates that the attainment test required under Option 1 would also apply to locations that have “recent” FRM and/or FEM monitoring data. Commenters stated the current FRM/FEM monitoring data should be sufficient to demonstrate attainment.

Response: States must demonstrate that they will attain the PM_{2.5} NAAQS in the nonattainment area as expeditiously as practicable, and no later than the moderate area attainment date. The recommended attainment test in the modeling guidance uses recent ambient data that encompass a 5-year period that is dependent on the base modeling year. For example, for a base modeling year of 2014, the guidance recommends using ambient PM_{2.5} data from the 2012–2016 period. The guidance also recommends only using ambient data from a particular monitoring site if it has at least one complete design value period during the relevant 5-year period. With these recommendations in mind, there are numerous cases where a monitoring site may have only partial data from the relevant 5-year period or may be a new monitor that started collecting data after the 5-year period or may have been shut down before the 5-year period. The EPA agrees that it is generally not necessary to examine the modeling results where monitors were shut down before the base modeling period. These monitors will not be used to make future

¹¹⁰ See fine particulate (PM_{2.5}) design criteria at 40 CFR part 58–Appendix D to part 58.

decisions relating to attainment status of the area. However, monitors that are new or were operating during the base modeling period are still relevant and can be used to provide additional information in the attainment demonstration. The data from these monitors may serve as the basis for examining potential violations in the area as part of an unmonitored area analysis. This is especially the case for new monitors, which may not have enough data to provide a robust future year concentration estimate in the attainment demonstration. But the monitoring data, combined with modeled information, can provide information about the likelihood of future violations in the area surrounding the monitor location.

5. Future Year(s) To Be Modeled in Attainment Demonstrations

a. Summary of Proposal. A state performing a modeling analysis for an attainment demonstration or impracticability analysis must select a future year for the analysis. For an attainment demonstration, a state should select the future modeling year such that all emissions control measures relied on for attainment will have been fully implemented by the beginning of that year. The EPA proposed that to demonstrate attainment, the modeling results for the nonattainment area must predict that emissions controls implemented no later than the beginning of the last calendar year preceding the attainment date will result in $PM_{2.5}$ concentrations that meet the level of the standard.¹¹¹ While states should choose the future modeling year based on a number of factors, the EPA proposed the last possible year permitted under the statute as a starting point for modeling.

b. Final Rule. The EPA is finalizing the recommendation that the last possible year permitted under the statute is an appropriate starting point for modeling. See 40 CFR 51.1011(a)(6). For a state that is submitting an attainment demonstration, modeling the sixth calendar year is a logical starting point to determine if attainment by that year is likely. Even though attainment is determined by averaging 3 years' worth of ambient data, states do not have to model 2 years before the attainment date to show modeled attainment. Since the design value is an average of 3 years' worth of data, attainment can still be

shown even if concentrations exceed the NAAQS in one or more of the 3 years used to determine attainment (as long as the 3 year average is less than the NAAQS). Therefore, it can be appropriate to model any of the 3 years used to determine attainment. In addition, if ambient data show attainment-level concentrations in the final statutory attainment year, a state may be eligible for up to two 1-year extensions of the attainment date, if the area meets the criteria for such extensions. Therefore, modeling attainment-level concentrations for the last year permitted by statute is acceptable.

States with Moderate areas that submit an impracticability demonstration must show that the area cannot attain the NAAQS by the end of the sixth calendar year following designation of the area. Therefore, the appropriate future modeling year for such a demonstration is also the sixth calendar year after designation.

For the reasons stated earlier, it is both acceptable, and will in fact be most efficient, for a state to begin the attainment demonstration process by modeling the last year permitted under the statute to determine future year modeled $PM_{2.5}$ concentrations in the sixth year after designations. For example, since designations for the 2012 $PM_{2.5}$ NAAQS were effective in March 2015, it is appropriate for states to model air quality for 2021 in the attainment demonstrations for designated nonattainment areas.

Because an area must attain "as expeditiously as practicable," additional considerations are necessary before an attainment date can be established. For purposes of determining the attainment date that is as expeditious as practicable, the state must conduct future year modeling which takes into account expected growth and known controls that are already in effect or that are adopted and will be in effect by January 1 of the future year. For example, for a Moderate nonattainment area for the 2012 $PM_{2.5}$ NAAQS, a future base case scenario for the year 2021 would project future air quality given implementation of existing federal, state and local measures. If this future base case scenario demonstrates attainment, then the state must determine if attainment can be achieved in an earlier year through the application of additional measures. Therefore, the state must conduct an analysis of RACM and RACT and additional reasonable measures to determine if, collectively, all technologically and economically feasible measures identified by the state that can be implemented by the

beginning of the sixth calendar year following designations can advance the attainment date by at least 1 year (note that RACM and RACT controls must be implemented within 4 years of an area being designated nonattainment, but additional reasonable measures for an area for which a state can demonstrate attainment by the end of the sixth calendar year following designation of the area are those technologically and economically feasible measures that can be implemented by the beginning of the last year prior to the projected attainment date). Results of this analysis may indicate attainment can be achieved earlier, through implementation of all reasonable control measures (*i.e.*, RACM and RACT and additional reasonable measures).

If, on the other hand, the future base case scenario does not demonstrate attainment, then a control case scenario is needed to examine whether the reasonable, technically and economically feasible measures identified by the state would result in attainment in the analysis year (*i.e.*, in 2021 for purposes of this example based on the 2012 $PM_{2.5}$ NAAQS). The control case scenario would add potential control measures—*e.g.* RACM and RACT (which must be implemented in 4 years) and additional reasonable measures, plus any measures on sources outside of the nonattainment area that the state has identified as feasible to implement by the attainment date. This modeling, along with other relevant information, would inform a judgment as to whether attainment of the relevant NAAQS is practicable by the end of the sixth year after designation or earlier. In the case of areas designated for the 2012 $PM_{2.5}$ NAAQS, if the analysis does not demonstrate attainment by December 31, 2021, then the analysis could serve as the technical basis for the state to submit a demonstration that attainment by the outermost statutory attainment date for Moderate areas is impracticable. This in turn could serve as a technical basis for the Administrator to reclassify the area to Serious.¹¹² If the analysis does demonstrate attainment, then the remaining step is to assess whether the attainment date can be advanced by 1 year.

In conducting this assessment, the EPA believes that it is not reasonable to require states to model each and every calendar year to determine the

¹¹¹ Note that for purposes of the $PM_{2.5}$ NAAQS, a determination of attainment (or failure to attain), which the EPA is required to make after the attainment date has passed, is based on an average of the most recent 3 years of ambient data prior to the area's attainment date.

¹¹² A demonstration that the area cannot attain by the moderate area attainment date would not be the only trigger for a reclassification to serious nonattainment. The Administrator maintains wide discretion in making a determination that an area cannot practicably attain the NAAQS by their attainment date.

appropriate attainment date. Developing and modeling future year inventories is a time-consuming and resource intensive process. Multiple emissions models are needed in order to generate year specific emissions for the various emissions sectors (e.g. mobile, non-road, non-EGU point and EGU point). In some cases it may be reasonable to model one additional interim year before the maximum statutory attainment date.¹¹³ However, in most cases, the air quality benefits of an identified set of RACM and RACT and additional reasonable measures can be estimated through model sensitivity analyses and the development of sensitivity factors (i.e., factors to relate tons of emissions reductions in the area to PM_{2.5} concentration changes in the area). For example, states can model across the board percentage reductions in direct PM_{2.5} and/or precursor emissions (in separate model runs or using advanced modeling techniques such as DDM) to determine the impact of emissions reductions on PM_{2.5} concentrations in the area. This modeling can be performed with a single attainment year modeling platform, which is much less resource intensive than modeling additional future years. The identified potential emissions reductions available from RACT and RACM and additional reasonable measures can be compared to the magnitude of the modeled PM_{2.5} reductions from the sensitivity analyses to determine if all such controls will advance attainment by a year. The EPA strongly recommends that states discuss the selection of the future year(s) to model with their EPA Regional Office as part of the modeling protocol development process and before embarking on the modeling.

c. Comments and Responses.

Comment: Some commenters disagreed with the proposal that the future year should reflect when all control measures relied on have been fully implemented by the beginning of that year and it should be no later than the beginning of the last calendar year preceding the attainment date. The commenters stated the CAA provides attainment must be achieved as expeditiously as practicable but no later than the end of the sixth calendar year (except RACT/RACM are required within 4 years) and states should be given the full period to demonstrate attainment and to require control of emissions.

Response: The proposal to require the modeling to reflect control measures

that have been fully implemented no later than the beginning of the last calendar year preceding the attainment date does give nonattainment areas “the full period” to demonstrate attainment and to require control of emissions. Since the design value is an average of 3 years’ worth of data, it could be argued that modeling and related emissions controls should be in place 3 years before the attainment date. However, if ambient data show attainment level concentrations in the final statutory attainment year, a state may be eligible for up to two 1-year extensions of the attainment date, if the area meets the criteria for such extensions. Therefore, modeling attainment level concentrations for the last year permitted by statute is acceptable. But in order to measure attainment level concentrations in the final year, controls must be in place for the full year (at the beginning of the year). Implementation of emissions controls at the end of the year would not be consistent with modeling attainment level or measuring attainment level concentrations during the year.

6. Attainment Year Motor Vehicle Emissions Budgets

The transportation conformity rule requires that attainment plans establish motor vehicle emissions budgets for the area’s attainment year. Therefore, once an area’s attainment date has been established, the state would establish motor vehicle emissions budgets for direct PM_{2.5} and any relevant PM_{2.5} precursor for the attainment year.¹¹⁴ It should be noted that states that submit impracticability demonstrations for Moderate areas under CAA section 189(a)(1)(B)(ii) are not required to submit motor vehicle emissions budgets for attainment purposes because the submitted SIP does not demonstrate attainment. A motor vehicle emissions budget for the purposes of a PM_{2.5} attainment plan is that portion of the total allowable emissions within the nonattainment area allocated to on-road sources as defined in the submitted attainment plan. Such motor vehicle emissions budgets would be calculated using the latest planning assumptions and the latest approved motor vehicle emissions model available at the time that the attainment plan is developed,

unless EPA approves the state’s use of an alternative model.¹¹⁵

F. RFP Requirements

1. Background on Statutory Requirements and Existing Guidance

Reasonable further progress (RFP) is a concept included in the CAA under part D, title I to assure that states make steady, incremental progress toward attaining air quality standards in the years prior to the attainment date for a nonattainment area, rather than merely deferring implementation of control measures and therefore emissions reductions until the date by which the standards are to be attained. As discussed elsewhere in this preamble, section 172 of the CAA addresses attainment plan provisions in general. Section 172(c)(2) of the CAA requires attainment plans to provide for RFP, which is defined in CAA section 171(l) as “such annual incremental reductions in emissions of the relevant air pollutant as are required by [part D of title I] or may reasonably be required by the Administrator for the purpose of ensuring attainment of the applicable national ambient air quality standard by the applicable date.” Section 189(c) of the CAA requires that “[P]lan revisions demonstrating attainment submitted to the Administrator for approval under this subpart shall contain quantitative milestones which are to be achieved every 3 years until the area is redesignated attainment and which demonstrate reasonable further progress, as defined in CAA section 171(1), toward attainment by the applicable date.” Quantitative milestones are discussed later in Section IV.G of the preamble.

Section 172(c)(3) of the CAA requires the state plan to include “a comprehensive, accurate, current inventory of actual emissions from all sources of the relevant pollutant or pollutants *in such area* . . .” Section 172(c)(1) of the CAA requires the state plan to include “all reasonably available control measures as expeditiously as practicable (including such reductions in emissions from existing sources *in the area* as may be obtained through the adoption, at a minimum, of reasonably available control technology) . . .” Section 172(c)(9) requires the state plan to “provide for the implementation of specific measures to be undertaken if the area fails to make reasonable further progress . . . Such measures shall be

¹¹³ If several future modeling years are available, it may in some cases be appropriate for states to interpolate PM_{2.5} concentrations between years.

¹¹⁴ For more information on PM_{2.5} precursor requirements, see CAA section 93.102(b)(2)(iv) and (v) of the transportation conformity rule. See also the May 6, 2005, final transportation conformity rule that addressed requirements for PM_{2.5} precursors. (70 FR 24280).

¹¹⁵ If an area includes re-entrained road dust in the motor vehicle emissions budget, the latest approved version of AP-42 should be used unless the EPA has approved an alternative model for the area.

included in the plan revision as contingency measures to take effect in any such case without further action by the State or the Administrator.” For additional background on statutory requirements and existing guidance, refer to preamble Section IV.F of the proposal for this rule.¹¹⁶

2. General Approach to RFP

a. Summary of Proposal. To satisfy the statutory requirements for RFP at CAA section 172(c)(2), the EPA proposed that a state must submit an RFP plan as part of its Moderate area attainment plan submission. The EPA proposed the following two options for developing an RFP plan.

Under the first option, the EPA proposed that the RFP analysis for any Moderate PM_{2.5} nonattainment area that can demonstrate attainment by the statutory attainment date must demonstrate either: (i) Generally linear progress toward attainment; or (ii) stepwise progress toward attainment. Stepwise emissions reductions would be slower than “generally linear” reductions for certain periods, and then would decline sharply (due to implementation of a new emission reduction program, or new operation of control technology on one or more stationary sources). The EPA proposed that a state must follow one primary approach for conducting the RFP analysis, but that they also have an option to conduct a secondary analysis that will provide greater flexibility in setting RFP goals with alternative emissions reductions and air quality improvement scenarios. The primary approach would be to show that nonattainment area emissions of each pollutant decline from the base year to the attainment year, either in a generally linear manner or in a stepwise manner. In the optional secondary analysis, the state could show that emissions of the various pollutants would change in a manner that would provide a change in air quality during the attainment period that is equivalent or more expeditious than the air quality change that would be estimated to occur under the primary approach. This optional analysis was referred to as an equivalency determination.

Under the second proposed option, the state would provide the control strategy implementation schedule and estimate the emissions reductions anticipated from the control measures (*i.e.*, RACM/RACT and additional reasonable measures) for sources in the nonattainment area. The state then would employ modeling or another

quantitative method to predict the overall PM_{2.5} concentrations in the nonattainment area for each milestone year. The milestone years would correspond to the years for which the state would be required to provide quantitative milestones pursuant to the requirement in section 189(c) of the Act.

b. Final Rule. The EPA is finalizing RFP requirements that allow the state flexibility to demonstrate RFP under CAA section 172(c)(2) using any of the general approaches included in the proposed rule. As part of its Moderate area attainment plan submission, the state must submit an RFP plan that includes three components: (1) An implementation schedule for control measures on sources in the nonattainment area, (2) RFP projected emissions for each applicable quantitative milestone year determined in Section IV.G of this preamble, based on the anticipated control measure implementation schedule; and (3) an analysis that demonstrates that this schedule of aggregate emissions reductions achieves sufficient progress toward attainment between the applicable baseline year to the attainment year. *See* 40 CFR 51.1012(a).

The first component of the RFP plan is the implementation schedule for all required control measures contained in the control strategy. The schedule should describe which measures will be implemented within the first 4 years following designation (and therefore would meet the statutory requirement for RACM and RACT). It should also describe the implementation schedule of additional reasonable measures (to be implemented more than 4 years following designation but before the attainment date) that have been adopted to help provide for expeditious attainment of the standard. Any Moderate area that cannot demonstrate attainment by the statutory Moderate area attainment date is required to provide an implementation schedule for all of the control measures identified as RACM/RACT and additional reasonable measures, in the same manner as an area that can demonstrate attainment.

The second component of the RFP plan is an analysis by the state identifying the RFP projected emissions by pollutant that are expected to be achieved by the control measures implemented within the nonattainment area according to the implementation schedule. The EPA requires the state to estimate these RFP projected emissions for each quantitative milestone year (*i.e.*, for a Moderate area, at 4.5 years and 7.5 years after designation of the area) by sector on a pollutant-by-pollutant basis. These milestone year

projected emissions are discussed further in Section IV.F.3 of the preamble. This information will be used by the state to show that the area is complying with quantitative milestone and RFP requirements for the area (discussed in Section IV.G of this preamble).

The final component of the RFP plan is an analysis demonstrating that the schedule of emissions changes achieves reasonable progress toward attainment between the applicable baseline year and the attainment year. This demonstration can be expressed in the form of emissions reductions only, or emissions reductions converted to air quality concentrations. This optional air quality RFP analysis is discussed later in this section.

Because the statute does not clearly establish the applicable baseline year from which to begin calculating annual emissions reductions for purposes of demonstrating RFP, the EPA is finalizing a requirement that states use the same year as the base year inventory used for developing the control strategy and associated air quality modeling demonstrating that the area will attain expeditiously.

A demonstration based on only emissions reductions must show that the implementation schedule achieves either: (i) Generally linear progress toward the projected attainment date; or (ii) stepwise progress toward the projected attainment date. For example, in one area new emission standards for mobile sources may achieve reductions in a generally linear manner over time, as a portion of the existing vehicle fleet is replaced each year with new vehicles meeting the more stringent standards. In another area, regulations to reduce emissions from certain stationary source sectors could have a single compliance date by which controls must be in place, which could result in a significant drop in emissions in a “stepwise” manner over a relatively short period.

In the first case, the EPA expects that, so long as the attainment date is as expeditious as practicable, then generally linear progress toward attainment by that date would satisfy the RFP requirement. In the second case, where progress is slower than generally linear, the state is required to submit a clear rationale and supporting information to explain why generally linear progress is not appropriate (*e.g.*, due to the nature of the nonattainment problem, the types of sources contributing to PM_{2.5} levels in the area and the implementation schedule for control requirements at such sources).

Similarly, for areas that cannot demonstrate attainment within the

¹¹⁶ 80 FR 15385.

Moderate area statutory deadline in CAA section 188(c)(1), the state must demonstrate either generally linear or stepwise emissions reductions toward the full amount of reductions that will be achieved by that deadline, *i.e.*, the amount that reflects implementation of all of the control measures identified as RACM and RACT and additional reasonable measures for the entire period of the applicable attainment plan. Generally linear progress toward this full amount would meet the RFP requirement, but progress that is slower than that would require further justification.

In some circumstances, the EPA expects that a state could develop an approvable RFP plan even if emissions of one or more PM_{2.5} plan precursors are not decreasing. In this scenario, the state must demonstrate that the emissions reductions of direct PM_{2.5} combined with the aggregate emissions reductions of PM_{2.5} plan precursors support expeditious attainment of the applicable PM_{2.5} NAAQS. To accomplish this, the EPA expects that a state could use the relative air quality impacts of the different PM_{2.5} plan precursors identified in the attainment modeling to demonstrate that the emissions reductions of direct PM_{2.5} and aggregate PM_{2.5} plan precursors constitute an acceptable RFP plan. For example, the state could demonstrate that even if one or more PM_{2.5} plan precursor is not decreasing, the emissions reductions of direct PM_{2.5} and the remaining PM_{2.5} plan precursors are the dominant factors in reducing ambient PM_{2.5} levels and are therefore adequate to support expeditious attainment. In providing this flexibility, the EPA recognizes that control measures for certain pollutants may be more effective at reducing PM_{2.5} concentrations than others, and that states may be able to implement some measures more quickly than others while still achieving reasonable overall progress toward attainment.

The EPA is also providing an additional optional RFP analysis that evaluates the collective changes in emissions of multiple pollutants during the attainment period in terms of changes in air quality concentration. Under this optional approach, a state would have to show that the air quality improvement that is anticipated by milestone dates due to the identified control measures in the implementation schedule supports expeditious attainment of the PM_{2.5} NAAQS. For an area that can demonstrate attainment within the Moderate area statutory deadline, a state using this option could rely upon attainment demonstration modeling results that link emissions

reductions with air quality improvements. For areas that cannot demonstrate attainment within the Moderate area statutory deadline, the state may have to conduct modeling or employ another quantitative method to predict the overall PM_{2.5} concentrations in the nonattainment area in each milestone year. The state would compare these air quality target values to certified ambient air quality monitoring data as part of the quantitative milestone report due after the area reaches each quantitative milestone date. The EPA recommends that states estimate air quality targets by establishing the relationship between modeled emissions reductions and air quality changes in the attainment plan (for the attainment year) and interpolating to the intermediate year(s) based on the same relationship.

The EPA recognizes that because atmospheric processes are complex, a specific percent change in emissions of PM_{2.5} precursors does not lead to an equivalent percent change in air quality, potentially creating uncertainty when determining air quality targets based upon predicted emissions reductions. Nevertheless, the EPA recognizes the importance of providing the flexibility to address different pollutants on different timetables so long as the plan can reasonably be expected to achieve the intended air quality benefits represented by the RFP analysis.

As previously noted, submission of the air quality-based RFP plan is optional. However, in certain circumstances, the applicable Regional Administrator may strongly recommend that a state or local agency submit an RFP plan with air quality targets for milestone years in order to satisfy the statutory RFP requirement. This approach could be appropriate when one or more pollutants is not decreasing over the attainment planning period or for areas that have experienced longstanding and persistent PM_{2.5} pollution problems despite the prior implementation of required control measures. The EPA will review each RFP plan on a case-by-case basis to determine whether it provides for such annual incremental reductions in emissions of the relevant air pollutant(s) as are necessary for the purpose of ensuring attainment by the applicable attainment date. *See* 40 CFR 51.1012. An additional RFP analysis will be required as part of a Serious area attainment plan if EPA reclassifies the area to Serious.

c. Comments and Responses.

Comment: Some commenters generally supported the equivalency determination concept because they

noted that different precursors are more or less effective in reducing atmospheric concentrations of PM_{2.5}. Some commenters stated that, because the goal is timely attainment regardless of when controls are implemented for each precursor that is to be controlled, the EPA should allow both options, including the option for states to determine whether to approach the demonstration on a pollutant-by-pollutant basis, or overall.

Response: The final rule allows for emissions from one or more PM_{2.5} plan precursors to increase over the attainment planning period, as long as the emissions of direct PM_{2.5} and aggregate PM_{2.5} plan precursors decrease consistent with RFP and the state can demonstrate that the emissions increase does not delay expeditious attainment. This approach recognizes the fact that different precursors have different impacts on PM_{2.5} concentrations depending upon the specific atmospheric chemistry of each area. As previously noted, submission of the air quality-based RFP plan is optional but may be strongly recommended by the applicable Regional Administrator depending upon the unique circumstances of the nonattainment area.

Comment: One commenter suggested that the equivalency determination must be based on modeling of ambient concentrations, not simply on inter-pollutant equivalency ratios.

Response: The EPA recognizes the importance of modeling and notes that there are potential benefits of using modeling when providing the optional air quality analysis. Additionally, in the preamble, the EPA described when these types of tools could be useful in the development of the air quality targets. Because the development of air quality targets is optional and complements the emissions reductions analysis, the EPA does not require modeling of ambient conditions for this purpose.

Comment: A few commenters supported the proposed Option 1 and the allowance for either generally linear or stepwise progress toward attainment. These commenters stated that allowing both methods is consistent with the pattern of many federal emissions reduction measures and it provides the most flexibility to states. Other commenters stated that existing guidance in the Addendum failed to recognize that, in many cases, more can be accomplished during one given year than in another. The commenters suggested the EPA provide states with the flexibility to manage their resources for rulemaking such that emissions reductions are obtained to attain

generally linear progress averaged over the 3-year period rather than in each individual year.

Response: As stated earlier, this rule requires that the RFP analysis must demonstrate either generally linear or stepwise emissions reduction progress toward attainment. If there are significant differences between emissions reductions in different years, which make the emissions reductions no longer generally linear, then the state would have to provide a justification for the stepwise progress as discussed earlier. Therefore, the suggestion of averaging the emissions reductions to obtain generally linear progress over a 3-year period is not an acceptable way to demonstrate RFP. In this example, the state would have to submit a justification of why stepwise emissions reductions are more appropriate for their area. However, the EPA notes that if stepwise emissions reductions are achieved more rapidly than expected and consistent with the amount necessary to demonstrate RFP toward timely attainment, this would be in line with the overall principles of the CAA and would not require the aforementioned justification.

3. RFP Projected Emissions for RFP Analyses

a. Summary of Proposal. The EPA proposed that a state with a Moderate PM_{2.5} nonattainment area must submit RFP projected emissions for sources within the nonattainment area as part of the RFP plan. The EPA also proposed that these RFP projected emissions would, at a minimum, include projected emissions of each pollutant by different source types corresponding to the quantitative milestone dates for the area.

b. Final Rule. The EPA is finalizing that a state with a Moderate PM_{2.5} nonattainment area must submit RFP projected emissions for sources within the nonattainment area as part of the RFP plan. These RFP projected emissions shall, at a minimum, include projected emissions of each pollutant (*i.e.*, direct PM_{2.5} and PM_{2.5} plan precursors) by different source types corresponding to the quantitative milestone dates for the area (quantitative milestone dates are described in greater detail in Section IV.G of this preamble). Specifically, the EPA requires that the RFP plan for any Moderate area must contain RFP projected emissions for each calendar year in which quantitative milestones for a Moderate nonattainment area must be met. As explained in Section IV.G of this preamble, a state must identify as part of the attainment plan submission for a Moderate nonattainment area

quantitative milestones to be achieved every 3 years from the Moderate area attainment plan due date, or 4.5 years from the effective date of designation of the area.¹¹⁷ For example, the first round of designations for the 2012 PM_{2.5} NAAQS became effective in April 2015; Moderate area attainment plans for these areas will thus be due 18 months later, or in October 2016. The first quantitative milestones for each of these areas will then have to be met in October 2019; the second quantitative milestones, in October 2022; and so on, until the area attains the NAAQS. Under this approach, the state will be required to submit such RFP projected emissions as part of the Moderate area attainment plan due in October 2016 that project emissions from sources in the nonattainment area for the same calendar years as those for which quantitative milestones will be due (*i.e.*, 2019 and 2022 inventories in this example).

The transportation conformity rule requires that RFP plans establish motor vehicle emissions budgets. RFP plans would therefore be required to establish motor vehicle emissions budgets for direct PM_{2.5} and any relevant PM_{2.5} precursor as determined under the transportation conformity rule.¹¹⁸ Precursors that are relevant for transportation conformity purposes would be limited to the PM_{2.5} plan precursors but may not include all of the PM_{2.5} plan precursors. For example, it is likely that many PM_{2.5} plans will include SO₂ as a plan precursor. However, emissions of SO₂ from on-road sources are usually low compared to stationary sources. The transportation conformity rule allows for the state to determine through its SIP development process if it is necessary to establish motor vehicle emissions budgets for SO₂. See 40 CFR 93.102(b)(2)(v). On the other hand, if a state provides a precursor demonstration approved by the EPA which shows that VOCs do not have a significant contribution to PM_{2.5} levels in a particular nonattainment area, then a motor vehicle emissions budget for VOCs would not need to be established for the area for transportation conformity purposes. A motor vehicle emissions budget for the purposes of a PM_{2.5} RFP plan is that portion of the total allowable emissions

allocated to on-road sources as defined in the submitted RFP plan for the relevant years as described earlier.¹¹⁹ Such motor vehicle emissions budgets will be calculated using the latest planning assumptions and the latest approved motor vehicle emissions model available at the time that the attainment plan is developed, unless the EPA approves the state's use of an alternative model.¹²⁰

c. Comments and Responses.

Comment: Some commenters stated that since RFP is one of the general attainment plan provisions listed in CAA section 172(c), the EPA's proposal to require motor vehicle emissions budgets as part of RFP plans extends beyond just the implementation of the PM_{2.5} NAAQS and, as a result, this proposal should be presented within the context of a revision to the conformity rule itself and not just this PM_{2.5} implementation rule.

Response: The EPA disagrees with the commenters. The transportation conformity rule already states that motor vehicle emissions budgets come from control strategy SIPs.¹²¹ Additionally, the transportation conformity rule defines control strategy SIPs as RFP plans and attainment demonstrations. It goes further to say that control strategy SIPs include the SIPs required by CAA sections 172(c), 189(a)(1)(B) and 189(b)(1)(A). The requirement in this PM_{2.5} SIP Requirements Rule does not amend the transportation conformity rule; it merely explains what is already required.

4. Geographic Coverage of Emission Sources for RFP

a. Summary of Proposal. The EPA proposed that the RFP demonstration to be included with a state's PM_{2.5} nonattainment area plan must include emissions only for sources located in the nonattainment area, and not from an area larger than the nonattainment area. This proposed policy approach differed from the remanded 2007 PM_{2.5} implementation rule. As explained in the proposal, the difference was due to the evolution of policy on a similar RFP issue in the ozone NAAQS implementation program that stemmed in part from a petition for reconsideration and a DC Circuit

¹¹⁷ According to CAA section 189(a)(2)(B), Moderate area attainment plans are due to the EPA 18 months after designation.

¹¹⁸ For more information on PM_{2.5} precursor requirements, see CAA section 93.102(b)(1) and (b)(2)(iv) and (v) of the transportation conformity rule. See also the May 6, 2005, final transportation conformity rule that addressed requirements for PM_{2.5} precursors. (70 FR 24280).

¹¹⁹ A state would also establish motor vehicle emissions budgets for an area's attainment year. Those budgets would be the motor vehicle emissions that the SIP establishes as being necessary to attain the NAAQS.

¹²⁰ If an area includes re-entrained road dust in the motor vehicle emissions budget, the latest approved version of AP-42 should be used unless the EPA has approved an alternative model for the area.

¹²¹ 40 CFR 93.101.

decision on the November 2005 Phase 2 Ozone Implementation Rule. The EPA received a similar petition for reconsideration of the 2007 PM_{2.5} Implementation Rule, which dealt with the EPA's interpretation of the statutory RFP requirements to allow a state to take "credit" for emissions reductions from outside the nonattainment area when addressing RFP in its attainment plan.¹²² The EPA granted the petition for reconsideration on this issue in 2010, after the DC Circuit issued its decision on litigation on the Phase 2 Ozone Implementation Rule.^{123 124} In light of these developments, the proposal indicated that the EPA now believes the best reading of the statute is that the CAA does not allow for a state to include emissions reductions from sources outside a nonattainment area when developing the plan to meet the CAA section 172(c)(2) RFP requirements for a PM_{2.5} nonattainment area.

b. Final Rule. The EPA is finalizing that the RFP demonstration to be included with a state's PM_{2.5} nonattainment area plan must include emissions only for sources located in the nonattainment area, and not from an area larger than the nonattainment area. Commenters disagreed with limiting the RFP demonstration to include emissions only for sources located in the nonattainment area stating that some areas are so dominated by upwind emissions and local sources over which they have no control, such as motor vehicles, that they cannot demonstrate RFP. One of these commenters noted they have provided extensive comments on this issue in connection with the EPA's proposal for the recent ozone implementation rule and incorporated by reference their prior comments. Other commenters agreed with the proposal and stated the EPA's conclusion is compelled by CAA sections 172(c)(1), 172(c)(3) and 189(d), which all focus on emissions and reductions in the area.

In the preamble to the remanded 2007 PM_{2.5} Implementation Rule, the EPA allowed states to incorporate reductions

of NO_x and SO₂ emissions up to 200 km from outside the nonattainment area (and potentially for reductions of VOC or ammonia) into their RFP plan when certain conditions were met. This policy was included in the 2007 PM_{2.5} Implementation Rule in part to be consistent with a similar RFP policy for NO_x and VOC that was included in the November 2005 Phase 2 ozone NAAQS implementation rule, which provided guidance for states on implementing the 1997 ozone NAAQS.¹²⁵ Under this policy, if a state intended to include emissions reductions from outside the nonattainment area in the RFP plan, the state would need to take on the additional accounting work associated with developing: (i) An expanded baseline emissions inventory for the entire geographic area and, (ii) a projected attainment year inventory for this expanded area outside the boundaries of the designated nonattainment area. Development of these more extensive inventories would likely have involved a substantial amount of additional time and resources. In addition, the state would have needed to provide information supporting its decision regarding how far outside the nonattainment area the RFP inventory should extend. While this "outside the nonattainment area" RFP approach was theoretically available to states in developing their PM_{2.5} attainment plans due in 2008, there were no states to the agency's knowledge that elected to follow this approach.

Both the Phase 2 ozone implementation rule and the 2007 PM_{2.5} Implementation Rule were challenged on several issues. With regard to the Phase 2 ozone implementation rule, the EPA granted a petition for reconsideration and ultimately issued a final notice of reconsideration in June 2007. In November 2008, the U.S. Court of Appeals for the DC Circuit heard oral argument concerning multiple petitions for judicial review of the Phase 2 ozone rule and the notice of reconsideration. One of the issues in that case involved whether compliance by EGUs with a regional emissions trading program could be considered to meet the RACT requirement for those sources located in a nonattainment area. In its July 2009 decision, the court emphasized that: "The RACT requirement calls for reductions in emissions from sources in the area; reductions from sources outside the nonattainment area do not satisfy the requirement. Accordingly, participation in the NO_x SIP call would

constitute RACT only if participation entailed at least RACT-level reductions in emissions from sources within the nonattainment area."

In light of this court decision, the EPA has determined that the best reading of the statute is that the term "sources in the area" should be interpreted in the same manner as ozone. The term appears in CAA section 182 (requirements for ozone nonattainment areas) with regard to RFP as well as RACT. The decision on the Phase 2 ozone rule found that CAA section 182(b)(2) requires that a SIP must provide for implementation of RACT (under CAA section 172(c)) for emissions sources "in the area," meaning in the nonattainment area. Similarly, the EPA position is that when CAA section 182(b)(1)(A)–(B) defines baseline emissions for RFP as "the total amount of actual VOC or NO_x emissions from all anthropogenic sources in the area," this also means sources in the nonattainment area.

Turning to PM_{2.5}, the EPA has determined that the DC Circuit's interpretation of the phrase "sources in the area" should apply to RACT and RFP requirements for both the ozone NAAQS and the PM_{2.5} NAAQS. In particular, for PM_{2.5}, the statutory language at CAA section 171(1) defines RFP in terms of "reductions in emissions" required in an attainment plan, which the EPA interprets as being directly linked to the baseline emissions inventory for sources located in a PM_{2.5} nonattainment area. The baseline emissions inventory is the foundation for the attainment plan. The emissions inventory requirement of CAA section 172(c)(3) explicitly requires that the attainment plan inventory include all sources of the relevant pollutants "in such area," which is a clear reference to the designated nonattainment area. Given that the baseline inventory must reflect the emissions "in such area," and that this inventory provides the starting point for a state's RFP analysis, in which the state must calculate generally linear progress in emissions reductions that will lead to attainment of the NAAQS in the area, the EPA believes it is appropriate that a state should consider only sources located within the nonattainment area when conducting its analysis to determine the annual emissions reductions necessary for demonstrating RFP.

Beyond the Court's interpretation, the EPA believes that the most appropriate approach with regard to the geographic area required to be covered for demonstrating RFP in a PM_{2.5} attainment plan also should be limited to the nonattainment area for two other

¹²² This same petition raised concerns regarding the criteria used to determine the economic feasibility of controls being considered for RACT for the 1997 PM_{2.5} NAAQS. See "Petition for Reconsideration," filed by Paul Cort, Earthjustice, on behalf of the American Lung Association, Medical Advocates for Healthy Air, Natural Resources Defense Council, and the Sierra Club (June 25, 2007). A copy of the petition is in the docket for this action.

¹²³ Letter dated May 13, 2010, from Gina McCarthy to David S. Baron and Paul Cort, Earthjustice. A copy of the letter is located in the docket for this action.

¹²⁴ See *NRDC v. EPA*, 571 F.3d 1245 (D.C. Cir. 2009).

¹²⁵ See Phase 2 Ozone Implementation rule, 70 FR 71612 (November 29, 2005).

reasons. First, the EPA believes that it makes policy sense for the PM_{2.5} implementation rule approach to be consistent with the approach finalized in the 2008 NAAQS for Ozone: SIP Requirements rule.¹²⁶ Second, a policy allowing the geographic area of the RFP plan to be larger than the nonattainment area would conflict with a key provision of subpart 4 that requires annual incremental reductions in emissions from sources within the nonattainment area. Under subpart 4, an area that fails to attain the standard by the Serious area attainment date is then subject to the provisions of CAA section 189(d). Section 189(d) of the CAA specifies that the state must submit a plan revision within 12 months which provides for “an annual reduction in PM₁₀ or PM₁₀ precursor emissions *within the area* of not less than 5 percent of the amount of such emissions as reported in the most recent inventory prepared *for such area*” (emphasis added). Therefore, the EPA is finalizing an RFP policy approach that is consistent with CAA section 189(d).

c. Comments and Responses.

Comment: Some commenters supported the EPA’s general guidance for developing the RFP demonstration. In particular, these commenters agreed with the EPA’s interpretation of the CAA to require that emissions reductions for purposes of meeting the RFP requirement must come from sources within the designated nonattainment area. Thus, the commenters supported the EPA’s proposal that the RFP demonstration submitted by states as a part of the attainment plan cannot take credit for emissions reductions occurring outside the nonattainment area to meet the RFP requirement. These commenters asserted that the EPA’s conclusion is compelled by sections 172(c)(1), 172(c)(3) and 189(d), which all focus on emissions and reductions in the designated nonattainment area. The commenters further stated the EPA has not identified any rational way for states to pick and choose what sources and related emissions outside the designated nonattainment area would need to be included in inventories and attainment planning in order to rationally measure RFP.

Other commenters disagreed with the EPA’s interpretation of the CAA on this issue and advocated that the EPA should provide an option for states to meet the RFP requirement with emissions reductions from sources outside the designated nonattainment area in addition to reductions from

sources inside the area. One commenter suggested the EPA should provide this option to states and also consider alternatives to simplify the “overly complicated analysis” needed to support this option in the now superseded 2007 PM_{2.5} implementation rule. The comment did not address the consistency of such an interpretation of the RFP requirements with the statute.

Another commenter asserted that the EPA should interpret the statute to permit states to meet the RFP requirement through emissions reductions from sources outside the designated area based upon several practical arguments. The commenter stated that, as the PM_{2.5} standards become lower and reductions from sources within a designated nonattainment area become more challenging to find, it may be necessary to obtain emissions reductions from sources beyond the designated area in order to attain the NAAQS. According to the commenters, some nonattainment areas are so dominated by emissions from outside the area and from local sources over which they have no control that they cannot demonstrate RFP, even though they could demonstrate timely attainment due to reductions from sources outside the nonattainment area. The commenters thus argued that the EPA should provide states with the option to meet the RFP requirement with emissions reductions from sources outside the nonattainment area in cases where they believe it would be unreasonable or impossible to do so only with emissions reductions from within the nonattainment area.

In response to the EPA’s request for comment on any potential legal basis for authorizing states to meet the RFP requirement with emissions reductions from outside the nonattainment area, the commenter suggested potential theories. The primary legal theory was that EPA should by regulation redefine the term “area” for purposes of the RFP requirement so that it would encompass geographic areas that are not part of the designated nonattainment area. Through this theory, the commenters suggested that the EPA could authorize states to meet the RFP requirement based on reductions from the “total area” affecting that nonattainment area, rather than from the actual designated nonattainment area. As an alternative theory, the commenter argued that the EPA could regulatorily redefine the emissions inventory requirement of section 172(c)(3). To support this theory, the commenter disagreed with the EPA’s position that because the base year inventory required by section 172(c)(3) includes the emissions from

sources within the designated nonattainment area, it supports the EPA’s reading of the statute with respect to the RFP requirement. The commenter instead argued that because the emissions information used for modeling purpose includes emissions from a much broader region (not just within the nonattainment area or even just within the state), the EPA was wrong to say in the proposal that the base year inventory for sources in the area is the “foundation for the attainment plan.” Finally, the commenter argued more broadly for the EPA to alter its interpretation of the statutory language to allow for the commenter’s preferred approach to RFP. In support of their preferred approach to the RFP requirement, the commenters noted that the EPA acknowledged in the proposal that “a literal interpretation is illogical” for other statutory requirements. To support this contention, the commenters point to the criteria in section 188(d) that provide the criteria for an extension of the Moderate area attainment date that require significant interpretation in order to make them appropriate for the statistical form of the current PM_{2.5} NAAQS rather than for the exceedance-based form of the PM₁₀ NAAQS that existed when the CAA was amended in 1990.

Response: The final rule requires that states demonstrate that they meet the RFP requirement through emissions reductions from sources in the nonattainment area. The EPA has decided to adopt this approach for two reasons. First, it is the most consistent with the statute. It aligns with RFP as defined in CAA section 171(1) and as required in CAA section 172(c)(2) and 189(c), and is also most consistent with other related requirements for attainment plans, such as the requirements for imposition of emission controls, e.g., RACM and RACT, and with the process for designations of nonattainment areas pursuant to section 107(d). Second, this approach is more straightforward to administer because it retains a nonattainment area focus to the RFP requirement and, while the alternative approaches would require complex and potentially burdensome requirements to define the scope of the out-of-area sources that must be inventoried and accounted for in the determination of what constitutes RFP. The EPA has concluded that such emissions reductions from sources outside the nonattainment area are more properly accounted for and reflected in other elements of the attainment plan, such as the attainment demonstration

¹²⁶ See 80 FR 12264.

modeling which will take into account the emissions reductions that occur outside the nonattainment area in a less burdensome fashion.

The EPA does not agree with the statutory interpretation of the RFP requirement preferred by the commenters who suggested that the EPA allow credit for emissions reductions from outside the area. Pursuant to section 171(1), the statute defines the term “reasonable further progress” to mean “such annual incremental reductions in emissions . . . as are required by this part or may reasonably be required by the Administrator for the purposes of ensuring attainment of the applicable [NAAQS] by the applicable date.” This provision plainly provides EPA with discretion to interpret this term within certain statutory parameters, *i.e.*, “as are required by this part,” and consistent with the EPA’s determination of what will be the appropriate approach for timely attainment, *i.e.*, “for the purpose of ensuring attainment . . . by the applicable date.” Thus, for example, the EPA has authority to interpret the RFP requirement to allow states to demonstrate generally linear reductions or stepwise reductions, rather than as a specific percentage of emissions reductions each year, as appropriate methods for meeting the RFP requirement for purposes of the subpart 1 and subpart 4 provisions applicable to the PM_{2.5} NAAQS. It does not follow, however, that EPA is obligated to interpret the term “reasonable further progress” in other ways that the EPA considers inconsistent with other relevant statutory requirements for attainment plans or more broadly.

To the contrary, the EPA believes that interpretation of the RFP requirement to reflect reductions in emissions “as are required by this part,” properly includes consideration of the context and structure of the statute with respect to the other attainment plan requirements. As explained in the proposal for this action, the EPA has concluded that several other related requirements for attainment plans support an interpretation of the RFP requirement for purposes of PM_{2.5} to be limited to emissions reductions from sources located within the nonattainment area. These requirements include the emissions inventory requirement of section 172(c)(3), the RACM/RACT requirement of section 172(c)(1) and section 189(a)(1)(C), and the not less than 5 percent emission reduction requirement of section 189(d).

With respect to the inventory requirement of section 172(c)(3), the EPA explained in the proposal its view

that because the emissions inventory requirement explicitly refers to a comprehensive, accurate, and current emissions inventory of emissions “from all sources of the relevant pollutant or pollutants in such area,” this statutory language supports the view that the primary focus of the attainment plan is reductions of emissions from the nonattainment area, not emissions reductions from sources elsewhere. Similarly, EPA explained in the proposal its views that the court’s decision in *NRDC v. EPA*, 571 F.3d 1245 (D.C. Cir. 2009) supports an interpretation of the RFP requirement to apply to emissions reductions from sources within the area. Although that decision focused on the RACT requirement for ozone in particular, the reasoning of the court’s decision based upon the phrase “in the area” is consistent with the EPA’s longstanding approach to both RACM and RACT (or BACM and BACT for serious areas) being required for emissions sources within the nonattainment area. Given that states typically elect to demonstrate that they meet the RFP requirement through emissions reductions that result from expeditious imposition of RACM/RACT or BACM/BACT emission controls applied to sources within the area, it is logical that the separate RFP requirement should likewise be based upon the expeditious progress towards attainment achieved through those emission controls. The EPA emphasizes that the RFP requirement and the requirements of section 172(c)(6) are separate components of an attainment plan. In those unusual circumstances where a state needs to impose specific additional controls on sources outside the nonattainment area in accordance with section 172(c)(6) to reach attainment, the state is not required to alter the base year emissions inventory for sources within the area or to alter its RFP analysis. As with other emissions reductions from sources outside the area that the state may rely upon, emissions reductions from measures states may impose to meet section 172(c)(6) will be reflected in the modeled attainment demonstration and thus included and taken into account in that fashion. [See sections IV.D.1 and VI.D.2 of the preamble for additional discussion of section 172(c)(6).]

The EPA also considers this interpretation of the RFP requirement to be consistent with the comparable requirements of CAA section 189(d). Specifically, section 189(d) requires that states with nonattainment areas that fail to attain by the applicable attainment date must make a new attainment plan

submission in order to achieve emissions reductions of not less than 5 percent of the most recent emissions inventory “for such area.” As discussed in Section VII.F of this rule, the EPA interprets the statute to require an area subject to section 189(d) to achieve not less than a 5 percent reduction of the most recent emissions inventory of direct PM_{2.5} or any PM_{2.5} plan precursor “for such area” (meaning from sources located within the nonattainment area). As a result, the EPA’s interpretation of “in such area” and “for such area” are consistently applied for these related provisions of the CAA.

As explained in the proposal, the EPA also sees no appropriate legal or policy basis for addressing the geographic area from which emissions reductions for RFP must be achieved for PM_{2.5} differently than is required by CAA section 182 for ozone. Both pollutants typically result from emissions from numerous sources that mix in the atmosphere and can transport great distances. For both pollutants, the CAA provides different tools for states and the EPA to address both the regional and the local contributions to violations of the NAAQS in a given area. With respect to the local contribution, the CAA provides a specific set of requirements (including RFP) designed to assure that states are properly addressing the emissions from sources located within the nonattainment area, whereas other requirements of the CAA are designed to address contributions from greater distances, whether from within the state, from other states, or even internationally. Were EPA to interpret the RFP requirements to authorize states to meet the emissions reductions requirement from sources outside the area, this would be inconsistent with the requirements specifically designed to assure that states get necessary reductions from the local sources that contribute to the violations through the attainment plan.

One commenter recommended a potential statutory interpretation in support of an outside-the-area approach. The EPA appreciates the suggestion, but has determined that it would be too inconsistent with the structure and purpose of the attainment plan requirements of the statute. The commenter specifically suggested that EPA should redefine the term “area” to encompass not just the designated nonattainment area, but also some larger geographic area with sources of emissions that cause or contribute to the ambient air quality; and that reductions from such sources should be allowed to count towards meeting the RFP requirement in addition to reductions

from sources in the designated nonattainment area. The EPA considers such an approach inappropriate for several reasons. First, such a reading would be inconsistent with the EPA's longstanding reading of this same term in many important places throughout the statute, including but not limited to explicit statutory references to the "area" in section 107(d)(1) (relevant to designations), section 107(d)(3) (relevant to redesignations), section 110(a)(2)(I) (relevant to the scope of all of the attainment plan requirements imposed by Part D), section 189(B)(2) (relevant to the schedule for submission of attainment plans under subpart 4), and section 189(e) (relevant to the statutory test for regulating precursors in a given "area"). Creating a different and conflicting definition of the word "area" for RFP purposes is not appropriate for common sense reasons, and it would require that the same word to be interpreted in multiple ways. Second, the EPA considers the redefinition of the term "area" inappropriate because it could be perceived as an attempt to alter the meaning of the term as the D.C. Circuit has already interpreted it in the *NRDC v. EPA* decision concerning the plain meaning of the term "in the area." Third, to the extent that there are situations in which the boundaries of the nonattainment area are incorrect because they fail to include the sources that contribute violations in an adjacent area to the extreme degree posited by the commenters, the statute already provides a straightforward solution to such a situation through the initial designation and redesignation provisions of section 107(d).

Finally, the EPA acknowledges that in the prior 2007 PM_{2.5} implementation rule, the EPA did adopt a different interpretation of the RFP requirement for the first time that would have authorized states to meet the RFP requirement with emissions reductions from sources outside the nonattainment area within certain narrow parameters for purposes of the 1997 PM_{2.5} NAAQS.¹²⁷ The EPA received a petition for reconsideration on this specific issue and granted the petition to reexamine that aspect of the 2007 PM_{2.5}

implementation rule.¹²⁸ Before the EPA proceeded with that reconsideration, however, the litigation over the 2007 PM_{2.5} implementation rule and the 2008 NSR revisions (addressing the PM_{2.5} NAAQS) proceeded with challenges on other statutory authority issues while the petition for reconsideration was still under evaluation. This litigation resulted in the court's decision in *NRDC v. EPA*, 706 F.3d 428 (D.C. Cir. 2013). In that decision, the court remanded the entire 2007 PM_{2.5} implementation rule, including the portions relevant to the RFP requirement, to the EPA for failure to comply with the statutory requirements of subpart 4. This rulemaking constitutes the EPA's response to that judicial remand and through this process the EPA is replacing the 2007 PM_{2.5} implementation rule, including the prior regulatory provisions and guidance related to states meeting the RFP requirements with emissions reductions from outside the designated nonattainment area. Accordingly, upon completion of this rulemaking the EPA will be interpreting the RFP requirement consistent with past practice. The EPA also notes, as a factual matter, that states have not been using this feature of the 2007 PM_{2.5} implementation rule.¹²⁹ Aside from the lack of a legal basis for the commenter's preferred approach to RFP, thus far the EPA's interpretation of the requirements has not posed the practical difficulties that the commenter raised.

5. Other RFP Considerations

a. Summary of Proposal. The proposal outlined the statutory requirements and existing guidance for RFP. During this discussion, the following guidance from the Addendum was referenced, "Additionally, the EPA believes that it is appropriate to require early implementation of the most cost-effective control measures . . . while phasing in the more expensive control measures."¹³⁰ The proposal also discussed other RFP considerations, including PM_{2.5} nonattainment areas that are shared by more than one state or tribe.

b. Final Rule. The EPA is finalizing that, although early implementation of the most cost-effective control measures is often appropriate, states should consider both cost-effectiveness and pollution reduction effectiveness when developing implementation schedules for their control measures and may implement measures that are more effective at reducing PM_{2.5} earlier to provide greater public health benefits. This increased flexibility enables states to develop a more effective implementation schedules for their control measures while efficiently using their resources.

For a multi-state or multi-jurisdictional nonattainment area, the RFP plans for each state represented in the nonattainment area shall demonstrate RFP on the basis of common multi-state inventories. The states or jurisdictions within which the area is located must provide a coordinated RFP plan. Each state must ensure that the sources within its boundaries comply with enforceable emission levels and other requirements that in combination with the reductions planned in other states within the nonattainment area will provide for attainment as expeditiously as practicable and demonstrate RFP consistent with these regulations. In general, the EPA seeks to ensure that PM_{2.5} nonattainment areas that are shared by more than one state or tribe meet RFP requirements as a whole. States and tribes that share a nonattainment area should therefore consult with one another to develop the RFP analysis and control strategy implementation schedule for the area as a whole. Such states and tribes should work with the EPA region or regions that oversee them to confirm that their collective approach is appropriate for RFP.

The EPA's approach for states to meet the RFP requirement is designed to ensure emissions reductions will yield incremental improvements in air quality on the path to attainment, while being sufficiently flexible to accommodate the range of control strategies necessary to address the complex mixtures of pollutants comprising PM_{2.5} in different areas.

c. Comments and Responses.

Comment: Some commenters asserted that the EPA should not "require" implementing the most cost-effective measures first since states should have the flexibility to implement the more effective but less cost-effective measure earlier, thus providing earlier and greater public health benefits.

Response: In this final rule, the EPA is providing states with the flexibility to

¹²⁷ See the discussion of this prior approach to RFP in the proposal for this action. 80 FR 15388–89. By its terms, the 2007 PM_{2.5} Implementation Rule applied only to the 1997 PM_{2.5} NAAQS. The EPA's guidance for the 2006 PM_{2.5} NAAQS did not follow this approach with respect to the RFP requirement for purposes of the 2006 PM_{2.5} NAAQS. The EPA later withdrew the guidance for the 2006 PM_{2.5} NAAQS as a result of the court decision in *NRDC v. EPA*, 706 F.3d 428 (D.C. Cir. 2013).

¹²⁸ See, Letter to David S. Baron, EarthJustice, from Gina McCarthy, Assistant Administrator, dated May 13, 2010. A copy of this letter is in the docket for this action.

¹²⁹ See, e.g., "Approval and Promulgation of Implementation Plans; California; 2007 South Coast PM_{2.5} Plan and 2007 State Strategy; Proposed Rule," 76 FR 41567, 41577–78 (July 14, 2011); Final Approval of Air Quality Implementation Plans; California; South Coast Attainment Plan for the 1997 PM_{2.5} NAAQS Standards; Final Rule," 76 FR 69928 (November 9, 2011).

¹³⁰ *Ibid.* at 42016.

implement measures that are more effective at reducing PM_{2.5} earlier to provide greater public health benefits, but is not requiring it. This increased flexibility is in keeping with the overall requirement of expeditious attainment of the NAAQS.

G. Quantitative Milestones

1. General Approach to Quantitative Milestones

a. Summary of the Proposal. The proposal built from the statutory language of 189(c)(1), which requires quantitative milestones that (1) demonstrate RFP, and (2) must be achieved every 3 years until the area is redesignated attainment. The proposal first addressed the issue of the starting date for counting the 3-year periods. For a Moderate area that cannot practicably attain the relevant PM_{2.5} NAAQS within the statutory timeframe for a Moderate area, the EPA proposed that a state must submit two sets of quantitative milestones—the first set to be achieved at year 4.5 from designation and the second set to be achieved at year 7.5 from designation. The EPA also proposed that the quantitative milestones contained in the attainment plan for a Moderate nonattainment area must be constructed such that they can be tracked, quantified and/or measured adequately in order for the state to meet its milestone reporting obligations, which come due 90 days after a given milestone date. The EPA therefore proposed to require that states select the quantitative milestones that are appropriate and quantifiable and that will provide for objective evaluation of progress toward attainment in their Moderate PM_{2.5} nonattainment area, whether the area can practicably attain the PM_{2.5} NAAQS by the statutory attainment date or not. In addition to this general proposed approach for selecting quantitative milestones for a Moderate nonattainment area, the EPA proposed a requirement that, at a minimum, states must include in all attainment plans for Moderate PM_{2.5} nonattainment areas a metric to confirm that all control measures identified and adopted as RACM and RACT for the area have been fully implemented within 4 years of designation.

b. Final Rule. Section 189(c) of the Act explicitly requires that quantitative milestones must be achieved every 3 years, but does not specify the starting date for counting the 3 year periods. In the General Preamble and Addendum, the agency stated that quantitative milestones must be achieved every 3 years starting from the due date for the plan submission (*i.e.*, because the

Moderate area attainment plan is due no later than 18 months after designation of the area, the first set of milestones would need to be achieved 4.5 years after the area's designation) until the area is redesignated attainment.¹³¹ The EPA is finalizing this approach for the PM_{2.5} NAAQS. The EPA interprets this requirement to be the most appropriate reading of CAA section 189(c)(1) which requires “quantitative milestones which are to be achieved every 3 years until the area is redesignated attainment.”

This approach is also consistent with the longstanding approach outlined in the General Preamble.¹³² These timeframes for the quantitative milestones apply to all areas designated nonattainment for a PM_{2.5} NAAQS on or after January 15, 2015, including all areas designated nonattainment effective April 15, 2015 for the 2012 PM_{2.5} NAAQS.¹³³ See 40 CFR 51.1013(a).

For all areas designated nonattainment for the 1997 and/or 2006 PM_{2.5} NAAQS before January 15, 2015,¹³⁴ the EPA is establishing December 31, 2014 as the starting point for the first 3 year period for quantitative milestones under CAA section 189(c). This is because December 31, 2014, was the due date for states to submit additional SIP elements necessary to satisfy the subpart 4 Moderate area requirements for the 1997 and 2006 PM_{2.5} standards.¹³⁵ Establishing December 31, 2014 as the starting point for the first 3 year period under CAA section 189(c) for the 1997 and 2006 PM_{2.5} standards is in keeping with the EPA's historical approach to quantitative milestone dates (*i.e.*, using the due date for the Moderate area plan submission as the starting point for the first 3 year milestone period). Thus, for any area designated nonattainment for

the 1997 and/or 2006 PM_{2.5} NAAQS that has not yet attained these NAAQS and therefore continues to have attainment planning obligations for these NAAQS, the state must submit quantitative milestones to be achieved by December 31, 2017 (the first milestone date), at minimum. Additional milestone dates may also apply to such an area depending on the relevant attainment planning period. See 40 CFR 51.1013(a)(4).

Regardless of whether or not an attainment plan demonstrates attainment by the statutory attainment date, the EPA requires that all Moderate area PM_{2.5} attainment plans must define appropriate quantitative milestones to be achieved by 4.5 years and 7.5 years following designation of the area. Although it occurs after the Moderate area attainment date, the EPA is requiring Moderate area plans to contain this 7.5 year milestone, even where those plans demonstrate attainment before the milestone would arrive. Where the EPA uses its discretionary authority in CAA section 188(b)(1) to reclassify an area before the Moderate area attainment date applicable to the area, CAA section 189(b)(2) allows the state up to 4 years to submit the required Serious area attainment demonstration and related plan elements, such as quantitative milestones. For example, if the reclassification occurs 4 years after designation, the state may be allowed to submit the Serious area quantitative milestones up to 8 years after designation, well after the second milestone date (7.5 years after designation) has passed. Without the 7.5 year milestone requirement, this circumstance would undermine the purpose of the quantitative milestone requirement, which is to ensure that states will report to EPA on each nonattainment area's progress toward attainment at regular intervals, even following reclassification.¹³⁶

A similar issue would result in the event that a Moderate area that did demonstrate attainment in the original attainment plan fails to attain by the statutory attainment date. In this case, the area would have failed to meet the attainment date which is as expeditiously as practicable but no later than the end of the sixth calendar year after designation as required by CAA section 188(c)(1). Section 188(b)(2) of the Act allows the Administrator up to

¹³¹ General Preamble, 57 FR 13498 (April 16, 1992), at page 13539.

¹³² 57 FR 13539.

¹³³ 80 FR 2206, January 15, 2015.

¹³⁴ The EPA promulgated nonattainment area designations for the 1997 PM_{2.5} NAAQS effective April 2005 (70 FR 944, January 5, 2005 and 70 FR 19844, April 14, 2005). The EPA promulgated nonattainment area designations for the 2006 PM_{2.5} NAAQS effective December 2009 (74 FR 58688, November 13, 2009), March 2011 (76 FR 6056, February 3, 2011), and November 2012 (77 FR 65310, October 26, 2012).

¹³⁵ 79 FR 31566 (June 2, 2014) (final rule establishing subpart 4 moderate area classifications and deadline for related SIP submissions) (“Classification and Deadline Rule”). Although the Classification and Deadline Rule did not affect any action that the EPA had previously taken under CAA section 110(k) on a SIP for a PM_{2.5} nonattainment area, the EPA noted that states may need to submit additional SIP elements to fully satisfy the applicable requirements of subpart 4, even for areas with previously approved PM_{2.5} attainment plans, and that the deadline for any such additional plan submissions was December 31, 2014. *Id.* at 31569.

¹³⁶ See, e.g., Addendum at 42016, n. 43 (noting that the plain terms of CAA section 189(c) require that milestones be achieved every 3 years until the area is redesignated attainment and, therefore, do not contemplate any breaks in the milestones due to an area's reclassification).

6 months to determine that a Moderate area failed to attain and reclassify that area to Serious, which would be at least 6.5 years after designation. As described in Section VI.A.1 of this preamble, the Serious area would have 18 months from reclassification due to a failure to attain (8 years after designation) in order to submit an attainment plan. The EPA has therefore determined that, in order to avoid gaps of greater than 3 years in the implementation of quantitative milestones, all Moderate area attainment plans must contain quantitative milestones to be achieved 4.5 years and 7.5 years after designation and which demonstrate continued progress toward timely attainment of the relevant PM_{2.5} NAAQS. In the event that the area fails to attain, this will provide the EPA with appropriate tools necessary to continue to monitor the area's continued progress toward attainment while the state develops the Serious area attainment plan.

The quantitative milestones contained in the attainment plan for a Moderate nonattainment area should be constructed such that they can be tracked, quantified and/or measured adequately in order for the state to meet its milestone reporting obligations, which come due 90 days after a given milestone date. In the Addendum, the EPA suggested some possible metrics that "support and demonstrate how the overall quantitative milestones identified for an area may be met," such as percent implementation of control strategies, percent compliance with implemented control measures, and adherence to a compliance schedule. This list was not exclusive or exhaustive but reflected the EPA's view that the purpose of the quantitative milestone requirement is to provide an objective way to determine whether the area is making the necessary progress towards attainment by the applicable attainment date.¹³⁷ The EPA interprets Section 189(c) of the Act to allow states to identify milestones that are suitable for the specific facts and circumstances of the attainment plan for a particular area, so long as they provide an objective means to measure RFP.

This rule requires that each attainment plan for a Moderate PM_{2.5} nonattainment area contain quantitative milestones that provide for objective evaluation of RFP toward attainment in the PM_{2.5} nonattainment area, whether the plan provides for attainment of the PM_{2.5} NAAQS by the statutory attainment date or demonstrates that attainment by such date is

impracticable. For this approach, the EPA does not require that such quantitative milestones take any particular form, merely that they provide a means to evaluate progress (*i.e.*, demonstrate RFP) meaningfully. The EPA will review each attainment plan submission on a case-by-case basis to determine whether the quantitative milestones contained in the plan are specific enough to provide an objective means for evaluating the area's progress toward attainment, consistent with the statutory requirements of CAA section 189(c). The EPA recommends that states confer with their respective EPA regional office to develop appropriate quantitative milestones. See 40 CFR 51.1013(a).

The Addendum stated that the Moderate area quantitative milestones "will be met by showing that emissions reductions scheduled to be made between the SIP due date and the attainment date for these moderate areas were actually achieved. Most of these emissions reductions will result from implementation of RACM (including RACT) as part of the moderate area SIP." However, this rule does not specify that quantitative milestones must be expressed in terms of emissions reductions. The EPA recognizes that it is impractical to expect that a state will always be able to quantify and compare real and projected emissions reductions, and submit a report to the EPA within 90 days of a given milestone as required under CAA section 189(c)(2). Therefore, the final rule requires that, at a minimum, states must include in all attainment plans for Moderate PM_{2.5} nonattainment areas a milestone that all control measures identified and adopted as RACM and RACT for the area have been fully implemented within 4 years of designation. This milestone specifically derives from section 189(a)(1)(C) of the Act, that applies to all Moderate areas and thus represents a milestone that all Moderate areas must meet regardless of whether it is listed explicitly as an individual milestone. See 40 CFR 51.1013(a)(1)(iii).

For an area that submitted air quality targets with the RFP plan under the optional provision that was described in Section IV.F of this preamble, an air quality based milestone (*i.e.*, one that is expressed in terms of an ambient PM_{2.5} level) is strongly recommended to be included in order to confirm that the air quality target has been met for the quantitative milestone year. If used, this milestone will be compared to the most recently certified monitored ambient air data as part of the milestone report due after the area reaches each quantitative milestone date. The EPA recognizes that

certified monitored ambient air data are not available for some period after a calendar year ends. As a result, the EPA expects that this quantitative milestone may sometimes be satisfied with data that are over a year old. For example, for Moderate areas having an effective date of designations in April 2015, the first quantitative milestone date will be in October 2019 (3 years after the 18 month SIP due date), and the associated report will be due 90 days later, in January 2020. In this example, the state would likely have to rely upon certified air quality data for 2018 because data for the 2019 calendar year would not yet be fully certified. Additionally, this milestone should normally be reported in the same form as the applicable PM_{2.5} NAAQS. However, the EPA expects that in some circumstances, it may be appropriate to use annual averages instead of the 3 year average to help justify variations due to meteorological occurrences.

c. Comments and Responses.

Comment: Some commenters stated the Act may be read to conclude that the requirement to include any quantitative milestones in a Moderate area plan does not apply to a plan demonstrating the impracticability of attaining the NAAQS by the attainment date.

Response: The EPA's longstanding interpretation of CAA section 189(c) as a requirement that applies to all PM₁₀ nonattainment area plans, including those demonstrating that attainment by the applicable attainment date is impracticable, is consistent with the purpose and structure of subpart 4. The design of the CAA for PM nonattainment areas combines the requirements of subpart 1 and subpart 4 to support expeditious attainment of the applicable NAAQS. RFP is the prescribed tool available to a state to plan their emission reduction progress toward expeditious attainment. Quantitative milestones are a critical aspect of the CAA and the attainment plan in order for the EPA to monitor the area's RFP toward expeditious attainment and trigger the appropriate response if RFP is not maintained. The EPA thus determined that allowing an area to simply not submit any quantitative milestones would not afford the EPA the necessary tools to monitor RFP toward expeditious attainment.

2. Milestone Report Submission

a. Summary of the Proposal. Because the statute does not define the parameters of quantitative milestone demonstrations, the EPA has discretion to determine the components of the required demonstration and the form

¹³⁷ Addendum to the General Preamble, 59 FR 41998 (August 16, 1994), at page 42016.

and manner for submission. The proposal took comment on options for doing this. The EPA proposed to require that the milestone report submission must include the following four components: (i) A certification by the Governor or Governor's designee that the state's attainment plan control strategy is being implemented as described in the applicable attainment plan, (ii) technical support sufficient to document completion statistics for appropriate milestones and to demonstrate that the quantitative milestones have been satisfied and how the emissions reductions achieved to date compare to those required or scheduled to meet RFP, (iii) as applicable, an air quality screening analysis to determine if measured air quality progress is consistent with the expected air quality improvement target correlated with the RFP emissions reductions for the previous 3 year period, and (iv) an evaluation of whether the PM_{2.5} NAAQS will be attained by the projected attainment date for the area. In addition, the EPA proposed that the milestone report must include a description and schedule for any remedial actions the state has taken or will take to address any failure to meet a quantitative milestone, including the implementation status of contingency measures for failing to meet RFP in the area.

The EPA also sought comment on how electronic reporting could facilitate a state's submission of the required milestone report, how it could accommodate the various narrative and data-dependent components that the EPA proposed be part of such a submission, and what particular system features might be desirable to accommodate milestone report submissions through the eSIP system.

b. Final Rule. The final rule, mirroring section 189(c)(2) of the Act, requires that each state containing a PM_{2.5} nonattainment area submit to EPA, within 90 days after each milestone date applicable to the area, a demonstration that all measures in the approved plan (including the RFP plan) for the area have been implemented and that the milestone has been met. This rule outlines the content required by the EPA for the quantitative milestone report. The EPA must then determine whether or not a state's demonstration is adequate within 90 days after receiving a demonstration which contains the required information and analysis. The EPA intends to promptly inform the relevant state of any determination that the state has failed to submit a timely quantitative milestone report and any determination that a

submitted milestone report is not adequate.

The EPA will work with a state to assist them in meeting the reporting deadline, and expects that, because the report is to be fairly low burden and may be submitted electronically through eSIP, in most cases the state will submit it on time, especially if they have implemented the programs required to meet their milestones. If, however, a state fails to submit a milestone demonstration report by the due date or the EPA determines that a milestone was not met, the final rule requires the state to submit a SIP revision within 9 months of either the missed reporting deadline or the EPA's determination of the state's failure to meet a milestone. According to the statutory requirements of CAA section 189(c)(3), the new SIP revision must assure "that the State will achieve the next milestone (or attain the national ambient air quality standard . . . , if there is no next milestone) by the applicable date." If a state fails to make a SIP submission to correct a failure to meet RFP expeditiously, sanctions under CAA sections 110(m) and 179(b) may apply. If a state is unable to correct a failure to meet RFP, this may be evidence that the state cannot practicably attain the NAAQS by the applicable attainment date and may serve as a basis for reclassification of the area to Serious under CAA section 188(b)(1).

As previously noted, the EPA has offered guidance about what the milestone report should contain. The Addendum says, "This report must contain technical support sufficient to document completion statistics for appropriate milestones. For example, the demonstration should graphically display RFP over the course of the relevant 3 years and indicate how the emissions reductions achieved to date compare to those required or scheduled to meet RFP and the required [quantitative] milestones. The calculations (and any assumptions made) necessary to determine the emissions reductions to date should also be submitted. The demonstration should also contain an evaluation of whether the PM₁₀ NAAQS will be attained by the projected attainment date."¹³⁸ This guidance is still appropriate for states demonstrating compliance with RFP and quantitative milestones for PM_{2.5} NAAQS. The EPA requires that the milestone report submission must include the following components. See 40 CFR 51.1013(b).

First, the report must include a certification by the Governor or

Governor's designee that the SIP control strategy is being implemented consistent with the RFP plan, as described in the applicable attainment plan. Second, the report must contain technical support, including calculations, sufficient to document completion statistics for each quantitative milestone and to demonstrate that the quantitative milestones have been satisfied and how the emissions reductions achieved to date compare to those required or scheduled to meet RFP. Additionally, the report must include a discussion of whether the PM_{2.5} NAAQS will be attained by the projected attainment date for the area. See 40 CFR 51.1013(b). The EPA decided not to finalize the proposed requirements to include an air quality screening analysis or the description and schedule for remedial actions taken by the state to address a failure to meet a quantitative milestone. This decision was made because the remaining components of the quantitative milestone report are sufficient to enable the EPA to assess whether the nonattainment area is meeting RFP.

As stated in the Addendum, the milestone report must be submitted from the Governor or Governor's designee to the Regional Administrator of the respective EPA Regional Office serving the submitting state. The EPA will notify the state of its determination (regarding whether or not the state's report is adequate) by sending a letter to the appropriate Governor or Governor's designee. The EPA encourages states to submit milestone reports, including supporting documents, through the agency's electronic SIP (eSIP) submission system in order to simplify the process and reduce resource burden on all sides.

c. Comments and Responses.

Comment: Some commenters did not support the proposal and stated that requiring this level of documentation is unnecessary and puts an excessive workload burden on states and local agencies.

Response: The EPA recognizes that there is some level of resources required to address the requirements prescribed by every rule. However, the EPA concluded that the benefit offered to the public by reviewing quantitative milestone reports while assessing whether nonattainment areas are making reasonable further progress toward attaining the PM_{2.5} NAAQS and the associated public health benefits outweigh the anticipated workload burden for states.

Comment: Some commenters stated that the first two components of the

¹³⁸ *Ibid.* at 42017.

quantitative milestone report described in the proposal are sufficient to comply with the requirements of CAA section 189(c)(2). The commenters stated that the proposed air quality screening analysis is not supported by the statute and is unnecessary if the second component is fulfilled. The commenters stated that the proposed description and schedule for remedial actions the state has taken or will take to address any failure to meet a quantitative milestone is more than what is necessary to demonstrate compliance with RFP milestones and could require revisions to the SIP.

Response: After considering these comments and in an effort to simplify the rule, the EPA decided to eliminate the two proposed requirements for the quantitative milestone report as suggested by these commenters. As stated earlier, this decision was made because the EPA determined that the remaining components of the quantitative milestone report are sufficient to enable the EPA to assess whether the nonattainment area is meeting RFP.

Comment: One commenter stated that, while they would not object to filing periodic reports, as part of their milestone report, the EPA should not insist on the state actually inspecting all covered facilities and indicating that RACT or RACM has not been implemented if a small subset of facilities is found in violation.

Response: It is not the intent of the EPA to require states to physically inspect all covered sources to verify the implementation of required control measures. The intent is that, at the time of the milestone due date, all covered sources would be legally required to have implemented required control measures and the state has reasonably been assured that this occurred.

H. Contingency Measures

1. Summary of the Proposal

The Act requires Moderate PM_{2.5} nonattainment area plans to contain contingency measures consistent with CAA section 172(c)(9). Contingency measures are additional control measures to be implemented in the event that the EPA determines that an area failed to meet RFP requirements (including associated quantitative milestones) or failed to attain the PM_{2.5} primary standard by the applicable attainment date. These measures must be fully adopted rules or control measures that are ready to be implemented quickly upon failure to meet RFP or failure of the area to meet the standard by its attainment date, and

such measures are required to take effect without further action by the state or the EPA. The EPA proposed and sought comment on general requirements for contingency measures for Moderate PM_{2.5} nonattainment areas. The EPA has longstanding interpretations of the statute with respect to the contingency measure requirement, both for PM and for other pollutants, in the General Preamble and Addendum. These documents provide guidance and recommendations for states to follow in submitting contingency measures, and the proposal did not contain any significant changes to the existing guidance and recommendations. However, the EPA sought comment on whether the guidance needed to be revised or expanded. Additionally, as discussed in the proposal, the EPA believes that the DC Circuit's decision in *NRDC v. EPA* does not affect the overall contingency measure requirements that were finalized in the remanded 2007 PM_{2.5} Implementation Rule. The EPA determined this because CAA section 172(c)(9) imposes the contingency measure requirement for attainment plans for the PM_{2.5} NAAQS and it is not superseded or subsumed by any specific contingency measure requirements under subpart 4. As a result, the proposal for this rule remained very similar to the final 2007 PM_{2.5} Implementation Rule.

2. Final Rule

Consistent with the proposal, the final rule codifies existing policies on contingency measures, but does not make significant changes to these policies. Although CAA section 172(c)(9) requires contingency measures, the provision does not specify exactly what parameters such measures must meet. The EPA is finalizing an approach to contingency measures for the PM_{2.5} NAAQS that is similar to the approach recommended in earlier EPA guidance. Specifically, in order for contingency measures to be approvable as part of a state's Moderate area attainment plan submission for the PM_{2.5} NAAQS, the state plan must meet the following general requirements (*See* 40 CFR 51.1014):

(1) Contingency measures must be fully adopted rules or control measures that are ready to be implemented quickly upon a determination by the Administrator of the nonattainment area's failure to meet RFP, failure to meet any quantitative milestone, failure to submit a quantitative milestone report or failure to attain the standard by the applicable attainment date.

(2) The state's attainment plan submission must contain trigger

mechanisms for the contingency measures, specify a schedule for implementation, and indicate that the measures will be implemented with minimal further action by the state or by the EPA.

(3) The contingency measures shall consist of control measures that are not otherwise included in the control strategy or that achieve emissions reductions not otherwise relied upon in the control strategy for the area.

(4) Contingency measures should provide for emissions reductions approximately equivalent to 1 year's worth of reductions needed for RFP, based on the overall level of reductions needed to demonstrate attainment divided by the number of years from the base year to the attainment year, or approximately equivalent to 1 year's worth of air quality improvement or emissions reductions proportional to the overall amount of air quality improvement or emissions reductions to be achieved by the area's attainment plan.

Regarding the first two points, consistent with prior guidance, states must show that their contingency measures can be implemented with minimal further action on their part and with no additional rulemaking actions such as public hearings or legislative review. After the EPA determines that a moderate PM_{2.5} nonattainment area has failed to meet an RFP requirement or to attain the PM_{2.5} NAAQS, the EPA generally expects all actions needed to effect full implementation of the contingency measures to occur within 60 days after the EPA notifies the state of the area's failure. The EPA intends to notify the state of a failure to meet RFP or to attain the NAAQS by publication of its determination in the **Federal Register**. The state should ensure that the contingency measures are fully implemented as expeditiously as practicable after such notice.¹³⁹

Regarding the third point, the EPA interprets the contingency measure requirement of CAA section 172(c)(9) to require control measures that are not otherwise included in the control strategy or that achieve emissions reductions not otherwise relied upon in the control strategy for the area. However, suitable contingency measures may be measures that were technologically and economically feasible for the area, but did not qualify as RACM or RACT or additional reasonable measures for one or more reasons. For example, a candidate contingency measure may have been deemed technologically and

¹³⁹ *Ibid.* at 42015.

economically feasible, but it was not needed to achieve expeditious attainment in a Moderate area for which the state could demonstrate attainment by the statutory attainment date and therefore was not included as part of the attainment demonstration for the area. It is important that states make decisions concerning contingency measures in conjunction with their determination of the overall control strategy for bringing the area into expeditious attainment, and that states first must identify those control measures needed in order to demonstrate expeditious attainment of the standards; any remaining measures should then be considered as candidates for contingency measures.

As discussed in Section IV.D of this preamble, the RACM/RACT provisions in this rule require that, for Moderate areas that cannot practicably attain the NAAQS by the statutory attainment date, states must implement all control measures that they determine to be reasonable (*i.e.*, all technologically and economically feasible measures) for sources in the area. In such cases, the contingency measures for such nonattainment areas would necessarily exceed the criteria for determining whether a measure is reasonable for purposes of RACM/RACT and additional reasonable measures. For example, contingency measures could consist of reasonable controls on sources outside the nonattainment area, early implementation of BACM/BACT on select sources inside the area, other measures identified by the state, or a combination thereof, that collectively provide approximately equivalent to 1 year's worth of emissions reductions/air quality improvement. Such contingency measures would only be triggered in the event the area fails to meet RFP; the EPA does not interpret the requirement for contingency measures for failing to attain the NAAQS by the applicable attainment date to apply to a Moderate area that a state demonstrates cannot practicably attain the NAAQS by the statutory attainment date. Rather, the EPA believes it is appropriate for the state to identify and adopt these measures in a timely way as part of the Serious area attainment plan that it will develop once the EPA reclassifies such an area. However, if a Moderate area that cannot practicably attain the NAAQS fails to meet RFP when reviewed as part of the quantitative milestone either 4.5 or 7.5 years after designation, the requirement to implement contingency measures would be triggered as required by CAA section 172(c)(9). For any Moderate PM_{2.5} nonattainment area, contingency

measures can include measures that achieve emissions reductions on sources located outside the nonattainment area as well as from sources within the nonattainment area, provided that the measures offer reasonable assurance that the appropriate air quality impact will result within the nonattainment area.

The final rule continues to allow states to rely on federal measures (*e.g.* federal mobile source measures based on the incremental turnover of the motor vehicle fleet each year) and local measures already scheduled for implementation that provide emissions reductions in excess of those needed to provide for RFP or expeditious attainment. The key is that the statute requires that contingency measures provide for additional emissions reductions that are not relied on for RFP or attainment and that are not included in the RFP or attainment demonstrations as meeting part or all of the contingency measure requirements. The purpose is "to provide a cushion while the plan is being revised to meet the missed milestone." Nothing in the statute precludes a State from implementing such measures before they are triggered. Additionally, the EPA determined that the court ruling upholding contingency measures that were previously required and implemented where they were in excess of the attainment demonstration and RFP for ozone attainment plans necessitates similar treatment for PM_{2.5} NAAQS.¹⁴⁰ The EPA has approved numerous SIPs under this interpretation, *i.e.*, SIPs that use as contingency measures one or more federal or local measures that are in place and provide reductions that are in excess of the reductions required by the attainment demonstration or RFP plan.¹⁴¹

For these reasons, the EPA concluded that this approach is reasonable for Moderate PM_{2.5} nonattainment areas that can demonstrate attainment by the statutory attainment date, as the state would calculate the emissions reductions needed for RFP separately from the control strategy determination for such an area. However, crediting an area for "excess" emissions reductions to satisfy the contingency measure requirement is not allowable for Moderate areas that cannot practicably attain by the statutory attainment date. Under the EPA's approach for calculating RFP for such areas, RFP would be calculated directly from the

projected emissions reductions from all control measures identified for the area (as RACM and RACT or additional reasonable measures), such that there should be no difference between emissions reductions estimated from control measures and those estimated for demonstrating RFP.

Finally, consistent with the EPA's past approach for contingency measures for PM_{2.5} nonattainment areas, the EPA expects that the emissions reductions from contingency measures should be approximately equivalent to 1 year's worth of emissions reductions while the state is revising its attainment plan for the area. States should explain the amount of anticipated emissions reductions to be accomplished by the contingency measures outlined in the plan. In the rare event that an area is unable to identify contingency measures to account for approximately 1 year's worth of emissions reductions, the state should provide a reasoned justification why the smaller amount of emissions reductions is appropriate. As described in Section IV.F of this preamble, the EPA requires an approach for interpreting the statutory RFP requirement that would require demonstrating RFP based on reductions from sources located inside the nonattainment area. Keeping with the historic linkage between RFP and contingency measures, the EPA is also finalizing a similar approach for calculating 1 year's worth of emissions reductions for purposes of adopting appropriate contingency measures. That is, the EPA's approach for determining the *level* of emissions reductions for contingency measure purposes is to calculate the annual reductions in emissions of direct PM_{2.5} and PM_{2.5} plan precursors needed from sources located inside the nonattainment area. As explained earlier, however, some or all of the contingency measures reductions can come from outside the area if they are demonstrated to produce the appropriate air quality impact within the nonattainment area.

This rule requires that states must implement contingency measures after the EPA determines that the area has either failed to meet RFP requirements, failed to meet any quantitative milestone, failed to submit a quantitative milestone report, or failed to attain the standards by the applicable attainment date. The purpose of the contingency measure provision is to ensure that corrective measures are put in place automatically at the time that the EPA makes its determination that an area has either failed to meet RFP or failed to meet the standard by its attainment date. The EPA is required to

¹⁴⁰ See *LEAN v. EPA*, 382 F.3d 575 (5th Cir., 2004).

¹⁴¹ See, *e.g.*, 62 FR 15844 (April 3, 1997); 62 FR 66279 (December 18, 1997); 66 FR 30811 (June 8, 2001); 66 FR 586 and 66 FR 634 (January 3, 2001); 78 FR 64402 (October 29, 2013).

determine within 90 days after receiving a state's quantitative milestone demonstration, and within 6 months after the attainment date for an area, whether these requirements have been met. The additional consequences for states with areas that fail to attain the NAAQS or to meet RFP are described in section 179(d) of the CAA and discussed in Section V of this preamble.

See Section IV.A of this preamble for a discussion of the due dates for submission of contingency measures and other attainment plan elements.

3. Comments and Responses

Comment: Commenters stated that requiring contingency measures in areas with mature air pollution control programs is very challenging because they already have developed aggressive control measures to meet CAA requirements and support expeditious attainment. Commenters asserted that it would be extremely difficult to develop further control measures to meet any contingency measure requirements. Commenters objected to the proposed requirement that contingency measures must be approximately equivalent to 1 year's worth of emissions reductions because it is a departure from existing guidance which states the contingency emissions reductions "should be" approximately equal and because sometimes identifying control measures for this level of reductions is just not possible. Commenters advocated that EPA should provide a more reasonable approach to the contingency measure requirement, but did not provide specific recommendations. Other commenters stated that contingency measures should provide 1 year's worth of emissions reductions needed for RFP.

Response: The EPA acknowledges that states containing areas with more longstanding and pervasive nonattainment problems may already have implemented many control measures for purposes of attaining the NAAQS, and there may be fewer sources and measures available to meet the contingency measure requirements of the statute. However, the EPA notes that section 172(c)(9) of the CAA explicitly requires states to adopt contingency measures to apply in the event of failure to meet RFP or failure to attain the NAAQS as a required component of all attainment plans. Typically, contingency measures will be comprised of measures that a state and the EPA have determined are not required to meet RACM/RACF or other requirements, e.g., on the grounds that they are more technologically or economically challenging. As a result, such measures may not be required as

RACM/RACF, but are nevertheless available for use as contingency measures. Another approach to contingency measures, if appropriate, would be to rely on control measures imposed on sources outside the boundaries of the designated nonattainment area. Such contingency measures require adequate support to establish that the reductions would have the intended impacts within the nonattainment area, but can be a source of additional measures for this purpose.

Finally, the EPA notes that its longstanding guidance is that contingency measures should provide approximately 1 year's worth of RFP, but this amount may vary based upon appropriate facts and circumstances of each unique nonattainment area. As discussed, states should explain the amount of anticipated emissions reductions to be accomplished by the contingency measures outlined in the plan. In the rare event that an area is unable to identify contingency measures to account for approximately 1 year's worth of emissions reductions, the state should provide a reasoned justification why the smaller amount of emissions reductions is appropriate.

Comment: Commenters stated that "excess" emissions reductions (i.e., emission reduction measures that are included in a modeled attainment demonstration indicating that the area will improve air quality to well below the standard) should not be used as contingency measures in the event an area actually fails to attain. Commenters asserted that the failure to attain should be considered a demonstration that excess emissions reductions do not exist. Further, the commenters stated that excess reductions do not provide the public health benefit intended by Congress. Other commenters stated that Moderate areas that cannot attain by the statutory attainment date could also have excess emissions reductions creditable as contingency measures.

Response: In keeping with longstanding practice, the final rule allows excess emissions reductions to be credited as contingency measures in plans that demonstrate attainment but not for plans that demonstrate an impracticability to attain. This allows nonattainment areas to credit emissions reductions beyond those planned to satisfy attainment plan requirements as meeting part or all of the contingency measure requirements. This allowance is further supported by the court's ruling in *LEAN v. EPA*, which found that emissions reductions in excess of what were needed for the attainment demonstration and RFP in ozone attainment plans are creditable for

contingency measures. Because the contingency measures requirement for both ozone and PM_{2.5} originates in CAA section 172(c)(9), it is applicable for all areas designated nonattainment for any NAAQS. Therefore, the EPA concluded that the same approach is appropriate for Moderate PM_{2.5} nonattainment areas that can demonstrate attainment by the statutory attainment date. Allowing "excess" emissions reductions affords proper credit for these areas as they continue to make progress toward attainment while the new SIP is developed for the area. Additionally, in support of the overarching goal of the CAA, public health will benefit from the excess emissions reductions. However, such an allowance for a Moderate area that cannot practicably attain is not acceptable because all emissions reductions anticipated from control measures while developing the attainment plan should be accounted for in the RFP plan. With all of these reductions accounted for in the RFP plan, there are no excess reductions beyond the attainment planning period to be credited as contingency measures.

I. Attainment Dates

1. Summary of Proposal

The proposal described the CAA section 188(c)(1) requirement for Moderate areas to attain the standard as expeditiously as practicable, but no later than the end of the sixth calendar year after the "area's designation as nonattainment." For purposes of clarity, the EPA proposed to interpret the term "area's designation" as meaning "the area's effective date of designation," consistent with the agency's past approach for implementing the 1997 and 2006 PM_{2.5} NAAQS, and with its approach for implementing the NAAQS for other criteria pollutants under part D, title I of the CAA. The EPA requested comment on this interpretation. The preamble to the proposal also described the process for determining whether an area has attained the NAAQS.

2. Final Rule

The final rule maintains the requirement interpreting of CAA section 188(c)(1) to mean that the attainment date must be as expeditiously as practicable, but no later than the end of the sixth calendar after the *effective date* of an area's designation. See 51.1004(a)(1). Thus, as an example, for areas designated nonattainment in the first round of designations for the 2012 PM_{2.5} NAAQS, the effective date of designation is April 15, 2015, and the Moderate area attainment date would be as expeditious as practicable, but no

later than December 31, 2021 (*i.e.*, the end of the sixth calendar year after designation). Serious area attainment dates are discussed fully in Section VI.I of this preamble.

The EPA's approach to approving an attainment date for a PM_{2.5} nonattainment area will be different for a Moderate area that cannot practicably attain the relevant PM_{2.5} NAAQS by the end of the sixth calendar year after designation. Given that the agency will reclassify any such area to Serious and thereby trigger additional Serious area requirements for the area, the EPA will approve an attainment date for the area when it takes action on the Serious area attainment plan submitted for the area. In the interim, before the EPA takes action to reclassify the area, the statutory Moderate area attainment date will continue to apply to such an area. See 40 CFR 51.1000 and 51.1004(a)(1)(ii). As discussed more fully in Section VI.I of this preamble, when the EPA reclassifies the area, then the presumptive attainment date for the area will be as expeditious as practicable, but no later than the end of the tenth calendar year following designation.

Once an area has an approved attainment date and has implemented its plan, the EPA has the responsibility for determining whether the nonattainment area has attained the standard by its applicable attainment date. Section 179(c)(1) of the CAA requires the EPA to make determinations of attainment no later than 6 months following the attainment date for the area. Under CAA section 179(c)(2), the EPA must publish a notice in the **Federal Register** identifying those areas that failed to attain by the applicable attainment date. The statute further provides that the EPA may revise or supplement its determination of attainment for the affected areas based upon more complete information or analysis concerning the air quality for the area as of the area's attainment date.

Section 179(c)(1) of the CAA provides that the EPA is to base the attainment determination for an area upon an area's "air quality data as of the attainment date." The EPA will make the determination of whether an area's air quality is meeting the PM_{2.5} NAAQS by the applicable attainment date based upon data gathered from the air quality monitoring sites that have been entered into the EPA's Air Quality System (AQS) database. The state is not required to make any special or additional submission in order for EPA to make a determination of attainment.

A Moderate PM_{2.5} nonattainment area's air quality status is determined in

accordance with Appendix N of 40 CFR part 50. To show attainment of the current 24-hour and annual standards for PM_{2.5}, data from the most recent 3 consecutive years prior to the area's attainment date must show that PM_{2.5} concentrations over the prior 3 year period are at or below the levels of the standards. A complete year of air quality data, as described in part 50, Appendix N, is comprised of all 4 calendar quarters with each quarter containing data from at least 75 percent of the scheduled sampling days.

The EPA will begin processing and analyzing data related to the attainment of Moderate PM_{2.5} nonattainment areas after the applicable attainment date for the affected areas. Current EPA regulations, under 40 CFR part 58, set the deadline for the state to submit air quality data into the AQS database as no later than 90 days after the end of the calendar year.

While the EPA may determine that an area's air quality data indicate that an area may be meeting the PM_{2.5} NAAQS for a specified period of time, this does not eliminate the state's responsibility under the Act to adopt and implement an approvable attainment plan unless the area also has been granted a clean data determination. If the EPA determines that an area has attained the standard as of its attainment date, the area will remain designated as nonattainment until the state has submitted an acceptable redesignation request and maintenance plan, and EPA has approved them.

In order for an area to be redesignated as attainment, the state must comply with the five requirements listed under section 107(d)(3)(E) of the CAA. Briefly, this section requires that:

- (1) The EPA has determined that the area has attained the PM_{2.5} NAAQS;
- (2) The EPA has fully approved the applicable state implementation plan;
- (3) The improvement in air quality is due to permanent and enforceable reductions in emissions;
- (4) The EPA has fully approved a maintenance plan for the area; and
- (5) The state(s) containing the area or portions of the area have met all applicable requirements under CAA section 110 and part D.¹⁴²

J. Attainment Date Extensions

1. Attainment Date Extension Criteria

a. *Summary of Proposal.* Subpart 4 of title I of the CAA provides the EPA with

¹⁴² See "Procedures for Processing Requests to Redesignate Areas to Attainment," Memorandum from John Calcagni, USEPA Office of Air Quality Planning and Standards, Director, Air Quality Management Division, September 4, 1992.

authority to grant up to two 1-year extensions of the attainment date for a Moderate area that otherwise could be found to have failed to attain the relevant PM_{2.5} NAAQS, if the area can meet specific statutory criteria related to monitored air quality in the area and the implementation of measures in the attainment plan. Under CAA section 188(d), a state may apply to the EPA for an extension of a Moderate area's attainment date of 1 additional year (the "Extension Year") if "(1) the state has complied with all requirements and commitments pertaining to the area in the applicable implementation plan; and (2) no more than one exceedance of the 24-hour [NAAQS] level for PM₁₀ has occurred in the area in the year preceding the Extension Year, and the annual mean concentration of PM₁₀ in the area for such year is less than or equal to the standard level." Section 188(d) of the CAA also provides for the possibility that the EPA may grant a second 1-year extension if the Moderate area meets specific criteria. The proposal took comment on two ambiguous aspects of this language that warrant further interpretation through this rule.

First, the proposal addressed the statutory language explicitly setting ambient air quality conditions for an attainment date extension in terms that relate factually to the 24-hour PM₁₀ NAAQS that was in effect at the time of the 1990 Amendments of the CAA, which has a statistical form that is substantially different from the 24-hour PM_{2.5} NAAQS. The requirement in CAA section 188(d)(2) states that an extension may be granted if "no more than one exceedance of the 24-hour national ambient air quality standard level for PM₁₀ has occurred in the area in the year preceding the Extension Year, and the annual mean concentration of PM₁₀ in the area for such year is less than or equal to the standard level." The proposal noted that the form of the 2006 24-hour PM_{2.5} NAAQS is a percentile-based form and not a "one expected exceedance" form as is the PM₁₀ NAAQS, and therefore the statutory language requires some interpretation with regard to how it applies to the PM_{2.5} NAAQS.

The EPA included a proposed option and requested comment on two other alternatives. The preferred proposed approach would only require a state to demonstrate that in the year prior to the applicable attainment date for the area, a Moderate area did not exceed the level of (*i.e.*, had clean data for) the specific PM_{2.5} NAAQS for which the area is designated nonattainment (the "applicable NAAQS") and for which the

state is seeking the extension of the attainment date. The second approach would require that a state demonstrate that in the year prior to the applicable attainment date for an area, the Moderate area did not exceed the level of the specific PM_{2.5} NAAQS for which the area is designated nonattainment (the applicable NAAQS), and did not exceed the most stringent level of any other PM_{2.5} NAAQS in effect nationally at the time the area was designated for the applicable NAAQS. The third approach would require that a state demonstrate that in the year prior to the applicable attainment date for an area, the Moderate area did not have more than one exceedance of the level of the 24-hour PM_{2.5} standard, and that the annual mean concentration of PM_{2.5} in the area for the attainment year was less than or equal to the annual standard, regardless of the NAAQS for which the state is seeking an attainment date extension.

Second, the proposal addressed how the language of CAA section 188(d)(2) should apply to the PM_{2.5} NAAQS to the extent that it does not specify whether the air quality criteria for an attainment date extension apply equally for a Moderate area designated nonattainment for both the 24-hour and annual standards, or for just one of the standards. In practice, most areas designated nonattainment for the PM₁₀ NAAQS following passage of the 1990 CAA Amendments were designated nonattainment only for the 24-hour PM₁₀ NAAQS, with a few designated for only the annual PM₁₀ NAAQS or for both the 24-hour and the annual PM₁₀ NAAQS. The 24-hour NAAQS has served as the “controlling” (*i.e.*, functionally more stringent) PM₁₀ standard, such that the agency’s experience to date in granting PM₁₀ Moderate area attainment date extension requests has been limited to extending the attainment date for the 24-hour PM₁₀ NAAQS.¹⁴³ The situation is distinctly different for PM_{2.5} nonattainment areas, as the specific facts and circumstances of a particular area may warrant a nonattainment designation for either the 24-hour standard or the annual standard, but often not both. In most cases, for instance, the current nonattainment areas for PM_{2.5} are designated either for the 1997 annual NAAQS or for the 2006 24-hour NAAQS, but not both.¹⁴⁴ For example,

the EPA recently promulgated designations for areas violating only the annual PM_{2.5} NAAQS revised in 2012, not the 24-hour NAAQS, which was retained at the level established during the 2006 p.m. NAAQS review. If a PM_{2.5} nonattainment area is designated only for the 24-hour or only for the annual PM_{2.5} NAAQS, this situation raises the question of how CAA section 188(d)(2) air quality criteria for both standards should apply to such a PM_{2.5} NAAQS nonattainment area if the state seeks an extension of the applicable attainment date for such area.

Regarding the “requirements and commitments” criterion, the EPA proposed to interpret this provision to mean that the state has adopted and is implementing the control measures in the SIP submission it made to address the attainment plan requirements for the applicable PM_{2.5} NAAQS. The proposal also described a second potential interpretation, in which the state would not be eligible for an attainment date extension unless it has adopted and submitted its Moderate area SIP *and* has received full approval from the EPA.

b. Final Rule. The EPA received a number of comments on the attainment date extension criteria. With respect to the criterion requiring compliance with all requirements and commitments in the applicable implementation plan, several commenters agreed with the EPA’s proposed approach that the state must have adopted and submitted its Moderate area SIP but does not need to have full approval of the plan by the EPA in order to receive an extension. These commenters indicated that a state should not be penalized for a failure by the EPA to take timely action on the implementation plan. Some commenters opposed the proposed approach, stating that an area’s attainment date is not predetermined as the end of the sixth calendar year after designation, but instead is to be “as expeditiously as practicable,” and no later than the end of the sixth calendar year. For this reason, the commenters stated that the actual attainment date to be extended would not be known until after approval of the SIP by the EPA.

After considering the comments received on this issue, the EPA is finalizing an approach similar to the preferred option in the proposal. This interpretation is based on the plain language of CAA section 188(d) that does not explicitly require that the state comply with all requirements pertaining to the area in the CAA, but merely requires that the state comply with all

requirements in the applicable SIP.¹⁴⁵ In other words, the EPA believes that CAA section 188(d)(1) should be interpreted to mean that so long as the state has submitted the necessary attainment plan for the area for the applicable PM_{2.5} NAAQS and is implementing the control measures in the submission, the fact that the EPA has not yet acted on such submission to make it an approved part of the applicable SIP should not be a barrier to the state obtaining an extension of the attainment date under CAA section 188(d)(1). *See* section 51.1005(a)(1) of the CAA. For the same reason, the EPA also proposes to read this provision not to bar an extension if all or part of an area’s Moderate area plan is disapproved or has been promulgated by the EPA as a FIP. In the case that the “applicable implementation plan” is a FIP (or combination of SIP and FIP), then the EPA requires the state to have implemented the control measures contained therein in order to meet the statutory criteria at CAA section 188(d)(1) for a Moderate area attainment date extension.

With respect to the air quality criterion, several commenters supported the EPA’s preferred option because it would require an area to show clean data only for the specific standard for which it is seeking an extension year. Some commenters acknowledged that a literal reading of the statute may seem to require a showing of clean data for both the annual and 24-hour PM_{2.5} standards in order to receive an extension, but suggested that this interpretation would not make sense under the circumstance where the two standards have different attainment dates. The commenter believed it would lead to absurd results if, in order to receive an extension for one standard, an area were required to show clean data for the other standard for which the attainment date had not yet passed. On the other hand, other commenters favored the option that would require clean data for both standards in order to obtain an extension for one standard because they believed that only requiring clean data for one standard would allow the area to avoid or delay achieving additional emissions reductions.

After considering the comments on the air quality criterion, the EPA has decided to finalize the approach that would require an area to show clean data during the attainment year only for

¹⁴³ For examples of the EPA actions to extend attainment dates for Moderate PM₁₀ areas, *see* 61 FR 20730 (May 8, 1996), 61 FR 66602 (December 18, 1996), and 66 FR 32752 (June 18, 2001).

¹⁴⁴ Nonattainment areas designated for both the 24-hour and annual PM_{2.5} NAAQS are located in central and southern CA.

¹⁴⁵ This interpretation as applied to CAA section 188(e) for Serious area attainment date extensions was upheld by the Ninth Circuit Court of Appeals in *Vigil v. Leavitt*, 366 F.3d 1025, amended at 381 F.3d 826 (9th Cir. 2004).

the specific standard for which it is seeking an extension. *See* 40 CFR 51.1005(a)(1). Under this approach, the EPA interprets the requirement to demonstrate that the area had “no more than one exceedance” of the 24-hour PM_{2.5} NAAQS to mean that the state must simply demonstrate that the area had “clean data” in the attainment year. Thus, a state seeking an attainment date extension for a Moderate nonattainment area for a 24-hour PM_{2.5} NAAQS would be required to demonstrate that the area had clean data with respect to the statistical form of that particular standard (*i.e.*, for the 2006 PM_{2.5} NAAQS, the 98th percentile value did not exceed 35 µg/m³) in the calendar year prior to the applicable attainment date for the area. The state would not have to demonstrate that the area also had clean data for any other PM_{2.5} NAAQS, including any annual PM_{2.5} NAAQS or later revision of the 24-hour PM_{2.5} NAAQS. Likewise, a state seeking an attainment date extension for an annual PM_{2.5} NAAQS would be required to demonstrate that the area had clean data for that particular standard (*i.e.*, for the 2012 annual PM_{2.5} NAAQS, the annual mean value did not exceed 12.0 µg/m³) in the calendar year prior to the applicable attainment date for the area, but would not have to demonstrate that the area had clean data for any other PM_{2.5} NAAQS.

The EPA believes this interpretation of CAA section 188(d)(2) is appropriate for two main reasons. First, while most PM₁₀ nonattainment areas were designated nonattainment for either just the 24-hour PM₁₀ NAAQS or for both the 24-hour and annual PM₁₀ NAAQS, the majority of current PM_{2.5} nonattainment areas are, in contrast, designated for either the 24-hour or the annual PM_{2.5} NAAQS, and should arguably only need to demonstrate clean data for the NAAQS for which the area is designated nonattainment. For those few PM_{2.5} nonattainment areas designated for both 24-hour and annual PM_{2.5} NAAQS, the EPA believes it also is appropriate that a state must only demonstrate clean data for the specific NAAQS for which the state is seeking an attainment date extension because such an approach is consistent with the statute’s overall approach to designating nonattainment areas and implementing control strategies for each separate PM_{2.5} NAAQS. Second, if an area is designated as nonattainment for both the 24-hour and annual PM_{2.5} standards and receives an extension for one standard while still working toward a later attainment date for the other standard, public health protection

would not be delayed because the state would still be subject to the ongoing mandate to adopt and implement measures to ensure expeditious attainment of the other standard.

c. Comments and Responses. Any additional comments received on this section are addressed in the Response to Comments document found in the docket for this action.

2. Process for Attainment Date Extension Request Submissions

a. Summary of Proposal. The proposal recognized that CAA section 188(d) does not specify the process by which the state should submit a Moderate area attainment date extension request, nor how the EPA should evaluate and act upon such a request. The proposal described the elements that the state would be required to submit for the various options proposed regarding the CAA section 188(d) extension criteria for 1) compliance with requirements and commitments in the applicable SIP, and 2) air quality data. The proposal suggested that any Moderate area extension request should be submitted to the EPA by the attainment date for the area (*i.e.*, by December 31 of the attainment year), and it proposed requiring the state to submit certified air quality data for the attainment year to the EPA by February 28 of the following year in order for the EPA to issue a determination within 6 months of the attainment date regarding whether the area attained or failed to attain. The proposal stated that an attainment date extension should be granted only after the agency provides notice in the **Federal Register** and an opportunity for the public to comment. Lastly, the proposal clarified that any 1-year extension would extend from January 1 to December 31 for the year following the year including the December 31 attainment date.

b. Final Rule. As discussed in the previous section, in order for the EPA to make a decision on whether to grant a 1-year attainment date extension, the state needs to submit sufficient information to demonstrate that it has both complied with applicable requirements and commitments in the applicable implementation plan, and that it has clean data for the attainment year. Under the final rule, a state would have to demonstrate that control measures have been submitted in the form of a SIP revision, and that RACM and RACT and additional reasonable measures for sources in the area have been implemented. The SIP revision would need to have been adopted and submitted by the state, but it would not need to have been approved by the EPA

in order for the state to qualify for an extension. *See* 40 CFR 51.1005(a)(1)(i). The state also would need to have “clean” air quality data in the attainment year, as explained in the previous section. *See* 40 CFR 51.1005(a)(1)(ii)–(iii). Any decision made by the EPA to extend the attainment date for an area would be based on facts specific to the nonattainment area at issue.

Some commenters suggested that in some cases a state will not know if it should seek an extension request until after the attainment date has passed, particularly for areas that commonly have higher air quality levels in the cooler months at the end of the calendar year. The commenter recommended that states should have until February 28 of the following year to submit an extension request along with certified air quality data. Other commenters stated that there is no legal basis for requiring the certification of monitoring data by February 28th of the following year, and therefore it should not be a requirement that could potentially disqualify a state from having an extension request be approved.

The EPA considered these comments in light of the EPA’s obligation under the CAA to issue a determination of attainment or failure to attain within 6 months of the original attainment date. After considering these comments, the EPA strongly recommends that a state should submit a Moderate area 1-year extension request to the appropriate EPA Regional Office by February 28 of the following year. In addition, the EPA strongly recommends that the state provide certified air quality data for the previous calendar year by this date or as close to this date as possible. The EPA understands that there may be certain situations that prevent the full certification of filter-based PM_{2.5} monitoring data by this date. If air quality data for the previous full calendar year has not been fully certified by February 28, the extension request should include any available preliminary data the state can provide. Submission of the necessary air quality data must occur as soon as possible after the attainment date to enable the EPA to review the state’s request expeditiously and take appropriate action on the request prior to the date by which the EPA is required to make a determination that the area failed to attain by its Moderate area attainment date, *i.e.*, within 6 months of the applicable attainment date (*see* the discussion of reclassification in Section V of this preamble).

As indicated in the proposal, the EPA believes that an attainment date

extension should only be granted after the agency provides notice in the **Federal Register** and an opportunity for the public to comment. A notice-and-comment rulemaking allows for the EPA to adequately evaluate whether the area meets the air quality and program implementation criteria, and to consider other relevant facts and information presented by the state and the public in determining whether the extension request should be granted or denied. This process also is consistent with past practice by the EPA in granting attainment date extensions, most recently for ozone nonattainment areas.

Regarding the extension period, the EPA interprets CAA section 188(d) to authorize the EPA to stipulate that any extension would begin on January 1 and end on December 31 of the extension year, and these dates would not depend on when the state submitted its request for an extension or was granted the extension by the EPA. The EPA is finalizing this interpretation at 40 CFR 51.1005(a)(4). The EPA believes this is a reasonable approach, as the original attainment date for the area will either be the end of the sixth calendar year following designation of the area, or the end of an earlier calendar year if the state demonstrated that it could advance attainment by at least 1 year. In addition, compliance with the relevant NAAQS will be evaluated based on monitored data collected over a full calendar year (*i.e.*, over the period beginning January 1 and ending December 31), so starting the extension year on January 1 is logical.

As noted earlier in this discussion of Moderate area attainment date extensions, CAA section 188(d) provides that a state may seek up to two 1-year extensions of the Moderate area attainment date if it meets the applicable criteria of CAA sections 188(d)(1) and 188(d)(2). The statute makes no distinction between the criteria that must be met for the first 1-year extension and the criteria for the second 1-year extension. Therefore, for a second 1-year attainment date extension request, the EPA intends to apply the same interpretations of the statutory criteria as described earlier in this section, including the recommended deadlines for the state to submit the extension request and the certified air quality data.

c. Comments and Responses.

Comment: Some commenters described the situation where the EPA has approved a Moderate area attainment date that is earlier than the latest date allowed by the statute (for example, assume the approved attainment date is the end of the 5th calendar year after

designation). The commenter suggested that if the area was unable to attain by its “earlier” approved attainment date, CAA section 188(d) should be interpreted in a way that would not require the state to submit a request for an attainment date extension. The commenter suggested that the state should only be required to meet the CAA section 188(d) requirements if the area is seeking an extension beyond the latest Moderate area attainment date allowed by statute (*i.e.* the end of the sixth calendar year after designations).

Response: The EPA does not agree with the commenter because the statute appears to address this situation clearly. Section 188(c)(1) of the CAA states that the Moderate area attainment date is “as expeditiously as practicable but no later than the end of the sixth calendar year after the area’s designation as nonattainment.” If the area had provided an attainment demonstration supporting the approval of an earlier attainment date by the EPA, then that approved attainment date is then regarded as the “applicable attainment date” for that area. Section 188(d)(1) of the CAA of the statute then enables the EPA to grant a 1-year extension for the “date specified in paragraph (c)(1),” which in this case would be the earlier attainment date.

V. Reclassification of a PM_{2.5} Moderate Nonattainment Area to Serious

As discussed elsewhere in this preamble, subpart 4, part D of title I of the CAA establishes a two-tier classification system for areas designated nonattainment for the PM_{2.5} NAAQS. While all areas designated nonattainment are initially classified as Moderate, CAA section 188(b) describes two pathways by which the EPA has the authority and/or the duty to reclassify a Moderate nonattainment area to a Serious nonattainment area. Pursuant to CAA section 188(b)(1), the EPA has general discretionary authority to reclassify from Moderate to Serious any area that the Administrator determines cannot practicably attain the NAAQS by the applicable Moderate area attainment date. Pursuant to CAA section 188(b)(2), the EPA has a mandatory duty to reclassify from Moderate to Serious any area that fails to attain the NAAQS by the applicable Moderate area attainment date. Both of these pathways are more fully described in the following sections.¹⁴⁶

¹⁴⁶ Note that a reclassification for a multi-state nonattainment area will be done in a single action by the EPA; separate actions are not needed to reclassify the portion of each state comprising the multi-state nonattainment area.

A. Discretionary Authority

1. Summary of Proposal

The proposal provided background on the EPA’s discretionary authority to reclassify a Moderate area to Serious. It proposed to interpret the statute to give EPA broad authority to reclassify based on available information, noting that the EPA could base this determination upon whatever factors are pertinent. The proposal sought comment on whether EPA should discretionarily reclassify an area without a request or submission from the affected state. The proposal also addressed the mandatory statutory timing for discretionary reclassification (*i.e.*, within 18 months of the moderate area SIP due date), and took comment on the appropriateness of EPA acting to reclassify an area beyond 18 months after the Moderate area SIP due date, including right up to the Moderate area attainment date.

2. Final Rule

The final rule remains largely unchanged with regard to this issue. The EPA’s discretionary authority to reclassify a Moderate area to Serious derives from language in section 188(b)(1) of the CAA, which provides that: “The Administrator may reclassify as a Serious PM₁₀ nonattainment area . . . any area that the Administrator determines cannot practicably attain the [NAAQS] . . . by the attainment date . . . for Moderate Areas.” The use of this discretionary authority thus would be triggered by the EPA making a determination that the Moderate area in question cannot practicably attain by its statutory attainment date.

The CAA does not specify the basis on which the EPA may make a determination that the area cannot practicably attain by the applicable attainment date. In the General Preamble, the EPA explained that the agency could base this determination upon whatever facts are pertinent, and could do so whether or not the state in question has submitted a Moderate area attainment plan, and whether or not the state has made the demonstration contemplated in CAA section 189(a)(1)(B).¹⁴⁷ The EPA may make such a determination based on evaluation of the attainment plan for the Moderate area in question, or based on other facts known to the agency. As discussed earlier in this preamble, the attainment plan that a state would submit for a Moderate nonattainment area must include either a demonstration that the area will attain the NAAQS by the

¹⁴⁷ See the **Federal Register** published on April 16, 1994 (57 FR 13498, 13537 and 13538).

statutory Moderate area attainment date or a demonstration that attaining by the statutory Moderate area attainment date is impracticable. If the state makes and the EPA concurs with an impracticability demonstration submitted as part of the attainment plan, then the demonstration could serve as the basis for the EPA initiating a notice-and-comment rulemaking to reclassify the area to Serious.

However, the CAA does not specify the basis for the EPA's exercise of its discretionary authority and does not require the EPA to make its determination based on a submission from the state. Indeed, such a prerequisite would be illogical in the case of a state that fails to make any attainment plan submission or fails to address the issue of the need for reclassification in such submission. The EPA believes that while a Moderate area impracticability demonstration as contemplated in CAA section 189(a)(1)(B) is desirable in order to help the agency make a determination that the area cannot practicably attain by its attainment date, such a demonstration is not necessary to trigger action by the EPA to reclassify a Moderate area to Serious. The statute does not prohibit the EPA from using the weight of available evidence, including information available in the public record of a state, to make such a determination, even in the absence of a complete attainment plan submission.

Regarding the timing of discretionary reclassifications, CAA section 188(b)(1)(B) establishes timeframes by which EPA is to act if it intends to exercise its discretionary authority to reclassify areas as appropriate following the Moderate area attainment plan due date, stating that "the Administrator shall reclassify appropriate areas within 18 months after the required date for the state's submission of a SIP for the Moderate Area." In the case of areas designated nonattainment for the 2012 PM_{2.5} NAAQS in the first round of designations, states will be required by statute to submit a Moderate area attainment plan within 18 months of the date of designation (April 2015), or no later than October 2016. Pursuant to CAA section 188(b)(1)(B), the EPA would then have until April 2018 (18 months following the Moderate area attainment plan submission deadline) to use its discretionary authority to reclassify any area that the EPA determines at that time cannot practicably attain by the Moderate area attainment date of December 2021.

However, as noted earlier, there may be situations in which it may be appropriate to reclassify an area at a

point in time more than 18 months after the SIP due date. On this issue, the General Preamble stated that:

" . . . under the plain meaning of the terms of section 188(b)(1), EPA has general discretion to reclassify at any time before the applicable attainment date any area EPA determines cannot practically attain the standards by such date. Accordingly, CAA section 188(b)(1) is a general expression of delegated rulemaking authority. In addition, subparagraphs (A) and (B) of CAA section 188(b)(1) mandate that the EPA reclassify at specified timeframes any areas it determines appropriate for reclassification at those dates. These subparagraphs do not restrict the general authority but simply specify that, at a minimum, it must be exercised at certain times."¹⁴⁸

The EPA continues to consider this the correct interpretation of the statutory requirements concerning its authority to reclassify a Moderate nonattainment area to Serious at any time prior to the area's Moderate area attainment date, if the agency determines that the area cannot practicably attain the relevant PM_{2.5} NAAQS by that date. See Section VI.A.2 of this preamble for a discussion of the due dates for submission of attainment plan elements for areas that receive a discretionary reclassification.

The EPA emphasizes that a state with an area designated as nonattainment for the PM_{2.5} NAAQS is required to meet all Moderate area attainment plan requirements, even after the EPA reclassifies the area to Serious. Section 189(b)(1) of the CAA states clearly that "in addition to" the Moderate area attainment plan requirements, states with areas reclassified to Serious must also meet Serious area attainment plan requirements, *i.e.*, the reclassification does not eliminate the statutory obligation to meet Moderate area attainment plan requirements.¹⁴⁹ Thus, the EPA believes that reclassifying Moderate areas to Serious at any time under its discretionary authority does not provide incentives to delay development and implementation of control measures by excusing states from meeting substantive Moderate area attainment plan requirements or by extending the applicable attainment date. The EPA articulated this position in the General Preamble, explaining that this interpretation:

" . . . creates an incentive for the timely submittal and effective implementation of moderate area SIP requirements and facilitates the PM₁₀ attainment objective. For example, if an area that fails to submit a timely moderate area SIP is reclassified, this

does not obviate the requirement that the area submit and implement RACM consistent with the moderate area schedule.

Accordingly, the area could be subject to sanctions for its delay in submitting the RACM SIP requirement . . . Further, reclassification before the applicable attainment date will ensure that additional control measures (*i.e.*, in addition to RACM, serious areas must implement best available control measures (BACM)), are implemented sooner and will expedite the application of more stringent new source review requirements to the area . . . Similarly, where an area submits a timely moderate area SIP, EPA may not discover that the area cannot practicably attain until sometime after it begins implementing its moderate area control measures. The EPA then may want to reclassify the area in order to facilitate the development and implementation of BACM.¹⁵⁰

The EPA considers this longstanding interpretation of CAA section 188(b)(1) to be the correct interpretation of the statutory requirements governing the discretionary reclassification of Moderate areas. The EPA will reclassify any area it determines cannot practicably attain by the Moderate area attainment date through notice-and-comment rulemaking. See 40 CFR 51.1002(b)(1).

3. Comments and Responses

Comment: Some commenters stated that while it may be desirable for a state or local agency to provide an impracticability demonstration to the EPA, the EPA is not prohibited from using the weight of available evidence to reclassify an area to Serious even before the Moderate area plan is due if it has a particularly challenging air quality situation. Other commenters did not agree with the EPA's interpretation of the statute, and believed that the EPA's authority should be limited to reclassification of areas that submit an impracticability demonstration.

Response: For the reasons described earlier, the EPA agrees with the first commenter and does not believe its authority is limited in the manner suggested by the second commenter.

B. Mandatory Duty

1. Summary of Proposal

The proposal provided background on the EPA's mandatory duty pursuant to CAA section 188(b)(2) to reclassify a Moderate area to Serious when the area fails to attain the standard by the attainment date. The CAA directs the EPA to reclassify an area from Moderate to Serious if the area fails to attain the relevant NAAQS by the applicable Moderate area attainment date

¹⁴⁸ *Ibid.* at 13537.

¹⁴⁹ See, *Vigil v. Leavitt*, 366 F.3d 1025, amended at 381 F.3d 826 (9th Cir. 2004).

¹⁵⁰ 57 FR 13498 (April 16, 1992), at page 13537.

(including any attainment date that had been extended by one or 2 years pursuant to CAA section 188(d)). Reclassification occurs by operation of law when the EPA determines that the area failed to attain the NAAQS by the applicable attainment date, in accordance with CAA section 188(b)(2)(A). Section 188(b)(2) of the CAA requires that “within six months following the applicable attainment date for a PM₁₀ nonattainment area, the Administrator shall determine whether the area attained the standard by that date” and publish its determination in the **Federal Register**.

The EPA proposed that the date of reclassification would be the effective date of the **Federal Register** notice issued by the EPA that determines the area failed to attain by the attainment date. Thus, for example in the case of the 2012 PM_{2.5} NAAQS, assuming a Moderate PM_{2.5} nonattainment area fails to attain the standard by its approved attainment date of December 31, 2021, the EPA would be required to publish in the **Federal Register** no later than June 30, 2022 its determination that the area failed to attain the NAAQS and is therefore reclassified as Serious by operation of law. The actual date of reclassification for the area would be the effective date of the **Federal Register** document (e.g. in July or August 2022). To meet the requirements of CAA section 189(b)(2), the Serious area attainment plan for the area would be due within 18 months of the actual reclassification date (i.e., in early 2024).

The proposal also discussed a possible alternative option, which would be to consider the date of reclassification to Serious to be the same as the Moderate area attainment date. Applying this approach in the example earlier would yield an earlier date of reclassification of December 31, 2021, and an earlier Serious area attainment plan due date of June 30, 2023.

2. Final Rule

Several commenters supported the EPA's proposed approach to interpret the date of reclassification as the effective date of the **Federal Register** notice announcing the area had failed to attain the standard by the Moderate area attainment date because this approach would allow adequate time for the EPA to evaluate air quality data and any exceptional events claims before making the determination that the area failed to attain. Some commenters opposed the proposed approach and supported interpreting the date of reclassification as being the same as the missed attainment date for the Moderate area. This commenter suggested that the

proposed approach could introduce additional delay because the EPA does not always issue determinations of failure to attain promptly. They also claimed that the term “reclassified by operation of law” in CAA section 188(b)(2)(A) would have no meaning (i.e., surplusage) if the proposed approach was adopted.

After taking the comments received under consideration, the EPA has decided to retain the proposed approach. The date of reclassification is the effective date of the **Federal Register** notice issued by the EPA that determines the area failed to attain by the attainment date. For practical reasons, the EPA does not believe that as a general matter it can be expected to make a determination on December 31 that an area failed to attain. Because the PM_{2.5} ambient monitoring method requires laboratory analysis of filters prior to determining the ambient mass for each day, adequate time is needed after December 31 to ensure that the filter-based measurements have been evaluated and quality-assured in an accurate manner.

Although CAA section 188(b)(2) does not explicitly address this issue, the EPA believes that this approach is a reasonable interpretation of statutory ambiguity in CAA section 188(b)(2) and preferable over the alternative approach for two additional reasons. First, the statute at CAA section 189(b)(2) gives a state 18 months from the date of reclassification of an area to submit for the EPA's approval an attainment demonstration with air quality modeling and provisions to assure timely implementation of BACM and BACT on sources in the nonattainment area. The workload associated with developing a Serious area plan can be substantial, and the EPA believes that it is reasonable to resolve the statutory ambiguity in favor of providing the state with the full 18 months from the effective date of reclassification to develop and submit a thorough, complete and accurate Serious area attainment plan that will provide for expeditious attainment of the NAAQS.

Second, the statutory attainment date for a Serious area reclassified under any circumstances is as expeditious as practicable but no later than the end of the tenth year following designation of the area, and is thus independent of the date of reclassification of the area. Allowing a state some additional amount of time beyond 18 months from the missed attainment date to develop and submit a complete Serious area attainment plan, including adopting BACM and BACT, will not change the statutory obligation on the state for the

area to attain the relevant NAAQS by the applicable attainment date. On the contrary, the EPA believes that the extra time may in fact help the area timely attain the relevant NAAQS by allowing the state to develop a more effective attainment plan for the area.

Thus, the EPA interprets the CAA such that the date of reclassification for an area reclassified under the EPA's mandatory duty is to be considered the effective date of the **Federal Register** document announcing that the area had not attained the relevant PM_{2.5} NAAQS and is therefore reclassified by operation of law. The EPA intends to make determinations of whether an area attained the relevant NAAQS pursuant to CAA section 188(b)(2) by notice-and-comment rulemaking. See 40 CFR 51.1002(b)(2). Accordingly, the final rule establishes a definition of “date of reclassification” to mean the effective date of a PM_{2.5} area reclassification from Moderate to Serious as promulgated by the Administrator. This definition is then used, for example, to establish the due date for the Serious area SIP. (See Section VI.A.1 of this preamble for more information on mandatory reclassification area SIP due dates.)

3. Comments and Responses

Any additional comments received on this section are addressed in the Response to Comments document found in the docket for this action.

VI. Requirements for PM_{2.5} Serious Nonattainment Area Plans

Sections 189(b) and (c) of the CAA include the following requirements for Serious area attainment plan submissions: (i) An attainment demonstration (CAA section 189(b)(1)(A)); (ii) provisions for the implementation of best available control measures (BACM) no later than 4 years after reclassification of the area to Serious (CAA section 189(b)(1)(B)); (iii) quantitative milestones that will be used to evaluate compliance with the requirement to demonstrate RFP (CAA section 189(c)); and (iv) regulation of PM_{2.5} precursors (in general to meet attainment and control strategy requirements, and as specifically required for major stationary sources by CAA section 189(e)). Other subpart 1 requirements for attainment plans not otherwise superseded under subpart 4 also apply to Serious areas for the PM_{2.5} NAAQS, including: (i) a description of the expected annual incremental reductions in emissions that will demonstrate RFP (CAA section 172(c)(2)); (ii) emissions inventories (CAA section 172(c)(3)); (iii) other control measures (besides BACM and

BACT) needed for attainment (CAA section 172(c)(6)); and (iv) contingency measures (CAA section 172(c)(9)).

Additionally, CAA section 189(b)(1) requires that “in addition” to the attainment plan requirements specific to Serious areas, states must also meet all Moderate area attainment plan requirements. The EPA interprets the statutory language of CAA section 189(b)(1) to require states with areas that are reclassified to Serious to meet Moderate area attainment plan requirements, including all areas that the EPA reclassifies through rulemaking under its discretionary authority, even if that occurs before the area has met all of its Moderate area attainment plan requirements.¹⁵¹ The following section describes the EPA’s final actions in this rule regarding Serious area attainment plan requirements in greater detail.

A. Plan Due Dates

The proposal discussed the statutory provisions that informed the options for the submission due dates for the various components of Serious area attainment plans. The timing of Serious area attainment plan elements is dictated by two provisions of the CAA: CAA section 189(b)(2) for certain subpart 4 elements and CAA section 172(b) for subpart 1 elements not superseded by subpart 4 requirements. Section 189(b)(2) of the CAA addresses the due dates for Serious area attainment demonstrations due under CAA section 189(b)(1)(A) and provisions for BACM and BACT implementation under CAA section 189(b)(1)(B). Specifically, section 189(b)(2) stipulates two alternative schedules for states to submit Serious area attainment demonstrations, depending upon the statutory authority governing the reclassification action. For an area reclassified to Serious by operation of law under CAA section 188(b)(2) upon a determination by the EPA that the area failed to attain the relevant NAAQS by the applicable Moderate area attainment date, a state must submit a new attainment demonstration for the area no later than 18 months after reclassification. For an area reclassified to Serious pursuant to the agency’s discretionary authority provided under CAA section 188(b)(1), a state must submit a new attainment demonstration no later than 4 years after reclassification of the area.¹⁵² For all Serious nonattainment areas, CAA section 189(b)(2) requires a state to

submit within 18 months of an area’s reclassification “provisions to assure that the best available control measures [BACM] for the control of PM₁₀ shall be implemented no later than 4 years after the date the area is classified (or reclassified) as a Serious Area.”

When considering attainment plan due dates for areas that have been discretionarily reclassified, it is also important to keep in mind the requirements of CAA section 188(b)(1). Section 188(b)(1) of the CAA generally states that: “The Administrator may reclassify as a Serious PM₁₀ nonattainment area . . . any area that the Administrator determines cannot practicably attain the [NAAQS] . . . by the attainment date . . . for Moderate Areas.” In addition, CAA section 188(b)(1)(B) provides that “the Administrator shall reclassify appropriate areas within 18 months after the required date for the state’s submission of a SIP for the Moderate Area.” Since all Moderate area SIPs are due 18 months after designation, then this provision contemplates that EPA will typically exercise its discretionary reclassification authority within 3 years of the area’s designation as nonattainment. Taken together with CAA section 189(b)(2), which for discretionary reclassifications requires the state to submit the attainment demonstration within 4 years of reclassification to Serious, subpart 4 contemplates that attainment plans for discretionary reclassifications will be submitted no later than 7 years after designation. However, as noted in the previous section, the EPA believes it can discretionarily reclassify an area more than 18 months after the Moderate area SIP due date under certain circumstances, meaning that the Serious area attainment demonstration for such a plan could be submitted to EPA more than 7 years after designation. (See more discussion in Section V.A of this preamble on the timing of discretionary reclassifications.)

Lastly, because some of the Serious area plan requirements noted earlier are established in subpart 1 of the Act (CAA section 172), the proposal also noted that CAA section 172(b) provides the EPA discretion to set a due date for submission of these subpart 1 attainment plan elements that is no later than 3 years after *designation* of the area. In the Addendum, the EPA interpreted the date of reclassification of a Moderate area to Serious to be analogous to the date of designation of the area to nonattainment. Accordingly, some of the options presented in the proposal included 3 year SIP due dates

for certain plan requirements that stem from subpart 1.¹⁵³

1. Area Reclassified to Serious After Failing To Attain the PM_{2.5} NAAQS

a. Summary of Proposal. The proposal noted that for an area reclassified to Serious after failing to attain the PM_{2.5} NAAQS by the Moderate area attainment date, CAA section 189(b)(2) requires the state to submit both the attainment demonstration for an area and provisions to ensure timely BACM and BACT implementation to the EPA within 18 months after reclassification. The EPA proposed a straightforward codification of this 18 month deadline. Assuming the effective date of the **Federal Register** reclassification notice is typically about 6 months after the end of the calendar year, this means that the attainment demonstration and BACM/BACT provisions would be required at about 8 years after designations. The notice also proposed that (1) in addition to BACM/BACT and the attainment demonstration, the emission inventory would also be required to be submitted within 18 months of the effective date of reclassification because it is essential for the development of BACM/BACT determinations; and (2) additional feasible measures (*i.e.*, control measures that may be able to help the area attain by the attainment date or advance the attainment date by a year, and that may be implemented later than BACM/BACT but before the attainment date) would also be required to be submitted within 18 months of the effective date of reclassification because such measures would be identified as part of the overall control measures analysis. Regarding the SIP submission date for the remaining required plan elements (*i.e.*, RFP, quantitative milestones and contingency measures), the proposal included two options: (1) no later than 18 months after reclassification (*i.e.*, at about 8 years after designation, or 2 years prior to the Serious area attainment date; or (2) within 3 years after reclassification (*i.e.*, at about 9.5 years after designation, or 6 months prior to the Serious area attainment date).

b. Final Rule. Some commenters opposed the proposed requirements for SIP elements other than BACM/BACT and the attainment demonstration to be due within 18 months of the effective date of reclassification because they favored providing states with as much time and flexibility as possible to provide their submissions. Other commenters suggested that having all

¹⁵¹ See *Vigil v. Leavitt*, 366 F.3d 1025, amended at 381 F.3d 826 (9th Cir. 2004).

¹⁵² Section V of this preamble provides a more detailed discussion of the process for reclassifying areas with severe nonattainment problems to Serious.

¹⁵³ Addendum to the General Preamble, 59 FR 41998 (August 16, 1994), at page 42015.

elements—including RFP, quantitative milestones, and contingency measures—be due at the same time would be more administratively efficient for states and would allow for EPA to conduct a single coordinated review of these plans, and should therefore all be due within 18 months of the effective date of reclassification. They also indicated that the alternative would not make sense because RFP, quantitative milestones, and contingency measures are all linked to the attainment demonstration.

After taking these comments into consideration, the EPA has decided to require all Serious area plan elements to be due within 18 months of the effective date of reclassification for any area reclassified due to a failure to attain by the Moderate area attainment date. The EPA believes that the proposed alternative 3 year deadline, which would have allowed some elements to be submitted as late as 6 months prior to the attainment date, would mean that the state would be required to submit two different SIPs and would require greater state government resources to conduct the administrative and public procedures required to submit the separate plans to the EPA. This approach also would not provide the EPA with sufficient time to appropriately review and take action on the state's submission prior to the attainment date. It also is appropriate to have the RFP, quantitative milestones, and contingency measures elements be developed and submitted at the same time as the attainment demonstration because they build from the information in the attainment demonstration. The EPA also maintains that requiring states to submit all elements of an attainment plan by the same date is reasonable because it allows for a complete review of the state submission by the EPA, regulated entities, and the general public, and it also should prove to be most efficient for states and the EPA. The EPA further agrees with commenters that a program requiring two submissions rather than one can generally be expected to be less administratively efficient because it will involve separate public hearings and comment periods at the state level, and separate proposed and final approval actions in the **Federal Register** by the EPA. Thus, the final rule requires any area that has been reclassified to Serious as a result of a failure to attain the standard by the Moderate area attainment date to submit all the plan elements to the EPA within 18 months of reclassification: updated base year emission inventory (described in more detail in the next section); BACM/BACT

determinations and adopted regulations; analysis of additional feasible measures (*i.e.*, control measures that may be able to help the area attain by the attainment date or advance the attainment date by a year, and that may be implemented later than BACM/BACT but before the attainment date) and adopted regulations, as appropriate; attainment demonstration; RFP; quantitative milestones; and contingency measures. See 40 CFR 51.1003(b)(2)(ii).

c. Comments and Responses. Any additional comments received on this section are addressed in the Response to Comments document found in the docket for this action.

2. Area Reclassified to Serious Because the EPA Finds in Its Discretion That the Area Cannot Practicably Attain the NAAQS by the Statutory Moderate Area Attainment Date

a. Summary of Proposal. The proposal noted that for an area reclassified to Serious because the area cannot practicably attain the standard by the Moderate area attainment date, CAA section 189(b)(2) requires the state to submit its BACM/BACT analyses and any adopted regulations to the EPA within 18 months; and to submit the attainment demonstration within 4 years of reclassification. Similar to the proposal for mandatory reclassification areas, the notice also proposed that an updated emission inventory (required under section 172(b) of the CAA) be required to be submitted within 18 months of reclassification because it is essential for the development of BACM/BACT determinations.

The notice also discussed a potential control measure option (described in Section VI.D. of the proposal, Attainment Plan Control Strategy, at page 15410) that would closely link the BACM/BACT determinations to the attainment demonstrations (rather than consider BACM/BACT as an independent requirement). Therefore, to facilitate this linked approach to BACM/BACT, an alternative option was proposed for submission of the attainment demonstration within 18 months of reclassification, instead of within 4 years.

The proposal also addressed the remaining plan elements: additional feasible measures (*i.e.*, control measures that may be able to help the area attain by the attainment date or advance the attainment date by a year, and that may be implemented later than BACM/BACT but before the attainment date); RFP; quantitative milestones; and contingency measures. Two SIP submission due date options were proposed for the remaining plan

elements: (1) No later than 3 years after reclassification¹⁵⁴; or (2) no later than 4 years after reclassification. The proposal requested comments on all of the proposed options for the various elements of a Serious area attainment plan.

b. Final Rule. Most commenters opposed the option requiring the attainment demonstration to be due within 18 months, at the same time as the BACM/BACT submission. Some of these commenters suggested that a 4-year due date for the attainment demonstration and other elements would provide maximum flexibility to the states. While some commenters acknowledged the reasoning behind requiring submittal of the attainment demonstration and BACM/BACT at the same time if BACM/BACT is linked to the attainment demonstration, most commenters favored an approach that provided additional time for submittal of the attainment demonstration.

Some commenters stated that for an area that is reclassified to Serious because it cannot practicably attain the NAAQS by the Moderate area attainment date, CAA section 188(b)(1)(B) requires the EPA to reclassify the area within 3 years of designation (*i.e.* within 18 months of the Moderate area SIP due date), and then per CAA section 189(b)(2) the attainment demonstration for such area would be due 4 years later (*i.e.*, 7 years from designation). The commenter stated that, if the EPA finalizes any discretionary reclassifications beyond 3 years after designation, then it cannot allow the area to have the full 4 years for development of the attainment demonstration because it would undermine the deadlines and schedules that Congress was plainly trying to impose.

For discretionary reclassification areas, just as for mandatory reclassification areas, the EPA is finalizing the statutory due date of 18 months for the BACT/BACM submission. However, after considering comments received on the timing options for submission of the attainment demonstration, the EPA has determined that the attainment demonstration should generally be due later than 18 months for areas subject to discretionary reclassifications. Because the statutory provision in CAA section 189(b)(2) provides up to 4 years, the EPA believes that an appropriate default due date for

¹⁵⁴ Under the EPA's prior interpretation as described in the Addendum at 42015, the EPA had suggested that states could submit contingency measures no later than 3 years after reclassification of an area to Serious because of the language of CAA section 172(b).

the attainment demonstration should be 4 years after reclassification for areas reclassified within 3 years of initial designation. However, after further consideration of this issue, the EPA also believes that a due date of less than 4 years should be required for areas that are reclassified closer to the Moderate area attainment date (*i.e.*, reclassified between 4 and 6 years after initial designation). In considering what would be a reasonable submission deadline for the attainment demonstration in this situation, the EPA considered the provisions applicable to areas that fail to attain by the attainment date.

Specifically, CAA section 189(b)(2) requires the attainment demonstration (and the rest of the plan) to be submitted no later than 8 years after designation. As explained further, the EPA believes this requirement provides a reasonable outer bound for submission of Serious area plans for any area that is discretionarily reclassified to Serious.

The circumstance that one of the commenters identifies, where the EPA reclassifies an area to Serious at a point in time more than 3 years after designation, raises an important timing issue that was not explicitly addressed in the proposal. The EPA was aware that it might need to reclassify an area to Serious beyond 3 years after designation (*e.g.*, for an area that fails to submit a Moderate area attainment plan at all; or for an area that is discretionarily reclassified by the EPA because it has very high air quality values). However, the proposal did not address the issue of when the attainment demonstration and other elements should be required for submission when this circumstance occurs. The comment raises the question regarding whether, in the most extreme example, it would be reasonable for an area to be reclassified just before the Moderate area attainment date (end of the sixth calendar year after designation) and then to have until just before the Serious area attainment date (end of the tenth calendar year after designation) to submit the attainment demonstration. This situation would provide little meaningful time for the state and relevant emissions sources to implement measures to reach attainment by the attainment date, nor would it provide sufficient time for the EPA to review and take action on the plan.

The EPA maintains that the statutory authority to “reclassify as a Serious PM-10 nonattainment area . . . any area that the Administrator determines cannot practicably attain [the NAAQS] by the attainment date . . . for Moderate Areas” includes the authority to make that determination and issue a

discretionary reclassification any time before the Moderate area attainment date, as long as doing so does not otherwise unreasonably frustrate the primary goals of the statute. For example, the EPA must consider the timing for submission of Serious area SIP requirements to ensure the state has sufficient time to implement an effective plan and the agency has sufficient time to review and act on the plan in advance of the outermost Serious area attainment date (*i.e.*, the end of the tenth calendar year after initial designation as nonattainment). *See* CAA section 188(c)(2).

The EPA interprets the statute to provide authority to require submission of attainment plan requirements, including the attainment demonstration, by a date less than 4 years from reclassification to Serious when exercising its discretionary authority to reclassify an area to serious nonattainment pursuant to CAA section 188(b)(1). While the EPA generally prefers to give states as much time as possible to develop and submit plans, the agency concluded that allowing 4 years for submission of the attainment demonstration in all discretionary reclassification actions would potentially frustrate the goals of the statute.

To resolve this issue, EPA is finalizing a specific schedule for submission of the attainment demonstration following discretionary reclassification. As discussed earlier, the terms of the statute provide some guidance as to the appropriate schedule because, as explained earlier, a state would have until the end of the 7th calendar year to submit the attainment demonstration after a discretionary reclassification that follows the timing in CAA section 188(b)(1)(B), and a state would have until the end of the 8th calendar year after a mandatory reclassification to submit the attainment demonstration. *See generally* CAA sections 188(b) and 189(b).

While not dispositive, these provisions indicate that Congress believes that Serious area attainment plans should be submitted at least 2 years in advance of the outermost statutory attainment date for Serious areas to ensure expeditious attainment of the NAAQS. The EPA finds that a minimum of 2 years is appropriate because (1) it provides time for emission reduction measures adopted by the state to take effect and improve air quality; (2) it will allow the agency sufficient time to evaluate and act on the Serious area attainment demonstration; and (3) for every other NAAQS, the CAA SIP submission dates are generally 2 years

or more prior to the attainment date. If for example the plan is not submitted until just before year 10, and the agency determines the plan will not lead to attainment, there will be no time to take corrective action before the attainment date to ensure attainment of the NAAQS. Such a result would not be reasonable.

Therefore, the EPA believes that a reasonable attainment demonstration due date for any discretionary reclassification to Serious would be the earlier of (1) 4 years from the date of reclassification, or (2) the end of the eighth calendar year after designation. As an example, an area that is reclassified at the end of year 5 would have 3 years rather than four years to submit the attainment demonstration and other plan elements by the end of year 8. An area that is reclassified no later than the end of year 4 would have the full four years, and any area reclassified after this point would have less than 4 years. At the outer extreme, in the unlikely event that the EPA chooses to exercise its discretion to reclassify an area in the sixth calendar year after designation (*i.e.*, within a year of the attainment date), the area would still have 2 years to submit the attainment demonstration, which is still no less than the timeframe Congress provided for a Moderate area that is reclassified because it fails to attain. *See* 40 CFR 51.1003(b)(2)(i).

Lastly, this section addresses appropriate SIP submission dates for the other required plan elements. Regarding the base year emission inventory, the EPA believes it is appropriate to require the updated base year emissions inventory at the same time that the BACM/BACT submission is due (18 months) because the updated inventory will be a critical element relied on for making control measure determinations. Regarding the remaining planning elements (*i.e.*, additional feasible measures, RFP, quantitative milestones, contingency measures, and attainment projected inventory), the proposed options allowed for the possibility of up to three separate submissions under certain policy combinations, and we believe having such an outcome would be very inefficient. Thus, the EPA has determined that the remaining elements must be submitted at the same time as the attainment demonstration (*i.e.*, the earlier of 4 years from the date of reclassification, or the end of the eighth calendar year after designation). This approach will provide for the most efficient process and at the same time provide the states with the maximum reasonable time when they are reclassified pursuant to the EPA’s

discretionary authority in CAA section 188(b)(2).

With regard to the due date for submission of NNSR program revisions that may be required when an area is reclassified to Serious, such as revisions to meet nonattainment NSR program requirements to lower the “major stationary source” threshold from 100 tons per year (tpy) to 70 tpy (CAA section 189(b)(3)) and to address the control requirements for major stationary sources of PM_{2.5} precursors [CAA section 189(e)],¹⁵⁵ the Act does not specify a deadline for the State’s submission following reclassification of a Moderate PM_{2.5} nonattainment area as Serious nonattainment under subpart 4. Pursuant to EPA’s gap-filling authority in CAA section 301(a) and to effectuate the statutory control requirements in section 189 of the Act, the final rule requires the state to submit these nonattainment NSR SIP revisions no later than 18 months after the effective date of final reclassification. This due date is also consistent with the due date for submission of BACM and BACT provisions and the emission inventory; thus, at most, a state will have two required SIP submissions after being reclassified. See 40 CFR 51.1003(b)(2)(i) and (ii).

c. Comments and Responses. Any additional comments received on this section are addressed in the Response to Comments document found in the docket for this action.

B. Emissions Inventory Requirements

1. Summary of Proposal

The EPA proposed that the inventory requirements for Serious areas were the same as those for Moderate areas with some additions. In addition to the Moderate area requirements, the EPA proposed that Serious area inventory requirements would include using a major source threshold of 70 tons/year for reporting sources as point sources for both the base year inventory for the nonattainment area and the attainment projected inventory for the nonattainment area.

With regard to the due date for the attainment projected inventory for the nonattainment area, the EPA proposed two cases. In the case where the area is reclassified after failing to attain the NAAQS by the Moderate area attainment date, the attainment projected inventory for the

nonattainment area was proposed to be submitted no later than 18 months after reclassification. In the case where the area is reclassified by the EPA because the area cannot practicably attain the NAAQS by the statutory attainment date, the EPA proposed that the attainment projected inventory for the nonattainment area would be due no later than 4 years after reclassification.

2. Final Rule

a. What Emissions Inventory Requirements Apply to Serious Area Attainment Plans? As with Moderate PM_{2.5} nonattainment areas, Congress did not create a specific emissions inventory requirement in subpart 4 that would supersede the emissions inventory requirement under subpart 1 for Serious areas. Thus, the statutory emissions inventory requirements that apply for Serious area attainment plans continue to be those of section 172(c)(3), which explicitly requires “a comprehensive, accurate, current inventory of actual emissions of the relevant pollutants” in the nonattainment area. In addition, the specific attainment plan requirements for the PM_{2.5} NAAQS set forth in section 189(a) and associated modeling requirements make an accurate and up-to-date emissions inventory a critical element of any viable attainment plan. Finally, the additional attainment plan requirements for the PM_{2.5} NAAQS for Serious areas contained in subpart 4 at section 189(b) have additional requirements that affect the emissions inventory requirements for Serious areas.¹⁵⁶

As noted earlier in this preamble, states must use the best available, current emissions inventory information for attainment plan development, because complete, high quality emissions inventory data are essential for the development of an effective control strategy. To assist states in preparing complete, high quality inventories, the EPA provides guidance for developing emissions inventories in its SIP Emissions Inventory Guidance, available at <https://www.epa.gov/air-emissions-inventories/emissions-inventory-guidance-documents>. The EPA recommends that states consult this guidance while developing emissions inventories to meet requirements for Serious area attainment plans.

b. How do States Meet the Inventory Requirements for the PM_{2.5} NAAQS for Areas Classified as Serious? As with Moderate PM_{2.5} nonattainment areas,

neither section 172(c)(3) nor the provisions specifically applicable to attainment plans for the PM_{2.5} NAAQS in subpart 4 specify how states should meet statutory emissions inventory requirements for Serious PM_{2.5} nonattainment areas. Section 172(c)(3) requires that states submit “a comprehensive, accurate, current inventory of actual emissions from all sources of the relevant pollutant or pollutants in such area, including such periodic revisions as the Administrator may determine necessary to assure that the requirements of this part are met” (emphasis added). The EPA interprets this provision to authorize the agency to require states to revise their base year emissions inventories whenever the state is required to submit a new attainment plan because of a change in the nonattainment area’s status (e.g. failure to attain by the applicable attainment date resulting in reclassification). In addition, pursuant to CAA section 301, the EPA has additional authority to promulgate regulations as necessary for the implementation of the PM_{2.5} NAAQS, including requirements pertaining to emissions inventories. Accordingly, this rule includes specific emissions inventory requirements that the EPA considers necessary to effectuate the attainment plan requirements of the CAA for the PM_{2.5} NAAQS.

Like Moderate areas, there are three key facets of the emissions inventory requirements: (i) The types of inventories required; (ii) the content of these inventories; and, (iii) the timing of submission of these inventories. The three facets are addressed in the following paragraphs.

First, the same two types of inventories required for Moderate areas are also required for Serious areas. While these inventories are the same types and names of inventories as for Moderate areas, they must be created specifically for Serious area attainment plans in accordance with the applicable Serious area requirements. The first type of inventory is called the “base year inventory for the nonattainment area,” and the second type of inventory is called the “attainment projected inventory for the nonattainment area.” See 40 CFR 51.1000. The attainment projected inventory is necessary to implement the attainment demonstration requirement of section 189(a)(1)(B), and it also may be used as part of the RFP requirement (see Section VI.F). For these reasons, this rule establishes a regulatory requirement that Serious area attainment plans must include a base year inventory for the nonattainment area and an attainment

¹⁵⁵ Section 189(e) of the CAA requires that the control requirements applicable to major stationary sources of PM_{2.5} also apply to major stationary sources of PM_{2.5} precursors, except where the state demonstrates to the EPA’s satisfaction that such sources do not contribute significantly to PM_{2.5} levels that exceed the standard in the area.

¹⁵⁶ All definitions described in Section III.B of this preamble for areas classified as Moderate apply in this section.

projected inventory for the nonattainment area.

Second, the content of the inventories will follow the content requirements for Moderate area inventories, with two exceptions needed to meet the requirements of section 189(b)(3). The first exception for Serious areas stems from the Section 189(b)(3) definition of a separate emissions threshold for major sources in Serious nonattainment areas (70 tpy potential to emit of PM₁₀). This threshold is lower than the 100 tpy potential to emit general requirement for major sources of PM₁₀, PM_{2.5} or one of its precursors that is used for Moderate area emissions inventories. Inventories for Serious area attainment plans must include these smaller sources as major stationary sources (rather than the nonmajor stationary source category that would apply for these in Moderate area plans) using the lower threshold specified in the CAA. Also as described earlier and in 40 CFR part 51, subpart A, this means that all other smaller stationary sources within the nonattainment area must be included in the base year inventory and projected attainment year inventory as nonpoint sources.

As described previously for Moderate areas, Appendix A of Table 1 of 40 CFR part 51, subpart A (the AERR) is required by this rule to define which sources must be reported as point sources for inventories associated with this rule (base year and projected attainment year inventories). To be consistent with the 70 tpy threshold finalized in this rule, this rule is also amending Table 1 of Appendix A of the AERR to include the 70 tpy threshold for PM_{2.5}, SO₂, NO_x, VOC and ammonia for point sources within nonattainment areas.

The second difference between the Serious area and Moderate area inventory requirements is a minor wording difference for the year that should be chosen for the base year inventory. The year should be one of the 3 years used for reclassification (rather than designation for Moderate areas) or another technically appropriate inventory year. Another inventory year may be chosen under specific circumstances (e.g., to account for a change in sources in the nonattainment area, changes in nonattainment area boundaries, or significant time lag between designations and preparation of the inventory) with consultation from the appropriate EPA Regional Office. This requirement is intended to ensure that the inventory will represent the emissions sources whose contributions resulted in a nonattainment designation for the area.

The third facet of the Serious area inventory requirements is the timing, which is somewhat different than for Moderate areas. Section VI.A of this preamble describes the requirement that states submit the base year inventory for a Serious nonattainment area at the same time that it submits provisions to implement BACM and BACT on sources in the area (due no later than 18 months from reclassification of the area pursuant to section 189(b)(2)). This is because the base year inventory serves as the starting point for conducting a BACM and BACT determination. In contrast to the base year inventory, the attainment projected inventory is more closely related to the Serious area attainment demonstration. Thus, the attainment projected inventory is most appropriately submitted with the attainment demonstration for a given Serious area to allow effective evaluation of the attainment plan as a whole.

Consequently, this rule requires that attainment projected emissions inventories be submitted at the same time as the Serious area attainment demonstration. This requirement gives rise to two possible deadlines for Serious areas to submit the attainment projected emissions inventory for the nonattainment area. For areas that are reclassified after failing to attain the NAAQS by the applicable Moderate area attainment date, the deadline is no later than 18 months after reclassification (same time period as for Moderate areas). For areas reclassified by the EPA because the area cannot practicably attain the NAAQS by the statutory Moderate area attainment date, the deadline is the earlier of 4 years from the date of reclassification, or the end of the eighth calendar year after designation.

3. Comments and Responses

Comment: Some commenters noted that the proposal was unclear with regard to the inventory year for areas that are reclassified from Moderate to Serious, and whether the terms “reclassification” and “designation” are interchangeable in this regard.

Response: In the final rule, the EPA clarifies that for areas that are redesignated to Serious, the inventory year must be one of the 3 years used for reclassification. Any additional comments received on this section are addressed in the Response to Comments document found in the docket for this action.

C. Pollutants To Be Addressed in the Plan

All PM_{2.5} precursors are presumptively required to be addressed in any Serious area attainment plan. Section III of this preamble includes a detailed discussion about optional analyses that a state may provide to demonstrate that sources of a precursor do not significantly contribute to PM_{2.5} concentrations in a particular nonattainment area. These demonstrations may be conducted for all sources of a precursor in an area (i.e., comprehensive precursor demonstration), or just for major sources of the precursor (i.e., major source precursor demonstration). It also discussed a similar demonstration that may be conducted for NNSR (i.e., NNSR precursor demonstration). These demonstrations may be used to justify the exclusion of certain types of precursor sources from certain SIP requirements in Serious area plans, just as in Moderate area plans. However, the expeditious attainment demonstration is not available for Serious area plans.

As noted in Section III of this preamble, if the EPA approves a state's precursor demonstration for the Moderate area plan, the state would need to re-evaluate whether the precursor contributes significantly to PM_{2.5} levels that exceed the standard for the Serious area plan. The reason for this is that precursor emissions and air quality concentrations will have changed since the submission of the demonstration for the Moderate area, and precursor emissions technical information and scientific understanding of precursor emissions and interactions in the area should be better understood several years later, and the Serious area plan needs to be based on the best available information to date. If the state reevaluates a precursor for potential exclusion from one or more of the Serious area plan requirements, it should take into account factors such as increases or decreases in emissions since the last precursor demonstration; new ambient monitoring data for fine particle composition and concentrations of important gases (such as ammonia); and improved air quality modeling programs that reflect improved understanding of the role of precursors in atmospheric transformation processes. To the extent appropriate, this precursor demonstration can build off the analyses conducted for the Moderate area precursor demonstration.

If the EPA approves a comprehensive precursor demonstration for the Serious area plan, then the state would not be

obligated to evaluate BACM/BACT measures for reducing that precursor in the nonattainment area, nor would it need to account for that precursor in the RFP plan, quantitative milestones, and contingency measures. If a major stationary source precursor demonstration is approved, then the state would not be obligated to evaluate BACM/BACT measures for reducing that precursor from major sources in the nonattainment area, nor would it need to account for emissions of that precursor from major sources in the RFP plan, quantitative milestones, and contingency measures. If a NNSR precursor demonstration is approved, then the state would not be obligated to address LAER and emission offset requirements for that precursor in the NNSR program for that nonattainment area.

D. Attainment Plan Control Strategy

1. General Approach to Designing a Control Strategy for a Serious Nonattainment Area

The statutory attainment planning requirements of subparts 1 and 4 were established to ensure that states meet the following goals of the CAA: (i) Implement measures that provide for attainment of the PM_{2.5} NAAQS as expeditiously as practicable, and (ii) adopt emission reduction strategies that will be effective at reducing PM_{2.5} levels in nonattainment areas. A state has discretion to require reductions from any source inside or outside of a PM_{2.5} nonattainment area (but within the state's boundaries) in order to fulfill its obligation to demonstrate attainment in a PM_{2.5} nonattainment area as expeditiously as practicable, in addition to having an obligation to meet the statutory requirements for specific control measures on sources located within a nonattainment area (e.g., BACM and BACT). A state may need to require emissions reductions on sources located outside of a PM_{2.5} nonattainment area if such reductions are needed in order to provide for expeditious attainment of the PM_{2.5} NAAQS.

The following sections describe the recommended approach for a state to follow in order to identify and select the complete suite of measures needed for an approvable attainment plan submission for a Serious PM_{2.5} nonattainment area.

2. Identification and Selection of BACM/BACT and Additional Feasible Measures

a. *Summary of Proposal.* The proposal provided background information on

statutory requirements and existing guidance regarding Serious area control strategies, and then presented two broad approaches describing the steps for determining BACM/BACT and additional feasible measures (i.e. control measures that may be able to help the area attain by the attainment date or advance the attainment date by a year, and that may be implemented later than BACM/BACT but before the attainment date). The first approach is consistent with current guidance for PM₁₀ NAAQS implementation in the Serious Area Addendum. Under the first approach, the emphasis of the analysis would be on the identification of feasible control measures. The analysis would be considered to be "generally independent" of whether such measures are needed for expeditious attainment of the relevant NAAQS. However, this approach also would allow the state to identify *de minimis* source categories before conducting any further analysis of technologically feasible or economically feasible control measures. The proposal requested comment on inclusion of an ambient impact threshold of 3 percent for determining whether a source category impact would be *de minimis*. This proposed threshold level was similar to the *de minimis* ambient levels included in the Serious Area Addendum for implementation of the PM₁₀ NAAQS, and the state would likely need to conduct air quality modeling to demonstrate *de minimis* impacts below a particular threshold. The proposal noted the challenges associated with providing a nationally consistent definition of what would be a "source category." For source categories found to be *de minimis*, the state would not be obligated to evaluate potential control measures. The basic analytical steps for proposed option 1 were presented as follows: (1) Update base year emissions inventory for the area; (2) evaluate source category impacts; (3) identify existing and potential control measures; (4) determine whether an available control measure or technology is technologically feasible; (5) determine whether an available control measure or technology is economically feasible; (6) determine the earliest date by which a control measure or technology can be implemented in whole or in part.

Under the second proposed option, there would be a greater emphasis on linking the control strategy evaluation process with the attainment needs for the area. Accordingly, this option would not include a "*de minimis*" step 2 early in the process. However, at the end of the process, the state would be able to

choose to not adopt certain measures that would otherwise meet the criteria for BACM/BACT if those measures collectively would not be necessary to bring the area into attainment or to advance the attainment date by 1 year (similar to the approach that EPA uses, and has historically used, for RACM/RACT). The EPA requested comment on all aspects of these options, and indicated the agency may finalize either approach or various elements of each approach after evaluating the comments that had been received.

b. *Final Rule.* The EPA has considered the comments that were submitted on the two proposed options for determining BACM/BACT (and additional feasible measures), and has determined that the final rule should include aspects of each option. The following sections provide background information and guidance on the steps of the process for determining Serious area control measures for PM_{2.5} nonattainment areas.

i. BACM and BACT

A Serious area attainment plan must include provisions to implement BACM on sources in a Serious nonattainment area, as provided by section 189(b)(1)(B), no later than 4 years after reclassification. Under section 189(b)(2), a state has 18 months following reclassification to submit these BACM provisions.

Section 189(b)(1)(B) refers only to BACM, but the EPA has long interpreted this term to include BACT, just as the analogous term for RACM includes RACT for Moderate areas. For implementation of the PM_{2.5} NAAQS, the EPA finds it reasonable to maintain the same interpretation. The legislative history for the 1990 Amendments to the CAA supports this interpretation, as the EPA has explained in past guidance.¹⁵⁷ Additionally, the requirement for BACT for existing sources in the context of PM_{2.5} NAAQS implementation in nonattainment areas is separate and distinct from the requirement for BACT for new and modified sources under the Prevention of Significant Deterioration (PSD) permitting program for new stationary sources in areas designated as attainment or unclassifiable for the PM_{2.5} NAAQS. As described later in this section, however, the process and criteria that states have historically used to determine BACT for new and modified sources under the PSD program have also been referenced and applied to the process for determining BACT for PM₁₀ NAAQS implementation, but these requirements

¹⁵⁷ *Ibid.* at 42008–09.

are otherwise unrelated. Consistent with past policy, BACT determinations for PM_{2.5} NAAQS implementation are to follow the same process and criteria that are applied to the BACT determination process for the PSD program.

Longstanding guidance in the General Preamble and Addendum, together with past practice associated with implementing the PM₁₀ NAAQS under subpart 4, has helped to establish a general approach for states and the EPA to determine BACM and BACT for Serious PM₁₀ nonattainment areas. This approach has served as the basis for developing a more stringent control strategy for a Serious PM₁₀ nonattainment area than that developed for such area when it was classified as Moderate. Indeed, as BACM and BACT are required to be implemented when a Moderate nonattainment area is reclassified as Serious due to its actual or projected inability to attain the relevant NAAQS by the Moderate area attainment date through the implementation of “reasonable” measures, it is logical that “best” control measures should represent a more stringent and potentially more costly level of control.¹⁵⁸ The level of stringency generally refers to the overall level of emissions reductions of a control measure or technology, or of such measures and technologies combined.

Congress first defined BACT in CAA section 169(3) for the PSD permitting program as: “an emission limitation based on the maximum degree of reduction of each pollutant . . . which the permitting authority, on a case-by-case basis, taking into account energy, environmental, and economic impacts and other costs, determines is achievable for such facility through application of production processes and available methods, systems, and techniques . . .”

In the Addendum, the EPA provided guidance concerning the requirements for BACM and BACT for Serious area attainment plan requirements for the PM₁₀ NAAQS.¹⁵⁹ The EPA discussed in the Addendum that when Congress amended the CAA, Congress selected the same “best” terminology for PM₁₀ nonattainment areas as it did for the language selected for the PSD program in 1977. The EPA interpreted this word choice at the time to mean that PSD BACT and PM₁₀ nonattainment area BACM should be generally analogous in definition and implementation, but with some differences due to different end policy goals between the PSD and

nonattainment area programs.¹⁶⁰ The EPA thus defined BACM for PM₁₀ Serious nonattainment area planning to be the maximum degree of emission reduction achievable from a source or source category which is determined on a case-by-case basis, considering energy, economic and environmental impacts and other costs.¹⁶¹

ii. BACM/BACT “Generally Independent” of Attainment

As noted earlier, the issue of whether BACM/BACT should be considered generally independent of attainment or more closely tied to attainment for purposes of implementing the PM_{2.5} NAAQS was a central issue distinguishing the two proposed options for determining BACM/BACT. Some commenters suggested that the overarching requirement of the CAA is to attain the standard expeditiously, and therefore the benefits of a “generally independent” BACM/BACT requirement are not clear. On the other hand, some other commenters supported maintaining the longstanding policy from the Serious Area Addendum that the BACM/BACT requirement is generally independent of attainment, citing the emphasis on “best” control measures and the statutory provision requiring BACM/BACT well before the attainment demonstration for certain reclassified areas. For the reasons discussed later in this section, the EPA has decided to maintain the policy that BACM/BACT determinations are to be “generally independent” of attainment for purposes of implementing the PM_{2.5} NAAQS.

In the Serious Area Addendum, the EPA described BACM as a generally independent requirement, to be determined without regard to the specific attainment analysis (*i.e.*, attainment demonstration) for the area.¹⁶² The EPA established that such

an interpretation is in accordance with the structural scheme of the CAA, which by its definition requires that when an area is classified as Serious, BACM are implemented in addition to RACM. Because of the two types of measures employed, the EPA found it reasonable to interpret the statute as requiring a different analysis for determining BACM, *i.e.*, that while RACM emphasizes the attainment needs of the area, BACM has a greater emphasis on identifying measures that are feasible to implement. Keeping in mind that the overall objective of the implementation of BACM and BACT and additional feasible measures is to bring a Serious PM_{2.5} nonattainment area into attainment as expeditiously as practicable, the General Preamble noted that the test for BACM puts a “greater emphasis on the merits of the measure or technology alone,” rather than on “flexibility in considering other factors,” in contrast to the approach for determining RACM and RACT.¹⁶³

The view that BACM and BACT measures are generally independent of the attainment needs of the area is also consistent with the statutorily specified submission date for BACM and BACT control measures, contrasted against the statutorily specified submission date for the attainment demonstration for Serious areas. Specifically, states with Serious nonattainment areas must submit BACM and BACT measures within 18 months of reclassification of areas to Serious, whereas they are given up to 4 years from reclassification (for areas where it is impracticable to attain by the attainment date) to submit the attainment demonstration for such areas.

Additionally, the EPA believes that interpreting the Serious PM_{2.5} nonattainment area BACM/BACT requirements to be “generally independent” of attainment is consistent with the structure and substance of the CAA control measure requirements for ground-level ozone nonattainment areas with more serious air quality problems. In the CAA ozone implementation requirements, an area that is reclassified to a more serious category because it failed to attain the standard or because it is impracticable to attain by the attainment date is then subject to additional specific control measure requirements that are considered to be generally independent of attainment (for example, *see* CAA section 182(b) through (e)). The statute includes these specific requirements in order to ensure continued progress toward attainment for these areas with

¹⁶⁰ *Ibid.* at 42010. “EPA will interpret PSD BACT and PM-10 BACM as generally similar because, despite the similarity in terminology, certain key differences exist between control measures applicable in the PSD and PM-10 serious nonattainment area programs. The BACT under the PSD program applies only in areas already meeting the NAAQS, while PM-10 BACM applies in areas which are seriously violating the NAAQS. The difference in policy goals, arguably, suggests that the PM-10 BACM control standard should be more stringent than that for PSD BACT EPA considers it reasonable to use the approach adopted in the PSD BACT program as defined in section 169(3) of the Act as an analogue for determining appropriate PM-10 nonattainment control measures in serious areas, while at the same time retaining the discretion to depart from that approach on a case-by-case basis as particular circumstances warrant.”

¹⁵⁸ *Ibid.* at 42009.

¹⁵⁹ *Ibid.* at 42009.

more difficult air quality problems. The EPA believes it is appropriate to have a similar interpretation of the PM_{2.5} Serious area control measure requirements. In a similar manner, interpreting BACM/BACT to be generally independent of the attainment needs of a Serious PM_{2.5} area will ensure continued progress toward attainment for those areas with more difficult air quality problems. The EPA also believes this more rigorous “independent control measure” approach for implementing the PM_{2.5} standards in a manner similar to ozone is appropriate because the health effects of both standards are very significant (including premature mortality), and robust emission reduction programs are needed to bring about expeditious attainment and public health protection for citizens in these nonattainment areas.

iii. No de Minimis Source Category Analysis for PM_{2.5} NAAQS Implementation

Another central issue distinguishing the two proposed options for how to determine BACM/BACT was the issue of whether, before analyzing any potential BACM/BACT, the state should conduct technical analyses to identify whether there are any source categories having a *de minimis* contribution to PM_{2.5} levels in the PM_{2.5} nonattainment area. This *de minimis* analysis is part of the process described in the Serious Area Addendum for implementation of the PM₁₀ standards. Under the proposal, for source categories found to be *de minimis*, the state would not be obligated to evaluate potential control measures.

As noted previously, the proposal requested comment on inclusion of an ambient impact threshold of 3 percent for determining whether a source category impact would be *de minimis*. This proposed threshold level was similar to the *de minimis* ambient levels included in the Serious Area Addendum for implementation of the PM₁₀ NAAQS, and the state would likely need to conduct air quality modeling to demonstrate *de minimis* impacts below a particular threshold. The proposal noted the challenges associated with providing a nationally consistent definition of what would be a “source category.”

The EPA also proposed a similar *de minimis* source category concept for the RACM/RACM process for Moderate area plans, and many of the comments received on the proposed Moderate area “upfront” *de minimis* source category analysis are also applicable when considering whether to include a *de*

minimis source category analysis concept for Serious areas in the final rule. A number of commenters expressed concern about the analytical resources that might be needed to conduct air quality modeling to identify whether all the sources in a particular source category have an ambient air quality contribution exceeding an air quality threshold. Some commenters suggested that a *de minimis* source category approach for either Moderate or Serious areas would allow the state to ignore a set of control measures that later in the control measure evaluation process could be determined to provide for a more expeditious attainment date. They believe that allowing the exemption of *de minimis* source categories would undermine any analysis to evaluate whether a collection of measures could advance the attainment date by a year. For example, it would be possible for a state to identify multiple *de minimis* source categories at the beginning of the process, and then after all potential control measures are identified, the state and the EPA would be unable to determine whether the collective reductions and air quality impact of the exempted categories could actually be sufficient to advance the attainment date. Other commenters noted that providing a source category exemption in one nonattainment area would lead to inconsistent treatment within a state or across states because it would give the exempted companies a competitive advantage over the same types of sources in other areas.

A number of commenters supported the *de minimis* source category concept because they believed it could result in a reduced burden in the control measure evaluation stage and help avoid regulating sources with limited impact on PM_{2.5} levels. Some commenters supported the *de minimis* concept only if controls on the source are not needed for expeditious attainment. Some commenters suggested that the EPA include an emissions-based threshold (e.g. tons per day) rather than an air quality based threshold to reduce potential analytical burden associated with *de minimis* source category analyses. However, in their comments they did not address the fact that the air quality impact of a specific tons per day rate could vary greatly from one pollutant to another within a particular nonattainment area, or across different nonattainment areas. One state commenter noted that the NAICS system does not provide categories for nonpoint sources, and that this issue would need to be addressed if the

NAICS approach were to be included in the final rule. Other commenters suggested that the rule not have a *de minimis* threshold at all but include the ability for the state to propose *de minimis* source categories to the EPA on a case-by-case basis.

After taking the range of comments on the *de minimis* source category concept into consideration, the EPA has decided to not finalize a *de minimis* source category approach for the purposes of implementing the PM_{2.5} NAAQS. The EPA is persuaded by commenters who argued it is not necessary, and believes that without this concept the final rule will nevertheless provide sufficient flexibility in the Serious area control measure analysis and attainment demonstration process, due to the availability of provisions enabling states to identify sources that should not be subject to control measures, including the ability to develop precursor demonstrations to exclude certain precursors from control requirements, and to consider case-specific factors in determining technical and economic feasibility of potential control measures. If the final rule were to include an explicit step to conduct a *de minimis* source category analysis on the entire inventory early in the control measure identification process, the EPA believes that there is a risk that such an analysis may bring about investment of scarce time and analytical resources on analysis of categories to exclude rather than on the identification of the most beneficial control measures for reducing PM_{2.5} and its precursors to achieve expeditious attainment of the standard. In addition, the EPA finds merit in comments suggesting that an upfront exemption of multiple *de minimis* source categories in an area would undermine the ability of the state (or other interested parties) to evaluate, after the identification of potential control measures, whether the area could advance the attainment date in order to attain “as expeditiously as practicable.”

Moreover, as noted in Section IV.D of this preamble on Moderate areas, the EPA also finds that from a technical perspective, it would be very challenging to implement a *de minimis* source category process in a consistent manner nationally without clear guidelines describing how narrowly or how broadly a *de minimis* exemption could apply to a “source category,” or how the technical analysis would need to be performed. For example, should a source category consist of all industrial boilers? Or all industrial boilers that burn a particular fuel? Or all industrial boilers that burn a particular fuel and

are within a specific size range? The NAICS codes do not provide an appropriately comprehensive approach for defining source categories for all stationary, mobile, and area sources for this purpose. It has been noted that a *de minimis* source category exemption process is described in the 1994 PM₁₀ NAAQS implementation guidance (the Serious Area Addendum). In PM₁₀ areas, however, it may have been relatively straightforward to identify what were the predominant source categories contributing to the NAAQS violations (such as direct PM_{2.5} emissions from dust or wood smoke), and therefore to be able to identify what categories might be considered as not predominant contributors (or *de minimis*). However, implementation of the PM_{2.5} NAAQS presents much more complex challenges. Precursors and their contribution to secondarily formed PM play a much greater role in PM_{2.5} nonattainment areas than in PM₁₀ nonattainment areas. In addition, the relative impact of each precursor to local PM_{2.5} concentrations varies from area to area, and even within sections of the same area. To appropriately implement an approach allowing for *de minimis* source category impacts, the EPA believes that a nationally consistent source category definition would be needed, along with sophisticated air quality modeling to evaluate the relative impacts of precursors emitted from different “source categories.” The resources needed to conduct such analyses could be substantial, and would ultimately not help identify what control measures would be needed to solve the air quality problem. For all of these reasons, a *de minimis* source category concept is not included in the final rule for Serious areas.

iv. Additional Feasible Measures

While the proposed approaches and criteria for identifying appropriate control measures for a Serious area are necessarily different than for a Moderate area, it is important to note two similarities: First, that the EPA interprets the requirement under CAA section 172(c)(6) for a state to adopt “other measures” needed for attainment to apply to sources located inside and outside of any PM_{2.5} nonattainment area (but within the state’s boundaries), whether the area is classified as Moderate or Serious; and second, similar to the RACM requirement for Moderate nonattainment areas under subpart 4, CAA section 189(b)(1)(B) requires that BACM must be implemented no later than 4 years after

a Moderate area is reclassified to Serious.

Taking these two statutory provisions together, the EPA proposed that the other measures required under CAA section 172(c)(6) must include “additional feasible measures,” which would be those measures and technologies that otherwise meet the criteria for BACM/BACT but that can only be implemented in whole or in part beginning 4 years after reclassification of an area, but no later than the statutory attainment date for the area. See proposed 40 CFR 51.1000.

Some commenters agreed that an area must also consider adopting control measures that cannot be implemented within the 4-year deadline for implementation of BACM and BACT. Some commenters suggested that additional feasible measures should only be tied to expeditious attainment.

In the final rule, additional feasible measures would necessarily be implemented by sources in the nonattainment area, and a state is required to implement them if they are needed in addition to BACM and BACT to bring the area into expeditious attainment. The state must also adopt other emission reduction measures for sources within the state but outside the nonattainment area if such measures in conjunction with other control measures would enable the area to attain the standard by the attainment date, or enable the area to advance the attainment date by at least 1 year.

These “additional feasible measures” would be analogous to the “additional reasonable measures” in the RACM and RACT analysis process, which are technologically and economically feasible measures that cannot qualify as RACM or RACT because they cannot be implemented within 4 years of designation of a Moderate nonattainment area. Under the approach for determining BACM and BACT for sources in a Serious nonattainment area described later in this section, a state would identify additional feasible measures as part of the BACM and BACT determination process, just as additional reasonable measures would be identified as part of the state’s RACM and RACT determination process.

The EPA recognizes that with regard to Serious areas, only a nonattainment area that is reclassified under the agency’s discretionary authority might have sufficient time between the date for implementing BACM and BACT and the statutory Serious area attainment date to implement additional measures beyond BACM and BACT. BACM and BACT must be implemented no later than 4 years after reclassification of the

area; areas reclassified to Serious because they cannot practicably attain the relevant NAAQS by the applicable attainment date could potentially have significantly more than 4 years between the date of reclassification and the statutory Serious area attainment date, during which time the area could continue to implement additional feasible measures to bring the area into attainment.

By way of illustration, for areas designated in the first round of designations for the 2012 PM_{2.5} NAAQS, the statutory Moderate area attainment date will be no later than December 31, 2021. If a state submits a Moderate area attainment plan by the statutory attainment plan due date (18 months after designation, or in this example, October 2016) and the plan demonstrates that the area cannot practicably attain the NAAQS by December 31, 2021, then the EPA has a statutory duty to reclassify such an area within 18 months of the attainment plan due date (*i.e.*, by April 2018). The statutory Serious area attainment date would be the end of the tenth year following designation, or December 31, 2025. In such a case, the state would need to implement BACM for the area within 4 years of reclassification, or by April 2022, leaving over 3.5 years between the statutory deadline for implementing BACM and the statutory attainment date for the area. The requirement for the state to identify and adopt additional feasible measures for the area would mean that the state would need to identify those control measures and technologies that are feasible (according to the proposed BACM and BACT criteria described later in this section) and that can be implemented between April 2022 and December 2025. The EPA expects that while such a long span of time may be available only to a very few Serious nonattainment areas, it would be appropriate to require such areas to implement measures in addition to BACM and BACT if, taken together, they can provide for attainment by the attainment date or advance the attainment date for the area by at least 1 year. Accordingly the EPA has codified a definition of “additional feasible measures” and specified the conditions under which such measures would need to be included in a serious area plan submission. See 40 CFR 51.1000 and 40 CFR 51.1010(a)(4)(ii).

v. Steps of the BACM/BACT Selection Process

In addition to the regulatory decisions earlier, the EPA summarized and sought comment on further guidance for states

to follow in selecting BACM/BACT. The guidance was primarily derived from the Addendum. This section reviews that guidance, clarifies and updates it for purposes of PM_{2.5}, and responds to significant comments on the guidance discussion included in the proposal.

The BACM/BACT selection process for implementation of the PM_{2.5} NAAQS is designed to take into account the local facts and circumstances and the nature of the air pollution problem in a given nonattainment area. The following sections describe the steps of the process, including: (i) Develop a comprehensive inventory of sources and source categories of directly emitted PM_{2.5} and PM_{2.5} precursors; (ii) identify existing and potential control measures for the sources in the inventory; (iii) evaluate the technological feasibility of potential control measures; (iv) evaluate the economic feasibility of potential control measures; and (v) determine the earliest date by which a control measure or technology can be implemented in whole or in part.¹⁶⁴ These steps are described more fully in the following subsections.

Step 1: Develop a comprehensive inventory of sources and source categories of directly emitted PM_{2.5} and PM_{2.5} precursors. As with any control strategy analysis for a nonattainment area, the EPA recommends that the state begin with a current detailed emissions inventory of the various sources that emit direct PM_{2.5} and PM_{2.5} precursors in the Serious area. The inventory should identify major stationary sources (*i.e.*, sources with the potential to emit 70 tpy of direct PM_{2.5} or any precursor), nonmajor stationary sources, mobile sources, and area sources. The inventory also should identify both anthropogenic and nonanthropogenic emissions sources.¹⁶⁵ The EPA expects the state to start with the base year emissions inventory submitted with the Moderate area attainment plan as required under CAA section 172(c)(3), and update it as necessary to reflect new source construction, facility shutdowns, growth in certain source categories, and any other relevant changes. This inventory should be the most comprehensive and accurate inventory available, and it should be consistent with the emissions inventory requirements for Serious area plans as described in Section VI.B of this preamble.

Step 2: Identify potential control measures. The state should identify potential control measures for all

sources and source categories in the latest base year emission inventory for the nonattainment area. The list of existing and potential control measures should include options not previously considered as RACM/RACT for the area, as well as additional measures not previously evaluated in the RACM/RACT analysis. For purposes of identifying new measures to consider in its BACM/BACT analysis, the EPA recommends that the state obtain and evaluate a wide range of sources of information on existing and potential control measures. Other nonattainment areas in the same state, and other states across the country are important sources of information about control measures that are currently being implemented. Regional planning organizations, and state and local air quality consortiums have in the past developed summaries of control measures that should provide useful information for this process.¹⁶⁶

The EPA's RBLC provides a central data base of air pollution technology information that may be highly relevant to states seeking information on stationary source control technology that may qualify as BACT for PM_{2.5} NAAQS implementation, and is available online at <http://cfpub.epa.gov/RBLC/>. There are also other resources available to assist states in identifying other potential control measures and control technologies for their BACM and BACT determinations. The EPA encourages states with Serious PM_{2.5} nonattainment areas to visit the agency's Web site to find links to other online sources of information on potential control measures for states to consider.¹⁶⁷

The state must incorporate appropriate measures into the list of potential control measures for the source categories in the Serious nonattainment area. The EPA would expect the state to identify an array of existing and potential new measures at least as broad as the list identified for the same area as part of the RACM and RACT analysis, in order to ensure that the state has a sufficiently expansive and comprehensive set of potential

measures to evaluate. The list of potential measures must include all measures identified as potential control measures for the nonattainment area when it was classified as Moderate or, for a given source category, one or more alternative control measures that would control emissions even more stringently than the measures included in the RACM/RACT analysis. In this way, the state will begin its BACM/BACT determination with a list of potential control options that is as complete and up-to-date as possible.

Step 3: Determine whether an available control measure or technology is technologically feasible. After developing a list of existing and potential new measures to evaluate for BACM and BACT, the state would then need to determine the technological feasibility of each identified control measure in light of a number of considerations, including each measure's individual energy and environmental impacts.¹⁶⁸

(1) Stationary sources. As described under the technological feasibility criteria for the control measures analysis for Moderate area attainment plans in Section IV.D of this preamble, the EPA's prior guidance on factors to consider for judging whether a particular control technology is technologically feasible should include a source's processes and operating procedures, raw materials, physical plant layout and potential environmental impacts such as increased water pollution, waste disposal and energy requirements. For example, the EPA recognizes that the process, operating procedures and raw materials used by a source can affect the feasibility of implementing process changes that reduce emissions and can also affect the selection of add-on emission control equipment. The feasibility of modifying processes or applying control equipment also can be influenced by the physical layout of the particular plant, if the physical space available in which to implement such changes limits the choices.¹⁶⁹

(2) Area and mobile sources. With respect to determining whether a given control measure might not be technologically feasible as BACM for an area or mobile source, a state may consider factors in conducting its analysis that are similar to factors the state may have considered during the RACM and RACT determination process, such as local circumstances, the condition and extent of needed infrastructure, or population size or workforce type and habits, which may

¹⁶⁶ Add cite to 2006 STAPPA ALAPCO document and other control measure summaries. Add cite to menu of measures. Specific to potential control measures for mobile source emissions, the EPA's past guidance has indicated that where mobile sources contribute significantly to PM_{2.5} violations, "the state must, at a minimum, address the transportation control measures listed in CAA section 108(f) to determine whether such measures are achievable in the area considering energy, environmental and economic impacts and other costs."

¹⁶⁷ Links are provided to a number of national, state and local air quality agency sites from the EPA's PM_{2.5} Web site: <http://www3.epa.gov/pm/measures.html>.

¹⁶⁴ For additional information, see *ibid.* at 42012-13.

¹⁶⁵ Addendum to the General Preamble, 59 FR 41998 (August 16, 1994), at page 42012.

¹⁶⁸ *Ibid.* at 42012.

¹⁶⁹ *Ibid.* at 42013.

prohibit certain potential control measures from being implementable. However, in the instance where a given control measure has been applied in another NAAQS nonattainment area (for PM_{2.5} or other pollutant), the state will need to provide a detailed justification for rejecting any potential BACM measure as technologically infeasible. Furthermore, if the state identifies a certain control measure for area or mobile sources that has been implemented in another nonattainment area and may qualify as BACM or BACT, the state must provide a reasoned justification if it deems it technologically infeasible to implement the same control measure to the same extent or magnitude as it was applied in the other nonattainment area.

Step 4: Determine whether an available control technology or measure is economically feasible. The fourth step of this process is to evaluate the costs of implementing each of the technologically feasible control measures and technologies in order to eliminate from further consideration any measures determined to be economically infeasible. In assessing “best” control measures and technologies, states with Serious PM_{2.5} nonattainment areas must identify a control strategy for the area that overall is more stringent than that identified for the area when the state considered only the “reasonableness” of potential control measures for purposes of the RACM/RACT analysis. States need to consider emission reduction measures with higher costs per ton when assessing the economic feasibility of BACM and BACT controls (and, where applicable, additional feasible measures) as compared to the economic feasibility criteria applied in their RACM and RACT analysis (and analysis for additional reasonable measures) for the same nonattainment area.

Indeed, consistent with prior guidance on evaluating costs of a potential BACM/BACT, the EPA maintains that while the economic feasibility of a control measure is as important as its technological feasibility under the RACM and RACT determination process, economic feasibility is a less significant factor in the BACM and BACT determination process. In other words, a state must apply a higher standard for eliminating a technologically feasible control measure from further consideration as BACM due to cost alone.

In the Addendum, the EPA stated that “for PM₁₀ BACM purposes, it is reasonable for similar sources to bear

similar costs of emission reduction.”¹⁷⁰ Additionally, the EPA indicated that “economic feasibility for PM₁₀ BACM purposes should focus upon evidence that the control technology in question has previously been implemented at other sources in a similar source category without unreasonable economic impacts.”¹⁷¹ Thus, a state may not eliminate a particular control measure from further consideration as potential BACM if similar sources have successfully implemented such a measure. That is, a state must at a minimum continue to consider as potential BACM any technologically feasible control measures or technologies implemented by similar sources.

In addition, a state may not automatically eliminate a particular control measure merely because other sources have not implemented the measure. In other words, a state must continue to consider technologically feasible measures that have not been implemented by similar sources but that can nonetheless effectively reduce emissions from the source category in question at a cost that is not cost prohibitive.

As with the EPA’s approach for evaluating economic feasibility of potential reasonable measures for Moderate area attainment plans, for each technologically feasible control measure or technology, a state must evaluate the economic feasibility of the measure through consideration of the capital costs, operating and maintenance costs, and cost effectiveness (*i.e.*, cost per ton of pollutant reduced by that measure or technology) associated with such measure or control. While the EPA is not establishing a fixed dollar per ton cost threshold for economic feasibility of controls identified as potential BACM and BACT, the cost per ton of an acceptable measure for the BACM and BACT analysis generally would be higher than it was for the RACM and RACT analysis for the same nonattainment area. In addition, if a source contends that a source-specific control level should not be established because the source cannot afford the control measure or technology that is demonstrated to be economically feasible for purposes of BACM for other sources in its source category, the source should make its claim known to the state and support the claim with information regarding the impact of imposing the identified control measure

or technology on the following financial indicators,¹⁷² to the extent applicable:

1. Fixed and variable production costs (\$/unit);
2. Product supply and demand elasticity;
3. Product prices (cost absorption vs. cost pass-through);
4. Expected costs incurred by competitors;
5. Company profits;
6. Employment costs;
7. Other costs (*e.g.*, for BACM implemented by public sector entities).

Step 5: Determine the earliest date by which a control measure or technology can be implemented in whole or in part. Section 189(b)(1)(B) of the CAA requires that Serious area attainment plans provide for the implementation of BACM no later than 4 years after reclassification of the area to Serious. As with the EPA’s proposed approach to RACM and RACT, the EPA proposes the term “implement” to mean that the control measure or technology has not only been adopted into the SIP for the area but has also been built, installed and/or otherwise physically manifested and the affected sources are required to comply. The EPA thus expects a state with a Serious nonattainment area to take timely action to implement BACM and BACT in the area.

A state must identify those technologically and economically feasible control measures and technologies that it can implement fully or partially within 4 years of reclassification of its Serious PM_{2.5} nonattainment area. These measures will be considered BACM and BACT for the area. If a state evaluates a potential BACM or BACT measure and determines that it can be implemented only partially within 4 years after reclassification, the state must adopt the partial measure as BACM.

Where the earliest date that a measure can be implemented is beyond the 4 year mark following reclassification to Serious, the measure may still be needed as an “additional feasible measure” if the 4 year mark occurs before the Serious area attainment date. “Additional feasible measures” would be “best”-level, feasible measures that a state could implement in whole or in part on sources in the area sometime after the fourth year following reclassification and prior to the statutory attainment date for the area.

c. Comments and Responses. Any additional comments received on this section are addressed in the Response to

¹⁷² These longstanding factors were established in the EPA guidance in 1992 and are applicable to implementation programs for all of the NAAQS pollutants. See the appendices to the General Preamble, 57 FR 18070 (April 28, 1992).

Comments document found in the docket for this action.

3. BACM and BACT Submission Requirements

a. Summary of Proposal. The proposal further specified the submission requirements once a state has determined the BACT/BACM requirements in its plan. The proposal required the state to submit a list of emissions sources, an emissions inventory for such sources, and several pieces of information regarding potential control measures for these sources.

b. Final Rule. The final rule remains relatively unchanged from the proposal. To ensure that attainment plan submissions contain the necessary supporting information for EPA review and approval of the state's selected BACM and BACT and additional feasible measures as applicable, 40 CFR 51.1010(a)(1)–(5) require the state to submit the following information as part of its Serious area attainment plan submission:

(1) A list of all emissions source categories, sources and activities in the nonattainment area that emit direct PM_{2.5} or any PM_{2.5} precursor (for multi-state nonattainment areas, this would include source categories, sources and activities from all states which make up the area);

(2) For each source category, source or activity in the nonattainment area, an inventory of direct PM_{2.5} and all PM_{2.5} precursor emissions;

(3) For each source category, source or activity in the nonattainment area, a comprehensive list of potential control measures considered by the state for the nonattainment area;^{173 174}

(4) For each potential control measure considered by the state but eliminated from further consideration due to a determination by the state that the control measure or technology was not technologically feasible, a narrative explanation and quantitative or qualitative supporting documentation to justify the state's conclusion;

(5) For each technologically feasible emission control measure or technology, the state must provide the following information relevant to economic feasibility: (i) The control efficiency by pollutant; (ii) the possible emissions reductions by pollutant; (iii) the estimated cost per ton of pollutant reduced; and, (iv) a determination of whether the measure is economically feasible, with narrative explanation and quantitative supporting documentation to justify the state's conclusion;

(6) For each technologically and economically feasible emission control measure or technology, the date by which the technology or measure can be implemented.

As with a Moderate area attainment plan submission, the EPA recognizes that the base year emissions inventory that the state submits for the area in conjunction with its Serious area attainment plan will likely contain the information required under the first two items in this list. However, the EPA believes that it is incumbent on the state to ensure that the information needed for the EPA to evaluate the state's BACM and BACT and additional feasible measures analysis is presented as part of that analysis and in a format that provides transparency, consistency and the ability for another party to evaluate the state's analysis effectively and to duplicate the state's results. For this reason, the EPA is requiring the state to include the base year emissions inventory information with the BACM and BACT submission and as one element of the state's attainment plan due 18 months after reclassification of the area to Serious.

c. Comments and Responses. Any additional comments received on this section are addressed in the Response to Comments document found in the docket for this action.

4. Criteria for Effective Regulations to Implement BACM and BACT and Additional Feasible Measures

a. Summary of Proposal. The proposal described the four main criteria for effective control measure regulations: such regulations must be quantifiable, enforceable, replicable, and accountable.

b. Final Rule. Guidance on effective control measure regulations is provided in the control strategy discussion for Moderate areas. See section IV.D.9 of this preamble, criteria for effective regulations to implement RACM and RACT and additional reasonable measures.

5. Relevance of Prior BACT, LAER and BART Determinations

a. Summary of Proposal. The preamble of the proposed rule stated that it should not be assumed that past control technology determinations would automatically be deemed to meet the Serious area control measure requirements (BACM, BACT, or additional feasible measures) for an area.

b. Final Rule. The guidance on this issue in the preamble to the final rule remains largely unchanged. The EPA believes that BACT or lowest achievable emission rate (LAER) provisions for new sources (as distinct from BACT for existing sources), or best available retrofit technology (BART) for existing sources, could potentially qualify as BACM or BACT for purposes of meeting the Serious area attainment plan requirements. However, the EPA does not believe it is appropriate for a state to assume that just because a certain control technology was determined to meet BACT, LAER, or BART criteria for a new source sometime in the past, that such a control will also automatically meet the criteria for BACM or BACT or additional feasible measures for attainment planning purposes because the regulated pollutant or source applicability may differ and the analyses may be conducted many years apart. Thus, a state may not simply rely on prior BACT, LAER or BART analyses for the purposes of showing that a source has also met BACT for the relevant PM_{2.5} NAAQS. Rather, the EPA expects that in Step 2 of the BACM and BACT determination process, the state would identify such measures as "existing measures" that should be further evaluated as potential BACM or BACT or additional feasible measures. At the same time, the EPA notes that the presence of previously installed control technology, and the technical and economic considerations that would be associated with upgrading to a measure that achieves greater reductions, is something that should be considered in the assessments of technological and economic feasibility of the newer measure.

c. Comments and Responses. Any additional comments received on this section are addressed in the Response to Comments document found in the docket for this action.

6. Multi-state Nonattainment Areas

a. Summary of Proposal. The preamble to the proposed rule provided general guidance on coordination between states in multi-state nonattainment areas to ensure they

¹⁷³ The EPA believes that it is not necessary to identify every possible variation of every type of control measure, or all possible combinations of technologies and measures that would apply to a given source or activity, as long as the state has properly characterized the potentially available emissions reductions and their costs. For example, the EPA believes that the state can conduct a thorough analysis of VMT reduction measures without including every possible level or stringency of implementation of certain possible measures or combinations of measures for reducing VMT, so long as those measures would not affect the overall assessment of VMT reduction capabilities and the associated costs.

¹⁷⁴ The Menu of Control Measures document is available at: <http://www3.epa.gov/ttn/naaqs/pdfs/MenuOfControlMeasures.pdf>.

adopt sufficient BACM/BACT and additional feasible measures to ensure expeditious attainment of the standard.

b. Final Rule. The guidance in the final rule remains largely unchanged. States that share a multi-state Serious PM_{2.5} nonattainment area must consult with one another on BACM and BACT and additional feasible measures that will be required for the nonattainment area in the different states. This requirement would be consistent with the overall requirements for BACM and BACT and additional feasible measures determinations, as all states with Serious areas need to consider implementing BACM and BACT-level measures that have been implemented in other states, even if those measures incur higher costs. The EPA anticipates that states may potentially adopt controls that differ from state to state, based upon each state's determination of what qualifies as "best" given the mixture of sources and potential controls in the state portions of relevant nonattainment areas, subject to EPA approval. If the state can adequately demonstrate that its chosen BACM and BACT and additional feasible measures fully meet the EPA's proposed criteria for such measures, then the agency may consider approving individual state plans that differ in implementation of control measures.

c. Comments and Responses. Any additional comments received on this section are addressed in the Response to Comments document found in the docket for this action.

7. Environmental Justice Considerations for Developing the Attainment Plan Control Strategy for a Serious PM_{2.5} Nonattainment Area

a. Summary of Proposal. The proposal provided general guidance for ensuring that overburdened populations are appropriately protected.

b. Final Rule. The guidance in the final rule remains largely unchanged. The EPA strongly urges states to consider the environmental justice aspects of any control measures they have identified as BACM and BACT or additional feasible measures in order to provide health protection for overburdened populations. Please see Section XI of this preamble, which discusses possible approaches for states to address environmental justice concerns associated with implementation of the PM_{2.5} NAAQS in their SIP development process and attainment plans.

c. Comments and Responses. Any additional comments received on this section are addressed in the Response to

Comments document found in the docket for this action.

E. Modeling for Attainment Demonstrations

1. Due Dates for Submission of Serious Area Attainment Demonstrations

a. Summary of Proposal. Section IV.E of this preamble describes the EPA's attainment demonstration and modeling requirements for Moderate area plans. The EPA proposed that the same general attainment demonstration and modeling requirements for Moderate area plans should apply to Serious area attainment demonstrations. However, Serious area plans have additional statutory requirements.

Attainment demonstrations are due 18 months after reclassification if the EPA reclassifies the area to Serious after failure of the area to attain the applicable Moderate area deadline. Alternatively, CAA section 189(b)(2) requires states with designated Serious nonattainment areas to submit attainment demonstrations no later than 4 years after reclassification of the area to Serious if the reclassification occurs before the Moderate area attainment deadline. The EPA proposed an approach for determining an appropriate attainment plan control strategy for a Serious PM_{2.5} nonattainment area that requires the state to submit the attainment demonstration for the area within 18 months after reclassification, regardless of when or the authority under which an area was reclassified to Serious.

b. Final Rule. The statutory attainment demonstration provisions for Serious areas are as follows: Section 189(b) of the CAA requires a state with a designated Serious nonattainment area to submit an attainment plan for such area. As discussed earlier, CAA section 189(b)(1)(A) more specifically requires the state to submit an attainment demonstration including air quality modeling to establish either: (i) That the area will attain the relevant NAAQS by the applicable attainment date, or (ii) if the state is seeking an extension of the attainment date, that it is impracticable for the area to attain the relevant NAAQS by the statutory Serious area attainment date. For Serious nonattainment areas, the attainment date is as expeditiously as practicable, but no later than the end of the tenth calendar year after designation as nonattainment. A demonstration that shows that it is impracticable for the area to attain within this timeframe must also provide for attainment of the NAAQS by the most expeditious alternative date practicable, but no later

than 5 years after the maximum statutory Serious area attainment date (based on the criteria specified in CAA section 188(e)).

The EPA is not finalizing the proposed approach of requiring all Serious area attainment demonstrations to be due 18 months after reclassification. If the EPA reclassifies the area to Serious after failure of the area to attain the applicable Moderate area deadline, the attainment demonstration will be due in 18 months. States with Serious nonattainment areas that were reclassified before the Moderate area attainment deadline must submit attainment demonstrations the earlier of 4 years after reclassification of the area to Serious or the end of the eighth calendar year after initial designation. However, these areas are still required to submit BACT/BACM measures within 18 months of being reclassified as Serious. Sections VI.A and VI.D of this preamble describe more fully the EPA's approach for plan due dates and control strategy analyses for all elements of a Serious area attainment plan. Section VI.J of this preamble provides a complete discussion of the EPA's criteria for granting a Serious area attainment date extension.

c. Comments and Responses. Any comments received on this section are addressed in the Response to Comments document found in the docket for this action.

2. Attainment Demonstration Requirements for Serious Areas

a. Summary of Proposal. The proposal described the attainment demonstration and impracticability demonstration requirements for Serious nonattainment areas. The EPA proposed that a serious area plan must include an attainment demonstration that demonstrates how a state will attain the PM_{2.5} NAAQS by the applicable attainment date, must include analyses supporting the state's determination of its proposed attainment date, and must show that the area will attain the NAAQS as expeditiously as practicable, but not later than the tenth calendar year after designation. The proposal indicated that in order to establish that the attainment date is as expeditious as practicable, the state must explain why the control measures adopted in the attainment plan provide for the most expeditious attainment and must include all BACM and BACT controls in the analysis.

b. Final Rule. The final rule requirements for Serious area attainment demonstrations are generally unchanged from the proposal. As described in Section IV.E of this

preamble, an attainment demonstration is a plan that demonstrates how a state will attain the PM_{2.5} NAAQS by the applicable attainment date. The EPA is finalizing a requirement that the demonstration for Serious areas must consist of: (i) Technical analyses such as base year and future year modeling of emissions which identify sources and quantify emissions that are contributing to violations of the PM_{2.5} NAAQS; and, (ii) analyses of future year projected emissions reductions and air quality improvement resulting from existing (*i.e.* already-adopted or “on the books”) national, regional and local programs, and potential new local measures needed for attainment, including RACM and RACT and BACM and BACT controls for the area, as well as other measures either inside the nonattainment area or outside the nonattainment area but within the state that could potentially accelerate attainment. Each state with a Serious nonattainment area must submit an attainment plan with an attainment demonstration that includes analyses supporting the state’s determination of its proposed attainment date. In all cases, the state must show that the area will attain the NAAQS as expeditiously as practicable, but not later than the tenth calendar year after designation. In order to establish that the attainment date is as expeditious as practicable, the state must explain why the control measures adopted in the attainment plan provide for the most expeditious attainment and must include all BACM and BACT controls in the analysis.

A state with a Serious nonattainment area can also submit an impracticability demonstration (under CAA section 189(b)(1)(A)(ii)) as part of seeking an extension of the attainment date under CAA section 188(e). The impracticability demonstration for a Serious area would be similar to an impracticability demonstration for Moderate areas because it must show that the area will not be able to attain the PM_{2.5} NAAQS by the latest possible statutory attainment date, which in this case is by the end of the tenth calendar year following designation.

In order to support a Serious area impracticability demonstration, the state must show (through modeling) that attainment cannot be reached by the latest statutory Serious area attainment date, even if all RACM and RACT and BACM and BACT controls, as well as other measures either inside the nonattainment area or outside the nonattainment area but within the state (as may be necessary to meet the requirements of 172(c)(6)), were implemented before the attainment date.

Moreover, in addition to the Serious area impracticability demonstration, to support an extension of the attainment date, the Serious area plan must demonstrate (again, using air quality modeling) that it provides for attainment by the most expeditious alternative date practicable employing MSM, as specified in CAA section 188(e). (MSM are discussed in more detail in Section VI.J of this preamble). As a result, the required plan in the case of a Serious area that cannot attain by the statutory attainment date is both an impracticability demonstration (to justify an extension beyond the statutory attainment date) and an attainment demonstration that serves as the basis for proposing an appropriate alternative attainment date. Note that this is different from a Moderate area impracticability demonstration, which is not required to serve as the basis for proposing a new area attainment date.

c. Comments and Responses. Any comments received on this section are addressed in the Response to Comments document found in the docket for this action.

3. Air Quality Modeling Required for Serious Area Attainment Demonstrations and Impracticability Demonstrations

a. Summary of Proposal. The EPA proposed to require air quality modeling in support of both a Serious area attainment demonstration and a Serious area impracticability demonstration.

b. Final Rule. The EPA is finalizing a requirement for states to submit air quality modeling in support of both attainment demonstrations and impracticability demonstrations for Serious PM_{2.5} nonattainment areas. Unlike the impracticability demonstration for Moderate areas described in CAA section 189(a)(1)(B)(ii), the impracticability demonstration for Serious areas in CAA section 189(b)(1)(A)(ii) also requires air quality modeling establishing the most expeditious alternative attainment date practicable. Therefore, air quality modeling is a required element in all attainment demonstrations for Serious areas.

Some commenters believed that both Moderate and Serious area impracticability demonstrations must include air quality modeling. The EPA does not agree and believes the statute only requires air quality modeling for Serious area impracticability demonstrations. This stems from the slightly different statutory construction in CAA section 189(b)(1)(A) compared to CAA section 189(a)(1)(B). Section 189(b)(1)(A) of the CAA specifies an air

quality modeling requirement as a parenthetical, which the EPA interprets to apply to both the requirements in CAA section 189(b)(1)(A)(i) [attainment demonstrations] and CAA section 189(b)(1)(A)(ii) [impracticability demonstrations]. Additionally, the fact that a Serious area impracticability demonstration must also include an attainment demonstration with an alternative attainment date logically supports the final rule conclusion that a Serious area impracticability demonstration must include air quality modeling. Modeling is needed to demonstrate attainment and to propose an alternative attainment date for the Serious area. This differs from a Moderate area impracticability demonstration, which only serves to demonstrate that attainment cannot be reached by the Moderate area attainment date. A Moderate area impracticability demonstration does not require a demonstration of attainment or setting of an alternative future attainment date. It merely starts the process of reclassifying an area to Serious and the eventual required submission of a Serious area implementation plan.

Other than the timing of plan submissions and additional required elements of a Serious area plan (such as BACM and BACT), the relevant air quality modeling procedures and guidance for Moderate and Serious area plans are the same. *See* Section IV.E of this preamble for more details on the modeling requirements and guidance for all PM_{2.5} nonattainment areas.

c. Comments and Responses. Any additional comments received on this section are addressed in the Response to Comments document found in the docket for this action.

4. Attainment Demonstrations Required To Be Submitted by an Area Reclassified to Serious

a. Summary of Proposal. The proposal discussed the attainment demonstration requirements for Moderate nonattainment areas that subsequently are reclassified to Serious nonattainment. The EPA proposed that states with Moderate nonattainment areas that get reclassified to Serious nonattainment areas must first submit a Moderate area plan and then a separate Serious area plan.

b. Final Rule. The EPA is finalizing requirements for states to submit a Moderate area attainment demonstration (or impracticability demonstration) and then if reclassified to Serious nonattainment, a separate Serious area attainment demonstration. Under CAA section 189(a)(1)(B), a state with a

Moderate nonattainment area is required to submit a demonstration that the area either will attain or cannot practicably attain the NAAQS by the statutory attainment date. Regardless of whether the state submits an attainment demonstration or an impracticability demonstration for a Moderate area, if such an area is reclassified to Serious prior to or after failing to attain the applicable NAAQS, the state is required under CAA section 189(b)(1)(A) to submit a new attainment demonstration as part of an area's Serious area attainment plan. The separate statutory requirements for Moderate and Serious nonattainment areas anticipate two separate attainment plan submissions, and the EPA's existing guidance in the General Preamble and Addendum further support this expectation. While the state is required to submit a separate Serious area attainment plan, the EPA anticipates that certain control strategies may build upon those previously adopted and implemented as part of the Moderate area plan. For example, an area dominated by wood smoke emissions may not attain the standard by the statutory Moderate area attainment date because all necessary woodstove change-outs could not occur in that timeframe, but additional woodstove change-outs could occur by the statutory Serious area attainment date.

c. Comments and Responses

Comment: Some commenters agreed with the EPA that areas seeking to be reclassified from moderate to serious must submit two separate attainment plan submissions. The commenter stated the Act promises that all areas, even the most polluted, will implement reasonably available controls and provide at least some interim health protections while preparing a serious area plan containing more protective requirements.

Response: The EPA agrees with the comment. In the final rule, an area that is reclassified to Serious must submit both Moderate and Serious area plans, and all statutory requirements for a Moderate area (including RACT and RACM) must be met by the statutory deadline.

5. Future Year(s) To Be Modeled in Attainment Demonstrations

a. Summary of proposal. A state performing a modeling analysis for an attainment demonstration or a Serious area impracticability analysis must select a future year for the analysis. The EPA proposed that for an attainment demonstration, a state should select the future modeling year such that all

emissions control measures relied on for attainment will have been implemented by the beginning of that year. The EPA recommended the last year of the statutory attainment date as a starting point for Serious nonattainment area modeling demonstrations.

b. Final Rule. The EPA is finalizing a requirement that all emissions control measures relied on for attainment must have been implemented by the beginning of the attainment year. See 40 CFR 51.1011(b)(6). To demonstrate attainment, the modeling results for the nonattainment area must predict that emissions reductions implemented by the beginning of the last calendar year preceding the attainment date will result in PM_{2.5} concentrations that meet the level of the standard.¹⁷⁵

While states should choose the future modeling year based on a number of factors, the EPA recommends the last year of the statutory attainment date as a starting point for modeling for two reasons. First, a state with a Serious area for which it submits an attainment date extension request under CAA section 188(e) must show that the area cannot practicably attain the NAAQS by the end of the tenth calendar year following designation of the area. Therefore, the appropriate future modeling year for making such a demonstration is the tenth year after designations. Even if a state does not submit (or does not intend to submit) a Serious area attainment date extension request, modeling the tenth year is a logical starting point to determine if attainment by year ten is likely. If attainment-level concentrations of PM_{2.5} are not expected in the tenth calendar year after designations, then the area must also, as a requirement to receive an extension of the Serious area attainment date, submit a demonstration (using air quality modeling) that provides for attainment by the most expeditious alternative date practicable, but no later than the end of the fifteenth year after designation, with the implementation of MSM (see Section VI.J of this preamble for details about MSM determinations).

Second, even though attainment of any PM_{2.5} NAAQS is determined by averaging 3 years of ambient data, states do not have to model 2 years before the attainment date to show modeled attainment. Since the design value is an average of the annual or 98th percentile value for 3 consecutive years, attainment can still be shown even if

concentrations exceed the NAAQS in one or more of the 3 years used to determine attainment (as long as the average of the three annual values is less than the NAAQS). Therefore, it is appropriate to model any of the 3 years used to determine attainment. For these reasons, it is acceptable, and may in fact be most efficient, for a state to begin the Serious area attainment demonstration process by modeling the final year of the statutory attainment date to determine future year modeled PM_{2.5} concentrations in the tenth year after designations.

Because an area must attain "as expeditiously as practicable," additional considerations are necessary before an attainment date can be established. Criteria for establishment of the Serious area attainment date are discussed in Section VI.I of this preamble. In evaluating such considerations, the question arises as to whether additional future modeling is required beyond the recommended final year modeling just discussed. For purposes of determining the attainment date that is as expeditious as practicable, the state must conduct future year modeling that takes into account growth and known controls (including any controls that were previously determined to be RACM and RACT for the area). For example, for an area designated nonattainment for the 2012 PM_{2.5} NAAQS in 2015 and subsequently reclassified to Serious in 2021, a future case scenario for the year 2025 (10 years after the initial nonattainment designation) would be needed to examine whether existing federal, state, and local measures (including previously identified and implemented RACT/RACM controls for the area) plus the BACM and BACT identified by the state would result in attainment. Since the EPA is finalizing the requirement that BACM and BACT must be determined independent of the attainment demonstration for the area, the future case scenario must include BACM and BACT controls in the analysis plus any additional measures on sources inside and outside of the nonattainment area (but within the state) that the state has identified as feasible to implement by the attainment date. Note that similar to RACM and RACT, BACM and BACT controls must be implemented within 4 years after reclassification to Serious nonattainment. In order to justify an extension of the attainment date beyond the end of the tenth year after designation, the state must show that attainment by that date (including the anticipated emissions reductions from

¹⁷⁵ Note that for purposes of the PM_{2.5} NAAQS, a determination of attainment (or failure to attain), which the EPA is required to make after the attainment date has passed, is based on ambient data from the most recent 3 years prior to the attainment date for the area.

RACM and RACT and additional reasonable measures, and BACM and BACT and additional feasible measures) would be impracticable. Any proposed attainment date after the 10 year period must include modeling of BACM and BACT controls plus the most stringent measures that are included in the implementation plan of any state and can be feasibly implemented in the area. The attainment date extension beyond 10 years can be for up to 5 additional years, but the proposed attainment date must also be shown to be as expeditious as practicable. Section VI.J of this preamble provides a complete discussion of the EPA's proposed interpretation of the statutory requirements for a Serious area attainment date extension under CAA section 188(e).

As with Moderate area attainment demonstrations, the EPA believes that it is not necessary or reasonable to require states to model each and every year to determine the appropriate attainment date for a Serious PM_{2.5} nonattainment area given the resource demands associated with modeling.¹⁷⁶ In some cases it may be reasonable to model one additional interim year before the maximum statutory attainment date. However, in most cases, the air quality benefits of an identified set of reasonable control measures, BACM and BACT and additional feasible control measures can be estimated through model sensitivity analyses and the development of sensitivity factors (factors to relate tons of emissions reductions in the area to PM_{2.5} concentration changes in the area). For example, states can model across the board percentage reductions in direct PM_{2.5} and/or precursor emissions (in separate model runs or using advanced modeling techniques such as DDM) to determine the impact of emissions reductions on PM_{2.5} concentrations in the area. This modeling can be performed with a single attainment year modeling platform, which is much less resource intensive than modeling multiple additional future years. The EPA strongly recommends that states discuss the selection of the future year(s) to model with their respective EPA Regional Office as part of the modeling protocol development process prior to embarking on the modeling.

c. Comments and Responses. Any comments received on this section are addressed in the Response to Comments

document found in the docket for this action.

6. Attainment Year Motor Vehicle Emissions Budgets

As with Moderate areas, the transportation conformity rule requires that Serious area attainment plans establish motor vehicle emissions budgets for the area's attainment year. Therefore, once a Serious area's attainment date has been established, the state is required to establish motor vehicle emissions budgets for direct PM_{2.5} and any relevant PM_{2.5} precursor for the attainment year.¹⁷⁷ If a state's SIP submission demonstrates that a Serious area cannot attain by the end of the tenth calendar year after the area's designation, motor vehicle emissions budgets are not required for that tenth calendar year, but are required for the year that the state demonstrates to be the area's attainment year. A motor vehicle emissions budget for the purposes of a Serious area PM_{2.5} attainment plan is that portion of the total allowable emissions within the nonattainment area allocated to on-road sources as defined in the submitted attainment plan.¹⁷⁸ Such motor vehicle emissions budgets would be calculated using the latest planning assumptions and the latest approved motor vehicle emissions model available at the time that the attainment plan is developed, unless EPA approves the state's use of an alternative model.¹⁷⁹

F. RFP Requirements

1. General Approach to RFP

a. Summary of the Proposal. The EPA generally proposed that a state must submit an RFP plan as part of any attainment plan submission for a Serious nonattainment area in order to satisfy the statutory requirements for RFP, similar to a Moderate area attainment plan. The EPA proposed that the applicable baseline year must be the same year as that represented by the latest base year inventory for the Serious area. The EPA proposed that the state must include in its RFP analysis the

¹⁷⁷ For more information on PM_{2.5} precursor requirements, see CAA section 93.102(b)(2)(iv) and (v) of the transportation conformity rule. See also the May 6, 2005, final transportation conformity rule that addressed requirements for PM_{2.5} precursors. (70 FR 24280).

¹⁷⁸ A state would also establish motor vehicle emissions budgets for an area's attainment year. Those budgets would be the motor vehicle emissions that the SIP establishes as being necessary to attain the NAAQS.

¹⁷⁹ If an area includes re-entrained road dust in the motor vehicle emissions budget, the latest approved version of AP-42 should be used unless the EPA has approved an alternative model for the area.

anticipated emissions reductions expected to be achieved through the implementation of control measures required by the control strategy explained in Section VI.D of this preamble (BACM and BACT, additional feasible measures and MSM if applicable). As with RFP plans for Moderate areas, the EPA proposed that a state must submit RFP projected emissions as part of the RFP plan for any Serious PM_{2.5} nonattainment area following the same guidance that applies to emissions inventories for attainment plans (see Section VI.B of this preamble for a complete discussion of emissions inventories for Serious area attainment plans). The EPA also proposed that motor vehicle emissions budgets must also be established for direct PM_{2.5} and any PM_{2.5} plan precursor using the latest planning assumptions and the latest approved motor vehicle emissions model available at the time that the Serious area attainment plan is developed.¹⁸⁰ It was not necessary to propose that RFP plans for Serious areas include motor vehicle emissions budgets for direct PM_{2.5} and any PM_{2.5} plan precursor because, as stated in the section of this rule that addresses RFP requirements for Moderate PM_{2.5} areas, the transportation conformity rule already requires that RFP plans establish motor vehicle emissions budgets. RFP plans would therefore be required to establish motor vehicle emissions budgets for direct PM_{2.5} and any relevant PM_{2.5} plan precursor. The EPA also proposed that guidance found in the Moderate nonattainment areas RFP section of the proposal should also apply to Serious nonattainment areas.

b. Final Rule. The EPA is finalizing rule provisions for Serious areas that essentially mirror the approach to Moderate areas found in Section IV.F of this preamble. The EPA is further clarifying application of those provisions by providing guidance that closely follows the Moderate area guidance regarding how to prepare an RFP plan, RFP projected emissions, geographic coverage of emission sources for RFP, and RFP requirements for multi-state nonattainment areas.

As with a Moderate area attainment plan, the EPA is finalizing that a state must submit an RFP plan as part of any Serious area attainment plan in order to satisfy the statutory requirements for RFP. The plan must contain appropriate information to demonstrate that adequate emissions reductions will be achieved through control measures in the attainment plan in order to meet the

¹⁸⁰ *Ibid.*

¹⁷⁶ States with Serious areas that request an attainment date extension beyond 10 years must model the tenth year after designation of the area as part of an impracticability demonstration, plus an additional year beyond that which represents the attainment date.

statutory definition of RFP. The plan must include three components: (1) An implementation schedule for control measures on sources in the nonattainment area, (2) RFP projected emissions for each applicable quantitative milestone year determined in Section VI.G of this preamble, based on the anticipated control measure implementation schedule; and (3) an analysis that demonstrates that this schedule of aggregate emissions reductions achieves sufficient progress toward attainment between the applicable baseline year to the attainment year. For additional discussion of each of the components of the RFP plan, refer to Section IV.F of this preamble. See 40 CFR 51.1012(a).

The EPA requires that the applicable baseline year must be the same year as that represented by the latest base year inventory for the Serious area. The projected attainment year may be up to the end of the tenth year following designation for a Serious area that can demonstrate attainment pursuant to CAA section 189(b)(1)(A), or up to the end of the fifteenth year following designation for a Serious area that sought an extension of the statutory attainment date pursuant to CAA section 188(e).¹⁸¹ As with Moderate areas, the RFP analysis must clearly convey how the schedule for implementing the control strategy will provide for generally linear or stepwise progress towards attainment. If stepwise progress is more appropriate for the specific nonattainment area, the state is required to submit a clear rationale and supporting information to explain why generally linear progress towards attainment in the area is not appropriate (e.g., due to the nature of the nonattainment problem, the types of sources contributing to PM_{2.5} levels in the area, and the ability to perform timely implementation of control measures). For a Serious area, the EPA requires that the state must include in its RFP analysis the anticipated emissions reductions expected to be achieved through the implementation of control measures required by the control strategy described in Section VI.D of this preamble (BACM and BACT, additional feasible measures and MSM, if applicable). Similar to Moderate areas, the optional air quality analysis discussed in Section IV.F of this preamble is also available for use by a state preparing a Serious area RFP plan.

Additionally, the EPA requires that motor vehicle emissions budgets must also be established for direct PM_{2.5} and PM_{2.5} plan precursors using the latest planning assumptions and the latest approved motor vehicle emissions model available at the time that the Serious area attainment plan is developed.¹⁸² See 40 CFR 51.1012(a).

Finally, similar to Moderate areas, Serious areas that are multi-state or multi-jurisdictional shall provide RFP plans for each state represented in the nonattainment area that demonstrate RFP on the basis of common multi-state inventories. The states or jurisdictions within which the area is located must provide a coordinated RFP plan. For further information, see Section IV.F.5 of this preamble. See 40 CFR 51.1012(b).

c. Comments and Responses. Any additional comments received related to RFP are addressed Section IV.F of this preamble or in the Response to Comments document found in the docket for this action.

G. Quantitative Milestones

1. Summary of the Proposal

The EPA proposed that a Serious area plan for an area that can demonstrate attainment by the statutory Serious area attainment date must also include quantitative milestones to be reached 7.5 and 10.5 years from designation, to help assess the state's progress toward attaining the PM_{2.5} NAAQS in the event the area fails to attain by the applicable attainment date. For a Serious area that cannot demonstrate attainment by the statutory Serious area attainment date, the EPA proposed that the state must include in the Serious area attainment plan quantitative milestones to be achieved at 7.5, 10.5 and 13.5 years from the area's date of designation.

The EPA proposed that the general approach to selecting quantitative milestones outlined in the Moderate nonattainment area section of the proposal should apply to any attainment plan for a PM_{2.5} nonattainment area, independent of its classification. Specifically, the EPA proposed that states be allowed to select the quantitative milestones that they identify as appropriate and quantifiable and that will provide for objective evaluation of progress toward attainment in their Serious PM_{2.5} nonattainment area, and that the EPA, in its attainment plan approval process, will determine if they satisfy the

statutory requirements of CAA section 189(c). Additionally, the EPA proposed to require that, at a minimum, states must include in all attainment plans for Serious PM_{2.5} nonattainment areas a measure to confirm that some specific portion of BACM and BACT for the area has been implemented as appropriate in order to comply with the statutory requirement at CAA section 189(b)(1)(B).

2. Final Rule

The final rule provisions for Serious area quantitative milestones are similar to such provisions for Moderate areas discussed in Section IV.G of this preamble. As required for Moderate areas, Serious area attainment plans must include quantitative milestones that demonstrate RFP towards attainment to be achieved every 3 years until the area is redesignated to attainment. To account for variations in the timing of possible additional plans that may be required beyond the Serious area attainment plan (such as a plan revision under CAA section 189(d) for a Serious area that fails to attain) the EPA is also clarifying, consistent with the requirements discussed in Section IV.G of this preamble for Moderate areas, that all Serious area attainment plans must contain one additional quantitative milestone to be met in the 3-year period beyond the applicable Serious area attainment date. This will provide the EPA with appropriate tools necessary to continue to monitor the area's continued progress toward attainment in the event that the area fails to attain and develops a new attainment plan.

For an area that is discretionarily reclassified to Serious under the provisions of CAA section 188(b)(1), the Serious area plan must contain quantitative milestones to be achieved by 7.5 years from the area's date of designation as nonattainment. In this case, the 7.5 year quantitative milestone that was submitted with the Moderate area plan may still be sufficient to demonstrate RFP or may have to be adjusted to reflect the difference in actual progress from the projections of the Moderate area plan. For an area that is reclassified to Serious under CAA section 188(b)(2) due to failure to attain, the 7.5 year quantitative milestones that were submitted with the Moderate area plan are still required and would be sufficient for the EPA to evaluate the area's progress toward attaining the NAAQS while the Serious area plan is being developed. All Serious area plans must also include quantitative milestones to be achieved 10.5 years from designation, to help assess the state's progress toward attaining the

¹⁸¹ As noted in Section V.B of this preamble, depending upon when the area is reclassified from Moderate to Serious, this base year inventory may need to be more recent than the inventory submitted with the Moderate area attainment plan.

¹⁸² If an area includes re-entrained road dust in the motor vehicle emissions budget, the latest approved version of AP-42 should be used unless the EPA has approved an alternative model for the area.

