Vol. 81 Tuesday,
No. 206 October 25, 2016

Book 1 of 2 Books
Pages 73333–73880

OFFICE OF THE FEDERAL REGISTER

The **FEDERAL REGISTER** (ISSN 0097-6326) is published daily, Monday through Friday, except official holidays, by the Office of the Federal Register, National Archives and Records Administration, Washington, DC 20408, under the Federal Register Act (44 U.S.C. Ch. 15) and the regulations of the Administrative Committee of the Federal Register (1 CFR Ch. I). The Superintendent of Documents, U.S. Government Publishing Office, Washington, DC 20402 is the exclusive distributor of the official edition. Periodicals postage is paid at Washington, DC.

The **FEDERAL REGISTER** provides a uniform system for making available to the public regulations and legal notices issued by Federal agencies. These include Presidential proclamations and Executive Orders, Federal agency documents having general applicability and legal effect, documents required to be published by act of Congress, and other Federal agency documents of public interest.

Documents are on file for public inspection in the Office of the Federal Register the day before they are published, unless the issuing agency requests earlier filing. For a list of documents currently on file for public inspection, see www.ofr.gov.

The seal of the National Archives and Records Administration authenticates the **Federal Register** as the official serial publication established under the Federal Register Act. Under 44 U.S.C. 1507, the contents of the **Federal Register** shall be judicially noticed.

The **Federal Register** is published in paper and on 24x microfiche. It is also available online at no charge at www.fdsys.gov, a service of the U.S. Government Publishing Office.

The online edition of the **Federal Register** is issued under the authority of the Administrative Committee of the Federal Register as the official legal equivalent of the paper and microfiche editions (44 U.S.C. 4101 and 1 CFR 5.10). It is updated by 6:00 a.m. each day the **Federal Register** is published and includes both text and graphics from Volume 59, 1 (January 2, 1994) forward. For more information, contact the GPO Customer Contact Center, U.S. Government Publishing Office. Phone 202-512-1800 or 866-512-1800 (toll free). E-mail, gpocusthelp.com.

The annual subscription price for the **Federal Register** paper edition is \$749 plus postage, or \$808, plus postage, for a combined **Federal Register**, **Federal Register** Index and List of CFR Sections Affected (LSA) subscription; the microfiche edition of the **Federal Register** including the **Federal Register** Index and LSA is \$165, plus postage. Six month subscriptions are available for one-half the annual rate. The prevailing postal rates will be applied to orders according to the delivery method requested. The price of a single copy of the daily **Federal Register**, including postage, is based on the number of pages: \$11 for an issue containing less than 200 pages; \$22 for an issue containing 200 to 400 pages; and \$33 for an issue containing more than 400 pages. Single issues of the microfiche edition may be purchased for \$3 per copy, including postage. Remit check or money order, made payable to the Superintendent of Documents, or charge to your GPO Deposit Account, VISA, MasterCard, American Express, or Discover. Mail to: U.S. Government Publishing Office—New Orders, P.O. Box 979050, St. Louis, MO 63197-9000; or call toll free 1-866-512-1800, DC area 202-512-1800; or go to the U.S. Government Online Bookstore site, see bookstore.gpo.gov.

There are no restrictions on the republication of material appearing in the **Federal Register**.

How To Cite This Publication: Use the volume number and the page number. Example: 81 FR 12345.

Postmaster: Send address changes to the Superintendent of Documents, Federal Register, U.S. Government Publishing Office, Washington, DC 20402, along with the entire mailing label from the last issue received.

Rules and Regulations

Federal Register

Vol. 81, No. 206

Tuesday, October 25, 2016

This section of the FEDERAL REGISTER contains regulatory documents having general applicability and legal effect, most of which are keyed to and codified in the Code of Federal Regulations, which is published under 50 titles pursuant to 44 U.S.C. 1510.

The Code of Federal Regulations is sold by the Superintendent of Documents. Prices of new books are listed in the first FEDERAL REGISTER issue of each week.

DEPARTMENT OF AGRICULTURE

Agricultural Marketing Service

7 CFR Part 906

[Doc. No. AMS–SC–16–0059; SC16–906–2 FR]

Oranges and Grapefruit Grown in Lower Rio Grande Valley in Texas; Increased Assessment Rate

AGENCY: Agricultural Marketing Service, USDA.

ACTION: Final rule.

SUMMARY: This rule implements a recommendation from the Texas Valley Citrus Committee (Committee) for an increase of the assessment rate established for the 2016–17 and subsequent fiscal periods from \$0.08 to \$0.09 per 7/10-bushel carton or equivalent of oranges and grapefruit handled under the marketing order (order). The Committee locally administers the order, and is comprised of producers and handlers of oranges and grapefruit operating within the area of production. Assessments upon orange and grapefruit handlers are used by the Committee to fund reasonable and necessary expenses of the program. The fiscal period begins August 1 and ends July 31. The assessment rate will remain in effect indefinitely unless modified, suspended, or terminated.

DATES: Effective October 26, 2016.

FOR FURTHER INFORMATION CONTACT: Doris Jamieson, Marketing Specialist, or Christian D. Nissen, Regional Director, Southeast Marketing Field Office, Marketing Order and Agreement Division, Specialty Crops Program, AMS, USDA; Telephone: (863) 324–3375, Fax: (863) 291–8614, or Email: Doris.Jamieson@ams.usda.gov or Christian.Nissen@ams.usda.gov.

Small businesses may request information on complying with this regulation by contacting Richard Lower,

Marketing Order and Agreement Division, Specialty Crops Program, AMS, USDA, 1400 Independence Avenue SW., STOP 0237, Washington, DC 20250–0237; Telephone: (202) 720–2491, Fax: (202) 720–8938, or Email: Richard.Lower@ams.usda.gov.

SUPPLEMENTARY INFORMATION: This rule is issued under Marketing Agreement and Order No. 906, as amended (7 CFR part 906), regulating the handling of oranges and grapefruit grown in the Lower Rio Grande Valley in Texas, hereinafter referred to as the “order.” The order is effective under the Agricultural Marketing Agreement Act of 1937, as amended (7 U.S.C. 601–674), hereinafter referred to as the “Act.”

The Department of Agriculture (USDA) is issuing this rule in conformance with Executive Orders 12866, 13563, and 13175.

This rule has been reviewed under Executive Order 12988, Civil Justice Reform. Under the marketing order now in effect, Texas orange and grapefruit handlers are subject to assessments. Funds to administer the order are derived from such assessments. It is intended that the assessment rate as issued herein will be applicable to all assessable oranges and grapefruit beginning on August 1, 2016, and continue until amended, suspended, or terminated.

The Act provides that administrative proceedings must be exhausted before parties may file suit in court. Under section 608c(15)(A) of the Act, any handler subject to an order may file with USDA a petition stating that the order, any provision of the order, or any obligation imposed in connection with the order is not in accordance with law and request a modification of the order or to be exempted therefrom. Such handler is afforded the opportunity for a hearing on the petition. After the hearing, USDA would rule on the petition. The Act provides that the district court of the United States in any district in which the handler is an inhabitant, or has his or her principal place of business, has jurisdiction to review USDA’s ruling on the petition, provided an action is filed not later than 20 days after the date of the entry of the ruling.

This rule increases the assessment rate established for the Committee for the 2016–17 and subsequent fiscal periods from \$0.08 to \$0.09 per 7/10-

bushel carton or equivalent of oranges and grapefruit handled.

The Texas orange and grapefruit marketing order provides authority for the Committee, with the approval of USDA, to formulate an annual budget of expenses and collect assessments from handlers to administer the program. The members of the Committee are producers and handlers of Texas oranges and grapefruit. They are familiar with the Committee’s needs and with the costs for goods and services in their local area and are thus in a position to formulate an appropriate budget and assessment rate. The assessment rate is formulated and discussed in a public meeting. Thus, all directly affected persons have an opportunity to participate and provide input.

For the 2015–16 and subsequent fiscal periods, the Committee recommended, and USDA approved, an assessment rate that would continue in effect from fiscal period to fiscal period unless modified, suspended, or terminated by USDA upon recommendation and information submitted by the Committee or other information available to USDA.

The Committee met on June 2, 2016, and unanimously recommended 2016–17 expenditures of \$751,148 and an assessment rate of \$0.09 per 7/10-bushel carton or equivalent of oranges and grapefruit. In comparison, last year’s budgeted expenditures were \$701,148. The assessment rate of \$0.09 is \$0.01 higher than the rate currently in effect. At the current assessment rate, assessment income would equal around \$640,000, an amount insufficient to cover the Committee’s anticipated expenditures, which includes a \$50,000 increase in funding for compliance. The Committee considered the estimated expenses and recommended increasing the assessment rate.

The major expenditures recommended by the Committee for the 2016–17 year include \$600,248 for the Mexican fruit fly control program, \$77,200 for management, and \$50,000 for compliance. Budgeted expenses for these items in 2015–16 were \$600,248, \$77,200, and \$0, respectively.

The assessment rate recommended by the Committee was derived by dividing anticipated expenses by expected shipments of Texas oranges and grapefruit. Orange and grapefruit shipments for the 2016–17 year are

estimated at 8 million 7/10-bushel cartons or equivalent, which should provide \$720,000 in assessment income. Income derived from handler assessments, along with interest income and funds from the Committee's authorized reserve, should be adequate to cover budgeted expenses. Funds in the reserve (currently around \$367,000) will be kept within the maximum permitted by the order (approximately one fiscal period's expenses as stated in § 906.35).

The assessment rate established in this rule will continue in effect indefinitely unless modified, suspended, or terminated by USDA upon recommendation and information submitted by the Committee or other available information.

Although this assessment rate will be in effect for an indefinite period, the Committee will continue to meet prior to or during each fiscal period to recommend a budget of expenses and consider recommendations for modification of the assessment rate. The dates and times of Committee meetings are available from the Committee or USDA. Committee meetings are open to the public and interested persons may express their views at these meetings. USDA will evaluate Committee recommendations and other available information to determine whether modification of the assessment rate is needed. Further rulemaking will be undertaken as necessary. The Committee's 2016–17 budget and those for subsequent fiscal periods would be reviewed and, as appropriate, approved by USDA.

Final Regulatory Flexibility Analysis

Pursuant to requirements set forth in the Regulatory Flexibility Act (RFA) (5 U.S.C. 601–612), the Agricultural Marketing Service (AMS) has considered the economic impact of this rule on small entities. Accordingly, AMS has prepared this final regulatory flexibility analysis.

The purpose of the RFA is to fit regulatory actions to the scale of businesses subject to such actions in order that small businesses will not be unduly or disproportionately burdened. Marketing orders issued pursuant to the Act, and the rules issued thereunder, are unique in that they are brought about through group action of essentially small entities acting on their own behalf.

There are approximately 170 producers of oranges and grapefruit in the production area and 13 handlers subject to regulation under the marketing order. Small agricultural producers are defined by the Small

Business Administration (SBA) as those having annual receipts less than \$750,000, and small agricultural service firms are defined as those whose annual receipts are less than \$7,500,000 (13 CFR 121.201).

According to Committee data, the average price for Texas citrus during the 2014–15 season was around \$16.50 per box and total shipments were near 4.1 million boxes. Using the average price and shipment information, the number of handlers, and assuming a normal distribution, the majority of handlers have average annual receipts of less than \$7,500,000. In addition, based on information from the National Agricultural Statistics Service, the weighted grower price for Texas citrus during the 2014–15 season was around \$9.55 per box. Using the weighted average price and shipment information, and assuming a normal distribution, the majority of producers would have annual receipts of less than \$750,000. Thus, the majority of Texas citrus handlers and producers may be classified as small entities.

This rule increases the assessment rate established for the Committee and collected from handlers for the 2016–17 and subsequent fiscal periods from \$0.08 to \$0.09 per 7/10-bushel carton or equivalent of Texas oranges and grapefruit. The Committee unanimously recommended 2016–17 expenditures of \$751,148 and an assessment rate of \$0.09 per 7/10-bushel carton or equivalent. The assessment rate of \$0.09 is \$0.01 higher than the 2015–16 rate. The quantity of assessable oranges and grapefruit for the 2016–17 season is estimated at 8 million 7/10-bushel cartons or equivalent. Thus, the \$0.09 rate should provide \$720,000 in assessment income. Income derived from handler assessments, along with interest income and funds from the Committee's authorized reserve, should be adequate to meet this year's expenses.

The major expenditures recommended by the Committee for the 2016–17 year include \$600,248 for the Mexican fruit fly control program, \$77,200 for management, and \$50,000 for compliance. Budgeted expenses for these items in 2015–16 were \$600,248, \$77,200, and \$0, respectively.

At the current assessment rate, assessment income would only equal around \$640,000, an amount insufficient to cover the Committee's anticipated expenditures, which includes a \$50,000 increase in funding for compliance. The Committee considered the estimated expenses and recommended increasing the assessment rate.

Prior to arriving at this budget and assessment rate, the Committee considered information from various sources, such as the Committee's Budget and Personnel Committee, and Committee management. Alternative expenditure levels were discussed by these groups, based upon the relative value of various activities to the Texas citrus industry. Based on estimated shipments, the recommended assessment rate of \$0.09 should provide \$720,000 in assessment income. The Committee determined that the assessment revenue, along with funds from interest income and funds from reserves, would be adequate to cover budgeted expenses for the 2016–17 fiscal period.

A review of historical information and preliminary information pertaining to the upcoming crop year indicates that the average grower price for the 2016–17 season could be around \$13.50 per 7/10-bushel carton or equivalent of oranges and grapefruit. Therefore, the estimated assessment revenue for the 2016–17 crop year as a percentage of total grower revenue could be around 0.6 percent.

This action increases the assessment obligation imposed on handlers. While assessments impose some additional costs on handlers, the costs are minimal and uniform on all handlers. Some of the additional costs may be passed on to producers. However, these costs are offset by the benefits derived by the operation of the marketing order.

The Committee's meeting was widely publicized throughout the Texas citrus industry and all interested persons were invited to attend the meeting and participate in Committee deliberations on all issues. Like all Committee meetings, the June 2, 2016, meeting was a public meeting and all entities, both large and small, were able to express views on this issue.

In accordance with the Paperwork Reduction Act of 1995 (44 U.S.C. Chapter 35), the order's information collection requirements have been previously approved by the Office of Management and Budget (OMB) and assigned OMB No. 0581–0189 Generic Fruit Crops. No changes in those requirements as a result of this action are necessary. Should any changes become necessary, they would be submitted to OMB for approval.

This rule imposes no additional reporting or recordkeeping requirements on either small or large Texas orange and grapefruit handlers. As with all Federal marketing order programs, reports and forms are periodically reviewed to reduce information requirements and duplication by

industry and public sector agencies. As noted in the initial regulatory flexibility analysis, USDA has not identified any relevant Federal rules that duplicate, overlap, or conflict with this final rule.

AMS is committed to complying with the E-Government Act, to promote the use of the internet and other information technologies to provide increased opportunities for citizen access to Government information and services, and for other purposes.

A proposed rule concerning this action was published in the **Federal Register** on August 17, 2016 (81 FR 54748). Copies of the proposed rule were also mailed or sent via facsimile to all Texas orange and grapefruit handlers. Finally, the proposal was made available through the internet by USDA and the Office of the Federal Register. A 30-day comment period ending September 16, 2016, was provided for interested persons to respond to the proposal. No comments were received.

A small business guide on complying with fruit, vegetable, and specialty crop marketing agreements and orders may be viewed at: <http://www.ams.usda.gov/rules-regulations/moa/small-businesses>. Any questions about the compliance guide should be sent to Richard Lower at the previously-mentioned address in the **FOR FURTHER INFORMATION CONTACT** section.

After consideration of all relevant material presented, including the information and recommendation submitted by the Committee and other available information, it is hereby found that this rule, as hereinafter set forth, will tend to effectuate the declared policy of the Act.

Pursuant to 5 U.S.C. 553, it also found and determined that good cause exists for not postponing the effective date of this rule until 30 days after publication in the **Federal Register** because: (1) The 2016–17 fiscal period began on August 1, 2016, and the marketing order requires that the rate of assessment for each fiscal period apply to all assessable Texas oranges and grapefruit handled during such fiscal period; (2) the Committee needs to have sufficient funds to pay its expenses which are incurred on a continuous basis; and (3) handlers are aware of this action which was unanimously recommended by the Committee at a public meeting. Also, a 30-day comment period was provided for in the proposed rule.

List of Subjects in 7 CFR Part 906

Grapefruit, Marketing agreements, Oranges, Reporting and recordkeeping requirements.

For the reasons set forth in the preamble, 7 CFR part 906 is amended as follows:

PART 906—ORANGES AND GRAPEFRUIT GROWN IN LOWER RIO GRANDE VALLEY IN TEXAS

■ 1. The authority citation for 7 CFR part 906 continues to read as follows:

Authority: 7 U.S.C. 601–674.

■ 2. Section 906.235 is revised to read as follows:

§ 906.235 Assessment rate.

On and after August 1, 2016, an assessment rate of \$0.09 per 7/10-bushel carton or equivalent is established for oranges and grapefruit grown in the Lower Rio Grande Valley in Texas.

Dated: October 19, 2016.

Elanor Starmer,

Administrator, Agricultural Marketing Service.

[FR Doc. 2016–25681 Filed 10–24–16; 8:45 am]

BILLING CODE 3410–02–P

NUCLEAR REGULATORY COMMISSION

10 CFR Part 72

[NRC–2016–0155]

RIN 3150–AJ80

List of Approved Spent Fuel Storage Casks: Holtec International HI–STORM UMAX Canister Storage System; Certificate of Compliance No. 1040, Amendment No. 2

AGENCY: Nuclear Regulatory Commission.

ACTION: Direct final rule.

SUMMARY: The U.S. Nuclear Regulatory Commission (NRC) is amending its spent fuel storage regulations by revising the Holtec International HI–STORM Underground Maximum Capacity (UMAX) Canister Storage System listing within the “List of approved spent fuel storage casks” to include Amendment No. 2 to Certificate of Compliance (CoC) No. 1040. Amendment No. 2 adds new fuel types to the HI–STORM UMAX Canister Storage System and updates an existing fuel type description. Additionally, Amendment No. 2 updates Table 3–4 of Appendix B of the CoC to reflect correct terminology and makes editorial changes to Appendix B of the CoC to clarify the description of the top surface pad. Each of these changes is described in Section IV, “Discussion of Changes,” in the **SUPPLEMENTARY INFORMATION** section of this document.

DATES: The direct final rule is effective January 9, 2017, unless significant adverse comments are received by November 25, 2016. If the direct final rule is withdrawn as a result of such comments, timely notice of the withdrawal will be published in the **Federal Register**. Comments received after this date will be considered if it is practical to do so, but the Commission is able to ensure consideration only for comments received on or before this date. Comments received on this direct final rule will also be considered to be comments on a companion proposed rule published in the Proposed Rules section of this issue of the **Federal Register**.

ADDRESSES: You may submit comments by any of the following methods:

- **Federal Rulemaking Web site:** Go to <http://www.regulations.gov> and search for Docket ID NRC–2016–0155. Address questions about NRC dockets to Carol Gallagher; telephone: 301–415–3463; email: Carol.Gallagher@nrc.gov. For technical questions contact the individual listed in the **FOR FURTHER INFORMATION CONTACT** section of this document.

- **Email comments to:** Rulemaking.Comments@nrc.gov. If you do not receive an automatic email reply confirming receipt, then contact us at 301–415–1677.

- **Fax comments to:** Secretary, U.S. Nuclear Regulatory Commission at 301–415–1101.

- **Mail comments to:** Secretary, U.S. Nuclear Regulatory Commission, Washington, DC 20555–0001, ATTN: Rulemakings and Adjudications Staff.

- **Hand deliver comments to:** 11555 Rockville Pike, Rockville, Maryland 20852, between 7:30 a.m. and 4:15 p.m. (Eastern Time) Federal workdays; telephone: 301–415–1677.

For additional direction on obtaining information and submitting comments, see “Obtaining Information and Submitting Comments” in the **SUPPLEMENTARY INFORMATION** section of this document.

FOR FURTHER INFORMATION CONTACT: Gregory R. Trussell, Office of Nuclear Material Safety and Safeguards, U.S. Nuclear Regulatory Commission, Washington, DC 20555–0001; telephone: 301–415–6445, or email: Gregory.Trussell@nrc.gov.

- XIII. Congressional Review Act
- XIV. Availability of Documents

I. Obtaining Information and Submitting Comments

A. Obtaining Information

Please refer to Docket ID NRC–2016–0155 when contacting the NRC about the availability of information for this action. You may obtain publicly-available information related to this action by any of the following methods:

- *Federal Rulemaking Web site:* Go to <http://www.regulations.gov> and search for Docket ID NRC–2016–0155.

- *NRC's Agencywide Documents Access and Management System (ADAMS):* You may obtain publicly-available documents online in the ADAMS Public Documents collection at <http://www.nrc.gov/reading-rm/adams.html>. To begin the search, select "ADAMS Public Documents" and then select "Begin Web-based ADAMS Search." For problems with ADAMS, please contact the NRC's Public Document Room (PDR) reference staff at 1–800–397–4209, 301–415–4737, or by email to pdr.resource@nrc.gov. For the convenience of the reader, instructions about obtaining materials referenced in this document are provided in the "Availability of Documents" section.

- *NRC's PDR:* You may examine and purchase copies of public documents at the NRC's PDR, Room O1–F21, One White Flint North, 11555 Rockville Pike, Rockville, Maryland 20852.

B. Submitting Comments

Please include Docket ID NRC–2016–0155 in your comment submission.

The NRC cautions you not to include identifying or contact information that you do not want to be publicly disclosed in your comment submission. The NRC will post all comment submissions at <http://www.regulations.gov> as well as enter the comment submissions into ADAMS. The NRC does not routinely edit comment submissions to remove identifying or contact information.

If you are requesting or aggregating comments from other persons for submission to the NRC, then you should inform those persons not to include identifying or contact information that they do not want to be publicly disclosed in their comment submission. Your request should state that the NRC does not routinely edit comment submissions to remove such information

before making the comment submissions available to the public or entering the comment into ADAMS.

II. Procedural Background

This rule is limited to the changes contained in Amendment No. 2 to CoC No. 1040 and does not include other aspects of the Holtec International HI–STORM UMAX Canister Storage System design. The NRC is using the "direct final rule procedure" to issue this amendment because it represents a limited and routine change to an existing CoC that is expected to be noncontroversial. Adequate protection of public health and safety continues to be ensured. The amendment to the rule will become effective on January 9, 2017. However, if the NRC receives significant adverse comments on this direct final rule by November 25, 2016, then the NRC will publish a document that withdraws this action and will subsequently address the comments received in a final rule as a response to the companion proposed rule published in the Proposed Rule section of this issue of the **Federal Register**. Absent significant modifications to the proposed revisions requiring republication, the NRC will not initiate a second comment period on this action.

A significant adverse comment is a comment where the commenter explains why the rule would be inappropriate, including challenges to the rule's underlying premise or approach, or would be ineffective or unacceptable without a change. A comment is adverse and significant if:

(1) The comment opposes the rule and provides a reason sufficient to require a substantive response in a notice-and-comment process. For example, a substantive response is required when:

(a) The comment causes the NRC staff to reevaluate (or reconsider) its position or conduct additional analysis;

(b) The comment raises an issue serious enough to warrant a substantive response to clarify or complete the record; or

(c) The comment raises a relevant issue that was not previously addressed or considered by the NRC staff.

(2) The comment proposes a change or an addition to the rule, and it is apparent that the rule would be ineffective or unacceptable without incorporation of the change or addition.

(3) The comment causes the NRC staff to make a change (other than editorial) to the rule, CoC, or Technical Specifications (TSs).

For detailed instructions on filing comments, please see the companion proposed rule published in the

Proposed Rule section of this issue of the **Federal Register**.

III. Background

Section 218(a) of the Nuclear Waste Policy Act (NWPA) of 1982, as amended, requires that "the Secretary [of the Department of Energy] shall establish a demonstration program, in cooperation with the private sector, for the dry storage of spent nuclear fuel at civilian nuclear power reactor sites, with the objective of establishing one or more technologies that the [Nuclear Regulatory] Commission may, by rule, approve for use at the sites of civilian nuclear power reactors without, to the maximum extent practicable, the need for additional site-specific approvals by the Commission." Section 133 of the NWPA states, in part, that "[the Commission] shall, by rule, establish procedures for the licensing of any technology approved by the Commission under Section 219(a) [sic: 218(a)] for use at the site of any civilian nuclear power reactor."

To implement this mandate, the Commission approved dry storage of spent nuclear fuel in NRC-approved casks under a general license by publishing a final rule which added a new subpart K in part 72 of title 10 of the *Code of Federal Regulations* (10 CFR) entitled, "General License for Storage of Spent Fuel at Power Reactor Sites" (55 FR 29181; July 18, 1990). This rule also established a new subpart L in 10 CFR part 72 entitled, "Approval of Spent Fuel Storage Casks," which contains procedures and criteria for obtaining NRC approval of spent fuel storage cask designs. The NRC subsequently issued a final rule (80 FR 12073; March 6, 2015), as corrected (80 FR 15679; March 25, 2015), that approved the Holtec International HI–STORM UMAX Canister Storage System design and added it to the list of NRC-approved cask designs in 10 CFR 72.214 as CoC No. 1040.

IV. Discussion of Changes

By letter dated March 31, 2015, as supplemented June 19 and November 30, 2015, Holtec International submitted a request to the NRC to amend CoC No. 1040. Amendment No. 2 adds new fuel types to the HI–STORM UMAX Canister Storage System and updates an existing fuel type description. Additionally, Amendment No. 2 updates Table 3–4 of Appendix B of the CoC to reflect correct terminology and makes editorial changes to Appendix B of the CoC to clarify the description of the top surface pad.

Specifically, Amendment No. 2 adds new 16X16 fuel types to approved

contents, in CoC No. 1040, named 16X16B and 16X16C and updates 15X15I fuel types to include those with guide tubes. Amendment No. 2 revises Table 2.1–1 to allow up to 37 undamaged 16X16A fuel assemblies in damaged fuel containers (DFCs) for the multipurpose canister—37 permitted for storage in the HI–STORM UMAX Canister Storage System. An updated heat load pattern is also included for loading up to 37 intact 16X16A fuel assemblies in DFCs. Also, Appendix B, Table 3–4 was revised to clarify the “Top Surface Pad” term.

As documented in the Preliminary Safety Evaluation Report (PSER), the NRC staff performed a detailed safety evaluation of the proposed CoC amendment request. There are no significant changes to cask fabrication or design requirements in the proposed CoC amendment. There will be no significant change in the types or significant revisions in the amounts of any effluent released, no significant increase in the individual or cumulative radiation exposure, and no significant increase in the potential for or consequences from radiological accidents. In addition, any resulting occupational exposure or offsite dose rates from the implementation of Amendment No. 2 would remain within the 10 CFR part 20 limits. Thus, as discussed in the PSER, staff has determined that there is reasonable assurance that: (i) The activities authorized by the amended certificate can be conducted without endangering the health and safety of the public, and (ii) these activities will be conducted in compliance with the applicable regulations of 10 CFR part 72.

This direct final rule revises the Holtec International HI–STORM UMAX Canister Storage System listing in 10 CFR 72.214 by adding Amendment No. 2 to CoC No. 1040. The amendment consists of the changes previously described, as set forth in the revised CoC and TSs. The revised TSs are identified in the PSER.

The amended Holtec International HI–STORM UMAX Canister Storage System design, when used under the conditions specified in the CoC, the TSs, and the NRC’s regulations, will meet the requirements of 10 CFR part 72; therefore, adequate protection of public health and safety will continue to be ensured. When this direct final rule becomes effective, persons who hold a general license under 10 CFR 72.210 may load spent nuclear fuel into Holtec International HI–STORM UMAX Canister Storage System casks that meet the criteria of Amendment No. 2 to CoC No. 1040 under 10 CFR 72.212.

V. Voluntary Consensus Standards

The National Technology Transfer and Advancement Act of 1995 (Pub. L. 104–113) requires that Federal agencies use technical standards that are developed or adopted by voluntary consensus standards bodies unless the use of such a standard is inconsistent with applicable law or otherwise impractical. In this direct final rule, the NRC will revise the Holtec International HI–STORM UMAX Canister Storage System design listed in 10 CFR 72.214, “List of approved spent fuel storage casks.” This action does not constitute the establishment of a standard that contains generally applicable requirements.

VI. Agreement State Compatibility

Under the “Policy Statement on Adequacy and Compatibility of Agreement State Programs” approved by the Commission on June 30, 1997, and published in the **Federal Register** on September 3, 1997 (62 FR 46517), this rule is classified as Compatibility Category “NRC.” Compatibility is not required for Category “NRC” regulations. The NRC program elements in this category are those that relate directly to areas of regulation reserved to the NRC by the Atomic Energy Act of 1954, as amended, or the provisions of 10 CFR. Although an Agreement State may not adopt program elements reserved to the NRC, and a Category “NRC” does not confer regulatory authority on the State, the State may wish to inform its licensees of certain requirements by means consistent with the particular State’s administrative procedure laws.

VII. Plain Writing

The Plain Writing Act of 2010 (Pub. L. 111–274) requires Federal agencies to write documents in a clear, concise, and well-organized manner. The NRC has written this document to be consistent with the Plain Writing Act as well as the Presidential Memorandum, “Plain Language in Government Writing,” published June 10, 1998 (63 FR 31883).

VIII. Environmental Assessment and Finding of No Significant Environmental Impact

A. The Action

The action is to amend 10 CFR 72.214 to revise the Holtec International HI–STORM UMAX Canister Storage System listing within the “List of approved spent fuel storage casks” to include Amendment No. 2 to CoC No. 1040. Under the National Environmental Policy Act of 1969, as amended, and the NRC’s regulations in subpart A of 10

CFR part 51, “Environmental Protection Regulations for Domestic Licensing and Related Regulatory Functions,” the NRC has determined that this rule, if adopted, would not be a major Federal action significantly affecting the quality of the human environment and, therefore, an environmental impact statement is not required. The NRC has made a finding of no significant impact on the basis of this environmental assessment.

B. The Need for the Action

This direct final rule amends the CoC for the Holtec International HI–STORM UMAX Canister Storage System design within the list of approved spent fuel storage casks that power reactor licensees can use to store spent fuel at reactor sites under a general license. Amendment No. 2 adds new fuel types to the HI–STORM UMAX Canister Storage System and updates an existing fuel type description. Additionally, Amendment No. 2 updates Table 3–4 of Appendix B of the CoC to reflect correct terminology and makes editorial changes to Appendix B of the CoC to clarify the description of the top surface pad.

Specifically, Amendment No. 2 adds new 16X16 fuel types to approved contents, in CoC No. 1040, named 16X16B and 16X16C and updates 15X15I fuel types to include those with guide tubes. Amendment No. 2 revises Table 2.1–1 to allow up to 37 undamaged 16X16A fuel assemblies in DFCs for the multipurpose canister—37 permitted for storage in the HI–STORM UMAX Canister Storage System. An updated heat load pattern is also included for loading up to 37 intact 16X16A fuel assemblies in DFCs. Also, Appendix B, Table 3–4 was revised to clarify the “Top Surface Pad” term.

C. Environmental Impacts of the Action

On July 18, 1990 (55 FR 29181), the NRC issued an amendment to 10 CFR part 72 to provide for the storage of spent fuel under a general license in cask designs approved by the NRC. The potential environmental impact of using NRC-approved storage casks was initially analyzed in the environmental assessment for the 1990 final rule. The environmental assessment for this Amendment No. 2 tiers off of the environmental assessment for the July 18, 1990, final rule. Tiering on past environmental assessments is a standard process under the National Environmental Policy Act.

The Holtec International HI–STORM UMAX Canister Storage System is designed to mitigate the effects of design basis accidents that could occur during

storage. Design basis accidents account for human-induced events and the most severe natural phenomena reported for the site and surrounding area.

Postulated accidents analyzed for an Independent Spent Fuel Storage Installation, the type of facility at which a holder of a power reactor operating license would store spent fuel in casks in accordance with 10 CFR part 72, include tornado winds and tornado-generated missiles, a design basis earthquake, a design basis flood, an accidental cask drop, lightning effects, fire, explosions, and other incidents.

Considering the specific design requirements for each accident condition, the design of the cask would prevent loss of confinement, shielding, and criticality control. If there is no loss of confinement, shielding, or criticality control, the environmental impacts would be insignificant. This amendment does not reflect a significant change in design or fabrication of the cask. There are no significant changes to cask design requirements in the proposed CoC amendment. In addition, because there are no significant design or process changes, any resulting occupational exposure or offsite dose rates from the implementation of Amendment No. 2 would remain well within the 10 CFR part 20 limits. Therefore, the proposed CoC changes will not result in any radiological or non-radiological environmental impacts that significantly differ from the environmental impacts evaluated in the environmental assessment supporting the July 18, 1990, final rule. There will be no significant change in the types or significant revisions in the amounts of any effluent released, no significant increase in the individual or cumulative radiation exposure, and no significant increase in the potential for or consequences from radiological accidents. The staff documented its safety findings in a PSER.

D. Alternative to the Action

The alternative to this action is to deny approval of Amendment No. 2 and discontinue the direct final rule process. Consequently, any 10 CFR part 72 general licensee that seeks to load spent nuclear fuel into the Holtec International HI-STORM UMAX Canister Storage System in accordance with the changes described in proposed Amendment No. 2 would have to request an exemption from the requirements of 10 CFR 72.212 and 72.214. Under this alternative, an interested licensee would have to prepare, and the NRC would have to review, a separate exemption request, thereby increasing the administrative

burden upon the NRC and the costs to each licensee. Therefore, the environmental impacts would be the same or less than the proposed action.

E. Alternative Use of Resources

Approval of Amendment No. 2 to CoC No. 1040 would result in no irreversible commitment of resources.

F. Agencies and Persons Contacted

No agencies or persons outside the NRC were contacted in connection with the preparation of this environmental assessment.

G. Finding of No Significant Impact

The environmental impacts of the action have been reviewed under the requirements in 10 CFR part 51. Based on the foregoing environmental assessment, the NRC concludes that this direct final rule entitled, "List of Approved Spent Fuel Storage Casks: Holtec International HI-STORM UMAX Canister Storage System, Amendment No. 2" will not have a significant effect on the human environment. Therefore, the NRC has determined that an environmental impact statement is not necessary for this direct final rule.

IX. Paperwork Reduction Act Statement

This final rule does not contain any new or amended collections of information subject to the Paperwork Reduction Act of 1995 (44 U.S.C. 3501 *et seq.*). Existing collections of information were approved by the Office of Management and Budget (OMB), approval number 3150-0132.

Public Protection Notification

The NRC may not conduct or sponsor, and a person is not required to respond to, a collection of information collection unless the document requesting or requiring the collection displays a currently valid OMB control number.

X. Regulatory Flexibility Certification

Under the Regulatory Flexibility Act of 1980 (5 U.S.C. 605(b)), the NRC certifies that this rule will not, if issued, have a significant economic impact on a substantial number of small entities. This direct final rule affects only nuclear power plant licensees and Holtec International. These entities do not fall within the scope of the definition of small entities set forth in the Regulatory Flexibility Act or the size standards established by the NRC (10 CFR 2.810).

XI. Regulatory Analysis

On July 18, 1990 (55 FR 29181), the NRC issued an amendment to 10 CFR

part 72 to provide for the storage of spent nuclear fuel under a general license in cask designs approved by the NRC. Any nuclear power reactor licensee can use NRC-approved cask designs to store spent nuclear fuel if it notifies the NRC in advance, the spent fuel is stored under the conditions specified in the cask's CoC, and the conditions of the general license are met. A list of NRC-approved cask designs is contained in 10 CFR 72.214. On March 6, 2015 (80 FR 12073), as corrected on March 25, 2015 (80 FR 15679), the NRC issued an amendment to 10 CFR part 72 that approved the Holtec International HI-STORM UMAX Canister Storage System design by adding it to the list of NRC-approved cask designs in 10 CFR 72.214. By letter dated March 31, 2015, as supplemented June 19 and November 30, 2015, Holtec submitted an application to amend the Holtec International HI-STORM UMAX Canister Storage System as described in Section IV, "Discussion of Changes," of this document.

The alternative to this action is to withhold approval of Amendment No. 2 and to require any 10 CFR part 72 general licensee seeking to load spent nuclear fuel into the Holtec International HI-STORM UMAX Canister Storage System under the changes described in Amendment No. 2 to request an exemption from the requirements of 10 CFR 72.212 and 72.214. Under this alternative, each interested 10 CFR part 72 licensee would have to prepare, and the NRC would have to review, a separate exemption request, thereby increasing the administrative burden upon the NRC and the costs to each licensee.

Approval of the direct final rule is consistent with previous NRC actions. Further, as documented in the PSER and the environmental assessment, the direct final rule will have no adverse effect on public health and safety or the environment. This direct final rule has no significant identifiable impact or benefit on other Government agencies. Based on this regulatory analysis, the NRC concludes that the requirements of the direct final rule are commensurate with the NRC's responsibilities for public health and safety and the common defense and security. No other available alternative is believed to be as satisfactory, and therefore, this action is recommended.

XII. Backfitting and Issue Finality

The NRC has determined that the backfit rule (10 CFR 72.62) does not apply to this direct final rule. Therefore, a backfit analysis is not required. This direct final rule revises CoC No. 1040

for the Holtec International HI-STORM UMAX Canister Storage System, as currently listed in 10 CFR 72.214, "List of approved spent fuel storage casks." Amendment No. 2 adds new fuel types to the HI-STORM UMAX Canister Storage System and updates an existing fuel type description. Additionally Amendment No. 2 updates Table 3–4 of Appendix B of the CoC to reflect correct terminology and makes editorial changes to Appendix B of the CoC to clarify the description of the top surface pad.

Amendment No. 2 to CoC No. 1040 for the Holtec International HI-STORM UMAX Canister Storage System was initiated by Holtec and was not

submitted in response to new NRC requirements, or an NRC request for amendment. Amendment No. 2 applies only to new casks fabricated and used under Amendment No. 2. These changes do not affect existing users of the Holtec International HI-STORM UMAX Canister Storage System, and the current Amendment No. 1 continues to be effective for existing users. While current CoC users may comply with the new requirements in Amendment No. 2, this would be a voluntary decision on the part of current users. For these reasons, Amendment No. 2 to CoC No. 1040 does not constitute backfitting under 10 CFR 72.62, 10 CFR 50.109(a)(1), or otherwise represent an

inconsistency with the issue finality provisions applicable to combined licenses in 10 CFR part 52. Accordingly, no backfit analysis or additional documentation addressing the issue finality criteria in 10 CFR part 52 has been prepared by the staff.

XIII. Congressional Review Act

The Office of Management and Budget has not found this to be a major rule as defined in the Congressional Review Act.

XIV. Availability of Documents

The documents identified in the following table are available to interested persons as indicated.

Document	ADAMS accession No.
Holtec License Amendment Request; Letter Dated March 31, 2015	ML15092A783

The NRC may post materials related to this document, including public comments, on the Federal rulemaking Web site at <http://www.regulations.gov> under Docket ID NRC–2016–0155. The Federal rulemaking Web site allows you to receive alerts when changes or additions occur in a docket folder. To subscribe: (1) Navigate to the docket folder (NRC–2016–0155); (2) click the "Sign up for Email Alerts" link; and (3) enter your email address and select how frequently you would like to receive emails (daily, weekly, or monthly).

List of Subjects in 10 CFR Part 72

Administrative practice and procedure, Criminal penalties, Hazardous waste, Indians, Intergovernmental relations, Manpower training programs, Nuclear energy, Nuclear materials, Occupational safety and health, Penalties, Radiation protection, Reporting and recordkeeping requirements, Security measures, Spent fuel, Whistleblowing.

For the reasons set out in the preamble and under the authority of the Atomic Energy Act of 1954, as amended; the Energy Reorganization Act of 1974, as amended; the Nuclear Waste Policy Act of 1982, as amended; and 5 U.S.C. 552 and 553; the NRC is adopting the following amendments to 10 CFR part 72:

PART 72—LICENSING REQUIREMENTS FOR THE INDEPENDENT STORAGE OF SPENT NUCLEAR FUEL, HIGH-LEVEL RADIOACTIVE WASTE, AND REACTOR-RELATED GREATER THAN CLASS C WASTE

■ 1. The authority citation for part 72 continues to read as follows:

Authority: Atomic Energy Act of 1954, secs. 51, 53, 57, 62, 63, 65, 69, 81, 161, 182, 183, 184, 186, 187, 189, 223, 234, 274 (42 U.S.C. 2071, 2073, 2077, 2092, 2093, 2095, 2099, 2111, 2201, 2210e, 2232, 2233, 2234, 2236, 2237, 2238, 2273, 2282, 2021); Energy Reorganization Act of 1974, secs. 201, 202, 206, 211 (42 U.S.C. 5841, 5842, 5846, 5851); National Environmental Policy Act of 1969 (42 U.S.C. 4332); Nuclear Waste Policy Act of 1982, secs. 117(a), 132, 133, 134, 135, 137, 141, 145(g), 148, 218(a) (42 U.S.C. 10137(a), 10152, 10153, 10154, 10155, 10157, 10161, 10165(g), 10168, 10198(a)); 44 U.S.C. 3504 note.

■ 2. In § 72.214, Certificate of Compliance 1040 is revised to read as follows:

§ 72.214 List of approved spent fuel storage casks.

* * * * *

Certificate Number: 1040.
Initial Certificate Effective Date: April 6, 2015.
Amendment Number 1 Effective Date: September 8, 2015.
Amendment Number 2, Effective Date: January 9, 2017.
SAR Submitted by: Holtec International, Inc.

SAR Title: Final Safety Analysis Report for the Holtec International HI-STORM UMAX Canister Storage System.

Docket Number: 72–1040.

Certificate Expiration Date: April 6, 2035.

Model Number: MPC–37, MPC–89.

Dated at Rockville, Maryland, this 4th day of October, 2016.

For the Nuclear Regulatory Commission.

Michael R. Johnson,

Acting Executive Director for Operations.

BILLING CODE 7590–01–P

DEPARTMENT OF TRANSPORTATION

Federal Aviation Administration

14 CFR Part 71

[Docket No. FAA–2016–5444; Airspace Docket No. 16–ANE–1]

Amendment of Class D and Class E Airspace; Falmouth, MA

AGENCY: Federal Aviation Administration (FAA), DOT.

ACTION: Final rule, correction.

SUMMARY: This action corrects a final rule published in the **Federal Register** of September 23, 2016, amending Class D and E airspace. Class E airspace designated as an extension at Cape Cod Coast Guard Air Station, (formerly Otis ANGB), Falmouth, MA is corrected by

adjusting the radials of the Class E surface extensions to coincide with the FAA's aeronautical database. Also, Falmouth Airpark is added to the Class E extension airspace description.

DATES: Effective 0901 UTC, November 10, 2016. The Director of the Federal Register approves this incorporation by reference action under title 1, Code of Federal Regulations, part 51, subject to the annual revision of FAA Order 7400.11 and publication of conforming amendments.

FOR FURTHER INFORMATION CONTACT: John Fornito, Operations Support Group, Eastern Service Center, Federal Aviation Administration, P.O. Box 20636, Atlanta, Georgia 30320; telephone (404) 305-6364.

SUPPLEMENTARY INFORMATION:

History

The **Federal Register** published a final rule amending Class D and E airspace at Cape Cod Coast Guard Air Station, Falmouth, MA (81 FR 65532, September 23, 2016) Docket No. FAA-2016-5444. In the Class E airspace designated as an extension, further review revealed the surface area extension radials for Cape Cod Coast Guard Air Station were given in magnetic values, instead of true values. Also, Falmouth Airpark, previously excluded from this Class E airspace is included in the description.

Class D and E airspace designations are published in paragraphs 5000, 6004, and 6005 of FAA Order 7400.11A dated August 3, 2016, and effective September 15, 2016, which is incorporated by reference in 14 CFR part 71.1. The Class E airspace designation listed in this document will be published subsequently in the Order.

Availability and Summary of Documents for Incorporation by Reference

This document amends FAA Order 7400.11A, Airspace Designations and Reporting Points, dated August 6, 2016, and effective September 15, 2016. FAA Order 7400.11A is publicly available as listed in the **ADDRESSES** section of this document. FAA Order 7400.11A lists Class A, B, C, D, and E airspace areas, air traffic service routes, and reporting points.

Correction to Final Rule

■ Accordingly, pursuant to the authority delegated to me, in the **Federal Register** of September 23, 2016 (81 FR 65532) FR Doc. 22748, Amendment of Class D and E Airspace for Cape Cod Coast Guard Air Station, Falmouth, MA, is corrected as follows:

§ 71.1 [Amended]

AEA MD E4 Falmouth, MA [Corrected]

On page 65533, column 2, add the following:
after line 39, add "Falmouth Airpark (lat. 41°35'08" N., long. 70°32'25" W.)",
and on line 41, remove "55°", and add in its place, "39°",
and on line 45, remove "143°", and add in its place, "127°",
and on line 49, remove "234°", and add in its place, "219°",
and on line 51, after "airport," add "excluding that airspace within a 1-mile radius of Falmouth Airpark",
and on line 52, remove "323°", and add in its place, "307°".

Issued in College Park, Georgia, on October 18, 2016.

Paul Lore,

*Acting Manager, Operations Support Group,
Eastern Service Center, Air Traffic
Organization.*

BILLING CODE 4910-13-P

DEPARTMENT OF TRANSPORTATION

Federal Aviation Administration

14 CFR Part 71

[Docket No. FAA-2016-7046; Airspace
Docket No. 16-ANM-3]

Amendment of Class E Airspace; Miles City, MT

AGENCY: Federal Aviation Administration (FAA), DOT.

ACTION: Final rule.

SUMMARY: This action modifies Class E surface area airspace and Class E airspace extending upward from 700 feet above the surface at Frank Wiley Field Airport, Miles City, MT, due to airspace redesign for the safety and management of Instrument Flight Rules (IFR) operations at the airport. The Class E airspace designated as an extension, proposed for revocation in the NPRM, is removed from this rulemaking as it was proposed in error.

DATES: Effective 0901 UTC, January 5, 2017. The Director of the Federal Register approves this incorporation by reference action under Title 1, Code of Federal Regulations, part 51, subject to the annual revision of FAA Order 7400.11 and publication of conforming amendments.

ADDRESSES: FAA Order 7400.11A, Airspace Designations and Reporting Points, and subsequent amendments can be viewed online at http://www.faa.gov/air_traffic/publications/. For further

information, you can contact the U.S. Department of Transportation, Docket Operations, 1200 New Jersey Avenue SE., West Bldg. Ground Floor Rm. W12-140, Washington, DC 20590; Telephone: 1-800-647-5527, or 202-366-9826. The Order is also available for inspection at the National Archives and Records Administration (NARA). For information on the availability of FAA Order 7400.11A at NARA, call 202-741-6030, or go to http://www.archives.gov/federal-register/code_of_federal-regulations/ibr_locations.html. FAA Order 7400.11, Airspace Designations and Reporting Points, is published yearly and effective on September 15.

FOR FURTHER INFORMATION CONTACT: Tom Clark, Federal Aviation Administration, Operations Support Group, Western Service Center, 1601 Lind Avenue SW., Renton, WA 98057; telephone (425) 203-4511.

SUPPLEMENTARY INFORMATION:

Authority for This Rulemaking

The FAA's authority to issue rules regarding aviation safety is found in Title 49 of the United States Code. Subtitle I, Section 106 describes the authority of the FAA Administrator. Subtitle VII, Aviation Programs, describes in more detail the scope of the agency's authority. This rulemaking is promulgated under the authority described in Subtitle VII, Part A, Subpart I, Section 40103. Under that section, the FAA is charged with prescribing regulations to assign the use of airspace necessary to ensure the safety of aircraft and the efficient use of airspace. This regulation is within the scope of that authority as it modifies controlled airspace at Frank Wiley Field Airport, Miles City, MT.

History

On June 17, 2016, the FAA published in the **Federal Register** a notice of proposed rulemaking (NPRM) (81 FR 39603) Docket No. FAA-2016-7046, to modify Class E airspace extending upward from the surface, remove Class E airspace designated as an extension to Class E surface airspace, and modify Class E airspace extending upward from 700 feet above the surface at Frank Wiley Field Airport, Miles City, MT. Subsequent to publication, the FAA found that there is no Class E airspace designated as an extension to the Class E surface area airspace at the airport and was added in error. Interested parties were invited to participate in this rulemaking effort by submitting written comments on the proposal to the FAA. No comments were received.

Class E airspace designations are published in paragraph 6002, and 6005,

respectively, of FAA Order 7400.11A, dated August 3, 2016, and effective September 15, 2016, which is incorporated by reference in 14 CFR part 71.1. The Class E airspace designations listed in this document will be published subsequently in the Order.

Availability and Summary of Documents for Incorporation by Reference

This document amends FAA Order 7400.11A, Airspace Designations and Reporting Points, dated August 3, 2016, and effective September 15, 2016. FAA Order 7400.11A is publicly available as listed in the **ADDRESSES** section of this document. FAA Order 7400.11A lists Class A, B, C, D, and E airspace areas, air traffic service routes, and reporting points.

The Rule

This amendment to Title 14, Code of Federal Regulations (14 CFR) part 71 modifies Class E surface area airspace, and Class E airspace extending upward from 700 feet above the surface at Frank Wiley Field Airport, Miles City, MT. The Class E surface area airspace is modified to within a 5-mile radius of Frank Wiley Field Airport to support terminal operations below 700 feet above the surface and to account for rising terrain. Additionally, Class E airspace extending upward from 700 feet above the surface is modified to within an 8-mile radius of Frank Wiley Field Airport to support IFR departures below 1,200 feet above the surface due to rising terrain. After a review of the airspace, the FAA found redesign of the airspace necessary for the safety and management of IFR operations at the airport. Class E airspace designated as an extension is removed from this rulemaking as the airspace was added in error.

Class E airspace designations are published in paragraph 6002, and 6005, respectively, of FAA Order 7400.11A, dated August 3, 2016, and effective September 15, 2016, which is incorporated by reference in 14 CFR 71.1. The Class E airspace designations listed in this document will be published subsequently in the Order.

Regulatory Notices and Analyses

The FAA has determined that this regulation only involves an established body of technical regulations for which frequent and routine amendments are necessary to keep them operationally current, is non-controversial and unlikely to result in adverse or negative comments. It, therefore: (1) Is not a "significant regulatory action" under

Executive Order 12866; (2) is not a "significant rule" under DOT Regulatory Policies and Procedures (44 FR 11034; February 26, 1979); and (3) does not warrant preparation of a Regulatory Evaluation as the anticipated impact is so minimal. Since this is a routine matter that only affects air traffic procedures and air navigation, it is certified that this rule, when promulgated, does not have a significant economic impact on a substantial number of small entities under the criteria of the Regulatory Flexibility Act.

Environmental Review

The FAA has determined that this action qualifies for categorical exclusion under the National Environmental Policy Act in accordance with FAA Order 1050.1F, "Environmental Impacts: Policies and Procedures," paragraph 5–6.5a. This airspace action is not expected to cause any potentially significant environmental impacts, and no extraordinary circumstances exist that warrant preparation of an environmental assessment.

Lists of Subjects in 14 CFR Part 71

Airspace, Incorporation by reference, Navigation (air).

Adoption of the Amendment

In consideration of the foregoing, the Federal Aviation Administration amends 14 CFR part 71 as follows:

PART 71—DESIGNATION OF CLASS A, B, C, D, AND E AIRSPACE AREAS; AIR TRAFFIC SERVICE ROUTES; AND REPORTING POINTS

- 1. The authority citation for Part 71 continues to read as follows:

Authority: 49 U.S.C. 106(f), 106(g); 40103, 40113, 40120; E.O. 10854, 24 FR 9565, 3 CFR, 1959–1963 Comp., p. 389.

§ 71.1 [Amended]

- 2. The incorporation by reference in 14 CFR 71.1 of FAA Order 7400.11A, Airspace Designations and Reporting Points, dated August 3, 2016, and effective September 15, 2016, is amended as follows:

Paragraph 6002 Class E Airspace Designated as Surface Areas.

* * * * *

ANM MT E2 Miles City, MT [Modified]

Miles City, Frank Wiley Field, MT
(Lat. 46°25'41" N., long. 105°53'10" W.)

That airspace extending upward from the surface within a 5-mile radius of Frank Wiley Field.

Paragraph 6005 Class E Airspace Areas Extending Upward From 700 Feet or More Above the Surface of the Earth.

* * * * *

ANM MT E5 Miles City, MT [Modified]

Miles City, Frank Wiley Field, MT
(Lat. 46°25'41" N., long. 105°53'10" W.)

That airspace extending upward from 700 feet above the surface within an 8-mile radius of Frank Wiley Field; and that airspace extending upward from 1,200 feet above the surface within a 34.5-mile radius of Frank Wiley Field.

Issued in Seattle, Washington, on October 12, 2016.

Tracey Johnson,

Manager, Operations Support Group, Western Service Center.

DEPARTMENT OF TRANSPORTATION

Federal Aviation Administration

14 CFR Part 71

[Docket No. FAA–2015–4513; Airspace Docket No. 15–AEA–8]

Amendment of Class D and Class E Airspace; Hagerstown, MD

AGENCY: Federal Aviation Administration (FAA), DOT.

ACTION: Final rule, correction.

SUMMARY: This action corrects a final rule published in the **Federal Register** of September 23, 2016, amending Class E Airspace designated as an extension, and Class E airspace areas extending upward from 700 feet or more above the surface at Hagerstown Regional Airport-Richard A. Henson Field by correcting the geographic coordinates of the Hagerstown Regional Airport-Richard A. Henson Field ILS Runway 27 Localizer. This is an administrative change to coincide with the FAA's aeronautical database.

DATES: Effective 0901 UTC, November 10, 2016. The Director of the Federal Register approves this incorporation by reference action under title 1, Code of Federal Regulations, part 51, subject to the annual revision of FAA Order 7400.11 and publication of conforming amendments.

FOR FURTHER INFORMATION CONTACT: John Fornito, Operations Support Group, Eastern Service Center, Federal Aviation Administration, P.O. Box 20636, Atlanta, Georgia 30320; telephone (404) 305–6364.

SUPPLEMENTARY INFORMATION:

History

The **Federal Register** published a final rule amending Class E Airspace Designated as an Extension and Class E airspace areas extending upward from 700 feet or more above the surface at Hagerstown Regional Airport-Richard A. Henson Field, Hagerstown, MD (81 FR 65533, September 23, 2016) Docket No. FAA-2015-4513. Further review revealed the geographic coordinates for the Hagerstown Regional Airport-Richard A. Henson Field ILS Runway 27 Localizer did not match the FAA's charting information.

Class E airspace designations are published in paragraphs 6004 and 6005 of FAA Order 7400.11A dated August 3, 2016, and effective September 15, 2016, which is incorporated by reference in 14 CFR part 71.1. The Class E airspace designations listed in this document will be published subsequently in the Order.

Availability and Summary of Documents for Incorporation by Reference

This document amends FAA Order 7400.11A, Airspace Designations and Reporting Points, dated August 6, 2016, and effective September 15, 2016. FAA Order 7400.11A is publicly available as listed in the **ADDRESSES** section of this document. FAA Order 7400.11A lists Class A, B, C, D, and E airspace areas, air traffic service routes, and reporting points.

Correction to Final Rule

■ Accordingly, pursuant to the authority delegated to me, in the **Federal Register** of September 23, 2016 (81 FR 65533) FR Doc. FAA-2015-4513, Amendment of E Airspace for Hagerstown Regional Airport-Richard A. Henson Field, Hagerstown, MD, is corrected as follows:

§ 71.1 [Amended]

AEA MD E4 Hagerstown, MD [Corrected]

On page 65535, column 1, line 20, remove “(lat. 39°42’22” N., long. 77°44’41” W.)”, and add in its place, “(lat. 39°42’23” N., long. 77°44’31” W.)”;

AEA MD E5 Hagerstown, MD [Corrected]

On page 65535, column 1 line 50, remove “(lat. 39°42’22” N., long. 77°44’41” W.)”, and add in its place, “(lat. 39°42’23” N., long. 77°44’31” W.)”.

Issued in College Park, Georgia, on October 18, 2016.

Paul Lore,

*Acting Manager, Operations Support Group,
Eastern Service Center, Air Traffic
Organization.*

[FR Doc. 2016-25704 Filed 10-24-16; 8:45 am]

BILLING CODE 4910-13-P

ENVIRONMENTAL PROTECTION AGENCY

40 CFR Part 180

[EPA-HQ-OPP-2015-0679; FRL-9951-80]

Spirotetramat; Pesticide Tolerance

AGENCY: Environmental Protection Agency (EPA).

ACTION: Final rule.

SUMMARY: This regulation establishes a tolerance for residues of spirotetramat in or on asparagus. Bayer CropScience LP requested this tolerance under the Federal Food, Drug, and Cosmetic Act (FFDCA).

DATES: This regulation is effective October 25, 2016. Objections and requests for hearings must be received on or before December 27, 2016, and must be filed in accordance with the instructions provided in 40 CFR part 178 (see also Unit I.C. of the **SUPPLEMENTARY INFORMATION**).

ADDRESSES: The docket for this action, identified by docket identification (ID) number EPA-HQ-OPP-2015-0679, is available at <http://www.regulations.gov> or at the Office of Pesticide Programs Regulatory Public Docket (OPP Docket) in the Environmental Protection Agency Docket Center (EPA/DC), West William Jefferson Clinton Bldg., Rm. 3334, 1301 Constitution Ave. NW., Washington, DC 20460-0001. The Public Reading Room is open from 8:30 a.m. to 4:30 p.m., Monday through Friday, excluding legal holidays. The telephone number for the Public Reading Room is (202) 566-1744, and the telephone number for the OPP Docket is (703) 305-5805. Please review the visitor instructions and additional information about the docket available at <http://www.epa.gov/dockets>.

FOR FURTHER INFORMATION CONTACT: Michael Goodis, Registration Division (7505P), Office of Pesticide Programs, Environmental Protection Agency, 1200 Pennsylvania Ave. NW., Washington, DC 20460-0001; main telephone number: (703) 305-7090; email address: RDfRNtices@epa.gov.

SUPPLEMENTARY INFORMATION:

I. General Information

A. Does this action apply to me?

You may be potentially affected by this action if you are an agricultural producer, food manufacturer, or pesticide manufacturer. The following list of North American Industrial Classification System (NAICS) codes is not intended to be exhaustive, but rather provides a guide to help readers determine whether this document applies to them. Potentially affected entities may include:

- Crop production (NAICS code 111).
- Animal production (NAICS code 112).
- Food manufacturing (NAICS code 311).
- Pesticide manufacturing (NAICS code 32532).

B. How can I get electronic access to other related information?

You may access a frequently updated electronic version of EPA's tolerance regulations at 40 CFR part 180 through the Government Printing Office's e-CFR site at http://www.ecfr.gov/cgi-bin/text-idx?&c=ecfr&tpl=/ecfrbrowse/Title40/40tab_02.tpl.

C. How can I file an objection or hearing request?

Under FFDCA section 408(g), 21 U.S.C. 346a, any person may file an objection to any aspect of this regulation and may also request a hearing on those objections. You must file your objection or request a hearing on this regulation in accordance with the instructions provided in 40 CFR part 178. To ensure proper receipt by EPA, you must identify docket ID number EPA-HQ-OPP-2015-0679 in the subject line on the first page of your submission. All objections and requests for a hearing must be in writing, and must be received by the Hearing Clerk on or before December 27, 2016. Addresses for mail and hand delivery of objections and hearing requests are provided in 40 CFR 178.25(b).

In addition to filing an objection or hearing request with the Hearing Clerk as described in 40 CFR part 178, please submit a copy of the filing (excluding any Confidential Business Information (CBI)) for inclusion in the public docket. Information not marked confidential pursuant to 40 CFR part 2 may be disclosed publicly by EPA without prior notice. Submit the non-CBI copy of your objection or hearing request, identified by docket ID number EPA-HQ-OPP-2015-0679, by one of the following methods:

- **Federal eRulemaking Portal:** <http://www.regulations.gov>. Follow the online

instructions for submitting comments. Do not submit electronically any information you consider to be CBI or other information whose disclosure is restricted by statute.

- *Mail:* OPP Docket, Environmental Protection Agency Docket Center (EPA/DC), (28221T), 1200 Pennsylvania Ave. NW., Washington, DC 20460-0001.

- *Hand Delivery:* To make special arrangements for hand delivery or delivery of boxed information, please follow the instructions at <http://www.epa.gov/dockets/contacts.html>.

Additional instructions on commenting or visiting the docket, along with more information about dockets generally, is available at <http://www.epa.gov/dockets>.

II. Summary of Petitioned-for Tolerance

In the **Federal Register** of May 19, 2016 (81 FR 31581) (FRL-9946-02), EPA issued a document pursuant to FFDCA section 408(d)(3), 21 U.S.C. 346a(d)(3), announcing the filing of a pesticide petition (PP 5E8376) by Bayer CropScience LP, P.O. Box 12014, 2 T.W. Alexander Dr., Research Triangle Park, NC 27709. The petition requested that 40 CFR 180.641 be amended by establishing tolerances for residues of the insecticide spirotetramat in or on asparagus at 0.10 parts per million (ppm). That document referenced a summary of the petition prepared by Bayer CropScience, the registrant, which is available in the docket, <http://www.regulations.gov>. A comment was received on the notice of filing. EPA's response to this comment is discussed in Unit IV.C.

III. Aggregate Risk Assessment and Determination of Safety

Section 408(b)(2)(A)(i) of FFDCA allows EPA to establish a tolerance (the legal limit for a pesticide chemical residue in or on a food) only if EPA determines that the tolerance is "safe." Section 408(b)(2)(A)(ii) of FFDCA defines "safe" to mean that "there is a reasonable certainty that no harm will result from aggregate exposure to the pesticide chemical residue, including all anticipated dietary exposures and all other exposures for which there is reliable information." This includes exposure through drinking water and in residential settings, but does not include occupational exposure. Section 408(b)(2)(C) of FFDCA requires EPA to give special consideration to exposure of infants and children to the pesticide chemical residue in establishing a tolerance and to "ensure that there is a reasonable certainty that no harm will result to infants and children from

aggregate exposure to the pesticide chemical residue. . . ."

Consistent with FFDCA section 408(b)(2)(D), and the factors specified in FFDCA section 408(b)(2)(D), EPA has reviewed the available scientific data and other relevant information in support of this action. EPA has sufficient data to assess the hazards of and to make a determination on aggregate exposure for spirotetramat including exposure resulting from the tolerances established by this action. EPA's assessment of exposures and risks associated with spirotetramat follows.

A. Toxicological Profile

EPA has evaluated the available toxicity data and considered its validity, completeness, and reliability as well as the relationship of the results of the studies to human risk. EPA has also considered available information concerning the variability of the sensitivities of major identifiable subgroups of consumers, including infants and children.

The target organs of toxicity following subchronic and chronic oral exposures to spirotetramat were different in rats and dogs. The thyroid and thymus glands were the target organs identified in subchronic and chronic toxicity studies in dogs while the testes were the target organs identified in rats. The dog was the most sensitive species, and in both rats and dogs, males were more sensitive than females. The thyroid effects in the dog consisted of lower circulating levels of thyroid hormones (T3 and/or T4) along with a reduction in follicle size, a possible indication of reduced amount of colloid. The effects in the dog thymus were described microscopically as involution, which also resulted in decreased organ weight.

In rats, reported testicular effects consisted of abnormal spermatozoa and hypospermia in the epididymis, decreased testicular weights, and testicular degenerative vacuolation. An investigative subchronic study where rats were dosed with a primary enol metabolite of spirotetramat reproduced the same testicular effects as the parent chemical, suggesting that this metabolite is, at minimum, a primary contributor to the observed male reproductive toxicity. Consistent with this notion, orally administered spirotetramat was demonstrated in rats to be extensively metabolized, and males were noted to achieve much higher systemic exposures than their female counterparts, which helps explain the higher sensitivity of males. Other effects reported in a rat chronic toxicity study were associated with kidney effects

consisting of decreased organ weight and tubular dilatation.

In one- and two-generation rat reproductive toxicity studies, male reproductive toxicity (abnormal sperm cells and reproductive performance) similar to that reported in subchronic toxicity studies with adult rats was reported in the first generation (F₁) males at relatively high dose levels. In all cases, a well-defined no-observed adverse-effect level (NOAEL) was established.

There was evidence of increased qualitative susceptibility in the rat developmental study with reduced fetal weight and increased incidences of malformations and skeletal deviations observed at the limit dose, while maternal effects at this dose consisted of only body weight decrements. There was no evidence of increased quantitative or qualitative susceptibility to offspring following pre- or postnatal exposure to spirotetramat in the rabbit developmental or two-generation reproduction studies.

The only evidence of neurotoxicity in the rat acute neurotoxicity study was based on decreased motor and locomotor activity, which occurred only at relatively high dose levels. The rat subchronic neurotoxicity (SCN) study does not indicate a concern for neurotoxicity, even at relatively high dose levels.

The results of an immunotoxicity study in rats do not indicate any functional deficits in immune function. There is no evidence of carcinogenicity in chronic toxicity/carcinogenicity studies performed in rats and mice and spirotetramat was also negative for mutagenicity and clastogenicity in guideline in vivo and in vitro assays.

Specific information on the studies received and the nature of the adverse effects caused by spirotetramat as well as the NOAEL and the lowest-observed-adverse-effect-level (LOAEL) from the toxicity studies can be found at <http://www.regulations.gov> in the document titled "*Spirotetramat. Human Health Risk Assessment for the Petition for a Tolerance for Residues in/on Asparagus Without a U.S. Registration*" at page 19 in docket ID number EPA-HQ-OPP-2015-0679.

B. Toxicological Points of Departure/Levels of Concern

Once a pesticide's toxicological profile is determined, EPA identifies toxicological points of departure (POD) and levels of concern to use in evaluating the risk posed by human exposure to the pesticide. For hazards that have a threshold below which there is no appreciable risk, the toxicological

POD is used as the basis for derivation of reference values for risk assessment. PODs are developed based on a careful analysis of the doses in each toxicological study to determine the dose at which no adverse effects are observed (the NOAEL) and the lowest dose at which adverse effects of concern are identified (the LOAEL). Uncertainty/safety factors are used in conjunction with the POD to calculate a safe

exposure level—generally referred to as a population-adjusted dose (PAD) or a reference dose (RfD)—and a safe margin of exposure (MOE). For non-threshold risks, the Agency assumes that any amount of exposure will lead to some degree of risk. Thus, the Agency estimates risk in terms of the probability of an occurrence of the adverse effect expected in a lifetime. For more information on the general principles

EPA uses in risk characterization and a complete description of the risk assessment process, see <http://www.epa.gov/pesticides/factsheets/riskassess.htm>.

A summary of the toxicological endpoints for spirotetramat used for human risk assessment is shown in Table 1 of this unit.

TABLE 1—SUMMARY OF TOXICOLOGICAL DOSES AND ENDPOINTS FOR SPIROTETRAMAT FOR USE IN HUMAN HEALTH RISK ASSESSMENT

Exposure/scenario	Point of departure and uncertainty/safety factors	RfD, PAD, LOC for risk assessment	Study and toxicological effects
Acute dietary (General population including infants and children).	NOAEL = 100 mg/kg/day. UF _A = 10x UF _H = 10x FQPA SF = 1x	Acute RfD = 1.0 mg/kg/day. aPAD = 1.0 mg/kg/day.	Acute neurotoxicity (rat). LOAEL = 200 mg/kg based on clinical signs and decreased motor activity in males.
Chronic dietary (All populations)	NOAEL = 5 mg/kg/day. UF _A = 10x UF _H = 10x FQPA SF = 1x	Chronic RfD = 0.05 mg/kg/day. cPAD = 0.05 mg/kg/day.	Chronic toxicity (dog). LOAEL = 20 mg/kg/day based on thymus involution in males.
Cancer (Oral, dermal, inhalation).	Classification: “not likely to be carcinogenic to humans” based on lack of evidence of carcinogenicity in rats and mice.		

FQPA SF = Food Quality Protection Act Safety Factor. LOAEL = lowest-observed-adverse-effect-level. LOC = level of concern. mg/kg/day = milligram/kilogram/day. MOE = margin of exposure. NOAEL = no-observed-adverse-effect-level. PAD = population adjusted dose (a = acute, c = chronic). RfD = reference dose. UF = uncertainty factor. UF_A = extrapolation from animal to human (interspecies). UF_H = potential variation in sensitivity among members of the human population (intraspecies).

C. Exposure Assessment

1. *Dietary exposure from food and feed uses.* In evaluating dietary exposure to spirotetramat, EPA considered exposure under the petitioned-for tolerances as well as all existing spirotetramat tolerances in 40 CFR 180.641. EPA assessed dietary exposures from spirotetramat in food as follows:

i. *Acute exposure.* Quantitative acute dietary exposure and risk assessments are performed for a food-use pesticide, if a toxicological study has indicated the possibility of an effect of concern occurring as a result of a 1-day or single exposure.

Such effects were identified for spirotetramat. In estimating acute dietary exposure, EPA used food consumption information from the United States Department of Agriculture's (USDA's) 2003–2008 National Health and Nutrition Examination Survey, What We Eat in America, (NHANES/WWEIA). As to residue levels in food, EPA assumed tolerance-level residues for all foods, Dietary Exposure Evaluation Model (DEEM) 7.81 default processing factors where provided, and 100 percent crop treated (PCT).

ii. *Chronic exposure.* In conducting the chronic dietary exposure assessment EPA used the food consumption data from the USDA's NHANES/WWEIA (2003–2008). As to residue levels in food, EPA assumed average field trial residues for some commodities, tolerance-level residues for the remaining commodities, and 100 PCT.

iii. *Cancer.* Based on the data summarized in Unit III.A., EPA has concluded that spirotetramat does not pose a cancer risk to humans. Therefore, a dietary exposure assessment for the purpose of assessing cancer risk is unnecessary.

iv. *Anticipated residue and PCT information.* Section 408(b)(2)(E) of FFDCA authorizes EPA to use available data and information on the anticipated residue levels of pesticide residues in food and the actual levels of pesticide residues that have been measured in food. If EPA relies on such information, EPA must require pursuant to FFDCA section 408(f)(1) that data be provided 5 years after the tolerance is established, modified, or left in effect, demonstrating that the levels in food are not above the levels anticipated. For the present action, EPA will issue such data call-ins as are required by FFDCA section 408(b)(2)(E) and authorized under

FFDCA section 408(f)(1). Data will be required to be submitted no later than 5 years from the date of issuance of these tolerances.

2. *Dietary exposure from drinking water.* The Agency used screening level water exposure models in the dietary exposure analysis and risk assessment for spirotetramat in drinking water. These simulation models take into account data on the physical, chemical, and fate/transport characteristics of spirotetramat. Further information regarding EPA drinking water models used in pesticide exposure assessment can be found at <http://www.epa.gov/oppefed1/models/water/index.htm>.

Based on the Tier 1 Rice Model and Pesticide Root Zone Model Ground Water (PRZM GW), the estimated drinking water concentrations (EDWCs) of spirotetramat and its metabolites for acute exposures are estimated to be 395 parts per billion (ppb) for surface water and 7.99 ppb for ground water, and for chronic exposures are estimated to be 395 ppb for surface water and 5.36 ppb for ground water.

Modeled estimates of drinking water concentrations were directly entered into the dietary exposure model. For both the acute and chronic dietary risk assessments, the water concentration

value of 395 ppb was used to assess the contribution to drinking water.

3. *From non-dietary exposure.* The term “residential exposure” is used in this document to refer to non-occupational, non-dietary exposure (e.g., for lawn and garden pest control, indoor pest control, termiticides, and flea and tick control on pets).

Spirotetramat is currently registered for the following uses that could result in residential exposures: golf courses and residential citrus trees. The golf course use could result in potential post-application dermal exposure; however, there is no dermal hazard and therefore, quantification of dermal risk is not necessary. For the residential citrus tree use, because the product is sold in bulk packaging for agricultural uses and the label requires that handlers wear specific clothing (e.g., long-sleeve shirt/long pants) and the use of personal-protective equipment (e.g., gloves), based on current Agency policy, EPA has made the assumption that this product is not meant for homeowner use, and therefore, there is no need to conduct a quantitative residential handler assessment.

4. *Cumulative effects from substances with a common mechanism of toxicity.* Section 408(b)(2)(D)(v) of FFDCA requires that, when considering whether to establish, modify, or revoke a tolerance, the Agency consider “available information” concerning the cumulative effects of a particular pesticide’s residues and “other substances that have a common mechanism of toxicity.”

EPA has not found spirotetramat to share a common mechanism of toxicity with any other substances, and spirotetramat does not appear to produce a toxic metabolite produced by other substances. For the purposes of this tolerance action, therefore, EPA has assumed that spirotetramat does not have a common mechanism of toxicity with other substances. For information regarding EPA’s efforts to determine which chemicals have a common mechanism of toxicity and to evaluate the cumulative effects of such chemicals, see EPA’s Web site at <http://www.epa.gov/pesticides/cumulative>.

D. Safety Factor for Infants and Children

1. *In general.* Section 408(b)(2)(C) of FFDCA provides that EPA shall apply an additional tenfold (10x) margin of safety for infants and children in the case of threshold effects to account for prenatal and postnatal toxicity and the completeness of the database on toxicity and exposure unless EPA determines based on reliable data that a different

margin of safety will be safe for infants and children. This additional margin of safety is commonly referred to as the FQPA Safety Factor (SF). In applying this provision, EPA either retains the default value of 10x, or uses a different additional safety factor when reliable data available to EPA support the choice of a different factor.

2. *Prenatal and postnatal sensitivity.* There was no evidence of quantitative susceptibility of offspring following pre- or postnatal exposure. There is evidence of qualitative susceptibility in the rat developmental study, such that reduced fetal weight and increased incidences of malformations and skeletal deviations were observed at the limit dose, while maternal effects at this dose consisted of only body weight decrements. Concern is low since effects were only seen at the limit dose, effects were seen in the presence of maternal toxicity, and selected endpoints are protective of the observed effects.

3. *Conclusion.* EPA has determined that reliable data show the safety of infants and children would be adequately protected if the FQPA SF were reduced to 1x. That decision is based on the following findings:

- i. The toxicity database for spirotetramat is complete.
- ii. Although there is evidence of neurotoxicity in the acute neurotoxicity study, concern is low since the effects are well-characterized with clearly established NOAEL/LOAEL values, the selected endpoints are protective of the observed neurotoxic effect, there are no neurotoxic effects seen in the subchronic neurotoxicity study, and the existing toxicological database indicates that spirotetramat is not a neurotoxic chemical.
- iii. There was no evidence of quantitative susceptibility of offspring following pre- or postnatal exposure. There is evidence of qualitative susceptibility in the rat developmental study; however, there is no residual uncertainty concerning these effects due to the clear NOAEL/LOAELs in the study for these effects. Moreover, concern for these effects is low since effects were only seen at the limit dose, effects were seen in the presence of maternal toxicity, and selected endpoints are protective of the observed effects.

iv. There are no residual uncertainties identified in the exposure databases. The acute dietary food and drinking water exposure assessment utilizes tolerance-level residues and 100 PCT information for all commodities. The chronic dietary food and drinking water exposure assessment utilizes average field trial residues for some

commodities, tolerance-level residues for the remaining commodities, and 100 PCT. The chronic assessment is somewhat refined; however, since it is based on reliable data, it will not underestimate exposure and risk. The drinking water assessments provide conservative, health-protective, high-end estimates of water concentrations that will not likely be exceeded. These assessments of exposure are not likely to underestimate the resulting estimates of risk from exposure to spirotetramat.

E. Aggregate Risks and Determination of Safety

EPA determines whether acute and chronic dietary pesticide exposures are safe by comparing aggregate exposure estimates to the acute PAD (aPAD) and chronic PAD (cPAD). For linear cancer risks, EPA calculates the lifetime probability of acquiring cancer given the estimated aggregate exposure. Short-, intermediate-, and chronic-term risks are evaluated by comparing the estimated aggregate food, water, and residential exposure to the appropriate PODs to ensure that an adequate MOE exists.

1. *Acute risk.* Using the exposure assumptions discussed in this unit for acute exposure, the acute dietary exposure from food and water to spirotetramat will occupy 16% of the aPAD for children 1–2 years old, the population group receiving the greatest exposure.

2. *Chronic risk.* Using the exposure assumptions described in this unit for chronic exposure, EPA has concluded that chronic exposure to spirotetramat from food and water will utilize 77% of the cPAD for children 1–2 years old, the population group receiving the greatest exposure. There are no residential uses for spirotetramat resulting in long-term exposure that require a quantitative risk assessment.

3. *Short- and Intermediate-term risk.* Short- and intermediate-term aggregate exposure takes into account short- and intermediate-term residential exposure plus chronic exposure to food and water (considered to be a background exposure level). A short- and intermediate-term inhalation adverse effect was identified; however, spirotetramat is not registered for any use patterns that would result in either short- or intermediate-term inhalation residential exposure. In a dermal toxicity study, no evidence of dermal hazard was found; therefore, dermal risk was not included in the aggregate assessment. Short- and intermediate-term risk is assessed based on short- and intermediate-term residential exposure plus chronic dietary exposure. Because

there is no short- or intermediate-term residential exposure and chronic dietary exposure has already been assessed under the appropriately protective cPAD (which is at least as protective as the POD used to assess short-term risk), no further assessment of short- or intermediate-term risk is necessary, and EPA relies on the chronic dietary risk assessment for evaluating short- and intermediate-term risk for spirotetramat.

4. *Aggregate cancer risk for U.S. population.* Based on the lack of evidence of carcinogenicity in two adequate rodent carcinogenicity studies, spirotetramat is not expected to pose a cancer risk to humans.

5. *Determination of safety.* Based on these risk assessments, EPA concludes that there is a reasonable certainty that no harm will result to the general population, or to infants and children from aggregate exposure to spirotetramat residues.

IV. Other Considerations

A. Analytical Enforcement Methodology

Adequate enforcement methodology (high-performance liquid chromatography with tandem mass spectrometry (HPLC–MS/MS)) is available to enforce the tolerance expression.

The method may be requested from: Chief, Analytical Chemistry Branch, Environmental Science Center, 701 Mapes Rd., Ft. Meade, MD 20755–5350; telephone number: (410) 305–2905; email address: residuemethods@epa.gov.

B. International Residue Limits

In making its tolerance decisions, EPA seeks to harmonize U.S. tolerances with international standards whenever possible, consistent with U.S. food safety standards and agricultural practices. EPA considers the international maximum residue limits (MRLs) established by the Codex Alimentarius Commission (Codex), as required by FFDCA section 408(b)(4). The Codex Alimentarius is a joint United Nations Food and Agriculture Organization/World Health Organization food standards program, and it is recognized as an international food safety standards-setting organization in trade agreements to which the United States is a party. EPA may establish a tolerance that is different from a Codex MRL; however, FFDCA section 408(b)(4) requires that EPA explain the reasons for departing from the Codex level.

The Codex has not established a MRL for spirotetramat in or on asparagus.

C. Response to Comments

EPA received one comment to the Notice of Filing noting general concerns about the potential effects on the cornea, thymus and thyroid, and testicular histopathology and stating, in part, that EPA should deny any approval of use of this chemical on any food products. The Agency understands the commenter's concerns and recognizes that some individuals believe that pesticides should be banned on agricultural crops. However, the existing legal framework provided by section 408 of the Federal Food, Drug and Cosmetic Act (FFDCA) states that tolerances may be set when persons seeking such tolerances or exemptions have demonstrated that the pesticide meets the safety standard imposed by that statute. EPA has assessed the effects of this chemical on human health and determined that aggregate exposure to it will be safe. This citizen's comment appears to be directed at the underlying statute and not EPA's implementation of it; the citizen has made no contention that EPA has acted in violation of the statutory framework.

V. Conclusion

Therefore, tolerances are established for residues of spirotetramat, including its metabolites and degradates, in or on asparagus at 0.10 ppm.

VI. Statutory and Executive Order Reviews

This action establishes a tolerance under FFDCA section 408(d) in response to a petition submitted to the Agency. The Office of Management and Budget (OMB) has exempted these types of actions from review under Executive Order 12866, entitled "Regulatory Planning and Review" (58 FR 51735, October 4, 1993). Because this action has been exempted from review under Executive Order 12866, this action is not subject to Executive Order 13211, entitled "Actions Concerning Regulations That Significantly Affect Energy Supply, Distribution, or Use" (66 FR 28355, May 22, 2001) or Executive Order 13045, entitled "Protection of Children from Environmental Health Risks and Safety Risks" (62 FR 19885, April 23, 1997). This action does not contain any information collections subject to OMB approval under the Paperwork Reduction Act (PRA) (44 U.S.C. 3501 *et seq.*), nor does it require any special considerations under Executive Order 12898, entitled "Federal Actions to Address Environmental Justice in Minority Populations and Low-Income

Populations" (59 FR 7629, February 16, 1994).

Since tolerances and exemptions that are established on the basis of a petition under FFDCA section 408(d), such as the tolerance in this final rule, do not require the issuance of a proposed rule, the requirements of the Regulatory Flexibility Act (RFA) (5 U.S.C. 601 *et seq.*), do not apply.

This action directly regulates growers, food processors, food handlers, and food retailers, not States or tribes, nor does this action alter the relationships or distribution of power and responsibilities established by Congress in the preemption provisions of FFDCA section 408(n)(4). As such, the Agency has determined that this action will not have a substantial direct effect on States or tribal governments, on the relationship between the national government and the States or tribal governments, or on the distribution of power and responsibilities among the various levels of government or between the Federal Government and Indian tribes. Thus, the Agency has determined that Executive Order 13132, entitled "Federalism" (64 FR 43255, August 10, 1999) and Executive Order 13175, entitled "Consultation and Coordination with Indian Tribal Governments" (65 FR 67249, November 9, 2000) do not apply to this action. In addition, this action does not impose any enforceable duty or contain any unfunded mandate as described under Title II of the Unfunded Mandates Reform Act (UMRA) (2 U.S.C. 1501 *et seq.*).

This action does not involve any technical standards that would require Agency consideration of voluntary consensus standards pursuant to section 12(d) of the National Technology Transfer and Advancement Act (NTTAA) (15 U.S.C. 272 note).

VII. Congressional Review Act

Pursuant to the Congressional Review Act (5 U.S.C. 801 *et seq.*), EPA will submit a report containing this rule and other required information to the U.S. Senate, the U.S. House of Representatives, and the Comptroller General of the United States prior to publication of the rule in the **Federal Register**. This action is not a "major rule" as defined by 5 U.S.C. 804(2).

List of Subjects in 40 CFR Part 180

Environmental protection, Administrative practice and procedure, Agricultural commodities, Pesticides and pests, Reporting and recordkeeping requirements.

Dated: October 14, 2016.

Michael Goodis,

Acting Director, Registration Division, Office of Pesticide Programs.

Therefore, 40 CFR chapter I is amended as follows:

PART 180—[AMENDED]

■ 1. The authority citation for part 180 continues to read as follows:

Authority: 21 U.S.C. 321(q), 346a and 371.

■ 2. In § 180.641:

■ a. Add alphabetically the commodity “Asparagus” to the table in paragraph (a)(1); and

■ b. Revise the footnote at the end of the table in paragraph (a)(1).

The additions and revisions read as follows:

§ 180.641 Spirotetramat; tolerances for residues.

(a) * * *
(1) * * *

Commodity	Parts per million
* * *	* * *
Asparagus ¹	0.10
* * *	* * *

¹ There are no U.S. registrations for these commodities.

BILLING CODE 6560–50–P

ENVIRONMENTAL PROTECTION AGENCY

40 CFR Part 272

[EPA–R06–2014–0791 FRL–9951–74–Region 6]

Oklahoma: Incorporation by Reference of Approved State Hazardous Waste Management Program

AGENCY: Environmental Protection Agency (EPA).

ACTION: Direct final rule.

SUMMARY: The Solid Waste Disposal Act, as amended, commonly referred to as the Resource Conservation and Recovery Act (RCRA), allows the Environmental Protection Agency (EPA) to authorize States to operate their hazardous waste management programs in lieu of the Federal program. The EPA uses the regulations entitled “Approved State Hazardous Waste Management Programs” to provide notice of the authorization status of State programs and to incorporate by reference those

provisions of the State statutes and regulations that will be subject to the EPA’s inspection and enforcement. The rule codifies in the regulations the prior approval of Oklahoma’s hazardous waste management program and incorporates by reference authorized provisions of the State’s statutes and regulations.

DATES: This regulation is effective December 27, 2016, unless the EPA receives adverse written comment on this regulation by the close of business November 25, 2016. If the EPA receives such comments, it will publish a timely withdrawal of this direct final rule in the **Federal Register** informing the public that this rule will not take effect. The Director of the Federal Register approves this incorporation by reference as of December 27, 2016 in accordance with 5 U.S.C. 552(a) and 1 CFR part 51.

ADDRESSES: Submit your comments by one of the following methods:

1. *Federal eRulemaking Portal:* <http://www.regulations.gov>. Follow the online instructions for submitting comments.

2. *Email:* patterson.alima@epa.gov or banks.julia@epa.gov.

3. *Mail:* Alima Patterson, Region 6, Regional Authorization Coordinator, or Julia Banks, RCRA Permits Section (6MM–RP), Multimedia Division (6MM), EPA Region 6, 1445 Ross Avenue, Dallas, Texas 75202–2733.

4. *Hand Delivery or Courier:* Deliver your comments to Alima Patterson, Region 6, Regional Authorization Coordinator, RCRA Permits Section, Multimedia Division, EPA Region 6, 1445 Ross, Dallas, Texas 75202–2733. *Instructions:* Do not submit information that you consider to be Confidential Business Information (CBI) or otherwise protected through <http://www.regulations.gov>, or email. The Federal <http://www.regulations.gov> Web site is an “anonymous access” system, which means the EPA will not know your identity or contact information unless you provide it in the body of your comment. If you send an email comment directly to the EPA without going through <http://www.regulations.gov>, your email

address will be automatically captured and included as part of the comment that is placed in the public docket and made available on the Internet. If you submit an electronic comment, the EPA recommends that you include your name and other contact information in the body of your comment and with any disk or CD–ROM you submit. If the EPA cannot read your comment due to technical difficulties, and cannot contact you for clarification, the EPA may not be able to consider your

comment. Electronic files should avoid the use of special characters, any form of encryption, and be free of any defects or viruses. (For additional information about the EPA’s public docket, visit the EPA Docket Center homepage at <http://www.epa.gov/epahome/dockets.htm>).

You can view and copy the documents that form the basis for this codification and associated publicly available materials from 8:30 a.m. to 4:00 p.m. Monday through Friday at the following location: EPA Region 6, 1445 Ross Avenue, Dallas, Texas, 75202–2733, phone number (214) 665–8533 or (214) 665–8178. Interested persons wanting to examine these documents should make an appointment with the office at least two weeks in advance.

FOR FURTHER INFORMATION CONTACT:

Alima Patterson, Region 6 Regional Authorization Coordinator or Julia Banks, Codification Coordinator, RCRA Permits Section (6MM–RP), Multimedia Division (6MM), EPA Region 6, 1445 Ross Avenue, Dallas, Texas 75202–2733, phone numbers: (214) 665–8533 or (214) 665–8178, email address: patterson.alima@epa.gov or banks.julia@epa.gov.

SUPPLEMENTARY INFORMATION:

A. What is codification?

Codification is the process of placing a State’s statutes and regulations that comprise the State’s authorized hazardous waste management program into the Code of Federal Regulations (CFR). Section 3006(b) of RCRA, as amended, allows the Environmental Protection Agency (EPA) to authorize State hazardous waste management programs to operate in lieu of the Federal hazardous waste management regulatory program. The EPA codifies its authorization of State programs in 40 CFR part 272 and incorporates by reference State statutes and regulations that the EPA will enforce under sections 3007 and 3008 of RCRA and any other applicable statutory provisions.

The incorporation by reference of State authorized programs in the CFR should substantially enhance the public’s ability to discern the current status of the authorized State program and State requirements that can be Federally enforced. This effort provides clear notice to the public of the scope of the authorized program in each State.

B. What is the history of the authorization and codification of Oklahoma’s hazardous waste management program?

Oklahoma initially received Final authorization effective January 10, 1985, (49 FR 50362) to implement its Base Hazardous Waste Management program.

Subsequently, the EPA approved additional program revision applications effective on June 18, 1990 (55 FR 14280), November 27, 1990 (55 FR 39274), June 3, 1991 (56 FR 13411), November 19, 1991 (56 FR 47675), November 29, 1993 (58 FR 50854), December 21, 1994 (59 FR 51116), April 27, 1995 (60 FR 2699), March 14, 1997 (62 FR 12100), July 14, 1998 (63 FR 23673), November 23, 1998 (63 FR 50528), February 8, 1999 (63 FR 67800), March 30, 2000 (65 FR 16528), July 10, 2000 (65 FR 29981) March 5, 2001 (66 FR 28), June 9, 2003 (68 FR 17308), April 6, 2009 (74 FR 5994), May 6, 2011 (76 FR 18927), May 14, 2012 (77 FR 15273), July 29, 2013 (78 FR 32161), and October 28, 2014 (79 FR 51497). The EPA first incorporated by reference Oklahoma's hazardous waste program effective December 13, 1993 (58 FR 52679), and updated the incorporation by reference effective July 14, 1998 (63 FR 23673), October 25, 1999 (64 FR 46567), October 27, 2003 (68 FR 51488), August 27, 2010 (75 FR 36546), July 16, 2012 (77 FR 29231), October 9, 2012 (77 FR 46964), July 29, 2013 (78 FR 32161), and September 2, 2014 (79 FR 37226). In this document, the EPA is revising Subpart LL of 40 CFR part 272 to include the recent authorization revision actions effective October 28, 2014 (79 FR 51497).

C. What codification decisions have we made in this rule?

In this rule, the EPA is finalizing regulatory text that includes incorporation by reference. In accordance with requirements of 1 CFR 51.5, the EPA is finalizing the incorporation by reference of the Oklahoma rules described in the amendments to 40 CFR part 272 set forth below. The EPA has made, and will continue to make, these documents available electronically through <http://www.regulations.gov> and in hard copy at the appropriate EPA office (see the **ADDRESSES** section of this preamble for more information).

The purpose of this **Federal Register** document is to codify Oklahoma's base hazardous waste management program and its revisions to that program. The EPA provided notices and opportunity for comments on the Agency's decisions to authorize the Oklahoma program, and the EPA is not reopening the decisions, nor requesting comments, on the Oklahoma authorizations as published in the **Federal Register** notices specified in Section B of this document.

This document incorporates by reference Oklahoma's hazardous waste statutes and regulations and clarifies which of these provisions are included

in the authorized and Federally enforceable program. By codifying Oklahoma's authorized program and by amending the Code of Federal Regulations, the public will be more easily able to discern the status of Federally approved requirements of the Oklahoma hazardous waste management program.

The EPA is incorporating by reference the Oklahoma authorized hazardous waste program in subpart LL of 40 CFR part 272. Section 272.1851 incorporates by reference Oklahoma's authorized hazardous waste statutes and regulations. Section 272.1851 also references the statutory provisions (including procedural and enforcement provisions) which provide the legal basis for the State's implementation of the hazardous waste management program, the Memorandum of Agreement, the Attorney General's Statements and the Program Description, which are approved as part of the hazardous waste management program under Subtitle C of RCRA.

D. What is the effect of Oklahoma's codification on enforcement?

The EPA retains its authority under statutory provisions, including but not limited to, RCRA sections 3007, 3008, 3013 and 7003, and other applicable statutory and regulatory provisions to undertake inspections and enforcement actions and to issue orders in authorized States. With respect to these actions, the EPA will rely on Federal sanctions, Federal inspection authorities, and Federal procedures rather than any authorized State analogues to these provisions. Therefore, the EPA is not incorporating by reference such particular, approved Oklahoma procedural and enforcement authorities. Section 272.1851(c)(2) of 40 CFR lists the statutory provisions which provide the legal basis for the State's implementation of the hazardous waste management program, as well as those procedural and enforcement authorities that are part of the State's approved program, but these are not incorporated by reference.

E. What State provisions are not part of the codification?

The public needs to be aware that some provisions of Oklahoma's hazardous waste management program are not part of the Federally authorized State program.

These provisions include:

(1) Provisions that are not part of the RCRA subtitle C program because they are "broader in scope" than RCRA subtitle C (see 40 CFR 271.1(i));

(2) Federal rules for which Oklahoma is not authorized, but which have been incorporated into the State regulations because of the way the State adopted Federal regulations by reference;

(3) A Federal program which has since been withdrawn by the U.S. EPA; and

(4) Federal rules for which Oklahoma is authorized but which were vacated by the U.S. Court of Appeals for the District of Columbia Circuit (D.C. Cir. No. 98–1379 and 08–1144, June 27, 2014).

State provisions that are "broader in scope" than the Federal program are not part of the RCRA authorized program and the EPA will not enforce them. Therefore, they are not incorporated by reference in 40 CFR part 272. For reference and clarity, 40 CFR 272.1851(c)(3) lists the Oklahoma regulatory provisions which are "broader in scope" than the Federal program and which are not part of the authorized program being incorporated by reference. "Broader in scope" provisions cannot be enforced by the EPA; the State, however, may enforce such provisions under State law.

Oklahoma has adopted but is not authorized for the Federal rules published in the **Federal Register** on October 5, 1990 (55 FR 40834); February 1, 1991 (56 FR 3978); February 13, 1991 (56 FR 5910); April 2, 1991 (56 FR 13406); May 1, 1991 (56 FR 19951); December 23, 1991 (56 FR 66365); June 29, 1995 (60 FR 33912), May 26, 1998 (63 FR 28556), June 14, 2005 (70 FR 34538), August 1, 2005 (70 FR 44150); and December 19, 2008 (73 FR 77954). Therefore, these Federal amendments included in Oklahoma's adoption by reference at 252:205–3–2(b) through 252:205–3–2(m) of the Oklahoma Administrative Code, are not part of the State's authorized program and are not part of the incorporation by reference addressed by this **Federal Register** document.

Oklahoma adopted and was authorized for the following Federal Performance Track program, which has since been terminated by the U.S. EPA: published in the **Federal Register** on April 22, 2004 (69 FR 21737), as amended October 25, 2004 (69 FR 62217), and the April 4, 2006 (71 FR 16862) Burden Reduction Initiative amendments to the following provisions regarding Performance Track: 40 CFR 260.10, 264.15, 264.174, 264.195, 264.1101, 265.15, 265.174, 265.195, 265.201, 265.1101, 270.42(l) and Item O.1 of Appendix I to 270.42.

Oklahoma has adopted and was authorized for the following Federal rules which have since been vacated by the U.S. Court of Appeals for the District

of Columbia Circuit (D.C. Cir. No. 98–1379 and 08–1144, respectively; June 27, 2014): (1) The Comparable Fuels Exclusion Rule published in the **Federal Register** on June 19, 1998 (63 FR 33782), as amended on June 15, 2010 (75 FR 33712); and (2) the Gasification Exclusion Rule published on January 2, 2008 (73 FR 57).

With respect to any requirement pursuant to the Hazardous and Solid Waste Amendments of 1984 (HSWA) for which the State has not yet been authorized, the EPA will continue to enforce the Federal HSWA standards until the State is authorized for these provisions.

F. What will be the effect of Federal HSWA requirements on the codification?

The EPA is not amending 40 CFR part 272 to include HSWA requirements and prohibitions that are implemented by the EPA. Section 3006(g) of RCRA provides that any HSWA requirement or prohibition (including implementing regulations) takes effect in authorized and not authorized States at the same time. A HSWA requirement or prohibition supersedes any less stringent or inconsistent State provision which may have been previously authorized by the EPA (50 FR 28702, July 15, 1985). The EPA has the authority to implement HSWA requirements in all States, including authorized States, until the States become authorized for such requirement or prohibition. Authorized States are required to revise their programs to adopt the HSWA requirements and prohibitions, and then to seek authorization for those revisions pursuant to 40 CFR part 271.

Instead of amending the 40 CFR part 272 every time a new HSWA provision takes effect under the authority of RCRA section 3006(g), the EPA will wait until the State receives authorization for its analog to the new HSWA provision before amending the State's 40 CFR part 272 incorporation by reference. Until then, persons wanting to know whether a HSWA requirement or prohibition is in effect should refer to 40 CFR 271.1(j), as amended, which lists each such provision.

Some existing State requirements may be similar to the HSWA requirement implemented by the EPA. However, until the EPA authorizes those State requirements, the EPA can only enforce the HSWA requirements and not the State analogs. The EPA will not codify those State requirements until the State receives authorization for those requirements.

G. Statutory and Executive Order Reviews

The Office of Management and Budget (OMB) has exempted this action from the requirements of Executive Order 12866 (58 FR 51735, October 4, 1993), and therefore this action is not subject to review by OMB. This rule incorporates by reference Oklahoma's authorized hazardous waste management regulations and imposes no additional requirements beyond those imposed by State law. Accordingly, I certify that this action will not have a significant economic impact on a substantial number of small entities under the Regulatory Flexibility Act (5 U.S.C. 601 *et seq.*). Because this rule merely incorporates by reference certain existing State hazardous waste management program requirements which the EPA already approved under 40 CFR part 271, and with which regulated entities must already comply, it does not contain any unfunded mandate or significantly or uniquely affect small governments, as described in the Unfunded Mandates Reform Act of 1995 (Pub. L. 104–4).

This action will not have substantial direct effects on the States, on the relationship between the national government and the States, or on the distribution of power and responsibilities among the various levels of government, as specified in Executive Order 13132 (64 FR 43255, August 10, 1999), because it merely incorporates by reference existing authorized State hazardous waste management program requirements without altering the relationship or the distribution of power and responsibilities established by RCRA. This action also does not have Tribal implications within the meaning of Executive Order 13175 (65 FR 67249, November 6, 2000).

This action also is not subject to Executive Order 13045 (62 FR 19885, April 23, 1997), because it is not economically significant and it does not make decisions based on environmental health or safety risks. This rule is not subject to Executive Order 13211, “Actions Concerning Regulations That Significantly Affect Energy Supply, Distribution, or Use” (66 FR 28355, May 22, 2001), because it is not a significant regulatory action under Executive Order 12866.

The requirements being codified are the result of Oklahoma's voluntary participation in the EPA's State program authorization process under RCRA Subtitle C. Thus, the requirements of section 12(d) of the National Technology Transfer and Advancement

Act of 1995 (15 U.S.C. 272 note) do not apply. As required by section 3 of Executive Order 12988 (61 FR 4729, February 7, 1996), in issuing this rule, the EPA has taken the necessary steps to eliminate drafting errors and ambiguity, minimize potential litigation, and provide a clear legal standard for affected conduct. The EPA has complied with Executive Order 12630 (53 FR 8859, March 15, 1988) by examining the takings implications of the rule in accordance with the “Attorney General's Supplemental Guidelines for the Evaluation of Risk and Avoidance of Unanticipated Takings” issued under the executive order. This rule does not impose an information collection burden under the provisions of the Paperwork Reduction Act of 1995 (44 U.S.C. 3501 *et seq.*).

The Congressional Review Act, 5 U.S.C. 801 *et seq.*, as amended by the Small Business Regulatory Enforcement Fairness Act of 1996, generally provides that before a rule may take effect, the agency promulgating the rule must submit a rule report, which includes a copy of the rule, to each House of the Congress and to the Comptroller General of the United States. The EPA will submit a report containing this document and other required information to the U.S. Senate, the U.S. House of Representatives, and the Comptroller General of the United States prior to publication in the **Federal Register**. A major rule cannot take effect until 60 days after it is published in the **Federal Register**. This action is not a “major rule” as defined by 5 U.S.C. 804(2).

List of Subjects in 40 CFR Part 272

Environmental protection, Administrative practice and procedure, Confidential business information, Hazardous waste, Hazardous waste transportation, Incorporation by reference, Indian lands, Intergovernmental relations, Penalties, Reporting and recordkeeping requirements, Water pollution control, Water supply.

Authority: This action is issued under the authority of Sections 2002(a), 3006 and 7004(b) of the Solid Waste Disposal Act as amended, 42 U.S.C. 6912(a), 6926, 6974(b).

Dated: August 1, 2016.

Ron Curry,

Regional Administrator, EPA Region 6.

For the reasons set forth in the preamble, 40 CFR part 272 is amended as follows:

PART 272—APPROVED STATE HAZARDOUS WASTE MANAGEMENT PROGRAMS

■ 1. The authority citation for part 272 continues to read as follows:

Authority: Sections 2002(a), 3006, and 7004(b) of the Solid Waste Disposal Act, as amended by the Resource Conservation and Recovery Act, as amended, 42 U.S.C. 6912(a), 6926, and 6974(b).

■ 2. Revise § 272.1851 to read as follows:

§ 272.1851 Oklahoma State-Administered program: Final authorization.

(a) Pursuant to section 3006(b) of RCRA, 42 U.S.C. 6926(b), the EPA granted Oklahoma final authorization for the following elements as submitted to EPA in Oklahoma's base program application for final authorization which was approved by EPA effective on January 10, 1985. Subsequent program revision applications were approved effective on June 18, 1990, November 27, 1990, June 3, 1991, November 19, 1991, November 29, 1993, December 21, 1994, April 27, 1995, March 14, 1997, July 14, 1998 and November 23, 1998, February 8, 1999, March 30, 2000, July 10, 2000, March 5, 2001, June 9, 2003, April 6, 2009, May 6, 2011, May 14, 2012, July 29, 2013, and October 28, 2014.

(b) The State of Oklahoma has primary responsibility for enforcing its hazardous waste management program. However, EPA retains the authority to exercise its inspection and enforcement authorities in accordance with sections 3007, 3008, 3013, 7003 of RCRA, 42 U.S.C. 6927, 6928, 6934, 6973, and any other applicable statutory and regulatory provisions, regardless of whether the State has taken its own actions, as well as in accordance with other statutory and regulatory provisions.

(c) State Statutes and regulations:

(1) The Oklahoma statutes and regulations cited in paragraph (c)(1)(i) of this section are incorporated by reference as part of the hazardous waste management program under subtitle C of RCRA, 42 U.S.C. 6921 *et seq.* The Director of the Federal Register approves this incorporation by reference in accordance with 5 U.S.C. 552(a) and 1 CFR part 51. You may obtain copies of the Oklahoma regulations that are incorporated by reference in this paragraph from the State's Office of

Administrative Rules, Secretary of State, P.O. Box 53390, Oklahoma City, OK 73152-3390; Phone number: 405-521-4911; Web site: <https://www.sos.ok.gov/oar/Default.aspx>. The statutes are available from West Publishing Company, 610 Opperman Drive, P. O. Box 64526, St. Paul, Minnesota 55164 0526; Phone: 1-800-328-4880; Web site: <http://west.thomson.com>. You may inspect a copy at EPA Region 6, 1445 Ross Avenue, Dallas, Texas 75202 (Phone number (214) 665-8533), or at the National Archives and Records Administration (NARA). For information on the availability of this material at NARA, call 202-741-6030, or go to: <http://www.archives.gov/federal-register/cfr/ibr-locations.html>.

(i) The binder entitled "EPA-Approved Oklahoma Statutory and Regulatory Requirements Applicable to the Hazardous Waste Management Program", October, 2014. Only those provisions that have been authorized by EPA are incorporated by reference. These provisions are listed in Appendix A to Part 272.

(ii) [Reserved]

(2) The following provisions provide the legal basis for the State's implementation of the hazardous waste management program, but they are not being incorporated by reference and do not replace Federal authorities:

(i) Oklahoma Environmental Crimes Act, as amended effective July 1, 2013, 21 Oklahoma Statutes (O.S.), Sections 1230.1 *et seq.*

(ii) Oklahoma Open Meeting Act, as amended effective July 1, 2013, 25 Oklahoma Statutes (O.S.), Sections 301 *et seq.*

(iii) Oklahoma Statutes, Title 27A, "Environment and Natural Resources", as amended effective July 1, 2013: Chapter 1, "Oklahoma Environmental Quality Act", Sections 1-1-101 *et seq.*; Chapter 2, "Oklahoma Environmental Quality Code", Sections 2-2-101, 2-2-104, 2-2-201, 2-3-101(F)(1), 2-3-104, 2-3-202, 2-3-501, 2-3-502, 2-3-503, 2-3-504; "Oklahoma Hazardous Waste Management Act", Sections 2-7-102, 2-7-104, 2-7-105 (except 2-7-105(27), 2-7-105(29) and 2-7-105(34)), 2-7-106, 2-7-107, 2-7-108(B)(2), 2-7-109, 2-7-110(A), 2-7-111(C)(2)(b) and (c), 2-7-111(C)(3), 2-7-113.1, 2-7-114, 2-7-115, 2-7-116(A), 2-7-116(G), 2-7-116(H)(1), 2-7-117, 2-7-123, 2-7-126, 2-7-129, 2-7-130, 2-7-131, 2-7-132, and 2-7-133; "Oklahoma Uniform

Environmental Permitting Act", Sections 2-14-101 *et seq.*

(iv) Oklahoma Open Records Act, as amended effective July 1, 2013, 51 Oklahoma Statutes (O.S.), Sections 24A.1 *et seq.*

(v) Oklahoma Administrative Procedures Act, as amended effective July 1, 2013, 75 Oklahoma Statutes (O.S.), Sections 250 *et seq.*

(vi) The Oklahoma Administrative Code (OAC), Title 252, Chapter 205, Hazardous Waste Management, effective July 1, 2013 (2011 Edition, as amended by the 2013 Supplement): Subchapter 1, Sections 252:205-1-1(b), 252:205-1-3(a) and (b), 252:205-1-4(a)-(d); Subchapter 3, Sections 252:205-3-2(a) introductory paragraph, 252:205-3-2(a)(1) and 252:205-3-2(a)(3); Subchapter 11, Section 252:205-11-3.

(3) The following statutory and regulatory provisions are broader in scope than the Federal program, are not part of the authorized program, and are not incorporated by reference:

(i) Oklahoma Hazardous Waste Management Act, as amended, 27A Oklahoma Statutes (O.S.) as amended effective July 1, 2013, Sections 2-7-119, 2-7-120, 2-7-121, 2-7-121.1, and 2-7-134.

(ii) The Oklahoma Administrative Code (OAC), Title 252, Chapter 205, effective July 1, 2013 (2011 Edition, as amended by the 2013 Supplement): Subchapter 1, Sections 252:205-1-1(c)(2) and (3), 252:205-1-2 "RRSIA", 252:205-1-2 "Reuse", 252:205-1-2 "Speculative accumulation", 252:205-1-2 "Transfer facility", 252:205-1-2 "Transfer station", 252:205-1-4(e); Subchapter 5, Section 252:205-5-1(4), Subchapter 15; Subchapter 17; Subchapter 21; Subchapter 23; and 252:205 Appendices B, C and D.

(4) *Unauthorized State Amendments.* (i) Oklahoma has adopted, but is not authorized to implement, the Federal rules that are listed in the following table. The EPA will continue to implement the Federal HSWA requirements for which Oklahoma is not authorized until the State receives specific authorization for those requirements. The EPA will not enforce the non-HSWA Federal rules although they may be enforceable under State law. For those Federal rules that contain both HSWA and non-HSWA requirements, the EPA will enforce only the HSWA portions of the rules.

Federal requirement	Federal Register reference	Publication date
Toxicity Characteristics; Hydrocarbon Recovery Operations (HSWA) (Checklist 80)	55 FR 40834	10/5/90
	56 FR 3978	2/1/91

Federal requirement	Federal Register reference	Publication date
Toxicity Characteristics; Chlorofluorocarbon Refrigerants (HSWA) (Checklist 84)	56 FR 13406	4/2/91
Administrative Stay for K069 Listing (Non-HSWA) (Checklist 88)	56 FR 5910	2/13/91
Amendments to Interim Status Standards for Downgradient Ground-water Monitoring Well Locations (non-HSWA) (Checklist 99).	56 FR 19951	5/1/91
Removal of Legally Obsolete Rules (HSWA/Non-HSWA) (Checklist 144)	56 FR 66365	12/23/91
Mineral Processing Secondary Materials Exclusion.—(Non-HSWA) (Checklist 167D—Amendments to 40 CFR 261.2(c)(3), 261.2(c)(4)/Table, 261.2(e)(1)(iii) and 261.4(a)(16)).	60 FR 33912	6/29/95
Methods Innovation: SW-846 (HSWA/non-HSWA) (Checklist 208)	63 FR 28556	5/26/98
Expansion of RCRA Comparable Fuel Exclusion (Non-HSWA) (Checklist 221)	70 FR 34538	6/14/05
	70 FR 44150	8/1/05
	73 FR 77954	12/19/08

(ii) The Federal rules listed in the table below are not delegable to States. Oklahoma has excluded the rules from

its incorporation by reference of the Federal regulations. EPA retains its

authority for the implementation and enforcement of these rules.

Federal requirement	Federal Register reference	Publication date
Imports and Exports of Hazardous Waste: Implementation of OECD Council Decision (HSWA) (Checklist 152).	61 FR 16290	April 12, 1996.
OECD Requirements; Export Shipments of Spent Lead-Acid Batteries (Non-HSWA) (Checklist 222).	75 FR 1236	January 8, 2010.

(5) *Terminated Federal program.* Oklahoma adopted and was authorized for the following Federal program as

amended, which has since been terminated by the U.S. EPA:

Federal requirement	Federal Register reference	Publication date
National Environmental Performance Track Program (Checklist 204)	69 FR 21737	April 22, 2004.
National Environmental Performance Track Program; Corrections (Rule 204.1)	69 FR 62217	October 25, 2004.
Burden Reduction Initiative (Checklist 213); amendments to the following provisions regarding Performance Track: 40 CFR 260.10, 264.15, 264.174, 264.195, 264.1101, 265.15, 265.174, 265.195, 265.201, 265.1101, 270.42(l) and Item O.1 of Appendix I to 270.42.	71 FR 16862	April 4, 2006.

(6) *Vacated Federal rules.* Oklahoma adopted and was authorized for the following Federal rules which have

since been vacated by the U.S. Court of Appeals for the District of Columbia

Circuit (D.C. Cir. No. 98–1379 and 08–1144, respectively; June 27, 2014):

Federal requirement	Federal Register reference	Publication date
Hazardous Waste Combustors; Revised Standards (HSWA) (Checklist 168—40 CFR 261.4(a)(16) and 261.38 only).	63 FR 33782	June 19, 1998.
Exclusion of Oil-Bearing Secondary Materials Processed in a Gasification System to Produce Synthesis Gas (Checklist 216—Definition of “Gasification” at 40 CFR 260.10 and amendment to 40 CFR 261.4(a)(12)(i)).	73 FR 57	January 2, 2008.
Withdrawal of the Emission Comparable Fuel Exclusion under RCRA (Checklist 224—amendments to 40 CFR 261.4(a)(16) and 261.38).	7 FR 33712	June 15, 2010.

(7) *Memorandum of Agreement.* The Memorandum of Agreement between EPA Region 6 and the State of Oklahoma, signed by the EPA Regional Administrator on May 15, 2013, is referenced as part of the authorized hazardous waste management program under subtitle C of RCRA, 42 U.S.C. 6921, *et seq.*

Authorization”, signed by the Attorney General of Oklahoma January 20, 1984 and revisions, supplements, and addenda to that Statement dated January 14, 1988 (as amended July 20, 1989); December 22, 1988 (as amended June 7, 1989 and August 13, 1990); November 20, 1989; November 16, 1990; November 6, 1992; June 24, 1994; December 8, 1994; March 4, 1996; April 15, 1997; February 6, 1998, December 2, 1998,

October 15, 1999, May 31, 2000, October 15, 2001, June 27, 2003, March 1, 2005, July 12, 2005, July 03, 2006, August 25, 2008, March 26, 2010, October 11, 2010, October 31, 2011, July 27, 2012, and July 1, 2013, are referenced as part of the authorized hazardous waste management program under subtitle C of RCRA, 42 U.S.C. 6921 *et seq.*

(8) *Statement of Legal Authority.* “Attorney General’s Statement for Final

(9) *Program description.* The Program Description and any other materials

submitted as supplements thereto are referenced as part of the authorized hazardous waste management program under subtitle C of RCRA, 42 U.S.C. 6921 *et seq.*

■ 3. Appendix A to part 272 is amended by revising the listing for “Oklahoma” to read as follows:

Appendix A to part 272—State Requirements

* * * * *

Oklahoma

The statutory provisions include:

Oklahoma Hazardous Waste Management Act, as amended, 27A Oklahoma Statute (O.S.) 2011 Main Volume, Sections 2-7-103, 2-7-108(A), 2-7-108(B)(1), 2-7-108(B)(3), 2-7-108(C), 2-7-110(B), 2-7-110(C), 2-7-111(A), 2-7-111(B), 2-7-111(C)(1), 2-7-111(C)(2)(a), 2-7-111(D), 2-7-111(E), 2-7-112, 2-7-116(B) through 2-7-116(F), 2-7-116(H)(2), 2-7-118, 2-7-124, 2-7-125, 2-7-127, and 2-10-301(G), as published by West Publishing Company, 610 Opperman Drive, P.O. Box 64526, St. Paul, Minnesota 55164 0526; Phone: 1-800-328-4880; Web site: <http://west.thomson.com>.

The regulatory provisions include:

The Oklahoma Administrative Code (OAC), Title 252, Chapter 205, effective July 1, 2013 (2011 Edition, as amended by the 2013 Supplement): Subchapter 1, Sections 252:205-1-1(a), 252:205-1-1(c) introductory paragraph, 252:205-1-1(c)(1), 252:205-1-2 introductory paragraph, 252:205-1-2 “OHWM”, 252:205-1-2 “Post-closure permit”, 252:205-1-3(c); Subchapter 3, Sections 252:205-3-1 (2013 Supplement), 252:205-3-2(a)(2), 252:205-3-2(b)-(n), 252:205-3-4, 252:205-3-5 and 252:205-3-6; Subchapter 5, Sections 252:205-5-1 (except 252:205-5-1(4)), 252:205-5-2 through 252:205-5-5; Subchapter 7, Sections 252:205-7-2 and 252:205-7-4 (except the phrase “or in accordance with 252:205-15-1(d)”; Subchapter 9, Sections 252:205-9-1 through 252:205-9-4; Subchapter 11, Sections 252:205-11-1(a) (except the word “recycling”), 252:205-11-1(b)-(e), and 252:205-11-2; and Subchapter 13, Sections 252:205-13-1(a)-(e), as published by the State’s Office of Administrative Rules, Secretary of State, P.O. Box 53390, Oklahoma City, OK 73152-3390; Phone number: 405-521-4911; Web site: <https://www.sos.ok.gov/oar/Default.aspx>.

BILLING CODE 6560-50-P

AGENCY FOR INTERNATIONAL DEVELOPMENT

48 CFR Part 752

RIN 0412-AA81

Requirement for Nondiscrimination Against End-Users of Supplies or Services (“Beneficiaries”) Under USAID-Funded Contracts

AGENCY: U.S. Agency for International Development.

ACTION: Final rule.

SUMMARY: The Foreign Assistance Act of 1961, as amended (FAA), authorizes the U.S. Agency for International Development (USAID) to provide foreign assistance in the form of development and humanitarian assistance that reflect American ideals. To help emphasize USAID’s intent and expectation of non-discrimination of beneficiaries in USAID-funded activities, USAID is issuing a final rule to amend its Agency for International Development Acquisition Regulation (AIDAR) to include a new clause entitled “Nondiscrimination against End-Users of Supplies or Services.” This clause expressly states that USAID-funded contractors must not discriminate among end-users of supplies or services (referred to in this rule as beneficiaries and potential beneficiaries) in any way that is contrary to the scope of the activity as defined in the statements of work (SOWs).

DATES: *Effective:* October 25, 2016.

FOR FURTHER INFORMATION CONTACT: Todd Larson Telephone: 202-712-4969 or Email: tlarson@usaid.gov.

SUPPLEMENTARY INFORMATION:

I. Background

USAID published a proposed rule in the **Federal Register** at 81 FR 56572 on August 22, 2016 to amend its Agency for International Development Acquisition Regulation (AIDAR) to include a new clause entitled “Nondiscrimination against End-Users of Supplies or Services.”

USAID seeks to improve the lives of people around the world by being inclusive in its development and humanitarian assistance efforts. In so doing, USAID recognizes that every person is instrumental in the transformation of their own societies, with the end result that each and every person is recognized and equally valued without regard to artificial and discriminatory distinctions. The inclusion, protection, and empowerment of all persons is critical

because drawing on the full contributions of the entire population leads to more effective, comprehensive, and sustainable development results.

Nondiscrimination is the basic foundation of USAID’s inclusive development approach; as such, all USAID programs seek to ensure access for all potential beneficiaries within the scope of the contract without discrimination. Contractors must adhere to this by implementing the activities as outlined in the contract SOWs. Nondiscrimination is a critical foundation for protecting and promoting the human rights of all persons. In addition, nondiscrimination ensures equitable access to USAID programs. Effective nondiscrimination practices support USAID’s principles of inclusion and equal access and help to ensure that USAID programs empower and effectively reach women and girls; marginalized ethnic and religious populations; indigenous peoples; internally displaced persons; persons with disabilities; youth and the elderly; lesbian, gay, bisexual, transgender, and intersex individuals; and other socially marginalized individuals and peoples unique to the country or regional context.

In recent years, the Government has made multiple pronouncements of policy in many areas reflecting its emphasis on equity, fairness, and human dignity—effective nondiscrimination is a means toward achieving all of these. For example, in 2011, the White House issued E.O. 13563, “Improving Regulation and Regulatory Review,” to update all agencies on factors to consider when issuing rules; in addition to quantitative factors, it advised that the qualitative values of equity, fairness, and human dignity are important considerations. Additionally, a 2011 Presidential Memorandum, “International Initiatives to Advance the Human Rights of Lesbian, Gay, Bisexual, and Transgender Persons,” directs all agencies engaged abroad to advance nondiscrimination. This rule addressing discrimination in the provision of supplies or services is consistent with the values that animate the above.

II. Discussion

This rulemaking revises (48 CFR) AIDAR to add a new clause at 752.7038 entitled “Nondiscrimination against End-Users of Supplies or Services.” The clause, applicable to all solicitations, contracts, and subcontracts at any tier, prohibits contractors and subcontractors from discriminating against beneficiaries or potential beneficiaries (*i.e.*, those individuals intended to

receive the benefits of the award, whether goods or services) on the basis of any characteristics not expressly stated in the award.

The purpose of this rulemaking is to ensure adherence to the intent and authorities in the FAA, and other statutes related to humanitarian assistance and international development. The intent of the FAA is to help people, without regard to irrelevant and discriminatory distinctions among them. This intent is reflected in many places in the statute. The first words of the Act set out that it seeks to promote United States interests “by assisting peoples of the world.” Congress explained its intent thusly in FAA section 101: “[T]he Congress reaffirms the traditional humanitarian ideals of the American people and renews its commitment to assist people in developing countries to eliminate hunger, poverty, illness, and ignorance.”

A survey of FAA provisions relevant to USAID awards reflects that they focus on development and humanitarian assistance needs and effectiveness toward meeting them. For example, FAA section 103, on agriculture, rural development, and nutrition, suggests assistance should focus on alleviating poverty. FAA section 104, on health-related assistance, suggests limited targeting of activities to the specialized health needs of children, infants, and mothers. FAA section 491, on international disaster assistance, contemplates “prompt United States assistance to alleviate human suffering” and emphasizes that the implementing agency “shall insure that the assistance provided by the United States shall, to the greatest extent possible, reach those most in need of relief and rehabilitation as a result of natural and manmade disaster.”

In some contexts, such as assistance for child survival, the foreign assistance authorities contemplate a focus on women and children, but that is a matter of programmatic need and effectiveness. USAID has identified no context where excluding individuals from assistance based on any of the types of discrimination proscribed by this clause, outside the scope of the award, would have a positive effect on implementing USAID’s foreign assistance authorities.

The main effect of this clause is to ensure that USAID’s policy and practice of non-discrimination in planning projects and activities is followed through to completion by the contractors that implement them. Its impact on contractors and offerors is to remind them to follow the terms and

conditions of the contract, including the implementation of the SOW as designed, and to refrain from the types of discrimination described in the clause. In itself, the clause serves as a reminder to contractors and offerors of USAID’s long-standing, pre-existing expectations based on USAID’s programmatic and planning priorities and authorities.

III. Summary of Comments and Explanation of Revisions

The proposed rule was published for public comment pursuant to the Office of Federal Procurement Policy Act (41 U.S.C. 1707). In total, six public comments were received. All six comments were supportive in nature.

Five commenters recommended minor edits to the second sentence of subsection (a) of the rule to clarify that all of the listed categories are included among the factors, which if not expressly stated in the award, are precluded from being used as a basis for discrimination by the contractor. The second sentence of this final rule has accordingly been clarified in response to these comments to eliminate any potential ambiguity.

Four commenters suggested that the rule be modified to apply to USAID grantees and be included in USAID grant and cooperative agreement awards. One commenter also urged that the rule be clarified to apply to subcontracts and subgrants. These comments did not warrant any changes to the final rule. The AIDAR only applies to contracts. USAID will address assistance awards (*i.e.*, grants and cooperative agreements) and subawards separately from this rulemaking. Additionally, the new clause already specifies in subsection (b) that it must be inserted in all subcontracts at any tier.

One commenter recommended the inclusion of language in the third sentence of the new clause to specify that targeted activities by the contractor toward the assistance needs of certain populations specified in the contract must serve a “legitimate programmatic purpose.” This change was not included in the final rule, as the programmatic purpose of USAID contracts is already considered as part of the contract SOWs. On its own initiative, USAID made a minor editorial revision to better clarify the regulation, replacing the article “a” with “the” in the third sentence of the clause to clearly refer to the contractor receiving a USAID funded contract.

Finally, USAID also received a comment outside the scope of this rule from one commenter urging the Agency to examine its reporting and verification

procedures to ensure compliance with the rule, and urging the government-wide harmonization of nondiscrimination policies for beneficiaries of foreign assistance.

IV. Executive Orders 12866 (Regulatory Planning and Review) and 13563 (Improving Regulation and Regulatory Review)

Executive Orders (E.O.s) 12866 and 13563 direct agencies to assess the costs and benefits of the intended regulation. E.O. 13563 allows that in making this assessment, an agency “may consider (and discuss qualitatively) values that are difficult or impossible to quantify, including equity, human dignity, fairness, and distributive impacts.” The estimated costs of this rulemaking do not exceed the threshold of economic significance (*i.e.*, an annual effect on the economy of \$100 million or more). However, the rule has been designated a “significant regulatory action” under section 3(f) of Executive Order 12866 and therefore it has been reviewed by the Office of Management and Budget.

This rule provides a benefit by promoting non-discrimination, which itself promotes programmatic efficiency, with very little additional administrative burden for the affected entities, USAID contractors. It does not ask them to carry out activities beyond those in their contract SOWs and terms and conditions; it does not ask them to alter the manner in which they conduct the work as set out in their contracts. In fact, it reminds them to stay within those instructions. The only potential cost the Agency could identify for contractors and subcontractors is for minimal training, to the extent that contractors do not already proscribe discrimination as part of the normal conduct of their business.

USAID awards approximately 1,300 contracts/task orders annually. As a practical matter for these current contracts, even absent this clause, if for example a contract specified the provision of food parcels in a certain community, the contractor could not, on its own, decide that only certain members of that community should receive the food parcels or that certain members should be excluded.

Including this clause in all new contracts and subcontracts going forward provides an explicit reminder of USAID’s expectation that its contractors not discriminate against any protected group or individual, and is particularly important in countries where stigma and discrimination toward certain groups is tolerated or officially endorsed by the government. The benefits of the rule would be to

expressly reinforce notions of equity, fairness, and human dignity under Federal Government contracts.

Contractors responding to a solicitation (e.g. request for proposals (RFP) or invitation for bid (IFB)) would further be on notice not to include any discriminatory criteria in their response to a solicitation, absent specific programmatic justification in the SOW to do so.

V. Regulatory Flexibility Act

Congress enacted the Regulatory Flexibility Act of 1980, as amended, 5 U.S.C. 601–612, to ensure that Government regulations do not unnecessarily or disproportionately burden small entities. It requires a regulatory flexibility analysis if a rule would have a significant economic impact, either detrimental or beneficial, on a substantial number of small entities.

In fiscal year 2015, 330 small businesses received USAID funds. In fiscal years 2011, 2012, 2013, and 2014 the 391, 384, 349, and 363 small businesses received USAID funds, respectively. The requirement this rule would impose on small businesses is no different than the requirement for other entities: Contracts or subcontracts awarded to them will include a provision reminding them not to discriminate. Beyond adding a brief reminder or discussion of this now explicit requirement to existing trainings on business ethics and conduct they provide to their staff, as already required by FAR 3.10, we do not estimate that this will impose a significant additional cost. As with all contractors, the employees of small businesses will be expected to be mindful of the principles of equity, fairness, and human dignity when

performing the work under their contracts; as they have always been. The additional effort by small businesses (a matter of a few minutes of discussion) is so de minimis that we do not estimate that this will impose more than a negligible cost.

There are no reporting or recordkeeping requirements associated with this rule. The rule does not duplicate, overlap, or conflict with any other Federal rules. There is currently no other Federal rule addressing discrimination of recipients of supplies or services pursuant to a Federal Government contract. There were no significant alternatives identified that would meet the objective of the rule.

In light of the above analysis, the USAID Chief Acquisition Officer certifies that this rule would not have a significant economic impact on a substantial number of small entities.

VI. Paperwork Reduction Act

This rule does not include a reporting or information collection requirement. Therefore, USAID has determined that this rule does not impose any new or revised reporting or disclosure requirements that would be considered collections of information requiring Office of Management and Budget approval under the Paperwork Reduction Act, 44 U.S.C. 3501 *et seq.*

List of Subjects in 48 CFR Part 752

Government procurement.

For the reasons discussed in the preamble, USAID amends 48 CFR Chapter 7 as set forth below:

PART 752—SOLICITATION PROVISIONS AND CONTRACT CLAUSES

■ 1. The authority citation for part 752 continues to read as follows:

Authority: Sec. 621, Pub. L. 87–195, 75 Stat. 445 (22 U.S.C. 2381), as amended; E.O. 12163, Sept. 29, 1979, 44 FR 56673; and 3 CFR 1979 Comp., p. 435.

PART 752—SOLICITATION PROVISIONS AND CONTRACT CLAUSES

■ 2. Add section 752.7038 to read as follows:

§ 752.7038 Nondiscrimination against End-Users of Supplies or Services.

The following clause must be inserted in section I of all solicitations and resulting contracts.

Nondiscrimination Against End-Users of Supplies or Services (OCT 2016)

(a) USAID policy requires that the contractor not discriminate against any end-user of the contract supplies or services (*i.e.*, the beneficiaries of the supplies or services) in implementation of this award, such as, but not limited to, by withholding, adversely impacting, or denying equitable access to the supplies or services (benefits) provided through this contract on the basis of any factor not expressly stated in the award. This includes, for example, race, color, religion, sex (including gender identity, sexual orientation, and pregnancy), national origin, disability, age, genetic information, marital status, parental status, political affiliation, or veteran's status. Nothing in this clause is intended to limit the ability of the contractor to target activities toward the assistance needs of certain populations as defined in the contract.

(b) The Contractor must insert this clause, including this paragraph, in all subcontracts under this contract.

(End of clause)

Dated: October 18, 2016.

Roy Plucknett,
Chief Acquisition Officer.

BILLING CODE P

Proposed Rules

Federal Register

Vol. 81, No. 206

Tuesday, October 25, 2016

This section of the FEDERAL REGISTER contains notices to the public of the proposed issuance of rules and regulations. The purpose of these notices is to give interested persons an opportunity to participate in the rule making prior to the adoption of the final rules.

NUCLEAR REGULATORY COMMISSION

10 CFR Part 72

[NRC–2016–0155]

RIN 3150–AJ80

List of Approved Spent Fuel Storage Casks: Holtec International HI–STORM UMAX Canister Storage System; Certificate of Compliance No. 1040, Amendment No. 2

AGENCY: Nuclear Regulatory Commission.

ACTION: Proposed rule.

SUMMARY: The U.S. Nuclear Regulatory Commission (NRC) is proposing to amend its spent fuel storage regulations by revising the Holtec International HI–STORM Underground Maximum Capacity (UMAX) Canister Storage System listing within the “List of approved spent fuel storage casks” to include Amendment No. 2 to Certificate of Compliance (CoC) No. 1040. Amendment No. 2 adds new fuel types to the HI–STORM UMAX Canister Storage System and updates an existing fuel type description. Additionally, Amendment No. 2 updates Table 3–4 of Appendix B of the CoC to reflect correct terminology and makes editorial changes to Appendix B of the CoC to clarify the description of the top surface pad.

DATES: Submit comments by November 25, 2016. Comments received after this date will be considered if it is practical to do so, but the NRC staff is able to ensure consideration only for comments received on or before this date.

ADDRESSES: You may submit comments by any of the following methods:

- *Federal Rulemaking Web site:* Go to <http://www.regulations.gov> and search for Docket ID NRC–2016–0155. Address questions about NRC dockets to Carol Gallagher; telephone: 301–415–3463; email: Carol.Gallagher@nrc.gov. For technical questions contact the individual listed in the **FOR FURTHER**

INFORMATION CONTACT section of this document.

- *Email comments to:* Rulemaking.Comments@nrc.gov. If you do not receive an automatic email reply confirming receipt, then contact us at 301–415–1677.

- *Fax comments to:* Secretary, U.S. Nuclear Regulatory Commission at 301–415–1101.

- *Mail comments to:* Secretary, U.S. Nuclear Regulatory Commission, Washington, DC 20555–0001, ATTN: Rulemakings and Adjudications Staff.

- *Hand deliver comments to:* 11555 Rockville Pike, Rockville, Maryland 20852, between 7:30 a.m. and 4:15 p.m. (Eastern Time) Federal workdays; telephone: 301–415–1677.

For additional direction on obtaining information and submitting comments, see “Obtaining Information and Submitting Comments” in the **SUPPLEMENTARY INFORMATION** section of this document.

FOR FURTHER INFORMATION CONTACT: Gregory Trussell, Office of Nuclear Material Safety and Safeguards, U.S. Nuclear Regulatory Commission, Washington DC 20555–0001; telephone: 301–415–6445 or email: Gregory.Trussell@nrc.gov.

SUPPLEMENTARY INFORMATION:

I. Obtaining Information and Submitting Comments

A. Obtaining Information

Please refer to Docket ID NRC–2016–0155 when contacting the NRC about the availability of information for this action. You may obtain publicly-available information related to this action by any of the following methods:

- *Federal Rulemaking Web site:* Go to <http://www.regulations.gov> and search for Docket ID NRC–2016–0155.

- *NRC’s Agencywide Documents Access and Management System (ADAMS):* You may obtain publicly-available documents online in the ADAMS Public Documents collection at <http://www.nrc.gov/reading-rm/adams.html>. To begin the search, select “ADAMS Public Documents” and then select “Begin Web-based ADAMS Search.” For problems with ADAMS, please contact the NRC’s Public Document Room (PDR) reference staff at 1–800–397–4209, 301–415–4737, or by email to pdr.resource@nrc.gov. For the convenience of the reader, instructions about obtaining materials referenced in

this document are provided in the “Availability of Documents” section.

- *NRC’s PDR:* You may examine and purchase copies of public documents at the NRC’s PDR, Room O1–F21, One White Flint North, 11555 Rockville Pike, Rockville, Maryland 20852.

B. Submitting Comments

Please include Docket ID NRC–2016–0155 in your comment submission.

The NRC cautions you not to include identifying or contact information that you do not want to be publicly disclosed in your comment submission. The NRC will post all comment submissions at <http://www.regulations.gov> as well as enter the comment submissions into ADAMS. The NRC does not routinely edit comment submissions to remove identifying or contact information.

If you are requesting or aggregating comments from other persons for submission to the NRC, then you should inform those persons not to include identifying or contact information that they do not want to be publicly disclosed in their comment submission. Your request should state that the NRC does not routinely edit comment submissions to remove such information before making the comment submissions available to the public or entering the comment into ADAMS.

II. Procedural Background

This proposed rule is limited to the changes contained in Amendment No. 2 to CoC No. 1040 and does not include other aspects of the Holtec International HI–STORM UMAX Canister Storage System design. Because the NRC considers this action noncontroversial and routine, the NRC is publishing this proposed rule concurrently with a direct final rule in the Rules and Regulations section of this issue of the **Federal Register**. Adequate protection of public health and safety continues to be ensured. The direct final rule will become effective on January 9, 2017. However, if the NRC receives significant adverse comments on this proposed rule by November 25, 2016, then the NRC will publish a document that withdraws the direct final rule. If the direct final rule is withdrawn, the NRC will address the comments received in response to these proposed revisions in a subsequent final rule. Absent significant modifications to the proposed revisions requiring republication, the NRC will

not initiate a second comment period on this action in the event the direct final rule is withdrawn.

A significant adverse comment is a comment where the commenter explains why the rule would be inappropriate, including challenges to the rule's underlying premise or approach, or would be ineffective or unacceptable without a change. A comment is adverse and significant if:

(1) The comment opposes the rule and provides a reason sufficient to require a substantive response in a notice-and-comment process. For example, a substantive response is required when:

(a) The comment causes the NRC staff to reevaluate (or reconsider) its position or conduct additional analysis;

(b) The comment raises an issue serious enough to warrant a substantive response to clarify or complete the record; or

(c) The comment raises a relevant issue that was not previously addressed or considered by the NRC staff.

(2) The comment proposes a change or an addition to the rule, and it is apparent that the rule would be ineffective or unacceptable without incorporation of the change or addition.

(3) The comment causes the NRC staff to make a change (other than editorial) to the rule, CoC, or Technical Specifications.

For additional procedural information and the regulatory analysis, see the

direct final rule published in the Rules and Regulations section of this issue of the **Federal Register**.

III. Background

Section 218(a) of the Nuclear Waste Policy Act (NWPA) of 1982, as amended, requires that “the Secretary [of the Department of Energy] shall establish a demonstration program, in cooperation with the private sector, for the dry storage of spent nuclear fuel at civilian nuclear power reactor sites, with the objective of establishing one or more technologies that the [Nuclear Regulatory] Commission may, by rule, approve for use at the sites of civilian nuclear power reactors without, to the maximum extent practicable, the need for additional site-specific approvals by the Commission.” Section 133 of the NWPA states, in part, that “[the Commission] shall, by rule, establish procedures for the licensing of any technology approved by the Commission under Section 219(a) [sic: 218(a)] for use at the site of any civilian nuclear power reactor.”

To implement this mandate, the Commission approved dry storage of spent nuclear fuel in NRC-approved casks under a general license by publishing a final rule which added a new subpart K in part 72 of title 10 of the Code of Federal Regulations (10 CFR) entitled, “General License for Storage of Spent Fuel at Power Reactor

Sites” (55 FR 29181; July 18, 1990). This rule also established a new subpart L in 10 CFR part 72 entitled, “Approval of Spent Fuel Storage Casks,” which contains procedures and criteria for obtaining NRC approval of spent fuel storage cask designs. The NRC subsequently issued a final rule (80 FR 12073; March 6, 2015), as corrected (80 FR 15679; March 25, 2015), that approved the Holtec International HI-STORM UMAX Canister Storage System design and added it to the list of NRC-approved cask designs in 10 CFR 72.214 as CoC No. 1040.

IV. Plain Writing

The Plain Writing Act of 2010 (Pub. L. 111–274) requires Federal agencies to write documents in a clear, concise, well-organized manner that also follows other best practices appropriate to the subject or field and the intended audience. The NRC has written this document to be consistent with the Plain Writing Act as well as the Presidential Memorandum, “Plain Language in Government Writing,” published June 10, 1998 (63 FR 31883). The NRC requests comment on the proposed rule with respect to clarity and effectiveness of the language used.

V. Availability of Documents

The documents identified in the following table are available to interested persons as indicated.

Document	ADAMS accession No.
Holtec/License Amendment Request, Letter Dated March 31, 2015	ML15092A783
Supplemental Letter Dated June 19, 2015	ML15170A434
Supplemental Letter Dated November 30, 2015	ML15334A496
Proposed CoC No. 1040, Amendment No. 2	ML16035A416
Proposed CoC No. 1040, Amendment No. 2—Technical Specifications, Appendix A	ML16039A113
Proposed CoC No. 1040, Amendment No. 2—Technical Specifications, Appendix B	ML16039A115
CoC No. 1040, Amendment No. 2—Preliminary Safety Evaluation Report	ML16039A156

The NRC may post materials related to this document, including public comments, on the Federal rulemaking Web site at <http://www.regulations.gov> under Docket ID NRC–2016–0155. The Federal rulemaking Web site allows you to receive alerts when changes or additions occur in a docket folder. To subscribe: (1) Navigate to the docket folder (NRC–2016–0155); (2) click the “Sign up for Email Alerts” link; and (3) enter your email address and select how frequently you would like to receive emails (daily, weekly, or monthly).

List of Subjects in 10 CFR Part 72

Administrative practice and procedure, Criminal penalties, Hazardous waste, Indians,

Intergovernmental relations, Manpower training programs, Nuclear energy, Nuclear materials, Occupational safety and health, Penalties, Radiation protection, Reporting and recordkeeping requirements, Security measures, Spent fuel, Whistleblowing.

For the reasons set out in the preamble and under the authority of the Atomic Energy Act of 1954, as amended; the Energy Reorganization Act of 1974, as amended; the Nuclear Waste Policy Act of 1982, as amended; and 5 U.S.C. 552 and 553; the NRC is proposing to adopt the following amendments to 10 CFR part 72:

PART 72—LICENSING REQUIREMENTS FOR THE INDEPENDENT STORAGE OF SPENT NUCLEAR FUEL, HIGH-LEVEL RADIOACTIVE WASTE, AND REACTOR-RELATED GREATER THAN CLASS C WASTE

■ 1. The authority citation for part 72 continues to read as follows:

Authority: Atomic Energy Act of 1954, secs. 51, 53, 57, 62, 63, 65, 69, 81, 161, 182, 183, 184, 186, 187, 189, 223, 234, 274 (42 U.S.C. 2071, 2073, 2077, 2092, 2093, 2095, 2099, 2111, 2201, 2210e, 2232, 2233, 2234, 2236, 2237, 2238, 2273, 2282, 2021); Energy Reorganization Act of 1974, secs. 201, 202, 206, 211 (42 U.S.C. 5841, 5842, 5846, 5851); National Environmental Policy Act of 1969 (42 U.S.C. 4332); Nuclear Waste Policy Act

of 1982, secs. 117(a), 132, 133, 134, 135, 137, 141, 145(g), 148, 218(a) (42 U.S.C. 10137(a), 10152, 10153, 10154, 10155, 10157, 10161, 10165(g), 10168, 10198(a)); 44 U.S.C. 3504 note.

■ 2. In § 72.214, Certificate of Compliance 1040 is revised to read as follows:

§ 72.214 List of approved spent fuel storage casks.

* * * * *

Certificate Number: 1040.

Initial Certificate Effective Date: April 6, 2015.

Amendment Number 1 Effective Date: September 8, 2015.

Amendment Number 2, Effective Date: January 9, 2017.

SAR Submitted by: Holtec International, Inc.

SAR Title: Final Safety Analysis Report for the Holtec International HI-STORM UMAX Canister Storage System.

Docket Number: 72–1040.

Certificate Expiration Date: April 6, 2035.

Model Number: MPC–37, MPC–89.

* * * * *

Dated at Rockville, Maryland, this 4th day of October, 2016.

For the Nuclear Regulatory Commission.

Michael R. Johnson,

Acting Executive Director for Operations.

BILLING CODE 7575–01–P

DEPARTMENT OF TRANSPORTATION

Federal Aviation Administration

14 CFR Part 39

[Docket No. FAA–2016–9192; Directorate Identifier 2016–NM–038–AD]

RIN 2120–AA64

Airworthiness Directives; Airbus Airplanes

AGENCY: Federal Aviation Administration (FAA), DOT.

ACTION: Notice of proposed rulemaking (NPRM).

SUMMARY: We propose to adopt a new airworthiness directive (AD) for certain Airbus Model A330–200, A330–300, A340–200, and A340–300 series airplanes. This proposed AD was prompted by a report of cracking at fastener holes located at a certain frame on the lower shell panel junction. This proposed AD would require repetitive inspections of certain fastener holes, and related investigative and corrective actions if necessary. We are proposing

this AD to detect and correct cracking on the lower shell panel junction; such cracking could lead to reduced structural integrity of the fuselage.

DATES: We must receive comments on this proposed AD by December 9, 2016.

ADDRESSES: You may send comments, using the procedures found in 14 CFR 11.43 and 11.45, by any of the following methods:

- *Federal eRulemaking Portal:* Go to <http://www.regulations.gov>. Follow the instructions for submitting comments.
- *Fax:* 202–493–2251.
- *Mail:* U.S. Department of Transportation, Docket Operations, M–30, West Building Ground Floor, Room W12–140, 1200 New Jersey Avenue SE., Washington, DC 20590.
- *Hand Delivery:* Deliver to Mail address above between 9 a.m. and 5 p.m., Monday through Friday, except Federal holidays.

For service information identified in this NPRM, contact Airbus SAS, Airworthiness Office—EAL, 1 Rond Point Maurice Bellonte, 31707 Blagnac Cedex, France; telephone +33 5 61 93 36 96; fax +33 5 61 93 45 80; email airworthiness.A330-A340@airbus.com; Internet <http://www.airbus.com>. You may view this referenced service information at the FAA, Transport Airplane Directorate, 1601 Lind Avenue SW., Renton, WA. For information on the availability of this material at the FAA, call 425–227–1221.

Examining the AD Docket

You may examine the AD docket on the Internet at <http://www.regulations.gov> by searching for and locating Docket No. FAA–2016–9192; or in person at the Docket Management Facility between 9 a.m. and 5 p.m., Monday through Friday, except Federal holidays. The AD docket contains this proposed AD, the regulatory evaluation, any comments received, and other information. The street address for the Docket Operations office (telephone 800–647–5527) is in the **ADDRESSES** section. Comments will be available in the AD docket shortly after receipt.

FOR FURTHER INFORMATION CONTACT: Vladimir Ulyanov, Aerospace Engineer, International Branch, ANM–116, Transport Airplane Directorate, FAA, 1601 Lind Avenue SW., Renton, WA 98057–3356; telephone 425–227–1138; fax 425–227–1149.

SUPPLEMENTARY INFORMATION:

Comments Invited

We invite you to send any written relevant data, views, or arguments about this proposed AD. Send your comments

to an address listed under the **ADDRESSES** section. Include “Docket No. FAA–2016–9192; Directorate Identifier 2016–NM–038–AD” at the beginning of your comments. We specifically invite comments on the overall regulatory, economic, environmental, and energy aspects of this proposed AD. We will consider all comments received by the closing date and may amend this proposed AD based on those comments.

We will post all comments we receive, without change, to <http://www.regulations.gov>, including any personal information you provide. We will also post a report summarizing each substantive verbal contact we receive about this proposed AD.

Discussion

The European Aviation Safety Agency (EASA), which is the Technical Agent for the Member States of the European Union, has issued EASA Airworthiness Directive 2014–0136, dated June 13, 2014 (referred to after this as the Mandatory Continuing Airworthiness Information, or “the MCAI”), to correct an unsafe condition for certain Airbus Model A330, A340–200, and A340–300 series airplanes. The MCAI states:

During A330/A340 aeroplanes full scale fatigue test specimen in the FR40-to-fuselage skin panel junction, fatigue damage has been found. Corrective actions consisted of the following actions:

- In-service installation of an internal reinforcing strap on related junction required by DGAC [Direction Générale de l’Aviation Civile (DGAC)] France AD 1999–448–126(B) and AD 2001–070(B),
- retrofit improvement of internal reinforcing strap fatigue life through recommended Airbus Service Bulletin (SB) A330–53–3145, and
- new design in production through Airbus modification 44360.

The aeroplanes listed in the Applicability section of this AD are all aeroplanes post-mod 44360 and pre-mod 55792 (fuselage reinforcement at FR40 in production).

Recently, during embodiment of a FR40 web repair on an A330 aeroplane and during FR40 keel beam fitting replacement on an A340 aeroplane, the internal strap was removed and rototest inspection was performed on several holes.

Cracks were found on both left-hand (LH) and right-hand (RH) sides on internal strap, or butt strap, or keel beam fitting, or forward fitting FR40 flange.

This condition, if not detected and corrected, could lead to crack propagation, possibly resulting in reduced structural integrity of the fuselage.

For the reasons described above, this [EASA] AD requires repetitive rototest inspections of 10 fastener holes located at FR40 lower shell panel junction on both LH and RH sides, and, depending on findings, accomplishment of the applicable corrective actions [which include oversizing, installing

fasteners and repair; and accomplishment of applicable related investigative actions, which include a rototest inspection for cracking after oversizing].

The compliance time ranges between 20,000 flight cycles or 65,400 flight hours and 20,800 flight cycles or 68,300 flight hours, depending on airplane utilization and configuration. The repetitive inspection interval ranges between 14,000 flight cycles or 95,200 flight hours and 24,600 flight cycles or 98,700 flight hours, depending on airplane configuration. You may examine the MCAI in the AD docket on the Internet at <http://www.regulations.gov> by searching for and locating Docket No. FAA-2016-9192.

Related Service Information Under 1 CFR Part 51

We reviewed Airbus Service Bulletin A330-53-3215, Revision 01, dated April 17, 2014; and Airbus Service Bulletin A340-53-4215, Revision 01, dated April 17, 2014. The service information describes procedures for repetitive rototest inspections of certain fastener holes, and corrective actions if necessary. These documents are distinct since they apply to different airplane models. This service information is reasonably available because the interested parties have access to it through their normal course of business or by the means identified in the ADDRESSES section.

FAA's Determination and Requirements of This Proposed AD

This product has been approved by the aviation authority of another country, and is approved for operation in the United States. Pursuant to our bilateral agreement with the State of Design Authority, we have been notified of the unsafe condition described in the MCAI and service information referenced above. We are proposing this AD because we evaluated all pertinent information and determined an unsafe condition exists and is likely to exist or develop on other products of these same type designs.

Costs of Compliance

We estimate that this proposed AD affects 41 airplanes of U.S. registry.

We estimate the following costs to comply with this proposed AD:

ESTIMATED COSTS

Action	Labor cost	Parts cost	Cost per product	Cost on U.S. operators
Inspection	41 work-hours × \$85 per hour = \$3,485 per inspection cycle.	\$0	\$3,485	\$142,885 per inspection cycle.

We estimate the following costs to do any necessary repairs that would be

required based on the results of the proposed inspection. We have no way of

determining the number of airplanes that might need these repairs:

ON-CONDITION COSTS

Action	Labor cost	Parts cost	Cost per product
Repair	46 work-hours × \$85 per hour = \$3,910	\$4,186	\$8,096

Authority for This Rulemaking

Title 49 of the United States Code specifies the FAA's authority to issue rules on aviation safety. Subtitle I, section 106, describes the authority of the FAA Administrator. "Subtitle VII: Aviation Programs," describes in more detail the scope of the Agency's authority.

We are issuing this rulemaking under the authority described in "Subtitle VII, Part A, Subpart III, Section 44701: General requirements." Under that section, Congress charges the FAA with promoting safe flight of civil aircraft in air commerce by prescribing regulations for practices, methods, and procedures the Administrator finds necessary for safety in air commerce. This regulation is within the scope of that authority because it addresses an unsafe condition that is likely to exist or develop on products identified in this rulemaking action.

Regulatory Findings

We determined that this proposed AD would not have federalism implications under Executive Order 13132. This proposed AD would not have a substantial direct effect on the States, on the relationship between the national Government and the States, or on the distribution of power and responsibilities among the various levels of government.

For the reasons discussed above, I certify this proposed regulation:

1. Is not a "significant regulatory action" under Executive Order 12866;
2. Is not a "significant rule" under the DOT Regulatory Policies and Procedures (44 FR 11034, February 26, 1979);
3. Will not affect intrastate aviation in Alaska; and
4. Will not have a significant economic impact, positive or negative, on a substantial number of small entities under the criteria of the Regulatory Flexibility Act.

List of Subjects in 14 CFR Part 39

Air transportation, Aircraft, Aviation safety, Incorporation by reference, Safety.

The Proposed Amendment

Accordingly, under the authority delegated to me by the Administrator, the FAA proposes to amend 14 CFR part 39 as follows:

PART 39—AIRWORTHINESS DIRECTIVES

- 1. The authority citation for part 39 continues to read as follows:

Authority: 49 U.S.C. 106(g), 40113, 44701.

§ 39.13 [Amended]

- 2. The FAA amends § 39.13 by adding the following new airworthiness directive (AD):

Airbus: Docket No. FAA-2016-9192; Directorate Identifier 2016-NM-038-AD.

(a) Comments Due Date

We must receive comments by December 9, 2016.

(b) Affected ADs

None.

(c) Applicability

This AD applies to the airplanes, certificated in any category, identified in paragraphs (c)(1) and (c)(2) of this AD, having serial numbers 0176 through 0915 inclusive.

(1) Airbus Model A330–201, –202, –203, –223, –243, –301, –302, –303, –321, –322, –323, –341, –342, and –343 airplanes.

(2) Airbus Model A340–211, –212, –213, –311, –312, and –313 airplanes.

(d) Subject

Air Transport Association (ATA) of America Code 53, Fuselage.

(e) Reason

This AD was prompted by a report of cracking at fastener holes located at frame (FR)40 on the lower shell panel junction. We are issuing this AD to detect and correct cracking at FR40 on the lower shell panel junction; such cracking could lead to reduced structural integrity of the fuselage.

(f) Compliance

Comply with this AD within the compliance times specified, unless already done.

(g) Repetitive Inspections and Related Investigative and Corrective Actions

Within the compliance times defined in table 1 to paragraph (g) of this AD, and, thereafter, at intervals not to exceed the compliance times defined in Airbus Service Bulletin A330–53–3215, Revision 01, dated April 17, 2014; or Airbus Service Bulletin A340–53–4215, Revision 01, dated April 17, 2014; as applicable, depending on airplane utilization and configuration: Accomplish a special detailed inspection of fastener holes located at FR40 lower shell panel junction on both left-hand (LH) and right-side (RH) sides, in accordance with the Accomplishment Instructions of Airbus Service Bulletin A330–53–3215, Revision 01, dated April 17, 2014; or Airbus Service Bulletin A340–53–4215, Revision 01, dated April 17, 2014; as applicable.

TABLE 1 TO PARAGRAPH (g) OF THIS AD—COMPLIANCE TIME FOR INITIAL INSPECTION

	Compliance time (whichever occurs later, A or B)
A	Before exceeding the compliance time “threshold” defined in table 1 of Airbus Service Bulletin A330–53–3215, Revision 01, dated April 17, 2014; or Airbus Service Bulletin A340–53–4215, Revision 01, dated April 17, 2014; as applicable, depending on airplane utilization and configuration and to be counted from airplane first flight.
B	For Model A330 airplanes: Within 2,400 flight cycles or 24 months, whichever occurs first after the effective date of this AD. For Model A340 airplanes: Within 1,300 flight cycles or 24 months, whichever occurs first after the effective date of this AD.

(1) If, during any inspection required by paragraph (g) of this AD, any crack is detected, before further flight, accomplish all applicable related investigative and corrective actions, in accordance with the Accomplishment Instructions of Airbus Service Bulletin A330–53–3215, Revision 01, dated April 17, 2014; or Airbus Service Bulletin A340–53–4215, Revision 01, dated April 17, 2014; as applicable, except where Airbus Service Bulletin A330–53–3215, Revision 01, dated April 17, 2014; or Airbus Service Bulletin A340–53–4215, Revision 01, dated April 17, 2014, specifies to contact Airbus for repair instructions, and specifies that action as “RC” (Required for Compliance), this AD requires repair before further flight using a method approved by the Manager, International Branch, ANM–116, Transport Airplane Directorate, FAA; or the European Aviation Safety Agency (EASA); or Airbus’s EASA Design Organization Approval (DOA).

(2) If, during any inspection required by paragraph (g) of this AD, the hole diameter is not within tolerance of the transition fit as nominal, or first oversize, or second oversize, or next nominal, as applicable, and Airbus Service Bulletin A330–53–3215, Revision 01, dated April 17, 2014; or Airbus Service Bulletin A340–53–4215, Revision 01, dated April 17, 2014, specifies to contact Airbus for repair instructions, and specifies that action as “RC” (Required for Compliance), before further flight, repair using a method approved by the Manager, International Branch, ANM–116, Transport Airplane Directorate, FAA; or EASA; or Airbus’s EASA DOA.

(3) Accomplishment of corrective actions, as required by paragraph (g)(1) of this AD, does not constitute terminating action for the

repetitive inspections required by the introductory text of paragraph (g) of this AD.

(4) Accomplishment of a repair on an airplane, as required by paragraph (g)(2) of this AD, does not constitute terminating action for the repetitive inspections required by the introductory text of paragraph (g) of this AD for that airplane, unless the method approved in accordance with the Manager, International Branch, ANM–116, Transport Airplane Directorate, FAA; or EASA; or Airbus’s EASA DOA indicates otherwise.

(h) Credit for Previous Actions

(1) This paragraph provides credit for actions required by the introductory text of paragraph (g) of this AD, if those actions were performed before the effective date of this AD using Airbus Service Bulletin A330–53–3215, dated June 21, 2013; or Airbus Service Bulletin A340–53–4215, dated June 21, 2013; as applicable.

(2) This paragraph provides credit for the inspections and corrective actions required by paragraph (g) of this AD, if those actions were performed before the effective date of this AD using Airbus Technical Disposition (TD) Reference LR57D11023360, Issue B, dated July 12, 2011.

(i) Other FAA AD Provisions

The following provisions also apply to this AD:

(1) *Alternative Methods of Compliance (AMOCs)*: The Manager, International Branch, ANM–116, Transport Airplane Directorate, FAA, has the authority to approve AMOCs for this AD, if requested using the procedures found in 14 CFR 39.19. In accordance with 14 CFR 39.19, send your request to your principal inspector or local Flight Standards District Office, as appropriate. If sending information directly

to the International Branch, send it to ATTN: Vladimir Ulyanov, Aerospace Engineer, International Branch, ANM–116, Transport Airplane Directorate, FAA, 1601 Lind Avenue SW., Renton, WA 98057–3356; telephone 425–227–1138; fax 425–227–1149. Information may be emailed to: 9-ANM-116-AMOC-REQUESTS@faa.gov. Before using any approved AMOC, notify your appropriate principal inspector, or lacking a principal inspector, the manager of the local flight standards district office/certificate holding district office. The AMOC approval letter must specifically reference this AD.

(2) *Contacting the Manufacturer*: For any requirement in this AD to obtain corrective actions from a manufacturer, the action must be accomplished using a method approved by the Manager, International Branch, ANM–116, Transport Airplane Directorate, FAA; or the European Aviation Safety Agency (EASA); or Airbus’s EASA Design Organization Approval (DOA). If approved by the DOA, the approval must include the DOA-authorized signature.

(3) *Required for Compliance (RC)*: Except as required by paragraph (g)(1) and (g)(2) of this AD: If any service information contains procedures or tests that are identified as RC, those procedures and tests must be done to comply with this AD; any procedures or tests that are not identified as RC are recommended. Those procedures and tests that are not identified as RC may be deviated from using accepted methods in accordance with the operator’s maintenance or inspection program without obtaining approval of an AMOC, provided the procedures and tests identified as RC can be done and the airplane can be put back in an airworthy condition. Any substitutions or

changes to procedures or tests identified as RC require approval of an AMOC.

(j) Related Information

(1) Refer to Mandatory Continuing Airworthiness Information (MCAI) EASA Airworthiness Directive 2014–0136, dated June 13, 2014, for related information. This MCAI may be found in the AD docket on the Internet at <http://www.regulations.gov> by searching for and locating Docket No. FAA–2016–9192.

(2) For service information identified in this AD, contact Airbus SAS, Airworthiness Office—EAL, 1 Rond Point Maurice Bellonte, 31707 Blagnac Cedex, France; telephone +33 5 61 93 36 96; fax +33 5 61 93 45 80; email airworthiness.A330-A340@airbus.com; Internet <http://www.airbus.com>. You may view this service information at the FAA, Transport Airplane Directorate, 1601 Lind Avenue SW., Renton, WA. For information on the availability of this material at the FAA, call 425–227–1221.

Issued in Renton, Washington, on October 12, 2016.

Michael Kaszycki,

Acting Manager, Transport Airplane Directorate, Aircraft Certification Service.

[Docket No. FAA–2016–9317; Directorate Identifier 2016–CE–029–AD]

RIN 2120–AA64

Airworthiness Directives; Diamond Aircraft Industries GmbH Airplanes

AGENCY: Federal Aviation Administration (FAA), Department of Transportation (DOT).

ACTION: Notice of proposed rulemaking (NPRM).

SUMMARY: We propose to adopt a new airworthiness directive (AD) for certain Diamond Aircraft Industries GmbH Model DA 42 airplanes. This proposed AD results from mandatory continuing airworthiness information (MCAI) originated by an aviation authority of another country to identify and correct an unsafe condition on an aviation product. The MCAI describes the unsafe condition as an uncommanded engine shutdown during flight due to failure of the propeller regulating valve caused by hot exhaust gases escaping from fractured engine exhaust pipes. We are issuing this AD to correct the unsafe condition on these products.

DATES: We must receive comments on this proposed AD by December 9, 2016.

ADDRESSES: You may send comments by any of the following methods:

- **Federal eRulemaking Portal:** Go to <http://www.regulations.gov>. Follow the instructions for submitting comments.
- **Fax:** (202) 493–2251.
- **Mail:** U.S. Department of Transportation, Docket Operations, M–30, West Building Ground Floor, Room W12–140, 1200 New Jersey Avenue SE., Washington, DC 20590.
- **Hand Delivery:** U.S. Department of Transportation, Docket Operations, M–30, West Building Ground Floor, Room W12–140, 1200 New Jersey Avenue SE., Washington, DC 20590, between 9 a.m. and 5 p.m., Monday through Friday, except Federal holidays.

For service information identified in this proposed AD, contact Diamond Aircraft Industries GmbH, N.A. Otto-Straße 5, A–2700 Wiener Neustadt, Austria, telephone: +43 2622 26700; fax: +43 2622 26780; email: office@diamond-air.at; Internet: <http://www.diamondaircraft.com>. You may review this referenced service information at the FAA, Small Airplane Directorate, 901 Locust, Kansas City, Missouri 64106. For information on the availability of this material at the FAA, call (816) 329–4148.

Examining the AD Docket

You may examine the AD docket on the Internet at <http://www.regulations.gov> by searching for and locating Docket No. FAA–2016–9317; or in person at the Docket Management Facility between 9 a.m. and 5 p.m., Monday through Friday, except Federal holidays. The AD docket contains this proposed AD, the regulatory evaluation, any comments received, and other information. The street address for the Docket Office (telephone (800) 647–5527) is in the **ADDRESSES** section. Comments will be available in the AD docket shortly after receipt.

FOR FURTHER INFORMATION CONTACT:

Mike Kiesov, Aerospace Engineer, FAA, Small Airplane Directorate, 901 Locust, Room 301, Kansas City, Missouri 64106; telephone: (816) 329–4144; fax: (816) 329–4090; email: mike.kiesov@faa.gov.

SUPPLEMENTARY INFORMATION:

Comments Invited

We invite you to send any written relevant data, views, or arguments about this proposed AD. Send your comments to an address listed under the **ADDRESSES** section. Include “Docket No. FAA–2016–9317; Directorate Identifier 2016–CE–029–AD” at the beginning of your comments. We specifically invite comments on the overall regulatory,

economic, environmental, and energy aspects of this proposed AD. We will consider all comments received by the closing date and may amend this proposed AD because of those comments.

We will post all comments we receive, without change, to <http://www.regulations.gov>, including any personal information you provide. We will also post a report summarizing each substantive verbal contact we receive about this proposed AD.

Discussion

The European Aviation Safety Agency (EASA), which is the Technical Agent for the Member States of the European Community, has issued AD No. 2016–0156, dated August 2, 2016 (referred to after this as “the MCAI”), to correct an unsafe condition for the specified products. The MCAI states:

Two cases were reported of uncommanded engine in-flight shutdown (IFSD) on DA 42 aeroplanes. Subsequent investigations identified these occurrences were due to failure of the propeller regulating valve, caused by hot exhaust gases coming from fractured engine exhaust pipes. The initiating cracks on the exhaust pipes were not detected during previous inspections, since those exhaust pipes are equipped with non-removable heat shields that do not allow inspection for certain sections of the exhaust pipe.

This condition, if not corrected, could lead to further cases of IFSD or overheat damage, possibly resulting in a forced landing, with consequent damage to the aeroplane and injury to occupants.

To address this potential unsafe condition, Diamond Aircraft Industries (DAI) developed an exhaust pipe without a directly attached integral heat shield that allows visual inspection over the entire exhaust pipe length. DAI issued Mandatory Service Bulletin (MSB) 42–120 and relevant Working Instruction (WI) WI–MSB 42–120, providing instructions to install the modified exhaust pipes. As an interim measure, an additional bracket was designed to hold the exhaust pipe in place in case of a pipe fracture.

For the reasons described above, this AD requires replacement of the exhaust pipes with pipes having new design, and prohibits (re)installation of the previous design pipes.

You may examine the MCAI on the Internet at <http://www.regulations.gov> by searching for and locating Docket No. FAA–2016–9317.

Related Service Information Under 14 CFR Part 51

Diamond Aircraft Industries GmbH has issued Mandatory Service Bulletin MSB 42–120, dated June 24, 2016, and Work Instruction WI–MSB 42–120, dated June 24, 2016. In combination, this service information describes procedures for replacing the exhaust

pipes with exhaust pipes having a new design. This service information is reasonably available because the interested parties have access to it through their normal course of business or by the means identified in the **ADDRESSES** section of this NPRM.

FAA's Determination and Requirements of the Proposed AD

This product has been approved by the aviation authority of another country, and is approved for operation in the United States. Pursuant to our bilateral agreement with this State of Design Authority, they have notified us of the unsafe condition described in the MCAI and service information referenced above. We are proposing this AD because we evaluated all information and determined the unsafe condition exists and is likely to exist or develop on other products of the same type design.

Costs of Compliance

We estimate that this proposed AD would affect 130 products of U.S. registry. We also estimate that it would take the following to comply with the requirements of this proposed AD:

It would take about 1 work-hour per product to comply with the installation of additional exhaust clamps required by this proposed AD. The average labor rate is \$85 per work-hour. Required parts would cost about \$125 per product.

Based on these figures, we estimate the cost of this proposed AD on U.S. operators for the installation of additional exhaust clamps to be \$27,300, or \$210 per product.

It would take about 4 work-hours per product to comply with the exhaust pipe replacement required by this proposed AD. The average labor rate is \$85 per work-hour. Required parts would cost about \$1,990 per product.

Based on these figures, we estimate the cost of this proposed AD on U.S. operators for the exhaust pipe replacement requirement to be \$302,900, or \$2,330 per product.

Authority for This Rulemaking

Title 49 of the United States Code specifies the FAA's authority to issue rules on aviation safety. Subtitle I, section 106, describes the authority of the FAA Administrator. "Subtitle VII: Aviation Programs," describes in more detail the scope of the Agency's authority.

We are issuing this rulemaking under the authority described in "Subtitle VII, Part A, Subpart III, section 44701: General requirements." Under that section, Congress charges the FAA with

promoting safe flight of civil aircraft in air commerce by prescribing regulations for practices, methods, and procedures the Administrator finds necessary for safety in air commerce. This regulation is within the scope of that authority because it addresses an unsafe condition that is likely to exist or develop on products identified in this rulemaking action.

Regulatory Findings

We determined that this proposed AD would not have federalism implications under Executive Order 13132. This proposed AD would not have a substantial direct effect on the States, on the relationship between the national Government and the States, or on the distribution of power and responsibilities among the various levels of government.

For the reasons discussed above, I certify this proposed regulation:

- (1) Is not a "significant regulatory action" under Executive Order 12866,
- (2) Is not a "significant rule" under the DOT Regulatory Policies and Procedures (44 FR 11034, February 26, 1979),
- (3) Will not affect intrastate aviation in Alaska, and
- (4) Will not have a significant economic impact, positive or negative, on a substantial number of small entities under the criteria of the Regulatory Flexibility Act.

List of Subjects in 14 CFR Part 39

Air transportation, Aircraft, Aviation safety, Incorporation by reference, Safety.

The Proposed Amendment

Accordingly, under the authority delegated to me by the Administrator, the FAA proposes to amend 14 CFR part 39 as follows:

PART 39—AIRWORTHINESS DIRECTIVES

- 1. The authority citation for part 39 continues to read as follows:

Authority: 49 U.S.C. 106(g), 40113, 44701.

§ 39.13 [Amended]

- 2. The FAA amends § 39.13 by adding the following new AD:

Diamond Aircraft Industries GmbH: Docket No. FAA-2016-9317; Directorate Identifier 2016-CE-029-AD.

(a) Comments Due Date

We must receive comments by December 9, 2016.

(b) Affected ADs

None.

(c) Applicability

This AD applies to Diamond Aircraft Industries GmbH DA 42 airplanes, serial numbers 42.004 through 42.427 and 42.AC001 through 42.AC151, that have a TAE 125-02-99 or TAE 125-02-114 engine installed, are equipped with an exhaust pipe, DAI part number (P/N) D60-9078-06-01, or Technify P/Ns 52-7810-H0001 02, 52-7810-H0001 03, or 52-7810-H0001 04, and are certificated in any category.

Note to paragraph (c) of this AD: Airplanes equipped with an exhaust pipe, DAI P/N D60-9078-06-01_01 or Technify P/N 52-7810-H0014 01, are not affected by this AD.

(d) Subject

Air Transport Association of America (ATA) Code 78: Engine Exhaust.

(e) Reason

This AD was prompted by mandatory continuing airworthiness information (MCAI) originated by an aviation authority of another country to identify and correct an unsafe condition on an aviation product. The MCAI describes the unsafe condition as an uncommanded engine shutdown during flight due to failure of the propeller regulating valve caused by hot exhaust gases escaping from fractured engine exhaust pipes. We are issuing this AD to prevent failure of the propeller regulating valve, which could result in forced landing with consequent damage to the airplane.

(f) Actions and Compliance

Unless already done, do the following actions. For the purpose of this AD, if the flight hours accumulated since first installation of an affected exhaust pipe is not known, use the total hours time-in-service (TIS) accumulated on the airplane.

(1) At whichever of the following compliance times that occurs later, install additional exhaust pipe clamps following the INSTRUCTIONS section of Diamond Aircraft Industries GmbH Work Instruction WI-MSB 42-120, dated June 24, 2016, as specified in the Accomplishments/Instructions paragraph of Diamond Aircraft Industries GmbH Mandatory Service Bulletin MSB 42-120, dated June 24, 2016. The replacement required in paragraph (f)(2) of this AD may be done in lieu of installing additional exhaust pipe clamps.

(i) Before or upon accumulating 1,300 hours TIS since the affected exhaust pipe was first installed on an airplane; or

(ii) Within the next 200 hours TIS after the effective date of this AD or within the next 12 months after the effective date of this AD, whichever occurs first.

(2) At whichever of the following compliance times that occurs later, replace the exhaust pipes listed in paragraph (c) of this AD with an exhaust pipe DAI P/N D60-9078-06-01_01 or Technify P/N 52-7810-H0014 01. Do the replacement following the INSTRUCTIONS section of Diamond Aircraft Industries GmbH Work Instruction WI-MSB 42-120, dated June 24, 2016, as specified in the Accomplishments/Instructions paragraph of Diamond Aircraft Industries GmbH Mandatory Service Bulletin MSB 42-120, dated June 24, 2016.

(i) Before or upon accumulating 2,800 hours TIS since the affected exhaust pipe was first installed on an airplane; or

(ii) Within the next 200 hours TIS after the effective date of this AD or within the next 12 months after the effective date of this AD, whichever occurs first.

(3) After installing an exhaust pipe DAI P/N D60-9078-06-01_01 or Technify P/N 52-7810-H0014 01, as required by this AD, do not install an exhaust pipe listed in paragraph (c) of this AD.

(g) Other FAA AD Provisions

The following provisions also apply to this AD:

(1) *Alternative Methods of Compliance (AMOCs)*: The Manager, Standards Office, FAA, has the authority to approve AMOCs for this AD, if requested using the procedures found in 14 CFR 39.19. Send information to ATTN: Mike Kiesov, Aerospace Engineer, FAA, Small Airplane Directorate, 901 Locust, Room 301, Kansas City, Missouri 64106; telephone: (816) 329-4144; fax: (816) 329-4090; email: mike.kiesov@faa.gov. Before using any approved AMOC on any airplane to which the AMOC applies, notify your appropriate principal inspector (PI) in the FAA Flight Standards District Office (FSDO), or lacking a PI, your local FSDO.

(2) *Airworthy Product*: For any requirement in this AD to obtain corrective actions from a manufacturer or other source, use these actions if they are FAA-approved. Corrective actions are considered FAA-approved if they are approved by the State of Design Authority (or their delegated agent). You are required to assure the product is airworthy before it is returned to service.

(3) *Reporting Requirements*: For any reporting requirement in this AD, a federal agency may not conduct or sponsor, and a person is not required to respond to, nor shall a person be subject to a penalty for failure to comply with a collection of information subject to the requirements of the Paperwork Reduction Act unless that collection of information displays a current valid OMB Control Number. The OMB Control Number for this information collection is 2120-0056. Public reporting for this collection of information is estimated to be approximately 5 minutes per response, including the time for reviewing instructions, completing and reviewing the collection of information. All responses to this collection of information are mandatory. Comments concerning the accuracy of this burden and suggestions for reducing the burden should be directed to the FAA at: 800 Independence Ave. SW., Washington, DC 20591, Attn: Information Collection Clearance Officer, AES-200.

(h) Related Information

Refer to MCAI European Aviation Safety Agency (EASA) AD No. 2016-0156, dated August 2, 2016, for related information. You may examine the MCAI on the Internet at <http://www.regulations.gov> by searching for and locating Docket No. FAA-2016-9317. For service information related to this AD, contact Diamond Aircraft Industries GmbH, N.A. Otto-Straße 5, A-2700 Wiener Neustadt, Austria, telephone: +43 2622 26700; fax: +43

2622 26780; email: office@diamond-air.at; Internet: <http://www.diamondaircraft.com>. You may review this referenced service information at the FAA, Small Airplane Directorate, 901 Locust, Kansas City, Missouri 64106. For information on the availability of this material at the FAA, call (816) 329-4148.

Issued in Kansas City, Missouri, on October 17, 2016.

Pat Mullen,

Acting Manager, Small Airplane Directorate, Aircraft Certification Service.

BILLING CODE 4910-13-P

DEPARTMENT OF TRANSPORTATION

Federal Aviation Administration

14 CFR Part 71

[Docket No. FAA-2016-5045; Airspace Docket No. 16-AGL-10]

Proposed Establishment of Class E Airspace; Drummond Island, MI

AGENCY: Federal Aviation Administration (FAA), DOT.

ACTION: Notice of proposed rulemaking (NPRM).

SUMMARY: This action proposes to establish Class E en route domestic airspace at Drummond Island Airport, Drummond Island, MI, to facilitate vectoring of Instrument Flight Rules (IFR) aircraft under control of Minneapolis Air Route Traffic Control Center (ARTCC). The FAA is proposing this action to enhance the safety and management of aircraft operations at Drummond Island Airport.

DATES: Comments must be received on or before December 9, 2016.

ADDRESSES: Send comments on this proposal to the U.S. Department of Transportation, Docket Operations, 1200 New Jersey Avenue SE., West Building Ground Floor, Room W12-140, Washington, DC 20591; telephone 1 800 617-5527, or 1 202 366-9826. You must identify the docket number FAA-2016-5045/Airspace Docket No. 16-AGL-10, at the beginning of your comments. You may also submit comments through the Internet at <http://www.regulations.gov>. You may review the public docket containing the proposal, any comments received, and any final disposition in person in the Dockets Office between 9:00 a.m. and 5:00 p.m., Monday through Friday, except Federal holidays. The Docket Office (telephone 1-800-647-5527), is on the ground floor of the building at the above address.

FAA Order 7400.11A, Airspace Designations and Reporting Points, and

subsequent amendments can be viewed online at http://www.faa.gov/air_traffic/publications/. For further information, you can contact the Airspace Policy Group, Federal Aviation Administration, 800 Independence Avenue SW., Washington, DC 20591; telephone: 202-267-8783. The Order is also available for inspection at the National Archives and Records Administration (NARA). For information on the availability of FAA Order 7400.11A at NARA, call 202-741-6030, or go to http://www.archives.gov/federal_register/code_of_federal_regulations/ibr_locations.html.

FAA Order 7400.11, Airspace Designations and Reporting Points, is published yearly and effective on September 15.

FOR FURTHER INFORMATION CONTACT: Raul Garza, Jr., Central Service Center, Operations Support Group, Federal Aviation Administration, Southwest Region, 10101 Hillwood Pkwy, Fort Worth, TX 76177; telephone: 817-222-5874.

SUPPLEMENTARY INFORMATION:

Authority for This Rulemaking

The FAA's authority to issue rules regarding aviation safety is found in Title 49 of the United States Code. Subtitle I, Section 106 describes the authority of the FAA Administrator. Subtitle VII, Aviation Programs, describes in more detail the scope of the agency's authority. This rulemaking is promulgated under the authority described in Subtitle VII, Part A, Subpart I, Section 40103. Under that section, the FAA is charged with prescribing regulations to assign the use of airspace necessary to ensure the safety of aircraft and the efficient use of airspace. This regulation is within the scope of that authority as it would establish Class E airspace in the Drummond Island, MI area.

Comments Invited

Interested parties are invited to participate in this proposed rulemaking by submitting such written data, views, or arguments, as they may desire. Comments that provide the factual basis supporting the views and suggestions presented are particularly helpful in developing reasoned regulatory decisions on the proposal. Comments are specifically invited on the overall regulatory, aeronautical, economic, environmental, and energy-related aspects of the proposal. Communications should identify both docket numbers and be submitted in triplicate to the address listed above. Commenters wishing the FAA to

acknowledge receipt of their comments on this notice must submit with those comments a self-addressed, stamped postcard on which the following statement is made: "Comments to Docket No. FAA-2016-5045/Airspace Docket No. 16-AGL-10." The postcard will be date/time stamped and returned to the commenter.

All communications received before the specified closing date for comments will be considered before taking action on the proposed rule. The proposal contained in this notice may be changed in light of the comments received. A report summarizing each substantive public contact with FAA personnel concerned with this rulemaking will be filed in the docket.

Availability of NPRMs

An electronic copy of this document may be downloaded through the Internet at <http://www.regulations.gov>. Recently published rulemaking documents can also be accessed through the FAA's Web page at http://www.faa.gov/air_traffic/publications/airspace_amendments/.

You may review the public docket containing the proposal, any comments received, and any final disposition in person in the Dockets Office (see **ADDRESSES** section for address and phone number) between 9:00 a.m. and 5:00 p.m., Monday through Friday, except Federal holidays. An informal docket may also be examined during normal business hours at the office of the Central Service Center, 10101 Hillwood Pkwy, Fort Worth, TX 76177.

Availability and Summary of Documents Proposed for Incorporation by Reference

This document proposes to amend FAA Order 7400.11A, Airspace Designations and Reporting Points, dated August 3, 2016, and effective September 15, 2016. FAA Order 7400.11A is publicly available as listed in the **ADDRESSES** section of this document. FAA Order 7400.11A lists Class A, B, C, D, and E airspace areas, air traffic service routes, and reporting points.

The Proposal

This action proposes to amend Title 14, Code of Federal Regulations (14 CFR), Part 71 by establishing Class E en route domestic airspace extending upward from 1,200 feet above the surface within a 17-mile radius of Drummond Island Airport, Drummond Island, MI, excluding Canadian airspace. This action would contain aircraft while in IFR conditions under control of Minneapolis ARTCC by safely

vectoring aircraft from en route airspace to terminal areas.

Class E airspace areas are published in Paragraph 6006 of FAA Order 7400.11A, dated August 3, 2016, and effective September 15, 2016, which is incorporated by reference in 14 CFR 71.1. The Class E airspace designation listed in this document will be published subsequently in the Order.

Regulatory Notices and Analyses

The FAA has determined that this proposed regulation only involves an established body of technical regulations for which frequent and routine amendments are necessary to keep them operationally current. It, therefore, (1) is not a "significant regulatory action" under Executive Order 12866; (2) is not a "significant rule" under DOT Regulatory Policies and Procedures (44 FR 11034; February 26, 1979); and (3) does not warrant preparation of a Regulatory Evaluation as the anticipated impact is so minimal. Since this is a routine matter that will only affect air traffic procedures and air navigation, it is certified that this rule, when promulgated, will not have a significant economic impact on a substantial number of small entities under the criteria of the Regulatory Flexibility Act.

Environmental Review

This proposal would be subject to an environmental analysis in accordance with FAA Order 1050.1F, "Environmental Impacts: Policies and Procedures" prior to any FAA final regulatory action.

List of Subjects in 14 CFR Part 71

Airspace, Incorporation by reference, Navigation (air).

The Proposed Amendment

In consideration of the foregoing, the Federal Aviation Administration proposes to amend 14 CFR part 71 as follows:

PART 71—DESIGNATION OF CLASS A, B, C, D, AND E AIRSPACE AREAS; AIR TRAFFIC SERVICE ROUTES; AND REPORTING POINTS

- 1. The authority citation for part 71 continues to read as follows:

Authority: 49 U.S.C. 106(f), 106(g); 40103, 40113, 40120; E.O. 10854, 24 FR 9565, 3 CFR, 1959–1963 Comp., p. 389.

§ 71.1 [Amended]

- 2. The incorporation by reference in 14 CFR 71.1 of FAA Order 7400.11A, Airspace Designations and Reporting Points, dated August 3, 2016, and

effective September 15, 2016, is amended as follows:

Paragraph 6006 En Route Domestic Airspace Areas.

* * * * *

AGL MI E6 Drummond Island, MI [New]

Drummond Island Airport, MI
(Lat. 46°00'34" N., long. 083°44'38" W.)

That airspace extending upward from 1,200 feet above the surface within a 17-mile radius of Drummond Island Airport, excluding that airspace within Canada.

Issued in Fort Worth, TX, on October 11, 2016.

Robert W. Beck,

Manager, Operations Support Group, ATO Central Service Center.

BILLING CODE 4910-13-P

DEPARTMENT OF THE TREASURY

Internal Revenue Service

26 CFR Part 300

[REG-134122-15]

RIN 1545-BN09

Special Enrollment Examination User Fee for Enrolled Agents

AGENCY: Internal Revenue Service (IRS), Treasury.

ACTION: Withdrawal of notice of proposed rulemaking, notice of proposed rulemaking, and notice of public hearing.

SUMMARY: This document withdraws a proposed regulation relating to the user fee for the special enrollment examination to become an enrolled agent. This document also proposes a new regulation to increase the user fee for the examination to recover the cost to the IRS of overseeing the administration of the examination. The withdrawal and proposal affect individuals taking the enrolled agent special enrollment examination. This document also contains a notice of public hearing on the new proposed regulation.

DATES: Written or electronic comments must be received by December 27, 2016. Requests to speak and outlines of topics to be discussed at the public hearing scheduled for December 29, 2016, must be received by December 27, 2016.

ADDRESSES: Send submissions to: CC:PA:LPD:PR (REG-134122-15), Room 5203, Internal Revenue Service, P.O. Box 7604, Ben Franklin Station, Washington, DC 20044. Submissions may be hand-delivered between the

hours of 8 a.m. and 4 p.m. to CC:PA:LPD:PR (REG-134122-15), Courier's Desk, Internal Revenue Service, 1111 Constitution Avenue NW., Washington, DC 20224, or sent via the Federal eRulemaking Portal at www.regulations.gov (IRS REG-134122-15). The public hearing will be held in the IRS Auditorium, Internal Revenue Building, 1111 Constitution Avenue NW., Washington, DC.

FOR FURTHER INFORMATION CONTACT:

Concerning this proposed regulation, Jonathan R. Black, (202) 317-6845 (not a toll-free number); concerning submissions of comments, the hearing, or to be placed on the building access list to attend the hearing, Regina Johnson, (202) 317-6901 (not a toll-free number); concerning cost methodology, Eva Williams, (202) 803-9728 (not a toll-free number).

SUPPLEMENTARY INFORMATION:

Background and Explanation of Provisions

A. Enrolled Agents and the Special Enrollment Examination

Section 330 of title 31 of the United States Code authorizes the Secretary of the Treasury to regulate the practice of representatives before the Treasury Department. Pursuant to 31 U.S.C. 330, the Secretary has published regulations governing practice before the IRS in 31 CFR part 10 and reprinted the regulations as Treasury Department Circular No. 230 (Circular 230).

Section 10.4(a) of Circular 230 authorizes the IRS to grant status as enrolled agents to individuals who demonstrate special competence in tax matters by passing a written examination (Enrolled Agent Special Enrollment Examination (EA-SEE)) administered by, or under the oversight of, the IRS and who have not engaged in any conduct that would justify suspension or disbarment under Circular 230. There were a total of 51,755 active enrolled agents as of September 1, 2016.

Starting in 2006, the IRS engaged the services of a third-party contractor to develop and administer the EA-SEE. The EA-SEE is composed of three parts, which are offered in a testing period that begins each May 1 and ends the last day of the following February. The EA-SEE is not available in March and April, during which period it is updated to reflect recent changes in the relevant law. More information on the EA-SEE, including content, scoring, and how to register, can be found on the IRS Web site at www.irs.gov/tax-professionals/enrolled-agents. The IRS Return

Preparer Office (RPO) oversees the administration of the EA-SEE.

B. User Fee Authority

The Independent Offices Appropriations Act (IOAA) (31 U.S.C. 9701) authorizes each agency to promulgate regulations establishing the charge for services provided by the agency (user fees). The IOAA provides that these user fee regulations are subject to policies prescribed by the President and shall be as uniform as practicable. Those policies are currently set forth in the Office of Management and Budget (OMB) Circular A-25 (OMB Circular), 58 FR 38142 (July 15, 1993).

The IOAA states that the services provided by an agency should be self-sustaining to the extent possible. 31 U.S.C. 9701(a). The OMB Circular states that agencies that provide services that confer special benefits on identifiable recipients beyond those accruing to the general public are to establish user fees that recover the full cost of providing those services. The OMB Circular requires that agencies identify all services that confer special benefits and determine whether user fees should be assessed for those services.

Agencies are to review user fees biennially and update them as necessary to reflect changes in the cost of providing the underlying services. During this biennial review, an agency must calculate the full cost of providing each service, taking into account all direct and indirect costs to any part of the U.S. government. The full cost of providing a service includes, but is not limited to, salaries, retirement benefits, rents, utilities, travel, and management costs, as well as an appropriate allocation of overhead and other support costs associated with providing the service.

An agency should set the user fee at an amount that recovers the full cost of providing the service unless the agency requests, and the OMB grants, an exception to the full-cost requirement. The OMB may grant exceptions only where the cost of collecting the fees would represent an unduly large part of the fee for the activity, or where any other condition exists that, in the opinion of the agency head, justifies an exception. When the OMB grants an exception, the agency does not collect the full cost of providing the service and therefore must fund the remaining cost of providing the service from other available funding sources. When the OMB grants an exception, the agency subsidizes the cost of the service to the recipients of reduced-fee services even though the service confers a special benefit on those recipients who should

otherwise be required to pay the full costs of receiving that benefit as provided for by the IOAA and the OMB Circular.

C. The EA-SEE User Fee

As discussed above, Circular 230 § 10.4(a) provides that the IRS will grant enrolled agent status to an applicant if the applicant, among other things, demonstrates special competence in tax matters by written examination. The EA-SEE is the written examination that tests special competence in tax matters for purposes of that provision, and an applicant must pass all parts of the EA-SEE to be granted enrolled agent status through written examination. The IRS confers a benefit on individuals who take the EA-SEE beyond those that accrue to the general public by providing them with an opportunity to demonstrate special competence in tax matters by passing a written examination and therefore satisfying one of the requirements for becoming an enrolled agent under Circular 230 § 10.4(a). Because the opportunity to take the EA-SEE is a special benefit, the IRS charges a user fee to take the examination.

Pursuant to the guidelines in the OMB Circular, the IRS has calculated its cost of providing examination services under the enrolled agent program. The proposed user fee will be implemented under the authority of the IOAA and the OMB Circular and will recover the full cost of overseeing the program. The current user fee is \$11 to take each part of the EA-SEE. The contractor who administers the EA-SEE also charges individuals taking the EA-SEE an additional fee for its services. For the May 2016 to February 2017 testing period, the contractor's fee is \$98 for each part of the EA-SEE. For the March 2017 to February 2019 testing periods, the contractor's fee will be \$100.94. For the March 2019 to February 2020 testing period, the contractor's fee will be \$103.97. The fee charged by the contractor is fixed by the current contract terms and therefore may not be reduced or renegotiated at this time. The contract will expire on February 29, 2020. The contract was subject to public procurement procedures, and there were no tenders that were more competitive.

The IRS has not increased the EA-SEE user fee since 2006, when it published the existing user fee regulation. Since that time, the costs incurred by the IRS to implement the EA-SEE program have increased. The IRS has recently gathered sufficient data to reliably estimate the IRS's current costs in implementing the EA-SEE

program as described in the costing analysis contained in this preamble.

The increased costs require an increase in the EA–SEE user fee. The increased costs are primarily attributable to the following: (1) The cost for background checks required under Publication 4812, “Contractor Security Controls,” for individuals working at the contractor’s testing centers increased by \$289,000 per year; (2) the IRS estimates that the contractor will administer 12,000 fewer parts of the EA–SEE per year than the estimated 34,000 used to calculate the \$11 fee, and the total costs are therefore being recovered from fewer individuals; and (3) the IRS’s costs of verifying the contractor’s compliance with the information technology security requirements necessary to protect the personally identifiable information of individuals taking the EA–SEE have increased, because Publication 4812 has strengthened those requirements.

In addition, the scope of the work performed to oversee the contract has expanded beyond what it was in 2006. The proposed fee more accurately accounts for the time and personnel necessary to oversee the development and administration of the EA–SEE and to ensure the contractor complies with the terms of its contract. The IRS’s costs for oversight now include costs associated with: (1) Review and approval of materials used by the contractor in developing the EA–SEE; (2) review of surveys of existing enrolled agents, which help to determine the topics to be covered in the EA–SEE; (3) composition of potential EA–SEE questions in coordination with the contractor’s external tax law experts; (4) Office of Chief Counsel review and revision of the potential questions for legal accuracy; and (5) analysis of the answers and raw scores of a testing population to determine what should be a passing score.

Further, the IRS’s personnel ensure the contractor’s compliance with its contract by reviewing the work of the contractor using an annual Work Breakdown Structure—a project management tool—and reviewing and verifying that the contractor is in compliance with its Quality Assurance Plan regarding customer satisfaction and accuracy. The IRS incurs additional costs associated with resolution of test-related issues such as cheating incidents, appeals regarding scores, refund requests, and customer service complaints that are not resolved at the contractor level.

Taking into account the full amount of these costs, the user fee for the EA–

SEE is proposed to be increased to \$81 per part as of the testing period that begins on May 1, 2017. The IRS does not intend to subsidize any of the cost of making the EA–SEE available to examinees, and is not applying for an exception to the full-cost requirement from the OMB.

D. Previous EA–SEE NPRM Is Withdrawn

On January 26, 2016, a notice of proposed rulemaking (REG–134122–15) proposing an increase to the EA–SEE user fee was published in the **Federal Register** (81 FR 4221). The January 26, 2016 notice of proposed rulemaking proposed to increase the EA–SEE user fee to \$99 per part. The IRS has redetermined the user fee and now proposes to increase the user fee to \$81 per part. The January 26, 2016 notice of proposed rulemaking is withdrawn.

E. Calculation of User Fees Generally

User fee calculations begin by first determining the full cost for the service. The IRS follows the guidance provided by the OMB Circular to compute the full cost of the service, which includes all indirect and direct costs to any part of the U.S. government, including, but not limited to, direct and indirect personnel costs, physical overhead, rents, utilities, travel, and management costs. The IRS’s cost methodology is described below.

Once the total amount of direct and indirect costs associated with a service is determined, the IRS follows the guidance in the OMB Circular to determine the costs associated with providing the service to each recipient, which represents the average per unit cost of that service. This average per unit cost is the amount of the user fee that will recover the full cost of the service.

The IRS follows generally accepted accounting principles (GAAP), as established by the Federal Accounting Standards Advisory Board (FASAB) in calculating the full cost of providing services. The FASAB Handbook of Accounting Standards and Other Pronouncements, as amended, which is available at http://files.fasab.gov/pdf/files/2015_fasab_handbook.pdf, includes the Statement of Federal Financial Accounting Standards No. 4: Managerial Cost Accounting Concepts and Standards for the Federal Government (SFFAS No. 4). SFFAS No. 4 establishes internal costing standards under GAAP to accurately measure and manage the full cost of federal programs. The methodology described below is in accordance with SFFAS No. 4.

1. Cost Center Allocation

The IRS determines the cost of its services and the activities involved in producing them through a cost accounting system that tracks costs to organizational units. The lowest organizational unit in the IRS’s cost accounting system is called a cost center. Cost centers are usually separate offices that are distinguished by subject-matter area of responsibility or geographic region. All costs of operating a cost center are recorded in the IRS’s cost accounting system and allocated to that cost center. The costs allocated to a cost center are the direct costs for the cost center’s activities as well as all indirect costs, including overhead, associated with that cost center. Each cost is recorded in only one cost center.