PM_{2.5} NAAQS in the event the area fails to attain by the applicable attainment date. Finally, for a Serious area that cannot demonstrate attainment by the statutory Serious area attainment date, the state must include quantitative milestones to be achieved every 3 years, such that the final milestone falls within the 3 years after the applicable Serious area attainment date. For example, if a state requests an attainment date extension to 14 years after designation pursuant to CAA section 188(e), the attainment plan should contain not only the 7.5 and 10.5 year milestones, but also milestones to be achieved 13.5 and 16.5 years from designation.

The Addendum included guidance that recommended milestones “should be addressed by quantifying and comparing the annual incremental emissions reductions which result from implementation of BACM and BACT (required within 4 years after the area is reclassified as serious) and from additional measures included in the final serious area SIP to those reductions which were identified in the SIP as quantitative milestones necessary to achieve the NAAQS by the applicable attainment date.”¹⁸³ The final rule does not specify that the milestones must be expressed in terms of emissions reductions. While the EPA notes that the Addendum contains this fundamental concept, it is impractical to expect that a state will always be able to quantify and compare real and projected emissions reductions, and submit a report to the EPA within 90 days of a given milestone, as required under CAA section 189(c)(2). Therefore, the final rule requires that states selecting quantitative milestones for a Serious area plan should use the approach outlined for Moderate areas, as described in Section IV.G of this preamble. This approach applies to any attainment plan for a PM_{2.5} nonattainment area, independent of its classification. Specifically, the final rule requires that states be allowed to select the quantitative milestones that they identify as appropriate and quantifiable and that will provide for objective evaluation of progress toward attainment in their Serious PM_{2.5} nonattainment area, and that the EPA, in its attainment plan approval process, will determine if they satisfy the statutory requirements of CAA section 189(c). See 40 CFR 51.1013(a)(2).

In addition to this general approach for selecting quantitative milestones and similar to what the final rule requires for Moderate area attainment plans, the

final rule requires that, at a minimum, states must ensure that the quantitative milestones for Serious PM_{2.5} nonattainment areas assure RFP is being met by demonstrating that BACM and BACT have been implemented, as appropriate considering the timing of the milestone report, in order to comply with the statutory requirement at CAA section 189(b)(1)(B). The agency is further finalizing a corresponding requirement for Serious PM_{2.5} nonattainment areas that receive an attainment date extension. For these areas, the quantitative milestone should assure that RFP is being met by demonstrating that MSM for the area has been implemented as required pursuant to CAA section 188(e). This requirement was not specifically outlined in the proposal. However, while considering the requirements that were proposed for Serious areas, the EPA determined that including this additional provision within quantitative milestones would enable the agency to better evaluate progress toward attainment in areas that receive a Serious area extension. The EPA acknowledges that the precise quantifiable metric for a quantitative milestone (e.g., 50 percent of BACM and BACT measures implemented by milestone date 7.5 years from designation) would need to be determined on a case-by-case basis, as it would depend upon the date of reclassification of the area, which quantitative milestone (i.e., 7.5 or 10.5 years from designation), and the anticipated implementation timing and nature of the BACM and BACT controls themselves. Nonetheless, the EPA believes it is appropriate to include confirmation that such control measures and technologies are implemented as a metric that any state with a Serious nonattainment area must adopt as a quantitative milestone to demonstrate RFP (and thus must demonstrate compliance with when they submit their milestone report), as it derives from a statutory provision that applies to all Serious areas and thus represents a milestone that all Serious nonattainment areas must meet.

Additional provisions discussed in the Moderate area quantitative milestones requirements in Section IV.G of the preamble also apply to Serious areas. Specifically, if a Serious area submitted the optional air quality targets with the RFP plan then an air quality based milestone (i.e., one that is expressed in terms of an ambient PM_{2.5} level) is strongly recommended to be included in order to confirm that the air quality target has been met for the

quantitative milestone year. If used, this milestone will be compared to the most recently certified monitored ambient air data as part of the milestone report due after the area reaches each quantitative milestone date. For additional details on this optional provision, refer to Section IV.G of this preamble.

Finally, the quantitative milestone report requirements outlined in Section IV.G of this preamble apply to Serious areas as well. Specifically, the requirements associated with the timing and contents of the quantitative milestone report submission for a Moderate area also requirements in a Serious area. For additional details on these requirements, refer to Section IV.G of this preamble. See 40 CFR 51.1013(b).

3. Comments and Responses

Any additional comments received on this section are addressed in Section IV.G of this preamble or in the Response to Comments document found in the docket for this action.

H. Contingency Measures

1. Summary of the Proposal

In the proposal, the EPA proposed that the criteria for identifying and selecting contingency measures for a Serious area attainment plan should be the same as those for Moderate area plans. The EPA also proposed that, as with Moderate areas, a state may elect to rely on contingency measures that achieve emissions reductions not only from sources within the nonattainment area, but also from sources located outside the nonattainment area but within the state, provided that the measures on sources outside the designated nonattainment area are demonstrated to produce the appropriate air quality impact within the nonattainment area. As with contingency measures for Moderate area attainment plans, the EPA proposed that the emissions reductions associated with contingency measures for Serious area plans must be equal to approximately 1 year's worth of emissions reductions necessary to achieve RFP for the area, unless the state adequately demonstrates that some smaller amount of reductions is appropriate while the state is revising its attainment plan for the area. The agency also proposed options for submission deadlines for Serious area contingency measures.

2. Final Rule

As noted in Section IV.G of this preamble, all PM_{2.5} nonattainment areas must include in their attainment plans contingency measures consistent with

¹⁸³ Addendum to the General Preamble, 59 FR 41998 (August 16, 1994), at page 42016.

CAA section 172(c)(9). Contingency measures are additional control measures to be implemented in the event that an area fails to meet RFP requirements, fails to meet any quantitative milestone, fails to submit a quantitative milestone report or fails to attain the PM_{2.5} standard by the applicable attainment date. These measures must be fully adopted rules or control measures that are ready to be implemented quickly upon a determination by the EPA that a failure occurred, and such measures are required to take effect without significant further action by the state or the EPA.

The statutory contingency measure requirement at CAA section 172(c)(9) is not superseded or subsumed by any requirement under subpart 4, nor does it apply only to Moderate area attainment plans. Thus, contingency measures are required for Serious PM_{2.5} nonattainment areas as part of a state's Serious area attainment plan submission. Accordingly, the final rule requires the criteria for identifying and selecting contingency measures for a Serious area attainment plan that are the same as those for Moderate area plans. Specifically, the EPA is finalizing that the following requirements must be met in order for contingency measures to be approvable as part of a state's Serious area attainment plan submission:

(1) Contingency measures must be fully adopted rules or control measures that are ready to be implemented quickly upon a determination by the Administrator of the nonattainment area's failure to meet RFP, failure to meet any quantitative milestone, failure to submit a quantitative milestone report or failure to meet the standard by the applicable attainment date.

(2) The SIP must contain trigger mechanisms for the contingency measures, specify a schedule for implementation, and indicate that the measures will be implemented without significant further action by the state or by the EPA.

(3) Contingency measures should consist of control measures that are not otherwise included in the control strategy for the SIP, or that achieve emissions reductions not otherwise relied upon in the control strategy for the area.

(4) Contingency measures should provide for emissions reductions equivalent to 1 year's share of reductions needed to demonstrate attainment (*i.e.*, the overall needed reductions divided by the number of years from the base year to the attainment year), or approximately equivalent to 1 year's worth of air

quality improvement or emissions reductions proportional to the overall amount of air quality improvement or emissions reductions to be achieved by the area's attainment plan.

The EPA is also finalizing its proposal to allow a state to rely on contingency measures that achieve emissions reductions on sources located outside the nonattainment area, but within the state provided that the measures on sources outside the designated nonattainment area are demonstrated to produce the appropriate air quality impact within the nonattainment area.

As with contingency measures for Moderate nonattainment areas, the EPA allows a state under these circumstances to rely on additional reductions from federal or local measures already scheduled for implementation as part or all of their contingency measures. The EPA could consider such measures as meeting the contingency measure requirement as long as they produce emissions reductions in excess of those required to meet other statutory nonattainment provisions (such as to meet BACM/BACT requirements) and they can be relied on to achieve a sufficient portion of the actual emissions reductions necessary to reduce emissions in the area while the state develops a new plan to bring the area into attainment.¹⁸⁴ As with contingency measures for Moderate area attainment plans, the EPA requires that the emissions reductions associated with contingency measures for Serious area plans should be approximately equivalent to 1 year's worth of emissions reductions necessary to achieve RFP for the area, unless the state adequately demonstrates that some smaller amount of reductions is appropriate while the state is revising its attainment plan for the area. *See* 40 CFR 51.1014(b)(2).

The Addendum provided guidance related specifically to the selection and implementation of contingency measures for Serious nonattainment areas. First, the guidance indicated that "for those moderate areas reclassified as serious, if all or part of the moderate area plan contingency measures become part of the required serious area control measures (*i.e.*, BACM), then additional contingency measures must be submitted whether or not the previously submitted contingency measures had already been implemented. Further, the affected states must ensure that serious areas have adequate contingency measures considering, among other things, new information about the

potential attainment shortfall for the newly reclassified serious area."¹⁸⁵ The EPA continues to believe that this approach to the statutory contingency measure requirement is appropriate and is finalizing it for purposes of implementing the PM_{2.5} NAAQS in Serious nonattainment areas. *See* 40 CFR 51.1014.

With regard to the timing for implementing contingency measures, the EPA reiterates that the purpose of contingency measures is to ensure that corrective measures are put in place automatically at the time that the EPA makes a determination that an area has failed to meet RFP, failed to meet any quantitative milestone, failed to submit a quantitative milestone report or failed to meet the NAAQS by the applicable attainment date. For any nonattainment area, the EPA is required to determine within 90 days after receiving a state's RFP demonstration, and within 6 months after the attainment date for an area, whether the state has met their statutory obligations for demonstrating RFP or attaining the standard, as appropriate. As with Moderate areas, the EPA expects that contingency measures should become effective for Serious areas within 60 days of the EPA making its determination that the area failed to meet RFP or attain the NAAQS.

3. Comments and Responses

Comment: One commenter supported the proposal that contingency measures may be approved if they will result in the equivalent air quality improvement as would be obtained by implementing measures obtaining 1 year's worth of emissions reductions needed to demonstrate attainment.

Response: In the case where a state selected the optional RFP analysis that includes air quality targets, the EPA expects that an area contingency measures may be approved if they will result in approximately 1 year's worth of air quality improvement.

I. Attainment Dates

1. Summary of Proposal

Section 188(c) of the CAA states that the attainment date for a Serious area is to be the end of the tenth calendar year after designation. The EPA proposed to interpret the reference to "designation" in section 188(c) as meaning the "effective date of designation."

2. Final Rule

As explained earlier, section 188 establishes the attainment dates for both Moderate and Serious areas. For a

¹⁸⁴ *See* *LEAN v. EPA*, 382 F.3d 575 (5th Cir. 2004).

¹⁸⁵ Addendum to General Preamble, 59 FR 41988 (August 16, 1994), at 42015.

Serious area, CAA section 188(c)(2) provides that “the attainment date shall be as expeditiously as practicable but no later than the end of the tenth calendar year beginning after the area’s designation as nonattainment.”¹⁸⁶ For example, for an area initially designated as a Moderate nonattainment area effective in April 2015 that is reclassified to Serious at some future date, the Serious area attainment date, absent any approved Serious area attainment date extension, would be no later than December 31, 2025 (the end of the tenth calendar year after designation). As discussed in Section IV.I of this preamble, the EPA interprets the references to “designation” in CAA section 188(c) as meaning “effective date of designation,” consistent with the agency’s prior approach for implementing the previous PM_{2.5} NAAQS under subpart 1 and other NAAQS.

3. Comments and Responses

Any additional comments received on this section are addressed in the Response to Comments document found in the docket for this action.

J. Attainment Date Extensions

Background. Section 188(e) of the CAA provides that the EPA may grant a Serious area one attainment date extension of no more than 5 years “upon application by any state . . . if attainment by the [original Serious area attainment date] would be impracticable, the state has complied with all requirements and commitments pertaining to that area in the implementation plan, and the state demonstrates to the satisfaction of the Administrator that the plan for that area includes the most stringent measures that are included in the implementation plan of any state or are achieved in practice in any state, and can feasibly be implemented in the area.”

The statute also includes factors that the EPA may consider in determining whether to grant the extension and the length of the extension, including “the nature and extent of nonattainment, the types and numbers of sources or other emitting activities in the area (including the influence of uncontrollable natural sources and transboundary emissions from foreign countries), the population exposed to concentrations in excess of

the standard, the presence and concentrations of potentially toxic substances in the mix of particulate emissions in the area, and the technological and economic feasibility of various control measures.”¹⁸⁷

The proposal described the four main elements the state must submit when requesting a Serious area attainment date extension: (1) A demonstration that attainment by the statutory Serious area attainment date is impracticable; (2) a demonstration that the area is complying with all requirements and commitments in the applicable attainment plan; (3) a demonstration that the plan includes the MSM that are included in the implementation plan of any state, or are achieved in practice in any state; and (4) a demonstration of attainment by the most expeditious alternative date practicable. The proposal also included a discussion about the timing of extension request submissions, and how to interpret the second element in cases where the extension request is submitted after the state has already submitted an initial Serious area attainment plan. These topics are addressed in the following sections.

1. Demonstration That Attainment by the Statutory Serious Area Attainment Date is Impracticable

a. Summary of Proposal. The proposed rule discussed the requirements for a demonstration to show that it is impracticable for a Serious area to attain by the attainment date. This demonstration involves evaluating through air quality modeling whether all best available control measures will enable the area to attain the standard by the attainment date.

b. Final Rule. This section remains relatively unchanged from the proposal. In order to demonstrate that it is impracticable for an area to attain by the attainment date, the state would have to show that the implementation of all BACM/BACT (and additional feasible measures) will not bring the area into attainment by the statutory Serious area attainment date (*i.e.*, by no later than the end of the tenth calendar year after designation).¹⁸⁸ The statutory provision

¹⁸⁷ Notably, these statutory criteria do not include specific ambient air quality criteria like the criteria that need to be met in the year prior to a Moderate area attainment date in order for the area to qualify for an attainment date extension under CAA section 188(d).

¹⁸⁸ This proposed approach parallels the EPA’s proposed approach, described earlier in this preamble, for the impracticability option for Moderate areas under CAA section 189(a)(1)(B) in which all measures that qualify as RACM and RACT and all additional reasonable measures are required before a Moderate area plan could show

for demonstrating that it is impracticable to attain by the Serious area attainment date requires that the demonstration be based on air quality modeling (*see* CAA section 189(b)(1)(A)). Additional guidance on this demonstration is provided in Section VI.E of this preamble.

c. Comments and Responses. Any additional comments received on this section are addressed in the Response to Comments document found in the docket for this action.

2. Demonstration That the Area is Complying With all Requirements and Commitments in the Applicable Implementation Plan

a. Extension Request Submitted at the Same Time as the Serious Area Attainment Plan

i. Summary of Proposal

The EPA proposed to interpret the criterion under CAA section 188(e) that requires a state to have “complied with all requirements and commitments pertaining to that area in the implementation plan” simply to mean that the state has implemented the control measures in the SIP revisions it has submitted to address the applicable requirements in CAA sections 172 and 189. For a Serious area attainment date extension request being submitted contemporaneously with the “original” Serious area attainment plan for the area, the EPA proposed to read CAA section 188(e) not to require the area to have a fully approved attainment plan that meets the CAA’s requirements for Moderate areas. The EPA also proposed to read this provision not to bar an extension if all or part of an area’s Moderate area plan is disapproved or has been promulgated as a FIP, provided the area has complied with all of the requirements in the applicable FIP, or in the applicable SIP and FIP.¹⁸⁹

ii. Final Rule

Some commenters stated that an area should only be able to receive an extension if the Moderate area plan had been fully approved by the EPA. Other commenters agreed with the EPA’s proposed approach. They suggested that if a part of the Moderate plan had been disapproved, but it was clear that the

impracticability of attainment by the statutory Moderate area attainment date (the end of the sixth calendar year after designation).

¹⁸⁹ In *Vigil v. Leavitt*, 366 F.3d 1025, amended at 381 F.3d 826 (9th Cir. 2004), the court indicated that an area that had previously failed to meet a requirement of the CAA could still be eligible to receive an attainment date extension: “Nowhere does the provision limit extensions to those states that never made a misstep in their efforts to comply with the Act.”

¹⁸⁶ The EPA believes that there is no real effect on attainment date determinations due to the small difference in statutory language in CAA section 188(c) basing the Moderate area attainment date on the “sixth calendar year after the area’s designation” and the Serious area attainment date on the “tenth calendar year beginning after the area’s designation,” (emphasis added).

area could not practicably attain by the Serious area attainment date, then the area should be able to receive an extension. Other commenters suggested that an area should not be deprived an extension if the approval of all or part of the Moderate area attainment plan is delayed due to logistical reasons or the EPA's inability to take final action in a timely manner.

The final rule does not require the area to have a fully approved Moderate area plan when the attainment date extension request is submitted at the same time as the Serious area plan. An extension is allowed if the area is complying with all Moderate area requirements and commitments pertaining to that area in the state's submitted Moderate area implementation plan, but the plan does not need to be fully approved by EPA. The EPA considers this to be a reasonable interpretation of the statute because, as noted by commenters, there may be various reasons why an area may not have a fully approved Moderate area SIP by the time an extension request may be granted.

iii. Comments and Responses

Any additional comments received on this section are addressed in the Response to Comments document found in the docket for this action.

b. Extension Request Submitted After Submission of an "Original" Serious Area Attainment Plan

i. Summary of Proposal

For a Serious area extension request that was submitted after submission of an "original" Serious area attainment plan that contained an attainment demonstration meeting the requirements of CAA section 189(b)(1)(A)(i), the EPA proposed to read CAA section 188(e) not to require the area to have a fully approved attainment plan that meets the CAA's requirements for Serious areas, but to have a fully approved Moderate area attainment plan. The EPA stated that this proposed interpretation of this criterion would apply whether the area was reclassified to Serious under the EPA's discretionary authority (CAA section 188(b)(1)) or by operation of law upon failing to attain by the Moderate area attainment date (CAA section 188(b)(2)).

The proposal also requested comment on an "alternative interpretation" that, as pointed out by some commenters, appears to also have mistakenly required the same thing as the first option: That the state would need to have a fully approved Moderate area

attainment plan in order to receive an extension.

The EPA notes that Section VI.C of this preamble, Timing of Extension Request Submission, also discusses this issue. It requested comment on whether, for areas that had already submitted Serious area attainment plans, it would be appropriate that the state must have complied with all requirements and commitments in the area's initial Serious area plan (the EPA's preferred option), or in the Moderate area plan.

ii. Final Rule

After considering the comments received on this issue, the EPA is finalizing an approach that requires that, where a Serious area attainment date extension is being submitted *after* the initial Serious area attainment plan has been submitted, the state would need to demonstrate that it was complying with all Serious area requirements and commitments pertaining to the area in the plan it had initially submitted. However, it would not need a fully approved Serious area attainment plan. The EPA believes the state should not be prevented from obtaining an attainment date extension in the event the EPA is unable to take final action on a submitted plan in a timely manner. The original proposal did not specify Serious area provisions implementing this approach, but commenters noted the proposed analogous provisions for Moderate areas seeking 1-year extensions, and suggested that EPA should adopt a similar approach for Serious areas. Under this approach, the state would not need a fully approved Serious area plan; it would be able to receive an extension if it had already submitted the Serious area plan but had not received EPA approval yet, and if it was complying with all Serious area requirements and commitments pertaining to the area in the state's implementation plan. The EPA also considered an alternative option wherein the state would be able to receive an extension only if it had a fully approved Serious area attainment plan. The commenters did not favor this option, nor does the EPA.

iii. Comments and Responses

Any additional comments received on this section are addressed in the Response to Comments document found in the docket for this action.

3. Demonstration That the Plan Includes the MSM That Are Included in the Implementation Plan of Any State, or Are Achieved in Practice in Any State

To qualify for any extension of a Serious area attainment date, CAA section 188(e) requires a state to "demonstrate to the satisfaction of the Administrator that the plan for the area includes the most stringent measures that are included in the implementation plan of any state, or are achieved in practice in any state, and can feasibly be implemented in the area." In its prior guidance in the Addendum, the EPA interpreted the term "most stringent measures" (MSM) to mean the maximum degree of emission reduction that has been required or achieved from a source or source category in any other attainment plans or in practice in any other states and that can feasibly be implemented in the area seeking the extension, such as what LAER represents for new or modified sources under the NNSR permit program.¹⁹⁰

a. *Summary of Proposal.* The proposal suggested that a state would need to follow a process for determining MSM for a Serious nonattainment area that is generally similar to proposed Option 2 for BACM/BACT described in Section VI.D of this preamble, which would include exemptions from MSM for sources in *de minimis* source categories if such measures did not collectively advance the attainment date for the area by at least 1 year. The EPA also proposed an alternative approach for determining MSM for a Serious nonattainment area that would provide for *de minimis* source category exemptions for MSM only for those source categories that do not contribute significantly to ambient PM_{2.5} concentrations in the Serious nonattainment area, an approach more closely aligned with proposed Option 1 for determining BACM/BACT.

For each approach, the proposal described a five step process for determining MSM: (1) Update the emissions inventories for the nonattainment area; (2) identify *de minimis* source categories through modeling; (3) identify potential MSM; (4) compare MSM to control measures already adopted in the SIP for the nonattainment area; and (5) adopt and implement any MSM that are more stringent than any measures that are already approved into the SIP. The proposal requested comment on whether the two proposed approaches are sufficiently consistent with the agency's respective proposed

¹⁹⁰ Addendum to the General Preamble, 59 FR 41998 (August 16, 1994), at page 42010.

approaches to BACM/BACT determinations.

b. Final Rule. Almost all comments received on this section involved the issue of whether the rule should allow for *de minimis* source categories to be exempted in the process of determining MSM. A few commenters supported the identification of *de minimis* source categories and their exemption from the MSM requirement. These commenters were split in terms of their preference for the two *de minimis* approaches that were presented. Some commenters suggested that under any approach, an area could still exclude a measure from MSM based on the inability to feasibly implement the measure in the area. Some commenters stated that it would be too burdensome to require a state to evaluate whether a particular source category had a “significant” or *de minimis* impact on air quality, while others supported the approach. One group of commenters disagreed with the notion that a Serious area could exempt *de minimis* sources from the MSM requirement in the first place. They stated that *de minimis* exemptions would not be appropriate for MSM, for which the CAA has expansive language requiring the most stringent measures required in any SIP or achieved in practice in any state.

After considering the comments received on the *de minimis* source category issue, the EPA is adopting a final rule that does not include an explicit *de minimis* source category exemption in determining MSM. The agency’s reasons for not allowing a *de minimis* source category or *de minimis* impact concept, articulated in prior sections on determining RACM/RACT (Section IV.D) and BACM/BACT (Section VI.D), apply equally here. Moreover, the EPA believes it would be particularly inappropriate to allow for a *de minimis* source category approach for MSM. The statute requires MSM to be implemented because the area is unable to attain the standard within 10 years of designation and has a more severe air quality problem. Congress clearly intended for such areas to more widely explore potential control measure possibilities, and a *de minimis* source category exclusion would be contrary to that intent.

The EPA believes the rule provides sufficient flexibility in the MSM area control measure analysis and attainment demonstration process enabling states to identify sources that should not be subject to control measures, including the ability to develop precursor demonstrations to exclude precursors from control requirements, and to consider case-specific factors in

determining technological and economic feasibility of potential control measures. If the final rule were to include an explicit step to conduct a *de minimis* source category analysis on the entire inventory early in MSM process, the EPA also believes that there is a risk that such an analysis may bring about investment of scarce time and analytical resources on analysis of categories to exclude rather than on the identification of the most stringent control measures necessary to attain the standard. As noted in Section IV.D of this preamble on Moderate areas, and again in [serious area section] the EPA also finds that from a technical perspective, it would be very challenging to implement a *de minimis* source category process in a consistent manner nationally without clear guidelines describing how narrowly or how broadly a *de minimis* exemption could apply to a “source category,” or how the technical analysis would need to be performed. For all of these reasons, a *de minimis* source category concept is not included in the final rule for MSM.

Process for determining MSM. The following sections describe the process for determining MSM that is finalized in this rule: (a) Update emissions inventories; (b) identify potential MSM; (c) compare MSM to control measures already adopted in the SIP for the nonattainment area; and (d) adopt and implement any MSM that are more stringent than any measures that are already approved into the SIP. (See 40 CFR 51.1010(b)(1)–(4).)

i. Update Emissions Inventories

The first step would be for the state to update as needed the emissions inventory of direct PM_{2.5} and PM_{2.5} precursor sources and source categories in the Serious nonattainment area required under CAA section 172(c)(3) for any attainment plan submission. The EPA expects that the state would meet this inventory requirement as part of its Serious area attainment plan submission without any additional work if the state submits the Serious area attainment date extension request simultaneously with the plan itself. However, in the event the attainment date extension request is submitted after the “original” Serious area attainment plan for the area (*i.e.*, toward the end of the Serious area attainment period), then the state must submit a more recent, complete and accurate emissions inventory that meets the same emissions inventory requirements for Moderate and Serious PM_{2.5} nonattainment areas pursuant to CAA section 172(c)(3), as well as an attainment projected inventory as part of the new Serious area attainment plan

for the area. The inventories submitted to support a Serious area attainment plan must also include point sources meeting the lower major stationary source threshold in 40 CFR part 51, subpart A.

ii. Identify Potential MSM

The second step in determining MSM involves identifying the potentially MSM in other state implementation plans for PM_{2.5} or other NAAQS, or that are used in practice in other states for controlling emissions from sources similar to those listed in the emissions inventory. This information can be obtained from a number of sources, including state regulations on the books, state summaries of control measures, state permitting databases, the RACT/BACT/LAER Clearinghouse, and control measure compilations developed by regional or state/local organizations. Elsewhere in this preamble, the EPA recommends that a state identify potential measures for consideration as RACM/RACT or BACM/BACT by evaluating control measures implemented by other states to meet PM_{2.5} NAAQS or other NAAQS. Thus, a state seeking to identify MSM should be able to start its process using the work already undertaken for the nonattainment area’s RACM and BACM determinations and to make updates to the list of potential control measures accordingly.

For each measure, the state is required to determine its technological and economic feasibility for sources in the area. States should apply more stringent criteria for determining the feasibility of potential MSM than that described for BACM and BACT in Section VI.D of this preamble. In some situations, MSM could involve increasing the coverage of measures that were already adopted and implemented as BACM and BACT (for example, changing out an even greater percentage of woodstoves in an area, if such sources were major contributors to the air quality problem in the nonattainment area).

However, because BACM and BACT represent the “best” level of control feasible for an area, in some cases it may be possible for the MSM requirement to result in no more controls and no more emissions reductions in an area than result from the implementation of BACM and BACT. Stated another way, there may be sources or categories for which no other feasible controls exist beyond what a state has already adopted as BACM or BACT. Given the strategy in the nonattainment provisions of the CAA to offset longer attainment timeframes with more stringent control requirements, the EPA therefore

interprets the MSM provision so as to increase the potential that it will result in additional controls beyond the set of measures adopted as BACM and BACT. In the MSM analysis, in addition to identifying additional candidate MSM, the state is required to reanalyze any measures that were rejected during the state's BACM and BACT analysis for the area to see if they are now feasible for the area given the potentially longer attainment date (up to 5 years after the statutory Serious area attainment date), or given the changes that have occurred in the interim that improve the feasibility of previously rejected measures.

iii. Compare MSM to Control Measures Already Adopted in the SIP for the Nonattainment Area

The third step requires the state to compare the potential MSM that have been identified for each source type or source category against the measures, if any, already adopted into the Serious area SIP for that source category to determine if such MSM would provide any additional reductions. This comparison will be used in determining what measures to adopt in the next step.

iv. Adopt and Implement Any MSM That are More Stringent Than Any Measures That Are Already Approved Into the SIP

The fourth step requires the adoption of any MSM that are more stringent than existing measures as a regulation, and requires submission of the regulation as part of the SIP, as well as expeditious implementation of the regulation. For any measures that the state determines cannot be feasibly implemented in the area, it should provide a reasoned justification for rejecting the potential MSM.

The EPA notes that CAA section 188(e) does not identify a deadline for a state to implement MSM, whereas elsewhere the statute establishes a deadline for implementing RACM and RACT and BACM and BACT [see CAA sections 189(a)(1)(C) and 189(b)(1)(A)], respectively). However, because the clear intent of CAA section 188(e) is to minimize the length of a Serious area attainment date extension, the EPA requires that the implementation of MSM must be as expeditious as practicable but no later than 1 year prior to the alternate Serious area attainment date identified by the state in its extension request.

c. *Comments and Responses.* Any additional comments received on this section are addressed in the Response to Comments document found in the docket for this action.

4. Demonstration of Attainment by the Most Expeditious Alternative Date Practicable

Section 189(b)(1)(A) of the CAA requires that a Serious area plan demonstrate attainment, using air quality modeling, by the most expeditious date practicable after the statutory Serious area attainment date. This demonstration is the final criterion that must be met before the EPA may consider granting an extension. The agency's determination of whether the plan provides for attainment by the most expeditious date practicable would depend on whether the plan provides for implementation of BACM and BACT by the statutory implementation deadline and MSM as expeditiously as practicable. In no case would a state be able to seek an extension of a Serious area attainment date to a date more than 5 years past the statutory attainment date for Serious areas. Section VI.E of this preamble describes the EPA's proposed requirements for attainment demonstration modeling for Serious area attainment plans.

5. Apply for an Attainment Date Extension

The state would have to apply to the EPA for any extension of a Serious area attainment date. The request would have to accompany an attainment plan submission containing an attainment demonstration showing attainment by the most expeditious alternative date practicable, and the state would need to submit modeling as part of the attainment demonstration in accordance with Section VI.E of this preamble. Furthermore, the state would have to provide the public reasonable notice and a public hearing on the attainment date extension request before submitting it to the EPA, as the EPA would consider it an integral part of the attainment demonstration and part of the revised SIP submission which is subject to the requirements of the CAA and federal regulations for public notice and hearing on SIP revisions.

6. Timing of Extension Request Submission

The EPA has identified two potential Serious area attainment date extension scenarios: (1) The more straightforward scenario where the attainment date extension is included with the initial Serious area plan, and (2) the scenario where a state may prepare and fully implement a timely Serious area plan that includes a modeling analysis that demonstrates the area would attain no later than the statutory Serious area attainment date (the end of the tenth

calendar year following designation), and yet the state may see as the attainment date nears that the Serious area will in fact fail to attain by its projected attainment date. While the statute provides a remedy to be instituted immediately upon failure of a Serious area to attain the standard (through contingency measures and other measures stipulated in CAA section 189(d)), the EPA also believes that the criteria of CAA section 188(e) could be applied after a state submits a Serious area attainment plan but prior to the area failing to attain (as long as the area had not already been granted a prior Serious area attainment date extension under CAA section 188(e)).

In the first scenario, there is no need to specify any further timing requirements beyond those previously described for Serious area plan submission. However, for the second scenario the final rule needs to specify a due date for the request. The EPA believes that it would be acceptable for a state to submit a Serious area attainment date extension request (as described earlier) together with a new Serious area attainment plan meeting all of the statutory requirements that apply to such plans. The state should submit the extension request and new implementation plan to EPA as early as possible, but the final rule requires that it must be submitted no later than 60 days prior to the approved attainment date for the area or, in the absence of an approved attainment date, no later than 60 days prior to the applicable statutory attainment date for Serious areas (*i.e.*, the end of the tenth year after designation). See 40 CFR 51.1005(b)(6). The EPA believes that this deadline is necessary due to its statutory obligation to determine whether the area attained by the attainment date. In order to preserve the possibility that EPA could review and take action on the new attainment plan for the area and the accompanying attainment date extension request prior to its deadline for making the attainment determination the EPA estimates that the 60-day deadline provides the minimum amount of necessary time. The EPA notes that during this time, it would have to ascertain the status of compliance with all requirements and commitments in the Moderate and initial Serious area attainment plans for the area, evaluate the state's justification for the selection of the alternate attainment date (including modeling), and review provisions for the implementation of MSM).

VII. Requirements Under CAA Section 189(d) for PM_{2.5} Serious Areas That Fail To Attain the NAAQS by the Applicable Attainment Date

Background. In the event that a Serious area fails to attain the PM_{2.5} NAAQS by the applicable attainment date, CAA section 189(d) requires that “the state in which such area is located shall, after notice and opportunity for public comment, submit within 12 months after the applicable attainment date, plan revisions which provide for attainment of the . . . standard and, from the date of such submission until attainment, for an annual reduction in PM₁₀ or PM₁₀ precursor emissions within the area of not less than 5 percent of the amount of such emissions as reported in the most recent inventory prepared for such area.”

In addition to the requirement for the submission of control measures providing for a 5 percent reduction in emissions of certain pollutants on an annual basis, the EPA interprets CAA section 189(d) as requiring the State to submit an attainment plan that includes the same basic statutory plan elements that are required for other attainment plans. Because section 189(d) does not include a specific provision specifying a new attainment date, the EPA relies on sections 179(d)(3) and 172(a)(2) of the CAA to establish the attainment date for such plans to be as expeditiously as practicable, and no later than five years from the effective date of the EPA’s determination that the area failed to attain. Pursuant to those provisions, the Administrator may also extend the attainment date to the extent the Administrator deems appropriate, for a period no greater than 10 years from the effective date of the EPA’s determination that the area failed to attain, considering the severity of nonattainment and the availability and feasibility of pollution control measures. The state must submit as part of the new attainment plan a justification explaining that it represents an attainment date that is as expeditious as practicable.

A state must submit to the EPA its plan to meet the requirements of CAA section 189(d) in the form of a complete attainment plan submission that includes the following elements: (i) Base year and attainment projection year emissions inventory requirements; (ii) additional attainment plan control strategy requirements, including control measures and a demonstration that each year the area will achieve at least a 5 percent reduction in emissions of direct PM_{2.5} or a 5 percent reduction in emissions of a PM_{2.5} plan precursor

based on the most recent emissions inventory for the area; (iii) attainment demonstration and modeling; (iv) RFP plan and quantitative milestones; and (v) contingency measures. A state with a Serious PM_{2.5} nonattainment area that fails to attain the NAAQS by the applicable Serious area attainment date must also address any statutory requirements relevant to Moderate nonattainment areas and Serious nonattainment areas under CAA sections 172 and 189 of the CAA that have not already been satisfied. These elements are discussed in more detail in the following sections.

A. Plan Due Dates

1. Summary of Proposal

The proposed rule indicated that under CAA section 189(d), the state would be required to submit the attainment plan for a Serious area that failed to attain the NAAQS by the Serious area attainment date within 12 months after the applicable attainment date.

2. Final Rule

The final rule remains unchanged from the proposal. Section 189(d) of the CAA requires a state with a Serious PM₁₀ nonattainment area that failed to attain the NAAQS by the applicable Serious area attainment date to submit a new attainment plan submission for the area within 12 months after the missed “applicable attainment date.” The EPA finds that the most straightforward interpretation of the statutory language is that the state must submit a new attainment plan for the area—with all required elements—within 12 months after the missed applicable attainment date. Although the EPA may take up to 6 months to make a determination that the area failed to attain, the text of the statute ties the 12-month SIP due date to the missed attainment date, not to the date that the EPA determines that the area failed to attain. Because all attainment dates for implementation of the PM_{2.5} NAAQS under subpart 4 are expressed in terms of the end of a calendar year, the new due date for a SIP required under CAA section 189(d) also would be due on December 31—of the year following the area’s Serious area attainment date. This requirement is consistent with the manner in which the CAA section 189(d) SIP submission date has been interpreted for implementation of the PM₁₀ NAAQS in the past. The EPA recognizes that this statutory timeline is shorter than for Moderate or Serious area attainment plans, but expects that, given the prior planning

history for such areas, much of the analyses to support these new attainment plan submissions will be based on updates to previous analyses, which would require less time than generating new analyses. In any event, it is clear from the face of the statute that Congress intended that states with areas that fail to attain the NAAQS by the outermost statutory attainment date for Serious areas must proceed more quickly to revise their SIPs to provide for attainment of the NAAQS.

3. Comments and Responses

Any comments received on this section are addressed in the Response to Comments document found in the docket for this action.

B. Emissions Inventory Requirements

1. Summary of Proposal

The EPA also proposed that the inventory requirements under section 189(d) for Serious areas that fail to attain by the attainment date should be the same as those for Moderate and Serious areas, but with a change to the appropriate year for the inventory. The EPA proposed that for these areas, the inventory year must be one of the 3 years from which monitored data was used to determine that the area failed to attain the PM_{2.5} NAAQS by the applicable Serious area attainment date. In addition, the EPA proposed an alternative approach that would allow the state to use an earlier year than one of the 3 years used to determine that the area failed to attain. As proposed, this alternative approach would require written justification that included an explanation of how the inventory modifications adequately incorporate emissions reductions projected to be achieved through the implementation of BACM and BACT, and additional feasible control measures submitted with the original Serious area attainment plan for the area, and through implementation of MSM if appropriate.

2. Final Rule

The statute requires states to use an emissions inventory that meets the requirements of section 172(c)(3). The final rule recommends using an inventory for one of the 3 years for which air quality data were used to determine that the area failed to attain in order to meet this requirement. However it also allows the state to use an earlier inventory year under certain circumstances.

As with all other attainment plan submissions required for Moderate and Serious PM_{2.5} nonattainment areas, a

state must develop its submission to meet CAA section 189(d) based on “the most recent inventory prepared for such [nonattainment] area.” This inventory must meet the same requirements that would apply to any other emissions inventory submitted for a PM_{2.5} nonattainment area to meet the requirements of CAA section 172(c)(3), which requires “a comprehensive, accurate, current inventory of actual emissions of the relevant pollutants” in the nonattainment area. Therefore this rule requires that the inventory submitted with an attainment plan to meet CAA section 189(d) requirements must also meet the EPA’s regulatory requirements for such emissions inventories as described earlier in this preamble under Section IV.B of this preamble (for Moderate area attainment plans) and Section VI.B of this preamble (for Serious area attainment plans).

One important aspect of the emissions inventory required to be submitted with an attainment plan under CAA section 189(d) is its role as the basis for calculating the emissions reductions of direct PM_{2.5} or any PM_{2.5} plan precursor necessary to satisfy the 5 percent annual reduction criterion of CAA section 189(d). For this reason, the “most recent inventory” for the area must not only meet the criteria described for a base year inventory submitted pursuant to CAA section 172(c)(3) and in Section VI.B of this preamble, but it also must fully account for emissions reductions achieved to date through the implementation of all RACM and RACT, BACM and BACT, additional reasonable and feasible measures, and MSM (as applicable) submitted with the Moderate and original Serious area attainment plans for the area. In this way, the state will calculate the additional reductions that the nonattainment area will need beyond those already required in order to fulfill the requirements of CAA section 189(d) and bring the area into attainment as expeditiously as practicable.

To ensure that the inventory is representative of the nonattainment problem in the area current at the time of the CAA section 189(d) submission, the EPA strongly recommends that the inventory year be one of the 3 years from which monitored air quality data were used to determine that the area failed to attain the PM_{2.5} NAAQS by the applicable Serious area attainment date. The EPA believes that associating the inventory with one of these 3 years is reasonable in light of the fact that some control measures (e.g., BACM and BACT controls and additional feasible measures) for sources in the area may not be implemented until the beginning

of the attainment year. Thus, using an emissions inventory for one of those 3 years will help ensure that the inventory adequately captures the emissions reductions already achieved through the prior implementation of control measures for Moderate and Serious areas.

The EPA recognizes that the timing and resource requirements for inventory preparation may make it challenging in some cases for a state to use an inventory for a year that is one of the 3 years from which monitored data were used to determine that the area failed to attain the NAAQS by the applicable attainment date. To address such cases, the final rule allows states to use an earlier inventory year in the plan, provided that (1) the year is selected in consultation with the appropriate EPA Regional Office, and (2) the state provides a written justification for selecting the earlier year in its SIP submission. *See* 51.1008(c)(1). At a minimum, the inventory must adequately incorporate emissions reductions projected to be achieved through the implementation of BACM and BACT, and additional feasible control measures submitted with the original Serious area attainment plan for the area, and MSM if appropriate. Because these emissions reductions may have occurred after the inventory year the state intends to use, adjustments to the original inventory for that year would need to be made to reflect those reductions. The written justification must also include an explanation of how those reductions have been incorporated into the inventory. In considering use of an “older” inventory, the EPA recommends that states weigh the possible impact of using an older inventory that could have higher emissions than a more current inventory. The state may be obligated to achieve a larger annual emissions reduction to satisfy the 5 percent annual reduction criteria of CAA section 189(d) than would otherwise be required if a newer inventory were used with lower emissions.

3. Comments and Responses

Any additional comments received on this section are addressed in the Response to Comments document found in the docket for this action.

C. Pollutants To Be Addressed in the Plan

1. Summary of Proposal

The proposed rule indicated that to determine what pollutants need to be addressed in the attainment plan and 5 percent requirement in CAA section

189(d), the state could provide a demonstration to the EPA showing that a particular precursor does not significantly contribute to PM_{2.5} levels that exceed the standard. The proposal suggested that if the precursor demonstration is approved by the EPA, then the state would not be required to evaluate or adopt control measures for that precursor, nor would the state need to address the precursor in meeting the 5 percent annual emissions reduction requirement in section 189(d). The proposal indicated that Section III of the preamble further discussed options describing optional precursor demonstrations.

2. Final Rule

The final rule remains relatively unchanged with respect to this issue. Section 189(d) of the CAA requires states to develop a new attainment plan for an area that failed to attain by the applicable Serious area attainment date that provides for “an annual reduction in PM₁₀ or PM₁₀ precursor emissions within the area of not less than 5 percent of the amount of such emissions” reported in the latest emissions inventory for the area. In Section III of this preamble, the EPA describes optional approaches by which a state could demonstrate that a PM_{2.5} precursor does not contribute significantly to PM_{2.5} levels that exceed the standard in the area, and thereby would not need to adopt control measures for that precursor in the area. The EPA also interprets the CAA generally to allow a state to provide such a “precursor demonstration” for the attainment plan required under section 189(d), even if the area has previously failed to attain the relevant NAAQS by the applicable Serious area attainment date. If the state has provided a demonstration with the previous Serious area attainment plan to establish that a precursor does not significantly contribute to PM_{2.5} levels for purposes of the attainment plan for the area, and it seeks to maintain the status of that precursor as not significantly contributing to PM_{2.5} levels in the area, the state would still need to provide an updated precursor demonstration for the new section 189(d) SIP because emissions and atmospheric conditions will have changed since the previous demonstration was submitted, and the conclusions from any previous precursor demonstration may no longer be appropriate. *See* Section III of this preamble for more information about potential precursor demonstrations that could be conducted to show that a particular precursor does not contribute

significantly to PM_{2.5} levels that exceed the standard.

3. Comments and Responses

Any comments received on this section are addressed in the Response to Comments document found in the docket for this action.

D. Attainment Plan Control Strategy

1. Background

As for other PM_{2.5} NAAQS attainment demonstrations, the overarching requirement for the CAA section 189(d) control strategy is that it needs to provide for attainment of the standard as expeditiously as practicable. The strategy must include any additional measures (beyond those already adopted in previous SIPs for the area as RACM/RACT, BACM/BACT, MSM (if applicable), for example) that are needed for the area to attain expeditiously. The plan must also demonstrate that the new attainment plan will at a minimum achieve an annual 5 percent reduction in emissions of direct PM_{2.5} or any PM_{2.5} plan precursor from sources in the area, based on the most recent emissions inventory for the area. However, it is important to emphasize that a CAA section 189(d) plan must require other control measures (even if beyond those sufficient to meet the annual 5 percent reduction requirement) that are needed in order to meet the overarching goal of attaining the standard as expeditiously as practicable.

2. 5 Percent Annual Reduction in Direct PM_{2.5} or Any PM_{2.5} Plan Precursor

a. Summary of Proposal. Section 189(d) of the CAA requires an “annual reduction in PM₁₀ or PM₁₀ precursor emissions within the area of not less than 5 percent of the amount of such emissions as reported in the most recent inventory prepared for such area.” Because the statute is ambiguous with regard to how this language should apply for the PM_{2.5} NAAQS, the EPA proposed two options for interpreting this provision. One option interpreted this language to require a 5 percent annual reduction in all pollutants that contribute to PM_{2.5}, meaning direct PM_{2.5} and the four precursors (SO₂, NO_x, VOC, and ammonia), or those precursors that are necessary to control in the area. A second option interpreted the language more literally, meaning that it required a 5 percent annual reduction of *either* direct PM_{2.5} or PM_{2.5} precursor emissions on an annual basis, and that a state could elect to control either direct PM_{2.5} or PM_{2.5} precursor emissions in a given year. (Note that

under either proposed option, a precursor still could be excluded from control requirements if the state submitted a new precursor demonstration as part of the revised CAA section 189(d) implementation plan showing that the precursor does not contribute significantly to levels that exceed the relevant PM_{2.5} NAAQS, and such demonstration is approved by the EPA).

b. Final Rule. One group of commenters supported the inclusion of direct PM_{2.5} and all precursors in the calculation of the annual emission reduction requirement because precursors typically play a significant role in PM_{2.5} formation, and they believed that allowing states to be able to pick and choose which pollutants to reduce would undermine efforts to attain most expeditiously. Other commenters supported the second option because they believe it follows a plain reading of the statute (*i.e.*, it uses the word “or”), and because it would allow a state to devote resources toward achieving emissions reductions in those pollutants that are most effective in reducing PM_{2.5} concentrations and thus in attaining the NAAQS most expeditiously.

After considering comments on this issue, the EPA agrees that the second option is the more appropriate reading of the statute. When paired with the overarching requirement for the area to reach attainment of the NAAQS as expeditiously as practicable, and with provisions in the rule allowing a state to demonstrate that a precursor does not provide a significant contribution to PM_{2.5} levels, the EPA believes that such an interpretation is reasonable and would authorize states to focus emission reduction efforts on those pollutants that will be most effective for purposes of attainment in a given area. For example, interpreting the statutory provision to require emissions reductions in a specific precursor merely for purposes of meeting a 5 percent requirement, without regard to whether the reductions would be effective for purposes of attainment, could be counterproductive to reducing the emissions of other pollutants that could result in earlier attainment. This interpretation of CAA section 189(d) is also consistent with past EPA actions for an area that failed to attain the PM₁₀ Serious area attainment date.¹⁹¹

¹⁹¹ For example, *see* 69 FR 30006 (May 26, 2004). Approval and Promulgation of Implementation Plans for California-San Joaquin Valley PM-10 Nonattainment Area; Serious Area Plan for Attainment of the 24-Hour and Annual PM-10 Standards.

Thus, in applying the statutory language to implementation of the PM_{2.5} NAAQS in the final rule, the EPA interprets an “annual reduction in PM₁₀ or PM₁₀ precursor emissions within the area of not less than 5 percent of the amount of such emissions” to mean that an attainment demonstration for a Serious area that failed to attain by the attainment date must include control measures providing for a 5 percent annual reduction in direct PM_{2.5} emissions *or* in the emissions of any PM_{2.5} plan precursor. The EPA considered whether the statutory phrase “precursor emissions” requires a 5 percent reduction of each individual plan precursor in each year, but determined that such an interpretation was unnecessarily restrictive in light of the overarching requirement for states to adopt the control measures that will result in attainment as expeditiously as practicable, and is not compelled by the wording of the 5 percent requirement in the statute. Accordingly, the final rule requires an annual reduction of either direct PM_{2.5} or any single PM_{2.5} precursor.

Because this requirement is an annual one, the final rule also authorizes the state to meet the 5 percent requirement to vary between direct PM_{2.5} and PM_{2.5} precursors, or among precursors, from year to year throughout the duration of the section 189(d) attainment plan, so long as the attainment plan provides for expeditious attainment and meets the other applicable attainment plan requirements. For example, in year 1 a state could provide for a 5 percent reduction of direct PM_{2.5}, and in year 2 could provide for a 5 percent reduction in a precursor, and so on.

c. Comments and Responses.

Comment: Some commenters suggested that a more appropriate approach would be to require a 5 percent annual reduction in PM_{2.5} ambient concentrations (rather than in pollutant emissions), and allow the state to meet this air quality target with any combination of emissions reductions.

Response: The EPA does not find that this approach would be consistent with the statutory language in CAA section 189(d), which clearly expresses the requirement in terms of emissions reductions (*i.e.*, “annual reduction in PM₁₀ or PM₁₀ precursor emissions within the area of not less than 5 percent of the amount of such emissions as reported in the most recent inventory prepared for such area.”) Moreover, the EPA is concerned that this approach would necessitate, on an annual basis, a complex modeling analysis or at the very least some other analytical approach to translate emissions to

ambient concentrations. The burdens of such analysis could be significant, and it is unclear what benefit would be realized from such an approach. States are already obligated to provide a modeled attainment demonstration as part of the new SIP submission to meet the requirements of section 189(d), and the 5 percent requirement is a separate requirement that the statute explicitly imposes in addition to that modeled attainment demonstration. For these reasons, the EPA is not adopting the commenter's suggested air quality approach in the final rule.

3. Calculating the 5 Percent Annual Reductions

a. Summary of Proposal. The proposed rule provided an example of how annual reductions would be tracked under this provision, and it also provided another example describing how reductions in excess of the 5 percent requirement in 1 year could be "carried forward" to help meet the requirement in a future year.

b. Final Rule. The previous section 2 explains that the EPA interprets the statute to require a 5 percent annual reduction in direct PM_{2.5} emissions or in the emissions of any one PM_{2.5} plan precursor in each year, until attainment. The requisite minimum 5 percent emissions reduction level for any pollutant must be calculated from the total emissions of the pollutant contained in the most recent inventory for the area, as described earlier in this section. The requirement for a 5 percent annual reduction in any one pollutant, calculated based on the emissions levels in the most recent inventory, must then be achieved every year between the CAA section 189(d) plan submission date and the new projected attainment date for the area.

For example, assume it is 2026, and based on monitoring data from years 2023–2025, a Serious area has failed to attain the 2012 PM_{2.5} NAAQS within 10 years of designation. Assume also that the most recent inventory available for an area subject to CAA section 189(d) is for the year 2023. This inventory would serve as the base inventory for determining the 5 percent emissions reduction requirement under CAA section 189(d). If the state elects to reduce direct PM_{2.5} emissions each year of the plan (*i.e.*, instead of choosing to reduce a precursor), and the most recent inventory ("base inventory") indicates that emissions of direct PM_{2.5} from all sources in the area are 10,000 tons/year, then the area at a minimum would need to reduce emissions of direct PM_{2.5} by 5 percent of the 2023 base inventory, or 500 tons, each year until the area attains

the NAAQS. Thus, in the first year following submission of the CAA section 189(d) plan for the area, emissions of direct PM_{2.5} could not exceed 9500 tons/year; in the second year, emissions could not exceed 9000 tons/year; and so forth. Note that if the area needs emissions reductions beyond this amount (*i.e.*, in direct PM_{2.5} or in PM_{2.5} plan precursors) in order to meet the overarching requirement of attaining the standard as expeditiously as practicable, then it must adopt and implement such control measures.¹⁹²

Although CAA section 189(d) requires that a state develop measures that will obtain annual emissions reductions of "not less than 5 percent" from the most recent inventory, the EPA interprets this language to authorize states to maximize emissions reductions in earlier years and still meet the 5 percent per year requirement for subsequent years. The EPA notes that interpreting the statute in this way will encourage states to implement measures earlier, where possible, rather than delay implementation of measures merely to assure that the 5 percent requirement can be met in later years. Thus, using the example described earlier, the annual reduction requirement for the area would be 500 tons/year from a base year emissions level of 10,000 tons/year. The required level after year 1 would be 9500 tons/year, after year 2 the level would be 9000 tons/year, and so on. If the area reached a level of 8100 tons/year by the end of year 3, then by the end of year 4 it would only need to reduce emissions by 100 tons/year to yield an emissions level of 8000 tons/year. Thus, this approach will allow states to carry forward any emissions reductions beyond the required minimum 5 percent in a given year to the next year as a means to encourage states to achieve emissions reductions as quickly as possible, as long as those emissions reductions are realized after the Serious area attainment date.¹⁹³

The previous example addresses a situation where the state chooses to reduce only direct PM_{2.5}. In that example, the 5 percent annual reduction amount for any year would be 5 percent of the 2023 PM_{2.5} emission inventory amount of 10,000 tons. The final rule allows the state to meet its 5 percent reduction each year in terms of reducing direct PM_{2.5} or any PM_{2.5} plan precursor. Thus, if the area had a 2023 emission inventory that included 5000 tons of each of the four PM_{2.5}

precursors, and if the state chose to meet its "5% reduction" obligation in a particular year by reducing SO₂, it would need to achieve emissions reductions of 250 tons of SO₂ in that year.

The EPA is also clarifying its interpretation of the statutory language under CAA section 189(d) that requires a state to submit a new attainment plan to achieve annual reductions "from the date of such submission until attainment," to mean annual reductions beginning from the due date of such submission until the new projected attainment date for the area based on the new or additional control measures identified to achieve at least 5 percent emissions reductions annually. This clarification is intended to make clear that even if a state is late in submitting its CAA section 189(d) plan, the area must still achieve its annual 5 percent emissions reductions beginning from the date by which the state is required to make its CAA section 189(d) plan submission, not by some later date. Because attainment dates for PM_{2.5} nonattainment areas established under subpart 4 occur at the end of the calendar year, any CAA section 189(d) plan, which is required within 12 months of the missed attainment date for the area, would also be due by the end of the calendar year.

c. Comments and Responses. Any additional comments received on this section are addressed in the Response to Comments document found in the docket for this action.

4. Additional Guidance on CAA Section 189(d) Control Measures

The EPA believes that an appropriate starting point for a state to identify measures to provide for attainment and to meet the requisite minimum 5 percent annual emissions reductions of direct PM_{2.5} and PM_{2.5} precursors is the list of potential control measures initially required to be identified as part of the RACM and RACT determination process, the BACM and BACT determination process, or the MSM determination process (if appropriate) for the area. The EPA anticipates that a state should be able to rely on much of the work it previously undertook to develop this list of potential control measures and analyze their technological and economic feasibility, and the time required to implement them. Control measures that the state identified but did not previously adopt may be likely measures for inclusion in an attainment plan to meet the requirements of section 189(d). However, for purposes of meeting the requirements of CAA section 189(d), the

¹⁹² See Section IV.D.3 of this preamble for a discussion on sources of information for control measures.

¹⁹³ 69 FR 30006 (May 26, 2004).

EPA recommends that the state first identify any additional potential measures not previously identified for the area, and then analyze any new or additional measures that the state has not already adopted in a previous attainment plan for the area.

In addition, a state may include in the CAA section 189(d) plan control strategy for the area any control measures triggered as contingency measures after the area failed to attain the PM_{2.5} NAAQS by the applicable attainment date. In order to be included as control measures that will help the area meet its requisite minimum 5 percent reductions in direct PM_{2.5} emissions or in emissions of any one PM_{2.5} plan precursor, such measures would have to meet the same requirements as all other approvable control measures for being quantifiable, enforceable, replicable and accountable. The EPA believes that reliance on triggered contingency measures may be appropriate given the short timeline provided for in the statute for states to revise and submit their SIP revisions (12 months from the missed attainment date) and the fact that the contingency measures included in the prior attainment plan for the area under CAA section 172(c)(9) must be activated once the EPA publishes its finding of the area's failure to attain the NAAQS by the applicable attainment date. As explained previously, however, the EPA interprets the statute to require that any new 189(d) submission must meet all the statutory requirements applicable to all submissions, including the requirement to identify contingency measures. Thus, if contingency measures from the Serious area attainment plan are relied on in the new attainment demonstration as part of the control strategy, then the state must submit additional contingency measures for the CAA section 189(d) attainment plan. *See* 40 CFR 51.1003(c)(1)(vii).

5. Control Strategy Submission Requirements

To ensure that attainment plan submissions contain the necessary supporting information for the EPA to review and approve the state's new control strategy to achieve at least 5 percent annual reductions in emissions of direct PM_{2.5} or any PM_{2.5} plan precursor, the final rule requires that a state must submit information about the new control strategy for an area subject to section 189(d) in a manner consistent with the requirements described in section VI.D.3.

As with other PM_{2.5} attainment plan submissions, the EPA believes that it is incumbent on the state to ensure that

the information needed for the EPA to evaluate the state's analysis of new control measures—which in the case of 189(d) plans is also needed to achieve annual 5 percent reductions—is presented separately as part of the control strategy analysis, and in a format that provides transparency, consistency and the ability for another party to evaluate the state's analysis effectively and to duplicate the state's results. For this reason, the EPA is including the CAA section 189(d) plan base year emissions inventory information as a necessary part of the control strategy submission and as one element of the state's CAA section 189(d) plan due 12 months after the missed attainment date for the area. In addition, the state must provide information as part of any attainment plan submitted to meet the requirements of CAA section 189(d) consistent with the criteria described in Section VI.D.5 of this preamble to ensure that a state adopts effective regulations to implement the control measures identified as being needed to meet those requirements. Specifically, all control measures must be quantifiable, enforceable, replicable and accountable.

E. Modeling for Attainment Demonstrations

Section 189(d) of the CAA requires a state with a Serious nonattainment area that failed to attain the relevant NAAQS by the applicable Serious area attainment date to submit a new attainment plan for such area within 12 months after the missed attainment date. The same general requirements for attainment demonstrations and modeling that apply to Moderate area plans and Serious area plans due under CAA sections 189(a) and 189(b) should also apply to CAA section 189(d) attainment plans. However, the EPA is including additional requirements in the final rule specific to plans submitted pursuant to CAA section 189(d), as described in the following sections.

1. Attainment Demonstrations for Serious Areas That Fail To Attain the NAAQS by the Applicable Attainment Date

a. Summary of Proposal. The EPA proposed attainment demonstration modeling requirements for Serious areas that fail to attain the NAAQS by the applicable attainment date. *See* Section VI.E of this preamble, for more details on Serious area attainment demonstrations.

b. Final Rule. The final rule requirements are unchanged from the proposal with respect to this requirement. Attainment

demonstrations for Serious areas subject to CAA section 189(d) requirements must consist of: (i) Technical analyses such as base year and future year modeling of emissions that identify sources and quantify their emissions that are contributing to violations of the PM_{2.5} NAAQS; (ii) analyses of future year projected emissions reductions and air quality improvement resulting from national, regional and local programs already implemented as part of previous Moderate and/or Serious area attainment plans for the area (including reasonable control measures, BACM and BACT and additional feasible measures), and (iii) additional measures needed for expeditious attainment, including measures needed to achieve 5 percent emissions reductions on an annual basis. Each state with a nonattainment area subject to the requirements of CAA section 189(d) must submit an attainment plan with an attainment demonstration that includes analyses supporting the state's determination of its proposed new attainment date. In all cases, the state must show that the area will attain the NAAQS as expeditiously as practicable.

c. Comments and Responses. Any comments received on this section are addressed in the Response to Comments document found in the docket for this action.

2. Air Quality Modeling Required for Serious Areas Subject to the Requirements of CAA Section 189(d)

a. Summary of Proposal. The EPA proposed that states are required to submit air quality modeling in support of an attainment demonstration for a nonattainment area subject to the requirements of CAA section 189(d).

b. Final Rule. The final rule requirements are unchanged from the proposal with respect to this issue. States are required to submit air quality modeling in support of an attainment demonstration for a Serious nonattainment area subject to the requirements of CAA section 189(d). The modeling demonstration must show how and when the area will attain the NAAQS. Other than the timing of plan submissions and requirement to achieve 5 percent emissions reductions in direct PM_{2.5} or any PM_{2.5} plan precursor, the relevant air quality modeling procedures and guidance for all PM_{2.5} nonattainment area plans are the same. *See* Sections IV.E. and VI.E of this preamble for more details on proposed modeling requirements and guidance for Moderate and Serious PM_{2.5} nonattainment areas, respectively.

c. Comments and Responses. Any comments received on this section are

addressed in the Response to Comments document found in the docket for this action.

3. Future Year(s) To Be Modeled in Attainment Demonstrations

a. Summary of Proposal. The EPA proposed that a state performing a modeling analysis for a plan submitted under CAA section 189(d) must select a future modeling year such that all emissions control measures relied on for attainment will have been implemented by the beginning of that calendar year. To demonstrate attainment, the modeling results for the nonattainment area must predict that emissions reductions implemented by the beginning of the last calendar year preceding the attainment date will result in PM_{2.5} concentrations that meet the level of the standard.

b. Final Rule. As discussed more fully in Section VII.I of this preamble, the EPA must establish a new attainment date for a PM_{2.5} nonattainment area subject to CAA section 189(d) and must do so according to the provisions of CAA sections 179(d)(3) and 172(a)(2), which require that the new attainment date must be as expeditious as practicable, but no later than 5 years from the date of publication in the **Federal Register** of the EPA's determination that the area failed to attain the relevant NAAQS. In addition, the EPA may extend the attainment date by up to 5 additional years (thus up to 10 years from the date of publication of the notice of finding of failure to attain by the applicable attainment date for the area) if the EPA deems it appropriate "considering the severity of nonattainment and the availability and feasibility of pollution control measures."

For purposes of determining the attainment date that is as expeditious as practicable, the state must conduct future year modeling that takes into account emissions growth, known controls (including any controls that were previously determined to be RACM and RACT, BACM and BACT, and MSM if appropriate, for the area), the 5 percent per year emissions reductions required by CAA section 189(d), plus any other emissions controls that are needed for expeditious attainment of the NAAQS. A state performing a modeling analysis for a plan submitted under CAA section 189(d) must select a future modeling year such that all emissions control measures relied on for attainment will have been implemented by the beginning of that year. To demonstrate attainment, the modeling results for the nonattainment area must predict that

emissions reductions implemented by the beginning of the last calendar year preceding the attainment date will result in PM_{2.5} concentrations that meet the level of the standard.¹⁹⁴

For a PM_{2.5} nonattainment area subject to CAA section 189(d), the state must adopt any control measures necessary to demonstrate expeditious attainment within 5 years of the area failing to attain the NAAQS by the applicable Serious area attainment date.

c. Comments and Responses. Any comments received on this section are addressed in the Response to Comments document found in the docket for this action.

4. Attainment Year Motor Vehicle Emissions Budgets

As with all other PM_{2.5} NAAQS attainment plans, the transportation conformity rule requires that attainment plans for areas subject to CAA section 189(d) establish motor vehicle emissions budgets for the area's attainment year. Therefore, for such an area, the state would first determine the new attainment date as described in Section VII.I of this preamble. Once an area's attainment date has been established, the state would establish motor vehicle emissions budgets for direct PM_{2.5} and any relevant PM_{2.5} precursor for the attainment year.¹⁹⁵ A motor vehicle emissions budget for the purposes of a PM_{2.5} attainment plan is that portion of the total allowable emissions within the nonattainment area allocated to on-road sources as defined in the submitted attainment plan.¹⁹⁶ Such motor vehicle emissions budgets would be calculated using the latest planning assumptions and the latest approved motor vehicle emissions model available at the time that the attainment plan is developed, unless the EPA approves the state's use of an alternative model.¹⁹⁷

¹⁹⁴ Note that for purposes of the PM_{2.5} NAAQS, a determination of attainment (or failure to attain), which the EPA is required to make after the attainment date has passed, is based on an average of the most recent 3 years of ambient data prior to the area's attainment date.

¹⁹⁵ For more information on PM_{2.5} precursor requirements, see CAA section 93.102(b)(2)(iv) and (v) of the transportation conformity rule. See also the May 6, 2005, final transportation conformity rule that addressed requirements for PM_{2.5} precursors. (70 FR 24280).

¹⁹⁶ A state would also establish motor vehicle emissions budgets for an area's attainment year. Those budgets would be the motor vehicle emissions that the SIP establishes as being necessary to attain the NAAQS.

¹⁹⁷ If an area includes re-entrained road dust in the motor vehicle emissions budget, the latest approved version of AP-42 should be used unless the EPA has approved an alternative model for the area.

F. RFP Requirements

1. Specific Requirements

a. Summary of the Proposal. The EPA proposed to determine that a state has satisfied the RFP requirement if the state submits an approvable control strategy under CAA section 189(d) that demonstrates that the state will achieve at least 5 percent reductions in direct PM_{2.5} or PM_{2.5} precursor emissions from sources in the area annually until attainment. Additionally, the EPA proposed that motor vehicle emissions budgets must also be established as part of any RFP plan for direct PM_{2.5} and for any relevant PM_{2.5} plan precursor using the latest planning assumptions and the latest approved motor vehicle emissions model available at the time that the plan is developed for a Serious area subject to 189(d).¹⁹⁸

b. Final Rule. The EPA is finalizing RFP requirements for attainment plans required pursuant to CAA section 189(d) that are similar to other Serious area RFP requirements discussed in section VI.F of this preamble. The EPA is providing similar guidance regarding how to prepare an RFP analysis, RFP projected emissions, geographic coverage of emission sources for RFP, and RFP requirements for multi-state nonattainment areas.

The RFP analysis must contain appropriate information to demonstrate that the state will achieve the emissions reductions from the control strategy necessary to result in generally linear reductions in emissions and provide for expeditious attainment as discussed in Section VII.D of this preamble. As with other Serious area RFP analyses, the state may consider PM_{2.5} plan precursor emissions reductions in the aggregate for RFP purposes in a 189(d) area.

The state's RFP analysis must include three components: (1) An implementation schedule for control measures on sources in the nonattainment area, (2) RFP projected emissions for each applicable quantitative milestone year (discussed in Section VII.G of this preamble), based on the anticipated control measure implementation schedule; and (3) an analysis that demonstrates that this schedule of aggregate emissions reductions achieves sufficient progress toward attainment between the applicable baseline year to the attainment year. For additional discussion of each of the components of the RFP analysis, refer to Section IV.F of this preamble. See 40 CFR 51.1012(a).

In the proposal, the EPA proposed an option to require at least 5 percent

¹⁹⁸ *Ibid.*

emissions reductions in direct PM_{2.5} and all PM_{2.5} plan precursor from sources in the area annually until attainment to meet the separate RFP requirement for attainment plans. However, some commenters did not agree that EPA should consider an area meeting the 5 percent requirement under CAA section 189(d) to automatically have satisfied the RFP requirement. The EPA agrees with this comment and is therefore not finalizing an approach to the RFP requirement that is tied to the 5 percent requirement. Instead, the final RFP requirement will be tied to progress toward expeditious attainment (which the EPA recommends should be generally linear but may also be stepwise with appropriate justification), just as it is for all other types of Moderate and Serious area plans for PM_{2.5} as summarized in the previous paragraph. The emissions reductions that a state achieves for purposes of meeting the 5 percent requirement may also be counted towards meeting the separate RFP requirement, but the EPA does not believe that meeting the 5 percent requirement would automatically equate to meeting the RFP requirement. That determination requires the separate evaluations required for the RFP analysis.

The EPA requires that the applicable baseline year for the RFP analysis must be the same year as that represented by the latest base year inventory for the Serious area. The projected attainment date should be as expeditiously as practicable and is discussed further in Section VII.I of this preamble. The RFP analysis must clearly convey how the schedule for implementing the control strategy will provide for generally linear or stepwise progress towards attainment. If stepwise progress is more appropriate for the specific nonattainment area, the state is required to submit a clear rationale and supporting information to explain why generally linear progress towards attainment in the area is not appropriate (e.g., due to the nature of the nonattainment problem, the types of sources contributing to PM_{2.5} levels in the area, and the ability to perform timely implementation of control measures). Further, if a stepwise approach is needed, this does not relieve the state of the requirements of CAA section 189(d). As stated earlier, the EPA requires that a section 189(d) plan must include in its RFP analysis the anticipated emissions reductions expected to be achieved through the implementation of control measures required by the control strategy described in Section VII.D of this

preamble. Further, the optional air quality analysis discussed in Section IV.F of this preamble is also available for use by a state preparing a section 189(d) plan.

Additionally, the EPA requires states to establish motor vehicle emissions budgets for direct PM_{2.5} and PM_{2.5} plan precursors using the latest planning assumptions and the latest approved motor vehicle emissions model available at the time that the 189(d) plan is developed.¹⁹⁹ See 40 CFR 51.1012(a). It is also important to note that if a section 189(d) area is multi-state or multi-jurisdictional, the states or jurisdictions comprising the area must provide a coordinated approach to meeting the RFP requirement for the shared area. For further information, see Section IV.F.5 of this preamble. See 40 CFR 51.1012(b).

c. Comments and Responses. Any additional comments received on RFP are addressed in the Response to Comments document found in the docket for this action.

G. Quantitative Milestones

1. Specific Requirements

a. Summary of the Proposal. The proposal indicated that quantitative milestones would need to be achieved every 3 years until the area attains the relevant NAAQS, similar to proposed requirements for Moderate area plans and other types of Serious area plans. In the proposal, the EPA stated that, at a minimum, quantitative milestones selected for an attainment plan submitted under CAA section 189(d) would need to demonstrate a reduction of at least 15 percent (i.e., 5 percent for each year in the 3-year period) in emissions of direct PM_{2.5} and PM_{2.5} plan precursors below those emissions reported in the most recent inventory for the area. The proposal identified requirements for direct PM_{2.5} and precursors, to be consistent with the RFP proposal. The EPA proposed that attainment plans developed pursuant to CAA section 189(d) would have to contain quantitative milestones beginning at 13.5 years or 16.5 years from designation (depending on whether the section 189(d) plan would be due before or after the 13.5 year mark), and every 3 years thereafter until the attainment date for the area.

The EPA also proposed that the requirements for quantitative milestones, described in Section VI.G of this preamble, should also apply to

quantitative milestones submitted with any revised Serious area attainment plan pursuant to CAA section 189(d).

b. Final Rule. The revised attainment plan for any Serious nonattainment area that fails to attain the relevant PM_{2.5} NAAQS by the applicable attainment date must include quantitative milestones pursuant to CAA section 189(c). These quantitative milestones should track the progress being made in the nonattainment area in the implementation of specific control measures in the SIP, and may potentially be in the form of metrics for tracking air quality improvement or emissions reductions over time. The EPA wishes to clarify that the quantitative milestones for a section 189(d) plan are designed to track RFP, not solely to track progress in achieving the minimum 5 percent annual emission reduction requirement in this section of the CAA. The RFP discussion in the previous section noted that in some cases, the state may need to adopt additional emission reduction measures (beyond those existing or new measures that will meet the 5 percent emission reduction requirement) in order for the plan to meet the overarching requirement to attain the standard as expeditiously as practicable. Thus, the RFP plan and quantitative milestones must be designed to track progress based on the overall set of control measures needed for expeditious attainment.

The quantitative milestones need to be achieved every 3 years until the area attains the relevant NAAQS. Therefore, at a minimum, the final rule requires that quantitative milestones selected for an attainment plan submitted under CAA section 189(d) need to track progress in the implementation of control measures required to achieve RFP in emissions reductions of direct PM_{2.5} and/or all PM_{2.5} plan precursors described in the previous section. The CAA section 189(d) plan must contain quantitative milestones to be achieved every 3 years, beginning with a milestone at either 13.5 years or 16.5 years from the area's date of designation. If the attainment plan is due prior to a date 13.5 years from designation of the area, then the plan shall contain milestones to be achieved by no later than a milestone date of 13.5 years from the date of designation of the area, and every 3 years thereafter, with the final milestone being the first 3-year milestone date falling after the applicable attainment date. If the attainment plan is due later than a date 13.5 years from designation of the area, then the plan shall contain milestones to be achieved by no later than a

¹⁹⁹ If an area includes re-entrained road dust in the motor vehicle emissions budget, the latest approved version of AP-42 should be used unless the EPA has approved an alternative model for the area.

milestone date of 16.5 years from the date of designation of the area, and every 3 years thereafter, with the final milestone being the first 3-year milestone date falling after the applicable attainment date. *See* 40 CFR 51.1013(a)(3).

The EPA is also finalizing that the requirements for quantitative milestones described in Section VI.G of this preamble shall also apply to quantitative milestones submitted with any revised attainment plan pursuant to CAA section 189(d), including but not limited to, the construction, content, reporting requirements and a quantitative milestone that specifically tracks implementation of control measures identified in the plan to attach the standard as expeditiously as practicable. *See* 40 CFR 51.1013(a)(3).

c. Comments and Responses. Any additional comments received on quantitative milestones are addressed in the Response to Comments document found in the docket for this action.

H. Contingency Measures

1. Summary of the Proposal

The EPA proposed that contingency measures for attainment plans under CAA section 189(d) for Serious areas that fail to attain the NAAQS by the applicable attainment date must meet the same criteria as contingency measures for a Serious area attainment plan outlined in Section VI.H of this preamble. The EPA also proposed that the contingency measures should achieve approximately 1 year's worth of emissions reductions.

2. Final Rule

All PM_{2.5} attainment plans, including plans for areas subject to CAA section 189(d), must contain contingency measures that are consistent with CAA section 172(c)(9). Section VI.H of this preamble describes the EPA's criteria for contingency measures for a Serious area attainment plan, and contingency measures for a section 189(d) plan must meet the same criteria. The final rule reiterates the EPA's longstanding policy that contingency measures should provide for emissions reductions approximately equivalent to 1 year's worth of reductions needed for RFP.

The statutory contingency measure requirement at CAA section 172(c)(9) is not superseded or subsumed by any requirement under subpart 4. Thus, contingency measures are required as part of a state's attainment plan submission under section 189(d). Accordingly, the final rule requires the criteria for identifying and selecting contingency measures for a section

189(d) submission that are the same as for Moderate or Serious area attainment plans.

Specifically, the EPA is finalizing that the following requirements must be met in order for contingency measures to be approvable as part of a state's attainment plan submission for purposes of section 189(d):

(1) Contingency measures must be fully adopted rules or control measures that are ready to be implemented quickly upon a determination by the Administrator of the nonattainment area's failure to meet RFP, failure to meet any quantitative milestone, failure to submit a quantitative milestone report or failure to meet the standard by the applicable attainment date.

(2) The SIP must contain trigger mechanisms for the contingency measures, specify a schedule for implementation, and indicate that the measures will be implemented without significant further action by the state or by the EPA.

(3) Contingency measures should consist of control measures that are not otherwise included in the control strategy for the SIP, or that achieve emissions reductions not otherwise relied upon in the control strategy for the area.

(4) Contingency measures should provide for emissions reductions equivalent to 1 year's share of reductions needed to demonstrate attainment (*i.e.*, the overall needed reductions divided by the number of years from the base year to the attainment year), or approximately equivalent to 1 year's worth of air quality improvement or emissions reductions proportional to the overall amount of air quality improvement or emissions reductions to be achieved by the area's attainment plan.

The EPA is also finalizing its proposal to allow a state to rely on contingency measures that achieve emissions reductions on sources located outside the nonattainment area, but within the state provided that the measures on sources outside the designated nonattainment area are demonstrated to produce the appropriate air quality impact within the nonattainment area.

As with contingency measures for Moderate or Serious areas, the EPA allows a state under these circumstances to rely on additional reductions from federal or local measures already scheduled for implementation as part or all of their contingency measures. The EPA could consider such measures as meeting the contingency measure requirement as long as they produce emissions reductions in excess of those required to meet other statutory

nonattainment provisions (*e.g.*, such as to meet BACM/BACT requirements) and they can be relied on to achieve a sufficient portion of the actual emissions reductions necessary to reduce emissions in the area while the state develops a new plan to bring the area into attainment.²⁰⁰ As with contingency measures for Moderate area or Serious area attainment plans, the EPA requires that the emissions reductions associated with contingency measures for attainment plans under section 189(d) should be approximately equivalent to 1 year's worth of emissions reductions necessary to achieve RFP for the area, unless the state adequately demonstrates that some smaller amount of reductions is appropriate while the state is revising its attainment plan for the area. *See* 40 CFR 51.1014(b)(2).

The EPA recognizes that identifying contingency measures for a Serious PM_{2.5} nonattainment area that failed to attain the relevant NAAQS by the applicable attainment date may be challenging for a state that should already have fully implemented all control measures identified as "reasonable" and "best," and potentially "most stringent," in addition to any new control measures to achieve the requisite minimum 5 percent reductions in direct PM_{2.5} or PM_{2.5} plan precursor emissions necessary for expeditious attainment. However, for an area that has not implemented MSM, states could identify potential contingency measures by reviewing attainment plans for other nonattainment areas. The state should also reevaluate control measures that were identified previously as technologically or economically infeasible for the area, or otherwise removed from consideration as part of the RACM/RACM or BACM/BACT process. Additionally, states can review other sources of control measure information, such as the RBLC (a central database of air pollution control technology information) and the EPA's Menu of Control Measures document available at <http://www3.epa.gov/ttn/naaqs/pdfs/MenuOfControlMeasures.pdf>. *See* 40 CFR 51.1014.

3. Comments and Responses

Comment: Commenters stated that because 189(d) requires annual emissions reductions of not less than 5 percent, then the EPA cannot assume that 1 year's worth of emissions reductions will be *no greater than* 5

²⁰⁰ *See* *LEAN v. EPA*, 382 F.3d 575 (5th Cir. 2004).

percent. The commenter stated that only if an area shows that the 5 percent reduction requirement of CAA section 189(d) is greater than what would be necessary to demonstrate RFP annually may an area assume that contingency measures must achieve only the 5 percent target.

Response: The EPA agrees with the commenters. As discussed earlier and in Sections IV.H and VI.H of this preamble, contingency measures should equal approximately 1 year's worth of emissions reductions necessary to achieve RFP for the area. The EPA notes that RFP might require more than the 5 percent emissions reductions required by CAA section 189(d). Therefore, if contingency measures should equal approximately 1 year's worth of emissions reductions necessary to achieve RFP, then those contingency measures should provide more than 5 percent of emissions reductions in direct PM_{2.5} or aggregate PM_{2.5} plan precursors.

Comment: Commenters suggested that, similar to the ozone program, the EPA should consider whether the contingency measures for an area that failed to attain by the deadline for Serious areas could anticipate the development of proven new technology, with a requirement to add further contingency measures if such technology does not develop as anticipated.

Response: The EPA disagrees with the commenters, noting that CAA section 182(e)(5) provides this flexibility for Extreme areas that are nonattainment for the ozone NAAQS. That section of the Act falls within subpart 2 of part D, which identifies additional contingency measure provisions applicable only in ozone nonattainment areas. Subpart 4 does not contain a provision similar to that in subpart 2. Therefore, CAA section 172(c)(9) applies and, as explained earlier, that provision requires contingency measures be included in the attainment plan.

Comment: Commenters requested the EPA to allow a state to demonstrate, in the alternative, that its contingency measures will achieve a 5 percent reduction in PM_{2.5} ambient concentrations, and that such reductions can be obtained by reducing direct PM_{2.5} emissions, emissions of one or more precursors, or both.

Response: The EPA is finalizing the optional air quality analysis as an additional component of the RFP plan, as previously discussed in Section IV.F of the preamble. Therefore, although the state could demonstrate that its contingency measures will achieve a 5 percent reduction in PM_{2.5} ambient

concentrations, the EPA notes that this optional analysis does not relieve the requirements of 189(d). Specifically, the area remains required to achieve an emissions reduction of not less than 5 percent of direct PM_{2.5} or any PM_{2.5} plan precursor.

I. Attainment Dates

1. Summary of the Proposal

The proposed rule indicated that the new attainment date for an area that failed to attain by the Serious area attainment date would be governed by sections 172(a)(2) and 179(d)(3) of the CAA. Under the proposal, the attainment date would be as expeditiously as practicable, but no later than 5 years from the date of publication in the **Federal Register** of the EPA's determination that the area failed to attain the relevant NAAQS. The EPA may extend the attainment date by up to 5 additional years based on certain criteria.

2. Final Rule

As described in the proposal, the final rule includes the overarching requirement for a Serious area that failed to attain by the previous attainment date to establish a new date for attaining the standard as expeditiously as practicable. However, neither CAA section 189(d) nor other sections in subpart 4 explicitly establish or provide the authority to establish a new attainment date for the area. Therefore, once an area is beyond the attainment dates that Congress specified in subpart 4 for the PM₁₀ NAAQS, the EPA must look to other provisions of part D of the CAA to provide authority for a new attainment date. Sections 179(d)(3) and 172(a)(2) of the CAA provide generally applicable attainment dates that fill the gap in the statute left for areas subject to the requirements of CAA section 189(d). Thus, for a PM_{2.5} nonattainment area subject to CAA section 189(d) requirements, the EPA must establish a new attainment date according to the provisions of CAA section 179(d)(3) and 172(a)(2). The EPA has followed this same approach in the past for PM₁₀ nonattainment areas governed by subpart 4 nonattainment requirements.²⁰¹

Applying these provisions, the final rule therefore provides that the new attainment date in a CAA section 189(d) plan must be as expeditious as practicable, but no later than 5 years

²⁰¹ For example, see the **Federal Register** notice from June 6, 2007 (72 FR 31183) in which the EPA found that the Phoenix PM₁₀ Serious nonattainment area failed to attain the standard by the 2006 attainment date.

from the date of publication in the **Federal Register** of the EPA's determination that the area failed to attain the relevant NAAQS. The EPA may extend the attainment date by up to 5 additional years (thus to 10 years from the date of publication of the notice of finding of failure to attain by the applicable attainment date for the area) if the agency deems it appropriate "considering the severity of nonattainment and the availability and feasibility of pollution control measures." For a PM_{2.5} nonattainment area subject to CAA section 189(d), the EPA expects that the state will adopt any control measures necessary to demonstrate expeditious attainment within 5 years of the area failing to attain the NAAQS by the applicable Serious area attainment date. The EPA will consider the state's proposed attainment date for the area based on its revised attainment demonstration and modeling of its updated control strategy, and other relevant facts and circumstances for the area, in order to identify the most expeditious attainment date practicable for the area.

3. Comments and Responses

Comment: Some commenters stated that the EPA should set a date that is as expeditious as practicable, but if it takes longer than 10 more years to attain, the EPA may approve such a plan, as long as the minimum 5 percent reduction requirement is met. The commenter stated that this is the plain meaning of CAA section 189(d)'s reference that the plan shall provide for at least 5 percent reductions "from the date of such submission until attainment."

Response: The EPA does not agree with the commenter. As indicated earlier, the EPA's longstanding interpretation is that the statutory provisions of CAA sections 172(c)(2) and 179(d)(3) govern the attainment date for new plans required under CAA section 189(d) for Serious areas that previously fail to attain by the Serious area attainment date. Under certain circumstances, these provisions would allow for an attainment date up to 10 years from the effective date of a finding of failure to attain, but would not allow for an attainment date longer than that.

VIII. NSR Requirements for PM_{2.5} Nonattainment Areas

A. Background

1. Statutory Requirements for NSR

Section 110(a)(2)(C) of the CAA requires states to include in their SIPs a preconstruction review permitting program that regulates the construction and modification of stationary sources

as necessary to ensure that NAAQS are achieved. To address the regulation of the larger pollutant-emitting sources (defined as major stationary sources), Congress provided specific permitting requirements in the CAA in parts C and D of title I. The requirements for preconstruction permits under parts C and D of the CAA are commonly known collectively as the major NSR program because they apply specifically to the preconstruction review and permitting of new major stationary sources and major modifications at existing sources. As explained in Sections VIII.A.1.a and b of this preamble, the preconstruction review of each proposed new major stationary source and major modification generally is carried out on a pollutant-specific basis and the permitting requirements with regard to each pollutant apply based on whether the area in which the proposed major source or major modification would locate is designated attainment (or unclassifiable) or nonattainment for that pollutant at the time the permit is issued.

a. Prevention of Significant Deterioration. Part C of title I of the CAA (hereafter referred to simply as part C) contains implementation plan requirements that apply to new major stationary sources and major modifications locating in areas designated attainment or unclassifiable for any NAAQS. These requirements constitute the Prevention of Significant Deterioration (PSD) program. Pursuant to part C, the EPA has adopted PSD regulations at 40 CFR 51.166 (minimum requirements for an approvable state PSD program in the SIP) and 40 CFR 52.21 (the federal PSD program, applicable in areas where the state does not have an EPA-approved PSD program in its SIP).²⁰² The EPA last amended the PSD regulations for PM_{2.5} on January 15, 2013, in the final rule revising the PM_{2.5} NAAQS.²⁰³ This final rule does not relate to the PSD program, nor does it amend the PSD regulations.

b. Nonattainment New Source Review. Part D of title I of the CAA (hereafter referred to as part D) contains implementation plan requirements for nonattainment areas, which include the requirements for permitting new major stationary sources and major modifications locating in designated nonattainment areas, referred to as the

Nonattainment New Source Review (NNSR) program. As noted earlier, part D contains several subparts that include various requirements for addressing nonattainment areas. Subpart 1 addresses plan requirements for nonattainment areas generally, including CAA section 172(c)(5), which requires preconstruction and operating permits for new major stationary sources and major modifications locating in nonattainment areas. Section 173 of the CAA outlines the minimum statutory requirements for a state's NNSR permit program and serves as the basis for the EPA's NNSR regulations for PM_{2.5} as promulgated in the 2008 PM_{2.5} NSR Rule published at 73 FR 28321, May 16, 2008. Subpart 4 was added to part D as part of the 1990 CAA Amendments and includes additional plan provisions for designated PM₁₀ nonattainment areas. Relevant here, CAA section 189(a)(1)(A) of subpart 4 requires states to include in their implementation plan a permit program addressing major stationary sources of PM₁₀ that meets the requirements under CAA section 173 of subpart 1. Subpart 4 also includes some additional preconstruction review requirements, which, until the court's decision in *NRDC v. EPA*, the EPA has only applied to major sources of PM₁₀ located in PM₁₀ nonattainment areas. The specific NNSR requirements contained in both subparts 1 and 4 are described later, including the changes that we are making in this final rule to the NNSR regulations to address these requirements with respect to PM_{2.5}.

2. Federal NNSR Regulations

The EPA has adopted numerous NNSR regulations in 40 CFR parts 51 and 52, including § 51.165; part 51 Appendix S; and § 52.24. An approvable NNSR program in a state's implementation plan must, at a minimum, meet the applicable program requirements set forth in the federal NNSR provisions at 40 CFR 51.165, which for PM_{2.5} have been based on changes to that section made by the 2008 PM_{2.5} NSR Rule. States with designated nonattainment areas for a particular pollutant are required to adopt regulations consistent with those applicable plan requirements, including any subsequent rule changes that the EPA may make, and submit them to the EPA for approval as part of their SIP within a period of time consistent with the schedule prescribed by the CAA or the EPA, as appropriate.

The EPA interprets the requirement established under section 110(a)(2)(C) of the CAA that states regulate the construction and modification of

sources to apply as of the effective date of an area's designation to nonattainment for a given pollutant.²⁰⁴ Although CAA section 110(a)(2)(C) does not contain specific requirements a state must follow for issuing major source permits during the interim period between effective date of designation and the date when the EPA approves a state's NNSR program to address a given pollutant, the EPA regulations at 40 CFR 52.24(k) authorize states to apply 40 CFR part 51, Appendix S, known as the Emission Offset Interpretative Ruling or simply the Offset Ruling, during the interim period.^{205 206}

Accordingly, states with newly designated nonattainment areas for the revised primary PM_{2.5} NAAQS have two possible means by which they can implement NNSR requirements for PM_{2.5} following the effective date of designations and until the EPA approves a SIP submission meeting the NNSR requirements for PM_{2.5} promulgated in this rule. First, any state that already has a SIP-approved NNSR program for PM_{2.5} (e.g., where the state has had other PM_{2.5} nonattainment areas for which the EPA has approved an NNSR program) should continue to apply those permitting requirements in the interim. Second, any state that lacks an approved NNSR program for PM_{2.5} may rely upon the NNSR provisions in Appendix S until the EPA approves that

²⁰⁴ See the EPA's final rule to implement certain aspects of the 1990 CAA Amendments relating to NSR and PSD, published in the *Federal Register* on November 29, 2005 (70 FR 71612, 71677 and 71678).

²⁰⁵ States with designated PM_{2.5} nonattainment areas for the 1997 and 2006 PM_{2.5} standards were required to submit SIPs, including a NNSR program satisfying the requirements of the 2008 PM_{2.5} NSR Rule, by May 16, 2011, 3 years from the date of publication of that 2008 rule. See 73 FR 28321 (May 16, 2008), at page 28342. States must continue to implement those approved state programs to issue permits to new major stationary sources and major modifications until the state's revised program containing the subpart 4 NNSR provisions promulgated in this rulemaking is approved under the applicable SIP.

²⁰⁶ Appendix S was originally promulgated in 1976 to address whether, and to what extent, new and modified sources would be allowed to construct in nonattainment areas whose attainment deadlines had already passed, in light of the regulatory requirement that applications for construction permits for new or modified sources be disapproved where the source would interfere with attainment of the NAAQS, see 41 FR 55524 (December 21, 1976). When Congress added the part D provisions in the 1977 CAA Amendments, it also added the requirement that SIPs contain NNSR provisions as set forth in Part D. Additionally, Congress provided that Appendix S would govern preconstruction permitting in nonattainment areas lacking approved part D SIPs before a construction ban went into effect. When Congress removed the construction ban via the 1990 CAA Amendments (except as provided for in CAA section 110(n)(3)), it left in place the use of the interim NNSR program under Appendix S.

²⁰² The federal PSD program enables the EPA or a state that has been delegated authority by the EPA to issue PSD permits.

²⁰³ More information on the PSD requirements for PM_{2.5} as well as the public comments and the EPA's responses to those comments is contained in the January 15, 2013 *Federal Register* document (78 FR 3086, beginning at page 3251).

state's SIP submission in order to ensure that proposed new major stationary sources and major modifications for PM_{2.5} in newly designated PM_{2.5} nonattainment areas undergo the appropriate type of preconstruction review in the interim.

a. General Applicability. Stationary sources are considered to be "major" sources based on the amount of a given pollutant (or a precursor for that pollutant) the source emits or has the potential to emit, as defined by the statute. New major stationary sources are subject to the NNSR requirements when they are major for the pollutant (or a precursor for that pollutant) for which an area is designated nonattainment. See 40 CFR 51.165(a)(2)(i). With regard to major modifications, NNSR applies to proposed physical changes or changes in the method of operation of an existing stationary source that (1) is major for the nonattainment pollutant (or a precursor for that pollutant) and (2) results in both a significant emissions increase and a significant net emissions increase of that same nonattainment pollutant (or same precursor for that pollutant).²⁰⁷

For each proposed new major stationary source and major modification, the general NNSR requirements to be included in a state's SIP include the following: (i) The installation and continuous operation of pollution control technology that complies with the Lowest Achievable Emission Rate (LAER); (ii) the acquisition of creditable emissions reductions to adequately offset the proposed emissions increase of the nonattainment pollutant; and (iii) a certification that all other sources owned by the applicant are complying with all applicable requirements of the

CAA.²⁰⁸ These NNSR requirements apply as of the effective date of the designation of an area as nonattainment for the pollutant and must be satisfied by a proposed major new source or major modification locating in such area

as a prerequisite for obtaining a NNSR permit.

b. Historical Overview of NNSR for PM₁₀ and PM_{2.5} National Ambient Air Quality Standards (NAAQS). The EPA revised the PM NAAQS in 1997, establishing new annual and 24-hour NAAQS using PM_{2.5} particles as a new indicator, while retaining the NAAQS for PM₁₀.²⁰⁹ In 2006, the EPA again revised the suite of PM NAAQS by tightening the 24-hour PM_{2.5} standards and retaining the level of the annual PM_{2.5} standards.²¹⁰ In 2008, the EPA issued the PM_{2.5} NSR Rule that established various provisions ensuring that proposed new major stationary sources or major modifications of sources of direct PM_{2.5} emissions or emissions of applicable PM_{2.5} precursors would be required to undergo preconstruction review.²¹¹ The EPA included specific provisions in the 2008 PM_{2.5} NSR Rule that apply when such sources are located in a designated PM_{2.5} nonattainment area. Unlike the NNSR requirements for PM₁₀ developed under subpart 4, the EPA determined that the applicable implementation requirements for the PM_{2.5} NAAQS were limited to the general nonattainment provisions under subpart 1.

With regard to NSR applicability for PM_{2.5} precursors in the 2008 PM_{2.5} NSR Rule, the EPA recognized that, under the appropriate conditions, NO_x, SO₂, VOC and ammonia could each contribute to the formation of PM_{2.5} in the ambient air. However, the EPA issued regulations that did not require states to subject all of these precursors to regulation as part of the attainment plan or NSR permitting requirements applicable in a given nonattainment area.²¹² Instead, the EPA established the initial presumptions for nonattainment areas that SO₂ and NO_x should be regulated precursors for PM_{2.5}, but VOC and ammonia need not be regulated precursors.²¹³

As described in Section II.B of this preamble, in January 2013 the court's decision in *NRDC v. EPA* held that the EPA erred in implementing the PM_{2.5} NAAQS under the general implementation requirements in subpart 1, rather than relying on the

implementation requirements specific to PM₁₀ in subpart 4 of the CAA. Accordingly, the court directed the EPA to comply with the requirements of subpart 4 when developing implementing regulations for PM_{2.5} nonattainment areas.

The *NRDC* decision has specific implications for implementing the NNSR program for PM_{2.5}. Two provisions of subpart 4 impose additional requirements on NNSR plans developed to address sources locating in areas designated nonattainment for PM_{2.5}. The first relates to the definition of "major stationary source" that applies to areas initially designated as Moderate nonattainment areas and subsequently reclassified as Serious. In such areas, section 189(b)(3) of the CAA defines the major source threshold as 70 tpy of PM₁₀. The second relevant subpart 4 provision governs the treatment of major sources of PM₁₀ precursors. As previously described in Section III of this preamble, section 189(e) of the CAA requires that the control requirements applicable to major stationary sources of PM₁₀ also apply to major stationary sources of PM₁₀ precursors, unless the Administrator determines that such sources of PM₁₀ precursors do not contribute significantly to PM₁₀ levels that exceed the standard in that area. The EPA's proposed amendments to address the subpart 4 requirements with respect to PM_{2.5} and the EPA's responses to comments received on its proposal are summarized in the relevant subsections later.

It is worth noting that the 2008 PM_{2.5} NSR Rule promulgated new NSR requirements for implementation of PM_{2.5} in both nonattainment areas (NNSR) and attainment/unclassifiable areas (PSD). As subpart 4 includes requirements only pertinent to nonattainment areas, the EPA does not consider the portions of the 2008 PM_{2.5} NSR Rule that address requirements for PM_{2.5} attainment and unclassifiable areas to be affected by the court's opinion in *NRDC v. EPA*. Therefore, the EPA did not propose to revise any PSD requirements promulgated in the 2008 PM_{2.5} NSR Rule in order to comply with the court's decision.

B. Final NNSR Requirements for PM_{2.5} Nonattainment Areas

This section provides a description of the changes that the EPA is making to the NNSR requirements for PM_{2.5} that are contained in 40 CFR 51.165, which provides the minimum requirements for a NNSR program under an approved implementation plan, and in Appendix S, which serves as an interim NNSR permitting program pending approval of

²⁰⁷ See 40 CFR 51.165(a)(1)(v)(A), (a)(2)(ii)(A). As will be explained in ensuing discussions, the nonattainment pollutant and any applicable precursors for that pollutant are considered separately for NNSR applicability purposes.

²⁰⁸ The basic NNSR requirements are set forth in CAA section 173 of subpart 1. Subpart 4 adds a more stringent definition of "major source" for PM₁₀ sources locating in PM₁₀ nonattainment areas classified as Serious and sets forth provisions for the regulation and potential exemption from regulation of major sources of PM₁₀ precursors in PM₁₀ nonattainment areas. Until the decision in *NRDC v. EPA* was issued, the additional subpart 4 requirements had not been directly applied to PM_{2.5}.

²⁰⁹ See 62 FR 38652 (July 18, 1997).

²¹⁰ See 71 FR 61144 (October 17, 2006).

²¹¹ See 73 FR 28321 (May 16, 2008).

²¹² See 72 FR 20589.

²¹³ In the 2008 PM_{2.5} NSR Rule, the EPA concluded that SO₂ should be regulated as a precursor for PM_{2.5} in all areas. In addition, the EPA or the states could rebut the initial presumptions regarding NO_x, VOC or ammonia on an area-by-area basis with a demonstration approved by the Administrator and thus reverse any of those presumptions in the state's implementation plan for that area. See 73 FR 28327.

a state's SIP to address NNSR requirements for a particular pollutant.

For both sets of regulations, we will describe the changes that were proposed, the final requirements, the comments received, and the EPA's responses to them.

1. 40 CFR 51.165

In this final rule, as explained in more detail later, the EPA is making the following revisions that affect the NNSR regulations for PM_{2.5} at 40 CFR 51.165: (a) Amending the definition of "regulated NSR pollutant" with regard to PM_{2.5} precursors; (b) amending the definition of "major stationary source" with regard to major sources of direct PM_{2.5} emissions and PM_{2.5} precursors locating in PM_{2.5} nonattainment areas classified as Moderate and Serious; (c) amending the definition of "significant" with regard to emissions of PM_{2.5} precursors; and (d) codifying the EPA's policy for determining whether a source is "major" for PM_{2.5} with regard to emissions of direct PM_{2.5} and its precursors.

Also, the EPA explains in this section that it is codifying the schedule for states to submit NNSR SIP revisions for PM_{2.5} that meet the requirements of 40 CFR 51.165. The schedules for submitting revised NNSR programs for PM_{2.5} for Moderate and Serious areas are not contained in 40 CFR 51.165 NNSR regulations but in new 40 CFR 51.1003(a) and (b), respectively.

a. Definition of "regulated NSR pollutant"—PM_{2.5} Precursors

i. Summary of Proposal

CAA section 189(e) requires that the control requirements applicable to major stationary sources of PM₁₀ also apply to major stationary sources of PM₁₀ precursors, unless the Administrator determines that such sources of PM₁₀ precursors do not contribute significantly to PM₁₀ levels that exceed the standard in that area. In order to align the NNSR regulations for PM_{2.5} with the requirements of CAA section 189(e), the EPA proposed several amendments to certain definitions within 40 CFR 51.165, as explained in the subsections that follow, in order to regulate all four identified PM_{2.5} precursors consistent with the statute.²¹⁴ The EPA proposed to revise

the NNSR definition of "regulated NSR pollutant" to include SO₂, NO_x, VOC and ammonia as regulated PM_{2.5} precursors.

The EPA also proposed to add language to the definition of "regulated NSR pollutant" to address the provision of CAA section 189(e) that allows an exemption from the NNSR permit requirements for major stationary sources or major modifications of a particular precursor if the state demonstrates to the satisfaction of the EPA that major stationary sources of such precursor do not contribute significantly to PM_{2.5} levels that exceed the PM_{2.5} ambient standards in a particular nonattainment area. In Section III of the preamble of the proposal, the EPA proposed and sought comment on several policy approaches that a state could use to make the necessary demonstration that would enable the state to exempt sources of a particular precursor from being regulated under the attainment plan for a particular PM_{2.5} nonattainment area altogether or from individual components of that plan, including the NNSR permitting requirements. *See* 80 FR 15350–62.

ii. Final Rule

The EPA is amending the definition of "regulated NSR pollutant" at 40 CFR 51.165 to include a new provision stating that SO₂, NO_x, VOC and ammonia are PM_{2.5} precursors in any PM_{2.5} nonattainment area. *See* 40 CFR 51.165(a)(1)(xxxvii)(C)(2). The EPA is also providing in this final rule that sources of a particular precursor may be exempted from the NNSR control requirements via a demonstration approved by the Administrator showing that new major stationary sources and major modifications of a particular precursor would not contribute significantly to levels of PM_{2.5} that exceed the standard in a particular nonattainment area. It is noted, however, that the exemption provision is not being codified within the definition of "regulated NSR pollutant" as originally proposed. Instead, this exemption provision is contained in a new paragraph 51.165(a)(13), which is based on CAA section 189(e) and provides generally that the control requirements applicable to new major stationary sources and major modifications of PM_{2.5} are also applicable to new major stationary sources and major modifications of PM_{2.5} precursors.

In addition, the provision has also been revised to focus on the exemption of control requirements for sources of a particular precursor rather than the

exemption of the precursor itself. The EPA believes that this shift in focus is more consistent with the statutory language at CAA section 189(e), which also focuses on the exemption of sources from the control requirements for that precursor. As explained in Section III of this preamble, the EPA has defined a precursor demonstration specifically for exempting major sources of a particular precursor from regulation under the NNSR program. This demonstration involves a sensitivity-based analysis that evaluates the sensitivity of ambient PM_{2.5} concentrations in a nonattainment area to increases of precursor emissions resulting from potential major source growth in the area. The EPA intends to issue a technical assistance document that provides additional information on conducting appropriate sensitivity-based analyses for this purpose. A more complete description of this and the other types of precursor demonstrations is contained in Section III of this preamble.

The EPA recommends that the state consult with the appropriate EPA Regional Office as early as possible to discuss appropriate analyses for the NNSR precursor demonstration. If the appropriate precursor demonstration is submitted to and approved by the Administrator, the state would not be required to regulate new major stationary sources and major modifications of the insignificant precursor under the state's approved NNSR program in a particular nonattainment area. Such exemption from the NNSR control requirements would include an exemption from all of the prerequisite conditions set forth in 40 CFR 51.165 for PM_{2.5}, including the requirements to implement LAER and to obtain emissions offsets for the precursor.

iii. Comments and Responses

Comments: Some commenters supported revising the definition of "regulated NSR pollutant" consistent with the *NRDC* decision and subpart 4 to establish SO₂, NO_x, VOC and ammonia as regulated PM_{2.5} precursors, unless a state demonstrates that major stationary sources of a particular precursor do not contribute significantly to PM_{2.5} levels that exceed the standard in the nonattainment area.

On the other hand, several commenters urged the EPA not to begin regulating VOC and ammonia as PM_{2.5} precursors under the NNSR program at this time. Some of the commenters cited ongoing technical challenges related to evaluating the contribution of PM_{2.5} precursor gases to ambient PM_{2.5}

²¹⁴ The EPA explained earlier in this preamble that the court's 2013 decision in *NRDC v. EPA* reasoned that the EPA's approach to precursors in the 2007 and 2008 PM_{2.5} regulations had the effect of reversing the presumption embodied with subpart 4 at CAA section 189(e) that a state should regulate major sources of all PM precursors unless the state has made a specific showing why regulation of sources of a particular precursor is not necessary.

concentrations, while some commenters stated that the EPA should provide an up-front rebuttable presumption that a state is not required to regulate VOC and ammonia as PM_{2.5} precursors under NNSR. A commenter stated that requiring NNSR to apply to sources of these precursors that would have an insignificant impact on the nonattainment issue is a waste of resources and will unnecessarily lead to burdensome over-regulation for affected sources.

Response: We do not agree with the commenters who oppose the EPA's proposal to require regulation of all four technical and scientific precursors in PM_{2.5} nonattainment areas. Specifically, we do not agree that a delay in regulating VOC and ammonia under a state's NNSR permitting program is reasonable or permissible. Similarly, the EPA does not agree that it has the authority to provide a rebuttable presumption to exempt VOC and ammonia from NNSR permitting requirements. CAA section 189(e) explicitly requires the regulation of major sources of PM_{2.5} precursors unless the state demonstrates to the EPA's satisfaction that such regulation is unnecessary. Thus, CAA section 189(e) does not allow the EPA to unilaterally exempt an identified scientific and technical PM_{2.5} precursor from regulation, nor does it permit the EPA to establish a rebuttable presumption exempting any PM_{2.5} precursor from regulation. The EPA's use of a rebuttable presumption exempting certain precursors from regulation in its prior PM_{2.5} implementation rules was directly at issue in *NRDC v. EPA*, wherein the court made it clear that it would be inappropriate for the EPA to establish such presumptions pursuant to the requirements of subpart 4.²¹⁵

In some PM_{2.5} nonattainment areas, the minimization (and offsetting) of new precursor emissions from major source growth in the area could be an important component of a state's attainment plan for the PM_{2.5} NAAQS. Where it is not, CAA section 189(e) provides states with the opportunity to make an area-by-area demonstration that would enable the state to exempt sources of any PM_{2.5} precursor from regulation if it is shown that sources of the precursor does not contribute significantly to the PM levels that exceed the standard in a particular nonattainment area. Accordingly, consistent with CAA section 189(e), this final rule provides guidance to assist states in preparing a NNSR precursor demonstration, as described in Section

III of this preamble, by which sources of VOC, ammonia or any other PM_{2.5} precursor may be exempted from the NNSR requirements for PM_{2.5} if the state shows that increased source emissions of the relevant precursor would not contribute significantly to PM_{2.5} concentrations in a PM_{2.5} nonattainment area.

Moreover, as described in Section VIII.B.2 of this preamble, the EPA is not commencing with the regulation of VOC and ammonia (hence not requiring NNSR review of any new major stationary sources and major modifications of such precursors) for those states relying on Appendix S to issue NNSR permits during the interim SIP development period.²¹⁶ This provides states with an opportunity to evaluate the contribution of VOC and ammonia emissions from potential major source growth to ambient PM_{2.5} concentrations and determine whether an exemption of new and modified sources of either of these precursors from the NNSR permitting requirements is justified before such sources will be subject to regulation.

b. Definition of "major stationary source" in Moderate and Serious PM_{2.5} Nonattainment Areas—Direct PM_{2.5} Emissions and PM_{2.5} Precursors

i. Summary of Proposal

Subpart 4, as described earlier in this document, contains provisions for the classifications of PM₁₀ nonattainment areas as either Moderate or Serious areas. However, the NNSR regulations for PM_{2.5} set forth in the 2008 PM_{2.5} NSR Rule were developed pursuant to subpart 1, which does not provide for the classification of designated nonattainment areas as Moderate and Serious areas. Accordingly, in the proposal for this final rule, the EPA proposed to amend its definition of "major stationary source" in the 40 CFR 51.165 NNSR regulations for PM_{2.5} to address subpart 4 requirements concerning the regulation of direct PM_{2.5} and PM_{2.5} precursors in both Moderate and Serious nonattainment areas for PM_{2.5}. First, the EPA proposed to revise the definition of "major stationary source" by qualifying the term "regulated NSR pollutant" with the new

phrase "(as defined in paragraph (a)(1)(xxxvii) of this section)." The new phrase explicitly cross-references the definition of "regulated NSR pollutant," which also defines each of the PM_{2.5} precursors. Hence, sources of both direct PM_{2.5} emissions and emissions of each PM_{2.5} precursor would clearly be included in the definition of a "major stationary source."

Second, the EPA proposed to amend the definition of "major stationary source" consistent with section 189(b)(3) of the CAA to establish a lower major source threshold for new major stationary sources and major modifications locating in PM_{2.5} nonattainment areas classified as Serious. CAA section 302(j) generally defines a "major stationary source" as a source that emits or has the potential to emit 100 tpy or more of any air pollutant. The provision explicitly states that this definition applies for purposes of the CAA except as otherwise expressly provided in the statute. Thus, for sources locating in PM_{2.5} nonattainment areas classified as Moderate, where no CAA provision provides otherwise, the applicable major source threshold for direct PM_{2.5} emissions and for each PM_{2.5} precursor is 100 tpy. Subpart 4, meanwhile, establishes a major source threshold for PM₁₀ nonattainment areas classified as Serious at 70 tpy in CAA section 189(b)(3). Therefore, the EPA proposed to set the major source threshold for direct PM_{2.5} emissions and for each PM_{2.5} precursor at 70 tpy of direct PM_{2.5} emissions and each individual precursor. The alternative proposed for consideration was to promulgate a PM_{2.5} major source threshold lower than 70 tpy of direct PM_{2.5} emissions, recognizing that PM_{2.5} is a subset of PM₁₀. The EPA sought comment on possible ways in which a PM_{2.5} emissions rate different from the statutory 70 tpy rate for PM₁₀ emissions could be established, taking into account variations in the PM₁₀/PM_{2.5} ratio for different source categories and activities. Nevertheless, the agency indicated that the proposed option (*i.e.*, a major source threshold of 70 tpy of direct PM_{2.5} emissions for stationary sources proposing to construct or modify in PM_{2.5} nonattainment areas classified as Serious) represented the preferred approach.

In its effort to ensure that major sources of PM_{2.5} precursors locating in Serious areas are regulated in the same manner as major sources of direct PM_{2.5} emissions locating in Serious areas, the EPA proposed major source thresholds for PM_{2.5} precursors would be consistent with the threshold already defined for

²¹⁶ States should use Appendix S to issue NNSR permits to new major stationary sources and major modifications with respect to a particular nonattainment pollutant if the state's implementation plan lacks a NNSR program for that pollutant. Where a state's existing NNSR program for a particular pollutant lacks certain provisions for which revision is required, the existing program—not Appendix S—is the applicable permit program for issuing NNSR permits until the necessary revisions are approved by the EPA.

²¹⁵ See *NRDC v. EPA*, 706 F.3d at 437, n.7 & n.10.

direct PM_{2.5} emissions in PM_{2.5} nonattainment areas reclassified as Serious. Consistent with the EPA's preferred approach for direct PM_{2.5} emissions, the EPA proposed to define "major" for each PM_{2.5} precursor as 70 tpy. However, the EPA also solicited comments on the appropriateness of setting the precursor major source thresholds at a different rate, particularly if, as alternatively proposed, the agency defined "major stationary source" for sources of direct PM_{2.5} emissions in Serious PM_{2.5} nonattainment areas at a rate lower than 70 tpy of PM_{2.5} emissions. For example, if the agency had set the major source threshold at 60 tpy of direct PM_{2.5} emissions in Serious PM_{2.5} nonattainment areas, the agency would have also considered setting the major source threshold for each PM_{2.5} precursor at 60 tpy of that particular precursor.

Regardless of whether the major source threshold for direct PM_{2.5} emissions was set at 70 tpy or some lower rate, the EPA indicated in the proposal that it believed a reasonable technical argument could be made that the threshold set for direct PM_{2.5} emissions would be too low to be regarded as "major" for each precursor when considering the effects that any precursor sources could have on ambient PM_{2.5} concentrations. In support of higher emissions rates for defining "major" for PM_{2.5} precursors, the EPA cited a previous analysis that it had undertaken to examine the relationship between emissions of SO₂ and NO_x and the formation of secondary PM_{2.5} in the ambient air.²¹⁷ However, the agency also identified potential legal impediments to setting a major source threshold for precursors at a rate higher than those statutorily prescribed for direct emissions of a pollutant. Accordingly, the agency solicited comments on the general appropriateness of setting higher major source thresholds for one or more PM_{2.5} precursors in PM_{2.5} nonattainment areas, and asked commenters to include legal and technical considerations that should be made part of the EPA's future analysis of NNSR requirements with respect to PM_{2.5} precursors.

ii. Final Rule

In this final rule, the EPA has followed its preferred approach and has

made the changes necessary to ensure that "major" is defined for direct PM_{2.5} emissions as well as all PM_{2.5} precursors in Moderate and Serious PM_{2.5} nonattainment areas. For Moderate areas, the major source threshold of 100 tpy applies individually to direct PM_{2.5} emissions and to each PM_{2.5} precursor; in Serious areas, the major source thresholds for direct PM_{2.5} emissions and emissions of each PM_{2.5} precursor are individually defined as 70 tpy. As explained in Section VIII.B.1.d of this preamble, the determination of whether sources of direct PM_{2.5} emissions or each PM_{2.5} precursor are "major" is to be made separately for each pollutant. That is, emissions rates for individual precursors should not be added together to determine a source's major source status with regard to PM_{2.5}. See 40 CFR 51.165(a)(2)(i).

iii. Comments and Responses

Comment: Most commenters generally supported the preferred approach of setting a major source threshold at 70 tpy of direct PM_{2.5} emissions in Serious areas, agreeing with the EPA that establishing a PM_{2.5} equivalency to PM₁₀ emissions would be problematic. Some commenters specifically opposed any effort to set a threshold for PM_{2.5} that is lower than the threshold for PM₁₀. A commenter stated that, if PM_{2.5} is legally subject to subpart 4 because it is a subset of PM₁₀, and Congress meant to subject all sources of PM₁₀ emissions to subpart 4, then Congress meant to have the major source threshold for PM₁₀ apply to PM_{2.5} as well. No commenter advocated that the EPA set a major source threshold lower than 70 tpy for direct PM_{2.5} emissions.

Response: The EPA agrees with the commenters that it is reasonable to set the major source threshold at 70 tpy of direct PM_{2.5} emissions for sources locating in PM_{2.5} nonattainment areas classified as Serious. While CAA section 189(b)(3) does not explicitly define a "major source" and "major stationary source" as 70 tpy of PM_{2.5} for PM_{2.5} nonattainment areas reclassified as Serious (because it refers to PM₁₀), the most straightforward and consistent application of the statutory provision is to establish the same numerical threshold for sources of PM_{2.5} in Serious PM_{2.5} nonattainment areas as the threshold for sources of PM₁₀ emissions in Serious PM₁₀ nonattainment areas. Sources locating in Moderate nonattainment areas are already subject to the same numerical major source threshold (100 tpy) under CAA section 302(j) for direct emissions of both PM₁₀ and PM_{2.5}, so the EPA believes that it is also reasonable to establish the

threshold for PM_{2.5} in Serious areas at the same numerical rate as the threshold that applies to PM₁₀ in Serious areas.

We also agree that it would be difficult to establish a lower uniform major source threshold for PM_{2.5} that would represent a rate that is equivalent to 70 tpy of PM₁₀ emissions at all sources subject to NNSR permitting requirements. With regard to the commenter who stated that "Congress meant to have the major source threshold for PM₁₀ apply to PM_{2.5} as well," it is not clear whether the commenter advocates that proposed sources of PM_{2.5} be subjected to NNSR permitting using a major source threshold of 70 tpy of PM₁₀ emissions or a major source threshold of 70 tpy of PM_{2.5} emissions for sources of PM_{2.5} locating in PM_{2.5} nonattainment areas. The former is not the EPA's interpretation of the CAA. While PM_{2.5} is a subset of PM₁₀, to assume that a source emitting major amounts of PM₁₀ will also emit a substantial amount of PM_{2.5} is not always reasonable. The relative amounts of PM₁₀ and PM_{2.5} emitted by various source categories is known to vary significantly and we do not believe that it would be reasonable to subject sources to major source review for PM_{2.5} on the basis of the level of PM₁₀ emissions as this could mean that sources are subject to NNSR based on different levels of PM_{2.5} emissions on an area-by-area basis. We do not believe that Congress intended such a lack of uniformity in the application of the major source threshold to sources of direct PM_{2.5}. Moreover, even if it were permissible to interpret CAA section 189(b)(3) in this manner, we have determined that the most reasonable and straightforward approach is to establish a separate major source threshold for direct emissions of PM_{2.5} at 70 tpy for sources locating in PM_{2.5} nonattainment areas classified as Serious.

Comment: With regard to the definition of "major stationary source" for PM_{2.5} precursors in Moderate and Serious areas, several commenters supported using the same major source threshold value for direct PM_{2.5} emissions and PM_{2.5} precursors. One of these commenters expressly opposed any alternative approach that would set a different threshold for PM_{2.5} precursors than for direct PM_{2.5} emissions because the commenter asserted that it would be impossible to set a uniform national ratio reflecting the effect of the various precursors on ambient PM_{2.5} concentrations relative to direct PM_{2.5} emissions.

On the other hand, some commenters wanted the EPA to include a provision

²¹⁷ See 80 FR 15433. The technical assessment, with details on data and modeling inputs, was fully described in a technical memo titled "Details on Technical Assessment to Develop Interpollutant Trading Ratios for PM_{2.5} Offsets," which was placed in the docket to the 2008 PM_{2.5} NSR Rule. See also 73 FR 28321 (May 16, 2008), at page 28339.

in the NNSR regulations allowing states to make a case-by-case demonstration to use higher major source thresholds for PM_{2.5} precursors for permit reviews. These commenters expressed concern that the 100 tpy major source threshold for Moderate areas, and the 70 tpy threshold for Serious, are both too low for the PM_{2.5} precursors and do not realistically reflect the effect that each precursor has on ambient PM_{2.5} concentrations. These commenters suggested the EPA should conduct further analyses to determine what higher quantity of emissions of each regulated precursor would be equivalent to 100 tpy (for Moderate areas) and 70 tpy (for Serious areas) of direct PM_{2.5} emissions in terms of contribution to PM_{2.5} concentrations in ambient air. These commenters recommended that the EPA use the information gained from the recommended analyses to determine appropriate thresholds and make its proposed thresholds available for public comment.

Response: In setting the major source threshold for each PM_{2.5} precursor at 100 tpy for Moderate areas, the EPA is following the precedent established in the 2008 PM_{2.5} NSR Rule in which the agency set the same 100 tpy major source threshold for direct PM_{2.5} emissions and each of the regulated precursors (at that time SO₂ and NO_x).²¹⁸ Setting the same 100 tpy major source thresholds for sources of PM_{2.5} emissions and regulated PM_{2.5} precursor emissions is also consistent with the way in which we have historically interpreted the requirements of CAA section 189(e) as they applied to emissions of PM₁₀ and PM₁₀ precursors.²¹⁹

Moreover, section 302(j) of the CAA contains a definition of “major emitting facility” and “major stationary source” that applies to, among other things, programs implemented under subpart 1 such as the general NNSR program requirements in CAA section 173.²²⁰ This definition also applies to programs implemented under subpart 4 to the extent that they regulate PM_{2.5} nonattainment areas classified as Moderate, as subpart 4 does not establish a different definition of major sources for such areas. That definition defines a source as “major” whenever a facility or source “emits, or has the potential to emit, one hundred tons per year or more of *any air pollutant*.”²²¹ This provision does not clearly provide

the EPA with the authority to set a major source threshold higher than 100 tpy for a pollutant merely because it is a precursor for another pollutant. Rather, CAA section 302(g) clearly defines the term “air pollutant” to “include any precursors to the formation of any air pollutant.”

With regard to the setting of the major source thresholds for PM₁₀ precursors in Serious areas, a House of Representatives Report accompanying the 1990 amendments to the CAA described the effects of adding CAA section 189(b)(3), defining “major” sources locating in PM nonattainment areas classified as Serious as those sources that emit or have the potential to emit 70 tpy of PM₁₀. The report specifically notes that “new or modified sources emitting 70 tons or more per year of VOC [a PM_{2.5} precursor] will be subject to new source review requirements.”²²² Thus, Congress contemplated that the same major source threshold would apply to sources of direct PM₁₀ emissions and PM₁₀ precursors in Serious PM₁₀ nonattainment areas. The same approach logically applies when applying the provision to sources locating in areas designated as Serious PM_{2.5} nonattainment areas.

Since the EPA may not have the legal authority to establish major source thresholds for PM_{2.5} precursors at levels higher than the statutory threshold applied to sources of direct PM_{2.5} emissions, it would be inappropriate to allow states discretion for setting major source thresholds for PM_{2.5} precursors that exceed the statutory thresholds. Moreover, while we acknowledge that PM_{2.5} precursors will not likely form ambient PM_{2.5} in the nonattainment area on a ton-per-ton basis, there is not currently sufficient technical basis that would enable the agency to propose uniform higher major source thresholds for any of the four PM_{2.5} precursors. As stated in the proposal, the EPA intends to continue its analysis of the relationship between each precursor and ambient PM_{2.5} concentrations.

Comment: Some commenters questioned the EPA’s interpretation of the 2006 court decision in *South Coast Air Quality Mgmt. Dist. v. EPA*²²³ as precluding higher major source thresholds because the court determined that NSR provisions, including major source thresholds, were control requirements subject to anti-backsliding provisions of the statute. The

commenter argued that the South Coast decision did not address setting a major source threshold for a precursor pollutant that is as stringent as, or more stringent than, the major source threshold for the pollutant when the pollutant is directly emitted. The commenter stated the statutory provision on which the court in *South Coast* relied [CAA section 172(e)] is applicable on its face only when the EPA relaxes the NAAQS, which the commenter claimed is not relevant to the current situation here, where the EPA has promulgated progressively more stringent NAAQS for PM.

Response: CAA section 189(e) requires the control requirements that are applicable to major stationary sources of PM_{2.5} to also apply to major stationary sources of PM_{2.5} precursors. The court in *South Coast* held that the term “controls” under section 172(e) of the CAA includes NSR requirements, and in particular includes major source thresholds specified by the statute.²²⁴ The commenter did not explain why the term “control” in CAA section 189(e) of the statute should be interpreted differently than the term “control” in other parts of the statute. Section 172(e) of the CAA is a provision in subpart 1 of part D of the statute concerning anti-backsliding requirements in designated nonattainment areas. It is reasonable for the EPA to conclude that the term “control” in one part of the statute pertaining to nonattainment area requirements should be interpreted consistent with the use of that term in other provisions of part D pertaining to nonattainment area requirements, particularly where both provisions apply to designated PM_{2.5} nonattainment areas. Thus, consistent with the holding of *South Coast* regarding the definition of “controls,” the EPA interprets the use of the term “control requirements” in CAA section 189(e) to require the same major source threshold be applied to PM_{2.5} precursors as applies to direct PM_{2.5} emissions.

The commenter also did not explain, and it is not clear, how a relaxation versus a strengthening of the NAAQS would bear on whether the EPA has authority to set different control requirements (e.g., major source thresholds) for sources of direct emissions of a pollutant and sources of precursors of that pollutant. The EPA notes that Congress, in adding additional particulate matter requirements in subpart 4 of the CAA,

²¹⁸ *Ibid.*

²¹⁹ See 57 FR 13498 (April 16, 1992), at page 13538.

²²⁰ *Ibid.* (emphasis added).

²²¹ 42 U.S.C. 7602(j).

²²² H.R. Rep. 101–490.

²²³ *South Coast Air Quality Mgmt. Dist. v. EPA*, 472 F.3d 882, 900–902 (D.C. Cir. 2006) (*South Coast* decision).

²²⁴ See *South Coast* decision (holding that “controls” in CAA section 172(e) anti-backsliding provision include NSR requirements such as LAER, offset ratios, and major source thresholds).

decided that more stringent requirements were required to address air quality in particulate matter nonattainment areas. Hence, it would be inconsistent with that intention for Congress to allow higher major source thresholds to apply to sources of precursors than apply to direct PM_{2.5} emissions.

The EPA therefore believes that at this time the most reasonable approach for defining the major source threshold for PM_{2.5} precursors in both Moderate and Serious areas is to use the same threshold that is being defined for direct PM_{2.5} emissions. As explained earlier, the EPA currently has studies underway to better understand the effects of emissions of each precursor on the secondary formation of ambient PM_{2.5} concentrations. However, even if such studies support the commenters' recommendation for higher precursor thresholds, the EPA must consider the potential legal restrictions on setting thresholds for precursors above the statutory requirements for direct emissions of an air pollutant.

c. Significant Emissions Rates (SERs) for PM_{2.5} Precursors

i. Summary of Proposal

As noted earlier, stationary sources locating in nonattainment areas are subject to the NNSR permitting requirements to the extent construction at the source qualifies as a major modification with respect to a pollutant for which the area is designated nonattainment. A major modification of a stationary source is defined in the NNSR regulations at 40 CFR 51.165(a)(1)(v)(A) as "any physical change in or change in the method of operation of a major stationary source" that would result in (1) a significant emissions increase of a regulated NSR pollutant, and (2) a significant net emissions increase of that pollutant. The term "significant" is separately defined at 40 CFR 51.165(a)(1)(x)(A) to mean a rate of emissions specified for each pollutant or precursor for that pollutant. This is known as a significant emissions rate (SER). In the 2008 PM_{2.5} NSR Rule, the EPA defined "significant" for SO₂ and NO_x as PM_{2.5} precursors with an emissions rate of 40 tpy for each precursor.²²⁵ Also, in the preamble to the 2008 PM_{2.5} NSR Rule, the EPA indicated that it would consider 40 tpy of VOC emissions to be "significant" in any state regulating VOC as a PM_{2.5} precursor; however, that significant emissions rate was not codified in any

of the NSR regulations because the regulations governing both NNSR and PSD permitting programs provided that VOC was generally presumed not to be a precursor to PM_{2.5}. Instead, the agency explained that any state making a demonstration that VOC should be treated as a PM_{2.5} precursor in a particular nonattainment area "would be required to adopt the 40 tpy SER unless it demonstrated that a more stringent SER (lower rate) is more appropriate."²²⁶

The EPA did not include any changes to the existing SERs for SO₂ and NO_x as PM_{2.5} precursors in the proposal. Nor did we propose a SER for ammonia, citing a lack of adequate technical support. However, the EPA proposed to codify a SER of 40 tpy for VOC in the NNSR permitting regulations. *See* 55 FR 15434.²²⁷ The EPA further stated that, as a result, only the ammonia SER would remain to be defined by each state that needs to control major stationary sources of ammonia as part of its NNSR program for PM_{2.5}. While not proposing to revise the existing 40 tpy SER values for SO₂ and NO_x, the EPA indicated it believed that, when more data are available, such data might provide a reasonable basis for considering subsequent changes to the SER for each PM_{2.5} precursor for purposes of implementing the PM_{2.5} NAAQS. Moreover, the EPA indicated that a separate rulemaking might be used to propose a new SER for each PM_{2.5} precursor. *See* 80 FR 15434.

ii. Final Rule

The EPA is finalizing its proposed approach with some changes to the final regulatory language. The final rule amends the definition of "significant" in the NNSR regulations at 40 CFR 51.165(a)(1)(x)(A) to add a SER for VOC. Thus, the revised definition contains individual SERs for direct PM_{2.5} emissions (10 tpy), SO₂ emissions (40 tpy), NO_x emissions (40 tpy), and VOC emissions (40 tpy). The revised definition does not contain a SER for ammonia emissions. Instead, a new subparagraph has been added to the definition of "significant" to require

that an implementation plan defines the term for ammonia in cases where sources of ammonia are not otherwise exempted from NNSR control requirements. *See* 40 CFR 51.165(a)(1)(x)(F). Such definition of "significant" for ammonia would need to be established by the state for a particular nonattainment area as part of its SIP submission for NNSR. The EPA's rationale for not establishing an ammonia SER in this action is provided in greater detail in the following section.

iii. Comments and Responses

Comment: Several commenters generally recommended that the EPA establish higher SERs for the PM_{2.5} precursors. These commenters expressed the need for values that more accurately represented each precursor's relative effect on ambient PM_{2.5} concentrations. One of these commenters stated that in the absence of such higher SERs in the NNSR regulations, the EPA should allow states to demonstrate the appropriateness of a higher SER for a particular precursor on either a statewide or area-by-area basis in a SIP submission, or through the NNSR program on a case-by-case basis.

Another of the commenters supporting higher significance thresholds for each precursor stated that the CAA's definitions of "major source" and "major emitting facility" trigger the statutory control requirements and its permit requirements for affected sources, but they do not define how much of a pollutant is regulated after the control or permit requirement is triggered by the CAA. The commenter stated that the EPA would appear to have ample authority to require that precursors be regulated based on different thresholds once a major source triggers a particular control or permit requirement, provided there is adequate technical basis for doing so.

Response: The EPA did not propose to reconsider or revise the SERs for SO₂ and NO_x; therefore, revisions to these rates are outside the scope of this action. Even if the EPA were to consider such a revision, it would provide little relief to new or modified sources subject to NSR. Because SO₂ and NO₂ are pollutants for which the EPA has established NAAQS and because NO_x and VOC are precursors for ozone, modifications with emissions increases above the current SERs for SO₂, NO_x or VOC would still be subject to some form of new source review (PSD if the area is attainment for the NAAQS pollutant or nonattainment NSR if the area is nonattainment) even if the SERs for these pollutants as PM_{2.5} precursors were revised to a higher value.

²²⁵ *See* the **Federal Register** published on May 16, 2008 (73 FR 28321, 28333 and 28334); and existing 40 CFR 51.165(a)(1)(x)(A).

²²⁶ *See* the **Federal Register** published on May 16, 2008 (73 FR 28321 and 28333).

²²⁷ The EPA notes that the 2015 NPRM included some potentially conflicting statements concerning the development of a SER for VOC. First, the preamble indicated that the EPA intended to consider a separate rulemaking to consider proposing new SERs for SO₂ and NO_x, while also proposing individual significant emissions rates for VOC and ammonia. Later in the same preamble, the EPA indicated that it was proposing to add VOC as a precursor with a 40 tpy significant emissions rate, and included regulatory text to show that aspect of the proposal, *i.e.*, proposed 40 CFR 51.165(a)(1)(x)(A).

Moreover, we do not believe that the statute would permit the EPA or states to adopt a definition of “significant” for purposes of identifying modifications subject to NSR permitting with rates greater than the statutory and regulatory definitions of a major source in a nonattainment area, as defined in CAA section 302(j) for sources locating in PM_{2.5} nonattainment areas classified as Moderate (100 tpy) and as defined in CAA section 189(b)(3) for sources locating in PM_{2.5} nonattainment areas classified as Serious (70 tpy). Consequently, we do not believe that there would be substantial cost savings to many sources if we were to revise the SERs for these pollutants specifically as PM_{2.5} precursors.

Comment: Some commenters directed specific attention to the definition of a SER for ammonia. These commenters urged the EPA to set a significance threshold for ammonia as soon as possible. These commenters stated that, without a SER, any significant emissions increase greater than zero tons per year would result in a major source review for NNSR.

Some commenters stated that, while the EPA indicates that a SER for ammonia may be developed in a subsequent rulemaking, if that rulemaking is not timely, the state would need to develop a SER for ammonia to reduce the burden on permit applicants and avoid permit issuance delays related to major source applicability determinations and permit development for ammonia and PM_{2.5}. Two of the commenters noted that ammonia is used in many industry and source types to control NO_x emissions through the implementation of selective catalytic reduction (SCR) and selective non-catalytic reduction (SNCR) control devices. These commenters stated that, without a SER for ammonia, it’s very possible that many NNSR reviews will be initiated simply because of any ammonia increase at a major source. To address this problem, some commenters stated that, until the EPA completes its analysis for ammonia, states need the ability to conduct case-by-case reviews for NNSR permits by requiring applicants to submit a technical demonstration showing that emissions of a particular precursor do not significantly contribute to PM_{2.5} levels that exceed the standard in an area, thus exempting the precursor from being controlled by that source.

Some commenters recommended that the EPA propose a SER for ammonia before finalizing the March 23, 2015, proposal and suggested the EPA should also provide definitive guidance for state and local agencies on how to

conduct permitting of major sources of ammonia until a SER is established. Other commenters stated that, at the time the EPA proposes new significant emission rates for precursors, the EPA should also establish the significant emission rate for ammonia. Yet another commenter stated that any precursor analyses conducted by the EPA should be done in close coordination with designated nonattainment areas to reduce duplication of efforts and conflicting outcomes that could in turn lead to more costly impacts on sources and on agencies’ limited resources. Finally, some commenters stated that the EPA should at least provide guidance for states to develop a SER for ammonia as a PM_{2.5} precursor.

Response: The EPA did not propose a SER for ammonia and, therefore, this rule does not finalize a SER for ammonia. The EPA’s initial plan, as explained in the proposal, was to establish a SER for ammonia in a separate rulemaking, which was also intended to establish significant impact levels (SILs) for Ozone and PM_{2.5} in order to streamline the air quality impact analysis under the PSD permitting program. However, based on the imminent need for the SILs (especially for ozone) for PSD permitting, the agency has decided to issue guidance in lieu of a rulemaking for the PSD-based SILs. After due consideration, the EPA has also concluded that a separate rulemaking solely for the purpose of developing a SER for ammonia is not warranted. We anticipate that very few states will actually need to control source modifications of ammonia under their NNSR programs for PM_{2.5} since (1) stationary sources of ammonia generally are not one of the primary causes of ambient PM_{2.5} concentrations in most PM_{2.5} nonattainment areas, and (2) according to information in the EPA’s NEI database, most existing PM_{2.5} nonattainment areas do not have an existing major stationary source of ammonia to which the ammonia SER would be applied to determine whether a proposed modification of such major source would be “major” for ammonia.

Unlike the EPA’s PSD regulations, the definition of “significant” in the NNSR regulations at 40 CFR 51.165 does not include a provision stipulating that, for any pollutant that does not have a listed emissions rate, “any increase” must be considered significant.²²⁸ Therefore, contrary to the concerns of some

commenters, the absence of an ammonia SER in the EPA’s NNSR regulations at 40 CFR 51.165 does not result in a default “any increase” interpretation of “significant” that must be contained in state NNSR programs. Accordingly, for the above reasons and due to the time, resources and process investment associated with a national rulemaking, the EPA believes that a national rulemaking to develop a SER for ammonia is neither warranted nor effective. As explained above, the EPA is finalizing a provision that requires states that must regulate modified major stationary sources of ammonia to develop and submit a definition of “significant,” such as an appropriate SER, for ammonia to be included, subject to the EPA’s approval in the state’s SIP. See 40 CFR 51.165(a)(1)(x)(F). The EPA recommends that states consult with the appropriate EPA Regional Office to develop an ammonia SER as a means of defining “significant” for a particular nonattainment area. As a general rule, the EPA believes that the ammonia SER in a Moderate nonattainment area should be an emissions rate no greater than 100 tpy of ammonia. Any SER that exceeds 100 tpy could not be approved by the EPA because any higher emissions rate would exceed the major source threshold established in the CAA.²²⁹ In the event that a nonattainment area is classified Serious for PM_{2.5}, the maximum acceptable ammonia SER would be a rate no greater than 70 tpy in accordance with the major source thresholds being finalized in this rule for major stationary sources of direct PM_{2.5} emissions and PM_{2.5} precursors locating in Serious PM_{2.5} nonattainment areas. States that regulate ammonia as a PM_{2.5} precursor should also include a technical justification for the ammonia SER for a nonattainment area that the state includes as a part of its NNSR SIP rules submission for EPA approval.

d. NNSR Applicability Determinations

i. Summary of Proposal

In setting SERs and major source thresholds for emissions of direct PM_{2.5} and PM_{2.5} precursors, the EPA explained in the preamble to the proposal that it intended for direct PM_{2.5} emissions and each individual PM_{2.5} precursor to be treated separately for determining the applicability of the

²²⁸ Compare the definitions of “significant” under the PSD regulations at 40 CFR 51.166(b)(23) and 52.21(b)(23), especially subparagraph (ii), with the NNSR definition at 40 CFR 51.165(a)(x).

²²⁹ The NNSR definition of “major stationary source” includes a provision at 40 CFR 51.165(a)(iv)(A)(3) that requires any physical change at an existing source that would not otherwise qualify as a major stationary source if the change would constitute a major stationary source by itself.

NNSR requirements to a proposed new source or modification. The EPA stated that such individual treatment of direct emissions and precursors was consistent with its policy as explained in previous rulemakings. In particular, the preamble to the 2008 PM_{2.5} NSR Rule explained that this applicability interpretation applied to both PSD and NNSR. However, at that time, we did not codify this interpretation in any of the NSR regulations. See 73 FR 28231, May 16, 2008, at page 28331. In the proposal, the EPA proposed language in the NNSR regulations at 40 CFR 51.165(a)(2)(i) to explicitly codify the policy.

ii. Final Action

The EPA is revising the NNSR regulations at 40 CFR 51.165(a)(2)(i) to codify the EPA's policy that direct emissions of a pollutant and emissions of any applicable precursor are to be considered independently for purposes of determining the applicability of the NNSR requirements for PM_{2.5} sources. For example, in order for a source to be subject to the NNSR requirements for PM_{2.5} with respect to NO_x as a PM_{2.5} precursor, the source must be either (1) a new stationary source that emits or has the potential to emit major amounts of NO_x (new major source of NO_x); or (2) an existing major source of NO_x that proposes to increase its emissions of NO_x by a significant amount and also results in a significant net emissions increase.

iii. Comments and Responses

Comment: A commenter requested that the EPA clarify in its NSR rules how to evaluate major source applicability for NNSR and PSD with respect to PM_{2.5} precursors. The commenter agreed that major source applicability determinations should be based on individual precursor pollutant emissions, and that different pollutants, including individual precursors, should not be summed to determine applicability for NNSR major stationary source or major modification. The commenter also raised various questions pertaining to how the precursors would trigger major source applicability for other pollutants.

Response: This final rule contains the following statement within the NNSR regulations at 40 CFR 51.165(a)(2)(i), "Different pollutants, including individual precursors, are not summed to determine applicability of a major stationary source or major modification." The commenter's specific precursor-related applicability questions and the EPA's responses are included in the Response to Comment

document contained in the Docket for this rulemaking.

e. NNSR Plan Due Dates

i. Summary of Proposal

In the proposal, the EPA explained that CAA section 189(a)(2)(B) requires states to submit to the EPA an attainment plan satisfying the applicable requirements within 18 months of an area being designated nonattainment pursuant to a new or revised PM_{2.5} NAAQS. See 80 FR 15437. Section 189(a)(1)(A) of the CAA specifically requires that such plans include the NNSR permitting requirements under CAA section 173. Thus, the EPA indicated that states would be required to submit the applicable NNSR program requirements for PM_{2.5} within 18 months from the effective date of area designations for the 2012 PM_{2.5} NAAQS. See 80 FR 15437.

The EPA also noted that the CAA does not specify a deadline for the states' submittal of NNSR program revisions in the event that a Moderate PM_{2.5} nonattainment area is subsequently reclassified as Serious like the CAA establishes a deadline for other plan provisions. Accordingly, the EPA used its gap-filling authority under CAA section 301(a) to propose a similar 18-month deadline, from the effective date of a final reclassification of the area as Serious, for states to submit a plan prescribing the more stringent NNSR requirements required by the statute for Serious areas. However, in light of the fact that such revisions would generally be straightforward to make, and to assure that new major sources and major modifications in the area would be subject to the more stringent NNSR requirements contained in subpart 4 for Serious areas, the EPA sought comments on an alternative 12-month timeframe for submittal of the NNSR plan revisions for Serious areas.

ii. Final Rule

The EPA is finalizing an 18-month deadline for states to submit plan revisions for NNSR requirements for PM_{2.5} after an area is initially designated to nonattainment (Moderate area) or reclassified to Serious. See 40 CFR 51.1003(a) and (b), respectively. As explained elsewhere in this Section VIII of the preamble, plan revisions applicable to areas reclassified as Serious must address the more stringent major source thresholds for direct PM_{2.5} emissions and each applicable PM_{2.5} precursor for Serious areas. With regard to the provisions for precursors, the EPA emphasizes that if the state seeks to

continue to exempt a precursor from NNSR control requirements, the state will need to reevaluate any previous finding that resulted in the exclusion of a precursor from the NNSR control requirements on the grounds that the precursor did not significantly contribute to PM_{2.5} levels that exceed the NAAQS. The requirement at 40 CFR 51.1006(b) calling for a new NNSR precursor demonstration means that, even if the existing NNSR program already includes the necessary provisions for a Serious area classification under a prior approval, a plan revision pertaining to NNSR may still be required to add requirements for a precursor that had previously been exempted, if a new NNSR precursor demonstration does not support continued exemption of that precursor.

The requirements for submitting plan revisions at 40 CFR 51.1003 also provide for situations where an area classified as Serious is subject to CAA section 189(d) for failing to attain the PM_{2.5} NAAQS by the applicable Serious area attainment date. See 40 CFR 51.1003(c). The list at § 51.1003(c), which contains attainment plan requirements that must be submitted as plan revisions, does not include the NNSR plan requirements contained at § 51.165. This omission results from the fact that Serious area requirements should have already been included in the NNSR program when the area was originally reclassified as Serious. Hence, there is no explicit requirement to revise the NNSR plan requirements in such cases. However, in light of the fact that states have the opportunity to submit a new NNSR precursor demonstration for each required plan revision (40 CFR 51.1006(b)), there may indeed be a need to revise the NNSR requirements in the event that a previous exemption can no longer be supported by the new NNSR precursor demonstration. Therefore, to the extent that a state's plan previously exempted sources of a precursor from NNSR regulation, a plan revision for a Serious area that fails to attain the PM_{2.5} NAAQS by the applicable Serious area attainment date will need to include a re-evaluated NNSR precursor demonstration if the state wishes to continue to exempt sources of that precursor. Such a plan revision is required to be submitted no later than 12 months from the applicable Serious area attainment date that was previously missed, in accordance with 40 CFR 51.1003(c)(2). The NNSR regulations have also been amended at 40 CFR 51.165(a)(13) to address the need to re-evaluate such a demonstration to

exempt a particular precursor from the NNSR requirements for PM_{2.5}.

iii. Comments and Responses

Comment: Some commenters supported allowing states at least 18 months to make the required SIP submission for NNSR. A commenter who supported the longer submission period stated that, although it is easy to write the rule language to make this change, it is likely to be quite difficult to perform the environmental and socio-economic analyses required by state law if the lowering of the threshold for a Serious area does indeed have a significant effect on the building of new or the repowering of existing power plants.

Response: Although the types of revisions needed to an existing NNSR program to address the new subpart 4 requirements for PM_{2.5} are relatively straightforward, the EPA acknowledges that such changes nevertheless often involve related analyses as well as state legislative review and approval. In addition, some states will be submitting NNSR regulations for PM_{2.5} for the first time and, as such, could need more than 12 months to obtain the necessary legislative review and approval. Accordingly, the EPA believes that the most reasonable approach for establishing the plan due date for revised plans for PM_{2.5} is to establish an 18-month deadline for submission of plans both upon initial designation to nonattainment for a particular PM_{2.5} standard and upon any subsequent reclassification to Serious.

2. Offset Ruling at 40 CFR Part 51 Appendix S

In this final rule, as explained later, the EPA is making the following revisions for PM_{2.5} in the Emission Offset Interpretive Ruling (40 CFR part 51, Appendix S): (a) Amending the definition of “regulated NSR pollutant” with regard to PM_{2.5} precursors; (b) amending the definition of “major stationary source” with regard to major sources of direct PM_{2.5} emissions and PM_{2.5} precursors in Serious areas; and (c) amending the definition of “significant” with regard to identifying major modifications of sources of PM_{2.5} precursors.

a. Appendix S Definition of “Regulated NSR Pollutant”—PM_{2.5} Precursors

i. Summary of Proposal

The definition of “regulated NSR pollutant” contained in Appendix S at section II.A.31(ii)(b)(2) has, to date, only required regulation of SO₂ as a PM_{2.5} precursor for states relying on Appendix S to issue permits to sources locating in

PM_{2.5} nonattainment areas. The EPA proposed to revise the definition in Appendix S of “regulated NSR pollutant” to also require regulation of NO_x as a PM_{2.5} precursor.²³⁰ The EPA noted that this proposed approach would ensure that states using the permitting requirements contained in Appendix S to issue permits to major new and modified sources in PM_{2.5} nonattainment areas will regulate the same precursors that have been subject to regulation in states that have already adopted NNSR requirements for PM_{2.5} based on the 2008 PM_{2.5} NSR Rule.

The EPA also proposed an alternative approach based on similar logic that would initially require only SO₂ and NO_x to be regulated as PM_{2.5} precursors, while later phasing in VOC and ammonia after states have prepared and the EPA has had sufficient time to evaluate any pending precursor demonstrations. See 80 FR 15436–37. Finally, the EPA also sought comments on an alternative to require the immediate regulation of all four scientific PM_{2.5} precursors (SO₂, NO_x, VOC and ammonia) in Appendix S.

ii. Final Rule

The EPA is amending Appendix S in this final rule to provide for the immediate regulation of SO₂ and NO_x as regulated NSR pollutants (specifically as PM_{2.5} precursors) and for the subsequent conditional phasing in of VOC and ammonia as regulated NSR pollutants (PM_{2.5} precursors) on the date 24 months from the effective date of the nonattainment designation in each area. The EPA was persuaded by the comments received expressing concerns that states may delay NNSR SIP development to instead rely on a less-inclusive Appendix S for NNSR permitting if only SO₂ and NO_x were regulated.

The alternative proposal featuring the phase-in approach balances the opportunity for states to demonstrate in the short-term that certain precursors need not be regulated with the need to ensure that the appropriate precursors are controlled in a manner consistent with the CAA. NNSR is unique among the nonattainment area requirements in that sources seeking a construction permit must comply with NNSR requirements for a particular pollutant

as soon as an area is designated nonattainment for that pollutant and not some months or years later, when the EPA formally approves a state plan and the sources comply with the remaining plan provisions. With respect to precursors in particular, this means that new and modified major sources of direct PM_{2.5} or a regulated PM_{2.5} precursor would be subject to NNSR regulation upon the effective date of the area designation to nonattainment. If the EPA required the immediate regulation of all four scientific PM_{2.5} precursors in Appendix S, states issuing permits pursuant to those provisions during the interim SIP development period would need to require regulation of certain precursors that the state may later be able to demonstrate through a SIP submission do not significantly contribute to PM_{2.5} levels that exceed the standard in a particular area. As state plans making such a NNSR precursor demonstration are not due until 18 months after the effective date of the area designation, and as the statute allows the EPA up to 18 months to act on such submissions, sources seeking permits to locate in such areas during this interim period might for several years be subject to more stringent controls than necessary to address PM_{2.5} nonattainment in that area.

The EPA is also cognizant, however, that some states have relied on Appendix S to conduct NNSR permitting well beyond the statutory SIP development period. In such cases, it would be inequitable if states could indefinitely rely on Appendix S that requires little to no regulation of some of the scientific PM_{2.5} precursors when other states are fulfilling their statutory duty to submit a SIP revision addressing all PM_{2.5} precursors. In particular, states that have submitted NNSR SIPs addressing PM_{2.5} requirements for the 1997 and 2006 standards have to date regulated SO₂ and NO_x as PM_{2.5} precursors. These SIP provisions will continue to apply with respect to any areas designated nonattainment as to the 2012 standard in those states until the states submit SIP revisions to address the 2012 NAAQS, including provisions necessary to comply with the precursor requirements in CAA section 189(e). States either continuing to rely on Appendix S by virtue of a nonattainment area designation under a prior PM_{2.5} standard or states newly relying on Appendix S by virtue of a nonattainment area designation under the 2012 standard have to date only been required to regulate SO₂ as a

²³⁰ The EPA notes that in the preamble to the proposal, it was stated that the EPA proposed to add NO_x as a PM_{2.5} precursor at section II.A.31.(iii)(b) of Appendix S. This was an incorrect reference, which should have read “section II.A.31.(ii)(b).” This final rule cites the correct section for the affected portion of the definition of “regulated NSR pollutant,” where NO_x is being added as a PM_{2.5} precursor.

regulated NSR pollutant (specifically as a PM_{2.5} precursor).

In order to balance these competing interests and concerns, the EPA has determined in this final rule to revise Appendix S in order to require that any state relying on Appendix S initially regulate both SO₂ and NO_x as regulated NSR pollutants (PM_{2.5} precursors) for NNSR permits, thereby aligning the requirements of Appendix S with the prevailing requirements of SIP-approved NNSR permitting provisions for PM_{2.5} in other states. See Appendix S, section II.A.31.(ii)(b)(2). Further, the final rule provides that VOC and ammonia will be phased in as regulated NSR pollutants (PM_{2.5} precursors) according to a prescribed schedule based on existing and future nonattainment area designations for PM_{2.5}, unless the EPA has determined, prior to the scheduled phase-in, that the state submitted a complete proposed NNSR program for PM_{2.5} that includes a NNSR precursor demonstration. The EPA believes it is reasonable not to require regulation of sources of VOC and ammonia in Appendix S during the interim SIP development period because we expect that, in many cases, states will submit SIPs that include as part of their proposed NNSR rules for PM_{2.5} a NNSR precursor demonstration indicating that they do not need to regulate new major stationary sources and major modifications of ammonia (and in some cases of VOC) under their NNSR programs in order to provide for attainment of the PM_{2.5} NAAQS.

Under the phase-in schedules being finalized in Appendix S, permits issued by states under the requirements in Appendix S will not be required to address VOC and ammonia as regulated NSR pollutants (PM_{2.5} precursors) until the state has had an opportunity to show that, as part of a proposed NNSR program for PM_{2.5}, sources of a particular precursor does not significantly contribute to PM_{2.5} concentrations that exceed the standard in a given nonattainment area. If a state submits such a NNSR precursor demonstration as to either VOC or ammonia as part of a complete SIP submission that includes the state's proposed NNSR program for PM_{2.5}, the state would not be required to regulate the applicable precursor pursuant to the provisions of Appendix S, unless the EPA reviews that proposed NNSR program for PM_{2.5} and the NNSR precursor demonstration and either determines that the SIP submission is incomplete or disapproves both the NNSR program and the NNSR precursor demonstration. Thus, the regulation of VOC and ammonia as regulated NSR

pollutants (PM_{2.5} precursors) pursuant to Appendix S will occur in three circumstances. First, in the absence of a plan submission that includes the appropriate NNSR precursor demonstration, VOC and ammonia will be phased in as regulated precursors pursuant to Appendix S 24 months after the effective date of area designations for PM_{2.5}. This will prevent states that fail to make a complete plan submission from continuing to rely on Appendix S to regulate only SO₂ and NO_x as PM_{2.5} precursors indefinitely. Second, if the EPA determines that the portion of the SIP containing the NNSR precursor demonstration submitted by the state is incomplete within the time allowed under CAA section 110(k)(1)(B), all precursors must be regulated upon EPA's determination of incompleteness or by the prescribed phase-in date, whichever date is later. The EPA believes it is important to condition the phase-in of VOC and ammonia regulation on the completeness of the SIP submission in order to deter the submission of plans that do not meet certain minimum criteria simply to avoid the regulation of these additional precursors.²³¹ Finally, if the EPA disapproves both the proposed NNSR program for PM_{2.5} and the accompanying NNSR precursor demonstration, the relevant precursors will be phased in to be regulated under Appendix S as of the effective date of the disapproval or by the prescribed phase-in date, whichever date is later.²³²

The EPA chose this 24-month period for phase-in of VOC and ammonia as PM_{2.5} precursors in accordance with (1) the requirement under CAA section 189(a)(2)(B) of subpart 4 that plan

²³¹ The minimum requirements for evaluating the completeness of such submissions can be found in 40 CFR part 51, Appendix V, Criteria for Determining the Completeness of Plan Submissions.

²³² If the EPA disapproves a state's NNSR precursor demonstration but the state's NNSR program is otherwise approvable, the EPA may partially disapprove the NNSR SIP provisions for failure to properly regulate sources of the relevant precursor and otherwise partially approve the program. Upon the partial approval of a state's NNSR program, Appendix S will no longer be the applicable set of requirements by which NNSR permits are to be issued by the state. Thus, the phase-in of the relevant precursor will only occur in the event that the EPA both disapproves the NNSR program for PM_{2.5} and the state's NNSR precursor demonstration. The partial disapproval of a state's NNSR program with respect to the regulation of a precursor will obligate the EPA to promulgate a federal implementation plan (FIP) pursuant to CAA section 110(c)(1) to address the regulation of that precursor within 2 years of the disapproval unless the Administrator approves a state plan or plan revision correcting the deficiency. The disapproval will also trigger the application of sanctions pursuant to CAA section 179(a) unless the state corrects the deficiency within 18 months.

revisions for PM_{2.5} attainment plans be submitted to the EPA within 18 months of area designations, and (2) the requirement under CAA section 110(k)(1)(B) that the EPA determine no later than six months after the date by which a state is required to submit a SIP whether a state has made a submission that meets the minimum completeness criteria established per CAA section 110(k)(1)(A).²³³ In order to provide an appropriate balance between the EPA's interests in providing states with the opportunity to develop precursor demonstrations prior to regulation of those precursors and in encouraging states to submit SIPs in a timely manner, the EPA believes it is reasonable to align the conditional phase-in of VOC and ammonia as regulated NSR pollutants (PM_{2.5} precursors) with the statutory timeframe for states to make SIP submissions addressing precursor regulation for NNSR and for the EPA to evaluate whether a state has made a complete submission. Thus, if by this 24-month deadline, a state has not submitted a precursor demonstration that VOC and/or ammonia need not be regulated, which has been determined to be complete by the EPA or deemed complete by the operation of law by this 24-month deadline, Appendix S will require regulation of these precursors going forward.

The EPA has specifically included the 6-month period for EPA's completeness review because we believe it is important to discourage states from submitting SIPs that do not meet the minimum completeness criteria found in 40 CFR part 51, Appendix V. Conditioning the phase-in on a completeness review will not only encourage states to make timely SIP submissions addressing the NNSR requirements, but also ensure that those submissions contain the minimum information necessary to enable the Administrator to determine whether the SIP complies with the statute. If a state with a designated PM_{2.5} nonattainment area that is currently relying on Appendix S makes a submission addressing NNSR program requirements, including a NNSR precursor demonstration, within 18 months of the designation (as required by CAA section 189(a)(2)(B)), either EPA

²³³ CAA section 110(k)(1)(B) specifically requires the Administrator to evaluate the completeness of a SIP submission within 60 days of receipt, but no later than 6 months after the date by which the SIPs were due. If the Administrator does not affirmatively evaluate the completeness of the SIP within that time period, the statute provides that the SIP shall be deemed complete by operation of law 6 months after receipt.

must evaluate the submission for completeness within 6 months or the SIP will become complete by operation of law, pursuant to CAA section 110(k)(1)(B). The latest date that a timely-submitted implementation plan would be determined to be complete by the EPA or deemed complete by operation of law is 24 months from the effective date of the PM_{2.5} nonattainment area designation. In other words, in the absence of EPA action to evaluate completeness, a state that submits a timely SIP addressing NNSR and including a NNSR precursor demonstration can be confident the submission will become complete by operation of law by the 24-month conditional phase-in date, and such states will not be required to regulate the precursor addressed by its demonstration (VOC or ammonia) in the PM_{2.5} nonattainment area pursuant to Appendix S during the period of EPA's review of the SIP. States that submit untimely SIPs, after the 18-month SIP submission deadline, cannot rely on the SIP becoming complete by operation of law before the 24-month conditional phase-in date. If the EPA has not acted to evaluate the completeness of the state's untimely SIP by the 24-month conditional phase-in, control of VOC and ammonia are automatically phased in for the PM_{2.5} nonattainment area under Appendix S, regardless of whether such SIP submission might later be determined complete, whether by EPA or by operation of law. Thus, if a state submits an untimely SIP addressing NNSR for a particular PM_{2.5} nonattainment area, including an NNSR precursor demonstration, such state can only avoid the conditional phase-in of VOC and ammonia control pursuant to Appendix S if the EPA affirmatively determines the submission to be complete by 24 months from the date of the area designation. In such circumstances, states are encouraged to coordinate with the appropriate EPA Regional Office.

The timing of the phase-in for a particular area will depend upon the effective date of the designation to nonattainment for PM_{2.5}. Because this rule establishes requirements that apply in both present and future nonattainment areas, the regulations address the timing of the precursor phase-in both for areas already designated nonattainment for PM_{2.5} and for areas that may be so designated in the future.

For any existing nonattainment area that was first designated nonattainment for PM_{2.5} effective on or before April 15, 2015 (which includes areas designated for the 1997, 2006 and 2012 PM_{2.5}

NAAQS), VOC and ammonia will be required to be controlled as PM_{2.5} precursors for any NNSR permit issued on or after April 15, 2017 (24 months from the date of area designations for the 2012 PM_{2.5} NAAQS), unless the state has submitted before the phase-in date a complete SIP revision that includes the state's proposed NNSR program for PM_{2.5} and a NNSR precursor demonstration showing that VOC, ammonia, or both do not contribute significantly to PM_{2.5} concentrations that exceed the standard in a given PM_{2.5} nonattainment area, consistent with the requirements of 51.1003, in which case the control of the precursors addressed by the submitted demonstration will not be required to be controlled at the 24-month mark. *See* Appendix S, section II.A.31.(ii)(b)(3). In order to satisfy this condition, such demonstration must be submitted in the form of a SIP revision and must either be determined to be complete by the EPA or deemed to be complete by operation of law pursuant to the provisions in CAA section 110(k)(1)(B).

Although areas were designated nonattainment for the 1997, 2006, and 2012 standards at different times, the EPA believes it is reasonable to apply the same phase-in date for all areas designated nonattainment as of the date of the designations for the 2012 standard. Area designations for the 2012 PM_{2.5} standards were finalized on April 15, 2015, and plans addressing the nonattainment area requirements as to that standard are due October 15, 2016. Therefore, states evaluating their NNSR programs in light of the subpart 4 requirements with respect to the 2012 standard will have some, if limited, opportunity to consider the requirements of this rule and EPA's technical guidance before submitting a plan revision addressing the statutory and regulatory requirements. By contrast, area designations for the 1997 standards were finalized many years ago. As to those areas, after the court's decision in *NRDC v. EPA*, the EPA promulgated a rule setting a deadline of December 31, 2014, for states to submit any attainment plan provisions that may be necessary to satisfy the subpart 4 requirements. 79 FR 31566 (June 2, 2014) at 31570. This included any submissions necessary to address NNSR permitting such as the CAA section 189(e) requirement that states regulate all PM_{2.5} precursors absent a demonstration that such regulation is unnecessary. This deadline superseded previous SIP submission deadlines initially established by application of the subpart 1 requirements. As that

deadline has passed, if the EPA were to apply the 24-month phase-in policy strictly, states relying upon Appendix S to issue NNSR permits in these areas would have had to commence regulating VOC and ammonia as PM_{2.5} precursors in June 2015—6 months after the SIP submission deadline. The EPA believes it is reasonable to provide states that have areas designated nonattainment with respect to the 1997 and 2006 PM_{2.5} standards with at least some limited opportunity to consider the requirements of this rule and EPA's technical guidance and submit a plan revision addressing the statutory and regulatory requirements before the state will be required to regulate sources of VOC and ammonia in such areas. Accordingly, the EPA finds that it is reasonable to subject all areas designated nonattainment for any PM_{2.5} standard as of April 15, 2015, to the same Appendix S requirements in this final rule.

For any area that is first designated nonattainment for any PM_{2.5} NAAQS after April 15, 2015 (that is, the area was not already designated nonattainment with respect to another PM_{2.5} NAAQS immediately prior to such date), any state relying on Appendix S to issue a NNSR permit on or after the effective date of such area designation must require control of SO₂ and NO_x as regulated NSR pollutants (PM_{2.5} precursors). Beginning on the date 24 months from the effective date of such area designation, a state relying on Appendix S to issue a NNSR permit must also require control of VOC and ammonia as regulated NSR pollutants (PM_{2.5} precursors) in that area, unless by that date the state has submitted a complete SIP revision that includes the state's proposed NNSR program for PM_{2.5} and an accompanying NNSR precursor demonstration that sources of VOC, ammonia, or both ammonia do not contribute significantly to the PM_{2.5} concentrations that exceed the standard in the PM_{2.5} nonattainment area. *See* Appendix S, section II.A.31.(ii)(b)(4). As explained earlier, such demonstration must be submitted as part of a SIP revision that is determined to be complete by the EPA or deemed to be complete by operation of law by the conditional phase-in date.

As noted earlier, the second phase-in provision applies to PM_{2.5} nonattainment areas that were not already designated as nonattainment for PM_{2.5} immediately prior to that date. If at the time of a new designation, an area was already designated nonattainment as to any prior PM_{2.5} NAAQS, and Appendix S applied and continues to apply for NNSR permitting with respect

to that existing nonattainment area, all PM_{2.5} precursors would likely already be required to be regulated in accordance with a prior phase-in schedule prescribed under Appendix S for that existing nonattainment designation. In such cases, all precursors would continue to be subject to regulation for NNSR permitting under Appendix S, even as to the new nonattainment designation. That is, once Appendix S definition of regulated NSR pollutant applies to all PM_{2.5} precursors in a given nonattainment area, it is not possible to later defer regulation of any precursors so long as the state continues to rely on Appendix S for NNSR permitting in that area. Once the state submits a SIP including an NNSR program and any appropriate NNSR precursor demonstration, and the EPA approves the SIP, Appendix S will no longer apply for the issuance of NNSR permits for PM_{2.5}.

iii. Comments and Responses

Comment: Several commenters generally supported the EPA's preferred approach in the proposal that would require only SO₂ and NO_x as PM_{2.5} precursors for NNSR permits issued pursuant to Appendix S. One commenter supported the alternative approach to phase in VOC and ammonia as PM_{2.5} precursors, while another commenter expressly opposed the EPA's preferred approach and the phase-in alternative, claiming that any approach that does not regulate all four scientific precursors of PM_{2.5} is contrary to CAA subpart 4 and unlawful.

Commenters supporting the preferred approach did not believe that it was appropriate to require NSR permitting during an interim period for sources that may be exempted from control requirements if a state can demonstrate that these sources do not contribute significantly to nonattainment in a particular area. These commenters stated that, since most, if not all, areas will not be able to demonstrate that SO₂ and NO_x do not contribute significantly to nonattainment levels of PM_{2.5}, the EPA's approach to include these two precursors in the interim is reasonable.

One commenter who supported the EPA's alternative approach to phase in VOC and ammonia as PM_{2.5} precursors stated that there are many unanswered questions and the science is not adequate to justify regulation of secondary formation precursors at this time. The commenter further stated that Appendix S should initially require sources issued a NNSR permit to control only SO₂ and NO_x as PM_{2.5} precursors, and only later, after a prescribed date (e.g., the date on which SIP revisions

based on subpart 4 requirements are due), require sources to control emissions of VOC and ammonia, if applicable.

A commenter who opposed any approach that did not immediately require the control of all four scientific precursors of PM_{2.5} stated that such approaches are unlawful and must be rejected. The commenter stated that the EPA must require immediate regulation of all four precursors, as only that alternative follows the plain language of the CAA and the *NRDC* decision. The commenter objected to the presumptive exemption of VOC and ammonia emissions as being identical to the "gamesmanship" that both Congress intended to curtail with subpart 4, and that the DC circuit found illegal in the *NRDC* decision. The commenter stated that the scope of the statutory definition, and consequently the application of subpart 4, did not change when the EPA subdivided PM₁₀ by regulation. The commenter stated that only this option would conform Appendix S to the requirements of subpart 4, and in so doing, align Appendix S with forthcoming state obligations to harmonize the PM_{2.5} portions of their SIPs with the obligations of subpart 4. The commenter stated that this approach would encourage states to submit SIPs in a timely fashion, rather than to rely on Appendix S for an extended period of time. The commenter stated that, in contrast, were the EPA to adopt illegally lax provisions into Appendix S, states might delay submitting replacement SIPs, particularly in those parts of the country with high VOC or ammonia precursor emissions.

Response: The EPA took each of these comments into consideration in concluding that the proposed phase-in alternative is a reasonable approach that balances competing factors regarding the regulation of PM_{2.5} precursors for NNSR permits issued pursuant to Appendix S. While CAA section 189(e) generally requires state plans to control all PM_{2.5} precursors, it also affords states an opportunity to demonstrate that a particular precursor does not contribute significantly to levels of PM_{2.5} that exceed the standard in a PM_{2.5} nonattainment area. Section 189(e) of the CAA clearly addresses how PM_{2.5} precursors must be regulated in the state's plan, but the statute does not address exactly when precursors are to be regulated pursuant to the NNSR requirements of Appendix S prior to the submission of the state's plan. As noted earlier, the NNSR provisions are unique among the nonattainment area requirements in that sources are

required to address NNSR immediately upon the effective date of an area's designation to nonattainment, rather than upon the EPA's approval of the state's SIP, which could be as much as 3 years after the nonattainment area designation (e.g., states have 18 months to submit attainment plans and the EPA may have up to 18 months from the date of the SIP submission to finalize action on such plans). Given this ambiguity in the statute and the unique application of the NNSR requirements, we believe a reasonable and balanced approach to the Appendix S requirements would allow states a time-limited period to submit a NNSR program for PM_{2.5} that includes a NNSR precursor demonstration that sources of a precursor do not contribute significantly to PM_{2.5} levels in a PM_{2.5} nonattainment area. The time limit will discourage states from unreasonably delaying regulation of such precursors where otherwise required to do so.

Moreover, the EPA believes it is reasonable to construct the Appendix S provisions regulating PM_{2.5} precursors in a manner that closely follows the way in which the precursors are being regulated in most state NSR programs based on EPA's 2008 NSR regulation. For areas that were designated attainment or unclassifiable prior to a new nonattainment designation, the PSD permit program was in effect and required that, at minimum, SO₂ and NO_x be regulated as PM_{2.5} precursors. It is therefore reasonable to ensure that those precursors continue to be regulated as part of the interim NNSR permit program via Appendix S. Moreover, in areas that were already designated nonattainment for a pre-existing PM_{2.5} NAAQS, and an approved plan containing NNSR permit requirements for PM_{2.5} is in effect, sources are required to control SO₂ and NO_x as PM_{2.5} precursors, as required under the 2008 PM_{2.5} NSR rule, until the EPA approves a SIP revision conforming those NNSR programs to the requirements of CAA subpart 4. Similarly, the EPA believes it is reasonable to not require the regulation of VOC and ammonia immediately upon designation of an area to nonattainment because it result in more regulation in newly designated nonattainment areas relying on Appendix S than is required in most states with approved programs. All states will ultimately be required to address the regulation of ammonia and VOC at the time their state plans are due or, failing submission of such plan by states relying on Appendix S to issue NNSR permits, Appendix S will require such regulation.

The phase-in schedule contained in this final rule requires that VOC and ammonia be phased in as PM_{2.5} precursors 24 months from the effective date of area designations for PM_{2.5}; however, states will not be required to control VOC and ammonia as PM_{2.5} precursors as part of a NNSR permit issued under Appendix S so long as the state submits a plan revision that includes the state's NNSR program for PM_{2.5} and a NNSR precursor demonstration to show that sources of a precursor does not contribute significantly to PM_{2.5} levels that exceed the standard in a PM_{2.5} nonattainment area. See Appendix S, sections II.A.31.(ii)(b)(3) and (4).

In initially requiring sources to control SO₂ and NO_x as regulated NSR pollutants (PM_{2.5} precursors), states that rely on Appendix S to issue NNSR permits generally will implement NNSR consistent with those states that issue NNSR permits for PM_{2.5} under the NNSR program in their approved SIP. The EPA believes that it is reasonable and appropriate to assure this consistency in the issuance of NNSR permits during the interim period when all states must revise their plans to address the 2012 PM_{2.5} NAAQS. Moreover, this final rule allows states to submit a SIP revision that contains a NNSR precursor demonstration showing that new major stationary sources and major modifications of either SO₂ or NO_x will be exempted where an analysis of increases in emissions of the particular precursor shows that sources of the precursor do not contribute significantly to PM_{2.5} levels that exceed the standard in the PM_{2.5} nonattainment area. In this case, the opportunity to exempt sources of either SO₂ or NO_x as PM_{2.5} precursors is addressed in the NNSR rules at 51.165. See 40 CFR 51.165(a)(13). Hence, when the EPA approves a state's plan revision containing the NNSR program for PM_{2.5} and a NNSR precursor demonstration showing an insignificant contribution, a new major stationary source or major modification of either SO₂ or NO_x as PM_{2.5} precursors will not be required to be controlled going forward in a NNSR permit issued to address PM_{2.5}, which permit would then be issued in accordance with the NNSR requirements in the approved plan, rather than the NNSR requirements in Appendix S.

With regard to the commenter's concern that states might delay submitting NNSR programs as part of their PM_{2.5} SIPs if Appendix S regulates only SO₂ and NO_x, the phase-in approach in this final rule will negate any incentive that a state may have to

delay submitting an NNSR program for PM_{2.5} addressing the CAA section 189(e) requirement to regulate all four precursors, absent a showing that such regulation is unnecessary. In fact, the phase-in requirement should actually encourage states to timely submit their NNSR programs for PM_{2.5}. Given CAA section 189(e) does not directly speak to its application to the Appendix S requirements, the EPA believes this approach represents a reasonable and equitable application of the CAA section 189(e) requirements regarding regulation of PM_{2.5} precursors to states applying Appendix S.

b. Appendix S Definition of "major stationary source" in Serious PM_{2.5} Nonattainment Areas

i. Summary of Proposal

The EPA proposed to amend Appendix S by revising the definition of "major stationary source" to include a separate PM_{2.5} major source threshold applicable to new major stationary sources and major modifications of direct PM_{2.5} and PM_{2.5} emissions in PM_{2.5} nonattainment areas reclassified as Serious. This proposed amendment to Appendix S was similar to one that was proposed to the definition of "major stationary source" in 40 CFR 51.165.²³⁴

ii. Final Rule

In this final rule, the EPA is amending the definition of "major stationary source" in Appendix S to include 70 tpy major source thresholds for direct PM_{2.5} emissions and individual PM_{2.5} precursors, applicable in Serious PM_{2.5} nonattainment areas.²³⁵ See Appendix S

²³⁴ The preamble language did not explicitly state that it was our intent to revise the definition in Appendix S to add separate major source thresholds for direct PM_{2.5} emissions and PM_{2.5} precursors, in the same way that earlier we had proposed to revise the definition of "major stationary source" in the NNSR regulations at 40 CFR 51.165. Instead, the preamble referred only to a change to the definition of "major stationary source" at proposed section II.A.4(i)(a)(7) of Appendix S, where a 70 tpy threshold for direct PM_{2.5} emissions is addressed. The proposed regulatory text did, however, also include new section II.A.4(i)(a)(8) of Appendix S, which adds a 70 tpy major source threshold for emissions of individual PM_{2.5} precursors. Despite this omission in the preamble discussion of the proposed changes to Appendix S, we believe that commenters had ample opportunity to comment on the actual changes being made to the definition of "major stationary source" in Appendix S because the intended change concerning emissions of PM_{2.5} and PM_{2.5} precursors was accurately provided in the regulatory text.

²³⁵ The EPA also notes that the definition of "major stationary source" in Appendix S is being revised in this rule at section II.A.4(i)(a) of Appendix S, which currently ends with the phrase "according to paragraphs II.A.4(i)(a)(1) through (6) of this ruling." By proposing to add new paragraphs (7) and (8), this phrase will be revised to read "according to paragraphs II.A.4(i)(a)(1) through (8)

sections II.A.4(i)(a)(7) and (8), respectively. As described earlier, applicability of the NNSR requirements to a source will be determined individually for direct PM_{2.5} emissions and for emissions of individual PM_{2.5} precursors. For example, if a new source locating in a Serious PM_{2.5} nonattainment area would emit 70 tpy of the PM_{2.5} precursor SO₂, it will be considered a major source of PM_{2.5} (with respect to the SO₂ precursor) and will be subject to the NNSR requirements for PM_{2.5} with regard to the SO₂ emissions. However, if the same proposed source does not emit 70 tpy of direct PM_{2.5} emissions or another PM_{2.5} precursor, the emissions increase of direct PM_{2.5} or the other precursor will not be subject to control based on the NNSR requirements for PM_{2.5}. It should also be noted that VOC and ammonia are subject to the phase-in schedule described in the definition of "regulated NSR pollutant" in the NNSR regulations at Appendix S, section II.A.31.(ii)(b)(2).

iii. Comments and Responses

As explained in Section VIII.B.1.b of this preamble, commenters addressing the proposed major source threshold of 70 tpy for sources of PM_{2.5} and its precursors locating in Serious areas had mixed responses, particularly with regard to the appropriate thresholds for precursors. Most of the comments applied generally to the proposed thresholds in 40 CFR 51.165 and Appendix S. The EPA's responses to these comments are provided in that earlier section of the preamble.

Comment: One commenter, however, recommended that during the SIP transition period (and while the EPA continues its analysis of the precursor relationships to PM_{2.5}), the EPA should allow states to make a case-by-case permitting demonstration to use higher major source thresholds for precursors for NNSR permit reviews.

Response: As explained previously, in light of the ongoing precursor impact studies as well as concerns about the legality of setting higher major source thresholds than those specified in the CAA, the EPA believes it is most reasonable to establish a 70 tpy major source threshold under Appendix S for sources of direct PM_{2.5} emissions and each PM_{2.5} precursor locating in Serious nonattainment areas.

of this ruling." The phrase is being modified accordingly in this final rule.

c. Significant Emissions Rates (SERs) in Appendix S—PM_{2.5} Precursors

i. Summary of Proposal

As explained earlier, the EPA proposed as its preferred approach to add NO_x as a PM_{2.5} precursor in the Appendix S definition of “regulated NSR pollutant.” Accordingly, the EPA also proposed to amend the definition of “significant” at section II.A.10(i) of Appendix S to establish a SER of 40 tpy for NO_x as a PM_{2.5} precursor. The Appendix S definition already contains a SER for SO₂ as a PM_{2.5} precursor at 40 tpy of SO₂. The EPA did not explicitly propose to include SERs for VOC and ammonia in Appendix S as part of the preferred approach; however, the EPA’s proposed alternative approach to phase in VOC and ammonia as PM_{2.5} precursors at a later date would inherently necessitate adding SERs for those two additional precursors in the event that an alternative approach was ultimately selected for the final rule.

ii. Final Action

The EPA is revising the definition of “significant” in Appendix S at section II.A.31(ii)(b)(2) to provide SERs for NO_x and VOC as PM_{2.5} precursors, consistent with its decision to conditionally phase in regulation of all four PM_{2.5} precursors 24 months from the date of redesignation. The individual SERs for NO_x and VOC as PM_{2.5} precursors, being added to the existing SER for SO₂ as a PM_{2.5} precursor, are each defined as 40 tpy of the respective precursor, consistent with the SERs provided in the revised definition of significant in 40 CFR 51.165.

The EPA is not adding a SER for ammonia (as a PM_{2.5} precursor) in the Appendix S definition of “significant” in this action. Consistent with the EPA’s approach for allowing states to define “significant” for ammonia in their NNSR rules, and for the reasons explained in Section VIII.B.1.c of this preamble, the EPA will allow states that issue NNSR permits pursuant to the requirements in Appendix S to define “significant” with respect to ammonia in a particular area in each NNSR permit issued pursuant to Appendix S. The state should provide a technical justification to support the definition of “significant” for ammonia, including any SER developed by the state for a particular nonattainment area, and such justification should be included in the administrative record for each proposed permit. The state also has the discretion to define “significant” with respect to ammonia as a PM_{2.5} precursor in those cases where it is determined that the proposed modification will result in

insignificant increases of ammonia and the source will therefore not be required to obtain a major NNSR permit. In such cases, the state and the source should also document the technical justification for determining the source impacts will be insignificant, including any SER developed by the state for a particular nonattainment area, whether such documentation occurs in the administrative record for a minor source permit, a nonapplicability determination, or some other form in the state or source’s records. The state should consult with the appropriate EPA Regional Office for assistance in developing an appropriate definition of “significant” for ammonia as a PM_{2.5} precursor in each permit or for each nonattainment area.

iii. Comments and Responses

The comments regarding the proposed addition of SERs for NO_x and VOC emissions as PM_{2.5} precursors in the NNSR definition of “significant” were summarized in Section VIII.B.1.c of this preamble. Those comments applied generally to the NNSR regulations at 40 CFR 51.165 and Appendix S. The reader is referred to that earlier section of the preamble to review the comments and the EPA’s responses to them.

Comment: Some commenters seemingly addressing NNSR under Appendix S recommended that the EPA include a provision allowing states to make case-by-case determinations to use higher SERs for precursors for NNSR permits issued before the SIP is effective. The commenter stated that the precursor SERs are too low and do not realistically reflect the effect that each precursor has on ambient PM_{2.5} concentrations.

Response: The EPA believes that the commenter’s concern is partially addressed by the fact that, in using Appendix S to review NNSR permit applications, neither VOC nor ammonia will need to be controlled as PM_{2.5} precursors if the state has submitted to the EPA a complete SIP submission that includes the state’s NNSR program for PM_{2.5} and a NNSR precursor demonstration showing that a particular precursor does not contribute significantly to ambient concentrations of PM_{2.5} in the nonattainment area, even though the plan revision containing such demonstration has not yet been formally approved. Until the SIP development period has passed and unless the state has failed to submit such a demonstration, the state issuing permits pursuant to Appendix S will not be required to regulate VOC or ammonia as PM_{2.5} precursors. If a state has not submitted a SIP including the

state’s NNSR program for PM_{2.5} and a NNSR precursor demonstration for either VOC or ammonia, sources of these precursor emissions must be controlled as PM_{2.5} precursors in any NNSR permit issued pursuant to Appendix S beginning on the prescribed phase-in date.

C. Transition Provisions for Major Source Permitting in PM_{2.5} Nonattainment Areas

The EPA did not propose any transition provisions for NNSR permit applications in either 40 CFR 51.165 or Appendix S that would expressly grandfather pending PSD or NNSR permit applications for proposed new and modified major stationary sources from newly established NNSR permit requirements applicable to PM_{2.5} nonattainment areas. In the final 2012 PM NAAQS Rule, the EPA provided a grandfathering provision only for certain PSD permit applications with respect to the revised PM_{2.5} standard. Historically, the EPA has not provided for the grandfathering of any permit applications from new NNSR requirements or from application of existing NNSR requirements to new or revised standards. Nevertheless, in promulgating the 2012 PM NAAQS Rule, the EPA received unsolicited comments advocating for grandfathering of NNSR requirements for the revised standard. Thus, while explaining the reasons why it did not believe that NNSR grandfathering was appropriate, the EPA sought comments in the proposal on possible circumstances where grandfathering similar to the PSD grandfathering provision established for the 2012 PM_{2.5} standard might be appropriate with respect to changes made regarding NNSR requirements for PM_{2.5} in this rulemaking.

Several comments received during the 2012 p.m. NAAQS rulemaking recommended that the EPA establish a grandfathering provision for NNSR as was proposed for the PSD program. A subset of these commenters recommended that PSD permit applications be grandfathered from the NNSR requirements for the revised 2012 PM_{2.5} standard by establishing an effective date for designations 1 year after initial publication in the **Federal Register**. The commenters presumably believed that by delaying the effective date of any new nonattainment designations for the primary annual PM_{2.5} NAAQS, sources with pending PSD permit applications could continue to be reviewed and permits issued under the PSD requirements rather than the NNSR requirements for PM_{2.5}.

The EPA explained at the time that the obligation to adopt new provisions under a state's NNSR program will not apply with regard to the revised NAAQS until such time as an area is designated nonattainment, and beginning on the effective date of the new area designations for PM_{2.5}, proposed new and modified major sources would be required to meet the applicable NNSR requirements for PM_{2.5}.²³⁶ Also, the EPA does not agree with the commenters' recommendation that the effective date of the area designation be delayed by 1 year because this approach, similar to delaying the effective date of the NAAQS, would also delay the implementation of the attainment plan and defer the important health benefits associated with the revised NAAQS. In the same preamble, the EPA proposed a schedule for promulgating area designations for PM_{2.5} that involved the maximum allowable 2-year period from the signature date of the 2012 PM_{2.5} NAAQS, as provided in CAA section 107(d)(1)(B). The CAA allows for a 1-year extension for such designations, but only if there is insufficient information to enable such designations to be made.²³⁷

In response to the EPA's request for comments in the proposal, commenters recommended that the EPA clarify the PM_{2.5} NSR grandfather policy to explain that both PSD and NNSR permit applications are exempt from the precursor and planning requirements being finalized in this rulemaking. In particular, the commenters recommended that the EPA establish a PM_{2.5} NSR transition policy that delays regulation of the scientific precursors of PM_{2.5} under any NSR program until the EPA has a better understanding of how these precursors contribute to nonattainment and could deteriorate air quality. One of the commenters indicated that a transitional policy is especially important until the EPA completes a rulemaking on a SER for ammonia. One of the commenters recommended that the EPA should allow for the grandfathering of pending PSD permit applications, similar to the

PSD grandfathering provision for the 2012 PM_{2.5} NAAQS, for sources that will not be issued a permit until after the effective date of the nonattainment designation under certain conditions. This commenter stated that CAA section 165(c), which forms part of the EPA's basis for grandfathering in the PSD context, should also apply to NNSR permit decisions.

The EPA does not find a compelling reason to grandfather pending NNSR permit applications for which a permit has not yet issued once the new NNSR requirements—primarily affecting the control of PM_{2.5} precursors—become effective. The EPA believes that it is reasonable to require that a new or modified major stationary source control emissions of PM_{2.5} precursors where such emissions contribute significantly to PM_{2.5} levels in the nonattainment area. If such precursor emissions are not effectively controlled, and offset by reductions in existing emissions, an increased burden could be placed on the overall attainment plan to address those emissions in order to attain the NAAQS in a timely manner.

While the final rule contains no general grandfathering provision, this final rule does provide a phase-in process for states relying on Appendix S for purposes of issuing NNSR permits for PM_{2.5}. Appendix S will require the immediate regulation of SO₂ and NO_x as PM_{2.5} precursors, the regulation of VOC and ammonia as PM_{2.5} precursors will only be required under certain conditions and on a delayed timetable. See Appendix S, revised section II.A.31.(ii)(b)(2)–(5). The precursor provisions in Appendix S should alleviate some of the commenter's concerns that the regulation of additional precursors will be required immediately upon the effective date of this final rule. Instead, the phase-in schedule for the regulation of VOC and ammonia will permit states the opportunity allowed by CAA section 189(e) to demonstrate that a particular precursor need not be subjected to control in a particular nonattainment area. Accordingly under the interim NNSR requirements in Appendix S, a state will not be required to begin immediate regulation of precursors for which sources will likely be exempted from the regulations upon review of a state's NNSR SIP submission. Similarly, where the state has a previously approved NNSR program for PM_{2.5}, the existing requirements for controlling precursors would continue to apply until the new SIP revisions required by this rule, including new precursor control requirements, are approved. Thus, such states would not be required

to immediately regulate any PM_{2.5} precursors not already required by the approved plan during the interim plan development period.

With regard to grandfathering PSD permit applications, we do not interpret the CAA to allow for the issuance of a PSD permit in an area that is designated nonattainment. The CAA requires proposed major stationary sources and major modifications to meet major NSR permitting requirements that apply on the basis of the area's designation.²³⁸ Accordingly, the EPA's longstanding interpretation of the CAA is that a proposed new major stationary source or major modification must satisfy the appropriate major NSR requirements (PSD vs. NNSR) for a particular pollutant that are in effect in a given area on the date that a permit is issued to the source, rather than the requirements that may have been applicable when the permit application was submitted.²³⁹

IX. Other Requirements and Considerations for PM_{2.5} Nonattainment Areas

A. Waivers Under CAA Section 188(f)

1. Statutory Requirements and Existing Guidance

a. Summary of Proposal. The proposal summarized the statutory requirements and existing guidance for CAA section 188(f), which provides that, "the Administrator may, on a case-by-case basis, waive any requirement applicable to any Serious Area . . . where the Administrator determines that anthropogenic sources of PM₁₀ do not contribute significantly to the violation of the PM₁₀ standard in the area." In addition it provides that, "the Administrator may also waive a specific date for attainment of the [PM₁₀] standard where the Administrator determines that nonanthropogenic sources of PM₁₀ contribute significantly to the violation of the PM₁₀ standard in the area." The agency requested comment on whether the existing guidance in the Addendum is appropriate when implementing the current and any future PM_{2.5} NAAQS.

b. Final Rule. The EPA is hereby affirming its reliance on the interpretation of CAA section 188(f) described in the Addendum for

²³⁸ Compare CAA section 165(a) (permitting requirements for sources locating in attainment and unclassifiable areas) with CAA sections 172(c)(5) and 173 (permitting requirements for sources locating in nonattainment areas).

²³⁹ See Memorandum from John S. Seitz, Director, EPA Office of Air Quality Planning and Standards, on March 11, 1991, titled "New Source Review (NSR) Transitional Guidance," Attachment p. 6, sent to Regional Air Division Directors.

²³⁶ The applicable NNSR requirements would be either the NNSR requirements for PM_{2.5} in the state's existing approved SIP or the requirements found at 40 CFR part 51 Appendix S, when a state's approved SIP does not currently include NNSR requirements for PM_{2.5}. States will be required to submit to the EPA for approval SIP revisions containing the amended NNSR program requirements for PM_{2.5} contained in the final PM_{2.5} NAAQS implementation, but those additional requirements will not apply in states with approved SIPs that include NNSR requirements for PM_{2.5} until the EPA approves the SIP revision. See 78 FR 3086 (January 15, 2013), at page 3263.

²³⁷ See 78 FR 3249 at page 3250.

purposes of implementing the PM_{2.5} NAAQS.²⁴⁰ For example, the Addendum lays out a series of questions that should be answered before the waiver provisions can be applied, including questions related to the types of sources that may be considered anthropogenic and nonanthropogenic, the specific conditions under which the attainment date for a Moderate area may be waived, and the time period that would apply to an attainment date waiver. The EPA believes that these questions, and the general guidance provided in the Addendum on how to evaluate the answers, provide adequate direction to the EPA and to states potentially interested in seeking waivers for certain PM_{2.5} NAAQS nonattainment areas. The EPA therefore refers interested states to the waiver guidance contained in the Addendum for more detail on how the agency interprets CAA section 188(f) for purposes of implementing the PM_{2.5} NAAQS.

c. Comments and Responses. The comments received on this section are addressed in the Response to Comments document found in the docket for this action.

2. Relationship Between the CAA Section 188(f) Waiver Provisions and the EPA's Exceptional Events Rule

a. Summary of Proposal. The proposal summarized the relationship between the 188(f) waiver provisions and the EPA's Exceptional Events Rule. On March 22, 2007, the EPA promulgated the "Treatment of Data Influenced by Exceptional Events; Final Rule" (72 FR 13560), known as the Exceptional Events Rule, pursuant to the 2005 amendment of CAA section 319.²⁴¹ The Exceptional Events Rule provides a mechanism by which the EPA can concur with a state's request to exclude from regulatory decisions air quality monitoring data determined by the EPA to have been affected by exceptional events.²⁴² The Exceptional Events Rule applies to all the NAAQS pollutants, including PM_{2.5}, CAA section 188(f) and the Exceptional Events Rule provide separate mechanisms by which states can seek to have event-influenced monitoring data excluded from certain regulatory requirements or decisions

associated with the PM NAAQS implementation process, under appropriate circumstances.

b. Final Rule. The EPA did not make any revisions to its interpretation of the relationship between the CAA section 188(f) waiver provisions and EPA's Exceptional Events Rule.

The Exceptional Events Rule addresses elevated emissions from specific events that influence monitored air quality concentrations. The EPA's regulations at 40 CFR 50.1(j) define an "exceptional event" as one that "affects air quality, is not reasonably controllable or preventable, is an event caused by human activity that is unlikely to recur at a particular location or a natural event, and is determined by the Administrator in accordance with 40 CFR 50.14 to be an exceptional event." Further, 40 CFR 50.1(j) explicitly provides that exceptional events do "... not include stagnation of air masses or meteorological inversions, a meteorological event involving high temperatures or lack of precipitation, or air pollution relating to source noncompliance." At 40 CFR 50.1(k), the EPA's regulations define a "natural event" as an event in which human activity plays little or no direct causal role to the event in question.²⁴³

Air quality monitoring data that the EPA determines to have been influenced by an exceptional event under the procedural steps, substantive criteria, and schedule specified in the Exceptional Events Rule may be excluded from regulatory decisions such as initial area designations decisions and decisions associated with implementing the PM_{2.5} NAAQS such as clean data determinations, evaluation of attainment demonstrations, and discretionary or mandatory reclassifications of nonattainment areas from Moderate to Serious. While the EPA may agree with a state's request to exclude event-influenced air quality monitoring data from regulatory

decisions, these regulatory actions require the EPA to provide an opportunity for public comment on the claimed exceptional event and all supporting data prior to the EPA taking final agency action.

If wildfire is a potential contributor to exceedances of the NAAQS and exceptional events, the EPA urges state and local agencies to coordinate with the land management agencies, as appropriate, in developing plans and appropriate public communications regarding public safety and reducing exposure. This action can directly help states meet their Exceptional Events Rule obligation whereby "states must provide public notice, public education, and must provide for implementation of reasonable measures to protect public health when an event occurs." When wildfire impacts are significant in a particular area, states and communities may be able to lessen the impacts of wildfires by working collaboratively with land managers and land owners to employ various mitigation measures including taking steps to minimize fuel loading in areas vulnerable to fire.

The EPA notes that there could be some potential overlap between the application of the Exceptional Events Rule and CAA section 188(f) because the conditions necessary for the Administrator to make a determination under CAA section 188(f)—*i.e.*, the lack of a significant anthropogenic contribution to a violation—may overlap with conditions that may be considered an exceptional event, particularly a natural event, which by definition represents a non-anthropogenic contribution. The EPA believes that this potential for overlap can best be addressed by considering the applicability of the Exceptional Events Rule and CAA section 188(f) in sequence. Thus, the EPA recommends that states first consider whether the monitored air quality data on specific days were influenced by an exceptional event. If the state requests and the EPA agrees with this request and determines that the monitored air quality data should be excluded from consideration in regulatory decisions, then using the provisions in the Exceptional Events Rule could address the situation adequately, and there would be no need for a CAA section 188(f) waiver. If the state determines that, even with the exclusion of the event-influenced data, the waiver provisions of CAA section 188(f) may also be applicable, then the EPA can evaluate that question based on the remaining data that are representative for the area in question. Given that section 188(f) has rarely been invoked, a state wishing to pursue this

²⁴⁰ See 59 FR 42003–42008, August 16, 1994.

²⁴¹ Section 319 of the CAA, as amended by section 6013 of the Safe Accountable Flexible Efficient-Transportation Equity Act: A Legacy for Users (SAFE-TEA-LU) of 2005, required the EPA to propose and promulgate regulations governing the review and handling of air quality monitoring data influenced by exceptional events.

²⁴² References to "air agencies" are meant to include state, local and tribal air agencies responsible for implementing the Exceptional Events Rule.

²⁴³ The EPA will generally consider human activity to have played little or no *direct* role in causing emissions of the dust generated by high wind for purposes of the regulatory definition of "natural event" if contributing anthropogenic sources of the dust are reasonably controlled at the time of the event, regardless of the amount of dust coming from these reasonably controlled anthropogenic sources, and thus the event could be considered a natural event. In such cases, the EPA believes that it would generally be a reasonable interpretation of its regulations to find that the anthropogenic source had "little" direct causal role. If anthropogenic sources of windblown dust that are reasonably controllable but that did not have those reasonable controls applied at the time of the high wind event have contributed significantly to a measured concentration, then the event would not be considered a natural event. See preamble to the Exceptional Events Rule at 72 FR 13560 (March 22, 2007), footnote 11 on page 13566.

provision should work closely with its EPA Regional Office.

c. Comments and Responses.

Comments: Some commenters urged the EPA to clarify the two-step approach. Some commenters recommended that the EPA refrain from directing the sequence and allow states to decide which of these provisions should apply in the specific circumstances that they are addressing, consistent with the commenter's overall recommendation that the EPA give states the maximum flexibility in developing PM_{2.5} SIPs. Some commenters urged the EPA to provide guidance to the states on when this two-step approach would be appropriate, and when it would be inappropriate. Commenters did not want implementation planning to follow the EPA's exceptional events justification model in which there is great variability among the EPA regions. Commenter encouraged the EPA to work to ensure that PM_{2.5} implementation plan reviews are subject to similar requirements in all EPA regions with clarifying language in the final guidance to ensure some level of national consistency.

Response: The EPA agrees with the first comment that, rather than the EPA "directing the sequence," the affected state and the appropriate EPA regional office should discuss the scenario and the affected data to determine whether the Exceptional Events Rule or CAA section 188(f) is the most appropriate mechanism. This decision would be made on a case-by-case basis considering the specific, relevant facts. In most cases, if the monitored air quality data satisfy the requirements of the Exceptional Events Rule, then applying these provisions would likely provide additional regulatory flexibilities beyond those that CAA section 188(f) would provide. However, regardless of whether the data in question meet or do not meet the requirements of the Exceptional Events Rule (e.g., because the exceptional events definition is not met in that the data do not constitute an exceedance or violation of the NAAQS or because other Exceptional Events rule criteria are not met), the waiver provisions in CAA section 188(f) could apply.

The EPA recognizes the implementation challenges associated with the 2007 Exceptional Events Rule and recently proposed revisions to this rule to address certain substantive issues raised by state, local and tribal co-regulators and other stakeholders since promulgation of the rule and to increase the administrative efficiency of the Exceptional Events Rule criteria and process (80 FR 72840, November 20,

2015). The public comment period on this rule closed on February 3, 2016. The EPA will consider timely comments provided to the Exceptional Events Rule docket as we finalize the revisions to this rule.

B. Conformity Requirements

1. Requirements That Apply to Both Transportation Conformity and General Conformity

a. Background on Transportation and General Conformity. Conformity is required under CAA section 176(c) to ensure that federal actions are consistent with ("conform to") the purpose of the SIP. Conformity to the purpose of the SIP means that federal activities will not cause new air quality violations, worsen existing violations, or delay timely attainment of the relevant NAAQS or interim reductions and milestones. Conformity applies to areas that are designated nonattainment, and those nonattainment areas redesignated to attainment with a CAA section 175A maintenance plan after 1990 ("maintenance areas").

The EPA's Transportation Conformity Rule (40 CFR 51.390 and part 93, subpart A) establishes the criteria and procedures for determining whether transportation activities conform to the SIP. These activities include adopting, funding or approving transportation plans, transportation improvement programs (TIPs) and federally supported highway and transit projects. The EPA first promulgated the Transportation Conformity Rule on November 24, 1993 (58 FR 62188), and subsequently published several amendments. For example, the EPA published a final rule on July 1, 2004 (69 FR 40004) that provided conformity procedures for state and local agencies under the 1997 PM_{2.5} NAAQS, among other things. On May 6, 2005 (70 FR 24280) the EPA published a final rule that addressed transportation conformity requirements for PM_{2.5} precursors.²⁴⁴ The EPA published another final rule on March 24, 2010 (75 FR 14260) that addressed additional requirements for the 2006 PM_{2.5} NAAQS. Finally, the EPA published a final rule on March 14, 2012 (77 FR 14979) that restructured portions of the transportation conformity rule so that they would clearly apply to nonattainment and maintenance areas for the new and revised NAAQS, including the 2012 PM_{2.5} NAAQS. All of these rules apply to the current PM_{2.5} NAAQS including

the 1997 PM_{2.5} NAAQS, the 2006 24-hour PM_{2.5} NAAQS and the 2012 primary annual PM_{2.5} NAAQS and will apply to future PM_{2.5} NAAQS. For further information on transportation conformity rulemakings, policy guidance and outreach materials, see the EPA's Web site at <http://www3.epa.gov/otaq/stateresources/transconf/index.htm>. The EPA issued transportation conformity guidance related to the implementation of the 2012 primary annual PM_{2.5} NAAQS in November 2015. The guidance is available at <http://www3.epa.gov/otaq/stateresources/transconf/documents/420b15091.pdf>.

With regard to general conformity, the EPA first promulgated general conformity regulations in November 1993 (40 CFR part 51, subpart W and 40 CFR part 93, subpart B). Subsequently, the EPA finalized revisions to the general conformity regulations on April 5, 2010. (75 FR 17254–17279) The general conformity program ensures that federal actions not covered by the transportation conformity rule will not interfere with the SIP. General conformity also fosters communications between federal agencies and state/local air quality agencies, provides for public notification of and access to federal agency conformity determinations and allows for air quality review of individual federal actions. More information on the general conformity program is available at www.epa.gov/airquality/genconform/.

b. Conformity in the Proposed Rule. The EPA did not propose any changes to the transportation conformity program as part of the current action. Nevertheless, to provide clarity in applying those regulations, the EPA is providing affected parties with information on when conformity must be implemented after nonattainment areas are designated for a new or revised PM_{2.5} NAAQS. At this time the EPA is using the 2012 PM_{2.5} NAAQS as an example. The agency is also discussing how it plans to make the transition from demonstrating conformity for the 1997 annual PM_{2.5} NAAQS to the 2012 primary annual PM_{2.5} NAAQS because this transition is unique in that the 1997 annual PM_{2.5} NAAQS was retained as a secondary NAAQS. Finally, we proposed a change to the general conformity rule that addresses *de minimis* levels that apply to federal actions in PM_{2.5} areas. The information presented here is consistent with existing conformity regulations and statutory provisions that are not addressed by this PM_{2.5} implementation rulemaking. Affected parties would include state and local transportation

²⁴⁴ This final rule was not challenged, nor was it affected by the January 2013 D.C. Circuit Court decision requiring the EPA to implement the PM_{2.5} NAAQS pursuant to subpart 4 of the CAA.

and air quality agencies, metropolitan planning organizations (MPOs), and all federal agencies including the U.S. Department of Transportation, the U.S. Department of Defense, the U.S. Department of Interior and the U.S. Department of Agriculture.

c. Applicability of Transportation and General Conformity to Areas Designated Nonattainment for the 2012 Primary Annual PM_{2.5} NAAQS. Transportation and general conformity apply 1 year after the effective date of nonattainment designations for a new or revised PM_{2.5} NAAQS including the 2012 primary annual PM_{2.5} NAAQS, April 15, 2016. This is because CAA section 176(c)(6) provides a 1-year grace period from the effective date of initial designations for any new NAAQS before transportation and general conformity apply in areas newly designated nonattainment for a specific pollutant and the NAAQS. With regard to general conformity, the EPA's April 2010 revisions to its general conformity regulations (*see* 75 FR 17277, April 5, 2010) apply the same 1-year grace period for the purposes of general conformity.

With regard to transportation conformity, the conformity grace period applies to all areas designated nonattainment for a new or revised PM_{2.5} NAAQS including the 2012 primary annual PM_{2.5} NAAQS. The requirements differ depending on whether the nonattainment area includes any part of an MPO area designated under 23 U.S.C. 134 or is an isolated rural area. Within 1 year after the effective date of the initial nonattainment designation for a given pollutant and the NAAQS, the MPOs and DOT must make a transportation conformity determination with regard to that pollutant and standard for all of the metropolitan transportation plans and TIPs in the nonattainment area. The conformity requirements for surrounding "donut areas," including the application of the 1-year conformity grace period, are generally the same as those for metropolitan areas.²⁴⁵ For the purposes of the implementation of the 2012 PM_{2.5} NAAQS, MPOs and any adjacent donut areas in a 2012 PM_{2.5} nonattainment area must continue to meet conformity requirements during the grace period for any other applicable NAAQS, including the 1997 annual PM_{2.5} NAAQS and the 2006 24-hour PM_{2.5} NAAQS. If, at the end of the grace period for the 2012 annual PM_{2.5} NAAQS, the MPO and DOT have not

made a transportation plan and TIP conformity determination for that NAAQS, the area would be in a conformity "lapse." During a conformity lapse, only certain projects can receive federal funding or approvals to proceed. The practical impact of a conformity lapse will vary from area to area. Finally, the 1-year conformity grace period also applies to project level conformity determinations.

Isolated rural nonattainment and maintenance areas are areas that do not contain or are not part of an MPO (40 CFR 93.101). Transportation conformity requirements for isolated rural nonattainment and maintenance areas can be found at 40 CFR 93.109(g). The CAA section 176(c)(6) 1-year grace period for newly designated nonattainment areas applies to isolated rural areas. Therefore, 1 year after the effective date of the initial nonattainment designation for a given pollutant and the NAAQS, conformity requirements with regard to that pollutant and standard would apply in any nonattainment areas that are isolated rural areas. Per the transportation conformity rule, an isolated rural area would be required to make a transportation conformity determination only at the point when an applicable transportation project needs funding or approval. This project level conformity determination may occur significantly after the 1-year grace period has ended. *See* the EPA's transportation conformity guidance related to the implementation of the 2012 primary annual PM_{2.5} NAAQS for further information on how the EPA has implemented this conformity grace period in metropolitan, donut and isolated rural areas. The guidance is available at <http://www3.epa.gov/otaq/stateresources/transconf/documents/420b15091.pdf>.

d. Applicability of Transportation and General Conformity With Regard to the 1997 Annual PM_{2.5} NAAQS, Which was Retained as a Secondary NAAQS. In the December 2012 PM NAAQS final rule, the EPA established a new health-based primary annual PM_{2.5} NAAQS of 12.0 µg/m³. In that same action the EPA retained the 1997 annual PM_{2.5} NAAQS of 15.0 µg/m³ as a secondary NAAQS to protect against certain welfare effects. In the 1997 PM_{2.5} designations rule (70 FR 944), the EPA designated areas nonattainment for both the 1997 primary and secondary annual PM_{2.5} NAAQS (which have identical levels of 15.0 µg/m³). Designations for the 2012 primary annual PM_{2.5} NAAQS were made in January 2015 (80 FR 2206) and were effective on April 15, 2015. This action did not make any changes to the

designations that apply for the 1997 secondary annual PM_{2.5} standard. Therefore, at this time, all areas designated nonattainment in 2005 for the 1997 annual PM_{2.5} standard are considered as having been designated nonattainment for both the 1997 primary annual PM_{2.5} NAAQS and for the 1997 secondary annual PM_{2.5} NAAQS. Similarly, for any 1997 PM_{2.5} nonattainment areas that have approved redesignation requests for attainment of the 1997 PM_{2.5} NAAQS, the redesignation applies to both the primary and secondary standards of the 1997 PM_{2.5} NAAQS. A discussion of how transportation and general conformity apply in this situation follows.

CAA section 176(c)(5) requires compliance with transportation and general conformity only in: (1) Nonattainment areas and (2) areas that have been redesignated to attainment and are required to develop a maintenance plan under CAA section 175A.

CAA section 175A(a), in turn, establishes the requirements that must be fulfilled by nonattainment areas in order to be redesignated to attainment. That section only requires that nonattainment areas for the primary standard submit a plan addressing maintenance of the primary NAAQS in order to be redesignated to attainment; it does not require nonattainment areas for secondary NAAQS to submit maintenance plans in order to be redesignated to attainment. *See* 42 U.S.C. 7505a(a). Therefore, since conformity does not apply in areas that have been redesignated without CAA section 175A maintenance plans, the EPA concludes that transportation and general conformity do not apply in areas that have been redesignated to attainment for any secondary NAAQS, such as the 1997 secondary annual PM_{2.5} NAAQS.

Elsewhere in this final rule, the EPA is finalizing one of the proposed options for revoking the 1997 primary annual PM_{2.5} NAAQS, which has been replaced by the more health protective 2012 primary annual PM_{2.5} NAAQS. As discussed in detail in Section X of this preamble, the EPA is finalizing the option that calls for revoking the 1997 primary annual PM_{2.5} NAAQS in areas that have always been designated attainment for that NAAQS and in areas that have been redesignated to attainment for that NAAQS. As a result, after the effective date of the revocation, areas that have been redesignated to attainment for the 1997 annual PM_{2.5} NAAQS (*i.e.*, maintenance areas for the 1997 annual PM_{2.5} NAAQS) will not be

²⁴⁵ For the purposes of transportation conformity, a "donut" area is the geographic area outside a metropolitan planning area boundary, but inside a designated nonattainment or maintenance area boundary that includes an MPO (40 CFR 93.101).

required to make transportation or general conformity determinations for the 1997 annual PM_{2.5} NAAQS. The revocation would leave nonattainment designations in place for the 1997 annual NAAQS for areas that have not yet been redesignated to attainment for that NAAQS. The EPA will continue to redesignate areas to attainment as states submit redesignation requests for the remaining nonattainment areas. Any area that is designated as nonattainment for the 1997 annual NAAQS at the time of the initial revocation would have to continue to make transportation and general conformity determinations for that NAAQS until such time that they are redesignated to attainment for that NAAQS.

For any area that has been redesignated to attainment for the 1997 annual PM_{2.5} NAAQS (*i.e.*, a

maintenance area for the 1997 annual PM_{2.5} NAAQS) and is not designated nonattainment for the 2012 primary annual PM_{2.5} NAAQS, the relevant planning organization will not have to make conformity determinations for any annual PM_{2.5} NAAQS after the effective date of the revocation of the 1997 primary annual PM_{2.5} NAAQS because, as discussed earlier, the CAA does not require maintenance areas for secondary NAAQS to make conformity determinations and the 1997 primary annual NAAQS will have been revoked. This means that, after the effective date of the revocation, areas redesignated to attainment for the 1997 annual PM_{2.5} NAAQS will no longer be required to make metropolitan transportation plan, TIP, or project-level transportation conformity determinations for that NAAQS. In addition, federal agencies

will no longer be required to make conformity determinations for that NAAQS. Areas that remain designated nonattainment for the 1997 annual PM_{2.5} NAAQS will continue to make metropolitan transportation plan, TIP, and project-level conformity determinations for that NAAQS and federal agencies will be required to continue to make general conformity determinations for that NAAQS in these areas until such time as these areas attain that NAAQS and are redesignated to attainment (*i.e.*, until the effective of the redesignation to attainment). Table 3 shows which types of areas are required to make conformity determinations for either the 1997 or 2012 annual PM_{2.5} NAAQS after the revocation of the 1997 primary annual NAAQS is effective.

TABLE 3—WHERE IS CONFORMITY REQUIRED FOR THE VARIOUS PM_{2.5} NAAQS AFTER THE REVOCATION OF THE 1997 PRIMARY ANNUAL PM_{2.5} NAAQS?

Attainment status	1997 Primary and secondary annual NAAQS	1997 24-Hour NAAQS	2006 24-Hour NAAQS	2012 Primary annual NAAQS
Nonattainment	X	X	X	X
Redesignated to Attainment (<i>i.e.</i> , Maintenance)		X	X	X

e. Impact of Implementation of a New or Revised PM_{2.5} NAAQS (such as the 2012 PM_{2.5} NAAQS) on a State's Transportation and/or General Conformity SIP. As long as the EPA does not make specific changes to its transportation or general conformity regulations states should not need to revise their transportation and/or general conformity SIPs. The EPA is not making any changes to its transportation conformity regulations and no transportation conformity SIP revisions are necessary. The only change that the EPA is making to its general conformity regulations is to change the *de minimis* levels in its general conformity regulations as discussed in Section IX.B.2.a of this preamble. States with a general conformity SIP should evaluate the need to revise those SIPs in light of this change. States with new nonattainment areas may also need to revise conformity SIPs in order to ensure the state regulations apply in any newly designated areas.

In the event that a nonattainment designation causes transportation conformity to apply for the first time in a state,²⁴⁶ such a state is required by the statute and the EPA regulations to

submit a SIP revision that addresses three specific transportation conformity requirements that address consultation procedures and written commitments to control or mitigation measures associated with conformity determinations for transportation plans, TIPs or projects. (40 CFR 51.390) Additional information and guidance can be found in the EPA's "Guidance for Developing Transportation Conformity State Implementation Plans" (<http://www3.epa.gov/otaq/stateresources/transconf/policy/420b09001.pdf>).

2. Additional General Conformity Requirements for PM_{2.5} Nonattainment Areas

a. De minimis Emission Levels for Direct PM_{2.5} and its Precursors. Federal actions estimated to have an annual net emissions increase less than the *de minimis* levels established in the general conformity regulations are not required to demonstrate conformity under those regulations. For direct PM_{2.5} and its precursors (SO₂, NO_x, VOC and ammonia), the existing *de minimis* emission levels are set forth in the EPA's general conformity regulations at 40 CFR 93.153(b)(1). Those levels were based on the definition of a major stationary source for nonattainment NSR programs. The EPA believes it is appropriate to continue this practice for

implementing the current and any future PM_{2.5} NAAQS. However, because the definition of precursors currently in the general conformity regulations at 40 CFR 93.153(b)(1) does not reflect the rebuttable presumptions for certain PM_{2.5} precursors, the EPA is finalizing changes to these conformity provisions to make them consistent with the agency's revised precursor requirements. Specifically, the current definition of precursors for PM_{2.5} in the general conformity regulations does not reflect the rebuttable presumptions for VOC and ammonia. To address the lack of rebuttable presumptions for VOC and ammonia the EPA is revising the tables in 40 CFR 93.153(b)(1) and (2) remove "(if determined to be a significant precursor)" from the entries in the tables that apply to VOC and ammonia emissions as PM_{2.5} precursors. It also does not reflect the subpart 4 definitions for "major source" and "major stationary source" that apply for Serious PM_{2.5} nonattainment areas. Therefore, the EPA is finalizing changes to the PM_{2.5} precursor *de minimis* levels currently in 40 CFR 93.153(b)(1) to make those levels consistent with the statutory requirements for major stationary source thresholds under subpart 4 and any relevant changes finalized in Section III of this preamble. Comments received on this proposed

²⁴⁶ This is not currently the case for the areas designated for the 2012 PM_{2.5} NAAQS, but the EPA is noting this in the event that future designations result in this situation.

change were supportive. The EPA is setting the *de minimis* levels that apply

to direct PM_{2.5} and PM_{2.5} precursors for PM_{2.5} nonattainment areas for purposes

of general conformity as identified in Table 4.

TABLE 4—GENERAL CONFORMITY DE MINIMIS EMISSION LEVELS FOR PM_{2.5} PRECURSORS

Type of emission	Tons/year in moderate PM _{2.5} nonattainment areas and all maintenance areas	Tons/year in serious PM _{2.5} nonattainment areas
Direct emissions	100	70
SO ₂	100	70
NO _x	100	70
VOC	100	70
Ammonia	100	70

b. Implementation Considerations for the General Conformity Program. The EPA did not propose any other revisions to the general conformity regulations and is not taking any additional final actions in this rule. However, as areas develop SIPs for the 2012 and future PM_{2.5} NAAQS, the agency recommends that state and local air quality agencies work with federal agencies with large facilities (e.g., commercial airports, ports and large military bases) that are subject to the general conformity regulations to establish an emissions budget for those facilities in order to facilitate future conformity determinations under the conformity regulations. Such a budget could be used by federal agencies in determining conformity or identifying mitigation measures if the budget level is included and identified in the SIP.

In a few cases, tracts of land under federal management may also be included in nonattainment and maintenance area boundaries. The role of fire in these areas should be assessed and emissions budgets developed in concert with those federal land management agencies. In such areas the EPA encourages states to consider in any baseline, modeling and SIP attainment inventory used and/or submitted to include emissions expected from projects subject to general conformity, including emissions from wildland fire that may be reasonably expected in the area. Where appropriate, states may consider developing plans for addressing wildland fuels in collaboration with land managers and owners. Information is available from DOI and USDA Forest Service on the ecological role of fire and on smoke management programs and basic smoke management practices.²⁴⁷

C. Clean Data Policy

1. Summary of the Proposal

In the proposed rule, the EPA described its longstanding clean data policy and proposed to codify the policy in regulatory text. A clean data determination (CDD) is a notice-and-comment rulemaking wherein the EPA determines that a specific nonattainment area has attained the relevant NAAQS based on 3 years of quality-assured certified air quality monitoring data. The CDD suspends the state's obligation to submit to the EPA the planning elements related to attaining the standard required of nonattainment areas under the Clean Air Act for as long as the area continues to attain the standard.²⁴⁸ The CDD does not suspend certain CAA requirements, such as an emissions inventory, nonattainment new source review requirements, and certain emission reduction requirements, that are considered independent of attainment needs.

The proposal provided additional discussion about attainment demonstrations, control requirements for Moderate areas, RFP and quantitative milestones, and contingency measures. With regard to control requirements for Serious areas, the proposal included two options: one option would suspend BACT/BACM requirements under a CDD if elsewhere in the rule such requirements were considered necessary for expeditious attainment, and the other option would not suspend BACT/BACM requirements

²⁴⁸ In the context of CDDs, the EPA distinguishes between attainment planning requirements of the CAA, which relate to the attainment demonstration for an area and related control measures designed to bring an area into attainment for the given NAAQS as expeditiously as practicable, and other types of requirements, such as permitting requirements under the NNSR program, and any specific control requirements independent of those strictly needed to ensure timely attainment of the given NAAQS.

if elsewhere in the rule such requirements were considered to be generally independent of attainment.

2. Final Rule

The final rule codifies the clean data policy in rules governing the implementation of current and future PM_{2.5} NAAQS, and much of the guidance discussed in the proposal regarding which requirements are suspended remains the same. The EPA has already codified the clean data policy in a regulation implementing the 1997 8-hour ozone NAAQS that was specifically challenged and upheld by the D.C. Circuit in *NRDC v. EPA*, 571 F.3d 1245 (D.C. Cir. 2009), and numerous United States Circuit Courts of Appeal have upheld the Clean Data Policy, including the EPA's application of this interpretation of the CAA with regard to implementation of the PM₁₀ NAAQS under subpart 4. See *Latino Issues Forum v. EPA*, Nos. 06–75831 and 08–71238 (9th Cir. March 2, 2009) (memorandum opinion). The EPA had also codified the clean data policy for PM_{2.5} in the now remanded 2007 PM_{2.5} implementation rule. For a complete discussion of the Clean Data Policy's history and EPA's longstanding interpretation under the Clean Air Act, please refer to the proposal.

The planning elements under subpart 1 and subpart 4 generally include reasonable further progress (RFP) requirements, attainment demonstrations, RACM and RACT, nonattainment area contingency measures, and other state planning requirements related to attaining the NAAQS.²⁴⁹ The suspension of the

²⁴⁹ See December 14, 2004 memorandum from Stephen D. Page, Director, EPA Office of Air Quality Planning and Standards, to Air Division Directors, EPA Regions I–X, titled “Clean Data Policy for the Fine Particle National Ambient Air Quality Standards.” Available at: http://www.epa.gov/airquality/urbanair/sipstatus/docs/pm25_clean_data_policy_14dec2004.pdf.

obligation to submit such requirements applies regardless of when the plan submissions are due. The CDD does not suspend CAA requirements that are independent of helping the area achieve attainment, such as the requirements to submit an emissions inventory and nonattainment new source review requirements. The determination of attainment is not equivalent to a redesignation, and the state must still meet the statutory requirements for redesignation in order to be redesignated to attainment. A determination of attainment for purposes of the Clean Data Policy/regulations is also not linked to any particular attainment deadline, and is not necessarily equivalent to a determination that an area has attained the standard by its applicable attainment deadline, *e.g.*, under CAA section 188(b). Note also that if the EPA determines that an area with a clean data determination subsequently is violating the standard prior to being redesignated to attainment, the area will be required to address the pertinent requirements when it submits the SIP to EPA. As has long been the EPA's policy, areas subject to a determination that a CDD is rescinded due to subsequent violation of the NAAQS would receive a reasonable amount of time to address the previously suspended requirements and submit revisions to their SIPs. The EPA would establish this SIP submittal date on a case-by-case basis, taking into account individual circumstances surrounding the particular SIP provisions at issue.²⁵⁰

This rule specifies that a determination that a nonattainment area is attaining the current and future PM_{2.5} NAAQS would suspend the following attainment planning related requirements under subpart 1 and subpart 4: (i) The part D, subpart 4 and subpart 1 obligation to provide an attainment demonstration pursuant to CAA section 189(a)(1)(B); (ii) the RACM and RACT provisions of CAA section 189(a)(1)(C); (iii) the RFP and quantitative milestones provisions of CAA section 189(c); and, (iv) related attainment demonstration, RACM and RACT, RFP and contingency measure provisions requirements of subpart 1, section 172. The following sections a–d provide additional detail on the PM_{2.5} NAAQS planning requirements that would be suspended by a CDD.

a. Attainment Demonstrations. With respect to the attainment demonstration requirements of section 172(c) and section 189(a)(1)(B) of the CAA, the EPA finds that if an area already has air

quality monitoring data demonstrating attainment of the standard, there is no need for an area to make a further submission containing additional measures to achieve attainment, nor is there a need for the area to perform future modeling to show how the area will achieve attainment. The plain language of CAA section 189(a)(1)(B) requires that the attainment plan provide for “a demonstration (including air quality modeling) that the [SIP] will provide for attainment by the applicable attainment date.” Where the area has attained the standard, such a demonstration no longer serves a purpose.

b. Control Measure Requirements for Moderate Areas. Both CAA sections 172(c)(1) and 189(a)(1)(C) require “provisions to assure that reasonably available control measures” (*i.e.*, RACM) are implemented in a nonattainment area. Reasonably available control technology (*i.e.*, RACT) is a subset of RACM. The EPA has long interpreted “reasonably available control measures” under CAA sections 172(c)(1) and 189(a)(1)(C) to mean only those measures that are necessary to help an area achieve attainment. Thus, where an area is already attaining the standard, no additional RACM are required, but all measures adopted into the SIP prior to attainment would remain. The EPA is interpreting CAA section 189(a)(1)(C) consistent with its interpretation of CAA section 172(c)(1).

c. RFP and Quantitative Milestones. The EPA has long interpreted the provisions of part D, subpart 1 of the CAA (sections 171 and 172) as not requiring the submission of RFP for an area already attaining the PM₁₀ NAAQS. For an area that is attaining, showing that the state will make RFP towards attainment “will, therefore, have no meaning at that point.”

d. Contingency Measures. Other SIP submission requirements are linked with these attainment demonstration and RFP requirements, and similar reasoning applies to them. These requirements include the contingency measure requirements of CAA sections 172(c)(9). The EPA has interpreted the obligation to submit contingency measure requirements of CAA sections 172(c)(9) as suspended when an area has attained the standard because those “contingency measures are directed at ensuring RFP and attainment by the applicable date.” 57 FR at 13564; *see also* Seitz memo at pgs. 5–6.

e. Control Measure Requirements for Serious Areas. Section VII.D of the preamble explains the rationale of the EPA's decision to maintain its longstanding policy of considering the

BACT/BACM requirement of CAA section 189(b)(1)(B) to be generally independent of attainment.