2. Determining the Per-Unit Cost

To establish the per-unit cost, the total cost of providing the service is divided by the volume of services provided. The volume of services provided includes both services for which a fee is charged as well as subsidized services. The subsidized services are those where the OMB has approved an exception to the full cost requirement, for example, to charge a reduced fee to low-income taxpayers. The volume of subsidized services is included in the total volume of services provided to ensure that the IRS, and not those who are paying full cost, subsidizes the cost of the reduced-full cost services.

3. Cost Estimation of Direct Labor and Benefits

Not all cost centers are fully devoted to only one service for which the IRS charges a user fee. Some cost centers work on a number of different services. In these cases, the IRS estimates the cost incurred in those cost centers attributable to the service for which a user fee is being calculated by measuring the time required to accomplish activities related to the service and estimating the average time required to accomplish these activities. The average time required to accomplish these activities is multiplied by the relevant organizational unit’s average labor and benefits costs per unit of time to determine the labor and benefits costs incurred to provide the service. To determine the full cost, the IRS then adds an appropriate overhead charge as discussed below.

4. Calculating Overhead

Overhead is an indirect cost of operating an organization that cannot be immediately associated with an activity that the organization performs.

Overhead includes costs of resources that are jointly or commonly consumed by one or more organizational unit's activities but are not specifically identifiable to a single activity.

These costs can include:

- General management and administrative services of sustaining and supporting organizations
- Facilities management and ground maintenance services (security, rent, utilities, and building maintenance)
- Procurement and contracting services
- Financial management and accounting services
- Information technology services
- Services to acquire and operate property, plants and equipment
- Publication, reproduction, and graphics and video services
- Research, analytical, and statistical services
- Human resources/personnel services
- Library and legal services

To calculate the overhead allocable to a service, the IRS first calculates the Corporate Overhead rate and then multiplies the Corporate Overhead rate by the direct labor and benefits costs determined as discussed above. The IRS calculates the Corporate Overhead rate annually based on cost elements underlying the Statement of Net Cost included in the IRS Annual Financial Statements, which are audited by the Government Accountability Office. The Corporate Overhead rate is the ratio of the sum of the IRS's indirect labor and benefits costs from the supporting and sustaining organizational units—those that do not interact directly with taxpayers—and all non-labor costs to the IRS's labor and benefits costs of its organizational units that interact directly with taxpayers.

The Corporate Overhead rate of 65.85 percent for costs reviewed during FY 2015 was calculated based on FY 2014 costs as follows:

Indirect Labor and Benefits Costs
\$1,693,339,843.

Non-Labor Costs + \$2,832,262,970.

Total Indirect Costs \$4,525,602,813.

Direct Labor and Benefits Costs +
\$6,872,934,473.

Corporate Overhead Rate 65.85%.

F. Calculation of the EA–SEE User Fee

1. Cost Estimate

The RPO is the only organization involved in overseeing the administration of the EA–SEE. The cost centers within the RPO support multiple programs and are not solely dedicated to the EA–SEE. The RPO, however, has a staff of only ten people

who devote time to oversee the administration of the EA–SEE program. Because there are only a few individuals who directly handle oversight of the EA–SEE, the IRS projected the estimated costs of direct labor and benefits based on the actual labor and benefits of these specific individuals reduced to reflect the percentage of time each individual spends overseeing the EA–SEE program. The RPO's managers are able to estimate the percentage of time these employees devote to overseeing the EA–SEE program based on their knowledge of actual program assignments. Of the ten people, eight devote seventy-five percent or more of their time to EA–SEE-related activities, and two devote approximately ten percent of their time to EA–SEE-related activities.

The baseline for the labor and benefits estimate was the actual labor and benefits for the ten personnel for Fiscal Year 2015. From this baseline, the IRS estimated the direct labor and benefits costs over the next three years using an inflation factor for Fiscal Years 2016, 2017, and 2018. The IRS used a three year projection because the increase in future labor and benefits costs are reliably predictable representations of the actual costs that will be incurred by the RPO. These estimated direct labor and benefits costs were then reduced by the percentage of time each of the ten individuals devoted to the EA–SEE program and are set out in the following table:

Year	Estimated direct labor and benefits costs
2016	\$912,180
2017	921,302
2018	930,515
Total	2,763,997

The total estimated direct labor and benefits costs for the three years is \$2,763,997. After estimating the direct total labor and benefits, the IRS applied the Fiscal Year 2015 Corporate Overhead rate of 65.85 percent to the estimated direct labor and benefits to calculate indirect costs of \$1,820,092, for a total labor and benefits costs for the three year period of \$4,584,089.

The EA–SEE program incurs a cost for required background investigations performed on the employees of the contractor that administers the EA–SEE. The background investigations are not performed by the RPO, so the cost of the background investigations is not included in the direct labor and benefits costs calculated above for the ten RPO employees. The contractor administers

the EA–SEE at approximately 260 domestic locations, and each employee at these locations must undergo a background investigation in order to administer the EA–SEE. The contractor's employees are typically short-term or seasonal workers, so the IRS must perform background investigations on new employees on a continuing basis. Where permissible, the IRS will piggyback on previously completed background investigations. Typically, the IRS may rely on another government agency's background investigation for up to two years from the date the prior investigation was completed. However, investigations performed by other organizations for the contractor's employees generally cannot supplant the need for the IRS to perform its own investigations because the IRS's background investigations include, among other elements, federal tax compliance checks, which are not necessarily part of investigations performed by other organizations. The EA–SEE is the only exam that the contractor administers on behalf of the IRS, so the contractor's new hires typically have not undergone a background investigation performed by the IRS prior to being hired.

The IRS estimated the cost for background investigations using historical costs from the years 2012 through 2014. The IRS cannot forecast the future costs of background investigations with the same certainty as it can forecast labor and benefits, and it therefore used a historical three year average to estimate the background investigation costs. The IRS did not include the historical background investigation cost from 2015 in the historical average because 2014 was the most recent year for which information was available at the time the IRS initiated this project to update the user fee.

The cost for background investigations for the contractor was an average of \$289,000 per year for the years 2012 through 2014, calculated as follows: The costs of all background investigations incurred on behalf of the RPO were \$294,000, \$259,000, and \$409,000 in 2012, 2013, and 2014, respectively, for a \$321,000 yearly average. Ninety percent of these background investigations were for the contractor who administers the EA–SEE. The other ten percent of these background investigations did not relate to the EA–SEE, so the IRS multiplied the \$321,000 yearly average cost of background investigations by the ninety percent allocable to the contractor. The resulting average annual cost for EA–SEE background investigations for each

year of the three year period was \$289,000, with a total cost of \$867,000. The IRS used the historical cost totals as the estimate of the 2016, 2017, and 2018 background investigations costs. Because background investigation costs may not increase as predictably as labor and benefits costs, the IRS did not apply an inflation factor.

The calculation of the total cost of the EA–SEE program for 2016 through 2018 is below:

Direct Labor and Benefits \$2,763,997.
Corporate Overhead at 65.85%
 \$1,820,092.
Subtotal \$4,584,089.
Background Checks \$867,000.
Total EA–SEE Cost \$5,451,089.

2. Volume of Examinations

The number of examinations provided during Fiscal Years 2012, 2013, and 2014 were 23,985, 23,110, and 20,180, respectively. As with the cost of background investigations, the number of examinations administered in 2015 was not available at the time this project was initiated, and the IRS therefore did not include it in the calculation. The total number of examinations for the three years was 67,275. The IRS used this historical three-year volume to estimate the number of examinations it expects to provide in 2016, 2017, and 2018.

3. Unit Cost Per Examination

The IRS divided the three year total EA–SEE program costs by the total volume of examinations expected over the same three year period to determine a unit cost per examination of \$81.

Total EA–SEE Cost \$5,450,089.
Volume ÷ 67,275.
Unit Cost \$81.

Special Analyses

Certain Treasury regulations, including this one, are exempt from the requirements of Executive Order 12866, as supplemented and reaffirmed by Executive Order 13563. Therefore, a regulatory impact assessment is not required. It is hereby certified that this proposed regulation, if adopted, would not have a significant economic impact on a substantial number of small entities. This certification is based on the information that follows. The user fee primarily affects individuals who take the enrolled agent examination, many of whom may not be classified as small entities under the Regulatory Flexibility Act. Therefore, a substantial number of small entities is not likely to be affected. Further, the economic impact on any small entities affected would be limited to paying the \$70 difference in cost per part between the

proposed \$81 user fee and the existing \$11 user fee, which is unlikely to present a significant economic impact. Moreover, the total economic impact of this proposed regulation would be approximately \$1.57 million, which is the product of the approximately 22,425 parts of the EA–SEE administered annually and the \$70 increase in the fee. Accordingly, the proposed rule is not expected to have a significant economic impact on a substantial number of small entities, and a regulatory flexibility analysis is not required. Pursuant to section 7805(f) of the Internal Revenue Code, this notice of proposed rulemaking has been submitted to the Chief Counsel for Advocacy of the Small Business Administration for comment on its impact on small business.

Comments and Public Hearing

Before this proposed regulation is adopted as a final regulation, consideration will be given to any comments that are submitted timely to the IRS as prescribed in the preamble under the **ADDRESSES** section. The Treasury Department and the IRS request comments on all aspects of the proposed regulation. All comments submitted will be made available at www.regulations.gov or upon request.

A public hearing has been scheduled for December 29, 2016, beginning at 10:00 a.m. in the IRS Auditorium, Internal Revenue Building, 1111 Constitution Avenue NW., Washington, DC. Due to building security procedures, visitors must enter at the Constitution Avenue entrance. All visitors must present photo identification to enter the building. Because of access restrictions, visitors will not be admitted beyond the immediate entrance area more than 30 minutes before the hearing starts. For information about having your name placed on the building access list to attend the hearing, see the **FOR FURTHER INFORMATION CONTACT** section of this preamble.

The rules of 26 CFR 601.601(a)(3) apply to the hearing. Persons who wish to present oral comments at the hearing must submit written or electronic comments and an outline of the topics to be discussed and the time to be devoted to each topic by December 27, 2016. A period of 10 minutes will be allocated to each person for making comments.

An agenda showing the scheduling of the speakers will be prepared after the deadline for receiving outlines has passed. Copies of the agenda will be available free of charge at the hearing.

Drafting Information

The principal author of this regulation is Jonathan R. Black of the Office of the Associate Chief Counsel (Procedure and Administration).

List of Subjects in 26 CFR Part 300

Reporting and recordkeeping requirements, User fees.

Withdrawal of Notice of Proposed Rulemaking

Accordingly, under the authority of 26 U.S.C. 7805, the notice of proposed rulemaking (REG–134122–15) that was published in the **Federal Register** on January 26, 2016, (81 FR 4221) is withdrawn.

Proposed Amendments to the Regulations

Accordingly, 26 CFR part 300 is proposed to be amended as follows:

PART 300—USER FEES

Paragraph 1. The authority citation for part 300 continues to read as follows:

Authority: 31 U.S.C. 9701.

Par. 2. Section 300.4 is amended by revising paragraphs (b) and (d) to read as follows:

§ 300.4 Enrolled agent special enrollment examination fee.

* * * * *

(b) *Fee.* The fee for taking the enrolled agent special enrollment examination is \$81 per part, which is the cost to the government for overseeing the development and administration of the examination and does not include any fees charged by the administrator of the examination.

* * * * *

(d) *Applicability date.* This section applies on and after the date of publication of a Treasury decision adopting this rule as a final regulation in the **Federal Register**.

John Dalrymple,

Deputy Commissioner for Services and Enforcement.

BILLING CODE 4830–01–P

ENVIRONMENTAL PROTECTION AGENCY**40 CFR Parts 272**

[EPA–R06–RCRA–2014–0791; FRL–9951–73–Region 6]

Oklahoma: Incorporation by Reference of State Hazardous Waste Management Program**AGENCY:** Environmental Protection Agency (EPA).**ACTION:** Proposed rule.

SUMMARY: The Environmental Protection Agency (EPA) proposes to codify in the regulations entitled “Approved State Hazardous Waste Management Programs”, Oklahoma’s authorized hazardous waste program. The EPA will incorporate by reference into the Code of Federal Regulations (CFR) those provisions of the State regulations that are authorized and that the EPA will enforce under the Solid Waste Disposal Act, commonly referred to as the Resource Conservation and Recovery Act (RCRA).

DATES: Send written comments by November 25, 2016.

ADDRESSES: Submit any comments identified by Docket ID No. EPA–R06–RCRA–2014–0791, by one of the following methods:

1. *Federal eRulemaking Portal:* <http://www.regulations.gov>. Follow the on-line instructions for submitting comments.

2. *Email:* patterson.alima@epa.gov or banks.julia@epa.gov.

3. *Mail:* Alima Patterson, Region 6, Regional Authorization Coordinator, or Julia Banks, Codification Coordinator, Permit Section (RPM), Multimedia Planning and Permitting Division, EPA Region 6, 1445 Ross Avenue, Dallas, Texas 75202–2733.

4. *Hand Delivery or Courier:* Deliver your comments to Alima Patterson, Region 6, Regional Authorization Coordinator, or Julia Banks, Codification Coordinator, Permit Section (RPM), Multimedia Planning and Permitting Division, EPA Region 6, 1445 Ross Avenue, Dallas, Texas 75202–2733.

Instructions: Do not submit information that you consider to be Confidential Business Information (CBI) or otherwise protected through [regulations.gov](http://www.regulations.gov), or email. Direct your comments to Docket ID No. EPA–R06–RCRA–2014–0791. The Federal [regulations.gov](http://www.regulations.gov) Web site is an “anonymous access” system, which means the EPA will not know your identity or contact information unless you provide it in the body of your comment. If you send an email comment directly to the EPA without

going through [regulations.gov](http://www.regulations.gov), your email address will be automatically captured and included as part of the comment that is placed in the public docket and made available on the Internet. If you submit an electronic comment, the EPA recommends that you include your name and other contact information in the body of your comment and with any disk or CD–ROM you submit. If the EPA cannot read your comment due to technical difficulties and cannot contact you for clarification, the EPA may not be able to consider your comment. Electronic files should avoid the use of special characters, any form of encryption, and be free of any defects or viruses. You can view and copy the documents that form the basis for this authorization and codification and associated publicly available materials from 8:30 a.m. to 4 p.m. Monday through Friday at the following location: EPA Region 6, 1445 Ross Avenue, Dallas, Texas 75202–2733, phone number: (214) 665–8533 or (214) 665–8178. Interested persons wanting to examine these documents should make an appointment with the office at least two weeks in advance.

FOR FURTHER INFORMATION CONTACT: Alima Patterson, Region 6, Regional Authorization Coordinator or Julia Banks, Codification Coordinator, Permit Section (RPM), Multimedia Planning and Permitting Division, EPA Region 6, 1445 Ross Avenue, Dallas, Texas 75202–2733, Phone number: (214) 665–8533 or (214) 665–8178, and Email address: patterson.alima@epa.gov or banks.julia@epa.gov.

SUPPLEMENTARY INFORMATION: In the “Rules and Regulations” section of this **Federal Register** (FR), the EPA is codifying and incorporating by reference the State’s hazardous waste program as direct final rule. The EPA did not make a proposal prior to the direct final rule because we believe these actions are not controversial and do not expect comments that oppose them. We have explained the reasons for this codification and incorporation by reference in the preamble to the direct final rule. Therefore, the purpose of this FR document is to codify Oklahoma’s base hazardous waste management program and its program revisions through RCRA Cluster XXI (see 78 FR 32161) May 29, 2013. The EPA provided notices and opportunity for comments on the Agency’s decisions to authorize the Oklahoma program, and the EPA is not now reopening the decisions, nor requesting comments, on the Oklahoma authorizations as published in the FR notices specified in Section B of the direct final rule FR document.

This document incorporates by reference Oklahoma’s hazardous waste statutes and regulations and clarifies which of these provisions are included in the authorized and federally enforceable program. By codifying Oklahoma’s authorized program and by amending the Code of Federal Regulations, the public will be more easily able to discern the status of federally approved requirements of the Oklahoma hazardous waste management program.

Dated: August 1, 2016.

Ron Curry,

Regional Administrator, EPA Region 6.

BILLING CODE 6560–50–P

FEDERAL COMMUNICATIONS COMMISSION**47 CFR Part 76**

[MB Docket No. 16–41; FCC 16–129]

Promoting the Availability of Diverse and Independent Sources of Video Programming

AGENCY: Federal Communications Commission.

ACTION: Proposed rule.

SUMMARY: In this document, the Federal Communications Commission (Commission) proposes to adopt rules that prohibit certain practices some multichannel video programming distributors (MVPDs) use in their negotiations for carriage of video programming that may impede competition, diversity, and innovation in the video marketplace. Specifically, the document proposes to prohibit the inclusion of “unconditional” most favored nation (MFN) provisions and unreasonable alternative distribution method (ADM) provisions in program carriage agreements between MVPDs and independent video programming vendors.

DATES: Comments are due on or before December 27, 2016; reply comments are due on or before January 23, 2017.

ADDRESSES: You may submit comments, identified by MB Docket No. 16–41, by any of the following methods:

- *Federal eRulemaking Portal:* <http://www.regulations.gov>. Follow the instructions for submitting comments.

- *Federal Communications Commission’s Web site:* <http://fjallfoss.fcc.gov/ecfs2/>. Follow the instructions for submitting comments.

- *Mail:* Filings can be sent by hand or messenger delivery, by commercial

overnight courier, or by first-class or overnight U.S. Postal Service mail. All filings must be addressed to the Commission's Secretary, Office of the Secretary, Federal Communications Commission.

People with Disabilities: Contact the FCC to request reasonable accommodations (accessible format documents, sign language interpreters, CART, etc.) by email: FCC504@fcc.gov or phone: (202) 418-0530 or TTY: (202) 418-0432.

FOR FURTHER INFORMATION CONTACT: For additional information on this proceeding, contact Raelynn Remy or Calisha Myers of the Policy Division, Media Bureau at Raelynn.Remy@fcc.gov, calisha.myers@fcc.gov, or (202) 418-2120.

SUPPLEMENTARY INFORMATION: This is a summary of the Commission's Notice of Proposed Rulemaking, FCC 16-129, adopted and released on September 29, 2016. The full text is available for public inspection and copying during regular business hours in the FCC Reference Center, Federal Communications Commission, 445 12th Street SW., Room CY-A257, Washington, DC 20554. This document will also be available via ECFS at <https://ecfsapi.fcc.gov/file/0929819517733/FCC-16-129A1.pdf>. Documents will be available electronically in ASCII, Microsoft Word, and/or Adobe Acrobat. The complete text may be purchased from the Commission's copy contractor, 445 12th Street SW., Room CY-B402, Washington, DC 20554. Alternative formats are available for people with disabilities (Braille, large print, electronic files, audio format), by sending an email to fcc504@fcc.gov or calling the Commission's Consumer and Governmental Affairs Bureau at (202) 418-0530 (voice), (202) 418-0432 (TTY).

Synopsis

1. We propose to adopt rules that prohibit the inclusion of unconditional most favored nation and unreasonable alternative distribution method provisions in carriage agreements between MVPDs and independent video programming vendors.¹ We seek comment below on our authority to adopt these rules pursuant to Section 616(a) of the Act, which directs the Commission to "establish regulations

governing program carriage agreements and related practices between [MVPDs] and video programming vendors."² We believe that our proposed rules will serve the objectives of Section 616 and the public interest by removing obstacles to enhanced competition, programming diversity, and innovation in the marketplace.

2. *Application to "Independent Video Programming Vendors."* We propose to apply the following rules to program carriage agreements between MVPDs³ and "independent video programming vendors."⁴ In the NOI, we defined "independent programmer" as a programmer that is not vertically integrated with an MVPD.⁵ Several commenters pointed out, however, that for purposes of this proceeding, we should define that term more narrowly to exclude established programmers that control a significant share of the video programming marketplace and therefore have bargaining leverage in carriage negotiations. Given this, we seek comment on whether, for purposes of the proposed rules, the term "independent video programming vendor" should be defined more narrowly to reflect that certain large programmers that are not vertically integrated with an MVPD do not confront the same obstacles in securing carriage for their content as smaller or niche programmers.

3. For example, as suggested by ITTA, should we define an independent video programming vendor as a video programming vendor that is not affiliated with a broadcast network, movie studio or MVPD? Alternatively,

² 47 U.S.C. 536(a).

³ *Id.* 522(13) (defining the term "multichannel video programming distributor" to mean "a person such as, but not limited to, a cable operator, a multichannel multipoint distribution service, a direct broadcast satellite service, or a television receive-only satellite program distributor, who makes available for purchase by subscribers or customers, multiple channels of video programming"); 47 CFR 76.1000(e) (defining MVPD as "an entity engaged in the business of making available for purchase, by subscribers or customers, multiple channels of video programming. Such entities include, but are not limited to, a cable operator, a BRS/EBS provider, a direct broadcast satellite service, a television receive-only satellite program distributor, and a satellite master antenna television system operator, as well as buying groups or agents of all such entities.").

⁴ Under this proposal, an "independent video programming vendor" would be a subset of the "video programming vendors" covered by Section 616 of the Act. 47 U.S.C. 536. See also *Liberian Broadcasting, Inc. v. Comcast Corporation*, MB Docket No. 16-121, Memorandum Opinion and Order, 2016 WL 4494601, at *1. As noted in the NOI, we do not address in this proceeding issues relating to retransmission consent negotiations between MVPDs and broadcast stations. NOI, 81 FR at 10243, n.3.

⁵ *Id.* at 10243, n.4.

or in combination with this approach, should we define an independent video programming vendor based on whether such vendor earns less than a threshold amount of annual gross revenue? If we were to define an independent programmer based on its annual gross revenue, what is the appropriate revenue threshold? Should we consider adopting a revenue threshold that is based solely on programming license fees and/or advertising revenue? Or are there other sources of revenue that we should consider? An alternative to using a threshold based on revenue is to define an independent programmer based on a programmer's total assets or a combination of revenue and total assets.⁶ Under this approach, what is the appropriate threshold for determining that a programming vendor is "independent," and how should that threshold be calculated? If we were to define independent programmer based on its revenue and/or assets, should a programmer that is affiliated with a MVPD, a broadcaster, or another video programming vendor be attributed with the revenue and/or assets of such affiliated entities?⁷ Or, instead, should we exclude from the definition any programmer that is affiliated with an MVPD, a broadcaster, or another video programming vendor, regardless of its annual revenue or total assets? We also seek comment on how a programmer could establish that it satisfies whatever definition of independent video programming vendor we adopt. In addition, we seek input on whether excluding larger programmers from the protections that would be afforded by our proposed rules would have any adverse impact on the video marketplace or consumers. To what extent are larger programmers subject to the types of contract provisions we are proposing to prohibit? Given the costs involved in bringing a complaint to the Commission, would larger programmers be more likely than smaller programmers to pursue relief through the filing of a complaint? We seek comment on any other potential way to define "independent video programming

⁶ See 47 CFR 24.709(a)(1) (1994) (setting the threshold for small entities at an annual gross revenue of less than \$125 million and total assets of less than \$500 million).

⁷ The Commission has stated that, for the purpose of determining whether a video programming vendor is affiliated with an MVPD under Section 616, it would apply the attribution standards applicable to its program access rules. *Implementation of Sections 12 and 19 of the Cable Television Consumer Protection and Competition Act of 1992, Development of Competition and Diversity in Video Programming and Distribution*, Second Report and Order, 9 FCC Rcd 2642, 2650, para. 19 (1993) (*Program Carriage Second Report and Order*).

¹ The prohibitions we propose herein are targeted only at contract clauses that harm competition, diversity and innovation while providing no apparent public interest benefits. If these proposals are adopted, independent programmers and MVPDs would have latitude to include conditional MFN and reasonable ADM provisions in their carriage agreements.

vendor” and on how any such definition would further the objectives of this proceeding. Finally, we seek comment on whether certain of the possible definitions of independent programmer would raise First Amendment concerns.

4. *Prohibition on “Unconditional” MFN Provisions.* We propose to adopt a rule that prohibits the inclusion of unconditional MFN provisions in carriage agreements between MVPDs and independent video programming vendors. For the purpose of applying this rule, we propose to define an unconditional MFN provision as “a provision that entitles an MVPD to contractual rights or benefits that an independent video programming vendor has offered or granted to another video programming distributor,⁸ without obligating the MVPD to accept any terms and conditions that are integrally related, logically linked, or directly tied⁹ to the grant of such rights or benefits in the other video programming distributor’s agreement, and with which the MVPD can reasonably comply technologically and legally.”¹⁰

5. In proposing this rule, we acknowledge that MFN provisions, which have long been common in the industry, may have legitimate public interest justifications, such as

⁸ The term “video programming distributor” as used here includes both traditional MVPDs and alternative distributors of video programming, such as OVDs. See ACA August 26 *Ex Parte* Letter at 1, 8.

⁹ The phrase “integrally related, logically linked, or directly tied” derives from DOJ’s Proposed Final Judgment in its review of the Charter Communications-Time Warner Cable (Charter-TWC) transaction. *U.S. v. Charter Communications, Inc. et al.*, Proposed Final Judgment, Civil Action No. 16-cv-00759 at 5, Section IV.B.2.i. (2016) (DOJ Charter-TWC Proposed Final Judgment). The relevant merger condition, among other things, bars Charter-TWC from entering into any agreement with a video programmer that creates incentives to limit such programmer’s provision of programming to OVDs, including agreements that entitle Charter-TWC to receive contractual benefits granted to an OVD “without requiring [Charter-TWC] to also accept any obligations, limitations, or conditions . . . that are *integrally related, logically linked, or directly tied* to the . . . grant of such . . . benefits.” *Id.* (emphasis added). DOJ used this phrase in crafting this condition because it found that such language is consistent with that contained in conditional MFN provisions industrywide. DOJ Charter-TWC Competitive Impact Statement at 17, n.8.

¹⁰ The phrase “reasonably comply technologically and legally” also derives from DOJ’s Proposed Final Judgment in the Charter-TWC transaction. DOJ Charter-TWC Proposed Final Judgment at 6, Section IV.B.2.ii. The relevant provision, which DOJ also found to be consistent with conditional MFN provisions throughout the industry, generally relieves Charter-TWC from having to comply with related terms and conditions if it is unable to do so for technological or regulatory reasons. DOJ Charter-TWC Competitive Impact Statement at 17, n.8. See also DOJ Charter-TWC Proposed Final Judgment at 6.

facilitating efficient negotiations by enabling well-informed positions, encouraging investment in programming by enabling MVPDs to adjust contract terms after an initial agreement is executed, and broadening MVPD subscribers’ access to video content by allowing MVPDs to secure additional rights to programming. However, we are not persuaded based on the record that such justifications exist for MFN provisions that are unconditional and thus permit “cherry picking” of the best contract terms. Because, as noted above, unconditional MFN provisions entitle an MVPD to the most favorable terms granted to other distributors without obligating the MVPD to provide the same or equivalent consideration in exchange for those terms, such provisions appear designed to discourage or foreclose the wider distribution of video content, including on online platforms.

6. The record reflects, moreover, that this category of MFN provisions can apply upward pressure on both wholesale and retail prices for program content by reducing a programmer’s incentive to cut its carriage rates to any one distributor out of fear that doing so would require it to reduce the rates charged to distributors with unconditional MFN status without receiving any reciprocal benefits. As a consequence, unconditional MFN provisions effectively limit the flexibility of content providers to enter into unique deals with new and emerging distributors, thereby impeding entry into program production and distribution marketplaces and reducing consumer choice.¹¹ We also note that

¹¹ See, e.g., Milunovich Remarks at 62:03; Newton Remarks at 130:30. See also *Charter-TWC Order*, 2016 WL 2858801, at *63, para. 221. The Commission has rejected the argument that MFN provisions included in agreements between cable operators and local franchising authorities reduce the incentives of a local franchising authority to agree to a more favorable deal with overbuilders new to the market. See, e.g., *Implementation of Section 621(A)(1) of The Cable Communications Policy Act of 1984, as amended by The Cable Television Consumer Protection and Competition Act of 1992*, Order on Reconsideration, 30 FCC Rcd 810, 814 n.39 (2015). We note the distinction between the incentives and interests of government entities such as local franchising authorities (among them, public interest concerns such as consumer costs) and those of commercial programmers (for example, profit maximization). In the context of wireline competition, the Commission has concluded that allowing competitive local exchange carriers (CLECs) to cherry-pick terms and conditions of service from incumbent local exchange carriers’ (ILECs) interconnection agreements with other ILECs impeded give-and-take negotiations between ILECs and resulted in “largely standardized agreements with little creative bargaining,” whereas requiring CLECs to accept all terms of an agreement between an ILEC and another party (“all-or-nothing” approach) would encourage ILECs to make trade-offs in negotiations that they

agreements resulting from the exercise of unconditional MFN rights may not reflect marketplace conditions because they disregard the balance struck in bilateral negotiations between the programmer and rival distributor. While some MVPDs generally defend MFN clauses on the basis that they provide certain pro-consumer benefits, no party has identified any public interest benefits that accrue from making such provisions unconditional. For these reasons, and consistent with conditions imposed by the Department of Justice in approving the Charter-TWC transaction,¹² we tentatively conclude that the potential harms to competition, diversity and innovation resulting from unconditional MFN provisions outweigh any potential public interest benefits.¹³

7. We seek comment on this tentative conclusion and on whether the purposes of Section 616 and the public interest would be served by adopting the proposed rule. In addition, we seek comment on our proposed definition of unconditional MFN provision and on any alternative definitions. Should we be concerned that the proposed definition is too narrow and thus would permit MVPDs to draft contract language that avoids application of the prohibition? If so, how should we address such concerns? Should any rules we adopt address MFN provisions that are partially unconditional or effectively discourage or foreclose wider distribution of content? We also seek input on our proposal to ban unconditional MFN provisions that entitle an MVPD to contractual rights that an independent programmer has negotiated with any other video programming distributor. Should we be uniquely concerned about the use of unconditional MFN provisions to harm competition from nascent OVDs? Accordingly, should we prohibit only unconditional MFN provisions that apply to terms an independent

were reluctant to make under the “pick and choose” approach. *Review of the Section 251 Unbundling Obligations of Incumbent Local Exchange Carriers*, Second Report and Order, 69 FR 43762, 43764, paras. 10–12 (July 22, 2004), *aff’d*, *New Edge Network, Inc. v. FCC*, 461 F.3d 1105, 1109–10 (9th Cir. 2006).

¹² See, e.g., DOJ Charter-TWC Proposed Final Judgment at 5, Section IV.B.2. *But see AT&T–DIRECTV Order*, 30 FCC Rcd at 9222, para. 237. Although the Commission, in the AT&T–DIRECTV merger proceeding, declined to adopt a transaction-specific condition due to the absence of a supporting record, we have since developed through the instant proceeding a record that demonstrates the competitive harms resulting from unconditional MFN provisions.

¹³ As noted above, the record reveals no public interest benefits that result from unconditional MFN provisions.

programmer has negotiated with an OVD? Recent merger conditions adopted in DOJ's Proposed Final Judgment in the Charter-TWC merger have precluded only unconditional MFN provisions that apply to terms negotiated with OVDs.¹⁴ Should we take a similar approach in this proceeding, or is it in the public interest to prohibit unconditional MFN provisions that apply to a broader range of video programming distributors? We seek comment on the costs and benefits of the rules proposed above and any other rules that commenters assert would better serve the public interest. To the extent possible, commenters should quantify any identified costs and benefits. Are there any circumstances in which unconditional MFN provisions may be beneficial to competition or programming diversity? If so, are the potential public interest benefits of allowing such provisions outweighed by the benefits of our proposed prohibition?

8. We also seek comment on which, if any, of the Commission's program carriage rules would need to be amended if we adopted the proposed rule.¹⁵ What remedies and penalties should we impose on an MVPD that violates the proposed prohibition on unconditional MFN provisions?¹⁶ For example, would it be appropriate to order that the unconditional MFN provision would be unenforceable starting on the effective date of any new rule, or that it be replaced with a conditional MFN provision?¹⁷ If we preclude MVPDs from enforcing unconditional MFN provisions in existing contracts, should we also afford parties some period of time to reform their contracts before the Commission will take enforcement action? To what extent, if at all, would costs, or other concerns, associated with pursuing a program carriage complaint affect the ability of independent programmers to obtain relief? Finally, we seek comment on what types of circumstances could justify waiver of a rule precluding the use of unconditional MFN provisions. Given the potential detrimental impact that such provisions have on competition, programming diversity and

innovation in the marketplace, what, if any, situations would constitute "good cause" for permitting MFN provisions that otherwise would be precluded under our proposed rules?¹⁸

9. *Prohibition on "Unreasonable" ADM Provisions.* We also propose to adopt a rule that prohibits the inclusion of an unreasonable ADM provision in a carriage agreement between an MVPD and an independent video programming vendor. As with MFN clauses, we recognize that ADM provisions, which are a form of exclusivity, can have valid public interest justifications. For example, they may incentivize MVPDs to invest in new or emerging programming sources, including independent or niche content and/or content targeted to underserved audiences. We also recognize that, as with MFN provisions, the use of ADM clauses is a longstanding industry practice, and that there is a broad variety of ADM restrictions in programming contracts today. Based on the record, however, it appears that certain restrictive ADM provisions have no discernibly pro-competitive justifications and have an adverse impact on the provision of diverse programming sources to consumers. As DOJ has found, such provisions also "negatively affect OVDs' business models and undermine their ability to provide robust video offerings that compete with the offerings of traditional MVPDs,"¹⁹ which can lead to "lower-quality services, fewer consumer choices, and higher prices."²⁰

10. We tentatively conclude that in determining whether a particular ADM provision is "unreasonable," we will consider, among other factors, the extent to which an ADM provision prohibits an independent programmer from licensing content to other distributors, including OVDs. Although the issue of whether a particular ADM clause is "unreasonable" would be fact-specific and determined in the context of a complaint proceeding brought under Section 616 of the Act under our proposal,²¹ certain ADM provisions appear unlikely to yield any procompetitive benefits that would outweigh the attendant public interest harms. Such ADM provisions include those that: (i) Bar an independent programmer from licensing content, for an extended time period or indefinitely, to an OVD that distributes content for

free to consumers;²² (ii) bar an independent programmer from licensing content, for any period of time, to an OVD that distributes content to paying subscribers;²³ (iii) bar an independent programmer from licensing content to an OVD unless or until the OVD meets conditions that are difficult to satisfy in a timely manner or are designed to undermine the OVD's ability to compete;²⁴ or (iv) provide for any pecuniary or non-pecuniary penalty or adverse impact on an independent programmer for the provision of its video programming to an OVD.²⁵ We tentatively conclude that ADM provisions that include any of these factors should be deemed presumptively unreasonable.

11. We believe that our proposed rule, which proscribes only "unreasonable" ADM provisions, would ensure that MVPDs cannot use ADM provisions to harm the development of nascent competition, while preserving independent programmers' and distributors' respective incentives to develop quality program content and invest in independent and diverse programming sources. Or would prohibiting such ADM provisions make it less likely that MVPDs would agree to carry independent programmers or would seek to enter into exclusive programming agreements with them that would limit rather than expand their carriage opportunities? We seek comment on our tentative conclusions and proposed framework for determining whether an ADM clause is unreasonable. How should we define an "extended time period" for the purpose

²² See DOJ Charter-TWC Competitive Impact Statement at 12.

²³ The only type of ADM provisions permissible under DOJ's Proposed Final Judgment in *Charter-TWC* are those that restrict the free distribution of programming online. The Proposed Final Judgment therefore restricts all ADM provisions that apply to paid distribution online. DOJ Charter-TWC Proposed Final Judgment at 5–6, Section IV.B–C.

²⁴ DOJ cited this as another example of a problematic ADM provision in its review of the Charter-TWC transaction. For example, DOJ noted one instance in which an ADM clause in one MVPD's contract with a video programmer prohibited the programmer from licensing its content to any OVD unless the OVD offered a package that included 35 channels, including at least two channels each from three out of a list of six large programmers. DOJ Charter-TWC Competitive Impact Statement at 12, n.5. See also Richard Greenfield Remarks, Media Bureau Workshop on the State of the Video Marketplace, at 71:58 (Mar. 21, 2016), <https://www.fcc.gov/news-events/events/2016/03/media-bureau-workshop-state-video-marketplace#acc2>.

²⁵ For example, such penalties could include rate reductions, re-tiering or repositioning penalties, termination rights for the MVPD, or loss or waiver of any rights or benefits otherwise available to the video programmer. DOJ Charter-TWC Proposed Final Judgment at 5, Section IV.B.1.

¹⁴ DOJ Charter-TWC Proposed Final Judgment at 5–6, Section IV.A–C.

¹⁵ 47 CFR 76.1300–1302. In particular, we seek comment on whether any rule revisions would be needed in addition to, or instead of, those set forth herein.

¹⁶ We note that Section 616 of the Act and its implementing rules authorize the Commission to prescribe appropriate penalties and remedies, including carriage, for a violation of the program carriage provisions. See 47 U.S.C. 536(a)(5); 47 CFR 76.1302(j).

¹⁷ See DOJ Charter-TWC Proposed Final Judgment at 5, Section IV.A.

¹⁸ See 47 CFR 1.3.

¹⁹ DOJ Charter-TWC Competitive Impact Statement at 14.

²⁰ *Id.*

²¹ 47 CFR 76.1302.

of our first proposal in the preceding paragraph? In addition, we seek comment on how an MVPD could rebut an independent programmer's showing that the ADM provisions noted above are unreasonable.

12. In addition, we tentatively conclude that an ADM provision that prohibits an independent video programming vendor from distributing programming, for which the MVPD has agreed to pay, to consumers for free over the Internet for a limited period after the programming's initial airing on a linear MVPD service should be deemed presumptively reasonable. Establishing such a presumption would be consistent with conditions imposed in the Comcast-NBCU and Charter-TWC merger proceedings that permit the respective combined entities to prevent a programmer from making its content available on the Internet for free for 30 days after its initial airing, if such entities paid a fee for that content.²⁶ We seek comment on this proposed presumption and on the time frame that should apply if we adopt it. Should it be presumptively reasonable for a carriage agreement to include an exclusivity window of 30 days vis-à-vis the free provision of programming online, or should the window be shorter or longer? Is allowing an MVPD to restrict free online distribution for 30 days generally consistent with industry practice? In addition, does a 30-day limit adequately balance our interest in ensuring ADM provisions do not inhibit the development of OVDs, while at the same time affording MVPDs a reasonable opportunity to protect their investment in high quality programming? Should the specified window (e.g., 30 days) apply only to certain types of programming (e.g., scripted programming)? Would a different time period be more reasonable in the case of "time sensitive" programming (e.g., live sports or news) that may lose its value to the public before thirty days after its initial airing?

13. We also seek input on the type of evidence that would be needed to rebut a positive presumption. What type of showing should be sufficient to

overcome the presumption of reasonableness? As an alternative to establishing rules based on presumptions, should we adopt a bright line rule that defines and expressly prohibits certain types of ADM provisions?

14. We also tentatively conclude that an ADM provision that grants an MVPD the universally exclusive right to distribute an independent video programming vendor's content should be deemed presumptively reasonable. We recognize that this type of blanket exclusivity long has been common in the video programming industry and does not appear to raise the same competitive concerns as ADMs targeted at OVDs.²⁷ This type of presumption also would be consistent with the conditions imposed by DOJ in the Charter-TWC merger proceeding.²⁸ We seek input on this proposed presumption. What type of showing would be sufficient to overcome this presumption of reasonableness? As an alternative to establishing this presumption, should we deem an ADM provision that grants an MVPD the universally exclusive right to distribute independent programming content to be outside the scope of the proposed rule, and thus permissible?

15. We also seek comment on whether adoption of a rule prohibiting unreasonable ADM provisions and our proposed framework for the rule would warrant any rule revisions besides those set forth herein. In particular, which, if any, of the Commission's program carriage rules would need to be amended if we adopted the proposed rule? What remedies and penalties should we impose on an MVPD that violates the proposed prohibition on unreasonable ADM provisions?²⁹ For example, would it be appropriate for the Media Bureau to order that an unreasonable ADM provision not be enforced or be replaced with an ADM provision with reasonable terms? If we adopt rules prohibiting the use of certain types of ADM clauses, should we preclude MVPDs from enforcing existing contracts that include such a

clause? If we preclude MVPDs from enforcing unreasonable ADM provisions in existing contracts, would it be necessary to require them to amend their contracts? If so, how much time should be afforded for these amendments?

16. To what extent, if at all, would the costs associated with pursuing a program carriage complaint affect the ability of independent programmers to obtain relief? We seek comment on the costs and benefits of the proposals above and any others that commenters assert would better serve the public interest. To the extent possible, commenters should quantify any identified costs and benefits. We also seek comment on whether there are any circumstances in which the kinds of ADM provisions we propose to prohibit are beneficial to competition or programming diversity. If so, are the potential public interest benefits of allowing such provisions outweighed by the benefits of a prohibition?

17. In addition, we seek comment on whether there are other kinds of ADM provisions that we should deem to be presumptively reasonable or presumptively unreasonable. We also invite comment on what circumstances could justify waiver of a rule prohibiting the use of unreasonable ADM provisions in agreements between MVPDs and independent video programming vendors. In light of the potential detrimental impact that unreasonable ADM provisions have on competition, diversity, and innovation in the marketplace, what, if any, situations would constitute "good cause" for permitting an MVPD to include in a carriage contract an ADM provision that otherwise would be precluded under our proposed rules?

18. *Additional Rules.* We also seek comment on whether, if we were to adopt the rules proposed above, we should adopt additional provisions that protect against retaliation by MVPDs if independent programmers bring complaints with regard to unconditional MFN or unreasonable ADM provisions.³⁰ Alternatively, should we consider adopting a rule that prohibits a broader range of retaliatory conduct by MVPDs, including retaliation against

(*Comcast-NBCU Order*); DOJ Charter-TWC Proposed Final Judgment at 6, Section IV.C.1. In its review of the Charter-TWC transaction, DOJ explained that such limitations on free distribution were "ubiquitous in the industry" and that there was "no evidence that such provisions are harmful to competition." DOJ Charter-TWC Competitive Impact Statement at 17. See also Comcast-NBCU Comments at 31.

²⁷ *AT&T-DIRECTV Order*, 30 FCC Rcd at 9198, para. 179.

²⁸ DOJ Charter-TWC Proposed Final Judgment at 6, Section IV.C.2.

²⁹ In implementing Section 616, the Commission stated that if it were to find that a carriage agreement "includes a coerced . . . exclusivity requirement in violation of Section 616, the appropriate remedy may simply be to determine that such terms are unenforceable by the [MVPD], and to revise the existing agreement, ordering carriage on the same terms negotiated in that agreement without the . . . coerced promise of exclusivity." *Program Carriage Second Report and Order*, 9 FCC Rcd at 2653, n.47.

³⁰ We note that the Commission in 2011 proposed to amend its rules to prohibit an MVPD from, among other things, retaliating against a video programming vendor for filing a program carriage complaint if the effect of such conduct is to unreasonably restrain the ability of the video programming vendor to compete fairly. *Revision of the Commission's Program Carriage Rules*, MB Docket Nos. 07-42, 11-131, Second Report and Order and Notice of Proposed Rulemaking, 76 FR 60675, 60692-94, paras. 60-67 (Sept. 29, 2011) (*Program Carriage NPRM*).

programmers that refuse to agree to unconditional MFN clauses, unreasonable ADM clauses, or other carriage-related demands? We note, for example, that conditions imposed in the Comcast-NBCU and Charter-TWC transaction proceedings include provisions that bar retaliatory conduct by the combined entities.³¹ Such rules also would be harmonious with Section 616(a)(2) and its implementing rules, which prohibit MVPDs from, among other things, retaliating against video programming vendors for failing to provide exclusive rights against other MVPDs as a condition of carriage.³² Parties urging the adoption of rules to address retaliatory conduct should specify the kinds of actions that should be restricted or prohibited. Should we adopt other rules designed to protect independent programmers from retaliation, such as rules that provide for a heightened level of confidentiality when a programmer brings a complaint to the Commission?

19. We also seek comment on what, if any, additional rules we should consider to advance competition, diversity, and innovation in the marketplace. In particular, are there other specific actions we can take to provide greater opportunities for distribution of programming from new video programming vendors, including minorities and women, or programming directed at minority, underserved, or female viewers? Are there any actions we can take to protect consumers from programming disruptions resulting from an MVPD's decision to drop an independent video programmer from its lineup? For example, would the public interest be served, as RFD-TV suggests, by adopting a rule that permits MVPD subscribers to cancel, without penalty, a subscription television package within a specified time period, *e.g.*, 90 days, after the MVPD has dropped such programmer from its lineup?³³ In addition, we seek comment on whether MVPDs engage in other negotiating

practices that hamper the ability of independent programmers to secure distribution of their content. To the extent MVPDs engage in such practices, we seek comment on whether the public interest would be served by requiring MVPDs to negotiate carriage agreements with independent video programming vendors in good faith.³⁴ We also seek further comment on bundling practices by video programming vendors.³⁵ Specifically, how, if at all, do bundling practices affect MVPDs' ability to carry independent programmers? Is bundling by large programmers as widespread as some in the record suggest? Do small MVPDs face greater demands to accept bundles than large MVPDs? Do programmers act differently in their negotiations with buying groups, such as the National Cable Television Cooperative (NCTC), than they do in negotiations with MVPDs that negotiate on their own behalf? Do programmers insist on bundling even with respect to capacity constrained MVPDs, or do they provide relief for such systems? What is the impact of bundling on small MVPDs relative to large MVPDs? How does bundling impact consumer costs, choice, and access to diverse programming? Are there other marketplace conditions that magnify the effects (harmful or beneficial) of bundling?

20. *Legal Authority.* We seek comment on the Commission's legal authority under Section 616 of the Act³⁶ to adopt rules prohibiting the use of unconditional MFN and unreasonable ADM provisions in program carriage agreements between MVPDs and independent video programming vendors, as proposed above. Section 616(a) provides, in relevant part, that "the Commission shall establish regulations governing program carriage agreements and related practices between cable operators or other [MVPDs] and video programming vendors."³⁷ We believe this provision reasonably can be read to grant general rulemaking authority to the Commission to adopt a prohibition on unfair, unreasonable, and/or anticompetitive practices employed by MVPDs when negotiating carriage agreements,

including the use of certain contract provisions in agreements with independent programmers.

21. Specifically, we seek comment on whether the Commission's grant of authority under Section 616(a) to adopt rules "governing program carriage agreements and related practices between [MVPDs] and video programming vendors" is sufficiently broad to enable us to prohibit the use of unconditional MFN or unreasonable ADM provisions. As noted above, the rules we propose will apply to agreements between MVPDs and "independent video programming vendors," which are encompassed within the term "video programming vendor."³⁸ We believe these rules will advance Congress's intent in enacting Section 616 "to stem and reduce the potential for abusive or anticompetitive actions [by MVPDs] against programming entities."³⁹ Congress expressed concern that MVPDs may be able "to extract concessions from programmers" which "could discourage entry of new programming services, restrict competition, impact adversely on diversity, and have other undesirable effects on program quality and viewer satisfaction."⁴⁰ Consistent with the intent of Section 616, our proposals are designed to enhance competition in the video programming marketplace and are predicated on the belief that "competition is essential both for ensuring diversity in programming and for protecting consumers from potential abuses by cable operators possessing market power" and other MVPDs.⁴¹

22. Some commenters argue that Section 616 is only a limited grant of authority to the Commission. For example, AT&T contends that the Commission has authority under Section 616 only to address conduct that violates one of three proscriptions set forth in the subsections of Section 616(a). Consistent with our previous determination that "[Section 616] does not preclude the Commission from adopting additional requirements beyond the six listed in the statute," we are not persuaded that Congress intended to limit the Commission's regulatory authority to only those practices specifically listed in Section 616(a).⁴² The introductory language in Section 616(a) grants the Commission broad authority to "establish regulations governing program carriage agreements

³¹ See *Comcast-NBCU Order*, 26 FCC Rcd at 4363–64, App. A, Condition IV.G.1.d.; *id.* at 4287, para. 121; DOJ Charter-TWC Competitive Impact Statement at 18–19.

³² 47 U.S.C. 536(a)(2); 47 CFR 76.1301(b). See also H.R. Rep. No. 102–628, 102d Cong., 2d Sess. at 110 (1992) (House Report) (stating that "[t]he regulations [to implement Section 616(a)(2)] should be designed to prevent a cable operator from taking any kind of retaliatory action against a programmer for refusing to grant exclusivity to the operator"); H.R. Rep. No. 102–862, 102d Cong., 2d Sess. at 83 (1992) (Conference Report).

³³ We note that the rules currently require customers to be notified of any changes in rates, programming services, or channel positions as soon as possible in writing, and with an advanced notice of 30 days or more if the change is within the operator's control. 47 CFR 76.1603(b).

³⁴ We note that in the 2011 *Program Carriage NPRM*, the Commission proposed to adopt a good faith negotiation requirement under Section 616 of the Act that would apply to vertically integrated MVPDs. *Program Carriage NPRM*, 76 FR at 60694–95, paras. 68–71.

³⁵ *NOI*, 81 FR at 10244–45.

³⁶ 47 U.S.C. 536.

³⁷ *Id.* 536(a). In addition, Section 616(b) defines the term "video programming vendor" as "a person engaged in the production, creation, or wholesale distribution of video programming for sale." *Id.* 536(b).

³⁸ 47 U.S.C. 536(b).

³⁹ House Report at 27.

⁴⁰ *Id.* at 42–43.

⁴¹ *Id.* at 43.

⁴² *Program Carriage NPRM*, 76 FR at 60693, para. 65.

and related practices between cable operators and multichannel video programming distributors and video programming vendors,” and nothing in the statute expressly precludes the Commission from establishing rules besides those specifically listed.⁴³ Furthermore, the subsections relating to substantive requirements, subsections 616(a)(1)–(a)(3), are introduced by the verbs “include” or “contain,” which suggests that such requirements are not exhaustive. Where Congress intends to limit the Commission’s rulemaking authority to specified areas, it has done so expressly.⁴⁴

23. Although the first sentence of Section 616(a) directs the Commission to adopt implementing rules “[w]ithin one year after October 5, 1992,”⁴⁵ we do not believe that the timing requirement in Section 616(a) means that the Commission’s rulemaking authority under that Section expired more than 20 years ago. As we have explained previously, the Commission’s authority under a statutory provision does not expire when a statutory deadline for implementation passes.⁴⁶ Indeed, the view that the Commission’s authority expires with passage of a deadline would be at odds with judicial precedent regarding statutory deadlines, which are generally considered directory rather than mandatory.⁴⁷

24. We also believe that our proposed rules are consistent with the overall structure and intent of Section 616(a). Although Sections 616(a)(1) and 616(a)(2) prohibit an MVPD from “requiring” or “coercing” programmers to accept certain terms as a condition of carriage on its systems,⁴⁸ we do not believe that our rulemaking authority under Section 616(a) is limited to those practices delineated in the subsections. In any case, based on the record, we find that independent programmers

generally do not agree to unconditional MFN or unreasonable ADM provisions voluntarily, but rather, are forced to accept such provisions because they lack sufficient bargaining leverage to resist MVPDs’ demands for such provisions. Thus, we find it reasonable to conclude that independent programmers agree to unconditional MFN and unreasonable ADM provisions only because MVPDs require them as a condition of carriage. We seek comment on this analysis. Does the use of the terms “requiring” and “coercing” in the subsections of 616(a) affect the scope of our rulemaking authority under this provision? We also seek comment on whether or to what extent Congress’s particular concerns about vertical integration as expressed in Section 616’s legislative history should factor into our determination about the scope of our authority to prohibit the use of unconditional MFN and unreasonable ADM provisions under Section 616.⁴⁹ In addition, we seek comment on any constitutional issues that we should consider in determining whether to adopt the proposed rules.

25. We seek comment on whether other provisions of the Act provide an alternative or an additional basis for the adoption of rules addressing restrictive MFN and ADM provisions. For example, does Section 616(a)(3) of the Act provide a basis for proscribing restrictive MFN and ADM provisions? Section 616(a)(3) directs the Commission to adopt rules “designed to prevent [an MVPD] from engaging in conduct the effect of which is to unreasonably restrain the ability of an unaffiliated video programming vendor to compete fairly by discriminating in video programming distribution on the basis of affiliation or nonaffiliation of vendors in the selection, terms, or conditions for carriage of video programming provided by such vendors.”⁵⁰ Is the Commission authorized under that provision, for example, to adopt rules that prohibit vertically integrated MVPDs from including unconditional MFN and unreasonable ADM clauses in carriage agreements with independent video programming vendors, where such MVPDs do not include the same clauses in carriage agreements with affiliated programming networks? If so, would the application of such rules only to vertically integrated MVPDs adequately address the competition and diversity concerns raised by restrictive MFN and

ADM clauses? Would a nondiscrimination requirement be effective given that an MVPD could enter into the same restrictive MFN and/or ADM provision with both the affiliated and unaffiliated programming network but simply not exercise its rights with respect to the affiliated network? To the extent that parties assert that Section 616(a)(3) authorizes adoption of the proposed rules, we seek comment on whether an independent video programming vendor would have ready access to the kind of information needed to prove unlawful program carriage discrimination under Section 616(a)(3), given that such clauses are contained in carriage contracts that are not generally subject to public disclosure.

26. We also seek input on whether any provisions of Section 628 serve as a valid basis for establishing rules to address restrictive MFN and ADM provisions. Consistent with the goal of our proposed rules, we note that the purpose of Section 628 is to “increase[e] competition and diversity in the [MVPD] market . . . and to spur the development of communications technologies.”⁵¹ In addition, Section 628(b) prohibits “a cable operator . . . or a satellite broadcast programming vendor [from engaging] in unfair methods of competition or unfair or deceptive acts or practices, the purpose or effect of which is to hinder significantly or to prevent any [MVPD] from providing . . . programming to subscribers or consumers.”⁵² And Section 628(c)(1) directs the Commission to “prescribe regulations to specify particular conduct that is prohibited by [Section 628(b)]” in order to “increase[e] competition and diversity in the [MVPD] market and the continuing development of communications technologies.”⁵³ Given that Section 628(b) appears to target only methods, acts, and practices that adversely affect MVPDs, can the Commission lawfully invoke this provision to proscribe, as an “unfair” method, act or practice, the use of certain MFN and ADM provisions in agreements between MVPDs and independent video programming vendors? For example, could Section 628(b) be invoked based on evidence that such MFN and ADM provisions adversely affect small MVPDs? Given

⁴³ See generally 47 U.S.C. 536.

⁴⁴ See, e.g., *id.* 613(f)(1), (2) (directing the Commission to reinstate its video description regulations adopted in *Report and Order*, 65 FR 54805 (Sept. 11, 2000), and to modify those rules “only as follows”).

⁴⁵ *Id.* 536(a).

⁵¹ *Id.* 548(a).

⁵² *Id.* 548(b). The term “satellite broadcast programming vendor” means “a fixed service satellite carrier that provides service pursuant to Section 119 of title 17, United States Code, with respect to satellite broadcast programming.” *Id.* 548(i)(4); 47 CFR 76.1000(g).

⁵³ 47 U.S.C. 548(c)(1).

that direct broadcast satellite (DBS) carriers are not subject to the provisions of Section 628, would reliance on that provision to limit the use of restrictive MFN and ADM provisions lead to a disparity in regulatory treatment among MVPDs? Finally, we seek comment on whether there are other provisions of the Act that potentially vest the Commission with authority to adopt rules addressing restrictive MFN and ADM provisions.⁵⁴

Initial Paperwork Reduction Act Analysis

27. This document does not contain proposed new or revised information collection requirements subject to the Paperwork Reduction Act of 1995, Public Law 104–13 (44 U.S.C. 3501–3520). In addition, therefore, it does not contain any new or modified “information burden for small business concerns with fewer than 25 employees” pursuant to the Small Business Paperwork Relief Act of 2002, Public Law 107–198, *see* 44 U.S.C. 3506(c)(4).

A. Ex Parte Rules

28. *Permit-But-Disclose*. This proceeding shall be treated as a “permit-but-disclose” proceeding in accordance with the Commission’s *ex parte* rules.⁵⁵ Persons making *ex parte* presentations must file a copy of any written presentation or a memorandum summarizing any oral presentation within two business days after the presentation (unless a different deadline applicable to the Sunshine period applies). Persons making oral *ex parte* presentations are reminded that memoranda summarizing the presentation must (i) list all persons attending or otherwise participating in the meeting at which the *ex parte* presentation was made, and (ii) summarize all data presented and arguments made during the presentation. If the presentation consisted in whole or in part of the

presentation of data or arguments already reflected in the presenter’s written comments, memoranda or other filings in the proceeding, the presenter may provide citations to such data or arguments in his or her prior comments, memoranda, or other filings (specifying the relevant page and/or paragraph numbers where such data or arguments can be found) in lieu of summarizing them in the memorandum. Documents shown or given to Commission staff during *ex parte* meetings are deemed to be written *ex parte* presentations and must be filed consistent with rule 1.1206(b). In proceedings governed by rule 1.49(f) or for which the Commission has made available a method of electronic filing, written *ex parte* presentations and memoranda summarizing oral *ex parte* presentations, and all attachments thereto, must be filed through the electronic comment filing system available for that proceeding, and must be filed in their native format (e.g., .doc, .xml, .ppt, searchable .pdf). Participants in this proceeding should familiarize themselves with the Commission’s *ex parte* rules.

B. Filing Requirements

29. *Comments and Replies*. Pursuant to Sections 1.415 and 1.419 of the Commission’s rules, 47 CFR 1.415, 1.419, interested parties may file comments and reply comments on or before the dates indicated on the first page of this document. Comments may be filed using the Commission’s Electronic Comment Filing System (ECFS). *See Electronic Filing of Documents in Rulemaking Proceedings*, 63 FR 24121 (1998).

- *Electronic Filers*: Comments may be filed electronically using the Internet by accessing the ECFS: <http://fjallfoss.fcc.gov/ecfs2/>.

- *Paper Filers*: Parties who choose to file by paper must file an original and one copy of each filing. If more than one docket or rulemaking number appears in the caption of this proceeding, filers must submit two additional copies for each additional docket or rulemaking number.

Filings can be sent by hand or messenger delivery, by commercial overnight courier, or by first-class or overnight U.S. Postal Service mail. All filings must be addressed to the Commission’s Secretary, Office of the Secretary, Federal Communications Commission.

30. *Availability of Documents*. Comments, reply comments, and *ex parte* submissions will be available for public inspection during regular business hours in the FCC Reference

Center, Federal Communications Commission, 445 12th Street SW., CY–A257, Washington, DC 20554. These documents will also be available via ECFS. Documents will be available electronically in ASCII, Microsoft Word, and/or Adobe Acrobat.

31. *People with Disabilities*. To request materials in accessible formats for people with disabilities (Braille, large print, electronic files, audio format), send an email to fcc504@fcc.gov or call the FCC’s Consumer and Governmental Affairs Bureau at (202) 418–0530 (voice), (202) 418–0432 (TTY).

C. Additional Information

32. For additional information on this proceeding, contact Raelynn Remy or Calisha Myers of the Policy Division, Media Bureau, at raelynn.remy@fcc.gov, calisha.myers@fcc.gov, or (202) 418–2120.

Initial Regulatory Flexibility Act Analysis

33. As required by the Regulatory Flexibility Act of 1980, as amended (RFA),⁵⁶ the Commission has prepared this present Initial Regulatory Flexibility Act Analysis (IRFA) concerning the possible significant economic impact on small entities by the policies and rules proposed in the Notice of Proposed Rulemaking (NPRM). Written public comments are requested on this IRFA. Comments must be identified as responses to the IRFA and must be filed by the deadlines for comments provided on the first page of the NPRM. The Commission will send a copy of the NPRM, including this IRFA, to the Chief Counsel for Advocacy of the Small Business Administration (SBA).⁵⁷ In addition, the NPRM and IRFA (or summaries thereof) will be published in the **Federal Register**.⁵⁸

A. Need for, and Objectives of, the Proposed Rules

34. In the NPRM, we propose to adopt rules that prohibit certain practices used by some multichannel video programming distributors (MVPDs) in their negotiations for carriage of video programming that impede competition, diversity and innovation in the video marketplace. Specifically, we propose to prohibit the inclusion of:

⁵⁶ 5 U.S.C. 603. The RFA, 5 U.S.C. 601 through 612, has been amended by the Small Business Regulatory Enforcement Fairness Act of 1996 (SBREFA), Public Law 104–121, Title II, 110 Stat. 857 (1996). The SBREFA was enacted as Title II of the Contract with America Advancement Act of 1996 (CWAAA).

⁵⁷ 5 U.S.C. 603(a).

⁵⁸ *Id.*

⁵⁴ Although we suggested in the *NOI* that Section 257 of the Act could provide a basis for adopting such rules, we note that section 257(a) directs the Commission, among other things, to “complete a proceeding for the purpose of identifying and eliminating, by regulations pursuant to its authority under this Act (other than [Section 257]), market entry barriers for entrepreneurs and other small businesses in the provision and ownership of telecommunications and information services, or in the provision of parts or services to providers of telecommunications services and information services.” 47 U.S.C. 257(a) (emphasis added). We read this provision, therefore, to authorize the adoption of rules to eliminate the specified entry barriers only if such rules are expressly authorized by provisions of the Act other than Section 257. *But see* TheBlaze Comments at 10. We seek comment on our interpretation.

⁵⁵ 47 CFR 1.1200 *et seq.*

(i) “unconditional” most favored nation (MFN) provisions; and (ii) unreasonable alternative distribution method (ADM) provisions in program.

B. Legal Basis

35. The proposed action is authorized pursuant to sections 4(i), 4(j), 157, 257, 303(r), 616 and 628 of the Communications Act of 1934, as amended, 47 U.S.C. 154(i), 154(j), 157, 257, 303(r), 536, and 548.

C. Description and Estimate of the Number of Small Entities to Which the Proposed Rules Will Apply

36. The RFA directs agencies to provide a description of, and where feasible, an estimate of the number of small entities that may be affected by the proposed rules, if adopted.⁵⁹ The RFA generally defines the term “small entity” as having the same meaning as the terms “small business,” “small organization,” and “small governmental jurisdiction.”⁶⁰ In addition, the term “small business” has the same meaning as the term “small business concern” under the Small Business Act.⁶¹ A small business concern is one which: (i) Is independently owned and operated; (ii) is not dominant in its field of operation; and (iii) satisfies any additional criteria established by the SBA.⁶² Below, we provide a list of such small entities.

- Wired Telecommunications Carriers
- Cable Television Distribution Services
- Cable Companies and Systems
- Cable System Operators
- Direct Broadcast Satellite (DBS)
- ServiceSatellite Master Antenna Television (SMATV) Systems, also known as Private Cable Operators (PCOs)
- Home Satellite Dish (HSD) Service
- Broadband Radio Service and Educational Broadband Service
- Fixed Microwave Services
- Open Video Systems
- Cable and Other Subscription Programming
- Small Incumbent Local Exchange Carriers
- Incumbent Local Exchange Carriers (ILECs)
- Competitive Local Exchange Carriers

- Competitive Access Providers (CAPs)
- Shared-Tenant Service Providers
- Other Local Service Providers
- Internet Publishing and Broadcasting and Web Search Portals
- Television Broadcasting

D. Description of Projected Reporting, Recordkeeping, and Other Compliance Requirements

37. *Reporting Requirements.* The NPRM does not propose to adopt reporting requirements.

38. *Recordkeeping Requirements.* The NPRM does not propose to adopt recordkeeping requirements.

39. Other Compliance Requirements.

The NPRM proposes to prohibit use of the following contract provisions in program carriage agreements between MVPDs and independent video programming vendors:

- Unconditional MFN provisions; and
- unreasonable ADM provisions.

E. Steps Taken To Minimize Significant Economic Impact on Small Entities and Significant Alternatives Considered

40. The RFA requires an agency to describe any significant alternatives that it has considered in reaching its proposed approach, which may include the following four alternatives (among others): “(i) The establishment of differing compliance or reporting requirements or timetables that take into account the resources available to small entities; (ii) the clarification, consolidation, or simplification of compliance and reporting requirements under the rule for such small entities; (iii) the use of performance, rather than design standards; and (iv) an exemption from coverage of the rule, or any part thereof, for small entities.”⁶³

41. Although the rules proposed in the NPRM would apply to all MVPDs, including those that are small, we do not believe such rules would have a significant economic impact on a substantial number of small MVPDs. The record indicates that small MVPDs do not appear to obtain the kinds of contractual restrictions the proposed rules would proscribe. In addition, the NPRM seeks comment on what circumstances could justify waiver of the proposed rules. We note further that to the extent small MVPDs are aggrieved by contractual restrictions imposed by larger MVPDs, small MVPDs would have standing to seek relief by filing a program carriage complaint under our existing rules.⁶⁴

42. With regard to the impact on other small video programming distributors

(such as online video distributors), and small video programming vendors (including independent content creators), based on the record, such small entities generally would benefit from Commission action addressing unconditional MFN and unreasonable ADM provisions. Because such entities likely would support the rules proposed in the NPRM, we find that no further analysis of alternatives on their behalf is necessary.

F. Federal Rules That May Duplicate, Overlap, or Conflict With the Proposed Rule

43. None.

44. We adopt this NPRM pursuant to the authority found in sections 1, 4(i), 4(j), 157, 257, 303(r), 616 and 628 of the Communications Act of 1934, as amended, 47 U.S.C. 151, 154(i), 154(j), 157, 257, 303(r), 536 and 548.

Federal Communications Commission.

Gloria J. Miles,

Federal Register Liaison Officer, Office of the Secretary.

Proposed Rules

For the reasons discussed in the preamble, the Federal Communications Commission proposes to amend 47 CFR part 76 as follows:

PART 76 — MULTICHANNEL VIDEO AND CABLE TELEVISION SERVICE

■ 1. The authority citation for part 76 continues to read as follows:

Authority: 47 U.S.C. 151, 152, 153, 154, 301, 302, 302a, 303, 303a, 307, 308, 309, 312, 315, 317, 325, 339, 340, 341, 503, 521, 522, 531, 532, 534, 535, 536, 537, 543, 544, 544a, 545, 548, 549, 552, 554, 556, 558, 560, 561, 571, 572 and 573.

■ 2. Section 76.1300 is amended by redesignating paragraphs (b), (c), (d), and (e) as paragraphs (c), (d), (e), and (g), and adding new paragraph (b) and paragraph (f) to read as follows:

§ 76.1300 Definitions.

* * * * *

(b) *Alternative distribution method provision.* The term “alternative distribution method provision” means a provision that prohibits or restricts a video programming vendor from exhibiting its programming on alternative, non-traditional video distribution platforms for a specified period of time following the programming’s original linear airing, or until certain conditions are met.

* * * * *

(f) *Unconditional most favored nation provision.* The term “unconditional most favored nation provision” means a provision that entitles a multichannel

⁵⁹ 5 U.S.C. 603(b)(3).

⁶⁰ *Id.* 601(6).

⁶¹ *Id.* 601(3) (incorporating by reference the definition of “small-business concern” in 15 U.S.C. 632). Pursuant to 5 U.S.C. 601(3), the statutory definition of a small business applies “unless an agency, after consultation with the Office of Advocacy of the Small Business Administration and after opportunity for public comment, establishes one or more definitions of such term which are appropriate to the activities of the agency and publishes such definition(s) in the **Federal Register**.” *Id.*

⁶² *Id.* 632.

⁶³ 5 U.S.C. 603(c)(1) through (c)(4).

⁶⁴ 47 CFR 76.1302(a).

video programming distributor to contractual rights or benefits that an independent video programming vendor has offered or granted to another video programming distributor, without obligating the multichannel video programming distributor to accept any terms and conditions that are integrally related, logically linked, or directly tied to the grant of such rights or benefits in the other video programming distributor's agreement, and with which the multichannel video programming distributor can reasonably comply technologically and legally.

* * * * *

■ 3. Section 76.1301 is amended by adding paragraphs (d) and (e) to read as follows:

§ 76.1301 Prohibited Practices.

* * * * *

(d) *Unconditional Most Favored Nation Provisions.* No multichannel video programming distributor shall enter into an agreement with an independent video programming vendor that contains an unconditional most favored nation provision.

(e) *Unreasonable Alternative Distribution Method Provisions.* No multichannel video programming distributor shall enter into an agreement with an independent video programming vendor that contains an unreasonable alternative distribution method provision.

(1) The following alternative distribution method provisions shall be deemed to be presumptively unreasonable:

(i) A provision that prohibits an independent video programming vendor from licensing content, for an extended time period or indefinitely, to an online video distributor that distributes content for free to consumers;

(ii) A provision that prohibits an independent video programming vendor from licensing content, for any period of time, to an online video distributor that distributes content to paying subscribers;

(iii) A provision that prohibits an independent video programming vendor from licensing content to an online video distributor unless or until such distributor meets conditions that are

difficult to satisfy in a timely manner or are designed to undermine such distributor's ability to compete; or

(iv) A provision that imposes any pecuniary or non-pecuniary penalty or adverse impact on an independent video programming vendor for the provision of its video programming to an online video distributor.

(2) The following alternative distribution method provisions shall be deemed to be presumptively reasonable:

(i) A provision that prohibits an independent video programming vendor from distributing programming, for which the multichannel video programming distributor has agreed to pay, to consumers for free over the Internet for a limited period after the programming's initial linear airing; and

(ii) A provision that grants a multichannel video programming distributor the universally exclusive right to distribute an independent video programming vendor's content.

Notices

Federal Register

Vol. 81, No. 206

Tuesday, October 25, 2016

This section of the FEDERAL REGISTER contains documents other than rules or proposed rules that are applicable to the public. Notices of hearings and investigations, committee meetings, agency decisions and rulings, delegations of authority, filing of petitions and applications and agency statements of organization and functions are examples of documents appearing in this section.

DEPARTMENT OF AGRICULTURE

Submission for OMB Review; Comment Request

October 20, 2016.

The Department of Agriculture has submitted the following information collection requirement(s) to OMB for review and clearance under the Paperwork Reduction Act of 1995, Public Law 104-13. Comments are requested regarding (1) whether the collection of information is necessary for the proper performance of the functions of the agency, including whether the information will have practical utility; (2) the accuracy of the agency's estimate of burden including the validity of the methodology and assumptions used; (3) ways to enhance the quality, utility and clarity of the information to be collected; and (4) ways to minimize the burden of the collection of information on those who are to respond, including through the use of appropriate automated, electronic, mechanical, or other technological collection techniques or other forms of information technology.

Comments regarding this information collection received by November 25, 2016 will be considered. Written comments should be addressed to: Desk Officer for Agriculture, Office of Information and Regulatory Affairs, Office of Management and Budget (OMB), New Executive Office Building, 725-17th Street NW., Washington, DC 20502. Commenters are encouraged to submit their comments to OMB via email to: OIRA_Submission@OMB.EOP.GOV or fax (202) 395-5806 and to Departmental Clearance Office, USDA, OCIO, Mail Stop 7602, Washington, DC 20250-7602. Copies of the submission(s) may be obtained by calling (202) 720-8958.

An agency may not conduct or sponsor a collection of information unless the collection of information displays a currently valid OMB control

number and the agency informs potential persons who are to respond to the collection of information that such persons are not required to respond to the collection of information unless it displays a currently valid OMB control number.

Animal and Plant Health Inspection Service

Title: Importation of Papaya from Colombia and Ecuador.

OMB Control Number: 0579-0358.

Summary of Collection: Under the Plant Protection Act (7 U.S.C. 7701 *et seq.*), the Secretary of Agriculture is authorized to carry out operations or measures to detect, eradicate, suppress, control, prevent, or retard the spread of plant pests new to the United States or not known to be widely distributed throughout the United States. The regulations in "Subpart-Fruits and Vegetables" (7 CFR 319.56), prohibits or restrict the importation of fruits and vegetables into the United States from certain parts of the world to prevent the introduction and dissemination of plant pests that are new to or not widely distributed within the United States.

Need and Use of the Information: The Animal and Plant Health Inspection Service (APHIS) regulations allow, under certain conditions, the importation of commercial shipments of fresh papaya from Colombia and Ecuador into the continental United States. These conditions for importation of papaya from Colombia and Ecuador include, but are not limited to, phytosanitary certificates, fruit fly trapping, trapping recordkeeping, grower registration and reinstatement of growers. Failing to collect this information would cripple APHIS' ability to ensure that papaya from Colombia and Ecuador are not carrying fruit flies.

Description of Respondents: Federal Government; Business or other for-profit.

Number of Respondents: 158.

Frequency of Responses: Recordkeeping; Reporting: On occasion.

Total Burden Hours: 371.

Ruth Brown,

Departmental Information Collection Clearance Officer.

DEPARTMENT OF COMMERCE

International Trade Administration

[A-570-831]

Fresh Garlic From the People's Republic of China: Final Rescission of the Semiannual Antidumping Duty New Shipper Review of Jinxiang Huameng Imp & Exp Co., Ltd.

AGENCY: Enforcement and Compliance, International Trade Administration, Department of Commerce.

SUMMARY: The Department of Commerce ("the Department") has conducted a new shipper review ("NSR") of Jinxiang Huameng Imp & Exp Co., Ltd. ("Huameng") regarding the antidumping duty order on fresh garlic from the People's Republic of China ("the PRC"). Based on our analysis of the comments received, we continue to find Huameng's sale is not *bona fide*. Consequently, the Department is rescinding this NSR.

DATES: Effective October 25, 2016.

FOR FURTHER INFORMATION CONTACT: Sean Carey, AD/CVD Operations, Office VII, Enforcement and Compliance, International Trade Administration, U.S. Department of Commerce, 14th Street and Constitution Avenue NW., Washington, DC 20230; telephone: (202) 482-3964.

SUPPLEMENTARY INFORMATION:

Background

On May 25, 2016, the Department published the preliminary results of this new shipper review.¹ The Department conducted a verification of Huameng's questionnaire responses from September 19 to September 23, 2016, and issued a verification report on September 28, 2016.² The review covers Huameng. The period of review (POR) is November 1, 2014, through April 30, 2015. A summary of the events that occurred since the Department published the *Preliminary Results*, as well as a full

¹ See *Fresh Garlic From the People's Republic of China: Preliminary Intent To Rescind the New Shipper Review of Jinxiang Huameng Imp & Exp Co., Ltd.*, 81 FR 33209 (May 25, 2016) (*Preliminary Results*) and accompanying Preliminary Decision Memorandum.

² See Memorandum to the File, "Verification of the Sales and Factors Response of Jinxiang Huameng Import & Export Co., Ltd. in the New Shipper Review of Garlic from the People's Republic of China," dated September 28, 2016 (Huameng Verification Report), at 6-7.

discussion of the issues raised by parties for this final determination, are found in the Issues and Decision Memorandum, dated concurrently with, and hereby adopted by, this notice.³

The Issues and Decision Memorandum is a public document and is made available to the public via Enforcement and Compliance's Antidumping and Countervailing Duty Centralized Electronic Service System (ACCESS). ACCESS is available to registered users at <https://iaaccess.trade.gov>, and is available to all parties in the Department's Central Records Unit, located in room B8024 of the main Department of Commerce building. In addition, a complete version of the Issues and Decision Memorandum can be found at <http://enforcement.trade.gov/frn/>. The signed and the electronic versions of the Issues and Decision Memorandum are identical in content.

Scope of the Order

The merchandise covered by this order is all grades of garlic, whether whole or separated into constituent cloves. The subject merchandise is currently classifiable under the Harmonized Tariff Schedule of the United States ("HTSUS") subheadings: 0703.20.0000, 0703.20.0005, 0703.20.0010, 0703.20.0015, 0703.20.0020, 0703.20.0090, 0710.80.7060, 0710.80.9750, 0711.90.6000, 0711.90.6500, 2005.90.9500, 2005.90.9700, and 2005.99.9700. A full description of the scope of the order is contained in the Issues and Decision Memorandum.⁴ Although the HTSUS subheadings are provided for convenience and customs purposes, the written product description is dispositive.

Final Rescission of New Shipper Review

As explained in the Issues and Decision Memorandum and in the proprietary Huameng *Bona Fides* Memorandum⁵ issued with the

Preliminary Results, due to the totality of circumstances, including the atypical nature of the product that was sold, *i.e.*, single-clove garlic, the lack of proof of payment by Huameng's U.S. customer for payment of all its contractual expenses per the sales terms and for its subsequent purchase of non-subject merchandise, and, other circumstances indicating that Huameng's business operations were not profitable, we continue to find that Huameng's sale is not *bona fide* within the meaning of section 751(a)(2)(B)(iv) of the Tariff Act of 1930, as amended (the Act). As a result, we are rescinding the new shipper review of Huameng.

Analysis of Comments Received

All issues raised in the case and rebuttal briefs are addressed in the Issues and Decision Memorandum. A list of the issues that are raised in the briefs and addressed in the Issues and Decision Memorandum is in the Appendix of this notice.

Cash Deposit Requirements

Effective upon publication of the final rescission of the NSR of Huameng, the Department will instruct CBP to discontinue the option of posting a bond or security in lieu of a cash deposit for entries of subject merchandise by Huameng. Cash deposits will be required for exports of subject merchandise by Huameng entered, or withdrawn from warehouse, for consumption on or after the publication date, at the PRC-wide rate.

Assessment Instructions

As the result of this rescission of the NSR of Huameng, the entries of Huameng covered by this NSR will be assessed at the cash deposit rate required at the time of entry, which is the PRC-wide rate.

Notification to Importers

This notice serves as final reminder to importers of their responsibility under 19 CFR 351.402(f)(2) to file a certificate regarding the reimbursement of antidumping duties prior to liquidation of the relevant entries during this POR. Failure to comply with this requirement could result in the Secretary of Commerce's presumption that reimbursement of antidumping duties occurred and the subsequent assessment of double antidumping duties.

Return or Destruction of Proprietary Information

This notice serves as a reminder to parties subject to administrative protective order (APO) of their responsibility concerning the

disposition of business proprietary information disclosed under the APO in accordance with 19 CFR 351.305(a)(3). We request timely written notification of return or destruction of APO materials or conversion to judicial protective order. Failure to comply with the regulations and the terms of an APO is a sanctionable violation.

This notice is issued and published this notice in accordance with sections 751(a)(2)(B) and 777(i) of the Act and 19 CFR 351.214.

Dated: October 14, 2016.

Paul Piquado,

Assistant Secretary for Enforcement and Compliance.

Appendix—List of Topics Discussed in the Issues and Decision Memorandum

1. Summary
2. Background
3. Scope of the Order
4. Discussion of the Issues
 - Comment 1a: Whether the Price of Huameng's Garlic Was Indicative of a *Bona Fide* Sale
 - Comment 1b: Evidence of Payment of Expenses Arising from the Transaction by Huameng's U.S. Customer
 - Comment 1c: Whether the Transaction Was Made on an Arm's Length Basis
 - Comment 1d: Whether Huameng's Business Operations Are Profitable
 - Comment 1e: Whether the Sale of Single-Clove Garlic is Typical
 - Comment 2: Whether Harmoni Qualifies as an Interested Party
 - Comment 3: Whether Huameng is Entitled to a Separate Rate
 - Comment 4: Whether Huameng Should Receive the PRC-Wide Cash Deposit Rate
 - Comment 5: Whether Huameng is Eligible to Participate in the New Shipper Review
5. Recommendation

DEPARTMENT OF COMMERCE

National Oceanic and Atmospheric Administration

National Integrated Drought Information System (NIDIS) Executive Council Meeting

AGENCY: Climate Program Office (CPO), Office of Oceanic and Atmospheric Research (OAR), National Oceanic and Atmospheric Administration (NOAA), Department of Commerce (DOC).

ACTION: Notice of open meeting.

SUMMARY: The National Integrated Drought Information System (NIDIS) Program Office will hold an organizational meeting on October 27, 2016, to reconstitute the Executive Council.

³ See Memorandum from Christian Marsh, Deputy Assistant Secretary for Antidumping and Countervailing Duty Operations, to Paul Piquado, Assistant Secretary for Enforcement and Compliance, regarding "Issues and Decision Memorandum for the Final Results of Antidumping Duty Semiannual New Shipper Review on Fresh Garlic from the People's Republic of China: Jinxiang Huameng Imp & Exp Co., Ltd.," issued concurrently with this notice (Issues and Decision Memorandum).

⁴ See the Issues and Decision Memorandum.

⁵ See Memorandum to Edward Yang, Office Director, AD/CVD Operations, Office VII, "Bona Fide Nature of the Sale in the Antidumping Duty New Shipper Review of Fresh Garlic from the People's Republic of China (PRC): Jinxiang Huameng Imp & Exp Co., Ltd.," dated May 17, 2016 (*Bona Fide* Memorandum).

DATES: The meeting will be held Thursday, October 27, 2016 from 9:00 a.m. EST to 3:00 p.m. EST. These times and the agenda topics described below are subject to change.

ADDRESSES: The meeting will be held at the Hall of States, Room 383/385, 444 North Capitol St. NW., Washington, DC 20001.

FOR FURTHER INFORMATION CONTACT: Veva Deheza, NIDIS Executive Director, David Skaggs Research Center, Room GD102, 325 Broadway, Boulder CO 80305. Email: Veva.Deheza@noaa.gov; or visit the NIDIS Web site at www.drought.gov.

SUPPLEMENTARY INFORMATION: The National Integrated Drought Information System (NIDIS) was established by Public Law 109-430 on December 20, 2006, and reauthorized by Public Law 113-86 on March 6, 2014, with a mandate to provide an effective drought early warning system for the United States; coordinate, and integrate as practicable, Federal research in support of a drought early warning system; and build upon existing forecasting and assessment programs and partnerships. See 15 U.S.C. 313d. The Public Law also calls for consultation with "relevant Federal, regional, State, tribal, and local government agencies, research institutions, and the private sector" in the development of NIDIS. 15 U.S.C. 313d(c). As such, the NIDIS Program Office is working to reconstitute a NIDIS Executive Council.

Status: This meeting will be open to public participation. Individuals interested in attending should register at <https://joss.ucar.edu/meetings/2016/nidis-executive-council>. Please refer to this Web page for the most up-to-date meeting times and agenda. Seating at the meeting will be available on a first-come, first-served basis.

Special Accommodations: This meeting is physically accessible to people with disabilities. Requests for special accommodations may be directed no later than 12:00 p.m. on October 24, 2016, to Elizabeth Ossowski, Program Coordinator, David Skaggs Research Center, Room GD102, 325 Broadway, Boulder CO 80305; Email: Elizabeth.Ossowski@noaa.gov.

Matters To Be Considered: The meeting will include the following topics: (1) an orientation around NIDIS, including its history and evolution, (2) connections between the NIDIS program and the aims of individual organizations/agencies represented on the Council, (3) updates to the implementation of the 2006 and 2014 NIDIS Public Laws, including the role of consultation in the development of

NIDIS, (4) opportunities to strengthen the integration of information and activities that address drought and water scarcity, and (5) defining how the Executive Council will function.

Dated: October 18, 2016.

BILLING CODE 3510-KB-P

DEPARTMENT OF COMMERCE

National Oceanic and Atmospheric Administration

Proposed Information Collection; Comment Request; Atlantic Mackerel, Squid, and Butterfish Amendment 14 Data Collection

AGENCY: National Oceanic and Atmospheric Administration (NOAA), Commerce.

ACTION: Notice.

SUMMARY: The Department of Commerce, as part of its continuing effort to reduce paperwork and respondent burden, invites the general public and other Federal agencies to take this opportunity to comment on proposed and/or continuing information collections, as required by the Paperwork Reduction Act of 1995.

DATES: Written comments must be submitted on or before December 27, 2016.

ADDRESSES: Direct all written comments to Jennifer Jessup, Departmental Paperwork Clearance Officer, Department of Commerce, Room 6616, 14th and Constitution Avenue NW., Washington, DC 20230 (or via the Internet at JJessup@doc.gov).

FOR FURTHER INFORMATION CONTACT: Requests for additional information or copies of the information collection instrument and instructions should be directed to Daniel Luers, Greater Atlantic Region, Sustainable Fisheries Office, 55 Great Republic Drive, Gloucester, MA 01930, (978) 282-8457, or Daniel.Luers@noaa.gov.

SUPPLEMENTARY INFORMATION:

I. Abstract

This request is for extension of a current information collection. Under the Magnuson-Stevens Fishery Conservation and Management Act, the Secretary of Commerce has the responsibility for the conservation and management of marine fishery resources. Much of this responsibility has been delegated to NOAA's National

Marine Fisheries Service (NMFS). Under this stewardship role, the Secretary was given certain regulatory authorities to ensure the most beneficial uses of these resources. One of the regulatory steps taken to carry out the conservation and management objectives is to collect information from users of the resources.

This collection requires vessel trip reports (VTRs) to be submitted weekly for all mackerel, squid, and butterfish permit holders. In addition, all limited access mackerel and longfin squid/butterfish moratorium permit holders must maintain a VMS unit on their vessels and declare intent to target Atlantic mackerel or longfin squid and submit daily catch reports via VMS. They must also submit daily catch reports via VMS. Vessels that land over 20,000 lb of mackerel must notify NMFS Office of Law Enforcement (OLE) via VMS of the time and place of offloading at least 6 hours prior to crossing the VMS demarcation line on their return trip to port, or if the vessel does not fish seaward of the VMS demarcation line, at least 6 hours prior to landing.

This collection also requires limited access mackerel and longfin squid/butterfish moratorium permit holders to bring all catch aboard the vessel and make it available for sampling by an observer. If catch is not made available to an observer before discard, that catch is defined as slippage, and the vessel operator must complete a "Released Catch Affidavit" form within 48 hours of the end of the fishing trip which details why catch was slipped, estimates the quantity and species composition of the slipped catch, and records the time and location of the slipped catch.

Finally, this collection requires any vessel with a limited access mackerel permit intending to land over 20,000 lbs of mackerel to contact NMFS at least 48 hours in advance of a fishing trip to request an observer. Vessels currently contact NMFS via phone, and selection notices or waivers are issued by NMFS via VMS. If service providers are unable to provide coverage, an owner, operator, or vessel manager may request a waiver by calling the Northeast Fisheries Observer Program.

II. Method of Collection

Information is submitted on paper, electronically or by telephone.

III. Data

OMB Control Number: 0648-0679.

Form Number(s): None.

Type of Review: Regular (extension of a current information collection).

Affected Public: Business or other for-profit organizations; individual or

households, state, local, or tribal government.

Estimated Number of Respondents: 426.

Estimated Total Annual Burden Hours: 3,751.

Estimated Total Annual Cost to Public: \$642,311 in recordkeeping/reporting costs.

Estimated Time per Response: Vessel trip reports, 5 minutes; VMS activity declarations, 5 minutes; released catch affidavit form, 5 minutes observer pre-trip notification of trip, 5 minutes; trip cancellation, 1 minute.

IV. Request for Comments

Comments are invited on: (a) Whether the proposed collection of information is necessary for the proper performance of the functions of the agency, including whether the information shall have practical utility; (b) the accuracy of the agency's estimate of the burden (including hours and cost) of the proposed collection of information; (c) ways to enhance the quality, utility, and clarity of the information to be collected; and (d) ways to minimize the burden of the collection of information on respondents, including through the use of automated collection techniques or other forms of information technology.

Comments submitted in response to this notice will be summarized and/or included in the request for OMB approval of this information collection; they also will become a matter of public record.

Dated: October 20, 2016.

Sarah Brabson,

NOAA PRA Clearance Officer.

BILLING CODE 3510-22-P

DEPARTMENT OF COMMERCE

National Oceanic and Atmospheric Administration

RIN 0648-XE938

Marine Mammals; File No. 20430

AGENCY: National Marine Fisheries Service (NMFS), National Oceanic and Atmospheric Administration (NOAA), Commerce.

ACTION: Notice; receipt of application.

SUMMARY: Notice is hereby given that James Harvey, Ph.D., Moss Landing Marine Laboratories, 8272 Moss Landing Road, Moss Landing, California 95039, has applied in due form for a permit to conduct research on blue (*Balaenoptera musculus*), fin (*B. physalus*), humpback (*Megaptera*

novaeangliae), gray (*Eschrichtius robustus*), and sperm (*Physeter microcephalus*) whales, and Risso's dolphins (*Grampus griseus*).

DATES: Written, telefaxed, or email comments must be received on or before November 25, 2016.

ADDRESSES: The application and related documents are available for review by selecting "Records Open for Public Comment" from the "Features" box on the Applications and Permits for Protected Species (APPS) home page, <https://apps.nmfs.noaa.gov>, and then selecting File No. 20430 from the list of available applications.

These documents are also available upon written request or by appointment in the Permits and Conservation Division, Office of Protected Resources, NMFS, 1315 East-West Highway, Room 13705, Silver Spring, MD 20910; phone (301) 427-8401; fax (301) 713-0376.

Written comments on this application should be submitted to the Chief, Permits and Conservation Division, at the address listed above. Comments may also be submitted by facsimile to (301) 713-0376, or by email to NMFS.Pr1Comments@noaa.gov. Please include the File No. in the subject line of the email comment.

Those individuals requesting a public hearing should submit a written request to the Chief, Permits and Conservation Division at the address listed above. The request should set forth the specific reasons why a hearing on this application would be appropriate.

FOR FURTHER INFORMATION CONTACT: Shasta McClenahan or Amy Hapeman, (301) 427-8401.

SUPPLEMENTARY INFORMATION: The subject permit is requested under the authority of the Marine Mammal Protection Act of 1972, as amended (MMPA; 16 U.S.C. 1361 *et seq.*), the regulations governing the taking and importing of marine mammals (50 CFR part 216), the Endangered Species Act of 1973, as amended (ESA; 16 U.S.C. 1531 *et seq.*), and the regulations governing the taking, importing, and exporting of endangered and threatened species (50 CFR 222-226).

The applicant is requesting a five-year permit to conduct research on large whales and dolphins in California waters. The primary objectives of this research project are to: (1) Relate distribution and abundance of cetaceans with environmental factors, (2) determine diet and foraging behaviors as they exploit prey resources, (3) determine types of acoustic behavior of marine mammals and how acoustic signals are affected by anthropogenic factors, and (4) determine the

movements of individuals or pods during migrations or within their home range. Research activities for large whales will include passive acoustics, behavioral observations, photography, video recording, biopsy sampling, collection of sloughed skin, attachment of suction cup or dart/barb tags, and tracking during vessel surveys. Research for Risso's dolphins will include passive acoustics, behavioral observations, and photo-identification. The number of species to be taken annually via tagging/biopsy/photo-identification are: 50/100/150 blue whales, 40/90/140 fin whales, 50/100/150 humpback whales, 160/210/260 gray whales, and 0/0/2,000 Risso's dolphins. Up to five sperm whales may be incidentally harassed and opportunistically photographed, annually. Up to 200 California sea lions (*Zalophus californianus*), 20 harbor seals (*Phoca vitulina richardii*), 50 Pacific white-sided dolphins (*Lagenorhynchus obliquidens*), 20 northern right whale dolphins (*Lissodelphis borealis*), 10 harbor porpoise (*Phocoena phocoena*), and 20 short-beaked common dolphins (*Delphinus delphis*) may be harassed incidental to research activities.

In compliance with the National Environmental Policy Act of 1969 (42 U.S.C. 4321 *et seq.*), an initial determination has been made that the activity proposed is categorically excluded from the requirement to prepare an environmental assessment or environmental impact statement.

Concurrent with the publication of this notice in the **Federal Register**, NMFS is forwarding copies of the application to the Marine Mammal Commission and its Committee of Scientific Advisors.

Dated: October 20, 2016.

Julia Harrison,

Chief, Permits and Conservation Division, Office of Protected Resources, National Marine Fisheries Service.

AGENCY: National Marine Fisheries Service (NMFS), National Oceanic and Atmospheric Administration (NOAA), Commerce.

ACTION: Notice; withdrawal of application.

SUMMARY: Notice is hereby given that Heather E. Liwanag, Ph.D. (California Polytechnic State University, San Luis Obispo, CA 93407-0401) has withdrawn an application for a permit to conduct research on Weddell seals (*Leptonychotes weddellii*) near McMurdo Station, Antarctica.

ADDRESSES: The application and related documents are available for review upon written request or by appointment in the Permits and Conservation Division, Office of Protected Resources, NMFS, 1315 East-West Highway, Room 13705, Silver Spring, MD 20910; phone (301) 427-8401; fax (301) 713-0376.

FOR FURTHER INFORMATION CONTACT: Sara Young or Amy Sloan, (301) 427-8401.

SUPPLEMENTARY INFORMATION: On August 3, 2016, notice was published in the *Federal Register* (81 FR 51189) that a request for a permit to conduct research on Weddell seals had been submitted by the above-named applicant.

The applicant has withdrawn the application from further consideration.

Dated: October 20, 2016.

Julia Harrison,

*Chief, Permits and Conservation Division,
Office of Protected Resources, National
Marine Fisheries Service.*

BILLING CODE 3510-22-P

DEPARTMENT OF COMMERCE

National Oceanic and Atmospheric Administration

Proposed Information Collection; Comment Request; Atlantic Herring Amendment 5 Data Collection

AGENCY: National Oceanic and Atmospheric Administration (NOAA), Commerce.

ACTION: Notice.

SUMMARY: The Department of Commerce, as part of its continuing effort to reduce paperwork and respondent burden, invites the general public and other Federal agencies to take this opportunity to comment on proposed and/or continuing information collections, as required by the Paperwork Reduction Act of 1995.

DATES: Written comments must be submitted on or before December 27, 2016.

ADDRESSES: Direct all written comments to Jennifer Jessup, Departmental Paperwork Clearance Officer, Department of Commerce, Room 6616, 14th and Constitution Avenue NW., Washington, DC 20230 (or via the Internet at Jjessup@doc.gov).

FOR FURTHER INFORMATION CONTACT: Requests for additional information or copies of the information collection instrument and instructions should be directed to Daniel Luers, Greater Atlantic Regional Fisheries Office, 55 Great Republic Dr., Gloucester, MA 01930, (978) 282-8457, Daniel.luers@noaa.gov.

SUPPLEMENTARY INFORMATION:

I. Abstract

This request is for extension of a current information collection. Under the Magnuson-Stevens Fishery Conservation and Management Act, the Secretary of Commerce has the responsibility for the conservation and management of marine fishery resources. Much of this responsibility has been delegated to NOAA's National Marine Fisheries Service (NMFS). Under this stewardship role, the Secretary was given certain regulatory authorities to ensure the most beneficial uses of these resources. One of the regulatory steps taken to carry out the conservation and management objectives is to collect information from users of the resources.

Data collection for Amendment 5 to the Atlantic Herring Fishery Management Plan requires renewal of Category E permits for limited access herring permit holders. This collection also requires herring carrier vessels that sell herring (rather than deliver those fish on behalf of a dealer for purchase) to obtain or maintain an At-Sea Atlantic Herring Dealer Permit. Vessels that have both an At-Sea Atlantic Herring Dealer Permit and a Federal fishing permit are required to fulfill the reporting requirements of both permits as appropriate.

This collection has several vessel monitoring system (VMS) and vessel trip reporting (VTR) components. Category E vessels must submit daily VMS reports, weekly VTRs, and maintain a VMS unit on their vessels and declare intent to target Atlantic herring via VMS. This collection allows a vessel that opts to enroll as a herring carrier to do so via VMS rather than obtaining a letter of authorization (LOA). By declaring a herring trip via VMS, a vessel is exempt from daily VMS catch reporting, and is not bound by the 7-day enrollment period required by the herring carrier LOA. Vessels with limited access herring permits, Category E permits, and vessels declaring herring carrier trips via VMS also must give a pre-landing notification to the NMFS Office of Law Enforcement via VMS. In addition, vessels are prohibited from turning off VMS units while in port. A

vessel representative must request a letter of exemption (LOE) from NMFS to turn off its VMS if that vessel will be out of the water for more than 72 hours. A vessel owner is able to sign a herring vessel out of the VMS program for a minimum of 30 days by requesting and obtaining an LOE from NMFS. A vessel is not able to leave the dock unless the VMS unit is turned back on.

This collection also requires that vessels with limited access herring permits, vessels with open access Category D permits that are fishing with midwater trawl gear in Areas 1A, 1B, and/or 3, vessels with open access category E permits, and herring carrier vessels contact NMFS at least 48 hours in advance of fishing to request an observer. Vessels currently contact NMFS via phone, and selection notices or waivers are issued by NMFS via VMS. Vessels with limited access herring permits, Category E permits, and vessels declaring herring carrier trips via VMS must notify NMFS via VMS of their intent to participate in the herring fishery prior to leaving port on each trip by entering the appropriate activity and gear codes in order to harvest, possess, or land herring on that trip.

Additionally, this collection requires vessels issued limited access permits working cooperatively in the herring fishery to provide NMFS-approved observers with the estimated weight of each species brought on board or released on each tow.

Finally, this collection requires that all herring vessels (*i.e.* any area throughout the EEZ, any gear type) bring all catch aboard the vessel and make it available for sampling by an observer. If catch is not made available to an observer before discard, that catch is defined as slippage, and the vessel operator must complete a "Released Catch Affidavit" form within 48 hours of the end of the fishing trip which details why catch was slipped, estimates the quantity and species composition of the slipped catch, and records the time and location of the slipped catch.

II. Method of Collection

Information is collection on paper forms, by telephone, or electronically.

III. Data

OMB Control Number: 0648-0674.

Form Number(s): None.

Type of Review: Regular (extension of a current information collection).

Affected Public: Business or other for-profit organizations; individual or households, state, local, or tribal government.

Estimated Number of Respondents: 16,065.

Estimated Total Annual Burden Hours: 1,231.

Estimated Total Annual Cost to Public: \$46,877 in recordkeeping/reporting costs.

Estimated Time per Response: Category E permit renewal, 1 minute; At-Sea Herring Dealer Permit renewal, 5 minutes; weekly dealer reports, 15 minutes; VMS activity declarations, 5 minutes; VMS power-down exemption letter, 5 minutes; VMS pre-landing notification and gear declaration, 5 minutes; catch reports and vessel trip reports, 5 minutes; request for an observer prior to a trip, 5 minutes; cancellation of trip, 1 minute; estimate of catch/discard provision, 1 minute; documentation of slippage, 5 minutes.

IV. Request for Comments

Comments are invited on: (a) Whether the proposed collection of information is necessary for the proper performance of the functions of the agency, including whether the information shall have practical utility; (b) the accuracy of the agency's estimate of the burden (including hours and cost) of the proposed collection of information; (c) ways to enhance the quality, utility, and clarity of the information to be collected; and (d) ways to minimize the burden of the collection of information on respondents, including through the use of automated collection techniques or other forms of information technology.

Comments submitted in response to this notice will be summarized and/or included in the request for OMB approval of this information collection; they also will become a matter of public record.

Dated: October 20, 2016.

Sarah Brabson,

NOAA PRA Clearance Officer.

[FR Doc. 2016-25733 Filed 10-24-16; 8:45 am]

BILLING CODE 3510-22-P

DEPARTMENT OF COMMERCE

Patent and Trademark Office

[Docket No. PTO-P-2016-0040]

Request for Comments on Examination Time Goals

AGENCY: United States Patent and Trademark Office, Commerce.

ACTION: Request for comments.

SUMMARY: The United States Patent and Trademark Office (Office or USPTO) is soliciting public feedback as part of an effort to reevaluate its examination time goals. Examination time goals vary by technology and represent the average

amount of time that a patent examiner is expected to spend examining a patent application in a particular technology. The Office plans to use the public feedback as an input to help ensure that the Office's examination time goals accurately reflect the amount of time needed by examiners to conduct quality examination in a manner that responds to stakeholders' interests. In addition to accepting public feedback through the submission of written comments, the Office will provide the following avenues for increased interactive participation: IdeaScale®, a Web-based collaboration tool that allows users to post comments and interact with the posted comments of others; and five roundtables that the Office will be conducting in: Alexandria, Virginia; Detroit, Michigan; Denver, Colorado; Dallas, Texas; and San Jose, California.

DATES: *Written Comments Deadline:* To be ensured of consideration, written comments must be received on or before December 27, 2016.

ADDRESSES: Written comments should be sent by electronic mail addressed to *ExternalExaminationTimeStudy@USPTO.gov*. Comments also may be submitted by postal mail addressed to: Mail Stop Comments—Patents, Commissioner for Patents, P.O. Box 1450, Alexandria, VA 22313-1450, marked to the attention of Raul Tamayo, Senior Legal Advisor, Office of Patent Legal Administration, Office of the Deputy Commissioner for Patent Examination Policy.

Although comments may be submitted by postal mail, the Office prefers to receive comments by electronic mail in order to facilitate posting on the USPTO's Internet Web site (<http://www.uspto.gov>). Electronic comments may be submitted in plain text, ADOBE® portable document format, or MICROSOFT WORD® format. Comments not submitted electronically should be submitted on paper in a format that facilitates digital scanning into ADOBE® portable document format.

The comments will be available for viewing via the USPTO's Internet Web site (<http://www.uspto.gov>). The comments also will be available for public inspection at the Office of the Commissioner for Patents, currently located in Madison East, Tenth Floor, 600 Dulany Street, Alexandria, Virginia 22314. Because the comments will be made publicly available, information that the submitter does not desire to make public, such as an address or phone number, should not be included in the comments.

FOR FURTHER INFORMATION CONTACT:

Roundtable information, including roundtable registration information: Elizabeth Magargel, Strategic Planning Project Manager, Office of the Assistant Deputy Commissioner for Patent Operations, by telephone at (571) 270-7248.

Written comments: Raul Tamayo, Senior Legal Advisor, Office of Patent Legal Administration, Office of the Deputy Commissioner for Patent Examination Policy, by telephone at (571) 272-7728.

Examination time goals: Daniel Sullivan, Director Technology Center 1600, by telephone at (571) 272-0900.

SUPPLEMENTARY INFORMATION: The Office has a staff of approximately 8,400 patent examiners who examine patent applications in hundreds of technology areas. Each technology area is assigned an examination time goal. The goals are used by the Office for a variety of purposes, including forecasting pendency and staffing needs and evaluating individual examiner performance. The goals originally were assigned over 40 years ago and have been adjusted twice.

Since the examination time goals were originally assigned, significant changes to the examination process have occurred, including increased use of electronic tools, changes in law due to court decisions, a growing volume of prior art, and progress in technology, which results in increasingly complex subject matter in applications. In addition, the Office recently transitioned from the United States Patent Classification (USPC) system to the Cooperative Patent Classification (CPC) system. Because the current examination time goals were assigned based on the USPC system, implementation of the CPC system has caused the Office to reconsider and reassess the assignments of examination time goals. Furthermore, the Office is (i) implementing the Enhanced Patent Quality Initiatives in order to provide a higher quality examination to our stakeholders and (ii) assessing the relationship between examination time and value-added examination activities, such as best practices for enhancing the clarity of the record with respect to claim interpretation, interview summaries, and reasons for allowance. All of these factors warrant a reevaluation of the Office's examination time goals.

To help inform public comments responsive to this request for comments (RFC), the Office has prepared background material illustrating the use of examination time goals in the context

of individual examiner evaluation, and as an input into the model used to forecast pendency and hiring needs. These materials can be found at <http://www.uspto.gov/patent/initiatives/eta-external-outreach>.

The Office has generated the following list of questions concerning examination time goals to further inform comments responsive to this RFC. Responders to this RFC can choose to address as many of these questions as desired. Responders are not limited to submitting information addressing the questions below. The Office welcomes any other comments on the topic of this RFC that may be informative, for example those that facilitate an understanding of the interests of stakeholders with respect to quality, pendency, and cost for services. A further area of inquiry seeks to shed light on other characteristics of patent applications, besides technological complexity, which lead to a more time-consuming examination.

(1) Do you perceive a difference in the quality of examination performed in complex technologies compared to less complex technologies? If yes, which do you perceive as higher quality and why? In what aspect(s) is the quality of examination higher?

(2) What factors do you consider when estimating the amount of time needed to take various steps in prosecution, such as preparing responses to Office actions or preparing for interviews? In particular, if you prosecute applications in a variety of technology areas, how do those factors vary among the technologies?

(3) Are the applications you prosecute more or less complex than in the past, *e.g.*, 10 years ago? What factors contribute to the increase or decrease in complexity? Do you believe the increase or decrease in complexity has affected the amount of time it takes to prosecute the applications? If so, by how much? Do you believe the increase or decrease in complexity has affected the quality of examination? If so, how?

(4) In order to increase the quality of examination, do you believe that an increase in the time allotted for examination should be designated for specific activities, such as interviews, or left to the discretion of the examiner? What activities would you prioritize and allocate more time to?

(5) Are there any portions of Office actions which you feel do not add value or quality to the examination? If yes, what are they?

(6) What other activities beyond examining, such as research or training, could examiners spend time on that

would add value? Why do you believe these activities could add value?

(7) While the focus of this request for comments and the roundtables is to find the appropriate amount of time for examination, cost and pendency are also contributing factors. Do these factors raise a concern that should be considered?

In addition to accepting public feedback through the submission of written comments, the Office will provide an avenue for interactive participation using IdeaScale®. IdeaScale® allows users to post comments on a topic, and view and respond to others' comments. Users also may vote to indicate agreement or disagreement with a particular comment. Information on how to use IdeaScale® to comment on examination time goals is available at <http://www.uspto.gov/patent/initiatives/eta-external-outreach>.

The Office also will provide an avenue for interactive participation by conducting five public roundtables. Information on the first two roundtables to be conducted, in Alexandria, Virginia, and Dallas, Texas, including locations, dates, and how to participate, is set forth below.

Alexandria and Dallas Roundtable Registration Information: Roundtables will be conducted in Alexandria, Virginia, and Dallas, Texas, as detailed below. Registration is required, and early registration is recommended because seating is limited. There is no fee to register for either roundtable, and registration will be on a first-come, first-served basis. Registration on the day of either roundtable will be permitted on a space-available basis beginning 30 minutes before the roundtable.

To register, please send an email message to ExternalExaminationTimeStudy@USPTO.gov and provide the following information: (1) Your name, title, and if applicable, company or organization, address, phone number, and email address; and (2) which roundtable you wish to attend. Each attendee, even if from the same organization, must register separately. If you need special accommodations, *e.g.*, due to a disability, please inform a contact person identified below.

For more information on the Alexandria and Dallas roundtables, including the agenda for each roundtable and webcast access instructions for the Alexandria roundtable, please visit <http://www.uspto.gov/patent/initiatives/eta-external-outreach>.

Alexandria Roundtable

Alexandria Dates: Roundtable Date: The Alexandria roundtable will be held on Monday, November 14, 2016, beginning at 9:00 a.m. Eastern Standard Time (EST) and ending at 11:00 a.m. EST.

Registration Deadline: Registration to attend the Alexandria roundtable in person or via webcast is requested by November 7, 2016. See the "Roundtable Registration Information" section of this notice for additional details on how to register.

Address of Alexandria Roundtable: The Alexandria roundtable will be held at USPTO Headquarters in the Madison Building, Madison Auditorium, Concourse Level, 600 Dulany Street, Alexandria, VA 22314.

Dallas Roundtable

Dallas Dates: Roundtable Date: The Dallas roundtable will be held on Tuesday, November 29, 2016, beginning at 10:00 a.m. Central Standard Time (CST) and ending at 12:00 p.m. CST.

Registration Deadline: Registration to attend the Dallas roundtable is requested by November 22, 2016. See the "Roundtable Registration Information" section of this notice for additional details on how to register.

Address of Dallas Roundtable: The Dallas roundtable will be held at the USPTO's Texas Regional Office in the Terminal Annex Federal Building, 207 S. Houston Street, Suite 159, Dallas, TX 75202.

Detroit, Denver, and San Jose Roundtables

Information on the roundtables to be conducted in Detroit, Michigan, Denver, Colorado, and San Jose, California will be provided at <http://www.uspto.gov/patent/initiatives/eta-external-outreach> as soon as it becomes available.

Dated: October 19, 2016.

Russell Slifer,

Deputy Under Secretary of Commerce for Intellectual Property and Deputy Director of the United States Patent and Trademark Office.

BILLING CODE 3510-16-P

DEPARTMENT OF EDUCATION**[Docket No.: ED–2016–ICCD–0093]****Agency Information Collection Activities; Submission to the Office of Management and Budget for Review and Approval; Comment Request; 2012/17 Beginning Postsecondary Students Longitudinal Study: (BPS: 12/17)**

AGENCY: National Center for Education Statistics (NCES), Department of Education (ED).

ACTION: Notice.

SUMMARY: In accordance with the Paperwork Reduction Act of 1995 (44 U.S.C. chapter 3501 *et seq.*), ED is proposing a revision of an existing information collection.

DATES: Interested persons are invited to submit comments on or before November 25, 2016.

ADDRESSES: To access and review all the documents related to the information collection listed in this notice, please use <http://www.regulations.gov> by searching the Docket ID number ED–2016–ICCD–0093. Comments submitted in response to this notice should be submitted electronically through the Federal eRulemaking Portal at <http://www.regulations.gov> by selecting the Docket ID number or via postal mail, commercial delivery, or hand delivery. *Please note that comments submitted by fax or email and those submitted after the comment period will not be accepted.* Written requests for information or comments submitted by postal mail or delivery should be addressed to the Director of the Information Collection Clearance Division, U.S. Department of Education, 400 Maryland Avenue SW., LBJ, Room 2E–347, Washington, DC 20202–4537.

FOR FURTHER INFORMATION CONTACT: For specific questions related to collection activities, please contact NCES Information Collections at NCES.Information.Collections@ed.gov.

SUPPLEMENTARY INFORMATION: The Department of Education (ED), in accordance with the Paperwork Reduction Act of 1995 (PRA) (44 U.S.C. 3506(c)(2)(A)), provides the general public and Federal agencies with an opportunity to comment on proposed, revised, and continuing collections of information. This helps the Department assess the impact of its information collection requirements and minimize the public's reporting burden. It also helps the public understand the Department's information collection requirements and provide the requested data in the desired format. ED is

soliciting comments on the proposed information collection request (ICR) that is described below. The Department of Education is especially interested in public comment addressing the following issues: (1) Is this collection necessary to the proper functions of the Department; (2) will this information be processed and used in a timely manner; (3) is the estimate of burden accurate; (4) how might the Department enhance the quality, utility, and clarity of the information to be collected; and (5) how might the Department minimize the burden of this collection on the respondents, including through the use of information technology. Please note that written comments received in response to this notice will be considered public records.

Title of Collection: 2012/17 Beginning Postsecondary Students Longitudinal Study: (BPS:12/17).

OMB Control Number: 1850–0631.

Type of Review: A revision of an existing information collection.

Respondents/Affected Public: Individuals or Households.

Total Estimated Number of Annual Responses: 39,399.

Total Estimated Number of Annual Burden Hours: 55,002.

Abstract: The 2012/17 Beginning Postsecondary Students Longitudinal Study (BPS:12/17) is conducted by the National Center for Education Statistics (NCES), within the U.S. Department of Education (ED). BPS is designed to follow a cohort of students who enroll in postsecondary education for the first time during the same academic year, irrespective of the date of high school completion. The study collects data on students' persistence in and completion of postsecondary education programs; their transition to employment; demographic characteristics; and changes over time in their goals, marital status, income, and debt, among other indicators. Data from BPS are used to help researchers and policymakers better understand how financial aid influences persistence and completion, what percentages of students complete various degree programs, what are the early employment and wage outcomes for certificate and degree attainers, and why students leave school. This request is to conduct the BPS:12/17 full-scale data collection, including a student interview, file matching to various administrative data sources, and collection of corresponding postsecondary education transcripts and student records.

Dated: October 20, 2016.

Kate Mullan,

Acting Director, Information Collection Clearance Division, Office of the Chief Privacy Officer, Office of Management.

DEPARTMENT OF EDUCATION**[Docket No. ED–2016–ICCD–0079]****Agency Information Collection Activities; Submission to the Office of Management and Budget for Review and Approval; Comment Request; Cash Management Contract URL Collection**

AGENCY: Federal Student Aid (FSA), Department of Education (ED).

ACTION: Notice.

SUMMARY: In accordance with the Paperwork Reduction Act of 1995 (44 U.S.C. chapter 3501 *et seq.*), ED is proposing a new information collection.

DATES: Interested persons are invited to submit comments on or before November 25, 2016.

ADDRESSES: To access and review all the documents related to the information collection listed in this notice, please use <http://www.regulations.gov> by searching the Docket ID number ED–2016–ICCD–0079. Comments submitted in response to this notice should be submitted electronically through the Federal eRulemaking Portal at <http://www.regulations.gov> by selecting the Docket ID number or via postal mail, commercial delivery, or hand delivery. *Please note that comments submitted by fax or email and those submitted after the comment period will not be accepted.* Written requests for information or comments submitted by postal mail or delivery should be addressed to the Director of the Information Collection Clearance Division, U.S. Department of Education, 400 Maryland Avenue SW., LBJ, Room 2E–347, Washington, DC 20202–4537.

FOR FURTHER INFORMATION CONTACT: For specific questions related to collection activities, please contact Beth Grebeldinger, 202–377–4018.

SUPPLEMENTARY INFORMATION: The Department of Education (ED), in accordance with the Paperwork Reduction Act of 1995 (PRA) (44 U.S.C. 3506(c)(2)(A)), provides the general public and Federal agencies with an opportunity to comment on proposed, revised, and continuing collections of information. This helps the Department assess the impact of its information collection requirements and minimize

the public's reporting burden. It also helps the public understand the Department's information collection requirements and provide the requested data in the desired format. ED is soliciting comments on the proposed information collection request (ICR) that is described below. The Department of Education is especially interested in public comment addressing the following issues: (1) Is this collection necessary to the proper functions of the Department; (2) will this information be processed and used in a timely manner; (3) is the estimate of burden accurate; (4) how might the Department enhance the quality, utility, and clarity of the information to be collected; and (5) how might the Department minimize the burden of this collection on the respondents, including through the use of information technology. Please note that written comments received in response to this notice will be considered public records.

Title of Collection: Cash Management Contract URL Collection.

OMB Control Number: 1845–NEW.

Type of Review: A new information collection.

Respondents/Affected Public: State, Local, and Tribal Governments; Private Sector.

Total Estimated Number of Annual Responses: 914.

Total Estimated Number of Annual Burden Hours: 73.

Abstract: The Department of Education (the Department) is seeking a new OMB control number for the collection of URLs hosting institutional contracts and contract data relating to campus banking agreements. This is a new requirement of the final Program Integrity and Improvement regulations published on October 30, 2015. When the Department added the requirement for institutions to post campus banking agreement contracts and contract data to their Web sites, consumer advocates requested that a central repository for these web addresses be made publicly available for research and comparison purposes. This database will allow interested parties, such as students, families, press, institutions, and researchers to easily access and compare banking agreements available at different institutions.

DEPARTMENT OF ENERGY

Office of Energy Efficiency and Renewable Energy

Supporting Clean Energy Startups—Industry and Investment Partnerships for Scaling Innovation

AGENCY: Office of Energy Efficiency and Renewable Energy (EERE), Department of Energy (DOE).

ACTION: Notice of Request for Information.

SUMMARY: The U.S. Department of Energy's Office of Energy Efficiency and Renewable Energy's Technology-to-Market (T2M) team is issuing a Request for Information (RFI) on Supporting Clean Energy Startups—Industry and Investment Partnerships for Scaling Innovation. The purpose of this RFI is to gain public input on how T2M can best facilitate a more efficient clean energy innovation ecosystem in the U.S. T2M is looking to understand unaddressed challenges faced by early-stage clean energy start-ups and by the investors and industry partners that can help facilitate the transition of new technologies into the marketplace. The information being sought under this RFI is intended to assist EERE in further defining the scope and priorities of its initiatives.

DATES: Written comments and information are requested on or before November 14, 2016.

ADDRESSES: Interested persons are encouraged to submit comments, which must be submitted electronically to T2M@ee.doe.gov. The complete RFI, including the list of specific questions and submission instructions, can be found at <https://eere-exchange.energy.gov/>.

FOR FURTHER INFORMATION CONTACT:

Questions may be directed to Johanna Wolfson, U.S. Department of Energy, Office of Energy Efficiency and Renewable Energy, EE–61, 1000 Independence Avenue SW., Washington, DC 20585–0121. Telephone: 202–586–1040. Email: T2M@ee.doe.gov.

SUPPLEMENTARY INFORMATION: None.

Issued in Washington, DC, on October 19, 2016.

Robert Dixon,

Director, Office of Strategic Programs, Office of Energy Efficiency and Renewable Energy.

BILLING CODE 6450–01–P

ENVIRONMENTAL PROTECTION AGENCY**[EPA-HQ-OGC-2016-0612; FRL-9954-48-OGC]****Proposed Consent Decree, Clean Air Act Citizen Suit****AGENCY:** Environmental Protection Agency (EPA).**ACTION:** Notice of proposed consent decree; request for public comment.

SUMMARY: In accordance with section 113(g) of the Clean Air Act, as amended (“CAA”), notice is hereby given of a proposed consent decree to address a lawsuit filed by Air Alliance Houston, Community In-Power and Development Association, Inc., Louisiana Bucket Brigade and Texas Environmental Justice Advocacy Services (“Plaintiffs”), in the United States District Court for the District of Columbia: *Air Alliance Houston, et al. v. McCarthy*, No. 1:16-cv-01998 (D.D.C.). On October 6, 2016, Plaintiffs filed a complaint that EPA failed to perform nondiscretionary duties under Clean Air Act. Specifically, Plaintiffs allege that EPA failed to review and, if necessary, revise the emissions factor for volatile organic compounds (“VOCs”) from flares at natural gas production facilities at least once every three years. The consent decree would require EPA to propose action by June 5, 2017, and take final action by February 5, 2018.

DATES: Written comments on the proposed consent decree must be received by November 25, 2016.

ADDRESSES: Submit your comments, identified by Docket ID number EPA-HQ-OGC-2016-0612, online at www.regulations.gov. For comments submitted at www.regulations.gov, follow the online instructions for submitting comments. Once submitted, comments cannot be edited or removed from www.regulations.gov. The EPA may publish any comment received to its public docket. Do not submit electronically any information you consider to be Confidential Business Information (CBI) or other information whose disclosure is restricted by statute. Multimedia submissions (audio, video, etc.) must be accompanied by a written comment. The written comment is considered the official comment and should include discussion of all points you wish to make. The EPA will generally not consider comments or comment contents located outside of the primary submission (*i.e.* on the web, cloud, or other file sharing system). For additional submission methods, please contact the person identified in the **FOR**

FURTHER INFORMATION CONTACT section. For the full EPA public comment policy, information about CBI or multimedia submissions, and general guidance on making effective comments, please visit <http://www2.epa.gov/dockets/commenting-epa-dockets>.

FOR FURTHER INFORMATION CONTACT: Susan Stahle, Air and Radiation Law Office (2344A), Office of General Counsel, U.S. Environmental Protection Agency, 1200 Pennsylvania Ave. NW., Washington, DC 20460; telephone: (202) 564-1272; fax number (202) 564-5603; email address: stahle.susan@epa.gov.

SUPPLEMENTARY INFORMATION:**I. Additional Information About the Proposed Consent Decree**

The proposed consent decree would settle Plaintiffs’ claims in a deadline suit alleging EPA failed to perform nondiscretionary duties pursuant to CAA section 130 to review, and, if necessary, revise the VOC emission factor for elevated flares and enclosed ground flares at natural gas production sites in the source category entitled “Crude Oil and Natural Gas Production, Transmission and Distribution” (ONG source category) at least once every three years (“Natural Gas VOC emissions factor”). The proposed consent decree would require EPA, by June 5, 2017, to review and either propose revisions to the Natural Gas VOC emissions factor under CAA section 130, or propose a determination under CAA section 130 that revision of the Natural Gas VOC emissions factor is not necessary. The proposed consent decree would also require EPA, by February 5, 2018, to issue final revisions to the Natural Gas VOC emissions factor under CAA section 130, or issue a final determination under CAA section 130 that revision of the Natural Gas VOC emissions factor is not necessary. EPA will post each proposed revision or determination (or combination thereof), and each final revision or determination (or combination thereof), on its AP-42 Web site (located at <https://www.epa.gov/air-emissions-factors-and-quantification/ap-42-compilation-air-emission-factors>) on the dates indicated above. In addition, EPA will provide a copy of each such action to Plaintiffs’ counsel within seven days of posting. Under the proposed consent decree, once EPA has met these obligations, and any claims by Plaintiffs for costs of litigation have been resolved pursuant to the process provided in the proposed consent decree, the court would dismiss the suit with prejudice.

For a period of 30 days following the date of publication of this notice, the

Agency will receive written comments relating to the proposed consent decree from persons who were not named as parties or intervenors to the litigation in question. EPA or the Department of Justice may withdraw or withhold consent to the proposed consent decree if the comments disclose facts or considerations that indicate that such consent is inappropriate, improper, inadequate, or inconsistent with the requirements of the Act. Unless EPA or the Department of Justice determines that consent to the consent decree should be withdrawn, the terms of the decree will be affirmed.

II. Additional Information About Commenting on the Proposed Consent Decree**A. How can I get a copy of the consent decree?**

The official public docket for this action under Docket ID No. EPA-HQ-OGC-2016-0612 contains a copy of the consent decree. The official public docket is available for public viewing at the Office of Environmental Information (OEI) Docket in the EPA Docket Center, EPA West, Room 3334, 1301 Constitution Ave. NW., Washington, DC. The EPA Docket Center Public Reading Room is open from 8:30 a.m. to 4:30 p.m., Monday through Friday, excluding legal holidays. The telephone number for the Public Reading Room is (202) 566-1744, and the telephone number for the OEI Docket is (202) 566-1752.

An electronic version of the public docket is available through www.regulations.gov. You may use the www.regulations.gov to submit or view public comments, access the index listing of the contents of the official public docket, and to access those documents in the public docket that are available electronically. Once in the system, key in the appropriate docket identification number then select “search”.

It is important to note that EPA’s policy is that public comments, whether submitted electronically or in paper, will be made available for public viewing online at www.regulations.gov without change, unless the comment contains copyrighted material, CBI, or other information whose disclosure is restricted by statute. Information claimed as CBI and other information whose disclosure is restricted by statute is not included in the official public docket or in the electronic public docket. EPA’s policy is that copyrighted material, including copyrighted material contained in a public comment, will not be placed in EPA’s electronic public

docket but will be available only in printed, paper form in the official public docket. Although not all docket materials may be available electronically, you may still access any of the publicly available docket materials through the EPA Docket Center.

B. How and to whom do I submit comments?

You may submit comments as provided in the **ADDRESSES** section. Please ensure that your comments are submitted within the specified comment period. Comments received after the close of the comment period will be marked "late." EPA is not required to consider these late comments.

If you submit an electronic comment, EPA recommends that you include your name, mailing address, and an email address or other contact information in the body of your comment and with any disk or CD ROM you submit. This ensures that you can be identified as the submitter of the comment and allows EPA to contact you in case EPA cannot read your comment due to technical difficulties or needs further information on the substance of your comment. Any identifying or contact information provided in the body of a comment will be included as part of the comment that is placed in the official public docket, and made available in EPA's electronic public docket. If EPA cannot read your comment due to technical difficulties and cannot contact you for clarification, EPA may not be able to consider your comment.

Use of the www.regulations.gov Web site to submit comments to EPA electronically is EPA's preferred method for receiving comments. The electronic public docket system is an "anonymous access" system, which means EPA will not know your identity, email address, or other contact information unless you provide it in the body of your comment. In contrast to EPA's electronic public docket, EPA's electronic mail (email) system is not an "anonymous access" system. If you send an email comment directly to the Docket without going through www.regulations.gov, your email address is automatically captured and included as part of the comment that is placed in the official public docket, and made available in EPA's electronic public docket.

Dated: October 17, 2016.

Gautam Srinivasan,

Acting Associate General Counsel.

[FR Doc. 2016-25771 Filed 10-24-16; 8:45 am]

BILLING CODE 6560-50-P

ENVIRONMENTAL PROTECTION AGENCY

[FRL-9954-44-OLEM]

Comprehensive Environmental Response, Compensation and Liability Act (CERCLA) or Superfund, Section 128(a); Notice of Grant Funding Guidance for State and Tribal Response Programs for FY2017

AGENCY: Environmental Protection Agency (EPA).

ACTION: Notice.

SUMMARY: The Environmental Protection Agency (EPA) will accept requests, from November 1, 2016 through December 31, 2016, for grants to establish and enhance State and Tribal Response Programs. This notice provides guidance on eligibility for funding, use of funding, grant mechanisms and process for awarding funding, the allocation system for distribution of funding, and terms and reporting under these grants. EPA has consulted with state and tribal officials in developing this guidance.

The primary goal of this funding is to ensure that state and tribal response programs include, or are taking reasonable steps to include, certain elements of a response program and establishing a public record. Another goal is to provide funding for other activities that increase the number of response actions conducted or overseen by a state or tribal response program. This funding is not intended to supplant current state or tribal funding for their response programs. Instead, it is to supplement their funding to increase their response capacity.

For fiscal year 2017, EPA will consider funding requests up to a maximum of \$1.0 million per state or tribe. Subject to the availability of funds, EPA regional personnel will be available to provide technical assistance to states and tribes as they apply for and carry out these grants.

DATES: This action is effective as of November 1, 2016. EPA expects to make non-competitive grant awards to states and tribes which apply during fiscal year 2017.

ADDRESSES: Mailing addresses for EPA Regional Offices and EPA Headquarters can be found at www.epa.gov/brownfields and at the end of this Notice. Funding requests may be submitted electronically to the EPA Regional Offices.

FOR FURTHER INFORMATION CONTACT: EPA's Office of Solid Waste and Emergency Response, Office of Brownfields and Land Revitalization,

(202) 566-2745 or the applicable EPA Regional Office listed at the end this Notice.

SUPPLEMENTARY INFORMATION:

I. General Information

Section 128(a) of the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA), as amended, authorizes a noncompetitive \$50 million grant program to establish and enhance state¹ and tribal² response programs. CERCLA section 128(a) response program grants are funded with categorical³ State and Tribal Assistance Grant (STAG) appropriations. Section 128(a) cooperative agreements are awarded and administered by the EPA regional offices. Generally, these response programs address the assessment, cleanup, and redevelopment of brownfields sites and other sites with actual or perceived contamination. This document provides guidance that will enable states and tribes to apply for and use Fiscal Year 2016 section 128(a) funds.⁴

The Catalogue of Federal Domestic Assistance entry for the section 128(a) State and Tribal Response Program cooperative agreements is 66.817. This grant program is eligible to be included in state and tribal Performance Partnership Grants under 40 CFR part 35 Subparts A and B, with the exception of funds used to capitalize a revolving loan fund for brownfield remediation under section 104(k)(3); or purchase environmental insurance or developing a risk sharing pool, an indemnity pool, or insurance mechanism to provide financing for response actions under a State or Tribal response program.

Requests for funding will be accepted from November 1, 2016 through December 31, 2016. Requests EPA receives after December 31, 2016 will not be considered for FY2017 funding. Information that must be submitted with the funding request is listed in Section IX of this guidance. States or tribes that do not submit the request in the appropriate manner may forfeit their ability to receive funds. First time requestors are strongly encouraged to

¹ The term "state" is defined in this document as defined in CERCLA section 101(27).

² The term "Indian tribe" is defined in this document as it is defined in CERCLA section 101(36). Intertribal consortia, as defined in the **Federal Register** Notice at 67 FR 67181, Nov. 4, 2002, are also eligible for funding under CERCLA section 128(a).

³ Categorical grants are issued by the U.S. Congress to fund state and local governments for narrowly defined purposes.

⁴ The Agency may waive any provision of this guidance that is not required by statute, regulation, Executive Order or overriding Agency policies.

contact their Regional EPA Brownfields contacts, listed at the end of this guidance, prior to submitting their funding request. EPA will consider funding requests up to a maximum of \$1.0 million per state or tribe for FY2017.

Requests submitted by the December 31, 2016 request deadline are preliminary; final cooperative agreement work plans and budgets will be negotiated with the regional offices once final funding allocation determinations are made. As in previous years, EPA will place special emphasis on reviewing a cooperative agreement recipient's use of prior section 128(a) funding in making allocation decisions and unexpended balances are subject to 40 CFR 35.118 and 40 CFR 35.518 to the extent consistent with this guidance. Also, EPA will prioritize funding for recipients establishing their response programs.

States and tribes requesting funds are required to provide a Dun and Bradstreet Data Universal Numbering System (DUNS) number with their cooperative agreement's final package. For more information, please go to www.grants.gov.

II. Background

State and tribal response programs oversee assessment and cleanup activities at brownfield sites across the country. The depth and breadth of these programs vary. Some focus on CERCLA related activities, while others are multi-faceted, addressing sites regulated by both CERCLA and the Resource Conservation and Recovery Act (RCRA). Many states also offer accompanying financial incentive programs to spur cleanup and redevelopment. In enacting CERCLA section 128(a),⁵ Congress recognized the value of state and tribal response programs in cleaning up and redeveloping brownfield sites. Section 128(a) strengthens EPA's partnerships with states and tribes, and recognizes the response programs' critical role in overseeing cleanups.

This funding is intended for those states and tribes that have the management and administrative capacity within their government required to administer a federal grant. The primary goal of this funding is to ensure that state and tribal response programs include, or are taking reasonable steps to include, certain elements of an environmental response program and that the program

establishes and maintains a public record of sites addressed.

Subject to the availability of funds, EPA regional personnel will provide technical assistance to states and tribes as they apply for and carry out section 128(a) cooperative agreements.

III. Eligibility for Funding

To be eligible for funding under CERCLA section 128(a), a state or tribe must:

1. Demonstrate that its response program includes, or is taking reasonable steps to include, the four elements of a response program described in Section V of this guidance; or be a party to a voluntary response program Memorandum of Agreement (VRP MOA)⁶ with EPA; AND
2. maintain and make available to the public a record of sites at which response actions have been completed in the previous year and are planned to be addressed in the upcoming year (see CERCLA section 128(b)(1)(C)).

IV. Matching Funds/Cost-Share

States and tribes are *not* required to provide matching funds for cooperative agreements awarded under section 128(a), with the exception of section 128(a) funds a state or tribe uses to capitalize a Brownfields Revolving Loan Fund (RLF), for which there is a 20% cost share requirement. Section 128(a) funds uses to capitalize a RLF must be operated in accordance with CERCLA section 104(k)(3).

V. The Four Elements—Section 128(a)(2)

Section 128(a) recipients that do not have a VRP MOA with EPA must demonstrate that their response program includes, or is taking reasonable steps to include, the four elements described below. Achievement of the four elements should be viewed as a priority. Section 128(a) authorizes funding for activities necessary to establish and enhance the four elements, and to establish and maintain the public record requirement.

The four elements of a response program are described below:

1. *Timely survey and inventory of brownfield sites in state or tribal land.* The goal for this element is to enable the state or tribe to establish or enhance a system or process that will provide a reasonable estimate of the number, likely locations, and the general characteristics of brownfields sites in their state or tribal lands.

EPA recognizes the varied scope of state and tribal response programs and will not require states and tribes to develop a "list" of brownfield sites. However, at a minimum, the state or tribe should develop and/or maintain a system or process that can provide a reasonable estimate of the number, likely location, and general characteristics of brownfield sites within their state or tribal lands. Inventories should evolve to a prioritization of sites based on community needs, planning priorities, and protection of human health and the environment. Inventories should be developed in direct coordination with communities, and particular attention should focus on communities with limited capacity to compete for and manage a competitive brownfield assessment, revolving loan, or cleanup cooperative agreement.

Given funding limitations, EPA will negotiate work plans with states and tribes to achieve this goal efficiently and effectively, and within a realistic time frame. For example, many of EPA's Brownfields Assessment cooperative agreement recipients conduct inventories of brownfields sites in their communities or jurisdictions. EPA encourages states and tribes to work with these cooperative agreement recipients to obtain the information that they have gathered and include it in their survey and inventory.

2. *Oversight and enforcement authorities or other mechanisms and resources.* The goal for this element is to have state and tribal response programs that include oversight and enforcement authorities or other mechanisms, and resources to ensure that:

a. A response action will protect human health and the environment, and be conducted in accordance with applicable laws; and

b. the state or tribe will complete the necessary response activities if the person conducting the response fails to complete them (this includes operation and maintenance and/or long-term monitoring activities).

3. *Mechanisms and resources to provide meaningful opportunities for public participation.*⁷ The goal for this element is to have states and tribes include in their response program mechanisms and resources for meaningful public participation, at the local level, including, *at a minimum*:

⁷ States and tribes establishing this element may find useful information on public participation on EPA's community involvement Web site at <https://www.epa.gov/superfund/superfund-community-involvement>.

⁵ Section 128(a) was added to CERCLA in 2002 by the Small Business Liability Relief and Brownfields Revitalization Act (Brownfield Amendments).

⁶ States or tribes that are parties to VRP MOAs and that maintain and make available a public record are automatically eligible for section 128(a) funding.

a. Public access to documents and related materials that a state, tribe, or party conducting the cleanup is relying on or developing to make cleanup decisions or conduct site activities;

b. prior notice and opportunity for meaningful public comment on cleanup plans and site activities, including the input into the prioritization of sites; and

c. a mechanism by which a person who is, or may be, affected by a release or threatened release of a hazardous substance, pollutant, or contaminant at a brownfield site—located in the community in which the person works or resides—may request that a site assessment be conducted. The appropriate state or tribal official must consider this request and appropriately respond.

4. *Mechanisms for approval of cleanup plans, and verification and certification that cleanup is complete.* The goal for this element is to have states and tribes include in their response program mechanisms to approve cleanup plans and to verify that response actions are complete, including a requirement for certification or similar documentation from the state, the tribe, or a licensed site professional that the response action is complete. Written approval by a state or tribal response program official of a proposed cleanup plan is an example of an approval mechanism.

VI. Public Record Requirement

In order to be eligible for section 128(a) funding, states and tribes (including those with MOAs) must establish and maintain a public record system, as described below, to enable meaningful public participation (refer to Section V.3 above). Specifically, under section 128(b)(1)(C), states and tribes must:

1. Maintain and update, at least annually or more often as appropriate, a public record that includes the name and location of sites at which response actions have been completed during the previous year;

2. maintain and update, at least annually or more often as appropriate, a public record that includes the name and location of sites at which response actions are planned in the next year; and

3. identify in the public record whether or not the site, upon completion of the response action, will be suitable for unrestricted use. If not, the public record must identify the institutional controls relied on in the remedy and include relevant information concerning the entity responsible for oversight, monitoring, and/or maintenance of the institutional

and engineering controls; and how the responsible entity is implementing those activities (see Section VI.C).

Section 128(a) funds may be used to maintain and make available a public record system that meets the requirements discussed above.

A. Distinguishing the “Survey and Inventory” Element From the “Public Record”

It is important to note that the public record requirement differs from the “timely survey and inventory” element described in the “Four Elements” section above. The public record addresses sites at which response actions have been completed in the previous year or are planned in the upcoming year. In contrast, the “timely survey and inventory” element, described above, refers to identifying brownfield sites regardless of planned or completed actions.

B. Making the Public Record Easily Accessible

EPA’s goal is to enable states and tribes to make the public record and other information, such as information from the “survey and inventory” element, easily accessible. For this reason, EPA will allow states and tribes to use section 128(a) funding to make such information available to the public via the internet or other avenues. For example, the Agency would support funding state and tribal efforts to include detailed location information in the public record such as the street address, and latitude and longitude information for each site.⁸ States and tribes should ensure that all affected communities have appropriate access to the public record by making it available on-line, in print at libraries, or at other community gathering places.

In an effort to reduce cooperative agreement reporting requirements and increase public access to the public record, EPA encourages states and tribes to place their public record on the internet. If a state or tribe places the public record on the Internet, maintains the substantive requirements of the public record, and provides EPA with the link to that site, EPA will, for purposes of cooperative agreement funding only, deem the public record reporting requirement met.

⁸ For further information on data quality requirements for latitude and longitude information, please see EPA’s data standards Web site available at http://iaspub.epa.gov/sor_internet/registry/datastds/fundadatastandard/epaapproved/latitude/longitude.

C. Long-Term Maintenance of the Public Record

EPA encourages states and tribes to maintain public record information, including data on institutional controls, on a long-term basis (more than one year) for sites at which a response action has been completed. Subject to EPA regional office approval, states or tribes may include development and operation of systems that ensure long-term maintenance of the public record, including information on institutional controls (such as ensuring the entity responsible for oversight, monitoring, and/or maintenance of the institutional and engineering controls is implementing those activities) in their work plans.⁹

VII. Use of Funding

A. Overview

Section 128(a)(1)(B) describes the eligible uses of cooperative agreement funds by states and tribes. In general, a state or tribe may use funding to “establish or enhance” its response program. Specifically, a state or tribe may use cooperative agreement funds to build response programs that include the four elements outline in section 128(a)(2). Eligible activities include, but are not limited to, the following:

- Developing legislation, regulations, procedures, ordinances, guidance, etc. that establish or enhance the administrative and legal structure of a response program;
- establishing and maintaining the required public record described in Section VI of this guidance;
- operation, maintenance and long-term monitoring of institutional controls and engineering controls;
- conducting site-specific activities, such as assessment or cleanup, provided such activities establish and/or enhance the response program and are tied to the four elements. In addition to the requirement under CERCLA section 128(a)(2)(C)(ii) to provide for public comment on cleanup plans and site activities, EPA strongly encourages states and tribes to seek public input regarding the priority of sites to be addressed—especially from local communities with health risks related to exposure to hazardous waste or other public health concerns, those in economically disadvantaged or remote areas, and those with limited experience working with government agencies. EPA will not provide section 128(a) funds solely for assessment or cleanup of

⁹ States and tribes may find useful information on institutional controls on the EPA’s institutional controls Web site at <http://www.epa.gov/superfund/policy/ic/index.htm>

specific brownfield sites; site-specific activities must be part of an overall section 128(a) work plan that includes funding for other activities that establish or enhance the four elements;

- capitalizing a revolving loan fund (RLF) for brownfields cleanup as authorized under CERCLA section 104(k)(3). These RLFs are subject to the same statutory requirements and cooperative agreement terms and conditions applicable to RLFs awarded under section 104(k)(3). Requirements include a 20 percent match (in the form of money, labor, material, or services from a non-federal source) on the amount of section 128(a) funds used for the RLF, a prohibition on using EPA cooperative agreement funds for administrative costs relating to the RLF, and a prohibition on using RLF loans or subgrants for response costs at a site for which the recipient may be potentially liable under section 107 of CERCLA. Other prohibitions relevant to CERCLA section 104(k)(4) also apply; and
- purchasing environmental insurance or developing a risk-sharing pool, indemnity pool, or insurance mechanism to provide financing for response actions under a state or tribal response program.

B. Uses Related To Establishing a State or Tribal Response Program

Under CERCLA section 128(a), establish includes activities necessary to build the foundation for the four elements of a state or tribal response program and the public record requirement. For example, a state or tribal response program may use section 128(a) funds to develop regulations, ordinances, procedures, guidance, and a public record.

C. Uses Related To Enhancing a State or Tribal Response Program

Under CERCLA section 128(a), enhance is related to activities that add to or improve a state or tribal response program or increase the number of sites at which response actions are conducted under such programs.

The exact enhancement activities that may be allowable depend upon the work plan negotiated between the EPA regional office and the state or tribe. For example, regional offices and states or tribes may agree that section 128(a) funds may be used for outreach and training directly related to increasing awareness of its response program, and improving the skills of program staff. It may also include developing better coordination and understanding of other state response programs, (e.g., RCRA or Underground Storage Tanks (USTs)). As another example, states and tribal

response program enhancement activities can also include outreach to local communities (e.g., distressed, environmental justice, rural, tribal, etc.) to increase awareness about brownfields, building a sustainable brownfields program, federal brownfields technical assistance opportunities¹⁰ (e.g., holding workshops to assist communities to apply for federal Brownfields grant funding), and knowledge regarding the importance of monitoring engineering and institutional controls. Additionally, enhancement activities can include facilitating the participation of the state and local agencies (e.g., transportation, water, other infrastructure) in implementation of brownfields projects. States and tribes can also help local communities collaborate with local workforce development entities or Brownfields Environmental Workforce Development Job training recipients on the assessment and cleanup of brownfield sites.¹¹ Other enhancement uses may be allowable as well.

Note: EPA anticipates that states and tribes will work with their EPA Brownfields Area-Wide Planning, Assessment, Cleanup, and Revolving Loan Fund recipients to incorporate changing climate conditions in their reuse plans and clean up remedies, as appropriate.¹²

D. Uses Related to Site-Specific Activities

1. Eligible Uses of Funds for Site-Specific Activities

Site-specific assessment and cleanup activities should establish and/or enhance the response program and be tied to the four elements. Site-specific assessments and cleanups can be both eligible and allowable if the activities is included in the work plan negotiated between the EPA regional office and the state or tribe, but activities must comply with all applicable laws and are subject to the following restrictions:

- a. Section 128(a) funds can only be used for assessments or cleanups at sites that meet the definition of a brownfields site at CERCLA section 101(39). EPA encourages states and tribes to use site-

¹⁰ EPA expects states and tribes will familiarize themselves with U.S. EPA's brownfields technical assistance opportunities for brownfields communities. For more information on technical assistance opportunities, please visit: <https://www.epa.gov/brownfields>.

¹¹ For more information about EPA's Brownfields Environmental Workforce Development and Job Training Program, please visit: <https://www.epa.gov/brownfields/types-brownfields-grant-funding>.

¹² For more information about EPA's Climate Adaptation Plan, please visit: <https://www.epa.gov/greeningepa/climate-change-adaptation-plans>.

specific funding to perform assessment (e.g., phase I, phase II, supplemental assessments and cleanup planning) and cleanup activities that will expedite the reuse and redevelopment of sites, particularly those located in distressed, environmental justice, rural or tribal communities. Furthermore, states and tribes that perform site-specific activities should plan to directly engage with and involve affected communities. For example, a Community Relations Plan (CRP) could be developed to provide reasonable notice about a planned cleanup, as well as opportunities for the public to comment on the cleanup. States and tribes should work towards securing additional funding for site-specific activities by leveraging resources from other sources such as businesses, non-profit organizations, education and training providers, and/or federal, state, tribal, and local governments;

- b. absent EPA approval, no more than \$200,000 per site assessment can be funded with section 128(a) funds, and no more than \$200,000 per site cleanup can be funded with section 128(a) funds;

- c. absent EPA approval, the state/tribe may not use funds awarded under this agreement to assess and/or clean up sites owned or operated by the recipient or held in trust by the United States Government for the recipient; and

- d. assessments and cleanups cannot be conducted at sites where the state/tribe is a potentially responsible party pursuant to CERCLA section 107, except:

- At brownfield sites contaminated by a controlled substance as defined in CERCLA section 101(39)(D)(ii)(I); or
- when the recipient would satisfy all of the elements set forth in CERCLA section 101(40) to qualify as a bona fide prospective purchaser except in cases where the date of acquisition of the property was on or before January 11, 2002.

Subawards are defined at 2 CFR 200.92 and may not be awarded to for-profit organizations. If the recipient plans on making any subawards under the cooperative agreement then they become a pass-through entity. As the pass-through entity, the recipient must report on its subaward monitoring activities under 2 CFR 200.331(d). Additional reporting requirements for these activities will be included in the cooperative agreement. In addition, subawards cannot be provided to entities that may be potentially responsible parties (pursuant to CERCLA section 107) at the site for which the assessment or cleanup

activities are proposed to be conducted, except:

1. At brownfields sites contaminated by a controlled substance as defined in CERCLA section 101(39)(D)(ii)(I); or
2. when the recipient would satisfy all of the elements set forth in CERCLA section 101(40) to qualify as a bona fide prospective purchaser except in cases where the date of acquisition of the property was on or before January 11, 2002.

2. Limitations on the Amount of Funds Used for Site-Specific Activities and Waiver Process

States and tribes may use section 128(a) funds for site-specific activities that improve state or tribal capacity but the amount recipients may request for site-specific assessments and cleanups may not exceed 50% of the total amount of funding.¹³ In order to exceed the 50% site-specific funding limit, a state or tribe must submit a waiver request. The total amount of the site-specific request may not exceed the recipient's total funding level for the previous year. The funding request must include a brief justification describing the reason(s) for spending more than 50% of an annual allocation on site-specific activities. An applicant, when requesting a waiver, must include the following information in the written justification:

- Total amount requested for site-specific activities;
- percentage of the site-specific activities (assuming waiver is approved) in the total budget;
- site-specific activities that will be covered by this funding. If known, provide site specific information and describe how work on each site contributes to the development or enhancement of your state/tribal site response program. EPA recognizes the role of response programs to develop and provide capacity in distressed, environmental justice, rural or tribal communities, and encourages prioritization for site-specific activities in those communities. Further explain how the community will be (or has been) involved in prioritization of site work and especially those sites where there is a potential or known significant environmental impact to the community;
- an explanation of how this shift in funding will not negatively impact the core programmatic capacity (*i.e.*, the ability to establish/enhance the four required elements of a response program) and how the core program

activities will be maintained in spite of an increase in site-specific work. Recipients must demonstrate that they have adequate funding from other sources to effectively carry out work on the four elements for EPA to grant a waiver of the 50% limit on using 128(a) funds for site-specific activities; and

- an explanation as to whether the sites to be addressed are those for which the affected community(ies) has requested work be conducted (refer to Section VII.A Overview of Funding for more information).

EPA Headquarters will review waiver requests based on the information in the justification and other information available to the Agency. EPA will inform recipients whether the waiver is approved.

3. Uses Related to Site-Specific Activities at Petroleum Brownfield Sites

States and tribes may use section 128(a) funds for activities that establish and enhance response programs addressing petroleum brownfield sites. Subject to the restrictions listed above (see Section VII.D.1) for all site-specific activities, the costs of site-specific assessments and cleanup activities at petroleum contaminated brownfield sites defined in CERCLA section 101(39)(D)(ii)(II), are both eligible and allowable if the activity is included in the work plan negotiated between the EPA regional office and the state or tribe. Section 128(a) funds used to capitalize a Brownfields RLF may be used at brownfield sites contaminated by petroleum to the extent allowed under CERCLA section 104(k)(3).

4. Additional Examples of Eligible Site-Specific Activities

Other eligible uses of funds for site-specific related include, but are not limited to, the following activities:

- Technical assistance to federal brownfields cooperative agreement recipients;
- development and/or review of quality assurance project plans (QAPPs); and
- entering data into the Assessment Cleanup and Redevelopment Exchange System (ACRES) database

E. Uses Related to Activities at "Non-Brownfield" Sites

Other uses not specifically referenced in this guidance may also be eligible and allowable. Recipients should consult with their regional state or tribal contact for additional guidance. Costs incurred for activities at non-brownfield sites may be eligible and allowable if such activities are included in the state's or tribe's work plan. *Direct*

assessment and cleanup activities may only be conducted on eligible brownfield sites, as defined in CERCLA section 101(39).

VIII. General Programmatic Guidelines for 128(a) Grant Funding Requests

Funding authorized under CERCLA section 128(a) is awarded through a cooperative agreement¹⁴ between EPA and a state or a tribe. The program administers cooperative agreements under the Uniform Administrative Requirements, Cost Principles and Audit requirements for Federal Awards regulations for all entity types including states, tribes, and local governments found in the Code of Federal Regulations at 2 CFR part 200 and any applicable EPA regulations in Title 2 CFR Subtitle B—Federal Agency Regulations for Grants and Agreements Chapter 15 as well as applicable provisions of 40 CFR part 35 Subparts A and B. Under these regulations, the cooperative agreement recipient for a section 128(a) grant is the government to which a cooperative agreement is awarded and which is accountable for use of the funds provided. The cooperative agreement recipient is the legal entity even if only a particular component of the entity is designated in the cooperative agreement award document. Further, unexpended balances of cooperative agreement funds are subject to restrictions under 40 CFR 35.118 and 40 CFR 35.518. EPA allocates funds to state and tribal response programs consistent with 40 CFR 35.420 and 40 CFR 35.737.

A. One Application per State or Tribe

Subject to the availability of funds, EPA regional offices will negotiate and enter into section 128(a) cooperative agreements with eligible and interested states or tribes. *EPA will accept only one application from each eligible state or tribe.*

B. Maximum Funding Request

For Fiscal Year 2017, EPA will consider funding requests up to a maximum of \$1.0 million per state or tribe. Please note the CERCLA 128(a) program's annual budget has remained relatively the same since 2003 while demand has increased over time. Due to the increasing number of entities requesting funding, it is likely that the FY17 states and tribal individual funding amounts will be less than the FY16 individual funding amounts.

¹³ Oversight of assessment and cleanup activities performed by responsible parties (other than the state or tribe) does not count toward the 50% limit.

¹⁴ A cooperative agreement is an agreement to a state/tribe that includes substantial involvement by EPA on activities described in the work plan which may include technical assistance, collaboration on program priorities, etc.

C. Define the State or Tribal Response Program

States and tribes must define in their work plan the “section 128(a) response program(s)” to which the funds will be applied, and may designate a component of the state or tribe that will be EPA’s primary point of contact. When EPA funds the section 128(a) cooperative agreement, states and tribes may distribute these funds among the appropriate state and tribal agencies that are part of the section 128(a) response program. This distribution must be clearly outlined in their annual work plan.

D. Separate Cooperative Agreements for the Capitalization of RLFS Using Section 128(A) Funds

If a portion of the section 128(a) grant funds requested will be used to capitalize a revolving loan fund for cleanup, pursuant to section 104(k)(3), two separate cooperative agreements must be awarded (*i.e.*, one for the RLF and one for non-RLF uses). States and tribes must, however, submit one initial request for funding, delineating the RLF as a proposed use. Section 128(a) funds used to capitalize an RLF are not eligible for inclusion into a Performance Partnership Grant (PPG).

E. Authority To Manage a Revolving Loan Fund Program

If a state or tribe chooses to use its section 128(a) funds to capitalize a revolving loan fund program, the state or tribe must have the lead authority to manage the program (*e.g.*, hold loans, make loans, enter into loan agreements, collect repayment, access and secure the site in event of an emergency or loan default). If the agency/department listed as the point of contact for the section 128(a) cooperative agreement does not have this authority, it must be able to demonstrate that another state or tribal agency does have the authority to manage the RLF and is willing to do so.

F. Section 128(a) Cooperative Agreements Can Be Part of a Performance Partnership Grant (PPG)

States and tribes may include section 128(a) cooperative agreements in their PPG as described in 69 FR 51,756 (2004). Section 128(a) funds used to capitalize an RLF or purchase environmental insurance or develop a risk sharing pool, an indemnity pool, or insurance mechanism to provide financing for response actions under a state or tribal response program are not eligible for inclusion in the PPG.

G. Project Period

EPA regional offices will determine the project period for each cooperative agreement. These may be for multiple years depending on the regional office’s cooperative agreement policies. Each cooperative agreement must have an annual budget period tied to an annual work plan. While not prohibited, pre-award costs are subject to 40 CFR 35.113 and 40 CFR 35.513.

H. Demonstrating the Four Elements

As part of the annual work plan negotiation process, states or tribes that do *not* have VRP MOAs must demonstrate that their program includes, or is taking reasonable steps to include, the four elements described in Section V. EPA will not fund state or tribal response program annual work plans if EPA determines that these elements are not met or reasonable progress is not being made. EPA may base this determination on the information the state or tribe provides to support its work plan, on progress reports, or on EPA’s review of the state or tribal response program.

I. Establishing and Maintaining the Public Record

Prior to funding a state’s or tribe’s annual work plan, EPA regional offices will verify and document that a public record, as described in Section VI and below, exists and is being maintained.¹⁵ Specifically for:

- States or tribes that received initial funding prior to FY16: Requests for FY17 funds will not be accepted from states or tribes that fail to demonstrate, by the December 31, 2016 request deadline, that they established and are maintaining a public record. (*Note*, this would potentially impact any state or tribe that had a term and condition placed on their FY16 cooperative agreement that prohibited drawdown of FY16 funds prior to meeting the public record requirement). States or tribes in this situation will not be prevented from drawing down their prior year funds once the public record requirement is met; and
- states or tribes that received initial funding in FY16: By the time of the actual FY17 award, the state or tribe must demonstrate that they established and maintained the public record (those states and tribes that do not meet this requirement will have a term and condition placed on their FY17 cooperative agreement that prohibits the

drawdown of FY17 funds until the public record requirement is met).

J. Demonstration of Significant Utilization of Prior Years’ Funding

States and tribes should be aware that EPA and its Congressional appropriations committees place significant emphasis on the utilization of prior years’ funding. Unused funds prior to FY16 will be considered in the allocation process. Existing balances of cooperative agreement funds as reflected in EPA’s Financial Data Warehouse may result in an allocation amount below a recipient’s request for funding or, if appropriate deobligation and reallocation by EPA Regions as provided for in 40 CFR 35.118 and 40 CFR 35.518.

EPA Regional staff will review EPA’s Financial Database Warehouse to identify the amount of remaining prior year(s) funds. The requestor should work, as early as possible, with both their own finance department, and with their Regional Project Officer to reconcile any discrepancy between the amount of unspent funds showing in EPA’s system, and the amount reflected in the recipient’s records. The recipient should obtain concurrence from the Region on the amount of unspent funds requiring justification by the deadline for this request for funding.

K. Allocation System and Process for Distribution of Funds

After the December 31, 2016, request deadline, EPA’s Regional Offices will submit summaries of state and tribal requests to EPA Headquarters. Before doing so, regional offices may take into account additional factors when determining recommended allocation amounts. Such factors include, but are not limited to, the depth and breadth of the state or tribal program, and scope of the perceived need for funding (*e.g.*, size of state or tribal jurisdiction or the proposed work plan balanced against capacity of the program, amount of current year funding, funds remaining from prior years, etc).

After receipt of the regional recommendations, EPA Headquarters will consolidate requests and make decisions on the final funding allocations.

EPA regional offices will work with interested states and tribes to develop their preliminary work plans and funding requests. Final cooperative agreement work plans and budgets will be negotiated with the regional office once final allocation determinations are made. Please refer to process flow chart below (dates are estimates and subject to change):

¹⁵ For purposes of 128(a) funding, the state’s or tribe’s public record applies to that state’s or tribe’s response program(s) that utilized the section 128(a) funding.

IX. Information To Be Submitted With the Funding Request

A. Summary of Planned Use of FY17 Funding

All states and tribes requesting FY17 funds must submit (to their regional brownfields contact, shown on the last page of this guidance) a draft work plan of the funds with associated dollar amounts. Please contact your regional contact listed on page 29 or visit www.epa.gov/brownfields/brownfields-comprehensive-environmental-response-compensation-and-liability-act-cercla for a sample draft work plan.

For entities which received CERCLA 128(a) funding in previous years, respond to the following:

1. Funding Request

a. Prepare a draft work plan and budget for your FY17 funding request. The funding requested should be reasonably spent in one year. The requestor should work, as early as possible, with their EPA regional program contact to ensure that the funding amount requested and related activities are reasonable.

b. In your funding request, include the prior years' funding amount. Include any funds that you, the recipient, have not received in payments (*i.e.*, funds EPA has obligated for grants that remain in EPA's Financial Data Warehouse). EPA will take into account these funds in the allocation process when determining the recipient's programmatic needs. The recipient should include a detailed explanation and justification of prior year funds that remain in EPA's Financial Data Warehouse. The recipient should consult with the region regarding the amount of unspent funds which require explanation to ensure they have addressed the full amount of any remaining balance.

c. If you do not have an MOA with EPA, demonstrate how your program includes, or is taking reasonable steps to include, the four elements described in Section VI.

For tribal entities which have never received CERCLA 128(a) funding, respond to the following:

1. Funding Request

a. Describe your plan to establish a response program, why it is a priority for your tribe, and why CERCLA 128(a) funding will be beneficial to your program. If your tribe is already supported by a tribal consortia receiving CERCLA 128(a) funding, explain why additional resources are necessary.

b. Prepare a draft work plan and budget for your first funding year. The funding requested should be reasonably spent in one year. For budget planning purposes, it is recommended that you assume funding sufficient to support 0.5 staff to establish a response program and some travel to attend regional and national trainings or events.

2. Programmatic Capability

a. Describe the organizational structure you will utilize to ensure sound program management to guarantee or confirm timely and successful expenditure of funds, and completion of all technical, administrative and financial requirements of the program and cooperative agreement.

b. Include a brief description of the key qualifications of staff to manage the response program and/or the process you will follow to hire staff to manage the response program. If key staff is already in place, include their roles, expertise, qualifications, and experience.

c. Discuss how this response program fits into your current environmental program(s). If you don't have an environmental program, describe your process to develop, or interest to start one.

d. Describe if you have had adverse audit findings. If you had problems with the administration of any grants or cooperative agreements, describe how you have corrected, or are correcting, the problems.

X. Terms and Reporting

Cooperative agreements for state and tribal response programs will include programmatic and administrative terms and conditions. These terms and conditions will describe EPA's substantial involvement including technical assistance and collaboration on program development and site-specific activities. Each of the subsections below summarizes the basic terms and conditions, and related reporting that will be incorporated into your cooperative agreement.

A. Progress Reports

In accordance with 2 CFR 200.328 and any EPA specific regulations, state and tribes must provide progress reports meeting the terms and conditions of the cooperative agreement negotiated. State and tribal costs for complying with reporting requirements are an eligible expense under the section 128(a) cooperative agreement. As a minimum, state or tribal progress reports must include both a narrative discussion and performance data relating to the state or tribe accomplishments and environmental outputs associated with the approved budget and work plan. Reports should also provide an accounting of section 128(a) funding. If applicable, the state or tribe must include information on activities related to establishing or enhancing the four elements of the state's or tribe's response program. All recipients must provide information related to establishing or, if already established, maintaining the public record. Depending upon the activities included in the state's or tribe's work plan, the recipient may also need to report on the following:

1. *Interim and final progress reports.* Reports must prominently display the following information as reflected in the current EPA strategic plan: *Strategic Plan Goal 3: Cleaning Up Communities and Advancing Sustainable Development*; *Strategic Plan Objective 3.1: Promote Sustainable and Livable Communities*; and *Work plan Commitments and Timeframes*. EPA's

strategic plan can be found on the internet at <http://www.epa.gov/planandbudget/strategicplan.html>.

2. *Reporting for Non-MOA states and tribes.* All recipients *without* a VRP MOA must report activities related to establishing or enhancing the four elements of the state's or tribe's response program. For each element state/tribes must report how they are maintaining the element or how they are taking reasonable steps to establish or enhance the element as negotiated in individual state/tribal work plans. For example, pursuant to CERCLA section 128(a)(2)(B), reports on the oversight and enforcement authorities/mechanisms element *may* include:

- A narrative description and copies of applicable documents developed or under development to enable the response program to conduct enforcement and oversight at sites. For example:
 - Legal authorities and mechanisms (e.g., statutes, regulations, orders, agreements); and
 - policies and procedures to implement legal authorities; and other mechanisms;
- a description of the resources and staff allocated/to be allocated to the response program to conduct oversight and enforcement at sites as a result of the cooperative agreement;
- a narrative description of how these authorities or other mechanisms, and resources, are adequate to ensure that:
 - a response action will protect human health and the environment; and be conducted in accordance with applicable federal and state law; and if the person conducting the response action fails to complete the necessary response activities, including operation and maintenance or long-term monitoring activities, the necessary response activities are completed; and
- a narrative description and copy of appropriate documents demonstrating the exercise of oversight and enforcement authorities by the response program at a brownfields site.

3. *Reporting for site-specific assessment or cleanup activities.* Recipients with work plans that include funding for *brownfields site assessment or cleanup* must input information required by the OMB-approved Property Profile Form into the ACRES database for each site assessment and cleanup. In addition, recipients must report how they provide the affected community with prior notice and opportunity for meaningful participation as per CERCLA section 128(a)(2)(C)(ii), on proposed cleanup plans and site activities. For example, EPA strongly encourages states and tribes to seek

public input regarding the priority of sites to be addressed and to solicit input from local communities, especially potential environmental justice communities, communities with a health risk related to exposure to hazardous waste or other public health concerns, economically disadvantaged or remote communities, and communities with limited experience working with government agencies.

4. *Reporting for other site-specific activities.* Recipients with work plans that include funding for *other site-specific related activities* must include a description of the site-specific activities and the number of sites at which the activity was conducted. For example:

- Number and frequency of oversight audits of licensed site professional certified cleanups;
- number and frequency of state/tribal oversight audits conducted;
- number of sites where staff conducted audits, provided technical assistance, or conducted other oversight activities; and
- number of staff conducting oversight audits, providing technical assistance, or conducting other oversight activities.

5. *Reporting required when using funding for an RLF.* Recipients with work plans that include funding for a revolving loan fund must include the information required by the terms and conditions for progress reporting under CERCLA section 104(k)(3) RLF cooperative agreements.

6. *Reporting environmental insurance.* Recipients with work plans that include funding for *environmental insurance* must report:

- Number and description of insurance policies purchased (e.g., name of insurer, type of coverage provided, dollar limits of coverage, any buffers or deductibles, category and identity of insured persons, premium, first dollar or umbrella, whether site specific or blanket, occurrence or claims made, etc.);
- the number of sites covered by the insurance;
- the amount of funds spent on environmental insurance (e.g., amount dedicated to insurance program, or to insurance premiums); and
- the amount of claims paid by insurers to policy holders.

The regional offices may also request that information be added to the progress reports, as appropriate, to properly document activities described by the cooperative agreement work plan.

EPA regions may allow states or tribes to provide performance data in appropriate electronic format.

The regional offices will forward progress reports to EPA Headquarters, if requested. This information may be used to develop national reports on the outcomes of CERCLA section 128(a) funding to states and tribes.

B. Reporting of Program Activity Levels

States and tribes must report, by December 31, 2016, a summary of the *previous federal fiscal year's* work (October 1, 2015 through September 30, 2016). The following information must be submitted to your regional project officer:

- Environmental programs where CERCLA section 128(a) funds are used to support capacity building (general program support, non-site-specific work). Indicate as appropriate from the following:

☐ Brownfields
☐ Underground Storage Tanks/Leaking
☐ Underground Storage Tanks
☐ Federal Facilities
☐ Solid Waste
☐ Superfund
☐ Hazardous Waste Facilities
☐ VCP (Voluntary Cleanup Program,
☐ Independent Cleanup Program, etc.)
☐ Other _____;

- number of properties (or sites) enrolled in a response program during FY16;
- number of properties (or sites) where documentation indicates that cleanup work is complete and all required institutional controls (IC's) are in place, or not required;
- total number of acres associated with properties (or sites) in the previous bullet;
- number of properties where assistance was provided, but the property was not enrolled in the response program (OPTIONAL);
- date that the public record was last updated;
- Estimated total number of properties (or sites) in your brownfields inventory;
- Number of audits/inspections/reviews/other conducted to ensure engineering controls and institutional controls are still protective; and
- Did you develop or revise legislation, regulations, codes, guidance documents or policies related to establishing or enhancing your Voluntary Cleanup Program/Response Program during FY16? If yes, please indicate the type and whether it was new or revised.

EPA may require states/tribes to report specific performance measures related to the four elements that can be aggregated for national reporting to Congress.

C. Reporting of Public Record

All recipients must report, as specified in the terms and conditions of their cooperative agreement, and in Section VIII.I of this guidance, information related to establishing, or if already established, maintaining the public record, described above. States and tribes can refer to an already existing public record, *e.g.*, Web site or other public database to meet the public record requirement. Recipients reporting may only be required to demonstrate that the public record a) exists and is up-to-date, and b) is adequate. A public record must, as appropriate, include the following information:

A list of sites at which response actions have been completed in the past year including:

- Date the response action was completed;
- site name;
- name of owner at time of cleanup, if known;
- location of the site (street address, and latitude and longitude);
- whether an institutional control is in place;
- type of institutional control(s) in place (*e.g.*, deed restriction, zoning restriction, local ordinance, state registries of contaminated property, deed notices, advisories, etc.);
- nature of the contamination at the site (*e.g.*, hazardous substances, contaminants or pollutants, petroleum contamination, etc.); and
- size of the site in acres.

A list of sites planned to be addressed by the state or tribal response program in the coming year including:

- Site name and the name of owner at time of cleanup, if known;
- location of the site (street address, and latitude and longitude);

- to the extent known, whether an institutional control is in place;
- type of the institutional control(s) in place (*e.g.*, deed restriction, zoning restriction, local ordinance, state registries of contaminated property, deed notices, advisories, etc.);
- to the extent known, the nature of the contamination at the site (*e.g.*, hazardous substances, contaminants, or pollutants, petroleum contamination, etc.); and
- size of the site in acres

D. Award Administration Information

1. Subaward and Executive Compensation Reporting

Applicants must ensure that they have the necessary processes and systems in place to comply with the subaward and executive total compensation reporting requirements established under OMB guidance at 2 CFR part 170, unless they qualify for an exception from the requirements, should they be selected for funding.

2. System for Award Management (SAM) and Data Universal Numbering System (DUNS) Requirements

Unless exempt from these requirements under OMB guidance at 2 CFR part 25 (*e.g.*, individuals), applicants must:

1. Be registered in SAM prior to submitting an application or proposal under this announcement. SAM information can be found at <https://www.sam.gov/portal/public/SAM/>;
2. Maintain an active SAM registration with current information at all times during which they have an active federal award or an application or proposal under consideration by an agency; and
3. Provide their DUNS number in each application or proposal submitted

to the agency. Applicants can receive a DUNS number, at no cost, by calling the dedicated toll-free DUNS Number request line at 1-866-705-5711, or visiting the D&B Web site at: <http://www.dnb.com>.

If an applicant fails to comply with these requirements, it will affect their ability to receive the award.

Please note that the Central Contractor Registration (CCR) system has been replaced by the System for Award Management (SAM). To learn more about SAM, go to SAM.gov or <https://www.sam.gov/portal/public/SAM/>.

3. Submitting an Application via Grants.gov

If funding is provided it will be provided through a cooperative agreement award. All cooperative agreement applications for non-competitive assistance agreements must be submitted using Grants.gov. Below is the information that the applicant will use to submit their State and Tribal Response Program Grant applications via Grants.gov:

CDDA number: 66.817.

Funding Opportunity Number (FON): EPA-CEP-02.

To learn more about the Grants.gov submission requirements, go to http://www.epa.gov/ogd/grants_gov_submission_requirement.htm.

4. Use of Funds

An applicant that receives an award under this announcement is expected to manage assistance agreement funds efficiently and effectively, and make sufficient progress towards completing the project activities described in the work-plan in a timely manner. The assistance agreement will include terms and conditions related to implementing this requirement.

REGIONAL STATE AND TRIBAL BROWNFIELDS CONTACTS

Region	State	Tribal
1—CT, ME, MA, NH, RI, VT	James Byrne, 5 Post Office Square, Suite 100 (OSRR07-2), Boston, MA 02109-3912, Phone (617) 918-1389, Fax (617) 918-1294.	AmyJean McKeown, 5 Post Office Square, Suite 100 (OSRR07-2), Boston, MA 02109-3912, Phone (617) 918-1248, Fax (617) 918-1294.
2—NJ, NY, PR, VI	John Struble, 290 Broadway, 18th Floor, New York, NY 10007-1866, Phone (212) 637-4291, Fax (212) 637-3083.	Phillip Clappin, 290 Broadway, 18th Floor, New York, NY 10007-1866, Phone (212) 637-4431, Fax (212) 637-3083.
3—DE, DC, MD, PA, VA, WV.	Michael Taurino, 1650 Arch Street (3HS51), Philadelphia, PA 19103, Phone (215) 814-3371, Fax (215) 814-3274.	
4—AL, FL, GA, KY, MS, NC, SC, TN.	Nicole Comick Bates, 61 Forsyth Street, S.W., 10TH FL (9T25), Atlanta, GA 30303-8960, Phone (404) 562-9966, Fax (404) 562-8788.	Olga Perry, 61 Forsyth Street, S.W., 10TH FL (9T25), Atlanta, GA 30303-8960, Phone (404) 562-8534, Fax (404) 562-8788.
5—IL, IN, MI, MN, OH, WI ...	Jan Pels, 77 West Jackson Boulevard (SB-7J), Chicago, IL 60604-3507, Phone (312) 886-3009, Fax (312) 692-2161.	Rosita Clarke-Moreno, 77 West Jackson Boulevard (SB-7J), Chicago, IL 60604-3507, Phone (312) 886-7215, Fax (312) 697-2075.
6—AR, LA, NM, OK, TX	Amber Perry, 1445 Ross Avenue, Suite 1200 (6SF), Dallas, TX 75202-2733, Phone (214) 665-3172, Fax (214) 665-6660.	Amber Perry, 1445 Ross Avenue, Suite 1200 (6SF), Dallas, TX 75202-2733, Phone (214) 665-3172, Fax (214) 665-6660.

XI. Statutory and Executive Order Reviews

Under Executive Order 12866 (58 FR 51735, October 4, 1993), this action is not a “significant regulatory action” and is therefore not subject to review under Executive Orders 12866 and 13563 (76 FR 3821, January 21, 2011). Because this action is not subject to notice and comment requirements under the Administrative Procedures Act or any other statute, it is not subject to the Regulatory Flexibility Act (5 U.S.C. 601 *et seq.*) or Sections 202 and 205 of the Unfunded Mandates Reform Act of 1999 (UMRA) (Pub. L. 104-4). In addition, this action does not significantly or uniquely affect small governments. This action does not create new binding legal requirements that substantially and directly affect Tribes under Executive Order 13175 (63 FR 67249, November 9, 2000). This action does not have significant Federalism implications under Executive Order 13132 (64 FR 43255, August 10, 1999). Because this action has been exempted from review under Executive Order 12866, this action is not subject to Executive Order 13211, entitled Actions Concerning Regulations That Significantly Affect Energy Supply, Distribution, or Use (66 FR 28355, May 22, 2001) or Executive Order 13045, entitled Protection of Children from Environmental Health Risks and Safety Risks (62 FR 19885, April 23, 1997). This action does not contain any information collections subject to OMB approval under the Paperwork Reduction Act (PRA), 44 U.S.C. 3501 *et seq.*, nor does it require any special considerations under Executive Order 12898, entitled Federal Actions to Address Environmental Justice in Minority Populations and Low-Income Populations (59 FR 7629, February 16, 1994). This action does not involve technical standards; thus, the requirements of Section 12(d) of the National Technology Transfer and Advancement Act of 1995 (15 U.S.C.

272 note) do not apply. The Congressional Review Act, 5 U.S.C. 801 *et seq.*, generally provides that before certain actions may take effect, the agency promulgating the action must submit a report, which includes a copy of the action, to each House of the Congress and to the Comptroller General of the United States. Because this final action does not contain legally binding requirements, it is not subject to the Congressional Review Act.

Dated: October 13, 2016.

Gail Cooper,

Deputy Director, Office of Brownfields and Land Revitalization, Office of Land and Emergency Management.

[FR Doc. 2016-25770 Filed 10-24-16; 8:45 am]

BILLING CODE 6560-50-P

ENVIRONMENTAL PROTECTION AGENCY

[EPA-HQ-OW-2016-0438; FRL-9954-50-OW]

Notice of Extension to Comment Period on the Request for Public Comments To Be Sent to EPA on Peer Review Materials To Inform the Safe Drinking Water Act Decision Making on Perchlorate

AGENCY: Environmental Protection Agency (EPA).

ACTION: Extension of comment period.

SUMMARY: The Environmental Protection Agency (EPA) is extending the comment period for the notice, “Request for Public Comments To Be Sent to EPA on Peer Review Materials To Inform the Safe Drinking Water Act Decision Making on Perchlorate.” In response to stakeholder requests, EPA is extending the comment period for an additional eleven days, from November 14, 2016, to November 25, 2016.

DATES: The comment period announced in the notice that was published on September 30, 2016 (81 FR 67350) is

extended. Comments now must be received by EPA on or before November 25, 2016.

ADDRESSES: Submit your comments, identified by Docket ID No. EPA-HQ-OW-2016-0438, to the *Federal eRulemaking Portal*: <http://www.regulations.gov>. Follow the online instructions for submitting comments. Once submitted, comments cannot be edited or removed from *Regulations.gov*. EPA may publish any comment received to its public docket. Do not submit electronically any information you consider to be Confidential Business Information (CBI) or other information whose disclosure is restricted by statute. Multimedia submissions (audio, video, etc.) must be accompanied by a written comment. The written comment is considered the official comment and should include discussion of all points you wish to make. EPA will generally not consider comments or comment contents located outside of the primary submission (*i.e.*, on the web, cloud, or other file sharing system). For additional submission methods, the full EPA public comment policy, information about CBI or multimedia submissions, and general guidance on making effective comments, please visit <http://www2.epa.gov/dockets/commenting-epa-dockets>.

FOR FURTHER INFORMATION CONTACT: Russ Perkinson at U.S. EPA, Office of Ground Water and Drinking Water, Standards and Risk Management Division, (Mail Code 4607M), 1200 Pennsylvania Avenue NW., Washington, DC 20460; telephone: 202-564-4901; or email: perkinson.russ@epa.gov.

SUPPLEMENTARY INFORMATION: On September 30, 2016, EPA published in the *Federal Register* (81 FR 67350), a notice announcing the release of materials for public comment. The materials will undergo expert peer review in support of the EPA’s Safe Drinking Water Act decision making on perchlorate. The Agency requests

comment on both the draft Biologically Based Dose-Response Model and an accompanying draft model report entitled "Biologically Based Dose-Response Models for the Effect of Perchlorate on Thyroid Hormones in the Infant, Breast Feeding Mother, Pregnant Mother, and Fetus: Model Development, Revision, and Preliminary Dose-Response Analyses." These materials will be reviewed by an expert peer review panel and the panelists will consider the public comments received. For more detailed information about this matter, please refer to the September 30, 2016, **Federal Register** notice.

The notice of request for public comment, as initially published in the **Federal Register**, provided for written comments to be submitted to EPA on or before November 14, 2016, (a 45-day public comment period). Since publication, EPA has received a request for additional time to submit comments. EPA is extending the public comment period for eleven days until November 25, 2016.

Dated: October 19, 2016.

Joel Beauvais,

Deputy Assistant Administrator, Office of Water.

[FR Doc. 2016-25772 Filed 10-24-16; 8:45 am]

BILLING CODE 6560-50-P

FEDERAL COMMUNICATIONS COMMISSION

[OMB 3060-0061]

Information Collection Being Reviewed by the Federal Communications Commission Under Delegated Authority

AGENCY: Federal Communications Commission.

ACTION: Notice and request for comments.

SUMMARY: As part of its continuing effort to reduce paperwork burdens, and as required by the Paperwork Reduction Act (PRA) of 1995 (44 U.S.C. 3501-3520), the Federal Communications Commission (FCC or Commission) invites the general public and other Federal agencies to take this opportunity to comment on the following information collections. Comments are requested concerning: whether the proposed collection of information is necessary for the proper performance of the functions of the Commission, including whether the information shall have practical utility; the accuracy of the Commission's burden estimate; ways to enhance the

quality, utility, and clarity of the information collected; ways to minimize the burden of the collection of information on the respondents, including the use of automated collection techniques or other forms of information technology; and ways to further reduce the information collection burden on small business concerns with fewer than 25 employees. The FCC may not conduct or sponsor a collection of information unless it displays a currently valid OMB control number. No person shall be subject to any penalty for failing to comply with a collection of information subject to the PRA that does not display a valid OMB control number.

DATES: Written PRA comments should be submitted on or before December 27, 2016. If you anticipate that you will be submitting comments, but find it difficult to do so within the period of time allowed by this notice, you should advise the contact listed below as soon as possible.

ADDRESSES: Direct all PRA comments to Cathy Williams, FCC, via email *PRA@fcc.gov* and to *Cathy.Williams@fcc.gov*.

FOR FURTHER INFORMATION CONTACT: For additional information about the information collection, contact Cathy Williams at (202) 418-2918.

SUPPLEMENTARY INFORMATION:

OMB Control Number: 3060-0061.

Title: Annual Report of Cable Television Systems, FCC Form 325.

Form Number: FCC Form 325.

Type of Review: Extension of a currently approved collection.

Respondents: Business or other for-profit entities.

Number of Respondents and Responses: 1,100 respondents; 1,100 responses.

Estimated Time per Response: 2.166 hours.

Frequency of Response: Annual reporting requirement.

Obligation to Respond: Required to obtain or retain benefits. The statutory authority for this collection is contained in Sections 4(i), 601 and 602 of the Communications Act of 1934, as amended.

Total Annual Burden: 2,383 hours.

Total Annual Cost: None.

Privacy Act Impact Assessment: No impact(s).

Nature and Extent of Confidentiality: There is no need for confidentiality with this collection of information.

Needs and Uses: The Federal Communications Commission uses FCC Form 325 "Annual Report of Cable Television Systems" to solicit basic operational information from the cable television industry. The information

requested includes: the operator's name and address; system-wide capacity and frequency information; channel usage; and number of subscribers. The purpose of the form is to require operational cable television systems to verify, correct and/or furnish the Commission with the most current information on their respective cable systems.

Federal Communications Commission.

Marlene H. Dortch,

Secretary, Office of the Secretary.

[FR Doc. 2016-25718 Filed 10-24-16; 8:45 am]

FOR FURTHER INFORMATION CONTACT: For additional information about the information collection, contact Nicole Ongele at (202) 418-2991.

SUPPLEMENTARY INFORMATION:

OMB Control Number: 3060-0057.

Title: Application for Equipment Authorization, FCC Form 731.

Form Number: FCC Form 731.

Type of Review: Revision of a currently approved collection.

Respondents: Business or other for-profit entities, and state, local, or tribal government.

Number of Respondents and Responses: 3,740 respondents; 22,250 responses.

Estimated Time per Response: 35 hours.

Frequency of Response: On occasion reporting requirement and third party disclosure requirement.

Obligation to Respond: Required to obtain or retain benefits. Statutory authority for these collections are contained in Sections 4(i), 301, 302, 303(e), 303(f), and 303(r) of the Communications Act of 1934, as amended, 47 U.S.C. Sections 154(i), 301, 302, 303(e), 303(f), and 303(r).

Total Annual Burden: 778,750 hours.

Total Annual Cost: No cost.

Privacy Impact Assessment: No impact(s).

Nature and Extent of Confidentiality: There is no need for confidentiality with this collection of information.

Needs and Uses: Commission rules require that manufacturers of certain radio frequency (RF) equipment file FCC Form 731 to obtain approval prior to marketing their equipment. Manufacturers may then market their RF equipment based on a showing of compliance with technical standards established in the FCC Rules for each type of equipment or device operated under the applicable FCC Rule part. The following types of equipment are regulated (a) the RF equipment is regulated under certain rule sections of 47 CFR part 15 and Part 18, and (b) in addition, rules governing certain RF equipment operating in the licensed services also require equipment authorization as established in the procedural rules in 47 CFR part 2. The RF equipment manufacturers comply with the information collection

requirements by (a) Filing FCC Form 731 electronically with the Commission, or (b) Submitting the information to a Telecommunications Certification Body (TCB), which acts on behalf of the FCC to issue grants of certification and may issue grants more expeditiously than the FCC. The TCBs have flexibility in the format in which they require the collection of information (i) TCBs may require applicants to submit the required information in FCC Form 731 format or in another format selected by the TCB, but (ii) whatever the information collection method, the information required is governed by the procedural rules in 47 CFR part 2 and a showing of compliance with the FCC technical standards for the specific type of equipment. RF manufacturer applicants for equipment certification may also request "expedited authorization" to market their equipment by: (a) Choosing to pay the fee levied by a TCB, and (b) submitting their request to a TCB in order for expedited authorization to market. The TCB processes the RF equipment manufacturer's application as follows: (i) The TCB receives and reviews the RF manufacturer's information submission/application; and (ii) the TCB enters the information into the FCC Equipment Authorization System database using an interface that provides the TCB with the tools to issue a standardized Grant of Equipment Authorization. Whichever method the RF manufacturers choose to submit their information—via either the FCC on FCC Form 731 or the TCB, FCC Rules require that applicants supply the following data: (a) Demographic information including Grantee name and address, contact information, etc.; (b) information specific to the equipment including FCC Identifier, equipment class, technical specifications, etc.; and (c) attachments that demonstrate compliance with FCC Rules that may include any combination of the following based on the applicable Rule parts for the equipment for which authorization is requested: (1) Identification of equipment (47 CFR 2.925); (2) attestation statements that may be required for specific equipments; (3) external photos of the equipment for which authorization is requested; (4) block diagram of the device; (5) schematics; (6) test report; (7) test setup photos; (8) Users Manual; (9) Internal Photos; (10) Parts List/Tune Up Information; (11) RF Exposure Information; (12) Operational Description; (13) Cover Letters; and, (14) Software Defined Radio/Cognitive Radio Files.

In general, an applicant's submission is as follows: (a) FCC Form 731 includes approximately two pages covering the demographic and equipment identification information; and (b) applicants must supply additional documentation and other information, as described above, demonstrating conformance with FCC Rules, which may range from 100–1,000 pages. The supplemental information is essential to control potential interference to radio communications, which the FCC may use, as is necessary, to investigate complaints of harmful interference. In response to new technologies and in allocating spectrum, the Commission may establish new technical operating standards: (a) RF equipment manufacturers must meet the new standards to receive an equipment authorization, and (b) RF equipment manufacturers must still comply with the Commission's requirements in FCC Form 731 and demonstrate compliance as required by 47 CFR part 2 of FCC Rules. Thus, this information collection applies to a variety of RF equipment: (a) That is currently manufactured, (b) that may be manufactured in the future, and (c) that operates under varying technical standards. On July 8, 2004, the Commission adopted a Report and Order, *Modification of Parts 2 and 15 of the Commission's Rules for Unlicensed Devices and Equipment Approval*, ET Docket No. 03-201, FCC 04-165. The change requires that all paper filings required in 47 CFR Sections 2.913, 2.926(c), 2.929(c), and 2.929(d) of the rules are outdated and now must be filed electronically via the Internet on FCC Form 731. The Commission believes that electronic filing speeds up application processing and supports the Commission in further streamlining to reduce cost and increase efficiency. Information on the procedures for electronically filing equipment authorization applications can be obtained from the Commission's rules, and from the Internet at: <http://transition.fcc.gov/oet/ea/ea-app-info.htm>.

On October 26, 2014, the Federal Communications Commission released a Report and Order, FCC 14-172, PS Docket 13-87, that modified Sections 2.1033 and 90.548 of the rules and effectively required equipment manufacturers to demonstrate compliance with the Interoperability Technical Standards contained in Section 90.548 of the Commission's rules as a condition for FCC certification of equipment designed to operate on the 700 MHz narrowband interoperability channels. One method of demonstrating

this requirement is documenting compliance with the Project 25 Compliance Assessment Program (P25 CAP). CAP is a program that establishes an independent compliance assessment process to ensure that communications equipment conforms to Project 25 standards and is interoperable across vendors. Alternatively, a manufacturer may submit a document describing how it determined compliance with Section 90.548 and that its equipment is interoperable across vendors.

On August, 22, 2016, the Federal Communications Commission released an *Order on Reconsideration*, FCC 16–111, PS Docket No. 13–87 (see attached) that modified Part 2 and Part 90 of the Rules for equipment approval and Private Land Mobile Radio Services. See 81 FR 66830 (Sept. 29, 2016). The amended rule requires all Wireless Communications Equipment Manufacturers who manufacture 700 MHz narrowband equipment capable of operating on the interoperability channels to demonstrate compliance with the Commission's Interoperability Technical Standards in 90.548. The *Order on Reconsideration* prescribes two methods for showing compliance with Section 90.548 after equipment authorization application approval and before the marketing and sale of equipment capable of operating on the 700 MHz narrowband interoperability channels. Specifically, the Commission modified Section 2.1033(c)(20) to provide that:

Before equipment operating under part 90 of this chapter and capable of operating on the 700 MHz interoperability channels (See § 90.531(b)(1) of this chapter) may be marketed or sold, the manufacturer thereof shall have a Compliance Assessment Program Supplier's Declaration of Conformity and Summary Test Report or, alternatively, a document detailing how the manufacturer determined that its equipment complies with § 90.548 of this chapter and that the equipment is interoperable across vendors. Submission of a 700 MHz narrowband radio for certification will constitute a representation by the manufacturer that the radio will be shown, by testing, to be interoperable across vendors before it is marketed or sold.

The Commission also modified Section 90.548(c) of the Commission's rules to provide:

Transceivers capable of operating on the interoperability channels listed in § 90.531(b)(1) shall not be marketed or sold unless the transceiver has previously been certified for interoperability by the Compliance Assessment Program (CAP) administered by the U.S. Department of Homeland Security; provided, however, that this requirement is suspended if the CAP is discontinued. Submission of a 700 MHz

narrowband radio for certification will constitute a representation by the manufacturer that the radio will be shown, by testing, to be interoperable across vendors before it is marketed or sold. In the alternative, manufacturers may employ their own protocol for verifying compliance with Project 25 standards and determining that their product is interoperable among vendors. In the event that field experience reveals that a transceiver is not interoperable, the Commission may require the manufacturer thereof to provide evidence of compliance with this § 90.548.

To effectively implement the provisions of the new Rules, no modifications to the existing FCC Form 731 Application for Equipment Authorization are required. The changes are intended to simplify the filing process, ensure equipment complies with Project 25 standards and is interoperable across vendors. The following specific methods are proposed to ensure compliance with Section 90.548 and simplify filing processes for equipment manufacturers:

(1) The *Order on Reconsideration* establishes that before the marketing or sale of equipment designed to operate on the 700 MHz narrowband interoperability channels, manufacturers shall have a Compliance Assessment Program Supplier's Declaration of Conformity and Summary Test Report or, alternatively, a document detailing how the manufacturer determined that its equipment complies with § 90.548 and that the equipment is interoperable across vendors. OMB has approved the information collections associated with P25 CAP compliance under OMB Control No. 1640–0015.¹

(2) In the event that field experience reveals that a transceiver is not interoperable, the Commission may require the manufacturer thereof to provide evidence of compliance with § 90.548.

The modified rules provide a benefit to public safety licensees by ensuring that only equipment that has been tested for interoperability in a vendor-neutral environment before equipment can be marketed or sold to public safety. This will provide the additional benefit of engendering competition in the public safety equipment marketplace by eliminating system compatibility as a gating factor when evaluating equipment purchases. The *Order on Reconsideration* reduces the burden on equipment manufacturers by allowing them to meet this standard by demonstrating compliance with the P25

¹ Congressional direction for a P25 compliance assessment program can be found in the *COPS Law Enforcement Technologies and Interoperable Communications Program* section of the Conference Report to Public Law 109–148, as well as the *Science & Technology Management and Administration* section of Division E of the Conference Report to Public Law 110–161.

CAP or manufacturers' interoperability testing protocol. Compliance with the P25 CAP program is already a requisite for grant eligibility and agency purchasing standards, consequently any new burden imposed by this requirement would be minimal.

Federal Communications Commission.

Marlene H. Dortch,

Secretary, Office of the Secretary.

[FR Doc. 2016–25714 Filed 10–24–16; 8:45 am]

BILLING CODE 6712–01–P

FEDERAL COMMUNICATIONS COMMISSION

[OMB 3060–XXXX]

Information Collection Being Reviewed by the Federal Communications Commission

AGENCY: Federal Communications Commission.

ACTION: Notice and request for comments.

SUMMARY: As part of its continuing effort to reduce paperwork burdens, and as required by the Paperwork Reduction Act (PRA) of 1995 (44 U.S.C. 3501–3520), the Federal Communications Commission (FCC or the Commission) invites the general public and other Federal agencies to take this opportunity to comment on the following information collection. Comments are requested concerning: whether the proposed collection of information is necessary for the proper performance of the functions of the Commission, including whether the information shall have practical utility; the accuracy of the Commission's burden estimate; ways to enhance the quality, utility, and clarity of the information collected; ways to minimize the burden of the collection of information on the respondents, including the use of automated collection techniques or other forms of information technology; and ways to further reduce the information collection burden on small business concerns with fewer than 25 employees. The FCC may not conduct or sponsor a collection of information unless it displays a currently valid control number. No person shall be subject to any penalty for failing to comply with a collection of information subject to the PRA that does not display a valid Office of Management and Budget (OMB) control number.

DATES: Written PRA comments should be submitted on or before December 27, 2016. If you anticipate that you will be submitting comments, but find it

difficult to do so within the period of time allowed by this notice, you should advise the contact listed below as soon as possible.

ADDRESSES: Direct all PRA comments to Nicole Ongele, FCC, via email PRA@fcc.gov and to Nicole.Ongele@fcc.gov.

FOR FURTHER INFORMATION CONTACT: For additional information about the information collection, contact Nicole Ongele at (202) 418-2991.

OMB Control Number: 3060-XXXX.

Title: Connect America Fund—High Cost Portal Filing.

Form Number: N/A.

Type of Review: New collection.

Respondents: Business or other for-profit.

Number of Respondents and Responses: 1,525 unique respondents; 3,590 responses.

Estimated Time per Response: 8 hours–30 hours.

Frequency of Response: On occasion, quarterly reporting requirements, annual reporting requirements, one-time reporting requirement and recordkeeping requirement.

Obligation to Respond: Required to obtain or retain benefits. Statutory authority for this information collection is contained in 47 U.S.C. 151–154, 155, 201–206, 214, 218–220, 251, 252, 254, 256, 303(r), 332, 403, 405, 410, and 1302.

Total Annual Burden: 65,640 hours.

Total Annual Cost: No Cost.

Privacy Act Impact Assessment: No impact(s).

Nature and Extent of Confidentiality: We note that USAC must preserve the confidentiality of certain data obtained from respondents; must not use the data except for purposes of administering the universal service programs or other purposes specified by the Commission; and must not disclose data in company-specific form unless directed to do so by the Commission. Respondents may request materials or information submitted to the Commission or the Administrator believed confidential to be withheld from public inspection under 47 CFR 0.459 of the FCC's rules.