Accordingly, this rule states that a clean data determination would not suspend the obligation for the state to submit any applicable outstanding BACM and BACT requirements.

For a Serious area that failed to attain the relevant PM_{2.5} NAAQS by the applicable attainment date and that is therefore subject to the annual 5 percent emissions reduction requirement under CAA section 189(d), but is nevertheless now attaining the relevant NAAQS, the EPA believes that the Clean Data Policy may apply to the obligations of the state to make an attainment plan submission to meet the requirements of CAA section 189(d). Once such an area is attaining the relevant NAAQS, a clean data determination would suspend the CAA section 189(d) submission requirement.

3. Comments and Responses

Comment: Several commenters supported the EPA's proposal to codify the clean data policy in the final rule because they believe the policy is lawful and relieves states from unnecessary planning burdens in areas where the NAAQS is met. Some commenters stated the policy has specifically been upheld by the D.C. Circuit in the context of review of nationally applicable implementation rules for the EPA's ozone NAAQS [*Natural Res. Def. Council v. EPA*, 571 F.3d 1245, 1260–61 (D.C. Cir. 2009)]. Other commenters, however, asserted that they “reiterate their previous comments regarding the illegality of the Clean Data Policy.” To the extent that the Agency planned to continue to follow the policy, these commenters agreed with the EPA's interpretation that only those requirements tied to an area's demonstration of attainment should be suspended. To that end, the commenters requested clarification that measures that have been responsible for the area's attainment must be submitted and approved into the SIP even following a Clean Data Determination. Similarly, other commenters requested clarification as to EPA's statement that “Thus, where an area is already attaining the standard, no additional RACM are required, but all measures adopted into the SIP prior to attainment would remain.” The commenter wondered if “all measures adopted into the SIP” includes measures that were included and identified as RACT or RACM in the original SIP, even if those measures have not yet been submitted to EPA in regulatory form.

Finally, some commenters noted that the Act requires that RACM/RACT be

²⁵⁰ *Ibid.*

implemented within 4 years of a nonattainment designation and stated that, as sources reduce emissions of PM_{2.5} and regional PM precursors due to national rules yet to be fully implemented (e.g., Boiler NESHAPS, CSAPR) it is entirely possible that an area may attain the standard prior to complete implementation of RACM/RACT. The commenters stated that, if an area attains the NAAQS prior to implementation of the planning requirements, it is meaningless and overly burdensome to require the area to continue implementing RACM/RACT.

Response: The EPA disagrees with commenters who allege, without explanation, that the Clean Data Policy is “illegal.” Rather, as noted by supportive commenters, the EPA has long interpreted certain CAA requirements that are designed to bring an area into attainment to serve no purpose once an area is attaining, and thus has interpreted the Act as permitting the Agency to suspend the requirements to submit revisions to the SIP addressing those requirements. This position has been upheld by multiple Circuit Courts of Appeals.²⁵¹

In response to the requests for clarification of which RACM requirements are suspended by a CDD, we note that, for over 30 years, the EPA has consistently interpreted the RACM requirement in CAA section 172(c)(1) to apply only to those measures that, individually or collectively, contribute to expeditious attainment of the NAAQS. The suspension of the statutory requirement to submit RACM is premised on the idea that, “[t]o the extent an area is already achieving attainment as expeditiously as possible, imposition of additional control [measures] would not hasten achievement of the NAAQS. In such a situation, the EPA may reasonably conclude that no control [measures] are reasonably available and the area need not implement further [measures] to satisfy the [RACM] requirement.” See *NRDC v. EPA*, 571 F.3d 1245, 1253 (D.C. Cir. 2009). Thus, upon the EPA’s finalization of a CDD for a particular NAAQS, the EPA formally suspends the obligation to submit attainment-related plan elements for that particular NAAQS, including RACM. A CDD does not, however, affect the criteria in CAA section 107(d)(3)(E) for redesignation to attainment, including the requirement for the state to demonstrate to the EPA’s satisfaction that the improvement in air

quality is due to “permanent and enforceable reductions in emissions resulting from implementation of the applicable implementation plan” and other permanent and enforceable reductions. Thus, to the extent certain state/local control measures were necessary to an area’s attainment of the NAAQS, the state may need to submit those measures to the EPA for SIP approval in order to meet the statutory criteria for redesignation in CAA section 107(d)(3)(I), notwithstanding the suspension of planning obligations under a CDD.

In this case, it is not clear to the EPA what the commenter means by the phrase “original SIP,” since the SIP is only those measures that have been submitted and approved by the EPA. To the extent that a measure was adopted into the SIP prior to an area’s attainment of the NAAQS, and therefore contributed to an area’s attainment, that measure is therefore required to remain as part of the SIP. We infer that the comment might be referring to commitments that were approved into a SIP to adopt future measures, or that commenters might be asking for clarification regarding measures that have been adopted locally or at a state level prior to the area’s coming into attainment but have not yet been submitted to the EPA for approval into the federally-approved SIP. As explained above, a CDD has no effect on the state’s obligation to demonstrate that an area’s improvement in air quality is due to “permanent and enforceable” emissions reductions in order to meet the statutory requirements for redesignation to attainment in CAA section 107(d)(3)(E). Additionally, a CDD does not alter the effect of any measure (including any state commitment) that has *already* been approved into a SIP, even if that measure is a commitment to adopt or submit a future measure. Once approved into a SIP, such a measure becomes an enforceable emission standard or limitation subject to EPA or citizen enforcement under CAA section 304, which cannot be altered except through a SIP revision approved by the EPA. Along those same lines, even if an area has adopted into its SIP RACM/RACT but has yet to fully implement those measures when the area first starts attaining the NAAQS, a CDD does not excuse the area from continuing to implement its SIP requirements, *i.e.*, the RACM/RACT measures that have been approved into the SIP. The CDD merely suspends the requirement to *submit* RACM/RACT, that is, additional measures on top of what brought the

area into attainment; a state may only stop implementing those measures already in its SIP through a SIP revision approved by the EPA.

Comment: Some commenters supported the EPA’s proposal to retain the BACM/BACT submission requirement even with a CDD (80 FR 15444). Other commenters, however, stated that, once the EPA makes an attainment determination, the EPA should suspend the requirements to submit BACM/BACT and that to do otherwise is illogical.

Response: The EPA is finalizing the option that requires BACM/BACT to be submitted even if the EPA has issued a CDD for an area. As discussed in our proposal and earlier in this section, the legal underpinning of the Clean Data Policy is that the EPA interprets the CAA not to require the submission of requirements that are designed to get an area to attainment once that area is already attaining the NAAQS. Thus, only those “attainment planning” requirements are suspended by a CDD. It is therefore illogical for the EPA to extend the Clean Data Policy to the submission of the BACM/BACT requirement for Serious Areas. Because the EPA interprets BACM/BACT as independent of attainment, as discussed above in Section VII.D of the preamble, the requirement to submit BACM/BACT continues to apply regardless of whether the EPA has determined that the area is attaining.

D. CAA Section 179B/International Border Areas

1. Specific Requirements

a. Summary of Proposal. Section 179B of the CAA, titled “International Border Areas,” applies to areas that would attain the relevant NAAQS by the statutory attainment date “but for” emissions emanating from outside the U.S. Under CAA section 179B, if applicable, the provision modifies subpart 4 attainment plan obligations applicable to areas designated nonattainment for any PM NAAQS. The EPA proposed and sought comment on two approaches that would give greater clarity to the agency’s existing interpretation of the RACM/RACT and additional reasonable measure requirements for Moderate area attainment plans to be approved under CAA section 179B. The first proposed interpretation would have clarified that the control strategy for an area that could attain by the Moderate area attainment date, “but for” foreign emissions of direct PM_{2.5} or its precursors, must include all control measures identified by the state to be

²⁵¹ See, e.g., *NRDC v. EPA*, 571 F.3d 1245 (D.C. Cir. 2009); *Sierra Club v. EPA*, 99 F.3d 1551 (10th Cir. 1996); *Latino Issues Forum v. EPA*, Nos. 06–75831 and 08–71238 (9th Cir. March 2, 2009) (memorandum opinion).

technologically and economically feasible and implementable on sources in the area by the end of the sixth calendar year following designation of the area. Under this approach, inclusion of such measures would satisfy requirements for RACM and RACT (for measures that can be implemented within four years) and additional reasonable measures (for measures that can be implemented within six years but not within four). The proposal also sought comment on a possible exception for any such measures that collectively would not be effective in reducing ambient PM_{2.5} levels in the area. The second proposed approach would have required a state to demonstrate that its selected control measures for a Moderate nonattainment area would achieve reductions in PM_{2.5} levels that exceeded the applicable NAAQS in proportion to their contribution to overall PM_{2.5} levels. Inclusion of these proportional measures would thus satisfy RACM/RACT and additional reasonable measures under the second approach. The EPA sought comment on these two approaches to clarify what constitutes a reasonable control strategy in the context of a SIP submitted pursuant to CAA section 179B.

The EPA also proposed that any Moderate area attainment plan submitted under CAA section 179B must include an RFP plan with required air quality targets consistent with the RFP Option 2. In addition, the EPA proposed requirements for establishing and reporting on quantitative milestones for areas with approved “but for” demonstrations.

b. Final Rule

Section 179B(a) of the CAA provides that the EPA shall approve an attainment plan for a nonattainment area that is an international border area if: (i) the attainment plan meets all other applicable requirements of the CAA, and (ii) the submitting state can demonstrate satisfactorily that “but for emissions emanating from outside of the United States,” the area would attain and maintain the relevant NAAQS. In addition, CAA section 179B(d) provides that if a state demonstrates that an area would have attained the NAAQS but for emissions emanating from outside the U.S., then the area is not subject to the mandatory reclassification element of CAA section 188(b)(2) for Moderate areas that fail to attain by the applicable attainment date.

Under CAA section 179B, areas affected by emissions from outside the U.S. continue to have attainment plan obligations. First, even if the area is impacted by emissions from outside the

U.S., that fact does not affect the designation of the area. Such an area that is violating the relevant NAAQS will be designated nonattainment even if emissions from outside the U.S. contribute to that violation. Second, as a result of that designation, the state is required to meet the applicable attainment plan requirements for the relevant NAAQS. Section 179B of the CAA does not negate the attainment plan requirements. Rather, it allows the EPA to approve an attainment plan that demonstrates attainment and maintenance of the NAAQS “but for” international emissions.

The EPA has determined that under the best reading of CAA section 179B, states remain obligated to meet the attainment plan requirements other than the requirement to demonstrate attainment and maintenance of the relevant NAAQS. This determination is based upon the fact that 179B(a)(1) explicitly states that such an attainment plan must meet all the requirements of the CAA with that exception. The applicable requirements for an attainment plan for PM_{2.5} include those requirements that apply to a Moderate area attainment plan. Those requirements include an emissions inventory, RACM and RACT, additional reasonable measures, RFP, quantitative milestones, contingency measures, NNSR and motor vehicle emissions budgets for transportation conformity purposes. The Addendum includes a discussion of the applicable attainment plan requirements in the context of developing a SIP subject to CAA section 179B. In it, the EPA clarified that “RACM/RACT must be implemented to the extent necessary to demonstrate attainment by the applicable attainment date if emissions emanating from outside the U.S. were not included in the analysis.”²⁵² The EPA further encouraged states “to reduce emissions beyond the minimum necessary to satisfy the ‘but for’ test in order to reduce the PM concentrations to which their populations are exposed.”²⁵³ However, the EPA acknowledged that “if . . . States . . . were also required, because of contributions to PM₁₀ violations caused by foreign emissions, to shoulder more of a regulatory and economic burden than States not similarly affected. . . such a requirement would unfairly penalize States containing international border areas and effectively undermine the purpose of CAA section 179B. Indeed, to the extent an affected State can

satisfactorily demonstrate that implementation of such measures clearly would not have advanced the attainment date, the EPA could conclude they are unreasonable and hence do not constitute RACM.”²⁵⁴

In the proposal, the EPA specifically took comment on the most appropriate way to address the RACM and RACT requirements. The past interpretation of RACM and RACT requirements in the context of CAA section 179B was considered when the agency proposed an option to allow a state not to adopt such measures if the state could demonstrate that collectively the measures will not be effective in reducing PM_{2.5} levels in the area. Some commenters supported this exception, stating that it would prevent wasting resources on ineffective measures. Some commenters stated that requiring implementation of all RACM/RACT and additional reasonable measures circumvents Congressional intent and the CAA. Other commenters disagreed, stating that these areas should implement all measures due to the importance to public health.

Regarding RACM/RACT and additional reasonable measures, the EPA reviewed the comments received and its past interpretation of RACM and RACT requirements in the context of CAA section 179B attainment plans for PM_{2.5} NAAQS. The EPA is persuaded that this approach is most appropriate and most consistent with the Act and with the control requirements for other Moderate areas that demonstrate they cannot practicably attain by the Moderate area attainment date. *See* section 51.1009(a)(4)(ii). In longstanding guidance the EPA has encouraged states “to reduce emissions beyond the minimum necessary to satisfy the ‘but for’ test in order to reduce the PM₁₀ concentrations to which their populations are exposed.”²⁵⁵ Given that the primary purpose of an attainment plan is to ensure expeditious attainment of the NAAQS and protection of public health and welfare through implementation of control measures that achieve emissions reductions, adopting an interpretation that would allow for continued emissions of pollutants that the state could reasonably reduce would be antithetical to the objectives of the CAA. Just as it is appropriate and consistent with the Act to adopt reasonable measures (*i.e.*, RACT/RACM or additional reasonable measures) in areas that cannot practicably attain by the attainment date, as previously discussed, it is also appropriate and

²⁵² Addendum to the General Preamble, 59 FR 41998 (August 16, 1994), at page 42001.

²⁵³ *Ibid.*

²⁵⁴ *Ibid.*

²⁵⁵ *Ibid.*

consistent with the Act to adopt reasonable measures in areas that cannot attain due to international emissions.

Therefore, the EPA requires that Moderate area attainment plans approved under CAA section 179B must implement all technologically and economically feasible measures that can be implemented on sources in the area by the end of the sixth calendar year following designation of the area (*i.e.*, RACM and RACT and additional reasonable measures). This requirement is intended to ensure that the area makes reasonable progress toward attaining the standard even if such measures are not expected to yield attainment by the statutory Moderate area attainment date. This approach parallels the requirements described in Section IV.D in this preamble, pursuant to CAA section 189(a)(1), for Moderate PM_{2.5} nonattainment areas that cannot practicably attain the NAAQS by the latest statutory attainment date for the area. Requiring the implementation of all reasonable measures is even more important in the context of a Moderate area for which CAA section 179B applies because sources in such areas will not be subject to the more stringent BACM/BACT, MSM, or 5 percent requirement because such areas are not subject to mandatory reclassification as Serious areas pursuant to CAA section 179B(d). Thus, the only level of PM_{2.5} control requirements that will likely ever apply to these sources is the less-stringent RACM/RACT and additional reasonable measures level of control; therefore, all the sources in the area should reduce emissions if such reduction is reasonable since the public in those areas will continue to be subject to ambient levels of emissions that the agency has determined are unsafe notwithstanding implementation of those reasonable measures. Additionally, the EPA notes that the process to determine RACM already allows states to identify the subset of all control measures that are technologically and economically feasible, which should be adequate to prevent significant wasting of resources on ineffective measures.

The EPA has determined that it will not finalize the proposed option of achieving reductions in PM_{2.5} levels in proportion to the area's contribution to overall PM_{2.5} levels. The EPA received several comments on the proposed option to allow states to implement control measures for a Moderate nonattainment area with a plan approved under CAA section 179B that would achieve reductions in PM_{2.5} levels in proportion to the area's

contribution to overall PM_{2.5} levels. Although some commenters supported the possibility of proportionally implementing control measures, other commenters raised possible negative consequences of this option. Commenters highlighted the difficulty that states would face in apportioning responsibility for emissions between foreign and non-foreign sources, which would be necessary under the proportional approach. These commenters also disagreed as to whether the EPA or states should be responsible to determine the proportional allocation of international emissions. The EPA is also concerned that a proportional approach would introduce too much complexity into an already complex analytical process. Additionally, the EPA notes that no other NAAQS pollutant offers a proportional approach to implementation of control measures and is not convinced that there are sufficient reasons to finalize this approach for PM_{2.5} nonattainment areas.

Section 179B(d) of the CAA states that any area for which the state establishes to the EPA's satisfaction that the area "would have attained the NAAQS by the applicable attainment date, but for emissions emanating from outside the United States, shall not be subject to the provisions of section [188(b)(2)]." CAA section 188(b)(2) requires the EPA to determine, within 6 months following the applicable attainment date for a Moderate PM_{2.5} nonattainment area, whether the area attained the NAAQS by that date and to reclassify the area as Serious if it is not in attainment after the applicable attainment date. For any Serious area subject to an EPA determination of failure to attain by the Serious area attainment date, CAA section 189(d) requires the state to submit plan revisions which provide for attainment of the PM_{2.5} NAAQS and for annual emissions reductions of not less than 5 percent until the area attains. These planning requirements in section 189(d) apply only upon the EPA's determination that a Serious area has failed to attain the applicable NAAQS by the Serious area attainment date. Because section 179B(d) explicitly provides that any area that satisfies the "but for" attainment test in CAA section 179B shall not be subject to the provisions for reclassification to Serious upon failure to attain in CAA section 188(b)(2), the consequences for failure to attain by the Serious area attainment date in section 189(d) generally do not apply to such areas.

In the event that the EPA has already reclassified an international border area as Serious, when the state submits a

"but for" demonstration under section 179B, all of the Serious area requirements that apply to the area (*e.g.*, the requirements to implement BACM/BACT and additional feasible measures) would remain in effect. This is because at the time the state submits the "but for" demonstration, these statutory requirements already apply. Upon the EPA's approval of a Serious area plan and section 179B demonstration for such an area, however, the EPA would no longer be obligated to make a determination of failure to attain by the Serious area attainment date triggering the additional planning requirements of section 189(d). Consistent with Congress's clear intent in section 179B(d) to relieve Moderate PM_{2.5} nonattainment areas that satisfy the "but for" attainment test of the additional planning obligations that result from a mandatory determination of failure to attain by the Moderate area attainment date, the EPA interprets section 179B as also relieving Serious PM_{2.5} nonattainment areas of the additional planning obligations in section 189(d) that result from a mandatory determination of failure to attain by the Serious area attainment date, once the EPA approves the state's Serious area plan and section 179B demonstration.

Where a Serious area fails to attain by the Serious area attainment date and is therefore subject to the requirements of section 189(d), the EPA's approval of a section 189(d) plan and 179B demonstration would mean that the EPA is no longer obligated to make further determinations of failure to attain or to trigger additional planning requirements. The EPA intends to review each SIP submission containing a "but for" attainment demonstration for an international border area for compliance with the requirements of section 179B.

The EPA notes that, with one exception for contingency measures, the final rule provisions governing for the RFP, quantitative milestone, and contingency measure requirements for PM_{2.5} nonattainment areas are the same for areas seeking plan approval under CAA section 179B as they are for any other area. For example, the EPA requires that as part of any Moderate area attainment plan submitted under CAA section 179B, a state must include an RFP plan developed consistent with the process described in Section IV.F of this preamble as a Moderate nonattainment area that cannot practicably attain the relevant NAAQS by the statutory attainment date. In addition, the EPA requires that the state must identify quantitative milestones for the area to be achieved 4.5 years and

7.5 years from the date of designation of the area. The EPA will apply the same requirements for establishing and reporting on quantitative milestones for Moderate nonattainment areas with an approved “but for” demonstration under CAA section 179B as for all other Moderate nonattainment areas, as described in Section IV.G of this preamble. Furthermore, the state must include as part of any attainment plan submission made for such an area contingency measures that are ready to be implemented quickly and with minimal further action by the state or by the EPA in the event the EPA determines that such area failed to meet RFP or quantitative milestone requirements. The contingency measures should achieve approximately 1 year’s worth of emissions reductions as calculated by the state for purposes of the RFP analysis. The exception to the contingency measure requirement for areas with approved CAA section 179B demonstrations is that contingency measures for failure to attain are not required in such plans, because under CAA section 179B(d) the EPA is not required to make determinations concerning attainment for such areas. Further explanation of contingency measures can be found in Section IV.H of this preamble.

Regarding the “but for” demonstrations under CAA section 179B, the EPA has historically evaluated these demonstrations on a case-by-case basis, based on the individual circumstances and data provided by the submitting state. These demonstrations have included information such as ambient air quality monitoring data, modeling scenarios, emissions inventory data and meteorological or satellite data.²⁵⁶ The Moderate area attainment demonstration modeling and other elements of the attainment demonstration must show attainment and maintenance of the NAAQS but for the emissions from outside of the U.S. However, CAA section 179B does not provide authority to exclude monitoring data influenced by international transport from regulatory determinations related to attainment and nonattainment.

Where international transport of emissions contributes to an exceedance or violation, such data may be excluded from consideration only if they were significantly influenced by exceptional

events under section 319(b) of the CAA. If the data meet the criteria contained in the EPA’s Exceptional Events Rule, the exceedance can be addressed by that rule.²⁵⁷ Specifically, if the EPA concurs with a state’s request to exclude affected data, the event-influenced data are officially noted and removed from the data set used to calculate official design values, which may be used as part of a regulatory determination.

The EPA expects that the best approach for evaluating the potential impacts of international transport on nonattainment is for states to work with the EPA on a case-by-case basis to determine the most appropriate information and analytical methods for each area’s unique situation. The EPA will work with states that are developing exceptional events demonstrations and attainment plans for which CAA section 179B is relevant, and ensure the states have the benefit of the EPA’s understanding of international transport of PM_{2.5} and PM_{2.5} precursors.

c. Comments and Responses

Comment: Commenters stated the EPA should not require the state to implement a section 189(d) 5 percent reduction plan, since attaining such reductions may well be impossible if there are significant international emissions.

Response: The EPA agrees that as long as the affected nonattainment area satisfactorily meets the provisions of CAA section 179B, that area should not be subjected to the additional requirements of CAA section 189(d) even if the area fails to attain.

Comment: Commenters stated that requiring implementation of all RACM and RACT for CAA section 179B nonattainment areas would penalize rural communities and would run counter to the intent of CAA section 179B of providing regulatory relief to areas affected by foreign emissions.

Response: For the reasons stated earlier, the EPA has determined that section 179B nonattainment areas should be required to implement control measures to the same extent as a Moderate nonattainment area that demonstrates it will not be able to attain the PM_{2.5} NAAQS by the statutory attainment date.

Comment: Some commenters stated that the EPA’s current interpretation of section 179B and the agency’s guidance which encourages states “to reduce emissions beyond the minimum necessary to satisfy the ‘but for’ test,” circumvents Congressional intent and

the CAA and establishes a second ambient air quality threshold not related to the NAAQS.

Response: The EPA disagrees that encouraging states to minimize emissions as much as possible to protect public health circumvents Congressional intent. The EPA has determined that the reasonable control measure requirements outlined in section 51.1009(a)(4)(ii) represent the most appropriate interpretation of the CAA in line with the overriding Congressional intent to protect and improve air quality thereby enabling the associated public health benefit.

Comment: Some commenters stated that if an area’s demonstration is approved under CAA section 179B, any contingency measures should only be required to obtain emissions reductions in proportion to the contribution of emissions excluding the international pollution, or at least to the contribution of emissions reductions that the state can feasibly attain.

Response: The EPA agrees that contingency measures relate to the domestic portion of emissions affecting the nonattainment area. The state will not be required to develop contingency measures to make up for those emissions coming from international sources. The EPA emphasizes that contingency measures for a section 179B area will be for failure to meet RFP requirements, not for failure to attain.

However, the EPA expects states with a section 179B area to follow the guidance and requirements outlined in Section IV.H of this preamble to identify contingency measures that can provide emissions reductions from sources within the state’s jurisdiction. As discussed in Section IV.H of the preamble, this should include an explanation of the amount of anticipated emissions reductions to be accomplished by the contingency measures. If such an area is unable to identify approximately 1 year’s worth of emissions reductions to constitute contingency measures, the explanation should describe the factors considered by the state when reaching this conclusion.

E. Enforcement and Compliance

a. *Summary of Proposal.* The agency proposed that in general, in order for a SIP regulation to be enforceable, it must clearly spell out which sources or source types are subject to its requirements and what its requirements (e.g., emission limits or work practices) are. The EPA proposed that an enforceable regulation would also specify the timeframes within which these requirements must be met, and

²⁵⁶ *Ibid.* The Addendum includes further examples of information a state may present for the EPA to consider as part of the “but for” demonstration, including additional monitors in international border areas, more detailed emissions inventories, and speciation data that identifies PM_{2.5} components from foreign sources.

²⁵⁷ See 40 CFR 40 CFR 50.1, 50.14 and 51.930.

definitively state the recordkeeping and monitoring requirements appropriate to the type of sources being regulated. Additionally, the EPA proposed that an enforceable regulation would also contain test procedures in order to determine whether sources are in compliance.

b. Final Rule. Section 172(c)(6) in subpart 1 of the CAA requires nonattainment SIPs to “include enforceable emission limitations, and such other control measures, means or techniques . . . as well as schedules and timetables for compliance, as may be necessary or appropriate to provide for attainment.” In the remanded 2007 PM_{2.5} Implementation Rule, the EPA described the general elements that characterize an enforceable SIP regulation, recognizing that enforceable SIP regulations may address the elements in different ways depending on the type of source category being regulated. The agency continues to believe and hereby finalizes that in general, in order for a SIP regulation to be enforceable, it must clearly spell out which sources or source types are subject to its requirements and what its requirements (*e.g.*, emission limits or work practices) are. An enforceable regulation would also specify the timeframes within which these requirements must be met, and definitively state the recordkeeping and monitoring requirements appropriate to the type of sources being regulated. The recordkeeping and monitoring requirements would have to be sufficient to enable the state or the EPA to determine whether the source is complying with the emission limit on a continuous basis. An enforceable regulation would also contain test procedures in order to determine whether sources are in compliance.

The EPA continues to believe that complete and effective regulations that ensure compliance with an applicable emissions limit must include requirements for both performance testing of emissions and ongoing monitoring of the compliance performance of control measures, and the agency requires that SIP regulations that establish emission limits include the following for performance testing:

(1) Indicator(s) of compliance—the pollutant or pollutants of interest (*e.g.*, filterable and condensable PM_{2.5}) and the applicable units of measurement for expressing compliance (*e.g.*, ng/J of heat input, lb/hr);

(2) Test method—reference to a specific EPA or other published set of sample collection and analytical procedures, equipment design and performance criteria, and the

calculations providing data in units of the indicator of compliance (Section IX.K of this preamble presents a discussion of specific test methods for condensable PM_{2.5} emissions);

(3) Sample collection characteristics—conditions related to the sample collection portion of the performance test. Such conditions would include duration of sampling period, either on a time or volume collected basis; the number of runs comprising a test (*e.g.*, three runs per test); and the averaging period, *i.e.*, the time over which the emissions limit is averaged (*e.g.*, 8 hours); and,

(4) Frequency—the time between emissions or performance tests (*e.g.*, within 30 days of facility start-up and once each successive quarter, every 6-month period, or yearly).

In order to be complete with regard to compliance monitoring provisions, the EPA requires that regulations adopted into the SIP must include the following critical elements:

(1) Indicator(s) of performance—the parameter or parameters measured or observed for demonstrating proper operation of the pollution control measure or compliance with the applicable emissions limitation or standard. Indicators of performance could include direct or predicted emissions measurements, process or control device (and capture system) operational parametric values that correspond to compliance with efficiency or emissions limits, and recorded findings of verification of work practice activities, raw material or fuel pollutant content, or design characteristics. Indicators could be expressed as a single maximum or minimum value, a function of process variables (*e.g.*, within a range of pressure drops), a particular operational or work practice status (*e.g.*, a damper position, completion of a waste recovery task), raw material or fuel pollutant content, or an interdependency between two or more variables;

(2) Measurement technique—the means used to gather and record information of or about the indicators of performance. The components of the measurement technique include the detector type or analytical method, location and installation specifications, inspection procedures, and quality assurance and quality control measures. Examples of measurement approaches include continuous emissions monitoring systems (CEMS), continuous opacity monitoring systems (COMS), continuous parametric monitoring systems (CPMS), performance testing, vendor or laboratory analytical data, and manual inspections and data collection

that include making records of process conditions, raw materials or fuel specifications, or work practices. Directly enforceable emission measurements, such as PM CEMS, are preferred wherever feasible. Where COMS are feasible, it should be clear that opacity is a directly enforceable standard, not merely an indicator of compliance;

(3) Averaging time—the period over which to average data to verify compliance with the emissions limitation or standard or proper operation of the pollution control measure. Examples of averaging time include a 3-hour average in units of the emissions limitation, a 30-day rolling average emissions value, a daily average of a control device operational parametric range, periodic (*e.g.*, monthly, annual) average of raw materials or fuel pollutant content, and an instantaneous alarm;

(4) Monitoring frequency—the number of monitoring data values recorded over a specified time interval. Examples of monitoring frequencies include at least one data value every 15 minutes for CEMS or CPMS, at least every 10 seconds for COMS, upon receipt or application of raw materials or fuel to the process, or at least once per operating day (or week, month, etc.) for performance testing, work practice verification, or equipment design inspections; and,

(5) Reporting and record retention requirements—criteria for retaining monitoring and test data in an electronic form and periodic electronic reporting of information as needed to the compliance office. Electronic record retention and submission have been widely adopted, and the EPA believes that such readily accessible documentation could be used by state, federal and other analysts to spot trends and non-compliance more easily than if these entities conducted reviews of paper documents. The EPA also recommends that compliance reports be made available online so that the general public can readily access the information without the need to submit Freedom of Information Act (FOIA) requests to the EPA. The EPA is in the process of revising federal rules to make similar requirements apply.

The EPA acknowledges that one way for regulatory authorities to have owners or operators of regulated sources demonstrate compliance via ongoing monitoring is to use a Compliance Assurance Monitoring (CAM) rule-type approach.²⁵⁸ Under such an approach,

²⁵⁸ See the CAM rule, available at 40 CFR part 64.

an owner or operator would be able to establish operating ranges of continuously monitored parameters determined through concurrent performance testing as indicators of performance. A CAM rule-type approach would require owners or operators who chose parameter monitoring as indicative of compliance to immediately take corrective action should a measured parameter value occur outside the demonstrated range associated with compliance. Moreover, concurrent performance testing and parameter measurement would be necessary on a periodic basis, generally annually, and may be necessary on a more frequent basis to reverify or reset parameter value range, particularly when the operating range is exceeded. Failure of the owner or operator to take immediate corrective action would constitute a violation of the applicable rule. Moreover, failure of a parameter range to demonstrate compliance when reverification or resetting performance testing occurred would also constitute a violation of the emission limit. This implementation rule does not prohibit states from taking a CAM rule type approach and making parameters directly enforceable limits.

The EPA continues to believe that approval of regulations adopted into SIPs should ensure that these critical elements are present and clearly defined to be approvable. In particular, the compliance obligations, including emissions limits and other applicable requirements, should be representative of and accountable to the assumptions used in a state's attainment demonstration. This accountability should include the ability to transfer the applicable regulatory requirements to a title V operating permit subject to the EPA and public review.²⁵⁹

c. Comments and Responses

Comment: Commenters suggested that the proposal's use of the term "indicators of compliance" is confusing and suggested the EPA should simply express that emission limitations must identify the pollutant of interest and the units of measurement. The commenters suggested the EPA use the term "measurement method" and the EPA acknowledge that sources may use procedures that are not published by the

EPA, especially for pollutants for which there is no federally promulgated test method, performance specification, or voluntary consensus standard. The commenters disagreed that "averaging time" is always the appropriate term, since it has no applicability for standards that use test methods that specify minimum run times or sample volumes, and numbers of runs, and suggested the EPA use the term "sample time or volume" and make clear that it can be a minimum or an absolute value.

Response: The EPA does not agree with the commenters' suggestion. The proposal identified four components associated with demonstrating compliance via performance testing—the indicator of compliance (for which the commenters expressed concern), the test method, the averaging time associated with the test method, and the frequency of conducting the test—as well as five components associated with demonstrating compliance via ongoing monitoring. However, the commenters appear to suggest to expand compliance demonstration techniques beyond testing and monitoring. To the extent that SIP regulations are developed that do not rely on performance testing or ongoing monitoring as means for demonstrating compliance, the EPA agrees that other components, including emission limitations that identify the pollutant of interest and units of measurement, as suggested by the commenter, would be appropriate.

The EPA believes neither a change in term from "test method" to "measurement method" nor an additional acknowledgement regarding its current wording "specific EPA or other published set of [criteria]" is needed. The component to which the commenter refers is based on performance testing; ongoing measurement components are covered as "measurement technique" in one of the five critical elements for ongoing measurement.

The EPA agrees with the commenters that in some circumstances, test methods rely on sample volumes as opposed to specific durations. The "averaging time" component of performance tests will be changed to "sample collection characteristics", where such characteristics will include averaging time, duration, or sample volume and number of runs, as applicable. While the EPA does not believe it to be necessary to identify that the sample collection characteristics could be minima, maxima, or ranges, the preamble discussion associated with this change indicates that specific test methods, or regulatory agencies, may impose restrictions or specific

conditions on sample collection characteristics.

Comment: Some commenters stated the EPA should make clear that states can rely on CAM-type parameters as indicators of compliance. The commenters stated the EPA should make clear that states that follow the CAM rule model are not required to establish those "indicators" as directly enforceable limitations, as long as the SIP imposes directly enforceable review and corrective action requirements that will ensure that the source takes corrective action prior to the point when the indicator would predict noncompliance with an emission limitation.

Response: The EPA agrees with the commenters that one way regulatory authorities have owners or operators of regulated sources demonstrate compliance via ongoing monitoring is to use a CAM rule-type approach. Under such an approach, an owner or operator would be able to establish operating ranges of continuously monitored parameters determined through concurrent performance testing as indicators of performance (indicators of compliance are components of performance testing). Nothing in the CAM rule precludes an owner or operator from establishing parameters as directly enforceable limitations, and neither does this rule. The CAM rule-type approach would require owners or operators who chose parameter monitoring as indicative of compliance to immediately take corrective action should a measured parameter value occur outside the demonstrated range associated with compliance. Moreover, concurrent performance testing and parameter measurement would be necessary on a periodic basis and may be necessary on a more frequent basis to reverify or reset a parameter value range. Failure to take immediate corrective action would constitute a violation. Moreover, failure of a parameter range to demonstrate compliance when reverification or resetting performance testing occurred would also constitute a violation.

Comment: Commenters agreed that a compliance monitoring provision must specify a "measurement technique" and stated the EPA should defer to states regarding the most appropriate measurement techniques. The commenter disagreed that use of CEMS for "directly enforceable measurements" is always preferable.

Response: The EPA appreciates the commenters' support and notes that the measurement technique component used in this rule corresponds to a similarly-named component contained

²⁵⁹ Under the title V regulations, sources have an obligation to include in their title V permit applications, among other components, all emissions of pollutants for which the source is major, and all emissions of regulated air pollutants. See, e.g., 40 CFR 70.5(c)(3). The definition of regulated air pollutant in 40 CFR 70.2 includes any pollutant for which the NAAQS has been promulgated, including PM_{2.5}.

in the definition of monitoring in the general provisions of 40 CFR part 63. To the extent that regulatory authorities choose appropriate measurement techniques, the EPA agrees with the commenter. The EPA believes the commenters take the language regarding use of directly enforceable emissions measurements out of context; the EPA said it is preferred wherever feasible, not that it is always required.

Comment: Commenters stated the EPA should make clear that “averaging time” is only required for measurement techniques that collect continuous data that will be averaged over some period in order to assess source operations; *i.e.*, the element is only essential to certain types of compliance monitoring requirements. The commenters suggested the EPA should not attempt to impose or require minimum frequencies in terms of calendar days, months, or year and urged the EPA to allow states flexibility to determine how best to address operational variability.

Response: The EPA disagrees with the commenters, noting that averaging time remains an important aspect of demonstrating compliance via ongoing monitoring for all types of monitoring. It remains important to know how the period over which collected data are used to determine compliance, whether that period is daily, hourly, or annually. The EPA has not assigned minimum averaging times that regulatory authorities must use; however, the EPA expects those regulatory authorities to select averaging times appropriate to demonstrate compliance for specific types of sources.

Comment: Commenters supported the EPA’s recommendation that information demonstrating compliance be made available online for general public access (80 FR 15448) so that the public can provide the oversight that the Act contemplates (42 U.S.C. 7604). Other commenters opposed an absolute requirement that all monitoring, testing, and reporting be done electronically since many permits are for small businesses who may not have the capital and technical expertise for electronic recordkeeping and reporting; commenters recommended that the EPA change this criterion into a recommendation that electronic means be used where feasible.

Response: The EPA agrees that electronic reporting and public access to information is important. The EPA notes that it is and has been moving towards electronic emissions reporting from all regulated sources for some time now. New NSPS and NESHAP require electronic emissions reporting, and efforts are underway to require existing

NSPS and NESHAP to use electronic emissions reporting.²⁶⁰ Consistent with this approach, and with the approach taken by the next generation of compliance program,²⁶¹ this rule will assist the shift toward electronic reporting to make environmental reporting more accurate, complete, and efficient. Moreover, electronic reporting of emissions will help us and regulatory authorities better manage information, improve effectiveness, and improve transparency.

F. Multi-Pollutant Considerations

1. Summary of Proposal

The EPA described many benefits of coordinating air quality planning efforts across a range of air quality programs addressing the NAAQS, air toxics, and climate change and encouraged states to pursue multipollutant planning approaches where possible.

2. Final Rule

The final rule reiterates many of the points made in support of multipollutant planning efforts in the proposal. Efforts to reduce fine particle concentrations fit well as part of multipollutant planning efforts because of the involvement of PM_{2.5} precursor gases (*i.e.*, NO_x, SO₂, VOC, and ammonia) and direct PM_{2.5} emissions in a number of other air quality and climate issues. NO_x and VOC play important roles in atmospheric chemistry and in the formation of ground-level ozone. Certain VOCs and constituents of direct PM_{2.5} are also hazardous air pollutants. SO₂ and NO_x emissions, and their reactions with ammonia to form ammonium sulfate and ammonium nitrate, have played important roles in acidic deposition, haze in national parks, and in fine particle formation. Black carbon from direct PM_{2.5} emissions is an important short-lived climate pollutant. Increasing average temperatures due to climate change are expected to lead to higher ozone concentrations. Many efforts to address traditional air pollutants have important co-benefits in terms of reducing emissions of CO₂ and other GHGs, and vice versa. For these reasons, efforts to reduce air pollution to address multiple objectives can provide important benefits to states, the regulated community, and the general public.

Multipollutant planning issues have been an area of strong interest by scientists and policymakers for many years. In 1995–1997, the EPA sought

recommendations from a federal advisory committee with broad stakeholder representation on ways to coordinate and make more efficient the implementation programs for upcoming ozone and PM_{2.5} standards and the regional haze program. The National Academy of Sciences issued “Air Quality Management in the United States,” a report on multipollutant planning issues and recommendations, in 2004. In June 2007, the EPA’s CAA Advisory Committee (CAAAC) recommended that the agency allow states to integrate SIP requirements and other air quality goals into a comprehensive plan.²⁶² The recommended plan would demonstrate attainment/maintenance of multiple NAAQS, accomplish sector-based reductions, realize risk reductions of HAPs and make improvements in visibility. It could also be structured to integrate programs addressing land use, transportation, energy and climate.

The EPA believes that in many cases it can be more efficient for states to develop integrated control strategies that address multiple pollutants rather than separate strategies for individual air quality programs. An integrated air quality control strategy that reduces multiple pollutants can help ensure that reductions are efficiently achieved and produce the greatest overall air quality benefits. The EPA has encouraged states to take a multi-pollutant approach to managing air quality to the extent possible.

While the agency encourages states to develop multi-pollutant plans, it recognizes that certain factors can make such efforts challenging. For example, the NAAQS are to be reviewed every 5 years, and any revisions to the standards will lead to a series of implementation steps required by specific statutory schedules. In some cases program requirements and deliverables may not be coordinated easily, but in other situations there are good opportunities for conducting technical analyses and developing policy approaches that can have important health and environmental benefits while addressing multiple key air pollution issues at the same time.

One such opportunity is the increased use of multi-pollutant assessments. A multi-pollutant assessment, or one-atmosphere modeling, is conducted with a single air quality model (such as CMAQ or CAMx) that is capable of simulating transport and formation of

²⁶⁰ See 80 FR 15099, March 20, 2015.

²⁶¹ See <http://www2.epa.gov/sites/production/files/2014-09/documents/next-gen-compliance-strategic-plan-2014-2017.pdf>.

²⁶² Recommendations to the Clean Air Act Advisory Committee: Phase II, June 2007, <http://www2.epa.gov/caaac/caaac-reports>.

multiple pollutants simultaneously.²⁶³ For example, this type of model can simulate formation and deposition involving pollutants associated with PM_{2.5}, ozone and regional haze, and it can include algorithms simulating gas phase chemistry, aqueous phase chemistry, aerosol formation and acid deposition. This type of model could also include the formation and deposition of key air toxics and the chemical interactions that occur with these individual toxic species to produce PM_{2.5} and ozone. It can also account for estimated changes in traditional air pollutant emissions resulting from programs (such as energy efficiency and renewable energy programs) to reduce emissions of CO₂ and other greenhouse gases.

Models and data analysis intended to address PM_{2.5} could be beneficial for use in addressing ozone, visibility impairment, and climate change. States that undertake multi-pollutant assessments as part of their attainment demonstration have the opportunity to assess the impact of their PM_{2.5} strategies on ozone, visibility, and climate programs to ensure that optimal emission reduction strategies are developed to the extent possible. This could facilitate addressing all of these pollutants in a more cost effective manner.

States may also find it desirable to assess the impact of PM_{2.5}, ozone, and/or regional haze control strategies on toxic air pollutants regulated under the CAA or under state air toxic initiatives. Given the relationships that exist between air toxics and the formation of PM_{2.5} and ozone, states may find that controls can be selected to meet goals for PM_{2.5} and/or ozone attainment as well as those of specific air toxic programs.

3. Comments and Response

Comments: Some commenters urged the EPA to provide assistance to those states that might be precluded from developing Multi-Pollutant SIPs due to lack of resources. Other commenters stated the EPA should support the states' use of various approaches and tools suggested the EPA make the Control Strategy (CoST) tool fully available, as well as provide any necessary training to facilitate states' ability to effectively use the tool. The commenter also suggested that the EPA

entertain the possibility for states to demonstrate that the controls put in place to comply with multi-pollutant CAIR and CSAPR are valid and should be accepted as part of attainment demonstrations; allowing states to credit emissions reductions that have occurred.

Response: The Control Strategy Tool (CoST) is a component of the EPA's Emissions Modeling Framework that is a client-server system developed to support emissions modeling. CoST was developed by the EPA to model the emissions reductions and engineering costs associated with control strategies applied to point, area, and mobile sources of air pollutant emissions to support the analyses of the EPA air pollution policies and regulations. Links to the software and documentation are available at the EPA's CoST Web site at <http://www3.epa.gov/ttnecas1/cost.htm>. Note that because of resource limitations, the EPA is not able to provide any support for the installation or operation of CoST outside of the agency.

G. Measures to Ensure Appropriate Protections for Overburdened Populations

1. Summary of Proposal

The EPA requested comments on ways that states can provide public health protection specifically for overburdened populations when preparing attainment plans for the PM_{2.5} NAAQS.

2. Final Rule

Environmentally overburdened, underserved, and economically distressed communities may be subject to a higher risk of pollutant-related health effects than the general population because they may be exposed to higher pollutant concentrations than the general population; they may experience a larger health impact at a given pollutant concentration; or they may be adversely affected by lower pollutant concentrations than the general population.²⁶⁴ Thus, the NAAQS review process inherently takes into consideration appropriate environmental justice factors as part of the standard-setting process for each pollutant.

Section 109(d) of the CAA requires the EPA to periodically review (every 5 years) the science upon which the

standards are based and the standards themselves. The policy assessment for the 2012 PM NAAQS review (U.S. EPA, 2011a, p. 2–60) observed that the highest concentrations of PM_{2.5} in an area tend to be measured at monitors located in areas where the surrounding populations are more likely to live below the poverty line and to have higher percentages of minorities. In its 2012 review of the PM NAAQS, the EPA revised the primary annual PM_{2.5} standard by lowering the level to 12.0 micrograms per cubic meter (µg/m³) to provide increased protection against health effects associated with long- and short-term PM_{2.5} exposures.²⁶⁵ The agency also (1) revised the form of the primary annual PM_{2.5} standard to eliminate the spatial averaging provisions to avoid potential disproportionate impacts on at-risk populations; and (2) directed states to relocate a limited number of existing monitors to near-roadway sites in large urban areas. Both of these actions were informed by scientific evidence that underscored the potentially disproportionate exposure to high PM_{2.5} concentrations and therefore disproportionate risk to low-income and minority populations.

In conjunction with these revisions, the EPA retained the primary 24-hour PM_{2.5} standard, as revised in 2006 (71 FR 61144, October 17, 2006), to provide supplemental protection against health effects associated with short-term PM_{2.5} exposures, especially in areas with high peak PM_{2.5} concentrations. This suite of primary annual PM_{2.5} standards provides increased public health protection, including the health of at-risk populations which include children, older adults, persons with pre-existing health and lung disease, and persons of lower socioeconomic status, against a broad range of PM_{2.5}-related effects that include premature mortality, increased hospital admissions and emergency department visits, and development of chronic respiratory disease.²⁶⁶

Relationship between direct PM_{2.5} emissions and PM_{2.5} precursor

²⁶⁵ 78 FR 3086 (January 15, 2013).

²⁶⁶ In the final 2012 PM NAAQS rule, based on information presented in the *Integrated Science Assessment for Particulate Matter* (U.S. EPA, 2009, sections 2.2.1 and 8.1.7), the EPA made a finding that persons with lower socioeconomic status are at increased risk for experiencing adverse health effects related to PM exposures (78 FR 3085, January 15, 2013, at page 3104). Persons with lower socioeconomic status (SES) have been generally found to have a higher prevalence of pre-existing diseases, limited access to medical treatment, and increased nutritional deficiencies, which can increase this population's risk to PM-related effects (77 FR 38911, June 29, 2012).

²⁶³ Depending on the context, "multi-pollutant" can be defined in different ways. In this context the agency is defining multi-pollutant modeling as simultaneous modeling of PM_{2.5}, ozone, key air toxics, and regional haze. Future multi-pollutant models may include the ability to model a broader array of air toxics as well as greenhouse gases.

²⁶⁴ See EPA 2011. Policy Assessment for the Review of the Particulate Matter National Ambient Air Quality Standards, Office of Air Quality Planning and Standards, Research Triangle Park, NC, EPA 452/R-11-003, April 2011.

emissions reductions and at-risk populations. Sources of direct PM emissions have their greatest impact on PM_{2.5} concentrations and public health in the general vicinity of the source (e.g., within 10 miles), while sources of precursor emissions can contribute to PM_{2.5} concentrations more than 100 miles away and are considered to have a more regional impact. To date, state PM_{2.5} attainment plans have generally relied to a greater extent on reductions of precursor pollutants rather than on reductions of direct PM_{2.5} emissions. Studies show, however, that on a per ton basis, the reduction of a ton of direct PM_{2.5} emissions leads to greater health benefits than the reduction of a ton of SO₂ or NO_x.²⁶⁷

The process for developing attainment plans for the current and future PM_{2.5} NAAQS presents a potential opportunity to target the health protections afforded by the NAAQS, as the EPA expects that attainment for the 2012 PM_{2.5} NAAQS and future PM_{2.5} NAAQS in nonattainment areas with the most severe pollution problems may need to give greater emphasis to reducing direct PM_{2.5} emissions in combination with efforts already underway to further reduce precursor emissions. Placing greater emphasis on reducing emissions from sources of direct PM_{2.5} (e.g., certain industrial facilities located in more densely populated areas; areas with high motor vehicle and other diesel engine emissions, such as rail yards and near major roadways; and, areas with high wood smoke emissions) could provide the added benefit of reducing exposure to PM_{2.5} in low-income and minority communities.

Options for states to consider to ensure appropriate protections from PM_{2.5} exposure for overburdened populations. The EPA believes that states have sufficient flexibility and discretion under the CAA in implementing their attainment strategies to focus resources on controlling those sources of emissions that directly and adversely affect low-income and other at risk populations. By reducing impacts on at-risk populations, states can maximize health benefits, thereby creating greater net benefits for the state

in a cost-effective manner.²⁶⁸ In addition, reducing adverse impacts to low-income and minority populations advances the environmental justice goal of fair treatment for these populations.

There are a number of actions that states could take to focus resources in this way. Some of these actions can help identify areas where additional ambient monitoring may be needed in low income and overburdened communities. Such information can be used to support updates to the state's annual monitoring plan.

Screening is a useful first step in understanding or highlighting locations that may be candidates for further review. The EPA has developed EJSCREEN, a public screening tool that allows users to access high-resolution environmental and demographic information for locations in the United States, and compare their selected locations to the rest of the state, the EPA region, or the nation. The tool may help users identify areas with minority and/or low-income populations, potential environmental quality issues, a combination of environmental and demographic indicators that is greater than usual, and other factors that may be of interest. Other examples of actions to support updates to the annual monitoring plan include:

- Develop databases and online mapping tools that enable users (including state staff, public, and the regulated community) to understand where sources of direct PM_{2.5} emissions are located and where new or modified sources of emissions could have potential impacts on low income and other overburdened communities;
- Incorporate existing mapping tools that identify target areas in the attainment plan development process and related actions; and,
- Analyze emissions data, ambient data, and available modeling to identify potential unmonitored PM_{2.5} hotspots in areas with a high percentage of low income, minority or indigenous persons (see Section III.E of this preamble for further discussion of this option).

Once target areas for addressing these sensitive population needs within a nonattainment area have been identified, the state could consider taking any of the following actions, which help target emissions reductions that may be needed to attain the PM_{2.5} NAAQS:

- Prioritize the selection of control measures that target reductions of direct PM_{2.5}, particularly from sources located in “at-risk” areas as part of the state’s RACM and RACT analysis (for Moderate nonattainment areas) or BACM and BACT analysis (for Serious nonattainment areas), as well as other measures needed to demonstrate attainment (see Sections III.D and V.D of this preamble, respectively, of this preamble for further discussion of this option);

- Improve the understanding of the potential impact of minor sources by improving or generating an emissions inventory for such minor sources, including sources that are not currently required to report emissions, to generate options on how emissions can be reduced in the target area;

- Design voluntary programs to reduce VMT and mobile source-related PM_{2.5} emissions (e.g., diesel retrofits);

- Incorporate environmental justice criteria into the alternatives analysis to ensure appropriate siting and require cumulative impact studies for proposed projects;

- Eliminate exemptions from and/or lower thresholds for minor source permitting;

- Prioritize targeted enforcement strategies; and

- Develop a list of potential supplemental environmental projects (SEPs)²⁶⁹ that could be applied in the target area.

In addition to the previous steps, states could increase opportunities for meaningful involvement of community groups in attainment plan development, annual monitoring network plan reviews, and permitting processes²⁷⁰ for at-risk and minority populations by taking the following steps:

- Develop advisory boards and/or develop enhanced notice-and-comment requirements for low income and minority communities to assure meaningful involvement relative to projects that impact their communities;

- Provide special notice of important actions affecting target areas in appropriate languages and with attention to cultural barriers;

- Provide advance notification for low income and minority communities of upcoming opportunities for public comment on SIPs, ambient air monitoring plans, and other relevant actions such as permit actions;

- Maintain multi-lingual Web sites and offer translators for public meetings and hearings; and,

- Coordinate with the state’s EJ coordinator, if applicable, to assist with outreach efforts.

3. Comment and Response

Comment: Some commenters supported the EPA’s recommendations for measures to ensure protections for

²⁶⁷ See Fann, N., Fulcher, C., and B. Hubbell, 2009. The Influence of location, source, and emission type in estimates of the human health benefits of reducing a ton of air pollution. *Air Quality, Atmosphere & Health*. Volume 2, Number 3, 169–176, June 2009. See also Fann et al., 2011. Maximizing health benefits and minimizing inequality: incorporating local-scale data in the design and evaluation of air quality policies. *Society for Risk Analysis*, vol. 31, no. 6, p. 908–922, June 2011.

²⁶⁸ Wesson, K., Fann, N., Morris, M, Fox, T., Hubbell, T., 2010. A multipollutant, risk-based approach to air quality management. Case study for Detroit. *Atmospheric Pollution Research*, 1, 296–304. The study compared air quality control strategies and concluded that the multi-pollutant, risk-based approach was able to produce approximately two times greater monetized benefits through avoided health impacts and was more cost effective than a pollutant-by-pollutant approach.

²⁶⁹ For more information on SEPs, go to <https://www.epa.gov/enforcement/supplemental-environmental-projects-seps>.

²⁷⁰ See 78 FR 27220 (May 9, 2013) notice of availability, “EPA Activities To Promote Environmental Justice in the Permit Application Process.”

overburdened communities, but stated that the EPA's proposal to allow areas to ignore near-roadway monitors is inconsistent with these objectives. The commenter stated that communities near heavily trafficked areas tend to be disproportionately low-income minority communities that suffer from disproportionately higher PM_{2.5} exposure risks; and that the EPA and states should address the information gaps that disempower these communities in their ability to protect themselves from pollution sources. The commenter also stated that making sources disclose and report compliance information and providing that information in easy to access formats would go a long way to improve the ability of these communities to be informed of their risks and to assure compliance in their communities.

Response: The EPA agrees that near-road monitoring data should not be ignored in future attainment planning. However, the EPA wishes to clarify that the statements in the proposal referenced the fact that the near-road monitors were not required to be in place before January 1, 2015. Compliance with the PM_{2.5} standards is based on 3 years of complete, quality-assured data at a monitor. Thus, the earliest that these monitors would have valid design values would be in early 2018 (based on data from 2015–2017). This timing makes it unlikely that sufficient data from these monitors will be available to be considered in attainment demonstrations that are due in 2016. In addition, the base modeling year of the attainment demonstration may pre-date the startup date of the near-road monitor(s). In this case, it may be possible to consider the near-road data in the attainment demonstration, but the recommended default projection methodology may not be applicable (since the time period of the near-road data may not correspond to the 5 year time period centered about the base modeling year, as recommended in the modeling guidance). Additionally, near-road PM_{2.5} monitors are only required in the 27 largest metropolitan areas of the country, and some PM_{2.5} nonattainment areas may not have any near-road monitoring sites. Thus, when complete data from near-road PM_{2.5} ambient monitors become available, the data should be used by states and the EPA for all aspects of the NAAQS implementation process, from attainment planning to the determination of attainment, in a manner similar to any other quality-assured PM_{2.5} monitoring data. States should consult with the appropriate the

EPA regional office to determine how and when near-road data should be used in the PM_{2.5} NAAQS implementation process for specific nonattainment areas.

With regard to the comment about having easy access to facility compliance information, the EPA directs the commenter to the Enforcement and Compliance History Online Web site to search for facilities to assess compliance with environmental regulations. The site provides the ability to investigate pollution sources, examine and create enforcement-related maps, or explore an individual state's performance. As noted earlier in this section, the EJSCREEN tool can also provide important information about estimated pollution impacts in specific communities.

H. Tribal Issues

The 1998 Tribal Authority Rule (TAR) (40 CFR part 49), which implements section 301(d) of the CAA, gives tribes the option of developing Tribal Implementation Plans (TIPs). Specifically, the TAR provides for the tribes to be treated in the same manner as a state in implementing certain sections of the CAA. However, tribes are not required to develop implementation plans. The EPA determined in the TAR that it was inappropriate to treat tribes in a manner similar to a state with regard to specific plan submission and implementation deadlines for the NAAQS-related requirements, including, but not limited to, such deadlines in CAA sections 110(a)(1), 172(a)(2), 182 187, and 191. *See* 40 CFR 49.4(a). In addition, the EPA determined it was not appropriate to treat tribes similarly to states with respect to provisions of the CAA requiring as a condition of program approval the demonstration of criminal enforcement authority or providing for the delegation of such criminal enforcement authority. *See* 40 CFR 49.4(g). To the extent a tribe is precluded from asserting criminal enforcement authority, the federal government will exercise primary criminal enforcement responsibility. *See* 40 CFR 49.8. In such circumstances, tribes seeking approval for CAA programs provide potential investigative leads to an appropriate federal enforcement agency.

If a tribe elects to do a TIP, the agency will work with the tribe to develop an appropriate schedule that meets the needs of the tribe and does not interfere with the attainment of the NAAQS in other jurisdictions. The tribe developing a TIP can work with the EPA Regional Office on the appropriateness of addressing RFP and other substantive

SIP requirements that may or may not be appropriate for the tribe's situation.

The CAA and the TAR provide tribes opportunity and flexibility, but not the obligation to develop a TIP to address the NAAQS. If a tribe elects to develop a TIP, the TAR offers flexibility for the tribe to identify and implement on a case-by-case basis only those CAA programs or reasonably severable program elements needed to address their specific air quality problems. In the TAR, the EPA described this flexible implementation approach as a modular approach. Each tribe may evaluate the particular activities, including potential sources of air pollution within the exterior boundaries of its reservation (or within non-reservation areas for which it has demonstrated jurisdiction), that cause or contribute to its air pollution problem. A tribe may adopt measures for controlling those sources of PM_{2.5}-related emissions, as long as these elements of the TIP are reasonably severable from other CAA requirements. A TIP must include regulations designed to solve specific air quality problems for which the tribe is seeking the EPA's approval, as well as a demonstration that the tribal air agency has the authority from the tribal government to develop and run their program, the capability to enforce their rules, and the resources to implement the program they adopt. In addition, the tribe must receive an eligibility determination from the EPA to be treated in the same manner as a state for the particular matter at issue and to receive authorization from the EPA to run a CAA program.

The EPA would review and approve, where appropriate, these TIPs as one step of an overall air quality plan to attain the NAAQS. A tribe may step in later to add other elements to the plan, or the EPA may step in to fill gaps in the air quality plan as necessary or appropriate. In approving a TIP, the agency would evaluate whether the plan appropriately coordinates with the overall air quality plan for an area when tribal lands are part of a multi-jurisdictional area.

Because many PM_{2.5} nonattainment areas will include multiple jurisdictions, and in some cases both Indian country and state lands, it is particularly important for the tribes and the states to work together to coordinate their planning efforts. States need to incorporate Indian country emissions in their base emissions inventories if Indian country is part of an attainment or nonattainment area.²⁷¹ Tribes and

²⁷¹ On January 17, 2014, the United States Court of Appeals for the District of Columbia Circuit

states should coordinate their planning activities as appropriate to ensure that neither is adversely affecting attainment of the NAAQS in the area as a whole. Coordinated planning in these areas will help ensure that the planning decisions made by the states and tribes complement each other and that the nonattainment area makes reasonable progress toward attainment and ultimately attains the applicable PM_{2.5} NAAQS. In reviewing and approving individual TIPs and SIPs, the EPA will determine if together they are consistent with the overall air quality needs of an area.

To date, very few tribes have submitted for the EPA's approval TIPs covering areas over which they have jurisdiction. In the absence of a TIP, the EPA is authorized under the TAR to implement CAA programs in such areas as necessary or appropriate. For example, an unhealthy air quality situation on an Indian reservation may require the EPA to develop a FIP to reduce emissions from sources on the reservation. Likewise, if the agency determines that sources in an area under tribal jurisdiction could interfere with a larger nonattainment area meeting the NAAQS by its attainment date, it would develop a FIP for those sources in consultation with the tribe as necessary or appropriate.

States have an obligation to notify other states in advance of any public hearing(s) on their state plans if such plans will significantly impact such other states. 40 CFR 51.102(d)(5). Under section 301(d) of the CAA and the TAR, tribes may become eligible to be treated in a manner similar to states (TAS) for this purpose. Affected tribes with this status must also be informed of the contents of such state plans and given access to the documentation supporting these plans. In addition to this mandated process, the EPA encourages states to extend the same notice to all affected tribes, regardless of their TAS status.

Executive Orders and the EPA's Indian policies generally call for the EPA to coordinate and consult with tribes on matters that affect tribes.

issued a decision vacating the EPA's 2011 rule titled "Review of New Sources and Modifications in Indian Country" (76 FR 38748, July 1, 2011) with respect to non-reservation areas of Indian country (See *Oklahoma Department of Environmental Quality v. EPA*, 740 F.3d 185 (D.C. Cir. 2014)). Under the court's reasoning, with respect to CAA state implementation plans, a state has primary regulatory jurisdiction in non-reservation areas of Indian country (*i.e.*, Indian allotments located outside of reservations and dependent Indian communities) within its geographic boundaries unless the EPA or a tribe has demonstrated that a tribe has jurisdiction over a particular area of non-reservation Indian country within the state.

Executive Order 13175, titled, "Consultation and Coordination with Indian Tribal Governments" requires the EPA to develop a process to ensure "meaningful and timely input by tribal officials in the development of regulatory policies that have Tribal implications." In addition, the EPA's policies include the agency's 1984 Indian Policy relating to Indian tribes and implementation of federal environmental programs, the 2014 Office of Air and Radiation's "Handbook for Interacting with Tribal Governments," and the "EPA Policy on Consultation and Coordination with Indian Tribes." Consistent with these policies, the EPA intends to meet with tribes on activities potentially affecting the attainment and maintenance of the current and future PM_{2.5} NAAQS in Indian country, including agency actions on SIPs. As such, it would be helpful for states to work with tribes with land that is part of the same air quality area during the SIP development process and to coordinate with tribes as they develop their SIPs.

I. Voluntary Programs for Reducing Ambient PM_{2.5}

1. PM Advance Program

The EPA believes there are significant advantages for states, tribes and local agencies to take steps to reduce direct PM_{2.5} emissions and emissions of PM_{2.5} precursors as early as possible. First and foremost, early reductions help to achieve cleaner air sooner, and help to ensure continued health protection. Second, early steps could help an area avoid a nonattainment designation in the first place, or for an area eventually designated as nonattainment, early reductions could help bring the area back into attainment sooner, which may lead to qualifying for a CDD and subsequent suspension of attainment planning requirements as described in Section IX.C of this preamble. In addition, early action to improve air quality can help an eventual nonattainment area, particularly an area that has never been designated nonattainment before, to establish working relationships between key stakeholders. The EPA's expectation is that early actions to reduce emissions in such areas would be less resource-intensive than actions taken once a nonattainment designation has been made, since at that point the implementation of controls would need to occur in conjunction with actions to comply with other requirements such as nonattainment NSR and transportation conformity.

In January 2013, the EPA began a new early emissions reduction program for attainment areas called "PM Advance," which is much like the related "Ozone Advance" program that began in April 2012. For additional information and a list of areas that are currently participating in the program, see <https://www.epa.gov/advance>.

2. Residential Wood Smoke Programs

The EPA recognizes that residential wood smoke is a concern for many nonattainment areas. The EPA estimates that wood stoves, indoor wood furnaces, hydronic heaters and fireplaces emit more than 382,000 tons of PM_{2.5} into the air throughout the country each year—mostly during the winter months. Residential wood smoke can increase fine particle pollution to levels that cause significant health concerns (*e.g.*, asthma attacks, heart attacks, premature death). Wood smoke causes many counties throughout the U.S. to either exceed the national health-based standards for fine particles, or places them on the cusp of exceeding the standards. Because wood stoves, hydronic heaters and other similar appliances can be used around the clock in residential areas, they can cause significant and varying health and quality of life issues.

To reduce fine particle pollution, many PM_{2.5} nonattainment areas will need to address residential wood smoke. The EPA has developed the "Strategies for Reducing Residential Wood Smoke" document that provides education and outreach tools, information on regulatory approaches to reduce wood smoke, as well as information about voluntary programs that communities around the country have used.²⁷² In addition, it includes methods for calculating emissions reductions, funding ideas and the basic components of a wood smoke reduction plan that can be adopted into a SIP as an enforceable control measure.²⁷³ To access the document, go to <https://epa.gov/burnwise/burn-wise-strategies-reducing-residential-wood-smoke>. For

²⁷² On February 3, 2015, the EPA strengthened the New Source Performance Standards (NSPS) for new residential wood heaters and established NSPS for other new wood heaters, including outdoor and indoor wood-fired boilers (also known as hydronic heaters). The standards will reduce emissions of direct PM_{2.5} as well as carbon monoxide, VOC, air toxics (including formaldehyde, benzene and polycyclic organic matter), and black carbon. See <http://www2.epa.gov/residential-wood-heaters>.

²⁷³ For further guidance on incorporating voluntary measures into a SIP, see "Incorporating Emerging and Voluntary Measures in a State Implementation Plan (SIP)." U.S. EPA. Office of Air and Radiation. September 2004. Available at http://www3.epa.gov/ttn/caaa/t1/memoranda/evm_ievm_g.pdf.

more information on the EPA's wood smoke reduction program, *see* <https://www.epa.gov/burnwise>.

J. Improved Stationary Source Emissions Monitoring

1. Summary of Proposal

For purposes of demonstrating compliance with the EPA's air quality regulatory requirements, the EPA, states, and sources rely on two basic types of monitoring: ambient air quality monitoring and stationary source emissions monitoring. Ambient air quality monitoring entails collecting and measuring samples of criteria pollutants in ambient air to evaluate air quality as compared to clean air standards and historical information. Stationary source emissions monitoring, on the other hand, entails collecting and using measurement data (or other information) from individual stationary sources to demonstrate compliance with emissions standards, to assess process or control device performance, or to verify work practices. While ambient air quality monitoring is used to assess compliance with the NAAQS, stationary source emissions monitoring is used to assess compliance with source-specific regulations under programs like the New Source Performance Standards (NSPS), the National Emissions Standards for Hazardous Air Pollutants (NESHAP), the compliance assurance monitoring (CAM) program, the title V air operating permits program, and the acid deposition control program, as well as specific SIP control measures.

Accurate stationary source emissions monitoring is also critical for the purposes of developing accurate emissions inventories and in order to identify appropriate control measures to reduce emissions from stationary sources. In addition, after control measures are in place, stationary source emissions monitoring provides process and control device performance information to the facility operator so that appropriate corrective action can be taken if indicated that emission levels may exceed applicable thresholds. Thus, appropriate stationary source emissions monitoring requirements, like the control measures with which they are associated, are a fundamental element of an approvable SIP.

Because of the important role that effective stationary source emissions monitoring can play in informing the development of attainment strategies for PM_{2.5} NAAQS nonattainment areas, the EPA is interested in applied best practices for stationary source emissions monitoring that could be included in guidance for other stationary sources

and states. As a result of this interest, the EPA sought to gather information about ways to make the source emissions monitoring data collection process easier and more transparent. In the proposal, the EPA therefore asked for information regarding appropriate examples and supporting data from individual sources and states with experience in this area to inform such future guidance. The EPA sought comment on specific topics and questions regarding source monitoring techniques and asked commenters to submit any examples of improved stationary source emissions monitoring and any other methodologies—complete with equations and explanations—for estimating emissions reductions due to improved monitoring.

2. Final Rule

The EPA did not propose any specific changes to source monitoring requirements for PM_{2.5} and is therefore not finalizing any specific requirements, beyond what is required elsewhere in the final rule.

3. Comments and Responses

Comment. Several commenters focused on critiquing PM CEMS, PM CPMS and BLDS technology and claim that improved monitoring changes the stringency of existing rules and requires rulemaking. The commenters provided no examples or specific information in response to the request for information.

Response. We appreciate the information submitted by the commenters, but we are not responding to the comments here because they are not directly pertinent to the rule being finalized. The EPA will continue to explore and implement innovative, cost-effective ideas that offer tangible incentives for improved source monitoring to be adopted as part of the associated emissions limitations that will help achieve additional reductions from stationary sources and bring areas into attainment for the PM_{2.5} NAAQS in a timely way. *See* the response to comments document for more detailed information.

K. Stationary Source Test Methods for Emissions of Condensable PM_{2.5}

1. Summary of Proposal

As discussed in the proposal, direct PM_{2.5} is comprised of two components: Filterable PM_{2.5} and condensable PM_{2.5} emissions. Accurate test methods for condensable PM_{2.5} emissions have only been recently developed and approved by the EPA, and in the proposal the EPA explained that use of these test methods, including methods to quantify

condensable PM_{2.5} emissions, were essential for identifying sources of direct PM_{2.5} emissions which, if better controlled, can help to bring a PM_{2.5} nonattainment area into attainment. However, the EPA did not propose any changes to those test methods.

The EPA did propose to require that, where a state needs to adopt new or revised control measures for direct PM_{2.5} from sources in a nonattainment area, the state must specify PM_{2.5} emission limits in its SIP that include both filterable and condensable emissions. In addition, compliance testing of those sources must include measurement of condensable emissions (such as through the use of Method 202). The EPA proposed that any new or revised emission limit used as a control measure to bring an area into attainment for any current or future PM_{2.5} NAAQS must use methods that measure PM_{2.5} or total PM including both filterable and condensable particulate matter.

The 2007 PM_{2.5} Implementation Rule required, beginning on January 1, 2011, that states take into consideration condensable PM_{2.5} emissions when establishing emission limits for stationary sources as part of any control strategy for PM_{2.5} NAAQS nonattainment areas.²⁷⁴ This date coincided with the effective date of the agency's revisions to test methods for measuring filterable PM₁₀ emissions from stationary sources (Method 201A) and for measuring condensable PM emissions from stationary sources (Method 202).²⁷⁵ The revisions to those test methods added procedures to measure PM_{2.5} filterable and condensable particulate material and increased the precision of Method 202 and improved the consistency in the measurements obtained between source tests performed under different regulatory authorities.

In the preamble to the 2007 PM_{2.5} Implementation Rule, the EPA explained that the use of the (then anticipated) revisions to the EPA Method 201A combined with Method 202 to obtain measured source specific emissions of PM_{2.5} would improve the quality of emissions inventories for stationary sources and would aid in the development of a more reliable attainment strategy, as sources that may have a considerable amount of condensable PM_{2.5} emissions could be better characterized with the new methods.

²⁷⁴ 72 FR 20586 (April 25, 2007).

²⁷⁵ 75 FR 80118 (December 21, 2010).

2. Final Rule

The EPA is finalizing the PM_{2.5} emissions limit and testing requirement as proposed. For sources that are required to adopt a new or revised direct PM_{2.5} emissions limit as part of the attainment demonstration (including, but not limited to, for RACT, BACT, or MSM), the state must specify PM_{2.5} emission limits in its SIP that include both filterable and condensable emissions. In addition, compliance testing requirements for those sources must include both measurement of filterable and condensable emissions. Existing filterable PM emission limitations that are not being revised as part of a Moderate area or Serious area attainment plan can remain expressed in terms of filterable PM and can rely on the existing test method used by the state for compliance determination.

The EPA continues to believe that using these improved test methods, including methods to quantify condensable PM_{2.5} emissions, can help identify sources of direct PM_{2.5} emissions which, if better controlled, can help to bring a PM_{2.5} nonattainment area into attainment. Likewise, use of these test methods may help a state identify sources whose condensable emissions may have been incorrectly estimated and therefore may not provide meaningful PM_{2.5} control opportunities.

3. Comments and Responses

Comment: Some commenters stated that the EPA should make clear that as long as testing and monitoring is required for any new filterable and/or condensable PM emission limitation imposed, testing for “total PM_{2.5}” is not required and the EPA should allow states flexibility in determining the best way to demonstrate compliance with any new emission limitations. The new emission limitation could take the form either of a limitation on condensable PM_{2.5} or a limitation on total direct PM_{2.5} emissions. The commenter further stated the EPA should make clear that states that specify condensable PM or total PM_{2.5} emission limitations are not required to adopt Method 202 as the compliance test method.

Response: In the final rule, the EPA is requiring new or revised PM_{2.5} emissions limits and associated source testing to account for condensable emissions, but the EPA is not imposing any specific source testing requirements that would require total PM_{2.5} testing or the use of a specific test method. The EPA acknowledges that states have flexibility to determine the necessary emissions limitations of PM_{2.5} to meet SIP requirements for the NAAQS

attainment. When states assess the contribution of the filterable and condensable PM component to PM_{2.5} they may require stationary source tests that include both filterable PM_{2.5} and condensable particulate matter to ensure emission limits are attained by subject facilities. Since we recognize that primary PM_{2.5} emissions can be measured with the combination of several promulgated test methods depending on the stationary source emission temperature and moisture content, states have the flexibility to require the appropriate filterable and condensable particulate measurement methods based on source conditions.

Comment: Some commenters agreed with the EPA’s proposal not to require consideration of condensable PM in any existing emission limitations that are not otherwise being revised. The commenters stated that no purpose would be served by requiring states to include condensable PM in such standards if no revision is necessary to demonstrate attainment. Other commenters objected to the EPA’s proposal to not require states to update all existing PM emission limitations to include limitations on condensable PM. The commenters stated the EPA’s proposal is nonsensical and undermines any ability to demonstrate compliance with the Act. The commenters stated that, by the EPA’s own admission, inventories that do not reflect measured condensables from direct PM_{2.5} sources are not an “accurate” inventory of “actual emissions.” The commenters further stated that, similarly, areas could not satisfy the criteria for RACM or BACM, or demonstrate expeditious attainment if the existing state emission limitations are not required to be updated to account for condensable emissions from these sources.

Response: The EPA agrees with the commenters who maintain that existing PM_{2.5} emissions limits do not need to be revised to include emissions limits for condensable PM for sources from which additional emissions reductions are not needed in order to demonstrate attainment. The EPA does not agree that all existing direct PM_{2.5} emissions limits in the SIP have to include emissions limits that account for or specifically address condensable PM. However sources with new or revised PM_{2.5} emissions limits and associated source testing must account for condensable emissions.

If the state has submitted an attainment demonstration that includes an adequate RACT, BACT, and/or MSM analysis, and has taken into account all known emissions of filterable and condensable PM_{2.5} in the area, then

there is no need to require new condensable PM_{2.5} emissions limits and testing for sources that were not needed to be additionally controlled for attainment purposes. The state may want to require additional condensable PM_{2.5} emissions limits and testing to gain a better understanding of the sources in the nonattainment area (especially for sources which may be most likely to emit condensables). This could provide additional information for future SIPs and control programs if nonattainment persists. However, unless specific direct PM_{2.5} emissions reductions are shown to be needed in order for the area to attain the NAAQS, there does not need to be a SIP requirement to include new condensable emissions limits and testing for all existing sources with PM_{2.5} emissions limits.

Additionally, the commenters stated that emissions inventories would not be “accurate” and states could not satisfy their RACM/BACM requirements if condensable emissions were not included in the SIP. Regardless of emissions limits and source testing requirements, quantification and reporting of filterable and condensable PM_{2.5} emissions is required as part of the emissions inventory and RACT/BACT rule requirements. In some cases, condensable PM_{2.5} information is available from previous source testing. In other cases, condensable PM_{2.5} emissions must be estimated through the use of emissions factors that have been developed from source testing of similar sources. States are therefore already required to take into account both filterable and condensable emissions as part of their inventory and control strategy (RACT/BACT) development. See section IV.B of this preamble for more information on emissions inventory requirements, section IV.D of this preamble for more information on RACT requirements, and section VI.D of this preamble for more information on BACT requirements.

X. Revocation of the 1997 Primary Annual PM_{2.5} NAAQS

A. Summary of the Proposal

The EPA proposed two options for revoking the 1997 primary annual PM_{2.5} NAAQS and sought comment on whether to revoke the NAAQS at the current time.

The two proposed options were:

- *Option 1:* Revoke the 1997 primary annual PM_{2.5} NAAQS for all purposes in attainment areas for that NAAQS 1 year after the effective date of the designations for the 2012 primary annual PM_{2.5} NAAQS; and
- *Option 2:* Revoke the 1997 primary annual PM_{2.5} NAAQS for all purposes in all

nonattainment and attainment areas for that NAAQS 1 year after the effective date of the designations for the 2012 primary annual PM_{2.5} NAAQS.

Under the first proposed option, the EPA would revoke the 1997 primary annual PM_{2.5} NAAQS for all purposes in areas that are designated as attainment for that NAAQS 1 year after the effective date of designations for the 2012 primary annual PM_{2.5} NAAQS, as well as in the future as additional areas are redesignated as attainment areas after the initial revocation. The areas addressed by this option are:

- Those that were originally designated as attainment areas for the 1997 annual PM_{2.5} NAAQS; and
- those that were originally designated as nonattainment but have since or will in the future be redesignated to attainment for that NAAQS.

Under this option, the EPA would not revoke the 1997 primary annual PM_{2.5} NAAQS in any area as long as it is designated nonattainment for that NAAQS. This option is consistent with the approach established for the transition to the current lead and SO₂ NAAQS.

Areas designated nonattainment for the 2012 primary annual PM_{2.5} NAAQS would be required under Option 1 to comply with applicable CAA requirements as set forth in the CAA. For transportation conformity purposes, these requirements began to apply 1-year after the effective date of designations and include using adequate or approved SIP motor vehicle emissions budgets for the 1997 annual PM_{2.5} NAAQS or the 2006 24-hour PM_{2.5} NAAQS where they exist until the area has approved or adequate budgets for the 2012 primary annual PM_{2.5} NAAQS.²⁷⁶ Areas that have adequate or approved motor vehicle emissions budgets for both the 1997 annual PM_{2.5} NAAQS or the 2006 24-hour PM_{2.5} NAAQS should refer to Question 3.3 in EPA's "Implementing Transportation Conformity Guidance for 2012 PM_{2.5} Nonattainment Areas" for additional information on which budgets to use in conformity determinations prior to having adequate or approved budgets for the 2012 primary annual PM_{2.5} NAAQS.²⁷⁷ The use of such budgets serves as the appropriate anti-

backsliding measure for transportation conformity purposes.

Under the second proposed option, the EPA would revoke the 1997 primary annual PM_{2.5} NAAQS for all CAA purposes in all nonattainment and attainment areas 1 year after the effective date of designations for the 2012 primary annual PM_{2.5} NAAQS. The requirements associated with revoking the 1997 primary annual PM_{2.5} NAAQS in attainment areas for that NAAQS would be the same as those that would apply under Option 1. However, revoking the 1997 primary annual PM_{2.5} NAAQS in nonattainment areas for that NAAQS would require anti-backsliding measures for areas designated nonattainment for the 1997 annual PM_{2.5} NAAQS at the time of the revocation. For details on the proposed anti-backsliding measures, refer to the discussion in the proposal for this final rule. (80 FR 15340)

The EPA also requested comment on not revoking the 1997 primary annual PM_{2.5} NAAQS at this time. For additional details on all of the proposed options refer to the proposal. (80 FR 15340)

The EPA did not propose to revoke the 1997 secondary annual PM_{2.5} NAAQS in this action because that NAAQS has been retained in order to prevent certain welfare effects associated with PM_{2.5}.²⁷⁸

For details on past revocations of the NAAQS including the 1-hour and 1997 ozone NAAQS and prior SO₂ and lead NAAQS, refer to the proposal for this final rule. (80 FR 15340)

B. Final Rule

The EPA is finalizing the revocation of the 1997 primary annual PM_{2.5} NAAQS for all purposes in attainment areas for that NAAQS as described in Option 1. *See* 40 CFR 50.13(d). The EPA had proposed that the revocation would be effective 1 year after the effective date of designations for the 2012 primary annual PM_{2.5} NAAQS. Those designations were effective on April 15, 2015. (80 FR 2206) Therefore, the proposed effective date of the revocation was effectively April 15, 2016. However, this final rule will not be effective before April 15, 2016. Therefore, the EPA is establishing the effective date of this final rule as the effective date of the revocation of the 1997 primary annual PM_{2.5} NAAQS.

On the effective date of this final rule, the 1997 primary annual PM_{2.5} NAAQS will be revoked for all purposes in all attainment areas for that NAAQS, including the areas that were initially

designated attainment for the 1997 annual PM_{2.5} NAAQS. The final rule will have no practical impact on these areas that have always attained the 1997 primary annual PM_{2.5} NAAQS. These areas have never been required to conduct air quality planning for this NAAQS for any CAA nonattainment purpose, although these areas would continue to implement applicable PSD requirements.

This final rule also revokes the 1997 primary annual PM_{2.5} NAAQS in areas that have been redesignated to attainment for this NAAQS (*i.e.*, maintenance areas for this NAAQS). These areas will be required to implement their approved maintenance plan for the 1997 primary annual PM_{2.5} NAAQS and their PSD program. The approved maintenance plan can only be revised if the revision meets the requirements of CAA section 110(l) and, if applicable, CAA section 193.

Similarly, all states will be required to continue to implement applicable control requirements in a FIP or approved SIP designed to address the interstate transport requirements of CAA section 110(a)(2)(D)(i) and (ii) with respect to the 1997 primary annual PM_{2.5} NAAQS, such as CAIR or CSAPR. These requirements continue to be necessary for downwind nonattainment areas to make progress towards attainment and to assure that the air quality protection achieved in all areas is maintained into the future. These provisions may only be modified if the revision meets the requirements of section 110(l). A similar provision was finalized to preserve interstate transport requirements with respect to the revocation of the 1997 ozone NAAQS. *See* 40 CFR 51.1105.

For areas that remain nonattainment for the 1997 annual PM_{2.5} NAAQS, the EPA will continue to redesignate areas to attainment as appropriate. For an area that is redesignated to attainment after the effective date of this final rule, the 1997 primary annual PM_{2.5} NAAQS will be revoked in such an area on the effective date of its redesignation to attainment for that NAAQS. The EPA will not revoke the 1997 primary annual PM_{2.5} NAAQS in any area as long as it is designated nonattainment for that NAAQS. Until the 1997 primary annual PM_{2.5} NAAQS is revoked, that NAAQS remains in effect, in parallel with the 2012 primary annual PM_{2.5} NAAQS, and continues to apply independently and by its own terms.

After revocation of the 1997 primary annual PM_{2.5} NAAQS in a given area, the designation for that standard is no longer in effect. The only PM_{2.5} designations that remain in effect in

²⁷⁶ Areas that do not have adequate or approved motor vehicle emissions budgets for the 1997 annual PM_{2.5} NAAQS or the 2006 24-hour PM_{2.5} NAAQS would use one of the two interim emissions tests required by 40 CFR 93.109(c)(3) and 40 CFR 93.119(b).

²⁷⁷ The guidance is available at: <http://www3.epa.gov/otaq/stateresources/transconf/documents/420b15091.pdf>.

²⁷⁸ 78 FR 3086 (January 15, 2013).

areas where the 1997 primary annual PM_{2.5} NAAQS has been revoked are those for the 1997 24-hour PM_{2.5} NAAQS, the 1997 secondary annual PM_{2.5} NAAQS, the 2006 24-hour PM_{2.5} NAAQS and the 2012 primary annual PM_{2.5} NAAQS. However, the EPA is retaining the listing of the designated areas for the 1997 annual PM_{2.5} NAAQS in 40 CFR part 81, for the purposes of identifying which areas remain designated as nonattainment for the 1997 annual PM_{2.5} NAAQS and therefore subject to the requirements of subpart 4 and the areas that have been redesignated to attainment for the 1997 secondary annual PM_{2.5} NAAQS. Accordingly, such references to historical designations of areas where the 1997 primary annual PM_{2.5} NAAQS has been revoked should not be viewed as current designations under CAA section 107(d) for the 1997 primary annual PM_{2.5}. As additional areas are redesignated to attainment for the 1997 annual PM_{2.5} NAAQS, the EPA will indicate in the redesignation rulemaking that the 1997 primary annual NAAQS is revoked on the effective date of the redesignation.

The EPA notes that areas designated nonattainment for the 1997 annual PM_{2.5} NAAQS at the time of the final rule's revocation would be required to continue to comply with applicable conformity requirements for that NAAQS. This obligation would continue until the effective date of the redesignation of such an area to attainment for the 1997 annual PM_{2.5} NAAQS. Transportation and general conformity would apply in all areas that are designated nonattainment for the more health protective 2012 primary annual PM_{2.5} NAAQS on April 15, 2016, the end of the conformity grace period (CAA section 176 (c)(c)(6) and 40 CFR 93.102(d)). Any areas that are also designated nonattainment or redesignated to attainment for the 1997 24-hour PM_{2.5} NAAQS or the 2006 24-hour PM_{2.5} NAAQS are required to continue to make conformity determinations for those NAAQS. *See* Section IX.B of this preamble for more information about this conformity implementation including information pertaining to conformity requirements for the 1997 secondary annual NAAQS.

As with other NAAQS revocations, this revocation is framed in the context of the CAA requirements that apply to the NAAQS transitions to ensure that states and nonattainment areas continue to make progress and do not reverse progress, or backslide, from improvements already made in air quality. The CAA contains several provisions indicating Congressional

intent not to allow a state to alter or remove provisions from an approved attainment or maintenance plan if the revision would reduce air quality protection. CAA section 193 prohibits modification of a control requirement in effect or required to be adopted as of November 15, 1990 (the date of enactment of the 1990 CAA Amendments), unless such a modification would ensure equivalent or greater emissions reductions. CAA section 172(e), which addresses relaxations of the NAAQS, requires protections for areas that have not attained the NAAQS prior to a relaxation by requiring controls which are at least as stringent as the controls applicable in nonattainment areas prior to any such relaxation. CAA Section 110(l) provides that a SIP revision cannot be approved if it will interfere with attainment or other CAA requirements. Under CAA section 175A(d), an area that is redesignated to attainment may, with an appropriate showing of no interference, cease to implement a measure that is contained in the SIP at the time of redesignation, but only if that measure is retained as a contingency measure in the area's maintenance plan.^{279 280}

The EPA has concluded that revoking the 1997 primary annual PM_{2.5} NAAQS in attainment areas for that NAAQS is consistent with the CAA and precedent in transitioning from a previous NAAQS to a new, more stringent NAAQS. The approach taken in this final rule is consistent with the approach taken in the transition from the past SO₂ and lead NAAQS to the current NAAQS for those pollutants. Revoking the 1997 primary annual PM_{2.5} NAAQS only in attainment areas ensures that any areas that remain designated nonattainment for the 1997 annual PM_{2.5} NAAQS make progress toward attaining that NAAQS

²⁷⁹ Nonattainment areas that were redesignated to attainment with an approved CAA section 175A maintenance plan are referred to throughout this document as "maintenance areas."

²⁸⁰ Unimplemented requirements in the SIP or those shown to be unnecessary for maintenance can be shifted to the contingency measures portion of the SIP upon redesignation. *See* "Procedures for Processing Requests to Redesignate Areas to Attainment," Memorandum from John Calcagni, Director, Air Quality Management Division, September 4, 1992; "State Implementation Plan (SIP) Requirements for Areas Submitting Requests for Redesignation to Attainment of the Ozone and Carbon Monoxide (CO) National Ambient Air Quality Standards (NAAQS) On or After November 15, 1992," Memorandum from Michael H. Shapiro, Acting Assistant Administrator for Air and Radiation, September 17, 1993. As discussed elsewhere in this document, an exception is made for NNSR, which can be removed from the SIP completely and need not be retained as a contingency measure after redesignation to attainment.

as expeditiously as practicable by implementing the CAA requirements that apply to PM_{2.5} nonattainment areas as described elsewhere in this final rule.

Continued attainment of the 1997 primary annual PM_{2.5} NAAQS in areas that have been redesignated to attainment for that NAAQS will be ensured through the ongoing implementation of the approved maintenance plan that applies in these areas. These areas are required to implement their approved CAA section 175A maintenance plan for the 1997 primary annual PM_{2.5} NAAQS. They are also required to implement a PSD program for the annual PM_{2.5} NAAQS, unless they are designated nonattainment for the 2012 primary annual PM_{2.5} NAAQS where an NNSR program would apply.²⁸¹ Revisions to the approved maintenance plan can only be made if the revisions meet the requirements of CAA section 110(l) and, if applicable, CAA section 193.

Under the selected option for revocation, it is unnecessary to finalize anti-backsliding requirements that would apply to nonattainment areas for the 1997 primary annual PM_{2.5} NAAQS, because the NAAQS is only being revoked in attainment areas. For former nonattainment areas that have been redesignated to attainment, the EPA has already determined through the redesignation process and approval of maintenance plans that all applicable requirements for the 1997 primary annual PM_{2.5} NAAQS—including anti-backsliding requirements—have been fulfilled. For areas that were initially designated as attainment for both the 1997 annual PM_{2.5} NAAQS and the 2012 primary annual PM_{2.5} NAAQS, the approved PSD SIPs satisfy the obligation to submit an approvable maintenance plan for the 2012 primary annual PM_{2.5} NAAQS under CAA section 110(a)(1).

The NAAQS is not being revoked in nonattainment areas. Therefore, nonattainment areas will continue to comply with the requirements applicable to their classification for the 1997 annual PM_{2.5} NAAQS as described in this final rule. For example, areas classified as Serious will be required to implement BACT and BACM level controls and implement an NNSR program that meets the Serious area requirements. Any areas that do not attain by the Serious area deadline

²⁸¹ Areas initially designated as attainment for the 1997 annual PM_{2.5} NAAQS would also be required to continue to implement a PSD program unless an area was designated nonattainment for the 2012 primary annual PM_{2.5} NAAQS or the 2006 24-hour PM_{2.5} NAAQS. In that case, such an area would be required to implement an NNSR program for that NAAQS.

would be required to comply with other requirements including most stringent measures and a 5 percent plan. This would ensure that these areas continue to make progress toward attaining the 1997 annual PM_{2.5} NAAQS and attain that NAAQS as expeditiously as practicable. It would also serve to provide early emissions reductions toward attaining the 2012 primary annual PM_{2.5} NAAQS. When these areas are eligible for redesignation to attainment, they may submit a redesignation request including a maintenance plan for the 1997 primary annual PM_{2.5} NAAQS as required by CAA sections 107(d)(3) and 175A. On the effective date of the approval of the redesignation request and maintenance plan, the 1997 primary annual PM_{2.5} NAAQS would be revoked and the approved maintenance plan along with the implementation of a PSD program for this NAAQS, if they are designated attainment for the 2012 primary annual PM_{2.5} NAAQS, would ensure continued attainment of the 1997 primary annual PM_{2.5} NAAQS.²⁸² Revisions to the approved maintenance plan can only be made if the revisions meet the requirements of CAA section 110(l) and, if applicable, CAA section 193.

As the EPA proposed, the areas where the NAAQS is being revoked are not required to submit a second 10-year maintenance plan for the 1997 primary annual PM_{2.5} NAAQS because there is no justification for additional maintenance plan burdens to be imposed on these areas solely because at one time they were designated nonattainment under the revoked 1997 primary annual PM_{2.5} NAAQS. Not requiring a second 10-year maintenance plan for these areas helps to minimize the burden associated with preparing SIPs for a succession of the NAAQS of increasing stringency. These areas are required to continue to implement their approved maintenance plans for the 1997 primary annual PM_{2.5} NAAQS. The maintenance plan remains in effect beyond the end of the maintenance period. It may only be revised if the revision complies with the requirements of CAA section 110(l) and, if applicable, CAA section 193. Any areas that are designated nonattainment for the 2012 primary annual PM_{2.5} NAAQS are required to comply with the applicable CAA requirements as described in this final rule.

The EPA notes that most of the 39 areas that were initially designated as

nonattainment for the 1997 annual PM_{2.5} NAAQS have already been redesignated to attainment (*i.e.*, they are maintenance areas) and their approved maintenance plans and PSD programs along with the CAA's anti-backsliding provisions in CAA sections 110(l) and 193 ensure continued attainment of the 1997 primary annual PM_{2.5} NAAQS. If additional areas are redesignated to attainment for the 1997 primary annual PM_{2.5} NAAQS, their approved maintenance plan and PSD program for the 1997 primary annual PM_{2.5} NAAQS would prevent backsliding for that NAAQS. As stated previously, applicable conformity requirements would continue to apply for the 1997 annual PM_{2.5} NAAQS until the effective date of the redesignation of such an area to attainment for the 1997 annual PM_{2.5} NAAQS.

In addition, transportation and general conformity will apply in all areas that are designated nonattainment for the more health protective 2012 primary annual PM_{2.5} NAAQS on April 15, 2016, the end of the conformity grace period (CAA section 176(c)(6) and 40 CFR 93.102(d)). In the D.C. Circuit Court's December 2006 decision in *South Coast v. EPA*, as modified following rehearing, the Court held with respect to the anti-backsliding approach for transportation conformity that 1-hour ozone motor vehicle emissions budgets must be used in transportation conformity determinations for the more protective 1997 ozone NAAQS where such SIP motor vehicle emissions budgets have been found adequate or approved, until SIP motor vehicle emissions budgets for the 1997 8-hour ozone NAAQS are available.²⁸³ In addition, the Court affirmed more broadly that in order for transportation conformity determinations to fulfill the requirements of CAA section 176(c)(1), motor vehicle emissions budgets for a prior NAAQS must be used in transportation conformity determinations under a revised NAAQS until emissions budgets for the revised NAAQS are either found adequate or are approved, but that conformity determinations need not be made for a revoked standard. Therefore, areas designated nonattainment for the 2012 primary annual PM_{2.5} NAAQS that have adequate or approved SIP budgets for the 1997 annual PM_{2.5} NAAQS must continue to use such budgets in transportation conformity determinations until budgets for the

2012 primary annual PM_{2.5} NAAQS are found adequate or are approved.²⁸⁴

With regard to general conformity, the D.C. Circuit Court did not address the need for specific anti-backsliding measures in its initial decision or in the modified decision on the *South Coast* litigation. However, general conformity determinations will be required in nonattainment areas for the 2012 primary annual NAAQS as required by CAA section 176(c)(5) to ensure that the actions of federal agencies do not cause a violation of that NAAQS, make an existing violation worse or delay timely attainment of the NAAQS or an interim milestone.

The EPA believes that revoking the 1997 primary annual PM_{2.5} NAAQS is logical because it results in only one primary annual PM_{2.5} NAAQS—the 2012 primary annual PM_{2.5} NAAQS—applying for purposes of transportation and general conformity in most areas, on the effective date of this rulemaking, which is after the end of the 1-year conformity grace period that applies to newly designated nonattainment areas. (CAA section 176(c)(6)).

An area that is attaining the more health-protective 2012 primary annual PM_{2.5} NAAQS would no longer have to expend resources to make conformity determinations or complete other applicable CAA air quality planning requirements for any of the current annual PM_{2.5} NAAQS after the 1997 primary annual PM_{2.5} NAAQS is revoked in the area. It should be noted that any areas that are attaining the more health protective 2012 primary annual NAAQS are also necessarily attaining the less stringent 1997 annual PM_{2.5} NAAQS by a wide margin. See further information for how conformity will be implemented for the 2012 PM_{2.5} NAAQS in Section IX.B of this preamble.

C. Comments and Responses

1. Comments on Revocation Options 1 and 2 and Not Revoking the 1997 Primary Annual PM_{2.5} NAAQS

Comment: Two commenters supported Option 1 and stated that any areas that are attaining the more protective 2012 PM_{2.5} NAAQS are also necessarily attaining the less stringent 1997 PM_{2.5} NAAQS. Some commenters agreed that it is confusing to continue to maintain two NAAQS for the same pollutant. Two commenters stated that

²⁸² Areas designated nonattainment for the 2012 primary annual PM_{2.5} NAAQS would implement a NNSR program for that NAAQS, instead of a PSD program for the 1997 primary annual PM.

²⁸³ See *South Coast Air Quality Management District v. EPA*, 472 F.3d at 882.

²⁸⁴ Such areas without adequate or approved SIP budgets for either the 1997 annual PM_{2.5} NAAQS or the 2006 24-hour PM_{2.5} NAAQS are required to demonstrate transportation conformity using one of the interim emissions tests depending on their classification as required by 40 CFR 93.119.

revocation of the 1997 NAAQS would relieve the states of the administrative burden of developing and submitting an additional maintenance plan, as well as demonstrating transportation conformity, for areas that are in compliance with the more stringent 2012 PM_{2.5} NAAQS.

Response: The EPA is finalizing Option 1, and we agree with the commenter that:

- Any area that is attaining the more health protective 2012 primary annual PM_{2.5} NAAQS of 12.0 µg/m³ is also attaining the 1997 annual PM_{2.5} NAAQS of 15.0 µg/m³;
- revoking the 1997 primary annual NAAQS in areas that have either always been in attainment for that NAAQS or have been redesignated to attainment reduces confusion concerning implementation of the various PM_{2.5} NAAQS; and
- burden on states is reduced because a second 10-year maintenance plan is not being required for the 1997 primary annual PM_{2.5} NAAQS.

If the 1997 primary annual PM_{2.5} NAAQS were to remain in place after CAA requirements begin to apply for the 2012 primary annual PM_{2.5} NAAQS, federal agencies, metropolitan planning organizations (MPOs) and other state, local, and federal transportation and air quality agencies in areas that are currently designated nonattainment or maintenance for the 1997 annual PM_{2.5} NAAQS and are now designated nonattainment for the 2012 primary annual NAAQS would be required to implement CAA requirements for both annual PM_{2.5} NAAQS concurrently. Additionally, some areas would also be implementing requirements for the 2006 24-hour PM_{2.5} NAAQS, and two areas remain subject to requirements for the 1997 24-hour PM_{2.5} NAAQS. This could lead to unnecessary complexity for transportation conformity determinations, especially if an area's boundaries for the various PM_{2.5} NAAQS differ from one another, as boundaries for several areas do, and the same test of conformity cannot be used for all the PM_{2.5} NAAQS. Even where an area's boundaries are unchanged, different analysis years under the transportation conformity rule may be required for each PM_{2.5} NAAQS. It could also lead to general conformity determinations being made in areas that are attainment for the 2012 primary annual PM_{2.5} NAAQS. Finally, state and local air quality agencies would be required to continue attainment planning activities for the 1997 primary annual PM_{2.5} NAAQS even if they had air quality data that resulted in their being designated attainment for the 2012 primary annual PM_{2.5} NAAQS.

Comment: Some commenters opposed revocation of the 1997 primary annual PM_{2.5} NAAQS but stated that if the EPA decides to revoke the standard, then Option 1 is preferable since it more fully complies with the health protection functions of the Act. This commenter stated that Option 2 would violate the Act by creating flexibility for regions that have failed to meet the standard. The commenter provides a number of reasons for why Option 2 should not be finalized. The commenter is primarily concerned that revoking the 1997 primary annual NAAQS in areas that are designated nonattainment for that NAAQS at the time of revocation would delay improvements in air quality and allow areas to postpone implementation of controls that apply in PM_{2.5} areas that are classified as Serious. The commenter also stated that the EPA must identify specific problems to be addressed by revocation and a beneficial purpose for the revocation, and not solely on a claim of the need for flexibility. While the D.C. Circuit held that the EPA can revoke a NAAQS, the EPA cannot do so to maximize its own discretion.

Response: The EPA concluded that it is important to have all of the CAA's tools in subpart 4 and, as applicable, subpart 1 available in order to bring areas that are still violating the 1997 annual PM_{2.5} NAAQS into attainment as expeditiously as practicable. Finalizing Option 1, which revokes the 1997 primary annual PM_{2.5} NAAQS in attainment areas, including areas redesignated to attainment with an approved CAA section 175A maintenance plan, leaves the CAA's compliance plan for PM areas in place as Congress envisioned it. As described earlier, the EPA is finalizing Option 1 for revoking the 1997 primary annual PM_{2.5} NAAQS. Under Option 1, the primary annual NAAQS is being revoked in areas that have always been attainment for the 1997 annual PM_{2.5} NAAQS and in areas that have been redesignated to attainment for that NAAQS. Any area that remains designated nonattainment for the 1997 annual PM_{2.5} NAAQS on the date of the revocation will have the 1997 primary annual PM_{2.5} NAAQS revoked after the area attains the 1997 annual PM_{2.5} NAAQS and is redesignated to attainment consistent with CAA section 107(d)(3)(E) (including the requirement to have an approved CAA section 175A maintenance plan for the primary NAAQS). This means that any area that remains designated nonattainment on the date of the revocation will remain subject to all subpart 4 requirements,

including Serious area requirements such as BACT and BACM and more stringent NNSR requirements. If the area does not attain by the Serious area deadline and is not eligible for a 1-year attainment date extension, the area would become subject to the requirement to develop a 5 percent plan. If the area has still not attained, it would be subject to the requirements in CAA section 179(d) for areas that fail to attain.

The EPA agrees with the commenter's assessment that attaining the 1997 annual PM_{2.5} NAAQS as expeditiously as practicable has both health and welfare benefits. The final rule ensures that attainment of the 1997 PM_{2.5} NAAQS is achieved in all areas. Furthermore, the final rule also requires that progress is made toward attainment of the 2012 primary annual PM_{2.5} NAAQS in nonattainment areas for that NAAQS. In addition, the 1997 annual secondary NAAQS was retained to protect against certain welfare effects. The EPA agrees that if we had revoked the 1997 primary annual PM_{2.5} NAAQS in areas that are still violating that NAAQS those areas would have started over as Moderate areas for the 2012 NAAQS, rather than being required to move forward with more stringent measures that would have applied to a Serious area for the 1997 annual PM_{2.5} NAAQS. The revocation of the 1997 primary annual PM_{2.5} NAAQS as proposed under Option 1 and being finalized is fully consistent with principles of CAA section 172(e). The 1997 primary annual PM_{2.5} NAAQS is only revoked after an area has attained that NAAQS and been redesignated to attainment with an approved CAA section 175A maintenance plan for that NAAQS. The NAAQS is not being revoked in any area that remains designated nonattainment for the NAAQS and areas that continue to violate the NAAQS continue to be required to implement all of the measures required by subpart 4 (e.g., BACT, BACM and Serious area NNSR) and would be subject to additional subpart 4 requirements (e.g., most stringent measures and a 5 percent plan) if the area cannot or does not attain by the Serious area deadline.

The EPA is finalizing the revocation of the 1997 primary annual PM_{2.5} NAAQS only in former nonattainment areas that have been redesignated to attainment. Areas that continue to violate the 1997 annual NAAQS must attain that NAAQS and be redesignated to attainment with an approved CAA section 175A maintenance plan for the 1997 primary annual PM_{2.5} NAAQS. The nonattainment areas where the

NAAQS is not being revoked will be required to comply with all subpart 4 requirements in order to bring them into attainment with the 1997 annual PM_{2.5} NAAQS as expeditiously as practicable. In sum, the final rule requires CAA subpart 4 to be implemented in all nonattainment areas for the 1997 primary annual PM_{2.5} NAAQS.

The EPA also disagrees with the commenter's assertion that the final rule changes CAA subpart 4's requirements. Revocation under Option 1 requires that nonattainment areas attain the 1997 annual PM_{2.5} NAAQS and be redesignated to attainment before that NAAQS is revoked. Any area that remains nonattainment and continues to violate the 1997 annual NAAQS must first attain that NAAQS by complying with the requirements for subpart 4 and then be redesignated to attainment with an approved maintenance plan for the 1997 primary annual PM_{2.5} NAAQS as described earlier.

The EPA has concluded that the final rule fully complies with CAA requirements and is consistent with both past precedents for revoking the original SO₂ and lead NAAQS and the tenets of the *South Coast* decision concerning revocation of the 1-hour ozone NAAQS. (*South Coast Air Quality Management Dist. v. EPA*, 472 F.3d 882) Areas that continue to violate the 1997 annual NAAQS at the time of the initial revocation are required to attain that NAAQS as expeditiously as practicable through implementation of requirements in subpart 4. This will ensure that these areas continue to make progress toward and eventually attain the 1997 annual NAAQS and make progress toward expeditious attainment of the more health protective 2012 primary annual PM_{2.5} NAAQS.

With regard to the comment that the EPA needs a better rationale for the revocation, the EPA is revoking the 1997 primary annual PM_{2.5} NAAQS in areas that have always been attainment for that NAAQS and in areas that were initially designated nonattainment but have been redesignated to attainment for that NAAQS because this action ensures that only one primary annual PM_{2.5} NAAQS—the more protective 2012 primary annual PM_{2.5} NAAQS—applies in areas that are designated as attainment for the 1997 annual PM_{2.5} NAAQS. These areas have successfully attained the less stringent 1997 annual PM_{2.5} NAAQS and have a maintenance plan in place to ensure that they do not slip back into nonattainment for that NAAQS. These areas can only revise their approved maintenance plans if the revision complies with CAA section 110(l) and, if applicable, CAA section

193. Any of these areas that are designated nonattainment for the more health protective 2012 primary annual PM_{2.5} NAAQS can now focus their efforts on expeditiously attaining the more protective NAAQS as required under subpart 4. Any of these areas that are designated attainment for the more health protective 2012 primary annual PM_{2.5} NAAQS can focus their resources on other pressing air quality issues.

The EPA believes that appropriately integrating prior requirements with new goals facilitates coherent, effective and timely planning and controls, and minimizes the separate potentially duplicative submission of requirements left over from previous standards. Expeditious attainment of the 1997 annual PM_{2.5} NAAQS in nonattainment areas provides both health and welfare benefits that should not be delayed by allowing nonattainment areas to restart the PM_{2.5} planning process under the Moderate area classification in subpart 4 for areas that are designated nonattainment for the more health protective 2012 primary annual PM_{2.5} NAAQS. For these reasons and the reasons stated earlier in Section X.a of this preamble, the EPA believes that the revocation of the 1997 primary annual PM_{2.5} NAAQS in areas that have always been attainment for that NAAQS and in areas that have been redesignated to attainment for that NAAQS provides the appropriate way to move toward attaining the more protective standard in a timely and effective manner. This approach ensures that progress made under previous PM_{2.5} NAAQS continues in attainment areas and continues in nonattainment areas.

Comment: Other commenters stated that it causes unnecessary complexity, confusion, and burden to have multiple national standards for the same criteria pollutant. The commenter stated that any concerns about states and nonattainment areas not continuing to make progress or reversing progress can be mitigated through anti-backsliding requirements. On the other hand, two commenters supported the option of not revoking the standard at all. One of these commenters believed that past experience has led to confusion and litigation and has diminished the urgency to attain a new NAAQS.

Response: As described earlier, the EPA is finalizing revocation Option 1, which leaves the nonattainment designation in place until the area is redesignated to attainment and for those areas to fulfill the requirements of CAA subpart 4 that apply to them. Revoking the 1997 primary annual PM_{2.5} NAAQS in areas that were designated nonattainment at the time of the

revocation could delay attainment of that NAAQS and slow progress on attaining the 2012 primary annual PM_{2.5} NAAQS because such areas would not be subject to all of the planning requirements in CAA subpart 4 after the date of the revocation. The EPA believes that the final rule simplifies the revocation because the approved maintenance plan and an area's PSD program serve to prevent backsliding. Anti-backsliding measures are not required for nonattainment areas because the NAAQS is not being revoked in nonattainment areas.

Comment: Several commenters supported Option 2 and stated that it is consistent with implementation rules for the other NAAQS, the 2012 primary annual PM_{2.5} NAAQS is more stringent and more protective of health than the 1997 primary annual PM_{2.5} standard, and revocation of the 1997 PM_{2.5} NAAQS would reduce the burden on states. One of these commenters also stated that, in 1997 PM_{2.5} NAAQS maintenance areas that have good PM_{2.5} air quality, revoking the 1997 PM_{2.5} NAAQS in its entirety will alleviate transportation conformity requirements as well as requirements for the submission of additional maintenance plans.

Response: As discussed in the proposal, the revocations of the prior lead and SO₂ NAAQS were accomplished in a manner consistent with Option 1. (80 FR 15340) The EPA notes that both Options 1 and 2 would reduce burden on the states. Under Option 1, areas that are redesignated to attainment would not be required to submit a second 10-year maintenance plan. However, under Option 1, areas that are designated nonattainment at the time of the revocation would remain subject to the CAA subpart 4 requirements applicable to the area until it attains the NAAQS and is redesignated to attainment through approval of a redesignation request and a CAA section 175A maintenance plan for the primary NAAQS. Under Option 2, areas that remain designated nonattainment at the time of the revocation would be required to implement their approved SIPs for the 1997 annual PM_{2.5} NAAQS but would not be susceptible to a reclassification from Moderate to Serious, and thus would not be required to adopt additional subpart 4 requirements including requirements for Serious areas that would apply if such an area were reclassified. Not requiring Serious area measures in such an area would delay emissions reductions and improvements in air quality.

The EPA also notes it retained the 1997 secondary annual NAAQS when the PM_{2.5} NAAQS was revised in December 2012, thus, full revocation of the 1997 standard would not be appropriate.

Comment: Two commenters opposed the possible approach of not revoking the 1997 primary annual PM_{2.5} NAAQS at this time because it would be inconsistent with past actions when a NAAQS has been replaced by the more stringent NAAQS and because it presents an unnecessary burden.

Response: The EPA is finalizing the proposed revocation of the 1997 primary annual PM_{2.5} NAAQS for the reasons set forth earlier.

2. Comments on Anti-Backsliding Requirements Under Option 1

Comment: Some commenters expressed concern that the proposal that an approved CAA section 175A maintenance plan would serve as the anti-backsliding measures may not be consistent with the language of CAA section 172(e).

Response: The EPA disagrees with the commenter. CAA section 172(e) applies in areas that have not attained the prior NAAQS. In this final rule, the EPA is only revoking the 1997 primary annual PM_{2.5} NAAQS in areas that have attained that NAAQS and been redesignated to attainment with an approved CAA section 175A maintenance plan. The EPA has determined that implementing the approved maintenance plan along with a PSD program will serve to prevent backsliding in the areas where the NAAQS is being revoked. The approved maintenance plan can only be revised if the revision meets the requirements of CAA section 110(l) and, if applicable, CAA section 193. In order for the 1997 primary annual PM_{2.5} NAAQS to be revoked in the future in an area that remains designated nonattainment at the time of the initial revocation, such an area would have to attain the NAAQS, submit a redesignation request including a maintenance plan for the primary NAAQS, and the EPA would have to approve that submission. The 1997 primary annual PM_{2.5} NAAQS would then be revoked in such an area on the effective date of the approval of the redesignation and maintenance plan. That approved maintenance plan would serve to prevent backsliding.

Comment: Some commenters questioned whether the EPA's conclusion is correct that under Option 1 there is no need for anti-backsliding measures, because the area would have already attained. Commenter stated there may be no need for implementing

additional measures, but it seems the state should continue to keep in effect those measures that have brought it to attainment (except NNSR which by statute is replaced by PSD permitting).

Response: The final rule addresses this comment. Former nonattainment areas where the 1997 primary annual PM_{2.5} NAAQS is being revoked are required to implement the approved maintenance plan for that NAAQS and to implement a PSD program. The approved maintenance plan remains in effect beyond the end of the maintenance period. The approved maintenance plan can only be revised if the revision complies with CAA section 110(l) and, if applicable, CAA section 193.

XI. Environmental Justice Considerations

The EPA believes the human health or environmental risk addressed by this action will not have disproportionately high and adverse human health or environmental effects on minority, low-income, or indigenous populations because it would not negatively affect the level of protection provided to human health or the environment under the PM_{2.5} NAAQS. When promulgated, these regulations will clarify the state implementation plan requirements and the NNSR permitting requirements to be met by states in order to attain the PM_{2.5} NAAQS as expeditiously as practicable. These requirements are designed to protect all segments of the general population. The EPA included specific discussion in this preamble about actions that could be considered for the protection of minority, low-income or indigenous populations in Section IV.D.6 of this preamble on Moderate area attainment plan control strategies; Section VI.D.7 on Serious area attainment plan control strategies; and Section IX.G of this preamble, measures to ensure appropriate protections for overburdened populations. In addition, as part of the consultation activities conducted in developing this rule, the EPA participated in training and outreach activities with representatives from environmental justice organizations in a March 2014 conference held in Research Triangle Park, NC titled, "Clean Air Act Rulemaking and Permitting Training for EJ Communities." These proposed regulations are designed to protect and enhance the health and safety of these and other populations, and they will not adversely affect the health or safety of minority, low-income or indigenous populations.

XII. Statutory and Executive Order Reviews

A. Executive Order 12866: Regulatory Planning and Review and Executive Order 13563: Improving Regulation and Regulatory Review

This action is a significant regulatory action that was submitted to the Office of Management and Budget (OMB) for review because it raises novel policy issues. Any changes made in response to OMB recommendations have been documented in the docket.²⁸⁵

B. Paperwork Reduction Act (PRA)

The information collection activities in this rule have been submitted to the Office of Management and Budget (OMB) under the PRA. The Information Collection Request (ICR) document prepared by the EPA has been assigned the EPA ICR number 2258.04, OMB Control No. 2060-0611. You can find a copy of the ICR in the docket for this rule, and it is briefly summarized here.

The EPA is finalizing this PM_{2.5} NAAQS SIP Requirements Rule to describe the CAA requirements that must be met by states with nonattainment areas required to develop attainment plans for attaining and maintaining the NAAQS. The intended effect of the SIP Requirements Rule is to provide certainty to states regarding their planning obligations such that states may begin SIP development. Only states with nonattainment areas are required to submit SIPs under this rule.

For purposes of analysis of the estimated paperwork burden, the EPA assumed there were 14 existing nonattainment areas for the 1997 and 2006 PM_{2.5} NAAQS, and 14 designated nonattainment areas.²⁸⁶ The attainment plan requirements would appear as 40 CFR 51.1000 through 51.1015 which implement CAA subsections 172(c)(1) and (2), and 189(a)(1)(B) and (C), 189(b)(1)(A) and (B) and 189(c). Some states have new nonattainment areas and some states should already have information from emission sources, as facilities should have provided this information to meet 1997 and 2006

²⁸⁵ Note that a regulatory impact analysis evaluating the costs and benefits associated with attaining the 2012 PM_{2.5} NAAQS was released at the time the NAAQS review was finalized. See "Regulatory Impact Analysis for the Final Revisions to the National Ambient Air Quality Standards for Particulate Matter." U.S. Environmental Protection Agency, Office of Air Quality and Planning Standards, Health and Environmental Impacts Division, February 28, 2013. EPA-452/R-12-005.

²⁸⁶ On December 18, 2014, the EPA issued final area designations for the 2012 annual national air quality standard for fine particulate matter (PM_{2.5}). The EPA designated 14 areas in six states as "nonattainment." The effective date was April 15, 2015.

PM_{2.5} NAAQS SIP requirements, operating permits and/or emissions reporting requirements. Such information does not generally reveal the details of production processes. But, to the extent it may, confidential business information for the affected facilities is protected. Specifically, submissions of emissions and control efficiency information that is confidential, proprietary and trade secret and is not emission data are protected from disclosure under the requirements of subsections 503(e) and 114(c) of the CAA.

The annual state burden for this information collection for the 14 designated 2012 PM_{2.5} nonattainment areas, averaged over the first 3 years of this ICR, is estimated to be a total of 42,000 labor hours per year at an annual a labor cost of \$2.5 million (present value) over the 3 year period, or approximately \$420,000 per state for the 6 state respondents. The average annual reporting burden is approximately 2,625 hours per response, with approximately 3 responses per state for 16 state responses. There are no capital or operating and maintenance costs associated with the proposal requirements. Burden is defined at 5 CFR 1320.3(b).

The annual state burden for this information collection for the 14 existing nonattainment areas for the 1997 and 2006 PM_{2.5} NAAQS, averaged over the first 3 years of this ICR, is estimated to be a total of 48,600 labor hours per year at an annual labor cost of \$2.9 million (present value) over the 3 year period, or approximately \$417,000 per state for the 7 state respondents. The average annual reporting burden is approximately 3,240 hours per response, with approximately two responses per state for 15 state responses. There are no capital or operating and maintenance costs associated with the proposal requirements. Burden is defined at 5 CFR 1320.3(b).

An agency may not conduct or sponsor, and a person is not required to respond to, a collection of information unless it displays a currently valid OMB control number. The OMB control numbers for the EPA's regulations in 40 CFR are listed in 40 CFR part 9.

C. Regulatory Flexibility Act (RFA)

I certify that this action will not have a significant economic impact on a substantial number of small entities under the RFA. In making this determination, the impact of concern is any significant adverse economic impact on small entities. An agency may certify that a rule will not have a

significant economic impact on a substantial number of small entities if the rule relieves regulatory burden, has no net burden or otherwise has a positive economic effect on the small entities subject to the rule. This rule will not impose any requirements directly on small entities. Entities potentially affected directly by this final rule include state, local and tribal governments and none of these governments are small governments. Other types of small entities are not directly subject to the requirements of this rule.

D. Unfunded Mandates Reform Act (UMRA)

This action does not contain any unfunded mandate as described in UMRA, 2 U.S.C. 1531–1538, and does not significantly or uniquely affect small governments. This action imposes no enforceable duty on any state, local or tribal governments or the private sector. The CAA imposes the obligation for states to submit attainment plans to implement the PM_{2.5} NAAQS. In this rule, the EPA is clarifying those requirements. Therefore, this action is not subject to the requirements of sections 202, 203, and 205 of the UMRA.

E. Executive Order 13132: Federalism

This action does not have federalism implications. It will not have substantial direct effects on the states, on the relationship between the national government and the states, or on the distribution of power and responsibilities among the various levels of government.

F. Executive Order 13175: Consultation and Coordination With Indian Tribal Governments

This final rule does not have tribal implications. It would not have a substantial direct effect on one or more Indian tribes. Furthermore, these regulation revisions do not affect the relationship or distribution of power and responsibilities between the federal government and Indian tribes. The CAA and the TAR establish the relationship of the federal government and tribes in characterizing air quality and developing plans to attain the NAAQS, and these revisions to the regulations do nothing to modify that relationship. Thus, Executive Order 13175 does not apply to this action.

G. Executive Order 13045: Protection of Children From Environmental Health and Safety Risks

The EPA interprets Executive Order 13045 as applying only to those

regulatory actions that concern environmental health or safety risks that the EPA has reason to believe may disproportionately affect children, per the definition of “covered regulatory action” in section 2–202 of the Executive Order. This action is not subject to Executive Order 13045 because it implements a previously promulgated health or safety-based federal standard established pursuant to the CAA.

H. Executive Order 13211: Actions Concerning Regulations That Significantly Affect Energy Supply, Distribution, or Use

This action is not a “significant energy action” as defined in Executive Order 13211 (66 FR 28355 (May 22, 2001)), because it is not likely to have a significant adverse effect on the supply, distribution, or use of energy.

I. National Technology Transfer and Advancement Act

This rulemaking does not involve technical standards.

J. Executive Order 12898: Federal Actions To Address Environmental Justice in Minority Populations and Low-Income Populations

The EPA believes the human health or environmental risk addressed by this action will not have disproportionately high and adverse human health or environmental effects on minority, low-income, or indigenous populations. The results of this evaluation are contained in Section XI of this preamble. However, because of the benefits of improved air quality on low SES populations, the EPA conducted outreach to communities on the proposal to encourage comment including a March 2014 environmental justice conference in Research Triangle Park, NC, conference calls and a meeting with the National Environmental Justice Advisory Committee.

K. Congressional Review Act (CRA)

This action is subject to the CRA, and the EPA will submit a rule report to each House of the Congress and to the Comptroller General of the United States. This action is not a “major rule” as defined by 5 U.S.C. 804(2).

L. Determination Under Section 307(d)

Pursuant to sections 307(d)(1)(E) and 307(d)(1)(V) of the CAA, the Administrator proposes to determine that this action is subject to the provisions of section 307(d). Under section 307(d)(1)(V), the provisions of section 307(d) apply to “such other

actions as the Administrator may determine.”

M. Judicial Review

Section 307(b)(1) of the CAA indicates which Federal Courts of Appeal have venue for petitions of review of final agency actions by the EPA under the CAA. This section provides, in part, that petitions for review must be filed in the U.S. Court of Appeals for the District of Columbia Circuit (i) when the agency action consists of “nationally applicable regulations promulgated, or final actions taken, by the Administrator” or (ii) when such action is locally or regionally applicable, if “such action is based on a determination of nationwide scope or effect and if in taking such action the Administrator finds and publishes that such action is based on such a determination.”

This rule implementing the PM_{2.5} SIP Requirements is “nationally applicable” within the meaning of CAA section 307(b)(1). First, the rulemaking addresses the NAAQS that applies to all states and territories in the U.S. Second, the rulemaking addresses issues relevant to specific existing SIP provisions in states across the U.S. that are located in each of the ten EPA regions, numerous federal circuits and multiple time zones. Third, the rulemaking addresses a common core of knowledge and analysis involved in formulating the decision and a common interpretation of the requirements of the CAA being applied to SIPs in states across the country. Fourth, the rulemaking, by addressing issues relevant to appropriate SIP provisions in one state, may have precedential impacts upon the SIPs of other states nationwide. Courts have found similar rulemaking actions to be of nationwide scope and effect.²⁸⁷

Under section 307(b)(1) of the Act, petitions for judicial review of this action must be filed in the United States Court of Appeals for the District of Columbia Circuit by October 24, 2016. Any such judicial review is limited to only those objections that are raised with reasonable specificity in timely

comments. Filing a petition for reconsideration by the Administrator of this final rule does not affect the finality of this rule for the purposes of judicial review nor does it extend the time within which a petition for judicial review may be filed and shall not postpone the effectiveness of such rule or action. Under section 307(b)(2) of the Act, the requirements of this final action may not be challenged later in civil or criminal proceedings brought by us to enforce these requirements.

XIII. Statutory Authority

The statutory authority for this action is provided by 42 U.S.C. 7403, 7407, 7410, and 7601.

List of Subjects

40 CFR Part 50

Environmental protection, Air pollution control, Intergovernmental relations, Particulate matter, Sulfur dioxide, Nitrogen oxides, Volatile organic compounds, Ammonia.

40 CFR Part 51

Environmental protection, Air pollution control, Intergovernmental relations, Particulate matter, Sulfur dioxide, Nitrogen oxides, Volatile organic compounds, Ammonia.

40 CFR Part 93

Environmental protection, Air pollution control, Intergovernmental relations, Particulate matter, Sulfur dioxide, Nitrogen oxides, Volatile organic compounds, Ammonia.

Dated: July 29, 2016.

Gina McCarthy,
Administrator.

For the reasons stated in the preamble, Title 40, Chapter I of the Code of Federal Regulations is amended as follows:

PART 50—NATIONAL PRIMARY AND SECONDARY AMBIENT AIR QUALITY STANDARDS

■ 1. The authority citation for part 50 continues to read as follows:

Authority: 42 U.S.C. 7401, *et seq.*

■ 2. In § 50.13, add paragraph (d) to read as follows:

§ 50.13 National primary and secondary ambient air quality standards for PM_{2.5}.

* * * * *

(d) Until the effective date of the final Fine Particulate Matter National Ambient Air Quality Standards: State Implementation Plan Requirements rule to be codified at 40 CFR 51.1000 through 51.1016, the 1997 annual PM_{2.5} NAAQS set forth in this section will continue in effect, notwithstanding the promulgation of the 2012 primary annual PM_{2.5} NAAQS under § 50.18. The 1997 primary annual PM_{2.5} NAAQS set forth in this section will no longer apply upon the effective date of the final Fine Particulate Matter National Ambient Air Quality Standards: State Implementation Plan Requirements rule; except that for areas designated nonattainment for the 1997 annual PM_{2.5} NAAQS set forth in this section as of the effective date of the final Fine Particulate Matter National Ambient Air Quality Standards: State Implementation Plan Requirements rule, the requirements applicable to the 1997 primary annual PM_{2.5} NAAQS set forth in this section will apply until the effective date of an area's redesignation to attainment for the 1997 annual PM_{2.5} NAAQS pursuant to the requirements of section 107 of the Clean Air Act. The 1997 secondary annual PM_{2.5} NAAQS and the 1997 24-hour PM_{2.5} NAAQS shall remain in effect. The area designations and classifications with respect to the 1997 annual and 24-hour PM_{2.5} NAAQS remain codified in 40 CFR part 81 in order to provide information on where the 1997 primary annual PM_{2.5} NAAQS has been revoked and to facilitate the implementation of the 1997 secondary annual PM_{2.5} NAAQS and the 1997 24-hour PM_{2.5} NAAQS.

PART 51—REQUIREMENTS FOR PREPARATION, ADOPTION, AND SUBMITTAL OF IMPLEMENTATION PLANS

■ 3. The authority citation for part 51 continues to read as follows:

Authority: 23 U.S.C. 101; 42 U.S.C. 7401–7671q.

■ 4. In Appendix A to subpart A of part 51, revise table 1 to read as follows:

Appendix A to Subpart A of Part 51—Tables

²⁸⁷ See, e.g., *State of Texas, et al. v. EPA*, 2011 U.S. App. LEXIS 5654 (5th Cir. 2011) (finding SIP call to 13 states to be of nationwide scope and effect and thus transferring the case to the U.S. Court of Appeals for the D.C. Circuit in accordance with CAA section 307(b)(1)).

TABLE 1 TO APPENDIX A OF SUBPART A—EMISSION THRESHOLDS ¹ BY POLLUTANT FOR TREATMENT AS POINT SOURCE UNDER 40 CFR 51.30

Pollutant	Every-year	Triennial	
	Type A sources ²	Type B sources	NAA sources ³
(1) SO ₂	≥2500	≥100	≥100. PM _{2.5} (serious) ≥70. ≥100.
(2) VOC	≥250	≥100	O ₃ (serious) ≥50. O ₃ (severe) ≥25. O ₃ (extreme) ≥10. PM _{2.5} (serious) ≥70. ≥100.
(3) NO _x	≥2500	≥100	PM _{2.5} (serious) ≥70. O ₃ (all areas) ≥100. CO (all areas) ≥100.
(4) CO	≥2500	≥1000	≥0.5 (actual). ≥100.
(5) Lead	≥0.5 (actual)	PM ₁₀ (serious) ≥70. ≥100.
(6) Primary PM ₁₀	≥250	≥100	PM _{2.5} (serious) ≥70. ≥100.
(7) Primary PM _{2.5}	≥250	≥100	PM _{2.5} (serious) ≥70. ≥100.
(8) NH ₃	≥250	≥100	PM _{2.5} (serious) ≥70.

¹ Thresholds for point source determination shown in tons per year of potential to emit as defined in 40 CFR part 70, with the exception of lead. Reported emissions should be in actual tons emitted for the required time period.

² Type A sources are a subset of the Type B sources and are the larger emitting sources by pollutant.

³ NAA = Nonattainment Area. The point source reporting thresholds vary by attainment status for SO₂, VOC, NO_x, CO, PM₁₀, PM_{2.5}, and NH₃.

* * * * *

Subpart I—Review of New Sources and Modifications

- 5. In § 51.165:
 - a. Revise paragraphs (a)(1)(iv)(A)(1) and (a)(1)(x)(A);
 - b. Add paragraph (a)(1)(x)(F);
 - c. Revise paragraph (a)(1)(xxxvii)(C)(2);
 - d. Remove paragraphs (a)(1)(xxxvii)(C)(3), and (4);
 - e. Revise paragraphs (a)(2)(i) and (a)(2)(ii)(A); and
 - f. Add paragraph (a)(13).

The revisions and additions read as follows:

§ 51.165 Permit requirements.

(a) * * *

(1) * * *

(iv)(A) * * *

(1) Any stationary source of air pollutants that emits, or has the potential to emit, 100 tons per year or more of any regulated NSR pollutant (as defined in paragraph (a)(1)(xxxvii) of this section), except that lower emissions thresholds shall apply in areas subject to subpart 2, subpart 3, or subpart 4 of part D, title I of the Act, according to paragraphs (a)(1)(iv)(A)(1)(i) through (viii) of this section.

(i) 50 tons per year of Volatile organic compounds in any serious ozone nonattainment area.

(ii) 50 tons per year of Volatile organic compounds in an area within an ozone

transport region, except for any severe or extreme ozone nonattainment area.

(iii) 25 tons per year of Volatile organic compounds in any severe ozone nonattainment area.

(iv) 10 tons per year of Volatile organic compounds in any extreme ozone nonattainment area.

(v) 50 tons per year of Carbon monoxide in any serious nonattainment area for carbon monoxide, where stationary sources contribute significantly to Carbon monoxide levels in the area (as determined under rules issued by the Administrator).

(vi) 70 tons per year of PM₁₀ in any serious nonattainment area for PM₁₀.

(vii) 70 tons per year of PM_{2.5} in any serious nonattainment area for PM_{2.5}.

(viii) 70 tons per year of any individual precursor for PM_{2.5} (as defined in paragraph (a)(1)(xxxvii) of this section), in any serious nonattainment area for PM_{2.5}.

(x)(A) *Significant* means, in reference to a net emissions increase or the potential of a source to emit any of the following pollutants, a rate of emissions that would equal or exceed any of the following rates:

Pollutant Emission Rate

Carbon monoxide: 100 tons per year (tpy)

Nitrogen oxides: 40 tpy

Sulfur dioxide: 40 tpy

Ozone: 40 tpy of Volatile organic compounds or Nitrogen oxides

Lead: 0.6 tpy

PM₁₀: 15 tpy

PM_{2.5}: 10 tpy of direct PM_{2.5} emissions; 40 tpy of Sulfur dioxide emissions, 40 tpy of Nitrogen oxide emissions, or 40 tpy of VOC emissions, to the extent that any such pollutant is defined as a precursor for PM_{2.5} in paragraph (a)(1)(xxxvii) of this section.

(F) For the purposes of applying the requirements of paragraph (a)(13) of this section to modifications at existing major stationary sources of Ammonia located in a PM_{2.5} nonattainment area, if the plan requires that the control requirements of this section apply to major stationary sources and major modifications of Ammonia as a regulated NSR pollutant (as a PM_{2.5} precursor), the plan shall also define “significant” for Ammonia for that area, subject to the approval of the Administrator.

(xxxvii) * * *

(C) * * *

(2) Sulfur dioxide, Nitrogen oxides, Volatile organic compounds and Ammonia are precursors to PM_{2.5} in any PM_{2.5} nonattainment area.

(2) *Applicability procedures.* (i) Each plan shall adopt a preconstruction review program to satisfy the requirements of sections 172(c)(5) and 173 of the Act for any area designated nonattainment for any national ambient air quality standard under subpart C of

40 CFR part 81. Such a program shall apply to any new major stationary source or major modification that is major for the pollutant for which the area is designated nonattainment under section 107(d)(1)(A)(i) of the Act, if the stationary source or modification would locate anywhere in the designated nonattainment area. Different pollutants, including individual precursors, are not summed to determine applicability of a major stationary source or major modification.

(ii) * * *

(A) Except as otherwise provided in paragraphs (a)(2)(iii) and (iv) of this section, and consistent with the definition of major modification contained in paragraph (a)(1)(v)(A) of this section, a project is a major modification for a regulated NSR pollutant (as defined in paragraph (a)(1)(xxvii) of this section) if it causes two types of emissions increases—a significant emissions increase (as defined in paragraph (a)(1)(xxvii) of this section), and a significant net emissions increase (as defined in paragraphs (a)(1)(vi) and (x) of this section). The project is not a major modification if it does not cause a significant emissions increase. If the project causes a significant emissions increase, then the project is a major modification only if it also results in a significant net emissions increase.

* * * * *

(13) The plan shall require that the control requirements of this section applicable to major stationary sources and major modifications of PM_{2.5} shall also apply to major stationary sources and major modifications of PM_{2.5} precursors in a PM_{2.5} nonattainment area, except that a reviewing authority may exempt new major stationary sources and major modifications of a particular precursor from the requirements of this section for PM_{2.5} if the NNSR precursor demonstration submitted to and approved by the Administrator shows that such sources do not contribute significantly to PM_{2.5} levels that exceed the standard in the area. Any demonstration submitted for the Administrator's review must meet the conditions for a NNSR precursor demonstration as set forth in § 51.1006(a)(3).

* * * * *

■ 6. Revise subpart Z to read as follows:

Subpart Z—Provisions for Implementation of PM_{2.5} National Ambient Air Quality Standards

Sec.

51.1000 Definitions.

51.1001 Applicability of part 51.

- 51.1002 Classifications and reclassifications.
- 51.1003 Attainment plan due dates and submission requirements.
- 51.1004 Attainment dates.
- 51.1005 Attainment date extensions.
- 51.1006 Optional PM_{2.5} precursor demonstrations.
- 51.1007 [Reserved]
- 51.1008 Emissions inventory requirements.
- 51.1009 Moderate area attainment plan control strategy requirements.
- 51.1010 Serious area attainment plan control strategy requirements.
- 51.1011 Attainment demonstration and modeling requirements.
- 51.1012 Reasonable further progress (RFP) requirements.
- 51.1013 Quantitative milestone requirements.
- 51.1014 Contingency measures requirements.
- 51.1015 Clean data requirements.
- 51.1016 Continued applicability of the FIP and SIP requirements pertaining to interstate transport under CAA section 110(a)(2)(D)(i) and (ii) after revocation of the 1997 primary annual PM_{2.5} NAAQS.

Subpart Z—Provisions for Implementation of PM_{2.5} National Ambient Air Quality Standards

§ 51.1000 Definitions.

The following definitions apply for purposes of this subpart. Any term not defined herein shall have the meaning as defined in 40 CFR 51.100 or Clean Air Act section 302.

Act means the Clean Air Act as codified at 42 U.S.C. 7401–7671q (2003).

Additional feasible measure is any control measure that otherwise meets the definition of “best available control measure” (BACM) but can only be implemented in whole or in part beginning 4 years after the date of reclassification of an area as Serious and no later than the statutory attainment date for the area.

Additional reasonable measure is any control measure that otherwise meets the definition of “reasonably available control measure” (RACM) but can only be implemented in whole or in part during the period beginning 4 years after the effective date of designation of a nonattainment area and no later than the end of the sixth calendar year following the effective date of designation of the area.

Applicable annual standard is the annual PM_{2.5} NAAQS established, revised, or retained as a result of a particular PM_{2.5} NAAQS review.

Applicable attainment date means the latest statutory date by which an area is required to attain a particular PM_{2.5} NAAQS, unless the EPA has approved an attainment plan for the area to attain such NAAQS, in which case the

applicable attainment date is the date approved under such attainment plan. If the EPA grants an extension of an approved attainment date, then the applicable attainment date for the area shall be the extended date.

Applicable 24-hour standard is the 24-hour PM_{2.5} NAAQS established, revised, or retained as a result of a particular PM_{2.5} NAAQS review.

Attainment projected inventory for the nonattainment area means the projected emissions of direct PM_{2.5} and all PM_{2.5} precursors on the projected attainment date for the area. This projected inventory includes sources included in the base year inventory for the nonattainment area revised to account for changes in direct PM_{2.5} and all PM_{2.5} precursors through implementation of the plan and any additional sources of such emissions expected within the boundaries of the nonattainment area by the projected attainment date for the area.

Average-season-day emissions means the sum of all emissions during the applicable season divided by the number of days in that season.

Base year inventory for the nonattainment area means the actual emissions of direct PM_{2.5} and all PM_{2.5} precursors from all sources within the boundaries of a nonattainment area in one of the 3 years used for purposes of designations or another technically appropriate year.

Best available control measure (BACM) is any technologically and economically feasible control measure that can be implemented in whole or in part within 4 years after the date of reclassification of a Moderate PM_{2.5} nonattainment area to Serious and that generally can achieve greater permanent and enforceable emissions reductions in direct PM_{2.5} emissions and/or emissions of PM_{2.5} plan precursors from sources in the area than can be achieved through the implementation of RACM on the same source(s). BACM includes best available control technology (BACT).

Date of designation means the effective date of a PM_{2.5} area designation as promulgated by the Administrator.

Date of reclassification means the effective date of a PM_{2.5} area reclassification from Moderate to Serious as promulgated by the Administrator.

Direct PM_{2.5} emissions means solid or liquid particles emitted directly from an air emissions source or activity, or reaction products of gases emitted directly from an air emissions source or activity which form particulate matter as they reach ambient temperatures. Direct PM_{2.5} emissions include filterable and condensable PM_{2.5} emissions

composed of elemental carbon, directly emitted organic carbon, directly emitted sulfate, directly emitted nitrate, and other organic or inorganic particles that exist or form through reactions as emissions reach ambient temperatures (including but not limited to crustal material, metals, and sea salt).

Implemented means adopted by the state, fully approved into the SIP by the EPA, and requiring expeditious compliance by affected sources with installation and/or operation of any equipment, control device, process change, or other emission reduction activity.

Major stationary source means any stationary source of air pollutant(s) that emits, or has the potential to emit 100 tons per year or more of direct PM_{2.5} or any PM_{2.5} precursor in any Moderate nonattainment area for the PM_{2.5} NAAQS, or 70 tons per year or more of direct PM_{2.5} or any PM_{2.5} precursor in any Serious nonattainment area for the PM_{2.5} NAAQS.

Mobile source means mobile sources as defined by 40 CFR 51.50.

Most stringent measure (MSM) is any permanent and enforceable control measure that achieves the most stringent emissions reductions in direct PM_{2.5} emissions and/or emissions of PM_{2.5} plan precursors from among those control measures which are either included in the SIP for any other NAAQS, or have been achieved in practice in any state, and that can feasibly be implemented in the relevant PM_{2.5} NAAQS nonattainment area.

Nonpoint source means nonpoint sources as defined by 40 CFR 51.50.

PM_{2.5} design value (DV) for a PM_{2.5} nonattainment area is the highest of the 3-year average concentrations calculated for the ambient air quality monitors in the area, in accordance with 40 CFR part 50, appendix N.

PM_{2.5} NAAQS are the fine particulate matter National Ambient Air Quality Standards codified at 40 CFR part 50.

PM_{2.5} plan precursors are those PM_{2.5} precursors required to be regulated in the applicable attainment plan and/or NNSR program.

PM_{2.5} precursors are Sulfur dioxide (SO₂), Oxides of nitrogen (NO_x), Volatile organic compounds (VOC), and Ammonia (NH₃).

Point source means point sources as defined by 40 CFR 51.50.

Precursor demonstration means an optional set of analyses provided by a state that are designed to show that emissions of a particular PM_{2.5} precursor do not contribute significantly to PM_{2.5} levels that exceed the relevant PM_{2.5} standard in a particular nonattainment area. The three types of

precursor demonstrations provided in this rule are the comprehensive precursor demonstration, the major stationary source precursor demonstration, and the NNSR precursor demonstration.

Reasonable further progress (RFP) means such annual incremental reductions in emissions of direct PM_{2.5} and PM_{2.5} plan precursors as are required for the purpose of ensuring attainment of the applicable PM_{2.5} NAAQS in a nonattainment area by the applicable attainment date.

Reasonably available control measure (RACM) is any technologically and economically feasible measure that can be implemented in whole or in part within 4 years after the effective date of designation of a PM_{2.5} nonattainment area and that achieves permanent and enforceable reductions in direct PM_{2.5} emissions and/or PM_{2.5} plan precursor emissions from sources in the area. RACM includes reasonably available control technology (RACT).

RFP projected emissions means the estimated emissions for direct PM_{2.5} and PM_{2.5} plan precursors by source category or subcategory for the years in which quantitative milestones are due for a nonattainment area.

Subpart 1 means subpart 1 of part D of title I of the Act.

Subpart 4 means subpart 4 of part D of title I of the Act.

§ 51.1001 Applicability of part 51.

The provisions in subparts A through X of this part apply to areas for purposes of the PM_{2.5} NAAQS to the extent they are not inconsistent with the provisions of this subpart.

§ 51.1002 Classifications and reclassifications.

(a) *Initial classification as Moderate PM_{2.5} nonattainment area.* Any area designated nonattainment for a PM_{2.5} NAAQS shall be classified at the time of such designation, by operation of law, as a Moderate PM_{2.5} nonattainment area.

(b) *Reclassification as Serious PM_{2.5} nonattainment area.* A Moderate nonattainment area shall be reclassified to Serious under the following circumstances:

(1) The EPA shall reclassify as Serious through notice-and-comment rulemaking any Moderate PM_{2.5} nonattainment area that the EPA determines cannot practicably attain a particular PM_{2.5} NAAQS by the applicable Moderate area attainment date.

(2) A Moderate PM_{2.5} nonattainment area shall be reclassified by operation of law as a Serious nonattainment area if the EPA finds through notice-and-

comment rulemaking that the area failed to attain a particular PM_{2.5} NAAQS by the applicable Moderate area attainment date.

§ 51.1003 Attainment plan due dates and submission requirements.

(a) *Nonattainment areas initially classified as Moderate.* (1) For any area designated as nonattainment and initially classified as Moderate for a PM_{2.5} NAAQS, the state(s) shall submit a Moderate area attainment plan that meets all of the following requirements:

(i) Base year emissions inventory requirements set forth at § 51.1008(a)(1);

(ii) Attainment projected emissions inventory requirements set forth at § 51.1008(a)(2);

(iii) Moderate area attainment plan control strategy requirements set forth at § 51.1009;

(iv) Attainment demonstration and modeling requirements set forth at § 51.1011;

(v) Reasonable Further Progress (RFP) requirements set forth at § 51.1012;

(vi) Quantitative milestone requirements set forth at § 51.1013;

(vii) Contingency measure requirements set forth at § 51.1014; and,

(viii) Nonattainment new source review plan requirements pursuant to § 51.165.

(2) The state(s) shall submit its Moderate area attainment plan to the EPA no later than 18 months from the effective date of designation of the area.

(b) *Nonattainment areas reclassified to Serious.* (1) For any nonattainment area reclassified to Serious for a PM_{2.5} NAAQS under § 51.1002(b), in addition to meeting the Moderate area attainment plan submission requirements set forth at § 51.1003(a), the state(s) shall submit a Serious area attainment plan that meets all of the following requirements:

(i) Base year emissions inventory requirements set forth at § 51.1008(b)(1);

(ii) Attainment projected emissions inventory requirements set forth at § 51.1008(b)(2);

(iii) Serious area attainment plan control strategy requirements set forth at § 51.1010;

(iv) Attainment demonstration and modeling requirements set forth at § 51.1011;

(v) Reasonable Further Progress (RFP) requirements set forth at § 51.1012;

(vi) Quantitative milestone requirements set forth at § 51.1013;

(vii) Contingency measure requirements set forth at § 51.1014; and,

(viii) Nonattainment new source review plan requirements pursuant to § 51.165.

(2) The state(s) shall submit its Serious area attainment plan to the EPA according to the following schedule:

(i) *Discretionary reclassification.* (A) For any nonattainment area reclassified to Serious for a particular PM_{2.5} NAAQS under § 51.1002(b)(1) because the EPA determined it cannot practicably attain the NAAQS by the applicable Moderate area attainment date, the state(s) shall submit to the EPA no later than 18 months from the effective date of reclassification the portion of the Serious area attainment plan that meets the following requirements:

(1) Base year emissions inventory requirements set forth at § 51.1008(b)(1);

(2) Serious area attainment plan control strategy requirements set forth at § 51.1010(a)(1) through (4); and,

(3) Nonattainment new source review plan requirements pursuant to § 51.165.

(B) The state(s) shall submit to the EPA the portion of the Serious area attainment plan that meets the requirements set forth at paragraphs (b)(1)(ii), and (b)(1)(iv) through (vii) of this section to the EPA by a date that is no later than 4 years after the effective date of reclassification, or 2 years prior to the attainment date, whichever is earlier.

(ii) *Mandatory reclassification.* For any nonattainment area reclassified to Serious for a particular PM_{2.5} NAAQS under § 51.1002(b)(2) because the EPA determined it failed to attain the NAAQS by the applicable Moderate area attainment date, the state(s) shall submit to the EPA a Serious area attainment plan meeting the requirements set forth at paragraphs (b)(1)(i) through (viii) of this section within 18 months from the effective date of reclassification, or 2 years before the attainment date, whichever is earlier.

(iii) If the state(s) submits to the EPA a request for a Serious area attainment date extension simultaneous with the Serious area attainment plan due under paragraph (b)(1) of this section, such a plan shall meet the most stringent measure (MSM) requirements set forth at § 51.1010(b) in addition to the BACM and BACT and additional feasible measure requirements set forth at § 51.1010(a).

(c) *Serious nonattainment areas subject to CAA section 189(d) for failing to attain the PM_{2.5} NAAQS by the applicable Serious area attainment date.*

(1) For any Serious nonattainment area that fails to attain the PM_{2.5} NAAQS by the applicable Serious area attainment date, the state(s) shall submit a revised Serious area attainment plan that demonstrates that each year the area will achieve at least a 5 percent reduction in emissions of direct PM_{2.5} or a 5 percent reduction in emissions of a PM_{2.5} plan precursor based on the most recent emissions inventory for the area.

The revised attainment plan shall meet the following requirements:

(i) Emissions inventory requirements set forth at § 51.1008(c)(1);

(ii) Emissions inventory requirements set forth at § 51.1008(c)(2);

(iii) Serious area attainment plan control strategy requirements set forth at § 51.1010;

(iv) Attainment demonstration and modeling requirements set forth at § 51.1011;

(v) Reasonable Further Progress (RFP) requirements set forth at § 51.1012;

(vi) Quantitative milestone requirements set forth at § 51.1013;

(vii) Contingency measure requirements set forth at § 51.1014; and

(viii) Nonattainment new source review plan requirements pursuant to § 51.165.

(2) The state(s) shall submit to the EPA the revised attainment plan meeting the requirements set forth at paragraphs (c)(1)(i) through (vii) of this section no later than 12 months from the applicable Serious area attainment date that was previously missed.

(d) Any attainment plan submitted to the EPA under this section shall establish motor vehicle emissions budgets for the projected attainment year for the area, if applicable. The state shall develop such budgets according to the requirements of the transportation conformity rule as they apply to PM_{2.5} nonattainment areas (40 CFR part 93).

§ 51.1004 Attainment dates.

(a) The state shall submit a projected attainment date as part of its attainment plan submission under § 51.1003 for any PM_{2.5} NAAQS nonattainment area located in whole or in part within its boundaries. The state shall justify the projected attainment date for each such nonattainment area (or portion of a nonattainment area) as part of the demonstration of attainment developed and submitted according to the requirements set forth at § 51.1011 and according to the following:

(1) Nonattainment areas initially classified as Moderate.

(i) Except for nonattainment areas that meet the criterion under paragraph (a)(1)(ii) of this section, the projected attainment date for a Moderate PM_{2.5} nonattainment area shall be as expeditious as practicable through the implementation of all control measures required under § 51.1009. The attainment date may be as late as the end of the sixth calendar year after the effective date of designation if the state demonstrates that the implementation of the control measures that qualify as RACM, RACT, and additional reasonable measures, but that are not

necessary for demonstrating attainment by the end of the sixth calendar year after the effective date of designation, will not collectively advance the attainment date by at least 1 year.

(ii) The projected attainment date for a Moderate PM_{2.5} nonattainment area which the state demonstrates cannot practicably attain the applicable PM_{2.5} NAAQS by the end of the sixth calendar year after the effective date of designation of the area with the implementation of all control measures required under § 51.1009 shall be the end of the sixth calendar year after the effective date of designation unless and until the area is reclassified as Serious according to § 51.1002.

(2) *Nonattainment areas reclassified to Serious.* (i) Except for nonattainment areas that meet the criterion under paragraph (a)(2)(ii) of this section, the projected attainment date for a Serious PM_{2.5} nonattainment area shall be as expeditious as practicable with the implementation of all control measures required under § 51.1010 but no later than the end of the tenth calendar year after the effective date of designation.

(ii) A state that submits an attainment plan that demonstrates that a Serious PM_{2.5} nonattainment area cannot practicably attain the PM_{2.5} NAAQS by the end of the tenth calendar year following the effective date of designation of the area with the implementation of all control measures required under § 51.1010(a) must request an extension of the Serious area attainment date consistent with § 51.1005(b). The request must propose a projected attainment date for the nonattainment area that is as expeditious as practicable, but no later than the end of the fifteenth calendar year following the effective date of designation of the area.

(3) Serious nonattainment areas subject to CAA section 189(d) for failing to attain by the applicable Serious area attainment date. The projected attainment date for a Serious PM_{2.5} nonattainment area that failed to attain the PM_{2.5} NAAQS by the applicable Serious area attainment date shall be as expeditious as practicable, but no later than 5 years following the effective date of the EPA's finding that the area failed to attain by the original Serious area attainment date, except that the Administrator may extend the attainment date to the extent the Administrator deems appropriate, for a period no greater than 10 years from the effective date of the EPA's determination that the area failed to attain, considering the severity of nonattainment and the availability and feasibility of pollution control measures.

(b) Except for attainment plans that meet the conditions of paragraphs (a)(1)(ii) or (a)(3) of this section, the Administrator shall approve an attainment date at the same time and in the same manner in which the Administrator approves the attainment plan for the area.

(1) In accordance with paragraph (a)(1)(ii) of this section, if a state demonstrates that a Moderate PM_{2.5} nonattainment area cannot practicably attain the PM_{2.5} NAAQS by the end of the sixth calendar year following the effective date of designation of the area, the EPA shall proceed under the provisions of § 51.1002(b)(1) to reclassify the area to Serious through notice-and-comment rulemaking.

(2) [Reserved]

§ 51.1005 Attainment date extensions.

(a) *Nonattainment areas initially classified as Moderate.* (1) A state with a Moderate PM_{2.5} nonattainment area may apply for a 1-year attainment date extension for the area if the following conditions are met in the calendar year that includes the applicable attainment date for the area:

(i) The state has complied with all requirements and commitments pertaining to the area in the applicable implementation plan;

(ii) For an area designated nonattainment for a particular 24-hour PM_{2.5} NAAQS for which the state seeks an attainment date extension, the 98th percentile 24-hour concentration at each monitor in the area for the calendar year that includes the applicable attainment date is less than or equal to the level of the applicable 24-hour standard (calculated according to the data analysis requirements in 40 CFR part 50, appendix N);

(iii) For an area designated nonattainment for a particular annual PM_{2.5} NAAQS for which the state seeks an attainment date extension, the annual average concentration at each monitor in the area for the calendar year that includes the applicable attainment date is less than or equal to the level of the applicable annual standard (calculated according to the data analysis requirements in 40 CFR part 50, appendix N).

(2) The applicable implementation plan for a Moderate PM_{2.5} nonattainment area for which a state seeks an attainment date extension is the plan submitted to the EPA to meet the requirements of § 51.1003(a).

(3) A Moderate area 1-year attainment date extension runs from January 1 to December 31 of the year following the year that includes the applicable attainment date.

(4) A state with a Moderate area that received an initial 1-year attainment date extension may apply for a second 1-year attainment date extension for the area if the state meets the conditions described in paragraph (a)(1) of this section for the first 1-year extension year.

(b) *Nonattainment areas reclassified as Serious.* (1) A state may apply for one attainment date extension not to exceed 5 years for a Serious nonattainment area if the following conditions are met:

(i) The state demonstrates that attainment of the applicable PM_{2.5} NAAQS by the approved attainment date for the area would be impracticable or, in the absence of an approved attainment date, attainment of the applicable PM_{2.5} NAAQS by the applicable statutory attainment date for the area would be impracticable;

(ii) The state has complied with all requirements and commitments pertaining to the area in the applicable implementation plan; and,

(iii) The state demonstrates that the attainment plan for the area includes the most stringent measures (MSM) that are included in the attainment plan of any state or are achieved in practice in any state, and can feasibly be implemented in the area consistent with § 51.1010(b).

(2) At the time of application for an attainment date extension, the state shall submit to the EPA a Serious area attainment plan that meets the following requirements:

(i) Base year and attainment projected emissions inventory requirements set forth at § 51.1008(b);

(ii) Most stringent measures (MSM) requirement described under paragraph (b)(1)(iii) of this section and § 51.1010(b), and best available control measures not previously submitted;

(iii) Attainment demonstration and modeling requirements set forth at § 51.1011 that justify the state's commitment under paragraph (b)(1)(i) of this section, and that demonstrate attainment as expeditiously as practicable;

(iv) Reasonable Further Progress (RFP) requirements set forth at § 51.1012;

(v) Quantitative milestone requirements set forth at § 51.1013;

(vi) Contingency measure requirements set forth at § 51.1014; and,

(vii) Nonattainment new source review plan requirements pursuant to § 51.165.

(3) The applicable implementation plan for a Serious PM_{2.5} nonattainment area for which a state seeks an attainment date extension under § 51.1004(a)(2)(ii) is the plan submitted to the EPA to meet the requirements set forth at § 51.1003(a).

(4) The applicable implementation plan for a Serious PM_{2.5} nonattainment area for which a state seeks an attainment date extension under § 51.1004(a)(2)(i) is the plan submitted to the EPA to meet the requirements set forth at § 51.1003(b)(1).

(5) A state applying for an attainment date extension for a Serious nonattainment area under § 51.1004(a)(2)(ii) shall submit to the EPA a request for an extension at the same time as it submits the Serious area attainment plan due under § 51.1003(b)(1).

(6) A state applying for an attainment date extension for a Serious nonattainment area subsequent to submitting an initial Serious area attainment plan that demonstrated attainment of the NAAQS by the applicable attainment date consistent with § 51.1004(a)(2)(i) at the time of submission may apply for such an extension no later than 60 calendar days prior to the approved attainment date for the area or, in the absence of an approved attainment date, no later than 60 calendar days prior to the applicable statutory attainment date for the area.

(c) *Serious nonattainment areas subject to CAA section 189(d) for failing to attain by the applicable Serious area attainment date.* If a Serious area fails to attain a particular PM_{2.5} NAAQS by the applicable Serious area attainment date, the area is then subject to the requirements of section 189(d) of the Act, and, for this reason, the state is prohibited from requesting an extension of the applicable Serious area attainment date for such area.

(d) For any attainment date extension request submitted pursuant to this section, the requesting state (or states) shall submit a written request and evidence of compliance with these regulations which includes both of the following:

(1) Evidence that all control measures submitted in the applicable attainment plan have been implemented, and

(2) Evidence that the area has made emission reduction progress that represents reasonable further progress toward timely attainment of the applicable PM_{2.5} NAAQS.

(e) For a PM_{2.5} nonattainment area located in two or more states or jurisdictions, all states and/or jurisdictions in which such area is located shall submit separate attainment date extension requests for the area consistent with the requirements set forth at paragraph (d) of this section.

§ 51.1006 Optional PM_{2.5} precursor demonstrations

(a) A state may elect to submit to the EPA one or more precursor demonstrations for a specific nonattainment area. The analyses conducted in support of any precursor demonstration must be based on precursor emissions attributed to sources and activities in the nonattainment area.

(1) A comprehensive precursor demonstration must show that emissions of a particular precursor from all existing stationary, area, and mobile sources located in the nonattainment area do not contribute significantly to PM_{2.5} levels that exceed the standard in the area. If the state chooses to conduct a comprehensive precursor demonstration, the state must conduct the analysis in paragraph (a)(1)(i) of this section and it may conduct the analysis in paragraph (a)(1)(ii) of this section.

(i) *Concentration-based contribution analysis.* The comprehensive precursor demonstration must evaluate the contribution of a particular precursor to PM_{2.5} levels in the area. If the contribution of the precursor to PM_{2.5} levels in the area is not significant, based on the facts and circumstances of the area, then the EPA may approve the demonstration.

(ii) *Sensitivity-based contribution analysis.* If the concentration-based contribution analysis does not support a finding of insignificant contribution, based on the facts and circumstances of the area, then the state may choose to submit an analysis evaluating the sensitivity of PM_{2.5} levels in the area to a decrease in emissions of the precursor in order to determine whether the resulting air quality changes are significant. If the estimated air quality changes determined in the sensitivity analysis are not significant, based on the facts and circumstances of the area, then the EPA may approve the demonstration.

(iii) If a comprehensive precursor demonstration is approved by the EPA, the state will not be required to control emissions of the relevant precursor from existing sources in the current attainment plan.

(2) A major stationary source precursor demonstration must show that emissions of a particular precursor from all existing major stationary sources located in the nonattainment area do not contribute significantly to PM_{2.5} levels that exceed the standard in the area. If the state chooses to conduct a major stationary source precursor demonstration, the state must conduct the analysis in paragraph (a)(2)(i) of this

section and it may conduct the analysis in paragraph (a)(2)(ii) of this section.

(i) *Concentration-based contribution analysis.* The major stationary source precursor demonstration must evaluate the contribution of major source emissions of a particular precursor to PM_{2.5} levels in the area. If the contribution of the precursor to PM_{2.5} levels in the area is not significant, based on the facts and circumstances of the area, then the EPA may approve the demonstration.

(ii) *Sensitivity-based contribution analysis.* If the concentration-based contribution analysis does not support a finding of insignificant contribution, based on the facts and circumstances of the area, then the state may choose to submit an analysis evaluating the sensitivity of PM_{2.5} levels in the area to a decrease in emissions of the precursor in order to determine whether the resulting air quality changes are significant. If the estimated air quality changes determined in the sensitivity analysis are not significant, based on the facts and circumstances of the area, then the EPA may approve the demonstration.

(iii) If a major stationary source precursor demonstration is approved by the EPA, the state will not be required to control emissions of the relevant precursor from existing major stationary sources in the current attainment plan.

(3)(i) A NNSR precursor demonstration must evaluate the sensitivity of PM_{2.5} levels in the nonattainment area to an increase in emissions of a particular precursor in order to determine whether the resulting air quality changes are significant. If the estimated air quality changes determined in the sensitivity analysis are not significant, based on the facts and circumstances of the area, the state may use that information to identify new major stationary sources and major modifications of a precursor that will not be considered to contribute significantly to PM_{2.5} levels that exceed the standard in the nonattainment area.

(ii) If a NNSR precursor demonstration for a particular PM_{2.5} nonattainment area is approved, the state may exempt such new major stationary sources or major modifications of the particular precursor from the requirements for PM_{2.5} in § 51.165.

(b) If an area with one or more precursor demonstrations approved by the EPA is required to submit another PM_{2.5} attainment plan in accordance with § 51.1003 of this part, the current precursor demonstration(s) will not apply to the new plan. The state must submit the appropriate updated

precursor demonstration(s) if it seeks to exempt sources of a particular precursor from control requirements in the new Serious area attainment demonstration or in the NNSR program for the Serious area.

§ 51.1007 [Reserved]**§ 51.1008 Emissions inventory requirements.**

(a) For any nonattainment area initially classified as Moderate, the state shall submit to the EPA all of the following:

(1) A base year inventory for the nonattainment area for all emissions sources that meets the following minimum criteria:

(i) The inventory year shall be one of the 3 years for which monitored data were used for designations or another technically appropriate inventory year if justified by the state in the plan submission.

(ii) The inventory shall include actual emissions of all sources within the nonattainment area.

(iii) The emissions values shall be either annual total emissions, average-season-day emissions, or both, as appropriate for the relevant PM_{2.5} NAAQS. The state shall include as part of the plan a rationale for providing annual or seasonal emissions, and the justification for the period used for any seasonal emissions calculations.

(iv) The inventory shall include direct PM_{2.5} emissions, separately reported PM_{2.5} filterable and condensable emissions, and emissions of the scientific PM_{2.5} precursors, including precursors that are not PM_{2.5} plan precursors pursuant to a precursor demonstration under § 51.1006.

(v) The state shall report emissions as point sources according to the point source emissions thresholds of the Air Emissions Reporting Requirements (AERR), 40 CFR part 51, subpart A.

(vi) The detail of the emissions inventory shall be consistent with the detail and data elements required by 40 CFR part 51, subpart A.

(2) An attainment projected inventory for the nonattainment area that meets the following minimum criteria:

(i) The year of the projected inventory shall be the most expeditious year for which projected emissions show modeled PM_{2.5} concentrations below the level of the NAAQS.

(ii) The emissions values shall be projected emissions of the same sources included in the base year inventory for the nonattainment area (*i.e.*, those only within the nonattainment area) and any new sources. The state shall include in this inventory projected emissions

growth and contraction from both controls and other causes during the relevant period.

(iii) The temporal period of emissions shall be the same temporal period (annual, average-season-day, or both) as the base year inventory for the nonattainment area.

(iv) Consistent with the base year inventory for the nonattainment area, the inventory shall include direct PM_{2.5} emissions, separately reported PM_{2.5} filterable and condensable emissions, and emissions of the scientific PM_{2.5} precursors, including precursors that are not PM_{2.5} plan precursors pursuant to a precursor demonstration under § 51.1006 of this part.

(v) The same sources reported as point sources in the base year inventory for the nonattainment area shall be included as point sources in the attainment projected inventory for the nonattainment area. Stationary nonpoint and mobile source projected emissions shall be provided using the same detail (e.g., state, county, and process codes) as the base year inventory for the nonattainment area.

(vi) The same detail of the emissions included shall be consistent with the level of detail and data elements as in the base year inventory for the nonattainment area (i.e., as required by 40 CFR part 41, subpart A).

(b) For any nonattainment area reclassified as Serious, the state shall submit to the EPA all of the following:

(1) For purposes of meeting the emissions inventory requirements of CAA section 172(c)(3), a base year inventory for the nonattainment area for all emissions sources that meets the requirements listed under paragraphs (a)(1) (ii) through (a)(1)(vi) of this section. In addition, the inventory shall use the Serious area definition of a major source listed under § 51.165(a)(1)(iv)(A), and (a)(1)(vii) and (viii), and consistent with Table 1 of Appendix A to subpart A of this part in determining sources to include as point sources. Finally, the inventory year shall be one of the 3 years for which monitored data were used for reclassification to Serious, or another technically appropriate inventory year if justified by the state in the plan submission.

(2) An attainment projected inventory for the nonattainment area that meets the criteria listed under paragraph (a)(2) of this section.

(c) *Serious nonattainment areas subject to CAA section 189(d) for failing to attain a PM_{2.5} NAAQS by the applicable Serious area attainment date.* No later than 12 months after the EPA finds through notice-and-comment

rulemaking that a Serious nonattainment area, or portion thereof contained within a state's borders, fails to attain a PM_{2.5} NAAQS by the applicable attainment date and thus becomes subject to the requirements under CAA section 189(d), the state shall submit to the EPA all of the following:

(1) For purposes of meeting the emissions inventory requirements of CAA section 172(c)(3), a base year inventory for the nonattainment area for all emissions sources that meets the requirements listed under paragraphs (a)(1) (ii) through (a)(1)(vi) of this section. In addition, the inventory shall use the Serious area definition of a major source listed under § 51.165(a)(1)(iv)(A)(vii) and (viii) and consistent with Table 1 of Appendix A to subpart A of this part in determining sources to include as point sources. The inventory year shall be one of the 3 years for which monitored data were used to determine that the area failed to attain the PM_{2.5} NAAQS by the applicable Serious area attainment date, or another technically appropriate inventory year if justified by the state in the plan submission.

(2) An attainment projected inventory for the nonattainment area as defined by § 51.1000(e) and that meets the criteria listed under paragraph (a)(2) of this section.

§ 51.1009 Moderate area attainment plan control strategy requirements.

(a) The state shall identify, adopt, and implement control measures, including control technologies, on sources of direct PM_{2.5} emissions and sources of emissions of PM_{2.5} plan precursors located in any Moderate PM_{2.5} nonattainment area or portion thereof located within the state consistent with the following:

(1) The state shall identify all sources of direct PM_{2.5} emissions and all sources of emissions of PM_{2.5} precursors in the nonattainment area in accordance with the emissions inventory requirements of § 51.1008(a).

(2) The state shall identify all potential control measures to reduce emissions from all sources of direct PM_{2.5} emissions and all sources of emissions of PM_{2.5} plan precursors in the nonattainment area identified under paragraph (a)(1) of this section.

(i) The state is not required to identify and evaluate potential control measures to reduce emissions of a particular PM_{2.5} precursor from any existing sources if the state has submitted a comprehensive precursor demonstration approved by the EPA pursuant to § 51.1006, except where the EPA requires such

information as necessary to evaluate the comprehensive precursor demonstration pursuant to § 51.1006(a)(1)(ii).

(ii) The state is not required to identify and evaluate potential control measures to reduce emissions of a particular PM_{2.5} precursor from any existing major stationary sources if the state has submitted a major stationary source precursor demonstration approved by the EPA pursuant to § 51.1006, except where the EPA requires such information as necessary to evaluate the major stationary source precursor demonstration pursuant to § 51.1006(a)(1)(ii).

(3) For any potential control measure identified under paragraph (a)(2) of this section, the state may make a demonstration that such measure is not technologically or economically feasible to implement in whole or in part by the end of the sixth calendar year following the effective date of designation of the area, and the state may eliminate such whole or partial measure from further consideration under this paragraph.

(i) For purposes of evaluating the technological feasibility of a potential control measure, the state may consider factors including but not limited to a source's processes and operating procedures, raw materials, physical plant layout, and potential environmental impacts such as increased water pollution, waste disposal, and energy requirements.

(ii) For purposes of evaluating the economic feasibility of a potential control measure, the state may consider factors including but not limited to capital costs, operating and maintenance costs, and cost effectiveness of the measure.

(iii) The state must submit to the EPA as part of its Moderate area attainment plan a detailed written justification for eliminating from further consideration any potential control measure identified under paragraph (a)(2) of this section on the basis of technological or economic infeasibility.

(4) The state shall use air quality modeling that meets the requirements of § 51.1011(a) and that accounts for emissions reductions estimated due to all technologically and economically feasible control measures identified for sources of direct PM_{2.5} emissions and sources of emissions of PM_{2.5} plan precursors in the Moderate PM_{2.5} nonattainment area to demonstrate that the area can attain the applicable PM_{2.5} NAAQS as expeditiously as practicable but no later than the end of the sixth year following the effective date of designation of the area. The state may use air quality modeling to demonstrate that the Moderate PM_{2.5} nonattainment

area cannot practicably attain the applicable PM_{2.5} NAAQS by such date.

(i) If the state demonstrates through air quality modeling that the area can attain the applicable PM_{2.5} NAAQS by the end of the sixth calendar year following the effective date of designation of the area, the state shall adopt and implement all technologically and economically feasible control measures identified under paragraph (a)(3) of this section that are necessary to bring the area into attainment by such date. The state shall also adopt and implement all other technologically and economically feasible measures identified under paragraph (a)(3) of this section that, when considered collectively, would advance the attainment date for the area by at least 1 year. If the state demonstrates through this analysis that control measures for reducing emissions of a PM_{2.5} precursor would not be necessary for attainment as expeditiously as practicable or to advance the attainment date, then the state would not be required to include control measures for the precursor in the Moderate area attainment plan, nor be required to address the precursor in the RFP plan, quantitative milestones and associated reports, and contingency measures.

(A) Any control measure identified for adoption and implementation under this paragraph that can be implemented in whole or in part by 4 years after the effective date of designation of the Moderate PM_{2.5} nonattainment area shall be considered RACM for the area. Any such control measure that is also a control technology shall be considered RACT for the area.

(B) Any control measure identified for adoption and implementation under this paragraph that can only be implemented in whole or in part during the period beginning 4 years after the effective date of designation of the Moderate PM_{2.5} nonattainment area and the applicable attainment date for the area shall be considered an additional reasonable measure for the area.

(ii) If the state demonstrates that the area cannot practicably attain the applicable PM_{2.5} NAAQS by the end of the sixth calendar year following the effective date of designation of the area, the state shall adopt all technologically and economically feasible control measures identified under paragraph (a)(3) of this section. This requirement also applies to areas that demonstrate pursuant to section 179B that the plan would be adequate to attain or maintain the standard but for emissions emanating from outside the United States.

(A) Any control measure identified for adoption and implementation under this paragraph that can be implemented in whole or in part by 4 years after the effective date of designation of the Moderate PM_{2.5} nonattainment area shall be considered RACM for the area. Any such control measure that is also a control technology shall be considered RACT for the area.

(B) Any control measure identified for adoption and implementation under this paragraph that can only be implemented in whole or in part during the period beginning 4 years after the effective date of designation of the Moderate PM_{2.5} nonattainment area through the end of the sixth calendar year following the effective date of designation of the area shall be considered an additional reasonable measure for the area.

(b) The state shall adopt control measures, including control technologies, on sources of direct PM_{2.5} emissions and sources of emissions of PM_{2.5} plan precursors located within the state but outside the Moderate PM_{2.5} nonattainment area if adopting such control measures is necessary to provide for attainment of the applicable PM_{2.5} NAAQS in such area.

(c) For new or revised source emissions limitations on sources of direct PM_{2.5} emissions, the state shall establish such emission limitations to apply either to the total of the filterable plus condensable fractions of direct PM_{2.5}, or to filterable PM_{2.5} and condensable PM_{2.5} separately.

§ 51.1010 Serious area attainment plan control strategy requirements.

(a) The state shall identify, adopt, and implement best available control measures, including control technologies, on sources of direct PM_{2.5} emissions and sources of emissions of PM_{2.5} plan precursors located in any Serious PM_{2.5} nonattainment area or portion thereof located within the state and consistent with the following:

(1) The state shall identify all sources of direct PM_{2.5} emissions and all sources of emissions of PM_{2.5} precursors in the nonattainment area in accordance with the emissions inventory requirements of § 51.1008(b).

(2) The state shall identify all potential control measures to reduce emissions from all sources of direct PM_{2.5} emissions and sources of emissions of PM_{2.5} plan precursors in the nonattainment area identified under paragraph (a)(1) of this section.

(i) The state shall survey other NAAQS nonattainment areas in the U.S. and identify any measures for direct PM_{2.5} and PM_{2.5} plan precursors not

previously identified by the state during the development of the Moderate area attainment plan for the area.

(ii) The state is not required to identify and evaluate potential control measures to reduce emissions of a particular PM_{2.5} precursor from any existing sources if the state has submitted a comprehensive precursor demonstration approved by the EPA, except where the EPA requires such information as necessary to evaluate the comprehensive precursor demonstration pursuant to § 51.1006(a)(1)(ii).

(iii) The state is not required to identify and evaluate potential control measures to reduce emissions of a particular PM_{2.5} precursor from any existing major stationary sources if the state has submitted a major stationary source precursor demonstration approved by the EPA, except where the EPA requires such information as necessary to evaluate the major stationary source demonstration pursuant to § 51.1006(a)(1)(ii).

(3) The state may make a demonstration that any measure identified under paragraph (a)(2) of this section is not technologically or economically feasible to implement in whole or in part by the end of the tenth calendar year following the effective date of designation of the area, and may eliminate such whole or partial measure from further consideration under this paragraph.

(i) For purposes of evaluating the technological feasibility of a potential control measure, the state may consider factors including but not limited to a source's processes and operating procedures, raw materials, physical plant layout, and potential environmental impacts such as increased water pollution, waste disposal, and energy requirements.

(ii) For purposes of evaluating the economic feasibility of a potential control measure, the state may consider capital costs, operating and maintenance costs, and cost effectiveness of the measure.

(iii) The state shall submit to the EPA as part of its Serious area attainment plan submission a detailed written justification for eliminating from further consideration any potential control measure identified under paragraph (a)(2) of this section on the basis of technological or economic infeasibility. The state shall provide as part of its written justification an explanation of how its criteria for determining the technological and economic feasibility of potential control measures under paragraphs (a)(3)(i) and (ii) of this section are more stringent than its criteria for determining the

technological and economic feasibility of potential control measures under § 51.1009(a)(3)(i) and (ii) for the same sources in the PM_{2.5} nonattainment area.

(4) Except as provided under paragraph (a)(3) of this section, the state shall adopt and implement all potential control measures identified under paragraph (a)(2) of this section.

(i) Any control measure that can be implemented in whole or in part by the end of the fourth year following the date of reclassification of the area to Serious shall be considered a best available control measure for the area. Any such control measure that is also a control technology for a stationary source in the area shall be considered a best available control technology for the area.

(ii) Any control measure that can be implemented in whole or in part between the end of the fourth year following the date of reclassification of the area to Serious and the applicable attainment date for the area shall be considered an additional feasible measure.

(5) The state shall use air quality modeling that meets the requirements of § 51.1011(b) and that accounts for emissions reductions estimated due to all best available control measures, including best available control technologies, and additional feasible measures identified for sources of direct PM_{2.5} emissions and sources of emissions of PM_{2.5} plan precursors in the area to demonstrate that the area can attain the PM_{2.5} NAAQS as expeditiously as practicable but no later than the end of the tenth calendar year following the effective date of designation of the area, or to demonstrate that the Serious PM_{2.5} nonattainment area cannot practicably attain the applicable PM_{2.5} NAAQS by such date.

(b) For a Serious PM_{2.5} nonattainment area for which air quality modeling demonstrates the area cannot practicably attain the applicable PM_{2.5} NAAQS by the end of the tenth calendar year following the date of designation of the area, the state shall identify, adopt, and implement the most stringent control measures that are included in the attainment plan for any state or are achieved in practice in any state, and can be feasibly implemented in the area, consistent with the following requirements.

(1) The state shall identify all sources of direct PM_{2.5} emissions and sources of emissions of PM_{2.5} precursors in the nonattainment area in accordance with the emissions inventory requirements of § 51.1008(b).

(2) The state shall identify all potential control measures to reduce

emissions from all sources of direct PM_{2.5} emissions and sources of emissions of PM_{2.5} plan precursors in the nonattainment area identified under paragraph (b)(1) of this section.

(i) For the sources and source categories represented in the emission inventory for the nonattainment area, the state shall identify the most stringent measures for reducing direct PM_{2.5} and PM_{2.5} plan precursors adopted into any SIP or used in practice to control emissions in any state.

(ii) The state shall reconsider and reassess any measures previously rejected by the state during the development of any previous Moderate area or Serious area attainment plan control strategy for the area.

(3) The state may make a demonstration that a measure identified under paragraph (b)(2) of this section is not technologically or economically feasible to implement in whole or in part by 5 years after the applicable attainment date for the area, and may eliminate such whole or partial measure from further consideration under this paragraph.

(i) For purposes of evaluating the technological feasibility of a potential control measure, the state may consider factors including but not limited to a source's processes and operating procedures, raw materials, physical plant layout, and potential environmental impacts such as increased water pollution, waste disposal, and energy requirements.

(ii) For purposes of evaluating the economic feasibility of a potential control measure, the state may consider capital costs, operating and maintenance costs, and cost effectiveness of the measure.

(iii) The state shall submit to the EPA as part of its Serious area attainment plan submission a detailed written justification for eliminating from further consideration any potential control measure identified under paragraph (b)(2) of this section on the basis of technological or economic infeasibility.

(4) Except as provided under paragraph (b)(3) of this section, the state shall adopt and implement all control measures identified under paragraph (b)(2) of this section that collectively shall achieve attainment as expeditiously as practicable but no later than 5 years after the applicable attainment date for the area.

(5) The state shall use air quality modeling that meets the requirements of § 51.1011(b) and that accounts for emissions reductions estimated due to all most stringent measures; best available control measures, including best available control technologies; and

additional feasible measures identified for sources of direct PM_{2.5} emissions and sources of emissions of PM_{2.5} plan precursors in the area to demonstrate that the area can attain the PM_{2.5} NAAQS as expeditiously as practicable but no later than the end of the fifteenth calendar year following the effective date of designation of the area.

(c) For a Serious PM_{2.5} nonattainment area that the EPA has determined has failed to attain by the applicable attainment date, the state shall submit a revised attainment plan with a control strategy that demonstrates that each year the area will achieve at least a 5 percent reduction in emissions of direct PM_{2.5} or a 5 percent reduction in emissions of a PM_{2.5} plan precursor based on the most recent emissions inventory for the area; and that the area will attain the standard as expeditiously as practicable consistent with § 51.1004(a)(3). The plan shall meet the requirements of § 51.1003(c)–(d), and the following requirements:

(1) The state shall identify all sources of direct PM_{2.5} emissions and sources of emissions of PM_{2.5} precursors in the nonattainment area in accordance with the emissions inventory requirements of § 51.1008(b).

(2) The state shall identify all potential control measures to reduce emissions from all sources of direct PM_{2.5} emissions and sources of emissions of PM_{2.5} plan precursors in the nonattainment area identified under paragraph (c)(1) of this section.

(i) For the sources and source categories represented in the emission inventory for the nonattainment area, the state shall identify the most stringent measures for reducing direct PM_{2.5} and PM_{2.5} plan precursors adopted into any SIP or used in practice to control emissions in any state, as applicable.

(ii) The state shall reconsider and reassess any measures previously rejected by the state during the development of any Moderate area or Serious area attainment plan control strategy for the area.

(3) The state may make a demonstration that a measure identified under paragraph (c)(2) of this section is not technologically or economically feasible to implement in whole or in part within 5 years or such longer period as the EPA may determine is appropriate after the EPA's determination that the area failed to attain by the Serious area attainment date, and may eliminate such whole or partial measure from further consideration under this paragraph.

(i) For purposes of evaluating the technological feasibility of a potential

control measure, the state may consider factors including but not limited to a source's processes and operating procedures, raw materials, physical plant layout, and potential environmental impacts such as increased water pollution, waste disposal, and energy requirements.

(ii) For purposes of evaluating the economic feasibility of a potential control measure, the state may consider capital costs, operating and maintenance costs, and cost effectiveness of the measure.

(iii) The state shall submit to the EPA as part of its Serious area attainment plan submission a detailed written justification for eliminating from further consideration any potential control measure identified under paragraph (c)(2) of this section on the basis of technological or economic infeasibility.

(4) Except as provided under paragraph (c)(3) of this section, the state shall adopt and implement all control measures identified under paragraph (c)(2) of this section that collectively achieve attainment of the standard as expeditiously as practicable pursuant to § 51.1004(a)(3).

(5) The state shall conduct air quality modeling that meets the requirements of § 51.1011(b) and that accounts for emissions reductions due to control measures needed to meet the annual reduction requirement of 5 percent of direct PM_{2.5} or a PM_{2.5} plan precursor; most stringent measures; best available control measures, including best available control technologies; and additional feasible measures identified for sources of direct PM_{2.5} emissions and sources of emissions of PM_{2.5} plan precursors in the area in order to demonstrate that the area can attain the PM_{2.5} NAAQS as expeditiously as practicable.

(d) The state shall adopt control measures, including control technologies, on sources of direct PM_{2.5} emissions and sources of emissions of PM_{2.5} plan precursors located within the state but outside the Serious PM_{2.5} nonattainment area if adopting such control measures is necessary to provide for attainment of the applicable PM_{2.5} NAAQS in such area by the attainment date.

(e) For new or revised source emissions limitations on sources of direct PM_{2.5} emissions, the state shall establish such emission limitations to apply either to the total of the filterable plus condensable fractions of direct PM_{2.5}, or to filterable PM_{2.5} and condensable PM_{2.5} separately.

§ 51.1011 Attainment demonstration and modeling requirements.

(a) *Nonattainment areas initially classified as Moderate.* The attainment demonstration due to the EPA as part of any Moderate area attainment plan required under § 51.1003(a) shall meet all of the following criteria:

(1) The attainment demonstration shall show the projected attainment date for the Moderate nonattainment area that is as expeditious as practicable in accordance with the requirements of § 51.1004(a)(1).

(2) The attainment demonstration shall meet the requirements of Appendix W of this part and shall include inventory data, modeling results, and emission reduction analyses on which the state has based its projected attainment date.

(3) The base year for the emissions inventory required for an attainment demonstration under this paragraph shall be one of the 3 years used for designations or another technically appropriate inventory year if justified by the state in the plan submission.

(4) The control strategies modeled as part of the attainment demonstration shall be consistent with the following as applicable:

(i) For a Moderate area that can demonstrate attainment of the applicable PM_{2.5} NAAQS no later than the end of the sixth calendar year following the date of designation of the area with the implementation of RACM and RACT and additional reasonable measures, the control strategies modeled as part of the attainment demonstration shall be consistent with control strategy requirements under § 51.1009(a).

(ii) For a Moderate area that cannot practicably attain the applicable PM_{2.5} NAAQS by the end of the sixth calendar year following the date of designation of the area with the implementation of RACM and RACT and additional reasonable measures, the control strategies modeled as part of the attainment demonstration shall be consistent with control strategy requirements under § 51.1009(b).

(5) Required time frame for obtaining emissions reductions. For each Moderate nonattainment area, the attainment plan must provide for implementation of all control measures needed for attainment as expeditiously as practicable. All control measures in the attainment demonstration must be implemented no later than the beginning of the year containing the applicable attainment date, notwithstanding RACM implementation deadline requirements in § 51.1009.

(b) *Nonattainment areas reclassified as Serious.* The attainment

demonstration due to the EPA as part of a Serious area attainment plan required under § 51.1003(b) or (c) shall meet all of the following criteria:

(1) The attainment demonstration shall show the projected attainment date for the Serious nonattainment area that is as expeditious as practicable.

(2) The attainment demonstration shall meet the requirements of Appendix W of this part and shall include inventory data, modeling results, and emission reduction analyses on which the state has based its projected attainment date.

(3) The base year for the emissions inventories required for attainment demonstrations under this paragraph shall be one of the 3 years used for designations or another technically appropriate inventory year if justified by the state in the plan submission.

(4) The control strategies modeled as part of a Serious area attainment demonstration shall be consistent with the control strategies required pursuant to § 51.1003 and § 51.1010.

(5) Required timeframe for obtaining emissions reductions. For each Serious nonattainment area, the attainment plan must provide for implementation of all control measures needed for attainment as expeditiously as practicable. All control measures must be implemented no later than the beginning of the year containing the applicable attainment date, notwithstanding BACM implementation deadline requirements in § 51.1010.

§ 51.1012 Reasonable further progress (RFP) requirements.

(a) Each attainment plan for a PM_{2.5} nonattainment area shall include an RFP plan that demonstrates that sources in the area will achieve such annual incremental reductions in emissions of direct PM_{2.5} and PM_{2.5} plan precursors as are necessary to ensure attainment of the applicable PM_{2.5} NAAQS as expeditiously as practicable. The RFP plan shall include all of the following:

(1) A schedule describing the implementation of control measures during each year of the applicable attainment plan. Control measures for Moderate area attainment plans are required in § 51.1009, and control measures for Serious area attainment plans are required in § 51.1010.

(2) RFP projected emissions for direct PM_{2.5} and all PM_{2.5} plan precursors for each applicable milestone year, based on the anticipated implementation schedule for control measures required in paragraph (a)(1) of this section. For purposes of establishing motor vehicle emissions budgets for transportation conformity purposes (as required in 40

CFR part 93) for a PM_{2.5} nonattainment area, the state shall include in its RFP submission an inventory of on-road mobile source emissions in the nonattainment area for each milestone year.

(3) An analysis that presents the schedule of control measures and estimated emissions changes to be achieved by each milestone year, and that demonstrates that the control strategy will achieve reasonable progress toward attainment between the applicable base year and the attainment year. The analysis shall rely on information from the base year inventory for the nonattainment area required in § 51.1008(a)(1) and the attainment projected inventory for the nonattainment area required in § 51.1008(a)(2), in addition to the RFP projected emissions required in paragraph (a)(2) of this section.

(4) An analysis that demonstrates that by the end of the calendar year for each milestone date for the area determined in accordance with § 51.1013(a), pollutant emissions will be at levels that reflect either generally linear progress or stepwise progress in reducing emissions on an annual basis between the base year and the attainment year. A demonstration of stepwise progress must be accompanied by appropriate justification for the selected implementation schedule.

(5) At the state's election, an analysis that identifies air quality targets associated with the RFP projected emissions identified for the milestone years at the design value monitor locations.

(b) For a multi-state or multi-jurisdictional nonattainment area, the RFP plans for each state represented in the nonattainment area shall demonstrate RFP on the basis of common multi-state inventories. The states or jurisdictions within which the area is located must provide a coordinated RFP plan. Each state in a multi-state nonattainment area must ensure that the sources within its boundaries comply with enforceable emission levels and other requirements that in combination with the reductions planned in other state(s) within the nonattainment area will provide for attainment as expeditiously as practicable and demonstrate RFP consistent with these regulations.

§ 51.1013 Quantitative milestone requirements.

(a) Consistent with CAA section 189(c)(1), the state must submit in each attainment plan for a PM_{2.5} nonattainment area specific quantitative milestones that demonstrate reasonable

further progress toward attainment of the applicable PM_{2.5} NAAQS in the area and that meet the following requirements:

(1) *Nonattainment areas initially classified as Moderate.* (i) Except as provided in paragraph (a)(4) of this section, each attainment plan submittal for a Moderate PM_{2.5} nonattainment area shall contain quantitative milestones to be achieved no later than a milestone date of 4.5 years and 7.5 years from the date of designation of the area.

(ii) The plan shall contain quantitative milestones to be achieved by the milestone dates specified in paragraph (a)(1)(i) of this section, as applicable, and that provide for objective evaluation of reasonable further progress toward timely attainment of the applicable PM_{2.5} NAAQS in the area. At a minimum, each quantitative milestone plan must include a milestone for tracking progress achieved in implementing the SIP control measures, including RACM and RACT, by each milestone date.

(2) *Nonattainment areas reclassified as Serious.* (i) Except as provided in paragraph (a)(4) of this section, each attainment plan submission that demonstrates that a Serious PM_{2.5} nonattainment area can attain a particular PM_{2.5} NAAQS by the end of the tenth calendar year following the effective date of designation of the area with the implementation of control measures as required under § 51.1010(a) shall contain quantitative milestones to be achieved no later than milestone dates of 7.5 years and 10.5 years, respectively, from the date of designation of the area.

(ii) Except as provided in paragraph (a)(4) of this section, each attainment plan submission that demonstrates that a Serious PM_{2.5} nonattainment area cannot practicably attain a particular PM_{2.5} NAAQS by the end of the tenth calendar year following the date of designation of the area with the implementation of control measures required under § 51.1010(a) shall contain quantitative milestones to be achieved no later than milestone dates of 7.5 years, 10.5 years, and 13.5 years from the date of designation of the area. If the attainment date is beyond 13.5 years from the date of designation of the area, such attainment plan shall also contain a quantitative milestones to be achieved no later than milestone dates of 16.5 years, respectively, from the date of designation of the area.

(iii) The plan shall contain quantitative milestones to be achieved by the milestone dates specified in paragraphs (a)(2)(i) and (ii) of this section, as applicable, and that provide

for objective evaluation of reasonable further progress toward timely attainment of the applicable PM_{2.5} NAAQS in the area. At a minimum, each quantitative milestone plan must include a milestone for tracking progress achieved in implementing SIP control measures, including BACM and BACT, by each milestone date.

(3) *Serious areas that fail to attain by the applicable Serious area attainment date.* (i) Except as provided in paragraph (a)(4) of this section, each attainment plan submission for a Serious area that failed to attain a particular PM_{2.5} NAAQS by the applicable Serious area attainment date and is therefore subject to the requirements of CAA section 189(d) and § 51.1003(c) shall contain quantitative milestones.

(A) If the attainment plan is due prior to a date 13.5 years from designation of the area, then the plan shall contain milestones to be achieved by no later than a milestone date of 13.5 years from the date of designation of the area, and every 3 years thereafter, until the milestone date that falls within 3 years after the applicable attainment date.

(B) If the attainment plan is due later than a date 13.5 years from designation of the area, then the plan shall contain milestones to be achieved by no later than a milestone date of 16.5 years from the date of designation of the area, and every 3 years thereafter, until the milestone date that falls within 3 years after the applicable attainment date.

(ii) The plan shall contain quantitative milestones to be achieved by the milestone dates for the area, and that provide for objective evaluation of reasonable further progress toward timely attainment of the applicable PM_{2.5} NAAQS in the area. At a minimum, each quantitative milestone plan must include a milestone for tracking progress achieved in implementing the SIP control measures by each milestone date.

(4) Each attainment plan submission for an area designated nonattainment for the 1997 and/or 2006 PM_{2.5} NAAQS before January 15, 2015, shall contain quantitative milestones to be achieved no later than 3 years after December 31, 2014, and every 3 years thereafter until the milestone date that falls within 3 years after the applicable attainment date.

(b) Not later than 90 days after the date on which a milestone applicable to a PM_{2.5} nonattainment area occurs, each state in which all or part of such area is located shall submit to the Administrator a milestone report that contains all of the following:

(1) A certification by the Governor or Governor's designee that the SIP control strategy is being implemented consistent with the RFP plan, as described in the applicable attainment plan;

(2) Technical support, including calculations, sufficient to document completion statistics for appropriate milestones and to demonstrate that the quantitative milestones have been satisfied and how the emissions reductions achieved to date compare to those required or scheduled to meet RFP; and,

(3) A discussion of whether the area will attain the applicable PM_{2.5} NAAQS by the projected attainment date for the area.

(c) If a state fails to submit a milestone report by the date specified in paragraph (b) of this section, the Administrator shall require the state to submit, within 9 months after such failure, a plan revision that assures that the area will achieve the next milestone or attain the applicable NAAQS by the applicable date, whichever is earlier. If the Administrator determines that an area has not met any applicable milestone by the milestone date, the state shall submit, within 9 months after such determination, a plan revision that assures that the area will achieve the next milestone or attain the applicable NAAQS by the applicable date, whichever is earlier.

§ 51.1014 Contingency measure requirements.

(a) The state must include as part of each attainment plan submitted under this subpart for a PM_{2.5} nonattainment area specific contingency measures that shall take effect with minimal further action by the state or the EPA following a determination by the Administrator that the area has failed:

(1) To meet any RFP requirement in an attainment plan approved in accordance with § 51.1012;

(2) To meet any quantitative milestone in an attainment plan approved in accordance with § 51.1013;

(3) To submit a quantitative milestone report required under § 51.1013(b); or,

(4) To attain the applicable PM_{2.5} NAAQS by the applicable attainment date.

(b) The contingency measures adopted as part of a PM_{2.5} attainment plan shall meet all of the following requirements:

(1) The contingency measures shall consist of control measures that are not otherwise included in the control strategy or that achieve emissions reductions not otherwise relied upon in the control strategy for the area; and,

(2) Each contingency measure shall specify the timeframe within which its requirements become effective following a determination by the Administrator under paragraph (a) of this section.

(c) The attainment plan submission shall contain a description of the specific trigger mechanisms for the contingency measures and specify a schedule for implementation.

§ 51.1015 Clean data requirements.

(a) *Nonattainment areas initially classified as Moderate.* Upon a determination by the EPA that a Moderate PM_{2.5} nonattainment area has attained the PM_{2.5} NAAQS, the requirements for the state to submit an attainment demonstration, provisions demonstrating that reasonably available control measures (including reasonably available control technology for stationary sources) shall be implemented no later than 4 years following the date of designation of the area, reasonable further progress plan, quantitative milestones and quantitative milestone reports, and contingency measures for the area shall be suspended until such time as:

(1) The area is redesignated to attainment, after which such requirements are permanently discharged; or,

(2) The EPA determines that the area has re-violated the PM_{2.5} NAAQS, at which time the state shall submit such attainment plan elements for the Moderate nonattainment area by a future date to be determined by the EPA and announced through publication in the **Federal Register** at the time EPA determines the area is violating the PM_{2.5} NAAQS.

(b) *Nonattainment areas reclassified as Serious.* Upon a determination by the EPA that a Serious PM_{2.5} nonattainment area has attained the PM_{2.5} NAAQS, the requirements for the state to submit an attainment demonstration, reasonable further progress plan, quantitative milestones and quantitative milestone reports, and contingency measures for the area shall be suspended until such time as:

(1) The area is redesignated to attainment, after which such requirements are permanently discharged; or,

(2) The EPA determines that the area has re-violated the PM_{2.5} NAAQS, at which time the state shall submit such attainment plan elements for the Serious nonattainment area by a future date to be determined by the EPA and announced through publication in the **Federal Register** at the time the EPA determines the area is violating the PM_{2.5} NAAQS.

§ 51.1016 Continued applicability of the FIP and SIP requirements pertaining to interstate transport under CAA section 110(a)(2)(D)(i) and (ii) after revocation of the 1997 primary annual PM_{2.5} NAAQS.

All control requirements associated with a FIP or approved SIP in effect for an area pursuant to obligations arising from CAA section 110(a)(2)(D)(i) and (ii) as of October 24, 2016, such as the CAIR or the CSAPR, shall continue to apply after revocation of the 1997 primary annual PM_{2.5} NAAQS. Control requirements associated with a FIP or approved into the SIP pursuant to obligations arising from CAA section 110(a)(2)(D)(i) and (ii), including 40 CFR 51.123, 51.124, 52.35, 52.36, 52.38 and 52.39, may be modified by the state only if the requirements of § 51.123, 51.124, 52.35, 52.36, 52.38 and 52.39, including statewide annual SO₂ and annual NO_x emission budgets, continue to be in effect. Any such modification must meet the requirements of CAA section 110(l).

■ 7. In Appendix S to Part 51:

■ a. Revise paragraph II.A.4.(i)(a) introductory text;

■ b. Add paragraphs II.A.4.(i)(a)(7)–(8);

■ c. Revise paragraph II.A.10.(i);

■ d. Add paragraph II.A.10.(vi);

■ e. Revise paragraph II.A.31.(ii)(b)(2); and

■ f. Add paragraphs II.A.31.(ii)(b)(3) and (4).

The revisions and additions read as follows:

Appendix S to Part 51—Emission Offset Interpretative Ruling

* * * * *

II. * * *

A. * * *

4. (i) * * *

(a) Any stationary source of air pollutants which emits, or has the potential to emit, 100 tons per year or more of a regulated NSR pollutant (as defined in paragraph II.A.31 of this Ruling), except that lower emissions thresholds shall apply in areas subject to subpart 2, subpart 3, or subpart 4 of part D, title I of the Act, according to paragraphs II.A.4(i)(a)(1) through (8) of this ruling.

* * * * *

(7) 70 tons per year of PM_{2.5} in any serious nonattainment area for PM_{2.5}.

(8) 70 tons per year of any individual PM_{2.5} precursor (as defined in paragraph II.A.31 of this Ruling) in any Serious nonattainment area for PM_{2.5}.

* * * * *

10.(i) *Significant* means, in reference to a net emissions increase or the potential of a source to emit any of the following pollutants, a rate of emissions that would equal or exceed any of the following rates:

Pollutant and Emissions Rate

Carbon monoxide: 100 tons per year (tpy)
 Nitrogen oxides: 40 tpy
 Sulfur dioxide: 40 tpy
 Ozone: 40 tpy of Volatile organic compounds or Nitrogen oxides
 Lead: 0.6 tpy
 Particulate matter: 25 tpy of Particulate matter emissions
 PM₁₀: 15 tpy
 PM_{2.5}: 10 tpy of direct PM_{2.5} emissions; 40 tpy of Sulfur dioxide emissions, 40 tpy of Nitrogen oxides emissions, or 40 tpy of Volatile organic compound emissions, to the extent that any such pollutant is defined as a precursor for PM_{2.5} in paragraph II.A.31 of this Ruling.

* * * * *

(vi) In any nonattainment area for PM_{2.5} in which a state must regulate Ammonia as a regulated NSR pollutant (as a PM_{2.5} precursor) as defined in paragraph II.A.31 of this Ruling, the reviewing authority shall define “significant” for Ammonia for that area and establish a record to document its supporting basis. All sources with modification projects with increases in Ammonia emissions that are not subject to Section IV of this Ruling must maintain records of the non-applicability of Section IV that reference the definition of “significant” for Ammonia that is established by the reviewing authority in the nonattainment area where the source is located.

31. * * *

(ii) * * *

(b) * * *

(2) Sulfur dioxide and Nitrogen oxides are regulated as precursors to PM_{2.5} in all PM_{2.5} nonattainment areas.

(3) For any area that was designated nonattainment for PM_{2.5} on or before April 15, 2015, Volatile organic compounds and Ammonia shall be regulated as precursors to PM_{2.5} beginning on April 15, 2017, with respect to any permit issued for PM_{2.5}, unless the following conditions are met: The state submits a SIP for the Administrator’s review containing the state’s preconstruction review provisions for PM_{2.5} consistent with § 51.165 and a complete NNSR precursor demonstration consistent with § 51.1006(a)(3); and such SIP is determined to be complete by the Administrator or deemed to be complete by operation of law in accordance with section 110(k)(1)(B) of the Act by April 15, 2017. If these conditions are met, the

precursor(s) addressed by the NNSR precursor demonstration (Volatile organic compounds, Ammonia, or both) shall not be regulated as a precursor to PM_{2.5} in such area. If the Administrator subsequently disapproves the state’s preconstruction review provisions for PM_{2.5} and the NNSR precursor demonstration, the precursor(s) addressed by the NNSR precursor demonstration shall be regulated as a precursor to PM_{2.5} under this Ruling in such area as of April 15, 2017, or the effective date of the disapproval, whichever date is later.

(4) For any area that is designated nonattainment for PM_{2.5} after April 15, 2015, and was not already designated nonattainment for PM_{2.5} on or immediately prior to such date, Volatile organic compounds and Ammonia shall be regulated as precursors to PM_{2.5} under this Ruling beginning 24 months from the date of designation as nonattainment for PM_{2.5} with respect to any permit issued for PM_{2.5}, unless the following conditions are met: the state submits a SIP for the Administrator’s review which contains the state’s preconstruction review provisions for PM_{2.5} consistent with § 51.165 and a complete NNSR precursor demonstration consistent with § 51.1006(a)(3); and such SIP is determined to be complete by the Administrator or deemed to be complete by operation of law in accordance with section 110(k)(1)(B) of the Act by the date 24 months from the date of designation. If these conditions are met, the precursor(s) addressed by the NNSR precursor demonstration (Volatile organic compounds, Ammonia, or both) shall not be regulated as a precursor to PM_{2.5} in such area. If the Administrator subsequently disapproves the state’s preconstruction review provisions for PM_{2.5} and the NNSR precursor demonstration, the precursor(s) addressed by the NNSR precursor demonstration shall be regulated as a precursor to PM_{2.5} under this Ruling in such area as of the date 24 months from the date of designation, or the effective date of the disapproval, whichever date is later.

PART 93—DETERMINING CONFORMITY OF FEDERAL ACTIONS TO STATE OR FEDERAL IMPLEMENTATION PLANS

■ 8. The authority citation for part 93 continues to read as follows:

Authority: 42 U.S.C. 7401–7671q.

Subpart B—Determining Conformity of General Federal Actions to State or Federal Implementation Plans

■ 9. In § 93.153, revise paragraphs (b)(1) and (2) to read as follows:

§ 93.153 Applicability.

* * * * *

(b) * * *

(1) For purposes of paragraph (b) of this section the following rates apply in nonattainment areas (NAA’s):

	Tons/year
Ozone (VOC’s or NO _x):	
Serious NAA’s	50
Severe NAA’s	25
Extreme NAA’s	10
Other ozone NAA’s outside an ozone transport region	100
Other ozone NAA’s inside an ozone transport region:	
VOC	50
NO _x	100
Carbon Monoxide: All maintenance areas	100
SO ₂ or NO ₂ : All NAA’s	100
PM ₁₀ :	
Moderate NAA’s	100
Serious NAA’s	70
PM _{2.5} (direct emissions, SO ₂ , NO _x , VOC, and Ammonia):	
Moderate NAA’s	100
Serious NAA’s	70
Pb: All NAA’s	25

(2) For purposes of paragraph (b) of this section the following rates apply in maintenance areas:

	Tons/year
Ozone (NO _x), SO ₂ or NO ₂ :	
All maintenance areas	100
Ozone (VOC’s):	
Maintenance areas inside an ozone transport region	50
Maintenance areas outside an ozone transport region	100
Carbon monoxide: All maintenance areas	100
PM ₁₀ : All maintenance areas	100
PM _{2.5} (direct emissions, SO ₂ , NO _x , VOC, and Ammonia) ...	100
All maintenance areas	100
Pb: All maintenance areas	25

10 CFR Parts 429 and 430

Energy Conservation Program: Test Procedures for Central Air Conditioners and Heat Pumps; Proposed Rule

DEPARTMENT OF ENERGY**10 CFR Parts 429 and 430****[Docket No. EERE-2016-BT-TP-0029]****RIN 1904-AD71****Energy Conservation Program: Test Procedures for Central Air Conditioners and Heat Pumps**

AGENCY: Office of Energy Efficiency and Renewable Energy, Department of Energy.

ACTION: Supplemental notice of proposed rulemaking.

SUMMARY: The U.S. Department of Energy (DOE) proposes to revise its test procedures for central air conditioners and heat pumps (CAC/HP) established under the Energy Policy and Conservation Act. DOE published several proposals in a November 2015 supplemental notice of proposed rulemaking (SNOPR). DOE finalized some of the proposed test procedure amendments in a June 2016 final rule. This SNOPR proposes additional revisions to some of the amendments proposed in the past notices and proposes some additional amendments. Specifically, this SNOPR proposes two sets of amendments to the test procedure: Amendments to appendix M that would be required as the basis for making efficiency representations starting 180 days after final rule publication; and amendments as part of a new appendix M1 that would be the basis for making efficiency representations as of the compliance date for any amended energy conservation standards. Broadly speaking, the proposed amendments address the off-mode test procedures, clarifications on test set-up and fan delays, limits to gross indoor fin surface area for valid combinations, external static pressure conditions for testing, clarifications on represented values for CAC/HP that are distributed in commerce with multiple refrigerants, and the methodology for testing and calculating heating performance. DOE does not expect the proposed changes to appendix M to change measured efficiency. However, DOE has determined that the proposed procedures in new appendix M1 would change measured efficiency. DOE welcomes comments from the public on any subject within the scope of this test procedure rulemaking.

DATES: DOE will accept comments, data, and information regarding this supplemental notice of proposed rulemaking (SNOPR) no later than

September 23, 2016. See section V, "Public Participation," for details.

DOE will hold a public meeting on Friday, August 26, 2016, from 10 a.m. to 2 p.m., in Washington, DC. The meeting will also be broadcast as a webinar. See section V, Public Participation, for webinar registration information, participant instructions, and information about the capabilities available to webinar participants.

ADDRESSES: The public meeting will be held at the U.S. Department of Energy, Forrestal Building, Room 1E-245, 1000 Independence Avenue SW., Washington, DC 20585.

Any comments submitted must identify the Test Procedure SNOPR for central air conditioners and heat pumps, and provide docket number EERE-2016-BT-TP-0029 and/or regulatory information number (RIN) number 1904-AD 71. Comments may be submitted using any of the following methods:

(1) *Federal eRulemaking Portal:* www.regulations.gov. Follow the instructions for submitting comments.

(2) *Email:* CACHeatPump2016TP0029@ee.doe.gov Include the docket number and/or RIN in the subject line of the message.

(3) *Mail:* Appliance and Equipment Standards Program, U.S. Department of Energy, Building Technologies Office, Mailstop EE-5B, 1000 Independence Avenue SW., Washington, DC 20585-0121. If possible, please submit all items on a CD, in which case it is not necessary to include printed copies.

(4) *Hand Delivery/Courier:* Appliance and Equipment Standards Program, U.S. Department of Energy, Building Technologies Office, 950 L'Enfant Plaza, SW., 6th Floor, Washington, DC 20024. Telephone: (202) 586-6636. If possible, please submit all items on a CD, in which case it is not necessary to include printed copies.

For detailed instructions on submitting comments and additional information on the rulemaking process, see section V of this document (Public Participation).

Docket: The docket, which includes **Federal Register** notices, comments, and other supporting documents/materials, is available for review at www.regulations.gov. All documents in the docket are listed in the www.regulations.gov index. However, some documents listed in the index, such as those containing information that is exempt from public disclosure, may not be publicly available.

The docket Web page can be found at <https://www.regulations.gov/docket?D=EERE-2016-BT-TP-0029>. The

docket Web page will contain simple instructions on how to access all documents, including public comments, in the docket. See section V for information on how to submit comments through www.regulations.gov.

FOR FURTHER INFORMATION CONTACT:

Ashley Armstrong, U.S. Department of Energy, Office of Energy Efficiency and Renewable Energy, Building Technologies Program, EE-5B, 1000 Independence Avenue SW., Washington, DC 20585-0121. Telephone: (202) 586-6590. Email: Ashley.Armstrong@ee.doe.gov.

Johanna Jochum, U.S. Department of Energy, Office of the General Counsel, GC-33, 1000 Independence Avenue SW., Washington, DC 20585-0121. Telephone: (202) 287-6307. Email: Johanna.Jochum@hq.doe.gov.

For further information on how to submit a comment, review other public comments and the docket, or participate in the public meeting, contact the Appliance and Equipment Standards Program staff at (202) 586-6636 or by email: CACHeatPump2016TP0029@ee.doe.gov.

SUPPLEMENTARY INFORMATION: DOE is not proposing to incorporate any new standards by reference in this supplemental notice of proposed rulemaking.

 - D. Submission of Comments
 - E. Issues on Which DOE Seeks Comment
- VI. Approval of the Office of the Secretary

I. Authority and Background

A. Authority

Title III, Part B¹ of the Energy Policy and Conservation Act of 1975 (“EPCA” or “the Act”), Public Law 94–163 (42 U.S.C. 6291–6309, as codified) sets forth a variety of provisions designed to improve energy efficiency and established the Energy Conservation Program for Consumer Products Other Than Automobiles.² These products

include central air conditioners and central air conditioning heat pumps,³ (single-phase⁴ with rated cooling capacities less than 65,000 British thermal units per hour (Btu/h))), which are the focus of this SNOPR. (42 U.S.C. 6291(1)–(2), (21) and 6292(a)(3))

Under EPCA, DOE’s energy conservation program generally consists of four parts: (1) Testing; (2) labeling; (3) Federal energy conservation standards; and (4) certification, compliance, and enforcement. The testing requirements consist of test procedures that manufacturers of covered products must use as the basis of: (1) Certifying to DOE that their products comply with applicable energy conservation standards adopted pursuant to EPCA, and (2) making other representations about the efficiency of those products. (42 U.S.C. 6293(c); 42 U.S.C. 6295(s)) Similarly, DOE must use these test procedures to determine whether covered products comply with any relevant standards promulgated under EPCA. (42 U.S.C. 6295(s))

EPCA sets forth criteria and procedures DOE must follow when prescribing or amending test procedures for covered products. (42 U.S.C. 6293(b)(3)) EPCA provides, in relevant part, that any test procedures prescribed or amended under this section shall be reasonably designed to produce test results which measure the energy efficiency, energy use, or estimated annual operating cost of a covered product during a representative average use cycle or period of use, and shall not be unduly burdensome to conduct. *Id.*

In addition, if DOE determines that a test procedure amendment is warranted, it must publish proposed test procedures and offer the public an opportunity to present oral and written comments on them. (42 U.S.C. 6293(b)(2)) Finally, in any rulemaking to amend a test procedure, DOE must determine to what extent, if any, the amended test procedure would alter the measured energy efficiency of any covered product as determined under the existing test procedure. (42 U.S.C. 6293(e)(1))

The Energy Independence and Security Act of 2007 (EISA 2007), Public Law 110–140, amended EPCA to require that, at least once every 7 years, DOE must review test procedures for all

Efficiency Improvement Act of 2015, Public Law 114–11 (Apr. 30, 2015).

³ This notice uses the term “CAC/HP” to refer specifically to central air conditioners (which include heat pumps) as defined by EPCA. 42 U.S.C. 6291(21.)

⁴ Where this notice uses the term “CAC/HP”, they are in reference specifically to central air conditioners and heat pumps as defined by EPCA.

covered products and either amend the test procedures (if the Secretary determines that amended test procedures would more accurately or fully comply with the requirements of 42 U.S.C. 6293(b)(3)) or publish a notice in the **Federal Register** of any determination not to amend a test procedure. (42 U.S.C. 6293(b)(1)(A))

DOE’s existing test procedures for CAC/HP adopted pursuant to these provisions appear under Title 10 of the Code of Federal Regulations (CFR) part 430, subpart B, appendix M (“Uniform Test Method for Measuring the Energy Consumption of Central Air Conditioners and Heat Pumps”). These procedures establish the currently permitted means for determining energy efficiency and annual energy consumption for CAC/HP. Some of the amendments proposed in this SNOPR will alter the measured efficiency, as represented in the regulating metrics of seasonal energy efficiency ratio (SEER), energy efficiency ratio (EER), and heating seasonal performance factor (HSPF). These amendments are proposed as part of a new appendix M1. Use of the test procedure changes proposed in this notice as part of a new appendix M1, if adopted, would become mandatory to demonstrate compliance if the existing energy conservation standards are revised. (42 U.S.C. 6293(e)(2)) In revising the energy conservation standards in a separate rulemaking, DOE would create a cross-walk from the existing standards under the current test procedure to what the standards would be if tested using the revised test procedure.

On December 19, 2007, the President signed the Energy Independence and Security Act of 2007 (EISA 2007), Public Law 110–140, which contains numerous amendments to EPCA. Section 310 of EISA 2007 established that the Department’s test procedures for all covered products must account for standby mode and off mode energy consumption. (42 U.S.C. 6295(gg)(2)(A)) For CAC/HP, standby mode is incorporated into the SEER and HSPF metrics, while off mode power consumption is separately regulated. This SNOPR includes proposals relevant to the determination of both SEER and HSPF (including standby mode) and off mode power consumption. DOE would then use the cross-walked equivalent of the existing standard as the baseline for its standards analysis to prevent backsliding as required under 42 U.S.C. 6295(o)(1).

B. Background

DOE initiated a round of test procedure revisions for CAC/HP by

¹ For editorial reasons, Part B was codified as Part A in the U.S. Code.

² All references to EPCA in this document refer to the statute as amended through the Energy

publishing a notice of proposed rulemaking in the **Federal Register** on June 2, 2010 (June 2010 NOPR; 75 FR 31224). Subsequently, DOE published several supplemental notices of proposed rulemaking (SNOPRs) on April 1, 2011 (April 2011 SNOPR; 76 FR 18105), on October 24, 2011 (October 2011 SNOPR; 76 FR 65616), and on November 9, 2015 (November 2015 SNOPR; 80 FR 69278) in response to comments received and to address additional needs for test procedure revisions. The June 2010 NOPR and the subsequent SNOPRs addressed a broad range of test procedure issues. On June 8, 2016, DOE published a test procedure final rule (June 2016 final rule) that finalized test procedure amendments associated with many but not all of these issues. 81 FR 36992.

On November 5, 2014, DOE published a request for information for energy conservation standards (ECS) for CAC/HP (November 2014 ECS RFI). 79 FR 65603. In response, several stakeholders provided comments suggesting that DOE amend the current test procedure. The November 2015 SNOPR addressed those test procedure-related comments, but, as mentioned in this preamble, not all of the related issues were resolved in the June 2016 final rule.

On July 14, 2015, DOE published a notice of intent to form a Working Group to negotiate a NOPR for energy conservation standards for CAC/HP and requested nominations from parties interested in serving as members of the Working Group. 80 FR 40938. The Working Group, which ultimately consisted of 15 members in addition to one member from Appliance Standards and Rulemaking Federal Advisory Committee (ASRAC), and one DOE representative, identified a number of issues related to testing and certification and made several recommendations that are being addressed in the proposals of this SNOPR. DOE believes proposed changes are consistent with the intent of the Working Group.

This SNOPR addresses proposals and comments from two rulemakings: (1) Stakeholder comments and proposals regarding the CAC test procedure (CAC TP; Docket No. EERE-2009-BT-TP-0004); and (2) stakeholder comments and proposals regarding the CAC energy conservation standard from the Working Group (CAC ECS; Docket No. EERE-2014-BT-STD-0048). Comments received through documents located in the test procedure docket are identified by “CAC TP” preceding the comment citation. Comments received through documents located in the energy conservation standard docket (EERE-2014-BT-STD-0048) are identified by

“CAC ECS” preceding the comment citation. Further, comments specifically received during the CAC/HP ECS Working Group meetings are identified by “CAC ECS: ASRAC Public Meeting” preceding the comment citation.

II. Synopsis of the Supplemental Notice of Proposed Rulemaking

In this SNOPR, DOE proposes revising the certification requirements and test procedure for CAC/HP based on public comment on various published materials and the ASRAC negotiation process discussed in section I.B. In this SNOPR, DOE proposes two sets of changes: One set of proposed changes to Appendix M effective 30 days after publication of a final rule and required for testing and determining compliance with current energy conservation standards; and another set of proposed changes to create a new Appendix M1 that would be used for testing to demonstrate compliance with any amended energy conservation standards (agreed to be January 1, 2023 by the Working Group in the CAC rulemaking negotiations (CAC ECS: ASRAC Term Sheet, No. 76)). DOE requests comment on whether representations in accordance with Appendix M1 should be permitted prior to the compliance date of any amended energy conservation standards. DOE does not expect the proposed changes to Appendix M to change measured efficiency. However, DOE has determined that the proposed procedures in the new Appendix M1 would change measured efficiency.

In this SNOPR, DOE proposes the following changes to certification requirements:

(1) Certification of the indoor fan off delay used for coil-only tests.

(2) Codifying the CAC/HP ECS Working Group's recommendation regarding delayed implementation of testing to demonstrate compliance with amended energy conservation standards;

(3) Relaxing the requirement that a split system's tested combination be a high sales volume combination;

(4) Revising requirements for certification of multi-split systems in light of the proposed adoption of multiple categories of duct pressure drop that the indoor units can provide;

(5) Making explicit certain provisions of the service coil definition;

(6) Certification of separate individual combinations within the same basic model for each refrigerant that can be used in a model of split system outdoor unit without voiding the warranty; and

(7) Certification of details regarding the indoor units with which unmatched outdoor units are tested.

DOE proposes the following changes to Appendix M:

(1) Establishment of a 4-hour or 8-hour delay time before the power measurement for units that require the outdoor temperature setting to reach thermal equilibrium;

(2) A limit on the internal volume of lines and devices connected to measure pressure at refrigerant circuit locations where the refrigerant state can switch from liquid to vapor for different test operating conditions;

(3) Requiring bin-by-bin EER and coefficient of performance (COP) interpolations for all variable speed units, to calculate performance at intermediate compressor speeds;

(4) Requiring a 30-minute test without the outside-air apparatus connected (a “non-ducted” test) to be the official test as part of all cooling and heating mode tests which use the outdoor air enthalpy method as the secondary measurement; and

(5) Imposing indoor coil size limits for split system ratings.

DOE proposes the following provisions for new Appendix M1:

(1) New higher external static pressure requirements for all units, including unique minimum external static pressure requirements for mobile home systems, ceiling-mount and wall-mount systems, low and mid-static multi-split systems, space-constrained systems, and small-duct, high-velocity systems;

(2) A unique default fan power for rating mobile home coil-only units and new default fan power for all other coil-only units;

(3) Revisions to the heating load line equation in the calculation of HSPF; and

(4) Amendments to the test procedures for variable speed heat pumps that change speed at lower ambient temperatures and a 5 °F heating mode test option for calculating full-speed performance below 17 °F.