Needs and Uses: The Commission is requesting approval for this new information collection. In March 2016, the Commission adopted an order reforming its universal service support program in areas served by rate-of-return carriers. Connect America Fund et al., WC Docket Nos. 10–90 et al., Report and Order, Order and Order on Reconsideration, and Further Notice of Proposed Rulemaking, FCC 16–33 (*Rate-of-Return Order*). Also, in May 2016, the Commission adopted rules to implement a competitive bidding

process for Phase II of the Connect America Fund. Connect America Fund et al., WC Docket Nos. 10–90 et al., Report and Order and Further Notice of Proposed Rulemaking, FCC 16–64 (*Phase II Auction Order*).

This information collection addresses the requirement that certain carriers with high cost reporting obligations must file information about their locations which meet their broadband deployment public interest obligations via an electronic portal (“portal”). The *Rate-of-Return Order* required that the Universal Service Administrative Company (USAC) establish the portal so that carriers could file their location data with the portal starting in 2017. The *Rate-of-Return Order* required all recipients of Phase II model-based support and rate-of-return carriers to submit geocoded location data and related certifications to the portal. Recipients of Phase II model-based support had been required to file such information in their annual reports due by July 1. The *Phase II Auction Order* requires auction winners to build-out networks capable of meeting their public interest obligations and report, to an online portal, locations to which auction winners had deployed such networks. This collection also implements the Rate-of-Return Order by moving and revising the currently approved requirements under OMB Control Numbers 3060–1200 and 3060–0986 to enable recipients of Phase II model-based support and rural broadband experiment funding to file their location information and associated reports and certifications in the portal instead of on the FCC Form 481 or as is currently required.

Federal Communications Commission.

Marlene H. Dortch,

Secretary, Office of the Secretary.

DEPARTMENT OF HEALTH AND HUMAN SERVICES

Centers for Disease Control and Prevention

Subcommittee for Dose Reconstruction Reviews (SDRR), Advisory Board on Radiation and Worker Health (ABRWH or the Advisory Board), National Institute for Occupational Safety and Health (NIOSH)

In accordance with section 10(a)(2) of the Federal Advisory Committee Act (Pub. L. 92-463), the Centers for Disease Control and Prevention (CDC), announces the following meeting for the aforementioned subcommittee:

Time and Date: 10:30 a.m.–5:00 p.m., EST, November 22, 2016.

Place: Audio Conference Call via FTS Conferencing.

Status: Open to the public, but without a public comment period. The public is welcome to submit written comments in advance of the meeting, to the contact person below. Written comments received in advance of the meeting will be included in the official record of the meeting. The public is also welcome to listen to the meeting by joining the teleconference at the USA toll-free, dial-in number at 1-866-659-0537 and the pass code is 9933701.

Background: The Advisory Board was established under the Energy Employees Occupational Illness Compensation Program Act of 2000 to advise the President on a variety of policy and technical functions required to implement and effectively manage the new compensation program. Key functions of the Advisory Board include providing advice on the development of probability of causation guidelines that have been promulgated by the Department of Health and Human Services (HHS) as a final rule; advice on methods of dose reconstruction, which have also been promulgated by HHS as a final rule; advice on the scientific validity and quality of dose estimation and reconstruction efforts being performed for purposes of the compensation program; and advice on petitions to add classes of workers to the Special Exposure Cohort (SEC).

In December 2000, the President delegated responsibility for funding, staffing, and operating the Advisory Board to HHS, which subsequently delegated this authority to CDC. NIOSH implements this responsibility for CDC. The charter was issued on August 3, 2001, renewed at appropriate intervals, rechartered on March 22, 2016 pursuant to Executive Order 13708, and will expire on September 30, 2017.

Purpose: The Advisory Board is charged with (a) providing advice to the Secretary, HHS, on the development of guidelines under Executive Order 13179; (b) providing advice to the Secretary, HHS, on the scientific validity and quality of dose reconstruction efforts performed for this program; and (c) upon request by the Secretary, HHS, advise the Secretary on whether there is a class of employees at any Department of Energy facility who were exposed to radiation but for whom it is not feasible to estimate their radiation dose, and on whether there is reasonable likelihood that such radiation doses may have endangered the health of members of this class. The Subcommittee for Dose Reconstruction Reviews was established to aid the Advisory Board in carrying out its duty to advise the Secretary, HHS, on dose reconstruction.

Matters for Discussion: The agenda for the Subcommittee meeting includes the following dose reconstruction review activities: dose reconstruction cases under review from Sets 14–18 and Set 22 (“blind reviews”), including the Oak Ridge sites (Y-12, K-25, Oak Ridge National Laboratory), Hanford, Feed Materials Production Center (“Fernald”), Mound Plant, Rocky Flats Plant, Nevada Test Site, Idaho National Laboratory, and Savannah River Site; and consideration of new dose reconstruction review methods and/or case selection criteria to evaluate the consistency of certain dose reconstruction methods.

The agenda is subject to change as priorities dictate.

Contact Person for More Information: Theodore Katz, Designated Federal Officer, NIOSH, CDC, 1600 Clifton Road, Mailstop E-20, Atlanta, Georgia 30329, Telephone (513)533-6800, Toll Free 1(800)CDC-INFO, Email ocas@cdc.gov.

The Director, Management Analysis and Services Office, has been delegated the authority to sign **Federal Register** notices pertaining to announcements of meetings and other committee management activities, for both the Centers for Disease Control and Prevention and the Agency for Toxic Substances and Disease Registry.

Elaine L. Baker,

Director, Management Analysis and Services Office, Centers for Disease Control and Prevention.

BILLING CODE 4163-19-P

DEPARTMENT OF HEALTH AND HUMAN SERVICES

Centers for Disease Control and Prevention

[60Day–17–17AX; Docket No. CDC–2016–0100]

Proposed Data Collection Submitted for Public Comment and Recommendations

AGENCY: Centers for Disease Control and Prevention (CDC), Department of Health and Human Services (HHS).

ACTION: Notice with comment period.

SUMMARY: The Centers for Disease Control and Prevention (CDC), as part of its continuing efforts to reduce public burden and maximize the utility of government information, invites the general public and other Federal agencies to take this opportunity to comment on proposed and/or continuing information collections, as required by the Paperwork Reduction Act of 1995. This notice invites comment on the proposed information collection project entitled “Mobile Messaging Intervention to Present New HIV Prevention Options for Men who have Sex with Men (MSM) Study.” The collect is part of a research study designed to evaluate the efficacy of smartphone-based platform for delivering sexual health and prevention messages to MSM.

DATES: Written comments will be received on or before December 27, 2016.

ADDRESSES: You may submit comments, identified by Docket No. CDC–2016–0100 by any of the following methods:

- **Federal eRulemaking Portal:** Regulations.gov. Follow the instructions for submitting comments.
- **Mail:** Leroy A. Richardson, Information Collection Review Office, Centers for Disease Control and Prevention, 1600 Clifton Road NE., MS–D74, Atlanta, Georgia 30329.

Instructions: All submissions received must include the agency name and Docket Number. All relevant comments received will be posted without change to Regulations.gov, including any personal information provided. For access to the docket to read background documents or comments received, go to Regulations.gov.

Please note: All public comment should be submitted through the Federal eRulemaking portal (Regulations.gov) or by U.S. mail to the address listed above.

FOR FURTHER INFORMATION CONTACT: To request more information on the

proposed project or to obtain a copy of the information collection plan and instruments, contact the Information Collection Review Office, Centers for Disease Control and Prevention, 1600 Clifton Road NE., MS-D74, Atlanta, Georgia 30329; phone: 404-639-7570; Email: omb@cdc.gov.

SUPPLEMENTARY INFORMATION: Under the Paperwork Reduction Act of 1995 (PRA) (44 U.S.C. 3501-3520), Federal agencies must obtain approval from the Office of Management and Budget (OMB) for each collection of information they conduct or sponsor. In addition, the PRA also requires Federal agencies to provide a 60-day notice in the **Federal Register** concerning each proposed collection of information, including each new proposed collection, each proposed extension of existing collection of information, and each reinstatement of previously approved information collection before submitting the collection to OMB for approval. To comply with this requirement, we are publishing this notice of a proposed data collection as described below.

Comments are invited on: (a) Whether the proposed collection of information is necessary for the proper performance of the functions of the agency, including whether the information shall have practical utility; (b) the accuracy of the agency's estimate of the burden of the proposed collection of information; (c) ways to enhance the quality, utility, and clarity of the information to be collected; (d) ways to minimize the burden of the collection of information on respondents, including through the use of automated collection techniques or other forms of information technology; and (e) estimates of capital or start-up costs and costs of operation, maintenance, and purchase of services to provide information. Burden means the total time, effort, or financial resources expended by persons to generate, maintain, retain, disclose or provide information to or for a Federal agency. This includes the time needed to review instructions; to develop, acquire, install and utilize technology and systems for the purpose of collecting, validating and verifying

information, processing and maintaining information, and disclosing and providing information; to train personnel and to be able to respond to a collection of information, to search data sources, to complete and review the collection of information; and to transmit or otherwise disclose the information.

Proposed Project

Mobile Messaging Intervention to Present New HIV Prevention Options for Men Who Have Sex with Men (MSM) Study—New—National Center for HIV/ AIDS, Viral Hepatitis, STD, and TB Prevention (NCHHSTP), Centers for Disease Control and Prevention (CDC).

Background and Brief Description

The National Center for HIV/AIDS, Viral Hepatitis, STD and TB Prevention is requesting approval for two years of data collection entitled, "Mobile Messaging Intervention to Present New HIV Prevention Options for MSM." The purpose of this study is to evaluate the efficacy of a smartphone-based HIV prevention intervention, known as M³, through a randomized controlled trial. The information collected through this study will be used to evaluate whether the M³ mobile-messaging intervention is an effective HIV-prevention strategy, by assessing whether exposure to the message-delivery platform results in improvements in participants' self-reported sexual health and HIV prevention behaviors, beliefs and attitudes. The trial will assess whether intervention participants' behaviors significantly change from baseline to post-intervention when compared to participants in a waitlist control arm, and whether these changes are sustained at 6-month and 9-month follow-ups.

This study will be carried out in three metropolitan areas in the United States: Atlanta, Georgia, Detroit, Michigan and New York City, New York. These cities were selected not only because they have high rates of HIV, but also because significant disparities in HIV among men who have sex with men (MSM) have been observed by race/ethnicity and age.

The study population will include 1,206 adult MSM living in Atlanta, Detroit, and New York City. Men recruited to the study will be at least 18 years in age, who have had anal sex with at least one man in the past 12 months, and who own and use an Android and iOS smartphone.

Across the three sites, we will ensure that at least 40% of participants are people of color (non-white or Hispanic) by quota sampling. Participants will be recruited to the study through a combination of approaches, including online advertisement, traditional print advertisement, referral, in-person outreach, and through word of mouth.

A quantitative assessment will be used to collect information for this study, which will be delivered at the time of study enrollment and again at 3-month, 6-month and 9-month follow-ups. The assessment will be used to measure changes in condom use behavior, number of sex partners, HIV testing, sexually transmitted disease (STD) testing, health care engagement, pre-exposure prophylaxis uptake and adherence, and antiretroviral therapy uptake and adherence following completion of the intervention. Participants will complete the assessment in-person at baseline and 9-months, using a computer in a private location, and remotely via their personal computer or tablet device at the 3-month and 6-month follow-ups.

It is expected that 50% of men screened will meet study eligibility and provide contact information, that 75% will schedule and show up for an in-person appointment, and that 95% of these men will remain eligible after reverification. We expect the initial screening to take approximately four minutes to complete, that providing contact information will take one minute, and the rescreening prior to study enrollment to take another four minutes. The assessment will take 90 minutes (1½ hour) to complete, and will be administered to 1,206 men a total of four times. The total number of burden hours are 5,164.

Type of respondent	Form name	Number of respondents	Number of responses per respondent	Average burden per response (in hours)	Total burden hours
General Public—Adults	Participant Screening (Eligibility)	1,356	1	4/60	90
General Public—Adults	Contact Information Form	678	1	1/60	11
General Public—Adults	Participant Screening (Verification) ..	508	1	4/60	34
General Public—Adults	Assessment	482	4	1.5	2,892
Total					3,027

BILLING CODE 4163-18-P

DEPARTMENT OF HEALTH AND HUMAN SERVICES

Centers for Disease Control and Prevention

Mine Safety and Health Research Advisory Committee, National Institute for Occupational Safety and Health (MSHRAC, NIOSH)

In accordance with section 10(a)(2) of the Federal Advisory Committee Act (Pub. L. 92-463), the Centers for Disease Control and Prevention (CDC) announces the following meeting for the aforementioned committee:

Time and Date: 8:00 a.m.–12:30 p.m. (PST), November 14, 2016.

Place: CDC/NIOSH Spokane Mining Research Division, 315 E. Montgomery, Spokane, WA 99207. Teleconference and webinar is also available. If you wish to attend in person, or by phone or webinar, please contact Marie Chovanec by email at MChovanec@cdc.gov or by phone at 412-386-5302 at least 5 days in advance.

Status: Open to public, limited only by the space available. In person, the meeting room accommodates approximately 30 people. By webinar, the webinar system accommodates a maximum of 100 people.

Purpose: This committee is charged with providing advice to the Secretary, Department of Health and Human Services; the Director, CDC; and the Director, NIOSH, on priorities in mine safety and health research, including grants and contracts for such research, 30 U.S.C. 812(b)(2), Section 102(b)(2).

Matters for Discussion: The meeting will focus on mining safety and health research projects, partnerships and initiatives, including the mining program strategic goals, and priority research areas. The meeting will also include updates from the Pittsburgh Mining Research Division, and the Spokane Mining Research Division.

Agenda items are subject to change as priorities dictate.

Contact Person for More Information: Jeffrey H. Welsh, Executive Secretary, MSHRAC, NIOSH, CDC, 626 Cochrans Mill Road, Pittsburgh, PA, telephone (412)386-4040, fax (412)386-6614. The Director, Management Analysis and Services Office, has been delegated the

authority to sign **Federal Register** notices pertaining to announcements of meetings and other committee management activities for both CDC and the Agency for Toxic Substances and Disease Registry.

Elaine L. Baker,

*Director, Management Analysis and Services
Office, Centers for Disease Control and
Prevention (CDC).*

BILLING CODE 4163-18-P

DEPARTMENT OF HEALTH AND HUMAN SERVICES

Centers for Disease Control and Prevention (CDC)

Request for Nominations of Candidates To Serve on the World Trade Center Health Program Scientific/Technical Advisory Committee (the STAC or the Committee), Centers for Disease Control and Prevention, Department of Health and Human Services

The CDC is soliciting nominations for membership on the World Trade Center (WTC) Health Program Scientific/Technical Advisory Committee (STAC).

Title I of the James Zadroga 9/11 Health and Compensation Act of 2010, Pub. L. 111-347 (Jan. 2, 2011), amended by Pub. L. 114-113 (Dec. 18, 2015), added Title XXXIII to the Public Health Service Act (PHS Act), establishing the WTC Health Program within HHS (42 U.S.C. 300mm to 300mm-61). Section 3302(a) of the PHS Act established the WTC Health Program STAC. The STAC is governed by the provisions of the Federal Advisory Committee Act, as amended (Pub. L. 92-463, 5 U.S.C. App.), which sets forth standards for the formation and use of advisory committees in the Executive Branch. PHS Act Section 3302(a)(1) establishes that the STAC will review scientific and medical evidence and make recommendations to the WTC Program Administrator on additional WTC Health Program eligibility criteria and on additional WTC-related health conditions. Section 3341(c) of the PHS Act requires the WTC Program Administrator to also consult with the STAC on research regarding certain health conditions related to the September 11, 2001 terrorist attacks. The STAC may also be consulted on other matters related to implementation and improvement of the WTC Health Program, as outlined in the PHS Act, at the discretion of the WTC Program Administrator.

In accordance with Section 3302(a)(2) of the PHS Act, the WTC Program Administrator will appoint the members of the committee, which must include at least:

- 4 occupational physicians, at least two of whom have experience treating WTC rescue and recovery workers;
- 1 physician with expertise in pulmonary medicine;
- 2 environmental medicine or environmental health specialists;
- 2 representatives of WTC responders;

- 2 representatives of certified-eligible WTC survivors;

- 1 industrial hygienist;
- 1 toxicologist;
- 1 epidemiologist; and
- 1 mental health professional.

At this time the Administrator is seeking nominations for members fulfilling the following categories:

- Mental Health Professional
- Occupational physician who has experience treating WTC rescue and recovery workers;
- Industrial Hygienist;
- Representative of WTC responders;
- Representative of certified-eligible WTC survivors

Additional members may be appointed at the discretion of the WTC Program Administrator.

A STAC member's term appointment may last 3 years. If a vacancy occurs, the WTC Program Administrator may appoint a new member who fulfills the same membership category as the predecessor. STAC members may be appointed to successive terms. The frequency of committee meetings shall be determined by the WTC Program Administrator based on program needs. Meetings may occur up to four times a year. Members are paid the Special Government Employee rate of \$250 per day, and travel costs and per diem are included and based on the Federal Travel Regulations.

Any interested person or organization may self-nominate or nominate one or more qualified persons for membership.

Nominations must include the following information:

- The nominee's contact information and current occupation or position;
- The nominee's resume or curriculum vitae, including prior or current membership on other National Institute for Occupational Safety and Health (NIOSH), CDC, or HHS advisory committees or other relevant organizations, associations, and committees;

- The category of membership (environmental medicine or environmental health specialist, occupational physician, pulmonary

physician, representative of WTC responders, or certified-eligible WTC survivor representative) that the candidate is qualified to represent;

- A summary of the background, experience, and qualifications that demonstrates the nominee's suitability for the nominated membership category;
- Articles or other documents the nominee has authored that indicate the nominee's knowledge and experience in relevant subject categories; and
- A statement that the nominee is aware of the nomination, is willing to regularly attend and participate in STAC meetings, and has no known conflicts of interest that would preclude membership on the Committee.

STAC members will be selected upon the basis of their relevant experience and competence in their respective categorical fields. The information received through this nomination process, in addition to other relevant sources of information, will assist the WTC Program Administrator in appointing members to serve on the STAC. In selecting members, the WTC Program Administrator will consider individuals nominated in response to this **Federal Register** notice, as well as other qualified individuals.

The U.S. Department of Health and Human Services policy stipulates that Committee membership be balanced in terms of points of view represented, and the committee's function. Appointments shall be made without discrimination on the basis of age, race, ethnicity, gender, sexual orientation, gender identity, HIV status, disability, and cultural, religious, or socioeconomic status. Nominees must be U.S. citizens, and cannot be full-time employees of the U.S. Government. Current participation on federal workgroups or prior experience serving on a federal advisory committee does not disqualify a candidate; however, HHS policy is to avoid excessive individual service on advisory committees and multiple committee memberships. Committee members are Special Government Employees, requiring the filing of financial disclosure reports at the beginning and annually during their terms. CDC reviews potential candidates for the STAC membership each year, and provides a slate of nominees for consideration to the Secretary of HHS for final selection.

Candidates invited to serve will be asked to submit the "Confidential Financial Disclosure Report," OGE Form 450. This form is used by CDC to determine whether there is a financial conflict between that person's private interests and activities and their public responsibilities as a Special Government

Employee as well as any appearance of a loss of impartiality, as defined by Federal regulation. The form may be viewed and downloaded at <http://www.oge.gov/Forms-Library/OGE-Form-450—Confidential-Financial-Disclosure-Report/>. This form should not be submitted as part of a nomination.

Dates: Nominations must be submitted (postmarked or electronically received) by December 15, 2016.

Submissions must be electronic or by mail. Submissions should reference docket 229–E. Electronic submissions: You may electronically submit nominations, including attachments, to nioshdocket@cdc.gov. Attachments in Microsoft Word are preferred. Regular, Express, or Overnight Mail: Written nominations may be submitted (one original and two copies) to the following address only: NIOSH Docket 229–E, c/o Mia Wallace, Committee Management Specialist, National Institute for Occupational Safety and Health, Centers for Disease Control and Prevention, 1600 Clifton Rd. NE., MS: E–20, Atlanta, Georgia 30329. Telephone and facsimile submissions cannot be accepted.

For Further Information Contact: Paul Middendorf, Acting Deputy Associate Director for Science, 1600 Clifton Rd. NE., MS: E–20, Atlanta, GA 30329–4027; telephone (404)498–2500 (this is not a toll-free number); email pmiddendorf@cdc.gov.

The Director, Management Analysis and Services Office, has been delegated the authority to sign **Federal Register** notices pertaining to announcements of meetings and other committee management activities for both the Centers for Disease Control and Prevention and the Agency for Toxic Substances and Disease Registry.

Elaine L. Baker,

Director, Management Analysis and Services Office, Centers for Disease Control and Prevention.

DEPARTMENT OF HEALTH AND HUMAN SERVICES

Centers for Medicare & Medicaid Services

[Document Identifier: CMS–10466]

Agency Information Collection Activities: Proposed Collection; Comment Request

AGENCY: Centers for Medicare & Medicaid Services, HHS.

ACTION: Notice.

SUMMARY: The Centers for Medicare & Medicaid Services (CMS) is announcing an opportunity for the public to comment on CMS' intention to collect information from the public. Under the Paperwork Reduction Act of 1995 (the PRA), federal agencies are required to publish notice in the **Federal Register** concerning each proposed collection of information (including each proposed extension or reinstatement of an existing

collection of information) and to allow 60 days for public comment on the proposed action. Interested persons are invited to send comments regarding our burden estimates or any other aspect of this collection of information, including any of the following subjects: The necessity and utility of the proposed information collection for the proper performance of the agency's functions; the accuracy of the estimated burden; ways to enhance the quality, utility, and clarity of the information to be collected; and the use of automated collection techniques or other forms of information technology to minimize the information collection burden.

DATES: Comments must be received by December 27, 2016.

ADDRESSES: When commenting, please reference the document identifier or OMB control number. To be assured consideration, comments and recommendations must be submitted in any one of the following ways:

1. *Electronically.* You may send your comments electronically to <http://www.regulations.gov>. Follow the instructions for "Comment or Submission" or "More Search Options" to find the information collection document(s) that are accepting comments.

2. *By regular mail.* You may mail written comments to the following address: CMS, Office of Strategic Operations and Regulatory Affairs, Division of Regulations Development, Attention: Document Identifier/OMB Control Number _____, Room C4-26-05, 7500 Security Boulevard, Baltimore, Maryland 21244-1850.

To obtain copies of a supporting statement and any related forms for the proposed collection(s) summarized in this notice, you may make your request using one of the following:

1. Access CMS' Web site address at <http://www.cms.hhs.gov/PaperworkReductionActof1995>.

2. Email your request, including your address, phone number, OMB number, and CMS document identifier, to Paperwork@cms.hhs.gov.

3. Call the Reports Clearance Office at (410) 786-1326.

FOR FURTHER INFORMATION CONTACT: Reports Clearance Office at (410) 786-1326.

SUPPLEMENTARY INFORMATION:

Contents

This notice sets out a summary of the use and burden associated with the following information collections. More detailed information can be found in each collection's supporting statement and associated materials (see **ADDRESSES**).

CMS-10466 Patient Protection and Affordable Care Act; Exchange Functions: Eligibility for Exemptions

Under the PRA (44 U.S.C. 3501-3520), federal agencies must obtain approval from the Office of Management and Budget (OMB) for each collection of information they conduct or sponsor. The term "collection of information" is defined in 44 U.S.C. 3502(3) and 5 CFR 1320.3(c) and includes agency requests or requirements that members of the public submit reports, keep records, or provide information to a third party. Section 3506(c)(2)(A) of the PRA requires federal agencies to publish a 60-day notice in the **Federal Register** concerning each proposed collection of information, including each proposed extension or reinstatement of an existing collection of information, before submitting the collection to OMB for approval. To comply with this requirement, CMS is publishing this notice.

Information Collection

1. *Type of Information Collection Request:* Revision of a previously approved collection; *Title of Information Collection:* Patient Protection and Affordable Care Act; Exchange Functions: Eligibility for Exemptions; *Use:* The data collection and reporting requirements in "Patient Protection and Affordable Care Act; Exchange Functions: Eligibility for Exemptions; Miscellaneous Minimum Essential Coverage Provisions" (CMS-9958-F, 78 FR 39518), address federal requirements that states must meet with regard to the Exchange minimum function of performing eligibility determinations and issuing certificates of exemption from the shared responsibility payment. In the final regulation, CMS addresses standards related to eligibility, including the verification and eligibility

determination process, eligibility redeterminations, options for states to rely on HHS to make eligibility determinations for certificates of exemption, and reporting. The data collection and reporting requirements included in this information collection request are critical to the basic ability of Exchanges to determine eligibility for and issue certificates of exemption, and will also assist Exchanges, HHS, and IRS in ensuring program integrity and quality improvement. *Form Number:* CMS-10466 (OMB Control Number: 0938-1190); *Frequency:* Monthly, Yearly; *Affected Public:* Business or other for-profit, Not-for-profit institutions; *Number of Respondents:* 2,000,000; *Total Annual Responses:* 2,000,000; *Total Annual Hours:* 540,000. (For policy questions regarding this collection contact Kate Ficke at 301-492-4256).

Dated: October 19, 2016.

William N. Parham, III,

Director, Paperwork Reduction Staff, Office of Strategic Operations and Regulatory Affairs.

DEPARTMENT OF HEALTH AND HUMAN SERVICES

Food and Drug Administration

[Docket No. FDA–2016–N–1380]

The Role of Hospitals in Modernizing Evidence Generation for Device Evaluation: Harnessing the Digital Revolution for Surveillance; Public Workshop; Request for Comments

AGENCY: Food and Drug Administration, HHS.

ACTION: Notice of public workshop; request for comments.

SUMMARY: The Food and Drug Administration (FDA) is announcing the following public workshop entitled “The Role of Hospitals in Modernizing Evidence Generation for Device Evaluation: Harnessing the Digital Revolution for Surveillance.” Hospitals play a critical role in the development

of these national capabilities, leading to more robust evidence generation. Recently, the role of hospital reporting of device-related adverse events in device surveillance and, more generally, device evaluation, has garnered increased scrutiny. This public workshop will further explore the critical role of hospitals in the evolution of device surveillance and in creating more robust surveillance capabilities.

DATES: The public workshop will be held on December 5, 2016, 8:30 a.m. to 5 p.m. ET. Submit either electronic or written comments on the public workshop by January 6, 2017.

ADDRESSES: The public workshop will be held at Fishers Lane Conference Center, Terrace Level, 5635 Fishers Lane, Rockville, MD 20852. Parking is available for this public meeting at \$7 per day (cash only). Alternatively, the location is accessible by metro via the Twinbrook metro stop (Red Line). When you leave the Metro station, make a right turn towards the east side of the parking lot. Proceed to the north east corner of the parking lot and leave through the pedestrian gate. When you exit the station you will be at the corner of Fishers Lane and Twinbrook Parkway. Cross the street and proceed down Fishers Lane to 5635 Fishers Lane. Entering through the main front entrance on Fishers Lane, you will need to take an elevator down to the Terrace Level. Follow the short hallway towards the elevators and the Conference Center glass doors are straight ahead near the elevators.

You may submit comments as follows:

Electronic Submissions

Submit electronic comments in the following way:

- *Federal eRulemaking Portal:* <http://www.regulations.gov>. Follow the instructions for submitting comments. Comments submitted electronically, including attachments, to <http://www.regulations.gov> will be posted to the docket unchanged. Because your comment will be made public, you are solely responsible for ensuring that your comment does not include any confidential information that you or a third party may not wish to be posted, such as medical information, your or anyone else's Social Security number, or confidential business information, such as a manufacturing process. Please note that if you include your name, contact information, or other information that identifies you in the body of your comments, that information will be posted on <http://www.regulations.gov>.

- If you want to submit a comment with confidential information that you

do not wish to be made available to the public, submit the comment as a written/paper submission and in the manner detailed (see "Written/Paper Submissions" and "Instructions").

Written/Paper Submissions

Submit written/paper submissions as follows:

- *Mail/Hand delivery/Courier (for written/paper submissions):* Division of Dockets Management (HFA-305), Food and Drug Administration, 5630 Fishers Lane, Rm. 1061, Rockville, MD 20852.

- For written/paper comments submitted to the Division of Dockets Management, FDA will post your comment, as well as any attachments, except for information submitted, marked and identified, as confidential, if submitted as detailed in "Instructions."

Instructions: All submissions received must include the Docket No. FDA-2016-N-1380 for "The Role of Hospitals in Modernizing Evidence Generation for Device Evaluation: Harnessing the Digital Revolution for Surveillance." Received comments will be placed in the docket and, except for those submitted as "Confidential Submissions," publicly viewable at <http://www.regulations.gov> or at the Division of Dockets Management between 9 a.m. and 4 p.m., Monday through Friday.

- *Confidential Submissions—*To submit a comment with confidential information that you do not wish to be made publicly available, submit your comments only as a written/paper submission. You should submit two copies total. One copy will include the information you claim to be confidential with a heading or cover note that states "THIS DOCUMENT CONTAINS CONFIDENTIAL INFORMATION." The Agency will review this copy, including the claimed confidential information, in its consideration of comments. The second copy, which will have the claimed confidential information redacted/blacked out, will be available for public viewing and posted on <http://www.regulations.gov>. Submit both copies to the Division of Dockets Management. If you do not wish your name and contact information to be made publicly available, you can provide this information on the cover sheet and not in the body of your comments and you must identify this information as "confidential." Any information marked as "confidential" will not be disclosed except in accordance with 21 CFR 10.20 and other applicable disclosure law. For more information about FDA's posting of comments to public dockets, see 80 FR

56469, September 18, 2015, or access the information at: <http://www.fda.gov/regulatoryinformation/dockets/default.htm>.

Docket: For access to the docket to read background documents or the electronic and written/paper comments received, go to <http://www.regulations.gov> and insert the docket number, found in brackets in the heading of this document, into the "Search" box and follow the prompts and/or go to the Division of Dockets Management, 5630 Fishers Lane, Rm. 1061, Rockville, MD 20852.

FOR FURTHER INFORMATION CONTACT: Jill Marion, Center for Devices and Radiological Health, Food and Drug Administration, 10903 New Hampshire Ave., Bldg. 66, Rm. 3110, Silver Spring, MD 20993, 301-796-6128, Jill.Marion@fda.hhs.gov.

SUPPLEMENTARY INFORMATION:

I. Background

In 2012, FDA issued a report, "Strengthening Our National System for Medical Device Postmarket Surveillance,"¹ that described limitations in current authorities and approaches to medical device postmarket surveillance and proposed a strategy for a national medical device postmarket surveillance system. The system would leverage real-world data—data developed through routine clinical practice—captured in electronic health information (such as device registries, electronic health records, and payer claims forms) that incorporated unique device identifiers to quickly identify poorly performing devices, accurately characterize and disseminate information about real-world device performance, including the clinical benefits and risks of marketed devices, and efficiently generate data to support premarket clearance or approval of new devices and new uses of currently marketed devices. Following extensive public input, FDA issued an update in 2013² that outlined concrete steps the Agency would take to promote more efficient and robust national system capabilities. Two critical steps were the creation of a Planning Board and a Medical Device Registry Task Force. The Brookings Institution, under commission by FDA, convened a multistakeholder Planning Board. In February 2015, the Planning Board issued a report, "Strengthening Patient

¹ <http://www.fda.gov/downloads/AboutFDA/CentersOffices/OfficeofMedicalProductsandTobacco/CDRH/CDRHReports/UCM301924.pdf>.

² <http://www.fda.gov/downloads/MedicalDevices/Safety/CDRHPostmarketSurveillance/UCM348845.pdf>.

Care: Building a National Postmarket Medical Device Surveillance System,”³ that sets out the key steps towards development of a national system, including its governance, operations, and sustainability.

The system was renamed an “evaluation system” to reflect the broad evidence needs of stakeholders with the August 2015 release of the report, “Recommendations for a National Medical Device Evaluation System: Strategically Coordinated Registry Networks to Bridge the Clinical Care and Research,” issued by the multistakeholder Task Force, under the auspices of the Medical Device Epidemiology Network (MDEpiNet).⁴ In 2016, the Planning Board, convened by the Duke-Margolis Center for Health Policy, published “Better Evidence on Medical Devices: A Coordinating Center for a 21st Century National Medical Device Evaluation System.”⁵ This document further clarifies the expectations, roles, and responsibilities of the coordinating center described in the Planning Board’s earlier 2015 report. This additional detail provides insight into the expected business practices of an independent, transparent coordinating center that would guide the future development and implementation of the national evaluation system now referred to as the National Evaluation System for Health Technology (NEST). The Planning Board’s most recent and last report titled, *The National Evaluation System for health Technology (NEST): Priorities for Effective Early Implementation*, was issued in September 2016. The report provides recommendations on organizational governance, development of NEST resources, and development/ demonstration project areas to help begin building resources for NEST while demonstrating value to stakeholders.⁶ FDA is in the process of implementing the Task Force’s and Planning Board’s recommendations including establishment of a Coordinating Center. FDA issued a grant in September to the Medical Device Innovation Consortium to establish the center.

The importance and challenges of hospital surveillance efforts have long been recognized. In 1997, Congress passed the Food and Drug

Administration Modernization Act (Pub. L. 105–115), which amended section 519(b) of the Food, Drug and Cosmetic Act (21 U.S.C. 360i(b)). This amendment legislated the replacement of universal user facility reporting by an alternative system that is limited to a “. . . subset of user facilities that constitutes a representative profile of user reports” for device related deaths and serious injuries. In response, FDA developed The Medical Product Safety Network (MedSun).⁷ Currently there are approximately 300 hospitals nationwide that are active, voluntary partners with FDA in the assessment and reporting of device-related events. The value of and challenges with the MedSun reporting program will be discussed at the workshop, including the limitations of passive reporting as a sole source of timely identification for the investigation and resolution of device safety issues. At this time, the digital revolution offers new opportunities to leverage information collected during routine clinical care and to build a robust national evaluation infrastructure. Therefore, the Agency believes it is an opportune time to revisit the role of hospitals in device surveillance, taking into account the limitations and challenges of traditional surveillance tools and the growing availability of new tools, methodologies, and electronic data sources. This public workshop is intended to bring together many medical device stakeholders from hospitals including clinicians, epidemiologists, healthcare risk managers, IT system managers, healthcare technology management professionals, clinical researchers, and others involved in surveillance efforts to discuss current hospital-based surveillance efforts, the role of hospitals in evidence generation and future opportunities for hospital-based surveillance, the importance of using unique device identification (UDI) to aid future development of surveillance efforts and healthcare delivery, and the partnership needed to build the future of surveillance into the infrastructure for NEST. Building the national evaluation system will bring with it changes that may support efforts in hospitals to address broader issues of improved quality of care and efficiencies.

II. Topics for Discussion at the Public Workshop

This workshop is intended to foster a dialogue about the value of, costs of, and challenges with current hospital-

based reporting and surveillance, what the role of hospitals should be and reasonably could be in the evolution of device surveillance and in creating more robust surveillance capabilities in the developing national evaluation system, and how that should impact current hospital reporting requirements and future voluntary opportunities to best meet the needs of patients in receiving and hospitals in providing quality care. Topics for discussion at the public workshop include:

- An overview of the role of hospitals and potential benefits from a national evaluation system. The recent reports of the Planning Board and the work in transitioning to establishing a Coordinating Center to support development of the national system.
- The role of hospitals in evidence generation and how this fits into the national system;
- Current hospital-based surveillance efforts including participation in registries, patient safety organizations, electronic health records-based surveillance projects, and other surveillance projects.
- A review of the role of hospitals in medical device reporting activities as outlined in the Safe Medical Devices Act (Pub. L. 101–629) and current challenges hospitals face in complying with these requirements. An assessment of the current value of reporting from user facilities and identification of opportunities for process improvement.
- An exploration of FDA’s MedSun, a user facility reporting program introduced in 2002 which partners with a subset of user facilities in the United States to identify and report medical device events including mandatory events under the Safe Medical Devices Act and voluntary events.
- Future surveillance opportunities for hospitals in the national system, including use of non-traditional sources of hospital data and capabilities.
- A review of the potential benefits to hospitals of the national system and Unique Device Identification implementation to modernize hospital surveillance. Additional benefits to hospitals include improvement of supply chain management, efficiency of recalls, efficiency of medical device purchasing, and quality of care.
- A discussion of how all stakeholders can work together to improve hospital-based medical device surveillance and determine the role and value of evidence generation as it is integrated into the developing national evaluation system.

Registration: Registration is free and available on a first-come, first-served basis. Persons interested in attending

³ <http://www.fda.gov/downloads/AboutFDA/CentersOffices/OfficeofMedicalProductsandTobacco/CDRH/CDRHReports/UCM435112.pdf>.

⁴ <http://mdepinet.org/>.

⁶ <http://www.fda.gov/AboutFDA/CentersOffices/OfficeofMedicalProductsandTobacco/CDRH/CDRHReports/ucm301912.htm>.

⁷ <http://www.fda.gov/MedicalDevices/Safety/MedSunMedicalProductSafetyNetwork/>.

this public workshop must register online by November 28, 2016. Early registration is recommended because facilities are limited and, therefore, FDA may limit the number of participants from each organization. If time and space permit, onsite registration on the day of the public workshop will be provided beginning at 7:30 a.m.

If you need special accommodations due to a disability, please contact Susan Monahan, Office of Communications and Education, Center for Devices and Radiological Health, Food and Drug Administration, 10903 New Hampshire Ave., Bldg. 66, Silver Spring, MD 20993, 301-796-5661, FAX: 301-847-8142, susan.monahan@fda.hhs.gov no later than November 21, 2016.

To register for the public workshop, please visit FDA's Medical Devices News & Events—Workshops & Conferences calendar at <http://www.fda.gov/MedicalDevices/NewsEvents/WorkshopsConferences/default.htm>. (Select this meeting/public workshop from the posted events list.) Please provide complete contact information for each attendee, including name, title, and affiliation, address, email, and telephone number. Those without Internet access should contact Susan Monahan to register (see special accommodations contact). Registrants will receive confirmation after they have been accepted. You will be notified if you are on a waiting list.

Streaming Webcast of the Public Workshop: This public workshop will also be Webcast. The Webcast link will be available on the registration Web page after November 28, 2016. Organizations are requested to view using one connection per location.

Requests for Oral Presentations: This public workshop includes a public comment session and topic-focused sessions. During online registration you may indicate if you wish to present during a public comment session or participate in a specific session, and which topics you wish to address. FDA has included general topics in this document. FDA will do its best to accommodate requests to make public comments. Individuals and organizations with common interests are urged to consolidate or coordinate their presentations and request time for a joint presentation, or submit requests for designated representatives to participate in the focused sessions. Following the close of registration, FDA will determine the amount of time allotted to each presenter and the approximate time each oral presentation is to begin, and will select and notify participants by November 29, 2016. All requests to make oral presentations must be

received by November 15, 2016. If selected for presentation, any presentation materials must be emailed to Jill Marion (see **FOR FURTHER INFORMATION CONTACT**) no later than December 2, 2016. No commercial or promotional material will be permitted to be presented or distributed at the public workshop.

FDA is holding this public workshop to obtain information on the role of hospitals in evidence generation and surveillance. In order to permit the widest possible opportunity to obtain public comment, FDA is soliciting either electronic or written comments on all aspects of the public workshop topics. The deadline for submitting comments related to this public workshop is January 6, 2017.

Transcripts: Please be advised that as soon as a transcript is available, it will be accessible at <http://www.regulations.gov>. It may be viewed at the Division of Dockets Management (see **ADDRESSES**). A transcript will also be available in either hardcopy or on CD-ROM, after submission of a Freedom of Information request. The Freedom of Information office address is available on the Agency's Web site at <http://www.fda.gov>. A link to the transcript will also be available approximately 45 days after the public workshop on the Internet at <http://www.fda.gov/MedicalDevices/NewsEvents/WorkshopsConferences/default.htm>. (Select this public workshop from the posted events list).

Dated: October 19, 2016.

Leslie Kux,

Associate Commissioner for Policy.

DEPARTMENT OF HEALTH AND HUMAN SERVICES

Food and Drug Administration

[Docket No. FDA-2016-N-0538]

Agency Information Collection Activities; Submission for Office of Management and Budget Review; Comment Request; Animation in Direct-to-Consumer Advertising

AGENCY: Food and Drug Administration, HHS.

ACTION: Notice.

SUMMARY: The Food and Drug Administration (FDA or we) is announcing that a proposed collection of information has been submitted to the Office of Management and Budget (OMB) for review and clearance under the Paperwork Reduction Act of 1995.

DATES: Fax written comments on the collection of information by November 25, 2016.

ADDRESSES: To ensure that comments on the information collection are received, OMB recommends that written comments be faxed to the Office of Information and Regulatory Affairs, OMB, Attn: FDA Desk Officer, FAX: 202-395-7285, or emailed to oira_submission@omb.eop.gov. All comments should be identified with the OMB control number 0910-NEW and title "Animation in Direct-to-Consumer Advertising." Also include the FDA docket number found in brackets in the heading of this document.

FOR FURTHER INFORMATION CONTACT: FDA PRA Staff, Office of Operations, Food and Drug Administration, Three White Flint North, 10A63, 11601 Landsdown St., North Bethesda, MD 20852, PRAStaff@fda.hhs.gov.

SUPPLEMENTARY INFORMATION: In compliance with 44 U.S.C. 3507, FDA has submitted the following proposed collection of information to OMB for review and clearance.

Animation in Direct-to-Consumer Advertising

OMB Control Number 0910-NEW

Section 1701(a)(4) of the Public Health Service Act (42 U.S.C. 300u(a)(4)) authorizes the FDA to conduct research relating to health information. Section 1003(d)(2)(C) of the Federal Food, Drug, and Cosmetic Act (the FD&C Act) (21 U.S.C. 393(b)(2)(c)) authorizes FDA to conduct research relating to drugs and other FDA-regulated products in carrying out the provisions of the FD&C Act.

Advertisers use many techniques to increase consumer interest in their ads, including the use of animated spokes-characters. These characters may be fictional or nonfictional and human or nonhuman (Ref. 1). Despite variations in form, animated characters are often used to grab attention, increase ad memorability, and enhance persuasion to ultimately drive behavior (Refs. 2-4). Animated characters have long been used for low-involvement products (e.g., food products) and have made their way into direct-to-consumer (DTC) prescription drug advertising. However, to our knowledge, one study (Ref. 5) has examined how animation affects attitudes toward products and risk perceptions in drug ads, and no studies have examined how various animation strategies (e.g., symbolizing the disease vs. the benefit) and product characteristics (e.g., low-risk medication vs. high-risk medication) influence these perceptions.

Animation in Drug Ads. Animation is used in prescription drug ads in a variety of ways. Perhaps the simplest way is the use of rotoscoped animation, which involves tracing live-action images frame-by-frame to create animated characters. ABILIFY has used this technique in advertisements (Ref. 6). In this instance, the animated character was not central to the informational content of the ad; instead, the animation appeared to be a visual technique to attract attention. Whether a drug ad with a rotoscoped human results in greater comprehension of product benefit and risk information than an ad with a human actor is unclear. The few studies that have examined this technique in drug ads have found that animated human characters either had no effect on perceived product risk (Ref. 7) or led to poorer recognition of drug side effects (Ref. 6).

Animation also has been used in drug ads to symbolize the disease (*e.g.*, IMITREX and LAMISIL ads), the sufferer (*e.g.*, MYBETRIQ and ZOLOFT), the benefit (*e.g.*, ROZEREM), the mode of administration (*e.g.*, FLUZONE), and the mechanism of action (*e.g.*, LUNESTA). Drug companies may use a personified nonhuman character to illustrate, in a visually memorable way, the medical condition or drug attributes. Using secondary data from copy-testing studies, Pashupati found that drug ads featuring animated characters led to much stronger brand recall and brand association scores (Ref. 8); however, the other elements of these studies (*e.g.*, ad characteristics, presence of control group) are unclear.

Animated characters may provide marketers with a way to explain product benefits in an engaging and even humorous manner. Thus, the majority of research on animated characters in advertising focuses on outcomes such as product evaluations (Ref. 9), emotional responses (Refs. 1, 10–11), brand attitudes (Ref. 12), and perceived product value (Ref. 13). The extent to

which emotional responses can be fostered by animated characters is especially relevant to this study, as the positive effects these animations induce might transfer to the brands being advertised. It is also possible that animated characters may lead to lower perceived risk by minimizing or camouflaging side effects (Ref. 14).

Animation and Message Communication. Personifying animated characters may interfere with message communication. Although personification may increase involvement with the characters in the ad (*i.e.*, perceived as engaging and likeable), it may not increase involvement with the message itself (*e.g.*, risk and benefit information). Whether personified characters lead to reduced comprehension of risk and benefit information in drug ads is an important and unanswered question. Based on a theory called the limited capacity model of mediated message processing (Ref. 15), advertising content that is engaging, relevant, and maximizes audio/visual redundancy should improve learning and memory (Ref. 16). However, others argue that the entertainment aspects can distract from learning key information and may lead to message complexity that interferes with message communication (Ref. 17).

It is important to examine whether animation in drug ads inflates efficacy perceptions, minimizes risk, or otherwise hinders comprehension of drug risks and benefits. To investigate these issues, we will conduct a two-part experimental study to examine how: (1) Type of animation and (2) nonhuman personification in drug ads influence consumer comprehension, processing, and perception of risk and benefit information. Understanding how issues of animation and personification affect perceptions of both risks and benefits can inform FDA regarding how prescription drug risk and benefit information is processed. These strategies will be examined across two different medical conditions to see if the

findings are consistent across patient populations.

General Research Questions

1. How does consumer processing of a DTC prescription drug ad differ depending on whether the ad is live-action, rotoscoped, or animated?

2. Does consumer processing differ depending on whether the sufferer, the disease, or the benefit is the focus of the animation?

Design

To test these research questions, we will conduct two experiments. Both experiments will be examined in two different medical conditions: Chronic dry eye and psoriasis. The mock drugs we will create for these conditions mimic currently available medications and were chosen for their variance in serious side effects, *i.e.*, medications for psoriasis have very long, serious lists of risks and side effects, whereas chronic dry eye medications have relatively few risks and side effects.

The first experiment will examine whether animation itself influences consumer processing, defined as consumer recall of risks and benefits, perceptions of risks and benefits, and attitudes and emotional responses to the ad, the brand, the product, and the character (table 1). We will examine two different types of animation in addition to a control ad which will be shot with live actors: An “in-between” animation technique, rotoscoping, in which live scenes are drawn to look animated, and full animation with nonhuman characters. The live action and rotoscoped ad will be identical except for the rotoscope treatment. The animated ad will follow the theme and message as closely as possible within the limitations of animation itself. The benefits and risks of the product will be identical, although the ad’s storyline may vary somewhat to account for a nonhuman protagonist.

TABLE 1—EXPERIMENT 1: ANIMATION DESIGN

Medical condition	Type of Animation		
	Nonhuman sufferer	Rotoscoped human sufferer	Human sufferer
Chronic Dry Eye	•	•	•
Psoriasis	•	•	•

The second experiment will examine whether the object of the animation influences consumer processing of the ad (table 2), defined as consumer recall

of risks and benefits, perceptions of risks and benefits, and attitudes and emotional responses to the ad, the brand, the product, and the character.

The animation will focus on the animated character who will personify either the sufferer of the medical condition, the disease itself, or the

benefit from the drug. In this study, all
ads will contain the same kind of full
animation and the general theme will be

as similar as possible, accounting for the
variations in focus of character. The
experiments will be conducted

concurrently, and the same participants
in the nonhuman sufferer groups will be
part of both.

TABLE 2—EXPERIMENT 2: PERSONIFICATION DESIGN

Nonhuman Personification			
Medical condition	Sufferer	Disease	Benefit
Chronic Dry Eye	•	•	•
Psoriasis	•	•	•

In both cases, a professional firm will create all ads such that they are indistinguishable from currently running DTC ads.

Pretesting will take place before the main study to evaluate the procedures and measures used in the main study. We will recruit adults who have experienced chronic dry eye or psoriasis. We will exclude individuals who work in healthcare or marketing settings because their knowledge and experiences may not reflect those of the average consumer. We propose to test 300 participants for the pretest. Each experiment will include 30 participants per condition for a total of 180 participants each, but 60 of those in the nonhuman sufferer conditions will overlap between the two experiments. We will need 1,500 unique participants for the main study to obtain 90 percent power to detect a moderately small effect size. There will be 150 participants per condition for a total of 900 participants in each experiment, with 300 participants in the overlapping nonhuman sufferer conditions.

In both experiments, participants who have been diagnosed with either chronic dry eye or psoriasis will be recruited via an opt-in Internet panel to watch one ad for a prescription drug that treats their medical condition. In experiment 1, participants will be randomly assigned to view either a live-action, rotoscoped, or fully animated ad. All themes in experiment 1 will focus on the main character as the sufferer of the condition. In experiment 2, participants will be randomly assigned to a personification condition: Sufferer, disease, or benefit. All ads in experiment 2 will be fully animated. Participants will watch the ad once and then answer an online survey with questions addressing recall of risks and benefits, perceptions of risks and benefits, and attitudes and emotional responses to the ad, the brand, the product, and the character. The questionnaire is available upon request. Participation is estimated to take approximately 25 minutes.

To examine differences between experimental conditions, we will conduct inferential statistical tests such as analysis of variance.

With online surveys, several participants may be completing the survey at the time that the total target sample is reached. Those participants are allowed to complete the survey, which can result in the number of completes going slightly over the target number. Thus, our target number of completes is 1,500, so we have rounded up by an additional 150, or 10 percent, to allow for some overage.

In the **Federal Register** of March 2, 2016 (81 FR 10867), FDA published a 60-day notice requesting public comment on the proposed collection of information. FDA received a number of comments as enumerated and discussed here. Of these comments, 22 were out of the scope of the proposed project (“Ban DTC” or “Ban animated DTC”).

1. AbbVie

(Comment 1) Note that the accuracy of the findings will be highly dependent on the quality of the stimuli (*i.e.*, the animation).

(Response 1) We agree.

2. Lilly

(Comment 2) Assume that stimuli will conform to FDA regulations and standards.

(Response 2) Reviewers from the Office of Prescription Drug Promotion have been involved throughout the development of the stimuli to ensure that the mock ads conform to FDA regulations and standards.

(Comment 3) Question the use of such a large (n = 300) pretest and recommends the use of a qualitative, in-person pretest.

(Response 3) Before the pretests and main studies are conducted, we will conduct nine cognitive interviews to obtain verbal in-person feedback on the questionnaires and the stimuli. We believe this will accomplish what this commenter is suggesting. The pretest is designed to test procedures, verify that the online questionnaire is working as intended, identify and correct any

challenges to nesting the stimuli within the questionnaire, and examine data trends to check that the manipulations and questionnaire items are appropriate. A qualitative in-person pretest would not meet those objectives.

(Comment 4) Recommend screening and quotas by length of time since diagnosis as this may influence the urgency with which individuals watch the ads and their familiarity with previous treatments.

(Response 4) We have included a question toward the end of the questionnaire to measure time since diagnosis, which will enable us to assess its association with attention to the ad and statistically control for it if necessary. However, statistical control will likely be unnecessary, since random assignment to conditions in our study design should prevent there from being systematic differences among groups in time since diagnosis or any other extraneous variable.

(Comment 5) For question 5, the item “think rather than feel” seems out of place in the question bank and Lilly recommends deletion.

(Response 5) The items in Question 5 make up a validated scale developed by Stephenson and Palmgreen (Ref. 18). Niederdeppe (Ref. 19) used the same scale items to measure cognitive processing. There may be psychometric consequences to deleting this item—in other words, the reliability of the scale may be reduced if we remove this item. Since it was previously validated as a scale, we will maintain the item.

(Comment 6) Questions 6 and 8 (“In your opinion, if 100 people take [DRUG X], for how many will the drug work?”) may be difficult to answer, as pharmaceutical ads rarely have specific side effect information. Recommend changing to ask how frequently side effects will occur, from “very frequent” to “never occurs.”

(Response 6) We agree and will revise these questions to focus on perceived frequency or likelihood of side effects and efficacy in more general terms.

(Comment 7) Questions 13 and 14 (overall comprehension closed-ended

questions) may be too difficult to answer because they are nuanced and involve multiple concepts. Recommend changing to an open-ended response.

(Response 7) We appreciate the commenter's concerns about the complexity of the response options. We will examine the closed-ended questions in cognitive testing, with careful attention to participant's ability to understand and choose among the response options. If participants have notable difficulty with the closed-ended questions, we will revise them to enhance accessibility, or we will replace those items with open-ended items.

(Comment 8) Question 16b for Chronic Dry Eye does not have any question or response options.

(Response 8) We have since developed question and response options for this item.

(Comment 9) Recommend moving questions 17–28 to before question 15 because questions 15 and 16 are specific and starting with question 17, questions again refer to general ad perceptions.

(Response 9) We always approach question ordering carefully, attempting to balance a number of considerations, including the reduction of bias from one question to another, flow, and importance of each item. In this case, we feel that specific claim comprehension is more important than the other more general questions in our questionnaire, which is why they are placed afterwards. We will examine this issue closer in cognitive testing.

(Comment 10) Recommend reducing question 18 to only “like/dislike” because the results will be too similar and will be confounded.

(Response 10) We selected these items because they have been used consistently in past research. We use three items rather than one to achieve reliability, which provides a fuller understanding of the dependent variable. However, we will pay close attention to this in cognitive testing to ensure that participants are not confused or annoyed by the three questions.

(Comment 11) For question 21, recommend adding clarifying language: “. . . in terms of dealing with your psoriasis/chronic dry eye” to provide context for participant to understand how to compare themselves with the character.

(Response 11) We will present the additional context as an alternative way of asking the question in cognitive interviews.

(Comment 12) Recommend removing question 26 about how “eerie” the character is because the essence of this question is answered in question 25 and

the question is leading, as it directs participants to respond only negatively about their perceptions of the character.

(Response 12) Given the uncanny valley theory concerning rotoscoped images (Ref. 6), we feel it is crucial to maintain this specific question about the eeriness of the character.

(Comment 13) Recommend adding an open-ended question, preferably near the beginning of the survey (e.g., after question 2), about how well they feel they took away all of the relevant information and understood the risks and benefits of the drug after viewing the ad.

(Response 13) Although we do not include questions that directly measure perceived understanding of the overall message, risks, and benefits, much of the questionnaire is focused on measuring participants' memory and comprehension of that information in the ad.

(Comment 14) Recommend adding demographic questions about how much television participants watch per week and whether English is their primary language to provide extra detail for analyses.

(Response 14) We appreciate this suggestion and will add the recommended demographic items to the questionnaire.

(Comment 15) Recommend adding another open-ended question about whether any additional information could have or should have been included in the ad (e.g., disease information, accessibility of the drug) to provide information on what participants feel could be added and communicated via DTC ads.

(Response 15) This is a great question and may provide fruitful avenues for future research. We will include the item in the pretest and if timing is not an issue, we will maintain it in the main study.

3. Merck

(Comment 16) Concerned that execution-specific learnings from this research may not translate readily into FDA DTC policy/guidance. The research may not have practical utility for the general public and may be unnecessary for the proper performance of FDA's functions.

(Response 16) On the contrary, this particular study has the potential to directly influence policy in an area that we have no prior research on. We have attempted to address the execution-specific nature of the research by investigating our questions in two distinct medical conditions with two distinct products and ad executions. Although one research study cannot

answer all questions, we believe we have designed the study in such a way that we will be able to provide information on the issue of animation in DTC ads. Because there is no previous research of this kind, this will be an informative study that will help FDA develop guidance and policy in the future, should the research reveal a need to.

(Comment 17) FDA should conduct research on how all of the elements investigated previously combine to influence DTC viewing.

(Response 17) We appreciate this suggestion and will look for opportunities to do so in the future. Note we have conducted research combining the results of two previous studies—toll-free wording and distraction—in our recent eye-tracking study.

4. GSK

(Comment 18) Suggests a number of additional reasons for animation besides those stated in the FRN: Education, to help consumers quickly identify relevant ads, and to de-personalize an ad to make it more relevant to a variety of people.

(Response 18) We will keep these in mind in writing up the results of the studies.

(Comment 19) The proposed research may oversimplify animation by not incorporating multiple types of animation or examining ads that are 100 percent versus partially animated, and thus be unlikely to yield any general conclusions about the use of animation.

(Response 19) We acknowledge that we are not studying all types and executions of animation. As the first study of its kind, we feel the animation manipulations that we propose to examine will provide information on a reasonable number of variations (i.e., full animation, rotoscoping, and three different foci of animated character). We will ensure that our conclusions are reasonable with regard to the issues we studied.

(Comment 20) The proposed methodology fails to measure the relevance of the ads. A copy-testing methodology, whereby the ads are embedded in a clutter reel, may more accurately gauge the recall of risks and benefits that might occur in the real world.

(Response 20) We needed to make difficult choices in this study, as in all of our studies, regarding the tradeoff between experimental control and real-world generalizability. Given the lack of data available regarding animation in DTC, we chose to err on the side of experimental control in this study. Our

research questions involve the issue of recall and comprehension of the ads when people have watched the ads. Depending on the findings of the current study, further research examining the effects of animation within a clutter reel or considering other variables may be warranted.

(Comment 21) Advertising concepts are generally not designed to be adapted or translated to different creative formats, and because whether an ad is animated or in live action is an integral part of the concept itself, this is an inherent limitation of the research.

(Response 21) We agree that animated ads often have different storylines or different approaches to conveying information from live action ads. However, if we were to use completely different ads for our animated, rotoscoped, and live-action ads, we would be unable to determine what caused any differences in our dependent variables. Indeed, by maintaining as much similarity as possible among these three conditions, we will be able to determine whether it is the animation form per se that causes differences or not.

5. Regeneron Pharmaceuticals

(Comment 22) Encourage FDA to acknowledge that this study is exploratory and that results will not be generalizable beyond the two medical conditions studied.

(Response 22) We acknowledge that this is the first study to directly examine animation in DTC advertising. We are always mindful of how far we can extrapolate our research. We chose to examine two different medical conditions because this will provide some assurance that our findings are not exclusive to one medical condition or execution, if that is what we find. We note that the strength of the study is in its experimental design. Participants will be randomly assigned to cells, which will allow us to determine whether differences exist between different levels of our independent variables. Random assignment will somewhat allay concerns about demographic differences and other individual characteristics, which should even out across cells. However, we agree that other medical situations may cause different reactions and we will acknowledge the limitations of our study, which include not examining all medical conditions and levels of risk, in any writeup we produce.

(Comment 24) The major statement is required to be in the audio and the amount and type of risk information will vary by drug. We request that the professional ad agency designing the TV

ads ensure that the major statement is presented consistently across the ads studied for the given “mock drug.”

(Response 24) We have designed the fictitious ads to very closely align with both FDA policies and with the types of DTC ads that currently air on TV. Our ads have been reviewed by staffers in the Office of Prescription Drug Promotion multiple times throughout the ads’ development. The mock products closely mimic existing drugs in their respective classes. We agree that the quality of the ads strongly influences the success of our research and the professional development of these ads is a high priority.

(Comment 25) An imbalance of gender distribution in the diseases and study groups could skew the results due to potential gender differences in consumer processing and perception of information from drug ads. To ensure a gender balance between the study groups, we propose a randomization scheme stratified by gender. Also, please capture patient demographic information and important confounding factors and report on a comparison of the baseline patient characteristics.

(Response 25) Stratified randomization by gender would be methodologically appropriate and conservative, but in practice would make our already complex survey even more complicated. We will acknowledge a potential gender-disease confound as a limitation of the design in reports of the results.

(Comment 26) While the results from this proposed study may suggest hypotheses on difference in how prescription drug risk and benefit information may be perceived by consumers viewing live versus animation ads, the results from this study should not be used to guide or influence FDA’s current thinking on the use of animation in DTC ads. More robust and controlled studies will be required in the future to test specific hypotheses generated from this two-part survey experiment.

(Response 26) Although this is the first study to directly examine animation in DTC ads the way we have proposed here, the research we have designed is robust and well controlled. As trained research psychologists, we adhere to the highest standards in terms of rigorous control, prespecified hypotheses, appropriate statistical analyses, and reasonable and responsible interpretations. Our research undergoes many internal and external reviews before and after data collection, including a stringent OMB review (of which public comment is a part), multiple levels of internal

clearance, and peer review at well-respected academic journals in relevant fields. Although FDA never exclusively uses the findings of one scientific study to make policy decisions, the quantitative research we conduct is one part of the calculus that FDA uses to inform policy decisions.

6. AstraZeneca

(Comment 27) Recommend that questions 18 and 19 be switched in order to avoid participants being confused by the questions. Also suggest some kind of bolding for emphasis.

(Response 27) We agree that formatting these questions to emphasize and differentiate the target object will be useful and have no problem changing the order of questions 18 and 19 and will do so.

(Comment 28) The term “main character” needs to be clarified. As it is, it could mean the human character or the animated character which may, or may not, be the human character.

(Response 28) Participants will only view one version of the ad corresponding to the ad condition to which they’ve been randomized, and each ad will either be animated or live action. In terms of screen time and storyline, a single character will be dominant in each ad. We do not expect ambiguity surrounding who the main character is in each ad, but we will test this phrase in cognitive interviewing.

(Comment 29) For question 23, the commenter agrees that trust is a useful metric to study but questions whether our options are valid measures of trust, particularly “ethical.” Suggest the use of the following adjectives instead: Exaggerated, deceptive, manipulative, trustworthy, informative, credible.

(Response 29) The negative adjectives on the list are from an existing scale (Refs. 20–21) and we would like to keep those consistent with the prior literature. We will revise the positive adjectives to reflect the commenter’s suggestion: Trustworthy, informative, credible, and reliable.

(Comment 30) For questions 24 and 25, suggest the addition of “hopeful,” “empowered,” and “informed.”

(Response 30) The emotional reaction questions were adapted from existing scales (Ref. 22), but we think it would be useful to test a longer set of emotions in cognitive interviews and narrow down from there.

(Comment 31) We feel that question 26 should be deleted because it is a leading question. If not deleted, change “eerie” to “strange.”

(Response 31) We agree that this is an unusual question and may seem offputting without context. However,

previous research has compared live action and rotoscoped action in advertisements and has determined that people feel uncomfortable with rotoscoping because it is very similar to what we expect from live renditions, but not exactly. This theory is called the uncanny valley theory (Ref. 6). Question 26 comes directly from this previous research and we feel strongly that we need the question as it is to ground our comparison of live action and rotoscoping in the prior literature.

(Comment 32) Question 29 about anthropomorphism seems inappropriate

to gauge audience acceptance of the premise. Suggest using a question such as: “To what extent do/can bodily organs or pills have personalities?”

(Response 32) The purpose of question 29 is to measure an individual difference variable, namely to what extent people tend to anthropomorphize. The question is modified from a validated measure (Ref. 23). We do not intend to assess people’s acceptance of animated DTC ads through this question. Instead, we are using this as a possible moderator variable to explain some of the variance

we might find in responses to other questions. Indeed, another commenter wrote that we should measure demographics and other possibly confounding variables. This is one of these variables. The amount of humanization people ascribe to nonhuman objects may influence their attitudes and perceptions, and these items have been validated in past research. It is not an outcome measure.

FDA estimates the burden of this collection of information as follows:

TABLE 3—ESTIMATED BURDEN

Activity	Number of respondents	Number of responses per respondent	Total annual responses	Average burden per response (in hours)	Total hours
Pretesting					
Number to complete the screener (assumes 50% eligible).	660	1	660	.08 (5 minutes)	53
Number of completes	330	1	330	.42 (25 minutes)	139
Main Study					
Number to complete the screener (assumes 50% eligible).	3,300	1	3,300	.08 (5 minutes)	264
Number of completes	1,650	1	1,650	.42 (25 minutes)	693
Total Hours					1,149

¹ There are no capital costs or operating and maintenance costs associated with this collection of information.

DEPARTMENT OF THE INTERIOR

National Park Service

[NPS–AKR–GLBA–22231; PPWOBSADA0, PPMPAS1Y.Y00000 (177)]

Information Collection Request Sent to the Office of Management and Budget (OMB) for Approval; Glacier Bay National Park and Preserve Bear Sighting and Encounter Reports

AGENCY: National Park Service, Interior.

ACTION: Notice; request for comments.

SUMMARY: We (National Park Service, NPS) have sent an Information Collection Request (ICR) to OMB for review and approval. We summarize the ICR below and describe the nature of the collection and the estimated burden and cost. We may not conduct or sponsor and a person is not required to respond to a collection of information unless it displays a currently valid OMB control number. However, under OMB regulations, we may continue to conduct or sponsor this information collection while it is pending at OMB.

DATES: You must submit comments on or before November 25, 2016.

ADDRESSES: Send your comments and suggestions on this information collection to the Desk Officer for the Department of the Interior at OMB–OIRA at (202) 395–5806 (fax) or *OIRA_Submission@omb.eop.gov* (email). Please provide a copy of your comments to Madonna L. Baucum, Information Collection Clearance Officer, National Park Service, 12201 Sunrise Valley Drive, Mail Stop 242, Reston, VA 20192; or *madonna_baucum@nps.gov* (email). Please include “1024–GLBA” in the subject line of your comments. You may

review the ICR online at <http://www.reginfo.gov>. Follow the instructions to review Department of the Interior collections under review by OMB.

FOR FURTHER INFORMATION CONTACT: To request additional information about this ICR, contact Margaret Hazen, Supervisory Park Ranger, Glacier Bay National Park and Preserve at *Margaret_Hazen@nps.gov* (email) or at (907) 697–2608 (telephone).

SUPPLEMENTARY INFORMATION:

I. Abstract

The National Park Service Organic Act, 54 U.S.C. 100101(a) *et seq.*, requires that the NPS preserve national parks for the enjoyment, education, and inspiration of this and future generations. Permit requirements and restrictions for recreational activities in the backcountry are governed in accordance with the regulations found at Title 36, Code of Federal Regulations, Sections 1.5, 1.6, and 2.10 (36 CFR 1.5, 1.6, 2.10, and 13.116). In order to monitor resources and wildlife in the Glacier Bay National Park and Preserve (GLBA) and to enhance the safety of future visitors, the park monitors all sightings and interactions by visitors with bears. The bear sighting and encounter reporting forms are an extension of our statutory authority and responsibility to protect the park areas we administer and to manage the public use thereof. NPS regulations codified in 36 CFR 1–7, 12 and 13, are designated to implement statutory mandates that provide for resource protection and public enjoyment.

Bear sighting data provides the park with important data used to determine bear movements, habitat use, and species distribution. This information can be used in backcountry management and planning, field research planning, and educational outreach for visitors. Bear-human interaction data is vital to understand how bears respond to people, detecting changes in bear behavior, and identifying potential areas of high bear-human conflict. Obtaining immediate information on bear-human conflicts allows managers to respond promptly to mitigate further conflicts. Proactive mitigation includes notifying other backcountry users, issuing advisories or recommendations, or issuing closures to prevent further conflicts and maintain public safety. Additionally, managers may respond to reports of bear-human conflict with bear management techniques such as hazing or aversive conditioning. Obtaining current accurate information on bear sightings and interactions is essential

for public safety and to effectively manage bears and people to minimize conflicts. Summary statistics (without personal information) may be generated to examine long-term trends in types and locations of bear-human interactions. Observations and interactions by visitors are recorded via the two forms: NPS Form 10–405 and NPS Form 10–406.

The NPS requires the submission of NPS Form 10–405 upon exiting the park backcountry in order to collect information regarding bear sightings within GLBA. The collection and timeliness of the data collection is critical for the NPS’ ability to enhance the safety of future visitors and to protect the bear population at the park. Information collected via NPS Form 10–405 includes:

- Group name;
- Take-out date;
- Whether visitor encountered dirty campsites left by previous users or observe unsafe or inappropriate behavior by other groups; and
- Detailed information for each sighting documented on the form, to include:
 - Date/time;
 - Species type
 - Total number of bears seen together (for each sighting);
 - Bear unit type;
 - Estimation of distance between visitor and bear(s);
 - Whether the bear was aware of the group;
 - Bear reaction to group;
 - Activity of group;
 - Number of observers; and
 - Location description/campsite name/GPS position/other comments.

Submission of a completed NPS Form 10–406 is required when a bear enters camp, approaches the group, damages gear, obtains food, and/or acts in an aggressive or threatening manner towards the group. The collection and timeliness of data concerning bear-human contact is critical for the NPS’ ability to enhance the safety of future visitors and to protect the bear population at the park. Information collected via NPS Form 10–406 includes:

- Name and phone number of the primary person involved in the interaction;
- Group type: Park visitor, concession employee, contractor, researcher, NPS employee, or other;
- Number of people who encountered the bear;
- Corresponding sighting number on NPS Form 10–405; Location 1–28 (Backcountry vs. Developed Area A and B);

- Types of vegetation in area of encounter;
- The bear's activity when it was first observed;
- The group's activity prior to seeing the bear;
- The bear's initial and subsequent reaction to the group;
- Group's response to bear's reaction;
- Group's distance to the bear;
- Whether food was present, and if so, if it was eaten by the bear;
- Whether property was damaged;
- Detailed description of the interaction;
- Detailed description of the bear, to include color, markings, scars, tags, etc.;

- Date, time, and duration of encounter;
- Exact location of encounter documented on map provided by GLBA, to include the latitude/longitude;
- Where did the individual learn about how to behave while in bear country; and
- Whether visitor encountered dirty campsites left by previous users or observe unsafe or inappropriate behavior by other groups

II. Data

OMB Control Number: 1024–New.

Title: Glacier Bay National Park and Preserve Bear Sighting and Encounter Reports.

Service Form Number(s): NPS Forms 10–405, “Tatshenshini—Alsek River Bear Report” and 10–406, “Bear Information Management Report”.

Type of Request: Existing collection in use without an OMB Control Number.

Description of Respondents: Backcountry and frontcountry visitors to Glacier Bay National Park and Preserve.

Respondent's Obligation: Mandatory.

Frequency of Collection: On occasion.

Estimated Annual Nonhour Burden Cost: None.

Activity	Estimated annual number of responses	Estimated completion time per response (minutes)	Estimated total annual burden hours
NPS Form 10–405, “Tatshenshini—Alsek River Bear Report Form 1”	40	5	3
NPS Form 10–406, “Tatshenshini—Alsek River Bear Information Management (BIM) Report Form 2”	10	5	1
Totals	50		4

III. Comments

On June 26, 2015, we published in the **Federal Register** (80 FR 36844) a Notice of our intent to request that OMB approve the collection of information associated with the collection of information via NPS Forms 10–405, “Tatshenshini—Alsek River Bear Report” and 10–406, “Bear Information Management Report”. We did not receive any comments in response to that notice.

We again invite comments concerning this information collection on:

- Whether or not the collection of information is necessary, including whether or not the information will have practical utility;
- The accuracy of our estimate of the burden for this collection of information;
- Ways to enhance the quality, utility, and clarity of the information to be collected; and
- Ways to minimize the burden of the collection of information on respondents.

Comments that you submit in response to this notice are a matter of public record. Before including your address, phone number, email address, or other personal identifying information in your comment, you should be aware that your entire comment, including your personal identifying information, may be made publicly available at any time. While you can ask OMB in your comment to withhold your personal identifying

information from public review, we cannot guarantee that it will be done.

Dated: October 20, 2016.

Madonna L. Baucum,
Information Collection Clearance Officer,
National Park Service.

BILLING CODE 4310–EH–P

INTERNATIONAL TRADE COMMISSION

[Investigation Nos. 731–TA–457–A–D (Fourth Review)]

Heavy Forged Hand Tools From China; Scheduling of Expedited Five-Year Reviews

AGENCY: United States International Trade Commission.

ACTION: Notice.

SUMMARY: The Commission hereby gives notice of the scheduling of expedited reviews pursuant to the Tariff Act of 1930 (“the Act”) to determine whether revocation of the antidumping duty orders on heavy forged hand tools from China would be likely to lead to continuation or recurrence of material injury within a reasonably foreseeable time.

DATES: *Effective Date:* October 4, 2016.

FOR FURTHER INFORMATION CONTACT: Edward Petronzio (202–205–3176), Office of Investigations, U.S. International Trade Commission, 500 E Street SW., Washington, DC 20436.

Hearing-impaired persons can obtain information on this matter by contacting the Commission's TDD terminal on 202–205–1810. Persons with mobility impairments who will need special assistance in gaining access to the Commission should contact the Office of the Secretary at 202–205–2000. General information concerning the Commission may also be obtained by accessing its internet server (<https://www.usitc.gov>). The public record for these reviews may be viewed on the Commission's electronic docket (EDIS) at <https://edis.usitc.gov>.

SUPPLEMENTARY INFORMATION:

Background.—On October 4, 2016, the Commission determined that the domestic interested party group response to its notice of institution (81 FR 43235, July 1, 2016) of the subject five-year reviews was adequate and that the respondent interested party group response was inadequate. The Commission did not find any other circumstances that would warrant conducting full reviews.¹ Accordingly, the Commission determined that it would conduct expedited reviews pursuant to section 751(c)(3) of the Tariff Act of 1930 (19 U.S.C. 1675(c)(3)).²

¹ A record of the Commissioners' votes, the Commission's statement on adequacy, and any individual Commissioner's statements will be available from the Office of the Secretary and at the Commission's Web site.

² Vice Chairman David S. Johanson voted to conduct full reviews.

For further information concerning the conduct of these reviews and rules of general application, consult the Commission's Rules of Practice and Procedure, part 201, subparts A and B (19 CFR part 201), and part 207, subparts A, D, E, and F (19 CFR part 207).

Staff report.—A staff report containing information concerning the subject matter of the reviews will be placed in the nonpublic record on October 27, 2016, and made available to persons on the Administrative Protective Order service list for these reviews. A public version will be issued thereafter, pursuant to section 207.62(d)(4) of the Commission's rules.

Written submissions.—As provided in section 207.62(d) of the Commission's rules, interested parties that are parties to the reviews and that have provided individually adequate responses to the notice of institution,³ and any party other than an interested party to the reviews may file written comments with the Secretary on what determination the Commission should reach in the reviews. Comments are due on or before November 1, 2016 and may not contain new factual information. Any person that is neither a party to the five-year reviews nor an interested party may submit a brief written statement (which shall not contain any new factual information) pertinent to the reviews by November 1, 2016. However, should the Department of Commerce extend the time limit for its completion of the final results of its reviews, the deadline for comments (which may not contain new factual information) on Commerce's final results is three business days after the issuance of Commerce's results. If comments contain business proprietary information (BPI), they must conform with the requirements of sections 201.6, 207.3, and 207.7 of the Commission's rules. The Commission's rules with respect to filing were revised effective July 25, 2014. See 79 FR 35920 (June 25, 2014), and the revised Commission Handbook on E-filing, available from the Commission's Web site at <https://edis.usitc.gov>.

In accordance with sections 201.16(c) and 207.3 of the rules, each document filed by a party to the reviews must be served on all other parties to the reviews (as identified by either the public or BPI service list), and a certificate of service must be timely filed. The Secretary will not accept a document for filing without a certificate of service.

Determination.—The Commission has determined these reviews are extraordinarily complicated and therefore has determined to exercise its authority to extend the review period by up to 90 days pursuant to 19 U.S.C. 1675(c)(5)(B).

Authority: These reviews are being conducted under authority of title VII of the Tariff Act of 1930; this notice is published pursuant to section 207.62 of the Commission's rules.

By order of the Commission.

Issued: October 19, 2016.

Lisa R. Barton,

Secretary to the Commission.

[FR Doc. 2016–25720 Filed 10–24–16; 8:45 am]

BILLING CODE 7020–02–P

INTERNATIONAL TRADE COMMISSION

[Investigation No. 337–TA–1026]

Certain Audio Processing Hardware, Software, and Products Containing the Same; Institution of Investigation

AGENCY: U.S. International Trade Commission.

ACTION: Notice.

SUMMARY: Notice is hereby given that a complaint was filed with the U.S. International Trade Commission on September 19, 2016, under section 337 of the Tariff Act of 1930, as amended, 19 U.S.C. 1337, on behalf of Andrea Electronics Corp. of Bohemia, New York. A supplement was filed on October 5, 2016. The complaint, as supplemented, alleges violations of section 337 based upon the importation into the United States, the sale for importation, and the sale within the United States after importation of certain audio processing hardware, software, and products containing the same by reason of infringement of certain claims of U.S. Patent No. 6,049,607 (“the ‘607 patent’”); U.S. Patent No. 6,363,345 (“the ‘345 patent’”); and U.S. Patent No. 6,377,637 (“the ‘637 patent’”). The complaint further alleges that an industry in the United States exists as required by subsection (a)(2) of section 337.

The complainant requests that the Commission institute an investigation and, after the investigation, issue a limited exclusion order and cease and desist orders.

ADDRESSES: The complaint, except for any confidential information contained therein, is available for inspection during official business hours (8:45 a.m. to 5:15 p.m.) in the Office of the Secretary, U.S. International Trade

Commission, 500 E Street SW., Room 112, Washington, DC 20436, telephone (202) 205–2000. Hearing impaired individuals are advised that information on this matter can be obtained by contacting the Commission's TDD terminal on (202) 205–1810. Persons with mobility impairments who will need special assistance in gaining access to the Commission should contact the Office of the Secretary at (202) 205–2000. General information concerning the Commission may also be obtained by accessing its internet server at <https://www.usitc.gov>. The public record for this investigation may be viewed on the Commission's electronic docket (EDIS) at <https://edis.usitc.gov>.

FOR FURTHER INFORMATION CONTACT: The Office of Unfair Import Investigations, U.S. International Trade Commission, telephone (202) 205–2560.

SUPPLEMENTARY INFORMATION:

Authority: The authority for institution of this investigation is contained in section 337 of the Tariff Act of 1930, as amended, and in section 210.10 of the Commission's Rules of Practice and Procedure, 19 CFR 210.10 (2015).

Scope of Investigation: Having considered the complaint, the U.S. International Trade Commission, on October 19, 2016, Ordered that—

(1) Pursuant to subsection (b) of section 337 of the Tariff Act of 1930, as amended, an investigation be instituted to determine whether there is a violation of subsection (a)(1)(B) of section 337 in the importation into the United States, the sale for importation, or the sale within the United States after importation of certain audio processing hardware, software, and products containing the same by reason of infringement of one or more of claims 1–12 and 25–37 of the ‘607 patent; claims 1–25, 38–40, and 42–47 of the ‘345 patent; claims 1–14 of the ‘637 patent, and whether an industry in the United States exists as required by subsection (a)(2) of section 337;

(2) Pursuant to Commission Rule 210.50(b)(1), 19 CFR 210.50(b)(1), the presiding administrative law judge shall take evidence or other information and hear arguments from the parties or other interested persons with respect to the public interest in this investigation, as appropriate, and provide the Commission with findings of fact and a recommended determination on this issue, which shall be limited to the statutory public interest factors set forth in 19 U.S.C. 1337(d)(1), (f)(1), (g)(1);

(3) For the purpose of the investigation so instituted, the following are hereby named as parties upon which

³ The Commission has found the responses submitted by Ames Companies, Inc. and Council Tool Company, Inc. to be individually adequate. Comments from other interested parties will not be accepted (see 19 CFR 207.62(d)(2)).

this notice of investigation shall be served:

(a) The complainant is: Andrea Electronics Corp., 620 Johnson Avenue, Suite 1B, Bohemia, NY 11716.

(b) The respondents are the following entities alleged to be in violation of section 337, and are the parties upon which the complaint is to be served:

Apple Inc., 1 Infinite Loop, Cupertino, CA 95014

Samsung Electronics Co., Ltd., 129, Samsung-ro, Yeongtong-gu, Suwon-si, Gyeonggi-do, Korea

Samsung Electronics America, Inc., 85 Challenger Road, Ridgefield Park, NJ 07660

(c) The Office of Unfair Import Investigations, U.S. International Trade Commission, 500 E Street SW., Suite 401, Washington, DC 20436; and

(4) For the investigation so instituted, the Chief Administrative Law Judge, U.S. International Trade Commission, shall designate the presiding Administrative Law Judge.

Responses to the complaint and the notice of investigation must be submitted by the named respondents in accordance with section 210.13 of the Commission's Rules of Practice and Procedure, 19 CFR 210.13. Pursuant to 19 CFR 201.16(e) and 210.13(a), such responses will be considered by the Commission if received not later than 20 days after the date of service by the Commission of the complaint and the notice of investigation. Extensions of time for submitting responses to the complaint and the notice of investigation will not be granted unless good cause therefor is shown.

Failure of a respondent to file a timely response to each allegation in the complaint and in this notice may be deemed to constitute a waiver of the right to appear and contest the allegations of the complaint and this notice, and to authorize the administrative law judge and the Commission, without further notice to the respondent, to find the facts to be as alleged in the complaint and this notice and to enter an initial determination and a final determination containing such findings, and may result in the issuance of an exclusion order or a cease and desist order or both directed against the respondent.

By order of the Commission.

Issued: October 19, 2016.

Lisa R. Barton,

Secretary to the Commission.

BILLING CODE 7020-02-P

INTERNATIONAL TRADE COMMISSION

[Investigation No. 337-TA-1025]

Certain Silicon-on-Insulator Wafers; Institution of Investigation

AGENCY: U.S. International Trade Commission.

ACTION: Notice.

SUMMARY: Notice is hereby given that a complaint was filed with the U.S. International Trade Commission on May 26, 2016, under section 337 of the Tariff Act of 1930, as amended, 19 U.S.C. 1337, on behalf of Silicon Genesis Corporation of Santa Clara, California. Supplements were filed on October 3 and 7, 2016. The complaint, as supplemented, alleges violations of section 337 based upon the importation into the United States, the sale for importation, and the sale within the United States after importation of certain silicon-on-insulator wafers by reason of infringement of U.S. Patent No. 6,458,672 ("the '672 patent") and U.S. Patent No. 6,171,965 ("the '965 patent"). The complaint further alleges that an industry in the United States exists as required by subsection (a)(2) of section 337.

The complainant requests that the Commission institute an investigation and, after the investigation, issue a limited exclusion order and a cease and desist order.

ADDRESSES: The complaint, except for any confidential information contained therein, is available for inspection during official business hours (8:45 a.m. to 5:15 p.m.) in the Office of the Secretary, U.S. International Trade Commission, 500 E Street SW., Room 112, Washington, DC 20436, telephone (202) 205-2000. Hearing impaired individuals are advised that information on this matter can be obtained by contacting the Commission's TDD terminal on (202) 205-1810. Persons with mobility impairments who will need special assistance in gaining access to the Commission should contact the Office of the Secretary at (202) 205-2000. General information concerning the Commission may also be obtained by accessing its internet server at <https://www.usitc.gov>. The public record for this investigation may be viewed on the Commission's electronic docket (EDIS) at <https://edis.usitc.gov>.

FOR FURTHER INFORMATION CONTACT: The Office of Unfair Import Investigations, U.S. International Trade Commission, telephone (202) 205-2560.

Authority: The authority for institution of this investigation is contained in section 337

of the Tariff Act of 1930, as amended, and in section 210.10 of the Commission's Rules of Practice and Procedure, 19 CFR 210.10 (2016).

Scope of Investigation: Having considered the complaint, the U.S. International Trade Commission, on October 19, 2016, *Ordered that*—

(1) Pursuant to subsection (b) of section 337 of the Tariff Act of 1930, as amended, an investigation be instituted to determine whether there is a violation of subsection (a)(1)(B) of section 337 in the importation into the United States, the sale for importation, or the sale within the United States after importation of certain silicon-on-insulator wafers by reason of infringement of one or more of claims 1, 3, 28 and 39 of the '672 patent and claims 1-3 and 5 of the '965 patent, and whether an industry in the United States exists as required by subsection (a)(2) of section 337;

(2) Notwithstanding any Commission Rules that would otherwise apply, the presiding Administrative Law Judge shall hold an early evidentiary hearing, find facts, and issue an early decision, as to whether the complainant has satisfied the economic prong of the domestic industry requirement. Any such decision shall be in the form of an initial determination (ID). Petitions for review of such an ID shall be due five calendar days after service of the ID; any replies shall be due three business days after service of a petition. The ID will become the Commission's final determination 30 days after the date of service of the ID unless the Commission determines to review the ID. Any such review will be conducted in accordance with Commission Rules 210.43, 210.44, and 210.45, 19 CFR 210.43, 210.44, and 210.45. The Commission expects the issuance of an early ID relating to the economic prong of the domestic industry requirement within 100 days of institution, except that the presiding ALJ may grant a limited extension of the ID for good cause shown. The issuance of an early ID finding that complainants do not satisfy the economic prong of the domestic industry requirement shall stay the investigation unless the Commission orders otherwise; any other decision shall not stay the investigation or delay the issuance of a final ID covering the other issues of the investigation;

(3) Pursuant to Commission Rule 210.50(b)(1), 19 CFR 210.50(b)(1), the presiding administrative law judge shall take evidence or other information and hear arguments from the parties or other interested persons with respect to the public interest in this investigation, as appropriate, and provide the

Commission with findings of fact and a recommended determination on this issue, which shall be limited to the statutory public interest factors set forth in 19 U.S.C. 1337(d)(1), (f)(1), (g)(1);

(4) For the purpose of the investigation so instituted, the following are hereby named as parties upon which this notice of investigation shall be served:

(a) The complainant is: Silicon Genesis Corporation, 2424 Walsh Avenue, Santa Clara, CA 95054.

(b) The respondent is the following entity alleged to be in violation of section 337, and is the party upon which the complaint is to be served: Soitec, S.A., Parc Technologique des Fontaines, Chemin des Franques, 38190 Bernin, France

(c) The Office of Unfair Import Investigations, U.S. International Trade Commission, 500 E Street SW., Suite 401, Washington, DC 20436; and

(5) For the investigation so instituted, the Chief Administrative Law Judge, U.S. International Trade Commission, shall designate the presiding Administrative Law Judge.

Responses to the complaint and the notice of investigation must be submitted by the named respondent in accordance with section 210.13 of the Commission's Rules of Practice and Procedure, 19 CFR 210.13. Pursuant to 19 CFR 201.16(e) and 210.13(a), such responses will be considered by the Commission if received not later than 20 days after the date of service by the Commission of the complaint and the notice of investigation. Extensions of time for submitting responses to the complaint and the notice of investigation will not be granted unless good cause therefor is shown.

Failure of the respondent to file a timely response to each allegation in the complaint and in this notice may be deemed to constitute a waiver of the right to appear and contest the allegations of the complaint and this notice, and to authorize the administrative law judge and the Commission, without further notice to the respondent, to find the facts to be as alleged in the complaint and this notice and to enter an initial determination and a final determination containing such findings, and may result in the issuance of an exclusion order or a cease and desist order or both directed against the respondent.

By order of the Commission.

Issued: October 19, 2016.

Lisa R. Barton,

Secretary to the Commission.

INTERNATIONAL TRADE COMMISSION

[Investigation Nos. 701-TA-379 and 731-TA-788, 792, and 793 (Third Review)]

Stainless Steel Plate From Belgium, South Africa, and Taiwan; Scheduling of Expedited Five-Year Reviews

AGENCY: United States International Trade Commission.

ACTION: Notice.

SUMMARY: The Commission hereby gives notice of the scheduling of expedited reviews pursuant to the Tariff Act of 1930 ("the Act") to determine whether revocation of the countervailing duty order on stainless steel plate from South Africa and the antidumping duty orders on stainless steel plate from Belgium, South Africa, Taiwan would be likely to lead to continuation or recurrence of material injury within a reasonably foreseeable time.

DATES: *Effective Date:* October 4, 2016.

FOR FURTHER INFORMATION CONTACT:

Amelia Shister (202-205-2047), Office of Investigations, U.S. International Trade Commission, 500 E Street SW., Washington, DC 20436. Hearing-impaired persons can obtain information on this matter by contacting the Commission's TDD terminal on 202-205-1810. Persons with mobility impairments who will need special assistance in gaining access to the Commission should contact the Office of the Secretary at 202-205-2000. General information concerning the Commission may also be obtained by accessing its Internet server (<https://www.usitc.gov>). The public record for these reviews may be viewed on the Commission's electronic docket (EDIS) at <https://edis.usitc.gov>.

SUPPLEMENTARY INFORMATION:

Background.—On October 4, 2016, the Commission determined that the domestic interested party group response to its notice of institution (81 FR 43245, July 1, 2016) of the subject five-year reviews was adequate and that the respondent interested party group response was inadequate. The Commission did not find any other circumstances that would warrant conducting full reviews.¹ Accordingly, the Commission determined that it would conduct expedited reviews pursuant to section 751(c)(3) of the

Tariff Act of 1930 (19 U.S.C. 1675(c)(3)).²

For further information concerning the conduct of these reviews and rules of general application, consult the Commission's Rules of Practice and Procedure, part 201, subparts A and B (19 CFR part 201), and part 207, subparts A, D, E, and F (19 CFR part 207).

Staff report.—A staff report containing information concerning the subject matter of the reviews will be placed in the nonpublic record on October 27, 2016, and made available to persons on the Administrative Protective Order service list for these reviews. A public version will be issued thereafter, pursuant to section 207.62(d)(4) of the Commission's rules.

Written submissions.—As provided in section 207.62(d) of the Commission's rules, interested parties that are parties to the reviews and that have provided individually adequate responses to the notice of institution,³ and any party other than an interested party to the reviews may file written comments with the Secretary on what determinations the Commission should reach in the reviews. Comments are due on or before November 1, 2016 and may not contain new factual information. Any person that is neither a party to the five-year reviews nor an interested party may submit a brief written statement (which shall not contain any new factual information) pertinent to the reviews by November 1, 2016. However, should the Department of Commerce extend the time limit for its completion of the final results of its reviews, the deadline for comments (which may not contain new factual information) on Commerce's final results is three business days after the issuance of Commerce's results. If comments contain business proprietary information (BPI), they must conform with the requirements of sections 201.6, 207.3, and 207.7 of the Commission's rules. The Commission's rules with respect to filing were revised effective July 25, 2014. See 79 FR 35920 (June 25, 2014), and the revised Commission Handbook on E-filing, available from the Commission's Web site at <https://edis.usitc.gov>.

In accordance with sections 201.16(c) and 207.3 of the rules, each document filed by a party to the reviews must be served on all other parties to the reviews

² Commissioner Broadbent voted to conduct full reviews.

³ The Commission has found the responses submitted by Allegheny Ludlum, LLC, North American Stainless, and Outokumpu Stainless USA, LLC to be individually adequate. Comments from other interested parties will not be accepted (see 19 CFR 207.62(d)(2)).

¹ A record of the Commissioners' votes, the Commission's statement on adequacy, and any individual Commissioner's statements will be available from the Office of the Secretary and at the Commission's Web site.

(as identified by either the public or BPI service list), and a certificate of service must be timely filed. The Secretary will not accept a document for filing without a certificate of service.

Determination.—The Commission has determined these reviews are extraordinarily complicated and therefore has determined to exercise its authority to extend the review period by up to 90 days pursuant to 19 U.S.C. 1675(c)(5)(B).

Authority: These reviews are being conducted under authority of title VII of the Tariff Act of 1930; this notice is published pursuant to section 207.62 of the Commission's rules.

By order of the Commission.

Issued: October 19, 2016.

Lisa R. Barton,

Secretary to the Commission.

[FR Doc. 2016–25715 Filed 10–24–16; 8:45 am]

BILLING CODE 7020–02–P

INTERNATIONAL TRADE COMMISSION

[Investigation No. 337–TA–1002]

Certain Carbon and Alloy Steel Products; Commission Decision Not To Review an Initial Determination Granting Complainant's Motion To Amend the Complaint and Notice of Investigation

AGENCY: U.S. International Trade Commission.

ACTION: Notice.

SUMMARY: Notice is hereby given that the U.S. International Trade Commission has determined not to review the presiding administrative law judge's ("ALJ") initial determination ("ID") (Order No. 34), granting a motion of complainant United States Steel Corporation to amend the Complaint and Notice of Investigation to correct the name of respondent "Shougang Group" to "Shougang Corporation."

FOR FURTHER INFORMATION CONTACT: Megan M Valentine, Office of the General Counsel, U.S. International Trade Commission, 500 E Street SW., Washington, DC 20436, telephone (202) 708–2301. Copies of non-confidential documents filed in connection with this investigation are or will be available for inspection during official business hours (8:45 a.m. to 5:15 p.m.) in the Office of the Secretary, U.S. International Trade Commission, 500 E Street SW., Washington, DC 20436, telephone (202) 205–2000. General information concerning the Commission may also be obtained by accessing its Internet server at <https://www.usitc.gov>.

The public record for this investigation may be viewed on the Commission's electronic docket (EDIS) at <https://edis.usitc.gov>. Hearing-impaired persons are advised that information on this matter can be obtained by contacting the Commission TDD terminal on (202) 205–1810.

SUPPLEMENTARY INFORMATION: The Commission instituted this investigation on June 2, 2016, based on a complaint filed by United States Steel Corporation of Pittsburgh, Pennsylvania ("U.S. Steel"), alleging a violation of section 337 of the Tariff Act of 1930, as amended, 19 U.S.C. 1337. 81 FR 35381 (June 2, 2016). The notice of investigation named numerous respondents, including Shougang Group and China Shougang International Trade & Engineering Corporation ("Shougang Trade") both of Beijing, China. *Id.* at 35382. The Office of Unfair Import Investigations ("OUII") was also named as a party. *Id.* The alleged violation of section 337 is based upon the importation into the United States, or in the sale of certain carbon and alloy steel products by reason of: (1) a conspiracy to fix prices and control output and export volumes, the threat or effect of which is to restrain or monopolize trade and commerce in the United States; (2) misappropriation and use of trade secrets, the threat or effect of which is to destroy or substantially injure an industry in the United States; or (3) false designation of origin or manufacturer, the threat or effect of which is to destroy or substantially injure an industry in the United States. *Id.* at 35381.

On August 31, 2016, U.S. Steel filed a motion for leave to amend the Complaint and Notice of Investigation to correct the name of respondent "Shougang Group" to "Shougang Corporation." On September 12, 2016, respondent Shougang Trade responded to the motion, identifying an apparent error in the proposed amended Complaint but stating that it does not oppose the motion. No other responses were received.

On September 19, 2016, the ALJ issued the subject ID, granting U.S. Steel's motion pursuant to Commission rule 210.14(b)(1) (19 CFR 210.14(b)(1)). The ID notes that on June 30, 2016, following institution of the investigation, Shougang Trade filed a response to the Complaint, stating that "Shougang Group" is not a legal entity. Shougang Trade also asserted that it is a wholly owned subsidiary of Shougang Corporation. U.S. Steel noted in its motion that the address for Shougang Corporation is the same address that was identified in the Complaint for

"Shougang Group." The ALJ found there is good cause to amend the pleadings to correct the name of a misidentified respondent. The ALJ also found that there is no prejudice in identifying Shougang Corporation at this stage of the investigation because Shougang Trade, its wholly owned subsidiary, was properly served the Complaint and Notice of Investigation and has entered an appearance.

No petitions for review were filed and the Commission has determined not to review the subject ID.

The authority for the Commission's determination is contained in section 337 of the Tariff Act of 1930, as amended (19 U.S.C. 1337), and in part 210 of the Commission's Rules of Practice and Procedure (19 CFR part 210).

By order of the Commission.

Issued: October 19, 2016.

Lisa R. Barton,

Secretary to the Commission.

BILLING CODE 7020–02–P

DEPARTMENT OF JUSTICE

Drug Enforcement Administration

[Docket No. DEA–420F]

Final Adjusted Aggregate Production Quotas for Schedule I and II Controlled Substances and Assessment of Annual Needs for the List I Chemicals Ephedrine, Pseudoephedrine, and Phenylpropanolamine for 2016

AGENCY: Drug Enforcement Administration (DEA), Department of Justice (DOJ).

ACTION: Final order.

SUMMARY: This final order establishes the final adjusted 2016 aggregate production quotas for controlled substances in schedules I and II of the Controlled Substances Act (CSA) and the assessment of annual needs for the list I chemicals ephedrine, pseudoephedrine, and phenylpropanolamine.

DATES: This order is effective October 25, 2016.

FOR FURTHER INFORMATION CONTACT: Michael J. Lewis, Diversion Control Division, Drug Enforcement Administration, 8701 Morrisette Drive, Springfield, VA 22152, Telephone: (202) 598–6812.

SUPPLEMENTARY INFORMATION:

Legal Authority

Section 306 of the Controlled Substances Act (CSA) (21 U.S.C. 826),

requires the Attorney General to establish aggregate production quotas for each basic class of controlled substances listed in schedules I and II and for the list I chemicals ephedrine, pseudoephedrine, and phenylpropanolamine. The Attorney General has delegated this function to the Administrator of the DEA pursuant to 28 CFR 0.100.

Background

The DEA published the 2016 established aggregate production quotas for controlled substances in schedules I and II and for the assessment of annual needs for the list I chemicals ephedrine, pseudoephedrine, and phenylpropanolamine in the **Federal Register** on October 6, 2015. 80 FR 60400. This notice stated that the Administrator would adjust, as needed, the established aggregate production quotas in 2016 in accordance with 21 CFR 1303.13 and 21 CFR 1315.13. The 2016 proposed adjusted aggregate production quotas for controlled substances in schedules I and II, and assessment of annual needs for the list I chemicals ephedrine, pseudoephedrine, and phenylpropanolamine were subsequently published in the **Federal Register** on July 22, 2016, (81 FR 47829) in consideration of the outlined criteria. All interested persons were invited to comment on or object to the proposed adjusted aggregate production quotas and assessment of annual needs on or before August 22, 2016.

Comments Received

Four DEA-registered entities submitted timely comments regarding a total of six schedule I and II controlled substances. Comments received proposed that the aggregate production quotas for amphetamine (for sale), etorphine hydrochloride, methadone, methadone intermediate, nabilone, and phencyclidine were insufficient to provide for the estimated medical, scientific, research, and industrial needs of the United States, for export requirements, and for the establishment and maintenance of reserve stocks. The DEA received one comment from a non-DEA registered entity requesting the reduction of oxycodone (for sale) to pre-2013 levels. The DEA received one comment from a DEA registrant regarding the proposed removal of the

additional 25% of the estimated medical, scientific, and research needs of the United States for the calendar year 2017 published in the **Federal Register** on July 22, 2016 (81 FR 47821).

The DEA received one comment from a DEA-registered entity and two comments from non-DEA registered entities for the proposed adjustments to the 2016 assessment of annual needs for ephedrine, pseudoephedrine, and phenylpropanolamine. Comments received proposed that the annual assessment of needs for ephedrine (for sale) and pseudoephedrine (for sale) were insufficient to provide for the estimated medical, scientific, research, and industrial needs of the United States, for export requirements, and for the establishment and maintenance of reserve stocks.

Analysis for Final Adjusted 2016 Aggregate Production Quotas and Assessment of Annual Needs

In determining the final adjusted 2016 aggregate production quotas and assessment of annual needs, the DEA has taken into consideration the above comments along with the factors set forth in 21 CFR 1303.13 and 21 CFR 1315.13 in accordance with 21 U.S.C. 826(a), and other relevant factors including the 2015 year-end inventories, initial 2016 manufacturing and import quotas, 2016 export requirements, actual and projected 2016 sales, research and product development requirements, and additional applications received. Based on all of the above, the Administrator has determined that the proposed adjusted 2016 aggregate production quotas and assessment of annual needs for amphetamine (for sale), etorphine hydrochloride, dextropropoxyphene, levorphanol, nabilone, noroxymorphone (for sale), phencyclidine, and secobarbital required additional consideration, and hereby further adjusts the 2016 aggregate production quotas and assessment of annual needs for these substances. This final order reflects those adjustments.

Regarding ephedrine (for sale), methadone, methadone intermediate, oxycodone (for sale), and pseudoephedrine (for sale) the Administrator hereby determines that the proposed adjusted 2016 aggregate production quotas and assessment of annual needs for these substances and list I chemicals as published on July 22,

2016, (81 FR 47829) are sufficient to meet the current 2016 estimated medical, scientific, research, and industrial needs of the United States and to provide for adequate reserve stock. This final order establishes these aggregate production quotas at the same amounts as proposed.

As described in the previously published notice establishing the 2016 aggregate production quotas and assessment of annual needs, the DEA has specifically considered that inventory allowances granted to individual manufacturers may not always result in the availability of sufficient quantities to maintain an adequate reserve stock pursuant to 21 U.S.C. 826(a), as intended. 21 CFR 1303.24. This would be concerning if a natural disaster or other unforeseen event resulted in substantial disruption to the amount of controlled substances available to provide for legitimate public need. As such, the DEA included in all final schedule II aggregate production quotas, and certain schedule I aggregate production quotas, an additional 25% of the estimated medical, scientific, and research needs as part of the amount necessary to ensure the establishment and maintenance of reserve stocks. The resulting final aggregate production quotas will reflect these included amounts. This action will not affect the ability of manufacturers to maintain inventory allowances as specified by regulation. The DEA expects that maintaining this reserve in certain established aggregate production quotas will mitigate adverse public effects if an unforeseen event results in the substantial disruption to the amount of controlled substances available to provide for legitimate public need, as determined by the DEA. The DEA does not anticipate utilizing the reserve in the absence of these circumstances.

Pursuant to the above, the Administrator hereby finalizes the 2016 aggregate production quotas for the following schedule I and II controlled substances and the 2016 assessment of annual needs for the list I chemicals ephedrine, pseudoephedrine, and phenylpropanolamine, expressed in grams of anhydrous acid or base, as follows:

Basic class	Revised 2016 quotas
	(g)
Temporarily Scheduled Substances	
beta-Hydroxythiofentanyl	30
Butyryl fentanyl	30
Schedule I	
[1-(5-fluoropentyl)-1H-indazol-3-yl](naphthalen-1-yl)methanone (THJ-2201)	15
1-(1-Phenylcyclohexyl)pyrrolidine	10
1-(5-Fluoropentyl)-3-(1-naphthoyl)indole (AM2201)	45
1-(5-Fluoropentyl)-3-(2-iodobenzoyl)indole (AM694)	45
1-[1-(2-Thienyl)cyclohexyl]piperidine	15
1-[2-(4-Morpholinyl)ethyl]-3-(1-naphthoyl)indole (JWH-200)	45
1-Benzylpiperazine	25
1-Butyl-3-(1-naphthoyl)indole (JWH-073)	45
1-Cyclohexylethyl-3-(2-methoxyphenylacetyl)indole (SR-18 and RCS-8)	45
1-Hexyl-3-(1-naphthoyl)indole (JWH-019)	45
1-Methyl-4-phenyl-4-propionoxypiperidine	2
1-Pentyl-3-(1-naphthoyl)indole (JWH-018 and AM678)	45
1-Pentyl-3-(2-chlorophenylacetyl)indole (JWH-203)	45
1-Pentyl-3-(2-methoxyphenylacetyl)indole (JWH-250)	45
1-Pentyl-3-(4-chloro-1-naphthoyl)indole (JWH-398)	45
1-Pentyl-3-(4-methyl-1-naphthoyl)indole (JWH-122)	45
1-Pentyl-3-[(4-methoxy)-benzoyl]indole (SR-19, RCS-4)	45
1-Pentyl-3-[1-(4-methoxynaphthoyl)]indole (JWH-081)	45
2-(2,5-Dimethoxy-4-ethylphenyl)ethanamine (2C-E)	30
2-(2,5-Dimethoxy-4-methylphenyl)ethanamine (2C-D)	30
2-(2,5-Dimethoxy-4-nitro-phenyl)ethanamine (2C-N)	30
2-(2,5-Dimethoxy-4-n-propylphenyl)ethanamine (2C-P)	30
2-(2,5-Dimethoxyphenyl)ethanamine (2C-H)	30
2-(4-Bromo-2,5-dimethoxyphenyl)-N-(2-methoxybenzyl)ethanamine (25B-NBOMe; 2C-B-NBOMe; 25B; Cimbi-36)	25
2-(4-Chloro-2,5-dimethoxyphenyl)ethanamine (2C-C)	30

BILLING CODE 4410-09-P

DEPARTMENT OF LABOR

Office of the Secretary

Agency Information Collection Activities; Submission for OMB Review; Comment Request; Program To Prevent Smoking in Hazardous Areas of Underground Coal Mines

ACTION: Notice.

SUMMARY: The Department of Labor (DOL) is submitting the Mine Safety and Health Administration (MSHA) sponsored information collection request (ICR) titled, "Program to Prevent Smoking in Hazardous Areas of Underground Coal Mines," to the Office of Management and Budget (OMB) for review and approval for continued use, without change, in accordance with the Paperwork Reduction Act of 1995 (PRA). Public comments on the ICR are invited.

DATES: The OMB will consider all written comments that agency receives on or before November 25, 2016.

ADDRESSES: A copy of this ICR with applicable supporting documentation; including a description of the likely respondents, proposed frequency of response, and estimated total burden may be obtained free of charge from the *RegInfo.gov* Web site at <http://www.reginfo.gov/public/do/>

PRAViewICR?ref_nbr=201605-1219-001 (this link will only become active on the day following publication of this notice) or by contacting Michel Smyth by telephone at 202-693-4129, TTY 202-693-8064, (these are not toll-free numbers) or by email at *DOL_PRA_PUBLIC@dol.gov*.

Submit comments about this request by mail or courier to the Office of Information and Regulatory Affairs, Attn: OMB Desk Officer for DOL-MSHA, Office of Management and Budget, Room 10235, 725 17th Street NW., Washington, DC 20503; by Fax: 202-395-5806 (this is not a toll-free number); or by email: *OIRA_submission@omb.eop.gov*. Commenters are encouraged, but not required, to send a courtesy copy of any comments by mail or courier to the U.S. Department of Labor—OASAM, Office of the Chief Information Officer, Attn: Departmental Information Compliance Management Program, Room N1301, 200 Constitution Avenue NW., Washington, DC 20210; or by email: *DOL_PRA_PUBLIC@dol.gov*.

FOR FURTHER INFORMATION CONTACT: Contact Michel Smyth by telephone at 202-693-4129, TTY 202-693-8064, (these are not toll-free numbers) or by email at *DOL_PRA_PUBLIC@dol.gov*.

SUPPLEMENTARY INFORMATION: This ICR seeks to extend PRA authority for the Program to Prevent Smoking in Hazardous Areas of Underground Coal Mines information collection. Regulations 30 CFR 75.1702 prohibits a person from smoking or carrying smoking materials underground or in places where there is a fire or explosion hazard. Regulations 30 CFR 75.1702-1 requires a mine operator to submit a smoking prevention plan to the MSHA for approval. Federal Mine Safety and Health Act of 1977 section 103(h)

authorizes this information collection. See 30 U.S.C. 813(h).

This information collection is subject to the PRA. A Federal agency generally cannot conduct or sponsor a collection of information, and the public is generally not required to respond to an information collection, unless it is approved by the OMB under the PRA and displays a currently valid OMB Control Number. In addition, notwithstanding any other provisions of law, no person shall generally be subject to penalty for failing to comply with a collection of information that does not display a valid Control Number. See 5 CFR 1320.5(a) and 1320.6. The DOL obtains OMB approval for this information collection under Control Number 1219-0041.

OMB authorization for an ICR cannot be for more than three (3) years without renewal, and the current approval for this collection is scheduled to expire on December 31, 2016. The DOL seeks to extend PRA authorization for this information collection for three (3) more years, without any change to existing requirements. The DOL notes that existing information collection requirements submitted to the OMB receive a month-to-month extension while they undergo review. For additional substantive information about this ICR, see the related notice published in the **Federal Register** on June 30, 2016 (81 FR 42734).

Interested parties are encouraged to send comments to the OMB, Office of Information and Regulatory Affairs at the address shown in the **ADDRESSES** section within thirty (30) days of publication of this notice in the **Federal Register**. In order to help ensure appropriate consideration, comments should mention OMB Control Number

1219-0041. The OMB is particularly interested in comments that:

- Evaluate whether the proposed collection of information is necessary for the proper performance of the functions of the agency, including whether the information will have practical utility;
- Evaluate the accuracy of the agency's estimate of the burden of the proposed collection of information, including the validity of the methodology and assumptions used;
- Enhance the quality, utility, and clarity of the information to be collected; and
- Minimize the burden of the collection of information on those who are to respond, including through the use of appropriate automated, electronic, mechanical, or other technological collection techniques or other forms of information technology, e.g., permitting electronic submission of responses.

Agency: DOL-MSHA.

Title of Collection: Program to Prevent Smoking in Hazardous Areas of Underground Coal Mines.

OMB Control Number: 1219-0041.

Affected Public: Private Sector—businesses or other for-profits.

Total Estimated Number of Respondents: 17.

Total Estimated Number of Responses: 17.

Total Estimated Annual Time Burden: 9 hours.

Total Estimated Annual Other Costs Burden: \$0.

Authority: 44 U.S.C. 3507(a)(1)(D).

Dated: October 19, 2016.

Michel Smyth,

Departmental Clearance Officer.

[FR Doc. 2016-25769 Filed 10-24-16; 8:45 am]

BILLING CODE 4510-43-P

NATIONAL CREDIT UNION ADMINISTRATION

Submission for OMB Review; Comment Request

AGENCY: National Credit Union Administration (NCUA).

ACTION: Notice.

SUMMARY: The National Credit Union Administration (NCUA) will be submitting the following information collection requests to the Office of Management and Budget (OMB) for review and clearance in accordance with the Paperwork Reduction Act of 1995, Public Law 104-13, on or after the date of publication of this notice.

DATES: Comments should be received on or before November 25, 2016 to be assured of consideration.

ADDRESSES: Send comments regarding the burden estimate, or any other aspect of the information collection, including suggestions for reducing the burden, to (1) Office of Information and Regulatory Affairs, Office of Management and Budget, Attention: Desk Officer for NCUA, New Executive Office Building, Room 10235, Washington, DC 20503, or email at OIRA_Submission@OMB.EOP.gov and (2) NCUA PRA Clearance Officer, 1775 Duke Street, Alexandria, VA 22314, Suite 5067, or email at PRAComments@ncua.gov.

FOR FURTHER INFORMATION CONTACT:

Copies of the submission may be obtained by emailing PRAComments@ncua.gov or viewing the entire information collection request at www.reginfo.gov.

SUPPLEMENTARY INFORMATION:

OMB Number: 3133-0098.

Type of Review: Reinstatement of a previously approved collection.

Title: Advertising of Excess Insurance, 12 CFR 740.3.

Abstract: Requirements of 12 CFR 740.3, Advertising of excess insurance, prescribes that federally insured credit unions must disclose in advertising the share or savings account insurance provided by a party other than NCUA. This disclosure statement must include the identity of the carrier, the type and amount of such insurance and must avoid any statement or implication that the carrier is affiliated with NCUA or the federal government. The disclosure requirements under § 740.3 are necessary to ensure that share account holders are aware that their accounts are insured by carriers other than the NCUA.

Affected Public: Private Sector: Not-for-profit institutions.

Estimated Total Annual Burden Hours: 300.

OMB Number: 3133-0130.

Type of Review: Extension of a previously approved collection.

Title: Written Reimbursement Policy.

Abstract: Federal Credit Unions ("FCU") may reimburse its board members for reasonable and proper costs incurred in conducting their official responsibilities only if the reimbursement is in accordance with the written reimbursement policies and procedures established by the FCU's board of directors. Access to this plan, and documentation related to its implementation is necessary for NCUA examiners to verify compliance with this requirement.

Affected Public: Private sector: Not-for-profit institutions.

Estimated Total Annual Burden Hours: 1,890.

By Gerard Poliquin, Secretary of the Board, the National Credit Union Administration, on October 19, 2016.

Dated: October 19, 2016.

Troy S. Hillier,

NCUA PRA Clearance Officer.

BILLING CODE 7535-01-P

NATIONAL FOUNDATION ON THE ARTS AND THE HUMANITIES

National Endowment for the Humanities

Meeting of National Council on the Humanities

AGENCY: National Endowment for the Humanities, National Foundation on the Arts and the Humanities.

ACTION: Notice of meeting.

SUMMARY: Pursuant to the Federal Advisory Committee Act, notice is hereby given that the National Council on the Humanities will meet to advise the Chairman of the National Endowment for the Humanities (NEH) with respect to policies, programs and procedures for carrying out his functions; to review applications for financial assistance under the National Foundation on the Arts and Humanities Act of 1965 and make recommendations thereon to the Chairman; and to consider gifts offered to NEH and make recommendations thereon to the Chairman.

DATES: The meeting will be held on Thursday, November 17, 2016, from 10:30 a.m. until 12:30 p.m., and Friday, November 18, 2016, from 9:00 a.m. until adjourned.

ADDRESSES: The meeting will be held at Constitution Center, 400 7th Street SW., Washington, DC 20506. See

SUPPLEMENTARY INFORMATION section for room numbers.

FOR FURTHER INFORMATION CONTACT:

Elizabeth Voyatzis, Committee Management Officer, 400 7th Street SW., 4th Floor, Washington, DC 20506; (202) 606-8322; evoyatzis@neh.gov.

SUPPLEMENTARY INFORMATION: The National Council on the Humanities is meeting pursuant to the National Foundation on the Arts and Humanities Act of 1965 (20 U.S.C. 951-960, as amended). The Committee meetings of the National Council on the Humanities will be held on November 17, 2016, as follows: the policy discussion session

(open to the public) will convene at 10:30 a.m. until approximately 11:30 a.m., followed by the discussion of specific grant applications and programs before the Council (closed to the public) from 11:30 a.m. until 12:30 p.m.

Challenge Grants: Room 4089

Education Programs: Conference Room C.

Federal/State Partnership: 2002

Preservation and Access Programs:

Room P002.

Public Programs: Room P003

Research Programs/Digital

Humanities: Room 4002.

The plenary session of the National Council on the Humanities will convene on November 18, 2016, at 9:00 a.m. in the Conference Center at Constitution Center. The agenda for the morning session (open to the public) will be as follows:

A. Minutes of the Previous Meeting

B. Reports

1. Chairman's Remarks
2. Deputy Chairman's Remarks
3. Conversation with NEH Chairman William D. Adams and Mellon Foundation President Earl Lewis
4. Congressional Affairs Report
5. Budget Report
6. Reports on Policy and General Matters
 - a. Challenge Grants
 - b. Education Programs
 - c. Federal/State Partnership
 - d. Preservation and Access Programs
 - e. Public Programs
 - f. Research Programs
 - g. Digital Humanities

The remainder of the plenary session will be for consideration of specific applications and therefore will be closed to the public.

As identified above, portions of the meeting of the National Council on the Humanities will be closed to the public pursuant to sections 552b(c)(4), 552b(c)(6) and 552b(c)(9)(b) of Title 5 U.S.C., as amended. The closed sessions will include review of personal and/or proprietary financial and commercial information given in confidence to the agency by grant applicants, and discussion of certain information, the premature disclosure of which could significantly frustrate implementation of proposed agency action. I have made this determination pursuant to the authority granted me by the Chairman's Delegation of Authority to Close Advisory Committee Meetings dated April 15, 2016.

Please note that individuals planning to attend the public sessions of the meeting are subject to security screening procedures. If you wish to attend any of the public sessions, please inform NEH

as soon as possible by contacting Ms. Katherine Griffin at (202) 606-8322 or kgriffin@neh.gov. Please also provide advance notice of any special needs or accommodations, including for a sign language interpreter.

Dated: October 19, 2016.

Elizabeth Voyatzis,

Committee Management Officer.

BILLING CODE 7536-01-P

NUCLEAR REGULATORY COMMISSION

[NRC-2016-0214]

Biweekly Notice; Applications and Amendments to Facility Operating Licenses and Combined Licenses Involving No Significant Hazards Considerations

AGENCY: Nuclear Regulatory Commission.

ACTION: Biweekly notice.

SUMMARY: Pursuant to Section 189a.(2) of the Atomic Energy Act of 1954, as amended (the Act), the U.S. Nuclear Regulatory Commission (NRC) is publishing this regular biweekly notice. The Act requires the Commission to publish notice of any amendments issued, or proposed to be issued, and grants the Commission the authority to issue and make immediately effective any amendment to an operating license or combined license, as applicable, upon a determination by the Commission that such amendment involves no significant hazards consideration, notwithstanding the pendency before the Commission of a request for a hearing from any person.

This biweekly notice includes all notices of amendments issued, or proposed to be issued, from September 27, 2016, to October 7, 2016. The last biweekly notice was published on October 11, 2016.

DATES: Comments must be filed by November 25, 2016. A request for a hearing must be filed by December 27, 2016.

ADDRESSES: You may submit comments by any of the following methods.

- *Federal Rulemaking Web site:* Go to <http://www.regulations.gov> and search for Docket ID NRC-2016-0214. Address questions about NRC dockets to Carol Gallagher; telephone: 301-415-3463; email: Carol.Gallagher@nrc.gov. For technical questions, contact the individual listed in the **FOR FURTHER INFORMATION CONTACT** section of this document.

- *Mail comments to:* Cindy Bladey, Office of Administration, Mail Stop: OWFN-12-H08, U.S. Nuclear Regulatory Commission, Washington, DC 20555-0001.

For additional direction on obtaining information and submitting comments, see "Obtaining Information and Submitting Comments" in the **SUPPLEMENTARY INFORMATION** section of this document.

FOR FURTHER INFORMATION CONTACT:

Lynn Ronewicz, Office of Nuclear Reactor Regulation, U.S. Nuclear Regulatory Commission, Washington DC 20555-0001; telephone: 301-415-1927, email: Lynn.Ronewicz@nrc.gov.

I. Obtaining Information and Submitting Comments

A. Obtaining Information

Please refer to Docket ID NRC-2016-0214, facility name, unit number(s), plant docket number, application date, and subject when contacting the NRC about the availability of information for this action. You may obtain publicly-available information related to this action by any of the following methods:

- *Federal Rulemaking Web site:* Go to <http://www.regulations.gov> and search for Docket ID NRC-2016-0214.

- *NRC's Agencywide Documents Access and Management System (ADAMS):* You may obtain publicly-available documents online in the ADAMS Public Documents collection at <http://www.nrc.gov/reading-rm/adams.html>. To begin the search, select "ADAMS Public Documents" and then select "Begin Web-based ADAMS Search." For problems with ADAMS, please contact the NRC's Public Document Room (PDR) reference staff at 1-800-397-4209, 301-415-4737, or by email to pdr.resource@nrc.gov. The ADAMS accession number for each document referenced (if it is available in ADAMS) is provided the first time that it is mentioned in this document.

- *NRC's PDR:* You may examine and purchase copies of public documents at the NRC's PDR, Room O1-F21, One White Flint North, 11555 Rockville Pike, Rockville, Maryland 20852.

B. Submitting Comments

Please include Docket ID NRC-2016-0214, facility name, unit number(s), plant docket number, application date, and subject in your comment submission.

The NRC cautions you not to include identifying or contact information that you do not want to be publicly disclosed in your comment submission. The NRC will post all comment submissions at <http://www.nrc.gov>.

www.regulations.gov as well as enter the comment submissions into ADAMS. The NRC does not routinely edit comment submissions to remove identifying or contact information.

If you are requesting or aggregating comments from other persons for submission to the NRC, then you should inform those persons not to include identifying or contact information that they do not want to be publicly disclosed in their comment submission. Your request should state that the NRC does not routinely edit comment submissions to remove such information before making the comment submissions available to the public or entering the comment into ADAMS.

I. Notice of Consideration of Issuance of Amendments to Facility Operating Licenses and Combined Licenses and Proposed No Significant Hazards Consideration Determination

The Commission has made a proposed determination that the following amendment requests involve no significant hazards consideration. Under the Commission's regulations in § 50.92 of title 10 of the *Code of Federal Regulations* (10 CFR), this means that operation of the facility in accordance with the proposed amendment would not (1) involve a significant increase in the probability or consequences of an accident previously evaluated, or (2) create the possibility of a new or different kind of accident from any accident previously evaluated; or (3) involve a significant reduction in a margin of safety. The basis for this proposed determination for each amendment request is shown below.

The Commission is seeking public comments on this proposed determination. Any comments received within 30 days after the date of publication of this notice will be considered in making any final determination.

Normally, the Commission will not issue the amendment until the expiration of 60 days after the date of publication of this notice. The Commission may issue the license amendment before expiration of the 60-day period provided that its final determination is that the amendment involves no significant hazards consideration. In addition, the Commission may issue the amendment prior to the expiration of the 30-day comment period if circumstances change during the 30-day comment period such that failure to act in a timely way would result, for example in derating or shutdown of the facility. If the Commission takes action prior to the expiration of either the comment period

or the notice period, it will publish in the **Federal Register** a notice of issuance. If the Commission makes a final no significant hazards consideration determination, any hearing will take place after issuance. The Commission expects that the need to take this action will occur very infrequently.

A. Opportunity To Request a Hearing and Petition for Leave To Intervene

Within 60 days after the date of publication of this notice, any persons (petitioner) whose interest may be affected by this action may file a request for a hearing and a petition to intervene (petition) with respect to the action. Petitions shall be filed in accordance with the Commission's "Agency Rules of Practice and Procedure" in 10 CFR part 2. Interested persons should consult a current copy of 10 CFR 2.309, which is available at the NRC's PDR, located at One White Flint North, Room O1-F21, 11555 Rockville Pike (first floor), Rockville, Maryland 20852. The NRC's regulations are accessible electronically from the NRC Library on the NRC's Web site at <http://www.nrc.gov/reading-rm/doc-collections/cfr/>. If a petition is filed within 60 days, the Commission or a presiding officer designated by the Commission or by the Chief Administrative Judge of the Atomic Safety and Licensing Board Panel, will rule on the petition; and the Secretary or the Chief Administrative Judge of the Atomic Safety and Licensing Board will issue a notice of a hearing or an appropriate order.

As required by 10 CFR 2.309, a petition shall set forth with particularity the interest of the petitioner in the proceeding, and how that interest may be affected by the results of the proceeding. The petition should specifically explain the reasons why intervention should be permitted with particular reference to the following general requirements: (1) The name, address, and telephone number of the petitioner; (2) the nature of the petitioner's right under the Act to be made a party to the proceeding; (3) the nature and extent of the petitioner's property, financial, or other interest in the proceeding; and (4) the possible effect of any decision or order which may be entered in the proceeding on the petitioner's interest. The petition must also set forth the specific contentions which the petitioner seeks to have litigated at the proceeding.

Each contention must consist of a specific statement of the issue of law or fact to be raised or controverted. In addition, the petitioner shall provide a

brief explanation of the bases for the contention and a concise statement of the alleged facts or expert opinion which support the contention and on which the petitioner intends to rely in proving the contention at the hearing. The petitioner must also provide references to those specific sources and documents of which the petitioner is aware and on which the petitioner intends to rely to establish those facts or expert opinion to support its position on the issue. The petition must include sufficient information to show that a genuine dispute exists with the applicant on a material issue of law or fact. Contentions shall be limited to matters within the scope of the proceeding. The contention must be one which, if proven, would entitle the petitioner to relief. A petitioner who fails to satisfy these requirements with respect to at least one contention will not be permitted to participate as a party.

Those permitted to intervene become parties to the proceeding, subject to any limitations in the order granting leave to intervene, and have the opportunity to participate fully in the conduct of the hearing with respect to resolution of that person's admitted contentions consistent with the NRC's regulations, policies, and procedures.

Petitions for leave to intervene must be filed no later than 60 days from the date of publication of this notice.

Requests for hearing, petitions for leave to intervene, and motions for leave to file new or amended contentions that are filed after the 60-day deadline will not be entertained absent a determination by the presiding officer that the filing demonstrates good cause by satisfying the three factors in 10 CFR 2.309(c)(1)(i) through (iii).

If a hearing is requested, and the Commission has not made a final determination on the issue of no significant hazards consideration, the Commission will make a final determination on the issue of no significant hazards consideration. The final determination will serve to decide when the hearing is held. If the final determination is that the amendment request involves no significant hazards consideration, the Commission may issue the amendment and make it immediately effective, notwithstanding the request for a hearing. Any hearing held would take place after issuance of the amendment. If the final determination is that the amendment request involves a significant hazards consideration, then any hearing held would take place before the issuance of any amendment unless the Commission finds an imminent danger to the health

or safety of the public, in which case it will issue an appropriate order or rule under 10 CFR part 2.

A State, local governmental body, Federally-recognized Indian Tribe, or agency thereof, may submit a petition to the Commission to participate as a party under 10 CFR 2.309(h)(1).

The petition should state the nature and extent of the petitioner's interest in the proceeding. The petition should be submitted to the Commission by December 27, 2016. The petition must be filed in accordance with the filing instructions in the "Electronic Submissions (E-Filing)" section of this document, and should meet the requirements for petitions set forth in this section, except that under 10 CFR 2.309(h)(2) a State, local governmental body, or Federally-recognized Indian Tribe, or agency thereof does not need to address the standing requirements in 10 CFR 2.309(d) if the facility is located within its boundaries. A State, local governmental body, Federally-recognized Indian Tribe, or agency thereof may also have the opportunity to participate under 10 CFR 2.315(c).

If a hearing is granted, any person who does not wish, or is not qualified, to become a party to the proceeding may, in the discretion of the presiding officer, be permitted to make a limited appearance pursuant to the provisions of 10 CFR 2.315(a). A person making a limited appearance may make an oral or written statement of position on the issues, but may not otherwise participate in the proceeding. A limited appearance may be made at any session of the hearing or at any prehearing conference, subject to the limits and conditions as may be imposed by the presiding officer. Details regarding the opportunity to make a limited appearance will be provided by the presiding officer if such sessions are scheduled.

B. Electronic Submissions (E-Filing)

All documents filed in NRC adjudicatory proceedings, including a request for hearing, a petition for leave to intervene, any motion or other document filed in the proceeding prior to the submission of a request for hearing or petition to intervene (hereinafter "petition"), and documents filed by interested governmental entities participating under 10 CFR 2.315(c), must be filed in accordance with the NRC's E-Filing rule (72 FR 49139; August 28, 2007, as amended at 77 FR 46562, August 3, 2012). The E-Filing process requires participants to submit and serve all adjudicatory documents over the internet, or in some cases to mail copies on electronic storage media.

Participants may not submit paper copies of their filings unless they seek an exemption in accordance with the procedures described below.

To comply with the procedural requirements of E-Filing, at least 10 days prior to the filing deadline, the participant should contact the Office of the Secretary by email at hearing.docket@nrc.gov, or by telephone at 301-415-1677, to request (1) a digital identification (ID) certificate, which allows the participant (or its counsel or representative) to digitally sign documents and access the E-Submittal server for any proceeding in which it is participating; and (2) advise the Secretary that the participant will be submitting a petition (even in instances in which the participant, or its counsel or representative, already holds an NRC-issued digital ID certificate). Based upon this information, the Secretary will establish an electronic docket for the hearing in this proceeding if the Secretary has not already established an electronic docket.

Information about applying for a digital ID certificate is available on the NRC's public Web site at <http://www.nrc.gov/site-help/e-submittals/getting-started.html>. System requirements for accessing the E-Submittal server are available on the NRC's public Web site at <http://www.nrc.gov/site-help/e-submittals/adjudicatory-sub.html>. Participants may attempt to use other software not listed on the Web site, but should note that the NRC's E-Filing system does not support unlisted software, and the NRC Electronic Filing Help Desk will not be able to offer assistance in using unlisted software.

Once a participant has obtained a digital ID certificate and a docket has been created, the participant can then submit a petition. Submissions should be in Portable Document Format (PDF). Additional guidance on PDF submissions is available on the NRC's public Web site at <http://www.nrc.gov/site-help/electronic-sub-ref-mat.html>. A filing is considered complete at the time the documents are submitted through the NRC's E-Filing system. To be timely, an electronic filing must be submitted to the E-Filing system no later than 11:59 p.m. Eastern Time on the due date. Upon receipt of a transmission, the E-Filing system time-stamps the document and sends the submitter an email notice confirming receipt of the document. The E-Filing system also distributes an email notice that provides access to the document to the NRC's Office of the General Counsel and any others who have advised the Office of the Secretary that they wish to participate in the

proceeding, so that the filer need not serve the documents on those participants separately. Therefore, applicants and other participants (or their counsel or representative) must apply for and receive a digital ID certificate before a hearing petition to intervene is filed so that they can obtain access to the document via the E-Filing system.

A person filing electronically using the NRC's adjudicatory E-Filing system may seek assistance by contacting the NRC Electronic Filing Help Desk through the "Contact Us" link located on the NRC's public Web site at <http://www.nrc.gov/site-help/e-submittals.html>, by email to MSHD.Resource@nrc.gov, or by a toll-free call at 1-866-672-7640. The NRC Electronic Filing Help Desk is available between 9 a.m. and 7 p.m., Eastern Time, Monday through Friday, excluding government holidays.

Participants who believe that they have a good cause for not submitting documents electronically must file an exemption request, in accordance with 10 CFR 2.302(g), with their initial paper filing stating why there is good cause for not filing electronically and requesting authorization to continue to submit documents in paper format. Such filings must be submitted by: (1) First class mail addressed to the Office of the Secretary of the Commission, U.S. Nuclear Regulatory Commission, Washington, DC 20555-0001, Attention: Rulemaking and Adjudications Staff; or (2) courier, express mail, or expedited delivery service to the Office of the Secretary, Sixteenth Floor, One White Flint North, 11555 Rockville Pike, Rockville, Maryland, 20852, Attention: Rulemaking and Adjudications Staff. Participants filing a document in this manner are responsible for serving the document on all other participants. Filing is considered complete by first-class mail as of the time of deposit in the mail, or by courier, express mail, or expedited delivery service upon depositing the document with the provider of the service. A presiding officer, having granted an exemption request from using E-Filing, may require a participant or party to use E-Filing if the presiding officer subsequently determines that the reason for granting the exemption from use of E-Filing no longer exists.

Documents submitted in adjudicatory proceedings will appear in the NRC's electronic hearing docket which is available to the public at <http://ehd1.nrc.gov/ehd/>, unless excluded pursuant to an order of the Commission, or the presiding officer. Participants are requested not to include personal

privacy information, such as social security numbers, home addresses, or home phone numbers in their filings, unless an NRC regulation or other law requires submission of such information. However, in some instances, a petition will require including information on local residence in order to demonstrate a proximity assertion of interest in the proceeding. With respect to copyrighted works, except for limited excerpts that serve the purpose of the adjudicatory filings and would constitute a Fair Use application, participants are requested not to include copyrighted materials in their submission.

The Commission will issue a notice or order granting or denying a hearing request or intervention petition, designating the issues for any hearing that will be held and designating the Presiding Officer. A notice granting a hearing will be published in the **Federal Register** and served on the parties to the hearing.

For further details with respect to these license amendment applications, see the application for amendment, which is available for public inspection in ADAMS and at the NRC's PDR. For additional direction on accessing information related to this document, see the "Obtaining Information and Submitting Comments" section of this document.

Dominion Energy Kewanee, Inc. (DEK), Docket No. 50-305, Kewanee Power Station (KPS), Carlton, Wisconsin

Date of amendment request: September 14, 2015. A publicly available version is in ADAMS under Accession No. ML15261A238.

Description of amendment request: The amendment would revise the KPS Permanently Defueled Emergency Plan (PDEP) and the Permanently Defueled Emergency Action Levels (EAL) Bases Document. DEK requests revisions of the PDEP and the EAL Bases Document that reflect DEK's plan to transfer all spent fuel to the independent spent fuel storage installation (ISFSI).

Basis for proposed no significant hazards consideration determination: As required by 10 CFR 50.91(a), the licensee has provided its analysis of the issue of no significant hazards consideration, which is presented below:

1. Do the proposed changes involve a significant increase in the probability or consequences of an accident previously evaluated?

Response: No.

The proposed amendment would modify the KPS renewed facility operating license by revising the emergency plan and revising the

EAL scheme. KPS has permanently ceased operation and is permanently defueled. The proposed amendment is conditioned on all spent nuclear fuel being removed from wet storage in the spent fuel pool and placed in dry storage within the ISFSI. Occurrence of postulated accidents associated with spent fuel stored in a spent fuel pool is no longer credible in a spent fuel pool devoid of such fuel. The proposed amendment has no effect on plant systems, structures, and components (SSCs) and no effect on the capability of any plant SSC to perform its design function. The proposed amendment would not increase the likelihood of the malfunction of any plant SSC. The proposed amendment would have no effect on any of the previously evaluated accidents in the KPS Updated Safety Analysis Report (USAR).

Since KPS has permanently ceased operation, the generation of fission products has ceased and the remaining source term continues to decay. This continues to significantly reduce the consequences of previously postulated accidents.

Therefore, the proposed amendment does not involve a significant increase in the consequences of a previously evaluated accident.

2. Do the proposed changes create the possibility of a new or different kind of accident from any accident previously evaluated?

Response: No.

The proposed amendment constitutes a revision of the emergency planning function commensurate with the ongoing and anticipated reduction in radiological source term at KPS.

The proposed amendment does not involve a physical alteration of the plant. No new or different types of equipment will be installed and there are no physical modifications to existing equipment as a result of the proposed amendment.

Similarly, the proposed amendment would not physically change any SSCs involved in the mitigation of any postulated accidents. Thus, no new initiators or precursors of a new or different kind of accident are created. Furthermore, the proposed amendment does not create the possibility of a new failure mode associated with any equipment or personnel failures. The credible events for the ISFSI remain unchanged.

Therefore, the proposed amendment does not create the possibility of a new or different kind of accident from any previously evaluated.

3. Do the proposed changes involve a significant reduction in the margin of safety?

Response: No.

Because the 10 CFR part 50 license for KPS no longer authorizes operation of the reactor or emplacement or retention of fuel into the reactor vessel, as specified in 10 CFR 50.82(a)(2), the occurrence of postulated accidents associated with reactor operation is no longer credible. With all nuclear spent fuel pool transferred out of wet storage from the spent fuel pool and placed in dry storage within the ISFSI, a fuel handling accident is no longer credible. There are no longer credible events that would result in any releases beyond the site boundary exceeding the EPA PAG [Environmental Protection

Agency protective action guideline] exposure levels, as detailed in the EPA's "Protective Action Guide and Planning Guidance for Radiological Incidents," Draft for Interim Use and Public Comment dated March 2013 (PAG Manual).

The proposed amendment does not involve a change in the plant's design, configuration, or operation. The proposed amendment does not affect either the way in which the plant structures, systems, and components perform their safety function or their design margins. Because there is no change to the physical design of the plant, there is no change to any of these margins.

Therefore, the proposed changes do not involve a significant reduction in a margin of safety.

The NRC staff has reviewed the licensee's analysis and, based on this review, it appears that the three standards of 10 CFR 50.92(c) are satisfied. Therefore, the NRC staff proposes to determine that the amendment request involves no significant hazards consideration.

Attorney for licensee: Lillian M. Cuoco, Senior Counsel, Dominion Resource Services, Inc., 120 Tredegar Street, RS-2, Richmond, VA 23219.

NRC Branch Chief: Bruce A. Watson.

Dominion Energy Kewanee, Inc. (DEK), Docket No. 50-305, Kewanee Power Station (KPS), Carlton, Wisconsin

Date of amendment request: July 28, 2016. A publicly available version is in ADAMS under Accession No. ML16216A187.

Description of amendment request: The amendment would revise the KPS Updated Safety Analysis Report (USAR) Section 9.5.2.2.4, "Auxiliary Building Crane," to: (1) Add a description of a non-single failure proof intermediate lifting device that DEK intends to use during a specific spent fuel cask handling activity in the auxiliary building, and (2) incorporate a new load drop analysis applicable to the use of this intermediate lifting device. The amendment also includes (for information) a new Technical Requirements Manual section that governs the use of the non-single failure proof intermediate lifting device to ensure compliance with the required parameters in the load drop analysis.

Basis for proposed no significant hazards consideration determination: As required by 10 CFR 50.91(a), the licensee has provided its analysis of the issue of no significant hazards consideration, which is presented below:

1. Do the proposed changes involve a significant increase in the probability or consequences of an accident previously evaluated?

Response: No.

The probability of a heavy load drop onto fuel is unchanged by this amendment since the intermediate lift device is not used for handling loaded or unloaded spent fuel canisters in or around the spent fuel pool. Heavy load lifts in and around the spent fuel pool will continue to be performed per the current licensing basis.

The proposed amendment has no effect on the capability of any plant systems, structures, and components (SSCs) to perform their design functions. The spent fuel pool is unaffected by the proposed amendment. The design function of the auxiliary building crane is not changed. Other lifting devices and interfacing lifting points associated with spent fuel cask handling are designed in accordance with applicable NRC guidance pertaining to single failure proof lifting systems. Therefore, the proposed amendment would not increase the likelihood of the malfunction of any plant SSC. The proposed amendment would have no effect on any of the previously evaluated accidents in the KPS USAR.

Therefore, the proposed amendment does not involve a significant increase in the consequences of a previously evaluated accident.

2. Do the proposed changes create the possibility of a new or different kind of accident from any accident previously evaluated?

Response: No.

The proposed amendment does not affect cask handling activities in or around the KPS spent fuel pool. Drops of heavy loads will continue to be very improbable events. Use of a different type of equipment to lift spent fuel canisters does not involve any new or different kind of accident.

The proposed amendment does not involve a physical alteration of the plant. Similarly, the proposed amendment would not physically change any SSCs involved in the mitigation of any postulated accidents. The physical structure of the spent fuel canisters is not altered by this amendment.

The possibility of a heavy load drop onto fuel remains non-credible since the intermediate lift device is not used to handle spent fuel canisters in or around the spent fuel pool. Heavy load lifts in and around the spent fuel pool will continue to be performed per the current licensing basis. The proposed amendment does not impact safe shutdown equipment. The spent fuel pool, including its cooling and inventory makeup, is unaffected by the proposed amendment.

The current licensing basis (USAR Section 14.2.1) includes evaluations of the consequences of a fuel handling accident involving failure of fuel cladding. Postulation of a canister load drop creates the possibility of a new initiator of this previously evaluated accident (failure of fuel cladding) caused by the postulated non-mechanistic single failure of the intermediate lift device. The analysis concludes that the postulated drop of a canister loaded with fuel assemblies would not result in failure of canister integrity (and therefore there would be no radiological release). The consequences of a canister drop are bounded by the current licensing scenario of a fuel handling accident.

Therefore, the proposed amendment does not create the possibility of a new or different

kind of accident from any previously evaluated.

3. Do the proposed changes involve a significant reduction in the margin of safety?

Response: No.

Heavy load handling will continue to be conducted in accordance with NRC approved methods. Analysis of a postulated load drop of a loaded spent fuel canister demonstrates satisfactory outcomes.

The proposed amendment does not involve a change in the plant's design, configuration, or operation. The proposed amendment does not significantly affect either the way in which the plant structures, systems, and components perform their safety function or their design margins. Because there is no change to the physical design of the plant, there is likewise no significant change to any of these margins.

Therefore, the proposed changes do not involve a significant reduction in a margin of safety.

The NRC staff has reviewed the licensee's analysis and, based on this review, it appears that the three standards of 10 CFR 50.92(c) are satisfied. Therefore, the NRC staff proposes to determine that the amendment request involves no significant hazards consideration.

Attorney for licensee: Lillian M. Cuoco, Senior Counsel, Dominion Resource Services, Inc., 120 Tredegar Street, RS-2, Richmond, VA 23219.

NRC Branch Chief: Bruce A. Watson.

Duke Energy Florida, Inc. (DEF), et al., Docket No. 50-302, Crystal River Unit 3 Nuclear Generating Plant (CR-3), Citrus County, Florida

Date of amendment request: August 31, 2016. A publicly available version is in ADAMS under Accession No. ML16243A259.

Description of amendment request: The amendment would revise the Operating License and associated Permanently Defueled Technical Specifications (PDTS) to reflect removal of all CR-3 spent nuclear fuel from the spent fuel pools and its transfer to dry cask storage within the onsite Independent Spent Fuel Storage Installation (ISFSI).

Basis for proposed no significant hazards consideration determination: As required by 10 CFR 50.91(a), the licensee has provided its analysis of the issue of no significant hazards consideration, which is presented below:

1. Does the proposed amendment involve a significant increase in the probability or consequences of an accident previously evaluated?

Response: No.

The proposed amendment would modify the CR-3 facility operating license and PDTS by deleting the portions of the license and PDTS that are no longer applicable to a

facility with no spent nuclear fuel stored in the spent fuel pools, while modifying the remaining portions to correspond to all nuclear fuel stored within an ISFSI. This amendment will be implemented within 60 days following DEF's submittal of written notification to the NRC that all spent fuel assemblies have been transferred out of the spent fuel pools and placed in dry storage within the ISFSI.

The definition of safety-related structures, systems, and components (SSCs) in 10 CFR 50.2 states that safety-related SSCs are those relied on to remain functional during and following design basis events to assure:

1. The integrity of the reactor coolant boundary;
2. The capability to shutdown the reactor and maintain it in a safe shutdown condition; or
3. The capability to prevent or mitigate the consequences of accidents which could result in potential offsite exposures comparable to the applicable guideline exposures set forth in 10 CFR 50.43(a)(1) or 100.11.

The first two criteria (integrity of the reactor coolant pressure boundary and safe shutdown of the reactor) are not applicable to a plant in a permanently defueled condition. The third criterion is related to preventing or mitigating the consequences of accidents that could result in potential offsite exposures exceeding limits. However, after all nuclear spent fuel assemblies have been transferred to dry cask storage within an ISFSI, none of the SSCs at CR-3 are required to be relied on for accident mitigation. Therefore, none of the SSCs at CR-3 meet the definition of a safety-related SSC stated in 10 CFR 50.2. The proposed deletion of requirements in the PDTS does not affect systems credited in any accident analysis at CR-3.

Section 14 of the CR-3 Final Safety Analysis Report (FSAR) described the design basis accidents (DBAs) related to the spent fuel pools. These postulated accidents are predicated on spent fuel being stored in the spent fuel pools. With the removal of the spent fuel from the spent fuel pools, there are no remaining spent fuel assemblies to be monitored and there are no credible accidents that require the actions of a Certified Fuel Handler, Shift Manager, or a Non-certified Operator to prevent occurrence or mitigate the consequences of an accident.

The proposed changes do not have an adverse impact on the remaining decommissioning activities or any of their postulated consequences.

The proposed changes related to the relocation of certain administrative requirements do not affect operating procedures or administrative controls that have the function of preventing or mitigating any accidents applicable to the safe management of irradiated fuel or decommissioning of the facility.

Therefore, the proposed amendment does not involve a significant increase in the probability or consequences of an accident previously evaluated.

2. Does the proposed change create the possibility of a new or different kind of accident from any accident previously evaluated?

Response: No.

The proposed changes eliminate the operational requirements and certain design requirements associated with the storage of the spent fuel in the spent fuel pools, and relocate certain administrative controls to the Quality Assurance Program Description or other licensee controlled document.

After the removal of the spent fuel from the spent fuel pools and transfer to the ISFSI, there are no spent fuel assemblies that remain in the spent fuel pools. Coupled with a prohibition against storage of fuel in the spent fuel pools, the potential for fuel related accidents is removed. The proposed changes do not introduce any new failure modes.

Therefore, the proposed amendment does not create the possibility of a new or different kind of accident from any previously evaluated.

3. Does the proposed amendment involve a significant reduction in a margin of safety?

Response: No.

The removal of all spent nuclear fuel from the spent fuel pools into storage in casks within an ISFSI, coupled with a prohibition against future storage of fuel within the spent fuel pools, removes the potential for fuel related accidents.

The design basis and accident assumptions within the CR-3 FSAR and the PDTs relating to safe management and safety of spent fuel in the spent fuel pools are no longer applicable. The proposed changes do not affect remaining plant operations, systems, or components supporting decommissioning activities.

The requirements for systems, structures, and components (SSCs) that have been removed from the CR-3 PDTs are not credited in the existing accident analysis for any applicable postulated accident; and as such, do not contribute to the margin of safety associated with the accident analysis.

Therefore, the proposed amendment does not involve a significant reduction in a margin of safety.

The NRC staff has reviewed the licensee's analysis and, based on this review, it appears that the three standards of 10 CFR 50.92(c) are satisfied. Therefore, the NRC staff proposes to determine that the amendment request involves no significant hazards consideration.

Attorney for licensee: Lara S. Nichols, 550 South Tryon Street, Charlotte, NC 28202.

NRC Branch Chief: Bruce A. Watson.

Duke Energy Progress, LLC, Docket No. 50-400, Shearon Harris Nuclear Power Plant (HNP), Unit 1, Wake and Chatham Counties, North Carolina

Date of amendment request: June 29, 2016. A publicly-available version is in ADAMS under Accession No. ML16182A387.

Description of amendment request: The amendment would revise HNP Technical Specifications (TSs) to (1) delete the Gaseous Radwaste Treatment System definition from TSs, (2) relocate

Explosive Gas Mixture TS requirements and Liquid Holdup Tanks TS requirements to a licensee-controlled program in the Procedures and Programs TSs section, and (3) modify the Gas Storage Tank Radioactivity Monitoring Program TSs into an Explosive Gas and Storage Tank Radioactivity Monitoring Program to include controls for potentially explosive gas mixtures and the quantity of radioactivity contained in unprotected outdoor liquid storage tanks.

Basis for proposed no significant hazards consideration determination: As required by 10 CFR 50.91(a), the licensee has provided its analysis of the issue of no significant hazards consideration, which is presented below:

1. Does the proposed change involve a significant increase in the probability or consequences of an accident previously evaluated?

Response: No.

The proposed changes do not involve a significant increase in the probability or consequences of an accident previously evaluated. The proposed changes are administrative in nature and alter only the format and location of programmatic controls and procedural details relative to explosive gas monitoring and liquid holdup tanks. Existing TS containing procedural details are being relocated to licensee control. Compliance with applicable regulatory requirements will continue to be maintained. In addition, the proposed changes do not alter the conditions or assumptions in any of the previous accident analyses. Because the previous accident analyses remain bounding, the radiological consequences previously evaluated are not adversely affected by the proposed changes.

Therefore, the proposed changes do not involve a significant increase in the probability or consequences of an accident previously evaluated.

2. Does the proposed change create the possibility of a new or different kind of accident from any previously evaluated?

Response: No.

The proposed changes do not create the possibility of a new or different kind of accident from any accident previously evaluated. The proposed changes do not involve any change to the configuration or method of operation of any plant equipment. Accordingly, no new failure modes have been defined for any plant system or component important to safety nor has any new limiting single failure been identified as a result of the proposed changes. Also, there will be no change in types or increase in the amounts of any effluents released offsite.

Therefore, the proposed changes do not create the possibility of a new or different kind of accident from any accident previously evaluated.

3. Does the proposed change involve a significant reduction in a margin of safety?

Response: No.

The proposed changes do not involve a significant reduction in a margin of safety and are considered administrative in nature. The proposed changes do not involve any actual change in the methodology used in the monitoring of explosive gas mixtures contained in the Gaseous Waste Processing System. HNP does not currently utilize unprotected outdoor liquid storage tanks; therefore, there are no associated methodology changes with this request. These changes provide for the relocation of procedural details outside of the technical specifications with the addition of appropriate administrative controls to provide continued assurance of compliance to applicable regulatory requirements. Therefore, the proposed changes do not involve a significant reduction in a margin of safety.

The NRC staff has reviewed the licensee's analysis and, based on this review, it appears that the three standards of 10 CFR 50.92(c) are satisfied. Therefore, the NRC staff proposes to determine that the amendment request involves no significant hazards consideration.

Attorney for licensee: Lara Nichols, Deputy General Counsel, Duke Energy Corporation, 550 South Tryon St., M/C DEC45A, Charlotte, NC 28202.

NRC Acting Branch Chief: Jeanne A. Dion.

Energy Northwest, Docket No. 50-397, Columbia Generating Station, Benton County, Washington

Date of amendment request: July 12, 2016. A publicly-available version is in ADAMS under Accession No. ML16194A515.

Description of amendment request: The amendment would reduce the minimum reactor dome pressure associated with the critical power correlation from 785 pounds per square inch gauge (psig) to 685 psig in Technical Specification (TS) 2.1.1, "Reactor Core SLs [Safety Limits]," and associated bases.

Basis for proposed no significant hazards consideration determination: As required by 10 CFR 50.91(a), the licensee has provided its analysis of the issue of no significant hazards consideration, which is presented below:

1. Does the proposed change involve a significant increase in the probability or consequences of an accident previously evaluated?

Response: No.

The change does not involve a modification of any plant hardware; the probability and consequence of the Pressure Regulator Failure Open (PRFO) transient are essentially unchanged. The reduction in the reactor dome pressure safety limit (SL) from 785 psig to 685 psig provides greater margin to accommodate the pressure reduction

during the transient within the revised TS limit.

The proposed change will continue to support the validity range for the correlations and the calculation of Minimum Core Power Ratio (MCPR) as approved. The proposed TS revision involves no significant changes to the operation of any systems or components in normal, accident or transient operating conditions.

Therefore, the proposed change does not involve a significant increase in the probability or consequences of an accident previously evaluated.

2. Does the proposed change create the possibility of a new or different kind of accident from any previously evaluated?

Response: No.

The proposed reduction in the reactor dome pressure SL from 785 psig to 685 psig is a change based upon previously approved documents and does not involve changes to the plant hardware or its operating characteristics. As a result, no new failure modes are being introduced.

Therefore, the change does not introduce a new or different kind of accident from those previously evaluated.

3. Does the proposed change involve a significant reduction in a margin of safety?

Response: No.

The margin of safety is established through the design of the plant structures, systems, and components, and through the parameters for safe operation and setpoints for the actuation of equipment relied upon to respond to transients and design basis accidents. The proposed change in reactor dome pressure enhances the safety margin, which protects the fuel cladding integrity during a depressurization transient, but does not change the requirements governing operation or availability of safety equipment assumed to operate to preserve the margin of safety. The change does not alter the behavior of plant equipment, which remains unchanged. The available pressure range is expanded by the change, thus offering greater margin for pressure reduction during the transient.

Therefore, the proposed change does not involve a significant reduction in the margin of safety.

The NRC staff has reviewed the licensee's analysis and, based on this review, it appears that the three standards of 10 CFR 50.92(c) are satisfied. Therefore, the NRC staff proposes to determine that the amendment request involves no significant hazards consideration.

Attorney for licensee: William A. Horin, Esq., Winston & Strawn, 1700 K Street NW., Washington, DC 20006–3817.

NRC Branch Chief: Robert J. Pascarelli.

Entergy Nuclear Operations, Inc. (ENO), Docket No. 50–333, James A. FitzPatrick Nuclear Power Plant (JAF), Oswego County, New York

Date of amendment request: January 15, 2016, as supplemented by letters

dated June 3, 2016, and September 19, 2016. Publicly available versions are available in ADAMS under Accession Nos. ML16015A456, ML16155A326, and ML16263A237, respectively.

Description of amendment request:

The licensee has provided a formal notification to the NRC of the intention to permanently cease power operations of JAF at the end of the current operating cycle. Once certifications for permanent cessation of operation and permanent removal of fuel from the reactor are submitted to the NRC, certain staffing and training Technical Specifications (TSs) administrative controls will no longer be applicable or appropriate for the permanently defueled condition. Therefore, ENO is requesting approval of changes to the staffing and training requirements in Section 5.0, “Administrative Controls,” of the JAF TSs. Specifically, the amendment would revise and remove certain requirements in TS Sections 5.1, “Responsibility”; 5.2, “Organization”; and 5.3, “Plant Staff Qualifications,” and add additional definitions to TS Section 1.1, “Definitions.” The proposed amendment would not be effective until the certification of permanent cessation of operation and certification of permanent removal of fuel from the reactor vessel are submitted to the NRC.

The license amendment request was originally noticed in the **Federal Register** on March 1, 2016 (81 FR 10678). The notice is being reissued in its entirety to include the revised scope and description of the amendment request.

Basis for proposed no significant hazards consideration determination:

As required by 10 CFR 50.91(a), the licensee has provided its analysis of the issue of no significant hazards consideration, with NRC staff revisions provided in [brackets], which is presented below:

1. Does the proposed amendment involve a significant increase in the probability or consequences of an accident previously evaluated?

Response: No.

The proposed amendment would not take effect until JAF has permanently ceased operation and entered a permanently defueled condition. The proposed amendment would modify the JAF TS by deleting the portions of the TS that are no longer applicable to a permanently defueled facility, while modifying the other sections to correspond to the permanently defueled condition.

The deletion and modification of provisions of the administrative controls do not directly affect the design of structures, systems, and components (SSCs) necessary for safe storage of irradiated fuel or the

methods used for handling and storage of such fuel in the fuel pool. The changes to the administrative controls are administrative in nature and do not affect any accidents applicable to the safe management of irradiated fuel or the permanently shutdown and defueled condition of the reactor.

In a permanently defueled condition, the only credible accident is the fuel handling accident.

The probability of occurrence of previously evaluated accidents is not increased, since extended operation in a defueled condition will be the only operation allowed, and therefore bounded by the existing analyses. Additionally, the occurrence of postulated accidents associated with reactor operation is no longer credible in a permanently defueled reactor. This significantly reduces the scope of applicable accidents.

Therefore, the proposed amendment does not involve a significant increase in the probability or consequences of an accident previously evaluated.

2. Does the proposed amendment create the possibility of a new or different kind of accident from any accident previously evaluated?

Response: No.

The proposed changes have no impact on facility SSCs affecting the safe storage of irradiated fuel, or on the methods of operation of such SSCs, or on the handling and storage of irradiated fuel itself. The administrative removal of or modifications of the TS that are related only to administration of facility cannot result in different or more adverse failure modes or accidents than previously evaluated because the reactor will be permanently shutdown and defueled and JAF will no longer be authorized to operate the reactor.

The proposed deletion of requirements of the JAF TS do not affect systems credited in the accident analysis for the fuel handling accident at JAF. The proposed TS will continue to require proper control and monitoring of safety significant parameters and activities.

The proposed amendment does not result in any new mechanisms that could initiate damage to the remaining relevant safety barriers for defueled plants (fuel cladding and spent fuel cooling). Since extended operation in a defueled condition will be the only operation allowed, and therefore bounded by the existing analyses, such a condition does not create the possibility of a new or different kind of accident.

Therefore, the proposed change does not create the possibility of a new or different kind of accident from any previously evaluated.

3. Does the proposed amendment involve a significant reduction in a margin of safety?

Response: No.

Because the 10 CFR part 50 license for JAF will no longer authorize operation of the reactor or emplacement or retention of fuel into the reactor vessel once the certifications required by 10 CFR 50.82(a)(1) are submitted, as specified in 10 CFR 50.82(a)(2), the occurrence of postulated accidents associated with reactor operation is no longer credible. The only remaining credible accident is a fuel handling accident (FHA). The proposed

amendment does not adversely affect the inputs or assumptions of any of the design basis analyses that impact the FHA.

The proposed changes are limited to those portions of the OL [operating license] and TS that are not related to the safe storage of irradiated fuel. The requirements that are proposed to be revised or deleted from the JAF OL and TS are not credited in the existing accident analysis for the remaining applicable as such, do not contribute to the margin of safety associated with the accident analysis. Postulated DBAs [design-basis accidents] involving the reactor are no longer possible because the reactor will be permanently shutdown and defueled and JAF will no longer be authorized to operate the reactor.

Therefore, the proposed change does not involve a significant reduction in a margin of safety.

The NRC staff has reviewed the licensee's analysis and, based on this review, it appears that the three standards of 10 CFR 50.92(c) are satisfied. Therefore, the NRC staff proposes to determine that the amendment request involves no significant hazards consideration.

Attorney for licensee: Ms. Jeanne Cho, Assistant General Counsel, Entergy Nuclear Operations, Inc., 440 Hamilton Avenue, White Plains, NY 10601.

NRC Branch Chief: Travis L. Tate.

Exelon Generation Company, LLC, Docket Nos. 50-352 and 50-353, Limerick Generating Station, Units 1 and 2, Montgomery County, Pennsylvania

Date of amendment request: July 26, 2016. A publicly-available version is in ADAMS under Accession No. ML16210A227.

Description of amendment request: The amendments would revise technical specification (TS) requirements relating to: (1) The inservice inspection (ISI) program required by the American Society of Mechanical Engineers (ASME) Boiler and Pressure Code (Code), and (2) the inservice testing (IST) program required by the ASME Code for Operation and Maintenance of Nuclear Power Plants (OM Code). The proposed changes are based, in part, on Technical Specifications Task Force (TSTF) Traveler TSTF-545, Revision 3, "TS Inservice Testing Program Removal & Clarify SR Usage Rule Application to Section 5.5 Testing."

Basis for proposed no significant hazards consideration determination: As required by 10 CFR 50.91(a), the licensee has provided its analysis of the issue of no significant hazards consideration, which is presented below with NRC staff edits in square brackets:

1. Does the proposed amendment involve a significant increase in the probability or

consequences of an accident previously evaluated?

Response: No.

The proposed change revises TS 4.0.5, Surveillance Requirements for inservice inspection and testing of ASME Code Class 1, 2 & 3 components, by revising the Inservice Testing Program and Inservice Inspection Program specification.

Most requirements in the IST Program are removed, as they are duplicative of requirements in the ASME OM Code, as clarified by Code Case OMN-20, "Inservice Test Frequency." The remaining requirements in the TS Section 4.0.5, IST Program are eliminated because the NRC has determined their inclusion in the TS is contrary to regulations. A new defined term, "Inservice Testing Program," is added to the TS, which references the requirements of 10 CFR 50.55a(f).

Similarly, the requirements in the ISI Program are revised, as they are [] duplicative of requirements in Section XI of the ASME Boiler and Pressure Vessel Code and applicable Addenda.

Performance of inservice testing or inservice inspection is not an initiator to any accident previously evaluated. As a result, the probability of occurrence of an accident is not significantly affected by the proposed change. Inservice test frequencies under Code Case OMN-20 are equivalent to the current testing period allowed by the TS with the exception that testing frequencies greater than two years may be extended by up to six months to facilitate test scheduling and consideration of plant operating conditions that may not be suitable for performance of the required testing. The testing frequency extension will not affect the ability of the components to mitigate any accident previously evaluated as the components are required to be operable during the testing period extension. Performance of inservice tests utilizing the allowances in OMN-20 will not significantly affect the reliability of the tested components. As a result, the availability of the affected components, as well as their ability to mitigate the consequences of accidents previously evaluated, is not affected.

Therefore, the proposed change does not involve a significant increase in the probability or consequences of an accident previously evaluated.

2. Does the proposed amendment create the possibility of a new or different kind of accident from any accident previously evaluated?

Response: No.

The proposed change does not alter the design or configuration of the plant. The proposed change does not involve a physical alteration of the plant; no new or different kind of equipment will be installed. The proposed change does not alter the types of inservice testing or inservice inspection performed. In most cases, the frequency of inservice testing and inservice inspection is unchanged. However, the frequency of testing or inspection would not result in a new or different kind of accident from any previously evaluated since the testing methods are not altered.

Therefore, the proposed change does not create the possibility of a new or different

kind of accident from any previously evaluated.

3. Does the proposed amendment involve a significant reduction in a margin of safety?

Response: No.

The proposed change eliminates some provisions from the TS in lieu of provisions in the ASME Code, as modified by use of Code Case OMN-20 (IST) or ASME Boiler and Pressure Vessel Code (ISI). Compliance with the ASME Code is required by 10 CFR 50.55a. The proposed change also allows inservice tests with frequencies greater than two years to be extended by six months to facilitate test scheduling and consideration of plant operating conditions that may not be suitable for performance of the required testing. The testing frequency extension will not affect the ability of the components to respond to an accident as the components are required to be operable during the testing period extension. The proposed change will eliminate the existing TS SR 4.0.2 allowance to perform a specified surveillance time interval with a maximum allowable extension not to exceed 25% of the surveillance interval, unless there is a specific SR referencing usage of the INSERVICE TESTING PROGRAM and TS SR 4.0.3 allowance to defer performance of missed inservice tests up to the duration of the specified testing frequency, and instead will require an assessment of the missed test on equipment operability. This assessment will consider the effect on a margin of safety (equipment operability). Should the component be inoperable, the Technical Specifications provide actions to ensure that the margin of safety is protected. The proposed change also eliminates a statement that nothing in the ASME Code should be construed to supersede the requirements of any TS. However, elimination of the statement will have no effect on plant operation or safety.

Therefore, the proposed change does not involve a significant reduction in a margin of safety.

The NRC staff has reviewed the licensee's analysis and, based on this review, it appears that the three standards of 10 CFR 50.92(c) are satisfied. Therefore, the NRC staff proposes to determine that the amendment request involves no significant hazards consideration.

Attorney for licensee: Tamra Domeyer, Associate General Counsel, Exelon Generation Company, LLC, 4300 Winfield Road, Warrenville, IL 60555.

NRC Branch Chief: Douglas A. Broadus.

Exelon Generation Company, LLC, Docket No. 50-289, Three Mile Island Nuclear Station, Unit 1 (TMI-1), Dauphin County, Pennsylvania

Date of amendment request: July 15, 2016. A publicly-available version is in ADAMS under Package Accession No. ML16201A306.

Description of amendment request: The amendment would revise the

Radiological Emergency Plan Annex for TMI-1. The proposed changes would decrease the radiation protection technician staffing from three to two technicians, remove two maintenance technicians currently assigned to the repair and corrective action function, and eliminate the on-shift Operations Support Center director position.

Basis for proposed no significant hazards consideration determination: As required by 10 CFR 50.91(a), the licensee has provided its analysis of the issue of no significant hazards consideration, which is presented below:

1. Does the proposed amendment involve a significant increase in the probability or consequences of an accident previously evaluated?

Response: No.

The proposed changes to the TMI Emergency Plan do not increase the probability or consequences of an accident. The proposed changes do not impact the function of plant Structures, Systems, or Components (SSCs). The proposed changes do not affect accident initiators or accident precursors, nor do the changes alter design assumptions. The proposed changes do not alter or prevent the ability of the onsite ERO [emergency response organization] to perform their intended functions to mitigate the consequences of an accident or event. The proposed changes remove onsite ERO positions no longer credited or considered necessary in support of Emergency Plan implementation.

Therefore, the proposed changes to the Emergency Plan do not involve a significant increase in the probability or consequences of an accident previously evaluated.

2. Does the proposed amendment create the possibility of a new or different kind of accident from any previously evaluated?

Response: No.

The proposed changes have no impact on the design, function, or operation of any plant SSCs. The proposed changes do not affect plant equipment or accident analyses. The proposed changes do not involve a physical alteration of the plant (*i.e.*, no new or different type of equipment will be installed), a change in the method of plant operation, or new operator actions. The proposed changes do not introduce failure modes that could result in a new accident, and the proposed changes do not alter assumptions made in the safety analysis. The proposed changes remove onsite ERO positions no longer credited or considered necessary in support of Emergency Plan implementation.

Therefore, the proposed changes to the Emergency Plan do not create the possibility of a new or different kind of accident from any accident previously evaluated.

3. Does the proposed amendment involve a significant reduction in a margin of safety?

Response: No.

Margin of safety is associated with confidence in the ability of the fission product barriers (*i.e.*, fuel cladding, reactor coolant system pressure boundary, and

containment structure) to limit the level of radiation dose to the public.

The proposed changes do not adversely affect existing plant safety margins or the reliability of the equipment assumed to operate in the safety analyses. There are no changes being made to safety analysis assumptions, safety limits, or limiting safety system settings that would adversely affect plant safety as a result of the proposed changes. Margins of safety are unaffected by the proposed changes to the ERO minimum on-shift staffing.

The proposed changes are associated with the Emergency Plan staffing and do not impact operation of the plant or its response to transients or accidents. The proposed changes do not affect the Technical Specifications. The proposed changes do not involve a change in the method of plant operation, and no accident analyses will be affected by the proposed changes. Safety analysis acceptance criteria are not affected by these proposed changes. The proposed changes to the Emergency Plan will continue to provide the necessary onsite ERO response staff.

Therefore, the proposed changes to the Emergency Plan do not involve a significant reduction in a margin of safety.

The NRC staff has reviewed the licensee's analysis and, based on this review, it appears that the three standards of 10 CFR 50.92(c) are satisfied. Therefore, the NRC staff proposes to determine that the amendment request involves no significant hazards consideration.

Attorney for licensee: Tamra Domeyer, Associate General Counsel, Exelon Generation Company, LLC, 4300 Winfield Road, Warrenville, IL 60555.

NRC Branch Chief: Douglas A. Broadus.

Northern States Power Company—Minnesota, Docket Nos. 50–282 and 50–306, Prairie Island Nuclear Generating Plant, Units 1 and 2, Goodhue County, Minnesota

Date of amendment request: August 31, 2016. A publicly-available version is in ADAMS under Accession No. ML16244A493.

Brief description of amendment request: The amendments would revise the Required Actions and associated Completion Times to Technical Specification (TS) 3.8.7, “Inverters—Operating.” Specifically, Condition B would be deleted and current Condition C would be re-lettered to Condition B. Additionally, the Required Actions and associated Completion Times for Condition A would be modified to require restoration of one inoperable inverter to operability within 24 hours. These changes conform to Improved Standard Technical Specification TS 3.8.7.

Basis for proposed no significant hazards consideration determination:

As required by 10 CFR 50.91(a), the licensee has provided its analysis of the issue of no significant hazards consideration, which is presented below:

1. Does the proposed change involve a significant increase in the probability or consequences of an accident previously evaluated?

Response: No.

The proposed change revises the TS for the purpose of eliminating a non-conservative Required Action. The proposed TS change does not introduce new equipment or new equipment operating modes, nor does the proposed change alter existing system relationships. The proposed change does not affect normal plant operation. Further, the proposed change does not increase the likelihood of the malfunction of any SSC [structure, system and component] or impact any analyzed accident. Consequently, the probability of an accident previously evaluated is not affected and there is no significant increase in the consequences of any accident previously evaluated.

Therefore, the proposed change does not involve a significant increase in the probability or consequences of an accident previously evaluated.

2. Does the proposed change create the possibility of a new or different kind of accident from any accident previously evaluated?

Response: No.

The proposed change revises the TS for the purpose of eliminating a non-conservative Required Action. The change does not involve a physical alteration of the plant (*i.e.*, no new or different type of equipment will be installed) or a change in the methods governing normal plant operations. The proposed change does not alter assumptions made in the safety analysis. Further, the proposed change does not introduce new accident initiators.

Therefore, the proposed change does not create the possibility of a new or different kind of accident from any accident previously evaluated.

3. Does the proposed change involve a significant reduction a margin of safety?

Response: No.

The proposed change revises the TS for the purpose of eliminating a non-conservative Required Action. The proposed change does not alter the manner in which safety limits, limiting safety system settings, or limiting conditions for operation are determined. The safety analysis assumptions and acceptance criteria are not affected by this change.

Therefore, the proposed change does not involve a significant reduction in a margin of safety.

The NRC staff has reviewed the licensee's analysis and, based on this review, it appears that the three standards of 10 CFR 50.92(c) are satisfied. Therefore, the NRC staff proposes to determine that the amendment requests involve no significant hazards consideration.

Attorney for licensee: Peter M. Glass, Assistant General Counsel, Xcel Energy

Services, Inc., 414 Nicollet Mall,
Minneapolis, MN 55401.

NRC Branch Chief: David J. Wrona.

*PSEG Nuclear LLC, Docket No. 50–354,
Hope Creek Generating Station, Salem
County, New Jersey*

Date of amendment request: July 20,
2016. A publicly-available version is in
ADAMS under Accession No.
ML16203A006.

Description of amendment request:
The amendment would revise the Hope
Creek Generating Station (Hope Creek)
Technical Specifications (TS), Section
6.8.4.i, “Inservice Testing Program,” to
remove requirements duplicated in the
American Society of Mechanical
Engineers (ASME) Code for Operations
and Maintenance of Nuclear Power
Plants Case OMN–20, “Inservice Test
Frequency.” A new defined term,
“Inservice Testing Program,” will be
added to the TS 1.0, “Definitions,”
section. The licensee stated that the
proposed change to the TS is consistent
with Technical Specifications Task
Force (TSTF) Traveler TSTF–545,
Revision 3, “TS Inservice Testing
Program Removal & Clarity SR Usage
Rule Application to Section 5.5 Testing”
(ADAMS Accession No. ML15294A555),
with no proposed variations or
deviations. However, the Hope Creek TS
uses different numbering for
surveillance requirements than the
Standard Technical Specifications on
which TSTF–545 was based, so the
licensee changed the TSTF–545
numbering to be consistent with the
Hope Creek TS numbering.

*Basis for proposed no significant
hazards consideration determination:*
As required by 10 CFR 50.91(a), the
licensee has provided its analysis of the
issue of no significant hazards
consideration, which is presented below
with NRC staff edits in square brackets:

1. Does the proposed change involve a
significant increase in the probability or
consequences of an accident previously
evaluated?

Response: No.

The proposed change revises TS Chapter 6,
“Administrative Controls,” Section 6.8,
“Procedures and Programs,” by eliminating
the “Inservice Testing Program”
specification. Most requirements in the
Inservice Testing Program are removed, as
they are duplicative of requirements in the
ASME OM Code, as clarified by Code Case
OMN–20, “Inservice Test Frequency.” The
remaining requirements in the Section 6.8
IST Program are eliminated [. . .]. A new
defined term, “Inservice Testing Program,” is
added to the TS, which references the
requirements of 10 CFR 50.55a(f).

Performance of inservice testing is not an
initiator to any accident previously
evaluated. As a result, the probability of
occurrence of an accident is not significantly

affected by the proposed change. Inservice
test frequencies under Code Case OMN–20
are equivalent to the current testing period
allowed by the TS with the exception that
testing frequencies greater than 2 years may
be extended by up to 6 months to facilitate
test scheduling and consideration of plant
operating conditions that may not be suitable
for performance of the required testing. The
testing frequency extension will not affect the
ability of the components to mitigate any
accident previously evaluated as the
components are required to be operable
during the testing period extension. Performance
of inservice tests utilizing the
allowances in OMN–20 will not significantly
affect the reliability of the tested
components. As a result, the availability of
the affected components, as well as their
ability to mitigate the consequences of
accidents previously evaluated, is not
affected.

Therefore, the proposed change does not
involve a significant increase in the
probability or consequences of an accident
previously evaluated.

2. Does the proposed change create the
possibility of a new or different kind of
accident from any accident previously
evaluated?

Response: No.

The proposed change does not alter the
design or configuration of the plant. The
proposed change does not involve a physical
alteration of the plant; no new or different
kind of equipment will be installed. The
proposed change does not alter the types of
inservice testing performed. In most cases,
the frequency of inservice testing is
unchanged. However, the frequency of
testing would not result in a new or different
kind of accident from any previously
evaluated since the testing methods are not
altered.

Therefore, the proposed change does not
create the possibility of a new or different
kind of accident from any previously
evaluated.

3. Does the proposed change involve a
significant reduction in a margin of safety?

Response: No.

The proposed change eliminates some
requirements from the TS in lieu of
requirements in the ASME Code, as modified
by use of Code Case OMN–20. Compliance
with the ASME Code is required by 10 CFR
50.55a. The proposed change also allows
inservice tests with frequencies greater than
2 years to be extended by 6 months to
facilitate test scheduling and consideration of
plant operating conditions that may not be
suitable for performance of the required
testing. The testing frequency extension will
not affect the ability of the components to
respond to an accident as the components are
required to be operable during the testing
period extension. The proposed change will
eliminate the existing TS 4.0.3 allowance to
defer performance of missed inservice tests
up to the duration of the specified testing
frequency, and instead will require an
assessment of the missed test on equipment
operability. This assessment will consider
the effect on a margin of safety (equipment
operability). Should the component be
inoperable, the TS provide actions to ensure

that the margin of safety is protected. The
proposed change also eliminates a statement
that nothing in the ASME Code should be
construed to supersede the requirements of
any TS. [. . .] However, elimination of the
statement will have no effect on plant
operation or safety.

Therefore, the proposed change does not
involve a significant reduction in a margin of
safety.

The NRC staff has reviewed the
licensee’s analysis and, based on this
review, it appears that the three
standards of 10 CFR 50.92(c) are
satisfied. Therefore, the NRC staff
proposes to determine that the
amendment request involves no
significant hazards consideration.

Attorney for licensee: Jeffrie J. Keenan,
PSEG Nuclear LLC—N21, P.O. Box 236,
Hancocks Bridge, NJ 08038.

NRC Branch Chief: Douglas A.
Broadus.

*South Carolina Electric & Gas Company
and South Carolina Public Service
Authority, Docket Nos. 52–027 and 52–
028, Virgil C. Summer Nuclear Station,
Units 2 and 3, Fairfield, South Carolina*

Date of amendment request:
September 15, 2016. A publicly-
available version is in ADAMS under
Accession No. ML16259A310.

Description of amendment request:
The amendments would revise
Combined License Nos. NPF–93 and
NPF–94 for the Virgil C. Summer
Nuclear Station, Units 2 and 3. The
amendments propose changes to the
Updated Final Safety Analysis Report
(UFSAR) in the form of departures from
the incorporated plant-specific Design
Control Document Tier 2* information.
Specifically, the proposed changes
would revise the Combined Licenses to
clarify information in WCAP–17179,
“AP1000® Component Interface Module
Technical Report,” which demonstrates
design compliance with licensing bases
requirements. WCAP–17179 is
incorporated by reference into the
UFSAR to provide additional details
regarding the component interface
module (CIM) system design. The
requested amendments also propose a
change to the CIM internal power
supply that will enable proper
functioning of the field programmable
gate arrays.

*Basis for proposed no significant
hazards consideration determination:*
As required by 10 CFR 50.91(a), the
licensee has provided its analysis of the
issue of no significant hazards
consideration, which is presented
below:

1. Does the proposed amendment involve
a significant increase in the probability or
consequences of an accident previously
evaluated?

Response: No.

The proposed change to the CIM internal power supply enables the field programmable gate array (FPGA) to function properly. The proposed change to the FPGA core power has no adverse effect on the operation of the output actuation relays. The function of the internal power supply has no input to plant safety analysis. The change to the CIM internal power supply has a negligible effect on the 24 Vdc [volts direct current] supplies and ultimately the plant electrical system load and has no adverse effect on the CIM functionality.

The proposed changes to clarify how licensing basis design documentation reflects compliance with license basis requirements, and the proposed change to the ownership of safety remote node controller (SRNC) and CIM intellectual property, are not technical changes. The proposed changes do not affect any accident initiator in the UFSAR, or affect the radioactive material releases in the UFSAR accident analyses. The proposed change does not alter the ability of the facility to prevent and mitigate abnormal events, e.g., accidents, anticipated operational occurrences, earthquakes, floods and turbine missiles, or their safety or design analyses. No safety-related structure, system, or component (SSC) or function is adversely affected. The change does not involve or interface with any SSC accident initiator or initiating sequence of events, and thus, the probabilities of the accidents evaluated in the UFSAR are not affected. This activity does not involve a new fission product release path, nor a new fission product barrier failure mode, nor create a new sequence of events that would result in significant fuel cladding failures. Because the proposed changes do not change any safety-related SSC or function credited in the mitigation of an accident, the consequences of the accidents evaluated in the UFSAR are not affected.

Therefore, the requested amendment does not involve a significant increase in the probability or consequences of an accident previously evaluated.

2. Does the proposed amendment create the possibility of a new or different kind of accident from any accident previously evaluated?

Response: No.

The proposed change to the CIM internal power supply enables the FPGA to function properly and does not involve accident initiators. The change to the CIM internal power supply has a negligible effect on the 24 Vdc supplies and ultimately the plant electrical system load and has no adverse effect on CIM functionality.

The proposed clarified descriptions and the proposed change to the ownership of SRNC and CIM intellectual property are not technical changes. The proposed changes do not affect other plant equipment or adversely affect the design of the CIM. Therefore, the proposed changes do not affect any safety-related equipment itself, nor do they affect equipment whose failure could initiate an accident or a failure of a fission product barrier. No analysis is adversely affected by the proposed changes. No system or design function or equipment qualification would be adversely affected by the proposed changes.

Furthermore, the proposed changes do not result in a new failure mode, malfunction or sequence of events that could affect safety or safety-related equipment.

Therefore, the proposed amendment does not create the possibility of a new or different kind of accident from any accident previously evaluated.

3. Does the proposed amendment involve a significant reduction in a margin of safety? Response: No.

The proposed change to the CIM internal power supply enables the FPGA to function properly. The function of the internal power supply has no input to plant safety analysis. The change to the CIM internal power supplies has a negligible effect on the 24 Vdc supplies and ultimately the plant electrical system load and has no adverse effect on the CIM functionality.

The proposed clarified descriptions and the proposed change to the ownership of SRNC and CIM intellectual property are not technical changes. The proposed changes do not adversely affect the design, construction, or operation of any plant SSCs, including any equipment whose failure could initiate an accident or a failure of a fission product barrier. No analysis is adversely affected by the proposed changes. Furthermore, no system function, design function, or equipment qualification will be adversely affected by the changes. No safety analysis or design basis acceptance limit/criterion is challenged or exceeded by the proposed changes, thus no margin of safety is reduced.

Therefore, the proposed amendment does not involve a significant reduction in a margin of safety.

The NRC staff has reviewed the licensee's analysis and, based on this review, it appears that the three standards of 10 CFR 50.92(c) are satisfied. Therefore, the NRC staff proposes to determine that the amendment request involves no significant hazards consideration.

Attorney for licensee: Ms. Kathryn M. Sutton, Morgan, Lewis & Bockius, LLC, 1111 Pennsylvania Ave. NW., Washington, DC 20004-2514.
NRC Branch Chief: Michael T. Markley.

South Carolina Electric & Gas Company, Inc., Docket Nos. 52-027 and 52-028, Virgil C. Summer Nuclear Station Units 2 and 3, Fairfield, South Carolina

Date of amendment request: September 28, 2016. A publicly-available version is in ADAMS under Accession No. ML16272A373.

Description of amendment request: The amendment request proposes changes to revise plant-specific Tier 1, plant-specific Tier 2, and Combined License (COL) Appendix C information concerning the details of the Class 1E direct current and uninterruptible power supply system (IDS), specifically adding seven Class 1E fuse panels to the IDS design. These proposed changes

provide electrical isolation between the non-Class 1E IDS battery monitors and their respective Class 1E battery banks. Because, this proposed change requires a departure from Tier 1 information in the Westinghouse Electric Company's AP1000 Design Control Document (DCD), the licensee also requested an exemption from the requirements of the Generic DCD Tier 1 in accordance with 10 CFR 52.63(b)(1).

Basis for proposed no significant hazards consideration determination: As required by 10 CFR 50.91(a), the licensee has provided its analysis of the issue of no significant hazards consideration, which is presented below with NRC staff edits in square brackets:

1. Does the proposed amendment involve a significant increase in the probability or consequences of an accident previously evaluated?

Response: No.

The proposed changes to revise plant-specific Tier 1, COL Appendix C, and [Updated Final Safety Analysis Report (UFSAR)] information concerning details of the IDS, specifically the addition of seven Class 1E fuse isolation panels at the interconnection of the non-Class 1E IDS battery monitors and Class 1E IDS circuits, are necessary to conform to Regulatory Guide 1.75 Rev. 2 (consistent with UFSAR Appendix 1A exceptions) and IEEE 384-1981 to prevent a fault on non-Class 1E circuits or equipment from degrading the operation of Class 1E IDS circuits and equipment below an acceptable level. The proposed changes do not adversely affect the design functions of the IDS, including the Class 1E battery banks and the battery monitors.

These proposed changes to revise plant-specific Tier 1, COL Appendix C, and UFSAR information concerning details of the IDS, specifically the addition of seven Class 1E fuse isolation panels at the interconnection of the non-Class 1E IDS battery monitors and Class 1E IDS circuits as described in the current licensing basis do not have an adverse effect on any of the design functions of any plant systems. The proposed changes do not adversely affect any plant electrical system and do not affect the support, design, or operation of mechanical and fluid systems required to mitigate the consequences of an accident. There is no change to plant systems or the response of systems to postulated accident conditions. There is no change to the predicted radioactive releases due to postulated accident conditions. The plant response to previously evaluated accidents or external events is not adversely affected, nor do the proposed changes create any new accident precursors.

Therefore, the requested amendment does not involve a significant increase in the probability or consequences of an accident previously evaluated.

2. Does the proposed amendment create the possibility of a new or different kind of accident from any accident previously evaluated?

Response: No.

The proposed changes to revise plant-specific Tier 1, COL Appendix C, and UFSAR information concerning details of the IDS, specifically the addition of seven Class 1E fuse isolation panels at the interconnection of the non-Class 1E IDS battery monitors and Class 1E IDS circuits, are necessary to conform to Regulatory Guide 1.75 Rev. 2 (consistent with UFSAR Appendix 1A exceptions) and IEEE 384–1981 to prevent a fault on non-Class 1E circuits or equipment from degrading the operation of Class 1E IDS circuits and equipment below an acceptable level. The proposed changes do not adversely affect any plant electrical system and do not adversely affect the design function, support, design, or operation of mechanical and fluid systems. The proposed changes do not result in a new failure mechanism or introduce any new accident precursors. No design function described in the UFSAR is adversely affected by the proposed changes.

Therefore, the proposed amendment does not create the possibility of a new or different kind of accident from any accident previously evaluated.

3. Does the proposed amendment involve a significant reduction in a margin of safety?

Response: No.

There is no safety-related [structure, system, and component (SSC)] or function adversely affected by the proposed change to add IDS fuse isolation panels to non-Class 1E IDS battery monitors and Class 1E IDS circuits. No safety analysis or design basis acceptance limit/criterion is challenged or exceeded by the proposed changes and no margin or safety is reduced.

Therefore, the proposed amendment does not involve a significant reduction in a margin of safety.

The NRC staff has reviewed the licensee's analysis and, based on this review, it appears that the three standards of 10 CFR 50.92(c) are satisfied. Therefore, the NRC staff proposes to determine that the amendment request involves no significant hazards consideration.

Attorney for licensee: Ms. Kathryn M. Sutton, Morgan, Lewis & Bockius, LLC, 1111 Pennsylvania Ave. NW., Washington, DC 20004–2514.

NRC Branch Chief: Jennifer Dixon-Herrity.

Southern Nuclear Operating Company, Docket Nos. 52–025 and 52–026, Vogtle Electric Generating Plant, Units 3 and 4, Burke County, Georgia

Date of amendment request: December 22, 2015, as supplemented by letter dated July 27, 2016. Publicly-available versions are in ADAMS under Accession Nos. ML15356A655 and ML16209A477, respectively.

Description of amendment request: The proposed changes would revise the Combined License (COL) Appendix C and corresponding plant-specific Tier 1 information to add two turbine building sump pumps to accommodate the

increased flow that will be experienced during condensate polishing system rinsing operations, for each unit, respectively. The proposed changes include information in the combined license, Appendix C. An exemption request relating to the proposed changes to the AP1000 DCD Tier 1 is included with the request.

Basis for proposed no significant hazards consideration determination: As required by 10 CFR 50.91(a), the licensee has provided its analysis of the issue of no significant hazards consideration, which is presented below with NRC staff edits in square brackets:

1. Does the proposed amendment involve a significant increase in the probability or consequences of an accident previously evaluated?

Response: No.

The proposed changes to identify that there is more than one turbine building sump and to add two turbine building sump pumps (WWS–MP–07A and WWS–MP–07B) to COL Appendix C Subsection 2.3.29 and corresponding Table 2.3.29–1 will provide consistency within the current licensing basis. The main turbine building sumps and sump pumps are not safety-related components and do not interface with any systems, structures, or components (SSCs) accident initiator or initiating sequence of events; thus, the probability of accidents evaluated within the [Updated Final Safety Analysis Report (UFSAR)] are not affected. The proposed changes do not involve a change to the predicted radiological releases due to accident conditions, thus the consequences of accidents evaluated in the UFSAR are not affected.

Therefore, the proposed amendment does not involve a significant increase in the probability or consequences of an accident previously evaluated.

2. Does the proposed amendment create the possibility of a new or different kind of accident from any accident previously evaluated?

Response: No.

The proposed changes to identify that there is more than one turbine building sump and to add two turbine building sump pumps to the non-safety waste water system (WWS) do not affect any safety-related equipment, nor do they add any new interface to safety-related SSCs. No system or design function or equipment qualification is affected by these changes. The changes do not introduce a new failure mode, malfunction, or sequence of events that could affect safety or safety-related equipment.

Therefore, the proposed amendment does not create the possibility of a new or different kind of accident from any accident previously evaluated.

3. Does the proposed amendment involve a significant reduction in a margin of safety?

Response: No.

The WWS is a non-safety-related system that does not interface with any safety-related equipment. The proposed changes to identify that there is more than one turbine building sump and to add two turbine building sump

pumps do not affect any design code, function, design analysis, safety analysis input or result, or design/safety margin. No safety analysis or design basis acceptance limit/criterion is challenged or exceeded by the proposed change.

Therefore, the proposed amendment does not involve a significant reduction in a margin of safety.

The NRC staff has reviewed the licensee's analysis and, based on this review, it appears that the three standards of 10 CFR 50.92(c) are satisfied. Therefore, the NRC staff proposes to determine that the amendment request involves no significant hazards consideration.

Attorney for licensee: M. Stanford Blanton, Balch & Bingham LLP, 1710 Sixth Avenue North, Birmingham, AL 35203–2015.

NRC Branch Chief: Jennifer Dixon-Herrity.

Southern Nuclear Operating Company, Inc., Docket Nos. 52–025 and 52–026, Vogtle Electric Generating Plant, Units 3 and 4, Burke County, Georgia

Date of amendment request: August 23, 2016. A publicly-available version is in ADAMS under Accession No. ML16236A266.

Description of amendment request: The proposed changes would amend Combined License Nos. NPF–91 and NPF–92 for the Vogtle Electric Generating Plant, Units 3 and 4. The amendments propose changes to the Updated Final Safety Analysis Report (UFSAR) in the form of departures from the incorporated plant-specific Design Control Document Tier 2 information and involve related changes to the Combined Operating License Appendix C (and corresponding plant-specific design control document Tier 1) information. Specifically, the proposed departures consist of changes to the design reliability assurance program (D-RAP) to identify the covers for the in-containment refueling water storage tank vents and overflow weirs as the risk-significant components included in the D-RAP and to differentiate between the rod drive motor-generator (MG) sets field control relays and the rod drive power supply control cabinets in which the relays are located.

Basis for proposed no significant hazards consideration determination: As required by 10 CFR 50.91(a), the licensee has provided its analysis of the issue of no significant hazards consideration, which is presented below:

1. Does the proposed amendment involve a significant increase in the probability or consequences of an accident previously evaluated?

Response: No.

The in-containment refueling water storage tank (IRWST) provides flooding of the refueling cavity for normal refueling. The tank also serves as a heat sink during Passive Residual Heat Removal (PRHR) Heat Exchanger (HX) operation and in the event of a loss-of-coolant-accident (LOCA) provides injection in support of long-term RCS [reactor coolant system] cooling. This activity adds normally closed covers to the IRWST vents and overflow weirs to prevent debris from entering the tank, prevent over-pressurization and accommodate volume and mass increases in the tank. The vent and overflow weir covers open upon differential pressures between the IRWST and containment.

The rod drive MG sets provide the power to the control rod drive mechanisms through the reactor trip switchgear. This activity revises the equipment description and equipment tag associated with the risk-significant control relays which open to de-energize the rod drive MG sets and permit rods to drop.

The proposed changes to add the IRWST vent and overflow weir covers and to change the description of the equipment and equipment tag related to the rod drive MG sets does not inhibit the SSCs from performing their safety-related function. The design bases of the IRWST vents and overflow weirs are not modified as a result of the addition of the covers to the vents and overflow weirs and the change to the control cabinet relay description and equipment tag. This proposed amendment does not have an adverse impact on the response to anticipated transients or postulated accident conditions because the functions of the SSCs are not changed. Required IRWST venting is not affected for any accident conditions. Required DAS functions are not affected for any accident conditions. Safety-related structure, system, component (SSC) or function is not adversely affected by this change. The changes to include the IRWST covers and to change the control cabinet relay description and tag number do not involve an interface with any SSC accident initiator or initiating sequence of events, and thus, the probabilities of the accidents evaluated in the UFSAR are not affected. The proposed changes do not involve a change to the predicted radiological releases due to postulated accident conditions, thus, the consequences of the accidents evaluated in the UFSAR are not affected. Probabilistic Risk Assessment (PRA) modeling and analyses associated with the SSCs are not impacted by this change.

Therefore, the proposed amendment does not involve a significant increase in the probability or consequences of an accident previously evaluated.

2. Does the proposed amendment create the possibility of a new or different kind of accident from any accident previously evaluated?

Response: No.

The proposed changes to the design of the IRWST vent and overflow weir covers do not adversely affect any safety-related equipment, and do not add any new interfaces to safety-related SSCs. No system or design function or equipment qualification

is affected by these changes. The changes do not introduce a new failure mode, malfunction or sequence of events that could affect plant safety or safety-related equipment as the simplistic design of the cover louvers and hinged flappers are not considered unique designs. No new credible failure modes are introduced by the addition of the covers.

The proposed changes to the description and equipment tag associated with the risk-significant control relays for the rod drive MG sets do not adversely affect any safety-related equipment, and do not add any new interfaces to safety-related SSCs. No system or design function or equipment qualification is affected by these changes. The changes do not introduce a new failure mode, malfunction or sequence of events that could affect plant safety or safety-related equipment because the design function of the control relays, control cabinets, or rod drive MG sets is not changed.

Therefore, the proposed amendment does not create the possibility of a new or different kind of accident from any accident previously evaluated.

3. Does the proposed amendment involve a significant reduction in a margin of safety?

Response: No.

The proposed changes maintain compliance with the applicable Codes and Standards, thereby maintaining the margin of safety associated with these SSCs. The proposed changes do not alter any applicable design codes, code compliance, design function, or safety analysis. Consequently, no safety analysis or design basis acceptance limit/criterion is challenged or exceeded by the proposed change, thus the margin of safety is not reduced. Because no safety analysis or design basis acceptance limit/criterion is challenged or exceeded by these changes, no margin of safety is reduced.

Therefore, the proposed change does not involve a significant reduction in a margin of safety.

The NRC staff has reviewed the licensee's analysis and, based on this review, it appears that the three standards of 10 CFR 50.92(c) are satisfied. Therefore, the NRC staff proposes to determine that the amendment request involves no significant hazards consideration.

Attorney for licensee: M. Stanford Blanton, Balch & Bingham LLP, 1710 Sixth Avenue North, Birmingham, AL 35203–2015.

NRC Branch Chief: Michael T. Markley.

Southern Nuclear Operating Company, Inc., Docket Nos. 52–025 and 52–026, Vogtle Electric Generating Plant, Units 3 and 4, Burke County, Georgia

Date of amendment request: August 31, 2016. A publicly-available version is in ADAMS under Accession No. ML16244A836.

Description of amendment request: The amendments propose changes to the Updated Final Safety Analysis

Report (UFSAR) in the form of departures from the incorporated plant-specific Design Control Document Tier 2* information. Specifically, the proposed changes would revise the Combined Licenses for the Vogtle Electric Generating Plant, Units 3 and 4, to clarify information in WCAP–17179, “AP1000® Component Interface Module Technical Report,” which demonstrates design compliance with licensing bases requirements. WCAP–17179 is incorporated by reference into the UFSAR to provide additional details regarding the component interface module (CIM) system design. The requested amendments also propose a change to the CIM internal power supply that will enable proper functioning of the field programmable gate arrays.

Basis for proposed no significant hazards consideration determination: As required by 10 CFR 50.91(a), the licensee has provided its analysis of the issue of no significant hazards consideration, which is presented below:

1. Does the proposed amendment involve a significant increase in the probability or consequences of an accident previously evaluated?

Response: No.

The proposed change to the CIM internal power supply enables the field programmable gate array (FPGA) to function properly. The proposed change to the FPGA core power has no adverse effect on the operation of the output actuation relays. The function of the internal power supply has no input to plant safety analysis. The change to the CIM internal power supply has a negligible effect on the 24 Vdc [volts direct current] supplies and ultimately the plant electrical system load and has no adverse effect on the CIM functionality.

The proposed changes to clarify how licensing basis design documentation reflects compliance with license basis requirements, and the proposed change to the ownership of safety remote node controller (SRNC) and CIM intellectual property, are not technical changes. The proposed changes do not affect any accident initiator in the UFSAR, or affect the radioactive material releases in the UFSAR accident analyses. The proposed change does not alter the ability of the facility to prevent and mitigate abnormal events, e.g., accidents, anticipated operational occurrences, earthquakes, floods and turbine missiles, or their safety or design analyses. No safety-related structure, system, or component (SSC) or function is adversely affected. The change does not involve or interface with any SSC accident initiator or initiating sequence of events, and thus, the probabilities of the accidents evaluated in the UFSAR are not affected. This activity does not involve a new fission product release path, nor a new fission product barrier failure mode, nor create a new sequence of events that would result in significant fuel cladding failures. Because the proposed changes do

not change any safety-related SSC or function credited in the mitigation of an accident, the consequences of the accidents evaluated in the UFSAR are not affected.

Therefore, the requested amendment does not involve a significant increase in the probability or consequences of an accident previously evaluated.

2. Does the proposed amendment create the possibility of a new or different kind of accident from any accident previously evaluated?

Response: No.

The proposed change to the CIM internal power supply enables the FPGA to function properly and does not involve accident initiators. The change to the CIM internal power supply has a negligible effect on the 24 Vdc supplies and ultimately the plant electrical system load and has no adverse effect on CIM functionality.

The proposed clarified descriptions and the proposed change to the ownership of SRNC and CIM intellectual property are not technical changes. The proposed changes do not affect other plant equipment or adversely affect the design of the CIM. Therefore, the proposed changes do not affect any safety-related equipment itself, nor do they affect equipment whose failure could initiate an accident or a failure of a fission product barrier. No analysis is adversely affected by the proposed changes. No system or design function or equipment qualification would be adversely affected by the proposed changes. Furthermore, the proposed changes do not result in a new failure mode, malfunction or sequence of events that could affect safety or safety-related equipment.

Therefore, the proposed amendment does not create the possibility of a new or different kind of accident from any accident previously evaluated.

3. Does the proposed amendment involve a significant reduction in a margin of safety?

Response: No.

The proposed change to the CIM internal power supply enables the FPGA to function properly. The function of the internal power supply has no input to plant safety analysis. The change to the CIM internal power supplies has a negligible effect on the 24 Vdc supplies and ultimately the plant electrical system load and has no adverse effect on the CIM functionality.

The proposed clarified descriptions and the proposed change to the ownership of SRNC and CIM intellectual property are not technical changes. The proposed changes do not adversely affect the design, construction, or operation of any plant SSCs, including any equipment whose failure could initiate an accident or a failure of a fission product barrier. No analysis is adversely affected by the proposed changes. Furthermore, no system function, design function, or equipment qualification will be adversely affected by the changes. No safety analysis or design basis acceptance limit/criterion is challenged or exceeded by the proposed changes, thus no margin of safety is reduced.

Therefore, the proposed amendment does not involve a significant reduction in a margin of safety.

The NRC staff has reviewed the licensee's analysis and, based on this

review, it appears that the three standards of 10 CFR 50.92(c) are satisfied. Therefore, the NRC staff proposes to determine that the amendment request involves no significant hazards consideration.

Attorney for licensee: M. Stanford Blanton, Balch & Bingham LLP, 1710 Sixth Avenue North, Birmingham, AL 35203–2015.

NRC Branch Chief: Michael T. Markley.

Southern Nuclear Operating Company, Docket No. 50–364, Joseph M. Farley Nuclear Plant, Unit 2, Houston County, Alabama

Date of amendment request: September 8, 2016. A publicly-available version is in ADAMS under Accession No. ML16256A135.

Description of amendment request: The amendment would correct an error in the Joseph M. Farley Nuclear Plant, Unit 2, Renewed Facility Operating License No. NPF–8, for Condition 2.C.(23). Specifically, the Unit 2 referenced date prior to the period of extended operation was incorrectly entered as June 25, 2017. This date corresponds to the Unit 1 period of extended operation. The Unit 2 correct date for this license condition is March 31, 2021.

Basis for proposed no significant hazards consideration determination: As required by 10 CFR 50.91(a), the licensee has provided its analysis of the issue of no significant hazards consideration, which is presented below:

1. Does the proposed amendment involve a significant increase in the probability or consequences of an accident previously evaluated?

Response: No.

The proposed amendment contains no technical changes; all proposed changes are administrative. These changes are consistent with the intent of what has already been approved by the Nuclear Regulatory Commission (NRC). There are no accidents affected by this change, and therefore no increase in the probability or consequences of an accident previously evaluated.

2. Does the proposed amendment create the possibility of a new or different kind of accident from any accident previously evaluated?

Response: No.

The proposed amendment contains no technical changes; all proposed changes are administrative. These changes are consistent with the intent of what has already been approved by the Nuclear Regulatory Commission (NRC). There are no accidents affected by this change, and therefore no possibility of a new or different kind of accident from any accident previously evaluated.

3. Does the proposed amendment involve a significant reduction in a margin of safety?

Response: No.

The proposed amendment contains no technical changes; all proposed changes are administrative. These changes are consistent with the intent of what has already been approved by the Nuclear Regulatory Commission (NRC). There are no accidents affected by this change, and therefore no reduction in a margin of safety.

The NRC staff has reviewed the licensee's analysis and, based on this review, it appears that the three standards of 10 CFR 50.92(c) are satisfied. Therefore, the NRC staff proposes to determine that the amendment request involves no significant hazards consideration.

Attorney for licensee: Jennifer M. Buettner, Associate General Counsel, Southern Nuclear Operating Company, Inc., 40 Inverness Center Parkway, Birmingham, AL 35242.

NRC Branch Chief: Michael T. Markley.

Susquehanna Nuclear, LLC, Docket Nos. 50–387 and 50–388, Susquehanna Steam Electric Station, Units 1 and 2, Luzerne County, Pennsylvania

Date of amendment request: July 27, 2016, as supplemented by letter dated September 13, 2016. Publicly-available versions are in ADAMS under Accession Nos. ML16210A001 and ML16257A598, respectively.

Description of amendment request: The amendments would revise Technical Specification 3.6.4.1, “Secondary Containment,” Surveillance Requirement (SR) 3.6.4.1.3 to provide an allowance for brief, inadvertent, simultaneous opening of redundant secondary containment access doors during normal entry and exit conditions.

Basis for proposed no significant hazards consideration determination: As required by 10 CFR 50.91(a), the licensee has provided its analysis of the issue of no significant hazards consideration, which is presented below, along with NRC edits in square brackets:

1. Do the proposed changes involve a significant increase in the probability or consequences of any accident previously evaluated?

Response: No.

The proposed change does not involve any physical change to structures, systems, or components (SSCs) and do not alter the method of operation of any SSCs. The proposed change addresses a temporary condition during which Secondary Containment SRs are not met. The Secondary Containment is not an initiator of any accident previously evaluated. As a result, the probability of any accident previously evaluated is not increased. [Two accidents credit the Secondary Containment from a dose consequence perspective. They are the

loss-of-coolant accident (LOCA) and fuel/equipment handling accident. Each accident requires time to drawdown the secondary containment to less than atmospheric pressure. The brief, inadvertent, simultaneous opening of both an inner and outer personnel access door during normal entry and exit conditions followed by prompt closure does not challenge the design basis drawdown time and does not result in an increase in any on-site or offsite dose for the LOCA dose analysis. All dose consequences are within the regulatory limits established for the fuel handling accident and bound the case in which airlock doors are briefly, inadvertently opened.] As a result, the consequences of any accident previously evaluated is not significantly increased.

Therefore, the proposed change does not involve a significant increase in the probability or consequences of an accident previously evaluated.

2. Do the proposed changes create the possibility of a new or different kind of accident from any accident previously evaluated?

Response: No.

The proposed change does not involve a physical alteration of any plant equipment. No new equipment is being introduced, and installed equipment is not being operated in a new or different manner. There are not setpoints, at which protective or mitigative actions are initiated, affected by the proposed change. The proposed change does not alter the manner in which equipment operation is initiated, nor will the function of credited equipment be changed. No alterations in the procedures that ensure the plant remains within analyzed limits are being proposed, and no changes are being made to the procedures relied upon to respond to an off-normal event described in the FSAR [Final Safety Analysis Report]. As such, no new failure modes are being introduced. The change does not alter the assumptions made in the safety analysis and licensing basis.

Therefore, the proposed change does not create the possibility of a new or different kind of accident from any previously evaluated.

3. Do the proposed changes involve a significant reduction in a margin of safety?

Response: No.

The margin of safety is established through equipment design, operating parameters, and the setpoints at which automatic actions are initiated. The proposed change addresses temporary conditions during which the Secondary Containment SR is not met. The allowance for both an inner and outer Secondary Containment access door to be open simultaneously for entry and exit does not affect the safety function of the reactor enclosure and refuel area Secondary Containments as the doors are promptly closed after entry or exit, thereby restoring the Secondary Containment boundary. In addition, brief, inadvertent simultaneous opening and closing of redundant Secondary Containment personnel access doors during normal entry and exit conditions does not affect the ability of the SGTS to establish the required Secondary Containment vacuum. Therefore, the safety function of the Secondary Containment is not affected.

Therefore, the proposed change does not involve a significant reduction in a margin of safety.

The NRC staff has reviewed the licensee's analysis and, based on this review, it appears that the three standards of 10 CFR 50.92(c) are satisfied. Therefore, the NRC staff proposes to determine that the amendment request involves no significant hazards consideration.

Attorney for licensee: Damon D. Obie, Esquire, Associate General Counsel, Talen Energy Supply, LLC, 835 Hamilton St., Suite 150, Allentown, PA 18101.

NRC Branch Chief: Douglas A. Broadus.

Tennessee Valley Authority, Docket No. 50-391, Watts Bar Nuclear Plant (WBN), Unit 2, Rhea County, Tennessee

Date of amendment request: September 30, 2016. A publicly-available version is in ADAMS under Accession No. ML16277A477.

Description of amendment request: The amendment would revise the Technical Specifications (TSs) to allow a one-time extension of the frequency for performing TS Surveillance Requirements (SRs) related to verifying the operability of the containment ice bed.

Basis for proposed no significant hazards consideration determination: As required by 10 CFR 50.91(a), the licensee has provided its analysis of the issue of no significant hazards consideration, which is presented below, with NRC edits in brackets:

1. Does the proposed amendment involve a significant increase in the probability or consequences of an accident previously evaluated?

Response: No.

The requested action is a one-time extension to the performance interval for TS SRs [3.6.11.2] and 3.6.11.3. The performance of these surveillances, or the extension of these surveillances, is not a precursor to an accident. Performing these surveillances or failing to perform these surveillances does not affect the probability of an accident.

Therefore, the proposed delay in performance of the SRs in this amendment request does not increase the probability of an accident previously evaluated.

A delay in performing these surveillances does not result in a system being unable to perform its required function. In the case of this one-time extension request, the short period of additional time that the systems and components will be in service before the next performance of the surveillance will not affect the ability of those systems to operate as designed. Therefore, the systems required to mitigate accidents will remain capable of performing their required function. No new failure modes have been introduced because of this action and the consequences remain

consistent with previously evaluated accidents. On this basis, the proposed delay in performance of the SRs in this amendment request does not involve a significant increase in the consequences of an accident.

Therefore, the proposed change does not involve a significant increase in the probability or consequences of an accident previously evaluated.

2. Does the proposed amendment create the possibility of a new or different kind of accident from any accident previously evaluated?

Response: No.

The proposed amendment does not involve a physical alteration of any system, structure, or component (SSC) or a change in the way any SSC is operated. The proposed amendment does not involve operation of any SSCs in a manner or configuration different from those previously recognized or evaluated. No new failure mechanisms will be introduced by the one-time SR extensions being requested.

Therefore, the proposed change does not create the possibility of a new or different kind of accident from any accident previously evaluated.

3. Does the proposed amendment involve a significant reduction in a margin of safety?

Response: No.

The proposed amendment is a one-time extension of the performance interval of TS SRs [3.6.11.2] and 3.6.11.3. Extending these surveillance requirements does not involve a modification of any TS limiting conditions for operation. Extending these SRs does not involve a change to any limit on accident consequences specified in the license or regulations. Extending these SRs does not involve a change in how accidents are mitigated or a significant increase in the consequences of an accident. Extending these SRs does not involve a change in a methodology used to evaluate consequences of an accident. Extending these SRs does not involve a change in any operating procedure or process.

Based on the limited additional period of time that the systems and components will be in service before the surveillances are next performed, as well as the operating experience that these surveillances are typically successful when performed, it is reasonable to conclude that the margins of safety associated with these SRs will not be affected by the requested extension.

Therefore, the proposed change does not involve a significant reduction in a margin of safety.

The NRC staff has reviewed the licensee's analysis and, based on this review, it appears that the three standards of 10 CFR 50.92(c) are satisfied. Therefore, the NRC staff proposes to determine that the amendment request involves no significant hazards consideration.

Attorney for licensee: Ms. Sherry A. Quirk, Executive Vice President and General Counsel, Tennessee Valley Authority, 400 West Summit Hill Drive, 6A West Tower, Knoxville, TN 37902.

NRC Acting Branch Chief: Jeanne A. Dion.

Virginia Electric and Power Company, Docket Nos. 50–280 and 50–281, Surry Power Station, Unit Nos. 1 and 2, Surry County, Virginia

Date of amendment request: May 18, 2016. A publicly-available version is in ADAMS under Accession No. ML16146A540.

Description of amendment request: The amendments would revise the Surry Power Station, Unit Nos. 1 and 2, Technical Specification (TS) 3.14, “Circulating and Service Water Systems,” to extend the allowed outage time (AOT) for only one operable service water (SW) flow path to the charging pump service water (CPSW) subsystem and to the main control room/emergency switchgear room (MCR/ESGR) air conditioning (AC) subsystem. TS 3.14.A.5 and TS 3.14.A.7 require two SW flow paths to the CPSW subsystem and to the MCR/ESGR AC subsystem, respectively, to be operable. Currently, the TS 3.14.C AOT for only one operable CPSW or MCR/ESGR AC flow path is 24 hours. The proposed revision will extend the AOT for only one operable CPSW or MCR/ESGR AC flow path from 24 hours to 72 hours.

Basis for proposed no significant hazards consideration determination: As required by 10 CFR 50.91(a), the licensee has provided its analysis of the issue of no significant hazards consideration, which is presented below:

1. Does the proposed change involve a significant increase in the probability or consequences of an accident previously evaluated?

Response: No.

The proposed change extends the AOT for only one operable CPSW or MCR/ESGR AC flow path from 24 hours to 72 hours. The CPSW subsystem is a support system for the Charging/High Head Safety Injection (HHSI) pumps; the proposed CPSW AOT extension aligns the CPSW support system AOT with the AOT for the supported components (*i.e.*, the Charging/HHSI pumps). The proposed MCR/ESGR AC AOT extension revises the AOT to be the same as the CPSW AOT since both subsystems share common piping. The design function of the CPSW system, which is to provide cooling to the charging pump intermediate seal coolers and the charging pump lubricating oil coolers, is not impacted by the proposed revision, nor is the design function of the Charging/HHSI pumps impacted. Furthermore, the design functions of the MCR/ESGR AC subsystem and the MCR/ESGR chillers are not impacted by the proposed revision. In addition, the proposed change deletes the now expired and no longer necessary requirements for the temporary SW jumper to the CCHXs [component cooling heat exchangers]. The deletion of these temporary requirements is administrative in nature. As a result, the proposed change does not involve a

significant increase in the probability or consequences of an accident previously evaluated.

2. Does the proposed change create the possibility of a new or different kind of accident from any accident previously evaluated?

Response: No.

The proposed change extends the AOT for only one operable CPSW or MCR/ESGR AC flow path from 24 hours to 72 hours. In addition, the proposed change deletes the now expired and no longer necessary requirements for the temporary SW jumper to the CCHXs. The proposed change does not involve a physical alteration of the plant (*i.e.*, no new or different type of equipment will be installed) and does not impact plant operation. Furthermore, the proposed change does not impose any new or different requirements that could initiate an accident. The proposed change does not alter assumptions made in the safety analysis and is consistent with the safety analysis assumptions.

Therefore, the proposed change does not create the possibility of a new or different kind of accident from any accident previously evaluated.

3. Does the proposed change involve a significant reduction in a margin of safety?

Response: No.

The proposed change extends the AOT for only one operable CPSW or MCR/ESGR AC flow path from 24 hours to 72 hours. The proposed change does not adversely affect any current plant safety margins or the reliability of the equipment assumed in the safety analysis. There are no changes being made to any safety analysis assumptions, safety limits, or limiting safety system settings that would adversely affect plant safety as a result of the proposed change. Furthermore, as noted above, a supporting PRA [probabilistic risk assessment] was performed for the proposed AOT changes. The PRA concluded that the increase in risk associated with the proposed changes is consistent with the RG [Regulatory Guide] 1.174 and RG 1.177 acceptance guidelines for a permanent TS AOT change. This PRA evaluation demonstrates that defense-in-depth will not be significantly impacted by changing the AOTs for only one operable SW flow path to the CPSW subsystem and to the MCR/ESGR AC subsystem from 24 to 72 hours. In addition, the proposed change deletes the now expired and no longer necessary requirements for the temporary SW jumper to the CCHXs. The deletion of these temporary requirements is administrative in nature. Therefore, the proposed change does not involve a significant reduction in a margin of safety.

The NRC staff has reviewed the licensee’s analysis and, based on this review, it appears that the three standards of 10 CFR 50.92(c) are satisfied. Therefore, the NRC staff proposes to determine that the amendment request involves no significant hazards consideration.

Attorney for licensee: Lillian M. Cuoco, Senior Counsel, Dominion

Resources Services, Inc., 120 Tredegar St., RS–2, Richmond, VA 23219.

NRC Branch Chief: Michael T. Markley.

Virginia Electric and Power Company, Docket Nos. 50–280 and 50–281, Surry Power Station, Unit Nos. 1 and 2, Surry County, Virginia

Date of amendment request: July 14, 2016. A publicly-available version is in ADAMS under Accession No.

ML16202A068.

Description of amendment request: The amendments would revise the Surry Power Station, Unit Nos. 1 and 2, Technical Specification (TS) 3.14, “Circulating and Service Water Systems,” to extend the allowed outage time (AOT) for emergency service water (ESW) pump inoperability. The proposed revision would extend the TS 3.14.B AOT for one inoperable ESW pump from 7 days to 14 days to provide operational flexibility for ESW pump maintenance and repairs.

Basis for proposed no significant hazards consideration determination: As required by 10 CFR 50.91(a), the licensee has provided its analysis of the issue of no significant hazards consideration, which is presented below:

1. Does the proposed change involve a significant increase in the probability or consequences of an accident previously evaluated?

Response: No.

The design function of the ESW pumps is to ensure that water can be provided to the intake canal (*i.e.*, the ultimate heat sink) when power is not available to the Circulating Water (CW) pumps. The proposed extension of the AOT for one inoperable ESW pump from 7 to 14 days does not impact the design function of the ESW pumps. In addition, the number of ESW pumps required to be operable for the specified plant operating conditions is not impacted by the proposed AOT extension. As a result, the proposed change does not involve a significant increase in the probability or consequences of an accident previously evaluated.

2. Does the proposed change create the possibility of a new or different kind of accident from any accident previously evaluated?

Response: No.

The proposed change does not involve a physical alteration of the plant (*i.e.*, no new or different type of equipment will be installed) and does not impact plant operation. Furthermore, the proposed change does not impose any new or different requirements that could initiate an accident. The proposed change does not alter assumptions made in the safety analysis and is consistent with the safety analysis assumptions.

Therefore, the proposed change does not create the possibility of a new or different

kind of accident from any accident previously evaluated.

3. Does the proposed change involve a significant reduction in a margin of safety?
Response: No.

The proposed change does not adversely affect any current plant safety margins or the reliability of the equipment assumed in the safety analysis. There are no changes being made to any safety analysis assumptions, safety limits, or limiting safety system settings that would adversely affect plant safety as a result of the proposed change. Furthermore, as noted above, a supporting PRA [probabilistic risk assessment] was performed for the proposed AOT change. The PRA concluded that the increase in risk associated with the proposed change is consistent with the RG [Regulatory Guide] 1.174 and RG 1.177 acceptance guidelines for a permanent TS AOT change. This PRA evaluation demonstrates that defense-in-depth will not be significantly impacted by changing the AOT for one inoperable ESW pump from 7 to 14 days.

Therefore, the proposed change does not involve a significant reduction in a margin of safety.

The NRC staff has reviewed the licensee's analysis and, based on this review, it appears that the three standards of 10 CFR 50.92(c) are satisfied. Therefore, the NRC staff proposes to determine that the amendment request involves no significant hazards consideration.

Attorney for licensee: Lillian M. Cuoco, Senior Counsel, Dominion Resources Services, Inc., 120 Tredegar St., RS-2, Richmond, VA 23219.
NRC Branch Chief: Michael T. Markley.

III. Notice of Issuance of Amendments to Facility Operating Licenses and Combined Licenses

During the period since publication of the last biweekly notice, the Commission has issued the following amendments. The Commission has determined for each of these amendments that the application complies with the standards and requirements of the Atomic Energy Act of 1954, as amended (the Act), and the Commission's rules and regulations. The Commission has made appropriate findings as required by the Act and the Commission's rules and regulations in 10 CFR Chapter I, which are set forth in the license amendment.

A notice of consideration of issuance of amendment to facility operating license or combined license, as applicable, proposed no significant hazards consideration determination, and opportunity for a hearing in connection with these actions, was published in the **Federal Register** as indicated.

Unless otherwise indicated, the Commission has determined that these

amendments satisfy the criteria for categorical exclusion in accordance with 10 CFR 51.22. Therefore, pursuant to 10 CFR 51.22(b), no environmental impact statement or environmental assessment need be prepared for these amendments. If the Commission has prepared an environmental assessment under the special circumstances provision in 10 CFR 51.22(b) and has made a determination based on that assessment, it is so indicated.

For further details with respect to the action see (1) the applications for amendment, (2) the amendment, and (3) the Commission's related letter, Safety Evaluation, and/or Environmental Assessment as indicated. All of these items can be accessed as described in the "Obtaining Information and Submitting Comments" section of this document.

Dominion Nuclear Connecticut, Inc., Docket No. 50-336, Millstone Power Station, Unit No. 2 (MPS2), New London County, Connecticut

Date of amendment request: September 1, 2015, as supplemented by letter dated March 24, 2016.

Brief description of amendment: The amendment revised the MPS2 Technical Specifications (TSs) to add the evaluation model EMF-2328(P)(A), Supplement 1, "PWR [pressurized water reactor] Small Break LOCA [loss-of-coolant accident] Evaluation Model S-RELAP5 Based," and EMF-92-116(P)(A), Supplement 1, "Generic Mechanical Design Criteria for PWR Fuel Designs," to the TS Section 6.9.1.8.b list of analytical methods used to determine core operating limits as a result of reanalyzing the small break LOCA.

Date of issuance: September 30, 2016.

Effective date: As of the date of issuance and shall be implemented within 60 days of issuance.

Amendment No.: 329. A publicly-available version is in ADAMS under Accession No. ML16249A001; documents related to this amendment are listed in the Safety Evaluation enclosed with the amendment.

Renewed Facility Operating License No. DPR-65: Amendment revised the Renewed Operating License and TSs.

Date of initial notice in Federal Register: December 8, 2015 (80 FR 76318). The supplemental letter dated March 24, 2016, provided additional information that clarified the application, did not expand the scope of the application as originally noticed, and did not change the staff's original proposed no significant hazards consideration determination as published in the **Federal Register**.

The Commission's related evaluation of the amendment is contained in a Safety Evaluation dated September 30, 2016.

No significant hazards consideration comments received: No.

Entergy Operations, Inc., Docket No. 50-313, Arkansas Nuclear One, Unit 1 (ANO-1), Pope County, Arkansas

Date of amendment request: January 29, 2014, as supplemented by letters dated May 19, June 16, July 21, August 12, September 22, November 4, and November 17, 2015; and January 15, March 25, April 7, May 19, and August 29, 2016.

Brief description of amendment: The amendment authorized the transition of the ANO-1 fire protection program to a risk-informed, performance-based program based on National Fire Protection Association (NFPA) 805, in accordance with 10 CFR 50.48(c). NFPA 805 allows the use of performance-based methods such as fire modeling and risk-informed methods such as fire probabilistic risk assessment to demonstrate compliance with the nuclear safety performance criteria.

Date of issuance: October 7, 2016.

Effective date: As of the date of issuance and shall be implemented as described in the transition license conditions.

Amendment No.: 256. A publicly-available version is in ADAMS under Accession No. ML16223A481; documents related to this amendment are listed in the Safety Evaluation enclosed with the amendment.

Renewed Facility Operating License No. DPR-51: The amendment revised the Facility Operating License and Technical Specifications.

Date of initial notice in Federal Register: July 8, 2014 (79 FR 38589). The supplemental letters dated May 19, June 16, July 21, August 12, September 22, November 4, and November 17, 2015; and January 15, March 25, April 7, May 19, and August 29, 2016, provided additional information that clarified the application, did not expand the scope of the application as originally noticed, and did not change the staff's original proposed no significant hazards consideration determination as published in the **Federal Register**.

The Commission's related evaluation of the amendment is contained in a Safety Evaluation dated October 7, 2016.

No significant hazards consideration comments received: No.

Florida Power & Light Company, et al., Docket Nos. 50–335 and 50–389, St. Lucie Plant, Unit Nos. 1 and 2, St. Lucie County, Florida

Date of amendment request: October 15, 2015, as supplemented by a letter dated May 6, 2016.

Description of amendment request: The amendments revised the St. Lucie Plant, Unit Nos. 1 and 2, Technical Specifications (TSs) and licensing bases to reflect the use of the commercially available computer code “Generation of Thermal-Hydraulic Information for Containments (GOTHIC Version 7.2b(QA))” to model the containment response following the inadvertent actuation of the containment spray system during normal plant operation (referred to as the vacuum analysis). The amendments also updated the licensing bases to credit the design basis ability of the containment vessel to withstand a higher external pressure differential of 1.04 pounds per square inch (psi) for Unit No. 1 and 1.05 psi for Unit No. 2, and updated TS 3.6.1.4 for each unit to revise the allowable containment operating pressure range.

Date of issuance: October 5, 2016.

Effective date: As of the date of issuance and shall be implemented within 90 days of issuance.

Amendment Nos.: 236 (Unit No. 1) and 186 (Unit No. 2). A publicly-available version is in ADAMS under Accession No. ML16166A424; documents related to these amendments are listed in the Safety Evaluation (SE) enclosed with the amendments.

Renewed Facility Operating License Nos. DPR–67 and NPF–16: Amendments revised the Renewed Facility Operating Licenses and TSs.

Date of initial notice in Federal Register: February 16, 2016 (81 FR 7839). The supplemental letter dated May 6, 2016, provided additional information that clarified the application, did not expand the scope of the application as originally noticed, and did not change the staff’s original proposed no significant hazards consideration determination as published in the **Federal Register**.

The Commission’s related evaluation of the amendments is contained in an SE dated October 5, 2016.

No significant hazards consideration comments received: No.

Luminant Generation Company LLC, Docket Nos. 50–445 and 50–446, Comanche Peak Nuclear Power Plant, Unit Nos. 1 and 2, Somervell County, Texas

Date of amendment request: November 12, 2015, as supplemented by

letters dated December 9, 2015, and March 14, March 29, April 7, April 20, August 16, September 16, September 21, and September 29, 2016.

Brief description of amendments: By order dated May 6, 2016, as published in the **Federal Register** on May 23, 2016 (81 FR 32350), the NRC approved the transfer of Facility Operating License (FOL) Nos. NPF–87 and NPF–89 for Comanche Peak Nuclear Power Plant, Unit Nos. 1 and 2, and the general license for the independent spent fuel storage installation facility from the current holder, Luminant Generation Company LLC, to Comanche Peak Power Company LLC, as owner, and TEX Operations Company LLC, as operator. The conforming amendments revised the FOLs to reflect the direct transfer of ownership and the indirect transfer of control of the licenses.

Date of issuance: October 3, 2016.

Effective date: As of the date of issuance and shall be implemented within 7 days from the date of issuance.

Amendment Nos.: 167 (Unit No. 1) and 167 (Unit No. 2). A publicly-available version is in ADAMS under Accession No. ML16266A005; documents related to these amendments are listed in the Safety Evaluation enclosed with the amendments.

Facility Operating License Nos. NPF–87 and NPF–89: Amendments revised the FOLs.

Date of initial notice in Federal Register: February 8, 2016 (81 FR 6545). The supplemental letters dated March 14, March 29, April 7, April 20, August 16, September 16, September 21, and September 29, 2016, provided additional information that clarified the application and did not expand the scope of the application as originally noticed.

The Commission’s related evaluation of the amendments is contained in a Safety Evaluation dated May 6, 2016.

PSEG Nuclear LLC, Docket Nos. 50–272 and 50–311, Salem Nuclear Generating Station, Unit Nos. 1 and 2, Salem County, New Jersey

Date amendment request: October 12, 2015.

Brief description of amendments: The amendments revised Salem Nuclear Generating Station, Unit Nos. 1 and 2, Technical Specifications (TSs) by adding MODE 4 to the applicability of TS 3.6.2.3, “Containment Cooling System.” The amendments also revised TS 3.7.1.1, “Safety Valves,” to correct discrepancies between the applicable modes and the action statements.

Date of issuance: September 29, 2016.

Effective date: As of the date of issuance and shall be implemented within 60 days.

Amendment Nos.: 315 (Unit No. 1) and 296 (Unit No. 2). A publicly-available version is in ADAMS under Accession No. ML16229A519; documents related to these amendments are listed in the Safety Evaluation enclosed with the amendments.

Renewed Facility Operating License Nos. DPR–70 and DPR–75: The amendments revised the Renewed Facility Operating Licenses and TSs.

Date of initial notice in Federal Register: January 5, 2016 (81 FR 264).

The Commission’s related evaluation of the amendments is contained in a Safety Evaluation dated September 29, 2016.

No significant hazards consideration comments received: No.

South Carolina Electric & Gas Company and South Carolina Public Service Authority, Docket Nos. 52–027 and 52–028, Virgil C. Summer Nuclear Station, Units 2 and 3, Fairfield County, South Carolina

Date of amendment request: March 14, 2016, as supplemented by letters dated May 12, 2016, and July 12, 2016.

Description of amendment: The amendments incorporated changes that are consistent with those generically approved in WCAP–17524–P–A, Revision 1, “AP1000 Core Reference Report,” dated February 19, 2015. The amendments also approved changes to the Updated Final Safety Analysis Report (UFSAR) in the form of departures from the incorporated plant-specific Design Control Document Tier 2 licensing basis information, involves changes to the UFSAR information that has been designated as Tier 2* information, and involves changes to the plant-specific Technical Specifications.

Date of issuance: September 20, 2016.

Effective date: As of the date of issuance and shall be implemented within 50 days of issuance.

Amendment Nos.: 52 (Unit 2) and 52 (Unit 3). A publicly-available version is in ADAMS under Package Accession No. ML16144A591; documents related to these amendments are listed in the Safety Evaluation enclosed with the amendments.

Facility Combined Licenses Nos. NPF–93 and NPF–94: Amendments revised the Facility Combined Licenses and Technical Specifications.

Date of initial notice in Federal Register: May 10, 2016 (81 FR 28900). The supplemental letters dated May 12, 2016, and July 12, 2016, provided additional information that clarified the

application, did not expand the scope of the application as originally noticed, and did not change the staff's original proposed no significant hazards consideration determination as published in the **Federal Register**.

The Commission's related evaluation of the amendment is contained in a Safety Evaluation dated September 20, 2016.

No significant hazards consideration comments received: No.

Southern Nuclear Operating Company, Inc.; Georgia Power Company; Oglethorpe Power Corporation; Municipal Electric Authority of Georgia; and City of Dalton, Georgia, Docket Nos. 50–321 and 50–366, Edwin I. Hatch Nuclear Plant, Unit Nos. 1 and 2, Appling County, Georgia

Date of amendment request: October 10, 2014, as supplemented by letters dated May 4, 2015; October 15, 2015; and August 26, 2016.

Brief description of amendments: The amendments revised Technical Specifications (TSs) by adopting 18 previously NRC-approved Technical Specifications Task Force (TSTF) Travelers, two TSTF T-Travelers, and one feature of the Improved Standard Technical Specifications not associated with a Traveler.

Date of issuance: September 29, 2016.

Effective date: As of the date of issuance and shall be implemented within 90 days of issuance.

Amendment Nos.: 279 (Unit 1) and 223 (Unit 2). A publicly-available version is in ADAMS under Accession No. ML16231A041; documents related to these amendments are listed in the Safety Evaluation enclosed with the amendments.

Renewed Facility Operating License Nos. DPR–57 and NPF–5: Amendments revised the Renewed Facility Operating Licenses and TSs.

Date of initial notice in Federal Register: March 31, 2015 (80 FR 17095). The supplemental letters dated May 4, 2015; October 15, 2015; and August 26, 2016, provided additional information that clarified the application, did not expand the scope of the application as originally noticed, and did not change the staff's original proposed no significant hazards consideration determination as published in the **Federal Register**.

The Commission's related evaluation of the amendments is contained in a Safety Evaluation dated September 29, 2016.

No significant hazards consideration comments received: No.

Southern Nuclear Operating Company, Inc.; Georgia Power Company; Oglethorpe Power Corporation; Municipal Electric Authority of Georgia; City of Dalton, Georgia, Docket Nos. 50–321 and 50–366, Edwin I. Hatch Nuclear Plant, Unit Nos. 1 and 2, Appling County, Georgia

Date of amendment request: October 15, 2015, as supplemented by letters dated March 16, May 9, and May 16, 2016.

Brief description of amendments: The amendments revised the Technical Specifications Surveillance Requirement 3.6.4.1.3 to increase the allowable time from 2 minutes to 10 minutes for the standby gas treatment system to draw down the secondary containment to negative pressure.

Date of issuance: September 30, 2016.

Effective date: As of the date of issuance and shall be implemented within 60 days of issuance.

Amendment Nos.: 280 (Unit No. 1) and 224 (Unit No. 2). A publicly-available version is in ADAMS under Accession No. ML16235A287; documents related to these amendments are listed in the Safety Evaluation enclosed with the amendments.

Renewed Facility Operating License Nos. DPR–57 and NPF–5: Amendments revised the Renewed Facility Operating Licenses and Technical Specifications.

Date of initial notice in Federal Register: November 24, 2015 (80 FR 73240). The supplemental letters dated March 16, May 9, and May 16, 2016, provided additional information that clarified the application, did not expand the scope of the application as originally noticed, and did not change the staff's original proposed no significant hazards consideration determination as published in the **Federal Register**.

The Commission's related evaluation of the amendments is contained in a Safety Evaluation dated September 30, 2016.

No significant hazards consideration comments received: No.

Tennessee Valley Authority, Docket Nos. 50–327 and 50–328, Sequoyah Nuclear Plant (SQN), Units 1 and 2, Hamilton County, Tennessee

Date of amendment request: May 16, 2016.

Brief description of amendments: The amendments consisted of change to the Completion Date of Cyber Security Plan (CSP) Implementation Milestone 8—full implementation of the CSP from October 31, 2016 to December 31, 2017.

Date of issuance: October 3, 2016.

Effective date: As of its date of issuance and shall be implemented within 30 days of issuance.

Amendment Nos.: 337 (Unit 1) and 330 (Unit 2). A publicly-available version is in ADAMS under Accession No. ML16228A096; documents related to these amendments are listed in the Safety Evaluation (SE) enclosed with the amendments.

Facility Operating License Nos. DPR–77 and DPR–79. The amendments revised the Technical Specifications.

Date of initial notice in Federal Register: July 8, 2016 (81 FR 44665).

The Commission's related evaluation of the amendments is contained in an SE dated October 3, 2016.

No significant hazards consideration comments received: No.

Effective date: As of the date of issuance and shall be implemented within 30 days of issuance.

Tennessee Valley Authority, Docket Nos. 50–327 and 50–328, Sequoyah Nuclear Plant, Units 1 and 2, Hamilton County, Tennessee

Date of amendment request: March 11, 2016, as supplemented by letters dated May 31, 2016, and July 22, 2016.

Brief description of amendments: The amendments revised the Technical Specifications (TSs) by adding a new Condition A to TS 3.7.8, "Essential Raw Cooling Water (ERCW) System," to extend the allowed completion time to restore ERCW System train to OPERABLE status from 72 hours to 7 days for planned maintenance when the opposite unit is defueled or in Mode 6 following defueled under certain restrictions.

Date of issuance: September 29, 2016.

Effective date: As of its date of issuance and shall be implemented within 30 days of issuance.

Amendment Nos.: 336 (Unit 1) and 329 (Unit 2). A publicly-available version is in ADAMS under Accession No. ML16225A276; documents related to these amendments are listed in the Safety Evaluation (SE) enclosed with the amendments.

Facility Operating License Nos. DPR–77 and DPR–79. Amendments revised the TSs.

Date of initial notice in Federal Register: April 12, 2016 (81 FR 21603). The supplemental letters dated May 31, 2016, and July 22, 2016, provided additional information that clarified the application, did not expand the scope of the application as originally noticed, and did not change the staff's original proposed no significant hazards consideration determination as published in the **Federal Register**.

The Commission's related evaluation of the amendments is contained in an SE dated September 29, 2016.

No significant hazards consideration comments received: No.

Dated at Rockville, Maryland, this 13th day of October 2016.

For the Nuclear Regulatory Commission.

George A. Wilson, Jr.,

Deputy Director, Division of Operating Reactor Licensing, Office of Nuclear Reactor Regulation.

[FR Doc. 2016-25641 Filed 10-24-16; 8:45 am]

BILLING CODE 7590-01-P

NUCLEAR REGULATORY COMMISSION

Advisory Committee on Reactor Safeguards (ACRS); Meeting of the ACRS Subcommittee on Digital I&C Systems; Notice of Meeting

The ACRS Subcommittee on Digital I&C Systems will hold a meeting on November 2, 2016, Room T-2B1, 11545 Rockville Pike, Rockville, Maryland.

The meeting will be open to public attendance with the exception of portions that may be closed to protect information that is proprietary pursuant to 5 U.S.C. 552b(c)(4). The agenda for the subject meeting shall be as follows:

Wednesday, November 2, 2016—8:30 a.m. Until 5:00 p.m.

The Subcommittee will review the Proposed Rulemaking on Cyber Security for Fuel Cycle Facilities. The Subcommittee will hear presentations by and hold discussions with the NRC staff and other interested persons regarding this matter. The Subcommittee will gather information, analyze relevant issues and facts, and formulate proposed positions and actions, as appropriate, for deliberation by the Full Committee.

Members of the public desiring to provide oral statements and/or written comments should notify the Designated Federal Official (DFO), Christina Antonescu (Telephone 301-415-6792 or Email: Christina.Antonescu@nrc.gov) five days prior to the meeting, if possible, so that appropriate arrangements can be made. Thirty-five hard copies of each presentation or handout should be provided to the DFO thirty minutes before the meeting. In addition, one electronic copy of each presentation should be emailed to the DFO one day before the meeting. If an electronic copy cannot be provided within this timeframe, presenters should provide the DFO with a CD containing each presentation at least thirty minutes before the meeting. Electronic recordings will be permitted only during those portions of the meeting that are open to the public.

Detailed procedures for the conduct of and participation in ACRS meetings were published in the **Federal Register** on October 21, 2015, (80 FR 63846).

Detailed meeting agendas and meeting transcripts are available on the NRC Web site at <http://www.nrc.gov/reading-rm/doc-collections/acrs>. Information regarding topics to be discussed, changes to the agenda, whether the meeting has been canceled or rescheduled, and the time allotted to present oral statements can be obtained from the Web site cited above or by contacting the identified DFO. Moreover, in view of the possibility that the schedule for ACRS meetings may be adjusted by the Chairman as necessary to facilitate the conduct of the meeting, persons planning to attend should check with these references if such rescheduling would result in a major inconvenience.

If attending this meeting, please enter through the One White Flint North building, 11555 Rockville Pike, Rockville, MD. After registering with security, please contact Mr. Theron Brown (Telephone 240-888-9835) to be escorted to the meeting room.

Dated: October 18, 2016.

Mark L. Banks,

Chief, Technical Support Branch, Advisory Committee on Reactor Safeguards.

[FR Doc. 2016-25767 Filed 10-24-16; 8:45 am]

BILLING CODE 7590-01-P

NUCLEAR REGULATORY COMMISSION

Advisory Committee on Reactor Safeguards (ACRS); Meeting of the ACRS Subcommittee on Planning and Procedures; Notice of Meeting

The ACRS Subcommittee on Planning and Procedures will hold a meeting on November 3, 2016, Room T-2B3, 11545 Rockville Pike, Rockville, Maryland.

The meeting will be open to public attendance with the exception of a portion that may be closed pursuant to 5 U.S.C. 552b(c)(2) and (6) to discuss organizational and personnel matters that relate solely to the internal personnel rules and practices of the ACRS, and information the release of which would constitute a clearly unwarranted invasion of personal privacy.

The agenda for the subject meeting shall be as follows:

Thursday, November 3, 2016—12:00 p.m. Until 1:00 p.m.

The Subcommittee will discuss proposed ACRS activities and related matters. The Subcommittee will gather

information, analyze relevant issues and facts, and formulate proposed positions and actions, as appropriate, for deliberation by the Full Committee.

Members of the public desiring to provide oral statements and/or written comments should notify the Designated Federal Official (DFO), Quynh Nguyen (Telephone 301-415-5844 or Email: Quynh.Nguyen@nrc.gov) five days prior to the meeting, if possible, so that arrangements can be made. Thirty-five hard copies of each presentation or handout should be provided to the DFO thirty minutes before the meeting. In addition, one electronic copy of each presentation should be emailed to the DFO one day before the meeting. If an electronic copy cannot be provided within this timeframe, presenters should provide the DFO with a CD containing each presentation at least thirty minutes before the meeting. Electronic recordings will be permitted only during those portions of the meeting that are open to the public. Detailed procedures for the conduct of and participation in ACRS meetings were published in the **Federal Register** on October 21, 2015 (80 FR 63846).

Information regarding changes to the agenda, whether the meeting has been canceled or rescheduled, and the time allotted to present oral statements can be obtained by contacting the identified DFO. Moreover, in view of the possibility that the schedule for ACRS meetings may be adjusted by the Chairman as necessary to facilitate the conduct of the meeting, persons planning to attend should check with the DFO if such rescheduling would result in a major inconvenience.

If attending this meeting, please enter through the One White Flint North building, 11555 Rockville Pike, Rockville, MD. After registering with security, please contact Mr. Theron Brown (240-888-9835) to be escorted to the meeting room.

Dated: October 18, 2016.

Mark L. Banks,

Chief, Technical Support Branch, Advisory Committee on Reactor Safeguards.

BILLING CODE 7590-01-P

NUCLEAR REGULATORY COMMISSION

[NRC-2016-0101]

Superseded or Outdated Generic Communications

AGENCY: Nuclear Regulatory Commission.

ACTION: Generic communications; withdrawal.

SUMMARY: The U.S. Nuclear Regulatory Commission (NRC) is withdrawing selected generic communications because their guidance no longer provides useful information, their guidance is superseded by updated guidance, or the information can be more effectively made available to interested stakeholders by other means.

DATES: The effective date of the withdrawals is October 25, 2016.

ADDRESSES: Please refer to Docket ID NRC-2016-0101 when contacting the NRC about the availability of information regarding this document. You may obtain publicly-available information related to this document using any of the following methods:

- **Federal Rulemaking Web site:** Go to <http://www.regulations.gov> and search for Docket ID NRC-2016-0101. Address questions about NRC dockets to Carol Gallagher; telephone: 301-415-3463; email: Carol.Gallagher@nrc.gov. For technical questions, contact the individual listed in the **FOR FURTHER INFORMATION CONTACT** section of this document.

- **NRC's Agencywide Documents Access and Management System (ADAMS):** You may obtain publicly-available documents online in the ADAMS Public Documents collection at <http://www.nrc.gov/reading-rm/>

[adams.html](#). To begin the search, select "ADAMS Public Documents" and then select "Begin Web-based ADAMS Search." For problems with ADAMS, please contact the NRC's Public Document Room (PDR) reference staff at 1-800-397-4209, 301-415-4737, or by email to pdr.resource@nrc.gov. The ADAMS accession number for each document referenced is provided the first time that it is mentioned in this document.

- **NRC's PDR:** You may examine and purchase copies of public documents at the NRC's PDR, Room O1-F21, One White Flint North, 11555 Rockville Pike, Rockville, Maryland 20852.

FOR FURTHER INFORMATION CONTACT:

Angela M. Baxter, Office of Nuclear Reactor Regulation, U.S. Nuclear Regulatory Commission, Washington, DC 20555-0001; telephone: 301-415-2976; email: Angela.Baxter@nrc.gov.

SUPPLEMENTARY INFORMATION:

Discussion

A. General Information

The NRC performs periodic reviews of generic communications and withdraws them when they no longer provide useful information or are superseded by technological innovations or updated guidance. A withdrawal includes the original generic communication and any supplements or revisions. The NRC is currently publishing withdrawals of generic communications on a quarterly basis.

Withdrawal of the original generic communication and supplements, if applicable, will not affect the public's ability to obtain this information. The original generic communication and supplements will remain accessible through ADAMS and the NRC's generic communications Web site. The NRC's generic communication Web site will be updated to reflect the generic communications status as withdrawn. The generic communications Web site is accessible at <http://www.nrc.gov/reading-rm/doc-collections/gen-comm/>.

B. Withdrawals of Generic Communications

The following generic communications, by category, are withdrawn.

1. NRC Requests for Scheduling and Licensing Request Information

This class of generic communications includes NRC requests for licensing action estimates, scheduling of acceptance reviews to determine budget, and requests for advance notice to pursue license renewals. This class of generic communications are routine

correspondence from the NRC requesting licensees, on a voluntary basis, to submit information to assist in planning and budgeting resources. The submittal of this information is strictly voluntary. No specific action or written response is required. After the voluntary submittal period for this class of communication has expired, the document is no longer needed and, in most cases, has been superseded by a new request for the next fiscal year or time period. Therefore, the NRC is withdrawing the following generic communications:

- Administrative Letter (AL) 1998–03, “Operating Reactor Licensing Action Estimates,” May 6, 1998 (ADAMS Accession No. ML031110198);
- AL 1999–02, “Operating Reactor Licensing Action Estimates,” June 3, 1999 (ADAMS Accession No. ML031110137);
- Regulatory Issue Summary (RIS) 2000–04, “Operating Reactor Licensing Action Estimates,” March 16, 2000 (ADAMS Accession No. ML003687730);
- RIS 2001–08, “Operating Reactor Licensing Action Estimates,” April 2, 2001 (ADAMS Accession No. ML010880474);
- RIS 2001–21, “Licensing Action Estimates for Operating Reactors,” November 16, 2001 (ADAMS Accession No. ML012840123);
- RIS 2014–13, “Planned Licensing Action Submittals for all Power Reactor Licensees,” December 17, 2014 (ADAMS Accession No. ML14329A165);
- RIS 2008–01, “Process for Scheduling Acceptance Reviews Based on Notification of Applicant Submission Dates for Early Site Permits, Combined Licenses and Design Certifications and Process for Determining Budget Needs for Fiscal Year 2010,” January 10, 2008 (ADAMS Accession No. ML080030011);
- RIS 2009–03, “Process for Scheduling Acceptance Reviews of New Reactor Licensing Applications After April 2009 and Process for Determining Budget Needs For Fiscal Year 2011,” February 12, 2009 (ADAMS Accession No. ML083260416);
- RIS 2010–01, “Process for Scheduling Acceptance Reviews of New Reactor Licensing Applications and Process for Determining Budget Needs for Fiscal Year 2012,” February 3, 2010 (ADAMS Accession No. ML093230517);
- RIS 2010–03, “Licensing Submittal Information for Small Modular Reactor Designs,” February 25, 2010 (ADAMS Accession No. ML100260855);
- RIS 2010–10, “Process for Scheduling Acceptance Reviews of New Reactor Licensing Applications and Process for Determining Budget Needs for Fiscal Year 2013,” November 15,

2010 (ADAMS Accession No. ML102720901);

- RIS 2011–02, “Licensing Submittal Information and Design Development Activities for Small Modular Reactor Designs,” February 2, 2011 (ADAMS Accession No. ML103260128);
- RIS 2012–12, “Licensing Submittal Information and Design Development Activities for Small Modular Reactor Designs,” December 28, 2012 (ADAMS Accession No. ML12319A181);
- RIS 2013–08, “Process for Scheduling Acceptance Reviews of New Reactor Licensing and Design Certification Applications and Process for Determining Budget Needs for Fiscal Year 2016,” May 28, 2013 (ADAMS Accession No. ML13077A148);
- RIS 2013–18, “Licensing Submittal Information and Design Development Activities for Small Modular Reactor Designs,” November 15, 2013 (ADAMS Accession No. ML13263A227);
- RIS 2000–20, “Importance of Industry Providing NRC Advance Notice of Intent to Pursue License Renewal,” November 14, 2000 (ADAMS Accession No. ML003752145); and
- RIS 2003–02, “Importance of Giving NRC Advance Notice of Intent to Pursue License Renewal,” February 3, 2003 (ADAMS Accession No. ML030340042).

2. Generic Communications Withdrawn Because the Information Is Superseded, Out-Of-Date, No Longer Needed, or Being Provided to Interested Stakeholders in a Different Manner

- RIS 2002–08, “Availability of the Topical Report Program Description and Status on Staff Reviews on the NRC’s Web site,” dated May 22, 2002 (ADAMS Accession No. ML012760489), is withdrawn because this RIS informed industry that the publication of NUREG–0390, “Topical Report Review Status,” was being discontinued and all information contained within the NUREG would be available on the NRC’s Web site, <http://www.nrc.gov/about-nrc/regulatory/licensing/topical-reports.html>. This RIS is being withdrawn because the information within the NUREG has been replaced by technological innovations and is available electronically.

- Circular 1980–18, “10 CFR 50.59 [§ 50.59 of title 10 of the Code of Federal Regulations, “Changes, tests, and experiments”] Safety Evaluations for Changes to Radioactive Waste Treatment Systems,” dated August 22, 1980 (ADAMS Accession No. ML103420467), is withdrawn because the information is no longer applicable following the NRC rulemaking (65 FR 53613; October 4, 1999) that went into effect on March 13, 2001.

- The class of communications in reference to occupational dose or dose equivalent are withdrawn because the information contained within each RIS has been consolidated into the guidance in Regulatory Guide 8.40, “Methods for Measuring Effective Dose Equivalent from External Exposure,” dated July 31, 2010 (ADAMS Accession No. ML100610534). Therefore, these generic communications are being withdrawn:

- RIS 2002–06, “Evaluating Occupational Dose for Individuals Exposed to NRC-Licensed Material and Medical X-Rays,” April 16, 2002 (ADAMS Accession No. ML021080436);
- RIS 2003–04, “Use of the Effective Dose Equivalent in Place of the Deep Dose Equivalent in Dose Assessments,” February 13, 2003 (ADAMS Accession No. ML030370122);
- RIS 2004–01, “Method for Estimating Effective Dose Equivalent from External Radiation Sources Using Two Dosimeters,” February 17, 2004 (ADAMS Accession No. ML040420042); and
- RIS 2009–09, “Use of Multiple Dosimetry and Compartment Factors in Determining Effective Dose Equivalent from External Radiation Exposures, July 13, 2009 (ADAMS Accession No. ML082320040).

- GL 1989–17, “Planned Administrative Changes to the NRC Operator Licensing Written Exam Process,” September 6, 1989 (ADAMS Accession No. ML031140236), is withdrawn because the eligibility requirements for taking the generic fundamentals examination section has been incorporated into Revision 10 of NUREG–1021, “Operator Licensing Examination Standards for Power Reactors,” December 31, 2014 (ADAMS Accession No. ML14352A297).

Dated at Rockville, Maryland, this 19th day of October, 2016.

For the Nuclear Regulatory Commission.

Sheldon Stuchell,

*Chief, Generic Communications Branch,
Division of Policy and Rulemaking, Office
of Nuclear Reactor Regulation.*

[FR Doc. 2016–25750 Filed 10–24–16; 8:45 am]

BILLING CODE 7590–01–P

SECURITIES AND EXCHANGE COMMISSION

Submission for OMB Review; Comment Request

*Upon Written Request Copies Available
From: Securities and Exchange
Commission, Office of FOIA Services,
100 F Street NE., Washington, DC
20549–2736.*

Extension:

Securities Rule 477, SEC File No. 270-493, OMB Control No. 3235-0550.

Notice is hereby given that, pursuant to the Paperwork Reduction Act of 1995 (44 U.S.C. 3501 *et seq.*), the Securities and Exchange Commission (“Commission”) has submitted to the Office of Management and Budget this request for extension of the previously approved collection of information discussed below.

Rule 477 (17 CFR 230.477) under the Securities Act of 1933 (15 U.S.C. 77a *et seq.*) sets forth procedures for withdrawing a registration statement, including any amendments or exhibits to the registration statement. The rule provides that if an issuer intends to rely on the safe harbor contained in Securities Act Rule 155 to conduct an unregistered private offering of securities, the issuer must affirmatively state in the withdrawal application that it plans to undertake a subsequent private offering of its securities. Without this statement, the Commission would not be able to monitor a company’s reliance on, and compliance with, Securities Act Rule 155(c). All information submitted to the Commission under Securities Act Rule 477 is available to the public for review. Information provided under Securities Act Rule 477 is mandatory. The information is required on occasion. We estimate that approximately 327 issuers will file Securities Act Rule 477 submissions annually at an estimated one hour per response for a total annual burden of approximately 327 hours. We estimate that 100% of the reporting burden is prepared by the issuer.

An agency may not conduct or sponsor, and a person is not required to respond to, a collection of information unless it displays a currently valid control number.

The public may view the background documentation for this information collection at the following Web site, www.reginfo.gov. Comments should be directed to: (i) Desk Officer for the Securities and Exchange Commission, Office of Information and Regulatory Affairs, Office of Management and Budget, Room 10102, New Executive Office Building, Washington, DC 20503, or by sending an email to: Shagufta.Ahmed@omb.eop.gov; and (ii) Pamela Dyson, Director/Chief Information Officer, Securities and Exchange Commission, c/o Remi Pavlik-Simon, 100 F Street NE., Washington, DC 20549 or send an email to: PRA_Mailbox@sec.gov. Comments must be submitted to OMB within 30 days of this notice.

Dated: October 18, 2016.

Brent J. Fields,

Secretary.

BILLING CODE 8011-01-P

SECURITIES AND EXCHANGE COMMISSION

[Release No. 34-79122; File No. SR-DTC-2016-010]

Self-Regulatory Organizations; The Depository Trust Company; Notice of Filing and Immediate Effectiveness of a Proposed Rule Change To Allow DTC To Automate the Process for Participants To Submit Eligibility Requests for Older Issues

October 19, 2016.

Pursuant to Section 19(b)(1) of the Securities Exchange Act of 1934 (“Act”) ¹ and Rule 19b-4,² notice is hereby given that on October 14, 2016, The Depository Trust Company (“DTC”) filed with the Securities and Exchange Commission (“Commission”) the proposed rule change as described in Items I, II and III below, which Items have been prepared by DTC. DTC filed the proposed rule change pursuant to Section 19(b)(3)(A) of the Act ³ and Rule 19b-4(f)(4) thereunder.⁴ The proposed rule change was effective upon filing with the Commission. The Commission is publishing this notice to solicit comments on the proposed rule change from interested persons.

I. Clearing Agency’s Statement of the Terms of Substance of the Proposed Rule Change

The proposed rule change would amend the DTC Operational Arrangements for Securities to Become and Remain Eligible for DTC Services (“OA”) ⁵ and the DTC Underwriting Service Guide (“Guide”) ⁶ to allow DTC to automate the process by which Participants submit requests and related documents for Securities that are already issued and outstanding (“Older Issues”) to become eligible for Deposit and book-entry transfer services at DTC (“Older Issue Eligibility Requests”).⁷

¹ 15 U.S.C. 78s(b)(1).

² 17 CFR 240.19b-4.

³ 15 U.S.C. 78s(b)(3)(A).

⁴ 17 CFR 240.19b-4(f)(4).

⁵ Available at <http://www.dtcc.com/~media/Files/Downloads/legal/issue-eligibility/eligibility/operational-arrangements.pdf>.

⁶ Available at <http://www.dtcc.com/~media/Files/Downloads/Settlement-Asset-Services/Underwriting/Underwriting-Service-Guide.pdf>.

⁷ Capitalized terms not otherwise defined herein have the respective meanings set forth in the DTC Rules, By-laws and Organization Certificate

Upon its implementation, the proposed rule change would enhance efficiencies for Participants and DTC by providing a secure, centralized environment for the submission of Older Issue Eligibility Requests.

II. Clearing Agency’s Statement of the Purpose of, and Statutory Basis for, the Proposed Rule Change

In its filing with the Commission, the clearing agency included statements concerning the purpose of and basis for the proposed rule change and discussed any comments it received on the proposed rule change. The text of these statements may be examined at the places specified in Item IV below. The clearing agency has prepared summaries, set forth in sections A, B, and C below, of the most significant aspects of such statements.

(A) Clearing Agency’s Statement of the Purpose of, and Statutory Basis for, the Proposed Rule Change

1. Purpose

The proposed rule change would change the method of submission of Older Issue Eligibility Requests by Participants from the current email method to instead utilize DTC’s Securities Origination, Underwriting and Reliable Corporate Action Environment (“UW SOURCE”) for this purpose.⁸

In order for an Older Issue to be made eligible for Deposit and book-entry transfer services at DTC, a Participant must submit an Older Issue Eligibility Request to DTC ⁹ that evidences that the Older Issue meets DTC’s requirements for Securities to become and remain eligible for DTC services ¹⁰ as set forth in the OA (“Eligibility Requirements”).¹¹ The Older Issue Eligibility Request must at a minimum include a questionnaire (“Older

(“Rules”), available at <http://www.dtcc.com/legal/rules-and-procedures.aspx>.

⁸ UW SOURCE is an existing Internet-based system currently used by Participants to submit eligibility requests for newly-issued Securities (“New Issues”). See OA, *supra* note 5, at 1. The process for submitting eligibility requests for New Issues through UW SOURCE would not change as a result of the proposed rule change. See generally DTC UW Reengineering Web page, available at <http://dtcc.com/matching-settlement-and-asset-services/underwriting/uw-source-info> (providing background and links to additional information on UW SOURCE).

⁹ Only Participants can request that DTC make a Security eligible. See OA, *supra* note 5, at 1-2.

¹⁰ It is the responsibility of the Participant requesting eligibility for the Securities to provide evidence that the Securities satisfy the criteria set forth in DTC’s OA. See *id.*

¹¹ See OA, *supra* note 5, at 2-13 (for DTC’s eligibility criteria).

Eligibility Questionnaire”),¹² a copy of the Security certificate for the Older Issue, an attestation form signed by the “Agent”¹³ for the issue (“Agent Attestation Form”)¹⁴ and the original offering documents prepared by the issuer of the Older Issue (collectively, “Eligibility Request Documents”).¹⁵ Today, Participants submit Older Issue Eligibility Requests, including the Eligibility Request Documents, to DTC using email.

Pursuant to the proposed rule change, in an effort to improve processing efficiencies and provide a centralized, secure method for the submission of Older Issue Eligibility Requests, Participants would be required to submit their Older Issue Eligibility Requests, including required Eligibility Request Documents, through UW SOURCE with the designation as an “Eligibility Only” request.¹⁶ In other words, pursuant to the proposed rule change, rather than attaching the Eligibility Request Documents to an email message to be sent to a DTC email box as in the current method, Participants would instead transmit the Eligibility Request Documents to DTC

via online transmission by uploading the documents into UW SOURCE.¹⁷

Implementation of the proposed rule change would provide several advantages to Participants and DTC in relation to the current email-based method used for Participants to transmit Older Issue Eligibility Requests to DTC. First, UW SOURCE would enhance security in transmission of Older Issue Eligibility Requests by using a secure online system instead of the current email method.¹⁸ Second, use of UW SOURCE for this purpose would enhance transparency for Participants with respect to the status of their Older Issue Eligibility Requests.¹⁹ Third, the migration of this function to UW SOURCE would enhance efficiencies associated with DTC’s processing of Older Issue Eligibility Requests by providing an automated and centralized means of receiving and managing Eligibility Request Documents rather than having to manually retrieve them from multiple emails as it does today.

Proposed Changes to the OA and Guide Text

Pursuant to the proposed rule change, DTC would amend the text of the OA to:

- i. State that Eligibility Request Documents must be submitted through UW SOURCE;
- ii. update an Internet link to an informational page on DTCC’s Web site relating to UW SOURCE; and
- iii. update the copyright date of the OA.

In addition, DTC would amend the Guide to:

- i. Delete text indicating that Older Issue Eligibility Requests are submitted either by providing DTC with copies of security certificates or a file on a diskette, and replacing it with text that would reflect the proposed UW SOURCE-based submission process;
- ii. conform relevant text relating to the Older Issue Eligibility Request process to the text of the OA, as amended by this proposed rule change;
- iii. provide the Internet address for the OA in order for Participants to reference additional information on the Eligibility Requirements and related documentation; and
- iv. delete an incorrect statement indicating that when a certificate is

received in connection with an Older Issue Eligibility Request that does not have a CUSIP number assigned to it, DTC would facilitate the assignment of a CUSIP number.²⁰

Implementation Date

DTC would announce the implementation date for the proposed rule change via a DTC Important Notice.

2. Statutory Basis

Section 17A(b)(3)(F) of the Act²¹ requires that the rules of the clearing agency be designed, *inter alia*, to promote the prompt and accurate clearance and settlement of securities transactions. DTC believes that the proposed rule change is consistent with this provision of the Act because it would (i) improve processing efficiencies and provide for a more secure transmission method for Older Issue Eligibility Requests by replacing an email-based method of submission with a secure online submission method, and (ii) provide greater transparency to Participants by providing them with a direct online view into the status of their Older Issue Eligibility Requests. As a result, the proposed rule change would facilitate processing of Participant requests to make Older Issues eligible for Deposit and book-entry transfer services at DTC, and therefore promote the prompt and accurate clearance and settlement of securities transactions through DTC, consistent with the Act, in particular Section 17A(b)(3)(F) cited above.

Rule 17Ad–22(d)(6) promulgated under the Act²² requires that each registered clearing agency shall establish, implement, maintain and enforce written policies and procedures reasonably designed to, as applicable, be cost-effective in meeting the requirements of participants while maintaining safe and secure operations. DTC believes that the proposed rule change is consistent with Rule 17Ad–22(d)(6) because (i) by enhancing the efficiency of the processing of Older Issue Eligibility Requests without increasing costs to Participants to access the service,²³ the proposed rule change would be cost-effective in meeting requirements of Participants, and (ii) by processing Older Issue Eligibility Requests through UW SOURCE, a

¹² The Older Issue Eligibility Questionnaire is a form that a Participant must complete with respect to the Older Issue to provide DTC with the issuer’s name, issue description, CUSIP number, information relating to compliance with Eligibility Requirements, contact information, and other information required in order for DTC to process the issue. In addition, by signing the Older Eligibility Questionnaire, the Participant (i) represents and warrants (a) that the issuer complies with all applicable securities laws, rules and regulations, and banking regulations, (b) the registration or exemption status of the Older Issue under the Securities Act of 1933, and (c) that the information provided on the form is true, accurate and complete, (ii) agrees to indemnify DTC and its affiliates for any loss, damage, cost or expense, arising out of the eligibility request and the Deposit of the referenced Security, and (iii) certifies that it complies with the Rules regarding compliance with sanctions administered and enforced by the Office of Foreign Assets Control (OFAC) and that the Participant has implemented a risk-based OFAC compliance program. (See Rule 2, Section 8, *supra* note 7.).

¹³ “Agent” in the OA means an issuer’s auction agent, custodian, depository, dividend reinvestment plan administrator, exchange agent, issuing and/or paying agent, redemption agent, remarketing agent, registrar, tender agent, transfer agent, trustee, trust company, and/or any other person or entity acting in an agency capacity on behalf of the issuer. See OA, *supra* note 5, at 1.

¹⁴ By signing the Agent Attestation Form, the Agent for the issue represents that the Agent will comply with the requirements stated in the OA with respect to the issue upon acceptance of the issue as eligible for deposit at DTC.

¹⁵ Further documents and information (e.g., legal opinions, indemnifications and other documentation) may be required as part of the eligibility review. See OA, *supra* note 5, at 2–13.

¹⁶ Designating the submission as “Eligibility Only” in UW SOURCE signifies that the issue is not a New Issue and allows the Participant to deposit the Securities for the issue as soon as it has been made eligible by DTC.

¹⁷ The forms of the Eligibility Request Documents as described above would not change.

¹⁸ UW SOURCE is a secure, centralized online system managed by DTC, whereas Participant security protocols for the transmission of emails may vary.

¹⁹ UW SOURCE provides Participants with the ability to view the status of their eligibility request online and directly obtain the contact information for the DTC staff person that is handling the request.

²⁰ DTC performs this function in regards to its Custody Service. See the DTC Custody Service Guide, at 4, available at <http://www.dtcc.com/~media/Files/Downloads/legal/service-guides/Custody.pdf>.

²¹ 15 U.S.C. 78q–1(b)(3)(F).

²² 17 CFR 240.17Ad–22(d)(6).

²³ DTC does not charge Participants a fee for access to UW SOURCE.

centralized and secure online application, DTC would maintain safe and secure operations with respect to transmission and processing of such requests.

(B) Clearing Agency's Statement on Burden on Competition

DTC does not believe that the proposed rule change would have any adverse impact, or impose any burden, on competition because DTC does not charge a fee for access to UW SOURCE and therefore the proposal would not impose additional costs on Participants in this regard. In addition, the process for Participant's to register for UW SOURCE is transparent and available on DTCC's Web site²⁴ and identical to that used by Participants to register for DTC Web-based services generally. Moreover, because the proposed rule change improves the efficiency of the Older Issue Eligibility Request process, the proposed rule change may have a positive effect on competition among DTC Participants.

(C) Clearing Agency's Statement on Comments on the Proposed Rule Change Received From Members, Participants, or Others

DTC has not solicited and does not intend to solicit, comments regarding the proposed rule change. DTC has not received any unsolicited written comments from interested parties. To the extent DTC receives written comments on the proposed rule change, DTC will forward such comments to the Commission. DTC has issued an Important Notice to provide notice and related information with regard to the implementation of the proposal.²⁵

III. Date of Effectiveness of the Proposed Rule Change and Timing for Commission Action

The foregoing rule change has become effective pursuant to Section 19(b)(3)(A)²⁶ of the Act and paragraph (f) of Rule 19b-4²⁷ thereunder. At any time within 60 days of the filing of the proposed rule change, the Commission summarily may temporarily suspend such rule change if it appears to the Commission that such action is necessary or appropriate in the public interest, for the protection of investors,

or otherwise in furtherance of the purposes of the Act.

IV. Solicitation of Comments

Interested persons are invited to submit written data, views, and arguments concerning the foregoing, including whether the proposed rule change is consistent with the Act. Comments may be submitted by any of the following methods:

Electronic Comments

- Use the Commission's Internet comment form (<http://www.sec.gov/rules/sro.shtml>); or
- Send an email to rule-comments@sec.gov. Please include File Number SR-DTC-2016-010 on the subject line.

Paper Comments

- Send paper comments in triplicate to Secretary, Securities and Exchange Commission, 100 F Street NE., Washington, DC 20549.

All submissions should refer to File Number SR-DTC-2016-010. This file number should be included on the subject line if email is used. To help the Commission process and review your comments more efficiently, please use only one method. The Commission will post all comments on the Commission's Internet Web site (<http://www.sec.gov/rules/sro.shtml>). Copies of the submission, all subsequent amendments, all written statements with respect to the proposed rule change that are filed with the Commission, and all written communications relating to the proposed rule change between the Commission and any person, other than those that may be withheld from the public in accordance with the provisions of 5 U.S.C. 552, will be available for Web site viewing and printing in the Commission's Public Reference Room, 100 F Street NE., Washington, DC 20549 on official business days between the hours of 10:00 a.m. and 3:00 p.m. Copies of the filing also will be available for inspection and copying at the principal office of DTC and on DTCC's Web site (<http://dtcc.com/legal/sec-rule-filings.aspx>). All comments received will be posted without change; the Commission does not edit personal identifying information from submissions. You should submit only information that you wish to make available publicly. All submissions should refer to File Number SR-DTC-2016-010 and should be submitted on or before November 15, 2016.

For the Commission, by the Division of Trading and Markets, pursuant to delegated authority.²⁸

Brent J. Fields,
Secretary.

October 19, 2016.

I. Introduction

On July 1, 2016, NYSE MKT LLC ("NYSE MKT" or the "Exchange") filed with the Securities and Exchange Commission ("Commission"), pursuant to Section 19(b)(1) of the Securities Exchange Act of 1934 ("Act")¹ and Rule 19b-4 thereunder,² a proposed rule change to amend certain rules related to Flexible Exchange ("FLEX") Options. The proposed rule change was published for comment in the **Federal Register** on July 21, 2016.³ On August 30, 2016, the Exchange filed Amendment No. 1 to the proposed rule change. On August 31, 2016, pursuant to Section 19(b)(2) of the Act,⁴ the Commission designated a longer period within which to either approve the proposed rule change, disapprove the proposed rule change, or institute proceedings to determine whether to disapprove the proposed rule change.⁵ On September 27, 2016, the Exchange filed Amendment No. 2 to the proposed rule change, which superseded and replaced Amendment No. 1.⁶ On

¹ 15 U.S.C. 78s(b)(1).

² 17 CFR 240.19b-4.

³ See Securities Exchange Act Release No. 78348 (July 15, 2016), 81 FR 47469 ("Notice").

⁴ 15 U.S.C. 78s(b)(2).

⁵ See Securities Exchange Act Release No. 78744 (August 31, 2016), 81 FR 61725 (September 7, 2016). The Commission designated October 19, 2016 as the date by which it shall approve, disapprove, or institute proceedings to determine whether to disapprove the proposed rule change.

⁶ In Amendment No. 2, the Exchange: (1) Provided greater clarity regarding the operation of FLEX Binary Return Derivatives contracts ("ByRDs"), including specifying position limits applicable to FLEX ByRDs and indicating that FLEX ByRDs will be settled using VWAP settlement and European exercise style; (2) specified that Asian and Cliquet style settlement will be available for

²⁸ 17 CFR 200.30-3(a)(12).

October 19, 2016, the Exchange filed Amendment No. 3 to the proposed rule change.⁷ The Commission received no comments on the proposed rule change. The Commission is publishing this notice to solicit comment on Amendment Nos. 2 and 3 to the proposed rule change from interested persons, and is approving the proposed rule change, as modified by Amendment Nos. 2 and 3, on an accelerated basis.

II. Description of the Proposed Rule Change, as Modified by Amendment Nos. 2 and 3

FLEX Options are customized equity or index contracts that allow investors to tailor contract terms for exchange-listed equity and index options.⁸ The Exchange has proposed to modify the rules relating to FLEX Options to allow FLEX Options in ByRDs, make available additional settlement styles, modify how exercise prices and premiums are expressed, change certain provisions relating to floor-based trading, and modify other related provisions pertaining to FLEX Options.

A. FLEX ByRDs

The Exchange has proposed to allow market participants to trade FLEX options contracts in ByRDs. ByRDs are option contracts that have a fixed return in cash based on a set strike price and that may only be exercised at expiration pursuant to the Rules of the Options Clearing Corporation.⁹ ByRDs may be issued on individual stocks, Exchange-Traded Fund Shares, and Section 107 Securities, and must satisfy heightened listing standards.¹⁰ ByRDs are settled using a settlement price calculated from the all-day Volume-Weighted Average Price of the composite prices of the underlying security on the expiration

date (“VWAP”) and using a European exercise style.¹¹

Through the use of FLEX ByRDs,¹² market participants would be able to trade ByRDs with non-standard exercise prices, non-standard expiration dates, or both. FLEX ByRDs would be settled in the same manner as ByRDs, with all-day VWAP settlement and European exercise style.¹³ The Exchange would establish position limits for FLEX ByRDs that are the same as Non-FLEX ByRDs, as set forth in Rule 904ByRDs(a), although positions in FLEX ByRDs would be aggregated with positions in Non-FLEX ByRDs on the same or similar underlying for the purpose of calculating position limits.¹⁴ The Exchange stated that, in its view, FLEX ByRDs would enable market participants to negotiate terms that differ from standardized ByRDs and thereby provide greater opportunities for investors to manage risk through the use of FLEX Options.¹⁵

B. Alternative Settlement Styles: Asian and Cliquet

The Exchange has proposed to allow market participants to designate Asian or Cliquet settlement styles for FLEX Index Options on broad stock index groups.¹⁶ In its filing, the Exchange

noted that these settlement styles are currently offered by another options exchange.¹⁷

1. Asian Style Settlement

FLEX Index Options on broad stock index groups with Asian style settlement would be cash-settled call¹⁸ option contracts for which the final payout would be based on an arithmetic average of specified closing prices of an underlying broad stock index group taken on twelve predetermined monthly observation dates, including the expiration date (“Asian option”).¹⁹ Asian options would use a “preceding business day convention,” such that if the monthly observation date falls on a non-NYSE MKT business day, the monthly observation date would be the immediately preceding business day.²⁰ Asian options would have a term of approximately one year, ranging from 350 to 371 days from the date of initial listing.²¹ The contract multiplier would be determined in accordance with Rule 900G(b)(12) and, for Asian options that settle in U.S. Dollars, would be \$100.²² The exercise settlement amount would be the difference between the designated strike price and the observed average closing price.²³ Given that settlement value would be determined by observations taken over a 12-month period, Asian options would require the use of European exercise style.²⁴

In its filing, the Exchange provided the following example of an Asian option that expires in-the-money. On January 21, 2015, an investor hedging the value of XYZ Index over a year purchases an Asian FLEX call option expiring on January 22, 2016 with a strike price of 2000 and a contract multiplier of \$100. The option has monthly observation dates occurring on the 23rd of each month.

for FLEX ByRDs. See Amendment No. 2, at 4–5, n. 9. The Commission notes that the Exchange has agreed file a proposed rule change to provide additional clarity to several aspects of the rule. None of these changes impact the Commission’s analysis of this proposed rule change.

¹⁷ See Amendment No. 2, at 4 (citing Chicago Board Options Exchange, Inc. (“CBOE”) Rules 24A.1, 24A.4, 24B.1, 24B.4).

¹⁸ Puts would not be permitted. See proposed Rule 903G(b)(4).

¹⁹ See proposed Rule 900G(b)(18) (defining “Asian style settlement”); proposed Rule 903G(b)(4) (specifying terms for Asian options).

²⁰ See proposed Rule 900G(b)(18).

²¹ See proposed Rule 903G(b)(4).

²² See Notice, 81 FR at 47470; Rule 900G(b)(12).

²³ See Notice, 81 FR at 47470.

²⁴ See proposed Rule 900G(b)(18).

FLEX Index Options on broad stock index groups; (3) clarified that VWAP settlement will be available for FLEX Equity Options; and (4) removed its proposal to allow cash settlement of FLEX Options. Amendment No. 2 is available at the Exchange’s Web site and at <https://www.sec.gov/comments/sr-nysemkt-2016-48/nysemkt201648-2.pdf>.

⁷ In Amendment No. 3, the Exchange removed its proposal to allow VWAP settlement of FLEX Equity Options generally, although VWAP settlement would still be used for FLEX ByRDs. Amendment No. 3 is available at the Exchange’s Web site.

⁸ See Rule 900G(b)(1) (defining “FLEX Option”). See generally Section 15, Flexible Exchange Options, Rules 900G–909G.

⁹ See Rule 900ByRDs(b)(1).

¹⁰ See Rule 915ByRDs. For a description of “Exchange-Traded Fund Shares” and “Section 107 Securities,” see also Rule 915, Commentaries .06 and .11.

¹¹ See Rules 900ByRDs (b)(1), 910ByRDs.

¹² Proposed Rule 900G(b)(17) would define “FLEX ByRDs” to mean “a Binary Return Derivatives contract on any ByRDs-eligible underlying security that is subject to the rules in this Section.” Proposed Rule 900G(b)(22) would define “Non-FLEX ByRDs” to mean “a Non-FLEX Option that is a Binary Return Derivatives contract.” Proposed Rule 900G(b)(16) would revise the definition of “Series of FLEX Options” to provide that a such a series would consist of, “in the case of FLEX ByRDs, all such option contracts of the same class having the same expiration date, strike price, and exercise settlement amount.”

¹³ See proposed Rule 903G(c)(3)(ii). Proposed Rule 903G(c)(3)(i) would specify that settlement by physical delivery of the underlying security would apply to FLEX Equity Options other than FLEX ByRDs. See also Amendment No. 2, at 6. “FLEX Equity Option” is defined in Rule 900G(b)(10).

¹⁴ See proposed Rule 906G(b)(ii). For purposes of these position limits, long positions in “Finish Low” and short positions in “Finish High” ByRDs would be considered to be on the same side of the market; and short positions in “Finish Low” and long positions in “Finish High” ByRDs would be considered to be on the same side of the market. See *id.*

¹⁵ See Notice, 81 FR at 47470.

¹⁶ See Amendment No. 2, at 4. “FLEX Index Option” is defined in Rule 900G(b)(11). A “broad stock index group” is “a stock index which reflects representative stock market values or prices of . . . a broad segment of the stock market.” Rule 900C(b)(1). See also Rule 901C, Commentary .02 (specifying conditions that must be satisfied to trade options on a broad stock index group). Asian and Cliquet settlement styles would not be available

Monthly observation date ²⁵	XYZ Index closing value
23-Feb-15	2025.36
23-Mar-15	2049.34
23-Apr-15	2019.77
22-May-15	1989.65
23-Jun-15	2005.64
23-Jul-15	2035.10
21-Aug-15	2032.15
23-Sep-15	2076.18
23-Oct-15	2099.01
23-Nov-15	2109.32
23-Dec-15	2085.42
22-Jan-16	2084.81
Exercise (Averaged) Settlement Value	24,611.75/12 = 2050.98

In this example, the exercise settlement amount would be \$5,098. This amount would be determined by adding the 12 observed closing values for the XYZ index and dividing that amount by 12 (24,611.75/12), which is equal to 2050.98 (when rounded). The payout would be the difference between the exercise (averaged) settlement value and the strike price (2050.98 – 2000 = 50.98) multiplied by the contract multiplier (50.98 × \$100 = \$5,098). If alternatively, in the above example, the strike price was 2060, the contract would have expired out-of-the money. The option would not be exercised and would expire worthless because the strike price of 2060 would be more than the 2050.98 exercise settlement value.²⁶

2. Cliquet Style Settlement

FLEX Index Options on broad stock index groups with Cliquet style settlement would be cash-settled call²⁷ option contracts for which the final payout would be based on the greater of \$0 or the sum of monthly returns (*i.e.*, percent changes in the closing value of the underlying broad stock index group from one month to the next), subject to a monthly return “cap” (*e.g.*, 3%), applied over twelve monthly observation dates (“Cliquet option”).²⁸ Cliquet options would use a preceding business day convention and have a term of approximately one year, ranging from 350 to 371 days from the date of initial listing.²⁹ The contract multiplier would be determined in accordance with Rule 900G(b)(12) and, for Cliquet

options that settle in U.S. Dollars, would be \$100.³⁰

The parties to a Cliquet option would designate a set of monthly observation dates for each contract and an expiration date for each contract. The monthly observation date would be the date each month on which the closing price of the underlying broad stock index group would be observed for the purpose of calculating the exercise settlement value. In addition, the parties to a Cliquet option would designate a capped monthly return (*i.e.*, percent change in the closing values of the underlying broad stock index group from one month to the next month) for the contract, which would be the maximum monthly return that would be included in the calculation of the exercise settlement value for the contract. On each monthly observation date, the Exchange would determine the actual monthly return by computing the percent change between the closing value of the broad stock index group on the current monthly observation date versus its closing value on the previous monthly observation date. The Exchange would then compare the actual monthly return to the capped monthly return. The value used as the monthly return for a Cliquet option would be the lesser of the actual monthly return or the capped monthly return.

For example, if the actual monthly return of the underlying broad stock index group was 1.75% and the designated capped monthly return for a Cliquet option was 2%, the 1.75% value would be utilized (and not the 2%) as the value for the observation date to determine the exercise settlement value. Using this same example, if the actual monthly return of the underlying broad stock index group was 3.30%, the 2% value would be utilized (and not the 3.30%) as the value of the observation date to determine the exercise

settlement value. This latter example illustrates that Cliquet options have a capped upside. Cliquet options do not, however, have a capped downside for the monthly return that would be utilized in determining the exercise settlement value. Drawing on this same example, if the actual monthly return of the underlying broad stock index group was –4.07%, the –4.07% value would be utilized as the value for the observation date to determine the exercise settlement value. There would, however, be a floor for all Cliquet options in that if the sum of the monthly returns is negative, a Cliquet option would expire worthless.

Unlike other options, Cliquet options would not have a traditional exercise (strike) price. Rather, the exercise (strike) price field for a Cliquet option would represent the designated capped monthly return for the contract and would be expressed in dollars and cents. For example, a capped monthly return of 2.25% would be represented by the dollar amount of \$2.25. The “strike” price for a Cliquet option could only be expressed in a dollar and cents amount and the “strike” price for a Cliquet option could only span a range between \$0.05 and \$25.95.³¹ In addition, the “strike” price for a Cliquet option could only be designated in \$0.05 increments, *e.g.*, \$1.75, \$2.50, \$4.15.³² Increments of \$0.01 in the “strike” price field (representing the capped monthly return) would not be permitted.

The first “monthly” return for a Cliquet option would be based on the initial reference value, which would be the closing value of the underlying broad stock index group on the date a new Cliquet option is listed. The time period measured for the first “monthly” return would be between the initial listing date and the first monthly observation date. For example, if a

²⁵ Note that May 23, 2015 and August 23, 2015 fell on a weekend or holiday, so the business days immediately preceding those dates were used as the monthly observation dates.

²⁶ See Notice, 81 FR at 47470.

²⁷ Puts would not be permitted. See proposed Rule 903G(b)(5).

²⁸ See proposed Rule 900G(b)(19) (defining “Cliquet style settlement”); proposed Rule 903G(b)(5) (specifying terms for Cliquet options).

²⁹ See proposed Rule 900G(b)(19); proposed Rule 903G(b)(5).

³⁰ See Notice, 81 FR at 47470; Rule 900G(b)(12).

³¹ See proposed Rule 903G(b)(5).

³² See *id.*

Cliquet option was opened on January 1 and the parties designated the 31st of each month as the monthly observation date, the measurement period for the first monthly return would span the time period from January 1 to January 31. The time period measured for the second monthly return, and all subsequent monthly returns, would run from the 31st of one month to the 31st of the next month (or the last Exchange business day of each month depending on the actual number of calendar days in each month covered by the contract).

Cliquet options would have European exercise style and could not be exercised prior to the expiration date.³³ The exercise settlement value for Cliquet options would be equal to the initial reference price of the underlying broad stock index group multiplied by the sum of the monthly returns (with the cap applied) on the 12 consecutive monthly observation dates, which include the expiration date of the option, provided that the sum is greater than 0. If the sum of the monthly returns (with the applied cap) is 0 or less, the option would expire worthless.

In its filing, the Exchange provided the following example of a Cliquet option. On January 21, 2015, an investor hedging the value of XYZ Index over a year purchases a Cliquet FLEX call option expiring on January 22, 2016 with a capped monthly return of 2% and a contract multiplier of \$100. The initial reference price of XYZ Index (closing value) on January 21, 2015 is 2000. The option has monthly observation dates occurring on the 23rd of each month.

Monthly observation date ³⁴	XYZ Index closing value	Actual monthly return (percent)	Capped monthly return (percent) ³⁵	Sum of monthly returns (percent)
23-Feb-15	2025.36	1.27	1.27	1.27
23-Mar-15	2049.34	1.18	1.18	2.45
23-Apr-15	2019.77	-1.44	-1.44	1.01
22-May-15	1989.65	-1.49	-1.49	-0.48
23-Jun-15	2005.64	0.80	0.80	0.32
23-Jul-15	2035.10	1.47	1.47	1.79
21-Aug-15	2032.15	-0.14	-0.14	1.65
23-Sep-15	2076.18	2.17	2.00	3.65
23-Oct-15	2099.01	1.10	1.10	4.75
23-Nov-15	2109.32	0.49	0.49	5.24
23-Dec-15	2085.42	-1.13	-1.13	4.11
22-Jan-16	2084.81	-0.03	-0.03	4.08
Exercise Settlement Value	(4.08% * 2000.00) + 2 = 83.60			

In this example, the exercise settlement amount would be \$8,160. This amount would be determined by adding the capped monthly return for the XYZ Index on the 12 monthly observation dates, multiplying that amount by the initial reference price (4.08% * 2000 = 81.60) and adding that amount to the strike price ³⁶ (81.60 + 2 = 83.60), to arrive at an Exercise Settlement Value ("ESV") that is the greater of zero (0) or the result of this calculation (83.60). Having determined the ESV, the payout at expiration would be based upon how much the ESV exceeds the strike price, similar to options that utilize standard settlement styles. Therefore the payout would be the amount by which the ESV exceeds the strike price (83.60 - 2 = 81.60), multiplied by the contract multiplier (81.60 * \$100 = \$8,160). In contrast, if the sum of the capped monthly returns had been negative, this option would have expired worthless.³⁷

3. Surveillance for Asian and Cliquet Options

The Exchange stated that it would utilize the same procedures for FLEX Options utilizing the proposed settlement styles as it currently utilizes for other FLEX Options with standard settlement. The Exchange also represented that these surveillance procedures will be adequate to monitor trading in these options products. The Exchange noted that, for surveillance purposes, it would have access to information regarding trading activity in the pertinent underlying securities.³⁸

C. Exercise Prices and Premiums

The Exchange has proposed to modify how market participants may express exercise prices and premiums for FLEX Options. The Exchange noted that these modifications reflect changes in the marketplace and a move towards decimalization. The Exchange explained that when it adopted its rules for FLEX Options, strike prices were designated

in one-eighth of a dollar and options were priced in fractions of a dollar, whereas now certain Exchange rules have been revised to reflect the decimal equivalent of the previously approved fractional amount.³⁹ With respect to FLEX Equity Options, proposed Rule 903G(c)(2) would provide that exercise prices and premiums may be stated in terms of (i) a dollar amount; (ii) a method for fixing such a number at the time a FLEX Request for Quote or FLEX Order is traded; or (iii) a percentage of the price of the underlying security at the time of the trade or as of the close of trading on the Exchange on the trade date. The Exchange explained that this change would align the Exchange's treatment of FLEX Equity Options with its treatment of FLEX Index Options and also be consistent with the rules of another options exchange.⁴⁰

In addition, with respect to both FLEX Index Options and FLEX Equity Options, proposed Rule 903G(b)(1) and (c)(2) would provide that exercise prices

³³ See proposed Rule 900G(b)(19).

³⁴ Note that May 23, 2015 and August 23, 2015 fell on a weekend or holiday, so the business days immediately preceding those dates were used as the monthly observation dates.

³⁵ Note that on September 23, 2015, the observed actual monthly return was 2.17%. Because the

actual monthly return exceeded the 2% cap, the calculation utilized a capped monthly return of 2% for this observation date.

³⁶ The "strike price" for a Cliquet option would be determined by the agreed upon capped monthly return, which in this example is 2%.

³⁷ See Notice, 81 FR at 47470-72.

³⁸ See *id.* at 47472.

³⁹ See *id.*

⁴⁰ See *id.* (citing CBOE Rule 24A.4(b)(2), (c)(2)).

may be rounded to the nearest minimum tick or other decimal increment determined by the Exchange on a class-by-class basis that may not be smaller than \$0.01 and exercise premiums will be rounded to the nearest minimum tick. Additionally, for exercise prices and premiums stated using a percentage based methodology, such values may be stated in a percentage increment determined by the Exchange on a class-by-class basis that may not be smaller than 0.01% and will be rounded as described above.⁴¹ The Exchange noted that this proposed change is consistent with the rules of another options exchange.⁴² Finally, the Exchange proposed to remove a reference to fractional pricing from Rule 903G(a)(3)(i).⁴³ The Exchange stated that, in its view, this change would provide market participants with greater flexibility to create an options contract tailored to an investor's needs.⁴⁴

D. FLEX Officials and Trading Posts

Currently under the FLEX rules, the FLEX Specialist is responsible for handling various aspects of FLEX Options, including receiving and displaying the terms of Requests for Quotes. The Exchange has proposed to delete these references to a FLEX Specialist and replace them with a floor official, to be known as a "FLEX Official."⁴⁵ A "FLEX Official" would be an Exchange employee that has regulatory responsibility for reviewing FLEX trades for adherence to the terms and specifications in the FLEX rules.⁴⁶

Under the proposal, the Exchange would be able, at any time, to designate an Exchange employee to act as a FLEX Official in one or more classes of FLEX Options and to designate other qualified employees to assist the FLEX Official as needed.⁴⁷ This FLEX Official would be responsible for: (i) Reviewing the conforming of FLEX Requests for Quotes and FLEX Quotes to the terms and specifications contained in Rule 903G (Terms of FLEX Options); (ii) posting FLEX Requests for Quotes for dissemination; (iii) determining the BBO; (iv) ensuring that FLEX contracts are executed in conformance with the priority principles set forth in Rule 904G (FLEX Trading Procedures and

Principles); and (v) calling upon Specialists to make FLEX Quotes in specific classes of FLEX Equity Options as provided in Rule 927NY(c), which sets forth the obligations of Specialists.⁴⁸ The Exchange noted that these provisions relating to a FLEX Official are consistent with the rules of another options exchange that trades FLEX Options.⁴⁹

Additionally, the Exchange has proposed to revise its rules to reflect that in its current trading environment, FLEX Requests for Quotes and FLEX Quotes are "disseminated," rather than "displayed."⁵⁰ The Exchange explained that at the time when it introduced FLEX Options, the Exchange displayed FLEX Requests for Quotes and FLEX Quotes at physical FLEX posts. However, according to the Exchange, as FLEX Option trading gained in popularity, it became apparent that liquidity for FLEX Options was more readily available at the trading posts where the standard options in the underlying security traded, rather than the specific FLEX post. The Exchange explained that, over time, floor participants asked floor brokers to use various means to communicate the existence of trading interest.⁵¹ Additionally, the Exchange has proposed to remove the modifier "FLEX" from before "post" in Rule 904G(b)(i) because there are no longer specific physical FLEX posts on the trading floor.⁵²

E. Additional Changes

The Exchange has proposed several additional modifications to the FLEX Options Rules. First, the Exchange has proposed to amend the title of Section 15 to add the abbreviation "FLEX."⁵³ In

addition, the Exchange has proposed to replace references to "Registered Options Traders" in the FLEX rules with the term "Floor Market Makers."⁵⁴ The Exchange explained that this change in terminology is consistent with a recent rule change approved by the Commission.⁵⁵ Further, the Exchange has proposed to remove obsolete references to Deutsche Marks and French Francs because these foreign currencies are no longer in circulation.⁵⁶ Additionally, the Exchange has proposed to modify Rule 909G(c) to update a cross-reference to rules pertaining to specialists' financial requirements by adding a reference to Rule 927NY(c)(1) and removing obsolete references to Rule 171 and Rule 950(h).⁵⁷

The Exchange also has proposed to clarify that each FLEX Request for Quotes or FLEX contract must contain, as a contract term, either the underlying security in the case of FLEX Equity Options or (rather than "and") an underlying index in the case of FLEX Index Options.⁵⁸ In addition, the Exchange has proposed to make a non-substantive change to Rule 903G(c)(4) to clarify the reference to Rule 805 of the Options Clearing Corporation.⁵⁹ Moreover, the Exchange has proposed to clarify that the minimum value size of one contract for FLEX Options applies to quotations, in addition to the transactions specified in the current rule text.⁶⁰ Finally, the Exchange has proposed that FLEX Options will be permitted in puts and calls that do not have the same settlement style.⁶¹ The Exchange explained that it does not allow trading of a FLEX Option that has the exact same terms as a Non-FLEX

⁵⁴ See proposed Rules 900G(b)(4), 906G(a)(iv) and (b), 908G, 909G (updating title), and 909G(b).

⁵⁵ See Securities Exchange Act Release No. 59472 (February 27, 2009), 74 FR 9843, 9843 n.11 (March 6, 2009) (SR-NYSEALTR-2008-14) (noting that Exchange had indicated that Rules 900G through 909G would become outdated upon approval of the described rules and the Exchange represented it would review these rules and submit a separate filing to revise any outdated references).

⁵⁶ See proposed Rules 900G(b)(12), 903G(b)(3), 904G(g). See also Notice, 81 FR at 47473. The Exchange also proposed to make non-substantive changes to certain references to British Pounds. See proposed Rules 900G(b)(12), 904G(g).

⁵⁷ See proposed Rule 909G(c).

⁵⁸ See proposed Rule 903G(a)(2)(i).

⁵⁹ See proposed Rule 903G(c)(4).

⁶⁰ See proposed Rule 903G(a)(2)(vii). The Exchange explained that this proposed change aligns the rule text with the Commission's adoption on a permanent basis of a pilot program regarding minimum value sizes for opening transactions in new series of FLEX Options and FLEX Quotes. See Notice, 81 FR at 47473 (citing Securities Exchange Act Release No. 72536 (July 3, 2014), 79 FR 39425 (July 10, 2014) (SR-NYSEMKT-2014-21)).

⁶¹ See proposed Rule 903G, Commentary .01.

⁴¹ See proposed Rule 903G(b)(1), (c)(2).

⁴² See Notice, 81 FR at 47472 (citing CBOE Rule 24A.4(b)(2), (c)(2)).

⁴³ See proposed Rule 903G(a)(3)(i).

⁴⁴ See Notice, 81 FR at 47472.

⁴⁵ See proposed Rule 904G(a)(i)-(ii).

⁴⁶ See Notice, 81 FR at 47472-73. Proposed Rule 900G(b)(21) would define "FLEX Official" as "an Exchange employee designated to perform the FLEX Official functions set forth in Rule 910G."

⁴⁷ See proposed Rule 910G(a).

⁴⁸ See proposed Rule 910G(b). The Exchange also proposed to make a conforming change to change a reference from "FLEX Post Official" to "FLEX Official." See proposed Rule 927NY(c)(7).

⁴⁹ See Notice, 81 FR at 47472-73 (citing NYSE Arca, Inc. ("NYSEArca") Rules 5.30(b)(7), 5.38 (defining role of FLEX Post Official)). See also CBOE Rule 24A.5(a)(i), (ii) (specifying role of FLEX Post Official in handling Requests for Quotes); CBOE Rule 24A.12(b) (setting forth duties of FLEX Official).

⁵⁰ See proposed Rule 904G(a)(ii), (c)(i)-(iii).

⁵¹ See Notice, 81 FR at 47473. The Commission notes that the Exchange has represented that dissemination will permit market participants to transmit required information widely, including through wireless communications, cellular telephones, instant messaging, and other Exchange-approved communication devices. The Commission expects that the Exchange will properly surveil the use of such communications.

⁵² See proposed Rule 904G(b)(i). The Exchange also proposed to make a non-substantive change to Rule 904G(c)(ii) to replace a colon with a semicolon.

⁵³ See proposed Section 15. The Exchange has also proposed to delete an extraneous "t" from the word "the" in Rule 900G(a).

Option, but that if the option's underlying security, exercise style, expiration date, exercise price, or, as proposed, settlement style differs then it may be traded as a FLEX Option.⁶²

III. Discussion and Commission Findings

After careful review, the Commission finds that the proposed rule change is consistent with the requirements of the Act and the rules and regulations thereunder applicable to a national securities exchange.⁶³ In particular, the Commission finds that the proposed rule change is consistent with Section 6(b)(5) of the Act,⁶⁴ which requires, among other things, that the rules of a national securities exchange be designed to prevent fraudulent and manipulative acts and practices, to promote just and equitable principles of trade, to remove impediments to and perfect the mechanism of a free and open market and a national market system and, in general, to protect investors and the public interest.

The Exchange has proposed several amendments to its rules related to FLEX Options. These amendments modify rules related to FLEX Options to offer new alternative terms for FLEX Options and to update rule text to more accurately reflect trading in FLEX Options on the Exchange. As is discussed in more detail below, the Commission finds these changes consistent with the Act.

The proposal to allow ByRDs to trade as FLEX Equity Options on NYSE MKT will allow market participants to flex strike prices and expiration dates and thus obtain strike prices and expiration dates that are not available in the standardized market on the Exchange in ByRDs. In its approval order originally approving ByRDs for Exchange trading, the Commission noted that the heightened initial and continued listing standards, as well as the settlement price based on an all-day VWAP, were reasonably designed to address potential manipulation concerns.⁶⁵ Similarly, the Commission believes that specifying that FLEX ByRDs can only be traded on ByRDs-eligible underlying securities that meet the same heightened initial and continued listing standards as ByRDs, thereby helping to ensure that only highly capitalized, actively traded

stocks and ETFs will underlie cash-settled FLEX ByRDs, as well as requiring settlement based on all-day VWAP (as required for standardized ByRDs), should help to mitigate concerns about manipulation in the underlying security to benefit a position in FLEX ByRDs.

The Commission also believes that establishing position limits for FLEX ByRDs to be the same as Non-FLEX ByRDs position limits, which are currently 25,000 contracts on the same side of the market,⁶⁶ and aggregating positions in Flex ByRDs with Non-FLEX ByRDs on the same or similar underlying security for purposes of calculating position limits is reasonable and consistent with the Act. In approving position limits for ByRDs, the Commission noted that these position limits appeared to reasonably balance the promotion of a free and open market for these securities with minimization of incentives for market manipulation.⁶⁷ By establishing the same position limits for FLEX ByRDs as for Non-FLEX ByRDs and, importantly, aggregating such positions on the same side of the market,⁶⁸ the Commission similarly believes that the position limit requirements for FLEX ByRDs should help to ensure that the trading of FLEX ByRDs on the Exchange will not increase the potential for manipulation and could help to minimize such incentives. Finally, as noted above, because FLEX ByRDs must, like standardized ByRDs, be cash settled, European-style exercise, with a settlement price based on an all-day VWAP (and meet heightened listing and continued listing standards), unlike other FLEX Options, the only non-standardized terms that can be flexed are strike prices and expiration dates. The Commission notes that the Exchange has represented that it will be able to adequately surveil trading in FLEX ByRDs utilizing existing surveillance procedures pertaining to Non-FLEX ByRDs and FLEX Options.

The Commission believes that the Asian and Cliquet style settlements for FLEX Index Options on broad stock index groups may provide investors with additional trading and hedging tools. The Commission also believes that the Exchange's proposal to allow

Asian and Cliquet style settlement for FLEX Index Options on broad stock index groups may give investors and other market participants the ability to individually tailor, within specified limits, certain terms of those options. Furthermore, the Commission believes that, since both Asian and Cliquet settlement styles depend on multiple measurements in determining the settlement value, both settlement styles could help to mitigate the potential for manipulation in the underlying security(ies).

The Commission notes that the Exchange would use the same surveillance procedures currently utilized for the Exchange's FLEX Options with standard settlement to monitor trading in those options with Asian or Cliquet style settlement. The Exchange has represented that these surveillance procedures will be adequate to monitor trading in options on these option products. The Exchange has also stated that for surveillance purposes, the Exchange will have complete access to information regarding trading activity in the pertinent underlying securities.

The Commission believes that the proposed modification in how exercise prices and premiums for FLEX Equity Options are stated may provide greater flexibility for market participants to tailor a contract to the needs of the investor. In addition, the Commission believes that the proposal to specify how exercise prices and premium for FLEX Index Options and FLEX Equity Options will be rounded and how they will be stated using a percentage-based methodology should provide greater clarity and allow market participants to specify contracts that meet their particular needs. Moreover, the Commission believes that the proposal to remove a reference to fractional pricing is consistent with the shift to decimal pricing found elsewhere in the Exchange's rules and would promote internal consistency.

The Commission notes that the Exchange's proposal to replace certain duties of a FLEX Specialist with respect to FLEX Options transactions with duties assigned to a FLEX Official, who is an Exchange employee, is consistent with the FLEX rules of CBOE.⁶⁹ Under current rules, the FLEX Specialist is responsible for assuring that a Request for Quotes is submitted properly as a FLEX Option and for displaying the terms and specifications of the Request for Quotes. The Exchange now proposes to change these duties to a FLEX Official

⁶² See Notice, 81 FR at 47473.

⁶³ In approving this proposed rule change, the Commission has considered the proposed rule's impact on efficiency, competition, and capital formation. See 15 U.S.C. 78c(f).

⁶⁴ 15 U.S.C. 78f(b)(5).

⁶⁵ See Securities Exchange Act Release No. 56251 (August 14, 2007), 72 FR 46523, 76524 (August 20, 2007) (SR-Amex-2004-27) ("ByRDs Order").

⁶⁶ The exercise limits for FLEX ByRDs will be equivalent to the position limits for FLEX ByRDs described in Rule 906G(b)(ii). See Rule 907G.

⁶⁷ See ByRDs Order, 72 FR at 76525.

⁶⁸ For purposes of these position limits, long positions in "Finish Low" and short positions in "Finish High" ByRDs would be considered to be on the same side of the market; and short positions in "Finish Low" and long positions in "Finish High" ByRDs would be considered to be on the same side of the market. See proposed Rule 906G(b)(ii).

⁶⁹ See CBOE Rules 24A.5(a)(i) and (ii), 24A.12(b). See also NYSEArca Rules 5.30(b)(7), 5.38.

rather than a FLEX Specialist due to market structure changes. The new rules will set forth with specificity the particular functions and requirements of a FLEX Official to, among other things, ensure adherence to FLEX rules and call in a Specialist to make FLEX Quotes. The Exchange has represented that the FLEX Official would be an Exchange employee that reports to the regulatory officer of the Exchange. The Commission would expect the Exchange to ensure that such FLEX Official, or any other designated qualified employees called in to assist the FLEX Official as permitted under the new rule, are properly qualified and meet any necessary requirements. The regulatory oversight of FLEX transactions by a properly qualified FLEX Official could help to ensure that FLEX transactions comply with the FLEX rules. Therefore we find this change is consistent with the Act. The proposed conforming changes to other provisions in the Exchange rules would enhance clarity and consistency. Moreover, the Commission believes that the proposed changes to refer to FLEX Requests for Quotes and FLEX Quotes as being disseminated and remove the concept of a post specific to the trading of FLEX options will align the rules with current trading practices on the Exchange's floor.⁷⁰

Finally, the Commission believes that the proposal's minor, conforming, and technical revisions to Section 15, Rules 900G through 909G are consistent with the Act.

IV. Solicitation of Comments on Amendment Nos. 2 and 3

Interested persons are invited to submit written data, views, and arguments concerning whether Amendment Nos. 2 and 3 are consistent with the Act. Comments may be submitted by any of the following methods:

Electronic Comments

- Use the Commission's Internet comment form (<http://www.sec.gov/rules/sro.shtml>); or
- Send an email to rule-comments@sec.gov. Please include File Number SR-NYSEMKT-2016-48 on the subject line.

Paper Comments

- Send paper comments in triplicate to Brent J. Fields, Secretary, Securities and Exchange Commission, 100 F Street NE., Washington, DC 20549-1090. All submissions should refer to File Number SR-NYSEMKT-2016-48. This file number should be included on the

subject line if email is used. To help the Commission process and review your comments more efficiently, please use only one method. The Commission will post all comments on the Commission's Internet Web site (<http://www.sec.gov/rules/sro.shtml>). Copies of the submission, all subsequent amendments, all written statements with respect to the proposed rule change that are filed with the Commission, and all written communications relating to the proposed rule change between the Commission and any person, other than those that may be withheld from the public in accordance with the provisions of 5 U.S.C. 552, will be available for Web site viewing and printing in the Commission's Public Reference Room, 100 F Street NE., Washington, DC 20549 on official business days between the hours of 10:00 a.m. and 3:00 p.m. Copies of such filing also will be available for inspection and copying at the principal office of the Exchange. All comments received will be posted without change; the Commission does not edit personal identifying information from submissions. You should submit only information that you wish to make available publicly. All submissions should refer to File Number SR-NYSEMKT-2016-48, and should be submitted on or before November 15, 2016.

V. Accelerated Approval of Proposed Rule Change, as Modified by Amendment Nos. 2 and 3

The Commission finds good cause to approve the proposed rule change, as modified by Amendment Nos. 2 and 3, prior to the thirtieth day after the date of publication of the notice of Amendment Nos. 2 and 3 in the **Federal Register**. As discussed above, the proposed changes regarding the operation of FLEX ByRDs, including the delineation of applicable position limits and statement that FLEX ByRDs will be settled similar to Non-FLEX ByRDs, using all-day VWAP settlement and European exercise style, will provide additional clarity to the Exchange's rules concerning FLEX ByRDs. Similarly, the proposed changes to specify that Asian and Cliquet style settlement will be available only for FLEX Index Options on broad stock index groups remove potential for ambiguity about the operation of these settlement styles for FLEX Options. Furthermore, the Commission believes it is appropriate to have these changes incorporated into the rules of the Exchange concurrently with the changes noticed for comment in the original

filing. Additionally, deleting the proposal to permit cash settlement for all FLEX Equity Options other than FLEX ByRDs, and the corresponding provision that would permit the use of a VWAP settlement for FLEX Equity Options other than FLEX ByRDs, helps to ensure that the proposal does not raise investor protection and manipulation concerns and allows the Commission to no longer consider these provisions for consistency with the Act.

Accordingly, for the reasons noted above, the Commission finds good cause for approving the proposed rule change, as modified by Amendment Nos. 2 and 3, on an accelerated basis, pursuant to Section 19(b)(2) of the Act.⁷¹

VI. Conclusion

It is therefore ordered, pursuant to Section 19b(2) of the Act,⁷² that the proposed rule change (SR-NYSEMKT-2016-48), as modified by Amendment Nos. 2 and 3 thereto, be, and hereby is, approved on an accelerated basis.

For the Commission, by the Division of Trading and Markets, pursuant to delegated authority.⁷³

Brent J. Fields,
Secretary.

SECURITIES AND EXCHANGE COMMISSION

Sunshine Act Meeting

Notice is hereby given, pursuant to the provisions of the Government in the Sunshine Act, Public Law 94-409, that the Securities and Exchange Commission will hold a closed meeting on Thursday, October 27, 2016 at 2 p.m.

Commissioners, Counsel to the Commissioners, the Secretary to the Commission, and recording secretaries will attend the closed meeting. Certain staff members who have an interest in the matters also may be present.

The General Counsel of the Commission, or her designee, has certified that, in her opinion, one or more of the exemptions set forth in 5 U.S.C. 552b(c)(3), (5), (7), 9(B) and (10) and 17 CFR 200.402(a)(3), (a)(5), (a)(7), (a)(9)(ii) and (a)(10), permit consideration of the scheduled matter at the closed meeting.

Commissioner Piwowar, as duty officer, voted to consider the items listed for the closed meeting in closed session.

The subject matter of the closed meeting will be:

Institution and settlement of injunctive actions;

Institution and settlement of administrative proceedings;

Resolution of litigation claims;

Adjudicatory matters; and

Other matters relating to enforcement proceedings.

At times, changes in Commission priorities require alterations in the scheduling of meeting items.

For further information and to ascertain what, if any, matters have been added, deleted or postponed; please contact Brent J. Fields from the Office of the Secretary at (202) 551-5400.

Dated: October 20, 2016.

Brent J. Fields,
Secretary.

SECURITIES AND EXCHANGE COMMISSION

Sunshine Act Meeting

Notice is hereby given, pursuant to the provisions of the Government in the Sunshine Act, Public Law 94-409, that the Securities and Exchange Commission will hold an Open Meeting on Wednesday, October 26, 2016 at 10:00 a.m., in the Auditorium, Room L-002.

The subject matter of the Open Meeting will be:

- The Commission will consider whether to propose amendments to the proxy rules relating to the use of universal proxy cards and disclosure about voting options and voting standards in director elections.

- The Commission will consider whether to adopt rule amendments related to Securities Act Rules 147 and 504 to facilitate intrastate and regional securities offerings and whether to repeal Securities Act Rule 505.

At times, changes in Commission priorities require alterations in the scheduling of meeting items.

For further information and to ascertain what, if any, matters have been added, deleted, or postponed, please contact Brent J. Fields in:

The Office of the Secretary at (202) 551-5400.

Dated: October 19, 2016.

BILLING CODE 8011-01-P

SECURITIES AND EXCHANGE COMMISSION

Submission for OMB Review; Comment Request

Upon Written Request, Copies Available From: Securities and Exchange Commission, Office of FOIA Services, 100 F Street NE., Washington, DC 20549-2736.

Extension:

Rule 17a-3; SEC File No. 270-026, OMB Control No. 3235-0033.

Notice is hereby given that pursuant to the Paperwork Reduction Act of 1995 ("PRA") (44 U.S.C. 3501 *et seq.*), the Securities and Exchange Commission ("Commission") has submitted to the Office of Management and Budget ("OMB") a request for extension of the previously approved collection of information discussed below. The Code of Federal Regulation citation to this collection of information is the following rule: 17 CFR 240.17a-3.

Rule 17a-3 under the Securities Exchange Act of 1934 establishes minimum standards with respect to business records that broker-dealers registered with the Commission must make and keep current. These records are maintained by the broker-dealer (in accordance with a separate rule), so they can be used by the broker-dealer and reviewed by Commission examiners, as well as other regulatory authority examiners, during inspections of the broker-dealer.

The collections of information included in Rule 17a-3 are necessary to provide Commission, self-regulatory organization and state examiners to conduct effective and efficient examinations to determine whether broker-dealers are complying with relevant laws, rules, and regulations. If broker-dealers were not required to create these baseline, standardized records, Commission, self-regulatory organization and state examiners could be unable to determine whether broker-dealers are in compliance with the Commission's antifraud and anti-manipulation rules, financial responsibility program, and other Commission, SRO, and State laws, rules, and regulations.

As of April 1, 2016 there were 4,104 broker-dealers registered with the Commission. The Commission estimates that these broker-dealer respondents

incur a total burden of 2,763,566 hours per year to comply with Rule 17a-3.

In addition, Rule 17a-3 contains ongoing operation and maintenance costs for broker-dealers, including the cost of postage to provide customers with account information, and costs for equipment and systems development. The Commission estimates that under Rule 17a-3(a)(17), approximately 41,143,233 customers will need to be provided with information regarding their account on a yearly basis. The Commission estimates that the postage costs associated with providing those customers with copies of their account record information would be approximately \$13,577,267 per year ($41,143,233 \times \$0.33$).¹ The staff estimates that broker-dealers establishing liquidity, credit, and market risk management controls pursuant to Rule 17a-3(a)(23) incur one-time startup costs of \$924,000, or \$308,000 amortized over a three-year approval period, to hire outside counsel to review the controls. The staff further estimates that the ongoing equipment and systems development costs relating to Rule 17a-3 for the industry would be about \$30,677,094 per year. Consequently, the total cost burden associated with Rule 17a-3 would be approximately \$44,562,361 per year.

Rule 17a-3 does not contain record retention requirements. Compliance with the rule is mandatory. The required records are available only to the staffs of the Commission, self-regulatory organizations of which the broker-dealer is a member, and the states during examination, inspections and investigations.

An agency may not conduct or sponsor, and a person is not required to respond to, a collection of information under the PRA unless it displays a currently valid OMB control number.

The public may view the background documentation for this information collection at the following Web site, www.reginfo.gov. Comments should be directed to (i) Desk Officer for the Securities and Exchange Commission, Office of Information and Regulatory Affairs, Office of Management and Budget, Room 10102, New Executive Office Building, Washington, DC 20503, or by sending an email to: Shagufta.Ahmed@omb.eop.gov; and (ii) Pamela Dyson, Director/Chief Information Officer, Securities and Exchange Commission, c/o Remi Pavlik-Simon, 100 F Street NE., Washington, DC

20549, or by sending an email to: PRA_Mailbox@sec.gov. Comments must be submitted to OMB within 30 days of this notice.

Dated: October 18, 2016.

Brent J. Fields,
Secretary.

SECURITIES AND EXCHANGE COMMISSION

Submission for OMB Review; Comment Request

Upon Written Request Copies Available From: Securities and Exchange Commission, Office of FOIA Services, 100 F Street NE., Washington, DC 20549-2736.

Extension:

Form S-1; SEC File No. 270-058, OMB Control No. 3235-0065.

Notice is hereby given that, pursuant to the Paperwork Reduction Act of 1995 (44 U.S.C. 3501 *et seq.*), the Securities and Exchange Commission ("Commission") has submitted to the Office of Management and Budget ("OMB") this request for an extension of the previously approved collection of information discussed below.

Form S-1 (17 CFR 239.11) is used by domestic issuers who are not eligible to use other forms to register a public offering of their securities under the Securities Act of 1933 (15 U.S.C. 77a *et seq.*). The information collected is intended to ensure that the information required to be filed by the Commission permits verification of compliance with securities law requirements and assures the public availability of such information. Form S-1 takes approximately 667 hours per response and is filed by approximately 901 respondents. We estimate that 25% of the 667 hours per response (166.75 hours) is prepared by the registrant for a total annual reporting burden of 150,242 hours (166.75 hours per response $\times$ 901 responses).

An agency may not conduct or sponsor, and a person is not required to respond to, a collection of information unless it displays a currently valid OMB control number.

Georgia Disaster # GA-00081

AGENCY: U.S. Small Business Administration.

ACTION: Notice.

SUMMARY: This is a Notice of the Presidential declaration of a major disaster for the State of Georgia (FEMA-4284-DR), dated 10/17/2016.

Incident: Hurricane Matthew.

Incident Period: 10/04/2016 through 10/15/2016.

Dates: Effective Date: 10/17/2016.

Physical Loan Application Deadline Date: 12/16/2016.

Economic Injury (EIDL) Loan Application Deadline Date: 07/17/2017.

ADDRESSES: Submit completed loan applications to: U.S. Small Business Administration, Processing and Disbursement Center, 14925 Kingsport Road, Fort Worth, TX 76155.

FOR FURTHER INFORMATION CONTACT:

Alan Escobar, Office of Disaster Assistance, U.S. Small Business Administration, 409 3rd Street SW., Suite 6050, Washington, DC 20416.

SUPPLEMENTARY INFORMATION: Notice is hereby given that as a result of the President's major disaster declaration on 10/17/2016, applications for disaster loans may be filed at the address listed above or other locally announced locations.

The following areas have been determined to be adversely affected by the disaster:

Primary Counties (Physical Damage and Economic Injury Loans): Bryan, Bulloch, Chatham, Effingham, Glynn, McIntosh, Wayne.

Contiguous Counties (Economic Injury Loans Only):

Georgia: Appling, Brantley, Camden, Candler, Emanuel, Evans, Jenkins, Liberty, Long, Pierce, Screven, Tattnall.

South Carolina: Hampton, Jasper.

The Interest Rates are:

	Percent
<i>For Physical Damage:</i>	
Homeowners With Credit Available Elsewhere	3.125
Homeowners Without Credit Available Elsewhere	1.563
Businesses With Credit Available Elsewhere	6.250
Businesses Without Credit Available Elsewhere	4.000
Non-Profit Organizations Without Credit Available Elsewhere	2.625

The number assigned to this disaster for physical damage is 149238 and for economic injury is 149240.

Effective Date: 10/14/2016.

Physical Loan Application Deadline Date: 12/13/2016.

Economic Injury (EIDL) Loan Application Deadline Date: 07/12/2017.

ADDRESSES: Submit completed loan applications to: U.S. Small Business Administration, Processing and Disbursement Center, 14925 Kingsport Road, Fort Worth, TX 76155.

FOR FURTHER INFORMATION CONTACT: A Escobar, Office of Disaster Assistance, U.S. Small Business Administration, 409 3rd Street SW., Suite 6050, Washington, DC 20416.

SUPPLEMENTARY INFORMATION: Notice is hereby given that as a result of the President's major disaster declaration on 10/14/2016, applications for disaster loans may be filed at the address listed above or other locally announced locations.

The following areas have been determined to be adversely affected by the disaster:

Primary Counties (Physical Damage and Economic Injury Loans): Marion, Orangeburg.

Contiguous Counties (Economic Injury Loans Only):

South Carolina: Aiken, Bamberg, Barnwell, Berkeley, Calhoun, Clarendon, Colleton, Dillon, Dorchester, Florence, Georgetown, Horry, Lexington, Williamsburg.

The Interest Rates are:

	Percent
<i>For Physical Damage:</i>	

	Percent
Homeowners With Credit Available Elsewhere	3.125
Homeowners Without Credit Available Elsewhere	1.563
Businesses With Credit Available Elsewhere	6.250
Businesses Without Credit Available Elsewhere	4.000
Non-Profit Organizations With Credit Available Elsewhere ...	2.625
Non-Profit Organizations Without Credit Available Elsewhere	2.625
<i>For Economic Injury:</i>	
Businesses & Small Agricultural Cooperatives Without Credit Available Elsewhere	4.000
Non-Profit Organizations Without Credit Available Elsewhere	2.625

The number assigned to this disaster for physical damage is 149218 and for economic injury is 149220.

(Catalog of Federal Domestic Assistance Numbers 59002 and 59008)

Lisa Lopez-Suarez,

Acting Associate Administrator for Disaster Assistance.

SMALL BUSINESS ADMINISTRATION

[Disaster Declaration #14921 and #14922]

South Carolina Disaster Number SC-00040

AGENCY: U.S. Small Business Administration.

ACTION: Amendment 1.

SUMMARY: This is an amendment of the Presidential declaration of a major disaster for the State of SOUTH CAROLINA (FEMA-4286-DR), dated 10/14/2016.

Incident: Hurricane Matthew.

Incident Period: 10/04/2016 and continuing.

Effective Date: 10/17/2016.

Physical Loan Application Deadline Date: 12/13/2016.

EIDL Loan Application Deadline Date: 07/12/2017.

ADDRESSES: Submit completed loan applications to: U.S. Small Business Administration, Processing and Disbursement Center, 14925 Kingsport Road, Fort Worth, TX 76155.

FOR FURTHER INFORMATION CONTACT:

Alan Escobar, Office of Disaster Assistance, U.S. Small Business Administration, 409 3rd Street SW., Suite 6050, Washington, DC 20416.

SUPPLEMENTARY INFORMATION: The notice of the Presidential disaster declaration

for the State of South Carolina, dated 10/14/2016 is hereby amended to include the following areas as adversely affected by the disaster:

Primary Counties (Physical Damage and Economic Injury Loans):

Allendale, Bamberg, Barnwell, Beaufort, Colleton, Darlington, Dillon, Dorchester, Florence, Georgetown, Hampton, Jasper, Lee, Sumter, Williamsburg.

Contiguous Counties (Economic Injury Loans Only):

Georgia: Burke, Chatham, Effingham, Screven

North Carolina: Columbus, Robeson

South Carolina: Charleston,

Chesterfield, Kershaw, Marlboro, Richland

All other information in the original declaration remains unchanged.

SMALL BUSINESS ADMINISTRATION

[Disaster Declaration #14925 and #14926]

Florida Disaster #FL-00121

AGENCY: U.S. Small Business Administration.

ACTION: Notice.

SUMMARY: This is a Notice of the Presidential declaration of a major disaster for the State of Florida (FEMA-4283-DR), dated 10/17/2016.

Incident: Hurricane Matthew.

Incident Period: 10/03/2016 and continuing.

Effective Date: 10/17/2016.

Physical Loan Application Deadline Date: 12/16/2016.

Economic Injury (EIDL) Loan

Application Deadline Date: 07/17/2017.

ADDRESSES: Submit completed loan applications to: U.S. Small Business Administration, Processing and Disbursement Center, 14925 Kingsport Road, Fort Worth, TX 76155.

FOR FURTHER INFORMATION CONTACT: A Escobar, Office of Disaster Assistance, U.S. Small Business Administration, 409 3rd Street SW., Suite 6050, Washington, DC 20416.

SUPPLEMENTARY INFORMATION: Notice is hereby given that as a result of the President's major disaster declaration on 10/17/2016, applications for disaster loans may be filed at the address listed above or other locally announced locations.

The following areas have been determined to be adversely affected by the disaster:

Primary Counties (Physical Damage and Economic Injury Loans): Flagler, Putnam, Saint Johns, Volusia.

Contiguous Counties (Economic Injury Loans Only):

Florida: Alachua, Bradford, Brevard, Clay, Duval, Lake, Marion, Orange, Seminole.

The Interest Rates are:

	Percent
<i>For Physical Damage:</i>	
Homeowners With Credit Available Elsewhere	3.125
Homeowners Without Credit Available Elsewhere	1.563
Businesses With Credit Available Elsewhere	6.250
Businesses Without Credit Available Elsewhere	4.000
Non-Profit Organizations With Credit Available Elsewhere	2.625
Non-Profit Organizations Without Credit Available Elsewhere	2.625
<i>For Economic Injury:</i>	
Businesses & Small Agricultural Cooperatives Without Credit Available Elsewhere	4.000
Non-Profit Organizations Without Credit Available Elsewhere	2.625

The number assigned to this disaster for physical damage is 149258 and for economic injury is 149260.

DEPARTMENT OF STATE

[Public Notice: 9773]

Shipping Coordinating Committee: Amended Notice of Public Meeting

Notice is hereby given of a change in date and location of the Shipping Coordinating Committee (SHC) meeting announced in the **Federal Register** on September 30, 2016, 81 FR 67415. The meeting will be held at 9:00 a.m. on November 10, 2016, in Room 6i10-01-a of the Douglas A. Munro Coast Guard Headquarters Building at St. Elizabeth's, 2703 Martin Luther King Jr. Avenue SE., Washington, DC 20593. The primary purpose of the meeting is to prepare for the ninety-seventh session of the International Maritime Organization's (IMO) Maritime Safety Committee to be

held at the IMO Headquarters, United Kingdom, November 21–25, 2016. For the agenda, security requirements, and RSVP/contact information, please refer to the previous **Federal Register** notice. Reasonable accommodation requests should be made by November 3, 2016. Requests after that date might not be able to be fulfilled.

Dated: October 17, 2016.

Jonathan W. Burby,

Executive Secretary, Shipping Coordinating Committee, Department of State.

BILLING CODE 4710–09–P

SURFACE TRANSPORTATION BOARD

[Docket No. AB 55 (Sub-No. 750X)]

CSX Transportation, Inc.— Discontinuance of Service Exemption—in Clay, Marion, and Clinton Counties, Ill.

CSX Transportation, Inc. (CSXT), filed with the Board a petition ¹ under 49 U.S.C. 10502 for exemption from the provisions of 49 U.S.C. 10903 to discontinue rail service over an approximately 59.3-mile rail line on its Southern Region, Nashville Division, Illinois Subdivision between milepost BC 244.7, near Flora, and milepost BC 304.00, near Aviston, in Clay, Marion, and Clinton Counties, Ill. (the Line). The Line traverses United States Postal Service Zip Codes 62839, 62899, 62849, 62881, 62870, 62882, 62801, 62231, 62230, 62216, and 62219. The Line serves the stations of Kenner at milepost BC 247, Xenia at milepost BC 251, Greendale at milepost BC 258, Bannister at milepost BC 265, Salem at milepost BC 268, Odin at milepost BC 274, Shattuc at milepost BC 281, Ferrin at milepost BC 286, Carlyle at milepost BC 291, Beckemeyer at milepost BC 294, and Breese at milepost BC 299.

CSXT states that the Line contains the following federally granted rights-of-way, each by Legislative Act: mileposts

BC 274 to BC 274.9; mileposts BC 275.2 to BC 275.6; mileposts BC 280.35 to BC 281; mileposts BC 285.5 to BC 285.9; mileposts BC 292.5 to BC 293; and mileposts BC 295.5 to BC 296. Any documentation in CSXT's possession concerning title will be made available to those requesting it.

CSXT states that continued operation of the Line will create a burden on CSXT and on interstate commerce. According to CSXT, it operated the Line until June 10, 2016, when the Line was embargoed due to the condition of the ties on the Line. CSXT states that, before the embargo, the only commodity shipped by the last active shipper on the Line, ProBuild East, LLC (ProBuild), was lumber.

According to CSXT, the traffic on the Line is not sufficient to offset maintenance costs or the costs to rehabilitate the ties on the Line. CSXT states that local traffic on the Line has fallen to two cars in 2014, two cars in 2015, and no traffic to date in 2016. Additionally, CSXT states that all overhead traffic has been rerouted. CSXT proposes to discontinue service over the Line to avoid maintenance, inspection, operating, and rehabilitation costs while leaving the Line in place to be reactivated in the event traffic reemerges on the Line.

CSXT states that there is adequate alternate transportation available which ProBuild is using, and cites motor carrier options in the area and rail loading and unloading facilities at East St. Louis, Ill. According to CSXT, it does not believe that ProBuild will oppose the proposed discontinuance of service.

The interest of railroad employees will be protected by the conditions set forth in *Oregon Short Line Railroad—Abandonment Portion Goshen Branch Between Firth & Ammon, in Bingham & Bonneville Counties, Idaho*, 360 I.C.C. 91 (1979).

By issuance of this notice, the Board is instituting an exemption proceeding pursuant to 49 U.S.C. 10502(b). A final decision will be issued by January 23, 2017.

Because this is a discontinuance proceeding and not an abandonment proceeding, trail use/rail banking and public use conditions are not appropriate. Because there will be environmental review during abandonment, this discontinuance does not require an environmental review.

Any offer of financial assistance (OFA) under 49 CFR 1152.27(b)(2) to subsidize continued rail service will be due no later than February 2, 2017, or 10 days after service of a decision granting the petition for exemption, whichever occurs sooner. Each offer

must be accompanied by a \$1,600 filing fee. See 49 CFR 1002.2(f)(25).

All filings in response to this notice must refer to Docket No. AB 55 (Sub-No. 750X) and must be sent to: (1) Surface Transportation Board, 395 E Street SW., Washington, DC 20423–0001; and (2) Louis E. Gitomer, Law Offices of Louis E. Gitomer, LLC, 600 Baltimore Ave. Suite 301, Towson, MD 21204. Replies to this petition are due on or before November 14, 2016.

Persons seeking further information concerning discontinuance procedures may contact the Board's Office of Public Assistance, Governmental Affairs, and Compliance at (202) 245–0238 or refer to the full abandonment and discontinuance regulations at 49 CFR pt. 1152. Assistance for the hearing impaired is available through the Federal Information Relay Service (FIRS) at 1–800–877–8339.

Board decisions and notices are available on our Web site at “WWW.STB.GOV.”

Decided: October 20, 2016.

By the Board, Rachel D. Campbell,
Director, Office of Proceedings.

Kenyatta Clay,
Clearance Clerk.

BILLING CODE 4915–01–P

DEPARTMENT OF TRANSPORTATION

Federal Aviation Administration

Supplemental Type Certificate SA893CE (Original Product Type Certificate Number A4CE)

AGENCY: Federal Aviation Administration (FAA), DOT.

ACTION: Request for information on holder of supplemental type certificate (STC) prior to FAA declaring STC abandoned.

SUMMARY: This notice requests the current holder(s) (or their heirs) of STC SA893CE come forward and identify themselves; otherwise, the FAA will declare the STC as abandoned. This notice is issued in accordance with § 302 of the FAA Modernization and Reform Act of 2012,¹ partially codified as Title 49 of the United States Code (49 U.S.C.) § 44704(a)(5).

DATES: We must receive all correspondence by April 24, 2017.

FOR FURTHER INFORMATION CONTACT: Send all correspondence on this issue via certified mail to: Federal Aviation Administration, Chicago Aircraft

¹ CSXT initially filed the petition on August 31, 2016. By letter filed September 12, 2016, CSXT notified the Board that it had omitted two Zip Codes (62219 and 62231) from its notice. By letter filed September 19, 2016, CSXT notified the Board that it had republished the notice of the proposed discontinuance in a newspaper of general circulation in Marion and Clinton Counties, Ill. By letter dated October 5, 2016, CSXT stated that it omitted Zip Code 62219 only. Zip Code 66231, which was identified as omitted in CSXT's September 12 and 19 letters, was in fact included in its original petition. CSXT also filed with its October 5 letter copies of the certificates of publication and requested permission to amend Exhibit D of its petition to include the certificates. October 5, 2016 is therefore considered the filing date and the basis for all dates in this notice.

¹ Public Law 112–95.

Certification Office, 2300 East Devon Avenue, Room 107, Des Plaines, IL 60018. ATTN: JoWanna Jenkins, ACE-116C1. All letters must be signed. You may also contact Ms. Jenkins by phone at (847) 294-7145 or electronically at jowanna.jenkins@faa.gov.

SUPPLEMENTARY INFORMATION:

Background

The FAA has received a third party request for the release of data for STC SA893CE under the provisions the Freedom of Information Act (FOIA), 5 U.S.C. 552. The FAA cannot release the requested data under FOIA without the permission of the STC holder. The STC holder last listed on the certificate record is Mr. Wayne B. Millard in Minneapolis, MN. The FAA has been unsuccessful in contacting Mr. Millard by telephone, email, and/or certified mail. There has been no activity with this STC holder for more than 3 years.

Information Requested

If you are the owner, or heir, or a transferee of STC SA893CE, or have any knowledge regarding who may now hold STC SA893CE, please contact JoWanna Jenkins using a method described in the CONTACT INFORMATION of this notice. If you are the owner of STC SA893CE, you must provide a notarized copy of your Government issued identification (ID) with a letter and background establishing your ownership of the STC and/or relationship as the heir to the deceased holder of the STC (if that is the case).

Conclusion

If we do not receive any response by April 24, 2017, we will consider STC SA893CE abandoned and we will proceed with the release of the requested data.

Robert Busto,

Acting Manager, Small Airplane Directorate, Aircraft Certification Service.

BILLING CODE 4910-13-P

DEPARTMENT OF TRANSPORTATION

Federal Highway Administration

Notice of Statute of Limitations on Claims; Notice of Final Federal Agency Actions on Proposed Highway in California

AGENCY: Federal Highway Administration (FHWA), DOT.

ACTION: Notice of limitation on claims for judicial review of actions by the

California Department of Transportation (Caltrans), pursuant to 23 U.S.C. 326.

SUMMARY: The FHWA, on behalf of Caltrans, is issuing this notice to announce actions taken by Caltrans, that are final within the meaning of 23 U.S.C. 139(j)(1). The actions relate to a proposed highway project, located at the Galleria Boulevard/Stanford Ranch Road/State Route 65 interchange between post miles R5.4 to R6.4 in the County of Placer, State of California. Those actions grant licenses, permits, and approvals for the project.

DATES: By this notice, the FHWA, on behalf of Caltrans, is advising the public of final agency actions subject to 23 U.S.C. 139(j)(1). A claim seeking judicial review of the Federal agency actions on the highway project will be barred unless the claim is filed on or before March 24, 2017. If the Federal law that authorizes judicial review of a claim provides a time period of less than 150 days for filing such claim, then that shorter time period still applies.

FOR FURTHER INFORMATION CONTACT: For Caltrans: Adele Pommerenck, Senior Environmental Planner, California Department of Transportation—District 3, 703 B Street, Marysville, California, 95901, during normal business hours from 8:00 a.m. to 5:00 p.m., telephone (530) 741-4215 or email adele.pommerenck@dot.ca.gov.

SUPPLEMENTARY INFORMATION: Effective July 1, 2007, the Federal Highway Administration (FHWA) assigned, and the California Department of Transportation (Caltrans) assumed, environmental responsibilities for this project pursuant to 23 U.S.C. 326. Notice is hereby given that the Caltrans, has taken final agency actions subject to 23 U.S.C. 139(j)(1) by issuing licenses, permits, and approvals for the following highway project in the State of California: improve the Galleria Boulevard/Stanford Ranch Road/State Route 65 northbound ramps in Placer County, California, to reduce current and future traffic congestion, improve operations and safety, and comply with current Caltrans and local agency design standards. The project limits consist of State Route 65 at the Galleria Boulevard/Stanford Ranch Road interchange (post mile R5.4 to R6.4) and along Galleria Boulevard/Stanford Ranch Road between Five Star Boulevard and the State Route 65 southbound ramps intersection, in the cities of Roseville and Rocklin. The total length of the project is 0.4 miles along Galleria Boulevard/Stanford Ranch Road. The actions by the Federal agencies, and the laws under which

such actions were taken, are described in the Categorical Exclusion (CE) for the project, approved on 6/23/16, and in other documents in the FHWA project records. The CE and other project records are available by contacting Caltrans at the addresses provided above. This notice applies to all Federal agency decisions as of the issuance date of this notice and all laws under which such actions were taken, including but not limited to:

1. Council on Environmental Quality Regulations
2. National Environmental Policy Act of 1969, as amended, 42 U.S.C. 4321 *et seq.*
3. Federal-Aid Highway Act of 1970, 23 U.S.C. 109
4. MAP-21, the Moving Ahead for Progress in the 21st Century Act (Pub. L. 112-141)
5. Clean Air Act Amendments of 1990 (CAAA)
6. Clean Water Act of 1977 and 1987
7. Federal Water Pollution Control Act of 1972 (see Clean Water Act of 1977 & 1987)
8. Federal Land Policy and Management Act of 1976 (Paleontological Resources)
9. Noise Control Act of 1972
10. Safe Drinking Water Act of 1944, as amended

BILLING CODE 4910-22-P

DEPARTMENT OF TRANSPORTATION

Federal Motor Carrier Safety Administration

[Docket No. FMCSA-2016-0342]

Hours of Service of Drivers: American Concrete Pumping Association (ACPA); Application for Exemption

AGENCY: Federal Motor Carrier Safety Administration (FMCSA), DOT.

ACTION: Notice of application for exemption; request for comments.

SUMMARY: FMCSA announces that it has received an application from the American Concrete Pumping Association (ACPA) for an exemption from the 30-minute rest break provision of the Agency's hours-of-service (HOS) regulations for commercial motor vehicle (CMV) drivers. ACPA requests that concrete pump operators be allowed to use 30 minutes or more of on-duty "waiting time" to satisfy the requirement for the 30-minute rest break, provided they do not perform any other work during the break. The requested exemption would apply industry-wide to all concrete pump operators, concrete pumping companies and drivers who operate concrete pumps. Due to the nature of pumper operations, ACPA believes that compliance with the 30-minute rest break rule increases the risk of dangerous conditions on job sites. ACPA also asserts that concrete pump operators already take regular rest breaks throughout the typical day, depending on the work flow at the job site, so an additional 30-minute rest break does not enhance overall job safety. FMCSA requests public comment on ACPA's application for exemption.

DATES: Comments must be received on or before November 25, 2016.

ADDRESSES: You may submit comments identified by Federal Docket Management System Number FMCSA-2016-0342 by any of the following methods:

- **Federal eRulemaking Portal:** www.regulations.gov. See the *Public Participation and Request for Comments* section below for further information.

- **Mail:** Docket Management Facility, U.S. Department of Transportation, 1200 New Jersey Avenue SE., West Building, Ground Floor, Room W12-140, Washington, DC 20590-0001.

- **Hand Delivery or Courier:** West Building, Ground Floor, Room W12-140, 1200 New Jersey Avenue SE., between 9 a.m. and 5 p.m. E.T., Monday through Friday, except Federal holidays.

- **Fax:** 1-202-493-2251.

Each submission must include the Agency name and the docket number for this notice. Note that DOT posts all comments received without change to www.regulations.gov, including any personal information included in a comment. Please see the *Privacy Act* heading below.

Docket: For access to the docket to read background documents or comments, go to www.regulations.gov at any time or visit Room W12-140 on the ground level of the West Building, 1200 New Jersey Avenue SE., Washington, DC, between 9 a.m. and 5 p.m., ET, Monday through Friday, except Federal holidays. The on-line FDMS is available 24 hours each day, 365 days each year.

Privacy Act: In accordance with 5 U.S.C. 553(c), DOT solicits comments from the public to better inform its rulemaking process. DOT posts these comments, without edit, including any personal information the commenter provides, to www.regulations.gov, as described in the system of records notice (DOT/ALL-14 FDMS), which can be reviewed at www.dot.gov/privacy.

FOR FURTHER INFORMATION CONTACT: For information concerning this notice, please contact Mr. Tom Yager, Chief, FMCSA Driver and Carrier Operations Division; Telephone: (614) 942-6477; Email: MCPSPD@dot.gov. If you have questions on viewing or submitting material to the docket, contact Docket Services, telephone (202) 366-9826.

SUPPLEMENTARY INFORMATION:

I. Public Participation and Request for Comments

FMCSA encourages you to participate by submitting comments and related materials.

Submitting Comments

If you submit a comment, please include the docket number for this notice (FMCSA-2016-0342), indicate the specific section of this document to which the comment applies, and provide a reason for suggestions or recommendations. You may submit

your comments and material online or by fax, mail, or hand delivery, but please use only one of these means. FMCSA recommends that you include your name and a mailing address, an email address, or a phone number in the body of your document so the Agency can contact you if it has questions regarding your submission.

To submit your comment online, go to www.regulations.gov and put the docket number, "FMCSA-2016-0342" in the "Keyword" box, and click "Search." When the new screen appears, click on "Comment Now!" button and type your comment into the text box in the following screen. Choose whether you are submitting your comment as an individual or on behalf of a third party and then submit. If you submit your comments by mail or hand delivery, submit them in an unbound format, no larger than 8½ by 11 inches, suitable for copying and electronic filing. If you submit comments by mail and would like to know that they reached the facility, please enclose a stamped, self-addressed postcard or envelope. FMCSA will consider all comments and material received during the comment period and may grant or not grant this application based on your comments.

II. Legal Basis

FMCSA has authority under 49 U.S.C. 31136(e) and 31315 to grant exemptions from certain Federal Motor Carrier Safety Regulations (FMCSRs). FMCSA must publish a notice of each exemption request in the **Federal Register** (49 CFR 381.315(a)). The Agency must provide the public an opportunity to inspect the information relevant to the application, including any safety analyses that have been conducted. The Agency must also provide an opportunity for public comment on the request.

The Agency reviews safety analyses and public comments submitted, and determines whether granting the exemption would likely achieve a level of safety equivalent to, or greater than, the level that would be achieved by the current regulation (49 CFR 381.305). The decision of the Agency must be published in the **Federal Register** (49 CFR 381.315(b)) with the reasons for denying or granting the application and, if granted, the name of the person or class of persons receiving the exemption, and the regulatory provision from which the exemption is granted. The notice must also specify the effective period and explain the terms and conditions of the exemption. The exemption may be renewed (49 CFR 381.300(b)).

III. Request for Exemption

On December 27, 2011 (76 FR 81133), FMCSA published a final rule amending its hours-of-service (HOS) regulations for drivers of property-carrying CMVs. The final rule adopted several changes to the HOS regulations, including a provision requiring drivers to take a rest break during the work day under certain circumstances. Drivers may drive a CMV only if 8 hours or less have passed since the end of the driver's last off-duty or sleeper-berth period of at least 30 minutes. FMCSA did not specify when drivers must take the 30-minute break, but the rule requires that they wait no longer than 8 hours after the last off-duty or sleeper-berth period of that length or longer to take the break if they want to drive a CMV.

ACPA seeks an exemption from the 30-minute rest break provision in 49 CFR 395.3(a)(3)(ii). The requested exemption would apply industry-wide to all concrete pump operators, concrete pumping companies and drivers who deliver, set-up, and operate concrete pumps across the United States. ACPA currently represents more than 600 member companies employing over 7,000 workers nationwide. The exemption would be applied to all interstate concrete pumper trucks and their operators. Although many of the trucks operate intrastate and would therefore not be covered by an FMCSA exemption, an unknown number of the pumping trucks are operated in metropolitan areas and do routinely cross State lines.¹

ACPA requests the exemption for the following reasons: First, it argues that the mandatory 30-minute rest break increases the risk of dangerous conditions on job sites. A mandatory 30-minute rest break during which the concrete pump operator is considered to be "off-duty" would require the concrete pump to be shut down, and likely cleaned out. Stopping the flow of concrete through the pump creates the risk of introducing air in the pump's pipe system. When air gets in the pump's pipe system, the risk of hose whipping is created, which can injure not only the pump operator, but any personnel within reach of the hose.

Secondly, concrete pump operators already take rest breaks throughout the typical day that reflect the work flow at the job site, so an additional minimum

30-minute rest break does not enhance job safety.

ACPA states that when concrete companies expect a 9-hour job and it ends up being 2–3 hours longer, most of that additional time is spent waiting on concrete and doing nothing more than recirculating the concrete in the pump about every 10–15 minutes to avoid hardening and the introduction of air pockets in the pipe system. Only a small percentage of the concrete pump operator's time is spent driving. On average, concrete pump operators spend between 25–32% of their time driving during a shift, and average daily driving distances are 20–25 miles. Another 30-minute break limits the operator's ability to return the concrete pump to the shop within the daily 14-hour driving window.

According to ACPA, concrete is a perishable product. The perishable nature of concrete also creates difficult schedule coordination issues due to concrete being needed on a just-in-time basis. A concrete pump operator cannot plan the timing of the 30-minute break, as they cannot interrupt their work activity without the threat of failure—failure to accept and deliver concrete within its perishable limits and failure by violating their contracts. Once the ingredients of ready-mixed concrete have been combined, there is a brief window during which the product can be pumped (roughly 90 minutes before the concrete hardens). Should the concrete pump operator be required to take a 30-minute off-duty break, it would cause a ripple effect on the ready-mix concrete trucks in line to supply the pump. Such a delay could cost thousands of dollars to rectify and could potentially violate a delivery contract. Once the concrete pump starts to receive a delivery, it must be completed, without disruption to conduct a safe and structurally sound pour.

Furthermore, ACPA adds that concrete pumping and placement companies work in collaboration with ready-mixed companies. Scheduling local business contracts in compliance with State and Federal regulations incorporating the 30-minute rest break is incredibly complicated, verging on impossible in cases when some concrete companies operate under different FMCSA rules. ACPA mentioned that the ready-mixed drivers were granted an exemption from the minimum 30-minute rest break provision.² As a result

of this, if a concrete pump operator has worked 8 hours when the ready-mixed truck arrives, it is impossible for the concrete pump operator to take his or her 30-minute break since he/she has to place the concrete.

ACPA believes that granting this exemption would achieve the same level of safety provided by the rule requiring the 30-minute rest break. The Association states that the concrete pumping industry has a solid safety record, and that concrete pump operators already receive numerous breaks throughout the work day. The ACPA Operation Certification Program ensures, encourages, and educates the industry on safe pumping and placement procedures. These safety practices allow concrete operators to maintain their safety record through careful training and well-developed safety guidelines.

A copy of the ACPA's application for exemption is available for review in the docket for this notice.

Issued on: October 17, 2016.

BILLING CODE 4910-EX-P

DEPARTMENT OF TRANSPORTATION

Federal Motor Carrier Safety Administration

[Docket No. FMCSA–2016–0224]

Qualification of Drivers; Exemption Applications; Diabetes

AGENCY: Federal Motor Carrier Safety Administration (FMCSA), DOT.

ACTION: Notice of denials.

SUMMARY: FMCSA announces its denial of 74 applications from individuals who requested an exemption from the Federal diabetes standard applicable to interstate truck and bus drivers and the reasons for the denials. FMCSA has statutory authority to exempt individuals from the diabetes requirement if the exemptions granted will not compromise safety. The Agency has concluded that granting these exemptions does not provide a level of safety that will be equivalent to, or

service regulations, including the 30-minute break rule, who operates within a 100 air-mile radius of his/her normal work reporting location and meets certain other requirements [Pub. L. 114–94, 129 Stat. 1312, 1559, Dec. 4, 2015, codified at 49 U.S.C. 31502(f)]. In addition, FMCSA granted drivers of ready mixed concrete trucks an exemption from the 30-minute break requirement [80 FR 17819, April 2, 2015], which section 5206(b)(1)(A) of the FAST Act made into permanent law [129 Stat. 1312, 1537].

¹ FMCSA does not have jurisdiction over intrastate transportation; however, most States have commercial motor vehicle statutes and regulations that are compatible with Federal regulations. An FMCSA exemption only applies to interstate transportation, although some States honor them for intrastate traffic.

² More precisely, section 5521 of the Fixing America's Surface Transportation (FAST) Act, exempts a "driver of a ready mixed concrete delivery vehicle" from all of the normal hours-of-

greater than, the level of safety maintained without the exemptions for these commercial motor vehicle (CMV) drivers.

FOR FURTHER INFORMATION CONTACT: Ms. Christine A. Hydock, Chief, Medical Programs Division, (202) 366-4001, fmcsamedical@dot.gov, FMCSA, Department of Transportation, 1200 New Jersey Avenue SE., Room W64-113, Washington, DC 20590-0001. Office hours are 8:30 a.m. to 5 p.m., e.t., Monday through Friday, except Federal holidays.

SUPPLEMENTARY INFORMATION:

Background

Under 49 U.S.C. 31136(e) and 31315, FMCSA may grant an exemption from the Federal diabetes standard for a renewable 2-year period if it finds “such an exemption would likely achieve a level of safety that is equivalent to, or greater than, the level that would be achieved absent such an exemption.” The procedures for requesting an exemption are set forth in 49 CFR part 381.

Accordingly, FMCSA evaluated 74 individual exemption requests on their merits and made a determination that these applicants do not satisfy the criteria eligibility or meet the terms and conditions of the Federal exemption program. Each applicant has, prior to this notice, received a letter of final disposition on the exemption request. Those decision letters fully outlined the basis for the denial and constitute final Agency action. The list published in this notice summarizes the Agency’s recent denials as required under 49 U.S.C. 31315(b)(4) by periodically publishing names and reasons for denial.

The following 10 applicants met the diabetes requirements of 49 CFR 391.41(b)(3) and do not need an exemption:

Byron D. Benham (IL)
Donald D. Dixon, Sr. (IN)
Reggie L. Knight (NC)
Daniel Meza (TX)
Robert L. Middleton (NC)
Augustino M. Pang (NY)
Dana W. Rhoades (WA)
Gary W. Shreve (MI)
Robert B. Ulrich, Jr. (PA)
Kenneth D. Williams (GA)

The following 34 applicants were not operating CMVs in interstate commerce:

William F. Batz (NY)
Gregory A. Carroll (MD)
Fred J. Conti (PA)
Francis D.P. Desouza (PA)
Cory J. Dey (PA)
John R. Ebell (OR)
Harold K. Goebel (TX)

Evon L. Gray (PA)
Joseph L. Gutierrez (IL)
Joseph A. Haase (WI)
Jeffrey L. Hays (ID)
Pieter M. Hoeckman (CO)
Mary A. Jefferson (VA)
Randy W. Jones (NC)
Dennis V. Klima (KS)
Chi H. Ku (WI)
Vernard E. Lackey (OR)
Cory K. Malloy (NY)
David Marseille (NY)
Colton R. Martin (TX)
Gerasim J. Merculief (AK)
Luong G. Pham (OR)
Alphonso Rose (NH)
Paul Ross (GA)
Rafael A. Santana (MA)
Cole J. Schoennema (CA)
William C. Sexton, Jr. (VA)
Nicole B. Sherman (CT)
Kim D. Steinbeck (MA)
John C. Story (MT)
Randy L. Toy (PA)
Hartman P. Trabeaux (LA)
Tracy W. Williams (MD)
Mark E. Wilson (VA)

The following applicant, Raphael N. Haynes (NY), had renal insufficiency.

The following 8 applicants have had more than one hypoglycemic episode requiring hospitalization or the assistance of others, or has had one such episode but has not had one year of stability following the episode:

Glen A. Clark (DE)
Dana L. Guest (TN)
Jason P. Kunkle (PA)
Giasi A. Leite (GA)
David V. Marreel (NE)
Casey M. O'Reilly (PA)
Daniel A. Sorem (MN)
Michael D. Underwood (AL)

The following 6 applicants had other medical conditions making the applicant otherwise unqualified under the Federal Motor Carrier Safety Regulations:

Gordon R. Jockisch (IL)
Gerald P. Malone (IA)
Michael J. Perfect (WA)
Van A. Tenny (KS)
Jay M. Westerfer (PA)
Timothy A. Wright (OH)

The following applicant, Kenneth W. Wilson (BC), currently resides in Canada. He is not eligible because the Federal exemption is for drivers operating only in the United States.

The following 5 applicants did not meet the minimum age criteria outlined in 49 CFR 391.41(b)(1) which states that an individual must be at least 21 years old to operate a CMV in interstate commerce:

James C. Cox (TX)
Joseph M. Hall (NY)

Logan J. Kocher (PA)
Wilbur Robinson (SC)
Makhial J. Webb (CA)

The following 9 applicants were exempt from the diabetes standard:

David B. Anderson (VA)
Carlos J. Carames (NJ)
Ronald L. Cogan (OH)
Douglas L. Dudley (VA)
Michael Halsey (IN)
Frederick R. Haynes (MI)
Danny R. Knox (KY)
John M. Reichenberg (NJ)
Julia M. Seger (MD)

Issued on: October 14, 2016.

Larry W. Minor,

Associate Administrator for Policy.

BILLING CODE 4910-EX-P

DEPARTMENT OF TRANSPORTATION

National Highway Traffic Safety Administration

[Docket No. NHTSA-2016-0105]

Traffic Safety for Older Road Users Meeting

AGENCY: National Highway Traffic Safety Administration (NHTSA), U.S. Department of Transportation (DOT).

ACTION: Notice.

SUMMARY: The National Highway Traffic Safety Administration (NHTSA) is announcing a meeting that will be held in Washington, DC on November 3, 2016 to discuss older driver traffic safety program priorities and current research efforts. The Traffic Safety for Older Road Users meeting will include presentations and discussions on a number of topics including older driver demographics; research on understanding the dynamics, mechanisms, determinants and consequences of older driver safety; integration of law enforcement information, education of licensing agency personnel, aging services providers and medical personnel; identification and services for at-risk drivers; state and local mobility alternatives and the future potential of connected and automated vehicles for an aging population. Attendance at the meeting is limited to invited participants because of space limitations of the DOT Conference Center. However, the meeting will be available for live public viewing on the NHTSA Web site (www.nhtsa.gov).

DATES: The meeting will be held on November 3, 2016 from 9:00 a.m. to 4:30 p.m.

ADDRESSES: The meeting will be held in the Media Center of the U.S. Department

of Transportation, 1200 New Jersey Avenue SE., Washington, DC 20590.

FOR FURTHER INFORMATION CONTACT: Mr. Brian Chodrow, Telephone: 202-366-9765; email address: brian.chodrow@dot.gov.

SUPPLEMENTARY INFORMATION: NHTSA will host a meeting to focus on ways to improve the safety of older drivers over the next 5–10 years. The Traffic Safety for Older Road Users Meeting will begin with an introduction by NHTSA Administrator Mark Rosekind, followed by a discussion of the demographics of older road users, effective technologies to ensure safe driving for older people, and integrating information from law enforcement, licensing agencies, aging services providers and medical care providers. A panel discussion will then explore methods for identifying and serving at-risk drivers, leading to the identification of State and local alternatives. The meeting will conclude with a discussion on connected and automated vehicles—the future of mobility for an aging population.

Invited participants will include representatives from a number of fields including the behavioral and engineering sciences, traffic and highway safety, and public health, as well as from diverse organizations including advocacy groups, industry, state government, and other Federal Agencies.

NHTSA will facilitate sharing of important information regarding programs to improve the safety of older road users. Saving lives by preventing traffic deaths is a top priority of this Administration.

Workshop Procedures. NHTSA will conduct the meeting informally. Thus, technical rules of evidence will not

apply. The meeting will consist of presentations and panels. Each panel will have two or three short presentations, a roundtable discussion among the panel members, and participant questions to be discussed by the panel members and other meeting participants.

Authority: 49 U.S.C. 30182.

Issued in Washington, DC, on October 20, 2016.

Jeff Michael,

Associate Administrator, Research and Program Development.

BILLING CODE 4910–59–P

DEPARTMENT OF TRANSPORTATION

Pipeline and Hazardous Materials Safety Administration

Hazardous Materials: Notice of Applications for Special Permits

AGENCY: Pipeline and Hazardous Materials Safety Administration (PHMSA), DOT.

ACTION: List of applications for special permits.

SUMMARY: In accordance with the procedures governing the application for, and the processing of, special permits from the Department of Transportation's Hazardous Material Regulations (49 CFR part 107, subpart B), notice is hereby given that the Office of Hazardous Materials Safety has received the application described herein. Each mode of transportation for which a particular special permit is requested is indicated by a number in the "Nature of Application" portion of

the table below as follows: 1—Motor vehicle, 2—Rail freight, 3—Cargo vessel, 4—Cargo aircraft only, 5—Passenger-carrying aircraft.

DATES: Comments must be received on or before November 25, 2016.

ADDRESSES: *Address Comments to:* Record Center, Pipeline and Hazardous Materials Safety Administration, U.S. Department of Transportation, Washington, DC 20590.

Comments should refer to the application number and be submitted in triplicate. If confirmation of receipt of comments is desired, include a self-addressed stamped postcard showing the special permit number.

FOR FURTHER INFORMATION CONTACT: Ryan Paquet, Director, Office of Hazardous Materials Approvals and Permits Division, Pipeline and Hazardous Materials Safety Administration, U.S. Department of Transportation, East Building, PHH–30, 1200 New Jersey Avenue Southeast, Washington, DC 20590–0001, (202) 366–4535.

SUPPLEMENTARY INFORMATION: Copies of the applications are available for inspection in the Records Center, East Building, PHH–30, 1200 New Jersey Avenue Southeast, Washington, DC or at <http://regulations.gov>.

This notice of receipt of applications for special permit is published in accordance with Part 107 of the Federal hazardous materials transportation law (49 U.S.C. 5117(b); 49 CFR 1.53(b)).

Issued in Washington, DC, on September 20, 2016.

Donald Burger,

Chief, Office of the Special Permits and Approvals.

SPECIAL PERMITS DATA

Application No.	Docket No.	Applicant	Regulation(s) affected	Nature of the special permits thereof
20307–N	TESLA MOTORS, INC..	172.101(j) 173.185(a)	To authorize the transportation in commerce of low production and prototype lithium ion batteries in excess of 35 kg by cargo-only aircraft. (mode 4).	
20308–N	THE DOW CHEMICAL COMPANY.	172.203(a), 172.302(c), 180.605(h)(3).	To authorize transportation in commerce of UN portable tanks which have been periodically pressure tested using materials other than water. (modes 1, 2, 3).	

SPECIAL PERMITS DATA—Continued

Application No.	Docket No.	Applicant	Regulation(s) affected	Nature of the special permits thereof
20311-N	ESSEX INDUSTRIES, INC..	178.57(d)(3)	To authorize the manufacture, mark, sale, and use of non-DOT specification cylinders meeting the requirements of 4L cylinders except that the heat transfer from the atmosphere to the contents of the cylinder may exceed 0.0005 as specified herein. (modes 1, 2, 4).	
20312-N	S.C. JOHNSON & SON, INC..	173.306 (a)(5)(v)	To authorize the transportation in commerce of DOT Specification 25 and non-DOT specification plastic inside containers which are leak tested by an automated in-line pressure check in lieu of the hot water bath specified in the Hazardous Materials Regulations. (modes 1, 3, 4, 5).	
20313-N	TIER HOLDINGS, LLC.	173.244	To authorize the one-time, one-way transportation in commerce of sodium in non-DOT specification metal bulk tanks. (mode 1).	
20315-N	TRANSPORT LOGISTICS INTERNATIONAL, INC..	173.420 (a)(2)(i)	To authorize the one-time movement of uranium hexa-fluoride in non-authorized packaging. (mode 1).	
20321-N	COLMAC COIL MANUFACTURING, INC..	173.202	To authorize the transportation in commerce of methanol in non-UN specification packaging. (modes 1, 3).	
20322-N	C.H. & I. TECHNOLOGIES, INC..	178.33-1(a), 178.33a-1(a).	To authorize the transportation in commerce of refillable 2P and 2Q receptacles. (modes 1, 2, 3, 4, 5).	
20323-N	CAMX POWER	173.185(a)	To authorize the transportation of prototype and low production lithium ion and lithium metal cells and batteries. (mode 4).	
20324-N	BLUEFIN ROBOTICS CORPORATION.	173.185(a), 172.101(j).	To authorize the transportation of prototype lithium ion and lithium metal batteries exceeding 35 kg in non-specification packaging via cargo-only aircraft. (mode 4).	
20326-N	AVIATION INFLATABLES, INC..	173.302(a), 173.3(a), 175.3.	To authorize the transportation in commerce of non-DOT specification cylinders containing carbon dioxide and other non-flammable, non-toxic gases. (mode 1).	
20327-N	NUVERA FUEL CELLS, INC..	173.187	To authorize the transportation in commerce of a hydrogen generation apparatus containing less than 100 kg of Division 4.2, PG II solid material in non-DOT specification stainless steel pressure vessel, (modes 1, 3).	
20328-N	ENDURA PRODUCTS CORP..	172.203(a), 172.302(a), 177.834(h).	To obtain the ability to pump chemicals from the back of our trucks during delivery to oil-field locations. (mode 1).	
20330-N	ANADARKO PETROLEUM CORPORATION.	173.448(f)	To authorize the transportation of Class 7 materials aboard passenger-carrying aircraft. (mode 5).

AGENCY: Pipeline and Hazardous Materials Safety Administration (PHMSA), DOT.

ACTION: List of Applications for Modification of Special Permit.

SUMMARY: In accordance with the procedures governing the application for, and the processing of, special permits from the Department of Transportation's Hazardous Material Regulations (49 CFR part 107, subpart B), notice is hereby given that the Office of Hazardous Materials Safety has

received the application described herein. Each mode of transportation for which a particular special permit is requested is indicated by a number in the "Nature of Application" portion of the table below as follows: 1—Motor vehicle, 2—Rail freight, 3—Cargo vessel, 4—Cargo aircraft only, 5—Passenger-carrying aircraft.

DATES: Comments must be received on or before November 25, 2016.

ADDRESSES: Address Comments To: Record Center, Pipeline and Hazardous Materials Safety Administration, U.S. Department of Transportation, Washington, DC 20590.

Comments should refer to the application number and be submitted in triplicate. If confirmation of receipt of comments is desired, include a self-addressed stamped postcard showing the special permit number.

FOR FURTHER INFORMATION CONTACT: Ryan Paquet, Director, Office of

Hazardous Materials Approvals and Permits Division, Pipeline and Hazardous Materials Safety Administration, U.S. Department of Transportation, East Building, PHH-30, 1200 New Jersey Avenue Southeast, Washington, DC 20590-0001, (202) 366-4535.

SUPPLEMENTARY INFORMATION: Copies of the applications are available for inspection in the Records Center, East Building, PHH-30, 1200 New Jersey Avenue Southeast, Washington, DC, or at <http://regulations.gov>.

This notice of receipt of applications for special permit is published in accordance with Part 107 of the Federal hazardous materials transportation law (49 U.S.C. 5117(b); 49 CFR 1.53(b)).

Issued in Washington, DC, on October 14, 2016.

Donald Burger,

Chief, Office of the Special Permits and Approvals.

BILLING CODE 4909-60-M

DEPARTMENT OF THE TREASURY

Office of the Comptroller of the Currency

Agency Information Collection Activities: Information Collection Renewal; Comment Request; Affiliate Marketing

AGENCY: Office of the Comptroller of the Currency (OCC), Treasury.

ACTION: Notice and request for comment.

SUMMARY: The OCC, as part of its continuing effort to reduce paperwork and respondent burden, invites the general public and other Federal agencies to comment on the renewal of an information collection as required by the Paperwork Reduction Act of 1995 (PRA).

An agency may not conduct or sponsor, and a respondent is not required to respond to, an information collection unless it displays a currently valid Office of Management and Budget (OMB) control number.

The OCC is soliciting comment concerning the renewal of an information collection titled, "Affiliate Marketing."

DATES: Comments must be submitted on or before December 27, 2016.

ADDRESSES: Because paper mail in the Washington, DC area and at the OCC is subject to delay, commenters are encouraged to submit comments by email, if possible. Comments may be sent to: Legislative and Regulatory Activities Division, Office of the Comptroller of the Currency, Attention: 1557-0230, 400 7th Street SW., suite 3E-218, mail stop 9W-11, Washington, DC 20219. In addition, comments may be sent by fax to (571) 465-4326 or by electronic mail to prainfo@occ.treas.gov. You may personally inspect and photocopy comments at the OCC, 400 7th Street SW., Washington, DC 20219. For security reasons, the OCC requires that visitors make an appointment to inspect comments. You may do so by calling (202) 649-6700 or, for persons who are deaf or hard of hearing, TTY, (202) 649-5597. Upon arrival, visitors will be required to present valid

government-issued photo identification and submit to security screening in order to inspect and photocopy comments.

All comments received, including attachments and other supporting materials, are part of the public record and subject to public disclosure. Do not include any information in your comment or supporting materials that you consider confidential or inappropriate for public disclosure.

FOR FURTHER INFORMATION CONTACT: Shaquita Merritt, OCC Clearance Officer, (202) 649-5490 or, for persons who are deaf or hard of hearing, TTY, (202) 649-5597, Legislative and Regulatory Activities Division, Office of the Comptroller of the Currency, 400 7th Street SW., Washington, DC 20219.

SUPPLEMENTARY INFORMATION: Under the PRA (44 U.S.C. 3501-3520), Federal agencies must obtain approval from OMB for each collection of information that they conduct or sponsor. "Collection of information" is defined in 44 U.S.C. 3502(3) and 5 CFR 1320.3(c) to include agency requests or requirements that members of the public submit reports, keep records, or provide information to a third party. Section 3506(c)(2)(A) of title 44 requires Federal agencies to provide a 60-day notice in the **Federal Register** concerning each proposed collection of information, including each proposed extension of an existing collection of information, before submitting the collection to OMB for approval. To comply with this requirement, the OCC is publishing notice of the proposed collection of information set forth in this document.

Title: Fair Credit Reporting Affiliate Marketing.

OMB Control No.: 1557-0230.

Type of Review: Regular.

Frequency of Response: On occasion.

Affected Public: Businesses or other for-profit.

Estimated Number of Respondents: 97,723.

Total Annual Burden: 10,281 hours.

Description: Section 214 of the Fair and Accurate Credit Transactions Act of 2003 (FACT Act),¹ which added section 624 to the Fair Credit Reporting Act (FCRA),² generally prohibits a person

from using certain information received from an affiliate to make a solicitation for marketing purposes to the consumer, unless the consumer is given notice and an opportunity and simple method to opt out of such solicitations.

Twelve CFR 1022.20-1022.27 requires financial institutions to issue notices informing consumers about their rights under section 214 of the FACT Act. Consumers use the notices to decide if they want to receive solicitations for marketing purposes or opt out. Financial institutions use the consumers' opt-out responses to determine the permissibility of making a solicitation for marketing purposes.

If a person receives certain consumer eligibility information from an affiliate, the person may not use that information to make solicitations to the consumer about its products or services, unless the consumer is given notice and a simple method to opt out of such use of the information, and the consumer does not opt out. Exceptions include, a person using eligibility information: (1) To make solicitations to a consumer with whom the person has a pre-existing business relationship; (2) to perform services for another affiliate subject to certain conditions; (3) in response to a communication initiated by the consumer; or (4) to make a solicitation that has been authorized or requested by the consumer. A consumer's affiliate marketing opt-out election must be effective for a period of at least five years. Upon expiration of the opt-out period, the consumer must be given a renewal notice and an opportunity to renew the opt-out before information received from an affiliate may be used to make solicitations to the consumer.

Comments submitted in response to this notice will be summarized and included in the request for OMB approval. All comments will become a matter of public record. Comments are invited on:

(a) Whether the collection of information is necessary for the proper performance of the functions of the OCC, including whether the information has practical utility;

(b) The accuracy of the OCC's estimate of the information collection burden;

(c) Ways to enhance the quality, utility, and clarity of the information to be collected;

¹ Pub. L. 108-159, 117 Stat. 1952 (December 4, 2003).

² 15 U.S.C. 1681 *et seq.*

(d) Ways to minimize the burden of the collection on respondents, including through the use of automated collection techniques or other forms of information technology; and

(e) Estimates of capital or start-up costs and costs of operation, maintenance, and purchase of services to provide information.

Dated: October 19, 2016.

Karen Solomon,

Deputy Chief Counsel, Office of the Comptroller of the Currency.

DEPARTMENT OF THE TREASURY

Bureau of the Fiscal Service

Senior Executive Service; Fiscal Service Performance Review Board

AGENCY: Bureau of the Fiscal Service, Treasury.

ACTION: Notice.

SUMMARY: This notice announces the appointment of the members of the Fiscal Service Performance Review Board (PRB) for the Bureau of the Fiscal Service (Fiscal Service). The PRB reviews the performance appraisals of career senior executives who are below the level of Assistant Commissioner/Executive Director and who are not assigned to the Office of the Commissioner in the Fiscal Service. The PRB makes recommendations regarding proposed performance appraisals, ratings, bonuses, pay adjustments, and other appropriate personnel actions.

DATES: Effective on October 25, 2016.

FOR FURTHER INFORMATION CONTACT: Michael R. Goodwin, Acting Chief Human Capital Officer, Bureau of the Fiscal Service, (304) 480-5290.

SUPPLEMENTARY INFORMATION: This Notice announces the appointment of the following primary and alternate members to the Fiscal Service PRB:

Primary Members

Kimberly A. McCoy, Deputy Commissioner, Accounting and Shared Services, Fiscal Service

Lori Santamarena, Executive Director, Government Securities Regulations Staff, Fiscal Service

Stephen L. Manning, Deputy Commissioner for Finance & Administration/CIO, Fiscal Service

ALTERNATE MEMBER

Douglas Anderson, Assistant Commissioner, Shared Services, Fiscal Service

Authority: 5 U.S.C. 4314(c)(4).

Sheryl R. Morrow,
Commissioner.

BILLING CODE 4810-AL-P

DEPARTMENT OF THE TREASURY

Internal Revenue Service

Proposed Information Collection; Comment Request

AGENCY: Internal Revenue Service (IRS), Treasury.

ACTION: Notice and request for comments.

SUMMARY: The Department of the Treasury, as part of its continuing effort to reduce paperwork and respondent burden, invites the general public and other Federal agencies to take this

opportunity to comment on proposed and/or continuing information collections, as required by the Paperwork Reduction Act of 1995, Public Law 104–13 (44 U.S.C. 3506(c)(2)(A)).

DATES: Written comments should be received on or before December 27, 2016 to be assured of consideration.

ADDRESSES: Direct all written comments to Tuawana Pinkston, Internal Revenue Service, Room 6526, 1111 Constitution Avenue NW., Washington, DC 20224, or at Elaine.H.Christophe@irs.gov.

Please send separate comments for each specific information collection listed below. You must reference the information collection's title, form number, reporting or record-keeping requirement number, and OMB number (if any) in your comment.

FOR FURTHER INFORMATION CONTACT: To obtain additional information, or copies of the information collection and instructions, or copies of any comments received, contact Elaine Christophe, at Internal Revenue Service, Room 6526, 1111 Constitution Avenue NW., Washington, DC 20224, or through the internet, at Elaine.H.Christophe@irs.gov.

SUPPLEMENTARY INFORMATION:

Request for Comments

The Department of the Treasury and the Internal Revenue Service, as part of their continuing effort to reduce paperwork and respondent burden, invite the general public and other Federal agencies to take this opportunity to comment on the proposed or continuing information collections listed below in this notice, as required by the Paperwork Reduction Act of 1995, (44 U.S.C. 3501 *et seq.*).

Request for Comments: Comments submitted in response to this notice will be summarized and/or included in our request for Office of Management and Budget (OMB) approval of the relevant information collection. All comments will become a matter of public record. Please do not include any confidential or inappropriate material in your comments. We invite comments on: (a) Whether the collection of information is necessary for the proper performance of the agency's functions, including whether the information has practical utility; (b) the accuracy of the agency's estimate of the burden of the collection of information; (c) ways to enhance the quality, utility, and clarity of the information to be collected; (d) ways to minimize the burden of the collection of information on respondents, including the use of automated collection techniques or other forms of information technology; and (e) estimates of capital

or start-up costs and costs of operation, maintenance, and purchase of services to provide the requested information.

Currently, the IRS is seeking comments concerning the following forms, and reporting and record-keeping requirements:

Certified Professional Employer Organization (CPEO)

OMB Number: 1545–2266.

Form Numbers: 14737 and 14737–A.

Abstract: Section 206 of the Achieving a Better Life Experience (ABLE) Act passed Dec. 19, 2014) created the Certified Professional Employer Organization (CPEO) designation. The application, attestation and supporting information will be used by IRS to qualify professional employer organizations to become and remain a Certified Professional Employer Organization, which entitles them to certain tax benefits. This certification is renewed annually and the CPEO will submit annual and quarterly financial statements in addition to supporting documentation. Responsible individuals will submit annual attestation forms and fingerprint cards. Form 14737, Request for Voluntary IRS Certification of a Professional Employer Organization (Application), and Form 14737–A, CPEO Responsible Individual Personal Attestation, will only be used by program applicants and related responsible individuals. The accompanying Regulations and Revenue Procedures are currently in draft form and not yet published.

Current Actions: New Information Collection.

Type of Review: Extension of a currently approved collection.

Affected Public: Business or other for-profit organizations & individuals.

Estimated Number of Respondents: 1,250.

Estimated Time per Respondent: 240 hours.

Estimated Total Annual Burden Hours: 90,000.

The following paragraph applies to all of the collections of information covered by this notice:

An agency may not conduct or sponsor, and a person is not required to respond to, a collection of information unless the collection of information displays a valid OMB control number. Books or records relating to a collection of information must be retained as long as their contents may become material in the administration of any internal revenue law. Generally, tax returns and tax return information are confidential, as required by 26 U.S.C. 6103.

Approved: October 17, 2016.

Tuawana Pinkston,

IRS Supervisory Tax Analyst.

BILLING CODE 4830–01–P

DEPARTMENT OF THE TREASURY

Internal Revenue Service

Proposed Collection; Comment Request for Information Collection Tools

AGENCY: Internal Revenue Service (IRS), Treasury.

ACTION: Notice and request for comments.

SUMMARY: The Department of the Treasury, as part of its continuing effort to reduce paperwork and respondent burden, invites the general public and other Federal agencies to take this opportunity to comment on proposed and/or continuing information collections, as required by the Paperwork Reduction Act of 1995, Public Law 104–13 (44 U.S.C. 3506(c)(2)(A)). Currently, the IRS is soliciting comments concerning Form 940, Employer's Annual Federal Unemployment (FUTA) Tax Return, and Form 940–PR, Planilla para la Declaracion Federal Anual del Patrono de la Contribucion Federal para el Desempleo (FUTA).

DATES: Written comments should be received on or before December 27, 2016 to be assured of consideration.

ADDRESSES: Direct all written comments to Tuawana Pinkston, Internal Revenue Service, Room 6526, 1111 Constitution Avenue NW., Washington, DC 20224.

FOR FURTHER INFORMATION CONTACT: Requests for additional information or copies of the collection tools should be directed to Sara Covington, Internal Revenue Service, Room 6526, 1111 Constitution Avenue NW., Washington, DC 20224, or through the internet at Sara.L.Covington@irs.gov.

SUPPLEMENTARY INFORMATION: Currently, the IRS is seeking comments concerning the following information collection tools, reporting, and record-keeping requirements:

Title: Employer's Annual Federal Unemployment (FUTA) Tax Return (Form 940) and Planilla para la Declaracion Federal Anual del Patrono de la Contribucion Federal para el Desempleo (FUTA) (Form 940–PR).

OMB Number: 1545–0028.

Form Number: 940 and 940–PR.

Abstract: Internal Revenue Code section 3301 imposes a tax on employers based on the first \$7,000 of

taxable wages paid to each employee. The tax is computed and reported on Forms 940 and 940-PR (Puerto Rico employers only). IRS uses the information on Forms 940 and 940-PR to ensure that employers have reported and figured the correct FUTA wages and tax.

Current Actions: The change in burden reflects the removal of burden associated with previously produced (preprinted) versions of the payment voucher forms (940-V and 940-V(PR)). The discontinuation of the production of these preprinted forms will result in a total burden decrease of 31,328 hours and an estimated 198,520 responses.

Type of Review: Revision of a currently approved collection.

Affected Public: Businesses or other for-profit organizations, individuals, or households, and farms.

Estimated Number of Responses: 6,802,400.

Estimated Time per Respondent: 15 hrs., 28 min.

Estimated Total Annual Burden Hours: 105,264,042.

The following paragraph applies to all of the collections of information covered by this notice:

An agency may not conduct or sponsor, and a person is not required to respond to, a collection of information unless the collection of information displays a valid OMB control number. Books or records relating to a collection of information must be retained as long as their contents may become material in the administration of any internal revenue law. Generally, tax returns and tax return information are confidential, as required by 26 U.S.C. 6103.

Request for Comments: Comments submitted in response to this notice will be summarized and/or included in the request for OMB approval. All comments will become a matter of public record. Comments are invited on: (a) Whether the collection of information is necessary for the proper performance of the functions of the agency, including whether the information shall have practical utility; (b) the accuracy of the agency's estimate of the burden of the collection of information; (c) ways to enhance the quality, utility, and clarity of the information to be collected; (d) ways to minimize the burden of the collection of information on respondents, including through the use of automated collection techniques or other forms of information technology; and (e) estimates of capital or start-up costs and costs of operation, maintenance, and purchase of services to provide information.

Approved: October 15, 2016.

Tuawana Pinkston,

Reports Clearance Officer, IRS.

Greenhouse Gas Emissions and Fuel Efficiency Standards for Medium- and Heavy-Duty Engines and Vehicles—Phase 2

AGENCY: Environmental Protection Agency (EPA) and National Highway Traffic Safety Administration (NHTSA), Department of Transportation (DOT).

ACTION: Final rule.

SUMMARY: EPA and NHTSA, on behalf of the Department of Transportation, are establishing rules for a comprehensive Phase 2 Heavy-Duty (HD) National Program that will reduce greenhouse gas (GHG) emissions and fuel consumption from new on-road medium- and heavy-duty vehicles and engines. NHTSA's fuel consumption standards and EPA's carbon dioxide (CO₂) emission standards are tailored to each of four regulatory categories of heavy-duty vehicles: Combination tractors; trailers used in combination with those tractors; heavy-duty pickup trucks and vans; and vocational vehicles. The rule also includes separate standards for the engines that power combination tractors and vocational vehicles. Certain requirements for control of GHG emissions are exclusive to the EPA program. These include EPA's hydrofluorocarbon standards to control leakage from air conditioning systems in vocational vehicles and EPA's nitrous oxide (N₂O) and methane (CH₄) standards for heavy-duty engines. Additionally, NHTSA is addressing misalignment between the Phase 1 EPA

GHG standards and the NHTSA fuel efficiency standards to virtually eliminate the differences. This action also includes certain EPA-specific provisions relating to control of emissions of pollutants other than GHGs. EPA is finalizing non-GHG emission standards relating to the use of diesel auxiliary power units installed in new tractors. In addition, EPA is clarifying the classification of natural gas engines and other gaseous-fueled heavy-duty engines. EPA is also finalizing technical amendments to EPA rules that apply to emissions of non-GHG pollutants from light-duty motor vehicles, marine diesel engines, and other nonroad engines and equipment. Finally, EPA is requiring that engines from donor vehicles installed in new glider vehicles meet the emission standards applicable in the year of assembly of the new glider vehicle, including all applicable standards for criteria pollutants, with limited exceptions for small businesses and for other special circumstances.

DATES: This final rule is effective on December 27, 2016. The incorporation by reference of certain publications listed in this regulation is approved by the Director of the Federal Register as of December 27, 2016.

ADDRESSES: EPA and NHTSA have established dockets for this action under Docket ID No. EPA-HQ-OAR-2014-0827 (for EPA's docket) and NHTSA-2014-0132 (for NHTSA's docket). All documents in the docket are listed on the <https://www.regulations.gov> Web site. NHTSA: Ryan Hagen, Office of Chief Counsel, National Highway Traffic Safety Administration, 1200 New Jersey Avenue SE., Washington, DC 20590. Telephone: (202) 366-2992; ryan.hagen@dot.gov.

SUPPLEMENTARY INFORMATION:**A. Does this action apply to me?**

This action will affect companies that manufacture, sell, or import into the United States new heavy-duty engines and new Class 2b through 8 trucks, including combination tractors, all types of buses, vocational vehicles including municipal, commercial, recreational vehicles, and commercial trailers as well as ¾-ton and 1-ton pickup trucks and vans. The heavy-duty category incorporates all motor vehicles with a gross vehicle weight rating of 8,500 lbs. or greater, and the engines that power them, except for medium-duty passenger vehicles already covered by the greenhouse gas standards and corporate average fuel economy standards issued for light-duty model year 2017–2025 vehicles.¹ Regulated categories and entities include the following:

Category	NAICS code ^a	Examples of potentially affected entities
Industry	336111 336112 333618 336120 336212	Motor Vehicle Manufacturers, Engine Manufacturers, Truck Manufacturers, Truck Trailer Manufacturers.
Industry	541514 811112	Commercial Importers of Vehicles and Vehicle Components.

¹ As discussed in Section I.A, the term heavy-duty is generally used in this rulemaking to refer

to all vehicles with a gross vehicle weight rating above 8,500 lbs, including vehicles that are

sometimes otherwise known as medium-duty vehicles.

Category	NAICS code ^a	Examples of potentially affected entities
Industry	811198 336111 336112 422720 454312 541514 541690 811198	Alternative Fuel Vehicle Converters.

Note:^a North American Industry Classification System (NAICS).

This table is not intended to be exhaustive, but rather provides a guide for readers regarding entities likely covered by these rules. This table lists the types of entities that the agencies are aware may be regulated by this action. Other types of entities not listed in the table could also be regulated. To determine whether your activities are regulated by this action, you should carefully examine the applicability criteria in the referenced regulations. You may direct questions regarding the applicability of this action to the persons listed in the preceding **FOR FURTHER INFORMATION CONTACT** section.

B. Did EPA conduct a peer review before issuing this document?

This regulatory action is supported by influential scientific information. Therefore, EPA conducted a peer review consistent with OMB's Final Information Quality Bulletin for Peer Review. As described in Section II.C, a peer review of updates to the vehicle simulation model (GEM) for the Phase 2 standards has been completed. This version of GEM is based on the model used for the Phase 1 rule, which was peer reviewed by a panel of four independent subject matter experts. The peer review report and EPA's response to the peer review comments are available in Docket ID No. EPA-HQ-OAR-2014-0827. We note that this rulemaking is based on a vast body of existing peer-reviewed work, *i.e.*, work that was peer-reviewed outside of this action, as noted in the references throughout this Preamble, the Regulatory Impacts Analysis, and the rulemaking docket. EPA also notified the SAB of its plans for this rulemaking and on June 11, 2014, the chartered SAB discussed the recommendations of its work group on the planned action and agreed that no further SAB consideration of the supporting science was merited.

C. Executive Summary

(1) Commitment to Greenhouse Gas Emission Reductions and Vehicle Fuel Efficiency

In June 2013, the President announced a comprehensive Climate Action Plan for the United States to reduce carbon pollution, prepare for the impacts of climate change, and lead international efforts to address global climate change.² In this plan, President Obama reaffirmed his commitment to reduce U.S. greenhouse gas emissions in the range of 17 percent below 2005 levels by 2020. More recently, in December 2015, the U.S. was one of over 190 signatories to the Paris Climate Agreement, widely regarded as the most ambitious climate change agreement in history. The Paris agreement reaffirms the goal of limiting global temperature increase to well below 2 degrees Celsius, and for the first time urged efforts to limit the temperature increase to 1.5 degrees Celsius. The U.S. submitted a non-binding intended nationally determined contribution (NDC) target of reducing economy-wide GHG emissions by 26–28 percent below its 2005 level in 2025 and to make best efforts to reduce emissions by 28 percent.³ This pace would keep the U.S. on a trajectory to achieve deep economy-wide reductions on the order of 80 percent by 2050.

As part of his Climate Action plan, the President specifically directed the Environmental Protection Agency (EPA) and the Department of Transportation's (DOT) National Highway Traffic Safety Administration (NHTSA) to set the next round of standards to reduce greenhouse gas (GHG) emissions and improve fuel efficiency for heavy-duty vehicles pursuant to and consistent with the agencies' existing statutory

authorities.⁴ More than 70 percent of the oil used in the United States and 26 percent of GHG emissions come from the transportation sector, and since 2009 EPA and NHTSA have worked with industry, states, and other stakeholders to develop ambitious, flexible standards for both the fuel economy and GHG emissions of light-duty vehicles and the fuel efficiency and GHG emissions of heavy-duty vehicles.⁵ The standards here (referred to as Phase 2) will build on the light-duty vehicle standards spanning model years 2012 to 2025 and on the initial phase of standards (referred to as Phase 1) for new medium and heavy-duty vehicles (MDVs and HDVs) and engines in model years 2014 to 2018. Throughout every stage of development for these programs, EPA and NHTSA (collectively, the agencies, or "we") have worked in close partnership not only with one another, but also with the vehicle manufacturing industry, environmental community leaders, and the State of California among other entities to create a single, effective set of national standards.

Through two previous rulemakings, EPA and NHTSA have worked with the auto industry to develop new fuel economy and GHG emission standards for light-duty vehicles. Taken together with NHTSA's 2011 CAFE standards, the light-duty vehicle standards span model years 2011 to 2025 and are the first significant improvement in fuel economy in approximately two decades. Under the final program, average new car and light truck fuel economy is expected to nearly double by 2025

⁴ EPA's HD Phase 2 GHG emission standards are authorized under the Clean Air Act, and NHTSA's HD Phase 2 fuel consumption standards are authorized under the Energy Independence and Security Act of 2007.

compared to 2010 vehicles.⁷ In the 2012 rule, the agencies projected the standards would save consumers \$1.7 trillion at the pump—roughly \$8,200 per vehicle for a MY 2025 vehicle—reducing oil consumption by 2.2 million barrels a day in 2025 and slashing GHG emissions by 6 billion metric tons over the lifetime of the vehicles sold during this period.⁸ These fuel economy standards are already delivering savings for American drivers. Between model years 2008 and 2013, the unadjusted average test fuel economy of new passenger cars and light trucks sold in the United States has increased by about four miles per gallon. Altogether, light-duty vehicle fuel economy standards finalized after 2008 have already saved nearly one billion gallons of fuel and avoided more than 10 million tons of carbon dioxide emissions.⁹

Similarly, EPA and NHTSA have previously developed joint GHG emission and fuel efficiency standards for MDVs and HDVs. Prior to these Phase 1 standards, heavy-duty trucks and buses—from delivery vans to the largest tractor-trailers—were required to meet pollution standards for soot and smog-causing air pollutants, but no requirements existed for the fuel efficiency or carbon pollution from these vehicles.¹⁰ By 2010, total fuel consumption and GHG emissions from MDVs and HDVs had been growing, and these vehicles accounted for 23 percent of total U.S. transportation-related GHG emissions¹¹ and about 20 percent of U.S. transportation-related energy use. In August 2011, the agencies finalized the groundbreaking Phase 1 standards for new MDVs and HDVs in model years 2014 through 2018. This program, developed with support from the trucking and engine industries, the State of California, Environment and Climate Change Canada, and leaders from the environmental community, set standards based on the use of off-the-shelf technologies. These standards are expected to save a projected 530 million barrels of oil and reduce carbon emissions by about 270 million metric tons, representing one of the most significant programs available to reduce domestic fuel consumption and emissions of GHGs.¹² The Phase 1 program, as well as the many additional

actions called for in the President's 2013 Climate Action Plan¹³ including this Phase 2 rulemaking, not only result in meaningful decreases in GHG emissions and fuel consumption, but also support—indeed are critical for—United States leadership to encourage other countries to also achieve meaningful GHG reductions and fuel conservation.

This rule builds on our commitment to robust collaboration with stakeholders and the public. It follows an expansive and thorough outreach effort in which the agencies gathered input, data and views from many interested stakeholders, involving over 400 meetings with heavy-duty vehicle and engine manufacturers, technology suppliers, trucking fleets, truck drivers, dealerships, environmental organizations, and state agencies.¹⁴ As with the previous light-duty rules and the heavy-duty Phase 1 rule, the agencies have consulted frequently with the California Air Resources Board (CARB) staff during the development of this rule, given California's unique ability among the states to adopt their own GHG standards for on-highway engines and vehicles. Through this close coordination, the agencies are finalizing a Phase 2 program that will be fully aligned between EPA and NHTSA, while providing CARB with the opportunity to adopt a Phase 2 program that will allow manufacturers to continue to build a single fleet of vehicles and engines.

(2) Overview of Phase 1 Medium- and Heavy-Duty Vehicle Standards

The Phase 1 program covers new trucks and heavy vehicles in model years 2014 and later. That program includes specific standards for combination tractors, heavy-duty pickup trucks and vans, and vocational vehicles and includes separate standards for both vehicles and engines. The program offers extensive flexibility, allowing manufacturers to reach standards through average fleet calculations, a mix of technologies, and the use of various credit and banking programs.

The Phase 1 program was developed by the agencies through close consultation with industry and other stakeholders, resulting in standards tailored to the specifics of each different class of vehicles and engines.

• *Heavy-duty combination tractors.* Combination tractors—semi trucks that

typically pull trailers—are regulated under nine subcategories based on weight class, cab type, and roof height. These vehicles represent approximately 60 percent of the fuel consumption and GHG emissions from MDVs and HDVs.

• *Heavy-duty pickup trucks and vans.* Heavy-duty pickup and van standards are based on a “work factor” attribute that combines a vehicle's payload, towing capabilities, and the presence of 4-wheel drive. These vehicles represent about 23 percent of the fuel consumption and GHG emissions from MDVs and HDVs.

• *Vocational vehicles.* Specialized vocational vehicles, which consist of a very wide variety of truck and bus types (e.g., delivery, refuse, utility, dump, cement, transit bus, shuttle bus, school bus, emergency vehicles, and recreational vehicles) are regulated in three subcategories based on engine classification. These vehicles represent approximately 17 percent of the fuel consumption and GHG emissions from MDVs and HDVs. The Phase 1 program includes EPA GHG standards for recreational vehicles, but not NHTSA fuel efficiency standards.¹⁵

• *Heavy-duty engines.* The Phase 1 rule has independent standards for heavy-duty engines to assure they contribute to reducing GHG emissions and fuel consumption because the Phase 1 tractor and vocational vehicle standards do not account for the contributions of engine improvements to reducing fuel consumption and GHG emissions.

The Phase 1 standards were premised on utilization of technologies that were already in production on some vehicles at the time of the Phase 1 FRM and are adaptable to the broader fleet. The Phase 1 program provides flexibilities that facilitate compliance. These flexibilities help provide sufficient lead time for manufacturers to make necessary technological improvements and reduce the overall cost of the program, without compromising overall environmental and fuel consumption objectives. The primary flexibility provisions are an engine averaging, banking, and trading (ABT) program and a vehicle ABT program. These ABT programs allow for emission and/or fuel consumption credits to be averaged, banked, or traded within each of the averaging sets.

The Phase 1 program was projected to save 530 million barrels of oil and avoid 270 million metric tons of GHG emissions.¹⁶ At the same time, the

¹⁵ The Phase 2 program will also include NHTSA recreational vehicle fuel efficiency standards.

¹⁶ The White House, *Improving the Fuel Efficiency of American Trucks—Bolstering Energy*

program was projected to produce \$50 billion in fuel savings and \$49 billion of net societal benefits. Today, the Phase 1 fuel efficiency and GHG reduction standards are already reducing GHG emissions and U.S. oil consumption, and producing fuel savings for America's trucking industry. The market appears to be very accepting of the Phase 1 technologies.