If adopted, the test procedures proposed in this SNOPR to appendix M for subpart B to 10 CFR part 430 pertaining to the efficiency of CAC/HP would be effective 30 days after publication in the **Federal Register** (referred to as the “effective date”). Pursuant to EPCA, manufacturers of covered products would be required to use the applicable test procedure as the basis for determining that their products comply with the applicable energy conservation standards. 42 U.S.C. 6295(s)) On or after 180 days after publication of a final rule, any representations made with respect to the

energy use or efficiency of CAC/HPs would be required to be made in accordance with the results of testing pursuant to the amended test procedures. (42 U.S.C. 6293(c)(2))(42 U.S.C. 6293(c)(2))

If adopted, the test procedures proposed in this SNOPR for appendix M1 to subpart B of 10 CFR part 430 pertaining to the efficiency of CAC/HP would be effective 30 days after publication in the **Federal Register**. The appendix M1 procedures would be required to be used as the basis for determining that CAC/HP comply with any amended energy conservation standards (if adopted in the concurrent CAC/HP energy conservation standards rulemaking) and for representing efficiency as of the compliance date for those amended energy conservation standards.

As noted in section I.A, 42 U.S.C. 6293(e) requires DOE to determine to what extent, if any, the proposed test procedure would alter the measured energy efficiency and measured energy use. DOE has determined that some of the proposed amendments in the new Appendix M1 would result in a change in measured energy efficiency and measured energy use for CAC/HP. DOE is conducting a separate rulemaking to amend the energy conservation standards for CAC/HP, which will take into account the test procedure revisions in Appendix M1. (CAC ECS: Docket No. EERE-2014-BT-STD-0048)

III. Discussion

This section discusses the revisions to the certification requirements and test procedure that DOE proposes in this SNOPR.

A. Testing, Rating, and Compliance of Basic Models of Central Air Conditioners and Heat Pumps

1. Representation Accommodation

The CAC/HP ECS Working Group made certain recommendations related to the Appendix M1 test procedure, with a recommended compliance date of January 1, 2023, for representations based on Appendix M1. (Docket No. EERE-2014-BT-STD-0048, No. 76, Recommendation #7) While the June 2016 Test Procedure Final Rule adopted mandatory testing requirements for representations of all basic models [81 FR at 37050-37051; 10 CFR 429.16(b)(2)(i)], the Working Group recommended several accommodations for representations for split systems:

- DOE will implement the following accommodation for representative values of split system air conditioners

and heat pumps based on the M1 methodology:

- By January 1, 2023, manufacturers of single-split systems must validate an AEDM that is representative of the amended M1 test procedure by:

- Testing a single-unit sample for 20-percent of the basic models certified.

- The predicted performance as simulated by the AEDM must be within 5 percent of the performance resulting from the test of each of the models.

- Although DOE will not require that a full complement of testing be completed by January 1, 2023, manufacturers are responsible for ensuring their representations are appropriate and that the models being distributed in commerce meet the applicable standards (without a 5% tolerance).

- By January 1, 2023, manufacturers must either determine representative values for each combination of single-split-system CAC/HP based on the M1 test procedures using a validated AEDM or through testing and the applicable sampling plan.

- By January 1, 2023, manufacturers of multi-split, multi-circuit, or multi-head mini-split systems must determine representative values for each basic model through testing and the applicable sampling plan.

- By July 1, 2024, each model of condensing unit of split system CAC/HP must have at least 1 combination whose rating is based on testing using the M1 test procedure and the applicable sampling plan.

(Docket No. EERE-2014-BT-STD-0048, No. 76, Recommendation #10)

DOE proposes to implement these recommendations, in their entirety, in 10 CFR 429.16 and 429.70.

2. Highest Sales Volume Requirement

The CAC/HP ECS Working Group recommended that DOE implement the following requirements for single-split-system air conditioners and suggested implementing regulatory text:

- Every combination distributed in commerce must be rated.

- Every single-stage and two-stage condensing unit distributed in commerce (other than a condensing unit for a 1-to-1 mini split) must have at least 1 coil-only rating that is representative of the least efficient coil distributed in commerce with a particular condensing unit.

- Every condensing unit distributed in commerce must have at least 1 tested combination.

- For single-stage and two-stage condensing units (other than condensing units for a 1-to-1 mini split), this must be a coil-only combination.

- All other combinations distributed in commerce for a given condensing unit may be rated based on the application of an AEDM or testing in accordance with the applicable sampling plan.

(Docket No. EERE-2014-BT-STD-0048, No. 76, Recommendation #7)

DOE addressed the first and third bullets in a final rule published on June 8, 2016, (June 2016 final rule), but at that time declined to implement the second bullet, which recommends removing the requirement that the tested combination be the highest sales volume combination (HSVC). DOE also received comments from non-working group members regarding this requirement. JCI commented that the current language used in Appendix M denoting the HSVC match cannot be determined with exact statistics and that it actually inhibits the adoption of new and promising advancements in product design. (CAC TP: JCI, No. 66 at p. 4) In contrast, Unico commented that, as an indoor coil manufacturer, it believes it to be important that the outdoor unit manufacturer continue to test and rate the HSVC, as this is an integral requirement for their AEDM to maintain accuracy. (CAC TP: Unico, No. 63 at p. 2)

DOE believes the CAC/HP ECS Working Group recommendation adequately addresses JCI's concern about using the HSVC as a tested combination. In response to Unico, DOE notes that the requirements adopted in the June 2016 final rule require independent coil manufacturers (ICMs) to test their own equipment. It is the ICM's own responsibility to ensure the accuracy of its AEDMs. ICMs may conduct additional testing or work with outdoor unit manufacturers (OUMs) as needed to do so. For these reasons, DOE is proposing to remove the requirement that the tested combination be the HSVC. DOE proposes to apply the requirements as recommended by the CAC/HP ECS Working Group to all single-split-system air conditioners and heat pumps, including space-constrained and small-duct, high-velocity, distributed in commerce by an OUM.

3. Determination of Certified Rating for Multi-Split, Multi-Circuit, and Multi-Head Mini-Split Systems

In the June 2016 final rule, DOE modified the testing requirements for multi-head mini-split systems and multi-split systems, and added similar requirements for testing multi-circuit systems. DOE also clarified that these requirements apply to variable refrigerant flow (VRF) systems that are

single-phase and less than 65,000 Btu/h.⁵ For all multi-split, multi-circuit, and multi-head mini-split systems, DOE required that, at a minimum, each model of outdoor unit must be tested as part of a tested combination (as defined at 10 CFR 430.2) that includes only non-ducted indoor units. For any models of outdoor units also sold with ducted indoor units, a second “tested combination” including only ducted indoor units must be tested. DOE also allowed for manufacturers to rate a mixed non-ducted/ducted combination as the mean of the represented values for the tested non-ducted and ducted combinations, and allowed manufacturers to test and rate specific individual combinations as separate basic models, even if they share the same model of outdoor unit. 81 FR 37003–37005 (June 8, 2016)

DOE also added a requirement that for any models of outdoor units also sold with models of small-duct, high velocity (SDHV) indoor units, a “tested combination” composed entirely of SDHV indoor units must be used for testing and rating. However, such a system must be certified as a different basic model. Finally, DOE allowed mismatch ratings for SDHV and other non-ducted or ducted indoor units based on an average of the ratings of the two individual indoor unit types. 81 FR 37004 (June 8, 2016)

In the June 2010 NOPR, DOE had proposed lower minimum external static pressure (ESP) requirements for ducted multi-split systems (75 FR at 31232), and in the November 2015 SNOPIR, DOE proposed to implement these requirements using the term “short duct systems,” which could refer to multi-split, multi-head mini-split, or multi-circuit systems with indoor units that produce a limited level of external static pressure. 80 FR at 69314 (Nov. 9, 2015). In response to the SNOPIR, DOE received several comments regarding its terminology and testing requirements related to short-duct systems as well as requests for changing terminology and testing requirements to include low-static and mid-static systems, as recommended in the CAC/HP ECS Working Group Term Sheet. Therefore in the June 2016 final rule, DOE maintained the existing ducted system terminology and is addressing the earlier comments from stakeholders and recommendations from the Working Group in this SNOPIR.

Unico supported DOE’s definition of short-ducted systems which would

create four indoor unit types for multi-split systems: Short-ducted (previously described as “ducted”), conventional ducted, SDHV-ducted, and non-ducted. (CAC TP: Unico, No. 63 at p. 11) In the Term Sheet, the CAC/HP ECS Working Group recommended that DOE define “low-static system” and “mid-static system” as discussed in section III.C.1. (CAC ECS: Docket No. EERE–2014–BT–STD–0048, No. 76 at p. 1–2) These systems are essentially sub-categories of DOE’s earlier proposal for short-ducted systems.

In addition, several stakeholders commented that multi-split systems may also be paired with models of conventional ducted indoor units. UTC/Carrier commented that some manufacturers also offer ducted units with external static pressure capabilities greater than 0.65 in w.c., the maximum external static pressure proposed by the Working Group for mid-static ducted units and recommended that DOE also include a requirement for separate multi-split system ratings with these “standard” ducted indoor units. (CAC TP: UTC/Carrier, No. 62 at p. 3–4)

Rheem commented that the definition of multi-split system is not limited to a specific duct configuration and that testing of all possible duct configurations should be considered. Rheem further commented that the testing requirements should be the same as single-split systems using conventional ducted indoor units because multi-split systems duct losses are the same as the standard single-split system. (CAC TP: Rheem, No. 69 at p. 5)

NEEA and NPCC commented that multi-split systems paired with more conventional blower coil indoor units should be testable with the external static pressure conditions specified for conventional blower coil units. (CAC TP: NEEA and NPCC, No. 64 at p. 3–4)

The California IOUs commented that additional testing is needed to ensure that the AEDM gives accurate ratings for all of the possible combinations when an outdoor unit of a multi-split system is paired with a conventional central forced air indoor unit. They said that, at present, a variable speed, mini-split outdoor unit is connected to an indoor unit(s) from the same manufacturer with complex software controls that produce the variable modes of operation needed to respond to indoor and outdoor conditions. They also asserted that the indoor units can be short ducted or ductless cassettes. Finally, they commented that, if the same outdoor section is installed with a central forced air unit, it will have indoor fan operation modes and significantly

different power draw and may not be representative of the nuanced behavior of the ductless and short duct components. (CAC TP: California IOUs, No. 67 at p. 3)

Given the multiple types of indoor units with which these systems can be paired, several stakeholders also made recommendations related to the testing and rating requirements.

Unico commented that multi-split ratings should be listed with homogeneous type of indoor units, which should be based on tests or a valid AEDM. Unico commented that short-ducted, conventional-ducted, SDHV-ducted and non-ducted are different types and should all be tested and rated using the appropriate test procedure for the type, and that ratings with mixed types should be an average. (CAC TP: Unico, No. 63 at p. 2)

Mitsubishi proposed that given the potential additional testing requirements presented for systems with multiple families of ducted indoor unit (low-static, mid-static and standard-static ducted), a manufacturer be allowed to produce tested combinations of all low-static, all mid-static or all standard-static indoor units, and that, if they do not wish to have separate ratings, they must use the highest rating of external static pressure to establish the tested combination. (CAC TP: Mitsubishi, No. 68 at p. 3)

Goodman suggested that any combinations of non-ducted, low-static, mid-static and/or high-static indoor units be based on the highest static units in the combination if a single rating is to be used for all short-ducted indoor units. In addition, Goodman stated that it believes these combinations should have the capability of being rated and certified using either test data or an AEDM. Goodman suggested that, if multiple combinations of non-ducted, low-static, mid-static and/or high-static indoor units are matched with a particular outdoor unit, the testing should be performed using the appropriate test static for each indoor unit. (CAC TP: Goodman, No. 73 at p. 13–14)

DOE supports the Working Group recommendations to replace its proposal to use the terminology short-duct with low-static and mid-static. The proposed definitions for these terms are discussed in section III.C.1. In addition, DOE agrees that multi-split, multi-head mini-split, or multi-circuit systems can include conventional ducted indoor units. DOE notes that the proposed test procedure allows selection of an appropriate external static pressure for this case.

⁵ A VRF system is a multi-split system with at least three compressor capacity stages, but most VRF systems have variable-speed compressors.

After reviewing the comments, DOE proposes that multi-split, multi-head mini-split, and multi-circuit systems can be tested and rated with five kinds of indoor units: Non-ducted, low-static ducted, mid-static ducted, conventional ducted, or SDHV. However, DOE agrees that if a manufacturer offers an outdoor model with all five kinds of indoor units, a requirement to determine a rating through testing of each could be burdensome. Therefore, DOE proposes that, when determining represented values including certifying compliance with amended energy conservation standards, at a minimum, a manufacturer must test and rate a “tested combination” composed entirely of non-ducted units. If a manufacturer

also offers the model of outdoor unit with models of low-static, mid-static, and/or conventional ducted indoor units, the manufacturer must at a minimum also test and rate a second “tested combination” with the highest static variety of indoor unit offered. The manufacturer may also choose to test and rate additional “tested combinations” composed of the lower static varieties. In each case, the manufacturer must test with the appropriate external static pressure. DOE believes that this option reduces test burden sufficiently and is not proposing use of AEDMs for these systems.

DOE proposes to maintain its requirement from the June 2016 final rule that, if a manufacturer also sells a

model of outdoor unit with SDHV indoor units, the manufacturer must test and rate the SDHV system (*i.e.* test a combination with indoor units that all have SDHV pressure capability). DOE also proposes to continue to allow mix-match ratings across any two of the five varieties by taking a straight average of the ratings of the individual varieties, and to allow ratings of individual combinations through testing. As noted in the June 2016 final rule, SDHV represented values must be a separate basic model. Any represented values for a mixed system including SDHV and another style of unit must be in the same basic model as the SDHV model. Tables III.1 and III.2 summarize example represented values.

Table III.1 Example Represented Values for Non-SDHV Multi-Split Systems

Basic Model	Indiv. Model # (Outdoor Unit)	Indiv. Model #(s) (Indoor Unit)	Sample Size	Non-ducted Rep. Value	Conv. Ducted Rep. Value	Mid-Static Rep. Value	Low-Static Rep. Value	Mix Rep. Value (ND/CD)	Mix Rep. Value (ND/MS)	Mix Rep. Value (ND/LS)	Mix Rep. Value (CD/MS)	Mix Rep. Value (CD/LS)
ABC	ABC	***	4	15.00	14.00	-	-	14.50	-	-	-	-
ABC -ND1	ABC	2- A123; 3- JH746	2	17.00	-	-	-	-	-	-	-	-
XYZ	XYZ	***	8	15.50	14.00	14.50	15.00	14.75	15.00	15.25	14.25	14.50

TABLE III.2—EXAMPLE REPRESENTED VALUES FOR SDHV MULTI-SPLIT SYSTEMS

Basic model	Individual model No. (outdoor unit)	Individual model No.(s) (indoor unit)	Sample size	SDHV rep. value	Mix rep. value (ND)	Mix rep. value (CD)	Mix rep. value (MS)	Mix rep. value (LS)
ABC-SDHV	ABC	* * *	6	11.50	13.25	12.75

4. Service Coil Definition

In the June 2016 final rule, to distinguish newly installed cased and uncased coils from replacement cased and uncased coils, DOE added a definition for service coils and explicitly excluded them from indoor units in the indoor unit definition:

Indoor unit means part of a split-system air conditioner or heat pump that includes (a) an arrangement of refrigerant-to-air heat transfer coil(s) for transfer of heat between the refrigerant and the indoor air and (b) a condensate drain pan, and may or may not include (c) sheet metal or plastic parts not

part of external cabinetry to direct/route airflow over the coil(s), (d) a cooling mode expansion device, (e) external cabinetry, and (f) an integrated indoor blower (*i.e.* a device to move air including its associated motor). A separate designated air mover that may be a furnace or a modular blower (as defined in Appendix AA to the subpart) may be considered to be part of the indoor unit. A service coil is not an indoor unit.

Service coil means an arrangement of refrigerant-to-air heat transfer coil(s) and condensate drain pan that may or may not include sheet metal or plastic parts to direct/route airflow over the coil(s), external cabinetry, and/or a cooling mode expansion device, and is sold exclusively to replace an

uncased coil or cased coil that has already been placed into service and is labeled accordingly.

In this SNOPR, DOE proposes to modify the adopted definition of service coil to more explicitly define what “labeled accordingly” means. Under 42 U.S.C. 6295(r), the Secretary may include any requirement which the Secretary determines is necessary to assure that each covered product to which such standard applies meets the required minimum level of energy efficiency or maximum quantity of energy use specified in such standard.

In this specific case, DOE believes service coils must be distinguished from indoor units to ensure compliance with the applicable energy conservation standards for central air conditioners and heat pumps. Specifically, DOE proposes that a manufacturer must designate a service coil as “for indoor coil replacement only” on the nameplate and in manufacturer product and technical literature. In addition, the model number for any service coil must include some mechanism (*e.g.*, an additional letter or number) for differentiating a service coil from a coil intended for an indoor unit.

5. Efficiency Representations of Split-Systems for Multiple Refrigerants

Split-system CAC/HP are required to be tested as a system. Prior to the June 2016 final rule, the condensing unit was required to be tested with “the evaporator coil that is likely to have the largest volume of retail sales with the particular model of condensing unit” (commonly referred to as the highest sales volume combination or HSVC). 10 CFR 429.16(a)(2)(ii) as of January 1, 2016. The June 2016 final rule amended the definition of “central air conditioner or central air conditioning heat pump” to recognize instances in which there is no HSVC, *i.e.*, an outdoor unit is sold separately with no matching indoor unit, referred to as an “outdoor unit with no match”. 81 FR at 36999 (June 8, 2016).

As discussed in the June 2016 final rule, outdoor units with no match are typically a result of the phase-out of HCFC-22 refrigerant. Effective January 1, 2010, the U.S. Environmental Protection Agency (EPA) banned the sale and distribution of those central air conditioning systems and heat pump systems that are designed to use HCFC-22 refrigerant. 74 FR 66450 (Dec. 15, 2009). EPA’s rulemaking included an exception for the manufacture and importation of replacement components, as long as those components are not pre-charged with HCFC-22. *Id.* at 66459–60. Because complete HCFC-22 systems can no longer be distributed, DOE established test procedure requirements for outdoor units that have “no match,” or are not sold with a matching indoor unit, which includes those units designed to use HCFC-22.

The “no match” test procedure’s goal is that the test should produce measurements of energy efficiency during a representative average use cycle (see 42 U.S.C. 6293(b)(3)) while also ensuring that any field-matched combination (including the new “no-match” outdoor unit and an existing

indoor unit) meets the standard. Due to the nature of these no-match systems, however, neither the manufacturer nor DOE knows exactly what the paired system will be for an outdoor unit with no match. To ensure compliance, DOE established indoor unit specifications that are representative of a less efficient unit (representative of units on the market at the time of the change in EPA regulations) that could be paired with the given outdoor unit with no match. Specifically, DOE established a requirement that outdoor units without a matching indoor unit must be tested with an indoor unit with a normalized gross indoor fin surface (NGIFS)⁶ no higher than 1.0 square inches per British thermal unit per hour (sq. in./Btu/hr). 81 FR at 37010 (June 8, 2016).

In response to the phase-out of HCFC-22, one course pursued by manufacturers has been to use the refrigerant R-407C, which can be used as a drop-in replacement for HCFC-22 if oil compatibility issues are addressed. (No. 1 at pp. 2–6) Because R-407C is a replacement for HCFC-22, it is possible for a central air conditioner to operate either with R-407C or with HCFC-22. Such a unit could be shipped charged with R-407C, or shipped without the refrigerant charge (*i.e.*, dry-shipped). A dry-shipped unit could then either be sold as part of an R-407C split-system, or sold as a replacement component and charged with HCFC-22. In any case, R-407C outdoor units are often marketed as replacements for HCFC-22 outdoor units, as indicated in marketing material. (Docket No. EERE–2016–BT–TP–0029–0007, –0008, –0009, –0010, –0011, –0012 and –0013) Some R-407C outdoor units are more explicitly marketed as HCFC-22 replacements than other units (*e.g.*, indicating that the outdoor unit is “compatible with R-22 coils and linesets!”). (Docket No. EERE–2016–BT–TP–0029–0010 at p. 1).

To address instances in which the manufacturer indicates that more than one refrigerant is acceptable for use in a unit (*i.e.*, the manufacturer specifications include use of multiple refrigerants or the warranty would not be voided by the use of more than one refrigerant), DOE is proposing that a split-system air conditioner or heat pump, including outdoor unit with no match, must be certified as a separate individual combination (including outdoor unit without match as applicable) for every acceptable refrigerant. Specifically, each individual

combination (including outdoor unit without match corresponding to each acceptable refrigerant) would be certified under the same basic model. DOE’s existing requirements for basic models would continue to apply; therefore, if an individual combination or an outdoor unit with no match fails to meet DOE’s energy conservation standards using any refrigerant indicated by the manufacturer to be acceptable, then the entire basic model would fail. DOE also proposes that manufacturers must certify the refrigerant for every individual combination that is distributed in commerce (including every outdoor unit with no match). For models where the manufacturer only indicates one acceptable refrigerant (DOE expects this to be the majority of units), this proposal would simply entail certifying to DOE the refrigerant for which the model is designed. Finally, DOE proposes that if a model of outdoor unit (used in a single-split, multi-split, multi-circuit, multi-head mini-split, and/or outdoor unit with no match system) is distributed in commerce without a specific refrigerant specified or not charged with a specified refrigerant from the point of manufacture, a manufacturer must determine the represented value as an outdoor unit with no match.

Under this proposal, if an outdoor unit manufacturer (OUM) indicates as an acceptable refrigerant for a model of outdoor unit a refrigerant that is banned for inclusion in CAC/HP distributed as systems, such as HCFC-22, the OUM would have to determine represented values (*e.g.*, SEER) for the model of outdoor unit tested as an outdoor unit with no match. Within the same basic model, the manufacturer must determine a represented value for all individual split-system combinations using the same model of outdoor unit for any acceptable refrigerants with which the model of outdoor unit can legally be sold as a system. DOE has tentatively determined that specification by an OUM as to the acceptable refrigerant indicates the ultimate use or uses for which the unit was designed and manufactured.

Inclusion of HCFC-22 as an acceptable refrigerant by the manufacturer indicates that the model of outdoor unit was designed and manufactured to be sold separately as a replacement component (*i.e.*, as a model of outdoor unit with no match), because manufacturers are prohibited from selling and distributing central air conditioning systems and heat pump systems that use HCFC-22 refrigerant,

⁶ NGIFS is equal to normalized gross indoor fin surface (for a conventional fin-tube heat exchanger, two times fin length times fin width times the number of fins) divided by the system cooling capacity.

except as replacement components (*i.e.*, outdoor units with no match).

As indicated previously in this discussion, it is DOE's understanding that the listing of acceptable refrigerants also impacts the unit's warranty. In order for a unit to remain under warranty, the unit generally must be operated and maintained as recommended by the manufacturer. If a manufacturer indicates that HCFC-22 is an acceptable refrigerant, its use in an outdoor unit would not be expected to void the warranty. Again, DOE understands conformance with the warranty to be an indication of the intended use for which a model is designed and manufactured. Additionally, DOE understands that manufacturer literature for some models may not explicitly state which refrigerants may be used without voiding the warranty and may instead generally refer to specific refrigerant characteristics for the warranty to remain valid. If for such a case, HCFC-22 meets the specified characteristics, DOE's proposal would require that the manufacturer certify, within the same basic model, an individual split-system combination or outdoor unit with no match for each refrigerant that meet these warranty criteria or characteristics.

Under the certification requirements proposed in this SNOPR, an outdoor unit for which both R-407C and HCFC-22 are acceptable refrigerants would need to be certified as a split-system combination and as an outdoor unit with no match, with representations for each. Per DOE's regulations established in the June 2016 final rule, outdoor units with no match cannot be certified using an AEDM, and the model of outdoor unit must be tested with an indoor unit meeting specified criteria. 81 FR at 37051 (June 8, 2016). Therefore, for a model of outdoor unit for which both R-407C and HCFC-22 are acceptable refrigerants, the outdoor unit with no match (with HCFC-22) must be tested and certified. In addition, DOE proposes to require that any split-system combination (with R-407C) must also be tested. The proposed certification requirements would represent the energy efficiency of an outdoor unit during a representative average use cycle for each intended sales scenario (*i.e.*, either sold as a split system and installed with a new matching indoor unit, or sold as a replacement component and installed with a legacy indoor unit).

In addition, DOE recognizes that concerns regarding warrantee coverage for a given refrigerant may not be a concern for all installers and consumers.

Consequently, DOE is concerned that the lack of explicit indication that a unit is acceptable for use with HCFC-22 may not prevent installation of such units with the refrigerants, if the installers and consumers have reasonable confidence that the unit can operate with this refrigerant. Because of the similarity of HCFC-22 and R-407C and the history of CAC/HP being used interchangeably with both of these refrigerants, this issue could very well arise for any unit certified and warranted for use with R-407C. Hence, DOE proposes that any outdoor unit intended for use in a split system with R-407C, *i.e.* any unit shipped with a charge of any amount of R-407C, would also have to be rated as an outdoor unit with no match.

Nearly all outdoor units of split systems are shipped with a quantity of refrigerant charge that is close to the required charge for installation. This has been confirmed by observation of units tested by DOE. Line sets for connecting indoor units to outdoor units also are sold with an appropriate pre-charge to compensate for the different amount of charge that remains in the lines of different-length line sets. During set-up, the refrigerant charge of the assembled system is adjusted, and the pre-charging of the components limits the amount of refrigerant that is needed to be added or removed in order to match the charging conditions specified in the manufacturer's installation instructions. Because of this general practice to ship outdoor units with close to full charge, DOE considers use of a charge quantity that is much less than the charge specified by the instructions to be equivalent to shipping a unit without refrigerant. Hence, DOE proposes to require a no-match rating for outdoor units that are shipped with a charge amount such that adjustment of charge as specified in manufacturer's instructions requires addition of more than one pound of refrigerant.

As an example illustrating the certification requirement proposals discussed in this section, assume a manufacturer advertises a model of outdoor unit for use with either HCFC-22 or R-407C.

In 10 CFR 430.2 (as amended in the June 2016 final rule), DOE defines "basic model" for OUMs as "all individual combinations having the same model of outdoor unit, which means comparably performing compressor(s) [a variation of no more than five percent in displacement rate (volume per time) as rated by the compressor manufacturer, and no more than five percent in capacity and power input for the same operating conditions

as rated by the compressor manufacturer], outdoor coil(s) [no more than five percent variation in face area and total fin surface area; same fin material; same tube material], and outdoor fan(s) [no more than ten percent variation in air flow and no more than twenty percent variation in power input]." According to this definition, the model of outdoor unit intended to be sold with both HCFC-22 and R-407C would represent multiple individual combinations within the same basic model. Therefore, a manufacturer has to determine a represented value for each single-split-system combination (sold for use with R-407C) as well as determine a represented value for the outdoor unit with no match (sold for use with HCFC-22). See 10 CFR 429.16(a)(1) (as amended in the June 2016 final rule), 81 FR 36001, 37056 (June 8, 2016).

Paragraph 10 CFR 429.16(b)(2)(i) (as amended in the June 2016 final rule) details the minimum testing requirements for each basic model, specified by equipment category. In this SNOPR, DOE is proposing to further specify in that same paragraph that when a basic model spans listed categories, as in this example, multiple testing requirements apply. Therefore, the manufacturer would have to test at least one single-split-system combination as well as the model of outdoor unit with a model of coil-only indoor unit meeting the requirements of section 2.2e of Appendix M or M1 to subpart B of part 430 (*i.e.*, test as an outdoor unit with no match). Under 10 CFR 429.16(c)(1)(i) (as amended in the June 2016 final rule), any other single-split combinations within the basic model may be tested or rated using an AEDM according to the applicable requirements. 81 FR 36001, 37049 (June 8, 2016).

In the event that DOE determines a basic model is noncompliant with an applicable energy conservation standard, DOE may issue a notice of noncompliance determination that, among other things, informs the manufacturer of its obligation to cease distribution of the basic model immediately. (10 CFR 429.114(a)) Therefore, if any individual combination (including the outdoor unit with no match) fails to comply with the applicable standard, whether the combination has been tested or rated using an AEDM, the entire basic model must be removed from the market and the model of outdoor unit may not be sold at all.

DOE also notes that although the discussion in this section of the SNOPR is directly related to refrigerants, a basic model may span listed categories in

other situations. For example, as mentioned in the June 2016 final rule, a model of outdoor unit may be sold both as part of a single-split system and as part of a multi-split system. 81 FR at 37005. In this case, the manufacturer would have to determine represented values within each of these categories as required by 429.16(a)(1) and would have to meet the testing requirements for each category in 429.16(b)(2)(i). Furthermore, if an individual combination that is either a single-split or multi-split system fails to comply with the standard, the model of outdoor unit may not be sold for use in either category.

DOE also proposes to add information to the items required to be provided in certification reports to address outdoor units with no match. The general certification requirements for air conditioners and heat pumps as amended in the June 2016 final rule already apply to outdoor units with no match. These requirements include reporting of SEER, the average off mode power consumption, the cooling capacity, the region(s) in which the basic model can be sold, HSPF (for heat pumps), and EER (for air conditioners), and non-public information including indoor air volume rate for the relevant operating modes (e.g., full-load cooling, part-load cooling, full-load heating). 81 FR 36991, 37053 (June 8, 2016). In this SNOPR, DOE proposes to require reporting of additional non-public information for the indoor unit that is tested with an outdoor unit with no match. This would include the indoor coil face area, depth in the direction of airflow, fin density (fins per inch), fin material, fin style (e.g., wavy or louvered), tube diameter, tube material, and numbers of tubes high and deep. These additional requirements would apply to outdoor units with no match, whether or not the outdoor unit was also certified as part of an individual combination.

Issue 1: DOE requests comment on its proposed certification requirements for outdoor units with no match. Also, DOE seeks comment on what fin style options should be considered as options for CCMS database data entry.

6. Representation Limitations for Independent Coil Manufacturers

In the June 2016 final rule, DOE discussed compliance with Federal (base national or regional) standards for CAC/HP. Specifically DOE cited a proposal in the November 2015 SNOPR to amend 10 CFR 430.32 to clarify that the least-efficient combination within each basic model must comply with the regional SEER and EER standards. 80 FR

69277, 69290 (Nov. 9, 2015). However, DOE declined to modify section 430.32 in the June 2016 final rule, instead stating that it would do so in the regional standards enforcement rulemaking. 81 FR 36991, 37012 (June 8, 2016). Instead, DOE adopted language in 10 CFR 429.16 specifying that a basic model may only be certified as compliant with a regional standard if all individual combinations within that basic model meet the regional standard for which that basic model would be certified and that an ICM cannot certify a basic model containing a representative value that is more efficient than any combination certified by an OUM containing the same outdoor unit. 81 FR at 37050.

In response to the June 2016 final rule, Advanced Distributor Products (ADP) and Lennox International submitted separate but essentially identical letters and AHRI submitted a similar letter (Docket No. EERE-2016-BT-TP-0029-0006, -0005, and -0003) stating that this language, while intended to define that ICM ratings cannot provide a means for an outdoor unit to span regions, is inconsistent with the Regional Standards ASRAC Working Group agreement (Docket No. EERE-2011-BT-CE-0077-0070). ADP, Lennox, and AHRI suggested that language proposed in the regional standards enforcement NOPR (80 FR 72389-72390), but not finalized, captured the enforcement working group intent and avoids inadvertent limitations on independent coil manufacturers. Mortex also submitted a letter (Docket No. EERE-2016-BT-TP-0029-0004) commenting on the same language, also stating that it seems inconsistent with agreements made during the Regional Standards ASRAC Working Group. Mortex suggested that the requirement be removed from the test procedure.

DOE did not adopt the language proposed in the regional standards enforcement NOPR in response to comments submitted in that rulemaking. DOE agrees, however, that the language adopted at 429.16 inadvertently constrains ICMs beyond the bounds agreed to in the Regional Standards ASRAC Working Group. Accordingly, DOE proposes to remove the sentence: "An ICM cannot certify a basic model containing a representative value that is more efficient than any combination certified by an OUM containing the same outdoor unit." and replace it with the following language in 429.16(a)(4)(i): An ICM cannot certify an individual combination with a rating that is compliant with a regional standard if the individual combination includes a

model of outdoor unit that the OUM has certified with a rating that is not compliant with a regional standard. Conversely, an ICM cannot certify an individual combination with a rating that is not compliant with a regional standard if the individual combination includes a model of outdoor unit that an OUM has certified with a rating that is compliant with a regional standard.

Issue 2: DOE requests comment on its proposed language in 429.16 related to allowable ICM ratings and compliance with regional standards.

7. Reporting of Low-Capacity Lockout for Air Conditioners and Heat Pumps With Two-Capacity Compressors

The current SEER and HSPF equations (4.1-1 and 4.2-1) in the DOE test procedure for a CAC/HP having a two-capacity compressor require different calculations of quantities depending on whether the test unit would operate at low capacity, cycle between low and high capacity, or operate at high capacity in response to the building load (see sections 4.1.3 and 4.2.3). To determine which calculations to use for units that lock out low capacity operation at higher outdoor temperatures, the outdoor temperature at which the unit locks out low capacity operation must be known. Section 4.1.3 of Appendix M indicates that this information must be provided by the manufacturer. Similarly, a two-stage heat pump may lock out low capacity heating operation below a certain lock-out temperature, as indicated in section 4.2.3 of Appendix M. Therefore, DOE proposes to add language to require that the lock-out temperatures for such systems for both cooling and heating modes be provided in the certification report.

8. Represented Values of Cooling Capacity

In the November 2015 SNOPR, DOE proposed adding a requirement that the represented values of cooling capacity and heating capacity must be the mean of the values measured for the sample. In response, AHRI, Lennox, JCI, Ingersoll Rand, Goodman, UTC/Carrier, Nortek, and Rheem disagreed with the requirement that the represented capacity values must be the mean of the tested values, and recommended that DOE allow manufacturers to rate capacity conservatively. (CAC TP: AHRI, No. 70 at p. 10; Lennox, No. 61 at p. 8, 15; JCI, No. 66 at p. 15-16; Ingersoll Rand, No. 65 at p. 5; Goodman, No. 73 at p. 15; UTC/Carrier, No. 62 at p. 8; Nortek, No. 58 at p. 6; Rheem, No. 69 at p. 8) The commenters provided additional detail as summarized in the

June 2016 final rule. 81 FR 37014–15 (June 8, 2016).

After reviewing the comments, in the June 2016 final rule DOE required the represented value of cooling (or heating) capacity to be a self-declared value that is no less than 95 percent of the mean of the cooling (or heating) capacities measured for the units in the sample selected for testing or of the output simulated by the AEDM. DOE stated that this would allow manufacturers the flexibility to derate capacity with conservative values as requested by multiple commenters, while still providing consumers with information that is reasonably close to the performance they may expect when purchasing a system. *Id.*; 10 CFR 429.16(b)(3) and 429.16(d).

Upon review, DOE has determined that the regulatory text adopted allows for unlimited overrating of capacity but only underrating of 5 percent. Consequently, in this SNOPR, DOE is proposing to revise the regulatory text in three locations (10 CFR 429.16(b)(3), 10 CFR 429.16(d), 10 CFR 429.70(e)(5)(iv)) to allow a one-sided tolerance on cooling and heating capacity that allows underrating of any amount but only overrating up to 5 percent (*i.e.*, the certified capacity must be no greater than 105 percent of the mean measured capacity or the output of the AEDM), as intended in the June 2016 final rule. As adopted in that final rule, DOE would still use the mean of the measured capacities in its enforcement provisions.

Issue 3: DOE requests comment on its proposal to allow a one-sided tolerance on represented values of cooling and heating capacity that allows underrating of any amount but only overrating up to 5 percent.

B. Proposed Amendments to Appendix M Testing To Determine Compliance With the Current Energy Conservation Standards

In this SNOPR, DOE proposes revisions to appendix M to subpart B of 10 CFR part 430. This section provides a discussion of those proposed changes. DOE proposes to make these changes to Appendix M effective 30 days after publication of a final rule in the **Federal Register**. Representations related to the efficiency of CAC/HP basic models must be based on testing in accordance with the final rule procedures not later than 180 days following publication of the final rule.

1. Measurement of Off Mode Power Consumption: Time Delay for Units With Self-Regulating Crankcase Heaters

DOE finalized an off-mode test procedure in the June 2016 final rule. 81

FR, 36991, 37022–5 (June 8, 2016). However, DOE recognizes that the current regulations may not account for excessive variation in the test results for units with self-regulating crankcase heaters or for units where the crankcase heater power measurement could be affected by the ambient temperature. These potential variations could be due to the large thermal mass of the compressor and the resulting time required for the compressor temperature to reach equilibrium. Because the power input of a self-regulating heater would depend on the compressor temperature, the test result would depend on the temperature of the unit just prior to the test. If conducted shortly after the B test, which is one of the steady-state wet coil cooling-mode tests conducted in an 82 °F ambient temperature, the compressor would still be quite warm, and the measured power input would be significantly lower than if the test were conducted after the compressor equilibrates with the surrounding space temperature. DOE proposes further revision to the test procedure to resolve this issue. The proposal in this section would not impact the measured off-mode power input beyond potentially reducing variation in the measured result.

In the off-mode test procedure established in the June 2016 final rule, DOE established a test method for units with self-regulating crankcase heaters that called for start of the test in a room conditioned to 82 °F temperature, with the compressor at a temperature no lower than 81 °F. The room temperature is then adjusted at a rate of change of no more than 20 °F per hour to approach 72 °F for conducting a first heater power measurement, and then to approach a manufacturer-specified lower temperature, again at a rate of change no more than 20 °F per hour, before conducting the second power measurement. 81 FR at 37022 (June 8, 2016). A half-hour duration in the initial reduction in room temperature from 82 °F to 72 °F would be compliant with the prescribed 20 °F maximum temperature reduction rate. However, DOE testing shows that the time constant for compressor cooldown, or for approach to equilibrium of the power input a self-regulating crankcase heater attached to a compressor, is much longer than a half-hour. This issue would be exacerbated if the compressor has a sound blanket. Self-regulating crankcase heaters draw less power when they are warmer. Hence, if the temperature cooldown from 82 °F is initiated when the compressor is hot (*e.g.*, after running the B test), the

compressor will still be very warm when the test is conducted, and the measured power input will be lower than for a test initiated with a compressor at the minimum 81 °F.

To determine the reasonable delay time for units to reach thermal equilibrium, DOE conducted tests using a 5-ton residential condensing unit. DOE connected a self-regulating crankcase heater to the compressor and measured heater power input, compressor shell temperature, and ambient temperature. DOE observed cooldown behavior and the corresponding increase in heater input power in a 60 °F environment both with and without a sound blanket covering the compressor after initially preheating the compressor to 120 °F to simulate warmup associated with refrigeration system operation. DOE used an exponential equation for the power input to the heater as a function of time to fit to the test data. The time constant for approach to equilibrium (time for the difference between the power input and the value it would attain after an infinite amount of time to drop by 63 percent) DOE observed in the tests was approximately 2 hours for tests without the sound blanket (bare shell) and 4 hours for tests with the sound blanket. DOE also observed that the crankcase heater power input generally approached to within 10 percent of its final value after passage of about two time constants (4 hours for bare-shell testing and 8 hours for sound blanket testing).

Based on the testing and analysis described in this preamble, DOE proposes adopting a time delay for testing units with self-regulating crankcase heaters or crankcase heating systems in which the heater control temperature sensor is affected by the heater. DOE proposes a 4-hour time delay for units where the compressors have no sound blanket, and an 8-hour time delay for units where the compressors do have sound blankets. The delay would take place after the room temperature reaches the lower target value and before making each of the power measurements (P_{1x} and P_{2x}). Also, the proposal would eliminate the 20 °F per hour room temperature reduction rate limit for any unit where ambient temperature can affect the measurement of crankcase heater power because the roughly half hour required for the temperature to transition at this rate from 82 °F to 72 °F would add unnecessarily to the compressor's equilibration time—equilibration would occur sooner if the ambient temperature more quickly drops to the final value rather than approaching it slowly.

Issue 4: DOE seeks comments from interested parties about its proposal to impose time delays to allow approach to equilibrium for measurements of off-mode power for units with self-regulating crankcase heaters. DOE requests comment regarding the 4-hour and 8-hour delay times proposed for units without and with compressor sound blankets, respectively.

2. Refrigerant Pressure Measurement Instructions for Cooling and Heating Heat Pumps

In DOE's current test procedures at Appendix M, refrigerant pressure measurement is required when using the refrigerant enthalpy method as the secondary capacity measurement (see section 2.10.3 of 10 CFR part 430, subpart B, appendix M). Refrigerant pressure measurement is also required for some methods for setting or confirming refrigerant charge (see section 2.2.5 of 10 CFR part 430, subpart B, appendix M), unless otherwise instructed by the manufacturer's installation instructions.

DOE is aware that the pressure measurement devices may be installed at a location where the refrigerant state switches between liquid and vapor under different cooling and heating modes. In this case, the actual refrigerant charge in the unit could be different under different modes due to the transfer of refrigerant to and from the extra internal volumes in the refrigerant pressure lines, connections, and transducers or gauges.

DOE is also aware that the refrigerant charge in pressure measurement systems may affect cyclic testing. In a cooling test, the liquid refrigerant in the liquid refrigerant pressure measurement system is cooler than the refrigerant in the condenser. For a system with a fixed orifice expansion device, allowing the cooler refrigerant from the pressure measurement systems to flow into the evaporator before the fan delay ends could affect the cyclic performance.

These issues have the potential to impact test reproducibility and repeatability, in particular for small capacity mini-split heat pump systems with low system refrigerant charges, depending on the differences in internal volumes of the tubing, connections, and transducers, particularly from one laboratory to the next.

As part of the compressor calibration method, ASHRAE 37–2009 section 7.4.2 provides instructions for making refrigerant pressure measurements. For equipment not sensitive to refrigerant charge, the pressure measurement instruments may be connected via pressure measurement lines to the

refrigerant lines without requiring that any preliminary tests be conducted to confirm that displacement of refrigerant into the pressure lines does not affect performance. The test standard sets a threshold for sensitivity to refrigerant charge, indicating that for equipment that is not sensitive to the charge, the refrigerant pressure lines must not affect the total charge by more than 0.5%.

To limit the amount of refrigerant charge that can transfer to and from the pressure measurement system, DOE proposes to require manufacturers to limit the total internal volume of pressure lines and pressure measurement devices connected at locations that can switch states from liquid to vapor for different operating modes or conditions. Based on the ASHRAE 37–2009 precedent, DOE selected a maximum internal volume connected at these locations that would represent at most 0.5 percent of the total system charge for the lowest-charge systems for which DOE collected information. The proposed maximum total internal volume of the pressure lines, connections and gauges would be 0.25 cubic inches per 12,000 Btu/hr certified cooling capacity. DOE selected this maximum volume based on a survey of refrigerant charge in mini-split heat pumps with capacities ranging from 9,000 to 33,000 Btu/hr.

DOE notes that the charge adjustment approach prescribed by ASHRAE 37–2009 for systems that are sensitive to refrigerant charge would not resolve the issue of displacement of refrigerant into the pressure lines because that approach is based on steady-state testing, for which the displaced refrigerant would remain in the lines. The required adjustment would add that same amount of refrigerant so that the charge actively circulating in the refrigerant circuit would be the same as if no pressure lines had been connected. In the present case, where refrigerant would be displaced between heating and cooling mode or between cycles of a cyclic test, simply adding the “missing” charge would not resolve the issue.

The internal volume of pressure measurement lines and connections can be determined using the tubing inner diameter or internal volume values found on pressure gauge or transducer manufacturer specification sheets. However, DOE is aware that the manufacturer specification sheets may not provide the internal volume of pressure gauges or pressure transducers, and they may not be easy to measure. Thus, DOE proposes to use 0.1 cubic inches as the default internal volume for each pressure transducer and 0.2 cubic

inches for each pressure gauge, if internal volume is not provided in specification sheets. DOE proposes to include this requirement in section 2.2 of 10 CFR part 430, subpart B, appendix M.

Issue 5: DOE requests comment on its proposal to limit the internal volume of pressure measurement systems for cooling/heating heat pumps where the pressure measurement location may switch from liquid to vapor state when changing operating modes and for all systems undergoing cyclic tests. DOE also requests comment specifically on (a) the proposed 0.25 cubic inch per 12,000 Btu/h maximum internal volume for such systems, and (b) the proposals for default internal volumes to assign to pressure transducers and gauges of 0.1 and 0.2 cubic inches, respectively.

3. Revised EER and COP Interpolation Method for Units Equipped With Variable Speed Compressors

In the current DOE test procedure specified in section 3.2.4 and 3.6.4 of 10 CFR part 430, subpart B, appendix M, the building load is determined as a function of temperature, for both cooling and heating. Units equipped with variable speed compressors are tested at full, intermediate and minimum speeds. In calculating SEER and HSPF for variable speed units, there are three possible scenarios: (a) When the building load requires less than the minimum-speed capacity, the unit cycles at the minimum compressor speed to meet the load; (b) when the load requires more than the maximum-speed capacity, the unit operates constantly at full load; and (c) when the unit operates at an intermediate speed to meet a building load that is between the minimum-speed and maximum-speed capacities. Three outdoor temperatures are calculated for cooling and/or heating units equipped with variable speed compressors to bound the conditions in which scenario c would apply. These three outdoor temperatures are the balance points (temperatures at which the building load and delivered capacity are equal) for operation at the tested minimum, intermediate, and full compressor speeds. For all variable speed units operating in cooling mode and non-multi-split variable speed units operating in heating mode, the unit's EER and COP are calculated using quadratic functions. These quadratic functions are determined based on the EER or COP evaluated for the three calculated outdoor temperatures representing the minimum, intermediate, and full speed balance points.

In a final rule published October 22, 2007, DOE adopted a different approach for multi-split heat pumps. 72 FR 59906 (October 2007 Final Rule). DOE determined in that final rule that the quadratic fit would not be well-suited for multi-split units because the intermediate speed initially defined for variable-speed units is not likely the peak efficiency point for multi-split units. (see 71 FR 41320, 41325 (July 20, 2006)). In addition to allowing multi-split manufacturers some flexibility in selecting intermediate speeds for testing, DOE also adopted in the October 2007 final rule a two-piece linear relationship to represent EER and COP vs. temperature, rather than the quadratic fit used for other variable-speed units. 72 FR 59906 (Oct. 22, 2007).

As discussed in section III.C.3.d, AHRI provided variable speed and two stage heat data (under a Non-Disclosure Agreement to DOE's contractor) to allow evaluation of the impact on the HSPF differential associated with the new heating load line equation. In reviewing AHRI's variable speed heat pump heating test data, DOE's contractor discovered that the quadratic interpolation in some cases provides very poor estimation of COPs in the intermediate-speed operating range—in some cases predicting higher or lower COP values than all of the measured COP results. DOE has found similar issues with prediction of the cooling EER using the quadratic function, although DOE has less cooling mode data to review, and the most egregious errors in EER prediction for cooling mode are not as bad as the observed COP errors. Nevertheless, DOE believes such issues could very well cause significant errors in calculation of SEER for variable-speed units.

In this SNOPR, DOE evaluated two alternative interpolation methods for calculating SEER and HSPF for variable-speed CAC/HP in addition to the current quadratic function approach: (1) The linear interpolation method which currently applies only to multi-split units in heating mode (section 4.2.4.2 of 10 CFR part 430, subpart B, appendix M); and (2) a bin-by-bin interpolation method. The bin-by-bin method uses interpolation of EER or COP for each temperature bin based on the estimates of capacity and power input for the specific bin temperature (EER is equal to cooling capacity divided by power input, while COP is proportional to heating capacity divided by power input). Under the bin-by-bin method, an interpolation factor is first calculated, which represents the compressor operating speed needed to achieve

balance between house load and delivered capacity. For example, if, for the specific temperature bin, the heating load is between the minimum-speed capacity and the intermediate-speed capacity, the interpolation factor is equal to the difference between the heating load and the minimum-speed capacity divided by the difference between the intermediate-speed capacity and the minimum-speed capacity. This factor is then applied to the COP values to determine COP when operating at the speed needed to deliver the desired heating load. The desired load is divided by this COP to determine power input. The interpolation is between the minimum speed and the intermediate speed performance values if the load is between the minimum and intermediate-speed capacities, or between the intermediate speed and the full speed performance values, if the load is between the intermediate and full speed capacities.

DOE found that HSPFs calculated with the current quadratic method deviated from HSPFs calculated using the bin-by-bin method up to 7.4 percent and the linear interpolation method deviated up to 2.9 percent from the bin-by-bin method. Calculations conducted for cooling mode SEER showed that SEER for the quadratic method deviated from the SEER calculated for the bin-by-bin method up to 2.5 percent. DOE believes that the bin-by-bin interpolation method is the most accurate of the three approaches (*i.e.*, DOE's current quadratic approach and the two alternative approaches considered for this SNOPR), because it is based on the best estimates of performance at the different compressor speeds for the specific ambient temperature considered for each bin. Hence, DOE proposes to require use of the bin-by-bin interpolations for all variable-speed units (including variable-speed multi-split and multi-head mini-split systems), to calculate performance when operating at an intermediate compressor speed to match the building cooling or heating load. Because DOE believes that the bin-by-bin method is the most accurate, DOE does not propose for all variable-speed systems to adopt the linear approach currently used for multi-split systems. DOE would implement this change by revising the intermediate speed EER and COP equations in section of 4.1.4.2 and 4.2.4.2 of appendix M of 10 CFR part 430 subpart B.

Issue 6: DOE requests comment on the proposal to require the use of a bin-by-bin method to calculate EER and COP for intermediate-speed operation for

SEER and HSPF calculations for variable-speed units.

4. Outdoor Air Enthalpy Method Test Requirements

In DOE's current test procedure in Section 2.10 of appendix M to subpart B of part 430, the outdoor air enthalpy method is an allowable secondary test method for split systems and single-package units. DOE currently requires that the outdoor air-side test apparatus be connected to the outdoor unit and used for measurements for the outdoor air enthalpy method during the "official" test. Additionally, DOE requires a preliminary test be conducted prior to conduct of the official test, in which the unit operates without the outdoor air-side test apparatus connected. After operating without the apparatus, the apparatus is connected, and the apparatus exhaust fan speed is adjusted until performance is verified as consistent with performance prior to attaching the apparatus. Specifically, the unit must operate for 30 minutes without the apparatus connected, followed by at least five consecutive readings with the apparatus connected (with measurements taken at one-minute intervals). The apparatus exhaust fan speed must be adjusted so that the averages for the evaporator and condenser temperatures, or the saturated temperatures corresponding to the measured pressures, agree within ± 0.5 °F between the tests with and without the apparatus connected. Additionally, a preliminary test is only required prior to the first steady-state cooling mode test and the first steady-state heating mode test, as long as the outdoor fan operates during all cooling mode steady-state tests at the same speed and during all heating mode steady-state tests at the same speed. However, the test procedure requires that a preliminary test be conducted prior to each cooling mode test where a different fan speed is used, and a similar requirement applies for heating mode tests.

The outdoor air enthalpy method includes two steps in order to verify the capacity determined from the indoor air enthalpy method during the official test. However, DOE is concerned that the tolerances on achieving the same condensing and evaporating conditions in the tests with and without the airflow measurement apparatus attached inherently introduces variability to the test results that could be eliminated by shifting to an official test with the apparatus not attached. DOE proposes to make such a change for the official test.

In this SNOPR, DOE proposes to require two-step measurements in the

outdoor air enthalpy method only for cooling and heating mode tests that currently require preliminary tests (*i.e.*, the first cooling mode and heating mode tests, and any cooling mode and heating mode tests where a different outdoor fan speed is used). For example, if the unit uses a different outdoor fan speed for each test, the two-step approach would be required for each test condition. On the other hand, if the unit is a single-capacity unit and the outdoor fan uses the same fixed speed for all tests, the two-step approach would be required only for the A and H1 tests. DOE proposes that for all cooling and heating mode tests, a 30-minute test be conducted without the outside-air apparatus connected (“non-ducted” test). For tests that do not require measurements for the outdoor air enthalpy method, this 30-minute test non-ducted test would constitute the official test. For tests that do require measurements using the outdoor air enthalpy method, DOE proposes to maintain the current approach, except for changing designation of what constitutes the official test. First, the current 30-minute preliminary test would be conducted without the outside-air apparatus attached (now the “non-ducted” test). Next, the outside-air apparatus would be attached. For this test, now termed the “ducted” test, the airflow would be adjusted so that condensing and evaporating conditions are matched within tolerances, and five consecutive readings would be required (as is required for the current test) to verify the primary capacity measurements. For the tests that require measurements using the outdoor air enthalpy method, DOE proposes that the following conditions must be met for the test to be considered valid:

(1) The energy balance specified in section 3.1.1 of appendix M to subpart B of part 430 is achieved for the ducted test (*i.e.*, compare the capacities determined using the indoor air enthalpy method and the outdoor air enthalpy method).

(2) The capacities determined using the indoor air enthalpy method from the ducted and non-ducted tests cannot deviate more than 2.0 percent.

If the test is valid, the non-ducted test would be used as the official measurement for the specific test condition.

DOE believes that use of the outdoor air enthalpy method for only certain tests sufficiently measures and verifies the capacity determined from the indoor air enthalpy method, and that losing the benefit of two-step verification of the capacity determined during all of the

official tests is outweighed by the three following benefits to DOE’s proposal:

- *Better Representativeness of Field Use.* First, attachment of an apparatus for measurements for the outdoor air enthalpy method inherently affects the airflow pattern for the condenser (for example, by blocking any potential for partial recirculation of condenser discharge air to the inlet) and adds external static pressure for the outdoor fan to overcome. While DOE’s procedure requires adjustment of apparatus exhaust fan speed to achieve similar performance to operation without the outdoor air-side apparatus, there is still a tolerance on this deviation in performance. Also, it may be impossible to exactly match no-discharge-duct performance—for example, if the discharge duct blocks partial air recirculation, total condenser fan airflow may have to be reduced to achieve the same condensing temperature, thus altering the condenser fan operating point. Therefore, DOE believes that removal of the requirement to connect the outdoor air-side test apparatus during the official test would allow for performance that better matches performance in the field.

- *Improved Test Reproducibility and Repeatability.* Second, to maintain similar performance to operation without the outdoor air-side apparatus, DOE currently requires that the apparatus exhaust fan speed be adjusted. Specifically, the averages for the evaporator and condenser temperatures, or the saturated temperatures corresponding to the measured pressures, must agree within ± 0.5 °F of the averages achieved when the apparatus was disconnected. However, if the outdoor air-side apparatus is connected during the official test, two different test labs could measure evaporate and condenser temperatures that differ by up to 1.0 °F when testing the same unit. This variation could, in turn, affect the measured cooling and/or heating capacity of the unit, and therefore would change the calculated SEER and/or HSPF. DOE believes that removing the ducted test requirement from the official test would reduce this variation in performance and therefore improve the reproducibility and repeatability of its test procedure.

- *Reduced Test Burden.* Third, for cooling mode and heating mode tests requiring a preliminary test, DOE’s current test procedure requires a 30-minute non-ducted test and 5-minute ducted test be conducted as part of the preliminary test, in addition to the 30-minute official test. However, in DOE’s proposal, separate 30-minute tests

would not be required for the preliminary and official tests—only a single 30-minute non-ducted test would be performed as the official test, assuming the required tolerances and test conditions are met. DOE expects this removal of a required test to reduce the burden of testing units with the outdoor air enthalpy method as a secondary method.

Issue 7: DOE requests comment on its proposed modifications to requirements when using the outdoor air enthalpy method as the secondary test method, including its proposal that the official test be conducted without the outdoor air-side test apparatus connected.

5. Certification of Fan Delay for Coil-Only Units

In the cyclic dry-coil cooling-mode tests, the current regulatory text requires coil-only units to be tested with a time-delay relay. Section 3.5.1 of the current Appendix M states that the automatic controls that are normally installed with the test unit must govern the OFF/ON cycling of the air moving equipment on the indoor side. (10 CFR 430 Subpart B, App. M, 3.5.1) Under that section, the manufacturer is to control the indoor coil airflow for ducted coil-only units according to the rated ON and/or OFF delays provided by the relay. However, DOE understands that in typical installations, a time-delay relay, if it exists, would be part of the furnace function. DOE reviewed furnace product literature collected during the furnace fan rulemaking (see Docket Number EERE-2010-BT-STD-0011) representing a broad range of furnaces sold by major furnace manufacturers to determine whether they have time-delay relays available for cooling mode when installed with coil-only air conditioners. DOE found that in many furnace series, both old and new, from multiple manufacturers, cooling time delays are common, but they are exclusively used for the compressor off-cycle, and they have varying time-delay durations. Thus, DOE concludes that coil-only units are likely to be installed with time-delay relay control for cooling, but that the duration of the delay varies by furnace. DOE is proposing no change in the use of time delays for testing of coil-only units, but proposes to amend its certification report requirements to require coil-only ratings specify whether a time delay is included, and if so, the duration of the delay used. DOE would use the certified time delay for any testing to verify performance. Section 3.5.1 would indicate that the time delay used for testing of a coil-only system shall be as listed in the certification report.

Issue 8: DOE requests comments on its proposal to require certification reports for coil-only units to indicate whether testing was conducted using a time-delay relay to provide an off-cycle time delay, and the duration of the time delay.

6. Normalized Gross Indoor Fin Surface Area Requirements for Split Systems

DOE must establish test procedures that are reasonably designed to measure energy efficiency during a representative average use cycle as determined by DOE. (42 U.S.C. 6293 (b)(3)) DOE is aware that many potential combinations of single-split-system condensing units and indoor coils could be tested even if they are not typically installed as a combination. Ratings of single-split-system coil-only combinations, for which the outdoor unit and indoor unit are not typically installed as a combination, would not be representative of an average use cycle. The CAC/HP ECS Working Group discussed this concept and the potentially undesirable impacts of rating combinations that are not distributed in commerce or installed for consumers. Specifically, the CAC/HP ECS Working Group addressed ratings based on a combination using a blower coil indoor unit consisting of a low-efficiency condensing unit paired with an indoor blower with unusually low input power, a concept the participants referred to as a “golden blower.” Such a combination would result in an inflated rating for a low-efficiency condensing unit that is not representative of its typical installed performance. (CAC ECS: ASRAC Public Meeting, No. 87 at p. 88) The concept of unrepresentative, high performance can apply to other design aspects of indoor units, such as units with an indoor coil size far larger than would be installed for the given system capacity. To help ensure that the test procedure results in ratings that are representative of average use, DOE proposes to include a provision that would prevent testing certain combinations that are not representative of single-split systems with coil-only indoor units that are commonly distributed in commerce.

Specifically, DOE proposes to limit the normalized gross indoor fin surface (NGIFS) for the indoor unit used for single-split-system coil-only tests be no greater than 2.0 square inches per British thermal unit per hour (sq.in./Btu/hr). NGIFS is equal to total fin surface multiplied by the number of fins and divided by system capacity. An NGIFS greater than 2.0 sq.in./Btu/hr indicates that the system combines a low-capacity condensing unit with a high capacity indoor coil, e.g., a 1.5-ton

condensing unit paired with a 5-ton indoor coil. First, a house requiring a 1.5-ton air conditioner would be expected to have a commensurately-sized furnace, and a much larger indoor coil may not fit with the furnace or the existing available space. Second, such a combination might have good rated efficiency, but would provide poor dehumidification performance, due to the elevation of coil surface temperature (potentially above incoming air dew point temperature) associated with the large coil surface area. Because of the size compatibility and poor dehumidification performance, DOE understands that systems with an NGIFS greater than 2.0 sq.in./Btu/hr are not typically installed.

DOE evaluated the NGIFS for a representative data set of single-split-system coil-only combinations currently offered in the market to set this value. DOE’s dataset included close to 100 two, three, and five-ton single-split-system coil-only combinations from multiple manufacturers that represent a majority of market share and span the available range of efficiency. Testing with a NGIFS no greater than 2.0 sq.in./Btu/hr would still reflect approximately 95 percent of the split-system coil-only combinations reviewed by DOE. DOE understands a single-split-system coil-only combination with an NGIFS that exceeds 2.0 sq.in./Btu/hr to be unrepresentative because it is unlikely to be distributed in commerce, which is supported by the review of NGIFS values for numerous rated combinations, as noted previously.

Issue 9: DOE requests comment on its proposal to limit the NGIFS of tested coil-only single-split systems to 2.0 sq.in./Btu/hr.

7. Modification to the Test Procedure for Variable-Speed Heat Pumps

In the November 2015 SNOPR, DOE proposed several changes to the test procedure for variable-speed heat pumps. First, DOE proposed that the maximum compressor speed used for the test be fixed at the absolute maximum speed at which the compressor operates for the given operating mode (heating or cooling). In other words, the maximum compressor speed used in different cooling mode test conditions would be the same, equal to the absolute maximum speed used for cooling at any operating condition. DOE proposed a similar approach for heating, allowing for a different maximum speed than for cooling. 80 FR at 69307 (Nov. 9, 2015).

The June 2016 final rule discussed comments on this proposal, several of which indicated that the compressors of

variable speed heat pumps very often operate at higher speeds at colder temperatures, which can enhance measured HSPF. 81 FR at 37029 (June 8, 2016). The comments indicated that for some of these heat pumps, the compressor cannot operate in a 47 °F ambient temperature at the same full speed that it uses in a 17 °F ambient temperature. Although DOE did not in that final rule modify the test procedure to allow different compressor speeds for the full-speed tests conducted at 17 °F, 35 °F, and 47 °F ambient temperatures, DOE did acknowledge that addressing this issue would improve the test method’s representation of the improved performance of variable speed heat pumps that use higher speeds at lower temperatures, indicating that consideration would be given to such a test procedure revision in the future.⁷ *Id.* In this SNOPR, DOE proposes such a test procedure revision.

The possible adoption of a 2 °F test for rating of variable speed heat pumps was proposed in the November 2015 SNOPR. 80 FR 69323 (Nov. 9, 2015) It was also discussed during the CAC/HP ECS Working Group meetings, ultimately leading to Recommendation #5 in the Term Sheet, that a 5 °F ambient temperature optional test be adopted for variable speed heat pumps under the new Appendix M1. (CAC ECS: ASRAC Term Sheet, No. 76 at p. 3) This proposed revision is discussed in greater detail in section III.C.4. Because the Appendix M1 test procedure changes would be required as the basis for efficiency representations on the effective date of any new energy conservation standards (January 1, 2023), the 5 °F test for variable speed heat pumps would not become an option for several years. Based on the stakeholder comments discussed in this preamble, some variable-speed heat pumps may be unable to operate as required by the appendix M procedure as finalized by the June 2016 final rule. In order to resolve this issue sooner than 2021, DOE proposes that the test procedure revisions to address it be adopted in appendix M rather than appendix M1. Hence, DOE proposes the following amendments for appendix M.

- A 47 °F full-speed test used to represent the heating capacity would be required and designated as H1_N. However, the 47 °F full-speed test would not have to be conducted using the same compressor speed (determined based on revolutions per minute (RPM))

⁷ The June 2016 final rule also changed the terminology for the highest compressor speed from “maximum speed” to “full speed,” as requested by several comments responding to the November 2015 SNOPR. 81 FR at 37030 (June 8, 2016).

or power input frequency) as the full-speed tests conducted at 17 °F and 35 °F ambient temperatures, nor at the same compressor speeds used for the full-speed cooling test conducted at 95 °F. For Appendix M, the compressor speed for the 47 °F full-speed test would be at the manufacturer's discretion, except that it would have to be no lower than the speed used in the 95 °F full-speed cooling test. Prior to the June 2016 final rule amendments, the heating capacity was represented either by the H₁₂ test (for which the compressor speed guidance was not explicit), or, if a manufacturer chose to conduct what was then the optional H_{1N} test, this latter test (using the same compressor speed as the full-speed cooling mode test) represented the heating capacity. In the current proposal, heating capacity would be represented only by the H_{1N} test, which would be mandatory, while the compressor speed would be at the manufacturer's discretion within a range from the speed used for the 95 °F full-speed cooling test to the speed used for the full-speed 17 °F test.

- The full-speed tests conducted at 17 °F and 35 °F ambient temperatures would still have to use the same speed, which would be the maximum speed at which the system controls would operate the compressor in normal operation in a 17 °F ambient temperature, although the 35 °F full-speed test is and would remain optional.

- It would be optional to conduct a second full-speed test at 47 °F ambient temperature at the same compressor

speed as used for the 17 °F test, if this speed is higher than the speed used for the H_{1N} test described in this preamble. This test would be designated the H₁₂ test. Because DOE does not expect that an H_{1N} test would ever use a higher compressor speed than used for the full-speed 17 °F test, the test procedure would not provide for this situation.

- If no 47 °F full-speed test is conducted at the same speed as used for the 17 °F full-speed test, standardized slope factors for capacity and power input would be used to estimate the performance of the heat pump for the 47 °F full-speed test point for the purpose of calculating HSPF.

- The capacity measured for the H_{1N} test would be used in the calculation to determine the design heating requirement.

Development of these proposals and decisions regarding their details is explained further below.

As discussed in the June 2016 final rule, DOE believes that extrapolations of performance to lower temperatures should be based on tests conducted at the same speed and used to estimate performance where there is a good expectation that the speeds are also the same or at least not very different. Hence, DOE believes that calculation of performance below 17 °F must be based on a same-speed extrapolation (or on an interpolation using measurements for a lower-temperature test, such as for the proposed 5 °F test discussed in section III.C.4). For those heat pumps which cannot operate in the 47 °F ambient temperature at the same compressor

speed used for the 17 °F full-speed test, DOE proposes use of average performance trends to represent the 47 °F test point so that a representative same-speed extrapolation can be done.

DOE evaluated the 17 °F-to-47 °F same-speed performance trends of heat pumps based on several sources including the AHRI database, data for two stage and variable speed heat pumps provided to DOE's contractor by AHRI during the CAC/HP ECS meetings, and product data sheets for 51 single-package heat pumps. The ratios for capacity and power input for the 17 °F test condition as compared to the 47 °F test condition are presented in Table III.4. The AHRI database provides capacity information for both 17 °F and 47 °F test conditions, but not power input for both. DOE did not consider variable speed models from the AHRI database in this analysis because of questions about whether the compressor speeds were the same for both test conditions for tests of these units. For the data provided by AHRI during the CAC/HP ECS meetings, DOE evaluated the two stage units and the variable speed units with a capacity ratio within a narrow range, to be sure that the results for these units were based on use of the same speed for both test conditions. Evaluation of the data for single-package units shows that they have a significantly lower capacity ratio, but roughly the same power input ratio, as compared with split systems. Consequently, DOE is proposing in this SNOPR a different standard capacity slope factor for single-package units.

TABLE III.3—AVERAGE HEAT PUMP CAPACITY AND POWER INPUT RATIOS FOR 17 °F AND 47 °F TESTS

Data source	Capacity ratio (17 °F vs. 47 °F)	Power input ratio (17 °F vs. 47 °F)
AHRI Database, Single-Stage and Two stage Split-System	0.618	Not available.
Single-Package	0.558	
Data Provided by AHRI During ASRAC Meetings:		
Two stage	0.623	0.886.
Variable speed *	0.637	0.875.
Data Sheets for Single-Package Units	0.557	0.874.

* Just for VS units with capacity ratio between 0.59 and 0.67, indicating high probability that compressor speed was the same for both 17 °F and 47 °F tests.

Based on the reviewed data, DOE selected capacity ratios equal to 0.62 for split systems and 0.56 for single-package units in order to calculate capacity slope factors. Also, DOE selected 0.88 as the power input ratio to use for calculating the power input slope factor. DOE proposes adopting slope factors that would be multiplied by the capacity or power input

measured for the 17 °F ambient temperature in order to obtain the slope of the evaluated parameter per degree temperature rise. For example:

Capacity Slope = $\dot{Q}_{h,k=2}(17) * CSF$

Where:

Capacity Slope is the change in capacity per change in temperature in Btu/h-°F,
 $\dot{Q}_{h,k=2}(17)$ is the capacity measured in the H₃₂ Test in Btu/h, and

CSF is the Capacity Slope Factor in 1/°F.

The CSF is calculated from the selected capacity ratio as follows:

$$CSF = \frac{1 - CR}{(30°F) * CR}$$

Where CR is the capacity ratio.

The resulting values for the capacity slope factors are 0.0204/°F for split

systems and 0.0262/°F for single-package systems. DOE adopted a similar approach for development of the Power Slope Factor (PSF), which is calculated to be 0.00455/°F for all systems.

DOE proposes use of these slope factors for any variable speed heat pumps for which the 47 °F full-speed test cannot be conducted at the same speed (represented by RPM or power input frequency) used in the 17 °F full-speed test. The slope factors would be used for calculation of representative capacity and power for operation at 47 °F ambient temperature for the purposes of calculating HSPF.

As mentioned in this preamble, DOE proposes that the 17 °F test be conducted using the maximum speed at which the system controls would operate the compressor during normal operation in this ambient temperature. This would help to ensure that the test procedure be representative of field operation, since, for cold temperatures close to 17 °F, the heat pump would be expected to be operating at full speed to satisfy the high heating loads expected for these temperatures. Further, DOE proposes that the 35 °F full-speed test, if conducted, use the same compressor speed as the 17 °F test, so that the impact of frosting and defrost for this test is not masked by an adjustment in compressor speed.

Issue 10: DOE requests comments on its proposal to require that full-speed tests conducted in 17 °F and 35 °F ambient temperatures use the maximum compressor speed at which the system controls would operate the compressor in normal operation in a 17 °F ambient temperatures. DOE requests comment on the proposed approach of using standardized slope factors for calculation of representative performance at 47 °F ambient temperature for heat pumps for which the 47 °F full-speed test cannot be conducted at the same speed as the 17 °F full-speed test. Further, DOE requests comment on the specific slope factors proposed, and/or data to show that different slope factors should be used.

In addition, DOE proposes that the H1_N test, at 47 °F ambient temperature, be conducted to represent nominal heat pump heating capacity, but that there would be no specific compressor speed requirement associated with it for Appendix M, except that it be no lower than the speed used for the 95 °F full-speed cooling test. If the H1_N test does not use the same speed as is used for the 17 °F full-speed heating test, it would affect the HSPF calculation only through its influence on the design heating requirement, since the

standardized slope factors would be used to represent full-speed heat pump performance. DOE proposes that the 47 °F full-speed test used to represent heat pump capacity would use the same maximum compressor speed that the control system would use during normal operation in 47 °F ambient temperatures in Appendix M1 (see section III.C.4). However, proposing flexibility in the selection of compressor speed for the test would be more consistent with the recent approach for measuring nominal heating capacity (prior to publication of the June 2016 final rule) because compressor speed requirements on the H1₂ test may not have been clearly defined at that time (see Appendix M to subpart B of part 430 as of January 1, 2016).

Issue 11: DOE requests comments on its proposal to allow the full speed test in 47 °F ambient temperature that is used to represent heat pump heating capacity, to use any speed that is no lower than used for the 95 °F full-speed cooling test for Appendix M.

8. Clarification of the Requirements of Break-in Periods Prior to Testing

In the June 2016 final rule, DOE maintained its proposal from the November 2015 SNOPR to allow manufacturers the option of specifying a break-in period to be conducted prior to testing under the DOE test procedure. DOE limited the optional break-in period to 20 hours, which is consistent with the test procedure final rule for commercial HVAC equipment (10 CFR 431.96). The duration of the compressor break-in period, if used, must be included in the certification report for CAC/HP (10 CFR 429.16). DOE also adopted the same provisions as the commercial HVAC rule regarding the requirement for manufacturers to record the use of a break-in period and its duration as part of the test data underlying their product certifications, the use for testing conducted by DOE of the same break-in period specified in product certifications, and use of the 20 hour break-in period for DOE testing of products certified using an AEDM. 81 FR at 37033 (Jun. 8, 2016).

Section 3.1.7 of Appendix M, "Test Sequence" indicates that manufacturers have the option to operate the equipment for a break-in period on to exceed 20 hours, and that this break-in period must be recorded in the test data underlying the certified rating if the manufacturer uses a break-in period. DOE has made reporting of the break-in period a certification report requirement. 81 FR at 37053 (June 8, 2016). Hence, the instructions to record the break-in period in the test report is

not necessary in section 3.1.7. Also, DOE intends that tests conducted by third-party testing facilities should use the break-in period that is certified and proposes to modify the language to clarify that the certified break-in period is used for the test (whether conducted by a manufacturer or other party). DOE also proposes to clarify that each compressor should undergo the break-in according to the certified number of hours, for units with multiple compressors. Finally, DOE proposes to clarify that the break-in period should be conducted prior to the first 30 minutes test data collection period as required by the test methods in section 3 of Appendix M.

Issue 12: DOE requests comments on its clarifications regarding use of break-in, including use of the certified break-in period for each compressor of the unit, regardless of who conducts the test, prior to any test period used to measure performance.

9. Modification to the Part Load Testing Requirement of VRF Multi-Split Systems

In addition to the adopted portions of the AHRI Standard 1230–2010, DOE proposed additional provisions in the November 2015 SNOPR for testing of VRF Multi-Split Systems. This included a provision adopted as part of section 2.2.3.a of Appendix M in the June 2016 final rule requiring that for part load tests, the sum of the nominal heating or cooling capacities of the operational indoor units be within 5 percent of the intended system part load heating or cooling capacity. 81 FR at 37066 (June 8, 2016). DOE recognizes the intended system part load heating or cooling capacity is not clearly defined in the test procedure and that the sum of nominal capacities of the indoor units may very well be higher than the system part load capacity during the test (since the indoor units would be expected to be operating at part load, less than their nominal capacity, during a part load test). Therefore, DOE proposes to remove this 5 percent tolerance requirement.

Issue 13: DOE requests comments on removing from section 2.2.3.a of Appendix M the 5 percent tolerance for part load operation when comparing the sum of nominal capacities of the indoor units and the intended system part load capacity.

10. Modification to the Test Unit Installation Requirement of Cased Coil Insulation and Sealing

The June 2016 final rule provided instructions in 2.2.c of Appendix M for uncased coils, including instructions

regarding the addition of internal insulation and/or sealing consistent with manufacturer's instructions. The section ends with a requirement that no extra insulating or sealing is allowed for cased coils. This statement was intended to indicate that no extra internal insulating or sealing is allowed. DOE believes that the statement as it stands may suggest that sealing is not allowed between a cased coil and its connections to inlet and outlet ducts. To prevent such confusion, DOE proposes to remove the statement about cased coils.

Issue 14: DOE requests comment on whether removing the statement about insulating or sealing cased coils in Appendix M, section 2.2.c would be sufficient to avoid confusion regarding whether sealing of duct connections is allowed.

C. Appendix M1 Proposal

The November 2015 SNOPR proposed to establish a new Appendix M1 to Subpart B of 10 CFR part 430, which would be required to demonstrate compliance with any new energy conservation standards. 80 FR 69278, 69397 (Nov. 9, 2015) In this SNOPR, DOE also proposes to establish a new Appendix M1. The appendix would include all of the test procedure provisions in Appendix M as finalized in the June 2016 final rule, all of the proposed changes to Appendix M that are discussed in section III.B, and all of the additional proposals discussed in this section III.C, which would be included only in the new Appendix M1. DOE proposes to make Appendix M1 mandatory for representations of efficiency starting on the compliance date of any amended energy conservation standards for CAC/HP (however, note that phase-in of testing requirements for certain proposed new requirements for split systems would be as discussed in section III.A.1).

1. Minimum External Static Pressure Requirements

Most of the CAC/HP in the United States use ductwork to distribute air in a residence, using either a fan inside the indoor unit or housed in a separate component, such as a furnace, to move the air. External static pressure (ESP) for a CAC/HP is the static pressure rise between the inlet and outlet of the indoor unit that is needed to overcome frictional losses in the ductwork. The external static pressure imposed by the ductwork affects the power consumed by the indoor fan, and therefore also affects the SEER and/or HSPF of a CAC/HP.

a. Conventional Central Air Conditioners and Heat Pumps

The current DOE test procedure⁸ stipulates that certification tests for "conventional" CACs and heat pump blower coil systems (*i.e.*, CACs and heat pump blower coil systems which are not small-duct, high-velocity systems) must be performed with an external static pressure at or above 0.10 in. wc. if cooling capacity is rated at 28,800 Btu/h or less; at or above 0.15 in. wc. if cooling capacity is rated from 29,000 Btu/h to 42,500 Btu/h; and at or above 0.20 in. wc. if cooling capacity is rated at 43,000 Btu/h or more.

DOE did not propose revisions to minimum external static pressure requirements for conventional blower coil systems in the June 2010 test procedure NOPR, stating that new values and a consensus standard were not readily available.⁹ 75 FR 13223, 31228 (June 2, 2010). However, between the June 2010 test procedure NOPR and the November 2015 test procedure SNOPR, many stakeholders submitted comments citing data that suggested the minimum external static pressure requirements were too low and a value of 0.50 in. wc. would be more representative of field conditions. These comments are summarized in the November 2015 test procedure SNOPR. 80 FR 69317–18 (Nov. 9, 2015). Ultimately, in the November 2015 SNOPR, DOE proposed to adopt, for inclusion into 10 CFR part 430, subpart B, appendix M1, for systems other than multi-split systems and small-duct, high-velocity systems, minimum external static pressure requirements of 0.45 in. wc. for units with a rated cooling capacity of 28,800 Btu/h or less; 0.50 in. wc. for units with a rated cooling capacity from 29,000 Btu/h to 42,500 Btu/h; and 0.55 in. wc. for units with a rated cooling capacity of 43,000 Btu/h or more. DOE reviewed available field data to determine the external static pressure values it proposed in the November 2015 test procedure SNOPR. DOE gathered field studies and research reports, where publically available, to estimate field external static pressures. DOE previously reviewed most of these studies when developing test requirements for furnace fans. The 20 studies, published from 1995 to 2007, provided 1,010 assessments of location

and construction characteristics of CAC and/or heat pump systems in residences, with the data collected varying by location, representation of system static pressure measurements, equipment's age, ductwork arrangement, and air-tightness.¹⁰ 79 FR 500 (Jan. 3, 2014). DOE also gathered data and conducted analyses to quantify the pressure drops associated with indoor coil and filter foulants.¹¹ The November 2015 test procedure SNOPR provides a detailed overview of the analysis approach DOE used to determine an appropriate external static pressure value using this data. 80 FR 69318–19 (Nov. 9, 2015). DOE did not consider revising the minimum external static pressure requirements for SDHV systems in the November 2015 test procedure SNOPR. DOE did, however, propose to establish a new category of ducted systems, short duct systems, which would have lower external static pressure requirements for testing. DOE proposed to define "short duct system" to mean ducted systems whose indoor units can deliver no more than 0.07 in. wc. external static pressure when delivering the full load air volume rate for cooling operation. 80 FR at 69314. DOE proposed in the November 2015 SNOPR to require short duct systems to be tested using the minimum external static pressure previously proposed in the June 2010 NOPR for "multi-split" systems: 0.03 in. wc. for units less than 28,800 Btu/h; 0.05 in. wc. for units between 29,000 Btu/h and 42,500 Btu/h; and 0.07 in. wc. for units greater than 43,000 Btu/h. 75 FR at 31232 (June 2, 2010)

In response to the November 2015 SNOPR, Lennox supported DOE's proposal to increase the minimum test static pressure to more accurately reflect field installation conditions. Lennox recommended that this level be set to 0.50 in. wc. for all capacities, commenting that the single set point simplifies the test procedure, is consistent with levels found in field studies, and avoids compliance issues related to minimum static pressure settings based upon capacity. (CAC TP:

¹⁰ DOE has included a list of citations for these studies in the docket for the furnace fan test procedure rulemaking. The docket number for the furnace fan test procedure rulemaking is EERE–2010–BT–TP–0010.

⁸ Table 3 of 10 CFR part 430 subpart B appendix M.

⁹ In the June 2010 NOPR, DOE proposed lower minimum ESP requirements for ducted multi-split systems: 0.03 in. wc. for units less than 28,800 Btu/h; 0.05 in. wc. for units between 29,000 Btu/h and 42,500 Btu/h; and 0.07 in. wc. for units greater than 43,000 Btu/h. 75 FR at 31232 (June 2, 2010).

Lennox, No. 61 at p. 11) Lennox also commented that improvements in field practices to reduce installed static pressure in parallel with optimizing products for lower static pressures are a more effective measure to optimize field performance and reduce energy consumption. Lennox commented that products optimized for increased static pressures will likely result in increased energy consumption. (Lennox, No. 61 at p. 11) Unlike Lennox, Rheem did not agree in its comments that the assumption of poorly designed ductwork should be built into the test procedure. (CAC TP: Rheem, No. 69 at p. 16)

Many interested parties supported the proposal to increase the external static pressure requirement. NEEA and NPCC commented that the minor adjustments on either side of 0.50 in. wc. on the basis of system capacity would be a needless complication of the test procedure because NEEA and NPCC's field data does not suggest any correlation between the external static pressure a system faces and the system capacity. (CAC TP: NEEA and NPCC, No. 64 at p. 8) The California IOUs recommended that all capacities use 0.50 in. wc. to simplify testing. (CAC TP: California IOUs, No. 67 at p. 2) ACEEE, NRDC, and ASAP fully supported adopting 0.50 in. wc. for all units (in blower coil configuration), as 0.5 in. wc. would be closer to the levels found in thousands of residential duct systems tested. (CAC TP: ACEEE, NRDC, ASAP, No. 72 at p. 4)

Lennox and Rheem commented that DOE's assumption that a CAC system would be poorly maintained, such as containing fouled coils and filters, should not be built into the test procedure. (CAC TP: Lennox, No. 61 at p. 19; Rheem, No. 69 at p. 16) Lennox further commented that any accommodation for poor field conditions should be administered equitably across all product types. (CAC TP: Lennox, No. 61 at p. 19) Rheem also commented that although dirty filters and fouled coils can increase system static, Rheem considers undersized duct work as the leading cause of high pressure drop measured in field applications. (CAC TP: Rheem, No. 69 at p. 16) Rheem believed that requiring higher minimum external static pressure would reduce published ratings, which could confuse installers and consumers. Rheem commented that a new energy metric should be introduced that would distinguish ratings based on appendix M from ratings based on appendix M1. The California IOUs commented that, as

shown in the ACCA Manual D,¹² the filter pressure drop value of 0.20 in. wc. is normal, and supported DOE's proposal. (CAC TP: California IOUs, No. 67 at p. 6)

After discussions that included the concerns from the comments summarized previously in this section, the CAC/HP ECS Working Group members weighed in on appropriate minimum external static pressure requirements. (CAC ECS: CAC/HP ECS Working Group meeting, No. 86 at pp. 31–128) Recommendation #2 of the CAC/HP ECS Working Group Term Sheet states that the minimum required external static pressure for CAC/HP blower coil systems other than mobile home systems, ceiling-mount and wall-mount systems, low and mid-static multi-split systems, space constrained systems, and small-duct, high-velocity systems should be 0.50 in. wc. for all capacities. (CAC ECS: ASRAC Term Sheet, No. 76 at p. 2) In comments in response to the November 2015 SNOPIR, Unico supported the values discussed during the ASRAC meetings. (CAC TP: Unico, No. 63 at p. 12) JCI and Carrier commented that this topic has already been resolved through the ASRAC meetings.¹³ (CAC TP: JCI, No. 66 at p. 21; Carrier, No. 62 at p. 20)

Based on DOE's analysis and consistent with the CAC/HP ECS Working Group Term Sheet, DOE proposes to adopt, for inclusion into 10 CFR part 430, subpart B, appendix M1, for systems other than mobile home, ceiling-mount and wall-mount systems, low and mid-static multi-split systems, space-constrained systems, and small-duct, high-velocity systems, a minimum external static pressure requirement of 0.50 in. wc. DOE is aware that such changes will impact the certification ratings for SEER, HSPF, and EER and is addressing such impact in the current energy conservation standards rulemaking.¹⁴ For this reason, DOE is not proposing to make this change in appendix M.

b. Non-Conventional Central Air Conditioners and Heat Pumps

In response to the November 2015 SNOPIR and during the CAC/HP ECS Working Group negotiations, DOE also received comment regarding the minimum external static pressure requirements for mobile home systems, ceiling-mount and wall-mount systems,

low and mid-static multi-split systems, space-constrained systems, and small-duct, high-velocity systems. In its comments, First Co. proposed to reduce the minimum static pressure for space-constrained and multi-family blower coils to 0.25 in. wc. or lower. (CAC TP: First Co., No. 56 at p. 2) The CAC/HP ECS Working Group included in its Final Term Sheet Recommendation #2, which is summarized in Table III.4 below. (CAC ECS: ASRAC Term Sheet, No. 76 at p. 2)

TABLE III.4—CAC/HP ECS WORKING GROUP RECOMMENDED MINIMUM EXTERNAL STATIC PRESSURE REQUIREMENT

Product description	Minimum external static pressure (in. wc.)
All central air conditioners and heat pumps except (2)–(7) below.	0.50.
(2) Ceiling-mount and Wall-mount Blower Coil System.	TBD by DOE.
(3) Manufactured Housing Air Conditioner Coil System.	0.30.
(4) Low-Static System	0.10.
(5) Mid-Static System	0.30.
(6) Small Duct, High Velocity System.	1.15.
(7) Space Constrained	0.30.

Recommendation #1 of the CAC/HP ECS Working Group included suggested definitions for distinguishing the CAC/HP varieties included in Recommendation #2 (Table III.4) to enable the proper administration of the CAC/HP ECS Working Group's recommended minimum external static pressure requirements. Recommendation #1 stated:

- Suggested definitions capture the intent of the Working Group and DOE should adopt them as is or modify them in a manner that captures the same intent.

- For those definitions that contain a maximum external static pressure requirement, the unit's maximum external static pressure would be determined using a dry coil test without electric heat installed and without an air filter installed at the unit's certified airflow, or, if the airflow is not certified, at an airflow of 400 cfm per ton of certified capacity.

- For those condensing units distributed in commerce with different indoor unit combinations, each specific combination would need to meet the applicable definition in order to be rated with the associated static.

The CAC/HP ECS Working Group's recommended definitions are as follows:

¹² Manual D: Residential Duct Systems. Arlington, VA: Air Conditioning Contractors of America (ACCA).

¹³ The comment period for the November 2015 SNOPIR was still open during the CAC/HP ECS Working Group negotiations.

¹⁴ Docket No. EERE–2014–BT–STD–0048.

- A ceiling-mount blower coil system is a split-system central air conditioner or heat pump that contains a condensing unit and an indoor unit intended to be exclusively installed by being secured to the ceiling of the conditioned space, with return air directly to the bottom of the unit (without ductwork), having an installed height no more than 12 inches (not including condensate drain lines) and depth (in the direction of airflow) of no more than 30 inches, with supply air discharged horizontally. The certified cooling capacity must be less than or equal to 36,000 Btu/h.

- A wall-mount blower coil system is a split-system central air conditioner or heat pump that contains a condensing unit and an indoor unit intended to be exclusively installed by having the back side of the unit secured to the wall within the conditioned space, with capability of front air return (without ductwork) and not capable of horizontal airflow, having a height no more than 45 inches, a depth of no more than 22 inches (including tubing connections), and a width no more than 24 inches. The certified cooling capacity must be less than or equal to 36,000 Btu/h.

- Manufactured housing air conditioner coil system is a split-system air conditioner or heat pump that contains a condensing unit with an indoor unit that: (1) Is distributed in commerce for installation only in a manufactured home with the home and equipment complying with HUD Manufactured Home Construction Safety Standard 24 CFR part 3280; (2) has an external static pressure that must not exceed 0.4 inches of water; and (3) has an indoor unit that must bear a label in at least 1/4 inch font that reads "For installation only in HUD Manufactured Home per Construction Safety Standard 24 CFR part 3280." Note, manufacturers must certify which combinations are manufactured housing air conditioner coil system.

- Low-static system means a ducted multi-split or multi-head mini-split system where all indoor sections produce greater than 0.01 and a maximum of 0.35 inches of water of external static pressure when operated at the full-load air volume rate not exceeding 400 cfm per rated ton of cooling.

- Mid-static system means a ducted multi-split or multi-head mini-split system where all indoor sections produce greater than 0.20 and a maximum of 0.65 inches of water of external static pressure when operated at the full-load air volume rate not exceeding 400 cfm per rated ton of cooling.

UTC/Carrier supported the low and medium static definitions as presented during the CAC/HP ECS Working Group meetings, in place of the short-duct unit definition DOE proposed in the November 2015 SNO PR. (CAC TP: UTC/Carrier, No. 62 at p. 3–4,19) AHRI and Mitsubishi recommended in their comments nearly identical definitions to those recommended in the CAC/HP ECS Working Group term sheet. (CAC TP: AHRI, No. 70 at p. 17; Mitsubishi, No. 68 at p. 2–3) Goodman generally supported the comments made by industry during the initial meetings of the CAC/HP ECS Working Group, in which additional sub-categories of "short-ducted" systems were proposed. Goodman recommended that DOE only include CAC/HP ECS Working Group's definitions and modifications to the test procedure in the "M1" test procedure and not part of "M" test procedure because the proposed modification to the test procedure would increase the measured energy consumption for those "short-ducted" systems being marketed under the current "M" test procedure. (CAC TP: Goodman, No. 73 at p. 6–7)

DOE agrees with the intent of Recommendation #1 and #2 of the CAC/HP ECS Working Group Term Sheet. DOE recognizes that the CAC/HP varieties included in these recommendations have unique installation characteristics that result in different field external static pressure conditions, and in turn, indoor fan power consumption in the field. While conventional split systems are typically installed in attics or basements and require long ductwork to deliver conditioned air to the conditioned space, ceiling-mount systems, wall-mount systems, space-constrained systems, low-static systems and mid-static systems are installed in or in closer proximity to the spaces they condition, typically requiring shorter ductwork than conventional split systems. The field external static pressure for these non-conventional systems is lower than the external static pressure for conventional split systems as a result. In this SNO PR, DOE proposes to adopt the CAC/HP ECS Working Group recommended minimum external static pressure requirements for space-constrained systems, low-static systems, and mid-static systems to be more reflective of field conditions for these reasons, with one modification. DOE understands that when some space-constrained outdoor units are paired with conventional indoor units, the minimum external static pressure requirement for space constrained systems recommended by

the CAC/HP ECS Working Group, 0.30 in. wc., would not be appropriate for these installations. Therefore, DOE also proposes to limit the CAC/HP ECS Working Group recommended minimum external static pressure requirement for space-constrained systems only to space-constrained indoor units and single-package space-constrained units.

The CAC/HP ECS Working Group tasked DOE with the determination of the appropriate minimum external static pressure for ceiling-mount and wall-mount systems. During the CAC/HP ECS Working Group meetings, manufacturers of these systems suggested a minimum external static pressure requirement of 0.30 in. wc. (CAC ECS: CAC/HP ECS Working Group meeting, No. 88 at p. 31) However, the CAC/HP ECS Working Group did not adopt this as a recommendation primarily due to lack of time to thoroughly review the subject. DOE proposes to specify a minimum external static pressure requirement of 0.30 in. wc. for ceiling-mount and wall-mount systems, consistent with manufacturers' recommendations.

Mobile home¹⁵ systems also have lower field external static pressure than conventional split systems. Mobile home systems are installed in homes that meet the HUD Manufactured Home Construction Safety Standard 24 CFR part 3280, which includes a maximum threshold of 0.30 in. wc. for the restrictiveness of ductwork. Consistent with these HUD requirements, the CAC/HP ECS Working Group recommendation, and the external static pressure requirements for mobile home systems in the DOE furnace fan test procedure, DOE proposes to adopt 0.30 in. wc. as the minimum external static pressure required for testing mobile home central air conditioning and heat pump systems.

In this SNO PR, DOE proposes to adopt the CAC/HP ECS Working Group recommendations for minimum external static pressure requirements for low-static and mid-static systems. By the definitions recommended by the Working Group, these systems are not capable of producing external static pressure significantly higher than the recommended minimum external static

¹⁵ In previous rulemaking documents for the furnace fan test procedure and, DOE used the term "manufactured home" to be synonymous with "mobile home," as used in some definitions in the **Federal Register**. 10 CFR 430.2. DOE will use the term "mobile home" in place of "manufactured home" hereinafter to be consistent with the **Federal Register** definitions that use "mobile home", such as for "mobile home furnace." All provisions and statements regarding mobile homes and mobile home products are applicable to manufactured homes and manufactured home products.

pressure requirements. Consequently, DOE expects that any system that would meet these definitions would be incapable of properly conditioning a home that has ductwork with an external static pressure significantly higher than the proposed minimum.

The CAC/HP ECS Working Group did not recommend a change to the current minimum external static pressure required (1.15 in. wc.) for SDHV systems with a cooling or heating capacity between 29,000 to 42,500 Btu/h. However, the CAC/HP ECS Working Group recommended that 1.15 in. wc. also be used as the minimum external static pressure requirement for SDHV systems of all other capacities. Using a single minimum external static pressure value for all capacities of a given CAC/HP variety is consistent with the approach recommended by the Working Group for all CAC/HP varieties. DOE proposes to adopt the Working Group recommendation for the minimum external static pressure requirement for SDHV systems.

Table III.5 summarizes DOE's proposed minimum external static pressure requirements.

TABLE III.5—PROPOSED MINIMUM EXTERNAL STATIC PRESSURE REQUIREMENTS

CAC/HP Variety	Minimum external static pressure (in. wc.)
Conventional (<i>i.e.</i> , all central air conditioners and heat pumps not otherwise listed in this table)	0.50
Ceiling-mount and Wall-mount	0.30
Mobile Home	0.30
Low-Static	0.10
Mid-Static	0.30
Small Duct, High Velocity	1.15
Space-Constrained (indoor and single-package units only)	0.30

Issue 15: DOE requests comments on the proposed minimum external static pressure requirements.

DOE also agrees with the intent of the definitions recommended by the CAC/HP ECS Working Group. DOE proposes to adopt those definitions with minor modifications to make them consistent with other proposed regulatory language. For example, DOE is proposing to replace the term “condensing unit” in the CAC/HP ECS Working Group recommended definition for mobile home systems with the term “outdoor unit” to ensure that the definition applies to both mobile home air conditioners and heat pumps.

DOE proposes to adopt the following definitions for the CAC/HP varieties included in Recommendations #1 and #2 in the CAC/HP ECS Working Group Term Sheet:

- *Ceiling-mount blower coil system* means a split system for which the outdoor unit has a certified cooling capacity less than or equal to 36,000 Btu/h and the indoor unit is shipped with manufacturer-supplied installation instructions that specify to secure the indoor unit only to the ceiling of the conditioned space, with return air directly to the bottom of the unit (without ductwork), having an installed height no more than 12 inches (not including condensate drain lines) and depth (in the direction of airflow) of no more than 30 inches, with supply air discharged horizontally.

- *Low-static blower coil system* means a ducted multi-split or multi-head mini-split system for which all indoor units produce greater than 0.01 in. wc. and a maximum of 0.35 in. wc. external static pressure when operated at the cooling full-load air volume rate not exceeding 400 cfm per rated ton of cooling.

- *Mid-static blower coil system* means a ducted multi-split or multi-head mini-split system for which all indoor units produce greater than 0.20 in. wc. and a maximum of 0.65 in. wc. when operated at the cooling full-load air volume rate not exceeding 400 cfm per rated ton of cooling.

- *Mobile home blower coil system* means a split system that contains an outdoor unit and an indoor unit that meet the following criteria: (1) Both the indoor and outdoor unit are shipped with manufacturer-supplied installation instructions that specify installation only in a mobile home with the home and equipment complying with HUD Manufactured Home Construction Safety Standard 24 CFR part 3280; (2) the indoor unit cannot exceed 0.40 in. wc. when operated at the cooling full-load air volume rate not exceeding 400 cfm per rated ton of cooling; and (3) the indoor unit and outdoor unit each must bear a label in at least ¼ inch font that reads “For installation only in HUD manufactured home per Construction Safety Standard 24 CFR part 3280.”

- *Wall-mount blower coil system* means a split system for which the outdoor unit has a certified cooling capacity less than or equal to 36,000 Btu/h and the indoor unit is shipped with manufacturer-supplied installation instructions that specify to secure the back side of the unit only to a wall within the conditioned space, with the capability of front air return (without ductwork) and not capable of horizontal airflow, having a height no more than 45

inches, a depth of no more than 22 inches (including tubing connections), and a width no more than 24 inches (in the direction parallel to the wall).

c. Certification Requirements

DOE proposes to establish the certification requirements for Appendix M1 to require manufacturers to certify the kind(s) of CAC/HP associated with the minimum external static pressure used in testing or rating (*i.e.*, ceiling-mount, wall-mount, mobile home, low-static, mid-static, small duct high velocity, space constrained, or conventional/not otherwise listed). In the case of mix-match ratings for multi-split, multi-head mini-split, and multi-circuit systems, manufacturers may select two kinds. In addition, models of outdoor units for which some combinations distributed in commerce meet the definition for ceiling-mount and wall-mount blower coil system are still required to have at least one coil-only rating (which uses the 441W/1000 scfm default fan power value) that is representative of the least efficient coil distributed in commerce with the particular model of outdoor unit. Mobile home systems are also required to have at least one coil-only rating that is representative of the least efficient coil distributed in commerce with the particular model of outdoor unit. DOE proposes to specify a default fan power value of 406W/1000 scfm, rather than 441W/1000 scfm, for mobile home coil-only systems. Details of this proposal are discussed in detail in section III.C.2.

Issue 16: DOE requests comment on the proposed definitions for kinds of CAC/HP associated with administering minimum external static pressure requirements.

d. External Static Pressure Reduction Related to Condensing Furnaces

In the November 2015 SNO PR, DOE requested comment on its proposal to implement a 0.10 in. wc. reduction in the minimum external static pressure requirement for air conditioning units tested in blower coil (or single-package) configuration in which a condensing furnace is in the airflow path during the test. This issue was also discussed as part of the CAC/HP ECS Working Group negotiation process. ADP, Lennox, NEEA, NPCC, California IOUs, Rheem, ACEEE, NRDC, and ASAP did not support the proposal because it would make the ratings for units paired with condensing furnaces less reflective of field energy use. (CAC TP: ADP, No. 59 at p. 12; Lennox, No. 61 at p. 20; NEEA and NPCC, No. 64 at p. 8; California IOUs, No. 67 at p. 6; Rheem, No. 69 at p. 17; ACEEE, NRDC, ASAP, No. 72 at

p. 4) JCI commented that this topic has already be resolved through the CAC/HP ECS Working Group meetings. (CAC TP: JCI, No. 66 at p. 21) Carrier commented to refer to the agreement on external static pressure from the CAC/HP ECS Working Group and expressed the view that this credit is contrary to better aligning the rating procedure with real world data. (CAC TP: Carrier, No. 62 at p. 21) As Carrier and JCI point out, Recommendation #2 of the CAC/HP ECS Working Group Term Sheet also states that the proposed reduction in minimum external static pressure required for units paired with condensing furnaces should not be used. (CAC ECS: CAC/HP ECS Working Group Term Sheet, No. 76 at p. 2)

In light of public comments and the consensus of the CAC/HP ECS Working Group, DOE is not proposing to adopt a reduced minimum external static pressure requirement for air conditioning units tested in blower coil (or single-package) configuration in which a condensing furnace is in the airflow path during the test.

Issue 17: DOE requests comments on not including a reduced minimum external static pressure requirement for blower coil or single-package systems tested with a condensing furnace.

2. Default Fan Power for Rating Coil-Only Units

The default fan power value (hereafter referred to as “the default value”) is used to represent fan power input when testing coil-only air conditioners, which do not include their own fans.¹⁶ In the current test procedure, the default value is 365 Watts (W) per 1,000 cubic feet per minute of standard air (scfm) and there is an associated adjustment to measured capacity to account for the fan heat equal to 1,250 British Thermal Units per hour (Btu/h) per 1,000 scfm (10 CFR part 430, subpart B, Appendix M, section 3.3.d). The default value was discussed in the June 2010 NOPR, in which DOE did not propose to revise it due to uncertainty on whether higher default values would better represent field installations. 75 FR 31227 (June 2, 2010). In response to the June 2010 NOPR, Earthjustice commented that the existing default values for coil-only units in the DOE test procedure were not supported by substantial evidence. Earthjustice stated that external static pressures measured from field data showed significantly higher values than DOE’s default values in its existing test procedure. (CAC TP: Earthjustice, No. 15 at p. 2) In the November 2015

SNOPR, DOE proposed to update the default value to be more representative of field conditions (*i.e.*, consistent with indoor fan power consumption at the minimum required external static pressures proposed in the November 2015 SNOPR). In the November 2015 SNOPR, DOE used indoor fan electrical power consumption data from product literature, testing, and exchanges with manufacturers collected for the furnace fan rulemaking (79 FR 506, January 3, 2014) to determine an appropriate default value for coil-only products.¹⁷ (80 FR 69318)

DOE calculated the adjusted default fan power to be 441 W/1000 scfm. In the November 2015 SNOPR, DOE proposed to use this value in Appendix M1 of 10 CFR part 430 subpart B where Appendix M included a default fan power of 365 W/1000 scfm. DOE proposed not to make such replacements in Appendix M of 10 CFR part 430 subpart B.

In response to the November 2015 SNOPR, NEEA, NPCC, ACEEE, NRDC, ASAP, and the California IOUs supported raising the coil-only test default fan power to 441 W/1000 scfm to allow for more representative ratings of units. (CAC TP: NEEA and NPCC, No. 64 at p. 8; ACEEE, NRDC, ASAP, No. 72 at p. 4; California IOUs, No. 67 at p. 2) ACEEE, NRDC, and ASAP also commented that they would be happy with 440 W/1000 scfm, as the implied precision of using 441W/1000 scfm is artificial. (CAC TP: ACEEE, NRDC, ASAP, No. 72 at p. 4)

The CAC/HP ECS Working Group also discussed the default value as part of the negotiation process. Ultimately, the Working Group came to a consensus on a recommendation for the default value. Recommendation #3 of the CAC/HP ECS Working Group Term Sheet states that the default fan power for rating the performance of all coil-only systems other than manufactured housing products shall be 441W/1000 scfm. (CAC ECS: ASRAC Working Group Term Sheet, No. 76 at p. 3)

Consistent with the CAC/HP ECS Working Group Term Sheet, DOE maintains its previous proposal to use a default value of 441 W/1000 scfm for split-system air conditioner, coil-only tests. DOE proposes to use this value in appendix M1 of 10 CFR part 430 subpart B in place of the default fan power of 365 W/1000 scfm that has been used previously in Appendix M.

Recommendation #3 of the CAC/HP ECS Working Group Term Sheet also stated that DOE should calculate an

alternative default fan power for rating mobile home air conditioner coil-only units based on the minimum external static pressure requirement for blower coil mobile home units (0.30 in. wc.) that it suggested in recommendation #2 of the Term Sheet. (CAC TP: ASRAC Working Group Term Sheet, No. 76 at p. 3) As discussed in section III.C.1, the CAC/HP ECS Working Group included this recommendation because HUD requires less restrictive ductwork for mobile homes than for other types of housing, which reduces electrical energy consumption of the indoor fan. The default value used to rate coil-only mobile home systems should reflect this difference in field energy consumption to improve the field representativeness of the test procedure.

DOE agrees with the CAC/HP ECS Working Group’s recommendation to use a different default value for coil-only mobile home systems to reflect the difference in ductwork and, in turn, external static pressure of field installations of these systems. In this SNOPR, DOE used the same aforementioned furnace fan power consumption data and methodology to calculate the appropriate default value for mobile home fan power consumption. However, in this case, DOE evaluated furnace fan power consumption at 0.54 in. wc., which is the 0.30 in. wc. recommended by the CAC/HP ECS Working Group plus 0.24 in. wc. to account for filter and indoor coil pressure drop. The resulting average indoor fan power consumption at the external static pressure representative of mobile home systems is 8% lower than the average indoor fan power consumption at the external static pressure representative of conventional systems. Applying the 8% reduction to the 441W/1000 scfm representing conventional indoor fan power consumption yields 406 W/1000 scfm. Thus, DOE proposes to use 406 W/1000 scfm as the default value for mobile home systems.

DOE notes that it used data from all of the furnaces in its database to calculate this value, instead of only mobile home furnaces, because its database includes a small number of mobile home furnaces that do not represent all capacities or motor technologies. DOE recognizes that including non-mobile home furnaces in this analysis may bias the result. Due to the space constraints typical of mobile home system installations, mobile home indoor units generally have more restrictive cabinets compared to conventional indoor units, which would be expected to increase the static pressure experienced by the indoor fan

¹⁶ See 10 CFR part 430, subpart B, appendix M, section 3.3.d.

¹⁷ For a complete explanation of DOE’s methodology, see 80 FR 69278, 69319–20 (Nov. 9, 2015).

and, in turn, increase indoor fan power consumption. Consequently, DOE expects that a default value calculated based on mobile home indoor fan performance data may result in a higher default value for these systems than the value proposed. In addition to the new default power values, DOE proposes to adjust measured capacity to account for the fan heat consistent with 441W/1000 scfm and 406 W/1000 scfm: 1,505 and 1,385 Btu/h per 1,000 scfm.

Issue 18: DOE requests comment on the proposed default fan power value for coil-only mobile home systems. DOE also requests mobile home indoor fan performance data for units of all capacities and that use all available motor technologies in order to allow confirmation that the proposed default value is a good representation for mobile home units.

The DOE test procedure needs a definition for a mobile home coil-only unit to appropriately apply the proposed default value for these kinds of CAC/HP. DOE proposes to define mobile home coil-only unit as:

- *Mobile home coil-only system* means a coil-only split system that includes an outdoor unit and coil-only indoor unit and coil-only indoor unit that meet the following criteria: (1) The outdoor unit is shipped with manufacturer-supplied installation instructions that specify installation only for mobile homes that comply with HUD Manufactured Home Construction Safety Standard 24 CFR part 3280, (2) the coil-only indoor unit is shipped with manufacturer-supplied installation instructions that specify installation only in a mobile home furnace, modular blower, or designated air mover that complies with HUD Manufactured Home Construction Safety Standard 24 CFR part 3280, and (3) the coil-only indoor unit and outdoor unit each has a label in at least 1/4 inch font that reads “For installation only in HUD manufactured home per Construction Safety Standard 24 CFR part 3280.”

Issue 19: DOE requests comments on its proposed definition for mobile home coil-only unit.

3. Revised Heating Load Line Equation

a. General Description of Heating Season Performance Factor (HSPF)

In the current test procedure, the HSPF determined for heat pumps in heating mode is calculated by evaluating the energy usage of both the heat pump unit (reverse refrigeration cycle) and the resistive heat component when matching the house heating load for the range of outdoor temperatures representing the heating season. The

temperature range is split into 5-degree “bins”, and an average temperature and total number of hours are assigned to each bin, based on weather data used to represent the heating season for each climate region. An HSPF value can be calculated for each climate region, but the HSPF rating is based on Region IV. In the HSPF calculation, the amount of heating delivered is set equal to the heating load, which increases as the bin temperature decreases. In the current test procedure, the heating load is proportional to the difference between 65 °F and the outdoor (bin) temperature. The heating load also is dependent on the size of the house that the unit heats. For the HSPF calculation the size of the house is set based on the capacity of the heat pump. For the current test procedure, the heating load is proportional to the heating capacity of the heat pump when operating at 47 °F outdoor temperature. The resulting relationship between heating load and outdoor temperature is called the heating load line equation—it slopes downward from low temperatures, dropping to zero at 65 °F. The slope of the heating load line equation affects HSPF both by dictating the heat pump capacity level used by two stage or variable speed heat pumps at a given outdoor temperature, and also by changing the amount of auxiliary electric resistance heat required when the unit’s heat pumping capacity is lower than the heating load. The current test procedure defines two heating load levels, called the minimum heating load line and maximum heating load line. However, it is the minimum heating load line in Region IV that is used to determine HSPF for rating purposes.¹⁸

b. HSPF Issues

Studies have indicated that the current HSPF test and calculation procedure overestimates ratings because the current minimum heating load line equation is too low compared to real world situations.¹⁹ In response to the November 2014 ECS RFI, NEEA and

NPCC commented that the federal test procedure does a poor job representing balance point temperatures and electric heat energy use in the case of heat pump systems. They pointed out the inability of the test procedure to capture dynamic response to heating needs, such as the use of electric resistance (strip) heat during morning or afternoon temperature setup (*i.e.*, rewarming of the space after a thermostat setback period). They also expressed concerns about capturing the use of electric resistance heat during defrost cycles and at times when it shouldn’t be needed, such as when outdoor temperatures are above 30 °F. (CAC ECS: NEEA & NPCC, No. 19 at p. 2)

DOE agreed with the NEEA and NPCC regarding balance point in the November 2015 SNOPIR and noted that the heating balance point determined for a typical heat pump using the current minimum heating load line equation in Region IV is near 17 °F, while the typical balance point is in the range 26 to 32 °F, resulting from installing a proper-sized unit based on the design cooling load according to ACCA Manual S, 2014.²⁰ The low heating balance point means that the test procedure calculation adds in much less auxiliary heat than would actually be needed in cooler temperatures, thus inflating the calculated HSPF. Furthermore, the zero load point of 65 °F ambient, which is higher than the typical 50–60 °F zero load point,²¹ causes the test procedure calculation to include more hours of operation at warmer outdoor temperatures, for which heat pump operation requires less energy input, again inflating the calculated HSPF. These effects result in overestimation of rated HSPF up to 30% compared to field performance, according to a paper by the Florida Solar Energy Center (FSEC).²² For these reasons, DOE reviewed the choice of heating load line equation for HSPF ratings and proposed to modify it in the November 2015 SNOPIR. 80 FR at 69320–2 (Nov. 9, 2015).

As part of its review for the November 2015 SNOPIR, DOE considered a 2015

Oak Ridge National Laboratory (ORNL) study²³ that examined the heating load line equation for cities representing the six climate regions of the HSPF test procedure in Appendix M. The study developed modified regional heating load line equations, including a heating load line equation for Region IV for calculation of a unit's HSPF. ORNL conducted building load analyses using the EnergyPlus simulation tool (see

energyplus.net) using single-family Prototype Residential House models based on building characteristics specified by the 2006 International Energy Conservation Code (2006 IECC). The study concluded that a heating load line equation closer to the maximum load line equation of the current test procedure and with a lower zero-load ambient temperature would better represent field operation than the

minimum load line equation presently used for HSPF rating values.

c. November 2015 SNOPI Heating Load Line Equation Proposal

In the November 2015 SNOPI, DOE proposed a new heating load line equation based on the findings of the ORNL study:

$$BL(T_j) = \frac{(T_{zl}-T_j)}{T_{zl}-T_{OD}} \cdot C \cdot \dot{Q}_c(95^\circ F) \text{ where,}$$

T_j = the outdoor bin temperature, °F
T_{zl} = the zero-load temperature, °F
T_{OD} = the outdoor design temperature, °F, which varies by climate region
C = the slope (adjustment) factor
Q_c(95 °F) = the nominal cooling capacity at 95 °F, Btu/h

The proposed equation included the following changes from the current heating load line equation used for the HSPF calculation:²⁴

- A zero-load temperature that varies by climate region, as shown in Table III.6, and is 55 °F for Region IV;
- The building load is proportional to the nominal cooling capacity at 95 °F, Q_c(95 °F), as opposed to the heating capacity at 47 °F (except for heating-only heat pumps), to reflect typical selection of cooling/heating heat pumps based on cooling capacity; and

- The slope (adjustment) factor, C, is 1.3 rather than 0.77;
- The November 2015 SNOPI also proposed revised heating load hours for each climate region, as shown in Table III.6. These hours are less than the current heating load hours by the number of hours in the temperature bins between the current and proposed zero-load temperatures.

TABLE III.6—CLIMATE REGION INFORMATION PROPOSED IN THE NOVEMBER 2015 SNOPI

Region No.	I	II	III	IV	V	VI
Heating Load Hours, HLH	562	909	1,363	1,701	2,202	* 1,974
Zero-Load Temperature, T _{zl}	60	58	57	55	55	58

* Pacific Coast Region.

The ORNL study developed heating load line equations consistent with the similar equations of the current test procedure, using the EnergyPlus heating and cooling loads calculated for the IECC 2006 building models developed for numerous cities of the climate regions of interest. The approach sized the house based on the heat pump cooling capacity rather than heating capacity, consistent with the sizing approach prescribed for heat pumps in ACCA Manual S, which is also based on cooling capacity. The study used the heat pump size recommendations based on the design cooling load calculated by EnergyPlus in its analysis. The design cooling load was determined for the 0.4% cooling design day dry-bulb temperature based on a 24-hour design day calculation using the heat balance method, which includes the effects of house thermal mass on the peak load. For Climate Region IV, used as the basis for the HSPF calculation, the study concluded that the appropriate slope

factor (C in the equation defined above) is 1.3.
In the November 2015 SNOPI, DOE also proposed to eliminate maximum and minimum heating load line equations in an effort to focus on one load level that would best represent heating. As mentioned, the proposed heating load line equation is based on nominal cooling capacity rather than nominal heating capacity, which is intended to better reflect field installation practices than the basis on heating capacity of the current test procedure. This approach also justifiably benefits units with higher heating to cooling capacity ratios. Such units would have improved HSPF ratings, reflecting the shift of more heat from electric resistance to heat pumping. For the special case of heating-only heat pumps, DOE proposed to maintain a sizing approach based on heating capacity.
The ORNL study also evaluated the impact of the proposal on HSPF ratings. Based on the results, DOE estimated that

HSPF would be reduced on average about 16 percent for single speed and two-stage heat pumps. Consistent with the requirements of 42 U.S.C. 6293(e), DOE will account for these changes in any proposed energy conservation standard, and this test procedure proposal would not be required as the basis for efficiency representations until the compliance date of any new energy conservation standard.

d. Comments on the November 2015 SNOPI

Comments expressed by stakeholders on the proposed heating load line equation, both in written form in response to the November 2015 SNOPI and verbally during the CAC/HP ECS Working Group meetings, are summarized in the following paragraphs, organized by common themes.

²³ ORNL, Rice, C. Keith, Bo Shen, and Som S. Shrestha, 2015. *An Analysis of Representative Heating Load Lines for Residential HSPF Ratings*,

ORNL/TM—2015/281, July. (Docket No. EERE–2009–BT–TP–0004–0046).
²⁴ In the current test procedure, for all climate regions but Region V, the heating load based on

minimum design heating requirement as a function of outdoor temperature T_j is Q_h(47) * 0.77 * (65 – T_j)/60.

Field Representativeness of the Heating Load Line Equation

One common theme raised in the comments concerned the field representativeness of the data used to generate the proposed heating load line equation. Unico expressed concern regarding the data collected, requesting more time dedicated to research, particularly on the northward shift of heat pump use despite the majority still being sold in temperate climates. (CAC TP: Unico, No. 63 at p. 13) Lennox expressed concern that the building stock used to evaluate the change was outdated; the current load line should be aligned with the time period of the standard. (CAC TP: Lennox, No. 61 at p. 20) During the ASRAC meetings, Ingersoll-Rand expressed the same concern, adding that the housing stock would continue to improve over time, driving the slope down. (CAC ECS: ASRAC Public Meeting, No. 87 at p. 7) Ingersoll-Rand also expressed reservations that the ORNL report relied on data generated through simulations. (CAC ECS: ASRAC Public Meeting, No. 85 at p. 134).

Southern Company commented that basing the heating load line equation exclusively on the 2006 IECC standard unrealistically assumes flawless adoption and enforcement of building code standards and that even future housing stock would be much less tight (*i.e.*, would allow much more infiltration of outdoor air than allowed by the IECC 2006 building code). (CAC ECS: ASRAC Public Meeting, No. 85 at p. 130) ACEEE requested that simulation data generated in the ORNL report remain in the discussion as the report represents a substantial contribution. (CAC ECS: ASRAC Public Meeting, No. 85 at p. 134).

DOE understands the importance of developing the heating load line equation with data that accurately represents field conditions and operation. Regarding the relevancy of the 2006 IECC code, DOE maintains that it is an appropriate representation of the housing stock in 2021 for the purposes of developing the heating load line equation. A follow-up investigation by Lawrence Berkeley National Laboratory (LBNL) examining RECS data corroborated this claim, showing that vintage housing characteristics in 2021 would at best resemble new housing characteristics in 2005. (CAC ECS: ASRAC Public Meeting, No. 85 at p. 81) DOE also maintains that EnergyPlus simulation results provide the most accurate available picture of heating load requirements and their dependence on independent parameters, (*e.g.*, house

design details, heat pump sizing, typical weather patterns). While the data from some direct field studies have been made available, none have included information on heat pump sizing, a vital parameter for fitting a heating load line curve to the data.

Impact on Model Differentiation

Another common theme expressed in the comments concerned the impact of the proposed heating load line equation on model differentiation. Mitsubishi suggested that the proposed changes would decrease performance differentiation between single stage, two stage, and variable speed systems and recommended DOE refrain from making any HSPF changes. (CAC TP: Mitsubishi, No. 68 at p. 5) Rheem, JCI, and Carrier/UTC concurred. (CAC TP: Rheem, No. 69 at p. 17; JCI, No. 66 at p. 13; Carrier/UTC, No. 62 at p. 21) ACEEE added that, in the short-term, accurately capturing relative performance of products should take precedence over better reflecting field energy use if the two are mutually exclusive. (CAC TP: ACEEE, No. 72 at p. 5) During the 2015–2016 CAC/HP ECS Working Group meetings, AHRI expressed concern over the lack of differentiation for variable speed products resulting from the proposed heating load line equation. (CAC ECS: ASRAC Public Meeting, No. 88 at p. 83) AHRI suggested a load line having a lower slope factor (equal to 1.02) and presented an initial assessment of the impact of both the DOE and AHRI proposals on product differentiation. Additionally, Southern Company stressed the importance of encouraging variable speed operation. (CAC ECS: ASRAC Public Meeting, No. 88 at p. 87).

To allow more detailed examination of this question, AHRI provided test data to DOE's contractor under a non-disclosure agreement. The data included performance measurements required to calculate HSPF using the current and the proposed test procedures, for a number of two stage and variable speed heat pumps. The calculations showed that the proposed heating load line equation (1.3 slope factor and 55 °F zero-load temperature, with sizing based on the nominal cooling capacity) would reduce the average HSPF difference between two stage and variable speed models as compared to the current heating load line equation (0.77 slope factor and 65 °F zero-load temperature, with sizing based on the nominal heating capacity) from 1 HSPF point currently to roughly 0.35. DOE presented the methodology, findings, conclusions, and implications of the analysis during the CAC/HP ECS

Working Group meetings. (CAC ECS: ASRAC Public Meeting, No. 63 at pp. 1–7).

DOE acknowledges the impact on differentiation of variable speed heat pumps when calculating HSPF with a higher-slope factor heating load line equation. However, EPCA requires test procedures to be representative of the covered product's average use cycle—not that the test procedure should favor particular design options. (42 U.S.C. 6292(b)(3)) DOE evaluated the proposed amendment with a focus on accurately capturing field performance and believes that the performance of models that clearly perform better in the field will be captured and reflected in higher ratings when tested using a field-representative efficiency metric. Nevertheless, DOE agrees that all variable speed CAC/HP designs should be considered carefully in the analysis to assure that the resulting test procedure fairly represents their performance. As described below, ORNL has made some revisions in its analysis that DOE has incorporated into a revised proposal that improves the differentiation of variable speed heat pumps.

General Impact on Current HSPF Ratings

Comments on the overall impact of the proposed heating load line equation on current HSPF ratings were also received. Carrier/UTC reported a dramatic impact on all types of equipment, with reductions in HSPF ranging from 15 to 25 percent as a result of the proposed change in the November 2015 SNOPR. (CAC TP: Carrier/UTC, No. 62 at p. 21). Rheem commented that the proposal would reduce the HSPF of heat pumps designed for southern market installations but did not clarify why southern market heat pumps would be more affected. (CAC TP: Rheem, No. 69 at p. 17).

DOE notes that, as indicated in the ORNL report, field studies have shown that HSPF ratings based on the current test procedure may be higher than actual performance. Hence, a reduction in the rating with the revised test procedure would be consistent with observations of actual heat pump field performance.

Sizing Based on Cooling Capacity

Other comments addressed DOE's proposal in the November 2015 SNOPR to base the heating load line equation on cooling capacity rather than heating capacity. NEEA and NPCC recommended that each heat pump be assigned one of several heating load line equations based on heating capacity and

balance point temperature. The appropriate heating load line equation would be the one where the load at 30 °F is most nearly equal to the heat pump capacity at that temperature. (CAC TP: NEEA and NPCC, No. 64 at p. 11) However, ACEEE expressed support for the cooling capacity basis during the ASRAC meetings. (CAC ECS: ASRAC Public Meeting, No. 88 at p. 92).

DOE understands that the balance point temperature for heat pumps operating in the field is closer to 30 °F than the 17 °F calculated for the current heating load line equation. For the heating load line equation proposed in the November 2015 SNOPR, the average balance point temperature is between 27 and 28 °F. However, DOE does not agree with NEEA and NPCC that heat pumps are typically sized in the field based on heating capacity or the balance point temperature. The sizing instructions outlined in ACCA Manual S specifically state that “heat pump equipment shall not be sized for the design day heating load, or for an arbitrary thermal balance point.” DOE further understands that most heat pump units in the field are sized based on cooling capacity as opposed to heat pump capacity, which is consistent with the Manual S provision that “heat pumps shall be sized for cooling.”²⁰ To ensure field representativeness, DOE proposes to maintain the approach that assumes heat pumps are sized based on cooling capacity. This approach also benefits heat pump units that have higher nominal heating to cooling capacity ratios by boosting their HSPF.

Overall Regulatory Approach

Other comments concerned the regulatory approach regarding the heating load line equation. Carrier/UTC encouraged DOE to go beyond adjusting the heating load line equation, suggesting that the current HSPF procedure does not adequately account for the benefits of variable speed designs and that DOE should fund research into a completely new procedure rather than applying corrections to the existing procedure by changing the slope (CAC TP: Carrier/UTC, No. 62 at p. 21). Unico suggested tabling the change until the next [CAC test procedure] rulemaking when and if there would be support for changing it (CAC TP: Unico, No. 63 at p. 13). JCI added that changing the temperature at which the heating cyclic test is performed would be acceptable for Appendix M1 but not for Appendix M. (CAC TP: JCI, No. 66 at p. 21).

ACEEE, NRDC, and ASAP proposed that AHRI, ASHRAE, DOE, and all other stakeholders begin work now on a new “clean-sheet” rating method for heat

pumps, to be effective in the next rule after this current rulemaking, as was recently done for water heaters. ACEEE, NRDC, and ASAP stated that the current heat pump test method is obsolete. It was developed when essentially all air-source heat pumps were single-stage, and it appears that the present method is not technology-neutral. According to ACEEE, NRDC, and ASAP, the current test method should be revised to avoid penalizing advanced technologies with the potential for higher efficiency, lower heating bills, and reduced impact on winter grid peaks. ACEEE, NRDC, and ASAP recommended that the test procedure for variable speed heat pumps be revised in a future rulemaking to better reflect both the relative performance and field energy use of this equipment. (CAC TP: ACEEE, NRDC, and ASAP, No. 72 at p. 5–6).

CAC/HP ECS Working Group members ultimately did not agree on a resolution on the current heating load line equation regulatory approach and agreed (as reflected in the Final Term Sheet Recommendation #4) that DOE should make a final decision based on a review of available information. (CAC ECS: ASRAC Term Sheet, No. 76 at p. 3).

DOE acknowledges that another test method could be developed rather than the current heating load line equation approach, but DOE does not wish to propose a sweeping overhaul with this notice. DOE has taken the steps agreed to in the ASRAC Final Term Sheet: To evaluate past comments, improve the current analysis, and recommend an improved heating load line equation based on a modest departure from the existing approach. These steps taken leading up to the proposal in this notice do not preclude DOE from evaluating more fundamental changes in future rulemakings. DOE will continue to evaluate test methodologies and will work with AHRI and other interested parties to evaluate other approaches for testing heat pumps, determining the suitability of a more fundamental change in a future rulemaking.

In response to JCI's comment regarding changes to the cyclic test, DOE proposed in the November 2015 SNOPR to change the cyclic test temperature for variable speed heat pumps only in Appendix M1 of 10 CFR part 430 subpart B, and not to Appendix M of the same Part and Subpart—DOE has not changed this aspect of the proposal in this notice.

Heating Load Line Equation Slope Factor and Zero-Load Temperature

DOE also received specific recommendations on the heating load

line equation slope factor and zero-load temperature. In its comments, Lennox opposed the heating load line equation slope factor change from 0.77 to 1.3 and recommended 1.02, citing better field representativeness and wider product differentiation. (CAC TP: Lennox, No. 61 at p. 12) During the ASRAC meetings, AHRI concurred, indicating that (a) differentiation of variable speed products from two stage or single stage products is better with the 1.02 slope factor, and (b) the 2012 IECC building requirements (for which the ORNL study showed a 1.02 slope) would better represent building stock in 2021 than the 2006 IECC requirements. (CAC ECS: ASRAC Public Meeting, No. 88 at p. 83).

Regarding the heating load line equation zero-load temperature, the California IOUs deferred to the CAC/HP ECS Working Group consensus, generally accepting the 55 °F zero-load temperature proposed in the November 2015 SNOPR. (CAC TP: CA IOUs, No. 67 at p. 7) JCI suggested retaining the 65 °F intercept and 0.7 slope factor of the current test procedure. JCI argued for the 65 °F intercept, referring to evidence shared during the ASRAC meetings by Ingersoll-Rand, which JCI indicated shows that heat pump operation does occur at these mild conditions. JCI cited the negative impact on variable speed product differentiation in supporting the lower slope factor. (CAC TP: JCI, No. 66 at p. 13).

In response to JCI's concerns outlined in this preamble, model differentiation is not an EPCA requirement for test procedures.

Additional 35 °F Test for Variable-Speed Heat Pumps

In the November 2015 SNOPR, DOE requested comment regarding the appropriate approach for rating of variable-speed heat pumps if DOE were not to adopt the proposed general heating load line equation. More specifically, DOE was concerned about a potential inaccuracy associated with the use of extrapolation of the minimum-speed performance measured in 47 °F and 62 °F ambient temperatures for characterization of heat pump performance below 47 °F. In the November 2015 SNOPR, DOE described two options. In Option 1, DOE would base performance on minimum speed tests at 47 °F and intermediate speed tests at 35 °F, an approach which would involve no additional test burden. In Option 2, DOE would require an additional minimum speed test at 35 °F, which would likely be more accurate, at the cost of a higher test burden.

In its comments, UTC/Carrier supported Option 1, because it would

not result in an increase in testing burden. (CAC TP: UTC/Carrier, No. 62 at p. 22) The California IOUs supported Option 2, and argued that the additional test burden would be justified by the accuracy improvements. (CAC TP: CA IOUs, No. 67 at p. 7) Johnson Controls asked for more time to study both options, requesting that the discussion be incorporated as part of the 2015–2016 ASRAC Negotiations. (CAC TP: JCI, No. 66 at p. 22).

DOE has responded to the comments received and addressed this issue in the context of the revised heating load line equation proposed in section III.C.3.i of this notice.

e. Modifications to the 2015 ORNL Analysis

Following the conclusion of the CAC/HP ECS Working Group meetings, ORNL reexamined key assumptions adopted in its 2015 report²³ and determined that three modifications would be beneficial in order to improve the field representativeness of the analysis. The analysis revisions and its results are described in an addendum to the 2015 report. (CAC TP: ORNL Report Addendum, No. 2) Ultimately the modifications to the analysis led DOE to propose lower heating load line equation slope factors (as discussed later in this section), which addresses the comments of several stakeholders.

First, ORNL removed continuous mechanical ventilation as a feature of the Prototype Residential Houses used in the analysis. While housing models used in the initial analysis included continuous mechanical ventilation, the 2006 IECC does not include that requirement, and DOE believes that a prototype design without continuous mechanical ventilation would be more representative of the average housing stock.

ORNL also modified the heat pump sizing approach used by the analysis. In the 2015 study, the auto-sizing feature of EnergyPlus was used. The auto-sizing feature uses a heat pump sized for the 0.4% cooling design dry-bulb temperature, based on a 24-hour design day calculation using the heat balance method, which includes the effects of house thermal mass on the peak load.

However, this approach does not provide cooling capacity sufficient to meet the load for all hours of the year. For the revised analysis, ORNL increased the heat pump size so that cooling capacity would match or exceed the cooling load for all hours of the year. This increases heat pumps capacities from 6% to 12%, depending on the cities evaluated. This approach also better aligns the sizing approach of the analysis with the sizing assumptions used in the DOE test procedure, meaning that the heat pump's cooling capacity is very close to 1.1 times the cooling load for 95 °F ambient temperature, consistent with equation 4.1–2 of the current test procedure. ORNL also applied an additional 10% oversizing to heat pumps for Region V, based on the observation that this adjustment is required to achieve consistency with the 1.1 factor oversizing for cooling used in the DOE test procedure.

The changes in heating load and heat pumps sizing led to reduction in all of the regional heating load line equation slope factors. Removing continuous ventilation reduced both the zero-load temperatures and the heating load line equation slope factor across each region. This change reduced the heating load line equation slope factor an average (across all regions) of 5% while the zero-load temperatures dropped on average by about 1–2 °F. The adjustment in heat pump size led to an average additional reduction in the slope factor of roughly 9%, but did not change the zero-load temperatures. The calculated heating load line equation slope factors of the modified analysis vary sufficiently that DOE is proposing regional heating load line equation slope factors as opposed to a single slope factor, using Region IV as the basis for the HSPF rating. (CAC TP: ORNL Report Addendum, No. 2)

f. DOE Proposal Based on Revised Analysis

Based on ORNL's revised findings, DOE has revised its heating load line equation proposal from the November 2015 SNOPR. DOE introduced a final adjustment to the slope factors developed by ORNL to address variable

speed systems. This aligns the analysis more closely with the range of capacity recommended in ACCA Manual S, which allows significantly more oversizing for variable-speed heat pumps than for single speed or two-stage heat pumps. The range of recommended capacity factor is 0.9 to 1.15 for single-stage heat pumps and 0.9 to 1.30 for variable-speed. DOE recognizes that such oversizing is much more tolerable with variable-speed heat pumps as compared to single-speed heat pumps, due to their ability to better match mild-weather loads in both heating and cooling seasons, and thus limit the inefficiencies associated with cycling losses. Based on the averages of these ranges, DOE calculated a size adjustment factor for variable-speed units equal to $(0.9 + 1.30)$ divided by $(0.9 + 1.15)$, which equals 1.07, essentially suggesting an additional 7 percent oversizing for variable-speed heat pumps. Applying this to the heating load line equation analysis leads to a corresponding reduction in the slope factors for variable-speed products. DOE notes that for consistency, this oversizing would be applied in seasonal performance calculations for cooling mode and for heating mode.

With the analysis changes and the adjustment for variable-speed models, DOE is proposing the following heating load line equation changes from the November 2015 SNOPR:

- The zero-load temperature would vary by climate region according to the values provided in Table III.10, but remain at 55 °F for Region IV;

- The heating load line equation slope factor for single- and two-stage heat pumps would vary by climate region, as shown in Table III.7, and be 1.15 for Region IV; and

- For variable speed heat pumps, the heating load line equation slope factor would be 7 percent less than for single- and two-stage heat pumps. It would vary by climate region, as shown in Table III.7, and be 1.07 for Region IV;

DOE also revised the heating load hours based on the new zero load temperatures of each climate region. The revised heating load hours are also given in Table III.10.

TABLE III.7—CLIMATE REGION INFORMATION PROPOSED IN THIS NOTICE

Region No.	I	II	III	IV	V	VI*
Heating Load Hours	493	857	1280	1701	2202	1842
Zero-Load Temperature, T_{z1}	58	57	56	55	55	57
Heating Load Line Equation Slope Factor, C	1.10	1.06	1.29	1.15	1.16	1.11

TABLE III.7—CLIMATE REGION INFORMATION PROPOSED IN THIS NOTICE—Continued

Region No.	I	II	III	IV	V	VI*
Variable Speed Slope Factor, C_{VS}	1.03	0.99	1.20	1.07	1.08	1.03

* Pacific Coast Region.

Following from this proposed heating load line equation change, DOE also proposes in this SNOPR to require cyclic testing for variable speed heat pumps be run at 47 °F, rather than using the 62 °F ambient temperature that is required by the current test procedure (see Appendix M, section 3.6.4 Table 11). The test would still be conducted using minimum compressor speed. The modified heating load line cyclic test at 47 °F would be more representative of the conditions for which cycling operation is considered in the HSPF calculation.

In addition, for variable-speed heat pumps, the SEER would be calculated using a building load that is adjusted downwards by 7 percent, consistent with the heating load adjustment.

Issue 20: DOE requests comments on the adjustments to the proposals for calculating HSPF for heat pumps and SEER for variable-speed heat pumps.

g. Impact of DOE Proposal on Current HSPF Ratings and Model Differentiation

DOE examined the impact of the present proposal on HSPF ratings based on test results for 2, 3, and 5-ton heat pumps provided by AHRI. Table III.8 presents the effect of different Region IV heating load line equation slope factors on the average HSPF of two-stage and variable speed units using these results. For two-stage units, the average HSPF reduction from measurements using the current test procedure to the current proposal would be 13.9%. For variable speed products, the average reduction

resulting from the current proposal would be 15.3%. The purpose of the test procedure is to evaluate the performance during a representative average use cycle. Nevertheless, DOE believes that reasonable differentiation is still preserved with the current proposal in this SNOPR. Further, DOE believes that heat pumps with good heating mode performance will continue to stand out as compared to heat pumps without good heating mode performance. The test procedure changes proposed in this notice to allow higher speed operation at lower temperature and for a 5 °F optional test (see section III.C.4) should allow for even greater differentiation for variable-speed heat pumps with good heating performance.

TABLE III.8—EFFECT OF REGION IV SLOPE FACTORS ON HSPF OF TWO-STAGE (TS) AND VARIABLE SPEED (VS) MODELS

	Region IV slope factors				
	2010 Final rule *	1.02	1.15	1.30	2016 SNOPR **
Avg. TS HSPF	9.49	8.47	8.17	7.80	8.17
Avg. VS HSPF	10.93	9.44	8.95	8.44	9.26
Avg. HSPF Differential	1.44	0.97	0.79	0.64	1.09

* Slope factor for all equipment: 0.77.

** Slope factor for two-stage equipment: 1.15. Slope factor for variable speed equipment: 1.07.

h. Translation of CAC/HP ECS Working Group Recommended HSPF Levels Using Proposed Heating Load Line Equation Changes

Recommendation #9 of the CAC/HP ECS Working Group Term Sheet

included two sets of recommended national HSPF standard levels. The Working Group based these levels on heating load line equation slope factors of 1.02 and 1.30 to reflect the two factors primarily discussed during the

negotiations. The Working Group designated these levels as “HSPF2” to indicate that they are not equivalent to current HSPF ratings. Table III.9 includes the Working Group’s recommended HSPF levels:

TABLE III.9—CAC/HP ECS WORKING GROUP RECOMMENDED HSPF LEVELS BASED ON PREVIOUSLY PROPOSED HEATING LOAD LINE EQUATIONS

Product class	HSPF2–1.02	HSPF2–1.30
Split-System Heat Pumps	7.8	7.1
Single-Package Heat Pumps	7.1	6.5

As mentioned, the Working Group ultimately left the decision of the appropriate heating load line equation factor up to DOE. The HSPF levels recommended by the Working Group are based on different heating load line equation factors than DOE is proposing in this SNOPR. Consequently, DOE determined HSPF levels that are

consistent with those recommended by the Working Group but based on the 1.15 heating load line equation factor DOE proposes in this notice. DOE does not have access to all of the data or details of the methodology used by the Working Group to derive the HSPF levels it recommended. In the absence of this information, DOE used linear

interpolation between the HSPF values recommended by the Working Group using 1.02 and 1.30 to derive the associated HSPF values using a heating load line equation factor of 1.15. DOE confirmed that linear interpolation provides good match to directly calculated results using available heat pump performance data. Specifically,

the maximum deviation for an interpolated value is 0.04 HSPF points for a representative sample of heat pumps, and the average deviation is 0.005 HSPF points. Table III.10 includes the HSPF levels that are consistent with the Working Group recommended HSPF levels, but based on a 1.15 heating load line equation slope factor.

TABLE III.10—CAC/HP ECS WORKING GROUP RECOMMENDED HSPF LEVELS BASED ON CURRENTLY PROPOSED HEATING LOAD LINE EQUATION

Product class	HSPF
Split-System Heat Pumps	7.5
Single-Package Heat Pumps	6.8

Issue 21: DOE requests comments on the adjusted values of minimum HSPF based on the HSPF efficiency levels recommended by the CAC/HP ECS Working Group.

i. Consideration of Inaccuracies Associated With Minimum-Speed Extrapolation for Variable-Speed Heat Pumps

DOE discussed in the November 2015 SNOPR potential inaccuracy associated with the use of test data conducted at minimum speed in 47 °F and 62 °F ambient temperature to estimate heat pump performance below 47 °F. 80 FR at 69322–3 (Nov. 9, 2015). Specifically, for heat pumps that increase compressor speed as ambient temperature drops below 47 °F, the extrapolation of performance based on the 47 °F and 62 °F minimum-speed tests over-estimates efficiency. Because the bins in this temperature range have many hours associated with them, the impact on HSPF of this inaccuracy can be significant, particularly with the current test procedure, which uses a 0.77 heating load line equation slope factor. However, for the 1.3 slope factor proposed in the November 2015 SNOPR, DOE found that the impact on HSPF for the available heat pump data was too small to justify modifying the test procedure. The higher slope factor reduces the impact of the issue because the higher heating load reduces the weighting of the HSPF on minimum-speed performance. DOE indicated that, because the higher slope factor alleviated the minimum-speed inaccuracy, it did not propose any test procedure amendment to address this issue, but that it might reconsider this possibility if a lower heating load line equation slope factor were adopted. Id.

DOE proposed two potential approaches to resolve this minimum-

speed issue. The first would have involved approximation of minimum-speed performance between 35 °F and 47 °F based on the intermediate-speed frosting-operation test at 35 °F and the minimum-speed test at 47 °F, and assuming that below 35 °F the nominal minimum speed is the same as the intermediate speed. This first approach would not have required any additional testing. The second approach discussed for resolving the issue was to require two additional tests, one intermediate-speed test at 17 °F and one minimum-speed frosting-operation test at 35 °F. DOE requested comment on which of these approaches would be preferable. 80 FR at 69323 (Nov. 9, 2015). A summary of the comments received is located in section III.C.3.d.

As discussed in this preamble, DOE is proposing in this SNOPR to reduce the heating load line equation slope factor to 1.07 for variable-speed heat pumps. At this level, the data currently available to DOE suggests that the HSPF may be overestimated by as much as 16 percent as a result of the inaccuracy associated with the minimum-speed extrapolation. Hence, DOE is also proposing revision to the estimation of minimum-speed performance to reduce the impact of the error. Consistent with stakeholder comments, DOE is proposing to adopt the approach discussed in the November 2015 SNOPR that does not require additional testing. Further, DOE proposes that the approach be used only for heat pumps that vary the minimum speed when operating in outdoor temperatures that are in a range for which the minimum-speed performance factors into the HSPF calculation. For example, if the rotational compressor operating speed for a heat pump operating at its minimum speed remains constant down to 37 °F and the HSPF calculation considers minimum-speed operation only down to the 37 °F temperature bin (this would occur if the calculated heating load is equal to or greater than the intermediate-speed capacity for temperature bins below 37 °F), any rotational speed increase below 37 °F would not require use of the alternative calculation. DOE proposes adoption of a definition, “minimum-speed-limiting variable-speed heat pump,” to refer to such heat pumps.

For the variable-speed heat pumps for which DOE’s contractor received data from AHRI during the 2015–2016 ASRAC Negotiations, use of this approach would reduce average HSPF from 9.26 to 9.13, reducing the VS/TS differential to 0.96, which is equivalent to the differential for a 1.02 slope factor without considering any different

treatment of variable-speed heat pumps (see Table III–11). However, it is not clear that all the heat pumps of the AHRI dataset would have required use of the alternative calculation approach, so the actual reduction in the average HSPF could be less.

DOE notes that it described another option for reducing the minimum-speed inaccuracy in the November 2015 SNOPR, specifically requiring additional tests to more thoroughly explore the heat pump’s performance for the range of different operating speeds and ambient conditions. DOE could consider additional tests to improve accuracy further. Potential additional tests would include an intermediate-speed test at 17 °F, and either minimum-speed frosting-condition tests near 35 °F or minimum-speed steady-state tests at 40 °F or above. The HSPF calculation could be adjusted to provide better estimates of variable-speed heat pump performance over the range of conditions considered in the calculation based on one or more of these tests.

DOE also proposes that certification reports indicate as part of non-public data whether the alternative calculation method was used to determine the heat pump’s rating.

Issue 22: DOE requests comment on its proposal to require use of an alternative HSPF rating approach (for heat pumps that raise minimum compressor speed in ambient temperatures that impact the HSPF calculation) that estimates minimum-speed performance (a) between 35 °F and 47 °F using the intermediate-speed frosting-operation test at 35 °F and the minimum-speed test at 47 °F, and (b) below 35 °F assuming that minimum-speed and intermediate-speed performance are the same. In addition, DOE requests comment on including in certification reports for variable-speed heat pumps whether this alternative approach was used to determine the rating. Finally, DOE requests comment on whether any of the additional tests that could be used to further improve the accuracy of variable-speed heat pump performance estimates should be required in the test procedure.

4. Revised Heating Mode Test Procedure for Units Equipped With Variable Speed Compressors

In the November 2015 SNOPR, DOE revisited the heating season ratings procedure for variable speed heat pumps found in section 4.2.4 of Appendix M of 10 CFR part 430 subpart B. 80 FR at 69322 (Nov. 9, 2015).

DOE proposed as part of Appendix M1 that for variable speed units that

limit the maximum speed operation below 17 °F and have a low cutoff temperature (temperature below which the unit will not operate in heat pump mode) less than 12 °F, the manufacturer could choose to calculate the maximum heating capacity and the corresponding energy usage for ambient temperatures less than 17 °F based on two maximum speed tests at: (1) 17 °F outdoor temperature, and (2) 2 °F outdoor temperature or at the low cutoff temperature, whichever is higher.²⁵ The proposal would have allowed manufacturers to choose to conduct one additional steady state test, at maximum compressor speed and at a low temperature of 2 °F or at a low cutoff temperature, whichever is higher. 80 FR at 69323 (Nov. 9, 2015).

Testing done by ORNL found that the unit efficiency at maximum speed below 17 °F is slightly higher than the extrapolated values in the current test procedure, and this proposed option would provide a more accurate prediction of heat pump low-ambient performance, not only for those units that limit maximum speed operation below 17 °F, but also for those that do not.²⁶ DOE therefore proposed to revise Appendix M1 such that, for variable speed units that do not limit maximum speed operation below 17 °F, manufacturers would also have the option to use this revised method if it is more representative of low ambient performance. 80 FR at 69323 (Nov. 9, 2015).

DOE developed the proposal based on review of the results of a limited number of tests. DOE requested test results and other data to show whether the impact on HSPF of the proposal is similar for other variable speed heat pumps, and also requested comment on the additional test burden of the proposed modification. 80 FR at 69323 (Nov. 9, 2015).

Several stakeholders provided comments in response to these requests for data and comments.

JCI supported the proposal on the condition that the tests be made optional, but at a higher temperature (e.g., 10 degrees) so that more test labs can perform the test. (CAC TP: JCI, No. 66 at p. 22)

Lennox and ADP expressed concerns over the difficulty of testing at 2 °F for

many labs, commenting that the test would greatly increase the burden on manufacturers as it would greatly increase the test time to achieve the 2 °F test point, possibly require expensive hardware upgrades for labs, or force manufacturers to use outside labs. (CAC TP: Lennox, No. 61 at p. 20; ADP, No. 59 at p. 13)

Rheem commented that the proposed 2 °F outdoor temperature introduces testing variability, and that the very low test temperature introduces a significant test burden because it is rare for manufacturers or independent labs to have such facilities. Rheem commented that there is no justification that the resulting HSPF results will more closely match the resulting energy costs to consumers. Major capital investment by manufacturers and independent-labs would be required to add this capability. (CAC TP: Rheem, No. 69 at p. 17)

Unico commented that most heat pumps are not able to be tested below 17 °F and that most test laboratories cannot test below 17 °F. Nevertheless, they also mentioned (a) public interest in heat pumps that operate at significantly lower temperatures and (b) manufacturers that are publishing data and promoting such cold climate heat pumps. Unico expressed support for a separate heat pump test standard for cold-weather heat pumps, indicating that such a test standard would require testing at 2 °F. (CAC TP: Unico, No. 63 at p. 13)

UTC/Carrier commented that the test point at 2 °F outdoor temperature is challenging for most test facilities (if it is possible at all). (CAC TP: UTC/Carrier, No. 62 at p. 22)

The California IOUs and ACEEE, NRDC, and ASAP commented that in response to industry's concerns over testing at 2 °F, they recommend that variable speed heat pumps be tested at 5 °F, in addition to the 17 °F cold temperature point. ACEEE, NRDC, and ASAP commented that requiring the 5 °F test seems to be a reasonable way to differentiate excellent cold-temperature performance, which is critical for customer acceptance nationally, and for mitigating winter peaks for utilities. The California IOUs noted that the European standard requires testing at 5 °F and that manufacturers participate in the global market and Europe, so that they must test at 5 °F. (CAC TP: California IOUs, No. 67 at p. 7; ACEEE, NRDC, and ASAP, No. 72 at p. 5)

NEEA and NPCC commented that they do not believe that the current test procedure for variable speed systems in any way delivers annual energy use or

efficiency ratings that are reasonably reflective of an average use cycle. (CAC TP: NEEA and NPCC, No. 64 at p. 9)

The possible adoption of a very-low-temperature test for rating of variable speed heat pumps was also discussed during the CAC/HP ECS Working Group meetings, ultimately leading to Recommendation #5 in the Term Sheet, that a 5 °F ambient temperature optional test be adopted for variable speed heat pumps. (CAC ECS: ASRAC Term Sheet, No. 76 at p. 3) Given the consensus among Working Group members regarding this recommendation, DOE believes that the concerns expressed by the initial comments about this optional test would be resolved by adopting a 5 °F ambient temperature for the test rather than the 2 °F initially proposed.

In addition, DOE discussed in the November 2015 SNOPIR the possibility of making an adjustment to the test procedure to address potential accuracy issues associated with estimation of minimum-speed heat pump performance for temperatures below 47 °F based on extrapolation of the results of tests conducted in 47 °F and 62 °F ambient temperatures. Specifically, testing by ORNL indicated that the HSPF may be over-predicted for heat pumps that do not allow use of the same minimum speed for ambient temperatures below 47 °F. 80 FR 69322–3 (Nov. 9, 2015). However, DOE did not propose to make this change in the November 2015 SNOPIR, explaining that the modification of the heating load line equation would sufficiently alleviate the potential inaccuracy, making adjustment to the test procedure unnecessary. However, DOE did request comment on preferences for approaches to modification to the test procedure in case the modified heating load line equation was not adopted, describing approaches that would involve an additional test and an approach that would not require additional testing. *Id.* *This issue and DOE's proposal to resolve it is discussed in greater detail in section III.C.3.i.*

The revised variable speed heat pump test procedure proposed in this notice would include the following changes in Appendix M1.

- If the optional 5 °F full-speed test (to be designated H4₂) is conducted, full-speed performance for ambient temperatures between 5 °F and 17 °F would be calculated using interpolation between full-speed test measurements conducted at these two temperatures, rather than the current approach, which uses extrapolation of performance measured at 17 °F and 47 °F ambient temperatures. For all heat pumps for which the 5 °F full-speed test is not

²⁵ In the November 2015 SNOPIR, DOE proposed that in the case that the low cutoff temperature is higher than 12 °F, the manufacturer would not be allowed to utilize this option for calculation of the maximum heating load capacity.

²⁶ Rice et al. (2015) Review of Test Procedure for Determining HSPFs of Residential Variable-Speed Heat pumps. (Docket No. EERE-2009-BT-TP-0004-0047).

conducted, the extrapolation approach would still be used to represent performance for all ambient temperatures below 17 °F.

- A target wet bulb temperature of 3.5 °F for the optional 5 °F test.
- If the optional 5 °F full-speed test is conducted, performance for ambient temperatures below 5 °F would be calculated using extrapolation below 5 °F using the same slopes (capacity vs. temperature and power input vs. temperature) as determined for the heat pump between 17 °F and 47 °F. Specifically, the extrapolation would be based on the 17 °F-to-47 °F slope rather than the 5 °F-to-17 °F slope. If the 47 °F full-speed test is conducted at a different speed than the 17 °F full-speed test, the extrapolation would be based on the standardized slope discussed in section III.B.7.

- Manufacturers would have to indicate in certification reports whether the 5 °F full-speed test was conducted.

- As proposed for Appendix M and discussed in section III.B.7, a 47 °F full-speed test, designated the H1_N test, would be used to represent the heating capacity. However, for Appendix M1, this test would be conducted at the maximum speed at which the system controls would operate the compressor in normal operation in a 47 °F ambient temperature.

- If the heat pump limits the use of the minimum speed (measured in terms of RPM or power input frequency) of the heat pump when operating at ambient temperatures below 47 °F (*i.e.* does not allow use of speeds as low as the minimum speed used at 47 °F for any temperature below 47 °F), a modified calculation would be used to determine minimum-speed performance below 47 °F.

Development of these proposals and decisions regarding their details is explained further below (except for the last proposal, which is discussed in section III.C.3.i).

For heat pumps using the 5 °F test, the CAC/HP ECS Working Group Term Sheet recommended use of interpolation to calculate heat pump performance in the temperature range from 5 °F to 17 °F based on the test results for the 5 °F and 17 °F tests (CAC ECS: ASRAC Term Sheet, No. 76 at p. 3, Recommendation #5) DOE considered what approach to use for calculation of heat pump performance below 5 °F, with the understanding that extrapolation of the 5 °F-to-17 °F trend below 5 °F is not likely to be accurate because full-speed operation could be very different at 5 °F than it is at 17 °F. Although the November 2015 SNOPR primarily addressed cases where the compressor

speed could be lower at the lower temperature (see, *e.g.* 80 FR at 69323 (Nov. 9, 2015)), the comments focus more on the possibility of higher speed at lower temperature. In any case, as indicated in this preamble, DOE does not believe such extrapolation is appropriate when the compressor speeds may be very different. DOE considered different approaches to calculate the performance below 5 °F and evaluated some of them using data obtained from the NEEP cold climate heat pump database.²⁷ Many of the heat pumps in the database have performance data for both 5 °F and for a lower ambient temperature. DOE evaluated for each such heat pump of the database how closely the performance at the lower ambient temperature could be predicted using the other available performance data. DOE concluded that a good approach is to apply the 17 °F-to-47 °F slope below 5 °F, for both capacity and power input. Using this approach, the lower-temperature capacity and power input were predicted within 10 percent for at least two thirds of the evaluated heat pumps.²⁸ DOE considers this to be acceptable accuracy for HSPF calculations, considering that the annual hours with temperature lower than 5 °F are limited, representing roughly one percent of heating season hours in Region IV. Hence, DOE has proposed an approach for extrapolation of heat pump performance for temperatures below 5 °F based on the slopes of the capacity and power input levels between 17 °F and 47 °F.

Issue 23: DOE requests comment on the proposals for evaluation of heat pump capacity and power input as a function of ambient temperature based on test measurements, both for cases where a 5 °F test is conducted and where it isn't.

DOE chose a target wet bulb temperature for the 5 °F test equal to 3.5 °F, corresponding to roughly 60 percent relative humidity which is consistent with the range of relative humidity of the other low temperature heating mode tests.

Issue 24: DOE requests comment on the target wet bulb temperature for the 5 °F test.

Issue 25: DOE requests general comments regarding its proposal to

²⁷ <http://www.neep.org/initiatives/high-efficiency-products/emerging-technologies/ashp/cold-climate-air-source-heat-pump>.

²⁸ In contrast, if extrapolation of performance based on the 5 °F and 17 °F tests was used below 5 °F, the capacity would be within the 10% tolerance for none of the heat pumps, and the power input would be within 10% for six percent of the analyzed heat pumps.

adopt an optional 5 °F test and regarding any other details of the related amendments proposed for calculation of HSPF.

As discussed in this preamble, DOE has proposed changing the ambient temperature requirement for the very-low-temperature heating mode test for variable-speed heat pumps from 2 °F to 5 °F. DOE notes that it proposed a 2 °F test for triple-capacity northern heat pumps in the June 2010 NOPR which was established as part of the test procedure in the June 2016 final rule. 81 FR at 37020 (June 8, 2016).

Issue 26: DOE requests comments on whether the very-low-temperature heating mode test for triple-capacity northern heat pumps should be changed to a 5 °F test for consistency with the proposed 5 °F variable-speed test.

IV. Procedural Issues and Regulatory Review

A. Review Under Executive Order 12866

The Office of Management and Budget (OMB) has determined that test procedure rulemakings do not constitute “significant regulatory actions” under section 3(f) of Executive Order 12866, Regulatory Planning and Review, 58 FR 51735 (Oct. 4, 1993). Accordingly, this action was not subject to review under the Executive Order by the Office of Information and Regulatory Affairs (OIRA) in the Office of Management and Budget.

B. Review Under the Regulatory Flexibility Act

The Regulatory Flexibility Act (5 U.S.C. 601 *et seq.*) requires preparation of an initial regulatory flexibility analysis (IFRA) for any rule that by law must be proposed for public comment, unless the agency certifies that the rule, if promulgated, will not have a significant economic impact on a substantial number of small entities. As required by Executive Order 13272, “Proper Consideration of Small Entities in Agency Rulemaking,” 67 FR 53461 (August 16, 2002), DOE published procedures and policies on February 19, 2003, to ensure that the potential impacts of its rules on small entities are properly considered during the DOE rulemaking process. 68 FR 7990. DOE has made its procedures and policies available on the Office of the General Counsel’s Web site: <http://energy.gov/gc/office-general-counsel>.

DOE reviewed this proposed rule, which would amend the test procedure for CAC/HP, under the provisions of the Regulatory Flexibility Act and the procedures and policies published on February 19, 2003. DOE has estimated

the impacts of the test procedure changes on small business manufacturers.

For the purpose of the regulatory flexibility analysis for this rule, the DOE adopts the Small Business Administration (SBA) definition of a small entity within this industry as a manufacturing enterprise with 1,250 employees or fewer. DOE used the small business size standards published by the SBA to determine whether any small entities would be required to comply with this rule. The size standards are codified at 13 CFR part 121. The standards are listed by North American Industry Classification System (NAICS) code and industry description and are available at https://www.sba.gov/sites/default/files/files/Size_Standards_Table.pdf.

CAC/HP manufacturing is classified under NAICS 333415, "Air Conditioning and Warm Air Heating Equipment and Commercial and Industrial Refrigeration Equipment Manufacturing," 70 FR 12395 (March 11, 2005). DOE reviewed publicly available data and contacted various companies on its complete list of manufacturers to determine whether they met the SBA's definition of a small business manufacturer. As a result of this review, DOE identified 22 manufacturers of CAC/HP that would be considered domestic small businesses with a total of less than 3 percent of the market sales.

Issue 27: DOE seeks comment on its estimate of the number of small entities that may be impacted by the proposed test procedure.

Potential impacts of the proposed test procedure on all manufacturers, including small businesses, come from impacts associated with the cost of proposed additional testing. DOE expects that many of the provisions proposed in this notice will result in no increase to test burden. DOE's proposals to use new heating load line equation provisions to calculate HSPF for heat pumps, new default values for indoor fan power consumption, and a new interpolation approach for COP of variable speed heat pumps are changes to calculations and do not require any additional time or investment from manufacturers. Similarly, DOE's proposal to require certification of the time delay used when testing coil-only units does not affect testing. DOE's proposal to test at new minimum external static pressure conditions would require manufacturers to test at different, but not additional test points using the same equipment and methodologies required by the current test procedure. DOE's proposal for

single-package units to make the official test the test that does not include the secondary outdoor air enthalpy method measurement also does not require any additional testing. Similarly, DOE's proposal to include an optional test at 5 °F for variable speed heat pumps does not require manufacturers to do any additional testing. Other proposed provisions may increase test burden. DOE anticipates that its proposed changes to provisions for mini-split refrigerant pressure lines may cause labs and manufacturers to relocate pressure transducers or in a worst case scenario, build a separate satellite test instrumentation console for pressure measurements closer to the test samples. DOE estimates that building such a satellite console would constitute a one-time cost on the order of \$1,000 per test room. DOE's proposal to modify the off mode test for units with self-regulated crankcase heaters could result in more significant increases to test burden, but for a small number of models. DOE estimates that the new provisions could add 8 hours per test for units with self-regulated crankcase heaters and an additional 8 hours for those units with self-regulated crankcase heaters that also have a compressor sound blanket. Sound blankets are premium features. DOE estimates that less than 25 percent of all units have self-regulated crankcase heaters and less than 5 percent have self-regulated crankcase heaters and sound blankets. DOE estimates the additional cost of testing to be \$250 for units with self-regulating crankcase heaters and \$500 for units with self-regulating crankcase heaters and sound blankets. DOE also estimates that testing of basic models may not have to be updated more than once every five years, and therefore the average incremental burden of testing one basic model may be one-fifth of these values when the cost is spread over several years.

DOE is proposing labeling requirements for the indoor and outdoor units of mobile home blower coil and coil-only systems and is also proposing that manufacturers include a specific designation in the installation instructions for these units. For further discussion of the proposed labeling requirements, see section III.C.1. As discussed in that section, DOE expects the additional cost to manufacturers associated with meeting the labeling requirement would be marginal as compared to the total production cost. The overall impact would be small.

As discussed in this preamble, DOE identified 22 domestic small business manufacturers of CAC/HP. Of these, only OUMs that operate their own

manufacturing facilities (*i.e.*, are not private labelers selling only models manufactured by other entities) and OUM importing private labelers would be subject to the additional requirements for testing required by this proposed rule. DOE identified 12 such small businesses but was able to estimate the number of basic models associated only with nine of these.

DOE requires that only one combination associated with any given outdoor unit be laboratory tested. 10 CFR 429.16(b). The majority of CAC/HP offered by a manufacturer are split-system combinations that are not required to be laboratory tested but can be certified using an AEDM that does not require DOE testing of these units. DOE reviewed available data for the nine small businesses to estimate the incremental testing cost burden those firms might experience due to the revised test procedure. These manufacturers had an average of 35 models requiring testing. DOE determined the numbers of models using the AHRI Directory of Certified Product Performance, www.ahridirectory.org/ahridirectory/pages/home.aspx. As discussed, DOE estimates that less than 25 percent of models have self-regulating crankcase heaters and less than 5 percent have self-regulating crankcase heaters with blankets. Applying these estimates to the average 35 models for each small manufacturer results in an estimated two models with \$500 per model in additional test costs and nine models with \$250 per model in additional test costs as a result of the proposed changes. The additional testing cost for final certification of these models was therefore estimated at \$3,250. Meanwhile, these certifications would be expected to last the CAC/HP life, estimated to be at least five years based on the time frame established in EPCA for DOE review of central air conditioner efficiency standards. Hence, average annual additional costs for these small business manufacturers to perform the tests as revised by the proposal is \$650.

DOE does not expect ICMs to incur any additional burden as a result of the proposed changes because the changes for which DOE estimates there will be increased burden do not apply to ICMs. Only outdoor units include self-regulating crankcase heaters with or without blankets, and DOE assumes that ICM manufacturers do not produce indoor units that have components with off mode power consumption. Consequently, ICMs would be able to use the off mode power measurements acquired and certified by OUMs to meet

the test procedure requirements for off mode. Regarding the proposed changes for mini-split refrigerant lines, DOE is not aware of any ICMs that maintain in-house test facilities. Consequently, the one-time cost associated with the proposed changes for mini-split refrigerant lines would not be incurred by the ICM. DOE also anticipates that the one-time cost is low enough that the per-test cost charged by independent labs that provide testing services to ICMs would not increase as a result of this proposed change.

Issue 28: DOE seeks comment on its estimate of the impact of the proposed test procedure amendments on small entities.

C. Review Under the Paperwork Reduction Act of 1995

Manufacturers of central air conditioners and heat pumps must certify to DOE that their products comply with any applicable energy conservation standards. In certifying compliance, manufacturers must test their products according to the DOE test procedures for central air conditioners and heat pumps, including any amendments adopted for those test procedures. DOE has established regulations for the certification and recordkeeping requirements for all covered consumer products and commercial equipment, including central air conditioners and heat pumps. 76 FR 12422 (March 7, 2011); 80 FR 5099 (Jan. 30, 2015). The collection-of-information requirement for the certification and recordkeeping is subject to review and approval by OMB under the Paperwork Reduction Act (PRA). This requirement has been approved by OMB under OMB control number 1910-1400. Public reporting burden for the certification is estimated to average 30 hours per response, including the time for reviewing instructions, searching existing data sources, gathering and maintaining the data needed, and completing and reviewing the collection of information.

Notwithstanding any other provision of the law, no person is required to respond to, nor shall any person be subject to a penalty for failure to comply with, a collection of information subject to the requirements of the PRA, unless that collection of information displays a currently valid OMB Control Number.

D. Review Under the National Environmental Policy Act of 1969

In this proposed rule, DOE proposes test procedure amendments that it expects will be used to develop and implement future energy conservation standards for central air conditioners

and heat pumps. DOE has determined that this rule falls into a class of actions that are categorically excluded from review under the National Environmental Policy Act of 1969 (42 U.S.C. 4321 *et seq.*) and DOE's implementing regulations at 10 CFR part 1021. Specifically, this proposed rule would amend the existing test procedures without affecting the amount, quality or distribution of energy usage, and, therefore, would not result in any environmental impacts. Thus, this rulemaking is covered by Categorical Exclusion A5 under 10 CFR part 1021, subpart D, which applies to any rulemaking that interprets or amends an existing rule without changing the environmental effect of that rule. Accordingly, neither an environmental assessment nor an environmental impact statement is required.

DOE's CX determination for this proposed rule is available at <http://energy.gov/nepa/categorical-exclusion-cx-determinations-cx>.

E. Review Under Executive Order 13132

Executive Order 13132, "Federalism," 64 FR 43255 (August 4, 1999) imposes certain requirements on agencies formulating and implementing policies or regulations that preempt State law or that have Federalism implications. The Executive Order requires agencies to examine the constitutional and statutory authority supporting any action that would limit the policymaking discretion of the States and to carefully assess the necessity for such actions. The Executive Order also requires agencies to have an accountable process to ensure meaningful and timely input by State and local officials in the development of regulatory policies that have Federalism implications. On March 14, 2000, DOE published a statement of policy describing the intergovernmental consultation process it will follow in the development of such regulations. 65 FR 13735. DOE has examined this proposed rule and has determined that it would not have a substantial direct effect on the States, on the relationship between the national government and the States, or on the distribution of power and responsibilities among the various levels of government. EPCA governs and prescribes Federal preemption of State regulations as to energy conservation for the products that are the subject of this proposed rule. States can petition DOE for exemption from such preemption to the extent, and based on criteria, set forth in EPCA. (42 U.S.C. 6297(d)) No further action is required by Executive Order 13132.

F. Review Under Executive Order 12988

Regarding the review of existing regulations and the promulgation of new regulations, section 3(a) of Executive Order 12988, "Civil Justice Reform," 61 FR 4729 (Feb. 7, 1996), imposes on Federal agencies the general duty to adhere to the following requirements: (1) Eliminate drafting errors and ambiguity; (2) write regulations to minimize litigation; (3) provide a clear legal standard for affected conduct rather than a general standard; and (4) promote simplification and burden reduction. Section 3(b) of Executive Order 12988 specifically requires that Executive agencies make every reasonable effort to ensure that the regulation: (1) Clearly specifies the preemptive effect, if any; (2) clearly specifies any effect on existing Federal law or regulation; (3) provides a clear legal standard for affected conduct while promoting simplification and burden reduction; (4) specifies the retroactive effect, if any; (5) adequately defines key terms; and (6) addresses other important issues affecting clarity and general draftsmanship under any guidelines issued by the Attorney General. Section 3(c) of Executive Order 12988 requires Executive agencies to review regulations in light of applicable standards in sections 3(a) and 3(b) to determine whether they are met or it is unreasonable to meet one or more of them. DOE has completed the required review and determined that, to the extent permitted by law, the proposed rule meets the relevant standards of Executive Order 12988.

G. Review Under the Unfunded Mandates Reform Act of 1995

Title II of the Unfunded Mandates Reform Act of 1995 (UMRA) requires each Federal agency to assess the effects of Federal regulatory actions on State, local, and Tribal governments and the private sector. Public Law 104-4, sec. 201 (codified at 2 U.S.C. 1531). For a proposed regulatory action likely to result in a rule that may cause the expenditure by State, local, and Tribal governments, in the aggregate, or by the private sector of \$100 million or more in any one year (adjusted annually for inflation), section 202 of UMRA requires a Federal agency to publish a written statement that estimates the resulting costs, benefits, and other effects on the national economy. (2 U.S.C. 1532(a), (b)) The UMRA also requires a Federal agency to develop an effective process to permit timely input by elected officers of State, local, and Tribal governments on a proposed "significant intergovernmental mandate," and

requires an agency plan for giving notice and opportunity for timely input to potentially affected small governments before establishing any requirements that might significantly or uniquely affect small governments. On March 18, 1997, DOE published a statement of policy on its process for intergovernmental consultation under UMRA. 62 FR 12820; also available at <http://energy.gov/gc/office-general-counsel>. DOE examined this proposed rule according to UMRA and its statement of policy and determined that the rule contains neither an intergovernmental mandate, nor a mandate that may result in the expenditure of \$100 million or more in any year, so these requirements do not apply.

H. Review Under the Treasury and General Government Appropriations Act, 1999

Section 654 of the Treasury and General Government Appropriations Act, 1999 (Pub. L. 105–277) requires Federal agencies to issue a Family Policymaking Assessment for any rule that may affect family well-being. This rule would not have any impact on the autonomy or integrity of the family as an institution. Accordingly, DOE has concluded that it is not necessary to prepare a Family Policymaking Assessment.

I. Review Under Executive Order 12630

DOE has determined, under Executive Order 12630, “Governmental Actions and Interference with Constitutionally Protected Property Rights” 53 FR 8859 (March 18, 1988), that this regulation would not result in any takings that might require compensation under the Fifth Amendment to the U.S. Constitution.

J. Review Under Treasury and General Government Appropriations Act, 2001

Section 515 of the Treasury and General Government Appropriations Act, 2001 (44 U.S.C. 3516 note) provides for agencies to review most disseminations of information to the public under guidelines established by each agency pursuant to general guidelines issued by OMB. OMB’s guidelines were published at 67 FR 8452 (Feb. 22, 2002), and DOE’s guidelines were published at 67 FR 62446 (Oct. 7, 2002). DOE has reviewed this proposed rule under the OMB and DOE guidelines and has concluded that it is consistent with applicable policies in those guidelines.

K. Review Under Executive Order 13211

Executive Order 13211, “Actions Concerning Regulations That Significantly Affect Energy Supply, Distribution, or Use,” 66 FR 28355 (May 22, 2001), requires Federal agencies to prepare and submit to OMB, a Statement of Energy Effects for any proposed significant energy action. A “significant energy action” is defined as any action by an agency that promulgated or is expected to lead to promulgation of a final rule, and that: (1) Is a significant regulatory action under Executive Order 12866, or any successor order; and (2) is likely to have a significant adverse effect on the supply, distribution, or use of energy; or (3) is designated by the Administrator of OIRA as a significant energy action. For any proposed significant energy action, the agency must give a detailed statement of any adverse effects on energy supply, distribution, or use should the proposal be implemented, and of reasonable alternatives to the action and their expected benefits on energy supply, distribution, and use.

The proposed regulatory action to amend the test procedure for measuring the energy efficiency of central air conditioners and heat pumps is not a significant regulatory action under Executive Order 12866. Moreover, it would not have a significant adverse effect on the supply, distribution, or use of energy, nor has it been designated as a significant energy action by the Administrator of OIRA. Therefore, it is not a significant energy action, and, accordingly, DOE has not prepared a Statement of Energy Effects.

L. Review Under Section 32 of the Federal Energy Administration Act of 1974

Under section 301 of the Department of Energy Organization Act (Pub. L. 95–91; 42 U.S.C. 7101), DOE must comply with section 32 of the Federal Energy Administration Act of 1974, as amended by the Federal Energy Administration Authorization Act of 1977. (15 U.S.C. 788; FEAA) Section 32 essentially provides in relevant part that, where a proposed rule authorizes or requires use of commercial standards, the notice of proposed rulemaking must inform the public of the use and background of such standards. In addition, section 32(c) requires DOE to consult with the Attorney General and the Chairman of the Federal Trade Commission (FTC) concerning the impact of the commercial or industry standards on competition.

The proposed rule incorporates testing methods contained in the

following commercial standards: AHRI 210/240–2008 with Addendum 1 and 2, Performance Rating of Unitary Air Conditioning & Air-Source Heat Pump Equipment; and ANSI/AHRI 1230–2010 with Addendum 2, Performance Rating of Variable Refrigerant Flow Multi-Split Air Conditioning and Heat Pump Equipment. While the proposed test procedure is not exclusively based on AHRI 210/240–2008 or ANSI/AHRI 1230–2010, one component of the test procedure, namely test setup requirements, adopts language from AHRI 210/240–2008 without amendment; and another component of the test procedure, namely test setup and test performance requirements for multi-split systems, adopts language from ANSI/AHRI 1230–2010 without amendment. The Department has evaluated these standards and is unable to conclude whether they fully comply with the requirements of section 32(b) of the FEAA, (*i.e.*, that they were developed in a manner that fully provides for public participation, comment, and review). DOE will consult with the Attorney General and the Chairman of the FTC concerning the impact of these test procedures on competition, prior to prescribing a final rule.

M. Description of Materials Incorporated by Reference

In this SNOPR, DOE proposes to incorporate by reference (IBR) into the proposed Appendix M1 to subpart B of part 430 specific sections, figures, and tables of several test standards published by AHRI, ASHRAE, and AMCA that are already incorporated by reference into Appendix M to subpart B of part 430: ANSI/AHRI 210/240–2008 with Addenda 1 and 2, titled “Performance Rating of Unitary Air-Conditioning & Air-Source Heat Pump Equipment;” ANSI/AHRI 1230–2010 with Addendum 2, titled “Performance Rating of Variable Refrigerant Flow (VRF) Multi-Split Air-Conditioning and Heat Pump Equipment;” ASHRAE 23.1–2010, titled “Methods of Testing for Rating the Performance of Positive Displacement Refrigerant Compressors and Condensing Units that Operate at Subcritical Temperatures of the Refrigerant;” ASHRAE Standard 37–2009, titled “Methods of Testing for Rating Electrically Driven Unitary Air-Conditioning and Heat Pump Equipment;” ASHRAE 41.1–2013, titled “Standard Method for Temperature Measurement;” ASHRAE 41.2–1987 (RA 1992), titled “Standard Methods for Laboratory Airflow Measurement;” ASHRAE 41.6–2014, titled “Standard Method for Humidity Measurement;”

ASHRAE 41.9–2011, titled “Standard Methods for Volatile-Refrigerant Mass Flow Measurements Using Calorimeters;” ASHRAE 116–2010, titled “Methods of Testing for Rating Seasonal Efficiency of Unitary Air Conditioners and Heat Pumps;” and AMCA 210–2007, titled “Laboratory Methods of Testing Fans for Certified Aerodynamic Performance Rating.”

ANSI/AHRI 210/240–2008 is an industry accepted test procedure that measures the cooling and heating performance of central air conditioners and heat pumps and is applicable to products sold in North America. The test procedure proposed in this SNOPR references various sections of ANSI/AHRI 210/240–2008 that address test setup, test conditions, and rating requirements. ANSI/AHRI 210/240–2008 is readily available on AHRI’s Web site at <http://www.ahrinet.org/site/686/Standards/HVACR-Industry-Standards/Search-Standards>.

ANSI/AHRI 1230–2010 is an industry accepted test procedure that measures the cooling and heating performance of variable refrigerant flow (VRF) multi-split air conditioners and heat pumps and is applicable to products sold in North America. The test procedure proposed in this SNOPR for VRF multi-split systems references various sections of ANSI/AHRI 1230–2010 that address test setup, test conditions, and rating requirements. ANSI/AHRI 1230–2010 is readily available on AHRI’s Web site at <http://www.ahrinet.org/site/686/Standards/HVACR-Industry-Standards/Search-Standards>.

ASHRAE 23.1–2010 is an industry accepted test procedure for rating the thermodynamic performance of positive displacement refrigerant compressors and condensing units that operate at subcritical temperatures. The test procedure proposed in this SNOPR references sections of ASHRAE 23.1–2010 that address requirements, instruments, methods of testing, and testing procedure specific to compressor calibration. ASHRAE 23.1–2010 can be purchased from ASHRAE’s Web site at <https://www.ashrae.org/resources-publications>.

ASHRAE Standard 37–2009 is an industry accepted standard that provides test methods for determining the cooling capacity of unitary air conditioning equipment and the cooling or heating capacities, or both, of unitary heat pump equipment. The test procedure proposed in this SNOPR references various sections of ASHRAE Standard 37–2009 that address test conditions and test procedures. ASHRAE Standard 37–2009 can be purchased from ASHRAE’s Web site at

<https://www.ashrae.org/resources-publications>.

ASHRAE 41.1–2013 is an industry accepted method for measuring temperature in testing heating, refrigerating, and air conditioning equipment. The test procedure proposed in this SNOPR references sections of ASHRAE 41.1–2013 that address requirements, instruments, and methods for measuring temperature. ASHRAE 41.1–2013 can be purchased from ASHRAE’s Web site at <https://www.ashrae.org/resources-publications>.

ASHRAE 41.2–1987 (RA 1992) is an industry accepted test method for measuring airflow. The test procedure proposed in this SNOPR references sections of ASHRAE 41.2–1987 (RA 1992) that address test setup and test methods. ASHRAE 41.2–1987 (RA 1992) can be purchased from ASHRAE’s Web site at <https://www.ashrae.org/resources-publications>.

ASHRAE 41.6–2014 is an industry accepted test method for measuring humidity of moist air. The test procedure proposed in this SNOPR references sections of ASHRAE 41.6–2014 that address requirements, instruments, and methods for measuring humidity. ASHRAE 41.6–2014 can be purchased from ASHRAE’s Web site at <https://www.ashrae.org/resources-publications>.

ASHRAE 41.9–2011 is an industry accepted standard that provides recommended practices for measuring the mass flow rate of volatile refrigerants using calorimeters. The test procedure proposed in this SNOPR references sections of ASHRAE 41.9–2011 that address requirements, instruments, and methods for measuring refrigerant flow during compressor calibration. ASHRAE 41.9–2011 can be purchased from ASHRAE’s Web site at <https://www.ashrae.org/resources-publications>.

ANSI/ASHRAE Standard 116–2010 is an industry accepted standard that provides test methods and calculation procedures for determining the capacities and cooling seasonal efficiency ratios for unitary air-conditioning, and heat pump equipment and heating seasonal performance factors for heat pump equipment. The test procedure proposed in this SNOPR references various sections of ANSI/ASHRAE 116–2010 that addresses test methods and calculations. ANSI/ASHRAE Standard 116–2010 can be purchased from ASHRAE’s Web site at <https://www.ashrae.org/resources-publications>.

AMCA 210–2007 is an industry accepted standard that establishes uniform test methods for a laboratory

test of a fan or other air moving device to determine its aerodynamic performance in terms of airflow rate, pressure developed, power consumption, air density, speed of rotation, and efficiency for rating or guarantee purposes. The test procedure in this SNOPR references various sections of AMCA 210–2007 that address test conditions. AMCA 210–2007 can be purchased from AMCA’s Web site at <http://www.amca.org/store/index.php>.

V. Public Participation

A. Attendance at the Public Meeting

The time, date, and location of the public meeting are listed in the **DATES** and **ADDRESSES** sections at the beginning of this document. If you plan to attend the public meeting, please notify the Appliance and Equipment Standards staff at (202) 586–6636 or Appliance_Standards_Public_Meetings@ee.doe.gov.

Please note that foreign nationals participating in the public meeting are subject to advance security screening procedures which require advance notice prior to attendance at the public meeting. If a foreign national wishes to participate in the public meeting, please inform DOE as soon as possible by contacting Ms. Regina Washington at (202) 586–1214 or by email: Regina.Washington@ee.doe.gov so that the necessary procedures can be completed.

DOE requires visitors to have laptops and other devices, such as tablets, checked upon entry into the building. Any person wishing to bring these devices into the Forrestal Building will be required to obtain a property pass. Visitors should avoid bringing these devices, or allow an extra 45 minutes to check in. Please report to the visitor’s desk to have devices checked before proceeding through security.

Due to the REAL ID Act implemented by the Department of Homeland Security (DHS), there have been recent changes regarding ID requirements for individuals wishing to enter Federal buildings from specific states and U.S. territories. Driver’s licenses from the following states or territory will not be accepted for building entry and one of the alternate forms of ID listed below will be required. DHS has determined that regular driver’s licenses (and ID cards) from the following jurisdictions are not acceptable for entry into DOE facilities: Alaska, American Samoa, Arizona, Louisiana, Maine, Massachusetts, Minnesota, New York, Oklahoma, and Washington. Acceptable alternate forms of Photo-ID include: U.S. Passport or Passport Card; an Enhanced

Driver's License or Enhanced ID-Card issued by the states of Minnesota, New York or Washington (Enhanced licenses issued by these states are clearly marked Enhanced or Enhanced Driver's License); a military ID or other Federal government issued Photo-ID card.

In addition, you can attend the public meeting via webinar. Webinar registration information, participant instructions, and information about the capabilities available to webinar participants will be published on DOE's Web site at: https://www1.eere.energy.gov/buildings/appliance_standards/standards.aspx?productid=48&action=viewlive.

Participants are responsible for ensuring their systems are compatible with the webinar software.

B. Procedure for Submitting Prepared General Statements for Distribution

Any person who has plans to present a prepared general statement may request that copies of his or her statement be made available at the public meeting. Such persons may submit requests, along with an advance electronic copy of their statement in PDF (preferred), Microsoft Word or Excel, WordPerfect, or text (ASCII) file format, to the appropriate address shown in the **ADDRESSES** section at the beginning of this document. The request and advance copy of statements must be received at least one week before the public meeting and may be emailed, hand-delivered, or sent by mail. DOE prefers to receive requests and advance copies via email. Please include a telephone number to enable DOE staff to make follow-up contact, if needed.

C. Conduct of the Public Meeting

DOE will designate a DOE official to preside at the public meeting and may also use a professional facilitator to aid discussion. The meeting will not be a judicial or evidentiary-type public hearing, but DOE will conduct it in accordance with section 336 of EPCA (42 U.S.C. 6306). A court reporter will be present to record the proceedings and prepare a transcript. DOE reserves the right to schedule the order of presentations and to establish the procedures governing the conduct of the public meeting. After the public meeting, interested parties may submit further comments on the proceedings as well as on any aspect of the rulemaking until the end of the comment period.

The public meeting will be conducted in an informal, conference style. DOE will present summaries of comments received before the public meeting, allow time for prepared general statements by participants, and

encourage all interested parties to share their views on issues affecting this rulemaking. Each participant will be allowed to make a general statement (within time limits determined by DOE), before the discussion of specific topics. DOE will allow, as time permits, other participants to comment briefly on any general statements.

At the end of all prepared statements on a topic, DOE will permit participants to clarify their statements briefly and comment on statements made by others. Participants should be prepared to answer questions by DOE and by other participants concerning these issues. DOE representatives may also ask questions of participants concerning other matters relevant to this rulemaking. The official conducting the public meeting will accept additional comments or questions from those attending, as time permits. The presiding official will announce any further procedural rules or modification of the above procedures that may be needed for the proper conduct of the public meeting.

A transcript of the public meeting will be included in the docket, which can be viewed as described in the Docket section at the beginning of this document. In addition, any person may buy a copy of the transcript from the transcribing reporter.

D. Submission of Comments

DOE will accept comments, data, and information regarding this proposed rule no later than the date provided in the **DATES** section at the beginning of this proposed rule. Interested parties may submit comments using any of the methods described in the **ADDRESSES** section at the beginning of this notice.

Under EPCA, DOE may not amass more than 270 days of public comment during a test procedure rulemaking. (42 U.S.C. 6293(b)(2)) Since the beginning of this test procedure rulemaking on June 2, 2010 (75 FR 31223), DOE has provided 216 days of public comment, in all.²⁹ Thus, DOE is providing 30 days of public comment for this SNOPIR to ensure that parties have a chance to comment throughout the rest of this rulemaking.

Submitting comments via regulations.gov. The *regulations.gov* Web page will require you to provide your name and contact information.

²⁹ This includes the comment period from the April 2011 SNOPIR and the comment period extension, the October 2011 SNOPIR and its comment period extension, and the November 2015 SNOPIR. See 76 FR 18105 (April 1, 2011); 76 FR 30555 (May 26, 2011); 76 FR 65616 (Oct. 24, 2011); 76 FR 79135 (Dec. 21, 2011); 80 FR 69277 (Nov. 9, 2015).

Your contact information will be viewable to DOE Building Technologies staff only. Your contact information will not be publicly viewable except for your first and last names, organization name (if any), and submitter representative name (if any). If your comment is not processed properly because of technical difficulties, DOE will use this information to contact you. If DOE cannot read your comment due to technical difficulties and cannot contact you for clarification, DOE may not be able to consider your comment.

However, your contact information will be publicly viewable if you include it in the comment or in any documents attached to your comment. Any information that you do not want to be publicly viewable should not be included in your comment, nor in any document attached to your comment. Persons viewing comments will see only first and last names, organization names, correspondence containing comments, and any documents submitted with the comments.

Do not submit to *regulations.gov* information for which disclosure is restricted by statute, such as trade secrets and commercial or financial information (hereinafter referred to as Confidential Business Information (CBI)). Comments submitted through *regulations.gov* cannot be claimed as CBI. Comments received through the Web site will waive any CBI claims for the information submitted. For information on submitting CBI, see the Confidential Business Information section.

DOE processes submissions made through *regulations.gov* before posting. Normally, comments will be posted within a few days of being submitted. However, if large volumes of comments are being processed simultaneously, your comment may not be viewable for up to several weeks. Please keep the comment tracking number that *regulations.gov* provides after you have successfully uploaded your comment.

Submitting comments via email, hand delivery, or mail. Comments and documents submitted via email, hand delivery, or mail also will be posted to *regulations.gov*. If you do not want your personal contact information to be publicly viewable, do not include it in your comment or any accompanying documents. Instead, provide your contact information on a cover letter. Include your first and last names, email address, telephone number, and optional mailing address. The cover letter will not be publicly viewable as long as it does not include any comments

Include contact information each time you submit comments, data, documents, and other information to DOE. If you submit via mail or hand delivery, please provide all items on a CD, if feasible. It is not necessary to submit printed copies. No facsimiles (faxes) will be accepted.

Comments, data, and other information submitted to DOE electronically should be provided in PDF (preferred), Microsoft Word or Excel, WordPerfect, or text (ASCII) file format. Provide documents that are not secured, written in English and free of any defects or viruses. Documents should not contain special characters or any form of encryption and, if possible, they should carry the electronic signature of the author.

Campaign form letters. Please submit campaign form letters by the originating organization in batches of between 50 to 500 form letters per PDF or as one form letter with a list of supporters' names compiled into one or more PDFs. This reduces comment processing and posting time.

Confidential Business Information. According to 10 CFR 1004.11, any person submitting information that he or she believes to be confidential and exempt by law from public disclosure should submit via email, postal mail, or hand delivery two well-marked copies: One copy of the document marked confidential including all the information believed to be confidential, and one copy of the document marked non-confidential with the information believed to be confidential deleted. Submit these documents via email or on a CD, if feasible. DOE will make its own determination about the confidential status of the information and treat it according to its determination.

Factors of interest to DOE when evaluating requests to treat submitted information as confidential include: (1) A description of the items; (2) whether and why such items are customarily treated as confidential within the industry; (3) whether the information is generally known by or available from other sources; (4) whether the information has previously been made available to others without obligation concerning its confidentiality; (5) an explanation of the competitive injury to the submitting person which would result from public disclosure; (6) when such information might lose its confidential character due to the passage of time; and (7) why disclosure of the information would be contrary to the public interest.

It is DOE's policy that all comments may be included in the public docket, without change and as received,

including any personal information provided in the comments (except information deemed to be exempt from public disclosure).

E. Issues on Which DOE Seeks Comment

Although DOE welcomes comments on any aspect of this proposal, DOE is particularly interested in receiving comments and views of interested parties concerning the following issues:

Issue 1: DOE requests comment on its proposed certification requirements for outdoor units with no match. Also, DOE seeks comment on what fin style options should be considered as options for CCMS database data entry.

Issue 2: DOE requests comment on its proposed language in 429.16 related to allowable ICM ratings and compliance with regional standards.

Issue 3: DOE requests comment on its proposal to allow a one-sided tolerance on represented values of cooling and heating capacity that allows underrating of any amount but only overrating up to 5 percent.

Issue 4: DOE seeks comments from interested parties about its proposal to impose time delays to allow approach to equilibrium for measurements of off-mode power for units with self-regulating crankcase heaters. DOE requests comment regarding the 4-hour and 8-hour delay times proposed for units without and with compressor sound blankets, respectively.

Issue 5: DOE requests comment on its proposal to limit the internal volume of pressure measurement systems for cooling/heating heat pumps where the pressure measurement location may switch from liquid to vapor state when changing operating modes and for all systems undergoing cyclic tests. DOE also requests comment specifically on (a) the proposed 0.25 cubic inch per 12,000 Btu/h maximum internal volume for such systems, and (b) the proposals for default internal volumes to assign to pressure transducers and gauges of 0.1 and 0.2 cubic inches, respectively.

Issue 6: DOE requests comment on the proposal to require the use of a bin-by-bin method to calculate EER and COP for intermediate-speed operation for SEER and HSPF calculations for variable-speed units.

Issue 7: DOE requests comment on its proposed modifications to requirements when using the outdoor air enthalpy method as the secondary test method, including its proposal that the official test be conducted without the outdoor air-side test apparatus connected.

Issue 8: DOE requests comments on its proposal to require certification reports for coil-only units to indicate whether testing was conducted using a

time-delay relay to provide an off-cycle time delay, and the duration of the time delay.

Issue 9: DOE requests comment on its proposal to limit the NGIFS of tested coil-only single-split systems to 2.0 sq.in/Btu/hr.

Issue 10: DOE requests comments on its proposal to require that full-speed tests conducted in 17 °F and 35 °F ambient temperatures use the maximum compressor speed at which the system controls would operate the compressor in normal operation in a 17 °F ambient temperatures. DOE requests comment on the proposed approach of using standardized slope factors for calculation of representative performance at 47 °F ambient temperature for heat pumps for which the 47 °F full-speed test cannot be conducted at the same speed as the 17 °F full-speed test. Further, DOE requests comment on the specific slope factors proposed, and/or data to show that different slope factors should be used.

Issue 11: DOE requests comments on its proposal to allow the full speed test in 47 °F ambient temperature that is used to represent heat pump heating capacity, to use any speed that is no lower than used for the 95 °F full-speed cooling test for Appendix M.

Issue 12: DOE requests comments on its clarifications regarding use of break-in, including use of the certified break-in period for each compressor of the unit, regardless of who conducts the test, prior to any test period used to measure performance.

Issue 13: DOE requests comments on removing from section 2.2.3.a of Appendix M the 5 percent tolerance for part load operation when comparing the sum of nominal capacities of the indoor units and the intended system part load capacity.

Issue 14: DOE requests comment on whether removing the statement about insulating or sealing cased coils in Appendix M, section 2.2.c would be sufficient to avoid confusion regarding whether sealing of duct connections is allowed.

Issue 15: DOE requests comments on the proposed minimum external static pressure requirements.

DOE proposes to establish the certification requirements for Appendix M1 to require manufacturers to certify the kind(s) of CAC/HP associated with the minimum external static pressure used in testing or rating (*i.e.*, ceiling-mount, wall-mount, mobile home, low-static, mid-static, small duct high velocity, space constrained, or conventional/not otherwise listed). In the case of mix-match ratings for multi-

split, multi-head mini-split, and multi-circuit systems, manufacturers may select two kinds. In addition, models of outdoor units for which some combinations distributed in commerce meet the definition for ceiling-mount and wall-mount blower coil system are still required to have at least one coil-only rating (which uses the 441W/1000 scfm default fan power value) that is representative of the least efficient coil distributed in commerce with the particular model of outdoor unit. Mobile home systems are also required to have at least one coil-only rating that is representative of the least efficient coil distributed in commerce with the particular model of outdoor unit. DOE proposes to specify a default fan power value of 406W/1000 scfm, rather than 441W/1000 scfm, for mobile home coil-only systems. Details of this proposal are discussed in detail in section III.C.2.

Issue 16: DOE requests comment on the proposed definitions for kinds of CAC/HP associated with administering minimum external static pressure requirements.

Issue 17: DOE requests comments on not including a reduced minimum external static pressure requirement for blower coil or single-package systems tested with a condensing furnace.

Issue 18: DOE requests comment on the proposed default fan power value for coil-only mobile home systems. DOE also requests mobile home indoor fan performance data for units of all capacities and that use all available motor technologies in order to allow confirmation that the proposed default value is a good representation for mobile home units.

Issue 19: DOE requests comments on its proposed definition for mobile home coil-only unit.

Issue 20: DOE requests comments on the adjustments to the proposals for calculating HSPF for heat pumps and SEER for variable-speed heat pumps.

Issue 21: DOE requests comments on the adjusted values of minimum HSPF based on the HSPF efficiency levels recommended by the CAC/HP ECS Working Group.

Issue 22: DOE requests comment on its proposal to require use of an alternative HSPF rating approach (for heat pumps that raise minimum compressor speed in ambient temperatures that impact the HSPF calculation) that estimates minimum-speed performance (a) between 35 °F and 47 °F using the intermediate-speed frosting-operation test at 35 °F and the minimum-speed test at 47 °F, and (b) below 35 °F assuming that minimum-speed and intermediate-speed performance are the same. In addition,

DOE requests comment on including in certification reports for variable-speed heat pumps whether this alternative approach was used to determine the rating. Finally, DOE requests comment on whether any of the additional tests that could be used to further improve the accuracy of variable-speed heat pump performance estimates should be required in the test procedure.

Issue 23: DOE requests comment on the proposals for evaluation of heat pump capacity and power input as a function of ambient temperature based on test measurements, both for cases where a 5 °F test is conducted and where it isn't.

Issue 24: DOE requests comment on the target wet bulb temperature for the 5 °F test.

Issue 25: DOE requests general comments regarding its proposal to adopt an optional 5 °F test and regarding any other details of the related amendments proposed for calculation of HSPF.

Issue 26: DOE requests comments on whether the very-low-temperature heating mode test for triple-capacity northern heat pumps should be changed to a 5 °F test for consistency with the proposed 5 °F variable-speed test.

Issue 27: DOE seeks comment on its estimate of the number of small entities that may be impacted by the proposed test procedure.

Issue 28: DOE seeks comment on its estimate of the impact of the proposed test procedure amendments on small entities.

VI. Approval of the Office of the Secretary

The Secretary of Energy has approved publication of this proposed rule.

List of Subjects

10 CFR Part 429

Administrative practice and procedure, Confidential business information, Energy conservation, Reporting and recordkeeping requirements.

10 CFR Part 430

Administrative practice and procedure, Confidential business information, Energy conservation, Energy conservation test procedures, Household appliances, Imports, Incorporation by reference, Intergovernmental relations, Small businesses.

Issued in Washington, DC, on August 1, 2016.

Kathleen B. Hogan,

Deputy Assistant Secretary for Energy Efficiency, Energy Efficiency and Renewable Energy.

For the reasons stated in the preamble, DOE is proposing to amend parts 429 and 430 of chapter II of title 10, subpart B, Code of Federal Regulations, as set forth below:

PART 429—CERTIFICATION, COMPLIANCE, AND ENFORCEMENT FOR CONSUMER PRODUCTS AND COMMERCIAL AND INDUSTRIAL EQUIPMENT

■ 1. The authority citation for part 429 continues to read as follows:

Authority: 42 U.S.C. 6291–6317.

■ 2. Section 429.11 is amended by revising paragraph (a) to read as follows:

§ 429.11 General sampling requirements for selecting units to be tested.

(a) When testing of covered products or covered equipment is required to comply with section 323(c) of the Act, or to comply with rules prescribed under sections 324, 325, or 342, 344, 345 or 346 of the Act, a sample comprised of production units (or units representative of production units) of the basic model being tested must be selected at random and tested, and must meet the criteria found in §§ 429.14 through 429.62. Components of similar design may be substituted without additional testing if the substitution does not affect energy or water consumption. Any represented values of measures of energy efficiency, water efficiency, energy consumption, or water consumption for all individual models represented by a given basic model must be the same, except for central air conditioners and central air conditioning heat pumps, as specified in § 429.16.

* * * * *

■ 3. Section 429.16 is amended by:

- a. Revising paragraph (a)(1);
- b. Redesignating paragraphs (a)(3) and (a)(4) as (a)(4) and (a)(5) and revising newly designated (a)(4)(i);
- c. Adding new paragraph (a)(3);
- d. Revising paragraph (b)(2)(i);
- e. Revising the introductory text of paragraph (b)(3)(i), and revising paragraphs (b)(3)(iii) and (b)(3)(iv);
- f. Revising paragraphs (c)(1)(i)(B), (c)(3), (d)(3) and (d)(4);
- g. Revising paragraphs (e)(2), (e)(3) and (e)(4); and
- h. Revising paragraphs (f) introductory text, (f)(1), (f)(2), (f)(4), and (f)(5).

The revisions and addition read as follows:

§ 429.16 Central air conditioners and central air conditioning heat pumps.

(a) *Determination of Represented Value*—(1) *Required represented values.* Determine the represented values (including SEER, EER, HSPF, $P_{W,OFF}$,

cooling capacity, and heating capacity, as applicable) for the individual models/combinations (or “tested combinations”) specified in the following table.

Category	Equipment subcategory	Required represented values
Single-Package Unit	Single-Package AC (including Space-Constrained). Single-Package HP (including Space-Constrained).	Every individual model distributed in commerce.
Outdoor Unit and Indoor Unit (Distributed in Commerce by OUM).	Single-Split-System AC with Single-Stage or Two-Stage Compressor (including Space-Constrained and Small-Duct, High Velocity Systems (SDHV)). Single-Split-System AC with Other Than Single-Stage or Two-Stage Compressor (including Space-Constrained and SDHV). Single-Split-System HP (including Space-Constrained and SDHV). Multi-Split, Multi-Circuit, or Multi-Head Mini-Split Split System—non-SDHV.	Every individual combination distributed in commerce, including all coil-only and blower coil combinations. Every outdoor unit and indoor unit combination, must have a coil-only rating. For each model of outdoor unit, this must include at least one coil-only value that is representative of the least efficient combination distributed in commerce with the particular model of outdoor unit. Every individual combination distributed in commerce, including all coil-only and blower coil combinations. Every individual combination distributed in commerce.
Indoor Unit Only Distributed in Commerce by ICM).	Multi-Split, Multi-Circuit, or Multi-Head Mini-Split Split System—SDHV. Single-Split-System Air Conditioner (including Space-Constrained and SDHV). Single-Split-System Heat Pump (including Space-Constrained and SDHV). Multi-Split, Multi-Circuit, or Multi-Head Mini-Split Split System—SDHV.	For each model of outdoor unit, at a minimum, a non-ducted “tested combination.” For any model of outdoor unit also sold with models of ducted indoor units, a ducted “tested combination.” When determining represented values on or after January 1, 2023, the ducted “tested combination” must comprise the highest static variety of ducted indoor unit distributed in commerce (<i>i.e.</i> , conventional, mid-static, or low-static). Additional representations are allowed, as described in paragraph (c)(3)(i) of this section. For each model of outdoor unit, an SDHV “tested combination.” Additional representations are allowed, as described in paragraph (c)(3)(ii) of this section. Every individual combination distributed in commerce.
Outdoor Unit with no Match		For a model of indoor unit within each basic model, an SDHV “tested combination.” Additional representations are allowed, as described in section (c)(3)(i) of this section. Every model of outdoor unit distributed in commerce (tested with a model of coil-only indoor unit as specified in paragraph (b)(2)(i) of this section).

* * * * *

(3) *Refrigerants.* If a model of outdoor unit (used in a single-split, multi-split, multi-circuit, multi-head mini-split, and/or outdoor unit with no match system) is distributed in commerce with multiple refrigerants, a manufacturer must determine all represented values for each refrigerant that can be used in an individual combination of the basic model (including outdoor units with no match or “tested combinations”) without voiding the manufacturer’s warranty. This requirement may apply across the listed categories in the table in paragraph (a)(1) of this section. If the warranty information specifies acceptable refrigerant characteristics rather than specific refrigerants and HCFC–22 meets these characteristics, a manufacturer must determine

represented values (including SEER, EER, HSPF, $P_{W,OFF}$, cooling capacity, and heating capacity, as applicable) for, at a minimum, an outdoor unit with no match. If a model of outdoor unit (used in a single-split, multi-split, multi-circuit, multi-head mini-split, and/or outdoor unit with no match system) is distributed in commerce without a specific refrigerant specified or not charged with a specified refrigerant from the point of manufacture, if the unit is shipped requiring addition of more than a pound of refrigerant to meet the charge recommended by the manufacturer’s installation instructions (or section 2.2.5 of appendix M or appendix M1), or if the unit is shipped with any amount of charge of R–407C, a manufacturer must determine represented values (including SEER,

EER, HSPF, $P_{W,OFF}$, cooling capacity, and heating capacity, as applicable) for, at a minimum, an outdoor unit with no match.

(4) * * *

(i) *Regional.* A basic model may only be certified as compliant with a regional standard if all individual combinations within that basic model meet the regional standard for which it is certified. A model of outdoor unit that is certified below a regional standard can only be rated and certified as compliant with a regional standard if the model of outdoor unit has a unique model number and has been certified as a different basic model for distribution in each region. An ICM cannot certify an individual combination with a rating that is compliant with a regional standard if the individual combination

includes a model of outdoor unit that the OUM has certified with a rating that is not compliant with a regional standard. Conversely, an ICM cannot certify an individual combination with a rating that is not compliant with a regional standard if the individual combination includes a model of outdoor unit that an OUM has certified with a rating that is compliant with a regional standard.

* * * * *

(b) * * *

(2) *Individual model/combination selection for testing.* (i) The table identifies the minimum testing requirements for each basic model that includes multiple individual models/combinations; if a basic model spans multiple categories listed in the table, multiple testing requirements apply. For each basic model that includes only one individual model/combination, test that individual model/combination. For

single-split-system non-space-constrained air conditioners and heat pumps, when testing is required in accordance with 10 CFR part 430, subpart B, appendix M1, these requirements do not apply until July 1, 2024, provided that the manufacturer is certifying compliance of all basic models using an AEDM in accordance with paragraph (c)(1)(i)(B) of this section and paragraph (e)(2)(i)(A) of § 429.70.

Category	Equipment subcategory	Must test:	With:
Single-Package Unit	Single-Package AC (including Space-Constrained). Single-Package HP (including Space-Constrained).	The lowest SEER individual model.	N/A.
Outdoor Unit and Indoor Unit (Distributed in Commerce by OUM).	Single-Split-System AC with Single-Stage or Two-Stage Compressor (including Space-Constrained and Small-Duct, High Velocity Systems (SDHV)).	The model of outdoor unit.	A model of coil-only indoor unit meeting the requirements of section 2.2h of appendix M or M1 to subpart B of part 430.
	Single-Split-System AC with Other Than Single-Stage or Two-Stage Compressor (including Space-Constrained and SDHV). Single-Split-System HP (including Space-Constrained and SDHV). Multi-Split, Multi-Circuit, or Multi-Head Mini-Split Split System—non-SDHV.	The model of outdoor unit.	A model of indoor unit. If the tested model of indoor unit is coil-only, it must meet the requirements of section 2.2h of appendix M or M1 to subpart B of part 430.
Indoor Unit Only (Distributed in Commerce by ICM).	Multi-Split, Multi-Circuit, or Multi-Head Mini-Split Split System—SDHV.	The model of outdoor unit.	At a minimum, a “tested combination” composed entirely of non-ducted indoor units. For any models of outdoor units also sold with models of ducted indoor units, test a second “tested combination” composed entirely of ducted indoor units (in addition to the non-ducted combination). If testing under appendix M1 to subpart B of part 430, the ducted “tested combination” must comprise the highest static variety of ducted indoor unit distributed in commerce (<i>i.e.</i> , conventional, mid-static, or low-static).
	Single-Split-System Air Conditioner (including Space-Constrained and SDHV). Single-Split-System Heat Pump (including Space-Constrained and SDHV).	A model of indoor unit Nothing, as long as an equivalent air conditioner basic model has been tested. If an equivalent air conditioner basic model has not been tested, must test a model of indoor unit.	A “tested combination” composed entirely of SDHV indoor units. The least efficient model of outdoor unit with which it will be paired where the least efficient model of outdoor unit is the model of outdoor unit in the lowest SEER combination as certified by the OUM. If there are multiple models of outdoor unit with the same lowest SEER represented value, the ICM may select one for testing purposes.
	Multi-Split, Multi-Circuit, or Multi-Head Mini-Split Split System—SDHV.	A model of indoor unit	A “tested combination” composed entirely of SDHV indoor units, where the outdoor unit is the least efficient model of outdoor unit with which the SDHV indoor unit will be paired. The least efficient model of outdoor unit is the model of outdoor unit in the lowest SEER combination as certified by the OUM. If there are multiple models of outdoor unit with the same lowest SEER represented value, the ICM may select one for testing purposes.
Outdoor Unit with No Match		The model of outdoor unit.	A model of coil-only indoor unit meeting the requirements of section 2.2e of appendix M or M1 to subpart B of part 430.

* * * * *

(3) *Sampling plans and represented values.* For individual models (for single-package systems) or individual

combinations (for split-systems, including “tested combinations” for multi-split, multi-circuit, and multi-head mini-split systems) with

represented values determined through testing, each individual model/combination (or “tested combination”) must have a sample of sufficient size

tested in accordance with the applicable provisions of this subpart. For heat pumps (other than heating-only heat pumps), all units of the sample population must be tested in both the cooling and heating modes and the results used for determining all representations. The represented values for any individual model/combination must be assigned such that:

* * * * *

(iii) *Cooling Capacity.* The represented value of cooling capacity must be a self-declared value that is no more than 105 percent of the mean of the cooling capacities measured for the units in the sample, rounded:

(A) To the nearest 100 Btu/h if cooling capacity is less than 20,000 Btu/h,

(B) To the nearest 200 Btu/h if cooling capacity is greater than or equal to 20,000 Btu/h but less than 38,000 Btu/h, and

(C) To the nearest 500 Btu/h if cooling capacity is greater than or equal to 38,000 Btu/h and less than 65,000 Btu/h.

(iv) *Heating Capacity.* The represented value of heating capacity must be a self-declared value that is no more than 105 percent of the mean of the heating capacities measured for the units in the sample, rounded:

(A) To the nearest 100 Btu/h if heating capacity is less than 20,000 Btu/h,

(B) To the nearest 200 Btu/h if heating capacity is greater than or equal to 20,000 Btu/h but less than 38,000 Btu/h, and

(C) To the nearest 500 Btu/h if heating capacity is greater than or equal to 38,000 Btu/h and less than 65,000 Btu/h.

(c) * * *

(1) * * *

(i) * * *

(B) The representative values of the measures of energy efficiency or energy consumption through the application of an AEDM in accordance with paragraph (d) of this section and § 429.70. An AEDM may only be used to determine represented values for individual models or combinations in a basic model other than the individual model or combination(s) required for mandatory testing under paragraph (b)(2) of this section, except that, for single-split, non-space-constrained systems, when testing is required in accordance with 10 CFR part 430, subpart B, appendix M1, an AEDM may be used to rate the individual model or combination(s) required for mandatory testing under paragraph (b)(2) of this section until July 1, 2024, in accordance with paragraph (e)(2)(i)(A) of § 429.70.

* * * * *

(3) *For multi-split systems, multi-circuit systems, and multi-head mini-split systems.* The following applies:

(i) For basic models that include additional varieties of ducted indoor units (*i.e.*, conventional, low-static, or mid-static) other than the one for which representation is required in paragraph (a)(1) of this section, if a manufacturer chooses to make a representation, the manufacturer must conduct testing of a tested combination in accordance with 10 CFR part 430, subpart B, appendix M1 and according to the requirements in paragraph (b)(3)(i) of this section.

(ii) For basic models composed of both non-ducted and ducted combinations, the represented value based on testing in accordance with 10 CFR part 430, subpart B, appendix M for the mixed non-ducted/ducted combination is the mean of the represented values for the non-ducted and ducted combinations as determined in accordance with paragraph (b)(3)(i) of this section. For basic models that include mixed combinations of indoor units (any two kinds of non-ducted, low-static, mid-static, and conventional ducted indoor units), the represented value based on testing in accordance with 10 CFR part 430, subpart B, appendix M1 for the mixed combination is the mean of the represented values for the individual component combinations as determined in accordance with paragraph (b)(3)(i) of this section.

(iii) For basic models composed of both SDHV and non-ducted or ducted combinations, the represented value based on testing in accordance with 10 CFR part 430, subpart B, appendix M for the mixed SDHV/non-ducted or SDHV/ducted combination is the mean of the represented values for the SDHV, non-ducted, or ducted combinations, as applicable, as determined in accordance with paragraph (b)(3)(i) of this section. For basic models including mixed combinations of SDHV and another kind of indoor unit (any of non-ducted, low-static, mid-static, and conventional ducted), the represented value based on testing in accordance with 10 CFR part 430, subpart B, appendix M1 for the mixed SDHV/other combination is the mean of the represented values for the SDHV and other tested combination as determined in accordance with paragraph (b)(3)(i) of this section.

(iv) All other individual combinations of models of indoor units for the same model of outdoor unit for which the manufacturer chooses to make representations must be rated as separate basic models, and the provisions of paragraphs (b)(1) through (3) and (c)(3)(i) through (iii) of this section apply.

(v) With respect to $P_{W,OFF}$ only, for every individual combination (or “tested combination”) within a basic model tested pursuant to paragraph (b)(2) of this section, but for which $P_{W,OFF}$ testing was not conducted, the representative values of $P_{W,OFF}$ may be assigned through either:

(A) The testing result from an individual model or combination of similar off-mode construction, or

(B) Application of an AEDM in accordance with paragraph (d) of this section and § 429.70.

(d) * * *

(3) Cooling capacity. The represented value of cooling capacity of an individual model/combination must be no greater than 105% of the cooling capacity output simulated by the AEDM.

(4) Heating capacity. The represented value of heating capacity of an individual model/combination must be no greater than 105% of the heating capacity output simulated by the AEDM.

(e) * * *

(2) *Public product-specific information.* Pursuant to § 429.12(b)(13), for each individual model (for single-package systems) or individual combination (for split-systems, including outdoor units with no match and “tested combinations” for multi-split, multi-circuit, and multi-head mini-split systems), a certification report must include the following public product-specific information: The seasonal energy efficiency ratio (SEER in British thermal units per Watt-hour (Btu/W-h)); the average off mode power consumption ($P_{W,OFF}$ in Watts); the cooling capacity in British thermal units per hour (Btu/h); the region(s) in which the basic model can be sold; when certifying compliance with amended energy conservation standards, the kind(s) of air conditioner or heat pump associated with the minimum external static pressure used in testing or rating (ceiling-mount, wall-mount, mobile home, low-static, mid-static, small duct high velocity, space constrained, or conventional/not otherwise listed); and

(i) For heat pumps, the heating seasonal performance factor (HSPF in British thermal units per Watt-hour (Btu/W-h));

(ii) For central air conditioners (excluding space constrained products), the energy efficiency ratio (EER in British thermal units per Watt-hour (Btu/W-h));

(iii) For single-split-systems, whether the represented value is for a coil-only or blower coil system;

(iv) For multi-split, multiple-circuit, and multi-head mini-split systems (including VRF and SDHV), when certifying compliance with current energy conservation standards, whether the represented value is for a non-ducted, ducted, mixed non-ducted/

ducted system, SDHV, mixed non-ducted/SDHV system, or mixed ducted/SDHV system;

(v) For all split systems including outdoor units with no match, the refrigerant.

(3) *Basic and individual model numbers.* The basic model number and individual model number(s) required to be reported under § 429.12(b)(6) must consist of the following:

Equipment type	Basic model No.	Individual model Nos.		
		1	2	3
Single-Package (including Space-Constrained).	Number unique to the basic model.	Package	N/A	N/A.
Single-Split System (including Space-Constrained and SDHV).	Number unique to the basic model.	Outdoor Unit	Indoor Unit	Air Mover (could be same as indoor unit if fan is part of indoor unit model number).
Multi-Split, Multi-Circuit, and Multi-Head Mini-Split System (including SDHV).	Number unique to the basic model.	Outdoor Unit	When certifying a basic model based on tested combination(s): * * *	When certifying a basic model based on tested combination(s): * * *
Outdoor Unit with No Match ..	Number unique to the basic model.	Outdoor Unit	When certifying an individual combination: Indoor Unit(s). N/A	When certifying an individual combination: Air Mover(s). N/A.

(4) *Additional product-specific information.* Pursuant to § 429.12(b)(13), for each individual model/combination (including outdoor units with no match and “tested combinations”), a certification report must include the following additional product-specific information: the cooling full load air volume rate for the system or for each indoor unit as applicable (in cubic feet per minute of standard air (scfm)); the air volume rates for other test conditions including minimum cooling air volume rate, intermediate cooling air volume rate, full load heating air volume rate, minimum heating air volume rate, intermediate heating air volume rate, and nominal heating air volume rate (scfm) for the system or for each indoor unit as applicable, if different from the cooling full load air volume rate; whether the individual model uses a fixed orifice, thermostatic expansion valve, electronic expansion valve, or other type of metering device; the duration of the compressor break-in period, if used; whether the optional tests were conducted to determine the C_D value used to represent cooling mode cycling losses or whether the default value was used; the temperature at which the crankcase heater with controls is designed to turn on, if applicable; the duration of the crankcase heater time delay for the shoulder season and heating season, if such time delay is employed; the maximum time between defrosts as allowed by the controls (in hours); whether an inlet plenum was installed during testing; the duration of the indoor fan time delay, if used; and

(i) For heat pumps, whether the optional tests were conducted to determine the C_D value or whether the default value was used;

(ii) For multi-split, multiple-circuit, and multi-head mini-split systems, the number of indoor units tested with the outdoor unit; the nominal cooling capacity of each indoor unit and outdoor unit in the combination; and the indoor units that are not providing heating or cooling for part-load tests;

(iii) For ducted systems having multiple indoor fans within a single indoor unit, the number of indoor fans; the nominal cooling capacity of the indoor unit and outdoor unit; which fan(s) operate to attain the full-load air volume rate when controls limit the simultaneous operation of all fans within the single indoor unit; and the allocation of the full-load air volume rate to each operational fan when different capacity blowers are connected to the common duct;

(iv) For blower coil systems, the airflow-control settings associated with full load cooling operation; and the airflow-control settings or alternative instructions for setting fan speed to the speed upon which the rating is based;

(v) For models with time-adaptive defrost control, the frosting interval to be used during Frost Accumulation tests and the procedure for manually initiating the defrost at the specified time;

(vi) For models of indoor units designed for both horizontal and vertical installation or for both up-flow and down-flow vertical installations, the orientation used for testing;

(vii) For variable speed models, the compressor frequency set points, and the required dip switch/control settings for step or variable components; and

(viii) For variable speed heat pumps, whether the optional H₄₂ low temperature test was used to characterize performance at temperatures below 17 °F, whether the H_{1N} or H₁₂ test speed is the same as the H₃₂ test speed, and whether the alternative test required for minimum-speed-limiting variable-speed heat pumps was used;

(ix) For models of outdoor units with no match, the following characteristics of the indoor coil: the face area, the coil depth in the direction of airflow, the fin density (fins per inch), the fin material, the fin style, the tube diameter, the tube material, and the numbers of tubes high and deep;

(x) For single-split-system coil-only ratings, NGIFS and the OFF-cycle time delay for the indoor fan, if used for certification testing; and

(xi) For central air conditioners and heat pumps that have two-capacity compressors that lock out low capacity operation for cooling at higher outdoor temperatures and/or heating at lower outdoor temperatures, the outdoor temperature(s) at which the unit locks out low capacity operation.

(f) *Represented values for the Federal Trade Commission.* Use the following represented value determinations to meet the requirements of the Federal Trade Commission.

(1) *Annual Operating Cost—Cooling.* Determine the represented value of estimated annual operating cost for cooling-only units or the cooling portion

of the estimated annual operating cost for air-source heat pumps that provide both heating and cooling by calculating the product of:

(i) The value determined in paragraph (A) if using appendix M to subpart B of part 430 or the value determined in paragraph (B) if using appendix M1 to subpart B of part 430;

(A) the quotient of the represented value of cooling capacity, in Btu's per hour as determined in paragraph (b)(3)(i)(C) of this section, divided by the represented value of SEER, in Btu's per watt-hour, as determined in paragraph (b)(3)(i)(B) of this section;

(B) the quotient of the represented value of cooling capacity, in Btu's per hour as determined in paragraph (b)(3)(i)(C) of this section, and multiplied by 0.93 for variable-speed heat pumps only, divided by the represented value of SEER, in Btu's per watt-hour, as determined in paragraph (b)(3)(i)(B) of this section.

(ii) The representative average use cycle for cooling of 1,000 hours per year;

(iii) A conversion factor of 0.001 kilowatt per watt; and

(iv) The representative average unit cost of electricity in dollars per kilowatt-hour as provided pursuant to section 323(b)(2) of the Act.

(2) *Annual Operating Cost—Heating.* Determine the represented value of estimated annual operating cost for air-source heat pumps that provide only heating or for the heating portion of the estimated annual operating cost for air-source heat pumps that provide both heating and cooling, as follows:

(i) When using appendix M to subpart B of part 430, the product of:

(A) The quotient of the mean of the standardized design heating requirement for the sample, in Btu's per hour, nearest to the Region IV minimum design heating requirement, determined for each unit in the sample in section 4.2 of appendix M to subpart B of part 430, divided by the represented value of heating seasonal performance factor (HSPF), in Btu's per watt-hour, calculated for Region IV corresponding to the above-mentioned standardized design heating requirement, as determined in paragraph (b)(3)(i)(B) of this section;

(B) The representative average use cycle for heating of 2,080 hours per year;

(C) The adjustment factor of 0.77, which serves to adjust the calculated design heating requirement and heating load hours to the actual load experienced by a heating system;

(D) A conversion factor of 0.001 kilowatt per watt; and

(E) The representative average unit cost of electricity in dollars per kilowatt-hour as provided pursuant to section 323(b)(2) of the Act;

(ii) When using appendix M1 to subpart B of part 430, the product of:

(A) The quotient of the represented value of cooling capacity (for air-source heat pumps that provide both cooling and heating) in Btu's per hour, as determined in paragraph (b)(3)(i)(C) of this section, or the represented value of heating capacity (for air-source heat pumps that provide only heating), as determined in paragraph (b)(3)(i)(D) of this section, divided by the represented value of heating seasonal performance factor (HSPF), in Btu's per watt-hour, calculated for Region IV, as determined in paragraph (b)(3)(i)(B) of this section;

(B) The representative average use cycle for heating of 1,572 hours per year;

(C) The adjustment factor of 1.15 (for heat pumps that are not variable-speed) or 1.07 (for heat pumps that are variable-speed), which serves to adjust the calculated design heating requirement and heating load hours to the actual load experienced by a heating system;

(D) A conversion factor of 0.001 kilowatt per watt; and

(E) The representative average unit cost of electricity in dollars per kilowatt-hour as provided pursuant to section 323(b)(2) of the Act;

* * * * *

(4) *Regional Annual Operating Cost—Cooling.* Determine the represented value of estimated regional annual operating cost for cooling-only units or the cooling portion of the estimated regional annual operating cost for air-source heat pumps that provide both heating and cooling by calculating the product of:

(i) The value determined in paragraph (A) if using appendix M to subpart B of part 430 or the value determined in paragraph (B) if using appendix M1 to subpart B of part 430;

(A) the quotient of the represented value of cooling capacity, in Btu's per hour as determined in paragraph (b)(3)(i)(C) of this section, divided by the represented value of SEER, in Btu's per watt-hour, as determined in paragraph (b)(3)(i)(B) of this section;

(B) the quotient of the represented value of cooling capacity, in Btu's per hour as determined in paragraph (b)(3)(i)(C) of this section, and multiplied by 0.93 for variable-speed heat pumps only, divided by the represented value of SEER, in Btu's per watt-hour, as determined in paragraph (b)(3)(i)(B) of this section;

(ii) The value determined in paragraph (A) if using appendix M to subpart B of part 430 or the value determined in paragraph (B) if using appendix M1 to subpart B of part 430;

(A) the estimated number of regional cooling load hours per year determined from Table 21 in section 4.4 of appendix M to subpart B of part 430;

(B) the estimated number of regional cooling load hours per year determined from Table 20 in section 4.4 of appendix M1 to subpart B of part 430;

(iii) A conversion factor of 0.001 kilowatts per watt; and

(iv) The representative average unit cost of electricity in dollars per kilowatt-hour as provided pursuant to section 323(b)(2) of the Act.