(3) Overview of Phase 2 Medium- and Heavy-Duty Vehicle Standards

The Phase 2 GHG and fuel efficiency standards for MDVs and HDVs are a critical next step in improving fuel efficiency and reducing GHG emissions. The Phase 2 national program carries forward our commitment to meaningful collaboration with stakeholders and the public, as they build on more than 400 meetings with manufacturers, suppliers, trucking fleets, dealerships, state air quality agencies, non-governmental organizations (NGOs), and other stakeholders; over 200,000 public comments; and two public hearings to identify and understand the opportunities and challenges involved with this next level of fuel-saving technology. These meetings and public feedback, in addition to close coordination with CARB, have been invaluable to the agencies, enabling the development of a program that appropriately balances all potential impacts, effectively minimizes the possibility of unintended consequences, and allows manufacturers to continue to build a single fleet of vehicles and engines.

Phase 2 will include technology-advancing standards that will phase in over the long-term (through model year 2027) to result in an ambitious, yet achievable program that will allow manufacturers to meet standards through a mix of different technologies at reasonable cost. The terminal requirements go into effect in 2027, and would apply to MY 2027 and subsequent model year vehicles, unless modified by future rulemaking. The Phase 2 standards will maintain the underlying regulatory structure developed in the Phase 1 program, such as the general categorization of MDVs and HDVs and the separate standards for vehicles and engines. However, the Phase 2 program will build on and advance Phase 1 in a number of important ways including the following: basing standards not only on currently available technologies but also on utilization of technologies now under

development or not yet widely deployed while providing significant lead time to assure adequate time to develop, test, and phase in these controls; developing first-time GHG and fuel efficiency standards for trailers; further encouraging innovation and providing flexibility; including vehicles produced by small business manufacturers with appropriate flexibilities for these companies; incorporating enhanced test procedures that (among other things) allow individual drivetrain and powertrain performance to be reflected in the vehicle certification process; and using an expanded and improved compliance simulation model.

The Phase 2 program will provide significant GHG reductions and save fuel by:

- *Strengthening standards to account for ongoing technological advancements.* Relative to the baseline as of the end of Phase 1, these final standards are projected to achieve vehicle fuel savings as high as 25 percent, depending on the vehicle category. While costs are higher than for Phase 1, benefits greatly exceed costs, and payback periods are short, meaning that consumers will see substantial net savings over the vehicle lifetime. Payback is estimated at about two years for tractors and trailers, about four years for vocational vehicles, and about three years for heavy-duty pickups and vans. The agencies are finalizing a program that phases in the MY 2027 standards with interim standards for model years 2021 and 2024 (and for certain types of trailers, EPA is finalizing model year 2018 phase-in standards as well). The final program includes both significant strengthening of certain standards from the NPRM as well as adjustments to better align other standards with new data, analysis, and stakeholder and public feedback received since the time of the proposal.

- *Setting standards for trailers for the first time.* In addition to retaining the vehicle and engine categories covered in the Phase 1 program, the Phase 2 standards include fuel efficiency and GHG emission standards for trailers used in combination with tractors. Although the agencies are not finalizing standards for all trailer types, the majority of new trailers will be covered.

- *Encouraging technological innovation while providing flexibility and options for manufacturers.* For each category of HDVs, the standards will set performance targets that allow manufacturers to achieve reductions

through a mix of different technologies and generally leave manufacturers free to choose any means of compliance. For tractor standards, for example, different combinations of improvements like advanced aerodynamics, engine improvements and waste-heat recovery, automated transmission, lower rolling resistance tires, and automatic tire inflation can be used to meet standards. For tractors and vocational vehicles, enhanced test procedures and an expanded and improved compliance simulation model enable the vehicle standards to encompass more of the complete vehicle than the Phase 1 program and to account for engine, transmission and driveline improvements. With the addition of the powertrain and driveline to the compliance model, representative drive cycles and vehicle baseline configurations become critically important to assure the standards promote technologies that improve real world fuel efficiency and GHG emissions. This rule updates drive cycles and vehicle configurations to better reflect real world operation. The final program includes adjustments to technical elements of the proposed compliance program, e.g., test procedures, reflecting the significant amount of stakeholder and public comment the agencies received on the program. Additionally, the agencies' analyses indicate that this rule should have no adverse impact on vehicle or engine safety.

- *Providing flexibilities to help minimize effect on small businesses.* All small businesses are exempt from the Phase 1 standards. The agencies are regulating small business entities under Phase 2 (notably certain trailer manufacturers), but we have conducted extensive proceedings pursuant to section 609 of the Regulatory Flexibility Act, and engaged in extensive consultation with stakeholders, and developed an approach to provide targeted flexibilities geared toward helping small businesses comply with the Phase 2 standards. Specifically, the agencies are delaying the initial implementation of the Phase 2 standards by one year and simplifying certification requirements for small businesses. We are also adopting additional flexibilities and exemptions adapted to particular vehicle categories.

The following tables summarize the impacts of the Heavy-Duty Phase 2 rule.

SUMMARY OF THE PHASE 2 MEDIUM- AND HEAVY-DUTY VEHICLE RULE IMPACTS TO FUEL CONSUMPTION, GHG EMISSIONS, BENEFITS AND COSTS OVER THE LIFETIME OF MODEL YEARS 2018–2029^{a b}

	3%	7%
Fuel Reductions (billion gallons)	71–82	
GHG Reductions (MMT, CO ₂ eq)	959–1098	
Pre-Tax Fuel Savings (\$billion)	149–169	80–87
Discounted Technology Costs (\$billion)	24–27	16–18
Value of reduced emissions (\$billion)	60–69	48–52
Total Costs (\$billion)	29–31	19–20
Total Benefits (\$billion)	225–260	136–151
Net Benefits (\$billion)	197–229	117–131

Notes:

^a Ranges reflect two analysis methods: Method A with the 1b baseline and Method B with the 1a baseline. For an explanation of analytical Methods A and B, please see Section I.D; for an explanation of the “flat” baseline, 1a, and the “dynamic” baseline, 1b, please see Section X.A.1.

^b Benefits and net benefits (including those in the 7% discount rate column) use the 3 percent average Social Cost of CO₂, the Social Cost of CH₄, and the Social Cost of N₂O.

SUMMARY OF THE PHASE 2 MEDIUM- AND HEAVY-DUTY VEHICLE ANNUAL FUEL AND GHG REDUCTIONS, PROGRAM COSTS, BENEFITS AND NET BENEFITS IN CALENDAR YEARS 2040 AND 2050^a

	2040	2050
Fuel Reductions (Billion Gallons)	10.8	13.0
GHG Reduction (MMT, CO ₂ eq)	166.8	199.3
Vehicle Program Costs (including Maintenance; Billions of 2013\$)	–\$6.5	–\$7.5
Fuel Savings (Pre-Tax; Billions of 2013\$)	\$53.1	\$63.4
Benefits (Billions of 2013\$)	\$24.8	\$31.7
Net Benefits (Billions of 2013\$)	\$71.4	\$87.6

Note:

^a Benefits and net benefits (including those in the 7% discount rate column) use the 3 percent average Social Cost of CO₂, the Social Cost of CH₄, and the Social Cost of N₂O. Values reflect the final program using Method B relative to the flat baseline (a reference case that projects very little improvement in new vehicle fuel economy absent new standards).

SUMMARY OF THE PHASE 2 MEDIUM- AND HEAVY-DUTY VEHICLE PROGRAM EXPECTED PER-VEHICLE FUEL SAVINGS, GHG EMISSION REDUCTIONS, AND COST FOR KEY VEHICLE CATEGORIES

	MY 2021	MY 2024	MY 2027
Maximum Vehicle Fuel Savings and Tailpipe GHG Reduction (%):			
Tractors ^b	13	20	25
Trailers ^a	5	7	9
Vocational Vehicles ^b	12	20	24
Pickups/Vans	2.5	10	16
Per Vehicle Cost (\$) ^{c d} (% Increase in Typical Vehicle Price):			
Tractors	\$6,400–\$6,480 (6%)	\$9,920–\$10,100 (10%)	\$12,160–\$12,440 (12%)
Trailers	\$850–\$870 (3%)	\$1,000–\$1,030 (4%)	\$1,070–\$1,110 (4%)
Vocational Vehicles	\$1,110–\$1,160 (1%)	\$1,980–\$2,020 (2%)	\$2,660–\$2,700 (3%)
Pickups/Vans	\$520–\$750 (1%)	\$760–\$960 (2%)	\$1,340–\$1,360 (3%)

Notes:

^a Note that the EPA standards for trailers begin in model year 2018

^b All engine costs are included

^c Please refer to Preamble Chapters 6 and 10 for additional information on the reference fleet used to analyze costs and benefits of the rule. Please also refer to these chapters for impacts of the rule under more dynamic baseline assumptions for pickups and vans.

^d Ranges reflect two analysis methods: Method A with the 1b baseline and Method B with the 1a baseline. For an explanation of analytical Methods A and B, please see Section I.D; for an explanation of the “flat” baseline, 1a, and the “dynamic” baseline, 1b, please see Section X.A.1.

^e For this table, we use an approximate minimum vehicle price today of \$100,000 for tractors, \$25,000 for trailers, \$100,000 for vocational vehicles and \$40,000 for HD pickups/vans.

PAYBACK PERIODS FOR MY 2027 VEHICLES UNDER THE FINAL STANDARDS, BASED ON BOTH ANALYSIS METHODS A AND B

[Payback occurs in the year shown; using 7% discounting]

	Final standards
Tractors/Trailers	2nd.
Vocational Vehicles	4th.
Pickups/Vans ^a	3rd.

Note:

^aPlease refer to Preamble Chapters 6 and 10 for additional information on the reference fleet used to analyze costs and benefits of the rule. Please also refer to these chapters for impacts of the rule under more dynamic baseline assumptions for pickups and vans.

(4) Issues Addressed in This Final Rule

This Preamble contains extensive discussion of the background, elements, and implications of the Phase 2 program, as well as updates made to the final program from the proposal based on new data, analysis, stakeholder feedback and public comments. Section I includes information on the MDV and HDV industry, related regulatory and non-regulatory programs, summaries of Phase 1 and Phase 2 programs, costs and benefits of the final standards, and relevant statutory authority for EPA and NHTSA. Section II discusses vehicle simulation, engine standards, and test procedures. Sections III, IV, V, and VI detail the final standards for combination tractors, trailers, vocational vehicles, and heavy-duty pickup trucks and vans. Sections VII and VIII discuss aggregate GHG impacts, fuel consumption impacts, climate impacts, and impacts on non-GHG emissions. Section IX evaluates the economic impacts of the final program. Sections X and XI present the alternatives analyses and consideration of natural gas vehicles. Finally, Sections XII and XIII discuss the changes that the Phase 2 rules will have on Phase 1 standards and other regulatory provisions. In addition to this Preamble, the Regulatory Impact Analysis (RIA),¹⁷ provides additional data, analysis and discussion of the standards, and the Response to Comments Document for Joint Rulemaking (RTC) provides responses to comments received on the Phase 2 rulemaking through the public comment process.¹⁸

I. Overview

The agencies issued a Notice of Proposed Rulemaking (NPRM) on July 13, 2015, that proposed Phase 2 GHG and fuel efficiency standards for heavy-duty engines and vehicles.¹⁹ The agencies also issued a Notice of Data Availability (NODA) on March 2, 2016, to solicit comment on new material not available at the time of the NPRM.²⁰ The agencies have revised the proposed standards and related requirements to address issues raised in public comments. Nevertheless, the final rules being adopted today remain fundamentally similar to the proposed rules.

Although the agencies describe the final requirements in this document, readers are encouraged to also read supporting materials that have been placed into the public dockets for these rules. In particular, the agencies note:

- The Final Regulatory Impact Analysis (RIA), provides additional technical information and analysis
- The Response to Comments Document for Joint Rulemaking (RTC), provides a detailed summary and analysis of public comments, including comments received in response to the NODA
- The NHTSA Final Environmental Impact Statement (FEIS)

This overview of the final Phase 2 GHG emissions and fuel efficiency standards includes a description of the heavy-duty truck industry and related

regulatory and non-regulatory programs, a summary of the Phase 1 GHG emissions and fuel efficiency program, a summary of the Phase 2 standards and requirements being finalized, a summary of the costs and benefits of the Phase 2 standards, discussion of EPA and NHTSA statutory authorities, and other issues.

A. Background

For purposes of this Preamble (and consistent with all terminology used at proposal), the terms “heavy-duty” or “HD” are used to apply to all highway vehicles and engines that are not within the range of light-duty passenger cars, light-duty trucks, and medium-duty passenger vehicles (MDPV) covered by separate GHG and Corporate Average Fuel Economy (CAFE) standards.²¹ (The terms also do not include motorcycles). Thus, in this rulemaking, unless specified otherwise, the heavy-duty category incorporates all vehicles with a gross vehicle weight rating above 8,500 lbs, and the engines that power them, except for MDPVs.^{22 23 24} Note also that the terms heavy-duty truck and heavy-duty vehicle are sometimes used interchangeably, even though commercially the term heavy-duty truck can have a narrower meaning.

Consistent with the President’s direction, over the past three years as we have developed this rulemaking, the agencies have met on an on-going basis with a very large number of diverse stakeholders. This includes meetings, and in many cases site visits, with truck, trailer, and engine manufacturers; technology supplier companies and their trade associations (*e.g.*, transmissions, drivelines, fuel systems, turbochargers, tires, catalysts, and many others); line haul and vocational trucking firms and trucking associations; the trucking industries

owner-operator association; truck dealerships and dealers associations; trailer manufacturers and their trade association; non-governmental organizations (NGOs, including environmental NGOs, national security NGOs, and consumer advocacy NGOs); state air quality agencies; manufacturing labor unions; and many other stakeholders. In addition, EPA and NHTSA have consulted on an on-going basis with the California Air Resources Board (CARB) over the past three years as we developed the Phase 2 rule. CARB staff and managers have also participated with EPA and NHTSA in meetings with many external stakeholders, including those with vehicle OEMs and technology suppliers.²⁵

EPA and NHTSA staff also participated in a large number of technical and policy conferences over the past three years related to the technological, economic, and environmental aspects of the heavy-duty trucking industry. The agencies also met with regulatory counterparts from several other nations who either have already or are considering establishing fuel consumption or GHG requirements, including outreach with representatives from the governments of Canada, the European Commission, Japan, and China.

These comprehensive outreach actions by the agencies provided us with information to assist in our identification of potential technologies that can be used to reduce heavy-duty GHG emissions and improve fuel efficiency. The outreach has also helped the agencies to identify and understand the opportunities and challenges involved with these standards for the heavy-duty trucks, trailers, and engines detailed in this Preamble, including time needed for implementation of various technologies and potential costs and fuel savings. The scope of this outreach effort to gather input for the proposal and final rulemaking included well over 400 meetings with stakeholders. These meetings and conferences have been invaluable to the agencies. We believe they enabled us to refine the proposal in such a way as to appropriately consider all of the potential impacts and to minimize the possibility of unintended consequences in the final rules.

²¹ 2017 and Later Model Year Light-Duty Vehicle Greenhouse Gas Emissions and Corporate Average Fuel Economy Standards; Final Rule, 77 FR 62623, October 15, 2012.

²² The CAA defines heavy-duty as a truck, bus or other motor vehicles with a gross vehicle weight rating exceeding 6,000 lbs (CAA section 202(b)(3)). The term HD as used in this action refers to a subset of these vehicles and engines.

²³ The Energy Independence and Security Act of 2007 requires NHTSA to set standards for commercial medium- and heavy-duty on-highway vehicles, defined as on-highway vehicles with a GVWR of 10,000 lbs or more, and work trucks, defined as vehicles with a GVWR between 8,500 and 10,000 lbs and excluding medium duty passenger vehicles.

²⁴ The term “medium-duty” is sometimes used to refer to the lighter end of this range of vehicles. This is typically in the context of statutes or reports that use the term “medium-duty.” For example, because the term medium-duty is used in EISA, the term is also used in much of the discussion of NHTSA’s statutory authority.

²⁵ Vehicle chassis manufacturers are known in this industry as original equipment manufacturers or OEMs.

²⁰ 81 FR 10824.

(1) Brief Overview of the Heavy-Duty Truck Industry

The heavy-duty sector is diverse in several respects, including the types of manufacturing companies involved, the range of sizes of trucks and engines they produce, the types of work for which the trucks are designed, and the regulatory history of different subcategories of vehicles and engines. The current heavy-duty fleet encompasses vehicles from the “18-

wheeler” combination tractor-trailers one sees on the highway to the largest pickup trucks and vans, as well as vocational vehicles covering the range between these extremes. Together, the HD sector spans a wide range of vehicles with often specialized form and function. A primary indicator of the diversity among heavy-duty trucks is the range of load-carrying capability across the industry. The heavy-duty truck sector is often subdivided by vehicle weight classifications, as

defined by the vehicle’s gross vehicle weight rating (GVWR), which is a measure of the combined curb (empty) weight and cargo carrying capacity of the truck.²⁶ Table I–1 below outlines the vehicle weight classifications commonly used for many years for a variety of purposes by businesses and by several Federal agencies, including the Department of Transportation, the Environmental Protection Agency, the Department of Commerce, and the Internal Revenue Service.

TABLE I–1—VEHICLE WEIGHT CLASSIFICATION

Class	2b	3	4	5	6	7	8
GVWR (lb.)	8,501–10,000	10,001–14,000	14,001–16,000	16,001–19,500	19,501–26,000	26,001–33,000	>33,000

In the framework of these vehicle weight classifications, the heavy-duty truck sector refers to “Class 2b” through “Class 8” vehicles and the engines that power those vehicles.²⁷

Unlike light-duty vehicles, which are primarily used for transporting passengers for personal travel, heavy-duty vehicles fill much more diverse operator needs. Heavy-duty pickup trucks and vans (Classes 2b and 3) are used chiefly as work trucks and vans, and as shuttle vans, as well as for personal transportation, with an average annual mileage in the range of 15,000 miles. The rest of the heavy-duty sector is used for carrying cargo and/or performing specialized tasks. “Vocational” vehicles, which span Classes 2b through 8, vary widely in size, including smaller and larger van trucks, utility “bucket” trucks, tank trucks, refuse trucks, urban and over-the-road buses, fire trucks, flat-bed trucks, and dump trucks, among others. The annual mileage of these vehicles is as varied as their uses, but for the most part tends to fall in between heavy-duty pickups/vans and the large combination tractors, typically from 15,000 to 150,000 miles per year.

Class 7 and 8 combination tractor-trailers—some equipped with sleeper cabs and some not—are primarily used for freight transportation. They are sold as tractors and operate with one or more trailers that can carry up to 50,000 lbs or more of payload, consuming significant quantities of fuel and producing significant amounts of GHG emissions. Together, Class 7 and 8 tractors and trailers account for

approximately 60 percent of the heavy-duty sector’s total CO₂ emissions and fuel consumption. Trailer designs vary significantly, reflecting the wide variety of cargo types. However, the most common types of trailers are box vans (dry and refrigerated), which are a focus of this Phase 2 rulemaking. The tractor-trailers used in combination applications can and frequently do travel more than 150,000 miles per year and can operate for 20–30 years.

Heavy-duty vehicles differ significantly from light-duty vehicles in other ways. In particular, we note that heavy-duty engines are much more likely to be rebuilt. In fact, it is common for Class 8 engines to be rebuilt multiple times. Commercial heavy-duty vehicles are often resold after a few years and may be repurposed by the second or third owner. Thus issues of resale value and adaptability have historically been key concerns for purchasers.

EPA and NHTSA have designed our respective standards in careful consideration of the diversity and complexity of the heavy-duty truck industry, as discussed in Section I.C.

(2) Related Regulatory and Non-Regulatory Programs

(a) History of EPA’s Heavy-Duty Regulatory Program and Assessments of the Impacts of Greenhouse Gases on Climate Change

To provide a context for EPA’s program to reduce greenhouse gas emissions from motor vehicles, this subsection provides an overview of two important related areas. First, we summarize the history of EPA’s heavy-

duty regulatory program, which provides a basis for the compliance structure of this rulemaking. Next we summarize EPA prior assessments of the impacts of greenhouse gases on climate change, which provides a basis for much of the analysis of the environmental benefits of this rulemaking.

(i) History of EPA’s Heavy-Duty Regulatory Program

Since the 1980s, EPA has acted several times to address tailpipe emissions of criteria pollutants and air toxics from heavy-duty vehicles and engines. During the last two decades these programs have primarily addressed emissions of particulate matter (PM) and the primary ozone precursors, hydrocarbons (HC) and oxides of nitrogen (NO_x). These programs, which have successfully achieved significant and cost-effective reductions in emissions and associated health and welfare benefits to the nation, were an important basis of the Phase 1 program. See *e.g.* 66 FR 5002, 5008, and 5011–5012 (January 18, 2001) (detailing substantial public health benefits of controls of criteria pollutants from heavy-duty diesel engines, including bringing areas into attainment with primary (public health) PM NAAQS, or contributing substantially to such attainment); *National Petrochemical Refiners Association v. EPA*, 287 F. 3d 1130, 1134 (D.C. Cir. 2002) (referring to the “dramatic reductions” in criteria pollutant emissions resulting from the EPA on-

²⁶ GVWR describes the maximum load that can be carried by a vehicle, including the weight of the vehicle itself. Heavy-duty vehicles (including those designed for primary purposes other than towing) also have a gross combined weight rating (GCWR),

which describes the maximum load that the vehicle can haul, including the weight of a loaded trailer and the vehicle itself.

²⁷ Class 2b vehicles manufactured as passenger vehicles (Medium Duty Passenger Vehicles,

MDPVs) are covered by the light-duty GHG and fuel economy standards and therefore are not addressed in this rulemaking.

highway heavy-duty engine standards, and upholding all of the standards).

As required by the Clean Air Act (CAA), the emission standards implemented by these programs include standards that apply at the time that the vehicle or engine is sold and continue to apply in actual use. EPA's overall program goal has always been to achieve emissions reductions from the complete vehicles that operate on our roads. The agency has often accomplished this goal for many heavy-duty truck categories by regulating heavy-duty engine emissions. A key part of this success has been the development over many years of a well-established, representative, and robust set of engine test procedures that industry and EPA now use routinely to measure emissions and determine compliance with emission standards. These test procedures in turn serve the overall compliance program that EPA implements to help ensure that emissions reductions are being achieved. By isolating the engine from the many variables involved when the engine is installed and operated in a HD vehicle, EPA has been able to accurately address the contribution of the engine alone to overall emissions.

(ii) EPA Assessment of the Impacts of Greenhouse Gases on Climate Change

In 2009, the EPA Administrator issued the document known as the Endangerment Finding under CAA section 202(a)(1).²⁸ In the Endangerment Finding, which focused on public health and public welfare impacts within the United States, the Administrator found that elevated concentrations of GHG emissions in the atmosphere may reasonably be anticipated to endanger public health and welfare of current and future generations. See also *Coalition for Responsible Regulation v. EPA*, 684 F.3d 102, 117–123 (D.C. Cir. 2012) (upholding the endangerment finding in all respects). The following sections summarize the key information included in the Endangerment Finding.

Climate change caused by human emissions of GHGs threatens public health in multiple ways. By raising average temperatures, climate change increases the likelihood of heat waves, which are associated with increased deaths and illnesses. While climate change also decreases the likelihood of cold-related mortality, evidence indicates that the increases in heat mortality will be larger than the

decreases in cold mortality in the United States. Compared to a future without climate change, climate change is expected to increase ozone pollution over broad areas of the U.S., including in the largest metropolitan areas with the worst ozone problems, and thereby increase the risk of morbidity and mortality. Other public health threats also stem from projected increases in intensity or frequency of extreme weather associated with climate change, such as increased hurricane intensity, increased frequency of intense storms and heavy precipitation. Increased coastal storms and storm surges due to rising sea levels are expected to cause increased drownings and other adverse health impacts. Children, the elderly, and the poor are among the most vulnerable to these climate-related health effects. See also 79 FR 75242 (December 17, 2014) (climate change, and temperature increases in particular, likely to increase O₃ (ozone) pollution “over broad areas of the U.S., including the largest metropolitan areas with the worst O₃ problems, increas[ing] the risk of morbidity and mortality”).

Climate change caused by human emissions of GHGs also threatens public welfare in multiple ways. Climate changes are expected to place large areas of the country at serious risk of reduced water supplies, increased water pollution, and increased occurrence of extreme events such as floods and droughts. Coastal areas are expected to face increased risks from storm and flooding damage to property, as well as adverse impacts from rising sea level, such as land loss due to inundation, erosion, wetland submergence and habitat loss. Climate change is expected to result in an increase in peak electricity demand, and extreme weather from climate change threatens energy, transportation, and water resource infrastructure. Climate change may exacerbate ongoing environmental pressures in certain settlements, particularly in Alaskan indigenous communities. Climate change also is very likely to fundamentally rearrange U.S. ecosystems over the 21st century. Though some benefits may balance adverse effects on agriculture and forestry in the next few decades, the body of evidence points towards increasing risks of net adverse impacts on U.S. food production, agriculture and forest productivity as temperature continues to rise. These impacts are global and may exacerbate problems outside the U.S. that raise humanitarian, trade, and national security issues for the U.S. See also 79 FR 75382 (December 17, 2014) (welfare effects of

O₃ increases due to climate change, with emphasis on increased wildfires).

As outlined in Section VIII.A of the 2009 Endangerment Finding, EPA's approach to providing the technical and scientific information to inform the Administrator's judgment regarding the question of whether GHGs endanger public health and welfare was to rely primarily upon the recent, major assessments by the U.S. Global Change Research Program (USGCRP), the Intergovernmental Panel on Climate Change (IPCC), and the National Research Council (NRC) of the National Academies. These assessments addressed the scientific issues that EPA was required to examine, were comprehensive in their coverage of the GHG and climate change issues, and underwent rigorous and exacting peer review by the expert community, as well as rigorous levels of U.S. government review. Since the administrative record concerning the Endangerment Finding closed following EPA's 2010 Reconsideration Denial, a number of new major, peer-reviewed scientific assessments have been released. These include the IPCC's 2012 “Special Report on Managing the Risks of Extreme Events and Disasters to Advance Climate Change Adaptation” (SREX) and the 2013–2014 Fifth Assessment Report (AR5), the USGCRP's 2014 “Climate Change Impacts in the United States” (Climate Change Impacts), and the NRC's 2010 “Ocean Acidification: A National Strategy to Meet the Challenges of a Changing Ocean” (Ocean Acidification), 2011 “Report on Climate Stabilization Targets: Emissions, Concentrations, and Impacts over Decades to Millennia” (Climate Stabilization Targets), 2011 “National Security Implications for U.S. Naval Forces” (National Security Implications), 2011 “Understanding Earth's Deep Past: Lessons for Our Climate Future” (Understanding Earth's Deep Past), 2012 “Sea Level Rise for the Coasts of California, Oregon, and Washington: Past, Present, and Future,” 2012 “Climate and Social Stress: Implications for Security Analysis” (Climate and Social Stress), and 2013 “Abrupt Impacts of Climate Change” (Abrupt Impacts) assessments.

EPA has reviewed these new assessments and finds that the improved understanding of the climate system they present further strengthens the case that GHG emissions endanger public health and welfare.

In addition, these assessments highlight the urgency of the situation as the concentration of CO₂ in the atmosphere continues to rise. Absent a reduction in emissions, a recent

²⁸ “Endangerment and Cause or Contribute Findings for Greenhouse Gases Under section 202(a) of the Clean Air Act,” 74 FR 66496 (December 15, 2009) (“Endangerment Finding”).

National Research Council assessment projected that concentrations by the end of the century would increase to levels that the Earth has not experienced for millions of years.²⁹ In fact, that assessment stated that “the magnitude and rate of the present greenhouse gas increase place the climate system in what could be one of the most severe increases in radiative forcing of the global climate system in Earth history.”³⁰ What this means, as stated in another NRC assessment, is that:

Emissions of carbon dioxide from the burning of fossil fuels have ushered in a new epoch where human activities will largely determine the evolution of Earth’s climate. Because carbon dioxide in the atmosphere is long lived, it can effectively lock Earth and future generations into a range of impacts, some of which could become very severe. Therefore, emission reductions choices made today matter in determining impacts experienced not just over the next few decades, but in the coming centuries and millennia.³¹

Moreover, due to the time-lags inherent in the Earth’s climate, the Climate Stabilization Targets assessment notes that the full warming from any given concentration of CO₂ reached will not be realized for several centuries.

The most recent USGCRP “National Climate Assessment”³² emphasizes that climate change is already happening now and is happening in the United States. The assessment documents the increases in some extreme weather and climate events in recent decades, as well as the resulting damage and disruption to infrastructure and agriculture, and projects continued increases in impacts across a wide range of peoples, sectors, and ecosystems.

These assessments underscore the urgency of reducing emissions now. Today’s emissions will otherwise lead to raised atmospheric concentrations for thousands of years, and raised Earth system temperatures for even longer. Emission reductions today will benefit the public health and public welfare of current and future generations.

Finally, it should be noted that the concentration of carbon dioxide in the atmosphere continues to rise dramatically. In 2009, the year of the Endangerment Finding, the average concentration of carbon dioxide as measured on top of Mauna Loa was 387

parts per million.³³ The average concentration in 2015 was 401 parts per million, the first time an annual average has exceeded 400 parts per million since record keeping began at Mauna Loa in 1958, and for at least the past 800,000 years according to ice core records.³⁴ Moreover, 2015 was the warmest year globally in the modern global surface temperature record, going back to 1880, breaking the record previously held by 2014; this now means that the last 15 years have been 15 of the 16 warmest years on record.³⁵

(b) The EPA and NHTSA Light-Duty National GHG and Fuel Economy Program

On May 7, 2010, EPA and NHTSA finalized the first-ever National Program for light-duty cars and trucks, which set GHG emissions and fuel economy standards for model years 2012–2016 (see 75 FR 25324). More recently, the agencies adopted even stricter standards for model years 2017 and later (77 FR 62624, October 15, 2012). The agencies have used the light-duty National Program as a model for the HD National Program in several respects. This is most apparent in the case of heavy-duty pickups and vans, which are similar to the light-duty trucks addressed in the light-duty National Program both technologically as well as in terms of how they are manufactured (*i.e.*, the same company often makes both the vehicle and the engine, and several light-duty manufacturers also manufacture HD pickups and vans).³⁶ For HD pickups and vans, there are close parallels to the light-duty program in how the agencies have developed our respective heavy-duty standards and compliance structures. However, HD pickups and vans are true work vehicles that are designed for much higher towing and payload capabilities than are light-duty pickups and vans. The technologies applied to light-duty trucks are not all applicable to heavy-duty pickups and vans at the same adoption rates, and the technologies often produce a lower percent reduction in CO₂ emissions and fuel consumption when used in heavy-duty vehicles. Another difference between the light-duty and the heavy-duty standards is that each agency adopts heavy-duty

standards based on attributes other than vehicle footprint, as discussed below.

Due to the diversity of the remaining HD vehicles, there are fewer parallels with the structure of the light-duty program. However, the agencies have maintained the same collaboration and coordination that characterized the development of the light-duty program throughout the Phase 1 rulemaking and the continued efforts for Phase 2. Most notably, as with the light-duty program, manufacturers will continue to be able to design and build vehicles to meet a closely coordinated, harmonized national program, and to avoid unnecessarily duplicative testing and compliance burdens. In addition, the averaging, banking, and trading provisions in the HD program, although structurally different from those of the light-duty program, serve the same purpose, which is to allow manufacturers to achieve large reductions in fuel consumption and emissions while providing a broad mix of products to their customers. The agencies have also worked closely with CARB to provide harmonized national standards.

(c) EPA’s SmartWay Program

EPA’s voluntary SmartWay Transport Partnership program encourages businesses to take actions that reduce fuel consumption and CO₂ emissions while cutting costs by working with the shipping, logistics, and carrier communities to identify low carbon strategies and technologies across their transportation supply chains. SmartWay provides technical information, benchmarking and tracking tools, market incentives, and partner recognition to facilitate and accelerate the adoption of these strategies. Through the SmartWay program and its related technology assessment center, EPA has worked closely with truck and trailer manufacturers and truck fleets over the past 12 years to develop test procedures to evaluate vehicle and component performance in reducing fuel consumption and has conducted testing and has established test programs to verify technologies that can achieve these reductions. SmartWay partners have demonstrated these new and emerging technologies in their business operations, adding to the body of technical data and information that EPA can disseminate to industry, researchers and other stakeholders. Over the last several years, EPA has developed hands-on experience testing the largest heavy-duty trucks and trailers and evaluating improvements in tire and vehicle aerodynamic performance. In developing the Phase 1

³⁴ <http://www.esrl.noaa.gov/gmd/ccgg/trends/>.

³⁵ <http://www.ncdc.noaa.gov/sotc/global/201513>.

³⁶ This is more broadly true for heavy-duty pickup trucks than vans because every manufacturer of heavy-duty pickup trucks also makes light-duty pickup trucks, while only some heavy-duty van manufacturers also make light-duty vans.

program, the agencies drew from this testing and from the SmartWay experience. In the same way, the agencies benefitted from SmartWay in developing the Phase 2 trailer program.

(d) DOE's SuperTruck Initiative

The U.S. Department of Energy launched its SuperTruck I initiative in 2009. SuperTruck I was a DOE partnership with four industry teams, who at this point have either met the SuperTruck I 50 percent fuel efficiency improvement goal (relative to a 2009 best-in-class truck) or have laid the groundwork to succeed. Teams from Cummins/Peterbilt, Daimler, and Volvo exceeded the 50 percent efficiency improvement goal, with Navistar on track to exceed this target later this year. Research vehicles developed under SuperTruck I are Class 8 combination tractor-trailers that have dramatically increased fuel and freight efficiency through the use of advanced technologies. These technologies include tractor and trailer aerodynamic devices, engine waste heat recovery systems, hybrids, automated transmissions and lightweight materials. In March 2016 DOE announced SuperTruck II, which is an \$80M follow-on to SuperTruck I, where DOE will continue to partner with industry teams to collaboratively fund new projects to research, develop, and demonstrate technologies to further improve heavy-truck freight efficiency—by more than 100 percent, relative to a manufacturer's best-in-class 2009 truck. Achieving these kinds of Class 8 truck efficiency increases will require an integrated systems approach to ensure that the various components of the vehicle work well together. SuperTruck II projects will utilize a wide variety of truck and trailer technology approaches to achieve performance targets, such as further improvements in engine efficiency, drivetrain efficiency, aerodynamic drag, tire rolling resistance, and vehicle weight.

The agencies leveraged the outcomes of SuperTruck I by projecting how these tractor and trailer technologies could continue to advance from this early developmental stage toward the prototype and production stages. For a number of the SuperTruck technologies, the agencies are projecting advancement into production, given appropriate lead time. For example, a number of the aerodynamic and transmission technologies are projected to be in widespread production by 2021, and the agencies are finalizing 2021 standards based in part on performance of these SuperTruck technologies. For other more advanced SuperTruck

technologies, such as organic Rankine cycle waste heat recovery systems, the agencies are projecting that additional lead time is needed to ensure that these technologies will be effective and reliable in production. For these technologies, the agencies are finalizing 2027 standards whose stringency reflects a significant market adoption rate of advanced technologies, including waste heat recovery systems. Furthermore, the agencies are encouraged by DOE's announcement of SuperTruck II. We believe that the combination of HD Phase 2 and SuperTruck II will provide both a strong motivation and a proven means for manufacturers to fully develop these technologies within the lead times we have projected.

(e) The State of California

California has established ambitious goals for reducing GHG emissions from heavy-duty vehicles and engines as part of an overall plan to reduce GHG emissions from the transportation sector in California.³⁷ Heavy-duty vehicles are responsible for one-fifth of the total GHG emissions from transportation sources in California. In the past several years, the California Air Resources Board (CARB) has taken a number of actions to reduce GHG emissions from heavy-duty vehicles and engines. For example, in 2008, CARB adopted regulations to reduce GHG emissions from heavy-duty tractors that pull box-type trailers through improvements in tractor and trailer aerodynamics and the use of low rolling resistance tires.³⁸ The tractor-trailer operators subject to the CARB regulation are required to use SmartWay-certified tractors and trailers, or retrofit their existing fleet with SmartWay-verified technologies, consistent with California's state authority to regulate both new and in-use vehicles. In December 2013, CARB adopted regulations that establish its own parallel Phase 1 program with standards consistent with EPA Phase 1 standards. On December 5, 2014, California's Office of Administrative Law approved CARB's adoption of the Phase 1 standards, with an effective date of December 5, 2014.³⁹ Complementary

to its regulatory efforts, CARB and other California agencies are investing significant public capital through various incentive programs to accelerate fleet turnover and stimulate technology innovation within the heavy-duty vehicle market (e.g., Air Quality Improvement, Carl Moyer, Loan Incentives, Lower-Emission School Bus and Goods Movement Emission Reduction Programs).⁴⁰ Recently, California Governor Jerry Brown established a target of up to 50 percent petroleum reduction by 2030.

California has long had the unique ability among states to adopt its own separate new motor vehicle standards per section 209 of the Clean Air Act (CAA). Although section 209(a) of the CAA expressly preempts states from adopting and enforcing standards relating to the control of emissions from new motor vehicles or new motor vehicle engines (such as state controls for new heavy-duty engines and vehicles), CAA section 209(b) directs EPA to waive this preemption under certain conditions. Under the waiver process set out in CAA section 209(b), EPA has granted CARB a waiver for its initial heavy-duty vehicle GHG regulation.⁴¹ Even with California's ability under the CAA to establish its own emission standards, EPA and CARB have worked closely together over the past several decades to largely harmonize new vehicle criteria pollutant standard programs for heavy-duty engines and heavy-duty vehicles. In the past several years EPA and NHTSA also consulted with CARB in the development of the Federal light-duty vehicle GHG and CAFE rulemakings for the 2012–2016 and 2017–2025 model years.

As discussed above, California operates under state authority to establish its own new heavy-duty vehicle and engine emission standards, including standards for CO₂, methane, N₂O, and hydrofluorocarbons. EPA recognizes this independent authority, and we also recognize the potential benefits for the regulated industry if the Federal Phase 2 standards could result

³⁷ See <http://www.arb.ca.gov/cc/cc.htm> for details on the California Air Resources Board climate change actions, including a discussion of Assembly Bill 32, and the Climate Change Scoping Plan developed by CARB, which includes details regarding CARB's future goals for reducing GHG emissions from heavy-duty vehicles.

³⁸ See <http://www.arb.ca.gov/msprog/truckstop/trailers/trailers.htm> for a summary of CARB's "Tractor-Trailer Greenhouse Gas Regulation."

³⁹ See <http://www.arb.ca.gov/regact/2013/hdghg2013/hdghg2013.htm> for details regarding CARB's adoption of the Phase 1 standards.

⁴⁰ See <http://www.arb.ca.gov/ba/fininfo.htm> for detailed descriptions of CARB's mobile source incentive programs. Note that EPA works to support CARB's heavy-duty incentive programs through the West Coast Collaborative (<http://westcoastcollaborative.org/>) and the Clean Air Technology Initiative (<https://www.epa.gov/cat/>).

⁴¹ See EPA's waiver of CARB's heavy-duty tractor-trailer greenhouse gas regulation applicable to new 2011 through 2013 model year Class 8 tractors equipped with integrated sleeper berths (sleeper-cab tractors) and 2011 and subsequent model year dry-can and refrigerated-van trailers that are pulled by such tractors on California highways at 79 FR 46256 (August 7, 2014).

in a single, National Program that would meet the EPA and NHTSA's statutory requirements to set appropriate and maximum feasible standards, and also be equivalent to potential future new heavy-duty vehicle and engine GHG standards established by CARB (addressing the same model years as addressed by the final Federal Phase 2 program and requiring the same technologies). In order to further the opportunity for maintaining coordinated Federal and California standards in the Phase 2 timeframe (as well as to benefit from different technical expertise and perspective), EPA and NHTSA consulted frequently with CARB while developing the Phase 2 rule. Prior to the proposal, the agencies' technical staff shared information on technology cost, technology effectiveness, and feasibility with the CARB staff. We also received information from CARB on these same topics. In addition, CARB staff and managers participated with EPA and NHTSA in meetings with many external stakeholders, in particular with vehicle OEMs and technology suppliers. The agencies continued significant consultation during the development of the final rules.

EPA and NHTSA believe that through this information sharing and dialog we have enhanced the potential for the Phase 2 program to result in a National Program that can be adopted not only by the Federal agencies, but also by the State of California, given the strong interest from the regulated industry for a harmonized State and Federal program. In its public comments, California reiterated its support for a harmonized State and Federal program, although it identified several areas in which it believed the proposed program needed to be strengthened.

(f) Environment and Climate Change Canada

On March 13, 2013, Environment and Climate Change Canada (ECCC), which is EPA's Canadian counterpart, published its own regulations to control GHG emissions from heavy-duty vehicles and engines, beginning with MY 2014. These regulations are closely aligned with EPA's Phase 1 program to achieve a common set of North American standards. ECCC has expressed its intention to amend these regulations to further limit emissions of greenhouse gases from new on-road heavy-duty vehicles and their engines for post-2018 MYs. As with the development of the current regulations, ECCC is committed to continuing to work closely with EPA to maintain a common Canada–United States approach to regulating GHG emissions

for post-2018 MY vehicles and engines. This approach will build on the long history of regulatory alignment between the two countries on vehicle emissions pursuant to the Canada–United States Air Quality Agreement.⁴² In furtherance of this coordination, EPA participated in a workshop hosted by ECCC on March 3, 2016 to discuss Canada's Phase 2 program.⁴³

The Government of Canada, including ECCC and Transport Canada, has also been of great assistance during the development of this Phase 2 rule. In particular, the Government of Canada supported aerodynamic testing, and conducted chassis dynamometer emissions testing.

(g) Recommendations of the National Academy of Sciences

In April 2010, as mandated by Congress in the EISA, the National Research Council (NRC) under the National Academy of Sciences (NAS) issued a report to NHTSA and to Congress evaluating medium- and heavy-duty truck fuel efficiency improvement opportunities, titled "Technologies and Approaches to Reducing the Fuel Consumption of Medium- and Heavy-duty Vehicles." That NAS report was far reaching in its review of the technologies that were available and that might become available in the future to reduce fuel consumption from medium- and heavy-duty vehicles. In presenting the full range of technical opportunities, the report included technologies that may not be available until 2020 or even further into the future. The report provided not only a valuable list of off-the-shelf technologies from which the agencies drew in developing the Phase 1 program, but also provided useful information the agencies have considered when developing this second phase of regulations.

In April 2014, the NAS issued another report: "Reducing the Fuel Consumption and Greenhouse Gas Emissions of Medium- and Heavy-Duty Vehicles, Phase Two, First Report."⁴⁴

⁴² http://www.ijc.org/en/_/Air_Quality_Agreement.

⁴³ "Phase 2 of the Heavy-duty Vehicle and Engine Greenhouse Gas Emission Regulations; Pre-Consultation Session," March 3, 2016.

⁴⁴ National Research Council "Reducing the Fuel Consumption and Greenhouse Gas Emissions of Medium- and Heavy-Duty Vehicles, Phase Two." Washington, DC, The National Academies Press. Cooperative Agreement DTNH22–12–00389. Available electronically from the National Academy Press Web site at <http://www.nap.edu/catalog/18736/reducing-the-fuel-consumption-and-greenhouse-gas-emissions-of-medium-and-heavy-duty-vehicles-phase-two> (last accessed May 18, 2016). On September 24, 2016, NAS will release an

This study outlines a number of recommendations to the U.S. Department of Transportation and NHTSA on technical and policy matters to consider when addressing the fuel efficiency of our nation's medium- and heavy-duty vehicles. In particular, this report provided recommendations with respect to:

- The Greenhouse Gas Emission Model (GEM) simulation tool used by the agencies to assess compliance with vehicle standards
- Regulation of trailers
- Natural gas-fueled engines and vehicles
- Data collection on in-use operation

The agencies are adopting many of these recommendations into the Phase 2 program, including recommendations relating to the GEM simulation tool and to trailers.

B. Summary of Phase 1 Program

(1) EPA Phase 1 GHG Emission Standards and NHTSA Phase 1 Fuel Consumption Standards

The EPA Phase 1 mandatory GHG emission standards commenced in MY 2014 and include increased stringency for standards applicable to MY 2017 and later MY vehicles and engines. NHTSA's fuel consumption standards were voluntary for MYs 2014 and 2015, due to lead time requirements in EISA, and apply on a mandatory basis thereafter. They also increase in stringency for MY 2017. Both agencies allowed voluntary early compliance starting in MY 2013 and encouraged manufacturers' participation through credit incentives.

Given the complexity of the heavy-duty industry, the agencies divided the industry into three discrete categories for purposes of setting our respective Phase 1 standards—combination tractors, heavy-duty pickups and vans, and vocational vehicles—based on the relative degree of homogeneity among trucks within each category. The Phase 1 rules also include separate standards for the engines that power combination tractors and vocational vehicles. For each regulatory category, the agencies adopted related but distinct program approaches reflecting the specific challenges in these segments. In the following paragraphs, we briefly summarize EPA's Phase 1 GHG emission standards and NHTSA's Phase 1 fuel consumption standards for the three regulatory categories of heavy-duty vehicles and for the engines powering vocational vehicles and

update report, consistent with Congress' quinquennial update requirement.

tractors. See Sections II, III, V, and VI for additional details on the Phase 1 standards. To respect differences in design and typical uses that drive different technology solutions, the agencies segmented each regulatory class into subcategories. The category-specific structure enabled the agencies to set standards that appropriately reflect the technology available for each regulatory subcategory of vehicles and the engines for use in each type of vehicle. The Phase 1 program also provided several flexibilities, as summarized in Section I.B.(3).

The agencies proposed and are adopting Phase 2 standards based on test procedures that differ from those used for Phase 1, including the revised GEM simulation tool. Significant revisions to GEM are discussed in Section II and in the RIA Chapter 4, and other test procedures are discussed further in the RIA Chapter 3. The pre-proposal revisions from Phase 1 GEM reflected input from both the NAS and from industry.⁴⁵ Changes since the proposal generally reflect comments received from industry and other key stakeholders. It is important to note that due to these test procedure changes, the Phase 1 and Phase 2 standards are not directly comparable in an absolute sense. In particular, the revisions being made to the 55 mph and 65 mph highway cruise cycles for tractors and vocational vehicles have the effect of making the cycles more challenging (albeit more representative of actual driving conditions). We are not applying these revisions to the Phase 1 program because doing so would significantly change the stringency of the Phase 1 standards, for which manufacturers have already developed engineering plans and are now producing products to meet. Moreover, the changes to GEM address a broader range of technologies not part of the projected compliance path for use in Phase 1.

Because the numeric values of the Phase 2 tractor and vocational standards are not directly comparable to their respective Phase 1 standards, the Phase 1 numeric standards were not appropriate baseline values to use to determine Phase 2's improvements. To address this situation, the agencies applied all of the new Phase 2 test procedures and GEM software to tractors and vocational vehicles equipped with Phase 1 compliant levels of technology. The agencies used the results of this approach to establish appropriate Phase 1 baseline values,

which *are* directly comparable to the Phase 2 standards. For example, in this rulemaking we present Phase 2 per vehicle percent reductions versus Phase 1, and for tractors and vocational vehicles these percent reductions were all calculated versus Phase 1 compliant vehicles, where we applied the Phase 2 test procedures and GEM software to determine these Phase 1 vehicles' results.

(a) Class 7 and 8 Combination Tractors

Class 7 and 8 combination tractors and their engines contribute the largest portion of the total GHG emissions and fuel consumption of the heavy-duty sector, approximately 60 percent, due to their large payloads, their high annual miles traveled, and their major role in national freight transport. These vehicles consist of a cab and engine (tractor or combination tractor) and a detachable trailer. The primary manufacturers of combination tractors in the United States are Daimler Trucks North America, Navistar, Volvo/Mack, and PACCAR. Each of the tractor manufacturers and Cummins (an independent engine manufacturer) also produce heavy-duty engines used in tractors. The Phase 1 standards require manufacturers to reduce GHG emissions and fuel consumption for these tractors and engines, which we expect them to do through improvements in aerodynamics and tires, reductions in tractor weight, reduction in idle operation, as well as engine-based efficiency improvements.⁴⁶

The Phase 1 tractor standards differ depending on gross vehicle weight rating (GVWR) (*i.e.*, whether the truck is Class 7 or Class 8), the height of the roof of the cab, and whether it is a "day cab" or a "sleeping cab." The agencies created nine subcategories within the Class 7 and 8 combination tractor category reflecting combinations of these attributes. The agencies set Phase 1 standards for each of these subcategories beginning in MY 2014, with more stringent standards following in MY 2017. The standards represent an overall fuel consumption and CO₂ emissions reduction up to 23 percent from the tractors and the engines installed in them when compared to a baseline MY 2010 tractor and engine.

For Phase 1, tractor manufacturers demonstrate compliance with the tractor

CO₂ and fuel consumption standards using a vehicle simulation tool described in Section II. The tractor inputs to the simulation tool in Phase 1 are the aerodynamic performance, tire rolling resistance, vehicle speed limiter, automatic engine shutdown, and weight reduction.

In addition to the Phase 1 tractor-based standards for CO₂, EPA adopted a separate standard to reduce leakage of hydrofluorocarbon (HFC) refrigerant from cabin air conditioning (A/C) systems from combination tractors, to apply to the tractor manufacturer. This HFC leakage standard is independent of the CO₂ tractor standard. Manufacturers can choose technologies from a menu of leak-reducing technologies sufficient to comply with the standard, as opposed to using a test to measure performance. Given that HFC leakage does not relate to fuel efficiency, NHTSA did not adopt corresponding HFC standards.

(b) Heavy-Duty Pickup Trucks and Vans (Class 2b and 3)

Heavy-duty vehicles with a GVWR between 8,501 and 10,000 lb. are classified as Class 2b motor vehicles. Heavy-duty vehicles with a GVWR between 10,001 and 14,000 lb. are classified as Class 3 motor vehicles. Class 2b and Class 3 heavy-duty vehicles (referred to in these rules as "HD pickups and vans") together emit about 23 percent of today's GHG emissions from the heavy-duty vehicle sector.⁴⁷

The majority of HD pickups and vans are ¾-ton and 1-ton pickup trucks, 12- and 15-passenger vans,⁴⁸ and large work vans that are sold by vehicle manufacturers as complete vehicles, with no secondary manufacturer making substantial modifications prior to registration and use. These vehicles can also be sold as cab-complete vehicles (*i.e.*, incomplete vehicles that include complete or nearly complete cabs that are sold to secondary manufacturers). The majority of heavy-duty pickups and vans are produced by companies with major light-duty markets in the United States. Furthermore, the technologies available to reduce fuel consumption and GHG emissions from this segment are similar to the technologies used on light-duty pickup trucks, including both engine efficiency improvements (for gasoline and diesel engines) and vehicle efficiency improvements. For these reasons, EPA and NHTSA concluded

⁴⁶ We note although the standards' stringency is predicated on use of certain technologies, and the agencies' assessed the cost of the rule based on the cost of use of those technologies, the standards can be met by any means. Put another way, the rules create a performance standard, and do not mandate any particular means of achieving that level of performance.

⁴⁷ EPA MOVES Model, <http://www3.epa.gov/otaq/models/moves/index.htm>.

⁴⁸ Note that 12-passenger vans are subject to the light-duty standards as medium-duty passenger vehicles (MDPVs) and are not subject to this proposal.

⁴⁵ For further discussion of the input the agencies received from NAS, see Section XII of the Phase 2 NPRM at 80 FR 40512, July 13, 2015.

that it was appropriate to adopt GHG standards, expressed as grams per mile, and fuel consumption standards, expressed as gallons per 100 miles, for HD pickups and vans based on the whole vehicle (including the engine), consistent with the way these vehicles have been regulated by EPA for criteria pollutants and also consistent with the way their light-duty counterpart vehicles are regulated by EPA and NHTSA. This complete vehicle approach adopted by both agencies for HD pickups and vans was consistent with the recommendations of the NAS Committee in its 2010 Report.

For the light-duty GHG and fuel economy standards, the agencies based the emissions and fuel economy targets on vehicle footprint (the wheelbase times the average track width). For those standards, passenger cars and light trucks with larger footprints are assigned higher GHG and lower fuel economy target levels reflecting their inherent tendency to consume more fuel and emit more GHGs per mile. For HD pickups and vans, the agencies believe that setting standards based on vehicle attributes is appropriate, but have found that a work-based metric is a more appropriate attribute than the footprint attribute utilized in the light-duty vehicle rulemaking, given that work-based measures such as towing and payload capacities are critical elements of these vehicles' functionality. EPA and NHTSA therefore adopted standards for HD pickups and vans based on a "work factor" attribute that combines their payload and towing capabilities, with an added adjustment for 4-wheel drive vehicles.

Each manufacturer's fleet average Phase 1 standard is based on production volume-weighting of target standards for all vehicles, which in turn are based on each vehicle's work factor. These target standards are taken from a set of curves (mathematical functions), with separate curves for gasoline and diesel vehicles.⁴⁹ However, both gasoline and diesel vehicles in this category are included in a single averaging set. EPA phased in the CO₂ standards gradually starting in the 2014 MY, at 15–20–40–60–100 percent of the MY 2018 standards stringency level in MYs 2014–2015–2016–2017–2018, respectively (*i.e.*, the 2014 standards requires only 15 percent of the reduction required in 2018, etc.). The phase-in takes the form

of a set of target curves, with increasing stringency in each MY.

NHTSA allowed manufacturers to select one of two fuel consumption standard alternatives for MYs 2016 and later. The first alternative defined individual gasoline vehicle and diesel vehicle fuel consumption target curves that will not change for MYs 2016–2018, and are equivalent to EPA's 67–67–67–100 percent target curves in MYs 2016–2017–2018–2019, respectively. The second alternative defined target curves that are equivalent to EPA's 40–60–100 percent target curves in MYs 2016–2017–2018, respectively. NHTSA allowed manufacturers to opt voluntarily into the NHTSA HD pickup and van program in MYs 2014 or 2015 at target curves equivalent to EPA's target curves. If a manufacturer chose to opt in for one category, they would be required to opt in for all categories. In other words, a manufacturer would be unable to opt in for Class 2b vehicles, but opt out for Class 3 vehicles.

EPA also adopted an alternative phase-in schedule for manufacturers wanting to have stable standards for model years 2016–2018. The standards for heavy-duty pickups and vans, like those for light-duty vehicles, are expressed as set of target standard curves, with increasing stringency in each model year. The Phase 1 EPA standards for 2018 (including a separate standard to control air conditioning system leakage) are estimated to represent an average per-vehicle reduction in GHG emissions of 17 percent for diesel vehicles and 12 percent for gasoline vehicles (relative to pre-control baseline vehicles). The NHTSA standard will require these vehicles to achieve up to about 15 percent reduction in fuel consumption by MY 2018 (relative to pre-control baseline vehicles). Manufacturers demonstrate compliance based on entire vehicle chassis certification using the same duty cycles used to demonstrate compliance with criteria pollutant standards.

(c) Class 2b–8 Vocational Vehicles

Class 2b–8 vocational vehicles include a wide variety of vehicle types, and serve a vast range of functions. Some examples include service for parcel delivery, refuse hauling, utility service, dump, concrete mixing, transit service, shuttle service, school bus, emergency, motor homes, and tow trucks. In Phase 1, we defined Class 2b–8 vocational vehicles as all heavy-duty vehicles that are not included in either the heavy-duty pickup and van category or the Class 7 and 8 tractor category. EPA's and NHTSA's Phase 1 standards

for this vocational vehicle category generally apply at the chassis manufacturer level. Class 2b–8 vocational vehicles and their engines emit approximately 17 percent of the GHG emissions and burn approximately 17 percent of the fuel consumed by today's heavy-duty truck sector.⁵⁰

The Phase 1 program for vocational vehicles has vehicle standards and separate engine standards, both of which differ based on the weight class of the vehicle into which the engine will be installed. The vehicle weight class groups mirror those used for the engine standards—Classes 2b–5 (light heavy-duty or LHD in EPA regulations), Classes 6 and 7 (medium heavy-duty or MHD in EPA regulations) and Class 8 (heavy heavy-duty or HHD in EPA regulations). Manufacturers demonstrate compliance with the Phase 1 vocational vehicle CO₂ and fuel consumption standards using a vehicle simulation tool described in Section II. The Phase 1 program for vocational vehicles limited the simulation tool inputs to tire rolling resistance. The model assumes the use of a typical representative, compliant engine in the simulation, resulting in one overall value for CO₂ emissions and one for fuel consumption.

(d) Engine Standards

The agencies established separate Phase 1 performance standards for the engines manufactured for use in vocational vehicles and Class 7 and 8 tractors.⁵¹ These engine standards vary depending on engine size linked to intended vehicle service class. EPA's engine-based CO₂ standards and NHTSA's engine-based fuel consumption standards are being implemented using EPA's existing test procedures and regulatory structure for criteria pollutant emissions from heavy-duty engines. EPA also established engine-based N₂O and CH₄ emission standards in Phase 1.

(e) Manufacturers Excluded From the Phase 1 Standards

Phase 1 deferred greenhouse gas emissions and fuel consumption standards for any manufacturers of heavy-duty engines, manufacturers of combination tractors, and chassis manufacturers for vocational vehicles that meet the "small business" size criteria set by the Small Business Administration (SBA). 13 CFR 121.201

⁴⁹ As explained in Section XI, as part of this rulemaking, EPA moved the Phase 1 requirements for pickups and vans from 40 CFR 1037.104 into 40 CFR part 86, which is also the regulatory part that applies for light-duty vehicles.

⁵⁰ EPA MOVES model, <http://www3.epa.gov/otaq/models/moves/index.htm>.

⁵¹ See 76 FR 57114 explaining why NHTSA's authority under the Energy Independence and Safety Act includes authority to establish separate engine standards.

defines a small business by the maximum number of employees; for example, this is currently 1,500 for heavy-duty truck manufacturing and 1,000 for engine manufacturing.⁵² In order to utilize this exemption, qualifying small businesses must submit a declaration to the agencies. See Section I.F.(1)(b) for a summary of how Phase 2 applies for small businesses.

The agencies stated that they would consider appropriate GHG and fuel consumption standards for these entities as part of a future regulatory action. This includes both U.S.-based and foreign small-volume heavy-duty manufacturers that introduce new products into the U.S.

(2) Costs and Benefits of the Phase 1 Program

Overall, EPA and NHTSA estimated that the Phase 1 HD National Program will cost the affected industry about \$8 billion, while saving vehicle owners fuel costs of nearly \$50 billion over the lifetimes of MY 2014–2018 vehicles. The agencies also estimated that the combined standards will reduce CO₂ emissions by about 270 million metric tons and save about 530 million barrels of oil over the life of MY 2014 to 2018 vehicles. The agencies estimated additional monetized benefits from CO₂ reductions, improved energy security, reduced time spent refueling, as well as possible dis-benefits from increased driving crashes, traffic congestion, and noise. When considering all these factors, we estimated that Phase 1 of the HD National Program will yield \$49 billion in net benefits to society over the lifetimes of MY 2014–2018 vehicles.

EPA estimated the benefits of reduced ambient concentrations of particulate matter and ozone resulting from the Phase 1 program to range from \$1.3 to \$4.2 billion in 2030.⁵³

In total, we estimated the combined Phase 1 standards will reduce GHG emissions from the U.S. heavy-duty fleet by approximately 76 million metric tons of CO₂-equivalent annually by 2030. In its Environmental Impact Statement for the Phase 1 rule, NHTSA also quantified and/or discussed other potential impacts of the program, such as the health and environmental impacts associated with changes in ambient exposures to toxic air pollutants and the benefits associated with avoided non-

CO₂ GHGs (methane, nitrous oxide, and HFCs).

(3) Phase 1 Program Flexibilities

As noted above, the agencies adopted numerous provisions designed to give manufacturers a degree of flexibility in complying with the Phase 1 standards. These provisions, which are essentially identical in structure and function in EPA's and NHTSA's regulations, enabled the agencies to consider overall standards that are more stringent and that will become effective sooner than we could consider with a more rigid program, one in which all of a manufacturer's similar vehicles or engines would be required to achieve the same emissions or fuel consumption levels, and at the same time.⁵⁴

Phase 1 included four primary types of flexibility: Averaging, banking, and trading (ABT) provisions; early credits; advanced technology credits (including hybrid powertrains); and innovative technology credit provisions. The ABT provisions were patterned on existing EPA and NHTSA ABT programs (including the light-duty GHG and fuel economy standards) and will allow a vehicle manufacturer to reduce CO₂ emission and fuel consumption levels further than the level of the standard for one or more vehicles to generate ABT credits. The manufacturer can use those credits to offset higher emission or fuel consumption levels in the same averaging set, "bank" the credits for later use, or "trade" the credits to another manufacturer. As also noted above, for HD pickups and vans, we adopted a fleet averaging system very similar to the light-duty GHG and CAFE fleet averaging system. In both programs, manufacturers are allowed to carry-forward deficits for up to three years without penalty. The agencies provided in the ABT programs flexibility for situations in which a manufacturer is unable to avoid a negative credit balance at the end of the year. In such cases, manufacturers are not considered to be out of compliance unless they are unable to make up the difference in credits by the end of the third subsequent model year.

In total, the Phase 1 program divides the heavy-duty sector into 14 subcategories of vehicles and 4 subcategories of engines. These subcategories are grouped into 4 vehicle

averaging sets and 4 engine averaging sets in the ABT program. For tractors and vocational vehicles, the fleet averaging sets are: Light heavy-duty (Classes 2b–5); medium heavy-duty (Class 6–7); and heavy heavy-duty (Class 8). Complete HD pickups and vans (both spark-ignition and compression-ignition) are the final vehicle averaging set. For engines, the fleet averaging sets are spark-ignition engines, compression-ignition light heavy-duty engines, compression-ignition medium heavy-duty engines, and compression-ignition heavy heavy-duty engines. ABT allows the exchange of credits within an averaging set. This means that a Class 8 day cab tractor can exchange credits with a Class 8 sleeper tractor but not with a smaller Class 7 tractor. Also, a Class 8 vocational vehicle can exchange credits with a Class 8 tractor. However, we did not allow trading between engines and chassis (*i.e.* vehicles).

In addition to ABT, the other primary flexibility provisions in the Phase 1 program involve opportunities to generate early credits, advanced technology credits (including for use of hybrid powertrains), and innovative technology credits.⁵⁵ For the early credits and advanced technology credits, the agencies adopted a 1.5x multiplier, meaning that manufacturers would get 1.5 credits for each early credit and each advanced technology credit. In addition, advanced technology credits for Phase 1 can be used anywhere within the heavy-duty sector (including both vehicles and engines). Put another way, as a means of promoting these promising technologies, the Phase 1 rule does not restrict averaging or trading by averaging set in this instance.

For other vehicle or engine technologies that can reduce CO₂ and fuel consumption, but whose benefits are not reflected if measured using the Phase 1 test procedures, the agencies wanted to encourage the development of such innovative technologies, and therefore adopted special "innovative technology" credits. These innovative technology credits apply to technologies that are shown to produce emission and fuel consumption reductions that are not adequately recognized on the Phase 1 test procedures and that were not yet in widespread use in the heavy-duty sector before MY 2010. Manufacturers

⁵² These thresholds were revised in early 2016. See <http://www.regulations.gov/#/documentDetail;D=SBA-2014-0011-0031>.

⁵³ Note: These calendar year benefits do not represent the same time frame as the model year lifetime benefits described above, so they are not additive.

⁵⁴ NHTSA explained that it has greater flexibility in the HD program to include consideration of credits and other flexibilities in determining appropriate and feasible levels of stringency than it does in the light-duty CAFE program. *Cf.* 49 U.S.C. 32902(h), which applies to light-duty CAFE but not heavy-duty fuel efficiency under 49 U.S.C. 32902(k).

⁵⁵ Early credits are for engines and vehicles certified before EPA standards became mandatory, advanced technology credits are for hybrids and/or Rankine cycle engines, and innovative technology credits are for other technologies not in the 2010 fleet whose benefits are not reflected using the Phase 1 test procedures.

need to quantify the reductions in fuel consumption and CO₂ emissions that the technology is expected to achieve, above and beyond those achieved on the Phase 1 test procedures. As with ABT, the use of innovative technology credits is allowed only among vehicles and engines of the same defined averaging set generating the credit, as described above. The credit multiplier likewise does not apply for innovative technology credits.

(4) Implementation of Phase 1

Manufacturers have already begun complying with the Phase 1 standards. In some cases manufacturers voluntarily chose to comply early, before compliance was mandatory. The Phase 1 rule allowed manufacturers to generate credits for such early compliance. The market appears to be very accepting of the new technologies, and the agencies have seen no evidence of “pre-buy” effects in response to the standards. In fact sales have been higher in recent years than they were before Phase 1. Moreover, manufacturers’ compliance plans indicate intention to utilize the Phase 1 flexibilities, and we have yet to see significant non-compliance with the standards.

(5) Litigation on Phase 1 Rule

The D.C. Circuit rejected all challenges to the agencies’ Phase 1 regulations. The court did not reach the merits of the challenges, holding that none of the petitioners had standing to bring their actions, and that a challenge to NHTSA’s denial of a rulemaking petition could only be brought in District Court. See *Delta Construction v. EPA*, 783 F. 3d 1291 (D.C. Cir. 2015).

C. Summary of the Phase 2 Standards and Requirements

The agencies are adopting new standards that build on and enhance existing Phase 1 standards, and are adopting as well the first-ever standards for certain trailers used in combination with heavy-duty tractors. Taken together, the Phase 2 program comprises a set of largely technology-advancing standards that will achieve greater GHG and fuel consumption savings than the Phase 1 program. As described in more detail in the following sections, the agencies are adopting these standards because, based on the information available at this time and careful consideration of all comments, we believe they best fulfill our respective statutory authorities when considered in the context of available technology, feasible reductions of emissions and fuel consumption, costs, lead time, safety, and other relevant factors.

The Phase 2 standards represent a more technology-forcing⁵⁶ approach than the Phase 1 approach, predicated on use of both off-the-shelf technologies and emerging technologies that are not yet in widespread use. The agencies are adopting standards for MY 2027 that we project will require manufacturers to make extensive use of these technologies. The standards increase in stringency incrementally beginning in MY 2018 for trailers and in MY 2021 for other segments, ensuring steady improvement to the MY 2027 stringency levels. For existing technologies and technologies in the final stages of development, we project that manufacturers will likely apply them to nearly all vehicles, excluding those specific vehicles with applications or uses that prevent the technology from functioning properly. We also project as one possible compliance pathway that manufacturers could apply other more advanced technologies such as hybrids and waste engine heat recovery systems, although at lower application rates than the more conventional technologies. Comments on the overall stringency of the proposed Phase 2 program were mixed. Many commenters, including most non-governmental organizations, supported more stringent standards with less lead time. Many technology and component suppliers supported more stringent standards but with the proposed lead time. Vehicle manufacturers did not support more stringent standards and emphasized the importance of lead time. To the extent these commenters provided technical information to support their comments on stringency and lead time, it is discussed in Sections II through VI.

The standards being adopted provide approximately ten years of lead time for manufacturers to meet these 2027 standards, which the agencies believe is appropriate to implement the technologies industry could use to meet these standards. For some of the more advanced technologies production prototype parts are not yet available, though they are in the research stage with some demonstrations in actual

vehicles.⁵⁷ In the respective sections of Chapter 2 of the RIA, the agencies explain what further steps are needed to successfully and reliably commercialize these prototypes in the lead time afforded by the Phase 2 standards. Additionally, even for the more developed technologies, phasing in more stringent standards over a longer timeframe will help manufacturers to ensure better reliability of the technology and to develop packages to work in a wide range of applications.

As discussed later, the agencies are also adopting new standards in MYs 2018 (trailers only), 2021, and 2024 to ensure that manufacturers make steady progress toward the 2027 standards, thereby achieving steady and feasible reductions in GHG emissions and fuel consumption in the years leading up to the MY 2027 standards.

Providing additional lead time can often enable manufacturers to resolve technological challenges or to find lower cost means of meeting new regulatory standards, effectively making them more feasible in either case. See generally *NRDC v. EPA*, 655 F. 2d 318, 329 (D.C. Cir. 1981). On the other hand, manufacturers and/or operators may incur additional costs if regulations require them to make changes to their products with less lead time than manufacturers would normally have when bringing a new technology to the market or expanding the application of existing technologies. After developing a new technology, manufacturers typically conduct extensive field tests to ensure its durability and reliability in actual use. Standards that accelerate technology deployment can lead to manufacturers incurring additional costs to accelerate this development work, or can lead to manufacturers beginning production before such testing can be completed. Some industry stakeholders have informed EPA that when manufacturers introduced new emission control technologies (primarily diesel particulate filters) in response to the 2007 heavy-duty engine standards they did not perform sufficient product development validation, which led to additional costs for operators when the technologies required repairs or resulted in other operational issues in use. Thus, the issues of costs, lead time, and reliability are intertwined for the

⁵⁶ In this context, the term “technology-forcing” has a specific legal meaning and is used to distinguish standards that will effectively require manufacturers to develop new technologies (or to significantly improve technologies) from standards that can be met using off-the-shelf technology alone. See, e.g., *NRDC v. EPA*, 655 F. 2d 318, 328 (D.C. Cir. 1981). Technology-forcing standards do not require manufacturers to use any specific technologies. See also 76 FR 57130 (explaining that section 202(a)(2) allows EPA to adopt such technology-forcing standards, although it does not compel such standards).

⁵⁷ “Prototype” as it is used here refers to technologies that have a potentially production-feasible design that is expected to meet all performance, functional, reliability, safety, manufacturing, cost and other requirements and objectives that is being tested in laboratories and on highways under a full range of operating conditions, but is not yet available in production vehicles already for sale in the market.

agencies' determination of whether standards are reasonable and maximum feasible, respectively.

Another important consideration was the possibility of disrupting the market, which would be a risk if compliance required application of new technologies too suddenly. Several of the heavy-duty vehicle manufacturers, fleets, and commercial truck dealerships informed the agencies that for fleet purchases that are planned more than a year in advance, *expectations* of reduced reliability, increased operating costs, reduced residual value, or of large increases in purchase prices can lead the fleets to pull-ahead by several months planned future vehicle purchases by pre-buying vehicles without the newer technology. In the context of the Class 8 tractor market, where a relatively small number of large fleets typically purchase very large volumes of tractors, such actions by a small number of firms can result in large swings in sales volumes. Such market impacts would be followed by some period of reduced purchases that can lead to temporary layoffs at the factories producing the engines and vehicles, as well as at supplier factories, and disruptions at dealerships. Such market impacts also can reduce the overall environmental and fuel consumption benefits of the standards by delaying the rate at which the fleet turns over. See *International Harvester v. EPA*, 478 F.2d 615, 634 (D.C. Cir. 1973). A number of commenters stated that the 2007 EPA heavy-duty engine criteria pollutant standard precipitated pre-buy for the Class 8 tractor market.⁵⁸ The agencies understand the potential impact that fleets pulling ahead purchases can have on American manufacturing and labor, dealerships, truck purchasers, and on the program's environmental and fuel savings goals, and have taken steps in the design of the program to avoid such disruption (see also our discussion in RTC Section 11.7). These steps include the following:

- Providing considerable lead time
- Adopting standards that will result in significantly lower operating costs for vehicle owners (unlike the 2007 standard, which increased operating costs)
- Phasing in the standards
- Structuring the program so the industry will have a significant range of technology choices to be considered for compliance, rather than the one or two new technologies

the OEMs pursued to comply with EPA's 2007 criteria pollutant standard

- Allowing manufacturers to use emissions averaging, banking and trading to phase in the technology even further

As discussed in the Phase 1 final rule, NHTSA has certain statutory considerations to take into account when determining feasibility of the preferred alternative.⁵⁹ EISA states that NHTSA (in consultation with EPA and the Secretary of Energy) will develop a commercial medium- and heavy-duty fuel efficiency program designed "to achieve the maximum feasible improvement."⁶⁰ Although there is no definition of maximum feasible standards in EISA, NHTSA is directed to consider three factors when determining what the maximum feasible standards are. Those factors are, appropriateness, cost-effectiveness, and technological feasibility,⁶¹ which modify "feasible" beyond its plain meaning.

NHTSA has the broad discretion to weigh and balance the aforementioned factors in order to accomplish EISA's mandate of determining maximum feasible standards. The fact that the factors may often be at odds gives NHTSA significant discretion to decide what weight to give each of the competing factors, policies and concerns and then determine how to balance them—as long as NHTSA's balancing does not undermine the fundamental purpose of the EISA: Energy conservation, and as long as that balancing reasonably accommodates "conflicting policies that were committed to the agency's care by the statute."⁶²

EPA also has significant discretion in assessing, weighing, and balancing the relevant statutory criteria. Section 202(a)(2) of the Clean Air Act (42 U.S.C. 7521(a)(2)) requires that the standards "take effect after such period as the Administrator finds necessary to permit the development and application of the requisite technology, giving appropriate consideration to the cost of compliance within such period." This language affords EPA considerable discretion in how to weight the critical statutory factors of emission reductions, cost, and lead time (76 FR 57129–57130). Section 202(a)(2) also allows (although it does not compel) EPA to adopt technology-forcing standards. *Id.* at 57130.

⁵⁹ 75 FR 57198.

⁶¹ *Id.*

⁶² *Center for Biological Diversity v. National Highway Traffic Safety Admin.*, 538 F.3d 1172, 1195 (9th Cir. 2008).

Sections II through VI of this Preamble explain the consideration that the agencies took into account based on careful assessment and balancing of the statutory factors under Clean Air Act section 202(a)(1) and (2), and under 49 U.S.C. 32902(k).

(1) Carryover From Phase 1 Program and Compliance Changes

Phase 2 is carrying over many of the compliance approaches developed for Phase 1, with certain changes as described below. Readers are referred to the regulatory text for much more detail. Note that the agencies have adapted some of these Phase 1 provisions in order to address new features of the Phase 2 program, notably provisions related to trailer compliance. The agencies have also reevaluated all of the compliance provisions to ensure that they will be effective in achieving the projected reductions without placing an undue burden on manufacturers.

The agencies received significant comments from vehicle manufacturers emphasizing the potential for the structure of the compliance program to impact stringency. Although the agencies do not agree with all of these comments (which are discussed in more detail in later sections), we do agree that it is important to structure the compliance program so that the effective stringency of standards is consistent with levels established by regulation. The agencies have made appropriate improvements to the compliance structure in response to these comments.

(a) Certification

EPA and NHTSA are applying the same general certification procedures for Phase 2 as are currently being used for certifying to the Phase 1 standards. Tractors and vocational vehicles will continue to be certified using the vehicle simulation tool (GEM). The agencies, however, revised the Phase 1 GEM simulation tool to develop a new version, Phase 2 GEM, that more specifically reflects improvements to engines, transmissions, and drivetrains.⁶³ Rather than the GEM simulation tool using default values for engines, transmissions and drivetrains, most manufacturers will enter measured or tested values as inputs reflecting performance of the actual engine, transmission and drivetrain technologies.

⁶³ As described in Section IV, although the trailer standards were developed using the simulation tool, the agencies are adopting a compliance structure that does not require trailer manufacturers to use it.

⁵⁸ For example, see the public comments of The International Union, Volvo Trucks North America, United Automobile, Aerospace and Agricultural Implement Workers of America (UAW).

The Phase 1 certification process for engines used in tractors and vocational vehicles was based on EPA's process for showing compliance with the heavy-duty engine criteria pollutant standards using engine dynamometer testing, and the agencies are continuing it for Phase 2. We also will continue certifying HD pickups and vans using the Phase 1 chassis dynamometer testing results and vehicle certification process, which is very similar to the light-duty vehicle certification process. The Phase 2 trailer certification process will resemble the Phase 2 tractor certification approach, but with a simplified version of Phase 2 GEM. The trailer certification process allows trailer manufacturers to use a simple equation to determine GEM-equivalent g/ton-mile emission rates without actually running GEM.

EPA and NHTSA are also clarifying provisions related to confirming a manufacturer's test data during certification (*i.e.*, confirmatory testing) and verifying a manufacturer's vehicles are being produced to perform as described in the application for certification (*i.e.*, selective enforcement audits or SEAs). The EPA confirmatory testing provisions for engines, vehicles, and components are in 40 CFR 1036.235 and 1037.235. The SEA provisions are in 40 CFR 1036.301 and 1037.301–1037.320. The NHTSA provisions are in 49 CFR 535.9(a). As we proposed, these clarifications will also apply for Phase 1 engines and vehicles.

In response to comments, we are making several changes to the proposed EPA confirmatory testing provisions. First, the regulations being adopted specify that EPA will conduct triplicate tests for engine fuel maps to minimize the impact of test-to-test variability. The final regulations also state that we will consider entire fuel maps rather than individual points. Engine manufacturers objected to EPA's proposal that individual points could be replaced based on a single test, arguing that it effectively made the vehicle standards more stringent due to point-to-point and test-to-test variability. We believe that the changes being adopted largely address these concerns. We are also applying this approach for axle and transmission maps for similar reasons.

As described in Sections III and IV, EPA has also modified the SEA regulations for verifying aerodynamic performance. These revised regulations differ somewhat from the standard SEA regulations to address the unique challenges of measuring aerodynamic drag. In particular EPA recognizes that for coastdown testing, test-to-test variability is expected to be large relative to production variability. This

differs fundamentally from traditional compliance testing, in which test-to-test variability is expected to be *small* relative to production variability. To address this difference, the modified regulations call for more repeat testing of the same vehicle, but fewer test samples. These revisions were generally supported by commenters. See Section III and IV for additional discussion.

Some commenters suggested that the agencies should apply a compliance margin to confirmatory and SEA test results to account for test variability. However, other commenters supported following EPA's past practice, which has been to base the standards on technology projections that assume manufacturers will apply compliance margins to their test results for certification. In other words, they design their products to have emissions below the standards by some small margin so that test-to-test or lab-to-lab variability would not cause them to exceed any applicable standards. Consequently, EPA has typically not set standards precisely at the lowest levels achievable, but rather at slightly higher levels—expecting manufacturers to target the lower levels to provide compliance margins for themselves. As discussed in Sections II through VI, the agencies have applied this approach to the Phase 2 standards.

(b) Averaging, Banking and Trading (ABT)

The Phase 1 ABT provisions were patterned on established EPA ABT programs that have proven to work well. In Phase 1, the agencies determined this flexibility would provide an opportunity for manufacturers to make necessary technological improvements and reduce the overall cost of the program without compromising overall environmental and fuel economy objectives. Commenters generally supported this approach for engines, pickups/vans, tractors, and vocational vehicles. Thus, we are generally continuing this Phase 1 approach with few revisions to the engine and vehicle segments. However, as described in Section IV, in response to comments, we are finalizing a much more limited averaging program for trailers that will not go into effect until 2027. We are adopting some other provisions for certain vocational vehicles, which are discussed in Section V.

The agencies see the overall ABT program as playing an important role in making the technology-advancing standards feasible, by helping to address many issues of technological challenges in the context of lead time and costs. It provides manufacturers flexibilities that

assist the efficient development and implementation of new technologies and therefore enable new technologies to be implemented at a more aggressive pace than without ABT.

ABT programs are more than just add-on provisions included to help reduce costs. They can be, as in EPA's Title II programs generally, an integral part of the standard setting itself. A well-designed ABT program can also provide important environmental and energy security benefits by increasing the speed at which new technologies can be implemented (which means that more benefits accrue over time than with later-commencing standards) and at the same time increase flexibility for, and reduce costs to, the regulated industry and ultimately consumers. Without ABT provisions (and other related flexibilities), standards would typically have to be numerically less stringent since the numerical standard would have to be adjusted to accommodate issues of feasibility and available lead time. See 75 FR 25412–25413. By offering ABT credits and additional flexibilities the agencies can offer progressively more stringent standards that help meet our fuel consumption reduction and GHG emission goals at a faster and more cost-effective pace.⁶⁴

(i) Carryover of Phase 1 Credits and Credit Life

The agencies proposed to continue the five-year credit life provisions from Phase 1, and not to adopt any general restriction on the use of banked Phase 1 credits in Phase 2. In other words, Phase 1 credits in MY 2019 could be used in Phase 1 or in Phase 2 in MYs 2021–2024. CARB commented in support of a more restrictive approach for Phase 1 credits, based on the potential for manufacturers to delay implementation of technology in Phase 2 by using credits generated under Phase 1. We also received comments asking the agencies to provide a path for manufacturers to generate credits for applying technologies not explicitly included in the Phase 1 program. In response to these comments, the agencies have analyzed the potential impacts of Phase 1 credits on the Phase 2 program for each sector and made appropriate adjustments in the program. For example, as described in Section II.D.(5), the agencies are adopting some restrictions on the carryover of windfall Phase 1 engine credits that result from the Phase 1 vocational engine standards.

⁶⁴ See *NRDC v. Thomas*, 805 F.2d 410, 425 (D.C. Cir. 1986) (upholding averaging as a reasonable and permissible means of implementing a statutory provision requiring technology-forcing standards).

Also, as described in Section III, the agencies are projecting that Phase 1 credit balances for tractor manufacturers will enable them to meet more stringent standards for MY 2021–2023, so the agencies have increased the stringency of these standards accordingly.

In contrast to the Phase 1 tractor program, the Phase 1 vocational chassis program currently offers fewer opportunities to generate credits for potential carryover into Phase 2. To address comments related to this particular situation and also to provide a new Phase 1 incentive to voluntarily apply certain Phase 2 technologies, which are available today but currently not being adopted, the agencies are finalizing a streamlined Phase 1 off-cycle credit approval process for these Phase 2 technologies. For vocational chassis, these technologies include workday idle reduction technologies such as engine stop-start systems, automatic engine shutdown systems, shift-to-neutral at idle automatic transmissions, automated manual transmissions, and dual-clutch transmissions. The agencies are also finalizing a streamlined Phase 1 off-cycle credit approval process for Phase 2 automatic tire inflation systems (ATIS), for both tractors and vocational chassis. The purpose for offering these streamlined off-cycle approval processes for Phase 1 is to encourage more early adoption of these Phase 2 technologies during the remaining portion of the Phase 1 program (e.g., model years 2018, 2019, 2020). Earlier adoption of these technologies would help demonstrate that these newer, but not advanced, technologies are effective, reliable and well-accepted into the marketplace by the time the agencies project that they would be needed for compliance with the Phase 2 standards.

The agencies are also including a provision allowing exempt small business manufacturers of vocational chassis to opt into the Phase 1 program for the purpose of generating credits which can be used throughout the Phase 2 program, as just described.

In conjunction with this provision allowing manufacturers to receive credit in Phase 1 for pulling ahead certain Phase 2 technologies, the agencies are providing an extended credit life for the Light and Medium heavy-duty vocational vehicle averaging sets (see next subsection) to provide additional Phase 2 transition flexibility for these vehicles. Unlike the HD Phase 1 pickup/van and tractor programs, where the averaging sets are broad; where manufacturers have many technology choices from which to earn credits (e.g., tractor aerodynamic and idle reduction

technologies, pickup/van engine and transmission technologies); and where we project manufacturers to have sufficient pickup/van and tractor credits to manage the transition to the Phase 2 standards, transitioning to the new Light and Medium vocational vehicle standards may be more challenging. Manufacturers selling lower volumes of these lighter vehicles may find themselves with fewer overall credits to manage the transition to the new standards, especially the 2027 standards. To facilitate this transition and better assure adequate lead time, the agencies are extending the credit life for the Light and Medium heavy-duty vehicle averaging sets (typically vehicles in Classes 2b through 7) so that all credits generated in 2018 and later will last at least until 2027. We are not doing this for the Heavy heavy-duty vocational vehicle category (typically Class 8) because tractor credits may be used within this averaging set. Because we project that manufacturers will have sufficient tractor credits, we believe that they will be able to manage the Heavy vocational transition to each set of new standards, without the extended credit life that we are finalizing for Light and Medium vocational averaging sets. Nevertheless, we will continue to monitor the manufacturers' progress in transitioning to the Phase 2 standards for each category, and we may reconsider the need for additional transitional flexibilities, such as extending other categories' credit lives.

Although, as we have already noted, the numerical values of Phase 2 standards are not directly comparable in an absolute sense to the existing Phase 1 standards (in other words, a given vehicle would have a different g/ton-mile emission rate when evaluated using Phase 1 GEM than it would when evaluated using Phase 2 GEM), we believe that the Phase 1 and Phase 2 credits are largely equivalent. Because the standards and emission levels are included in a relative sense (as a difference), it is not necessary for the Phase 1 and Phase 2 standards to be directly equivalent in an absolute sense in order for the credits to be equivalent.

This is best understood by examining the way in which credits are calculated. For example, the credit equations in 40 CFR 1037.705 and 49 CFR 535.7 calculate credits as the product of the difference between the standard and the vehicle's emission level (g/ton-mile or gallon/1,000 ton-mile), the regulatory payload (tons), production volume, and regulatory useful life (miles). The Phase 2 payloads, production volumes, and useful lives for tractors, medium and heavy heavy-duty engines, or medium

and heavy heavy-duty vocational vehicles are equivalent to those of Phase 1. However, EPA is changing the regulatory useful lives of HD pickups and vans, light heavy-duty vocational vehicles, spark-ignited engines, and light heavy-duty compression-ignition engines. Because useful life is a factor in determining the value of a credit, the agencies proposed to apply interim adjustment factors to ensure banked credits maintain their value in the transition from Phase 1 to Phase 2.

For Phase 1, EPA aligned the useful life for GHG emissions with the useful life already in place for criteria pollutants. After the Phase 1 rules were finalized, EPA updated the useful life for criteria pollutants as part of the Tier 3 rulemaking.⁶⁵ The new useful life implemented for Tier 3 is 150,000 miles or 15 years, whichever occurs first. This same useful life is being adopted in Phase 2 for HD pickups and vans, light heavy-duty vocational vehicles, spark-ignited engines, and light heavy-duty compression-ignition engines.⁶⁶ The numeric value of the adjustment factor for each of these regulatory categories depends on the Phase 1 useful life. These are described in detail below in this Preamble in Sections II, V, and VI. Without these adjustment factors the changes in useful life would effectively result in a discount of banked credits that are carried forward from Phase 1 to Phase 2, which is not the intent of the changes in the useful life. With the relatively flat deterioration generally associated with CO₂, EPA does not believe the changes in useful life will significantly affect the feasibility of the Phase 2 standards.

We note that the primary purpose of allowing manufacturers to bank credits is to provide flexibility in managing transitions to new standards. The five-year credit life is substantial, and allows credits generated in either Phase 1 or early in Phase 2 to be used for the intended purpose. The agencies believe a credit life longer than five years is unnecessary to accomplish this transition. Restrictions on credit life serve to reduce the likelihood that any manufacturer will be able to use banked credits to disrupt the heavy-duty vehicle market in any given year by effectively limiting the amount of credits that can be held. Without this limit, one manufacturer that saved enough credits over many years could achieve a significant cost advantage by using all the credits in a single year. The agencies

⁶⁵ 79 FR 23492, April 28, 2014 and 40 CFR 86.1805–17.

⁶⁶ NHTSA's useful life is based on mileage and years of duration.

believe that allowing a five-year credit life for all credits, and as a consequence allowing use of Phase 1 credits in Phase 2, creates appropriate flexibility and appropriately facilitates a smooth transition to each new level of standards.

(ii) Averaging Sets

EPA has historically restricted averaging to some extent for its HD emission standards to avoid creating unfair competitive advantages or environmental risks due to credits being inconsistent. It also helps to ensure a robust and manageable compliance program. Under Phase 1, averaging, banking and trading can only occur within and between specified “averaging sets” (with the exception of credits generated through use of specified advanced technologies). As proposed, we will continue this regime in Phase 2, retaining the existing vehicle and engine averaging sets, and creating new trailer averaging sets. We are also continuing the averaging set restrictions from Phase 1 in Phase 2. (See Section V for certain other provisions applicable to vehicles certified to special standards.) These general averaging sets for vehicles are:

- Complete pickups and vans
- Other light heavy-duty vehicles (Classes 2b–5)
- Medium heavy-duty vehicles (Class 6–7)
- Heavy heavy-duty vehicles (Class 8)
- Long dry and refrigerated van trailers⁶⁷
- Short dry and refrigerated van trailers

We are not allowing trading between engines and chassis, even within the same vehicle class. Such trading would essentially result in double counting of emission credits, because the same engine technology would likely generate credits relative to both standards (and indeed, certain engine improvements are reflected exclusively in the vehicle standards the agencies are adopting). We similarly limit trading among engine categories to trades within the designated averaging sets:

- Spark-ignition engines
- Compression-ignition light heavy-duty engines
- Compression-ignition medium heavy-duty engines
- Compression-ignition heavy heavy-duty engines

The agencies continue to believe that maintaining trading to be only within the classes listed above will provide adequate opportunities for manufacturers to make necessary

technological improvements and to reduce the overall cost of the program without compromising overall environmental and fuel efficiency objectives, and it is therefore appropriate and reasonable under EPA’s authority and maximum feasible under NHTSA’s authority, respectively. We do not expect emissions from engines and vehicles—when restricted by weight class—to be dissimilar. We therefore expect that the lifetime vehicle performance and emissions levels will be very similar across these defined categories, and the credit calculations will fairly ensure the expected fuel consumption and GHG emission reductions.

These restrictions have generally worked well for Phase 1, and we continue to believe that these averaging sets create flexibility without creating an unfair advantage for manufacturers with integrated portfolios, including engines and vehicles. See 76 FR 57240.

(iii) Credit Deficits

The Phase 1 regulations allow manufacturers to carry-forward deficits for up to three years. This is an important flexibility because the program is designed to address the diversity of the heavy-duty industry by allowing manufacturers to sell a mix of engines or vehicles that have very different emission levels and fuel efficiencies. Under this construct, manufacturers can offset sales of engines or vehicles not meeting the standards by selling others (within the same averaging set) that perform better than the standards require. However, in any given year it is possible that the actual sales mix will not balance out, and the manufacturer may be short of credits for that model year. The three-year provision allows for this possibility and creates additional compliance flexibility to accommodate it.

(iv) Advanced Technology Credits

At the time of the proposal, the agencies believed it was no longer appropriate to provide extra credit for any of the technologies identified as advanced technologies for Phase 1, although we requested comment on this issue. The Phase 1 advanced technology credits were adopted to promote the implementation of advanced technologies that were not included in our basis of the feasibility of the Phase 1 standards. Such technologies included hybrid powertrains, Rankine cycle waste heat recovery systems on engines, all-electric vehicles, and fuel cell vehicles (see 40 CFR 86.1819–14(k)(7), 1036.150(h), and 1037.150(p)). The Phase 2 heavy-duty engine and vehicle

standards are premised on the use of some of these technologies, making them equivalent to other fuel-saving technologies in this context. We believe the Phase 2 standards themselves will provide sufficient incentive to develop those specific technologies.

Although the agencies proposed to eliminate all advanced technology incentives, we remained open to targeted incentives that would address truly advanced technology. We specifically requested comment on this issue with respect to electric vehicle, plug-in hybrid, and fuel cell technologies. Although the Phase 2 standards are premised on some use of Rankine cycle waste heat recovery systems on engines and hybrid powertrains, none of these standards are based on projected utilization of these other even more-advanced technologies (e.g., all-electric vehicles, fuel cell vehicles). 80 FR 40158. Commenters generally supported providing credit multipliers for these advanced technologies. However, Allison supported ending the incentives for hybrids, fuel cells, and electric vehicles in Phase 2. ATA, on the other hand, commented that the agencies should preserve the advanced technology credits which provide a credit multiplier of 1.5 in order to promote the use of hybrid and electric vehicles in larger vocational vehicles and tractors. ARB supported the use of credit multipliers even more strongly and provided suggestions for values larger than 1.5 that could be used to incentivize plug-in hybrids, electric vehicles, and fuel cell vehicles. Eaton recommended the continuation of advanced technology credits for hybrid powertrains until a sufficient number are in the market. Overall, the comments indicated that there is support for such incentives among operators, suppliers, and states. Upon further consideration, the agencies are adopting advanced technology credits for these three types of advanced technologies, as shown in Table I–2 below.

TABLE I–2—ADVANCED TECHNOLOGY MULTIPLIERS

Technology	Multiplier
Plug-in hybrid electric vehicles	3.5
All-electric vehicles	4.5
Fuel cell vehicles	5.5

Our intention in adopting these multipliers is to create a meaningful incentive to those considering adopting these qualifying advanced technologies into their vehicles. The values being

⁶⁷ Averaging for trailers does not begin until 2027.

adopted are consistent with values recommended by CARB in their supplemental comments.⁶⁸ CARB's values were based on a cost analysis that compared the costs of these technologies to costs of other conventional technologies. Their cost analysis showed that adopting multipliers in this range would make these technologies much more competitive with the conventional technologies and could allow manufacturers to more easily generate a viable business case to develop these technologies for heavy-duty and bring them to market at a competitive price.

Another important consideration in the adoption of these larger multipliers is the tendency of the heavy-duty sector to significantly lag the light-duty sector in the adoption of advanced technologies. There are many possible reasons for this, such as:

- Heavy-duty vehicles are more expensive than light-duty vehicles, which makes it a greater monetary risk for purchasers to invest in unproven technologies.
- These vehicles are work vehicles, which makes predictable reliability even more important than for light-duty vehicles.
- Sales volumes are much lower for heavy-duty vehicles, especially for specialized vehicles.

As a result of factors such as these, adoption rates for these advanced technologies in heavy-duty vehicles are essentially non-existent today and seem unlikely to grow significantly within the next decade without additional incentives.

The agencies believe it is appropriate to provide such large multipliers for these very advanced technologies at least in the short term, because they have the potential to provide very large reductions in GHG emissions and fuel consumption and advance technology development substantially in the long term. However, because they are so large, we also believe that we should not necessarily allow them to continue indefinitely. Therefore, the agencies are adopting them as an interim program that will continue through MY 2027. If the agencies determine that these credit multipliers should be continued beyond MY 2027, we could do so in a future rulemaking.

As discussed in Section I.C.(1)(d), the agencies are not specifically accounting for upstream emissions that might occur from production of electricity to power these advanced vehicles. This approach is largely consistent with the incentives offered for electric vehicles in the light-duty National Program. 77 FR 62810. For light-duty vehicles, the agencies also did not require manufacturers to account for upstream emissions during the initial years, as the technologies are being developed. While we proactively sunset this allowance for light-duty due to concerns about potential impacts from very high sales volumes, we do not have similar concerns for heavy-duty. Nevertheless, in this program we are only adopting these credit multipliers through MY 2027, and should we not promulgate a future rulemaking to extend them beyond MY 2027, these multipliers would essentially sunset in MY 2027.

One feature of the Phase 1 advanced technology program that is not being continued in Phase 2 is the allowance to use advanced technology credits across averaging sets. We believe that combined with the very large multipliers being adopted, there could be too large a risk of market distortions if we allowed the use of these credits across averaging sets.

(v) Transition Flexibility for Meeting the Engine Standards

Some manufacturers commented that the proposed engine regulations did not offer sufficient flexibility. Although these commenters acknowledge that the tractor and vocational *vehicle* standards will separately drive engine improvements, they nonetheless maintain that the MY 2024 *engine* standards may constrain potential compliance paths too much. Some commented that advanced technologies (such as waste heat recovery) may need to be deployed before the technologies are fully reliable for every engine manufacturer, and may lead to the development and implementation of additional engine technologies outside of scheduled engine redesign cycles, which could cause manufacturers to incur costs which were not accounted for in the agencies' analyses. These costs could include both product development and equipment costs for the engine manufacturer, and potential

increased costs for vehicle owners associated with potential reliability issues in-the-field.

The agencies have considered these comments carefully. See, e.g., RIA Section 2.3.9 and RTC Section 3.4. The agencies recognize the importance of ensuring that there is adequate lead time to develop, test, and otherwise assure reliability of the technologies projected to be needed to meet the standards and for the advanced engine technologies in particular. See Section I.C above; see also responses regarding waste heat recovery technology in RTC Section 3.4, and Response 3.4.1. The agencies are therefore adopting an alternative, optional ABT flexibility for heavy-heavy and medium-heavy engines in partial response to these comments. This optional provision would affect only the MYs 2021 and 2024 standards for these engines, not the final MY 2027 engine standards, and to the extent manufacturers elect the provision would increase fuel consumption and GHG reduction benefits, as explained below.

This optional provision has three aspects:

- A pull ahead of the engine standards to MY 2020
- Extended credit life for engine credits generated against MYs 2018–2019 Phase 1 standards, the MY 2020 pull-ahead Phase 2 engine standards, and the MYs 2021–2024 Phase 2 engine standards
- Slightly relaxed engine standards for MYs 2024–2026 tractor engine standards⁶⁹

Thus, the final rule provides the option of an extended credit life for the medium heavy-duty and heavy heavy-duty engines so that all credits generated in MY 2018 and later will last at least until MY 2030.⁷⁰ To be eligible for this allowance, manufacturers would need to voluntarily certify all of their HHD and/or MHD MY 2020 engines (tractor and vocational) to MY 2021 standards.⁷¹ Manufacturers could elect to apply this provision separately to medium heavy-duty and heavy heavy-duty engines, since these remain separate averaging sets. Credits banked by the manufacturer in Phase 1 for model year 2018 and 2019 engines would be eligible for the extended credit life for manufacturers satisfying the pull ahead requirement. Such credits could be used in any model year 2021 through

⁶⁸ Letter from Michael Carter, ARB, to Gina McCarthy, Administrator, EPA and Mark Rosekind, Administrator, NHTSA, June 16, 2016.

⁶⁹ Credits can be generated against these standards as well, but the life of credits generated for 2025 and 2026 would be five years. The pull ahead of the MY 2021 standards should more than

balance out any slight decreases in benefits attributable to such credits.

⁷⁰ The final rule (40 CFR 1036.150(p)) provides that for engine manufacturers choosing this alternative option, credits generated with MY 2018–2024 engines can be used until MY 2030. Credits from later model years can be used for five years from generation under 40 CFR 1037.740(c).

⁷¹ Compliance with this requirement would be evaluated at the time of certification and when end of year ABT reports are submitted. Manufacturers that show a net credit deficit for the averaging set at the end of the year would not meet this requirement.

2030. Manufacturers that voluntarily certify their engines to MY 2021

standards early would then also be eligible for slightly less stringent engine

tractor standards in MYs 2024–2026, as shown in the following table.

TABLE I–3—OPTIONAL ABT FLEXIBILITY STANDARDS FOR HEAVY-HEAVY AND MEDIUM-HEAVY ENGINES

Model years	Medium heavy-duty—tractor		Heavy heavy-duty—tractor	
	EPA CO ₂ standard (g/bhp-hr)	NHTSA fuel consumption standard (gal/100bhp-hr)	EPA CO ₂ standard (g/bhp-hr)	NHTSA fuel consumption standard (gal/100bhp-hr)
2020–2023	473	4.6464	447	4.3910
2024–2026	467	4.5874	442	4.3418

Once having opted into this alternative compliance path, engine manufacturers would have to adhere to that path for the remainder of the Phase 2 program. The choice would be made when certifying MY 2020 engines. Instead of certifying engines to the final year of the Phase 1 engine standards, manufacturers electing the alternative would indicate that they are instead certifying to the MY 2021 Phase 2 engine standard.

Because these engine manufacturers would be reducing emissions of engines otherwise subject to the MY 2020 Phase 1 engine standards (and because engine reductions were not reflected in the Phase 1 *vehicle* program), there would be a net benefit to the environment. These engines would not generate credits relative to the Phase 1 standards (that is, MY 2020 engines would only use or generate credits relative to the pulled ahead MY 2021 Phase 2 engines standards) which would result in net reductions of CO₂ and fuel consumption of about 2 percent for each engine. Thus, if every engine manufacturer chooses to use this flexibility, there could be resulting reductions of an additional 12MMT of CO₂ and saving of nearly one billion gallons of diesel fuel.

This alternative also does not have adverse implications for the vehicle standards. As just noted, the vehicle standards themselves are unaffected. Thus, these voluntary standards would not reduce the GHG reductions or fuel savings of the program. Vehicle manufacturers using the alternative MYs 2024–2026 engines would need to adopt additional vehicle technology (*i.e.* technology beyond that projected to be needed to meet the standard) to meet the vehicle standards. This means the vehicles would still achieve the same fuel efficiency in use.⁷²

In sum, the agencies view this alternative as being positive from the environmental and energy conservation perspectives, and believe it will provide significant flexibility for manufacturers that may reduce their compliance costs. It also provides a hedge against potential premature introduction of advanced engine technologies, providing more lead time to assure in-use reliability.

(c) Innovative Technology and Off-Cycle Credits

The agencies are continuing the Phase 1 innovative technology program (reflecting certain streamlining features as just discussed), but re-designating it as an off-cycle program for Phase 2. In other words, beginning in MY 2021 technologies that are not accounted for in the GEM simulation tool, or by compliance dynamometer testing (for engines or chassis certified vehicles) will be considered “off-cycle,” including those technologies that may no longer be considered innovative technologies.

The final rules provide that in order for a manufacturer to receive these credits for Phase 2, the off-cycle technology will still need to meet the requirement that it was not in common use prior to MY 2010. Although we have not identified specific off-cycle technologies at this time that should be excluded, we believe it is prudent to continue this requirement to avoid the potential for manufacturers to receive windfall credits for technologies that they were already using before MY 2010, and that are therefore reflected in the Phase 2 (and possibly Phase 1) baselines. However, because the Phase 2 program will be implemented in MY 2021 and extend at least through MY 2027, the agencies and manufacturers may have difficulty in the future

determining whether an off-cycle technology was in common use prior to MY 2010. In order to avoid this approach becoming an unnecessary hindrance to the off-cycle program, the agencies will presume that off-cycle technologies were not in common use in 2010 unless we have clear evidence to the contrary. Neither the agencies nor manufacturers will be required to demonstrate that the technology meets this 2010 criteria. Rather, the agencies will simply retain the authority to deny a request for off-cycle credits if it is clear that the technology was in common use in 2010 and thus part of the baseline.

Manufacturers will be able to carry over innovative technology credits from Phase 1 into Phase 2, subject to the same restrictions as other credits.

Manufacturers will also be able to carry over the improvement factor (not the credit value) of a technology, if certain criteria are met. The agencies will require documentation for all off-cycle requests similar to those required by EPA for its light-duty GHG program.

Additionally, the agencies will not grant any off-cycle credits for crash avoidance technologies. The agencies will also require manufacturers to consider the safety of off-cycle technologies and will request a safety assessment from the manufacturer for all off-cycle technologies.

Similar principles apply to off-cycle credits in this heavy-duty Phase 2 program as under the light-duty vehicle rules. Thus, technologies which are part of the basis of a Phase 2 standard would not be eligible for off-cycle credits. Their benefits have been accounted for in developing the stringency of the Phase 2 standard, as have their costs. See 77 FR 62835 (October 15, 2012). In addition, technologies which are integral or inherent to the basic vehicle design and are recognized in GEM or under the FTP (for pickups and vans), including engine, transmission, mass reduction, passive aerodynamic design, and base tires, will not be eligible for off-cycle credits. 77 FR 62836.

⁷² The agencies view this alternative as of reasonable cost with respect to the vehicle standards. First, where engine manufacturers and vehicle manufacturers are vertically integrated, that manufacturer would choose the alternative which is most cost advantageous. Second, where engine manufacturers and vehicle manufacturers are not

vertically integrated, the agencies anticipate that engines certified to the alternative and the main standards will both be available for the vehicle manufacturer to purchase, so that the vehicle manufacturer would not need to incur any costs attributable to the alternative engine standard.

Technologies integral or inherent to basic vehicle design are fully functioning and are thus recognized in GEM, or operate over the entirety of the FTP/HFET and therefore are adequately captured by the test procedure.

Just as some technologies that were considered off-cycle for Phase 1 are being adopted as primary technologies in Phase 2 on whose performance standard stringency is calculated, the agencies may revise the regulation in a future rulemaking to create a more direct path to recognize technologies currently considered off-cycle. For example, although we are including specific provisions to recognize certain electrified accessories, recognizing others would require the manufacturer to go through the off-cycle process. However, it is quite possible that the agencies could gather sufficient data to allow us to adopt specific provisions in a future rulemaking to recognize other accessories in a simpler manner. Because such a change would merely represent a simpler way to receive the same credit as could be obtained under the regulations being adopted today (rather than a change in stringency), it would not require us to reconsider the standards.

(d) Alternative Fuels and Electric Vehicles

The agencies will largely continue the Phase 1 approach for engines and vehicles fueled by fuels other than gasoline and diesel.⁷³ Phase 1 engine emission standards applied uniquely for gasoline-fueled and diesel-fueled engines. The regulations in 40 CFR part 86 implement these distinctions for alternative fuels by dividing engines into Otto-cycle and Diesel-cycle technologies based on the combustion cycle of the engine. However, as proposed, the agencies are making a small change that is described in Section II. Under this change, we will require manufacturers to divide their natural gas engines into primary intended service classes, like the current requirement for compression-ignition engines. Any alternative fuel-engine qualifying as a heavy heavy-duty engine will be subject to all the emission standards and other requirements that apply to compression-ignition engines. Note that this small change in approach will also apply with respect to EPA's criteria pollutant program.

We are also applying the Phase 2 standards at the vehicle tailpipe. That is, compliance is based on vehicle fuel consumption and GHG emission

reductions, and does not reflect any so-called lifecycle emission properties. The agencies have explained why it is reasonable that the heavy-duty standards be fuel neutral in this manner and adhere to this reasoning here. See 76 FR 57123; see also 77 FR 51705 (August 24, 2012) and 77 FR 51500 (August 27, 2012). In particular, EPA notes that there is a separate, statutorily-mandated program under the Clean Air Act which encourages use of renewable fuels in transportation fuels, including renewable fuel used in heavy-duty diesel engines. This program considers lifecycle greenhouse gas emissions compared to petroleum fuel. NHTSA notes that the fuel efficiency standards are necessarily tailpipe-based, and that a lifecycle approach would likely render it impossible to harmonize the fuel efficiency and GHG emission standards, to the great detriment of our goal of achieving a coordinated program. 77 FR 51500–51501; see also 77 FR 51705 (similar finding by EPA); see also Section I.F.(1)(a) below, Section 1.8 of the RTC, and Section XI.B.

The agencies received mixed comments on this issue. Many commenters supported the proposed approach, generally agreeing with the agencies' arguments. However, some other commenters opposed this approach. Opposing commenters generally fell into two categories:

- Commenters concerned that upstream emissions of methane occurring during the production and distribution of natural gas would offset some or all of the GHG emission reductions observed at the tailpipe.
- Commenters concerned that tailpipe-only standards ignore the GHG benefits of using renewable fuels.

The agencies are not issuing rules that effectively would turn these rules into a fuel program, rather than an emissions reduction and fuel efficiency program. Nor will the agencies disharmonize the program by having GHG standards reflect upstream emissions having no relation to fuel efficiency. See *e.g.* 77 FR 51500–51501; see also 77 FR 51705. We thus will continue to measure compliance at the tailpipe. Issues relating to whether to consider in the emission standards upstream emissions related to natural gas exploration and production are addressed in detail in Section XI below. It is sufficient to state here that the agencies carefully investigated the potential use of natural gas in the heavy-duty sector and the impacts of such use. We do not believe that the use of natural gas is likely to become a major fuel source for heavy-duty vehicles during the Phase 2 time frame. Thus, since we project natural

gas vehicles to have little impact on both overall GHG emissions and fuel consumption during the Phase 2 time frame, the agencies see no need to make fundamental changes to the Phase 1 approach for natural gas engines and vehicles.

The agencies note further that a consequence of the tailpipe-based approach is that the agencies will treat vehicles powered by electricity the same as in Phase 1. In Phase 1, EPA treated all electric vehicles as having zero tailpipe emissions of CO₂, CH₄, and N₂O (see 40 CFR 1037.150(f)). Similarly, NHTSA adopted regulations in Phase 1 that set the fuel consumption standards based on the fuel consumed by the vehicle. The agencies also did not require emission testing for electric vehicles in Phase 1. The agencies considered the potential unintended consequence of not accounting for upstream emissions from the charging of heavy-duty electric vehicles. In our reassessment for Phase 2, we have found only one all-electric heavy-duty vehicle manufacturer that has certified through 2016. As we look to the future, we project limited adoption of all-electric vehicles into the market. Therefore, we believe that this provision is still appropriate. Unlike the 2017–2025 light-duty rule, which included a cap whereby upstream emissions would be counted after a certain volume of sales (see 77 FR 62816–62822), we believe there is no need to establish a cap for heavy-duty vehicles because of the small likelihood of significant production of EV technologies in the Phase 2 timeframe. Commenters specifically addressing electric vehicles generally supported the agencies' proposal. However, some commenters did support accounting for emissions from the generation of electricity in the broader context of supporting full lifecycle analysis. As noted above, and in more detail in Section I.F.(2)(f) as well as Section 1.8 of the RTC, the agencies are not predicated the standards on a full life-cycle approach.

(e) Phase 1 Interim Provisions

EPA adopted several flexibilities for the Phase 1 program (40 CFR 86.1819–14(k), 1036.150 and 1037.150) as interim provisions. Because the existing regulations do not have an end date for Phase 1, most of these provisions did not have an explicit end date. NHTSA adopted similar provisions. With few exceptions, the agencies are not continuing these provisions for Phase 2. These will generally remain in effect for the Phase 1 program. In particular, the agencies note that we are not continuing the blanket exemption for small

⁷³ See Section XI for additional discussion of natural gas engines and vehicles.

manufacturers. Instead, in Phase 2 the agencies are providing more targeted relief for these entities.

(f) In-Use Standards and Recall

Section 202(a)(1) of the CAA specifies that EPA is to adopt emissions standards that are applicable for the useful life of the vehicle and for the engine. EPA finalized in-use standards for the Phase 1 program, whereas NHTSA's rules do not include these standards. For the Phase 2 program, EPA will carry-over its in-use provisions, and NHTSA is adopting EPA's useful life requirements for its vehicle and engine fuel consumption standards to ensure manufacturers consider in the design process the need for fuel efficiency standards to apply for the same duration and mileage as EPA standards. If EPA determines a manufacturer fails to meet its in-use standards, civil penalties may be assessed.

CAA section 207(c)(1) requires "the manufacturer" to remedy certain in-use problems. The remedy process is to recall the nonconforming vehicles and bring them into conformity with the standards and the certificate. The regulations for this process are in 40 CFR part 1068, subpart F. EPA is also adopting regulatory text addressing recall obligations for component manufacturers and other non-certifying manufacturers. We note that the CAA does not limit this responsibility to certificate holders, consistent with the definition of a "manufacturer" as "any person engaged in the manufacturing or assembling of new motor vehicles, new motor vehicle engines, new nonroad vehicles or new nonroad engines, or importing such vehicles or engines for resale, or who acts for and is under the control of any such person in connection with the distribution of new motor vehicles, new motor vehicle engines, new nonroad vehicles or new nonroad engines, but shall not include any dealer with respect to new motor vehicles, new motor vehicle engines, new nonroad vehicles or new nonroad engines received by him in commerce."

As discussed in Section I.E.(1) below, this definition was not intended to restrict the definition of "manufacturer" to a single person per vehicle. Under EPA regulations, we can require any person meeting the definition of manufacturer for a nonconforming vehicle to participate in a recall. However, we would normally presume the certificate holder to have the primary responsibility.

EPA requested comment on adding regulatory text that would explicitly apply these provisions to tire

manufacturers. Comments from the tire industry generally opposed this noting that they are not the manufacturer of the vehicle. These comments are correct that tires are not incomplete vehicles and hence that the recall authority does not apply for companies that only manufacture the tires. However, EPA remains of the view that in the event that vehicles (e.g. trailers) do not conform to the standards in-use due to nonconforming tires, tire manufacturers would have a role to play in remedying the problem. In this (hypothetical) situation, a tire manufacturer would not only have produced the part in question, but in the case of a trailer manufacturer or other small vehicle manufacturer, would have significantly more resources and knowledge regarding how to address (and redress) the problem. Accordingly, EPA would likely require that a component manufacturer responsible for the nonconformity assist in the recall to an extent and in a manner consistent with the provisions of CAA section 208(a). This section specifies that component and part manufacturers "shall establish and maintain records, perform tests where such testing is not otherwise reasonably available under this part and part C of this subchapter (including fees for testing), make reports and provide information the Administrator may reasonably require to determine whether the manufacturer or other person has acted or is acting in compliance with this part and part C of this subchapter and regulations thereunder, or to otherwise carry out the provision of this part and part C of this subchapter. . .". Any such action would be considered on a case-by-case basis, adapted to the particular circumstances at the time.

(g) Vehicle Labeling

EPA proposed to largely continue the Phase 1 engine and vehicle labeling requirements, but to eliminate the requirement for tractor and vocational vehicle manufacturers to list emission control on the label. The agencies consider it crucial that authorized compliance inspectors are able to identify whether a vehicle is certified, and if so whether it is in its certified condition. To facilitate this identification in Phase 1, EPA adopted labeling provisions for tractors that included several items. The Phase 1 tractor label must include the manufacturer, vehicle identifier such as the Vehicle Identification Number (VIN), vehicle family, regulatory subcategory, date of manufacture, compliance statements, and emission control system identifiers (see 40 CFR

1037.135). EPA proposed to apply parallel requirements for trailers.

In Phase 1, the emission control system identifiers are limited to vehicle speed limiters, idle reduction technology, tire rolling resistance, some aerodynamic components, and other innovative and advanced technologies. However, the number of emission control systems for greenhouse gas emissions in Phase 2 has increased significantly for tractors and vocational vehicles. For example, all aspects of the engine transmission and drive axle; accessories; tire radius and rolling resistance; wind averaged drag; predictive cruise control; idle reduction technologies; and automatic tire inflation systems are controls which can be evaluated on-cycle in Phase 2 (*i.e.* these technologies' performance can now be input to GEM), but could not be in Phase 1. Due to the complexity in determining greenhouse gas emissions in Phase 2, the agencies do not believe that we can unambiguously determine whether or not a vehicle is in a certified condition through simply comparing information that could be made available on an emission control label with the components installed on a vehicle. Therefore, EPA proposed to remove the requirement to include the emission control system identifiers required in 40 CFR 1037.135(c)(6) and in Appendix III to 40 CFR part 1037 from the emission control labels for vehicles certified to the Phase 2 standards. The agencies received comments on the emission control labels from Navistar, which supported the elimination of the emission control information from the vehicle GHG label.

Although we are largely finalizing the proposed labeling requirements, we remain interested in finding a better approach for labeling. Under the agencies' existing authorities, manufacturers must provide detailed build information for a specific vehicle upon our request. Our expectation is that this information should be available to us via email or other similar electronic communication on a same-day basis, or within 24 hours of a request at the latest. The agencies have started to explore ideas that would provide inspectors with an electronic method to identify vehicles and access on-line databases that would list all of the engine-specific and vehicle-specific emissions control system information. We believe that electronic and Internet technology exists today for using scan tools to read a bar code or radio frequency identification tag affixed to a vehicle that could then lead to secure on-line access to a database of manufacturers' detailed vehicle and

engine build information. Our exploratory work on these ideas has raised questions about the level of effort that would be required to develop, implement and maintain an information technology system to provide inspectors real-time access to this information. We have also considered questions about privacy and data security. We requested comment on the concept of electronic labels and database access, including any available information on similar systems that exist today and on burden estimates and approaches that could address concerns about privacy and data security.

Although we are not finalizing such a program in this rulemaking, we remain very interested in the use of electronic labels that could be used by the agencies to access vehicle information and may pursue these in a future rulemaking. Such a rulemaking would likely consider the feasibility of accessing dynamic link libraries in real-time to view each manufacturer's build records (and perhaps pending orders). The agencies envision that this could be very useful for our inspectors by providing them access to the build information by VIN to confirm that each vehicle has the proper emission control features.

(h) Model Year Definition

The agencies proposed to continue the Phase definitions of "model year" for compliance with GHG emissions and fuel efficiency standards. However, in response to comments, the agencies are revising the definition slightly for Phase 2 tractors and vocational vehicles to match the model years of the engines installed in them. The revised definition generally sets the vehicle model year to be the calendar year of manufacture, but allows the vehicle manufacturer the option to select the prior year if the vehicle uses an engine manufactured in the prior model year.⁷⁴ Because Phase 2 vehicle standards are based in part on engine performance, some commenters stated that the engine model year should dictate the vehicle's GHG and fuel efficiency compliance model year, and that the emissions and fuel efficiency compliance model year should be presented on the vehicle emissions label. This would allow manufacturers to market a vehicle and certify it to NHTSA's safety standards based on the standards applicable on the date of manufacture, but certify the vehicle for GHG emissions and fuel efficiency purposes based on the engine model

compliance year. For example, a 2023 model year tractor might have a 2022 model year engine in it. The tractor would be marketed as a model year 2023 tractor, certified as complying with NHTSA's safety standards applicable at the time when certifying the vehicle, but would have an "emissions and fuel efficiency compliance model year" of 2022 for purposes of emissions and fuel efficiency standards. In today's action, NHTSA and EPA are finalizing standards that allow for the use of an "emissions and fuel efficiency compliance model year." This is consistent with past program practice, in which certain manufacturers have been able to reclassify tractors to the previous model year for emissions purposes when the tractors use engines from the previous model year.

(2) Phase 2 Standards

This section briefly summarizes the Phase 2 standards for each category and identifies the technologies that the agencies project will be needed to meet the standards. Given the large number of different regulatory categories and model years for these standards, the actual numerical standards are not listed. Readers are referred to Sections II through IV for the tables of standards.

(a) Summary of the Engine Standards

The agencies are continuing the basic Phase 1 structure for the Phase 2 engine standards. There will be separate standards and test cycles for tractor engines, vocational diesel engines, and vocational gasoline engines. However, as described in Section II, we are adopting a revised test cycle for tractor engines to better reflect actual in-use operation. After consideration of comments, including those specifically addressing whether the agencies should adopt an alternative with accelerated stringency targets, the agencies are adopting engine standards that can generally be characterized as more stringent than the proposed alternative.

Specifically, for diesel tractor engines, the agencies are adopting standards for MY 2027 that are more stringent than the preferred alternative from the proposal, and require reductions in CO₂ emissions and fuel consumption that are 5.1 percent better than the 2017 baseline for tractor engines.⁷⁵ We are also adopting standards for MY 2021 and

MY 2024, requiring reductions in CO₂ emissions and fuel consumption of 1.8 to 4.2 percent better than the 2017 baseline tractor engines. For vocational diesel engines, the new standards will require reductions of 2.3, 3.6, and 4.2 percent in MYs 2021, 2024, and 2027, respectively. These levels are more stringent than the proposed standards for these same MYs, and approximately as stringent in MY 2021 and MY 2024 as the Alternative 4 standards discussed at proposal.⁷⁶

The agencies project that these reductions will be maximum feasible and reasonable for diesel engines based on technological changes that will improve combustion and reduce energy losses. For most of these improvements, the agencies project (*i.e.*, the agencies have set out a potential, but by no means mandatory, compliance path) that manufacturers will begin applying improvements to about 45 percent of their heavy-duty engines by 2021, and ultimately apply them to about 95 percent of their heavy-duty engines by 2024. However, for some of these improvements we project more limited application rates. In particular, we project a more limited use of waste exhaust heat recovery systems in 2027, projecting that about 10 percent of tractor engines will have turbo-compounding systems, and an additional 25 percent of tractor engines will employ Rankine-cycle waste heat recovery. We do not project that turbo-compounding or Rankine-cycle waste heat recovery technology will be utilized in vocational engines due to vocational vehicle drive cycles under which these technologies would not show significant benefit, and also due to low sales volumes, limiting the ability to invest in newer technologies for these vehicles.

As described in Section III.D.(1)(b)(i), the agencies project that some engine manufacturers will be able to achieve larger reductions for at least some of their tractor engines. So in developing the tractor *vehicle* standards, we projected slightly better fuel efficiency for the *average* tractor engine than is required by the engine standards. We are projecting that similar over-compliance will occur for heavy heavy-duty vocational engines.

For gasoline vocational engines, we are not adopting more stringent *engine* standards. Gasoline engines used in

⁷⁴ Anti-stockpiling provisions will generally prevent vehicle manufacturers from using new engines older than the prior model year. See Section XIII.B for a discussion of EPA requirements for installing older used engines into new vehicles.

⁷⁵ For the flat baseline reference case, the agencies project that tractors engines will meet the Phase 1 engine standards with a small compliance margin. The Phase 1 standards for diesel engines will be fully phased-in by MY 2017, so we use MY 2017 as the baseline engine for tractors. Note that we project that vocational engines will achieve additional over-compliance with the Phase 1 vocational engine standards.

⁷⁶ As noted in Section II, the numerical levels of the vocational engine standards also reflect an updated baseline in which Phase 1 vocational engines are more efficient than assumed for the proposal. In addition, the numerical levels of the tractor engine standards reflect an updated baseline to reflect the changes to the test cycle.

vocational vehicles are generally the same engines as are used in the complete HD pickups and vans in the Class 2b and 3 weight categories, although the operational demands of vocational vehicles often require use of the largest, most powerful SI engines, so that some engines fitted in complete pickups and vans are not appropriate for use in vocational vehicles. Given the relatively small sales volumes for gasoline-fueled vocational vehicles, manufacturers typically cannot afford to invest significantly in developing separate technology for these vocational vehicle engines. Thus, we project that in general, vocational gasoline engines will incorporate much of the technology that will be used to meet the pickup and van chassis standards, and this will result in some real world reductions in CO₂

emissions and fuel consumption. The agencies received many comments suggesting that technologies be applied to increase the stringency of the SI engine standard, which technologies in fact are already presumed to be adopted at 100 percent to meet the MY 2016 engine standard. The commenters did not identify any additional engine technologies that are not already fully considered by the agencies in setting the MY 2016 engine standard, that could be recognized over the HD SI Engine FTP test cycle. We did, however, consider some additional technologies recommended by commenters, which can be recognized over the GEM vehicle cycles. As a result, the Phase 2 *vehicle* standards for gasoline-fueled vocational vehicles are predicated on adoption of engine technologies beyond what is

required to meet the separate engine standard, those additional technologies being advanced engine friction reduction and cylinder deactivation. As described in Section V, we are projecting these technologies to improve fuel consumption over the GEM cycles by nearly one percent in MY 2021, MY 2024, and MY 2027. In other words, this improvement is reflected in the vehicle standards rather than in the engine standards. To the extent any SI engines do not incorporate the projected engine technologies, manufacturers of gasoline-fueled vocational vehicles would need to achieve equivalent reductions from some other technology to meet the GEM-based vehicle standards. The engine standards are summarized in Table I–4.

TABLE I–4—SUMMARY OF PHASE 1 AND PHASE 2 REQUIREMENTS FOR ENGINES IN COMBINATION TRACTORS AND VOCATIONAL VEHICLES

	Phase 1 program	Final 2027 standards
Covered in this category	Engines installed in tractors and vocational chassis.	
Share of HDV fuel consumption and GHG emissions.	Combination tractors and vocational vehicles account for approximately 85 percent of fuel use and GHG emissions in the heavy duty truck sector.	
Per vehicle fuel consumption and CO ₂ improvement.	5%–9% improvement over MY 2010 baseline, depending vehicle application. Improvements are in addition to improvements from tractor and vocational vehicle standards.	4%–5% improvement over MY 2017 for diesel engines. Note that improvements are captured in complete vehicle tractor and vocational vehicle standards, so that engine improvements and the vehicle improvement shown below are not additive.
Form of the standard	EPA: CO ₂ grams/horsepower-hour and NHTSA: Gallons of fuel/horsepower-hour.	
Example technology options available to help manufacturers meet standards.	Combustion, air handling, friction and emissions after-treatment technology improvements.	Further technology improvements and increased use of all Phase 1 technologies, plus waste heat recovery systems for tractor engines (e.g., turbo-compound and Rankine-cycle).
Flexibilities	ABT program which allows emissions and fuel consumption credits to be averaged, banked, or traded (five year credit life). Manufacturers allowed to carry-forward credit deficits for up to three model years. Interim incentives for advanced technologies, recognition of innovative (off-cycle) technologies not accounted for by the HD Phase 1 test procedures, and credits for certifying early.	Same ABT and off-cycle program as Phase 1. Adjustment factor of 1.36 for credits carried forward from Phase 1 to Phase 2 for SI and LHD CI engines due to change in useful life. Revised multipliers for Phase 2 advanced technologies. No Phase 2 early credit multipliers.

(b) Summary of the Tractor Standards

As explained in Section III, the agencies will largely continue the structure of the Phase 1 tractor program, but adopt new standards and update test procedures, as summarized in Table I–6. The tractor standards for MY 2027 will achieve up to 25 percent lower CO₂ emissions and fuel consumption than a 2017 model year Phase 1 tractor. The agencies project that the 2027 tractor standards could be met through improvements in the:

- Engine⁷⁷ (including some use of waste heat recovery systems)
- Transmission
- Driveline
- Aerodynamic design
- Tire rolling resistance
- Idle performance
- Other accessories of the tractor.

The agencies have enhanced the Phase 2 GEM vehicle simulation tool to recognize these technologies, as

⁷⁷ Although the agencies are adopting new engine standards with separate engine certification, engine improvements will also be reflected in the vehicle certification process. Thus, it is appropriate to also consider engine improvements in the context of the vehicle standards.

described in Section II.C. The agencies' evaluation shows that some of these technologies are available today, but have very low adoption rates on current vehicles, while others will require some lead time for development and deployment. In addition to the proposed alternative for tractors, the agencies solicited comment on an alternative that reached similar ultimate stringencies, but at an accelerated pace.

We have also determined that there is sufficient lead time to introduce many of these tractor and engine technologies into the fleet at a reasonable cost starting in the 2021 model year. The

2021 model year standards for combination tractors and engines will achieve up to 14 percent lower CO₂ emissions and fuel consumption than a 2017 model year Phase 1 tractor, the 2024 model year standards will achieve up to 20 percent lower CO₂ emissions

and fuel consumption, and as already noted, the 2027 model year standards will achieve up to 25 percent lower CO₂ emissions and fuel consumption.

In addition to the CO₂ emission standards for tractors, EPA is adopting new particulate matter (PM) standards

which effectively limit which diesel fueled auxiliary power units (APUs) can be used as emission control devices to reduce main engine idling in tractors, as shown in Table I-5. Additional details are discussed in Section III.C.3.

TABLE I-5—PM STANDARDS RELATED TO DIESEL APUS

Tractor MY	PM emission standard (g/kW-hr)	Expected control technology
2018–2023	0.15	In-cylinder PM control.
2024	0.02	DPF.

TABLE I-6—SUMMARY OF PHASE 1 AND PHASE 2 REQUIREMENTS FOR CLASS 7 AND CLASS 8 COMBINATION TRACTORS

	Phase 1 program	Final 2027 standards
Covered in this category	Tractors that are designed to pull trailers and move freight.	
Share of HDV fuel consumption and GHG emissions.	Combination tractors and their engines account for approximately sixty percent of fuel use and GHG emissions in the heavy duty vehicle sector.	
Per vehicle fuel consumption and CO ₂ improvement.	10%–23% improvement over MY 2010 baseline, depending on tractor category. Improvements are in addition to improvements from engine standards.	19%–25% improvement over tractors meeting the MY 2017 standards.
Form of the standard	EPA: CO ₂ grams/ton payload mile and NHTSA: Gallons of fuel/1,000 ton payload mile.	
Example technology options available to help manufacturers meet standards.	Aerodynamic drag improvements; low rolling resistance tires; high strength steel and aluminum weight reduction; extended idle reduction; and speed limiters.	Further technology improvements and increased use of all Phase 1 technologies, plus engine improvements, improved transmissions and axles, tire pressure systems, and predictive cruise control (depending on tractor type).
Flexibilities	ABT program which allows emissions and fuel consumption credits to be averaged, banked, or traded (five year credit life). Manufacturers allowed to carry-forward credit deficits for up to three model years. Interim incentives for advanced technologies, recognition of innovative (off-cycle) technologies not accounted for by the HD Phase 1 test procedures, and credits for certifying early.	Same ABT and off-cycle program as Phase 1. Revised multipliers for Phase 2 advanced technologies.

(c) Summary of the Trailer Standards

The final rules contain a set of GHG emission and fuel consumption standards for manufacturers of new trailers that are used in combination with tractors. These standards will significantly reduce CO₂ and fuel consumption from combination tractor-trailers nationwide over a period of several years. As described in Section IV, there are numerous aerodynamic and tire technologies available to manufacturers to achieve these standards. Many of these technologies have already been introduced into the market through EPA's voluntary SmartWay program and California's tractor-trailer greenhouse gas requirements.

The agencies are adopting Phase 2 standards that will phase-in beginning in MY 2018 and be fully phased-in by 2027. These standards are predicated on use of aerodynamic and tire improvements, with trailer OEMs making incrementally greater improvements in MYs 2021 and 2024 as standard stringency increases in each of those model years. EPA's GHG emission standards will be mandatory beginning in MY 2018, while NHTSA's fuel consumption standards will be voluntary beginning in MY 2018, and be mandatory beginning in MY 2021. In general, the trailer standards being finalized apply only for box vans, flatbeds, tankers, and container chassis.

As described in Section XIV.D and Chapter 12 of the RIA, the agencies are

adopting special provisions to minimize the impacts on small business trailer manufacturers. These provisions have been informed by and are largely consistent with recommendations from the SBAR Panel that EPA conducted pursuant to section 609(b) of the Regulatory Flexibility Act (RFA). Broadly, these provisions provide additional lead time for small business manufacturers, as well as simplified testing and compliance requirements. The agencies also are not finalizing standards for various trailer types, including most specialty types of non-box trailers. Excluding these specialty trailers also reduces the impacts on small businesses.

TABLE I-7—SUMMARY OF PHASE 2 REQUIREMENTS FOR TRAILERS

	Phase 1 program	Final 2027 standards
Covered in this category	All lengths of dry vans, refrigerated vans, tanks, flatbeds, and container chassis hauled by low, mid, and high roof day and sleeper cab tractors.	
Share of HDV fuel consumption and GHG emissions.	Trailers are modeled together with combination tractors and their engines. Together, they account for approximately sixty percent of fuel use and GHG emissions in the heavy duty truck sector.	
Per vehicle fuel consumption and CO ₂ improvement.	N/A	Between 3% and 9% improvement over MY 2018 baseline, depending on the trailer type.
Form of the standard	N/A	EPA: CO ₂ grams/ton payload mile and NHTSA: Gallons/1,000 ton payload mile.
Example technology options available to help manufacturers meet standards.	N/A	Low rolling resistance tires and tire pressure systems for most trailers, plus weight reduction and aerodynamic improvements such as side and rear fairings, gap closing devices, and undercarriage treatment for box vans (e.g., dry and refrigerated).
Flexibilities	N/A	One year delay in implementation for small businesses, trailer manufacturers may use pre-approved aerodynamic data in lieu of additional testing, averaging program available in MY 2027 for manufacturers of dry and refrigerated box vans.

(d) Summary of the Vocational Vehicle Standards

As explained in Section V, the agencies are adopting new vocational vehicle standards that expand upon the Phase 1 Program. These new standards reflect further subcategorization from Phase 1, with separate standards based on mode of operation: Urban, regional, and multi-purpose. The agencies are also adopting optional separate standards for emergency vehicles and other custom chassis vehicles.

The agencies project that the vocational vehicle standards could be met through improvements in the engine, transmission, driveline, lower rolling resistance tires, workday idle reduction technologies, weight reduction, and some application of

hybrid technology. These are described in Section V of this Preamble and in Chapter 2.9 of the RIA. These MY 2027 standards will achieve up to 24 percent lower CO₂ emissions and fuel consumption than MY 2017 Phase 1 standards. The agencies are also making revisions to the compliance program for vocational vehicles. These include: The addition of two idle cycles that will be weighted along with the other drive cycles for each vocational vehicle; and revisions to Phase 2 GEM to recognize improvements to the engine, transmission, and driveline.

Similar to the tractor program, we have determined that there is sufficient lead time to introduce many of these new technologies into the fleet starting in MY 2021. Therefore, we are adopting new standards for MY 2021 and 2024.

Based on our analysis, the MY 2021 standards for vocational vehicles will achieve up to 12 percent lower CO₂ emissions and fuel consumption than a MY 2017 Phase 1 vehicle, on average, and the MY 2024 standards will achieve up to 20 percent lower CO₂ emissions and fuel consumption.

In Phase 1, EPA adopted air conditioning (A/C) refrigerant leakage standards for tractors, as well as for heavy-duty pickups and vans, but not for vocational vehicles. For Phase 2, EPA believes that it will be feasible to apply similar A/C refrigerant leakage standards for vocational vehicles, beginning with the 2021 model year. The certification process for vocational vehicles to certify low-leakage A/C components is identical to that already required for tractors.

TABLE I-8—SUMMARY OF PHASE 1 AND PHASE 2 REQUIREMENTS FOR VOCATIONAL VEHICLE CHASSIS

	Phase 1 program	Final 2027 standard
Covered in this category	Class 2b—8 chassis that are intended for vocational services such as delivery vehicles, emergency vehicles, dump truck, tow trucks, cement mixer, refuse trucks, etc., except those qualified as off-highway vehicles. Because of sector diversity, vocational vehicle chassis are segmented into Light, Medium and Heavy Heavy-Duty vehicle categories and for Phase 2 each of these segments are further subdivided using three duty cycles: Regional, Multi-purpose, and Urban.	
Share of HDV fuel consumption and GHG emissions.	Vocational vehicles account for approximately 17 percent of fuel use and GHG emissions in the heavy duty truck sector categories.	
Per vehicle fuel consumption and CO ₂ improvement.	2% improvement over MY 2010 baseline. Improvements are in addition to improvements from engine standards.	Up to 24% improvement over MY 2017 standards.
Form of the standard	EPA: CO ₂ grams/ton payload mile and NHTSA: Gallons of fuel/1,000 ton payload mile.	
Example technology options available to help manufacturers meet standards.	Low rolling resistance tires	Further technology improvements and increased use of Phase 1 technologies, plus improved engines, transmissions and axles, weight reduction, hybrids, and workday idle reduction systems.

TABLE I-8—SUMMARY OF PHASE 1 AND PHASE 2 REQUIREMENTS FOR VOCATIONAL VEHICLE CHASSIS—Continued

	Phase 1 program	Final 2027 standard
Flexibilities	ABT program which allows emissions and fuel consumption credits to be averaged, banked, or traded (five year credit life). Manufacturers allowed to carry-forward credit deficits for up to three model years. Interim incentives for advanced technologies, recognition of innovative (off-cycle) technologies not accounted for by the HD Phase 1 test procedures, and credits for certifying early.	Same ABT and off-cycle program as Phase 1. Adjustment factor of 1.36 for credits carried forward from Phase 1 to Phase 2 due to change in useful life. Revised multipliers for Phase 2 advanced technologies. No Phase 2 early credit multipliers. Chassis intended for emergency vehicles, cement mixers, coach buses, school buses, transit buses, refuse trucks, and motor homes may optionally use application-specific Phase 2 standards using a simplified version of GEM.

(e) Summary of the Heavy-Duty Pickup and Van Standards

The agencies are adopting new Phase 2 GHG emission and fuel consumption standards for heavy-duty pickups and

vans that will be applied in largely the same manner as the Phase 1 standards. These standards are based on the extensive use of most known and proven technologies, and could result in some use of mild or strong hybrid

powertrain technology. These standards will commence in MY 2021. By 2027, these standards are projected to be 16 percent more stringent than the 2018–2019 standards.

TABLE I-9—SUMMARY OF PHASE 1 AND PHASE 2 REQUIREMENTS FOR HD PICKUPS AND VANS

	Phase 1 program	Final 2027 standard
Covered in this category	Class 2b and 3 complete pickup trucks and vans, including all work vans and 15-passenger vans but excluding 12-passenger vans which are subject to light-duty standards.	
Share of HDV fuel consumption and GHG emissions.	HD pickups and vans account for approximately 23% of fuel use and GHG emissions in the heavy duty truck sector.	
Per vehicle fuel consumption and CO ₂ improvement.	15% improvement over MY 2010 baseline for diesel vehicles, and 10% improvement for gasoline vehicles.	16% improvement over MY 2018–2019 standards.
Form of the standard	Phase 1 standards are based upon a “work factor” attribute that combines truck payload and towing capabilities, with an added adjustment for 4-wheel drive vehicles. There are separate target curves for diesel-powered and gasoline-powered vehicles. The Phase 2 standards are based on the same approach.	
Example technology options available to help manufacturers meet standards.	Engine improvements, transmission improvements, aerodynamic drag improvements, low rolling resistance tires, weight reduction, and improved accessories.	Further technology improvements and increased use of all Phase 1 technologies, plus engine stop-start, and powertrain hybridization (mild and strong).
Flexibilities	Two optional phase-in schedules; ABT program which allows emissions and fuel consumption credits to be averaged, banked, or traded (five year credit life). Manufacturers allowed to carry-forward credit deficits for up to three model years. Interim incentives for advanced technologies, recognition of innovative (off-cycle) technologies not accounted for by the HD Phase 1 test procedures, and credits for certifying early.	Same as Phase 1, with phase-in schedule based on year-over-year increase in stringency. Same ABT and off-cycle program as Phase 1. Adjustment factor of 1.25 for credits carried forward from Phase 1 to Phase 2 due to change in useful life. Revised multipliers for Phase 2 advanced technologies. No Phase 2 early credit multipliers.

Similar to Phase 1, the agencies are adopting for Phase 2 a set of continuous equation-based standards for HD pickups and vans. Please refer to Section VI for a description of these standards, including associated tables and figures.

D. Summary of the Costs and Benefits of the Final Rules

This section summarizes the projected costs and benefits of the NHTSA fuel consumption and EPA GHG emission standards. See Sections VII through IX and the RIA for additional details about these projections.

For these rules, the agencies used two analytical methods for the heavy-duty pickup and van segment by employing both DOT’s CAFE model and EPA’s MOVES model. The agencies used EPA’s MOVES model to estimate fuel consumption and emissions impacts for tractor-trailers (including the engine that powers the tractor), and vocational vehicles (including the engine that powers the vehicle). Additional calculations were performed to determine corresponding monetized program costs and benefits. For heavy-duty pickups and vans, the agencies performed separate analyses, which we refer to as “Method A” and “Method B.”

In Method A, a new version of the CAFE model was used to project a pathway the industry could use to comply with each regulatory alternative and the estimated effects on fuel consumption, emissions, benefits and costs. In Method B, the CAFE model from the NPRM was used to project a pathway the industry could use to comply with each regulatory alternative, along with resultant impacts on per-vehicle costs. However, the MOVES model was used to calculate corresponding changes in total fuel consumption and annual emissions for pickups and vans in Method B. Additional calculations were performed to determine corresponding

monetized program costs and benefits. NHTSA considered Method A as its central analysis and Method B as a supplemental analysis. EPA considered the results of Method B. The agencies concluded that these methods led the agencies to the same conclusions and the same selection of these standards. See Section VII for additional discussion of these two methods.

(1) Reference Case Against Which Costs and Benefits Are Calculated

The No Action Alternatives for today's analysis, alternatively referred to as the "baselines" or "reference cases," assume that the agencies did not issue new rules regarding MD/HD fuel efficiency and GHG emissions. These are the baselines against which costs and benefits for these standards are calculated. The reference cases assume that model year 2018 engine, tractor, vocational vehicle, and HD pickup and van standards will be extended indefinitely and without change. They also assume that no new standards would be adopted for trailers.

The agencies recognize that if these Phase 2 standards had not been adopted, manufacturers would nevertheless continue to introduce new heavy-duty vehicles in a competitive market that responds to a range of factors, and manufacturers might have continued to improve technologies to reduce heavy-duty vehicle fuel consumption. Thus, as described in Section VII, both agencies fully analyzed these standards and the regulatory alternatives against two reference cases. The first case uses a baseline that projects no improvement in new vehicles in the absence of new Phase 2 standards, and the second uses a more dynamic baseline that projects some significant improvements in vehicle fuel efficiency. NHTSA considered its primary analysis to be based on the dynamic baseline, where certain cost-effective technologies are assumed to be applied by manufacturers to improve fuel efficiency beyond the Phase 1 requirements in the absence of new Phase 2 standards. EPA considered both reference cases. The results for all of the regulatory alternatives relative to both reference cases, derived via the same methodologies discussed in this section, are presented in Section X of the Preamble.

The agencies received limited comments on these reference cases. Some commenters expressed support for a flat baseline in the context of the need for the regulations, arguing that little improvement would occur without the regulations. Others supported the less dynamic baseline because they believe

it more fully captures the costs. A number of commenters expressed that purchasers are willing to and do pay for fuel efficiency improving technologies, provided the cost for the technology is paid back through fuel savings within a certain period of time; this is the premise for a dynamic baseline. Some commenters thought it reasonable that the agencies consider both baselines given the uncertainty in this area. No commenters opposed the consideration of both baselines.

The agencies have continued to analyze two different baselines for the final rules because we recognize that there are a number of factors that create uncertainty in projecting a baseline against which to compare the future effects of this action and the remaining alternatives. The composition of the future fleet—such as the relative position of individual manufacturers and the mix of products they each offer—cannot be predicted with certainty at this time. Additionally, the heavy-duty vehicle market is diverse, as is the range of vehicle purchasers. Heavy-duty vehicle manufacturers have reported that their customers' purchasing decisions are influenced by their customers' own determinations of minimum total cost of ownership, which can be unique to a particular customer's circumstances. For example, some customers (*e.g.*, less-than-truckload or package delivery operators) operate their vehicles within a limited geographic region and typically own their own vehicle maintenance and repair centers within that region. These operators tend to own their vehicles for long time periods, sometimes for the entire service life of the vehicle. Their total cost of ownership is influenced by their ability to better control their own maintenance costs, and thus they can afford to consider fuel efficiency technologies that have longer payback periods, outside of the vehicle manufacturer's warranty period. Other customers (*e.g.*, truckload or long-haul operators) tend to operate cross-country, and thus must depend upon truck dealer service centers for repair and maintenance. Some of these customers tend to own their vehicles for about four to seven years, so that they typically do not have to pay for repair and maintenance costs outside of either the manufacturer's warranty period or some other extended warranty period. Many of these customers tend to require seeing evidence of fuel efficiency technology payback periods on the order of 18 to 24 months before seriously considering evaluating a new technology for potential adoption

within their fleet (NAS 2010, Roeth et al. 2013, and Klemick et al. 2014). Purchasers of HD pickups and vans wanting better fuel efficiency tend to demand that fuel consumption improvements pay back within approximately one to three years, but some HD pickup and van owners accrue relatively few vehicle miles traveled per year, such that they may be less likely to adopt new fuel efficiency technologies, while other owners who use their vehicle(s) with greater intensity may be even more willing to pay for fuel efficiency improvements. Regardless of the type of customer, their determination of minimum total cost of ownership involves the customer balancing their own unique circumstances with a heavy-duty vehicle's initial purchase price, availability of credit and lease options, expectations of vehicle reliability, resale value and fuel efficiency technology payback periods. The degree of the incentive to adopt additional fuel efficiency technologies also depends on customer expectations of future fuel prices, which directly impacts customer payback periods. Purchasing decisions are not based exclusively on payback period, but also include the considerations discussed above and in Section X.A.1. For the baseline analysis, the agencies use payback period as a proxy for all of these considerations, and therefore the payback period for the baseline analysis is shorter than the payback period industry uses as a threshold for the further consideration of a technology. See Section X.A.1 of this Preamble and Chapter 11 of the RIA for a more detailed discussion of baselines. As part of a sensitivity analysis, additional baseline scenarios were also evaluated for HD pickups and vans, including baseline payback periods of 12, 18 and 24 months. See Section VI of this Preamble and Chapter 10 of the RIA for a detailed discussion of these additional scenarios.

(2) Costs and Benefits Projected for the Phase 2 Standards

The tables below summarize the benefits and costs for the program in two ways: First, from the perspective of a program designed to improve the Nation's energy security and to conserve energy by improving fuel efficiency and then from the perspective of a program designed to reduce GHG emissions. The individual categories of benefits and costs presented in the tables below are defined more fully and presented in more detail in Chapter 8 of the RIA.

Lifetime fuel savings, GHG reductions, benefits, costs and net benefits for model years 2018 through

2029 vehicles as presented below. This is consistent with the NPRM analysis and allows readers to compare the costs and benefits of the final program with those projected for the NPRM. It also includes for modeling purposes at least three model years for each standard.

Table I–10 shows benefits and costs for these standards from the perspective of a program designed to improve the Nation's energy security and conserve energy by improving fuel efficiency. From this viewpoint, technology costs occur when the vehicle is purchased.

Fuel savings are counted as benefits that occur over the lifetimes of the vehicles produced during the model years subject to the Phase 2 standards as they consume less fuel.

TABLE I–10—LIFETIME FUEL SAVINGS, GHG REDUCTIONS, BENEFITS, COSTS, AND NET BENEFITS FOR MODEL YEARS 2018–2029 VEHICLES USING ANALYSIS METHOD A

[Billions of 2013\$]^{a,b}

Category	3% discount rate	7% discount rate
Fuel Reductions (Billion Gallons)	71.1–77.7	
GHG reductions (MMT CO ₂ eq)	959–1049	
Vehicle Program: Technology and Indirect Costs, Normal Profit on Additional Investments	23.7 to 24.4	16.1 to 16.6
Additional Routine Maintenance	1.7 to 1.7	0.9 to 0.9
Congestion, Crashes, Fatalities and Noise from Increased Vehicle Use ^d	3.1 to 3.2	1.8 to 1.9
Total Costs	28.5 to 29.3	18.8 to 19.4
Fuel Savings (valued at pre-tax prices)	149.1 to 163.0	79.7 to 87.0
Savings from Less Frequent Refueling	3.0 to 3.2	1.6 to 1.7
Economic Benefits from Additional Vehicle Use	5.4 to 5.5	3.4 to 3.5
Reduced Climate Damages from GHG Emissions ^c	33.0 to 36.0	
Reduced Health Damages from Non-GHG Emissions	27.1 to 30.0	14.6 to 16.1
Increased U.S. Energy Security	7.3 to 7.9	3.9 to 4.2
Total Benefits	225 to 246	136 to 149
Net Benefits	197 to 216	117 to 129

Notes:

^a For an explanation of analytical Methods A and B, please see Section I.D; for an explanation of the flat baseline, 1a, and dynamic baseline, 1b, please see Section X.A.1.

^b Range reflects two reference case assumptions 1a and 1b.

^c Benefits and net benefits use the 3 percent global average SCC value applied only to CO₂ emissions; GHG reductions include CO₂, CH₄, N₂O and HFC reductions, and include benefits to other nations as well as the U.S. See Draft RIA Chapter 8.5 and Preamble Section IX.G for further discussion.

^d "Congestion, Crashes, Fatalities and Noise from Increased Vehicle Use" includes NHTSA's monetized value of estimated reductions in the incidence of highway fatalities associated with mass reduction in HD pickup and vans, but this does not include these reductions from tractor-trailers or vocational vehicles. This likely results in a conservative overestimate of these costs.

Table I–11 shows benefits and cost from the perspective of reducing GHG. As shown below in terms of MY lifetime GHG reductions, and in RIA Chapter 5 in terms of year-by-year GHG reductions, the final program is

expected to reduce more GHGs over the long run than the proposed program. In general, the greater reductions can be attributed to increased market penetration and effectiveness of key technologies, based on new data and

comments, leading to increases in stringency such as with the diesel engine standards (Section I.C.(2)(a) above).

TABLE I–11—LIFETIME FUEL SAVINGS, GHG REDUCTIONS, BENEFITS, COSTS AND NET BENEFITS FOR MODEL YEARS 2018–2029 VEHICLES USING ANALYSIS METHOD B

[Billions of 2012\$]^{a,b}

Category	3% discount rate	7% discount rate
Fuel Reductions (Billion Gallons)	73–82	
GHG reductions (MMT CO ₂ eq)	976–1,098	
Vehicle Program (e.g., technology and indirect costs, normal profit on additional investments)	–\$26.5 to –\$26.2	–\$17.6 to –\$17.4
Additional Routine Maintenance	–\$1.9 to –\$1.9	–\$1.0 to –\$1.0
Fuel Savings (valued at pre-tax prices)	\$149.3 to \$169.1	\$76.8 to \$87.2
Energy Security	\$6.9 to \$7.8	\$3.5 to \$4.0
Congestion, Crashes, and Noise from Increased Vehicle Use	–\$3.2 to –\$3.2	–\$1.8 to –\$1.8
Savings from Less Frequent Refueling	\$3.4 to \$4.0	\$1.8 to \$2.1
Economic Benefits from Additional Vehicle Use	\$10.4 to \$10.5	\$5.7 to \$5.7
Benefits from Reduced Non-GHG Emissions ^c	\$28.3 to \$31.9	\$13.4 to \$15.0

TABLE I-11—LIFETIME FUEL SAVINGS, GHG REDUCTIONS, BENEFITS, COSTS AND NET BENEFITS FOR MODEL YEARS 2018–2029 VEHICLES USING ANALYSIS METHOD B—Continued

[Billions of 2012\$]^{a b}

Category	3% discount rate	7% discount rate
Reduced Climate Damages from GHG Emissions ^d	\$33.0 to \$37.2	
Net Benefits	\$200 to \$229	\$114 to \$131

Notes:

^a For an explanation of analytical Methods A and B, please see Section I.D; for an explanation of the flat baseline, 1a, and dynamic baseline, 1b, please see Section X.A.1.

^b Range reflects two baseline assumptions 1a and 1b.

^c Range reflects both the two baseline assumptions 1a and 1b using the mid-point of the low and high \$/ton estimates for calculating benefits.

^d Benefits and net benefits use the 3 percent average directly modeled SC-GHG values applied to direct reductions of CO₂, CH₄ and N₂O emissions; GHG reductions include CO₂, CH₄ and N₂O reductions.

Table I-12 breaks down by vehicle standards using the Method A analytical vehicle break-downs of costs and category the benefits and costs for these approach. For additional detail on per-benefits, please see RIA Chapter 10.

TABLE I-12—PER VEHICLE CATEGORY LIFETIME FUEL SAVINGS, GHG REDUCTIONS, BENEFITS, COSTS AND NET BENEFITS FOR MODEL YEARS 2018–2029 VEHICLES USING ANALYSIS METHOD A (BILLIONS OF 2013\$), RELATIVE TO BASELINE 1b^a

Key costs and benefits by vehicle category	3% discount rate	7% discount rate
Tractors, Including Engines, and Trailers		
Fuel Reductions (Billion Gallons)	50	
GHG Reductions (MMT CO ₂ eq)	685	
Total Costs	13.8	9.0
Total Benefits	161.0	96.8
Net Benefits	147.2	85.5
Vocational Vehicles, Including Engines		
Fuel Reductions (Billion Gallons)	12	
GHG Reductions (MMT CO ₂ eq)	162	
Total Costs	7.3	4.8
Total Benefits	37.8	22.7
Net Benefits	30.5	15.3
HD Pickups and Vans		
Fuel Reductions (Billion Gallons)	10	
GHG Reductions (MMT CO ₂ eq)	111	
Total Costs	7.4	5.1
Total Benefits	26.0	16.7
Net Benefits	18.6	11.6

Notes:

^a For an explanation of analytical Methods A and B, please see Section I.D; for an explanation of the flat baseline, 1a, and dynamic baseline, 1b, please see Section X.A.1.

TABLE I-13—PER VEHICLE COSTS, USING METHOD A (2013\$), RELATIVE TO BASELINE 1b

	MY 2021	MY 2024	MY 2027
Per Vehicle Cost (\$): ^a			
Tractors	\$6,400	\$9,920	\$12,160
Trailers	850	1,000	1,070
Vocational Vehicles	1,110	2,020	2,660
Pickups/Vans	750	760	1,340

Note:

^a Per vehicle costs include new engine and vehicle technology only; costs associated with increased insurance, taxes and maintenance are included in the payback period values.

TABLE I-14—PER VEHICLE COSTS USING METHOD B RELATIVE TO BASELINE 1a

	MY 2021	MY 2024	MY 2027
Per Vehicle Cost (\$): ^a			
Tractors	\$6,484	\$10,101	\$12,442
Trailers	868	1,033	1,108
Vocational Vehicles	1,110	2,022	2,662
Pickups/Vans	524	963	1,364

Note:

^a Per vehicle costs include new engine and vehicle technology only; costs associated with increased insurance, taxes and maintenance are included in the payback period values.

An important metric to vehicle purchasers is the payback period that can be expected on any new purchase. In other words, there is greater willingness to pay for new technology if that new technology “pays back” within an acceptable period of time. The agencies make no effort to define the acceptable period of time, but seek to estimate the payback period for others to make the decision themselves. The payback period is the point at which reduced fuel expenditures outpace increased vehicle costs, including increased maintenance, insurance premiums and taxes. The payback periods for vehicles meeting the standards considered for the final year of implementation are shown in Table I-15, and are similar for both Method A and Method B.

TABLE I-15—PAYBACK PERIODS FOR MY 2027 VEHICLES RELATIVE TO BASELINE 1a

[Payback occurs in the year shown; using 7% discounting]

Tractors/Trailers	2nd.
Vocational Vehicles	4th.
Pickups/Vans	3rd.

TABLE I-16—PAYBACK PERIODS FOR MY 2027 VEHICLES RELATIVE TO BASELINE 1b

[Payback occurs in the year shown; using 7% discounting]

Tractors/Trailers	2nd.
Vocational Vehicles	4th.
Pickups/Vans	3rd.

(3) Cost Effectiveness

These regulations implement section 32902(k) of EISA and section 202(a)(1) and (2) of the Clean Air Act. Through the 2007 EISA, Congress directed NHTSA to create a medium- and heavy-

duty vehicle fuel efficiency program designed to achieve the maximum feasible improvement by considering appropriateness, cost effectiveness, and technological feasibility to determine maximum feasible standards.⁷⁸ The Clean Air Act requires that any air pollutant emission standards for heavy-duty vehicles and engines take into account the costs of any requisite technology and the lead time necessary to implement such technology. Both agencies considered overall costs, overall benefits and cost effectiveness in developing the Phase 2 standards. Although there are different ways to evaluate cost effectiveness, the essence is to consider some measure of costs relative to some measure of impacts.

Considering that Congress enacted EPCA and EISA to, among other things, address the need to conserve energy, the agencies have evaluated these standards in terms of costs per gallon of fuel conserved. We also considered the similar metric of cost of technology per ton of CO₂e removed, consistent with the objective of CAA section 202(a)(1) and (2) to reduce emissions of air pollutants which contribute to air pollution which endangers public health and welfare. As described in the RIA, the agencies also evaluated these standards using the same approaches employed in HD Phase 1. Together, the agencies have considered the following three ratios of cost effectiveness:

1. Total social costs per gallon of fuel conserved

⁷⁸ This EISA requirement applies to regulation of medium- and heavy-duty vehicles. For many years, and as reaffirmed by Congress in 2007, “economic practicability” has been among the factors EPCA requires NHTSA to consider when setting light-duty fuel economy standards at the (required) maximum feasible levels. NHTSA interprets “economic practicability” as a factor involving considerations broader than those likely to be involved in “cost effectiveness.”

2. Technology costs per ton of GHG emissions reduced (CO₂eq)
3. Technology costs minus fuel savings per ton of GHG emissions reduced

By all three of these measures, the total heavy-duty program will be highly cost effective.

As discussed below, the agencies estimate that over the lifetime of heavy-duty vehicles produced for sale in the U.S. during model years 2018–2029, these standards will cost about \$30 billion and conserve about 75 billion gallons of fuel, such that the first measure of cost effectiveness will be about 40 cents per gallon. Relative to fuel prices underlying the agencies’ analysis, the agencies have concluded that today’s standards will be cost effective.

With respect to the second measure, which is useful for comparisons to other GHG rules, these standards will have overall \$/ton costs similar to the HD Phase 1 rule. As Chapter 7 of the RIA shows, social costs will amount to about \$30 per metric ton of GHG (CO₂eq) for the entire HD Phase 2 program. This compares well to both the HD Phase 1 rule, which was also estimated to cost about \$30 per metric ton of GHG (without fuel savings), and to the agencies’ estimates of the social cost of carbon.⁷⁹ Thus, even without accounting for fuel savings, these standards will be cost-effective.

The following table include the overall per-unit costs of both gallons of fuel conserved and metric tons of GHG emissions abated using both a 3 percent and a 7 percent discount rate. Table I-16 gives these values under the Method A analysis.

⁷⁹ As described in Section IX.G, the social cost of carbon is a metric that estimates the monetary value of impacts associated with marginal changes in CO₂ emissions in a given year.

TABLE I-17—METHOD A COST PER-UNIT OF FUEL SAVINGS AND GHG EMISSION REDUCTIONS BY VEHICLE CLASS
[Relative to the dynamic baseline]

Per-unit costs (2013\$/Unit) by vehicle category	3% Discount rate	7% Discount rate
Tractors, Including Engines, and Trailers		
Cost per Gallon of Fuel Saved	\$0.28	\$0.18
Cost per Ton of GHG Emissions Saved	20	13
Vocational Vehicles, Including Engines		
Cost per Gallon of Fuel Saved	0.61	0.40
Cost per Ton of GHG Emissions Saved	45	30
HD Pickups and Vans		
Cost per Gallon of Fuel Saved	0.76	0.52
Cost per Ton of GHG Emissions Saved	67	46
Total Program		
Cost per Gallon of Fuel Saved	0.40	0.26
Cost per Ton of GHG Emissions Saved	30	20

When considering these values, it is important to emphasize two points:

1. As is shown throughout this rulemaking, the Phase 2 standards represent the most stringent standards that are technologically feasible and reliably implementable within the lead time provided.

2. These are not the marginal cost-effectiveness values.

Without understanding these two points, some readers might assume that because the tractor-trailer standards are more cost-effective overall than the other standards that manufacturers would choose to over-comply with the more cost-effective tractor or trailer standards and do less for other vehicles.

However, the agencies believe this is not a technologically feasible option.

Because the tractor and trailer standards represent maximum feasible standards, they will effectively require manufacturers to deploy all available technology to meet the standards. The agencies do not project that manufacturers would be able to over-comply with the 2027 standards by a significant margin.

The third measure deducts fuel savings from costs, which also is useful for comparisons to other GHG rules. As shown in Table I-18, the agencies have also calculated the cost per metric ton of CO₂e emission reductions including the savings associated with reduced fuel

consumption. The calculations presented here include all engine-related costs but do not include benefits associated with the final program such as those associated with criteria pollutant reductions or energy security benefits (discussed in Chapter 8 of this RIA). On this basis, net costs per ton of GHG emissions reduced will be negative under these standards. This means that the value of the fuel savings will be greater than the technology costs, and there will be a net cost saving for vehicle owners. In other words, the technologies will pay for themselves (indeed, more than pay for themselves) in fuel savings.

TABLE I-18—ANNUAL NET COST PER METRIC TON OF CO₂eq EMISSIONS REDUCED IN THE FINAL PROGRAM VS. THE FLAT BASELINE AND USING METHOD B FOR CALENDAR YEAR 2030

[Dollar values are 2013\$]^a

Calendar year	Vehicle & maintenance costs (\$billions)	Fuel savings (\$billions)	GHG reduced (MMT)	Net cost (\$/metric ton) ^b
HDE Pickups and Vans	1.6	3.9	15	0
Vocational Vehicles	1.5	3.5	14	0
Tractor-Trailers	2.3	16	64	0
All Vehicles	5.5	23	94	0

Notes:

^a For an explanation of analytical Methods A and B, please see the beginning of this Section I.D; for an explanation of the flat baseline, 1a, and dynamic baseline, 1b, please see Section X.A.1. GHG reductions include CO₂ and CO₂ equivalents of CH₄, and N₂O.

^b For each category, fuel savings exceed cost so there is no net cost per ton of GHG reduced.

In addition, while the net economic benefits (*i.e.*, total benefits minus total costs) of these standards is not a traditional measure of their cost effectiveness, the agencies have concluded that the total costs of these standards are justified in part by their significant economic benefits. As

discussed in the previous subsection and in Section IX, this rule will provide benefits beyond the fuel conserved and GHG emissions avoided. The rule's net benefits is a measure that quantifies each of its various benefits in economic terms, including the economic value of the fuel it saves and the climate-related

damages it avoids, and compares their sum to the rule's estimated costs. The agencies estimate that these standards will result in net economic benefits exceeding \$100 billion, making this a highly beneficial program.

EPA and NHTSA received many comments suggesting that more

stringent standards were feasible because many cost effective technologies exist for future vehicle designs. While the agencies agree that many cost effective technologies exist, and indeed, we reflect the potential for many of those technologies to be applied in our analysis for today's final rule, commenters who focused on the cost-effectiveness of technologies did not consistently recognize certain real-world constraints on technology implementation. Manufacturers and suppliers have limited research and development capacities, and although they have some ability to expand (by adding staff or building new facilities), the process of developing and applying new technologies is inherently constrained by time. Adequate lead time is also necessary to complete durability, reliability, and safety testing and ramp up production to levels that might be necessary to meet future standards. If the agencies fail to account for lead time needs in determining the stringency of the standards, we could create unintended consequences, such as technologies that are applied before they are ready and lead to maintenance and repair problems. In addition to cost-effectiveness, then, lead time constraints can also be highly relevant to feasibility of more stringent standards.

E. EPA and NHTSA Statutory Authorities

This section briefly summarizes the respective statutory authority for EPA and NHTSA to promulgate the Phase 1 and Phase 2 programs. For additional details of the agencies' authority, see Section XV of this document as well as the Phase 1 rule.⁸⁰

(1) EPA Authority

Statutory authority for the emission standards in this rule is found in CAA section 202(a)(1) and (2) (which requires EPA to establish standards for emissions of pollutants from new motor vehicles and engines which emissions cause or

contribute to air pollution which may reasonably be anticipated to endanger public health or welfare), and in CAA sections 202(a)(3), 202(d), 203–209, 216, and 301 (42 U.S.C. 7521 (a)(1) and (2), 7521(d), 7522–7543, 7550, and 7601).

Title II of the CAA provides for comprehensive regulation of mobile sources, authorizing EPA to regulate emissions of air pollutants from all mobile source categories. When acting under Title II of the CAA, EPA considers such issues as technology effectiveness, its cost (both per vehicle, per manufacturer, and per consumer), the lead time necessary to implement the technology, and based on this the feasibility and practicability of potential standards; the impacts of potential standards on emissions reductions of both GHGs and non-GHG emissions; the impacts of standards on oil conservation and energy security; the impacts of standards on fuel savings by customers; the impacts of standards on the truck industry; other energy impacts; as well as other relevant factors such as impacts on safety.

This action implements a specific provision from Title II, section 202(a). Section 202(a)(1) of the CAA states that “the Administrator shall by regulation prescribe (and from time to time revise) . . . standards applicable to the emission of any air pollutant from any class or classes of new motor vehicles . . . , which in his judgment cause, or contribute to, air pollution which may reasonably be anticipated to endanger public health or welfare.” With EPA's December 2009 final findings that certain greenhouse gases may reasonably be anticipated to endanger public health and welfare and that emissions of GHGs from section 202(a) sources cause or contribute to that endangerment, section 202(a) requires EPA to issue standards applicable to emissions of those pollutants from new motor vehicles. See *Coalition for Responsible Regulation v. EPA*, 684 F. 3d at 116–125, 126–27 cert. granted by, in part *Util. Air Regulatory Group v. EPA*, 134 S. Ct. 418 (2013), affirmed in

part and reversed in part on unrelated grounds by *Util. Air Regulatory Group v. EPA*, 134 S. Ct. 2427 (2014) (upholding EPA's endangerment and cause and contribute findings, and further affirming EPA's conclusion that it is legally compelled to issue standards under section 202(a) to address emission of the pollutant which endangers after making the endangerment and cause or contribute findings); see also *id.* at 127–29 (upholding EPA's light-duty GHG emission standards for MYs 2012–2016 in their entirety).

Other aspects of EPA's legal authority, including its authority under section 202(a), its testing authority under section 203 of the Act, and its enforcement authorities under sections 205 and 207 of the Act are discussed fully in the Phase 1 rule, and need not be repeated here. See 76 FR 57129–57130.

In this final rule, EPA is establishing first-time CO₂ emission standards for trailers hauled by tractors. 80 FR 40170. Certain commenters, notably the Truck Trailer Manufacturers Association (TTMA), maintained that EPA lacks authority to adopt requirements for trailer manufacturers, and that emission standards for trailers could be implemented, if at all, by requirements applicable to the entity assembling a tractor-trailer combination. The argument is that trailers by themselves are not “motor vehicles” as defined in section 216(2) of the Act, that trailer manufacturers therefore do not manufacture motor vehicles, and that standards for trailers can be imposed, if at all, only on “the party that joined the trailer to the tractor.” Comments of TTMA, p. 4; Comments of TTMA (March 31, 2016) p. 2.

EPA also proposed a number of changes and clarifications for rules respecting glider kits and glider vehicles. 80 FR 40527–40530. As shown in Figure I.1, a glider kit is a tractor chassis with frame, front axle, interior and exterior cab, and brakes.

⁸⁰ 76 FR 57106–57129, September 15, 2011.

Figure I.1 Typical Incomplete Glider Kit Configuration

It is intended for self-propelled highway use, and becomes a glider vehicle when an engine, transmission, and rear axle are added. Engines are often salvaged from earlier model year vehicles, remanufactured, and installed in the glider kit. The final manufacturer of the glider vehicle, *i.e.* the entity that installs an engine, is typically a different manufacturer than the original manufacturer of the glider kit. The final rule contains emission standards for glider vehicles, but does not contain separate standards for glider kits.⁸¹

Many commenters to both the proposed rule and the NODA supported EPA's interpretation. However, a number of commenters, including Daimler, argued that glider kits are not motor vehicles and so EPA lacks the authority to impose any rules respecting their sale or configuration. Comments of Daimler, pp. 122–23; Comments of Daimler Trucks (April 1, 2016) pp. 2–3. We respond to these comments below, with a more detailed response appearing in RTC Section 1.3.1 and 14.2.

Under the Act, “motor vehicle” is defined as “any self-propelled vehicle designed for transporting persons or property on a street or highway.” CAA

section 216(2). At proposal, EPA maintained that tractor-trailers are motor vehicles and that EPA therefore has the authority to promulgate emission standards for complete and incomplete vehicles—both the tractor and the trailer. 80 FR 40170. The same proposition holds for glider kits and glider vehicles. *Id.* at 80 FR 40528. The argument that a trailer, or a glider kit, standing alone, is not self-propelled, and therefore is not a motor vehicle, misses the key issues of authority under the Clean Air Act to promulgate emission standards for motor vehicles produced in discrete segments, and the further issue of the entities—namely “manufacturers”—to which standards and certification requirements apply. Simply put, EPA is authorized to set emission standards for complete and incomplete motor vehicles, manufacturers of complete and incomplete motor vehicles can be required to certify to those emission standards, and there can be multiple manufacturers of a motor vehicle, each of which can be required to certify.

(a) Standards for Complete Vehicles—Tractor-Trailers and Glider Vehicles

Section 202(a)(1) authorizes EPA to set standards “applicable to the emission of any air pollutant from any . . . new motor vehicles.” There is no question that EPA is authorized to establish emission standards under this

provision for complete new motor vehicles, and thus can promulgate emission standards for air pollutants emitted by tractor-trailers and by glider vehicles.

Daimler maintained in its comments that although a glider vehicle is a motor vehicle, it is not a “new” motor vehicle because “glider vehicles, when constructed retain the identity of the donor vehicle, such that the title has already been exchanged, making the vehicles not ‘new’ under the CAA.” Daimler Comments p. 121; see also the similar argument in Daimler Truck Comments (April 1, 2016), p. 4. Daimler maintains that because title to the powertrain from the donor vehicle has already been transferred, the glider vehicle to which the powertrain is added cannot be “new.” Comments of April 1, 2016 p. 4. Daimler also notes that NHTSA considers a truck to be “newly manufactured” and subject to Federal Motor Vehicle Safety Standards when a new cab is used in its assembly, “unless the engine, transmission, and drive axle(s) (as a minimum) of the assembled vehicle are not new, and at least two of these components were taken from the same vehicle.” 49 CFR 571.7(e). Daimler urges EPA to adopt a parallel provision here.

First, this argument appears to be untimely. In Phase 1, EPA already indicated that glider vehicles are new motor vehicles, at least implicitly, by

⁸¹ As discussed in sections (c) and (d) below, however, manufacturers of glider kits can, and typically are, responsible for obtaining a certificate of conformity before shipping a glider kit. This is because they are manufacturers of motor vehicles, in this case, an incomplete vehicle.

adopting an interim exemption for them. See 76 FR 57407 (adopting 40 CFR 1037.150(j) indicating that the general prohibition against introducing a vehicle not subject to current model year standards does not apply to MY 2013 or earlier engines). Assuming the argument that glider vehicles are not new can be raised in this rulemaking, EPA notes that the Clean Air Act defines “new motor vehicle” as “a motor vehicle the equitable or legal title to which has never been transferred to an ultimate purchaser” (section 216(3)). Glider vehicles are typically marketed and sold as “brand new” trucks. Indeed, one prominent assembler of glider kits and glider vehicles advertises that “Fitzgerald Glider Kits offers customers the option to purchase a *brand new 2016 tractor*, in any configuration offered by the manufacturer . . . Fitzgerald Glider Kits has mastered the process of taking the ‘Glider Kit’ and installing the components to work seamlessly *with the new truck*.”⁸² The purchaser of a “new truck” necessarily takes initial title to that truck.⁸³ Daimler would have it that this ‘new truck’ terminology is a mere marketing ploy, but it obviously reflects reality. As shown in Figure I.1 above, the glider kit constitutes the major parts of the vehicle, lacking only the engine, transmission, and rear axle. The EPA sees nothing in the Act that compels the result that adding a used component to an otherwise new motor vehicle necessarily vitiates classification of the motor vehicle as “new.” See 80 FR 40528. Rather, reasonable judgments must be made, and in this case, the agency believes it reasonable that the tail need not wag the dog: Adding the engine and transmission to the otherwise-complete vehicle does not prevent the glider vehicle from being “new”—as marketed. The fact that this approach is reasonable, if not mandated, is confirmed by the language of the Act’s definition of “new motor vehicle engine,” which includes any “engine in a new motor vehicle” without regard to whether or not the engine was previously used. EPA has also previously addressed the issue of used components in new engines and vehicles explicitly in regulations in the context of locomotives and locomotive engines in 40 CFR part 1033. There we defined remanufactured locomotives

and locomotive engines to be “new” locomotives and locomotive engines. See 63 FR 18980; see also Summary and Analysis of Comments on Notice of Proposed Rulemaking for Emission Standards for Locomotives and Locomotive Engines (EPA-420-R-97-101 (December 1997)) at pp. 10–14. This is a further reason that the model year of the engine is not determinative of whether a glider vehicle is “new.” As to the suggestion to adopt a provision parallel to the NHTSA definition, EPA notes that the NHTSA definition was developed for different purposes using statutory authority which differs from the Clean Air Act in language and intent. There consequently is no basis for requiring EPA to adopt such a definition, and doing so would impede meaningful control of both GHG emissions and criteria pollutant emissions from glider vehicles.

(b) Standards for Incomplete Vehicles

Section 202(a)(1) not only authorizes EPA to set standards “applicable to the emission of any air pollutant from any . . . new motor vehicles,” but states further that these standards are applicable “whether such vehicles . . . are designed as complete systems or incorporate devices to prevent or control such pollution.” The Act in fact thus not only contemplates, but in some instances, directly commands that EPA establish standards for incomplete vehicles and vehicle components. See CAA section 202(a)(6) (standards for onboard vapor recovery systems on “new light-duty vehicles,” and requiring installation of such systems); section 202(a)(5)(A) (standards to control emissions from refueling motor vehicles, and requiring consideration of, and possible design standards for, fueling system components); 202(k) (standards to control evaporative emissions from gasoline-fueled motor vehicles). Both TTMA and Daimler argued, in effect, that these provisions are the exceptions that prove the rule and that without this type of enumerated exception, only entire, complete vehicles can be considered to be “motor vehicles.” This argument is not persuasive. Congress did not indicate that these incomplete vehicle provisions were exceptions to the definition of motor vehicle. Just the opposite. Without amending the new motor vehicle definition, or otherwise indicating that these provisions were not already encompassed within Title II authority over “new motor vehicles”, Congress required EPA to set standards for evaporative emissions from a portion of a motor vehicle. Congress thus indicated in these provisions: (1) That

standards should apply to “vehicles” whether or not the “vehicles” were designed as complete systems; (2) that some standards should explicitly apply only to certain components of a vehicle that are plainly not self-propelled. Congress thus necessarily was of the view that incomplete vehicles can be motor vehicles.

Emission standards EPA sets pursuant to this authority thus can be, and often are focused on emissions from the new motor vehicle, and from portions, systems, parts, or components of the vehicle. Standards thus apply not just to exhaust emissions, but to emissions from non-exhaust portions of a vehicle, or from specific vehicle components or parts. See the various evaporative emission standards for light duty vehicles in 40 CFR part 86, subpart B (e.g., 40 CFR 86.146–96 and 86.150–98 (refueling spitback and refueling test procedures); 40 CFR 1060.101–103 and 73 FR 59114–59115 (various evaporative emission standards for small spark ignition equipment); 40 CFR 86.1813–17(a)(2)(iii) (canister bleed evaporative emission test procedure, where testing is solely of fuel tank and evaporative canister); see also 79 FR 23507 (April 28, 2014) (incomplete heavy duty gasoline vehicles could be subject to, and required to certify compliance with, evaporative emission standards)). These standards are implemented by testing the particular vehicle component, not by whole vehicle testing, notwithstanding that the component may not be self-propelled until it is installed in the vehicle or (in the case of non-road equipment), propelled by an engine.⁸⁴

EPA thus can set standards for all or just a portion of the motor vehicle notwithstanding that an incomplete motor vehicle may not yet be self-propelled. This is not to say that the Act authorizes emission standards for any part of a motor vehicle, however insignificant. Under the Act it is reasonable to consider both the significance of the components in comparison to the entire vehicle and the significance of the components for achieving emissions reductions. A vehicle that is complete except for an ignition switch can be subject to standards even though it is not self-

⁸² Advertisement for Fitzgerald Glider kits in Overdrive magazine (December 2015) (emphasis added).

⁸³ Fitzgerald states “All Fitzgerald glider kits will be titled in the state of Tennessee and you will receive a title to transfer to your state.” <https://www.fitzgeraldgliderkits.com/frequently-asked-questions>. Last accessed July 9, 2016.

⁸⁴ “Non-road vehicles” are defined differently than “motor vehicles” under the Act, but the difference does not appear relevant here. Non-road vehicles, like motor vehicles, must be propelled by an engine. See CAA section 216(11) (“‘nonroad vehicle’ means a vehicle that is powered by a nonroad engine”). Pursuant to this authority, EPA has promulgated many emission standards applicable to components of engineless non-road equipment, for which the equipment manufacturer must certify.

propelled. Likewise, as just noted, vehicle components that are significant for controlling evaporative emissions can be subject to standards even though in isolation the components are not self-propelled. However, not every individual component of a complete vehicle can be subjected to standards as an incomplete vehicle. To reflect these considerations, EPA is adopting provisions stating that a trailer is a vehicle “when it has a frame with one or more axles attached,” and a glider kit becomes a vehicle when “it includes a passenger compartment attached to a frame with one or more axles.” Section 1037.801 definition of “vehicle,” paragraphs (1)(ii) and (iii); see also Section XIII.B below.

TTMA and Daimler each maintained that this claim of authority is open-ended, and can be extended to the least significant vehicle part. As noted above, EPA acknowledges that lines need to be drawn, but whether looking at the relation between the incomplete vehicle and the complete vehicle, or looking at the relation between the incomplete vehicle and the emissions control requirements, it is evident that trailers and glider kits should properly be treated as vehicles, albeit incomplete ones.⁸⁵ They properly fall on the vehicle side of the line. When one finishes assembling a whole aggregation of parts to make a finished section of the vehicle (e.g. the trailer), that is sufficient. You have an entire, complete section made up of assembled parts. Everything needed to be a trailer is complete. This is not an engine block, a wheel, or a headlight. Similarly, glider kits comprise the largely assembled tractor chassis with front axles, frame, interior and exterior cab, and brakes. This is not a few assembled components; rather, it is an assembled truck with a few components missing. See CAA section 216(9) of the Act, which defines “motor vehicle or engine part manufacturer” as “any person engaged in the manufacturing, assembling or rebuilding of any device, system, part, component or element of design which is installed in or on motor vehicles or motor vehicle engines.” Trailers and glider kits are not “installed in or on” a motor vehicle. A trailer is half of the tractor-trailer, not some component installed on the tractor. And one would more naturally refer to the donor drivetrain being installed on the glider kit than vice versa. See Figure I.1 above. Furthermore, as discussed below, the

trailer and the glider kit are significant for purposes of controlling emissions from the completed vehicle.

Incomplete vehicle standards must, of course, be reasonably designed to control emissions caused by that particular vehicle segment. The standards for trailers would do so and account for the tractor-trailer combination by using a reference tractor in the trailer test procedure (and, conversely, by use of a reference trailer in the tractor test procedure). The Phase 2 rule contains no emission standards for glider kits in isolation, but the standards for glider vehicles necessarily reflect the contribution of the glider kit.

(c) Application of Emission Standards to Manufacturers

In some ways, the critical issue is to whom these emission standards apply. As explained in this section, the emission standards apply to manufacturers of motor vehicles, and manufacturers thus are required to test and to certify compliance to those standards. Moreover, the Act contemplates that a motor vehicle can have multiple manufacturers. With respect to the further question of which manufacturer certifies and tests in multiple manufacturer situations, EPA rules have long contained provisions establishing responsibilities where a vehicle has multiple manufacturers. We are applying those principles in the Phase 2 rules. The overarching principle is that the entity with most control over the particular vehicle segment due to producing it is usually the most appropriate entity to test and certify.⁸⁶ EPA is implementing the trailer and glider vehicle emission standards in accord with this principle, so that the entities required to test and certify are the trailer manufacturer and, for glider kits and glider vehicles, either the manufacturer of the glider kit or glider vehicle, depending on which is more appropriate in individual circumstances.

⁸⁶ See discussion of standards applicable to small SI equipment fuel systems, implemented by standards for the manufacturers of that equipment at 73 FR 59115 (“In most cases, nonroad standards apply to the manufacturer of the engine or the manufacturer of the nonroad equipment. Here, the products subject to the standards (fuel lines and fuel tanks) are typically manufactured by a different manufacturer. In most cases the engine manufacturers do not produce complete fuel systems and therefore are not in a position to do all the testing and certification work necessary to cover the whole range of products that will be used. We are therefore providing an arrangement in which manufacturers of fuel-system components are in most cases subject to the standards and are subject to certification and other compliance requirements associated with the applicable standards”).

(i) Definition of Manufacturer

Emission standards are implemented through regulation of the manufacturer of the new motor vehicle. See, e.g., section 206(a)(1) (certification testing of motor vehicle submitted by “a manufacturer”); 203(a)(1) (manufacturer of new motor vehicle prohibited from introducing uncertified motor vehicles into commerce); 207(a)(1) (manufacturer of motor vehicle to provide warranty to ultimate purchaser of compliance with applicable emission standards); 207(c) (recall authority); 208(a) (recordkeeping and testing can be required of every manufacturer of new motor vehicle).

The Act further distinguishes between manufacturers of motor vehicles and manufacturers of motor vehicle parts. See, e.g., section 206(a)(2) (voluntary emission control system verification testing); 203(a)(3)(B) (prohibition on parts manufacturers and other persons relating to defeat devices); 207(a)(2) (parts manufacturer may provide warranty certification regarding use of parts); 208(a) (recordkeeping and testing requirements for manufacturers of vehicle and engine “parts or components”).

Thus, the question here is whether a trailer manufacturer or glider kit manufacturer can be a manufacturer of a new motor vehicle and thereby become subject to the certification and related requirements for manufacturers, or must necessarily be classified as a manufacturer of a motor vehicle part or component. EPA may reasonably classify trailer manufacturers and glider kit manufacturers as motor vehicle manufacturers.

Section 216(1) defines a “manufacturer” as “any person engaged in the manufacturing or assembling of new motor vehicles, new motor vehicle engines, new nonroad vehicles or new nonroad engines, or importing such vehicles or engines for resale, or who acts for and is under the control of any such person in connection with the distribution of new motor vehicles, new motor vehicle engines, new nonroad vehicles or new nonroad engines, but shall not include any dealer with respect to new motor vehicles, new motor vehicle engines, new nonroad vehicles or new nonroad engines received by him in commerce.”

It appears plain that this definition was not intended to restrict the definition of “manufacturer” to a single person per vehicle. The use of the conjunctive, specifying that a manufacturer is “any person engaged in the manufacturing or assembling of new motor vehicles . . . or who acts for and is under the control of any such person

⁸⁵ Cf. *Marine Shale Processors v. EPA*, 81 F. 3d 1371, 1383 (5th Cir. 1996) (“[w]e make no comment on this argument: This is simply not a thimbleful case”).

. . .” (emphasis added) indicates that Congress anticipated that motor vehicles could have more than one manufacturer, since in at least some cases those will plainly be different people. The capacious reference to “any person engaged in the manufacturing of motor vehicles” likewise allows the natural inference that it could apply to multiple entities engaged in manufacturing.⁸⁷

The provision also applies both to entities that manufacture and entities that assemble, and does so in such a way as to encompass multiple parties: Manufacturers “or” (rather than “and”) assemblers are included. Nor is there any obvious reason that only one person can be engaged in vehicle manufacture or vehicle assembling.

Reading the Act to provide for multiple motor vehicle manufacturers reasonably reflects industry realities, and achieves important goals of the CAA. Since title II requirements are generally imposed on “manufacturers” it is important that the appropriate parties be included within the definition of manufacturer—“any person engaged in the manufacturing or assembling of new motor vehicles.” Indeed, as set out in Chapter 1 of the RIA, most heavy duty vehicles are manufactured or assembled by multiple entities; see also Comments of Daimler (October 1, 2015) p. 103.⁸⁸ One entity produces a chassis; a different entity manufactures the engine; specialized components (*e.g.* garbage compactors, cement mixers) are produced by still different entities. For tractor-trailers, one person manufactures the tractor, another the trailer, a third the engine, and another typically assembles the trailer to the tractor. Installation of various vehicle components occurs at different and varied points and by different entities, depending on ultimate desired configurations. See, *e.g.* Comments of Navistar (October 1, 2015), pp. 12–13. The heavy duty sector thus differs markedly from the light duty sector (and from manufacturing of light duty pickups and vans), where a single company designs the vehicle and engine (and many of the parts), and does all

assembling of components into the finished motor vehicle.

(ii) Controls on Manufacturers of Trailers

It is reasonable to view the trailer manufacturer as “engaged in” (section 216(1)) the manufacturing or assembling of the tractor-trailer. The trailer manufacturer designs, builds, and assembles a complete and finished portion of the tractor-trailer. All components of the trailer—the tires, axles, flat bed, outsider cover, aerodynamics—are within its control and are part of its assembling process. The trailer manufacturer sets the design specifications that affect the GHG emissions attributable to pulling the trailer. It commences all work on the trailer, and when that work is complete, nothing more is to be done. The trailer is a finished product. With respect to the trailer, the trailer manufacturer is analogous to the manufacturer of the light duty vehicle, specifying, controlling, and assembling all aspects of the product from inception to completion. GHG emissions attributable to the trailer are a substantial portion of the total GHG emissions from the tractor-trailer.⁸⁹ Moreover, the trailer manufacturer is not analogous to the manufacturer of a vehicle part or component, like a tire manufacturer, or to the manufacturer of a side skirt. The trailer is a significant, integral part of the finished motor vehicle, and is essential for the tractor-trailer to carry out its commercial purpose. See 80 FR 40170. Although it is true that another person may ultimately hitch the trailer to a tractor (which might be viewed as completing assembly of the tractor-trailer), as noted above, EPA does not believe that the fact that one person might qualify as a manufacturer, due to “assembling” the motor vehicle, precludes another person from qualifying as a manufacturer, due to “manufacturing” the motor vehicle. Given that section 216(1) does not restrict motor vehicle manufacturers to a single entity, it appears to be consistent with the facts and the Act to consider trailer manufacturers as persons engaged in the manufacture of a motor vehicle.

This interpretation of section 216(1) is also reasonable in light of the various provisions noted above relating to implementation of the emissions standards—certification under section 206, prohibitions on entry into

commerce under section 203, warranty and recall under section 207, and recordkeeping/reporting under section 208. All of these provisions are naturally applied to the entity responsible for manufacturing the trailer, which manufacturer is likewise responsible for its GHG emissions.

TTMA maintains that if a tractor-trailer is a motor vehicle, then only the entity connecting the trailer to the tractor could be subject to regulation.⁹⁰ This is not a necessary interpretation of section 216(1), as explained above. TTMA does not discuss that provision, but notes that other provisions refer to “a” manufacturer (or, in one instance, “the” manufacturer), and maintains that this shows that only a single entity can be a manufacturer. See TTMA Comment pp. 4–5, citing to sections 206(a)(1), 206(b), 207, and 203(a). This reading is not compelled by the statutory text. First, the term “manufacturer” in all of these provisions necessarily reflects the underlying definition in section 216(1), and therefore is not limited to a single entity, as just discussed. Second, the interpretation makes no practical sense. An end assembler of a tractor-trailer is not in a position to certify and warrant performance of the trailer, given that the end-assembler has no control over how trailers are designed, constructed, or even which trailers are attached to the tractor. It makes little sense for the entity least able to control the outcome to be responsible for that outcome. The EPA doubts that Congress compelled such an ungainly implementation mechanism, especially given that it is well known that vehicle manufacture responsibility in the heavy duty vehicle sector is divided, and given further that title II includes requirements for EPA to promulgate emission standards for portions of vehicles.

(iii) Controls on Manufacturers of Glider Kits

Application of these same principles indicate that a glider kit manufacturer is a manufacturer of a motor vehicle and, as an entity responsible for assuring that glider vehicles meet the Phase 2 vehicle emission standards, can be a party in the certification process as either the certificate holder or the entity which provides essential test information to the glider vehicle manufacturer. As noted above, glider kits include the entire tractor chassis, cab, tires, body, and brakes. Glider kit manufacturers thus control critical elements of the

⁸⁷ See *United States v. Gonzales*, 520 U.S. 1, 5, (1997) (“Read naturally the word ‘any’ has an expansive meaning, that is, ‘one or some indiscriminately of whatever kind’; *New York v. EPA*, 443 F.3d 880, 884–87 (D.C. Cir. 2006).”).

⁸⁸ “The EPA should understand that vehicle manufacturing is a multi-stage process (regardless of the technologies on the vehicles) and that each stage of manufacturer has the incentive to properly complete manufacturing . . . [T]he EPA should continue the longstanding industry practice of allowing primary manufacturers to pass incomplete vehicles with incomplete vehicle documents to secondary manufacturers who complete the installation.”

⁸⁹ The relative contribution of trailer controls depends on the types of tractors and trailers, as well as the tier of standards applicable; however, it can be approximately one-third of the total reduction achievable for the tractor-trailer.

⁹⁰ Consequently, the essential issue here is not whether EPA can issue and implement emission standards for trailers, but at what point in the implementation process those standards apply.

ultimate vehicle's greenhouse gas emissions, in particular, all aerodynamic features and all emissions related to steer tire type. Glider kit manufacturers would therefore be the entity generating critical GEM inputs—at the least, those for aerodynamics and tires. Glider kit manufacturers also often know the final configuration of the glider vehicle, *i.e.* the type of engine and transmission which the final assembler will add to the glider kit.⁹¹ This is because the typical glider kit contains all necessary wiring, and it is necessary, in turn, for the glider kit manufacturer to know the end configuration in order to wire the kit properly. Thus, a manufacturer of a glider kit can reasonably be viewed as a manufacturer of a motor vehicle under the same logic as above: There can be multiple manufacturers of a motor vehicle; the glider kit manufacturer designs, builds, and assembles a substantial, complete and finished portion of the motor vehicle; and that portion contributes substantially to the GHG emissions from the ultimate glider vehicle. A glider kit is not a vehicle part; rather, it is an assembled truck with a few components missing.

EPA rules have long provided provisions establishing responsibilities where there are multiple manufacturers of motor vehicles. See 40 CFR 1037.620 (responsibilities for multiple manufacturers), 40 CFR 1037.621 (delegated assembly), and 40 CFR 1037.622 (shipment of incomplete vehicles to secondary vehicle manufacturers). These provisions, in essence, allow manufacturers to determine among themselves as to which should be the certificate holder, and then assign respective responsibilities depending on that decision. The end result is that incomplete vehicles cannot be introduced into commerce without one of the manufacturers being the certificate holder.

Under the Phase 1 rules, glider kits are considered to be incomplete vehicles which may be introduced into commerce to a secondary manufacturer for final assembly. See 40 CFR

1037.622(b)(1)(i) and 1037.801 (definition of “vehicle” and “incomplete vehicle”) of the Phase 1 regulations (76 FR 57421). Note that 40 CFR 1037.622(b)(1)(i) was originally codified as 40 CFR 1037.620(b)(1)(i). EPA is expanding somewhat on these provisions, but in essence, as under Phase 1, glider kit and glider vehicle manufacturers could operate under delegated assembly provisions whereby the glider kit manufacturer would be the certificate holder. See 40 CFR 1037.621 of the final regulations. Glider kit manufacturers would also continue to be able to ship uncertified kits to secondary manufacturers, and the secondary manufacturer must assemble the vehicle into certifiable condition. 40 CFR 1037.622.⁹²

(d) Additional Authorities Supporting EPA's Actions

Even if, against our view, trailers and glider kits are not considered to be “motor vehicles,” and the entities engaged in assembling trailers and glider kits are not considered to be manufacturers of motor vehicles, the Clean Air Act still provides authority for the testing requirements adopted here. Section 208 (a) of the Act authorizes EPA to require “every manufacturer of new motor vehicle or engine parts or components” to “perform tests where such testing is not otherwise reasonably available.” This testing can be required to “provide information the Administrator may reasonably require to determine whether the manufacturer . . . has acted or is acting in compliance with this part,” which includes showing whether or not the parts manufacturer is engaged in conduct which can cause a prohibited act. Testing would be required to show that the trailer will conform to the vehicle emission standards. In addition, testing for trailer manufacturers would be necessary here to show that the trailer manufacturer is not causing a violation of the combined tractor-trailer GHG emission standard either by manufacturing a trailer which fails to comply with the trailer emission standards, or by furnishing a trailer to the entity assembling tractor-trailers inconsistent with tractor-trailer certified condition. Testing for glider kit manufacturers is necessary to prevent a glider kit manufacturer furnishing a glider kit inconsistent with the tractor's certified condition. In this regard, we note that section 203 (a)(1) of the Act

not only prohibits certain acts, but also prohibits “the causing” of those acts. Furnishing a trailer not meeting the trailer standard would cause a violation of that standard, and the trailer manufacturer would be liable under section 203 (a)(1) for causing the prohibited act to occur. Similarly, a glider kit supplied in a condition inconsistent with the tractor standard would cause the manufacturer of the glider vehicle to violate the GHG emission standard, so the glider kit manufacturer would be similarly liable under section 203 (a)(1) for causing that prohibited act to occur.

In addition, section 203 (a)(3)(B) prohibits use of “defeat devices”—which include “any part or component intended for use with, or as part of, any motor vehicle . . . where a principal effect of the part or component is to . . . defeat . . . any . . . element of design installed . . . in a motor vehicle” otherwise in compliance with emission standards. Manufacturing or installing a trailer not meeting the trailer emission standard could thus be a defeat device causing a violation of the emission standard. Similarly, a glider kit manufacturer furnishing a glider kit in a configuration that would not meet the tractor standard when the specified engine, transmission, and axle are installed would likewise cause a violation of the tractor emission standard. For example, providing a tractor with a coefficient of drag or tire rolling resistance level inconsistent with tractor certified condition would be a violation of the Act because it would cause the glider vehicle assembler to introduce into commerce a new tractor that is not covered by a *valid* certificate of conformity. Daimler argued in its comments that a glider kit would not be a defeat device because glider vehicles use older engines which are more fuel efficient since they are not meeting the more rigorous standards for criteria pollutant emissions. (Daimler Truck Comment, April 1, 2016, p. 5). However, the glider kit would be a defeat device with respect to the tractor *vehicle* standard, not the separate engine standard. A non-conforming glider kit would adversely affect compliance with the vehicle standard, as just explained. Furthermore, as explained in RTC Section 14.2, Daimler is incorrect that glider vehicles are more fuel efficient than Phase 1 2017 and later vehicles, much less Phase 2 vehicles.

In the memorandum accompanying the Notice of Data Availability, EPA solicited comment on adopting additional regulations based on these principles. EPA has decided not to adopt those provisions, but again notes

⁹¹ PACCAR indicated in its comments that manufacturers of glider kits may not know all details of final assembly. Provisions on delegated assembly, shipment of incomplete vehicles to secondary manufacturers, and assembly instructions for secondary vehicle manufacturers allow manufacturers of glider kits and glider vehicles to apportion responsibilities, as appropriate, including responsibility as to which entity shall be the certificate holder. See 40 CFR 1037.130, 1037.621, and 1037.622. Our point here is that both of these entities are manufacturers of the glider motor vehicle and therefore that both are within the Act's requirements for certification and testing.

⁹² Under this provision in the Phase 2 regulations, the glider kit manufacturer would still have some responsibility to ensure that products they introduce into U.S. commerce will conform with the regulations when delivered to the ultimate purchasers.

that the authorities in CAA sections 208 and 203 support the actions EPA is taking here with respect to trailer and glider kit testing.

(e) Standards for Glider Vehicles and Lead Time for Those Standards

At proposal, EPA indicated that engines used in glider vehicles are to be certified to standards for the model year in which these vehicles are assembled. 80 FR 40528. This action is well within the agency's legal authority. As noted above, the Act's definition of "new motor vehicle engine," includes any "engine in a new motor vehicle" without regard to whether or not the engine was previously used. Given the Act's purpose of controlling emissions of air pollutants from motor vehicle engines, with special concern for pollutant emissions from heavy-duty engines (see, e.g., section 202(a)(3)(A) and (B)), it is reasonable to require engines placed in newly-assembled vehicles to meet the same standards as all other engines in new motor vehicles. Put another way, it is both consistent with the plain language of the Act and reasonable and equitable for the engines in "new trucks" (see Section I.E.(1)(a) above) to meet the emission standards for all other engines installed in new trucks.

Daimler challenged this aspect of EPA's proposal, maintaining that it amounted to regulation of vehicle rebuilding, which (according to the commenter) is beyond EPA's authority. Comments of Daimler, p. 123; Comments of Daimler Trucks (April 1, 2016) p. 3. This comment is misplaced. The EPA has authority to regulate emissions of pollutants from engines installed in new motor vehicles. As explained in subsection (a) above, glider vehicles are new motor vehicles. As also explained above, the Act's definition of "new motor vehicle engine" includes any "engine in a new motor vehicle" without regard to whether or not the engine was previously used. CAA section 216(3). Consequently, a previously used engine installed in a glider vehicle is within EPA's multiple authorities. See CAA sections 202(a)(1) (GHGs), 202(a)(3)(A) and (B)(ii) (hydrocarbon, CO, PM and NO_x from heavy-duty vehicles or engines), and 202(a)(3)(D) (pollutants from rebuilt heavy duty engines).⁹³

As explained in more detail in Section XIII.B, the final rule requires that as of January 1, 2017, glider kit and glider vehicle production involving engines not meeting criteria pollutant standards corresponding to the year of glider vehicle assembly be allowed at the highest annual production for any year from 2010 to 2014. See section 1037.150(t)(3). (Certain exceptions to this are explained in Section XIII.B.) The rule further requires that as of January 1, 2018, engines in glider vehicles meet criteria pollutant standards and GHG standards corresponding to the year of the glider vehicle assembly, but allowing certain small businesses to introduce into commerce vehicles with engines meeting criteria pollutant standards corresponding to the year of the engine for up to 300 vehicles per year, or up to the highest annual production volume for calendar years 2010 to 2014, whichever is less. Section 1037.150(t)(1)(ii) (again subject to various exceptions explained in Section XIII.B). Glider vehicles using these exempted engines will not be subject to the Phase 1 GHG vehicle standards, but will be subject to the Phase 2 vehicle standards beginning with MY 2021. As explained in Section XIII.B, there are compelling environmental reasons for taking these actions in this time frame.

With regard to the issue of lead time, EPA indicated at proposal that the agency has long since justified the criteria pollutant standards for engines installed in glider kits. 80 FR 40528. EPA further proposed that engines installed in glider vehicles meet the emission standard for the year of glider vehicle assembly, as of January 1, 2018 and solicited comment on an earlier effective date. Id. at 40529. The agency noted that CAA section 202(a)(3)(D)⁹⁴ requires that standards for rebuilt heavy-duty engines take effect "after a period . . . necessary to permit the development and application of the requisite control measures." Here, no time is needed to develop and apply requisite control measures for criteria pollutants because compliant engines are immediately available. In fact, manufacturers of compliant engines, and dealers of trucks containing those compliant engines, commented that they are disadvantaged by manufacturing more costly compliant

engines while glider vehicles avoid using those engines. Not only are compliant engines immediately available, but (as commenters warned) there can be risk of massive pre-buys. Moreover, EPA does not envision that glider manufacturers will actually modify the older engines to meet the applicable standards. Rather, they will either choose from the many compliant engines available today, or they will seek to qualify under other flexibilities provided in the final rule. See Section XIII.B. Given that compliant engines are immediately available, the flexibilities provided in the final rule for continued use of donor engines for traditional glider vehicle functions and by small businesses, and the need to expeditiously prevent further perpetuation of use of heavily polluting engines, EPA sees a need to begin constraining this practice on January 1, 2017. However, the final rule is merely capping glider production using higher-polluting engines in 2017 at 2010–2014 production levels, which would allow for the production of thousands of glider vehicles using these higher polluting engines, and unlimited production of glider vehicles using less polluting engines.

Various commenters, however, argued that the EPA must provide four years lead-time and three-year stability pursuant to section 202(a)(3)(C) of the Act, which applies to regulations for criteria pollutant emissions from heavy duty vehicles or engines. For criteria pollutant standards, CAA section 202(a)(3)(C) establishes lead time and stability requirements for "[a]ny standard promulgated or revised under this paragraph and applicable to classes or categories of heavy duty vehicles or engines." In this rule, EPA is generally requiring large manufacturers of glider vehicles to use engines that meet the standards for the model year in which a vehicle is manufactured. EPA is not promulgating new criteria pollutant standards. The NO_x and PM standards that apply to heavy duty engines were promulgated in 2001.

We are not amending these provisions or promulgating new criteria pollutant standards for heavy duty engines here. EPA interprets the phrase "classes or categories of heavy duty vehicles or engines" in CAA section 202(a)(3)(C) to refer to categories of vehicles established according to features such as their weight, functional type, (e.g. tractor, vocational vehicle, or pickup truck) or engine cycle (spark-ignition or compression-ignition), or weight class of the vehicle into which an engine is installed (LHD, MHD, or HHD). EPA has established several different categories

⁹³ Comments from, e.g. Mondial and MEMA made clear that all of the donor engines installed in glider vehicles are rebuilt. See also <http://www.truckinginfo.com/article/story/2013/04/the-return-of-the-glider.aspx> ("1999 to 2002-model diesels were known for reliability, longevity and good fuel mileage. Fitzgerald favors Detroit's 12.7-liter Series 60 from that era, but also installs pre-EGR 14-liter

Cummins and 15-liter Caterpillar diesels. All are rebuilt. . . .").

⁹⁴ The engine rebuilding authority of section 202(a)(3)(D) includes removal of an engine from the donor vehicle. See 40 CFR 86.004–40 and 62 FR 54702 (Oct. 21, 1997). EPA interprets this language as including installation of the removed engine into a glider kit, thereby assembling a glider vehicle.

of heavy duty vehicles (distinguished by gross vehicle weight, engine-cycle, and other criteria related to the vehicles' intended purpose) and is establishing in this rule GHG standards applicable to each category.⁹⁵ By contrast, a "glider vehicle" is defined not by its weight or function but by its method of manufacture. A Class 8 tractor glider vehicle serves exactly the same function and market as a Class 8 tractor manufactured by another manufacturer. Similarly, rebuilt engines installed in glider vehicles (*i.e.* donor engines) are not distinguished by engine cycle, but rather serve the same function and market as any other HHD or MHD engine. Thus, EPA considers "glider vehicles" to be a description of a method of manufacturing new motor vehicles, not a description of a separate "class or category" of heavy duty vehicles or engines. Consequently, EPA is not adopting new standards for a class or category of heavy duty engines within the meaning of section 202(a)(3)(C) of the Act.

EPA believes this approach is most consistent with the statutory language and the goals of the Clean Air Act. The date of promulgation of the criteria pollutant standards was 2001. There has been plenty of lead time for the criteria pollutant standards and as a result, manufacturers of glider vehicles have many options for compliant engines that are available on the market today—just as manufacturers of other new heavy-duty vehicles do. We are even providing additional compliance flexibilities to glider manufacturers in recognition of the historic practice of salvaging a small number of engines from vehicles involved in crashes. See Section XIII.B. We do not believe that Congress intended to allow changes in how motor vehicles are manufactured to be a means of avoiding existing, applicable engine standards. Obviously, any industry attempts to avoid or circumvent standards will not become apparent until the standards begin to apply. The commenters' interpretation would effectively preclude EPA from curbing many types of avoidance, however dangerous, until at least four years from detection.

As to Daimler's further argument that the lead time provisions in section 202(3)(C) not only apply but also must trump those specifically applicable to heavy duty engine rebuilding, the usual rule of construction is that the more specific provision controls. See, *e.g.* *HCSC-Laundry v. U.S.*, 450 U.S.1, 6

(1981). Daimler's further argument that section 202(a)(3)(C) lead time provisions also apply to engine rebuilding because those provisions fall within the same paragraph would render the separate lead time provisions for engine rebuilding a virtual nullity. The sense of the provision is that Congress intended there to be independent lead time consideration for the distinct practice of engine rebuilding. In any case, as just explained, it is EPA's view that section 202(a)(3)(C) does not apply here.

(2) NHTSA Authority

The Energy Policy and Conservation Act (EPCA) of 1975 mandates a regulatory program for motor vehicle fuel economy to meet the various facets of the need to conserve energy. In December 2007, Congress enacted the Energy Independence and Security Act (EISA), amending EPCA to require, among other things, the creation of a medium- and heavy-duty fuel efficiency program for the first time.

Statutory authority for the fuel consumption standards in this final rule is found in EISA section 103, 49 U.S.C. 32902(k). This section authorizes a fuel efficiency improvement program, designed to achieve the maximum feasible improvement to be created for commercial medium- and heavy-duty on-highway vehicles and work trucks, to include appropriate test methods, measurement metrics, standards, and compliance and enforcement protocols that are appropriate, cost-effective and technologically feasible.

NHTSA has responsibility for fuel economy and consumption standards, and assures compliance with EISA through rulemaking, including standard-setting; technical reviews, audits and studies; investigations; and enforcement of implementing regulations including penalty actions. This rule continues to fulfill the requirements of section 103 of EISA, which instructs NHTSA to create a fuel efficiency improvement program for "commercial medium- and heavy-duty on-highway vehicles and work trucks" by rulemaking, which is to include standards, test methods, measurement metrics, and enforcement protocols. See 49 U.S.C. 32902(k)(2).

Congress directed that the standards, test methods, measurement metrics, and compliance and enforcement protocols be "appropriate, cost-effective, and technologically feasible" for the vehicles to be regulated, while achieving the "maximum feasible improvement" in fuel efficiency. NHTSA has broad discretion to balance the statutory factors in section 103 in developing fuel consumption standards

to achieve the maximum feasible improvement.

As discussed in the Phase 1 final rule, NHTSA has determined that the five year statutory limit on average fuel economy standards that applies to passengers and light trucks is not applicable to the HD vehicle and engine standards. As a result, the Phase 1 HD engine and vehicle standards remain in effect indefinitely at their 2018 or 2019 MY levels until amended by a future rulemaking action. As was contemplated in that rule, NHTSA is finalizing a Phase 2 rulemaking action. Therefore, the Phase 1 standards will not remain in effect at their 2018 or 2019 MY levels indefinitely; they will remain in effect until the MY Phase 2 standards begin. In accordance with section 103 of EISA, NHTSA will ensure that not less than four full MYs of regulatory lead-time and three full MYs of regulatory stability are provided for in the Phase 2 standards.

With respect to the proposal, many stakeholders opined in their comments as to NHTSA's legal authority to issue the Phase 2 medium- and heavy-duty standards (Phase 2 standards), in whole or in part. NHTSA addresses these comments in the following discussion.

Allison Transmission, Inc. (Allison) questioned NHTSA's authority to issue the Phase 2 Standards. Allison stated that the Energy Independence and Security Act of 2007 (EISA)⁹⁶ directs NHTSA to undertake "a rulemaking proceeding," (emphasis added) predicated on a study by the National Academy of Sciences (NAS). Allison and the Truck Trailer Manufacturers Association (TTMA) asserted that because NAS has published a study on medium- and heavy duty vehicles and NHTSA promulgated the Phase 1 medium- and heavy-duty vehicle standards (Phase 1 standards), NAS and NHTSA have fulfilled their statutory duties under EISA. Thus, Allison stated, NHTSA has no authority to issue standards beyond the Phase 1 standards.

NHTSA maintains that EISA allows the agency to promulgate medium- and heavy duty fuel efficiency standards beyond the Phase 1 standards. EISA states that NHTSA:⁹⁷

by regulation, shall determine in a rulemaking proceeding how to implement a commercial medium- and heavy-duty on-highway vehicle and work truck fuel

⁹⁶ Public Law 110–140, 121 Stat. 1492. (December 19, 2007).

⁹⁷ By delegation at 49 CFR 1.95(a). For purposes of this NPRM, grants of authority from EISA to the Secretary of Transportation regarding fuel efficiency will be referred to as grants of authority to NHTSA, as NHTSA has been delegated the authority to implement these programs.

⁹⁵ Note, however, the Phase 2 GHG standards for tractors and vocational vehicles do not apply until MY 2021.

efficiency program designed to achieve the maximum feasible improvement, and shall adopt and implement appropriate test methods, measurement metrics, fuel economy standards, and compliance and enforcement protocols . . . for commercial medium- and heavy-duty on-highway vehicles and work trucks.⁹⁸

Allison equates the process by which Congress specified NHTSA promulgate standards—a rulemaking proceeding—to mean a limitation or constraint on NHTSA’s ability to create, amend, or update the medium- and heavy duty fuel efficiency program. NHTSA believes the charge in 49 U.S.C. 32902(k)(2) discusses “a rulemaking proceeding” only insofar as the statute specifies the process by which NHTSA would create a medium- and heavy-duty on-highway vehicle and work truck fuel efficiency improvement program and its associated standards.

Allison and TTMA commented that EISA only refers to an initial NAS study, meaning EISA only specified that NHTSA issue one set of standards based on that study. As NHTSA stated in the NPRM, EISA requires NAS to issue updates to the initial report every five years through 2025.⁹⁹ With that in mind, NAS issued an interim version of its first update to inform the Phase 2 NPRM. EISA’s requirement that NAS update its initial report, which examines existing and potential fuel efficiency technologies that can practically be integrated into medium- and heavy-duty vehicles, is consistent with the conclusion that EISA intended the medium- and heavy-duty standards to function as part of an ongoing program¹⁰⁰ and not a single rulemaking.

Allison also noted that the language in EISA discussing lead time and stability refers to a single medium- and heavy-duty on-highway vehicle and work truck fuel economy standard.¹⁰¹ NHTSA believes the language highlighted by Allison serves the purpose of noting that each medium- and heavy-duty segment standard included in its program shall have the requisite amount of lead-time and stability. As discussed in 49 U.S.C.

32902(k)(2), “[t]he Secretary may prescribe separate standards for different classes of vehicles . . .” Since NHTSA has elected to set standards for particular classes of vehicles, this language ensures each particular standard shall have the appropriate lead-time and stability required by EISA.

TTMA asserted that NHTSA has no more than 24 months from the completion of the NAS study to issue regulations related to the medium- and heavy-duty program and therefore regulations issued after 2013 “lack congressional authorization.” This argument significantly misinterprets the Congressional purpose of this provision. Section 32902(k)(2) requires that, 24 months after the completion of the NAS study, NHTSA begin implementing through a rulemaking proceeding a commercial medium- and heavy-duty on-highway vehicle and work truck fuel efficiency improvement *program*. Congress therefore authorized NHTSA to implement through rulemaking a “program,” which the dictionary defines as “a plan of things that are done in order to achieve a specific result.”¹⁰² Contrary to TTMA’s assertion, Congress did not limit NHTSA to the establishment of one set of regulations, nor did it in any way limit NHTSA’s ability to update and revise this program. The purpose of the 24 month period was simply to ensure that NHTSA exercised this authority expeditiously after the NAS study, which NHTSA accomplished by implementing the first phase of its fuel efficiency program in 2011.¹⁰³ Today’s rulemaking merely continues this program and clearly comports with the statutory language in 49 U.S.C. 32902(k). Further, the specific result sought by Congress in establishing the medium- and heavy-duty fuel efficiency program was a program focused on continuing fuel efficiency improvements. Specifically, Congress emphasized that the fuel efficiency program created by NHTSA be “designed to achieve the maximum feasible improvement,” allowing NHTSA to ensure the regulations implemented throughout the program encourage regulated entities to achieve the maximum feasible improvements. Congress did not limit, restrict, or otherwise suggest that the phrase “designed to achieve the maximum feasible improvement” be confined to the issuance of one set of standards.

NHTSA actions are, therefore, clearly consistent with the authority conferred upon it in 49 U.S.C. 32902(k).

POP Diesel stated that the word “fuel” has not been defined by Congress, and therefore NHTSA should use its authority to define the term “fuel” as “fossil fuel,” allowing the agencies to assess fuel efficiency based on the carbon content of the fuels used in an engine or vehicle. Congress has already defined the term “fuel” in 49 U.S.C. 32901(a)(10) as gasoline, diesel oil, or other liquid or gaseous fuel that the Secretary decides to include. As Congress has already spoken to the definition of fuel, it would be inappropriate for the agency to redefine “fuel” as “fossil fuel.”

Additionally, POP Diesel asserted that NHTSA’s metric for measuring fuel efficiency is contrary to the mandate in EISA. Specifically, POP Diesel stated that many dictionaries define “efficiency” as a ratio of work performed to the amount of energy used, and NHTSA’s load specific fuel consumption metric runs afoul of the plain meaning of statute the Phase 2 program implements. POP Diesel noted that Congressional debate surrounding what is now codified at 49 U.S.C. 32902(k)(2) included a discussion that envisioned NHTSA and EPA having separate regulations, despite having overlapping jurisdiction.

NHTSA continues to believe its use of load specific fuel consumption is an appropriate metric for assessing fuel efficiency as mandated by Congress. 49 U.S.C. 32902(k)(2) states, as POP Diesel noted, that NHTSA shall develop a medium- and heavy-duty fuel efficiency program. The section further states that NHTSA “. . . shall adopt and implement appropriate test methods [and] measurement metrics . . . for commercial medium- and heavy-duty on-highway vehicles and work trucks.” In the Phase 1 rulemaking, NHTSA, aided by the National Academies of Sciences (NAS) report, assessed potential metrics for evaluating fuel efficiency. NHTSA found that fuel economy would not be an appropriate metric for medium- and heavy-duty vehicles. Instead, NHTSA chose a metric that considers the amount of fuel consumed when moving a ton of freight (*i.e.*, performing work).¹⁰⁴ This metric, delegated by Congress to NHTSA to formulate, is not precluded by the text of the statute. It is a reasonable way by which to measure fuel efficiency for a program designed to reduce fuel consumption.

⁹⁸ Public Law 110–140, 121 Stat. 1492, Section 108. Codified at 49 U.S.C. 32902(k)(2).

⁹⁹ 80 FR 40512 (July 13, 2015).

¹⁰⁰ “. . . the Secretary . . . shall determine in a rulemaking proceeding how to implement a commercial medium- and heavy-duty on-highway vehicle and work truck fuel efficiency program designed to achieve the maximum feasible improvement . . .” 49 U.S.C. 42902(k)(2).

¹⁰¹ 49 U.S.C. 32902(k)(3) states that, “The commercial medium- and heavy-duty on-highway vehicle and work truck fuel economy standard adopted pursuant to this subsection shall provide not less than—(A) 4 full model years of regulatory lead-time; and (B) 3 full model years of regulatory stability.”

¹⁰² “Program.” Merriam-Webster (2016 <http://www.merriam-webster.com/dictionary/program> (last accessed July 19, 2016).

¹⁰⁴ See: 75 FR 74180 (November 30, 2010).

(a) NHTSA's Authority To Regulate Trailers

As contemplated in the Phase 1 proposed and final rules, the agencies proposed standards for trailers in the Phase 2 rulemaking. Because Phase 1 did not include standards for trailers, NHTSA did not discuss its authority for regulating them in the proposed or final rules; that authority is described here.

NHTSA is finalizing fuel efficiency standards applicable to heavy-duty trailers as part of the Phase 2 program. NHTSA received several comments on the proposal relating to the agency's statutory authority to issue standards for trailers as part of the Phase 2 program. In particular, TTMA commented that NHTSA does not have the authority to regulate trailers as part of the medium- and heavy-duty standards. TTMA took issue with NHTSA's use of the National Traffic and Motor Vehicle Safety Act as an aid in defining an undefined term in EISA. Additionally, TTMA stated that EISA's use of GVWR instead of gross combination weight rating (GCWR) to define the vehicles subject to these regulations was intended to exclude trailers from the regulation.

As stated in the proposal, EISA directs NHTSA to "determine in a rulemaking proceeding how to implement a commercial medium- and heavy-duty on-highway vehicle and work truck fuel efficiency improvement program designed to achieve the maximum feasible improvement" ¹⁰⁵ EISA defines a commercial medium- and heavy-duty on-highway vehicle to mean "an on-highway vehicle with a GVWR of 10,000 lbs or more." A "work truck" is defined as a vehicle between 8,500 and 10,000 lbs GVWR that is not an MDPV. These definitions do not explicitly exclude trailers, in contrast to MDPVs. Because Congress did not act to exclude trailers when defining these terms by GVWRs, despite demonstrating the ability to exclude MDPVs, it is reasonable to interpret the provision to include them.

Both the tractor and the trailer are vehicles subject to regulation by NHTSA in the Phase 2 program. Although EISA does not define the term "vehicle," NHTSA's authority to regulate motor vehicles under its organic statute, the Motor Vehicle Safety Act ("Safety Act"), does. The Safety Act defines a motor vehicle as "a vehicle driven or drawn by mechanical power and manufactured primarily for use on public streets, roads, and highways. . . ." ¹⁰⁶ NHTSA clearly has authority to regulate trailers

under this Act as they are vehicles that are drawn by mechanical power—in this instance, a tractor engine—and NHTSA has exercised that authority numerous times. ¹⁰⁷ Given the absence of any apparent contrary intent on the part of Congress in EISA, NHTSA believes it is reasonable to interpret the term "vehicle" as used in the EISA definitions to have a similar meaning that includes trailers.

Additionally, it is worth noting that the dictionary definition of "vehicle" is "a machine used to transport goods or persons from one location to another." ¹⁰⁸ A trailer is a machine designed for the purpose of transporting goods. With these foregoing considerations in mind, NHTSA interprets its authority to regulate commercial medium- and heavy-duty on-highway vehicles, including trailers.

TTMA pointed to language in the Phase 1 NPRM where the agencies stated that GCWR included the weight of a loaded trailer and the vehicle itself. TTMA interprets this language to mean that standards applicable to vehicles defined by GVWR must inherently exclude trailers. The language TTMA cited is a clarification from a footnote in an introductory section describing the heavy-duty trucking industry. This statement was not a statement of NHTSA's legal authority over medium- and heavy-duty vehicles. NHTSA continues to believe a trailer is a vehicle under EISA if its GVWR fits within the definitions in 49 U.S.C. 32901(a), and is therefore subject to NHTSA's applicable fuel efficiency regulations.

Finally, in a comment on the Notice of Data Availability, TTMA stated that because NHTSA's statutory authority instructs the agency to develop a fuel efficiency program for medium- and heavy-duty on-highway vehicles, and trailers themselves do not consume fuel, trailers cannot be regulated for fuel efficiency. The agency disagrees with this assertion. A tractor-trailer is designed for the purpose of holding and transporting goods. While heavy-duty trailers themselves do not consume fuel, they are immobile and inoperative without a tractor providing motive power. Inherently, trailers are designed to be pulled by a tractor, which in turn affects the fuel efficiency of the tractor-trailer as a whole. As previously

discussed, both a tractor and trailer are motor vehicles under NHTSA's authority. Therefore it is reasonable to consider all of a tractor-trailer's parts—the engine, the cab-chassis, and the trailer—as parts of a whole. As such they are all parts of a vehicle, and are captured within the scope of NHTSA's statutory authority. As EPA describes above, the tractor and trailer are both incomplete without the other. Neither can fulfill the function of the vehicle without the other. For this reason, and the other reasons stated above, NHTSA interprets its authority to regulate commercial medium- and heavy-duty on-highway vehicles, including tractor-trailers, as encompassing both tractors and trailers.

(b) NHTSA's Authority To Regulate Recreational Vehicles

NHTSA did not regulate recreational vehicles as part of the Phase 1 medium- and heavy-duty fuel efficiency standards, although EPA did regulate them as vocational vehicles for GHG emissions. In the Phase 1 NPRM, NHTSA interpreted "commercial medium- and heavy duty on-road vehicle" to mean that recreational vehicles, such as motor homes, were not to be included within the program because recreational vehicles are not commercial. Following comments to the Phase 1 proposal, NHTSA reevaluated its statutory authority and proposed that recreational vehicles be included in the Phase 2 standards, and that early compliance be allowed for manufacturers who want to certify during the Phase 1 period.

The Recreational Vehicle Industry Association (RVIA) and Newell Coach Corporation (Newell) asserted that NHTSA does not have the authority to regulate recreational vehicles (RVs). RVIA and Newell stated that NHTSA's authority under EISA is limited to commercial medium- and heavy-duty vehicles and that RVs are not commercial. RVIA pointed to the fact that EISA gives NHTSA fuel efficiency authority over "commercial medium- and heavy-duty vehicles" and "work trucks," the latter of which is not prefaced with the word "commercial." Because of this difference, RVIA argued that NHTSA is ignoring a limitation on its authority—that is, that NHTSA only has authority over medium- and heavy-duty vehicles that are commercial in nature. RVIA stated that RVs are not used for commercial purposes, and are therefore not subject to Phase 2.

NHTSA's authority to regulate medium- and heavy-duty vehicles under EISA extends to "commercial medium- and heavy-duty on-highway vehicles"

¹⁰⁵ 49 U.S.C. 42902(k)(2).

¹⁰⁶ 49 U.S.C. 30102(a)(6).

¹⁰⁷ See, e.g., 49 CFR 571.106 (Standard No. 106; Brake hoses); 49 CFR 571.108 (Standard No. 108; Lamps, reflective devices, and associated equipment); 49 CFR 571.121 (Standard No. 121; Air brake systems); 49 CFR 571.223 (Standard No. 223; Rear impact guards).

¹⁰⁸ "Vehicle." Merriam-Webster (2016). <http://www.merriam-webster.com/dictionary/vehicle> (last accessed May 20, 2016).

and “work truck[s].”¹⁰⁹ If terms in the statute are defined, NHTSA must apply those definitions. Both terms highlighted by RVIA have been defined in EISA, therefore, NHTSA will use their defined meanings. “Work truck” means a vehicle that is rated between 8,500 and 10,000 pounds GVWR and is not an MDPV.¹¹⁰ “Commercial medium- and heavy-duty on-road highway vehicle” means an on-highway vehicle with a gross vehicle weight rating (GVWR) of 10,000 pounds or more.¹¹¹ Based on the definitions in EISA, recreational vehicles would be regulated as class 2b–8 vocational vehicles. Neither statutory definition requires that those vehicles encompassed be commercial in nature, instead dividing the medium- and heavy-duty segments based on weight. The definitions of “work truck” and “commercial medium- and heavy-duty on-highway vehicles” collectively encompass the on-highway motor vehicles not covered in the light duty CAFE standards.

RVIA further stated that NHTSA’s current fuel efficiency regulations are not consistent with EISA and do not purport to grant NHTSA authority to regulate vehicles simply based on weight. NHTSA’s regulations at 49 CFR 523.6 define, by cross-reference the language in 49 U.S.C. 32901(a)(7) and (19), and consistent with the discussion above, include recreational vehicles.

Finally, NHTSA notes that excluding recreational vehicles in Phase 2 could create illogical results, including treating similar vehicles differently, as determinations over whether a given vehicle would be covered by the program would be based upon either its intended or actual use, rather than the actual characteristics of the vehicle. Moreover, including recreational vehicles under NHTSA regulations furthers the agencies’ goal of one national program, as EPA regulations will continue to regulate recreational vehicles. NHTSA will allow early compliance for manufacturers that want to certify during the Phase 1 period.

F. Other Issues

In addition to establishing new Phase 2 standards, this document addresses several other issues related to those standards. The agencies are adopting some regulatory provisions related to the Phase 1 program, as well as amendments related to other EPA and NHTSA regulations. These other issues are summarized briefly here and

discussed in greater detail in later sections.

(1) Opportunities for Further Oxides of Nitrogen (NO_x) Reductions From Heavy-Duty On-Highway Engines and Vehicles

The EPA has the authority under section 202 of the Clean Air Act to establish, and from time to time revise, emission standards for certain air pollutants emitted from heavy-duty on-highway engines and vehicles. The emission standards that EPA has developed for heavy-duty on-highway engines have become progressively more stringent over the past 40 years, with the most recent NO_x standards for new heavy-duty on-highway engines fully phased in with the 2010 model year. NO_x emissions standards for heavy-duty on-highway engines have contributed significantly to the overall reduction in the national NO_x emissions inventory. Nevertheless, a need for additional NO_x reductions remains, particularly in areas of the country with elevated levels of air pollution. As discussed further below, in response to EPA’s responsibilities under the Clean Air Act, the significant comments we received on this topic during the public comment period, the recent publication by the California Air Resources Board (CARB) of its May 2016 Mobile Source Strategy report and Proposed 2016 Strategy for the State implementation Plan¹¹² and a recent Petition for Rulemaking,¹¹³ EPA plans to further engage with stakeholders after the publication of this Final Rule to discuss the opportunities for developing more stringent federal standards to further reduce the level of NO_x emissions from heavy-duty on-highway engines through a coordinated effort with CARB.

NO_x is one of the major precursors of tropospheric ozone (ozone), exposure to

which is associated with a number of adverse respiratory and cardiovascular effects, as described in Section VIII.A.2 below. These effects are particularly pronounced among children, the elderly, and among people with lung disease such as asthma. NO_x is also a major contributor to secondary PM_{2.5} formation, and exposure to PM_{2.5} itself has been linked to a number of adverse health effects (see Section VIII.A.1), such as heart attacks and premature mortality. In addition, NO₂ exposure is linked to asthma exacerbation and possibly to asthma development in children (see Section VIII.A.3). EPA has already adopted many emission control programs that are expected to reduce ambient ozone levels. However, the U.S. Energy Information Administration’s AEO 2015 predicts that vehicles miles travelled (VMT) for heavy-duty trucks will increase in the coming years,¹¹⁴ and even with the implementation of all current state and federal regulations, some of the most populous counties in the United States are expected to have ozone air quality that exceeds the National Ambient Air Quality Standards (NAAQS) into the future. As of April 22, 2016, there were 44 ozone nonattainment areas for the 2008 ozone NAAQS composed of 216 full or partial counties, with a population of more than 120 million. These nonattainment areas are dispersed across the country, with counties in the west, northeastern United States, Texas, and several Great Lakes states. The geographic diversity of this problem necessitates action at the national level. In California, the San Joaquin Valley and the South Coast Air Basin are highly-populated areas classified as “extreme nonattainment” for the 2008 8-hour ozone standard, with an attainment demonstration deadline of 2031 (one year in advance of the actual 2032 attainment date). In addition, EPA lowered the level of the primary and secondary NAAQS for the 8-hour standards from 75 ppb to 70 ppb in 2015 (2015 ozone NAAQS),¹¹⁵ with plans to finalize nonattainment designations for the 2015 ozone NAAQS in October 2017. Further NO_x reductions would provide reductions in ambient ozone levels, helping to prevent adverse health impacts associated with ozone exposure and assisting states and local areas in attaining and maintaining the applicable ozone NAAQS. Reductions in NO_x emissions would also improve air quality and provide

¹¹² See “Mobile Source Strategy,” May 16, 2016 from CARB. Available at: <http://www.arb.ca.gov/planning/sip/2016sip/2016mobsrc.htm> and “Proposed 2016 State Strategy for the State Implementation Plan,” May 17, 2016 from CARB. Available at <http://www.arb.ca.gov/planning/sip/2016sip/2016sip.htm>.

¹¹³ EPA received a Petition for Rulemaking to adopt new NO_x emission standards for on-road heavy-duty trucks and engines on June 3, 2016 from the South Coast Air Quality Management District, the Arizona Pima County Department of Environmental Quality, the Bay Area Air Quality Management District, the Connecticut Department of Energy and Environmental Protection Agency, the Delaware Department of Energy and Environmental Protection, the Nevada Washoe County Health District, the New Hampshire Department of Environmental Services, the New York City Department of Environmental Protection, the Akron Regional Air Quality Management District of Akron, Ohio, the Washington State Department of Ecology, and the Puget Sound Clean Air Agency.

public health and welfare benefits throughout the country by (1) reducing PM formed by reactions of NO_x in the atmosphere; (2) reducing concentrations of the criteria pollutant NO₂; (3) reducing nitrogen deposition to sensitive environments; and (4) improving visibility.

In the past year, EPA has received requests from several state and local air quality districts and other organizations asking that EPA establish more stringent NO_x standards for heavy-duty on-highway engines to help reduce the public's exposure to air pollution. In its comments, CARB estimated that heavy-duty on-highway vehicles currently contribute about one-third of all NO_x emissions in California. In order to achieve the 2008 ozone NAAQS, California has estimated that the state's South Coast Air Basin will need an 80 percent reduction in NO_x emissions by 2031. California has the unique ability among states to adopt its own separate new motor engine and vehicle emission standards under section 209 of the CAA; however, CARB commented that EPA action to establish a new federal low-NO_x standard for heavy-duty trucks is critical, since California standards alone are not sufficient to demonstrate compliance with either the 2008 ozone NAAQS or the 2015, even more stringent ozone NAAQS. CARB has developed a comprehensive mobile source strategy which for heavy-duty on-highway vehicles includes: Lowering the emissions from the in-use fleet; establishing more stringent NO_x standards for new engines; and accelerating the deployment of zero and near-zero emissions technology.¹¹⁶ In September of 2015, CARB published a draft of this strategy, *Mobile Source Strategy Discussion Draft*, after which CARB held a public workshop and provided opportunity for public comment. On May 16, 2016, CARB issued a final *Mobile Source Strategy* report.¹¹⁷ In this report, CARB provides a comprehensive strategy plan for the future of mobile sources and goods movement in the State of California for how mobile sources in California can meet air quality and climate goals over the next fifteen years. Among the many programs discussed are plans for a future on-highway heavy-duty engine

and vehicle NO_x control regulatory program for new products with implementation beginning in 2024. CARB states "*The need for timely action by U.S. EPA to establish more stringent engine performance standards in collaboration with California efforts is essential. About 60 percent of total heavy-duty truck VMT in the South Coast on any given day is accrued by trucks purchased outside of California, and are exempt from California standards. U.S. EPA action to establish a federal low-NO_x standard for trucks is critical.*" CARB lays out a time line for a California specific action for new highway heavy-duty NO_x standards with CARB action in 2017–2019 that would lead to new standards that could begin with the model year 2023. CARB also requests that the U.S. EPA work on a Federal rulemaking action in the 2017–2019 time frame which could result in standards that could begin with the model year 2024. The CARB Mobile Source Strategy document also states "Due to the preponderance of interstate trucking's contribution to in-state VMT, federal action would be far more effective at reducing in-state emissions than a California-only standard. However, California is prepared to develop a California-only standard, if needed, to meet federal attainment targets." CARB goes on to state "[C]ARB will begin development of new heavy-duty low NO_x emission standard in 2017 with Board action expected in 2019. ARB may also petition U.S. EPA in 2016 to establish new federal heavy-duty engine emission standards If U.S. EPA begins the regulatory development process for a new federal heavy-duty emission standard by 2017, ARB will coordinate its regulatory development efforts with the federal regulation." On May 17, 2016, CARB published its "Proposed 2016 State Strategy for the State Implementation Plan."¹¹⁸ This document contains CARB staff's proposed strategy to attain the health-based federal air quality standards over the next fifteen years. With respect to future on-highway heavy-duty NO_x standards, the proposed State Implementation Plan is fully consistent with the information published by CARB in the Mobile Source Strategy report. EPA intends to work with CARB to consider the development of a new harmonized Federal and California program that would apply lower NO_x emissions

standards at the national level to heavy-duty on-highway engines and vehicles.

In addition to CARB, EPA received compelling letters and comments from the National Association of Clean Air Agencies, the Northeast States for Coordinated Air Use Management, the Ozone Transport Commission, and the South Coast Air Quality Management District explaining the critical and urgent need to reduce NO_x emissions that significantly contribute to ozone and fine particulate air quality problems in their represented areas. The comments describe the challenges many areas face in meeting both the 2008 and recently strengthened 2015 ozone NAAQS. These organizations point to the significant contribution of heavy-duty vehicles to NO_x emissions in their areas, and call upon EPA to begin a rulemaking to require further NO_x controls for the heavy-duty sector as soon as possible. Commenters such as the American Lung Association, Environmental Defense Fund, Union of Concerned Scientists, the California Interfaith Power and Light, Coalition for Clean Air/California Cleaner Freight Coalition, and the Moving Forward Network similarly describe the air quality and public health need for NO_x reductions and request EPA to lower NO_x emissions standards for heavy-duty vehicles. Taken as a whole, the numerous comments, the expected increase in heavy-duty truck VMT, and the fact that ozone challenges will remain across the country demonstrate the critical need for more stringent nationwide NO_x emissions standards. Such standards are vital to improving air quality nationwide and reducing public health effects associated with exposure to ozone and secondary PM_{2.5}, especially for vulnerable populations and in highly impacted regions.

On June 3, 2016, the EPA received a Petition for Rulemaking from the South Coast Air Quality Management District (California), the Pima County Department of Environmental Quality (Arizona), the Bay Area Air Quality Management District (California), the Connecticut Department of Energy and Environmental Protection Agency, the Delaware Department of Energy and Environmental Protection, the Washoe County Health District (Nevada), the New Hampshire Department of Environmental Services, the New York City Department of Environmental Protection, the Akron Regional Air Quality Management District (Ohio), the Washington State Department of Ecology, and the Puget Sound Clean Air

¹¹⁶ To foster the development of the next generation of lower NO_x engines, in 2013, CARB adopted optional low-NO_x heavy-duty engine standards ranging from 0.10 down to 0.02 grams per brake horsepower-hour (g/bhp-hr). CARB also funded over \$1 million to a low-NO_x engine research and demonstration project at Southwest Research Institute (SwRI).

¹¹⁷ See "Mobile Source Strategy," May 16, 2016 from CARB. Available at: <http://www.arb.ca.gov/planning/sip/2016sip/2016mobsrc.htm>.

¹¹⁸ See "Proposed 2016 State Strategy for the State Implementation Plan," May 17, 2016 from CARB. Available at <http://www.arb.ca.gov/planning/sip/2016sip/2016sip.htm>.

Agency (Washington).^{119 120} In a June 15, 2016 letter to EPA, the Commonwealth of Massachusetts also joined this petition. On June 22, 2016, the San Joaquin Valley Air Pollution Control District (California) also submitted a petition for rulemaking to EPA.¹²¹ In these Petitions, the Petitioners request that EPA establish a new, lower NO_x emission standard for on-road heavy-duty engines. The Petitioners request that EPA implement a new standard by January 1, 2022, and that EPA establish this new standard through a Final Rulemaking issued by December 31, 2017. EPA is not formally responding to this Petition in this Final Rule, but we will do so in a future action. In the petitions, the Petitioners include a detailed discussion of their views and underlying data regarding the need for large scale reduction in NO_x emissions from heavy-duty engines, why they believe new standards can be achieved, and their legal views on EPA's responsibilities under the Clean Air Act.

Since the establishment of the current heavy-duty on-highway standards in January of 2001,¹²² there has been continued progress in emissions control technology. EPA and CARB are currently investing in research to evaluate opportunities for further NO_x reductions from heavy-duty on-highway vehicles and engines. Programs and research underway at CARB, as well as a significant body of work in the technical literature, indicate that reducing NO_x emissions significantly below the current on-highway standard of 0.20 grams per brake horsepower-hour (g/bhp-hr) is potentially feasible.^{123 124} Opportunities for additional NO_x reductions include reducing emissions over cold start operation as well as low-speed, low-load off-cycle operation. Reductions are being accomplished through the use of improved engine management, advanced aftertreatment technologies

(improvements in SCR catalyst design/formulation), catalyst positioning, aftertreatment thermal management, and heated diesel exhaust fluid dosing. At the same time, the effect of these new technologies on cost and GHG emissions is being carefully evaluated,¹²⁴ since it is important that any future NO_x control technologies be considered in the context of the final Phase 2 GHG standards. During the Phase 2 program public comment period, EPA received some comments stressing the need for careful evaluation of emerging NO_x control technologies and urging EPA to consider the relationship between CO₂ and NO_x before setting lower NO_x standards (commenters include American Trucking Association, Caterpillar, Daimler Trucks North America, Navistar Inc., PACCAR Inc., Volvo Group, Truck and Engine Manufacturers Association, Diesel Technology Forum, National Association of Manufacturers, and National Automobile Dealers Association). EPA also received comments pointing to advances in NO_x emission control technologies that would lower NO_x without reducing engine efficiency (commenters include Advanced Engine Systems Institute, Clean Energy, Manufacturers of Emission Controls Association, and Union of Concerned Scientists). EPA will continue to evaluate both opportunities and challenges associated with lowering NO_x emissions from the current standards, and over the coming months we intend to engage with many stakeholders as we develop our response to the June 2016 Petitions for Rulemaking discussed above.

EPA believes the opportunity exists to develop, in close coordination with CARB and other stakeholders, a new, harmonized national NO_x reduction strategy for heavy-duty on-highway engines which could include the following:

- Substantially lower NO_x emission standards;
- Improvements to emissions warranties;
- Consideration of longer useful life, reflecting actual in-use activity;
- Consideration of rebuilding/remanufacturing practices;
- Updated certification and in-use testing protocols;
- Incentives to encourage the transition to next-generation cleaner technologies as soon as possible;
- Improvements to test procedures and test cycles to ensure emission reductions occur in the real-world, not only over the applicable certification test cycles.

Based on the air quality need, the requests described above, the continued progress in emissions control technology, and the June 2016 petitions for rulemaking, EPA plans to engage with a range of stakeholders to discuss the opportunities for developing more stringent federal standards to further reduce the level of NO_x emissions from heavy-duty on-highway engines, after the publication of this Final Rule. Recognizing the benefits of a nationally harmonized program and given California's unique ability under CAA section 209 to be allowed to regulate new motor vehicle and engine emission standards if certain criteria are met, EPA intends to work closely with CARB on this effort. EPA also intends to engage with truck and engine manufacturers, suppliers, state air quality agencies, NGOs, labor, the trucking industry, and the Petitioners over the next several months as we develop our formal response to the June 2016 Petitions for Rulemaking.

(2) Issues Related to Phase 2

(a) Natural Gas Engines and Vehicles

This combined rulemaking by EPA and NHTSA is designed to regulate two separate characteristics of heavy duty vehicles and engines: GHGs and fuel consumption. In the case of diesel or gasoline powered vehicles, there is a one-to-one relationship between these two characteristics. For alternatively fueled vehicles, which use no petroleum, the situation is different. For example, a natural gas vehicle that achieves approximately the same fuel efficiency as a diesel powered vehicle will emit 20 percent less CO₂; and a natural gas vehicle with the same fuel efficiency as a gasoline vehicle will emit 30 percent less CO₂. Yet natural gas vehicles consume no petroleum. The agencies are continuing Phase 1 approach, which the agencies have previously concluded balances these facts by applying the gasoline and diesel CO₂ standards to natural gas engines based on the engine type of the natural gas engine. Fuel consumption for these vehicles is then calculated according to their tailpipe CO₂ emissions. In essence, this applies a one-to-one relationship between fuel efficiency and tailpipe CO₂ emissions for all vehicles, including natural gas vehicles. The agencies determined that this approach will likely create a small balanced incentive for natural gas use. In other words, it created a small incentive for the use of natural gas engines that appropriately balanced concerns about the climate impact methane emissions against other factors such as the energy security

benefits of using domestic natural gas. See 76 FR 57123.

(b) Alternative Refrigerants

In addition to use of low-leak components in air conditioning system design, manufacturers can also decrease the global warming impact of any refrigerant leakage emissions by adopting systems that use alternative, lower global warming potential (GWP) refrigerants, to replace the refrigerant most commonly used today, HFC-134a (R-134a). HFC-134a is a potent greenhouse gas with a GWP 1,430 times greater than that of CO₂.

Under EPA's Significant New Alternatives Policy (SNAP) Program,¹²⁵ EPA has found acceptable, subject to use conditions, three alternative refrigerants that have significantly lower GWPs than HFC-134a for use in A/C systems in newly manufactured *light-duty vehicles*: HFC-152a, CO₂ (R-744), and HFO-1234yf.¹²⁶ HFC-152a has a GWP of 124, HFO-1234yf has a GWP of 4, and CO₂ (by definition) has a GWP of 1, as compared to HFC-134a which has a GWP of 1,430.¹²⁷ CO₂ is nonflammable, while HFO-1234yf and HFC-152a are flammable. All three are subject to use conditions requiring labeling and the use of unique fittings, and where appropriate, mitigating flammability and toxicity. Currently, the SNAP listing for HFO-1234yf is limited to newly manufactured A/C systems in light-duty vehicles, whereas HFC-152a and CO₂ have been found acceptable for all motor vehicle air conditioning applications, including heavy-duty vehicles.

None of these alternative refrigerants can simply be "dropped" into existing HFC-134a air conditioning systems. In order to account for the unique properties of each refrigerant and address use conditions required under SNAP, changes to the systems will be necessary. Typically these changes will need to occur during a vehicle redesign cycle but can also occur during a refresh. For example, because CO₂, when used as a refrigerant, is physically

and thermodynamically very different from HFC-134a and operates at much higher pressures, a transition to this refrigerant would require significant hardware changes. A transition to A/C systems designed for HFO-1234yf, which is more thermodynamically similar to HFC-134a than is CO₂, requires less significant hardware changes that typically include installation of a thermal expansion valve and can potentially require resized condensers and evaporators, as well as changes in other components. In addition, vehicle assembly plants require re-tooling in order to handle new refrigerants safely. Thus a change in A/C refrigerants requires significant engineering, planning, and manufacturing investments.

EPA is not aware of any significant development of A/C systems designed to use alternative refrigerants in heavy-duty vehicles.¹²⁸ However, all three lower GWP alternatives are in use or under various stages of development for use in LD vehicles. Of these three refrigerants, most manufacturers of LD vehicles have identified HFO-1234yf as the most likely refrigerant to be used in that application. For that reason, EPA anticipates that HFO-1234yf will be a primary candidate for refrigerant substitution in the HD market in the future if it is listed as an acceptable substitute under SNAP for HD A/C applications.

As mentioned above, EPA has listed as acceptable, subject to use conditions, two lower-GWP refrigerants, R-744 (CO₂) and HFC-152a, for use in HD vehicles. On April 18, 2016, EPA also proposed to list HFO-1234yf as acceptable, subject to use conditions, in A/C systems for newly manufactured MDPVs, HD pickup trucks, and complete HD vans (81 FR 22810). In that action, EPA proposed to list HFO-1234yf as acceptable, subject to use conditions, for those vehicle types for which human health and environmental risk could be assessed using the currently available risk assessments and analysis on LD vehicles. Also in that action, EPA requested "information on development of HFO-1234yf MVAC systems for other HD vehicle types or off-road vehicles, or plans to develop these systems in the future." EPA also stated "This information may be used to inform a future listing" (81 FR 22868).

In another rulemaking action under the SNAP program, on July 20, 2015, EPA published a final rule (80 FR

42870) that will change the listing status of HFC-134a to unacceptable for use in newly manufactured LD motor vehicles beginning in MY 2021 (except as allowed under a narrowed use limit for use in newly manufactured LD vehicles destined for use in countries that do not have infrastructure in place for servicing with other acceptable refrigerants through MY 2025). In that same rule, EPA listed the refrigerant blends SP34E, R-426A, R-416A, R-406A, R-414A, R-414B, HCFC Blend Delta, Freeze 12, GHG-X5, and HCFC Blend Lambda as unacceptable for use in newly manufactured light-duty vehicles beginning in MY 2017. EPA's decisions were based on the availability of other substitutes that pose less overall risk to human health and the environment, when used in accordance with required use conditions. Neither the April 2016 proposed rule nor the July 2015 final rule consider a change of listing status for HFC-134a in HD vehicles.

LD vehicle manufacturers are currently making investments in systems designed for lower-GWP refrigerants, both domestically and on a global basis. In support of the LD GHG rule, EPA projected a full transition of LD vehicles to lower-GWP alternatives in the United States by MY 2021. We expect the costs of transitioning to decrease over time as alternative refrigerants are adopted across all LD vehicles and trucks, in part due to increased availability of components and the continuing increases in refrigerant production capacity, as well as knowledge gained through experience. As lower-GWP alternatives become widely used in LD vehicles, some HD vehicle manufacturers may wish to also transition their vehicles. Transitioning could be advantageous for a variety of reasons, including platform standardization and company environmental stewardship policies.

In the proposal for this Phase 2 HD rule, EPA proposed another action related to alternative refrigerants. EPA proposed to allow a manufacturer to be "deemed to comply" with the leakage standard if its A/C system used a refrigerant other than HFC-134a that was both listed as an acceptable substitute refrigerant for heavy-duty A/C systems under SNAP, and was identified in the LD GHG regulations at 40 CFR 86.1867-12(e). 80 FR 40172. By slightly reducing the regulatory burden of compliance with the leakage standard for a manufacturer that used an alternative refrigerant, the "deemed to comply" provision was intended to provide a modest incentive for the use of such refrigerants. There were comments in support of this approach,

¹²⁵ Section 612(c) of the Clean Air Act requires EPA to review substitutes for class I and class II ozone-depleting substances and to determine whether such substitutes pose lower risk than other available alternatives. EPA is also required to publish lists of substitutes that it determines are acceptable and those it determines are unacceptable. See <http://www3.epa.gov/ozone/snap/refrigerants/lists/index.html>, last accessed on March 5, 2015.

¹²⁶ Listed at 40 CFR part 82, subpart G.

¹²⁷ GWP values cited in this final action are from the IPCC Fourth Assessment Report (AR4) unless stated otherwise. Where no GWP is listed in AR4, GWP values are determined consistent with the calculations and analysis presented in AR4 and referenced materials.

¹²⁸ To the extent that some manufacturers produce HD pickups and vans on the same production lines or in the same facilities as LD vehicles, some A/C system technology commonality between the two vehicle classes may be developing.

including from Honeywell and Chemours, both of which manufacture HFO-1234yf.

For several reasons, EPA has reconsidered the proposed “deemed to comply” provision for this rule, and instead, the Phase 2 program retains the Phase 1 requirement that manufacturers attest that they are using low-leak components, regardless of the refrigerant they use. CARB and several NGO commenters expressed concerns about the proposed “deemed to comply” provision, primarily citing the potential for manufacturers to revert to less leak-tight components if they were no longer required to attest to the use of low-leak A/C system components because they used a lower-GWP refrigerant. In general, we expect that the progress LD vehicle manufacturers are making toward more leak-tight A/C systems will continue and that this progress will transfer to HD A/C systems. Still, we agree that continued improvements in low-leak performance HD vehicles is an important goal, and that continuing the Phase 1 leakage requirements in the Phase 2 program should discourage manufacturers from reverting to higher-leak and potentially less expensive components. It is also important to note that there is no “deemed to comply” option in the parallel LD-GHG program—manufacturers must attest to meeting the leakage standard. There is no compelling reason to have a different regime for heavy duty applications.

Although leakage of lower-GWP refrigerants is of less concern from a climate perspective than leakage of higher GWP refrigerants, we also agree with several commenters that expressed a concern related to the servicing of lower-GWP systems with higher-GWP refrigerants in the aftermarket. We agree that this could result due to factors such as price differentials between aftermarket refrigerants. However, as is the case for Phase 1, as a part of certification, HD manufacturers will attest both to the use of low-leak components as well as to the specific refrigerant used. Thus, in the future, a manufacturer wishing to certify a vehicle with an A/C system designed for an alternative refrigerant will attest to the use of that specific refrigerant. In that situation, any end-user servicing and recharging that A/C system with any other refrigerant would be considered tampering with an emission-related component under Title II of the CAA. For example, recharging an A/C system certified to use a lower-GWP refrigerant, such as HFO-1234yf, with any other refrigerant, including but not limited to HFC-134a, would be

considered a violation of Title II tampering provisions.

At the same time, EPA does not believe that finalizing the “deemed to comply” provision would have had an impact on any future transition of the HD industry to alternative refrigerants. As discussed above, two lower-GWP refrigerants are already acceptable for use in HD vehicles, and EPA has proposed to list HFO-1234yf as acceptable, subject to use conditions, for limited HD vehicle types. As also discussed above, and especially in light of the rapid expansion of alternative refrigerants that has been occurring in the LD vehicle market, similar trends may develop in the HD vehicle market, regardless of EPA’s action regarding leakage of alternative refrigerants in this final rule.

(c) Small Business Issues

The Regulatory Flexibility Act (RFA) generally requires an agency to prepare a regulatory flexibility analysis of any rule subject to notice and comment rulemaking requirements under the Administrative Procedure Act or any other statute unless the agency certifies that the rule will not have a significant economic impact on a substantial number of small entities. See generally 5 U.S.C. 601–612. The RFA analysis is discussed in Section XIV.

Pursuant to section 609(b) of the RFA, as amended by the Small Business Regulatory Enforcement Fairness Act (SBREFA), EPA also conducted outreach to small entities and convened a Small Business Advocacy Review Panel to obtain advice and recommendations of representatives of the small entities that potentially will be subject to the rule’s requirements. Consistent with the RFA/SBREFA requirements, the Panel evaluated the assembled materials and small-entity comments on issues related to elements of the Initial Regulatory Flexibility Analysis (IRFA). A copy of the Panel Report was included in the docket for this rule.

The agencies previously determined that the Phase 2 regulations could potentially have a significant economic impact on small entities. Specifically, the agencies identified four categories of directly regulated small businesses that could be impacted:

- Trailer Manufacturers
- Alternative Fuel Converters
- Vocational Chassis Manufacturers
- Glider Vehicle ¹²⁹ Assemblers

¹²⁹ Vehicles produced by installing a used engine into a new chassis are commonly referred to as “gliders,” “glider kits,” or “glider vehicles.” See Section I.E.i and XIII.B.

To minimize these impacts the agencies are adopting certain regulatory flexibilities—both general and category-specific. In general, we are delaying new requirements for EPA GHG emission standards by one initial year and simplifying certification requirements for small businesses. Even with this one year delay, small businesses will be required to comply with EPA’s standards before NHTSA’s fuel efficiency standards are mandatory. Because of this timing, compliance with NHTSA’s regulations will not be delayed, as small business manufacturers will be accommodated through EPA’s initial one year delay. The agencies are also providing the following specific relief:

- *Trailers*: Adopting simpler requirements for non-box trailers, which are more likely to be manufactured by small businesses; reduced reliance on emission averaging; and making third-party testing easier for certification.

- *Alternative Fuel Converters*: Omitting recertification of a converted vehicle when the engine is converted and certified; reduced N₂O testing; and simplified onboard diagnostics and delaying required compliance with each new standard by one model year.

- *Vocational Chassis*: Less stringent standards for certain vehicle categories; opportunity to generate credits under the Phase 1 program.

- *Glider Vehicle Assemblers*:¹³⁰ Exempting existing small businesses, but limiting the small business exemption to a capped level of annual production (production in excess of the capped amount will be allowed, but subject to all otherwise applicable requirements including the Phase 2 standards). Providing additional flexibility for newer engines.

These flexibilities are described in more detail in Section XIV, in RIA Section 12 and in the Panel Report. Flexibilities specific to glider vehicle assemblers are described in Section XIII.

(d) Confidentiality of Test Results and GEM Inputs

The agencies received mixed comments regarding the question of whether GEM inputs should be made available to public. Some commenters supported making this information available, while others thought it should

¹³⁰ EPA is amending its rules applicable to engines installed in glider kits, which will affect emission standards not only for GHGs but for criteria pollutants as well. EPA is also clarifying its requirements for certification and revising its definitions for glider kit and glider vehicle manufacturers. NHTSA is not including glider vehicles under its Phase 2 fuel consumption standards. See Section XIII.B.

be protected as confidential business information (CBI). In accordance with Federal statutes, EPA does not release information from certification applications (or other compliance reports) that we determine to be CBI under 40 CFR part 2. Consistent with section 114(c) of the CAA, EPA does not consider emission test results to be CBI after introduction into commerce of the certified engine or vehicle. (However, we have generally treated test results as protected before the introduction into commerce date). EPA has not yet made a final determination for Phase 1 or Phase 2 certification test results. Nevertheless, at this time we expect to continue this policy and consider it likely that we would not treat any test results or other GEM inputs as CBI after the introduction into commerce date as identified by the manufacturer.

With regard to NHTSA's treatment of confidential business information, manufacturers must submit a request for confidentiality with each electronic submission specifying any part of the information or data in a report that it believes should be withheld from public disclosure as trade secret or other confidential business information. A form is available through the NHTSA Web site to request confidentiality. NHTSA does not consider manufacturers to continue to have a business case for protecting pre-model report data after the vehicles contained within that report have been introduced into commerce.

(e) Delegated Assembly and Secondary Manufacturers

In EPA's existing regulations (40 CFR 1068.261), we allow engine manufacturers to sell or ship engines that are missing certain emission-related components if those components will be installed by the vehicle manufacturer. These provisions already apply to Phase 1 vehicles as well, providing a similar allowance for *vehicle* manufacturers to sell or ship *vehicles* that are missing certain emission-related components if those components will be installed by a *secondary* vehicle manufacturer. See section 1037.620. EPA has found this provision to work well and is finalizing certain amendments in this rule. See 40 CFR 1037.621. Under the amended rule, as conditions of this allowance, manufacturers will be required to:

- Have a contractual obligation with the secondary manufacturer to complete the assembly properly and provide instructions about how to do so
- Keep records to demonstrate compliance
- Apply a temporary label to the incomplete vehicles

- Take other reasonable steps to ensure the assembly is completed properly
- Describe in its application for certification how it will use this allowance

Under delegated assembly, it is the upstream manufacturer that holds the certificate and assumes primary responsibility for all compliance requirements. Our experience applying this approach has shown that holding the upstream manufacturer responsible ensures that they will exercise due diligence throughout the process.

EPA proposed to apply this new section broadly. However, commenters raised valid questions about whether it is necessary to apply this formal process as broadly as proposed. In response, we have reconsidered the proposed approach and have determined that it would be appropriate to allow a less formal process with components for which market forces will make it unlikely that a secondary manufacturer would not complete assembly properly. In those cases, the certifying manufacturers will be required to provide sufficiently detailed installation instructions to the secondary manufacturers, who would then be obligated to complete assembly properly before the vehicles are delivered to the ultimate purchasers.

One example of a case for which market forces could ensure that assembly is completed properly would be air conditioning leakage requirements. Purchasers will have the expectation that the systems will not leak, and a secondary manufacturer should have no incentive to not follow the certifying manufacturer's instructions.

As revised, § 1037.621 will require the formal delegated assembly process for the following technologies if they are part of the OEM's certified configuration but not shipped with the vehicle:

- Auxiliary power units
- Aerodynamic devices
- Hybrid components
- Natural gas fuel tanks

Certificate holders will remain responsible for other certified components, but will not automatically be required to comply with the formal delegated assembly requirements. That determination will be made case-by-case as part of the certification process. We are also explicitly making the flexibility in 40 CFR 1037.621 available for HD pickups and vans certified to the standards in 40 CFR part 86. As is currently specified in 40 CFR 1068.261, EPA will retain the authority to apply additional necessary conditions (at the time of certification) to the allowance to

delegate assembly of emission to secondary manufacturers (when emission control equipment is not shipped with the vehicle to the secondary manufacturer, as just noted). In particular, we would likely apply such additional conditions for manufacturers that we determine to have previously not completed assembly properly. Issues of delegated assembly are addressed in more detail in Section 1.4.4 of the RTC.

(f) Engine/Vehicle Useful Life

We received comment on what policies we should adopt to address the situation where the engine and the vehicle are subject to emission standards over different useful-life periods. For example, a medium heavy-duty engine may power vehicles in weight classes ranging from 2b to 8, with correspondingly different regulatory useful lives for those vehicles. As provided in 40 CFR 1037.140 of the final regulations, we have structured the vehicle regulations to generally apply the same useful life for the vehicle that applies for the engines. However, these regulations also allow vehicle manufacturers to certify their vehicles to longer useful lives. The agencies see no problem with allowing vehicles to have longer useful lives than the engines.

(g) Compliance Reports

The agencies received comment on the NPRM from two environmental organizations requesting that the agencies make available to the public data and information that would enable the public to track trends in technology sales over time, as well as track company-specific compliance data. The commenters suggested that this should include an agency publication of an annual compliance report for the Heavy-duty Phase 2 program. The commenters requested this information to allow all stakeholders to see how individual companies, as well as the industry overall, were performing relative to their compliance obligations (see comments from ACEEE and NRDC).

The agencies agree with this comment. In the context of the light-duty vehicle GHG standards, EPA has already published four annual compliance reports which has made available to the public detailed information regarding both how individual light-duty vehicle companies have been meeting their compliance obligations, as well as summary information at the light-duty fleet level. NHTSA makes the up-to-date information on the light-duty fuel economy program available through its

CAFE Public Information Center (http://www.nhtsa.gov/CAFE_PIC/CAFE_PIC_Home.htm). Information includes manufacturer and overall fleet standards and CAFE performance, credit status, and civil penalty status. This information has been helpful to increase transparency to all stakeholders and to allow the public to see how companies are progressing from one year to the next with respect to their compliance requirements. It is EPA's intention to publish a similar annual compliance report for the heavy duty GHG program, covering both the existing Phase 1 program, as well as the Phase 2 standards contained in this final rule. It is NHTSA's intention to expand the Public Information Center to include the medium- and heavy-duty fuel efficiency program and to make up-to-date information collected in the heavy-duty fuel efficiency compliance process available publicly. Both the EPA and NHTSA compliance reports will provide available information at the vehicle subclass level for each of the four vehicle categories (*i.e.* Tractors, Trailers, Vocational, and Heavy-Duty Pickups and Vans), and EPA will provide available information for the other GHG standards, such as N₂O and refrigerant leak detection standards. Prior to issuing the compliance reports, EPA and NHTSA will work with regulated manufacturers to reconcile concerns over the release of claimed confidential business information, consistent with 40 CFR part 2 and 49 CFR 512.

(3) Life Cycle Emissions

The agencies received many comments expressing concerns about establishing the GHG and fuel consumption standards as tailpipe standards that do not account for upstream emissions or other life cycle impacts. However, many other commenters supported this approach. Comments specifically related to alternative fuels or electric vehicles are addressed in Section I.C.(1)(d) and in Section XI.B. This section addresses the issue more broadly.

As discussed below, the agencies do not see how we could accurately account for life cycle emissions in our vehicle standards, nor have commenters shown that such an accounting is needed. In addition, NHTSA has already noted that the fuel efficiency standards are necessarily tailpipe-based, and that a lifecycle approach would likely render it impossible to harmonize the fuel efficiency and GHG emission standards, to the great detriment of our goal of achieving a national, harmonized program. See 76 FR 57125.

It is also worth noting that EPA's engine and vehicle emission standards and NHTSA's vehicle fuel consumption standards (including those for light-duty vehicles) have been in place for decades as tailpipe standards. The agencies find no reasonable basis in the comments or elsewhere to change fundamentally from this longstanding approach.

Although the final standards do not account for life cycle emissions, the agencies have estimated the upstream emission impact of reducing fuel consumption for heavy-duty vehicles. As shown in Section VII and VIII, these upstream emission reductions are significant and worth estimating, even with some uncertainty. However, this analysis would not be a sufficient basis for inclusion in the standards themselves.

(a) Challenges for Addressing Life Cycle Emissions With Vehicle Standards

Commenters supporting accounting for life cycle emissions generally did so in the context of one or more specific technologies. However, the agencies cannot accurately address life-cycle emissions on a technology specific basis at this time for two reasons:

- We lack data to address each technology, and see no path to selectively apply a life cycle analysis to some technologies, but not to others.
- Actual life cycle emissions are dependent on factors outside the scope of the rulemaking that may change in the future.

With respect to the first reason, even if we were able to accurately and fully account for life cycle impacts of one technology (such as weight reduction), this would not allow us to address life cycle emissions for other technologies. For example, how would the agencies address potential differences in life cycle emissions for shifting from a manual transmission to and AMT, or the life cycle emissions of aerodynamic fairings? If we cannot factor in life cycle impacts for all technologies, how would we do it for weight reductions? Given the complexity of these rules and the number of different technologies involved, we see no way to treat the technologies equitably. Commenters do not provide the information necessary to address this challenge, nor are the agencies aware of such information.

The second reason is just as problematic. This rulemaking is setting standards for vehicles under specific statutory provisions. It is not regulating manufacturing processes, distribution practices, or the locations of manufacturing facilities. And yet each of these factors could impact life cycle emissions. So while we could take a

snapshot of life cycle emissions at this point in time for specific manufacturers, it may or may not have any relation to life cycle emissions in 2027, or for other manufacturers. Consider, for example, two component manufacturers: One that produces its components near the vehicle assembly plant, and relies on natural gas to power its factory; and a second that is located overseas and relies on coal-fired power. How would the agencies equitably (or even non-arbitrarily) factor in these differences without regulating these processes? To the extent commenters provided any information on life cycle impacts, they did not address this challenge.

(b) Need for Life Cycle Consideration in the Standards

The agencies acknowledge that a full and accurate accounting of life cycle emissions (if it were possible) could potentially make the Phase 2 program marginally better. However, we do not agree that this is an issue of fundamental importance. While some commenters submitted estimates of the importance of life cycle emissions for light-duty vehicles, life cycle emissions are less important for heavy-duty vehicles. Consider, for example, the difference between a passenger car and a heavy-duty tractor. If the passenger car achieves 40 mile per gallon and travels 150,000 miles in its life, it would consume less than 4,000 gallons of fuel in its life. On the other hand, a tractor that achieves 8 miles per gallon and travels 1,000,000 miles would consume 125,000 gallons of fuel in its life, or more than 30 times the fuel of the passenger car. Commenters provide no basis to assume the energy consumption associated with tractor production would be 30 times that of the production of a passenger car.

(4) Amendments to the Phase 1 Program

The agencies are revising some test procedures and compliance provisions used for Phase 1. These changes are described in Section XII. This includes both amendments specific to Phase 1, as well as amendments that apply more broadly than Phase 1, such as the revisions to the delegated assembly provisions. As a drafting matter, EPA notes that we are moving the GHG standards for Class 2b and 3 pickups and vans from 40 CFR 1037.104 to 40 CFR 86.1819–14.

NHTSA is also amending 49 CFR part 535 to make technical corrections to its Phase 1 program to better align with EPA's compliance approach, standards and CO₂ performance results. In general, these changes are intended to improve the regulatory experience for regulated

parties and also reduce agency administrative burden. More specifically, NHTSA is changing the rounding of its standards and performance values to have more significant digits. Increasing the number of significant digits for values used for compliance with NHTSA standards reduces differences in credits generated and overall credit balances for the EPA and NHTSA programs. NHTSA is also removing the petitioning process for off-road vehicles, clarifying requirements for the documentation needed for submitting innovative technology requests in accordance with 40 CFR 1037.610 and 49 CFR 535.7, and adding further detail to requirements for submitting credit allocation plans as specified in 49 CFR 535.9. Finally, NHTSA is adding the same recordkeeping requirements that EPA currently requires to facilitate in-use compliance inspections. These changes are intended to improve the regulatory experience for regulated parties and also reduce agency administrative burden.

The agencies received few comments on these changes, with most supporting the proposed changes or suggesting improvements. These comments as well as the few comments opposing any of these changes are discussed in Section XII and in the RTC.

(5) Other Amendments to EPA Regulations

EPA is finalizing certain other changes to regulations that we proposed, which are not directly related to the HD Phase 1 or Phase 2 programs, as detailed in Section XIII. For these amendments, there are no corresponding changes in NHTSA regulations. Some of these amendments relate directly to heavy-duty highway engines, but not to the GHG programs. Others relate to nonroad engines. This latter category reflects the regulatory structure EPA uses for its mobile source regulations, in which regulatory provisions applying broadly to different types of mobile sources are codified in common regulatory parts such as 40 CFR part 1068. This approach creates a broad regulatory structure that regulates highway and nonroad engines, vehicles, and equipment collectively in a common program. Thus, it is appropriate to include some amendments to nonroad regulations in addition to the changes applicable only for highway engines and vehicles.

Except as noted below, the agencies received relatively few significant comments on these issues. All comments are discussed in more detail in Section XIII and in the RTC. One area, for which we did receive

significant comment was the issue of competition vehicles. As described in Section XIII, EPA is not finalizing the proposed clarification related to highway vehicles used for competition.

(a) Standards for Engines Installed In Glider Kits

EPA regulations currently allow used pre-2013 engines to be installed into new glider kits without meeting currently applicable standards. As described in Section XIII.B, EPA is amending its regulations to allow only engines that have been certified to meet standards for the model year in which the glider vehicle is assembled (*i.e.* current model year engine standards) to be installed in new glider kits, with certain exceptions. First, engines certified to earlier MY standards that are identical to the current model year standards may be used. Second, engines still within their useful life (and certain similar engines) may be used. Note that this would not allow use of the pre-2002 engines that are currently being used in most glider vehicles because they all would be outside of the 10-year useful life period. Finally, the interim small manufacturer allowance for glider vehicles will also apply for the engines used in the exempted glider kits. Comments on this issue are summarized and addressed in Section XIII.B and in RTC Section 14.2.

(b) Nonconformance Penalty Process Changes

Nonconformance penalties (NCPs) are monetary penalties established by regulation that allow a vehicle or engine manufacturer to sell engines that do not meet the emission standards. Manufacturers unable to comply with the applicable standard pay penalties, which are assessed on a per-engine basis.

On September 5, 2012, EPA adopted final NCPs for heavy heavy-duty diesel engines that could be used by manufacturers of heavy-duty diesel engines unable to meet the current oxides of nitrogen (NO_x) emission standard. On December 11, 2013 the U.S. Court of Appeals for the District of Columbia Circuit issued an opinion vacating that Final Rule. It issued its mandate for this decision on April 16, 2014, ending the availability of the NCPs for the current NO_x standard, as well as vacating certain amendments to the NCP regulations due to concerns about inadequate notice. In particular, the amendments revise the text explaining how EPA determines when NCP should be made available. In the Phase 2 NPRM, EPA re-proposed most of these amendments to provide fuller

notice and additional opportunity for public comment. As discussed in Section XIII, although EPA received one comment opposing these amendments, they are being finalized as proposed.

(c) Updates to Heavy-Duty Engine Manufacturer In-Use Testing Requirements

EPA and manufacturers have gained substantial experience with in-use testing over the last four or five years. This has led to important insights in ways that the test protocol can be adjusted to be more effective. We are accordingly making changes to the regulations in 40 CFR part 86, subparts N and T.

(d) Extension of Certain 40 CFR Part 1068 Provisions to Highway Vehicles and Engines

As part of the Phase 1 GHG standards, we applied the exemption and importation provisions from 40 CFR part 1068, subparts C and D, to heavy-duty highway engines and vehicles. We also specified that the defect reporting provisions of 40 CFR 1068.501 were optional. In an earlier rulemaking, we applied the selective enforcement auditing under 40 CFR part 1068, subpart E (75 FR 22896, April 30, 2010). We are adopting the rest of 40 CFR part 1068 for heavy-duty highway engines and vehicles, with certain exceptions and special provisions.

As described above, we are applying all the general compliance provisions of 40 CFR part 1068 to heavy-duty engines and vehicles subject to 40 CFR parts 1036 and 1037. We are also applying the recall provisions and the hearing procedures from 40 CFR part 1068 for highway motorcycles and for all vehicles subject to standards under 40 CFR part 86, subpart S.

EPA is updating and consolidating the regulations related to formal and informal hearings in 40 CFR part 1068, subpart G. This will allow us to rely on a single set of regulations for all the different categories of vehicles, engines, and equipment that are subject to emission standards. We also made an effort to write these regulations for improved readability.

We are also making a number of changes to part 1068 to correct errors, to add clarification, and to make adjustments based on lessons learned from implementing these regulatory provisions.

(e) Amendments to Engine and Vehicle Test Procedures in 40 CFR Parts 1065 and 1066

EPA is making several changes to our engine testing procedures specified in

40 CFR part 1065. None of these changes will significantly impact the stringency of any standards.

(f) Amendments Related to Marine Diesel Engines in 40 CFR Parts 1042 and 1043

EPA's emission standards and certification requirements for marine diesel engines under the Clean Air Act and the act to Prevent Pollution from Ships are identified in 40 CFR parts 1042 and 1043, respectively. EPA is amending these regulations with respect to continuous NO_x monitoring and auxiliary engines, as well as making several other minor revisions.

(g) Amendments Related to Locomotives in 40 CFR Part 1033

EPA's emission standards and certification requirements for locomotives under the Clean Air Act are identified in 40 CFR part 1033. EPA is making several minor revisions to these regulations.

(6) Other Amendments to NHTSA Regulations

NHTSA proposed to amend 49 CFR parts 512 and 537 to allow manufacturers to submit required compliance data for the Corporate Average Fuel Economy (CAFE) program electronically, rather than submitting some reports to NHTSA via paper and CDs and some reports to EPA through its VERIFY database system. NHTSA is not finalizing this proposal in this rulemaking and will consider electronic submission for CAFE reports in a future action.

II. Vehicle Simulation and Separate Engine Standards for Tractors and Vocational Chassis

A. Introduction

This Section II. describes two regulatory program elements that are *common* among tractors and vocational chassis. In contrast, Sections III and V respectively describe the regulatory program elements that are *unique* to tractors and to vocational chassis. The common elements described here are the vehicle simulation approach to vehicle certification and the separate standards for engines. Section II.B discusses the reasons for this Phase 2 regulatory approach; namely, requiring vehicle simulation for tractor and vocational chassis certification, maintaining separate engine standards, and expanding and updating their related mandatory and optional test procedures. Section II.C discusses in detail the evolution and final version of the vehicle simulation computer program, which is called the

Greenhouse gas Emissions Model or "GEM." Section II.C also discusses the evolution and final versions of the test procedures for determining the GEM inputs that are common for tractors and vocational chassis. Section II.D discusses in detail the separate engine standards for GHGs and fuel efficiency and their requisite test procedures.

In this final action, the agencies have built on the success of the Phase 1 GEM-based approach for the certification of tractors and vocational chassis. To better recognize the real-world impact of vehicle technologies, we have expanded the number of required and optional vehicle inputs into GEM. Inputting these additional details into GEM results in more accurate representations of vehicle performance and greater opportunities to demonstrate reductions in CO₂ emissions and fuel consumption. We are also finalizing revisions to the vehicle driving patterns that are programmed into GEM to better reflect real-world vehicle operation and the emissions reductions that result from applying GHG and fuel efficiency technologies to vehicles. As a result of these revisions, the final GEM-based vehicle certification approach necessitates new testing of engines and testing of some other vehicle components to generate the additional GEM inputs for Phase 2. More detail is provided in Section II.C.

Based on our assessments of the technological feasibility; cost effectiveness; requisite lead times for implementing new and additional tractor and vocational vehicle technologies; and based on comments we received in response to our notice of proposed rulemaking and in response to our more recent notice of additional data availability, the agencies are finalizing steadily increasing stringencies of the CO₂ and fuel consumption standards for tractors and vocational chassis for vehicle model years 2021, 2024 and 2027. See Section I or Sections III and V respectively for these numerical standards for tractors and vocational chassis. As part of our analytical process for determining the numerical values of these standards, the agencies utilized GEM. Using GEM as an integral part of our own standard-setting process helps ensure consistency between our technology assessments and the GEM-based certification process that we require for compliance with the Phase 2 standards. Our utilization of GEM in our standard-setting process is described further in Section II.C.

For Phase 2 we are finalizing, as proposed, the same Phase 1 certification approach for all of the GHG and fuel efficiency separate engine standards for

those engines installed in tractors and vocational chassis. For the separate engine standards, we will continue to require the Phase 1 engine dynamometer certification test procedures, which were adopted substantially from EPA's existing heavy-duty engine emissions test procedures. In this action we are finalizing, as proposed, revisions to the weighting factors of the tractor engine 13-mode steady-state test cycle (*i.e.*, the Supplemental Engine Test cycle or "SET"). The SET is required for determining tractor engine CO₂ emissions and fuel consumption. Consistent with the rationale we presented in our proposal and consistent with comments we received, these revised SET weighting factors better reflect the lower engine speed operation of modern engines, which frequently occurs at tractor cruise speeds. We used these revised weighting factors as part of our engine technology assessments of both current engine technology (*i.e.*, our "baseline engine" technology) and future engine technology.

Based on our assessments of the technological feasibility; cost effectiveness; requisite lead times for implementing new and additional engine technologies; and based on comments we received in response to our notice of proposed rulemaking and in response to our more recent notice of additional data availability, the agencies are finalizing steadily increasing stringencies of the CO₂ and fuel consumption separate engine standards for engine model years 2021, 2024 and 2027. In addition, for each of these model years, EPA is maintaining the Phase 1 separate engine standards for CH₄ and N₂O emissions—both at their Phase 1 numeric values. While EPA is not finalizing at this time more stringent N₂O emissions standards, as originally proposed, EPA may soon revisit these separate engine N₂O standards in a future rulemaking. All of the final Phase 2 separate engine standards are presented in Section II.D, along with our related assessments.

B. Phase 2 Regulatory Structure

As proposed, in this final action the agencies have built on the success of the Phase 1 GEM-based approach for the certification of tractors and vocational chassis, while also maintaining the Phase 1 separate engine standards approach to engine certification. While the regulatory structures of both Phase 1 and Phase 2 are quite similar, there are a number of new elements for Phase 2. Note that we are not applying these new

Phase 2 elements for compliance with the Phase 1 standards.

These modifications for Phase 2 are consistent with the agencies' Phase 1 commitments to consider a range of regulatory approaches during the development of future regulatory efforts (76 FR 57133), especially for vehicles not already subject to full vehicle chassis dynamometer testing. For example, we committed to consider a more sophisticated approach to vehicle testing to more completely capture the complex interactions within the total vehicle, including the engine and powertrain performance. We also committed to consider the potential for full vehicle certification of complete tractors and vocational chassis using a chassis dynamometer test procedure. We also considered chassis dynamometer testing of complete tractors and vocational chassis as a complementary approach for validating a more complex vehicle simulation approach. We committed to consider the potential for a regulatory program for some of the trailers hauled by tractors. After considering these various approaches, the agencies proposed a structure in which regulated tractor and vocational chassis manufacturers would additionally enter engine and powertrain-related inputs into GEM, which was not part of in Phase 1.

The basic structure in the proposal was widely supported by commenters, although some commenters supported changing certain aspects. Some commenters suggested revising GEM to recognize additional technologies, such as tire pressure monitoring systems and electronic controls that decrease fuel consumption while a vehicle is coasting. To the extent that the agencies were able to collect and receive sufficient data to support such revisions in GEM, these changes were made. See Section II.C. for details. For determining certain GEM inputs, some commenters suggested more cost-effective test procedures for separate engine and transmission testing, compared to the engine-plus-transmission powertrain test procedure that the agencies proposed. In collaboration with researchers at engine manufacturer test

laboratories, at Oak Ridge National Laboratory and at Southwest Research Institute, the agencies completed a number of laboratory evaluations of these suggested test procedures.¹³¹ Based on these results, which were made available to the public for a 30-day comment period in the NODA, the agencies are finalizing these more cost-effective test procedures as options, in addition to the powertrain test procedure we proposed. We note that we are also finalizing some of these more cost-effective test procedures, the cycle average approach for all vehicle cycles, as optional for the testing of "pre-transmission" hybrids. In response to our request for comment, some commenters expressed support for a so-called, "cycle-average" approach for generating engine map data for input into GEM. This approach facilitates an accurate recognition of an engine's transient performance. The agencies further refined this approach, and we made detailed information on this approach available in the NODA.¹³² Based on comments, we are finalizing this approach as mandatory for mapping engines over GEM's transient cycle, and we are allowing this approach as optional for GEM's 55 mph and 65 mph cycles.

Some commenters expressed concern about GEM and our proposed tractor standards appropriately accounting for the performance of powertrain technologies installed in some of the largest specialty tractors. We have addressed this concern by finalizing a new "heavy-haul" tractor sub-category, with a unique payload and vehicle masses in GEM, which result in a unique set of numeric standards for these vehicles. This is explained in detail in Section III.D. Other commenters expressed concern about the greater complexity of GEM's additional inputs and the appropriateness of our proposed

¹³¹ Oak Ridge National Laboratory results docketed for the NODA: EPA-HQ-OAR-2014-0827-1622 and NHTSA-2014-0132-0183. Southwest Research Institute results docketed for the NODA: EPA-HQ-OAR-2014-0827-1619 and NHTSA-2014-0132-0184.

¹³² Ibid.

vocational chassis standards, as applied to certain custom-built vocational chassis. We have addressed these concerns by finalizing a limited number of optional custom chassis standards, tailored according to a vocational chassis' final application (e.g., school bus, refuse truck, cement mixer, etc.). To address the concerns about GEM's complexity for these specialty vehicles, these optional custom chassis standards require a smaller number of GEM inputs. This is explained in detail in Section V.D.

Some vehicle manufacturers did not support the agencies finalizing separate engine standards. However, as described below, the agencies continue to believe that separate engine standards are necessary and appropriate. Thus, the agencies are finalizing the basic rule structure that was proposed, but with a number of refinements.

For trailer manufacturers, which will be subject to first-time standards under Phase 2, we will apply the standards using a GEM-based certification, but to do so without actually running GEM. More specifically, based on the agencies' analysis of the results of running GEM many times and varying GEM's trailer configurations, the agencies have developed a simple equation that replicates GEM results, based on inputting certain trailer values into the equation. Use of the equation, rather than full GEM, should significantly facilitate trailer certification. As described in Chapter 2.10.5 of the RIA, the equation has a nearly perfect correlation with GEM, so that they can be used instead of GEM, without impacting stringency. This is a result of the relative simplicity of the trailer inputs as compared to the tractor and vocational vehicle inputs.

(1) Other Structures Considered

To follow-up on the commitment to consider other approaches, the agencies spent significant time and resources before the proposal in evaluating six different options for demonstrating compliance with the proposed Phase 2 standards as shown in Figure II.1

Figure II.1 Six Certification Options

As shown in Figure II.1 these six options include:

1. Full vehicle simulation, where vehicle inputs are entered into simulation software.

2. Vehicle simulation, supplemented with separate engine standards.

3. Controllers-in-the-loop simulation, where an actual electronic transmission controller module (TCM) and an actual engine controller module (ECM) are tested in hardware.

4. Engine-in-the-loop simulation, with or without a TCM, where at least the engine is tested in hardware.

5. Vehicle simulation with powertrain-in-the-loop, where the engine and transmission are tested in hardware. One variation involves an engine standard.

6. Full vehicle chassis dynamometer testing.

The agencies evaluated these options in terms of the capital investment required of regulated manufacturers to conduct the testing and/or simulation, the cost per test, the accuracy of the simulation, and the challenges of validating the results. Other considerations included the representativeness compared to the real world behavior, maintaining existing Phase 1 certification approaches that are known to work well, enhancing the Phase 1 approaches that could use improvements, the alignment of test procedures for determining GHG and

non-GHG emissions compliance, and the potential to circumvent the intent of the test procedures. The agencies presented our evaluations in the proposal, and we received comments on some of these approaches, and these comments were considered carefully in our evaluations for this final action. Notably, in this final action we are adopting a combination of these options, where some are mandatory and others are optional for certification via GEM. We have concluded that this combination of these options strikes an optimal balance between their costs, accuracy with respect to real-world performance, and robustness for ensuring compliance. In this section we present our evaluation and rationale for finalizing these Phase 2 certification approaches.

Chassis dynamometer testing (Option 6) is used extensively in the development and certification of light-duty vehicles. It also is used in Phase 1 to certify complete Class 2b/3 pickups and vans, as well as to certify certain incomplete vehicles (at the manufacturer's option). The agencies considered chassis dynamometer testing more broadly as a heavy-duty fuel efficiency and GHG certification option because chassis dynamometer testing has the ability to evaluate a vehicle's performance in a manner that most closely resembles the vehicle's in-use performance. Nearly all of the fuel

efficiency technologies can be evaluated simultaneously on a chassis dynamometer, including the vehicle systems' interactions that depend on the behavior of the engine, transmission, and other vehicle electronic controllers. One challenge associated with the application of wide-spread heavy-duty chassis testing is the small number of heavy-duty chassis test sites that are available in North America. As discussed in RIA Chapter 3, the agencies were only able to locate 11 heavy-duty chassis test sites. However, more recently we have seen an increased interest in building new sites since issuing the Phase 1 Final Rule. For example, EPA is currently building a heavy-duty chassis dynamometer with the ability to test up to 80,000 pound vehicles at the National Vehicle and Fuel Emissions Laboratory in Ann Arbor, Michigan.

Nevertheless, the agencies continue to be concerned about requiring a chassis test procedure for certifying tractors or vocational chassis due to the initial cost of a new test facility and the large number of heavy duty tractor and vocational chassis variants that could require testing. We have also concluded that for heavy-duty tractors and vocational chassis, there can be increased test-to-test variability under chassis dynamometer test conditions, versus other approaches. First, the agencies recognize that such testing

requires expensive, specialized equipment that is not widely available. The agencies estimate that it would vary from about \$1.3 to \$4.0 million per new test site depending on existing facilities.¹³³ In addition, the large number of heavy-duty vehicle configurations would require significant amounts of testing to cover the sector. For example, for Phase 1 tractor manufacturers typically certified several thousand variants of one single tractor model. Finally, EPA's evaluation of heavy-duty chassis dynamometer testing has shown that the variation of chassis test results is greater than light-duty testing, up to 3 percent worse, based on our sponsored testing at Southwest Research Institute.¹³⁴ The agencies' research identified a number of unique sources of test-to-test variability in HD chassis dynamometer testing versus other types of testing (described next). These unique sources include variations in HD tire performance and tire temperature and pressure stability; variations in human driver performance; and variations in the test facilities' heating, ventilation and air conditioning system affecting emissions after-treatment performance (e.g., increased fuel consumption to maintain after-treatment temperature) and engine accessory power (e.g., engine fan clutching). Although the agencies are not requiring chassis dynamometer certification of tractors and vocational chassis, we believe such an approach could potentially be appropriate in the future for some heavy duty vehicles if more test facilities become available and if the agencies are able to address the large number of vehicle variants that might require testing and the unique sources of test-to-test variability. Note, as discussed in Section II.C.(4) we are finalizing a manufacturer-run complete tractor heavy-duty chassis dynamometer test program for monitoring relative trends fuel efficiency and for comparing those trends to the trends indicated via GEM simulation. While the agencies did not receive significant comment on the appropriateness of full vehicle heavy-duty chassis dynamometer testing for certification, the agencies did receive significant, mostly negative, comment on the costs versus benefits of a manufacturer-run complete tractor heavy-duty chassis dynamometer test program for data collection. These comments and our responses are detailed in Section II.C.(4).

Another option considered for certification involves testing a vehicle's powertrain in a modified engine dynamometer test facility, which is part of option 5 shown in Figure II.1. In this case the engine and transmission are installed together in a laboratory test facility, and a dynamometer is connected to the output shaft of the transmission. GEM or an equivalent vehicle simulation computer program is then used to control the dynamometer to simulate vehicle speeds and loads. The step-by-step test procedure considered for this option was initially developed as an option for hybrid powertrain testing for Phase 1. We are not finalizing this approach as mandatory, but we are allowing this as an option for manufacturers to generate powertrain inputs for use in GEM. For Phase 2 we generally require this test procedure for evaluating hybrid powertrains for inputs into GEM, but there are certain exceptions where engine-only test procedures may be used to certify hybrids via GEM (e.g., pre-transmission hybrids).

A key advantage of the powertrain test approach is that it directly measures the effectiveness of the engine, the transmission, and the integration of these two components. Engines and transmissions are particularly challenging to simulate within a computer program like GEM because the engines and transmissions installed in vehicles today are actively and interactively controlled by their own sophisticated electronic controls; namely the ECM and TCM.

We believe that the capital investment impact on manufacturers for powertrain testing is reasonable; especially for those who already have heavy-duty engine dynamometer test facilities. We have found that, in general, medium-duty powertrains can be tested in heavy-duty engine test cells. EPA has successfully completed such a test facility conversion at the National Vehicle and Fuel Emissions Laboratory in Ann Arbor, Michigan. Southwest Research Institute (SwRI) in San Antonio, Texas has completed a similar test cell conversion. Oak Ridge National Laboratory in Oak Ridge, Tennessee has been operating a recently constructed heavy heavy-duty powertrain dynamometer facility, and EPA currently has an interagency agreement with DOE to fund EPA powertrain testing at ORNL. The results from this testing were published for a 30-day comment period, as part of the NODA.¹³⁵ Eaton Corporation has been

operating a heavy-duty powertrain test cell and has provided the agencies with valuable test results and other comments.¹³⁶ PACCAR recently constructed and began operation of a powertrain test cell that includes engine, transmission and axle test capabilities.¹³⁷ EPA also contracted SwRI to evaluate North America's capabilities (as of 2014) for powertrain testing in the heavy-duty sector and the cost of installing a new powertrain cell that meets agency requirements.¹³⁸ Results from this 2014 survey indicated that one supplier (Eaton) already had this capability. We estimate that the upgrade costs to an existing engine test facility are on the order of \$1.2 million, and a new test facility in an existing building are on the order of \$1.9 million. We also estimate that current powertrain test cells that could be upgraded to measure CO₂ emissions would cost approximately \$600,000. For manufacturers or suppliers wishing to contract out such testing, SwRI estimated that a cost of \$150,000 would provide about one month of powertrain testing services. Once a powertrain test cell is fully operational, we estimate that for a nominal powertrain family (i.e. one engine family tested with one transmission family), the cost for powertrain installation, testing, and data analysis would be about \$70,000 in calendar year 2016, in 2016 dollars. Since the NPRM in July 2015, the agencies and other stakeholders have completed significant new work toward refining the powertrain test procedure itself, and these results confirm the robustness of this approach. The agencies regulations provide details of the final powertrain test procedure. See 40 CFR 1037.550.

Furthermore, the agencies have worked with key transmission suppliers to develop an approach to define transmission families. Coupled with the agencies' existing definitions of engine families (40 CFR 1036.230 and 1037.230), we are finalizing powertrain family definitions in 40 CFR 1037.231 and axle and transmission families in 40 CFR 1037.232.

Even though there is conclusive evidence that powertrain testing is a

technically robust and cost-effective approach to evaluating the CO₂ and fuel consumption performance of powertrains, and even though there has been a clear trend toward manufacturers and other test laboratories recognizing the benefits and investing in new powertrain testing facilities, the agencies also received significant negative comment regarding the sheer amount of powertrain testing that could be required to certify the large number of unique configurations (*i.e.*, unique combinations of engines and transmissions). While the agencies proposed to allow manufacturers to group powertrains in powertrain families, as defined by the EPA in 40 CFR 1037.231, requiring powertrain testing broadly would still likely require a large number of tests. To address these concerns, while at the same time achieving most of the advantages of powertrain testing, the agencies are also finalizing some mandatory and optional test procedures to separately evaluate engine transient performance (via the mandatory “cycle-average” approach for the transient cycle) and transmission efficiency performance. While neither of these test procedures capture the optimized shift logic and other benefits of deep integration of the engine and transmission controllers, which only powertrain testing can capture, these separate test procedures do capture the remaining benefits of powertrain testing. The advantage of these separate tests is that their results can be mixed and matched within GEM to represent many more combinations of engines and transmissions than a comparable number of powertrain tests. For example, separately testing three parent engines that each have two child ratings and separately efficiency testing three transmissions that each have three major calibrations requires the equivalent test time of testing 6 powertrains, but without requiring the use of a powertrain test facility. More importantly, the results of these 6 tests can be combined within GEM to certify at least 27 different powertrain families, which would otherwise have required 27 powertrain tests—more than a four-fold increase in costs. This example clearly shows how cost-effective a vehicle simulation approach to vehicle certification can be.

Another regulatory structure option considered by the agencies was engine-only testing over the GEM duty cycles over a range of simulated vehicle configurations, which is part of Option 4 in Figure II.1. This is essentially a “cycle-average approach,” which would use GEM to generate engine duty cycles

by simulating a range of transmissions and other vehicle variations. These engine-level duty cycles would then be programmed into a separate controller of a dynamometer connected to an engine’s output shaft. The agencies requested comment on this approach, and based on continued research that has been conducted since the proposal, and based on comments we received in response to the NODA, we are finalizing this approach as mandatory for determining the GEM inputs that characterize an engine’s transient engine performance within GEM over the ARB Transient duty cycle. We are also finalizing this approach as optional for characterizing the more steady-state engine operation in GEM over the 55 mph and 65 mph duty cycles with road grade, in lieu of steady-state engine mapping for these two cycles. We are also finalizing this approach as an option for certifying pre-transmission hybrids, in lieu of powertrain testing. We are calling this approach the “cycle-average” approach, which generates a cycle-average engine fuel map that is input into GEM. This map simulates an engine family’s performance over a given vehicle drive cycle, for the full range of vehicles into which that engine could be installed. Unlike the chassis dynamometer or powertrain dynamometer approaches, which could have significant test facility construction or modification costs, this engine-only approach necessitates little capital investment because engine manufacturers already have engine test facilities to both develop engines and to certify engines to meet both EPA’s non-GHG standards and the agencies’ Phase 1 fuel efficiency and GHG separate engine standards. This option has received significant attention since our notice of proposed rulemaking. EPA and others have published peer reviewed journal articles demonstrating the efficacy of this approach.^{139 140} and the agencies have received significant comments on both the information we presented in the proposal and in the NODA. Comments have been predominantly supportive, and the comments we received tended to focus on ideas for further minor refinements of this test procedure.^{136 141 142 143 144 145}

¹⁴¹ Cummins, Inc., Comments in Response to Greenhouse Gas Emissions and Fuel Efficiency Standards for Medium- and Heavy-Duty Engines

At this time the agencies believe that the wealth of experimental data supporting the robustness and cost-effectiveness of the cycle-average approach, supports the agencies’ decision to finalize this test procedure as mandatory for the determination of the transient performance of engines for use in GEM (*i.e.*, over the ARB Transient Cycle).

The agencies also considered simulating the engine, transmission, and vehicle using a computer program; while having the actual transmission electronic controller connected to the computer running the vehicle simulation program, which is part of Option 3 in Figure II.1. The output of the simulation would be an engine cycle that would be used to test the engine in an engine test facility. Just as in the cycle-average approach, this procedure would not require significant capital investment in new test facilities. An additional benefit of this approach would be that the actual transmission controller would be determining the transmission gear shift points during the test, without a transmission manufacturer having to reveal their proprietary transmission control logic. This approach comes with some significant technical challenges, however. The computer model would have to become more complex and tailored to each new transmission and controller to make sure that the controller would operate properly when it is connected to a computer instead of an actual transmission. Some examples of the transmission specific requirements would be simulating all the Controller Area Network (CAN) communication to and from the transmission controller and the specific sensor responses both through simulation and hardware. Each vehicle manufacturer would have to be

responsible for connecting the transmission controller to the computer, which would require a detailed verification process to ensure it is operating properly while it is in fact disconnected from a real transmission. Determining full compliance with this test procedure would be a significant challenge for the regulatory agencies because the agencies would have to be able to replicate each of the manufacturer's unique interfaces between the transmission controller and computer running GEM. The agencies did not receive any significant comments on this approach, presumably because commenters focused on the more viable options of powertrain testing and the cycle-average engine mapping approach. And because of the significant challenges noted above, the agencies did not pursue this option further between the time of proposal and this final action. However, should this approach receive more research attention in the future, such that the concerns noted above are sufficiently addressed, the agencies could consider allowing this certification approach as an option, within the context of a separate future rulemaking.

Finally, the agencies considered full vehicle simulation plus separate engine standards (Option 2 in Figure II.1), which is the required approach being finalized for Phase 2. This approach is discussed in more detail in the following sections. It should be noted before concluding this subsection that the agencies do provide a regulatory path for manufacturers to apply for approval of alternative test methods that are different than those the agencies specify. See 40 CFR part 1065, subpart A. Therefore, even though we have not finalized some of the certification approaches and test procedures that we investigated, our conclusions about these procedures do not prevent a manufacturer from seeking agency approval of any of these procedures or any other alternative procedures.

(2) Final Phase 2 Regulatory Structure

Under the final Phase 2 structure, tractor and vocational chassis manufacturers will be required to provide engine, transmission, drive axle(s) and tire inputs into GEM (as well as the inputs already required under Phase 1). For Phase 1, GEM used fixed default values for all of these, which limited the types of technologies that could be recognized by GEM to show compliance with the standards. We are expanding GEM to account for a wider range of technological improvements that would otherwise need to be recognized through the more

cumbersome off-cycle crediting approach in Phase 1. Additional technologies that will now be recognized in GEM also include lightweight thermoplastic materials, automatic tire inflation systems, tire pressure monitoring systems, advanced cruise control systems, electronic vehicle coasting controls, engine stop-start idle reduction systems, automatic engine shutdown systems, hybrids, and axle configurations that decrease the number of drive axles. The agencies are also continuing separate engine standards. As described below, we see advantages to having both engine-based and vehicle-based standards. Moreover, the advantages described here for full vehicle simulation do not necessarily correspond to disadvantages for engine testing or vice versa.

(a) Advantages of Vehicle Simulation

The agencies' primary purpose in developing fuel efficiency and GHG emissions standards is to increase the use of vehicle technologies that improve fuel efficiency and decrease GHG emissions. Under the Phase 1 tractor and vocational chassis standards, there is no *regulatory* incentive for vehicle manufacturers to consider adopting new engine, transmission or axle technologies because GEM was not configured to recognize these technologies uniquely, leaving off-cycle credits as the only regulatory mechanism to recognize these technologies' benefits. By recognizing such technologies in GEM under Phase 2, the agencies will be creating a direct regulatory incentive to improve engine, transmission, and axle technologies to improve fuel efficiency and decrease GHG emissions. In its 2014 report, NAS also recognized the benefits of full vehicle simulation and recommended that the Phase 2 rules incorporate such an approach.¹⁶⁰

The new Phase 2 approach will create three new specific regulatory incentives. First, vehicle manufacturers will have an incentive to use the most efficient engines. Since GEM will no longer use the agency default engine in simulation, manufacturers will have their own engines recognized in GEM. Under Phase 1, engine manufacturers have a regulatory incentive to design efficient engines, but vehicle manufacturers do not have a similar regulatory incentive to use the most efficient engines in their vehicles. Second, the new Phase 2 approach will create incentives for both engine and vehicle manufacturers to design engines and vehicles to work together to ensure that engines actually operate as much as possible near their most efficient points. This is because

Phase 2 GEM will require the vehicle manufacturers to input specific transmission, axle, and tire characteristics, thus recognizing powertrain optimization, such as engine down-speeding, and different transmission architectures and technologies, such as automated manual transmissions, automatic transmissions, and different numbers of transmission gears, transmission gear ratios, axle ratios and tire revolutions per mile. No matter how well designed, all engines have speed and load operation points with differing fuel efficiency and GHG emissions. The speed and load point with the best fuel efficiency (*i.e.*, peak thermal efficiency) is commonly known as the engine's "sweet spot." The more frequently an engine operates near its sweet spot, the better the vehicle's fuel efficiency will be. In Phase 1, a vehicle manufacturer receives no regulatory credit under GEM for designing its vehicle to operate closer to its engine's sweet spot because Phase 1 GEM does not model the specific engine, transmission, axle, or tire revolutions per mile of the vehicle. Third, this approach will recognize improvements to the overall efficiency of the drivetrain, including the axle. The new version of GEM will recognize the benefits of different integrated axle technologies including axle lubricants (via an optional axle efficiency test), and technologies that reduce axle losses such as by enabling three-axle vehicles to deliver power to only one rear axle. This is accomplished through the simulation of axle disconnect technology (see Chapter 4.5 of the RIA). The new version of GEM also will be able to recognize the benefits of reducing energy losses within a transmission, via an optional transmission efficiency test.

In addition to providing regulatory incentives to use more fuel efficient technologies, expanding GEM to recognize engine and other powertrain component improvements will provide important flexibility to vehicle manufacturers. Providing flexibility to effectively trade engine and other powertrain component improvements against the other vehicle improvements that are recognized in GEM will allow vehicle manufacturers to better optimize their vehicles to achieve the lowest cost for specific customers. Because of the improvements in GEM, GEM will recognize this deeper level of vehicle optimization. Vehicle manufacturers could use this flexibility to reduce overall compliance costs and/or address special applications where certain vehicle technologies are not preferred or

practical. The agencies considered in Phase 1 allowing the exchange of emission certification credits generated relative to the separate brake-specific engine standards and credits generated relative to the vehicle standards. However, we did not allow this in Phase 1 due in part to concerns about the equivalency of credits generated relative to different standards, with different units of measure and different test procedures. The Phase 2 approach eliminates these concerns because engine and other vehicle component improvements will be evaluated relative to the same vehicle standard in GEM. This also means that under the Phase 2 approach there is no need to consider allowing emissions credit trading between engine-generated and vehicle-generated credits because vehicle manufacturers are directly credited by the combination of engine and vehicle technologies they choose to install in each vehicle. Therefore, this approach eliminates one of the concerns about continuing separate engine standards, which was that a separate engine standard and a full vehicle standard were somehow mutually exclusive. That is not the case. In fact, in the next section we describe how we are continuing the separate engine standard along with recognizing engine performance at the vehicle level. The agencies acknowledge that maintaining a separate engine standard will limit flexibility in cases where a vehicle manufacturer wanted to use less efficient engines and make up for them using more efficient vehicle technologies. However, as described below, we see important advantages to maintaining a separate engine standard, and we believe they more than justify the reduced flexibility. Furthermore, in response to comments about some specialized vocational custom chassis, the agencies are finalizing a limited number of optional standards that would be met using a somewhat simplified version of GEM. Specifically, in this simplified version of GEM, which is only applicable as an option for certain custom chassis applications, the GEM inputs for the engine, transmission gears, gear ratios, gear efficiency; axle ratio, axle efficiency; and tire revolutions per mile are all fixed to default values. This simplification allows the option of certifying these custom chassis without penalty for utilizing less efficient engines, transmissions, or axles. This flexibility also addresses a comment the agencies received from Cummins that the inclusion of the specific engine in GEM limits the flexibility provided by

the separate engine standards' emissions averaging, banking and trading program. Cummins explained that certain applications like emergency vehicles, cement mixers and recreational vehicles oftentimes require higher-performance, less-efficient, engines, which are credit using engines under the ABT program of the separate engine standards. Because these particular vehicle applications have few other cost-effective and practical vehicle-level technologies with which to offset their use of less efficient engines, the main Phase 2 vocational chassis standards that require engine and other powertrain inputs into GEM (*i.e.*, the standards for other than custom chassis vocational vehicles) could be particularly challenging for these applications. However, the optional custom chassis standards solves this issue for custom chassis applications. This approach solves two issues. First, it provides a means toward certification for these custom chassis applications, without penalty for using the engines they need. Second, this approach maintains the flexibility intended by the separate engine standards' averaging, banking and trading program since these custom chassis applications would still be using certified engines.

One disadvantage of recognizing engines and transmission in GEM is that it will increase complexity for the vehicle standards. For example, vehicle manufacturers will be required to conduct additional engine tests and to generate additional GEM inputs for compliance purposes. However, we believe that most of the burden associated with this increased complexity will be an infrequent burden of engine testing and updating information systems to track these inputs. Furthermore, the agencies are requiring that engine manufacturers certify their respective GEM inputs; namely, their own engine maps. Because there are a relatively small number of heavy-duty engine manufacturers who will be responsible for generating and complying with their declared engine maps for GEM, the overall engine testing burden to the heavy-duty vehicle industry is small. With this approach, the large number of vocational chassis manufacturers will not have to conduct any engine testing.

Another potential disadvantage to GEM-based vehicle certification is that because GEM measures performance over specific duty cycles intended to represent average operation of vehicles in-use, this approach might also create an incentive to optimize powertrains and drivetrains for the best GEM performance rather than the best in-use performance for a particular application.

This is always a concern when selecting duty cycles for certification, and so is not an issue unique to GEM. There will always be instances, however infrequent, where specific vehicle applications will operate differently than the duty cycles used for certification. The question is would these differences force manufacturers to optimize vehicles to the certification duty cycles in a way that decreases fuel efficiency and increases GHG emissions in-use? We believe that the certification duty cycles will not create a disincentive for manufacturers to properly optimize vehicles for customer fuel efficiency. First, the impact of the certification duty cycles versus any other real-world cycle will be relatively small because they affect only a small fraction of all vehicle technologies. Second, the emission averaging and fleet average provisions mean that the regulations will not require all vehicles to meet the standards. Vehicles exceeding a standard over the duty cycles because they are optimized for different in-use operation can be offset by other vehicles that perform better over the certification duty cycles. Third, vehicle manufacturers also have the ability to lower such a vehicle's measured GHG emissions by adding technology that would improve fuel efficiency both over the certification duty cycles and in-use (and to be potentially eligible to generate off-cycle credits in doing so). These standards are not intended to be at a stringency where manufacturers will be expected to apply all technologies to all vehicles. Thus, there should be technologies available to add to vehicle configurations that initially fail to meet the Phase 2 standards. Fourth, we are further sub-categorizing the vocational vehicle segment compared to Phase 1, tripling the number of subcategories within this segment from three to nine. These nine subcategories will divide each of the three Phase 1 weight categories into three additional vehicle speed categories. Each of the three speed categories will have unique duty cycle weighting factors to recognize that different vocational chassis are configured for different vehicle speed applications. This further subdivision better recognizes technologies' performance under the conditions for which the vocational chassis was configured to operate. This also decreases the potential of the certification duty cycles to encourage manufacturers to configure vocational chassis differently than the optimum configuration for specific customers' applications. Similarly, for the tractor

category we are finalizing a new “heavy-haul” category to recognize the greater payload and vehicle mass of these tractors, as well as their limitations to effectively utilize some technologies like aerodynamic technologies. These new categories help minimize differences between GEM simulation and real-world operation. Finally, we are also recognizing seven specific vocational vehicle applications under the optional custom chassis vocational vehicle standards.

Another disadvantage of our full vehicle simulation approach is the potential requirement for engine manufacturers to disclose information to vehicle manufacturers who install their engines that engine manufacturers might consider to be proprietary. Under this approach, vehicle manufacturers may need to know some additional details about engine performance long before production, both for compliance planning purposes, as well as for the actual submission of applications for certification. Moreover, vehicle manufacturers will need to know details about the engine’s performance that are generally not publicly available—specifically the detailed steady-state fuel consumption map of an engine. Some commenters expressed significant concern about the Phase 2 program forcing the disclosure of proprietary steady-state engine performance information to business competitors; especially prior to an engine being introduced into commerce. It can be argued that a sufficiently detailed steady-state engine map, such as the one required for input into GEM, can reveal proprietary engine design elements such as intake air, turbo-charger, and exhaust system design; exhaust gas recirculation strategies; fuel injection strategies; and exhaust after-treatment thermal management strategies. Conversely, the agencies also received comments requesting that all GEM inputs be made public, as a matter of transparency and public interest.

It is unclear at this point whether such information is truly proprietary. In accordance with Federal statutes, EPA does not release information from certification applications (or other compliance reports) that we determine to be Confidential Business Information (CBI) under 40 CFR part 2. Consistent with section 114(c) of the CAA, EPA does not consider emission test results to be CBI *after* introduction into commerce of the certified engine or vehicle. However, we have generally treated test results as protected *before* a product’s introduction into commerce date. EPA has not yet made a final CBI determination for Phase 1 or Phase 2

GEM inputs. Nevertheless, at this time we expect to continue our current policy of non-disclosure prior to introduction into commerce, but we consider it likely that we would ultimately not treat any test results or other GEM inputs as CBI *after* the introduction into commerce date, as identified by the manufacturer.

To further address the specific concern about the Phase 2 program forcing the disclosure of proprietary steady-state engine maps to business competitors, especially prior to an engine being introduced into commerce, the agencies are finalizing an option for engine manufacturers to certify only “cycle average” engine maps over the 55-mph and 65-mph GEM cycles and separately mandating the cycle average approach for use over the ARB Transient cycle. See Section II.B. above. The advantage to this approach is that each data point of a cycle average map represents the average emissions over an entire cycle. Therefore, the cycle average engine map approach does not reveal any potentially proprietary information about an engine’s performance at a particular steady-state point of operation.

(b) Advantages of Separate Engine Standards

For engines installed in tractors and vocational vehicle chassis, we are maintaining separate engine standards for fuel consumption and GHG emissions in Phase 2 for both spark-ignition (SI, generally but not exclusively gasoline-fueled) and compression-ignition (CI, generally but not exclusively diesel-fueled) engines. Moreover, we are adopting a sequence of new more stringent engine standards for CI engines for engine model years 2021, 2024 and 2027. While the vehicle standards alone are intended to provide sufficient incentive for improvements in engine efficiency, we continue to see important advantages to maintaining separate engine standards for both SI and CI engines. The agencies believe the advantages described below are critical to fully achieve the goals of the EPA and NHTSA standards.

First, EPA has a robust compliance program based on separate engine testing. For the Phase 1 standards, we applied the existing criteria pollutant compliance program to ensure that engine efficiency in actual use reflected the improvements manufacturers claimed during certification. With engine-based standards, it is straightforward to hold engine manufacturers accountable by testing in-use engines in an engine dynamometer laboratory. If the engines exceed the

standards, manufacturers can be required to correct the problem or perform other remedial actions. Without separate engine standards in Phase 2, addressing in-use compliance would be more subjective. Having clearly defined compliance responsibilities is important to both the agencies and to the manufacturers.

Second, engine standards for CO₂ and fuel efficiency force engine manufacturers to optimize engines for both fuel efficiency and control of non-CO₂ emissions at the same engine operating points. This is of special concern for NO_x emissions, given the strong counter-dependency between engine-out NO_x emissions and fuel consumption. By requiring engine manufacturers to comply with both NO_x and CO₂ standards using the same test procedures, the agencies ensure that manufacturers include technologies that can be optimized for both, rather than alternate, calibrations that would trade NO_x emissions against fuel consumption, depending how the engine or vehicle is tested. In the past, when there was no CO₂ engine standard and no steady-state NO_x standard, some manufacturers chose this dual calibration approach instead of investing in technology that would allow them to simultaneously reduce both CO₂ and NO_x.

It is worth noting that these first two advantages foster fair competition within the marketplace. In this respect, the separate engine standards help assure manufacturers that their competitors are not taking advantage of regulatory ambiguity. The agencies believe that the absence of separate engine standards would leave open the opportunity for a manufacturer to choose a high-risk compliance strategy by gaming the NO_x-CO₂ tradeoff. Manufacturer concerns that competitors might take advantage of this can create a dilemma for those who wish to fully comply, but also perceive shareholder pressure to choose a high-risk compliance strategy to maintain market share.

Finally, the existence of meaningful separate engine standards allows the agencies to exempt certain vehicles from some or all of the vehicle standards and requirements without forgoing the engine improvements. A good example of this is the off-road vehicle exemption in 40 CFR 1037.631 and 49 CFR 535.3, which exempts vehicles “intended to be used extensively in off-road environments” from the vehicle requirements. The engines used in such vehicles must still meet the engine standards of 40 CFR 1036.108 and 49 CFR 535.5(d). The agencies see no

reason why efficient engines cannot be used in such vehicles. However, without separate engine standards, there would be no way to require the engines to be efficient. The engine standards provide a similar benefit with respect to the custom chassis program discussed in Section V.

In the past there has been some confusion about the Phase 1 separate engine standards somehow preventing the recognition of engine-vehicle optimization that vehicle manufacturers perform to minimize a vehicle's overall fuel consumption. It was not the existence of separate engine standards that prevented recognition of this optimization. Rather it was that the agencies did not allow manufacturers to enter inputs into GEM that characterized unique engine performance. For Phase 2 we are requiring that manufacturers input such data because we intend for GEM to recognize this engine-vehicle optimization. The continuation of separate engine standards in Phase 2 does not undermine in any way the recognition of this optimization in GEM.

*C. Phase 2 GEM and Vehicle Component Test Procedures*¹⁴⁶

GEM was originally created for the certification of tractors and vocational vehicle chassis to the agencies' Phase 1 CO₂ and fuel efficiency standards. See 76 FR 57116, 57146, and 57156–57157. For Phase 2 the agencies proposed a number of modifications to GEM, and based on public comments in response to the agencies' proposed modifications, the agencies have further refined these modifications for this final action.

In Phase 1 the agencies adopted a regulatory structure where regulated entities are required to use GEM to simulate and certify tractors and vocational vehicle chassis. This computer program is provided free of charge for unlimited use, and the program may be downloaded by anyone from EPA's Web site: <http://www3.epa.gov/otaq/climate/gem.htm>. GEM mathematically combines the results of a number of performance tests of certain vehicle components, along with other pre-determined vehicle attributes and driving patterns to determine a vehicle's characteristic levels of fuel consumption and CO₂ emissions, for certification purposes. For Phase 1, the required inputs to GEM for tractors include vehicle aerodynamics information, tire rolling resistance, and whether or not a vehicle

is equipped with certain lightweight high-strength steel or aluminum components, a tamper-proof speed limiter, or tamper-proof idle reduction technologies. For Phase 1, the sole input for vocational vehicles is tire rolling resistance. For Phase 1, the computer program's inputs did not include engine test results or attributes related to a vehicle's powertrain; namely, its transmission, drive axle(s), or tire revolutions per mile. Instead, for Phase 1 the agencies specified generic engine and powertrain attributes within GEM. For Phase 1 these are fixed and cannot be changed in GEM.¹⁴⁷

Similar to other vehicle simulation computer programs, GEM combines various vehicle inputs with known physical laws and justified assumptions to predict vehicle performance for a given period of vehicle operation. GEM represents this information numerically, and this information is integrated as a function of time to calculate CO₂ emissions and fuel consumption. Some of the justified assumptions in GEM include average energy losses due to friction between moving parts of a vehicle's powertrain; the logical behavior of an average driver shifting from one transmission gear to the next; and speed limit assumptions such as 55 miles per hour for urban highway driving and 65 miles per hour for rural interstate highway driving. The sequence of the GEM vehicle simulation can be visualized by imagining a human driver initially sitting in a parked running tractor or vocational vehicle. The driver then proceeds to drive the vehicle over a prescribed route that includes three distinct patterns of driving: Stop-and-go city driving, urban highway driving, and rural interstate highway driving. The driver then exits the highway and brings the vehicle to a stop, with the engine still running at idle. This concludes the vehicle simulation sequence.

Over each of the three driving patterns or "duty cycles," GEM simulates the driver's behavior of pressing the accelerator, coasting, or applying the brakes. GEM also simulates how the engine operates as the gears in the vehicle's transmission are shifted and how the vehicle's weight, aerodynamics, and tires resist the forward motion of the vehicle. GEM combines the driver behavior over the duty cycles with the various vehicle inputs and other assumptions to determine how much fuel must be consumed to move the vehicle forward

at each point during the simulation. For Phase 2 the agencies added the effect of road grade. In GEM the effect of road grade on fuel consumption is simulated by increasing fuel consumption uphill, by the amount of fuel consumed by the engine to provide the power needed to raise the mass of the vehicle and its payload against the force of Earth's gravity—while at the same time maintaining the duty cycle's vehicle speed. Downhill road grades are simulated by decreasing the engine's fuel consumption, by the amount of power returned to the vehicle by it moving in the same direction as Earth's gravity. To maintain vehicle speed downhill, simulated brakes are sometimes applied, and the energy lost due to braking results in a certain amount of fuel consumption as well. For each of the three duty cycles, GEM totals the amount of fuel consumed and then divides that amount by the product of the miles travelled and tons of payload carried. The tons of payload carried are specified by the agencies for each vehicle type and weight class, and these cannot be changed in GEM.

In addition to determining fuel consumption over these duty cycles, for Phase 2, GEM calculates a vehicle's fuel consumption rate when it is stopped in traffic with the driver still operating the vehicle (*i.e.*, "drive idle") and when the vehicle is stopped and parked with the engine still running (*i.e.*, "parked idle"). For each regulatory subcategory of tractor and vocational vehicle (*e.g.*, sleeper cab tractor, day cab tractor, light heavy-duty urban vocational vehicle, heavy heavy-duty regional vocational vehicle, etc.), GEM applies the agencies' prescribed weighting factors to each of the three duty cycles and to each of the two idle fuel consumption rates to represent the fraction of city driving, urban highway driving, rural highway driving, drive idle, and parked idle that is typical of each subcategory. After combining the weighted results of all the cycles and idle fuel rates, GEM then outputs a single composite result for the vehicle, expressed as both fuel consumed in gallon per 1,000 ton-miles (for NHTSA standards) and an equivalent amount of CO₂ emitted in grams per ton-mile (for EPA standards). These are the vehicle's GEM results that are used along with other information to demonstrate that a vehicle certificate holder (*e.g.*, a vehicle manufacturer) complies with the applicable standards. This other information includes the annual sales volume of the vehicle family, plus information on emissions credits that may be generated or used as

¹⁴⁶ The specific version of GEM used to develop these standards, and which we propose to use for compliance purposes is also known as GEM 3.0.

¹⁴⁷ These attributes are recognized in Phase 1 innovative technology provisions at 40 CFR 1037.610.

part of that vehicle family's certification.

For Phase 1 GEM's tractor inputs include vehicle aerodynamics information, tire rolling resistance, and whether or not a vehicle is equipped with lightweight materials, a tamper-proof speed limiter, or tamper-proof idle reduction technologies. Other vehicle and engine characteristics in GEM were fixed as defaults that cannot be altered by the user. These defaults included tabulated data of engine fuel rate as a function of engine speed and torque (*i.e.*, "engine fuel maps"), transmissions, axle ratios, and vehicle payloads. For tractors, Phase 1 GEM simulates a tractor pulling a standard trailer. For vocational vehicles, Phase 1 GEM includes a fixed aerodynamic drag coefficient and vehicle frontal area.

For Phase 2 new inputs are required and other new inputs are allowed as options. These include the outputs of new test procedures to "map" an engine to generate steady-state and transient, cycle-average, engine fuel rate inputs to represent the actual engine in a vehicle. As described in detail in RIA Chapter 4, certification to the Phase 2 standards will require entering new inputs into GEM to describe the vehicle's transmission type and its number of gears and gear ratios. Manufacturers must also enter attributes that describe the vehicle's drive axle(s) type, axle ratio and tire revolutions per mile. We are also finalizing a number of options to conduct additional component testing for the purpose of replacing some of the agencies' "default values" in GEM with inputs that are based on component testing. These include optional axle and transmission power loss test procedures. We are also finalizing an optional powertrain test procedure that would replace both the required engine mapping and the agencies' default values for a transmission and its automated shift strategy. We are also finalizing an option to generate cycle-average maps for the 55 mph and 65 mph cycles in GEM. In addition, we have made a number of improvements to the aerodynamic coast-down test procedures and associated aerodynamic data analysis techniques. While these aerodynamic test and data analysis improvements are primarily intended for tractors, for Phase 2 we are providing a streamlined off-cycle credit pathway for vocational vehicle aerodynamic performance to be recognized in GEM.

As proposed, we are finalizing a significantly expanded number of technologies that are recognized in GEM. These include recognizing lightweight thermoplastic materials, automatic tire inflation systems,

advanced cruise control systems, workday idle reduction systems, and axle configurations that decrease the number of drive axles. In response to comments and data submitted to the agencies on the Phase 2 proposal we are also finalizing inputs related to tire pressure monitoring systems and advanced electronically controlled vehicle coast systems.

Although GEM is similar in concept to a number of other commercially available vehicle simulation computer programs, the applicability of GEM is unique. First, GEM was designed exclusively for manufacturers and regulated entities to certify tractor and vocational vehicle chassis to the agencies' fuel consumption and CO₂ emissions standards. For GEM to be effective for this purpose, the inputs to GEM include only information related to certain vehicle components and attributes that significantly impact vehicle fuel efficiency and CO₂ emissions. For example, these include vehicle aerodynamics, tire rolling resistance, and powertrain component information. On the other hand, other attributes such as those related to a vehicle's suspension, frame strength, or interior features are not included, where these otherwise might be included in other commercially available vehicle simulation programs that are used for other purposes. Furthermore, the simulated payload, driver behavior and duty cycles in GEM cannot be changed. Keeping these values constant helps to ensure that all vehicles are simulated and certified in the same way. However, these fixed attributes in GEM largely preclude GEM from being of much use as a research tool for exploring the effects of payload, driver behavior and different duty cycles.

Similar to Phase 1, GEM for Phase 2 is available free of charge for unlimited use, and the GEM source code is open source. That is, the programming source code of GEM is freely available upon request for anyone to examine, manipulate, and generally use without restriction. In contrast, commercially available vehicle simulation programs are generally not free and open source. Additional details of GEM are included in Chapter 4 of the RIA.

GEM is a computer software program, and like all other software development processes the agencies periodically released a number of developmental versions of the GEM software for others to review and test during the Phase 2 rulemaking process. This type of user testing significantly helps the agencies detect and fix any problems or "bugs" in the GEM software.

As part of Phase 1, the agencies conducted a peer review of GEM version 1.0, which was the version released for the Phase 1 proposal.^{148 149} In response to this peer review and to comments from stakeholders, EPA made changes to the version of GEM released with the Phase 1 final rule. Updates to the Phase 1 GEM were also made via Technical Amendments.¹⁵⁰ The current version of Phase 1 GEM is v2.0.1, which is the version applicable for the Phase 1 standards.¹⁵⁰ As part of the development of GEM for Phase 2, both a formal peer review¹⁴⁹ and a series of expert reviews were conducted.^{151 152 153 154}

The agencies have provided numerous opportunities for comment on GEM, and its iterative development. Shortly after the Phase 2 proposal's publication in July 2015 (and before the end of the public comment period), the agencies received comments on GEM. Based on these early comments, the agencies made minor revisions to fix a few bugs in GEM and in August 2015 released an updated version of GEM to the public for additional comment, which also included new information on GEM road grade profiles. The agencies also extended the public comment period on the proposal, which provided at least 30 days for public comment on this slightly updated version of GEM.¹⁵³ Then, in response to comments submitted at the close of the comment period, in early January 2016

the agencies released a “debugging” version of GEM to a wide range of expert reviewers.¹⁵² The agencies provided one month for expert reviewers to provide informal feedback for debugging purposes.¹⁵² Because the changes for this debugging version mostly added new features to make GEM easier to use for certifying via optional test procedures, like the powertrain test, there were only minor changes to the way that GEM performed. In the March 2016 NODA, the agencies included another developmental version of GEM¹⁵³ for public comment and provided 30 days for public comment. Based on the NREL report, which was also released as part of the NODA for public comment, the NODA version of GEM contained updated weighting factors of the duty cycles and idle cycles.¹⁵⁵ Therefore, the outputs of GEM for a given vehicle configuration changed because these duty cycle weighting factors changed, but there were only minor updates to how the individual technologies were simulated in GEM. Based on comments received on the NODA, the agencies made minor changes to GEM and released another debugging version in May 2016 to manufacturers, NGOs, suppliers, and CARB staff.¹⁵⁴ The most significant change to GEM for the May 2016 version was that 0.5 miles of flat road was added to the beginning and end of the 55 mph and 65 mph drive cycles in response to concerns raised by manufacturers.¹⁵⁶ This change did not change the way that GEM worked, but it did change GEM results because of the change in the duty cycles. This change was made to better align GEM simulation with real-world engine operation. The agencies provided the expert reviewers with at least a 3-week period in which to review GEM and provide feedback. Details on the history of the comments the agencies received and the history of the agencies responses leading to these multiple releases of GEM can be found in Section II.C.(1). The following list summarizes the changes in GEM in response to those comments and data submitted to the agencies in response to the Phase 2 proposal, NODA and other GEM releases:

- Revised road grade profiles for 55- and 65-mph cruise cycles, only minor changes since August 2015.
- Revised idle cycles for vocational vehicles with new vocational cycle

weightings, weightings released for public comment in NODA.

- Made changes to the input file structures. Examples includes additions of columns for axle configuration (“6×2,” “6×4,” “6×4D,” “4×2”), and additions of a few more technology improvement inputs, such as “Neutral Idle,” “Start/Stop,” and “Automatic Engine Shutdown.” These were minor changes, all were in NODA version of GEM.

- Made changes to the output file structures. Examples include an option to allow the user to select an output of detailed results on average speed, average work at the input and output of the transmission, and the numbers of shifts for each cycle (e.g., 55 mph cycle, 65 mph cycle and the ARB Transient cycle). These were minor changes, all were in NODA version of GEM.

- Added an input file for optional axle power losses (function of axle output speed and torque) and replaced a single axle efficiency value with lookup table of power loss. These were minor changes to streamline the use of GEM, all were in NODA version of GEM.

- Modified engine torque response to be more realistic, with a fast response region scaled by engine displacement, and a slower torque response in the turbo-charger’s highly boosted region. These were minor changes, all were in NODA version of GEM.

- Added least-squares regression models to interpret cycle-average fuel maps for all cycles. These were minor changes to streamline the use of GEM, all were in NODA version of GEM.

- Added different fuel properties according to 40 CFR 1036.530. This was a fix to align GEM with regulations.

- Improved shift strategy based on testing data and comments received. These were minor changes, all were in NODA version of GEM.

- Added scaling factors for transmission loss and inertia, per regulatory subcategory. These were minor changes, all were in NODA version of GEM.

- Added optional input table for transmission power loss data. These were minor changes to streamline the use of GEM, all were in NODA version of GEM.

- Added minimum torque converter lock-up gear user input for automatic transmissions. This was a minor change to streamline the use of GEM, this change was in the NODA version of GEM.

- Revised the default transmission power loss tables, based on test data. This was a minor change to streamline

the use of GEM, this change was in the NODA version of GEM.

- Added neutral idle and start/stop effects idle portions of the ARB Transient cycle. These were minor changes, all were in NODA version of GEM

- Adjusted shift and torque converter lockup strategy. This was a minor change to streamline the use of GEM, this change was in the NODA version of GEM.

Notwithstanding these numerous opportunities for public comment (as well as many informal opportunities via individual meetings), some commenters maintained that they still had not received sufficient notice to provide informed comment because each proposal represented too much of a “moving target.”^{157 158 159} The agencies disagree. Even at proposal, Phase 2 GEM provided nearly all of the essential features of the version we are promulgating in final form. These include: (1) The reconfiguration of the engine, transmission, and axle sub-models to reflect additional designs and to receive manufacturer inputs; and (2) the addition of road grade and idle cycles for vocational vehicles, along with revised weighting factors.

Moreover, the changes the agencies have made to GEM in response to public comment indicates that those comments were highly informed by the proposal. The agencies thus do not accept the contention that commenters were not afforded sufficient information to provide meaningful comment on GEM.

(1) Description of Modifications to GEM From Phase 1 to Phase 2

As explained above, GEM is a computer program that was originally developed by EPA specifically for manufacturers to use to certify to the Phase 1 tractor and vocational chassis standards. GEM mathematically combines the results of vehicle component test procedures with other vehicle attributes to determine a vehicle’s certified levels of fuel consumption and CO₂ emissions. Again as explained above, for Phase 1 the required inputs to GEM include vehicle aerodynamics information, tire rolling resistance, and whether or not a vehicle is equipped with certain lightweight

high-strength steel or aluminum components, a tamper-proof speed limiter, or tamper-proof idle reduction technologies for tractors. The vocational vehicle inputs to GEM for Phase 1 only included tire rolling resistance. For Phase 1 GEM's inputs did not include engine test results or attributes related to a vehicle's powertrain; namely, its transmission, drive axle(s), or loaded tire radius. Instead, for Phase 1 the agencies specified a generic engine and powertrain within GEM, and for Phase 1 these cannot be changed in GEM.

For this rulemaking, GEM has been modified as proposed and validated against a set of experimental data that represent over 130 unique vehicle variants conducted at powertrain and chassis dynamometers with the manufacturers' provided transmission shifting tables. In addition, GEM has been validated against different types of tests when the EPA transmission default auto-shift strategy is used, which includes powertrain dynamometer tests and two truck tests running in a real-world driving route. Detailed comparisons can be seen in Chapter 4 of the RIA. As noted above, the agencies believe that this new version of GEM is an accurate and cost-effective alternative to measuring fuel consumption and CO₂ over a chassis dynamometer test procedure. Again as noted earlier, some of the key modifications will require additional vehicle component test procedures (both mandatory and optional) to generate additional GEM inputs. The results of which will provide additional inputs into GEM. These include a new required engine test procedure to provide engine fuel consumption inputs into GEM. We proposed to measure fuel consumption as a matrix of steady-state points, but also sought comment on a newly developed engine test procedure that captures transient engine performance for use in GEM. We are specifying a combination of these procedures for the final rule—steady-state fuel maps for the highway cruise simulations, and cycle-average maps for transient simulations. As an option, cycle average maps could be also used for the highway cruise simulation as well. See Chapter 3 of the RIA for additional discussion of the fuel mapping procedures. We are also requiring inputs that describe the vehicle's transmission type, and its number of gears and gear ratios. We are allowing an optional powertrain test procedure that would provide inputs to override the agencies' simulated engine and transmission in GEM. In addition, in response to comments, we will also

allow manufacturers to measure transmission efficiency in the form of the power loss tables to replace the default values in GEM. We are finalizing the proposed requirement to input a description of the vehicle's drive axle(s), including its type (e.g., 6×4 or 6×2) and axle ratio. We are also finalizing the optional axle efficiency test procedure for which we sought comment. This would allow manufacturers to override the agencies' simulated axle in GEM. Chapter 4 of the RIA details all of these GEM related input changes.

As noted above, we are significantly expanding the number of technologies that are recognized in GEM. These include recognizing lightweight thermoplastic materials, automatic tire inflation systems, advanced cruise control systems, engine stop-start idle reduction systems, and axle configurations that decrease the number of drive axles. To better reflect real-world operation, we are also revising the vehicle simulation computer program's urban and rural highway duty cycles to include changes in road grade, and including a new duty cycle to capture the performance of technologies that reduce the amount of time a vehicle's engine is at idle during a workday. Finally, to better recognize that vocational vehicle powertrains are configured for particular applications, we are further subdividing the vocational chassis category into three different vehicle speed categories, where GEM weights the individual duty cycles' results of each of the speed categories differently. Section 4.2 of the RIA details all these modifications. The following sub-sections provide further details on some of these key modifications to GEM.

(a) Simulating Engines for Vehicle Certification

Before describing the Phase 2 approach, this section first reviews how engines are simulated for vehicle certification in Phase 1. As noted earlier, GEM for Phase 1 simulates the same generic engine for any vehicle in a given regulatory subcategory with a data table of steady-state engine fuel consumption mass rates (g/s) versus a series of steady-state engine output shaft speeds (revolutions per minute, rpm) and loads (torque, N-m). This data table is also sometimes called a "fuel map" or an "engine map," although the term "engine map" can mean other kinds of data in different contexts. The engine speeds in this map range from idle to maximum governed speed and the loads range from engine motoring (negative load) to the maximum load of an engine. When GEM executes a simulation over

a vehicle duty cycle, this data table is linearly interpolated to find a corresponding fuel consumption mass rate at each engine speed and load that is demanded by the simulated vehicle operating over the duty cycle. The fuel consumption mass rate of the engine is then integrated over each duty cycle in GEM to arrive at the total mass of fuel consumed for the specific vehicle and duty cycle. Under Phase 1, manufacturers were not allowed to input their own engine fuel maps to represent their specific engines in the vehicle being simulated in GEM. Because GEM was programmed with fixed engine fuel maps for Phase 1 that all manufacturers had to use, the tables themselves did not have to exactly represent how an actual engine might operate over these three different duty cycles.

In contrast, for Phase 2 we are requiring manufacturers to generate their own engine fuel maps to represent each of their engine families in GEM. This Phase 2 approach is consistent with the 2014 NAS Phase 2 First Report recommendation.¹⁶⁰ To investigate this approach, before proposal we examined the results from 28 individual engine dynamometer tests. Three different engines were used to generate this data, and these engines were produced by two different engine manufacturers. One engine was tested at three different power ratings (13 liters at 410, 450 & 475 bhp) and one engine was tested at two ratings (6.7 liters at 240 and 300 bhp), and other engine with one rating (15 liters 455 bhp) service classes. For each engine and rating the steady-state engine dynamometer test procedure was conducted to generate an engine fuel map to represent that particular engine in GEM. Next, with GEM, we simulated various vehicles in which the engine could be installed. For each of the GEM duty cycles we are using, namely the urban local (ARB Transient), urban highway with road grade (55 mph), and rural highway with road grade (65 mph) duty cycles, we determined the GEM result for each vehicle configuration, and we saved the engine output shaft speed and torque information that GEM created to interpolate the steady-state engine map for each vehicle configuration. We then had this same engine output shaft speed and torque information programmed into an engine dynamometer controller, and we had each engine perform the same duty cycles that GEM demanded of the

¹⁶⁰ National Academy of Science. "Reducing the Fuel Consumption and GHG Emissions of Medium- and Heavy-Duty Vehicles, Phase Two, First Report." 2014. Recommendation 3.8.

simulated version of the engine. We then compared the GEM results based on GEM's linear interpolation of the engine maps to the measured engine dynamometer results. We concluded that for the 55 mph and 65 mph duty cycles, GEM's interpolation of the steady-state data tables was sufficiently accurate versus the measured results. This is an outcome one would reasonably expect because even with changes in road grade, the 55 mph and 65 mph duty cycles do not demand rapid changes in engine speed or load. The 55 mph and 65 mph duty cycles are nearly steady-state, as far as engine operation is concerned, just like the engine maps themselves. However, for the ARB Transient cycle, we observed a consistent bias when using the steady-state maps, where GEM consistently under-predicted fuel consumption and CO₂ emissions. This low bias over the 28 engine tests ranged from 4.2 percent low to 7.8 percent low. The mean was 5.9 percent low and the 90th percentile value was 7.1 percent low. These observations are consistent with the fact that engines generally operate less efficiently under transient conditions than under steady-state conditions.

A number of reasons explain this consistent trend. For example, under rapidly changing (*i.e.* transient) engine conditions, it is generally more challenging to program an engine electronic controller to respond with optimum fuel injection rate and timing, exhaust gas recirculation valve position, variable nozzle turbocharger vane position and other set points than under steady-state conditions. Transient heat and mass transfer within the intake, exhaust, and combustion chambers also tend to increase turbulence and enhance energy loss to engine coolant during transient operation. In many cases during cold transient operation, the thermal management is triggered in order to maintain optimal performance of selective catalytic reduction devices for a diesel engine. Furthermore, because exhaust emissions control is more challenging under transient engine operation, engineering tradeoffs sometimes need to be made between fuel efficiency and transient criteria pollutant emissions control. Special calibrations are typically also required to control smoke and manage exhaust temperatures during transient operation for a transient cycle.

To account for these effects in GEM, the agencies have developed and are finalizing a test procedure called "cycle average" mapping to account for this transient behavior (40 CFR 1036.540). Detailed analyses and presentation of the test procedure was published in two

peer-reviewed journal articles.^{139,140} A number of commenters likewise suggested this approach. Additionally, progress has been made on further improving this test procedure since publication, based on a large number of engine dynamometer tests conducted by a variety of laboratory test facilities.¹⁶¹ Since the proposal, further refinement of the numerical schemes used for interpreting cycle average engine fuel map was also completed. The engine dynamometer tests include a Cummins medium duty ISB engine, a Navistar heavy duty N13 engine, a Volvo heavy duty D13 engine, and a Cummins heavy duty ISX engine. All testing results indicated that the new test procedure works well for the transient ARB cycle.¹⁶² In addition, Cummins in their NODA comments (see the following paragraph) provided additional data supporting this approach with their ISL 450 bhp rating engine. This data corroborated earlier data showing good agreement between engine dynamometer tests and the cycle average engine mapping approach.¹⁶³

EPA solicited comment on the cycle average approach at proposal. 80 FR 40193. EPA also specifically provided notice and a 30-day opportunity for public comment on the possibility of requiring use of the cycle average mapping approach for the ARB Transient cycle. This was included in the version of GEM that was made available for public comment as part of the NODA.¹⁵³ In response, many comments were received on the cycle average approach. These include comments from Cummins¹⁶³ and Volvo.¹⁶⁴ Cummins was very supportive of the cycle average approach and also supported applying this approach to the 55 mph and 65 mph cruise cycles in GEM. Volvo expressed some concern over having enough time to fully evaluate this approach. The agencies believe that one of the reasons that Volvo expressed concern over having enough time to evaluate this approach is because Volvo initially declined working with the agencies to

collaboratively refine this approach. At the same time, a number of Volvo's competitors chose to actively coordinate laboratory testing and technical analysis to contribute to the development of this approach. We believe these other manufacturers gained a deeper understanding of the approach earlier than Volvo because they invested time and resources to make technical contributions at earlier point in time. Nevertheless, the agencies fully welcome and appreciate Volvo's more recent active involvement in reviewing the cycle average approach and for making a number of productive suggestions for further refinement.

While the agencies are finalizing the cycle average engine mapping test procedure as mandatory for the ARB Transient cycle, for the 55 mph and 65 mph GEM drive cycles, the agencies are finalizing the same steady-state mapping procedure that the agencies originally proposed. The only difference is that we are finalizing about 85 unique steady-state map points, versus the about 143 points that were proposed. See 40 CFR 1036.535 for details. We are adopting a lower number of points because many of the originally proposed points were specified for use with the ARB Transient cycle.¹³⁹ Again, as an option, the cycle average mapping test procedure also may be used for these two cruise speed cycles, in lieu of the steady-state mapping procedure.

(b) Simulating Human Driver Behavior and Transmissions for Vehicle Certification

GEM for Phase 1 simulates the same generic human driver behavior and manual transmission shifting patterns for all vehicles. The simulated driver responds to changes in the target vehicle speed of the duty cycles by changing the simulated positions of the vehicle's accelerator pedal, brake pedal, clutch pedal, and gear shift lever. For simplicity, in Phase 1 the GEM driver shifted at pre-specified vehicle speeds and the manual transmission was simulated as an ideal transmission that did not have any delay time (*i.e.*, torque interruption) between gear shifts and did not have any energy losses associated with clutch slip during gear shifts.

In GEM for Phase 2 we are allowing manufacturers to select one of four types of transmissions to represent the transmission in the vehicle they are certifying: Manual transmission (MT), automated manual transmission (AMT), automatic transmission (AT) and dual clutch transmission (DCT). For Phase 2 the agencies proposed unique transmission shifting patterns to

¹⁶¹ Memos to Docket, "Test Procedure Review with Cummins, Volvo, Navistar, Paccar, Daimler Eaton and Allison."

¹⁶² Michael Ross, *Validation Testing for Phase 2 Greenhouse Gas Test Procedures and the Greenhouse Gas Emission Model (GEM) for Medium and Heavy-Duty Engines and Powertrains*, Final Report to EPA, Southwest Research Institute, June 2016, found in docket of this rulemaking, EPA-HQ-QAR-2014-0827.

¹⁶³ Cummins NODA Comments, found in Phase 2 Docket: ID No. EPA-HQ-OAR-2014-0817, April 1, 2016.

¹⁶⁴ Volvo Group NODA Comments, found in Phase 2 Docket: ID No. EPA-HQ-OAR-2014-0817, April 1, 2016.

represent the different types of automated transmissions. These shifting patterns over the steady state cruise cycles has been further modified from the proposed version to be more realistic with respect to slight variations in vehicle speed due to road grade. In particular, when going downhill, the simulated vehicle is now allowed to exceed the speed target by 3 mph before the brakes are applied. In the proposed version, the driver model applied the brakes much sooner to prevent the vehicle from exceeding the speed target. This change allows the vehicle to carry additional momentum into the next hill, much the same as real drivers would.

In the final version of GEM, the driver behavior and the different transmission types are simulated in the same basic manner as in Phase 1, but each transmission type features unique transmission responses that match the transmission responses we measured during vehicle testing of these three transmission types. In general the transmission gear shifting strategy for all of the transmissions is designed to shift the transmission so that it is in the most efficient gear for the current vehicle demand, while staying within certain limits to prevent unrealistically high frequency shifting (*i.e.*, to prevent “short-shifting”). Some examples of these limits are torque reserve limits (which vary as function of engine speed), minimum time-in-gear and minimum fuel efficiency benefit to shift to the next gear. Some of the differences between the transmission types include a driver “double-clutching” during gear shifts of the manual transmission only, and “power shifts” and torque converter torque multiplication, slip, and lock-up in automatic transmissions only. Refer to Chapter 4 of the RIA for a more detailed description of these different simulated driver behaviors and transmission types.

Prior to the proposal, we considered an alternative approach where transmission manufacturers would provide vehicle manufacturers with detailed information about their automated transmissions’ proprietary shift strategies for representation in GEM. NAS also recommended this approach.¹⁶⁵ The advantages of this approach would include a more realistic representation of a transmission in GEM

and potentially the recognition of additional fuel efficiency improving strategies to achieve additional fuel consumption and CO₂ emissions reductions. However, there are a number of technical and compliance disadvantages of this approach. One disadvantage is that it would require the disclosure of proprietary information because some vehicle manufacturers produce their own transmissions and also use other suppliers’ transmissions. There are technical challenges too. For example, some transmission manufacturers have upwards of 40 different shift strategies programmed into their transmission controllers. Depending on in-use driving conditions, some of which are not simulated in GEM (*e.g.*, changing payloads, changing tire traction) a transmission controller can change its shift strategy. Representing dynamic switching between multiple proprietary shift strategies would be extremely complex to simulate in GEM. Furthermore, if the agencies were to require transmission manufacturers to provide shift strategy inputs for use in GEM, then the agencies would have to devise a compliance strategy to monitor in-use shift strategies, including a driver behavior model that could be implemented as part of an in-use shift strategy confirmatory test. This too would be very complex. If manufacturers were subject to in-use compliance requirements of their transmission shift strategies, this could lead to restricting the use of certain shift strategies in the heavy-duty sector, which would in turn potentially lead to sub-optimal vehicle configurations that do not improve fuel efficiency or adequately serve the wide range of customer needs; especially in the vocational vehicle segment. For example, if the agencies were to restrict the use of more aggressive and less fuel efficient in-use shift strategies that are used only under heavy loads and steep grades, then certain vehicle applications would need to compensate for this loss of capability through the installation of over-sized and over-powered engines that are subsequently poorly matched and less efficient under lighter load conditions. Therefore, as a policy consideration to preserve vehicle configuration choice and to preserve the full capability of heavy-duty vehicles today, the agencies are intentionally not allowing transmission manufacturers to submit detailed proprietary shift strategy information to vehicle manufacturers to input into GEM. The agencies are finalizing as proposed that vehicle manufacturers can choose from among several transmission types that

the agencies have already developed, validated, and programmed into GEM. The vehicle manufacturers will then enter into GEM their particular transmission’s number of gears and gear ratios, optionally together with power loss tables representing their transmission’s gear friction, pumping and spin losses. If a manufacturer chooses to use the optional powertrain test procedure, however, then the agencies’ transmission types in GEM would be overridden by the actual data collected during the powertrain test, which would recognize the transmission’s unique shift strategy. (Presumably, vehicle manufacturers will choose to use the optional powertrain test procedure only if their actual transmission shift strategy is more efficient compared to its respective default shift strategy simulated by GEM.)

(c) Simulating Axles for Vehicle Certification

In GEM for Phase 1 the axle ratio of the primary drive axle and the energy losses assumed in the simulated axle itself were the same for all vehicles. For Phase 2 the vehicle manufacturer will be required to input into GEM the axle ratio of the primary drive axle. This input will recognize the design to operate the engine at a particular engine speed when the transmission is operating in its highest transmission gear; especially for the 55 mph and 65 mph duty cycles in GEM. This input facilitates GEM’s recognition of vehicle designs that take advantage of operating the engine at the lowest possible engine speeds. This is commonly known as “engine down-speeding,” and the general rule-of-thumb for heavy-duty engines is that for every 100 rpm decrease in engine speed, there can be about a 1 percent decrease in fuel consumption and CO₂ emissions. Therefore, it is important that GEM allow this value to be input by the vehicle manufacturer. Axle ratio is also straightforward to verify during any in-use compliance audit. UCS and ACEEE commented that engine down-speeding should be recognized in the agencies’ separate engine standards, rather than in the vehicle standard. The agencies disagree with this because recognizing down-speeding at the vehicle level ensures that the powertrain configuration in-use, in the real world, will lead to the engine operating at lower speeds. In contrast, the engine speeds specified in the separate engine standards’ test procedures are based on the engine’s maximum torque versus speed curve (*i.e.*, lug curve) and not on the configuration of the powertrain to

¹⁶⁵ Transportation Research Board 2014. “Reducing the Fuel Consumption and Greenhouse Gas Emissions of Medium- and Heavy-Duty Vehicles, Phase Two.” (“Phase 2 First Report”) Washington, DC, The National Academies Press. Cooperative Agreement DTNH22-12-00389. Available electronically from the National Academy Press Web site at http://www.nap.edu/catalog.php?record_id=12845 (last accessed December 2, 2014). Recommendation 3.7.

which the engine is attached in a vehicle. This means that even if a manufacturer manipulated the engine's lug curve such that the separate engine standards' test procedure led to the engine operating at lower speeds during certification, that same engine could be installed in a vehicle with a powertrain configured for the engine to operate at higher engine speeds. Therefore, recognizing down-speeding within GEM, at the vehicle level, best ensures that the agencies' test procedures and standards lead to real-world engine down-speeding in-use.

We proposed to use a fixed axle ratio energy efficiency of 95.5 percent at all speeds and loads, but requested comment on whether this pre-specified efficiency is reasonable. 80 FR 40185. In general, commenters stated that the efficiency of the axle actually varies as a function of axle ratio, axle speed, and axle input torque. Therefore, we have modified GEM to accept an input data table of power loss as a function of axle speed and axle torque. The modified version of GEM subsequently interpolates this table over each of the duty cycles to represent a more realistic axle efficiency at each point of each duty cycle. The agencies specify a default axle efficiency table in GEM for any manufacturer to use. We are also finalizing an optional axle power loss test procedure that requires the use of a dynamometer test facility (40 CFR 1037.560). With this optional test procedure, a manufacturer can create an axle efficiency table for use in lieu of the EPA default table. We requested comment on this test procedure in the proposal, and we received supportive comments. Refer to 40 CFR 1037.560 of the Phase 2 regulations, which contain this test procedure.

Moreover, the final regulations allow the manufacturers to develop analytical methods to derive axle efficiency tables for untested axle configurations, based on testing of similar axles. This would be similar to the analytically derived CO₂ emission calculations allowed for pickups and vans. However, manufacturers would be required to obtain prior approval from the agencies before using analytically derived values. In addition, the agencies could conduct confirmatory testing or require a selective enforcement audit for any axle configuration. See 40 CFR 1037.235.

In addition to requiring the primary drive axle ratio input into GEM (and an option to input an actual axle power loss data table), we are requiring that the vehicle manufacturer input into GEM whether one or two drive axles are driven by the engine. When a heavy-duty vehicle is equipped with two rear

axles where both are driven by the engine, this is called a "6×4" configuration. "6" refers to the total number of wheel hubs on the vehicle. In the 6×4 configuration there are two front wheel hubs for the two steer wheels and tires plus four rear wheel hubs for the four rear wheels and tires (or more commonly four sets of rear dual wheels and tires). "4" refers to the number of wheel hubs driven by the engine. These are the two rear axles that have two wheel hubs each. Compared to a 6×4 configuration, a 6×2 configuration decreases axle energy loss due to friction and oil churning in two driven axles, by driving only one axle. The decrease in fuel consumption and CO₂ emissions associated with a 6×2 versus 6×4 axle configuration can be in the range of 2.5 percent depending on specific axles, which is modeled by the power loss table.¹⁶⁶ Therefore, in the Phase 2 version of GEM, if a manufacturer simulates a 6×2 axle configuration using the default axle efficiencies, GEM decreases the overall GEM result roughly by 2.5 percent on average through the power loss table. Note that GEM will similarly decrease the overall GEM result by 2.5 percent for a 4×2 tractor or Class 8 vocational chassis configuration if it has only two wheel hubs driven. If a manufacturer does not use the default efficiencies, the benefit of 6×2 and 4×2 configurations will be reflected directly in its input tables. Note that the Phase 2 version of GEM does not have an option to simulate more than two drive axles or configurations where the front axle(s) are driven or where there are more than two rear axles. The regulations specify that such vehicles are to be simulated as 6×4 vehicles in GEM. This is consistent with how the standards were developed and the agencies believe this approach will provide the appropriate incentive for manufacturers to apply the same fuel saving technologies to these vehicles, as they would to their conventional 6×4 vehicles. Moreover, because these configurations are manufactured for specialized vehicles that require extra traction for off-road applications, they have very low sales volume and any increased fuel consumption and CO₂ emissions from them are not significant in comparison to the overall reductions of the Phase 2 program. Note that 40 CFR 1037.631 (for off-road vocational vehicles), which is being continued from the Phase 1 program, exempts many of these vehicles from the vehicle

standards because they are limited mechanically to low-speed operation.

(d) Simulating Accessories for Vehicle Certification

The agencies proposed to continue the approach from Phase 1 whereby GEM uses a fixed power consumption value to simulate the fuel consumed for powering accessories such as steering pumps and alternators. 80 FR 40186. The final rule continues the Phase 1 approach, as proposed. However, Phase 2 GEM provides an option to provide a GEM input reflecting technology improvement inputs for the accessory loads. This allows the manufacturers to receive credit for those technologies that are not modeled in GEM. Manufacturers seeking credit for those technologies that are not modeled in GEM would generally follow the off-cycle credit program procedures in 40 CFR 1037.610.

(e) Aerodynamics in GEM for Tractor, Vocational Vehicle, and Trailer Certification

Phase 2 GEM simulates aerodynamic drag in using C_dA (the product of the drag coefficient and frontal area of the vehicle) rather than a drag coefficient (C_d). For tractors and trailers we will continue to use an aerodynamic bin approach similar to the one that exists in Phase 1 today, although the actual Phase 2 bins are being revised to reflect new test procedures and our projections for more aerodynamic tractors and trailers in the future. This approach allows manufacturers to determine C_dA (or delta-C_dA in the case of trailers) from coastdown testing, scale wind tunnel testing and/or computational fluid dynamics modeling. It requires tractor manufacturers (but not trailer manufacturers) to conduct a certain minimum amount of coast-down vehicle testing to validate their methods. The regulations also provide an alternate path for trailer manufacturers to rely on testing performed by component suppliers. See 40 CFR 1037.

The results of these tests determine into which bin a tractor or trailer is assigned. GEM uses the aerodynamic drag coefficient applicable to the bin, which is the same for all tractors (or trailers) within a given bin. This approach helps to account for limits in the repeatability of aerodynamic testing and it creates a compliance margin since any test result which keeps the vehicle in the same aerodynamic bin is considered compliant. For Phase 2 we are establishing new boundary values for the bins themselves and we are adding two additional tractor bins in order to recognize further advances in

¹⁶⁶ NACFE, Executive Report—6×2 (Dead Axle) Tractors, November 2010. See Docket EPA-HQ-OAR-2014-0827.

aerodynamic drag reduction beyond what was recognized in Phase 1. Furthermore, while Phase 1 GEM used predefined frontal areas for tractors where the manufacturers input only a C_d value, manufacturers will use a measured drag area (C_dA) value for each tractor configuration for Phase 2. See 40 CFR 1037.525. The agencies do not project that vocational vehicles will need to improve their aerodynamic performance to comply with the Phase 2 vocational chassis standards.

However, the agencies are providing features in GEM for vocational vehicles to receive credit for improving the aerodynamics of vocational vehicles (see 40 CFR 1037.520(m)).

In addition to these changes, we are making a number of aerodynamic drag test procedure improvements. One improvement is to update the “standard trailer” that is prescribed for use during aerodynamic drag testing of a tractor. Using the C_dA from such testing means the standard trailer would also be the hypothetical trailer modeled in GEM to represent a trailer paired with the tractor in actual use.¹⁶⁷ In Phase 1, a non-aerodynamic 53-foot long box-shaped dry van trailer was specified as the standard trailer for tractor aerodynamic testing (see 40 CFR 1037.501(g)). For Phase 2 we are modifying this standard trailer for tractor testing to make it more similar to the trailers we expect to be produced during the Phase 2 timeframe. More specifically, we are prescribing the installation of aerodynamic trailer skirts (and low rolling resistance tires as applied in Phase 1) on the standard trailer, as discussed in further in Section III.E.2. As explained more fully in Sections III and IV, the agencies believe that tractor-trailer pairings will be optimized aerodynamically to a significant extent in-use (such as using high-roof cabs when pulling box trailers), and that this real-world optimization should be reflected in the certification testing. We are also revising the test procedures to better account for average wind yaw angle to reflect the true impact of aerodynamic features on the in-use fuel consumption and CO₂ emissions of tractors, again as discussed in more detail in Section III below. Refer to the test procedures in 40 CFR 1037.525 through 1037.527 for further details of these aerodynamic test procedures.

For trailer certification, the agencies use GEM in a different way than it is used for tractor certification. As

described in Section IV, the agencies developed a simple equation to replicate GEM performance. The trailer standards are based on this equation, and trailer manufacturers use this GEM-based equation for certification. The only technologies recognized by this GEM-based equation for trailer certification are aerodynamic technologies, tire technologies (including tire rolling resistance and tire pressure systems), and weight reduction. Note that since the purpose of this equation is to replicate GEM performance, it can be considered as simply another form of the model using a different input interface. Thus, for simplicity, the remainder of this Section II.C. sometimes discusses GEM as being used for trailers, without regard to how manufacturers will actually input GEM variables. As with all of the standards in Phase 2, compliance is measured consistent with the same test methods used by the agencies to establish the standard.

Similar to tractor certification, trailer manufacturers will use data from aerodynamic testing (e.g., coastdown testing, scale wind tunnel testing, computational fluid dynamics modeling, or possibly aerodynamic component testing) with the equation.¹⁶⁸ As part of the protocol for generating these inputs, the agencies are specifying the configuration of a reference tractor for conducting trailer testing. Refer to Section IV of this Preamble and to 40 CFR 1037.501 of the regulations for details on the reference tractor configuration for trailer test procedures.

Finally, GEM has been modified to accept an optional delta C_dA value for vocational chassis, to simulate aerodynamic improvements relative to pre-specified baseline defined in Chapter 4 of RIA. For example, a manufacturer that demonstrates that adding side skirts to a box truck reduces its C_dA by 0.2 m² could input that value into GEM for box trucks that include those skirts. See 40 CFR 1037.520(m).

(f) Tires and Tire Inflation Systems for Truck and Trailer Certification

For GEM in Phase 1 tractor and vocational chassis manufacturers input the tire rolling resistance of steer and drive tires directly into GEM. The agencies prescribed an internationally recognized tire rolling resistance test procedure, ISO 28580, for determining the tire rolling resistance value that is

input into GEM, as described in 40 CFR 1037.520(c). For Phase 2 we will continue this same approach and the use of ISO 28580, and we are expanding these requirements to trailer tires as well.

In addition to tire rolling resistance, Phase 2 vehicle manufacturers will enter into GEM the tire manufacturer's specified revolutions per distance directly (revs/mile) for the vehicle's drive tires. This value is commonly reported by tire manufacturers already so that vehicle speedometers can be adjusted appropriately. This input value is needed so that GEM can accurately convert simulated vehicle speed into axle speed, transmission speed, and ultimately engine speed.

For tractors and trailers, we proposed to allow manufacturers to specify whether or not an automatic tire inflation system (ATIS) is installed. 80 FR 40187. Based on comments and as discussed further in Sections III, IV, and V, in the Phase 2 final rule we are adopting provisions that allow manufacturers of tractors, trailers, and vocational vehicle chassis to input a percent decrease in overall fuel consumption and CO₂ emissions into GEM if the vehicle includes either an ATIS or a tire pressure monitoring system (TPMS). The value that can be input depends on whether a TPMS or ATIS is deployed. See 40 CFR 1037.520.

(g) Weight Reduction for Tractor, Vocational Chassis and Trailer Certification

Phase 2 GEM continues the weight reduction recognition approach in Phase 1, where the agencies prescribe fixed weight reductions, or “deltas,” for using certain lightweight materials for certain vehicle components. In Phase 1 the agencies published a list of weight reductions for using high-strength steel and aluminum materials on a part by part basis. For Phase 2 we use updated values for high-strength steel and aluminum parts for tractors and for trailers and we have scaled these values for use in certifying the different weight classes of vocational chassis. In addition we use a similar part by part weight reduction list for tractor parts made from thermoplastic material. We proposed to assign a fixed weight increase to natural gas fueled vehicles to reflect the weight increase of natural gas fuel tanks versus gasoline or diesel tanks, but we are not finalizing that provision based on comments. 80 FR 40187. Commenters opposing this provision generally noted that the proposed provision was not consistent with how the agencies were treating other technologies. We agree that

¹⁶⁷ See Section III. for a discussion of how GEM will model a more advanced trailer beginning with the 2027 model year.

¹⁶⁸ The agencies project that more than enough aerodynamic component vendors will take advantage of proposed optional pre-approval process to make testing optional for trailer manufacturer.

natural gas vehicles should be treated consistently with other technologies and so are not adopting the proposed provision.

For tractors, we will continue the same mathematical approach in GEM to assign $\frac{1}{3}$ of a total weight decrease to a payload increase and $\frac{2}{3}$ of the total weight decrease to a vehicle mass decrease. For Phase 1, these ratios were based on the average frequency that a tractor operates at its gross combined weight rating. We will also use these ratios for trailers in Phase 2. For vocational chassis, for which Phase 1 did not address weight reduction, we will assign $\frac{1}{2}$ of a total weight decrease to a payload increase and $\frac{1}{2}$ of the total weight decrease to a vehicle mass decrease.

(h) GEM Duty Cycles for Tractor, Vocational Chassis and Trailer Certification

In Phase 1, there are three GEM vehicle duty cycles that represent stop-and-go city driving (ARB Transient), urban highway driving (55 mph), and rural interstate highway driving (65 mph). In Phase 1 these cycles were time-based. That is, they were specified as a function of simulated time and the duty cycles ended once the specified time elapsed in simulation. The agencies proposed to continue to use these three drive cycles in Phase 2, but with some revisions. 80 FR 40187. We are finalizing revisions similar but not identical to those that were proposed. First, GEM will simulate these cycles on a distance-based specification, rather than on a time-based specification. A distance-based specification ensures that even if a vehicle in simulation does not always achieve the target vehicle speed, the vehicle will have to continue in simulation for a longer period to complete the duty cycle. This ensures that vehicles are evaluated over the complete distance of the duty cycle and not just the portion of the duty cycle that a vehicle completes in a given time period. A distance-based duty cycle specification also facilitates a straightforward specification of road grade as a function of distance along the duty cycle. As noted in above, for Phase 2, the agencies have enhanced the 55 mph and 65 mph duty cycles by adding representative road grade to exercise the simulated vehicle's engine, transmission, axle, and tires in a more realistic way. A flat road grade profile over a constant speed test does not properly simulate a transmission with respect to shifting gears, and may have the unintended consequence of enabling underpowered vehicles or excessively down-spiced drivetrains to generate

credits, when in actuality the engine does not remain down-spiced in-use when the vehicle encounters road grades. The road grade profile being finalized is the same hill and valley profile for both the 55 mph and 65 mph duty cycles, and is based on statistical analysis of the United States' national distribution of road grades. Although the final profile is different than that proposed, the agencies provided notice of the analysis that was used to generate the final profile.¹⁶⁹ In written comments, we received in-use engine data from some manufacturers, and based on this information we made minor adjustments to the road grade to ensure that engines simulated in GEM operated similarly to that reported in the in-use engine data submitted to us. See Section III.E.(2)(b) of this document and Chapter 3.4.2.1 of the RIA for more details on development of the road grade profile. We believe that the enhancement of the 55 mph and 65 mph duty cycles with road grade is consistent with the NAS recommendation regarding road grade.¹⁷⁰

(i) Workday Idle Operation for Vocational Chassis Certification

In the Phase 1 program, reduction in idle emissions was recognized only for sleeper cab tractors, and only with respect to hoteling idle, where a driver needs power to operate heating, ventilation, air conditioning and other electrical equipment in order to use the sleeper cab to eat, rest, or conduct other business. As described in Section V, GEM for Phase 2 will recognize technologies that reduce workday idle emissions, such as automatic stop-start systems, daytime parked idle automatic engine shutdown systems, and

transmissions that either automatically or inherently shift to neutral at idle while in drive. Many vocational vehicle applications operate on patterns implicating workday idle cycles, and the agencies use test procedures in GEM to account specifically for these cycles and potential idle controls. GEM will recognize these idle controls in two ways. For technologies like neutral-idle transmissions and stop-start systems that address idle that occurs during vehicle operation when the vehicle is stopped at a stop light, GEM will interpolate lower fuel rates from the engine map during the idle portions of the ARB Transient and during a separate GEM "drive idle cycle." For technologies like start-stop and auto-shutdown that eliminate some of the idle that occurs when a vehicle is stopped or parked, GEM will assign a value of zero fuel rate during a separate GEM "parked idle cycle." The idle cycles will be weighted along with the 65 mph, 55 mph, and ARB Transient duty cycles, according to the new vocational chassis duty cycle weighting factors. These weighting factors are different for each of the three vocational chassis speed categories for Phase 2. For tractors, only neutral idle and hotel idle will be addressed in GEM.

(2) Experimental Validation of GEM

The core simulation algorithms in GEM have not changed significantly since the proposal. Most of the changes since proposal focused on streamlining how manufacturers input data into GEM; revising to the drive cycles in GEM; and updating how GEM weights these different drive cycles to determine a composite fuel consumption value. These changes did not alter the fundamental way that GEM simulates varying vehicle "road load" and how GEM converts vehicle speed to engine speed and then interpolates engine maps to determine vehicle fuel consumption and CO₂ emissions.

Refinements to GEM since the time of proposal that did alter GEM's simulation performance include modifying the default transmissions' shift strategies and their power losses. Another key refinement was cycle average mapping engines for simulation of the ARB Transient cycle. Each time the agencies made such modifications to GEM, GEM's correlation to the agencies collection of laboratory-generated engine and vehicle data was checked. Potential refinements to GEM were accepted if GEM's correlation was improved versus this set of experimental data. If potential refinements resulted in GEM's correlation to the experimental data

¹⁶⁹ See National Renewable Energy Laboratory report "EPA GHG Certification of Medium- and Heavy-Duty Vehicles: Development of Road Grade Profiles Representative of US Controlled Access Highways" dated May 2015 and EPA memorandum "Development of an Alternative, Nationally Representative, Activity Weighted Road Grade Profile for Use in EPA GHG Certification of Medium- and Heavy-Duty Vehicles" dated May 13, 2015, both available in Docket EPA-HQ-OAR-2014-0827. This docket also includes file NREL_SyntheticAndLocalGradeProfiles.xlsx which contains numerical representations of all road grade profiles described in the NREL report.

¹⁷⁰ NAS 2010 Report, Page 189. "A fundamental concern raised by the committee and those who testified during our public sessions was the tension between the need to set a uniform test cycle for regulatory purposes, and existing industry practices of seeking to minimize the fuel consumption of medium and heavy-duty vehicles designed for specific routes that may include grades, loads, work tasks or speeds inconsistent with the regulatory test cycle. This highlights the critical importance of achieving fidelity between certification values and real-world results to avoid decisions that hurt rather than help real-world fuel consumption."

becoming worse, those potential changes were rejected. Chapter 4.3.2 of the RIA details the GEM validation that was performed to determine if potential changes to GEM should be accepted or rejected. The first step of the validation process involves simulating vehicles in GEM using engine fuel maps and transmission shifting strategies obtained from manufacturers and comparing GEM results to experiments conducted with the same engines and transmissions. This first step re-validates all of the non-powertrain elements of GEM, which were already validated in Phase 1. The second step is to use GEM's default transmissions' shift strategies in simulation¹⁷¹ and then compare GEM results to powertrain tests of several transmissions. The only difference between the first and second step is the shifting strategy and powertrain energy loss assumptions. This step facilitates tuning of GEM's default transmission models so that they correlate well to a variety of real transmissions. The third step is to compare GEM simulations to real-world in-use recorded data from actual vehicles. This is the most challenging step because the experimental data

includes real-world effects of wind, road grade, and driver behavior in traffic. The most important element of this third step is not *absolute* correlation, but rather, *relative* correlation, which demonstrates that when a technology is added to a real vehicle, the relative improvement in the real world is simulated in GEM with a high degree of correlation.

In the first validation step, the agencies compared GEM to over 130 vehicle variants, consistent with the recommendation made by the NAS in their Phase 2-First Report.¹⁷² As described in Chapter 4 of the RIA, good agreement was observed between GEM simulations and test data over a wide range of vehicles. In general, the model simulations agreed with experimental test results within ± 5 percent on an absolute basis. As pointed out in Chapter 4.3.2 of the RIA, relative accuracy is more relevant to the intent of this rulemaking, which is to accelerate the adoption of *additional* fuel efficiency improving technologies. Consistent with the intent of this rulemaking, all of the numeric standards for tractors, trailers and vocational chassis are derived from running GEM

first with Phase 1 "baseline" technology packages and then with various Phase 2 technology packages. The differences between these GEM results are examined to determine final stringencies. In other words, the agencies used the same final version of GEM to establish the numeric standards as will be used by manufacturers to demonstrate compliance. Therefore, it is most important that GEM accurately reflects *relative* changes in emissions for each added technology. In other words, for vehicle certification purposes it is less important that GEM's absolute value of the fuel consumption or CO₂ emissions be accurate compared to laboratory testing of the same vehicle. The ultimate purpose of GEM is to evaluate *changes* or *additions* in technology, and compliance is demonstrated on a relative basis to the numeric standards that were also derived from GEM. Nevertheless, the agencies concluded that the absolute accuracy of GEM is generally within ± 5 percent, as shown in Figure II.2. Chapter 4.3.2 of the RIA shows that *relative* accuracy is even better, $\pm 2-3$ percent.

Figure II.2 GEM Validation Data

¹⁷¹ K. Newman, J. Kargul, and D. Barba, "Development and Testing of an Automatic Transmission Shift Schedule Algorithm for Vehicle

Simulation," *SAE Int. J. Engines* 8(3):2015, doi:10.4271/2015-01-1142.

¹⁷² National Academy of Science, "Reducing the Fuel Consumption and GHG Emissions of Medium- and Heavy-Duty Vehicles, Phase Two, First Report." 2014. Recommendation 1.2.

In addition to this successful validation against experimental results, the agencies have also conducted a peer review of the GEM source code. This peer review has been submitted to Docket number EPA-HQ-OAR-2014-0827.

The second validation step was to repeat the first step's GEM simulations with the agencies' default transmission shift strategies.¹⁷¹ It was expected that GEM's absolute accuracy would decrease because these shift strategies were tuned for best average performance and for a particular transmission. Nevertheless, it was shown that relative accuracy did not suffer; therefore, the agencies deemed the GEM default shift strategies acceptable for GEM certification purposes. Further details of this validation step are presented in Chapter 4.3.2.3 of the RIA and in a SwRI final report.¹⁶²

As explained above and in Chapter 4.3.2.3 of the RIA, it is challenging to achieve absolute correlation between any computer simulation and real-world vehicle operation. Therefore, the agencies focused on relative comparisons. Following the SAE standard procedure SAE J1321 "Type II," two trucks have been tested and these real-world results were compared to GEM simulations. In summary, the relative comparisons between GEM simulations and the real-world testing of trucks showed a 2.4 percent difference. The details of this testing and correlation analysis is presented in Chapter 4.3.2.3 of the RIA.

In conclusion, the agencies completed a number of validation steps to ensure that GEM demonstrates a reasonable degree of absolute accuracy, but more importantly a high degree of relative accuracy, versus both laboratory and real-world experimental data.

(3) Supplements to GEM Simulation

As in Phase 1, for most tractors and vocational vehicles, compliance with the Phase 2 g/ton-mile vehicle standards could be evaluated by directly comparing the GEM result to the standard. However, in Phase 1, manufacturers incorporating innovative or advanced technologies could apply improvement factors to lower the GEM result before comparing to the standard.¹⁷³ For example, a manufacturer incorporating a launch-assist mild hybrid that was pre-approved for a 5 percent benefit would apply a 0.95 improvement factor to its GEM results for such vehicles. In this

example, a GEM result of 300 g/ton-mile will be reduced to 285 g/ton-mile.

For Phase 2, the agencies largely continue the existing Phase 1 innovative technology approach, but we name it "off-cycle" to better reflect its purpose.

(a) Off-Cycle Technology Procedures

In Phase 1 the agencies adopted an emissions credit generating opportunity that applied to new and innovative technologies that reduce fuel consumption and CO₂ emissions, which were not in common use with heavy-duty vehicles before model year 2010 and are not reflected over the test procedures or GEM (*i.e.*, the benefits are "off-cycle"). See 76 FR 57253. As was the case in the development of Phase 1, the agencies continue this approach for technologies and concepts with CO₂ emissions and fuel consumption reduction potential that might not be adequately captured over the Phase 2 duty cycles or are not inputs to GEM. Note, however, that the agencies now refer to these technologies as off-cycle rather than innovative. Comments were generally supportive of continuing this provision. See Section I.C(1)(c) of this document and Section 1 of the RTC for more discussion of innovative and off-cycle technologies.

We recognize that the Phase 1 testing burden associated with the innovative technology credit provisions discouraged some manufacturers from applying. To streamline recognition of many technologies, default values have been integrated directly into GEM. For example, automatic tire inflation systems have fixed default values, and such technologies are now recognized through a post-simulation adjustment approach, discussed in Chapter 4 of the RIA. This is similar to the technology "pick list" from our light-duty programs. See 77 FR 62833–62835 (October 15, 2012). If manufacturers wish to receive additional credit beyond these fixed values, then the off-cycle technology credit provisions provide a regulatory path toward that additional recognition.

Beyond the additional technologies that the agencies have added to GEM, the agencies also believe there are several emerging technologies that are being developed today, but will not be accounted for in GEM because we do not have enough information about these technologies to assign fixed values to them in GEM. Any credits for these technologies will need to be based on the off-cycle technology credit generation provisions. These require the assessment of real-world fuel consumption and GHG reductions that can be measured with verifiable test

methods using representative operating conditions typical of the engine or vehicle application.

As in Phase 1, the agencies continue to provide two paths for approval of the test procedure to measure the CO₂ emissions and fuel consumption reductions of an off-cycle technology used in the HD tractor. See 40 CFR 1037.610 and 49 CFR 535.7. The first path does not require a public approval process of the test method. A manufacturer can use "pre-approved" test methods for HD vehicles including the A-to-B chassis testing, powertrain testing or on-road testing. A manufacturer may also use any developed test procedure which has known quantifiable benefits. A test plan detailing the testing methodology is required to be approved by the agencies prior to collecting any test data. The agencies will also continue the second path which includes a public approval process of any testing method which could have uncertain benefits (*i.e.*, an unknown usage rate for a technology). Furthermore, the agencies are modifying our provisions to better clarify the documentation required to be submitted for approval aligning them with provisions in 40 CFR 86.1869–12, and NHTSA separately prohibits credits from technologies addressed by any of its crash avoidance safety rulemakings (*i.e.*, congestion management systems).

Sections III and V separately describe tractor and vocational vehicle technologies, respectively, that the agencies anticipate may qualify for these off-cycle credit provisions.

(4) Production Vehicle Testing for Comparison to GEM

As described in Section III.E.(2)(j), The agencies are requiring tractor manufacturers to annually chassis test five production vehicles over the GEM cycles to verify that relative reductions simulated in GEM are being achieved in production. See 40 CFR 1037.665. We do not expect absolute correlation between GEM results and chassis testing. GEM makes many simplifying assumptions that do not compromise its usefulness for certification, but do cause it to produce emission rates different from what would be measured during a chassis dynamometer test. Given the limits of correlation possible between GEM and chassis testing, we would not expect such testing to accurately reflect whether a vehicle was compliant with the GEM standards. Therefore, we are not applying GHG compliance liability to such testing. Rather, this testing will be for data collection and informational purposes only. The agencies will continue to evaluate in-use compliance

¹⁷³ 40 CFR 1036.610, 1036.615, 1037.610, and 1037.615.

by verifying GEM inputs and testing in-use engines. (Note that NTE standards for criteria pollutants may apply for some portion of the test cycles.)

(5) Use of GEM in Establishing the Phase 2 Numerical Standards

As in Phase 1, the agencies are setting specific numerical standards against which tractors and vocational vehicles will be certified using GEM (box trailers will use a GEM-based equation, and some trailers and custom chassis vocational vehicles may optionally use a non-GEM certification path). Although these standards are performance-based standards, which do not specifically require the use of any particular technologies,¹⁷⁴ the agencies established these standards by evaluating specific vehicle technology packages using the final version of Phase 2 GEM. We note that that this means the final numerical standards are not directly comparable to the proposed standards, which were based on an intermediate version of GEM, rather than on the final version.

(a) Relation to In-Use Emissions

The purpose of this rulemaking is to achieve in-use emission and fuel consumption reductions by requiring manufacturers to demonstrate that they meet the promulgated emission standards. Thus, it is important that GEM simulations be reasonably representative of in-use operation. Testing that is unrepresentative of actual in-use operation does not necessarily tell us anything about whether any emission reductions occur. However, we recognize that certain simplifications are necessary for practical simulations. In the past, EPA has addressed this issue by including in our testing regulations a process by which EPA can work with manufacturers to adjust test procedures to make them more representative of in-use operation. For engine testing, this provision is in 40 CFR 1065.10(c)(1), where EPA requires manufacturers to notify us in cases in which they determine that the specified test procedures would result in measurements that do not represent in-use operation.

Although we are not adopting an equivalent provision for GEM at this time, we expect similar principles to apply. To the extent that GEM fails to represent in-use emission, we would expect to work with manufacturers to address the issue—under the existing regulations where possible, or by promulgating a new rulemaking.

We recognize that many compromises must be made between the practicality of testing/simulation and the matching of in-use operation. We have considered many aspects of the test procedures in this respect for the engines, vehicles, and emission controls of which we are currently aware. We have concluded that the procedures will generally result in emission simulations that are sufficiently representative of in-use emissions, even though not all in-use operation will occur during simulation. Nevertheless, we have identified several areas that deserve some additional discussion.

GEM is structured to simulate a single vehicle weight (curb weight plus payload) per regulatory subcategory. However, we know that actual in-use weights will rarely be exactly the same as the simulated weights. Nevertheless, since the representativeness of the simulated weights (or lack thereof) is being fully considered in the setting of the standards, there would be no need to modify the procedures to account for different curb weights or payloads.

GEM simulates vehicle emissions over three drive cycles plus two idle cycles, and weights the cycle results based on the type of vehicle being certified. These cycles and weightings reflect *fleet average* driving patterns and the agencies do not expect them to fully match driving patterns for *individual* vehicles. Thus, we would generally not consider GEM's cycles as unrepresentative for vehicles with different in-use driving patterns. However, if new information became available that demonstrated that GEM's cycles somehow did not reflect fleet average driving patterns, the agencies would consider such information in the context of the principles of representative testing, described above.

Finally, GEM includes default values for axle and transmission efficiency derived from baseline technologies. However, we generally expect manufacturers to use more efficient axles and transmissions for Phase 2 vehicles. As noted above, based on comments, the agencies are allowing manufacturers to optionally input measured efficiencies to better represent these more efficient technologies. We would not consider GEM unrepresentative if manufacturers chose to use the default values rather than measure these efficiencies directly.

(b) Relation to Powertrain Testing

As already noted, GEM correlates very well with powertrain testing. To the extent they differ, it would be expected to be primarily related to how transmission performance is modeled in

GEM. Although GEM includes a sophisticated model of transmissions, it cannot represent a transmission better than a powertrain test of the same transmission. Thus, the agencies consider powertrain testing to be as good as or better than GEM run using engine-only fuel maps; hence the provision in the final rules allowing results from powertrain testing to be used as a GEM input.

In some respects, powertrain testing can be considered to be a reference method for this rulemaking. Because manufacturers have the option to perform powertrain testing instead of engine-only fuel mapping, the stringency of the final standards can be traced to powertrain testing. In other words, methods that can be shown to be equivalent to powertrain testing can be considered to be consistent with the testing that was used as the basis of the final Phase 2 standards.

In a related context, it may be useful in the future to consider equivalency to powertrain testing as an appropriate criterion for evaluating changes to GEM to address new technologies. Consider, for example, a new technology that is not represented in GEM, but that is reflected in powertrain testing. The agencies could determine that it would be appropriate to modify GEM to reflect the technology rather than to require manufacturers to perform powertrain testing. In such a case, the agencies would not consider the modification to GEM to impact the effective stringency of the Phase 2 standards because the new version of GEM would be equivalent to performing powertrain testing.

D. Engine Test Procedures and Engine Standards

In addition to the Phase 1 GEM-based vehicle certification of tractors and vocational chassis, the agencies also set Phase 1 separate CO₂ and fuel efficiency standards for the engines installed in tractors and vocational chassis. EPA also set Phase 1 separate engine standards for capping methane (CH₄) and nitrous oxide (N₂O) emissions (essentially capping emissions at current emission levels). Compliance with all of these Phase 1 separate engine standards is demonstrated by measuring these emissions during an engine dynamometer test procedure. For Phase 1 the agencies use the same test procedure specified for EPA's existing heavy-duty engine emissions standards (e.g., NO_x and PM standards). These Phase 1 engine standards are specified in terms of brake-specific (g/bhp-hr) fuel, CO₂, CH₄ and N₂O emissions limits. Since the test procedure already

¹⁷⁴ The sole exception being the design-based standards for non-aero and partial aero trailers.

specified how to measure fuel consumption, CO₂ and CH₄, few changes were needed to utilize the test procedure for Phase 1, the most notable change being a modification specifying how to measure N₂O.

There are some differences in how these non-GHG test procedures are applied in Phase 1 and Phase 2. In EPA's non-GHG engine emissions standards, heavy-duty engines must meet brake-specific standards for emissions of total oxides of nitrogen (NO_x), particulate mass (PM), non-methane hydrocarbon (NMHC), and carbon monoxide (CO). These standards must be met by all engines both over a 13-mode steady-state duty cycle called the "Supplemental Emissions Test" (SET)¹⁷⁵ and over a composite of a cold-start and a hot-start transient duty cycle called the "Federal Test Procedure" (FTP). In contrast, for Phase 1 the agencies require that engines specifically installed in tractors meet fuel efficiency and CO₂ standards over only the SET but not the composite FTP. This requirement was intended to reflect that tractor engines typically operate near steady-state conditions versus transient conditions. See 76 FR 57159. For Phase 2 the agencies are finalizing, as proposed, slight changes to the 13-modes' weighting factors to better reflect in-use engine operation. These weighting factors apply only for determining SET fuel consumption and CO₂ emissions. No changes are being made to the weighting factors for EPA's non-GHG emission standards. The agencies adopted the converse for engines installed in vocational vehicles. That is, these engines must meet fuel efficiency and CO₂ standards over the composite FTP but not the SET. This requirement was intended to reflect that vocational vehicle engines typically operate under transient conditions versus steady-state conditions (76 FR 57178). For both tractor and vocational vehicle engines in Phase 1, EPA set CH₄ and N₂O emissions cap standards over the composite FTP only and not over the SET duty cycle. See Section II.D. for details on this final action's engine test procedures for Phase 2.

In response to the agencies' proposed engine standards, we received a number of public comments. The agencies considered those comments, and the following list summarizes key changes we've made in response, and more detailed descriptions of these changes are presented in Chapter 2.7 of the RIA:

- Recalculated the SET baseline using the new Phase 2 SET weighting factors.
- Recalculated the FTP baseline, based on MY 2016 FTP certification data from Cummins, DTNA, Volvo, Navistar, Hino, Isuzu, Ford, GM and FCA. These included HHD, MHD, and LHD engines.
- Projected how manufacturers would modify maximum fuel rates as a function of speed to strategically relocate SET mode points to achieve lowest SET results.
- Projected a higher market penetration of WHR in 2027, versus what we proposed.
- Decreased our projected impact of engine technology dis-synergies by increasing the magnitude of our so-called "dis-synergy factors;" accounting for these changes by increasing the research and development costs needed for this additional optimization.

The following section first describes the engine test procedures used to certify engines to the Phase 2 separate engine standards. Sections that follow describe the Phase 2 CO₂, N₂O and CH₄ separate engine standards and their feasibility.

(1) Engine Test Procedures

(a) SET Cycle Weighting

The SET cycle was adopted by EPA in 2000 and modified in 2005 from a discrete-mode test to a ramped-modal cycle to broadly cover the most significant part of the speed and torque map for heavy-duty engines, defined by three non-idle speeds and three relative torques. The low speed is called the "A speed," the intermediate speed is called the "B speed," and the high speed is called the "C speed." As is shown in Table II-1, the SET cumulatively weights these three speeds at 23 percent, 39 percent, and 23 percent.

TABLE II-1—SET MODES WEIGHTING FACTOR IN PHASE 1

Speed, % Load	Weighting factor in Phase 1 (%)

TABLE II-1—SET MODES WEIGHTING FACTOR IN PHASE 1—Continued

Speed, % Load	Weighting factor in Phase 1 (%)
Cumulative A Speed	23
Cumulative B Speed	39
Cumulative C Speed	23

The C speed is typically in the range of 1800 rpm for current heavy heavy-duty engine designs. However, it is becoming much less common for engines to operate at such a high speeds in real-world driving conditions, and especially not during cruise vehicle speeds in the 55 to 65 mph vehicle speed range. This trend has been corroborated by engine manufacturers' in-use data that has been submitted to the agencies in comments and presented at technical conferences.¹⁷⁶ Thus, although the current SET represents highway operation better than the FTP cycle, it could be improved by adjusting its weighting factors to better reflect modern trends in in-use engine operation. Furthermore, the most recent trends indicate that manufacturers are configuring drivetrains to operate engines at speeds down to a range of 1050–1200 rpm at a vehicle speed of 65 mph.

To address this trend toward in-use engine down-speeding, the agencies are finalizing as proposed refined SET weighting factors for the Phase 2 CO₂ emission and fuel consumption standards. The new SET mode weightings move most of the C weighting to "A" speed, as shown in Table II-2. To better align with in-use data, these changes also include a reduction of the idle speed weighting factor. These new mode weightings do not apply to criteria pollutants or to the Phase 1 CO₂ emission and fuel consumption standards.

TABLE II-2—NEW SET MODES WEIGHTING FACTOR IN PHASE 2

Speed/% load	Weighting factor in Phase 2 (%)
Idle	12

(b) Engine Test Provisions for SET, FTP, and Engine Mapping for GEM Inputs

Although GEM does not apply directly to engine certification, Phase 2 will require engine manufacturers to generate and certify full load and motoring torque curves and engine fuel rate maps for input into GEM for tractor and vocational chassis manufacturers to demonstrate compliance to their respective standards. The full load and motoring torque curve procedures were previously defined in 40 CFR part 1065, and these are already required for non-GHG emissions certification. The Phase 2 final default test procedure for generating an engine map for GEM's 55 mph and 65 mph drive cycles is the "steady-state" mapping procedure. However, the agencies are finalizing an option for manufacturers to use the "cycle average" mapping procedure for GEM's 55 mph and 65 mph drive cycles. The test procedure for generating an engine map for GEM's ARB Transient drive cycle is the "cycle-average" mapping procedure, and the agencies are not finalizing any other mapping options for the ARB Transient drive cycle. Note that if an engine manufacturer elects to conduct powertrain testing to generate inputs for GEM, then steady-state and cycle-average engine maps would not be required for those GEM vehicle configurations to which the powertrain test inputs would apply. The steady-state and cycle-average test procedures are specified in 40 CFR parts 1036 and 1065. The technical and confidential business information motivations for finalizing these test procedures are explained in II. B. (2), along with a summary of comments we received.

One important consideration is the need to correct measured fuel consumption rates for the carbon and energy content of the test fuel. As proposed, we will continue the Phase 1 approach, which is specified in 40 CFR

1036.530. We are specifying a similar approach to GEM fuel maps in Phase 2.

As proposed, the agencies are requiring that engine manufacturers certify fuel maps for GEM, as part of their certification to the engine standards. However, there were a number of manufacturer comments strongly questioning the particular proposed requirement that engine manufacturers provide these maps to vehicle manufacturers starting in MY 2020 for the certification of vehicles commercially marketed as MY 2021 vehicles in calendar year 2020. This is a normal engine and vehicle manufacturing process, where many vehicles may be produced with engines having an earlier model year than the commercial model year of the vehicle. For example, we expect that some MY 2021 vehicles will be produced with MY 2020 engines. Thus, we proposed to require engine manufacturers to begin providing GEM fuel maps for MY 2020 engines so that vehicle manufacturers could run GEM to certify MY 2021 vehicles with MY 2020 engines. EMA and some of its members commented that MY 2020 engines should not be subject to Phase 2 requirements, based on NHTSA's statutory 4-year lead-time requirement and because the potential higher fuel consumption of MY 2020 (*i.e.*, Phase 1) engine maps could force vehicle manufacturers to install additional technologies that were not projected by the agencies for compliance. The agencies considered these comments along with the potential cost savings for manufacturers to align the timing of both their engines' and vehicle's Phase 2 product plans and certification paths. The agencies also considered how this situation would repeat in MY 2024 and MY 2027 and possibly with future standards as well. Based on these considerations, we have decided that it would be more appropriate to harmonize the engine and vehicle standards, starting in MY 2021 so that vehicle manufacturers will not need fuel maps for 2020 engines. Thus, we are not finalizing the requirement to provide fuel maps for MY 2020 engines. However, we are requiring fuel maps for all MY 2021 engines, even those (*e.g.*, small businesses) for which the Phase 2 engine and vehicle standards have been delayed. See 40 CFR 1036.150.