(5) *Regional Annual Operating Cost—Heating.* Determine the represented value of estimated regional annual operating cost for air-source heat pumps that provide only heating or for the heating portion of the estimated regional annual operating cost for air-source heat pumps that provide both heating and cooling as follows:

(i) When using appendix M to subpart B of part 430, the product of:

(A) The estimated number of regional heating load hours per year determined from Table 21 in section 4.4 of appendix M to subpart B of part 430;

(B) The quotient of the mean of the standardized design heating requirement for the sample, in Btu's per hour, for the appropriate generalized climatic region of interest (*i.e.*, corresponding to the regional heating load hours from "A") and determined for each unit in the sample in section 4.2 of appendix M to subpart B of part 430, divided by the represented value of HSPF, in Btu's per watt-hour, calculated for the appropriate generalized climatic region of interest and corresponding to the above-mentioned standardized design heating requirement, and determined in paragraph (b)(3)(i)(B);

(C) The adjustment factor of 0.77; which serves to adjust the calculated design heating requirement and heating load hours to the actual load experienced by a heating system;

(D) A conversion factor of 0.001 kilowatts per watt; and

(E) The representative average unit cost of electricity in dollars per kilowatt-hour as provided pursuant to section 323(b)(2) of the Act.

(ii) When using appendix M1 to subpart B of part 430, the product of:

(A) The estimated number of regional heating load hours per year determined from Table 20 in section 4.4 of appendix M1 to subpart B of part 430;

(B) The quotient of the represented value of cooling capacity (for air-source

heat pumps that provide both cooling and heating) in Btu's per hour, as determined in paragraph (b)(3)(i)(C) of this section, or the represented value of heating capacity (for air-source heat pumps that provide only heating), as determined in paragraph (b)(3)(i)(D) of this section, divided by the represented value of HSPF, in Btu's per watt-hour, calculated for the appropriate generalized climatic region of interest, and determined in paragraph (b)(3)(i)(B) of this section;

(C) The adjustment factor of 1.15 (for heat pumps that are not variable-speed) or 1.07 (for heat pumps that are variable-speed), which serves to adjust the calculated design heating requirement and heating load hours to the actual load experienced by a heating system;

(D) A conversion factor of 0.001 kilowatts per watt; and

(E) The representative average unit cost of electricity in dollars per kilowatt-hour as provided pursuant to section 323(b)(2) of the Act.

* * * * *

■ 4. Section 429.70 is amended by revising paragraph (e)(2)(i) and the introductory text of paragraph (e)(5)(iv) to read as follows:

§ 429.70 Alternative methods for determining energy efficiency or energy use.

* * * * *

(e) * * *

(2) * * *

(i) Conduct minimum testing and compare to AEDM output as described in paragraphs (A) and (B) respectively.

(A) *Minimum testing.* (1) For non-space constrained single-split system air conditioners and heat pumps rated based on testing in accordance with appendix M to subpart B of part 430, the manufacturer must test each basic model as required under § 429.16(b)(2). Until July 1, 2024, for non-space constrained single-split-system air conditioners and heat pumps rated based on testing in accordance with appendix M1 to subpart B of part 430, the manufacturer must test a single-unit sample from 20 percent of the basic models distributed in commerce to validate the AEDM. On or after July 1, 2024, for non-space constrained single-split-system air conditioners and heat pumps rated based on testing in accordance with appendix M1 to subpart B of part 430, the manufacturer must complete testing of each basic model as required under § 429.16(b)(2).

(2) For other than non-space constrained single-split-system air conditioners and heat pumps, the

manufacturer must test each basic model as required under § 429.16(b)(2).

(B) Using the AEDM, calculate the energy use or efficiency for each of the tested individual models/combinations within each basic model. Compare the represented value based on testing and the AEDM energy use or efficiency output according to paragraph (e)(2)(ii) of this section. The manufacturer is responsible for ensuring the accuracy and reliability of the AEDM and that their representations are appropriate and the models being distributed in commerce meet the applicable standards, regardless of the amount of testing required in paragraphs (e)(2)(i)(A) and (e)(2)(i)(B) of this section.

* * * * *

(5) * * *

(iv) *Failure to meet certified value.* If an individual model/combination tests worse than its certified value (*i.e.*, lower than the certified efficiency value or higher than the certified consumption value) by more than 5 percent, or the test results in cooling capacity that is greater than 105 percent of its certified cooling capacity, DOE will notify the manufacturer. DOE will provide the manufacturer with all documentation related to the test set up, test conditions, and test results for the unit. Within the timeframe allotted by DOE, the manufacturer:

* * * * *

PART 430—ENERGY CONSERVATION PROGRAM FOR CONSUMER PRODUCTS

■ 5. The authority citation for part 430 continues to read as follows:

Authority: 42 U.S.C. 6291–6309; 28 U.S.C. 2461 note.

§ 430.3 [Amended]

■ 6. Section 430.3 is amended by removing, in paragraphs (b)(2), (c)(1), (c)(3), (g)(2), (g)(4), (g)(7), (g)(8), (g)(9), (g)(10) and (g)(13), “appendix M” and adding in its place, “appendices M and M1”.

■ 7. Section 430.23 is amended by revising paragraph (m) to read as follows:

§ 430.23 Test procedures for the measurement of energy and water consumption.

* * * * *

(m) *Central air conditioners and heat pumps.* See the note at the beginning of appendix M and M1 to determine the appropriate test method. Determine all values discussed in this section using a single appendix.

(1) Determine cooling capacity from the steady-state wet-coil test (A or A2

Test), as described in section 3.2 of appendix M or M1 to this subpart, and rounded off to the nearest

(i) To the nearest 50 Btu/h if cooling capacity is less than 20,000 Btu/h;

(ii) To the nearest 100 Btu/h if cooling capacity is greater than or equal to 20,000 Btu/h but less than 38,000 Btu/h; and

(iii) To the nearest 250 Btu/h if cooling capacity is greater than or equal to 38,000 Btu/h and less than 65,000 Btu/h.

(2) Determine seasonal energy efficiency ratio (SEER) as described in section 4.1 of appendix M or M1 to this subpart, and round off to the nearest 0.025 Btu/W-h.

(3) Determine EER as described in section 4.7 of appendix M or M1 to this subpart, and round off to the nearest 0.025 Btu/W-h.

(4) Determine heating seasonal performance factors (HSPF) as described in section 4.2 of appendix M or M1 to this subpart, and round off to the nearest 0.025 Btu/W-h.

(5) Determine average off mode power consumption as described in section 4.3 of appendix M or M1 to this subpart, and round off to the nearest 0.5 W.

(6) Determine all other measures of energy efficiency or consumption or other useful measures of performance using appendix M or M1 of this subpart.

* * * * *

■ 8. Appendix M to subpart B of part 430 is amended by:

■ a. Revising the definition of “service coil” in Section 1.2., Definitions;

■ b. Revising paragraph c. and adding paragraphs g. and h. in Section 2.2, Test Unit Installation Requirements;

■ c. Revising paragraph a. in section 2.2.3;

■ d. Removing in, Section 2.10.1, paragraph (c) first sentence, the word “preliminary” and adding in its place the word “non-ducted”;

■ e. Revising section 3.1.7;

■ f. Revising the introductory paragraph of section 3.5.1;

■ g. Revising section 3.6.4;

■ h. Revising section 3.11.1;

■ i. Revising section 3.11.1.1;

■ j. Revising section 3.11.1.2;

■ l. Revising paragraphs b., and d., in section 3.13.2;

■ m. Revising the last paragraph in section 4.1.3;

■ n. Revising section 4.1.4.2;

■ o. Revising paragraph b., in section 4.2;

■ p. Redesignating paragraph c. as paragraph d. in section 4.2 and adding paragraph c., respectively;

■ q. Revising the first paragraph in section 4.2.3;

- r. Revising the second paragraph in section 4.2.4; and
- s. Revising section 4.2.4.2.

The additions and revisions read as follows:

Appendix M to Subpart B of Part 430—Uniform Test Method for Measuring the Energy Consumption of Central Air Conditioners and Heat Pumps

* * * * *

1.2 Definitions

* * * * *

Service coil means an arrangement of refrigerant-to-air heat transfer coil(s), condensate drain pan, sheet metal or plastic parts to direct/route airflow over the coil(s), which may or may not include external cabinetry and/or a cooling mode expansion device, distributed in commerce solely for replacing an uncased coil or cased coil that has already been placed into service, and that has been labeled “for indoor coil replacement only” on the nameplate and in manufacturer technical and product literature. The model number for any service coil must include some mechanism (e.g., an additional letter or number) for differentiating a service coil from a coil intended for an indoor unit.

* * * * *

2.2 Test Unit Installation Requirements.

* * * * *

c. Testing a ducted unit without having an indoor air filter installed is permissible as long as the minimum external static pressure requirement is adjusted as stated in Table 3, note 3 (see section 3.1.4 of this appendix). Except as noted in section 3.1.10 of this appendix, prevent the indoor air supplementary heating coils from operating during all tests. For uncased coils, create an enclosure using 1 inch fiberglass foil-faced ductboard having a nominal density of 6 pounds per cubic foot. Or alternatively, construct an enclosure using sheet metal or a similar material and insulating material having a thermal resistance (“R” value) between 4 and 6 hr·ft²·°F/Btu. Size the enclosure and seal between the coil and/or drainage pan and the interior of the enclosure as specified in installation instructions shipped with the unit. Also seal between the plenum and inlet and outlet ducts.

* * * * *

g. If pressure measurement devices are connected to refrigerant lines at locations where the refrigerant state changes from liquid to vapor for different parts of the test (e.g. heating mode vs. cooling mode, on-cycle vs. off-cycle during cyclic test), the total

internal volume of the pressure measurement system (transducers, gauges, connections, and lines) must be no more than 0.25 cubic inches per 12,000 Btu/h certified cooling capacity. Calculate total system internal volume using internal volume reported for pressure transducers and gauges in product literature, if available. If such information is not available, use the value of 0.1 cubic inches internal volume for each pressure transducer, and 0.2 cubic inches for each pressure gauge.

h. For single-split-system coil-only air conditioners, test using an indoor coil that has a normalized gross indoor fin surface (NGIFS) no greater than 2.0 square inches per British thermal unit per hour (sq. in./Btu/hr). NGIFS is calculated as follows:

$$NGIFS = 2 \times L_f \times W_f \times N_f \div \dot{Q}_c (95)$$

Where:

L_f = Indoor coil fin length in inches, also height of the coil transverse to the tubes.

W_f = Indoor coil fin width in inches, also depth of the coil.

N_f = Number of fins.

\dot{Q}_c = the measured space cooling capacity of the tested outdoor unit/indoor unit combination as determined from the A2 or A Test whichever applies, Btu/h.

* * * * *

2.2.3 Special Requirements for Multi-Split Air Conditioners and Heat Pumps and Ducted Systems Using a Single Indoor Section Containing Multiple Indoor Blowers That Would Normally Operate Using Two or More Indoor Thermostats.

* * * * *

a. Additional requirements for multi-split air conditioners and heat pumps. For any test where the system is operated at part load (i.e., one or more compressors “off”, operating at the intermediate or minimum compressor speed, or at low compressor capacity), record the indoor coil(s) that are not providing heating or cooling during the test. For variable-speed systems, the manufacturer must designate in the certification report at least one indoor unit that is not providing heating or cooling for all tests conducted at minimum compressor speed.

* * * * *

3.1

* * * * *

3.1.7 Test Sequence

Before making test measurements used to calculate performance, operate the equipment for a “break-in” period, which may not exceed 20 hours. Each compressor

of the unit must undergo this “break-in” period. Record the duration of the break-in period. When testing a ducted unit (except if a heating-only heat pump), conduct the A or A2 Test first to establish the cooling full-load air volume rate. * * *

* * * * *

3.5.1 Procedures When Testing Ducted Systems

The automatic controls that are normally installed with the test unit must govern the OFF/ON cycling of the air moving equipment on the indoor side (exhaust fan of the airflow measuring apparatus and the indoor blower of the test unit). For ducted coil-only systems rated based on using a fan time-delay relay, control the indoor coil airflow according to the OFF delay listed by the manufacturer in the certification report. For ducted units having a variable-speed indoor blower that has been disabled (and possibly removed), start and stop the indoor airflow at the same instances as if the fan were enabled. * * *

* * * * *

3.6.4 Tests for a Heat Pump Having a Variable-Speed Compressor

a. Conduct one maximum temperature test (H0₁), two high temperature tests (H1_N and H1₁), one frost accumulation test (H2_v), and one low temperature test (H3₂). Conducting one or both of the following tests is optional: An additional high temperature test (H1₂) and an additional frost accumulation test (H2₂). Conduct the optional maximum temperature cyclic (H0C₁) test to determine the heating mode cyclic-degradation coefficient, C_D^h. If this optional test is conducted but yields a tested C_D^h that exceeds the default C_D^h or if the optional test is not conducted, assign C_D^h the default value of 0.25. Test conditions for the eight tests are specified in Table 13. The compressor shall operate at the same heating full speed, measured by RPM or power input frequency (Hz), equal to the maximum speed at which the system controls would operate the compressor in normal operation in 17 °F ambient temperature, for the H1₂, H2₂ and H3₂ tests. For a cooling/heating heat pump, the compressor shall operate for the H1_N test at a speed, measured by RPM or power input frequency (Hz), no lower than the speed used in the A₂ test. The compressor shall operate at the same heating minimum speed, measured by RPM or power input frequency (Hz), for the H0₁, H1C₁, and H1₁ Tests. Determine the heating intermediate compressor speed cited in Table 13 using the heating mode full and minimum compressors speeds and:

Heating intermediate speed

$$= \text{Heating minimum speed} + \frac{\text{Heating full speed} - \text{Heating minimum speed}}{3}$$

Where a tolerance of plus 5 percent or the next higher inverter frequency step from that calculated is allowed.

b. If the H1₂ test is conducted, set the 47 °F capacity and power input values used for calculation of HSPF equal to the measured values for that test:

$$\dot{Q}_{hcalc}^{k=2}(47) = \dot{Q}_h^{k=2}(47); \dot{E}_{hcalc}^{k=2}(47) = \dot{E}_h^{k=2}(47)$$

Where:

$\dot{Q}_{hcalc}^{k=2}(47)$ and $\dot{E}_{hcalc}^{k=2}(47)$ are the capacity and power input representing full-speed operation at 47 °F for the HSPF calculations,

$\dot{Q}_h^{k=2}(47)$ is the capacity measured in the H1₂ test, and

$\dot{E}_h^{k=2}(47)$ is the power input measured in the H1₂ test.

Evaluate the quantities $\dot{Q}_h^{k=2}(47)$ and from $\dot{E}_h^{k=2}(47)$ according to section 3.7.

Otherwise, if the H1_N test is conducted using the same compressor speed (RPM or power input frequency) as the H3₂ test, set the 47 °F capacity and power input values used for calculation of HSPF equal to the measured values for that test:

$$\dot{Q}_{hcalc}^{k=2}(47) = \dot{Q}_h^{k=N}(47); \dot{E}_{hcalc}^{k=2}(47) = \dot{E}_h^{k=N}(47)$$

Where:

$\dot{Q}_{hcalc}^{k=2}(47)$ and $\dot{E}_{hcalc}^{k=2}(47)$ are the capacity and power input representing full-speed operation at 47 °F for the HSPF calculations,

$\dot{Q}_h^{k=N}(47)$ is the capacity measured in the H1_N test, and

$\dot{E}_h^{k=N}(47)$ is the power input measured in the H1_N test.

Evaluate the quantities $\dot{Q}_h^{k=N}(47)$ and from $\dot{E}_h^{k=N}(47)$ according to section 3.7.

Otherwise (if no high temperature test is conducted using the same speed (RPM or power input frequency) as the H3₂ test), calculate the 47 °F capacity and power input values used for calculation of HSPF as follows:

$$\dot{Q}_{hcalc}^{k=2}(47) = \dot{Q}_h^{k=2}(17) * (1 + 30 \text{ °F} * CSF);$$

$$\dot{E}_{hcalc}^{k=2}(47) = \dot{E}_h^{k=2}(17) * (1 + 30 \text{ °F} * PSF)$$

Where:

$\dot{Q}_{hcalc}^{k=2}(47)$ and $\dot{E}_{hcalc}^{k=2}(47)$ are the capacity and power input representing full-speed operation at 47 °F for the HSPF calculations,

$\dot{Q}_h^{k=2}(17)$ is the capacity measured in the H3₂ test,

$\dot{E}_h^{k=2}(17)$ is the power input measured in the H3₂ test,

CSF is the capacity slope factor, equal to 0.0204/°F for split systems and 0.0262/°F for single-package systems, and

PSF is the Power Slope Factor, equal to 0.00455/°F.

c. If the H2₂ test is not done, use the following equations to approximate the capacity and electrical power at the H2₂ test conditions:

$$\dot{Q}_h^{k=2}(35) = 0.90 * \{ \dot{Q}_h^{k=2}(17) + 0.6 * [\dot{Q}_{hcalc}^{k=2}(47) - \dot{Q}_h^{k=2}(17)] \}$$

$$\dot{E}_h^{k=2}(35) = 0.985 * \{ \dot{E}_h^{k=2}(17) + 0.6 * [\dot{E}_{hcalc}^{k=2}(47) - \dot{E}_h^{k=2}(17)] \}$$

Where:

$\dot{Q}_{hcalc}^{k=2}(47)$ and $\dot{E}_{hcalc}^{k=2}(47)$ are the capacity and power input representing full-speed operation at 47 °F for the HSPF calculations, calculated as described in section b above.

$\dot{Q}_h^{k=2}(17)$ and $\dot{E}_h^{k=2}(17)$ are the capacity and power input measured in the H3₂ test.

d. Determine the quantities $\dot{Q}_h^{k=2}(17)$ and $\dot{E}_h^{k=2}(17)$ from the H3₂ test, determine the quantities $\dot{Q}_h^{k=2}(5)$ and $\dot{E}_h^{k=2}(5)$ and $\dot{E}_h^{k=2}(5)$ from the H4₂ test, and evaluate all four according to section 3.10.

TABLE 13—HEATING MODE TEST CONDITIONS FOR UNITS HAVING A VARIABLE-SPEED COMPRESSOR

Test description	Air entering indoor unit temperature (°F)		Air entering outdoor unit temperature (°F)		Compressor speed	Heating air volume rate
	Dry bulb	Wet bulb	Dry bulb	Wet bulb		
H0 ₁ test (required, steady)	70	60(max)	62	56.5	Heating Minimum	Heating Minimum. ¹
H1 ₂ test (optional, steady)	70	60(max)	47	43	Heating Full ⁴	Heating Full-Load. ³
H1 ₁ test (required, steady)	70	60(max)	47	43	Heating Minimum	Heating Minimum. ¹
H1 _N test (required, steady)	70	60(max)	47	43	Heating Full	Heating Full-Load. ³
H1C ₁ test (optional, cyclic)	70	60(max)	47	43	Heating Minimum	(²)
H2 ₂ test (optional)	70	60(max)	35	33	Heating Full ⁴	Heating Full-Load. ³
H2 _V test (required)	70	60(max)	35	33	Heating Intermediate	Heating Intermediate. ⁵
H3 ₂ test (required, steady)	70	60(max)	17	15	Heating Full ⁴	Heating Full-Load. ³

¹ Defined in section 3.1.4.5 of this appendix.

² Maintain the airflow nozzle(s) static pressure difference or velocity pressure during an ON period at the same pressure or velocity as measured during the H1₁ test.

³ Defined in section 3.1.4.4 of this appendix.

⁴ Maximum speed that the system controls would operate the compressor in normal operation in 17 °F ambient temperature. The H1₂ test is not needed if the H1_N test uses this same compressor speed.

⁵ Defined in section 3.1.4.6 of this appendix.

* * * * *

3.11.1 If Using the Outdoor Air Enthalpy Method as the Secondary Test Method

a. For all cooling mode and heating mode tests, first conduct a test without the outdoor air-side test apparatus described in section 2.10.1 of this appendix connected to the outdoor unit (“non-ducted” test).

b. For the first section 3.2 steady-state cooling mode test and the first section 3.6 steady-state heating mode test, conduct a second test in which the outdoor-side apparatus is connected (“ducted” test). No other cooling mode or heating mode tests require the ducted test so long as the unit operates the outdoor fan during all cooling mode steady-state tests at the same speed and all heating mode steady-state tests at the same speed. If using more than one outdoor fan speed for the cooling mode steady-state tests, however, conduct the ducted test for each cooling mode test where a different fan speed is first used. This same requirement applies for the heating mode tests.

* * * * *

3.11.1.1 Non-Ducted Test

a. For the non-ducted test, connect the indoor air-side test apparatus to the indoor coil; do not connect the outdoor air-side test apparatus. Allow the test room reconditioning apparatus and the unit being tested to operate for at least one hour. After attaining equilibrium conditions, measure the following quantities at equal intervals that span 5 minutes or less:

(1) The section 2.10.1 evaporator and condenser temperatures or pressures;

(2) Parameters required according to the indoor air enthalpy method.

Continue these measurements until a 30-minute period (e.g., seven consecutive 5-minute samples) is obtained where the Table 8 or Table 15, whichever applies, test tolerances are satisfied.

b. For cases where a ducted test is not required per section 3.11.1.b of this appendix, the non-ducted test constitutes the “official” test for which validity is not based on comparison with a secondary test.

c. For cases where a ducted test is required per section 3.11.1.b of this appendix, the following conditions must be met for the

non-ducted test to constitute a valid “official” test:

(1) The energy balance specified in section 3.1.1 of this appendix is achieved for the ducted test (i.e., compare the capacities determined using the indoor air enthalpy method and the outdoor air enthalpy method).

(2) The capacities determined using the indoor air enthalpy method from the ducted and non-ducted tests must agree within 2.0 percent.

3.11.1.2 Ducted Test

a. The test conditions and tolerances for the ducted test are the same as specified for the official test.

b. After collecting 30 minutes of steady-state data during the non-ducted test, connect the outdoor air-side test apparatus to the unit for the ducted test. Adjust the exhaust fan of the outdoor airflow measuring apparatus until averages for the evaporator and condenser temperatures, or the saturated temperatures corresponding to the measured pressures, agree within ±0.5 °F of the averages achieved during the non-ducted test. Calculate the averages for the ducted test using five or more consecutive readings taken

at one minute intervals. Make these consecutive readings after re-establishing equilibrium conditions.

c. During the ducted test, at one minute intervals, measure the parameters required according to the indoor air enthalpy method and the outdoor air enthalpy method.

d. For cooling mode ducted tests, calculate capacity based on outdoor air-enthalpy measurements as specified in sections 7.3.3.2 and 7.3.3.3 of ASHRAE 37–2009 (incorporated by reference, see § 430.3). For heating mode ducted tests, calculate heating capacity based on outdoor air-enthalpy measurements as specified in sections 7.3.4.2 and 7.3.4.3 of the same ASHRAE Standard. Adjust the outdoor-side capacity according to section 7.3.3.4 of ASHRAE 37–2009 to account for line losses when testing split systems.

* * * * *

* * * * *

3.13.2 This test determines the off mode average power rating for central air conditioners and heat pumps for which ambient temperature can affect the measurement of crankcase heater power.

* * * * *

b. Configure Controls: Position a temperature sensor to measure the outdoor dry-bulb temperature in the air between 2 and 6 inches from the crankcase heater control temperature sensor or, if no such temperature sensor exists, position it in the air between 2 and 6 inches from the crankcase heater. Utilize the temperature

measurements from this sensor for this portion of the test procedure. Configure the controls of the central air conditioner or heat pump so that it operates as if connected to a building thermostat that is set to the OFF position. Use a compatible building thermostat if necessary to achieve this configuration.

Conduct the test after completion of the B, B₁, or B₂ test. Alternatively, start the test when the outdoor dry-bulb temperature is at 82 °F and the temperature of the compressor shell (or temperature of each compressor's shell if there is more than one compressor) is at least 81 °F. Then adjust the outdoor temperature and achieve an outdoor dry-bulb temperature of 72 °F. If the unit's compressor has no sound blanket, wait at least 4 hours after the outdoor temperature reaches 72 °F. Otherwise, wait at least 8 hours after the outdoor temperature reaches 72 °F. Maintain this temperature within +/- 2 °F while the compressor temperature equilibrates and while making the power measurement, as described in section 3.13.2.c of this appendix.

* * * * *

d. Reduce outdoor temperature: Approach the target outdoor dry-bulb temperature by adjusting the outdoor temperature. This target temperature is five degrees Fahrenheit less than the temperature certified by the manufacturer as the temperature at which the crankcase heater turns on. If the unit's compressor has no sound blanket, wait at least 4 hours after the outdoor temperature reaches the target temperature. Otherwise,

wait at least 8 hours after the outdoor temperature reaches the target temperature. Maintain the target temperature within +/- 2 °F while the compressor temperature equilibrates and while making the power measurement, as described in section 3.13.2.e of this appendix.

4.1 * * *

* * * * *

4.1.3 SEER Calculations for an Air Conditioner or Heat Pump Having a Two-Capacity Compressor

* * * * *

The calculation of Equation 4.1–1 quantities $q_c(T_j)/N$ and $e_c(T_j)/N$ differs depending on whether the test unit would operate at low capacity (section 4.1.3.1 of this appendix), cycle between low and high capacity (section 4.1.3.2 of this appendix), or operate at high capacity (sections 4.1.3.3 and 4.1.3.4 of this appendix) in responding to the building load. For units that lock out low capacity operation at higher outdoor temperatures, the outdoor temperature at which the unit locks out must be that specified by the manufacturer in the certification report so that the appropriate equations are used. Use Equation 4.1–2 to calculate the building load, $BL(T_j)$, for each temperature bin.

* * * * *

4.1.4.2 Unit operates at an intermediate compressor speed ($k=i$) in order to match the building cooling load at temperature T_j , $\dot{Q}_c^{k=1}(T_j) < BL(T_j) < \dot{Q}_c^{k=2}(T_j)$.

$$\frac{q_c(T_j)}{N} = \dot{Q}_c^{k=i}(T_j) * \frac{n_j}{N} \quad \frac{e_c(T_j)}{N} = \dot{E}_c^{k=i}(T_j) * \frac{n_j}{N}$$

Where:

$\dot{Q}_c^{k=i}(T_j) = BL(T_j)$, the space cooling capacity delivered by the unit in matching the building load at temperature T_j , Btu/h.

The matching occurs with the unit operating at compressor speed $k = i$.

$$\dot{E}_c^{k=i}(T_j) = \frac{\dot{Q}_c^{k=i}(T_j)}{EER^{k=i}(T_j)}, \text{ the electrical power input required by the test unit when operating}$$

at a compressor speed of $k = i$ and temperature T_j , W.

$EER^{k=i}(T_j)$, the steady-state energy efficiency ratio of the test unit when operating at a compressor speed of $k = i$ and temperature T_j , Btu/h per W.

Obtain the fractional bin hours for the cooling season, n_j/N , from Table 18. For each temperature bin where the unit operates at an intermediate compressor speed, determine

the energy efficiency ratio $EER^{k=i}(T_j)$ using the following equations,

For each temperature bin where $\dot{Q}_c^{k=1}(T_j) < BL(T_j) < \dot{Q}_c^{k=v}(T_j)$,

$$EER^{k=i}(T_j) = EER^{k=1}(T_j) + \frac{EER^{k=v}(T_j) - EER^{k=1}(T_j)}{Q^{k=v}(T_j) - Q^{k=1}(T_j)} * (BL(T_j) - Q^{k=1}(T_j))$$

For each temperature bin where $\dot{Q}_c^{k=v}(T_j) \leq BL(T_j) < \dot{Q}_c^{k=2}(T_j)$,

$$EER^{k=i}(T_j) = EER^{k=v}(T_j) + \frac{EER^{k=2}(T_j) - EER^{k=v}(T_j)}{Q^{k=2}(T_j) - Q^{k=v}(T_j)} * (BL(T_j) - Q^{k=v}(T_j))$$

Where:

$EER^{k=1}(T_j)$ is the steady-state energy efficiency ratio of the test unit when operating at minimum compressor speed and temperature T_j , Btu/h per W, calculated using capacity $\dot{Q}_c^{k=1}(T_j)$ calculated using Equation 4.1.4-1 and electrical power consumption $\dot{E}_c^{k=1}(T_j)$ calculated using Equation 4.1.4-2;

$EER^{k=v}(T_j)$ is the steady-state energy efficiency ratio of the test unit when operating at intermediate compressor speed and temperature T_j , Btu/h per W, calculated using capacity $\dot{Q}_c^{k=v}(T_j)$ calculated using Equation 4.1.4-3 and electrical power consumption $\dot{E}_c^{k=v}(T_j)$ calculated using Equation 4.1.4-4;

$EER^{k=2}(T_j)$ is the steady-state energy efficiency ratio of the test unit when operating at full compressor speed and temperature T_j , Btu/h per W, calculated using capacity $\dot{Q}_c^{k=2}(T_j)$ and electrical power consumption $\dot{E}_c^{k=2}(T_j)$, both calculated as described in section 4.1.4; and

$BL(T_j)$ is the building cooling load at temperature T_j , Btu/h.

* * * * *

4.2 * * *

* * * * *

b. For a section 3.6.2 single-speed heat pump or a two-capacity heat pump not covered by item d, $\dot{Q}_h^{k=1}(47) = \dot{Q}_h^{k=2}(47)$, the space heating capacity determined from the H1 or H1₂ test.

c. For a variable-speed heat pump, $\dot{Q}_h^{k=1}(47) = \dot{Q}_h^{k=N}(47)$, the space heating capacity determined from the H1_N test.

d. For two-capacity, northern heat pumps (see section 1.2 of this appendix, Definitions), $\dot{Q}_h^{k=1}(47) = \dot{Q}_h^{k=1_h}(47)$, the space heating capacity determined from the H1₁ test.

For all heat pumps, HSPF accounts for

* * * * *

4.2.3 Additional Steps for Calculating the HSPF of a Heat Pump Having a Two-Capacity Compressor

The calculation of the Equation 4.2-1 quantities differ depending upon whether the heat pump would operate at low capacity (section 4.2.3.1 of this appendix), cycle between low and high capacity (section 4.2.3.2 of this appendix), or operate at high capacity (sections 4.2.3.3 and 4.2.3.4 of this appendix) in responding to the building load.

For heat pumps that lock out low capacity operation at low outdoor temperatures, the outdoor temperature at which the unit locks out must be that specified by the manufacturer in the certification report so that the appropriate equations can be selected.

* * * * *

4.2.4 * * *

* * * * *

Evaluate the space heating capacity, $\dot{Q}_h^{k=2}(T_j)$, and electrical power consumption, $\dot{E}_h^{k=2}(T_j)$, of the heat pump when operating at full compressor speed and outdoor temperature T_j by solving Equations 4.2.2-3 and 4.2.2-4, respectively, for $k=2$. For Equation 4.2.2-3, use $\dot{Q}_{hcalc}^{k=2}(47)$ to represent $\dot{Q}_h^{k=2}(47)$, and for Equation 4.2.2-4, use $\dot{E}_{hcalc}^{k=2}(47)$ to represent $\dot{E}_h^{k=2}(47)$ —evaluate $\dot{Q}_{hcalc}^{k=2}(47)$ and $\dot{E}_{hcalc}^{k=2}(47)$ as specified in section 3.6.4b of this appendix.

* * *

* * * * *

4.2.4.2 Heat pump operates at an intermediate compressor speed ($k=i$) in order to match the building heating load at a temperature T_j , $\dot{Q}_h^{k=1}(T_j) < BL(T_j) < \dot{Q}_h^{k=2}(T_j)$. Calculate

$\frac{RH(T_j)}{N}$ using Equation 4.2.3-2 while evaluating $\frac{e_h(T_j)}{N}$ using,

$$\frac{e_h(T_j)}{N} = \dot{E}_h^{k=i}(T_j) * \delta(T_j) * \frac{n_j}{N}$$

where,

$$\dot{E}_h^{k=i}(T_j) = \frac{\dot{Q}_h^{k=i}(T_j)}{3.413 \frac{Btu/h}{W} * COP^{k=i}(T_j)}$$

and $\delta(T_j)$ is evaluated using Equation 4.2.3-3 while,

$\dot{Q}_h^{k=1}(T_j) = BL(T_j)$, the space heating capacity delivered by the unit in matching the building load at temperature (T_j) , Btu/h.

The matching occurs with the heat pump operating at compressor speed $k=i$. $COP^{k=i}(T_j)$ = the steady-state coefficient of performance of the heat pump when operating at compressor speed $k=i$ and temperature T_j , dimensionless.

For each temperature bin where the heat pump operates at an intermediate compressor speed, determine $COP^{k=i}(T_j)$ using the following equations,

For each temperature bin where $\dot{Q}_h^{k=1}(T_j) < BL(T_j) < \dot{Q}_h^{k=v}(T_j)$,

$$COP_h^{k=i}(T_j) = COP_h^{k=1}(T_j) + \frac{COP_h^{k=v}(T_j) - COP_h^{k=1}(T_j)}{Q_h^{k=v}(T_j) - Q_h^{k=1}(T_j)} * (BL(T_j) - Q_h^{k=1}(T_j))$$

For each temperature bin where $\dot{Q}_h^{k=v}(T_j) \leq BL(T_j) < \dot{Q}_h^{k=2}(T_j)$,

$$COP_h^{k=i}(T_j) = COP_h^{k=v}(T_j) + \frac{COP_h^{k=2}(T_j) - COP_h^{k=v}(T_j)}{Q_h^{k=2}(T_j) - Q_h^{k=v}(T_j)} * (BL(T_j) - Q_h^{k=v}(T_j))$$

Where:

$COP_h^{k=1}(T_j)$ is the steady-state coefficient of performance of the heat pump when operating at minimum compressor speed and temperature T_j , dimensionless, calculated using capacity $\dot{Q}_h^{k=1}(T_j)$ calculated using Equation 4.2.4–1 and electrical power consumption $\dot{E}_h^{k=1}(T_j)$ calculated using Equation 4.2.4–2;

$COP_h^{k=v}(T_j)$ is the steady-state coefficient of performance of the heat pump when operating at intermediate compressor speed and temperature T_j , dimensionless, calculated using capacity $\dot{Q}_h^{k=v}(T_j)$ calculated using Equation 4.2.4–3 and electrical power consumption $\dot{E}_h^{k=v}(T_j)$ calculated using Equation 4.2.4–4;

$COP_h^{k=2}(T_j)$ is the steady-state coefficient of performance of the heat pump when operating at full compressor speed and temperature T_j , dimensionless, calculated using capacity $\dot{Q}_h^{k=2}(T_j)$ and electrical power consumption $\dot{E}_h^{k=2}(T_j)$, both calculated as described in section 4.2.4; and

$BL(T_j)$ is the building heating load at temperature T_j , Btu/h.

■ 9. Add appendix M1 to subpart B of part 430 to read as follows:

Appendix M1 to Subpart B of Part 430—Uniform Test Method for Measuring the Energy Consumption of Central Air Conditioners and Heat Pumps

Prior to January 1, 2023, any representations, including compliance certifications, made with respect to the energy use, power, or efficiency of central air conditioners and central air conditioning heat pumps must be based on the results of testing pursuant to Appendix M of this subpart.

On or after January 1, 2023, any representations, including compliance certifications, made with respect to the energy use, power, or efficiency of central air conditioners and central air conditioning heat pumps must be based on the results of testing pursuant to this appendix.

1. Scope and Definitions

1.1 Scope

This test procedure provides a method of determining SEER, EER, HSPF and $P_{W,OFF}$ for central air conditioners and central air conditioning heat pumps including the following categories:

(a) Split-system air conditioners, including single-split, multi-head mini-split, multi-

split (including VRF), and multi-circuit systems

(b) Split-system heat pumps, including single-split, multi-head mini-split, multi-split (including VRF), and multi-circuit systems

(c) Single-package air conditioners

(d) Single-package heat pumps

(e) Small-duct, high-velocity systems (including VRF)

(f) Space-constrained products—air conditioners

(g) Space-constrained products—heat pumps

For the purposes of this appendix, the Department of Energy incorporates by reference specific sections of several industry standards, as listed in § 430.3. In cases where there is a conflict, the language of the test procedure in this appendix takes precedence over the incorporated standards.

All section references refer to sections within this appendix unless otherwise stated.

1.2 Definitions

Airflow-control settings are programmed or wired control system configurations that control a fan to achieve discrete, differing ranges of airflow—often designated for performing a specific function (e.g., cooling, heating, or constant circulation)—without manual adjustment other than interaction with a user-operable control (i.e., a thermostat) that meets the manufacturer specifications for installed-use. For the purposes of this appendix, manufacturer specifications for installed-use are those found in the product literature shipped with the unit.

Air sampling device is an assembly consisting of a manifold with several branch tubes with multiple sampling holes that draws an air sample from a critical location from the unit under test (e.g. indoor air inlet, indoor air outlet, outdoor air inlet, etc.).

Airflow prevention device denotes a device that prevents airflow via natural convection by mechanical means, such as an air damper box, or by means of changes in duct height, such as an upturned duct.

Aspirating psychrometer is a piece of equipment with a monitored airflow section that draws uniform airflow through the measurement section and has probes for measurement of air temperature and humidity.

Blower coil indoor unit means an indoor unit either with an indoor blower housed with the coil or with a separate designated air mover such as a furnace or a modular blower (as defined in appendix AA to the subpart).

Blower coil system refers to a split system that includes one or more blower coil indoor units.

Cased coil means a coil-only indoor unit with external cabinetry.

Ceiling-mount blower coil system means a split-system air conditioner or heat pump for which the outdoor unit has a certified cooling capacity less than or equal to 36,000 Btu/h and the indoor unit is shipped with manufacturer-supplied installation instructions that specify to secure the indoor unit only to the ceiling of the conditioned space, with return air directly to the bottom of the unit (without ductwork), having an installed height no more than 12 inches (not including condensate drain lines) and depth (in the direction of airflow) of no more than 30 inches, with supply air discharged horizontally.

Coefficient of Performance (COP) means the ratio of the average rate of space heating delivered to the average rate of electrical energy consumed by the heat pump. Determine these rate quantities from a single test or, if derived via interpolation, determine at a single set of operating conditions. COP is a dimensionless quantity. When determined for a ducted coil-only system, COP must be calculated using the default values for heat output and power input of a fan motor specified in sections 3.7 and 3.9.1 of this appendix.

Coil-only indoor unit means an indoor unit that is distributed in commerce without an indoor blower or separate designated air mover. A coil-only indoor unit installed in the field relies on a separately-installed furnace or a modular blower for indoor air movement.

Coil-only system means a system that includes only (one or more) coil-only indoor units.

Condensing unit removes the heat absorbed by the refrigerant to transfer it to the outside environment and consists of an outdoor coil, compressor(s), and air moving device.

Constant-air-volume-rate indoor blower means a fan that varies its operating speed to provide a fixed air-volume-rate from a ducted system.

Continuously recorded, when referring to a dry bulb measurement, dry bulb temperature used for test room control, wet bulb temperature, dew point temperature, or relative humidity measurements, means that the specified value must be sampled at regular intervals that are equal to or less than 15 seconds.

Cooling load factor (CLF) means the ratio having as its numerator the total cooling delivered during a cyclic operating interval

consisting of one ON period and one OFF period, and as its denominator the total cooling that would be delivered, given the same ambient conditions, had the unit operated continuously at its steady-state, space-cooling capacity for the same total time (ON + OFF) interval.

Crankcase heater means any electrically powered device or mechanism for intentionally generating heat within and/or around the compressor sump volume. Crankcase heater control may be achieved using a timer or may be based on a change in temperature or some other measurable parameter, such that the crankcase heater is not required to operate continuously. A crankcase heater without controls operates continuously when the compressor is not operating.

Cyclic Test means a test where the unit's compressor is cycled on and off for specific time intervals. A cyclic test provides half the information needed to calculate a degradation coefficient.

Damper box means a short section of duct having an air damper that meets the performance requirements of section 2.5.7 of this appendix.

Degradation coefficient (C_D) means a parameter used in calculating the part load factor. The degradation coefficient for cooling is denoted by C_D^c . The degradation coefficient for heating is denoted by C_D^h .

Demand-defrost control system means a system that defrosts the heat pump outdoor coil-only when measuring a predetermined degradation of performance. The heat pump's controls either:

(1) Monitor one or more parameters that always vary with the amount of frost accumulated on the outdoor coil (e.g., coil to air differential temperature, coil differential air pressure, outdoor fan power or current, optical sensors) at least once for every ten minutes of compressor ON-time when space heating or

(2) Operate as a feedback system that measures the length of the defrost period and adjusts defrost frequency accordingly. In all cases, when the frost parameter(s) reaches a predetermined value, the system initiates a defrost. In a demand-defrost control system, defrosts are terminated based on monitoring a parameter(s) that indicates that frost has been eliminated from the coil. (Note: Systems that vary defrost intervals according to outdoor dry-bulb temperature are not demand-defrost systems.) A demand-defrost control system, which otherwise meets the requirements, may allow time-initiated defrosts if, and only if, such defrosts occur after 6 hours of compressor operating time.

Design heating requirement (DHR) predicts the space heating load of a residence when subjected to outdoor design conditions. Estimates for the minimum and maximum DHR are provided for six generalized U.S. climatic regions in section 4.2 of this appendix.

Dry-coil tests are cooling mode tests where the wet-bulb temperature of the air supplied to the indoor unit is maintained low enough that no condensate forms on the evaporator coil.

Ducted system means an air conditioner or heat pump that is designed to be

permanently installed equipment and delivers conditioned air to the indoor space through a duct(s). The air conditioner or heat pump may be either a split-system or a single-package unit.

Energy efficiency ratio (EER) means the ratio of the average rate of space cooling delivered to the average rate of electrical energy consumed by the air conditioner or heat pump. Determine these rate quantities must be determined from a single test or, if derived via interpolation, determine at a single set of operating conditions. EER is expressed in units of

$$\frac{\text{Btu/h}}{W}$$

When determined for a ducted coil-only system, EER must include, from this appendix, the section 3.3 and 3.5.1 default values for the heat output and power input of a fan motor.

Evaporator coil means an assembly that absorbs heat from an enclosed space and transfers the heat to a refrigerant.

Heat pump means a kind of central air conditioner that utilizes an indoor conditioning coil, compressor, and refrigerant-to-outdoor air heat exchanger to provide air heating, and may also provide air cooling, air dehumidifying, air humidifying, air circulating, and air cleaning.

Heat pump having a heat comfort controller means a heat pump with controls that can regulate the operation of the electric resistance elements to assure that the air temperature leaving the indoor section does not fall below a specified temperature. Heat pumps that actively regulate the rate of electric resistance heating when operating below the balance point (as the result of a second stage call from the thermostat) but do not operate to maintain a minimum delivery temperature are not considered as having a heat comfort controller.

Heating load factor (HLF) means the ratio having as its numerator the total heating delivered during a cyclic operating interval consisting of one ON period and one OFF period, and its denominator the heating capacity measured at the same test conditions used for the cyclic test, multiplied by the total time interval (ON plus OFF) of the cyclic-test.

Heating season means the months of the year that require heating, e.g., typically, and roughly, October through April.

Heating seasonal performance factor (HSPF) means the total space heating required during the heating season, expressed in Btu, divided by the total electrical energy consumed by the heat pump system during the same season, expressed in watt-hours. The HSPF used to evaluate compliance with 10 CFR 430.32(c) is based on Region IV and the sampling plan stated in 10 CFR 429.16(a).

Independent coil manufacturer (ICM) means a manufacturer that manufactures indoor units but does not manufacture single-package units or outdoor units.

Indoor unit means a separate assembly of a split system that includes—

(1) An arrangement of refrigerant-to-air heat transfer coil(s) for transfer of heat between the refrigerant and the indoor air,

(2) A condensate drain pan, and may or may not include

(3) Sheet metal or plastic parts not part of external cabinetry to direct/route airflow over the coil(s),

(4) A cooling mode expansion device,

(5) External cabinetry, and

(6) An integrated indoor blower (i.e. a device to move air including its associated motor). A separate designated air mover that may be a furnace or a modular blower (as defined in appendix AA to the subpart) may be considered to be part of the indoor unit. A service coil is not an indoor unit.

Low-static blower coil system means a ducted multi-split or multi-head mini-split system for which all indoor units produce greater than 0.01 in. wc. and a maximum of 0.35 in. wc. external static pressure when operated at the cooling full-load air volume rate not exceeding 400 cfm per rated ton of cooling.

Mid-static blower coil system means a ducted multi-split or multi-head mini-split system for which all indoor units produce greater than 0.20 in. wc. and a maximum of 0.65 in. wc. when operated at the cooling full-load air volume rate not exceeding 400 cfm per rated ton of cooling.

Minimum-speed-limiting variable-speed heat pump means a heat pump for which the compressor speed (represented by revolutions per minute or motor power input frequency) is higher than its value for operation in a 47 °F ambient temperature for any bin temperature T_i for which the calculated heating load is less than the calculated intermediate-speed capacity.

Mobile home blower coil system means a split system that contains an outdoor unit and an indoor unit that meet the following criteria:

(1) Both the indoor and outdoor unit are shipped with manufacturer-supplied installation instructions that specify installation only in a mobile home with the home and equipment complying with HUD Manufactured Home Construction Safety Standard 24 CFR part 3280;

(2) The indoor unit cannot exceed 0.40 in. wc. when operated at the cooling full-load air volume rate not exceeding 400 cfm per rated ton of cooling; and

(3) The indoor and outdoor unit each must bear a label in at least ¼ inch font that reads "For installation only in HUD manufactured home per Construction Safety Standard 24 CFR part 3280."

Mobile home coil-only system means a coil-only split system that includes an outdoor unit and coil-only indoor unit that meet the following criteria:

(1) The outdoor unit is shipped with manufacturer-supplied installation instructions that specify installation only for mobile homes that comply with HUD Manufactured Home Construction Safety Standard 24 CFR part 3280,

(2) The coil-only indoor unit is shipped with manufacturer-supplied installation instructions that specify installation only in a mobile home furnace, modular blower, or designated air mover that complies with HUD Manufactured Home Construction Safety Standard 24 CFR part 3280, and

(3) The coil-only indoor unit and outdoor unit each has a label in at least ¼ inch font

that reads "For installation only in HUD manufactured home per Construction Safety Standard 24 CFR part 3280."

Multi-head mini-split system means a split system that has one outdoor unit and that has two or more indoor units connected with a single refrigeration circuit. The indoor units operate in unison in response to a single indoor thermostat.

Multiple-circuit (or multi-circuit) system means a split system that has one outdoor unit and that has two or more indoor units installed on two or more refrigeration circuits such that each refrigeration circuit serves a compressor and one and only one indoor unit, and refrigerant is not shared from circuit to circuit.

Multiple-split (or multi-split) system means a split system that has one outdoor unit and two or more coil-only indoor units and/or blower coil indoor units connected with a single refrigerant circuit. The indoor units operate independently and can condition multiple zones in response to at least two indoor thermostats or temperature sensors. The outdoor unit operates in response to independent operation of the indoor units based on control input of multiple indoor thermostats or temperature sensors, and/or based on refrigeration circuit sensor input (e.g., suction pressure).

Nominal capacity means the capacity that is claimed by the manufacturer on the product name plate. Nominal cooling capacity is approximate to the air conditioner cooling capacity tested at A or A2 condition. Nominal heating capacity is approximate to the heat pump heating capacity tested in the H_{1N} test.

Non-ducted indoor unit means an indoor unit that is designed to be permanently installed, mounted on room walls and/or ceilings, and that directly heats or cools air within the conditioned space.

Normalized Gross Indoor Fin Surface (NGIFS) means the gross fin surface area of the indoor unit coil divided by the cooling capacity measured for the A or A2 Test, whichever applies.

Off-mode power consumption means the power consumption when the unit is connected to its main power source but is neither providing cooling nor heating to the building it serves.

Off-mode season means, for central air conditioners other than heat pumps, the shoulder season and the entire heating season; and for heat pumps, the shoulder season only.

Outdoor unit means a separate assembly of a split system that transfers heat between the refrigerant and the outdoor air, and consists of an outdoor coil, compressor(s), an air moving device, and in addition for heat pumps, may include a heating mode expansion device, reversing valve, and/or defrost controls.

Outdoor unit manufacturer (OUM) means a manufacturer of single-package units, outdoor units, and/or both indoor units and outdoor units.

Part-load factor (PLF) means the ratio of the cyclic EER (or COP for heating) to the steady-state EER (or COP), where both EERs (or COPs) are determined based on operation at the same ambient conditions.

Seasonal energy efficiency ratio (SEER) means the total heat removed from the conditioned space during the annual cooling season, expressed in Btu's, divided by the total electrical energy consumed by the central air conditioner or heat pump during the same season, expressed in watt-hours.

Service coil means an arrangement of refrigerant-to-air heat transfer coil(s), condensate drain pan, sheet metal or plastic parts to direct/route airflow over the coil(s), which may or may not include external cabinetry and/or a cooling mode expansion device, distributed in commerce solely for replacing an uncased coil or cased coil that has already been placed into service, and that has been labeled "for indoor coil replacement only" on the nameplate and in manufacturer technical and product literature. The model number for any service coil must include some mechanism (e.g., an additional letter or number) for differentiating a service coil from a coil intended for an indoor unit.

Shoulder season means the months of the year in between those months that require cooling and those months that require heating, e.g., typically, and roughly, April through May, and September through October.

Single-package unit means any central air conditioner or heat pump that has all major assemblies enclosed in one cabinet.

Single-split system means a split system that has one outdoor unit and one indoor unit connected with a single refrigeration circuit.

Small-duct, high-velocity system means a split system for which all indoor units are blower coil indoor units that produce at least 1.2 inches (of water column) of external static pressure when operated at the full-load air volume rate certified by the manufacturer of at least 220 scfm per rated ton of cooling.

Split system means any central air conditioner or heat pump that has at least two separate assemblies that are connected with refrigerant piping when installed. One of these assemblies includes an indoor coil that exchanges heat with the indoor air to provide heating or cooling, while one of the others includes an outdoor coil that exchanges heat with the outdoor air. Split systems may be either blower coil systems or coil-only systems.

Standard Air means dry air having a mass density of 0.075 lb/ft³.

Steady-state test means a test where the test conditions are regulated to remain as constant as possible while the unit operates continuously in the same mode.

Temperature bin means the 5 °F increments that are used to partition the outdoor dry-bulb temperature ranges of the cooling (≥65 °F) and heating (<65 °F) seasons.

Test condition tolerance means the maximum permissible difference between the average value of the measured test parameter and the specified test condition.

Test operating tolerance means the maximum permissible range that a measurement may vary over the specified test interval. The difference between the maximum and minimum sampled values must be less than or equal to the specified test operating tolerance.

Tested combination means a multi-head mini-split, multi-split, or multi-circuit system having the following features:

(1) The system consists of one outdoor unit with one or more compressors matched with between two and five indoor units;

(2) The indoor units must:

(i) Collectively, have a nominal cooling capacity greater than or equal to 95 percent and less than or equal to 105 percent of the nominal cooling capacity of the outdoor unit;

(ii) Each represent the highest sales volume model family, if this is possible while meeting all the requirements of this section. If this is not possible, one or more of the indoor units may represent another indoor model family in order that all the other requirements of this section are met.

(iii) Individually not have a nominal cooling capacity greater than 50 percent of the nominal cooling capacity of the outdoor unit, unless the nominal cooling capacity of the outdoor unit is 24,000 Btu/h or less;

(iv) Operate at fan speeds consistent with manufacturer's specifications; and

(v) All be subject to the same minimum external static pressure requirement while able to produce the same external static pressure at the exit of each outlet plenum when connected in a manifold configuration as required by the test procedure.

(3) Where referenced, "nominal cooling capacity" means, for indoor units, the highest cooling capacity listed in published product literature for 95 °F outdoor dry bulb temperature and 80 °F dry bulb, 67 °F wet bulb indoor conditions, and for outdoor units, the lowest cooling capacity listed in published product literature for these conditions. If incomplete or no operating conditions are published, use the highest (for indoor units) or lowest (for outdoor units) such cooling capacity available for sale.

Time-adaptive defrost control system is a demand-defrost control system that measures the length of the prior defrost period(s) and uses that information to automatically determine when to initiate the next defrost cycle.

Time-temperature defrost control systems initiate or evaluate initiating a defrost cycle only when a predetermined cumulative compressor ON-time is obtained. This predetermined ON-time is generally a fixed value (e.g., 30, 45, 90 minutes) although it may vary based on the measured outdoor dry-bulb temperature. The ON-time counter accumulates if controller measurements (e.g., outdoor temperature, evaporator temperature) indicate that frost formation conditions are present, and it is reset/remains at zero at all other times. In one application of the control scheme, a defrost is initiated whenever the counter time equals the predetermined ON-time. The counter is reset when the defrost cycle is completed.

In a second application of the control scheme, one or more parameters are measured (e.g., air and/or refrigerant temperatures) at the predetermined, cumulative, compressor ON-time. A defrost is initiated only if the measured parameter(s) falls within a predetermined range. The ON-time counter is reset regardless of whether or not a defrost is initiated. If systems of this second type use cumulative ON-time

intervals of 10 minutes or less, then the heat pump may qualify as having a demand defrost control system (see definition).

Triple-capacity, northern heat pump means a heat pump that provides two stages of cooling and three stages of heating. The two common stages for both the cooling and heating modes are the low capacity stage and the high capacity stage. The additional heating mode stage is the booster capacity stage, which offers the highest heating capacity output for a given set of ambient operating conditions.

Triple-split system means a split system that is composed of three separate assemblies: An outdoor fan coil section, a blower coil indoor unit, and an indoor compressor section.

Two-capacity (or two-stage) compressor system means a central air conditioner or heat pump that has a compressor or a group of compressors operating with only two stages of capacity. For such systems, low capacity means the compressor(s) operating at low stage, or at low load test conditions. The low compressor stage that operates for heating mode tests may be the same or different from the low compressor stage that operates for cooling mode tests. For such systems, high capacity means the compressor(s) operating at high stage, or at full load test conditions.

Two-capacity, northern heat pump means a heat pump that has a factory or field-selectable lock-out feature to prevent space cooling at high-capacity. Two-capacity heat pumps having this feature will typically have two sets of ratings, one with the feature disabled and one with the feature enabled. The heat pump is a two-capacity northern heat pump only when this feature is enabled at all times. The certified indoor coil model number must reflect whether the ratings pertain to the lockout enabled option via the inclusion of an extra identifier, such as "+LO". When testing as a two-capacity, northern heat pump, the lockout feature must remain enabled for all tests.

Uncased coil means a coil-only indoor unit without external cabinetry.

Variable refrigerant flow (VRF) system means a multi-split system with at least three compressor capacity stages, distributing refrigerant through a piping network to multiple indoor blower coil units each

capable of individual zone temperature control, through proprietary zone temperature control devices and a common communications network. Note: Single-phase VRF systems less than 65,000 Btu/h are central air conditioners and central air conditioning heat pumps.

Variable-speed compressor system means a central air conditioner or heat pump that has a compressor that uses a variable-speed drive to vary the compressor speed to achieve variable capacities.

Wall-mount blower coil system means a split-system air conditioner or heat pump for which the outdoor unit has a certified cooling capacity less than or equal to 36,000 Btu/h and the indoor unit is shipped with manufacturer-supplied installation instructions that specify to secure the back side of the unit only to a wall within the conditioned space, with the capability of front air return (without ductwork) and not capable of horizontal airflow, having a height no more than 45 inches, a depth of no more than 22 inches (including tubing connections), and a width no more than 24 inches (in the direction parallel to the wall).

Wet-coil test means a test conducted at test conditions that typically cause water vapor to condense on the test unit evaporator coil.

2. Testing Overview and Conditions

(A) Test VRF systems using AHRI 1230–2010 (incorporated by reference, see § 430.3) and appendix M. Where AHRI 1230–2010 refers to the appendix C therein substitute the provisions of this appendix. In cases where there is a conflict, the language of the test procedure in this appendix takes precedence over AHRI 1230–2010.

For definitions use section 1 of appendix M and section 3 of AHRI 1230–2010 (incorporated by reference, see § 430.3). For rounding requirements, refer to § 430.23(m). For determination of certified ratings, refer to § 429.16 of this chapter.

For test room requirements, refer to section 2.1 of this appendix. For test unit installation requirements refer to sections 2.2.a, 2.2.b, 2.2.c, 2.2.1, 2.2.2, 2.2.3.a, 2.2.3.c, 2.2.4, 2.2.5, and 2.4 to 2.12 of this appendix, and sections 5.1.3 and 5.1.4 of AHRI 1230–2010. The "manufacturer's published instructions," as stated in section 8.2 of ANSI/ASHRAE 37–2009 (incorporated by reference, see § 430.3) and "manufacturer's installation

instructions" discussed in this appendix mean the manufacturer's installation instructions that come packaged with or appear in the labels applied to the unit. This does not include online manuals. Installation instructions that appear in the labels applied to the unit take precedence over installation instructions that are shipped with the unit.

For general requirements for the test procedure, refer to section 3.1 of this appendix, except for sections 3.1.3 and 3.1.4, which are requirements for indoor air volume and outdoor air volume. For indoor air volume and outdoor air volume requirements, refer instead to section 6.1.5 (except where section 6.1.5 refers to Table 8, refer instead to Table 3 of this appendix) and 6.1.6 of AHRI 1230–2010.

For the test method, refer to sections 3.3 to 3.5 and 3.7 to 3.13 of this appendix. For cooling mode and heating mode test conditions, refer to section 6.2 of AHRI 1230–2010. For calculations of seasonal performance descriptors, refer to section 4 of this appendix.

(B) For systems other than VRF, only a subset of the sections listed in this test procedure apply when testing and determining represented values for a particular unit. Table 1 shows the sections of the test procedure that apply to each system. This table is meant to assist manufacturers in finding the appropriate sections of the test procedure; the appendix sections rather than the table provide the specific requirements for testing, and given the varied nature of available units, manufacturers are responsible for determining which sections apply to each unit tested based on the model characteristics. To use this table, first refer to the sections listed under "all units". Then refer to additional requirements based on:

- (1) System configuration(s),
- (2) The compressor staging or modulation capability, and
- (3) Any special features.

Testing requirements for space-constrained products do not differ from similar equipment that is not space-constrained and thus are not listed separately in this table. Air conditioners and heat pumps are not listed separately in this table, but heating procedures and calculations apply only to heat pumps.

Table 1 Informative Guidance for Using Appendix M1

			Testing conditions	Testing procedures			Calculations		
			General	General	Cooling*	Heating**	General	Cooling*	Heating**
Requirements for all units (except VRF)			2.1; 2.2a-c; 2.2.1; 2.2.4; 2.2.4.1; 2.2.4.1 (1); 2.2.4.2; 2.2.5.1-5; 2.2.5.7-8; 2.3; 2.3.1; 2.3.2; 2.4; 2.4.1a,d; 2.5a-c; 2.5.1; 2.5.2 -2.5.4.2; 2.5.5 – 2.13	3.1; 3.1.1- 3; 3.1.5-9; 3.11; 3.12	3.3; 3.4; 3.5a-i	3.1.4.7; 3.1.9; 3.7a,b,d; 3.8a,d; 3.8.1; 3.9; 3.10	4.4; 4.5	4.1	4.2

		Single indoor unit having multiple indoor blowers			3.2.6	3.6.2; 3.6.7		4.1.5	4.2.7

*Does not apply to heating-only heat pumps.

**Applies only to heat pumps; not to air conditioners.

[†]Use AHRI 1230-2010 (incorporated by reference, see §430.3), with the sections referenced in section 2(A) of this appendix, in conjunction with the sections set forth in the table to perform test setup, testing, and calculations for determining represented values for VRF multiple-split and VRF SDHV systems.

NOTE: For all units, use section 3.13 of this appendix for off mode testing procedures and section 4.3 of this appendix for off mode calculations. For all units subject to an EER standard, use section 4.6 of this appendix to determine the energy efficiency ratio.

2.1 Test Room Requirements

a. Test using two side-by-side rooms: an indoor test room and an outdoor test room. For multiple-split, single-zone-multi-coil or multi-circuit air conditioners and heat pumps, however, use as many indoor test rooms as needed to accommodate the total number of indoor units. These rooms must comply with the requirements specified in sections 8.1.2 and 8.1.3 of ANSI/ASHRAE 37–2009 (incorporated by reference, see § 430.3).

b. Inside these test rooms, use artificial loads during cyclic tests and frost accumulation tests, if needed, to produce stabilized room air temperatures. For one room, select an electric resistance heater(s) having a heating capacity that is approximately equal to the heating capacity of the test unit's condenser. For the second room, select a heater(s) having a capacity that is close to the sensible cooling capacity of the test unit's evaporator. Cycle the heater located in the same room as the test unit evaporator coil ON and OFF when the test unit cycles ON and OFF. Cycle the heater located in the same room as the test unit condensing coil ON and OFF when the test unit cycles OFF and ON.

2.2 Test Unit Installation Requirements

a. Install the unit according to section 8.2 of ANSI/ASHRAE 37–2009 (incorporated by reference, see § 430.3), subject to the following additional requirements:

(1) When testing split systems, follow the requirements given in section 6.1.3.5 of AHRI 210/240–2008 (incorporated by reference, see § 430.3). For the vapor refrigerant line(s), use the insulation included with the unit; if no insulation is provided, use insulation meeting the specifications for the insulation in the installation instructions included with the unit by the manufacturer; if no insulation is included with the unit and the installation instructions do not contain provisions for insulating the line(s), fully insulate the vapor refrigerant line(s) with vapor proof insulation having an inside diameter that matches the refrigerant tubing and a nominal thickness of at least 0.5 inches. For the liquid refrigerant line(s), use the insulation included with the unit; if no insulation is provided, use insulation meeting the specifications for the insulation in the installation instructions included with the unit by the manufacturer; if no insulation is included with the unit and the installation instructions do not contain provisions for insulating the line(s), leave the liquid refrigerant line(s) exposed to the air for air conditioners and heat pumps that heat and cool; or, for heating-only heat pumps, insulate the liquid refrigerant line(s) with insulation having an inside diameter that matches the refrigerant tubing and a nominal thickness of at least 0.5 inches. Insulation must be the same for the cooling and heating tests.

(2) When testing split systems, if the indoor unit does not ship with a cooling mode expansion device, test the system using the device as specified in the installation instructions provided with the indoor unit. If none is specified, test the system using a fixed orifice or piston type expansion device that is sized appropriately for the system.

(3) When testing triple-split systems (see section 1.2 of this appendix, Definitions), use the tubing length specified in section 6.1.3.5 of AHRI 210/240–2008 (incorporated by reference, see § 430.3) to connect the outdoor coil, indoor compressor section, and indoor coil while still meeting the requirement of exposing 10 feet of the tubing to outside conditions;

(4) When testing split systems having multiple indoor coils, connect each indoor blower coil unit to the outdoor unit using:

(a) 25 feet of tubing, or

(b) Tubing furnished by the manufacturer, whichever is longer.

(5) When testing split systems having multiple indoor coils, expose at least 10 feet of the system interconnection tubing to the outside conditions. If they are needed to make a secondary measurement of capacity or for verification of refrigerant charge, install refrigerant pressure measuring instruments as described in section 8.2.5 of ANSI/ASHRAE 37–2009 (incorporated by reference, see § 430.3). Section 2.10 of this appendix specifies which secondary methods require refrigerant pressure measurements and section 2.2.5.5 of this appendix discusses use of pressure measurements to verify charge. At a minimum, insulate the low-pressure line(s) of a split system with insulation having an inside diameter that matches the refrigerant tubing and a nominal thickness of 0.5 inch.

b. For units designed for both horizontal and vertical installation or for both up-flow and down-flow vertical installations, use the orientation for testing specified by the manufacturer in the certification report. Conduct testing with the following installed:

(1) The most restrictive filter(s);

(2) Supplementary heating coils; and

(3) Other equipment specified as part of the unit, including all hardware used by a heat comfort controller if so equipped (see section 1 of this appendix, Definitions). For small-duct, high-velocity systems, configure all balance dampers or restrictor devices on or inside the unit to fully open or lowest restriction.

c. Testing a ducted unit without having an indoor air filter installed is permissible as long as the minimum external static pressure requirement is adjusted as stated in Table 3, note 3 (see section 3.1.4 of this appendix). Except as noted in section 3.1.10 of this appendix, prevent the indoor air supplementary heating coils from operating during all tests. For uncased coils, create an enclosure using 1 inch fiberglass foil-faced ductboard having a nominal density of 6 pounds per cubic foot. Or alternatively, construct an enclosure using sheet metal or a similar material and insulating material having a thermal resistance ("R" value) between 4 and 6 hr-ft² · °F/Btu. Size the enclosure and seal between the coil and/or drainage pan and the interior of the enclosure as specified in installation instructions shipped with the unit. Also seal between the plenum and inlet and outlet ducts.

d. When testing a coil-only system, install a toroidal-type transformer to power the system's low-voltage components, complying with any additional requirements for the transformer mentioned in the installation manuals included with the unit by the

system manufacturer. If the installation manuals do not provide specifications for the transformer, use a transformer having the following features:

(1) A nominal volt-amp rating such that the transformer is loaded between 25 and 90 percent of this rating for the highest level of power measured during the off mode test (section 3.13 of this appendix);

(2) Designed to operate with a primary input of 230 V, single phase, 60 Hz; and

(3) That provides an output voltage that is within the specified range for each low-voltage component. Include the power consumption of the components connected to the transformer as part of the total system power consumption during the off mode tests; do not include the power consumed by the transformer when no load is connected to it.

e. Test an outdoor unit with no match (*i.e.*, that is not distributed in commerce with any indoor units) using a coil-only indoor unit with a single cooling air volume rate whose coil has:

(1) Round tubes of outer diameter no less than 0.375 inches, and

(2) A normalized gross indoor fin surface (NGIFS) no greater than 1.0 square inches per British thermal unit per hour (sq. in./Btu/hr). NGIFS is calculated as follows:

$$NGIFS = 2 \times L_f \times W_f \times N_f \div \dot{Q}_c(95)$$

Where,

L_f = Indoor coil fin length in inches, also height of the coil transverse to the tubes.

W_f = Indoor coil fin width in inches, also depth of the coil.

N_f = Number of fins.

\dot{Q}_c = the measured space cooling capacity of the tested outdoor unit/indoor unit combination as determined from the A2 or A Test whichever applies, Btu/h.

f. If the outdoor unit or the outdoor portion of a single-package unit has a drain pan heater to prevent freezing of defrost water, energize the heater, subject to control to de-energize it when not needed by the heater's thermostat or the unit's control system, for all tests.

g. If pressure measurement devices are connected to refrigerant lines at locations where the refrigerant state changes from liquid to vapor for different parts of the test (*e.g.* heating mode vs. cooling mode, on-cycle vs. off-cycle during cyclic test), the total internal volume of the pressure measurement system (transducers, gauges, connections, and lines) must be no more than 0.25 cubic inches per 12,000 Btu/h certified cooling capacity. Calculate total system internal volume using internal volume reported for pressure transducers and gauges in product literature, if available. If such information is not available, use the value of 0.1 cubic inches internal volume for each pressure transducer, and 0.2 cubic inches for each pressure gauge.

h. For single-split-system coil-only air conditioners, test using an indoor coil that has a normalized gross indoor fin surface (NGIFS) no greater than 2.5 square inches per British thermal unit per hour (sq. in./Btu/hr). NGIFS is calculated as follows:

$$NGIFS = 2 \times L_f \times W_f \times N_f \div \dot{Q}_c(95)$$

Where,

L_f = Indoor coil fin length in inches, also height of the coil transverse to the tubes.
 W_f = Indoor coil fin width in inches, also depth of the coil.

N_f = Number of fins.

Q_c = the measured space cooling capacity of the tested outdoor unit/indoor unit combination as determined from the A2 or A Test whichever applies, Btu/h.

2.2.1 Defrost Control Settings

Set heat pump defrost controls at the normal settings which most typify those encountered in generalized climatic region IV. (Refer to Figure 1 and Table 19 of section 4.2 of this appendix for information on region IV.) For heat pumps that use a time-adaptive defrost control system (see section 1.2 of this appendix, Definitions), the manufacturer must specify in the certification report the frosting interval to be used during frost accumulation tests and provide the procedure for manually initiating the defrost at the specified time.

2.2.2 Special Requirements for Units Having a Multiple-Speed Outdoor Fan

Configure the multiple-speed outdoor fan according to the installation manual included with the unit by the manufacturer, and thereafter, leave it unchanged for all tests. The controls of the unit must regulate the operation of the outdoor fan during all lab tests except dry coil cooling mode tests. For dry coil cooling mode tests, the outdoor fan must operate at the same speed used during the required wet coil test conducted at the same outdoor test conditions.

2.2.3 Special Requirements for Multi-Split Air Conditioners and Heat Pumps and Ducted Systems Using a Single Indoor Section Containing Multiple Indoor Blowers that Would Normally Operate Using Two or More Indoor Thermostats

Because these systems will have more than one indoor blower and possibly multiple outdoor fans and compressor systems, references in this test procedure to a singular indoor blower, outdoor fan, and/or compressor means all indoor blowers, all outdoor fans, and all compressor systems that are energized during the test.

a. Additional requirements for multi-split air conditioners and heat pumps. For any test where the system is operated at part load (*i.e.*, one or more compressors “off”, operating at the intermediate or minimum compressor speed, or at low compressor capacity), the manufacturer must designate in the certification report the indoor coil(s) that are not providing heating or cooling during the test. For variable-speed systems, the manufacturer must designate in the certification report at least one indoor unit that is not providing heating or cooling for all tests conducted at minimum compressor speed. For all other part-load tests, the manufacturer must choose to turn off zero, one, two, or more indoor units. The chosen configuration must remain unchanged for all tests conducted at the same compressor speed/capacity. For any indoor coil that is not providing heating or cooling during a test, cease forced airflow through this indoor coil and block its outlet duct.

b. Additional requirements for ducted split systems with a single indoor unit containing

multiple indoor blowers (or for single-package units with an indoor section containing multiple indoor blowers) where the indoor blowers are designed to cycle on and off independently of one another and are not controlled such that all indoor blowers are modulated to always operate at the same air volume rate or speed. For any test where the system is operated at its lowest capacity—*i.e.*, the lowest total air volume rate allowed when operating the single-speed compressor or when operating at low compressor capacity—turn off indoor blowers accounting for at least one-third of the full-load air volume rate unless prevented by the controls of the unit. In such cases, turn off as many indoor blowers as permitted by the unit’s controls. Where more than one option exists for meeting this “off” requirement, the manufacturer must indicate in its certification report which indoor blower(s) are turned off. The chosen configuration shall remain unchanged for all tests conducted at the same lowest capacity configuration. For any indoor coil turned off during a test, cease forced airflow through any outlet duct connected to a switched-off indoor blower.

c. For test setups where the laboratory’s physical limitations require use of more than the required line length of 25 feet as listed in section 2.2.a.(4) of this appendix, then the actual refrigerant line length used by the laboratory may exceed the required length and the refrigerant line length correction factors in Table 4 of AHRI 1230–2010 are applied to the cooling capacity measured for each cooling mode test.

2.2.4 Wet-Bulb Temperature Requirements for the Air Entering the Indoor and Outdoor Coils

2.2.4.1 Cooling Mode Tests

For wet-coil cooling mode tests, regulate the water vapor content of the air entering the indoor unit so that the wet-bulb temperature is as listed in Tables 4 to 7. As noted in these same tables, achieve a wet-bulb temperature during dry-coil cooling mode tests that results in no condensate forming on the indoor coil. Controlling the water vapor content of the air entering the outdoor side of the unit is not required for cooling mode tests except when testing:

(1) Units that reject condensate to the outdoor coil during wet coil tests. Tables 4–7 list the applicable wet-bulb temperatures.

(2) Single-package units where all or part of the indoor section is located in the outdoor test room. The average dew point temperature of the air entering the outdoor coil during wet coil tests must be within $\pm 3.0^\circ\text{F}$ of the average dew point temperature of the air entering the indoor coil over the 30-minute data collection interval described in section 3.3 of this appendix. For dry coil tests on such units, it may be necessary to limit the moisture content of the air entering the outdoor coil of the unit to meet the requirements of section 3.4 of this appendix.

2.2.4.2 Heating Mode Tests

For heating mode tests, regulate the water vapor content of the air entering the outdoor unit to the applicable wet-bulb temperature listed in Tables 11 to 14. The wet-bulb

temperature entering the indoor side of the heat pump must not exceed 60°F . Additionally, if the Outdoor Air Enthalpy test method (section 2.10.1 of this appendix) is used while testing a single-package heat pump where all or part of the outdoor section is located in the indoor test room, adjust the wet-bulb temperature for the air entering the indoor side to yield an indoor-side dew point temperature that is as close as reasonably possible to the dew point temperature of the outdoor-side entering air.

2.2.5 Additional Refrigerant Charging Requirements

2.2.5.1 Instructions To Use for Charging

a. Where the manufacturer’s installation instructions contain two sets of refrigerant charging criteria, one for field installations and one for lab testing, use the field installation criteria.

b. For systems consisting of an outdoor unit manufacturer’s outdoor section and indoor section with differing charging procedures, adjust the refrigerant charge per the outdoor installation instructions.

c. For systems consisting of an outdoor unit manufacturer’s outdoor unit and an independent coil manufacturer’s indoor unit with differing charging procedures, adjust the refrigerant charge per the indoor unit’s installation instructions. If instructions are provided only with the outdoor unit or are provided only with an independent coil manufacturer’s indoor unit, then use the provided instructions.

2.2.5.2 Test(s) To Use for Charging

a. Use the tests or operating conditions specified in the manufacturer’s installation instructions for charging. The manufacturer’s installation instructions may specify use of tests other than the A or A₂ test for charging, but, unless the unit is a heating-only heat pump, determine the air volume rate by the A or A₂ test as specified in section 3.1 of this appendix.

b. If the manufacturer’s installation instructions do not specify a test or operating conditions for charging or there are no manufacturer’s instructions, use the following test(s):

(1) For air conditioners or cooling and heating heat pumps, use the A or A₂ test.

(2) For cooling and heating heat pumps that do not operate in the H1 or H1₂ test (*e.g.* due to shut down by the unit limiting devices) when tested using the charge determined at the A or A₂ test, and for heating-only heat pumps, use the H1 or H1₂ test.

2.2.5.3 Parameters To Set and Their Target Values

a. Consult the manufacturer’s installation instructions regarding which parameters (*e.g.*, superheat) to set and their target values. If the instructions provide ranges of values, select target values equal to the midpoints of the provided ranges.

b. In the event of conflicting information between charging instructions (*i.e.*, multiple conditions given for charge adjustment where all conditions specified cannot be met), follow the following hierarchy.

(1) For fixed orifice systems:

(i) Superheat

- (ii) High side pressure or corresponding saturation or dew-point temperature
- (iii) Low side pressure or corresponding saturation or dew-point temperature
- (iv) Low side temperature
- (v) High side temperature
- (vi) Charge weight
- (2) For expansion valve systems:
 - (i) Subcooling
 - (ii) High side pressure or corresponding saturation or dew-point temperature
 - (iii) Low side pressure or corresponding saturation or dew-point temperature
 - (iv) Approach temperature (difference between temperature of liquid leaving condenser and condenser average inlet air temperature)
 - (v) Charge weight

c. If there are no installation instructions and/or they do not provide parameters and target values, set superheat to a target value of 12 °F for fixed orifice systems or set subcooling to a target value of 10 °F for expansion valve systems.

2.2.5.4 Charging Tolerances

a. If the manufacturer's installation instructions specify tolerances on target values for the charging parameters, set the values within these tolerances.

b. Otherwise, set parameter values within the following test condition tolerances for the different charging parameters:

1. Superheat: ± 2.0 °F
2. Subcooling: ± 2.0 °F
3. High side pressure or corresponding saturation or dew point temperature: ± 4.0 psi or ± 1.0 °F
4. Low side pressure or corresponding saturation or dew point temperature: ± 2.0 psi or ± 0.8 °F
5. High side temperature: ± 2.0 °F
6. Low side temperature: ± 2.0 °F
7. Approach temperature: ± 1.0 °F
8. Charge weight: ± 2.0 ounce

2.2.5.5 Special Charging Instructions

a. Cooling and Heating Heat Pumps

If, using the initial charge set in the A or A₂ test, the conditions are not within the range specified in manufacturer's installation instructions for the H1 or H1₂ test, make as small as possible an adjustment to obtain conditions for this test in the specified range. After this adjustment, recheck conditions in the A or A₂ test to confirm that they are still within the specified range for the A or A₂ test.

b. Single-Package Systems

i. Unless otherwise directed by the manufacturer's installation instructions, install one or more refrigerant line pressure gauges during the setup of the unit, located depending on the parameters used to verify or set charge, as described:

(1) Install a pressure gauge at the location of the service valve on the liquid line if charging is on the basis of subcooling, or high side pressure or corresponding saturation or dew point temperature;

(2) Install a pressure gauge at the location of the service valve on the suction line if charging is on the basis of superheat, or low side pressure or corresponding saturation or dew point temperature.

ii. Use methods for installing pressure gauge(s) at the required location(s) as indicated in manufacturer's instructions if specified.

2.2.5.6 Near-Azeotropic and Zeotropic Refrigerants

Perform charging of near-azeotropic and zeotropic refrigerants only with refrigerant in the liquid state.

2.2.5.7 Adjustment of Charge Between Tests

After charging the system as described in this test procedure, use the set refrigerant charge for all tests used to determine performance. Do not adjust the refrigerant charge at any point during testing. If measurements indicate that refrigerant charge has leaked during the test, repair the refrigerant leak, repeat any necessary set-up steps, and repeat all tests.

2.3 Indoor Air Volume Rates

If a unit's controls allow for overspeeding the indoor blower (usually on a temporary basis), take the necessary steps to prevent overspeeding during all tests.

2.3.1 Cooling Tests

a. Set indoor blower airflow-control settings (e.g., fan motor pin settings, fan motor speed) according to the requirements that are specified in section 3.1.4 of this appendix.

b. Express the Cooling full-load air volume rate, the Cooling Minimum Air Volume Rate, and the Cooling Intermediate Air Volume Rate in terms of standard air.

2.3.2 Heating Tests

a. Set indoor blower airflow-control settings (e.g., fan motor pin settings, fan motor speed) according to the requirements that are specified in section 3.1.4 of this appendix.

b. Express the heating full-load air volume rate, the heating minimum air volume rate, and the heating nominal air volume rate in terms of standard air.

2.4 Indoor Coil Inlet and Outlet Duct Connections. Insulate and/or construct the outlet plenum as described in section 2.4.1 of this appendix and, if installed, the inlet plenum described in section 2.4.2 of this appendix with thermal insulation having a nominal overall resistance (R-value) of at least 19 hr·ft²·°F/Btu.

2.4.1 Outlet Plenum for the Indoor Unit

a. Attach a plenum to the outlet of the indoor coil. (Note: For some packaged systems, the indoor coil may be located in the outdoor test room.)

b. For systems having multiple indoor coils, or multiple indoor blowers within a single indoor section, attach a plenum to each indoor coil or indoor blower outlet. In order to reduce the number of required airflow measurement apparatus (section 2.6 of this appendix), each such apparatus may serve multiple outlet plenums connected to a single common duct leading to the apparatus. More than one indoor test room may be used, which may use one or more common ducts leading to one or more airflow measurement apparatus within each test room that contains multiple indoor coils. At the

plane where each plenum enters a common duct, install an adjustable airflow damper and use it to equalize the static pressure in each plenum. The outlet air temperature grid(s) (section 2.5.4 of this appendix) and airflow measuring apparatus shall be located downstream of the inlet(s) to the common duct(s). For multiple-circuit (or multi-circuit) systems for which each indoor coil outlet is measured separately and its outlet plenum is not connected to a common duct connecting multiple outlet plenums, install the outlet air temperature grid and airflow measuring apparatus at each outlet plenum.

c. For small-duct, high-velocity systems, install an outlet plenum that has a diameter that is equal to or less than the value listed in Table 2. The limit depends only on the Cooling full-load air volume rate (see section 3.1.4.1.1 of this appendix) and is effective regardless of the flange dimensions on the outlet of the unit (or an air supply plenum adapter accessory, if installed in accordance with the manufacturer's installation instructions).

d. Add a static pressure tap to each face of the (each) outlet plenum, if rectangular, or at four evenly distributed locations along the circumference of an oval or round plenum. Create a manifold that connects the four static pressure taps. Figure 9 of ANSI/ASHRAE 37–2009 (incorporated by reference, see § 430.3) shows allowed options for the manifold configuration. The cross-sectional dimensions of plenum must be equal to the dimensions of the indoor unit outlet. See Figures 7a, 7b, and 7c of ANSI/ASHRAE 37–2009 for the minimum length of the (each) outlet plenum and the locations for adding the static pressure taps for ducted blower coil indoor units and single-package systems. See Figure 8 of ANSI/ASHRAE 37–2009 for coil-only indoor units.

TABLE 2—SIZE OF OUTLET PLENUM FOR SMALL-DUCT HIGH-VELOCITY INDOOR UNITS

Cooling full-load air volume rate (scfm)	Maximum diameter* of outlet plenum (inches)
≤500	6
501 to 700	7
701 to 900	8
901 to 1100	9
1101 to 1400	10
1401 to 1750	11

*If the outlet plenum is rectangular, calculate its equivalent diameter using $(4A/P)$, where A is the cross-sectional area and P is the perimeter of the rectangular plenum, and compare it to the listed maximum diameter.

2.4.2 Inlet Plenum for the Indoor Unit

Install an inlet plenum when testing a coil-only indoor unit, a ducted blower coil indoor unit, or a single-package system. See Figures 7b and 7c of ANSI/ASHRAE 37–2009 for cross-sectional dimensions, the minimum length of the inlet plenum, and the locations of the static-pressure taps for ducted blower coil indoor units and single-package systems. See Figure 8 of ANSI/ASHRAE 37–2009 for coil-only indoor units. The inlet plenum duct

size shall equal the size of the inlet opening of the air-handling (blower coil) unit or furnace. For a ducted blower coil indoor unit the set up may omit the inlet plenum if an inlet airflow prevention device is installed with a straight internally unobstructed duct on its outlet end with a minimum length equal to 1.5 times the square root of the cross-sectional area of the indoor unit inlet. See section 2.1.5.2 of this appendix for requirements for the locations of static pressure taps built into the inlet airflow prevention device. For all of these arrangements, make a manifold that connects the four static-pressure taps using one of the three configurations specified in section 2.4.1.d. of this appendix. Never use an inlet plenum when testing a non-ducted system.

2.5 Indoor Coil Air Property Measurements and Airflow Prevention Devices

Follow instructions for indoor coil air property measurements as described in section 2.14 of this appendix, unless otherwise instructed in this section.

a. Measure the dry-bulb temperature and water vapor content of the air entering and leaving the indoor coil. If needed, use an air sampling device to divert air to a sensor(s) that measures the water vapor content of the air. See section 5.3 of ANSI/ASHRAE 41.1–2013 (incorporated by reference, see § 430.3) for guidance on constructing an air sampling device. No part of the air sampling device or the tubing transferring the sampled air to the sensor must be within two inches of the test chamber floor, and the transfer tubing must be insulated. The sampling device may also be used for measurement of dry bulb temperature by transferring the sampled air to a remotely located sensor(s). The air sampling device and the remotely located temperature sensor(s) may be used to determine the entering air dry bulb temperature during any test. The air sampling device and the remotely located sensor(s) may be used to determine the leaving air dry bulb temperature for all tests except:

- (1) Cyclic tests; and
- (2) Frost accumulation tests.

b. Install grids of temperature sensors to measure dry bulb temperatures of both the entering and leaving airstreams of the indoor unit. These grids of dry bulb temperature sensors may be used to measure average dry bulb temperature entering and leaving the indoor unit in all cases (as an alternative to the dry bulb sensor measuring the sampled air). The leaving airstream grid is required for measurement of average dry bulb temperature leaving the indoor unit for the two special cases noted in preamble. The grids are also required to measure the air temperature distribution of the entering and leaving airstreams as described in sections 3.1.8 of this appendix. Two such grids may be applied as a thermopile, to directly obtain the average temperature difference rather than directly measuring both entering and leaving average temperatures.

c. Use of airflow prevention devices. Use an inlet and outlet air damper box, or use an inlet upturned duct and an outlet air damper box when conducting one or both of the cyclic tests listed in sections 3.2 and 3.6 of this appendix on ducted systems. If not

conducting any cyclic tests, an outlet air damper box is required when testing ducted and non-ducted heat pumps that cycle off the indoor blower during defrost cycles and there is no other means for preventing natural or forced convection through the indoor unit when the indoor blower is off. Never use an inlet damper box or an inlet upturned duct when testing non-ducted indoor units. An inlet upturned duct is a length of ductwork installed upstream from the inlet such that the indoor duct inlet opening, facing upwards, is sufficiently high to prevent natural convection transfer out of the duct. If an inlet upturned duct is used, install a dry bulb temperature sensor near the inlet opening of the indoor duct at a centerline location not higher than the lowest elevation of the duct edges at the inlet, and ensure that any pair of 5-minute averages of the dry bulb temperature at this location, measured at least every minute during the compressor OFF period of the cyclic test, do not differ by more than 1.0 °F.

2.5.1 Test Set-Up on the Inlet Side of the Indoor Coil: For Cases Where the Inlet Airflow Prevention Device is Installed

a. Install an airflow prevention device as specified in section 2.5.1.1 or 2.5.1.2 of this appendix, whichever applies.

b. For an inlet damper box, locate the grid of entering air dry-bulb temperature sensors, if used, and the air sampling device, or the sensor used to measure the water vapor content of the inlet air, at a location immediately upstream of the damper box inlet. For an inlet upturned duct, locate the grid of entering air dry-bulb temperature sensors, if used, and the air sampling device, or the sensor used to measure the water vapor content of the inlet air, at a location at least one foot downstream from the beginning of the insulated portion of the duct but before the static pressure measurement.

2.5.1.1 If the section 2.4.2 inlet plenum is installed, construct the airflow prevention device having a cross-sectional flow area equal to or greater than the flow area of the inlet plenum. Install the airflow prevention device upstream of the inlet plenum and construct ductwork connecting it to the inlet plenum. If needed, use an adaptor plate or a transition duct section to connect the airflow prevention device with the inlet plenum. Insulate the ductwork and inlet plenum with thermal insulation that has a nominal overall resistance (R-value) of at least 19 hr · ft² · °F/Btu.

2.5.1.2 If the section 2.4.2 inlet plenum is not installed, construct the airflow prevention device having a cross-sectional flow area equal to or greater than the flow area of the air inlet of the indoor unit. Install the airflow prevention device immediately upstream of the inlet of the indoor unit. If needed, use an adaptor plate or a short transition duct section to connect the airflow prevention device with the unit's air inlet. Add static pressure taps at the center of each face of a rectangular airflow prevention device, or at four evenly distributed locations along the circumference of an oval or round airflow prevention device. Locate the pressure taps at a distance from the indoor unit inlet equal to 0.5 times the square root of the cross sectional area of the indoor unit

inlet. This location must be between the damper and the inlet of the indoor unit, if a damper is used. Make a manifold that connects the four static pressure taps using one of the configurations shown in Figure 9 of ANSI/ASHRAE 37–2009 (incorporated by reference, see § 430.3). Insulate the ductwork with thermal insulation that has a nominal overall resistance (R-value) of at least 19 hr · ft² · °F/Btu.

2.5.2 Test Set-Up on the Inlet Side of the Indoor Unit: For Cases Where No Airflow Prevention Device is Installed

If using the section 2.4.2 inlet plenum and a grid of dry bulb temperature sensors, mount the grid at a location upstream of the static pressure taps described in section 2.4.2 of this appendix, preferably at the entrance plane of the inlet plenum. If the section 2.4.2 inlet plenum is not used (*i.e.* for non-ducted units) locate a grid approximately 6 inches upstream of the indoor unit inlet. In the case of a system having multiple non-ducted indoor units, do this for each indoor unit. Position an air sampling device, or the sensor used to measure the water vapor content of the inlet air, immediately upstream of the (each) entering air dry-bulb temperature sensor grid. If a grid of sensors is not used, position the entering air sampling device (or the sensor used to measure the water vapor content of the inlet air) as if the grid were present.

2.5.3 Indoor Coil Static Pressure Difference Measurement

Fabricate pressure taps meeting all requirements described in section 6.5.2 of ANSI/ASHRAE 37–2009 (incorporated by reference, see § 430.3) and illustrated in Figure 2A of AMCA 210–2007 (incorporated by reference, see § 430.3), however, if adhering strictly to the description in section 6.5.2 of ANSI/ASHRAE 37–2009, the minimum pressure tap length of 2.5 times the inner diameter of Figure 2A of AMCA 210–2007 is waived. Use a differential pressure measuring instrument that is accurate to within ±0.01 inches of water and has a resolution of at least 0.01 inches of water to measure the static pressure difference between the indoor coil air inlet and outlet. Connect one side of the differential pressure instrument to the manifolded pressure taps installed in the outlet plenum. Connect the other side of the instrument to the manifolded pressure taps located in either the inlet plenum or incorporated within the airflow prevention device. For non-ducted systems that are tested with multiple outlet plenums, measure the static pressure within each outlet plenum relative to the surrounding atmosphere.

2.5.4 Test Set-Up on the Outlet Side of the Indoor Coil

a. Install an interconnecting duct between the outlet plenum described in section 2.4.1 of this appendix and the airflow measuring apparatus described below in section 2.6 of this appendix. The cross-sectional flow area of the interconnecting duct must be equal to or greater than the flow area of the outlet plenum or the common duct used when testing non-ducted units having multiple indoor coils. If needed, use adaptor plates or

transition duct sections to allow the connections. To minimize leakage, tape joints within the interconnecting duct (and the outlet plenum). Construct or insulate the entire flow section with thermal insulation having a nominal overall resistance (R-value) of at least $19 \text{ hr} \cdot \text{ft}^2 \cdot ^\circ\text{F}/\text{Btu}$.

b. Install a grid(s) of dry-bulb temperature sensors inside the interconnecting duct. Also, install an air sampling device, or the sensor(s) used to measure the water vapor content of the outlet air, inside the interconnecting duct. Locate the dry-bulb temperature grid(s) upstream of the air sampling device (or the in-duct sensor(s) used to measure the water vapor content of the outlet air). Turn off the sampler fan motor during the cyclic tests. Air leaving an indoor unit that is sampled by an air sampling device for remote water-vapor-content measurement must be returned to the interconnecting duct at a location:

- (1) Downstream of the air sampling device;
- (2) On the same side of the outlet air damper as the air sampling device; and
- (3) Upstream of the section 2.6 airflow measuring apparatus.

2.5.4.1 Outlet Air Damper Box Placement and Requirements

If using an outlet air damper box (see section 2.5 of this appendix), the leakage rate from the combination of the outlet plenum, the closed damper, and the duct section that connects these two components must not exceed 20 cubic feet per minute when a negative pressure of 1 inch of water column is maintained at the plenum's inlet.

2.5.4.2 Procedures To Minimize Temperature Maldistribution

Use these procedures if necessary to correct temperature maldistributions. Install a mixing device(s) upstream of the outlet air, dry-bulb temperature grid (but downstream of the outlet plenum static pressure taps). Use a perforated screen located between the mixing device and the dry-bulb temperature grid, with a maximum open area of 40 percent. One or both items should help to meet the maximum outlet air temperature distribution specified in section 3.1.8 of this appendix. Mixing devices are described in sections 5.3.2 and 5.3.3 of ANSI/ASHRAE 41.1–2013 and section 5.2.2 of ASHRAE 41.2–1987 (RA 1992) (incorporated by reference, see § 430.3).

2.5.4.3 Minimizing Air Leakage

For small-duct, high-velocity systems, install an air damper near the end of the interconnecting duct, just prior to the transition to the airflow measuring apparatus of section 2.6 of this appendix. To minimize air leakage, adjust this damper such that the pressure in the receiving chamber of the airflow measuring apparatus is no more than 0.5 inch of water higher than the surrounding test room ambient. If applicable, in lieu of installing a separate damper, use the outlet air damper box of sections 2.5 and 2.5.4.1 of this appendix if it allows variable positioning. Also apply these steps to any conventional indoor blower unit that creates a static pressure within the receiving chamber of the airflow measuring apparatus that exceeds the test room ambient pressure by more than 0.5 inches of water column.

2.5.5 Dry Bulb Temperature Measurement

a. Measure dry bulb temperatures as specified in sections 4, 5.3, 6, and 7 of ANSI/ASHRAE 41.1–2013 (incorporated by reference, see § 430.3).

b. Distribute the sensors of a dry-bulb temperature grid over the entire flow area. The required minimum is 9 sensors per grid.

2.5.6 Water Vapor Content Measurement

Determine water vapor content by measuring dry-bulb temperature combined with the air wet-bulb temperature, dew point temperature, or relative humidity. If used, construct and apply wet-bulb temperature sensors as specified in sections 4, 5, 6, 7.2, 7.3, and 7.4 of ASHRAE 41.6–2014 (incorporated by reference, see § 430.3). The temperature sensor (wick removed) must be accurate to within $\pm 0.2^\circ\text{F}$. If used, apply dew point hygrometers as specified in sections 4, 5, 6, 7.1, and 7.4 of ASHRAE 41.6–2014. The dew point hygrometers must be accurate to within $\pm 0.4^\circ\text{F}$ when operated at conditions that result in the evaluation of dew points above 35°F . If used, a relative humidity (RH) meter must be accurate to within $\pm 0.7\%$ RH. Other means to determine the psychrometric state of air may be used as long as the measurement accuracy is equivalent to or better than the accuracy achieved from using a wet-bulb temperature sensor that meets the above specifications.

2.5.7 Air Damper Box Performance Requirements

If used (see section 2.5 of this appendix), the air damper box(es) must be capable of being completely opened or completely closed within 10 seconds for each action.

2.6 Airflow Measuring Apparatus

a. Fabricate and operate an airflow measuring apparatus as specified in section 6.2 and 6.3 of ANSI/ASHRAE 37–2009 (incorporated by reference, see § 430.3). Place the static pressure taps and position the diffusion baffle (settling means) relative to the chamber inlet as indicated in Figure 12 of AMCA 210–07 and/or Figure 14 of ASHRAE 41.2–1987 (RA 1992) (incorporated by reference, see § 430.3). When measuring the static pressure difference across nozzles and/or velocity pressure at nozzle throats using electronic pressure transducers and a data acquisition system, if high frequency fluctuations cause measurement variations to exceed the test tolerance limits specified in section 9.2 of this appendix and Table 2 of ANSI/ASHRAE 37–2009, dampen the measurement system such that the time constant associated with response to a step change in measurement (time for the response to change 63% of the way from the initial output to the final output) is no longer than five seconds.

b. Connect the airflow measuring apparatus to the interconnecting duct section described in section 2.5.4 of this appendix. See sections 6.1.1, 6.1.2, and 6.1.4, and Figures 1, 2, and 4 of ANSI/ASHRAE 37–2009; and Figures D1, D2, and D4 of AHRI 210/240–2008 (incorporated by reference, see § 430.3) with Addendum 1 and 2 for illustrative examples of how the test apparatus may be applied within a complete laboratory set-up. Instead of following one of these examples, an

alternative set-up may be used to handle the air leaving the airflow measuring apparatus and to supply properly conditioned air to the test unit's inlet. The alternative set-up, however, must not interfere with the prescribed means for measuring airflow rate, inlet and outlet air temperatures, inlet and outlet water vapor contents, and external static pressures, nor create abnormal conditions surrounding the test unit. (Note: Do not use an enclosure as described in section 6.1.3 of ANSI/ASHRAE 37–2009 when testing triple-split units.)

2.7 Electrical Voltage Supply

Perform all tests at the voltage specified in section 6.1.3.2 of AHRI 210/240–2008 (incorporated by reference, see § 430.3) for "Standard Rating Tests." If either the indoor or the outdoor unit has a 208V or 200V nameplate voltage and the other unit has a 230V nameplate rating, select the voltage supply on the outdoor unit for testing. Otherwise, supply each unit with its own nameplate voltage. Measure the supply voltage at the terminals on the test unit using a volt meter that provides a reading that is accurate to within ± 1.0 percent of the measured quantity.

2.8 Electrical Power and Energy Measurements

a. Use an integrating power (watt-hour) measuring system to determine the electrical energy or average electrical power supplied to all components of the air conditioner or heat pump (including auxiliary components such as controls, transformers, crankcase heater, integral condensate pump on non-ducted indoor units, etc.). The watt-hour measuring system must give readings that are accurate to within ± 0.5 percent. For cyclic tests, this accuracy is required during both the ON and OFF cycles. Use either two different scales on the same watt-hour meter or two separate watt-hour meters. Activate the scale or meter having the lower power rating within 15 seconds after beginning an OFF cycle. Activate the scale or meter having the higher power rating within 15 seconds prior to beginning an ON cycle. For ducted blower coil systems, the ON cycle lasts from compressor ON to indoor blower OFF. For ducted coil-only systems, the ON cycle lasts from compressor ON to compressor OFF. For non-ducted units, the ON cycle lasts from indoor blower ON to indoor blower OFF. When testing air conditioners and heat pumps having a variable-speed compressor, avoid using an induction watt/watt-hour meter.

b. When performing section 3.5 and/or 3.8 cyclic tests on non-ducted units, provide instrumentation to determine the average electrical power consumption of the indoor blower motor to within ± 1.0 percent. If required according to sections 3.3, 3.4, 3.7, 3.9.1 of this appendix, and/or 3.10 of this appendix, this same instrumentation requirement (to determine the average electrical power consumption of the indoor blower motor to within ± 1.0 percent) applies when testing air conditioners and heat pumps having a variable-speed constant-air-volume-rate indoor blower or a variable-speed, variable-air-volume-rate indoor blower.

2.9 Time Measurements

Make elapsed time measurements using an instrument that yields readings accurate to within ± 0.2 percent.

2.10 Test Apparatus for the Secondary Space Conditioning Capacity Measurement

For all tests, use the indoor air enthalpy method to measure the unit's capacity. This method uses the test set-up specified in sections 2.4 to 2.6 of this appendix. In addition, for all steady-state tests, conduct a second, independent measurement of capacity as described in section 3.1.1 of this appendix. For split systems, use one of the following secondary measurement methods: outdoor air enthalpy method, compressor calibration method, or refrigerant enthalpy method. For single-package units, use either the outdoor air enthalpy method or the compressor calibration method as the secondary measurement.

2.10.1 Outdoor Air Enthalpy Method

a. To make a secondary measurement of indoor space conditioning capacity using the outdoor air enthalpy method, do the following:

- (1) Measure the electrical power consumption of the test unit;
- (2) Measure the air-side capacity at the outdoor coil; and
- (3) Apply a heat balance on the refrigerant cycle.

b. The test apparatus required for the outdoor air enthalpy method is a subset of the apparatus used for the indoor air enthalpy method. Required apparatus includes the following:

- (1) On the outlet side, an outlet plenum containing static pressure taps (sections 2.4, 2.4.1, and 2.5.3 of this appendix),
- (2) An airflow measuring apparatus (section 2.6 of this appendix),
- (3) A duct section that connects these two components and itself contains the instrumentation for measuring the dry-bulb temperature and water vapor content of the air leaving the outdoor coil (sections 2.5.4, 2.5.5, and 2.5.6 of this appendix), and
- (4) On the inlet side, a sampling device and temperature grid (section 2.11.b of this appendix).

c. During the non-ducted tests described in sections 3.11.1 and 3.11.1.1 of this appendix, measure the evaporator and condenser temperatures or pressures. On both the outdoor coil and the indoor coil, solder a thermocouple onto a return bend located at or near the midpoint of each coil or at points not affected by vapor superheat or liquid subcooling. Alternatively, if the test unit is not sensitive to the refrigerant charge, install pressure gages to the access valves or to ports created from tapping into the suction and discharge lines according to sections 7.4.2 and 8.2.5 of ASHRAE 37–2009. Use this alternative approach when testing a unit charged with a zeotropic refrigerant having a temperature glide in excess of 1 °F at the specified test conditions.

2.10.2 Compressor Calibration Method

Measure refrigerant pressures and temperatures to determine the evaporator superheat and the enthalpy of the refrigerant that enters and exits the indoor coil.

Determine refrigerant flow rate or, when the superheat of the refrigerant leaving the evaporator is less than 5 °F, total capacity from separate calibration tests conducted under identical operating conditions. When using this method, install instrumentation and measure refrigerant properties according to section 7.4.2 and 8.2.5 of ANSI/ASHRAE 37–2009 (incorporated by reference, see § 430.3). If removing the refrigerant before applying refrigerant lines and subsequently recharging, use the steps in 7.4.2 of ANSI/ASHRAE 37–2009 in addition to the methods of section 2.2.5 of this appendix to confirm the refrigerant charge. Use refrigerant temperature and pressure measuring instruments that meet the specifications given in sections 5.1.1 and 5.2 of ANSI/ASHRAE 37–2009.

2.10.3 Refrigerant Enthalpy Method

For this method, calculate space conditioning capacity by determining the refrigerant enthalpy change for the indoor coil and directly measuring the refrigerant flow rate. Use section 7.5.2 of ANSI/ASHRAE 37–2009 (incorporated by reference, see § 430.3) for the requirements for this method, including the additional instrumentation requirements, and information on placing the flow meter and a sight glass. Use refrigerant temperature, pressure, and flow measuring instruments that meet the specifications given in sections 5.1.1, 5.2, and 5.5.1 of ANSI/ASHRAE 37–2009. Refrigerant flow measurement device(s), if used, must be either elevated at least two feet from the test chamber floor or placed upon insulating material having a total thermal resistance of at least R–12 and extending at least one foot laterally beyond each side of the device(s)' exposed surfaces.

2.11 Measurement of Test Room Ambient Conditions

Follow instructions for setting up air sampling device and aspirating psychrometer as described in section 2.14 of this appendix, unless otherwise instructed in this section.

a. If using a test set-up where air is ducted directly from the conditioning apparatus to the indoor coil inlet (see Figure 2, Loop Air-Enthalpy Test Method Arrangement, of ANSI/ASHRAE 37–2009 (incorporated by reference, see § 430.3)), add instrumentation to permit measurement of the indoor test room dry-bulb temperature.

b. On the outdoor side, use one of the following two approaches, except that approach (1) is required for all evaporatively-cooled units and units that transfer condensate to the outdoor unit for evaporation using condenser heat.

- (1) Use sampling tree air collection on all air-inlet surfaces of the outdoor unit.
- (2) Use sampling tree air collection on one or more faces of the outdoor unit and demonstrate air temperature uniformity as follows. Install a grid of evenly-distributed thermocouples on each air-permitting face on the inlet of the outdoor unit. Install the thermocouples on the air sampling device, locate them individually or attach them to a wire structure. If not installed on the air sampling device, install the thermocouple grid 6 to 24 inches from the unit. Evenly space the thermocouples across the coil inlet

surface and install them to avoid sampling of discharge air or blockage of air recirculation. The grid of thermocouples must provide at least 16 measuring points per face or one measurement per square foot of inlet face area, whichever is less. Construct this grid and use as per section 5.3 of ANSI/ASHRAE 41.1–2013 (incorporated by reference, see § 430.3). The maximum difference between the average temperatures measured during the test period of any two pairs of these individual thermocouples located at any of the faces of the inlet of the outdoor unit, must not exceed 2.0 °F, otherwise use approach (1).

Locate the air sampling devices at the geometric center of each side; the branches may be oriented either parallel or perpendicular to the longer edges of the air inlet area. Size the air sampling devices in the outdoor air inlet location such that they cover at least 75% of the face area of the side of the coil that they are measuring.

Review air distribution at the test facility point of supply to the unit and remediate as necessary prior to the beginning of testing. Mixing fans can be used to ensure adequate air distribution in the test room. If used, orient mixing fans such that they are pointed away from the air intake so that the mixing fan exhaust does not affect the outdoor coil air volume rate. Particular attention should be given to prevent the mixing fans from affecting (enhancing or limiting) recirculation of condenser fan exhaust air back through the unit. Any fan used to enhance test room air mixing shall not cause air velocities in the vicinity of the test unit to exceed 500 feet per minute.

The air sampling device may be larger than the face area of the side being measured. Take care, however, to prevent discharge air from being sampled. If an air sampling device dimension extends beyond the inlet area of the unit, block holes in the air sampling device to prevent sampling of discharge air. Holes can be blocked to reduce the region of coverage of the intake holes both in the direction of the trunk axis or perpendicular to the trunk axis. For intake hole region reduction in the direction of the trunk axis, block holes of one or more adjacent pairs of branches (the branches of a pair connect opposite each other at the same trunk location) at either the outlet end or the closed end of the trunk. For intake hole region reduction perpendicular to the trunk axis, block off the same number of holes on each branch on both sides of the trunk.

Connect a maximum of four (4) air sampling devices to each aspirating psychrometer. In order to proportionately divide the flow stream for multiple air sampling devices for a given aspirating psychrometer, the tubing or conduit conveying sampled air to the psychrometer must be of equivalent lengths for each air sampling device. Preferentially, the air sampling device should be hard connected to the aspirating psychrometer, but if space constraints do not allow this, the assembly shall have a means of allowing a flexible tube to connect the air sampling device to the aspirating psychrometer. Insulate and route the tubing or conduit to prevent heat transfer to the air stream. Insulate any surface of the

air conveying tubing in contact with surrounding air at a different temperature than the sampled air with thermal insulation with a nominal thermal resistance (R-value) of at least $19 \text{ hr} \cdot \text{ft}^2 \cdot ^\circ\text{F}/\text{Btu}$. Alternatively the conduit may have lower thermal resistance if additional sensor(s) are used to measure dry bulb temperature at the outlet of each air sampling device. No part of the air sampling device or the tubing conducting the sampled air to the sensors may be within two inches of the test chamber floor.

Take pairs of measurements (e.g. dry bulb temperature and wet bulb temperature) used to determine water vapor content of sampled air in the same location.

2.12 Measurement of Indoor Blower Speed

When required, measure fan speed using a revolution counter, tachometer, or stroboscope that gives readings accurate to within ± 1.0 percent.

2.13 Measurement of Barometric Pressure

Determine the average barometric pressure during each test. Use an instrument that meets the requirements specified in section 5.2 of ANSI/ASHRAE 37–2009 (incorporated by reference, see § 430.3).

2.14 Air Sampling Device and Aspiring Psychrometer Requirements

Make air temperature measurements in accordance with ANSI/ASHRAE 41.1–2013 (incorporated by reference, see § 430.3), unless otherwise instructed in this section.

2.14.1 Air Sampling Device Requirements

The air sampling device is intended to draw in a sample of the air at the critical locations of a unit under test. Construct the device from stainless steel, plastic or other suitable, durable materials. It shall have a main flow trunk tube with a series of branch tubes connected to the trunk tube. Holes must be on the side of the sampler facing the upstream direction of the air source. Use other sizes and rectangular shapes, and scale them accordingly with the following guidelines:

1. Minimum hole density of 6 holes per square foot of area to be sampled
2. Sampler branch tube pitch (spacing) of 6 ± 3 in
3. Manifold trunk to branch diameter ratio having a minimum of 3:1 ratio
4. Distribute hole pitch (spacing) equally over the branch ($\frac{1}{2}$ pitch from the closed end to the nearest hole)
5. Maximum individual hole to branch diameter ratio of 1:2 (1:3 preferred)

The minimum average velocity through the air sampling device holes must be 2.5 ft/s as determined by evaluating the sum of the open area of the holes as compared to the flow area in the aspiring psychrometer.

2.14.2 Aspiring Psychrometer

The psychrometer consists of a flow section and a fan to draw air through the flow section and measures an average value of the sampled air stream. At a minimum, the flow section shall have a means for measuring the dry bulb temperature (typically, a resistance temperature device (RTD) and a means for measuring the humidity (RTD with wetted sock, chilled mirror hygrometer, or relative

humidity sensor). The aspiring psychrometer shall include a fan that either can be adjusted manually or automatically to maintain required velocity across the sensors.

Construct the psychrometer using suitable material which may be plastic (such as polycarbonate), aluminum or other metallic materials. Construct all psychrometers for a given system being tested, using the same material. Design the psychrometers such that radiant heat from the motor (for driving the fan that draws sampled air through the psychrometer) does not affect sensor measurements. For aspiring psychrometers, velocity across the wet bulb sensor must be 1000 ± 200 ft/min. For all other psychrometers, velocity must be as specified by the sensor manufacturer.

3. Testing Procedures

3.1 General Requirements

If, during the testing process, an equipment set-up adjustment is made that would have altered the performance of the unit during any already completed test, then repeat all tests affected by the adjustment. For cyclic tests, instead of maintaining an air volume rate, for each airflow nozzle, maintain the static pressure difference or velocity pressure during an ON period at the same pressure difference or velocity pressure as measured during the steady-state test conducted at the same test conditions.

Use the testing procedures in this section to collect the data used for calculating:

- (1) Performance metrics for central air conditioners and heat pumps during the cooling season;
- (2) Performance metrics for heat pumps during the heating season; and
- (3) Power consumption metric(s) for central air conditioners and heat pumps during the off mode season(s).

3.1.1 Primary and Secondary Test Methods

For all tests, use the indoor air enthalpy method test apparatus to determine the unit's space conditioning capacity. The procedure and data collected, however, differ slightly depending upon whether the test is a steady-state test, a cyclic test, or a frost accumulation test. The following sections described these differences. For all steady-state tests (i.e., the A, A₂, A₁, B, B₂, B₁, C, C₁, EV, F₁, G₁, H₀₁, H₁, H₁₂, H₁₁, H_{1N}, H₃, H₃₂, and H₃₁ Tests), in addition, use one of the acceptable secondary methods specified in section 2.10 of this appendix to determine indoor space conditioning capacity. Calculate this secondary check of capacity according to section 3.11 of this appendix. The two capacity measurements must agree to within 6 percent to constitute a valid test. For this capacity comparison, use the Indoor Air Enthalpy Method capacity that is calculated in section 7.3 of ANSI/ASHRAE 37–2009 (incorporated by reference, see § 430.3) (and, if testing a coil-only system, compare capacities before making the after-test fan heat adjustments described in section 3.3, 3.4, 3.7, and 3.10 of this appendix). However, include the appropriate section 3.3 to 3.5 and 3.7 to 3.10 fan heat adjustments within the indoor air enthalpy method capacities used for the section 4 seasonal calculations of this appendix.

3.1.2 Manufacturer-Provided Equipment Overrides

Where needed, the manufacturer must provide a means for overriding the controls of the test unit so that the compressor(s) operates at the specified speed or capacity and the indoor blower operates at the specified speed or delivers the specified air volume rate.

3.1.3 Airflow Through the Outdoor Coil

For all tests, meet the requirements given in section 6.1.3.4 of AHRI 210/240–2008 (incorporated by reference, see § 430.3) when obtaining the airflow through the outdoor coil.

3.1.3.1 Double-Ducted

For products intended to be installed with the outdoor airflow ducted, install the unit with outdoor coil ductwork installed per manufacturer installation instructions. The unit must operate between 0.10 and 0.15 in H₂O external static pressure. Make external static pressure measurements in accordance with ANSI/ASHRAE 37–2009 section 6.4 and 6.5.

3.1.4 Airflow Through the Indoor Coil

Determine airflow setting(s) before testing begins. Unless otherwise specified within this or its subsections, make no changes to the airflow setting(s) after initiation of testing.

3.1.4.1 Cooling Full-Load Air Volume Rate

3.1.4.1.1 Cooling Full-Load Air Volume Rate for Ducted Units

Identify the certified Cooling full-load air volume rate and certified instructions for setting fan speed or controls. If there is no certified Cooling full-load air volume rate, use a value equal to the certified cooling capacity of the unit times 400 scfm per 12,000 Btu/h. If there are no instructions for setting fan speed or controls, use the as-shipped settings. Use the following procedure to confirm and, if necessary, adjust the Cooling full-load air volume rate and the fan speed or control settings to meet each test procedure requirement:

a. For all ducted blower coil systems, except those having a constant-air-volume-rate indoor blower:

Step (1) Operate the unit under conditions specified for the A (for single-stage units) or A₂ test using the certified fan speed or controls settings, and adjust the exhaust fan of the airflow measuring apparatus to achieve the certified Cooling full-load air volume rate;

Step (2) Measure the external static pressure;

Step (3) If this external static pressure is equal to or greater than the applicable minimum external static pressure cited in Table 3, the pressure requirement is satisfied; proceed to step 7 of this section. If this external static pressure is not equal to or greater than the applicable minimum external static pressure cited in Table 3, proceed to step 4 of this section;

Step (4) Increase the external static pressure by adjusting the exhaust fan of the airflow measuring apparatus until either

(i) The applicable Table 3 minimum is equaled or

(ii) The measured air volume rate equals 90 percent or less of the Cooling full-load air volume rate, whichever occurs first;

Step (5) If the conditions of step 4 (i) of this section occur first, the pressure requirement is satisfied; proceed to step 7 of this section. If the conditions of step 4 (ii) of this section occur first, proceed to step 6 of this section;

Step (6) Make an incremental change to the setup of the indoor blower (e.g., next highest fan motor pin setting, next highest fan motor speed) and repeat the evaluation process beginning above, at step 1 of this section. If the indoor blower setup cannot be further changed, increase the external static pressure by adjusting the exhaust fan of the airflow measuring apparatus until the applicable Table 3 minimum is equaled; proceed to step 7 of this section;

Step (7) The airflow constraints have been satisfied. Use the measured air volume rate as the Cooling full-load air volume rate. Use the final fan speed or control settings for all tests that use the Cooling full-load air volume rate.

b. For ducted blower coil systems with a constant-air-volume indoor blower. For all tests that specify the Cooling full-load air volume rate, obtain an external static pressure as close to (but not less than) the applicable Table 3 value that does not cause automatic shutdown of the indoor blower or air volume rate variation Q_{var} , defined as follows, greater than 10 percent.

$$Q_{var} = \left[\frac{Q_{max} - Q_{min}}{\left(\frac{Q_{max} + Q_{min}}{2} \right)} \right] * 100$$

Where:

Q_{max} = maximum measured airflow value

Q_{min} = minimum measured airflow value

Q_{var} = airflow variance, percent

Additional test steps as described in section 3.3.e of this appendix are required if the measured external static pressure exceeds the target value by more than 0.03 inches of water.

c. For coil-only indoor units. For the A or A₂ Test, (exclusively), the pressure drop across the indoor coil assembly must not exceed 0.30 inches of water. If this pressure drop is exceeded, reduce the air volume rate until the measured pressure drop equals the specified maximum. Use this reduced air volume rate for all tests that require the Cooling full-load air volume rate.

TABLE 3—MINIMUM EXTERNAL STATIC PRESSURE FOR DUCTED BLOWER COIL SYSTEMS

Product variety	Minimum external static pressure (in. wc.)
Conventional (i.e., all central air conditioners and heat pumps not otherwise listed in this table)	0.50
Ceiling-mount and Wall-mount	0.30
Mobile Home	0.30

TABLE 3—MINIMUM EXTERNAL STATIC PRESSURE FOR DUCTED BLOWER COIL SYSTEMS—Continued

Product variety	Minimum external static pressure (in. wc.)
Low Static	0.10
Mid Static	0.30
Small Duct, High Velocity	1.15
Space Constrained	0.30

¹ For ducted units tested without an air filter installed, increase the applicable tabular value by 0.08 inches of water.

² See section 1.2, Definitions, to determine for which Table 3 product variety and associated minimum external static pressure requirement equipment qualifies.

³ If a closed-loop, air-enthalpy test apparatus is used on the indoor side, limit the resistance to airflow on the inlet side of the indoor blower coil to a maximum value of 0.1 inch of water.

d. For ducted systems having multiple indoor blowers within a single indoor section, obtain the full-load air volume rate with all indoor blowers operating unless prevented by the controls of the unit. In such cases, turn on the maximum number of indoor blowers permitted by the unit's controls. Where more than one option exists for meeting this "on" indoor blower requirement, which indoor blower(s) are turned on must match that specified in the certification report. Conduct section 3.1.4.1.1 setup steps for each indoor blower separately. If two or more indoor blowers are connected to a common duct as per section 2.4.1 of this appendix, temporarily divert their air volume to the test room when confirming or adjusting the setup configuration of individual indoor blowers. The allocation of the system's full-load air volume rate assigned to each "on" indoor blower must match that specified by the manufacturer in the certification report.

3.1.4.1.2. Cooling Full-Load Air Volume Rate for Non-Ducted Units

For non-ducted units, the Cooling full-load air volume rate is the air volume rate that results during each test when the unit is operated at an external static pressure of zero inches of water.

3.1.4.2 Cooling Minimum Air Volume Rate

Identify the certified cooling minimum air volume rate and certified instructions for setting fan speed or controls. If there is no certified cooling minimum air volume rate, use the final indoor blower control settings as determined when setting the cooling full-load air volume rate, and readjust the exhaust fan of the airflow measuring apparatus if necessary to reset to the cooling full load air volume obtained in section 3.1.4.1 of this appendix. Otherwise, calculate the target external static pressure and follow instructions a, b, c, d, or e below. The target external static pressure, ΔP_{st_i} , for any test "i" with a specified air volume rate not equal to the Cooling full-load air volume rate is determined as follows:

$$\Delta P_{st_i} = \Delta P_{st_full} \left[\frac{Q_i}{Q_{full}} \right]^2$$

Where:

ΔP_{st_i} = target minimum external static pressure for test i;

ΔP_{st_full} = minimum external static pressure for test A or A₂ (Table 3);

Q_i = air volume rate for test i; and

Q_{full} = Cooling full-load air volume rate as measured after setting and/or adjustment as described in section 3.1.4.1.1 of this appendix.

a. For a ducted blower coil system without a constant-air-volume indoor blower, adjust for external static pressure as follows:

Step (1) Operate the unit under conditions specified for the B₁ test using the certified fan speed or controls settings, and adjust the exhaust fan of the airflow measuring apparatus to achieve the certified cooling minimum air volume rate;

Step (2) Measure the external static pressure;

Step (3) If this pressure is equal to or greater than the minimum external static pressure computed above, the pressure requirement is satisfied; proceed to step 7 of this section. If this pressure is not equal to or greater than the minimum external static pressure computed above, proceed to step 4 of this section;

Step (4) Increase the external static pressure by adjusting the exhaust fan of the airflow measuring apparatus until either

(i) The pressure is equal to the minimum external static pressure computed above or

(ii) The measured air volume rate equals 90 percent or less of the cooling minimum air volume rate, whichever occurs first;

Step (5) If the conditions of step 4 (i) of this section occur first, the pressure requirement is satisfied; proceed to step 7 of this section. If the conditions of step 4 (ii) of this section occur first, proceed to step 6 of this section;

Step (6) Make an incremental change to the setup of the indoor blower (e.g., next highest fan motor pin setting, next highest fan motor speed) and repeat the evaluation process beginning above, at step 1 of this section. If the indoor blower setup cannot be further changed, increase the external static pressure by adjusting the exhaust fan of the airflow measuring apparatus until it equals the minimum external static pressure computed above; proceed to step 7 of this section;

Step (7) The airflow constraints have been satisfied. Use the measured air volume rate as the cooling minimum air volume rate. Use the final fan speed or control settings for all tests that use the cooling minimum air volume rate.

b. For ducted units with constant-air-volume indoor blowers, conduct all tests that specify the cooling minimum air volume rate—(i.e., the A₁, B₁, C₁, F₁, and G₁ Tests)—at an external static pressure that does not cause an automatic shutdown of the indoor blower or air volume rate variation Q_{var} , defined in section 3.1.4.1.1.b of this appendix, greater than 10 percent, while being as close to, but not less than the target minimum external static pressure. Additional test steps as described in section 3.3.e of this appendix are required if the measured

external static pressure exceeds the target value by more than 0.03 inches of water.

c. For ducted two-capacity coil-only systems, the cooling minimum air volume rate is the higher of—

(1) The rate specified by the installation instructions included with the unit by the manufacturer; or

(2) 75 percent of the cooling full-load air volume rate. During the laboratory tests on a coil-only (fanless) system, obtain this cooling minimum air volume rate regardless of the pressure drop across the indoor coil assembly.

d. For non-ducted units, the cooling minimum air volume rate is the air volume rate that results during each test when the unit operates at an external static pressure of zero inches of water and at the indoor blower setting used at low compressor capacity (two-capacity system) or minimum compressor speed (variable-speed system). For units having a single-speed compressor and a variable-speed variable-air-volume-rate indoor blower, use the lowest fan setting allowed for cooling.

e. For ducted systems having multiple indoor blowers within a single indoor section, operate the indoor blowers such that the lowest air volume rate allowed by the unit's controls is obtained when operating the lone single-speed compressor or when operating at low compressor capacity while meeting the requirements of section 2.2.3.2 of this appendix for the minimum number of blowers that must be turned off. Using the target external static pressure and the certified air volume rates, follow the procedures described in section 3.1.4.2.a of this appendix if the indoor blowers are not constant-air-volume indoor blowers or as described in section 3.1.4.2.b of this appendix if the indoor blowers are not constant-air-volume indoor blowers. The sum of the individual "on" indoor blowers' air volume rates is the cooling minimum air volume rate for the system.

3.1.4.3 Cooling Intermediate Air Volume Rate

Identify the certified cooling intermediate air volume rate and certified instructions for setting fan speed or controls. If there is no certified cooling intermediate air volume rate, use the final indoor blower control settings as determined when setting the cooling full load air volume rate, and readjust the exhaust fan of the airflow measuring apparatus if necessary to reset to the cooling full load air volume obtained in section 3.1.4.1 of this appendix. Otherwise, calculate target minimum external static pressure as described in section 3.1.4.2 of this appendix, and set the air volume rate as follows.

a. For a ducted blower coil system without a constant-air-volume indoor blower, adjust for external static pressure as described in section 3.1.4.2.a of this appendix for cooling minimum air volume rate.

b. For a ducted blower coil system with a constant-air-volume indoor blower, conduct the E_v Test at an external static pressure that does not cause an automatic shutdown of the indoor blower or air volume rate variation Q_{var} , defined in section 3.1.4.1.1.b of this appendix, greater than 10 percent, while being as close to, but not less than the target

minimum external static pressure. Additional test steps as described in section 3.3.e of this appendix are required if the measured external static pressure exceeds the target value by more than 0.03 inches of water.

c. For non-ducted units, the cooling intermediate air volume rate is the air volume rate that results when the unit operates at an external static pressure of zero inches of water and at the fan speed selected by the controls of the unit for the E_v Test conditions.

3.1.4.4 Heating Full-Load Air Volume Rate

3.1.4.4.1. Ducted Heat Pumps Where the Heating and Cooling Full-Load Air Volume Rates Are the Same

a. Use the Cooling full-load air volume rate as the heating full-load air volume rate for:

(1) Ducted blower coil system heat pumps that do not have a constant-air-volume indoor blower, and that operate at the same airflow-control setting during both the A (or A_2) and the H1 (or H1₂) Tests;

(2) Ducted blower coil system heat pumps with constant-air-flow indoor blowers that provide the same airflow for the A (or A_2) and the H1 (or H1₂) Tests; and

(3) Ducted heat pumps that are tested with a coil-only indoor unit (except two-capacity northern heat pumps that are tested only at low capacity cooling—see section 3.1.4.4.2 of this appendix).

b. For heat pumps that meet the above criteria "1" and "3," no minimum requirements apply to the measured external or internal, respectively, static pressure. Use the final indoor blower control settings as determined when setting the Cooling full-load air volume rate, and readjust the exhaust fan of the airflow measuring apparatus if necessary to reset to the cooling full-load air volume obtained in section 3.1.4.1 of this appendix. For heat pumps that meet the above criterion "2," test at an external static pressure that does not cause an automatic shutdown of the indoor blower or air volume rate variation Q_{var} , defined in section 3.1.4.1.1.b of this appendix, greater than 10 percent, while being as close to, but not less than, the same Table 3 minimum external static pressure as was specified for the A (or A_2) cooling mode test. Additional test steps as described in section 3.9.1.c of this appendix are required if the measured external static pressure exceeds the target value by more than 0.03 inches of water.

3.1.4.4.2. Ducted Heat Pumps Where the Heating and Cooling Full-Load Air Volume Rates Are Different Due to Changes in Indoor Blower Operation, i.e. Speed Adjustment by the System Controls

Identify the certified heating full-load air volume rate and certified instructions for setting fan speed or controls. If there is no certified heating full-load air volume rate, use the final indoor blower control settings as determined when setting the cooling full-load air volume rate, and readjust the exhaust fan of the airflow measuring apparatus if necessary to reset to the cooling full-load air volume obtained in section 3.1.4.1 of this appendix. Otherwise, calculate the target minimum external static pressure as described in section 3.1.4.2 of this appendix and set the air volume rate as follows.

a. For ducted blower coil system heat pumps that do not have a constant-air-volume indoor blower, adjust for external static pressure as described in section 3.1.4.2.a of this appendix for cooling minimum air volume rate.

b. For ducted heat pumps tested with constant-air-volume indoor blowers installed, conduct all tests that specify the heating full-load air volume rate at an external static pressure that does not cause an automatic shutdown of the indoor blower or air volume rate variation Q_{var} , defined in section 3.1.4.1.1.b of this appendix, greater than 10 percent, while being as close to, but not less than the target minimum external static pressure. Additional test steps as described in section 3.9.1.c of this appendix are required if the measured external static pressure exceeds the target value by more than 0.03 inches of water.

c. When testing ducted, two-capacity blower coil system northern heat pumps (see section 1.2 of this appendix, Definitions), use the appropriate approach of the above two cases. For coil-only system northern heat pumps, the heating full-load air volume rate is the lesser of the rate specified by the manufacturer in the installation instructions included with the unit or 133 percent of the cooling full-load air volume rate. For this latter case, obtain the heating full-load air volume rate regardless of the pressure drop across the indoor coil assembly.

d. For ducted systems having multiple indoor blowers within a single indoor section, obtain the heating full-load air volume rate using the same "on" indoor blowers as used for the Cooling full-load air volume rate. Using the target external static pressure and the certified air volume rates, follow the procedures as described in section 3.1.4.4.2.a of this appendix if the indoor blowers are not constant-air-volume indoor blowers or as described in section 3.1.4.4.2.b of this appendix if the indoor blowers are constant-air-volume indoor blowers. The sum of the individual "on" indoor blowers' air volume rates is the heating full-load air volume rate for the system.

3.1.4.4.3. Ducted Heating-Only Heat Pumps

Identify the certified heating full-load air volume rate and certified instructions for setting fan speed or controls. If there is no certified heating full-load air volume rate, use a value equal to the certified heating capacity of the unit times 400 scfm per 12,000 Btu/h. If there are no instructions for setting fan speed or controls, use the as-shipped settings.

a. For all ducted heating-only blower coil system heat pumps, except those having a constant-air-volume-rate indoor blower. Conduct the following steps only during the first test, the H1 or H1₂ test:

Step (1) Adjust the exhaust fan of the airflow measuring apparatus to achieve the certified heating full-load air volume rate.

Step (2) Measure the external static pressure.

Step (3) If this pressure is equal to or greater than the Table 3 minimum external static pressure that applies given the heating-only heat pump's rated heating capacity, the pressure requirement is satisfied; proceed to step 7 of this section. If this pressure is not

equal to or greater than the applicable Table 3 minimum external static pressure, proceed to step 4 of this section;

Step (4) Increase the external static pressure by adjusting the exhaust fan of the airflow measuring apparatus until either—

(i) The pressure is equal to the applicable Table 3 minimum external static pressure; or
(ii) The measured air volume rate equals 90 percent or less of the heating full-load air volume rate, whichever occurs first;

Step (5) If the conditions of step 4 (i) of this section occur first, the pressure requirement is satisfied; proceed to step 7 of this section. If the conditions of step 4 (ii) of this section occur first, proceed to step 6 of this section;

Step (6) Make an incremental change to the setup of the indoor blower (e.g., next highest fan motor pin setting, next highest fan motor speed) and repeat the evaluation process beginning above, at step 1 of this section. If the indoor blower setup cannot be further changed, increase the external static pressure by adjusting the exhaust fan of the airflow measuring apparatus until it equals the applicable Table 3 minimum external static pressure; proceed to step 7 of this section;

Step (7) The airflow constraints have been satisfied. Use the measured air volume rate as the heating full-load air volume rate. Use the final fan speed or control settings for all tests that use the heating full-load air volume rate.

b. For ducted heating-only blower coil system heat pumps having a constant-air-volume-rate indoor blower. For all tests that specify the heating full-load air volume rate, obtain an external static pressure that does not cause an automatic shutdown of the indoor blower or air volume rate variation Q_{var} , defined in section 3.1.4.1.1.b of this section, greater than 10 percent, while being as close to, but not less than, the applicable Table 3 minimum. Additional test steps as described in section 3.9.1.c of this appendix are required if the measured external static pressure exceeds the target value by more than 0.03 inches of water.

c. For ducted heating-only coil-only system heat pumps in the H1 or H1₂ Test, (exclusively), the pressure drop across the indoor coil assembly must not exceed 0.30 inches of water. If this pressure drop is exceeded, reduce the air volume rate until the measured pressure drop equals the specified maximum. Use this reduced air volume rate for all tests that require the heating full-load air volume rate.

3.1.4.4.4 Non-Ducted Heat Pumps, Including Non-Ducted Heating-Only Heat Pumps

For non-ducted heat pumps, the heating full-load air volume rate is the air volume rate that results during each test when the unit operates at an external static pressure of zero inches of water.

3.1.4.5 Heating Minimum Air Volume Rate

3.1.4.5.1 Ducted Heat Pumps Where the Heating and Cooling Minimum Air Volume Rates are the Same

a. Use the cooling minimum air volume rate as the heating minimum air volume rate for:

(1) Ducted blower coil system heat pumps that do not have a constant-air-volume

indoor blower, and that operates at the same airflow-control setting during both the A₁ and the H1₁ tests;

(2) Ducted blower coil system heat pumps with constant-air-flow indoor blowers installed that provide the same airflow for the A₁ and the H1₁ Tests; and

(3) Ducted coil-only system heat pumps.
b. For heat pumps that meet the above criteria “1” and “3,” no minimum requirements apply to the measured external or internal, respectively, static pressure. Use the final indoor blower control settings as determined when setting the cooling minimum air volume rate, and readjust the exhaust fan of the airflow measuring apparatus if necessary to reset to the cooling minimum air volume rate obtained in section 3.1.4.2 of this appendix. For heat pumps that meet the above criterion “2,” test at an external static pressure that does not cause an automatic shutdown of the indoor blower or air volume rate variation Q_{var} , defined in section 3.1.4.1.1.b, greater than 10 percent, while being as close to, but not less than, the same target minimum external static pressure as was specified for the A₁ cooling mode test. Additional test steps as described in section 3.9.1.c of this appendix are required if the measured external static pressure exceeds the target value by more than 0.03 inches of water.

3.1.4.5.2. Ducted Heat Pumps Where the Heating and Cooling Minimum Air Volume Rates are Different Due to Indoor Blower Operation, i.e. Speed Adjustment by the System Controls

Identify the certified heating minimum air volume rate and certified instructions for setting fan speed or controls. If there is no certified heating minimum air volume rate, use the final indoor blower control settings as determined when setting the cooling minimum air volume rate, and readjust the exhaust fan of the airflow measuring apparatus if necessary to reset to the cooling minimum air volume obtained in section 3.1.4.2 of this appendix. Otherwise, calculate the target minimum external static pressure as described in section 3.1.4.2 of this appendix.

a. For ducted blower coil system heat pumps that do not have a constant-air-volume indoor blower, adjust for external static pressure as described in section 3.1.4.2.a of this appendix for cooling minimum air volume rate.

b. For ducted heat pumps tested with constant-air-volume indoor blowers installed, conduct all tests that specify the heating minimum air volume rate—(i.e., the H0₁, H1₁, H2₁, and H3₁ Tests)—at an external static pressure that does not cause an automatic shutdown of the indoor blower while being as close to, but not less than the air volume rate variation Q_{var} , defined in section 3.1.4.1.1.b of this appendix, greater than 10 percent, while being as close to, but not less than the target minimum external static pressure. Additional test steps as described in section 3.9.1.c of this appendix are required if the measured external static pressure exceeds the target value by more than 0.03 inches of water.

c. For ducted two-capacity blower coil system northern heat pumps, use the appropriate approach of the above two cases.

d. For ducted two-capacity coil-only system heat pumps, use the cooling minimum air volume rate as the heating minimum air volume rate. For ducted two-capacity coil-only system northern heat pumps, use the cooling full-load air volume rate as the heating minimum air volume rate. For ducted two-capacity heating-only coil-only system heat pumps, the heating minimum air volume rate is the higher of the rate specified by the manufacturer in the test setup instructions included with the unit or 75 percent of the heating full-load air volume rate. During the laboratory tests on a coil-only system, obtain the heating minimum air volume rate without regard to the pressure drop across the indoor coil assembly.

e. For non-ducted heat pumps, the heating minimum air volume rate is the air volume rate that results during each test when the unit operates at an external static pressure of zero inches of water and at the indoor blower setting used at low compressor capacity (two-capacity system) or minimum compressor speed (variable-speed system). For units having a single-speed compressor and a variable-speed, variable-air-volume-rate indoor blower, use the lowest fan setting allowed for heating.

f. For ducted systems with multiple indoor blowers within a single indoor section, obtain the heating minimum air volume rate using the same “on” indoor blowers as used for the cooling minimum air volume rate. Using the target external static pressure and the certified air volume rates, follow the procedures as described in section 3.1.4.5.2.a of this appendix if the indoor blowers are not constant-air-volume indoor blowers or as described in section 3.1.4.5.2.b of this appendix if the indoor blowers are constant-air-volume indoor blowers. The sum of the individual “on” indoor blowers’ air volume rates is the heating full-load air volume rate for the system.

3.1.4.6 Heating Intermediate Air Volume Rate

Identify the certified heating intermediate air volume rate and certified instructions for setting fan speed or controls. If there is no certified heating intermediate air volume rate, use the final indoor blower control settings as determined when setting the heating full-load air volume rate, and readjust the exhaust fan of the airflow measuring apparatus if necessary to reset to the cooling full-load air volume obtained in section 3.1.4.2 of this appendix. Calculate the target minimum external static pressure as described in section 3.1.4.2 of this appendix.

a. For ducted blower coil system heat pumps that do not have a constant-air-volume indoor blower, adjust for external static pressure as described in section 3.1.4.2.a of this appendix for cooling minimum air volume rate.

b. For ducted heat pumps tested with constant-air-volume indoor blowers installed, conduct the H2_v Test at an external static pressure that does not cause an automatic shutdown of the indoor blower or air volume rate variation Q_{var} , defined in section 3.1.4.1.1.b of this appendix, greater than 10

percent, while being as close to, but not less than the target minimum external static pressure. Additional test steps as described in section 3.9.1.c of this appendix are required if the measured external static pressure exceeds the target value by more than 0.03 inches of water.

c. For non-ducted heat pumps, the heating intermediate air volume rate is the air volume rate that results when the heat pump operates at an external static pressure of zero inches of water and at the fan speed selected by the controls of the unit for the H2_v Test conditions.

3.1.4.7 Heating Nominal Air Volume Rate

The manufacturer must specify the heating nominal air volume rate and the instructions for setting fan speed or controls. Calculate

target minimum external static pressure as described in section 3.1.4.2 of this appendix. Make adjustments as described in section 3.14.6 of this appendix for heating intermediate air volume rate so that the target minimum external static pressure is met or exceeded.

3.1.5 Indoor Test Room Requirement When the Air Surrounding the Indoor Unit is Not Supplied From the Same Source as the Air Entering the Indoor Unit

If using a test set-up where air is ducted directly from the air reconditioning apparatus to the indoor coil inlet (see Figure 2, Loop Air-Enthalpy Test Method Arrangement, of ANSI/ASHRAE 37–2009 (incorporated by reference, see § 430.3)), maintain the dry bulb temperature within the

test room within ±5.0 °F of the applicable sections 3.2 and 3.6 dry bulb temperature test condition for the air entering the indoor unit. Dew point must be within 2 °F of the required inlet conditions.

3.1.6 Air Volume Rate Calculations

For all steady-state tests and for frost accumulation (H2, H2₁, H2₂, H2_v) tests, calculate the air volume rate through the indoor coil as specified in sections 7.7.2.1 and 7.7.2.2 of ANSI/ASHRAE 37–2009. When using the outdoor air enthalpy method, follow sections 7.7.2.1 and 7.7.2.2 of ANSI/ASHRAE 37–2009 (incorporated by reference, see § 430.3) to calculate the air volume rate through the outdoor coil. To express air volume rates in terms of standard air, use:

$$\text{Equation 3-1} \quad \bar{V}_s = \frac{\bar{V}_{mx}}{0.075 \frac{\text{lbm da}}{\text{ft}^3} * v_n' [1 + W_n]} = \frac{\bar{V}_{mx}}{0.075 \frac{\text{lbm da}}{\text{ft}^3} * v_n}$$

Where:

\bar{V}_s = air volume rate of standard (dry) air, (ft³/min)_{da}

\bar{V}_{mx} = air volume rate of the air-water vapor mixture, (ft³/min)_{mx}

v_n' = specific volume of air-water vapor mixture at the nozzle, ft³ per lbm of the air-water vapor mixture

W_n = humidity ratio at the nozzle, lbm of water vapor per lbm of dry air

0.075 = the density associated with standard (dry) air, (lbm/ft³)

v_n = specific volume of the dry air portion of the mixture evaluated at the dry-bulb temperature, vapor content, and barometric pressure existing at the nozzle, ft³ per lbm of dry air.

(Note: In the first printing of ANSI/ASHRAE 37–2009, the second IP equation for

Q_{mi} should read, $Q_{mi} = 1097 C A_n \sqrt{P_v v_n'}$)

3.1.7 Test Sequence

Before making test measurements used to calculate performance, operate the equipment for the “break-in” period specified in the certification report, which may not exceed 20 hours. Each compressor of the unit must undergo this “break-in” period. When testing a ducted unit (except if a heating-only heat pump), conduct the A or A₂ Test first to establish the cooling full-load air volume rate. For ducted heat pumps where the heating and cooling full-load air volume rates are different, make the first heating mode test one that requires the heating full-load air volume rate. For ducted heating-only heat pumps, conduct the H1 or H1₂ Test first to establish the heating full-load air volume rate. When conducting a cyclic test, always conduct it immediately after the steady-state test that requires the same test conditions. For variable-speed systems, the first test using the cooling minimum air volume rate should precede the E_v Test, and the first test using the heating minimum air volume rate must precede the H2_v Test. The test laboratory makes all other decisions on the test sequence.

3.1.8 Requirement for the Air Temperature Distribution Leaving the Indoor Coil

For at least the first cooling mode test and the first heating mode test, monitor the temperature distribution of the air leaving the indoor coil using the grid of individual sensors described in sections 2.5 and 2.5.4 of

this appendix. For the 30-minute data collection interval used to determine capacity, the maximum spread among the outlet dry bulb temperatures from any data sampling must not exceed 1.5 °F. Install the mixing devices described in section 2.5.4.2 of this appendix to minimize the temperature spread.

3.1.9 Requirement for the Air Temperature Distribution Entering the Outdoor Coil

Monitor the temperatures of the air entering the outdoor coil using air sampling devices and/or temperature sensor grids, maintaining the required tolerances, if applicable, as described in section 2.11 of this appendix.

3.1.10 Control of Auxiliary Resistive Heating Elements

Except as noted, disable heat pump resistance elements used for heating indoor air at all times, including during defrost cycles and if they are normally regulated by a heat comfort controller. For heat pumps equipped with a heat comfort controller, enable the heat pump resistance elements only during the below-described, short test. For single-speed heat pumps covered under section 3.6.1 of this appendix, the short test follows the H1 or, if conducted, the H1C Test. For two-capacity heat pumps and heat pumps covered under section 3.6.2 of this appendix, the short test follows the H1₂ Test. Set the heat comfort controller to provide the

maximum supply air temperature. With the heat pump operating and while maintaining the heating full-load air volume rate, measure the temperature of the air leaving the indoor-side beginning 5 minutes after activating the heat comfort controller. Sample the outlet dry-bulb temperature at regular intervals that span 5 minutes or less. Collect data for 10 minutes, obtaining at least 3 samples. Calculate the average outlet temperature over the 10-minute interval, T_{cc}.

3.2 Cooling Mode Tests for Different Types of Air Conditioners and Heat Pumps

3.2.1 Tests for a System Having a Single-Speed Compressor and Fixed Cooling Air Volume Rate

This set of tests is for single-speed-compressor units that do not have a cooling minimum air volume rate or a cooling intermediate air volume rate that is different than the cooling full load air volume rate. Conduct two steady-state wet coil tests, the A and B Tests. Use the two optional dry-coil tests, the steady-state C Test and the cyclic D Test, to determine the cooling mode cyclic degradation coefficient, C_{D^c}. If the two optional tests are conducted but yield a tested C_{D^c} that exceeds the default C_{D^c} or if the two optional tests are not conducted, assign C_{D^c} the default value of 0.25 (for outdoor units with no match) or 0.2 (for all other systems). Table 4 specifies test conditions for these four tests.

TABLE 4—COOLING MODE TEST CONDITIONS FOR UNITS HAVING A SINGLE-SPEED COMPRESSOR AND A FIXED COOLING AIR VOLUME RATE

Test description	Air entering indoor unit temperature (°F)		Air entering outdoor unit temperature (°F)		Cooling air volume rate
	Dry bulb	Wet bulb	Dry bulb	Wet bulb	
A Test—required (steady, wet coil)	80	67	95	175	Cooling full-load. ²
B Test—required (steady, wet coil)	80	67	82	165	Cooling full-load. ²
C Test—optional (steady, dry coil)	80	(3)	82	Cooling full-load. ²
D Test—optional (cyclic, dry coil)	80	(3)	82	(4).

¹ The specified test condition only applies if the unit rejects condensate to the outdoor coil.

² Defined in section 3.1.4.1 of this appendix.

³ The entering air must have a low enough moisture content so no condensate forms on the indoor coil. (It is recommended that an indoor wet-bulb temperature of 57 °F or less be used.)

⁴ Maintain the airflow nozzles static pressure difference or velocity pressure during the ON period at the same pressure difference or velocity pressure as measured during the C Test.

3.2.2 Tests for a Unit Having a Single-Speed Compressor Where the Indoor Section Uses a Single Variable-Speed Variable-Air-Volume Rate Indoor Blower or Multiple Indoor Blowers

3.2.2.1 Indoor Blower Capacity Modulation That Correlates With the Outdoor Dry Bulb Temperature or Systems With a Single Indoor Coil but Multiple Indoor Blowers

Conduct four steady-state wet coil tests: The A₂, A₁, B₂, and B₁ tests. Use the two

optional dry-coil tests, the steady-state C₁ test and the cyclic D₁ test, to determine the cooling mode cyclic degradation coefficient, C_D^c. If the two optional tests are conducted but yield a tested C_D^c that exceeds the default C_D^c or if the two optional tests are not conducted, assign C_D^c the default value of 0.2.

3.2.2.2 Indoor Blower Capacity Modulation Based on Adjusting the Sensible to Total (S/T) Cooling Capacity Ratio

The testing requirements are the same as specified in section 3.2.1 of this appendix and Table 4. Use a cooling full-load air volume rate that represents a normal installation. If performed, conduct the steady-state C Test and the cyclic D Test with the unit operating in the same S/T capacity control mode as used for the B Test.

TABLE 5—COOLING MODE TEST CONDITIONS FOR UNITS WITH A SINGLE-SPEED COMPRESSOR THAT MEET THE SECTION 3.2.2.1 INDOOR UNIT REQUIREMENTS

Test description	Air entering indoor unit temperature (°F)		Air entering outdoor unit temperature (°F)		Cooling air volume rate
	Dry bulb	Wet bulb	Dry bulb	Wet bulb	
A ₂ Test—required (steady, wet coil)	80	67	95	175	Cooling full-load. ²
A ₁ Test—required (steady, wet coil)	80	67	95	175	Cooling minimum. ³
B ₂ Test—required (steady, wet coil)	80	67	82	165	Cooling full-load. ²
B ₁ Test—required (steady, wet coil)	80	67	82	165	Cooling minimum. ³
C ₁ Test ⁴ —optional (steady, dry coil)	80	(4)	82	Cooling minimum. ³
D ₁ Test ⁴ —optional (cyclic, dry coil)	80	(4)	82	(5).

¹ The specified test condition only applies if the unit rejects condensate to the outdoor coil.

² Defined in section 3.1.4.1 of this appendix.

³ Defined in section 3.1.4.2 of this appendix.

⁴ The entering air must have a low enough moisture content so no condensate forms on the indoor coil. (It is recommended that an indoor wet-bulb temperature of 57 °F or less be used.)

⁵ Maintain the airflow nozzles static pressure difference or velocity pressure during the ON period at the same pressure difference or velocity pressure as measured during the C₁ Test.

3.2.3 Tests for a Unit Having a Two-Capacity Compressor (See Section 1.2 of This Appendix, Definitions)

a. Conduct four steady-state wet coil tests: the A₂, B₂, B₁, and F₁ Tests. Use the two optional dry-coil tests, the steady-state C₁ Test and the cyclic D₁ Test, to determine the cooling-mode cyclic-degradation coefficient, C_D^c. If the two optional tests are conducted but yield a tested C_D^c that exceeds the default C_D^c or if the two optional tests are not conducted, assign C_D^c the default value of 0.2. Table 6 specifies test conditions for these six tests.

b. For units having a variable speed indoor blower that is modulated to adjust the

sensible to total (S/T) cooling capacity ratio, use cooling full-load and cooling minimum air volume rates that represent a normal installation. Additionally, if conducting the dry-coil tests, operate the unit in the same S/T capacity control mode as used for the B₁ Test.

c. Test two-capacity, northern heat pumps (see section 1.2 of this appendix, Definitions) in the same way as a single speed heat pump with the unit operating exclusively at low compressor capacity (see section 3.2.1 of this appendix and Table 4).

d. If a two-capacity air conditioner or heat pump locks out low-capacity operation at higher outdoor temperatures, then use the

two dry-coil tests, the steady-state C₂ Test and the cyclic D₂ Test, to determine the cooling-mode cyclic-degradation coefficient that only applies to on/off cycling from high capacity, C_D^c(k=2). If the two optional tests are conducted but yield a tested C_D^c(k=2) that exceeds the default C_D^c(k=2) or if the two optional tests are not conducted, assign C_D^c(k=2) the default value. The default C_D^c(k=2) is the same value as determined or assigned for the low-capacity cyclic-degradation coefficient, C_D^c [or equivalently, C_D^c(k=1)].

TABLE 6—COOLING MODE TEST CONDITIONS FOR UNITS HAVING A TWO-CAPACITY COMPRESSOR

Test description	Air entering indoor unit temperature (°F)		Air entering outdoor unit temperature (°F)		Compressor capacity	Cooling air volume rate
	Dry bulb	Wet bulb	Dry bulb	Wet bulb		
A ₂ Test—required (steady, wet coil)	80	67	95	175	High	Cooling Full-Load. ²
B ₂ Test—required (steady, wet coil)	80	67	82	165	High	Cooling Full-Load. ²
B ₁ Test—required (steady, wet coil)	80	67	82	165	Low	Cooling Minimum. ³
C ₂ Test—optional (steady, dry-coil)	80	(⁴)	82	High	Cooling Full-Load. ²
D ₂ Test—optional (cyclic, dry-coil) ..	80	(⁴)	82	High	(⁵)
C ₁ Test—optional (steady, dry-coil)	80	(⁴)	82	Low	Cooling Minimum. ³
D ₁ Test—optional (cyclic, dry-coil) ..	80	(⁴)	82	Low	(⁶)
F ₁ Test—required (steady, wet coil)	80	67	67	153.5	Low	Cooling Minimum. ³

¹ The specified test condition only applies if the unit rejects condensate to the outdoor coil.

² Defined in section 3.1.4.1 of this appendix.

³ Defined in section 3.1.4.2 of this appendix.

⁴ The entering air must have a low enough moisture content so no condensate forms on the indoor coil. DOE recommends using an indoor air wet-bulb temperature of 57 °F or less.

⁵ Maintain the airflow nozzle(s) static pressure difference or velocity pressure during the ON period at the same pressure or velocity as measured during the C₂ Test.

⁶ Maintain the airflow nozzle(s) static pressure difference or velocity pressure during the ON period at the same pressure or velocity as measured during the C₁ Test.

3.2.4 Tests for a Unit Having a Variable-Speed Compressor

a. Conduct five steady-state wet coil tests: The A₂, E_v, B₂, B₁, and F₁ Tests. Use the two optional dry-coil tests, the steady-state G₁ Test and the cyclic I₁ Test, to determine the cooling mode cyclic degradation coefficient,

C_D^c. If the two optional tests are conducted but yield a tested C_D^c that exceeds the default C_D^c or if the two optional tests are not conducted, assign C_D^c the default value of 0.25. Table 7 specifies test conditions for these seven tests. The compressor shall operate at the same cooling full speed,

measured by RPM or power input frequency (Hz), for both the A₂ and B₂ tests. The compressor shall operate at the same cooling minimum speed, measured by RPM or power input frequency (Hz), for the B₁, F₁, G₁, and I₁ tests. Determine the cooling intermediate compressor speed cited in Table 7 using:

Cooling intermediate speed

$$= \text{Cooling minimum speed} + \frac{\text{Cooling full speed} - \text{Cooling minimum speed}}{3}$$

where a tolerance of plus 5 percent or the next higher inverter frequency step from that calculated is allowed.

b. For units that modulate the indoor blower speed to adjust the sensible to total (S/T) cooling capacity ratio, use cooling full-load, cooling intermediate, and cooling minimum air volume rates that represent a normal installation. Additionally, if conducting the dry-coil tests, operate the unit

in the same S/T capacity control mode as used for the F₁ Test.

c. For multiple-split air conditioners and heat pumps (except where noted), the following procedures supersede the above requirements: For all Table 7 tests specified for a minimum compressor speed, turn off at least one indoor unit. The manufacturer shall designate the particular indoor unit(s) that is turned off. The manufacturer must also specify the compressor speed used for the

Table 7 E_v Test, a cooling-mode intermediate compressor speed that falls within 1/4 and 3/4 of the difference between the full and minimum cooling-mode speeds. The manufacturer should prescribe an intermediate speed that is expected to yield the highest EER for the given E_v Test conditions and bracketed compressor speed range. The manufacturer can designate that one or more indoor units are turned off for the E_v Test.

TABLE 7—COOLING MODE TEST CONDITION FOR UNITS HAVING A VARIABLE-SPEED COMPRESSOR

Test description	Air entering indoor unit temperature (°F)		Air entering outdoor unit temperature (°F)		Compressor speed	Cooling air volume rate
	Dry bulb	Wet bulb	Dry bulb	Wet bulb		
A ₂ Test—required (steady, wet coil)	80	67	95	175	Cooling Full	Cooling Full-Load. ²
B ₂ Test—required (steady, wet coil)	80	67	82	165	Cooling Full	Cooling Full-Load. ²
E _v Test—required (steady, wet coil).	80	67	87	169	Cooling Intermediate.	Cooling Intermediate. ³
B ₁ Test—required (steady, wet coil)	80	67	82	165	Cooling Minimum	Cooling Minimum. ⁴

TABLE 7—COOLING MODE TEST CONDITION FOR UNITS HAVING A VARIABLE-SPEED COMPRESSOR—Continued

Test description	Air entering indoor unit temperature (°F)		Air entering outdoor unit temperature (°F)		Compressor speed	Cooling air volume rate
	Dry bulb	Wet bulb	Dry bulb	Wet bulb		
F ₁ Test—required (steady, wet coil)	80	67	67	¹ 53.5	Cooling Minimum	Cooling Minimum. ⁴
G ₁ Test ⁵ —optional (steady, dry-coil).	80	(⁶)	67	Cooling Minimum	Cooling Minimum. ⁴
I ₁ Test ⁵ —optional (cyclic, dry-coil)	80	(⁶)	67	Cooling Minimum	(⁶)

¹ The specified test condition only applies if the unit rejects condensate to the outdoor coil.

² Defined in section 3.1.4.1 of this appendix.

³ Defined in section 3.1.4.3 of this appendix.

⁴ Defined in section 3.1.4.2 of this appendix.

⁵ The entering air must have a low enough moisture content so no condensate forms on the indoor coil. DOE recommends using an indoor air wet bulb temperature of 57 °F or less.

⁶ Maintain the airflow nozzle(s) static pressure difference or velocity pressure during the ON period at the same pressure difference or velocity pressure as measured during the G₁ Test.

3.2.5 Cooling Mode Tests for Northern Heat Pumps With Triple-Capacity Compressors

Test triple-capacity, northern heat pumps for the cooling mode in the same way as specified in section 3.2.3 of this appendix for units having a two-capacity compressor.

3.2.6 Tests for an Air Conditioner or Heat Pump Having a Single Indoor Unit Having Multiple Indoor Blowers and Offering Two Stages of Compressor Modulation

Conduct the cooling mode tests specified in section 3.2.3 of this appendix.

3.3 Test Procedures for Steady-State Wet Coil Cooling Mode Tests (the A, A₂, A₁, B, B₂, B₁, E_v, and F₁ Tests)

a. For the pretest interval, operate the test room reconditioning apparatus and the unit to be tested until maintaining equilibrium conditions for at least 30 minutes at the specified section 3.2 test conditions. Use the exhaust fan of the airflow measuring apparatus and, if installed, the indoor blower of the test unit to obtain and then maintain the indoor air volume rate and/or external static pressure specified for the particular test. Continuously record (see section 1.2 of this appendix, Definitions):

(1) The dry-bulb temperature of the air entering the indoor coil,

(2) The water vapor content of the air entering the indoor coil,

(3) The dry-bulb temperature of the air entering the outdoor coil, and

(4) For the section 2.2.4 of this appendix cases where its control is required, the water vapor content of the air entering the outdoor coil.

Refer to section 3.11 of this appendix for additional requirements that depend on the selected secondary test method.

b. After satisfying the pretest equilibrium requirements, make the measurements specified in Table 3 of ANSI/ASHRAE 37–2009 for the indoor air enthalpy method and the user-selected secondary method. Make said Table 3 measurements at equal intervals that span 5 minutes or less. Continue data sampling until reaching a 30-minute period (e.g., seven consecutive 5-minute samples) where the test tolerances specified in Table 8 are satisfied. For those continuously recorded parameters, use the entire data set from the 30-minute interval to evaluate Table 8 compliance. Determine the average electrical power consumption of the air conditioner or heat pump over the same 30-minute interval.

c. Calculate indoor-side total cooling capacity and sensible cooling capacity as specified in sections 7.3.3.1 and 7.3.3.3 of ANSI/ASHRAE 37–2009 (incorporated by reference, see § 430.3). To calculate capacity, use the averages of the measurements (e.g. inlet and outlet dry bulb and wet bulb temperatures measured at the psychrometers) that are continuously recorded for the same 30-minute interval used as described above to evaluate compliance with test tolerances. Do not adjust the parameters used in calculating capacity for the permitted variations in test conditions. Evaluate air enthalpies based on the measured barometric pressure. Use the values of the specific heat of air given in section 7.3.3.1 of ANSI/ASHRAE 37–2009 (incorporated by reference, see § 430.3) for calculation of the sensible cooling capacities. Assign the average total space cooling capacity, average sensible cooling capacity, and electrical power consumption over the 30-minute data collection interval to the variables Q_c^k(T), Q_{sc}^k(T) and Ê_c^k(T), respectively. For these three variables, replace the “T” with the

nominal outdoor temperature at which the test was conducted. The superscript k is used only when testing multi-capacity units. Use the superscript k=2 to denote a test with the unit operating at high capacity or full speed, k=1 to denote low capacity or minimum speed, and k=v to denote the intermediate speed.

d. For mobile home ducted coil-only system tests, decrease Q_c^k(T) by

$$\frac{1385 \text{ Btu/h}}{1000 \text{ scfm}} * \bar{V}_s$$

and increase Ê_c^k(T) by,

$$\frac{406 \text{ W}}{1000 \text{ scfm}} * \bar{V}_s$$

where \bar{V}_s is the average measured indoor air volume rate expressed in units of cubic feet per minute of standard air (scfm).

For non-mobile home ducted coil-only system tests, decrease Q_c^k(T) by

$$\frac{1505 \text{ Btu/h}}{1000 \text{ scfm}} * \bar{V}_s$$

and increase Ê_c^k(T) by,

$$\frac{441 \text{ W}}{1000 \text{ scfm}} * \bar{V}_s$$

where \bar{V}_s is the average measured indoor air volume rate expressed in units of cubic feet per minute of standard air (scfm).

TABLE 8—TEST OPERATING AND TEST CONDITION TOLERANCES FOR SECTION 3.3 STEADY-STATE WET COIL COOLING MODE TESTS AND SECTION 3.4 DRY COIL COOLING MODE TESTS

	Test operating tolerance ¹	Test condition tolerance ¹
Indoor dry-bulb, °F:		
Entering temperature	2.0	0.5
Leaving temperature	2.0	
Indoor wet-bulb, °F:		

TABLE 8—TEST OPERATING AND TEST CONDITION TOLERANCES FOR SECTION 3.3 STEADY-STATE WET COIL COOLING MODE TESTS AND SECTION 3.4 DRY COIL COOLING MODE TESTS—Continued

	Test operating tolerance ¹	Test condition tolerance ¹
Entering temperature	1.0	² 0.3
Leaving temperature	² 1.0	
Outdoor dry-bulb, °F:		
Entering temperature	2.0	0.5
Leaving temperature	³ 2.0	
Outdoor wet-bulb, °F:		
Entering temperature	1.0	⁴ 0.3
Leaving temperature	³ 1.0	
External resistance to airflow, inches of water	0.05	⁵ 0.02
Electrical voltage, % of rdg	2.0	1.5
Nozzle pressure drop, % of rdg	2.0	

¹ See section 1.2 of this appendix, Definitions.

² Only applies during wet coil tests; does not apply during steady-state, dry coil cooling mode tests.

³ Only applies when using the outdoor air enthalpy method.

⁴ Only applies during wet coil cooling mode tests where the unit rejects condensate to the outdoor coil.

⁵ Only applies when testing non-ducted units.

e. For air conditioners and heat pumps having a constant-air-volume-rate indoor blower, the five additional steps listed below are required if the average of the measured external static pressures exceeds the applicable sections 3.1.4 minimum (or target) external static pressure (ΔP_{\min}) by 0.03 inches of water or more.

(1) Measure the average power consumption of the indoor blower motor

($\dot{E}_{fan,1}$) and record the corresponding external static pressure (ΔP_1) during or immediately following the 30-minute interval used for determining capacity.

(2) After completing the 30-minute interval and while maintaining the same test conditions, adjust the exhaust fan of the airflow measuring apparatus until the external static pressure increases to approximately $\Delta P_1 + (\Delta P_1 - \Delta P_{\min})$.

(3) After re-establishing steady readings of the fan motor power and external static pressure, determine average values for the indoor blower power ($\dot{E}_{fan,2}$) and the external static pressure (ΔP_2) by making measurements over a 5-minute interval.

(4) Approximate the average power consumption of the indoor blower motor at ΔP_{\min} using linear extrapolation:

$$\dot{E}_{fan,min} = \frac{\dot{E}_{fan,2} - \dot{E}_{fan,1}}{\Delta P_2 - \Delta P_1} (\Delta P_{\min} - \Delta P_1) + \dot{E}_{fan,1}$$

(5) Increase the total space cooling capacity, $\dot{Q}_c(T)$, by the quantity ($\dot{E}_{fan,1} - \dot{E}_{fan,min}$), when expressed on a Btu/h basis. Decrease the total electrical power, $\dot{E}_e(T)$, by the same fan power difference, now expressed in watts.

3.4 Test Procedures for the Steady-State Dry-Coil Cooling-Mode Tests (the C, C₁, C₂, and G₁ Tests)

a. Except for the modifications noted in this section, conduct the steady-state dry coil cooling mode tests as specified in section 3.3 of this appendix for wet coil tests. Prior to recording data during the steady-state dry coil test, operate the unit at least one hour after achieving dry coil conditions. Drain the drain pan and plug the drain opening. Thereafter, the drain pan should remain completely dry.

b. Denote the resulting total space cooling capacity and electrical power derived from the test as $\dot{Q}_{ss,dry}$ and $\dot{E}_{ss,dry}$. With regard to a section 3.3 deviation, do not adjust $\dot{Q}_{ss,dry}$ for duct losses (*i.e.*, do not apply section 7.3.3.3 of ANSI/ASHRAE 37–2009). In preparing for the section 3.5 cyclic tests of this appendix, record the average indoor-side air volume rate, \bar{V} , specific heat of the air, C_p , a (expressed on dry air basis), specific volume of the air at the nozzles, v'_n , humidity ratio at the nozzles, W_n , and either pressure difference or velocity pressure for the flow nozzles. For units having a variable-speed indoor blower (that provides either a

constant or variable air volume rate) that will or may be tested during the cyclic dry coil cooling mode test with the indoor blower turned off (see section 3.5 of this appendix), include the electrical power used by the indoor blower motor among the recorded parameters from the 30-minute test.

c. If the temperature sensors used to provide the primary measurement of the indoor-side dry bulb temperature difference during the steady-state dry-coil test and the subsequent cyclic dry-coil test are different, include measurements of the latter sensors among the regularly sampled data. Beginning at the start of the 30-minute data collection period, measure and compute the indoor-side air dry-bulb temperature difference using both sets of instrumentation, ΔT (Set SS) and ΔT (Set CYC), for each equally spaced data sample. If using a consistent data sampling rate that is less than 1 minute, calculate and record minutely averages for the two temperature differences. If using a consistent sampling rate of one minute or more, calculate and record the two temperature differences from each data sample. After having recorded the seventh ($i=7$) set of temperature differences, calculate the following ratio using the first seven sets of values:

$$F_{CD} = \frac{1}{7} \sum_{i=6}^i \frac{\Delta T(\text{Set SS})}{\Delta T(\text{Set CYC})}$$

Each time a subsequent set of temperature differences is recorded (if sampling more frequently than every 5 minutes), calculate F_{CD} using the most recent seven sets of values. Continue these calculations until the 30-minute period is completed or until a value for F_{CD} is calculated that falls outside the allowable range of 0.94–1.06. If the latter occurs, immediately suspend the test and identify the cause for the disparity in the two temperature difference measurements. Recalibration of one or both sets of instrumentation may be required. If all the values for F_{CD} are within the allowable range, save the final value of the ratio from the 30-minute test as F_{CD}^* . If the temperature sensors used to provide the primary measurement of the indoor-side dry bulb temperature difference during the steady-state dry-coil test and the subsequent cyclic dry-coil test are the same, set $F_{CD}^* = 1$.

3.5 Test Procedures for the Cyclic Dry-Coil Cooling-Mode Tests (the D, D₁, D₂, and I₁ Tests)

After completing the steady-state dry-coil test, remove the outdoor air enthalpy method test apparatus, if connected, and begin manual OFF/ON cycling of the unit's compressor. The test set-up should otherwise

be identical to the set-up used during the steady-state dry coil test. When testing heat pumps, leave the reversing valve during the compressor OFF cycles in the same position as used for the compressor ON cycles, unless automatically changed by the controls of the unit. For units having a variable-speed indoor blower, the manufacturer has the option of electing at the outset whether to conduct the cyclic test with the indoor blower enabled or disabled. Always revert to testing with the indoor blower disabled if cyclic testing with the fan enabled is unsuccessful.

a. For all cyclic tests, the measured capacity must be adjusted for the thermal mass stored in devices and connections located between measured points. Follow the procedure outlined in section 7.4.3.4.5 of ASHRAE 116–2010 (incorporated by reference, see § 430.3) to ensure any required measurements are taken.

b. For units having a single-speed or two-capacity compressor, cycle the compressor OFF for 24 minutes and then ON for 6 minutes ($\Delta t_{cyc,dry} = 0.5$ hours). For units having a variable-speed compressor, cycle the compressor OFF for 48 minutes and then ON for 12 minutes ($\Delta t_{cyc,dry} = 1.0$ hours). Repeat the OFF/ON compressor cycling pattern until the test is completed. Allow the controls of the unit to regulate cycling of the outdoor fan. If an upturned duct is used, measure the dry-bulb temperature at the inlet of the device at least once every minute and ensure that its test operating tolerance is within 1.0 °F for each compressor OFF period.

c. Sections 3.5.1 and 3.5.2 of this appendix specify airflow requirements through the indoor coil of ducted and non-ducted indoor units, respectively. In all cases, use the exhaust fan of the airflow measuring apparatus (covered under section 2.6 of this appendix) along with the indoor blower of the unit, if installed and operating, to approximate a step response in the indoor coil airflow. Regulate the exhaust fan to quickly obtain and then maintain the flow nozzle static pressure difference or velocity

pressure at the same value as was measured during the steady-state dry coil test. The pressure difference or velocity pressure should be within 2 percent of the value from the steady-state dry coil test within 15 seconds after airflow initiation. For units having a variable-speed indoor blower that ramps when cycling on and/or off, use the exhaust fan of the airflow measuring apparatus to impose a step response that begins at the initiation of ramp up and ends at the termination of ramp down.

d. For units having a variable-speed indoor blower, conduct the cyclic dry coil test using the pull-thru approach described below if any of the following occur when testing with the fan operating:

- (1) The test unit automatically cycles off;
- (2) Its blower motor reverses; or
- (3) The unit operates for more than 30 seconds at an external static pressure that is 0.1 inches of water or more higher than the value measured during the prior steady-state test.

For the pull-thru approach, disable the indoor blower and use the exhaust fan of the airflow measuring apparatus to generate the specified flow nozzles static pressure difference or velocity pressure. If the exhaust fan cannot deliver the required pressure difference because of resistance created by the unpowered indoor blower, temporarily remove the indoor blower.

e. Conduct three complete compressor OFF/ON cycles with the test tolerances given in Table 9 satisfied. Calculate the degradation coefficient C_D for each complete cycle. If all three C_D values are within 0.02 of the average C_D then stability has been achieved, use the highest C_D value of these three. If stability has not been achieved, conduct additional cycles, up to a maximum of eight cycles total, until stability has been achieved between three consecutive cycles. Once stability has been achieved, use the highest C_D value of the three consecutive cycles that establish stability. If stability has not been achieved after eight cycles, use the highest C_D from cycle one through cycle eight, or the default C_D , whichever is lower.

f. With regard to the Table 9 parameters, continuously record the dry-bulb temperature of the air entering the indoor and outdoor coils during periods when air flows through the respective coils. Sample the water vapor content of the indoor coil inlet air at least every 2 minutes during periods when air flows through the coil. Record external static pressure and the air volume rate indicator (either nozzle pressure difference or velocity pressure) at least every minute during the interval that air flows through the indoor coil. (These regular measurements of the airflow rate indicator are in addition to the required measurement at 15 seconds after flow initiation.) Sample the electrical voltage at least every 2 minutes beginning 30 seconds after compressor start-up. Continue until the compressor, the outdoor fan, and the indoor blower (if it is installed and operating) cycle off.

g. For ducted units, continuously record the dry-bulb temperature of the air entering (as noted above) and leaving the indoor coil. Or if using a thermopile, continuously record the difference between these two temperatures during the interval that air flows through the indoor coil. For non-ducted units, make the same dry-bulb temperature measurements beginning when the compressor cycles on and ending when indoor coil airflow ceases.

h. Integrate the electrical power over complete cycles of length $\Delta t_{cyc,dry}$. For ducted blower coil systems tested with the unit's indoor blower operating for the cycling test, integrate electrical power from indoor blower OFF to indoor blower OFF. For all other ducted units and for non-ducted units, integrate electrical power from compressor OFF to compressor OFF. (Some cyclic tests will use the same data collection intervals to determine the electrical energy and the total space cooling. For other units, terminate data collection used to determine the electrical energy before terminating data collection used to determine total space cooling.)

TABLE 9—TEST OPERATING AND TEST CONDITION TOLERANCES FOR CYCLIC DRY COIL COOLING MODE TESTS

	Test operating tolerance ¹	Test condition tolerance ¹
Indoor entering dry-bulb temperature, ² °F	2.0	0.5
Indoor entering wet-bulb temperature, °F		(³)
Outdoor entering dry-bulb temperature, ² °F	2.0	0.5
External resistance to airflow, ² inches of water	0.05	
Airflow nozzle pressure difference or velocity pressure, ² % of reading	2.0	⁴ 2.0
Electrical voltage, ⁵ % of rdg	2.0	1.5

¹ See section 1.2 of this appendix, Definitions.

² Applies during the interval that air flows through the indoor (outdoor) coil except for the first 30 seconds after flow initiation. For units having a variable-speed indoor blower that ramps, the tolerances listed for the external resistance to airflow apply from 30 seconds after achieving full speed until ramp down begins.

³ Shall at no time exceed a wet-bulb temperature that results in condensate forming on the indoor coil.

⁴ The test condition must be the average nozzle pressure difference or velocity pressure measured during the steady-state dry coil test.

⁵ Applies during the interval when at least one of the following—the compressor, the outdoor fan, or, if applicable, the indoor blower—are operating except for the first 30 seconds after compressor start-up.

If the Table 9 tolerances are satisfied over the complete cycle, record the measured

electrical energy consumption as $e_{cyc,dry}$ and express it in units of watt-hours. Calculate

the total space cooling delivered, $q_{cyc,dry}$, in units of Btu using,

$$q_{cyc,dry} = \frac{60 \cdot \bar{V} \cdot C_{p,a} \cdot \Gamma}{[v_n' \cdot (1 + W_n)]} = \frac{60 \cdot \bar{V} \cdot C_{p,a} \cdot \Gamma}{v_n} \quad \text{and} \quad \Gamma = F_{CD}^* \int_{\tau_1}^{\tau_2} [T_{a1}(\tau) - T_{a2}(\tau)] \delta\tau, \text{ hr} \cdot ^\circ\text{F}$$

Where,

\bar{V} , $C_{p,a}$, v_n' (or v_n), W_n , and F_{CD}^* are the values recorded during the section 3.4 dry coil steady-state test and

$T_{a1}(\tau)$ = dry bulb temperature of the air entering the indoor coil at time τ , $^\circ\text{F}$.

$T_{a2}(\tau)$ = dry bulb temperature of the air leaving the indoor coil at time τ , $^\circ\text{F}$.

τ_1 = for ducted units, the elapsed time when airflow is initiated through the indoor coil; for non-ducted units, the elapsed time when the compressor is cycled on, hr.

τ_2 = the elapsed time when indoor coil airflow ceases, hr.

Adjust the total space cooling delivered, $q_{cyc,dry}$, according to calculation method outlined in section 7.4.3.4.5 of ASHRAE 116–2010 (incorporated by reference, see § 430.3).

3.5.1 Procedures When Testing Ducted Systems

The automatic controls that are normally installed with the test unit must govern the OFF/ON cycling of the air moving equipment on the indoor side (exhaust fan of the airflow measuring apparatus and the indoor blower of the test unit). For ducted coil-only systems rated based on using a fan time-delay relay, control the indoor coil airflow according to the OFF delay listed by the manufacturer in

the certification report. For ducted units having a variable-speed indoor blower that has been disabled (and possibly removed), start and stop the indoor airflow at the same instances as if the fan were enabled. For all other ducted coil-only systems, cycle the indoor coil airflow in unison with the cycling of the compressor. If air damper boxes are used, close them on the inlet and outlet side during the OFF period. Airflow through the indoor coil should stop within 3 seconds after the automatic controls of the test unit (act to) de-energize the indoor blower. For mobile home ducted coil-only systems increase $e_{cyc,dry}$ by the quantity,

$$\text{Equation 3.5-2.} \quad \frac{406 \text{ W}}{1000 \text{ scfm}} \cdot \bar{V}_s \cdot [\tau_2 - \tau_1]$$

and decrease $q_{cyc,dry}$ by,

$$\text{Equation 3.5-3.} \quad \frac{1385 \text{ Btu/h}}{1000 \text{ scfm}} \cdot \bar{V}_s \cdot [\tau_2 - \tau_1]$$

where \bar{V}_s is the average indoor air volume rate from the section 3.4 dry coil steady-state test and is expressed in units of cubic feet per minute of standard air (scfm). For ducted non-mobile home coil-only units increase $e_{cyc,dry}$ by the quantity,

$$\text{Equation 3.5-2.} \quad \frac{441 \text{ W}}{1000 \text{ scfm}} \cdot \bar{V}_s \cdot [\tau_2 - \tau_1]$$

and decrease $q_{cyc,dry}$ by,

$$\text{Equation 3.5-3.} \quad \frac{1505 \text{ Btu/h}}{1000 \text{ scfm}} \cdot \bar{V}_s \cdot [\tau_2 - \tau_1] \text{ where } \bar{V}_s \text{ is the average indoor air volume rate from}$$

the section 3.4 dry coil steady-state test and is expressed in units of cubic feet per minute of standard air (scfm). For units having a variable-speed indoor blower that is disabled during the cyclic test, increase $e_{cyc,dry}$ and decrease $q_{cyc,dry}$ based on:

a. The product of $[\tau_2 - \tau_1]$ and the indoor blower power measured during or following the dry coil steady-state test; or,

b. The following algorithm if the indoor blower ramps its speed when cycling.

(1) Measure the electrical power consumed by the variable-speed indoor blower at a minimum of three operating conditions: at the speed/air volume rate/external static pressure that was measured during the steady-state test, at operating conditions associated with the midpoint of the ramp-up

interval, and at conditions associated with the midpoint of the ramp-down interval. For these measurements, the tolerances on the airflow volume or the external static pressure are the same as required for the section 3.4 steady-state test.

(2) For each case, determine the fan power from measurements made over a minimum of 5 minutes.

(3) Approximate the electrical energy consumption of the indoor blower if it had operated during the cyclic test using all three

power measurements. Assume a linear profile during the ramp intervals. The manufacturer must provide the durations of the ramp-up and ramp-down intervals. If the test setup instructions included with the unit by the manufacturer specifies a ramp interval that exceeds 45 seconds, use a 45-second ramp interval nonetheless when estimating the fan energy.

3.5.2 Procedures When Testing Non-Ducted Indoor Units

Do not use airflow prevention devices when conducting cyclic tests on non-ducted indoor units. Until the last OFF/ON compressor cycle, airflow through the indoor coil must cycle off and on in unison with the compressor. For the last OFF/ON compressor cycle—the one used to determine $e_{cyc,dry}$ and $q_{cyc,dry}$ —use the exhaust fan of the airflow measuring apparatus and the indoor blower of the test unit to have indoor airflow start 3 minutes prior to compressor cut-on and end three minutes after compressor cutoff. Subtract the electrical energy used by the indoor blower during the 3 minutes prior to

compressor cut-on from the integrated electrical energy, $e_{cyc,dry}$. Add the electrical energy used by the indoor blower during the 3 minutes after compressor cutoff to the integrated cooling capacity, $q_{cyc,dry}$. For the case where the non-ducted indoor unit uses a variable-speed indoor blower which is disabled during the cyclic test, correct $e_{cyc,dry}$ and $q_{cyc,dry}$ using the same approach as prescribed in section 3.5.1 of this appendix for ducted units having a disabled variable-speed indoor blower.

3.5.3 Cooling-Mode Cyclic-Degradation Coefficient Calculation

Use the two dry-coil tests to determine the cooling-mode cyclic-degradation coefficient,

$$C_D^c = \frac{1 - \frac{EER_{cyc,dry}}{EER_{ss,dry}}}{1 - CLF}$$

where:

$$EER_{cyc,dry} = \frac{q_{cyc,dry}}{e_{cyc,dry}}$$

the average energy efficiency ratio during the cyclic dry coil cooling mode test, Btu/W·h

$$EER_{ss,dry} = \frac{\dot{Q}_{ss,dry}}{\dot{E}_{ss,dry}}$$

the average energy efficiency ratio during the steady-state dry coil cooling mode test,

Btu/W·h

$$CLF = \frac{q_{cyc,dry}}{Q_{ss,dry} * \Delta\tau_{cyc,dry}}$$

the cooling load factor dimensionless

C_D^c . Append “(k=2)” to the coefficient if it corresponds to a two-capacity unit cycling at high capacity. If the two optional tests are conducted but yield a tested C_D^c that exceeds the default C_D^c or if the two optional tests are not conducted, assign C_D^c the default value of 0.25 for variable-speed compressor systems and outdoor units with no match, and 0.2 for all other systems. The default value for two-capacity units cycling at high capacity, however, is the low-capacity coefficient, *i.e.*, $C_D^c(k=2) = C_D^c$. Evaluate C_D^c using the above results and those from the section 3.4 dry-coil steady-state test.

3.6 Heating Mode Tests for Different Types of Heat Pumps, Including Heating-Only Heat Pumps

3.6.1 Tests for a Heat Pump Having a Single-Speed Compressor and Fixed Heating Air Volume Rate

This set of tests is for single-speed-compressor heat pumps that do not have a

heating minimum air volume rate or a heating intermediate air volume rate that is different than the heating full load air volume rate. Conduct the optional high temperature cyclic (H1C) test to determine the heating mode cyclic-degradation coefficient, C_D^h . If this optional test is conducted but yields a tested C_D^h that exceeds the default C_D^h or if the optional test

is not conducted, assign C_D^h the default value of 0.25. Test conditions for the four tests are specified in Table 10 of this section.

TABLE 10—HEATING MODE TEST CONDITIONS FOR UNITS HAVING A SINGLE-SPEED COMPRESSOR AND A FIXED-SPEED INDOOR BLOWER, A CONSTANT AIR VOLUME RATE INDOOR BLOWER, OR NO INDOOR BLOWER

Test description	Air entering indoor unit temperature (°F)		Air entering outdoor unit temperature (°F)		Heating air volume rate
	Dry bulb	Wet bulb	Dry bulb	Wet bulb	
H1 Test (required, steady)	70	60 (max)	47	43	Heating Full-load. ¹

TABLE 10—HEATING MODE TEST CONDITIONS FOR UNITS HAVING A SINGLE-SPEED COMPRESSOR AND A FIXED-SPEED INDOOR BLOWER, A CONSTANT AIR VOLUME RATE INDOOR BLOWER, OR NO INDOOR BLOWER—Continued

Test description	Air entering indoor unit temperature (°F)		Air entering outdoor unit temperature (°F)		Heating air volume rate
	Dry bulb	Wet bulb	Dry bulb	Wet bulb	
H1C Test (optional, cyclic)	70	60 (max)	47	43	(2).
H2 Test (required)	70	60 (max)	35	33	Heating Full-load. ¹
H3 Test (required, steady)	70	60 (max)	17	15	Heating Full-load. ¹

¹ Defined in section 3.1.4.4 of this appendix.

² Maintain the airflow nozzles static pressure difference or velocity pressure during the ON period at the same pressure difference or velocity pressure as measured during the H1 Test.

3.6.2 Tests for a Heat Pump Having a Single-Speed Compressor and a Single Indoor Unit Having Either (1) a Variable Speed, Variable-Air-Rate Indoor Blower Whose Capacity Modulation Correlates With Outdoor Dry Bulb Temperature or (2) Multiple Indoor Blowers.

Conduct five tests: Two high temperature tests (H1₂ and H1₁), one frost accumulation

test (H2₂), and two low temperature tests (H3₂ and H3₁). Conducting an additional frost accumulation test (H2₁) is optional. Conduct the optional high temperature cyclic (H1C₁) test to determine the heating mode cyclic-degradation coefficient, C_D^h. If this optional test is conducted but yields a tested C_D^h that exceeds the default C_D^h or if the optional test is not conducted, assign C_D^h the default

value of 0.25. Test conditions for the seven tests are specified in Table 11. If the optional H2₁ test is not performed, use the following equations to approximate the capacity and electrical power of the heat pump at the H2₁ test conditions:

$$\dot{E}_h^{k=1}(35) = PR_h^{k=2}(35) * \dot{E}_h^{k=1}(17) + 0.6 * [\dot{E}_h^{k=1}(47) - \dot{E}_h^{k=1}(17)]$$

Where,

$$\dot{Q}_h^{k=2}(35) = \frac{\dot{Q}_h^{k=2}(35)}{\dot{Q}_h^{k=2}(17) + 0.6 * [\dot{Q}_h^{k=2}(47) - \dot{Q}_h^{k=2}(17)]}$$

$$PR_h^{k=2}(35) = \frac{\dot{E}_h^{k=2}(35)}{\dot{E}_h^{k=2}(17) + 0.6 * [\dot{E}_h^{k=2}(47) - \dot{E}_h^{k=2}(17)]}$$

The quantities $\dot{Q}_h^{k=2}(47)$, $\dot{E}_h^{k=2}(47)$, $\dot{Q}_h^{k=1}(47)$, and $\dot{E}_h^{k=1}(47)$ are determined from the H1₂ and H1₁ tests and evaluated as specified in section 3.7 of this appendix; the

quantities $\dot{Q}_h^{k=2}(35)$ and $\dot{E}_h^{k=2}(35)$ are determined from the H2₂ test and evaluated as specified in section 3.9 of this appendix; and the quantities $\dot{Q}_h^{k=2}(17)$, $\dot{E}_h^{k=2}(17)$,

$\dot{Q}_h^{k=1}(17)$, and $\dot{E}_h^{k=1}(17)$, are determined from the H3₂ and H3₁ tests and evaluated as specified in section 3.10 of this appendix.

TABLE 11—HEATING MODE TEST CONDITIONS FOR UNITS WITH A SINGLE-SPEED COMPRESSOR THAT MEET THE SECTION 3.6.2 INDOOR UNIT REQUIREMENTS

Test description	Air entering indoor unit temperature (°F)		Air entering outdoor unit temperature (°F)		Heating air volume rate
	Dry bulb	Wet bulb	Dry bulb	Wet bulb	
H1 ₂ Test (required, steady)	70	60(max)	47	43	Heating Full-load. ¹
H1 ₁ Test (required, steady)	70	60(max)	47	43	Heating Minimum. ²
H1C ₁ Test (optional, cyclic)	70	60(max)	47	43	(3).
H2 ₂ Test (required)	70	60(max)	35	33	Heating Full-load. ¹
H2 ₁ Test (optional)	70	60(max)	35	33	Heating Minimum. ²
H3 ₂ Test (required, steady)	70	60(max)	17	15	Heating Full-load. ¹
H3 ₁ Test (required, steady)	70	60(max)	17	15	Heating Minimum. ²

¹ Defined in section 3.1.4.4 of this appendix.

² Defined in section 3.1.4.5 of this appendix.

³ Maintain the airflow nozzles static pressure difference or velocity pressure during the ON period at the same pressure difference or velocity pressure as measured during the H1₁ test.

3.6.3 Tests for a Heat Pump Having a Two-Capacity Compressor (See Section 1.2 of This Appendix, Definitions), Including Two-Capacity, Northern Heat Pumps (See Section 1.2 of This Appendix, Definitions)

a. Conduct one maximum temperature test (H0₁), two high temperature tests (H1₂ and H1₁), one frost accumulation test (H2₂), and one low temperature test (H3₂). Conduct an additional frost accumulation test (H2₁) and low temperature test (H3₁) if both of the following conditions exist:

(1) Knowledge of the heat pump's capacity and electrical power at low compressor capacity for outdoor temperatures of 37 °F and less is needed to complete the section 4.2.3 of this appendix seasonal performance calculations; and

(2) The heat pump's controls allow low-capacity operation at outdoor temperatures of 37 °F and less.

If the two conditions in a.(1) and a.(2) of this section are met, an alternative to conducting the H2₁ frost accumulation is to use the following equations to approximate the capacity and electrical power:

$$\dot{Q}_{h,k=1}(35) = 0.90 * \{ \dot{Q}_{h,k=1}(17) + 0.6 * [\dot{Q}_{h,k=1}(47) - \dot{Q}_{h,k=1}(17)] \}$$

$$\dot{E}_{h,k=1}(35) = 0.985 * \{ \dot{E}_{h,k=1}(17) + 0.6 * [\dot{E}_{h,k=1}(47) - \dot{E}_{h,k=1}(17)] \}$$

Determine the quantities $\dot{Q}_{h,k=1}(47)$ and $\dot{E}_{h,k=1}(47)$ from the H1₁ test and evaluate them according to section 3.7 of this appendix. Determine the quantities $\dot{Q}_{h,k=1}(17)$ and $\dot{E}_{h,k=1}(17)$ from the H3₁ test and evaluate them according to section 3.10 of this appendix.

b. Conduct the optional high temperature cyclic test (H1C₁) to determine the heating mode cyclic-degradation coefficient, C_{D^h} . If this optional test is conducted but yields a tested C_{D^h} that exceeds the default C_{D^h} or if

the optional test is not conducted, assign C_{D^h} the default value of 0.25. If a two-capacity heat pump locks out low capacity operation at lower outdoor temperatures, conduct the high temperature cyclic test (H1C₂) to determine the high-capacity heating mode cyclic-degradation coefficient, $C_{D^h}(k=2)$. If this optional test at high capacity is conducted but yields a tested $C_{D^h}(k=2)$ that exceeds the default $C_{D^h}(k=2)$ or if the optional test is not conducted, assign C_{D^h} the default value. The default $C_{D^h}(k=2)$ is the same value as determined or assigned for the low-capacity cyclic-degradation coefficient, C_{D^h} [or equivalently, $C_{D^h}(k=1)$]. Table 12 specifies test conditions for these nine tests.

TABLE 12—HEATING MODE TEST CONDITIONS FOR UNITS HAVING A TWO-CAPACITY COMPRESSOR

Test description	Air entering indoor unit temperature (°F)		Air entering outdoor unit temperature (°F)		Compressor capacity	Heating air volume rate
	Dry bulb	Wet bulb	Dry bulb	Wet bulb		
H0 ₁ Test (required, steady)	70	60(max)	62	56.5	Low	Heating Minimum. ¹
H1 ₂ Test (required, steady)	70	60(max)	47	43	High	Heating Full-Load. ²
H1C ₂ Test (optional, ⁷ cyclic)	70	60(max)	47	43	High	(³).
H1 ₁ Test (required)	70	60(max)	47	43	Low	Heating Minimum. ¹
H1C ₁ Test (optional, cyclic)	70	60(max)	47	43	Low	(⁴).
H2 ₂ Test (required)	70	60(max)	35	33	High	Heating Full-Load. ²
H2 ₁ Test ^{5,6} (required)	70	60(max)	35	33	Low	Heating Minimum. ¹
H3 ₂ Test (required, steady)	70	60(max)	17	15	High	Heating Full-Load. ²
H3 ₁ Test ⁵ (required, steady)	70	60(max)	17	15	Low	Heating Minimum. ¹

¹ Defined in section 3.1.4.5 of this appendix.

² Defined in section 3.1.4.4 of this appendix.

³ Maintain the airflow nozzle(s) static pressure difference or velocity pressure during the ON period at the same pressure or velocity as measured during the H1₂ test.

⁴ Maintain the airflow nozzle(s) static pressure difference or velocity pressure during the ON period at the same pressure or velocity as measured during the H1₁ test.

⁵ Required only if the heat pump's performance when operating at low compressor capacity and outdoor temperatures less than 37 °F is needed to complete the section 4.2.3 HSPF calculations.

⁶ If table note #5 applies, the section 3.6.3 equations for $\dot{Q}_{h,k=1}(35)$ and $\dot{E}_{h,k=1}(17)$ may be used in lieu of conducting the H2₁ test.

⁷ Required only if the heat pump locks out low capacity operation at lower outdoor temperatures.

3.6.4 Tests for a Heat Pump Having a Variable-Speed Compressor

a. Conduct one maximum temperature test (H0₁), two high temperature tests (H1_N and H1₁), one frost accumulation test (H2_V), and one low temperature test (H3₂). Conducting one or more of the following tests is optional: An additional high temperature test (H1₂), an additional frost accumulation test (H2₂), and a very low temperature test (H4₂). Conduct the optional high temperature cyclic (H1C₁) test to determine the heating mode cyclic-

degradation coefficient, C_{D^h} . If this optional test is conducted but yields a tested C_{D^h} that exceeds the default C_{D^h} or if the optional test is not conducted, assign C_{D^h} the default value of 0.25. Test conditions for the nine tests are specified in Table 13. The compressor shall operate at the same heating full speed, measured by RPM or power input frequency (Hz), as the maximum speed at which the system controls would operate the compressor in normal operation in 17 °F ambient temperature, for the H1₂, H2₂ and

H3₂ Tests. The compressor shall operate for the H1_N test at the maximum speed at which the system controls would operate the compressor in normal operation in 47 °F ambient temperature. The compressor shall operate at the same heating minimum speed, measured by RPM or power input frequency (Hz), for the H0₁, H1C₁, and H1₁ Tests. Determine the heating intermediate compressor speed cited in Table 13 using the heating mode full and minimum compressors speeds and:

Heating intermediate speed

$$= \text{Heating minimum speed} + \frac{\text{Heating full speed} - \text{Heating minimum speed}}{3}$$

Where a tolerance of plus 5 percent or the next higher inverter frequency step from that calculated is allowed.

b. If one of the high temperature tests (H1₂ or H1_N) is conducted using the same compressor speed (RPM or power input frequency) as the H3₂ test, set the 47 °F capacity and power input values used for calculation of HSPF equal to the measured values for that test:

$$\dot{Q}_{hcalc}^{k=2}(47) = \dot{Q}_h^{k=2}(47); \dot{E}_{hcalc}^{k=2}(47) = \dot{E}_h^{k=2}(47)$$

Where:

$\dot{Q}_{hcalc}^{k=2}(47)$ and $\dot{E}_{hcalc}^{k=2}(47)$ are the capacity and power input representing full-speed operation at 47 °F for the HSPF calculations,

$\dot{Q}_h^{k=2}(47)$ is the capacity measured in the high temperature test (H1₂ or H1_N) which used the same compressor speed as the H3₂ test, and

$\dot{E}_h^{k=2}(47)$ is the power input measured in the high temperature test (H1₂ or H1_N) which

used the same compressor speed as the H3₂ test.

Evaluate the quantities $\dot{Q}_h^{k=2}(47)$ and from $\dot{E}_h^{k=2}(47)$ according to section 3.7.

Otherwise (if no high temperature test is conducted using the same speed (RPM or power input frequency) as the H3₂ test), calculate the 47 °F capacity and power input values used for calculation of HSPF as follows:

$$\dot{Q}_{hcalc}^{k=2}(47) = \dot{Q}_h^{k=2}(17) * (1 + 30 \text{ °F} * \text{CSF});$$

$$\dot{E}_{hcalc}^{k=2}(47) = \dot{E}_h^{k=2}(17) * (1 + 30 \text{ °F} * \text{PSF})$$

Where:

$\dot{Q}_{hcalc}^{k=2}(47)$ and $\dot{E}_{hcalc}^{k=2}(47)$ are the capacity and power input representing full-speed operation at 47 °F for the HSPF calculations,

$\dot{Q}_h^{k=2}(17)$ is the capacity measured in the H3₂ test,

$\dot{E}_h^{k=2}(17)$ is the power input measured in the H3₂ test,

CSF is the capacity slope factor, equal to 0.0204/°F for split systems and 0.0262/°F for single-package systems, and

PSF is the Power Slope Factor, equal to 0.00455/°F.

c. If the H2₂ test is not done, use the following equations to approximate the capacity and electrical power at the H2₂ test conditions:

$$\dot{Q}_h^{k=2}(35) = 0.90 * \{ \dot{Q}_h^{k=2}(17) + 0.6 * [\dot{Q}_{hcalc}^{k=2}(47) - \dot{Q}_h^{k=2}(17)] \}$$

$$\dot{E}_h^{k=2}(35) = 0.985 * \{ \dot{E}_h^{k=2}(17) + 0.6 * [\dot{E}_{hcalc}^{k=2}(47) - \dot{E}_h^{k=2}(17)] \}$$

Where:

$\dot{Q}_{hcalc}^{k=2}(47)$ and $\dot{E}_{hcalc}^{k=2}(47)$ are the capacity and power input representing full-speed operation at 47 °F for the HSPF calculations, calculated as described in section b above.

$\dot{Q}_h^{k=2}(17)$ and $\dot{E}_h^{k=2}(17)$ are the capacity and power input measured in the H3₂ test.

d. Determine the quantities $\dot{Q}_h^{k=2}(17)$ and $\dot{E}_h^{k=2}(17)$ from the H3₂ test, determine the quantities $\dot{Q}_h^{k=2}(5)$ and $\dot{E}_h^{k=2}(5)$ from the H4₂ test, and evaluate all four according to section 3.10.

TABLE 13—HEATING MODE TEST CONDITIONS FOR UNITS HAVING A VARIABLE-SPEED COMPRESSOR

Test description	Air entering indoor unit temperature (°F)		Air entering outdoor unit temperature (°F)		Compressor speed	Heating air volume rate
	Dry bulb	Wet bulb	Dry bulb	Wet bulb		
H0 ₁ test (required, steady)	70	60 (max)	62	56.5	Heating Minimum	Heating Minimum. ¹
H1 ₂ test (optional, steady)	70	60 (max)	47	43	Heating Full ⁴	Heating Full-Load. ³
H1 ₁ test (required, steady)	70	60 (max)	47	43	Heating Minimum	Heating Minimum. ¹
H1 _N test (required, steady)	70	60 (max)	47	43	Heating Full ⁵	Heating Full-Load. ³
H1C ₁ test (optional, cyclic)	70	60 (max)	47	43	Heating Minimum	(²)
H2 ₂ test (optional)	70	60 (max)	35	33	Heating Full ⁴	Heating Full-Load. ³
H2 _V test (required)	70	60 (max)	35	33	Heating Intermediate.	Heating Intermediate. ⁶
H3 ₂ test (required, steady)	70	60 (max)	17	15	Heating Full ⁴	Heating Full-Load. ³
H4 ₂ test (optional, steady)	70	60 (max)	5	3.5	Heating Full	Heating Full-Load. ³

¹ Defined in section 3.1.4.5 of this appendix.

² Maintain the airflow nozzle(s) static pressure difference or velocity pressure during an ON period at the same pressure or velocity as measured during the H1₁ test.

³ Defined in section 3.1.4.4 of this appendix.

⁴ Maximum speed that the system controls would operate the compressor in normal operation in 17 °F ambient temperature. The H1₂ test is not needed if the H1_N test uses this same compressor speed.

⁵ Maximum speed that the system controls would operate the compressor in normal operation in 47 °F ambient temperature.

⁶ Defined in section 3.1.4.6 of this appendix.

e. For multiple-split heat pumps (only), the following procedures supersede the above requirements. For all Table 13 tests specified for a minimum compressor speed, turn off at least one indoor unit. The manufacturer shall designate the particular indoor unit(s) that is turned off. The manufacturer must also specify the compressor speed used for the Table 13 H2_V test, a heating mode intermediate compressor speed that falls within ¼ and ¾ of the difference between the full and minimum heating mode speeds. The manufacturer should prescribe an intermediate speed that is expected to yield the highest COP for the given H2_V test conditions and bracketed compressor speed

range. The manufacturer can designate that one or more specific indoor units are turned off for the H2_V test.

3.6.5 Additional Test for a Heat Pump Having a Heat Comfort Controller

Test any heat pump that has a heat comfort controller (see section 1.2 of this appendix, Definitions) according to section 3.6.1, 3.6.2, or 3.6.3, whichever applies, with the heat comfort controller disabled. Additionally, conduct the abbreviated test described in section 3.1.9 of this appendix with the heat comfort controller active to determine the system's maximum supply air temperature. (Note: heat pumps having a variable speed

compressor and a heat comfort controller are not covered in the test procedure at this time.)

3.6.6 Heating Mode Tests for Northern Heat Pumps With Triple-Capacity Compressors

Test triple-capacity, northern heat pumps for the heating mode as follows:

a. Conduct one maximum-temperature test (H0₁), two high-temperature tests (H1₂ and H1₁), one frost accumulation test (H2₂), two low-temperature tests (H3₂, H3₃), and one minimum-temperature test (H4₃). Conduct an additional frost accumulation test (H2₁) and low-temperature test (H3₁) if both of the following conditions exist: (1) Knowledge of

the heat pump's capacity and electrical power at low compressor capacity for outdoor temperatures of 37 °F and less is needed to complete the section 4.2.6 seasonal performance calculations; and (2) the heat pump's controls allow low-capacity operation at outdoor temperatures of 37 °F and less. If the above two conditions are met, an alternative to conducting the H2₁ frost accumulation test to determine $\dot{Q}_{h,k=1}(35)$ and $\dot{E}_{h,k=1}(35)$ is to use the following equations to approximate this capacity and electrical power:

$$\dot{Q}_{h,k=1}(35) = 0.90 * \{ \dot{Q}_{h,k=1}(17) + 0.6 * [\dot{Q}_{h,k=1}(47) - \dot{Q}_{h,k=1}(17)] \}$$

$$\dot{E}_{h,k=1}(35) = 0.985 * \{ \dot{E}_{h,k=1}(17) + 0.6 * [\dot{E}_{h,k=1}(47) - \dot{E}_{h,k=1}(17)] \}$$

In evaluating the above equations, determine the quantities $\dot{Q}_{h,k=1}(47)$ from the H1₁ test and evaluate them according to section 3.7 of this appendix. Determine the quantities $\dot{Q}_{h,k=1}(17)$ and $\dot{E}_{h,k=1}(17)$ from the H3₁ test and evaluate them according to section 3.10 of this appendix. Use the paired values of $\dot{Q}_{h,k=1}(35)$ and $\dot{E}_{h,k=1}(35)$ derived from conducting the H2₁ frost accumulation test and evaluated as specified in section 3.9.1 of this appendix or use the paired values calculated using the above default

equations, whichever contribute to a higher Region IV HSPF based on the DHRmin.

b. Conducting a frost accumulation test (H2₃) with the heat pump operating at its booster capacity is optional. If this optional test is not conducted, determine $\dot{Q}_{h,k=3}(35)$ and $\dot{E}_{h,k=3}(35)$ using the following equations to approximate this capacity and electrical power:

$$\dot{Q}_{h,k=3}(35) = \dot{Q}_{R,k=2}(35) * \{ \dot{Q}_{h,k=3}(17) + 1.20 * [\dot{Q}_{h,k=3}(17) - \dot{Q}_{h,k=3}(2)] \}$$

$$\dot{E}_{h,k=3}(35) = PR_{h,k=2}(35) * \{ \dot{E}_{h,k=3}(17) + 1.20 * [\dot{E}_{h,k=3}(17) - \dot{E}_{h,k=3}(2)] \}$$

Where:

$$QR_{h,k=2}(35) = \frac{\dot{Q}_{h,k=2}(35)}{\dot{Q}_{h,k=2}(17) + 0.6 * [\dot{Q}_{h,k=2}(47) - \dot{Q}_{h,k=2}(17)]}$$

$$PR_{h,k=2}(35) = \frac{\dot{E}_{h,k=2}(35)}{\dot{E}_{h,k=2}(17) + 0.6 * [\dot{E}_{h,k=2}(47) - \dot{E}_{h,k=2}(17)]}$$

Determine the quantities $\dot{Q}_{h,k=2}(47)$ and $\dot{E}_{h,k=2}(47)$ from the H1₂ test and evaluate them according to section 3.7 of this appendix. Determine the quantities $\dot{Q}_{h,k=2}(35)$ and $\dot{E}_{h,k=2}(35)$ from the H2₂ test and evaluate them according to section 3.9.1 of this appendix. Determine the quantities $\dot{Q}_{h,k=2}(17)$ and $\dot{E}_{h,k=2}(17)$ from the H3₂ test, determine the quantities $\dot{Q}_{h,k=3}(17)$ and $\dot{E}_{h,k=3}(17)$ from the H3₃ test, and determine the quantities $\dot{Q}_{h,k=3}(2)$ and $\dot{E}_{h,k=3}(2)$ from the H4₃ test. Evaluate all six quantities according to section 3.10 of this appendix. Use the paired values of $\dot{Q}_{h,k=3}(35)$ and $\dot{E}_{h,k=3}(35)$ derived from conducting the H2₃ frost accumulation

test and calculated as specified in section 3.9.1 of this appendix or use the paired values calculated using the above default equations, whichever contribute to a higher Region IV HSPF based on the DHRmin.

c. Conduct the optional high-temperature cyclic test (H1C₁) to determine the heating mode cyclic-degradation coefficient, C_{D^h} . A default value for C_{D^h} of 0.25 may be used in lieu of conducting the cyclic. If a triple-capacity heat pump locks out low capacity operation at lower outdoor temperatures, conduct the high-temperature cyclic test (H1C₂) to determine the high-capacity heating mode cyclic-degradation coefficient,

C_{D^h} (k=2). The default C_{D^h} (k=2) is the same value as determined or assigned for the low-capacity cyclic-degradation coefficient, C_{D^h} [or equivalently, C_{D^h} (k=1)]. Finally, if a triple-capacity heat pump locks out both low and high capacity operation at the lowest outdoor temperatures, conduct the low-temperature cyclic test (H3C₃) to determine the booster-capacity heating mode cyclic-degradation coefficient, C_{D^h} (k=3). The default C_{D^h} (k=3) is the same value as determined or assigned for the high-capacity cyclic-degradation coefficient, C_{D^h} [or equivalently, C_{D^h} (k=2)]. Table 14 specifies test conditions for all 13 tests.

TABLE 14—HEATING MODE TEST CONDITIONS FOR UNITS WITH A TRIPLE-CAPACITY COMPRESSOR

Test description	Air entering indoor unit temperature °F		Air entering outdoor unit temperature °F		Compressor capacity	Heating air volume rate
	Dry bulb	Wet bulb	Dry bulb	Wet bulb		
H0 ₁ Test (required, steady)	70	60 (max)	62	56.5	Low	Heating Minimum. ¹
H1 ₂ Test (required, steady)	70	60 (max)	47	43	High	Heating Full-Load. ²
H1C ₂ Test (optional ⁸ , cyclic)	70	60 (max)	47	43	High	(³).
H1 ₁ Test (required)	70	60 (max)	47	43	Low	Heating Minimum. ¹
H1C ₁ Test (optional, cyclic)	70	60 (max)	47	43	Low	(⁴).
H2 ₃ Test (optional, steady)	70	60 (max)	35	33	Booster	Heating Full-Load. ²
H2 ₂ Test (required)	70	60 (max)	35	33	High	Heating Full-Load. ²
H2 ₁ Test (required)	70	60 (max)	35	33	Low	Heating Minimum. ¹
H3 ₃ Test (required, steady)	70	60 (max)	17	15	Booster	Heating Full-Load. ²
H3C ₃ Test ^{5,6} (optional, cyclic)	70	60 (max)	17	15	Booster	(⁷).
H3 ₂ Test (required, steady)	70	60 (max)	17	15	High	Heating Full-Load. ²
H3 ₁ Test ⁵ (required, steady)	70	60 (max)	17	15	Low	Heating Minimum. ¹

TABLE 14—HEATING MODE TEST CONDITIONS FOR UNITS WITH A TRIPLE-CAPACITY COMPRESSOR—Continued

Test description	Air entering indoor unit temperature °F		Air entering outdoor unit temperature °F		Compressor capacity	Heating air volume rate
	Dry bulb	Wet bulb	Dry bulb	Wet bulb		
H4 ₃ Test (required, steady)	70	60 (max)	2	1	Booster	Heating Full-Load. ²

¹ Defined in section 3.1.4.5 of this appendix.

² Defined in section 3.1.4.4 of this appendix.

³ Maintain the airflow nozzle(s) static pressure difference or velocity pressure during the ON period at the same pressure or velocity as measured during the H1₂ test.

⁴ Maintain the airflow nozzle(s) static pressure difference or velocity pressure during the ON period at the same pressure or velocity as measured during the H1₁ test.

⁵ Required only if the heat pump's performance when operating at low compressor capacity and outdoor temperatures less than 37 °F is needed to complete the section 4.2.6 HSPF calculations.

⁶ If table note ⁵ applies, the section 3.6.6 equations for $\dot{Q}_{h,k=1}(35)$ and $\dot{E}_{h,k=1}(17)$ may be used in lieu of conducting the H2₁ test.

⁷ Maintain the airflow nozzle(s) static pressure difference or velocity pressure during the ON period at the same pressure or velocity as measured during the H3₃ test.

⁸ Required only if the heat pump locks out low capacity operation at lower outdoor temperatures.

3.6.7 Tests for a Heat Pump Having a Single Indoor Unit Having Multiple Indoor Blowers and Offering Two Stages of Compressor Modulation

Conduct the heating mode tests specified in section 3.6.3 of this appendix.

3.7 Test Procedures for Steady-State Maximum Temperature and High Temperature Heating Mode Tests (the H0₁, H1, H1₂, H1₁, and H1_N Tests)

a. For the pretest interval, operate the test room reconditioning apparatus and the heat pump until equilibrium conditions are maintained for at least 30 minutes at the

specified section 3.6 test conditions. Use the exhaust fan of the airflow measuring apparatus and, if installed, the indoor blower of the heat pump to obtain and then maintain the indoor air volume rate and/or the external static pressure specified for the particular test. Continuously record the dry-bulb temperature of the air entering the indoor coil, and the dry-bulb temperature and water vapor content of the air entering the outdoor coil. Refer to section 3.11 of this appendix for additional requirements that depend on the selected secondary test method. After satisfying the pretest equilibrium requirements, make the measurements specified in Table 3 of ANSI/

ASHRAE 37–2009 (incorporated by reference, see § 430.3) for the indoor air enthalpy method and the user-selected secondary method. Make said Table 3 measurements at equal intervals that span 5 minutes or less. Continue data sampling until a 30-minute period (e.g., seven consecutive 5-minute samples) is reached where the test tolerances specified in Table 15 are satisfied. For those continuously recorded parameters, use the entire data set for the 30-minute interval when evaluating Table 15 compliance. Determine the average electrical power consumption of the heat pump over the same 30-minute interval.

TABLE 15—TEST OPERATING AND TEST CONDITION TOLERANCES FOR SECTION 3.7 AND SECTION 3.10 STEADY-STATE HEATING MODE TESTS

	Test operating tolerance ¹	Test condition tolerance ¹
Indoor dry-bulb, °F:
Entering temperature	2.0	0.5
Leaving temperature	2.0
Indoor wet-bulb, °F:
Entering temperature	1.0
Leaving temperature	1.0
Outdoor dry-bulb, °F:
Entering temperature	2.0	0.5
Leaving temperature	² 2.0
Outdoor wet-bulb, °F:
Entering temperature	1.0	0.3
Leaving temperature	² 1.0
External resistance to airflow, inches of water	0.05	³ 0.02
Electrical voltage, % of rdg	2.0	1.5
Nozzle pressure drop, % of rdg	2.0

¹ See section 1.2 of this appendix, Definitions.

² Only applies when the Outdoor Air Enthalpy Method is used.

³ Only applies when testing non-ducted units.

b. Calculate indoor-side total heating capacity as specified in sections 7.3.4.1 and 7.3.4.3 of ANSI/ASHRAE 37–2009 (incorporated by reference, see § 430.3). To calculate capacity, use the averages of the measurements (e.g. inlet and outlet dry bulb temperatures measured at the psychrometers) that are continuously recorded for the same

30-minute interval used as described above to evaluate compliance with test tolerances. Do not adjust the parameters used in calculating capacity for the permitted variations in test conditions. Assign the average space heating capacity and electrical power over the 30-minute data collection interval to the variables $\dot{Q}_{h,k}$ and $\dot{E}_{h,k}(T)$

respectively. The “T” and superscripted “k” are the same as described in section 3.3 of this appendix. Additionally, for the heating mode, use the superscript to denote results from the optional H1_N test, if conducted.

c. For mobile home coil-only system heat pumps, increase $\dot{Q}_{h,k}(T)$ by

$$\frac{1385 \text{ BTU/h}}{1000 \text{ scfm}} * \bar{V}_s$$

and increase $\dot{E}_h^k(T)$ by,

$$\frac{406 \text{ W}}{1000 \text{ scfm}} * \bar{V}_s$$

where \bar{V}_s is the average measured indoor air volume rate expressed in units of cubic feet per minute of standard air (scfm).

For non-mobile home coil-only system heat pumps, increase $\dot{Q}_h^k(T)$ by

$$\frac{1505 \text{ BTU/h}}{1000 \text{ scfm}} * \bar{V}_s$$

and increase $\dot{E}_h^k(T)$ by,

$$\frac{441 \text{ W}}{1000 \text{ scfm}} * \bar{V}_s$$

where \bar{V}_s is the average measured indoor air volume rate expressed in units of cubic feet per minute of standard air (scfm). During the 30-minute data collection interval of a high temperature test, pay attention to preventing a defrost cycle. Prior to this time, allow the heat pump to perform a defrost cycle if automatically initiated by its own controls. As in all cases, wait for the heat pump's defrost controls to automatically terminate the defrost cycle. Heat pumps that undergo a defrost should operate in the heating mode for at least 10 minutes after defrost termination prior to beginning the 30-minute data collection interval. For some heat pumps, frost may accumulate on the outdoor coil during a high temperature test. If the indoor coil leaving air temperature or the difference between the leaving and entering air temperatures decreases by more than 1.5 °F over the 30-minute data collection interval, then do not use the collected data to determine capacity. Instead, initiate a defrost cycle. Begin collecting data no sooner than 10 minutes after defrost termination.

Collect 30 minutes of new data during which the Table 15 test tolerances are satisfied. In this case, use only the results from the second 30-minute data collection interval to evaluate $\dot{Q}_h^k(47)$ and $\dot{E}_h^k(47)$.

d. If conducting the cyclic heating mode test, which is described in section 3.8 of this appendix, record the average indoor-side air volume rate, \bar{V} , specific heat of the air, $C_{p,a}$ (expressed on dry air basis), specific volume of the air at the nozzles, v_n' (or v_n), humidity ratio at the nozzles, W_n , and either pressure difference or velocity pressure for the flow nozzles. If either or both of the below criteria apply, determine the average, steady-state, electrical power consumption of the indoor blower motor ($\dot{E}_{fan,1}$):

(1) The section 3.8 cyclic test will be conducted and the heat pump has a variable-speed indoor blower that is expected to be disabled during the cyclic test; or

(2) The heat pump has a (variable-speed) constant-air volume-rate indoor blower and during the steady-state test the average external static pressure (ΔP_1) exceeds the

applicable section 3.1.4.4 minimum (or targeted) external static pressure (ΔP_{min}) by 0.03 inches of water or more.

Determine $\dot{E}_{fan,1}$ by making measurements during the 30-minute data collection interval, or immediately following the test and prior to changing the test conditions. When the above "2" criteria applies, conduct the following four steps after determining $\dot{E}_{fan,1}$ (which corresponds to ΔP_1):

(i) While maintaining the same test conditions, adjust the exhaust fan of the airflow measuring apparatus until the external static pressure increases to approximately $\Delta P_1 + (\Delta P_1 - \Delta P_{min})$.

(ii) After re-establishing steady readings for fan motor power and external static pressure, determine average values for the indoor blower power ($\dot{E}_{fan,2}$) and the external static pressure (ΔP_2) by making measurements over a 5-minute interval.

(iii) Approximate the average power consumption of the indoor blower motor if the 30-minute test had been conducted at ΔP_{min} using linear extrapolation:

$$\dot{E}_{fan,min} = \frac{\dot{E}_{fan,2} - \dot{E}_{fan,1}}{\Delta P_2 - \Delta P_1} (\Delta P_{min} - \Delta P_1) + \dot{E}_{fan,1}$$

(iv) Decrease the total space heating capacity, $\dot{Q}_h^k(T)$, by the quantity ($\dot{E}_{fan,1} - \dot{E}_{fan,min}$), when expressed on a Btu/h basis. Decrease the total electrical power, $\dot{E}_h^k(T)$ by the same fan power difference, now expressed in watts.

e. If the temperature sensors used to provide the primary measurement of the

indoor-side dry bulb temperature difference during the steady-state dry-coil test and the subsequent cyclic dry-coil test are different, include measurements of the latter sensors among the regularly sampled data. Beginning at the start of the 30-minute data collection period, measure and compute the indoor-side air dry-bulb temperature difference using

both sets of instrumentation, ΔT (Set SS) and ΔT (Set CYC), for each equally spaced data sample. If using a consistent data sampling rate that is less than 1 minute, calculate and record minutely averages for the two temperature differences. If using a consistent sampling rate of one minute or more, calculate and record the two temperature

differences from each data sample. After having recorded the seventh ($i=7$) set of temperature differences, calculate the following ratio using the first seven sets of values:

$$F_{CD} = \frac{1}{7} \sum_{i=6}^i \frac{\Delta T(\text{Set SS})}{\Delta T(\text{Set CYC})}$$

Each time a subsequent set of temperature differences is recorded (if sampling more frequently than every 5 minutes), calculate F_{CD} using the most recent seven sets of values. Continue these calculations until the 30-minute period is completed or until a value for F_{CD} is calculated that falls outside the allowable range of 0.94–1.06. If the latter occurs, immediately suspend the test and identify the cause for the disparity in the two temperature difference measurements. Recalibration of one or both sets of instrumentation may be required. If all the values for F_{CD} are within the allowable range, save the final value of the ratio from the 30-minute test as F_{CD}^* . If the temperature sensors used to provide the primary measurement of the indoor-side dry bulb temperature difference during the steady-state dry-coil test and the subsequent cyclic dry-coil test are the same, set $F_{CD}^* = 1$.

3.8 Test Procedures for the Cyclic Heating Mode Tests (the H0C₁, H1C, H1C₁ and H1C₂ Tests)

a. Except as noted below, conduct the cyclic heating mode test as specified in section 3.5 of this appendix. As adapted to the heating mode, replace section 3.5 references to “the steady-state dry coil test” with “the heating mode steady-state test

conducted at the same test conditions as the cyclic heating mode test.” Use the test tolerances in Table 16 rather than Table 9. Record the outdoor coil entering wet-bulb temperature according to the requirements given in section 3.5 of this appendix for the outdoor coil entering dry-bulb temperature. Drop the subscript “dry” used in variables cited in section 3.5 of this appendix when referring to quantities from the cyclic heating mode test. If available, use electric resistance heaters (see section 2.1 of this appendix) to minimize the variation in the inlet air temperature. Determine the total space heating delivered during the cyclic heating test, q_{cyc} , as specified in section 3.5 of this appendix except for making the following changes:

(1) When evaluating Equation 3.5–1, use the values of \dot{V} , $C_{p,a}, v_n'$, (or v_n), and W_n that were recorded during the section 3.7 steady-state test conducted at the same test conditions.