The current engine test procedures also require the development of regeneration emission rate and frequency factors to determine infrequent regeneration adjustment factors (IRAFs) that account for the emission changes for *criteria* pollutants during an exhaust emissions control

system regeneration event. In Phase 1 the agencies adopted provisions to exclude CO₂ emissions and fuel consumption due to regeneration. However, for Phase 2, we are requiring the inclusion of CO₂ emissions and fuel consumption due to regeneration over the FTP and SET (RMC) cycles, as determined using the IRAF provisions in 40 CFR 1065.680. While some commenters opposed this because of its potential impact on stringency, we do not believe this will significantly impact the stringency of these standards because manufacturers have already made great progress in reducing the frequency and impact of regeneration emissions since 2007. Rather, the agencies are including IRAF CO₂ emissions for Phase 2 to prevent these emissions from increasing in the future to the point where they would otherwise become significant. Manufacturers qualitatively acknowledged the likely already small and decreasing magnitude of IRAF CO₂ emissions in their comments. For example, EMA stated, "the rates of infrequent regenerations have been going down since the adoption of the Phase 1 standards" and that IRAF "contributions are minor."

Nevertheless, we believe it is prudent to begin accounting for regeneration emissions to discourage manufacturers from adopting criteria emissions compliance strategies that could reverse this trend. Manufacturers expressed concern about the additional test burden, but the only additional requirement would be to measure and report CO₂ emissions for the same tests they are already performing to determine IRAFs for other pollutants.

At the time of the proposal, we did not specifically adjust baseline levels to include additional IRAF emissions because we believed them to be negligible and decreasing. Commenters opposing this proposed provision provided no data to dispute this belief. We continue to believe that regeneration strategies can be engineered to maintain these negligible rates. Thus, we do not believe they are of fundamental significance for our baselines in the FRM. Highway operation includes enough high temperature operation to make active regenerations unnecessary. Furthermore, recent improvements in exhaust after-treatment catalyst formulations and exhaust temperature thermal management strategies, such as intake air throttling, minimize CO₂ IRAF impacts during non-highway operation, where active regeneration might be required. Finally, as is discussed in Section II.D.(2), recent significant

efficiency improvements over the FTP cycle suggest that FTP emissions may actually be even lower than we have estimated in our updated FTP baselines, which would provide additional margin for manufacturers to manage any minor CO₂ IRAF impacts that may occur.

We are not including fuel consumption due to after-treatment regeneration in the creation of fuel maps used in GEM for vehicle compliance. We believe that the IRAF requirements for the separate SET and FTP engine standards, along with market forces that already exist to minimize regeneration events, will create sufficient incentives to reduce fuel consumption during regeneration over the entire fuel map.

(c) Powertrain Testing

The agencies are finalizing a powertrain test option to afford a robust mechanism to quantify the benefits of CO₂ reducing technologies that are a part of the powertrain (conventional or hybrid), that are not captured in the GEM simulation. Among these technologies are integrated engine and transmission control and hybrid systems. We are finalizing a number of improvements to the test procedure in 40 CFR 1037.550. As proposed we are finalizing the requirement for Phase 2 hybrid powertrains to mapped using this powertrain test method. The agencies are also finalizing modifications to 40 CFR 1037.550 to separate out the hybrid specific testing protocols.

To limit the amount of testing under this rule, powertrains can be divided into families and are tested in a limited number of simulated vehicles that will cover the range of vehicles in which the powertrain will be used. A matrix of 8 to 9 tests will be needed per vehicle cycle, to enable the use of the powertrain results broadly across all the vehicles in which the powertrain will be installed. The individual tests differ by the vehicle that is being simulated during the test. These are discussed in detail in Chapter 3.6 of the RIA.

(i) Powertrain Test Procedure

The agencies are expanding upon the test procedures defined 40 CFR 1037.550 for Phase 1 hybrid vehicles. The Phase 2 expansion will migrate the current Phase 1 test procedure to a new 40 CFR 1037.555 and will modify the current test procedure in 40 CFR 1037.550, allowing its use for Phase 2 only. The Phase 2 modifications relative to 40 CFR 1037.550 include the addition of the rotating inertia of the driveline and tires, and the axle efficiency. This revised procedure also requires that each of the powertrain components be

cooled so that the temperature of each of the components is kept in the normal operation range. We are extending the powertrain procedure to PHEV powertrains.

Powertrain testing contains many of the same requirements as engine dynamometer testing. The main differences are where the test article connects to the dynamometer and the software that is used to command the dynamometer and operator demand setpoints. The powertrain procedure finalized in Phase 2 allows for the dynamometer(s) to be connected to the powertrain either upstream of the drive axle or at the wheel hubs. The output of the transmission is upstream of the drive axle for conventional powertrains. In addition to the transmission, a hydraulic pump or an electric motor in the case of a series hybrid may be located upstream of the drive axle for hybrid powertrains. If optional testing with the wheel hub is used, two dynamometers will be needed, one at each hub. Beyond these points, the only other difference between powertrain testing and engine testing is that for powertrains, the dynamometer and throttle setpoints are not set by fixed speed and torque targets prescribed by the cycle, but are calculated in real time by the vehicle model. The powertrain test procedure requires a forward calculating vehicle model, thus the output of the model is the dynamometer speed setpoints. The vehicle model calculates the speed target using the measured torque at the previous time step, the simulated brake force from the driver model, and the vehicle parameters (tire rolling resistance, drag area, vehicle mass, rotating mass, and axle efficiency). The operator demand that is used to change the torque from the engine is controlled such that the powertrain follows the vehicle speed target for the cycle instead of being controlled to match the torque or speed setpoints of the cycle. The emission measurement procedures and calculations are identical to engine testing.

(ii) Engine Test Procedures for Replicating Powertrain Tests

As described in Section II.B.(2)(b), the agencies are finalizing the proposed powertrain test option to quantify the benefits of CO₂-reducing powertrain technologies. This option is very similar to the cycle average mapping approach, although these powertrain test results would be used to override both the engine and transmission (and possibly axle) simulation portions of GEM, not just the engine fuel map. The agencies are requiring that any manufacturer

choosing to use this option also measure engine speed and engine torque during the powertrain test so that the engine's performance during the powertrain test could be replicated in a non-powertrain engine test cell. Manufacturers would be required to measure or calculate, using good engineering judgment, the engine shaft output torque, which would be close-coupled to the transmission input shaft during a powertrain test. Subsequent engine testing then could be conducted using the normal part 1065 engine test procedures as specified in 40 CFR 1037.551, and g/bhp-hr CO₂ results could be compared to the levels the manufacturer reported during certification. Such testing could apply for both confirmatory and selective enforcement audit (SEA) testing. This would simplify both the certification and SEA testing.

As proposed, engine manufacturers certifying powertrain performance (instead of or in addition to the multi-point fuel maps) will be held responsible for powertrain test results. If the engine manufacturer does not certify powertrain performance and instead certifies only the steady-state and/or cycle-average fuel maps, it will be held responsible for fuel map performance rather than the powertrain test results. Engine manufacturers certifying both will be responsible for both.

Some commenters objected to the potential liability for such engine-only tests. However, it appears they do not understand our intent. This provision states clearly that this approach could be used only where "the test engine's operation represents the engine operation observed in the powertrain test." Also, since the manufacturers perform all SEA testing themselves, this would be an option for the manufacturer rather than something imposed by EPA. Thus, this concern should be limited to the narrow circumstance in which EPA performs confirmatory engine testing of an engine that was certified using powertrain testing, follows the manufacturer's specified engine test cycle, and ensures that the test accurately represents the engine's performance during the powertrain test. However, it is not clear why this would be problematic. It is entirely reasonable to assume that testing the engine in this way would result in equivalent emission results. To the extent manufacturer concerns remain, each manufacturer would be free to certify their engines based on engine-only fuel maps rather than powertrain testing.

(d) CO₂ From Urea SCR Systems

For diesel engines utilizing urea SCR emission control systems for NO_x

reduction, the agencies will allow, but not require, correction of the final engine (and powertrain) fuel maps to account for the contribution of CO₂ from the urea injected into the exhaust. This urea typically contributes 0.2 to 0.5 percent of the total CO₂ emissions measured from the engine, and up to 1 percent at certain map points. Since current urea production methods use gaseous CO₂ captured from the atmosphere (along with NH₃), CO₂ emissions from urea consumption does not represent a net carbon emission. This adjustment is necessary so that fuel maps developed from CO₂ measurements will be consistent with fuel maps from direct measurements of fuel flow rates. This adjustment is also necessary to fully align EPA's CO₂ standards with NHTSA's fuel consumption standards. Failing to account for urea CO₂ tailpipe emissions would result in reporting higher fuel consumption than what was actually

consumed. Thus, we are only allowing this correction for emission tests where CO₂ emissions are determined from direct measurement of CO₂ and not from fuel flow measurement, which would not be impacted by CO₂ from urea.

We note that this correction will be voluntary for manufacturers, and we expect that some manufacturers may determine that the correction is too small to be of concern. The agencies will use this correction for CO₂ measurements with any engines for which the engine manufacturer applied the correction for its fuel maps during certification.

We are not allowing this correction for engine test results with respect to the engine CO₂ standards. Both the Phase 1 standards and the new standards for CO₂ from diesel engines are based on test results that included CO₂ from urea. In other words, these standards are consistent with using a test procedure that does not correct for CO₂ from urea.

(2) Engine Standards for CO₂ and Fuel Consumption

We are largely maintaining the existing Phase 1 regulatory structure for engine standards, which had separate standards for spark-ignition engines (such as gasoline engines) and compression-ignition engines (such as diesel engines), and for HHD, MHD and LHD engines, but we are changing how these standards will apply to alternative fuel engines as described in Section XII.A.2.

Phase 1 applied different test cycles depending on whether the engine is used for tractors, vocational vehicles, or both, and we are continuing this approach. Tractor engines are subject to standards over the SET, while vocational engines are subject to standards over the FTP. Table II–3 shows the Phase 1 standards for diesel engines.

TABLE II–3—PHASE 1 MY 2017 DIESEL ENGINE CO₂ AND FUEL CONSUMPTION STANDARDS

Units	HHD SET	MHD SET	HHD FTP	MHD FTP	LHD FTP
g/bhp-hr	460	487	555	576	576
gal/100 bhp-hr	4.5187	4.7839	5.4519	5.6582	5.6582

In the Phase 2 proposal we assumed that these numeric values of the Phase 1 standards were the baselines for Phase 2. We applied our technology assessments to these baselines to arrive at the Phase 2 standards for MY 2021, MY 2024 and MY 2027. In other words, for the Phase 2 proposal we projected that starting in MY 2017 engines would, on average, just meet the Phase 1 standards and not over-comply. However, based on comments we received on how to consistently apply our new SET weighting factors in our analysis and based on recent MY 2016 engine certification data, we are updating our Phase 2 baseline assumptions for both the SET and FTP.

First, with respect to the SET, in the proposal we compared our proposed Phase 2 standards, which are based on these new Phase 2 weighting factors, to the Phase 1 numeric standards, which are based on the current Phase 1 weighting factors. Because we continue to use the same 13-mode brake specific CO₂ and fuel consumption numeric values we used for the proposal to represent the performance of a MY 2017 baseline engine, we are not projecting a different technology level in the baseline. Rather, this is simply correcting an “apples-to-oranges” comparison from the proposal by applying the Phase 2 weighting factors

to the MY 2017 baseline engine. This was pointed out to us by UCS, ICCT and EDF in their public comments. While this did not impact our technology effectiveness or cost analyses, it did impact the numeric value of our baseline to which we reference the effectiveness of applying technologies to the 13 individual modes of the SET. Because the revised SET weighting factors result in somewhat lower brake specific CO₂ and fuel consumption numeric results for the composite baseline SET value, this correction, in turn, lowers the numerical values of the final Phase 2 SET standards. Making this particular update did not result in a change to the relative stringency of the final Phase 2 numeric engine standards (relative to MY 2017 baseline performance), but our updated feasibility analysis did; see Section II.D.(2)(a) below).

Second, the agencies made adjustments to the FTP baselines, but these adjustments were not made because of a calculation error. Rather, MY 2016 FTP certification data showed an unexpected step-change improvement in engine fuel consumption and CO₂ emissions. These data were not available at the time of proposal, so the agencies relied upon the MY 2017 Phase 1 standard as a baseline. EDF publicly commented in

response to the NODA that the more recent certification data revealed this new step-change. MY 2016 certification data submitted to the agencies¹⁷⁷ as well as to ARB¹⁷⁸ show that many engines from many manufacturers already not only achieve the Phase 1 FTP standards, but some were also below the MY 2027 standards proposed for Phase 2. This was not the case for the SET, where most manufacturers are still not yet complying with the MY 2017 Phase 1 SET standards. In view of this situation for the FTP, the agencies are adjusting the Phase 2 FTP baseline to reflect this shift. The underlying reasons for this shift are mostly related to manufacturers optimizing their SCR thermal management strategy over the FTP in ways that we (mistakenly) thought they already had in MY 2010 (*i.e.*, the Phase 1 baseline). As background, the FTP includes a cold-start, a hot-start and significant time spent at engine idle. During these portions of the FTP, the NO_x SCR system can cool down and lose NO_x reducing efficiency. One simplistic strategy to maintain SCR temperature is to inefficiently consume additional fuel, such that the fuel energy is lost to the

¹⁷⁷ <https://www3.epa.gov/otaq/certdata.htm#oh>.

¹⁷⁸ <http://www.arb.ca.gov/msprog/onroad/cert/mdehdehdv/2016/2016.php>.

exhaust system in the form of heat. There are more sophisticated strategies to maintain SCR temperature, however, but these apparently required additional time from MY 2010 for research, development and refinement. In updating these baseline values, the agencies did consider the concerns raised by manufacturers about the potential impact of IRAFs on baseline emissions.

As just noted, at the time of Phase 1 we had not realized that these improvements were not already in the Phase 1 baseline. These include optimizing the use of an intake throttle to decrease excess intake air at idle and SCR catalyst reformulation to maintain SCR efficiency at lower temperatures.

Based on this information, which was provided to the agencies by engine manufacturers, but only after we specifically requested this information, the agencies concluded that in Phase 1 we did not account for how much further these kinds of improvements could still impact FTP fuel consumption. Conversely, only by reviewing the new MY 2016 certification data did we realize how little SCR thermal management optimization actually occurred for the engine model years that we used to establish the Phase 1 baseline—namely MY 2009 and MY 2010 engines. Because we never accounted for this kind of improvement in our Phase 2 proposal's stringency analysis for meeting the

Phase 2 proposed FTP standards, this baseline shift does not alter our projected effectiveness and market adoption rates from the proposal. Therefore, we continue to apply the same improvements that we proposed, but we apply them to the updated FTP baseline. See Section II.D.(5) for a discussion on how this impacts carry-over of Phase 1 emission credits.

Table II–4 shows the Phase 2 diesel engine final CO₂ baseline emissions. Note that the gasoline engine CO₂ baseline for Phase 2 is the same as the Phase 1 HD gasoline FTP standard, 627 g/bhp-hr. More detailed analyses on these Phase 2 baseline values of tractor and vocational vehicles can be found in Chapter 2.7.4 of RIA.

TABLE II–4—PHASE 2 DIESEL ENGINE FINAL CO₂ AND FUEL CONSUMPTION BASELINE EMISSIONS

Units	HHD SET	MHD SET	HHD FTP	MHD FTP	LHD FTP
g/bhp-hr	455	481	525	558	576
gal/100 bhp-hr	4.4695	4.7250	5.1572	5.4813	5.6582

As described below, the agencies are adopting standards for new compression-ignition engines for Phase 2, commencing in MY 2021, that will require additional reductions in CO₂ emissions and fuel consumption beyond the Phase 2 baselines. The agencies are not adopting new CO₂ or fuel consumption *engine* standards for new heavy-duty gasoline engines. Note, however, that we are projecting some small improvement in gasoline engine

performance that will be recognized over the vehicle cycles (that is, reflected in the stringency of certain of the vocational vehicle standards). See Section V.B.2.a below.

For diesel engines to be installed in Class 7 and 8 combination tractors, the agencies are adopting the SET standards shown in Table II–5.¹⁷⁹ The MY 2027 SET standards for engines installed in tractors will require engine manufacturers to achieve, on average, a

5.1 percent reduction in fuel consumption and CO₂ emissions beyond the Phase 2 baselines. We are also adopting SET standards in MY 2021 and MY 2024 that will require tractor engine manufacturers to achieve, on average, 1.8 percent and 4.2 percent reductions in fuel consumption and CO₂ emissions, respectively, beyond the Phase 2 baselines.

TABLE II–5—PHASE 2 HEAVY-DUTY TRACTOR ENGINE STANDARDS FOR ENGINES¹⁸⁰ OVER THE SET CYCLE

Model year	Standard	Heavy heavy-duty	Medium heavy-duty
2021–2023	CO ₂ (g/bhp-hr)	447	473
	Fuel Consumption (gallon/100 bhp-hr)	4.3910	4.6464
2024–2026	CO ₂ (g/bhp-hr)	436	461
	Fuel Consumption (gallon/100 bhp-hr)	4.2829	4.5285
2027 and Later	CO ₂ (g/bhp-hr)	432	457
	Fuel Consumption (gallon/100 bhp-hr)	4.2436	4.4892

For diesel engines to be installed in vocational chassis, the agencies are adopting the FTP standards shown in Table II–6. The MY 2027 FTP standards for engines installed in vocational chassis will require engine

manufacturers to achieve, on average, a 4.2 percent reduction in fuel consumption and CO₂ emissions beyond the Phase 2 baselines. We are also adopting FTP standards in MY 2021 and MY 2024 that will require vocational

chassis engine manufacturers to achieve, on average, 2.3 percent and 3.6 percent reductions in fuel consumption and CO₂ emissions, respectively, beyond the Phase 2 baselines.

¹⁷⁹ The agencies note that the CO₂ and fuel consumption standards for Class 7 and 8 combination tractors do not cover gasoline or LHDD

engines, as those are not used in Class 7 and 8 combination tractors.

¹⁸⁰ Tractor engine standards apply to all tractor engines, without regard to the actual fuel (e.g.,

diesel or natural gas) or engine-cycle classification (e.g., compression-ignition or spark-ignition).

TABLE II-6—VOCATIONAL DIESEL (CI) ENGINE STANDARDS OVER THE HEAVY-DUTY FTP CYCLE

Model year	Standard	Heavy heavy-duty ¹⁸¹	Medium heavy-duty diesel ¹⁸¹	Light heavy-duty diesel ¹⁸²
2021–2023	CO ₂ (g/bhp-hr)	513	545	563
	Fuel Consumption (gallon/100 bhp-hr)	5.0393	5.3536	5.5305
2024–2026	CO ₂ (g/bhp-hr)	506	538	555
	Fuel Consumption (gallon/100 bhp-hr)	4.9705	5.2849	5.4519
2027 and Later	CO ₂ (g/bhp-hr)	503	535	552
	Fuel Consumption (gallon/100 bhp-hr)	4.9411	5.2554	5.4224

(a) Feasibility of the Diesel (Compression-Ignition) Engine Standards

In this section, the agencies discuss our assessment of the feasibility of the engine standards and the extent to which they conform to our respective statutory authorities and responsibilities. More details on the technologies discussed here can be found in RIA Chapter 2.3. The feasibility of these standards is further discussed in RIA Chapter 2.7 for tractor and vocational vehicle engines. While the projected technologies are discussed here separately, as is discussed at the beginning of this Section II.D, the agencies also accounted for dis-synergies between technologies. Note that Section II.D.(2)(e) discusses the potential for some manufacturers to achieve greater emission reductions by introducing new engine platforms, and how and why these reductions are reflected in the tractor and vocational vehicle standards.

Based on the technology analysis described below, the agencies project that a technology path exists that will allow engine manufacturers to meet the final Phase 2 standards by 2027, and to meet the MY 2021 and 2024 standards. The agencies also project that these manufacturers will be able to meet these standards at a reasonable cost and without adverse impacts on in-use reliability.

In general, engine performance for CO₂ emissions and fuel consumption can be improved by improving the internal combustion process and by reducing energy losses. More specifically, the agencies have identified the following key means by which fuel efficiency can be improved:

- Combustion optimization
- Turbocharger design and optimization
- Engine friction and other parasitic loss reduction
- Exhaust after-treatment pressure drop reduction
- Intake air and exhaust system pressure drop reduction (including EGR system)
- Engine down-sizing to improve core engine efficiency
- Engine down-speeding over the SET, and in-use, by lug curve shape optimization
- Waste heat recovery system installation and optimization
- Physics model based electronic controls for transient performance optimization

The agencies are gradually phasing in the separate engine standards from 2021 through 2027 so that manufacturers can gradually introduce these technology improvements. For most of these, the agencies project manufacturers could begin applying these technologies to about 45–50 percent of their heavy-duty engines by 2021, 90–95 percent by 2024, and ultimately apply them to 100 percent of their heavy-duty engines by 2027. However, for some of these improvements (such as waste heat recovery and engine downsizing) we project lower application rates in the Phase 2 time frame. This phase-in structure is consistent with the normal manner in which manufacturers introduce new technology to manage limited R&D budgets as well as to allow them to work with fleets to fully evaluate in-use reliability before a technology is applied fleet-wide. The agencies believe the phase-in schedule will allow manufacturers to complete these normal processes. See RIA 2.3.9.

Based on our technology assessment described below, the engine standards appear to be consistent with the agencies' respective statutory authorities. All of the technologies with high penetration rates above 50 percent have already been demonstrated to some extent in the field or in research laboratories, although some development work remains to be

completed. We note that our feasibility analysis for these engine standards is not based on projecting 100 percent application for any technology until 2027. We believe that projecting less than 100 percent application is appropriate and gives us additional confidence that the 2021 and 2024 MY standards are feasible.

Because this analysis considers reductions from engines meeting the Phase 1 standards, it assumes manufacturers will continue to include the same compliance margins as in Phase 1. In other words, a manufacturer currently declaring FCLs 10 g/bhp-hr above its measured emission rates (in order to account for production and test-to-test variability) will continue to do the same in Phase 2. Both the costs and benefits are determined relative to these baselines, and so are reflective of these compliance margins.

The agencies have carefully considered the costs of applying these technologies, which are summarized in Section II.D.(2)(d). These costs appear to be reasonable on both a per engine basis, and when considering payback periods.¹⁸³ The engine technologies are discussed in more detail below. Readers are encouraged to see the RIA Chapter 2.7 for additional details (and underlying references) about our feasibility analysis.

(i) Combustion Optimization

Although manufacturers are making significant improvements in combustion to meet the Phase 1 engine standards, the agencies project that even more improvement is possible after 2018. For example, improvements to fuel injection systems will allow more flexible fuel injection capability with higher injection pressure, which can provide more opportunities to improve engine fuel efficiency. Further optimization of piston bowls and injector tips will also improve engine performance and fuel efficiency. We project that a reduction of up to 1.0 percent is feasible in the 2024 model year through the use of

¹⁸¹ Heavy heavy-duty engine standards apply to all heavy heavy-duty engines, without regard to the actual fuel (e.g., diesel or natural gas) or engine-cycle classification (e.g., compression-ignition or spark-ignition).

¹⁸² The agencies are not adopting new CO₂ or fuel consumption engine standards for new heavy-duty gasoline engines. Therefore, the Phase 2 HD gasoline FTP standard is the same as the Phase 1 HD gasoline FTP standard, 627 g/bhp-hr, 7.0552 gallon/100 bhp-hr.

¹⁸³ See Section IX.M for additional information about payback periods.

these technologies, although it will likely apply to only 95 percent of engines until 2027.

Another important area of potential improvement is advanced engine control incorporating model based calibration to reduce losses of control during transient operation. Improvements in computing power and speed will make it possible to use much more sophisticated algorithms that are more predictive than today's controls. Because such controls are only beneficial during transient operation, they will reduce emissions over the FTP cycle, over the ARB Transient cycle's cycle-average mapping procedure, and during in-use operation, but this technology will not reduce emissions over the SET cycle or over the steady-state engine mapping procedure. Thus, the agencies are projecting model based control reductions only for vocational engines' FTP standards and for projecting improvements captured by the cycle-average mapping over the ARB Transient cycle. Although this control concept is not currently available and is still under development, we project model based controls achieving a 2 percent improvement in transient emissions. Based on model based controls already in widespread use in engine laboratories for the calibration of simpler controllers and based on recent model based control development under the DOE SuperTruck partnership (*e.g.*, DTNA's SuperTruck engine's model based controls), we project that such controls could be in limited production for some engine models by 2021. We believe that some vocational chassis applications would particularly benefit from these controls in-use (*e.g.*, urban applications with significant in-use transient operation). Therefore, we project that a modest amount of engine models will have these controls by MY 2021. We also project that manufacturers will learn more from the in-use operation of these technology leading engines, and manufacturers will be able to improve these controls even further, such that they would additionally benefit other vocational applications, such as multi-purpose and regional applications. By 2027, we project that 40 percent of all vocational diesel engines will incorporate model-based controls at a 2 percent level of effectiveness.

(ii) Turbocharging System

Many advanced turbocharger technologies can be brought into production in the time frame between 2021 and 2027, and some of them are already in production, such as mechanical or electric turbo-

compounding, more efficient variable geometry turbines, and Detroit Diesel's patented asymmetric turbocharger. A turbo-compound system, like those installed on some of Volvo's EURO VI compliant diesels and on some of DTNA's current U.S. offerings (supplied to DTNA by a division of Cummins), extracts energy from the exhaust to provide additional power. Mechanical turbo-compounding includes a power turbine located downstream of the turbine which in turn is connected to the crankshaft to supply additional power. On-highway demonstrations of this technology began in the early 1980s. It was used first in heavy duty production in the U.S. by Detroit Diesel for their DD15 and DD16 engines and reportedly provided a 3 to 5 percent fuel consumption reduction. Results are duty cycle dependent, and require significant time at high load to realize an in-use fuel efficiency improvement. Lightly loaded vehicles on flat roads or at low vehicle speeds can expect little or no benefit. Volvo reports two to four percent fuel consumption improvement in line haul applications.¹⁸⁴ Because of turbo-compound technology's drive cycle dependent effectiveness, the agencies are only projecting a market penetration of 10 percent for all tractor engines, at slightly less than 2 percent effectiveness over the SET. The agencies are considering turbo-compound to be mutually exclusive with WHR because both technologies seek to extract additional usable work from the same waste heat and are unlikely to be used together.

(iii) Engine Friction and Parasitic Losses

The friction associated with each moving part in an engine results in a small loss of engine power. For example, frictional losses occur at bearings, in the valve train, and at the piston ring-cylinder interface. Taken together such losses represent a measurable fraction of all energy lost in an engine. For Phase 1, the agencies projected a 1–2 percent reduction in fuel consumption due to friction reduction. However, new information leads us to project that an additional 1.4 percent reduction is possible for some engines by 2021 and all engines by 2027. These reductions are possible due to improvements in bearing materials, lubricants, and new accessory designs such as variable-speed pumps.

(iv) After-Treatment Optimization

All heavy duty diesel engine manufacturers are already using diesel particulate filters (DPFs) to reduce

particulate matter (PM) and selective catalytic reduction (SCR) to reduce NO_x emissions. The agencies see two areas in which improved after-treatment systems can also result in lower fuel consumption. First, increased SCR efficiency could allow re-optimization of combustion for better fuel consumption because the SCR would be capable of reducing higher engine-out NO_x emissions. We don't expect this to be significant, however. Manufacturers already optimize the DEF (urea) consumption and fuel consumption to achieve the lowest cost of operation; taking into account fuel consumption, DEF consumption and the prices of fuel and DEF. Therefore, if manufacturers re-optimized significantly for fuel consumption, it is possible that this would lead to higher net operating costs. This scenario is highly dependent upon fuel and DEF prices, so projecting this technology path is uncertain. Second, improved designs could reduce backpressure on the engine to lower pumping losses. If manufacturers have opportunities to lower backpressure within the size constraints of the vehicle, the agencies project that manufacturers will opt to lower after-treatment back pressure. The agencies project the combined impact of these improvements would be 0.6 percent over the SET.

Note that this improvement is independent of cold-start improvements made recently by some manufacturers with respect to vocational engines. Thus, the changes being made to the FTP baseline engines do not reduce the likelihood of the benefits of re-optimizing after-treatment projected here.

(v) Engine Intake and Exhaust Systems

Various high efficiency air handling for both intake air and exhaust systems could be produced in the 2020 and 2024 time frame. To maximize the efficiency of such processes, induction systems may be improved by manufacturing more efficiently designed flow paths (including those associated with air cleaners, chambers, conduit, mass air flow sensors and intake manifolds) and by designing such systems for improved thermal control. Improved turbocharging and air handling systems will likely include higher efficiency EGR systems and intercoolers that reduce frictional pressure losses while maximizing the ability to thermally control induction air and EGR. EGR systems that often rely upon an adverse pressure gradient (exhaust manifold pressures greater than intake manifold pressures) must be reconsidered and their adverse pressure gradients

¹⁸⁴ <http://www.volvotrucks.us/powertrain/d13/>.

minimized. Other components that offer opportunities for improved flow efficiency include cylinder heads, ports and exhaust manifolds to further reduce pumping losses by about 1 percent over the SET.

(vi) Engine Downsizing and Down Speeding

Proper sizing of an engine is an important component of optimizing a vehicle for best fuel consumption. This Phase 2 rule will require reductions in road load due to aerodynamic resistance, tire rolling resistance and weight, which will result in a drop in the vehicle power demand for most operation. This drop moves the engine operating points down to a lower load zone, which can move the engine away from operating near its peak thermal efficiency (a.k.a. the “sweet spot”). Engine downsizing combined with engine down speeding can allow the engine to move back to higher loads and a lower speed zone, thus achieving better fuel efficiency in the real world. However, because of the way engines are tested, little of the benefit of engine downsizing would be detected during engine testing (if power density remains the same) because the engine test cycles are de-normalized based on the full torque curve. Thus, the separate engine standards are not the appropriate standards for recognizing the benefits of engine downsizing. Nevertheless, we project that some small benefit can be measured over the engine test cycles depending on the characteristics of the engine fuel map and how the SET points are determined as a function of the engine’s lug curve.

After the proposal we received comments recommending that we should recognize some level of engine down speeding within the separate engine standards. Based on this comment and some additional confidential business information that we received, we believe that engine lug curve reshaping to optimize the locations of the 13-mode points is a way that manufacturers can demonstrate some degree of engine down-speeding over the engine test. As pointed out in Chapter 2.3.8 and 2.7.5 of the RIA, down speeding via lug curve reshaping alone can provide SET reductions in the range of 0.4 percent depending on the engine map characteristics.

(vii) Waste Heat Recovery

More than 40 percent of all energy loss in an engine is lost as heat to the exhaust and engine coolant. For many years, manufacturers have been using turbochargers to convert some of this waste heat in the exhaust into usable

mechanical power that is then used to compress the intake air. Manufacturers have also been developing a Rankine cycle-based system to extract additional heat energy from the engine. Such systems are often called waste heat recovery (WHR) systems. The possible sources of waste heat energy include the exhaust, recirculated exhaust gases, compressed charge air, and engine coolant. The basic approach with WHR is to use waste heat from one or more of these sources to evaporate a working fluid, which is passed through a turbine or equivalent expander to create mechanical or electrical power, then re-condensed.

For the proposal, the agencies projected that by 2027, 15 percent of tractor engines would employ WHR systems with an effectiveness of better than three percent. We received many comments on this projection, which are discussed briefly below and in more detail in the RTC. In particular, we note that some of the comments included confidential data related to systems not yet on the market. After carefully considering all of these comments, we have revised our projections to increase the effectiveness, decrease costs, and project higher adoption rates than we proposed.

Prior to the Phase 1 Final Rule, the NAS estimated the potential for WHR to reduce fuel consumption by up to 10 percent.¹⁸⁵ However, the agencies do not believe such levels will be achievable within the Phase 2 time frame. There currently are no commercially available WHR systems for diesel engines, although research prototype systems are being tested by some manufacturers. American Trucking Association, Navistar, DTNA, OOIDA, Volvo, and UPS commented that because WHR is still in the prototype stage, it should not be assumed for setting the stringency of the tractor engine standards. Many of these commenters pointed to the additional design and development efforts that will be needed to reduce cost, improve packaging, reduce weight, develop controls, select an appropriate working fluid, implement expected OBD diagnostics, and achieve the necessary reliability and durability. Some stated that the technology has not been thoroughly tested or asked that more real-world data be collected before setting standards based on WHR. Some of these commenters provided confidential business information pertaining to their analysis of WHR system component costs, failure modes,

and projected warranty cost information.

Alternatively, a number of commenters including Cummins, ICCT, CARB, ACEEE, EDF, Honeywell, ARB and others stated that the agencies should increase the assumed application rate of WHR in the final rule and the overall stringency of the engine standards. They argued the agencies’ WHR technology assessment was outdated and too conservative, the fuel savings and GHG reduction estimation for WHR were too low, and the agencies’ cost estimates were based on older WHR systems where costs were confounded with hybrid component costs and that these have since been improved upon. In addition, the agencies received CBI information supporting the arguments of some of these commenters.

Cummins stated the agencies underestimated the commercial viability of WHR and that we overstated the development challenges and timing in the NPRM. They said WHR can provide a 4 to 5 percent improvement in fuel consumption on tractor drive cycles and that WHR would be commercially viable and available in production as early as 2020 and will exceed the agencies’ estimates for market penetration over the period of the rule. According to Cummins, the reliability of their WHR system has improved with each generation of the technology and they have developed a smaller system footprint, improved integration with the engine and vehicle and a low-GWP working fluid, resulting in a much more compact and integrated system. They added that their system would be evaluated in extended customer testing by the end of 2015, and that results of that experience will inform further technology development and product engineering leading to expected commercial product availability in the 2020 timeframe. Furthermore, they said multiple product development cycles over the implementation timeframe of the rule would provide opportunities for further development for reduced cost and improved performance and reliability.

Some commenters, including EDF, said the agencies’ assumed design had little in common with the latest designs planned for production. They cited several publications, including the NAS 21st Century Truck Program report #3 and stated WHR effectiveness is much higher than the agencies estimated. Genthram cited an ICCT study saying that up to a 12 percent fuel consumption reduction from a 2010 baseline engine is possible with the application of advanced engine technologies and WHR.

¹⁸⁵ See 2010 NAS Report, page 57.

The agencies recognize that much work remains to be done, but we are providing significant lead time to bring WHR to market. Based on our assessment of each manufacturer's work to date, we are confident that a commercially-viable WHR capable of reducing fuel consumption by over three percent will be available in the 2021 to 2024 time frame. Concerns about the system's cost and complexity may remain high enough to limit the use of such systems in this time frame. Moreover, packaging constraints and lower effectiveness under transient conditions will likely limit the application of WHR systems to line-haul tractors. Refer to RIA Chapter 2.3.9 for a detailed description of these systems and their applicability. For our analysis of the engine standards, the agencies project that WHR with the Rankine technology could be used on 1 percent of tractor engines by 2021, on 5 percent by 2024, and 25 percent by 2027, with nearly all being used on sleeper cabs. We project this sharper increase in market adoption in the 2027 timeframe because we have noted that most technology adoption rate curves follow an S-shape: Slow initial adoption, then more rapid adoption, and then a leveling off as the market saturates (not always at 100 percent).¹⁸⁶ We assumed an S-shape curve for WHR adoption, where we project a steeper rise in market adoption in and around the 2027 timeframe. Given our averaging, banking and trading program flexibilities and that manufacturers may choose from a range of other technologies, we believe that manufacturers will be able to meet the 2027 standards, which we based on a 25 percent WHR adoption in tractor engines. Although we project these as steps, it is more likely that manufacturers will try to gradually increase the WHR adoption in MY 2025 and MY 2026 from the 5 percent in 2024 to generate emission credits to smooth the transition to the 2027 standards.

Commenters opposing the agencies' WHR projections argued that the real-world GHG and fuel consumption savings will be less than in prototype systems. DTNA said a heat rejection increase of 30 percent to 40 percent with WHR systems will require larger radiators, resulting in more aerodynamic drag and lower fuel savings from WHR systems. DTNA cited a Volvo study showing a 2 percent loss of efficiency with the larger frontal areas needed to accommodate heat rejection from WHR systems. Daimler stated effectiveness may be lower than expected since there is large drop off in

fuel savings when the tractor is not operating on a steady state cycle and the real world performance of WHR systems will be hurt by transient response issues. Daimler and ACEEE said the energy available from exhaust and other waste heat sources could diminish as tractor aerodynamics improve, thus lowering the expected fuel savings from WHR. Daimler said because of this, WHR estimated fuel savings was overestimated by the agencies. Navistar said WHR working fluids will have a significant GHG impact based on their high global warming potential. They commented that fuel and GHG reductions will be lower in the real world with the re-weighting of the RMC which results in lower engine load, and thus lower available waste heat. However, none of these commenters have access to the full range of data available to the agencies, which includes CBI.

It is important to note that the net cost and effectiveness of future WHR systems depends on the sources of waste heat. Systems that extract heat from EGR gases may provide the side benefit of reducing the size of EGR coolers or eliminating them altogether. To the extent that WHR systems use exhaust heat, they increase the overall cooling system heat rejection requirement and likely require larger radiators. This could have negative impacts on cooling fan power needs and vehicle aerodynamics. Limited engine compartment space under the hood could leave insufficient room for additional radiator size increasing. Many of these issues disappear if exhaust waste heat is not recovered from the tailpipe and brought under the hood for conversion to mechanical work. In fact, it is projected that if a WHR system only utilizes heat that was originally within the engine compartment (e.g., EGR cooler heat, coolant heat, oil heat, etc.), then any conversion of that heat to mechanical heat actually reduces the heat rejection demand under the hood; potentially leading to smaller radiators and lower frontal area, which would actually lead toward improved aerodynamic performance. Refer to RIA Chapter 2.3.9 for more discussion.

Several commenters stated that costs are highly uncertain for WHR technology, but argued that the agencies' assumption of a \$10,523 cost in 2027 are likely significantly lower than reality. Volvo estimated a cost of \$21,700 for WHR systems. Volvo said that in addition to hardware cost being underestimated, the agencies had not properly accounted for other costs such as the R&D needed to bring the

technology into production within a vehicle. Volvo said they would lose \$17,920 per unit R&D alone, excluding other costs such as materials and administrative expenses. Daimler said that costs almost always inflate as the complexity of real world requirements drive up need for more robust designs, sensors, controls, control hardware, and complete vehicle integration. They added that development costs will be large and must be amortized over limited volumes. Furthermore, OOIDA said the industry experience with such complex systems is that maintenance, repair, and down-time cost can be much greater than the initial purchase cost. ATA and OOIDA said that potential downtime associated with an unproven technology is a significant concern for the industry.

On the other hand, some commenters argued that the agencies had actually overestimated WHR costs in the proposal. These commenters generally argued that engineering improvements to the WHR systems that will go into production in the Phase 2 time frame would lower costs, in particular by reducing components. The agencies largely agree with these commenters and we have revised our analysis to reflect these cost savings. See RIA 2.11.2.15 for additional discussion.

(viii) Technology Packages for Diesel Engines Installed in Tractors

This Section (a)(viii) describes technology packages that the agencies project could be applied to Phase 1 tractor engines to meet the Phase 2 SET separate engine standards. Section II.D.(2)(e) also describes additional improvements that the agencies project some engine manufacturers will be able to apply to their engines.

We received comments on the tractor engine standards in response to the proposal and in response to the NODA. These comments can be grouped into two general themes. One theme expressed by ARB, non-governmental environmentally focused organizations, Cummins and some technology suppliers like Honeywell, recommended higher engine stringencies, up to 10–15 percent in some comments. Another theme, generally expressed by vertically integrated engine and vehicle manufacturers supported either no Phase 2 engine standards at all, or they supported the proposal's standards, but none of these commenters supported standards that were more stringent than what we proposed. An example of the contrast between these two themes can be shown in one report submitted to the docket and another submission rebutting the statements made in the

¹⁸⁶ NACFE 2015 Annual Fleet Fuel Study.

report. The report was submitted to the agencies by the Environmental Defense Fund (EDF).¹⁸⁷ On the other hand, four vertically integrated engine and vehicle manufacturers, DTNA, Navistar, Paccar, and Volvo, submitted a rebuttal to EDF's findings.¹⁸⁸ Some of these individual vehicle manufacturers also provided their own comments on EDF's report.¹⁸⁹ Cummins also provided comments and recommended stringencies somewhere between EDF's recommendations and the integrated

manufacturers' rebuttal. Cummins recommended achieving reductions by 2030 in the range of 9–15 percent. CARB's recommendation from their comments¹⁹¹ is 7.1 percent in 2024.

The agencies carefully considered this wide range of views, and based on the best data available, the agencies modified some of our technology projections between the proposal and the final rule.

Table II–5 lists our projected technologies together with our projected

effectiveness and market adoption rates for tractor engines. The reduction values shown as "SET reduction" are relative to our Phase 2 baseline values, as shown in Table II–7. It should be pointed out that the reductions in Table II–7 are based on the Phase 2 final SET weighting factors, shown in Table II–2. RIA Chapter 2.7.5 details the reasoning supporting our projection of improvements attributable to this fleet average technology package.

TABLE II–7—PROJECTED TRACTOR ENGINE TECHNOLOGIES AND REDUCTION

SET mode	SET weighted reduction (%) 2020–2027	Market penetration (2021) (%)	Market penetration (2024) (%)	Market penetration (2027) (%)
Turbo compound with clutch	1.9	5	10	10
WHR (Rankine cycle)	3.6	1	5	25
Parasitic/Friction (Cyl Kits, pumps, FIE), lubrication	1.5	45	95	100
After-treatment (lower dP)	0.6	30	95	100
EGR/Intake & exhaust manifolds/Turbo/VVT/Ports	1.1	45	95	100
Combustion/FI/Control	1.1	45	95	100
Downsizing	0.3	10	20	30
Overall reductions (%)				
Weighted reduction (%)		1.7	4.0	4.8
Down speeding optimization on SET		0.1	0.2	0.3
Total % reduction		1.8	4.2	5.1

The weighted reductions shown in this table have been combined using the "PI-formula," which has been augmented to account for technology dis-synergies that occur when combining multiple technologies. A 0.85 dis-synergy factor was used for 2021, and a 0.90 dis-synergy factor was used for 2024 and 2027.¹⁹² RIA Chapter 2.7.4 provides details on the "PI-formula" and an explanation for how the dis-synergy factors were determined. Some commenters argued that use of a single dis-synergy factor for all technologies is inappropriate. While we

agree that it would be preferable to have a more detailed analysis of the dis-synergy between each pair or group of technologies, we do not have the information necessary to conduct such an analysis. In the absence of such information, the simple single value approach is a reasonable approximation. Moreover, we note that the degree of dis-synergy is sufficiently small to make the impact of any errors on the resulting standards negligible.

Figure II.3 2018 HHD Figure II.4 are the samples of the HHD engine fuel maps used for the agencies' MY 2018

baseline engine and MY 2027 sleeper cab engine for tractors. As can be seen from these two figures, the torque curve shapes are different. This is because engine down speeding optimization for the SET is taken into consideration, where the engine peak torque is increased and the engine speed is shifted to lower speed. All maps used by GEM for all vehicles are shown in Chapter 2.7 of the RIA.

(ix) Technology Packages for Diesel Engines Installed in Vocational Vehicles

For diesel engines (and other compression-ignition engines) used in vocational vehicles, the MY 2021 standards will require engine manufacturers to achieve, on average, a 2.3 percent reduction in fuel

consumption and CO₂ emissions beyond the Phase 2 FTP baselines. Beginning in MY 2024, the agencies are requiring a 3.6 percent reduction in fuel consumption and CO₂ emissions beyond the Phase 2 FTP baselines for all diesel engines including LHD, MHD, and HHD, and beginning in MY 2027 this increases to 4.2 percent, on average. The

agencies have based these FTP standards on the performance of reduced parasitic and friction losses, improved after-treatment, combustion optimization, superchargers and variable geometry turbochargers, physics model-based controls, improved EGR pressure drop, and variable valve timing (only in LHD and MHD engines).

The percent reduction for the MY 2021, MY 2024, and MY 2027 standards is based on the combination of technology effectiveness and the respective market adoption rates projected.

Most of the potential engine technologies discussed previously for tractor engines can also be applied to vocational engines. However, neither of the waste heat technologies, Rankine cycle nor turbo-compound, are likely to be applied to vocational engines because they are less effective under transient operation, which is weighted more heavily for all of the vocational sub-categories. Given the projected cost and complexity of such systems, we believe that for the Phase 2 time frame manufacturers will focus their WHR development work on tractor applications (which will have better payback for operators), rather than on vocational applications. In addition, the

benefits due to engine downsizing, which can be realized in some tractor engines, may not be realized at all in the vocational sector, again because this control technology produces few benefits under transient operation.

One of the most effective technologies for vocational engines is the optimization of transient controls with physics model based control, which would replace current look-up table based controls. These are described more in detail in Chapter 2.3 of the RIA. We project that more advanced transient controls, including different levels of model based control, discussed in Chapter 2.3 of the RIA, would continue to progress and become more broadly applicable throughout the Phase 2 timeframe.

Other effective technologies include parasitic load/friction reduction, as well as improvements to combustion, air

handling systems, turbochargers, and after-treatment systems. Table II–8 below lists those potential technologies together with the agencies' projected market penetration rates for vocational engines. Again, similar to tractor engines, the technology reduction and market penetration rates are estimated by combining manufacturer-submitted confidential business information, together with estimates reflecting the agencies' judgment, which is informed by historical trends in the market adoption of other fuel efficiency improving technologies. The reduction values shown as "percent reduction" are relative to the Phase 2 FTP baselines, which are shown in Table II–3. The overall reductions combine the technology reduction values with their market adoption rates. The same set of the dis-synergy factors as the tractor are used for MY 2021, 2024, and 2027.

TABLE II–8—PROJECTED VOCATIONAL ENGINE TECHNOLOGIES AND REDUCTION

Technology	Percent reduction 2020–2027	Market penetration 2021 (%)	Market penetration 2024 (%)	Market penetration 2027 (%)
Model based control	2.0	25	30	40
Parasitic/Friction	1.5	60	90	100
EGR/Air/VVT/Turbo	1.0	60	90	100
Improved AT	0.5	30	60	100
Combustion Optimization	1.0	60	90	100
Weighted reduction (%)–L/M/HHD		2.3	3.6	4.2

(x) Summary of the Agencies' Analysis of the Feasibility of the Diesel Engine Standards

The HD Phase 2 standards are based on projected adoption rates for technologies that the agencies regard as the maximum feasible for purposes of EISA section 32902 (k) and appropriate under CAA section 202(a) based on the technologies discussed above and in RIA Chapter 2. The agencies believe these technologies can be adopted at the estimated rates for these standards within the lead time provided, as discussed in RIA Chapter 2.7. The 2021 and 2024 MY standards are phase-in standards on the path to the 2027 MY standards, and these earlier standards were developed using less aggressive application rates and therefore have lower technology package costs than the 2027 MY standards.

As described in Section II.D.(2)(d) below, the costs to comply with these standards are estimated to range from \$275 to \$1,579 per engine. This is slightly higher than the costs for Phase 1, which were estimated to be \$234 to \$1,091 per engine. Although the agencies did not separately determine fuel savings or emission reductions due to the engine standards apart from the vehicle program, it is expected that the fuel savings will be significantly larger than these costs, and the emission reductions will be roughly proportional to the technology costs when compared to the corresponding vehicle program reductions and costs. Thus, we regard these standards as cost-effective. This is true even without considering payback period. The phase-in 2021 and 2024 MY standards are less stringent and less costly than the 2027 MY standards. Given that the agencies believe these standards are technologically feasible, are highly cost effective, and highly cost effective when accounting for the fuel savings, and have no apparent adverse potential impacts (e.g., there are no projected negative impacts on safety or vehicle utility), they appear to represent a reasonable choice under section 202(a) of the CAA and the maximum feasible under NHTSA's EISA authority at 49 U.S.C. 32902(k)(2).

(b) Basis for Continuing the Phase 1 Spark-Ignited Engine Standard

For gasoline vocational engines, we are not adopting more stringent *engine* standards. Today most SI-powered vocational vehicles are sold as incomplete vehicles by a vertically integrated chassis manufacturer, where the incomplete chassis shares most of the same technology as equivalent complete pickups or vans, including the

powertrain. Another, even less common way that SI-powered vocational vehicles are built is by a non-integrated chassis manufacturer purchasing an engine from a company that also produces complete and/or incomplete HD pickup trucks and vans. Gasoline engines used in vocational vehicles are generally the same engines as are used in the complete HD pickups and vans in the Class 2b and 3 weight categories, although the operational demands of vocational vehicles often require use of the largest, most powerful SI engines, so that some engines fitted in complete pickups and vans are not appropriate for use in vocational vehicles. Given the relatively small sales volumes for gasoline-fueled vocational vehicles, manufacturers typically cannot afford to invest significantly in developing separate technology for these engines.

The agencies received many comments suggesting that technologies be applied to increase the stringency of the SI engine standard. These comments were essentially misplaced, since the agencies already had premised the Phase 1 SI MY 2016 FTP engine standards on 100 percent adoption of these technologies. The commenters thus did not identify any additional engine technologies that the agencies did not already consider and account for in setting the MY 2016 FTP engine standard. Therefore, the Phase 1 SI engine FTP standard for these engines will remain in place. However, as noted above, projected engine improvements are being reflected in the stringency of the vehicle standard for the vehicle in which the engine will be installed. In part this is because the GEM cycles result in very different engine operation than what occurs when an engine is run over the engine FTP cycle. We believe that certain technologies will show a fuel consumption and CO₂ emissions reduction during GEM cycles that do not occur over the engine FTP. We received comments on engine technologies that can be recognized over the GEM vehicle cycles. As a result, the Phase 2 gasoline-fueled vocational vehicle standards are predicated on adoption of advanced engine friction reduction and cylinder deactivation. To the extent any SI engines do not incorporate the projected engine technologies, manufacturers of SI-powered vocational vehicles would need to achieve equivalent reductions from some other vehicle technology to meet the vehicle standards. See Section V.C of this Preamble for a description of how we applied these technologies to develop the vocational vehicle standards. See Section VI.C of this

Preamble for a description of the SI engine technologies that have been considered in developing the HD pickup truck and van standards.

(c) Engine Improvements Projected for Vehicles Over the GEM Duty Cycles

As part of the certification process for the Phase 2 vehicle standards, tractor and vocational vehicle manufacturers will need to represent their vehicles' actual engines in GEM. Although the vehicle standards recognize the same engine technologies as the separate engine standards, each have different test procedures for demonstrating compliance. As explained earlier in Section II.D.(1), compliance with the tractor separate *engine* standards is determined from a composite of the Supplemental Engine Test (SET) procedure's 13 steady-state operating points. Compliance with the vocational vehicle separate *engine* standards is determined over the Federal Test Procedure's (FTP) transient engine duty cycle. In contrast, compliance with the vehicle standards is determined using GEM, which calculates composite results over a combination of 55 mph, 65 mph, ARB Transient and idle vehicle cycles. Each of these duty cycles emphasize different engine operating points; therefore, they can each recognize certain technologies differently. Hence, these engine improvements can be readily recognized in GEM and appropriately reflected in the stringency of the vehicle standards. It is important to note, however, that the tractor vehicle standards presented in Section III project that some (but not all) tractor engines will achieve greater reductions than required by the engine standards. This was reflected in the agencies' feasibility analysis using projected engine fuel maps that represent engines having fuel efficiency better than what is required by the engine standards. Similarly, the vocational vehicle standards in presented in Section V project that the average vocational engine will achieve greater reductions than required by the engine standards. These additional reductions are recognized by GEM and are reflected in the stringency of the respective vehicle standards.

Our first step in aligning our engine technology assessment at both the engine and vehicle levels was to separately identify how each technology impacts performance at each of the 13 individual test points of the SET steady-state engine duty cycle. For example, engine friction reduction technology is expected to have the greatest impact at the highest engine speeds, where frictional energy losses are the greatest.

As another example, turbocharger technology is generally optimized for best efficiency at steady-state cruise vehicle speed. For an engine, this is near its lower peak-torque speed and at a moderately high load that still offers sufficient torque reserve to climb modest road grades without frequent transmission gear shifting. The agencies also considered the combination of certain technologies causing dis-synergies with respect to engine efficiency at each of these test points. See RIA Chapter 2.3 and 2.7 for further details. Chapter 2.8 and 2.9 of the RIA details how the engine fuel maps are created for both tractor and vocational vehicles used for GEM as the default engine fuel maps.

(d) Engine Technology Package Costs for Tractor and Vocational Engines (and Vehicles)

As described in Chapters 2 and 7 of the RIA, the agencies estimated costs for each of the engine technologies discussed here. All costs are presented relative to engines projected to at least comply with the model year 2017 standards—*i.e.*, relative to our Phase 2 baseline engines. Note that we are not presenting any costs for gasoline engines (SI engines) in this section because we are not changing the SI engine standards. However, we are including a cost for additional engine technology as part of the vocational vehicle analysis in Section V.C.2.(e) (and appropriately so, since those engine improvements are reflected in the stringency of the vocational vehicle standard).

Our engine cost estimates include a separate analysis of the incremental part costs, research and development activities, and additional equipment. Our general approach used elsewhere in this action (for HD pickup trucks, gasoline engines, Class 7 and 8 tractors, and Class 2b–8 vocational vehicles) estimates a direct manufacturing cost for a part and marks it up based on a factor to account for indirect costs. *See also* 75 FR 25376. We believe that approach is appropriate when compliance with the standards is achieved generally by installing new parts and systems purchased from a supplier. In such a case, the supplier is conducting the bulk of the research and development on the new parts and systems and including those costs in the purchase price paid by the original equipment manufacturer. Consequently, the indirect costs incurred by the original equipment manufacturer need not reflect significant cost to cover research and development since the bulk of that effort is already completed. For the MHD and HHD diesel engine segment, however, the agencies believe that OEMs will incur costs not associated with the purchase of parts or systems from suppliers or even the production of the parts and systems, but rather the development of the new technology by the original equipment manufacturer itself. Therefore, the agencies have directly estimated additional indirect costs to account for these development costs. The agencies used the same approach in the Phase 1 HD rule. EPA commonly uses this approach in cases

where significant investments in research and development can lead to an emission control approach that requires no new hardware. For example, combustion optimization may significantly reduce emissions and cost a manufacturer millions of dollars to develop but would lead to an engine that is no more expensive to produce. Using a bill of materials approach would suggest that the cost of the emissions control was zero reflecting no new hardware and ignoring the millions of dollars spent to develop the improved combustion system. Details of the cost analysis are included in the RIA Chapter 2.7. To reiterate, we have used this different approach because the MHD and HHD diesel engines are expected to comply in part via technology changes that are not reflected in new hardware but rather reflect knowledge gained through laboratory and real world testing that allows for improvements in control system calibrations—changes that are more difficult to reflect through direct costs with indirect cost multipliers. Note that these engines are also expected to incur new hardware costs as shown in Table II–9 through Table II–12. EPA also developed the incremental piece cost for the components to meet each of the 2021 and 2024 standards. The costs shown in Table II–13 include a low complexity ICM of 1.15 and assume the flat-portion of the learning curve is applicable to each technology.

(e) Feasibility of Additional Engine Improvements

While the agencies' technological feasibility analysis for the engine standards focuses on what is achievable for existing engine platforms, we recognize that it could be possible to achieve greater reductions by designing entirely new engine platforms. Unlike existing platforms, which are limited with respect to peak cylinder pressures (precluding certain efficiency improvements), new platforms can be designed to have higher cylinder pressure than today's engines. New designs are also better able to incorporate recent improvements in materials and manufacturing, as well as other technological developments. Considered together, it is likely that a new engine platform could be about 2 percent better than engines using older platforms. Moreover, the agencies have seen CBI data that suggests improvement of more than 3 percent are

possible. However, because designing and producing a new engine platform requires hundreds of millions of dollars in capital investment and significant lead time for research and development, it would not be appropriate to project that each engine manufacturer could complete a complete redesign of all of its engines within the Phase 2 time frame. Unlike light-duty, heavy-duty sales volumes are not large enough to support short redesign cycles. As a result, it can take 20 years for a manufacturer to generate the necessary return on the investment associated with an engine redesign. Forcing a manufacturer to redesign its engines prematurely could easily result in significant financial strain on a company.

On the other hand, how far the various manufacturers are into their design cycles suggests that one or more manufacturers will probably introduce a new engine platform during the Phase 2

time frame. This would not enable other engine manufacturers to meet more stringent standards, and thus it would not be an appropriate basis to justify more stringent engine standards (and certainly not engine standards reflecting 100 percent use of technologies premised on existence of new platforms). However, the availability of some more efficient engines on the market will provide the opportunity for vehicle manufacturers to lower their average fuel consumption as measured by GEM. Vehicle manufacturers can use a mix of newer and older engine designs to achieve an average engine performance significantly better than what is required by the engine standards. Thus, the vehicle standards can reflect engine platform improvements (which are amenable to measurement in GEM), without necessarily forcing each manufacturer to achieve these additional reductions,

which may be achievable only for new engine platforms.

As discussed in Section III.D.(1)(b)(i), the agencies project that at least one engine manufacturer (and possibly more) will have completed a redesign for tractor engines by 2027.

Accordingly, we project that 50 percent of tractor engines in 2027 will be redesigned engines and be 1.6 percent more efficient than required by the engine standards, so the average engine would be 0.8 percent better. However, we could have projected the same overall improvement by projecting 25 percent of engine getting 3.2 percent better. Based on the CBI information available to us, we believe projecting a 0.8 percent improvement is reasonable, but may be somewhat conservative.

Adding this 0.8 percent improvement to the 5.1 percent reduction *required* by the standards means we project the average 2027 tractor engine would be 5.9 percent better than Phase 1. Because engine improvements for tractors are applied separately for day cabs and sleeper cabs in the vehicle program, we estimated separate improvements for them here. Specifically, we project a 5.4 percent reduction for day cabs and a 6.4 percent reduction in fuel consumption in sleeper cabs beyond Phase 1. It is important to also note that manufacturers that do not achieve this level would be able to make up for the difference by applying one of the many other tractor vehicle technologies to a greater extent than we project, or to achieve greater reductions by

optimizing technology efficiency further. We are not including the cost of developing these new engines in our cost analysis because we believe these engines are going to be developed due to market forces (*i.e.*, the new platform, already contemplated) rather than due to this rulemaking.

We are making a similar new engine platform projection for vocational vehicles. This is because many of tractor and vocational engines, such as HHD, would likely share the same engine hardware with the exception of WHR. In addition, the model based control discussed in Chapter 2.3 of the RIA could integrate engines better with transmissions on the vehicle side. We believe manufacturers will first focus their efforts on improving tractor engines but still believe that the 2027 vocational engine will be significantly better than required by the engine standards.

(3) EPA Engine Standards for N₂O

EPA will continue to apply the Phase 1 N₂O engine standard of 0.10 g/bhp-hr and a 0.02 g/bhp-hr default deterioration factor to the Phase 2 program. EPA adopted the cap standard for N₂O as an engine-based standard because the agency believes that emissions of this GHG are technologically related solely to the engine, fuel, and emissions after-treatment systems, and the agency is not aware of any influence of vehicle-based technologies on these emissions. Note that NHTSA did not adopt standards for N₂O because these emissions do not

impact fuel consumption in a significant way.

In the proposal we considered reducing both the standard and deterioration factor to 0.05 and 0.01 g/bhp-hr respectively because engines certified in model year 2014 were generally meeting the proposed standard. We also explained the process behind N₂O formation in urea SCR after-treatment systems and how that process could be optimized to elicit additional N₂O reductions. 80 FR 40203. While we have seen some reductions and a few increases in engine family certified N₂O levels across the 2014, 2015, and 2016 model years, the majority have remained unchanged.

While we still believe that further optimization of SCR systems is possible to reduce N₂O emissions, as demonstrated for some engine families, we do not know to what extent further optimization can be achieved given the tradeoffs required to meet the Phase 2 CO₂ standards. These tradeoffs potentially include advancing fuel injection timing to reduce CO₂ emissions resulting in an increase in NO_x emissions at the engine outlet before the after-treatment, increasing the needed NO_x reduction efficiency of the SCR system. We will continue to assess N₂O emissions as SCR technology evolves and CO₂ emission reductions phase in, and we will revisit the standard at a later date to further control N₂O emission. This will likely be included in the upcoming rule to consider more stringent NO_x standards.

Figure II.6 EPA 2014 Certification Database N₂O Emission Results for 24 Engines.Figure II.7 EPA 2015 Certification Database N₂O Emission Results for 24 Engines.

Figure II.8 EPA 2016 Certification Database N₂O Emission Results for 24 Engines.

(4) EPA Engine Standards for Methane

EPA will continue to apply the Phase 1 methane engine standards to the Phase 2 program. EPA adopted the cap standards for CH₄ (along with N₂O standards) as engine-based standards because the agency believes that emissions of this GHG are technologically related solely to the engine, fuel, and emissions after-treatment systems, and the agency is not aware of any influence of vehicle-based technologies on these emissions. We are applying these cap standards against the FTP duty-cycle because the FTP cycle is the most stringent with respect to emissions of these pollutants and we do not believe that a reduction in stringency from the current Phase 1 standards is warranted. Note that NHTSA did not adopt standards for CH₄ (or N₂O) because these emissions do not impact fuel consumption in a significant way.

EPA continues to believe that manufacturers of most engine technologies will be able to comply with the Phase 1 CH₄ standard with no technological improvements. We note that we are not aware of any new technologies that would have allowed

us to adopt more stringent standards at this time.

(5) Compliance Provisions and Flexibilities for Engine Standards

The agencies are continuing most of the Phase 1 compliance provisions and flexibilities for the Phase 2 engine standards.

(a) Averaging, Banking, and Trading

The agencies' general approach to averaging is discussed in Section I. We did not propose to offer any new or special credits to engine manufacturers to comply with any of the separate engine standards. Except for early credits, the agencies are retaining all Phase 1 credit flexibilities and limitations to continue for use in the Phase 2 engine program.

As discussed below and as proposed, EPA is changing the useful life for LHD engines for GHG emissions from the current 10 years/110,000 miles to 15 years/150,000 miles to be consistent with the useful life of criteria pollutants recently updated in EPA's Tier 3 rule. In order to ensure that banked credits maintain their value in the transition from Phase 1 to Phase 2, EPA and NHTSA are adopting the proposed adjustment factor of 1.36 (*i.e.*, 150,000

mile ÷ 110,000 miles) for credits that are carried forward from Phase 1 to the MY 2021 and later Phase 2 standards. Without this adjustment factor the change in useful life would have effectively resulted in a discount of banked credits that are carried forward from Phase 1 to Phase 2, which is not the intent of the change in the useful life. See Sections V and VI for additional discussion of similar adjustments of vehicle-based credits.

Finally, the agencies are limiting the carryover of certain Phase 1 engine credits into the Phase 2 program. As described in Section II.D.(2) the agencies made adjustments to the FTP baselines, to address the unexpected step-change improvement in engine fuel consumption and CO₂ emissions. The underlying reasons for this shift are mostly related to manufacturers optimizing their SCR thermal management strategy over the FTP in ways that we (mistakenly) thought they already had in MY 2010 (*i.e.*, the Phase 1 baseline). At the time of Phase 1 we had not realized that these improvements were not already in the Phase 1 baseline. This issue does not apply for SET emissions, and thus only significantly impacts engines certified

exclusively to the FTP standards (rather than both FTP and SET standards). To prevent manufacturers from diluting the Phase 2 engine program with credits generated relative to this incorrect baseline, we are not allowing engine credits generated against the Phase 1 FTP standards to be carried over into the Phase 2 program.

(b) Changing Global Warming Potential (GWP) Values in the Credit Program for CH₄ and N₂O

The Phase 1 rule included a compliance flexibility that allowed heavy-duty manufacturers and conversion companies to comply with the respective methane or nitrous oxide standards by means of over-complying with CO₂ standards (40 CFR 1036.705(d)). The heavy-duty rules allow averaging only between vehicles or engines of the same designated type (referred to as an “averaging set” in the rules). Specifically, the Phase 1 heavy-duty rulemaking added a CO₂ credits program which allowed heavy-duty engine manufacturers to average and bank emission credits to comply with the methane and nitrous oxide requirements after adjusting the CO₂ emission credits based on the relative GWP equivalents. To establish the GWP equivalents used by the CO₂ credits program, the Phase 1 rule incorporated the IPCC Fourth Assessment Report GWP values of 25 for CH₄ and 298 for N₂O, which are assessed over a 100 year lifetime.

EPA will continue this provision for Phase 2. However, since the Phase 1 rule was finalized, a new IPCC report has been released (the Fifth Assessment Report), with new GWP estimates. This caused us to look again at the relative GWP equivalency of methane and nitrous oxide and to seek comment on whether the methane and nitrous oxide GWPs used to establish the equivalency value for the CO₂ Credit program should be updated to those established by IPCC in its Fifth Assessment Report. 80 FR 40206. The Fifth Assessment Report provides four 100 year GWP values for methane ranging from 28 to 36 and two 100 year GWP values for nitrous oxide, either 265 or 298.

EPA is updating the GWP value to convert CO₂ credits for use against the methane standard. We are using a GWP of 34 for the value of methane reductions relative to CO₂ reductions. (The GWP remains 298 for N₂O). The use of this new methane GWP will not begin until MY 2021, when the Phase 2 engine standards begin. This provides sufficient lead time for both the agencies and manufacturers to update systems, and also ensures that manufacturers

would be able make any necessary design changes. The choice of when to commence use of this GWP value for our engines standards does not prejudice the choice of other GWP values for use in regulations and other purposes in the near term. Further discussion is found in Section XI.D.2.a.

(c) In-Use Compliance and Useful Life

Consistent with section 202(a)(1) and 202(d) of the CAA, for Phase 1, EPA established in-use standards for heavy-duty engines. Based on our assessment of testing variability and other relevant factors, we established in-use standards by adding a 3 percent adjustment factor to the full useful life CO₂ emissions and fuel consumption results measured in the EPA certification process to address measurement variability inherent in comparing results among different laboratories and different engines. See 40 CFR part 1036. The agencies are not changing this for Phase 2 SET and FTP engine standard compliance.

In Phase 1, EPA set the useful life for engines and vehicles with respect to GHG emissions equal to the respective useful life periods for criteria pollutants. In April 2014, as part of the Tier 3 light-duty vehicle final rule, EPA extended the regulatory useful life period for criteria pollutants to 150,000 miles or 15 years, whichever comes first, for Class 2b and 3 pickup trucks and vans and some light-duty trucks (79 FR 23414, April 28, 2014). As proposed, EPA is applying the same useful life of 150,000 miles or 15 years for the Phase 2 GHG standards for engines primarily intended for use in vocational vehicles with a GVWR at or below 19,500 lbs. NHTSA will use the same useful life values as EPA for all heavy-duty vehicles.

As proposed, we will continue the regulatory allowance in 40 CFR 1036.150(g) that allows engine manufacturers to use assigned deterioration factors (DFs) for most engines without performing their own durability emission tests or engineering analysis. However, the engines will still be required to meet the standards in actual use without regard to whether the manufacturer used the assigned DFs. This allowance is being continued as an interim provision and may be discontinued for later phases of standards as more information becomes known. Manufacturers are allowed to use an assigned additive DF of 0.0 g/bhp-hr for CO₂ emissions from any conventional engine (*i.e.*, an engine not including advanced or off-cycle technologies). Upon request, we could allow the assigned DF for CO₂ emissions from engines including advanced or off-

cycle technologies, but only if we determine that it would be consistent with good engineering judgment. We believe that we have enough information about in-use CO₂ emissions from conventional engines to conclude that they will not increase as the engines age. However, we lack such information about the more advanced technologies. For technologies such as WHR that are considered advanced in the context of Phase 1, but would be treated as a more ordinary technology by the end of Phase 2, we plan to work with manufacturers to determine if using the assigned zero DF would be appropriate.

(d) Alternate CO₂ Standards

In the Phase 1 rulemaking, the agencies allowed certification to alternate CO₂ engine standards in model years 2014 through 2016. This flexibility was intended to address the special case of needed lead time to implement new standards for a previously unregulated pollutant. Since that special case does not apply for Phase 2, we are not adopting a similar flexibility in this rulemaking.

(e) Approach to Standards and Compliance Provisions for Natural Gas Engines

EPA is also making certain clarifying changes to its rules regarding classification of natural gas engines. This relates to standards for all emissions, both greenhouse gases and criteria pollutants. These clarifying changes are intended to reflect the status quo, and therefore should not have any associated costs.

EPA emission standards have always applied differently for gasoline-fueled and diesel-fueled engines. The regulations in 40 CFR part 86 implement these distinctions by dividing engines into Otto-cycle and Diesel-cycle technologies. This approach led EPA to categorize natural gas engines according to their design history. A diesel engine converted to run on natural gas was classified as a diesel-cycle engine; a gasoline engine converted to run on natural gas was classified as an Otto-cycle engine.

The Phase 1 rule described our plan to transition to a different approach, consistent with EPA's non-road programs, in which we divide engines into compression-ignition and spark-ignition technologies based only on the thermodynamic operating characteristics of the engines.¹⁹³ However, the Phase 1 rule included a provision allowing us to continue with

¹⁹³ See 40 CFR 1036.108.

the historic approach on an interim basis.

Under the existing EPA regulatory definitions of “compression-ignition” and “spark-ignition,” a natural gas engine would generally be considered compression-ignition if it operates with lean air-fuel mixtures and uses a pilot injection of diesel fuel to initiate combustion, and would generally be considered spark-ignition if it operates with stoichiometric air-fuel mixtures and uses a spark plug to initiate combustion.

EPA’s basic premise here is that natural gas engines performing similar in-use functions as diesel engines should be subject to similar regulatory requirements. The compression-ignition emission standards and testing requirements reflect the operating characteristics for the full range of heavy-duty vehicles, including substantial operation in long-haul service characteristic of tractors. The

spark-ignition emission standards and testing requirements do not include some of those provisions related to use in long-haul service or other applications where diesel engines predominate, such as steady-state testing, Not-to-Exceed standards, and extended useful life. We believe it would be inappropriate to apply the spark-ignition standards and requirements to natural gas engines that are being used in applications mostly served by diesel engines today. We therefore proposed to replace the interim provision described above with a differentiated approach to certification of natural gas engines across all of the EPA standards—for both GHGs and criteria pollutants. 80 FR 40207. Under the proposed amendment, we would require manufacturers to divide all their natural gas engines into primary intended service classes, as we already require for compression-ignition engines, whether or not the engine has

features that otherwise could (in theory) result in classification as SI under the current rules. We proposed that any natural gas engine qualifying as a medium heavy-duty engine (19,500 to 33,000 lbs. GVWR) or a heavy heavy-duty engine (over 33,000 lbs. GVWR) would be subject to all the emission standards and other requirements that apply to compression-ignition engines. However, based on comments, we are finalizing this change only for heavy heavy-duty engines. Commenters identified medium heavy-duty applications in which SI alternative fuel engines compete significantly with gasoline engines, which is not consistent with the premise of the proposal. Thus, we are not finalizing the proposed change for medium heavy-duty engines.

Table II–15 describes the provisions that apply differently for compression-ignition and spark-ignition engines:

TABLE II–15—REGULATORY PROVISIONS THAT ARE DIFFERENT FOR COMPRESSION-IGNITION AND SPARK-IGNITION ENGINES

Provision	Compression-ignition	Spark-ignition
Transient duty cycle	40 CFR part 86, Appendix I, paragraph (f)(2) cycle; divide by 1.12 to de-normalize.	40 CFR part 86, Appendix I, paragraph (f)(1) cycle.
Ramped-modal test (SET)	yes	no.
NTE standards	yes	no.
Smoke standard	yes	no.
Manufacturer-run in-use testing	yes	no.
ABT—pollutants	NO _x , PM	NO _x , NMHC.
ABT—transient conversion factor ..	6.5	6.3.
ABT—averaging set	Separate averaging sets for light, medium, and heavy HDDE	One averaging set for all SI engines.
Useful life	110,000 miles for light HDDE, ^a 185,000 miles for medium HDDE, 435,000 miles for heavy HDDE.	110,000 miles. ^a
Warranty	50,000 miles for light HDDE, 100,000 miles for medium HDDE, 100,000 miles for heavy HDDE.	50,000 miles.
Detailed AECD description	yes	no.
Test engine selection	highest injected fuel volume	most likely to exceed emission standards.

Note:

^a As proposed, useful life for light heavy-duty diesel and spark ignition engines is being increased to 150,000 miles for GHG emissions, but remains at 110,000 for criteria pollutant emissions.

The onboard diagnostic requirements already differentiate requirements by fuel type, so there is no need for those provisions to change based on the considerations of this section.

We are not aware of any currently certified engines that will change from compression-ignition to spark-ignition under this approach. Nonetheless, because these proposed changes could result in a change in standards for engines currently under development, we believe it is appropriate to provide additional lead time. We will therefore continue to apply the existing interim provision through model year 2020.¹⁹⁴

¹⁹⁴ Section 202(a)(2), applicable to emissions of greenhouse gases, does not mandate a specific period of lead time, but EPA sees no reason for a

Starting in model year 2021, all the provisions will apply as described above for heavy heavy-duty engines. Manufacturers will not be permitted to certify any engine families using carryover emission data if a particular engine model switched from compression-ignition to spark-ignition, or vice versa. However, as noted above, in practice these vehicles are already

different compliance date here for GHGs and criteria pollutants. This is also true with respect to the closed crankcase emissions discussed in the following subsection. Also, as explained in section I.E.i.e, EPA interprets the phrase “classes or categories of heavy duty vehicles or engines” in CAA section 202(a)(3)(C) to refer to categories of vehicles established according to features such as their engine cycle (spark-ignition or compression-ignition).l.

being certified as CI engines, so we view these changes as clarifications ratifying the current status quo.

These provisions will apply equally to engines fueled by any fuel other than gasoline or ethanol, should such engines be produced in the future. Given the current and historic market for vehicles above 33,000 lbs. GVWR, the agencies believe any alternative-fueled vehicles in this weight range will be competing primarily with diesel vehicles and should be subject to the same requirements as them. See Sections XI and XII for additional discussion of natural gas fueled engines.

(f) Crankcase Emissions From Natural Gas Engines

EPA proposed to require that all natural gas-fueled engines have closed crankcases, rather than continuing the provision that allows venting to the atmosphere all crankcase emissions from all compression-ignition engines. 80 FR 40208. However, EPA is not finalizing the proposed requirement at this time.

Open crankcases have been allowed as long as these vented crankcase emissions are measured and accounted for as part of an engine's tailpipe emissions. This allowance has historically been in place to address the technical limitations related to recirculating diesel-fueled engines' crankcase emissions, which have high PM emissions, back into the engine's air intake. High PM emissions vented into the intake of an engine can foul turbocharger compressors and after cooler heat exchangers. In contrast, historically EPA has mandated closed crankcase technology on all gasoline fueled engines and all natural gas spark-ignition engines.¹⁹⁵ The inherently low PM emissions from these engines posed no technical barrier to a closed crankcase mandate. However, after considering the comments on this issue, we now believe that there are practical reasons why we should not close natural gas crankcases without also requiring closed crankcases for other compression-ignition engines. Because current natural gas engines are generally produced from diesel engine designs that are not designed to operate with closed crankcases, we have concerns that sealing the crankcase on the natural gas versions will require substantial development effort, and the seals may not function properly. Thus, we expect to update our regulations for crankcase emissions from all compression ignition engines at the same time in a future rulemaking.

(g) Compliance Margins

Some commenters suggested that the agencies should apply a compliance margin to confirmatory and SEA test results to account for variability of engine maps and emission tests. However, EPA's past practice has been to base the standards on technology projections that assume manufacturers will apply compliance margins to their test results for certification. In other words, they design their products to have emissions below the standards by some small margin so that test-to-test or lab-to-lab variability would not cause

them to exceed any applicable standards. Consequently, EPA has typically not set standards precisely at the lowest levels achievable, but rather at slightly higher levels—expecting manufacturers to target the lower levels to provide compliance margins for themselves. The agencies have applied this approach to the Phase 2 standards. Thus, the feasibility and cost analyses reflect the expectation that manufacturers will target lower values to provide compliance margins.

The agencies have also improved the engine test procedures and compliance provisions to reduce the agencies' and the manufacturers' uncertainty of engine test results. For example, in the agencies' confirmatory test procedures we are requiring that the agencies use the average of at least three tests (*i.e.*, the arithmetic mean of a sample size of at least three test results) for determining the values of confirmatory test results for any GEM engine fuel maps. We are only doing this for GEM engine fuel maps because these are relatively new tests, compared to Phase 1 testing or EPA's other emissions standards. Therefore, this provision does not apply to any other emissions testing. For all other emissions testing besides GEM engine fuel maps the agencies' maintain our usual convention of utilizing a sample size of one for confirmatory testing. For GEM engine fuel mapping this at least triples the test burden for the agencies to conduct confirmatory testing, but it also decreases confirmatory test result uncertainty by at least 42 percent.¹⁹⁶ Based on improvements like this one, and others described in Section 1.4 of the RTC, we believe that SET, FTP and GEM's steady-state, cycle-average and powertrain test results will have an overall uncertainty of ± 1.0 percent. To further protect against falsely high emissions results or false failures due to this remaining level of test procedure uncertainty, we have included a +1 percent compliance margin into our stringency analyses of the engine standards and the GEM fuel map inputs used to determine the tractor and vocational vehicle standards. In other words we set Phase 2 engine and vehicle standards 1 percent less stringent than if we had not considered this test procedure uncertainty.

¹⁹⁶ The statistical formula for standard error, which is a well-accepted measure of uncertainty, is the standard deviation times the reciprocal of the square root of the sample size. For a sample size of three, the reciprocal of the square root of three is approximately 0.58, which results in a 42% reduction in uncertainty, versus a sample size of one.

In addition to the test procedure improvements and the +1 percent margin we incorporated into our standards, the agencies are also committed to a process of continuous improvement of test procedures to further reduce test result uncertainty. To contribute to this effort, in mid-2016 EPA committed \$250,000 to fund research to further evaluate individual sources of engine mapping test procedure uncertainty. This work will occur at SwRI. Should the results of this work or other similar future work indicate test procedure improvements that would further reduce test result uncertainty, the agencies will incorporate these improvements through appropriate guidance or through technical amendments to the regulations via a notice and comment rulemaking. If we determine in the future through the SwRI work or other work that such improvements eliminate the need to require the agencies to conduct triplicate confirmatory testing of GEM engine fuel maps, we will promulgate technical amendments to the regulations to remove this requirement. If we determine in the future through the SwRI work or other work that the +1.0 percent we factored into our stringency analysis was inappropriately low or high, we will promulgate technical amendments to the regulations to address any inappropriate impact this +1.0 percent had on the stringency of the engine and vehicle standards.¹⁹⁷ In addition, whenever the agencies determine whether or not confirmatory test results are statistically significantly different from manufacturers' declared values, the agencies will use good engineering judgment to appropriately factor into such determinations the results of this SwRI work and/or any other future work that quantifies our test procedures' uncertainty.

III. Class 7 and 8 Combination Tractors

Class 7 and 8 combination tractors-trailers contribute the largest portion of the total GHG emissions and fuel consumption of the heavy-duty sector, approximately 60 percent, due to their large payloads, their high annual miles traveled, and their major role in national freight transport.¹⁹⁸ These vehicles

¹⁹⁷ Note that this +1.0 percent compliance margin built into the standards, or any other future determination of test procedure uncertainty, does not impact the agencies' technology feasibility or cost-benefit analyses for this rulemaking.

¹⁹⁸ The on-highway Class 7 and 8 combination tractor-trailers constitute the vast majority of this regulatory category. A small fraction of combination tractors are used in off-road applications and are regulated differently, as described in Section III.C.

¹⁹⁵ See 40 CFR 86.008–10(c).

consist of a cab and engine (tractor or combination tractor) and a trailer.¹⁹⁹ In general, reducing GHG emissions and fuel consumption for these vehicles will involve improvements to all aspects of the vehicle.

As we found during the development in Phase 1 and as continues to be true in the industry today, the heavy-duty combination tractor-trailer industry consists of separate tractor manufacturers and trailer manufacturers. We are not aware of any manufacturer that typically assembles both the finished truck and the trailer and introduces the combination into commerce for sale to a buyer. There are also large differences in the kinds of manufacturers involved with producing tractors and trailers. For HD highway tractors and their engines, a relatively limited number of manufacturers produce the vast majority of these

products. The trailer manufacturing industry is quite different, and includes a large number of companies, many of which are relatively small in size and production volume. Setting standards for the products involved—tractors and trailers—requires recognition of the large differences between these manufacturing industries, which can then warrant consideration of different regulatory approaches. Thus, although tractor-trailers operate essentially as a unit from both a commercial standpoint and for purposes of fuel efficiency and CO₂ emissions, the agencies have developed separate standards for each.

Based on these industry characteristics, EPA and NHTSA believe that the most appropriate regulatory approach for combination tractors and trailers is to establish standards for tractors separately from trailers. As discussed below in Section IV, the

agencies are also adopting standards for certain types of trailers.

A. Summary of the Phase 1 Tractor Program

The design of each tractor's cab and drivetrain determines the amount of power that the engine must produce in moving the truck and its payload down the road. As illustrated in Figure III-1, the loads that require additional power from the engine include air resistance (aerodynamics), tire rolling resistance, and parasitic losses (including accessory loads and friction in the drivetrain). The importance of the engine design is that it determines the basic GHG emissions and fuel consumption performance for the variety of demands placed on the vehicle, regardless of the characteristics of the cab in which it is installed.

Figure III-1 Combination Tractor and Trailer Loads²⁰⁰

Accordingly, for Class 7 and 8 combination tractors, the agencies adopted two sets of Phase 1 tractor standards for fuel consumption and CO₂ emissions. The CO₂ emission and fuel consumption reductions related to engine technologies are recognized in the engine standards. For vehicle-related emissions and fuel consumption, tractor manufacturers are required to meet vehicle-based standards. Compliance with the vehicle standard must be determined using the GEM vehicle simulation tool.

The Phase 1 tractor standards were based on several key attributes related to GHG emissions and fuel consumption that reasonably represent the many differences in utility and performance among these vehicles. Attribute-based standards in general recognize the variety of functions performed by vehicles and engines, which in turn can affect the kind of technology that is available to control emissions and reduce fuel consumption, or its effectiveness. Attributes that characterize differences in the design of vehicles, as well as differences in how

the vehicles will be employed in-use, can be key factors in evaluating technological improvements for reducing CO₂ emissions and fuel consumption. Developing an appropriate attribute-based standard can also avoid interfering with the ability of the market to offer a variety of products to meet the customer's demand. The Phase 1 tractor standards differ depending on GVWR (*i.e.*, whether the truck is Class 7 or Class 8), the height of the roof of the cab, and whether it is a "day cab" or a "sleeper cab." These later two attributes are important

¹⁹⁹ "Tractor" is defined in 49 CFR 571.3 to mean "a truck designed primarily for drawing other motor vehicles and not so constructed as to carry a load

other than a part of the weight of the vehicle and the load so drawn."

²⁰⁰ Adapted from Figure 4.1, Class 8 Truck Energy Audit, Technology Roadmap for the 21st Century

Truck Program: A Government-Industry Research Partnership, 21CT-001, December 2000.

because the height of the roof, designed to correspond to the height of the trailer, significantly affects air resistance, and a sleeper cab generally corresponds to the opportunity for extended duration idle emission and fuel consumption improvements. Based on these attributes, the agencies created nine subcategories within the Class 7 and 8 combination tractor category. The Phase 1 rules set standards for each of them. Phase 1 standards began with the 2014 model year and were followed with more stringent standards following in model year 2017.²⁰¹ The standards represent an overall fuel consumption and CO₂ emissions reduction up to 23 percent from the tractors and the engines installed in them when compared to a baseline 2010 model year tractor and engine without idle shutdown technology. Although the EPA and NHTSA standards are expressed differently (grams of CO₂ per ton-mile and gallons per 1,000 ton-mile respectively), the standards are equivalent.

In Phase 1, the agencies allowed manufacturers to certify certain types of combination tractors as vocational vehicles. These are tractors that do not typically operate at highway speeds, or would otherwise not benefit from efficiency improvements designed for line-haul tractors (although standards still apply to the engines installed in these vehicles). The agencies created a subcategory of “vocational tractors,” or referred to as “special purpose tractors” in 40 CFR part 1037, because real world operation of these tractors is better represented by our Phase 1 vocational vehicle duty cycle than the tractor duty cycles. Vocational tractors are subject to the standards for vocational vehicles rather than the combination tractor standards. In addition, specific vocational tractors and heavy-duty vocational vehicles primarily designed to perform work off-road or having tires installed with a maximum speed rating at or below 55 mph are exempted from the Phase 1 standards.

In Phase 1, the agencies also established separate performance standards for the engines manufactured for use in these tractors. EPA’s engine-based CO₂ standards and NHTSA’s engine-based fuel consumption standards are being implemented using EPA’s existing test procedures and regulatory structure for criteria pollutant emissions from medium- and heavy-duty engines. These engine standards

vary depending on engine size linked to intended vehicle service class (which are the same service classes used for many years for EPA’s criteria pollutant standards).

Manufacturers demonstrate compliance with the Phase 1 tractor standards using the GEM simulation tool. As explained in Section II above, GEM is a customized vehicle simulation model which is the preferred approach to demonstrating compliance testing for combination tractors rather than chassis dynamometer testing used in light-duty vehicle compliance. As discussed in the development of HD Phase 1 and recommended by the NAS 2010 study, a simulation tool is the preferred approach for HD tractor compliance because of the extremely large number of vehicle configurations.²⁰² The GEM compliance tool was developed by EPA and is an accurate and cost-effective alternative to measuring emissions and fuel consumption while operating the vehicle on a chassis dynamometer. Instead of using a chassis dynamometer as an indirect way to evaluate real world operation and performance, various characteristics of the vehicle are measured and these measurements are used as inputs to the model. For HD Phase 1, these characteristics relate to key technologies appropriate for this category of truck including aerodynamic features, weight reductions, tire rolling resistance, the presence of idle-reducing technology, and vehicle speed limiters. The model also assumes the use of a representative typical engine in compliance with the separate, applicable Phase 1 engine standard. Using these inputs, the model is used to quantify the overall performance of the vehicle in terms of CO₂ emissions and fuel consumption. CO₂ emission reduction and fuel consumption technologies not measured by the model must be evaluated separately, and the HD Phase 1 rules establish mechanisms allowing credit for such “off-cycle” technologies.

In addition to the final Phase 1 tractor-based standards for CO₂, EPA adopted a separate standard to reduce leakage of HFC refrigerant from cabin air conditioning (A/C) systems from combination tractors that apply to the tractor manufacturer. This HFC leakage standard is independent of the CO₂ tractor standard. Manufacturers can

choose technologies from a menu of leak-reducing technologies sufficient to comply with the standard, as opposed to using a test to measure performance.

The Phase 1 program also provided several flexibilities to advance the goals of the overall program while providing alternative pathways to achieve compliance. The primary flexibility is the averaging, banking, and trading program which allows emissions and fuel consumption credits to be averaged within an averaging set, banked for up to five years, or traded among manufacturers. Manufacturers with credit deficits were allowed to carry-forward credit deficits for up to three model years, similar to the LD GHG and CAFE carry-back credits. Phase 1 also included several interim provisions, such as incentives for advanced technologies and provisions to obtain credits for innovative technologies (called off-cycle in the Phase 2 program) not accounted for by the HD Phase 1 version of GEM or for certifying early.

B. Overview of the Phase 2 Tractor Program and Key Changes From the Proposal

The HD Phase 2 program is similar in many respects to the Phase 1 approach. The agencies are keeping the Phase 1 attribute-based regulatory structure in terms of dividing the tractor category into the same nine subcategories based on the tractor’s GVWR, cab configuration, and roof height. This structure is working well in the implementation of Phase 1. EMA and Daimler supported this approach again in their comments to the Phase 2 NPRM. The one area where the agencies are changing the regulatory structure is related to heavy-haul tractors. As noted above, the Phase 1 regulations include a set of provisions that allow vocational tractors to be treated as vocational vehicles. However, because the agencies are including the powertrain as part of the technology basis for the tractor and vocational vehicle standards in Phase 2, we are classifying a certain set of these vocational tractors as heavy-haul tractors and subjecting them to a separate tractor standard that reflects their unique powertrain requirements and limitations in application of technologies to reduce fuel consumption and CO₂ emissions.²⁰³ The agencies are adopting some revisions to the proposed Phase 2 criteria used to define heavy-haul tractors in response

²⁰¹ Manufacturers may have voluntarily opted-in to the NHTSA fuel consumption standards in model years 2014 or 2015. Once a manufacturer opts into the NHTSA program it must stay in the program for all optional MYs.

²⁰² National Academy of Science. “Technologies and Approaches to Reducing the Fuel Consumption of Medium- and Heavy-Duty Vehicles.” 2010. Recommendation 8–4 stated “Simulation modeling should be used with component test data and additional tested inputs from powertrain tests, which could lower the cost and administrative burden yet achieve the needed accuracy of results.”

²⁰³ See 76 FR 57138 for Phase 1 discussion. See 40 CFR 1037.801 for Phase 2 heavy-haul tractor regulatory definition.

to comments, as discussed below in Section III.C.4.

The agencies will retain much of the certification and compliance structure developed in Phase 1. The Phase 2 tractor CO₂ emissions and fuel consumption standards, as in Phase 1, will be aligned.²⁰⁴ The agencies will also continue to have separate engine and vehicle standards to drive technology improvements in both areas. The reasoning behind maintaining separate standards is discussed above in Section II.B.2. As in Phase 1, the manufacturers will certify tractors using the GEM simulation tool and evaluate the performance of subsystems through testing (the results of this testing to be used as inputs to the GEM simulation tool). Other aspects of the HD Phase 2 certification and compliance program also mirror the Phase 1 program, such as maintaining a single reporting structure to satisfy both agencies, requiring limited data at the beginning of the model year for certification, and determining compliance based on end of year reports. In the Phase 1 program, manufacturers participating in the ABT program provided 90 day and 270 day reports after the end of the model year. For the Phase 2 program, the agencies proposed that manufacturers would only be required to submit one end of the year report, which would have simplified reporting. Manufacturers provided comments opposing this approach. After further consideration, the agencies are adopting an approach in Phase 2 that mirrors the Phase 1 approach with a 90 day preliminary report and a 270 day final report, with the manufacturer having the option to request a waiver of the 90 day report based on positive credit balances.

Even though many aspects of the HD Phase 2 program are similar to Phase 1, there are some key differences. While Phase 1 focused on reducing CO₂ emissions and fuel consumption in tractors through the application of existing ("off-the-shelf") technologies, the HD Phase 2 standards seek additional reductions through increased use of existing technologies and the development and deployment of more advanced technologies. The agencies received numerous comments on the proposed Phase 2 technology assessments in terms of the baseline, the technology effectiveness, the market adoption rate projections, and the technology costs. The agencies have made changes reflecting our assessment

of these comments, as described in Section III.D.

To evaluate the effectiveness of a more comprehensive set of technologies in Phase 2, the agencies are including several additional inputs to the Phase 2 GEM. The set of inputs includes the Phase 1 inputs plus parameters to assess the performance of the engine, transmission, and driveline. Specific inputs for, among others, predictive cruise control, automatic tire inflation systems, and 6x2 axles will now be required. The final Phase 2 program includes some changes to the proposed Phase 2 technology inputs to GEM. These changes from proposal include the use of cycle-averaged fuel maps for use when evaluating a vehicle over the transient cycle, optional transmission efficiency inputs, optional axle efficiency inputs, an increase in the types of idle reduction technologies recognized in GEM, and the ability to recognize the effectiveness of tire pressure monitoring systems, neutral coast, and neutral idle. As in Phase 1, in Phase 2 manufacturers will conduct component testing to obtain the values for these technologies (should they choose to use them), then the testing values will be input into the GEM simulation tool. See Section III.D.1 below. To effectively assess performance of the technologies, the agencies are adopting a revised version of the road grade profiles proposed for Phase 2. Finally, the agencies are adopting Phase 2 regulations with clarified selective enforcement and confirmatory testing requirements for the GEM inputs that differ from the Phase 2 NPRM based on the comments received.

The key aerodynamic assessment areas that the agencies proposed to change in Phase 2 relative to Phase 1 were the use of a more aerodynamic reference trailer, the inclusion of the impact of wind on the tractor, and changes to the aerodynamic test procedures. We are adopting these changes in Phase 2 with some further revisions from those proposed for Phase 2 based on comments. To reflect the evolving trailer market, the agencies are adopting as proposed the addition of trailer skirts (an aerodynamic improving device) to the reference trailer (*i.e.* the trailer used during testing to determine the relative aerodynamic performance of the tractor). The agencies are also adopting the proposed aerodynamic certification test procedure that captures the impact of wind average drag on tractor aerodynamic performance. However, the agencies are specifying in the final rule the use of a single surrogate yaw angle instead of a full

yaw sweep to reduce the aerodynamic testing burden based on further assessment of the EPA aerodynamic data and comments received on the NPRM. Finally, the agencies are adopting aerodynamic test procedure and data analysis changes from the Phase 2 proposal to further reduce the variability of aerodynamic test results. Detailed discussion of the aerodynamic test procedures is included in Section III.E.2.

Another key change to the final rule is the adoption of more stringent particulate matter (PM) standards for auxiliary power units (APU) installed in new tractors.²⁰⁵ In the Phase 2 NPRM, EPA sought comment on the need for and feasibility of new PM standards for these engines because APUs can be used in lieu of operating the main engine during extended idle operations to provide climate control and power to the driver. See 80 FR 40213. APUs can reduce fuel consumption, NO_x, HC, CH₄, and CO₂ emissions when compared to main engine idling.²⁰⁶ However, a potential unintended consequence of reducing CO₂ emissions from combination tractors through the use of APUs during extended idle operation is an increase in PM emissions. EPA is adopting requirements for APUs installed in new tractors to meet lower PM standards starting in 2018, with a more stringent PM standard starting in 2024. Please see Section III.C.3 for more details.

The agencies are also ending some of the interim provisions developed in Phase 1 to reflect the maturity of the program and the reduced need and justification for some of the Phase 1 flexibilities. Further discussions on all of these matters are covered in the following sections.

C. Phase 2 Tractor Standards

EPA is adopting CO₂ standards and NHTSA is adopting fuel consumption standards for new Class 7 and 8 combination tractors in Phase 2 that are more stringent than Phase 1. In addition, EPA is continuing the HFC standards for the air conditioning systems that were adopted in Phase 1. EPA is also adopting new standards to further control emissions of particulate matter (PM) from auxiliary power units (APU) installed in new tractors that will prevent an unintended consequence of

²⁰⁵ This is necessarily an EPA-only provision since it relates to control of criteria pollutant emissions from a type of non-road engine, not to fuel efficiency.

²⁰⁶ U.S. EPA. Development of Emission Rates for Heavy-Duty Vehicles in the Motor Vehicle Emissions Simulator MOVES 2010. EPA-420-B-12-049. August 2012.

²⁰⁴ Fuel consumption is calculated from CO₂ using the conversion factor of 10,180 grams of CO₂ per gallon for diesel fuel.

increasing PM emissions during long duration idling.

This section describes these standards in detail.

(1) Final Fuel Consumption and CO₂ Standards

The Phase 2 fuel consumption and CO₂ standards for the tractor cab are shown below in Table III–1. These standards will achieve reductions of up

to 25 percent compared to the 2017 model year baseline level when fully phased in for the 2027 MY.²⁰⁷ The standards for Class 7 are described as “Day Cabs” because we are not aware of any Class 7 sleeper cabs in the market today; however, the agencies require any Class 7 tractor, regardless of cab configuration, meet the standards described as “Class 7 Day Cab.”

The agencies’ analyses, as discussed briefly below and in more detail later in this Preamble and in the RIA Chapter 2.4 and 2.8, indicate that these standards are the maximum feasible (within the meaning of 49 U.S.C. 32902(k)) and are appropriate under each agency’s respective statutory authorities.

TABLE III–1—PHASE 2 HEAVY-DUTY COMBINATION TRACTOR EPA EMISSIONS STANDARDS (g CO₂/TON-MILE) AND NHTSA FUEL CONSUMPTION STANDARDS (GAL/1,000 TON-MILE)

	Day cab		Sleeper cab	Heavy-haul
	Class 7	Class 8	Class 8	Class 8
2021 Model Year CO₂ Grams per Ton-Mile				
Low Roof	105.5	80.5	72.3	52.4
Mid Roof	113.2	85.4	78.0	
High Roof	113.5	85.6	75.7

High Roof	9.82318	7.43615	6.31631	

Note:

^a The 2027 MY high roof tractor standards include a 0.3 m² reduction in CdA as described in Section III.E.2.a.vii.

As the agencies noted in the Preamble to the proposed standards, the HD Phase 2 CO₂ and fuel consumption standards are not directly comparable to the Phase 1 standards. 80 FR 40212. This is because the agencies are adopting several test procedure changes to more accurately reflect real world operation. With respect to tractors, these changes will result in the following differences. First, the same vehicle evaluated using

the HD Phase 2 version of GEM will obtain higher (*i.e.* less favorable) CO₂ and fuel consumption values because the Phase 2 drive cycles include road grade. Road grade, which (of course) exists in the real-world, requires the engine to operate at higher horsepower levels to maintain speed while climbing a hill. Even though the engine saves fuel on a downhill section, the overall impact increases CO₂ emissions and fuel

consumption. The second of the key differences between the CO₂ and fuel consumption values in Phase 1 and Phase 2 is due to changes in the evaluation of aerodynamics. Vehicles are exposed to wind when in use which increases the drag of the vehicle and in turn increases the power required to move the vehicle down the road. To more appropriately reflect the in-use aerodynamic performance of tractor-

²⁰⁷ Since the HD Phase 1 tractor standards fully phase-in by the MY 2017, this is the logical baseline year.

trailers, the agencies are adopting a wind averaged coefficient of drag instead of the no-wind (zero yaw) value used in Phase 1. The final key difference between Phase 1 and the Phase 2 program includes a more realistic and improved simulation of the transmission in GEM, which could increase CO₂ and fuel consumption relative to Phase 1.

The agencies are adopting Phase 2 CO₂ emissions and fuel consumption standards for the combination tractors that reflect reductions that can be achieved through improvements in the tractor's powertrain, aerodynamics, tires, and other vehicle systems. The agencies have analyzed the feasibility of achieving the CO₂ and fuel consumption standards, and have identified means of achieving these standards that are technically feasible in the lead time afforded, economically practicable and cost-effective. EPA and NHTSA present the estimated costs and benefits of these standards in Section III.D.1. In developing these standards for Class 7 and 8 tractors, the agencies have evaluated the following:

- The current levels of emissions and fuel consumption
- the types of technologies that could be utilized by tractor and engine manufacturers to reduce emissions and fuel consumption from tractors and associated engines
- the necessary lead time
- the associated costs for the industry
- fuel savings for the consumer
- the magnitude of the CO₂ and fuel savings that may be achieved

The technologies on whose performance the final tractor standards are predicated include: improvements in the engine, transmission, driveline, aerodynamic design, tire rolling resistance, other accessories of the tractor, and extended idle reduction technologies. These technologies, and other accessories of the tractor, are described in RIA Chapter 2.4 and 2.8. The agencies' evaluation shows that some of these technologies are available today, but have very low adoption rates on current vehicles, while others will require some lead time for development. EPA and NHTSA also present the estimated costs and benefits of the Class 7 and 8 combination tractor standards in RIA Chapter 2.8 and 2.12, explaining as well the basis for the agencies' stringency level.

As explained below in Section III.D, EPA and NHTSA have determined that there will be sufficient lead time to introduce various tractor and engine technologies into the fleet starting in the 2021 model year and fully phasing in by

the 2027 model year. This is consistent with NHTSA's statutory requirement to provide four full model years of regulatory lead time for standards. As was adopted in Phase 1, the agencies are adopting provisions for Phase 2 that allow manufacturers to generate and use credits from Class 7 and 8 combination tractors to show compliance with the standards. This is discussed further in Section III.F.

Based on our analysis, the 2027 model year standards for combination tractors and engines represent up to a 25 percent reduction in CO₂ emissions and fuel consumption over a 2017 model year baseline tractor, as detailed in Section III.D.1. In considering the feasibility of vehicles to comply with these standards over their useful lives, EPA also considered the potential for CO₂ emissions to increase during the regulatory useful life of the product. As we discuss in Phase 1 and separately in the context of deterioration factor (DF) testing, we have concluded that CO₂ emissions are likely to stay the same or actually decrease in-use compared to new certified configurations for the projected technologies. In general, engine and vehicle friction decreases as products wear, leading to reduced parasitic losses and consequent lower CO₂ emissions. Similarly, tire rolling resistance falls as tires wear due to the reduction in tread depth. In the case of aerodynamic components, we project no change in performance through the regulatory life of the vehicle since there is essentially no change in their physical form as vehicles age. Similarly, weight reduction elements such as aluminum wheels are not projected to increase in mass through time, and hence, we can conclude will not deteriorate with regard to CO₂ emissions performance in-use. Given all of these considerations, the agencies are confident in projecting that the tractor standards today will be technically feasible throughout the regulatory useful life of the product.

(2) Non-CO₂ GHG Emission Standards for Tractors

EPA is also continuing the Phase 1 standards to control non-CO₂ GHG emissions from Class 7 and 8 combination tractors.

(a) N₂O and CH₄ Emissions

The final Phase 2 heavy-duty engine standards for both N₂O and CH₄ as well as details of these standards are included in the discussion in Section II.D.3 and II.D.4. EPA requested comment, but did not receive any comments (or otherwise obtain any new information) indicating that there were

appropriate controls for these non-CO₂ GHG emissions for the tractors manufacturers. Nor does EPA believe there are any technologies available to set vehicle standards. Therefore, EPA is not adopting any additional controls for N₂O or CH₄ emissions beyond those in the HD Phase 2 engine standards for the tractor category.

(b) HFC Emissions

Manufacturers can reduce hydrofluorocarbon (HFC) emissions from air conditioning (A/C) leakage emissions in two ways. First, they can utilize leak-tight A/C system components. Second, manufacturers can largely eliminate the global warming impact of leakage emissions by adopting systems that use an alternative, low-Global Warming Potential (GWP) refrigerant, to replace the commonly used R-134a refrigerant. EPA is maintaining the A/C leakage standards adopted in HD Phase 1 (see 40 CFR 1037.115). EPA believes the Phase 1 use of leak-tight components is at an appropriate level of stringency while maintaining the flexibility to produce the wide variety of A/C system configurations required in the tractor category. Please see Section I.F.(1)(b) for a discussion related to alternative refrigerants.

(3) EPA's PM Emission Standards for APUs Installed in New Tractors

Auxiliary power units (APUs) can be used in lieu of operating the main engine during extended idle operations to provide climate control and additional hotel power for the driver. As noted above, APUs can reduce fuel consumption, NO_x, HC, CH₄, and CO₂ emissions by a meaningful amount when compared to main engine idling.²⁰⁸ However, a potential unintended consequence of reducing CO₂ emissions from combination tractors through the use of APUs during extended idle operation is an increase in diesel PM emissions. Engines currently being used to power APUs have been subject to the Nonroad Tier 4 p.m. standards (40 CFR 1039.101), which are less stringent in this power category than the heavy-duty on-highway standards (40 CFR 86.007-11) on a brake-specific basis. In the NPRM, EPA sought comment on the need for and appropriateness of further reducing PM emissions from APUs used as part of a compliance strategy for Phase 2, and suggested the basis for possible new PM

²⁰⁸ U.S. EPA. Development of Emission Rates for Heavy-Duty Vehicles in the Motor Vehicle Emissions Simulator MOVES 2010. EPA-420-B-12-049. August 2012.

standards to avoid these unintended consequence. 80 FR 40213.

After considering the numerous comments submitted on this issue and our consideration of feasibility of PM controls, EPA is adopting a new PM standard of 0.02 g/kW-hr that applies exclusively to APUs installed in MY 2024 and later new tractors. EPA is also amending the Phase 1 GHG standards to provide that as of January 1, 2018 and through MY 2020, a tractor can receive credit for use of an AESS with an APU installed at the factory only if the APU engine is certified under 40 CFR part 1039 with a deteriorated emission level for PM that is at or below 0.15 g/kW-hr. For MY 2021 through 2023, this same emission level applies as a standard for all new tractors with an APU installed. Starting in MY 2024, any

APU installed in a new tractor must be certified to a PM emission standard of 0.02 g/kW-hr over the full useful life as specified in 40 CFR 1039.699. Engine manufacturers may alternatively meet the APU standard by certifying their engines under 40 CFR part 1039 with a Family Emission Limit for PM at or below 0.02 g/kW-hr. APUs installed on MY 2024 and later tractors must have a label stating that the APU meets the PM requirements of 40 CFR 1039.699. Tractor manufacturers will be subject to a prohibition against selling new MY 2024 and later tractors with APUs that are not certified to the specified standards, and manufacturers will similarly be subject to a prohibition against selling new MY 2021 through 2023 tractors with APUs that do not meet the specified emission levels. This

applies for both new and used APUs installed in such new tractors. Manufacturers of new nonroad engines and new APUs may continue to produce and sell their products for uses other than installation in new tractors without violating these prohibitions. However, nonroad engine manufacturers and APU manufacturers would be liable if they are found to have caused a tractor manufacturer to violate this prohibition, such as by mislabeling an APU as compliant with this standard. Note also that the PM standard for APUs applies for new tractors, whether or not the engine and APU are new; conversely, the PM standard does not apply for APU retrofits on tractors that are no longer new, even if the engine and APU are new.

TABLE III-2—PM STANDARDS FOR TRACTORS USING APUS

Tractor MY	PM emission standard (g/kW-hr)	Expected control technology
MY 2021–2023 ^a	0.15	In-cylinder PM control.
MY 2024 and later	0.02	Diesel Particulate Filter.

Note:

^a APUs installed on new tractors built January 1, 2018 and later, through model year 2020, must have engines that meet the same 0.15 g/kW-hr emission level if they rely on AESS for demonstrating compliance with emission standards.

We discuss below the principal comments we received on whether to adopt a standard to control PM emissions from APUs used for tractor idle emission control, the basis for the amended standards, and how EPA envisions the standards operating in practice.

Among the comments we received were those from the American Lung Association, National Association of Clean Air Agencies, Northeast States for Coordinated Air Use Management, Environmental Defense Fund, Natural Resources Defense Council, Environmental Law and Policy Center, Coalition for Clean Air/California Cleaner Freight Coalition, Moving Forward Network, Ozone Transport Commission, and the Center for Biological Diversity that urged EPA to amend the standards for PM emissions from these engines in order to reduce PM emission increases resulting from increased APU use. Bendix commented that EPA should consider the full vehicle emissions and fuel consumption, including the APU, to create a more accurate comparison when considering alternatives to diesel powered APUs. California's ARB supported the development of a federal rule that requires DPFs on APUs, similar to the requirements already in place in

California because diesel PM poses a large public health risk.

In contrast, EMA commented that EPA should not impose any new emission requirements on APU engines because they already meet the Tier 4 nonroad standards and argued further that this rulemaking is not the proper forum for amending nonroad engine emission standards. Ingersoll Rand commented that they have significant concerns with regard to a nationwide requirement for use of DPFs in diesel-powered APUs, and strongly urged EPA not to impose such a perceived burden on the trucking industry. Ingersoll Rand's concerns are that the additional cost would push owners away from diesel-powered APUs to battery-powered APUs that, according to Ingersoll Rand, are not yet mature enough to serve as a replacement for diesel-powered APUs. Ingersoll Rand believes that high-capacity battery-powered APUs will eventually become a commercially available and cost-effective alternative to diesel-powered APUs. Ingersoll Rand stated that, although Thermo King has been dedicating resources to research and development in this area for some time, mandating this technology today would significantly decrease consumer choice, competitiveness in the APU marketplace, and driver comfort and

safety. ATA is concerned that efforts to place additional emissions controls, and therefore additional costs, on APUs by making PM standards more stringent will discourage the use of this fuel efficient technology. EPA considered Ingersoll Rand's comments in developing a phased-in approach to the new PM standards for new tractors using APUs to, having the principal standard apply commencing with MY 2024 tractors in order to provide sufficient lead time.

Following is discussion of our analysis of this issue in light of the information we received and of our decision to establish a new PM standard for these units.

(a) PM Emissions Impact Without Additional Controls

EPA conducted an analysis using MOVES, which evaluates the potential impact on PM emissions due to an increase in APU adoption rates. In this analysis, EPA assumed that PM emission rates from current technology APUs would be unchanged in the future. We estimated an average in-use APU emission rate of 0.96 grams PM per hour from three in-use APUs (model years 2006 and 2011), measured in

different load conditions.²⁰⁹ We determined that a typical 2010 model year or newer tractor that uses its main engine to idle emits 0.32 grams PM per hour, based on a similar analysis of in-use idling of emissions from 2010 model year and newer tractors.¹² Thus, the use of an APU would lead to a potential increase in PM of as much as 0.64 grams per hour.

The results from these MOVES runs are shown below in Table III–3. These results show that an increase in use of APUs could lead to an overall increase in PM emissions if no additional PM emission standards were put in place. Column three labeled “Final Phase 2 GHG Program PM_{2.5} Emission Impact without Further PM Control (tons)” shows the incremental increase in PM_{2.5} without further regulation of APU PM_{2.5}

emissions, assuming the rate of APU use on which the final CO₂ standard is premised. These PM emission impacts represent an increase of approximately three percent of the HD sector PM emissions. We note further that the pollutant at issue is diesel PM, which is associated with myriad serious health effects, including premature mortality. See Section VIII.A.6 below.

TABLE III–3—PROJECTED IMPACT OF INCREASED ADOPTION OF APUS IN PHASE 2

CY	Baseline HD vehicle PM _{2.5} emissions (tons)	Final phase 2 GHG program PM _{2.5} ^a emission impact without further PM control (tons) ^b
2040	20,939	464
2050	22,995	534

Note:

^a Positive numbers mean emissions would increase from baseline to control case.

^b The impacts shown include all PM_{2.5} impacts from the rule including impacts from increased tire wear and brake wear that results from the slight increase in VMT projected as a result of this rule.

(b) Feasibility of PM Emission Reductions

As EPA discussed in the NPRM, there are DPFs in the marketplace today that can reduce PM emissions from APUs. 80 FR 40213. Since January 1, 2008, California ARB has restricted the idling of sleeper cab tractors during periods of sleep and rest.²¹⁰ The regulations apply additional requirements to diesel-fueled APUs on tractors equipped with 2007 model year or newer main engines. Truck owners in California must either: (1) Fit the APU with an ARB verified Level 3 particulate control device that achieves 85 percent reduction in particulate matter; or (2) have the APU exhaust plumbed into the vehicle's exhaust system upstream of the particulate matter aftertreatment device.²¹¹ Currently ARB has identified four control devices that have been verified to meet the Level 3 p.m. requirements. These devices include HUSS Umwelttechnik GmbH's FS–MK Series Diesel Particulate filters, Impco Ecotrans Technologies' ClearSky Diesel Particulate Filter, Thermo King's Electric Regenerative Diesel Particulate Filter, and Proventia's Electronically Heated Diesel Particulate Filter. In addition, ARB has approved a Cummins integrated diesel-fueled APU and

several fuel-fired heaters produced by Espar and Webasto.

EPA received comments from Daimler, Idle Smart, MECA, and Proventia addressing the feasibility of PM reductions from APU engines. Daimler stated that they supply APUs that currently meet ARB's PM emission requirements and encouraged EPA to simply adopt ARB's regulations. Proventia commented that they have produced an ARB-approved actively regenerating DPF to fit the Thermo King Tripac APU since 2012 and that it is proven, reliable, and commercially available. Idle Smart commented that their start-stop idle reduction solution emits less PM emissions than a diesel APU without a DPF. MECA commented that a particulate filter in this application would be a wall flow device and, due to the relatively cold exhaust temperature of these small engines, the filters would need to use either all active or a combination of passive and active regeneration to periodically clean the soot from the filter. MECA stated that active regeneration could be achieved through the use of a fuel burner or electric heater upstream of the filter. MECA also stated that ARB's regulations demonstrate that it is feasible to control PM from small APU engines and that the technology has been available since 2008.

California's Clean Idle program requires that diesel-powered APUs be fitted with a verified DPF. In some cases, limits are put on the PM emission level at the engine outlet (upstream of the DPF). For example, the ThermoKing APU approval utilizing a Yanmar engine requires that engine is certified to a PM level of 0.2 g/kW-hr or less (upstream of the DPF).²¹² Implementation of the California program and the subsequent approval of Level 3 verified devices has led to the certification of engines utilized in APUs whose PM emissions at the engine outlet are well below the 0.4 g/kW-hr nonroad Tier 4 final standard for this size engine in 40 CFR part 1039. For example, the Yanmar TK270M engine that is used in combination with ThermoKing's electronic regenerative diesel particulate filter, which is certified under the EPA designated engine family GYDXL0.57NUA, is certified with a PM level of 0.09 g/kW-hr. The addition of a DPF affords at least an additional 85 percent reduction from the engine outlet certified value, or less than 0.014 g/kW-hr.

EPA believes that these comments confirm our discussion at proposal that PM standards reflecting performance of a diesel particulate filter are technically feasible.

(c) Benefits of Further PM Controls

Using MOVES, EPA evaluated the impact of requiring further PM control from APUs nationwide. As shown in Table III–3 and Table III–4, EPA projects that the HD Phase 2 program without additional PM controls would increase PM_{2.5} emissions by 464 tons in 2040 and 534 tons in 2050. The annual impact of

the final program to further control PM is projected to lead to a reduction of PM_{2.5} emissions nationwide by 927 tons in 2040 and by 1,114 tons in 2050, as shown in Table III–4 the column labeled “Net Impact on National PM_{2.5} Emission with Further PM Control of APUs (tons).” Note that these requirements will reduce PM emissions from APUs assumed in the baseline for MY 2018

and later, as well as the additional APUs that are projected to be used as a result of the Phase 2 standards. This results in projected reductions that exceed the projected increase in PM emissions that would have occurred with the new Phase 2 GHG standards but without these newly promulgated APU standards.

TABLE III–4—PROJECTED IMPACT OF FURTHER CONTROL ON PM_{2.5} EMISSIONS ^a

CY	Baseline national heavy-duty vehicle PM _{2.5} emissions (tons)	HD Phase 2 program national PM _{2.5} emissions without further PM control (tons)	HD Phase 2 program national PM _{2.5} emissions with further PM control (tons)	Net impact on national PM _{2.5} emission with further PM control of APUs (tons)
2040	20,939	21,403	20,476	– 927
2050	22,995	23,529	22,416	– 1,114

Note:

^a The impacts shown include all PM_{2.5} impacts from the rule including impacts from increased tire wear and brake wear that results from the slight increase in VMT projected as a result of this rule.

(d) PM Emission Reduction Technology Costs

EPA does not project any cost for meeting the requirement, commencing on January 1, 2018, that tractor manufacturers using APUs as part of a compliance path to meeting the Phase 1 GHG standards only receive credit in GEM for use of the APU if they use an APU with an engine with deteriorated PM emissions at or below 0.15 g/kW-hr. The same conclusion applies for MY 2021, when we adopt the PM emission level of 0.15 g/kW-hr as an emission standard, not only as a qualifying condition for using AESS for demonstrating compliance with the CO₂ standard. First, EPA projects that the 2018–2023 requirements can be achieved at zero cost because several engines are already meeting them today with in-cylinder controls. Second, this is only one of many potential compliance pathways for tractors meeting the Phase 1 standards. We nonetheless are providing extra lead time by tying this provision to calendar year 2018, rather than model year 2018, to allow manufacturers time for confirming emission levels and otherwise complying with administrative requirements.

PM emission reductions from APU engines beginning in MY 2024 would most likely be achieved through installation of a diesel particulate filter (DPF).²¹³ In the NPRM, EPA discussed several sources for DPF cost estimates.

The three sources included the federal Nonroad Diesel Tier 4 rule, ARB, and Proventia. EPA developed long-term cost projections for catalyzed diesel particulate filters (DPF) as part of the Nonroad Diesel Tier 4 rulemaking. In that rulemaking, EPA estimated the DPF costs would add \$580 to the cost of 150 horsepower engines (69 FR 39126, June 29, 2004). On the other hand, ARB estimated the cost of retrofitting a diesel powered APU with a PM trap to be \$2,000 in 2005.²¹⁴ Proventia is charging customers \$2,240 for electronically heated DPF for retrofitting existing APUs.²¹⁵

EPA requested comment on DPF costs in the NPRM and received comments from MECA, Proventia, and Ingersoll Rand. MECA agreed with EPA's range of DPF costs discussed in the NPRM. Proventia stated that the \$2,240 end user price cited in the NPRM is for an aftermarket retrofit device. Proventia estimated that the direct manufacturing cost of materials and manufacturing (which is less than the retail price equivalent) for quantities exceeding 10,000 annually would be \$975 for an actively regenerating device. The basis for this estimate is Proventia's current production cost in the quantity of 50 units of \$1069. Proventia stated that EPA's estimate of \$580 for a 150hp

engine is likely to be for a catalyzed passively regenerating DPF because those engines have higher exhaust temperatures. Proventia also stated that a cost of an actively regenerating DPF is significantly higher than for passively regenerating devices. Ingersoll Rand commented that Thermo King currently offers a DPF option on its line of diesel-powered APUs and the incremental price of the DPF option can be as high as \$3,500. ATA commented that adding a DPF to an APU increases the cost of the device by up to 20 percent. Daimler provided DPF costs as CBI.

EPA considered the comments and more closely evaluated NHTSA's contracted TetraTech cost report which found the total retail price of a diesel-powered APU that includes a DPF to be \$10,000.²¹⁶ Based on all of this information, EPA is projecting the retail price increment of an actively regenerating DPF installed in an APU to be \$2,000. This cost is incremental to the diesel-powered APU technology costs beginning in 2024 MY.

EPA regards these costs as reasonable. First, the PM standard is necessary to avoid an unintended consequence of GHG idle control. The standard adopted is also appropriate for APUs used in on-highway applications, since it is comparable to the heavy-duty on-highway standard after considering rounding conventions (the PM standard for a tractor's main engine is 0.01 g/hp-hr as specified in 40 CFR 86.007–11(a)(1)(iv)). The standard is also voluntary in the sense that tractor

²¹³ As discussed below, a DPF could be installed by the APU manufacturer, the engine manufacturer, the tractor manufacturer, or a fourth entity, with certification and labelling responsibilities differing depending on which entity does the installation.

²¹⁴ California Air Resources Board. Staff Report: Initial Statement of Reasons; Notice of Public Hearing to Consider Requirements to Reduce Idling Emissions From New and In-Use Trucks, Beginning in 2008. September 1, 2005. Page 38. ²¹⁶ U.S. DOT/NHTSA. Commercial Medium- and Heavy-Duty Truck Fuel Efficiency Technology Cost Study. May 2015. Page 71.

manufacturers can use other types of idle reducing technologies, or choose a Phase 2 compliance path not involving idle control. The agencies have developed technology packages for determining the final Phase 2 tractor GHG and fuel consumption standards that are predicated on lower penetration rates of diesel APUs than in the NPRM and have included several additional idle reducing technologies, making it more likely that alternative compliance paths are readily available. APU manufacturers (and manufacturers of APU engines) also can market their product to any entities other than MY 2024 and later new tractors without meeting the DPF-based PM standard. Our review of the costs of these standards thus indicates that they will be reasonable.

It is also worth noting that the reductions also have monetized benefits far greater than the costs of the standard. Section IX.H.1 of this Preamble discusses the economic value of reductions in criteria pollutants. In this analysis, EPA estimates the economic value of the human health benefits associated with the resulting reductions in PM_{2.5} exposure using what are known as “benefit per ton” values. The benefit per ton values estimate the benefits of reducing incidence of specific PM_{2.5}-related health impacts, including reduction in both premature mortality and premature morbidity from on-road mobile sources. The estimate of benefits from reducing one ton of direct PM_{2.5} from on-road mobile sources in 2030 using a three percent discount rate range is between \$490,000 and \$1,100,000 (2013\$) and is between \$440,000 and \$990,000 (2013\$) using a seven percent discount rate.²¹⁷ The estimated cost per ton for the new APU standards in 2040 is \$101,717.

(e) Other Considerations

EPA considered the lead time of the new PM standards for APUs installed in new tractors. The 2018 provision restricting GEM credit for use of APUs is not a new standard, but rather a compliance constraint. There should be ample time for tractor manufacturers to consider how to obtain APUs certified

to the designated deteriorated PM emissions level should they wish to receive GEM credit for use of APUs. As noted in (d) above, we concluded that the reasonable feasible lead time is to implement these provisions on January 1, 2018 because the manufacturer's contemplating use of APUs in conjunction with a Phase 1 compliance strategy using AESS would need time to adapt their certification systems, which we believe requires lead time of at least several months.

In MY 2021, tractor manufacturers will be subject to a prohibition against selling new MY 2021 through 2023 tractors with APUs that do not meet those specified PM emission levels. For the reasons just given, there is ample time to meet this requirement.

The diesel particulate filter-based standard for APUs installed in new tractors begins in MY 2024. This allows several years for the development and application of diesel particulate filters to these APUs. We have concluded that, given the timing of the PM emission standards finalized in this document and the availability of the technologies, APUs can be designed to meet the new standards with the lead time provided (and, again, noting that tractor manufacturers have available compliance pathways available not involving APUs).

In terms of safety, EPA considered the fact that diesel particulate filters are a known technology. DPFs have been installed on a subset of diesel powered APUs since the beginning of the California requirements and have been used with on-highway diesel engines since the sale of MY 2007 engines. We are unaware of any safety issues with this technology. We are adopting these APU requirements because they allow for reduced fuel consumption; this also leads to a positive impact with respect to energy.

(f) Implementation of the Standard

EPA has a choice as to whether to adopt these provisions as a tractor vehicle standard or as a standard for the non-road engine in the APU. Under either approach, EPA is required to consider issues of technical feasibility, cost, safety, energy, and lead time. EPA has addressed all of these factors above, and finds the 2018, 2021, and 2024 provisions, and associated lead time, to be justified.²¹⁸

The final rule applies most directly to tractor manufacturers. However, other entities potentially affected are the manufacturer of the APU, the

manufacturer of the engine installed in the APU, and a different entity (if any) separately installing a DPF on the APU engine. At present, all engines used in APUs must certify to the PM standard in 40 CFR 1039.101, and must label the engine accordingly (see 40 CFR 1039.135). The provisions we are adopting for MY 2024 require that any APU engine being certified to the 0.02 g/kW-hr PM standard have a label indicating that the APU or engine is so certified. This puts any entity receiving that engine on notice that the APU (and its engine) can be used in a new tractor. Conversely, the absence of such a label indicates that the engine cannot be so used. Consequently, if a tractor manufacturer receives an APU without the supplemental label, it can only use the APU in a new tractor if it installs a DPF or otherwise retrofits the APU engine to meet the PM standard.

The APU certification provisions in 40 CFR 1039.699 are simplified to account for the fact that the APU manufacturer would generally be adding emission control hardware without modifying the engine from its certified configuration. Note that engine manufacturers, tractor manufacturers or others installing the emission control hardware may also certify to the 0.02 g/kW-hr standard. Since the prohibition applies to the tractor manufacturer, we would not expect the delegated assembly provisions of 40 CFR 1037.621 or the secondary vehicle manufacturer provisions of 40 CFR 1037.622 to apply for APU manufacturers.

As described above, we are aware that the PM standards as adopted would not prevent a situation in which tractors are retrofitted with diesel APUs after they are no longer new, without meeting the PM standards described above. We believe that vehicle manufacturers will strongly desire to apply the benefit of AESS with low-PM diesel APUs to help them meet CO₂ standards for any installations where a diesel APU is a viable or likely option for in-use tractors. We will consider addressing this possible gap in the program with a standard for *new* APUs installed on *new* or *used* tractors. Such a standard would be issued exclusively under our authority to regulate nonroad engines as described in Clean Air Act section 213 (a)(4). If we adopt such a standard, we will also consider whether to adopt that same requirement for new APUs installed in other motor vehicles, and for other nonroad installations generally.

²¹⁷ This valuation is undoubtedly conservative because it reflects exposure to PM_{2.5} generally, rather than to the form of PM here: Diesel exhaust particulate, a likely human carcinogen. See section VIII.A.6.b. Due to underlying analytical limitations, PM_{2.5}-related benefit per ton values are only estimated out to the year 2030. For the criteria pollutant benefits analysis in this rulemaking, we make a conservative assumption that 2030 values apply to all emission reductions in years that extend beyond 2030. We assume benefit-per-ton values grow larger in the future due to income growth and a larger future population.

²¹⁸ As noted above, the 2018 provision is a compliance constraint, not a standard.

(4) Special Purpose Tractors and Heavy-Haul Tractors

The agencies proposed and are adopting provisions in Phase 2 to set standards for a new subcategory of heavy-haul tractors. In addition and as noted above, in Phase 1 the agencies adopted provisions to allow tractor manufacturers to reclassify certain tractors as vocational vehicles, also called Special Purpose Tractors.²¹⁹ The agencies proposed and are adopting provisions in Phase 2 to continue to allow manufacturers to exclude certain vocational-types of tractors (Special Purpose Tractors) from the combination tractor standards and instead be subject to the vocational vehicle standards. However, the agencies are making changes to the proposed Phase 2 Special Purpose Tractors and heavy-haul tractors in response to comments, as discussed below.

(a) Heavy-Haul Tractors

For Phase 2, the agencies proposed and are adopting an additional subcategory to the tractor category for heavy-haul tractors that are designed to haul much heavier loads than conventional tractors. The agencies recognize the need for manufacturers to build these types of vehicles for specific applications and also recognize that such heavy-haul tractors are not fully represented by the way GEM simulates conventional tractors. We believe the appropriate way to prevent effectively penalizing these vehicles is to set separate standards recognizing a heavy-haul vehicle's unique needs, which include the need for a higher horsepower engine and different transmissions. In addition drivetrain technologies such as 6x2 axles, may not be capable of handling the heavier loads. The agencies are adopting this change in Phase 2 because, unlike in Phase 1, the engine, transmission, and drivetrain technologies are included in the technology packages used to determine the stringency of the tractor standards and are included as manufacturer inputs in GEM. The agencies also recognize that certain technologies used to determine the stringency of the Phase 2 tractor standards are less applicable to the heavy-haul tractors designed for the U.S. market. For example, heavy-haul tractors in the U.S. are not typically used in the same manner as long-haul tractors with extended highway driving, and therefore will experience less benefit from aerodynamics. This means that the agencies are adopting a

standard that reflects individualized performance of these technologies in particular applications, in this case, heavy-haul tractors, and further, have a means of reliably assessing individualized performance of these technologies at certification.

The typical tractor is designed in the U.S. with a Gross Combined Weight Rating (GCWR) of approximately 80,000 pounds due to the effective weight limit on the federal highway system, except in states with preexisting higher weight limits. The agencies proposed in Phase 2 to consider tractors with a GCWR over 120,000 pounds as heavy-haul tractors. Based on comments received during the development of HD Phase 1 (76 FR 57136–57138) and because we did not propose in Phase 2 a sales limit for heavy-haul as we have for the vocational tractors in Phase 1, the agencies also believed it would be appropriate to further define the heavy-haul vehicle characteristics to differentiate these vehicles from the vehicles in the other nine tractor subcategories. The two additional requirements in the Phase 2 proposal included a total gear reduction greater than or equal to 57:1 and a frame Resisting Bending Moment (RBM) greater than or equal to 2,000,000 in-lbs per rail or rail and liner combination. Heavy-haul tractors typically require the large gear reduction to provide the torque necessary to start the vehicle moving. These vehicles also typically require frame rails with extra strength to ensure the ability to haul heavy loads. We requested comment on the proposed heavy-haul tractor specifications, including whether Gross Vehicle Weight Rating (GVWR) or Gross Axle Weight Rating (GAWR) would be a more appropriate metric to differentiate between a heavy-haul tractor and a typical tractor.

We received comments from several manufacturers about the proposed heavy-haul subcategory. None of the commenters were averse to creating such a subcategory, and many manufacturers directly supported such an action. Navistar supported creating a new heavy-haul subcategory maintaining that this type of vehicle is specified uniquely and is not designed for standard trailers. Volvo supported this addition since heavy-haul tractors require large engines and increased cooling capacity and most heavy-haul rigs have some requirement for off-road access to pick up machinery, bulk goods, and unusual loads.

We received comments from several manufacturers about the criteria proposed to define the heavy-haul tractor subcategory. Allison commented

that for heavy-haul tractors equipped with an automatic transmission, the gear reduction ratio should be greater than or equal to 24.9:1 because an automatic transmission with a torque converter provides a torque multiplying effect and better launch capability. EMA and other manufacturers commented that the proposed specifications for heavy-haul tractors do not allow the relevant vehicles to meet the proposed total gear reduction ratio of 57:1 or greater. EMA commented that the Allison 7-speed 4700 transmission and the Eaton 9LL products both are specifically designed for heavy-haul operations, could meet a 53:1 specification, but not a 57:1 ratio. PACCAR also commented that an automatic transmission torque converter ratio should be included in the Total Reduction ratio calculation to properly incorporate the slip and first gear ratio combination that is inherent in an automatic transmission. EMA, PACCAR, and Volvo recommended that the agencies should change the rear axle ratio for the baseline vehicle to attain the 53:1 total reduction ratio because the proposed baseline heavy-haul vehicle did not meet the proposed total reduction ratio. Daimler commented that the agencies should remove both the frame resistance bending moment requirement and the gear reduction requirement.

EMA and some of the manufacturers commented that the agencies should revise the definition of heavy-haul tractor to be “equal to or greater than 120,000 pounds GCWR” rather than “greater than 120,000 pounds GCWR.” They stated that the specifications for the heavy-haul market start with and include 120,000 pounds GCWR. Daimler suggested that the minimum GCWR be set at 105,000 pounds to better catch the large number of Canadian vehicles that are heavy-haul. Daimler stated that this broader weight definition catches a very small number of US vehicles (0.1 to 0.9 percent of the vehicles, depending on other factors) but catches the large number of Canadian vehicles that Daimler considers to be heavy-haul.

Volvo commented that there are multiple types of heavy-haul tractors, each with their own specific characteristics based on operational considerations: High-roof highway sleeper tractors pulling box vans at or above 120,000 pounds GCWR (e.g. long combination vehicles) that run regional and long-haul operations and can benefit from the same technologies as high-roof sleepers with 80,000 pound GCWR and should be credited for the higher payload; low- and mid-roof sleepers that primarily run long-haul routes (e.g. pulling low-boy trailers and

²¹⁹ See 40 CFR 1037.630.

heavy equipment); low-roof day cab tractors running regional and shorter routes (e.g. bulk haul); and then what the industry typically refers to as heavy-haul that are extremely high GCWR and can haul above 300 metric tons and sometimes run in multiple tractor configurations that provide for one or more tractor(s) pulling and one or more tractor(s) pushing.

In part to follow up on the comments made by manufacturers, EPA held discussions with Environment and Climate Change Canada (ECCC) after the NPRM was released regarding the Special Purpose tractors and heavy-haul tractors.²²⁰ In our discussions, ECCC emphasized that the highway weight limitations in Canada are much greater than those in the U.S. Where the U.S. federal highways have limits of 80,000 pounds GCW, Canadian provinces have weight limits up to 140,000 pounds. This difference could potentially limit emission reductions that could be achieved if ECCC were to fully harmonize with the U.S.'s HD Phase 2 standards because a significant portion of the tractors sold in Canada have GCWR greater than 120,000 pounds, the proposed limit for heavy-haul tractors.

For the FRM, EPA and NHTSA are revising the heavy-haul tractor provisions to balance the certainty that vehicles are regulated in an appropriate subcategory along with the potential to better harmonize the U.S. and Canadian regulations. Based on our assessment, the tractors with GCWR greater than or equal to 120,000 pounds truly represent heavy-haul applications in the U.S. Therefore, we are adopting criteria only based on GCWR, not the proposed RBM or total gear reduction ratios. The agencies are adopting Phase 2 heavy-haul standards for this subset of vehicles, similar to the standards proposed for Phase 2 and detailed below in Section III.D.1.

In Canada, due to their differences in weight and dimension requirements, it is primarily tractors with a GCWR of equal to or greater than 140,000 pounds that are truly heavy-haul vehicles. This leaves a set of tractors sold in Canada with a GCWR between 120,000 and 140,000 pounds that are used in ways that are similar to the way tractors with a GCWR less than 120,000 pounds (the typical Class 8 tractor) are used in the U.S. These tractors sold in Canada could benefit from the deployment of additional GHG-reducing technologies beyond what is being required for heavy-haul tractors in the U.S., such as

aerodynamic and idle reduction improvements. Most manufacturers tend to rely on U.S. certificates as their evidence of conformity for products sold into Canada to reduce compliance burden. Therefore, in Phase 2 the agencies are adopting provisions that allow the manufacturers the option to meet standards that reflect the appropriate technology improvements, along with the powertrain requirements that go along with higher GCWR. While these heavy Class 8 tractor standards will be optional for tractors sold into the U.S. market, we expect that Canada will consider adopting these as mandatory requirements as part of their regulatory development and consultation process. Given the unique circumstances in the Canadian fleet, we believe that there is a reasonable basis for considering such an approach for Canadian tractors. As such, the agencies have coordinated these requirements with ECCC. The agencies are only adopting optional heavy Class 8 standards for MY 2021 at this time. The expectation is that ECCC will develop their own heavy-duty GHG regulations to harmonize with this Phase 2 rulemaking through its own domestic regulatory process. We expect that ECCC will include a mandate that heavy Class 8 tractors be certified to the MY 2021 heavy Class 8 tractor standards, but could also specify more stringent standards for later years for these vehicles. We plan to coordinate with ECCC to incorporate any needed future changes in a timely manner. Details of these optional standards are included in Section III.D.1.

(b) Special Purpose Tractors

During the development of Phase 1, the agencies received comments from several stakeholders supporting an approach for an alternative treatment of a subset of tractors because they were designed to operate at lower speeds, in stop and go traffic, and sometimes operate off-road or at higher weights than the typical line-haul tractor. These types of applications have limited potential for improvements in aerodynamic performance to reduce CO₂ emissions and fuel consumption. Therefore, we adopted provisions to allow these special purpose tractors to certify as vocational vehicles (or vocational tractors). Consistent with our approach in Phase 1, the agencies still believe that these vocational tractors are operated differently than line-haul tractors and therefore fit more appropriately into the vocational vehicle category. However, we need to continue to ensure that only tractors that are *truly* vocational tractors are

classified as such.²²¹ As adopted in Phase 1, a Phase 2 vehicle determined by the manufacturer to be a HHD vocational tractor will fall into one of the HHD vocational vehicle subcategories and be regulated as a vocational vehicle. Similarly, MHD tractors which the manufacturer chooses to reclassify as vocational tractors will be regulated as MHD vocational vehicles. Specifically, the agencies adopted in Phase 1 provisions in EPA's 40 CFR 1037.630 and NHTSA's regulation at 49 CFR 523.2 to only allow the following three types of vocational tractors to be eligible for reclassification by the manufacturer: Low-roof tractors intended for intra-city pickup and delivery, such as those that deliver bottled beverages to retail stores; tractors intended for off-road operation (including mixed service operation), such as those with reinforced frames and increased ground clearance; and tractors with a GCWR over 120,000 pounds.²²²

In the Phase 2 proposal, the agencies proposed to remove the third type of vocational tractors, heavy-haul tractors with a GCWR over 120,000 pounds, from the Phase 2 Special Purpose Tractor category and set unique standard for heavy-haul tractors. 80 FR 40214. The agencies requested comment on the Special Purpose Tractor criteria and received comments from the manufacturers. EMA and PACCAR commented there is a group of special purpose tractors with a gross combination weight rating over 120,000 pounds that fall in between the proposed regulatory categories for heavy-haul tractors and Class 8 tractors that need to be accounted for in a separate and distinct manner. They stated that such vehicles are still appropriately categorized as Special Purpose Tractors and should be included at the manufacturer's option in the vocational tractor family, even though they may not meet the proposed total gear reduction requirement or the frame rail requirements. PACCAR and Volvo also requested a modification to the definition to include "equal to 120,000 GCWR."

Volvo provided a list of recommended Special Purpose Tractor criteria. Volvo stated that these characteristics differentiate these vehicles from line haul operation, especially in terms of fuel economy as well as the significant added costs for these features. Volvo's

²²⁰ Memo to Docket. Heavy Class 8 Discussion with Environment and Climate Change Canada. July 2016. Docket EPA-HQ-OAR-2014-0827.

²²¹ As a part of the end of the year compliance process, EPA and NHTSA verify manufacturer's production reports to avoid any abuse of the vocational tractor allowance.

²²² See existing 40 CFR 1037.630 (a)(1)(i) through (iii).

recommended criteria included GCWR greater than 120,000 pounds or any three of the following vehicles specifications: Configuration other than 4x2, 6x2, or 6x4; greater than 14,600 pounds front axle load rating; greater than 46,000 pounds rear axle load rating; greater than or equal to 3.00:1 overall axle reduction in transmission high range; greater than 57.00:1 overall axle reduction in transmission low range; frame rails with a resistance bending moment greater than or equal to 2,000,000 in-lbs., greater than or equal to 20 degree approach angle; or greater than or equal to 14 inch ground clearance.

The heavy-haul tractor standards that the agencies are adopting in Phase 2 apply to tractors with a GCWR greater than or equal to 120,000 pounds. As stated above, the agencies are adopting heavy-haul tractor criteria based only on GCWR, and are not adopting the proposed criteria of RBM or total gear reduction. With these Phase 2 changes to the proposed heavy-haul tractor definition, all tractors that would have been considered as Special Purpose Tractors in Phase 1 due to the GCWR criteria listed in EPA's 40 CFR 1037.630 and NHTSA's regulation at 49 CFR 523.2 will now qualify as heavy-haul tractors in Phase 2. Therefore, we no longer believe that it is necessary for heavy-haul tractors to be treated as Special Purpose Tractors. The agencies also reviewed Volvo's suggested criteria and concluded that the Phase 1 approach and Special Purpose Tractor criteria are working well; therefore, we do not see the need to adopt more restrictive criteria. Consequently, the agencies are adopting in Phase 2 provisions in EPA's 40 CFR 1037.630 and NHTSA's regulation at 49 CFR 523.2 to only allow the following two types of vocational tractors to be eligible for reclassification to Special Purpose Tractors by the manufacturer:

(1) Low-roof tractors intended for intra-city pickup and delivery, such as those that deliver bottled beverages to retail stores.

(2) Tractors intended for off-road operation (including mixed service operation), such as those with reinforced frames and increased ground clearance.

These provisions apply only for purposes of Phase 2. The agencies are not amending the Phase 1 provisions for special purposes tractors.

Volvo also requested that the agencies add a Vocational Heavy-Haul Tractor subcategory that allows for a heavy-haul tractor which benefits from the utilization of a powertrain optimized to meet the vocational operational

requirements of this segment, a technology package corresponding to those operational characteristics, and with a corresponding duty cycle and, most importantly, a payload representative of heavy-haul operation. The agencies considered this request and analyzed the expected technology package differences between the vocational and tractor program. As described in Section III.D.1, the agencies are only adopting technologies in the heavy-haul tractor category that would be applicable to the operation of these vehicles. For example, we are not adopting standards that are premised on any improvements to aerodynamics or extended idle reduction. Therefore, we concluded that there is no need to develop another vocational subcategory to account for heavy-haul tractors.

Because the difference between some vocational tractors and line-haul tractors is potentially somewhat subjective, and because of concerns about relative stringency, we also adopted in Phase 1 and proposed to continue in Phase 2 a rolling three year sales limit of 21,000 vocational tractors per manufacturer consistent with past production volumes of such vehicles to limit the use of this provision. We proposed in Phase 2 to carry-over the existing three year sales limit with the recognition that heavy-haul tractors would no longer be permitted to be treated as vocational vehicles (suggesting a lower volume cap could be appropriate) but that the heavy-duty market has improved since the development of the HD Phase 1 rule (suggesting the need for a higher sales cap). The agencies requested comment on whether the proposed sales volume limit is set at an appropriate level looking into the future. 80 FR 40214.

Several of the manufacturers commented that it would be reasonable to remove the sales cap limit. Allison stated that this limitation may have been reasonable in the initial years of the program as a precaution against unreasonably assigning too many tractors to the vocational vehicle category. However in Phase 2, Allison recommended that the agencies should remove the cap for three reasons: (1) Vehicle configurations change over time; (2) the Phase 2 vocational program drives technology improvements of powertrains; and (3) Phase 2 better represents the diversity of vocational vehicle uses that would allow for better alignment of vehicles with duty cycles that most represent their real world operation. Daimler stated that they think that with the addition of heavy-haul tractor standards, there will be less need for a sales volume limit on special purpose tractors. In Volvo Group's

opinion, the proposed volume limit is overly constraining and burdensome and should be removed. Volvo stated that given the recent product lineup overhauls across the industry they do not believe that there are many models still on the market that are sold in large numbers into both highway tractor and vocational tractor segments, nor is there sufficient reason that any OEM cannot identify specific vehicle attributes in order to classify a tractor as suitable solely for highway use, or for on/off-road use. Volvo Group suggested that the agencies remove the vocational tractor volume restrictions and employ a guideline based on specific vehicle characteristics.

The agencies evaluated the sales cap limit proposed for special purpose tractors and the comments addressing the issue of a sales cap. EPA calculated the number of vocational tractors certified in MY 2014 and MY 2015. The number of tractors ranged between approximately 2,600 and 6,200 per year per manufacturer that certified special purpose tractors, but one manufacturer did not use this provision at all.²²³ It is apparent that none of the manufacturers are utilizing this provision near the maximum allowable level in Phase 1 (a rolling three year sales limit of 21,000). We also believe that there is more incentive for manufacturers to use the special purpose tractor provisions in Phase 1 because the relative difference in stringency between the tractor and vocational programs is much greater in Phase 1 than it will be in Phase 2. Upon further consideration, we concluded that there is significantly less incentive for the manufacturers to reclassify tractors that are not truly special purpose tractors as vocational vehicles as a pathway to a less stringent standard in Phase 2 primarily since the Phase 2 vocational vehicle program stringency is similar to the stringency of the tractor program. In addition, the Phase 2 vocational vehicle compliance program and standards better represent the duty cycles expected of these vehicles and are predicated on performance of similar sets of vehicle technologies, except for aerodynamic technologies, as the primary tractor program. Therefore, we are adopting Phase 2 special purpose tractor provisions without a sales cap, but will continue to monitor during the Phase 2 implementation.

²²³ U.S. EPA. Memo to Docket: Special Purpose Tractor Production Volumes. Docket EPA-HQ-OAR-2014-0827.

(5) Small Tractor Manufacturer Provisions

In Phase 1, EPA determined that manufacturers that met the small business criteria specified in 13 CFR 121.201 for “Heavy Duty Truck Manufacturing” should not be subject to the initial phase of greenhouse gas emissions standards in 40 CFR 1037.106.²²⁴ The regulations required that qualifying manufacturers notify the Designated Compliance Officer each model year before introducing the exempted vehicles into commerce. The manufacturers are also required to label the vehicles to identify them as excluded vehicles. EPA and NHTSA proposed to eliminate this small business provision for tractor manufacturers in the Phase 2 program. As stated in the NPRM, the agencies are aware of two second stage manufacturers building custom sleeper cab tractors. In the proposal we stated that we could treat these vehicles in one of two ways. First, the vehicles may be considered as dromedary vehicles and therefore treated as vocational vehicles.²²⁵ Or the agencies could provide provisions that stated if a manufacturer changed the cab, but not the frontal area of the vehicle, then it could retain the aerodynamic bin of the original tractor. 80 FR 40214.

The agencies received comments on the second stage manufacturer options for small manufacturers discussed in the proposal. American Reliance Industries (ARI) raised concerns related to the proposed alternative methods for excluding or exempting second stage manufacturers performing cab sleeper modifications. ARI is concerned that treating these vehicles as vocational vehicles may mean that other regulations related to vocational vehicles would become applicable and have unanticipated adverse results and that the vehicles would not be certified as vocational vehicles when originally certified by an OEM. ARI commented that if EPA and NHTSA adopt a frontal area approach for second stage manufacturers making cab sleeper modifications, that the section be revised to ensure greater clarity as to the intention and effect of this section. In building a custom sleeper cab, ARI stated that they may use wind fairings, fuel tank fairings, roof fairings, and side extenders that can modify the frontal area of the tractor in height and width as compared to the frontal area of the

vehicle used to obtain the original certification. ARI also commented that depending on the custom cab sleeper modification, ARI may replace an aerodynamic fairing from the tractor in order to provide better aerodynamic results in light of the cab sleeper modification. ARI does not want to be precluded from continuing to provide these benefits to clients. ARI encourages the agencies to take a similar approach to small business exemption under the Phase 1 regulation in the Phase 2 regulation.

Daimler commented on the agencies’ two proposed approaches for second stage manufacturers that build custom sleepers. Daimler’s main concern is to clarify that where the primary manufacturer has certified a vehicle as a day cab, the second stage manufacturer’s actions do not draw the primary manufacturer into noncompliance. Daimler stated that in many cases, they do not know that a vehicle will be altered by a second stage manufacturer. Daimler did not have a preference on the way that the agencies proposed to regulate these secondary vehicle manufacturers, as long as the primary vehicle manufacturers could continue to sell vehicles with the expectation that anyone changing them from the compliant state in which it was built would certify those changes.

In response to these comments, EPA is clarifying in 40 CFR 1037.622 that small businesses may modify tractors as long as they do not modify the front of the vehicle and so long as the sleeper compartment is no more than 102 inches wide or 162 inches in height. As an interim provision, to allow for a better transition to Phase 2, EPA is finalizing a more flexible compliance path in 40 CFR 1037.150(r). This option allows small manufacturers to convert a low or mid roof tractor to a high roof configuration without recertification, provided it is for the purpose of building a custom sleeper tractor or for conversion to a natural gas tractor. Although this more flexible allowance to convert low and mid roof tractors to high roof tractors is being adopted as an interim provision, we have not established an end date at this time. We expect to reevaluate as manufacturers begin to make use of and may decide to revise it in the future, potentially deciding to make it a permanent allowance. To be eligible for this option, the secondary manufacturer must be a small manufacturer and the original low or mid roof tractor must be covered by a valid certificate of conformity. The modifications may not increase the frontal area of the tractor beyond the frontal area of the equivalent high roof

tractor paired with a standard box van. With respect to Daimler’s comment, 40 CFR 1037.130 only applies to vehicles sold in an uncertified condition and does not apply to vehicles sold in a certified condition.

(6) Glider Vehicles

As described in Section XIII.B, EPA is adopting new provisions related to glider vehicles, including glider tractors.²²⁶ NHTSA did not propose such changes. Glider vehicles and glider kits were also treated differently under NHTSA and EPA regulations prior to this rulemaking. They are exempt from NHTSA’s Phase 1 fuel consumption standards. For EPA purposes, the CO₂ provisions of Phase 1 exempted glider vehicles and glider kits produced by small businesses but did not include such a blanket exemption for other glider kits. Thus, some gliders and glider kits are already subject to the Phase 1 requirement to obtain a vehicle certificate prior to introduction into commerce as a new vehicle. 80 FR 40528.

In the NPRM, EPA proposed to revise the provisions applicable to glider vehicles so that the engines used in these vehicles would need to meet the standards for the year of the new glider vehicle. EPA’s resolution of issues relating to glider vehicles, including glider tractors, and glider kits, is discussed fully in Section XIII.B and RTC Section 14.2.

Similarly, NHTSA considered including glider vehicles under its Phase 2 program. After assessing the impact glider vehicles have on the tractor segment, NHTSA has elected not to include glider vehicles in its Phase 2 program. NHTSA may reconsider fuel efficiency regulations for glider vehicles in a future rulemaking.

As discussed in the NPRM, NHTSA would like to reiterate its safety authority over gliders—notably, that it has become increasingly aware of potential noncompliance with its regulations applicable to gliders. While there are instances in which NHTSA regulations allow gliders to use a “donor VIN” from a “donor tractor,” NHTSA has learned of manufacturers that are creating glider vehicles that are new vehicles under 49 CFR 571.7(e); however, the manufacturers are not certifying them and obtaining a new VIN as required. NHTSA plans to pursue enforcement actions as applicable against noncompliant manufacturers. In addition to enforcement actions, NHTSA may

²²⁴ See 40 CFR 1037.150(c).

²²⁵ A dromedary is a box, deck, or plate mounted behind the tractor cab and forward of the fifth wheel on the frame of the power unit of a tractor-trailer combination to carry freight.

²²⁶ See section I.E. 1 for descriptions of glider vehicles and glider kits.

consider amending 49 CFR 571.7(e) and related regulations as necessary. NHTSA believes manufacturers may not be using this regulation as originally intended.

We believe that the agencies having different policies for glider kits and glider vehicles under the Phase 2 program will not result in problematic disharmony between the NHTSA and EPA programs, because of the small number of vehicles that will be involved. EPA believes that its changes will result in the glider market returning to the pre-2007 levels, in which fewer than 1,000 glider vehicles will be produced in most years. Only non-exempt glider vehicles will be subject to different requirements under the NHTSA and EPA regulations. However, we believe that this is unlikely to exceed a few hundred vehicles in any year, which will be few enough not to result in any meaningful disharmony between the two agencies.

(7) Useful Life and Deterioration Factors

Section 202(a)(1) of the CAA specifies that EPA is to adopt emissions standards that are applicable for the useful life of the vehicle. The in-use Phase 2 standards that EPA is adopting will apply to individual vehicles and engines, just as EPA adopted for Phase 1. NHTSA is also adopting the same useful life mileage and years as EPA for Phase 2.

EPA is also not adopting any changes to the existing provisions that require that the useful life for tractors with respect to CO₂ emissions be equal to the respective useful life periods for criteria pollutants, as shown below in Table III–5. See 40 CFR 1037.106(e). EPA does not expect degradation of the technologies evaluated for Phase 2 in terms of CO₂ emissions, therefore we did not adopt any changes to the regulations describing compliance with GHG pollutants with regards to deterioration. See 40 CFR 1037.241.

TABLE III–5—TRACTOR USEFUL LIFE PERIODS

	Years	Miles
Class 7 Tractors	10	185,000
Class 8 Tractors	10	435,000

D. Feasibility of the Final Phase 2 Tractor Standards

This section describes the agencies' technical feasibility and cost analysis. Further detail on all of these technologies can be found in the RIA Chapter 2.

Class 7 and 8 tractors are used in combination with trailers to transport

freight. The variation in the design of these tractors and their typical uses drive different technology solutions for each regulatory subcategory. As noted above, the agencies are continuing the Phase 1 provisions that treat vocational tractors as vocational vehicles instead of as combination tractors, as noted in Section III.C.4. The focus of this section is on the feasibility of final standards for combination tractors including the heavy-haul tractors, but not the vocational tractors.

EPA and NHTSA collected information on the cost and effectiveness of fuel consumption and CO₂ emission reducing technologies from several sources, including new information collected since the NPRM was promulgated. The primary sources of pre-proposal information were the Southwest Research Institute evaluation of heavy-duty vehicle fuel efficiency and costs for NHTSA,²²⁷ the Department of Energy's SuperTruck Program,²²⁸ 2010 National Academy of Sciences report of Technologies and Approaches to Reducing the Fuel Consumption of Medium- and Heavy-Duty Vehicles,²²⁹ TIAX's assessment of technologies to support the NAS panel report,²³⁰ the analysis conducted by the Northeast States Center for a Clean Air Future, International Council on Clean Transportation, Southwest Research Institute and TIAX for reducing fuel consumption of heavy-duty long haul combination tractors (the NESCCAF/ICCT study),²³¹ and the technology cost analysis conducted by ICF for EPA.²³² Some additional information and data were also provided in comments.

Commenters generally supported the agencies' projection that manufacturers

can reduce CO₂ emissions and fuel consumption of combination tractors through use of many technologies, including engine, drivetrain, aerodynamic, tire, extended idle, and weight reduction technologies. The agencies' determination of the feasibility of the final HD Phase 2 standards is based on our updated projection of the use of these technologies and an updated assessment of their effectiveness. We will also discuss other technologies that could potentially be used, such as vehicle speed limiters, although we are not basing the final standards on their use for the model years covered by this rule, for various reasons discussed below.

(1) Projected Technology Effectiveness and Cost

EPA and NHTSA project that CO₂ emissions and fuel consumption reductions can be feasibly and cost-effectively met through technological improvements in several areas. The agencies evaluated each technology and estimated the most appropriate adoption rate of technology into each tractor subcategory. The next sections describe the baseline vehicle configuration, the effectiveness of the individual technologies, the costs of the technologies, the projected adoption rates of the technologies into the regulatory subcategories, and finally the derivation of these standards.

Based on information available at the time of the NPRM, the agencies proposed Phase 2 standards that projected by 2027, all high-roof tractors would have aerodynamic performance equal to or better today's SmartWay performance—which represents the best of today's technology. This would equate to having 40 percent of new high roof sleeper cabs in 2027 complying with the current best practices and 60 percent of the new high-roof sleeper cab tractors sold in 2027 having better aerodynamic performance than the best tractors available today. For tire rolling resistance, we premised the proposed standards on the assumption that nearly all tires in 2027 would have rolling resistance equal to or superior to tires meeting today's SmartWay designation. At proposal, the agencies assumed the 2027 MY engines would achieve an additional 4 percent improvement over Phase 1 engines and we projected 15 percent adoption of waste heat recovery (WHR) and many other advanced engine technologies. In addition, we proposed standards that projected improvements to nearly all of today's transmissions, incorporation of extended idle reduction technologies on 90 percent of sleeper cabs, and significant adoption of

other types of technologies such as predictive cruise control and automatic tire inflation systems.

The agencies also discussed several other alternatives in the proposal. When considering alternatives, it is necessary to evaluate the impact of a regulation in terms of CO₂ emission reductions, fuel consumption reductions, and technology costs. However, it is also necessary to consider other aspects, such as manufacturers' research and development resources, the impact on purchase price, and the impact on purchasers. Manufacturers are limited in their ability to develop and implement new technologies due to their human resources and budget constraints. This has a direct impact on the amount of lead time that is required to meet any new standards. From the owner/operator perspective, heavy-duty vehicles are a capital investment for firms and individuals so large increases in the upfront cost could impact buying patterns. Though the dollar value of the lifetime fuel savings will far exceed the upfront technology costs, purchasers often discount future fuel savings for a number of reasons, as discussed in more detail in Section IX.A. Tractor purchasers are often uncertain regarding the amount of fuel savings that can be expected for their specific operation due to the diversity of the heavy-duty tractor market. Although a nationwide perspective that averages out this uncertainty is appropriate for rulemaking analysis, individual operators must consider their potentially narrow operation. In addition, purchasers often put a premium on reliability (because downtime is costly in terms of towing, repair, late deliveries, and lost revenue) and may perceive any new technology as a potential risk with respect to reliability. Another factor that purchasers consider is the impact of a new technology on the resale market, which can also be impacted by uncertainty.

The agencies solicited comment on all of these issues and again noted the possibility of adopting, in a final action, standards that are more accelerated than those in Alternative 3, notably what we termed at proposal, Alternative 4 which would have involved a three year pull ahead of the proposed 2027 standards. 80 FR 40211. The agencies also assumed in the NPRM that both the proposed standards and Alternative 4 could be accomplished with all changes being made during manufacturers' normal product design cycles. However, we noted that doing so would be more challenging for Alternative 4 and may require accelerated research and

development outside of design cycles with attendant increased costs.

Commenters were encouraged in the NPRM to address all aspects of feasibility analysis, including costs, the likelihood of developing the technology to achieve sufficient reliability within the lead time, and the extent to which the market could utilize the technology.

The agencies received several general comments on the overall stringency of the proposed Phase 2 standards. Several entities encouraged the agencies to adopt more stringent tractor standards, including adoption of Alternative 4. They pointed out that DOE's SuperTruck program demonstrated over 40 percent improvement over 2010 levels, including 10.7 mpg by Cummins-Peterbilt and 12.2 mpg by Daimler. CBD stated that the technology forcing nature of Clean Air Act section 202(a)(2)²³³ and EPCA/EISA requires more aggressive assumptions regarding technology adoption. UCS commented that the tractor standards could be strengthened by another six percent in 2024 and seven percent in 2027 to reflect the full range of improvements to the powertrain and engine. ICCT stated that its analysis indicates that the technology potential is higher and costs are lower than the agencies' assessments in the NPRM. CARB stated that Alternative 4 is technologically feasible and will result in more emission and fuel consumption reductions. CARB continued to state that the increased cost due to accelerated implementation is minimal, about \$1,000 per vehicle purportedly according to the NPRM.

In contrast to the commenters that called for more stringent standards than those proposed, several other commenters cautioned the agencies from adopting final standards that are more stringent than those proposed. Diesel Technology Forum commented that the agencies should proceed with caution on technologies that are not in wide use that have not demonstrated reliability or commercial availability. The International Foodservice Distributors Association is concerned about Alternative 4 in terms of reliability, commenting that it would require their members to purchase unproven and unreliable equipment in order for OEMs to meet the requirements. OOIDA commented if owners fear a reduction in reliability, increased operating costs, reduced residual value, or large increases in

purchase prices, they will adjust their purchase plans.

PACCAR commented about the importance of lead time because their customers need time to determine if a technology meets their specific needs in their specific application and need assurance that a technology will be reliable in use. PACCAR also stated that the timing provided in the NPRM Alternative 3 provides the "greatest likelihood for a successful program." Volvo commented that SuperTruck demonstration vehicles serve only the purpose of demonstration but are not proven with respect to cost, reliability, and durability. Volvo stated that the purpose of SuperTruck was narrow in applicability of matched tractor-trailers and that it did not result in a cost effective tractor because each project cost between \$40 and \$80 million to produce a single vehicle. Volvo also commented that not all SuperTruck technologies should be forced into all applications and duty cycles and if they are a pre-buy (or no-buy) could result.

The agencies considered all of the general comments associated with the proposed Alternative 3 and Alternative 4 tractor standards. We believe there is merit in many of the detailed comments received regarding technologies. These are discussed in detail in the following sections. Instead of merely choosing from among the proposed alternatives, the agencies have developed a set of final tractor standards that reflect our reevaluation of the ability to pull ahead certain technologies, the limitations in adoption rates and/or effectiveness of other technologies, and consideration of additional technologies. In general, the final Phase 2 tractor standards are similar in overall stringency as the levels proposed in Alternative 3, but have been determined using new technology packages that reflect consideration of all of the technology comments, and in some respects reflect greater stringency than the proposed Alternative 3.

As can be seen from the comments, there is uncertainty and a wide range of opinions regarding the extent to which these technologies can be applied to heavy-duty tractors. Vehicle manufacturers tended to take the conservative position for each technology and argue that the agencies should not project effectiveness or adoption rates beyond that which is certain. Many other commenters took a more optimistic view and argued for the agencies to assume that each potential technology will be highly effective in most applications. However the agencies believe the most likely outcome will be that some technologies

²³³ CBD is mistaken that section 202(a)(2) mandates technology-forcing standards, although it allows them. See generally 74 FR 49464–465 (Sept. 28, 2009).

will work out better than expected while others will be slightly more challenging than projected. Thus, the agencies have tended to make balanced projections for the various technologies, although some may be slightly optimistic while others are somewhat conservative. We believe the overall effect of this approach will be standards that achieve large reductions with minimal risks to the industry.

(a) Tractor Baselines for Costs and Effectiveness

The fuel efficiency and CO₂ emissions of combination tractors vary depending on the configuration of the tractor. Many aspects of the tractor impact its performance, including the engine, transmission, drive axle, aerodynamics, and rolling resistance. For each subcategory, the agencies selected a theoretical tractor to represent the average 2017 model year tractor that meets the Phase 1 standards (see 76 FR 57212, September 15, 2011). These tractors are used as baselines from which to evaluate costs and effectiveness of additional technologies and standards.

As noted earlier, the Phase 1 2017 model year tractor standards (based on Phase 1 GEM and test procedures) and the baseline 2017 model year tractor results (using Phase 2 GEM and test procedures) are not directly comparable. The same set of aerodynamic and tire rolling resistance technologies were used in both setting the Phase 1 standards and determining the baseline of the Phase 2 tractors. However, there are several aspects that differ. First, a new version of GEM was developed and validated to provide additional capabilities, including more refined modeling of transmissions and engines. Second, the determination of the HD Phase 2 C_dA value takes into account a revised test procedure, a new standard reference trailer, and wind averaged drag as discussed below in Section III.E. In addition, the HD Phase 2 version of GEM includes road grade in the 55 mph and 65 mph highway cycles, as discussed below in Section III.E.

The agencies used the same adoption rates of tire rolling resistance for the Phase 2 baseline as we used to set the Phase 1 2017 MY standards. See 76 FR 57211. The tire rolling resistance level assumed to meet the 2017 MY Phase 1 standard high roof sleeper cab is considered to be a weighted average of 10 percent pre-Phase 1 baseline rolling resistance, 70 percent Level 1, and 20 percent Level 2. The tire rolling resistance to meet the 2017MY Phase 1 standards for the high roof day cab, low roof sleeper cab, and mid roof sleeper

cab includes 30 percent pre-Phase 1 baseline level, 60 percent Level 1 and 10 percent Level 2. Finally, the low and mid roof day cab 2017 MY standards were premised on a weighted average rolling resistance consisting of 40 percent baseline, 50 percent Level 1, and 10 percent Level 2. The agencies did not receive comments on the tire packages used to develop the Phase 2 baseline in the NPRM.

The agencies sought comment on the baseline vehicle attributes described in the NPRM. The agencies received comments related to the baseline adoption rate of automatic engine shutdown systems (AESS) and the baseline aerodynamics assessment. In the proposal, the agencies noted that the manufacturers were not using tamper-proof AESS to comply with the Phase 1 standards so the agencies reverted back to the baseline APU adoption rate of 30 percent used in the Phase 1 baseline. EMA and TRALA commented that the agencies confused the use of an APU with the use of tamper-proof idle technologies in assessing the baseline for the proposed Phase 2 standards. They stated that a 30 percent penetration rate of APUs is not the same as a 30 percent penetration rate of tamper-proof idle systems. ATA and Volvo also commented that the assumption that 30 percent of 2017 sleeper tractors will utilize the tamper-proof automatic engine shutdown is too high. EMA and PACCAR commented that virtually all tractors in the field have an automatic shutdown programmed in their engine; however, less than one percent of vehicles sold in recent years have tamper-proof AESS that are triggered in less than five minutes and cannot be reprogrammed for 1.259 million miles. In response to these comments, the agencies reassessed the baseline idle reduction adoption rates. The latest NACFE confidence report found that 9 percent of tractors had auxiliary power units and 96 percent of vehicles are equipped with adjustable automatic engine shutdown systems.²³⁴ Therefore, the agencies are projecting that 9 percent of sleeper cabs will contain an adjustable AESS and APU, while the other 87 percent will only have an adjustable AESS. Additional discussion on adjustable AESS is included in Section III.D.1.b.

The Phase 2 baseline in the NPRM was determined based on the aerodynamic bin adoption rates used to determine the Phase 1 MY 2017 tractor standards. Volvo, EMA, and other

manufacturers also commented that the aerodynamic drag baseline for 2017 tractors included in the NPRM was too aerodynamically efficient. EMA commented that some of the best aerodynamic tractors available were tested by the agencies and then declared to be the baseline. According to the manufacturers, the average tractor—the true baseline—is a full bin worse than these best tractors. While the agencies agree with the commenters that it is important to develop an accurate baseline so that the appropriate aerodynamic technology package effectiveness and costs can be evaluated in determining the final Phase 2 standards, there appears to be some confusion regarding the NPRM baseline aerodynamic assessment. The Phase 2 baseline in the NPRM was determined based on the aerodynamic bin adoption rates used to determine the Phase 1 MY 2017 tractor standards (see 76 FR 57211). The baseline was not determined by or declared to be the average results of the vehicles tested, as some commenters maintained. The vehicles that were tested prior to the NPRM were used to develop the proposed aerodynamic bin structure for Phase 2. In both the NPRM and this final rulemaking, we developed the Phase 2 bins such that there is an alignment between the Phase 1 and Phase 2 aerodynamic bins after taking into consideration the changes in aerodynamic test procedures and reference trailers required in Phase 2. The Phase 2 bins were developed so that tractors that performed as a Bin III in Phase 1 would also perform as Bin III tractors in Phase 2. Additional details regarding how the agencies refined the aerodynamic bin values for Phase 2 for the final rule can be found in Section III.E.2.a. The baseline aerodynamic value for the Phase 2 final rulemaking was determined in the same manner as the NPRM, using the adoption rates of the bins used to determine the Phase 1 standards, but reflect the final Phase 2 bin C_dA values.

In the NPRM, we used a transmission top gear ratio of 0.73 and drive axle ratio of 3.70 in the baseline 2017 MY tractor. UCS commented that the baseline axle ratio is too high. The agencies determined the rear axle ratio and final drive ratio in the baseline tractor based on axle market information shared by Meritor,²³⁵ one of the primary suppliers of heavy-duty axles, and confidential business information provided by Daimler. Our assessment of this information found that a rear axle ratio

²³⁴ North American Council for Freight Efficiency. Confidence Report: Idle Reduction Solutions. 2014. Page 13.

²³⁵ NACFE. Confidence Report: Programmable Engine Parameters. February 2015. Page 23.

of 3.70 and a top gear ratio of 0.73 (equivalent to a final drive ratio of 2.70) is a commonly spec'd tractor. Meritor's white paper on downspeeding stated that final drive ratios of less than 2.64 are considered to be "downsped."²³⁶ The agencies recognize that there is a significant range in final drive ratios that will be utilized by tractors built in

2017 MY, we do not believe that the average (*i.e.*, baseline) tractor in 2017 MY will downsped (*i.e.*, have a final drive ratio of less than 2.64). Therefore, the agencies are maintaining the proposed top gear ratio and drive axle ratio for the assessment of the baseline tractor performance.

The agencies are using the specific attributes of each tractor subcategory as are listed below in Table III-6 for the Phase 2 baselines. Using these values, the agencies assessed the CO₂ emissions and fuel consumption performance of the baseline tractors using the Phase 2 GEM. The results of these simulations are shown below in Table III-7.

Fuel Consumption (gal/1,000 ton-mile)	11.69941	12.49509	12.74067	8.96857	9.48919	9.64637	8.25147	8.86051	8.62475

The agencies also received comments related to the baseline heavy-haul tractor parameters. Volvo did not agree that certain segments of the heavy-haul

population are appropriately represented by the baseline in the NPRM. Volvo stated that these types of vehicles typically utilize an 18-speed

transmission, since they require the very close gear ratios and nearly all heavy-haul tractors have deeper drive axle ratios than the agencies have assumed

²³⁶ Ostrander, Robert, et.al. (Meritor). Understanding the Effects of Engine Downspeeding on Drivetrain Components. 2014. Page 2.

(3.55). PACCAR commented the 14.4 first gear of the 18-speed transmission coupled with the 3.73 rear axle ratio is an example of a significant sales volume combination that meets their recommended 53:1 Total Reduction ratio. Upon further consideration, the agencies find the suggestion that the baseline heavy-haul tractor is better represented by an 18-speed manual transmission to be persuasive. We therefore revised the baseline heavy-haul tractor configuration, as shown in Table III–8.

The baseline 2017 MY heavy-haul tractor will emit 56.9 grams of CO₂ per ton-mile and consume 5.59 gallons of fuel per 1,000 ton-mile.

TABLE III–8—HEAVY-HAUL TRACTOR BASELINE CONFIGURATION

Baseline heavy-haul tractor configuration
Engine = 2017 MY 15L Engine with 600 HP.
Aerodynamics (C _d A in m ²) = 5.00.
Steer Tires (CRR in kg/metric ton) = 7.0.

Drive axle Ratio = 3.73.
All Technology Improvement Factors = 0%.

The fuel consumption and CO₂ emissions in this “flat” baseline described above remains the same over time with no assumed improvements after 2017, absent a Phase 2 regulation. An alternative baseline was also evaluated by the agencies in which there is a continuing uptake of technologies in the tractor market that reduce fuel consumption and CO₂ emissions absent a Phase 2 regulation. This alternative baseline, referred to as the “dynamic” baseline, was developed to estimate the potential effect of market pressures and non-regulatory government initiatives to improve tractor fuel consumption. The dynamic baseline assumes that the significant level of research funded and conducted by the Federal government, industry, academia and other organizations will, in the future, result in the adoption of some technologies beyond the levels required to comply with Phase 1 standards. One example of such research is the Department of Energy

Super Truck program²³⁷ which has a goal of demonstrating cost-effective measures to improve the efficiency of Class 8 long-haul freight trucks by 50 percent by 2015. The dynamic baseline also assumes that manufacturers will not cease offering fuel efficiency improving technologies that currently have significant market penetration, such as automated manual transmissions. The baselines (one for each of the nine tractor types) are characterized by fuel consumption and CO₂ emissions that gradually decrease between 2019 and 2028. In 2028, the fuel consumption for the alternative tractor baselines is approximately 4.0 percent lower than those shown in Table III–7. This results from the assumed introduction of aerodynamic technologies such as down exhaust, underbody airflow treatment in addition to tires with lower rolling resistance. The assumed introduction of these technologies reduces the C_dA of the baseline tractors and CRR of the tractor tires. To take one example, the C_dA for baseline high roof sleeper cabs in Table III–6 is 5.90 m² in 2017. In 2028, the C_dA of a high roof sleeper cab would be assumed to still be 5.90 m² in the flat baseline case outlined above. Alternatively, in the dynamic baseline, the C_dA for high roof sleeper cabs is 5.61 m² in 2028 due to assumed market penetration of technologies absent the Phase 2 regulation. The dynamic baseline analysis is discussed in more detail in RIA Chapter 11.

(b) Tractor Technology Effectiveness

The agencies’ assessment of the technology effectiveness was developed through the use of the GEM in coordination with modeling conducted by Southwest Research Institute. The agencies developed these standards through a three-step process, similar to the approach used in Phase 1. First, the agencies developed estimates of technology performance characteristics and effectiveness in terms of reducing CO₂ emissions and fuel consumption for each technology, as described below. Each technology is associated with an input parameter which in turn is used as an input to the Phase 2 GEM simulation tool. There are two types of GEM input parameters. The first type requires a manufacturer to measure aspects of the technology. These aspects are used as inputs to GEM which then models the technology’s effectiveness (*i.e.* the effectiveness for that technology

is the GEM output). Aerodynamics, tire rolling resistance, engine fuel maps, axle ratio, the optional axle efficiency, and optional transmission efficiencies are examples of this first type of GEM input. The second type of GEM input only requires a manufacturer to install the technology onto the vehicle and does not require any testing to determine the GEM input. The agencies determined and specify in the regulations (see 40 CFR 1037.520) the effectiveness of this second type of GEM input. The agencies also define the technologies that qualify to be eligible for these GEM technology inputs in the regulations (see 40 CFR 1037.660 and 1037.801). Examples of these technology inputs include transmission type, idle reduction technologies, tire pressure systems, vehicle speed limiters, weight reduction, intelligent controls, and other accessories. The performance levels for the range of Class 7 and 8 tractor aerodynamic packages and vehicle technologies are described below in Table III–10.²³⁸ All percentage improvements noted below are relative to the 2017 MY baseline tractor.

As discussed in Section I.C.1.a, we assume manufacturers will incorporate appropriate compliance margins for all measured GEM inputs. In other words, they will declare values slightly higher than their measured values. As discussed in Section II.D.5, compliance margins associated with fuel maps are likely to be approximately one percent. For aerodynamic inputs, we believe the bin structure will eliminate the need for C_dA compliance margins for most vehicles. However, for vehicles with measured C_dA values very near the upper bin boundary, manufacturers will likely choose to certify some of them to the next higher bin values (as a number of commenters noted). For tire rolling resistance, our feasibility rests on the Phase 1 standards, consistent with our expectation that manufacturers will to continue to incorporate the compliance margins they considered necessary for Phase 1. With respect to optional axle and/or transmission power loss maps, we believe manufacturers will need very small compliance margins. These power loss procedures require high precision so measurement uncertainty will likely be on the order of 0.1 percent of the transmitted power. All of these margins are reflected in our projections of the emission levels that will be technologically feasible.

The agencies then determined the adoption rates feasible for each

²³⁷ U.S. Department of Energy. See SuperTruck Report to Congress. <http://energy.gov/eere/vehicles/downloads/vehicle-technologies-office-report-adoption-new-fuel-efficient-technologies>.

²³⁸ These GEM default values could be superseded on a case-by-case basis based on an appropriate off-cycle credit demonstration.

technology in each model year, as described in Section III.D.1.c. Then as described in Section III.D.1.f, the agencies combined the technology performance levels with a projected technology adoption rate to determine the GEM inputs used to set the stringency of these standards. The agencies input these parameters into Phase 2 GEM and used the output to determine the final CO₂ emissions and fuel consumption levels.

(i) Engine Improvements

There are several technologies that could be used to improve the efficiency of diesel engines used in tractors. These technologies include friction reduction, combustion system optimization, and waste heat recovery using the Rankine cycle. Details of the engine technologies, adoption rates, and overall fuel consumption and CO₂ emission reductions are included in Section II.D. The Phase 2 *engine* standards will lead each manufacturer to achieve reductions of 1.8 percent in 2021 MY, 4.2 percent in 2024 MY, and 5.1 percent in 2027 MY. For the final Phase 2 rule, we recognize that it could be possible to achieve greater reductions than those included in the engine standard by designing entirely new engine platforms. See Section II.D.2.e. Unlike existing platforms, which are limited with respect to peak cylinder pressures (precluding certain efficiency improvements), new platforms can be designed to have higher cylinder pressure than today's engines. New designs are also better able to incorporate recent improvements in materials and manufacturing, as well as other technological developments. Considered together, it is likely that a new engine platform could be about 2 percent better than engines using older platforms. Moreover, the agencies have seen CBI data that suggests improvement of more than 3 percent are possible. As discussed in Section II.D.2.e above, how far the various manufacturers are into their design cycles suggests that one or more manufacturers will probably introduce a new engine platform during the Phase 2 time frame. Thus, we project that 50 percent of tractor engines produced in 2027 MY will be redesigned engines (*i.e.* engines reflecting redesigned engine platforms, again based on existing engine platform redesign schedules within the industry). This means the average 2027 MY tractor engine would be 5.4 and 6.4 percent better than Phase 1 for day and sleeper cabs

respectively.²³⁹ This reflects an average 0.8 percent improvement beyond what is required to meet the engine standards.

As noted in Section II.D.2.e, it is import to note that these new platforms will be developed based on normal market forces rather than as a result of this rulemaking. Some engine manufacturers have developed new platforms with the last ten years, and we do not expect these engines to be replaced within the Phase 2 time frame. However, other engines have not been fundamentally redesigned recently and will be due for replacement by 2027. Because these new platforms will occur because of market forces rather than this rulemaking, these reductions are in some ways windfalls for vehicle manufacturers. Thus, we have not included the cost of these new platforms as part of our rulemaking analysis.

We have factored these levels into our analysis of the vehicle efficiency levels that will be achievable in MY 2027. These additional engine improvements will result in vehicles having lower GEM results. Thus, they make more stringent vehicle standards feasible, and the final standards are structured so that these improved engines are not able to generate windfall credits against the engine standards, but rather that their projected performance is reflected in the stringency of the final tractor vehicle standard. It is important to also note that manufacturers that do not achieve this level of engine reduction would be able to make up the difference by applying one of the many other available and cost-effective tractor technologies to a greater extent or more effectively, so that there are multiple technology paths for meeting the final standards. In other words, a manufacturer that does not invest in updating engine platforms in the Phase 2 time frame is likely to be able to invest in improving other vehicle technologies. (Note that these same reductions cannot be assumed as part of the engine standards because engine manufacturers will not have this same flexibility). These reductions from the engine will show up in the fuel maps used in GEM to set the Phase 2 tractor stringencies.

(ii) Aerodynamics

There are opportunities to reduce aerodynamic drag from the tractor by further optimization of body components, but it is sometimes difficult to assess the benefit of individual aerodynamic features. Therefore, reducing aerodynamic drag requires optimizing of the entire system.

The potential areas to reduce drag include all sides of the truck—front, sides, top, rear and bottom. The grill, bumper, and hood can be designed to minimize the pressure created by the front of the truck. Technologies such as aerodynamic mirrors and fuel tank fairings can reduce the surface area perpendicular to the wind and provide a smooth surface to minimize disruptions of the air flow. Roof fairings provide a transition to move the air smoothly over the tractor and trailer. Side extenders can minimize the air entrapped in the gap between the tractor and trailer. Lastly, underbelly treatments can manage the flow of air underneath the tractor. DOE has partnered with the heavy-duty industry to demonstrate high roof sleeper cab tractor and box trailer combinations that achieve a 50 percent improvement in freight efficiency evaluated as a 65,000 pound vehicle operating on the highway under somewhat controlled circumstances. However, these demonstration vehicles developed in SuperTruck are not necessarily designed to handle the rigors of daily use over actual in-use roads. For example, they generally have very limited ground clearance that would likely preclude operation in snow, and would be very susceptible to damage from potholes or other road hazards. Nevertheless, this SuperTruck program has led to significant advancements in the aerodynamics of combination tractor-trailers. While the agencies cannot simply apply the SuperTruck program achievements directly into the Phase 2 program because of the significant differences in the limited purpose of SuperTruck and the plenary applicability of a regulation to all operating conditions and duty cycles, it is helpful to assess the achievements and evaluate how the technologies could be applied into mass production into a variety of real world applications while maintaining performance throughout the full useful life of the vehicle. A manufacturer's SuperTruck demonstration vehicle achieved approximately a seven percent freight efficiency improvement over a 2009 MY baseline vehicle due to improvements in tractor aerodynamics and approximately 16 percent overall for the tractor-trailer combination.²⁴⁰ The seven percent freight efficiency improvement due to tractor aerodynamics equates to roughly a 14 percent reduction in C_dA from a 2010 MY baseline vehicle. The 2010 NAS Report on heavy-duty trucks found that there are achievable aerodynamic

²³⁹ See RIA Chapter 2.8.4.1 for the analysis of the engine technologies and the associated fuel maps.

²⁴⁰ Daimler Truck North America. SuperTruck Program Vehicle Project Review. June 19, 2014.

improvements which yield 3 to 4 percent fuel consumption reduction or six to eight percent reduction in Cd values, beyond a baseline reflecting performance of technologies used in today's SmartWay trucks.²⁴¹

The Phase 2 aerodynamic packages are categorized as Bin I, Bin II, Bin III, Bin IV, Bin V, Bin VI, or Bin VII based on the wind averaged drag aerodynamic performance determined through testing conducted by the manufacturer. Bin I represents the least aerodynamic tractors, while Bins V–VII would be more aerodynamic than any tractor on the road today. A more complete description of these aerodynamic packages is included in Chapter 2.8.2.2 of the RIA. In general, the CdA values for each package and tractor subcategory were developed through EPA's coastdown testing of tractor-trailer combinations, the 2010 NAS report, and SAE papers.

The agencies received comments on our aerodynamic technology assessment. A de F Limited commented that wheel covers improve the aerodynamics of tractors and trailers, though the results may be lost in the noise when evaluated on tractors and trailers separately. Daimler commented that they found in their SuperTruck work that there are diminishing opportunities for tractor aerodynamics improvements and there may be impediments to some due to the need to access the back of cab and reliability concerns. AIR CTI commented that they have built a truck with aerodynamic technologies such as a front spoiler that automatically deploys at vehicle speeds over 30 mph, aerodynamic mirrors, and wheel covers over the rear wheels. ICCT found in their workshop that opportunities exist for high roof line haul tractor aerodynamic improvements that could lead to a three to nine percent improvement in fuel consumption over a 2010 baseline.²⁴² The HD manufacturers and EMA raised significant concerns with regard to the proposed aerodynamic assessment for Phase 2. They stated that even the best anticipated future-technology SuperTruck tractor configurations with a Phase 2 reference trailer likely would only qualify for the proposed Phase 2 Bin IV or possibly Bin V, leaving Bins V, VI and VII largely infeasible and unachievable.

The agencies' assessment is that the most aerodynamic tractor tested by EPA

in 2015 achieved Bin IV performance. See RIA Chapter 3.2.1.2. This vehicle did not include all of the possible aerodynamic technologies, such as wheel covers or active aerodynamics like a grill shutter or front air dam. Upon further analysis of simulation modeling of a SuperTruck tractor with a Phase 2 reference trailer with skirts, we agree with the manufacturers that a SuperTruck tractor technology package would only achieve the Bin V level of CdA, as discussed above and in RIA Chapter 2.8.2.2. Therefore, the agencies' assessment is that Bin V is achievable with known aerodynamic technologies, as discussed in RIA Chapter 2.4.2.1 and 2.8.2.2, but agree with the manufacturers that Bins VI and VII have less known technology paths. The agencies are including definitions of Bins VI and VII performance in the Phase 2 regulations with the understanding that aerodynamics will continue to improve over the next ten years until the full phase-in of the Phase 2 program and to provide a value to be input to GEM should they do so. However, we considered the comments and discuss the adoption rates of the more aerodynamic bins in Section III.D.1.c.i, which ultimately concludes that the standards should be predicated only on performance of aerodynamic technologies reflecting up to Bin V.

As discussed in Section III.E.2, the agencies are increasing the number of aerodynamic bins for low and mid roof tractors from the two levels adopted in Phase 1 to seven levels in Phase 2. The agencies adopted an increase in the number of bins for these tractors to reflect the actual range of aerodynamic technologies effective in low and mid roof tractor applications. The aerodynamic improvements to the bumper, hood, windshield, mirrors, and doors are developed for the high roof tractor application and then carried over into the low and mid roof applications.

(iii) Tire Rolling Resistance

A tire's rolling resistance is a function of the tread compound material, the architecture and materials of the casing, tread design, the tire manufacturing process, and its operating conditions (surface, inflation pressure, speed, temperature, etc.). Differences in rolling resistance of up to 50 percent have been identified for tires designed to equip the same vehicle. Since 2007, SmartWay designated tractors have had steer tires with rolling resistance coefficients of less than 6.5 kg/metric ton for the steer tire and less than 6.6 kg/metric ton for

the drive tire.²⁴³ Low rolling resistance (LRR) drive tires are currently offered in both dual assembly and wide-based single configurations. Wide based single tires can offer rolling resistance reduction along with improved aerodynamics and weight reduction. The rolling resistance coefficient target for the Phase 2 NPRM was developed from SmartWay's tire testing to develop the SmartWay certification and testing a selection of tractor tires as part of the Phase 1 and Phase 2 programs. Even though the coefficient of tire rolling resistance comes in a range of values, to analyze this range, the tire performance was evaluated at four levels for both steer and drive tires, as determined by the agencies. The four levels in the Phase 2 proposal included the baseline (average) from 2010, Level I and Level 2 from Phase 1, and Level 3 that achieves an additional 25 percent improvement over Level 2. The Level 1 rolling resistance performance represents the threshold used to develop SmartWay designated tires for long haul tractors. The Level 2 threshold represents an incremental step for improvements beyond today's SmartWay level and represents the best in class rolling resistance of the tires we tested for Phase 1. The Level 3 values in the NPRM represented the long-term rolling resistance value that the agencies predicts could be achieved in the 2025 timeframe. Given the multiple year phase-in of the standards, the agencies expect that tire manufacturers will continue to respond to demand for more efficient tires and will offer increasing numbers of tire models with rolling resistance values significantly better than today's typical low rolling resistance tires.

ICCT found in their workshop that opportunities exist for improvements in rolling resistance for tractor tires that could lead to a two to six percent improvement in fuel consumption when compared to a 2010 baseline tractor.²⁴⁴ A fuel consumption improvement in this range would require a six to 18 percent improvement in the tractor tire rolling resistance levels. Michelin commented that the proposed values for the drive tires seem reasonable, though the 4.5 kg/ton level would require significantly higher adoption rate of

²⁴³ U.S. EPA. "US EPA Low Rolling Resistance Tire Testing Activities" presentation to SAE Government-Industry Meeting. January 22, 2016. Values represent the ISO 28580 2 meter drum results because these align with the test method used to certify tractors to the GHG and fuel consumption standards.

new generation wide base single tires. Michelin also stated that the value of 4.3 kg/ton target for steer tires is highly unlikely based on current evolution and that research shows that 5.0 kg/ton would be more likely.

The agencies have evaluated this comment and find it persuasive. The agencies analyzed the 2014MY certification data for tractors between the NPRM and final rulemaking. We found that the lowest rolling resistance value submitted for 2014 MY GHG and fuel efficiency certification for tractors was 4.9 and 5.1 kg/metric ton for the steer and drive tires respectively, while the highest rolling resistance tire had a CRR of 9.8 kg/metric ton.²⁴⁵ We have accordingly increased the coefficient of rolling resistance for Level 3 tires in the final rule based on the comments and the certification data.

(iv) Tire Pressure Monitoring and Automatic Tire Inflation Systems

Proper tire inflation is critical to maintaining proper stress distribution in the tire, which reduces heat loss and rolling resistance. Tires with low inflation pressure exhibit a larger footprint on the road, more sidewall flexing and tread shearing, and therefore, have greater rolling resistance than a tire operating at its optimal inflation pressure. Bridgestone tested the effect of inflation pressure and found a 2 percent variation in fuel consumption over a 40 psi range.²⁴⁶ Generally, a 10 psi reduction in overall tire inflation results in about a one percent reduction in fuel economy.²⁴⁷ To achieve the intended fuel efficiency benefits of low rolling resistance tires, it is critical that tires are maintained at the proper inflation pressure.

Proper tire inflation pressure can be maintained with a rigorous tire inspection and maintenance program or with the use of tire pressure and inflation systems. According to a study conducted by FMCSA in 2003, about 1 in 5 tractors/trucks is operating with 1 or more tires underinflated by at least 20 psi.²⁴⁸ A 2011 FMCSA study estimated

under inflation accounts for one service call per year and increases tire procurement costs 10 to 13 percent. The study found that total operating costs can increase by \$600 to \$800 per year due to under inflation.²⁴⁹ A recent study by The North American Council on Freight Efficiency, found that openness to the use of tire pressure monitoring systems is increasing. It also found that reliability and durability of commercially available tire pressure systems are good and early issues with the systems have been addressed.²⁵⁰ These automatic tire inflation systems (ATIS) monitor tire pressure and also automatically keep tires inflated to a specific level. The agencies proposed to provide a one percent CO₂ and fuel consumption reduction value for tractors with automatic tire inflation systems installed.

Tire pressure monitoring systems (TPMS) notify the operator of tire pressure, but require the operator to manually inflate the tires to the optimum pressure. Because of the dependence on the operator's action, the agencies did not propose an emission reduction value for tire pressure monitoring systems. Instead, we requested comment on this approach and sought data from those that support a reduction value be assigned to tire pressure monitoring systems. 80 FR 40218.

Many commenters including OOIDA, ATA, the truck manufacturers, RMA, UPS, Bendix, Doran, First Industries, NADA, and others suggested that the agencies should recognize TPMS as a technology in GEM, with the effectiveness value set at an equal level as ATIS. On the other hand, ARB generally supported the use of ATIS but not TPMS because it requires action from the driver. Many stakeholders stated that TPMS offers similar benefit, but at a lower cost, so is more acceptable in the market. UPS commented that they prefer TPMS because TPMS gives the truck owner an affirmative indication that there is a tire pressure problem, so it can be fixed, whereas the ATIS does not and they are concerned that ATIS simply keeps adding tire pressure automatically, wasting energy, and the truck owner may never know it. Bendix believes that

both ATIS and TPMS should be available in the market in the Phase 2 timeframe for tractors. RMA cited a NHTSA study of LD vehicles of model years 2004–2007 and found that the presence of a TPMS system led to a 55.6 percent reduction in the likelihood that a vehicle would have one tire that is significantly underinflated (25 percent or greater).²⁵¹ RMA also stated that NHTSA found TPMS to be effective in reducing moderate under inflation (at least 10 percent, but under 25 percent), which was reduced by 35.3 percent.²⁵² RMA's comments also stated for light trucks and vans, the effectiveness rates were even higher, with TPMS reducing severe under inflation by 61.2 percent and moderate under inflation by 37.7 percent. RMA commented that NHTSA found that in 2011, the TPMS systems save \$511 million in fuel costs across the vehicle fleet.²⁵³ Navistar said the driver alert with TPMS is simpler and sufficient to ensure tire inflation in commercial applications. Navistar also commented that in heavy duty, a professional driver has both the incentive and the knowledge to keep tires adequately inflated, neither of which may necessarily be the case with light duty. Doran Manufacturing cited FMCSA studies on TPMS in 2006 that found TPMS were accurate at assessing tire pressure, in 2007 found acceptable durability of TPMS, and in 2011 found that TPMS or ATIS in fleet studies showed a 1.4 percent improvement in fuel economy. ARB's technology assessment found ATIS benefit at one percent.²⁵⁴ ICCT found in their workshop that opportunities exist for ATIS that could lead to a 0.5 to two percent improvement in fuel consumption.²⁵⁵ AIR CTI discussed the consequences of improper inflation pressures on tire life, safety, stopping distance, vehicle vibration, and damage to the roads. AIR CTI commented that their Central Tire Inflation system controls tire pressure from controls on the dash and is commonly used in logging and other off-road transportation.

After consideration of the comments, the agencies found them persuasive and are adopting provisions in Phase 2 GEM that allow manufacturers flexibility to

show compliance with the CO₂ and fuel consumption standards using various technologies, including the flexibility to adopt ATIS or TPMS (see 40 CFR 1037.520). This reflects a change from the Phase 2 NPRM, where only ATIS (not TPMS) was a GEM input. The agencies believe that sufficient incentive exists for truck operators to address low tire pressure conditions if they are notified that they exist through a TPMS.