(2) Calculate Γ using, $\Gamma = F_{CD}^* \tau_1 \tau_2 [T_{a1}(\tau) - T_{a2}(\tau)] \delta \tau, \text{ hr} \times ^\circ \text{F}$, where F_{CD}^* is the value recorded during the section 3.7 steady-state test conducted at the same test condition.

b. For ducted coil-only system heat pumps (excluding the special case where a variable-speed fan is temporarily removed), increase q_{cyc} by the amount calculated using Equation 3.5–3. Additionally, increase e_{cyc} by the amount calculated using Equation 3.5–2. In making these calculations, use the average indoor air volume rate (\dot{V}_s) determined from the section 3.7 steady-state heating mode test conducted at the same test conditions.

c. For non-ducted heat pumps, subtract the electrical energy used by the indoor blower during the 3 minutes after compressor cutoff

from the non-ducted heat pump’s integrated heating capacity, q_{cyc} .

d. If a heat pump defrost cycle is manually or automatically initiated immediately prior to or during the OFF/ON cycling, operate the heat pump continuously until 10 minutes after defrost termination. After that, begin cycling the heat pump immediately or delay until the specified test conditions have been re-established. Pay attention to preventing defrosts after beginning the cycling process. For heat pumps that cycle off the indoor blower during a defrost cycle, make no effort here to restrict the air movement through the indoor coil while the fan is off. Resume the OFF/ON cycling while conducting a minimum of two complete compressor OFF/ON cycles before determining q_{cyc} and e_{cyc} .

3.8.1 Heating Mode Cyclic-Degradation Coefficient Calculation

Use the results from the required cyclic test and the required steady-state test that were conducted at the same test conditions to determine the heating mode cyclic-degradation coefficient C_D^h . Add “(k=2)” to the coefficient if it corresponds to a two-capacity unit cycling at high capacity. For the below calculation of the heating mode cyclic degradation coefficient, do not include the duct loss correction from section 7.3.3.3 of ANSI/ASHRAE 37–2009 (incorporated by reference, see § 430.3) in determining $\dot{Q}_h^k(T_{cyc})$ (or q_{cyc}). If the optional cyclic test is conducted but yields a tested C_D^h that exceeds the default C_D^h or if the optional test is not conducted, assign C_D^h the default value of 0.25. The default value for two-capacity units cycling at high capacity, however, is the low-capacity coefficient, *i.e.*, $C_D^h(k=2) = C_D^h$. The tested C_D^h is calculated as follows:

$$C_D^h = \frac{1 - \frac{COP_{cyc}}{COP_{ss}(T_{cyc})}}{1 - HLF}$$

where:

$$COP_{cyc} = \frac{q_{cyc}}{3.413 \frac{\text{Btu/h}}{W} * e_{cyc}}$$

the average coefficient of performance during the cyclic heating mode test,

dimensionless.

$$COP_{ss}(T_{cyc}) = \frac{\dot{Q}_h^k(T_{cyc})}{3.413 \frac{\text{Btu/h}}{W} * \dot{E}_h^k(T_{cyc})}$$

the average coefficient of performance during the steady-state heating mode test conducted at the same test conditions—*i.e.*, same outdoor dry bulb temperature, T_{cyc} , and speed/capacity, k, if applicable—as specified

for the cyclic heating mode test, dimensionless.

$$HLF = \frac{q_{cyc}}{\dot{Q}_h^k(T_{cyc}) * \Delta \tau_{cyc}}$$

the heating load factor, dimensionless.

T_{cyc} = the nominal outdoor temperature at which the cyclic heating mode test is conducted, 62 or 47 °F.
 Δt_{cyc} = the duration of the OFF/ON intervals; 0.5 hours when testing a heat pump

having a single-speed or two-capacity compressor and 1.0 hour when testing a heat pump having a variable-speed compressor.

Round the calculated value for C_D^h to the nearest 0.01. If C_D^h is negative, then set it equal to zero.

TABLE 16—TEST OPERATING AND TEST CONDITION TOLERANCES FOR CYCLIC HEATING MODE TESTS

	Test operating tolerance ¹	Test condition tolerance ¹
Indoor entering dry-bulb temperature, ² °F	2.0	0.5
Indoor entering wet-bulb temperature, ² °F	1.0
Outdoor entering dry-bulb temperature, ² °F	2.0	0.5
Outdoor entering wet-bulb temperature, ² °F	2.0	1.0
External resistance to air-flow, ² inches of water	0.05
Airflow nozzle pressure difference or velocity pressure, ^{2%} of reading	2.0	32.0
Electrical voltage, ^{4%} of rdg	2.0	1.5

¹See section 1.2 of this appendix, Definitions.

²Applies during the interval that air flows through the indoor (outdoor) coil except for the first 30 seconds after flow initiation. For units having a variable-speed indoor blower that ramps, the tolerances listed for the external resistance to airflow shall apply from 30 seconds after achieving full speed until ramp down begins.

³The test condition must be the average nozzle pressure difference or velocity pressure measured during the steady-state test conducted at the same test conditions.

⁴Applies during the interval that at least one of the following—the compressor, the outdoor fan, or, if applicable, the indoor blower—are operating, except for the first 30 seconds after compressor start-up.

3.9 Test Procedures for Frost Accumulation Heating Mode Tests (the H₂, H₂₂, H₂_v, and H₂₁ Tests)

a. Confirm that the defrost controls of the heat pump are set as specified in section 2.2.1 of this appendix. Operate the test room reconditioning apparatus and the heat pump for at least 30 minutes at the specified section 3.6 test conditions before starting the “preliminary” test period. The preliminary test period must immediately precede the “official” test period, which is the heating and defrost interval over which data are collected for evaluating average space heating capacity and average electrical power consumption.

b. For heat pumps containing defrost controls which are likely to cause defrosts at intervals less than one hour, the preliminary test period starts at the termination of an automatic defrost cycle and ends at the termination of the next occurring automatic defrost cycle. For heat pumps containing defrost controls which are likely to cause defrosts at intervals exceeding one hour, the preliminary test period must consist of a heating interval lasting at least one hour followed by a defrost cycle that is either manually or automatically initiated. In all cases, the heat pump’s own controls must govern when a defrost cycle terminates.

c. The official test period begins when the preliminary test period ends, at defrost termination. The official test period ends at the termination of the next occurring automatic defrost cycle. When testing a heat pump that uses a time-adaptive defrost

control system (see section 1.2 of this appendix, Definitions), however, manually initiate the defrost cycle that ends the official test period at the instant indicated by instructions provided by the manufacturer. If the heat pump has not undergone a defrost after 6 hours, immediately conclude the test and use the results from the full 6-hour period to calculate the average space heating capacity and average electrical power consumption.

For heat pumps that turn the indoor blower off during the defrost cycle, take steps to cease forced airflow through the indoor coil and block the outlet duct whenever the heat pump’s controls cycle off the indoor blower. If it is installed, use the outlet damper box described in section 2.5.4.1 of this appendix to affect the blocked outlet duct.

d. Defrost termination occurs when the controls of the heat pump actuate the first change in converting from defrost operation to normal heating operation. Defrost initiation occurs when the controls of the heat pump first alter its normal heating operation in order to eliminate possible accumulations of frost on the outdoor coil.

e. To constitute a valid frost accumulation test, satisfy the test tolerances specified in Table 17 during both the preliminary and official test periods. As noted in Table 17, test operating tolerances are specified for two sub-intervals: (1) When heating, except for the first 10 minutes after the termination of a defrost cycle (sub-interval H, as described in Table 17) and (2) when defrosting, plus these same first 10 minutes after defrost termination (sub-interval D, as described in

Table 17). Evaluate compliance with Table 17 test condition tolerances and the majority of the test operating tolerances using the averages from measurements recorded only during sub-interval H. Continuously record the dry bulb temperature of the air entering the indoor coil, and the dry bulb temperature and water vapor content of the air entering the outdoor coil. Sample the remaining parameters listed in Table 17 at equal intervals that span 5 minutes or less.

f. For the official test period, collect and use the following data to calculate average space heating capacity and electrical power. During heating and defrosting intervals when the controls of the heat pump have the indoor blower on, continuously record the dry-bulb temperature of the air entering (as noted above) and leaving the indoor coil. If using a thermopile, continuously record the difference between the leaving and entering dry-bulb temperatures during the interval(s) that air flows through the indoor coil. For coil-only system heat pumps, determine the corresponding cumulative time (in hours) of indoor coil airflow, Δt_a . Sample measurements used in calculating the air volume rate (refer to sections 7.7.2.1 and 7.7.2.2 of ANSI/ASHRAE 37–2009) at equal intervals that span 10 minutes or less. (Note: In the first printing of ANSI/ASHRAE 37–2009, the second IP equation for Q_{mi} should read:) Record the electrical energy consumed, expressed in watt-hours, from defrost termination to defrost termination, $e_{DEF}^k(35)$, as well as the corresponding elapsed time in hours, Δt_{FR} .

TABLE 17—TEST OPERATING AND TEST CONDITION TOLERANCES FOR FROST ACCUMULATION HEATING MODE TESTS

	Test operating tolerance ¹		Test condition tolerance ¹ Sub-interval H ²
	Sub-interval H ²	Sub-interval D ³	
Indoor entering dry-bulb temperature, °F	2.0	4.0	0.5
Indoor entering wet-bulb temperature, °F	1.0
Outdoor entering dry-bulb temperature, °F	2.0	10.0	1.0

TABLE 17—TEST OPERATING AND TEST CONDITION TOLERANCES FOR FROST ACCUMULATION HEATING MODE TESTS—Continued

	Test operating tolerance ¹		Test condition tolerance ¹ Sub-interval H ²
	Sub-interval H ²	Sub-interval D ³	
Outdoor entering wet-bulb temperature, °F	1.5	0.5
External resistance to airflow, inches of water	0.05	⁵ 0.02
Electrical voltage, % of rdg	2.0	1.5

¹ See section 1.2 of this appendix, Definitions.

² Applies when the heat pump is in the heating mode, except for the first 10 minutes after termination of a defrost cycle.

³ Applies during a defrost cycle and during the first 10 minutes after the termination of a defrost cycle when the heat pump is operating in the heating mode.

⁴ For heat pumps that turn off the indoor blower during the defrost cycle, the noted tolerance only applies during the 10 minute interval that follows defrost termination.

⁵ Only applies when testing non-ducted heat pumps.

3.9.1 Average Space Heating Capacity and Electrical Power Calculations

a. Evaluate average space heating capacity, $\dot{Q}_h^k(35)$, when expressed in units of Btu per hour, using:

$$\dot{Q}_h^k(35) = \frac{60 * \bar{V} * C_{p,a} * \Gamma}{\Delta\tau_{FR}[\nu_n' * (1 + W_n)]} = \frac{60 * \bar{V} * C_{p,a} * \Gamma}{\Delta\tau_{FR}\nu_n}$$

Where,

\bar{V} = the average indoor air volume rate measured during sub-interval H, cfm.

$C_{p,a} = 0.24 + 0.444 \cdot W_n$, the constant pressure specific heat of the air-water vapor mixture that flows through the indoor coil and is expressed on a dry air basis, Btu/lbm_{da} · °F.

ν_n' = specific volume of the air-water vapor mixture at the nozzle, ft³/lbm_{mx}.

W_n = humidity ratio of the air-water vapor mixture at the nozzle, lbm of water vapor per lbm of dry air.

$\Delta\tau_{FR} = \tau_2 - \tau_1$, the elapsed time from defrost termination to defrost termination, hr.

$\Gamma = \int_{\tau_{au};2\tau_1} [T_{a2}(\tau) - T_{a1}(\tau)] d\tau$, hr * °F

$T_{a1}(\tau)$ = dry bulb temperature of the air entering the indoor coil at elapsed time τ , °F; only recorded when indoor coil airflow occurs; assigned the value of zero during periods (if any) where the indoor blower cycles off.

$T_{a2}(\tau)$ = dry bulb temperature of the air leaving the indoor coil at elapsed time τ , °F; only recorded when indoor coil airflow occurs; assigned the value of zero during periods (if any) where the indoor blower cycles off.

τ_1 = the elapsed time when the defrost termination occurs that begins the official test period, hr.

τ_2 = the elapsed time when the next automatically occurring defrost

termination occurs, thus ending the official test period, hr.

ν_n = specific volume of the dry air portion of the mixture evaluated at the dry-bulb temperature, vapor content, and barometric pressure existing at the nozzle, ft³ per lbm of dry air.

To account for the effect of duct losses between the outlet of the indoor unit and the section 2.5.4 dry-bulb temperature grid, adjust $\dot{Q}_h^k(35)$ in accordance with section 7.3.4.3 of ANSI/ASHRAE 37–2009 (incorporated by reference, see § 430.3).

b. Evaluate average electrical power, $\dot{E}_h^k(35)$, when expressed in units of watts, using:

$$\dot{E}_h^k(35) = \frac{e_{def}(35)}{\Delta \tau_{FR}}$$

For mobile home coil-only system heat pumps, increase $\dot{Q}_h^k(35)$ by

$$\frac{1385 \text{ BTU/h}}{1000 \text{ scfm}} * \bar{V}_s$$

and increase $\dot{E}_h^k(35)$ by,

$$\frac{406 \text{ W}}{1000 \text{ scfm}} * \bar{V}_s$$

where \bar{V}_s is the average measured indoor air volume rate expressed in units of cubic feet per minute of standard air (scfm).

For non-mobile home coil-only system heat pumps, increase $\dot{Q}_h^k(35)$ by

$$\frac{1505 \text{ BTU/h}}{1000 \text{ scfm}} * \bar{V}_s$$

and increase $\dot{E}_h^k(35)$ by,

$$\frac{441 \text{ W}}{1000 \text{ scfm}} * \bar{V}_s$$

where \bar{V}_s is the average measured indoor air volume rate expressed in units of cubic feet per minute of standard air (scfm).

c. For heat pumps having a constant-air-volume-rate indoor blower, the five additional steps listed below are required if the average of the external static pressures measured during sub-interval H exceeds the applicable section 3.1.4.4, 3.1.4.5, or 3.1.4.6 minimum (or targeted) external static pressure (ΔP_{\min}) by 0.03 inches of water or more:

(1) Measure the average power consumption of the indoor blower motor

($\dot{E}_{fan,1}$) and record the corresponding external static pressure (ΔP_1) during or immediately following the frost accumulation heating mode test. Make the measurement at a time when the heat pump is heating, except for the first 10 minutes after the termination of a defrost cycle.

(2) After the frost accumulation heating mode test is completed and while maintaining the same test conditions, adjust the exhaust fan of the airflow measuring apparatus until the external static pressure increases to approximately $\Delta P_1 + (\Delta P_1 - \Delta P_{\min})$.

(3) After re-establishing steady readings for the fan motor power and external static pressure, determine average values for the indoor blower power ($\dot{E}_{fan,2}$) and the external static pressure (ΔP_2) by making measurements over a 5-minute interval.

(4) Approximate the average power consumption of the indoor blower motor had the frost accumulation heating mode test been conducted at ΔP_{\min} using linear extrapolation:

$$\dot{E}_{fan,\min} = \frac{\dot{E}_{fan,2} - \dot{E}_{fan,1}}{\Delta P_2 - \Delta P_1} (\Delta P_{\min} - \Delta P_1) + \dot{E}_{fan,1}$$

(5) Decrease the total heating capacity, $\dot{Q}_h^k(35)$, by the quantity $[(\dot{E}_{fan,1} - \dot{E}_{fan,\min}) \cdot (\Delta \tau_a / \Delta \tau_{FR})]$, when expressed on a Btu/h basis. Decrease the total electrical power, $E_h^k(35)$,

by the same quantity, now expressed in watts.

3.9.2 Demand Defrost Credit

a. Assign the demand defrost credit, F_{def} , that is used in section 4.2 of this appendix

to the value of 1 in all cases except for heat pumps having a demand-defrost control system (see section 1.2 of this appendix, Definitions). For such qualifying heat pumps, evaluate F_{def} using,

$$F_{def} = 1 + 0.03 * \left[1 - \frac{\Delta \tau_{def} - 1.5}{\Delta \tau_{\max} - 1.5} \right]$$

Where:

$\Delta\tau_{\text{def}}$ = the time between defrost terminations (in hours) or 1.5, whichever is greater.

Assign a value of 6 to $\Delta\tau_{\text{def}}$ if this limit is reached during a frost accumulation test and the heat pump has not completed a defrost cycle.

$\Delta\tau_{\text{max}}$ = maximum time between defrosts as allowed by the controls (in hours) or 12, whichever is less, as provided in the certification report.

b. For two-capacity heat pumps and for section 3.6.2 units, evaluate the above equation using the $\Delta\tau_{\text{def}}$ that applies based on the frost accumulation test conducted at high capacity and/or at the heating full-load air volume rate. For variable-speed heat pumps, evaluate $\Delta\tau_{\text{def}}$ based on the required frost accumulation test conducted at the intermediate compressor speed.

3.10 Test Procedures for Steady-State Low Temperature and Very Low Temperature Heating Mode Tests (the H3, H3₂, H3₁, H3₃, H4₃, and H4₂ Tests)

Except for the modifications noted in this section, conduct the low temperature and very low temperature heating mode tests using the same approach as specified in section 3.7 of this appendix for the maximum and high temperature tests. After satisfying the section 3.7 requirements for the pretest interval but before beginning to collect data to determine the capacity and power input, conduct a defrost cycle. This defrost cycle may be manually or automatically initiated. Terminate the defrost sequence using the heat pump's defrost controls. Begin the 30-minute data collection interval described in section 3.7 of this appendix, from which the capacity and power input are determined, no sooner than 10 minutes after defrost termination. Defrosts should be prevented over the 30-minute data collection interval.

3.11 Additional Requirements for the Secondary Test Methods

3.11.1 If Using the Outdoor Air Enthalpy Method as the Secondary Test Method

a. For all cooling mode and heating mode tests, first conduct a test without the outdoor air-side test apparatus described in section 2.10.1 connected to the outdoor unit ("non-ducted" test).

b. For the first section 3.2 steady-state cooling mode test and the first section 3.6 steady-state heating mode test, conduct a second test in which the outdoor-side apparatus is connected ("ducted" test). No other cooling mode or heating mode tests require the ducted test so long as the unit operates the outdoor fan during all cooling mode steady-state tests at the same speed and all heating mode steady-state tests at the same speed. If using more than one outdoor fan speed for the cooling mode steady-state tests, however, conduct the ducted test for each cooling mode test where a different fan speed is first used. This same requirement applies for the heating mode tests.

3.11.1.3 Non-Ducted Test

a. For the non-ducted test, connect the indoor air-side test apparatus to the indoor coil; do not connect the outdoor air-side test apparatus. Allow the test room reconditioning apparatus and the unit being

tested to operate for at least one hour. After attaining equilibrium conditions, measure the following quantities at equal intervals that span 5 minutes or less:

- (1) The section 2.10.1 evaporator and condenser temperatures or pressures;
- (2) Parameters required according to the Indoor Air Enthalpy Method.

Continue these measurements until a 30-minute period (e.g., seven consecutive 5-minute samples) is obtained where the Table 8 or Table 15, whichever applies, test tolerances are satisfied.

b. For cases where a ducted test is not required per section 3.11.1.b of this appendix, the non-ducted test constitutes the "official" test for which validity is not based on comparison with a secondary test.

c. For cases where a ducted test is required per section 3.11.1.b of this appendix, the following conditions must be met for the non-ducted test to constitute a valid "official" test:

(1) The energy balance specified in section 3.1.1 is achieved for the ducted test (*i.e.*, compare the capacities determined using the indoor air enthalpy method and the outdoor air enthalpy method).

(2) The capacities determined using the indoor air enthalpy method from the ducted and non-ducted tests must agree within 2.0 percent.

3.11.1.4 Ducted Test

a. The test conditions and tolerances for the ducted test are the same as specified for the official test.

b. After collecting 30 minutes of steady-state data during the non-ducted test, connect the outdoor air-side test apparatus to the unit for the ducted test. Adjust the exhaust fan of the outdoor airflow measuring apparatus until averages for the evaporator and condenser temperatures, or the saturated temperatures corresponding to the measured pressures, agree within ± 0.5 °F of the averages achieved during the non-ducted test. Calculate the averages for the ducted test using five or more consecutive readings taken at one minute intervals. Make these consecutive readings after re-establishing equilibrium conditions.

c. During the ducted test, at one minute intervals, measure the parameters required according to the indoor air enthalpy method and the outdoor air enthalpy method.

d. For cooling mode ducted tests, calculate capacity based on outdoor air-enthalpy measurements as specified in sections 7.3.3.2 and 7.3.3.3 of ANSI/ASHRAE 37–2009 (incorporated by reference, see § 430.3). For heating mode ducted tests, calculate heating capacity based on outdoor air-enthalpy measurements as specified in sections 7.3.4.2 and 7.3.4.3 of the same ANSI/ASHRAE Standard. Adjust the outdoor-side capacity according to section 7.3.3.4 of ANSI/ASHRAE 37–2009 to account for line losses when testing split systems.

3.11.2 If Using the Compressor Calibration Method as the Secondary Test Method

a. Conduct separate calibration tests using a calorimeter to determine the refrigerant flow rate. Or for cases where the superheat of the refrigerant leaving the evaporator is less than 5 °F, use the calorimeter to measure

total capacity rather than refrigerant flow rate. Conduct these calibration tests at the same test conditions as specified for the tests in this appendix. Operate the unit for at least one hour or until obtaining equilibrium conditions before collecting data that will be used in determining the average refrigerant flow rate or total capacity. Sample the data at equal intervals that span 5 minutes or less. Determine average flow rate or average capacity from data sampled over a 30-minute period where the Table 8 (cooling) or the Table 15 (heating) tolerances are satisfied. Otherwise, conduct the calibration tests according to sections 5, 6, 7, and 8 of ASHRAE 23.1–2010 (incorporated by reference, see § 430.3); sections 5, 6, 7, 8, 9, and 11 of ASHRAE 41.9–2011 (incorporated by reference, see § 430.3); and section 7.4 of ANSI/ASHRAE 37–2009 (incorporated by reference, see § 430.3).

b. Calculate space cooling and space heating capacities using the compressor calibration method measurements as specified in section 7.4.5 and 7.4.6 respectively, of ANSI/ASHRAE 37–2009.

3.11.3 If Using the Refrigerant-Enthalpy Method as the Secondary Test Method

Conduct this secondary method according to section 7.5 of ANSI/ASHRAE 37–2009. Calculate space cooling and heating capacities using the refrigerant-enthalpy method measurements as specified in sections 7.5.4 and 7.5.5, respectively, of the same ASHRAE Standard.

3.12 Rounding of Space Conditioning Capacities for Reporting Purposes

a. When reporting rated capacities, round them off as specified in § 430.23 (for a single unit) and in 10 CFR 429.16 (for a sample).

b. For the capacities used to perform the calculations in section 4 of this appendix, however, round only to the nearest integer.

3.13 Laboratory Testing To Determine Off Mode Average Power Ratings

Voltage tolerances: As a percentage of reading, test operating tolerance must be 2.0 percent and test condition tolerance must be 1.5 percent (see section 1.2 of this appendix for definitions of these tolerances).

Conduct one of the following tests: If the central air conditioner or heat pump lacks a compressor crankcase heater, perform the test in section 3.13.1 of this appendix; if the central air conditioner or heat pump has a compressor crankcase heater that lacks controls and is not self-regulating, perform the test in section 3.13.1 of this appendix; if the central air conditioner or heat pump has a crankcase heater with a fixed power input controlled with a thermostat that measures ambient temperature and whose sensing element temperature is not affected by the heater, perform the test in section 3.13.1 of this appendix; if the central air conditioner or heat pump has a compressor crankcase heater equipped with self-regulating control or with controls for which the sensing element temperature is affected by the heater, perform the test in section 3.13.2 of this appendix.

3.13.1 This test determines the off mode average power rating for central air conditioners and heat pumps that lack a

compressor crankcase heater, or have a compressor crankcase heating system that can be tested without control of ambient temperature during the test. This test has no ambient condition requirements.

a. **Test Sample Set-up and Power Measurement:** For coil-only systems, provide a furnace or modular blower that is compatible with the system to serve as an interface with the thermostat (if used for the test) and to provide low-voltage control circuit power. Make all control circuit connections between the furnace (or modular blower) and the outdoor unit as specified by the manufacturer's installation instructions. Measure power supplied to both the furnace or modular blower and power supplied to the outdoor unit. Alternatively, provide a compatible transformer to supply low-voltage control circuit power, as described in section 2.2.d of this appendix. Measure transformer power, either supplied to the primary winding or supplied by the secondary winding of the transformer, and power supplied to the outdoor unit. For blower coil and single-package systems, make all control circuit connections between components as specified by the manufacturer's installation instructions, and provide power and measure power supplied to all system components.

b. **Configure Controls:** Configure the controls of the central air conditioner or heat pump so that it operates as if connected to a building thermostat that is set to the OFF position. Use a compatible building thermostat if necessary to achieve this configuration. For a thermostat-controlled crankcase heater with a fixed power input, bypass the crankcase heater thermostat if necessary to energize the heater.

c. **Measure P_{2x} :** If the unit has a crankcase heater time delay, make sure that time-delay function is disabled or wait until delay time has passed. Determine the average power from non-zero value data measured over a 5-minute interval of the non-operating central air conditioner or heat pump and designate the average power as P_{2x} , the heating season total off mode power.

d. **Measure P_x for coil-only split systems and for blower coil split systems for which a furnace or a modular blower is the designated air mover:** Disconnect all low-voltage wiring for the outdoor components and outdoor controls from the low-voltage transformer. Determine the average power from non-zero value data measured over a 5-minute interval of the power supplied to the (remaining) low-voltage components of the central air conditioner or heat pump, or low-voltage power, P_x . This power measurement does not include line power supplied to the outdoor unit. It is the line power supplied to the air mover, or, if a compatible transformer is used instead of an air mover, it is the line power supplied to the transformer primary coil. If a compatible transformer is used instead of an air mover and power output of the low-voltage secondary circuit is measured, P_x is zero.

e. **Calculate P_2 :** Set the number of compressors equal to the unit's number of single-stage compressors plus 1.75 times the unit's number of compressors that are not single-stage.

For single-package systems and blower coil split systems for which the designated air

mover is not a furnace or modular blower, divide the heating season total off mode power (P_{2x}) by the number of compressors to calculate P_2 , the heating season per-compressor off mode power. Round P_2 to the nearest watt. The expression for calculating P_2 is as follows:

$$P_2 = \frac{P_{2x}}{\text{number of compressors}}$$

For coil-only split systems and blower coil split systems for which a furnace or a modular blower is the designated air mover, subtract the low-voltage power (P_x) from the heating season total off mode power (P_{2x}) and divide by the number of compressors to calculate P_2 , the heating season per-compressor off mode power. Round P_2 to the nearest watt. The expression for calculating P_2 is as follows:

$$P_2 = \frac{P_{2x} - P_x}{\text{number of compressors}}$$

f. **Shoulder-season per-compressor off mode power, P_1 :** If the system does not have a crankcase heater, has a crankcase heater without controls that is not self-regulating, or has a value for the crankcase heater turn-on temperature (as certified to DOE) that is higher than 71 °F, P_1 is equal to P_2 .

Otherwise, de-energize the crankcase heater (by removing the thermostat bypass or otherwise disconnecting only the power supply to the crankcase heater) and repeat the measurement as described in section 3.13.1.c of this appendix. Designate the measured average power as P_{1x} , the shoulder season total off mode power.

Determine the number of compressors as described in section 3.13.1.e of this appendix.

For single-package systems and blower coil systems for which the designated air mover is not a furnace or modular blower, divide the shoulder season total off mode power (P_{1x}) by the number of compressors to calculate P_1 , the shoulder season per-compressor off mode power. Round P_1 to the nearest watt. The expression for calculating P_1 is as follows:

$$P_1 = \frac{P_{1x}}{\text{number of compressors}}$$

For coil-only split systems and blower coil split systems for which a furnace or a modular blower is the designated air mover, subtract the low-voltage power (P_x) from the shoulder season total off mode power (P_{1x}) and divide by the number of compressors to calculate P_1 , the shoulder season per-compressor off mode power. Round P_1 to the nearest watt. The expression for calculating P_1 is as follows:

$$P_1 = \frac{P_{1x} - P_x}{\text{number of compressors}}$$

3.13.2 This test determines the off mode average power rating for central air conditioners and heat pumps for which ambient temperature can affect the measurement of crankcase heater power.

a. **Test Sample Set-up and Power Measurement:** set up the test and measurement as described in section 3.13.1.a of this appendix.

b. **Configure Controls:** Position a temperature sensor to measure the outdoor dry-bulb temperature in the air between 2 and 6 inches from the crankcase heater control temperature sensor or, if no such temperature sensor exists, position it in the air between 2 and 6 inches from the crankcase heater. Utilize the temperature measurements from this sensor for this portion of the test procedure. Configure the controls of the central air conditioner or heat pump so that it operates as if connected to a building thermostat that is set to the OFF position. Use a compatible building thermostat if necessary to achieve this configuration.

Conduct the test after completion of the B, B₁, or B₂ test. Alternatively, start the test when the outdoor dry-bulb temperature is at 82 °F and the temperature of the compressor shell (or temperature of each compressor's shell if there is more than one compressor) is at least 81 °F. Then adjust the outdoor temperature and achieve an outdoor dry-bulb temperature of 72 °F. If the unit's compressor has no sound blanket, wait at least 4 hours after the outdoor temperature reaches 72 °F. Otherwise, wait at least 8 hours after the outdoor temperature reaches 72 °F. Maintain this temperature within ± 2 °F while the compressor temperature equilibrates and while making the power measurement, as described in section 3.13.2.c of this appendix.

c. **Measure P_{1x} :** If the unit has a crankcase heater time delay, make sure that time-delay function is disabled or wait until delay time has passed. Determine the average power from non-zero value data measured over a 5-minute interval of the non-operating central air conditioner or heat pump and designate the average power as P_{1x} , the shoulder season total off mode power. For units with crankcase heaters which operate during this part of the test and whose controls cycle or vary crankcase heater power over time, the test period shall consist of three complete crankcase heater cycles or 18 hours, whichever comes first. Designate the average power over the test period as P_{1x} , the shoulder season total off mode power.

d. **Reduce outdoor temperature:** Approach the target outdoor dry-bulb temperature by adjusting the outdoor temperature. This target temperature is five degrees Fahrenheit less than the temperature certified by the manufacturer as the temperature at which the crankcase heater turns on. If the unit's compressor has no sound blanket, wait at least 4 hours after the outdoor temperature reaches the target temperature. Otherwise, wait at least 8 hours after the outdoor temperature reaches the target temperature. Maintain the target temperature within ± 2 °F while the compressor temperature equilibrates and while making the power measurement, as described in section 3.13.2.e of this appendix.

e. **Measure P_{2x} :** If the unit has a crankcase heater time delay, make sure that time-delay function is disabled or wait until delay time has passed. Determine the average non-zero power of the non-operating central air conditioner or heat pump over a 5-minute interval and designate it as P_{2x} , the heating season total off mode power. For units with

crankcase heaters whose controls cycle or vary crankcase heater power over time, the test period shall consist of three complete crankcase heater cycles or 18 hours, whichever comes first. Designate the average power over the test period as P_{2x} , the heating season total off mode power.

f. Measure P_x for coil-only split systems and for blower coil split systems for which a furnace or modular blower is the designated air mover: Disconnect all low-voltage wiring for the *outdoor* components and *outdoor* controls from the low-voltage transformer. Determine the average power from non-zero value data measured over a 5-minute interval of the power supplied to the (remaining) low-voltage components of the central air conditioner or heat pump, or low-voltage power, P_x . This power measurement does not include line power supplied to the outdoor unit. It is the line power supplied to the air mover, or, if a compatible transformer is used instead of an air mover, it is the line power supplied to the transformer primary coil. If a compatible transformer is used instead of an air mover and power output of the low-voltage secondary circuit is measured, P_x is zero.

g. Calculate $P1$:

Set the number of compressors equal to the unit's number of single-stage compressors

plus 1.75 times the unit's number of compressors that are not single-stage.

For single-package systems and blower coil split systems for which the air mover is not a furnace or modular blower, divide the shoulder season total off mode power ($P1_x$) by the number of compressors to calculate $P1$, the shoulder season per-compressor off mode power. Round to the nearest watt. The expression for calculating $P1$ is as follows:

$$P1 = \frac{P1_x}{\text{number of compressors}}$$

For coil-only split systems and blower coil split systems for which a furnace or a modular blower is the designated air mover, subtract the low-voltage power (P_x) from the shoulder season total off mode power ($P1_x$) and divide by the number of compressors to calculate $P1$, the shoulder season per-compressor off mode power. Round to the nearest watt. The expression for calculating $P1$ is as follows:

$$P1 = \frac{P1_x - P_x}{\text{number of compressors}}$$

h. Calculate $P2$:

Determine the number of compressors as described in section 3.13.2.g of this appendix.

For, single-package systems and blower coil split systems for which the air mover is

not a furnace, divide the heating season total off mode power ($P2_x$) by the number of compressors to calculate $P2$, the heating season per-compressor off mode power. Round to the nearest watt. The expression for calculating $P2$ is as follows:

$$P2 = \frac{P2_x}{\text{number of compressors}}$$

For coil-only split systems and blower coil split systems for which a furnace or a modular blower is the designated air mover, subtract the low-voltage power (P_x) from the heating season total off mode power ($P2_x$) and divide by the number of compressors to calculate $P2$, the heating season per-compressor off mode power. Round to the nearest watt. The expression for calculating $P2$ is as follows:

$$P2 = \frac{P2_x - P_x}{\text{number of compressors}}$$

4. Calculations of Seasonal Performance Descriptors

4.1 Seasonal Energy Efficiency Ratio (SEER) Calculations. Calculate SEER as follows: For equipment covered under sections 4.1.2, 4.1.3, and 4.1.4 of this appendix, evaluate the seasonal energy efficiency ratio,

$$\text{Equation 4.1-1 } SEER = \frac{\sum_{j=1}^8 q_c(T_j)}{\sum_{j=1}^8 e_c(T_j)} = \frac{\sum_{j=1}^8 \frac{q_c(T_j)}{N}}{\sum_{j=1}^8 \frac{e_c(T_j)}{N}}$$

where,

$\frac{q_c(T_j)}{N}$ = the ratio of the total space cooling provided during periods of the space cooling

season when the outdoor temperature fell within the range represented by bin temperature

T_j to the total number of hours in the cooling season (N), Btu/h.

$\frac{e_c(T_j)}{N}$ = the electrical energy consumed by the test unit during periods of the space cooling

season when the outdoor temperature fell within the range represented by bin temperature

T_j to the total number of hours in the cooling season (N), W.

T_j = the outdoor bin temperature, °F. Outdoor temperatures are grouped or "binned." Use bins of 5 °F with the 8 cooling

season bin temperatures being 67, 72, 77, 82, 87, 92, 97, and 102 °F. j = the bin number. For cooling season calculations, j ranges from 1 to 8.

Additionally, for sections 4.1.2, 4.1.3, and 4.1.4 of this appendix, use a building cooling load, $BL(T_j)$. When referenced, evaluate $BL(T_j)$ for cooling using,

$$\text{Equation 4.1-2 } BL(T_j) = \frac{(T_j - 65)}{95 - 65} * \frac{\dot{Q}_c^{k=2}(95)}{1.1} * V$$

Where,

$\dot{Q}_{c,k=2}(95)$ = the space cooling capacity determined from the A₂ test and calculated as specified in section 3.3 of this appendix, Btu/h.

1.1 = sizing factor, dimensionless.

The temperatures 95 °F and 65 °F in the building load equation represent the selected outdoor design temperature and the zero-load base temperature, respectively.

V is a factor equal to 0.93 for variable-speed heat pumps and otherwise equal to 1.0.

4.1.1 SEER Calculations for a Blower Coil System Having a Single-Speed Compressor and Either a Fixed-Speed Indoor Blower or a Constant-Air-Volume-Rate Indoor Blower, or a Coil-Only System Air Conditioner or Heat Pump

a. Evaluate the seasonal energy efficiency ratio, expressed in units of Btu/watt-hour, using:

$$SEER = PLF(0.5) * EER_B$$

Where:

$$EER_B = \frac{\dot{Q}_c(82)}{\dot{E}_c(82)} = \text{the energy efficiency ratio determined from the B test described in}$$

sections 3.2.1, 3.1.4.1, and 3.3 of this appendix, Btu/h per watt.

$PLF(0.5) = 1 - 0.5 \cdot C_{D^c}$, the part-load performance factor evaluated at a cooling load factor of 0.5, dimensionless.

b. Refer to section 3.3 of this appendix regarding the definition and calculation of $\dot{Q}_c(82)$ and $\dot{E}_c(82)$. Evaluate the cooling mode cyclic degradation factor C_{D^c} as specified in section 3.5.3 of this appendix.

4.1.2 SEER Calculations for an Air Conditioner or Heat Pump Having a Single-Speed Compressor and a Variable-Speed Variable-Air-Volume-Rate Indoor Blower

4.1.2.1 Units Covered by Section 3.2.2.1 of This Appendix Where Indoor Blower Capacity Modulation Correlates With the

Outdoor Dry Bulb Temperature. The manufacturer must provide information on how the indoor air volume rate or the indoor blower speed varies over the outdoor temperature range of 67 °F to 102 °F. Calculate SEER using Equation 4.1–1. Evaluate the quantity $q_c(T_j)/N$ in Equation 4.1–1 using,

$$\text{Equation 4.1.2-1} \quad \frac{q_c(T_j)}{N} = X(T_j) * \dot{Q}_c(T_j) * \frac{n_j}{N}$$

where:

$$X(T_j) = \left\{ \begin{array}{c} BL(T_j)/\dot{Q}_c(T_j) \\ \text{or} \\ 1 \end{array} \right\} \text{ whichever is less; the cooling mode load factor for}$$

temperature bin j, dimensionless.

$\dot{Q}_c(T_j)$ = the space cooling capacity of the test unit when operating at outdoor temperature, T_j, Btu/h.

n_j/N = fractional bin hours for the cooling season; the ratio of the number of hours

during the cooling season when the outdoor temperature fell within the range represented by bin temperature T_j to the total number of hours in the cooling season, dimensionless.

a. For the space cooling season, assign n_j/N as specified in Table 18. Use Equation 4.1–2 to calculate the building load, BL(T_j). Evaluate $\dot{Q}_c(T_j)$ using,

$$\text{Equation 4.1.2-2 } \dot{Q}_c(T_j) = \dot{Q}_c^{k=1}(T_j) + \frac{\dot{Q}_c^{k=2}(T_j) - \dot{Q}_c^{k=1}(T_j)}{FP_c^{k=2} - FP_c^{k=1}} * [FP_c(T_j) - FP_c^{k=1}]$$

where:

$$\dot{Q}_c^{k=1}(T_j) = \dot{Q}_c^{k=1}(82) + \frac{\dot{Q}_c^{k=1}(95) - \dot{Q}_c^{k=1}(82)}{95 - 82} * (T_j - 82)$$

the space cooling capacity of the test unit at outdoor temperature T_j if operated at the cooling minimum air volume rate, Btu/h.

$$\dot{Q}_c^{k=2}(T_j) = \dot{Q}_c^{k=2}(82) + \frac{\dot{Q}_c^{k=2}(95) - \dot{Q}_c^{k=2}(82)}{95 - 82} * (T_j - 82)$$

the space cooling capacity of the test unit at outdoor temperature T_j if operated at the Cooling full-load air volume rate, Btu/h.

b. For units where indoor blower speed is the primary control variable, $FP_c^{k=1}$ denotes the fan speed used during the required A_1 and B_1 tests (see section 3.2.2.1 of this

appendix), $FP_c^{k=2}$ denotes the fan speed used during the required A_2 and B_2 tests, and $FP_c(T_j)$ denotes the fan speed used by the unit when the outdoor temperature equals T_j . For units where indoor air volume rate is the primary control variable, the three FP_c 's are similarly defined only now being expressed

in terms of air volume rates rather than fan speeds. Refer to sections 3.2.2.1, 3.1.4 to 3.1.4.2, and 3.3 of this appendix regarding the definitions and calculations of $\dot{Q}_c^{k=1}(82)$, $\dot{Q}_c^{k=1}(95)$, $\dot{Q}_c^{k=2}(82)$, and $\dot{Q}_c^{k=2}(95)$.

Calculate $e_c(T_j)/N$ in Equation 4.1-1 using, Equation 4.1.2-3

$$\frac{e_c(T_j)}{N} = \frac{X(T_j) * \dot{E}_c(T_j)}{PLF_j} * \frac{n_j}{N}$$

Where:

$PLF_j = 1 - C_{D^c} * [1 - X(T_j)]$, the part load factor, dimensionless.

$\dot{E}_c(T_j)$ = the electrical power consumption of the test unit when operating at outdoor temperature T_j , W.

c. The quantities $X(T_j)$ and n_j/N are the same quantities as used in Equation 4.1.2-1.

Evaluate the cooling mode cyclic degradation factor C_{D^c} as specified in section 3.5.3 of this appendix.

d. Evaluate $\dot{E}_c(T_j)$ using,

$$\dot{E}_c(T_j) = \dot{E}_c^{k=1}(T_j) + \frac{\dot{E}_c^{k=2}(T_j) - \dot{E}_c^{k=1}(T_j)}{FP_c^{k=2} - FP_c^{k=1}} * [FP_c(T_j) - FP_c^{k=1}]$$

where:

$$\dot{E}_c^{k=1}(T_j) = \dot{E}_c^{k=1}(82) + \frac{\dot{E}_c^{k=1}(95) - \dot{E}_c^{k=1}(82)}{95 - 82} * (T_j - 82)$$

the electrical power consumption of the test unit at outdoor temperature T_j if operated at the cooling minimum air volume rate, W.

$$\dot{E}_c^{k=2}(T_j) = \dot{E}_c^{k=2}(82) + \frac{\dot{E}_c^{k=2}(95) - \dot{E}_c^{k=2}(82)}{95 - 82} * (T_j - 82) \quad \text{the electrical power consumption}$$

of the test unit at outdoor temperature T_j if operated at the cooling full-load air volume rate, W.

e. The parameters $FP_c^{k=1}$, and $FP_c^{k=2}$, and $FP_c(T_j)$ are the same quantities that are used when evaluating Equation 4.1.2–2. Refer to sections 3.2.2.1, 3.1.4 to 3.1.4.2, and 3.3 of this appendix regarding the definitions and calculations of $\dot{E}_c^{k=1}(82)$, $\dot{E}_c^{k=1}(95)$, $\dot{E}_c^{k=2}(82)$, and $\dot{E}_c^{k=2}(95)$.

4.1.2.2 Units Covered by Section 3.2.2.2 of this Appendix Where Indoor Blower Capacity Modulation is Used to Adjust the Sensible to Total Cooling Capacity Ratio. Calculate SEER as Specified in Section 4.1.1 of This Appendix

4.1.3 SEER Calculations for an Air Conditioner or Heat Pump Having a Two-Capacity Compressor

Calculate SEER using Equation 4.1–1. Evaluate the space cooling capacity, $\dot{Q}_c^{k=1}$

(T_j), and electrical power consumption, $\dot{E}_c^{k=1}(T_j)$, of the test unit when operating at low compressor capacity and outdoor temperature T_j using,

$$\text{Equation 4.1.3-1 } \dot{Q}_c^{k=1}(T_j) = \dot{Q}_c^{k=1}(67) + \frac{\dot{Q}_c^{k=1}(82) - \dot{Q}_c^{k=1}(67)}{82 - 67} * (T_j - 67)$$

$$\text{Equation 4.1.3-2 } \dot{E}_c^{k=1}(T_j) = \dot{E}_c^{k=1}(67) + \frac{\dot{E}_c^{k=1}(82) - \dot{E}_c^{k=1}(67)}{82 - 67} * (T_j - 67)$$

where $\dot{Q}_c^{k=1}(82)$ and $\dot{E}_c^{k=1}(82)$ are determined from the B₁ test, $\dot{Q}_c^{k=1}(67)$ and $\dot{E}_c^{k=1}(67)$ are determined from the F₁ test, and all four quantities are calculated as specified in

section 3.3 of this appendix. Evaluate the space cooling capacity, $\dot{Q}_c^{k=2}(T_j)$, and electrical power consumption, $\dot{E}_c^{k=2}(T_j)$, of the test unit when operating at high

compressor capacity and outdoor temperature T_j using,

$$\text{Equation 4.1.3-3 } \dot{Q}_c^{k=2}(T_j) = \dot{Q}_c^{k=2}(82) + \frac{\dot{Q}_c^{k=2}(95) - \dot{Q}_c^{k=2}(82)}{95 - 82} * (T_j - 82)$$

$$\text{Equation 4.1.3-4 } \dot{E}_c^{k=2}(T_j) = \dot{E}_c^{k=2}(82) + \frac{\dot{E}_c^{k=2}(95) - \dot{E}_c^{k=2}(82)}{95 - 82} * (T_j - 82)$$

where $\dot{Q}_c^{k=2}(95)$ and $\dot{E}_c^{k=2}(95)$ are determined from the A₂ test, $\dot{Q}_c^{k=2}(82)$, and $\dot{E}_c^{k=2}(82)$, are determined from the B₂ test, and all are calculated as specified in section 3.3 of this appendix.

The calculation of Equation 4.1–1 quantities $q_c(T_j)/N$ and $e_c(T_j)/N$ differs depending on whether the test unit would operate at low capacity (section 4.1.3.1 of this

appendix), cycle between low and high capacity (section 4.1.3.2 of this appendix), or operate at high capacity (sections 4.1.3.3 and 4.1.3.4 of this appendix) in responding to the building load. For units that lock out low capacity operation at higher outdoor temperatures, the outdoor temperature at which the unit locks out must be that specified by the manufacturer in the

certification report so that the appropriate equations are used. Use Equation 4.1–2 to calculate the building load, $BL(T_j)$, for each temperature bin.

4.1.3.1 Steady-state space cooling capacity at low compressor capacity is greater than or equal to the building cooling load at temperature T_j , $\dot{Q}_c^{k=1}(T_j) \geq BL(T_j)$.

$$\frac{q_c(T_j)}{N} = X^{k=1}(T_j) * \dot{Q}_c^{k=1}(T_j) * \frac{n_j}{N} \quad \frac{e_c(T_j)}{N} = \frac{X^{k=1}(T_j) * \dot{E}_c^{k=1}(T_j)}{PLF_j} * \frac{n_j}{N}$$

Where:

$X^{k=1}(T_j) = BL(T_j)/\dot{Q}_c^{k=1}(T_j)$, the cooling mode low capacity load factor for temperature bin j , dimensionless.

$PLF_j = 1 - C_{D^c} * [1 - X^{k=1}(T_j)]$, the part load factor, dimensionless.

n_j/N = fractional bin hours for the cooling season; the ratio of the number of hours during the cooling season when the outdoor temperature fell within the range represented by bin temperature T_j to the total number of hours in the cooling season, dimensionless.

Obtain the fractional bin hours for the cooling season, n_j/N , from Table 18. Use Equations 4.1.3–1 and 4.1.3–2, respectively, to evaluate $\dot{Q}_c^{k=1}(T_j)$ and $\dot{E}_c^{k=1}(T_j)$. Evaluate the cooling mode cyclic degradation factor C_{D^c} as specified in section 3.5.3 of this appendix.

TABLE 18—DISTRIBUTION OF FRACTIONAL HOURS WITHIN COOLING SEASON TEMPERATURE BINS

Bin number, j	Bin temperature range °F	Representative temperature for bin °F	Fraction of of total temperature bin hours, n_j/N
1	65–69	67	0.214
2	70–74	72	0.231
3	75–79	77	0.216
4	80–84	82	0.161
5	85–89	87	0.104
6	90–94	92	0.052
7	95–99	97	0.018
8	100–104	102	0.004

4.1.3.2 Unit alternates between high (k=2) the building cooling load at temperature T_j , and low (k=1) compressor capacity to satisfy $\dot{Q}_{c^{k=1}}(T_j) < BL(T_j) < \dot{Q}_{c^{k=2}}(T_j)$.

$$\frac{q_c(T_j)}{N} = [X^{k=1}(T_j) * \dot{Q}_c^{k=1}(T_j) + X^{k=2}(T_j) * \dot{Q}_c^{k=2}(T_j)] * \frac{n_j}{N}$$

$$\frac{e_c(T_j)}{N} = [X^{k=1}(T_j) * \dot{E}_c^{k=1}(T_j) + X^{k=2}(T_j) * \dot{E}_c^{k=2}(T_j)] * \frac{n_j}{N}$$

where:

$$X^{k=1}(T_j) = \frac{\dot{Q}_c^{k=2}(T_j) - BL(T_j)}{\dot{Q}_c^{k=2}(T_j) - \dot{Q}_c^{k=1}(T_j)} \text{ the cooling mode, low capacity load factor for temperature}$$

bin j, dimensionless.

$$X^{k=2}(T_j) = 1 - X^{k=1}(T_j), \text{ the cooling mode, high capacity load factor for temperature bin j,}$$

dimensionless.

Obtain the fractional bin hours for the cooling season, n_j/N , from Table 18. Use Equations 4.1.3-1 and 4.1.3-2, respectively, to evaluate $\dot{Q}_{c^{k=1}}(T_j)$ and $\dot{E}_{c^{k=1}}(T_j)$. Use

Equations 4.1.3-3 and 4.1.3-4, respectively, to evaluate $\dot{Q}_{c^{k=2}}(T_j)$ and $\dot{E}_{c^{k=2}}(T_j)$.

4.1.3.3 Unit only operates at high (k=2) compressor capacity at temperature T_j and its capacity is greater than the building cooling

load, $BL(T_j) < \dot{Q}_{c^{k=2}}(T_j)$. This section applies to units that lock out low compressor capacity operation at higher outdoor temperatures.

$$\frac{q_c(T_j)}{N} = X^{k=2}(T_j) * \dot{Q}_c^{k=2}(T_j) * \frac{n_j}{N} \quad \frac{e_c(T_j)}{N} = \frac{X^{k=2}(T_j) * \dot{E}_c^{k=2}(T_j)}{PLF_j} * \frac{n_j}{N}$$

Where,

$X^{k=2}(T_j) = BL(T_j) / \dot{Q}_{c^{k=2}}(T_j)$, the cooling mode high capacity load factor for temperature bin j, dimensionless.

$PLF_j = 1 - C_{D^c}(k=2) * [1 - X^{k=2}(T_j)]$, the part load factor, dimensionless.

Obtain the fractional bin hours for the cooling season, n_j/N , from Table 18. Use Equations 4.1.3-3 and 4.1.3-4, respectively, to evaluate $\dot{Q}_{c^{k=2}}(T_j)$ and $\dot{E}_{c^{k=2}}(T_j)$. If the C_2 and D_2 tests described in section 3.2.3 and Table 6 of this appendix are not conducted,

set C_{D^c} (k=2) equal to the default value specified in section 3.5.3 of this appendix.

4.1.3.4 Unit must operate continuously at high (k=2) compressor capacity at temperature T_j , $BL(T_j) \geq \dot{Q}_{c^{k=2}}(T_j)$.

$$\frac{q_c(T_j)}{N} = \dot{Q}_c^{k=2}(T_j) * \frac{n_j}{N} \quad \frac{e_c(T_j)}{N} = \dot{E}_c^{k=2}(T_j) * \frac{n_j}{N}$$

Obtain the fractional bin hours for the cooling season, n_j/N , from Table 18. Use Equations 4.1.3-3 and 4.1.3-4, respectively, to evaluate $\dot{Q}_{c^{k=2}}(T_j)$ and $\dot{E}_{c^{k=2}}(T_j)$.

4.1.4 SEER Calculations for an Air Conditioner or Heat Pump Having a Variable-Speed Compressor

Calculate SEER using Equation 4.1-1. Evaluate the space cooling capacity, $\dot{Q}_{c^{k=1}}(T_j)$,

and electrical power consumption, $\dot{E}_{c^{k=1}}(T_j)$, of the test unit when operating at minimum compressor speed and outdoor temperature T_j . Use,

$$\text{Equation 4.1.4-1} \quad \dot{Q}_c^{k=1}(T_j) = \dot{Q}_c^{k=1}(67) + \frac{\dot{Q}_c^{k=1}(82) - \dot{Q}_c^{k=1}(67)}{82-67} * (T_j - 67)$$

$$\text{Equation 4.1.4-2} \quad \dot{E}_c^{k=1}(T_j) = \dot{E}_c^{k=1}(67) + \frac{\dot{E}_c^{k=1}(82) - \dot{E}_c^{k=1}(67)}{82-67} * (T_j - 67)$$

where $\dot{Q}_{c^{k=1}}(82)$ and $\dot{E}_{c^{k=1}}(82)$ are determined from the B_1 test, $\dot{Q}_{c^{k=1}}(67)$ and $\dot{E}_{c^{k=1}}(67)$ are determined from the $F1$ test, and all four quantities are calculated as specified in section 3.3 of this appendix. Evaluate the

space cooling capacity, $\dot{Q}_{c^{k=2}}(T_j)$, and electrical power consumption, $\dot{E}_{c^{k=2}}(T_j)$, of the test unit when operating at full compressor speed and outdoor temperature T_j . Use Equations 4.1.3-3 and 4.1.3-4,

respectively, where $\dot{Q}_{c^{k=2}}(95)$ and $\dot{E}_{c^{k=2}}(95)$ are determined from the A_2 test, $\dot{Q}_{c^{k=2}}(82)$ and $\dot{E}_{c^{k=2}}(82)$ are determined from the B_2 test, and all four quantities are calculated as specified in section 3.3 of this appendix.

Calculate the space cooling capacity, $\dot{Q}_c^{k=v}(T_j)$, and electrical power consumption, $\dot{E}_c^{k=v}(T_j)$, of the test unit when operating at

outdoor temperature T_j and the intermediate compressor speed used during the section

3.2.4 (and Table 7) E_v test of this appendix using,

$$\text{Equation 4.1.4-3 } \dot{Q}_c^{k=v}(T_j) = \dot{Q}_c^{k=v}(87) + M_Q * (T_j - 87)$$

$$\text{Equation 4.1.4-4 } \dot{E}_c^{k=v}(T_j) = \dot{E}_c^{k=v}(87) + M_E * (T_j - 87)$$

where $\dot{Q}_c^{k=v}(87)$ and $\dot{E}_c^{k=v}(87)$ are determined from the E_v test and calculated as specified

in section 3.3 of this appendix. Approximate the slopes of the $k=v$ intermediate speed

cooling capacity and electrical power input curves, M_Q and M_E , as follows:

$$M_Q = \left[\frac{\dot{Q}_c^{k=1}(82) - \dot{Q}_c^{k=1}(67)}{82 - 67} * (1 - N_Q) \right] + \left[N_Q * \frac{\dot{Q}_c^{k=2}(95) - \dot{Q}_c^{k=2}(82)}{95 - 82} \right]$$

$$M_E = \left[\frac{\dot{E}_c^{k=1}(82) - \dot{E}_c^{k=1}(67)}{82 - 67} * (1 - N_E) \right] + \left[N_E * \frac{\dot{E}_c^{k=2}(95) - \dot{E}_c^{k=2}(82)}{95 - 82} \right]$$

where,

$$N_Q = \frac{\dot{Q}_c^{k=v}(87) - \dot{Q}_c^{k=1}(87)}{\dot{Q}_c^{k=2}(87) - \dot{Q}_c^{k=1}(87)} \quad N_E = \frac{\dot{E}_c^{k=v}(87) - \dot{E}_c^{k=1}(87)}{\dot{E}_c^{k=2}(87) - \dot{E}_c^{k=1}(87)}$$

Use Equations 4.1.4-1 and 4.1.4-2, respectively, to calculate $\dot{Q}_c^{k=1}(87)$ and $\dot{E}_c^{k=1}(87)$.

4.1.4.1 Steady-state space cooling capacity when operating at minimum compressor speed is greater than or equal to

the building cooling load at temperature T_j , $\dot{Q}_c^{k=1}(T_j) \geq BL(T_j)$.

$$\frac{q_c(T_j)}{N} = X^{k=1}(T_j) * \dot{Q}_c^{k=1}(T_j) * \frac{n_j}{N} \quad \frac{e_c(T_j)}{N} = \frac{X^{k=1}(T_j) * \dot{E}_c^{k=1}(T_j)}{PLF_j} * \frac{n_j}{N}$$

Where:

$X^{k=1}(T_j) = BL(T_j) / \dot{Q}_c^{k=1}(T_j)$, the cooling mode minimum speed load factor for temperature bin j , dimensionless.

$PLF_j = 1 - C_{D^c} - [1 - X^{k=1}(T_j)]$, the part load factor, dimensionless.

n_j/N = fractional bin hours for the cooling season; the ratio of the number of hours

during the cooling season when the outdoor temperature fell within the range represented by bin temperature T_j to the total number of hours in the cooling season, dimensionless.

Obtain the fractional bin hours for the cooling season, n_j/N , from Table 18. Use Equations 4.1.3-1 and 4.1.3-2, respectively,

to evaluate $\dot{Q}_c^{k=1}(T_j)$ and $\dot{E}_c^{k=1}(T_j)$. Evaluate the cooling mode cyclic degradation factor C_{D^c} as specified in section 3.5.3 of this appendix.

4.1.4.2 Unit operates at an intermediate compressor speed ($k=i$) in order to match the building cooling load at temperature T_j , $\dot{Q}_c^{k=1}(T_j) < BL(T_j) < \dot{Q}_c^{k=2}(T_j)$.

$$\frac{q_c(T_j)}{N} = \dot{Q}_c^{k=i}(T_j) * \frac{n_j}{N} \quad \frac{e_c(T_j)}{N} = \dot{E}_c^{k=i}(T_j) * \frac{n_j}{N}$$

Where:

$\dot{Q}_c^{k=i}(T_j) = BL(T_j)$, the space cooling capacity delivered by the unit in matching the building load at temperature T_j , Btu/h.

The matching occurs with the unit operating at compressor speed $k = i$.

$$\dot{E}_c^{k=i}(T_j) = \frac{\dot{Q}_c^{k=i}(T_j)}{EER^{k=i}(T_j)}, \text{ the electrical power input required by the test unit when operating}$$

at a compressor speed of $k = i$ and temperature T_j , W.

$EER^{k=i}(T_j)$ = the steady-state energy efficiency ratio of the test unit when operating at a compressor speed of $k = i$ and temperature T_j , Btu/h per W.

Obtain the fractional bin hours for the cooling season, n_j/N , from Table 18 of this section. For each temperature bin where the unit operates at an intermediate compressor

speed, determine the energy efficiency ratio $EER^{k=i}(T_j)$ using the following equations,

For each temperature bin where $\dot{Q}_c^{k=1}(T_j) < BL(T_j) < \dot{Q}_c^{k=v}(T_j)$,

$$EER^{k=i}(T_j) = EER^{k=1}(T_j) + \frac{EER^{k=v}(T_j) - EER^{k=1}(T_j)}{Q^{k=v}(T_j) - Q^{k=1}(T_j)} * (BL(T_j) - Q^{k=1}(T_j))$$

For each temperature bin where $\dot{Q}_c^{k=v}(T_j) \leq BL(T_j) < \dot{Q}_c^{k=2}(T_j)$,

$$EER^{k=i}(T_j) = EER^{k=v}(T_j) + \frac{EER^{k=2}(T_j) - EER^{k=v}(T_j)}{Q^{k=2}(T_j) - Q^{k=v}(T_j)} * (BL(T_j) - Q^{k=v}(T_j))$$

Where:

$EER^{k=1}(T_j)$ is the steady-state energy efficiency ratio of the test unit when operating at minimum compressor speed and temperature T_j , Btu/h per W, calculated using capacity $\dot{Q}_c^{k=1}(T_j)$ calculated using Equation 4.1.4–1 and electrical power consumption $\dot{E}_c^{k=1}(T_j)$ calculated using Equation 4.1.4–2;

$EER^{k=v}(T_j)$ is the steady-state energy efficiency ratio of the test unit when operating at intermediate compressor speed and temperature T_j , Btu/h per W, calculated using capacity $\dot{Q}_c^{k=v}(T_j)$ calculated using Equation 4.1.4–3 and electrical power consumption $\dot{E}_c^{k=v}(T_j)$ calculated using Equation 4.1.4–4;

$EER^{k=2}(T_j)$ is the steady-state energy efficiency ratio of the test unit when operating at full compressor speed and temperature T_j , Btu/h per W, calculated using capacity $\dot{Q}_c^{k=2}(T_j)$ and electrical power consumption $\dot{E}_c^{k=2}(T_j)$, both calculated as described in section 4.1.4; and

$BL(T_j)$ is the building cooling load at temperature T_j , Btu/h.

4.1.4.3 Unit must operate continuously at full ($k=2$) compressor speed at temperature T_j , $BL(T_j) \geq \dot{Q}_c^{k=2}(T_j)$. Evaluate the Equation 4.1–1 quantities

$$\frac{q_c(T_j)}{N} \text{ and } \frac{e_c(T_j)}{N}$$

as specified in section 4.1.3.4 of this appendix with the understanding that $\dot{Q}_c^{k=2}(T_j)$ and $\dot{E}_c^{k=2}(T_j)$ correspond to full compressor speed operation and are derived from the results of the tests specified in section 3.2.4 of this appendix.

4.1.5 SEER calculations for an air conditioner or heat pump having a single indoor unit with multiple indoor blowers.

Calculate SEER using Eq. 4.1–1, where $q_c(T_j)/N$ and $e_c(T_j)/N$ are evaluated as specified in the applicable subsection.

4.1.5.1 For multiple indoor blower systems that are connected to a single, single-speed outdoor unit.

a. Calculate the space cooling capacity, $\dot{Q}_c^{k=1}(T_j)$, and electrical power consumption, $\dot{E}_c^{k=1}(T_j)$, of the test unit when operating at the cooling minimum air volume rate and outdoor temperature T_j using the equations given in section 4.1.2.1 of this appendix. Calculate the space cooling capacity, $\dot{Q}_c^{k=2}(T_j)$, and electrical power consumption, $\dot{E}_c^{k=2}(T_j)$, of the test unit when operating at the cooling full-load air volume rate and outdoor temperature T_j using the equations given in section 4.1.2.1 of this appendix. In evaluating the section 4.1.2.1 equations, determine the quantities $\dot{Q}_c^{k=1}(82)$ and $\dot{E}_c^{k=1}(82)$ from the B1 test, $\dot{Q}_c^{k=1}(95)$ and $\dot{E}_c^{k=1}(95)$ from the A1 test, $\dot{Q}_c^{k=2}(82)$ and $\dot{E}_c^{k=2}(82)$ from the B2 test, and $\dot{Q}_c^{k=2}(95)$ and $\dot{E}_c^{k=2}(95)$ from the A2 test. Evaluate all eight quantities as specified in section 3.3. Refer to section 3.2.2.1 and Table 5 for additional

information on the four referenced laboratory tests.

b. Determine the cooling mode cyclic degradation coefficient, C_{D^c} , as per sections 3.2.2.1 and 3.5 to 3.5.3 of this appendix. Assign this same value to $C_{D^c}(K=2)$.

c. Except for using the above values of $\dot{Q}_c^{k=1}(T_j)$, $\dot{E}_c^{k=1}(T_j)$, $\dot{E}_c^{k=2}(T_j)$, $\dot{Q}_c^{k=2}(T_j)$, C_{D^c} , and $C_{D^c}(K=2)$, calculate the quantities $q_c(T_j)/N$ and $e_c(T_j)/N$ as specified in section 4.1.3.1 of this appendix for cases where $\dot{Q}_c^{k=1}(T_j) \geq BL(T_j)$. For all other outdoor bin temperatures, T_j , calculate $q_c(T_j)/N$ and $e_c(T_j)/N$ as specified in section 4.1.3.3 of this appendix if $\dot{Q}_c^{k=2}(T_j) > BL(T_j)$ or as specified in section 4.1.3.4 of this appendix if $\dot{Q}_c^{k=2}(T_j) \leq BL(T_j)$.

4.1.5.2 For multiple indoor blower systems that are connected to either a lone outdoor unit having a two-capacity compressor or two separate but identical model single-speed outdoor units. Calculate the quantities $q_c(T_j)/N$ and $e_c(T_j)/N$ as specified in section 4.1.3 of this appendix.

4.2 Heating Seasonal Performance Factor (HSPF) Calculations

Unless an approved alternative efficiency determination method is used, as set forth in 10 CFR 429.70(e). Calculate HSPF as follows: Six generalized climatic regions are depicted in Figure 1 and otherwise defined in Table 19. For each of these regions and for each applicable standardized design heating requirement, evaluate the heating seasonal performance factor using,

$$\text{Equation 4.2-1} \quad HSPF = \frac{\sum_j n_j * BL(T_j)}{\sum_j e_h(T_j) + \sum_j RH(T_j)} * F_{def} = \frac{\sum_j \left[\frac{n_j}{N} * BL(T_j) \right]}{\sum_j \frac{e_h(T_j)}{N} + \sum_j \frac{RH(T_j)}{N}} * F_{def}$$

Where:

$e_h(T_j)/N$ = The ratio of the electrical energy consumed by the heat pump during periods of the heating season when the outdoor temperature fell within the range represented by bin temperature T_j to the total number of hours in the heating season (N), W. For heat pumps having a heat comfort controller, this ratio may also include electrical energy used by resistive elements to maintain a minimum air delivery temperature (see 4.2.5).

$RH(T_j)/N$ = The ratio of the electrical energy used for resistive space heating during periods when the outdoor temperature fell within the range represented by bin temperature T_j to the total number of

hours in the heating season (N), W.

Except as noted in section 4.2.5 of this appendix, resistive space heating is modeled as being used to meet that portion of the building load that the heat pump does not meet because of insufficient capacity or because the heat pump automatically turns off at the lowest outdoor temperatures. For heat pumps having a heat comfort controller, all or part of the electrical energy used by resistive heaters at a particular bin temperature may be reflected in $e_h(T_j)/N$ (see section 4.2.5 of this appendix).

T_j = the outdoor bin temperature, °F. Outdoor temperatures are “binned” such that calculations are only performed based

one temperature within the bin. Bins of 5 °F are used.

n_j/N = Fractional bin hours for the heating season; the ratio of the number of hours during the heating season when the outdoor temperature fell within the range represented by bin temperature T_j to the total number of hours in the heating season, dimensionless. Obtain n_j/N values from Table 19.

j = the bin number, dimensionless.

J = for each generalized climatic region, the total number of temperature bins, dimensionless. Referring to Table 19, J is the highest bin number (j) having a nonzero entry for the fractional bin hours for the generalized climatic region of interest.

F_{def} = the demand defrost credit described in section 3.9.2 of this appendix, dimensionless.

$BL(T_j)$ = the building space conditioning load corresponding to an outdoor temperature of T_j ; the heating season building load

also depends on the generalized climatic region's outdoor design temperature and the design heating requirement, Btu/h.

TABLE 19—GENERALIZED CLIMATIC REGION INFORMATION

Region No.	I	II	III	IV	V	* VI

18 −23	0	0	0	0	.001	0

* Pacific Coast Region.

Evaluate the building heating load using

$$\text{Equation 4.2-2} \quad BL(T_j) = \frac{(T_{z1} - T_j)}{T_{z1} - T_{OD}} * C * \dot{Q}_c(95^\circ F)$$

Where,

T_j = the outdoor bin temperature, °F

T_{z1} = the zero-load temperature, °F, which varies by climate region according to Table 19

T_{OD} = the outdoor design temperature, °F, which varies by climate region according to Table 19

C = the slope (adjustment) factor, which varies by climate region according to Table 19

$\dot{Q}_c(95^\circ F)$ = the cooling capacity at 95 °F determined from the A or A₂ test, Btu/h

For heating-only heat pump units, replace $\dot{Q}_c(95^\circ F)$ in Equation 4.2-2 with $\dot{Q}_h(47^\circ F)$

$\dot{Q}_h(47^\circ F)$ = the heating capacity at 47 °F determined from the H, H₁₂ or H_{1N} test, Btu/h.

a. For all heat pumps, HSPF accounts for the heating delivered and the energy consumed by auxiliary resistive elements when operating below the balance point. This condition occurs when the building load exceeds the space heating capacity of the heat pump condenser. For HSPF calculations for all heat pumps, see either section 4.2.1, 4.2.2, 4.2.3, or 4.2.4 of this appendix, whichever applies.

b. For heat pumps with heat comfort controllers (see section 1.2 of this appendix, Definitions), HSPF also accounts for resistive

heating contributed when operating above the heat-pump-plus-comfort-controller balance point as a result of maintaining a minimum supply temperature. For heat pumps having a heat comfort controller, see section 4.2.5 of this appendix for the additional steps required for calculating the HSPF.

4.2.1 Additional Steps for Calculating the HSPF of a Blower Coil System Heat Pump Having a Single-Speed Compressor and Either a Fixed-Speed Indoor Blower or a Constant-Air-Volume-Rate Indoor Blower Installed, or a Coil-Only System Heat Pump.

$$\text{Equation 4.2.1-1} \quad \frac{e_h(T_j)}{N} = \frac{X(T_j) \cdot \dot{E}_h(T_j) \cdot \delta(T_j)}{PLF_j} * \frac{n_j}{N}$$

$$\text{Equation 4.2.1-2} \quad \frac{RH(T_j)}{N} = \frac{BL(T_j) - [X(T_j) \cdot \dot{Q}_h(T_j) \cdot \delta(T_j)]}{3.413 \frac{\text{Btu/h}}{W}} * \frac{n_j}{N}$$

Where:

$$X(T_j) = \begin{cases} BL(T_j) / \dot{Q}_h(T_j) \\ \text{or} \\ 1 \end{cases}$$

whichever is less; the heating mode load factor for temperature bin j, dimensionless.

$\dot{Q}_h(T_j)$ = the space heating capacity of the heat pump when operating at outdoor temperature T_j , Btu/h.

$\dot{E}_h(T_j)$ = the electrical power consumption of the heat pump when operating at outdoor temperature T_j , W.

$\delta(T_j)$ = the heat pump low temperature cut-out factor, dimensionless.

$PLF_j = 1 - C_{D^h} \cdot [1 - X(T_j)]$ the part load factor, dimensionless.

Use Equation 4.2–2 to determine $BL(T_j)$. Obtain fractional bin hours for the heating season, n_j/N , from Table 19. Evaluate the heating mode cyclic degradation factor C_{D^h} as specified in section 3.8.1 of this appendix.

Determine the low temperature cut-out factor using

$$\text{Equation 4.2.1-3} \quad \delta(T_j) = \begin{cases} 0, \text{ if } T_j \leq T_{off} \text{ and } \frac{\dot{Q}_h(T_j)}{3.413 \cdot \dot{E}_h(T_j)} < 1 \\ 1/2, \text{ if } T_{off} < T_j \leq T_{on} \text{ and } \frac{\dot{Q}_h(T_j)}{3.413 \cdot \dot{E}_h(T_j)} \geq 1 \\ 1, \text{ if } T_j > T_{on} \text{ and } \frac{\dot{Q}_h(T_j)}{3.413 \cdot \dot{E}_h(T_j)} \geq 1 \end{cases}$$

Where:

T_{off} = the outdoor temperature when the compressor is automatically shut off, °F.

(If no such temperature exists, T_j is always greater than T_{off} and T_{on}).
 T_{on} = the outdoor temperature when the compressor is automatically turned back

on, if applicable, following an automatic shut-off, °F.

Calculate $\dot{Q}_h(T_j)$ and $\dot{E}_h(T_j)$ using,

$$\text{Equation 4.2.1-4} \quad \dot{Q}_h(T_j) = \begin{cases} \dot{Q}_h(17) + \frac{[\dot{Q}_h(47) - \dot{Q}_h(17)] \cdot (T_j - 17)}{47 - 17}, & \text{if } T_j \geq 45^\circ\text{F or } T_j \leq 17^\circ\text{F} \\ \dot{Q}_h(17) + \frac{[\dot{Q}_h(35) - \dot{Q}_h(17)] \cdot (T_j - 17)}{35 - 17}, & \text{if } 17^\circ\text{F} < T_j < 45^\circ\text{F} \end{cases}$$

Equation 4.2.1-5

$$\begin{aligned} & \dot{E}_h(T_j) \\ &= \begin{cases} \dot{E}_h(17) + \frac{[\dot{E}_h(47) - \dot{E}_h(17)] \cdot (T_j - 17)}{47 - 17}, & \text{if } T_j \geq 45^\circ\text{F or } T_j \leq 17^\circ\text{F} \\ \dot{E}_h(17) + \frac{[\dot{E}_h(35) - \dot{E}_h(17)] \cdot (T_j - 17)}{35 - 17}, & \text{if } 17^\circ\text{F} < T_j < 45^\circ\text{F} \end{cases} \end{aligned}$$

where $\dot{Q}_h(47)$ and $\dot{E}_h(47)$ are determined from the H1 test and calculated as specified in section 3.7 of this appendix; $\dot{Q}_h(35)$ and $\dot{E}_h(35)$ are determined from the H2 test and calculated as specified in section 3.9.1 of this appendix; and $\dot{Q}_h(17)$ and $\dot{E}_h(17)$ are determined from the H3 test and calculated as specified in section 3.10 of this appendix.

4.2.2 Additional Steps for Calculating the HSPF of a Heat Pump Having a Single-Speed Compressor and a Variable-Speed, Variable-Air-Volume-Rate Indoor Blower

The manufacturer must provide information about how the indoor air volume rate or the indoor blower speed varies over

the outdoor temperature range of 65 °F to –23 °F. Calculate the quantities

$$\frac{e_h(T_j)}{N} \text{ and } \frac{RH(T_j)}{N}$$

in Equation 4.2–1 as specified in section 4.2.1 of this appendix with the exception of

replacing references to the H1C test and section 3.6.1 of this appendix with the H1C₁

test and section 3.6.2 of this appendix. In addition, evaluate the space heating capacity

and electrical power consumption of the heat pump $\dot{Q}_h(T_j)$ and $\dot{E}_h(T_j)$ using

$$\text{Equation 4.2.2-1 } \dot{Q}_h(T_j) = \dot{Q}_h^{k=1}(T_j) + \frac{\dot{Q}_h^{k=2}(T_j) - \dot{Q}_h^{k=1}(T_j)}{FP_h^{k=2} - FP_h^{k=1}} * [FP_h(T_j) - FP_h^{k=1}]$$

$$\text{Equation 4.2.2-2 } \dot{E}_h(T_j) = \dot{E}_h^{k=1}(T_j) + \frac{\dot{E}_h^{k=2}(T_j) - \dot{E}_h^{k=1}(T_j)}{FP_h^{k=2} - FP_h^{k=1}} * [FP_h(T_j) - FP_h^{k=1}]$$

where the space heating capacity and electrical power consumption at both low capacity

(k=1) and high capacity (k=2) at outdoor temperature T_j are determined using

$$\text{Equation 4.2.2-3 } \dot{Q}_h^k(T_j) = \begin{cases} \dot{Q}_h^k(17) + \frac{[\dot{Q}_h^k(47) - \dot{Q}_h^k(17)] * (T_j - 17)}{47 - 17}, & \text{if } T_j \geq 45^\circ\text{F or } T_j \leq 17^\circ\text{F} \\ \dot{Q}_h^k(17) + \frac{[\dot{Q}_h^k(35) - \dot{Q}_h^k(17)] * (T_j - 17)}{35 - 17}, & \text{if } 17^\circ\text{F} < T_j < 45^\circ\text{F} \end{cases}$$

Equation 4.2.2-4

$$\dot{E}_h^k(T_j) = \begin{cases} \dot{E}_h^k(17) + \frac{[\dot{E}_h^k(47) - \dot{E}_h^k(17)] * (T_j - 17)}{47 - 17}, & \text{if } T_j \geq 45^\circ\text{F or } T_j \leq 17^\circ\text{F} \\ \dot{E}_h^k(17) + \frac{[\dot{E}_h^k(35) - \dot{E}_h^k(17)] * (T_j - 17)}{35 - 17}, & \text{if } 17^\circ\text{F} < T_j < 45^\circ\text{F} \end{cases}$$

For units where indoor blower speed is the primary control variable, $FP_h^{k=1}$ denotes the fan speed used during the required H1₁ and H3₁ tests (see Table 11), $FP_h^{k=2}$ denotes the fan speed used during the required H1₂, H2₂, and H3₂ tests, and $FP_h(T_j)$ denotes the fan speed used by the unit when the outdoor temperature equals T_j . For units where indoor air volume rate is the primary control variable, the three FP_h 's are similarly defined only now being expressed in terms of air volume rates rather than fan speeds.

Determine $\dot{Q}_h^{k=1}(47)$ and $\dot{E}_h^{k=1}(47)$ from the H1₁ test, and $\dot{Q}_h^{k=2}(47)$ and $\dot{E}_h^{k=2}(47)$ from the H1₂ test. Calculate all four quantities as specified in section 3.7 of this appendix. Determine $\dot{Q}_h^{k=1}(35)$ and $\dot{E}_h^{k=1}(35)$ as

specified in section 3.6.2 of this appendix; determine $\dot{Q}_h^{k=2}(35)$ and $\dot{E}_h^{k=2}(35)$ and from the H2₂ test and the calculation specified in section 3.9 of this appendix. Determine $\dot{Q}_h^{k=1}(17)$ and $\dot{E}_h^{k=1}(17)$ from the H3₁ test, and $\dot{Q}_h^{k=2}(17)$ and $\dot{E}_h^{k=2}(17)$ from the H3₂ test. Calculate all four quantities as specified in section 3.10 of this appendix.

4.2.3 Additional Steps for Calculating the HSPF of a Heat Pump Having a Two-Capacity Compressor

The calculation of the Equation 4.2-1 quantities differ depending upon whether the heat pump would operate at low capacity (section 4.2.3.1 of this appendix), cycle between low and high capacity (section 4.2.3.2 of this appendix), or operate at high

capacity (sections 4.2.3.3 and 4.2.3.4 of this appendix) in responding to the building load. For heat pumps that lock out low capacity operation at low outdoor temperatures, the outdoor temperature at which the unit locks out must be that specified by the manufacturer in the certification report so that the appropriate equations can be selected.

$$\frac{e_h(T_j)}{N} \text{ and } \frac{RH(T_j)}{N}$$

a. Evaluate the space heating capacity and electrical power consumption of the heat pump when operating at low compressor capacity and outdoor temperature T_j using

$$\dot{Q}_h^{k=1}(T_j) = \begin{cases} \dot{Q}_h^{k=1}(47) + \frac{[\dot{Q}_h^{k=1}(62) - \dot{Q}_h^{k=1}(47)] * (T_j - 47)}{62 - 47}, & \text{if } T_j \geq 40^\circ\text{F} \\ \dot{Q}_h^{k=1}(17) + \frac{[\dot{Q}_h^{k=1}(35) - \dot{Q}_h^{k=1}(17)] * (T_j - 17)}{35 - 17}, & \text{if } 17^\circ\text{F} \leq T_j < 40^\circ\text{F} \\ \dot{Q}_h^{k=1}(17) + \frac{[\dot{Q}_h^{k=1}(47) - \dot{Q}_h^{k=1}(17)] * (T_j - 17)}{47 - 17}, & \text{if } T_j < 17^\circ\text{F} \end{cases}$$

$$\dot{E}_h^{k=1}(T_j) = \begin{cases} \dot{E}_h^{k=1}(47) + \frac{[\dot{E}_h^{k=1}(62) - \dot{E}_h^{k=1}(47)] * (T_j - 47)}{62 - 47}, & \text{if } T_j \geq 40^\circ\text{F} \\ \dot{E}_h^{k=1}(17) + \frac{[\dot{E}_h^{k=1}(35) - \dot{E}_h^{k=1}(17)] * (T_j - 17)}{35 - 17}, & \text{if } 17^\circ\text{F} \leq T_j < 40^\circ\text{F} \\ \dot{E}_h^{k=1}(17) + \frac{[\dot{E}_h^{k=1}(47) - \dot{E}_h^{k=1}(17)] * (T_j - 17)}{47 - 17}, & \text{if } T_j < 17^\circ\text{F} \end{cases}$$

b. Evaluate the space heating capacity and electrical power consumption ($\dot{Q}_h^{k=2}(T_j)$ and $\dot{E}_h^{k=2}(T_j)$) of the heat pump when operating at high compressor capacity and outdoor temperature T_j by solving Equations 4.2.2–3 and 4.2.2–4, respectively, for $k=2$. Determine $\dot{Q}_h^{k=1}(62)$ and $\dot{E}_h^{k=1}(62)$ from the H0₁ test, $\dot{Q}_h^{k=1}(47)$ and $\dot{E}_h^{k=1}(47)$ from the H1₁ test, and $\dot{Q}_h^{k=2}(47)$ and $\dot{E}_h^{k=2}(47)$ from the H1₂ test. Calculate all six quantities as specified in

section 3.7 of this appendix. Determine $\dot{Q}_h^{k=2}(35)$ and $\dot{E}_h^{k=2}(35)$ from the H2₂ test and, if required as described in section 3.6.3 of this appendix, determine $\dot{Q}_h^{k=1}(35)$ and $\dot{E}_h^{k=1}(35)$ from the H2₁ test. Calculate the required 35 °F quantities as specified in section 3.9 in this appendix. Determine $\dot{Q}_h^{k=2}(17)$ and $\dot{E}_h^{k=2}(17)$ from the H3₂ test and, if required as described in section 3.6.3 of this appendix, determine $\dot{Q}_h^{k=1}(17)$ and

$\dot{E}_h^{k=1}(17)$ from the H3₁ test. Calculate the required 17 °F quantities as specified in section 3.10 of this appendix.

4.2.3.1 Steady-state space heating capacity when operating at low compressor capacity is greater than or equal to the building heating load at temperature T_j , $\dot{Q}_h^{k=1}(T_j) \geq BL(T_j)$.

$$\text{Equation 4.2.3-1} \quad \frac{e_h(T_j)}{N} = \frac{X^{k=1}(T_j) * \dot{E}_h^{k=1}(T_j) * \delta(T_j)}{PLF_j} * \frac{n_j}{N}$$

$$\text{Equation 4.2.3-2} \quad \frac{RH(T_j)}{N} = \frac{BL(T_j) * [1 - \delta(T_j)]}{3.413 \frac{\text{Btu/h}}{W}} * \frac{n_j}{N}$$

Where:

$X^{k=1}(T_j) = BL(T_j) / \dot{Q}_h^{k=1}(T_j)$, the heating mode low capacity load factor for temperature bin j , dimensionless.

$PLF_j = 1 - C_{D^h} \cdot [1 - X^{k=1}(T_j)]$, the part load factor, dimensionless.

$\delta'(T_j)$ = the low temperature cutoff factor, dimensionless.

Evaluate the heating mode cyclic degradation factor C_{D^h} as specified in section 3.8.1 of this appendix.

Determine the low temperature cut-out factor using

$$\text{Equation 4.2.3-3} \quad \delta(T_j) = \begin{cases} 0, & \text{if } T_j \leq T_{off} \\ 1/2, & \text{if } T_{off} < T_j \leq T_{on} \\ 1, & \text{if } T_j > T_{on} \end{cases}$$

where T_{off} and T_{on} are defined in section 4.2.1 of this appendix. Use the calculations given in section 4.2.3.3 of this appendix, and not the above, if:

a. The heat pump locks out low capacity operation at low outdoor temperatures and

b. T_j is below this lockout threshold temperature.

4.2.3.2 Heat pump alternates between high ($k=2$) and low ($k=1$) compressor capacity to satisfy the building heating load at a temperature T_j , $\dot{Q}_h^{k=1}(T_j) < BL(T_j) < \dot{Q}_h^{k=2}(T_j)$.

Calculate $\frac{RH(T_j)}{N}$ using Equation 4.2.3-2. Evaluate $\frac{e_h(T_j)}{N}$ using

$$\frac{e_h(T_j)}{N} = [X^{k=1}(T_j) * \dot{E}_h^{k=1}(T_j) + X^{k=2}(T_j) * \dot{E}_h^{k=2}(T_j)] * \delta(T_j) * \frac{n_j}{N}$$

where:

$$X^{k=1}(T_j) = \frac{\dot{Q}_h^{k=2}(T_j) - BL(T_j)}{\dot{Q}_h^{k=2}(T_j) - \dot{Q}_h^{k=1}(T_j)}$$

$X^{k=2}(T_j) = 1 - X^{k=1}(T_j)$ the heating mode, high capacity load factor for temperature bin j , dimensionless.

Determine the low temperature cut-out factor, $\delta'(T_j)$, using Equation 4.2.3-3.
4.2.3.3 Heat pump only operates at high ($k=2$) compressor capacity at temperature T_j and its capacity is greater than the building

heating load, $BL(T_j) < \dot{Q}_h^{k=2}(T_j)$. This section applies to units that lock out low compressor capacity operation at low outdoor temperatures.

Calculate $\frac{RH(T_j)}{N}$ using Equation 4.2.3-2. Evaluate $\frac{e_h(T_j)}{N}$ using

$$\frac{e_h(T_j)}{N} = \frac{X^{k=2}(T_j) * \dot{E}_h^{k=2}(T_j) * \delta(T_j)}{PLF_j} * \frac{n_j}{N}$$

Where:

$X^{k=2}(T_j) = BL(T_j) / \dot{Q}_h^{k=2}(T_j)$. $PLF_j = 1 - C_{D^h}$ ($k=2$) * $[1 - X^{k=2}(T_j)]$

If the H1C₂ test described in section 3.6.3 and Table 12 of this appendix is not conducted, set C_{D^h} ($k=2$) equal to the default value specified in section 3.8.1 of this appendix.

Determine the low temperature cut-out factor, $\delta(T_j)$, using Equation 4.2.3-3.

4.2.3.4 Heat pump must operate continuously at high ($k=2$) compressor capacity at temperature T_j , $BL(T_j) \geq \dot{Q}_h^{k=2}(T_j)$.

$$\frac{e_h(T_j)}{N} = \dot{E}_h^{k=2}(T_j) * \delta'(T_j) * \frac{n_j}{N} \quad \frac{RH(T_j)}{N} = \frac{BL(T_j) * [\dot{Q}_h^{k=2}(T_j) * \delta'(T_j)]}{3.413 \frac{Btu/h}{W}} * \frac{n_j}{N}$$

where:

$$\delta'(T_j) = \begin{cases} 0, & \text{if } T_j \leq T_{off} \text{ or } \frac{\dot{Q}_h^{k=2}(T_j)}{3.413 * \dot{E}_h^{k=2}(T_j)} < 1 \\ 1/2, & \text{if } T_{off} < T_j \leq T_{on} \text{ and } \frac{\dot{Q}_h^{k=2}(T_j)}{3.413 * \dot{E}_h^{k=2}(T_j)} \geq 1 \\ 1, & \text{if } T_j > T_{on} \text{ and } \frac{\dot{Q}_h^{k=2}(T_j)}{3.413 * \dot{E}_h^{k=2}(T_j)} \geq 1 \end{cases}$$

a. Minimum Compressor Speed. Evaluate the space heating capacity, $\dot{Q}_h^{k=1}(T_j)$, and

electrical power consumption, $\dot{E}_h^{k=1}(T_j)$, of the heat pump when operating at minimum

compressor speed and outdoor temperature T_j using

$$\text{Equation 4.2.4-1 } \dot{Q}_h^{k=1}(T_j) = \dot{Q}_h^{k=1}(47) + \frac{\dot{Q}_h^{k=1}(62) - \dot{Q}_h^{k=1}(47)}{62 - 47} * (T_j - 47)$$

$$\text{Equation 4.2.4-2 } \dot{E}_h^{k=1}(T_j) = \dot{E}_h^{k=1}(47) + \frac{\dot{E}_h^{k=1}(62) - \dot{E}_h^{k=1}(47)}{62 - 47} * (T_j - 47)$$

where $\dot{Q}_h^{k=1}(62)$ and $\dot{E}_h^{k=1}(62)$ are determined from the H0₁ test, $\dot{Q}_h^{k=1}(47)$ and $\dot{E}_h^{k=1}(47)$ are determined from the H1₁ test, and all four quantities are calculated as specified in section 3.7 of this appendix.

b. Minimum Compressor Speed for Minimum-speed-limiting Variable-speed Heat Pumps: Evaluate the space heating capacity, $\dot{Q}_h^{k=1}(T_j)$, and electrical power consumption, $\dot{E}_h^{k=1}(T_j)$, of the heat pump

when operating at minimum compressor speed and outdoor temperature T_j using

Equation 4.2.4-3

$$\dot{Q}_h^{k=1}(T_j) = \begin{cases} \dot{Q}_h^{k=1}(47) + \frac{[\dot{Q}_h^{k=1}(62) - \dot{Q}_h^{k=1}(47)] * (T_j - 47)}{62 - 47}, & \text{if } T_j \geq 47 \text{ }^\circ\text{F} \\ \dot{Q}_h^{k=v}(35) + \frac{[\dot{Q}_h^{k=1}(47) - \dot{Q}_h^{k=v}(35)] * (T_j - 35)}{47 - 35}, & \text{if } 35 \text{ }^\circ\text{F} \leq T_j < 47 \text{ }^\circ\text{F} \\ \dot{Q}_h^{k=v}(T_j), & \text{if } T_j < 35 \text{ }^\circ\text{F} \end{cases}$$

Equation 4.2.4-4

$$\dot{E}_h^{k=1}(T_j) = \begin{cases} \dot{E}_h^{k=1}(47) + \frac{[\dot{E}_h^{k=1}(62) - \dot{E}_h^{k=1}(47)] * (T_j - 47)}{62 - 47}, & \text{if } T_j \geq 47 \text{ }^\circ\text{F} \\ \dot{E}_h^{k=v}(35) + \frac{[\dot{E}_h^{k=1}(47) - \dot{E}_h^{k=v}(35)] * (T_j - 35)}{47 - 35}, & \text{if } 35 \text{ }^\circ\text{F} \leq T_j < 47 \text{ }^\circ\text{F} \\ \dot{E}_h^{k=v}(T_j), & \text{if } T_j < 35 \text{ }^\circ\text{F} \end{cases}$$

where $\dot{Q}_h^{k=1}(62)$ and $\dot{E}_h^{k=1}(62)$ are determined from the H0₁ test, $\dot{Q}_h^{k=1}(47)$ and $\dot{E}_h^{k=1}(47)$ are determined from the H1₁ test, and all four quantities are calculated as specified in section 3.7 of this appendix; $\dot{Q}_h^{k=v}(35)$ and $\dot{E}_h^{k=v}(35)$ are determined from the H2_v test and are calculated as specified in section 3.9 of this appendix; and $\dot{Q}_h^{k=v}(T_j)$ and $\dot{E}_h^{k=v}(T_j)$ are calculated using equations 4.2.4-5 and 4.2.4-6, respectively.

c. Full Compressor Speed for Heat Pumps for which the H4₂ test is not Conducted.

Evaluate the space heating capacity, $\dot{Q}_h^{k=2}(T_j)$, and electrical power consumption, $\dot{E}_h^{k=2}(T_j)$, of the heat pump when operating

at full compressor speed and outdoor temperature T_j by solving Equations 4.2.2-3 and 4.2.2-4, respectively, for $k=2$, using $\dot{Q}_{hcalc}^{k=2}(47)$ to represent $\dot{Q}_h^{k=2}(47)$ and $\dot{E}_{hcalc}^{k=2}(47)$ to represent $\dot{E}_h^{k=2}(47)$ (see section 3.6.4.b of this appendix regarding determination of the capacity and power input used in the HSPF calculations to represent the H1₂ Test). Determine $\dot{Q}_h^{k=2}(35)$ and $\dot{E}_h^{k=2}(35)$ from the H2₂ test and the calculations specified in section 3.9 or, if the H2₂ test is not conducted, by conducting the calculations specified in section 3.6.4. Determine $\dot{Q}_h^{k=2}(17)$ and $\dot{E}_h^{k=2}(17)$ from the

H3₂ test and the methods specified in section 3.10 of this appendix.

d. Full Compressor Speed for Heat Pumps for which the H4₂ test is Conducted.

For T_j above 17 °F, evaluate the space heating capacity, $\dot{Q}_h^{k=2}(T_j)$, and electrical power consumption, $\dot{E}_h^{k=2}(T_j)$, of the heat pump when operating at full compressor speed as described above for heat pumps for which the H4₂ is not conducted. For T_j between 5 °F and 17 °F, evaluate the space heating capacity, $\dot{Q}_h^{k=2}(T_j)$, and electrical power consumption, $\dot{E}_h^{k=2}(T_j)$, of the heat pump when operating at full compressor speed using the following equations:

$$\dot{Q}_h^{k=2}(T_j) = \dot{Q}_h^{k=2}(5) + \frac{\dot{Q}_h^{k=2}(17) - \dot{Q}_h^{k=2}(5)}{17 - 5} * (T_j - 5)$$

$$\dot{E}_h^{k=2}(T_j) = \dot{E}_h^{k=2}(5) + \frac{\dot{E}_h^{k=2}(17) - \dot{E}_h^{k=2}(5)}{17 - 5} * (T_j - 5)$$

Determine $\dot{Q}_h^{k=2}(17)$ and $\dot{E}_h^{k=2}(17)$ from the H3₂ test, and $\dot{Q}_h^{k=2}(5)$ and $\dot{E}_h^{k=2}(5)$ from the H4₂ test, using the methods specified in

section 3.10 of this appendix for all four values.

For T_j below 5 °F, evaluate the space heating capacity, $\dot{Q}_h^{k=2}(T_j)$, and electrical

power consumption, $\dot{E}_h^{k=2}(T_j)$, of the heat pump when operating at full compressor speed using the following equations:

$$\dot{Q}_h^{k=2}(T_j) = \dot{Q}_h^{k=2}(5) - \frac{\dot{Q}_{hcalc}^{k=2}(47) - \dot{Q}_h^{k=2}(17)}{47 - 17} * (5 - T_j)$$

$$\dot{E}_h^{k=2}(T_j) = \dot{E}_h^{k=2}(5) - \frac{\dot{E}_{hcalc}^{k=2}(47) - \dot{E}_h^{k=2}(17)}{47 - 17} * (5 - T_j)$$

Determine $\dot{Q}_{hcalc}^{k=2}(47)$ and $\dot{E}_{hcalc}^{k=2}(47)$ as described in section 3.6.4.b of this appendix.

Determine $\dot{Q}_h^{k=2}(17)$ and $\dot{E}_h^{k=2}(17)$ from the H3₂ test, using the methods specified in section 3.10 of this appendix.

e. Intermediate Compressor Speed.

Calculate the space heating capacity, $\dot{Q}_h^{k=v}(T_j)$, and electrical power consumption,

of the heat pump when operating at outdoor temperature T_j and the intermediate

compressor speed used during the section 3.6.4 H2_v test using

$$\text{Equation 4.2.4-5 } \dot{Q}_h^{k=v}(T_j) = \dot{Q}_h^{k=v}(35) + M_Q * (T_j - 35)$$

$$\text{Equation 4.2.4-6 } \dot{E}_h^{k=v}(T_j) = \dot{E}_h^{k=v}(35) + M_E * (T_j - 35)$$

where $\dot{Q}_h^{k=v}(35)$ and $\dot{E}_h^{k=v}(35)$ are determined from the H2_v test and calculated as specified in section 3.9 of this appendix. Approximate the slopes of the $k=v$ intermediate speed heating capacity and electrical power input curves, M_Q and M_E , as follows:

$$M_Q = \left[\frac{\dot{Q}_h^{k=1}(62) - \dot{Q}_h^{k=1}(47)}{62 - 47} * (1 - N_Q) \right] + \left[N_Q * \frac{\dot{Q}_h^{k=2}(35) - \dot{Q}_h^{k=2}(17)}{35 - 17} \right]$$

$$M_E = \left[\frac{\dot{E}_h^{k=1}(62) - \dot{E}_h^{k=1}(47)}{62 - 47} * (1 - N_E) \right] + \left[N_E * \frac{\dot{E}_h^{k=2}(35) - \dot{E}_h^{k=2}(17)}{35 - 17} \right]$$

where,

$$N_Q = \frac{\dot{Q}_h^{k=v}(35) - \dot{Q}_h^{k=1}(35)}{\dot{Q}_h^{k=2}(35) - \dot{Q}_h^{k=1}(35)} \quad N_E = \frac{\dot{E}_h^{k=v}(35) - \dot{E}_h^{k=1}(35)}{\dot{E}_h^{k=2}(35) - \dot{E}_h^{k=1}(35)}$$

Use Equations 4.2.4-1 and 4.2.4-2, respectively, to calculate $\dot{Q}_h^{k=1}(35)$ and $\dot{E}_h^{k=1}(35)$, whether or not the heat pump is a minimum-speed-limiting variable-speed heat pump.

4.2.4.1 Steady-state space heating capacity when operating at minimum compressor speed is greater than or equal to the building heating load at temperature T_j , $\dot{Q}_h^{k=1}(T_j) \geq BL(T_j)$. Evaluate the Equation 4.2-1 quantities

$$\frac{RH(T_j)}{N} \quad \text{and} \quad \frac{e_h(T_j)}{N}$$

as specified in section 4.2.3.1 of this appendix. Except now use Equations 4.2.4-1 and 4.2.4-2 (for heat pumps that are not minimum-speed-limiting) or Equations 4.3.4-3 and 4.2.4-4 (for minimum-speed-limiting variable-speed heat pumps) to evaluate $\dot{Q}_h^{k=1}(T_j)$ and $\dot{E}_h^{k=1}(T_j)$, respectively, and replace section 4.2.3.1 references to “low

capacity” and section 3.6.3 of this appendix with “minimum speed” and section 3.6.4 of this appendix. Also, the last sentence of section 4.2.3.1 of this appendix does not apply.

4.2.4.2 Heat pump operates at an intermediate compressor speed ($k=i$) in order to match the building heating load at a temperature T_j , $\dot{Q}_h^{k=1}(T_j) < BL(T_j) < \dot{Q}_h^{k=2}(T_j)$. Calculate

$$\frac{RH(T_j)}{N} \text{ using Equation 4.2.3-2 while evaluating } \frac{e_h(T_j)}{N} \text{ using,}$$

$$\frac{e_h(T_j)}{N} = \dot{E}_h^{k=i}(T_j) * \delta(T_j) * \frac{n_j}{N}$$

where:

$$\dot{E}_h^{k=i}(T_j) = \frac{\dot{Q}_h^{k=i}(T_j)}{3.413 \frac{Btu/h}{W} * COP^{k=i}(T_j)}$$

and $\delta(T_j)$ is evaluated using Equation 4.2.3-3 while,

$\dot{Q}_h^{k=i}(T_j) = BL(T_j)$, the space heating capacity delivered by the unit in matching the building load at temperature (T_j) , Btu/h.

The matching occurs with the heat pump operating at compressor speed $k=i$. $COP^{k=i}(T_j)$ = the steady-state coefficient of performance of the heat pump when operating at compressor speed $k=i$ and temperature T_j , dimensionless.

For each temperature bin where the heat pump operates at an intermediate compressor speed, determine $COP^{k=i}(T_j)$ using the following equations,

For each temperature bin where $\dot{Q}_h^{k=1}(T_j) < BL(T_j) < \dot{Q}_h^{k=v}(T_j)$,

$$COP_h^{k=i}(T_j) = COP_h^{k=1}(T_j) + \frac{COP_h^{k=v}(T_j) - COP_h^{k=1}(T_j)}{Q_h^{k=v}(T_j) - Q_h^{k=1}(T_j)} * (BL(T_j) - Q_h^{k=1}(T_j))$$

For each temperature bin where $\dot{Q}_h^{k=v}(T_j) \leq BL(T_j) < \dot{Q}_h^{k=2}(T_j)$,

$$COP_h^{k=i}(T_j) = COP_h^{k=v}(T_j) + \frac{COP_h^{k=2}(T_j) - COP_h^{k=v}(T_j)}{Q_h^{k=2}(T_j) - Q_h^{k=v}(T_j)} * (BL(T_j) - Q_h^{k=v}(T_j))$$

Where:

$COP_h^{k=1}(T_j)$ is the steady-state coefficient of performance of the heat pump when operating at minimum compressor speed and temperature T_j , dimensionless, calculated using capacity $\dot{Q}_h^{k=1}(T_j)$ calculated using Equation 4.2.4-1 or 4.2.4-3 and electrical power consumption $\dot{E}_h^{k=1}(T_j)$ calculated using Equation 4.2.4-2 or 4.2.4-4;

$COP_h^{k=v}(T_j)$ is the steady-state coefficient of performance of the heat pump when operating at intermediate compressor speed and temperature T_j , dimensionless, calculated using capacity $\dot{Q}_h^{k=v}(T_j)$ calculated using Equation 4.2.4-5 and electrical power consumption $\dot{E}_h^{k=v}(T_j)$ calculated using Equation 4.2.4-6;

$COP_h^{k=2}(T_j)$ is the steady-state coefficient of performance of the heat pump when operating at full compressor speed and temperature T_j , dimensionless, calculated using capacity $\dot{Q}_h^{k=2}(T_j)$ and electrical power consumption $\dot{E}_h^{k=2}(T_j)$, both calculated as described in section 4.2.4; and

$BL(T_j)$ is the building heating load at temperature T_j , Btu/h.

4.2.4.3 Heat pump must operate continuously at full ($k=2$) compressor speed at temperature T_j , $BL(T_j) \geq \dot{Q}_h^{k=2}(T_j)$. Evaluate the Equation 4.2-1 quantities

$$\frac{RH(T_j)}{N} \quad \text{and} \quad \frac{e_h(T_j)}{N}$$

as specified in section 4.2.3.4 of this appendix with the understanding that $\dot{Q}_h^{k=2}(T_j)$ and $\dot{E}_h^{k=2}(T_j)$ correspond to full compressor speed operation and are derived from the results of the specified section 3.6.4 tests of this appendix.

4.2.5 Heat Pumps Having a Heat Comfort Controller

Heat pumps having heat comfort controllers, when set to maintain a typical minimum air delivery temperature, will cause the heat pump condenser to operate less because of a greater contribution from the resistive elements. With a conventional heat pump, resistive heating is only initiated if the heat pump condenser cannot meet the building load (*i.e.*, is delayed until a second stage call from the indoor thermostat). With a heat comfort controller, resistive heating can occur even though the heat pump condenser has adequate capacity to meet the

building load (*i.e.*, both on during a first stage call from the indoor thermostat). As a result, the outdoor temperature where the heat pump compressor no longer cycles (*i.e.*, starts to run continuously), will be lower than if the heat pump did not have the heat comfort controller.

4.2.5.1 Blower Coil System Heat Pump Having a Heat Comfort Controller: Additional Steps for Calculating the HSPF of a Heat Pump Having a Single-Speed Compressor and Either a Fixed-Speed Indoor Blower or a Constant-Air-Volume-Rate Indoor Blower Installed, or a Coil-Only System Heat Pump Controller

Calculate the space heating capacity and electrical power of the heat pump without the heat comfort controller being active as specified in section 4.2.1 of this appendix (Equations 4.2.1-4 and 4.2.1-5) for each outdoor bin temperature, T_j , that is listed in Table 19. Denote these capacities and electrical powers by using the subscript “hp” instead of “h.” Calculate the mass flow rate (expressed in pounds-mass of dry air per hour) and the specific heat of the indoor air (expressed in Btu/lbm_{da} · °F) from the results of the H1 test using:

$$\dot{m}_{da} = \bar{V}_s * 0.075 \frac{\text{lbm}_{da}}{\text{ft}^3} * \frac{60_{min}}{hr} = \frac{\bar{V}_{mx}}{v'_n * [1 + W_n]} * \frac{60_{min}}{hr} = \frac{\bar{V}_{mx}}{v_n} * \frac{60_{min}}{hr}$$

where \bar{V}_s , \bar{V}_{mx} , v'_n (or v_n), and W_n are defined following Equation 3-1. For each outdoor bin temperature listed in Table 19, calculate the nominal temperature of the air leaving the heat pump condenser coil using,

$$T_o(T_j) = 70^\circ\text{F} + \frac{\dot{Q}_{hp}(T_j)}{\dot{m}_{da} * C_{p,da}}$$

Evaluate $e_h(T_j/N)$, $RH(T_j)/N$, $X(T_j)$, PLF_j , and $\delta(T_j)$ as specified in section 4.2.1 of this appendix. For each bin calculation, use the space heating capacity and electrical power from Case 1 or Case 2, whichever applies.

Case 1. For outdoor bin temperatures where $T_o(T_j)$ is equal to or greater than T_{cc} (the maximum supply temperature determined according to section 3.1.9 of this

appendix), determine $\dot{Q}_h(T_j)$ and $\dot{E}_h(T_j)$ as specified in section 4.2.1 of this appendix (*i.e.*, $\dot{Q}_h(T_j) = \dot{Q}_{hp}(T_j)$ and $\dot{E}_h(T_j) = \dot{E}_{hp}(T_j)$). Note: Even though $T_o(T_j) \geq T_{cc}$, resistive heating may be required; evaluate Equation 4.2.1-2 for all bins.

Case 2. For outdoor bin temperatures where $T_o(T_j) < T_{cc}$, determine $\dot{Q}_h(T_j)$ and $\dot{E}_h(T_j)$ using,

$$\dot{Q}_h(T_j) = \dot{Q}_{hp}(T_j) + \dot{Q}_{cc}(T_j) \quad \dot{E}_h(T_j) = \dot{E}_{hp}(T_j) + \dot{E}_{cc}(T_j)$$

where,

$$\dot{Q}_{cc}(T_j) = \dot{m}_{da} * C_{p,da} * [T_{cc} - T_o(T_j)] \quad \dot{E}_{cc}(T_j) = \frac{\dot{Q}_{cc}(T_j)}{3.413 \frac{\text{Btu/h}}{\text{W}}}$$

Note: Even though $T_o(T_j) < T_{cc}$, additional resistive heating may be required; evaluate Equation 4.2.1–2 for all bins.

4.2.5.2 Heat Pump Having a Heat Comfort Controller: Additional Steps for Calculating the HSPF of a Heat Pump Having a Single-Speed Compressor and a Variable-Speed, Variable-Air-Volume Indoor Blower

Calculate the space heating capacity and electrical power of the heat pump without the heat comfort controller being active as specified in section 4.2.2 of this appendix

(Equations 4.2.2–1 and 4.2.2–2) for each outdoor bin temperature, T_j , that is listed in Table 19. Denote these capacities and electrical powers by using the subscript “hp” instead of “h.” Calculate the mass flow rate (expressed in pounds-mass of dry air per hour) and the specific heat of the indoor air (expressed in Btu/lbm_{da} · °F) from the results of the H1₂ test using:

$$\dot{m}_{da} = \bar{V}_s * 0.075 \frac{\text{lbm}_{da}}{\text{ft}^3} * \frac{60_{min}}{hr} = \frac{\bar{V}_{mx}}{v'_n * [1 + W_n]} * \frac{60_{min}}{hr} = \frac{\bar{V}_{mx}}{v_n} * \frac{60_{min}}{hr}$$

$$C_{p,da} = 0.24 + 0.444 * W_n$$

where \bar{V}_s , \bar{V}_{mx} , v'_n (or v_n), and W_n are defined following Equation 3–1. For each outdoor bin temperature listed in Table 19, calculate the nominal temperature of the air leaving the heat pump condenser coil using,

$$T_o(T_j) = 70^\circ\text{F} + \frac{\dot{Q}_{hp}(T_j)}{\dot{m}_{da} * C_{p,da}}$$

Evaluate $e_h(T_j)/N$, $RH(T_j)/N$, $X(T_j)$, PLF_j , and $\delta(T_j)$ as specified in section 4.2.1 of this

appendix with the exception of replacing references to the H1C test and section 3.6.1 of this appendix with the H1C₁ test and section 3.6.2 of this appendix. For each bin calculation, use the space heating capacity and electrical power from Case 1 or Case 2, whichever applies.

Case 1. For outdoor bin temperatures where $T_o(T_j)$ is equal to or greater than T_{cc} (the maximum supply temperature determined according to section 3.1.9 of this appendix), determine $\dot{Q}_h(T_j)$ and $\dot{E}_h(T_j)$ as

specified in section 4.2.2 of this appendix (i.e. $\dot{Q}_h(T_j) = \dot{Q}_{hp}(T_j)$ and $\dot{E}_h(T_j) = \dot{E}_{hp}(T_j)$).

Note: Even though $T_o(T_j) \geq T_{cc}$, resistive heating may be required; evaluate Equation 4.2.1–2 for all bins.

Case 2. For outdoor bin temperatures where $T_o(T_j) < T_{cc}$, determine $\dot{Q}_h(T_j)$ and $\dot{E}_h(T_j)$ using,

$$\dot{Q}_h(T_j) = \dot{Q}_h(T_j) \dot{E}_h(T_j) = \dot{E}_{hp}(T_j) \dot{E}_{cc}(T_j)$$

Where,

$$\dot{Q}_{cc}(T_j) = \dot{m}_{da} * C_{p,da} * [T_{cc} - T_o(T_j)] \quad \dot{E}_{cc}(T_j) = \frac{\dot{Q}_{cc}(T_j)}{3.413 \frac{\text{Btu/h}}{W}}$$

Note: Even though $T_o(T_j) < T_{cc}$, additional resistive heating may be required; evaluate Equation 4.2.1–2 for all bins.

4.2.5.3 Heat Pumps Having a Heat Comfort Controller: Additional Steps for Calculating the HSPF of a Heat Pump Having a Two-Capacity Compressor

Calculate the space heating capacity and electrical power of the heat pump without the heat comfort controller being active as specified in section 4.2.3 of this appendix for both high and low capacity and at each

outdoor bin temperature, T_j , that is listed in Table 19. Denote these capacities and electrical powers by using the subscript “hp” instead of “h.” For the low capacity case, calculate the mass flow rate (expressed in pounds-mass of dry air per hour) and the specific heat of the indoor air (expressed in Btu/lbm_{da} · °F) from the results of the H1₁ test using:

$$\dot{m}_{da}^{k=1} = \bar{V}_s * 0.075 \frac{\text{lbm}_{da}}{\text{ft}^3} * \frac{60_{min}}{hr} = \frac{\bar{V}_{mx}}{v'_n * [1 + W_n]} * \frac{60_{min}}{hr} = \frac{\bar{V}_{mx}}{v_n} * \frac{60_{min}}{hr}$$

$$C_{p,da}^{k=1} = 0.24 + 0.444 * W_n$$

where \bar{V}_s , \bar{V}_{mx} , v'_n (or v_n), and W_n are defined following Equation 3–1. For each outdoor bin temperature listed in Table 19, calculate the nominal temperature of the air leaving the heat pump condenser coil when operating at low capacity using,

$$T_o^{k=1}(T_j) = 70^\circ\text{F} + \frac{\dot{Q}_{hp}^{k=1}(T_j)}{\dot{m}_{da}^{k=1} * C_{p,da}^{k=1}}$$

Repeat the above calculations to determine the mass flow rate ($\dot{m}_{da}^{k=2}$) and the specific heat of the indoor air ($C_{p,da}^{k=2}$) when operating at high capacity by using the results of the H1₂ test. For each outdoor bin

temperature listed in Table 19, calculate the nominal temperature of the air leaving the heat pump condenser coil when operating at high capacity using,

$$T_o^{k=2}(T_j) = 70^\circ\text{F} + \frac{\dot{Q}_{hp}^{k=2}(T_j)}{\dot{m}_{da}^{k=2} * C_{p,da}^{k=2}}$$

Evaluate $e_h(T_j)/N$, $RH(T_j)/N$, $X^{k=1}(T_j)$, and/or $X^{k=2}(T_j)$, PLF_j , and $\delta'(T_j)$ or $\delta''(T_j)$ as specified in section 4.2.3.1, 4.2.3.2, 4.2.3.3, or 4.2.3.4 of this appendix, whichever applies, for each temperature bin. To evaluate these quantities, use the low-capacity space heating capacity and the low-capacity electrical power from Case 1 or Case 2,

whichever applies; use the high-capacity space heating capacity and the high-capacity electrical power from Case 3 or Case 4, whichever applies.

Case 1. For outdoor bin temperatures where $T_o^{k=1}(T_j)$ is equal to or greater than T_{cc} (the maximum supply temperature determined according to section 3.1.9 of this appendix), determine $\dot{Q}_h^{k=1}(T_j)$ and $\dot{E}_h^{k=1}(T_j)$ as specified in section 4.2.3 of this appendix (i.e., $\dot{Q}_h^{k=1}(T_j) = \dot{Q}_{hp}^{k=1}(T_j)$ and $\dot{E}_h^{k=1}(T_j) = \dot{E}_{hp}^{k=1}(T_j)$).

Note: Even though $T_o^{k=1}(T_j) \geq T_{cc}$, resistive heating may be required; evaluate $RH(T_j)/N$ for all bins.

Case 2. For outdoor bin temperatures where $T_o^{k=1}(T_j) < T_{CC}$, determine $\dot{Q}_h^{k=1}(T_j)$ and $\dot{E}_h^{k=1}(T_j)$ using,

$$\dot{Q}_h^{k=1}(T_j) = \dot{Q}_{hp}^{k=1}(T_j) + \dot{Q}_{CC}^{k=1}(T_j) \quad \dot{E}_h^{k=1}(T_j) = \dot{E}_{hp}^{k=1}(T_j) + \dot{E}_{CC}^{k=1}(T_j)$$

where,

$$\dot{Q}_{CC}^{k=1}(T_j) = \dot{m}_{da}^{k=1} * C_{p,da}^{k=1} * [T_{CC} - T_o^{k=1}(T_j)] \quad \dot{E}_{CC}^{k=1}(T_j) = \frac{\dot{Q}_{CC}^{k=1}(T_j)}{3.413 \frac{Btu/h}{W}}$$

Note: Even though $T_o^{k=1}(T_j) \geq T_{CC}$, additional resistive heating may be required; evaluate $RH(T_j)/N$ for all bins.

Case 3. For outdoor bin temperatures where $T_o^{k=2}(T_j)$ is equal to or greater than T_{CC} , determine $\dot{Q}_h^{k=2}(T_j)$ and $\dot{E}_h^{k=2}(T_j)$ as

specified in section 4.2.3 of this appendix (i.e., $\dot{Q}_h^{k=2}(T_j) = \dot{Q}_{hp}^{k=2}(T_j)$ and $\dot{E}_h^{k=2}(T_j) = \dot{E}_{hp}^{k=2}(T_j)$).

Note: Even though $T_o^{k=2}(T_j) < T_{CC}$, resistive heating may be required; evaluate $RH(T_j)/N$ for all bins.

Case 4. For outdoor bin temperatures where $T_o^{k=2}(T_j) < T_{CC}$, determine $\dot{Q}_h^{k=2}(T_j)$ and $\dot{E}_h^{k=2}(T_j)$ using,

$$\dot{Q}_h^{k=2}(T_j) = \dot{Q}_{hp}^{k=2}(T_j) + \dot{Q}_{CC}^{k=2}(T_j) \quad \dot{E}_h^{k=2}(T_j) = \dot{E}_{hp}^{k=2}(T_j) + \dot{E}_{CC}^{k=2}(T_j)$$

where,

$$\dot{Q}_{CC}^{k=2}(T_j) = \dot{m}_{da}^{k=2} * C_{p,da}^{k=2} * [T_{CC} - T_o^{k=2}(T_j)] \quad \dot{E}_{CC}^{k=2}(T_j) = \frac{\dot{Q}_{CC}^{k=2}(T_j)}{3.413 \frac{Btu/h}{W}}$$

Note: Even though $T_o^{k=2}(T_j) < T_{CC}$, additional resistive heating may be required; evaluate $RH(T_j)/N$ for all bins.

4.2.5.4 Heat pumps Having a Heat Comfort Controller: Additional Steps for Calculating the HSPF of a Heat Pump Having a Variable-Speed Compressor [Reserved]

4.2.6 Additional Steps for Calculating the HSPF of a Heat Pump Having a Triple-Capacity Compressor

The only triple-capacity heat pumps covered are triple-capacity, northern heat pumps. For such heat pumps, the calculation of the Eq. 4.2–1 quantities

$$\frac{RH(T_j)}{N} \quad \text{and} \quad \frac{e_h(T_j)}{N}$$

differ depending on whether the heat pump would cycle on and off at low capacity (section 4.2.6.1 of this appendix), cycle on and off at high capacity (section 4.2.6.2 of this appendix), cycle on and off at booster capacity (section 4.2.6.3 of this appendix), cycle between low and high capacity (section 4.2.6.4 of this appendix), cycle between high and booster capacity (section 4.2.6.5 of this appendix), operate continuously at low capacity (section 4.2.6.6 of this appendix),

operate continuously at high capacity (section 4.2.6.7 of this appendix), operate continuously at booster capacity (section 4.2.6.8 of this appendix), or heat solely using resistive heating (also section 4.2.6.8 of this appendix) in responding to the building load. As applicable, the manufacturer must supply information regarding the outdoor temperature range at which each stage of compressor capacity is active. As an informative example, data may be submitted in this manner: At the low ($k=1$) compressor capacity, the outdoor temperature range of operation is $40^\circ\text{F} \leq T \leq 65^\circ\text{F}$; At the high ($k=2$) compressor capacity, the outdoor temperature range of operation is $20^\circ\text{F} \leq T \leq 50^\circ\text{F}$; At the booster ($k=3$) compressor capacity, the outdoor temperature range of operation is $-20^\circ\text{F} \leq T \leq 30^\circ\text{F}$.

a. Evaluate the space heating capacity and electrical power consumption of the heat pump when operating at low compressor capacity and outdoor temperature T_j using the equations given in section 4.2.3 of this appendix for $\dot{Q}_h^{k=1}(T_j)$ and $\dot{E}_h^{k=1}(T_j)$. In evaluating the section 4.2.3 equations, Determine $\dot{Q}_h^{k=1}(62)$ and $\dot{E}_h^{k=1}(62)$ from the H0₁ test, $\dot{Q}_h^{k=1}(47)$ and $\dot{E}_h^{k=1}(47)$ from the H1₁ test, and $\dot{Q}_h^{k=2}(47)$ and $\dot{E}_h^{k=2}(47)$ from the H1₂

test. Calculate all four quantities as specified in section 3.7 of this appendix. If, in accordance with section 3.6.6 of this appendix, the H3₁ test is conducted, calculate $\dot{Q}_h^{k=1}(17)$ and $\dot{E}_h^{k=1}(17)$ as specified in section 3.10 of this appendix and determine $\dot{Q}_h^{k=1}(35)$ and $\dot{E}_h^{k=1}(35)$ as specified in section 3.6.6 of this appendix.

b. Evaluate the space heating capacity and electrical power consumption ($\dot{Q}_h^{k=2}(T_j)$ and $\dot{E}_h^{k=2}(T_j)$) of the heat pump when operating at high compressor capacity and outdoor temperature T_j by solving Equations 4.2.2–3 and 4.2.2–4, respectively, for $k=2$. Determine $\dot{Q}_h^{k=1}(62)$ and $\dot{E}_h^{k=1}(62)$ from the H0₁ test, $\dot{Q}_h^{k=1}(47)$ and $\dot{E}_h^{k=1}(47)$ from the H1₁ test, and $\dot{Q}_h^{k=2}(47)$ and $\dot{E}_h^{k=2}(47)$ from the H1₂ test, evaluated as specified in section 3.7 of this appendix. Determine the equation input for $\dot{Q}_h^{k=2}(35)$ and $\dot{E}_h^{k=2}(35)$ from the H2₂ test evaluated as specified in section 3.9.1 of this appendix. Also, determine $\dot{Q}_h^{k=2}(17)$ and $\dot{E}_h^{k=2}(17)$ from the H3₂ test, evaluated as specified in section 3.10 of this appendix.

c. Evaluate the space heating capacity and electrical power consumption of the heat pump when operating at booster compressor capacity and outdoor temperature T_j using

$$\dot{Q}_h^{k=3}(T_j) = \begin{cases} \dot{Q}_h^{k=3}(17) + \frac{[\dot{Q}_h^{k=3}(35) - \dot{Q}_h^{k=3}(17)] * (T_j - 17)}{35 - 17}, & \text{if } 17^\circ\text{F} < T_j \leq 45^\circ\text{F} \\ \dot{Q}_h^{k=3}(2) + \frac{[\dot{Q}_h^{k=3}(17) - \dot{Q}_h^{k=3}(2)] * (T_j - 2)}{17 - 2}, & \text{if } T_j \leq 17^\circ\text{F} \end{cases}$$

$$\dot{E}_h^{k=3}(T_j)$$

$$= \begin{cases} \dot{E}_h^{k=3}(17) + \frac{[\dot{E}_h^{k=3}(35) - \dot{E}_h^{k=3}(17)] * (T_j - 17)}{35 - 17}, & \text{if } 17^\circ\text{F} < T_j \leq 45^\circ\text{F} \\ \dot{E}_h^{k=3}(2) + \frac{[\dot{E}_h^{k=3}(17) - \dot{E}_h^{k=3}(2)] * (T_j - 2)}{17 - 2}, & \text{if } T_j \leq 17^\circ\text{F} \end{cases}$$

Determine $\dot{Q}_h^{k=3}(17)$ and $\dot{E}_h^{k=3}(17)$ from the H3₃ test and determine $\dot{Q}_h^{k=2}(2)$ and $\dot{E}_h^{k=3}(2)$ from the H4₃ test. Calculate all four quantities as specified in section 3.10 of this appendix. Determine the equation input for $\dot{Q}_h^{k=3}(35)$ and $\dot{E}_h^{k=3}(35)$ as specified in section 3.6.6 of this appendix.

4.2.6.1 Steady-state Space Heating Capacity when Operating at Low Compressor Capacity is Greater than or Equal to the Building Heating Load at Temperature T_j , $\dot{Q}_h^{k=1}(T_j) \geq BL(T_j)$, and the Heat Pump Permits Low Compressor Capacity at T_j . Evaluate the quantities

$$\frac{RH(T_j)}{N} \quad \text{and} \quad \frac{e_h(T_j)}{N}$$

using Eqs. 4.2.3-1 and 4.2.3-2, respectively. Determine the equation inputs $X^{k=1}(T_j)$, PLF_j , and $\delta'(T_j)$ as specified in section 4.2.3.1. In calculating the part load factor, PLF_j , use the low-capacity cyclic-degradation coefficient C_{D^h} , [or equivalently, $C_{D^h}(k=1)$] determined in accordance with section 3.6.6 of this appendix.

4.2.6.2 Heat Pump Only Operates at High (k=2) Compressor Capacity at Temperature T_j and its Capacity is Greater than or Equal to the Building Heating Load, $BL(T_j) < \dot{Q}_h^{k=2}(T_j)$. Evaluate the quantities

$$\frac{RH(T_j)}{N} \quad \text{and} \quad \frac{e_h(T_j)}{N}$$

as specified in section 4.2.3.3 of this appendix. Determine the equation inputs $X^{k=2}(T_j)$, PLF_j , and $\delta'(T_j)$ as specified in section 4.2.3.3 of this appendix. In calculating the part load factor, PLF_j , use the high-capacity cyclic-degradation coefficient, $C_{D^h}(k=2)$ determined in accordance with section 3.6.6 of this appendix.

4.2.6.3 Heat Pump Only Operates at High (k=3) Compressor Capacity at Temperature T_j and its Capacity is Greater than or Equal to the Building Heating Load, $BL(T_j) \leq \dot{Q}_h^{k=3}(T_j)$.

Calculate $\frac{RH(T_j)}{N}$ and using Eq. 4.2.3-2. Evaluate $\frac{e_h(T_j)}{N}$ using

$$\frac{e_h(T_j)}{N} = \frac{X^{k=3}(T_j) * \dot{E}_h^{k=3}(T_j) * \delta'(T_j)}{PLF_j} * \frac{n_j}{N}$$

Where:

$$X^{k=3}(T_j) = BL(T_j) / \dot{Q}_h^{k=3}(T_j) \text{ and } PLF_j = 1 - \frac{C_{D^h}(k=3)}{C_{D^h}(k=3)} * [1 - X^{k=3}(T_j)]$$

Determine the low temperature cut-out factor, $\delta'(T_j)$, using Eq. 4.2.3-3. Use the booster-capacity cyclic-degradation coefficient, $C_{D^h}(k=3)$ determined in accordance with section 3.6.6 of this appendix.

4.2.6.4 Heat Pump Alternates Between High (k=2) and Low (k=1) Compressor Capacity to Satisfy the Building Heating Load at a Temperature T_j , $\dot{Q}_h^{k=1}(T_j) < BL(T_j) < \dot{Q}_h^{k=2}(T_j)$. Evaluate the quantities

$$\frac{RH(T_j)}{N} \quad \text{and} \quad \frac{e_h(T_j)}{N}$$

as specified in section 4.2.3.2 of this appendix. Determine the equation inputs $X^{k=1}(T_j)$, $X^{k=2}(T_j)$, and $\delta'(T_j)$ as specified in section 4.2.3.2 of this appendix.

4.2.6.5 Heat Pump Alternates Between High (k=2) and Booster (k=3) Compressor Capacity to Satisfy the Building Heating Load at a Temperature T_j , $\dot{Q}_h^{k=2}(T_j) < BL(T_j) < \dot{Q}_h^{k=3}(T_j)$.

Calculate $\frac{RH(T_j)}{N}$ and using Eq. 4.2.3-2. Evaluate $\frac{e_h(T_j)}{N}$ using

$$\frac{e_h(T_j)}{N} = [X^{k=2}(T_j) * \dot{E}_h^{k=2}(T_j) + X^{k=3}(T_j) * \dot{E}_h^{k=3}(T_j)] * \delta'(T_j) * \frac{n_j}{N}$$

where:

$$X^{k=2}(T_j) = \frac{\dot{Q}_h^{k=3}(T_j) - BL(T_j)}{\dot{Q}_h^{k=3}(T_j) - \dot{Q}_h^{k=2}(T_j)}$$

and $X^{k=3}(T_j) = X^{k=2}(T_j)$ = the heating mode, booster capacity load factor for temperature bin j , dimensionless. Determine the low

temperature cut-out factor, $\delta'(T_j)$, using Eq. 4.2.3–3.

4.2.6.6 Heat Pump Only Operates at Low ($k=1$) Capacity at Temperature T_j and its Capacity is less than the Building Heating Load, $BL(T_j) > \dot{Q}_h^{k=1}(T_j)$.

$$\frac{e_h(T_j)}{N} = \dot{E}_h^{k=1}(T_j) * \delta'(T_j) * \frac{n_j}{N} \quad \text{and} \quad \frac{RH(T_j)}{N} = \frac{BL(T_j) - [\dot{Q}_h^{k=1}(T_j) * \delta'(T_j)]}{3.413 \frac{\text{Btu/h}}{W}} * \frac{n_j}{N}$$

where the low temperature cut-out factor, $\delta'(T_j)$, is calculated using Eq. 4.2.3–3.

4.2.6.7 Heat Pump Only Operates at High ($k=2$) Capacity at Temperature T_j and its Capacity is less than the Building Heating Load, $BL(T_j) > \dot{Q}_h^{k=2}(T_j)$.

Evaluate the quantities

$\frac{RH(T_j)}{N}$ and $\frac{e_h(T_j)}{N}$ as specified in section 4.2.3.4 of this appendix. Calculate $\delta''(T_j)$ using the equation given in section 4.2.3.4 of this appendix.

4.2.6.8 Heat Pump Only Operates at Booster ($k=3$) Capacity at Temperature T_j and its Capacity is less than the Building Heating Load, $BL(T_j) > \dot{Q}_h^{k=3}(T_j)$ or the System Converts to using only Resistive Heating.

$$\frac{e_h(T_j)}{N} = \dot{E}_h^{k=3}(T_j) * \delta'(T_j) * \frac{n_j}{N} \quad \text{and} \quad \frac{RH(T_j)}{N} = \frac{BL(T_j) - [\dot{Q}_h^{k=3}(T_j) * \delta'(T_j)]}{3.413 \frac{\text{Btu/h}}{W}} * \frac{n_j}{N}$$

where $\delta''(T_j)$ is calculated as specified in section 4.2.3.4 of this appendix if the heat pump is operating at its booster compressor capacity. If the heat pump system converts to using only resistive heating at outdoor temperature T_j , set $\delta'(T_j)$ equal to zero.

4.2.7 Additional Steps for Calculating the HSPF of a Heat Pump having a Single Indoor Unit with Multiple Indoor Blowers. The calculation of the Eq. 4.2–1 quantities $e_h(T_j)/N$ and $RH(T_j)/N$ are evaluated as specified in the applicable subsection.

4.2.7.1 For Multiple Indoor Blower Heat Pumps that are Connected to a Singular, Single-speed Outdoor Unit.

a. Calculate the space heating capacity, $\dot{Q}_h^{k=1}(T_j)$, and electrical power consumption, $\dot{E}_h^{k=1}(T_j)$, of the heat pump when operating at the heating minimum air volume rate and outdoor temperature T_j using Eqs. 4.2.2–3 and 4.2.2–4, respectively. Use these same equations to calculate the space heating capacity, $\dot{Q}_h^{k=2}(T_j)$ and electrical power consumption, $\dot{E}_h^{k=2}(T_j)$, of the test unit when operating at the heating full-load air volume

rate and outdoor temperature T_j . In evaluating Eqs. 4.2.2–3 and 4.2.2–4, determine the quantities $\dot{Q}_h^{k=1}(47)$ and $\dot{E}_h^{k=1}(47)$ from the H1₁ test; determine $\dot{Q}_h^{k=2}(47)$ and $\dot{E}_h^{k=2}(47)$ from the H1₂ test. Evaluate all four quantities according to section 3.7 of this appendix. Determine the quantities $\dot{Q}_h^{k=1}(35)$ and $\dot{E}_h^{k=1}(35)$ as specified in section 3.6.2 of this appendix. Determine $\dot{Q}_h^{k=2}(35)$ and $\dot{E}_h^{k=2}(35)$ from the H2₂ frost accumulation test as calculated according to section 3.9.1 of this appendix. Determine the quantities $\dot{Q}_h^{k=1}(17)$ and $\dot{E}_h^{k=1}(17)$ from the H3₁ test, and $\dot{Q}_h^{k=2}(17)$ and $\dot{E}_h^{k=2}(17)$ from the H3₂ test. Evaluate all four quantities according to section 3.10 of this appendix. Refer to section 3.6.2 and Table 11 of this appendix for additional information on the referenced laboratory tests.

b. Determine the heating mode cyclic degradation coefficient, C_D^h , as per sections 3.6.2 and 3.8 to 3.8.1 of this appendix. Assign this same value to $C_D^h(k=2)$.

c. Except for using the above values of $\dot{Q}_h^{k=1}(T_j)$, $\dot{E}_h^{k=1}(T_j)$, $\dot{Q}_h^{k=2}(T_j)$, $\dot{E}_h^{k=2}(T_j)$, C_D^h ,

and $C_D^h(k=2)$, calculate the quantities $e_h(T_j)/N$ as specified in section 4.2.3.1 of this appendix for cases where $\dot{Q}_h^{k=1}(T_j) \geq BL(T_j)$. For all other outdoor bin temperatures, T_j , calculate $e_h(T_j)/N$ and $RH_h(T_j)/N$ as specified in section 4.2.3.3 of this appendix if $\dot{Q}_h^{k=2}(T_j) > BL(T_j)$ or as specified in section 4.2.3.4 of this appendix if $\dot{Q}_h^{k=2}(T_j) \leq BL(T_j)$.

4.2.7.2 For Multiple Indoor Blower Heat Pumps Connected to either a Single Outdoor Unit with a Two-capacity Compressor or to Two Separate but Identical Model Single-speed Outdoor units. Calculate the quantities $e_h(T_j)/N$ and $RH(T_j)/N$ as specified in section 4.2.3 of this appendix.

4.3 Calculations of Off-Mode Power Consumption

For central air conditioners and heat pumps with a cooling capacity of: Less than 36,000 Btu/h, determine the off mode represented value, $P_{W,OFF}$, with the following equation:

$$P_{W,OFF} = \frac{P1 + P2}{2};$$

greater than or equal to 36,000 Btu/h, calculate the capacity scaling factor according to:

$$F_{scale} = \frac{\dot{Q}_C(95)}{36,000},$$

where, $\dot{Q}_C(95)$ is the total cooling capacity at the A or A₂ test condition, and determine the off mode represented value, $P_{W,OFF}$, with the following equation:

$$P_{W,OFF} = \frac{P1 + P2}{2 \times F_{scale}};$$

4.4 Rounding of SEER and HSPF for Reporting Purposes

After calculating SEER according to section 4.1 of this appendix and HSPF according to

section 4.2 of this appendix round the values off as specified per § 430.23(m) of title 10 of the Code of Federal Regulations.

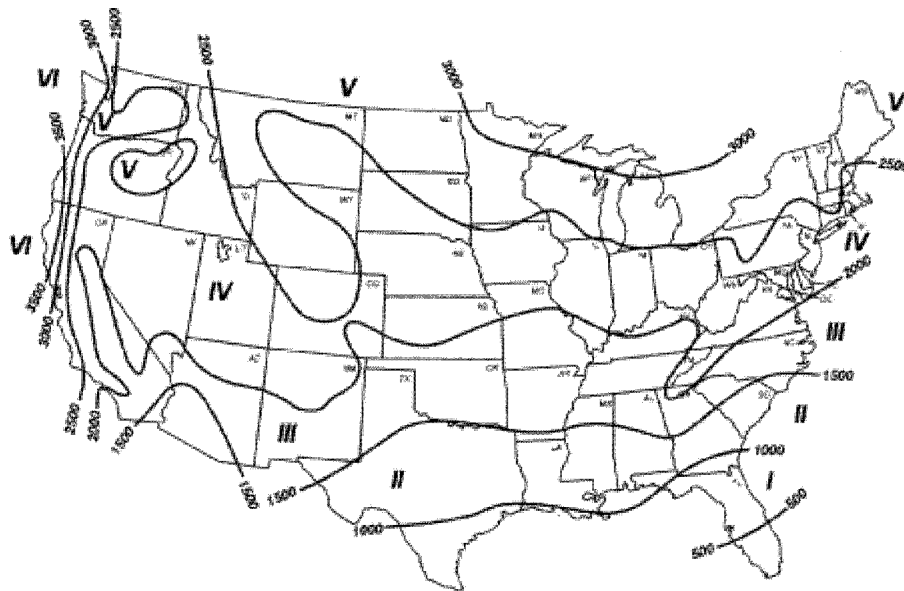

Figure 1—Heating Load Hours (HLH_A) for the United States

Figure 2—Cooling Load Hours (CLH_A) for the United States

TABLE 20—REPRESENTATIVE COOLING AND HEATING LOAD HOURS FOR EACH GENERALIZED CLIMATIC REGION

Climatic region	Cooling load hours CLH _R	Heating load hours HLH _R
I	2,400	750
II	1,800	1,250
III	1,200	1,750
IV	800	2,250
Rating Values	1,000	2,080
V	400	2,750
VI	200	2,750

4.5 Calculations of the SHR, Which Should Be Computed for Different Equipment Configurations and Test Conditions Specified in Table 21

TABLE 21—APPLICABLE TEST CONDITIONS FOR CALCULATION OF THE SENSIBLE HEAT RATIO

Equipment configuration	Reference table number of Appendix M	SHR computation with results from	Computed values
Units Having a Single-Speed Compressor and a Fixed-Speed Indoor blower, a Constant Air Volume Rate Indoor blower, or No Indoor blower.	4	B Test	SHR(B).
Units Having a Single-Speed Compressor That Meet the section 3.2.2.1 Indoor Unit Requirements.	5	B2 and B1 Tests	SHR(B1), SHR(B2).
Units Having a Two-Capacity Compressor	6	B2 and B1 Tests	SHR(B1), SHR(B2).
Units Having a Variable-Speed Compressor	7	B2 and B1 Tests	SHR(B1), SHR(B2).

The SHR is defined and calculated as follows:

$$SHR = \frac{\text{Sensible Cooling Capacity}}{\text{Total Cooling Capacity}}$$

$$= \frac{\dot{Q}_{sc}^k(T)}{\dot{Q}_c^k(T)}$$

Where both the total and sensible cooling capacities are determined from the same cooling mode test and calculated from data

collected over the same 30-minute data collection interval.

4.6 Calculations of the Energy Efficiency Ratio (EER)

Calculate the energy efficiency ratio using,

$$EER = \frac{\text{Total Cooling Capacity}}{\text{Total Electrical Power Consumption}}$$

$$= \frac{\dot{Q}_c^k(T)}{\dot{E}_c^k(T)}$$

where $\dot{Q}_c^k(T)$ and $\dot{E}_c^k(T)$ are the space cooling capacity and electrical power consumption

determined from the 30-minute data collection interval of the same steady-state

wet coil cooling mode test and calculated as specified in section 3.3 of this appendix. Add the letter identification for each steady-state test as a subscript (e.g., EER_{A_2}) to differentiate among the resulting EER values.

FEDERAL REGISTER

Vol. 81

Wednesday,

No. 164

August 24, 2016

Part IV

Federal Communications Commission

47 CFR Parts 2, 25, 30, et al.

Use of Spectrum Bands Above 24 GHz for Mobile Radio Services;
Proposed Rule

FEDERAL COMMUNICATIONS COMMISSION

47 CFR Parts 2, 25, 30, and 101

[GN Docket No. 14–177, IB Docket Nos. 15–256 and 97–95, RM–11664, WT Docket No. 10–112; FCC 16–89]

Use of Spectrum Bands Above 24 GHz for Mobile Radio Services

AGENCY: Federal Communications Commission.

ACTION: Proposed rule.

SUMMARY: In this document, the Federal Communications Commission (Commission or FCC) seeks comment on proposed service rules to allow flexible fixed and mobile uses in additional bands and on refinements to the rules the Commission adopted in FCC 16–89. These refinements include: Providing additional detail on the sharing arrangement the Commission adopted in FCC 16–89 for the 37 GHz band; performance requirements for innovative uses such as Internet of Things (IoT) and machine-to-machine communications; additional issues relating to our mobile spectrum holdings policies; whether antenna height limits are necessary in mmW bands; whether minimum bandwidth scaling factors are necessary for transmitter power limits; whether allowing higher Power Flux Density (PFD) levels for Fixed Satellite Service (FSS) in the 37 and 39 GHz bands would be consistent with terrestrial use of those bands; refining the coordination limits for point-to-point operations; and on sharing analysis and modeling.

DATES: Comments are due on or before September 30, 2016; reply comments are due on or before October 31, 2016.

ADDRESSES: You may submit comments, identified by GN Docket No. 14–177, by any of the following methods:

- *Federal eRulemaking Portal:* <http://www.regulations.gov>. Follow the instructions for submitting comments.

- *Federal Communications Commission's Web site:* <https://www.fcc.gov/ecfs/>. Follow the instructions for submitting comments.

- *People with Disabilities:* Contact the FCC to request reasonable accommodations (accessible format documents, sign language interpreters, CART, etc.) by email: FCC504@fcc.gov, phone: 202–418–0530 or TTY: 202–418–0432.

For detailed instructions for submitting comments and additional information on the rulemaking process, see the **SUPPLEMENTARY INFORMATION** section of this document.

FOR FURTHER INFORMATION CONTACT: John Schauble of the Wireless Telecommunications Bureau, Broadband Division, at 202–418–0797 or John.Schauble@fcc.gov, Michael Ha of the Office of Engineering and Technology, Policy and Rules Division, at 202–418–2099 or Michael.Ha@fcc.gov, or Jose Albuquerque of the International Bureau, Satellite Division, at 202–418–2288 or Jose.Albuquerque@fcc.gov.

SUPPLEMENTARY INFORMATION: This is a summary of the *Further Notice of Proposed Rulemaking (FNPRM)*, GN Docket No. 14–177, IB Docket Nos. 15–256 and 97–95, RM–11664, WT Docket No. 10–112; FCC 16–89, adopted and released on July 14, 2016. The full text of the *FNPRM* is available for inspection and copying during normal business hours in the FCC Reference Center, 445 12th Street SW., Washington, DC 20554. The document also is available for download over the Internet at https://apps.fcc.gov/edocs_public/attachmatch/FCC-16-89A1.docx.

Comment Filing Procedures: You may submit comments, identified by GN Docket No. 14–177, by any of the following methods:

- *Electronic Filers:* Comments may be filed electronically using the Internet by accessing the Commission's Electronic Comment Filing System (ECFS) <https://www.fcc.gov/ecfs/> or the Federal eRulemaking Portal: <http://www.regulations.gov>. Filers should follow the instructions provided on the Commission's Web site for submitting comments and transmit one electronic copy of the filing to GN Docket No. 14–177. For ECFS filers, in completing the transmittal screen, filers should include their full name, U.S. Postal Service mailing address, and the applicable docket number.

- Parties may also submit an electronic comment by Internet email. To get filing instructions, filers should send an email to ecfs@fcc.gov, and include the following words in the body of the message, “get form your email address”. A sample form and instructions will be sent in response.

- *Paper Filers:* Parties who choose to file by paper must file an original and four copies of reach filing. Filings can be sent by hand or messenger delivery, by commercial overnight courier, or by first-class or overnight U.S. Postal Service mail. All filings must be addressed to the Commission's Secretary, Office of the Secretary, Federal Communications Commission.

- All hand-delivered or messenger-delivered paper filings for the Commission's Secretary must be

delivered to FCC Headquarters at 445 12th St. SW., Room TW–A325, Washington, DC 20554. All hand deliveries must be held together with rubber bands or fasteners. The filing hours are 8:00 a.m. to 7 p.m. All hand deliveries must be held together with rubber bands or fasteners. Any envelopes must be disposed of before entering the building.

- Commercial overnight mail (other than U.S. Postal Service Express Mail and Priority Mail) must be sent to 9300 E. Hampton Drive, Capitol Heights, MD 20743.
- U.S. Postal Service first-class, Express, and Priority must be addressed to 445 12th Street SW., Washington, DC 20554.

Ex Parte Rules—Permit-But-Disclose

Pursuant to Section 1.1200(a) of the Commission's rules, this *FNPRM* shall be treated as a “permit-but-disclose” proceeding in accordance with the Commission's *ex parte* rules. Persons making *ex parte* presentations must file a copy of any written presentation or a memorandum summarizing any oral presentation within two business days after the presentation (unless a different deadline applicable to the Sunshine period applies). Persons making oral *ex parte* presentations are reminded that memoranda summarizing the presentation must: (1) List all persons attending or otherwise participating in the meeting at which the *ex parte* presentation was made, and (2) summarize all data presented and arguments made during the presentation. If the presentation consisted in whole or in part of the presentation of data or arguments already reflected in the presenter's written comments, memoranda or other filings in the proceeding, the presenter may provide citations to such data or arguments in his or her prior comments, memoranda, or other filings (specifying the relevant page and/or paragraph numbers where such data or arguments can be found) in lieu of summarizing them in the memorandum. Documents shown or given to Commission staff during *ex parte* meetings are deemed to be written *ex parte* presentations and must be filed consistent with rule 1.1206(b). In proceedings governed by rule 1.49(f) or for which the Commission has made available a method of electronic filing, written *ex parte* presentations and memoranda summarizing oral *ex parte* presentations, and all attachments thereto, must be filed through the electronic comment filing system available for that proceeding, and must be filed in their native format (e.g., .doc,

.xml, .ppt, searchable .pdf). Participants in this proceeding should familiarize themselves with the Commission's *ex parte* rules.

Initial Regulatory Flexibility Analysis

As required by the Regulatory Flexibility Act of 1980, as amended (RFA), the Commission has prepared this present IRFA of the possible significant economic impact on a substantial number of small entities by the policies and rules proposed in the attached *FNPRM*. Written public comments are requested on this IRFA. Comments must be identified as responses to the IRFA and must be filed by the deadlines specified in the *FNPRM* for comments. The Commission will send a copy of this *FNPRM*, including this IRFA, to the Chief Counsel for Advocacy of the Small Business Administration (SBA).

Paperwork Reduction Analysis

This document does not contain new or modified information collection requirements subject to the Paperwork Reduction Act of 1995 (PRA), Public Law 104–13.

Synopsis

1. This *FNPRM* has two sections that the Commission is seeking comment. First, the Commission proposes to adopt service rules allowing flexible fixed and mobile uses in additional bands. These bands potentially offer 17.7 GHz of spectrum that could be available for fixed or mobile use. By examining the suitability for mobile use of such a large amount of spectrum, the Commission takes steps to ensure that additional spectrum is available to allow the next generation of wireless technologies to flourish in the mmW bands. In addition, many of these bands will require sharing solutions to unlock their potential for flexible use services—the Commission seeks comment on the potential sharing mechanisms, and continue to encourage all stakeholders to work to develop and refine effective solutions to sharing. Second, the Commission seeks further comment on refinements to the rules the Commission adopted in the *Report and Order* in GN Docket No. 14–177, IB Docket Nos. 15–256 and 97–95, RM–11664, WT Docket No. 10–112; FCC 16–89, adopted and released on July 14, 2016 (hereinafter *Order* or *Report and Order*). In particular, the Commission seeks comment on: (1) Providing additional detail on the sharing arrangement that the Commission adopted in the *Order* for the 37 GHz band; (2) performance requirements for innovative uses such as IoT and machine-to-machine

communications; (3) additional issues relating to our mobile spectrum holdings policies; (4) whether antenna height limits are necessary in mmW bands; (5) whether minimum bandwidth scaling factors are necessary for transmitter power limits; (6) whether allowing higher PFD levels for FSS in the 37 and 39 GHz bands would be consistent with terrestrial use of those bands; (7) refining the coordination limits for point-to-point operations; and (8) on sharing analysis and modeling.

2. In the *Order*, several commenters ask the Commission to consider other bands for mobile use. Many commenters argue that the criteria should not preclude the Commission from considering bands that do not meet all of those criteria. For example, CTIA and Nokia ask the Commission to consider bands that do not have 500 MHz of spectrum because certain applications may be feasible for smaller bandwidths. Commenters also agree that while international harmonization is preferable, the Commission should not preclude bands from further consideration just because they are not proposed for mobile use throughout the world.

3. Several factors lead us to conclude that it is now appropriate to consider additional bands for mobile use. First, as the record to the *Report and Order* has made clear, there are a wide variety of services, including fixed, mobile, and satellite, for which these bands could be used. This variety favors making multiple bands available, including bands for which the Commission did not to propose service rules in the *NPRM* (see *In the Matter of Use of Spectrum Bands Above 24 GHz for Mobile Radio Services*, Notice of Proposed Rulemaking, 30 FCC Rcd 11878 (2015)). Second, the World Radio Conference identified a large number of bands as candidate bands for IMT–2020 (International Mobile Telecommunications), including several bands that the Commission did not address in the *NPRM*. Third, it appears that the amount of global data traffic will continue to grow exponentially. Cisco estimates that global mobile data traffic will grow nearly tenfold between 2014 and 2019. Under these circumstances, the Commission believes it is now appropriate to seek comment on proposing mobile service rules for most of the bands identified at the 2015 World Radio Conference.

4. Specifically, the Commission proposes authorizing flexible use licenses that would permit fixed and mobile services in the following bands: 24.25–24.45 GHz and 24.75–25.25 GHz, 31.8–33.4 GHz, 42–42.5 GHz, 47.2–50.2

GHz, 50.4–52.6 GHz, 71–76 GHz, and 81–86 GHz. Each of these bands was identified as a candidate band for IMT–2020.

5. At the same time, the Commission recognizes that there are challenges that must be overcome before the Commission can authorize service in these bands, including existing allocations and/or operations in these bands. The Commission will continue to work with existing stakeholders, wireless providers, the satellite industry, National Telecommunications and Information Administration (NTIA), and other interested Federal stakeholders to determine where different services can coexist and develop ways to maximize flexible use. In several bands, the Commission believes sharing mechanisms that the Commission has adopted in the *Report and Order* and in other proceedings can allow many of these bands to be utilized for fixed and mobile use while also accommodating existing uses.

6. The Commission discusses each of the bands in additional detail below. The Commission generally proposes to use the licensing and service rule framework the Commission adopted in the *Order*. Except for the 71–76 GHz, and 81–86 GHz bands, the Commission proposes to use geographic area licensing with Partial Economic Area (PEAs) as the license area size. For the 71–76 GHz and 81–86 GHz bands, the Commission proposes to use a licensing framework similar to the framework developed for the Citizens Broadband Radio Service. For any Upper Microwave Flexible Use Service (UMFUS) bands for which the Commission adopts geographic area licensing and accept mutually exclusive initial applications, the Commission has decided to conduct any spectrum auction of licenses in conformity with the general competitive bidding procedures set forth in Part 1 Subpart Q of the Commission's rules, including rules governing designated entity preferences. The Commission seeks comment here on whether to apply the same small business definitions and associated bidding credits the Commission has adopted for auctions of UMFUS licenses to auctions of licenses in the additional bands discussed below, as the Commission seeks any other spectrum bands that the Commission may subsequently decide to include in the UMFUS. Our proposal is based on our anticipation that the same types of services would be deployed in these additional bands as are contemplated to be deployed in the bands that the Commission has already designated for the UMFUS. The

Commission asks commenters to provide specific data on the costs and benefits associated with the licensing mechanisms the Commission has proposed.

7. In the *Order*, the Commission is making 3.85 GHz of mmW spectrum available for licensed mobile use, as well as adding seven gigahertz of spectrum for unlicensed use, bringing the total to 14 GHz of unlicensed spectrum available in the 57–71 GHz band. In view of these relative proportions, the Commission believes it is appropriate to make additional licensed spectrum available for flexible use. Furthermore, the Commission continues to believe there is value in using both geographic area licensing and shared access. The Commission seeks comment on alternative licensing mechanisms for each of these bands, including unlicensed operation. To the extent the Commission adopts geographic area licensing, the Commission also seeks comment on alternative license area sizes.

8. The Commission also proposes to generally apply the Part 30 technical rules the Commission has adopted in the *Order* to each of the bands where the Commission ultimately adopts flexible use rules. The Commission seeks comment on any deviations from those rules or special technical rules that would be needed for any of those bands. Commenters who propose special technical rules should explain the specific need for such rules and quantify the costs and benefits associated with their proposed rules. The Commission also encourages commenters to provide detailed technical analysis supporting any technical proposals.

9. As the Commission explained in the *NPRM*, the Commission believes these bands might be able to support expanded sharing, including two-way shared use between Federal and non-Federal users in these bands and sharing among different types of service platforms. The Commission continues to believe there is an opportunity to leverage the propagation characteristics of these bands to further enhance sharing Federal and non-Federal users. The Commission seeks comment generally on ways to further Federal and non-Federal sharing in these bands, including refinement of the concept the Commission adopted in the *Order* for the 37 GHz band.

A. Additional Bands

1. 24 GHz Bands (24.25–24.45 GHz and 24.75–25.25 GHz)

10. The Commission proposes to add a mobile allocation to the 24.25–24.45 and 24.75–25.25 GHz segments of the 24 GHz band, a fixed allocation to 24.75–25.05 GHz, and to authorize both mobile and fixed operations in those segments under the new Part 30 UMFUS rules. This band is already used internationally for fixed service and is included in the WRC study for future international mobile allocation. The existing manufacturing base and global harmonization of this band make it an attractive option for mobile use. The Commission further proposes to grant mobile rights to the existing fixed licensees, in order to facilitate coordination between fixed and mobile uses in the areas that are currently licensed. The Commission proposes to add these new fixed and mobile authorizations on a co-primary basis. The Commission seeks comment on that arrangement, as well as on the alternative of making mobile or fixed use secondary to FSS.

11. The Commission recognizes that there are existing satellite interests and operations in this band, and the Commission seeks comment on the best way to promote effective sharing between satellite and mobile uses. Given that the current use of the band for satellite appears to be rather limited, should the Commission maintain the existing limits and coordination procedures on satellite operations in the 25.05–25.25 GHz band, and apply those same limits to the 24.75–25.05 GHz band? Alternatively, are there other sharing mechanisms that would better achieve coexistence? Would the sharing regime the Commission has adopted for the 28 GHz band be appropriate in this band, or do the differences between FSS earth stations in that band and BSS feeder links here suggest a different solution?

12. The Commission also proposes to modify the existing band plan for new licenses in the 24 GHz band. Currently, the 24 GHz bands is channelized into five 40 MHz by 40 MHz channel pairs. As with the 39 GHz band, the Commission sees benefits to converting the 24 GHz band plan to unpaired blocks. Going forward, the Commission proposes to license the 24.25–24.45 GHz band segment as a single, unpaired block of 200 MHz, and the 24.75–25.25 GHz band segment as two unpaired blocks of 250 MHz each. The Commission seeks comment on this proposal, as well as the alternative of using 100 MHz unpaired channels, or

two 200 MHz channels and one 100 MHz channel in 24.75–25.25 GHz. The Commission also seeks comment on how to treat existing 24 GHz band licensees. Should incumbent licenses be converted to UMFUS licenses, as the Commission has done in 28 GHz and 39 GHz? Also, is it necessary to repack existing licensees, or can they keep their existing frequency assignments because there are so few licensees?

2. 32 GHz Band (31.8–33.4 GHz)

13. The Commission proposes to add primary non-Federal fixed and mobile service allocations to the 32 GHz band (31.8–33.4 GHz).¹ The Commission also proposes to authorize fixed and mobile operations in the 32 GHz under the Part 30 Upper Microwave Flexible Use Service rules. In the *NPRM*, the Commission noted that the 32 GHz band is not currently allocated for mobile operations, and therefore, perhaps it is not as suited to the provision of 5G services as other bands under consideration. Since the *NPRM* was adopted, however, ITU WRC–15 decided to conduct the appropriate sharing and compatibility studies for the 32 GHz band, which may lead to an allocation for mobile service in the 32 GHz band at WRC–19 and the opportunity for globally harmonized services in this band. Global harmonization, in turn, will promote global interconnection, roaming, and interoperability. In addition, there is a significant amount of contiguous bandwidth available in the 32 GHz band. Finally, the Commission notes that there is significant support among the commenters to allocate the 32 GHz band for fixed and mobile 5G services.

14. However, there are still two major challenges to authorizing mobile operations in the 32 GHz band: (1) Protecting radionavigation operations in the 32 GHz band; and (2) protecting radio astronomy observations in the adjacent 31.3–31.8 GHz band. The Commission discusses those challenges and invites further comment on those issues below.

a. Federal and Non-Federal Services in the 32 GHz Band

15. In the *NPRM*, the Commission sought comment on the compatibility of mobile use of the 32 GHz band with existing aeronautical and shipborne radar use of the band, future radionavigation and other Federal services, as well as deep space research

¹ In the *NPRM*, the Commission addressed the 31.8–33 GHz band. Because the ITU identified 31.8–33.4 GHz as a potential candidate band, we will expand our consideration to the 31.8–33.4 GHz band.

in the 31.8–32.3 GHz portion of the 32 GHz band. In the *Order*, commenters did not address these issues directly. Instead, Echodyne, a technology startup, asks the Commission to proceed cautiously to ensure that it does not hinder the development of innovative technologies for the radionavigation bands. Echodyne states that “near term advances in radar technology soon will help fuel revolutionary changes in many sectors.” For instance, Echodyne indicates that “accurate, lightweight, and low-power detect and avoid systems will be essential to widespread commercial deployment of Unmanned Aerial Systems and autonomous vehicles,” which Echodyne argues, will change the face of transportation, shipping, security, and numerous other industries. According to Echodyne, these advances rely on effective radionavigation operations that need consistent operating conditions across a geographic region, including a predictable and uniform interference environment. Echodyne indicates that it is skeptical that the 32 GHz band could be made available for mobile use.

16. The Commission seeks comment on the compatibility of fixed and mobile services with existing allocated services in the 32 GHz band. In the *Order*, commenters who support mobile use of this band should provide specific technical information and proposals showing how fixed and mobile uses of this band is compatible with radionavigation uses. In that regard, the Commission asks Echodyne and other commenters to provide specific information on existing and planned non-Federal uses of radar in this band. The Commission will continue to work with NTIA and other Federal partners to determine the protection requirements for Federal users and the opportunity to expand shared Federal use across the band.

17. The Commission also seeks comment on protecting other allocated service within the 32 GHz band. For Space Research Service operations in the Goldstone, California area, would coordination requirements be sufficient to protect those operations? In the *NPRM*, the Commission noted that the risk of interference between terrestrial operations and ISS links in 64–71 GHz appeared to be low because of atmospheric absorption. Would the same analysis apply in the 32 GHz band?

b. Radio Astronomy and EESS in the Adjacent 31.3–31.8 GHz Band

18. The 32 GHz band is adjacent to the 31.3–31.8 GHz band. In the United States, the 31.3–31.8 GHz band is

allocated for Earth Exploration Satellite (passive), radio astronomy, and Space Research (passive). No station is authorized to transmit in the 31.3–31.8 GHz band and the radio astronomy operations in the 31.3–31.8 GHz band are protected from unwanted emissions only to the extent that such radiation exceeds the level which would be present if the offending station were operating in compliance with the technical standards or criteria applicable to the service in which it operates.

19. In the *NPRM*, the Commission noted that the need to protect the 31.3–31.8 GHz passive band may severely limit the availability of usable spectrum in the 31.8–33 GHz band and sought detailed technical analysis from commenters on the out-of-band emission limits required to protect operations in the 31.3–31.8 GHz band. The Commission indicated that a detailed analysis would help it determine how much of the 31.8–33 GHz band could be used for mobile operations while protecting the passive services in the 31.3–31.8 GHz band.

20. In the *Order*, CORF submitted the most information on this topic. CORF states that although the critical science undertaken by Radio Astronomy observers cannot be performed without access to interference free bands, Radio Astronomy Service (RAS) bands can be protected regionally by limiting emissions within a certain radius of the facility. But, CORF explains, “the emissions that radio astronomers receive are extremely weak—a radio telescope receives less than 1 percent of one-billionth of one-billionth of a watt (10–20 W) from a typical cosmic object.” CORF further explains that radio observatories are particularly vulnerable to interference from in-band emissions, spurious and out-of-band emissions from licensed and unlicensed users of neighboring bands, and emissions that produce harmonic signals in the RAS bands, even when those manmade signals are weak and distant. EMEA Satellite Operators Association (ESOA) argues that any deep space research operations in the 31.3–31.8 GHz band can be protected from mobile terrestrial operations in the 32 GHz band because there are very few research facilities and they are located in very remote areas. The Commission seeks specific comment on how the Commission should protect these operations.

21. CORF stresses the importance of the data collected from Earth Exploration Satellite Service (EESS) and that billions of dollars have been invested in EESS satellites. CORF notes

that for certain applications, satellite-based microwave remote sensing is the only practical method of obtaining atmospheric and surface data for the entire planet. Data derived from EESS have contributed substantially to the study of meteorology, atmospheric chemistry, climatology, and oceanography and is used by multiple governmental agencies. CORF indicates that incumbent users designed and developed EESS missions without the expectation of transmissions in close proximity to the 31.3–31.8 GHz band. They also report that most incumbent users at 31.5 GHz operate in a direct detection (homodyne) mode. CORF recommends that the Commission adopt adequate guard bands to protect EESS operations in the 31.3–31.8 GHz “until the current satellites can be replaced with satellites with filtering suited to the new spectral environment.” CORF claims that proportionally larger guard bands are needed as the frequency increases. In direct detection, CORF explains, band definition is achieved with filters that are limited by the properties of the materials used in the filter itself. Thus, for example, “for a given material, the minimum bandwidth of a filter is proportional to the central frequency, so that the width of the necessary guard bands to suppress emissions to a desired level also increases in proportion to the frequency.” CORF continues, “it is impossible to reject a signal 10 MHz away from a band edge at these higher frequencies, so guard bandwidths must be scaled in frequency to accommodate this physical limitation.” The Commission seeks comment on whether the Commission should adopt a guard band to protect EESS operations in the 31.3–31.8 GHz band, and if so, how large should the guard band be? ESOA, disagrees with CORF and states that services operating in the 31.3–31.8 GHz band can be protected through “carefully crafted operating requirements.” The Commission seeks comment on ESOA’s statement and ask what these “carefully crafted operating requirements” might be.

22. CORF also expresses concern that “mobile devices with limited size and cost will not be able to adequately filter their out-of-band emissions to meet the stringent requirements” of the 31.3–31.8 GHz band. Avanti responds that under agenda item 1.13 for WRC–19 (World Radiocommunication Conference), the International Telecommunication Union–Radiocommunication (ITU–R) will develop technical measures, if necessary, to protect passive services from interference from 5G mobile

broadband systems. The Commission seeks detailed information concerning the capability of mobile and other consumer devices to limit out-of-band emissions into the 31.3–31.8 GHz band, and seek comment on whether guard bands or other special rules will be necessary to limit emissions into the 31.3–31.8 GHz band.

c. Band Plan

23. The Commission also seeks comment on the appropriate band plan for the 32 GHz band. The Commission proposes to license the band using channels of either 200 MHz or 400 MHz bandwidth. Given the contemplated use cases and the nature of this band, what channel size would be best? The Commission encourages commenters to discuss the specific advantages and disadvantages of various band plans.

3. 42 GHz Band (42–42.5 GHz)

24. The Commission proposes to authorize fixed and mobile service operations to operate in the 42 GHz band (42–42.5 GHz) under the Part 30 Upper Microwave Flexible Use Service rules, as long as the Commission can ensure that adjacent channel RAS services will be protected. The band potentially offers 500 megahertz for new flexible use services, has existing fixed and mobile allocations, and is being studied internationally for possible mobile use. The Commission also proposes to adopt geographic area licensing using PEAs as the geographic area. The Commission seeks comment on this proposal, as well as alternatives.

25. The Commission denies FWCC's request that the Commission establish service rules to enable fixed service at 42–42.5 GHz, but keeps its request pending for the 42.5–43.5 GHz band. The Commission believes that flexible use licensing, which would allow a variety of services to be offered, would be more likely to place the spectrum in its highest and best use, as opposed to rules that would only allow point-to-point operation. Nevertheless, the Commission does not deny FWCC's petition with respect to the 42.5–43.5 GHz band because point-to-point operation may be more likely to co-exist with co-channel RAS. The Commission will give further consideration to the 42.5–43.5 GHz band separately.

26. The Commission seeks comment on whether it is possible to authorize fixed and mobile use in the 42 GHz band while protecting RAS observations in the adjacent 42.5–43.5 GHz band. If protection is possible, the Commission seeks comment on what protections should be established. CORF notes that frequency lines at 42.519, 42.821,

43.122, and 43.424 GHz (for observations of silicon monoxide) are among those of greatest importance to radio astronomy. CORF represents, "The detrimental levels for continuum and spectral line radio astronomy observations for single dishes are –227 dBW/m²/Hz and –210 dBW/m²/Hz, respectively, for the average across the full 1 GHz band and the peak level in any single 500 kHz channel. For observations using the entire Very Long Baseline Array (VLBA), the corresponding limit is –175 dBW/m²/Hz." Does the Commission need to establish special out-of-band emission limits into the 42.5–43.5 GHz band? Is it necessary or appropriate to establish a guard band below 42.5 GHz? The Commission asks proponents of terrestrial use in the 42 GHz band to provide detailed studies demonstrating how such use can be compatible with RAS use in the 42.4–43.5 GHz band. The Commission also asks CORF and other radio astronomy interests to provide additional information on the locations where observations are made in the 42.4–43.5 GHz band.

27. The Commission also seeks comment on the appropriate band plan for the 42 GHz band. Should the band be licensed as a single channel, split into two channels, or split into multiple 100 megahertz channels? The Commission recognizes that if the Commission adopts a guard band to protect adjacent channel radio astronomy, the guard band will affect the band plan by making less spectrum available. Given the contemplated use cases and the nature of this band, what channel size would be best? The Commission encourages commenters to discuss the specific advantages and disadvantages of various band plans.

28. Finally, the Commission proposes to add Federal fixed and mobile allocations into this band, and additionally seek comment on establishing a framework under which Federal and non-Federal users could share the band. Given the short propagation distances, lack of incumbent licensees, and other factors, as described in the 37 GHz sharing section and the rules the Commission adopted in the *Report and Order*, the Commission believes it is possible for both Federal and non-Federal users to coexist on a co-primary basis, particularly using simple methods of coordination (to enable geographic sharing). The Commission therefore seeks comment on whether to extend Federal access to this band, including how to best achieve coexistence with non-Federal uses. For instance, are there additional considerations in addition to

leveraging the sharing regime adopted for the co-primary coordinated sharing in the 37 GHz band? Should the Commission use more static sharing mechanisms? Would an SAS-based sharing approach facilitate Federal and non-Federal sharing of this band? Are there other tools the Commission can leverage to create a robust sharing environment that allows this spectrum to meet both Federal and non-Federal needs?

4. 47 GHz Band (47.2–50.2 GHz)

29. The Commission proposes to authorize fixed and mobile operations in the 47 GHz band (47.2–50.2 GHz) under the Part 30 Upper Microwave Flexible Use Service rules. The band potentially offers 3 GHz of spectrum and is being studied internationally for possible mobile use.

30. At the same time, the Commission recognizes that this band is authorized for FSS use. While there are no current authorized operations, this band may be paired with the 40–42 GHz downlink band. Unlike in the 28 GHz or 39 GHz bands, where FSS can use other spectrum to operate user equipment, FSS would have to use some portion of the 47 GHz band to operate user equipment. Sharing between terrestrial mobile and FSS user equipment is more complicated, particularly when the FSS user equipment is transmitting.

31. With respect to individually licensed earth stations, it appears that the Commission could adopt the sharing framework the Commission has adopted for the 28 GHz band. Specifically, in each PEA, the Commission proposes that there can be one location where FSS earth stations can be located on a co-primary basis, subject to the conditions and limitations the Commission has adopted in other bands. The Commission seeks comment on this proposal, as well as alternatives.

32. The Commission seeks comment on the best approach for sharing between FSS user equipment and terrestrial operations. One option would be to have geographic area licensing on a PEA basis, but also authorize database-driven sharing between terrestrial licensees and stationary FSS user equipment. In the *NPRM*, the Commission sought comment on leveraging a Spectrum Access System (SAS) or other database coordination mechanism to facilitate sharing between terrestrial operations and FSS user equipment. Under the SAS proposal, terrestrial licensees would provide the geographic coordinates and other pertinent technical information concerning their facilities to the SAS. Satellite operators would then access

the information in the SAS to determine where their user equipment could transmit without causing interference to terrestrial operations. The Commission recognizes that many terrestrial operators oppose being required to provide information on their deployments to a database, but those operators have not presented a viable alternative that would allow sharing between these services.

33. Another option would be to divide the band into a segment where FSS has priority and a segment where UMFUS operations has priority.² In the segment where FSS had priority, FSS could operate its user equipment without any obligation to protect UMFUS operations. Conversely, in the segment where UMFUS licensees had priority, satellite user equipment could operate on a purely secondary basis and would be required to cease transmitting if it caused interference to fixed or mobile operations. Supporters of this option should propose a split for the band and explain how their proposed split best balances the needs of UMFUS and FSS licensees.

34. A third option would be to develop specific criteria for assigning priority between FSS and terrestrial operations. For example, the Commission could require both FSS and UMFUS licensees to register their operations in a database, and the Commission could assign interference protection on a first-come, first-served basis. The Commission seeks comment on a first-come, first-served approach, and the Commission also invites commenters to propose alternative criteria for assigning priority. Commenters should provide detailed information on the costs and benefits of their proposed mechanisms for assigning priorities. The Commission also seeks comment on other alternatives for sharing between UMFUS and FSS in this band.

35. The Commission also seeks comment on sharing with co-primary Federal services in the 48.2–50.2 GHz band, as well as protection of passive services in the adjacent 50.2–50.4 GHz band. Our understanding is that there are currently no authorized Federal or non-Federal operations in the 48.2–50.2 GHz band but that there may be future Federal operations in that band. Are the rules and framework the Commission adopted in the *Order* for sharing of the 37 GHz band applicable to the 48.2–50.2

GHz band? Could a modified first-come, first-served mechanism be used to establish priority in this band without precluding use of the band by co-primary Federal users? Should the Commission leverage the database-driven sharing mechanism? The Commission intends to work with NTIA and other Federal agencies to identify an appropriate framework to protect current or planned Federal interests in and ensure future access to this band on a co-primary shared basis. The Commission also seeks comment on protecting radio astronomy in the 48.94–49.04 GHz band. Are there any steps the Commission needs to take to protect radio astronomy over and above implementing the existing prohibition on aeronautical use in that segment? The Commission encourages CORF and other radio astronomy interests to provide information on locations where this band is used for radio astronomy observations. With respect to the 50.2–50.4 GHz band, the Commission notes that the international allocation for the passive services “shall not impose undue constraints on the use of adjacent bands by the primary allocated services in those bands.” On the other hand, at WRC-12, the WRC recognized “that long-term protection of the EESS in the [*inter alia*, 50.2–50.4 GHz band] is vital to weather prediction and disaster management.” The WRC did establish emission limits for FSS stations operating in the 49.7–50.2 GHz and 50.4–50.9 GHz bands, but did not address fixed or mobile stations operating in those bands. Given that framework, what requirements would be appropriate to protect passive services in the 50.2–50.4 GHz bands?

36. The Commission also seeks comment on the appropriate band plan for the 47 GHz band. One possibility would be to divide the band into six channels of 500 MHz each. One advantage of that band plan is that the channels would align with 48.2 GHz, which is where the Federal allocation and current FSS designation begin and where FSS user equipment can begin to be deployed. On the other hand, 500 megahertz channels would not align with the band plan in other bands, where the Commission is using multiples of 200 MHz. Given the contemplated use cases and the nature of this band, what channel size would be best? The Commission encourages commenters to discuss the specific advantages and disadvantages of various band plans.

5. 50 GHz Band (50.4–52.6 GHz)

37. The Commission proposes to authorize fixed and mobile operations

in the 50 GHz band (50.4–52.6 GHz) under the Part 30 Upper Microwave Flexible Use Service rules. The band potentially offers 2 GHz of spectrum and is being studied internationally for possible mobile use. The Commission also proposes to use geographic area licensing in this band and license the band on a PEA basis. The Commission seeks comment on these proposals, as well as alternatives. The Commission also seeks comment on the non-Federal satellite allocations in the 50.4–51.4 GHz band.³ Assuming that the 40–42 GHz (space-to-Earth) band is paired with the 48.2–50.2 GHz (Earth-to-space) band, the Commission requests comments on how this uplink band would be used by FSS operators. The Commission also requests comments on means of accommodating sharing between terrestrial and satellite operations.

38. The Commission also seeks comment on sharing with co-primary Federal services in the 50.4–52.6 GHz band, as well as protection of passive services in the adjacent 50.2–50.4 GHz and 52.6–54.25 GHz bands. The Commission’s understanding is that there are currently no authorized Federal or non-Federal operations in this band but that there may be future Federal operations in that band. Are the rules and framework the Commission adopted in the *Order* for sharing of the 37 GHz band applicable to this band? Could a database-driven sharing approach facilitate sharing between Federal and non-Federal operations? Could a modified first-come, first-served mechanism be used to establish priority in this band without precluding use of the band by co-primary Federal users? The Commission intends to work with NTIA and other Federal agencies to identify an appropriate framework to protect current or planned Federal interests and to ensure future access to this band on a co-primary shared basis. With respect to the 50.2–50.4 GHz band this band is vital to weather prediction and disaster management, and the international allocation for the passive services “shall not impose undue constraints on the use of adjacent bands by the primary allocated services in those bands.” Given that framework, what limits on emissions into the 50.2–50.4 GHz would be appropriate? On the

² The Commission could maintain the current wireless services and FSS designations. When the Commission made the separate designations for the FSS and wireless services in the band, it did not place any restrictions on the use of either portion of the band by either the FSS or wireless services.

³ The Commission notes that the NATO Joint Frequency Agreement identifies the 39–5–40.5 GHz downlink band and the 50.4–51.4 GHz uplink band for future military FSS and MSS requirements. See NTIA letter, IB Docket No. 97–95, received May 7, 1997, at p. 4. See also NTIA’s Federal Long-Range Spectrum Plan, September 2000, at p. 122 (available at <https://www.ntia.doc.gov/files/ntia/publications/final-1rsp.pdf>).

other hand, there is a specific limit on fixed emissions into the 52.6–54.25 GHz band. What impact will that limit have on the suitability of this band to provide terrestrial service? What limits would be necessary on mobile service to protect the 52.6–54.25 GHz band?

39. The Commission also seeks comment on the appropriate band plan for the 50 GHz band. One option is to establish ten channels of 200 MHz each, which would be consistent with the channel plan for the 39 GHz band. Other options include four channels of 500 megahertz each or five channels of 400 MHz each, with one extra 200 MHz channel. Is there any value in establishing a guard band immediately below 52.6 GHz to protect the passive band above 52.6 GHz? Given the contemplated use cases and the nature of this band, what channel size would be best? The Commission encourages commenters to discuss the specific advantages and disadvantages of the various band plans.

6. 70/80 GHz Bands (71–76 GHz and 81–86 GHz)

40. When evaluating services or uses that could be viable if the Commission authorize their introduction into the 71–76 and 81–86 GHz bands, the Commission must consider three basic issues. First, the Commission needs to consider whether the bands offer adequate spectrum for the proposed new services or uses in bands where tens of thousands of incumbent operations are already registered. Second, the Commission needs to consider whether the new services or uses are compatible with the fundamental electromagnetic characteristics of the relevant spectrum. And third, the Commission needs to consider whether more than one service or use can coexist in the bands. The Commission addresses each of these considerations and corollary concerns below.

41. The *NPRM* posited that it might not be possible to authorize mobile services or unlicensed access in the 71–76 and 81–86 GHz bands without causing interference to incumbent point-to-point links. After further review, the Commission finds that the bands are relatively lightly used both in terms of the number of registered sites (especially on a large geographic scale) and with respect to the quantity of spectrum available. As E-Band Communications notes, “The 10 GHz of spectrum available [in the 71–76 and 81–86 GHz bands] represents by far the most ever allocated by the FCC at any one time, representing 50-times the bandwidth of the entire cellular

spectrum.” Moreover, the great majority of existing links in the bands are concentrated in just a few localities. As of June 10, 2016, only 16 counties had an average site density of more than one transmission or reception site per square mile, and those 16 counties contain more than 73 percent of all registered transmitters and receivers in the 71–76 and 81–86 GHz bands. Given the narrow beamwidths and limited path lengths involved, it would be reasonable to treat the remaining 3,125 counties and county-equivalents as the functional equivalent of a green field, provided that adequate measures are taken to protect the few incumbents in them.

42. The Commission must also consider whether the physical characteristics of the bands are suitable for the kinds of services that might be authorized in the bands—this is particularly true for mmW bands where atmospheric and other environmental phenomena affect the utility of the band. In general, for example, atmospheric attenuation increases the higher one goes in the electromagnetic spectrum, limiting the potential length of transmission paths. However, the 71–76 and 81–86 GHz bands experience less attenuation than frequencies in the 50–60 GHz range.

43. In addition to atmospheric attenuation, spreading loss also becomes an issue in the mmW bands. As the Friis transmission law states, path loss grows with the square of the frequency, even when radio waves are traveling through a vacuum. The caveat, however, is that Friis’s law applies only to transmissions from omnidirectional antennas. As a recent technical study and analysis explains, “[T]he smaller wavelength of mmW signals also enables proportionally greater antenna gain for the same physical antenna size. Consequently, the higher frequencies of mmW signals do not in themselves result in any increased free space propagation loss, provided the antenna area remains fixed and suitable directional transmissions are used.” In short, the directionality of the antennas that are feasible at shorter wavelengths may result in less path loss than theorized. Based upon this preliminary analysis, the Commission believes the bands might be valuable for a variety of uses, including mobile as well as fixed uses. In determining whether new and different services can coexist in these bands, the Commission must also look at whether the new service use can be authorized in a manner that does not disrupt the incumbent use (or otherwise, the Commission could decide to disrupt the incumbent use), and whether the existing use can and

should continue to expand. Specific to this analysis is whether the current and potential future fixed point-to-point uses of these bands might be compatible with other types of fixed or mobile uses.

44. When evaluating the compatibility between fixed and mobile services in the 70/80 GHz band, one important consideration is the beamwidths of their transmission paths because tighter beams are less likely to cause interference. Historically, the Commission has tried to balance the desire for smaller antennas against the spectrum efficiencies of narrow beamwidths in the 70/80 GHz band. Over the last decade, the Commission has continued to explore modifying the technical rules to allow larger beamwidths. Most recently, on October 13, 2015, WTB’s Broadband Division opened a new docket (Public Notice 30 FCC Rcd 10961 (WTB 2015)) to address two waiver requests seeking a further relaxation of antenna standards in the 71–76 and 81–86 GHz bands. As the waiver requests and comments filed in that docket attest, evidence suggests that the Commission might further relax the allowed beamwidth to 2.2 degrees. That step, if taken, would bring the bands’ technical standards into a realm that is at least potentially compatible with dynamic beamforming technology because a 2.2-degree beamwidth is also achievable by the kinds of MIMO base stations that will be supporting mmW mobile services. At least when operating with beamforming MIMO, these base stations would likely be able to coexist with conventional point-to-point Fixed Service links.

45. The introduction of fixed services under somewhat relaxed directionality requirements in addition to mmW mobile services pose a new coexistence consideration. It is likely that, when both fixed and mobile mmW services are operated by the same entity, they can sufficiently plan, coordinate, and time their use to facilitate coexistence. In looking at whether incumbent fixed services, new more dynamic fixed services, and potential mobile services (and equipment) in these bands may coexist, it is apparent that the use of a central coordinating database capable of calculating and enforcing protections among different types of users, like a Spectrum Access System, could facilitate this coexistence.

46. Initially, coordination of non-Federal links with Federal operations in the 71–76 GHz, 81–86 GHz, and 92–95 GHz (70/80/90) bands was accomplished under a traditional coordination process: that is, requested non-Federal links were recorded in the Commission’s Universal Licensing

System (ULS) database and coordinated with the NTIA through the Interdepartment Radio Advisory Committee (IRAC) Frequency Assignment Subcommittee. However, beginning on February 8, 2005, this interim link registration process was replaced by a permanent process in which third-party database managers are responsible for recording each proposed non-Federal link in the third-party database link system and coordinating with NTIA's automated "green light/yellow light" mechanism to determine the potential for harmful interference with Federal operations. A "green light" response indicates that the link is coordinated with the Federal Government; a "yellow light" response indicates a potential for interference to Federal Government or certain other operations. In the case of a "yellow light," the licensee must file an application for the requested link with the Commission, which in turn will submit the application to IRAC for individual coordination. This automated process is designed to streamline the administrative process for non-Federal users in the bands. The Commission noted that the classified nature of some Federal operations precludes the use of a public database containing both Federal and non-Federal links.

47. This system has been effectively used for over a decade to facilitate coexistence between commercial systems and Federal systems: the technical data needed to avoid interfering with incumbent non-Federal licensees is already available in existing registration databases, and an automated system to prevent interference with Federal systems is already in place and has been in operation for years.

48. Recently, the Commission has developed other means of facilitating spectrum sharing. In May 2016, seven parties filed applications to be certified SAS Administrators for the Citizens Broadband Radio Service. The SAS is a critical tool to enable spectrum sharing in the band. SAS will protect incumbent users based on technical criteria, authorize all devices in the band, protect a Priority Access Tier, and coordinate a General Authorized Access (GAA) Tier. By leveraging the SAS computational power, protections can be tailored to the characteristics of the systems that require protection, different uses with different characteristics can be coordinated in a similar area, and spectrum efficiency can be maximized. Based on the experience with the coordination system for the 70/80 GHz band, and the existing rules for the SAS, the

Commission proposes to establish a SAS-based regulatory framework adapted to the constraints and the opportunities of the 71–76 and 81–86 GHz bands. In particular, the Commission invites comments on the following questions and proposals:

- The Commission proposes to establish three tiers of users for the 71–76 and 81–86 GHz band, consisting of: (1) Incumbent Access users, which would receive the highest level of protection; (2) Priority Access Licensees (PALs); and (3) GAA users. Each tier would be required to prevent interference to, and accept interference from, higher tier users.

- The Commission seeks comment on whether the rules for these bands should be included in Part 30 (Upper Microwave Flexible Use Service) or Part 96 (Citizens Broadband Radio Service).

- Incumbent Access: The Commission proposes to continue to protect existing Federal locations and seek comment on the ability to add future sites on the same protected basis. The Commission seeks comment on whether existing 70/80 GHz licensees and registered links should also qualify for incumbent protection. Alternatively, the Commission seeks comment on whether they should be grandfathered for some period of time, then required to transition to the new service the Commission proposes here (most notably, deploy equipment consistent with the technical rules and capable of communicating to an SAS). To the extent grandfathered links are protected, the Commission proposes to require the links to be operational and in service, and seek comment on requiring incumbent licensees to certify their construction and operational status with the Commission. The Commission also seeks comment on the appropriate means for protecting Federal incumbents, including whether the Commission should modify the existing system or utilize a more automated system (like a sensor-based system). Finally, the Commission seeks comment on the extent to which Federal users could expand their service area and gain protected status under the incumbent tier.

- *Priority Access:* As in the Citizens Broadband Radio Service, the Commission proposes to create a Priority Access Tier in which the Commission would make PALs available for geographic license areas. The Commission proposes to authorize PALs within census tracts, with one-year, non-renewable license terms. The Commission believes that this approach will provide licensees with the certainty required to promote investment while

maximizing efficient use of the spectrum and incentivizing a variety of innovative deployment models. The Commission seeks comment on this proposal.

- *General Authorized Access:* The Commission proposes to create a GAA tier, and seek comment on whether the tier should be licensed by rule or subject to a "licensed light" regime similar to the existing structure for the 70/80 GHz band (non-exclusive nationwide licenses with individual sites authorized). The Commission seeks comment on whether the GAA tier should have access to a set channels, (*i.e.*, there would be some first-in-time right that would provide some level of certainty) or if the Commission should require (or allow) the SAS to dynamically maximize the number of GAA sites in a given area. Finally, the Commission seeks comment on whether the Commission should defer authorizing GAA users until the conclusion of initial Priority Access license terms.

- *Protection Methodology:* The Commission invites comment on the appropriate technical methodologies for protecting licensees that are entitled to protection, including but not limited to the following alternatives:

- Require SAS to calculate expected aggregate interference at each incumbent or Priority Access receiver, based on their positions and the technical parameters of their equipment, together with the corresponding parameters of intruding transmitters.

- Establish a maximum aggregate received signal level within Priority Access license areas, which would be measured in terms of power flux density (PFD) per megahertz of bandwidth at specified heights above the ground.

- Implement an alternate protection scheme whereby the SAS would protect operator-defined contours around Priority Access base stations to a protection level at a specified dBm per megahertz of bandwidth anywhere within the contour.

- *Technical Rules:* The Commission proposes to establish two classes of licenses for point-to-point operations in these bands that will be subject to the technical requirements described below.

- Class A licenses would be authorized only for operations at a minimum specified height above ground level, would be authorized to use comparatively high power levels, and would be required to use tight-beamwidth antennas. Class B point-to-point licenses would be authorized to transmit at streetlamp level, with somewhat relaxed beamwidth requirements in order to accommodate

smaller antennas. The Commission invites comment on the appropriate height limits, power levels, and beamwidth constraints that would be appropriate for these purposes.

b. The Commission proposes to authorize dynamic beamforming antennas to provide in-band backhaul so long as they conform to the same beamwidth requirements, height limitations, and other requirements that apply to conventional antennas used for point-to-point links.

c. The Commission proposes to authorize the same dynamic beamforming antennas to serve mobile user equipment, with further relaxation of beamwidth requirements, provided that they are situated no higher than streetlamp level and provided further that their antennas are inclined downward at a minimum specified angle when they are communicating with mobile user equipment. The Commission invites comment on appropriate beamwidths, inclination angles, power levels, and height constraints for these purposes.

d. The Commission proposes to require that Class A license equipment be professionally installed but that non-professionals be allowed to install Class B license equipment and mobile base station equipment, provided that the installer is equipped with the necessary geo-location equipment or that the equipment itself is capable of ascertaining its location and its orientation.

e. The Commission invites comment on technical requirements that would be appropriate for different kinds of user equipment in these bands, differentiating between point-to-point, handheld mobile equipment, and mobile equipment that will typically be situated more than 20 centimeters away from people. The Commission proposes to require that user equipment be allowed to transmit only when it is locked onto a serving base station, with the possible exception of brief pilot or sounding signals.

f. The Commission proposes to require SAS to maintain and verify information from registered base stations and Fixed Service transmitters and receiver equipment under their coordination, and the Commission invites comment on the minimum geographic positioning accuracy that the Commission should require, including accuracy with respect to altitude as well as latitude and longitude. The Commission also seeks comment on requiring licenses to update registration information if the location or operational status of registered base station equipment changes. The

Commission does not propose to require SAS to maintain position awareness of mobile user equipment.

g. The Commission proposes to establish out of band emissions (OOBE) limits for all equipment authorized to operate in these bands, and the Commission invites comments on the appropriate technical parameters to apply for that purpose.

- *Indoor Use:* The Commission invites comments on the feasibility of authorizing unlicensed, indoor-only operations, subject to Part 15 of our rules. The Commission has decided not to adopt the *NPRM's* proposal to authorize unlicensed indoor-only operations in the 37 GHz band, but the Commission believes that the comparative amount of signal leakage through windows could be much lower in the 71–76 GHz and 81–86 GHz bands, and consequently would be less likely to interfere with outdoor operations. The Commission seeks further information on that issue, especially from commenters that have performed relevant tests or have access to the results of such tests. The Commission notes that Part 15 already provides technical rules for indoor-only operation in the 92–95 GHz band that are similar to the rules in the existing 57–64 GHz band, but require that these devices be AC-powered in order to ensure that they only operate indoors. If the Commission allows unlicensed operation at 71–76 GHz/81–86 GHz, should similar technical rules apply? What additional restrictions should be added to ensure that this type of equipment will not interfere with authorized services that are currently operating in these bands? Alternatively, would registered indoor GAA use be a better mechanism for facilitating indoor use of these bands? The Commission seeks comment on this and any other relevant issue regarding unlicensed and indoor operations within this spectrum.

- The Commission proposes to extend the same requirements and privileges to all parts of the United States, but the Commission also invites comment on the alternative of establishing a separate regulatory framework for the 16 counties that are heavily registered with incumbent users.

- The Commission proposes to require SAS to be capable of performing the following operations:

- a. Determine the available frequencies at a given geographic location and assign them to PAL and/or GAA licensees;

- b. Determine the maximum permissible transmission power level for incumbent, PAL, and GAA licensees

at a given location and communicate that information;

- c. Register and authenticate the identification information and location of incumbent, PAL and GAA licensees;

- d. Enforce Exclusion and Protection Zones, including any future changes to such Zones, to ensure compatibility between non-Federal users of spectrum in the 71–76 GHz and 81–86 GHz bands and incumbent Federal operations;

- e. Ensure that PAL and GAA licensees protect non-Federal incumbent users consistent with the rules;

- f. Protect Priority Access Licensees from impermissible interference from other users;

- g. Facilitate coordination between GAA users to promote a stable spectral environment;

- h. Ensure secure and reliable transmission of information between the SAS, ESC, and PAL and GAA licensees;

- i. Provide any ESC that the Commission might approve with any sensing information reported by PAL and GAA licensees if available;

- j. Facilitate coordination and information exchange with other SASs and exchange information, as needed, with NTIA.

49. The Commission also seeks comment on alternative methods of authorizing additional access to these bands, including exclusive use licensing and unlicensed. As discussed, authorizing new flexible use operations in these bands is difficult given the incumbent fixed commercial and Federal operations. How would an exclusive use licensing or unlicensed access models work? How would incumbents be protected and be permitted to expand? Could the Commission auction overlay licenses that allow the auction winner to negotiate with the incumbents in the area for their rights? How could unlicensed operations sufficiently protect incumbents? Have circumstances changed since the Commission declined to allow unlicensed operations in these bands in 2003? The Commission seeks comment on these and other issues implicated in any alternative licensing or authorization scheme.

8. Bands Above 95 GHz

50. In the *NPRM*, the Commission noted that several parties expressed support for making additional spectrum available in the upper reaches of the spectrum, particularly above 95 GHz. The Commission invited parties to submit proposals for use of this spectrum, including proposals for authorizing use under our Part 15 rules for unlicensed devices. Commenters

generally did not respond to this request, but the Commission recognizes that the *NPRM* explored many spectrum issues and commenters may have chosen to focus on the specific proposals for the frequency bands below 95 GHz. Moreover, the Commission is aware that operations above 95 GHz involve nascent technology that is being developed by small companies that may not be accustomed to participating in FCC proceedings. Nevertheless, the Commission is committed to developing a record that will provide a basis for proposing rules that will encourage the introduction of new services and devices above 95 GHz.

75. The spectrum from 95 to 275 GHz has been allocated for a variety of different types of Federal and non-Federal radio services. In addition, the international Table of Frequency Allocations has been extended from 275 to 1,000 GHz for specific services and, in a separate proceeding, the Commission is considering how to amend the United States table. The bands above 95 GHz have already been identified for services that typically involve the reception of extremely weak signals, such as radio astronomy, space research, and Earth Exploration Satellite. All of the bands, with some minor exceptions, are allocated on a co-primary basis for Federal and non-Federal use.

51. The Commission recognizes that signals in the frequency bands above 95 GHz will attenuate rapidly, intuitively tending to minimize the risk of harmful interference to other radio services. However, this does not by itself provide a basis for proposing to allow use of any spectrum above 95 GHz. The Commission believes the process of facilitating technology above 95 GHz can best be advanced by identifying specific frequency bands rather than attempting to address all parts of the spectrum above 95 GHz. Accordingly, the Commission takes this opportunity to solicit information on the specific parts of the spectrum that would be most attractive from the standpoint of technology development while successfully coexisting with the types of radio communications services that operate under the existing allocations.

52. In identifying specific frequency bands, the Commission asks commenters to provide specific analyses to justify any claims that there are no risks of harmful interference to other radio services. Which bands should be made available for licensed or unlicensed use? Is there sufficient information to identify where and on what frequencies both existing and planned radio astronomy, space

research, Earth Exploration Satellite, and similar users will actually operate? What technical rules may be appropriate? For parties supporting unlicensed use, will it be necessary to control the locations of operation to prevent harmful interference to radio astronomy, space research, Earth Exploration Satellite, or other services? If so, how could the areas of permissible operations be controlled under the unlicensed rules? For bands that commenters believe should be made available on a licensed basis, should the new Part 30 rules or other service rules apply? How would the Commission create a licensing scheme for signals that generally propagate over very short distances? Should the Commission permit both mobile and fixed service? What technical rules should apply? The Commission encourages parties to file comments addressing these matters.

B. Federal Sharing Issues—37 GHz Band (37–38.6 GHz)

53. As the Commission indicated in the *Report and Order*, FCC staff will—in coordination with NTIA, Department of Defense (DoD), and other Federal and non-Federal stakeholders—further define the sharing framework by more fully developing the coordination mechanisms the Commission adopt for the lower band segment. The Commission also seeks comment on adopting methods for shared (Federal and non-Federal) access of the upper band segment, including through a use or share requirement, and how to facilitate coordination for potential future Federal access across the licensed portions. Thus the Commission seeks comment on the issues described below.

1. Coordination Mechanism for the Lower Band Segment

54. As explained in the *Report and Order*, the lower band segment is available for coordinated coequal sharing between Federal fixed and mobile users and non-Federal fixed and mobile users. Non-Federal fixed and mobile users, which the Commission will identify as Shared Access Licensees (SALs), will be authorized by rule. Federal and non-Federal fixed and mobile users will access the band by registering individual sites through a coordination mechanism. The *Report and Order* explained that FCC staff will work with stakeholders, both Federal and non-Federal, to help develop the details of the coordination process. Here, the Commission seeks comment on the coordination mechanism—that is, the regulatory, technical, or procedural tool necessary to actually facilitate coordinated access. Our

expectation is that some of the issues raised here may be further developed through the collaborative process between the FCC, NTIA, DOD, and other Federal users set out in the *Report and Order*, as well as through comments in response to this *FNPRM*.

55. The Commission believes that a robust coordination mechanism is essential to ensuring that both Federal and non-Federal fixed and mobile users have effective coordinated access to the lower band segment. The coordination mechanism will authorize a particular user to use a particular bandwidth of spectrum at a particular location. To do so efficiently and effectively, it must be able to obtain information about the type of equipment used, the signal contour from the coordinated location, and the bandwidth requested compared with the bandwidth available. As discussed below, it must also be capable of regularly updating the status of a coordinated location (on/off or authorized/unauthorized). Moreover, it will have to incorporate this type of information for both Federal and non-Federal fixed and mobile uses. Here, the sharing environment is relatively straight forward—there are limited incumbent uses that need to be protected, and Federal and non-Federal fixed and mobile users will have coequal rights to the band. The Commission also believes that the propagation characteristics of this band might help minimize the complexity of the coordination mechanism.

56. The Commission notes that historically the Commission has used manual frequency coordination managed by third party frequency coordinators. Recently however, the Commission finalized the rules for the 3.5 GHz Citizens Broadband Radio Service, which relies not on a static frequency coordination mechanism, but on a dynamic mechanism known as a SAS that coordinates uses among different tiers of users, rather than on an individual basis. The Commission seeks comment on the most appropriate mechanism for the lower band segment. Should the Commission rely on static, manual frequency coordination, a dynamic SAS-type mechanism, or something in between? For instance, would the advanced capabilities of automated coordination from SAS present advantages over other types of coordination? Is a full SAS implementation, consistent with the Part 96 requirements, appropriate here?

57. The Commission also seeks comment on the protection or operation contours necessary for the coordination mechanism to reserve a quantity of spectrum at a location for a user. In the

Report and Order, the Commission established technical rules for operation in the lower band segment, which are consistent with the rules adopted for the 28 GHz band, the 39 GHz band, and the upper band segment of the 37 GHz band. Based on this technical information, should the Commission establish a maximum protection contour for coordinated sites? Alternatively, should the Commission allow the coordinated party to request less or more protection?

58. Although non-Federal fixed and mobile users must follow the coordination requirements that the Commission adopted in the *Report and Order* to protect the Federal sites listed in Section 30.205 of our rules, the Commission seeks comment on how to ensure coexistence between Federal and non-Federal fixed and mobile users. Ideally, Federal fixed and mobile users would comply with the same or similar technical requirements as non-Federal fixed and mobile users. For instance, NTIA might establish in its Manual of Regulations and Procedures for Federal Radio Frequency Management a set of technical rules for operations in this band, there could be a notation in the U.S. Table of Frequency Allocations, or the Commission could rely on some other means. The Commission seeks comment on these and other mechanisms. Absent consistent (or known) technical rules governing Federal operations, how should the coordination mechanism account for their protection or operational area of these operations?

59. Finally, the Commission seeks comment on how best to coordinate Federal access. Is it feasible for Federal users to rely on the same coordination mechanism as non-Federal? How should the coordination mechanism address information security issues particular to Federal users? The Commission seeks comment on the means of achieving information security, including ways for the information to be masked, e.g., by having Federal users coordinate through a Federal intermediary that interfaces with the non-Federal coordination mechanism, such as the existing mechanism in the 70/80/90 GHz band.

2. Channelization of the Lower Band Segment

60. As discussed in the *Report and Order*, the lower band segment consists of 600 MHz of spectrum from 37–37.6 GHz. Although the Commission adopted a channelization plan for the upper band segment, the Commission did not do so for the lower band segment. Thus, the Commission proposes to guarantee users in the lower band segment a

minimum channel size. Specifically, the Commission proposes to establish a 100 MHz minimum channel size. The Commission also proposes, however, to allow users to aggregate 100 MHz channels into larger channel sizes, up to the maximum of 600 MHz where available (subject to use requirements as described below).

61. The Commission also finds that our proposal to adopt a minimum channel size of 100 MHz strikes the right balance between providing enough spectrum for a diversity of wireless uses with helping to minimize the complexity of the coordination mechanism. The Commission notes that while most commenters in this proceeding generally favor channel sizes of 200 MHz or greater, other commenters suggest that smaller channel sizes can still facilitate robust wireless broadband services. By permitting users to aggregate up to 600 MHz channels, the Commission found that it has enabled maximum flexibility for a variety of use cases involving a variety of channel sizes. The Commission seeks comment on these proposals. The Commission also seeks comment on alternative approaches, including whether the Commission should adopt 100 MHz or a larger minimum channel size. In addition, the Commission seeks comment on whether the Commission should refrain from setting a minimum channel size and instead require the coordination mechanism to attempt to maximize the number of users in a given area.

3. Authorization Expiration/Construction Requirement for the Lower Band Segment

62. To achieve a robust and efficient sharing environment and prevent spectrum warehousing, the Commission proposes that registered non-Federal sites must be put into service within seven days of coordination and that registered and coordinated sites must reassert their registration every seven days. For example, if the Commission relies on a database for coordination, a user could query the database for available frequencies at a location, and reserve those frequencies for seven days. Within seven days, it would need to activate a device that is capable of notifying the database that it is active on the channel. That device would then check in with the database (or receive and respond to a message from the database) at least once every seven days. If the device fails to check in within the seven day period, its authorization would lapse. The Commission seeks comment on this proposal. Are these time frames appropriate? Are there other

tools to ensure the spectrum is put to use consistent with the public interest?

4. Priority Access for Federal Users of the Lower Band Segment

63. The Commission recognizes that Federal users' needs are not necessarily commensurate with non-Federal users' needs. The use cases will likely differ, the level of certainty and protection or a use related to a critical defense or national security mission may vary. The Commission therefore seeks comment on whether the Commission should make a portion of the lower band segment available for priority access by Federal users. For instance, should the Commission allow Federal users to claim priority access to up to 200 MHz of the 600 MHz lower band segment? Could the coordination mechanism statically reserve this space or dynamically make it available when requested? For instance, if the entire band is in use, could the database reconfigure the channels or clear the necessary channel size?

5. Interference Mitigation in the Lower Band Segment

64. The Commission seeks comment on any necessary enforcement mechanism in the lower band segment to help identify and rectify interference events. Because the Commission proposes to require users in the lower band segment to coordinate on a site-basis, it may be easier to identify and rectify any interference issues that may arise. The Commission recognizes, however, that there may be users and uses, both Federal and non-Federal, for which any interference may be significantly problematic. Therefore, the Commission seeks comment on any additional interference mitigation and enforcement mechanisms that might be necessary.

6. Secondary Market Policies for the Lower Band Segment

65. Finally, the Commission seeks comment on whether and how to apply secondary market rules to the lower band segment. As proposed, the band will be made available on a site-by-site basis. Partitioning and disaggregation generally do not apply in site-based licensing circumstances. Should they apply here, and if so, how? Should the Commission apply our leasing rules? What are the benefits to secondary market rules for the lower band segment relative to other ways to gain access to the spectrum?

7. Use It or Share It and Federal Sharing in the Upper Band Segment

66. As described in the *Report and Order*, the upper band segment, 37.6–38.6 GHz, is divided into five channels each 200 megahertz wide. The upper band segment will be available on a geographic basis (with protected Federal sites) via auction. The technical and service rules the Commission adopted allow continuity between the upper band segment and the 39 GHz band, which provides 2400 MHz of contiguous spectrum under the same licensing and technical rules. Given the types of uses that may be deployed in the 37 GHz band and the flexible build out requirements that the Commission adopted in the *Report and Order*, there may be significant unused spectrum in the upper band segment at any given time. To improve the spectrum efficiency and provide an opportunity for Shared Access Licensees and Federal users to expand in a manner that does not impact geographically licensed uses, the Commission proposes to permit shared access of the unused portions of the five channels in the upper band segment, under certain conditions. The Commission also seeks comment on establishing a process by which Federal users could coordinate with licensees for future expanded access in the upper band segment.

67. The Commission notes that it has found spectrum sharing to be an effective tool to maximize spectrum efficiency. In the 700 MHz band, the Commission adopted a performance requirement that results in the licensee losing its unconstructed license area. In the Citizens Broadband Radio Service, Priority Access License areas that are not in use must be made available for General Authorized Access use. Moreover, in the *Report and Order*, to meet the applicable performance requirements, licensees in the 28 GHz and 39 GHz band may choose to share access to their licensed spectrum. Furthermore, the Commission believes that the prospect of future shared access (on a coordinated and non-interference basis) to the remainder of the band may create incentives for investment and innovation in the shared channel.

68. The Commission understands that upper band segment licensees may make reasonable business decisions to not serve particular parts of a licensed area, and that these decisions may change over time. In an environment where these unserved areas are shared, it is important to be able to both accurately identify the areas in use and enable the geographic area licensees to expand or contract their coverage as

necessary. Under our proposal, the upper band segment licensee would retain the primary right to construct and provide service anywhere within its license area at any time, and any operations undertaken on a shared basis would be subject to displacement by the primary licensee. The Commission therefore proposes to require licensees to provide information about the extent of their operations at some future point in order to enable shared access.

69. The Commission also seeks comment on when the Commission should phase in shared access. Would it be appropriate to phase in shared access at the end of the initial license term, or would it be appropriate to adopt a sharing requirement at an earlier time (e.g., 5 years from the date the upper band segment geographic area license is granted). The Commission seeks comment on the scope of the information that the incumbent licensee must provide to the coordinating mechanism. Would a map with simple protection contours be sufficient, or would additional information be necessary? The Commission also seeks comment on the appropriate mechanism for dealing with multiple requests to share the same spectrum in the same location. Should the Commission adopt a first-come, first-served approach, require multiple parties to share unused spectrum amongst themselves, or adopt some other mechanism? In the *Report and Order*, the Commission established coordination zones around three Space Research Service (SRS) sites and 14 military sites that apply across the entire 37 GHz band, including the upper band segment. As the Commission envision non-Federal users being able to coordinate for access on within the 14 military sites, the Commission seeks comment on additional circumstances and methods under which the upper band segment can be made for expanded future Federal use, in addition to the shared access scheme. For example, should the Commission establish a required coordination process under which Federal users could formally request coordinated access from a licensee? If the Commission establishes such a process, how does the Commission properly balance the respective rights and interests of Federal users and non-Federal licensees? How would the Commission ensure co-existence between deployed commercial systems (or planned systems) and the Federal system that is seeking coordinated access? Should the Commission impose an obligation on UMFUS licensees to consider in good faith such coordination requests from

Federal users? What standards should the Commission establish for consideration of such coordination requests? Are there alternative ways of ensuring that Federal users can take advantage of their co-primary fixed and mobile allocations while protecting the rights of non-Federal licensees? Are there lessons and recommendations that the Commission can incorporate form the ongoing work within the Commerce Spectrum Management Advisory Committee? The Commission seeks comment on all issues relating to Federal access to the upper band segment.

C. Performance Requirements

1. Additional Metrics

70. In the *Report and Order*, the Commission adopted a list of performance metrics for measuring sufficient use of a license to qualify for renewal. The Commission acknowledged that this list is not exhaustive, and in particular, does not contain metrics designed to accommodate new and innovative services that may develop in the millimeter wave bands. The Commission therefore seeks comment on additional performance metrics that will better accommodate these new services while fulfilling our statutory obligation to encourage productive use of spectrum and avoid warehousing and speculation.

71. In particular, the Commission seeks comment on an appropriate metric to evaluate the deployment and performance of an Internet of Things (IoT) type service, which is designed primarily to facilitate machine-to-machine communication. Such services may or may not be deployed in areas of substantial residential population, and may or may not be designed to serve unaffiliated customers. Examples of this type of service would include the Supervisory Control and Data Acquisition (SCADA) systems described by Southern Co. Because of the unique characteristics of these machine-to-machine services, the Commission proposes to develop a distinct metric by which to measure the deployment of such services, rather than attempting to modify a population coverage approach for this purpose. The Commission seeks comment on this proposal, including specific suggestions for what aspects of such services should be measured, how they should be measured, and what specific levels would constitute an acceptable level of service.

72. In the *Order*, several commenters suggested that the Commission measure performance for all services in the

millimeter wave bands on the basis of actual use of the service, including number of devices connected, volume of data transmitted, or number of sessions initiated on the network. The Commission seeks further comment on these metrics, including specific numbers for the levels of devices, sessions, and data volume that commenters believe would be appropriate milestones. Would one of these metrics be the most appropriate way to measure deployment of an Internet of Things or machine-to-machine type service? The Commission also seeks comment on whether and how it would be practical to implement this type of usage-based requirement. How could the Commission verify information provided by licensees? Should all kinds of devices, sessions, and/or data be counted equally? How should such a requirement be structured to ensure that it both measures and encourages meaningful service, rather than gamesmanship?

73. As some commenters note in this proceeding, licensees in these bands may seek to provide service to areas with high daytime or transient populations but low or no residential populations, such as corporate campuses, interstate highways, or event venues. The Commission seeks comment on how to define such locations for the purposes of evaluating service coverage. The Commission also seeks comment on the appropriate framework for incorporating coverage of such locations into an overall performance metric. Would a venue per population metric be appropriate, similar to the current treatment for fixed links? Should the applicable milestone be based on the daytime or transient population served by such venues or traffic corridors? How should such population be measured?

74. The Commission also seeks comment on any other types of service being contemplated by potential providers, as well as metrics that would be appropriate to measure performance or build-out of those services.

75. Finally, in the *Report and Order* the Commission explained that licensees may demonstrate combinations of fixed and mobile deployments in order to meet their performance requirement, and that the Commission intended to review the showings on a case-by-case basis. Here, the Commission seeks comment on whether to establish clear benchmarks or even guidance for the amount of buildout that might be adequate in these combined showings. For instance, should the Commission establish a scale with levels showing acceptable

combinations of mobile and fixed deployment, where either mobile or fixed is increased relative to the other? Or should the Commission establish variations depending on the population density of a given license area, the land mass of the area, or some other factor? The Commission seeks comment on any other means to provide flexibility and clarity in how the Commission may measure combined showings, or whether the Commission should continue to review the showings on a case-by-case basis as contemplated in the *Report and Order*.

2. Sharing Mechanisms

76. Given the relatively limited record on the substantive issues regarding mechanisms for sharing unused portions of UMFUS licenses, the Commission seeks further comment on the possibility of implementing a use-or-share regime in the UMFUS bands. The Commission continues to believe that a use-or-share regime may have the potential to enhance the efficiency and productivity of spectrum, if properly implemented. In particular, given the propagation characteristics, and high potential for re-use, of the mmW spectrum, the Commission seeks comment on whether such a regime could maximize the efficient use of these spectrum bands. The Commission further seeks comment on the costs and benefits of adopting mechanisms for sharing unused UMFUS spectrum, as well as on the incentives that particular sharing regimes will create. In addition, the Commission seeks comment on the appropriateness of requiring UMFUS licensees to share unused portions of their license in addition to, or in lieu of, meeting specific construction requirements, particularly in geographically licensed bands such as 28 GHz and 39 GHz.

77. In crafting an effective mechanism to share unused spectrum, there are two governing considerations: first, ensuring the licensee has exclusive use of the areas in which it is using the spectrum; and second, creating an efficient mechanism that both makes unused spectrum available and protects the licensee from interference. There are a variety of potential options for enhanced sharing mechanisms that address these considerations. The Commission seeks comment generally on the following opportunistic sharing mechanisms: a fully dynamic sharing solution, facilitated by a SAS or other third-party database; a modified shared access system that would be less dynamic but simpler; an unlicensed shared access approach, similar to white spaces, and other alternatives.

78. The Commission seeks comment on variations of a use it or share it mechanism. A potential drawback of a keep what you use mechanism is that the Commission must reclaim, and later re-auction, the unused portions of the band, which takes time and minimizes a licensee's ability to decide later to deploy in an area (which is also a feature of the approach because it incentivizes maximum initial deployment). Use or share mechanisms permit a licensee to retain control of its license area, but require the licensee to share with other entrants in portions of the license area in which it is not operating. A use or share mechanism may be less administratively burdensome than keep what you use, and may also allow a greater number of users to access the shared spectrum. There are a number of possible variations of use or share, all of which share characteristics of basic frequency coordination.

79. One option would be to automate shared access to enable dynamic opportunistic sharing. In a dynamic sharing solution, licensees would have some initial period of time to build out their networks. After this period, information about the extent of licensees' deployment would be made available, and other entities would be free to deploy outside of the area used by the licensee's operations on a coordinated basis, subject to further expansion by the licensee. The Commission seeks comment on whether an automated dynamic use or share mechanism would be appropriate in the mmW bands. Generally, these shared users would need to operate similar technologies subject to the same technical rules as the licensee to maximize spectrum efficiency and economies of scale with respect to equipment. The Commission seeks comment on whether the propagation characteristics of these bands might facilitate shared access with slightly different technical rules. With respect to the sharing mechanism, what types of information, and what level of detail, would be required to facilitate dynamic sharing? Should opportunistic users be authorized on a license-by-rule basis, or by some other method? Should opportunistic users be afforded some level of interference protection from each other, and if so what should that level be?

80. Another option is to rely on more traditional frequency coordination, typically used in point-to-point microwave, shared millimeter wave bands, and other services today. Under a simple frequency coordination process, the licensee's operations would

be protected around a contour, and new sites would be individually coordinated into the license area. While a database could further automate this process, it may not be necessary given the relatively simple sharing regime. The Commission seeks comment on whether a sharing mechanism based on traditional frequency coordination would be appropriate for the mmW bands.

81. Yet another option is to establish pre-defined geographic areas that will be available for shared access, depending on a licensee's construction. For instance, if a licensee meets its performance requirement, the Commission could find that any county (or other unit of geographic area) in which it has any operation is unavailable for sharing. For example, a licensee of a PEA might deploy heavily in some counties but not others; the heavily-deployed counties would then be deemed "in use," while the counties with no deployment would be available for opportunistic use in undeployed areas. The Commission seeks comment on the appropriateness of this mechanism as a whole, and on the specific details. What level of subdivision would best accommodate both licensee certainty and sharing opportunity? Should the Commission stop at the county level, or should the Commission further subdivide into census tracts or census blocks? What level of deployment in each subdivision should qualify that area for "used" status? How should the Commission enable sharing—through a database, individual coordination, or some other method?

82. Finally, the Commission also seeks comment on implementing unlicensed shared access, similar to TV white spaces, in the unused portions of the UMFUS bands. In this case, opportunistic users would operate on an unlicensed basis at lower power in any area where the licensee was not actually deployed. The Commission seeks comment on whether and how to implement such a system in the millimeter wave bands. Would this system require a third-party database, similar to the dynamic sharing solution? How should the Commission draw the contours around licensee deployments? Should the Commission use a fixed radius, or an interference contour at a certain level, or some other metric? Would this method be preferable to a dynamic sharing solution where the opportunistic users and the licensee followed the same technical rules? Are there technical benefits to this approach? Will there be sufficient scale

to drive more special-purpose equipment development?

83. To the extent that the Commission implements any variation of a use it or share it mechanism in the mmW bands, certain key aspects of that mechanism must be defined. Most importantly, the Commission seeks comment on how to define a licensee's "use" of its licensed spectrum. Should "use" be defined geographically, either by the service area of a network or by a defined radius or contour around deployed equipment? In the Citizens Broadband Radio Service, the Commission recently adopted an engineering metric to determine the extent to which Priority Access Licenses are in use. Licensees can define the area of use subject to an objective maximum. Should the Commission follow this model? Should "use" be defined differently for different types of deployments, for example mobile vs. fixed links? Additionally, the Commission seeks comment on how best to allow the licensee room to expand beyond its area of actual deployment (or its "used" spectrum, however ultimately defined). For example, should the Commission define a contour for an additional protected area? If so, on what basis and how often should the Commission do so? Should the Commission set some level at which a subdivision of a license area would be declared "used" in its entirety, and off-limits to opportunistic use? If so, what subdivisions and what level of deployment would be appropriate (e.g., 40% of the geographic area of a census tract)? Finally, the Commission seeks comment on the appropriate level of protection for licensees at the boundaries between "used" and "unused" areas. Should the level of cross-border interference protection be the same as that between two licensees, or would some other limit, either higher or lower, be more appropriate?

84. In addition to the inquiries above, the Commission seeks comment on any other mechanisms of opportunistic sharing that could enhance spectrum efficiency in the UMFUS bands, as well as any other aspects of such a system that would be required to ensure it could be reliably and effectively implemented. The Commission especially seeks comment from any entity interested in using spectrum on an opportunistic basis in these bands. What technologies or business cases would lend themselves to this type of spectrum access? Which sharing mechanism, described above or otherwise, would best accommodate that use?

D. Mobile Spectrum Holdings Policies

85. In the *Order*, the Commission adopted an ex ante spectrum aggregation limit of 1250 megahertz that will apply to licensees acquiring spectrum in the 28 GHz, 37 GHz, and 39 GHz bands through competitive bidding.⁴ By helping to ensure that multiple providers have access to the spectrum the Commission made available in the *Report and Order*, the spectrum aggregation policies the Commission adopted support our overarching goals of facilitating competition, innovation, and the efficient use of the spectrum. The Commission seeks comment below on additional mobile spectrum holdings issues related to how to implement the spectrum aggregation limit; the appropriate holding period; and whether a spectrum aggregation limit would be appropriate as additional "frontier" spectrum bands become available.

1. Implementation of a Spectrum Aggregation Limit at Auction

86. Of the 986 designated license areas in the 28 GHz band, 412 areas have active licenses, which cover about 75 percent of the U.S. population, while the 37 GHz band is not yet licensed, and in the 39 GHz band, current licensed areas cover about 49 percent of the U.S. population. Further, in terms of geographic licensed areas, the 28 GHz band will be licensed on a county basis across the U.S., while the 37 GHz and 39 GHz bands will be licensed by PEA.

87. For purposes of assessing eligibility to bid across the three spectrum bands any given entity cannot hold more than 1250 MHz of this spectrum in total. Taking into account existing incumbents' holdings in the 28 GHz band and the 39 GHz band, as well as different geographical license areas, the Commission put forward and seeks comment on two alternative methodologies for assessing bidding eligibility. The Commission asks for comment on which methodology is more appropriate, and why. The Commission also asks that interested parties comment on the likely costs and benefits associated with each methodology. Are there additional methodologies beyond the two alternatives set out below that would be more appropriate to adopt? If so, the

⁴ The Commission adopted a spectrum threshold of 1250 MHz in the *Order* for proposed secondary market transactions, and noted that while this 1250 MHz threshold would help identify those markets that provide particular reason for further competitive analysis, the Commission's consideration of potential competitive harms would not be limited solely to those markets.

Commission invites interested parties to present their alternatives. Which methodological approach should the Commission use and how best would the Commission implement it?

88. The first methodology that the Commission invites comment on is the “maximum county-to-PEA” option. Under this option, if any incumbent licensee in the 28 GHz band, for example, holds such spectrum, its spectrum holdings at the county level would be counted at the PEA level when determining eligibility to bid on 37 GHz and 39 GHz spectrum. For instance, if an incumbent licensee currently holds two licenses, or 850 MHz of spectrum, in the 28 GHz band in any county within a PEA, then that licensee’s 28 GHz spectrum holdings would be counted as 850 MHz for the PEA as a whole. In addition, that same licensee’s 39 GHz holdings, if any, would be added on to its 28 GHz holdings of 850 MHz. That licensee would then be able to acquire a maximum of an additional 400 MHz of spectrum across the 37 GHz and 39 GHz bands if it so chose (this maximum of 400 MHz assumes it has no current holdings in the 39 GHz band). Similar calculations would apply in the 39 GHz band. For instance, for those licensees that currently hold more than 400 MHz of spectrum in the 39 GHz band in any county in a given PEA, such entities would be unable to bid on both licenses in the 28 GHz band but potentially could still bid for one license in the 28 GHz band, as well as on 37 GHz spectrum and additional 39 GHz spectrum. To determine bidding eligibility across the three bands for those entities who do not currently hold licenses in the 28 GHz or 39 GHz band, the Commission would similarly count maximum spectrum holdings in counties at the PEA level. The “maximum county-to-PEA” option is a simple way to calculate spectrum holdings in which the licensing areas of each band have varied geographies, and the Commission seeks comment on this first methodology for determining eligibility to bid.

89. The second methodology that the Commission invites comment on is the “population-weighted-average” option. This option involves calculating an entity’s current spectrum holdings on a county-by-county basis within a PEA in the 28 GHz and 39 GHz bands, and then constructing a population the weighted average for that PEA as a whole. For incumbent licensees in the 28 GHz and 39 GHz bands, the Commission would sum the product of county spectrum holdings and county population within the PEA (using U.S. Census 2010

population data), and then divide that sum by the total population of the PEA. This would provide us with the population-weighted amount of 28 GHz and 39 GHz spectrum held by that incumbent in that PEA. The entity would then be able to bid on 28 GHz spectrum (by county, and any winning bid would be weighted by the county population divided by the PEA population), and 37 GHz and 39 GHz spectrum (by PEA or partial PEA), up to the population-weighted limit of 1250 MHz. To determine eligibility to bid for those entities who do not currently hold licenses in the 28 GHz or 39 GHz bands, the Commission would also calculate prospective holdings based on a population-weighted average within the PEA. Overall, any entity would not be able to bid on certain spectrum if, across the three bands, it would hold 1250 megahertz or more on a population-weighted basis. The Commission seeks comment on this second methodology for determining eligibility to bid.

2. Holding Period

90. In addition to the decisions made in the *Report and Order*, the Commission seeks comment on our proposal to adopt a holding period that would preclude certain proposed secondary market transactions for licensees that acquire certain amounts of 28 GHz, 37 GHz, and/or 39 GHz spectrum at auction. In the *Mobile Spectrum Holdings Report and Order* (see *Policies Regarding Mobile Spectrum Holdings*; WT Docket No. 12–269, Report and Order, 29 FCC Rcd 6133 (2014)), the Commission established a six-year holding period, which represented the interim buildout period for 600 MHz licensees, restricting certain proposed secondary market transactions for 600 MHz band licensees. The Commission determined that establishing a holding period best balanced its goals of preserving the integrity of the market-based spectrum reserve it had established while still permitting some flexibility in secondary market transactions.

91. The Commission proposes to adopt a holding period for licensees acquiring spectrum in the 28 GHz, 37 GHz, and/or 39 GHz bands. In particular, the Commission seeks comment on our proposal to adopt a holding period that would restrict certain proposed secondary market transactions for mmW licensees necessary to support the spectrum aggregation policies the Commission adopted in the *Report and Order*, as well as our objective of ensuring that multiple providers will be able to access mmW spectrum as it becomes available.

92. The Commission proposes a period of three years, given the nascent nature of the frontier spectrum in the 28 GHz, 37 GHz, and 39 GHz bands and the likely rapid development of multiple use cases for this spectrum. While the Commission could establish a holding period tied to the length of the license term or build out period for licensees in these bands, a shorter three-year holding period that is half of the buildout period the Commission established for incumbent licensees in the 28 GHz and 39 GHz bands may best serve the public interest by allowing flexibility while still preventing entities from undermining our ex ante spectrum aggregation policies. The Commission seeks comment on our proposal. To the extent commenters support a longer holding period, the Commission seeks comment on how a longer holding period would better help the Commission achieve its objectives for the use of this spectrum. If a longer holding period is warranted, how long should it be? For example, should the length of the holding period be based on the 10 year license term and performance benchmarks for new licensees that the Commission adopted in the *Order* or would a different holding period be appropriate? The Commission asks commenters to address how it can best balance its general policy of promoting flexibility in secondary market transactions with our goals of encouraging competition and facilitating the deployment of new services and innovation to the benefit of consumers.

3. Spectrum Aggregation Limits for Additional Spectrum Bands

93. The Commission determined in the *Order* that grouping spectrum in the 28 GHz, 37 GHz, and 39 GHz bands together for purposes of applying these mobile spectrum holdings policies is appropriate in view of the similar technical characteristics and potential uses of spectrum in these bands. The Commission seeks comment on the proposal to apply spectrum aggregation policies generally in the bands the Commission proposes making available in this Further Notice. The objective of the spectrum aggregation policies the Commission adopted in the *Order* is to promote competitive conditions and help ensure that multiple providers have the ability to acquire mmW spectrum as it becomes available, while avoiding the excessive concentration of licenses. Further, to the extent these bands to be made available have similar technical characteristics and potential uses as the 28 GHz, 37 GHz, and 39 GHz bands, the Commission proposes to use

the approximately one-third threshold of the total amount of spectrum as our starting point but recognizes that its understanding of the appropriate approach for these bands is developing and that other thresholds may be appropriate. Is the approximately one-third threshold appropriate or are there alternative thresholds that the Commission should consider? What are the likely benefits and costs of our proposed threshold? The Commission asks interested parties to provide us with any alternative approaches to the appropriate spectrum aggregation policies for these bands as they become available.

E. 37.5–40 GHz Band Satellite Issues

1. Satellite Power Flux Density Limits

94. The Commission does not believe the current record is sufficient for us to conclude that authorizing satellites to operate at the higher PFD of -105 dBW/m²/MHz would be consistent with terrestrial use of the 37.5–40 GHz band. In theory, the same rain storm that impairs satellite reception might be able to shield earth stations if the satellite raises its power level; the problem is that rain will rarely be uniformly present throughout a spot beam's footprint, leaving at least some terrestrial stations unshielded or inadequately shielded by rain and, hence, vulnerable to any increase in the spot beam's PFD level. Unlike with respect to the 28 GHz band, the issue of satellite-terrestrial coexistence in the 39 GHz band has received relatively little attention.

95. At the same time, the Commission recognizes that Boeing has submitted a study which shows that coexistence is possible, even at the higher PFD level. Boeing's presentation suggests that terrestrial mobile units might be able to suppress interfering signals from satellites if the satellite signals arrive at sufficiently high angles of elevation. On the other hand, Boeing assumes a maximum distance of 200 meters between mobile units and base stations. The Commission believes the record would benefit from further development on this issue.

96. Accordingly, the Commission seeks further comment on whether there are any circumstances under which allowing FSS satellites in the 37.5–40 GHz band to operate at a higher PFD level than permitted under the existing rules would be consistent with terrestrial use of the 37.5–40 GHz band. If a higher PFD limit would be appropriate, what limit should the Commission adopt? Commenters should provide detailed technical studies that

explicitly list the assumptions they made concerning both terrestrial and satellite operations. Studies should study both fixed and mobile terrestrial operations. If a commenter believes a study submitted by another commenter is not valid, it should list the specific assumptions or analysis that it believes are not valid and provide its own assumptions or analysis. Ultimately, the Commission believes the burden is on FSS interests to show that the higher PFD level is consistent with terrestrial use. Terrestrial interests do have an obligation to provide sufficient information concerning the nature of their systems to allow other parties to analyze the interference impact of a higher PFD level.

2. Authorizing Satellite User Equipment

97. The Commission seeks comment on the possibility of repealing the prohibition on satellite user equipment in the 37.5–40 GHz band. Initially, the Commission asks satellite interests to provide further information concerning the need and demand for user equipment in that band. The Commission notes that FSS user equipment can receive in the 40–42 GHz band, which is not licensed for terrestrial operations. Are there uses for which access to the 40–42 GHz band is insufficient? The Commission asks FSS providers to provide specific examples and data demonstrating the need for user equipment in the 37.5–40 GHz band.

98. Assuming a need exists, the Commission seeks comment on the appropriate manner of authorizing satellite user equipment. The Commission agrees with ViaSat's observation that because user equipment in this band would be receiving, it would not cause interference to terrestrial operations. One option would be to adopt ViaSat's proposal to allow FSS user equipment purely on a secondary basis at their own risk. If the Commission adopted that proposal, the Commission emphasizes that the equipment would truly be on a secondary basis and that FSS user equipment would have no expectation of interference protection. A variation on that option, based on the analysis Boeing has done, would be to require terrestrial operators to provide information on their deployments to FSS providers through a database, which the FSS providers could then use to determine where user equipment could operate without interference. The Commission asks other parties to comment on Boeing's technical analysis. To the extent Boeing relies on erroneous data concerning the nature of technical

operations, the Commission asks terrestrial operators and equipment manufacturers to provide a specific analysis in response, with an explanation for the specific parameters used in their analysis. The Commission also seeks comment on whether the benefit to FSS operators of enhancing the ability to operate user equipment in the band outweighs the burden to UMFUS licensees of providing information on their deployments. The Commission asks both FSS operators and terrestrial operators to provide specific data on the relative costs and benefits.

F. Digital Station Identification

99. Currently, AM/FM/TV broadcasters are required to announce their call signs, as are land mobile station operators. Adopting a similar requirement for millimeter wave band operations could make it easier to identify and monitor signals, which in turn could make it easier to find sources of interference to these systems. Accordingly, the Commission seeks comment on requiring a digital identification (digital ID) for the millimeter wave band systems under consideration in this proceeding. Specifically, should operators be required to transmit an ID that is readily observable and decipherable by the Commission and/or other users that could be used to identify the operator/licensee of an unknown and/or interference source?

100. If so, the Commission seeks comment on the details of such a digital ID requirement. For example, should the ID requirement apply to all millimeter wave band services, or be limited to licensed services, non-licensed services, or fixed operations? Alternatively, should it apply to all transmissions above a certain power limit or antenna height, or be limited to transmissions with some other technical parameter? If so, what should those technical parameters be? If there is an ID requirement for unlicensed equipment, what should the content of the ID be? Should unlicensed equipment authorization holder or equipment user be required to register in a nationwide database that would allow either the FCC and/or anyone to search an ID for operator contact information? Should the ID be continuously broadcast, similar to consumer Wi-Fi routers, only when the transmitter is operational, or only at regular intervals? Finally, should there be a labeling (or software screen display) requirement for the equipment itself that identifies the owner/operator? If so, should the requirement apply to all millimeter wave band equipment, or

only to fixed or mobile equipment, only to outdoor equipment, or only to some other subset of millimeter wave band equipment?

G. Technical Issues

1. Antenna Height

101. The Commission seeks further comment on whether antenna height limits are appropriate and, if so, what thresholds and corresponding reductions in power should apply at higher antenna heights. Considering what future wireless networks are envisioned to be, are the antenna height thresholds and corresponding power reductions in the existing Part 24 (PCS) or Part 27 rules appropriate for future mmW mobile base stations? Based on what has been presented on the record, mobile mmW base stations in this band may be more likely deployed at street lamp post height, and will not be deployed at the heights of traditional mobile base station deployments. In that context is the 305 meter threshold currently in Part 27 valid or would lower thresholds be appropriate? Is there an alternative maximum height that should be considered? Conversely, given the existing PFD limits that the Commission has adopted to control interference at market boundaries and at the edge of an earth station contour, are additional antenna height restrictions and corresponding power reductions even necessary? The Commission tentatively proposes to adopt antenna height and power limits similar to those in our Part 27 rules. However, the Commission seeks comment on whether power limits based on antenna height are necessary and/or whether any modifications should be made to either the height thresholds or the power limits at specific heights that the Commission have proposed. The Commission also seeks comment on whether there would there be any benefit in requiring antenna downtilt for antennas above a certain height?

2. Minimum Bandwidth for Given BS/MS/Transportable Transmit Power Levels

102. For applications and technologies that operate under the umbrella of the next generation of wireless networks, is it worth considering a sub-set of networks that might operate with band widths less than 100 MHz and how the maximum power limits adopted should be evaluated? What minimum band width should be established for base stations, transportable station, and mobile station classes of equipment? Is there value in establishing these bandwidth scaling

limits for mobile and transportable classes such as the Commission did for base stations? If so what should the minimum band width scaling factors be for these classes of equipment based on the power levels the Commission adopted in the *Report and Order*? What is the minimum bandwidth that should be established for these two classes of equipment in relation to the adopted transmit power limits? Should the establishment of these limits be comparable to the rules that currently exist for part 27 frequency bands?

3. Coordination Criteria at Market Borders for Fixed Point-to-Point Operations

103. In the *Report and Order*, in particular with smaller licensed areas, the Commission recognized that the existing coordination distances of 16 km for 39 GHz and 20 km for 28GHz result in coordination zones that encompass a large part of many license areas. In fact, in the context of 28 GHz county based licenses, the entire market area is subject to the coordination requirement in many cases. In adopting market border limits and coordination requirements our goal is to ensure that there is a mechanism in place to mitigate interference between adjacent area licensees without creating an unnecessary burden on licensees. While the Commission recognizes that under our rules adjacent area licensees are able to negotiate and agree to mutual terms and criteria that deviate from the market border and coordination limits imposed in our rules, the Commission also believes that the changes that the Commission adopted to market sizes warrants re-examination of the market boundary coordination requirements that were originally developed in the context of larger market sizes. Therefore, the Commission now seeks to create a record with an eye toward reducing the coordination burden on licensees. The Commission notes that in its comments in response to the *NPRM*, Sprint recommends that the Commission require an operator proposing to initiate new fixed operations to coordinate those operations with the adjacent block operator when a new fixed transmitter would be located within 3 km and within ± 10 degrees of the receive azimuth of an existing fixed receiver, or a new fixed transmitter would be within 1 km of an existing fixed receiver, but outside the ± 10 degree receive antenna main lobe, in order to avoid adjacent channel OOB interference or brute force receiver overload. While Sprint's comments were in relation to adjacent channel interference a similar approach might be appropriate for co-

channel coordination. The Commission seeks comment first on whether the existing coordination distances for traditional fixed point-to-point operations are still appropriate given smaller market area sizes. The Commission also seeks comment on whether the coordination distance should incorporate other technical criteria into factoring the distance. For example, should the coordination distances be dependent on the orientation of the fixed point-to-point antenna relative to the market boundary? Should the coordination distance be reduced in cases where a directional antenna is pointed away from the market boundary? Should the coordination distance be dependent on other technical factors such as the EIRP of the transmitting station, gain of the antenna, or other factors? The Commission requests comment on these issues. The Commission requests that commenters support any proposal with technical analysis.

4. Sharing Analysis and Modeling

104. The wireless industry, standards groups, government organizations, and academia are currently engaged in developing propagation models for millimeter wave bands. The National Institute of Standards and Technology (NIST) and the European Commission's 5G partnership with industry have active study groups looking at millimeter wave propagation modeling. Academia have published papers describing several models such as the Close In (CI) and alpha-beta-gamma (ABG) free space reference distance models. The Commission seeks comment on whether these or other models are appropriate propagation models to apply when analyzing inter-service interference between terrestrial-based transmitters and receivers of different services. There are several factors that are common to the interference effects in both directions to and from 5G stations, including antenna beam forming, the location and height of antennas, and the propagation distance and environment between other systems and the 5G stations. Lower gain 5G antennas that are mostly indoors in cluttered environments and at lower heights will reduce the degree of RF coupling in both directions, and therefore reduce the propagation path loss required to meet interference threshold limits. Which millimeter wave propagation models are most appropriate for sharing analyses where the interfering emitters may be assembled from a group of indoor and outdoor emitters? When applying transmitter or receiver isolation factors

such as antenna directionality, should a degree of statistical probability be associated with the factor versus the assumption of worse case interference? The Commission asks parties to submit propagation analysis and path loss models of 5G deployment in both indoor and outdoor environments for use in determining interference impact and potential mitigation.

105. If the terrestrial receiver or transmitter is fixed at a specific location then a terrain-based propagation loss model can be employed; what terrain based propagation models are most appropriate for millimeter wave analyses? When the terrestrial receiver is not at a known location, what are the most appropriate millimeter wave models to apply? How much isolation could one typically assume due to antenna beam forming techniques? What other interference mechanism, such as clutter, should be considered when modeling inter-service interference in millimeter wave bands? Generally, the Commission seeks further comment on millimeter wave propagation models appropriate for spectrum sharing studies between fixed, mobile and satellite systems, as well as active and passive services.

5. Part 15 Operation On-Board Aircraft in the 57–71 GHz Band

107. The Commission is seeking further technical analyses and sharing studies, specifically with respect to the various types of unlicensed applications envisioned on-board aircraft, the priority/order of their planned introduction, as well as their associated potential harmful interference profile with respect to passive sensor services. For example, is the intent to provide only for applications that are used by the aircraft itself to reduce weight by replacing cabling and wiring with radio for applications, such as for connecting inflight entertainment systems, seatback display consoles, or connecting with sensors used to monitor the health of the aircraft structure and its critical systems in wireless avionics intra-communication (WAIC)? Or is the intent to provide for the direct streaming of movies/news/internet service from ceiling-mounted access points to portable electronic devices carried aboard the aircraft by passengers in nearby seats? Are there additional inflight applications that commenters further envision?

108. What harmful interference profile could be expected from each of these various types of on-board aircraft provisions of 60 GHz transmitters? How much difference would the type of aircraft body make in providing

additional protection to passive sensor services from operation of these transmitters? Should the Commission propose, as a first cautious step, to allow WiGig transmissions on-board aircraft only for certain applications, such as inflight entertainment provision beaming from seatback display to user-provided devices, because such transmissions would be at a very short distance (1–2 feet, or 30 to 60 cm), in a direct line-of-sight between each seatback display and user-provided device, with little risk of escaping through cabin windows? If the Commission were to prohibit the first WiGig channel (57.24–59.4 GHz) as CORF suggested to protect EESS, would this limitation ameliorate in any way the need to protect RAS, as WiGig devices will be using the rest of the spectrum from 59.4 GHz to 71 GHz? How would RAS and EESS be protected from potential WAIC applications using external structural sensors or cameras mounted on the outside of the aircraft structure to monitor the performance of the aircraft during various phases of aircraft operation (taxi, take-off, landing, cruise, etc.)? Commenters should provide detailed technical analyses, with possible real-world transmission scenarios on aircraft, including expected signal leakage in this particular frequency band through unshielded cabin windows for the various types of inflight applications (e.g., entertainment provisions, WAIC provisions, etc.) in different aircraft body structures if the fuselage type and cabin window placements make a difference in signal shielding, etc., and any other additional harmful interference considerations involving use of 60 GHz transmitters on-board aircraft.

H. Initial Regulatory Flexibility Analysis

109. As required by the Regulatory Flexibility Act of 1980, as amended (RFA), the Commission has prepared this present Initial Regulatory Flexibility Analysis (IRFA) of the possible significant economic impact on a substantial number of small entities by the policies and rules proposed in the *FNPRM*. Written public comments are requested on this IRFA. Comments must be identified as responses to the IRFA and must be filed by the deadlines specified in the *FNPRM* for comments. The Commission will send a copy of this *FNPRM*, including this IRFA, to the Chief Counsel for Advocacy of the Small Business Administration (SBA). In addition, the *FNPRM* and IRFA (or summaries thereof) will be published in the **Federal Register**.

A. Need for, and Objectives of, the Proposed Rules

110. In this *FNPRM*, the Commission proposes to authorize mobile operations in the 24.25–24.45 and 24.75–25.25 GHz band (24 GHz band), the 31.8–33.4 GHz band (32 GHz band), the 42–42.5 GHz band (42 GHz band), the 47.2–50.2 GHz band (47 GHz band), the 50.4–52.6 GHz band (50 GHz band) and the 71–76 and 81–86 GHz bands (70/80 GHz bands). The Commission is also seeking comment on possible uses of bands above 95 GHz. Together with the bands that are the subject of our *Report and Order*—namely the 28, 37, 39 and 57–71 GHz bands, these bands are known as the “mmW bands”.

111. Until recently, the mmW bands were generally considered unsuitable for mobile applications because of propagation losses at such high frequencies and the inability of mmW signals to propagate around obstacles. As increasing congestion has begun to fill the lower bands and carriers have resorted to smaller and smaller microcells in order to re-use the available spectrum, however, industry is taking another look at the mmW bands and beginning to realize that at least some of its presumed disadvantages can be turned to advantage. For example, short transmission paths and high propagation losses can facilitate spectrum re-use in microcellular deployments by limiting the amount of interference between adjacent cells. Furthermore, where longer paths are desired, the extremely short wavelengths of mmW signals make it feasible for very small antennas to concentrate signals into highly focused beams with enough gain to overcome propagation losses. The short wavelengths of mmW signals also make it possible to build multi-element, dynamic beam-forming antennas that will be small enough to fit into handsets—a feat that might never be possible at the lower, longer-wavelength frequencies below 6 GHz where cell phones operate today.

112. The Commission proposes to include the 24 GHz, 32 GHz, 42 GHz, 47 GHz, 50 GHz and 70/80 GHz bands in the Part 30 Upper Microwave Flexible Use Service. The Commission also proposes to add a mobile allocation in the 24 GHz and 32 GHz bands. This additional spectrum for mobile use will help ensure that the speed, capacity, and ubiquity of the nation’s wireless networks keeps pace with the skyrocketing demand for mobile service. It could also make possible new types of services for consumers and businesses.

113. In proposing service rules for these bands, which include technical rules to protect against harmful interference, licensing rules to establish geographic license areas and spectrum block sizes, and performance requirements to promote robust buildout, the Commission advances toward enabling rapid and efficient deployment. The Commission does so by proposing flexible service, technical, assignment, and licensing rules for this spectrum, except where special provisions are necessary to facilitate shared use with other co-primary users.

114. For the 24 GHz, 32 GHz, 42 GHz, 47 GHz and 50 GHz bands the Commission proposes to assign PEA-based licenses through competitive bidding. In the 48.2–50.2 GHz portion of the 47 GHz band, the Commission proposes to require licensees to provide information on their facilities to enable sharing with FSS user equipment. Finally, in the 71–76/81–86 GHz bands, the Commission seeks comment on various systems managed by database operators which will coordinate use as between mmW base stations, fixed point-to-point links used for backhaul, and Federal operations.

115. A portion of the 24 GHz band is allocated for satellite service but is limited to only feeder links for the Broadcast Satellite Service (BSS), and the Commission has proposed to either retain existing coordination procedures or to adopt the sharing regime used for the 28 GHz band to manage interference between terrestrial and satellite operations. Meanwhile, the 47 GHz band is also allocated for satellite and is intended to be used for FSS user equipment. The Commission has proposed that FSS operation at 47 GHz be limited to individually licensed earth stations subject to the same sharing framework the Commission adopted in the 28 GHz band except with SAS-based sharing between terrestrial and satellite operations. Finally, although the 50 GHz band is also allocated for satellite, it contains no present satellite use and the Commission is exploring sharing mechanisms for the band in the future, including SAS.

116. Overall, these proposals are designed to provide for flexible use of this spectrum by allowing licensees to choose their type of service offerings, to encourage innovation and investment in mobile broadband use in this spectrum, and to provide a stable regulatory environment in which fixed, mobile, and satellite deployment would be able to develop through the application of flexible rules. The market-oriented licensing framework for these bands would ensure that this spectrum is

efficiently utilized and will foster the development of new and innovative technologies and services, as well as encourage the growth and development of a wide variety of services, ultimately leading to greater benefits to consumers.

117. In the *FNPRM*, the Commission also seeks comment on various proposals for refining the rules the Commission have adopted in the *Report and Order*. The Commission seeks comment on various ways of developing the shared access framework the Commission has adopted for the 37–37.6 GHz band. That framework creates an innovative shared space that can be used by a wide variety of Federal and non-Federal users, by new entrants and by established operators—and smaller businesses in particular—to experiment with new technologies in the mmW space. The Commission proposes to adopt additional performance requirement metrics for uses such as Internet of Things and machine-to-machine communications. Adopting these additional metrics will allow licensees to use the mmW bands for innovative uses with the certainty that they can meet performance requirements and renew their licenses. For example, the Commission seeks further comment on whether the Commission should impose a “use-or-share” obligation on UMFUS licensees in order to efficiently make as much unused spectrum available as possible. Such a “use-or-share” regime could take varying forms, such as a fully dynamic sharing solution whereby opportunistic users could indefinitely deploy outside a licensee’s geographic build-out area subject to the latter’s potential expansion—as coordinated by a third-party database administrator; a modified shared access system whereby meeting a defined level of deployment in a set of geographic areas would foreclose their opportunistic use; and, an unlicensed shared access approach whereby opportunistic users would operate wherever licensees were not actually deployed.

118. The Commission seeks comment on whether the Commission can allow FSS satellites in the 37.5–40 GHz band to operate at higher power and transmit a higher power flux density at the Earth’s surface. If the Commission can allow such higher power without causing interference to terrestrial operations, this change could allow FSS operators to make greater use of the band. The Commission also asks whether the Commission should repeal the prohibition on satellite (FSS) user equipment in the 37.5–40 GHz band and seek comment on whether terrestrial operators should have to divulge their

deployments to FSS providers through a database in order to allow individual users to install their own receiving equipment without interfering with terrestrial operations. In addition, the Commission asks whether the Commission should adopt a requirement that millimeter wave band systems transmit an ID identifying themselves to enable better identification and control of sources of interfering signals much the same way that TV, radio or even WiFi systems presently identify themselves. Finally, the Commission seeks comment on revisions to the technical rules for the Upper Microwave Flexible Use Service, including revising coordination criteria between adjacent licensees for point-to-point operations; establishing a minimum bandwidth and bandwidth scaling factor corresponding to various power levels; proposing a reduction in transmit power limits responsive to increasing antenna height, and obtaining further information on millimeter wave propagation models, and whether Part 15 operations in the 57–71 GHz band can be allowed on board aircraft. These portions of the *FNPRM* will help ensure that licensees have maximum flexibility to operate while not causing interference to other licensees.

B. Legal Basis

119. The proposed action is authorized pursuant to Sections 1, 2, 3, 4, 5, 7, 10, 201, 225, 227, 301, 302, 302a, 303, 304, 307, 309, 310, 316, 319, 332, and 336 of the Communications Act of 1934, 47 U.S.C. 151, 152, 153, 154, 155, 157, 160, 201, 225, 227, 301, 302, 302a, 303, 304, 307, 309, 310, 316, 319, 332, 336 and Section 706 of the Telecommunications Act of 1996, as amended, 47 U.S.C. 1302.

C. Description and Estimate of the Number of Small Entities to Which the Proposed Rules Will Apply

120. The RFA directs agencies to provide a description of, and, where feasible, an estimate of the number of small entities that may be affected by the proposed rules and policies, if adopted. The RFA generally defines the term “small entity” as having the same meaning as the terms “small business,” “small organization,” and “small governmental jurisdiction.” In addition, the term “small business” has the same meaning as the term “small business concern” under the Small Business Act. A “small business concern” is one which: (1) Is independently owned and operated; (2) is not dominant in its field of operation; and (3) satisfies any

additional criteria established by the SBA.

D. Small Businesses, Small Organizations, and Small Governmental Jurisdictions

121. Our action may, over time, affect small entities that are not easily categorized at present. The Commission therefore describe here, at the outset, three comprehensive, statutory small entity size standards. First, nationwide, there are a total of approximately 28.2 million businesses, 99.7 percent of which are small, according to the SBA. In addition, a “small organization” is generally “any not-for-profit enterprise which is independently owned and operated and is not dominant in its field.” Nationwide, as of 2007, there were approximately 1,621,315 small organizations. Finally, the term “small governmental jurisdiction” is defined generally as “governments of cities, towns, townships, villages, school districts, or special districts, with a population of less than fifty thousand.” Census Bureau data for 2011 indicate that there were 89,476 local governmental jurisdictions in the United States. The Commission estimates that, of this total, as many as 88,506 entities may qualify as “small governmental jurisdictions.” Thus, the Commission estimates that most governmental jurisdictions are small.

1. Wireless Telecommunications Carriers (Except Satellite)

122. The appropriate size standard under SBA rules is for the category Wireless Telecommunications Carriers. Under that size standard, such a business is small if it has 1,500 or fewer employees. Census Bureau data for 2012, show that there were 967 firms in this category that operated for the entire year. Of this total, 955 had employment of 999 or fewer, and 12 firms had employment of 1,000 employees or more. Thus under this category and the associated small business size standard, the Commission estimates that the majority of wireless telecommunications carriers (except satellite) are small entities that may be affected by our action.

2. Fixed Microwave Services

123. Microwave services include common carrier, private-operational fixed, and broadcast auxiliary radio services. They also include the Local Multipoint Distribution Service (LMDS), the Digital Electronic Message Service (DEMS), the 39 GHz Service (39 GHz), the 24 GHz Service, and the Millimeter Wave Service where licensees can choose between common carrier and

non-common carrier status. At present, there are approximately 61,970 common carrier fixed licensees, 62,909 private and public safety operational-fixed licensees, 20,349 broadcast auxiliary radio licensees, 412 LMDS licenses, 35 DEMS licenses, 870 39 GHz licenses, and five 24 GHz licenses, and 408 Millimeter Wave licenses in the microwave services. The Commission has not yet defined a small business with respect to microwave services. For purposes of the FRFA, the Commission will use the SBA’s definition applicable to Wireless Telecommunications Carriers (except satellite)—*i.e.*, an entity with no more than 1,500 persons is considered small. Under that size standard, such a business is small if it has 1,500 or fewer employees. Census Bureau data for 2012, show that there were 967 firms in this category that operated for the entire year. Of this total, 955 had employment of 999 or fewer, and 12 firms had employment of 1,000 employees or more. Thus under this category and the associated small business size standard, the Commission estimates that the majority of wireless telecommunications carriers (except satellite) are small entities that may be affected by our proposed action. The Commission notes that the number of firms does not necessarily track the number of licensees. The Commission estimates that virtually all of the Fixed Microwave licensees (excluding broadcast auxiliary licensees) would qualify as small entities under the SBA definition.

3. Satellite Telecommunications and All Other Telecommunications

124. Two economic census categories address the satellite industry. The first category has a small business size standard of \$32.5 million or less in average annual receipts, under SBA rules. The second also has a size standard of \$32.5 million or less in annual receipts.

125. The category of Satellite Telecommunications “comprises establishments primarily engaged in providing telecommunications services to other establishments in the telecommunications and broadcasting industries by forwarding and receiving communications signals via a system of satellites or reselling satellite telecommunications.” Census Bureau data for 2012 show that 333 Satellite Telecommunications firms operated for that entire year. Of this total, 275 firms had annual receipts of under \$10 million, and 58 firms had receipts of \$10 million to \$24,999,999. Consequently, the Commission estimates that the majority of Satellite

Telecommunications firms are small entities that might be affected by our action.

126. The second category, *i.e.*, “All Other Telecommunications,” comprises “establishments primarily engaged in providing specialized telecommunications services, such as satellite tracking, communications telemetry, and radar station operation. This industry also includes establishments primarily engaged in providing satellite terminal stations and associated facilities connected with one or more terrestrial systems and capable of transmitting telecommunications to, and receiving telecommunications from, satellite systems. Establishments providing Internet services or voice over Internet protocol (VoIP) services via client-supplied telecommunications connections are also included in this industry.” For this category, Census Bureau data for 2012 show that there were a total of 1442 firms that operated for the entire year. Of this total, 1400 firms had annual receipts of under \$25 million and 42 firms had annual receipts of \$25 million to \$49,999,999. Consequently, the Commission estimates that the majority of All Other Telecommunications firms are small entities that might be affected by our action.

4. Radio and Television Broadcasting and Wireless Communications Equipment Manufacturing

127. The proposed rules relating to Part 15 operation pertain to manufacturers of unlicensed communications devices. The Census Bureau defines this category as follows: “This industry comprises establishments primarily engaged in manufacturing radio and television broadcast and wireless communications equipment. Examples of products made by these establishments are: Transmitting and receiving antennas, cable television equipment, GPS equipment, pagers, cellular phones, mobile communications equipment, and radio and television studio and broadcasting equipment.” The SBA has developed a small business size standard for firms in this category, which is: All such firms having 750 or fewer employees. According to Census Bureau data for 2007, there were a total of 939 establishments in this category that operated for part or all of the entire year. Of this total, 784 had less than 500 employees and 155 had more than 100 employees. Thus, under this size standard, the majority of firms can be considered small.

E. Description of Projected Reporting, Recordkeeping, and Other Compliance Requirements

128. The projected reporting, recordkeeping, and other compliance requirements proposed in the *FNPRM* will apply to all entities in the same manner. The revisions the Commission adopts should benefit small entities by giving them more information, more flexibility, and more options for gaining access to wireless spectrum.

129. Any applicants for UMFUS licenses will be required to file license applications using the Commission's automated ULS. ULS is an online electronic filing system that also serves as a powerful information tool, one that enables potential licensees to research applications, licenses, and antenna structures. It also keeps the public informed with the weekly public notices, FCC rulemakings, processing utilities, and a telecommunications glossary. UMFUS applicants that must submit long-form license applications must do so through ULS using Form 601, FCC Ownership Disclosure Information for the Wireless Telecommunications Services using FCC Form 602, and other appropriate forms.

130. Applicants in the UMFUS will be required to meet buildout requirements at the end of their initial license terms. In doing so, they will be required to provide information to the Commission on the facilities they have constructed, the nature of the service they are providing, and the extent to which they are providing coverage in their license area.

131. The Commission also proposes to require UMFUS licensees to provide information on their proposed operations in order to facilitate sharing with other authorized services. This may include the possibility that UMFUS licensees will have to digitally identify their stations in order to help identify and eliminate causes of interference. In the 48.2–50.2 GHz band, terrestrial licensees may have to report their deployment information to FSS providers to facilitate the deployment of FSS user equipment. The Commission seeks comment on the scope of the information to be provided and the manner in which it should be provided.

132. The Commission expects that all of the filing, recordkeeping and reporting requirements associated with the demands described above, including professional, accounting, engineering or survey services used in meeting these requirements will be the same for large and small businesses that intend to utilize these new UMFUS licenses, but

the Commission seeks comment on any steps that could be taken to minimize any significant economic impact on small businesses.

F. Steps Taken To Minimize Significant Economic Impact on Small Entities, and Significant Alternatives Considered

133. The RFA requires an agency to describe any significant alternatives that it has considered in reaching its approach, which may include the following four alternatives (among others): (1) The establishment of differing compliance or reporting requirements or timetables that take into account the resources available to small entities; (2) the clarification, consolidation, or simplification of compliance or reporting requirements under the rule for small entities; (3) the use of performance, rather than design, standards; and (4) an exemption from coverage of the rule, or any part thereof, for small entities. Accordingly, the Commission seeks comment on whether any of burdens associated the filing, recordkeeping and reporting requirements described above can be minimized for small businesses. In particular, the Commission seeks comment on whether any of the costs associated with our construction or performance requirements in these bands can be alleviated for small businesses.

134. The Commission intends to license the 24 GHz, 32 GHz, 42 GHz, and 50 GHz bands on a PEA basis, but the Commission will also permit partitioning and disaggregation by licensees in the mmW bands. As the Commission noted in the *Report and Order*, while PEAs are small enough to provide spectrum access opportunities for smaller carriers and PEAs could even be further disaggregated, PEAs also nest within, and may be aggregated to form, larger license areas. Therefore, the benefits and burdens resulting from assigning spectrum in PEA license areas would be equivalent for small and large businesses. Depending on the licensing mechanisms the Commission adopts for these bands, licensees may adjust their geographic coverage through auction or through the secondary markets. This proposal should enable providers, or any entities, whether large or small, providing service in the mmW bands to more easily adjust their spectrum to build their networks pursuant to individual business plans. And the Commission believes this ability to adjust spectrum holdings will make it easier for small entities to acquire or access spectrum. The Commission seeks comment from the public concerning whether these license area

determinations would indeed benefit the small businesses or whether there are other alternatives the Commission should consider.

135. For UMFUS bands for which the Commission accept mutually exclusive initial applications, the Commission will resolve such applications by competitive bidding conducted pursuant to Part 1 Subpart Q of the Commission's rules, including rules governing designated entity preferences. In the *Report and Order*, the Commission adopted bidding credits for applicants for UMFUS licenses who qualify as small businesses. An entity with average annual gross revenues for the preceding three years not exceeding \$55 million will qualify as a "small business" and be eligible to receive a 15 percent discount on its winning bid. An entity with average annual gross revenues for the preceding three years not exceeding \$20 million will qualify as a "very small business" and be eligible to receive a 25 percent discount on its winning bid. The *FNPRM* seeks comment on whether to apply these same small business definitions and associated bidding credits to the auction of licenses in the additional bands the *FNPRM* proposes, as well as any other spectrum bands the Commission may subsequently decide to include in the UMFUS. The Commission believes providing small businesses and very small businesses with bidding credits, in addition to the protections built into the auction rules themselves should provide an economic benefit to small businesses by making it easier for them to acquire or access spectrum in these bands. The Commission seeks comment on this assessment and on whether there are any alternative steps the Commission could take to better assist small businesses.

136. In the *Report and Order*, the Commission adopted service rules that will permit licensees the flexibility to provide any fixed or mobile service that is consistent with their spectrum allocation. The Commission proposes that the same flexibility shall apply to the 24 GHz, 32 GHz, 42 GHz, 47 GHz, and 50 GHz bands and the Commission seeks comment concerning whether this flexibility will benefit small businesses by giving them more avenues for gaining access to valuable wireless spectrum. Finally, as noted above, the Commission is proposing to create a SAS-based regulatory framework in the 70/80 GHz band that will permit an innovative shared space in these bands. The SAS serves as an advanced, highly automated frequency coordinator across the band, potentially allowing this shared space to be used by a wide

variety of Federal and non-Federal users, by new entrants, by established operators, and small businesses in particular—to experiment with new technologies in the mmW space and innovate. Our proposals require that small businesses register with an SAS and comply with the rules established for the service and in return they receive the ability to access spectrum currently unavailable to them. The Commission believes this should constitute a significant benefit for small businesses, and the Commission seeks comment on this proposal.

137. The technical rules the Commission now proposes will allow licensees of mmW band spectrum to operate while also protecting licensees of nearby spectrum, some of whom are

small entities, from harmful interference, and the Commission also seeks comment on these proposals.

J. Federal Rules That May Duplicate, Overlap, or Conflict With the Proposed Rules

138. None.

List of Subjects in 47 CFR Parts 2, 25, 30, and 101

Reporting and recordkeeping requirements, Communications equipment.

Federal Communications Commission.

Marlene H. Dortch,

Secretary.

For the reasons discussed in the preamble, the Federal Communications

Commission proposes to amend 47 CFR parts 2, 25, 30 and 101 as follows:

PART 2—FREQUENCY ALLOCATIONS AND RADIO TREATY MATTERS; GENERAL RULES AND REGULATIONS

■ 1. The authority citation for part 2 continues to read as follows:

Authority: 47 U.S.C. 154, 302a, 303, and 336, unless otherwise noted.

■ 2. Amend § 2.106, the Table of Frequency Allocations, by revising pages 54, 56, and 58 through 62 to read as follows:

§ 2.106 Table of Frequency Allocations.

* * * * *

24-24.05 AMATEUR AMATEUR-SATELLITE			24-24.05	24-24.05 AMATEUR AMATEUR-SATELLITE	ISM Equipment (18) Amateur Radio (97)

PART 25—SATELLITE COMMUNICATIONS

■ 3. The authority citation for part 25 continues to read as follows:

Authority: Interprets or applies Sections 4, 301, 302, 303, 307, 309, 319, 332, 705, and 721 of the Communications Act, as amended, 47 U.S.C. 154, 301, 302, 303, 307, 309, 319, 332, 605, and 721, unless otherwise noted.

■ 4. Amend § 25.208 by revising paragraphs (q) and (r) to read as follows:

§ 25.208 Power flux density limits.

(q) In the band 37.5–40.0 GHz, the power flux-density at the Earth's surface produced by emissions from a geostationary space station for all methods of modulation shall not exceed the following values:

- 127 dB(W/m²) in any 1 MHz band for angles of arrival between 0 and 5 degrees above the horizontal plane;
- 127 + 4/3 (δ – 5) dB(W/m²) in any 1 MHz band for angles of arrival δ (in degrees) between 5 and 20 degrees above the horizontal plane; and
- 107 + 0.4 (δ – 20) dB(W/m²) in any 1 MHz band for angles of arrival δ (in degrees) between 20 and 25 degrees above the horizontal plane;

– 105 dB(W/m²) in any 1 MHz band for angles of arrival between 25 and 90 degrees above the horizontal plane.

(r) In the band 37.5–40.0 GHz, the power flux-density at the Earth's surface produced by emissions from a non-geostationary space station for all methods of modulation shall not exceed the following values:

- 120 dB(W/m²) in any 1 MHz band for angles of arrival between 0 and 5 degrees above the horizontal plane;
- 120 + 0.75 (δ – 5) dB(W/m²) in any 1 MHz band for angles of arrival δ (in degrees) between 5 and 25 degrees above the horizontal plane; and
- 105 dB(W/m²) in any 1 MHz band for angles of arrival between 25 and 90 degrees above the horizontal plane.

* * * * *

■ 5. Add part 30 to read as follows:

PART 30—UPPER MICROWAVE FLEXIBLE USE SERVICE

Subpart A—General

Sec.

- 30.1 Creation of upper microwave flexible use service.
- 30.2 Definitions.
- 30.3 Eligibility.
- 30.4 Frequencies.
- 30.5 Service areas.
- 30.6 Permissible communications.
- 30.7 37–37.6 GHz Band—Shared Coordinated Service
- 30.8 5G Provider Cybersecurity Statement Requirements

Subpart B—Applications and Licenses

- 30.101 Initial authorizations.
- 30.102 Authorization of operation of local area networks in 37–38.6 GHz band.
- 30.103 Transition of existing local multipoint distribution service and 39 GHz licenses.
- 30.104 License term.
- 30.105 Construction requirements.
- 30.106 Geographic partitioning and spectrum disaggregation.
- 30.107 Discontinuance of service.

Subpart C—Technical Standards

- 30.201 Equipment authorization.
- 30.202 Power limits.
- 30.203 Emission limits.
- 30.204 Field strength limits.
- 30.205 Federal coordination requirements.
- 30.206 International coordination.
- 30.207 RF safety.
- 30.208 Operability.
- 30.209 Duplexing.
- 30.210 Information sharing requirements in the 48.2–50.2 GHz band.

Subpart D—Competitive Bidding Procedures

- 30.301 Upper microwave flexible use service subject to competitive bidding.
- 30.302 Designated entities and bidding credits.

Subpart E—Special Provisions for Fixed Point-to-Point, Fixed Point-to-Multipoint Hub Stations, and Fixed Point-to-Multipoint User Stations

- 30.401 Permissible service.
- 30.402 Frequency tolerance.
- 30.403 Bandwidth.
- 30.404 Emission limits.
- 30.405 Transmitter power limitations.
- 30.406 Directional antennas.
- 30.407 Antenna Polarization.

Subpart F—Shared operation in the 71–76 GHz and 81/86 GHz bands

- 30.501 Scope.
- 30.502 Authorization required.
- 30.503 Frequency assignments.
- 30.504 Technical rules.
- 30.505 Protection of Federal incumbents.
- 30.506 Priority Access Licenses.
- 30.507 General Access.
- 30.508 Spectrum access system purposes and functionality.
- 30.509 Registration, authentication, and authorization of devices.

Authority: 47 U.S.C. 151, 152, 153, 154, 301, 303, 304, 307, 309, 310, 316, 332, 1302.

§ 30.1 Creation of upper microwave flexible use service, scope and authority.

As of [effective date of final rule], Local Multipoint Distribution Service licenses for the 27.5–28.35 GHz band, and licenses issued in the 38.6–40 GHz band under the rules in part 101 of this chapter shall be reassigned to the Upper Microwave Flexible Use Service. Local Multipoint Distribution Service licenses in bands other than 27.5–28.35 GHz shall remain in that service and shall be governed by the part 101 of this chapter applicable to that service.

§ 30.2 Definitions.

The following definitions apply to this part:

Authorized bandwidth. The maximum width of the band of frequencies permitted to be used by a station. This is normally considered to be the necessary or occupied bandwidth, whichever is greater. (See § 2.202 of this chapter).

Authorized frequency. The frequency, or frequency range, assigned to a station by the Commission and specified in the instrument of authorization.

Fixed satellite earth station. An earth station intended to be used at a specified fixed point.

Local Area Operations. Operations confined to physical facility boundaries, such as a factory.

Point-to-Multipoint Hub Station. A fixed point-to-multipoint radio station that provides one-way or two-way communication with fixed Point-to-Multipoint Service User Stations.

Point-to-Multipoint User Station. A fixed radio station located at users' premises, lying within the coverage area of a Point-to-Multipoint Hub station, using a directional antenna to receive one-way communications from or providing two-way communications with a fixed Point-to-Multipoint Hub Station.

Point-to-Multipoint Service. A fixed point-to-multipoint radio service consisting of point-to-multipoint hub stations that communicate with fixed point-to-multipoint user stations.

Point-to-point station. A station that transmits a highly directional signal from a fixed transmitter location to a fixed receive location.

Portable device. Transmitters designed to be used within 20 centimeters of the body of the user.

Prior coordination. A bilateral process conducted prior to filing applications which includes the distribution of the technical parameters of a proposed radio system to potentially affected parties for their evaluation and timely response.

Secondary operations. Radio communications which may not cause interference to operations authorized on a primary basis and which are not protected from interference from these primary operations

Transportable Station. Transmitting equipment that is not intended to be used while in motion, but rather at stationary locations.

Universal Licensing System. The Universal Licensing System (ULS) is the consolidated database, application filing system, and processing system for all Wireless Radio Services. ULS supports electronic filing of all applications and

related documents by applicants and licensees in the Wireless Radio Services, and provides public access to licensing information.

§ 30.3 Eligibility.

Any entity who meets the technical, financial, character, and citizenship qualifications that the Commission may require in accordance with such Act, other than those precluded by section 310 of the Communications Act of 1934, as amended, 47 U.S.C. 310, is eligible to hold a license under this part.

§ 30.4 Frequencies.

The following frequencies are available for assignment in the Upper Microwave Flexible Use Service:

- (a) 27.5 GHz–28.35 GHz band—27.5–27.925 GHz and 27.925–28.35 GHz.
(b) 38.6–40 GHz band:
(1) New channel plan:

Channel No.	Frequency band limits (MHz)
1	38,600–38,800
2	38,800–39,000

Channel No.	Frequency band limits (MHz)
3	39,000–39,200
4	39,200–39,400
5	39,400–39,600
6	39,600–39,800
7	39,800–40,000

(2) Pending transition to the new channel plan, existing 39 GHz licensees licensed under part 101 of this chapter may continue operating on the following channel plan:

Channel Group A		Channel Group B	
Channel No.	Frequency band limits (MHz)	Channel No.	Frequency band limits (MHz)
1-A	38,600–38,650	1-B	39,300–39,350
2-A	38,650–38,700	2-B	39,350–39,400
3-A	38,700–38,750	3-B	39,400–39,450
4-A	38,750–38,800	4-B	39,450–39,500
5-A	38,800–38,850	5-B	39,500–39,550
6-A	38,850–38,900	6-B	39,550–39,600
7-A	38,900–38,950	7-B	39,600–39,650
8-A	38,950–39,000	8-B	39,650–39,700
9-A	39,000–39,050	9-B	39,700–39,750
10-A	39,050–39,100	10-B	39,750–39,800
11-A	39,100–39,150	11-B	39,800–39,850
12-A	39,150–39,200	12-B	39,850–39,900
13-A	39,200–39,250	13-B	39,900–39,950
14-A	39,250–39,300	14-B	39,950–40,000

(c) 37–38.6 GHz band: 37,600–37,800 MHz; 37,800–38,000 MHz; 38,000–38,200 MHz; 38,200–38,400 MHz, and 38,400–38,600 MHz. The 37,000–37,600 MHz band segment shall be available on a site-specific, coordinated shared basis with eligible Federal entities;

(d) 24.25–24.45 GHz band:

(e) 24.75–25.25 GHz band: 24.75–25.00 GHz, 25.00–25.25 GHz;

(f) 31.8–33.4 GHz band:

Channel No.	Frequency
1	31,000–32,000
2	32,000–32,200
3	32,200–32,400
4	32,400–32,600
5	32,600–32,800
6	32,800–33,000
7	33,000–33,200
8	33,200–33,400

(g) 42–42.5 GHz band:

(h) 47.2–50.2 GHz band:

Channel No.	Frequency
1	47,200–47,700
2	47,700–48,200
3	48,200–48,700
4	48,700–49,200
5	49,200–49,700
6	49,700–50,200

(i) 50.4–52.6 GHz band:

Channel No.	Frequency
1	50,400–50,600
2	50,600–50,800
3	50,800–51,000
4	51,000–51,200
5	51,200–51,400
6	51,400–51,600
7	51,600–51,800
8	51,800–52,000
9	52,000–52,200
10	52,200–52,400
11	52,400–52,600

(j) The 71–76 GHz and 81–86 GHz bands shall be available on a shared basis pursuant to the rules in subpart F of this part.

§ 30.5 Service areas.

(a) Except as noted in paragraphs (b) and (c) of this section, and except for the shared 37–37.6 GHz, 71–76 GHz, and 81–86 GHz bands, the service areas for the Upper Microwave Flexible Use Service are Partial Economic Areas.

(b) For the 27.5–28.35 GHz band, the service areas shall be counties.

(c) Common Carrier Fixed Point-to-Point Microwave Stations licensed in the 38.6–40 GHz bands licensed with Rectangular Service Areas shall maintain their Rectangular Service Area as defined in their authorization. The frequencies associated with Rectangular Service Area authorizations that have

expired, cancelled, or otherwise been recovered by the Commission will automatically revert to the applicable county licensee.

(d) In the 37.5–40 GHz band, Upper Microwave Flexible Use Service licensees shall not place facilities within the protection zone of Fixed-Satellite Service earth stations authorized pursuant to § 25.136 of this chapter, absent consent from the Fixed-Satellite Service earth station licensee.

§ 30.6 Permissible communications.

(a) A licensee in the frequency bands specified in § 30.4 may provide any services for which its frequency bands are allocated, as set forth in the non-Federal Government column of the Table of Frequency Allocations in § 2.106 of this chapter (column 5).

(b) Fixed-Satellite Service shall be provided in a manner consistent with part 25 of this chapter.

§ 30.7 37–37.6 GHz Band—Shared Coordinated Service.

(a) The 37–37.6 GHz band will be available for site-based registrations on a coordinated basis with co-equal eligible Federal entities.

(b) Any non-Federal entity meeting the eligibility requirements of § 30.3 of this part may operate equipment that complies with the technical rules of this

part pursuant to a Shared Access License.

(c) Licensees in the 37–37.6 GHz band must register their individual base stations and access points prior to placing them in operation.

(d) The minimum authorized channel bandwidth in this band is 100 megahertz.

(e) Registered non-Federal sites must be put placed service within seven days of coordination.

(f) Equipment in this band must be capable of notifying the database that it is active on the channel. At least once every seven days, the equipment must be capable of notifying the coordination mechanism that the equipment is active and operating. If the equipment fails to make such a notification, the registration to operate that equipment is automatically terminated.

(g) Federal licensees may claim access to 200 megahertz of spectrum in this area on a priority basis.

§ 30.8 5G Provider Cybersecurity Statement Requirements.

(a) *Statement.* Each Upper Microwave Flexible Use Service licensee is required to submit to the Commission a Statement describing its network security plans and related information, which shall be signed by a senior executive within the licensee's organization with personal knowledge of the security plans and practices within the licensee's organization. The Statement must contain, at a minimum, the following elements:

(1) *Security Approach.* A high-level, general description of the licensee's approach designed to safeguard the planned network's confidentiality, integrity, and availability, with respect to communications from:

- (i) A device to the licensee's network;
- (ii) One element of the licensee's network to another element on the licensee's network;
- (iii) The licensee's network to another network; and
- (iv) Device to device (with respect to telephone voice and messaging services).

(2) *Cybersecurity Coordination.* A high-level, general description of the licensee's anticipated approach to assessing and mitigating cyber risk induced by the presence of multiple participants in the band. This should include the high level approach taken toward ensuring consumer network confidentiality, integrity, and availability security principles, are to be protected in each of the following use cases:

(i) Communications between a wireless device and the licensee's network;

(ii) Communications within and between each licensee's network;

(iii) Communications between mobile devices that are under end-to-end control of the licensee; and

(iv) Communications between mobile devices that are not under the end-to-end control of the licensee;

(3) *Cybersecurity Standards and Best Practices.* A high-level description of relevant cybersecurity standards and practices to be employed, whether industry-recognized or related to some other identifiable approach;

(4) *Participation With Standards Bodies, Industry-Led Organizations.* A description of the extent to which the licensee participates with standards bodies or industry-led organizations pursuing the development or maintenance of emerging security standards and/or best practices;

(5) *Other Security Approaches.* The high-level identification of any other approaches to security, unique to the services and devices the licensee intends to offer and deploy; and

(6) *Plans With Information Sharing and Analysis Organizations.* Plans to incorporate relevant outputs from Information Sharing and Analysis Organizations (ISAOs) as elements of the licensee's security architecture. Plans should include comment on machine-to-machine threat information sharing, and any use of anticipated standards for ISAO-based information sharing.

(b) *Timing.* Each Upper Microwave Flexible Use Service licensee shall submit this *Statement* to the Commission within three years after grant of the license, but no later than six months prior to deployment.

(c) *Definitions.* The following definitions apply to this section:

(i) *Confidentiality.* The protection of data from unauthorized access and disclosure, both while at rest and in transit.

(ii) *Integrity.* The protection against the unauthorized modification or destruction of information.

(iii) *Availability.* The accessibility and usability of a network upon demand.

Subpart B—Applications and Licenses

§ 30.101 Initial authorizations.

Except with respect to in the 37–37.6 GHz band, an applicant must file a single application for an initial authorization for all markets won and frequency blocks desired. Initial authorizations shall be granted in accordance with § 30.4. Applications for individual sites are not required and will not be accepted, except where required for environmental assessments,

in accordance with §§ 1.1301 through 1.1319 of this chapter.

§ 30.103 Transition of existing local multipoint distribution service and 39 GHz licenses.

Local Multipoint Distribution Service licenses in the 27.5–28.35 GHz band issued on a Basic Trading Area basis shall be disaggregated into county-based licenses and 39 GHz licenses issued on an Economic Area basis shall be disaggregated into Partial Economic Area-based licenses on [effective date of final rule]. For each county in the Basic Trading Area or Partial Economic Area in the Economic Area which is part of the original license, the licensee shall receive a separate license. If there is a co-channel Rectangular Service Area licensee within the service area of a 39 GHz Economic Area licensee, the disaggregated license shall not authorize operation with the service area of the Rectangular Service Area licensee.

§ 30.104 License term.

Initial authorizations will have a term not to exceed ten years from the date of initial issuance or renewal.

§ 30.105 Construction requirements.

(a) Upper Microwave Flexible Use Service licensees must make a buildout showing as part of their renewal applications. Licensees relying on mobile or point-to-multipoint service to demonstrate that they are providing reliable signal coverage and service to at least 40 percent of the population within the service area of the licensee, and that they are using facilities to provide service in that area either to customers or for internal use. Licensees relying on point-to-point service must demonstrate that they have four links operating and providing service, either to customers or for internal use. If the population within the license area is equal to or less than 268,000. If the population within the license area is greater than 268,000, a licensee relying on point-to-point service must demonstrate it has at least one link in operation and providing service for each 67,000 population within the license area.

(b) Showings that rely on a combination of multiple types of service will be evaluated on a case-by-case basis.

(c) If a licensee in this service is also a Fixed-Satellite Service licensee and uses the spectrum covered under its UMFUS license in connection with a satellite earth station, it can demonstrate compliance with the requirements of this section by demonstrating that the earth station in question is in service,

operational, and using the spectrum associated with the license. This provision can only be used to demonstrate compliance for the county in which the earth station is located.

(d) Failure to meet this requirement will result in automatic cancellation of the license. In bands licensed on a Partial Economic Area basis, licensees will have the option of partitioning a license on a county basis in order to reduce the population within the license area to a level where the licensee's buildout would meet one of the applicable performance metrics.

(e) Existing 28 GHz and 39 GHz licensees shall be required to make a showing pursuant to this rule by June 1, 2024.

§ 30.106 Geographic partitioning and spectrum disaggregation.

(a) Parties seeking approval for partitioning and disaggregation shall request from the Commission an authorization for partial assignment of a license pursuant to § 1.948 of this chapter. Upper Microwave Flexible Use Service licensees may apply to partition their licensed geographic service area or disaggregate their licensed spectrum at any time following the grant of their licenses.

(b) *Technical standards—(1) Partitioning.* In the case of partitioning, applicants and licensees must file FCC Form 603 pursuant to § 1.948 of this chapter and list the partitioned service area on a schedule to the application. The geographic coordinates must be specified in degrees, minutes, and seconds to the nearest second of latitude and longitude and must be based upon the 1983 North American Datum (NAD83).

(2) Spectrum may be disaggregated in any amount.

(3) The Commission will consider requests for partial assignment of licenses that propose combinations of partitioning and disaggregation.

(4) For purposes of partitioning and disaggregation, part 30 systems must be designed so as not to exceed the signal level specified for the particular spectrum block in § 30.204 at the licensee's service area boundary, unless the affected adjacent service area

licensees have agreed to a different signal level.

(c) *License term.* The license term for a partitioned license area and for disaggregated spectrum shall be the remainder of the original licensee's license term as provided for in § 30.104.

(d)(1) Parties to partitioning agreements must satisfy the construction requirements set forth in § 30.105 by the partitioner and partitionee each certifying that it will independently meet the construction requirement for its respective partitioned license area. If the partitioner or partitionee fails to meet the construction requirement for its respective partitioned license area, then the relevant partitioned license will automatically cancel.

(2) Parties to disaggregation agreements must satisfy the construction requirements set forth in § 30.105 by the disaggregator and disaggregatee each certifying that it will independently meet the construction requirement for its respective disaggregated license area. If the disaggregator or disaggregatee fails to meet the construction requirement for its respective disaggregated license area, then the relevant disaggregated license will automatically cancel.

§ 30.107 Discontinuance of service.

(a) An Upper Microwave Flexible Use License authorization will automatically terminate, without specific Commission action, if the licensee permanently discontinues service after the initial license term.

(b) For licensees with common carrier regulatory status, permanent discontinuance of service is defined as 180 consecutive days during which a licensee does not provide service to at least one subscriber that is not affiliated with, controlled by, or related to the licensee in the individual license area. For licensees with non-common carrier status, permanent discontinuance of service is defined as 180 consecutive days during which a licensee does not operate.

(c) A licensee that permanently discontinues service as defined in this section must notify the Commission of the discontinuance within 10 days by

filing FCC Form 601 or 605 requesting license cancellation. An authorization will automatically terminate, without specific Commission action, if service is permanently discontinued as defined in this section, even if a licensee fails to file the required form requesting license cancellation.

Subpart C—Technical Standards

§ 30.201 Equipment authorization.

(a) Except as provided under paragraph (c) of this section, each transmitter utilized for operation under this part must be of a type that has been authorized by the Commission under its certification procedure.

(b) Any manufacturer of radio transmitting equipment to be used in these services may request equipment authorization following the procedures set forth in subpart J of part 2 of this chapter. Equipment authorization for an individual transmitter may be requested by an applicant for a station authorization by following the procedures set forth in part 2 of this chapter.

(c) Unless specified otherwise, transmitters for use under the provisions of subpart E of this part for fixed point-to-point microwave and point-to-multipoint services must be a type that has been verified for compliance.

§ 30.202 Power limits.

(a) For fixed and base stations operating in connection with mobile systems, the average power of the sum of all antenna elements is limited to a maximum equivalent isotopically radiated power (EIRP) density of +75 dBm/100MHz, except as specified in paragraph (e) of this section.

(b) For mobile stations, the average power of the sum of all antenna elements is limited to a maximum EIRP density of +43 dBm/100MHz.

(c) For transportable stations, as defined in § 30.2, the average power of the sum of all antenna elements is limited to a maximum EIRP density of +55 dBm/100MHz.

(d) For fixed point-to-point and point-to-multipoint limits see § 30.405.

(e) *Antenna Height Limits*

Antenna height (AAT) in meters (feet)	Effective isotropic radiated power density (EIRP) (dBm/100 MHz)
Above 1372 (4500)	62
Above 1220 (4000) To 1372 (4500)	63
Above 1067 (3500) To 1220 (4000)	64
Above 915 (3000) To 1067 (3500)	65
Above 763 (2500) To 915 (3000)	67
Above 610 (2000) To 763 (2500)	69

Antenna height (AAT) in meters (feet)	Effective isotropic radiated power density (EIRP) (dBm/100 MHz)
Above 458 (1500) To 610 (2000)	71
Above 305 (1000) To 458 (1500)	73
Up to 305 (1000)	75

§ 30.203 Emission limits.

(a) The conductive power or the total radiated power of any emission outside a licensee's frequency block shall be – 13 dBm/MHz or lower. However, in the bands immediately outside and adjacent to the licensee's frequency block, having a bandwidth equal to 10 percent of the channel bandwidth, the conductive power or the total radiated power of any emission shall be – 5 dBm/MHz or lower.

(b)(1) Compliance with this provision is based on the use of measurement instrumentation employing a resolution bandwidth of 1 megahertz or greater.

(2) When measuring the emission limits, the nominal carrier frequency shall be adjusted as close to the licensee's frequency block edges as the design permits.

(3) The measurements of emission power can be expressed in peak or average values.

(c) For fixed point-to-point and point-to-multipoint limits see § 30.404.

§ 30.204 Field strength limits.

(a) *Base/Mobile Operations.* The predicted or measured Power Flux

Density (PFD) from any Base Station operating in the 27.5–28.35 GHz band, 37–38.6 GHz band, and 38.6–40 GHz bands at any location on the geographical border of a licensee's service area shall not exceed – 76dBm/m²/MHz (measured at 1.5 meters above ground) unless the adjacent affected service area licensee(s) agree(s) to a different PFD.

(b) Fixed Point-to-Point Operations:

(1) Prior to operating a fixed point-to-point transmitting facility in the 27,500–28,350 MHz band where the facilities are located within 20 kilometers of the boundary of the licensees authorized market area, the licensee must complete frequency coordination in accordance with the procedures specified in § 101.103(d)(2) of this chapter with respect to neighboring licensees that may be affected by its operations.

(2) Prior to operating a fixed point-to-point transmitting facility in the 37,000–40,000 MHz band where the facilities are located within 16 kilometers of the boundary of the licensees authorized market area, the licensee must complete frequency coordination in accordance with the procedures specified in

§ 101.103(d)(2) of this chapter with respect to neighboring licensees that may be affected by its operations.

§ 30.205 Federal coordination requirements.

(a) Licensees in the 37–38 GHz band located within the zones defined by the coordinates in the tables below must coordinate their operations with Federal Space Research Service (space to Earth) users of the band via the National Telecommunications and Information Administration (NTIA). All licensees operating within the zone defined by the 60 dBm/100 MHz EIRP coordinates in the tables below must coordinate all operations. Licensees operating within the area between the zones defined by the 60 dBm and 75 dBm/100 MHz EIRP coordinates in the tables below must coordinate all operations if their base station EIRP is greater than 60 dBm/100 MHz or if their antenna height exceeds 100 meters above ground level. Licensees operating outside the zones defined by the 75 dBm/100 MHz EIRP coordinates in the tables below are not required to coordinate their operations with NTIA.

(b) Licensees in the 37–38.6 GHz band located within the zones defined by the coordinates in the table below must

coordinate their operations with the Department of Defense via the National

Telecommunications and Information Administration (NTIA).

TABLE—COORDINATION AREAS FOR FEDERAL TERRESTRIAL SYSTEMS

Location	Agency	Coordination area (Decimal Degrees)
China Lake, CA	Navy	30 kilometer radius centered on latitude 35.59527 and longitude – 117.22583. 30 kilometer radius centered on latitude 35.52222 and longitude – 117.30333. 30 kilometer radius centered on latitude 35.76222 and longitude – 117.60055. 30 kilometer radius centered on latitude 35.69111 and longitude – 117.66916.
San Diego, CA	Navy	30 kilometer radius centered on latitude 32.68333 and longitude – 117.23333.
Nanakuli, HI	Navy	30 kilometer radius centered on latitude 21.38333 and longitude – 158.13333.
Fishers Island, NY	Navy	30 kilometer radius centered on latitude 41.25 and longitude – 72.01666.
Saint Croix, VI	Navy	30 kilometer radius centered on latitude 17.74722 and longitude – 64.88.
Fort Irwin, CA	Army	30 kilometer radius centered on latitude 35.26666 and longitude – 116.68333.
Fort Carson, CO	Army	30 kilometer radius centered on latitude 38.71666 and longitude – 104.65.
Fort Hood, TX	Army	30 kilometer radius centered on latitude 31.11666 and longitude – 97.76666.
Fort Bliss, TX	Army	30 kilometer radius centered on latitude 31.8075 and longitude – 106.42166.

TABLE—COORDINATION AREAS FOR FEDERAL TERRESTRIAL SYSTEMS—Continued

Location	Agency	Coordination area (Decimal Degrees)
Yuma Proving Ground, AZ	Army	30 kilometer radius centered on latitude 32.48333 and longitude – 114.33333.
Fort Huachuca, AZ	Army	30 kilometer radius centered on latitude 31.55 and longitude – 110.35.
White Sands Missile Range, NM	Army	30 kilometer radius centered on latitude 33.35 and longitude – 106.3.
Moody Air Force Base, GA	Air Force	30 kilometer radius centered on latitude 30.96694 and longitude – 83.185.
Hurlburt Air Force Base, FL	Air Force	30 kilometer radius centered on latitude 30.42388 and longitude – 86.70694.

§ 30.206 International coordination.

Operations in the 27.5–28.35 GHz, 37–38.6, and 38.6–40 GHz bands are subject to existing and future international agreements with Canada and Mexico.

§ 30.207 RF safety.

Licensees and manufacturers are subject to the radio frequency radiation exposure requirements specified in §§ 1.1307(b), 1.1310, 2.1091, and 2.1093 of this chapter, as appropriate. Applications for equipment authorization of mobile or portable devices operating under this section must contain a statement confirming compliance with these requirements. Technical information showing the basis for this statement must be submitted to the Commission upon request.

§ 30.208 Operability.

Mobile and transportable stations that operate on any portion of frequencies within the 27.5–28.35 GHz or the 37–40 GHz bands must be capable of operating on all frequencies within those particular bands.

§ 30.209 Duplexing.

Stations authorized under this rule part may employ frequency division duplexing, time division duplexing, or any other duplexing scheme, provided that they comply with the other technical and operational requirements specified in this part.

§ 30.210 Information sharing requirements in the 48.2–50.2 GHz band.

(a) Each operator of a Fixed Service or Mobile Service system in the 48.2–50.2 GHz band will make the technical information about its system listed in paragraphs (b) and (c) of this section available to FSS operators by one or more of the following means:

- (1) An online database operated by the Upper Microwave Flexible Use licensee;
- (2) An online database operated by a third-party database manager, or

(3) A continuously transmitted pilot signal receivable throughout the terrain within which a FSS facility could cause interference to or receive interference from the terrestrial system.

(b) All licensees deploying fixed systems in the 48.2–50.2 GHz bands will make the following information about each such system available to FSS operators in those bands by one or more of the means described in paragraph (a) of this section:

- (1) Licensee's name and address.
- (2) Transmitting station name.
- (3) Transmitting station coordinates.
- (4) Frequencies and polarizations.
- (5) Transmitting equipment, its stability, effective isotropic radiated power, emission designator, and type of modulation (digital).
- (6) Transmitting antenna(s), model, gain, and a radiation pattern provided or certified by the manufacturer.
- (7) Transmitting antenna center line height(s) above ground level and ground elevation above mean sea level.
- (8) Transmitting antenna boresight(s) angle of elevation with respect to the horizon.
- (9) Receiving station name.
- (10) Receiving station coordinates.
- (11) Receiving antenna(s), model, gain, and, if required, a radiation pattern provided or certified by the manufacturer.
- (12) Receiving antenna center line height(s) above ground level and ground elevation above mean sea level.
- (13) Receiving antenna boresight(s) angle of elevation with respect to the horizon.
- (14) Path azimuth and distance.

(c) All licensees deploying mobile service base stations in the 48.2–50.2 GHz bands will make the following information about each such base station available to FSS operators by one or both of the means described in paragraph (a) of this section:

- (1) Licensee's name and address.
- (2) Transmitting station name.
- (3) Transmitting station coordinates.
- (4) Frequencies and polarizations.

(5) Transmitting equipment, its stability, maximum effective isotropic radiated power, emission designator, and types of modulation.

(6) Transmitting antenna(s), model, maximum gain, and maximum extent of all possible radiation patterns provided or certified by the manufacturer.

(7) Transmitting antenna center line height(s) above ground level and ground elevation above mean sea level.

(8) Transmitting antenna boresight(s) maximum and minimum angles of elevation with respect to the horizon.

(9) Transmitting antenna boresight minimum and maximum azimuths, or designation of omnidirectionality.

(10) Boundary of the area served by the base station for purposes of communication with mobile user equipment.

(11) Receiving antenna(s), model, gain, and maximum extent of all possible radiation patterns provided or certified by the manufacturer.

(12) Receiving antenna center line height(s) above ground level and ground elevation above mean sea level.

(13) Receiving antenna boresight maximum and minimum angles of elevation with respect to the horizon.

(14) Receiving antenna boresight minimum and maximum azimuths, or designation of omnidirectionality.

Subpart D—Competitive Bidding Procedures**§ 30.301 Upper microwave flexible use service subject to competitive bidding.**

Mutually exclusive initial applications for Upper Microwave Flexible User Service licenses are subject to competitive bidding. The general competitive bidding procedures set forth in part 1, subpart Q of this chapter will apply unless otherwise provided in this subpart.

§ 30.302 Designated entities and bidding credits.

(a) *Eligibility for small business provisions.* (1) A small business is an entity that, together with its affiliates, its

controlling interests and the affiliates of its controlling interests, have average gross revenues that are not more than \$55 million for the preceding three (3) years.

(2) A very small business is an entity that, together with its affiliates, its controlling interests and the affiliates of its controlling interests, has average gross revenues that are not more than \$20 million for the preceding three (3) years.

(b) *Bidding credits.* A winning bidder that qualifies as a small business, as defined in this section, or a consortium of small businesses may use a bidding credit of 15 percent, as specified in § 1.2110(f)(2)(i)(C) of this chapter. A winning bidder that qualifies as a very small business, as defined in this section, or a consortium of very small businesses may use a bidding credit of 25 percent, as specified in § 1.2110(f)(2)(i)(B) of this chapter.

(c) A rural service provider, as defined in § 1.2110(f)(4) of this chapter, who has not claimed a small business bidding credit may use a bidding credit of 15 percent bidding credit, as specified in § 1.2110(f)(4)(i) of this chapter.

Subpart E—Special Provisions for Fixed Point-to-Point, Fixed Point-to-Multipoint Hub Stations, and Fixed Point-to-Multipoint User Stations

§ 30.401 Permissible service.

Stations authorized under this subpart may deploy stations used solely as fixed point-to-point stations, fixed point-to-multipoint hub stations, or fixed point-to-multipoint user stations, as defined in § 30.2 subject to the technical and operational requirements specified in this subpart.

§ 30.402 Frequency tolerance.

The carrier frequency of each transmitter authorized under this subpart must be maintained within the following percentage of the reference frequency (unless otherwise specified in the instrument of station authorization the reference frequency will be deemed to be the assigned frequency):

Frequency (MHz)	Frequency tolerance (percent)
27,500 to 28,350	0.001
38,600 to 40,000	0.03

§ 30.403 Bandwidth.

(a) Stations under this sub-part will be authorized any type of emission, method of modulation, and transmission characteristic, consistent

with efficient use of the spectrum and good engineering practice.

(b) The maximum bandwidth authorized per frequency to stations under this subpart is set out in the table that follows.

Frequency band (MHz)	Maximum authorized bandwidth
27,500 to 28,350	850 MHz.
38,600 to 40,000	200 MHz. ¹

¹For channel block assignments in the 38,600–40,000 MHz bands when adjacent channels are aggregated, equipment is permitted to operate over the full channel block aggregation without restriction.

§ 30.404 Emission limits.

(a) The mean power of emissions must be attenuated below the mean output power of the transmitter in accordance with the following schedule:

(1) When using transmissions other than those employing digital modulation techniques:

(i) On any frequency removed from the assigned frequency by more than 50 percent up to and including 100 percent of the authorized bandwidth: At least 25 decibels;

(ii) On any frequency removed from the assigned frequency by more than 100 percent up to and including 250 percent of the authorized bandwidth: At least 35 decibels;

(iii) On any frequency removed from the assigned frequency by more than 250 percent of the authorized bandwidth: At least $43 + 10 \log_{10}$ (mean output power in watts) decibels, or 80 decibels, whichever is the lesser attenuation.

(2) When using transmissions employing digital modulation techniques in situations not covered in this section:

(i) In any 1 MHz band, the center frequency of which is removed from the assigned frequency by more than 50 percent up to and including 250 percent of the authorized bandwidth: As specified by the following equation but in no event less than 11 decibels:

$A = 11 + 0.4(P - 50) + 10 \log_{10} B$.
(Attenuation greater than 56 decibels or to an absolute power of less than -13 dBm/1MHz is not required.)

(ii) In any 1 MHz band, the center frequency of which is removed from the assigned frequency by more than 250 percent of the authorized bandwidth: At least $43 + 10 \log_{10}$ (the mean output power in watts) decibels, or 80 decibels, whichever is the lesser attenuation. The authorized bandwidth includes the nominal radio frequency bandwidth of an individual transmitter/modulator in block-assigned bands. Equipment licensed prior to April 1, 2005 shall

only be required to meet this standard in any 4 kHz band.

(iii) The emission mask in paragraph (a)(2)(i) of this section applies only to the band edge of each block of spectrum, but not to subchannels established by licensees. The value of P in the equation is the percentage removed from the carrier frequency and assumes that the carrier frequency is the center of the actual bandwidth used. The emission mask can be satisfied by locating a carrier of the subchannel sufficiently far from the channel edges so that the emission levels of the mask are satisfied. The emission mask shall use a value B (bandwidth) of 40 MHz, for all cases even in the case where a narrower subchannel is used (for instance the actual bandwidth is 10 MHz) and the mean output power used in the calculation is the sum of the output power of a fully populated channel. For block assigned channels, the out-of-band emission limits apply only outside the assigned band of operation and not within the band.

(b) [Reserved]

§ 30.405 Transmitter power limitations.

On any authorized frequency, the average power delivered to an antenna in this service must be the minimum amount of power necessary to carry out the communications desired. Application of this principle includes, but is not to be limited to, requiring a licensee who replaces one or more of its antennas with larger antennas to reduce its antenna input power by an amount appropriate to compensate for the increased primary lobe gain of the replacement antenna(s). In no event shall the average equivalent isotropically radiated power (EIRP), as referenced to an isotropic radiator, exceed the following:

MAXIMUM ALLOWABLE EIRP

Frequency band (MHz)	Fixed (dBW)
27,500–28,350 ¹	+ 55
38,600–40,000	+ 55

¹For Point-to-multipoint user stations authorized in these bands, the EIRP shall not exceed 55 dBW or 42 dBW/MHz.

§ 30.406 Directional antennas.

(a) Unless otherwise authorized upon specific request by the applicant, each station authorized under the rules of this subpart must employ a directional antenna adjusted with the center of the major lobe of radiation in the horizontal plane directed toward the receiving station with which it communicates; *provided, however*, where a station communicates with more than one

point, a multi- or omni-directional antenna may be authorized if necessary.

(b) Fixed stations (other than temporary fixed stations) must employ transmitting and receiving antennas (excluding second receiving antennas for operations such as space diversity) meeting the appropriate performance Standard A indicated below, except that

in areas not subject to frequency congestion, antennas meeting performance Standard B may be used. For frequencies with a Standard B1 and a Standard B2, in order to comply with Standard B an antenna must fully meet either Standard B1 or Standard B2. Licensees shall comply with the

antenna standards table shown in this paragraph in the following manner:

(1) With either the maximum beamwidth to 3 dB points requirement or with the minimum antenna gain requirement; and

(2) With the minimum radiation suppression to angle requirement.

Frequency (MHz)	Category	Maximum beamwidth to 3 dB points ¹ (included angle in degrees)	Minimum antenna gain (dbi)	Minimum radiation suppression to angle in degrees from centerline of main beam in decibels						
				5° to 10°	10° to 15°	15° to 20°	20° to 30°	30° to 100°	100° to 140°	140° to 180°
38,600 to 40,000 ² .	A	n/a	38	25	29	33	36	42	55	55
	B	n/a	38	20	24	28	32	35	36	36

¹ If a licensee chooses to show compliance using maximum beamwidth to 3 dB points, the beamwidth limit shall apply in both the azimuth and the elevation planes.

² Stations authorized to operate in the 38,600–40,000 MHz band may use antennas other than those meeting the Category A standard. However, the Commission may require the use of higher performance antennas where interference problems can be resolved by the use of such antennas.

§ 30.407 Antenna polarization.

In the 27,500–28,350 MHz band, system operators are permitted to use any polarization within its service area, but only vertical and/or horizontal polarization for antennas located within 20 kilometers of the outermost edge of their service area.

Subpart F—Shared operation in the 71–76 GHz and 81/86 GHz bands

§ 30.501 Scope.

(a) This section sets forth the regulations governing use of devices in the 71–76 GHz and 81–86 GHz bands. The operation of all equipment in this band shall be coordinated by one or more authorized Spectrum Access Systems (SASs).

(b) Operations in this band include Priority Access and General Authorized Access tiers of service. Priority Access Licensees and General Authorized Access Users must not cause harmful interference to Incumbent Users and must accept interference from Incumbent Users. General Authorized Access Users must not cause harmful interference to Priority Access Licensees and must accept interference from Priority Access Licensees.

§ 30.502 Authorization required.

(a) Devices must be used and operated consistent with the rules in this subpart.

(b) Authorizations for PALs may be granted upon proper application, provided that the applicant is qualified in regard to citizenship, character, financial, technical and other criteria established by the Commission, and that the public interest, convenience and necessity will be served. See 47 U.S.C.

301, 308, 309, and 310. The holding of an authorization does not create any rights beyond the terms, conditions, and period specified in the authorization and shall be subject to the provisions of the Communications Act of 1934, as amended, and the Commission's rules and policies thereunder.

(c) Grandfathered registered fixed links are authorized to operate consistent with § 101.1529 of this chapter.

§ 30.503 Frequency assignments.

(a) Any frequencies designated for Priority Access that are not in use by a Priority Access Licensee may be utilized by General Authorized Access Users.

(b) An SAS shall assign authorized devices to specific frequencies, which may be reassigned by that SAS, consistent with this part.

§ 30.504 Technical rules.

Devices in these bands shall be subject to the technical rules in subpart C of this part.

§ 30.505 Protection of Federal incumbents.

Prior to commencing operation, all operations in these bands must complete coordination with Federal Government links according to the coordination standards and procedures adopted in Report and Order, FCC 03–248, and as further detailed in subsequent implementation public notices issued consistent with that order.

§ 30.506 Priority Access Licenses.

(a) Applications for Priority Access Licenses must:

(1) Demonstrate the applicant's qualifications to hold an authorization;

(2) State how a grant would serve the public interest, convenience, and necessity;

(3) Contain all information required by FCC rules and application forms;

(4) Propose operation of a facility or facilities in compliance with all applicable rules; and

(5) Be amended as necessary to remain substantially accurate and complete in all significant respects, in accordance with the provisions of § 1.65 of this chapter.

(b) Devices used for Priority Access must register with a Spectrum Access System and comply with its instructions pursuant to § 30.508.

(c) Records pertaining to PALs, including applications and licenses, shall be maintained by the Commission in a publicly accessible system.

§ 30.507 General Access.

(a) Devices used for General Authorized Access must register with the Spectrum Access System and comply with its instructions.

(b) General Authorized Access Users shall be permitted to use frequencies assigned to Priority Access Licenses when such frequencies are not in use, as determined by the Spectrum Access System.

(c) Frequencies that are available for General Authorized Access Use shall be made available on a shared basis.

(d) General Authorized Access Users shall have no expectation of interference protection from other General Authorized Access Users operating in accordance with this part.

(e) General Authorized Access Users must not cause harmful interference to and must accept interference from

Priority Access Licensees and Grandfathered Registered Links in accordance with this part.

§ 30.508 Spectrum access system purposes and functionality.

The Spectrum Access System shall:

- (a) Enact and enforce all policies and procedures developed by the SAS Administrator.

- (b) Determine and provide to devices the permissible channels or frequencies at their location.

- (c) Determine and provide to devices the maximum permissible transmission power level at their location.

- (d) Register and authenticate the identification information and location of devices.

- (e) Ensure that devices protect Grandfathered Register Links from harmful interference.

- (f) Protect Priority Access Licensees from interference caused by other Priority Access Licenses and from General Authorized Access Users.

- (g) Resolve conflicting uses of the band while maintaining, as much as possible, a stable radio frequency environment.

- (h) Ensure secure and reliable transmission of information between the SAS and devices.

- (i) Protect Grandfathered Registered Links consistent with § 101.1529 of this chapter.

- (j) Implement the terms of applicable current and future international agreements.

§ 30.509 Registration, authentication, and authorization of devices.

- (a) A Spectrum Access System must register, authenticate, and authorize operations of devices consistent with this part.

- (b) Devices composed of a network of base and fixed stations may employ a subsystem for aggregating and communicating all required information exchanges between the SAS and devices.

- (c) A Spectrum Access System must also verify that the FCC identifier (FCC ID) of any device seeking access to its services is valid prior to authorizing it to begin providing service. A list of devices with valid FCC IDs and the FCC IDs of those devices is to be obtained

from the Commission's Equipment Authorization System.

PART 101—FIXED MICROWAVE SERVICES

■ 6. The authority citation for part 101 continues to read as follows:

Authority: 47 U.S.C. 154, 303.

■ 7. Add § 101.1529 to read as follows:

§ 101.529 Grandfathered operation and transition to upper microwave flexible use service.

Links registered with a third party database administrator on or before [insert effective date of rules] that are constructed, in service, and fully compliant with the rules in part 101, subpart Q as of [insert date one year after effective date of rules] will be afforded protection from harmful interference caused by Upper Microwave Flexible Use users until the end of their license term.

Part V

Bureau of Consumer Financial Protection

12 CFR Parts 1070 and 1091

Amendments Relating to Disclosure of Records and Information; Proposed Rule

BUREAU OF CONSUMER FINANCIAL PROTECTION**12 CFR Parts 1070 and 1091**

[Docket No. CFPB–2016–0039]

RIN 3170–AA63

Amendments Relating to Disclosure of Records and Information**AGENCY:** Bureau of Consumer Financial Protection.**ACTION:** Proposed rule with request for public comment.

SUMMARY: The Bureau of Consumer Financial Protection (Bureau) proposes amendments to the procedures used by the public to obtain information from the Bureau under the Freedom of Information Act, the Privacy Act of 1974, and in legal proceedings. The Bureau also proposes amendments to its rule regarding the confidential treatment of information obtained from persons in connection with the exercise of its authorities under Federal consumer financial law.

DATES: Comments must be received on or before October 24, 2016.

ADDRESSES: You may submit comments, identified by Docket No. CFPB–2016–0039 or RIN 3170–AA63, by any of the following methods:

Federal eRulemaking Portal: <http://www.regulations.gov>. Follow the instructions for submitting comments.

- *Email:* FederalRegisterComments@cfpb.gov. Include Docket No. CFPB–2016–0039 and/or RIN 3170–AA63 in the subject line of the email.

- *Mail:* Monica Jackson, Office of the Executive Secretary, Consumer Financial Protection Bureau, 1700 G Street NW., Washington, DC 20552.

- *Hand Delivery/Courier:* Monica Jackson, Office of the Executive Secretary, Consumer Financial Protection Bureau, 1275 First Street NE., Washington, DC 20002.

- *Instructions:* All submissions should include the agency name and docket number or Regulatory Information Number (RIN) for this rulemaking. Because paper mail in the Washington, DC area and at the Bureau is subject to delay, commenters are encouraged to submit comments electronically. In general, all comments received will be posted without change to <http://www.regulations.gov>. In addition, comments will be available for public inspection and copying at 1275 First Street NE., Washington, DC 20002, on official business days between the hours of 10 a.m. and 5 p.m. Eastern Time. You can make an appointment to inspect the documents by telephoning

(202) 435–7275. All comments, including attachments and other supporting materials, will become part of the public record and subject to public disclosure. Sensitive personal information, such as account numbers or Social Security numbers, should not be included. Comments generally will not be edited to remove any identifying or contact information.

FOR FURTHER INFORMATION CONTACT: David Snyder, Senior Counsel, Legal Division, 202–435–7758.

SUPPLEMENTARY INFORMATION:**I. Background**

On July 21, 2010, the President signed into law the Dodd–Frank Wall Street Reform and Consumer Protection Act (Pub. L. 111–203, codified at 12 U.S.C. 5301 *et seq.*) (Dodd–Frank Act). Title X of the Dodd–Frank Act created the Bureau. Pursuant to the provisions of the Dodd–Frank Act, the Bureau began to exercise its authority to regulate the offering and provision of consumer financial products and services under Federal consumer financial law on July 21, 2011.¹

In order to establish safeguards for protecting the confidentiality of information, as well as procedures for disclosing information as appropriate, the Bureau published an interim final rule on July 28, 2011, 76 FR 45371 (Jul. 28, 2011), followed by a final rule on February 15, 2013, 78 FR 11483 (Feb. 15, 2013). The Bureau now proposes to amend the rule to clarify, correct, and amend certain provisions based on its experience over the last several years. The Bureau solicits comments on all aspects of its proposal.

II. Summary of the Proposed Rule

The Bureau proposes revising all five subparts of part 1070. It seeks comment on all aspects of its proposed rule.

Subpart A of the rule consists largely of definitions of terms that are used throughout the remainder of the part. The Bureau proposes revising several of these definitions to clarify their intended meanings as well as Bureau practices.

Subpart B of the rule implements the Freedom of Information Act, 5 U.S.C. 552 (the FOIA). The Bureau proposes revising this subpart to clarify its practices, provide additional flexibility for requesters, and reflect recent changes made to the FOIA by the FOIA Improvement Act of 2016 (Pub. L. 114–

185). Additionally, these changes streamline the Bureau's process for assessing FOIA fees and notifying requesters of such fees. These changes will allow the Bureau to process FOIA requests more efficiently and provide records to requesters more quickly.

Subpart C of the rule (sometimes referred to as *Touhy* regulations) sets forth procedures for requests for information from the Bureau in connection with legal proceedings between others, and describes the Bureau's procedures for considering such requests or demands for official information. The Bureau proposes organizational and clarifying revisions to the provisions currently set forth in this subpart.

Subpart D of the rule pertains to the protection and disclosure of confidential information that the Bureau generates and receives during the course of its work. Various provisions of the Dodd–Frank Act require the Bureau to promulgate regulations providing for the confidentiality of certain types of information and protecting such information from public disclosure. The Bureau has sought to provide the maximum protection for confidential information, while ensuring its ability to share or disclose information to the extent necessary to achieve its mission. The Bureau has included detailed procedures in its rule in order to promote transparency regarding its practices and anticipated uses of confidential information.

The Bureau has sought to balance concerns regarding the need to protect confidential information, including sensitive personal information, business information, and confidential supervisory information, against the need to use and disclose certain information in the course of its work or, as appropriate, the work of other agencies with overlapping statutory or regulatory authority. The Bureau proposes amending subpart D to clarify, correct, and amend certain aspects of the rule based on its experience over the last several years.

In addition, in amending this subpart, the Bureau intends to codify its revised interpretation of 12 U.S.C. 5512(c)(6). The Bureau has previously interpreted 12 U.S.C. 5512(c)(6)(C)(ii), which discusses discretionary disclosure of confidential supervisory information to certain agencies with “jurisdiction,” to set forth a positive grant of authority that limits the Bureau's discretion to disclose confidential supervisory information under the rules authorized by 12 U.S.C. 5512(c)(6)(A). The Bureau now believes that the better interpretation of 12 U.S.C.

¹ Pursuant to section 1062 of the Dodd–Frank Act, 12 U.S.C. 5582, the Secretary of the Treasury designated July 21, 2011 as the “transfer date” on which various provisions of Title X of the Dodd–Frank Act became effective. 75 FR 57252.

5512(c)(6)(C)(ii), when read in context with 12 U.S.C. 5512(c)(6)(B) and 12 U.S.C. 5512(c)(6)(C)(i), is that it establishes part of an information-sharing regime with a limited set of other agencies. Aside from mandatory disclosure requirements in 12 U.S.C. 5512(c)(6)(C)(i), the regime does not limit the Bureau's discretion to draft rules related to the disclosure of confidential supervisory information. The Bureau proposes accounting for its revised interpretation in 12 CFR 1070.43(b)(1), which addresses the Bureau's discretionary disclosure of confidential information to other agencies. The Bureau's revised interpretation and proposed revision to § 1070.43 do not alter the Bureau's policy on disclosing confidential supervisory information to law enforcement agencies, as previously articulated in CFPB Bulletin 12–01 (Jan. 4, 2012).

Subpart E contains the Bureau's rule implementing the Privacy Act of 1974, 5 U.S.C. 552a. The Bureau proposes revising the subpart to clarify the Chief Privacy Officer's authority, to provide additional flexibility for requestors, and to make technical corrections.

III. Legal Authority

The Bureau is proposing this rule pursuant to its authority under the following statutory provisions: (1) Title X of the Dodd-Frank Act, 12 U.S.C. 5481 *et seq.*, including (a) Section 1022(b)(1), 12 U.S.C. 5512(b)(1), which allows the Bureau to “prescribe rules . . . as may be necessary and appropriate to enable the Bureau to administer and carry out the purposes and objectives of the Federal consumer financial laws”; (b) Section 1022(c)(6)(A), 12 U.S.C. 5512(c)(6)(A), which states that the Bureau “shall prescribe rules regarding the confidential treatment of information obtained from persons in connection with the exercise of its authorities under Federal consumer financial law”; and (c) Section 1052(d), 12 U.S.C. 5562(d), which instructs that “[d]ocumentary materials and tangible things received as a result of a civil investigative demand shall be subject to requirements and procedures regarding confidentiality, in accordance with rules established by the Bureau,” and addresses the disclosure of confidential information to Congress; (2) the Freedom of Information Act, 5 U.S.C. 552, which grants the public an enforceable right to obtain access to or copies of federal agency records unless disclosure of those records, or information contained within them, is exempt from disclosure due to one or more statutory exemptions and

exclusions; (3) the Privacy Act of 1974, 5 U.S.C. 552a, which provides individuals with certain privacy protections related to federal agencies' collection, maintenance, use, and disclosure of information about them; (4) the Right to Financial Privacy Act, 12 U.S.C. 3401 *et seq.*, which provides individuals with certain privacy protections related to the disclosure of financial records by financial institutions to federal agencies; (5) the Trade Secrets Act, 18 U.S.C. 1905, which provides certain protections related to proprietary information disclosed to federal agencies; (6) 18 U.S.C. 641, which prohibits the embezzlement, theft, purloining, knowing conversion, or unauthorized sale, conveyance, or disposal of a federal agency's record, voucher, money, or thing of value; (7) the Paperwork Reduction Act, 44 U.S.C. 3501 *et seq.*, which generally addresses information collections by federal agencies; and (8) the Federal Records Act, 44 U.S.C. 3101, which addresses the creation, maintenance, use, and disposition of federal records by federal agencies;

IV. Section-by-Section Analysis of the Proposed Rule

Part 1070—Disclosure of Records and Information

Subpart A—General Provisions and Definitions

Section 1070.2 General Definitions

Section 1070.2(a) Agency

The Bureau proposes adding a new definition, “agency,” which it will define to include “a Federal, State, or foreign governmental authority or an entity exercising governmental authority.” As currently drafted, § 1070.43 provides the Bureau with discretion to share confidential information with Federal or State agencies in certain circumstances. The proposed definition, combined with proposed revisions to §§ 1070.43 and 1070.45, will clarify the Bureau's ability to share confidential information with foreign regulators and certain entities that exercise governmental authority, such as registration and disciplinary organizations like state bar associations, and the procedures that should be used to do so. The Bureau may at times collaborate with such entities in the course of carrying out its authorities under Federal consumer financial laws. Proposed revisions to § 1070.47 would expand protections for confidential information disclosed under subpart D to include information shared with these additional entities. The Bureau

proposes additional technical corrections throughout the rule to account for use of this new term.²

Section 1070.2(b) Associate Director for Supervision, Enforcement and Fair Lending

The Bureau proposes adding a new definition for “Associate Director for Supervision, Enforcement and Fair Lending” in order to clarify the meaning of a term used in the current rule, as well as several times in the proposed revisions to the rule.

Section 1070.2(e) Civil Investigative Demand Material

Section 1070.2(e) defines the term “civil investigative demand material.” For purposes of clarity and efficiency, the Bureau proposes incorporating this definition into the definition of “confidential investigative information” in § 1070.2(j). Because the term “civil investigative demand material” only arises in the rule in § 1070.2(j), the separate definition is unnecessary.

Section 1070.2(g) Confidential Information

Section 1070.2(g) defines the term “confidential information.” Confidential information refers to three defined categories of non-public information—confidential consumer complaint information, confidential investigative information, and confidential supervisory information—as well as other Bureau information that is exempt from disclosure pursuant to one or more of the statutory exemptions to the FOIA.

Confidential information does not include information contained in records that have been made publicly available or otherwise publicly disclosed by the Bureau. The Bureau proposes revising the definition to clarify that such appropriate disclosures may be made by either Bureau employees or other authorized agents of the Bureau. An unauthorized disclosure of information would not affect the information's confidentiality.

In addition, the Bureau proposes revising the definition to clarify that confidential information disclosed to a third party in accordance with subpart D shall remain the Bureau's confidential information.

Section 1070.2(h) Confidential Consumer Complaint Information

Section 1070.2(h) defines the term “confidential consumer complaint information.” The Bureau proposes expanding the definition to include any

² The Bureau also proposes renumbering the definitions in § 1070.2 to account for the addition and subtraction of various definitions.

information received or generated by the Bureau through processes or procedures established under 12 U.S.C. 5493(b)(3). The Bureau has found that its Consumer Response system at times receives misdirected complaints for which it lacks authority to act, or complaints filed by companies rather than consumers. This revision will clarify that any complaints submitted to the Bureau through its Consumer Response system, and any information generated therein, are similarly classified under its confidentiality rules and subject to the same confidentiality protections. The revision does not alter the current text which limits confidential consumer complaint information to only include information that is exempt from disclosure pursuant to 5 U.S.C. 552(b).

Section 1070.2(i) Confidential Investigative Information

Section 1070.2(i) defines the term “confidential investigative information.” As discussed above with respect to § 1070.2(e), the Bureau proposes incorporating the definition of “civil investigative demand material” into § 1070.2(i). In addition, we propose revising the term to clarify that confidential investigative information includes any information obtained or generated in the course of Bureau enforcement activities, including general investigative activities that may not pertain to a specific institution. The Bureau also proposes replacing § 1070.2(i)(2)’s reference to “materials” with “documents, materials, or records” in order to parallel similar language in the definition of “confidential supervisory information” at § 1070.2(j)(2).

Section 1070.2(j) Confidential Supervisory Information

Section 1070.2(j) defines the term “confidential supervisory information.” The Bureau proposes revising § 1070.2(j)(1)(i) to clarify that the term includes supervisory letters and similar documents. Since adopting the current definition of “confidential supervisory information,” the Bureau has refined the formats it uses for summarizing and memorializing the results of an examination or other supervisory review of a supervised financial institution. The Bureau currently issues different types of documents, including examination reports and supervisory letters, to convey the results of its examinations and other supervisory reviews. These documents are the property of the Bureau and are provided to the supervised financial institution for its confidential use only.

In addition, the Bureau proposes revising § 1070.2(j)(1)(ii) to state that, in addition to “documents” prepared by, or on behalf of, or for the use of the Bureau or any other Federal, State, or foreign government agency in the exercise of its supervisory authority over a financial institution, confidential supervisory information also includes “materials[] or records” prepared by, or on behalf of, or for the use of the Bureau or any other Federal, State, or foreign government agency in the exercise of its supervisory authority over a financial institution. This revision is intended to clarify that any such physical materials can include confidential supervisory information, regardless of the format. Likewise, the Bureau proposes revising the definition to include information derived from such “materials[] or records.” We note that information “derived” from such documents, materials, or records could include either physical materials (such as other documents, materials, or records) or information known to individuals (such as oral testimony or interviews based on knowledge gleaned from the documents, materials, or records).

In addition, the Bureau proposes revising § 1070.2(j)(1)(iv) to delete the reference to information collected using the Bureau’s authority to monitor for risks to consumers in the offering or provision of consumer financial products or services under 12 U.S.C. 5512(c)(4) (sometimes referred to as the Bureau’s “market monitoring” authority). The Bureau believes that it is not necessary to classify such information as “confidential supervisory information” if it is not used for supervisory purposes. In accordance with the definition of “confidential information” in § 1070.2(g), market monitoring information will continue to be classified and protected as “confidential information” to the extent that it is exempt from disclosure pursuant to one or more of the statutory exemptions to the FOIA. For example, market monitoring information that contains confidential business information or personal information would generally be classified as confidential information because that information generally is exempt from disclosure under the FOIA exemptions (b)(4) or (b)(6), respectively. See 5 U.S.C. 552(b)(4) & (6). Such information would be subject to the same protections currently accorded to it, including the limitations on public disclosure and disclosures to other regulators.

In contrast, information collected for market monitoring purposes that is already publicly available generally

would not be classified as confidential information because such information generally would not be exempt from disclosure under the FOIA. Under the proposed revision, the Bureau would have more flexibility to use and disclose less-sensitive, non-confidential information as appropriate.

The Bureau proposes replacing the “market monitoring” reference in § 1070.2(j)(1)(iv) with new language stating that confidential supervisory information includes information obtained by the Bureau “for purposes of detecting and assessing risks to consumers and to markets for consumer financial products or services pursuant to 12 U.S.C. 5514(b)(1)(C), 5515(b)(1)(C), and 5516(b).” The purpose of this revision is to clarify that confidential supervisory information continues to include information obtained by the Bureau under its supervisory authorities at 12 U.S.C. 5514(b)(1)(C), 5515(b)(1)(C), and 5516(b). The Bureau has previously interpreted § 1070.2(j)(1)(iv) to address information obtained using these authorities as well as information obtained using its market monitoring authority. The revision is intended to retain the former, but exclude the latter.

Finally, the Bureau proposes deleting § 1070.2(i)(2), which currently states that confidential information does not include documents prepared by a supervised financial institution for its own business purposes and that the Bureau does not possess. This provision was intended to prevent any implication that a supervised financial institution’s copies of internal documents would be deemed to be confidential supervisory information on the grounds that those documents had been submitted to the Bureau in the course of a Bureau supervisory process. However, the Bureau believes that this interpretation already follows from the other provisions of the rule, including the definition of “confidential supervisory information,” and therefore this exception is unnecessary. Should a supervised financial institution submit copies of such documents to the Bureau in the course of a Bureau supervisory process, the copies of the documents in the Bureau’s possession would be Bureau confidential supervisory information. However, submission of those documents to the Bureau does not convert the copies of those documents that are in the possession of the financial institution into Bureau confidential information. The Bureau proposes renumbering § 1070.2(j) in light of this revision.

Section 1070.2(l) Employee

Section 1070.2(l) defines the term “employee”. The Bureau proposes revising the definition to clarify that, for purposes of this rule, Bureau “employees” include certain contract personnel and employees of the Bureau’s Inspector General.

Section 1070.3 Custodian of Records; Certification; Alternative Authority

Section 1070.3(b) Certification of Record

Section 1070.3(b) authorizes the Bureau’s Chief Operating Officer to certify the authenticity of any Bureau record or any copy of such record. The Bureau proposes revising the rule to clarify that the Chief Operating Officer can also certify the absence of a record. Such certification is contemplated in Rule 44 of the Federal Rules of Civil Procedure and Rule 902 of the Federal Rules of Evidence. *See also* Federal Rule of Evidence 803(10).

Section 1070.5 Service of Summonses and Complaints

Currently, § 1070.31 provides the process for serving the Bureau with summonses or complaints. The Bureau proposes moving the provision to a new section in subpart A for clarity in order to separate the rule governing service when the Bureau is a party from the remaining provisions in subpart C, which deal with requests for information for other proceedings. In addition, the Bureau proposes revising paragraph (d)’s requirement that documents be “stamped” “Service Accepted for Official Capacity Only” by replacing the word “stamped” with the word “marked.” This proposal would clarify that the documents may be labeled using a variety of methods.

Subpart B—Freedom of Information Act

Section 1070.11 Information Made Available; Discretionary Disclosures

Section 1070.11(a) In General

Section 1070.11(a)(2)

The Bureau proposes to remove the phrase “and copying” and replace it with “in an electronic format.” The Bureau proposes similar revisions to section 1070.13. These changes are required by the FOIA Improvement Act of 2016.

Section 1070.14 Requests for CFPB Records

Section 1070.14(b) Form of Request

Section 1070.14(b) specifies the form of FOIA requests. The current text distinguishes between requests made in writing and by electronic means. The

Bureau proposes a technical change to this provision. It proposes to remove the phrase “or by electronic means” and add “as follows:” in its place. The Bureau also proposes changes to sections 1070.14(b)(1) and (2) to clarify how requesters must submit FOIA requests to the Bureau. The Bureau proposes similar changes to the following sections: 1070.17(b)(1); 1070.21(c); and 1070.22(e)(1)(i).

Section 1070.14(c) Content of Request

Section 1070.14(c)(4)

Section 1070.14(c)(4) provides that a FOIA requester should indicate in the request whether the requester is a commercial user, an educational institution, non-commercial scientific institution, representative of the news media, governmental entity, or “other” requester, as those terms are defined in § 1070.22(b). The section also informs requesters that they may contact the Bureau’s FOIA Public Liaison to seek assistance in determining the appropriate fee category. The current language only permits the Bureau to use information provided to the FOIA Public Liaison by a requester for the purpose of determining the requester’s fee category. The Bureau proposes to remove this limitation so that it can use this information for other purposes, such as aiding a requester in clarifying the scope of a request, assisting in identifying records sought by a requester, and helping to resolve disputes related to a request.

Section 1070.14(c)(5)

Section 1070.14(c)(5) provides that if a requester seeks a waiver or reduction of fees associated with processing a request, then the request shall include a statement to that effect. The current language also includes a statement that any request that does not seek a waiver or reduction of fees constitutes an agreement of the requester to pay all fees up to \$25. The Bureau proposes to remove this language in light of other proposed fee related revisions. Under the Bureau’s proposed revisions to § 1070.22(d) and (f), FOIA requesters may still specify an upper limit on the fees that they are willing to pay to process a request and the Bureau will notify a requester of any potential fees beyond that limit before processing the request.

Section 1070.18 Responses To Requests for CFPB Records

Section 1070.18(a) Acknowledgement of Requests

Section 1070.18(a)(4)

Section 1070.18(a)(4) specifies what fee related information the Bureau will include in acknowledgement letters it sends to requesters. The Bureau proposes to make a technical change to this provision, removing the phrase “(of not less than \$25)” to account for the proposed revisions to fee-related provisions in § 1070.22(d) and (f).

Section 1070.18(b) Initial Determination To Grant or Deny a Request

Section 1070.18(b)(4)

The Bureau proposes to add a new provision at section 1070.18(b)(4)(iv) requiring it to inform requesters of the right to seek dispute resolution services from the Bureau’s FOIA Public Liaison or the Office of Government Information Services. The Bureau also proposes to renumber the existing provisions under section 1070.18(b)(4) to accommodate this change. This change is required by the FOIA Improvement Act of 2016.

Section 1070.18(c) Resolution of Disputes

The Bureau proposes a new paragraph to inform requesters about the resources available to resolve any disputes that may arise during the request process. These resources are the Bureau’s FOIA Public Liaison and mediation services provided by the National Archives and Records Administration (NARA), Office of Government Information Services (OGIS).

Section 1070.18(d) Format of Records Disclosed

The Bureau proposes a new paragraph to inform requesters that they may request records in a particular format. The Bureau will provide records in a requested format when the requested format can readily be reproduced from the original file.

Section 1070.20 Requests for Business Information Provided to the CFPB

Section 1070.20(f) Opportunity To Object to Disclosure

Section 1070.20(f) provides a submitter of business information with ten business days to object to the Bureau’s disclosure of the submitter’s business information. The Bureau proposes to make two technical changes to this provision clarifying that the Bureau will delay any release of

information to afford the submitter ten business days to object to the disclosure.

Section 1070.21 Administrative Appeals

Section 1070.21(b) Time Limits for Filing Administrative Appeals

Section 1070.21(b) provides the time limits for filing administrative appeals. The Bureau proposes to revise this provision to clarify that the time period for filing an appeal begins on the day after the date the initial determination is sent to the requester or the date of the letter transmitting the last records released, whichever is later. The Bureau also proposes to change the time limit for filing an administrative appeal from 45 days to 90 days. This change is required by the FOIA Improvement Act of 2016.

Section 1070.21(d) Processing of Administrative Appeals

Section 1070.21(d) specifies how the Bureau will process administrative appeals. The Bureau proposes to remove the requirement that appeals be stamped with the date of their receipt by the FOIA Office. The FOIA Office does not stamp an appeal with the date the Bureau received it, but the date is recorded in Bureau's system for tracking FOIA requests. This requirement is outmoded and the Bureau proposes to remove it to account for its current practice.

Section 1070.21(d) also currently provides that appeals will be processed in the order in which they are received. Since adopting this provision in 2011, the Bureau has found that it is not always practicable to complete action on appeals in the order in which they are received, and sometimes has chosen to act on a simple later-received appeal rather than delay action pending completion of a more complex earlier-received appeal. In order to better align the regulation with current practice, the Bureau is proposing to delete the provision calling for first-in-first-out processing of appeals.

Section 1070.21(e) Determinations To Grant or Deny Administrative Appeals

Section 1070.21(e) authorizes the General Counsel to decide administrative appeals, and § 1070.21(e)(3) currently allows for remand of a FOIA determination as one option for the General Counsel's disposition of an appeal. The Bureau proposes to amend the first sentence of § 1070.21(e) to add a reference to remands so that all options for disposition of appeals are listed in that sentence.

Section 1070.22 Fees for Processing Requests for CFPB Records

Section 1070.22(b) Categories of Requesters

Section 1070.22(b)(1)

Section 1070.22(b)(1)(i) defines the "Commercial user" category of requester. The Bureau proposes to amend this provision to clarify that the Bureau's decision to place a requester in the commercial user category will be made on a case-by-case basis based on how the requester will use the information. The Bureau proposes this change to clarify how it will make decisions whether to place a requester in the commercial user category.

Section 1070.22(b)(2)

Section 1070.22(b)(2) provides that the Bureau will notify a requester of its determination as to the proper fee category to apply to the requester. The current language of the provision provides that the Bureau will make its determination based on a review of the requester's submission and the Bureau's own records. The Bureau proposes to delete this limitation to clarify that it may base its determination on other appropriate information, including phone conversations with the requester and publicly available information.

Section 1070.22(d) Other Circumstances When Fees Are Not Charged

Section 1070.22(d)(2)

The Bureau proposes to insert a new paragraph at § 1070.22(d)(2); existing paragraphs in § 1070.22(d) will be renumbered to accommodate the new paragraph. Section 1070.22(d) provides certain circumstances where the Bureau may not charge a requester a fee for processing a FOIA request. The proposed new paragraph would provide that the Bureau will not charge a requester any fees when the fee, excluding duplication costs, is less than \$250. The Bureau proposes this change as part of its larger goal of revising the process for how it assesses FOIA processing fees and how the Bureau notifies requesters of such fees. This new provision would streamline the Bureau's process for assessing FOIA fees. This change would allow the Bureau to process FOIA requests more quickly and efficiently because the Bureau will no longer need to contact a FOIA requester concerning processing fees when the cost to process the request is less than \$250. As such, this provision would provide information to these requesters more quickly and at a reduced cost to the requesters.

Section 1070.22(d)(4)

The Bureau proposes to revise this provision to prohibit it from charging search fees, or in certain cases duplication fees, when the Bureau has failed to comply with time limits under § 1070.15 or § 1070.21, unless (1) unusual circumstances apply to the processing of the request; (2) the Bureau has provided timely written notice of the unusual circumstances to the requester; (3) more than 5,000 pages are necessary to respond to the request; and (4) the Bureau has discussed with the requester (or made three good-faith attempts to do so) how the requester could effectively limit the scope of the request. These changes are required by the FOIA Improvement Act of 2016.

Section 1070.22(e) Waiver or Reduction of Fees

Section 1070.22(e)(5)

Section 1070.22(e)(5) provides that the Bureau will decide whether to grant or deny a request to reduce or waive fees prior to processing the FOIA request and that the Bureau will notify the requester of such a determination in writing. The Bureau proposes to delete this requirement because it is unnecessary in light of other proposed fee related revisions. In many cases involving requests for fee waivers, the Bureau will be able to process the FOIA request without deciding the merits of the fee waiver request because the processing fees will be less than \$250. Furthermore, removing this requirement will allow the Bureau to process FOIA requests more efficiently and provide information to requesters more quickly. Under the Bureau's proposed revisions, the Bureau will notify a requester when it has denied a fee waiver request and processing the request would incur fees.

Section 1070.22(e)(6)

Section 1070.22(e)(6) specifies what information the Bureau will include in the letter it sends notifying the requester that the Bureau has denied a request for a waiver or reduction of fees. The Bureau proposes to make a technical change to this provision, removing the phrase "(of not less than \$25)" to account for other newly proposed fee related provisions.

Section 1070.22(f) Advance Notice and Prepayment of Fees

Section 1070.22(f) describes the Bureau's process for notifying a requester of any processing fees associated with a FOIA request. The Bureau proposes several changes to this provision to clarify and streamline its process for assessing FOIA processing

fees and for notifying requesters of such fees. First, the Bureau proposes to revise § 1070.22(f)(1) to provide that the Bureau will notify a requester of the estimated fees to process a FOIA request when the estimated fees are \$250 or more and the estimated fees exceed the limit set by the requester, the requester has not specified a limit, or the Bureau has denied a request for a reduction or waiver of fees. Next, the Bureau proposes to revise § 1070.22(f)(2) to raise the fee threshold above which a requester must pre-pay estimated processing fees from \$250 to \$1000. This change is necessary because of the Bureau's proposed change to § 1070.22(d): The Bureau proposes raising its current pre-payment threshold of \$250 because it will no longer charge fees for processing a request when the fees are \$250 or less. The Bureau's proposed revisions to § 1070.22(f) will require a requester to agree to pay processing fees before the Bureau begins processing the request. The Bureau believes that such an agreement will provide sufficient assurance of payment for fees less than \$1000. This change is in accordance with the Bureau's current practice for requiring pre-payment of fees. Furthermore, this change will allow the Bureau to process FOIA requests more efficiently and provide records to requesters more quickly.

Section 1070.23 Authority and Responsibilities of the Chief FOIA Officer

Section 1070.22(a) Chief FOIA Officer

Paragraph 1070.22(a) discusses the role of the Bureau's Chief FOIA Officer. The Bureau proposes insert two new subparagraphs to this paragraph. The first concerns the Chief FOIA Officer's responsibility to offer training to Bureau staff regarding their responsibilities under the FOIA and the second concerns the Chief FOIA Officer's role as the primary Bureau liaison with the Office of Government Information Services and the Department of Justice's Office of Information Policy. The Bureau also proposes to renumber the provisions in this section to accommodate these changes. These changes are required by the FOIA Improvement Act of 2016.

Subpart C—Disclosure of CFPB Information in Connection With Legal Proceedings

Subpart C addresses the disclosure of Bureau information in connection with legal proceedings. The Bureau proposes several technical corrections throughout the subpart.

Section 1070.30 Purpose and Scope; Definitions

Section 1070.30(a)

Section 1070.30(a) defines the circumstances for which the procedures outlined in subpart C apply. The Bureau proposes to delete paragraph (a)(1) from this provision and to renumber the section accordingly. The Bureau proposes this revision as a technical change to account for moving § 1070.31 to subpart A.

Section 1070.30(e)

Section 1070.30(e)(2)

Section 1070.30(e)(2) defines the term "legal proceeding" for subpart C. The Bureau proposes to add the phrase "their agents" to the last sentence of this provision to clarify that this definition applies to formal and informal requests made by both attorneys and their agents.

Section 1070.31 Service of Summonses and Complaints

Section 1070.31 provides the process for serving the Bureau with summonses or complaints. As discussed above, the Bureau proposes to delete § 1070.31 from subpart C and move it to a new section in subpart A, § 1070.5. The Bureau also proposes to renumber sections and cross-references in subpart C to account for this change. For additional information, see the discussion of § 1070.5.

Section 1070.31 Service of Subpoenas, Court Orders, and Other Demands for CFPB Information or Action

Section 1070.31(d)

Section 1070.31(d) provides that the Bureau is not authorized to accept on behalf of its employees any subpoenas, orders, or other demands or requests, which are not related to the employees' official duties. In addition, the current text of the provision implies that it is the Bureau's practice to accept such demands or requests "upon the express, written authorization of the individual CFPB employee to whom such demand or request is directed." The Bureau proposes to delete this part of the provision because it is not the general practice of the Bureau to accept service on behalf of individual employees. The Bureau further proposes deleting the paragraph's introductory caveat, "[e]xcept as otherwise provided in this subpart," because the subpart does not otherwise provide for the Bureau to act as an agent for service for subpoenas, orders, or other demands or requests that do not relate to employees' official conduct.

Section 1070.33 Procedure When Testimony or Production of Documents is Sought; General

Section 1070.33(b)

Section 1070.33(b) provides that the General Counsel may require a party seeking official information through testimony, CFPB records, or other material, to describe all reasonably foreseeable demands for such information. The Bureau proposes to make several technical changes to clarify this provision.

Subpart D—Confidential Information

Section 1070.41 Non-Disclosure of Confidential Information

Section 1070.41(b) Disclosures to Contractors and Consultants

Section 1070.41(b) provides that contractors and consultants in possession of confidential information must treat it in accordance with these rules, Federal laws and regulations that apply to Federal agencies for the protection of the confidentiality of personally identifiable information and for data security and integrity, as well as any additional conditions or limitations that the Bureau may impose. The current language includes a requirement that contractors and consultants certify in writing that they will follow this provision. The Bureau proposes replacing the certification requirement with an affirmative statement that contractors and consultants must follow this provision. The revision is intended to clarify that contractors and consultants are subject to § 1070.41(b)'s requirements irrespective of any affirmative certification. We note that this revision will in no way alter the Bureau's current practices related to requiring contractors and consultants to sign non-disclosure agreements, agree to protections in contracts, or take other appropriate steps to protect confidential information.

Section 1070.41(c) Disclosures of Materials Derived From Confidential Information

Section 1070.41(c) addresses the disclosure of materials derived from confidential information. It requires that, when the Bureau discloses such materials, they may not directly or indirectly identify any particular person to whom the confidential information pertains. The Bureau proposes replacing the phrase "[n]othing in this subpart shall limit the discretion of the CFPB" with "[t]he CFPB may . . ." in order to clarify that § 1070.41(c) authorizes such disclosure by the Bureau.

Section 1070.41(d) Disclosures of Confidential Information With Consent

The Bureau proposes a new paragraph that, where practicable, authorizes the Bureau to, upon receipt of prior consent, disclose confidential information that directly or indirectly identifies particular persons. The provision would require consent from all such persons to the extent that the identification constitutes confidential information, and any such disclosure would have to comply with applicable law. The Bureau believes that it may at times be useful to disclose such information in order to achieve its mission objectives. By conditioning disclosure on consent, affected persons' interests would be appropriately protected. This new provision is intended to serve as a distinct authority for disclosure, and it in no way impacts other methods of disclosure currently addressed in the Rule, such as in § 1070.43. The Bureau proposes renumbering the section to account for the new paragraph.

Section 1070.41(e) Nondisclosure of Confidential Information Provided to the CFPB by Other Agencies

Section 1070.41(e) provides that nothing in subpart D requires or authorizes the Bureau to disclose confidential information that it has received from other agencies where such disclosure would contravene applicable law or conflict with any agreement between the CFPB and the provider agency. The Bureau proposes replacing the word "disclosability" in the paragraph's title with "nondisclosure" in order to clarify that this provision protects the confidentiality of other agencies' confidential information. This revision would not make any substantive change to the provision.

Section 1070.42 Disclosure of Confidential Supervisory Information and Confidential Investigative Information to and by Financial Institutions and Their Affiliates

Section 1070.42 provides that the Bureau may, in its discretion, disclose confidential supervisory information concerning a supervised financial institution or its service providers to that supervised financial institution or its affiliates. In addition, § 1070.42 provides that, unless directed otherwise by the Bureau's Associate Director for Supervision, Enforcement, and Fair Lending or by his or her delegee, any supervised financial institution in possession of confidential supervisory information pursuant to this section may further disclose the information to

certain recipients and subject to certain conditions.

The Bureau proposes expanding the scope of § 1070.42 to address its enforcement activities in addition to its supervisory activities. This revision will lend clarity to the Bureau's disclosures in the enforcement context, and to the extent of financial institutions' discretion to further disclose confidential investigative information (such as civil investigative demands ("CIDs") or notice and opportunity to respond and advise ("NORA") letters). The resulting rule will provide that recipients of confidential investigative information have the same discretion with respect to disclosing confidential investigative information that they currently have with respect to confidential supervisory information. In addition, the proposal will establish a single process for such recipients to follow if they wish to further disclose confidential information obtained in the course of the Bureau's supervisory or enforcement activities. The proposed revisions will result in no substantive change to the Bureau's supervisory activities or supervised financial institutions' discretion to disclose confidential supervisory information, as currently articulated in the rule.

To achieve these ends, the Bureau proposes revising the section's title to read "Disclosure of confidential supervisory information and confidential investigative information." In addition, all references in the section to "confidential supervisory information" will be accompanied by the phrase "or confidential investigative information." Furthermore, references to any "supervised financial institution" will be replaced by a broader reference to any "person." "Supervised financial institutions" are a kind of "person," which is defined at § 1070.2. The Bureau proposes using this broader term because the recipients of confidential investigative information may not be supervised financial institutions, and at times some recipients, such as third-party recipients of civil investigative demands, may not be financial institutions. Finally, the Bureau proposes several non-substantive technical revisions for purposes of clarity.

The Bureau also proposes revising § 1070.42(a) to provide that, in addition to disclosing information concerning a person, its affiliates, or its service providers to that person or its affiliates, the Bureau may also disclose such information to its service providers. The Bureau proposes this change because such information may at times be

relevant to supervision or enforcement activities related to service providers.

In addition, the Bureau proposes revising § 1070.42(b)(2) to clarify that a person in possession of confidential supervisory information or confidential investigative information relating to that person may disclose such information to an insurance provider pursuant to a claim for coverage made by that person under an existing policy. Such disclosures may only be made if the Bureau has not precluded indemnification or reimbursement for the claim.

We note that this revised language only authorizes disclosure to the extent necessary for the insurance provider to process and administer the claim for coverage. Further distribution or use of the information is prohibited. These limitations do not foreclose an insurance provider from using information that has been publicly disclosed by the Bureau in making future underwriting determinations regarding the person or for other purposes—even if that information was originally submitted to the insurance provider as confidential information under this provision.

Finally, the Bureau proposes to remove references to the Associate Director for Supervision, Enforcement, and Fair Lending's delegee. Such reference is no longer necessary because the new definition of Associate Director for Supervision, Enforcement, and Fair Lending, located at § 1070.2(b), includes delegees.

Section 1070.43 Disclosure of Confidential Information to Agencies

Section 1070.43 sets forth the circumstances in which the Bureau may disclose confidential information to other government agencies. The Bureau proposes revising the section's title and subtitles to delete the references to "law enforcement agencies" and "government" agencies because the references are superfluous. Instead, the title and subtitles will reference "Agencies." Likewise, as discussed above with respect to § 1070.2(a), the Bureau proposes revisions throughout the section to account for the newly proposed defined term "Agency." The Bureau proposes various other non-substantive technical corrections.

Section 1070.43(b) Discretionary Disclosure of Confidential Information to Agencies**Section 1070.43(b)(1)**

Section 1070.43(b)(1) sets forth the standard under which the Bureau may disclose confidential information to

other agencies in its discretion. The current rule establishes two distinct standards for disclosing confidential supervisory information and other confidential information. It states that the Bureau may disclose confidential information to an agency “to the extent that the disclosure of the information is relevant to the exercise of the [Agency’s] statutory or regulatory authority.” However, the Bureau may only share confidential supervisory information with agencies “having jurisdiction over a supervised financial institution.” The Bureau proposes removing the separate standard for confidential supervisory information. This proposed change would align the two standards and provide the Bureau with discretion to disclose confidential supervisory information to another agency “to the extent that the disclosure of the information is relevant to the exercise of the [agency’s] statutory or regulatory authority,” as it may currently do with respect to other categories of confidential information.

This change is intended to facilitate communication and information-sharing among the Bureau and other governmental authorities. The Bureau has determined that sharing confidential supervisory information in situations where the disclosure of the information is relevant to the exercise of the receiving agency’s statutory or regulatory authority will facilitate the Bureau’s purposes and objectives. Multiple agencies engage in operations that have the potential to affect the offering and provision of consumer financial products and services, as well as the markets, industries, companies, and other persons relevant to the Bureau’s work. In addition, multiple agencies have interests and obligations relating to implementation, interpretation, and enforcement of the Dodd-Frank Act and the other Federal consumer financial law administered by the Bureau. The proposed change will assist the Bureau in implementing and administering Federal consumer financial law in a more consistent and effective fashion, and enable the Bureau to work together with other agencies having responsibilities related to consumer financial matters. The Bureau also believes that the proposed change would comport with the intent of the Dodd-Frank Act, since effective coordination and communication among agencies is essential in order for the regulatory framework established by that Act to work as Congress intended.

In the Bureau’s judgment, the current rule’s restrictions have proven overly cumbersome in application, pose unnecessary impediments to

cooperating with other agencies, and otherwise risk impairing the Bureau’s ability to fulfill its statutory duties. Unnecessary impediments to information-sharing in such circumstances impede supervisory and enforcement coordination and create opportunities for potential conflict, inefficiency, and duplication of efforts across agencies. The Bureau believes that retaining discretion to share confidential supervisory information in such situations would better promote the Bureau’s mission and overall effectiveness.

This proposal would codify the Bureau’s revised interpretation of 12 U.S.C. 5512(c)(6). 12 U.S.C. 5512(c)(6) has three subparagraphs. 12 U.S.C. 5512(c)(6)(A) directs the Bureau to “prescribe rules regarding the confidential treatment of information obtained from persons in connection with the exercise of its authorities under Federal consumer financial law.” 12 U.S.C. 5512(c)(6)(B) addresses disclosure of confidential supervisory information to the Bureau by certain agencies: Subparagraph (B)(i) requires that the Bureau “shall have access” to reports of examination or financial condition by “a prudential regulator or other Federal agency having jurisdiction over a covered person or service provider,” and subparagraph (B)(ii) provides that the same agencies “may, in [their] discretion, furnish to the Bureau any other report or other confidential supervisory information concerning any [entity] examined by such agency” Meanwhile, 12 U.S.C. 5512(c)(6)(C) addresses disclosure of confidential supervisory information by the Bureau to certain agencies: Subparagraph (C)(i) requires that “a prudential regulator, a State regulator, or any other Federal agency having jurisdiction over a covered person or service provider shall have access to any report of examination made by the Bureau with respect to such person” and subparagraph (C)(ii) provides that the Bureau “may, in its discretion, furnish to a prudential regulator or other agency having jurisdiction over a covered person or service provider any other report or other confidential supervisory information concerning such person examined by the Bureau”

The Bureau had previously interpreted 12 U.S.C. 5512(c)(6)(C)(ii) to set forth a positive grant of authority that limits the Bureau’s discretion to disclose confidential supervisory information under the rules authorized by 12 U.S.C. 5512(c)(6)(A). By only providing for the discretion to disclose confidential supervisory information to

“prudential regulator[s] or other agenc[ies] having jurisdiction,” it was assumed that the provision prohibited disclosure by the Bureau to agencies that lack “jurisdiction.” The Bureau articulated this interpretation in the interim final rule and the final rule that established this subpart. *See* 76 FR 45372, 45373–75 (Jul. 28, 2011); 78 FR 11484, 11496 (Feb. 15, 2013).

12 U.S.C. 5512(c)(6)’s framework—providing the Bureau with broad discretion to draft confidentiality rules, followed by instructions related to the exchange of confidential supervisory information with certain agencies—is ambiguous. *See generally Adirondack Medical Center et al. v. Sebelius*, 740 F.3d 692 (D.C. Cir. 2014). The juxtaposition implies that the provisions relate to each other, but their terms leave the precise relationship unclear, resulting in more than one plausible interpretation. The Bureau’s previous interpretation was reasonable, but the Bureau believes that an alternative interpretation is more reasonable.

12 U.S.C. 5512(c)(6)(A) provides the Bureau with broad discretion to draft rules regarding the confidential treatment of information. We think the better view is that Congress did not intend 12 U.S.C. 5512(c)(6)(C)(ii) to restrict that discretion. The language in subparagraph (C)(ii) is permissive—it says “the Bureau may, in its discretion” disclose confidential supervisory information to certain agencies. Notably, Congress did not include any restrictive language, such as “the Bureau may only” make certain disclosures. Understanding subparagraph (C)(ii) as a limit to the Bureau’s discretion requires, essentially, reading the word “only” into text where it does not exist. We find this interpretation strained, as “Congress generally knows how to use the word ‘only’ when drafting laws.” *Adirondack Medical Center*, 740 F.3d at 697.

Furthermore, 12 U.S.C. 5512(c)(6)(C)(ii) contrasts with 12 U.S.C. 5562(d)(2), where Congress clearly and unambiguously restricted the Bureau’s discretion in drafting these same confidentiality rules by stating that “[n]o rule . . . shall be intended to prevent disclosure [to Congress].” The difference between the permissive language used in 12 U.S.C. 5512(c)(6)(C)(ii) and the restrictive language used in 12 U.S.C. 5562(d)(2) indicates that Congress intended the two provisions to act in different ways.

We also think that the presence of subparagraphs (B)(i), (B)(ii), and (C)(i) in 12 U.S.C. 5512(c)(6) demonstrate that subparagraph (C)(ii) could serve a purpose other than limiting

subparagraph (A). Although subparagraph (C)(ii), in isolation, could perhaps be read as a limiting principle, statutory provisions should be read in context. *See, e.g., Food & Drug Admin. v. Brown & Williamson Tobacco Corp.*, 529 U.S. 120, 132–33 (2000) (“The meaning—or ambiguity—of certain words or phrases may only become evident when placed in context.”). That subparagraph (B) closely tracks the word-choice and structure of subparagraph (C) shows that they could and should be read in relation to each other. But by addressing the receipt, and not the disclosure, of confidential supervisory information, subparagraph (B) is substantively irrelevant to the Bureau’s confidentiality rules; its inclusion indicates that the provisions can serve a purpose other than to restrict the Bureau’s discretion in drafting its rule.

The Bureau believes that subparagraphs (B) and (C) can reasonably be read to establish an information-sharing regime with a limited set of agencies. The purpose of subparagraphs (B)(ii) and (C)(ii) is to contrast and limit the mandatory disclosures in subparagraphs (B)(i) and (C)(i), respectively. Whereas subparagraph (B)(i) requires a set of agencies (prudential regulators and Federal agencies having jurisdiction) to provide reports of examination or financial condition to the Bureau, subparagraph (B)(ii) clarifies that those same agencies have discretion with respect to disclosing other reports or other confidential supervisory information. Likewise, whereas subparagraph (C)(i) requires the Bureau to disclose reports of examination to prudential regulators, state regulators, and Federal regulators having jurisdiction, subparagraph (C)(ii) clarifies that disclosure of other reports and other confidential supervisory information to prudential regulators and other agencies is discretionary. The phrase “other report and other confidential supervisory information” clarifies, contrasts and narrows the reference to “report of examination” in subparagraph (C)(i).

The Bureau has already addressed subparagraph (C)(i)’s mandatory disclosures in the confidentiality rules at § 1070.43(a), and this paragraph remains unchanged. The Bureau’s proposed revision to § 1070.43(b)(1) will include 12 U.S.C. 5512(c)(6)(C)(ii)’s discretionary disclosures of confidential supervisory information, and it will allow for additional disclosures to agencies that do not “hav[e] jurisdiction,” so long as such disclosure is “relevant to the exercise of the

[agency’s] statutory or regulatory authority.” 12 U.S.C. 5512(c)(6)(A)’s broad grant of authority to draft confidentiality rules provides the Bureau sufficient discretion to make this change.

Please note that the Bureau’s policy regarding the disclosure of confidential supervisory information to law enforcement agencies, which we previously articulated in CFPB Bulletin 12–01 (Jan. 4, 2012), remains in place. The Bureau’s revised interpretation of 12 U.S.C. 5512(c)(6) and its proposed revision to § 1070.43(b)(1) do not alter CFPB Bulletin 12–01.

Section 1070.43(b)(2)

Section 1070.43(b)(2) sets forth a process for agencies to submit written requests (sometimes referred to as “access requests”) to the Bureau in order to obtain access to its confidential information pursuant to § 1070.43(b). Whereas the section currently requires submission of access requests to the General Counsel, the Bureau proposes to instead require submission to the Associate Director for Supervision, Enforcement, and Fair Lending. The Bureau believes that this change would lead to increased efficiency because the vast majority of access requests submitted to the Bureau pertain to work conducted by its Division of Supervision, Enforcement, and Fair Lending. The Associate Director for Supervision, Enforcement, and Fair Lending will continue to consult with other Bureau stakeholders, including the Legal Division, as necessary. The Bureau also proposes that access requests be emailed to a single email address, accessrequests@cfpb.gov, or to the Bureau’s mailing address at 1700 G Street NW., Washington, DC 20552, in order to facilitate processing. In making these changes, the authority to act upon access requests would shift from the Legal Division to other Bureau staff with expertise more directly related to processing these requests.

In addition, for purposes of clarity, the Bureau proposes revising § 1070.43(b)(2)(iii) to state that, among other things, access requests must include a statement certifying and identifying the agency’s “statutory or regulatory authority that is relevant to the requested information, as required by paragraph (b)(1).” We have found in our experience that the current formulation (the agency must certify or identify its “authority for requesting the documents”) can lead to confusion.

Section 1070.43(c) State Requests for Information Other Than Confidential Information

Section 1070.43(c) states that state agency requests for information other than confidential information are not to be made and considered under § 1070.43. The Bureau proposes deleting this paragraph because it is unnecessary and can lead to confusion. Because, by its own terms, § 1070.43 only applies to confidential information, there is no need to state that it does not apply to information that is not confidential.

Section 1070.44 Disclosure of Confidential Consumer Complaint Information

Section 1070.44 addresses the Bureau’s disclosure of confidential consumer complaint information in the course of investigating, resolving, or otherwise responding to consumer complaints. The Bureau proposes replacing the phrase “[n]othing in this subpart shall limit the discretion of the CFPB” with “[t]he CFPB may” This revision is intended to clarify that § 1070.44 authorizes such disclosure by the Bureau. The Bureau also proposes replacing the phrase “concerning financial institutions or consumer financial products and services” with “concerning consumer financial products and services or a violation of Federal consumer financial law” in order to clarify that the section broadly addresses any information received or generated by the Bureau through processes or procedures established under 12 U.S.C. 5493(b)(3), including where complaints do not concern financial institutions, or where the Bureau lacks authority to act on them.

Section 1070.45 Affirmative Disclosure of Confidential Information

Section 1070.45 addresses various instances where the Bureau may make disclosures of confidential information on its own initiative. The Bureau proposes several revisions to clarify, supplement, or amend the disclosures currently addressed in the section. Any disclosures made pursuant to this section must be made in accordance with applicable law.

The Bureau proposes deleting the reference in § 1070.45(a) to “confidential investigative information” in the phrase “confidential investigative information or other confidential information.” Because confidential investigative information is a subcategory of confidential information, and § 1070.45(a) already addresses confidential information generally, the separate reference to confidential

investigative information is unnecessary. Nevertheless, while the Bureau may disclose any category of confidential information under § 1070.45(a), disclosures made under this section—particularly paragraphs (a)(3), (a)(4), and (a)(5)—are more likely to involve confidential investigative information, rather than other categories of confidential information, such as confidential supervisory information.

Subparagraph (a)(2) addresses disclosure of confidential information to either House of the Congress, or to an appropriate committee or subcommittee of the Congress, as set forth in 12 U.S.C. 5562(d)(2). The current text states that, upon receipt of a request from the Congress for confidential information that a financial institution submitted to the Bureau along with a claim that such information consists of trade secret or privileged or confidential commercial or financial information, or confidential supervisory information, the Bureau “shall notify” the financial institution in writing of its receipt of the request and provide the institution with a copy of the request. The Bureau proposes revising the text to state that it “may notify” the financial institution in such circumstances. This revision will provide greater flexibility and more closely align with 12 U.S.C. 5562(d)(2), which states that the Bureau “is permitted to adopt rules allowing prior notice to any party that owns or otherwise provided the material to the Bureau and had designated such material as confidential.”

Subparagraph (a)(3) pertains to the disclosure of confidential information in “investigational hearings and witness interviews, as is reasonably necessary, at the discretion of the CFPB.” This paragraph was initially intended to address disclosure in the course of investigations and enforcement actions. *See* 76 FR 45372, 45375 (Jul. 28, 2011). The Bureau proposes revising the paragraph to state that it may disclose confidential information in “investigational hearings and witness interviews, or otherwise in the investigation and administration of enforcement actions, as is reasonably necessary, at the discretion of the CFPB.” This revision clarifies that the Bureau may disclose confidential information in its discretion to conduct its investigations or perform administrative tasks to further its own enforcement actions. This includes, for example, disclosures to expert witnesses, service process servers, or other federal and state agencies that may provide assistance with space for investigational hearings or advise the

Bureau on local rules regarding a court filing.

Subparagraph (a)(4) authorizes the disclosure of confidential information “[i]n an administrative or court proceeding to which the CFPB is a party.” The Bureau proposes revising this paragraph to state that it may disclose confidential information “[i]n or related to an administrative or court proceeding to which the Bureau is a party.” This revision clarifies that the Bureau may disclose confidential information not only during an administrative or court proceeding to which the Bureau is a party, such as in complaints and consent orders, but also when related to the Bureau’s implementation of ongoing administrative or court orders. Such disclosures may be made in furtherance of the Bureau’s reporting requirements and include, for example, updates on required consumer remuneration and the payment of civil money penalties.

Subparagraph (a)(4) also enables the submitter of such information to seek a protective or other order prior to such disclosure. For clarity, the Bureau proposes replacing the phrase “confidential investigatory materials” with “confidential investigative information,” a defined term used throughout the rule. Likewise, the Bureau proposes replacing the reference to “appropriate protective or in camera order” with “appropriate order,” which would encompass both examples in the current version. Finally, the Bureau proposes revising the rule to also allow the Bureau to seek an appropriate order in its discretion. Whereas the current text only discusses the submitter seeking such an order, there may be times where it would be more efficient or appropriate for the Bureau itself to make such a request.

Subparagraph (a)(5) addresses disclosure to other agencies of confidential information in summary form to notify them about potential violations of law subject to their jurisdiction. The purpose of this provision is to allow the Bureau to inform agencies about potential legal violations in which they may have an interest, including situations in which they may wish to submit a request for information under § 1070.43. The Bureau proposes revising this paragraph to authorize disclosure to “Agencies in summary form to the extent necessary to confer with such Agencies about matters relevant to the exercise of the Agencies’ statutory or regulatory authority.” This revision would clarify the paragraph’s intended purpose and more closely align with the standard used for

disclosing confidential information to agencies under § 1070.43.

Finally, the Bureau proposes a new subparagraph that states that the Bureau may disclose confidential information in “CFPB personnel matters, as necessary and subject to appropriate protections.” This revision is intended to clarify that confidential information may at times be disclosed in the course of equal employment opportunity matters, grievance proceedings, and other personnel matters. Any such disclosures would only be made as necessary, in accordance with applicable law, and subject to appropriate protections. The Bureau proposes re-numbering § 1070.45 to account for this new paragraph.

Section 1070.47 Other Rules Regarding the Disclosure of Confidential Information

The Bureau proposes reorganizing § 1070.47 for clarity. Specifically, it proposes moving subparagraph 1070.47(a)(5) to immediately after subparagraph 1070.47(a)(2). The Bureau proposes this change because the two subparagraphs both address further disclosure by the recipient of confidential information. The Bureau further proposes making subparagraph 1070.47(a)(3), which addresses third-party requests for information, a new paragraph titled “Third party requests for information.” This revision will highlight the provision and lead to better ease of use. Finally, the Bureau proposes re-numbering the section to account for these changes.

Section 1070.47(a) Further Disclosure Prohibited

Section 1070.47(a) describes certain steps that recipients of confidential information under subpart D must take to protect the information. It notes that confidential information disclosed under this subpart remains Bureau property, it prohibits further disclosure of confidential information without the Bureau’s prior written permission, and it sets forth procedures to follow in the event that a recipient of confidential information receives from a third party a legally enforceable demand for the information.

Consistent with proposed revisions to § 1070.43(b), the Bureau proposes shifting from its General Counsel to the Associate Director for Supervision, Enforcement, and Fair Lending the authority in subparagraph (a)(1) to provide in writing that confidential information is no longer Bureau property, and the authority in subparagraph (a)(2) to provide written permission to further disclose

confidential information. The Bureau believes that this change would lead to increased efficiency because the vast majority of access requests submitted to the Bureau pertain to work conducted by its Division of Supervision, Enforcement, and Fair Lending. The General Counsel's authority with respect to legally enforceable demands or requests for confidential information, described in subparagraph (a)(3), will remain with the General Counsel. Finally, as discussed above with respect to § 1070.2(a), the Bureau proposes revisions to account for the newly proposed defined term "agency."

Section 1070.47(d) Return or Destruction of Records

The Bureau proposes adding a new paragraph (d) to clarify that the Bureau may require any person in possession of confidential information to return the records to the Bureau or destroy them.

Section 1070.47(e) Non-Waiver of CFPB Rights

The Bureau proposes adding a new paragraph (e) to clarify that the Bureau's disclosure of confidential information under subpart D does not waive the Bureau's right to control, or impose limitations on, the subsequent use and dissemination of its confidential information.

Section 1070.47(f) Non-Waiver of Privilege

The Bureau proposes moving the former paragraph (c), *Non-waiver*, to a new paragraph (f), and making corresponding technical corrections to subparagraph (f)(2), in order to account for the two newly proposed paragraphs described above. In addition, the Bureau proposes replacing the title "Non-waiver" with a new title "Non-waiver of privilege" so as to clarify the distinction between this paragraph and the newly proposed paragraph (e), *Non-waiver of CFPB rights*. As discussed previously in the preamble to the Bureau's final rule, Confidential Treatment of Privileged Information, 77 FR 39671 (Jul 5, 2012), this provision applies to situations where the Bureau transfers information to, or permits information to be used by, agencies.

Section 1070.47(g) Reports of Unauthorized Disclosure

The Bureau proposes adding a new paragraph (g) to require any persons in possession of confidential information to immediately notify the Bureau upon discovery of any disclosures of confidential information made in violation of subpart D.

Section 1070.48 Privileges Not Affected by Disclosure to the CFPB

Section 1070.48 provides that the submission by any person of any information to the Bureau in the course of the Bureau's supervisory or regulatory processes will not waive or otherwise affect any privilege such person may claim with respect to such information under Federal or State law as to any other person or entity. This section was promulgated separately from the rest of this rule in a final rule, Confidential Treatment of Privileged Information, 77 FR 39617 (Jul. 5, 2012). Congress subsequently enacted Public Law 112-215, 126 Stat. 1589, Dec. 20, 2012, which amended 12 U.S.C. 1828(x) to provide these same protections to privileged information submitted to the Bureau. Because 12 U.S.C. 1828(x), as revised, provides the exact same protections as § 1070.48, it renders § 1070.48 superfluous and unnecessary going forward. To avoid confusion, the Bureau proposes deleting the current text of § 1070.48.

Section 1070.48 Disclosure of Confidential Information by the Inspector General

The Bureau proposes adding a new section to clarify that part 1070 does not limit the discretion of its Inspector General's office to disclose confidential information as needed in fulfilling its responsibilities under the Inspector General Act of 1978, 5 U.S.C. App. 3. Because the Bureau proposes deleting the current text of § 1070.48, this new section would replace that text.

Subpart E—The Privacy Act

Section 1070.51 Authority and Responsibilities of the Chief Privacy Officer

Section 1070.51 specifies the authority and responsibilities of the Bureau's Chief Privacy Officer. The Bureau proposes to add a new paragraph at § 1070.51(a) authorizing the Chief Privacy Officer to "[d]evelop, implement, and maintain an organization-wide privacy program" and to renumber the other paragraphs in § 1070.51 to reflect this change. This change is in accordance with National Institute of Standards and Technology (NIST) Special Publication 800-53 Revision 4, which provides that agencies should "[appoint] a Senior Agency Official for Privacy (SAOP)/Chief Privacy Officer (CPO) accountable for developing, implementing, and maintaining an organization-wide governance and privacy program to ensure compliance with all applicable laws and regulations regarding the

collection, use, maintenance, sharing, and disposal of personally identifiable information (PII) by programs and information systems" The Bureau proposes this change to clarify the authority of its Chief Privacy Officer.

Section 1070.53 Request for Access to Records

Section 1070.53(a) Procedures for Making a Request for Access to records

Section 1070.53(a) specifies the procedures for making Privacy Act requests for records. The current text distinguishes between requests made in writing and by electronic means. The Bureau proposes a technical change to this provision. It proposes to remove the phrase "or by electronic means" and add "as follows:" in its place. The Bureau also proposes changes to section 1070.53(a)(1) to clarify how requesters must submit Privacy Act requests to the Bureau. The Bureau proposes similar changes to sections 1070.56(a) and 1070.58(b).

Section 1070.56 Request for Amendment of Records

Section 1070.56(a) Procedures for Making Request

Section 1070.56(a)(2)(i)

Section 1070.56(a)(2)(i) provides that an individual requesting an amendment of a record must identify the system of records containing the record. The Bureau proposes to revise this provision to allow an individual to provide a description of the record in sufficient detail to allow Bureau personnel to locate the system of records containing the record. This revision would provide a requester with more flexibility in the event that the requester does not know the precise name of the applicable system of records. Furthermore, this change is consistent with § 1070.53(b)(2), which specifies requirements for requests for access to records.

Section 1070.61 Training; Rules of Conduct; Penalties for Non-Compliance

Section 1070.61 addresses, among other things, the CFPB's obligations to conduct privacy-related training and establish rules of conduct related to privacy. The Bureau proposes to replace references to "employees of Government contractors" with the term "contract personnel" to avoid confusion with respect to § 1070.2(l), which defines the term "employee."

Part 1091—Procedural Rule To Establish Supervisory Authority Over Certain Nonbank Covered Persons Based on Risk Determination

Section 1091.103 Contents of Notice

The Bureau proposes to revise subparagraph 1091.103(a)(2)(vii) to remove the cross-reference to § 1070.2(i)(1) and replace it with the appropriate cross-reference to § 1070.2(j).

Section 1091.115 Change of Time Limits and Confidentiality of Proceedings

The Bureau proposes to revise paragraph 1091.115(c) to remove the cross-reference to § 1070.2(i)(1) and replace it with the appropriate cross-reference to § 1070.2(j).

V. Section 1022(b)(2)(A) of the Dodd-Frank Act

In developing this proposed rule, the Bureau has considered the potential benefits, costs, and impacts required by section 1022(b)(2)(A) of the Dodd-Frank Act. The Bureau has consulted, or offered to consult with, the prudential regulators and the Federal Trade Commission including consultation regarding consistency with any prudential, market, or systemic objectives administered by such agencies.³

The Bureau has chosen to consider the benefits, costs, and impacts of the proposed provisions as compared to the status quo: The current statutory provisions and the regulations as set forth by the Bureau on February 15, 2013, 78 FR 11483 (Feb. 15, 2013) (which includes the protections for privileged information which Congress enacted in Public Law 112–215, 126 Stat. 1589, Dec. 20, 2012, which amended 12 U.S.C. 1828(x)).⁴ At this time, the Bureau does not have data with which to quantify the benefits or costs of the proposed rule.

In this analysis, the Bureau focuses on the benefits, costs, and impacts of the

main aspects of the proposed rule. The proposed changes to the definitions in subpart A would alter the treatment of certain information submitted to the Bureau. The revised definition of confidential consumer complaint information would now include any information received or generated by the CFPB through processes or procedures established under 12 U.S.C. 5493(b)(3), clarifying that any complaints submitted to the CFPB through its Consumer Response system, and any information generated therein, are similarly classified under its confidentiality rules and subject to the same confidentiality protections. The revised definition of confidential supervisory information will no longer include reference to information collected using the Bureau's market monitoring authority.

The proposed changes in subpart D would alter the rules concerning the disclosure of confidential investigative information to and by financial institutions and their affiliates by lending clarity to the Bureau's disclosures of confidential investigative information in the enforcement context; providing that recipients of confidential investigative information have the same discretion with respect to disclosing confidential investigative information that they currently have with respect to confidential supervisory information; providing that, in addition to disclosing information concerning a person, its affiliates, or its service providers to that person or its affiliates, the Bureau may also disclose such information to its service providers; and providing that a person lawfully in possession of confidential supervisory information or confidential investigative information provided directly to it by the Bureau pursuant to § 1070.42 may disclose the information to an insurance provider to the extent necessary for the insurance provider to process and administer any claims for coverage.

The proposed changes also alter the rules concerning the sharing of confidential supervisory information between the Bureau and other agencies by providing the Bureau with discretion to disclose confidential supervisory information to another agency “to the extent that the disclosure of the information is relevant to the exercise of the [agency's] statutory or regulatory authority,” rather than to another agency “having jurisdiction over a supervised financial institution.”

Lastly, the proposed rule would authorize the Bureau, upon receipt of prior consent, to disclose confidential information that directly or indirectly identifies particular persons. The proposed rule also includes

clarifications that the Bureau may disclose confidential information in its discretion as needed to conduct its investigations or perform administrative tasks to further its own enforcement actions; and, that the Bureau may disclose confidential information not only during an administrative or court proceeding to which the Bureau is a party, such as in complaints and consent orders, but also when related to the Bureau's implementation of ongoing administrative or court orders.

The Bureau views the remainder to the proposed rule to mainly include clarifications, corrections and technical changes.

The proposed revisions to the definition of confidential consumer complaint information would provide benefits for consumers and covered persons. Specifically, the expansion of the definition of confidential consumer complaint information should afford greater protections to consumers submitting, and covered persons referenced by, any misdirected complaints that the Bureau receives and that are now covered under the definition.

The change to the definition of confidential supervisory information and the proposed changes regarding information sharing would also benefit consumer and covered persons. Removing market monitoring information that contains confidential business information or personal information from the definition would have limited effect since such information would be subject to the same protections currently accorded to it, including the limitations on public disclosures and disclosures to other regulators. In contrast, the Bureau would have more flexibility to use and disclose less sensitive, non-confidential information collected for market monitoring purposes such as data that are already publicly available. The lesser burden should allow the Bureau to implement and administer Federal consumer financial law more efficiently.

Regarding the proposed provisions related to sharing information, consumers would benefit, to the extent that each of these changes allows more efficient sharing of confidential information between the CFPB and various parties and thus also results in more efficient administration of consumer financial laws. Covered persons would benefit, to the extent that the efficiencies embodied in these changes reduce costs either by altering and simplifying the covered person's obligations or by allowing for more efficient sharing among regulators that interact with the covered person. For

³ Section 1022(b)(2)(A) of the Dodd-Frank Act addresses the consideration of the potential benefits and costs of regulation to consumers and covered persons, including the potential reduction of access by consumers to consumer financial products or services; the impact on depository institutions and credit unions with \$10 billion or less in total assets as described in section 1026 of the Dodd-Frank Act; and the impact on consumers in rural areas. Section 1022(b)(2)(B) directs the Bureau to consult, before and during the rulemaking, with appropriate prudential regulators or other Federal agencies, regarding consistency with objectives those agencies administer.

⁴ The Bureau has discretion in any rulemaking to choose an appropriate scope of analysis with respect to potential benefits and costs and an appropriate baseline.

example, the creation of one standard for how covered persons can share confidential supervisory information and confidential investigative information would lower the internal costs at these firms.

The changes in the sharing provisions of the rule may entail certain costs to covered persons. The broader sharing of information provided for in the proposed rule has an increased risk for a loss of confidentiality. However, as noted above, the Bureau has sought to provide the maximum protection for confidential information, while ensuring its ability to share or disclose information to the extent necessary to achieve its mission. The Bureau will continue to appropriately protect sensitive information. Further, as noted in the original 2013 rule, increased sharing of information under the proposed rule may increase the volume and costs of litigation or regulatory action for covered persons whose information the Bureau will share with other agencies, and which such agencies may use as bases for administrative or judicial actions against covered persons. To the extent that such costs occur, the Bureau believes that in most cases these costs would be associated with concomitant benefits to consumers from the prevention or remedy of harms associated with violations of law by covered persons.

The CFPB does not expect that the proposed rule would have an appreciable impact on consumers' access to consumer financial products or services. The scope of the rulemaking is limited to matters related to access to and disclosure of certain types of information, and does not relate to credit access.

The Bureau does not believe that this proposed rule would have a unique impact on insured depository institutions or insured credit unions with less than \$10 billion in assets as described in section 1026(a) of the Dodd-Frank Act. Since such institutions are not supervised by the Bureau, they are generally less likely to share information with the Bureau and therefore any impacts of the rule from the provisions on supervisory information may indeed be less compared to other institutions.

The Bureau also does not believe that this proposed rule would have a unique impact on consumers in rural areas. To the extent that these consumers may use smaller financial service providers not supervised by the Bureau, and therefore less likely to share information with the Bureau, the impacts of the rule from the provisions on supervisory information

for these consumers may indeed be less than for other consumers.

VI. Procedural Requirements

The Regulatory Flexibility Act, 5 U.S.C. 601 *et seq.*, as amended by the Small Business Regulatory Enforcement Fairness Act of 1996 (the RFA), requires each agency to consider the potential impact of its regulations on small entities, including small businesses, small governmental units, and small not-for-profit organizations, unless the head of the agency certifies that the rule will not have a significant economic impact on a substantial number of small entities. The undersigned so certifies. The rule does not impose any obligations or standards of conduct for purposes of analysis under the RFA, and it therefore does not give rise to a regulatory compliance burden for small entities.

Finally, the Bureau has determined that this proposed rule does not impose any new recordkeeping, reporting, or disclosure requirements on members of the public that would be collections of information requiring approval under the Paperwork Reduction Act, 44 U.S.C. 3501 *et seq.*

List of Subjects

12 CFR Part 1070

Confidential business information, Consumer protection, Freedom of information, Privacy.

12 CFR Part 1091

Administrative practice and procedure, Consumer protection, Credit, Trade practices.

Authority and Issuance

For the reasons set forth in the preamble, the Bureau proposes to amend chapter X of title 12 of the CFR to read as follows:

PART 1070—DISCLOSURE OF RECORDS AND INFORMATION

- 1. Revise part 1070 to read as follows.

Subpart A—General Provisions and Definitions

Sec.

- 1070.1 Authority, purpose and scope.
- 1070.2 General definitions.
- 1070.3 Custodian of records; certification; alternative authority.
- 1070.4 Records of the CFPB not to be otherwise disclosed.
- 1070.5 Service of summonses and complaints

Subpart B—Freedom of Information Act

- 1070.10 General.
- 1070.11 Information made available; discretionary disclosures.
- 1070.12 Publication in the Federal Register.

- 1070.13 Public inspection in an electronic format.
- 1070.14 Requests for CFPB records.
- 1070.15 Responsibility for responding to requests for CFPB records.
- 1070.16 Timing of responses to requests for CFPB records.
- 1070.17 Requests for expedited processing.
- 1070.18 Responses to requests for CFPB records.
- 1070.19 Classified information.
- 1070.20 Requests for business information provided to the CFPB.
- 1070.21 Administrative appeals.
- 1070.22 Fees for processing requests for CFPB records.
- 1070.23 Authority and responsibilities of the Chief FOIA Officer.

Subpart C—Disclosure of CFPB Information in Connection With Legal Proceedings

- 1070.30 Purpose and scope; definitions.
- 1070.31 Service of subpoenas, court orders, and other demands for CFPB information or action.
- 1070.32 Testimony and production of documents prohibited unless approved by the General Counsel.
- 1070.33 Procedure when testimony or production of documents is sought; general.
- 1070.34 Procedure when response to demand is required prior to receiving instructions.
- 1070.35 Procedure in the event of an adverse ruling.
- 1070.36 Considerations in determining whether the CFPB will comply with a demand or request.
- 1070.37 Prohibition on providing expert or opinion testimony.

Subpart D—Confidential Information

- 1070.40 Purpose and scope.
- 1070.41 Non-disclosure of confidential information.
- 1070.42 Disclosure of confidential supervisory information and confidential investigative information.
- 1070.43 Disclosure of confidential information to agencies.
- 1070.44 Disclosure of confidential consumer complaint information.
- 1070.45 Affirmative disclosure of confidential information.
- 1070.46 Other disclosures of confidential information.
- 1070.47 Other rules regarding the disclosure of confidential information.
- 1070.48 Disclosure of confidential information by the Inspector General.

Subpart E—Privacy Act

- 1070.50 Purpose and scope; definitions.
- 1070.51 Authority and responsibilities of the Chief Privacy Officer.
- 1070.52 Fees.
- 1070.53 Request for access to records.
- 1070.54 CFPB procedures for responding to a request for access.
- 1070.55 Special procedures for medical records.
- 1070.56 Request for amendment of records.
- 1070.57 CFPB review of a request for amendment of records.
- 1070.58 Appeal of adverse determination of request for access or amendment.

- 1070.59 Restrictions on disclosure.
- 1070.60 Exempt records.
- 1070.61 Training; rules of conduct; penalties for non-compliance.
- 1070.62 Preservation of records.
- 1070.63 Use and collection of Social Security numbers.

Authority: 12 U.S.C. 5481 *et seq.*; 5 U.S.C. 552; 5 U.S.C. 552a; 18 U.S.C. 1905; 18 U.S.C. 641; 44 U.S.C. ch. 31; 44 U.S.C. ch. 35; 12 U.S.C. 3401 *et seq.*

Subpart A—General Provisions and Definitions

§ 1070.1 Authority, purpose, and scope.

(a) **Authority.** (1) This part is issued by the Bureau of Consumer Financial Protection, an independent Bureau within the Federal Reserve System, pursuant to the Consumer Financial Protection Act of 2010, 12 U.S.C. 5481 *et seq.*; the Freedom of Information Act, 5 U.S.C. 552; the Privacy Act of 1974, 5 U.S.C. 552a; the Federal Records Act, 44 U.S.C. 3101; the Paperwork Reduction Act, 44 U.S.C. 3501 *et seq.*; the Right to Financial Privacy Act of 1978, 12 U.S.C. 3401; the Trade Secrets Act, 18 U.S.C. 1905; 18 U.S.C. 641; and any other applicable law that establishes a basis for the exercise of governmental authority by the CFPB.

(2) This part establishes mechanisms for carrying out the CFPB's statutory responsibilities under the statutes in paragraph (a)(1) of this section to the extent those responsibilities require the disclosure, production, or withholding of information. In this regard, the CFPB has determined that the CFPB, and its delegates, may disclose information of the CFPB, in accordance with the procedures set forth in this part, whenever it is necessary or appropriate to do so in the exercise of any of the CFPB's authority. The CFPB has determined that all such disclosures, made in accordance with the rules and procedures specified in this part, are authorized by law.

(b) **Purpose and scope.** This part contains the CFPB's rules relating to the disclosure of records and information generated by and obtained by the CFPB.

(1) Subpart A contains general provisions and definitions used in this part.

(2) Subpart B implements the Freedom of Information Act, 5 U.S.C. 552.

(3) Subpart C sets forth the procedures with respect to subpoenas, orders, or other requests for CFPB information in connection with legal proceedings.

(4) Subpart D provides for the protection of confidential information and procedures for sharing confidential information with supervised

institutions, government agencies, and others in certain circumstances.

(5) Subpart E implements the Privacy Act of 1974, 5 U.S.C. 552a.

§ 1070.2 General definitions.

For purposes of this part:

(a) **Agency** means a Federal, State, or foreign governmental authority, or an entity exercising governmental authority.

(b) **Associate Director for Supervision, Enforcement and Fair Lending** means the Associate Director for Supervision, Enforcement and Fair Lending of the CFPB or any CFPB employee to whom the Associate Director for Supervision, Enforcement and Fair Lending has delegated authority to act under this part.

(c) **Business day** means any day except Saturday, Sunday or a legal Federal holiday.

(d) **CFPB** means the Bureau of Consumer Financial Protection.

(e) **Chief FOIA Officer** means the Chief Operating Officer of the CFPB, or any CFPB employee to whom the Chief Operating Officer has delegated authority to act under this part.

(f) **Chief Operating Officer** means the Chief Operating Officer of the CFPB, or any CFPB employee to whom the Chief Operating Officer has delegated authority to act under this part.

(g) **Confidential information** means confidential consumer complaint information, confidential investigative information, and confidential supervisory information, as well as any other CFPB information that may be exempt from disclosure under the Freedom of Information Act pursuant to 5 U.S.C. 552(b). Confidential information does not include information contained in records that have been made publicly available by the CFPB or information that has otherwise been publicly disclosed by an employee, or agent of the CFPB, with the authority to do so. Confidential information obtained by a third party or otherwise incorporated in the records of a third party, including another Agency, shall remain confidential information subject to this Part.

(h) **Confidential consumer complaint information** means information received or generated by the CFPB through processes or procedures established under 12 U.S.C. 5493(b)(3), to the extent that such information is exempt from disclosure pursuant to 5 U.S.C. 552(b).

(i) **Confidential investigative information** means:

(1) Any documentary material, written report, or written answers to questions, tangible thing, or transcript of oral testimony received by the CFPB in

any form or format pursuant to a civil investigative demand, as those terms are set forth in 12 U.S.C. 5562, or received by the CFPB voluntarily in lieu of a civil investigative demand; and

(2) Any other documents, materials, or records prepared by, on behalf of, received by, or for the use by the CFPB or any other Agency in the conduct of enforcement activities, and any information derived from such materials.

(j) **Confidential supervisory information** means:

(1) Reports of examination, inspection and visitation, non-public operating, condition, and compliance reports, supervisory letter, or similar document, and any information contained in, derived from, or related to such documents;

(2) Any documents, materials, or records, including reports of examination, prepared by, or on behalf of, or for the use of the CFPB or any other Agency in the exercise of supervisory authority over a financial institution, and any information derived from such documents, materials, or records;

(3) Any communications between the CFPB and a supervised financial institution or a Federal, State, or foreign government agency related to the CFPB's supervision of the institution;

(4) Any information provided to the CFPB by a financial institution for purposes of detecting and assessing risks to consumers and to markets for consumer financial products or services pursuant to 12 U.S.C. 5414(b)(1)(C), 5515(b)(1)(C), or 5516(b), or to assess whether an institution should be considered a covered person, as that term is defined by 12 U.S.C. 5481, or is subject to the CFPB's supervisory authority; and/or

(5) Information that is exempt from disclosure pursuant to 5 U.S.C. 552(b)(8).

(k) **Director** means the Director of the CFPB or his or her designee, or a person authorized to perform the functions of the Director in accordance with law.

(l) **Employee** means all current employees or officials of the CFPB, including contract personnel, the employees of the Office of the Inspector General of the Board of Governors of the Federal Reserve System and the Consumer Financial Protection Bureau, and any other individuals who have been appointed by, or are subject to the supervision, jurisdiction, or control of the Director, as well as the Director. The procedures established within this part also apply to former employees where specifically noted.

(m) *Financial institution* means any person involved in the offering or provision of a “financial product or service,” including a “covered person” or “service provider,” as those terms are defined by 12 U.S.C. 5481.

(n) *General Counsel* means the General Counsel of the CFPB or any CFPB employee to whom the General Counsel has delegated authority to act under this part.

(o) *Person* means an individual, partnership, company, corporation, association (incorporated or unincorporated), trust, estate, cooperative organization, or other entity.

(p) *Report of examination* means the report prepared by the CFPB concerning the examination or inspection of a supervised financial institution.

(q) *State* means any State, territory, or possession of the United States, the District of Columbia, the Commonwealth of Puerto Rico, the Commonwealth of the Northern Mariana Islands, Guam, American Samoa, or the United States Virgin Islands or any Federally recognized Indian tribe, as defined by the Secretary of the Interior under section 104(a) of the Federally Recognized Indian Tribe List Act of 1994 (25 U.S.C. 479a–1(a)), and includes any political subdivision thereof.

(r) *Supervised financial institution* means a financial institution that is or that may become subject to the CFPB’s supervisory authority.

§ 1070.3 Custodian of records; certification; alternative authority.

(a) *Custodian of records.* The Chief Operating Officer is the official custodian of all records of the CFPB, including records that are in the possession or control of the CFPB or any CFPB employee.

(b) *Certification of record.* The Chief Operating Officer may certify the authenticity of any CFPB record or any copy of such record, or the absence thereof, for any purpose, and for or before any duly constituted Federal or State court, tribunal, or agency.

(c) *Alternative authority.* Any action or determination required or permitted to be done by the Chief Operating Officer may be done by any employee who has been duly designated for this purpose by the Chief Operating Officer.

§ 1070.4 Records of the CFPB not to be otherwise disclosed.

Except as provided by this part, employees or former employees of the CFPB, or others in possession of a record of the CFPB that the CFPB has not already made public, are prohibited from disclosing such records, without

authorization, to any person who is not an employee of the CFPB.

§ 1070.5 Service of summonses and complaints.

(a) Only the General Counsel is authorized to receive and accept summonses or complaints sought to be served upon the CFPB or CFPB employees sued in their official capacity. Such documents should be served upon the General Counsel, Consumer Financial Protection Bureau, 1700 G Street NW., Washington, DC 20552. This authorization for receipt shall in no way affect the requirements of service elsewhere provided in applicable rules and regulations.

(b) If, notwithstanding paragraph (a) of this section, any summons or complaint described in that paragraph is delivered to an employee of the CFPB, the employee shall decline to accept the proffered service and may notify the person attempting to make service of the regulations set forth herein. If, notwithstanding this instruction, an employee accepts service of a document described in paragraph (a) of this section, the employee shall immediately notify and deliver a copy of the summons and complaint to the General Counsel.

(c) When a CFPB employee is sued in an individual capacity for an act or omission occurring in connection with duties performed on behalf of the CFPB (whether or not the officer or employee is also sued in an official capacity), the employee by law is to be served personally with process. *See* Fed. R. Civ. P. 4(i)(3). An employee sued in an individual capacity for an act or omission occurring in connection with duties performed on behalf of the CFPB shall immediately notify, and deliver a copy of the summons and complaint to, the General Counsel.

(d) The CFPB will only accept service of process for an employee sued in his or her official capacity. Documents for which the General Counsel accepts service in official capacity shall be marked “Service Accepted in Official Capacity Only.” Acceptance of service shall not constitute an admission or waiver with respect to jurisdiction, propriety of service, improper venue, or any other defense in law or equity available under applicable laws or rules.

Subpart B—Freedom of Information Act

§ 1070.10 General.

This subpart contains the regulations of the CFPB implementing the Freedom of Information Act (the FOIA), 5 U.S.C. 552, as amended. These regulations set

forth procedures for requesting access to records maintained by the CFPB. These regulations should be read together with the FOIA, the 1987 Office of Management and Budget Guidelines for FOIA Fees, the CFPB’s Privacy Act regulations set forth in subpart E, and the FOIA Web page on the CFPB’s Web site, <http://www.consumerfinance.gov>, which provide additional information about this topic.

§ 1070.11 Information made available; discretionary disclosures.

(a) *In general.* The FOIA provides for public access to information and records developed or maintained by Federal agencies. Generally, the FOIA divides agency information into three major categories and provides methods by which each category of information is to be made available to the public. The three major categories of information are as follows:

(1) Information required to be published in the **Federal Register** (see § 1070.12);

(2) Information required to be made available for public inspection and in an electronic format or, in the alternative, to be published and offered for sale (see § 1070.13); and

(3) Information required to be made available to any member of the public upon specific request (see §§ 1070.14 through 1070.22).

(b) *Discretionary disclosures.* Even though a FOIA exemption may apply to the information or records requested, the CFPB may, if not precluded by law, elect under the circumstances not to apply the exemption. The fact that the exemption is not applied by the CFPB in response to a particular request shall have no precedential significance in processing other requests, but is merely an indication that, in the processing of the particular request, the CFPB finds no necessity for applying the exemption.

(c) *Disclosures of records frequently requested.* Subject to the application of the FOIA exemptions and exclusions (5 U.S.C. 552(b) and (c)), the CFPB shall make publicly available, as provided by § 1070.13, all records regardless of form or format, which have been released previously to any person under 5 U.S.C. 552(a)(3) and §§ 1070.14 through 1070.22, and which the CFPB determines have become or are likely to become the subject of subsequent requests for substantially the same records. When the CFPB receives three (3) or more requests for substantially the same records, then the CFPB shall also make the released records publicly available.

§ 1070.12 Publication in the Federal Register.

(a) *Requirement.* The CFPB shall separately state, publish and maintain current in the **Federal Register** for the guidance of the public the following information:

(1) Descriptions of its central and field organization and the established place at which, the persons from whom, and the methods whereby, the public may obtain information, make submissions or requests, or obtain decisions;

(2) Statements of the general course and method by which its functions are channeled and determined, including the nature and requirements of all formal and informal procedures available;

(3) Rules of procedure, descriptions of forms available or the places at which forms may be obtained, and instructions as to the scope and contents of all papers, reports, or examinations;

(4) Substantive rules of general applicability adopted as authorized by law, and statements of general policy or interpretations of general applicability formulated and adopted by the CFPB; and

(5) Each amendment, revision, or repeal of matters referred to in paragraphs (a)(1) through (4) of this section.

(b) *Exceptions.* Publication of the information under paragraph (a) of this section shall be subject to the application of the FOIA exemptions and exclusions (5 U.S.C. 552(b) and (c)) and the limitations provided in 5 U.S.C. 552(a)(1).

§ 1070.13 Public inspection in an electronic format.

(a) *In general.* Subject to the application of the FOIA exemptions and exclusions (5 U.S.C. 552(b) and (c)), the CFPB shall, in conformance with 5 U.S.C. 552(a)(2), make available for public inspection in an electronic format, including by posting on the CFPB's Web site, <http://www.consumerfinance.gov>, or, in the alternative, promptly publish and offer for sale the following information:

(1) Final opinions, including concurring and dissenting opinions, and orders made in the adjudication of cases;

(2) Those statements of policy and interpretations which have been adopted by the CFPB but are not published in the **Federal Register**;

(3) Its administrative staff manuals and instructions to staff that affect a member of the public;

(4) Copies of all records made publicly available pursuant to § 1070.11; and

(5) A general index of the records referred to in paragraph (a)(4) of this section.

(b) *Information made available online.* For records required to be made available for public inspection in an electronic format pursuant to 5 U.S.C. 552(a)(2) (paragraphs (a)(1) through (4) of this section), as soon as practicable, the CFPB shall make such records available on its e-FOIA Library, located at <http://www.consumerfinance.gov>.

(c) *Record availability at the on-site e-FOIA Library.* Any member of the public may, upon request, access the CFPB's e-FOIA Library via a computer terminal at 1700 G Street NW., Washington, DC 20552. Such a request may be made by electronic means as set forth on the CFPB's Web site, <http://www.consumerfinance.gov>, or in writing, to the Chief FOIA Officer, Consumer Financial Protection Bureau, 1700 G Street NW., Washington, DC 20552. The request must indicate a preferred date and time for the requested access. The CFPB reserves the right to arrange a different date and time with the requester, if necessary.

(d) *Redaction of identifying details.* To prevent a clearly unwarranted invasion of personal privacy, the CFPB may redact identifying details contained in any matter described in paragraphs (a)(1) through (4) of this section before making such matters available for inspection or publication. The justification for the redaction shall be explained fully in writing, and the extent of such redaction shall be indicated on the portion of the record which is made available or published, unless including that indication would harm an interest protected by the exemption in 5 U.S.C. 552(b) under which the redaction is made. If technically feasible, the extent of the redaction shall be indicated at the place in the record where the redaction is made.

§ 1070.14 Requests for CFPB records.

(a) *In general.* Subject to the application of the FOIA exemptions and exclusions (5 U.S.C. 552(b) and (c)), the CFPB shall promptly make its records available to any person pursuant to a request that conforms to the rules and procedures of this section.

(b) *Form of request.* A request for records of the CFPB shall be made in writing as follows:

(1) If a request is submitted by mail or delivery service, it shall be addressed to the Chief FOIA Officer, Consumer Financial Protection Bureau, 1700 G Street NW., Washington, DC 20552. The request shall be labeled "Freedom of Information Act Request."

(2) If a request is submitted by electronic means, it shall be submitted as set forth on the CFPB's Web site, <http://www.consumerfinance.gov>. The request shall be labeled "Freedom of Information Act Request."

(c) *Content of request.* (1) In order to ensure the CFPB's ability to respond in a timely manner, a FOIA request should describe the records that the requester seeks in sufficient detail to enable CFPB personnel to locate them with a reasonable amount of effort. Whenever possible, the request should include specific information about each record sought, such as the date, title or name, author, recipient, and subject matter of the record. If known, the requester should include any file designations or descriptions for the records requested. As a general rule, the more specific the requester is about the records or type of records requested, the more likely the CFPB will be able to locate those records in response to the request;

(2) In order to ensure the CFPB's ability to communicate effectively with the requester, a request should include contact information for the requester, including the name of the requester and, to the extent available, a mailing address, telephone number, and email address at which the CFPB may contact the requester regarding the request;

(3) The request should state whether the requester wishes to inspect the records or desires to receive an electronic copy or have a copy made and furnished without first inspecting the records;

(4) For the purpose of determining any fees that may apply to processing a request, a requester should indicate in the request whether the requester is a commercial user, an educational institution, non-commercial scientific institution, representative of the news media, governmental entity, or "other" requester, as those terms are defined in § 1070.22(b), and the basis for claiming that fee category. Requesters may seek assistance in determining the appropriate fee category by contacting the CFPB's FOIA Public Liaison at the telephone number listed on the CFPB's Web site, <http://www.consumerfinance.gov>.

(5) If a requester seeks a waiver or reduction of fees associated with processing a request, then the request shall include a statement to that effect as is required by § 1070.22(e); and

(6) If a requester seeks expedited processing of a request, then the request must include a statement to that effect as is required by § 1070.17.

(d) *Perfected requests; effect of request deficiencies.* For purposes of computing its deadline to respond to a

request, the CFPB will deem itself to have received a request only if, and on the date that, it receives a request that contains substantially all of the information required by and that otherwise conforms with paragraphs (b) and (c) of this section. The CFPB need not accept a request, process a request, or be bound by any deadlines in this subpart for processing a request that fails to conform, in any material respect, to the requirements of paragraphs (b) and (c) of this section. If a request is deficient in any material respect, then the CFPB may return it to the requester and if it does so, it shall advise the requester in what respect the request is deficient, and what additional information is needed to respond to the request. The requester may then amend or resubmit the request. A determination by the CFPB that a request is deficient in any respect is not a denial of a request for records and such determinations are not subject to appeal. If a requester fails to respond to a CFPB notification that a request is deficient within thirty (30) days of the CFPB's notification, the CFPB will deem the request withdrawn.

(e) *Requests by an individual for CFPB records pertaining to that individual.* An individual who wishes to inspect or obtain copies of records of the Bureau that pertain to that individual shall file a request in accordance with subpart E of these rules.

(f) *Requests for CFPB records pertaining to another individual.* Where a request for records pertains to a third party, a requester may receive greater access by submitting either a notarized authorization signed by that individual or a declaration by that individual made in compliance with the requirements set forth in 28 U.S.C. 1746 authorizing disclosure of the records to the requester, or submits proof that the individual is deceased (e.g., a copy of a death certificate or an obituary). The CFPB may require a requester to supply additional information if necessary in order to verify that a particular individual has consented to disclosure.

§ 1070.15 Responsibility for responding to requests for CFPB records.

(a) *In general.* In determining which records are responsive to a request, the CFPB ordinarily will include only records in its possession as of the date the CFPB begins its search for them. If any other date is used, the CFPB shall inform the requester of that date.

(b) *Authority to grant or deny requests.* The Chief FOIA Officer shall be authorized to grant or deny any request for a record of the CFPB.

(c) *Consultations and referrals.* (1) When a requested record has been created by an agency other than the CFPB, the CFPB shall refer the record to the originating agency for a direct response to the requester.

(2) When a FOIA request is received for a record created by the CFPB that includes information originated by another agency, the CFPB shall consult the originating agency for review and recommendation on disclosure. The CFPB shall not release any such records without prior consultation with the originating agency.

(d) *Notice of referral.* Whenever the CFPB refers all or any part of the responsibility for responding to a request to another agency, it will notify the requester of the referral and inform the requester of the name of each agency to which the request has been referred, in whole or in part.

§ 1070.16 Timing of responses to requests for CFPB records.

(a) *In general.* Except as set forth in paragraphs (b) through (d) of this section, and § 1070.17, the CFPB shall respond to requests according to their order of receipt.

(b) *Multitrack processing.* (1) The CFPB may establish separate tracks to process simple and complex requests. The CFPB may assign a request to the simple or complex track(s) based on the amount of work and/or time needed to process the request. The CFPB shall process requests in each track based on the date the request was perfected in accordance with § 1070.14(d).

(2) The CFPB may provide a requester in its complex track with an opportunity to limit the scope of the request to qualify for faster processing within the specified limits of the simple track(s).

(c) *Time period for responding to requests for records.* Ordinarily, the CFPB shall have twenty (20) business days from when a request is received by the CFPB to determine whether to grant or deny a request for records. The twenty (20) business day time period set forth in this paragraph shall not be tolled by the CFPB except that the CFPB may:

(1) Make one reasonable demand to the requester for clarifying information about the request and toll the twenty (20) business day time period while it awaits the clarifying information; or

(2) Toll the twenty (20) business day time period while it awaits clarification from or addresses any dispute with the requester regarding the assessment of fees.

(d) *Unusual circumstances.* (1) Where the CFPB determines that due to unusual circumstances it cannot

respond either to a request within the time period set forth in paragraph (c) of this section or to an appeal within the time period set forth in § 1070.21, the CFPB may extend the applicable time periods by informing the requester in writing of the unusual circumstances and of the date by which the CFPB expects to complete its processing of the request or appeal. Any extension or extensions of time with respect to a request or an appeal shall not cumulatively total more than ten (10) business days. However, if the CFPB determines that it needs additional time beyond a ten (10) business day extension to process the request or appeal, then the CFPB shall notify the requester and provide the requester with an opportunity to limit the scope of the request or appeal or to arrange for an alternative time frame for processing the request or appeal or a modified request or appeal. The requester shall retain the right to define the desired scope of the request or appeal, as long as it meets the requirements contained in this subpart.

(2) As used in this paragraph, "unusual circumstances" means:

(i) The need to search for and collect the requested records from field facilities or other establishments that are separate from the office processing the request;

(ii) The need to search for, collect, and appropriately examine a voluminous amount of separate and distinct records which are demanded in a single request; or

(iii) The need for consultation, which shall be conducted with all practicable speed, with another Agency having a substantial interest in the determination of the request, or among two or more CFPB offices having substantial subject matter interest therein.

§ 1070.17 Requests for expedited processing.

(a) *In general.* The CFPB shall process a request on an expedited basis whenever a requester demonstrates a compelling need for expedited processing in accordance with the requirements of this paragraph or in other cases that the CFPB deems appropriate.

(b) *Form and content of a request for expedited processing.* A request for expedited processing shall be made as follows:

(1) A request for expedited processing shall be made in writing and submitted as part of a request for records in accordance with § 1070.14(b). When a request for records includes a request for expedited processing, the request shall be labeled "Expedited Processing Requested."

(2) A request for expedited processing shall contain a statement that demonstrates a compelling need for the requester to obtain expedited processing of the requested records. A “compelling need” is defined as follows:

(i) Failure to obtain the requested records on an expedited basis could reasonably be expected to pose an imminent threat to the life or physical safety of an individual. The requester shall fully explain the circumstances warranting such an expected threat so that the CFPB may make a reasoned determination that a delay in obtaining the requested records could pose such a threat; or

(ii) With respect to a request made by a person primarily engaged in disseminating information, urgency to inform the public concerning actual or alleged Federal government activity. A person “primarily engaged in disseminating information” does not include individuals who are engaged only incidentally in the dissemination of information. The standard of “urgency to inform” requires that the records requested pertain to a matter of current exigency to the American public and that delaying a response to a request for records would compromise a significant recognized interest to and throughout the American general public. The requester must adequately explain the matter or activity and why the records sought are necessary to be provided on an expedited basis.

(3) The requester shall certify the written statement that purports to demonstrate a compelling need for expedited processing to be true and correct to the best of the requester’s knowledge and belief. The certification must be in the form prescribed by 28 U.S.C. 1746: “I declare under penalty of perjury that the foregoing is true and correct to the best of my knowledge and belief. Executed on [date].” The requester shall mail or submit electronically a copy of such written certification to the Chief FOIA Officer as set forth in § 1070.14(b). The CFPB may waive this certification requirement in appropriate circumstances.

(c) *Determinations of requests for expedited processing.* Within ten (10) calendar days of its receipt of a request for expedited processing, the CFPB shall decide whether to grant it and shall notify the requester of the determination in writing.

(d) *Effect of granting requests for expedited processing.* If the CFPB grants a request for expedited processing, then the CFPB shall give the expedited request priority over non-expedited requests and shall process the expedited request as soon as practicable. The

CFPB may assign expedited requests to their own simple and complex processing tracks based upon the amount of work and/or time needed to process them. Within each such track, an expedited request shall be processed in the order of its receipt.

(e) *Appeals of denials of requests for expedited processing.* If the CFPB denies a request for expedited processing, then the requester shall have the right to submit an appeal of the denial determination in accordance with § 1070.21. The CFPB shall communicate this appeal right as part of its written notification to the requester denying expedited processing. The requester shall label its appeal request “Appeal for Expedited Processing.” The CFPB shall act expeditiously upon an appeal of a denial of a request for expedited processing.

§ 1070.18 Responses to requests for CFPB records.

(a) *Acknowledgements of requests.* Upon receipt of a perfected request, the CFPB will assign to the request a unique tracking number. The CFPB will send an acknowledgement letter to the requester by mail or email within ten (10) calendar days of receipt of the request. The acknowledgment letter will contain the following information:

(1) The applicable request tracking number;

(2) The date of receipt of the request, as determined in accordance with section 1070.14(d), as well as the date when the requester may expect a response;

(3) A brief statement identifying the subject matter of the request; and

(4) A confirmation, with respect to any fees that may apply to the request pursuant to § 1070.22, that the requester has sought a waiver or reduction in such fees, has agreed to pay any and all applicable fees, or has specified an upper limit that the requester is willing to pay in fees to process the request.

(b) *Initial determination to grant or deny a request.* (1) The officer designated in § 1070.15(b) to this subpart, or his or her delegate, shall make initial determinations either to grant or to deny in whole or in part requests for records.

(2) If the request is granted in full or in part, and if the requester requests a copy of the records requested, then a copy of the records shall be mailed or emailed to the requester in the requested format, to the extent the records are readily producible in the requested format. The CFPB shall also send the requester a statement of the applicable fees, either at the time of the determination or shortly thereafter.

(3) In the case of a request for inspection, the requester shall be notified in writing of the determination, when and where the requested records may be inspected, and of the fees incurred in complying with the request. The CFPB shall then promptly make the records available for inspection at the time and place stated, in a manner that will not interfere with CFPB’s operations and will not exclude other persons from making inspections. The requester shall not be permitted to remove the records from the room where inspection is made. If, after making inspection, the requester desires copies of all or a portion of the requested records, copies shall be furnished upon payment of the established fees prescribed by § 1070.22. Fees may be charged for search and review time as stated in § 1070.22.

(4) If it is determined that the request for records should be denied in whole or in part, the requester shall be notified by mail or by email. The letter of notification shall:

(i) State the exemptions relied upon in denying the request;

(ii) If technically feasible, indicate the amount of information deleted and the exemptions under which the deletion is made at the place in the record where such deletion is made (unless providing such indication would harm an interest protected by the exemption relied upon to deny such material);

(iii) Set forth the name and title or position of the responsible official;

(iv) Advise the requester of the right to seek dispute resolution services from the Bureau’s FOIA Public Liaison or the Office of Governmental Information Services;

(v) Advise the requester of the right to administrative appeal in accordance with § 1070.21; and

(vi) Specify the official or office to which such appeal shall be submitted.

(5) If it is determined, after a reasonable search for records, that no responsive records have been found to exist, the requester shall be notified in writing or by email. The notification shall also advise the requester of the right to administratively appeal the CFPB’s determination that no responsive records exist (*i.e.*, to challenge the adequacy of the CFPB’s search for responsive records) in accordance with § 1070.21. The response shall specify the official or office to which the appeal shall be submitted for review.

(c) *Resolution of disputes.* The CFPB is committed to efficiently resolving disputes during the request process. The following resources are available to

requesters to resolve any disputes that may arise during the request process:

(1) *FOIA Public Liaison*. Any request related questions or concerns should be directed to the FOIA Public Liaison, who is responsible for reducing delays, increasing transparency and understanding of the status of requests, and assisting in the resolution of disputes.

(2) *Mediation*. The National Archives and Records Administration (NARA), Office of Government Information Services (OGIS) offers non-compulsory, non-binding mediation services to help resolve FOIA disputes. A requester may contact OGIS directly at Office of Government Information Services, National Archives and Records Administration, Room 2510, 8601 Adelphi Road, College Park, MD 20740–6001, Email: ogis@nara.gov, Phone: (301) 837–1996, Fax: (301) 837–0348. This information is provided as a public service only. By providing this information, the CFPB does not commit to refer disputes to OGIS, or to defer to OGIS mediation decisions in particular cases.

(d) *Format of records disclosed*. (1) The CFPB will provide records in the requested format if the records can readily be reproduced from the original file to that specific format.

(2) The CFPB may charge fees associated with converting records or files into the requested format in accordance with § 1070.22.

§ 1070.19 Classified information.

Whenever a request is made for a record containing information that another agency has classified, or which may be appropriate for classification by another agency under Executive Order 13526 or any other executive order concerning the classification of information, the CFPB shall refer the responsibility for responding to the request to the classifying or originating agency, as appropriate.

§ 1070.20 Requests for business information provided to the CFPB.

(a) *In general*. Business information provided to the CFPB by a business submitter shall not be disclosed pursuant to a FOIA request except in accordance with this section.

(b) *Definitions*. For purposes of this section:

(1) *Business information* means commercial or financial information obtained by the CFPB from a submitter that may be protected from disclosure under Exemption 4 of the FOIA, 5 U.S.C. 552(b)(4).

(2) *Submitter* means any person from whom the CFPB obtains business

information, directly or indirectly. The term includes, without limitation, corporations, State, local, and tribal governments, and foreign governments.

(c) *Designation of business information*. A submitter of business information will use good-faith efforts to designate, by appropriate markings, either at the time of submission or at a reasonable time thereafter, any portions of its submission that it considers to be protected from disclosure under Exemption 4 of the FOIA. These designations will expire ten (10) years after the date of the submission unless the submitter requests otherwise and provides justification for, a longer designation period.

(d) *Notice to submitters*. The CFPB shall provide a submitter with prompt written notice of receipt of a request or appeal encompassing its business information whenever required in accordance with paragraph (e) of this section. Such written notice shall either describe the exact nature of the business information requested or provide copies of the records or portions of records containing the business information. When notification of a voluminous number of submitters is required, notification may be made by posting or publishing the notice in a place reasonably likely to accomplish it.

(e) *When notice is required*. (1) The CFPB shall provide a submitter with notice of receipt of a request or appeal whenever:

(i) The information has been designated in good faith by the submitter as information considered protected from disclosure under Exemption 4; or

(ii) The CFPB has reason to believe that the information may be protected from disclosure under Exemption 4.

(2) The notice requirements of this paragraph shall not apply if:

(i) The CFPB determines that the information is exempt under the FOIA;

(ii) The information lawfully has been published or otherwise made available to the public;

(iii) Disclosure of the information is required by statute (other than the FOIA) or by a regulation issued in accordance with the requirements of Executive Order 12600 (3 CFR, 1988 Comp., p. 235); or

(iv) The designation made by the submitter under paragraph (e)(1)(i) of this section appears obviously frivolous, except that, in such a case, the CFPB shall, within a reasonable time prior to a specified disclosure date, give the submitter written notice of any final decision to disclose the information.

(f) *Opportunity to object to disclosure before release*. (1) Through the notice

described in paragraph (d) of this section, the CFPB shall delay any release in order to afford a submitter ten (10) business days from the date of the notice to provide the CFPB with a detailed statement of any objection to disclosure. Such statement shall specify all grounds for withholding any of the information under any exemption of the FOIA and, in the case of Exemption 4, shall demonstrate why the information is considered to be a trade secret or commercial or financial information that is privileged or confidential. In the event that a submitter fails to respond to the notice within the time specified in it, the submitter shall be considered to have no objection to disclosure of the information. Information provided by a submitter pursuant to this paragraph may itself be subject to disclosure under the FOIA.

(2) When notice is given to a submitter under this section, the requester shall be advised that such notice has been given to the submitter. The requester shall be further advised that a delay in responding to the request may be considered a denial of access to records and that the requester may proceed with an administrative appeal or seek judicial review, if appropriate. However, the requester will be invited to agree to a voluntary extension of time so that the CFPB may review the submitter's objection to disclose, if any.

(g) *Notice of intent to disclose*. The CFPB shall consider a submitter's objections and specific grounds for nondisclosure prior to determining whether to disclose business information. Whenever the CFPB decides to disclose business information over the objection of a submitter, the CFPB shall forward to the submitter a written notice which shall include:

(1) A statement of the reasons for which the submitter's disclosure objections were not sustained;

(2) A description of the business information to be disclosed; and

(3) A specified disclosure date which is not less than ten (10) business days after the notice of the final decision to release the requested information has been mailed to the submitter. Except as otherwise prohibited by law, a copy of the disclosure notice shall be forwarded to the requester at the same time.

(h) *Notice to submitter of FOIA lawsuit*. Whenever a requester brings suit seeking to compel disclosure of business information, the CFPB shall promptly notify the submitter of that business information of the existence of the suit.

(i) *Notice to requester of business information*. The CFPB shall notify a requester whenever it provides the

submitter with notice and an opportunity to object to disclosure; whenever it notifies the submitter of its intent to disclose the requested information; and whenever a submitter files a lawsuit to prevent the disclosure of the information.

§ 1070.21 Administrative appeals.

(a) *Grounds for administrative appeals.* A requester may appeal an initial determination of the CFPB, including for the following reasons:

- (1) To deny access to records in whole or in part (as provided in § 1070.18(b));
- (2) To assign a particular fee category to the requestor (as provided in § 1070.22(b));
- (3) To deny a request for a reduction or waiver of fees (as provided in § 1070.22(e));
- (4) That no records exist that are responsive to the request (as provided in § 1070.18(b)); or
- (5) To deny a request for expedited processing (as provided in § 1070.17(e)).

(b) *Time limits for filing administrative appeals.* An appeal, other than an appeal of a denial of expedited processing, must be postmarked or submitted electronically on a date that is within ninety (90) calendar days after the date the initial determination is sent to the requester or the date of the letter transmitting the last records released, whichever is later. An appeal of a denial of expedited processing must be made within ten (10) days of the date of the initial determination letter to deny expedited processing (see § 1070.17).

(c) *Form and content of administrative appeals.* In order to ensure a timely response to an appeal, the appeal shall be made in writing as follows:

(1) If appeal is submitted by mail or delivery service, it shall be addressed to and submitted to the officer specified in paragraph (e) of this section at the address set forth in 1070.14(b). The appeal shall be labeled "Freedom of Information Act Appeal."

(2) If an appeal is submitted by electronic means, it shall be addressed to the officer specified in paragraph (e) of this section and submitted as set forth on the CFPB's Web site, <http://www.consumerfinance.gov>. The appeal shall be labeled "Freedom of Information Act Appeal."

(3) The appeal shall set forth contact information for the requester, including, to the extent available, a mailing address, telephone number, or email address at which the CFPB may contact the requester regarding the appeal; and

(4) The appeal shall specify the applicable request tracking number, the

date of the initial request, and the date of the letter of initial determination, and, where possible, enclose a copy of the initial request and the initial determination being appealed.

(d) *Processing of administrative appeals.* The FOIA office will record the date that appeals are received. The receipt of the appeal will be acknowledged by the CFPB and the requester will be advised of the date the appeal was received, the appeal tracking number, and the expected date of response.

(e) *Determinations to grant or deny administrative appeals.* The General Counsel is authorized to and shall decide whether to affirm the initial determination (in whole or in part), to reverse the initial determination (in whole or in part) or to remand the initial determination to the Chief FOIA Officer for further action and shall notify the requester of this decision in writing within twenty (20) business days after the date of receipt of the appeal, unless extended pursuant to § 1070.16(d).

(1) If it is decided that the appeal is to be denied (in whole or in part) the requester shall be:

- (i) Notified in writing of the denial;
- (ii) Notified of the reasons for the denial, including which of the FOIA exemptions were relied upon;
- (iii) Notified of the name and title or position of the official responsible for the determination on appeal;
- (iv) Provided with a statement that judicial review of the denial is available in the United States District Court for the judicial district in which the requester resides or has a principal place of business, the judicial district in which the requested records are located, or the District of Columbia in accordance with 5 U.S.C. 552(a)(4)(B); and

(v) Provided with notification that mediation services are available to the requester as a non-exclusive alternative to litigation through the Office of Government Information Services in accordance with 5 U.S.C. 552(h)(3).

(2) If the initial determination is reversed on appeal, the requester shall be so notified and the request shall be processed promptly in accordance with the decision on appeal.

(3) If the initial determination is remanded on appeal to the Chief FOIA Officer for further action, the requester shall be so notified and the request shall be processed in accordance with the decision on appeal. The remanded request shall be treated as a new request received by the CFPB as of the date when the General Counsel transmits the remand notification to the requester. The procedures and deadlines set forth

in this subpart for processing, deciding, responding to, and filing administrative appeals of new FOIA requests shall apply to the remanded request.

(f) *Adjudication of administrative appeals of requests in litigation.* An appeal ordinarily will not be adjudicated if the request becomes a matter of FOIA litigation.

§ 1070.22 Fees for processing requests for CFPB records.

(a) *In general.* The CFPB shall determine whether and to what extent to charge a requester fees for processing a FOIA request, for the services and in the amounts set forth in this paragraph, by determining an appropriate fee category for the requester (as set forth in paragraph (b) of this section) and then by charging the requester those fees applicable to the assigned category (as set forth in paragraph (c) of this section), unless circumstances exist (as described in paragraph (d) of this section) that render fees inapplicable or inadvisable or unless the requester has requested and the CFPB has granted a reduction in or waiver of fees (as set forth in paragraph (e) of this section).

(1) The CFPB shall charge a requester fees for the cost of copying or printing records at the rate of \$0.10 per page.

(2) The CFPB shall charge a requester for all time spent by its employees searching for records that are responsive to a request. The CFPB shall charge the requester fees for search time as follows:

(i) The CFPB shall charge for search time at the salary rate(s) (basic pay plus sixteen (16) percent) of the employee(s) who conduct the search. However, the CFPB shall charge search fees at the rate of \$9.00 per fifteen (15) minutes of search time whenever only administrative/clerical employees conduct a search and at the rate of \$23.00 per fifteen (15) minutes of search time whenever only professional/executive employees conduct a search. Search charges shall also include transportation of employees and records necessary to the search at actual cost. Fees may be charged for search time even if the search does not yield any responsive records, or if records are exempt from disclosure.

(ii) The CFPB shall charge the requester for the actual direct costs of conducting an electronic records search, including computer search time, runs, and output. The CFPB shall also charge for time spent by computer operators or programmers (at the rates set forth in paragraph (a)(2)(i) of this section) who conduct or assist in the conduct of an electronic records search.

(3) The CFPB shall charge a requester for time spent by its employees

examining responsive records to determine whether any portions of such record are exempt from disclosure, pursuant to the FOIA exemptions of 5 U.S.C. 552(b). The CFPB shall also charge a requester for time spent by its employees redacting any such exempt information from a record and preparing a record for release to the requester. The CFPB shall charge a requester for time spent reviewing records at the salary rate(s) (*i.e.*, basic pay plus sixteen (16) percent) of the employees who conduct the review. However, the CFPB shall charge review fees at the rate of \$9.00 per fifteen (15) minutes of search time whenever only administrative/clerical employees review records and at the rate of \$23.00 per fifteen (15) minutes of search time whenever only professional/executive employees review records. Fees shall be charged for review time even if records ultimately are not disclosed.

(4) Fees for all services provided shall be charged whether or not copies are made available to the requester for inspection. However, no fee shall be charged for monitoring a requester's inspection of records.

(5) Other services and materials requested which are not covered by this part nor required by the FOIA are chargeable at the actual cost to the CFPB. This includes, but is not limited to:

(i) Certifying that records are true copies; or

(ii) Sending records by special methods such as express mail, etc.

(b) *Categories of requesters.* (1) For purposes of assessing fees as set forth in this section, each requester shall be assigned to one of the following categories:

(i) *Commercial user* refers to one who seeks information for a use or purpose that furthers the commercial, trade, or profit interests of the requester or the person on whose behalf the request is made, which can include furthering those interests through litigation. The CFPB's decision to place a requester in the commercial use category will be made on a case-by-case basis based on how the requester will use the information.

(ii) *Educational institution* refers to a preschool, a public or private elementary or secondary school, an institution of graduate higher education, an institution of undergraduate higher education, an institution of professional education, and an institution of vocational education, which operates a program or programs of scholarly research.

(iii) *Non-commercial scientific institution* refers to an institution that is

not operated on a "commercial user" basis as that term is defined in paragraph (b)(2)(i) of this section, and which is operated solely for the purpose of conducting scientific research, the results of which are not intended to promote any particular product or industry.

(iv) *Representative of the news media* refers to any person or entity that gathers information of potential interest to a segment of the public, uses its editorial skills to turn the raw materials into a distinct work, and distributes that work to an audience. In this paragraph, the term "news" means information that is about current events or that would be of current interest to the public. Examples of news-media entities are television or radio stations broadcasting to the public at large and publishers of periodicals (but only if such entities qualify as disseminators of "news") who make their products available for purchase by or subscription by or free distribution to the general public. Other examples of news media entities include online publications and Web sites that regularly deliver news content to the public. These examples are not all-inclusive. Moreover, as methods of news delivery evolve (for example, the adoption of the electronic dissemination of newspapers through telecommunications services), such alternative media shall be considered to be news-media entities. A freelance journalist shall be regarded as working for a news-media entity if the journalist can demonstrate a solid basis for expecting publication through that entity, whether or not the journalist is actually employed by the entity. A publication contract would present a solid basis for such an expectation; the CFPB may also consider the past publication record of the requester in making such a determination.

(v) *"Other" requester* refers to a requester who does not fall within any of the previously described categories.

(2) Within twenty (20) calendar days of its receipt of a request, the CFPB shall make a determination as to the proper fee category to apply to a requester. The CFPB shall inform the requester of the determination in the request acknowledgment letter, or if no such letter is required, in another writing. Where the CFPB has reasonable cause to doubt the use to which a requester will put the records sought, or where that use is not clear from the request itself, the CFPB should seek additional clarification before assigning the request to a specific category.

(3) If the CFPB assigns to a requester a fee category, then the requester shall have the right to submit an appeal of the

CFPB's determination in accordance with § 1070.21. The CFPB shall communicate this appeal right as part of its written notification to the requester of an adverse fee category determination. The requester shall label its appeal request "Appeal of Fee Category Determination."

(c) *Fees applicable to each category of requester.* The following fee schedule applies uniformly throughout the CFPB to requests processed under the FOIA. Specific levels of fees are prescribed for each category of requester defined in paragraph (b) of this section.

(1) Commercial users shall be charged the full direct costs of searching for, reviewing, and duplicating the records they request. Moreover, when a request is received for disclosure that is primarily in the commercial interest of the requester, the CFPB is not required to consider a request for a waiver or reduction of fees based upon the assertion that disclosure would be in the public interest. The CFPB may recover the cost of searching for and reviewing records even if there is ultimately no disclosure of records or no records are located.

(2) Educational and non-commercial scientific institution requesters shall be charged only for the cost of duplicating the records they request, except that the CFPB shall provide the first one hundred (100) pages of duplication free of charge. To be eligible, requesters must show that the request is made under the auspices of a qualifying institution and that the records are not sought for a commercial use, but are sought in furtherance of scholarly (if the request is from an educational institution) or scientific (if the request is from a non-commercial scientific institution) research. These categories do not include requesters who want records for use in meeting individual academic research or study requirements.

(3) Representatives of the news media shall be charged only for the cost of duplicating the records they request, except that the CFPB shall provide them with the first one hundred (100) pages of duplication free of charge.

(4) Other requesters who do not fit any of the categories described above shall be charged the full direct cost of searching for and duplicating records that are responsive to the request, except that the CFPB shall provide the first one hundred (100) pages of duplication and the first two hours of search time free of charge. The CFPB may recover the cost of searching for records even if there is ultimately no disclosure of records, or no records are located. Requests from persons for

records about themselves filed in the CFPB's systems of records shall continue to be treated under the fee provisions of the Privacy Act of 1974, 5 U.S.C. 552a, which permit fees only for duplication, after the first one hundred (100) pages are furnished free of charge.

(d) *Other circumstances when fees are not charged.* Notwithstanding paragraphs (b) and (c) of this section, the CFPB may not charge a requester a fee for processing a FOIA request if any of the following applies:

(1) The cost of collecting a fee would be equal to or greater than the fee itself;

(2) The fee is less than \$250, excluding duplication costs;

(3) The fees were waived or reduced in accordance with paragraph (e) of this section;

(4) If the CFPB fails to comply with any time limit under § 1070.15 or § 1070.21, then the CFPB shall not assess search fees, or if the requester is a representative of the news media or an educational or noncommercial scientific institution, then the CFPB shall not assess duplication fees, unless the CFPB has:

(i) Determined that unusual circumstances apply to the processing of the request;

(ii) Provided timely written notice to the requester of the unusual circumstances in accordance with § 1070.16(d);

(iii) Determined that more than 5,000 pages are necessary to respond to the request; and

(iv) Discussed with the requester via mail, email, or telephone (or made not less than three good-faith attempts to do so) how the requester could effectively limit the scope of the request.

(5) If the CFPB determines, as a matter of administrative discretion, that waiving or reducing the fees would serve the interest of the United States Government.

(e) *Waiver or reduction of fees.* (1) A requester shall be entitled to receive from the CFPB a waiver or reduction in the fees otherwise applicable to a FOIA request whenever the requester:

(i) Requests such waiver or reduction of fees in writing as part of the FOIA request;

(ii) Labels the request for waiver or reduction of fees "Fee Waiver or Reduction Requested" on the FOIA request; and

(iii) Demonstrates that the fee reduction or waiver request that a waiver or reduction of the fees is in the public interest because:

(A) Furnishing the information is likely to contribute significantly to public understanding of the operations or activities of the government; and

(B) Furnishing the information is not primarily in the commercial interest of the requester.

(2) To determine whether the requester has satisfied the requirements of paragraph (e)(1)(iii)(A), the CFPB shall consider the following factors:

(i) The subject of the requested records must concern identifiable operations or activities of the Federal government, with a connection that is direct and clear, and not remote or attenuated.

(ii) The disclosable portions of the requested records must be meaningfully informative about government operations or activities in order to be "likely to contribute" to an increased public understanding of those operations or activities. The disclosure of information that already is in the public domain, in either a duplicative or a substantially similar form, is not as likely to contribute to the public's understanding.

(iii) The disclosure must contribute to the understanding of a reasonably broad audience of persons interested in the subject, as opposed to the individual understanding of the requester. A requester's expertise in the subject area and ability and intention to effectively convey information to the public shall be considered. It shall be presumed that a representative of the news media will satisfy this consideration.

(iv) The public's understanding of the subject in question, as compared to the level of public understanding existing prior to the disclosure, must be enhanced by the disclosure to a significant extent.

(3) To determine whether the requester has satisfied the requirements of paragraph (e)(1)(iii)(B), the CFPB shall consider the following factors:

(i) The CFPB shall consider any commercial interest of the requester (with reference to the definition of "commercial user" in (b)(1)(i) of this section), or of any person on whose behalf the requester may be acting, that would be furthered by the requested disclosure. Requesters shall be given an opportunity in the administrative process to provide explanatory information regarding this consideration.

(ii) A fee waiver or reduction is justified where the public interest standard is satisfied and that public interest is greater in magnitude than that of any identified commercial interest in disclosure. The CFPB ordinarily shall presume that where a news media requester has satisfied the public interest standard, the public interest will be the interest primarily served by disclosure to that requester. Disclosure

to data brokers or others who merely compile and market government information for direct economic return shall not be presumed to primarily serve the public interest.

(4) Where only some of the records to be released satisfy the requirements for a waiver of fees, a waiver shall be granted for those records.

(5) If the CFPB denies a request to reduce or waive fees, then the CFPB shall advise the requester, in the denial notification letter, that the requester may incur fees if the CFPB proceeds to process the request. The notification letter shall also advise the requester that the CFPB will not proceed to process the request further unless the requester, in writing, directs the CFPB to do so and either agrees to pay any fees that may apply to processing the request or specifies an upper limit that the requester is willing to pay to process the request. If the CFPB does not receive this written direction and agreement/specification within thirty (30) calendar days of the date of the denial notification letter, then the CFPB shall deem the request to be withdrawn.

(6) If the CFPB denies a request to reduce or waive fees, then the requester shall have the right to submit an appeal of the denial determination in accordance with § 1070.21. The CFPB shall communicate this appeal right as part of its written notification to the requester denying the fee reduction or waiver request. The requester should label its appeal request "Appeal for Fee Reduction/Waiver."

(f) *Advance notice and prepayment of fees.* (1) The CFPB shall notify a requester of the estimated fees for processing a request and provide a breakdown of the fees attributable to search, review, and duplication, when the estimated fees are \$250 or more and:

(i) The fees exceed the limit set by the requester;

(ii) The requester did not specify a limit; or

(iii) The CFPB has denied a request for a reduction or waiver of fees.

The requester must provide an agreement to pay the estimated fees; however, the requester shall also be given an opportunity to reformulate the request in an attempt to reduce fees.

(2) If the fees are estimated to exceed \$1000, the requester must pre-pay such amount prior to the processing of the request, or provide satisfactory assurance of full payment if the requester has a history of prompt payment of FOIA fees. The requester shall also be given an opportunity to reformulate the request in such a way as to lower the applicable fees.

(3) The CFPB reserves the right to request prepayment after a request is processed and before documents are released.

(4) If a requester has previously failed to pay a fee within thirty (30) calendar days of the date of the billing, the requester shall be required to pay the full amount owed plus any applicable interest and to make an advance payment of the full amount of the estimated fee before the CFPB begins to process a new request or the pending request.

(5) When the CFPB acts under paragraphs (f)(1) through (4) of this section, the statutory time limits of twenty (20) days (excluding Saturdays, Sundays, and legal public holidays) from receipt of initial requests or appeals, plus extensions of these time limits, shall begin only after fees have been paid, a written agreement to pay fees has been provided, or a request has been reformulated.

(g) *Form of payment.* Payment may be tendered as set forth on the CFPB's Web site, <http://www.consumerfinance.gov>.

(h) *Charging interest.* The CFPB may charge interest on any unpaid bill starting on the 31st day following the date of billing the requester. Interest charges will be assessed at the rate provided in 31 U.S.C. 3717 and will accrue from the date of the billing until payment is received by the CFPB. The CFPB will follow the provisions of the Debt Collection Act of 1982 (Pub. L. 97-365, 96 Stat. 1749), as amended, and its administrative procedures, including the use of consumer reporting agencies, collection agencies, and offset.

(i) *Aggregating requests.* Where the CFPB reasonably believes that a requester or a group of requesters acting together is attempting to divide a request into a series of requests for the purpose of avoiding fees, the CFPB may aggregate those requests and charge accordingly. The CFPB may presume that multiple requests of this type made within a thirty (30) day period have been made in order to avoid fees. Where requests are separated by a longer period, the CFPB will aggregate them only where there exists a solid basis for determining that aggregation is warranted under all the circumstances involved. Multiple requests involving unrelated matters will not be aggregated.

§ 1070.23 Authority and responsibilities of the Chief FOIA Officer.

(a) *Chief FOIA Officer.* The Director authorizes the Chief FOIA Officer to act upon all requests for agency records, with the exception of determining appeals from the initial determinations of the Chief FOIA Officer, which will be

decided by the General Counsel. The Chief FOIA officer shall, subject to the authority of the Director:

(1) Have CFPB-wide responsibility for efficient and appropriate compliance with the FOIA;

(2) Monitor implementation of the FOIA throughout the CFPB and keep the Director, the General Counsel, and the Attorney General appropriately informed of the CFPB's performance in implementing the FOIA;

(3) Recommend to the Director such adjustments to agency practices, policies, personnel and funding as may be necessary to improve the Chief FOIA Officer's implementation of the FOIA;

(4) Review and report to the Attorney General, through the Director, at such times and in such formats as the Attorney General may direct, on the CFPB's performance in implementing the FOIA;

(5) Facilitate public understanding of the purposes of the statutory exemptions of the FOIA by including concise descriptions of the exemptions in both the CFPB's handbook and the CFPB's annual report on the FOIA, and by providing an overview, where appropriate, of certain general categories of CFPB records to which those exemptions apply;

(6) Designate one or more FOIA Public Liaisons;

(7) Offer Training to Bureau staff regarding their responsibilities under the FOIA;

(8) Serve as the primary Bureau liaison with the Office of Government Information Services and the Office of Information Policy; and

(9) Maintain and update, as necessary and in accordance with the requirements of this subpart, the CFPB's FOIA Web site, including its e-FOIA Library.

(b) *FOIA Public Liaisons.* FOIA Public Liaisons shall report to the Chief FOIA Officer and shall serve as supervisory officials to whom a requester can raise concerns about the service the requester has received from the CFPB's FOIA office, following an initial response from the FOIA office staff. FOIA Public Liaisons shall be responsible for assisting in reducing delays, increasing transparency and understanding of the status of requests, and assisting in the resolution of disputes.

Subpart C—Disclosure of CFPB Information in Connection with Legal Proceedings

§ 1070.30 Purpose and scope; definitions.

(a) This subpart sets forth the procedures to be followed with respect to subpoenas, court orders, or other

requests or demands for any CFPB information, whether contained in the files of the CFPB or acquired by a CFPB employee as part of the performance of that employee's duties or by virtue of employee's official status.

(b) This subpart does not apply to requests for official information made pursuant to subparts B, D, and E of this part.

(c) This subpart does not apply to requests for information made in the course of adjudicating claims against the CFPB by CFPB employees (present or former) or applicants for CFPB employment for which jurisdiction resides with the U.S. Equal Employment Opportunity Commission, the U.S. Merit Systems Protection Board, the Office of Special Counsel, the Federal Labor Relations Authority, or their successor agencies, or a labor arbitrator operating under a collective bargaining agreement between the CFPB and a labor organization representing CFPB employees.

(d) This subpart is intended only to inform the public about CFPB procedures concerning the service of process and responses to subpoenas, summons, or other demands or requests for official information or action and is not intended to and does not create, and may not be relied upon to create any right or benefit, substantive or procedural, enforceable at law by a party against the CFPB or the United States.

(e) For purposes of this subpart:

(1) *Demand* means a subpoena or order for official information, whether contained in CFPB records or through testimony, related to or for possible use in a legal proceeding.

(2) *Legal proceeding* encompasses all pre-trial, trial, and post-trial stages of all judicial or administrative actions, hearings, investigations, or similar proceedings before courts, commissions, boards, grand juries, arbitrators, or other judicial or quasi-judicial bodies or tribunals, whether criminal, civil, or administrative in nature, and whether foreign or domestic. This phrase includes all stages of discovery as well as formal or informal requests by attorneys, their agents, or others involved in legal proceedings.

(3) *Official Information* means all information of any kind, however stored, that is in the custody and control of the CFPB or was acquired by CFPB employees, or former employees as part of their official duties or because of their official status while such individuals were employed by or served on behalf of the CFPB. Official information also includes any information acquired by CFPB employees or former employees

while such individuals were engaged in matters related to consumer financial protection functions prior to the employees' transfer to the CFPB pursuant to Subtitle F of the Consumer Financial Protection Act of 2010.

(4) *Request* means any request for official information in the form of testimony, affidavits, declarations, admissions, responses to interrogatories, document production, inspections, or formal or informal interviews, during the course of a legal proceeding, including pursuant to the Federal Rules of Civil Procedure, the Federal Rules of Criminal Procedure, or other applicable rules of procedure.

(5) *Testimony* means a statement in any form, including personal appearances before a court or other legal tribunal, interviews, depositions, telephonic, televised, or videographed statements or any responses given during discovery or similar proceeding in the course of litigation.

§ 1070.31 Service of subpoenas, court orders, and other demands for CFPB information or action.

(a) Except in cases in which the CFPB is represented by legal counsel who have entered an appearance or otherwise given notice of their representation, only the General Counsel is authorized to receive and accept subpoenas or other demands or requests directed to the CFPB or its employees, whether civil or criminal in nature, for:

(1) Records of the CFPB;

(2) Official information including, but not limited to, testimony, affidavits, declarations, admissions, responses to interrogatories, or informal statements, relating to material contained in the files of the CFPB or which any CFPB employee acquired in the course and scope of the performance of his or her official duties;

(3) Garnishment or attachment of compensation of current or former employees; or

(4) The performance or non-performance of any official CFPB duty.

(b) Documents described in paragraph (a) of this section should be served upon the General Counsel, Consumer Financial Protection Bureau, 1700 G Street NW., Washington, DC 20552. Service must be effected as provided in applicable rules and regulations governing service in Federal judicial and administrative proceedings. Acceptance of such documents by the General Counsel does not constitute a waiver of any defense that might otherwise exist with respect to service under the Federal Rules of Civil or

Criminal Procedure or other applicable laws or regulations.

(c) In the event that any demand or request described in paragraph (a) of this section is sought to be delivered to a CFPB employee other than in the manner prescribed in paragraph (b) of this section, such employee shall decline service and direct the server of process to these regulations. If the demand or request is nonetheless delivered to the employee, the employee shall immediately notify, and deliver a copy of that document to, the General Counsel.

(d) The CFPB is not an agent for service for, or otherwise authorized to accept on behalf of its employees, any subpoenas, orders, or other demands or requests, which are not related to the employees' official duties.

(e) Copies of any subpoenas, orders, or other demands or requests that are directed to former employees of the CFPB in connection with the performance of official CFPB duties shall also be served upon the General Counsel. The CFPB shall not, however, serve as an agent for service for the former employee, nor is the CFPB otherwise authorized to accept service on behalf of its former employees. If the demand involves their official duties as CFPB employees, former employees who receive subpoenas, orders, or similar compulsory process should also notify, and deliver a copy of the document to, the General Counsel.

§ 1070.32 Testimony and production of documents prohibited unless approved by the General Counsel.

(a) Unless authorized by the General Counsel, no employee or former employee of the CFPB shall, in response to a demand or a request provide oral or written testimony by deposition, declaration, affidavit, or otherwise concerning any official information.

(b) Unless authorized by the General Counsel, no employee or former employee shall, in response to a demand or request, produce any document or any material acquired as part of the performance of that employee's duties or by virtue of that employee's official status.

§ 1070.33 Procedure when testimony or production of documents is sought; general.

(a) If, as part of a proceeding in which the United States or the CFPB is not a party, official information is sought through a demand for testimony, CFPB records, or other material, the party seeking such information must (except as otherwise required by Federal law or authorized by the General Counsel) set forth in writing:

(1) The title and forum of the proceeding, if applicable;

(2) A detailed description of the nature and relevance of the official information sought;

(3) A showing that other evidence reasonably suited to the requester's needs is not available from any other source; and

(4) If testimony is requested, the intended use of the testimony, a general summary of the desired testimony, and a showing that no document could be provided and used in lieu of testimony.

(b) To the extent he or she deems necessary or appropriate, the General Counsel may also require from the party seeking such information a plan of all reasonably foreseeable demands, including but not limited to the names of all employees and former employees from whom testimony or discovery will be sought, areas of inquiry, expected duration of proceedings requiring oral testimony, identification of potentially relevant documents, or any other information deemed necessary to make a determination. The purpose of this requirement is to assist the General Counsel in making an informed decision regarding whether testimony, the production of documents, or the provision of other information should be authorized.

(c) The General Counsel may consult or negotiate with an attorney for a party, or the party if not represented by an attorney, to refine or limit a request or demand so that compliance is less burdensome.

(d) The General Counsel will notify the CFPB employee and such other persons as circumstances may warrant of his or her decision regarding compliance with the request or demand.

§ 1070.34 Procedure when response to demand is required prior to receiving instructions.

(a) If a response to a demand described in § 1070.34 is required before the General Counsel renders a decision, the CFPB will request that the appropriate CFPB attorney or an attorney of the Department of Justice, as appropriate, take steps to stay, postpone, or obtain relief from the demand pending decision. If necessary, the attorney will:

(1) Appear with the employee upon whom the demand has been made;

(2) Furnish the court or other authority with a copy of the regulations contained in this subpart;

(3) Inform the court or other authority that the demand has been, or is being, as the case may be, referred for the prompt consideration of the appropriate CFPB official; and

(4) Request the court or authority to stay the demand pending receipt of the requested instructions.

(b) In the event that an immediate demand for production or disclosure is made in circumstances which would preclude the proper designation or appearance of an attorney of the CFPB or the Department of Justice on the employee's behalf, the employee, if necessary, shall request from the demanding court or authority a reasonable stay of proceedings for the purpose of obtaining instructions from the General Counsel.

§ 1070.35 Procedure in the event of an adverse ruling.

If a stay of, or other relief from, the effect of a demand made pursuant to §§ 1070.33 and 1070.34 is declined or not obtained, or if the court or other judicial or quasi-judicial authority declines to stay the effect of the demand made pursuant to §§ 1070.33 and 1070.34, or if the court or other authority rules that the demand must be complied with irrespective of the General Counsel's instructions not to produce the material or disclose the information sought, the employee upon whom the demand has been made shall decline to comply with the demand citing this subpart and *United States ex rel. Touhy v. Ragen*, 340 U.S. 462 (1951).

§ 1070.36 Considerations in determining whether the CFPB will comply with a demand or request.