The agencies also considered the comments to determine the effectiveness of TPMS and ATIS. The agencies conducted a further review of the FCMSA study cited by commenters and we interpret the results of the study to indicate that overall a combination of TPMS and ATIS in the field achieved 1.4 percent reduction. However, it did not separate the results from each technology, and therefore did not indicate that TPMS and ATIS achieved the same levels of reduction. Therefore, we set the effectiveness of TPMS slightly lower than ATIS to reflect that operators will be required to take some action to insure that the proper inflation pressure is maintained. The input values to the Phase 2 GEM are set to 1.2 percent reduction in CO₂ emissions and fuel consumption for ATIS and 1.0 percent reduction for TPMS. In other words, if a manufacturer installs an ATIS onto a vehicle, then they will enter 1.2 percent into the Tire Pressure System value in their GEM input file. If a manufacturer installs a TPMS, then they will input 1.0 percent into the Tire Pressure System value in GEM.

EPA proposed a definition of ATIS in 40 CFR 1037.801 to qualify it as a technology input to GEM. The proposed definition stated that “Automatic tire inflation system means a system installed on a vehicle to keep each tire inflated to within 10 percent of the target value with no operator input.” The agencies received comment about this definition. Meritor suggested adopting the historical industry definition of ATIS as “Automatic Tire Inflation Systems maintain tire pressure at a single preset level and are pneumatically or electronically activated. These systems eliminate the need to manually inflate tires.” Meritor is concerned with the proposed definition of ATIS that required the system must “keep each tire inflated to within 10 percent” to qualify as a technology input to GEM. Meritor commented that the proposed definition is not consistent with the manner in which these systems are used in practice. Meritor stated that an ATIS assures that tires will always be running at the recommended cold tire inflation pressure. The agencies are adopting

changes to reflect the appropriate definition of ATIS in the final rule (see 40 CFR 1037.801).

(v) Idle Reduction

Auxiliary power units (APU), fuel operated heaters (FOH), battery supplied air conditioning, and thermal storage systems are among the technologies available today to reduce fuel consumption and CO₂ emissions from extended idling (or hoteling). Each of these technologies reduces fuel consumption during idling relative to a truck without this equipment. In Phase 1 and in the Phase 2 NPRM, the agencies took an approach whereby tractor manufacturers could input an idle reduction value into GEM only if a vehicle included a tamper-proof automatic engine shutdown system (AESS) programmed to shut down the engine after five minutes or less. This approach allows the manufacturers to use AESS as one of the technologies (in combination with other technologies such as aerodynamics or low rolling resistance tires) to demonstrate compliance with the CO₂ emission and fuel consumption standards. The agencies also included several override provisions for the AESS and a discounted GEM input value for an expiring AESS or a system that allowed a specified number of hours of idling per year (see 40 CFR 1037.660).

The agencies did not differentiate between the various idle reduction technologies in terms of effectiveness because we adopted in Phase 1 and proposed in Phase 2 a conservative effectiveness level to recognize that some vehicles may be sold with only an AESS but may then install an idle reduction technology after it leaves the factory (76 FR 57207). The effectiveness for AESS in Phase 1 and proposed in Phase 2 was determined by comparing the idle fuel consumption of the main engine at approximately 0.8 gallons per hour to the fuel consumption of a diesel powered APU that consumes approximately 0.2 gallons per hour. This difference equates to a five percent reduction in overall CO₂ emissions and fuel consumption of a Class 8 sleeper cab. A diesel powered APU was selected for determining the effectiveness and cost because it was a conservative estimate. Diesel powered APUs have the highest fuel consumption and cost of the idle reduction technologies considered.²⁵⁶ The agencies proposed that a tamper-proof AESS would receive a five percent CO₂ emissions and fuel consumption reduction in GEM for vehicles that included this technology.

²⁵⁶ See the draft RIA Chapter 2.4.8 for details.

This value is in line with the TIAX assessment which found a five percent reduction in overall fuel consumption to be achievable.²⁵⁷ The agencies requested comments on the proposed approach.

The agencies received a number of comments regarding “mandating APU” or “mandating AESS.” There is a misconception of the proposed Phase 2 program where stakeholders thought that the agencies were mandating use of APUs. This is incorrect. The tractor standards are performance standards. The agencies merely *projected* an adoption rate of up to 90 percent for tamper-proof AESS in our analysis for determining the stringency level of the proposed standard. As stated above, we did not propose to differentiate between the various idle reduction technologies in terms of effectiveness and only used the diesel powered APU in terms of determining the cost and effectiveness of a potential standard. Also, because the standards are performance standards, the agencies are not mandating any specific fuel consumption or GHG emission reducing technology. For each standard, we developed one potential technology pathway to demonstrate the feasibility of the standards, but manufacturers will be free to choose other paths.²⁵⁸

The agencies received a significant number of comments about idle reduction for sleeper cabs, including recommendations to the agencies to assess the emission reduction for a variety of idle reduction technologies instead of just a tamper-proof AESS. ATA, NADA, and others commented that fleets have a variety of choices available in providing the driver power and comfort in-lieu of idling including use of APUs, FOHs, stop-start (main engine turns on only to recharge the battery after several hours), shore power, battery stand-by, stand-alone anti-idling infrastructure establishments, slip-seat operations, and hotel accommodations. Convoy Solutions stated that IdleAir’s electrified parking spaces are an important bridge technology to more electrified solutions. IdleAir commented it may be possible to recognize off board behavior at the OEM level as a buyer of a new truck could enter into a contract with an EPS provider prior to accepting delivery. ATA and First Industries support efficiency credits for idling reduction options installed by fleets either at the OEM point-of-sale or installed in the after-market.

²⁵⁷ See the 2010 NAS Report at 128.

²⁵⁸ The one exception being the design standards for certain non-aero trailers. See Section IV below.

The agencies also received comments regarding the level of effectiveness of idle reduction technologies. ICCT found in their workshop that opportunities exist for line haul tractor idle reduction improvements that could lead to a four to seven percent improvement in fuel consumption.²⁵⁹ MEMA recommended that the agencies modify the projected effectiveness level based on the merit of the individual idle control technology. MEMA's recommendation for effectiveness levels based on the fuel consumption and GHG emissions of each technology ranged from 7.7 g/ton-mile for fuel cell APU, 6 g/ton-mile for diesel APU, and 9 g/ton-mile for battery air conditioning systems, fuel operated heater, and combinations of technologies. MEMA supports the agencies' proposal that, in order to qualify for the use of an idle reduction technology in GEM, it is mandatory that the truck be equipped with an AESS. MEMA also commented that in the Phase 1 RIA, the agencies assumed a Class 8 sleeper cab spends 1,800 hours in extended idle per year and travels about 250 days per year. MEMA recommends that the agencies use 2,500 annual hours for APUs and 1,250 annual hours for FOHs to better reflect real-world application and experiences. Additionally, MEMA recommends that 0.87 gallon/hour fuel consumed by the main engine during idle be used in the calculations for credit.

The agencies also received a significant number of comments about idle reduction encouraging the agencies to consider recognizing adjustable AESS instead of only a tamper-proof AESS. ATA commented that most fleets already purchase "programmable" idle shutdown timers to limit idling due to the national patchwork of anti-idling laws currently in place. ATA continued to say that these timers are typically set for a given period of time throughout the initial fleet's ownership period. ATA also stated as witnessed under Phase I, fleets are unwilling to purchase hard-programmed, tamper-proof AESS given their need for flexibility regarding their resale of used equipment on the secondary market. Caterpillar also noted that fleets do not purchase tamper-resistant automatic engine shutdown systems; therefore, AESS should not be part of the stringency setting, unless the agencies also consider programmable versions of AESS. PACCAR, Volvo and EMA request the agencies to consider partial credit for AESS that are

programmed to a 5-minute or sooner shutdown but are not tamper-resistant to changes by an owner. Daimler and Navistar also commented that the agencies should consider adjustable AESS as a technology input to GEM. Daimler found that less than one percent of the adjustable AESS systems set at or below 5 minutes that were installed in customer tractors were deactivated or reprogrammed to a value longer than 5 minutes. PACCAR viewed the proposed tamper-proof AESS for 1.259 million miles as unrealistic and not reflecting current market conditions.

While the agencies do not necessarily believe that customer reluctance in the initial years of Phase 1 should be considered insurmountable, we do agree with commenters that the agencies should allow adjustable AESS to be a technology input to GEM and should differentiate effectiveness based on the idle reduction technology installed by the tractor manufacturer. We will still apply the Phase 1 requirement that the AESS be programmed to 5 minutes or less at the factory to qualify as a technology input in GEM (see 40 CFR 1037.660), but for Phase 2 will allow a variety of both tamper-proof and adjustable systems to qualify for some reduction (*i.e.* to be recognized by GEM). Any changes made subsequent to the factory but prior to delivery to the purchaser, must be accounted for in the manufacturer's end of year reports.

The agencies developed effectiveness levels for the extended idle technologies from literature, SmartWay work, and the 2010 NAS report. The agencies also reviewed the NACFE report on programmable engine parameters which included a fleet survey on how often the fleets change programmable parameters, such as automatic engine shutdown timers.²⁶⁰ The survey found that approximately 70 percent of these fleets never changed the setting. The agencies developed the effectiveness levels to reflect that there is some greater uncertainty of adjustable AESS systems, therefore the effectiveness values are discounted from the values determined for tamper-proof AESS. A detailed discussion regarding the comments and the associated calculations to determine the effectiveness of each of the idle reduction technologies are included in RIA Chapter 2.4.8.1.1. In summary, the effectiveness for each type of idle reduction technology is included in Table III-9.

TABLE III-9—IDLE REDUCTION TECHNOLOGY EFFECTIVENESS

Idle Reduction Technology	Idle reduction value in GEM (%)
Tamper-Proof AESS	4
Tamper-Proof AESS w/Diesel APU	4
Tamper-Proof AESS w/Battery APU	6
Tamper-Proof AESS w/Automatic Stop-Start	3
Tamper-Proof AESS w/FOH Cold, Main Engine Warm ..	3
Adjustable AESS w/Diesel APU	3
Adjustable AESS w/Battery APU	5
Adjustable AESS w/Automatic Stop-Start	3
Adjustable AESS w/FOH Cold, Main Engine Warm ..	2
Adjustable AESS programmed to 5 minutes	1

In addition to extended idling (or hoteling) by sleeper cabs, the agencies discussed work day idle by day cabs in the Phase 2 NPRM. 80 FR 40217. Day cab tractors often idle while cargo is loaded or unloaded, as well as during the frequent stops that are inherent with driving in urban traffic conditions near cargo destinations. Prior to issuing the Phase 2 NPRM, the agencies reviewed literature to quantify the amount of idling which is conducted outside of hoteling operations. One study, conducted by Argonne National Laboratory, identified several different types of trucks which might idle for extended amounts of time during the work day.²⁶¹ Idling may occur during the delivery process, queuing at loading docks or border crossings, during power take off operations, or to provide comfort during the work day. However, the study provided only "rough estimates" of the idle time and energy use for these vehicles. At the time of the Phase 2 NPRM, the agencies were not able to appropriately develop a baseline of workday idling for day cabs and identify the percent of this idling which could be reduced through the use of AESS. We welcomed comment and data on quantifying the effectiveness of AESS on day cabs. We further requested comment on the possibility of adapting the idle-only duty cycle for vocational vehicles to certain day cab tractors, and also considered the possibility of neutral idle technology for tractors using torque-converter automatic

²⁶¹ Gaines, L., A. Vyas, J. Anderson. Estimation of Fuel Use by Idling Commercial Trucks. January 2006.

transmissions and stop-start for any tractor. Id.

The agencies received a significant number of comments regarding day cab idle reduction. CARB commented that the agencies should include idle reduction technologies for day cabs, similar to the proposed vocational vehicle approach. CARB stated that even if the first owners do not see significant emission reductions, many of the day cab tractors are used in port and drayage applications in their second life where they would see significant reductions. CARB suggested that the GEM composite weighting factor for idle should be between 5 and 10 percent. Bendix would like to see the vocational vehicle idle reduction approach extended to day cab tractors based on their data which found that there are many applications of day cab tractors that spend a significant portion of their day's drive time at idle, especially pick-up and delivery type applications and a growing number of fleets that run hub and spoke type operations. MEMA supported extending neutral idle and stop-start technologies to day cab tractors. MEMA recommends that the agencies set the effectiveness of day cabs idle reduction technologies at a value equal to 35 percent of the effectiveness associated with a comparable technology in a Class 8 sleeper cab. Allison stated that agencies should include automatic neutral in all tractors. Allison stated that automatic neutral is standard with the Allison TC10 and is available with the Allison 3000 and 4000 Series transmissions.

Daimler commented that they have not validated that stop-start strategies are viable for Class 7 and 8 applications and considers it premature for the agencies to project that stop-start strategies are viable for this class of engines. Daimler stated that lubrication of critical bearing surfaces is lacking or severely compromised during engine start up due to the lack of lubricating oil pressure and this lack of lubrication leads to metal to metal contact, wear, and ultimately failure. In addition, Daimler commented that firing pressures inherent to compression ignition engines further exacerbate wear as compared to, for example, spark ignition engines where stop-start technology is being increasingly applied. Daimler also stated that these known problems, coupled with the extremely long million mile plus service life expectations for this heavier class of heavy-duty engines, together pose a development challenge that is significantly more challenging than that posed to spark ignition engines in passenger cars. Daimler further stated

that heat soak of temperature critical parts and temporary disruption of their lubrication/cooling systems will have to be understood and possible degradations handled through modifications at either component or system basis, the extent of which is not yet fully quantified. Daimler also stated that similarly, on the turbocharger side, the larger speed swings will shorten turbocharger wheel life, which is increasingly challenged in vocational applications that are characteristically more transient as compared to the relatively steady operation nature of line haul.

The agencies considered the comments, both supporting and raising concerns over idle reduction in day cabs. The agencies determined that neutral idle for automatic transmissions is an appropriate technology for use in tractors. Therefore, the agencies are adopting provisions in Phase 2 to recognize neutral-idle in automatic transmissions as an input to GEM. Our analysis shows that neutral idle effectiveness is approximately 0.8 to one percent over the composite day cab tractor cycles, as shown in RIA Chapter 2.8.2.6.2. The agencies will also include neutral idle as a GEM input for sleeper cabs, though the effectiveness is very low. The agencies are predicated the standards for day cabs based on a technology package that includes neutral idle.

In terms of stop-start technologies in tractors, the agencies are not including it as a technology input to GEM because we believe the technology, as applied to tractors, needs further development. If this technology is developed in the future for tractors, then manufacturers may consider applying for off-cycle technology credits. Since the agencies are not predicated the Phase 2 standards on adoption of start-stop technologies, the agencies are also not including this technology as a GEM input.

(vi) Transmissions

As discussed in the 2010 NAS report, automatic (AT) and automated manual transmissions (AMT) may offer the ability to improve vehicle fuel consumption by optimizing gear selection compared to an average driver.²⁶² However, as also noted in the

²⁶² Manual transmissions require the driver to shift the gears and manually engage and disengage the clutch. Automatic transmissions shift gears through computer controls and typically include a torque converter. An AMT operates similar to a manual transmission, except that an automated clutch actuator disengages and engages the drivetrain instead of a human driver. An AMT does not include a clutch pedal controllable by the driver or a torque converter.

report and in the supporting TIAx report, the improvement is very dependent on the driver of the truck, such that reductions ranged from zero to eight percent.²⁶³ Well-trained drivers would be expected to perform as well or even better than an automated transmission since the driver can see the road ahead and anticipate a changing stoplight or other road condition that neither an automatic nor automated manual transmission can anticipate. However, less well-trained drivers that shift too frequently or not frequently enough to maintain optimum engine operating conditions could be expected to realize improved in-use fuel consumption by switching from a manual transmission to an automatic or automated manual transmission. As transmissions continue to evolve, dual clutch transmissions (DCTs) are now being used in the European heavy-duty vehicle market. DCTs operate similar to AMTs, but with two clutches so that the transmission can maintain engine speed during a shift which improves fuel efficiency.

The benefits for automated manual, automatic, and dual clutch transmissions were developed from literature, from simulation modeling conducted by Southwest Research Institute, and powertrain testing conducted at Oak Ridge National Laboratory. The proposed Phase 2 benefit of these transmissions in GEM was set at a two percent improvement over a manual transmission due to the automation of the gear shifting. 80 FR 40217.

Allison Transmission commented that their real world studies indicate that automatic transmissions perform as well or better than AMTs or DCTs in terms of GHG and fuel efficiency impact. Allison commented that their ATs can exceed the 2 percent level estimated at proposal, but believe it is a reasonable level to apply this level of effectiveness for ATs and AMTs. Allison stated that automatic transmissions in tractors have neutral at stop capability, first gear lockup operation, load-based and grade-based shift algorithms and acceleration rate management that contribute to the overall fuel efficiency of ATs in tractors. Allison also commented that although DCTs should logically perform better than the MT baseline, there was no record information to support that assumption. Volvo commented that fuel consumption with their I-Shift DCT is the same as the I-Shift AMT. PACCAR recommends that the agencies take a more detailed approach to assessing transmission advances and revise the

²⁶³ See TIAx, Note 230, above at 4–70.

agencies' estimate to reflect technologies that are already under true consideration for use in production powertrains.

UCS commented that as much as 1.3 to 2.0 percent savings from tractor-trailers could be added to the proposed stringency to reflect the true potential from tractor-trailers from powertrain optimization, particularly since every major manufacturer already offers at least one "integrated powertrain" option in its long-haul fleet. ICCT referred to two studies related to tractor-trailer technologies in their comments.²⁶⁴ In their stakeholder workshop, they found that the effectiveness of automated manual transmissions ranged between two and three percent. They also cited another finding that highlighted opportunities to improve transmission efficiency, including direct drive, which would provide about two percent fuel consumption reduction.²⁶⁶

The agencies' assessment of the comments is that Allison, ICCT, and Volvo support the proposed two percent effectiveness for AT and AMT transmission types. In addition, the agencies reviewed the NACFE report on electronically controlled transmissions (AT, AMT, and DCT).²⁶⁷ This report had similar findings as those noted above in the NAS 2010 report. Electronically controlled transmissions were found to be more fuel efficient than manual transmissions, though the amount varied significantly. The report also stated that fleets found that electronically controlled transmissions also reduced the fuel efficiency variability between drivers. Therefore after considering the comments related to effectiveness and additional reports, the agencies are adopting as proposed a two percent effectiveness for AMT. As discussed in RIA 2.8.2.5, the agencies conducted powertrain testing at Oak Ridge National Laboratory to compare the fuel efficiency of an AMT to an AT. Based on the results, the agencies expect that automatic transmissions designed for long haul operation and automated manual transmissions will perform

similarly and have similar effectiveness when compared to a manual transmission.

The benefit of the AMT's automatic shifting compared to a manual transmission is recognized in Phase 2 GEM by simulating the MT as an AMT and increasing the emission results from the simulation by two percent. For ATs, the agencies developed the default automatic transmission inputs to GEM to represent a typical heavy-duty automatic transmission, which is less efficient than the TC10 (the transmission tested at Oak Ridge National Lab). The agencies selected more conservative default transmission losses in GEM so that we would not provide a false efficiency improvement for the less efficient automatic transmissions that exist in the market today. Under the regulations in this rulemaking, manufacturers that certify using the TC10 transmission would need to either conduct the optional transmission gear efficiency testing or powertrain testing to recognize the effectiveness of this type of automatic transmission in GEM. In our technology packages developed to set the Phase 2 standard stringencies, the agencies used a two percent effectiveness for automatic transmissions with neutral idle under the assumption that either powertrain or transmission gear efficiency tests would be conducted. The compliance costs for this type of testing (which crosses over both the vocational and tractor programs) are included as noted in RIA Chapter 7.2.1.2.

The agencies agree with PACCAR that we should consider future transmission advances. There are three certification pathways for manufacturers to assess benefits of future transmissions; that is, to generate a value reflecting greater improvement than the two percent GEM input. The first is an optional powertrain test (40 CFR 1037.550), the second is an optional transmission efficiency test (40 CFR 1037.565), and the third is off-cycle credits (40 CFR 1037.610).

The agencies acknowledge UCS's comment about increasing the stringency of the tractor program due to the opportunity to further improve powertrain optimization through powertrain testing. For the Phase 2 final rule, we have made several changes that capture much of the improvement potential highlighted by UCS. First, the required use of a cycle average fuel map in lieu of a steady state fuel map for evaluating the transient cycle in GEM will recognize improvements to transient fuel control of the engine. The agencies are including the impact of

improved transient fuel control in the engine fuel maps used to derive the final standards. Second, the optional transmission efficiency test will recognize the benefits of improved gear efficiencies. The agencies have built some improvements in transmission gear efficiency into the technology package used to derive the final standards. This leaves only the optimization of the transmission shift strategy, which would need to be captured on a powertrain test. The agencies believe that the opportunity of shift strategy optimization is less for tractors than for other types of vocational vehicles because a significant portion of the tractor drive cycles are at highway speeds with limited transmission shifting. Therefore, we have not included the powertrain optimization portion only recognized through powertrain testing into the standard setting for the final rule.

The agencies also proposed standards that considered the efficiency benefit of transmissions that operate with top gear direct drive instead of overdrive. In the proposal, we estimated that direct drive had two percent higher gear efficiency than an overdrive gear. 80 FR 40229. The benefit of direct drive was recognized through the transmission gear ratio inputs to GEM. Direct drive leads to greater reductions of CO₂ emissions and fuel consumption during highway operation, but virtually none in transient operation. The agencies did not receive any negative comments regarding the efficiency difference between direct drive and overdrive; therefore, we continued to include the default transmission gear efficiency advantage of two percent for a gear with a direct drive ratio in the version of GEM adopted for the final Phase 2 rules.

The agencies are also adopting in Phase 2 an optional transmission efficiency test (40 CFR 1037.565) for generating an input to GEM that overrides the default efficiency of each gear based on the results of the test. Although optional, the transmission efficiency test will allow manufacturers to reduce the CO₂ emissions and fuel consumption by designing better transmissions with lower friction due to better gear design and/or mandatory use of better lubricants. The agencies project that transmission efficiency could improve one percent over the 2017 baseline transmission in Phase 2. Our assessment was based on comments received and discussions with transmission manufacturers.²⁶⁸

(vii) Drivetrain and Engine Downsizing

Downsizing: As tractor manufacturers continue to reduce the losses due to vehicle loads, such as aerodynamic drag and rolling resistance, the amount of power required to move the vehicle decreases. In addition, engine manufacturers continue to improve the power density of heavy-duty engines through means such as reducing the engine friction due to smaller surface area. These two changes lead to the ability for truck purchasers to select lower displacement engines while maintaining the previous level of performance. Engine downsizing could be more effective if it is combined with the downsizing assuming increased brake mean effective pressure does not affect durability. The increased efficiency of the vehicle moves the operating points down to a lower load zone on a fuel map, which often moves the engine away from its sweet spot to a less efficient zone. In order to compensate for this loss, downsizing allows the engine to run at a lower engine speed and move back to higher load zones, and thus can slightly improve fuel efficiency. Reducing the engine size allows the vehicle operating points to move back to the sweet spot, thus further improving fuel efficiency. Engine downsizing can be accounted for as a vehicle technology through the use of the engine's fuel map in GEM in combination with the vehicle's transmission gear ratios, drive axle ratio, and tire diameter. The agencies evaluated the impact of downsizing in setting the stringencies by modeling different rear axle ratios in GEM. As shown in RIA Chapter 2.8.2.7, a decrease in final drive ratio from 2.6 to 2.3 will lead to a 2.5 percent reduction in tractor CO₂ emissions and fuel consumption. The reshaping of the torque curve of an engine to increase the low speed torque and reduce the speed at which maximum torque occurs, will impact the CO₂ emissions and fuel consumption on the engine test cycles, but will also have a small impact on the vehicle fuel consumption. Higher torque at lower engine speeds will allow the transmission to operate in top gear for a longer period of the time which will reduce the number of downshifts over a cycle and in turn means that the engine speed is lower on average. This benefit will show up in GEM. Additional information on engine downsizing can be found in RIA Chapter 2.3.8.

Low Friction Axle and Wheel Bearing Lubricants: The 2010 NAS report assessed low friction lubricants for the drivetrain as providing a one percent

improvement in fuel consumption based on fleet testing.²⁶⁹ A field trial of European medium-duty trucks found an average fuel consumption improvement of 1.8 percent using SAE 5W-30 engine oil, SAE 75W90 axle oil and SAE 75W80 transmission oil when compared to SAE 15W40 engine oil and SAE 90W axle oil, and SAE 80W transmission oil.²⁷⁰ The light-duty 2012-16 MY vehicle rule and the pickup truck portion of this program estimate that low friction lubricants can have an effectiveness value between zero and one percent compared to traditional lubricants. In the Phase 2 proposal, the agencies proposed the reduction in friction due to low viscosity axle lubricants of 0.5 percent. 80 FR 40217.

Lubrizol commented that high performing lubricants should play a role in Phase 2. Lubrizol also supports the axle test procedures to further recognize axle efficiency improvements. PACCAR recommended eliminating the rear axle efficiency test and provide credits based on calculated values.

The agencies' assessment of axle improvements found that axles built in the Phase 2 timeline could be 2 percent more efficient than a 2017 baseline axle.²⁷¹ In lieu of a fixed value for low friction axle lubricants (*i.e.* in lieu of a specified GEM input), the agencies are adopting an axle efficiency test procedure (40 CFR 1037.560), as discussed in the NPRM. 80 FR 40185. The axle efficiency test will be optional, but will allow manufacturers to recognize in GEM reductions in CO₂ emissions and fuel consumption through improved axle gear designs and/or mandatory use of low friction lubricants. The agencies are not providing an alternate path to recognize better lubricants without axle testing.

Axle Configuration: Most tractors today have three axles—a steer axle and two rear drive axles, and are commonly referred to as 6x4 tractors. Manufacturers offer 6x2 tractors that include one rear drive axle and one rear non-driving axle. The 6x2 tractors offer three distinct benefits. First, the non-driving rear axle does not have internal friction and therefore reduces the overall parasitic losses in the drivetrain. In addition, the 6x2 configuration typically weighs approximately 300 to

400 lbs less than a 6x4 configuration.²⁷² Finally, the 6x2 typically costs less or is cost neutral when compared to a 6x4 tractor. Sources cite the effectiveness of 6x2 axles at between one and three percent.^{273 274} The NACFE report found in OEM evaluations of 6x2 axles that the effectiveness ranged between 1.6 and 2.2 percent. NACFE also evaluated 6x2 axle tests conducted by several fleets and found the effectiveness in the range of 2.2 to 4.6 percent. Similarly, with the increased use of double and triple trailers, which reduce the weight on the tractor axles when compared to a single trailer, manufacturers offer 4x2 axle configurations. The 4x2 axle configuration would have as good as or better fuel efficiency performance than a 6x2. The agencies proposed to apply a 2.5 percent improvement in vehicle efficiency to 6x4 and 4x2 axle configurations. 80 FR 40217-218.

Meritor stated in their comments that their internal testing and real world testing supported the 2.5 percent efficiency proposed by the agencies for 6x2 axles. Meritor suggested the need to better define a “disengageable tandem” when the agencies discussed what we called axle disconnect in the NPRM. Meritor recommends that a fuel efficiency benefit of 2.0 percent be assigned to the disengageable tandem for the 55 mph and 65 mph drive cycles to account for the more limited use.

ICCT referred to two studies related to tractor-trailer technologies in their comments.^{275 276} In their stakeholder workshop, they found that the effectiveness of 6x2 axles ranged between one and 2.5 percent.

The agencies' assessments of these technologies show that the reductions are in the range of two to three percent. For the final rule, the agencies are simulating 6x2, 4x2, and disengageable axles within GEM based on the manufacturer input of the axle configuration instead of providing a fixed value for the reduction. This approach is more technically sound because it will take into account future changes in axle efficiency. See RIA

Chapter 4 for additional details regarding GEM.

(viii) Accessories and Other Technologies

Accessory Improvements: Parasitic losses from the engine come from many systems, including the water pump, oil pump, and power steering pump. Reductions in parasitic losses are one of the areas being developed under the DOE SuperTruck program. As presented in the DOE Merit reviews, Navistar stated that they demonstrated a 0.45 percent reduction in fuel consumption through water pump improvements and 0.3 percent through oil pump improvements compared to a current engine. In addition, Navistar showed a 0.9 percent benefit for a variable speed water pump and variable displacement oil pump. Detroit Diesel reports a 0.5 percent benefit coming from improved water pump efficiency.²⁷⁷ It should be noted that water pump improvements include both pump efficiency improvement and variable speed or on/off controls. Lube pump improvements are primarily achieved using variable displacement pumps and may also include efficiency improvement. All of these results shown in this paragraph are demonstrated through the DOE SuperTruck program at a single operating point on the engine map, and therefore the overall expected reduction of these technologies is less than the single point result. The agencies proposed that compared to 2017 MY air conditioners, air conditioners with improved efficiency compressors will reduce CO₂ emissions by 0.5 percent. Improvements in accessories, such as power steering, can lead to an efficiency improvement of one percent over the 2017 MY baseline. 80 FR 40218.

Navistar commented that the proposed “electrically powered pumps for engine cooling” be revised to include “electronically controlled variable speed coolant pumps” to align with the Preamble descriptions and technology under development as part of the SuperTruck program. Navistar commented that shifting to fully electronic pump creates reliability concerns and adds additional complexity due to the size of the necessary pumps (2+ horsepower) and that the increased power load will require a larger alternator and upgraded wiring. Navistar suggested that in addition to a fully electric pump, Dual Displacement power steering should also be included as an accessory improvement because this technology reduces parasitic loads by applying

power proportional to steering demand. ZF TRW Commercial Steering commented that they are developing a power steering pump that uses a secondary chamber deactivation during highway cruise operations that reduce the pump drive torque by 30 to 40 percent. Navistar also commented that the effectiveness for an electrified air conditioning compressor is understated in the NPRM. Navistar’s estimates are closer to 1.5 percent when in use which will be during the use of air conditioning and during defrost; therefore, the effective benefit should be one percent. Daimler commented that the proposed high efficiency air conditioning effectiveness should be refined and that other opportunities to reduce losses, such as blend air systems, should be considered. In response to the comments, the agencies evaluated a set of accessories that can be designed to reduce accessory losses. Due to the complexity in determining what qualifies as an efficient accessory, we are maintaining the proposed language for accessories for tractors which provides defined effectiveness values for only electric air conditioning compressors and electric power steering pumps and coolant pumps. Manufacturers have the option to apply for off-cycle credits for the other types and designs of high efficiency accessories.

Intelligent Controls: Skilled drivers know how to control a vehicle to obtain maximum fuel efficiency by, among other things, considering road terrain. For example, the driver may allow the vehicle to slow down below the target speed on an uphill and allow it to go over the target speed when going downhill, to essentially smooth out the engine demand. Electronic controls can be developed to essentially mimic this activity. The agencies proposed to provide a two percent reduction in fuel consumption and CO₂ emissions for vehicles configured with intelligent controls, such as predictive cruise control. 80 FR 40218. ICCT found in their workshop that opportunities exist for road load optimization through predictive cruise, GPS, and driver feedback that could lead to a zero to five percent improvement in fuel consumption.²⁷⁸ Daimler commented that eCoast should also be recognized as an intelligent control within GEM. Eaton offers similar technology, known as Neutral Coast Mode. Neutral coast is an electronic feature that places an

automated transmission in neutral on downhill grades which allows the engine speed to go idle speed. A fuel savings is recognized due to the difference in engine operating conditions due to the reduced load on the engine due to the transmission.

Based on literature information, intelligent controls such as predictive cruise control will reduce CO₂ emissions by two percent, and the agencies are assuming this level of improvement in considering the level of the tractor standard. In addition, the agencies’ review of literature and confidential business information provided based on the SuperTruck demonstration vehicles indicates that neutral coasting will reduce fuel consumption and CO₂ emissions by 1.5 percent.

Solar Load Management: The agencies received a letter from the California Air Resources Board prior to the proposal requesting consideration of including technologies that reduce solar heating of the cab (to reduce air conditioning loads) in setting the Phase 2 tractor standards. Solar reflective paints and solar control glazing technologies are discussed in RIA Chapter 2.4.9.3. The agencies requested comment on the Air Resources Board’s letter and recommendations.²⁷⁹ The agencies received some clarifications from ARB on our evaluation of solar technologies and some CBI from Daimler, but not a sufficient amount of information to evaluate the baseline level of solar control that exists in the heavy-duty market today, determine the effectiveness of each of the solar technologies, or to develop a definition of what qualifies as a solar control technology that could be used in the regulations. Therefore, the agencies would consider solar control to be a technology that manufacturers may consider pursuing through the off-cycle credit program. As such, the agencies did not include solar load management technologies in the technology packages used in setting the final Phase 2 tractor standard stringencies.

(ix) Weight Reduction

Reductions in vehicle mass lower fuel consumption and GHG emissions by decreasing the overall vehicle mass that is moved down the road. Weight reductions also increase vehicle payload capability which can allow additional tons to be carried by fewer trucks consuming less fuel and producing

²⁷⁸ Delgado, Oscar. N. Lutsey. Advanced Tractor-Trailer Efficiency Technology Potential in the 2020–2030 Timeframe. April 2015. Docket EPA–HQ–OAR–2014–0827.

²⁷⁹ California Air Resources Board. Letter from Michael Carter to Matthew Spears dated December 3, 2014. Solar Control: Heavy-Duty Vehicles White Paper. Docket EPA–HA–OAR–2014–0827.

²⁷⁷ See the RIA Chapter 2.4 for details.

lower emissions on a ton-mile basis. We treated such weight reduction in two ways in Phase 1 to account for the fact that combination tractor-trailers weigh-out approximately one-third of the time and cube-out approximately two-thirds of the time. Therefore in Phase 1 and also as finalized for Phase 2, one-third of the weight reduction will be added payload in the denominator while two-thirds of the weight reduction is subtracted from the overall weight of the vehicle in GEM. See 76 FR 57153.

In Phase 1, we reflected mass reductions for specific technology substitutions (*e.g.*, installing aluminum wheels instead of steel wheels). These substitutions were included where we could with confidence verify the mass reduction information provided by the manufacturer. The weight reductions were developed from tire manufacturer information, the Aluminum Association, the Department of Energy, SABIC and TIAH. The agencies proposed to expand the list of weight reduction components which can be input into GEM in order to provide the manufacturers with additional means to comply via GEM with the combination tractor standards and to further encourage reductions in vehicle weight. As in Phase 1, we recognize that there may be additional potential for weight reduction in new high strength steel components which combine the reduction due to the material substitution along with improvements in redesign, as evidenced by the studies done for light-duty vehicles.²⁸⁰ The agencies however do not agree with all of the recommendations in this report. See Section I.C.1 and RTC Section 1 for a discussion on lifecycle emissions. In the development of the high strength steel component weights, we are only assuming a reduction from material substitution and no weight reduction from redesign, since we do not have any data specific to redesign of heavy-duty components nor do we have a regulatory mechanism to differentiate between material substitution and improved design. Additional weight reduction would be evaluated as a potential off-cycle credit. As described in Section III.E.2 below, the agencies discuss the weight reduction component comments received and are adopting an expanded list of weight reduction options which could be input into the GEM by the manufacturers to reduce their certified

CO₂ emission and fuel consumption levels.

(x) Vehicle Speed Limiter

Fuel consumption and GHG emissions increase proportional to the square of vehicle speed. Therefore, lowering vehicle speeds can significantly reduce fuel consumption and GHG emissions. A vehicle speed limiter (VSL), which limits the vehicle's maximum speed, is another technology option for compliance that is already utilized today by some fleets (though the typical maximum speed setting is often higher than 65 mph).

CARB recommended not giving any credit for VSLs because the available data do not fully support whether VSLs result in real-world fuel consumption and GHG reductions. CARB referenced Oakridge National Laboratory's Transportation Energy Data Book, Table 5.11 that shows CO₂ emissions decrease with increased speed. CARB also stated that the draft GEM model appears to offer up to 22 percent credit for use of VSL set to 45 mph, which they consider to be unreasonably high. Before including VSLs as a technology, CARB staff suggests that EPA and NHTSA should thoroughly evaluate whether they would result in real-world CO₂ and fuel consumption benefits.

The agencies conducted in-use tractor testing at different speeds and in turn used this data to validate the GEM simulations of VSL, as discussed in more detail in RIA Chapter 4. The agencies are confident that GEM appropriately recognizes the impact of VSL on CO₂ emissions and fuel consumption. The agencies have limited the range of inputs to the VSL in Phase 2 GEM to a minimum of 55 mph to align with the regulations in 40 CFR 1037.631 that provide exemptions for vocational vehicles intended for off-road use. A 55 mph VSL installed on a typical day cab tractor would reduce the composite grams of CO₂ emitted per ton-mile by seven percent. Similarly, a 55 mph VSL on a sleeper cab would reduce the composite grams of CO₂ per ton-mile emitted by 10 percent. Please see RIA Chapter 2.8 for additional detail of technology impacts.

(xi) Hybrid Powertrains

In Phase 2, hybrid powertrains are generally considered a conventional rather than innovative technology, especially for vocational vehicles. However, hybrid powertrain development in Class 7 and 8 tractors has been limited to a few manufacturer demonstration vehicles to date. One of the key benefit opportunities for fuel consumption reduction with hybrids is

less fuel consumption when a vehicle is idling, but the standard is already premised on use of extended idle reduction so use of hybrid technology will duplicate many of the same emission reductions attributable to extended idle reduction. NAS estimated that hybrid systems would cost approximately \$25,000 per tractor in the 2015 through the 2020 time frame and provide a potential fuel consumption reduction of ten percent, of which six percent is idle reduction that can be achieved (less expensively) through the use of other idle reduction technologies.²⁸¹ The limited reduction potential outside of idle reduction for Class 8 sleeper cab tractors is due to the mostly highway operation and limited start-stop operation. Due to the high cost and limited benefit during the model years at issue in this action, the agencies did not include hybrids in assessing stringency of the proposed tractor standard.

In addition to the high cost and limited utility of hybrids for many tractor drive cycles noted above, the agencies believe that hybrid powertrains systems for tractors may not be sufficiently developed and the necessary manufacturing capacity put in place to base a standard on any significant volume of hybrid tractors. Unlike hybrids for vocational vehicles and light-duty vehicles, the agencies are not aware of any full hybrid systems currently developed for long haul tractor applications. To date, hybrid systems for tractors have been primarily focused on extended idle shutdown technologies and not on the broader energy storage and recovery systems necessary to achieve reductions over typical tractor drive cycles. The Phase 2 sleeper cab tractor standards instead reflect the potential for extended idle shutdown technologies. Further, as highlighted by the 2010 NAS report, the agencies do believe that full hybrid powertrains may have the potential in the longer term to provide significant improvements in long haul tractor fuel efficiency and to greenhouse gas emission reductions. With respect to day cab tractors, the types of tractors that would receive the benefit from hybrid powertrains would be those such as beverage delivery tractors which could be treated as vocational vehicles through the Special Purpose Tractor provisions (40 CFR 1037.630).

Several stakeholders commented on hybrid powertrain development for tractor applications. Allison agreed with the agencies' overall assessment of hybrids in tractors, as discussed in the

²⁸⁰ American Iron and Steel Institute. "A Cost Benefit Analysis Report to the North American Steel Industry on Improved Material and Powertrain Architectures for 21st Century Trucks."

²⁸¹ See the 2010 NAS Report, Note 229, page 128.

NPRM. Bendix agreed that hybrid systems for tractors have not been focused on. Bendix believed that mild hybrid systems should be included in GEM for credit, including stop-start and electrification of accessories. Daimler commented that in SuperTruck, a tractor that was tested on line haul-type highway routes, the hybrid system provided little benefit beyond what eCoast achieved because it competes with hybrids for energy that might be lost on hills. Overall, Daimler's view was that hybrid systems proved too costly relative to their benefit. Eaton stated that hybrids have not penetrated the commercial trucking landscape, primarily due to the costs but that there may be potential in the future for hybrids in tractor applications driven by improved aerodynamics and lower rolling resistance tires because it would lead to longer coasting times and higher braking loads, therefore greater regeneration opportunities. PACCAR commented that their history with hybrid technology was a niche market application appealing to "green" companies as long as incentives offset the cost of the technology. PACCAR stated that the low sales volumes were not based on performance, but rather on the combination of the payback of the high initial cost based on the limited number of gallons saved in low mileage pick up-and-delivery applications and on the concern over resale value, since at some point in the vehicle's life the battery must be replaced at a significant cost to the owner.

After considering the comments, the agencies are continuing the Phase 1 approach of not including hybrid powertrains in our feasibility analysis for Phase 2. Because the technology for tractor applications is still under development we cannot confidently

assess the effectiveness of this technology at this point in time. In addition, due to the high cost, limited benefit during highway driving, and lacking any existing systems or manufacturing base, we cannot conclude that such technology will be available for tractors in the 2021–2027 timeframe. However, manufacturers will be able to use powertrain testing to capture the performance of a hybrid system in GEM if systems are developed in the Phase 2 timeframe, so this technology remains a potential compliance option (without requiring an off-cycle demonstration).

(xii) Operational Management

The 2010 NAS report noted many operational opportunities to reduce fuel consumption, such as driver training and route optimization. The agencies have included discussion of several of these strategies in RIA Chapter 2, but are not using these approaches or technologies in the Phase 2 standard setting process. The agencies are looking to other resources, such as EPA's SmartWay Transport Partnership and regulations that could potentially be promulgated by the Federal Highway Administration and the Federal Motor Carrier Safety Administration, to continue to encourage the development and utilization of these approaches. In addition, the agencies have also declined to base standard stringencies on technologies which are largely to chiefly driver-dependent, and evaluate such potential improvements through the off-cycle credit mechanism. See, e.g., 77 FR 62838/3 (Oct. 12, 2012).

(xiii) Consideration of Phase 1 Credits in Phase 2 Stringency Setting

The agencies requested comment regarding the treatment of Phase 1

credits, as discussed in Section I.C.1.b. See 80 FR 40251. As examples, the agencies discussed limiting the use of Phase 1 credits in Phase 2 and factoring credit balances into the 2021 standards. Daimler commented that allowing Phase 1 credits in Phase 2 is necessary to smooth the transition into a new program that is very complex and that HD manufacturers cannot change over an entire product portfolio at one time. The agencies evaluated the status of Phase 1 credit balances in 2015 by sector. For tractors, we found that manufacturers are generating significant credits, and that it appears that many of the credits result from their use of an optional provision for calculating aerodynamic drag. However, we also believe that manufacturers will generate fewer credits in MY 2017 and later when the final Phase 1 standards begin. Still, the agencies believe that manufacturers will have significant credit balances available to them for MYs 2021–2023, and that much of these balances would be the result of the test procedure provisions rather than pull ahead of any technology. Based on confidential product plans for MYs 2017 and later, we expect this total windfall amount to be three percent of the MY 2021 standards or more. Therefore, the agencies are factoring in a total credit amount equivalent to this three percent credit (*i.e.* three years times 1 percent per year). Thus, we are increasing the stringency of the CO₂ and fuel consumption tractor standards for MYs 2021–2023 by 1 percent to reflect these credits.

(xiv) Summary of Technology Performance

Table III–10 describes the performance levels for the range of Class 7 and 8 tractor vehicle technologies.

Note:

“Modeled in GEM” means that a manufacturer will input information into GEM, such as “Yes or No” for neutral idle, and GEM will simulate that condition. The values listed in the table above as percentages reflect a post-processing done within GEM after the simulation runs the drive cycles.

(c) Tractor Technology Adoption Rates

As explained above, tractor manufacturers often introduce major product changes together, as a package. In this manner the manufacturers can optimize their available resources, including engineering, development, manufacturing and marketing activities to create a product with multiple new features. Since Phase 1 began, this approach also has allowed manufacturers to consolidate testing and certification requirements. In addition, manufacturers recognize that a truck design will need to remain competitive over the intended life of the design and meet future regulatory requirements. In some limited cases, manufacturers may implement an individual technology outside of a vehicle's redesign cycle.

With respect to the levels of technology adoption used to develop the HD Phase 2 standards, NHTSA and EPA established technology adoption constraints. The first type of constraint was established based on the application of fuel consumption and CO₂ emission reduction technologies into the different types of tractors. For example, extended idle reduction technologies are limited to Class 8 sleeper cabs using the reasonable assumption that day cabs are not used for overnight hoteling. Day cabs typically idle for shorter durations throughout the day.

A second type of constraint was applied to most other technologies and limited their adoption based on factors reflecting the real world operating conditions that some combination tractors encounter (so that the standards are not based on use of technologies which do not provide in-use benefit). This second type of constraint was applied to the aerodynamic, tire, powertrain, vehicle speed limiter technologies, and other technologies. NHTSA and EPA believe that within each of these individual vehicle categories there are particular applications where the use of the identified technologies will be either ineffective or not technically feasible. For example, the agencies are not predicating these standards on the use of full aerodynamic vehicle treatments on 100 percent of tractors because we know that in some applications (for example, gravel trucks engaged in local delivery) the added weight of the aerodynamic technologies will increase fuel consumption and hence CO₂ emissions to a greater degree than the reduction that will be accomplished from the more aerodynamic nature of the tractor. General considerations of needed lead time also play a significant

role in the agencies' determination of technology adoption rates.

In the development of the standards, we generally focused initially on what technology could be adopted in 2027 MY after ten years of lead time, consistent with the general principles discussed above. Based on our detailed discussions with manufacturers and technology suppliers, we can project that the vast majority of technologies will be fully developed and in widespread use by 2027 MY. (One notable exception to this is Rankine cycle waste heat recovery, which we project to be less widespread in 2027). Having identified what could be achieved in 2027 MY, we projected technology steps for 2021 MY and 2024 MY to reflect the gradual development and deployment of these technologies.

This is also consistent with how manufacturers will likely approach complying with these standards. In general, we would expect a manufacturer to first identify technology packages that would allow them to meet the 2027 MY standards, then to structure a development plan to make steady progress toward the 2027 MY standards. To some extent, it was easier to project the technology for 2027 MY, because it represents a maximum feasible adoption of most technologies. The agencies' projections for MYs 2021 and 2024 are less certain because they reflect choices manufacturers would likely make to reach the 2027 levels. As such, we have more confidence that the levels of our MYs 2021 and 2024 standards are appropriate than we do that each manufacturer will follow our specific technology development path in 2021 MY or 2024 MY.

Table III–13, Table III–14, and Table III–15 specify the adoption rates that EPA and NHTSA used to develop these standards.

(i) Aerodynamics Adoption Rate

The impact of aerodynamics on a tractor-trailer's efficiency increases with vehicle speed. Therefore, the usage pattern of the vehicle will determine the benefit of various aerodynamic technologies. Sleeper cabs are often used in line haul applications and drive the majority of their miles on the highway travelling at speeds greater than 55 mph. The industry has focused aerodynamic technology development, including SmartWay tractors, on these types of trucks. Therefore the agencies proposed standards that reflect the most aggressive aerodynamic technology application rates to this regulatory subcategory, along with the high roof day cabs. 80 FR 40227. All of the major manufacturers today offer at least one

SmartWay sleeper cab tractor model, which is represented as Bin III aerodynamic performance. The agencies requested comment on the proposed aerodynamic assessment.

The agencies received significant comment from the manufacturers regarding our assessment of aerodynamics in the most aerodynamic bins for high roof sleeper cabs. EMA commented that the assumptions that Class 7 and Class 8 high-roof vehicles will achieve a 35 percent penetration rate into Bin V, a 20 percent penetration rate into Bin VI, and a 5 percent penetration rate into Bin VII by 2027 are over-stated and unreasonable. Volvo and EMA commented that it is impossible to achieve the targeted aerodynamic drag reductions that ultimately are predicated on 60 percent of tractors achieving aero bins V, VI, and VII. According to their analysis, the manufacturers stated that it is not possible to achieve these low drag levels with any tractor design coupled to the non-aerodynamic test trailer prescribed in this proposal. Caterpillar commented that given the proposed aerodynamic testing procedures, the Phase 2 test trailer, and the lack of any audit margin for these highly variable test processes, it is infeasible to design tractors that can achieve bin V, and so would not be able to achieve bins VI and VII. Caterpillar also stated that none of the vehicles developed within the Department of Energy's SuperTruck program are capable of meeting the proposed aerodynamic targets.

In Phase 1, the agencies determined the stringency of the tractor standards through the use of a mix of aerodynamic bins in the technology packages. For example, we included 10 percent Bin II, 70 percent Bin III, and 20 percent Bin IV in the high roof sleeper cab tractor standard. The weighted average aerodynamic performance of this technology package is equivalent to Bin III. 76 FR 57211. In consideration of the comments, the agencies have adjusted the aerodynamic adoption rate for Class 8 high roof sleeper cabs used to set the final standards in 2021, 2024, and 2027 MYs (*i.e.*, the degree of technology adoption on which the stringency of the standard is premised). Upon further analysis of simulation modeling of a SuperTruck tractor with a Phase 2 reference trailer with skirts, we agree with the manufacturers that a SuperTruck tractor technology package would only achieve the Bin V level of C_dA, as discussed above and in RIA Chapter 2.8.2.2. Consequently, as noted above, the final standards are not premised on any adoption of Bin VI and VII technologies. Accordingly, we

determined the adoption rates in the technology packages developed for the final rule using a similar approach as Phase 1—spanning three aerodynamic bins and not setting adoption rates in the most aerodynamic bin(s)—to reflect that there are some vehicles whose operation limits the applicability of some aerodynamic technologies. We set the MY 2027 high roof sleeper cab tractor standards using a technology package that included 20 percent of Bin III, 30 percent Bin IV, and 50 percent Bin V reflecting our assessment of the fraction of high roof sleeper cab tractors that we project could successfully apply these aerodynamic packages with this amount of lead time. The weighted average of this set of adoption rates is equivalent to a tractor aerodynamic performance near the border between Bin IV and Bin V. We believe that there is sufficient lead time to develop aerodynamic tractors that can move the entire high roof sleeper cab aerodynamic performance to be as good as or better than today's SmartWay designated tractors.

The agencies phased-in the aerodynamic technology adoption rates within the technology packages used to determine the MY 2021 and 2024 standards so that manufacturers can gradually introduce these technologies. The changes required for Bin V performance reflect the kinds of improvements projected in the Department of Energy's SuperTruck program. That program has demonstrated tractor-trailers in 2015 with significant aerodynamic technologies. For the final rule, the agencies are projecting that truck manufacturers will be able to begin implementing some of these aerodynamic technologies on high roof tractors as early as 2021 MY on a limited scale. For example, in the 2021 MY technology package, the agencies have assumed that 10 percent of high roof sleeper cabs will have aerodynamics better than today's best tractors. This phase-in structure is consistent with the normal manner in which manufacturers introduce new technology to manage limited research and development budgets as well as to allow them to work with fleets to fully evaluate in-use reliability before a technology is applied fleet-wide. The agencies believe the phase-in schedule will allow manufacturers to complete these normal processes. Overall, while the agencies are now projecting slightly less benefit from aerodynamic improvements than we did in the NPRM, the actual aerodynamic technologies being projected are very

similar to what was projected at the time of NPRM (however, these vehicles fall into Bin V in the final rule, instead of Bin VI and VII in the NPRM). Importantly, our averaging, banking and trading provisions provide manufacturers with the flexibility (and incentive) to implement these technologies over time even though the standard changes in a single step.

The agencies also received comment regarding our aerodynamic assessment of the other tractor subcategories. Daimler commented that due to their shorter length, day cabs are more difficult to make aerodynamic than sleeper cabs, and that the bin boundaries and adoption rates should reflect this. EMA commented that the assumed aerodynamic performance improvements to be achieved by day cab and mid and low-roof vehicles are over-estimated by at least one bin. Daimler commented that the agencies should adjust the average bin down in recognition of the fact that mid/low-roof vehicles should have lower penetration rates of aerodynamic vehicles to reflect market needs, reflecting these vehicles' use in rough environments or in hauling non-aerodynamic trailers.

Aerodynamic improvements through new tractor designs and the development of new aerodynamic components is an inherently slow and iterative process. The agencies recognize that there are tractor applications that require on/off-road capability and other truck functions which restrict the type of aerodynamic equipment applicable. We also recognize that these types of trucks spend less time at highway speeds where aerodynamic technologies have the greatest benefit. The 2002 VIUS data ranks trucks by major use.²⁸² The heavy trucks usage indicates that up to 35 percent of the trucks may be used in on/off-road applications or heavier applications. The uses include construction (16 percent), agriculture (12 percent), waste management (5 percent), and mining (2 percent). Therefore, the agencies analyzed the technologies to evaluate the potential restrictions that will prevent 100 percent adoption of more advanced aerodynamic technologies for all of the tractor regulatory subcategories and developed standards with new penetration rates reflecting that these vehicles spend less time at highway speeds. For the final rule, the agencies evaluated the certification data to assess how the aerodynamic performance of high roof day cabs compare to high roof sleeper cabs. In 2014, the high roof day

cabs on average are certified to one bin lower than the high roof sleeper cabs.²⁸³ Consistent with the public comments, and the certification data, the aerodynamic adoption rates used to develop the final Phase 2 standards for the high roof day cab regulatory subcategories are less aggressive than for the Class 8 sleeper cab high roof tractors. In addition, the agencies are also accordingly reducing the adoption rates in the highest bins for low and mid roof tractors to follow the changes made to the high roof subcategories because we neither proposed nor expect the aerodynamics of a low or mid roof tractor to be better than a high roof tractor.

(ii) Low Rolling Resistance Tire Adoption Rate

For the tire manufacturers to further reduce tire rolling resistance, the manufacturers must consider several performance criteria that affect tire selection. The characteristics of a tire also influence durability, traction control, vehicle handling, comfort, and retreadability. A single performance parameter can easily be enhanced, but an optimal balance of all the criteria will require improvements in materials and tread design at a higher cost, as estimated by the agencies. Tire design requires balancing performance, since changes in design may change different performance characteristics in opposing directions. Similar to the discussion regarding lesser aerodynamic technology application in tractor segments other than sleeper cab high roof, the agencies believe that the proposed standards should not be premised on 100 percent application of Level 3 tires in all tractor segments given the potential interference with vehicle utility that could result. 80 FR 40223.

Several stakeholders commented about the level of rolling resistance used in setting the proposed level of tractor stringencies because the agencies used a single level for all tractor subcategories. ATA, First Industries, National Association of Manufacturers, PACCAR, Navistar and Daimler commented that the agencies erred by using the same rolling resistance for all types of day and sleeper cab tractors. They stated that the tire stringency levels should account for fleet and class variations and different duty-cycle needs. Caterpillar stated that tires need to meet demands of all conditions, including

²⁸² U.S. Department of Energy. *Transportation Energy Data Book*, Edition 28–2009. Table 5.7.

²⁸³ U.S. EPA. Memo to Docket. Coefficient of Rolling Resistance and Coefficient of Drag Certification Data for Tractors. See Docket EPA–HQ–OAR–2014–0827.

unpaved roads, sloped loading docks which are frequently not treated in winter conditions. Caterpillar also stated that tire casings must have adequate durability to allow for as many as five retreads. NADA commented current LRRT tractor adoption rates are low and are not expected to increase significantly any time soon unless significant improvements in design are forthcoming and that there is no realistic means of ensuring that customers (or subsequent owners) will continue to use LRR tires. OOIDA commented that the LRR tire may be beneficial on flat terrain, but may pose a safety concern in many geographical regions. OOIDA also stated that a LRR tire achieves much of its potential fuel savings benefit by reducing the very component of friction or resistance that a truck driver may rely upon. PACCAR commented that customers with low- and mid-roof configurations typically operate more in urban areas where tires must withstand the abuse of curbs and other obstacles or in more on/off road conditions that are typical for flatbed, tanker, and low-boy operations, which use the low and mid-roof configuration vehicles. PACCAR stated that the tires for low and mid roof tractors vehicles are designed with additional side wall protection and generally have a higher coefficient of rolling resistance. Volvo commented with respect to tractor penetration and stringency setting the agencies show penetration of Level 3 tires starting in MY 2021. Volvo stated that they continue to hear customer feedback that low rolling resistance tires often lack adequate traction under many of the demanding conditions that trucks and tractors experience, such as snow and off-road. Schneider commented that fleet uses low rolling resistance tires on dual wheels for the majority of the standard fleet while using wide-based single tires for weight sensitive portions of the fleet. Schneider commented that regulations should not force the use of wide based single tires based solely on rolling resistance advantages without considering the overall performance because it may increase waste, the number of scrapped tire casings and landfill requirements. The commenter's view is that LRR dual tires are very comparable to wide based single tires (WBS) tires in fuel efficiency while providing better overall operating and economic efficiency.

For the final rulemaking, the agencies evaluated the tire rolling resistance levels in the Phase 1 certification

data.²⁸⁴ We found that high roof sleeper cabs are certified today with steer tire rolling resistance levels that ranged between 4.9 and 7.6 kg/ton and with drive tires ranging between 5.1 and 9.8 kg/ton. In the same analysis, we found that high roof day cabs are certified with rolling resistance levels ranging between 4.9 and 9.0 kg/ton for steer tires and between 5.1 and 9.8 kg/ton for drive tires. This range spans the baseline through Level 3 rolling resistance performance levels. Therefore, for the final rule we took an approach similar to the one taken in Phase 1 and proposed in Phase 2 that considers adoption rates across a wide range of tire rolling resistance levels to recognize that operators may have different needs. 76 FR 57211 and 80 FR 40227. The adoption rates for the technology packages used to determine the MY 2027 standards for each high roof tractor subcategory are shown in Table III–15.

In our analysis of the Phase 1 certification data, we found that the drive tires on low and mid roof sleeper cab tractors on average had 10 to 17 percent higher rolling resistance than the high roof sleeper cabs. But we found only a minor difference in rolling resistance of the steer tires between the tractor subcategories. Based on comments received and further consideration of our own analysis of the difference in tire rolling resistance levels that exist today in the certification data, the agencies are adopting Phase 2 standards using a technology pathway that utilizes higher rolling resistance levels for low and mid roof tractors than the levels used to set the high roof tractor standards. This is also consistent with the approach that we took in setting the Phase 1 tractor standards. 76 FR 57211. In addition, the final rule reflects a reduction in Level 3 adoption rates for low and mid roof tractors from 25 percent in MY 2027 used at proposal (80 FR 40227) to zero percent adoption rate. The technology packages developed for the low and mid roof tractors used to determine the stringency of the MY 2027 standards in the final rule do not include any adoption rate of Level 3 drive tires to recognize the special needs of these applications, consistent with the comments noted above raising concerns about applications that limit the use of low rolling resistance tires.

The agencies phased-in the low rolling resistance tire adoption rates within the technology packages used to determine the MY 2021 and 2024

standards so that manufacturers can gradually introduce these technologies. In addition, the levels of rolling resistance used in all of the technology packages are achievable with either dual or wide based single tires, so the agencies are not forcing one technology over another. The adoption rates for the technology packages used to determine the MY 2021, 2024, and 2027 standards for each tractor subcategory are shown in Table III–13, Table III–14, and Table III–15.

(iii) Tire Pressure Monitoring and Automatic Tire Inflation System (ATIS) Adoption Rate

The agencies used a 20 percent adoption rate of ATIS in MY 2021 and a 40 percent adoption rate in setting the proposed Phase 2 MY 2024 and 2027 tractor standards. 80 FR 40227.

ATA commented that as of 2012, roughly one percent of tractors used ATIS. Caterpillar and First Industries stated that the agencies should not force ATIS into the market by assuming any penetration rate. EMA commented that the assumption that 40 percent of all Class 7 and 8 vehicles will utilize automated tire inflation systems lacked support and failed to account for the prevalence of tire inflation monitoring systems. NADA stated that they can support a 40 percent tractor adoption rate for MY 2027 if TPMS are considered. Volvo commented that given the poor reliability of past ATIS systems, they are skeptical of supplier's claims of current or future reliability improvements to these systems. Volvo stated that fleets are even more skeptical than truck OEMs, as an ATIS air leak results in increased fuel consumption due to a compressor cycling more frequently and also in potentially significant downtime of the vehicle. Volvo also commented that to incentivize truck operators to maintain tire pressure on vehicles equipped with a TPMS system, fleets have the ability to monitor fuel consumption remotely, including the ability to identify causes for increased fuel consumption which would be expected to motivate drivers to properly maintain tire pressure on TPMS equipped vehicles.

The agencies find the comments related to a greater acceptance of TPMS in the tractor market to be persuasive. However, available information indicates that it is feasible to utilize either TPMS or ATIS to reduce the prevalence on underinflated tires in-use on all tractors. As a result, we are finalizing tractor standards that are predicated on the performance of a mix of TPMS and ATIS adoption rates in all tractor subcategories. The agencies are

²⁸⁴ Memo to Docket. Coefficient of Rolling Resistance and Coefficient of Drag Certification Data for Tractors. Docket EPA–HQ–OAR–2014–0827.

using adoption rates of 30 percent of ATIS and 70 percent of TPMS in the technology packages used in setting the final Phase 2 MY 2027 tractor standards. This represents a lower adoption rate of ATIS than used in the NPRM, but the agencies have added additional adoption rate of TPMS because none of the comments or available information disputed the ability to use it on all tractors. The agencies have developed technology packages for setting the 2021 and 2024 MY standards which reflect a phase in of adoption rates of each of these technologies. In 2021 MY, the adoption rates consist of 20 percent TPMS and 20 percent ATIS. In 2024 MY, the adoption rates are 50 percent TPMS and 25 percent ATIS.

(iv) Idle Reduction Technology Adoption Rate

Idle reduction technologies provide significant reductions in fuel consumption and CO₂ emissions for Class 8 sleeper cabs and are available on the market today. There are several different technologies available to reduce idling. These include APUs, diesel fired heaters, and battery powered units. Our discussions with manufacturers prior to the Phase 2 NPRM indicated that idle technologies are sometimes installed in the factory, but that it is also a common practice to have the units installed after the sale of the truck. We want to continue to incentivize this practice and to do so in a manner that the emission reductions associated with idle reduction technology occur in use. We proposed to continue the Phase 1 approach into Phase 2 where we recognize only idle emission reduction technologies that include a tamper-proof automatic engine shutoff system (AESS) with some override provisions.²⁸⁵ However, we welcomed comment on other approaches that will appropriately quantify the reductions that will be experienced in the real world. 80 FR 40224.

We used an overall 90 percent adoption rate of tamper-proof AESS for Class 8 sleeper cabs in setting the proposed MY 2024 and 2027 standards. Id. The agencies stated in the Phase 2 NPRM that we were unaware of reasons why AESS with extended idle reduction technologies could not be applied to this high fraction of tractors with a sleeper cab, except those deemed a vocational tractor, in the available lead time.

EMA, Volvo, Daimler, and Navistar commented that the agencies should consider that customers are not accepting the tamper-proof AESS in Phase 1, therefore the adoption rates included in the proposal were too high and that resale concerns remain a significant issue for customers. PACCAR and EMA commented that the proposed 90 percent penetration rate of tamper-proof AESS is unachievable. Many comments also focused on the need for adjustable AESS. OOIDA commented that 90 percent APU adoption is unreasonable and that the 400 pound weight exemption for APUs is not provided in California, Washington DC, Hawaii, Kentucky, Massachusetts, North Carolina, and Rhode Island. OOIDA also raised concerns about situations where an AESS could have negative consequences—such as team drivers where the co-driver was left asleep in the berth while the truck was shut off, or drivers with certain medical conditions, or pets.

The agencies find the comments regarding the concerns for using 90 percent adoption rates of tamper-proof AESS to be persuasive. For the final rule, the agencies developed a menu of idle reduction technologies that include both tamper-proof and adjustable AESS (as discussed in Section III.D.1.b) that are recognized at different levels of effectiveness in GEM. As discussed in the discussion of tractor baselines (Section III.D.1.a), the latest NACFE confidence report found that 96 percent of HD vehicles are equipped with adjustable automatic engine shutdown systems.²⁸⁶ Therefore, the agencies built this level of idle reduction into the baseline for sleeper cab tractors. Due to the high percentage acceptance of adjustable AESS today, the agencies project that by 2027 MY it is feasible for 100 percent of sleeper cabs to contain some type of AESS and idle reduction technology to meet the hoteling needs of the driver. However, we recognize that there are a variety of idle reduction technologies that meet the various needs of specific customers and not all customers will select diesel powered APUs due to the cost or weight concerns highlighted in the comments. Therefore, we developed an idle reduction technology package for each MY that reflects this variety. The idle reduction packages developed for the final rule contain lower AESS adoption rates than used at proposal. The AESS used during the NPRM assumed that it also included a diesel powered APU in terms of

determining the effectiveness and costs. In the final rule, the idle reduction technology mix actually has an overall lower cost (even after increasing the diesel APU technology cost estimate for the final rule) than would have been developed for the final rule. In addition, the stringency of the tractor standards are not affected because the higher penetration rate of other idle reduction technologies, which are not quite as effective, but will be deployed more. We developed the technology package to set the 2027 MY sleeper cab tractor standards that includes 15 percent adoption rate of adjustable AESS only, 40 percent of adjustable AESS with a diesel powered APU, 15 percent adjustable AESS with automatic stop/start, and 15 percent adjustable AESS with a fuel operated heater. We continued the same approach of phasing in different technology packages for the 2021 and 2024 MY standards, though we included some type of idle reduction on 100 percent of the sleeper cab tractors. The 2021 MY technology package had a higher adoption rate of adjustable AESS with no other idle reduction technology and lower adoption rates of adjustable AESS with other idle reduction technologies. Details on the idle reduction technology adoption rates for the MY 2021 and 2024 standards are included in Table III–13 and Table III–14.

(v) Transmission Adoption Rates

The agencies' proposed standards included a 55, 80, and 90 percent adoption rate of automatic, automated manual, and dual clutch transmissions in MYs 2021, 2024, and 2027 respectively. 80 FR 40225–7. The agencies did not receive any comments regarding these proposed transmission adoption rates, and have not found any other information suggesting a change in approach. Therefore, we are including the same level of adoption rates in setting the final rule standards. The MY 2021 and 2024 standards are likewise premised on the same adoption rates of these transmission technologies as at proposal.

The agencies have added neutral idle as a technology input to GEM for Phase 2 in the final rulemaking. The TC10 that was tested by the agencies for the final rule included this technology. Therefore, we projected that neutral idle would be included in all of the automatic transmissions and therefore the adoption rates of neutral idle match the adoption rates of the automatic transmission in each of the MYs.

Transmissions with direct drive as the top gear and numerically lower axles are

²⁸⁵ The agencies are retaining the HD Phase 1 AESS override provisions included in 40 CFR 1037.660(b) for driver safety.

²⁸⁶ North American Council for Freight Efficiency. Confidence Report: Idle-Reduction Solutions. 2014. Page 13.

better suited for applications with primarily highway driving with flat or low rolling hills. Therefore, this technology is not appropriate for use in 100 percent of tractors. The agencies proposed standards reflected the projection that 50 percent of the tractors would have direct drive in top gear in MYs 2024 and 2027. 80 FR 40226–7. The agencies did not receive any comments regarding the adoption rates of transmissions with direct drive in those MYs. We therefore are including the same level of adoption rates in setting the final rule standards for MYs 2024 and 2027. Transmissions with direct drive top gears exist in the market today, therefore, the agencies determined it is feasible to also include this technology in the package for setting the 2021 MY standards. For the final rule, the agencies included a 20 percent adoption rate of direct drive in the 2021 MY technology package.

The agencies received comments supporting establishing a transmission

efficiency test that measures the efficiency of each transmission gear and could be input into GEM. In the final rule, the agencies are adopting Phase 2 standards that project that 20, 40, and 70 percent of the AMT and DCT transmissions will be tested and achieve a fuel consumption and CO₂ emissions reduction of one percent in MYs 2021, 2024, and 2027, respectively.

The adoption rates for the technology packages used to determine the MY 2021, 2024, and 2027 standards for each tractor subcategory are shown in Table III–13, Table III–14, and Table III–15.

(vi) Engine DownsPEEDING Adoption Rates

The agencies proposed to include lower final drive ratios in setting the Phase 2 standards to account for engine downsPEEDING. In the NPRM, we used a transmission top gear ratio of 0.73 and baseline drive axle ratio of 3.70 in 2017 going down to a rear axle ratio of 3.55

in 2021 MY, 3.36 in 2024 MY, and 3.20 in 2027 MY. 80 FR 40228–30.

UCS commented that downsPEEDING was only partially captured as proposed. The agencies also received additional information from vehicle manufacturers and axle manufacturers that we believe supports using lower numerical drive axle ratios in setting the final Phase 2 standards for sleeper cabs that spend more time on the highway than day cabs, directionally consistent with the UCS comment. For the final rules, the agencies have used 3.70 in the baseline and 3.16 for sleeper cabs and 3.21 for day cabs in MY 2027 to account for continued downsPEEDING opportunities. The final drive ratios used for setting the other model years are shown in Table III–11. These values represent the “average” tractor in each of the MYs, but there will be a range of final drive ratios that contain more aggressive engine downsPEEDING on some tractors and less aggressive on others.

TABLE III–11—FINAL DRIVE RATIO FOR TRACTOR TECHNOLOGY PACKAGES

Model year	Rear axle ratio	Transmission top gear ratio	Final drive ratio
Sleeper Cabs			
2018	3.70	0.73	2.70
2021	3.31	0.73	2.42
2024	3.26	0.73	2.38
2027	3.16	0.73	2.31
Day Cabs			
2018	3.70	0.73	2.70
2021	3.36	0.73	2.45
2024	3.31	0.73	2.42
2027	3.21	0.73	2.34

(vii) Drivetrain Adoption Rates

The agencies’ proposed standards included 6x2 axle adoption rates in high roof tractors of 20 percent in 2021 MY and 60 percent in MYs 2024 and 2027. Because 6x2 axle configurations could raise concerns of traction, the agencies proposed standards that reflected lower adoption rates of 6x2 axles in low and mid roof tractors recognizing that these tractors may require some unique capabilities. The agencies proposed standards for low and mid roof tractors that included 6x2 axle adoption rates of 10 percent in MY 2021 and 20 percent in MYs 2024 and 2027. 80 FR 40225–7.

ATA and others commented that limitations to a high penetration rate of 6x2 axles include curb cuts, other uneven terrain features that could expose the truck to traction issues,

lower residual values, traction issues, driver dissatisfaction, tire wear, and the legality of their use. The commenters stated that recent surveys indicate current market penetration rates of new line-haul 6x2 tractor sales are only in the range of two percent, according to a NACFE confidence report. The commenters also stated that while recent improvements in traction control systems can automatically shift weight for short periods of time from the non-driving axle to the driving axle during low-traction events, concerns remain over the impacts to highways caused by such shifting of weight between axles. EMA, ATA, OOIDA, Volvo, Daimler, PACCAR, First Industries, National Association of Manufacturers, Caterpillar, and others discussed that 6x2 axles are not legal in all U.S. states and Canadian provinces. Caterpillar and

Daimler also stated the agencies should not assume more than 5 percent penetration rates of 6x2 through 2027. EMA forecasts a 6x2 penetration rate of less than 5 percent.

Upon further consideration, the agencies have reduced the adoption rate of 6x2 axles and projected a 30 percent adoption rate in the technology package used to determine the Phase 2 2027 MY standards. The 2021 MY standards include an adoption rate of 15 percent and the 2024 MY standards include an adoption rate of 25 percent 6x2 axles. This adoption rate represents a combination of liftable 6x2 axles (which as noted in ATA’s comments are allowed in all states but Utah, and Utah is expected to revise their law) and 4x2 axles. In addition, it is worth recognizing that state regulations related to 6x2 axles could change significantly

over the next ten years. It is also worth noting that the issue related to the legality of 6x2 axles was not mentioned as a barrier to adoption by fleets in the NACFE Confidence Report on 6x2 axles.²⁸⁷

In the NPRM, the agencies projected that 20 percent of 2021 MY and 40 percent of the 2024 and 2027 MY axles would use low friction axle lubricants. 80 FR 40225–7. In the final rule, we are requiring that manufacturers conduct an axle efficiency test if they want to include the benefit of low friction lubricant or other axle design improvements when certifying in GEM.

The axle efficiency test will be optional, but will allow manufacturers to reduce CO₂ emissions and fuel consumption if the manufacturers have improved axle gear designs and/or mandatory use of low friction lubricants. The agencies' assessment of axle improvements found that 80 percent of the axles built in MY 2027 could be two percent more efficient than a 2017 baseline axle. Because it will take time for axle manufacturers to make improvements across the majority of their product offerings, the agencies phased in the amount of axle efficiency improvements in the technology packages in setting the

2021 and 2024 MY standards to include 30 and 65 percent adoption rates, respectively.

(viii) Accessories and Other Technology Adoption Rates

In the NPRM, the agencies projected adoption rates as show in Table III–12. 80 FR 40227. The agencies are adopting the same level of adoption rates for setting the final Phase 2 standards because we did not receive any comments or new data to support a change in the adoption rates used in the proposal.

TABLE III–12—ADOPTION RATES USED IN THE TRACTOR TECHNOLOGY PACKAGES IN THE NPRM

Model year	Predictive cruise control (%)	Electrified accessories (%)	Higher efficiency air conditioning (%)
2021	20	10	10
2024	40	20	20
2027	40	30	30

(ix) Weight Reduction Technology Adoption Rates

In the NPRM, the agencies proposed to allow manufacturers to use tractor weight reduction to comply with the standards. 80 FR 40223. A number of organizations commented generally in favor of the inclusion of light weight components for compliance, including the Aluminum Association, Meritor, American Die Casting Association, and the American Chemistry Council saying light-weight materials are durable and their use in heavy-duty vehicles can reduce weight and fuel consumption.

Unlike in HD Phase 1, the agencies proposed the 2021 through 2027 model year tractor standards without using weight reduction as a technology to demonstrate the feasibility of the standards. The ICCT stated that the agencies should include light weight components in setting the stringency of the standards, citing an ICCT tractor and trailer study showing specific light weight benefits for tractor components. Meritor argued that weight reduction should not be included in setting stringency, given the high cost to benefit ratio for weight reduction.

The agencies view weight reduction as a technology with a high cost that offers a small benefit in the tractor sector. For example, our estimate of a 400 pound weight reduction will cost \$2,050 (2012\$) in 2021 MY, but offers a 0.3 percent reduction in fuel

consumption and CO₂ emissions. The agencies are excluding the use of weight reduction components for the tractor stringency calculation due to the high cost associated with this technology. As noted above, Meritor in their comments expressed agreement with this approach.

(x) Vehicle Speed Limiter Adoption Rate

Consistent with Phase 1, we proposed to continue the approach where vehicle speed limiters may be used as a technology to meet the Phase 2 standard. See 80 FR 40224. In setting the Phase 2 proposed standard, however, we assumed a zero percent adoption rate of vehicle speed limiters. Although we expect there will be some use of VSL, currently it is used when the fleet involved decides it is feasible and practicable and increases the overall efficiency of the freight system for that fleet operator. To date, the compliance data provided by manufacturers indicate that none of the tractor configurations include a tamper-proof VSL setting less than 65 mph.

At this point the agencies are not in a position to determine in how many additional situations use of a VSL will result in similar benefits to overall efficiency or how many customers will be willing to accept a tamper-proof VSL setting. Although we believe vehicle speed limiters are a simple, easy to

implement, and inexpensive technology, we want to leave the use of vehicle speed limiters to the truck purchaser. In doing so, we are providing another means of meeting the standard that can lower compliance costs and provide a more optimal vehicle solution for some truck fleets or owners. For example, a local beverage distributor may operate trucks in a distribution network of primarily local roads. Under those conditions, aerodynamic fairings used to reduce aerodynamic drag provide little benefit due to the low vehicle speed while adding additional mass to the vehicle. A vehicle manufacturer could choose to install a VSL set at an optimized speed for its intended application and use this technology to assist in complying with our program all at a lower cost to the ultimate tractor purchaser.²⁸⁸

We welcomed comment on whether the use of a VSL would require a fleet to deploy additional tractors, but did not receive responsive comment. ARB stated that if EPA and NHTSA decide to give credit in Phase 2 GEMs for VSLs, VSL benefit should also be reflected in the standard's stringency. Daimler supported the approach of not including VSLs in setting the stringency because of the resistance in the market to accept tamperproof VSLs. OOIDA commented that the agencies must consider the significant negative consequences of VSLs, such as safety impact from

²⁸⁷ North American Council for Freight Efficiency. "Confidence Findings on the Potential of 6x2 Axles." 2014. Page 16.

²⁸⁸ Ibid.

²⁸⁸ The agencies note that because a VSL value can be input into GEM, its benefits can be directly

assessed with the model and off cycle credit applications therefore are not necessary even though the standard is not based on performance of VSLs (*i.e.* VSL is an on-cycle technology).

differential speeds between light duty vehicles and trucks.

After considering the comments, we still could not make a determination regarding the reasonableness of setting a standard based on a particular VSL adoption rate, for the same reasons articulated at proposal. Therefore, the

agencies are not premising these final Phase 2 standards on use of VSL, and instead will continue to rely on the industry to select VSL when circumstances are appropriate for its use (in which case there is an input in GEM reflecting VSL efficiency).

(d) Summary of the Adoption Rates Used To Determine the Final Phase 2 Tractor Standards

Table III–13 through Table III–16 provide the adoption rates of each technology broken down by weight class, cab configuration, and roof height.

(e) Adoption Rates Used To Set the Heavy-Haul Tractor Standards

The agencies recognize that certain technologies used to determine the stringency of the Phase 2 tractor standards are less applicable to heavy-haul tractors. Heavy-haul tractors are not typically used in the same manner as long-haul tractors with extended highway driving, and therefore will experience less benefit from aerodynamics. Aerodynamic technologies are very effective at reducing the fuel consumption and GHG emissions of tractors, but only when traveling at highway speeds. At lower speeds, the aerodynamic technologies may have a detrimental impact due to the potential of added weight. The agencies therefore proposed not considering the use of aerodynamic technologies in the development of the Phase 2 heavy-haul tractor standards. Moreover, because aerodynamics will not play a role in the heavy-haul standards, the agencies proposed to combine all of the heavy-haul tractor cab configurations (day and sleeper) and roof heights (low, mid, and high) into a

single heavy-haul tractor subcategory. We welcomed comment on this approach. 80 FR 40233.

The agencies received comments regarding the applicability of aerodynamic technologies on heavy-haul vehicles. Daimler commented that heavy-haul vehicles are designed to meet high cooling needs, therefore have large radiators and grilles, and are not designed primarily for hauling standard trailers on the highway. Daimler also stated that these vehicles are designed to operate off-road or on difficult terrain, which also limits the application of aerodynamic fairings, and that requiring aerodynamic improvements on these vehicles, may compromise the vehicles' work. EMA supported the agencies' proposed approach of not requiring the use of aerodynamic technologies as a component of the proposed Phase 2 heavy-haul tractor standards. EMA stated that those vehicles are already quite heavy (by virtue of need), are designed to meet high-cooling needs (thus having, for example, large grilles), and generally are not designed for

hauling standard trailers on highways. EMA also stated that those vehicles are often designed to be capable of operation off-road or on difficult terrain. Volvo supported the addition of a heavy-haul subcategory since heavy-haul tractors require large engines and increased cooling capacity that limits aerodynamic improvements. Volvo also stated the most heavy-haul rigs have some requirement for off-road access to pick up machinery, bulk goods, and unusual loads that also inhibit aerodynamic improvements. These comments largely echo the agencies' own concerns voiced at proposal. After considering these comments, the agencies are using a technology package that does not use aerodynamic improvements in setting the Phase 2 heavy-haul tractor standards, as we proposed.²⁸⁹

Certain powertrain and drivetrain components are also impacted during the design of a heavy-haul tractor,

²⁸⁹ Since aerodynamic improvements are not part of the technology package, the agencies likewise are not adopting any aero bin structure for the heavy-haul tractor subcategory.

including the transmission, axles, and the engine. Heavy-haul tractors typically require transmissions with 13 or 18 speeds to provide the ratio spread to ensure that the tractor is able to start pulling the load from a stop. Downsized powertrains are typically not an option for heavy-haul operations because these vehicles require more torque to move the vehicle because of the heavier load. Finally, due to the loading requirements of the vehicle, it is not likely that a 6x2 axle configuration can be used in heavy-haul applications. We requested comments on all aspects of our heavy-haul tractor technology packages. 80 FR 40233.

We received comments from stakeholders about the application of technologies other than aerodynamics for heavy-haul tractors. Daimler commented that the low rolling resistance levels in the NPRM are overly

aggressive because heavy-haul tractors require unusually high traction and stopping power. Daimler agreed with the agencies' assessment in the NPRM that did not include weight reduction because these vehicles require strong frames and axles to carry heavy loads. Volvo commented that heavy-haul tractors would not likely be able to utilize current SmartWay tires; would see no benefit from predictive cruise; sometimes utilize an auxiliary transmission for further reduction or closer ratios; and nearly all heavy-haul tractors have deeper drive axle ratios than the agencies assumed in the NPRM. After considering these comments and the information regarding the tire rolling resistance improvement opportunities, discussed in Section III.D.1.b.iii, the agencies have adjusted the adoption rate of low rolling resistance tires. Consistent with the

changes made in the final rule for the adoption of low rolling resistance tires in low and mid roof tractors, the agencies did not project any adoption of Level 3 tires for heavy-haul tractors in the final rule.

Allison commented that AMTs in the NPRM receive a 1.8 percent credit in GEM for heavy-haul tractors, yet there is no similar credit for ATs. Allison commented that since ATs offer similar, if not greater, benefits, they should also receive credit and that neutral-idle recognition should be available. The final version of Phase 2 GEM treats ATs and AMTs the same for heavy-haul tractors as for the other tractors.

The agencies used the following heavy-haul tractor adoption rates for developing the final Phase 2 2021, 2024, and 2027 MY standards, as shown in Table III–16.

TABLE III–16—APPLICATION RATES FOR HEAVY-HAUL TRACTOR STANDARDS

[Heavy-haul tractor application rates]

The agencies are also adopting in Phase 2 provisions that allow the manufacturers to meet an optional heavy Class 8 tractor standard that reflects both aerodynamic

improvements, along with the powertrain requirements that go along with higher GCWR. Table III–17 reflects the adoption rates for each of the technologies for each of the

subcategories in MY 2021. The technology packages closely reflect those in the primary Class 8 tractor program. The exceptions include less aggressive targets for low rolling

resistance tires, no 6x2 axle adoption rates, and no downspeeding due to the heavier loads of these vehicles.

(f) Derivation of the Final Phase 2 Tractor Standards

The agencies used the technology effectiveness inputs and technology adoption rates to develop GEM inputs to derive the HD Phase 2 fuel consumption and CO₂ emissions standards for each subcategory of Class 7 and 8 combination tractors. Note that we have analyzed *one* technology pathway for each level of stringency, but manufacturers will be free to use any combination of technology to meet the

standards, as well as the flexibility of averaging, banking and trading, to meet the standard on average. The agencies derived a scenario tractor for each subcategory by weighting the individual GEM input parameters included in Table III–7 with the adoption rates in Table III–8 through Table III–10. For example, the C_dA value for a 2021 MY Class 8 Sleeper Cab High Roof scenario case was derived as 60 percent times 5.95 plus 30 percent times 5.40 plus 10 percent times 4.90, which is equal to a

C_dA of 5.68 m². Similar calculations were made for tire rolling resistance, transmission types, idle reduction, and other technologies. The agencies developed fuel maps that achieved the CO₂ emissions and fuel consumption reductions described in Section III.D.1.b. The agencies then ran GEM with a single set of vehicle inputs, as shown in Table III–18 through Table III–21, to derive the final standards for each subcategory. Additional detail is provided in the RIA Chapter 2.8.4.

(g) Technology Costs of the Final Phase 2 Tractor Standards

A summary of the technology package costs is included in Table III–15 through Table III–17 for MYs 2021, 2024, and 2027, respectively, with additional details available in the RIA Chapter 2.12.

The agencies received several comments related to the APU, tire, and

aerodynamic technology costs used by the agencies at proposal. As noted in Section III.C.3 above, ATA, First Industries, and Daimler commented that APU costs are substantially higher than the figures in the proposal. PACCAR commented that the cost of a diesel or battery-based APU is \$8,570 to \$11,263. EMA commented that the direct per-chassis cost of a diesel APU is

approximately \$8,500–\$10,100 and approximately \$11,300 for battery/electric APUs. Volvo commented that APU prices can vary between \$9,500 and \$11,000 depending on the type. Schneider commented that an electronic APU will have an initial cost of at least \$5,000 and engine powered APUs are 2 to 3 times the electric costs.

EPA considered the comments and more closely evaluated NHTSA's contracted TetraTech cost report found the retail price of a diesel-powered APU with a DPF to be \$10,000.²⁹⁰ The agencies used a retail price of a diesel-powered APU to be \$8,000 without a DPF and \$10,000 with a DPF in the cost analysis for this final rulemaking.

ATA and First Industries commented that the LRR tire costs calculations appear to be based on calculations on 1999 data indexed for inflation. Michelin's comments stated that they estimate the cost of low rolling resistance tires to be about \$25 per tire. ATA commented that the industry commonly sees a 40 percent reduction in useful life and a 20 percent reduction in casing life resulting from low rolling resistance tires. ATA and First Industries commented that the LRR tire costs do not account for reduced tire life resulting in fewer retreads. Schneider commented that WBS tire costs must include additional service costs, cost of reduced tire life, and increased replacement tire costs due to recaps not available, and reduced resale value. Volvo also commented that heavy-duty fleets expect to retread tires as many as five times and have concerns that tire casing durability may be compromised with low rolling resistance tires. Volvo stressed that retreading saves cost and about two thirds of the oil required to produce a new tire.

We have estimated the cost of lower rolling resistance tires based on an estimate from TetraTech of \$30 (retail, 2013\$). We also have applied a "medium" complexity markup value for the more advanced low rolling resistance tires. We expect that, when replaced, the lower rolling resistance tires would be replaced by equivalent performing tires throughout the vehicle lifetime. As such, the incremental increases in costs for lower rolling resistance tires would be incurred throughout the vehicle lifetime at intervals consistent with current tire replacement intervals. A recent study conducted by ATA's Technology and Maintenance Council found through surveys of 51 fleets that low rolling

resistance tires and wide base single tires lasted longer than standard tractor tires.²⁹¹ Due to the uncertainty regarding the life expectancy of the LRR tires, we maintained the current tire replacement intervals in our cost analysis.

ATA and First Industries commented that the estimated costs of future aerodynamic devices appear low given the historical nature of the proposed changes. ATA and First Industries also commented that the agencies should describe in detail the component packages they expect to satisfy each bin level, cost breakdowns of these individual components, and how this technology will be modified over time to maintain compliance with increasingly stringency levels. The agencies included the technology cost of aerodynamic improvements, such as wheel covers and active grill shutters, in RIA Chapter 2.11.

The agencies also received comments associated with other costs that should be considered related to the technologies, specifically 6x2 axle configurations, tire pressure monitoring and inflation system, and APUs. ATA and First Industries commented that the agencies should include additional tire wear and negative residual values associated with 6x2 axles. Schneider commented that 6x2 axle configurations cost should include loss on resale value, increased tire wear, and cost for electronic technology to improve traction. ATA and First Industries commented that the cost estimates for tire inflation systems and TPMS must include warranty limitations, useful life, maintenance and replacement costs, as well as costs of false warnings and increased operation of the air compressor. Doran cited a FMCSA study that found TPMS and ATIS reduce road calls for damaged tires and reduced number of tire replacements and did not introduce unscheduled maintenance. Schneider commented that an electronic APU will have maintenance of \$500 per year and engine powered APUs must also include maintenance costs. Caterpillar requested that the agencies take a total cost of ownership approach

when considering the technology feasibility and adoption rates.

With respect to costs, all of the agencies' technology cost analyses include both direct and indirect costs. Indirect costs include items such as warranty. In terms of maintenance, the presence of tire inflation management systems, should serve to improve tire maintenance intervals and perhaps reduce vehicle downtime due to tire issues; they may also carry with them some increased maintenance costs to ensure that the tire inflation systems themselves remain in proper operation. For the analysis, we have considered these two competing factors to cancel each other out. The agencies also considered the maintenance impact of 6x2 axles. As noted in the NACFE Confidence Report on 6x2 axles, the industry expects an overall reduction in maintenance costs and labor for vehicles with a 6x2 configuration as compared to a 6x4 configuration.²⁹² Among other savings, the reduction in number of parts, such as the interaxle drive shaft, will reduce the number of lubrication procedures needed and reduce the overall quantity of differential fluid needed at change intervals. The agencies have taken an approach to the maintenance costs for the 6x2 technology where we believe that the overall impact will be zero. The agencies added maintenance costs for diesel powered APUs, battery powered APUs, and diesel fired heaters into the cost analysis for the final rulemaking, as described in RIA Chapter 7.2.3. In response to Caterpillar's comment, the agencies considered the total cost of ownership during the payback calculations, included in RIA Chapter 7 of the final rule. The payback calculations include the hardware costs of the new technologies and their associated fixed costs, increased insurance, taxes, and maintenance. The agencies found that for each category of vehicle—tractor/trailers, vocational vehicles, and HD pickups and vans— included in the Phase 2 rule that the fuel savings significantly exceed the costs associated with the technologies over the lifetime of the vehicles.

^cEngine costs are for a heavy HD diesel engine meant for a combination tractor.

(2) Consistency of the Tractor Standards With the Agencies' Legal Authority

The HD Phase 2 standards are based on adoption rates for technologies that the agencies regard as the maximum feasible for purposes of EISA Section 32902(k) and appropriate under CAA section 202(a) for the reasons given in Section III.D.1(b) through (d) above; see also RIA Chapter 2.8. The agencies believe these technologies can be adopted at the estimated rates for these standards within the lead time

provided, as discussed above and in RIA Chapter 2.8. The 2021 and 2024 MY standards are phase-in standards on the path to the 2027 MY standards and were developed using less aggressive application rates and therefore have lower technology package costs than the 2027 MY standards. Moreover, we project the cost of these technologies will be rapidly recovered by operators due to the associated fuel savings, as shown in the payback analysis included in Section IX below. The cost per tractor

to meet the 2027 MY standards is projected to range between \$10,200 and \$13,700 (which includes the cost of the engine standards). See Table III–25 above. Much or all of this will be recovered in the form of fuel savings during the first two years of ownership. The agencies note that while the projected costs per vehicle are significantly greater than the costs projected for Phase 1, we still consider that cost to be reasonable, especially given the relatively short payback

period. In this regard the agencies note that the estimated payback period for tractors of less than two years,²⁹³ is itself shorter than the estimated payback period for light duty trucks in the 2017–2025 light duty greenhouse gas standards. That period was slightly over three years, see 77 FR 62926–62927, which EPA found to be a highly reasonable given the usual period of ownership of light trucks is typically five years.²⁹⁴ The same is true here. Ownership of new tractors is customarily four to six years, meaning that the greenhouse gas and fuel consumption technologies pay for themselves early on and the purchaser sees overall savings in succeeding years—while still owning the vehicle.²⁹⁵ The agencies note further that the costs for each subcategory are relatively proportionate; that is, costs of any single tractor subcategory are not disproportionately higher (or lower) than any other. Although the rule is technology-forcing (especially with respect to aerodynamic and drivetrain efficiency improvements), the agencies believe that manufacturers retain leeway to develop alternative compliance paths, increasing the likelihood of the standards' successful implementation. The agencies also regard these reductions as cost-effective, even

without considering payback period. The agencies estimate the cost per metric ton of CO₂eq reduction without considering fuel savings to be \$36 for tractor-trailers in 2030 which compares favorably with the levels of cost effectiveness the agencies found to be reasonable for light duty trucks.^{296 297} See 77 FR 62922. The phase-in 2021 and 2024 MY standards are less stringent and less costly than the 2027 MY standards and hence likewise reasonable. For these reasons, and because the agencies have carefully considered lead time and shown that lead time is adequate, EPA believes they are also reasonable under Section 202(a) of the CAA. Given that the agencies believe these standards are technically feasible, are highly cost effective, and even more highly cost effective when accounting for the fuel savings, and have no apparent adverse potential impacts (*e.g.*, there are no projected negative impacts on safety or vehicle utility, and EPA has taken steps to avoid adverse collateral consequences from use of APUs without filter-based particulate controls), these standards represent a reasonable choice under Section 202(a)(2) of the CAA and the maximum feasible under NHTSA's EISA authority at 49 U.S.C. 32902(k)(2).

(3) Alternative Tractor Standards Considered

The agencies developed and considered other alternative levels of stringency for the Phase 2 program. The results of the analysis of these alternatives are discussed below in Section X of the Preamble. For tractors, the agencies developed the following alternatives as shown in Table III–29. The agencies are not adopting standards reflecting Alternative 2, because as already described, technically feasible standards are available that provide for greater emission reductions and reduced fuel consumption than provided under Alternative 2. The agencies are not adopting standards reflecting Alternative 4 or Alternative 5 in their entirety because we do not believe to be feasible considering lead time and other relevant factors. However, we note that the tractor standards are predicated on the adoption of engine technology beyond what was projected in Alternative 4 of the NPRM. In addition, the final rule stringency includes additional technologies for tractors that were not considered in any of the alternatives analyzed in the NPRM—axle efficiency, transmission efficiency, adjustable automatic engine shutdown systems, and tire pressure monitoring systems.

TABLE III–29—SUMMARY OF ALTERNATIVES CONSIDERED FOR THE FINAL RULEMAKING

Alternatives 1a and 1b	No action alternatives
Alternative 2	Less Stringent than the Preferred Alternative applying off-the-shelf technologies.
Preferred Alternative	Final Phase 2 standards, fully phased-in by 2027 MY.
Alternative 4	Alternative presented in the NPRM that pulls ahead the proposed 2027 MY standards to 2024 MY.
Alternative 5	Alternative based on very high market adoption of advanced technologies.

E. Phase 2 Compliance Provisions for Tractors

In HD Phase 1, the agencies developed an entirely new program to assess the CO₂ emissions and fuel consumption of tractors. The agencies are carrying over many aspects of the Phase 1 compliance approach, but we are also adopting changes to enhance several aspects of the compliance program. The sections below highlight the key areas that are the same and those that are different.

(1) HD Phase 2 Compliance Provisions That Remain the Same

The overall Phase 2 regulatory structure is discussed in more detail above in Section II. This section discusses tractor-specific compliance provisions.

(a) Application and Certification Process

For the Phase 2 final rule, the agencies are keeping many aspects of the HD Phase 1 tractor compliance program. For example, the agencies will continue to use GEM (as revised for Phase 2), in coordination with

additional component testing by manufacturers to determine the inputs, to determine compliance with the fuel efficiency and CO₂ standards. Another aspect that we are carrying over is the overall compliance approach. EMA's and the HD manufacturers' comments supported the continued use of GEM and did not support chassis-based certification.

In Phase 1 and as finalized in Phase 2, the general compliance process in terms of the pre-model year, during the model year, and post model year activities remains unchanged. The manufacturers will be required to apply

²⁹⁶ See RIA Chapter 7.2.5 and Memo to Docket "Tractor-Trailer Cost per Ton Values." July 2016. EPA–HQ–OAR–2014–0827.

²⁹⁷ If using a cost effectiveness metric that treats fuel savings as a negative cost, net costs per ton of GHG emissions reduced or per gallon of avoided fuel consumption will be negative under these standards.

for certification through a single source, EPA, with limited sets of data and GEM results (see 40 CFR 1037.205). EPA will issue certificates upon approval based on information submitted through the VERIFY database (see 40 CFR 1037.255). In Phase 1, EPA and NHTSA jointly review and approve innovative technology requests, *i.e.* performance of any technology whose performance is not measured by the GEM simulation tool and is not in widespread use in the 2010 MY. For Phase 2, the agencies are adopting a similar process for allowing credits for off-cycle technologies that are not measured by the GEM simulation tool, although the revised GEM now recognizes many more technologies than the Phase 1 version of GEM, notably drivetrain and transmission improvements, so fewer technologies would be candidates for off-cycle credits (see Section I.B.v. for a more detailed discussion of off-cycle requests). During the model year, the manufacturers will continue to generate certification data and conduct GEM runs on each of the vehicle configurations it builds. After the model year ends, the manufacturers will submit end of year reports to EPA that include the GEM results for all of the configurations it builds, along with credit/deficit balances if applicable (see 40 CFR 1037.250 and 1037.730). EPA and NHTSA will jointly coordinate on any enforcement action required.

(b) Compliance Requirements

As proposed in Phase 2, the agencies did not adopt any provisions in the final Phase 2 rules that significantly change the following Phase 1 provisions:

- Useful life of tractors (40 CFR 1037.105(e) and 1037.106(e)) although added for NHTSA in Phase 2 (49 CFR 535.5)
- Emission-related warranty requirements (40 CFR 1037.120)
- Maintenance instructions, allowable maintenance, and amending maintenance instructions (40 CFR 1037.125 and 137.220)
- Deterioration factors (40 CFR 1037.205(l) and 1037.241(c))
- Vehicle family, subfamily, and configurations (40 CFR 1037.230), except for the addition of a heavy-haul family in Phase 2

(c) Drive Cycle Speed Targets and Weightings

In Phase 1, the agencies adopted three drive cycles used in GEM to evaluate the fuel consumption and CO₂ emissions from various vehicle configurations. One of the cycles is the Transient mode of the California ARB Heavy Heavy-Duty Truck 5 Mode cycle. It is intended to broadly cover urban

driving. The other two cycles represent highway driving at 55 mph and 65 mph.

The agencies proposed to maintain the existing Phase 1 drive cycle speed traces and weightings in Phase 2. In the Phase 2 proposal sleeper cab weightings would remain 5 percent of the Transient cycle, 9 percent of the 55 mph cycle, and 86 percent of the 65 mph cycle. The day cabs would be weighted based on 19 percent of the transient cycle, 17 percent of the 55 mph cycle, and 64 percent of the 65 mph cycle (see proposed 40 CFR 1037.510(c) and 80 FR 40242). In response to the Phase 2 NPRM, the American Trucking Associations (ATA) submitted comments based on spot speed records throughout the month of May 2015. This study found that Class 8 trucks operated at speeds of 55 mph or less 57 percent of the time. United Parcel Service (UPS) stated that their Class 8 tractor-trailers average 54 miles per hour in part because they use vehicle speed limiters in their fleet. UPS also shared ATA's comments on the spot speed records. Daimler stated that they did not see a benefit of increasing the amount of low speed operation for tractors, unless the EPA-NREL work supported the need for a change.

The agencies considered these comments along with the information that was used to derive the drive cycle weightings in Phase 1. The agencies did not receive any new drive cycle weighting data for tractors from the EPA-NREL work. The agencies believe that the study cited by ATA includes weightings of speed records, which represent the fraction of *time* spent at a given speed. However, our drive cycle weightings represent the fraction of *vehicle miles traveled* (VMT). The agencies used the vehicle speed information provided in the ATA comments and translated the weightings to VMT. Based on our assessment shown in RIA Chapter 3.4.3, their findings produce weightings that are approximately 74 percent of the vehicle miles traveled are at speeds greater than 55 mph and 26 percent less than 55 mph. In addition, the study cited by ATA represents "Class 8 trucks" which would include day cab tractors, sleeper cab tractors, and heavy heavy-duty vocational trucks. Based on this assessment, the agencies do not believe this new information is significantly different than the drive cycle weightings that were proposed. Therefore, we are adopting the drive cycle weightings for tractors that we adopted for Phase 1 and proposed for Phase 2.

Both in the Phase 1 program and as proposed in the Phase 2 program, the 55 mph and 65 mph drive cycles used in

GEM assume a constant target speed with downshifting occurring if road incline causes a predetermined drop in vehicle speed. In real-world vehicle operation, traffic conditions and other factors may cause periodic operation at lower (*e.g.* creep) or variable vehicle speeds. In the Phase 2 NPRM, the agencies requested comment on the need to include segments of lower or variable speed operation in the nominally 55 mph and 65 mph drive cycles used in GEM and how this may or may not impact the strategies manufacturers would develop. 80 FR 80242.

In response, ACEEE commented that NREL found that constant speeds on positive and negative grades misrepresent the real world operation of HD trucks because there is a strong correlation between road grade and average speed. Daimler commented that for regulatory purposes using a constant speed cycle with representative road grade is appropriate, noting as well that some manufacturers use a constant speed cycle in their internal development processes and have found it correlates well to real world operation. They also highlight the concern that it would be extremely difficult to develop traffic patterns that represent a national average. However, Daimler also stated in their comments that they do see a benefit of allowing increased variability in the vehicle speeds in the 55 and 65 mph cycles, for evaluating the effectiveness of technologies such as predictive cruise control.

After considering these comments and evaluating the final Phase 2 version of GEM, the agencies are adopting in the Phase 2 final rules constant target speed for the 55 mph and 65 mph cycles, as adopted in Phase 1. One key difference in Phase 2 is the addition of road grade in these cruise cycles, as discussed below in Section III.E.2. The addition of road grade to the cruise cycles brings the GEM simulation of vehicles over the drive cycles closer to the real world operation described by ACEEE and Daimler. Even though the cruise cycles will continue to have constant target speeds (55 mph or 65 mph), the vehicle may slow down from the target speed of the cycle on an uphill stretch of road due to the addition of road grade in the Phase 2 cycles. If the vehicle does slow down, the transmission shift logic built into GEM will downshift the transmission to limit the amount of further vehicle deceleration. Similarly, on the downhill portions of the cycles, the driver control logic built into GEM will allow the vehicle to exceed the

target speed by 3 mph prior to braking the vehicle.

(d) Empty Weight and Payload

The total weight of the tractor-trailer combination is the sum of the tractor curb weight, the trailer curb weight, and the payload. The total weight of a vehicle is important because it in part determines the impact of technologies, such as rolling resistance, on GHG emissions and fuel consumption. In Phase 2, we proposed to carry over the total weight of the tractor-trailer combination used in GEM for Phase 1. The agencies developed the tractor curb weight inputs for Phase 2 from actual tractor weights measured in two of EPA's Phase 1 test programs. The trailer curb weight inputs were derived from actual trailer weight measurements conducted by EPA and from weight data provided to ICF International by the trailer manufacturers.²⁹⁸ We welcomed comment on the tractor weights we proposed.

Daimler commented that there is a large spread of weights within a subcategory given the variety of different features that a vehicle might incorporate in order to perform its task. The agencies' proposed curb weights for tractors may be higher than Daimler's vehicles but in Daimler's opinion align with some of their competitors' vehicles, and therefore are reasonable. Based on no negative comment or newer data, the agencies are adopting the Phase 1 tractor curb weights, as proposed.

There is a further issue of what payload weight to assign during compliance testing. In use, trucks

operate at different weights at different times during their operations. The greatest freight transport efficiency (the amount of fuel required to move a ton of payload)—would be achieved by operating trucks at the maximum load for which they are designed all of the time. However, this may not always be practicable. Delivery logistics may dictate partial loading. Some payloads, such as potato chips, may fill the trailer before it reaches the vehicle's maximum weight limit. Or full loads simply may not be available commercially. M.J. Bradley analyzed the Truck Inventory and Use Survey and found that approximately 9 percent of combination tractor miles travelled empty, 61 percent are "cubed-out" (the trailer volume is full before the weight limit is reached), and 30 percent are "weighed out" (operating weight equals 80,000 lbs which is the gross vehicle weight limit on the Federal Interstate Highway System or greater than 80,000 lbs for vehicles traveling on roads outside of the interstate system).²⁹⁹

The amount of payload that a tractor can carry depends on the category (or GVWR and GCWR) of the vehicle. For example, a typical Class 7 tractor can carry less payload than a Class 8 tractor. For Phase 1, the agencies used the Federal Highway Administration Truck Payload Equivalent Factors using Vehicle Inventory and Use Survey (VIUS) and Vehicle Travel Information System data to determine the payloads. FHWA's results indicated that the average payload of a Class 8 vehicle ranged from 36,247 to 40,089 lbs, depending on the average distance travelled per day.³⁰⁰ The same study

shows that Class 7 vehicles carried between 18,674 and 34,210 lbs of payload also depending on average distance travelled per day. Based on these data, the agencies proposed to continue to prescribe a fixed payload of 25,000 lbs for Class 7 tractors and 38,000 lbs for Class 8 tractors for certification testing for Phase 2. The agencies also proposed to continue to use a common payload for Class 8 day cabs and sleeper cabs as a predefined GEM input because the data available do not distinguish among Class 8 tractor types. These payload values represent a heavily loaded trailer, but not maximum GVWR, since as described above the majority of tractors "cube-out" rather than "weigh-out."

The agencies requested comments and data to support changes to our proposed payloads for Phase 2. 80 FR 40242. Daimler commented that the payload weight is even more difficult to determine because weights change based on economic conditions, such as when carriers continue to try to reduce their dead volume and increase their weight per load. Daimler suggested that the agencies might consider increasing the proposed payloads, but did not provide data. In the absence of newer data or other compelling comments, the agencies continue to believe that it is appropriate to continue using the Phase 1 tractor payloads for all of the Class 7 and 8 tractors, as proposed, except for heavy-haul.

Details of the predefined weights by regulatory subcategory, as shown in Table III-30, are included in RIA Chapter 3.

TABLE III-30—FINAL COMBINATION TRACTOR WEIGHT INPUTS

Model type	Regulatory subcategory	Tractor tare weight (lbs)	Trailer weight (lbs)	Payload (lbs)	Total weight (lbs)
Class 8	Sleeper Cab High Roof	19,000	13,500	38,000	70,500
Class 8	Sleeper Cab Mid Roof	18,750	10,000	38,000	66,750
Class 8	Sleeper Cab Low Roof	18,500	10,500	38,000	67,000
Class 8	Day Cab High Roof	17,500	13,500	38,000	69,000
Class 8	Day Cab Mid Roof	17,100	10,000	38,000	65,100
Class 8	Day Cab Low Roof	17,000	10,500	38,000	65,500

(e) Tire Testing

In Phase 1, manufacturers are required to input their tire rolling resistance coefficient into GEM. Also in Phase 1, the agencies adopted the provisions in ISO 28580 to determine the rolling resistance of tires. As described in 40 CFR 1037.520(c), the agencies require that at least three tires for each tire design are to be tested at least one time. Our assessment of the Phase 1 program to date indicates that these requirements reasonably balance the need for precision, repeatability, and testing burden. Therefore we proposed to carry over the Phase 1 testing provisions for tire rolling resistance into Phase 2. 80 FR 40243. We welcomed comments regarding the tire testing provisions, but did not receive any. Therefore, based on the same reasoning presented at proposal, we are adopting the Phase 1 tire testing provisions in Phase 2.

In Phase 1, the agencies received comments from stakeholders highlighting a need to develop a reference lab and alignment tires for the HD sector. The agencies discussed the lab-to-lab comparison conducted in the Phase 1 EPA tire test program (80 FR 40243, citing to 76 FR 57184). The agencies reviewed the rolling resistance data from the tires that were tested at both the STL and Smithers laboratories to assess inter-laboratory and test machine variability. The agencies conducted statistical analysis of the data to gain better understanding of lab-to-lab correlation and developed an adjustment factor for data measured at each of the test labs. Based on these results, the agencies believe the lab-to-lab variation for the STL and Smithers laboratories will have very small effect on measured rolling resistance values. Based on the test data, the agencies judge for the HD Phase 2 program to continue to use the current levels of variability, and the agencies therefore proposed to allow the use of either Smithers or STL laboratories for determining the tire rolling resistance value. The agencies requested comment on the need to establish a reference machine for the HD sector and whether tire testing facilities are interested in and willing to commit to developing a reference machine. The agencies did not receive any comments on the issue. Therefore, again based on the reasoning presented at proposal, we are adopting the Phase 1 testing approach for Phase 2.

(2) Key Differences in HD Phase 2 Compliance Provisions

The agencies are adopting certain provisions in Phase 2 that are significantly different from Phase 1. Details regarding some of these key changes such as aerodynamic assessments, road grade in the drive cycles, weight reduction, GEM inputs, emission control labels, and chassis dynamometer testing are provided in this subsection.

(a) Aerodynamic Assessment

In Phase 1, the manufacturers conduct aerodynamic testing to establish the appropriate bin and GEM input for determining compliance with the CO₂ and fuel consumption standards. The agencies proposed to continue this general approach in HD Phase 2, but to make several enhancements to the aerodynamic assessment of tractors. As discussed below, we proposed some modifications to the aerodynamic test procedures—the addition of wind averaged drag in the aerodynamic assessment, the addition of trailer skirts to the standard trailer used to determine aerodynamic performance of tractors and revisions to the aerodynamic bins. As discussed in more detail in the following subsections, we are adopting many of the proposed Phase 2 aerodynamic test procedures, but with some additional revisions to the test procedures. These procedures are then appropriately reflected in the final Phase 2 aerodynamic bins.

(i) Phase 1 Aerodynamic Test Procedures

The aerodynamic drag of a vehicle is determined by the vehicle's coefficient of drag (Cd), frontal area, air density and speed. Quantifying tractor aerodynamics as an input to the GEM presents technical challenges because of the proliferation of tractor configurations and subtle variations in measured aerodynamic values among various test procedures. In Phase 1, Class 7 and 8 tractor aerodynamic results are developed by manufacturers using a range of techniques, including wind tunnel testing, computational fluid dynamics, and constant speed tests.

We continue to believe a broad approach allowing manufacturers to use these multiple test procedures to demonstrate aerodynamic performance of its tractor fleet is appropriate given that no single test procedure is superior in all aspects to other approaches. However, we also recognize the need for consistency and a level playing field in evaluating aerodynamic performance. To address the consistency and level

playing field concerns, NHTSA and EPA adopted in Phase 1, while working with industry, an approach that identified a reference aerodynamic test method (coastdown) and a procedure to align results from other aerodynamic test procedures with the reference method by applying a correction factor ($F_{alt-aero}$) to results from alternative methods. The Phase 1 regulations require manufacturers to use good engineering judgment in developing their corrections and specify some minimum testing requirements.

(ii) Reference Aerodynamic Method in Phase 2

Based on feedback received during the development of Phase 1, we understood even before the Phase 2 NPRM was issued that there was interest from some manufacturers to change the reference method in Phase 2 from coastdown to constant speed testing. EPA conducted an aerodynamic test program at Southwest Research Institute to evaluate both methods in terms of cost of testing, testing time, testing facility requirements, and repeatability of results. Details of the analysis and results are included in RIA Chapter 3.2. The results showed that the enhanced coastdown test procedures and analysis produced results with acceptable repeatability and at a lower cost than the constant speed testing. Based on the results of this testing, the agencies proposed to continue to use the enhanced coastdown procedure for the reference method in Phase 2.³⁰¹ 80 FR 40244. However, we welcomed comment on the need to change the reference method for the Phase 2 final rule to constant speed testing, including comparisons of aerodynamic test results using both the coastdown and constant speed test procedures. In addition, we welcomed comments on and suggested revisions to the constant speed test procedure specifications set forth in the proposal in Chapter 3.2.2.2 of the draft RIA and 40 CFR 1037.533 in the proposed regulations (40 CFR 1037.534 in the final regulations).

Several stakeholders provided comments both in favor and against the use of coastdown as the reference aero method for Phase 2 for tractors. CARB does not support the constant speed test as the reference method until it can be demonstrated to be superior to the coastdown methods. Their concerns included the cost associated with vehicle modifications required in test preparation (such as the torque meters

³⁰¹ Southwest Research Institute. "Heavy Duty Class 8 Truck Coastdown and Constant Speed Testing." April 2015.

on the wheel hubs). Daimler did not support a change to constant speed testing for the reference method and stated that more time is needed to determine if constant speed testing would be a better alternative. Navistar supports the coastdown as the reference method and does not believe constant speed testing should be adopted even as an alternative, unless significant further work is conducted. EMA stated that they could not support the adoption of constant speed testing as the reference method in Phase 2 because there is insufficient time in the process to properly study whether constant speed is equivalent to or better than coastdown testing. Further, EMA recommended that constant speed testing be included only as a potential alternative to be phased in at a future date if appropriate. Volvo opposed a change in the aerodynamic reference test method to constant speed at this time due to insufficient time to fully evaluate the new test method.

Exa supported the use of constant speed testing as a reference method because it is a real-world measurement with the ability to evaluate wind-averaged drag. Exa also cited some concerns that coastdown is limited to near zero wind yaw angle and does not accurately represent the aerodynamics experienced on the road. MEMA supported including the constant speed test based on research that has demonstrated that it is reliable relative to coastdown tests and is required in European aerodynamic test protocols. SABIC commented that constant speed testing may help isolate the aerodynamic drag from vibration, mechanical, and friction encountered at low speeds. SABIC also cited research that suggested constant speed testing may provide better repeatability than coastdown tests, and suggested that the U.S. may be able to promote harmonization with the required European constant speed testing.

After consideration of the comments, the agencies are continuing to use the Phase 1 approach of setting coastdown testing as the reference method for tractor aerodynamic assessment in Phase 2. After developing revised coastdown test procedures and data analysis methods for the final rule, we have concluded that coastdown testing continues to produce acceptable repeatability and can be conducted at a lower cost than constant speed testing. However, we are finalizing some revisions to the Phase 2 coastdown test procedures in response to comments and discussed below. The agencies are also continuing to allow alternative test methods to be used to determine the

aerodynamic performance of tractors in Phase 2, as long as the results are correlated back to the reference method using a correlation factor (Falt-aero). Additional details are included in the Falt-aero discussion below.

(iii) Coastdown Test Procedure Changes for Phase 2

The agencies worked closely with the tractor manufacturers between the Phase 2 NPRM and final rulemaking to develop robust coastdown test procedures that are technically sound.³⁰² EPA also continued to test additional tractors after the proposal to better inform the test procedure development. Based on this work, the agencies are adopting aerodynamic test procedures that have been improved from those proposed for Phase 2. The details of these procedures and their development are included in RIA Chapter 3.2. Below is a summary of the changes to the coastdown test procedures and data analysis method for the final rule.

The coastdown test procedure changes include the tested speed range, the calibration of the equipment, and specification of yaw and air speed measurements. The agencies proposed two test speed ranges for coastdown testing—70 to 60 mph and 25 to 15 mph. EPA's evaluation of the C_dA values in relation to yaw angle showed that the 25 to 15 mph low-speed range specified in the NPRM test procedures produced yaw curves that were flatter than expected and flatter than demonstrated using other test methods, such as wind tunnels and CFD. Upon further analysis, EPA found that by reducing the low-speed range to even lower speeds, the yaw curve results were more representative. The best speed range to alleviate this concern is a 15 to 5 mph low speed range; however, requiring this would significantly reduce the number of available days for testing in a given year because it would lead to a wind speed limit of 3 mph. Therefore, the agencies are adopting a low speed range of 20 to 10 mph to balance the yaw curve representativeness with the real world testing implications. Along with this test speed change, the component of the wind speed parallel to the road or track will be limited to less than or equal to 6 mph. The agencies are adopting Phase 2 coastdown test procedures that specify the yaw measurement method resolution and accuracy requirements similar to those proposed for constant

speed testing. The calibration of the yaw and air speed equipment will be conducted in a point-by-point manner for each run.

The coastdown data analysis changes include the analysis of low speed pairs and filtering methods, adjustments for rear axle losses and rolling resistance, and determination of the final C_dA value for coastdown. EPA found that the method proposed to analyze the coastdown results of paired runs leads to an unexpected yaw curve asymmetry. Upon further evaluation, EPA found that the yaw curve asymmetry is mitigated by averaging the road load force and air speed from every two opposite direction low-speed segments and using the average with each of the high speed segments in the data analysis. Therefore, the agencies are adopting this method for the Phase 2 final rules. The filtering of the air speed, yaw, vehicle speed, and track wind speed is necessary to remove outliers and replace the data with the moving median value to reduce the variability of coastdown test results. The agencies are specifying this filtering method in the final rules. Coastdown testing measures all of the losses associated with the vehicle, including aerodynamics, rolling resistance, and axle spin losses. To isolate the aerodynamic C_dA , it is important to remove the losses associated with drive axle and tire rolling resistance. For the final Phase 2 rules, the agencies are adopting the SAE J2452 test procedures that require manufacturers to measure the speed dependence of the tire rolling resistance for each of the steer, drive, and trailer tire models used on the article undergoing a coastdown test. The agencies are also requiring that manufacturers measure the speed dependence of the drive axle spin losses for the drive axle model used in the article undergoing a coastdown test using a subset of the rear axle efficiency test procedure being adopted in Phase 2.

The agencies have also developed a process of identifying and removing coastdown test result outliers for the final rules. First, the median yaw angle of the data is determined. All results outside of a range of plus or minus 1 yaw degree are removed. Then the mean C_dA value of the remaining data points is determined. C_dA values that lie outside of plus or minus two standard deviations from the C_dA mean are removed. At least 24 data points are needed after removal of outliers for the results to be valid. Finally, the mean C_dA and mean effective yaw angle are calculated from the remaining points. These values are then used to adjust to reflect a 4.5 degree yaw angle result

³⁰² Memo to Docket. Aerodynamic Subteam Meetings with EMA. July 2016. Docket EPA-HQ-OAR-2014-0827.

based on an alternate method yaw curve results.

(iv) Improving Correlation of Coastdowns With Alternative Methods ($F_{\text{alt-aero}}$)

As already noted, the agencies adopted in Phase 1 a coastdown procedure as the reference method (see 40 CFR 1066.310) and defined a process for manufacturers to align drag results from each of their own alternative test methods to the reference method results using $F_{\text{alt-aero}}$ (see 40 CFR 1037.525).³⁰³ Manufacturers are able to use any aerodynamic evaluation method in demonstrating a vehicle's aerodynamic performance as long as they obtain our prior approval and the method is aligned to the reference method. The agencies proposed to continue to use this alignment method approach in Phase 2 to maintain the testing flexibility that manufacturers have today. However, the agencies proposed to increase the rigor in determining the $F_{\text{alt-aero}}$ for Phase 2, including enhancing the minimum testing requirements. Beginning in MY 2021, we proposed that the manufacturers would be required to determine a new $F_{\text{alt-aero}}$ for each of their tractor models for each aerodynamic test method. In Phase 1, manufacturers are required to determine their $F_{\text{alt-aero}}$ using only a high roof sleeper cab with a full aerodynamics package (see 40 CFR 1037.521(a)(2) and proposed 40 CFR 1037.525(b)(2)). In Phase 2, we proposed that manufacturers would be required to determine a unique $F_{\text{alt-aero}}$ value for each major model of their high roof day cabs and high roof sleeper cabs. In Phase 2, we proposed that manufacturers may carry over the $F_{\text{alt-aero}}$ value until a model changeover or based on the agencies' discretion to require up to six new $F_{\text{alt-aero}}$ determinations each year. We requested comment on the amount of testing required to accurately develop a $F_{\text{alt-aero}}$ value and the burden associated with it. See 80 FR 40244.

The agencies received comments with regard to the need of $F_{\text{alt-aero}}$ and the burden of determining it. Exa Corporation (a supplier of CFD software) commented that it is not clear that the $F_{\text{alt-aero}}$ factor would alleviate challenges associated with their expectation that the absolute drag values will differ substantially between different test methods and different facilities. Exa suggested that the agencies require a

certification procedure for an alternate tool that includes a broad validation suite including different types of vehicles from aerodynamic sleeper to less aerodynamic day cabs. The HD vehicle manufacturers strongly recommended that the agencies reduce the number of coastdown tests that must be conducted each year. Navistar commented that only one $F_{\text{alt-aero}}$ should be required for Phase 2. Navistar's testing of their ProStar sleeper and day cabs found that the $F_{\text{alt-aero}}$ only differed within less than one percent using the same test facility. Navistar also commented that the data in the Phase 2 NPRM draft RIA show that three different sleepers show $F_{\text{alt-aero}}$ values within 0.4 percent. EMA commented that only one $F_{\text{alt-aero}}$ value should be required, as supported by the values shown in the Phase 2 Draft RIA where the $F_{\text{alt-aero}}$ values were 1.09 ± 0.02 for three tested vehicles. EMA also commented that the proposed requirements would be time-consuming, costly, and an unreasonable burden. Daimler supported EMA's comments. The HD vehicle manufacturers also submitted data to the agencies that show the $F_{\text{alt-aero}}$ values were within a range of one percent. Volvo shared data with the agencies that support that $F_{\text{alt-aero}}$ is highly consistent for varying truck models when correcting the test data under the conditions and methods that the industry has recommended. Volvo therefore concluded that multiple $F_{\text{alt-aero}}$ values are not necessary for Phase 2. PACCAR provided results from three tractor models showing the spread of $F_{\text{alt-aero}}$ is less than 0.3 percent.

The agencies determined the $F_{\text{alt-aero}}$ values for all of the tractors tested using different aerodynamic methods for Phase 2 using the aerodynamic test procedures and data analysis finalized for Phase 2. As shown in further detail in RIA Chapter 3.2.1, the $F_{\text{alt-aero}}$ values ranged between 1.13 and 1.20 for a single CFD software. Therefore, the agencies concluded that a single $F_{\text{alt-aero}}$ value is not sufficient for determining the correlation of test methods for all tractors. Furthermore, based on the comments and further refinement of our selective enforcement audit (SEA) provisions in the Phase 2 final rule, we are adopting provisions that require manufacturers to determine $F_{\text{alt-aero}}$ for a minimum of one day cab and one sleeper cab in MYs 2021, 2024, and 2027.³⁰⁴ While this significantly reduces the test burden from the levels proposed, it also only represents a minimum requirement. The agencies

believe that the improvements to the SEA requirements for aerodynamics will further encourage the manufacturers to ensure that they are accurately reflecting the $F_{\text{alt-aero}}$ for their entire tractor fleet and that they may do additional $F_{\text{alt-aero}}$ determinations beyond the minimum requirement in Phase 2. Without confidence in their $F_{\text{alt-aero}}$ values, manufacturers would risk SEA failures that could halt vehicle production. Even without failing the SEA overall, failing individual vehicles would lead to increased SEA testing. Thus, the SEA requirements will create a stronger incentive for manufacturers to use good engineering judgment for $F_{\text{alt-aero}}$ values.

The agencies also received comments from HD manufacturers stressing that coastdown testing does not produce C_dA values at zero yaw as assumed. Even at calm test conditions, the resulting yaw angle is something greater than zero degrees. The agencies evaluated our aerodynamic test data and agree with the manufacturers. Therefore, we are adopting Phase 2 provisions that use the effective yaw angle from coastdown testing to determine the $F_{\text{alt-aero}}$ value (see 40 CFR 1037.525). See RIA Chapter 3.2.2 for additional detail.

(v) Computational Fluid Dynamics

The agencies considered refinements to the computational fluid dynamics (CFD) modeling method to determine the aerodynamic performance of tractors in the NPRM. Specifically, we are considering whether the conditions for performing the analysis require greater specificity (e.g., wind speed and direction inclusion, turbulence intensity criteria value) or if turbulence model and mesh deformation should be required, rather than "if applicable," for all CFD analysis.³⁰⁵ The agencies welcomed comment on the proposed revisions.

Daimler and EMA recommended that the agencies should raise the test speed for CFD from the proposed 55 mph to 65 mph to be consistent with GEM and the sleeper cab tractor weighting of 86 percent. Daimler supported the agencies' other proposed revisions to CFD test procedures.

The agencies agree with the suggested comment to include consistency between the test methods and are adopting CFD provisions that include a test speed of 65 mph, along with the other proposed revisions. The agencies finalized these changes through incorporation of the SAE J2966 CFD guidelines with exceptions and clarifications to keep other aspects of

³⁰³ $F_{\text{alt-aero}}$ is an experimentally determined factor that represents the ratio of coastdown results to results from the alternative method. The agencies allow other functional forms of the relationship consistent with good engineering judgment.

³⁰⁴ See Section III.E.(2)(a)(ix) for details on the SEA requirements.

³⁰⁵ 40 CFR 1037.532 "Using computational fluid dynamics to calculate drag area (C_dA)."

the CFD simulations consistent with Phase 1.

(vi) Wind Averaged Drag Determination

In Phase 1, EPA and NHTSA recognized that wind conditions, most notably wind direction, have a greater impact on real world CO₂ emissions and fuel consumption of heavy-duty trucks than of light-duty vehicles.³⁰⁶ As noted in the NAS report, the wind average drag coefficient is about 15 percent higher than the zero degree coefficient of drag.³⁰⁷ In addition, the agencies received comments in Phase 1 that supported the use of wind averaged drag results for the aerodynamic determination. The agencies considered adopting the use of a wind averaged drag coefficient in the Phase 1 regulatory program, but ultimately decided to finalize drag values which represent zero yaw (*i.e.*, representing wind from directly in front of the vehicle, not from the side) instead. We took this approach recognizing that the reference method is coastdown testing and it is not capable of determining wind averaged yaw.³⁰⁸ Wind tunnels and CFD are currently the only tools to accurately assess the influence of wind speed and direction on a truck's aerodynamic performance. The agencies recognized, as NAS did, that the results of using the zero yaw approach may result in fuel consumption predictions that are offset slightly from real world performance levels, not unlike the offset we see today between fuel economy test results in the CAFE program and actual fuel economy performance observed in-use.

As the tractor manufacturers continue to refine the aerodynamics of tractors, we believe that continuing the zero yaw approach into Phase 2 would potentially impact the overall technology effectiveness or change the kinds of technology decisions made by the tractor manufacturers in developing equipment to meet our HD Phase 2 standards. Therefore, we proposed and are adopting aerodynamic test procedures that take into account the wind averaged drag performance of tractors. The agencies proposed to account for this change in aerodynamic test procedure by appropriately adjusting the aerodynamic bins to reflect a wind averaged drag result instead of a zero yaw result.

The agencies proposed and are adopting provisions that require manufacturers to adjust their C_dA values

to represent a zero yaw value from coastdown and add the C_dA impact of the wind averaged drag. The impact of wind averaged drag relative to a zero yaw condition can only be measured in a wind tunnel or with CFD. This requirement commences in MY 2021.

All stakeholders that commented on wind averaged drag supported its use over zero yaw. ACEEE supports the shift to the use of wind averaged drag in Phase 2. Exa supported the use of wind averaged drag because it is a better predictor of real world fuel economy. Michelin supported wind average drag assessments for a realistic and complete assessment of aerodynamic performance and would prevent the unintended consequence of incentivizing improvements that are better at zero wind conditions but sacrifice cross-wind performance. SABIC Innovative Plastics commented that it is imperative that wind effects be part of the standard due to the real-world impact of wind. Plastics Industry Trade Association supported wind average drag to better simulate real life conditions.

PACCAR and Daimler recommended the use of a surrogate angle of 4.5° in lieu of the nine angles required for a full wind averaged draft evaluation for CFD evaluated at 65 mph. PACCAR and Daimler provided data to support the use of a single angle. PACCAR also stated that there is significant CFD burden associated with the use of a nine angle yaw sweep. According to PACCAR in a given year, this would add approximately 4,000 additional simulations to their certification burden. EMA and other tractor manufacturers supported the single surrogate angle of 4.5° as being equivalent to the full yaw sweep result generated with SAE J1252.

As discussed in further detail in RIA Chapter 3.2.1.1.3, our data support that 4.5° results are a good surrogate for full wind averaged drag results for wind tunnel and CFD assessments. Therefore, we are adopting the 4.5° surrogate angle in Phase 2.

The agencies require that manufacturers use the following equation to make the necessary adjustments to a coastdown result to obtain the C_dA_{wa} value:

$$C_{dA_{wa}} = C_{dA_{effective\ yaw\ angle,\ coastdown}} * (C_{dA_{4.5^\circ}} / C_{dA_{effective\ yaw\ angle}})$$

If the manufacturer has a C_dA value from either a wind tunnel or CFD, then they will use the following equation to obtain the C_dA_{wad} value:

$$C_{dA_{wa}} = C_{dA_{4.5^\circ}} * F_{alt-aero}$$

Because the agencies are adopting a 4.5° surrogate angle, the agencies are not adopting the proposed provisions that

manufacturers have the option of determining the offset between zero yaw and wind averaged yaw either through testing or by using the EPA-defined default offset.

(vii) Standard Trailer Definition

Similar to the approach the agencies adopted in Phase 1, NHTSA and EPA are adopting provisions such that the tractor performance in GEM is judged assuming the tractor is pulling a standardized trailer.³⁰⁹ The agencies believe that an assessment of the tractor fuel consumption and CO₂ emissions should be conducted using a tractor-trailer combination, as tractors are invariably used in combination with trailers and this is their essential commercial purpose. Trailers, of course, also influence the extent of carbon emissions from the tractor (and vice-versa). We believe that using a standardized trailer best reflects the impact of the overall weight of the tractor-trailer and the aerodynamic technologies in actual use, and consequent real-world performance, where tractors are designed and used with a trailer. EPA research confirms what one intuit: Tractor-trailer pairings are almost always optimized, but this does not indicate that a tractor always uses the same trailer. EPA conducted an evaluation of over 4,000 tractor-trailer combinations using live traffic cameras in 2010.³¹⁰ The results showed that approximately 95 percent of the tractors were matched with the standard trailer specified (high roof tractor with dry van trailer, mid roof tractor with tanker trailer, and low roof with flatbed trailer). Therefore, the agencies are continuing the Phase 1 approach into Phase 2 GEM to use a predefined typical trailer in assessing overall performance for test purposes. As such, the high roof tractors will be paired with a standard dry van trailer; the mid roof tractors will be paired with a tanker trailer; and the low roof tractors will be paired with a flatbed trailer.

However, the agencies proposed a change to the definition of the standard dry van reference trailer used by tractor manufacturers to determine the aerodynamic performance of high roof tractors in Phase 2. We believe this is necessary to reflect the aerodynamic improvements experienced by the trailer fleet over the last several years due to influences from the California Air Resources Board mandate³¹¹ and EPA's

³⁰⁹ See 40 CFR 1037.501(g).

³⁰⁸ See 2010 NAS Report, Page 95.

SmartWay Transport Partnership. The standard dry van trailer used in Phase 1 to assess the aerodynamic performance of high roof tractors is a 53 foot box trailer without any aerodynamic devices. In the development of Phase 2, the agencies evaluated the increase in adoption rates of trailer side skirts and boat tails in the market over the last several years and have seen a marked increase. We estimate that approximately 50 percent of the new trailers sold in 2018 will have trailer side skirts.^{312 313} As the agencies look towards these tractor standards in the 2021 and beyond timeframe, we believe that it is appropriate to update the standard box trailer definition. In 2021–2027, we believe the trailer fleet will be a mix of trailers with no aerodynamics, trailers with skirts, and trailers with advanced aero; with the advanced aero being a very limited subset of the new trailers sold each year. Consequently, overall, we believe a trailer with a skirt will be the most representative of the trailer fleet for the duration of the regulation timeframe, and plausibly beyond. EPA has conducted extensive aerodynamic testing to quantify the impact on the coefficient of drag of a high roof tractor due to the addition of a trailer skirt. Details of the test program and the results can be found in RIA Chapter 3.2. The results of the test program indicate that on average, the impact of a trailer skirt matching the definition of the skirt specified in 40 CFR 1037.501(g)(1) is approximately eight percent reduction in drag area.

We proposed a definition of the standard dry van trailer in Phase 2—the trailer assumed during the certification process to be paired with a high roof tractor—that includes a trailer skirt starting in 2021 model year. 80 FR 40245. Even though the agencies proposed that new dry van trailer standards begin in 2018 MY, we did not propose to update the standard trailer in the tractor certification process until 2021 MY, to align with the new tractor standards. If we were to revise the standardized trailer definition for Phase 1, then we would have needed to revise the Phase 1 tractor standards. The details of the trailer skirt definition are included in 40 CFR 1037.501(g)(1). We

requested comment on our HD Phase 2 standard trailer configuration. We also welcomed comments on suggestions for alternative ways to define the standard trailer, such as developing a certified computer aided drawing (CAD) model.

The agencies received support in comments for adopting a reference trailer with skirts. Daimler supported the addition of side skirts to the Phase 2 reference trailer and stated that it aligns with their internal development process. Daimler also suggested that if the agencies believe there will be significant adoption of trailers with boat tails, then the agencies could update the C_dA bin value input to GEM and reduce it by 0.5 m^2 to reflect the actual on-road aerodynamics load without changing the standard trailer. The Plastics Industry Trade Association stated that the proposed reference trailer is representative of trailer aerodynamic improvements likely to emerge during Phase 2. Navistar suggested that the standard trailer should be more aerodynamic to reflect trailers that will be used during the life of Phase 2 tractors. ACEEE supports the use of a more aerodynamic reference trailer in Phase 2, however, they suggest an even more aerodynamic reference trailer be required that is closer to the aerodynamic packages projected to be installed on new trailers in 2027. ACEEE and UCS suggested that Phase 2 should facilitate the transition of promoting more tractor-trailer integration. ACEEE recommended providing manufacturers the option to test tractors with advanced trailers; correct the test result appropriately to account for the benefit provided by the trailer alone to promote integration of aerodynamically advanced tractors and trailers. UCS raised concerns that because tractors and trailers are interchangeable and that there is no guarantee that the Phase 2 tractors will pull the newest trailers, therefore, the agencies should not revise the standard trailer over the course of the rule.

The agencies re-evaluated the proposal to include trailer skirts on the Phase 2 reference trailer with consideration of the comments. Based on testing conducted to support the trailer portion of Phase 2, we found that on average a boat tail added to a dry van trailer with skirts reduces wind averaged C_dA by 0.6 m^2 .³¹⁴ We still project that the bulk of trailers that will be in operation during the life of tractors produced early in Phase 2 will be represented by the aerodynamic performance of a trailer with skirts. Therefore, we are adopting the reference

trailer as proposed. However, we also want to recognize that the trailer fleet will continue to evolve over the lifetime of tractors built and certified to Phase 2, especially from MY 2027 and later. We recognize that if we do not account for reduced aerodynamic loads in the real world, then we may not be appropriately evaluating the tractor powertrain. We considered changing the standard trailer in MY 2027; however, this would lead to significant testing burden for the manufacturers because they would have to determine new C_dA values for their entire fleet of tractors. Instead, we are adopting Phase 2 GEM that beginning in MY 2027 will take the C_dA input for each vehicle and reduce it by 0.3 m^2 to reflect the lower aerodynamic loads that are a mix of trailers with skirts and trailers with skirts and boat tails. This change has been accounted for in both the baseline and standard setting of the CO₂ emissions and fuel consumption values.

With respect to ACEEE's recommendation for the agencies to facilitate the transition to more integrated tractor-trailers, such as those demonstrated with SuperTruck, the agencies believe this would require a significant change in tractor-trailer logistics to encourage more matching of specific tractors to specific trailers in operation. We believe that this would be most appropriately handled through the Off-Cycle Credit program.

(viii) Aerodynamic Bins

The agencies proposed to continue the approach where the manufacturer would determine a tractor's aerodynamic drag force through testing, determine the appropriate predefined aerodynamic bin, and then input the predefined C_dA value for that bin into the GEM. 80 FR 40245. The agencies' Phase 2 aerodynamic bins reflect three changes to the Phase 1 bins—the incorporation of wind averaged drag, the addition of trailer skirts to the standard box trailer used to determine the aerodynamic performance of high roof tractors (as just explained above), and the addition of bins to reflect the continued improvement of tractor aerodynamics in the future. Because of each of these changes, the aerodynamic bins for Phase 2 are not directly comparable to the Phase 1 bins.

HD Phase 1 included five aerodynamic bins to cover the spectrum of aerodynamic performance of high roof tractors. Since the development of the Phase 1 rules, the manufacturers have continued to invest in aerodynamic improvements for tractors. This continued evolution of aerodynamic performance, both in

³¹⁴ See RIA Chapter 2.10.2.1.3.

production and in the research stage as part of the SuperTruck program, has consequently led the agencies to propose two additional aerodynamic technology bins (Bins VI and VII) for high roof tractors.

In both HD Phase 1 and Phase 2, aerodynamic Bin I through Bin V represent tractors sharing similar levels of technology. The first high roof aerodynamic category, Bin I, is designed to represent tractor bodies which prioritize appearance or special duty capabilities over aerodynamics. These Bin I tractors incorporate few, if any, aerodynamic features and may have several features that detract from aerodynamics, such as bug deflectors, custom sunshades, B-pillar exhaust stacks, and others. The second high roof aerodynamics category is Bin II, which roughly represents the aerodynamic performance of the average new tractor sold in 2010. The agencies developed this bin to incorporate conventional tractors that capitalize on a generally aerodynamic shape and avoid classic features that increase drag. High roof tractors within Bin III build on the basic aerodynamics of Bin II tractors with added components to reduce drag in the most significant areas on the tractor, such as integral roof fairings, side extending gap reducers, fuel tank fairings, and streamlined grill/hood/mirrors/bumpers, similar to 2013 model year SmartWay tractors. The Bin IV aerodynamic category for high roof tractors builds upon the Bin III tractor body with additional aerodynamic treatments such as underbody airflow treatment, down exhaust, and lowered ride height, among other technologies. HD Phase 1 Bin V tractors incorporate advanced technologies which are currently in the prototype stage of development, such as advanced gap reduction, rearview cameras to replace mirrors, wheel system streamlining, and advanced body designs. For HD Phase 2, the agencies proposed to segment the aerodynamic performance of these advanced technologies into Bins V through VII.

In Phase 1, the agencies adopted only two aerodynamic bins for low and mid roof tractors. The agencies limited the number of bins to reflect the actual range of aerodynamic technologies

effective in low and mid roof tractor applications. High roof tractors are consistently paired with box trailer designs, and therefore manufacturers can design the tractor aerodynamics as a tractor-trailer unit and target specific areas like the gap between the tractor and trailer. In addition, the high roof tractors tend to spend more time at high speed operation which increases the impact of aerodynamics on fuel consumption and GHG emissions. On the other hand, low and mid roof tractors are designed to pull variable trailer loads and shapes. They may pull trailers such as flat bed, low boy, tankers, or bulk carriers. The loads on flat bed trailers can range from rectangular cartons with tarps, to a single roll of steel, to a front loader. Due to these variables, manufacturers do not design unique low and mid roof tractor aerodynamics but instead use derivatives from their high roof tractor designs. The aerodynamic improvements to the bumper, hood, windshield, mirrors, and doors are developed for the high roof tractor application and then carried over into the low and mid roof applications. As mentioned above, the types of designs that will move high roof tractors from a Bin III to Bins IV through V include features such as gap reducers and integral roof fairings which will not be appropriate on low and mid roof tractors.

As Phase 2 looks to further improve the aerodynamics for high roof sleeper cabs, we believe it is also appropriate to expand the number of bins for low and mid roof tractors too. For Phase 2, the agencies proposed to differentiate the aerodynamic performance for low and mid roof applications with four bins, instead of two, in response to feedback received from manufacturers of low and mid roof tractors related to the limited opportunity to incorporate certain aerodynamic technologies in their compliance plan. However, upon further discussions with EMA, it became evident to the agencies that the most straightforward approach would be to include the same number of low and mid roof aero bins as we have for high

roof tractors.³¹⁵ Therefore, we are adopting seven aero bins for low and mid roof tractors in Phase 2. In addition, we proposed and are adopting provisions that allow low and mid roof tractor aerodynamic bins to be determined based on the aerodynamic bin of an equivalent high roof tractor, as shown below in Table III–31.

TABLE III–31—PHASE 2 REVISIONS TO 40 CFR 1037.520(b)(3)

High roof bin	Low and mid roof bin
Bin I	Bin I.
Bin II	Bin II.
Bin III	Bin III.
Bin IV	Bin IV.
Bin V	Bin V.
Bin VI	Bin VI.
Bin VII	Bin VII.

The agencies developed new high roof tractor aerodynamic bins for Phase 2 that reflect the change from zero yaw to wind averaged drag, the more aerodynamic reference trailer, and the addition of two bins. Details regarding the derivation of the high roof bins are included in RIA Chapter 3.2.1.2. The high roof bin values being adopted in the HD Phase 2 final rulemaking differ from those proposed due to the coastdown and other aerodynamic test procedures changes discussed above in Section III.E.2.a. However, as explained above in Section III.D.1, in both the NPRM and this final rulemaking, we developed the Phase 2 bins such that there is an alignment between the Phase 1 and Phase 2 aerodynamic bins after taking into consideration the changes in aerodynamic test procedures and reference trailers required in Phase 2. The Phase 2 bins were developed so that a tractor that performed as a Bin III in Phase 1 would also perform as a Bin III tractor in Phase 2. The high roof tractor bins are defined in Table III–32. The final revisions to the low and mid roof tractor bins reflect the addition of five new aerodynamic bins and are listed in Table III–33.

(ix) Selective Enforcement Audits (SEA) and Confirmatory Testing for Aerodynamics

EPA has long required manufacturers to perform SEAs to verify that actual production engines and vehicles conform to their certificates. Before this rulemaking, the regulations in 40 CFR 1037.301 provided generally for SEAs for Phase 1 vehicles, but did not provide specific descriptions of how such testing would be conducted for coastdowns. In Phase 1, we adopted interim provisions in 40 CFR 1037.150(k) that accounted for coastdown measurement variability by

allowing a compliance demonstration based on in-use test results if the drag area was at or below the maximum drag area allowed for the bin above the bin to which the vehicle was certified. Since adoption of Phase 1, EPA has conducted in-use aerodynamic testing and found that uncertainty associated with coastdown testing is less than anticipated.³¹⁶ In addition, as noted earlier in this Section III.E.(2)(a), we proposed and are adopting additional enhancements in the Phase 2 coastdown

³¹⁶ Southwest Research Institute. "Heavy Duty Class 8 Truck Coastdown and Constant Speed Testing." April 2015.

procedures to continue to reduce the variability of coastdown results, including the impact of environmental conditions. Therefore, we are sunseting the provision in 40 CFR 1037.150(k) at the end of the Phase 1 program (after the 2020 model year). In the NPRM, we proposed a conventional approach to conducting SEAs with respect to aerodynamics. See 80 FR at 40156 and proposed section 1037.301. We requested comment on whether or not we should factor in a test variability compliance margin into the aerodynamic test procedure, and

therefore requested data on aerodynamic test variability.

The agencies received comments from manufacturers arguing for the agencies to establish compliance margins that would allow actual production vehicles to exceed the standards by some fixed amount. These comments included specific requests for an aerodynamic compliance margin. We also received comments from UCS supporting the elimination of the aerodynamic compliance margin. As explained in Section I.C.1, although EPA sometimes provides interim compliance margins to facilitate the initial implementation of new programs, we generally do not consider such an approach to be an appropriate long-term policy. Nevertheless, EPA recognizes that compliance testing relying on coastdowns to evaluate aerodynamic parameters differs fundamentally from traditional compliance testing, in which test-to-test variability is normally expected to be small relative to production variability. With coastdown testing, however, test-to-test variability is expected to be larger relative to production variability. In response to comments addressing this difference, EPA developed a different structure for conducting SEAs to evaluate tractor C_dA

and solicited supplemental comments on it. See 81 FR 10825. This new structure reflects an approach that would be consistent with the following principles:

- Test-to-test variability for individual coastdown runs can be high, so compliance determinations should be based on average values from multiple runs.
- Coastdown testing of a single vehicle is expensive and time consuming, so testing should focus more on repeat tests for the same vehicle than on tests for multiple vehicles. However, manufacturers should not be required to conduct more than 100 valid coastdown runs on any single vehicle.
- Compliance determinations should be based on whether or not the true value for the C_dA falls within the bin to which the vehicle was certified, rather than on whether or not the true value for the C_dA exceeds the value measured for certification.
- Given the limited ability to eliminate uncertainty, compliance determinations should consider the statistical confidence that a true value lies outside a bin.

Commenters were generally very supportive of these principles and the proposed structure.

We believe the structure being finalized appropriately balances EPA's need to provide strong incentives for manufacturers to act in good faith with manufacturers' need to avoid compliance actions based on inaccurate testing. Our current assessment is that, where a manufacturer acts in good faith when certifying and uses good engineering judgment throughout the process, false failures for individual vehicles would be rare and false failures for a family would not occur.

Under this approach, EPA would select a production vehicle for coastdown testing, and the manufacturer would be required to perform up to 100 valid coastdown runs to demonstrate whether or not the vehicle was certified to the correct bin. The coastdown results must be adjusted to a yaw angle of 4.5° using an alternate aerodynamic method. EPA will address uncertainty in the measurement using a confidence interval around the mean C_dA value, where the confidence interval will be calculated from the standard deviation of the C_dA values (σ) and the number of runs (n) according to the following equation:

$$\text{Confidence interval} = \text{mean} \pm \left(\frac{1.5 \cdot \sigma}{\sqrt{n}} + 0.03 \right)$$

For example, the result of the testing could be a C_dA value of 5.90 ± 0.09 , which would fall entirely within Bin III for high roof sleeper cabs.³¹⁷ If the vehicle had been certified to Bin III or lower, this would be considered a passing test. If it had been certified to Bin IV or higher, this would be considered a failing test. For each vehicle that fails, the manufacturer would be required to test two additional vehicles up to a maximum of 11 vehicles. Manufacturers would have the option to select the same vehicle configuration, or they could choose to have EPA select another configuration within the family. It is appropriate to allow manufacturers the opportunity to retest the same failed configurations because they would only do so where there had reasonable confidence that the failure did not accurately reflect the true value.

The regulations require that manufacturers continue testing until the results are clearly either above or below the applicable bin boundary (*i.e.*, the confidence interval does not cross the boundary), or until 100 runs are completed. By making the confidence interval a function of the number of runs, it will generally become smaller as additional runs are completed, so that it would be increasingly likely to have a clear result as additional runs are completed. Nevertheless, there may be some cases where the results are close enough to the bin boundary that the confidence interval still crosses the boundary after 100 runs, meaning the true C_dA value could be slightly above or slightly below the bin boundary. The regulations will treat these results as passing.

It is important to note that, although SEAs are directed by EPA, the actual testing is conducted by the manufacturer at their chosen facilities. This minimizes many potential causes of test variability, such as differences in test trailers, test tracks, or

instrumentation. Thus confidence intervals need only reflect true test-to-test variability. Also, manufacturers generally rent facilities for coastdown testing as needed, which means EPA will need to provide some advance notice to allow the manufacturer to reserve the appropriate facility.

In selecting the original configuration and subsequent selections, EPA would likely consider vehicles with measured C_dA values near the top of the bin since they could be most the likely to be mis-certified based on inaccurate results. However, EPA could select any configuration. For subsequent testing if the first vehicle fails, manufacturers would be allowed to retest the same configuration (but not the same exact vehicle). EPA believes this would not decrease the risk of failure for subsequent vehicles, but could allow a manufacturer the opportunity to show its design was actually compliant.

With respect to confirmatory testing, which is testing EPA conducts during certification rather than during production, EPA has generally

³¹⁷ As specified in 40 CFR 1037.305, bin boundaries for this determination are expressed to two decimal places and adjusted for rounding effects.

considered its test results to be the official test results. However, we recognize that we need to treat confirmation of a manufacturer's $F_{alt-aero}$ differently because small changes in its value would be spread over an entire family. Therefore, EPA is adopting an interim provision that would apply the SEA confidence interval approach for confirmatory testing with respect to $F_{alt-aero}$. EPA would also attempt to use the same test trailers, test locations, and instrumentation that the manufacturer. Nevertheless, we expect to revisit this issue in the future.

(b) Road Grade in the Drive Cycles

Road grade can have a significant impact on the overall fuel economy of a heavy-duty vehicle. Table III-34 shows the results from a real world evaluation of heavy-duty tractor-trailers conducted by Oak Ridge National Lab.³¹⁸ The study found that the impact of a mild upslope of one to four percent led to a decrease in average fuel economy from 7.33 mpg to 4.35 mpg. These results are as expected because vehicles consume more fuel while driving on an upslope than driving on a flat road because the vehicle needs to exert additional power to overcome the grade resistance force.³¹⁹ The amount of extra fuel increases with increases in road gradient. On downgrades, vehicles consume less fuel than on a flat road. However, as shown in the fuel consumption results in Table III-34, the amount of increase in fuel consumption on an upslope is greater than the amount of decrease in fuel consumption on a downslope which leads to a net increase in fuel consumption. As an example, the data show that a vehicle would use 0.3 gallons per mile more fuel in a severe upslope than on flat terrain, but only save 0.1 gallons of fuel per mile on a severe downslope. In another study, Southwest Research Institute modeling found that the addition of road grade to a drive cycle has an 8 to 10 percent negative impact on fuel economy.³²⁰

TABLE III-34—FUEL CONSUMPTION
RELATIVE TO ROAD GRADE

Type of terrain	Average fuel economy (miles per gallon)	Average fuel consumption (gallons per mile)
Severe upslope (>4%) ..	2.90	0.34
Mild upslope (1% to 4%) ..	4.35	0.23
Flat terrain (1% to 1%) ..	7.33	0.14
Mild downslope (–4% to –1%) ..	15.11	0.07
Severe downslope (≤4%) ..	23.50	0.04

In Phase 1, the agencies did not include road grade. However, we believe it is important to include road grade in Phase 2 to properly assess the value of technologies, such as downspeeding and the integration of the engine and transmission, which were not technologies included in the technology basis for Phase 1 and are not directly assessed by GEM in its Phase 1 iteration. The addition of road grade to the drive cycles is consistent with the NAS recommendation in the 2014 Phase 2 First Report.³²¹

The U.S. Department of Energy and EPA partnered to support a project to develop the appropriate road grade profiles for the 55 mph and 65 mph highway cruise duty cycles that will be used in the certification of heavy-duty vehicles to the Phase 2 final GHG emission and fuel efficiency standards. The National Renewable Energy Laboratory (NREL) was contracted to do this work and has developed a database of activity-weighted percent road grades representative of U.S. limited-access highways. To this end, NREL used high-accuracy road grade data and county-specific vehicle miles traveled data. A report documenting this NREL work is in the public docket for these final rules.³²²

In the Phase 2 proposal, the agencies developed an interim road grade profile and provided information in the docket on two NREL-derived road grade profiles. The agencies proposed the inclusion of an interim road grade profile, in both the 55 mph and 65 mph cycles. The grade profile was developed by Southwest Research Institute on a 12.5 mile stretch of restricted-access highway during on-road tests conducted for EPA's validation of the Phase 2

version of GEM.³²³ The agencies also included an additional road grade profile as part of the Notice of Data Availability (81 FR at 10825). The agencies sought comment on all of the road grade profiles.

Cummins supported the development of road grade and stated that the proposed road grade with ± 2 percent did not reflect their assessment of the distribution of North American roads with a distribution of road grades of ± 6 percent. ACEEE supported inclusion of road grade. Daimler, Navistar, EMA, Volvo, and Eaton commented that the road grade profile presented in the NODA were too steep and did not represent real world driving. Their primary concern was related to the fraction of time the engine spent at full load for various vehicle configurations. According to the manufacturers, the road grade cycle presented in GEM in the NODA spent too high of a fraction of time at full load.

After considering the road grade profile comments and using the NREL database, the agencies have independently developed a road grade profile for the final rules for use in the 55 mph and 65 mph highway cruise duty cycles for the Phase 2 final rulemaking. While based on the same road grade database generated by NREL for U.S. restricted-access highways, its design is predicated on a different approach. The development of this profile is documented in the RIA Chapter 3.4.2.1. The road grade in the final rules includes a stretch with zero percent grade and lower peak grades than the profile presented in the NODA. The minimum grade in the final cycle is –5 percent and the maximum grade is 5 percent. The cycle spends 46 percent of the distance in grades of ± 0.5 percent. Overall, the cycle spends approximately 66 percent of the time in relatively flat terrain with road gradients of ± 1 percent. A detailed discussion of the road grade profile is included in RIA Chapter 3.4.2.1.

(c) Heavy-Haul Provisions

The agencies proposed that heavy-haul tractors demonstrate compliance with the standards using the day cab drive cycle weightings of 19 percent transient cycle, 17 percent 55 mph cycle, and 64 percent 65 mph cycle. We also proposed that GEM simulates the heavy-haul tractors with a payload of 43

³¹⁸ Oakridge National Laboratory. Transportation Energy Book, Edition 33. Table 5.10 Effect of Terrain on Class 8 Truck Fuel Economy. 2014. Last accessed on September 19, 2014 at <http://cta.ornl.gov/data/Chapter5.shtml>.

tons and a total tractor, trailer, and payload weight of 118,500 lbs. In addition, we proposed that the engines installed in heavy-haul tractors meet the tractor engine standards included in 40 CFR 1036.108. We welcomed comments on these specifications.

Volvo does not agree with the proposal that the engine installed in a heavy-haul tractor must meet the tractor engine standard defined in 40 CFR 1036.108. As discussed below in Section III.E.2.i, we have modified 40 CFR 1037.601(a)(1) in this final rulemaking to remove the prohibition of using vocational engines in tractors.

(d) Weight Reduction

In Phase 1, the agencies adopted regulations that provided manufacturers with the ability to use GEM to measure emission reduction and reductions in fuel consumption resulting from use of high strength steel and aluminum components for weight reduction, and to do so without the burden of entering the curb weight of every tractor produced. We treated such weight reduction in two ways in Phase 1 to account for the fact that combination tractor-trailers weigh-out approximately one-third of the time and cube-out approximately two-thirds of the time. Therefore, one-third of the weight reduction is added payload in the denominator while two-thirds of the weight reduction is subtracted from the overall weight of the vehicle in GEM. See 76 FR 57153. The agencies also allowed manufacturers to petition for off-cycle credits for components not measured in GEM.

NHTSA and EPA proposed to carry the Phase 1 treatment of weight reduction into Phase 2. That is, these types of weight reduction, although not part of the agencies' technology packages for the final standards, can still be recognized in GEM up to a point. In addition, the agencies proposed to add additional thermoplastic components to the weight reduction table. The thermoplastic component weight reduction values were developed in coordination with SABIC, a thermoplastic component supplier. Also, in Phase 2, we proposed to

recognize the potential weight reduction opportunities in the powertrain and drivetrain systems as part of the vehicle inputs into GEM. Therefore, we believe it is appropriate to also recognize the weight reduction associated with both smaller engines and 6x2 axles.³²⁴ We welcomed comments on all aspects of weight reduction. 80 FR 40249.

Several organizations suggested changes to specific weights proposed in the NPRM. The Aluminum Association cited several additional advancements in the aluminum industry and stated that the proposed table is appropriate when these components are considered for substitution on an individual basis. Aluminum Association also asked the agencies to add a 500 pound weight reduction for switching from steel to aluminum tractor cabs, among other components. Meritor supported the inclusion and expansion of the weight reduction technologies in the NPRM. Meritor suggested the aluminum carriers illustrate consistent weight reductions of 60 pounds for the rear-front-drive axle, 35 pounds for the rear-rear-drive axle and therefore 95 pounds for the tandem. Based on their data, Meritor recommends that a 42 pound weight savings be credited per tractor for using High-Strength steel drums on the steer (non-drive) axle and 74 pound per vehicle for 6x4 drive axle applications. Meritor anticipates the availability of an aluminum version of a brake bracket in the timeframe of the regulation which will provide a calculated per vehicle weight savings of 36 pounds for a 6x4 configuration. Meritor believes that weight savings should be credited for the use of single-piece drivelines in excess of 86" because today, most drivelines in excess of 86" are two piece. American Iron and Steel Institute commented that light weight values for high strength steel should be adjusted upward in the FRM, citing light duty vehicle weight reduction approaches using high strength steel and saying these improvements should apply to the heavy-duty sector as well. Daimler commented that increased credit should be given to hoods and fairings for the difference between steel and thermoplastic, but no specific values

were provided. PACCAR recommends that the agencies broaden the definition of "composite" to include materials other than thermoplastics, including thermoplastics, thermosets, and fiber reinforced plastics.

Some organizations commented against including some or all light-weight components for compliance with the tractor standards. American Iron and Steel Institute commented against the inclusion of any light-weight components as a compliance mechanism for tractors unless improved technical data to support the weight saving values are used. Daimler commented that the weight reduction values for engines less than 15 liters are arbitrary. Allison commented that the agencies should establish weight penalties for components that increase weight, and they used the example of MT/AMT with countershaft architectures.

We have expanded the list of weight reduction technologies for some steel and aluminum components for the final rule based on information provided in the comments. We did not adopt weight reduction values for some components, such as an axle carrier, because we are not confident that this is not double counting the weight reduction of the axles already provided in the regulations. We also did not adopt weight reduction values for technologies still in development, such as aluminum brake brackets. The agencies are not finalizing a weight penalty for any components since this would require detailed information on conventional and light-weight tractor components to establish a baseline and the weight reduction potential for each component. In addition, we are not broadening the definition of composite at this time to include materials other than thermoplastics because the specific weight reduction values in the table are specific to thermoplastics. We are adopting the values listed in Table III-35 and Table III-36 and making them available upon promulgation of the final Phase 2 rules (*i.e.*, available even under Phase 1). Additional weight reduction would be evaluated as a potential off-cycle credit.

(e) GEM Inputs

The agencies proposed to continue to require the Phase 1 GEM inputs for

³²⁵ Kenworth. "Kenworth T680 with PACCAR MX-13 Engine Lowers Costs for Oregon Open-Deck Carrier." Last viewed on December 16, 2014 at <http://www.kenworth.com/news/news-releases/2013/december/t680-cotc.aspx>.

tractors in Phase 2. These inputs include the following:

- Steer tire rolling resistance,
- Drive tire rolling resistance,
- Coefficient of Drag Area,
- Idle reduction,
- Weight reduction, and
- Vehicle Speed Limiter.

As discussed above in Section II.C and III.D, there are several additional inputs that we are adopting for Phase 2. The majority of these new inputs are the same as proposed, with the addition of two new optional inputs to account for transmission and axle efficiency improvements in response to comments. The new GEM inputs for Phase 2 include the following:

- Engine information including manufacturer, model, combustion type, fuel type, family name, and calibration identification,

- Engine steady state and cycle average fuel maps,
- Engine full-load torque curve,
- Engine motoring curve,
- Transmission information including manufacturer and model,
- Transmission type,
- Transmission gear ratios,
- Transmission loss map (optional),
- Drive axle(s) ratio,
- Axle power loss map (optional),
- Tire size (revolutions per mile) for drive tires, and
- Other technology inputs.

(f) Vehicle Speed Limiter Provisions

The agencies received comments during the development of Phase 1 that the Clean Air Act provisions to prevent tampering (CAA section 203(a)(3)(A)) of vehicle speed limiters and extended idle reduction technologies would prohibit

their use for demonstrating compliance with the Phase 1 standards. In Phase 1, the agencies adopted provisions to allow for discounted credits for idle reduction technologies that allowed for override conditions and expiring engine shutdown systems (see 40 CFR 1037.660). Similarly, the agencies adopted provisions to allow for “soft top” speeds and expiring vehicle speed limiters, and we did not propose to change those provisions (see 40 CFR 1037.640). However, as we developed Phase 2, we understood that the concerns still exist that the ability for a tractor manufacturer to reflect the use of a VSL in its compliance determination may be constrained by the demand for flexibility in the use of VSLs by the customers. The agencies welcomed suggestions on how to close the gap between the provisions that would be acceptable to the industry while maintaining our need to ensure that modifications do not violate section 203(a)(3)(A). We requested comment on potential approaches which would enable a feedback mechanism between the vehicle owner/fleet that would provide the agencies the assurance that the benefits of the VSLs will be seen in use but would also provide the vehicle owner/fleet the flexibility they may need during in-use operation. More generally, in our discussions with several trucking fleets and with the American Trucking Associations, an interest was expressed by the fleets if there was a means by which they could participate in the emissions credit transactions that are currently limited to the directly regulated truck manufacturers. VSLs were an example technology that fleets and individual owners can order for a new build truck, and for which, from the fleets’ perspective, the truck manufacturers receive emission credits. The agencies did not have a specific suggestion in the Phase 2 NPRM or a position on the request from the American Trucking Association and its members, but we requested comment on whether or not it is appropriate to allow owners to participate in the overall compliance process for the directly regulated parties, if such a thing is allowed under the two agencies’ respective statutes, and what regulatory provisions would be needed to incorporate such an approach. 80 FR 40250.

The agencies received comments regarding VSLs. ATA commented that the agencies should recognize in GEM VSLs set at speeds less than the speed limit mandated if a rule is adopted by NHTSA and FMCSA. ATA also suggested that the agencies should

explore ways of incorporating the in-use benefits being derived from VSLs, such as allowing manufacturers to accept a purchaser’s commitment to establish a maximum limited speed, as opposed to the tamper-proof option, when acknowledged and affirmed on a vehicle’s purchase agreement. ATA also suggested that the agencies allow manufacturers to adjust VSLs at the end of a vehicle’s lease or trade-in and allow the creation of deficits or credits if such adjustments affect the initial VSL effectiveness that was generated and allow trucking companies to adjust maximum speeds if company policies change during the ownership cycle with corresponding adjustment to manufacturer credits. CARB stated it is not clear what fleet owners would do with Phase 2 credits and allowing fleet owners to garner such credits would unnecessarily complicate implementation and enforcement of the Phase 2 program. As a result, CARB staff recommends not including owners in emission credit transactions for VSL installation. Daimler suggested that they report in their 270 day end of year report the number of VSLs that remain active. Daimler recommends that the agencies provide in GEM reduced effectiveness for non-regulatory VSLs in proportion to the fraction of non-regulatory ones that remained unaltered, based upon their study of their database. Volvo commented that approximately 15 percent of tractors built over 2013–2015 were shipped with their programmable road speed limiters set at less than 65 mph from the factory and 47 percent were reported in use with the same setting, even during a period of very low fuel prices. Volvo Group requests that the agencies consider providing an effectiveness value in GEM for reprogrammable speed limiters set at the factory at, or below 65 mph. UPS commented that instead of tamperproof VSLs, they would support a regulatory approach in which the fleet owner can adjust speed settings, but only if certified personnel make these changes and their activities within the ECIVIs are trackable and fully accountable to proper authorities.

The agencies considered the comments and the compliance burden associated with the suggestions. The agencies also considered DOT’s upcoming actions with respect to mandatory vehicle speed limiters for heavy-duty trucks. The existing Phase 1 VSL flexibilities provide opportunities for manufacturers to use VSL as a technology in GEM while still allowing the settings to change after an “expiration” time determined by the

manufacturer. At this time, we believe that the Phase 1 flexibilities sufficiently balance the desire to encourage technologies that reduce GHG emissions and fuel consumption while minimizing the compliance burden of trying to accommodate changes throughout the useful life of the vehicle. Therefore, the agencies are not adopting any new VSL provisions for Phase 2 and the Phase 1 provisions will continue (see 40 CFR 1037.640).

(g) Emission Control Labels

The agencies consider it crucial that authorized compliance inspectors are able to identify whether a vehicle is certified, and if so whether it is in its certified condition. To facilitate this identification in Phase 1, EPA adopted labeling provisions for tractors that included several items. The Phase 1 tractor label must include the manufacturer, vehicle identifier such as the Vehicle Identification Number (VIN), vehicle family, regulatory subcategory, date of manufacture, compliance statements, and emission control system identifiers (see 40 CFR 1037.135). In Phase 1, the emission control system identifiers are limited to vehicle speed limiters, idle reduction technology, tire rolling resistance, some aerodynamic components, and other innovative and advanced technologies.

The number of emission control systems for greenhouse gas emissions in Phase 2 has increased significantly. For example, all aspects of the engine transmission and drive axle; accessories; tire radius and rolling resistance; wind averaged drag; predictive cruise control; idle reduction technologies; and automatic tire inflation systems are controls that can be evaluated on-cycle in Phase 2 (*i.e.* these technologies’ performance can now be input to GEM), but could not be in Phase 1. Due to the complexity in determining greenhouse gas emissions as in Phase 2, the agencies do not believe that we can unambiguously determine whether or not a vehicle is in a certified condition through simply comparing information that could be made available on an emission control label with the components installed on a vehicle. Therefore, EPA proposed to remove the requirement to include the emission control system identifiers required in 40 CFR 1037.135(c)(6) and in Appendix III to 40 CFR part 1037 from the emission control labels for vehicles certified to the Phase 2 standards. However, the agencies requested comment on the appropriate content that would properly balance the need to limit label content with the interest in providing the most useful information for inspectors to

confirm that vehicles have been properly built. The agencies received comments on the emission control labels. Navistar supported the elimination of the emission control information from the vehicle GHG label. After considering the comments, EPA is finalizing the proposed tractor labeling requirements. Nevertheless, as described below we remain interested in finding a better approach for labeling.

Under the agencies' existing authorities, manufacturers must provide detailed build information for a specific vehicle upon our request. Our expectation is that this information should be available to us via email or other similar electronic communication on a same-day basis, or within 24 hours of a request at most. The agencies have started to explore ideas that would provide inspectors with an electronic method to identify vehicles and access on-line databases that would list all of the engine-specific and vehicle-specific emissions control system information. We believe that electronic and Internet technology exists today for using scan tools to read a bar code or radio frequency identification tag affixed to a vehicle that could then lead to secure on-line access to a database of manufacturers' detailed vehicle and engine build information. Our exploratory work on these ideas has raised questions about the level of effort that would be required to develop, implement and maintain an information technology system to provide inspectors real-time access to this information. We have also considered questions about privacy and data security. We requested comment on the concept of electronic labels and database access, including any available information on similar systems that exist today and on burden estimates and approaches that could address concerns about privacy and data security. Based on new information that we receive, we stated in the NPRM that we may consider initiating a separate rulemaking effort to propose and request comment on implementing such an approach.

(h) End of Year Reports

In the Phase 1 program, manufacturers participating in the ABT program provided 90 day and 270 day reports to EPA and NHTSA after the end of the model year. The agencies adopted two reports for the initial program to help manufacturers become familiar with the reporting process. For the HD Phase 2 program, the agencies proposed to simplify reporting such that manufacturers would only be required to submit the final report 90 days after the end of the model year with the

potential to obtain approval for a delay up to 30 days. We requested comments on this approach. EMA, PACCAR, Navistar, Daimler, and Cummins recommended keeping the 270 day report to allow sufficient time after the production period is completed. We are accordingly keeping both the 90 day and 270 day reports, with the ability of the agencies to waive the 90 day report.

(i) Other Compliance Provisions

In Phase 2, the agencies are adopting provisions to evaluate the performance of the engine, transmission, and drivetrain in determining compliance with the Phase 2 tractor standards. With the inclusion of the engine's performance in the vehicle compliance, EPA proposed to modify the prohibition to introducing into U.S. commerce a tractor containing an engine not certified for use in tractor (see proposed 40 CFR 1037.601(a)(1)). During development of the Phase 2 NPRM, we no longer saw the need to prohibit the use of vocational engines in tractors because the performance of the engine would be appropriately reflected in GEM. We welcomed comments on removing this prohibition.

The agencies received comments supporting the proposed approach. PACCAR supports removing the prohibition on the installation of vocational engines into tractors where these engines are appropriate for the customer's application. Daimler agreed with the proposal that with the engine properly represented in GEM, there is less need for the prohibition on vocational-only certified engines in tractors and that the true in-vehicle emissions are represented by the full-vehicle standard. Accordingly, we are modifying 40 CFR 1037.601(a)(1) in this final rulemaking to remove the prohibition of using vocational engines in tractors.

The agencies also proposed to change the compliance process for manufacturers seeking to use the off-road exclusion. During the Phase 1 program, manufacturers realized that contacting the agencies in advance of the model year was necessary to determine whether vehicles would qualify for exemption and need approved certificates of conformity. The agencies found that the petition process allowed at the end of the model year was not necessary and that an informal approval during the precertification period was more effective. Therefore, NHTSA proposed to remove its off-road petitioning process in 49 CFR 535.8 and EPA proposed to add requirements for informal approvals in 40 CFR 1037.610. The agencies did not receive any

comments regarding the petition process. We are adopting the Phase 2 provisions as proposed.

In Phase 1 and as proposed in Phase 2, the agencies allow manufacturers to certify vehicles into a higher service class. No credits can be generated from vehicles certified to the higher service class, but any deficit produced must be offset by credits generated from other vehicles within the higher service class. Though the agencies did not propose any changes, we received comments on the treatment of 4x2 tractors. EMA and the manufacturers suggest that tractors with a 4x2 axle configuration and a heavy heavy-duty engine should be classified as a Class 8 tractor regardless of GVWR and be included in the Class 8 averaging set. Navistar and EMA stated that these vehicles are typically purchased to pull multiple trailers, even though the GVWR is less than 33,000 pounds. In the agencies' assessment, we agree with the manufacturers that these vehicles resemble Class 8 work and due to the higher useful life requirements, we are adopting provisions into the Phase 2 regulations that gives all manufacturers the option to classify Class 7 tractors with 4x2 axle configurations as Class 8 tractors.

(j) Chassis Dynamometer Testing Requirement

The agencies foresee the need to continue to track the progress of the Phase 2 program throughout its implementation. As discussed in Section II, the agencies expect to evaluate the overall performance of tractors with the GEM results provided by manufacturers through the end of year reports. However, we also need to continue to have confidence in our simulation tool, GEM, as the vehicle technologies continue to evolve. Therefore, EPA proposed that the manufacturers conduct annual chassis dynamometer testing of three sleeper cab tractors and two day cab tractors and provide the data and the GEM result from each of these tractor configurations to EPA (see 40 CFR 1037.665). 80 FR 40251. We requested comment on the costs and efficacy of this data submission requirement.

In response, the agencies received mixed comments supporting and raising concerns about the proposed chassis test requirements. ACEEE and ICCT supported the proposal to conduct annual chassis testing to verify the relative reductions simulated in GEM and suggested that the results be provided to the public. UCS supported the proposal, similar to ACEEE and ICCT, with the additional suggestion to conduct an over the road testing of

select vehicles under real world conditions. EMA, Daimler, Volvo, PACCAR, and Navistar commented that they support auditing, but the proposed chassis testing is burdensome with few facilities available and will not achieve the agencies' stated goal of validating GEM's measure trends in the real world. Daimler and Navistar also stated that chassis dyno testing cannot replicate the real-world conditions for many technologies, such as tire pressure monitoring systems, intelligent coasting on grades, predictively adjusting vehicle speed on hills, adapting ride height at speed, using advanced cooling system controls, etc. Volvo raised concerns about the chassis test results due to driver variability, accessory loads, and the need to simulate road loads that comprise around 90 percent of the vehicle load in tractor cycles. Volvo and Daimler noted that without separate tests to quantify the aerodynamics and rolling resistance, which accounts for a significant majority of the vehicle losses, the chassis test essentially only evaluates the powertrain and therefore recommended powertrain testing for this purpose over a chassis test. The manufacturer's suggested that EPA conduct the testing or work collaboratively to develop an in-use research program. Navistar commented that if the provision remains for the final rule, then it be limited to one vehicle in 2021, 2024, and 2027 model year. Navistar also suggested that the final requirements do not include the proposed measurement of gaseous emissions due to the additional cost burden.

After consideration of the comments, the agencies are requiring tractor manufacturers to annually chassis test five production vehicles over the GEM cycles to verify that relative reductions simulated in GEM are being achieved in actual production. See 40 CFR 1037.665. We do not expect absolute correlation between GEM results and chassis testing. GEM makes many simplifying assumptions that do not compromise its usefulness for certification, but do cause it to produce emission rates different from what would be measured during a chassis dynamometer test. Given the limits of correlation possible between GEM and chassis testing, we would not expect such testing to accurately reflect whether a vehicle was compliant with the GEM standards. Therefore, we are not applying compliance liability to such testing. Rather, this testing will be for informational purposes only. However, we do expect there to be correlation in a relative sense. Vehicle to vehicle differences showing a 10

percent improvement in GEM should show a similar percent improvement with chassis dynamometer testing. Nevertheless, manufacturers will not be subject to recall or other compliance actions if chassis testing did not agree with the GEM results on a relative basis. Rather, the agencies will continue to evaluate in-use compliance by verifying GEM inputs and testing in-use engines. (Note that NTE standards for criteria pollutants may apply for some portion of the test cycles.)

EPA believes this chassis test program is necessary because of our experience implementing regulations for heavy-duty engines. In the past, manufacturers have designed engines that have much lower emissions on the duty cycles than occur during actual use. The recent experience with Volkswagen is an unfortunate instance. By using this simple test program, we hope to be able to identify such issues earlier and to dissuade any attempts to design solely to the certification test. We also expect the results of this testing to help inform the need for any further changes to GEM.

As already noted in Section II.B.(1), it can be expensive to build chassis test cells for certification. However, EPA has structured this pilot-scale program to minimize the costs. First, this chassis testing will not need to comply with the same requirements as will apply for official certification testing. This will allow testing to be performed in developmental test cells with simple portable analyzers. Second, since the program will require only five tests per year, manufacturers without their own chassis testing facility will be able to contract with a third party to perform the testing. Finally, EPA is applying this testing to only those manufacturers with annual production in excess of 20,000 vehicles.

F. Flexibility Provisions

EPA and NHTSA are adopting two flexibility provisions specifically for heavy-duty tractor manufacturers in Phase 2. These are an averaging, banking and trading program for CO₂ emissions and fuel consumption credits, as well as provisions for credits for off-cycle technologies which are not included as inputs to the GEM. Credits generated under these provisions can only be used within the same averaging set that generated the credit.

The agencies are also modifying several Phase 1 interim provisions, as described below.

(1) Averaging, Banking, and Trading (ABT) Program

Averaging, banking, and trading of emission credits have been an important part of many EPA mobile source programs under CAA Title II, and the NHTSA light-duty CAFE program. The agencies also included this flexibility in the HD Phase 1 program. ABT provisions are useful because they can help to address many potential issues of technological feasibility and lead-time, as well as considerations of cost. They provide manufacturers flexibilities that assist in the efficient development and implementation of new technologies and therefore enable new technologies to be implemented at a more aggressive pace than without ABT. A well-designed ABT program can also provide important environmental and energy security benefits by increasing the speed at which new technologies can be implemented. Between MYs 2013 and 2014 all four tractor manufacturers are taking advantage of the ABT provisions in the Phase 1 program. NHTSA and EPA proposed to carry-over the Phase 1 ABT provisions for tractors into Phase 2, and are adopting these provisions.

The agencies proposed and are adopting for Phase 2 the five year credit life and three year deficit carry-over provisions from Phase 1 (40 CFR 1037.740(c) and 1037.745). Please see additional discussion in Section I.C.1.b.i. Although we did not propose any additional restrictions on the use of Phase 1 credits, we requested comment on this issue. In the NPRM, we stated that early indications suggest that positive market reception to the Phase 1 technologies could lead to manufacturers accumulating credits surpluses that could be quite large at the beginning of the Phase 2 program. 80 FR 40251. For the final rule, the agencies assessed the level of credits that the tractor manufacturers are accruing. As discussed above in Section III.D, the agencies adjusted the 2021 MY standards to reflect the accumulation of credits.

(2) Off-Cycle Technology Credits

In Phase 1, the agencies adopted an emissions and fuel consumption credit generating opportunity that applied to innovative technologies that reduce fuel consumption and CO₂ emissions. These technologies were required to not be in common use with heavy-duty vehicles before the 2010MY and not reflected in the GEM simulation tool (*i.e.*, the benefits are "off-cycle"). See 76 FR 57253. The agencies proposed to essentially continue this program in Phase 2. However, we are calling the

program an off-cycle credit program rather than an innovative technology program (although there is little, if any, difference in practice). In other words, beginning in 2021 MY all technologies that are not accounted for in the GEM test procedure (including powertrain testing) could be considered off-cycle, including those technologies that may have been considered innovative technologies in Phase 1 of the program. The agencies proposed to maintain the requirement that, in order for a manufacturer to receive credits for Phase 2, the off-cycle technology would still need to meet the requirement that it was not in common use prior to MY 2010. However, the final provisions will not require manufacturers to make such a demonstration. Rather, the agencies will merely retain the authority to deny a request if we determine that a technology was in common use in 2010 and was thus part of the Phase 1 baseline (and thus also the Phase 2 baseline). For additional information on the treatment of off-cycle technologies see Section I.C.1.c. as well as the discussion of off-cycle credits in each of the Phase 2 standard chapters.

(3) Post Useful Life Modifications

Under 40 CFR part 1037, it is generally prohibited for any person to remove or render inoperative any emission control device installed to comply with the requirements of part 1037. However, in 40 CFR 1037.655 EPA clarifies that certain vehicle modifications are allowed after a vehicle reaches the end of its regulatory useful life. This section applies for all vehicles subject to 40 CFR part 1037 and will thus apply for trailers regulated in Phase 2. EPA proposed to continue this provision and requested comment on it. 80 FR 40252.

This section states (as examples) that it is generally allowable to remove tractor roof fairings after the end of the vehicle's useful life if the vehicle will no longer be used primarily to pull box trailers, or to remove other fairings if the vehicle will no longer be used significantly on highways with vehicle speed of 55 miles per hour or higher. More generally, this section clarifies that owners may modify a vehicle for the purpose of reducing emissions, provided they have a reasonable technical basis for knowing that such modification will not increase emissions of any other pollutant. This essentially requires the owner to have information that will lead an engineer or other person familiar with engine and vehicle design and function to reasonably believe that the modifications will not increase emissions of any regulated

pollutant. Thus, this provision does not provide a blanket allowance for modifications after the useful life.

This section also makes clear that no person may ever disable a vehicle speed limiter prior to its expiration point, or remove aerodynamic fairings from tractors that are used primarily to pull box trailers on highways. It is also clear that this allowance does not apply with respect to engine modifications or recalibrations.

This section does not apply with respect to modifications that occur within the useful life period, other than to note that many such modifications to the vehicle during the useful life and to the engine at any time are presumed to violate section 202(a)(3)(A) of the Act. EPA notes, however, that this is merely a presumption, and it does not prohibit modifications during the useful life where the owner clearly has a reasonable technical basis for knowing that the modifications would not cause the vehicle to exceed any applicable standard.

The agencies did not receive comments opposing the proposed regulation, and is adopting it as proposed.

(4) Other Interim Provisions

In HD Phase 1, EPA adopted provisions to delay the full onboard diagnostics (OBD) requirements for heavy-duty hybrid powertrains until the 2016 and 2017 model years (see 40 CFR 86.010–18(q)). In discussions with manufacturers during the development of Phase 2, the agencies have learned that meeting the on-board diagnostic requirements for criteria pollutant engine certification continues to be a potential impediment to adoption of hybrid systems. See Section XIII.A.1 for a discussion of regulatory changes to reduce the non-GHG certification burden for engines paired with hybrid powertrain systems.

The Phase 1 advanced technology credits were adopted to promote the implementation of advanced technologies, such as hybrid powertrains, Rankine cycle engines, all-electric vehicles, and fuel cell vehicles (see 40 CFR 1037.150(p)). As the agencies stated in the Phase 1 final rule, the Phase 1 standards were not premised on the use of advanced technologies but we expected these advanced technologies to be an important part of the Phase 2 rulemaking (76 FR 57133, September 15, 2011). The HD Phase 2 heavy-duty engine and tractor standards are premised on the use of Rankine-cycle engines; therefore, the agencies believe it is no longer appropriate to provide

extra credit for this technology. While the agencies have not premised the HD Phase 2 tractor standards on hybrid powertrains, fuel cells, or electric vehicles, we also foresee some limited use of these technologies in 2021 and beyond. We proposed in Phase 2 to not provide advanced technology credits in Phase 2 for any technology, but received many comments supporting the need for such incentive. As described in Section I.C.1.b, the agencies are finalizing credit multipliers for plug-in battery electric hybrids, all-electric, and fuel cell vehicles.

(5) Phase 1 Flexibilities Not Adopted for Phase 2

In Phase 1, the agencies adopted an early credit mechanism to create incentives for manufacturers to introduce more efficient engines and vehicles earlier than they otherwise would have planned to do (see 40 CFR 1037.150(a)). The agencies did not propose to extend this flexibility to Phase 2 because the ABT program from Phase 1 will be available to manufacturers in 2020 model year and this will displace the need for early credits. However, the agencies are adopting provisions in the final Phase 2 rule that provide early credit opportunities for a limited set of technologies (see 40 CFR 1037.150(y)(2); see also 40 CFR 1037.150(y)(1) and (3) providing early credit flexibilities to certain vocational vehicles).

IV. Trailers

As mentioned in Section III, trailers pulled by Class 7 and 8 tractors (together considered “tractor-trailers”) account for approximately 60 percent of the heavy-duty sector's total CO₂ emissions and fuel consumption. Because neither trailers nor the tractors that pull them are useful by themselves, it is the combination of the tractor and the trailer that forms the useful vehicle. Although trailers do not directly generate exhaust emissions or consume fuels (except for the refrigeration units on refrigerated trailers), their designs and operation nevertheless contribute substantially to the CO₂ emissions and diesel fuel consumption of the tractors pulling them. See also Section I.E above.

The agencies are finalizing standards for trailers specifically designed to be drawn by Class 7 and 8 tractors when coupled to the tractor's fifth wheel. Although many other vehicles are known commercially as trailers, this trailer program does not apply to those that are pulled by vehicles other than tractors, and those that are coupled to vehicles exclusively by pintle hooks or hitches instead of a fifth wheel. These

standards are expressed in terms of CO₂ emissions and fuel consumption, and as described in more detail in Section IV.C.(2), apply to specific trailer subcategories. In general, the final standards are based on the same technology as the proposed standards—primarily better tires (including tire pressure management) for all regulated trailers and aerodynamic improvements for box vans (dry and refrigerated). Most of the changes from the proposal are intended to simplify and clarify the implementation of these standards. See Section IV.B. for an overview of the final program, and the rest of this Section IV for more detailed discussions.

This rulemaking establishes the first EPA regulations covering trailer manufacturers for CO₂ emissions (or any other emissions), and the first fuel consumption regulations by NHTSA for these manufacturers. The agencies have designed this program to be a unified national program, so that when a trailer model complies with EPA's standards it will also comply with NHTSA's standards, and vice versa.

A. The Trailer Industry

(1) Industry Characterization

The trailer industry encompasses a wide variety of trailer applications and designs. Among these are box vans (dry and refrigerated vans of various sizes) and “non-box” trailers, including platform (e.g., lowboys, flatbeds), tanks, container chassis, bulk, dump, grain, and many specialized types of trailers, such as car carriers, pole trailers, and logging trailers. Most trailers are designed for predominant use on paved streets, roads, and highways. A relatively small number of trailers are designed with unique capabilities and features for dedicated use in off-road applications.

The trailer manufacturing industry is very competitive, and manufacturers are highly responsive to their customers' diverse demands. The wide range of trailer designs and features reflects the broad variety of customer needs, chief among them typically being the ability to maximize the amount of freight the trailer can transport. Other design goals reflect the numerous, more specialized customer needs.

Box vans (*i.e.*, dry and refrigerated) are the most common type of trailer and are made in many different lengths, generally ranging from 28 feet to 53 feet. While all have a rectangular shape, they can vary widely in basic construction design (internal volume and weight), materials (steel, fiberglass composites, aluminum, and wood) and the number

and configuration of axles (usually two axles closely spaced, but number and spacing of axles can be greater). Box van designs may also include additional features, such as one or more side doors, out-swinging or roll-up rear doors, side or rear lift gates, and numerous types of undercarriage accessories (such as access ramps, dolly storage, spare tire storage, or mechanical lifts).

Non-box trailers are often uniquely designed to transport a specific type of freight. Platform trailers carry cargo that may not be easily contained within or loaded into/unloaded from a box van, such as large, non-uniform equipment or machine components. Tank trailers are often sealed or pressurized enclosures designed to carry liquids, gases or bulk, dry solids and semi-solids. There are also a number of other specialized trailers such as grain, dump, livestock trailers, or logging.

Chapter 1 of the RIA includes a more thorough characterization of the trailer industry. The agencies have considered the variety of trailer designs and applications in developing the CO₂ emissions and fuel consumption standards for trailers. As is described later in this Section IV, the agencies have excluded most types of specialized trailers from the Phase 2 regulations.

(2) Context for the Trailer Provisions

(a) Summary of Trailer Consideration in Phase 1

In the Phase 1 program, the agencies did not regulate trailers, but discussed how we might do so in the future (see 76 FR 57362). In proposing the Phase 1 program, the agencies solicited general comments on controlling CO₂ emissions and fuel consumption through future trailer regulations (see 75 FR 74345–74351). The agencies considered those comments in developing today's rules.

(b) SmartWay Program

For several years, EPA's voluntary SmartWay Transport Partnership program has been encouraging businesses to take actions that reduce fuel consumption and CO₂ emissions while cutting costs. The SmartWay program works with the shipping, logistics, and carrier communities to identify cleaner strategies and technologies for moving goods across their transportation supply chains. It is a voluntary, market-based program that provides carbon footprint and other air emissions performance information to partners who submit annual partner reports. SmartWay Partners commit to assessing, tracking, and improving environmental performance over time, by adopting fuel-saving practices and

technologies. SmartWay also provides technical assistance, provides recognition incentives and encourages the use of best practices that enable companies to readily incorporate fuel and emission reduction strategies into their freight supply chains.

Annually, SmartWay trucking fleet partners report type and amount of fuel consumption, tons of goods moved, type and model year of equipment used, miles driven, speed profiles and other data. Using EPA MOVES model emission factors and other EPA resources, SmartWay's assessment and tracking tools convert this information to an objective ranking of a company's environmental efficiency, enabling each participating company to benchmark performance relative to its competitors. Logistics companies, multimodal firms and shippers use this information to calculate their corporate emissions from goods movement, which can be included in annual carbon reporting protocols and sustainability reports.

EPA's SmartWay program has accelerated the availability and market penetration of advanced, fuel efficient technologies and operational practices. In conjunction with the SmartWay Partnership Program, EPA established a testing, verification, and designation program, the SmartWay Technology Program, to help freight companies identify the equipment, technologies, and strategies that save fuel and lower emissions. SmartWay verifies the performance of aerodynamic equipment, low rolling resistance tires and other technologies and maintains lists of verified technologies on its Web site. Trailer aerodynamic technologies are grouped in performance bins that represent one percent, four percent, five percent or nine percent fuel savings relative to a typical long-haul tractor-trailer at 65-mph cruise conditions. As a shorthand description and to encourage saving fuel with multiple available technologies, EPA established criteria to describe tractors and trailers as SmartWay designated if they are equipped with specific technologies. Historically, a 53-foot dry van trailer equipped with verified aerodynamic devices totaling at least five percent fuel savings, and SmartWay verified tires, qualifies as a “SmartWay Designated Trailer.” In 2014, EPA expanded the program to include the aerodynamic bin for nine percent or more fuel savings and these trailers when also equipped with verified tires qualify as “SmartWay Designated Elite Trailer.” The 2014 updates also expanded the use of aerodynamic technologies and SmartWay-designated trailer eligibility to include 53-foot refrigerated van

trailers in addition to 53-foot dry van trailers.

The SmartWay Technology Program continues to improve the industry understanding of technologies, test methods and quality of data fleet stakeholders need to achieve fuel savings and environmental goals. EPA bases its SmartWay verification protocols on common industry test methods with additional criteria to achieve performance objectives and cost effective industry acceptance. Historically, SmartWay's aerodynamic equipment verification protocol was based on the TMC type II and SAE J1321 test procedures, which measures fuel consumption as test vehicles drive laps around a test track. Under SmartWay's 2014 updates, EPA expanded the aerodynamic technology verification program to allow additional testing options. The updates included a new, more stringent 2014 track test protocol based on industry updates to the TMC RP 1102 (2014) and SAE's 2012 update to its SAE J1321 test method³²⁶ as well as protocols for wind tunnel and coastdown methods. The SmartWay program is also reviewing computational fluid dynamics (CFD) approaches for verification. These new protocols are based on stakeholder input, the latest industry standards (*i.e.*, 2012 versions of the SAE fuel consumption and wind tunnel test³²⁷ methods and 2013 CFD guidance³²⁸), EPA's own testing and research, and lessons learned from years of communications with manufacturers, testing organizations and trucking companies. Wind tunnel, coastdown, and CFD testing produce values for aerodynamic drag improvements in terms of coefficient of drag (C_D), which is then related to projected fuel savings using a mathematical curve.³²⁹

The SmartWay Technology Program verifies tires based on test data submitted by tire manufacturers demonstrating the coefficient of rolling resistance (C_{RR}) of their tires using either the SAE J1269 or ISO 28580 test

methods. These verified tires have rolling resistance targets for each axle position on the tractor and trailer. SmartWay-verified trailer tires achieve a C_{RR} of 5.1 kg/metric ton or less on the ISO28580 test method. Compared to popular tires used in 2007, an operator who replaces the trailer tires with SmartWay-verified tires can expect fuel consumption savings of one percent or more at a 65-mph cruise. Operators who apply SmartWay-verified tires on both the trailer *and* tractor can achieve three percent fuel consumption savings at 65-mph. As most van trailers and many other trailer types are manufactured with SmartWay verified tires, fleets have confidence in maintaining their fuel performance thru the use of and flexibility to choose other SmartWay verified tires.

Over the last decade, the trucking industry has achieved measureable fuel consumption benefits by adding aerodynamic features and low rolling resistance tires to their trailers. To date, SmartWay has verified over 70 aerodynamic technologies, including ten packages from five manufacturers that have received the Elite performance level. The SmartWay Transport Partnership program has worked with over 3,000 partners, the majority of which are trucking fleets, and broadly throughout the supply-chain industry, since 2004. These relationships, combined with the Technology Program's extensive involvement testing and technology development has provided EPA with significant experience in freight fuel efficiency. Furthermore, the more than 10-year duration of the voluntary SmartWay Transport Partnership has resulted in significant fleet and manufacturer experience with innovating and deploying technologies that reduce CO₂ emissions and fuel consumption.

(c) California Tractor-Trailer Greenhouse Gas Regulation

The state of California passed the Global Warming Solutions Act of 2006 (Assembly Bill 32, or AB32), enacting the state's 2020 greenhouse gas emissions reduction goal into law. Pursuant to this Act, the California Air Resource Board (CARB) was required to begin developing early actions to reduce GHG emissions. As a part of a larger effort to comply with AB32, the California Air Resource Board issued a regulation entitled "Heavy-Duty Greenhouse Gas Emission Reduction Regulation" in December 2008.

This regulation reduces GHG emissions by requiring improvement in the efficiency of heavy-duty tractors and 53 feet or longer dry and refrigerated