(a) In deciding whether to comply with a demand or request, CFPB officials and attorneys shall consider, among other pertinent considerations:

(1) Whether such compliance would be unduly burdensome or otherwise inappropriate under the applicable rules of discovery or the rules of procedure governing the case or matter in which the demand arose;

(2) Whether the number of similar requests would have a cumulative effect on the expenditure of CFPB resources;

(3) Whether compliance is appropriate under the relevant substantive law concerning privilege or disclosure of information;

(4) The public interest;

(5) The need to conserve the time of CFPB employees for the conduct of official business;

(6) The need to avoid spending time and money of the United States for private purposes;

(7) The need to maintain impartiality between private litigants in cases where a substantial government interest is not implicated;

(8) Whether compliance would have an adverse effect on performance by the CFPB of its mission and duties;

(9) The need to avoid involving the CFPB in controversial issues not related to its mission;

(10) Whether compliance would interfere with supervisory examinations, compromise the CFPB's supervisory functions or programs, or undermine public confidence in supervised financial institutions; and

(11) Whether compliance would interfere with the CFPB's ability to monitor for risks to consumers in the offering or provision of consumer financial products and services.

(b) Among those demands and requests in response to which compliance will not ordinarily be authorized are those with respect to which any of the following factors, *inter alia*, exist:

(1) Compliance would violate a statute or applicable rule of procedure;

(2) Compliance would violate a specific regulation or Executive order;

(3) Compliance would reveal information properly classified in the interest of national security;

(4) Compliance would reveal confidential or privileged commercial or financial information or trade secrets without the owner's consent;

(5) Compliance would compromise the integrity of the deliberative processes of the CFPB;

(6) Compliance would not be appropriate or necessary under the relevant substantive law governing privilege;

(7) Compliance would reveal confidential information; or

(8) Compliance would interfere with ongoing investigations or enforcement proceedings, compromise constitutional rights, or reveal the identity of a confidential informant.

(c) The CFPB may condition disclosure of official information pursuant to a request or demand on the entry of an appropriate protective order.

§ 1070.37 Prohibition on providing expert or opinion testimony.

(a) Except as provided in this section, and subject to 5 CFR 2635.805, CFPB employees or former employees shall not provide opinion or expert testimony based upon information which they acquired in the scope and performance of their official CFPB duties, except on behalf of the CFPB or the United States or a party represented by the CFPB, or the Department of Justice, as appropriate.

(b) Any expert or opinion testimony by a former employee of the CFPB shall be excepted from paragraph (a) of this

section where the testimony involves only general expertise gained while employed at the CFPB.

(c) Upon a showing by the requestor of exceptional need or unique circumstances and that the anticipated testimony will not be adverse to the interests of the United States, the General Counsel may, consistent with 5 CFR 2635.805, exercise his or her discretion to grant special, written authorization for CFPB employees, or former employees, to appear and testify as expert witnesses at no expense to the United States.

(d) If, despite the final determination of the General Counsel, a court of competent jurisdiction or other appropriate authority orders the appearance and expert or opinion testimony of a current or former CFPB employee, that person shall immediately inform the General Counsel of such order. If the General Counsel determines that no further legal review of or challenge to the court's order will be made, the CFPB employee, or former employee, shall comply with the order. If so directed by the General Counsel, however, the employee, or former employee, shall decline to testify.

Subpart D—Confidential Information

§ 1070.40 Purpose and scope.

This subpart does not apply to requests for official information made pursuant to subparts B, C, or E of this part.

§ 1070.41 Non-disclosure of confidential information.

(a) *Non-disclosure.* Except as required by law or as provided in this part, no current or former employee or contractor or consultant of the CFPB, or any other person in possession of confidential information, shall disclose such confidential information by any means (including written or oral communications) or in any format (including paper and electronic formats), to:

(1) Any person who is not an employee, contractor, or consultant of the CFPB; or

(2) Any CFPB employee, contractor, or consultant when the disclosure of such confidential information to that employee, contractor, or consultant is not relevant to the performance of the employee's, contractor's, or consultant's assigned duties.

(b) *Disclosures to contractors and consultants.* CFPB contractors or consultants must treat confidential information in accordance with this part, other Federal laws and regulations

that apply to Federal agencies for the protection of the confidentiality of personally identifiable information and for data security and integrity, as well as any additional conditions or limitations that the CFPB may impose.

(c) *Disclosure of materials derived from confidential information.* The CFPB may, in its discretion, disclose materials that it derives from or creates using confidential information to the extent that such materials do not identify, either directly or indirectly, any particular person to whom the confidential information pertains.

(d) *Disclosure of confidential information with consent.* Where practicable, the CFPB may, in its discretion and in accordance with applicable law, disclose confidential information that directly or indirectly identifies particular persons if the CFPB obtains prior consent from such persons to make the disclosure.

(e) *Nondisclosure of confidential information provided to the CFPB by other agencies.* Nothing in this subpart requires or authorizes the CFPB to disclose confidential information that another agency has provided to the CFPB to the extent that such disclosure contravenes applicable law or the terms of any agreement that exists between the CFPB and the agency to govern the CFPB's treatment of information that the agency provides to the CFPB.

§ 1070.42 Disclosure of confidential supervisory information and confidential investigative information.

(a) *Discretionary disclosure of confidential supervisory information or confidential investigative information by the CFPB.* The CFPB may, in its discretion, and to the extent consistent with applicable law, disclose confidential supervisory information or confidential investigative information concerning a person, its affiliates, or its service providers to that person, its affiliates, or its service providers.

(b) *Disclosure of confidential supervisory information or confidential investigative information by the recipients of the information.* Unless directed otherwise by the Associate Director for Supervision, Enforcement, and Fair Lending:

(1) Any person lawfully in possession of confidential supervisory information or confidential investigative information provided directly to it by the CFPB pursuant to this section may disclose such information, or portions thereof, to its affiliates and to the following individuals to the extent that the disclosure of such confidential supervisory information or confidential investigative information is relevant to

the performance of such individuals' assigned duties:

(i) Its directors, officers, trustees, members, general partners, or employees; and

(ii) The directors, officers, trustees, members, general partners, or employees of its affiliates.

(2) Any person lawfully in possession of confidential supervisory information or confidential investigative information provided directly to it by the CFPB pursuant to this section may disclose such information, or portions thereof, to:

(i) Its certified public accountant, legal counsel, contractor, consultant, or service provider;

(ii) Its insurance provider pursuant to a claim made under an existing policy, provided that the Bureau has not precluded indemnification or reimbursement for the claim; information disclosed pursuant to this subparagraph may be used by the insurance provider solely for purposes of administering such a claim; or

(iii) Another person, with the prior written approval of the Associate Director for Supervision, Enforcement, and Fair Lending.

(3) Where a person discloses confidential supervisory information or confidential investigative information pursuant to paragraph (b) of this section:

(i) The recipient of such confidential supervisory information or confidential investigative information shall not, without the prior written approval of the Associate Director for Supervision, Enforcement, and Fair Lending, utilize, make, or retain copies of, or disclose confidential supervisory information or confidential investigative information for any purpose, except as is necessary to provide advice or services to the person or its affiliate; and

(ii) The person disclosing the confidential supervisory information or confidential investigative information shall take reasonable steps to ensure that the recipient complies with paragraph (b)(3)(i) of this section.

§ 1070.43 Disclosure of confidential information to agencies.

(a) *Required disclosure of confidential information to agencies.* The CFPB shall:

(1) Disclose a draft of a report of examination of a supervised financial institution prior to its finalization, in accordance with 12 U.S.C. 5515(e)(1)(C), and disclose a final report of examination, including any and all revisions made to such a report, to a Federal or State agency with jurisdiction over that supervised financial institution, provided that the CFPB

receives from the agency reasonable assurances as to the confidentiality of the information disclosed; and

(2) Disclose confidential consumer complaint information to a Federal or State agency to facilitate preparation of reports to Congress required by 12 U.S.C. 5493(b)(3)(C) and to facilitate the CFPB's supervision and enforcement activities and its monitoring of the market for consumer financial products and services, provided that the agency shall first give written assurance to the CFPB that it will maintain such information in confidence, including in a manner that conforms to the standards that apply to Federal agencies for the protection of the confidentiality of personally identifiable information and for data security and integrity.

(b) *Discretionary disclosure of confidential information to agencies.* (1) Upon receipt of a written request that contains the information required by paragraph (b)(2) of this section, the CFPB may, in its discretion, disclose confidential information to an Agency to the extent that the disclosure of the information is relevant to the exercise of the Agency's statutory or regulatory authority.

(2) To obtain access to confidential information pursuant to paragraph (b)(1) of this section, an authorized officer or employee of the agency shall submit a written request to the CFPB's Associate Director for Supervision, Enforcement, and Fair Lending at accessrequests@cfpb.gov or at 1700 G Street NW., Washington, DC 20552. The request shall include the following:

(i) A description of the particular information, kinds of information, and where possible, the particular documents to which access is sought;

(ii) A statement of the purpose for which the information will be used;

(iii) A statement certifying and identifying the Agency's statutory or regulatory authority that is relevant to the requested information, as required by paragraph (b)(1) of this section;

(iv) A statement certifying and identifying the agency's legal authority for protecting the requested information from public disclosure; and

(v) A certification that the agency will maintain the requested confidential information in confidence, including in a manner that conforms to the standards that apply to Federal agencies for the protection of the confidentiality of personally identifiable information and for data security and integrity, as well as any additional conditions or limitations that the CFPB may impose.

(c) *Negotiation of standing requests.* The CFPB may negotiate terms governing the exchange of confidential

information with Agencies on a standing basis, as appropriate.

§ 1070.44 Disclosure of confidential consumer complaint information.

The CFPB may, to the extent permitted by law, disclose confidential consumer complaint information as it deems necessary to investigate, resolve, or otherwise respond to consumer complaints or inquiries concerning consumer financial products and services or a violation of Federal consumer financial law.

§ 1070.45 Affirmative disclosure of confidential information.

(a) The CFPB may disclose confidential information, in accordance with applicable law, as follows:

(1) To a CFPB employee, as that term is defined in § 1070.2 and in accordance with § 1070.41;

(2) To either House of the Congress or to an appropriate committee or subcommittee of the Congress, as set forth in 12 U.S.C. 5562(d)(2), provided that, upon the receipt by the CFPB of a request from the Congress for confidential information that a financial institution submitted to the CFPB along with a claim that such information consists of a trade secret or privileged or confidential commercial or financial information, or confidential supervisory information, the CFPB may notify the financial institution in writing of its receipt of the request and provide the institution with a copy of the request;

(3) In investigational hearings and witness interviews, or otherwise in the investigation and administration of enforcement actions, as is reasonably necessary, at the discretion of the CFPB;

(4) In or related to an administrative or court proceeding to which the CFPB is a party. In the case of confidential investigative information that contains any trade secret or privileged or confidential commercial or financial information, as claimed by designation by the submitter of such material, or confidential supervisory information, the submitter, or the CFPB, in its discretion, may seek an appropriate order prior to disclosure of such material in a proceeding;

(5) In CFPB personnel matters, as necessary and subject to appropriate protections;

(6) To Agencies in summary form to the extent necessary to confer with such Agencies about matters relevant to the exercise of the Agencies' statutory or regulatory authority; or

(7) As required under any other applicable law.

§ 1070.46 Other disclosures of confidential information.

(a) To the extent permitted by law and as authorized by the Director in writing, the CFPB may disclose confidential information other than as set forth in this subpart.

(b) Prior to disclosing confidential information pursuant to paragraph (a) of this section, the CFPB may, as it deems appropriate under the circumstances, provide written notice to the person to whom the confidential information pertains that the CFPB intends to disclose its confidential information in accordance with this section.

(c) The authority of the Director to disclose confidential information pursuant to paragraph (a) of this section shall not be delegated. However, a person authorized to perform the functions of the Director in accordance with law may exercise the authority of the Director as set forth in this section.

§ 1070.47 Other rules regarding the disclosure of confidential information.

(a) *Further disclosure prohibited.* (1) All confidential information made available under this subpart shall remain the property of the CFPB, unless the Associate Director for Supervision, Enforcement, and Fair Lending provides otherwise in writing.

(2) Except as set forth in this subpart, no supervised financial institution, Agency, any officer, director, employee or agent thereof, or any other person to whom the confidential information is made available under this subpart, may further disclose such confidential information without the prior written permission of the Associate Director for Supervision, Enforcement, and Fair Lending.

(3) No person obtaining access to confidential information pursuant to this subpart may make a personal copy of any such information, and no person may remove confidential information from the premises of the institution or agency in possession of such information except as permitted under this subpart or by the CFPB.

(b) *Third party requests for information.* (1) A supervised financial institution, agency, any officer, director, employee or agent thereof, or any other person to whom the CFPB's confidential information is made available under this subpart, that receives from a third party a legally enforceable demand or request for such confidential information (including but not limited to, a subpoena or discovery request or a request made pursuant to the Freedom of Information Act, 5 U.S.C. 552, the Privacy Act of 1974, 5 U.S.C. 552a, or

any State analogue to such statutes) should:

(i) Inform the General Counsel of such request or demand in writing and provide the General Counsel with a copy of such request or demand as soon as practicable after receiving it;

(ii) To the extent permitted by applicable law, advise the requester that:

(A) The confidential information sought may not be disclosed insofar as it is the property of the CFPB; and

(B) Any request for the disclosure of such confidential information is properly directed to the CFPB pursuant to its regulations set forth in this part.

(iii) Consult with the General Counsel before complying with the request or demand, and to the extent applicable:

(A) Give the CFPB a reasonable opportunity to respond to the demand or request;

(B) Assert all reasonable and appropriate legal exemptions or privileges that the CFPB may request be asserted on its behalf; and

(C) Consent to a motion by the CFPB to intervene in any action for the purpose of asserting and preserving any claims of confidentiality with respect to any confidential information.

(2) Nothing in this section shall prevent a supervised financial institution, agency, any officer, director, employee or agent thereof, or any other person to whom the information is made available under this subpart from complying with a legally valid and enforceable order of a court of competent jurisdiction compelling production of the CFPB's confidential information, or, if compliance is deemed compulsory, with a request or demand from either House of the Congress or a duly authorized committee of the Congress. To the extent that compulsory disclosure of confidential information occurs as set forth in this paragraph, the producing party shall use its best efforts to ensure that the requestor secures an appropriate protective order or, if the requestor is a legislative body, use its best efforts to obtain the commitment or agreement of the legislative body that it will maintain the confidentiality of the confidential information.

(c) *Additional conditions and limitations.* The CFPB may impose any additional conditions or limitations on disclosure or use under this subpart that it determines are necessary.

(d) *Return or destruction of records.* The CFPB may require any person in possession of CFPB confidential information to return the records to the CFPB or destroy them.

(e) *Non-waiver of CFPB rights.* The disclosure of confidential information to any person in accordance with this subpart does not constitute a waiver by the CFPB of its right to control, or impose limitations on, the subsequent use and dissemination of the information.

(f) *Non-waiver of privilege*—(1) *In general.* The CFPB shall not be deemed to have waived any privilege applicable to any information by transferring that information to, or permitting that information to be used by, any Federal or State Agency.

(2) *Rule of Construction.* Paragraph (f)(1) of this section shall not be construed as implying that any person waives any privilege applicable to any information because paragraph (f)(1) of this section does not apply to the transfer or use of that information.

(g) *Reports of unauthorized disclosure.* Any person in possession of confidential information shall immediately notify the CFPB upon the discovery of any disclosures made in violation of this subpart.

§ 1070.48 Disclosure of confidential information by the Inspector General.

(a) Nothing in this subpart shall limit the discretion of the Office of the Inspector General of the Board of Governors of the Federal Reserve System and the Consumer Financial Protection Bureau to disclose confidential information as needed in accordance with the Inspector General Act of 1978, 5 U.S.C. App. 3.

Subpart E—Privacy Act

§ 1070.50 Purpose and scope; definitions.

(a) This subpart implements the provisions of the Privacy Act of 1974, 5 U.S.C. 552a (the Privacy Act). The regulations apply to all records maintained by the CFPB and which are retrieved by an individual's name or personal identifier. The regulations set forth the procedures for requests for access to, or amendment of, records concerning individuals that are contained in systems of records maintained by the CFPB. These regulations should be read in conjunction with the Privacy Act, which provides additional information about this topic.

(b) For purposes of this subpart, the following definitions apply:

(1) The term *Chief Privacy Officer* means the Chief Information Officer of the CFPB or any CFPB employee to whom the Chief Information Officer has delegated authority to act under this part;

(2) The term *guardian* means the parent of a minor, or the legal guardian

of any individual who has been declared to be incompetent due to physical or mental incapacity or age by a court of competent jurisdiction;

(3) *Individual* means a citizen of the United States or an alien lawfully admitted for permanent residence;

(4) *Maintain* includes maintain, collect, use, or disseminate;

(5) *Record* means any item, collection, or grouping of information about an individual that is maintained by an agency, including, but not limited to, his education, financial transactions, medical history, and criminal or employment history and that contains his name or the identifying number, symbol, or other identifying particular assigned to the individual, such as a finger or voiceprint or a photograph;

(6) *Routine use* means the disclosure of a record that is compatible with the purpose for which it was collected;

(7) *System of records* means a group of any records under the control of an agency from which information is retrieved by the name of the individual or by some identifying number, symbol, or other identifying particular assigned to the individual; and

(8) *Statistical record* means a record in a system of records maintained for statistical research or reporting purposes only and not used in whole or in part in making any determination about an identifiable individual, except as provided by 13 U.S.C. 8.

§ 1070.51 Authority and responsibilities of the Chief Privacy Officer.

The Chief Privacy Officer is authorized to:

(a) Develop, implement, and maintain an organization-wide privacy program;

(b) Respond to requests for access to, accounting of, or amendment of records contained in a system of records maintained by the CFPB;

(c) Approve the publication of new systems of records and amend existing systems of record; and

(d) File any necessary reports related to the Privacy Act.

§ 1070.52 Fees.

(a) *Copies of records.* The CFPB shall provide the requester with copies of records requested pursuant to § 1070.53 at the same cost charged for duplication of records under § 1070.22.

(b) *No fee.* The CFPB will not charge a fee if:

(1) Total charges associated with a request are less than \$5, or

(2) The requester is a CFPB employee or former employee, or an applicant for employment with the CFPB, and the request pertains to that employee, former employee, or applicant.

§ 1070.53 Request for access to records.

(a) *Procedures for making a request for access to records.* An individual's requests for access to records that pertain to that individual (or to the individual for whom the requester serves as guardian) may be submitted to the CFPB in writing as follows:

(1) If submitted by mail or delivery service, the request shall be labeled "Privacy Act Request" and shall be addressed to the Chief Privacy Officer, Consumer Financial Protection Bureau, 1700 G Street NW., Washington, DC 20552.

(2) If submitted by electronic means, the request shall be labeled "Privacy Act Request" and the request shall be submitted as set forth at the CFPB's Web site, <http://www.consumerfinance.gov>.

(b) *Content of a request for access to records.* A request for access to records shall include:

(1) A statement that the request is made pursuant to the Privacy Act;

(2) The name of the system of records that the requester believes contains the record requested, or a description of the nature of the record sought in detail sufficient to enable CFPB personnel to locate the system of records containing the record with a reasonable amount of effort;

(3) Whenever possible, a description of the nature of the record sought, the date of the record or the period in which the requester believes that the record was created, and any other information that might assist the CFPB in identifying the record sought (e.g., maiden name, dates of employment, account information, etc.).

(4) Information necessary to verify the requester's identity pursuant to paragraph (c) of this section;

(5) The mailing or email address where the CFPB's response or further correspondence should be sent.

(c) *Verification of identity.* To obtain access to the CFPB's records pertaining to a requester, the requester shall provide proof to the CFPB of the requester's identity as provided below.

(1) In general, the following will be considered adequate proof of a requester's identity:

(i) A photocopy of two forms of identification, including one form of identification that bears the requester's photograph, and one form of identification that bears the requester's signature;

(ii) A photocopy of a single form of identification that bears both the requester's photograph and signature; or

(iii) A statement swearing or affirming the requester's identity and to the fact that the requester understands the

penalties provided in 5 U.S.C. 552a(i)(3).

(2) Notwithstanding paragraph (c)(1) of this section, a designated official may require additional proof of the requester's identity before action will be taken on any request, if such official determines that it is necessary to protect against unauthorized disclosure of information in a particular case. In addition, if a requester seeks records pertaining to an individual in the requester's capacity as that individual's guardian, the requester shall be required to provide adequate proof of the requester's legal relationship before action will be taken on any request.

(d) *Request for accounting of previous disclosures.* An individual may request an accounting of previous disclosures of records pertaining to that individual in a system of records as provided in 5 U.S.C. 552a(c). Such requests should conform to the procedures and form for requests for access to records set forth in paragraphs (a) and (b) of this section.

§ 1070.54 CFPB procedures for responding to a request for access.

(a) *Acknowledgment and response.* The CFPB will provide written acknowledgement of the receipt of a request within twenty (20) business days from the receipt of the request and will, where practicable, respond to each request within that twenty (20) day period. When a full response is not practicable within the twenty (20) day period, the CFPB will respond as promptly as possible.

(b) *Disclosure.* (1) When the CFPB discloses information in response to a request, the CFPB will make the information available for inspection and copying during regular business hours as provided in § 1070.13, or the CFPB will mail it or email it to the requester, if feasible, upon request.

(2) The requester may bring with him or her anyone whom the requester chooses to see the requested material. All visitors to the CFPB's buildings must comply with the applicable security procedures.

(c) *Denial of a request.* If the CFPB denies a request made pursuant to § 1070.53, it will inform the requester in writing of the reason(s) for denial and the procedures for appealing the denial.

§ 1070.55 Special procedures for medical records.

If an individual requests medical or psychological records pursuant to § 1070.53, the CFPB will disclose them directly to the requester unless the CFPB determines that such disclosure could have an adverse effect on the requester. If the CFPB makes that

determination, the CFPB shall provide the information to a licensed physician or other appropriate representative that the requester designates, who shall disclose those records to the requester in a manner he or she deems appropriate.

§ 1070.56 Request for amendment of records.

(a) *Procedures for making request.* (1) If an individual wishes to amend a record that pertains to that individual in a system of records, that individual may submit a request in writing to the Chief Privacy Officer, as set forth in § 1070.53(a). The request shall be labeled "Privacy Act Amendment Request."

(2) A request for amendment of a record must:

(i) Identify the name of the system of records that the requester believes contains the record for which the amendment is requested, or a description of the nature of the record in detail sufficient to enable CFPB personnel to locate the system of records containing the record with a reasonable amount of effort;

(ii) Specify the portion of that record requested to be amended; and

(iii) Describe the nature and reasons for each requested amendment.

(3) When making a request for amendment of a record, the CFPB will require a requester to verify his or her identity under the procedures set forth in § 1070.53(c), unless the requester has already done so in a related request for access or amendment.

(b) *Burden of proof.* In a request for amendment of a record, the requester bears the burden of proving by a preponderance of the evidence that the record is not accurate, relevant, timely, or complete.

§ 1070.57 CFPB review of a request for amendment of records.

(a) *Time limits.* The CFPB will acknowledge a request for amendment of records within ten (10) business days after it receives the request. In the acknowledgment, the CFPB may request additional information necessary for a determination on the request for amendment. The CFPB will make a determination on a request to amend a record promptly.

(b) *Contents of response to a request for amendment.* When the CFPB responds to a request for amendment, the CFPB will inform the requester in writing whether the request is granted or denied, in whole or in part. If the CFPB grants the request, it will take the necessary steps to amend the record and, when appropriate and possible,

notify prior recipients of the record of its action. If the CFPB denies the request, in whole or in part, it will inform the requester in writing:

(1) Why the request (or portion of the request) was denied;

(2) That the requester has a right to appeal; and

(3) How to file an appeal.

§ 1070.58 Appeal of adverse determination of request for access or amendment.

(a) *Appeal.* A requester may appeal a denial of a request made pursuant to § 1070.53 or § 1070.56 within ten (10) business days after the CFPB notifies the requester that it has denied the request.

(b) *Content of appeal.* A requester may submit an appeal in writing as set forth in § 1070.53(a). The appeal shall be addressed to the General Counsel and labeled "Privacy Act Appeal." The appeal must also:

(1) Specify the background of the request; and

(2) Provide reasons why the requester believes the denial is in error.

(c) *Determination.* The General Counsel will make a determination as to whether to grant or deny an appeal within thirty (30) business days from the date it is received, unless the General Counsel extends the time for good cause.

(1) If the General Counsel grants an appeal regarding a request for amendment, he or she will take the necessary steps to amend the record and, when appropriate and possible, notify prior recipients of the record of its action.

(2) If the General Counsel denies an appeal, he or she will inform the requester of such determination in writing, including the reasons for the denial, and the requester's right to file a statement of disagreement and to have a court review its decision.

(d) *Statement of disagreement.* (1) If the General Counsel denies an appeal regarding a request for amendment, a requester may file a concise statement of disagreement with the denial. The CFPB will maintain the requester's statement with the record that the requester sought to amend and any disclosure of the record will include a copy of the requester's statement of disagreement.

(2) When practicable and appropriate, the CFPB will provide a copy of the statement of disagreement to any prior recipients of the record.

§ 1070.59 Restrictions on disclosure.

The CFPB will not disclose any record about an individual contained in a system of records to any person or agency without the prior written consent of that individual unless the

disclosure is authorized by 5 U.S.C. 552a(b). Disclosures authorized by 5 U.S.C. 552a(b) include disclosures that are compatible with one or more routine uses that are contained within the CFPB's Systems of Records Notices, which are available on the CFPB's Web site, at <http://www.consumerfinance.gov>.

§ 1070.60 Exempt records.

(a) *Exempt systems of records.* Pursuant to 5 U.S.C. 552a(k)(2), the CFPB exempts the systems of records listed below from 5 U.S.C. 552a(c)(3), (d), (e)(1), (e)(4)(G)–(H), and (f), and §§ 1070.53 through 1070.59, to the extent that such systems of records contain investigatory materials compiled for law enforcement purposes, provided, however, that if any individual is denied any right, privilege, or benefit to which he or she would otherwise be entitled under Federal law, or for which he or she would otherwise be eligible as a result of the maintenance of such material, such material shall be disclosed to such individual, except to the extent that the disclosure of such material would reveal the identity of a source who furnished information to the CFPB under an express promise that the identity of the source would be held in confidence:

- (1) CFPB.002 Depository Institution Supervision Database.
- (2) CFPB.003 Non-Depository Institution Supervision Database.
- (3) CFPB.004 Enforcement Database.
- (4) CFPB.005 Consumer Response System.

(b) *Information compiled for civil actions or proceedings.* This subpart does not permit an individual to have access to any information compiled in reasonable anticipation of a civil action or proceeding.

§ 1070.61 Training; rules of conduct; penalties for non-compliance.

(a) *Training.* The Chief Privacy Officer shall institute a training program to instruct CFPB employees and contractor personnel covered by 5 U.S.C. 552a(m), who are involved in the design, development, operation, or maintenance of any CFPB system of records, on a continuing basis with respect to the duties and responsibilities imposed on them and the rights conferred on individuals by the Privacy Act, the regulations in this subpart, and any other related regulations. Such training shall provide suitable emphasis on the civil and criminal penalties imposed on the CFPB and the individual employees by the Privacy Act for non-compliance with specified requirements of the Act

as implemented by the regulations in this subpart.

(b) *Rules of conduct.* The following rules of conduct are applicable to employees of the CFPB (including, to the extent required by the contract or 5 U.S.C. 552a(m), Government contractors and employees of such contractors), who are involved in the design, development, operation or maintenance of any system of records, or in maintain any records, for or on behalf of the CFPB.

(1) The head of each office of the CFPB shall be responsible for assuring that employees subject to such official's supervision are advised of the provisions of the Privacy Act, including the criminal penalties and civil liabilities provided therein, and the regulations in this subpart, and that such employees are made aware of their individual and collective responsibilities to protect the security of personal information, to assure its accuracy, relevance, timeliness and completeness, to avoid unauthorized disclosure either orally or in writing, and to ensure that no system of records is maintained without public notice.

(2) Employees of the CFPB involved in the design, development, operation, or maintenance of any system of records, or in maintaining any record shall:

- (i) Collect no information of a personal nature from individuals unless authorized to collect it to achieve a function or carry out a responsibility of the CFPB;
- (ii) Collect information, to the extent practicable, directly from the individual to whom it relates;
- (iii) Inform each individual asked to supply information, on the form used to collect the information or on a separate form that can be retained by the individual of—

(A) The authority (whether granted by statute, or by executive order of the President) which authorizes the solicitation of the information and whether disclosure of such information is mandatory or voluntary;

(B) The principal purpose or purposes for which the information is intended to be used;

(C) The routine uses which may be made of the information, as published pursuant to 5 U.S.C. 552a(e)(4)(D); and

(D) The effects on the individual, if any, of not providing all or any part of the requested information.

(iv) Not collect, maintain, use or disseminate information concerning an individual's religious or political beliefs or activities or membership in associations or organizations, unless expressly authorized by statute or by the

individual about whom the record is maintained or unless pertinent to and within the scope of an authorized law enforcement activity;

(v) Advise their supervisors of the existence or contemplated development of any record system which is capable of retrieving information about individuals by individual identifier;

(vi) Assure that no records maintained in a CFPB system of records are disseminated without the permission of the individual about whom the record pertains, except when authorized by 5 U.S.C. 552a(b);

(vii) Maintain and process information concerning individuals with care in order to ensure that no inadvertent disclosure of the information is made either within or without the CFPB;

(viii) Prior to disseminating any record about an individual to any person other than an agency, unless the dissemination is made pursuant to 5 U.S.C. 552a(b)(2) of this section, make reasonable efforts to assure that such records are accurate, complete, timely, and relevant for agency purposes; and

(ix) Assure that an accounting is kept in the prescribed form, of all dissemination of personal information outside the CFPB, whether made orally or in writing, unless disclosed under 5 U.S.C. 552 or subpart B of this part.

(3) The head of each office of the CFPB shall, at least annually, review the record systems subject to their supervision to ensure compliance with the provisions of the Privacy Act of 1974 and the regulations in this subpart.

§ 1070.62 Preservation of records.

The CFPB will preserve all correspondence pertaining to the requests that it receives under this part, as well as copies of all requested records, until disposition or destruction is authorized by title 44 of the United States Code or the National Archives and Records Administration's General Records Schedule 14. Records will not be disposed of or destroyed while they are the subject of a pending request, appeal, proceeding, or lawsuit.

§ 1070.63 Use and collection of Social Security numbers.

The CFPB will ensure that employees authorized to collect information are aware:

(a) That individuals may not be denied any right, benefit, or privilege as a result of refusing to provide their Social Security numbers, unless the collection is authorized either by a statute or by a regulation issued prior to 1975; and

- (b) That individuals requested to provide their Social Security numbers must be informed of:
- (1) Whether providing Social Security numbers is mandatory or voluntary;
- (2) Any statutory or regulatory authority that authorizes the collection of Social Security numbers; and
- (3) The uses that will be made of the numbers.

PART 1091—PROCEDURAL RULE TO ESTABLISH SUPERVISORY AUTHORITY OVER CERTAIN NONBANK COVERED PERSONS BASED ON RISK DETERMINATION

- 2. The authority citation for part 1091 continues to read as follows:
- Authority:** 12 U.S.C. 5512(b)(1), 5514(a)(1)(C), 5514(b)(7).

Subpart B—Determination and Voluntary Consent Procedures

- 3. Section 1091.103 is amended by revising paragraph (a)(2)(vii) to read as follows:

§ 1091.103 Contents of notice.

- * * * *
- (a) * * *
- (2) * * *
- (vii) In connection with a proceeding under this part, including a petition for termination under § 1091.113, all documents, records or other items submitted by a respondent to the Bureau, all documents prepared by, or on behalf of, or for the use of the Bureau, and any communications between the Bureau and a person, shall be deemed confidential supervisory information under 12 CFR 1070.2(j).
- * * * *

Subpart D—Time Limits and Deadlines

- 4. Section 1091.115 is amended by revising paragraph (c) to read as follows:

§ 1091.115 Change of time limits and confidentiality of proceedings.

- * * * *
- (c) In connection with a proceeding under this part, including a petition for termination under § 1091.113, all documents, records or other items submitted by a respondent to the Bureau, all documents prepared by, or on behalf of, or for the use of the Bureau, and any communications between the Bureau and a person, shall be deemed confidential supervisory information under 12 CFR 1070.2(j).
- Dated: July 13, 2016.

Good Laboratory Practice for Nonclinical Laboratory Studies; Proposed Rule

DEPARTMENT OF HEALTH AND HUMAN SERVICES

Food and Drug Administration

21 CFR Parts 16 and 58

[Docket No. FDA-2010-N-0548]

Good Laboratory Practice for Nonclinical Laboratory Studies

AGENCY: Food and Drug Administration, HHS.

ACTION: Proposed rule.

SUMMARY: The Food and Drug Administration (FDA) is proposing to amend the regulations for good laboratory practice (GLP) for nonclinical laboratory studies to require a complete quality system approach, referred to as a GLP Quality System, when safety and toxicity studies support or are intended to support applications or submissions for products regulated by FDA. We are proposing additional management responsibilities and standard operating procedures (SOPs) consistent with the proposed requirement for a GLP Quality System. We also propose to revise the testing facility definition to reflect current practices for the conduct of nonclinical laboratory studies, particularly multisite studies. These proposals are intended to build quality into planning, conducting, and reporting a nonclinical laboratory study and to help ensure data quality and integrity.

DATES: Submit either electronic or written comments on the proposed rule by November 22, 2016. Submit comments on information collection issues under the Paperwork Reduction Act of 1995 by September 23, 2016 see section IX). See section VII for the proposed effective date of a final rule based on this proposed rule.

ADDRESSES: You may submit comments as follows:

Electronic Submissions

Submit electronic comments in the following way:

- Federal eRulemaking Portal: <http://www.regulations.gov>. Follow the instructions for submitting comments. Comments submitted electronically, including attachments, to <http://www.regulations.gov> will be posted to the docket unchanged. Because your comment will be made public, you are solely responsible for ensuring that your comment does not include any confidential information that you or a third party may not wish to be posted, such as medical information, your or anyone else's Social Security number, or

confidential business information, such as a manufacturing process. Please note that if you include your name, contact information, or other information that identifies you in the body of your comments, that information will be posted on <http://www.regulations.gov>.

- If you want to submit a comment with confidential information that you do not wish to be made available to the public submit the comment as a written/paper submission and in the manner detailed (see "Written/Paper Submissions" and "Instructions").

Written/Paper Submissions

Submit written/paper submissions as follows:

- *Mail/Hand delivery/Courier (for written/paper submissions):* Division of Dockets Management (HFA-305), Food and Drug Administration, 5630 Fishers Lane, Rm. 1061, Rockville, MD 20852.

- For written/paper comments submitted to the Division of Dockets Management, FDA will post your comment, as well as any attachments, except for information submitted, marked and identified, as confidential, if submitted as detailed in "Instructions."

Instructions: All submissions received must include the Docket No. FDA-2010-N-0548 for "Good Laboratory Practice for Nonclinical Laboratory Studies." Received comments will be placed in the docket and, except for those submitted as "Confidential Submissions," publicly viewable at <http://www.regulations.gov> or at the Division of Dockets Management between 9 a.m. and 4 p.m., Monday through Friday.

- **Confidential Submissions—**To submit a comment with confidential information that you do not wish to be made publicly available submit your comments only as a written/paper submission. You should submit two copies total. One copy will include the information you claim to be confidential with a heading or cover note that states "THIS DOCUMENT CONTAINS CONFIDENTIAL INFORMATION." The Agency will review this copy, including the claimed confidential information, in its consideration of comments. The second copy, which will have the claimed confidential information redacted/blacked out, will be available for public viewing and posted on <http://www.regulations.gov>. Submit both copies to the Division of Dockets Management. If you do not wish your name and contact information to be made publicly available, you can provide this information on the cover sheet and not in the body of your comments and you must identify this

information as "confidential." Any information marked as "confidential" will not be disclosed except in accordance with 21 CFR 10.20 and other applicable disclosure law. For more information about FDA's posting of comments to public dockets, see 80 FR 56469, September 18, 2015, or access the information at: <http://www.fda.gov/regulatoryinformation/dockets/default.htm>.

Docket: For access to the docket to read background documents or the electronic and written/paper comments received, go to <http://www.regulations.gov> and insert the docket number, found in brackets in the heading of this document, into the "Search" box and follow the prompts and/or go to the Division of Dockets Management, 5630 Fishers Lane, Rm. 1061, Rockville, MD 20852.

Submit comments on information collection issues to the Office of Management and Budget (OMB) in the following ways:

Fax to the Office of Information and Regulatory Affairs, OMB, Attn: FDA Desk Officer, FAX: 202-395-7285, or email to oira_submission@omb.eop.gov. All comments should be identified with the title, "Reporting and Recordkeeping Requirements for Good Laboratory Practice for Nonclinical Laboratory Studies."

FOR FURTHER INFORMATION CONTACT:

Vernon Toelle, Office of Surveillance and Compliance, Center for Veterinary Medicine, Food and Drug Administration, 7519 Standish Pl., MPN4-142, Rockville, MD 20855, 240-402-5637; or Kristin Webster Maloney, Office of Policy and Risk Management, Office of Regulatory Affairs, Food and Drug Administration, 10903 New Hampshire Ave., Bldg. 32, Rm. 4373, Silver Spring, MD 20993, 240-402-4993.

I. Executive Summary

A. Purpose of the Proposed Rule

Nonclinical laboratory studies, often referred to as preclinical studies when conducted before first-in-human clinical studies, provide safety or toxicity information, or both, that is essential for the development of FDA-regulated products and help determine the safety of new food ingredients. For drugs administered to animals whose products will be consumed by humans, nonclinical laboratory studies are critical for determining safe levels of residual drug product. For tobacco products, nonclinical laboratory studies may provide evidence regarding the relative toxicities of new or modified risk tobacco products. FDA's regulation of the conduct of nonclinical laboratory studies is important to help ensure the quality and integrity of data derived from those studies, the protection of human subjects, and that marketing decisions are based on accurate and reliable data.

Therefore, FDA proposes to amend the GLP regulations to require the use of

a complete quality system approach (proposed GLP Quality System) when a nonclinical laboratory study supports or is intended to support an application or submission to FDA. Part 58 (21 CFR part 58) presently includes many aspects of a quality system approach. However, certain fundamentals of a fully implemented GLP Quality System considered essential to a quality system, such as certain SOPs and adequate management roles, responsibilities, and accountability, are not presently required. We therefore propose a fully implemented GLP Quality System as the proper framework for building quality into planning, conducting, and reporting a nonclinical laboratory study to help ensure the quality and integrity of the resulting data used to support FDA regulatory decisions.

We also propose to amend the GLP regulations to reflect current practices for the conduct of nonclinical laboratory studies, particularly multisite studies, while allowing industry flexibility to meet the proposed requirements.

B. Summary of the Major Provisions of the Proposed Rule

Under the proposed GLP Quality System, FDA intends to enhance the current quality system approach for nonclinical laboratory studies. The GLP Quality System will provide additional responsibilities for testing facility management and new responsibilities for maintaining SOPs. We propose modifications to the definition of a testing facility to be applicable to all nonclinical laboratory studies, whether they are conducted at a single facility or at multiple sites. We propose amending roles and functions consistent with the revised testing facility definition. FDA expects that a GLP Quality System will provide the appropriate framework for

building quality into a nonclinical laboratory study and will result in more reliable data for FDA to consider when making regulatory decisions.

C. Legal Authority

FDA proposes to issue this rule under the authority of the provisions in sections 351 and 354–360F of the Public Health Service Act (PHS Act) and the provisions in the Federal Food, Drug, and Cosmetic Act (the FD&C Act) applicable to the conduct of nonclinical laboratory studies, specifically under section 701(a) of the FD&C Act (21 U.S.C. 371(a), as essential to enforcement of the Agency's responsibilities under sections 402, 406, 408, 409, 501, 502, 503, 505, 510, 512–516, 518–520, 571, 721, 801, 905, 910, and 911 of the FD&C Act (21 U.S.C. 342, 346, 348, 349, 351, 352, 353, 355, 360, 360b–360f, 360h–360j, 360ccc, 379, 381, 387e, 387j, and 387k).

D. Costs and Benefits

Costs estimates of the rule include annual costs from the additional reporting and recordkeeping responsibilities required under the proposed GLP Quality System. One-time costs include reading and understanding the rule, updating existing SOPs, writing new SOPs, and training. We estimate annualized costs, over a 10-year period, at a 7-percent discount rate would average \$51.9 million, or \$51.5 million with a 3-percent discount rate. We lack sufficient information to quantify the benefits of the proposed rule, but we anticipate that it would result in better quality and more reliable data to support applications and submissions to us. The table summarizes these estimates along with their ranges.

SUMMARY OF BENEFITS, COSTS AND DISTRIBUTIONAL EFFECTS OF PROPOSED RULE

Category	Primary estimate	Low estimate	High estimate	Units			Notes
				Year dollars	Discount rate (%)	Period covered (years)	
Benefits:							
Annualized	2014	7	10	
Monetized				
\$millions/year	2014	3	10	
Annualized	2014	7	10	
Quantified	2014	3	10	
Qualitative	The proposed rule would clarify GLP standards to facilitate a more consistent approach and provide greater international consistency. As a result, we anticipate improvements in the integrity and quality of data submitted for FDA review decisions.						
Costs:							

SUMMARY OF BENEFITS, COSTS AND DISTRIBUTIONAL EFFECTS OF PROPOSED RULE—Continued

Category	Primary estimate	Low estimate	High estimate	Units			Notes
				Year dollars	Discount rate (%)	Period covered (years)	
Annualized	\$51.9	\$34.4	\$69.3	2014	7	10	
Monetized \$millions/year	51.5	34.2	68.9	2014	3	10	
Annualized	2014	7	10	
Quantified	2014	3	10	
Qualitative:							
Federal	2014	7	10	
Annualized	2014	3	10	
Monetized millions/year	From:			To:			
Transfers:							
Other	2014	7	10	
Annualized	2014	3	10	
Monetized millions/year	From:			To:			
Effects:	State, Local or Tribal Government: None estimated. Small Business: The proposed requirements would likely impose a significant burden on small entities employing fewer than 10 workers in “Dental Equipment and Supplies” (between 1.87 and 8.94 percent of average annual sales). However, we do not have data on how many of these dental-equipment small entities perform nonclinical laboratory studies to support, or intended to support, an application or submission regulated by us; only such entities would be affected by the rule. Wages: None estimated.						

II. Introduction

FDA is proposing to amend the GLP regulations in part 58 to require the use of a complete quality system approach, referred to as a GLP Quality System, for the conduct of nonclinical laboratory studies when safety or toxicity studies, or both, support or are intended to support applications or submissions to FDA. FDA proposes to define a GLP Quality System as the organizational structure, responsibilities, procedures, processes, and resources for implementing quality management in the conduct of nonclinical laboratory studies.

While many aspects of a quality system approach are presently included in part 58, we expect that implementation of a GLP Quality System will provide an improved framework that is more flexible and will help ensure quality in planning, conducting, and reporting nonclinical laboratory studies. Consistent with the proposed requirement for a GLP Quality System, we propose additional management responsibilities, with accompanying SOPs, to ensure management's responsibility for establishing and maintaining the quality system. We also propose to revise the definition of a testing facility to reflect current practices for the conduct of

nonclinical laboratory studies, particularly the conduct of multisite studies. Conforming modifications are proposed for consistency with the proposed GLP Quality System and today's prevalence of multisite studies.

FDA is proposing these changes to help ensure the quality and integrity of data from nonclinical laboratory studies conducted in support of applications and submissions to FDA. We also are modernizing the regulations to further the Agency's efforts to encourage the implementation of the principles of the “3Rs,” to reduce, refine, and replace animal use in testing. This approach seeks to minimize the use of animals in such testing and promote more humane, appropriate, and specific test methods for evaluating product safety. These proposed changes will clarify and update the regulations. In particular, we are proposing changes recognizing the current prevalence of multisite studies while adding flexibility consistent with current practices and the use of ever-changing technology.

A. What is the background for this rule?

On December 21, 2010, FDA published an advanced notice of proposed rulemaking (ANPRM), “Good Laboratory Practice for Nonclinical Laboratory Studies” (December 2010 ANPRM) (75 FR 80011), to solicit

stakeholder input regarding FDA's intention to modify the GLP regulations in part 58. As stated in the December 2010 ANPRM, FDA is proposing to require that all facilities conduct nonclinical laboratory studies under a GLP Quality System when those studies support or are intended to support an application or submission to FDA.

The December 2010 ANPRM addressed nine specific areas to consider for amending part 58. Those nine areas are: (1) The GLP Quality System, (2) Multisite Studies, (3) Electronic/Computerized Systems, (4) Sponsor Responsibilities, (5) Animal Welfare, (6) Information on Quality Assurance Inspection Findings, (7) Process-Based Systems Inspections, (8) Test and Control Article Information, and (9) Sample Storage Container Retention.

FDA received about 90 comments to the December 2010 ANPRM. Most of the comments address the nine specific areas; however, a number of the comments include additional areas for FDA's consideration. All comments were reviewed and considered by a working group with representatives from all FDA Centers, along with representatives from the U.S. Environmental Protection Agency (EPA), the Animal and Plant Health Inspection Service of the U.S.

Department of Agriculture (USDA/APHIS), and the Office of Laboratory Animal Welfare at the National Institutes of Health (NIH/OLAW).

In addition to the December 2010 ANPRM comments, we reviewed and considered the documents of the working group on GLP of the Organisation for Economic Co-operation and Development (OECD), including the general principles of GLP and consensus and advisory documents (Ref. 1). The United States is a signatory to OECD's GLP Mutual Acceptance of Data agreement (Ref. 2) and, as an OECD member country, FDA participated in the development of OECD's GLP documents. For this proposal, we strive for consistency with the relevant OECD documents whenever possible.

B. Why is FDA proposing this rule?

The proposed GLP Quality System would help to provide a flexible framework for building quality into planning, conducting, and reporting a nonclinical laboratory study, and would help ensure the integrity of data submitted to FDA to support FDA regulatory decisions. The present regulations do not require certain fundamentals considered essential to a complete quality system. For example, the present regulations do not specifically require SOPs for developing and maintaining SOPs, or SOPs for developing and periodically assessing a quality system, nor do they provide for adequate management roles, responsibilities, and accountability. We note that a major principle of a complete quality system is management's ultimate responsibility for establishing and maintaining the quality system.

This proposal also is intended to update the regulations to reflect today's conduct of nonclinical laboratory studies, particularly the conduct of multisite studies. For multisite studies that may have multiple contracts and subcontracts for various study phases, effective communication is essential, especially considering the proposed requirement for a single final study report. We agree with the numerous comments to the December 2010 ANPRM that support a clear delineation of study responsibilities and effective communication among all parties involved in multisite studies.

Some stakeholders suggest that certain provisions in part 58 are outdated and hamper efficient use of present technology (for example, requiring hard copies of records and documentation instead of allowing computerized options). Several industry organizations approached FDA after the announcement of the Bioresearch

Monitoring (BIMO) Modernization Initiative in 2006 (Ref. 3), requesting that we modernize the GLP regulations. One request, among others, was to remove the requirement that the quality assurance unit (QAU) must maintain the master schedule and copies of protocols. These requests were echoed in several comments to the December 2010 ANPRM. FDA agrees with those comments and proposes to update part 58 to help address the use of present technology.

Because the number of FDA inspections is limited by competing priorities and limited resources, we look to sponsors and nonclinical laboratory management to help ensure that data submitted to FDA in support of applications and submissions are reliable. For those nonclinical laboratory studies that are the bases for allowing a new medical product into first-in-human clinical studies, the quality and integrity of the data are crucial to human subject protection.

This proposal complements the intent of the original GLP proposed rule to ensure the quality and integrity of the resulting data (41 FR 51206 at 51210, November 19, 1976) (Ref. 4). FDA expects that requiring a GLP Quality System will help ensure data quality and integrity. The proposed GLP Quality System also will allow the flexibility to develop site-specific procedures for related SOPs. Because of the great diversity in institutions, research activities, and organizational structures covered by these regulations, it is important to have sufficient flexibility in the regulations to allow the regulated parties to meet these requirements in a manner that best suits their organizational needs.

III. Description of the Part 58 Proposal

A. What did FDA consider when drafting this rule?

1. Animal Rule

Several comments to the December 2010 ANPRM requested that FDA modify part 58 to accommodate studies conducted in animals to support the effectiveness of human drugs or biological products when human efficacy studies are not ethical or feasible. Those comments refer to the "Animal Rule" (21 CFR parts 314 and 601) (67 FR 37988, May 31, 2002).

The Animal Rule provides a pathway for FDA to grant marketing approval based on adequate and well-controlled animal efficacy studies when the results of those studies establish that the drugs or biological products are reasonably likely to produce clinical benefit in humans. Products evaluated for efficacy

under the Animal Rule should be evaluated for safety under the existing requirements for establishing the safety of new drugs and biological products. The provisions in part 314, subpart I for drugs and part 601, subpart H for biological products apply only to situations when adequate and well-controlled human efficacy studies cannot ethically be conducted because they would involve deliberate exposure of healthy human volunteers to a potentially lethal or permanently disabling toxic chemical, biological, radiological, or nuclear substance, and field trials to study the product's effectiveness after an accidental or hostile exposure have not been feasible.

In the past, FDA has said that "All studies subject to this rule must be conducted in accordance with preexisting requirements under the good laboratory practices (21 CFR part 58) regulations" (67 FR 37988 at 37989, May 31, 2002). FDA made this statement because part 58 includes requirements for a quality system structure to ensure the quality and integrity of animal study data. These studies are intended to generate data that are essential for the approval or licensure of products intended for human use. Thus, ensuring the quality and integrity of data from these studies is critical as they serve as substantial evidence of effectiveness of the product.

Part 58 was issued to ensure the quality and integrity of nonclinical laboratory studies conducted to assess the safety of FDA-regulated products. In response to comments made to the ANPRM, FDA questions whether any requirement presently in part 58 or in this proposal poses a unique or disproportionate obstacle or burden on the conduct of certain animal studies specific to product development under the Animal Rule.

FDA, however, tentatively concludes there may be justifiable limitations to applying GLP regulations when conducting Animal Rule-specific studies, especially for studies using challenge agents that require high-containment facilities (for example, biosafety level 4 (BSL-4)¹ laboratory environments). Therefore, although part 58 embodies critical elements of a quality system to ensure data quality

¹ BSL-4 refers to the practices, safety equipment, and safeguards required for laboratories that work with highly infectious and lethal pathogenic microbes which cause, for example, such lethal diseases in humans as smallpox, Ebola, or Marburg virus hemorrhagic fever. BSL-4 is the highest biosafety level designation possible and means that the most stringent safeguards are in place to protect researchers, non-laboratory building occupants, the general public, and the environment from exposure to exotic or lethal agents.

and integrity, FDA also recognizes that some current part 58 requirements may not be appropriate, or may require modification to address adequately data quality practices for the Animal Rule-specific studies.

Accordingly, although not included in the regulatory text portion of this proposal, FDA is considering expanding part 58 to include the conduct of certain Animal Rule studies that support approval or licensure of products for human use under the established data quality and integrity standards. We seek comment on this proposal. In particular, we invite comment on the possibility of amending the scope of the regulation in § 58.1(a) to encompass not only nonclinical laboratory studies, but also to include certain Animal Rule-specific studies. Correspondingly, we are considering adding a definition in § 58.3 for “Animal Rule-specific studies subject to GLP” (for purposes of this document, “Animal Rule-specific studies subject to GLP” are referred to as “covered Animal Rule studies”).

Specifically, FDA is considering including within the definition of covered Animal Rule studies only the following types of studies to support product approval under the Animal Rule: (1) The adequate and well-controlled animal efficacy studies that serve as substantial evidence of the effectiveness necessary for approval or licensure of human drugs or biological products, respectively; (2) pharmacokinetic and/or pharmacodynamic studies in animals used to select a dose and regimen in humans; and (3) if seeking qualification through FDA’s Animal Model Qualification Program,² the model-defining natural history studies.^{3,4}

² The Animal Model Qualification Program is part of FDA’s Drug Development Tool (DDT) Qualification Program. The DDT Program provides a framework for development and regulatory acceptance of scientific tools for use in drug development programs. Qualification of an animal model is not required for the approval of drugs or licensure of biologics under the Animal Rule. For more information about this program, see FDA’s guidance for industry and FDA staff *Qualification Process for Drug Development Tools* (January 2014) (<http://www.fda.gov/downloads/drugs/guidancecomplianceregulatoryinformation/guidances/ucm230597.pdf>), and the Animal Model Qualification Program Web site: <http://inside.fda.gov:9003/CDER/OfficeofTranslationalSciences/BiomarkerQualifications/ucm271856.htm>.

³ In the context of animal model qualification, the model-defining natural history studies are the animal studies that establish the ranges of values of key parameters of the disease or condition that will be specified in the context of use statement for the qualified model and that will be used as measures of quality control and quality assurance when the model is replicated.

⁴ Natural history studies that will not be used to support the qualification of an animal model, as

FDA seeks comment on the impact of expanding part 58 to include these covered Animal Rule studies. We also request comment on what other changes to the regulations, beyond amending the scope and definitions, are needed to address issues unique to covered Animal Rule studies. FDA specifically requests comments in response to the following questions:

1. Would amending part 58 to expand the scope to include covered Animal Rule studies establish an appropriate quality system approach to the conduct of such studies to ensure data quality and integrity? If not, what gaps or shortcomings would remain, and how should they be addressed?

2. Would such an amendment provide sufficient clarity and flexibility to sponsors and investigators? If not, what alternatives or changes to this approach are needed?

3. FDA is considering adding a definition in part 58 for “Animal Rule-specific studies subject to GLP” (referred to as “covered Animal Rule studies”). As discussed in section III.A.1., the proposed definition contains three specific types of studies that would be subject to part 58. Is the term “Animal Rule-specific studies subject to GLP,” as defined in § 58.3, clear and appropriately inclusive?

4. What are the benefits, challenges, and burdens of amending part 58 to include covered Animal Rule studies?

a. Would this proposed expansion of the scope in § 58.1(a) impact entities conducting covered Animal Rule studies?

b. Would the proposed expansion of the scope in § 58.1(a) impact those entities engaged in conducting nonclinical laboratory studies to assess product safety?

c. What could be done to minimize burdens or costs, including costs or burdens on small entities, associated with part 58 compliance for covered Animal Rule studies?

5. Are there any challenges or differences involved in the conduct of covered Animal Rule studies (versus nonclinical laboratory studies) that merit different standards or establishment of a separate regulation? If so, what are those challenges or differences, and what alternative(s) would be preferable?

6. Based on possible differences identified in question 5, are there any particular aspects in the current or proposed part 58 that would be unduly difficult to meet? What changes to current part 58, or the proposed

defined in footnote 2, would not be subject to GLP regulations.

amendments, could be made to address or accommodate these issues? For example:

a. Would it be satisfactory to include a provision to allow on a case-by-case basis a covered Animal Rule study sponsor to seek FDA agreement on deviations from certain part 58 requirements that may not be practicable to meet as follows: “When the study is an Animal Rule-specific study subject to GLP, FDA may agree to deviations from any requirement of this part that it finds unnecessary to ensure the quality and integrity of the study by written agreement with the sponsor before the conduct of the study. In such cases, FDA’s acceptance of deviations from the requirements will be contingent upon compliance with any alternative requirements included in that agreement.”

b. Would it be workable or appropriate to entirely exempt covered Animal Rule studies from certain requirements of part 58? If so, what exemption(s) would be necessary or appropriate?

As discussed in section III.A.1., FDA considers GLP regulations to be a well-established and relevant system for ensuring data quality and integrity for covered Animal Rule studies. Therefore, until a final rule is published, FDA recommends the use of the current GLP framework (for example, definitions, procedures, roles and responsibilities, and controls) for covered Animal Rule studies to the extent practicable, and intends to provide more information about FDA’s expectations for adapting a GLP framework to these studies.

Before initiating covered Animal Rule studies, sponsors should identify aspects of the studies anticipated to be challenging with regard to GLP and propose methods for adapting the studies to ensure the quality and integrity of the resulting data. Sponsors should submit this information to FDA for concurrence on the data quality and integrity plan before the studies are initiated. A guidance document is available regarding the essential elements necessary to address efficacy under the Animal Rule.⁵

2. ISO 9001 and GLP Quality System

Many comments to the December 2010 ANPRM note that the International Organization for Standardization (ISO) 9001 is very general and not all aspects outlined in ISO 9001 are applicable to GLPs. FDA acknowledges this.

⁵ See FDA’s guidance for industry *Product Development Under the Animal Rule* (October 2015), at <http://www.fda.gov/downloads/Drugs/GuidanceComplianceRegulatoryInformation/Guidances/UCM399217.pdf>.

However, ISO 9001 is an internationally recognized standard for quality systems. Also, FDA's Quality System Regulation (QSR) in part 820 (21 CFR part 820) for current good manufacturing practice requirements for medical devices was harmonized, to the extent possible, with the ISO 9001: 1994 "Quality Systems—Model for Quality Assurance in Design, Development, Production, Installation and Servicing."

Some comments to the December 2010 ANPRM state that consistency with the ISO 9001 standard would be acceptable if we retained what they perceived as the present flexibility of the regulations. A number of comments state that it would be beneficial to borrow elements of a quality system from the QSR requirements in part 820 rather than reference ISO 9001:1994. Many comments also request that we define the operational areas necessary for broader adoption of a quality system approach.

In this proposal, we incorporate aspects of ISO 9001:1994 that are consistent with part 820 and our desire to propose a complete quality system approach. For example, we propose to address establishing and maintaining a GLP quality system by adding to part 58 certain definitions, relevant SOPs, and management roles and responsibilities modeled after the part 820 requirements. Our proposed additions to more fully enable a GLP quality system will help expand the present flexibility in part 58. Our proposals also are consistent with OECD guidance documents for GLP wherever possible and, at the very least, do not conflict with them.

3. Animal Welfare

Many comments to the December 2010 ANPRM note that § 58.90 covers animal care and thus, FDA investigators review documentation of animal care during GLP inspections. This is true. If animal care is not compliant with appropriate standards, there is a high likelihood that such noncompliance could confound the results of affected studies. Since the good laboratory practice regulations were published, the Animal Welfare Act has been amended and the public's perception of animal welfare has changed. Therefore, we propose specific responsibilities regarding animal welfare because the humane treatment of animals in research settings is essential to the quality and integrity of GLP studies.

Many comments to the December 2010 ANPRM state that addressing animal welfare in part 58 would be a duplication of USDA/APHIS or the NIH regulations. That is not our intention.

FDA has a Memorandum of Understanding (MOU) (Ref. 5) with USDA/APHIS and NIH/OLAW regarding animal welfare oversight. FDA forwards to the relevant regulatory agency any concerns regarding animal welfare observed during FDA inspections for their followup. Those animal welfare observations are not included on a Form FDA 483 (Inspectional Observations) that may be issued at the close of an FDA inspection, unless the observations also show noncompliance with § 58.90.

While this proposal addresses animal welfare concerns, FDA supports the use of non-animal testing methods when scientifically valid alternatives are available. We encourage sponsors with questions about non-animal testing methods to approach FDA early in the development process for consultation on the suitability and acceptability of non-animal tests for their particular product. This approach reflects FDA's position in its May 20, 2010, citizen petition response to the Mandatory Alternatives Petition Coalition and subsequent Agency statements. That petition requested that FDA require only non-animal test methods instead of corresponding animal test methods whenever such scientifically satisfactory methods are available. (See Docket No. FDA-2007-P-0109.)

4. Multisite Studies

As stated in the December 2010 ANPRM, FDA's intent was simply to add new definitions relevant to roles and responsibilities specific to multisite studies. Many comments to the December 2010 ANPRM state that the present regulations are basically adequate and suggested only minimal modifications.

Since publication of the December 2010 ANPRM, we have changed our thinking concerning regulatory changes needed to address multisite studies. For example, we have determined that amending the definition of a testing facility will help address the current conduct of multisite studies. We discuss in section III.B.2. our proposed changes to that definition.

Many comments to the December 2010 ANPRM suggest that we align our requirements regarding multisite studies with the OECD consensus document entitled, *The Application of the OECD Principles of GLP to the Organisation and Management of Multi-Site Studies* (Ref. 6). The comments also requested that we not be as prescriptive as those OECD directives. We agree with those comments. We reviewed and considered this OECD consensus document and

incorporated into our proposal the same general concepts, where applicable.

5. GLP Roles and Responsibilities

We propose to maintain the current GLP roles for management, study director, and QAU. We propose that the overarching responsibilities of those who fulfill these roles remain as follows: Management is responsible for establishing and maintaining conditions and procedures necessary for the conduct of nonclinical laboratory studies compliant with GLPs; the study director, as the sole point of study control, is responsible for implementing those procedures in specific studies; and the QAU is responsible for inspecting and general oversight of studies, verifying that they are GLP compliant or recommending changes needed for bringing them into compliance.

These responsibilities complement each other and sometimes overlap in multiple areas, providing for a system of checks and balances. We intend for this proposal to maintain the authority necessary for fulfilling each of these roles while allowing maximum flexibility for the conduct of a GLP-compliant nonclinical laboratory study.

We are interested in feedback about whether this proposal will accomplish our goal of maintaining the necessary interrelationships among these roles, and whether our proposal undermines any one of these roles or fails to provide adequate flexibility.

B. Part 58, Subpart A—General Provisions

1. Scope (§ 58.1)

We propose to expand the scope of FDA-regulated nonclinical laboratory studies to specifically include toxicity studies. For purposes of this proposal, toxicity means the acute or long-term adverse effects that could result from use of the FDA-regulated product. While some nonclinical laboratory studies of FDA-regulated products evaluate a product's safety, including toxicity, most are conducted solely to determine a product's toxicity. For example, when combined with the results of clinical trials, determination of toxicity at various doses can inform an appropriate risk-to-benefit analysis when relevant to FDA's consideration of a product's marketing application or submission.

For drugs administered to animals whose products will be consumed by humans, toxicity studies are critical for determining safe levels of residual drug product. Nonclinical laboratory studies of food ingredients and food contact substances provide the basis for

establishing levels at which a substance will not, with reasonable certainty, be harmful under its intended conditions of use. In the evaluation of tobacco products, FDA could use the data derived from nonclinical laboratory studies to evaluate relative toxicity as opposed to evaluating safety.

Additional proposed modifications to the scope in § 58.1 expand the language to include FDA jurisdictional oversight of tobacco products as specified in the FD&C Act, sections 905, 910, and 911. We also propose to modify and broaden “medical devices for human use” to “devices” to include FDA’s Center for Veterinary Medicine (CVM), which has jurisdiction over devices used in veterinary medicine.

In addition, we propose changing the provision “for research and marketing permits” to “applications or submissions” for FDA-regulated products. This proposed change will include the applications and submissions to FDA listed in the definitions section of this proposal.

As stated in both the preamble to the original proposed regulations (original GLP proposed rule) (41 FR 51206 at 51210) and the preamble to the original GLP final rule (43 FR 59986 at 59988), the GLP “regulations are intended to ensure, as far as possible, the quality and integrity of test data that are submitted to FDA and become the basis for regulatory decisions made by the Agency.” Therefore, the phrase “intended to support” in present and proposed § 58.1(a) means that any nonclinical laboratory study included within the proposed expanded scope of Part 58 that is conducted with the intent that it may support an application or submission to FDA should be conducted in compliance with the GLP regulations.

Also, we propose adding § 58.1(c) to describe what we mean by “where appropriate” when used in the part 58 regulatory text. This proposal addresses studies conducted at a single testing facility as well as at multiple sites. We propose using “where appropriate” in many of the revised or added provisions because not all requirements are applicable to all studies. For example, a test site tasked only with interpreting a study’s histopathology would not require all of the SOPs required for a test site responsible for multiple phases.

2. Definitions (§ 58.3)

The current § 58.3 *Definitions*, is not alphabetized and includes paragraphs (a) through (p). We propose to remove the paragraph designations, add new definitions, modify certain current definitions, and alphabetize the complete listing of definitions.

We propose modifying current § 58.3(e) to change the defined term from “Application for research or marketing permit” to “Applications and Submissions to FDA”. We propose this change because nonclinical laboratory studies can support applications and submissions to FDA other than those for research and marketing. Also, in the definition for “Applications and Submissions to FDA” proposed paragraphs (1) through (35), we add certain relevant statutory or regulatory citations for consistency.

We propose including applications and submissions for tobacco products described in the FD&C Act. We note that FDA plans to issue regulations under section 910(g), providing conditions under which tobacco products intended for investigational use may be exempted from the requirements of chapter IX of the FD&C Act. It is our intent that applications for such investigational tobacco products will be included within the scope of § 58.3.

We also propose adding those applications and submissions for FDA-regulated products that include nonclinical laboratory study results but are not currently specifically included. For example, Humanitarian Device Exemption applications are new since publishing in 1987 the last final rule modifying part 58. We also propose expressly adding the medical device Premarket Notification (also known as a “510(k)” submission).

Attending Veterinarian: We propose adding a definition for an attending veterinarian. Our proposed definition is the same as the definition in USDA’s Animal Welfare Regulations (9 CFR 1.1) but without specifics about educational requirements. We propose defining an attending veterinarian as a veterinarian with training, experience, or both in the care and management of the species being attended, with direct or delegated authority for activities involving animals. We propose this definition because we propose in part 58 certain provisions about animal welfare. For example, we propose that the study director must defer to the attending veterinarian when decisions regarding animal welfare arise, particularly when animals are in pain or distress.

Batch: We propose changing the definition of batch currently in § 58.3(n) to reference the relevant provisions in § 58.105 (Test, control, and reference article characterization) and § 58.107 (Test, control, and reference article handling). We also add that batch means a specific quantity or lot of a reference article (see section III.B.2.), we discuss the addition of a reference article definition.

Contracted Person: We propose adding a definition for contracted person to mean a person that assumes, either directly or indirectly as an independent contractor, one or more of the responsibilities for conducting a nonclinical laboratory study. Several comments to the December 2010 ANPRM state that the responsibilities of all persons (any legal entity) involved in multisite studies need to be addressed in the regulations. We propose the use of this term to allow us to address the comments without specifically identifying all possible contracted entities.

The comments also request that FDA include specifics for multisite studies as to how responsibilities are to be met and by whom. In response to these comments, we intend that a contracted person includes any person (for example, testing facility or individual) that the sponsor contracts with to conduct a phase (defined activity or set of activities) of a nonclinical laboratory study. Also, the term contracted person includes any person that is under a subcontract to conduct a phase of a nonclinical laboratory study.

Contributing Scientist: We propose adding and defining the term contributing scientist. A contributing scientist is an individual responsible for conducting, interpreting, analyzing, or performing any service for a phase of a nonclinical laboratory study. The current regulation in § 58.185 for reporting study results refers to “individual scientists or other professionals involved in the study” (see § 58.185(a)(12)). Our proposal replaces these scientists or other professionals with the term contributing scientist. In addition, when a contributing scientist is a contracted independent expert or specialist, we use the term independent contributing scientist. See, also, section III.C.6. where we discuss § 58.37 (Contributing scientist).

Control Article: We propose modifying the definition of control article currently in § 58.3(c) by changing “medical device for human use” to “device” to expand the regulations to include devices used in veterinary medicine. Also, the revised definition proposes to include a “tobacco product”.

Establish: For this part 58 proposal, the meaning of establish is to define, document (in writing or electronically), and implement. We propose adding a definition for establish to help eliminate repeating in the applicable regulatory text the words that define establish. Our proposed definition is identical to the

definition of establish in the part 820 quality system regulation in § 820.3(k).

Facility-Based Inspection: We propose introducing the term facility-based inspection to mean a QAU inspection that covers the general facilities and activities; for example, installations, support systems, computer systems, training, environmental monitoring, and equipment maintenance and calibration. This addition, along with the definition of process-based inspection (see section III.B.2.) would allow for greater efficiency instead of duplicating, for each study, inspection of those general facilities and activities. Our proposed definition also is consistent with the definition for facility-based inspection in the OECD document, *Quality Assurance and GLP* (Ref. 7).

GLP Quality System: We propose adding a definition for GLP Quality System to mean the organizational structure, responsibilities, procedures, processes, and resources for implementing quality management in the conduct of nonclinical laboratory studies. As discussed in section II.B., we consider a fully implemented GLP Quality System the proper framework for building quality into planning, conducting, and reporting a nonclinical laboratory study while allowing flexibility for site-specific procedures.

Lead Quality Assurance Unit: We propose adding a definition for a lead quality assurance unit (lead QAU) meaning the QAU responsible for quality assurance (QA) in a multisite nonclinical laboratory study. We propose that testing facility management with executive responsibility selects the lead QAU. The location of the lead QAU may be at the testing facility, with another person conducting a phase of the study, or provided through a contractual relationship. This definition is consistent with the definition for lead QAU in the OECD consensus document, *The Application of the OECD Principles of GLP to the Organisation and Management of Multi-Site Studies* (Ref. 6).

Management with Executive Responsibility: We propose adding a definition for management with executive responsibility to mean senior employees of the testing facility or test site who have the authority to establish or make changes to the quality policy and GLP Quality System at their testing facility or test site. We note that part 820 (see § 820.3(n)) adopted this term describing senior management to be consistent with the quality system specifications in ISO 9001:1994 (61 FR 52602 at 52609, October 7, 1996).

Master Schedule: We propose adding a definition for master schedule that

means a compilation of information used for assessment of workload and the tracking of nonclinical laboratory studies. The master schedule will include information about all nonclinical laboratory studies conducted. For multisite studies, the master schedule also will include the phases conducted (see proposed 58.31(k)). Our proposed definition of master schedule is consistent with the definition in the OECD GLP document, *OECD Principles on Good Laboratory Practice* (Ref. 8). When we discuss § 58.31 (Management with executive responsibility, section III.C.2.), we elaborate on requirements concerning the master schedule.

Multisite Study: We propose adding a definition for multisite study to mean any study that has phases (defined in section III.B.2.) conducted at more than one site. Our proposed definition of multisite study is consistent with the definition in the OECD consensus document, *The Application of the OECD Principles of GLP to the Organisation and Management of Multi-Site Studies* (Ref. 6).

Nonclinical Laboratory Study: We propose modifying the current definition in § 58.3(d) for a nonclinical laboratory study to add after “under laboratory conditions” the phrase “or in the applicable environment”. This addition recognizes that the conduct of a nonclinical laboratory study is not limited to a traditional laboratory environment. We propose to make clear that the purpose for conducting nonclinical laboratory studies may be to determine relative toxicity. For example, because tobacco products are not safe, nonclinical laboratory studies help FDA evaluate the relative toxicities of those products. We also propose to update the regulations by changing “field trials in animals” to “clinical investigational use in animals”, which more accurately describes our intent. We propose a sentence structure change in the last sentence in this definition to clarify our intent, which is often misinterpreted due to the current sentence structure.

Phase: We propose adding a definition for phase to mean a defined activity or set of activities in the conduct of a nonclinical laboratory study. We propose this new definition to aid in understanding the new proposed definition of multisite study, which is any study that has phases conducted at more than one site. Our proposed definition is consistent with the definition of phase in the OECD consensus document, *The Application of the OECD Principles of GLP to the*

Organisation and Management of Multi-Site Studies (Ref. 6).

Principal Investigator: We propose adding a definition for principal investigator to mean an individual with specific responsibilities delegated by the study director for a phase of a nonclinical laboratory study. We propose defining principal investigator in general terms rather than specifying the principal investigator's single role in a multisite study as defined in the OECD document, *OECD Principles on Good Laboratory Practice* (Ref. 8). However, we propose that principal investigator responsibilities are those delegated by the study director, which is consistent with OECD principles. See, also, section III.C.7. where we discuss § 58.39 (Principal investigator).

Process-based Inspection: We propose adding a definition for process-based inspection to mean inspecting repetitive, frequently performed procedures and processes (for example, certain mutagenicity studies). This definition recognizes present practice and allows for greater efficiency, as noted elsewhere (section III.B.2.). Our proposed definition is consistent with the definition for process-based inspection in the OECD document, *Quality Assurance and GLP* (Ref. 7).

Quality: We propose adding a definition for quality, meaning the totality of features and characteristics bearing on the ability of a nonclinical laboratory study to provide reliable data.

Quality Assurance Unit (QAU): We propose modifying the current definition in § 58.3(l) to remove “except the study director” and “designation by testing facility management”. Also, we propose adding a sentence “The QAU must be entirely separate from and independent of the personnel engaged in the direction and conduct of the particular study.” We propose these changes for clarity and to be consistent with our inclusion of multisite studies and with the statement currently in § 58.35.

Quality Policy: We propose adding a definition for quality policy that is identical to the definition in § 820.3(u), meaning “the overall intentions and direction of an organization with respect to quality, as established by management with executive responsibility.”

Raw Data: We propose modifying the current definition in § 58.3(k) to update the regulations to address copying requirements and computerized systems, and to specifically include the pathology report. We propose adding to the definition that raw data means “all nonclinical laboratory study records and

documentation or exact copies that maintain the original intent and meaning and are made according to the person's certified copy procedures." This additional regulatory text eliminates the need to provide examples of what we consider a copy. We also propose adding "correspondence" and "other documentation (regardless of capture medium)" to the examples of raw data. The addition of "regardless of capture medium" eliminates the need to provide examples of possible capture media. Also, we propose including as raw data "the signed and dated pathology report" to clarify what we consider as raw data.

Reference Article: We propose adding a definition for reference article consistent with EPA's GLP regulations in 40 CFR 160.3 and 792.3 for defining a "reference substance" to mean an article used to establish a basis for comparison of the test article for known chemical or biological measurements. We propose this addition to acknowledge the use of reference articles in certain studies.

Short-Term Study: We propose adding a definition for short-term study to mean when the in-life period (study period during which data are collected) is completed within several days or, at most, a week. Since the pre-specified, periodic timing of process-based inspections can result in the lack of an inspection of a short-term study, this definition is necessary to address our proposed addition of process-based inspections (see also the discussion of the definition of process-based inspection in section III.B.2.).

Specimen: We propose adding "or retention" to the end of the current definition of specimen in § 58.3(j) to read, "Specimen means any material derived from a test system for examination, analysis, or retention." We propose this change because a specimen may be collected solely for retention purposes. Also, this proposed change is consistent with the definition in the OECD GLP document, *OECD Principles on Good Laboratory Practice* (Ref. 8).

Sponsor: We propose modifying the current definition of sponsor in § 58.3(f) consistent with our proposal to expand the scope of part 58, and to address possible roles of the sponsor in multisite studies. We propose revising the current definition in § 58.3(f)(3) to include the possible roles a sponsor could play in a multisite study in addition to initiating and supporting the study. Those roles and applicable requirements are the same as those for a testing facility, test site, or contributing scientist as we propose to define those terms.

See, also, section III.B.3. where we discuss § 58.5 (Sponsor responsibilities).

Standard Operating Procedures (SOPs): We propose adding a definition for SOPs to mean documented procedures describing how to perform tests or activities normally not specified in detail in study protocols. We propose this addition because many proposed modifications in § 58.31 refer to required SOPs. This definition is consistent with the OECD GLP document, *OECD Principles on Good Laboratory Practice* (Ref. 8).

Study-based Inspection: We propose adding a definition for study-based inspection to mean the same QAU inspection specified currently in § 58.35(b)(3) for inspecting a critical operation of the study that is scheduled according to the study's chronology or sequence of events. Our proposed definition is consistent with the definition for study-based inspection in the OECD consensus document, *Quality Assurance and GLP* (Ref. 7).

Test Article: We propose modifying the current definition of test article in § 58.3(b) to change "medical device for human use" to "device" and to add "tobacco product". As discussed in section III.B.1. concerning the scope of part 58, we propose these changes to broaden devices to include FDA's CVM and to include FDA's jurisdiction of tobacco products.

Test Site: We propose adding a definition for test site to mean a "person" (currently defined in § 58.3(h)) responsible for a phase of a multisite nonclinical laboratory study. We propose that a test site includes management with executive responsibility and supporting SOPs for the conduct of a nonclinical laboratory study. For a different nonclinical laboratory study, a test site could function as a testing facility.

Test System: We propose modifying the current definition of test system in § 58.3(i) to add "reference" article consistent with our other proposed changes. See elsewhere in section III.B.2. for our proposed definition and explanation for adding a definition of reference article.

Testing Facility: We propose removing and replacing most of the current definition of testing facility in current § 58.3(g) to update the regulations consistent with the conduct of multisite nonclinical laboratory studies. Our proposed definition is as follows: "Testing facility means a person responsible for conducting, coordinating, or completing a nonclinical laboratory study, or any combination thereof. The testing facility designates the study director."

We propose this change because, in a multisite study, the testing facility might not be the person treating the test system with the test article as specified in the current definition. Rather, the person treating the test system with the test article might be a contracted or subcontracted person. Therefore, this general definition of a testing facility is necessary to capture all possible contractual relationships in a multisite study.

Validation: We propose adding a definition for validation to mean confirmation by examination and provision of objective evidence that the particular requirements for a specific intended use of a system or process can be consistently fulfilled. This proposed definition is similar to the definition in § 820.3(z), and addresses comments to the December 2010 ANPRM requesting a definition for validation of a system or process.

Vehicle: We propose adding a definition for vehicle to mean any agent that serves as a carrier and is used to mix, disperse, or solubilize the test, control, or reference article for administration or application to the test system. This proposal recognizes the use of vehicles in the conduct of nonclinical laboratory studies. Our proposed definition is consistent with the definition of vehicle in the OECD GLP document, *OECD Principles on Good Laboratory Practice* (Ref. 8), for describing a carrier for test, control, or reference articles.

3. Sponsor Responsibilities (§ 58.5)

The present regulations in § 58.10 cover only a sponsor's responsibilities to notify a consulting laboratory, contractor, or grantee that their service "is part of a nonclinical laboratory study that must be conducted in compliance with the provisions of this part [part 58]". FDA received many comments to the December 2010 ANPRM noting that there are other sponsor responsibilities implicit throughout the present regulations, and stating that the study sponsor must share in the responsibility for complying with part 58. We agree with those comments.

Therefore, we propose adding § 58.5 *Sponsor responsibilities*, that provides explicit provisions for the presently implied sponsor responsibilities and adds new sponsor responsibilities. Our proposed sponsor responsibilities are consistent with the preamble to the original GLP proposed rule stating that the adequacy and validity of nonclinical laboratory tests remain the responsibility of the sponsor of the product as part of establishing the marketability of the product (41 FR

51206 at 51206) (Ref. 4). In addition, we propose adding provisions consistent with the OECD advisory document, *The Role and Responsibilities of the Sponsor in the Application of the Principles of GLP* (Ref. 9).

For each nonclinical laboratory study, we propose that the sponsor must ensure the study protocol meets the requirements specified in § 58.120 (*Protocol* (see proposed § 58.5(a) regulatory text, elsewhere in this document). Also, we propose that the sponsor must ensure the study protocol provides for the humane care of animals⁶ (see proposed § 58.5(b)). We propose these additions because the sponsor is responsible for developing the study protocol, either directly or through a contracted person. To indicate the sponsor's approval of the study protocol, we propose that the sponsor must sign and date the study protocol (see proposed § 58.5(c)).

For any phase of a nonclinical laboratory study that includes the use of animals, we propose that the sponsor contract with persons accredited as following appropriate animal welfare procedures. If, for any reason, the sponsor does not use an accredited person for a phase that includes the use of animals, we propose that the sponsor must document the reason for using the non-accredited person. (See proposed § 58.5(d).) If the study supports an application or submission to FDA, we propose requiring in the application or submission the reason for using a non-accredited person, along with supporting information to show the qualifications of that person, such as a copy of SOPs showing the application of current animal welfare laws, regulations, policies, and guidelines. This information must be included in the compliance statement. (See proposed § 58.5(d) and (k).) We are proposing these requirements to help ensure animal welfare concerns are adequately addressed, and to help safeguard the reliability of study results.

A sponsor may transfer to another party responsibility for any or all of the obligations set forth in this part. A party that assumes any obligation of a sponsor

must comply with the specific regulations in this chapter applicable to this obligation and must be subject to the same regulatory action as a sponsor for failure to comply with any obligation assumed under these regulations. Although a sponsor might transfer certain responsibilities, the sponsor is still ultimately responsible for compliance with all sponsor responsibilities provided in this chapter. When referring to the sponsor throughout this proposal, we also mean any person that assumes, as an independent contractor with the sponsor, one or more of the obligations of a sponsor.

We propose that the sponsor must document that the contracted person conducting a phase of the nonclinical laboratory study is qualified according to the provisions in part 58 applicable for the phase or phases that person is contracted to perform. (See proposed § 58.5(e).) Using qualified contracted persons is essential for ensuring GLP compliance and the quality and integrity of the resulting data.

We propose adding communication requirements to sponsor responsibilities. The OECD consensus document, *The Application of the OECD Principles of GLP to the Organisation and Management of Multi-Site Studies* (Ref. 6), states that many problems associated with the conduct of multisite studies “can be prevented by clear allocation of responsibilities and effective communication among all parties involved in the conduct of the study.” This includes the sponsor, study director, management, principal investigators, QAU, and all other study personnel. Many comments to the December 2010 ANPRM repeat this opinion. We agree and propose that the sponsor must ensure appropriate lines of communication are established (defined, documented in writing or electronically, and implemented) among all persons conducting any phase of the nonclinical laboratory study. We also propose that communications established among persons conducting a phase of the study that involve the sponsor must be documented by the sponsor. (See proposed § 58.5(f).)

We propose that the sponsor must document that test, control, and reference articles are prepared, characterized, and labeled according to part 58, subpart F, and are appropriately shipped. In addition, the sponsor must obtain, and provide to the study director as soon as available, information about test, control, and reference article characterization as specified in § 58.105. (See proposed § 58.5(g).) We propose this requirement in § 58.5(g), because

the study director must have characterization information to help ensure appropriate dosing of the test article and to interpret study results in the final study report.

We propose that the sponsor inform the study director of any known potential risks of the test article to human health or to the environment, and any measures necessary to protect study personnel. (See proposed § 58.5(h).) Since the sponsor is most familiar with test article characteristics because of either direct testing or receiving results from a contracted person that characterized the test article, we propose this requirement as a sponsor responsibility. If there are known or suspected risks to human health or the environment, it is essential that the study director, as the single point of study control, is aware of the risks and the measures necessary to protect study personnel and the environment. This is consistent with OECD's advisory document, *The Role and Responsibilities of the Sponsor in the Application of the Principles of GLP* (Ref. 9).

We propose that the sponsor must review, approve, sign, and date each protocol amendment before implementation. (See proposed § 58.5(i).) Many comments to the December 2010 ANPRM recommend this requirement and we agree. After initiating the study, the sponsor must be aware of proposed study protocol changes and why the changes are proposed. This requirement is part of our proposed checks and balances in part 58 and will help ensure that the amended protocol complies with GLP.

We propose that the sponsor must document and update, as necessary, the archive location of all raw data and records described in proposed §§ 58.190 and 58.195. When we conduct BIMO GLP inspections as a result of an application or submission to FDA, we rely on the sponsor to provide the location of the study archives. (See proposed § 58.5(j).)

We propose that the sponsor must include, in any application or submission to FDA that contains the results of a nonclinical laboratory study, the final study report of the nonclinical laboratory study and all amendments to the final report described in proposed § 58.185. Also, we propose that the sponsor must include either a statement that the study was conducted in compliance with the requirements in part 58 or, if not conducted in compliance with part 58, a brief statement of the reason for noncompliance. (See proposed § 58.5(k).) We propose this requirement,

⁶ The document, “International Guiding Principles for Biomedical Research Involving Animals,” last revised in December 2012, advocates among other principles, the “Three Rs” of the ethical use of animals—replacement, refinement, and reduction (Ref. 10). Additionally, the protocol must meet the requirements in § 58.90 for animal care. USDA's Animal Welfare Act regulations (Code of Federal Regulations, Title 9, Chapter 1, Subchapter A, Parts 1–4) and the Institute for Laboratory Animal Research's Guide for the Care and Use of Laboratory Animals (Ref. 11), provide specifics regarding the veterinary care expected when animals are used for research.

consistent with the proposed expansion of the scope, to include all applications and submissions to FDA supported by data from nonclinical laboratory studies.

4. Transfer of Responsibilities (§ 58.10)

We propose significant changes to current § 58.10 to help address the possibility of multiple contractual relationships, including subcontracting, in multisite nonclinical laboratory studies, and to conform as much as possible to the regulations in 21 CFR 312.52, Transfer of obligations to a contract research organization, and 21 CFR 511.1(f), Contract research organizations. Many comments to the December 2010 ANPRM suggest that we specify in part 58 the parties responsible in a multisite study and how any transfer of responsibilities is accomplished. We agree with those suggestions. We also propose the changes because the current regulations address explicitly only testing facilities.

We propose changing the title of § 58.10 from “Applicability to studies performed under grants and contracts” to “Transfer of responsibilities” to reflect the proposed changes to this section. We also propose adding paragraph designations (a), (b), and (c).

In § 58.10(a), we propose to require written documentation of any transfer of responsibilities to a “contracted person”, as that term is proposed in § 58.3, referring to any person a sponsor utilizes to provide a service for the conduct of a nonclinical laboratory study. Contracted persons may, for example, serve as the study director, management with executive responsibility, the QAU, a testing facility, a test site, or an independent contributing scientist. These contracted persons may further contract with other individuals or entities. Specifically, we propose that any responsibility required by the regulations that is transferred must be described in writing, and that any responsibility not covered by the written description is considered not transferred.

We propose to add in § 58.10(b) that any person transferring to a contracted person any regulatory responsibility for a phase of a nonclinical laboratory study must inform that contracted person that the transferred responsibility is required to be performed in compliance with the provisions in part 58. Proposed paragraph (b) therefore includes what is currently in § 58.10.

In § 58.10(c), we propose adding that a contracted person assuming any regulatory responsibility for a phase of a nonclinical laboratory study must comply with the regulations in chapter I (21 CFR chapter I) applicable to the

transferred responsibility. That contracted person will be subject to the same regulatory requirements as those regulated persons transferring the responsibility.

We propose these requirements for transfer of responsibilities in a nonclinical laboratory study to help ensure contracted persons perform any transferred responsibilities in compliance with part 58 and to help ensure the quality and integrity of data supporting applications and submissions to FDA. Also, our proposal is consistent with industry’s desire for flexible relationships among persons conducting phases of a nonclinical laboratory study.

5. Inspection of Any Person Conducting a Phase of a Nonclinical Laboratory Study (§ 58.15)

We propose revising § 58.15 to clarify FDA’s inspection authority to include inspecting any person that conducts a phase of a nonclinical laboratory study of an FDA-regulated product. This includes all contracted and subcontracted persons that agree to assume one or more regulatory responsibilities. We propose revising the heading of § 58.15 to be consistent with these proposed changes.

Also, we propose modifying the provision about FDA inspection of QAU records. In the preamble to the original GLP final rule (43 FR 59986 at 59998, December 22, 1978) (Ref. 12) and repeated in FDA’s compliance policy guide (CPG 7151.02) (Ref. 13), we state our policy that FDA investigators will not *routinely* inspect QAU records. Exceptions when FDA will inspect QAU records include “for cause” FDA inspections, or inspections conducted under an inspection warrant, or when necessary for litigation purposes. Therefore, we propose modifying § 58.15(a) to specifically state that the “records inspection and copying requirements do not routinely apply to QAU records of findings and problems, or to actions recommended and taken”. We propose adding for clarity, that “FDA retains the authority to inspect all QAU records when necessary to ensure compliance with this part [part 58]”.

In § 58.15(b), we propose changing certain terms for consistency within this proposal. For example, we propose changing “the testing facility” to “any person conducting a phase of the nonclinical laboratory study”.

C. Part 58, Subpart B—Organization and Personnel

1. Personnel (§ 58.29)

We propose no changes to the intent of current § 58.29(a). However, we propose adding to the end of this provision clarifying sentences, “This must include training and experience with GLP requirements. Personnel who work with animals must have both general and species-specific training and experience.”

Several comments to the December 2010 ANPRM state that training on GLP requirements is essential for all personnel in a nonclinical laboratory study. This proposed training requirement also is consistent with the personnel requirements in the *OECD Principles on Good Laboratory Practice* (Ref. 8). Therefore, we propose requiring GLP training to ensure all personnel in a nonclinical laboratory study understand how to comply with GLP and all aspects of a nonclinical laboratory study are GLP compliant.

As we state elsewhere in section III.A.3., we propose specific responsibilities regarding animal welfare because compliance with animal care requirements helps ensure the quality and integrity of study data. Therefore, we propose that all personnel involved with animal treatment and care must have relevant training and experience, including species-specific training when applicable.

In § 58.29(b), we propose adding a requirement that all study personnel must have access to and comply with the study protocol and applicable protocol amendments and SOPs, and any protocol deviation must be reported to the study director. In § 58.29(c), we propose adding a requirement that all study personnel must record raw data promptly and accurately as required by a new regulatory provision in § 58.180 Data quality and integrity. We propose these new provisions to help ensure compliance with GLPs and to update the regulations consistent with current practices and the prevalence of multisite studies. This proposal also is consistent with personnel responsibilities in the *OECD Principles on Good Laboratory Practice* (Ref. 8).

In proposed § 58.29(d) (currently, § 58.29(b)), we replace “Each testing facility” with “Any person conducting a phase of a nonclinical laboratory study”. We propose this and other conforming changes in § 58.29 to address the occurrence of contracting and subcontracting in multisite studies, to update the regulations, and for consistency with our proposals in part 58.

2. Testing Facility Management With Executive Responsibility (§ 58.31)

We propose significant changes in § 58.31 consistent with our proposal requiring a GLP Quality System. To clarify who is responsible for the proposed requirements in § 58.31, we propose adding “with executive responsibility” to the current heading of “Testing facility management.” We propose this change to specify that upper management at a testing facility or test site is ultimately responsible for GLP compliance. We also propose summarizing in the introductory paragraph the expanded responsibilities of management consistent with the regulatory text in part 820 (see § 820.20).

The current provisions in § 58.31(c) through (g) require only assurances that certain activities are available, performed, understood, or communicated. For those responsibilities currently in § 58.31, we propose clarifying and expanding them, requiring actions and referencing specific SOPs (where applicable). We also propose adding new responsibilities consistent with a GLP Quality System and the conduct of multisite studies.

We propose a new § 58.31(a) requiring testing facility management with executive responsibility to establish and update written GLP Quality System SOPs. For continuing oversight of the GLP Quality System, in new § 58.31(b), we propose requiring testing facility management with executive responsibility to review at specified and sufficient intervals and document that the GLP Quality System meets the requirements in proposed part 58. We propose that testing facility management with executive responsibility is responsible for overseeing the implementation of the requirements in proposed § 58.31(b), according to established procedures to be included in proposed § 58.81(b)(2) (establishment and periodic review of a GLP Quality System).

In § 58.31(e), we propose that testing facility management with executive responsibility appoint and document the appointment of a management representative who is a member of the testing facility management with authority over and responsibility for documenting that GLP Quality System requirements are effectively established and maintained. We also propose that this appointed member reports to management with executive responsibility about the performance of the GLP Quality System, which includes reports from the QAU. Appointment of this individual is an organizational

responsibility of the testing facility management with executive responsibility such as in part 820, Quality System Regulation, the model for the GLP Quality System.

In § 58.31(f), we propose that testing facility management with executive responsibility is responsible for documenting that all persons in a multisite study follow adequate equipment-related SOPs. In § 58.31(h), we propose this same management is responsible for documenting that all study personnel are trained to perform their assigned functions. In § 58.31(k), we propose this same management is responsible for appointing a person to maintain the master schedule along with other requirements concerning the master schedule, such as requiring in a master schedule the core information presently specified under QAU responsibilities in § 58.35(b)(1). This core information is essential on each master schedule to ensure consistent identification across all persons (individuals or entities) in a multisite study. We propose adding § 58.31(m), requiring testing facility management with executive responsibility to review all protocols to ensure that environmental, animal welfare, or work resource issues or issues with scientific methodology do not affect or bias any phase of the study’s conduct.

We propose adding § 58.31(r) to require testing facility management with executive responsibility to review the suitability and effectiveness of the QAU or lead QAU, as applicable, at defined intervals and with sufficient frequency, according to established SOPs as required in proposed § 58.81(b)(17). Periodic review of the QAU’s capability to fulfill their responsibilities helps to ensure the quality and integrity of study data and is also consistent with a quality system.

We propose adding § 58.31(u), requiring testing facility management with executive responsibility to establish SOPs for archiving records and materials generated during the course of a nonclinical laboratory study, including the designation and replacement of the archivist and any supporting staff. This archiving process is an essential aspect of compliance with GLPs because maintenance of raw data and specimens from a specific study enables reconstruction of that study for verification of the information in the final study report and confirmation of the study’s compliance with part 58.

These and other proposals in § 58.31 are consistent with the preamble to the original GLP final rule that states, “A determination of the adequacy of each

standard operating procedure is the responsibility of the management” (43 FR 59986 at 60002) (Ref. 12). Also, our proposals are responsive to many comments to the December 2010 ANPRM asking that we define operational areas necessary for broader adoption of a quality system approach to the conduct of nonclinical laboratory studies.

Rather than specifying how essential activities of a GLP Quality System must be conducted, we propose requiring management with executive responsibility at testing facilities and test sites to establish essential SOPs. This flexible approach would allow testing facilities and test sites to establish SOPs best suited to their specific organizational structure.

3. Test Site Management With Executive Responsibility (§ 58.32)

We propose updating the regulations by adding § 58.32. This new provision would address the current prevalence of multisite studies and require test site management with executive responsibility to comply with relevant requirements in proposed § 58.31 and develop and maintain SOPs described in § 58.81, “where appropriate”, as that term is proposed in § 58.1(c).

We expect that a test site, like a testing facility, has management with executive responsibility and appropriate SOPs. Therefore, while a test site might be conducting a phase of a particular multisite study, for a different study the same test site could function as a testing facility by coordinating, conducting, or completing the entire study.

4. Study Director (§ 58.33)

In § 58.33, we propose modifying and adding study director requirements to update the regulations and to address the prevalence of multisite studies. We propose certain study director requirements for consistency with our other proposals in part 58 (for example, our proposals for a GLP Quality System and for checks and balances to help ensure data quality and integrity).

In § 58.33(a), we propose keeping the current requirement that the study director is the single point of study control. We propose adding that the study director cannot delegate overall responsibility for a nonclinical laboratory study. This proposed addition clarifies and emphasizes that a study director cannot delegate oversight of an entire nonclinical laboratory study, even though a study director may delegate to a principal investigator certain responsibilities.

This proposed change is consistent with FDA’s longstanding interpretation

of a study director's responsibilities and consistent with present FDA and EPA GLP regulations. This proposed addition also is consistent with the OECD consensus document, *The Role and Responsibilities of the Study Director in GLP Studies* (Ref. 14). Many comments to the December 2010 ANPRM stress the importance of the study director remaining the single point of study control.

We propose in § 58.33(a)(2) the study director's responsibility for implementing procedures that ensure adequate communication among all study personnel and with the sponsor, as applicable, because communication is essential in a nonclinical laboratory study.

In § 58.33(b), we propose new requirements for the study director for documenting, consulting, signing, and archiving (see proposed §§ 58.33(b)(2) through (7) and (12) through (14)). In § 58.33(b)(13), we propose that the study director must sign and date the final study report. FDA agrees with OECD's discussion in this regard in both the *OECD Principles on Good Laboratory Practice* (Ref. 8) and the consensus document, *The Role and Responsibilities of the Study Director in GLP Studies* (Ref. 14). The study director's signature on the final study report indicates acceptance of responsibility for the validity of the data and the extent to which the study complies with GLP principles. We also recognize that we use the terms retain and archive interchangeably throughout this proposal (see, for example, proposed § 58.33(b)(14)), and we seek comment on which term is preferred by industry.

We propose adding in § 58.33(b)(5) and (6) new study director responsibilities affecting the welfare of test animals. When a protocol and its amendments impact test animal use, we propose the study director must document that a committee whose function is ensuring the appropriate and humane care of animals must first review and approve the protocol and applicable amendments before initiating the study or implementing the amendments. The study director also must document that such a committee has reviewed and approved general procedures for commonly conducted animal tests. Any protocol requiring only those tests, with their approved parameters, would not require additional review before study initiation. However, if a protocol increases the numbers of animals to be used or alters any of the approved testing parameters, specific review and

approval of that protocol would be required before study initiation.

We propose in 58.35(b)(6), that the study director must consult with the attending veterinarian during review of proposed study protocols to determine potential animal welfare concerns and appropriate responses to likely contingencies. Early identification of potential animal welfare concerns benefits the test animals because they will receive prompt care, which improves the quality of the data collected.

In 58.33(b)(11), we propose adding that the study director must document that all applicable GLP regulations are followed and include a study compliance statement in the final study report. FDA agrees with the statement in the OECD consensus document, *The Role and Responsibilities of the Study Director in GLP Studies* (Ref. 14) that the study director should ascertain that GLP requirements are fully complied with in every phase of a study, that the study protocol is faithfully followed, and that all observations, including any deviations from the protocol, are fully documented.

In § 58.33(b)(14), we propose adding a timeframe for archiving of no later than 2 weeks after the study completion date. We think that timely archiving of raw data, documents, protocols, specimens, and final reports will help prevent their loss or destruction. Stakeholders requesting modernizing part 58 asked specifically for a reasonable time period after the study completion date to complete study archiving. Numerous comments to the December 2010 ANPRM agree, particularly with regard to archiving computerized systems. We propose the 2-week timeframe to allow flexibility for archiving material without jeopardizing study material integrity.

5. Quality Assurance Unit (QAU) (§ 58.35)

In § 58.35, we propose keeping the QAU functions currently in the regulations. We propose modifying § 58.35(a) by separating it into paragraph (1) QAU function and paragraph (2) QAU location. We propose this change for consistency with our other proposals in part 58 (for example, to address the location of the lead QAU for multisite studies), and in response to comments to the December 2010 ANPRM requesting a clear description of the relationship between the QAU and testing facility management.

We propose in § 58.35(a)(2)(ii) that, for multisite studies, testing facility management with executive responsibility must designate a lead

QAU. The concept of a lead QAU is consistent with the discussion in the preamble of the original GLP final rule stating that when portions of a study must be contracted to a site that lacks a QAU "the person letting the contract, and not the contract facility, is responsible for the performance of the quality assurance functions" (43 FR 59986 at 59997) (Ref. 12). This change also is consistent with the OECD consensus document, *Quality Assurance and GLP* (Ref. 7). Several comments to the December 2010 ANPRM specifically note the need for a lead QAU in multisite studies.

We propose several modifications to current § 58.35(b). We propose changing the present QAU requirement to maintain a copy of the master schedule and all protocols to require that the QAU maintain "access" to them. For example, if the QAU is a contracted person, then the QAU might not have overall knowledge about the person (*i.e.*, testing facility) to which they are providing QA services. However, the QAU requires "access" to the master schedule and protocols to ensure GLP compliance.

We recognize that many sites have a central computerized system for maintenance of essential documents. Our proposed change about QAU access to the master schedule responds to stakeholder requests to modernize part 58 and also to comments to the December 2010 ANPRM. This change also is consistent with our proposal in § 58.195(d) that management with executive responsibility must ensure "maintenance" of the master schedule and copies of study protocols.

Because the lead QAU is responsible for ensuring GLP compliance of all phases of a multisite study, we propose that the lead QAU must maintain access to the master schedule of any person that lacks a QAU. We consider the master schedule an important tool for determining whether a person is capable of conducting a GLP compliant study. For example, a person with numerous scheduled studies still in progress may lack sufficient resources to begin the conduct of a GLP compliant study.

Also, as many comments to the December 2010 ANPRM suggest, we propose removing the word "sheet" from the term "master schedule sheet". We propose removing "sheet" because we do not want to imply that a paper copy is required for electronic systems.

In new § 58.35(b)(3), we propose requiring the QAU to review the study protocol before initiating the study and all protocol amendments before implementing them, along with documenting this review. In new

§ 58.35(b)(4), we propose requiring the QAU to review all SOPs applicable to a given nonclinical laboratory study along with documenting this review. Current regulations state the QAU is “responsible for monitoring each study to assure management that the facilities, equipment, personnel, methods, practices, records, and controls are in conformance” with GLPs (current § 58.35(a)).

Our proposed initial review by the QAU of the study protocol and applicable facility SOPs will help ensure compliance with part 58 from the start of the study. Otherwise, when the study is underway, amendments to the study protocol and SOPs might be needed if QAU inspections reveal compliance deficiencies.

We propose in § 58.35(b)(5) expanding the types of QAU inspections recognized by FDA by adding process-based and facility-based inspections.⁷ Many comments to the December 2010 ANPRM request this change consistent with QAU inspections described in the OECD consensus document, *Quality Assurance and GLP* (Ref. 7), specifically supporting an appropriate mix of study-specific and process-based inspections.

However, many comments to the December 2010 ANPRM express concern about how process-based inspection results will be appropriately considered for all relevant studies, particularly when an inspection reveals problems. This concern is especially relevant to any phase involving a short-term study, as we propose to define this term. Process-based inspections are conducted on a prearranged schedule, which is not connected to the timing of any particular nonclinical laboratory study. Therefore, a facility utilizing process-based inspections might conduct a short-term study that is not inspected during its in-life period (that is, during the time data are collected). This concern also is addressed in the OECD consensus document, *The Application of the GLP Principles to Short Term Studies* (Ref. 15).

To ensure that any problem revealed during a process-based inspection is properly captured in the reports of all relevant studies, we propose adding § 58.35(e). This provision requires preparation of a written certification, by the person conducting a phase of the study, whenever a process-based inspection reveals problems. As proposed, this certification requires documenting actions taken to properly

inform, and modify (when applicable), reports for all studies impacted by the results of that process or procedure. While a management responsibility, we propose adding this requirement in § 58.35 because of its similarity to the existing requirement in current § 58.35(d) for management to provide an FDA representative, upon request, a certification regarding the implementation of required QAU inspections.

In § 58.35(b)(7) (a redesignation and revision of current § 58.35(b)(4)), we propose expanding the requirement that the QAU must submit to management with executive responsibility and the study director a periodic written status report on each study. We propose that these periodic reports “discuss the overall progress and compliance status of the study and include any problems observed and the corrective actions taken.” In conjunction with this requirement, we propose that the content and frequency of these reports be specified in SOPs as required in proposed § 58.81(b)(21).

We propose this revision in § 58.35(b)(7) because feedback to management with executive responsibility and the study director about the overall progress and compliance status of the study is essential to ensure study compliance. We intend these periodic reports to give a general overview of the study. We expect these periodic reports to complement any inspection reports for the study, which only provide a snapshot in time.

We are interested in receiving feedback about the use and relevance of periodic status reports. Specifically, we are seeking comment about whether QAUs regularly provide such reports and whether they are useful to the study director and management when provided.

Consistent with our proposals addressing multisite studies, we propose adding in new § 58.35(b)(8) (revision of current § 58.35(b)(5)) that the lead QAU must identify all deviations occurring in the entire study, including deviations identified by any other existing QAUs participating in the study. We expect this requirement may be facilitated by principal investigator reports to the study director, documentation by other existing QAUs, and direct oversight by the lead QAU of independent contributing scientists and any persons conducting a phase of the study lacking either a principal investigator or a QAU or both. We propose this requirement to ensure the lead QAU is made aware of protocol deviations in a timely manner. This

awareness will help alert the lead QAU to the need to correct or modify relevant SOPs and the study protocol when necessary to maintain data integrity.

The remaining additions we propose in § 58.35 relate to QAU oversight of the integrity of data in the final study report. Current responsibilities in § 58.35(b)(6) (revised and redesignated as § 58.35(b)(10)) are to ensure the quality and integrity of the final study report. Therefore, we propose in § 58.35(b)(9) that the QAU must audit the reports of all contributing scientists and all existing principal investigators.

Currently § 58.35(b)(6) requires the QAU to assure that the “reported results accurately reflect the raw data of the nonclinical laboratory study.” However, QAU members might not have the scientific judgment needed for evaluating the scientific merits of the final report and determining whether the results accurately reflect the data. In the preamble to the original GLP final rule (43 FR 59986 at 59998, comment 90) (Ref. 12), we agreed that “the QAU should not attempt to evaluate the scientific merits of the final report.” Therefore, in § 58.35(b)(9) and (10), we propose clarifying our intent.

Specifically, we propose that the QAU must audit all contributing scientists’ reports and any report amendments to ensure they include a report of all data and reflect the protocol, and amendments, and applicable SOPs. This requires that all data generated during the study are included and discussed, which is essential for the full transparency necessary for reconstruction of the study.

For multisite studies, we propose that other QAUs participating in the study must audit the reports and report amendments of any principal investigators and all contributing scientists for whom they are responsible. We also propose in § 58.35(b)(9), for any person that lacks a QAU, that the lead QAU audits the reports and amendments of all contributing scientists and any principal investigators. This includes audits of any independent contributing scientist. This proposed requirement will ensure all data from a nonclinical laboratory study will receive QAU review, thus improving the quality and integrity of the final study report.

In § 58.35(b)(10), we propose that the QAU must verify that all original and amended signed and dated reports from contributing scientists are appended to the final study report. For multisite studies, we propose that the lead QAU is responsible for this requirement. Under existing regulations that require providing the final study report and any

⁷ The term “study-based inspection” is not used in current FDA regulations; however, this type of inspection is equivalent to the QAU inspection currently required in part 58.

amendments, we expect that both original and amended versions of reports from all contributing scientists be appended to the final study report. The proposed changes make this expectation a specific requirement. This requirement will allow the study sponsor and FDA reviewers to have access to the original conclusions for each phase and any modifications made as a result of interactions among those involved with the study. We propose this requirement to address the potential inadvertent or intentional introduction of bias that may result when only the final amended version of contributing scientists' reports are included.

6. Contributing Scientist (§ 58.37)

As discussed in section III.B.2., we propose adding a definition for a contributing scientist. In that definition, we include an independent contributing scientist as an individual expert or specialist who is an independently employed contracted person. We propose adding responsibilities for contributing and independent contributing scientists to help facilitate the development of a GLP Quality System. To describe the responsibilities of these positions, we propose adding § 58.37(a) and (b), respectively.

When a contributing scientist is responsible for a phase, we propose in § 58.37(a) that the contributing scientist must comply with part 58; provide a signed and dated report for inclusion in the final study report; and permit oversight by the designated QAU. (See proposed § 58.37(a)(1) through (3)).

In § 58.37(b), we propose requirements for an independent contributing scientist in addition to those requirements in § 58.37(a). The proposed requirements in § 58.37(b) include, among others, that independent contributing scientists must document, maintain, and update information about their education, training, and experience related to their responsibilities for a particular phase. Also, we propose they must archive all materials as required by the protocol and by proposed § 58.195.

Our proposal for adding § 58.37 is consistent with the expectations in the present regulations for individual scientists and professionals. We propose these requirements in part to help clarify the regulations.

7. Principal Investigator (§ 58.39)

We propose adding § 58.39 to include principal investigator requirements related to a principal investigator's responsibilities for a phase of a nonclinical laboratory study. We

propose that designating a principal investigator is optional.

The *OECD Principles on Good Laboratory Practice* (Ref. 8) includes the term principal investigator solely in reference to multisite studies. We recognize, however, the possibility of a testing facility employing a principal investigator for a single-site study. For example, a single-site study conducted in a facility situated on a large campus with multiple buildings might have one or more principal investigators.

We also recognize that a testing facility may conduct a multisite study where, at all sites, only the study director oversees the study. Several comments to the December 2010 ANPRM note these various practices. We therefore propose in § 58.39 principal investigator requirements for specific responsibilities in one or more phases as delegated to the principal investigator by the study director.

We propose principal investigator responsibilities consistent with a principal investigator's role of ensuring compliance with part 58 for a specific phase. For example, we propose the principal investigator must document and report to the study director all deviations the principal investigator observes during the conduct of the study. These requirements also are consistent with the responsibilities of a principal investigator in *The Application of the OECD Principles of GLP to the Organisation and Management of Multi-Site Studies* (Ref. 6), and with a GLP Quality System.

D. Part 58, Subpart C—Facilities

1. General (§ 58.41)

In § 58.41, we propose changing "Each testing facility shall be" to "Any person conducting a phase of a nonclinical laboratory study must have facilities" of suitable size and construction to facilitate the proper conduct of nonclinical laboratory studies. We propose this change to include multisite studies.

2. Animal Care Facilities (§ 58.43)

In § 58.43, we propose changes to include multisite studies and to cover any phase involving the use of animals. We propose these changes consistent with our proposal revising the testing facility definition and our goal of applying the GLP regulations to all nonclinical laboratory studies, including multisite studies.

3. Facilities for Handling Test, Control, and Reference Articles (§ 58.47)

In § 58.47 we propose adding "reference" to refer to "reference

articles" for consistency with our other proposals.

E. Part 58, Subpart D—Equipment

1. Equipment Design (§ 58.61)

In § 58.61, we propose adding that equipment includes computerized systems. We also propose adding in § 58.61, equipment used for maintenance, archiving, and retrieval of data. We propose these additions to update and clarify the regulations.

2. Maintenance and Calibration of Equipment (§ 58.63)

In § 58.63, we propose adding to paragraph (a) maintenance, archiving, and retrieval of data. In paragraph (b), we propose changing the citation reference from § 58.81(b)(11) to (14) and adding a reference to the written SOP requirement in § 58.81(b)(15). Also, in paragraph (b), we propose adding "as applicable" to address the possibility of a multisite study. We propose these changes for consistency with our other proposed changes in part 58 and to update the regulations to address multisite studies.

F. Part 58, Subpart E—Nonclinical Laboratory Study Operations

Consistent with our proposals in part 58 to address multisite studies, we propose revising the heading of subpart E from "Testing Facilities Operation" to "Nonclinical Laboratory Study Operations". Also, accordingly, we propose modifying the sections in subpart E.

1. Standard Operating Procedures (SOPs) (§ 58.81)

We propose modifying § 58.81 Standard operating procedures (SOPs), consistent with our proposals for a GLP Quality System and to address multisite studies. In § 58.81(a), we propose adding to the current requirement that a testing facility must have written SOPs, that all test sites, too, must have written SOPs. Also, in § 58.81(a), we propose changing "management" to "management with executive responsibility".

In § 58.81(b), consistent with our proposal in § 58.81(a), we propose adding that the testing facility and all test sites must establish SOPs for an applicable phase of a nonclinical laboratory study. As discussed in section III.B.1., we use the terms "applicable phases" and "where appropriate" because in a multisite study no one person will conduct all phases of the study. Therefore, each person requires SOPs only for those phases which that person conducts.

We propose adding to the current list of SOPs in § 58.81(b) numerous topics that require SOPs. For example, we propose adding that SOPs must include an SOP for preparing, modifying, and administering all SOPs. We propose these additional SOP requirements because they are essential components of a complete quality system approach (*i.e.*, the proposed GLP Quality System) and also address the current prevalence of multisite studies.

Our proposal in § 58.81 will require initial efforts by testing facilities and test sites to modify or add SOPs as needed for a GLP Quality System. However, once established, the GLP Quality System will facilitate greater flexibility and efficiency for the conduct of nonclinical laboratory studies and, over time, will help reduce costs.

2. Animal Care (§ 58.90)

In § 58.90, we propose modifying paragraph (b) to require, throughout the study, evaluation of the health status of test animals according to acceptable veterinary medical practices for the care of test animals. We propose this change because proper animal care is essential during the entire study to ensure the welfare of test animals and the integrity of test results. However, test animal evaluations can be performed by the attending veterinarian or appropriately-trained personnel who are delegated this responsibility by the attending veterinarian.

In § 58.90(c), we propose removing from the third sentence the phrase “provided that such treatment does not interfere with the study”, and replacing this phrase with “as deemed necessary by the study’s attending veterinarian.” We propose few changes in § 58.90(d) and (e). In the first sentence of current § 58.90(d), we propose replacing “excluding suckling rodents” with “except nursing neonates” to update the regulation to be more inclusive and appropriate. In § 58.90(e), we propose adding the word “reference” to conform to changes proposed elsewhere in this document.

We propose these changes in § 58.90 to update and clarify the regulations, and because test animal welfare concerns are an essential part of a GLP Quality System.

G. Part 58, Subpart F—Test, Control, and Reference Articles

We propose adding the term “Reference” to the heading in subpart F, and in certain applicable provisions in subpart F. We also propose adding in subpart F specifics concerning tobacco

products, and a reference to method validation.⁸

1. Test, Control, and Reference Article Characterization (§ 58.105)

We propose modifying § 58.105 to require that all information about test, control, and reference article characterization be provided to the study director as soon as available. This information is necessary for determining appropriate dosing and drafting conclusions in the final study report. The lack of this information limits the important test result discussion in the final study report.

Reports submitted to FDA must provide study information based on the characteristics of the product (test article) studied. We expect a test article to be characterized to the extent required to interpret the study properly. For nonclinical laboratory studies conducted in support of initiating clinical “first-in-human” studies, this characterization information is particularly important for human subject protection.

We propose modification of § 58.105(a) to exclude the use of a marketed tobacco product’s labeling to characterize such a product if it is used as a control or reference article in a nonclinical laboratory study. The labeling of currently marketed tobacco products does not provide the information required for full product characterization. That is, the chemical composition (including mainstream smoke composition), microbiological composition, and design parameters of the product are not fully described in tobacco product labels. Thus, the composition and toxicant deliveries of currently marketed tobacco products are less well defined in tobacco product labeling than the safety and efficacy information described in the labels of marketed drug products. Therefore, FDA notes that when using a marketed tobacco product as a control or reference article, the marketed tobacco product’s characteristics must be determined and documented as required in this part.

We propose revising and redesignating the current provisions in § 58.105(b), (c), and (d). These proposed changes are necessary for consistency with our other proposals in part 58, such as the addition of reference articles.

⁸ There is a draft guidance document regarding bioanalytical method validation, “Bioanalytical Method Validation Draft Guidance” (Ref. 16). When final, this guidance will provide FDA’s current thinking. We consider many of the general principles in this draft guidance document applicable to method validation in nonclinical laboratory studies.

The current regulations imply that empty containers from test articles must be retained. Comments to the December 2010 ANPRM did not see the need to retain the empty containers provided appropriate product information is maintained and test article accountability is fully documented. We agree with those comments and propose to remove this implied requirement. To provide for adequate test article accountability, in lieu of retaining empty test article containers, we propose requiring in § 58.105(d) that the study director verify and document by dated signature the distribution and final disposition of the test article.

2. Test, Control, and Reference Article Handling (§ 58.107)

We propose minimal conforming changes in § 58.107, such as adding “reference” to the section heading and first sentence.

3. Mixtures of Articles with Carriers (§ 58.113)

We propose modifying § 58.113 by adding “reference” to the provisions proposed in § 58.113(a), (a)(1), (a)(2), (b)(2), and (d). Also, we propose requiring that the results from the determination of the uniformity, concentration, and stability of mixtures of test articles with carriers are provided to the study director as soon as available. We propose these changes in § 58.113 for the same reasons we propose changes in § 58.105.

H. Part 58, Subpart G—Protocol for and Conduct of a Nonclinical Laboratory Study

1. Protocol (§ 58.120)

We propose modifying § 58.120 to address multisite studies more specifically, and to provide consistency with our other proposed changes discussed elsewhere.

Many comments to the December 2010 ANPRM suggest that the study protocol identify all sites participating in a multisite study. We agree, and propose adding in § 58.120(a)(3) that the protocol contain contact information for all persons conducting a phase of the nonclinical laboratory study.

Current § 58.120(a)(6) includes in the protocol the methods for controlling bias. We propose adding to this provision the analysis and reporting of study test results and procedures to be followed if a study includes a peer review of any phase. Also, for multisite studies, we propose adding a requirement that the protocol identify the person(s) conducting the phases of the nonclinical laboratory study.

We propose expanding current § 58.120(a)(10) to clarify that the protocol must include a listing of the study-specific records that are required to be maintained. We think this clarification will help assure that study-specific records are maintained.

Current § 58.120(a)(11) requires the date of protocol approval by the sponsor, and the dated signature of the study director. We propose expanding this provision to indicate study protocol approval by the dated signature of the study sponsor, the study director, independent contributing scientists, principal investigators, and any other person conducting a phase of the nonclinical laboratory study, as applicable.

We propose redesignating and modifying § 58.120(b) as § 58.120(d). In § 58.120(d), we propose requiring, before implementing any change or revision to an approved protocol, that the study sponsor and the study director document their approval of the change or revision. For a multisite study, any person affected by the proposed changes (for example, the principal investigator or independent contributing scientist) also must document approval. We consider a person's dated signature on the protocol revision to be acceptable documentation indicating approval. We propose that these signed and dated protocol amendments must be maintained with the protocol.

Before initiating any study using animals, we propose requiring in new § 58.120(b) protocol review and approval by "a committee whose function is to ensure that the care and use of animals in studies is appropriate and humane". In new § 58.120(e), we propose the same review and approval by this committee before implementing any protocol changes that affect animal welfare. These additions are consistent with the proposal in § 58.33(b)(5) that the study director must ensure that all studies that include the use of animals are approved by such a committee.

In new § 58.120(c), we propose requiring that the study sponsor and testing facility management with executive responsibility sign and date a statement that the study will be conducted in compliance with part 58. We propose appending this statement to the protocol. This proposal is consistent with the requirement in § 58.10(b) that a sponsor must inform a contracted person that the study must be conducted in compliance with chapter I. This proposal also is consistent with the requirements discussed elsewhere in this document that the study director documents applicable GLP regulations are followed (section III.C.4.), and that

the QAU ensures studies conform to the regulations in part 58 (section III.C.5.).

2. Conduct of a Nonclinical Laboratory Study (§ 58.130)

We propose redesignating current § 58.130(a) through (c), as (d), (f), and (g) respectively. In new proposed § 58.130(a), we require demonstration that all analytical methods are accurate, sufficiently precise, and sensitive enough to result in accurate and reproducible data. We expect this requirement will help ensure data quality and integrity as its intent is to produce accurate and reproducible data. This requirement also is consistent with requirements in part 320 (21 CFR part 320), "Bioavailability and Bioequivalence Requirements" (see § 320.29(a)).

In new § 58.130(b), we propose conducting test, control, and reference article characterization as specified in part 58, subpart F. We propose this requirement to clarify our current and future expectations regarding test, control, and reference article characterization.

In new § 58.130(c), we propose that "humane care and ethical treatment of test animals must be considered in advance and upheld in conjunction with achieving study objectives." We propose this provision is consistent with our other proposals addressing animal welfare discussed elsewhere in section III.A.3.

In new § 58.130(e), we propose that any change to the protocol must be approved as an amendment. We propose this requirement consistent with the proposed requirement in § 58.120(d) for approval of protocol amendments. However, we understand the importance of test animal welfare along with maintaining the integrity of the study. Therefore, FDA intends to evaluate on a case-by-case basis certain circumstances when a protocol deviation is necessary to prevent a potential hazard to animal welfare or study integrity.

In proposed § 58.130(h) (revised and redesignated current § 58.130(d)), postmortem observations must be available to the pathologist unless specified otherwise in the study protocol. We understand that some study protocols might blind the pathologist to postmortem observations. We expect, however, in most cases the pathologist will not need to be blinded to postmortem observations.

I. Part 58, Subpart J—Records and Reports

1. Data Quality and Integrity (§ 58.180)

We propose adding a new § 58.180 for data quality and integrity. Ensuring data quality and integrity in a nonclinical laboratory study is one of our critical goals in this part 58 proposal. Therefore, we propose adding this separate § 58.180 to clearly identify requirements for data quality and integrity. We propose this new section in subpart J because data are part of study records and reports.

We propose moving to this new section, and revising, the requirements in current § 58.130(e). In § 58.180(a), we propose creating the acronym "ALCOA". This is a mnemonic that signifies quality data to stakeholders that conduct clinical and nonclinical studies. We propose therefore that all nonclinical laboratory study data are "accurate, legible, contemporaneous, original, and attributable".

In § 58.180(b), we propose modifying and updating the provisions currently in § 58.130(e) to address electronic data capture and maintenance. Numerous comments to the December 2010 ANPRM note that part 11 (21 CFR part 11, "Electronic Records; Electronic Signatures") is applicable to part 58 and therefore parts 11 and 58 should be consistent. We agree, and do not intend to duplicate in part 58 the requirements in part 11. As a result, we propose that electronic records systems need to be compliant with applicable regulations.

In § 58.180(c), we propose adding that the final study report must contain all data accrued during the study. This proposed requirement is consistent with our proposal in § 58.120(b)(6) requiring that the protocol describe methods for controlling bias. We propose this requirement because selective data inclusion in the study analysis could introduce bias into the final study report.

2. Reporting of Nonclinical Laboratory Study Results (§ 58.185)

Study data must be maintained in a manner that allows for "reconstruction of the study for the purpose of assessing the quality and integrity of the results or the reinterpretation of the data in the light of later findings" (41 FR 51206 at 51215) (Ref. 4). Study records and reports required in part 58, subpart J, are acceptable in electronic or paper medium, or a combination of both. In § 58.185, we propose eliminating any current requirements that might impede a fully computerized facility.

Many comments to the December 2010 ANPRM suggest we allow testing

facilities to develop an integrated final study report. This integrated final study report would be in lieu of individual scientists' reports, which the study director must then compile and discuss in an integrated final study report. The preamble to the original GLP final rule states that individual reports are required as part of the final report to ensure the findings of the individual scientists are accurately reflected (43 FR 59986 at 60009) (Ref. 12). Also, in the preamble to the 1987 final rule amending part 58, FDA thought that reports combining data, information, and views from scientists of different disciplines would obscure the individual scientist's accountability for accurate reporting (see 52 FR 33768 at 33778).

We continue to affirm these statements. However, we support processes used for the efficient review of the draft study report to facilitate completion of the final study report.

In § 58.185, we propose adding general statements for consistency with our other part 58 proposals. We propose adding two provisions specific to animal welfare. In § 58.185(a)(2), we propose requiring that final study reports contain the names of all study attending veterinarians. We propose redesignating and modifying § 58.185(a)(9) as (a)(10) to add the example of "all health-related issues reported by an attending veterinarian or appropriately designated personnel during the course of the study". This provision recognizes that circumstances affecting the quality and integrity of the data could include health-related issues noted and reported by the attending veterinarian or appropriately designated personnel. We propose this addition to help ensure that all untoward health-related observations of test animals are captured and reported so that FDA reviewers can consider their possible effect on study results.

We propose redesignating and modifying § 58.185(a)(12) as (a)(13) to be consistent with the EPA's GLP regulations (see 40 CFR 160.185(a)(12) and 792.185(a)(12)). That is, we propose requiring a signed and dated report from each person conducting an analysis or evaluation of study data or specimens after data generation was completed. We propose this addition to provide transparency regarding the review of study findings and the development of conclusions submitted in the final study report.

In new § 58.185(a)(16), we propose that the study director provide with the final study report a statement about the study's extent of compliance with part 58, including any study deviations. This

requirement is consistent with OECD's consensus document *The Role and Responsibilities of the Study Director in GLP Studies* (Ref. 14) and addresses a recommendation from stakeholders who requested that FDA modernize part 58.

Many testing facilities provide services internationally and therefore, this statement is commonly seen in final study reports submitted to FDA. Such a statement also is included in EPA's study profile templates, which outline the necessary documents for submission of supporting data.⁹ FDA presently requires such a compliance statement from the applicant for applications and submissions for research and marketing and frequently receives the study director's statement in fulfillment of, or at least as the primary basis for, the required statement.

Several comments to the December 2010 ANPRM suggest modifying part 58 to include requirements for studies discontinued before completion. In response to this suggestion, we propose new § 58.185(d) requiring the study director to write, sign, and date a short written summary report closing the study and discussing why the study was discontinued. This report and study material must be archived as required in § 58.190 in case of future study review or study completion.

3. Storage and Retrieval of Records and Data (§ 58.190)

We propose modifying § 58.190(a) to add reserve samples to those items generated as a result of a nonclinical laboratory study that must be retained. We also propose adding a requirement for retention of "Correspondence and other documents relating to interpretation and evaluation of data, other than those documents contained in the final study report." We propose this addition to harmonize with the EPA GLP regulations (see 40 CFR 160.190(a) and 792.190(a)) and to clarify our requirement for retaining these documents.

Our other proposed modifications in § 58.190 provide timeframes for archiving required study material and requirements for the SOPs about archiving to include procedures specific to removing study material from the archives. Stakeholders who asked that we modernize part 58 requested a reasonable timeframe after the study completion date to complete study archiving. Comments to the December

2010 ANPRM also made this request. The SOP requirement for procedures specific to removing study material from the archives is to address concerns that material in the archives could be lost or destroyed if removed without having in place adequate and specific procedures.

We propose that archiving occur no later than 2 weeks after the study completion date (see study completion date defined in § 58.3). We propose this 2-week timeframe to prevent required material from being inadvertently misplaced, lost, or destroyed over the long term. We understand that certain situations may prevent archiving study material during, or at the completion of, a nonclinical laboratory study as currently required of the study director in § 58.33(f).

We also propose, when the study sponsor delays finalizing the final study report, that the study director must complete, sign, and date the final study report and archive all study material no later than 6 months after completion of the last draft of the final study report. Additionally, if the study sponsor stops a nonclinical laboratory study before all protocol requirements are complete, a decision about discontinuing the study must be made no later than 6 months after stopping the study. For discontinued studies, a summary report and study material must be archived within 2 weeks of the study director signing the summary report. We propose these timeframes to provide the requested flexibility without compromising the integrity of study material.

4. Retention of Records (§ 58.195)

We propose modifying § 58.195(b) to conform with § 58.190(a) for the listing arrangement. We also propose modifying § 58.195(b)(1) to address those applications and submissions to FDA that might not result in an approval, clearance, or a premarket authorization. We therefore propose adding an additional required retention period from the date an application or submission is administratively closed by FDA. "Administratively closed" includes those applications and submissions closed administratively with or without a decision.

In § 58.195(h), we propose adding a statement recognizing that a change of archive location may be due to reasons other than closure of a testing facility. For example, changes in ownership as well as changes in physical location would change the archive location. We also propose including a timeframe of "no later than 10 working days after the transfer occurs" for reporting to FDA

⁹ A link to those templates is provided in the Pesticide Registration Notice 2011-3 "Standard Format for Data Submitted Under the Federal Insecticide, Fungicide, and Rodenticide Act and Certain Provisions of the Federal Food, Drug, and Cosmetic Act" (Ref.17).

and the study sponsor a change in archive location.

We propose this timeframe to ensure that FDA is informed of the location of study materials if a GLP BIMO inspection of the study is warranted. This requirement is necessary to prevent waste of inspectional resources and delay in receiving FDA inspectional findings, which provide FDA reviewers information about data quality and integrity.

Other proposed changes to § 58.195 are for consistency with our proposals throughout this document and to update the regulations consistent with current practices.

J. Part 58, Subpart K—Disqualification of Any Person Conducting a Phase of a Nonclinical Laboratory Study

We propose modifying subpart K to extend the authority of the Commissioner of Food and Drugs to disqualify any person conducting a phase of a nonclinical laboratory study upon finding either or both of the conditions for disqualification in the proposed revisions in § 58.202. We propose adding any person conducting a phase of a nonclinical laboratory study for consistency with other modifications throughout this proposal.

We propose modifying § 58.202 to clarify the conditions for disqualification. To help provide uniformity in FDA regulations, we propose adding as a basis for initiating disqualification proceedings the repeated or deliberate submission of false information in any required report. FDA intends to reserve disqualification for the rare case when the rejection of a particular study is an inadequate regulatory response (see 43 FR 59986 at 60011) (Ref. 12).

In addition, we propose to amend the current provision in § 58.206(a) so that a person disqualified under part 58 would no longer be eligible to receive a test article under part 511, New Animal Drugs For Investigational Use. A clinical investigator who is ineligible to receive a test article under part 511 also would be ineligible to conduct any nonclinical laboratory study that is intended to support an application for a research or marketing permit.

For certain FDA-regulated products, such as new animal drugs, the study subjects are animals in both “nonclinical laboratory studies” and “clinical investigations.” In the new animal drug approval process, nonclinical laboratory studies, such as those that target animal safety and human food safety, may be essential in determining whether to approve an application for a research or marketing

permit for a new animal drug. For new animal drugs, the same clinical investigator could conduct both nonclinical laboratory studies and clinical investigations. Therefore, we propose this action to help protect the safety and welfare of animal research subjects involved in FDA-regulated nonclinical laboratory studies and clinical investigations, and to help ensure the reliability and integrity of the data submitted to FDA to support FDA decisions concerning new animal drugs.

Concurrent with this proposal, FDA is publishing elsewhere in this issue of the **Federal Register** a proposal to amend § 511.1(c), to expand the scope of clinical investigator disqualification under part 511. Under the current regulations, a clinical investigator disqualified by the Commissioner is ineligible to receive the particular type of test article regulated under that part (e.g. new animal drugs in § 511.1(c)) and is ineligible to conduct any clinical investigation that supports an application for a research or marketing permit for products regulated by FDA. Under the proposed amendment to part 511, a clinical investigator disqualified under part 511 also would be ineligible to conduct any nonclinical laboratory study intended to support an application for a research or marketing permit for a new animal drug.

When a clinical investigator is disqualified pursuant to part 511, the basis for that disqualification typically is the repeated or deliberate submission of false information to FDA or a sponsor in any required report. For new animal drugs, the same investigator could conduct both nonclinical laboratory studies and clinical investigations. The proposed amendment to part 511 would make a clinical investigator disqualified under part 511 ineligible to conduct any nonclinical laboratory study intended to support an application for a research or marketing permit for a new animal drug. In addition, the proposed amendment to part 511 would help to provide consistency for disqualification proceedings in parts 58 and 511.8.

Other proposed provisions in §§ 58.200, 58.202, 58.204, 58.206, 58.210, 58.213, 58.215, and 58.217 are for clarity and consistency with our proposals throughout this document. In § 58.210, when a study is determined to be unacceptable, we propose to eliminate from consideration data in support of the application or submission to FDA, as defined in proposed § 58.3. We also propose to add that such elimination may serve as new information justifying appropriate regulatory action not limited to termination or withdrawal of approval.

We propose modifying § 58.219 to reference § 58.210(b) and to require an FDA inspection of a disqualified person before reinstatement can be considered. Presently, § 58.219 states that the Commissioner “may” require such an inspection. Before a request for reinstatement can be appropriately considered by FDA, we propose requiring an inspection. This inspection would help provide additional information about the disqualified person that may be relevant to the consideration for reinstatement.

IV. Regulatory Hearing Before FDA

We propose to add to 21 CFR 16.1(b)(2) a new provision for 21 CFR part 58, subpart K relating to disqualifying any person that conducts a phase of nonclinical laboratory studies of FDA-regulated products.

V. Analysis of Environmental Impact

The Agency has determined under 21 CFR 25.30(h) that this action is of a type that does not individually or cumulatively have a significant effect on the human environment. Therefore, neither an environmental assessment nor an environmental impact statement is required.

VI. Legal Authority

Legal authority to issue good laboratory practice regulations exists under section 701(a) of the FD&C Act, as essential to enforcement of the Agency’s responsibilities under sections 402, 406, 408, 409, 501, 502, 503, 505, 510, 512–516, 518–520, 571, 721, 801, 905, 910, and 911 of the FD&C Act; and, sections 351 and 354–360F of the PHS Act.

VII. Proposed Implementation Plan

FDA proposes that any final rule that may issue based on this proposal become effective 1 year after the date of publication of the final rule in the **Federal Register**.

VIII. Economic Analysis of Impacts

A. Introduction

We have examined the impacts of the proposed rule under Executive Order 12866, Executive Order 13563, the Regulatory Flexibility Act (5 U.S.C. 601–612), and the Unfunded Mandates Reform Act of 1995 (Pub. L. 104–4). Executive Orders 12866 and 13563 direct Agencies to assess all costs and benefits of available regulatory alternatives and, when regulation is necessary, to select regulatory approaches that maximize net benefits (including potential economic, environmental, public health and safety, and other advantages; distributive

impacts; and equity). We have developed a comprehensive Economic Analysis of Impacts that assesses the impacts of the proposed rule. We believe that this proposed rule is not a significant regulatory action as defined by Executive Order 12866.

The Regulatory Flexibility Act requires Agencies to analyze regulatory options that would minimize any significant impact of a rule on small entities. Because the proposed requirements are likely to impose a significant burden on small entities employing fewer than 10 workers in “Dental Equipment and Supplies” (between 1.87 and 8.94 percent of average annual sales), we find that the proposed rule would have a significant economic impact on a substantial number of small entities, but the impacts are uncertain.

Section 202(a) of the Unfunded Mandates Reform Act of 1995 requires that Agencies prepare a written statement, which includes an assessment of anticipated costs and benefits, before proposing “any rule that includes any Federal mandate that may result in the expenditure by State, local, and tribal governments, in the aggregate, or by the private sector, of \$100,000,000 or more (adjusted annually for inflation) in any one year.” The current threshold after adjustment for inflation is \$146 million, using the most current (2015) Implicit Price Deflator for the Gross Domestic Product. This proposed rule would not result in an expenditure in any year that meets or exceeds this amount.

B. Summary

This proposed rule would amend the regulations regarding GLPs and would require that nonclinical laboratory studies (sometimes referred to as preclinical studies) follow a complete quality system approach, referred to as a GLP Quality System, when safety and toxicity studies support or are intended to support applications and submissions to FDA. The proposed rule would expand the scope to include all products for which nonclinical laboratory studies are currently conducted that are not explicitly discussed in the current regulations, specifically tobacco products. The proposed expanded scope also includes all applications and submissions under the FD&C Act that can be supported by the results of nonclinical laboratory studies. In addition, the proposed rule would introduce and modify definitions, terms, and organizational and personnel roles and responsibilities consistent with the implementation of the proposed GLP Quality System and the prevalence of multisite studies. Finally, the proposed rule would incorporate wording consistent with some of the existing domestic and international guidelines, rules or regulations covering good laboratory practices such as those established by the OECD.

Costs of the rule, when final, would include annual and one-time costs. Annual costs would include the additional reporting and recordkeeping responsibilities required under the proposed GLP Quality System. One-time costs include reading and understanding the rule, updating

existing SOPs, writing new SOPs, and training. Combined, all costs annualized over a ten-year period at a 7-percent discount rate are estimated to range between \$34.4 million and \$69.3 million, with an average annualized cost of \$51.9 million. By contrast, with a 3 percent discount rate, annualized cost would range from \$34.2 million to \$68.9 million, with an average annualized cost of \$51.5 million.

Conducting nonclinical laboratory studies under the proposed GLP Quality System is expected to improve the reliability and quality of the data that support applications and submissions to us, including those applications and submissions that lead to the use of new medical products in first-in-human clinical studies. In addition, the proposed system is conducive to improving compliance and accountability by all involved in the conduct of nonclinical laboratory studies.

As described, we understand the potential effects on small entities. We therefore seek comment, particularly from small entities, about the proposed effective date of 1 year after the date of publication of any final rule that may issue (see section VII. Proposed Implementation Plan).

The full discussion of economic impacts is available in docket FDA–2010–N–0548 at <http://www.regulations.gov> and at <http://www.fda.gov/AboutFDA/ReportsManualsForms/Reports/EconomicAnalyses/default.htm> (Ref. 18).

Table 1 summarizes the costs and benefits.

TABLE 1—SUMMARY OF BENEFITS, COSTS AND DISTRIBUTIONAL EFFECTS OF PROPOSED RULE ¹

Category	Primary estimate	Low estimate	High estimate	Units			Notes
				Year dollars	Discount rate (%)	Period covered (years)	
Benefits:							
Annualized	2014	7	10	
Monetized							
\$millions/year	2014	3	10	
Annualized	2014	7	10	
Quantified	2014	3	10	
Qualitative	The proposed rule would clarify GLP standards to facilitate a more consistent approach and provide greater international consistency. As a result, we anticipate improvements in the integrity and quality of data submitted for FDA review decisions.						
Costs:							
Annualized	\$51.9	\$34.4	\$69.3	2014	7	10	
Monetized							
\$millions/year	51.5	34.2	68.9	2014	3	10	
Annualized	2014	7	10	

TABLE 1—SUMMARY OF BENEFITS, COSTS AND DISTRIBUTIONAL EFFECTS OF PROPOSED RULE¹—Continued

Category	Primary estimate	Low estimate	High estimate	Units			Notes
				Year dollars	Discount rate (%)	Period covered (years)	
Quantified	2014	3	10	
Qualitative							
Transfers:							
Federal	2014	7	10	
Annualized	2014	3	10	
Monetized \$millions/year	From:			To:			
Other	2014	7	10	
Annualized	2014	3	10	
Monetized \$millions/year	From:			To:			
Effects:	State, Local or Tribal Government: None estimated. Small Business: The proposed requirements would likely impose a significant burden on small entities employing fewer than 10 workers in “Dental Equipment and Supplies” (between 1.87 and 8.94 percent of average annual sales). However, we do not have data on how many of these dental-equipment small entities perform nonclinical laboratory studies to support, or intended to support, an application or submission regulated by us; only such entities would be affected by the rule. Wages: None estimated.						

¹ Full Disclosure Preliminary Impact Analysis of the proposed rule “Good Laboratory Practice for Nonclinical Laboratory Studies,” Docket No. FDA-2010-N-0548. (Available at: <http://www.fda.gov/AboutFDA/ReportsManualsForms/Reports/EconomicAnalyses/default.htm>.)

IX. Paperwork Reduction Act of 1995

This proposed rule contains information collection provisions that are subject to review by the Office of Management and Budget (OMB) under the Paperwork Reduction Act of 1995 (44 U.S.C. 3501–3520). A description of these provisions is given in the Description section of this document with an estimate of the annual reporting and recordkeeping burden. Included in the estimate is the time for reviewing instructions, searching existing data sources, gathering and maintaining the data needed, and completing and reviewing each collection of information.

FDA invites comments on: (1) Whether the proposed collection of information is necessary for the proper performance of FDA’s functions, including whether the information will have practical utility; (2) the accuracy of FDA’s estimate of the burden of the proposed collection of information, including the validity of the methodology and assumptions used; (3) ways to enhance the quality, utility, and clarity of the information to be collected; and (4) ways to minimize the burden of the collection of information on respondents, including through the use of automated collection techniques, when appropriate, and other forms of information technology.

Title: Reporting and Recordkeeping Requirements for Good Laboratory

Practice for Nonclinical Laboratory Studies—OMB Control Number 0910–0119—Revision

Description: This proposed rule would revise the existing information collection requirements in the GLP regulations to provide for the development and implementation of a GLP Quality System and to reflect current procedures for the conduct of nonclinical laboratory studies, particularly multisite studies.

Description of respondents: Respondents to the information collection are persons conducting a phase of a nonclinical laboratory study that is within the proposed expanded scope of part 58, including their personnel, independent contributing scientists, and study sponsors as the latter two terms are defined in this proposed rule; universities; or government agencies.

Reporting: Currently, the GLP regulations include requirements to: (1) Report the results of QAU inspections; (2) submit periodic QAU study reports; (3) provide a QAU statement as part of the final study report; (4) provide the results of test and control article characterization and the testing of mixtures of test and control articles with carriers; (5) report a change in archive location; and (6) prepare in writing a final study report containing an overall interpretation of nonclinical laboratory studies.

The proposed rule will revise these requirements to include: (1) A final study report incorporating additional information about all persons conducting one or more nonclinical laboratory study phases and a study director’s compliance statement; (2) QAU reports on facility-based inspections and process-based inspections, where conducted; (3) written certification whenever a process-based QAU inspection reveals problems, with documentation that records the actions taken; (4) summaries of the closeout of discontinued studies; (5) notification of the change of archival site within a specified timeframe; (6) reports by the study sponsor to the study director of known risks of the test article and necessary measures to protect study personnel; and (7) reports by the study sponsor to the study director of the results of characterization of any reference articles that may be employed in a study as well of mixtures of such reference articles with carriers. Finally, for sponsors who submit the results of nonclinical laboratory studies in support of applications or submissions to FDA that are proposed additions to the scope of part 58 and that lack enacting regulations, (8) submission of the final study report and a GLP compliance statement.

QAU inspection reports provide the study director and management with executive responsibility information about the progress of a study and its

compliance with GLP regulations so they can take any corrective actions required to ensure the quality and integrity of the data. Test, control, and reference article information helps ensure proper dosing of the test system(s) and allows interpretation of study results in the final study report. The study sponsor receives the final study report and commonly submits the report in support of an application or

submission to FDA. The information in the final study report gives FDA's scientific review experts the information needed to help determine the safety or toxicity of the test article or both. FDA needs such safety and toxicity information to make regulatory decisions regarding the test article, including permitting the conduct of clinical studies on human subjects, determining safe levels of residual drug

for drugs administered to animals whose products will be consumed by humans, and marketing new products for both human and non-human animal use. Since a number of the additional applications and submissions proposed for the scope expansion do not have enacting regulations, inclusion in part 58 is necessary.

We estimate the reporting burden of this collection of information as follows:

TABLE 2—ESTIMATED ONE-TIME REPORTING BURDEN ¹

Activity	Number of respondents	Number of responses per respondent	Total annual responses	Average burden per response	Total hours
Read and Understand the Proposed Rule: Sponsors of Nonclinical Laboratory Studies	2,193	1	2,193	7.2	15,790
Read and Understand the Proposed Rule: Testing Facilities of Nonclinical Laboratory Studies	300	1	300	18	5,400
Total			2,493		21,190

¹ There are no capital costs or operating and maintenance costs associated with this collection of information.

Table 2 shows the estimated one-time burden associated with the new reporting provisions of the proposed rule. We expect that persons conducting a phase of a nonclinical laboratory study that is within the proposed expanded scope of part 58 will need to read and understand the proposed rule. We expect that some entities would face lower complexity from reading the proposed rule and some entities would face higher complexity. In the Preliminary Regulatory Impact Analysis

(PRIA), we calculated lower and upper estimates of time to read and understand the proposed rule under a low-complexity scenario for sponsors of nonclinical laboratory studies who would face fewer provisions. Our estimates under a high-complexity scenario apply to testing facilities of nonclinical laboratory studies that would have to read and understand more provisions in the rule. As stated in the PRIA, we estimate that there are 2193 sponsors of nonclinical laboratory

studies and 300 testing facilities of nonclinical laboratory studies. We estimate that the 2193 sponsors of nonclinical laboratory studies will take from 4.8 to 9.6 hours, for an average of 7.2 hours, to read and understand the proposed rule. We expect that the 300 testing facilities of nonclinical laboratory studies will take from 12 to 24 hours, for an average of 18 hours, to read and understand the proposed rule.

TABLE 3—ESTIMATED RECURRING REPORTING BURDEN ¹

21 CFR Section	Number of respondents	Number of responses per respondent	Total annual responses	Average burden per response	Total hours
Sponsor provides test, control, and reference article characterization and risk information (§ 58.5(g) & (h))	1,316	5	6,580	1	6,580
Sponsor provides nonclinical laboratory study report in support of applications and submissions (§ 58.5(k))	10	1	10	15	150
Expanded content of QAU statement in final study report (§ 58.35(b)(11))	300	60.25	18,075	.25 (15 minutes)	4,518.75
Management report of actions taken when a process-based inspection reveals problems (§ 58.35(e))	10	2	20	5	100
Expanded contents of final study report (§ 58.185(a))	300	60.25	18,075	2	36,150
Compliance statement by study director appended to final study report (§ 58.185(a)(16))	300	60.25	18,075	.5 (30 minutes)	9,037.5
Summary report of close-out for discontinued studies (§ 58.185(d))	300	2	600	2	1,200
Reports by independent contributing scientists (§ 58.37(a)(2))	30	1	30	5	150
Principal Investigator (PI) reports of deviations (§ 58.39(c))	200	10	2,000	1	2,000
PI study report & compliance statement (§ 58.39 (d))	200	5	1,000	8	8,000
Management report of personnel deviations from protocol (§ 58.29(b))	300	10	3,000	.5 (30 minutes)	1,500
Total			67,465		69,386.25

¹ There are no capital costs or operating and maintenance costs associated with this collection of information.

Table 3 shows the estimated recurring reporting burden associated with the proposed rule. Together, this results in a total of 90,576.25 hours and 69,958 responses.

Recordkeeping: Currently, the GLP regulations include requirements that respondents must record: (1) Personnel job descriptions and summaries of training and experience; (2) master schedules, protocols, and protocol amendments; (3) equipment inspection, maintenance, calibration, and testing records; (4) SOPs; (5) documentation of feed and water analyses and animal treatments; (6) test article accountability records; and (7) study documentation, including raw data.

This proposed rule will add to the existing requirements with regard to initial changes and additions to SOPs for both testing facilities and test sites to develop, implement, and maintain a GLP Quality System and to expand many SOPs to specifically include multisite studies.

This proposed rule would also expand personnel record maintenance to require records of training and experience on GLP requirements and species-specific animal care. In addition, this proposed rule includes revisions to the required content of study protocols as part of a GLP Quality System and for multisite study specifics.

The additional documentation by management with executive responsibility and study directors is for the implementation of a GLP Quality System and the resulting additional burden is nominal. Documentation by independent contributing scientists, as defined in this proposed rule, includes records these individuals would usually retain, so a nominal added burden is predicted.

To implement the proposed checks and balances discussed previously in the preamble, proposed revisions will require that added documentation be made by the study director and the QAU to ensure the viability of the proposed GLP Quality System (see Table 5).

This proposed rule also adds requirements for the study sponsor to maintain records of: (1) Protocol and protocol amendment approval; (2) the accreditation status of a contracted person (as defined in this proposed rule) that conducts a phase of the study that involves the use of animals; (3) test, control, and reference article characterization; and (4) the qualifications of all contracted persons.

In addition, the proposed rule includes recordkeeping requirements for nonclinical laboratory studies that choose to utilize the option of having a principal investigator, particularly for multisite studies. These individuals will

have recordkeeping responsibilities comparable to those of the study director for the nonclinical laboratory study phases for which they are responsible.

The persons potentially retaining nonclinical laboratory study documents are persons conducting a phase of a nonclinical laboratory study that is within the proposed expanded scope of part 58, including independent contributing scientists, and study sponsors as defined in this proposed rule. Results of nonclinical laboratory studies may be used by firms in support of applications and submissions to FDA, including applications and submissions for research and marketing of new products. The additional documentation of the conduct and data collection of nonclinical laboratory studies of FDA-regulated products will help ensure the quality and integrity of final study reports. FDA conducts on-site reviews of records and study reports during inspections of persons conducting one or more nonclinical laboratory study phases to verify the reliability of results submitted in support of applications and submissions to FDA.

We estimate the recordkeeping burden of this collection of information as follows:

TABLE 4—ESTIMATED ONE-TIME RECORDKEEPING BURDEN ¹

Activity	Number of recordkeepers	Number of records per recordkeeper	Total annual records	Average burden per recordkeeping	Total hours
Update Existing SOPs	300	12	3,600	7.5	27,000
Write New SOPs	300	10	3,000	24	72,000
Training	300	2	600	14	8,400
Total	7,200	107,400

¹ There are no capital costs or operating and maintenance costs associated with this collection of information.

Table 4 shows the estimated one-time burden associated with the revised recordkeeping provisions of the proposed rule. We expect that the 300 testing facilities of nonclinical laboratory studies will need to update existing SOPs and to write new SOPs. In the PRIA, we estimated that each facility would need to update 12 existing SOPs and write 10 new SOPs. We calculated lower and upper estimates of time to update existing

SOPs and to write new SOPs. We estimate that it will take from 4 to 11 hours, for an average of 7.5 hours, to update 12 existing SOPs. We estimate that it will take from 15 to 33 hours, for an average of 24 hours, to write 10 new SOPs. We also expect that the 300 testing facilities of nonclinical laboratory studies will need to conduct training. In the PRIA, we estimated that for the low estimate one person would be doing the training and one person

would be trained. By contrast, for the high estimate, we estimated that also one person would be doing the training and potentially three people would receive such training, for an average of two employees for each facility. We calculated lower and upper estimates of time to train, estimating that it will take from 5 to 23 hours, for an average of 14 hours, to train.

TABLE 5—ESTIMATED RECURRING RECORDKEEPING BURDEN ¹

	Number of recordkeepers	Number of records per recordkeeper	Total annual records	Average burden per recordkeeping	Total hours
Sponsor documentation (§ 58.5):					

TABLE 5—ESTIMATED RECURRING RECORDKEEPING BURDEN ¹—Continued

	Number of recordkeepers	Number of records per recordkeeper	Total annual records	Average burden per recordkeeping	Total hours
—(c) protocol approval and (i) all amendments	2,193	100	219,300	1	219,300

Recordkeeping (§ 58.195)	300	251.5	75,450	3.9	294,255
Total			1,188,031		906,289.5

¹ There are no capital costs or operating and maintenance costs associated with this collection of information.

Table 5 shows the estimated recurring recordkeeping burden associated with the proposed rule. Together, this results in a total of 1,013,689.5 hours and 1,195,231 records.

To ensure that comments on information collection are received, OMB recommends that written comments be faxed to the Office of Information and Regulatory Affairs, OMB (see **ADDRESSES**). All comments should be identified with the title of the information collection.

In compliance with the Paperwork Reduction Act of 1995 (44 U.S.C. 3407(d)), the Agency has submitted the information collection provisions of this proposed rule to OMB for review. These requirements will not be effective until FDA obtains OMB approval. FDA will publish a notice concerning OMB approval of these requirements in the **Federal Register**.

X. Federalism

FDA has analyzed this proposed rule according to the principles set forth in Executive Order 13132. FDA has

determined that the proposed rule, if finalized, would not contain policies that would have substantial direct effects on the States, on the relationship between the National Government and the States, or on the distribution of power and responsibilities among the various levels of government. Accordingly, the Agency tentatively concludes that the proposed rule does not contain policies that have federalism implications as defined in the Executive order and, consequently, a federalism summary impact statement is not required.

List of Subjects

21 CFR Part 16

Administrative practice and procedure.

21 CFR Part 58

Laboratories, Reporting and recordkeeping requirements.

Therefore, under the Federal Food, Drug, and Cosmetic Act and under authority delegated to the Commissioner of Food and Drugs, it is proposed that 21 CFR parts 16 and 58 be amended as follows:

PART 16—REGULATORY HEARING BEFORE THE FOOD AND DRUG ADMINISTRATION

■ 1. The authority citation for part 16 continues to read as follows:

Authority: 15 U.S.C. 1451–1461; 21 U.S.C. 141–149, 321–394, 467f, 679, 821, 1034; 28 U.S.C. 2112; 42 U.S.C. 201–262, 263b, 364.

■ 2. In § 16.1, amend paragraph (b)(2) by removing the entry for § 58.204(b) and adding an entry for §§ 58.200 through 58.219 to read as follows:

§ 16.1 Scope.

* * * * *

(b) * * *

(2) * * *

§§ 58.200 through 58.219 (see part 58, subpart K of this chapter), relating to disqualifying any person conducting a phase of a nonclinical laboratory study of FDA-regulated products.

* * * * *

PART 58—GOOD LABORATORY PRACTICE FOR NONCLINICAL LABORATORY STUDIES

■ 3. The authority citation for part 58 is revised to read as follows:

Authority: 21 U.S.C. 342, 346, 346a, 348, 351, 352, 353, 355, 360, 360b–360f, 360h–360j, 360ccc, 371, 379e, 381, 387e, 387j, 387k; 42 U.S.C. 216, 262, 263b–263n.

■ 4. In § 58.1, revise paragraph (a) and add paragraph (c) to read as follows:

§ 58.1 Scope.

(a) This part prescribes good laboratory practices (GLPs) for conducting nonclinical laboratory studies of safety or toxicity or both that support or are intended to support an application or submission for products regulated by the Food and Drug Administration (FDA), including food and color additives, animal food additives, human and animal drugs, devices, biological products, electronic products, and tobacco products. Applications and submissions to FDA affected by these regulations include those listed in § 58.3. Compliance with this part is intended to assure the quality and integrity of data from nonclinical laboratory studies filed or submitted pursuant to sections 402, 406, 408, 409, 501, 502, 503, 505, 510, 512–516, 518–520, 571, 701, 721, 801, 905, 910, and 911 of the Federal Food, Drug, and Cosmetic Act and sections 351 and 354–360F of the Public Health Service Act.

* * * * *

(c) In this part the term “where appropriate” is used several times. When a requirement is qualified by “where appropriate,” it is deemed to be “appropriate” unless justification can be otherwise documented. A requirement is “appropriate” if non-implementation could reasonably be expected to result in a nonclinical laboratory study whose results lack the required reliability.

■ 5. Revise § 58.3 to read as follows:

§ 58.3 Definitions.

As used in this part, the following terms have the meanings specified:

Applications and Submissions to FDA include:

(1) A color additive petition, described in section 721 of the Federal Food, Drug, and Cosmetic Act, and as described in part 71 of this chapter.

(2) A food additive petition, described in section 409 of the Federal Food, Drug and Cosmetic Act, and as described in parts 171 and 571 of this chapter.

(3) Data and information regarding a substance submitted as part of the procedures for establishing that a substance is generally recognized as safe for use, which use results or may reasonably be expected to result, directly or indirectly, in its becoming a component or otherwise affecting the characteristics of any food, described in §§ 170.35 and 570.25 of this chapter.

(4) Data and information regarding a food additive submitted as part of the procedures regarding food additives permitted to be used on an interim basis pending additional study, described in § 180.1 of this chapter.

(5) A petition for a nutrient content claim, described in section 403 of the Federal Food, Drug, and Cosmetic Act, and as described in subpart D of part 101 of this chapter.

(6) A petition for a health claim, described in section 403 of the Federal Food, Drug, and Cosmetic Act, and as described in subpart E of part 101 of this chapter.

(7) An *investigational new drug application*, described in section 505(i) of the Federal Food, Drug, and Cosmetic Act, and as described in part 312 of this chapter.

(8) *Applications for FDA approval to market a new drug*, described in section 505 of the Federal Food, Drug, and Cosmetic Act, and as described in part 314 of this chapter.

(9) Data and information regarding an over-the-counter drug for human use, submitted as part of the procedures for classifying such drugs as generally recognized as safe and effective and not misbranded, described in part 330 of this chapter.

(10) Data and information about a substance submitted as part of the procedures for establishing a tolerance for unavoidable contaminants in food and food-packaging materials, described in sections 406, 408, and 409 of the Federal Food, Drug, and Cosmetic Act, and as described in parts 109 and 509 of this chapter.

(11) A *notice of claimed investigational exemption for a new animal drug*, section 512(j) of the Federal Food, Drug, and Cosmetic Act, and as described in described in part 511 of this chapter.

(12) *New animal drug applications*, described in section 512 of the Federal Food, Drug, and Cosmetic Act, and as described in part 514 of this chapter.

(13) An *abbreviated application for a new animal drug*, described in section 512(b) of the Federal Food, Drug, and Cosmetic Act.

(14) An *application for conditional approval of new animal drugs for minor use and minor species*, described in section 571(a)(2) of the Federal Food, Drug, and Cosmetic Act, and as described in part 516 of this chapter.

(15) *Authorization to market edible products from experimental animals* as described in parts 170 and 570 of this chapter.

(16) A request to establish or amend an import tolerance described in section

512 of the Federal Food, Drug, and Cosmetic Act.

(17) [Reserved]

(18) An *application for a biologics license*, described in section 351 of the Public Health Service Act, and as described in part 601 of this chapter.

(19) An *application for an investigational device exemption*, described in section 520(g) of the Federal Food, Drug, and Cosmetic Act, and as described in part 812 of this chapter.

(20) An *application for premarket approval of a medical device*, described in section 515 of the Federal Food, Drug, and Cosmetic Act, and as described in part 814 of this chapter.

(21) An *application for humanitarian device exemption*, authorized under section 520(m) of the Federal Food, Drug, and Cosmetic Act, and as described in part 814, subpart H of this chapter.

(22) A *product development protocol for a medical device*, described in section 515 of the Federal Food, Drug, and Cosmetic Act, and as described in part 814 of this chapter.

(23) A *premarket notification submission* for a medical device as authorized under section 510(k) of the Federal Food, Drug, and Cosmetic Act, and as described in part 807, subpart E of this chapter.

(24) Data and information regarding a medical device submitted as part of the procedures for classifying such devices described in part 860, subpart B of this chapter, reclassification petitions described in part 860, subpart C of this chapter, and requests associated with the evaluation of automatic class III designations, authorized under section 513(f)(2) of the Federal Food, Drug, and Cosmetic Act.

(25) Data and information regarding a medical device submitted as part of the procedures for establishing, amending, or revoking a performance standard for such devices, described in section 514 of the Federal Food, Drug, and Cosmetic Act, and as described in part 861 of this chapter.

(26) Data and information regarding an electronic product submitted as part of the procedures for obtaining an exemption from notification of a radiation safety defect or failure of compliance with a radiation safety performance standard, described in subpart D of part 1003 of this chapter.

(27) Data and information regarding an electronic product submitted as part of the procedures for establishing, amending, or repealing a standard for such product, described in section 358 of the Public Health Service Act.

(28) Data and information regarding an electronic product submitted as part of the procedures for obtaining a variance from any electronic product performance standard as described in § 1010.4 of this chapter.

(29) Data and information regarding an electronic product submitted as part of the procedures for granting, amending, or extending an exemption from any electronic product performance standard, as described in § 1010.5 of this chapter.

(30) A *premarket notification for a food contact substance*, described in section 409 of the Federal Food, Drug, and Cosmetic Act, and as described in part 170, subpart D of this chapter.

(31) [Reserved]

(32) A *premarket application for a new tobacco product*, as described in section 910(b)(1) of the Federal Food, Drug, and Cosmetic Act.

(33) A *substantial equivalence report* as described in section 905(j) of the Federal Food, Drug, and Cosmetic Act.

(34) A *request for exemption* under section 905(j)(3) of the Federal Food, Drug, and Cosmetic Act, and as described in part 1107 of this chapter.

(35) An *application or submission related to a modified risk tobacco product*, as described in section 911 of the Federal Food, Drug, and Cosmetic Act.

Attending veterinarian means a veterinarian who has training or experience or both in the care and management of the species being attended and who has direct or delegated authority for activities involving animals.

Batch means a specific quantity or lot of a test, control, or reference article that has been characterized according to § 58.105 and handled according to § 58.107.

Contracted person means a person who assumes, either directly or indirectly as an independent contractor, one or more responsibilities for the conduct of a nonclinical laboratory study.

Contributing scientist means an individual responsible for the conduct, interpretation, analysis, or any other service for a phase of a nonclinical laboratory study. An individual expert or specialist who is an independently employed contracted person, as defined in this section, is an independent contributing scientist.

Control article means any food additive, color additive, drug, biological product, electronic product, device, tobacco product, or any article other than a test article, reference article, feed, or water that is administered to the test system in the course of a nonclinical

laboratory study for the purpose of establishing a basis for comparison with the test article.

Establish means define, document (in writing or electronically), and implement.

Facility-based inspection means an inspection which is not based on specific studies but covers general facilities and activities, for example, installations, support systems, computer systems, training, environmental monitoring, and equipment maintenance and calibration.

GLP Quality System means the organizational structure, responsibilities, procedures, processes, and resources for implementing quality management in the conduct of a nonclinical laboratory study.

Lead quality assurance unit (lead QAU) means the QAU responsible for quality assurance (QA) in a multisite nonclinical laboratory study. Testing facility management with executive responsibility selects the lead QAU.

Management with executive responsibility means those senior employees of a testing facility or test site who have the authority to establish or make changes to the quality policy and GLP Quality System at the testing facility and test site, respectively.

Master schedule means a compilation of information used for assessment of workload and the tracking of nonclinical laboratory studies.

Multisite study means any study that has phases conducted at more than one site.

Nonclinical laboratory study means in vivo or in vitro experiments in which test articles are studied prospectively in test systems under laboratory conditions or in the applicable environment to determine their safety or toxicity or both. The term does not include studies involving human subjects, clinical studies, or clinical investigational use in animals. The term does not include basic exploratory studies carried out to determine whether a test article has any potential utility or basic exploratory studies to determine the physical or chemical characteristics of a test article.

Person includes an individual, partnership, corporation, association, scientific or academic establishment, government agency, or organizational unit thereof, and any other legal entity.

Phase means a defined activity or set of activities in the conduct of a nonclinical laboratory study.

Principal investigator means an individual who has specific responsibilities for one or more phases of a nonclinical laboratory study as delegated by the study director.

Process-based inspection means an inspection conducted to monitor procedures or processes of a repetitive nature that are very frequently performed. Process-based inspections are conducted on a prearranged schedule, which is not connected to the timing of any particular nonclinical laboratory study. Performance of process-based inspections covering processes or procedures that occur with a very high frequency (for example, certain mutagenicity studies) may cause some studies to be uninspected during the in-life period of the study, as defined in this section within the definition of *Short-term study*.

Quality means the totality of features and characteristics that bear on the ability of a nonclinical laboratory study to provide data that can be relied upon.

Quality assurance unit (QAU) means any person or organizational element designated to perform the duties relating to quality assurance (QA) of nonclinical laboratory studies. For any given study, the QAU must be entirely separate from and independent of the personnel engaged in the direction and conduct of the study.

Quality policy means the overall intentions and direction of an organization with respect to quality, as established by management with executive responsibility.

Raw data means all original nonclinical laboratory study records and documentation or exact copies that maintain the original intent and meaning and are made according to the person's certified copy procedures. *Raw data* includes any laboratory worksheets, correspondence, notes, and other documentation (regardless of capture medium) that are the result of original observations and activities of a nonclinical laboratory study and are necessary for the reconstruction and evaluation of the report of that study. *Raw data* also includes the signed and dated pathology report.

Reference article means any chemical substance or mixture, or analytical standard, or material other than a test article, control article, feed, or water that is administered to or used in analyzing the test system in the course of a study for the purposes of establishing the basis for comparison with the test article for known chemical or biological measurements.

Short-term study means a study for which the in-life period is completed within several days or a week at most. The in-life period of a study is that period during which data are collected.

Specimen means any material derived from a test system for examination, analysis, or retention.

Sponsor means: (1) A person that initiates and supports, by provision of financial or other resources, a nonclinical laboratory study; or

(2) A person that submits a nonclinical laboratory study in support of an application or submission to FDA; or

(3) A person that initiates a nonclinical laboratory study and functions as, and has the same responsibilities as, a testing facility, test site, or contributing scientist, as those terms are defined in this section.

Standard operating procedures (SOPs) means documented procedures which describe how to perform tests or activities normally not specified in detail in study protocols.

Study-based inspection means an inspection of a critical operation of the study which is scheduled according to the chronology of the given study. Management with executive responsibility at the testing facility and/or test site identifies which operations are critical before initiation of the study.

Study completion date means the date the final report is signed by the study director.

Study director means the individual responsible for the overall conduct of a nonclinical laboratory study.

Study initiation date means the date the protocol is signed by the study director.

Test article means any food additive, color additive, drug, biological product, electronic product, device, tobacco product, or any other article subject to regulation under the Federal Food, Drug, and Cosmetic Act or under sections 351 and 354–360F of the Public Health Service Act.

Test site means a person who is responsible for one or more phases of a multisite nonclinical laboratory study. A test site includes management with executive responsibility and supporting SOPs relevant to the conduct of nonclinical laboratory studies.

Test system means any animal, plant, microorganism, or subparts thereof to which the test, control, or reference article is administered or added for study. *Test system* also includes appropriate groups or components of the system not treated with the test, control, or reference articles.

Testing facility means the person responsible for coordinating, conducting, or completing a nonclinical laboratory study, or any combination thereof. The testing facility designates the study director.

Validation means confirmation by examination and provision of objective evidence that the particular

requirements for a specific intended use can be consistently fulfilled.

Vehicle means any agent which serves as a carrier and is used to mix, disperse, or solubilize the test, control, or reference article for administration or application to the test system.

■ 6. Add § 58.5 to subpart A to read as follows:

§ 58.5 Sponsor responsibilities.

For each nonclinical laboratory study, the sponsor must:

(a) Ensure the nonclinical laboratory study protocol (the study protocol) meets the requirements in § 58.120.

(b) Ensure that the study protocol provides for humane care and ethical treatment of animals.

(c) Sign and date the study protocol to indicate approval.

(d) Contract with persons accredited as following appropriate animal welfare procedures for phases of a nonclinical laboratory study that include the use of animals. If these contracted persons are not accredited, document this fact, the reason for using a non-accredited person, and the qualifications of the non-accredited person. This information must be included in the compliance statement required in paragraph (k) in this section.

(e) Document that any contracted person conducting a phase of a nonclinical laboratory study is qualified according to the provisions in this part.

(f) Ensure that appropriate lines of communication are established among all persons conducting a phase of the nonclinical laboratory study and document all study-related communications that involve the sponsor.

(g) Document that test, control, and reference articles are prepared, characterized, and labeled according to subpart F of this part, and are appropriately shipped. Obtain, and provide to the study director as soon as available, information regarding test, control, and reference article characterization as specified in § 58.105.

(h) Inform the study director of any known potential risks of the test article to human health or the environment and any measures necessary to protect study personnel and the environment.

(i) Review, approve, sign, and date each protocol amendment before implementation.

(j) Document and update as necessary the archive location of all raw data and records as described in §§ 58.190 and 58.195.

(k) Include, in any application or submission to FDA that includes the results of a nonclinical laboratory study, the final study report and all

amendments. If a summary report of the nonclinical laboratory study is included in such applications or submissions, a copy of the final study report, as described in § 58.185, must be appended or provided elsewhere within the application or submission. Also, include either a statement that the study was conducted in compliance with the requirements set forth in this part, or, if the study was not conducted in compliance with these regulations, a brief statement of the reason for the noncompliance.

■ 7. Revise § 58.10 to read as follows:

§ 58.10 Transfer of responsibilities.

(a) Any person utilizing the services of a contracted person (as defined in § 58.3) to perform a phase (as defined in § 58.3) of a nonclinical laboratory study may transfer to the contracted person any regulatory responsibility in this chapter, unless delegation of such responsibility is expressly prohibited. Any such transfer must be described in writing. Any responsibility not covered by the written description is deemed not transferred.

(b) Any person transferring to a contracted person any responsibility for a phase of a nonclinical laboratory study must inform that contracted person that the transferred responsibility must be performed in compliance with the provisions in this part.

(c) A contracted person assuming any responsibility for a phase of a nonclinical laboratory study must comply with the regulations in this chapter applicable to the transferred responsibility and is subject to the same regulatory actions as those transferring the responsibility.

■ 8. Revise § 58.15 to read as follows:

§ 58.15 Inspection of any person conducting a phase of a nonclinical laboratory study.

(a) Any person conducting a phase of a nonclinical laboratory study must permit, at reasonable times and in a reasonable manner, an authorized employee of FDA to inspect and copy all records and inspect all specimens required to be maintained for nonclinical laboratory studies within the scope of this part and, where applicable, to collect reserve samples for such studies. The records inspection and copying requirements do not routinely apply to QAU records of findings and problems or to actions recommended and taken. However, FDA retains the authority to inspect all QAU records when necessary to ensure compliance with this part.

(b) FDA will not consider a nonclinical laboratory study submitted

in support of an application or submission to FDA if any person conducting a phase of the nonclinical laboratory study refuses to permit inspection. The determination that a nonclinical laboratory study will not be considered in support of an application or submission to FDA does not, however, relieve the applicant of any obligation under any other applicable statute or regulation to submit the results of the study to FDA.

■ 9. Revise § 58.29 to read as follows:

§ 58.29 Personnel.

(a) Each individual engaged in the conduct of, or responsible for the supervision of, a nonclinical laboratory study must have education, training, and experience, or a combination thereof, to enable that individual to perform the assigned functions. This must include training and experience with GLP requirements. Personnel who work with animals must have both general and species-specific training and experience.

(b) All study personnel must have access to and comply with the protocol and all applicable protocol amendments and SOPs. Any deviation must be reported to the study director.

(c) All study personnel must record raw data, as defined in § 58.3, promptly and accurately as required by § 58.180.

(d) Any person conducting a phase of a nonclinical laboratory study must maintain a current summary of training and experience and a job description for each individual in the person's employment engaged in or supervising the phase of the study for which the person is responsible.

(e) There must be a sufficient number of personnel for the timely and proper conduct of the study according to the protocol.

(f) Personnel must take necessary personal sanitation and health precautions designed to avoid contamination of test, control, and reference articles and test systems.

(g) Personnel engaged in a nonclinical laboratory study must wear clothing appropriate for the duties they perform. Such clothing must be changed as often as necessary to prevent microbiological, radiological, or chemical contamination of test systems and test, control, and reference articles.

(h) Any individual found at any time to have an illness that may adversely affect the quality and integrity of the nonclinical laboratory study must be excluded from direct contact with test systems; test, control, and reference articles; and any other operation or function that may adversely affect the study until the condition is corrected.

All personnel must be instructed to report to their immediate supervisors any health or medical conditions that may reasonably be considered to have an adverse effect on a nonclinical laboratory study.

■ 10. Revise § 58.31 to read as follows:

§ 58.31 Testing facility management with executive responsibility.

Management with executive responsibility is ultimately responsible for the GLP Quality System and must establish policy and objectives for a GLP Quality System and a commitment to quality, as defined in § 58.3.

Management with executive responsibility must ensure that the quality policy, as defined in § 58.3, is implemented and maintained at all levels of the organization. Management with executive responsibility must:

(a) Establish and update written SOPs, as required in § 58.81(b)(2) for a GLP Quality System.

(b) Review the suitability and effectiveness of the GLP Quality System at defined intervals and with sufficient frequency according to established procedures, to be included in SOPs for the GLP Quality System (§ 58.81(b)(2)), to ensure that the GLP Quality System satisfies the established quality policy and objectives and the requirements of this part. The dates and results of these reviews must be documented.

(c) Establish and maintain an adequate organizational structure (personnel, resources, facilities, equipment, materials, and methodologies) to ensure that all testing complies with the established GLP Quality System, according to the requirements of this part.

(d) Establish procedures, to be included in SOPs for the GLP Quality System (§ 58.81(b)(2)), for the appropriate responsibility, authority, and interrelationship among all personnel who manage, perform, and assess work affecting quality, and provide the independence and authority necessary to perform these tasks.

(e) Appoint and document the appointment of, according to procedures to be included in SOPs for the GLP Quality System (§ 58.81(b)(2)), a management representative who is a member of the testing facility management with authority over and responsibility for:

(1) Documenting that GLP Quality System requirements are effectively established and effectively maintained; and

(2) Reporting on the performance of the GLP Quality System to management with executive responsibility for review, including all reports from the QAU.

(f) Establish SOPs for equipment, as required in § 58.81(b)(14), including standards for appropriate documentation of equipment validation, as defined in § 58.3. For multisite studies, document that any person conducting a phase of the nonclinical laboratory study follows adequate equipment-related SOPs.

(g) Establish SOPs to ensure that computerized systems are suitable for their intended purposes and are appropriately validated, operated, and maintained as required in § 58.81(b)(15).

(h) Document that all study personnel are trained to perform their assigned functions.

(i) Establish SOPs, as required in § 58.81(b)(18), for ensuring and documenting the qualifications of any person conducting a phase of a nonclinical laboratory study.

(j) Establish SOPs for the development and maintenance of the master schedule as required in § 58.81(b)(13).

(k) Appoint and document the appointment of a person to maintain the master schedule. The master schedule must be indexed by test article and contain the identification of the test system, the nature of the study, the date the study was initiated, the current status of each study, the identity of the sponsor, and the name of the study director. For multisite studies, the master schedule of each person conducting a phase of a nonclinical laboratory study must also include the specific phases that person conducts.

(l) Establish procedures, to be included in SOPs for multisite studies required in § 58.81(b)(18), for the transfer of data, specimens, and samples among all persons conducting phases of the nonclinical laboratory study; verification of the accuracy and completeness of any translations of SOPs and protocols, when applicable; and storage, return, or disposal of test, control, and reference articles, as applicable.

(m) Review all protocols to determine that there are no environmental, animal welfare, or work resource issues or issues with scientific methodology that might affect or bias any phase of the conduct of the proposed study. Document the review and acceptance of each protocol.

(n) Establish SOPs, as required in § 58.81(b)(3), for designation of a study director, as described in § 58.33, before the study is initiated and prompt replacement of the study director if it becomes necessary to do so during the conduct of a study.

(o) Establish procedures, to be included in SOPs for the GLP Quality System (§ 58.81(b)(2)), to ensure a clear

line of communication among the study director, principal investigator(s), QAU(s), the sponsor, and all study personnel, as applicable.

(p) Provide for a QAU as described in § 58.35. Before initiating a multisite study, as defined in § 58.3, designate and document the designation of the lead QAU with overall responsibility for the entire study. Provide the information described in § 58.35(a) of the lead QAU to all persons involved in the conduct of the study and all QAUs serving those persons.

(q) Establish procedures, to be included in SOPs for the GLP Quality System (§ 58.81(b)(2)), to ensure QAU review of SOPs and study protocols to verify that they meet GLP requirements. This review must be documented.

(r) Review the suitability and effectiveness of the QAU or lead QAU, as applicable, at defined intervals and with sufficient frequency, according to established SOPs as required in § 58.81(b)(17), to ensure that the QAU satisfies established quality policy and objectives and the requirements of this part. For multisite studies, testing facility management with executive responsibility must periodically review the suitability and effectiveness of the lead QAU. The dates and results of reviews of the QAU must be documented.

(s) Establish SOPs, as required in § 58.81(b)(6), for the receipt of information regarding the characterization of all test, control, and reference articles or mixtures, including data on their identity, strength, purity, stability, and uniformity, as applicable.

(t) Establish SOPs, with appropriate timeframes, for the conduct of QAU inspections and for the receipt, review, and followup of all concerns, problems, and regulatory deviations reported by the QAU. These SOPs must include procedures for correcting reported problems and, as necessary, for modification of relevant SOPs to prevent a recurrence of any problems, as required in § 58.81(b)(20) and (21).

(u) Establish SOPs, as required in § 58.81(b)(13), for the development and maintenance of an archive system, including the designation and replacement of the archivist and any supporting staff.

(v) Establish procedures to ensure maintenance of a historical file of all SOPs as required in § 58.81(b)(1).

■ 11. Add § 58.32 to subpart B to read as follows:

§ 58.32 Test site management with executive responsibility.

For multisite studies, each test site participating in the study must have

management with executive responsibility for the test site who must:

(a) Comply with responsibilities delineated for testing facility management with executive responsibility, as described in section § 58.31, where appropriate.

(b) Develop and maintain SOPs as specified in § 58.81, where appropriate.

■ 12. Revise § 58.33 to read as follows:

§ 58.33 Study director.

(a) For each nonclinical laboratory study, a scientist or other professional of appropriate education, training, and experience, or combination thereof, must be identified as the study director. The study director represents the single point of study control and has overall responsibility, which cannot be delegated, for:

(1) The technical conduct of the entire study;

(2) The implementation of procedures to ensure adequate communication among all study personnel and with the study sponsor, as applicable; and

(3) The interpretation, analysis, documentation, and reporting of results and study compliance.

(b) The study director must:

(1) Approve the protocol, including any changes, as provided by § 58.120, and document that it is followed.

(2) Document that the QAU has reviewed the protocol and all applicable SOPs, and any amendments, before study initiation and implementation of applicable amendments to ensure that they are compliant with GLP requirements.

(3) Document that testing facility management with executive responsibility has committed adequate resources for the conduct of the specific study.

(4) Document that computerized systems are validated and fit for use in the specific study.

(5) For studies requiring the use of animals, document that the initial protocol and any amendments that impact the use of animals are reviewed and approved, as required in § 58.120(b) and (e), by a committee whose function is to ensure that the care and use of animals in studies is appropriate and humane, before study initiation and the implementation of applicable amendments.

(6) Consult with the attending veterinarian, as defined in § 58.3, during review of proposed study protocols to determine potential animal welfare concerns and appropriate responses to likely contingencies. Defer to the attending veterinarian when decisions regarding animal welfare arise, particularly when animals are in pain or distress.

(7) For multisite studies:

(i) Document the qualifications of any person conducting a phase of the nonclinical laboratory study.

(ii) Determine and document the need for principal investigators.

(8) Document that all experimental data, including observations of unanticipated responses of the test system, are accurately recorded and verified.

(9) Document unforeseen circumstances that may affect the quality and integrity of the nonclinical laboratory study when they occur and the corrective action taken.

(10) Document that test systems are as specified in the approved study protocol.

(11) Document that all applicable GLP regulations are followed and include a study compliance statement in the final study report.

(12) Document all communications with all persons conducting a phase of the nonclinical laboratory study and with the sponsor, as applicable.

(13) Sign and date the final study report.

(14) Archive all raw data, documentation, protocols, specimens, reserve samples, and final reports no later than 2 weeks after the study completion date.

■ 13. Revise § 58.35 to read as follows:

§ 58.35 Quality assurance unit (QAU).

(a)(1) *Function.* A QAU must monitor each study to assure management that the facilities, equipment, personnel, methods, practices, records, and controls are in conformance with the regulations in this part. For any given study, the QAU must be entirely separate from and independent of the personnel engaged in the direction and conduct of the study.

(2) *Location and identity.* (i) For studies conducted entirely at the testing facility, the QAU can consist of personnel at the facility itself or be a separately contracted unit.

(ii) For multisite studies, a lead QAU must be designated by testing facility management with executive responsibility and must have responsibility for the QA of the entire study. The lead QAU can consist of personnel at the testing facility, be a QAU for another person conducting a phase of the study, or be a separately contracted unit. QAUs for persons conducting a phase of the study must coordinate with the lead QAU as specified in SOPs as described in § 58.81(b)(17) and (20). The lead QAU has direct QA responsibility for any person lacking a QAU.

(b) QAUs must: (1) Maintain access to the master schedule (defined in § 58.3) of all nonclinical laboratory studies conducted by the person employing the QAU or contracting for QA services. For multisite studies, the lead QAU must maintain access to the master schedule of any person lacking a QAU.

(2) Maintain access to copies of all protocols pertaining to all nonclinical laboratory studies for which the QAU is responsible.

(3) Review all protocols before study initiation, and all protocol amendments before implementation, to ensure that they can be conducted in compliance with this part. This review must be documented.

(4) Review all SOPs to be used for the conduct of all phases of a nonclinical laboratory study to assess their clarity and compliance with this part. This review must be documented.

(5) Inspect each nonclinical laboratory study for which the QAU is responsible at intervals adequate to ensure the integrity of the specific study.

Inspections must determine compliance with the protocol, applicable SOPs, and the requirements of this part. These can include study-based, process-based, and facility-based inspections as defined in § 58.3 and as specified in SOPs as required in § 58.81(b)(20). For multisite studies, the lead QAU must coordinate the conduct of study inspections with any other existing QAUs, as specified in SOPs as required in § 58.81(b)(20). Upon discovery, any problems found during an inspection which are likely to affect study integrity must be reported to the study director and management with executive responsibility for the study or studies affected.

(6) Maintain written and properly signed records of all inspections that include the date of the inspection, the individual performing the inspection, findings and problems, action recommended and taken to resolve existing problems, and any scheduled date for reinspection. For study-specific inspections, reports must also include the identity of the study and the phase of the study inspected.

(7) Periodically submit to management with executive responsibility and the study director written status reports on each study that discuss the overall progress and compliance status of the study and that include any problems observed and the corrective actions taken. The content and frequency of these reports must be specified in SOPs, as described in § 58.81(b)(21).

(8) Determine that no deviations from approved protocols or SOPs were made without proper authorization and

documentation. For multisite studies, the lead QAU is responsible for identifying all deviations that occur across the entire study, including deviations identified by all other QAUs participating in the study, as described in SOPs in § 58.81(b)(17).

(9) Audit the reports of all contributing scientists, and any amendments to such reports, to ensure such reports reflect the protocol and all amendments, accurately describe the methods and SOPs, and report all of the raw data of the specific phases covered by each report. For multisite studies, QAUs for persons conducting a phase of the study must audit the reports of any principal investigators and all contributing scientists for whom they are responsible, and any amendments to such reports, as specified in SOPs as described in § 58.81(b)(17). The lead QAU must audit the reports, and any amendments to such reports, of any principal investigators and all contributing scientists for any person lacking a QAU and of any independent contributing scientists.

(10) Audit the final study report, and any amendments to this report, to ensure that such report accurately describes the methods and SOPs, all raw data of the nonclinical laboratory study are reported, and that all original and amended signed and dated reports from all contributing scientists are appended. For multisite studies, this is the responsibility of the lead QAU.

(11) Prepare, sign, and date a statement to be included with the final study report that specifies:

(i) The dates of study-specific inspections, process-based inspections if applicable, and facility-based inspections;

(ii) Findings reported to management with executive responsibility and to the study director; and

(iii) The dates of QAU audits of the reports of all contributing scientists (including any independent contributing scientists), any principal investigators, and of the final study report and all amendments to such. For multisite studies, this is the responsibility of the lead QAU. When other persons conducting a phase of the study have QAUs, those QAUs must provide to the lead QAU such statements regarding the audits they conducted, for appending to the final study report.

(c) The responsibilities and procedures applicable to the QAU, the records maintained by the QAU, and the method of indexing such records must be in writing and must be maintained as specified in SOPs as required in § 58.81(b)(17). For multisite studies, the

lead QAU and all other QAUs participating in the study must maintain those documents relevant to their oversight. These SOPs as well as documentation of the dates of all QAU inspections, the study or process or procedure, or facility inspected as applicable, the phase or segment of the study inspected for study-specific inspections, and the name of the individual performing the inspection must be made available for inspection to authorized employees of FDA.

(d) A designated representative of FDA must, upon request, be given access to the written SOPs established for QAU inspections. If requested by FDA, the person inspected must certify that inspections are being implemented, performed, documented, and followed up according to this part.

(e) If a person conducting a phase of a nonclinical laboratory study chooses to conduct process-based inspections, that person must prepare a written certification, as specified in SOPs as required in § 58.81(b)(21), whenever a process-based inspection reveals problems. This certification must document actions taken to properly inform and, when applicable, modify reports for all studies impacted by the results of the process or procedure in question.

■ 14. Add § 58.37 to subpart B to read as follows:

§ 58.37 Contributing scientist.

(a) Each contributing scientist must:

(1) Conduct, oversee, analyze, and provide any other service for the conduct of all phases of the nonclinical laboratory study for which the contributing scientist is responsible according to the requirements of this part.

(2) Provide a signed and dated report of all phases for which the contributing scientist is responsible, to be included in the final study report. When there are amendments to the original report, provide a signed and dated copy of the amended report, to be included in the final study report along with the original report. Provide the report, and all amendments, to the study director or, when a multisite study employs principal investigators, through the principal investigator.

(3) Permit oversight by the designated QAU.

(b) In addition to the requirements in paragraphs (a)(1) through (3) of this section, an independent contributing scientist must:

(1) Date and sign the study protocol to indicate agreement to comply with protocol requirements for all phases of the nonclinical laboratory study the

independent contributing scientist will conduct and the applicable requirements of this part. Date and sign any protocol amendments applicable to the phases of the nonclinical laboratory study conducted by the independent contributing scientist to indicate agreement.

(2) Maintain and update documentation of education, training, and experience pertinent to those phases of the nonclinical laboratory studies for which the independent contributing scientist is responsible.

(3) If conducting phases of a nonclinical laboratory study that include the use of animals:

(i) Document that housing, feeding, handling, and care of the animals as specified in § 58.90 are available.

(ii) Document that an attending veterinarian is available for consult and deferred to as necessary, particularly when animals are in pain or distress.

(iii) Document corrective actions required to assure the humane care and ethical treatment of animals.

(4) Archive all materials pertinent to all phases of the nonclinical laboratory the independent contributing scientist conducted, as required by the protocol and § 58.195; document when and where archiving was completed.

■ 15. Add § 58.39 to subpart B to read as follows:

§ 58.39 Principal investigator.

The study director can delegate to principal investigators responsibility for phases of a nonclinical laboratory study but not responsibility for an entire study. For all phases of the nonclinical laboratory study for which the principal investigator is responsible, a principal investigator must:

(a) Sign and date the study protocol, and any applicable amendments, to document agreement to comply with the protocol requirements and the applicable requirements of this part.

(b) Verify that the study is conducted according to the requirements of this part.

(c) Document all deviations noted during the conduct of the study, report those deviations to the study director as soon as possible after discovery, and document that the information was forwarded to the study director.

(d) Submit to the study director either:

(1) The signed and dated reports from all contributing scientists for whom the principal investigator is responsible and any amendments to such reports, any raw data not covered by such reports, and a signed compliance statement indicating any areas of noncompliance; or

(2) Signed and dated report of all phases for inclusion in the final study report. The signed report must include the original principal investigator's report and any amendments, reports of all contributing scientists for whom the principal investigator is responsible and any amendments to such reports, and a signed compliance statement indicating any areas of noncompliance.

(e) Document that all materials and records are appropriately archived, as required by the protocol and § 58.195.

■ 16. Revise § 58.41 to read as follows:

§ 58.41 General.

Any person conducting a phase of a nonclinical laboratory study must have facilities of suitable size and construction to facilitate the proper conduct of nonclinical laboratory studies. Facilities must be designed so that there is a degree of separation that will prevent any function or activity from having an adverse effect on the study.

■ 17. In § 58.43, revise paragraphs (a), (b), and (d) to read as follows:

§ 58.43 Animal care facilities.

(a) Any person conducting a phase of a nonclinical laboratory study that utilizes animals must have a sufficient number of animal rooms or areas, as needed, to assure proper:

(1) Separation of species or test systems,

(2) Isolation of individual projects,

(3) Quarantine of animals, and

(4) Routine or specialized housing of animals.

(b) Any person conducting a phase of a nonclinical laboratory study that utilizes animals must have a number of animal rooms or areas separate from those described in paragraph (a) of this section to ensure isolation of studies being done with test systems or test, control, or reference articles known to be biohazardous, including volatile substances, aerosols, radioactive materials, and infectious agents.

* * * * *

(d) When animals are housed, facilities must exist for the collection and disposal of all animal waste and refuse or for safe sanitary storage of waste before removal from any facility at which a phase of a nonclinical laboratory study that utilizes animals is conducted. Disposal facilities must be so provided and operated as to minimize vermin infestation, odors, disease hazards, and environmental contamination.

■ 18. Revise § 58.47 to read as follows:

§ 58.47 Facilities for handling test, control, and reference articles.

(a) As necessary to prevent contamination or mixups, there must be separate areas for:

(1) Receipt and storage of the test, control, and reference articles.

(2) Mixing of the test, control, and reference articles with a carrier, *e.g.*, feed.

(3) Storage of the test, control, and reference article mixtures.

(b) Storage areas for the test, control, and reference articles and test, control, and reference article mixtures must be separate from areas housing the test systems and must be adequate to preserve the characteristics of the articles and mixtures, including their identity, strength, purity, and stability, as applicable.

■ 19. Revise § 58.61 to read as follows:

§ 58.61 Equipment design.

Equipment, including computerized systems, used in the generation, measurement, maintenance, archiving, retrieval, or assessment of data (or any combination thereof) and equipment used for facility environmental control must be of appropriate design and adequate capacity to function according to the protocol and must be suitably located for operation, inspection, cleaning, and maintenance.

■ 20. In § 58.63, revise paragraphs (a) and (b) to read as follows:

§ 58.63 Maintenance and calibration of equipment.

(a) Equipment must be adequately inspected, cleaned, and maintained. Equipment used for the generation, measurement, maintenance, archiving, retrieval, or assessment of data (or any combination thereof) must be adequately tested, calibrated, and standardized, as applicable.

(b) The written SOPs required under § 58.81(b)(14) and (15) must set forth in sufficient detail the methods, materials, and schedules to be used in the routine inspection, cleaning, maintenance, testing, calibration, and standardization of equipment, as applicable, and must specify, when appropriate, remedial action to be taken in the event of failure or malfunction of equipment. The written SOPs must designate the person responsible for the performance of each operation.

* * * * *

■ 21. Revise the heading of subpart E to read as follows:

Subpart E—Nonclinical Laboratory Study Operations

■ 22. Revise § 58.81 to read as follows:

§ 58.81 Standard operating procedures (SOPs).

(a) The testing facility and all test sites must have SOPs in writing setting forth nonclinical laboratory study procedures that management with executive responsibility is satisfied are adequate to ensure the quality and integrity of the data generated in the course of a study. All deviations from SOPs in a study must be authorized by the study director and must be documented in the raw data. Significant changes in established SOPs must be properly authorized in writing by management with executive responsibility.

(b) The testing facility and all test sites must establish SOPs for all applicable phases of a nonclinical laboratory study. Where appropriate, SOPs must include the following:

(1) Preparation, modification, and administration of all SOPs. These must include procedures for developing and maintaining a historical file of SOPs and all revisions, including the dates of such revisions.

(2) Establishment and periodic review of a GLP Quality System.

(3) Designation and replacement of the study director.

(4) Animal room preparation.

(5) Animal care.

(6) Receipt, identification, storage, handling, mixing, and method of sampling of the test, control, and reference articles.

(7) Test system observations for in vivo and in vitro testing, as applicable.

(8) Laboratory tests.

(9) Handling of animals found moribund or dead during study.

(10) Necropsy of animals or post mortem examination of animals.

(11) Collection and identification of specimens.

(12) Histopathology.

(13) Data handling, storage, and retrieval, including maintenance of the master schedule and all study protocols, and the establishment and maintenance of an archive system.

(14) Validation, maintenance, and calibration of equipment.

(15) Ensuring computerized systems are suitable for their intended purpose and are appropriately validated, operated, and maintained and that electronic records from computerized systems are readily available for review and assessment.

(16) Transfer, proper placement, and identification of animals.

(17) QAU functions, including QA oversight for multisite studies.

(18) Multisite studies.

(19) Designation and replacement of a principal investigator.

(20) Planning, performing, documenting, and reporting inspections conducted by the QAU.

(21) Receipt, review, and followup of all concerns, problems, and regulatory deviations reported by the QAU, including the frequency and content of periodic study reports required by § 58.35(b)(7), and for modifying relevant SOPs when necessary to prevent recurrence.

(22) Certifying copies of study records as true copies of the original that maintain the original intent and meaning.

(c) Each laboratory area must have immediately available laboratory manuals and SOPs relative to the laboratory procedures being performed. Published literature may be used as a supplement to SOPs.

■ 23. In § 58.90, revise paragraphs (b) through (e) to read as follows:

§ 58.90 Animal care.

* * * * *

(b) All newly received animals from outside sources must be isolated and their health status must be evaluated according to acceptable veterinary medical practices. Also, throughout the study, all test animals must be evaluated for their health status according to acceptable veterinary medical practices.

(c) At the initiation of a nonclinical laboratory study, animals must be free of any disease or condition that might interfere with the purpose or conduct of the study. If, during the course of the study, the animals contract such a disease or condition, the diseased animals must be isolated, if necessary. These animals may be treated for disease or signs of disease as deemed necessary by the study's attending veterinarian. The diagnosis, treatment authorizations, treatment description, and each treatment date must be documented and must be retained as part of the study raw data.

(d) Warm-blooded animals, except nursing neonates, used in laboratory procedures that require manipulations and observations over an extended period of time or in studies that require the animals to be removed from and returned to their home cages for any reason (*e.g.*, cage cleaning, treatment, etc.), must receive appropriate identification. All information needed to specifically identify each animal within an animal-housing unit must appear on the outside of that unit.

(e) Animals of different species must be housed in separate rooms when necessary. Animals of the same species, but used in different studies, should not ordinarily be housed in the same room when inadvertent exposure to control,

reference, or test articles or animal mixup could affect the outcome of either study. If such mixed housing is necessary, adequate differentiation by space and identification must be made.

* * * * *

■ 24. Revise the heading of subpart F to read as follows:

Subpart F—Test, Control, and Reference Articles

■ 25. Revise § 58.105 to read as follows:

§ 58.105 Test, control, and reference article characterization.

(a) For all test, control, and reference articles other than tobacco products, the identity, strength, purity, and composition or other characteristics which will appropriately define the test, control, or reference article must be determined for each batch and must be documented. For test, control, and reference articles for tobacco products, the chemical composition (including mainstream or aerosol smoke composition, when applicable), microbiological characterization (fermented tobacco products), and design parameters which will appropriately define the test, control, or reference article must be determined for each batch and must be documented. These analyses must be performed by the sponsor or by a contracted person either:

(1) Before study initiation, or
(2) Concomitantly according to written SOPs as required in § 58.81(b)(6). The results of such analyses must be provided to the study director as soon as available. In those cases where marketed products are used as control or reference articles, with the exception of tobacco products, such products can be characterized by their labeling.

(b) Methods of synthesis, fabrication, or derivation of the test, control, and reference articles must be documented by the person who conducts the analyses.

(c) The stability of each test, control, and reference article must be determined as required by the conditions of the study either:

(1) Before study initiation, or
(2) Concomitantly according to written SOPs, as required in § 58.81(b)(6), which provide for periodic analysis of each batch. The results of such testing must be provided to the study director as soon as available.

(d) Each storage container for a test, control, or reference article must be labeled by name; Chemical Abstract Service (CAS) number or code number, where such identification exists; batch

number; expiration date, if any; and, where applicable, storage conditions necessary to maintain the identity, strength, purity, and composition of the test, control, or reference article, other than tobacco products. For tobacco product test, control, and reference articles, labeling must include storage conditions necessary to maintain the chemical composition (including mainstream smoke composition), microbiological composition, and design parameters, where applicable. Storage containers must be assigned to a particular test article for the duration of the study. Empty test article containers may be disposed of once the study director verifies and documents the distribution and final disposition of the test article. Approval for the disposal of empty containers must be in writing and signed and dated by the study director.

(e) For studies of more than 4 weeks duration, reserve samples from each batch of test, control, and reference article must be retained for the period of time provided by § 58.195.

■ 26. In § 58.107, revise the heading and introductory text to read as follows:

§ 58.107 Test, control, and reference article handling.

Procedures must be established, as required in § 58.81(b)(6), for a system for the handling of the test, control, and reference articles to ensure that:

* * * * *

■ 27. Revise § 58.113 to read as follows:

§ 58.113 Mixtures of articles with carriers.

(a) For each test, control, and reference article that is mixed with a carrier, tests by appropriate analytical methods must be conducted:

(1) To determine the uniformity of the mixture and to determine, periodically, the concentration of the test, control, or reference article in the mixture; and

(2) To determine the stability of the test, control, and reference articles in the mixture as required by the conditions of the study.

(b) Determination of uniformity, concentration, and stability must be conducted either:

(1) Before study initiation; or
(2) Concomitantly according to written SOPs, as required by § 58.81(b)(6), which provide for periodic analysis of the test, control, or reference articles in the mixture.

(c) The results of such testing, performed by the sponsor or by a contracted person, must be provided to the study director as soon as available.

(d) Where any of the components of the test, control, or reference article carrier mixture has an expiration date,

that date must be clearly shown on the container. If more than one component has an expiration date, the earliest expiration date must be shown.

■ 28. Revise § 58.120 to read as follows:

§ 58.120 Protocol.

(a) Each study must have an approved written protocol that clearly indicates the specific objectives and all methods for the conduct of the study. The protocol must contain, where appropriate, the following information:

(1) A descriptive title and statement of the purpose of the study.

(2) Identification of test, control, and reference articles by:

(i) Name;

(ii) Chemical Abstract Service (CAS) number or code number, where such identification exists;

(iii) The name and address of the manufacturer(s); and

(iv) The person(s) determining their characteristics, as applicable.

(3) The name and contact information (including address, phone number, email address, and facsimile number) for the sponsor and the testing facility and the name and affiliation of the study director. Also, for multisite studies, the contact information for all persons conducting a phase of the nonclinical laboratory study, including all principal investigators and independent contributing scientists.

(4) The number, body weight range, sex, source of supply, species, strain, substrain, and age of the test system.

(5) The procedure for identification of the test system.

(6) A description of the experimental design, including the methods for the control of bias in the conduct of the study and the analysis and reporting of study test results and procedures to be followed when a study includes a peer review of any phase. For multisite studies, identification of which phases of the nonclinical laboratory study will be conducted by which person or persons.

(7) A description or identification, as applicable, of the diet used in the study as well as solvents, emulsifiers, and/or other materials used to solubilize or suspend the test, control, or reference articles, as applicable, before mixing with the carrier. The description must include specifications for acceptable levels of contaminants that are reasonably expected to be present in the dietary materials and are known to be capable of interfering with the purpose or conduct of the study if present at levels greater than established by the specifications.

(8) Each dosage level, expressed in milligrams per kilogram of body weight

or other appropriate units, of the test, control, or reference article to be administered and the method and frequency of administration. For each test, control, or reference article that is mixed with a carrier for administration, limits for the results of concentration, uniformity, and stability testing and the name and address of the person conducting the testing.

(9) The type and frequency of tests, analyses, and measurements to be made.

(10) A list or description of the records to be maintained for the specific study. For multisite studies, the archive location(s) of study materials and records from all phases of the nonclinical laboratory study.

(11) The dated signature of the study sponsor, the study director, independent contributing scientists, principal investigators, and any other person conducting a phase of the nonclinical laboratory study, as applicable.

(12) A statement of the proposed statistical methods to be used.

(b) For studies that include the use of animals, a committee whose function is to ensure that the care and use of animals is appropriate and humane must review and approve the study before initiation of the study and approval must be documented.

(c) A statement that the study must be conducted in compliance with the provisions of this part, to be signed and dated by the study sponsor and testing facility management with executive responsibility, must be appended to the protocol.

(d) All changes in or revisions of an approved protocol and the reasons for the changes must be documented. These amendments to the protocol must be signed and dated by the study sponsor and the study director. For multisite studies, these amendments must also be signed and dated by all independent contributing scientists, principal investigators, and any other person conducting a phase of the nonclinical laboratory study affected by the amendment. Signed and dated amendments must be maintained with the protocol.

(e) A committee whose function is to ensure that the care and use of animals in studies is appropriate and humane must review and approve any protocol changes that would impact animal welfare before implementation and approval must be documented.

■ 29. Revise § 58.130 to read as follows:

§ 58.130 Conduct of a nonclinical laboratory study.

(a) The analytical methods used for all phases of a nonclinical laboratory study

must be demonstrated to be accurate and of sufficient sensitivity to measure, with appropriate precision, the analytes in question.

(b) Test, control, and reference article characterization testing must be conducted as described in subpart F of this part.

(c) Humane care and ethical treatment of test animals must be considered in advance and upheld in conjunction with achieving study objectives. The attending veterinarian must be included in consultations regarding the impact of a given protocol on the welfare of test animals, in particular the recognition and alleviation of species-specific pain or distress and methods of euthanasia. The attending veterinarian must be deferred to when decisions regarding animal welfare arise, particularly when animals are in pain or distress.

(d) The nonclinical laboratory study must be conducted according to the protocol. The person responsible for a given phase of a nonclinical laboratory study must sign and date the protocol, as required in § 58.120(a)(11), before initiation of that phase of the study.

(e) Any change to the protocol must be approved as an amendment, as required in § 58.120(d), before implementation.

(f) The test systems must be monitored in conformity with the protocol.

(g) Specimens must be identified by test system, study, nature, and date of collection. This information must be located on the specimen container or must accompany the specimen in a manner that precludes error in the recording and storage of data.

(h) Records of gross findings for a specimen from post mortem observations must be available to a pathologist when examining that specimen histopathologically, unless specified otherwise in the study protocol.

■ 30. Add § 58.180 to subpart J to read as follows:

§ 58.180 Data quality and integrity.

(a) All data generated during the conduct of a nonclinical laboratory study must be accurate, legible, contemporaneous, original, and attributable (ALCOA). Also, data must be credible, internally consistent, and corroborated.

(b) All data must be recorded indelibly, directly, and promptly to a permanent medium at the time of observation and must identify unambiguously the person entering the data. Any change to any entry must be made so as not to obscure the original entry, must indicate the reason for such

change, must indicate when the change was made, and must identify who made the change. When data are either captured or maintained, or both captured and maintained electronically, these requirements are fulfilled by the use of an electronic records system fully compliant with applicable regulations.

(c) All data accrued as required in paragraphs (a) and (b) of this section must be included in the final study report.

■ 31. Revise § 58.185 to read as follows:

§ 58.185 Reporting of nonclinical laboratory study results.

(a) A final study report must be prepared for each nonclinical laboratory study and must include the following:

(1) Name and address of the testing facility and the dates on which the study was initiated and completed. For multisite studies, additionally the name and address of any person conducting a phase of the nonclinical laboratory study, including the location of all independent contributing scientists.

(2) Names of the attending veterinarians for all phases of the nonclinical laboratory study that included the use of animals.

(3) Objectives and procedures stated in the approved protocol, including any changes in the original protocol.

(4) Statistical methods employed for analyzing the data.

(5) Test, control, and reference articles identified by:

(i) Name;

(ii) Chemical Abstract Service (CAS) number or code number, where such identification exists;

(iii) Strength, purity, and composition or other appropriate characteristics, and for tobacco products as described in § 58.105(a);

(iv) The name and address of the manufacturer(s); and

(v) The name and address of the person(s) conducting the testing to define their characteristics, as applicable.

(6) Stability of test, control, and reference articles under the conditions of administration, including the name and address of the person(s) conducting the testing.

(7) A description of the methods used, including methods for the control of bias in the conduct of the study and the analysis and reporting of test results.

(8) A description of the test system used. Where applicable, the final study report must include the number of animals used, sex, body weight range, source of supply, species, strain and substrain, age, and procedure used for identification.

(9) A description of the dosage, dosage regimen, route of administration,

and duration, including the results of testing conducted to determine the concentration, uniformity, and stability of mixtures of articles with carriers, as applicable, and the name and address of the person conducting the testing.

(10) A description of all circumstances that may have affected the quality or integrity of the data, including those documented by the study director as described in § 58.33(b)(9) and all health-related issues reported by an attending veterinarian or appropriately designated personnel during the course of the study as described in § 58.90(b) and (c).

(11) The name and affiliation of the study director, the names of all contributing scientists, principal investigators, and other professionals, the sponsor, and all supervisory personnel who were involved in the study or in the preparation or review of the final study report.

(12) A description of the transformations, calculations, or operations performed on the data, a summary and analysis of the data, and a statement of the conclusions drawn from the analysis.

(13) The original, and any amended, signed and dated reports of each of the contributing scientists, principal investigators, or any other person involved in the study, including each person who conducted an analysis or evaluation of data or specimens from the study after data generation was completed. These reports must contain all data generated.

(14) The locations where all specimens, reserve samples, raw data, and the final study report are to be stored.

(15) The statement prepared and signed by the responsible QAU as described in § 58.35(b)(11).

(16) A statement by the study director of the study's extent of compliance with this part, including a discussion of any study deviations found to impact the integrity of the study as described in § 58.185(a)(10).

(b) The final report must be signed and dated by the study director.

(c) Corrections or additions to a final report must be in the form of an amendment by the study director. The amendment must clearly identify that part of the final report that is being added to or corrected and the reasons for the correction or addition, and must be signed and dated by the person responsible.

(d) If for any reason a study is discontinued before completion, the study director must write, sign, and date a short summary report closing the study. This report must discuss the

reasons for closure and must be archived, along with all study material, as described in § 58.190.

■ 32. Revise § 58.190 to read as follows:

§ 58.190 Storage and retrieval of records and data.

(a) All raw data, documentation, protocols, final reports, reserve samples, and specimens (except those specimens obtained from mutagenicity tests and wet specimens of blood, urine, feces, and biological fluids) generated as a result of a nonclinical laboratory study must be retained. Correspondence and other documents relating to interpretation and evaluation of data, other than those documents contained in the final study report, must also be retained.

(b) There must be archives for orderly storage and expedient retrieval of all raw data, documentation, protocols, specimens, and interim and final reports. Conditions of storage must minimize deterioration of the documents or specimens in accordance with the requirements for the time period of their retention and the nature of the documents or specimens. A testing facility may contract with commercial archives to provide a repository for all material to be retained. Raw data and specimens may be retained elsewhere provided that the archives have specific reference to those other locations.

(c) Material retained or referred to in the archives must be indexed to permit expedient retrieval.

(d) All study material described in paragraph (a) of this section must be archived no later than 2 weeks after the study completion date (as defined in § 58.3).

(e) If a sponsor delays completion of the final study report, the study director must complete, sign, and date the final study report and archive all study material no later than 6 months after completion of the last draft of the final study report.

(f) If a study sponsor halts a nonclinical laboratory study before all protocol-required testing is completed, a decision that the study is discontinued must be made no later than 6 months after the study was stopped. Once the study has been determined to be discontinued, the study director must prepare a summary report, as required by § 58.185(d). The summary report and all study material must be archived no later than 2 weeks after the study director signs the summary report.

(g) An individual must be identified as responsible for the archives. Archiving specifications for multisite

studies must also be included in the approved study protocol.

(h) Only authorized personnel can have access to the archives.

(i) SOPs regarding archiving, required in § 58.81(b)(13), must include specific procedures for removal of study materials from the archives, including maximum timeframes material can remain outside of the archives.

■ 33. Revise § 58.195 to read as follows:

§ 58.195 Retention of records.

(a) Record retention requirements set forth in this section do not supersede the record retention requirements of any other regulations in this chapter nor do they supersede any other legal requirements elsewhere in applicable statutes or regulations.

(b) Except as provided in paragraph (c) of this section, all raw data, documentation, protocols, final study reports, reserve samples, and specimens pertaining to a nonclinical laboratory study and required to be made by this part must be retained in the archive(s) for whichever of the following periods is shortest:

(1) A period of at least 2 years following the date on which an application or submission to FDA, in support of which the results of the nonclinical laboratory study were submitted, is approved or cleared by FDA, a premarket authorization is issued, or the application or submission is administratively closed. This requirement does not apply to studies supporting investigational new drug applications (INDs) or applications for investigational device exemptions (IDEs), records of which are governed by the provisions of paragraph (b)(2) of this section.

(2) A period of at least 5 years following the date on which the results of the nonclinical laboratory study are submitted to FDA in support of an application or submission.

(3) In other situations (*e.g.*, where the nonclinical laboratory study does not result in the submission of the study in support of an application or submission to FDA), a period of at least 2 years following the study completion date or the date on which the study is terminated or discontinued.

(c) Wet specimens (except those specimens obtained from mutagenicity tests and wet specimens of blood, urine, feces, and biological fluids), samples of test, control, and reference articles, and specially prepared material, which are relatively fragile and differ markedly in stability and quality during storage, must be retained only as long as the quality of the preparation affords evaluation. In no case is retention

required for longer periods than those set forth in paragraphs (a) and (b) of this section.

(d) Management with executive responsibility must ensure maintenance of the master schedule and copies of study protocols, as specified in SOPs as described in § 58.81(b)(13) and as specified in paragraphs (a) and (b) of this section. QAU's must maintain records of QAU inspections, as required by § 58.35(c) for the period of time specified in paragraphs (a) and (b) of this section.

(e) Summaries of training and experience and job descriptions required to be maintained by § 58.29(d) may be retained along with all other employment records for the length of time specified in paragraphs (a) and (b) of this section.

(f) Records and reports of the maintenance and calibration and inspection of equipment, as required by § 58.63(b) and (c), must be retained for the length of time specified in paragraph (b) of this section.

(g) Records required by this part may be retained either as original records or as true copies that maintain the original intent and meaning and are made according to the person's SOPs as described in § 58.81(b)(22).

(h) If a facility conducting nonclinical laboratory testing goes out of business or for any reason can no longer serve as the archive site for a particular study, all raw data, documentation, and other material specified in this section must be transferred to the archives of the sponsor of the study or to another appropriate archive facility. The facility must notify FDA in writing (and the study sponsor if not the recipient of the study material) of the transfer no later than 10 working days after the transfer occurs.

(i) A copy of the notification of change of archive site, as required by paragraph (h) of this section, can serve as the amendment to the final study report required in § 58.185(c) when appended to that report.

■ 34. Revise the heading of subpart K to read as follows:

Subpart K—Disqualification of Any Person Conducting a Phase of a Nonclinical Laboratory Study

■ 35. Revise § 58.200 to read as follows:

§ 58.200 Purpose.

(a) The purposes of disqualification are:

(1) To permit the exclusion from consideration of completed studies for which a phase was conducted by any person failing to comply with the

requirements of the GLP regulations until it can be adequately demonstrated that such noncompliance did not occur during, or did not affect the validity or acceptability of data generated by, a particular study; and

(2) To exclude from consideration all studies completed after the date of disqualification until the disqualified person can satisfy the Commissioner that it will conduct studies in compliance with such regulations.

(b) The determination that a nonclinical laboratory study may not be considered in support of an application or submission to FDA does not, however, relieve the applicant of any obligation under any other applicable regulation to submit the results of the study to FDA.

■ 36. Revise § 58.202 to read as follows:

§ 58.202 Grounds for disqualification.

FDA may disqualify any person conducting a phase of a nonclinical laboratory study upon finding that person repeatedly or deliberately failed to comply with one or more of the regulations set forth in this part (or any other regulations regarding such facilities in this chapter) or repeatedly or deliberately submitted false information in any required report.

■ 37. In § 58.204, revise paragraph (a) to read as follows:

§ 58.204 Notice of and opportunity for hearing on proposed disqualification.

(a) Whenever FDA has information indicating that grounds exist under § 58.202, which justifies disqualification of any person conducting a phase of a nonclinical laboratory study, FDA may issue to that person a written notice proposing that person be disqualified.

* * * * *

■ 38. Revise § 58.206 to read as follows:

§ 58.206 Final order on disqualification.

(a) If the Commissioner, after the regulatory hearing, or after the time for requesting a hearing expires without a request being made, upon an evaluation of the administrative record of the disqualification proceeding, makes the findings required in § 58.202, the Commissioner issues a final order disqualifying that person. Such order must include a statement of the basis for that determination. Upon issuing a final order, the Commissioner notifies (with a copy of the order) the disqualified person of the action. The notification also will explain that a person who is disqualified under this part will be ineligible to receive a test article under part 511 of this chapter. A clinical investigator ineligible to receive a test article under part 511 of this chapter

will be ineligible to conduct any nonclinical laboratory study intended to support an application for a research or marketing permit for a new animal drug.

(b) If the Commissioner, after a regulatory hearing or after the time for requesting a hearing expires without a request being made, upon an evaluation of the administrative record of the disqualification proceeding, does not make the findings required in § 58.202, the Commissioner issues a final order terminating the disqualification proceeding. Such order must include a statement of the basis for that determination. Upon issuing a final order the Commissioner notifies that person and provides a copy of the order.

■ 39. Revise § 58.210 to read as follows:

§ 58.210 Actions upon disqualification.

(a) Once a person has been disqualified, each application and submission to FDA containing or relying upon any nonclinical laboratory study for which a phase was conducted by the disqualified person may be examined to determine whether such study was or would be essential to a decision. If it is determined that a study was or would be essential, FDA must also determine whether the study is acceptable, notwithstanding the disqualification of that person. Any study for which a phase was conducted by the disqualified person before disqualification may be presumed to be unacceptable, and the person relying on the study may be required to establish that the study was not affected by the circumstances that led to the disqualification, *e.g.*, by submitting validating information. If the study is then determined to be unacceptable, such data will be eliminated from consideration in support of the application or submission to FDA and such elimination may serve as new information justifying appropriate regulatory action.

(b) No nonclinical laboratory study for which any phase was begun by a disqualified person after the date of that person's disqualification can be considered in support of any application or submission to FDA, unless the disqualified person has been reinstated under § 58.219. The determination that a study may not be considered in support of an application or submission to FDA does not, however, relieve the applicant of any obligation under any other applicable regulation to submit the results of the study to FDA.

■ 40. Revise § 58.213 to read as follows:

§ 58.213 Public disclosure of information regarding disqualification.

(a) Upon issuance of a final order disqualifying a person under § 58.206(a), the Commissioner may notify all or any interested persons. Such notice may be given at the discretion of the Commissioner whenever the Commissioner believes that such disclosure would further the public interest or would promote compliance with the GLP regulations set forth in this part. Such notice, if given, must include a copy of the final order issued under § 58.206(a) and must state that the disqualification constitutes a determination by FDA that nonclinical laboratory studies for which a phase was performed by the disqualified person will not be considered by FDA in support of any application or submission to FDA. If such notice is sent to another Federal Government agency, FDA will recommend that the agency also consider whether or not it should accept nonclinical laboratory studies for which a phase was performed by the disqualified person. If such notice is sent to any other person, it states that it is given because of the relationship between the disqualified person and the person being notified and that FDA is not advising or recommending that any action be taken by the person notified.

(b) A determination that a person has been disqualified and the administrative record regarding such determination are disclosable to the public under part 20 of this chapter.

■ 41. Revise § 58.215 to read as follows:

§ 58.215 Alternative or additional actions to disqualification.

(a) Disqualification of any person under this subpart is independent of, and neither in lieu of nor a precondition to, other proceedings or actions authorized by the Federal Food, Drug, and Cosmetic Act. FDA may, at any time, institute against a disqualified person or against the sponsor of a nonclinical laboratory study that has been submitted to FDA, or both, any appropriate judicial proceedings (civil or criminal) and any other appropriate regulatory action, including civil money penalties, in addition to or in lieu of, and before, simultaneously with, or subsequent to, disqualification. FDA may also refer the matter to another Federal, State, or local government law enforcement or regulatory agency for such action as that agency deems appropriate.

(b) FDA may refuse to consider any particular nonclinical laboratory study in support of an application or submission to FDA, if it finds that the

study was not conducted according to the GLP regulations set forth in this part, without disqualifying any person that conducted one or more phases of the study or undertaking other regulatory action.

■ 42. Revise § 58.217 to read as follows:

§ 58.217 Suspension or termination of any person conducting a phase of a nonclinical laboratory study by a sponsor.

Termination of any person conducting a phase of a nonclinical laboratory study by a sponsor is independent of, and neither in lieu of nor a precondition to, proceedings or actions authorized by this subpart. If a sponsor terminates or suspends any person conducting a phase of a nonclinical laboratory study from further participation in a study that is being conducted as part of any application or submission to FDA that has been submitted to any Center of FDA (whether approved or cleared, premarket authorization issued, or administratively closed), the sponsor must notify that Center in writing within 15 working days of the action; the notice must include a statement of the reasons for such action. Suspension or termination of any person conducting a phase of a nonclinical laboratory study by a sponsor does not relieve the sponsor of any obligation under any other applicable regulation to submit the results of the study to FDA.

■ 43. Revise § 58.219 to read as follows:

§ 58.219 Reinstatement of a disqualified person.

Any person that has been disqualified may be reinstated as an acceptable source of data for a phase of a nonclinical laboratory study to be submitted to FDA if the Commissioner determines, upon an evaluation of materials submitted by that person, as well as the results from an FDA inspection of that person, that procedures are in place that would allow that person to conduct a phase of future nonclinical laboratory studies in compliance with the GLP regulations set forth in this part. As noted in § 58.210(b), no nonclinical laboratory study for which a phase was begun by a disqualified person after the date of that person's disqualification is considered in support of any application or submission to FDA, unless that person has been reinstated. A disqualified person that wishes to be so reinstated must present in writing to the Commissioner reasons why it believes it should be reinstated and a detailed description of the corrective actions it has taken or intends to take to assure that the acts or omissions which led to its disqualification will not recur.

The disqualified person must also state its availability for inspection. If a disqualified person is reinstated, the Commissioner must so notify that person and all organizations and persons who were notified, under

§ 58.213 of the disqualification of that person. A determination that a disqualified person has been reinstated is disclosable to the public under part 20 of this chapter.

Dated: August 16, 2016.

Peter Lurie,

Associate Commissioner for Public Health Strategy and Analysis.

LIST OF PUBLIC LAWS

Note: No public bills which have become law were received by the Office of the Federal Register for inclusion

in today's **List of Public Laws**.

Last List August 4, 2016

Public Laws Electronic Notification Service (PENS)

PENS is a free electronic mail notification service of newly

enacted public laws. To subscribe, go to <http://listserv.gsa.gov/archives/publaws-l.html>

Note: This service is strictly for E-mail notification of new laws. The text of laws is not available through this service. **PENS** cannot respond to specific inquiries sent to this address.
